C. Egertonianum var. *viride*, Lindl., *Bot. Reg.*, xxxii. (1846), t. 46, said to have been introduced from Oaxaca by Messrs. Loddiges, has pale green flowers, and appears to me to be closely allied to *C. Warszewiczii*, Rehb. f., as figured in the *Floral Magazine*, if not specifically identical.

There are two or three other Central American forms whose position remains doubtful, and I fear

will remain so until a better series of specimens, dried or otherwise, comes to hand. Indeed, the whole genus would amply repay a little closer attention. Distinct progress has been made within the last three years, but very much still remains to be done. In conclusion, we may call attention to three distinct and beautiful species which seem to have quite been lost to cultivation. These are *C. Loddigesii*, *C. aureum*, and *C. maculatum*. All are well worth re-introducing. *R. A. Rolfe*.

THE CLEMATIS IN POTS.

WHEN properly managed, few things are more showy than Clematises in pots, and as they are so readily grown to perfection, it is very strange we so seldom see them under pot treatment. They are among the most certain flowering plants we have, and can be had in bloom very early in the season with little trouble, provided one chooses the right sections for this work, and secures well-matured growths.

Plants may be purchased at all times, as they are generally kept in pots, and the present would be a good time to make a start. One of the main points in cultivating these flowers is to know to which class or section any particular variety belongs. For instance, one would not expect those of the Jackman type to be so amenable to early forcing as the varieties of the Patens and Florida sections. These last contain many splendid varieties, and are by far the best for early work. They should be grown on strongly during the coming spring and summer, having their shoots well exposed to the light. This is best secured by growing them up a wire or string, over the roof of the house. In this position they get thoroughly matured, and as the flowers of these sections are practically stored up in the growths during their ripening, it will readily be seen how very important it is that they should have plenty of light. After the growths are ripe, they may be removed from the wires or strings, and tied round some sticks set into the pots, or over any balloon-shaped wire support according to fancy. When the plants have rested for some few weeks, they may have the top soil removed, and be mulched with a rich compost. The Clematis is a gross feeder, and well repays generous treatment. The plants may now be stood in a moist heat of 55° to 65°, and will very soon show signs of activity. Keep them moist at the roots, and frequently syringed, when you will soon have growths carrying a flower from almost every one of the matured eyes on the summer-made wood.

When finished flowering, remove the growth that has borne the blooms, and grow on the sucker-like shoots that will be springing from the bottom by this time. These must be ripened in an efficient manner, like the previous growths were, and will require exactly the same treatment. These sections of Clematis want very much the same style of treatment as climbing tea-scented Roses, and are then exceedingly pretty flowers for a conservatory or greenhouse. They may be grown in a cool house, too, with ease. The only thing is to let them come on naturally during early spring; and when the flowers are secured, you may stand them in some sheltered situation out-of-doors for the rest of the summer. But they must not suffer from drought in any way, at least, not until their growths are completed, and the plants are at rest. Remove to the cool house before any very sharp frosts come, and then treat them in the same steady manner as before.

The Florida class are all double, and many of them are very sweetly scented. Countess of Lovelace, Duchess of Edinburgh, and Bille of Woking are three grand varieties in this class.

Fair Rosamond, The Queen, Albert Victor, Miss Bateman, and Lord Lonsborough are good examples of the Patens class.

The Jackman section flowers from the growths made during the same season. These attain their full length, and then break into blossom from under almost every leaf towards the end of the shoots. It

is best to train the growth of these to their position as they grow. As soon as they have flowered, the plants may be shifted to a pit or frame until early the next year, when they should be overhauled and mulched heavily. They will soon commence growing again when introduced to heat; the wood that has flowered generally dies down, and should be cut away before starting the plants again. A few of the best varieties in this class are Star of India, Alexandra, Jackman, Jackmanii superba, and Rubro-violacea.

Those of the Lanuginosa class require growing much the same as the Patens and Florida classes; but as these bloom in succession on the short lateral growths, they should not be cut away so hard as the Patens or Florida varieties. Many of our finest varieties are included in this class, Gem, Blue Gem, Henryii, Alba Magna, Beauty of Surrey, and Otto Frobel are all good kinds.

Clematises do not require much heat to force them. The Patens or Florida sections, if they have matured growths, may be introduced to heat in October, and will make showy specimens for Christmas, and a little later. These classes when properly treated, and brought on in batches, will supply flowers all through the winter and early spring, at the cost of very little trouble.

As Clematises require a large amount of water, they must have good drainage; then, while in full growth, it is hard to give them too much water, and they benefit very much from liquid manure. I grow mine in 10 and 12-inch pots, and shake them out and repot every third season. As they make a lot of roots, and it is difficult to remove any but the surface soil, I find it better to pick out the soil with a stick, and even to cut away a portion of their roots. Too much care cannot be given to securing an efficient drainage, and they like a rich loamy compost, with a little coarse sand. *A. P.*

CULTURAL NOTES.

CHOROZEMA CORDATUM var. SPLENDENS.

My object in drawing attention to this hard-wooded greenhouse shrub, is to point out its adaptability for furnishing a supply of cut flowers from the middle of January on through February. Its usual season for flowering under greenhouse treatment is April, but if grown in a little extra warmth, it can be had in bloom at the time mentioned, a period when most families are entertaining guests, and consequently a heavy demand for cut flowers exist. Here we have two large specimens planted in a narrow border, and trained up the back wall of a house that we utilise for flowering zonal Pelargoniums and double Primulas during late autumn and winter months. The temperature during those months ranges from 48° to 55°, according to the weather outside. During the growing season, the shoots are allowed to ramble at will, no attempt being made to tie them in, and by the end of summer they are from 2 to 3½ feet in length. Long sprays of their bright flowers are thrown out from the axil of almost every leaf, making a beautiful picture. We cut the shoots as long as possible, and arrange them in large vases by themselves; if Arums are arranged with their own foliage in other vases close at hand, the effect is very pretty. When flowering is over, the plants are pruned and retied, kept a little on the dry side at the root until growth recommences, and syringed daily. When growth is fairly active, the plants require abundance of water, stimulants being afforded once a week. Compost suitable for them consist of peat and loam in equal parts, with charcoal and sand added to keep it porous. *J. Tunnington, Ripley Castle Gardens, Yorks.*

FREESIAS.

The delicious perfume of the Freesia has made it a popular flower. In addition to its fragrance, it is useful for conservatory decoration, and producing bloom for cutting. The best time to pot the first batch of bulbs is early in August, and some may be potted at a later period to keep up a succession. The

earliest lot, if potted in August, would flower the following January. They like a compost of good turfy loam and leaf-soil, with enough sharp sand to keep the whole porous. For general purposes it is best to put five good bulbs in 48-pots. After potting, water and allow the pots to stand for a hour or two to drain before placing under ashes. They should be examined occasionally, and as soon as the bulbs are beginning to push, remove the pots to a light airy position, such as a shelf near the glass, with a temperature of 50° by night, rising to 60° by day, or even 70° with sun-heat. They can also be grown very well with cool treatment. As soon as the flower-buds appear, a little weak manure-water will be very beneficial to them, but care should be taken not to give plants too much water at any time, neither should they be allowed to get dry, as both extremes are very injurious. After flowering, care should be taken to dry the bulbs off gradually, and allow them to be well exposed to the sun and air, for on this will depend next year's success. A little weak manure-water after they have done flowering will assist the bulbs a great deal. It is at this period of their growth that extra attention should be given, to see that they do not get too dry as long as the foliage remains fresh. When the bulbs do not start into growth satisfactorily, it is generally because they have been dried off too rapidly. When the foliage is dead, the pots can be stored in a cool place; or, if preferred, the bulbs can be shaken out and placed in sand, where it is not too dry, till the following August. The plants here are just now coming into bloom, and some are really grand specimens. Some of the flower spikes measure 2 feet 6 inches in length, with four and five smaller ones branching out of the stem. Given the above treatment, the bulbs will increase very rapidly. *T. Neale, Barham Court Gardens.*

THE WEEK'S WORK.

FORESTRY.

By J. B. WEBSTER.

YOUNG WOODS AND SNOW.—Young shelter plantations require to have the fences of stone or turf cleared on the outer side of drifted snow, by doing which deer and sheep cannot enter the plantation, as they would do if the snow remained till it could bear their weight, and browse on the leaders and twigs of the young trees, doing irreparable injury to them. As soon as snow begins to melt on hills and high ground, there is sure to be a great rush of water to the low ground, consequently, all conduits, ditches, and drains should be scoured out to give it free vent, and thus avoid probable flooding of forest-land. In hill districts, especially in the North, when the snow has become firm, advantage should be taken to remove heavy timber from out-of-the-way places where roads do not exist, the logs being dragged along the surface with little trouble, as compared with their removal on the bare ground. The fact is, that were this not put in practice in many highland forests, the timber would in many cases not pay for its removal. When timber has been removed, it should be cut up for use [sometimes before, Ed.], and allowed to season before using for estate purposes. During stormy weather, when much labour is at a standstill on farms, &c., the making of sheep-hurdles should be prosecuted, so that these may be ready when wanted. The cross-cutting, splitting-up, and preparation of firewood, should also receive attention, which will give profitable employment to some of the hands. During frosty weather, heavy materials of all kinds may be carted, so as to have them ready when wanted in the spring. Stones should be selected and broken for road-metal, and in most cases it will prove to be an advantage to form heaps at intervals along the lines or roads on which repairs are likely to be made. Gravel should likewise be dug and prepared at the pits, and in some cases carted where it will be required in the spring. Old dilapidated fences of all kinds should either be repaired or removed altogether, and the ground trenched and turned to account, to improve the appearance of the spot. At each and all of these, profitable employment may be found for man and beast when planting and other kinds of work cannot be engaged in.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

STRAWBERRIES.—Clear all Strawberry plants in pots of dead leaves, top-dress any that require it, and water those that are dry before taking them into the forcing-house; and when a hot-bed is at command plunge them to the rims of the pots. In the absence of a structure specially devoted to forcing Strawberries, the plants may be put in any vinery or Peach-house when forcing is being carried on. A situation near the glass, and not far from the ventilators, is what should be aimed at, to ensure stout flower stalks and good fruit. In such positions, too, they are likely to get the full force of the syringes applied to them twice daily, morning and afternoon, with water of the same temperature as that in the house. Sufficient water to keep the soil in the pots just moist will be all the plants require until coming into blossom. Plants about to bloom should have every provision made for them getting the direct rays of the sun, and an airy position, for the next fortnight at least. A number of the weaker buds may be picked before they open, by way of concentrating the plant's vigour into those left. Some growers maintain a dry atmosphere around Strawberry plants during the flowering period, and assist fertilisation by distributing the pollen with a fine hair-brush; but if any red spider is lurking about, this is the time it has the chance of taking possession, and damaging the foliage, so that fine fruits cannot be expected afterwards. A better plan is to give them dewings with the syringe in the afternoons of bright days when in bloom. Thin the fruits, which will set freely under this treatment, to from seven to seventeen to a plant, according to its strength, and feed liberally with phosphatic and nitrogenous manures. For support to the fruit, nothing is simpler or handier than old worn birch-brooms. A succession of ripe Strawberries may be kept up by taking a batch of plants in to force once a week.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Gardens, Swansea.*

CLEODENDRON THOMPSONI.—Plants of this which have been kept dry at the roots during the winter should now be examined, and sufficient tepid water given them to thoroughly soak the ball; also ascertain if the drainage is in good condition. Any plants that require it should be repotted before they have started into growth; rich fibrous loam, a little decayed manure, and sharp sand should be used. Pot firmly to induce a short pointed growth. Apply water cautiously until the roots have permeated the fresh compost. Keep the night temperature from 60° to 65°, with a rise of 5° or 10° by day. To encourage the plants to break freely, syringe with tepid water. When the plants are required to flower in succession, they may be started at intervals of five or six weeks, according to the requirements. If taken to an intermediate-house when the flowers are commencing to expand, the plants will continue to produce bloom for a much longer period than if kept in a higher temperature. Those planted out in beds should also be examined, and the soil thoroughly soaked with tepid water, afterwards finishing-off with a surface-dressing of loam, decayed manure, and sharp sand. Should the plants be overcrowded, the present is a suitable time for thinning out the old wood.

AMARYLLIS (HIPPEASTRUM).—The earlier portion of the stock of these bulbs should now be started, and the others brought on at intervals of three to four weeks, so as to have a rich succession of flowers extending over a long period. A good compost for Amaryllis consists of two parts rich fibrous loam, one of decayed cow manure, one of peat or leaf soil, and sharp sand in sufficient quantity to keep the whole porous. The pots to be used will depend greatly on the size of the bulbs, but generally a 6 or 7-inch pot will be found large enough for an ordinary-sized flowering bulb. The pots should be thoroughly clean and well-croaked, and over the crocks may be placed some of the roughest of the compost. Before potting the bulbs, it is advisable to clear away the decayed bases of the leaves of last year; and if mealy bug or spider be suspected, the necks of the bulbs may be washed with some weak kind of insecticide. About one-third of the bulb should be above the surface of the soil, and a small quantity of sharp sand should be placed under each bulb, to encourage the emission of roots, and to act as a pre-

servative against injury by damp soil at the base. After potting, which should be done firmly, place the pots in an intermediate temperature, on a warm bed of Oak leaves, over which 6 inches of Cocoanut fibre are placed, plunging the pots to the rims. The heat of the bed may range from 70° to 80°. Syringe the bulbs lightly on bright days, and afford no water before the roots have taken possession of the soil in the pots.

CROWEAS.—To have these plants in flower during the autumn, last year shoots should be cut back to within some 4 inches of where they were cut in last year. Although greenhouse plants, I have always seen them thrive best in an intermediate-house, and in which they should be placed after being cut back, standing them in as light a position as possible, and well up to the glass, so as to encourage the young shoots to grow sturdy. Water should be withheld for several days previous to cutting back; and until the plants have started well into new growth, they should be kept drier at the roots than before the cutting down. Should any plants require repotting, this may be done when the young shoots have made some 2 or 3 inches of growth, using for the purpose for moderate-sized plants 7-inch pots, and for specimen plants 10 or 11-inch pots. The potting soil may consist of good fibrous peat, with sufficient sand in it to keep the soil open.

NEW HOLLAND PLANTS.—*Boronia*, *Gompholobium*, *Pimelea*, *Leschenaultia*, *Darwinia*, and others of that class of plants, should be examined frequently, as if kept in too low a temperature during the winter, they are liable to the attacks of mildew, which, if not noticed in time, will cause the majority of the leaves to fall off, causing much injury to the plants, and sometimes their destruction. Whenever the plants lose their leaves in quantity, it seriously affects the amount of bloom, and weakens the succeeding year's growth. Should there be the least signs of mildew on a plant, lay it on its side, and apply flowers-of-sulphur over every part, especially the under-side of the leaves. This dressing should be allowed to remain on the plant for two entire days, afterward syringing it off with clear water, and keeping them still on their sides till the leaves are dry, so as to prevent the sulphur penetrating the soil and killing the plant. If any of the flowers-of-sulphur should lodge on the surface of the soil, it must be scraped off. In affording air to these plants in winter and early spring, care should be taken to avoid draughts of cold air; and, if possible, the ventilators of the house should be placed on opposite sides, and only those facing the direction from which the wind is not coming, opened.

THE ORCHID HOUSES.

By H. A. BURNBURY, *Orchid Grower, Highbury, Birmingham.*

THE COOL-HOUSE.—*Epidendrum vitellinum majus* is an old favourite, although it is somewhat difficult to manage. The plant adapts itself to no other house so readily as the cool-house, where a light position suits it best, if the plant be potted in good materials and well-drained pans, and liberally supplied with moisture during its season of growth. The same remarks apply to *Odontoglossum Rossi majus*, which is an Orchid that enjoys the coolest house, and where *O. Alexandræ* would perish. This treatment of *O. R. majus* has been proved to suit the plant by many growers, both before and during the last severe winter. I am not quite certain, at this distance of time, but I think I noticed *Epidendrum vitellinum majus* and *O. Rossi majus*, when newly imported, sometimes growing together in the same mass. *Odontoglossum Cervantesii* is another Orchid that likes cool treatment, and it is a useful species, the more recent importations of which have produced some magnificent varieties with colours that vary from the purest white to deep rose-colour, all being more or less barred and spotted. *O. Cervantesii* and *O. Rossi majus* should be grown in pans or baskets close up to the roof-glass. *Ada suraticana* is another lovely and much-valued Orchid, and is, unlike the above, very accommodating, thriving equally well in the cool or in the intermediate-houses, which fact may be utilised to prolong its flowering-season; for example, those growing here in an intermediate-house, are now in bloom, whilst those in the cool-house will flower later. It is a plant that should be grown in numbers, its showy, rich, orange-coloured flowers lasting a very long time in great perfection. The cultivation of the plant is easy, and it admits of

rapid increase. It is not, however, safe to let the warmth of the house in which it stands fall below 45°, when it or other Adas are growing, or the foliage will soon get badly spotted.

THE CATTLEYA-HOUSE.—Plants of Cattleya Trianae should now be making a great show, and I have remarked with some surprise, when I take the character of our last summer into consideration, that all those which have hitherto flowered are decidedly better in quality than the same plants were last year. I have also observed the same improvement in Cattleya Percivaliana, and in some Dendrobiums. Vanda suavis, V. concolor, and their varieties, grow best in this division, and strong plants of these will now be exhibiting their flower-spikes, and consequently may be afforded more moisture at the root. Aërides crispum and its varieties, Lindleyanum and Warneri, and A. Fieldingi (the Fox-brush Orchid), are likewise best grown here, because they get the most light and ventilation.

TEMPERATURES.—The warmth maintained in all divisions may remain as advised on January 6, with the exception of a rise of a few degrees with the increasing sun heat; and let a sufficient quantity of fresh air be admitted daily, with care, avoiding draughts, which check growth and bring other evils in their train. The plan of opening the doors between the houses, when these are in one range, commends itself to me as a good one for ventilating purposes; and, if it can be so managed, the outside air should enter at the coolest house and pass on to the warmer ones through the opened doors. Whilst advocating the letting in of fresh air on every possible opportunity, much caution should be exercised during the next few months, when bright sunshine and piercing winds often go together, and it is better then to lower the warmth in the hot-water pipes rather than open the ventilators.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Barkham Court, Maidstone.

THE MORELLO CHERRY.—This is amongst stone-fruits, perhaps, the most prolific bearer, and it is one that adapts itself better than any other variety or kind to cold situations, consequently it may be planted with every reasonable expectation of success in places and positions where other stone-fruits would fail. Whether it be trained in a fan-shape, and treated like the Peach tree—that is, by laying in as much of the young wood annually as there is room for, or planting it as a standard, it will be found to grow alike well, and produce prodigious crops of fruit.

THE PRUNING AND TRAINING OF THE MORELLO consist principally in cutting out much of the growth which has carried fruit, and laying in shoots of the previous year. These may be laid-in much thicker than is advisable in the Peach, and still with good results; nevertheless, I do not recommend these summer growths to be laid-in at less than 5 inches apart; for, if they are placed closer, the fruits are small. If summer attention has been neglected, and the knife will have to be freely used at this season; and only the stoutest and best placed shoots left. Old trees which have but a small amount of fruiting-shoots at the lower parts and centre of the trees, may have several of the old branches sawn back to a point where these shoots are most required. There is no fear of harm in doing this, the Morello Cherry generally breaking freely.

STANDARD MORELLOS.—These are getting much more common than formerly, but the tree not being a very strong grower, it should not be planted in orchards where stock is turned out to graze. It makes a drooping tree beautiful in bloom and fruit, and whether it be planted on the lawn or in the fruit quarters, it is always much admired.

GRAFTS.—Scions for grafting of the various kinds of fruit trees should now be taken, tied up in small bundles, correctly labelled, and placed in little trenches 5 inches deep; the earth being trodden firm about them. A cool but not shady place should be found for them, so that they be not excited by the sun's heat to push their buds. The scions must be ripened shoots of last year.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

GENERAL WORK.—With the favourable weather we have had, digging will have been pushed forward, the frosty weather in January having allowed the necessary manure to be wheeled on to

vacant quarters. I pointed out in a previous calendar the desirability of deep cultivation of the soil, and affording a change of manure and the rotation of crops. This will apply to Potatoes and other root crops. By getting all land which is vacant into good order betimes, time will be saved in the spring—a great consideration when so much presses to be done. Plots of Broccoli or Borecole now cut over may be cleared of their stems, which may be burnt, and returned to the soil. This is a better way of dealing with these clearings than to throw them into heaps to decay.

HERB BORDERS.—These should be cleaned, and the needful division of the plants performed, for as the present is likely to prove a forward season, the sooner such is performed the better. Much ground need not, in a general way, be occupied with pot-herbs, as when each kind is properly grown, the produce from the plants is equal to that derived from a much greater space. I like to have my herbs near a walk. Mint and Thyme, which are always in demand by cooks, should be more extensively grown. Spear Mint will be largely required in many families for the next few weeks, and it may be forced in any kind of forcing-house or the stove. Tarragon may be lifted for forcing, the older roots being divided into many pieces and replanted. Now is a good time to plant new beds, for, like other plants, a change of ground is beneficial to it. Basil, of both kinds, should be sown for early use—Sweet Basil is nearly always required. Herb seeds should be sown this month, and in frames, if this method be convenient, planting out the seedlings in April. Towards the end of the present month or next, slips or cuttings of Sage, Rue, and Thyme should be planted in firm ground in a sandy compost, and in rows 18 inches apart.

HORSERADISH.—This root well repays good cultivation, and now is a good time to lift all roots that are in the ground, the sorting them, and getting a new bed ready for planting. The large straight roots should be heeled in rows, on a north border for use, and if in quantity, these will furnish the summer supply. In laying-in cover the crown, as if exposed the root deteriorates in flavour, and in dry weather it becomes soft. The smaller straight roots will make the best sets for planting the new bed; these should have the side-growths cut, and be laid-in till wanted for planting. It is hardly necessary for me to point out the importance of new ground for this root; still, if the old bed must be utilised, it should be deeply trenched, taking care to remove every bit of root, and putting in plenty of rich manure. Planting should take place as soon as the ground is in condition to tread upon; a dibber of wood or iron should be used, and the sets placed 3 inches below the surface. The ground after planting should be levelled with a rake, which will fill up the holes. Rows of Horseradish should be 2 feet apart, and the sets in the row 1 foot. As soon as growth is a few inches high, remove all side-growths, leaving only the strongest one; this will in a great measure assure unbarbed roots.

RHUBARB.—Where much Rhubarb is forced, annual plantings must be made, and that for forcing should be grown in a warm part of the garden, so as to get ripened early in the season; it is also best to have small roots in preference to large ones, so that frequent removal becomes a necessity. Division of the large masses should now take place, planting the divisions in well-manured ground in rows 4 feet by 3 feet, taking care that each root has a good strong bud. After planting, afford the land a mulching of decayed manure or leaf-mould, and in the event of hard frosts, throw some Fern or straw over the crowns. No stalks must be pulled—at least, not in the spring.

JERUSALEM ARTICHOKE.—These roots should now be taken up, and the larger ones selected for use, and covered with soil. I prefer to keep Jerusalem Artichokes covered in the open ground, to keeping them in dry sheds in sand where they soon shrivel, and become almost unfit for the table. The middle-sized tubers may be placed thickly together, and covered with soil until planted. Give the crop fresh land, and prepare it by trenching and manuring. Some heavy materials may be added to land that is light; and half-rotted leaves, sand, and lime-rubbish, burnt earth, or road-scrapings to clayey soils. Plant in rows, 2 feet apart each way, or have the rows 3 feet apart, and the sets at 18 inches in the rows.

POTATOS.—Examine tubers stored in dark places, and bring them to the light; indeed, Potato sets are better at all times for free exposure. If space allows,

place them in a single layer so as to induce a short stumpy growth of shoots; and if shallow boxes can be spared, much time is saved by placing the tubers in them, with the eyes at the top. Any sets that require to be cut before planting should be so treated at once, in order that a strong eye or bud may start from each.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

CANNAS.—These are becoming very popular for bedding, and old plants which were lifted from the beds last autumn and then stored away in boxes of dry sand, should now be brought to the potting-shed and the best crowns selected. These should be put into boxes or pots, using a light rich compost, and placed in a vinery or Peach-house to start them steadily into growth, and by planting-out time they will be well-established, and make a good show at once. Young plants resulting from seed sown to be sown early last month will now require potting into small pots, using a mixture of three-parts light sandy loam and one of sifted leaf mould and horse droppings. Return them to heat, and water to settle the soil. Shift into larger pots as occasion requires to prevent the roots getting pot-bound before planting-time arrives. These seedling plants being comparatively small, should not be intermixed with those raised from seed last year, but might be used as an edging to them.

DAHLIAS.—Dahlia roots should now be taken out of their winter quarters, and placed closely together (with the labels attached) on the floor of a forcing-house, or any other convenient and suitable place, with a little light mould put around and amongst them. As soon as they have made shoots about 2 inches long, these should be taken off with or without a slight piece of tuber attached, and inserted singly in small pots filled with sandy mould, watered, and then plunged in a hotbed. If only a few plants are required, they may be plunged a few inches deep in sawdust, placed in hand-lights somewhere in heat. Shade from sunshine for a few hours daily until the cuttings are rooted, and the young plants be gradually hardened off between then and planting-out time—the end of May or early in June.

LILIUM AURATUM, and many other Lilies usually grown in pots, do equally well planted out in herbaceous and shrubby borders, with full exposure to the sun. They also do well, and show off to great advantage, when planted in recesses in the margins of beds and borders planted with Rhododendrons, and such like plants. But in this latter case, it will be advisable to plant the Lilies in large efficiently-drained pots, filled with a compost consisting of three parts fibry loam, and one of peat, leaf mould and horse droppings, and sharp sand, and buried in the soil. This will prevent the roots of the ordinary occupants of the beds from intermixing with those of the Lilliums. The bulbs should be planted this month in warm districts, and early in March in places less favourably situated as regards soil and climate.

PLANT PORTRAITS.

ACER PALMATUM VAR. *AOKII*, *Gartenflora*, t. 1363. —A form with finely divided leaves, variegated with pink and cream colour.

ANOUOLA UNIFLORA VAR. *TREVERANI*, *Lindena*, January, t. 310; a variety in which the transverse bars at the base of the lip are more developed than usual.

APPLE ANTONOOKA, *Bulletin d'Arboriculture*, &c., January. The most highly-esteemed Apple in Russia. It is a globular Apple, of medium size, deeply depressed at each end, and of a lemon yellow colour, like that of Calville Blanche. Flavour, sub-acid. It is a valuable Apple for cold countries.

CARNATION KETTON ROSE, *Garden*, January 16.

CHRYSANTHEMUM M. GEORGES NEXT, *Revue de l'Horticulture Belge*, February 1. Japanese, florets ruddy bronze, golden yellow on the reverse side.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, FEB 18 { Linnean Society.
Brighton and Hove.
Chrysanthemum Society.

SATURDAY, FEB 20 Wakefield Paxton Society.

SALES.

MONDAY, FEB 15 { Carnations, Hollyhocks, Peonies,
&c., at Protheroe & Morris' Rooms.

TUESDAY, FEB 16 { Nursery Stock, at Horsell Birch
Nurseries, Woking, by Protheroe & Morris.

WEDNESDAY FEB 17 { Greenhouse Ferns, Roses, Azaleas,
Carnations, Daffodils, &c., at
Protheroe & Morris' Rooms.
Orchids at the Orchid Nurseries,
by order of Messrs. Seeger &
Tropp, by Protheroe & Morris.
1000 Choice Roses, Fruit Trees, &c.,
at Stevens' Rooms.

THURSDAY, FEB 18 { Nursery Stock Sale, at the Nur-
series, Wansstead Flats, by Pro-
theroe & Morris (two days).

FRIDAY, FEB 19 { A Grand Importation of Orchids,
at Protheroe & Morris' Rooms.

SATURDAY, FEB 20 { Border Plants, Liliums, Fruit
trees, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°·2.

The Royal Horticultural Society.

WHAT a difference the annual meeting of the Royal Horticultural Society on Tuesday last presented from some of its predecessors! In the old South Kensington days, horticulture had to take a second place. Horticulture then was very much in the same position that landscape gardening is now in the opinion of some architects. Then followed a dismal period—lively enough, indeed, for those who had to take part in it, but dismal enough for those lookers on who had the higher interests of horticulture at heart.

The fog end of these times was the period of "internal heat," of which Professor FOSTER spoke the other day. These were the times when individual members of Council came straight from the Council-board to us, and doubtless to our contemporaries—not, indeed, to reveal secrets—they were gentlemen—but to retail the latest squabbles, and make complaints about the acerbity of this man, the masterfulness of that, to narrate how So-and-So was ruining the Society, and turning it into a Cremorne, and so on, and so on. We do not wish to be boastful, but we may take some credit for the fact, that editorial discretion at that time prevented many things from being worse than they were. All this is happily a "by-gone." The editorial sanctum is no longer invaded by councillors anxious to ventilate their own special nostrums, or to make complaint against those who were advocates of a different panacea. Ever

since the principle was laid down that horticulture was the sole, or, at least, the essential, business of the Royal Horticultural Society, things have gone better, and the Society has risen in public estimation. It is not the interests of prize-loving exhibitors, not the welfare of traders, not the whims and caprices of mere pleasure-seekers that the Royal Horticultural Society has primarily to do with. These things are all well enough, and unobjectionable if kept within due bounds, but neither of them singly nor a combination of all of them, can be urged as anything but very secondary objects for the Royal Horticultural Society.

At the annual meeting held on Tuesday last, the President, Sir TREVOR LAWRENCE, was jubilant in commenting on the report, as published in our last issue. Right glad are we that he should be. The President took office at the dismal period, he maintained even away during the period of "internal heat." During evil times, as in better ones, he has stuck to the Society with undiminished interest, and with an impartiality that has never been challenged. We rejoice that, at last, it is his good fortune to be able to say that "the affairs of the Society are in a thoroughly satisfactory condition." Of course, there are the usual grumblers and sun-spot students, but they did not make themselves heard on this occasion; and, although they perform a useful office, we may leave them out of consideration at the present moment.

The main facts elicited at the meeting were that the number of new Fellows has greatly increased—no fewer than sixty-seven were elected on Tuesday; the income, too, has increased. The *Journal* has been published with greater regularity, and meets with great approval. How different from the old times, when no one applied for their copies, and the publication was for the most part a sheer waste of money and energy, in spite of the fact that its contents, even then, were not so greatly inferior to what they are now.

The Drill Hall came in for its share of animadversion, but as the scheme for building a new Hall is for the moment in abeyance, and no better site offers, it must be put up with for the present. The thanks offered to the committee and lecturers have been well earned, and the same may be said of the Council, and specially of the indefatigable Honorary Secretary. The Conferences were alluded to as satisfactory, and the Conifer Conference as having "eclipsed all its predecessors." Remembering, as we do, the first Orchid Conference, the Primula Conference, that devoted to Roses, and some others, we think the President's praise very high praise indeed. Unhappily, the weather was simply atrocious, and so the general public had little opportunity of seeing what was done or of appreciating the labour spent in its behalf.

The relation of the Society to such matters of public importance as fruit culture—and the promotion of technical education was alluded to. We can but express our wish that the Society will on all occasions promptly assert itself in all such questions, and render unnecessary the host of special societies, which sap the vitality of the parent Society, and entail such a wasteful expenditure of energy and financial resources. All these should be sections of the Imperial Society, working for and with it, but each endowed with home rule and the liberty to manage its own affairs in its own way as far as consistent with the welfare of the central body. Why, to pursue our subject, should the Society of Arts monopolise the arrangement of affairs connected with the

Chicago Exhibition? Surely the Royal Horticultural Society is the proper body to undertake the supervision of matters relating to horticulture.

The renewed offer of money prizes is a conciliation to the weakness of frail human nature. Such prizes constitute one of the main objects and reasons for existence of the special and of all the local societies, but are of far less consequence in the case of a body whose duty it is to advance horticulture rather than gratify individual ambition, or satisfy less honourable, however legitimate, proclivities.

Ultimately, the adoption of the Report was proposed by the President, seconded by Baron SCHRODER, and carried unanimously. In the discussion which followed, Professor FOSTER reiterated the praises of the *Journal*, alluded to the difficulties of the education question, but thought that the matter, including that of examinations, was one which the Council should take up. Coming from such an authority, this expression of opinion was specially valuable.

Some formal business was then got through, and eventually a vote of thanks to the President and officers was proposed by Dr. HOOG. No words were necessary to explain or enforce the resolution, for never certainly within the last quarter of a century, has better work been done by any Council. No wonder the vote was unanimous.

The Gardeners' Orphan Fund.

It is a matter of great satisfaction to those who, like ourselves, were present at the birth of this institution, and who have watched its career to the present time, to find that it is steadily making its way. Its finances are surely progressing; the number of children who are benefitting by it is increasing in proportion, so that now, after less than five years, no fewer than fifty are on the books. Considering how short is the time since the inauguration of the Fund, these results are very satisfactory. In spite of severe losses, the executive committee has managed to continue its beneficent work in a manner to command the gratitude of the subscribers. The votes of thanks which were passed to the officers and the local secretaries at the annual meeting on Friday last will be taken up warmly by those at a distance. The Chairman of the Committee is Mr. WILLIAM MARSHALL, who is also the Chairman of the Floral Committee, and who is in both capacities emphatically the right man in the right place. The Secretary is Mr. A. F. BARRON, the ever-popular Superintendent of the garden of the Royal Horticultural Society at Chiswick. This connection of the Royal Horticultural Society and of Chiswick with the Gardeners' Orphan Fund, though quite informal and accidental, is also in accordance with the fitness of things. Perhaps it might be possible to inaugurate a Strawberry *fête*, or a Rose *fête*, with the adjunct of music, at Chiswick, as well as at the Crystal Palace, some day in the forthcoming summer, for the benefit of the Fund. But whether this be feasible or not, it is evident that no reasonable means must be left untried to increase the annual income, and to accumulate a sufficient reserve fund to meet possible contingencies. Actuarial calculations would show what proportion the reserve fund should bear to the income, and specially to the liabilities. The extremely low rate of subscription, again, is a matter which must surely soon attract the attention of the governing body. As it is, the working expenses must of necessity bear a very large proportion to the receipts. The secretarial work, for instance, which must be very heavy, would be no heavier were the present subscrip-

FIG. 31.—A GROUP OF SNOWDROPS, GROWN AT MR. HUGH ST. JOHN'S, WESTMOUNT, GLASGOW.

tion rate doubled. There are many, we are confident, who would not object to raise their subscription from 5s. to 10s., whilst the Fund would still gladly continue to receive the help of those who would prefer to contribute at the lower rate. At the meeting, something was said as to the propriety of increasing the number of gardeners—meaning, presumably, private gardeners—on the executive committee. No doubt, it is an excellent principle, that this class should be specially well represented. When it is remembered that all the local secretaries are *ex officio* members of the committee, and that of these gentlemen (nearly sixty in number) almost all are practical gardeners, it becomes evident that principle and practice are in fair accord.

A GROUP OF ODONTOGLOSSUMS.—Our illustration, Fig. 31, shows a group of *Odontoglossums*, presumably *O. crispum* and its varieties, as seen when at their best in the garden of HUGH STEVENS, Esq., Westmount, Glasgow. There are persons of refined tastes who are proud of possessing a collection of show or fancy *Pelargoniums*, whilst others have a fancy for *Asiaticas*, *Tulips*, *Pansies*, *Dahlias*, or *Carnations*, and each is equally at liberty to prefer his pet subject before all others. In *Odontoglossums* Mr. STEVENS has found his particular fancy, and if we may judge from the excellence of the plants shown in our engraving, he has got a gardener who knows how to treat them.

LINNEAN SOCIETY.—At the meeting held at the Society's room on Thursday, February 4, Professor STEWART, President, in the Chair, a letter was read from General Sir DIGNTON PROBYN, conveying the thanks of the Prince and Princess of WALES for the expression of condolence with their Royal Highnesses in their severe bereavement, which had been forwarded by the President on behalf of the Society. Mr. JOHN RATTRAY was elected, and Mr. W. H. BLAKE was admitted a Fellow of the Society. Mr. F. N. WILLIAMS read a paper on "The Genus *Dianthus*." He pointed out that *Velezia*, *Dianthus*, and *Tunica* form a natural group of genera distinguishable from the *Silene* group by their seeds, which have a facial hilum and straight embryo. *Velezia* may be distinguished from *Dianthus* and *Tunica* by having half the number of stamens. There are, however, three characters to be relied on in distinguishing these two genera:—(1), the presence of an epicalyx of bracts; (2), the number of nerves to the calyx; (3), the junction of the claw with the blade of the petal. This last character was regarded as distinguishing very clearly *Dianthus* from *Tunica*. In *Dianthus* the blade of the petal is abruptly narrowed into the claw, so that the two are distinct; in *Tunica* the transition is gradual. Mr. WILLIAMS was of opinion that the species of *Dianthus* might be arranged in three natural groups (subgenera):—(1), in which the flowers are numerous and clustered, as in *Sweet William*; (2), the largest group in which the flowers are few, and usually solitary on the branches of the stems, as in *Carnation*; and (3), a small group intermediate between *Tunica* and the true *Pinks*, and corresponding with the genus *Kohlruschia* of Kunth. The number of species recognised by Mr. WILLIAMS in this monograph amount in round numbers to 250. At the evening meeting, to be held on Thursday, February 18, at 8 P.M., the following papers will be read:—1, on "Bud Protection in Dicotyledons," by PERCY GROOM, F.L.S.; and 2, "Revision of *Colensoa* New Zealand Hepaticæ," by F. STEPHENS.

ROYAL GARDENS, KEW.—As an appendix to the *Kew Bulletin*, has been published a list of seeds of hardy herbaceous plants, trees and shrubs available for distribution by means of exchange among the regular correspondents of the garden. None are sold. An index to the five volumes of the *Kew Bulletin* has also been issued.

Ghent QUINQUENNIAL EXHIBITION OF 1893.—The programme of this Exhibition will appear in

March, when it will be seen that some important alterations are contemplated, special attention being given to growing plants and Orchids. The Exhibition of 1893 will contain some new features of much interest to the horticultural world.

INTERNATIONAL HORTICULTURAL EXHIBITION AT EARL'S COURT.—On the invitation of Mr. H. E. MILNER, a large number of leading horticulturists were entertained by him at luncheon at the Hotel Windsor on the 9th inst., among those present being Messrs. William Paul, W. Bull, H. Williams, H. M. Pollett, H. Cannell, F. Q. Lane, W. Marshall, H. Turner, A. Turner, J. Smith (Mentmore), G. Wythes, B. R. Cant, John Lee, P. Barr, G. T. Miles, E. O. Greening, J. Hudson, R. Dean, B. Wynne, &c. After luncheon, Mr. MILNER, who presided, made a statement to the effect that the land at Earl's Court is the property of the District Railway Co., that Baron Reuter and Colonel North have an interest in it, and it was their desire that an important exhibition should be held during the coming summer. Something was wanted, and it was proposed that it be illustrative of different features of practical horticulture. The promoters he had named would provide plenty of funds. Possession would be taken of the ground on Thursday next, and operations commenced at once. It was his desire that the scheme should be upon the broadest grounds, and be taken up warmly. Several distinguished foreigners had accepted invitations to be present, and many leading horticulturists had promised their assistance. No liability would attach to those who formed the Committee. An immense amount of work would have to be got through in a short space of time, as the exhibition must be opened on May 7. Mr. Milner made an appeal for the co-operation of all present. A number of questions were asked, and the following resolution, proposed by Mr. William Paul, and seconded by Mr. McKellar, of Sandringham, was carried unanimously:—"That this meeting of representatives of leading nurserymen and gardeners of the United Kingdom desires to express their appreciation of the objects of the International Horticultural Exhibition, and promises to do what they can to secure its success, and also extend a cordial greeting to their continental friends." Several of those present gave in their names as members of the committee, and the proceedings closed with a hearty vote of thanks to Mr. Milner for his hospitality.

BRIXTON, STREATHAM AND CLAPHAM HORTICULTURAL SOCIETY.—At the Annual General Meeting of this Society it was decided to hold the Autumn Show on November 1 and 2, at the New Town Hall, Streatham. A pleasing incident at the meeting was the presentation by exhibitors of the Society of a handsome salad bowl, fork and spoon, to the Hon. Sec., Mr. W. RUFFELL, with a hearty vote of thanks from the members for his services during the past year.

SOUTH AFRICAN FRUITS.—There were further sales of fruit from South Africa at Covent Garden on Wednesday, Feb. 10, the Union Steamship Company's mail steamer *Tartar* having brought home in refrigerators a consignment of Peaches, Tomatoes, Grapes, Cucumbers, and Pine Apples from Cape Colony and Natal.

THE NATIONAL DAHLIA SOCIETY.—The annual meeting of members took place at the Horticultural Club, Hotel Windsor, on the 9th inst., Mr. E. MAWLEY in the chair, there being a good attendance of the leading growers and exhibitors. The annual report set forth that the reduction in the amount of subscription paid by members, while it had operated to bring about an increase in number, had reduced the amount received from this source, though only slightly. The annual exhibition, held at the Crystal Palace on September 4 and 5 last, was an extensive one: more blooms of the show and fancy types of Dahlias were staged than at any time since 1887; while the Cactus, decorative, and single varieties had greatly increased in quantity. The commencement made last year of com-

piling and publishing in the schedule a list of true Cactus varieties, resulted in the addition to the society's exhibition of a beautiful and attractive feature; this list will be revised and added to, for service in the ensuing season. The Society has to deplore the loss of one of their Vice-Presidents in the person of Mr. HENRY GLASSCOCK, late of Bishop's Stortford, who for some years occupied the position of amateur champion of the Dahlia world, and cultivated all the types with great skill and success. The financial statement showed that the sum of £71 3s. 6d. had been received as subscriptions and donations; the sum of £50 from the Crystal Palace Company; and the balance of £31 17s. 7d., brought over from last year, made a total available income of £153 1s. 1d. On the other side, £130 7s. had been paid as prizes; printing, &c., amounted to £15 4s. 8d., and small disbursements left a balance of £22 8s. 10d., with unpaid subscriptions amounting altogether to £7 7s. The report and balance sheet were adopted, and ordered to be printed in the usual way. The annual exhibition of the Society will take place at the Crystal Palace on September 2 and 3. Some revision of the privileges given to subscribers was made; tickets of admission will be given *pro rata* to the amount of subscription paid; and, for the first time, members will receive a copy of the official report of the Dahlia conference held at Chiswick in 1890. It is subscribers only who can compete for prizes at the annual exhibition in September. The Vice-Presidents were re-elected, with the addition of the names of Messrs. S. BARLOW, JOHN DOWNIE, and G. H. ST. PIERRE HARRIS. The members of the old committee were re-elected, with the addition of Messrs. A. RAWLINS, F. GLASSCOCK, T. VAGO, and G. PHIPPEAN. An offer of two Turner memorial prizes of £5 each from the trustees of the fund was accepted, and also a *Gardeners' Magazine* medal from Mr. Geo. GORDON. A vote of thanks to the chairman brought the proceedings to a close.

THE OLDEST EXISTING VARIETY OF POTATO IN IRELAND.—Although the last century, and up to the famine times in the '40s, there were some very fine varieties of Potato in the south of Ireland, purely native raising, but whose raisers names are now unknown. The most famous were Quarries and Mignons, the Quarries being the chief food with the people during early summer and harvest; the Mignons, as a main crop, occupying the same attention then that the famous Scotch Champion does at present. Mr. BAYLOR HARTLAND, who sent some samples of Quarries to us, says, "There was no better variety grown during his time, and he can remember Irish Potatoes fifty-two years ago; and he knows that Quarries were in cultivation for one hundred years previously." In fact, he asserts that "Quarries" and "Mignons" were the staple food of the Irish peasantry that formed the bone and sinew of Wellington's Irish troops. We understand the quantity of seed is limited, and only last year the variety was re-discovered in a remote part of the co. Cork, in the possession of a small farmer whose land consists of dry peat resting on limestone. He further states that it is the oldest known Potato in Ireland at present in cultivation. We should like to hear of the oldest variety in cultivation in England or Scotland. Some of the tubers, which we cooked in the usual manner—i.e., peeled—were very heavy, close-grained, slightly mealy outside, and dry within. The flavour is that of boiled Chestnuts, which was the more readily remarked, as our new varieties are mostly flavourless.

THE CHARING CROSS EMBANKMENT GARDEN.—We observe that a bandstand is in process of erection, from which we infer that the laudable practice of gratifying Her Majesty's poorer subjects with occasional musical performances is to be continued. We trust that the occasion will be seized to do away with, or, at least, re-construct some of the silly and purposeless flower beds, the design of which is about as bad as it could be. It would be a great

improvement, also, if the *Euonymus* bushes, dotted about on the lawns, were removed. At present, they are eyesores, and they destroy the sense of space and repose (we use the words in a landscape gardener's sense), which was apparent, even in such a small area as the embankment garden before the lawn was needlessly cut up with these obstructions. It is too late to protest now, but could not those who are responsible for the pruning of the flowering shrubs, see that the work of pruning is so carried out that some, at least, of the flowering shoots are left for the delectation of the citizens.

APPLE GRAFTS.—We are requested to publish the following note:—"We have at present at Chiswick one of the largest (if not the largest) collections of Apple trees in the world. There are, however, a number of good sorts scattered here and there throughout the country, and but very little known. The Council of the Society invite the owners of such comparatively unknown sorts to send grafts of them with name, locality, age of tree (if known), and any other particulars, to Chiswick, for trial alongside of the standard collection. Grafts should be addressed, Superintendent, Royal Horticultural Society's Gardens, Chiswick.—W. WILKS, Secretary, Royal Horticultural Society."

THE JERUSALEM ARTICHOKE.—We have so often recommended our cultivators to grow this plant under glass for the purpose of procuring seedlings and improved varieties, that we were pleased to find that Messrs. VILMORIN have succeeded in obtaining seed from Corsica, and according to the *Revue Horticole*, have already secured one or two varieties which are improvements upon the ordinary form.

ENGLISH ORCHID COLLECTIONS.—The last number of the *Journal des Orchidées* contains an eulogistic account of the collection of Sir TREVOR LAWRENCE, from the pen of M. LECIEN LINDEN.

DEVON AND EXETER GARDENERS' ASSOCIATION.—On Wednesday, the fortnightly meeting of members of the Devon and Exeter Gardeners' Association was held at the Guildhall, Mr. G. D. CANN, Hon. Secretary of the Exeter Horticultural Society, presided, and there was a good attendance. The subject for discussion was, "How to Grow and Show Vegetables for Exhibition," a paper on that subject having been prepared by the Rev. A. H. CRUWYS, Rector of Cruwys Morchard, near Tiverton. Unfortunately, Mr. Cruwys' medical advisers would not sanction his being out-of-doors in the evening, and Mr. HORE, Hon. Secretary, therefore, at the essayist's request, read the paper. The paper treated of the Potato, the time for planting it, how to grow tubers for exhibition, &c.; then came papers on Beetroot, Turnips, and ending with a list of what may be called exhibition varieties of the above roots.

NATIONAL ROSE SOCIETY.—We are informed by the honorary secretaries of the National Rose Society that the following exhibitions of Roses, in the current year, have been decided on, viz., a show of Tea Roses at the Drill Hall, James Street, Westminster, on Tuesday, June 21; the Metropolitan Show at the Crystal Palace, on Saturday, July 2; and the Provincial Show, at Chester, on Thursday, July 14. The date of the annual dinner of the Society is fixed for Tuesday, June 21, at the Hotel Windsor, Victoria Street, S.W.

STEPHAN L. ENDLICHER.—We read in the *Illustrirte Garten Zeitung* for last month, that this celebrated botanist, who died in 1849, is to have a memorial tombstone, which will probably be erected somewhere in, and at the expense of the municipality of, Vienna, the city of his birth.

BELGIUM.

ORCHIDS AT BRUSSELS.

THERE may be seen, in the houses of M. Peeters, a very fine lot of *Cypripedium* raised by this skilful orchidist. *Cypripedium* × *Senateur Montefiore*, a

cross between *C. marmorophyllum* and *C. Spicerianum*, the new hybrid, is remarkable for its size, form, and the snowy white dorsal sepal, which is very large, spreading, and (after a time) curling up like a sugar-paper; the mid-rib is plainly marked by a purple line; the base is rather bright, clear green. The rest of this handsome flower is green, more or less tinged with bronze, especially over the two petals which spread widely and are fringed at the upper edge. The lip resembles that of *C. marmorophyllum*; the staminode is wavy; the centre green surrounded by a pretty shade of purple; and the edge white. The leaves are short, broad, and green slightly marbled. *Selenipedium leucorrhodum*, white in colour; a fine variety of *S. candidulum*; *Cypripedium nitens superbum*, well bloomed, with many and distinct purple spots; *Laelia anceps alba*, with strong sepals, and petals ivory white in colour, and *Odontoglossum Humeanum*, deserve to be specially signalled out among the Orchids now in bloom in M. Peeters' establishment. *Ch. de B., Liège.*

AMATEURS' NOTES.

THE CULTURE OF ODONTOGLOSSUM (CRISPUM).—There are but few of the *Odontoglossum* plants that possess so much of beauty as does a well-grown plant of *O. crispum* when in flower. Much has been written about its fascinating charms, its habits, its culture; and I think its renown is everywhere known. Experts and novices have repeatedly given us their opinions respecting its merits. The Press has paid considerable attention to it, and has directed the notice of the public to its superlative qualities. Financiers and speculators have reaped golden harvests as the result of good importations, and much good has been done, and much benefit derived from such "labours of love." Any one with means can buy a dozen or two plants of it, and at the same time have the history of its cultivation, gratis, from the salesman, if necessary, but, alas! how often is the result failure!

Perhaps the best method of purchasing *Odontoglossum crispum* is to buy the imported bulbs at one of the London sales. In my experience this has been the most satisfactory, and to any one who knows how to treat the imported masses after he has procured them, I would say by all means buy imported bulbs.

Assuming that we have before us an importation of the pseudobulbs just unpacked from the case—ugly, worthless-looking things they are—and we wish in twelve months' time to transform these "dry bones" into living, beautiful plants, perhaps bearing in some cases two or three spikes of their lovely blossoms; how are we to set about it? First, then, wash the pseudobulbs very carefully in tepid water, so as to thoroughly cleanse them from all parasites, both insect and fungoid, which are almost certain to be there, cut away all dead roots, bulbs, leaves, &c.; in short, make perfectly clean. In the shady cool end of the stove spread a mat on the stage, and on the top of this a layer of broken crocks, washed and perfectly clean; place the cleansed masses of bulbs base downwards on these, and syringe several times a day, being ruled by the intensity of the brightness of the weather. The rays from the sun must be shaded off with fine straw paper, gradually admitting more light as the young growths make their appearance.

When the rootlets appear, and before they attain any size, and the growths are beginning to nicely develop themselves, remove the masses into pots of suitable size, three parts filled with clean crocks and a few lumps of charcoal, place one or two lumps of very fibrous peat on the top of this, as close as expedient to the young rootlets which are forming. Let the bulbs lie rather loosely, but upright, on this, until they have forced their roots into the material, syringing periodically as they develop. After a time press firmly and carefully into the pot other pieces of fibrous peat so as to form a mound around the pseudobulbs, at the same time taking care that the bulbs rest on the summit—as nearly as possible—of

the mound, and plant over with fresh green sphagnum. At this stage they can be moved into a cooler temperature. The sphagnum must always be kept fresh and green; in order to accomplish this, rather plentiful supplies of water must be given. As long as the sphagnum is in good condition, the plant itself is certain to be right; the sphagnum should never be allowed to become dry. After the first leaves are fully developed, they may be moved into their proper quarters in the cool house, and grow on there, giving them plenty of moisture and ventilation. In all probability many of them will flower the first year.

This mode of treatment is about the most successful, and one that never fails. After the plants are established, nothing is required but the necessary ventilation, watering and syringing. In very bright weather they should be lightly sprayed over with the syringe at least four times a day, and the floor of the house should be kept constantly damp. Plenty of water must also be supplied, if the drainage is in good order, and the potting compost is of a porous nature. Too much water can scarcely be applied; at least, such is my conclusion after six years' constant experience with this lovely class of plants. When they grow too large for the pots in which they have been established, they must be carefully moved into a larger size. When any of the pseudobulbs decay, they must be carefully removed with a sharp knife. *C. H. B.*

HOME CORRESPONDENCE.

BRITTLE TIMBER.—In the issue of the *Gardeners Chronicle* for January 30, p. 152, "T. S." wants to know which of the statements is correct, "That the slower the growth, the more brittle; and that the quicker the growth, the stronger the timber." No doubt there are different opinions regarding this question, but my experience is that the quick-grown timber is the best. Let us take the common Ash, for example. For many years I have realised 1s. 6d. per cubic foot for quick-grown strong elastic stuff, fit for handle wood, car shafts, pig shafts, and a variety of other purposes in connection with coach building, where strength, elasticity, and durability are indispensable. On the other hand, slow-grown stuff, of the same kind, only averaged, as a general rule, 1s. per cubic foot, but extra good trees of this class of timber sometimes realised as a top price 1s. 3d. per foot. Slow-grown timber, no doubt, is of a hard, dry, firm texture, but it is wanting in elasticity, as compared with quick-grown trees of the same age. A good deal also depends upon the class of soil where the trees have been grown; hard, dry, rocky ground, composed principally of inorganic matter, produce dry, brittle timber with a short grain, as compared with trees of the same species and age produced upon ground of a softer texture, and well mixed with combustible matter or clay. Tradesmen who use large quantities of timber are generally pretty good judges, and this accounts for the difference in price. *J. B. Webster.*

APPLES, HOME-GROWN.—Speaking of Apples, brings me to A. D.'s article (p. 118). His proposition to submit samples of American and home-grown to the Fruit Committee of the Royal Horticultural Society for the purpose of comparing, determining, and testing their relative domestic values, would be, I venture to say, of little or no value whatever; and this for very obvious and paramount reasons, which will occur to none more readily than the Committee in question. Having lived in the States for several years, with ample opportunities on the spot for purposes of comparison, my own impression is that, barring two or three varieties, our best English Apples are far ahead either for culinary use or dessert. Regarding colour, "A. D." has, I think, overstated the value of this to one-half, as the American view. What percentage of value would "A. D." or even the Americans themselves, attribute to colour in such varieties as Rhode Island Greening, Northern Spy, Gravenstein, and Newtown Pippin? All standard fruits, and readily cleared at remunerative prices in all the American markets. Quality, size, and evenness of sample are the chief points upon which growers rely to command, and hold the market, at top prices. That our home-grown crops are badly stored.

sampled, and marketed, there cannot be much doubt; that there are one-half too many varieties, and some of very inferior quality is patent to all. To reduce these by some means or other ought to be the first task of the Royal Horticultural Society, whose influences for good, in matters horticultural, is happily now rapidly extending. We have many first-class Apples in this country, that will vie with the best of foreign growth, for flavour, size, or colour; and as a guide to intending planters, of small or large areas, a condensed list ought to be compiled of the most superior varieties, only of the two classes into which we usually divide them, i.e., dessert and kitchen, and this list sown broadcast over the land. The more condensed the list the better, and to meet the varying climatic conditions of these islands, which are, after all, more apparent than real, need not, at the outside, exceed twenty varieties, although twelve or sixteen would doubtless be found quite ample. If this were done, and determinedly stuck to, everyone concerned would be gainers thereby, and none more so in the end than our large fruit-tree nurserymen, from whom, at least on first thoughts, we should expect the most persistent obstruction. Our nurserymen, however, are progressive men now-a-days, and a moment's reflection will speedily prove why, and where they would be special gainers. But why continue growing kitchen Apples? Superstition—and in this connection it amounts to this—dies hard. By kitchen or culinary Apples in this country we generally mean those varieties which are deficient in saccharine juices, and being unfit to eat in a raw state, we relegate them to the kitchen to be cooked, and supply the deficiency by added sugar, before eating—a procedure at once uneconomical and far from healthy. By giving our best dessert varieties, in their hundreds of thousands throughout the land, a revulsion of feeling would soon set in against all those varieties the juices of which were found below the adopted standard of quality; and I cannot here too strongly impress upon all those who do not know, or who have never tried, that our best dessert varieties are also by far the best to cook. Amongst the chief reasons—some of which I must candidly admit, deserve the fullest consideration—which can be advanced for the retention of at least the best of our too numerous kitchen Apples, are 1st, their earliness; 2nd, their heavy, and in some varieties sure-cropping qualities; 3rd, their general large size; and lastly, the length of time some may be kept in sound condition. At any rate, I must ask your readers in general, and the Fruit Committee of the Royal Horticultural Society in particular, to bear steadily in mind, that the comparatively few varieties grown by the Americans, and which are unanimously admitted to be the best for their climate, have been so obtained through the most determined and rigorous clipping and condensing of lists, carried out by the leading fruit and farmers' associations throughout the Union for a period of twenty years. The Americans are now quite satisfied with the work accomplished, and with the results, amply evident in the enormous quantities with which they yearly fill our markets, chiefly of varieties the number of which may be counted on the fingers of one hand. Are we, then, to be aboving taking a leaf from their book? I sincerely hope not! If knowledge is power, then, by the shades of all the good Apple trees, let us apply it. Let us lay the axe to the root of all those be-lichened, be-garled, worthless and unprofitable Apple trees which cumber the ground, and rob their better brethren in too many dilapidated man-of-gotten orchards in this country; let us ruthlessly tear them from the ground, top and branch, root and bole; let us consign them to a smouldering fire, whose ashes—the best legacy they have left us—will help compensate our labour, and begin afresh, for never in the history of our country was the need greater, or the time more opportune. *Pomum.*

BIGNONIA VENUSTA.—My experience of this club is that it is an exceedingly showy plant when in bloom; but in the cut state it is useless, the blooms lasting but a very short time. We used to grow it here in a house mainly devoted to Gardenias, and which was not kept at a high temperature. The Bignonia grew remarkably well and flowered profusely every January; but owing to its uselessness in a cut state, the plant was cut out to make room for something else more useful. *L. M.* [What a pity! En]

AMATEURS' GARDENS.—I was pleased to read the good advice you gave to the amateur (p. 144) as to the management of the indoor department of his

garden. My experience of the amateur has been somewhat a large one, and I may, without fear of contradiction, say that I know of no people who have a greater love for their gardens than amateurs, and if for that reason only they deserve any assistance that can be afforded them in the columns of this journal. The amateur spends much time and money in his or her garden, and no one can better appreciate advice on any point connected with his favourite pursuit than they. Take, for instance, a course of technical lectures on horticulture: it will be found that the amateur is a most regular attendant, and proves his interest in what is going on by asking twice the number of questions that anyone else will, his thirst for knowledge seeming insatiable. A good many persons are inclined to scoff at the amateur if he be classed as a gardener, but such persons are not wise in doing so. I know no other persons who, as a class, read the various horticultural papers more attentively, and this fact I have learned by conversation with them at various times, when they have surprised me by the keen interest in gardening that they display. For these reasons I am pleased, Mr. Editor, to see you give the amateur a turn. *A Head Gardener.* [Only considerations of space prevent us doing more. En.]

THUJA GIGANTEA.—The note by Mr. Leach, at p. 147, comes as a confirmation of my opinion of it as a timber producer. Here, in our strong soil, it grows fast, 18 inches to 2 feet annually when once established, and with stems as straight as the proverbial gun-barrel, although the tree shows a great tendency in a young state to produce several leaders, one of which, however, takes the lead. With the object of testing it thoroughly, we planted, a year ago, 2000 in a field which is fully exposed to the north-east, the soil of a stiff nature, inclining to clay, and in spite of the unfavourable spring of 1891 for newly-planted small trees, these trees on the whole look at the present time most promising. *South Hants.*

REMOVING STRAWBERRY PLANTS.—In answer to your enquiry in last week's issue about the Strawberry, I may say they can be removed. Mr. A. Bath of Vine-court Farm, Sevenoaks, Kent, left his farm at Halstead, Kent, a few years ago, where he had 40 acres of Strawberry Canes. Mr. Mildmay, the landlord, would not pay him, so he got a mowing-machine, and mowed them all off; and then he got the steam-plough into the field, and was going to plough them all up, but his landlord then decided to give him £400 for the plantation, so he did not do it. I know Mr. Bath; also the ground. Mr. Bath will be glad to answer enquiries. *F.*

EUCALYPTUS GLOBULUS FLOWERING.—In answer to your correspondent, "C. H. H." I may say that although the severe winter of 1890–91 destroyed all our plants growing outside, it has bloomed abundantly in the shrubberies here on plants 12 to 15 feet high—hundreds of flowers on a plant. We had no frost here for eight or ten years, previous to the winter I speak of, severe enough to destroy them, so that the plants were from six to ten years old. The flower buds were formed the year before, as described by your correspondent, but do not open till June on plants outside. The perfume is very strong. *Susfield, Bournemouth.*

THE ALLEGED DISAPPEARANCE OF ENGLISH APPLES.—The mania to dispose of their produce before foreign supplies reach our market, which possesses growers and holders of Apples, will to a great extent account for the comparative absence of native Apples in the markets at the present time. A large fruit grower and dealer told me that if he did not get rid of his Apples before foreign supplies come in, the prices are usually so low, that what with transit, costs, and commission, it was barely worth sending them to the market; and again to keep Apples on a large scale and in good condition, means labour and money, together with a certain loss in decayed fruit. Wellington as an Apple is one of the best late varieties of Apple, which usually sells fairly well; but it does not succeed in some kinds of soil, and in some seasons they do not keep so sound as in others. With regard to selecting the best fruits, and making two or three different samples, I was told this had been tried, but the trade more money obtained for these sorted samples did not balance the loss on the smaller ones, the latter finding scarcely any sale. He now intends opening a shop on his own account, but with what success remains to be proved. One other point connected

with fruit-growing—I opine planters will shortly over-plant the earlier varieties, for go where you will, the cry is, "Plant early Apples," which has been and is being done on a large scale; but we should not lose sight of Blenheim Pippin. *H. Markham, Maidstone.*

EARLY PEAS.—Considering the trouble autumn-sown Peas give in most gardens, they are hardly worth bothering about, for if put into the ground at the period referred to, they have to stand the attacks of mice, birds and slugs, and by one or other, or the whole combined, rows become so decimated or the plants so crippled that the yield from them is very poor and inferior. This being so, instead of putting seed into the ground in November, we wait and sow in boxes filled with sifted leaf-soil, and by patting a lath or strip of deal every 2 inches or so apart, the Peas may be taken out of the boxes in long lengths, as they hold tightly together, and easily transferred to the rows. The way we prepare the drills is just to strain a line, and chop down at the side of it, so as to get the necessary depth for the roots, which cannot well be done with a hoe, and the Peas are then laid in, and the earth drawn to them, leaving their tips just clear of the soil. To ward off sparrows, I have never found anything equal to black cotton, in three lines, strained one over the middle, and the others along each side, and at a height of 3 inches or so from the ground, and with that arrangement it must be a very knowing or bold sparrow that will venture to interfere with the Peas. The sort I prefer as a dwarf is Chelsea Gem, and of the taller kinds I always grow Veitch's Extra Early, Kentish Lovick, and William I, the last-mentioned succeeding the others. In January, if the weather is favourable, we sow the same kinds outdoors, or as soon as the land is fit for the seed. The Marrow kinds, if put in early, will rot, and in wet ground it is a good plan to cover with fine coal-ashes or very dry soil. *J. S.*

EDUCATION OF GARDENERS.—What will be the result of all the correspondence that is now going on in the *Gardeners' Chronicle* on this subject? Many and diversified have been the suggestions offered from time to time for the further education of our gardeners. For my part, I think the suggestion given by James Wilson, jun., p. 117, the most sensible and the most practicable. An intelligent man, working day after day amidst flowers and fruits, all in themselves educational, is ever noticing something to improve upon, or something that should be avoided. He is also assisted by literature, which is to be obtained so reasonably now, containing good sound information, the records of practical results. Lecturers and theorists are often delusive; the lectures are mostly far-fetched, are not retained in the mind, and generally the lecturer does not possess sufficient ability. There is nothing like the nursery for the fundamental training of young men, but the latter should not confine themselves to one place. Three shifts in a period of six years would be most beneficial, and until a man reaches the mature age of thirty, he should endeavour to master the various systems practised in northern and southern gardens. At thirty years of age he would be ready to take the helm, fortified with a practical knowledge that "Professors" might envy. The most important and vital matter to consider just now is, by what means can be brought practically into working a fair and equitable position for gardeners of ability receiving their pecuniary award? The palm is not gained without the labour; let him who has won it bear the palm. There are men filling positions who are not virtually fit to hold them; the mystery is, how do they manage to retain such positions? Will some one of influence take up the cause? Will some of the lecturers throw in their mighty flow of eloquence, and claim that the gardener proper shall take his position; must be brought out of the degrading obscurity where he has so long been hidden, and with conscious importance of his equality with his fellow men, uphold with pride an occupation that speaks of thought else but peace and contentment? I would suggest a unity of certificated gardeners; it appears to me the only way out of the lethargy. A power vested in a society granting certificates to men on recommendation from substantial and representative nurserymen. I would further suggest a gradation of certificates issued in degrees, 1st, head gardener; 2nd, foreman, nursery or otherwise; 3rd, first-class journeyman; also a special certificate for marked excellence. Situations to be taken through or notified to the Society. I believe this could be made thoroughly practicable, and give every man his due. *Semper Paratus.*

TREES AND SHRUBS.

CHIMONANTHUS FRAGRANS GRANDIFLORUS.

WHAT a glorious winter-flowering shrub, yet how few are in possession of it. It is one of the few subjects that produce their welcome flowers during the dreary months of winter without the assistance of artificial heat. Although so much has been said in its favour from time to time in the pages of the *Gardeners' Chronicle* and elsewhere, it is still very rare that one meets with it even in the best gardens,

fourishes best is against a warm wall, which shelters it from the north and east winds, and in such a position, the pale yellow cup-shaped flowers streaked with a brownish-red on the inside, are seen to the greatest advantage. It may also be planted in the shrubbery border, but there its flowers get sometimes cut by frost, hence the good derived from a wall. When planted in fairly rich loam, and carefully pruned after it has blossomed, the plant can be made to bloom from December to February, but owing to the mildness of the early part of the present winter, it commenced to open its flowers on November 17. *H.*

FIG. 32.—CHIMONANTHUS FRAGRANS: FLOWERS FRAGRANT, PALE YELLOW, STREAKED WITH PURPLE.

a fact to be deplored, as it merits the widest cultivation. The type is planted rather extensively. Although the flowers of this fine shrub do not possess brilliant colouring, they are nevertheless distinct, and if there is a deficiency in one respect, it is fully made up for by the quantity of bloom produced and the very sweet fragrance they emit, and that, too, when almost everything else is dormant. The flowers are useful for table decoration; they last a considerable time after being severed from the plant, and a few only are necessary to perfume a good-sized room. Under garden cultivation, it makes a bush of 6 feet in height, and if planted against a wall, it will reach 7 to 8 feet. Planted singly, or three or four in a group on the lawn, it forms a mass of great beauty; but the position in which it

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, B. Wynne, H. Herbet, C. T. Drury, C. H. Breeze, R. Dean, C. Jeffries, W. C. Leach, P. B. Lowe, G. Phippen, W. H. Williams, C. E. Pearson, H. H. D'Ombra, C. J. Salter, H. Cannell, C. Noble, J. Frazer, G. Paul, T. W. Girdlestone, E. Mawley, H. B. May, H. Turner, R. Owen, and F. Ross.

Cyclamens were the principal features that came before this Committee, some representative groups being staged by various trade growers. Those shown by Mr. T. Walker, Hounslow, were remarkably well flowered, as also were the plants staged by the St. George's Nursery Co., Hanwell; and Mr. J. May, Gordon Nursery, St. Margaret's. In the group staged by the last-named exhibitor, a variety named *Queen of the Whites* was particularly good.

Messrs. Hugh Low & Co., Enfield, sent a collection of hard-wooded plants in flower, among which *Correas*, *Pimeleas*, *Boronias*, and *Ericas* of kinds were noticeable.

From Messrs. J. Laing & Sons, Forest Hill, S.E., came a group of stove plants and Orchids, and the same firm also exhibited a few plants of *Dracena* Alex. Laing, apparently a very pretty variety, with rather narrow leaves of a bronzy colour, edged with red.

Several interesting things from the Royal Gardens, Kew, were staged, and included a bunch of fruit of *Caryota Cummingii*, a Palm, and blooms of *Hæmanthus magnifica*, *Aloe supralavis*, which somewhat resembled a *Kniphofia*, *Greyia Sutherlandia*, and a fine flower of *Brownea Crawfordii*, a hybrid between *B. grandiceps* and *B. macrophyllus*.

Mr. G. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, staged a basket of *Amaryllis* and *Narcissi*; and Mr. R. Owen, Castle Hill Nursery, Maidenhead, sent a few blooms of late-flowering *Chrysanthemums*. A bunch of *Marie Louise* Violets came from Mr. Miller, gr. to Lord Foley, Ruxley Lodge, Esher; and some *Bertolonias* were exhibited by Mr. C. T. Bause, Norwood. Of the latter, *B. argyrea* and *B. Comte de Kerchove* were the best.

Messrs. Cannell & Sons, Swanley, showed a small collection of *Primulas*; while from Messrs. F. Ross & Co., Bletchingly, came blooms of *Oxera pulchella*, a useful winter-flowering subject.

Mr. J. Friend, gr. to the Hon. P. C. Glynn, Rooknest, Godstone, Surrey, exhibited four boxes of *Camellia* blooms, several masses of *Acacia dealbata*, and *Cliveas* Mrs. Glyn and the Hon. P. C. Glynn, both of which appeared to be capital varieties.

Some sprays of *Lilac* were sent by Messrs. G. Paul & Sons, Cheshunt, the best being *President Grévy*, a white-flowering variety, and useful for forcing. And, among other things, Messrs. B. S. Williams, Upper Holloway, showed a plant of *Elmis melanococca*.

Flowering branches of *Amygdalus Davidiana* and *A. Davidiana alba*, staged by Messrs. J. Veitch & Sons, Chelsea, attracted some attention. The shoots, although cut from trees growing in the open air, were covered with bloom; as also were sprays of *Lonicera Standishi*, exhibited by the same firm. Messrs. Veitch also showed plants of *Lachenalia Aureliana*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; Messrs. James O'Brien, De B. Crawshaw, T. B. Haywood, S. Courtauld, Norman C. Cookson, C. J. Lucas, H. M. Pollett, H. Ballantine, T. W. Bond, J. Douglas, H. Williams, F. Sander, W. White, E. Hill, and J. Jacques.

The weather being mild, numerous Orchids were staged, fifty entries being made for the adjudication of the Committee. Baron Schroder (gr. Mr. H. Ballantine) exhibited *Odontoglossum crispum* nobilior, one of the finest heavily spotted varieties yet seen, the pretty purple-spotted *O. Pescatorei* Schroderianum, which is second only to *O. P. Veitchianum*, also a "Dell" plant, and the violet-coloured and fragrant *O. iplocon*. Sir Trevor Lawrence, Bart., M.P., Burford Lodge, Dorking (grower, Mr. W. White) sent *Lycaste Youngii*, Hort., a citron-yellow species, bearing nearly fifty flowers; *Phalaenopsis Stuartiana punctatissima*, *Dendrobium chrysodiscus* X, the elegant little *D. Felschii*, and the new yellow *Trichocentrum triguetrum*, a species with curiously flattened growths. W. R. Lee, Esq., Beech Lawn, Arden-shaw, Manchester, staged a noble plant of *Dendrobium splendidissimum* *Leeanum* X (*D. nobile* pen-

SOCIETIES.

ROYAL HORTICULTURAL.

FEBRUARY 9.—There was a capital display of bloom in the Drill Hall, James Street, S.W., on the occasion of this meeting, and the attendance was larger than is usual at this time of the year, being swelled by those who had come to attend the general annual meeting. Orchids, of which mention is made elsewhere, were the principal features, but some fine collections of miscellaneous plants and groups of Cyclamens, the latter being very attractive, were staged by various nurserymen. Fruit, too, as reported below, was well represented, some large collections of Apples and Pears being exhibited by a few of the leading growers.

dulum × *D. anreum* philippinense. Some of the stout pseudobulbs were over 3 feet in height, and bore over thirty flowers, some of the sprays having four or five flowers. DREWETT O. DREWETT, Esq., Riding Mill-on-Tyne (gr., Mr. A. J. Keeling), sent his hybrid *Cypripedium Ceres* × (*hirutissimum* × *Spicerianum*), which appeared to be the best of the *hirutissimum* crosses; also *C. Juno* × (*Fairrianum* × *callosum*), which bore some resemblance to a good *C. vexillarium*, but with a large white, crimson-veined upper sepal. Mr. DREWETT also sent a tall spike and leaf of the curious *C. Lindleyanum*.

CHARLES INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), exhibited *Cypripedium Lathamianum* ×, obtained from the reverse cross to the original, but without material difference; *C. la Nymphe* × (*oceanum* × *Dauthieri*); a spike of a fine form of *Phalenopsis Sanderiana*, and cut flowers of ten good varieties of *Cattleya Triana*.

F. WIGAN, Esq., Clare Lawn, East Sheen (grower, Mr. W. H. Young) set up a group of cut Orchids, comprising a dozen fine spikes of *Phalaenopsis Schilleriana*, one of *C. Stuartiana*, *Dendrobium speciosum*, *Cattleya labiata* *Luddeமானiana* and *C. Percivaliana*, all showing evidence of good culture.

MRS. ADAIR, Beechwood Park, Danstables (gr., Mr. J. Freeman), showed a fine plant of the rare *Cattleya Percivaliana* alba, and a spike of a noble light-coloured *C. Triana*.

R. N. DALE, Esq., Bromborough Hall, Cheshire, sent cut examples of a very fine, large-flowered, white *C. Triana*; a four-flowered spray of *Laelia anceps* *Sanderiana*, a grand form of *Phajus Humblotii*, and spikes of the rare *Odontoglossum Rosellii* albens.

MRS. ARBUTHNOT, Bridgen Place, Bexley (gr., Mr. Mitchell), exhibited a well-grown plant of the rare *Vanda concolor*.

NORMAN C. COOKSON, Esq., Wylam-on-Tyne, showed his hybrid *Dendrobium Cassiope* × (*japonicum* × *nobile* *albiflorum*), a dwarf variety with creamy-white flowers, and some resemblance to *D. endocharis* ×. J. F. EBNER, Esq., Horton House, Beckenham (grower, Mr. C. Franklin), submitted *Cypripedium Savageanum* *superbum* ×, *C. Enfieldense* ×, and *C. villosum* *Horton House* variety, which last bore the largest flower we have seen in the species. E. G. WRIGLEY, Esq., Victoria House, Dorkingfield, Cheshire (gr., Mr. C. Harris), sent a curious, small-flowered, thick-bulbed form of *Dendrobium lituiflorum*, and a variety of *D. Wardianum*.

CHARLES WINN, Esq., Selby Hill, Birmingham, submitted, for the opinion of the committee, a hybrid *Dendrobium*, decided to be *D. Apasia* ×. R. T. MEASURES, Esq., Cambridge Lodge, Flodden Road, Camberwell (gr., Mr. H. Simpkins), exhibited *Cypripedium* insigne *Cambridge Lodge* variety, a lovely little thing, something like a miniature *C. violaceopunctatum*, and which attracted much attention; also *Cypripedium* × (*insigne* *Chantinii* × *villosum*), which somewhat resembled *C. Sallierii* ×, and the reverse cross of *C. Lathamianum* ×, also exhibited by Mr. Ingram.

T. STATTER, Esq., Stand Hall, Whitefield, Manchester, sent cut examples of *Oncidium Loxense*, *Odontoglossum ramosissimum*, varieties of *Laelia anceps*, *Sophrontitis grandiflora*, &c. C. J. LUCAS, Esq., Warnham Court, Horeham, sent a few examples of good Orchids, among which was a very large flower of *Lycaste Skinneri* alba.

MESSRS. JAMES VEITCH & SON, Royal Exotic Nursery, King's Road, Chelsea, also exhibited some startling novelties in hybrids. Under the name *Cypripedium Hera* × (*Boxallii* × *Leeanum* ×), they exhibited one of the noblest hybrids yet raised. We find, however, that in the *Gardeners' Chronicle*, January 25, 1890, p. 103, Mr. Rolfe applied the name *C. Hera* × to a very different plant (*villosum* × *Spicerianum* ×). Another fine hybrid of Messrs. Veitch was *Zygopetalum leucociliatum* (*Burkei* × *Mackayii*), an elegant plant, with tall scapes of white-tipped flowers. The same firm also sent *Dendrobium dulce* (*Linawianum* × *aurum* ×), with rose-coloured flowers; and the favourite *Cypripedium Sedeni* *candidulum*.

MESSRS. HUGH LOW & CO., Clapton, had an extensive and well-arranged display, in which the rare *Phalenopsis casta* and *P. Brymeriana* were prominent among the *Phalenopsis*, for which this firm is noted; other striking species, in more or less quantity, being the pretty fragrant *Vanda Amesiana*, fine varieties of *Cattleya Percivaliana*, the white *Calanthe niva*, *Vanda Boxallii* *lutea*, *Saccolabium bellinum*, *Dendrobium fimbriatum* *oculatum*, *D. Wardianum* *Lowii*, and many other *Dendrobis*, a fine lot of *Cypripediums*, &c.

In the large group from Messrs. B. S. Williams & Son, Upper Holloway, the species and varieties of *Cypripedium* predominated, and these were effectively arranged. Among them were a fine lot of *C. Williamsii* ×; *C. Amesianum* ×, *C. polium* ×, *C. Harrisonianum* ×, *C. Leeanum* ×, *C. Fitchianum* ×, *C. Dauthieri* ×, *C. Boxallii*, *C. villosum*, *C. Sallierii* ×, *C. vexillarium* *superbum*, and the rare *C. reticulatum* ×. These were arranged with white varieties of *Laelia anceps*, *Dendrobiums*, and other showy Orchids of the season.

MESSRS. F. SANDER & CO., St. Albans, had a smaller group of rare and well-grown Orchid, the centre being some grand *Oncidium* *splendendum*, and with these were fine varieties of *Lycaste Skinneri*, a plant of the handsome new *Epidendrum Watsonianum*, four varieties of *Odontoglossum asperum*, and a handsome hybrid *Odontoglossum*, six forms of the elegant cool-house *Oncidium Phalaenopsis*, some *Laelia harpophylla*, the very curious *Diss Cooperi*, &c.

MESSRS. SEGER AND TROPP, Lordship Lane, East Dulwich, had a small stand with a fine form of *Masdevallia macrura*, *Cirrhopetalum picturatum*, *Oncidium chetophorum*, *Odontoglossum blandum*, various species of *Masdevallia*, &c.

FROM LORD FOLEY, Ruxley Lodge, Esher, came a group of finely grown *Oncologie cristata*, and F. T. STEED, Esq., Lismore Woodhill, Wimbledon Park (gr., Mr. John Currie), also sent a good specimen of the same species.

MR. JAMES CRISPIN, Fishponds, Bristol, exhibited a curious large form of *Laelia furfuracea* and cut *Saccolabium giganteum*, *Odontoglossum Edwadii*, and other Orchids. F. W. MOORE, Esq., Curator, Royal Botanic Gardens, Glasnevin, Dublin, forwarded the rare terrestrial *Cyporchis Lowii*, with large rose-coloured lip, and *Restrepia striata*. Mr. H. A. TRACY, nurseryman, Amyand Park Road, Twickenham, staged a fine dark form of *Cattleya Triana* as *Tracy's* var.

J. GATHORN WOOD, Esq., Thedden Grange, Alton, Hants (gr., Mr. N. Campany), sent flowers of a very fine form of *Dendrobium nobile*, and Messrs. F. ROSS & CO., Brewer Street, Bletchingley, exhibited a spike of *Cymbidium Hookerianum*.

MESSRS. JOHN LAING & SON, Forest Hill, also had a good sprinkling of popular Orchids in their fine group of miscellaneous plants.

Fruit and Vegetable Committee.

Present: Phillip Crowley, Esq., in the chair; Messrs. J. Lee, R. D. Blackmore, H. Weir, W. Wilks, C. W. Cummins, J. Cheal, G. Bunyard, A. W. Sutton, J. Jabez, T. J. Saltmarsh, A. Dean, W. Bates, G. H. Sage, G. Wythes, J. Hudson, J. A. Laing, H. Balderson, J. Smith, F. Q. Lane, G. Norman, G. T. Miles, and Dr. Hogg.

Apples and Pears were well represented for the time of year, the collection comprising 100 dishes, staged by A. H. Smees, Esq., Carshalton (gr., Mr. G. W. Cummins), being particularly fine. The majority of the samples were of good size and well coloured.

MESSRS. J. CHEAL & SONS, Crawley, also sent a good collection of Apples and Pears, as likewise did Mr. Miller, gr. to Lord Foley, Ruxley Lodge, Esher. Mr. W. CRUMP, Madresfield Court Gardens, Malvern, showed a dish of Apple May Queen; and Mr. Leach, samples of Albury Park Noosuch, a seedling Apple of merit. Several dishes of Apples for naming were staged.

A large basket of Seakale, called Canford Lily White, and said to be a distinct type of the well-known Lily White, was sent by Mr. T. H. Crisp, gr., Canford Manor, Wimborne, but it was not specially recognised by the committee.

Mushrooms were staged by Mr. Miller, Ruxley Lodge; and Mr. C. Leach, Albury Park Gardens.

List of Awards.

ORCHID COMMITTEE.

MEDALS.

Silver Gilt.

To Messrs. Hugh Low & Co., Clapton, for a group of Orchids.

Silver Flora.

To Messrs. B. S. Williams & Son, Upper Holloway, for a group of Orchids.

Silver Bankian.

To Messrs. F. Sander & Co., St. Albans, for a group of Orchids.

First-class Certificates.

To Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, for *Zygopetalum leucociliatum*.

To Messrs. J. Veitch & Sons, for *Cypripedium Hera* ×.

To Baron Schroder, for *Odontoglossum crispum nobiliss* and *O. Pescatorei* *Schroderianum*.

To DREWITT O. DREWITT, Esq., Riding Mill-on-Tyne, for *Cypripedium Juno* ×.

Botanical Certificates.

To Messrs. F. Sander & Co., for *Epidendrum Watsonianum*.

To Sir Trevor Lawrence, for *Dendrobium Fockschii* and *Tricostema triquetrum*.

To DREWITT O. DREWITT, Esq., for *Cypripedium Lindleyanum*.

Awards of Merit.

To W. R. Lee, Esq., Beech Lawn, Andersham, near Manchester, for *Dendrobium splendissimum* *Leeanum*.

To Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, for *Dendrobium Cassiope* ×.

To R. J. Measures, Esq. (gr., H. Simpkins), Cambridge Lodge, Camberwell, for *Cypripedium insigne*, *Cambridge Lodge* var.

To Sir T. Lawrence and Messrs. B. S. Williams, for *Lycaste Youngii*.

To Baron Schroder, for *Odontoglossum isoplocum*.

To DREWITT O. DREWITT, Esq., for *Cypripedium Ceres* ×.

Cultural Commendation.

To Lord Foley, Ruxley Lodge, Esher, for *Oncologie cristata*.

FLORAL COMMITTEE.

MEDALS.

Silver Gilt Bankian.

To Messrs. J. Laing & Sons, Forest Hill, for a miscellaneous group of plants.

Silver Bankian.

To Mr. J. May, Gordon Nurseries, Twickenham, for a group of Cyclamens.

To Mr. T. Walker, Whitton, Hounslow, for a group of Cyclamens.

To the St. George's Nursery Co., Haswell, for a group of Cyclamens.

To Messrs. Hugh Low & Co., for a group of miscellaneous plants.

To Mr. J. Friend, gr. to the Hon. P. C. Glynn, Godstone, Surrey, for *Camellia* blooms, &c.

First-class Certificates.

To Mr. C. F. Banse, Norwood, for *Bertolonia Argyroaurea* and *Cornu de Kerchove*.

To Messrs. B. S. Williams, for *Elmis melanococca*.

Awards of Merit.

To Mr. J. Friend, for *Clivias* Mrs. P. C. Glynn and Hon. P. C. Glynn.

To Messrs. J. Laing & Sons, for *Iris hibernica*.

To Messrs. G. Paul & Son, Chesham, for *Lilac* President Grévy.

FRUIT AND VEGETABLE COMMITTEE.

MEDALS.

Silver Gilt.

To A. H. Smees, Esq. (gr., Mr. Cummins), Carshalton, for collection of fruit.

Silver.

To Messrs. J. Cheal & Sons, Crawley, for a collection of Apples and Pears.

To Lord Foley, Ruxley Lodge, Esher (gr., Mr. Miller) for collection of fruit.

Awards of Merit.

To Mr. W. CRUMP, Madresfield Court Gardens, Malvern, for Apple May Queen.

Cultural Commendation.

To Mr. W. C. Leach, Albury Park Gardens, for a dish of Mushrooms.

GARDENERS' ORPHAN FUND.

FEBRUARY 5.—At the annual general meeting, held at the Cannon Street Hotel on Friday, the following candidates were elected to receive the benefits of the fund:—Mary Esther Green, Thomas James Francis, Charles Newrey Wesley, Annie Parker, Edward William Butcher, John Ernest Vine, Agnes Jane McIntosh, Edmund Norgate, James Alfred Bolton, Janet Hood Ireland, and Olive Hall.

The following is the Report and statement of accounts from July 1, 1890, to December 31, 1891, which were presented at the meeting:—

The executive committee in presenting their fourth report have again the pleasure of congratulating the subscribers to the *Gardeners' Orphan Fund* on its growing importance to the gardening community, as testified by the generous support it continues to receive from all classes.

The committee deem it necessary for the information of new subscribers to state that eighteen months have elapsed since the last report and statement of accounts was issued, owing to the alterations made in the rules twelve months ago, which provided for the commencement of the financial year being altered from July 1 to January 1, the former date having been found to cause much trouble and confusion in the management. The committee are glad to report that although the accounts (which are herewith submitted) include the working expenses of eighteen months, and the subscriptions practically only for the twelve months, there has been no diminution of revenue, but on the contrary a considerable increase.

The magnificent proposal made by Mr. N. N. Sherwood and Mr. H. J. Veitch at the last general meeting, that if the subscribers would contribute a minimum sum of £250 they would jointly provide any further sum that might be required to allow the committee to place on the Fund the seven children who had that day been unsuccessful, as a memorial to the late chairman, Mr. George Deal, was readily accepted by the committee. The sum of £555 16s. 6d. was speedily raised, enabling the committee to grant the benefits of the Fund to seven orphans. The committee, recognising the great value of the

services rendered by Mr. Deal to the Fund, most gratefully thank all those who so generously helped in promoting such an appropriate tribute to his memory.

The lamented death of Mr. B. S. Williams, a warm supporter of the Fund, called forth a very general desire that his honoured name should also be associated with the Fund in a similar manner, and on receipt of £250 from the B. S. Williams Memorial trustees, two more children, on the nomination of Mr. H. Williams, were elected.

The committee deplore the loss of Mr. William Richards, one of their most zealous and active colleagues, who was never weary of promoting the best interests of the Fund. His name will be long held in grateful remembrance.

The committee greatly regret that they were unable to arrange for a floral fête in Covent Garden Market as in former years, owing to practical difficulties in carrying them out. The loss thus sustained was in a great measure compensated for by a generous subscription raised by the standholders in the market, and by the profits arising from the Rose Fair and Floral Fête held at the Crystal Palace. The desirability of establishing this fête at the Crystal Palace as an annual event is under the consideration of the committee.

The National Card Collection, which was instituted in the summer of last year, resulted in adding the handsome sum of £250 to the resources of the Fund. This collection, it is proposed, shall be continued annually. The fact that of the amount collected last year the greater part came from non-subscribers to the Fund, and mostly in small sums, was considered extremely gratifying.

The committee find it impossible to acknowledge in detail the great obligations they are under to so many kind friends for efficient help rendered in many ways during the past eighteen months, and embrace this opportunity of tendering to them collectively very hearty thanks.

At the present time thirty-nine children are receiving the benefits of the Fund, and the Committee recommend that eleven be elected, thus raising the number of beneficiaries to fifty, who will be supported by the Fund at a cost of £650 a year. Most gratifying as the Committee regard this, as the result of the work of the Fund during the comparatively short time (four and a half years) it has been established, they cannot ignore the fact that they are still unable to meet the claims of many necessitous cases that come before them, and take this opportunity of again urging the claims of the Fund upon gardeners in particular and a generous-hearted public for assistance.

The Committee were fortunate in securing Mr. William Marshall, of Bexley, a gentleman well known in the horticultural world, as Chairman in succession to the late Mr. Deal. Mr. Hugh Low, of Clapton, was elected a member of the Committee, in the room of Mr. George Deal, deceased; and Mr. A. W. G. Weeks, of Chelsea, in the place of Mr. W. Richards, deceased. The members of the Committee who retire by rotation are Messrs. Asbee, Cannell, Cummins, Gordon, Lane, Roupell, Sharman, and Wynne, who, being eligible, all offer themselves for re-election.

TRADE NOTICE.

HALE FARM NURSERIES, TOTTENHAM.

WE are informed that this business, until recently carried on by Mr. Thomas Ware, will in future be conducted solely by Mr. Francis Fell, who for many years been connected with the business as Manager. The business will still be known as "Thomas S. Ware."

Obituary.

MR. J. ROBERTS.—On the 23rd January last, at Charleville Forest Gardens, Tullamore, passed away a veteran Irish Grape grower, J. Roberts, gardener to Lady Emily Howard-Bury. He succumbed after an illness of but two days duration, to acute pneumonia, brought on by influenza. He had reached the 62nd year of his age, and the 36th year of his service in the Charleville family, he having been the faithful servant of five members of this house, including three Earls. He was engaged by the 3rd Earl of Charleville, whilst in the Pine-Apple Nursery, Maidland, London. Previous to this he had served Lord Ellesmere, at Worsley Hall; Lord Windsor, at Hewell Grange; and Sir Joseph Radcliffe, Bart., at Rudding Park. Mr. J. Roberts was very successful as a gardener, and he was very intelligent, and had enjoyed the benefit of a good education. It was as a Grape-grower, however, that he made his mark, and at the shows of the Royal Horticultural Society of Ireland, held in Dublin, he always swept off the best prizes. Several times when showing Grapes in England and Scotland, he beat all opponents, as at the International Shows of Manchester and Edinburgh. During his career as an exhibitor, he had gained over 50 medals, including several of the coveted Veitch Memorial Medals. Mr. Roberts was the raiser of an improved variety of Gros Guillaume, and exhibited several very large bunches of this variety; one of which weighed more than 23 lb. Some years ago, Mr. Roberts was taken out to Algiers by the Countess of Charleville, for the purpose of laying out the gardens and grounds attached to the winter residence of the family at that place, and contributed an account of his impressions to these columns. He leaves a widow, five sons, and two daughters. His son-in-law, Mr. R. McKenna, succeeds him as gardener at Charleville Forest.

MRS. RAWLINGS.—Mrs. Rawlings, wife of Mr. George Rawlings, formerly of Bethnal Green and Romford, and mother of Mr. Arthur Rawlings, of

the Dahlia Nurseries, Romford, died at Brgowear, Monmouthshire, on the 2nd inst., at the age of 75. She had been a great sufferer, having been helpless for 14 years through chronic rheumatism.

SIR JAMES CAIRD.—We regret to hear of the decease of Sir James Caird, the eminent agricultural writer; also of Colonel Grant, the associate of Speke in the discovery of the sources of the Nile. Both were in former years correspondents of this journal.

JAMES TAPLIN.—We take the following particulars relating to one of our former contributors, from the *American Florist*. Taplin was a man of mark in the horticultural circles of this country a quarter of a century or more ago, but after his departure to America, but little was heard of him on this side of the Atlantic.

Mr. James Taplin died at his home in Maywood, N.J., on Saturday Jan. 9, after an illness of only 14 days from an attack of influenza, which turned to bronchial pneumonia, and ended in his death as above in the 61st year of his age.

He was born at Overton, at village in Hampshire, England, and as soon as able to earn his own living was duly apprenticed to the business of a gardener. After serving his full time as such, he worked in several of the best gardens in England, first as journeyman, then as foreman, &c., during which time he was steadily adding to his knowledge. Being always a very hard worker, and also a great student, he mastered his business much earlier than many others who start out under equally favourable conditions.

As evidence of this, while quite a young man he was appointed head gardener to Hia Grace the Duke of Devonshire at Chatsworth, England, where he succeeded Sir Joseph Paxton. In 1864 he relinquished his position there to go to America and take charge of the florist business of Mr. George Such of South Amboy, N.J., where he soon displayed his master hand by producing such magnificent specimens of many rare tropical plants as had never been seen in that country, if anywhere, before, and which were often exhibited by him at the old Madison Square Garden, N.Y., at the time the New York Horticultural Society held its grand shows there. In 1879, after Mr. Such had decided to dispose of his immense collection, Mr. Taplin bought a farm at Maywood, having considerable glass already built upon it, to which he removed with his family, and where he resided till his death, and where he had carried on the wholesale growing of flowers and plants, principally for the New York market. Of late he has been turning his attention to hardy flowering shrubs, &c.

RICHARD EDWARD THOMSON.—On Thursday February 4, 1892, at his residence, Kenfield Hall, Petham, near Canterbury, from influenza followed by bronchitis, Richard Edward Thomson, J.P., son of the late Edward Toker, Esq., of The Oaks, Ospringe, Kent, aged 84. Kenfield Hall is noted, amongst other things, for the Pætaum planted by the late Mr. Masters, of Canterbury. Some of the earliest Wellingtonias were there planted by his own hand, and have now reached noble proportions.

VARIORUM.

ECOLCS AND PATRICROFT CHRYSANTHEMUM SOCIETY.—The subscribers of this Society held their annual meeting recently, and Mr. J. ANDREW presided. According to the report of the Hon. Secretary, Mr. HUBER, their fifth show, held in November last, was a great success, over 3000 persons having viewed the exhibits. Although £20 more were offered in prizes last year, there remains a balance in hand of £75 13s. 2d., against £60 10s. 9d. in the previous year. The next show will be held on November 11 and 12.

SHEFFIELD BOTANICAL GARDENS.—The annual meeting of the shareholders of the Botanical Gardens Co. was held at the Cutlers' Hall, Sheffield, on February 5. According to the committee's report, the net income from the gala during the past year was £247 5s. 10d., being £171 2s. 2d. less than that for 1890. This was due to the inclement weather which prevailed on the gala days. It is satisfactory to note, however, that after the payment of outstanding accounts, there will be a balance in favour of the Company of £102 1s. 10d. Mr. WILLIAM BARRON, late of the Botanic Gardens, Cambridge, is the Curator.

LITERARY GARDENING.—A correspondent signing himself "Sultus in Hortu or Hort-u-not?" writes, "Please, sir, if my boy John plant 'a slip of a pen,' what will it come up?" Answer paid—A Jon-quill.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number to the first column are the following:

Principal Wheat-producing Districts.—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts.—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending February 6, is furnished from the Meteorological Office:—

"The weather during this period varied considerably, in the W. and N. it was generally squally, with showers of rain, sleet, or snow daily, but over the E. and S.E. districts the conditions were quieter, the showers slight and less frequent. A good many intervals of bright sunshine occurred in nearly all parts of the Kingdom—especially in the E. and N.E."

"The temperature continued above the mean (the excess being 1° or 2°) in most parts of England, as well as 'Ireland, S.' and the 'Channel Islands,' and just equalled it in 'England, N.E.' and 'Scotland, W.'; in 'Scotland, N. and E.' and 'Ireland, N.,' however, it was a little below the normal. The highest of the maxima, which were recorded either at the beginning or end of the week, ranged from 35° in 'Ireland, S.,' and 54° in 'England, S.,' to 49° in 'Scotland, N. and W.' and 'England, N.E.' The lowest of the minima were registered either on the 3rd or 4th, when the thermometer fell to 14° in 'Scotland, N.,' 18° in 'Scotland, E.,' to between 23° and 30° in most other districts, and to 38° in the 'Channel Islands.'

"The rainfall exceeded the mean in all the 'Grazing Districts,' as well as in 'Scotland, W.,' but showed a deficit elsewhere.

"The bright sunshine was very deficient in the 'Channel Islands,' but in all other districts it was fairly abundant, and in most instances considerably exceeded the mean. The percentage of the possible amount of duration ranged from 32 to 37 over the eastern part of Great Britain, and from 31 in 'Scotland, W.,' to 17 in 'Scotland, N.,' and to only 8 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, February 11.

[We cannot accept any editorial responsibility for the subjoined reports. They are given to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate not only from day to day, but often several times in one day, &c.]

BUSINESS somewhat better this week, with prices firm. Supplies equal to the demand. *James Webber, Wholesale Apple Market.*

NOTICES TO CORRESPONDENTS.

AMARYLLIS: *G. Cooper.* A variety excellent in every way, and especially in colouring, in which it resembles Empress of India, and in the number of blooms on a scape. The bulb has exceptional vigour.

BOOK ON TABLE DECORATIONS: *J. C. G. Floral Decorations for the Dwelling House*, by Annis Hassard, would meet your requirements. Its publishers are Macmillan & Co., London.

CARNATION: *E. H. A.* Your Carnations are probably attacked by some species of fungus, or they have eel-worms at the roots. Kindly send examples, so that we may be better able to assist you.

CARNATIONS IN NOVEMBER. You can obtain from the nurserymen, in March, nicely-rooted cuttings of Tree Carnations. These may be grown on till April in a cold frame, transferring them in that month to a sunny spot out-of-doors. Repot them when the roots have filled the soil, and do not let them get pot-bound. If you have a hot-bed, you can strike cuttings of C. Miss Jolliffe at this season.

CATTLEYA DISEASE: *W. L.* This disease has affected Cattleyas and Lælias in various parts of the country lately, and it is supposed to be contagious, but nothing definite has, as yet been made out about it. The matter will be re-investigated.

CATTLEYA LABIATA ATUNNALIS: *X.* It is now known that the plant comes from Pernambuco. The fact was stated in the *Orchidophile*, October, 1891, p. 311.

CINERARIA LEAF: *A Constant Reader.* The leaf sent is channelled by the leaf-miner *Tephritis oenopionis*. It attacks Celery, Chrysanthemums, and other cultivated plants, besides British ones. Badly-infested leaves should be cut off and burned, and the miner squeezed and killed if it has just begun operations. Soot-water or quassia-water may be used over the leaves from May to December to render them distasteful. Soils for pot plants should not be used in a fresh state, as these are apt to contain the pupæ, but let them be thrown in heaps for two years before using them, and when using the soil examine it for the little brown pupæ cases.

CLIANthus DAMPIERI: *Constant Reader.* Like all the Clanthi, this species requires perfect drainage, and to be kept rather dry at most times, except whilst making growth, and even then water should be supplied in not too great abundance. The best kind of compost for it is loam 3, finely broken brick or burnt clay, soil, and sand with broken charcoal 2. The pot should be large enough for the seedling to grow and flower, without repotting during the two or three years it can be kept alive, and it should be placed—whether planted out against a wall in the conservatory, or in a pot—in a sunny spot. The foliage must be kept clear of red spider, which is very partial to it; and the bark of the white Scale, although this last insect is not so likely to attack it, during its short life as C. unguis or C. magnificus. Your plant may be suffering from too much moisture at the roots, or an improper kind of soil, or want of sunshine, we cannot say what, as no particulars were furnished.

CORRECTION: The title of the Supplementary Illustration in our last issue was inadvertently stated by us to be *Hedychium coronarium*, when it should have been *H. Gardnerianum*.

FUNGUS SPAWN: *A. D.* It is not possible in its present condition to say what the mature state is likely to be. In any case, it is likely to be a deadly enemy, and should be dealt with accordingly.

LAURELS: *A. W.* You may increase your stock by layering the shoots that grow near the ground—two-year-old wood rooting in about one year, and older wood in from one to two years. Scrape out a small hollow, bend the shoot into it after giving it a twist with the hand at the point of contact with the earth, or cut a notch in the shoot, and make it secure in the ground with stout wooden hooks; fill in the mould and tread it firm. Take cuttings of young wood with a heel in September, and insert them in well-drained and properly prepared sandy compost, consisting of loam and potting-bank refuse—not much leaf-mould, and no manure—under hand-glasses placed under the shelter of a wall facing east or north. Another way, take cuttings, or better, slips of two-year old growth, cutting back the soft, current season's

growth to half its length, and place these at a distance of 3 or 4 inches apart in trenches cut out deep enough to take the cuttings almost up to the beginning of the young growth; scatter some sand or sandy compost at the bottom of the trenches, just burying up the base of the cuttings; return the rest of the soil to the trenches, making it firm; and before frosts arrive, cover the soil with 1 inch of half rotted leaf mould, or cocoa-fibre. Some pea-sticks or broken put over the bed during hard weather is an advantage.

MAIDENHAIR FERN: *J. T. L.* We know that letting the fronds lay immersed in cold water—not icy cold—for an hour, prolongs their freshness; but, we greatly doubt the efficacy of boiling water. Why not try it for yourself—only as a precaution, do not put an armful of fronds into the tub.

NAMES OF FRUITS: *C. Pocock*, 1, Old Russet; 2, Bees Pool.—*Hartwell*, 1, Wyken, or Warwickshire; 2, not recognised.—*D. T. F.* Apple Striped Beeing.—*Tuffy*, Doyenné d'Aleçon.

NAMES OF PLANTS: *A. Y. Z.* Plant sent early last week, and whose sender's name is lost, is *Tillandsia striata*.

PEACH TREES: *Amateur*. You must remove the shoots by degrees, say, first taking off all those shoots which spring from the rear, or under-sides, of the branches. Next, in about a week, those growing out at right angles to the wall may be pinched off; and finally, in another week afterwards, a selection must be made of shoots to be left to grow, removing the remainder. Those to be left are such as are wanted to fill up blank spaces, those springing from the upper sides at the base of this year's fruiting-shoots, and the leaders of all shoots, young and old. When these shoots once obtain the lead, very little disbudbing will be required afterwards, but now and then a strong shoot that is getting too much sap to itself must be bent sharply downwards, and fastened there for a time, or cut back to its lowest side-shoot.

RECENTLY-TRANSPLANTED YEW HEDGE: *E.* It will be prudent to wait until the bushes break, before doing anything further than just cutting back the browned or damaged tips. See that the plants get well watered during March, April, and May, and that the soil has a slight mulch to check evaporation.

ROSE W. ALLEN RICHARDSON: *Amateur*. As it has ceased to flower, cut it in hard—into the old wood. Do not give it much water till it breaks, then remove some of the top soil, which replace with new rich loam, trodden well, then afford the whole a thorough watering, and when the weather gets warm, mulch the soil.

SOILS AND CAPILLARITY NOTICE.—Consult any ordinary text-book on agriculture.

THE FIRST COLTSFOOT: *X.* The first flowers were noticed near London on the 10th inst. The first Snowdrops were observed on January 22 in a garden north-west of London, nearly three weeks later than last year in the same situation.

THE NEWSPAPER STATEMENTS ABOUT FRUIT FROM TASMANIA, the CAPE, and NEW ZEALAND: *J. D.* Yes, it is quite correct that fruit has been arriving in this country from these and other distant parts. Tasmanian Apples came over first, we think, in 1888.

VIOLETS: *J. B.* Obtain rooted runners in April, and plant them 1 foot apart in good land, enriched with leaf-mould and road-scraps, and not in too sunny a position, but still, not under trees. The Czar and Marie Louise are good kinds.

WHITE ARUM: *J. B.* It does not matter how you grow them, so long as the roots are not crowded or starved. One or three in a pot, feeding them well with weak manure-water, or top-dressings of rotted manure and plenty of water whilst growing, and a rest of a month or more before starting them.

NATIVE GUANO.—BEST AND CHEAPEST
MANURE FOR GARDEN USE. Price £3 10s. per ton, in bags.
Lots under 10 cwt., 4s. per cwt.; 1 cwt., Simple Bag, sent
Carriage Paid to any Station in England, on receipt of P.O. for 5s.

Extracts from 16th Annual Collection of Reports:—
NATIVE GUANO, FOR POTATOES, VEGETABLES, &c.
H. BINKWORTH, Potato Grower, Reading, used for Potatoes,
Onions, and Carrots, results:—"Very good; never had better
results."—J. BUTLER, Sittingbourne:—"Used for Potatoes,
Celery, and other Market Garden Crops, with very good results;
Potatoes large, clean, and free from disease. Best and Cheapest
Manure in the Market."

NATIVE GUANO, FOR FRUIT, ROSES, TOMATOES, &c.
J. FELL & Sons, Streatham, used for Fruit Trees and Roses,
results:—"Very satisfactory; we use no other Guano now;
consider yours preferable to Peruvian."—J. FINCH, Orrell
Gardens:—"Used for Vegetables, Tomatoes, Grapes, Cucumbers,
and Flowers, with satisfactory results. Most excellent for
Potatoes and many other things. The Cheapest Manure in the
Market."

Orders to the Native Guano Co., Ltd., 29, New Bridge
Street, Blackfriars, London, where Pamphlet of Testimonials,
&c., may be obtained. AGENTS WANTED.

THE PATENT
SILICATE MANURE.

This manure is chemically distinct from all
other Manures, and has been proved to supply
the place of sunshine, and has the power of
hastening the colouring and ripening of Grapes,
Tomatoes, Peaches, &c., beyond any other
Manure.

Field Crawler, Sussex, Sept. 14, 1891.
"The effect of this manure is most noticeable in the develop-
ment, ripening, and colouring of the fruit. In consequence of
the wet and sultry weather, I could not get my Tomatoes
growing in an unheated and rather damp house to ripen; but
within three days of applying your manure, they began to colour,
and I have been gathering splendid fruit almost daily since."
(Signed), B. C. RAVENSCROFT.

Prices in Sacks, at Works, 10s. per cwt.; £2 per
½ ton; £3 15s. per ¾ ton; £7 per ton.

"PICRENA," THE UNIVERSAL
INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear
Sirs, I have thoroughly tested a sample of a new Insecticide
which you were so good to send me. At the rate of 1 oz. to a
gallon of water at a temperature of 80° F. I find it kills Green
Gall of water at a temperature of 80° F. I find it kills Green
Gall at 120° F., seals the fate of Scale of all sorts in a few seconds;
while 3 oz. to gallon at same temperature effectually dissolves
Mealy Bug, and so far as I have yet observed, without the
slightest injury to leaf or flower, and it is withal a most
agreeable compound to work with. All our insect remedies
are applied through common syringe, or garden engine, a much
simpler test of efficiency than when applied by hand-washing
ever used. I ought to command a good sale. (Signed) A.
MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London,
January 7, 1888. "GENTLEMEN—I have given your Insecti-
cide, 'Picrena,' a good trial in competition with many others.
I am pleased to say that I have found it to be more effective
in destroying Mealy Bug and other insects than anything we
have ever used. I ought to command a good sale. (Signed)
B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists,
in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2
gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and
upwards, 8s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen,
Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise
Nurseries, Upper Holloway, London; and from
WILLIAM EDWARDS AND SON, 157, Queen Victoria
Street, London.

"Nothing Succeeds like Success."

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s.
If set across three Columns the lowest charge will be 30s.
Page, 2s; Half Page, 2s 10s.; Column, 2s.

NOTICE TO ADVERTISERS.—In many instances
Remittances in Payment of Repeat Adver-
tisements are received without name, address,
or anything beyond the postmark on envelope
by which to identify the sender; this in all
cases causes a very great deal of trouble, and
frequently the sender cannot be identified at all.
Advertisers are requested when Remitting
to give their Names and Addresses, and also
a Reference to the Advertisements which they
wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS,
26 words, including name and address, 1s. 6d.,
and 6d. for every additional line (about nine
words) or part of a line. These Advertisements
must be prepaid. This scale does not
apply to announcements of Vacant Situations,
which are charged at the ordinary scale.

Births, Deaths, and Marriages, 6s. each
insertion.

POSITION.—Advertisers are specially requested
to note, that under no circumstances shall
ever can any particular position be guaranteed
for advertisements occupying less space than
an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers,
and Others.—It is very important in remit-
ting by Postal Order that it should be filled
in payable at No. 42, DRURY LANE, to
A. G. MARTIN, as, unless the number of a
Postal Order is known, and it has been made
payable at a particular office, and to a par-
ticular person, it is impossible to prevent any
person into whose hands it may fall from
negotiating it.

N.B.—The best and safest means of Re-
mitting is by **POST-OFFICE MONEY
ORDER.**

Advertisements for the current week MUST reach
the Office not later than Thursday noon.

All Advertisements should be addressed to the
PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United
Kingdom, 12 months, 15s.; 6 months, 7s. 6d.;
3 months, 3s. 9d. All Foreign Subscriptions,
including Postage, 17s. 6d. for 12 months:
Post-office Orders to be made payable at the
Post-Office, 42, Drury Lane, W.C., to
A. G. MARTIN.

Subscribers who experience any difficulty in
obtaining their Copies regularly, are particu-
larly requested to communicate with the
Publisher (in cases of delay in the delivery
by post, the cover should be forwarded with
complaint).

HOLLOWAY'S PILLS.—Weak stomachs. The wisest cannot estimate the number of distressing symptoms arising from enfeebled digestion, all of which might be readily dispelled by these admirable Pills. They remove all unpleasant tastes from the mouth, flatulency, and constipation. Holloway's Pills rouse the stomach, liver, and every other organ, helping digestion to that healthy tone which fully enables it to convert all we eat and drink to the nourishment of our bodies. Hence these Pills are the surest strength-givers and the most efficacious remedies for indigestion, nervousness, wasting, and chronic debility. Holloway's Pills are infallible remedies for impaired appetite, eructations, and a multitude of other disagreeable symptoms, which render miserable the lives of thousands. These Pills are approved by all classes.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH—THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 8, says:—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 170,000 of these Machines have been Sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER.

With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady ... £1 15 0
To cut 8 in., do. ... 2 10 0
To cut 10 in., do. by a strong youth 3 10 0
To cut 12 in., do. by a man ... 4 10 0
To cut 14 in., do. do. ... 5 10 0

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man } 26 10 0
To cut 18 inches, do. on even lawn ... } 7 10 0
To cut 20 inches, do. man and boy ... } 8 0 0
To cut 22 inches, do. do. ... } 9 0 0
* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches ... £14 0 0
To cut 28 inches ... 16 0 0
To cut 30 inches ... 18 0 0
Leather Boots for Donkey ... 1 0 0
Leather Boots for Pony ... 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

HORSE MACHINES.

To cut 30 inches ... £22 0 0
To cut 36 inches ... 26 0 0
To cut 42 inches ... 30 0 0
To cut 48 inches ... 34 0 0
Leather Boots for Horse ... 1 9 0

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.

PRICES, With Grassbox.

PROTHEROE AND MORRIS will sell by auction, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **WEDNESDAY NEXT, February 24**, at half-past 11 o'clock, **500 AZALEAS**, **PALMS** in variety, **Greenhouse FERNS**, **TEA ROSES** in pots, choice **GLORIAS**, **BEGONIAS**, 100 lots of **LILUMS** in variety, **TUBEROSUS**, **GLADIOLUS**, **CARNATIONS**, **DAFFODILS**, **HEBEOUS PHLOX**, 200 **Standard and Dwarf ROSES**, &c.

On view morning of Sale, and Catalogues had.

Paddock Wood, Kent.

At the very low upset price of **£1700**, £55 per acre. **FREEHOLD FARM**, **MARKET GARDEN**, adapted for building development.

MESSRS. PROTHEROE AND MORRIS will sell by auction, at the Mart, Tockenhay Yard, London, E.C., on **WEDNESDAY, February 24**, at 2 o'clock, the valuable and productive **FREEHOLD MARKET GARDEN** and **FRUIT GROUND**, of 26 acres, abutting on the South and East of the Tockenhay Wood Station, with 2 Cottages, Stabling, and Buildings, at present let at £100 a year, but possession could be arranged.

May be viewed. Particulars had on the Premises; at the Mart; of Messrs. HORSLEY and WIGHTMAN, Solicitors, 1, Guildhall Chambers, London, E.C.; and of the Auctioneers and Surveyors, 67 and 68, Cheapside, London, E.C.

Roehampton.

Two minutes walk from Barnes Station.

IMPORTANT CLEARANCE SALE of the remaining portion of the noted collection of **STOVE and GREENHOUSE PLANTS** formed by the late D. B. Chapman, Esq.

MESSRS. PROTHEROE AND MORRIS will sell by auction, on the Premises, Downshire House, Roehampton Lane, S.W., on **THURSDAY, February 25**, at 12 o'clock, without reserve, the whole of the valuable **STOVE and GREENHOUSE PLANTS**, fine coloured **Crotons**, **Dracaenas**, and other specimen **Chimeras**, handsome **Palms**, including a few **Imported LILIES**, **Chimeras**, and **Lettuce**, **Established Orchids**, **Lapagerias**, **Two Green's Lawn Mowers**, **Garden Roller**, and other garden utensils.

May be viewed any day prior to the Sale. Catalogues had on the premises; of the head gardener, Mr. RAWLINS; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Friday Next, February 26

CATTLEYA LABIATA, from Swainson's hunting ground, **CATTLEYA SP.**, from the Venezuelan frontier, in magnificent masses. **CATTLEYA** of the Imperialis section, from the Cattleya aurea country.

CATTLEYA GRANULOSA VAR.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. Sander to sell by auction, at their rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT, February 26**, at half-past 12 o'clock, a grand importation of **CATTLEYA LABIATA**, from Swainson's hunting ground, with broad sepals and petals and big lip, not the *Fernambuco variety* which, although pretty and desirable, is flimsy compared with Swainson's original plant. The *Fernambuco* form of the old labiata was shown in Paris during the Universal Exhibition in 1889, but it is the poorest form for horticultural purposes of all the labiatae.

A fine lot of a most distinct-looking **CATTLEYA**, from the Colombo-Venezuelan frontier, in splendid and perfectly shaped masses.

A capital lot of **CATTLEYA GRANULOSA VAR.** and **CATTLEYA IMPERIALIS**.

A magnificent importation of **DENDROBIUM FORMOSUM GIGANTEUM**, the finest type, in simply superb order. **CYPRIPEDIUM SP.**, much like *C. Regineri* in habit, together with **VANILIA**, **SACCOLABIUM**, **BULBOPHYLLUMS**, and **PHATIS** from the East.

Some fine plants of the chaste and elegant **CYMBIDIUM EUBURNUM** in flower and bud. Importations of **DENDROBIUM AUREUM**, **HEDYOSMUM CAMBODIANUM**.

Also two hybrid seedling **CYPRIPEDIUMS**, very distinct, **ORCHIDS IN FLOWER**, &c. (another property).

On view morning of Sale, and Catalogues had.

TUESDAY, MARCH 1.

By order of Messrs. F. HORNMAN & Co.,

Five Thousand

ODONTOGLOSSUM CRISPUM,

and ITS VARIETIES.

Collected by Mr. JOHN CARDER,

(late partner in the Firm of SHUTTLEWORTH, CALDER & Co.)

MESSRS. PROTHEROE AND MORRIS will sell by auction, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **TUESDAY, March 1**, at half-past 12 o'clock,

5000 ODONTOGLOSSUM CRISPUM.

Mr. CARDER is a well-known Collector of this plant, and his name has been associated with the finest forms ever imported.

On view morning of Sale, and Catalogues had.

Friday, March 4.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to sell the following most remarkable and **VANILIA ORCHIDS** by auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY, March 4**, at half-past 12 o'clock.

NEW ORCHIDS.

NO RESERVE.

CATTLEYA VICTORIA REGINA (Sander).

A distinguished and excellent New Cattleya. From one of my oldest exploring Collectors, and a superb Novelty of great merit in every way. Free growing, free and abundant flowering. The flowers are, individually, 5 inches across, and as many as eight or nine are borne on a spike. The flower is very compact, and of great substance. The sepals and petals are of a deep rosy red, glowing and glistening, blotched crimson and purple, the margin lighter and undulate. The lip is crimson, with a white tube. The importation is in magnificent condition.

CATTLEYA SPECIES.

A beautiful Cattleya. See dried flowers on view day of Sale.

CYPRIPEDIUM GOLDEN YELLOW.

When the beautiful **Cypripedium insignis** Sander flowered, a few years ago, we induced our collector to search for it, and are pleased to be able to offer now a few plants of a simply magnificent golden-yellow and white **Cypripedium insignis**. The plants are in fine order.

On view morning of Sale, and Catalogues had.

THE STAND HALL COLLECTION OF ORCHIDS.

ABSOLUTELY WITHOUT RESERVE.

HIGHLY IMPORTANT SALE of the whole of this Renowned Collection,

Including many plants matchless in point of rarity, the whole being unsupplied for culture and condition.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from the Executors of the late Thomas Statter, Esq., to sell by auction, early in May, on the Premises, Stand Hall, Whitefield, near Manchester, the whole of the

CELEBRATED COLLECTION OF ESTABLISHED ORCHIDS. A list of the principal plants appeared in the *Gardeners' Chronicle*, February 6, 1892. The Catalogues will be prepared in due course, and the Auctioneers will be pleased to receive early application.

MARCH 4 NEXT.

NEW ORCHIDS.

GREAT SALE. NO RESERVE.

EXTRAORDINARY NEW LADY'S SLIPPER.

CYPRIPEDIUM CHAMBERLAINIANUM (SANDER).

GRAND NEW SPECIES.

EVERY PLANT RECEIVED WILL BE OFFERED WITHOUT ANY RESERVE.

A magnificent and beautiful new **Cypripedium**, which we have the privilege to offer; it is delicately, by permission, to the Right Hon. J. Chamberlain, M.P.

An altogether unique and absolutely new departure in every way from all known **Cypripediums**. In inflorescence, in habit, and in leaf, a perfectly marvellous novelty. Its leaves are in some instances 4 inches across, simple, undulated, and beautifully tessellated on the upper surface, reminding one slightly of **Cypripedium Morganii**, but much larger and finer. It is altogether a noble plant.

This extraordinary **Cypripedium** produces flower-spikes up to 2 feet high, bearing all along it; stem its white, yellow, and purple blossoms, and we are able to show dried flower-spikes which have produced over 50 flowers. Another remarkable feature is, that the flower-seeds are not more than half an inch from each other.

The upper part of the flower is yellow, with about six rosy-purple lines, divided by the midrib emerging from a profusion of rosy-purple spots; these at the lower part are much denser than at the upper half of the dorsal sepal; the whole is beautifully reticulated, and charmingly transparent towards the margin, densely covered on the outer surface with white hairs; the upper half of the dorsal sepal is clear and pure, without any spots or lines; the lower dorsal sepal is similar in its markings, only not so dense, and about half the size of the upper dorsal sepal, which, extraordinary enough, is as broad as it is long, being about 2 inches in diameter.

The two petals are spreading, curled and twisted at the ends like a corkscrew, and spotted in the way of **Cypripedium cupreum**, the margins are charmingly undulated and bear a profusion of white hairs. They are spotted on both surfaces with blackish purple and chocolate spots and blotches, some purple lines also run along them; they are of a lovely shining white and creamy yellow colour, each of them of about two inches long, the slipper, shoe or pouch, sometimes called the labellum, is also exceptionally beautiful, it is rose and white more inflated than **Cypripedium cardinale**, and double its size, reminding one of a beautiful spotted bird's egg, so exquisite is the fine blackish purple spotting over two-thirds of its lower part; the upper part and side-lobes are of a shining porcelain white colour, this combined with the purple black spotting leads it a hue and charm perfectly unique.

We have been asked by several gentlemen to sell the whole importation of this altogether extraordinary and charming new **Cypripedium** without reserve, and we will do so. **Cypripediums** are most difficult to introduce, and unless the right moment is caught, all arrive dead; this is the case unfortunately with *Cypripedium Victoria Regina*.

Our importation is the first of the kind we have ever imported. We shall try next year to introduce it; however, the finest of the two *Cyp. Chamberlainianum*, and, fortunately, this has come home in altogether exceptional order and condition, and we have secured the valuable importation of about 700 plants. Abundant dried material will be on view.

MAGNIFICENT NEW CYPRIPEDIUM.

(CYPRIPEDIUM KIMBALLIANUM, SANDER.)

QUITE NEW SPECIES.

This grand new species is now offered for the first time, and no plants have ever been sold of it. It is a grand grower and a grand novelty. Nothing similar to it or in any way like, has ever been imported up to now. It is a safely species, its flowers are said by the natives to be of enormous size, and the colours are described as crimson, purple and white. In this description we believe. It has been a terrible difficulty to get plants home alive, and after all the trouble and expense, got a few plants only. Those offered are in grand condition, and we believe that it will be absolutely impossible for us to get again to offer it. It will be on view only this time. It will be on sale. An imported plant had leaves on it fully 2 feet long; the leaves are most beautiful, of elegant shape and heavily mottled and blotched.

CYPRIPEDIUM SPECIES.

This may turn out to be simply a variety of **Cypripedium Wallisii**, but it comes from quite a different country. The extraordinary flowers have the long narrow, lanceolate, pointed, very satiny white, excepting the lip, which is rose. In *Wallisii* it is white. It is one of the most stately of **Cypripediums** we have introduced. In fact it is quite a sensational plant. The consignment is in fine condition.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. F. Sander to sell the above **VALUABLE ORCHIDS** by auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY, March 4th**, at half-past 12 o'clock.

On view morning of Sale and Catalogues had.

Wednesday Next.

12,000 Bulbs of **PANCRATIUM ZEVIANICUM**, a free-flowering species; flowers snow-white, something like *petraea* in appearance, very fine for cut flowers. Importation received direct from India. Six splendid Specimen Plants of **ASPIDISTRA CUNEA VARIEGATA**.

MESSRS. PROTHEROE AND MORRIS, will include the above in their SALE on **WEDNESDAY NEXT, February 24**, at half-past 11 o'clock.

On view morning of Sale, and Catalogues had.

TUESDAY, March 1.

ODONTOGLOSSUM CRISPUM AND ITS VARIETIES,

Collected by Mr. JOHN CARDER (late Partner in the firm of Shuttleworth, Carder & Co).

Messrs. FRED. HORSMAN AND CO. have much pleasure in informing their friends that Mr. John Carder, whose well-known character as a collector has extended for upwards of twenty years, and whose name has been associated with the finest forms of ODONTOGLOSSUM CRISPUM ever imported, is now collecting, and has forwarded on their behalf 5000 large plants. His instructions were to get the most perfect forms, large pieces, and spotted varieties, no one knowing better than he where to find such. He writes that he "cannot get as many as he wished for, and that such are very costly when obtained." He has, however, succeeded to a certain extent, and the above number of plants will be offered at—

MESSRS. PROTHEROE & MORRIS' SALE ROOMS,

67 and 68, CHEAPSIDE, LONDON, E.C., on TUESDAY, March 1, at half-past 12 o'Clock.

Thursday Next.

**SEED and NURSERY BUSINESS FOR
DISPOSAL. AT ONCE.**—Established forty years. The
Seed Shop, Office, Warehouse, and Residence are spacious and
convenient, situate in a leading thoroughfare of the City of
Truro, adjacent to the principal public buildings. The Nursery
Ground is fertile, fairly sheltered, well watered, in good
heart and condition, within an easy distance at the west end,
five minutes' walk of the railway station; a Cottage, Glass
Houses, Packing Sheds, Frames, &c., on the same; a good
demand for Fruit Trees, Roses, Sirals, Decorative Plants, Cut
Flowers, &c. The stock at present is low, to be taken at a
valuation. Market Stall in the best position. All the premises
mentioned are within an hour's distance by rail of the seven
principal market towns in the County, thus offering a favourable
opportunity to a man or men, of experience and energy,
with moderate capital to realise advantageously.

Apply to ROBERT DOBELL, Jun., Solicitor, Truro.

County Borough of Newport.

TO ARCHITECTS, LANDSCAPE GARDENERS, AND OTHERS.
PUBLIC PARK.—THE CORPORATION OF NEWPORT are prepared to receive COMPETITIVE PLANS for LAYING OUT LANDS for a PUBLIC PARK, with Estimates of the probable Cost. Plans of the site showing the levels, and particulars, may be obtained on application to Coopers Kirby, Esq., Town Surveyor, Newport, Mon. A premium of fifty guineas will be awarded to the Author of the Plans most approved, and a premium of twenty guineas in respect of the drawings next approved by the Corporation. The plans in respect of which the premiums are awarded are to become the property of the Corporation, and the Authors of such plans will not necessarily be employed by the Corporation to carry out the works. Plans indorsed "Public Park," under a motto, with a sealed envelope containing the Author's name and address, to be sent to my office not later than the 26th day of March, 1892.—Dated this 16th day of February, 1892.

ALBERT A. NEWMAN, Town Clerk.

Town Hall, Newport, Mon.

THE GARDEN.

We issue the best book and the best varieties of everything for the best-kept gardens. Send for one immediately.

The "WEEKLY TIMES" says—

"H. Cannell & Sons' Floral and Vegetable Guides are the most complete illustrated Catalogues published. They are indispensable to all growers of flowers, &c. Those who wish to see what the florists art can do should pay a visit to Swanley."

One of our greatest connoisseurs writes us thus:—

"B. HOOKE, Esq.,

"The Turret, Hollingdon, Exbridge.
"I had some sprays of blooms of your Begonias on my table the other evening, and I had some difficulty in persuading my friends that they were not Rose 'La France.'"

"ANATEUR GARDENING" also states:—

"Messrs. H. Cannell & Sons give an open invitation to Swanley; consequently, there ought not to be one solitary individual among the whole army of amateur gardeners who would fail to avail himself of the opportunity thus afforded of viewing one of the grandest floral displays imaginable, had he but the slightest idea of its magnificence. Well, indeed, was I repaid for my journey thither on New Year's Day, for, although the country around was wrapped in its mantle of snow, and everything that I saw appeared desolate and dreary, yet on reaching the 'Home of Flowers' one seemed to have suddenly dropped into midsummer, so great was the wealth of bloom."

Our far-away friends encourage us by the following:—

"Rupert Nursery, Preston, Victoria, Australia,

May 28th, 1891.

"DEAR SIRS.—We received the box of plants last winter. They have flowered splendidly, and were exhibited at our Chrysaethum Show. Your novelties were in the centre, distinguished by a drapery of yellow silk. All the papers spoke of them, and we send you two reports. We were so pleased that we had your name and address printed on placards, and also decided to give you the enclosed order, to further show the pleasure and satisfaction we have had from dealing with your firm."

"JAMES STEVENSON, Esq., Hounslow.
"The Vegetable Seeds we had last year gave great satisfaction to myself and my garden."

Mr. W. HURSON, Gardener to A. YULE, Esq., Bracide, Norwood.

"The seed I had of you all came up splendidly. I have had seeds from other well-known firms for several years past, but none have been equal to yours."

CANNELSEEDS

Loughborough, Leicestershire.

THE OLD BROWN QUARRY EARLY
POTATO. The Oldest Existing Stock in Ireland.

I believe this to have been in existence here for 150 years;
certainly, when I was a child, prior to the famine period.
There was no other sort grown for harvest purposes when men
worked with a sickle. I am enabled to offer it for redistribution—
it never having made its way to England—from a stock
preserved for years on peat land, resting on limestone, in a
remote part of county Car. There must be something in the
soil that preserved it for years. It is a first-class variety, of
great substance. 7-lb. bag and postage for 2s. 9d.

WM. BAYLOR HARTLAND, F.R.H.S., Old Established
Seed Warehouse, Cork, Ireland.

Seeds.—Carriage Paid.—Seeds.

NEW ORCHIDS.

GREAT SALE.—NO RESERVE.

Extraordinary New Lady's Slipper,

CYPRIPEDIUM CHAMBERLAINIANUM (SANDER).

GRAND NEW SPECIES.

EVERY PLANT RECEIVED WILL BE OFFERED
WITHOUT ANY RESERVE.

A magnificent and beautiful new *Cypridium* which we have the privilege to offer. It is dedicated by permission to the Right Hon. Joseph Chamberlain, M.P.

An altogether unique and absolute new departure in every way from all known *Cypridiums*, in inflorescence, in habit, and in leaf, a perfectly marvellous novelty. Its leaves in some instances are 4 inches across, ample, undulated, and often beautifully tessellated on the upper surface, reminding one slightly of *C. Morganæ*, but much larger and finer; it is altogether a noble plant.

This extraordinary *Cypridium* produces flower spikes up to 2 feet high, bearing all along its stem its white, yellow, and purple blossoms, and we are able to show dried flower spikes which have produced over thirty flowers. Another remarkable feature is, that the flower seats are not more than half an inch from each other.

The upper part of the flower is yellow with about six rose-purple lines, divided by the midrib, emerging from a profusion of rosy-purple spots; those at the lower part are much denser than at the upper half of the dorsal sepal; the whole is beautifully reticulated and charmingly transparent towards the margins, densely covered on the outer surface with white hairs. The upper half of the dorsal sepal is clear and pure, without any spots or lines; the lower dorsal sepal is similar in its markings, only not so dense, and about half the size of the upper dorsal sepal, which extraordinarily enough is as broad as it is long, being about 2 inches in diameter.

The two petals are spreading, curled and twisted at the ends like a corkscrew, and spotted in the way of *C. superbians*; the margins are charmingly undulated, and bear a profusion of white hairs. They are spotted on both surfaces with blackish-purple and chocolate spots and blotches; some purple lines also run along them. They are of a lovely shining white and creamy-yellow colour, highly ornate, each of them over 2 inches long. The slipper, shoe, or pouch, sometimes called the labellum, is also exceptionally beautiful; it is rose and white, more inflated than *C. cardinale*, and double its size, reminding one of a beautifully-spotted bird's egg, so exquisite is the fine blackish-purple spotting over two-thirds of its lower part. The upper part and side-lobes are of a shining porcelain white colour; this combined with the purplish-black spotting lends it a hue and charm perfectly unique.

We have been asked by several Gentlemen to Sell the whole Importation of this altogether extraordinary and charming new *Cypridium*, without reserve, and we will do so.

Cypridiums are most difficult to introduce, and without the right moment is caught, all arrive dead. This is the case unfortunately with *Cypridium Victoria Regina*. These have perished on the journey. We shall try next year to introduce it. However, the finer of the two is *CYPRIPEDIUM CHAMBERLAINIANUM*, and fortunately this has come home in altogether exceptional order and condition, and the Sale will contain the whole Importation of about 700 Plants.

Abundant dried material will be on view.

March 4th next.

NEW ORCHIDS.

NO RESERVE.

CATTLEYA VICTORIA REGINA

(SANDER).

A distinguished and excellent new *Cattleya*. From one of my oldest exploring collectors, and a superb novelty of greatest merit in every way. Free growing, free and abundant flowering. The flowers are, individually, 5 inches across, and as many as eight or nine are borne on a spike. The flower is very compact, and of great substance. The sepals and petals are of a deep rosy-red, glowing and glistening, blotched crimson and purple, the margin lighter, and undulate. The lip is crimson, with a white tube. The importation is in magnificent condition.

CATTLEYA SPECIES.

A beautiful *Cattleya*. See dried flowers on view day of sale.

CYPRIPEDIUM

(GOLDEN YELLOW).

When the beautiful *Cypridium* insignis Sandera flowered, a few years ago, we instructed our collector to search for it, and are pleased to be able to offer now a few plants of a simply magnificent golden-yellow and white *C. insignis*. The plants are in fine order.

MAGNIFICENT NEW CYPRIPEDIUM.

CYPRIPEDIUM KIMBALLIANUM

(SANDER).

QUITE NEW SPECIES.

This grand new species is now offered for the first time, and no plants of it have ever been sold. It is a grand grower, and a grand novelty. Nothing similar to it, or in any way like it, has ever been imported up to now. It is a stately species. Its flowers are said by the natives to be of enormous size, and the colours are described as crimson, purple, and white in this description, we believe. It has been a terrible difficulty to get plants home alive; and after all our trouble and expense, we only got a few plants. Those offered are in grand condition, and we believe that it will be absolutely impossible for us to ever again offer it, and that this will be the only time it will be on sale. An imported plant had leaves on it fully 2 feet long. The leaves are most beautiful, of elegant shape, and heavily mottled and blotched.

CYPRIPEDIUM SPECIES.

This may turn out to be simply a variety of *Cypridium Wallisii*, but it comes from quite a different country, the extraordinary flowers have petals nearly 2 feet long and are pure satiny white, excepting the tip—which is rose. In *Wallisii* it is white. It is one of the most stately of *Cypridiums* we have introduced. In fact, it is quite a sensational plant. The consignment is in fine condition.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 20, 1892.

CEYLON.

PROFESSOR GOODALE, of Harvard University, has been visiting some of the tropical botanic gardens, and contributes an account of his trip to one of the American papers, whence, through the medium of the *Tropical Agriculturist*, we take the following extracts:—

1. Botanic Gardens in the Equatorial Belt and in the South Seas (First Paper).—It is my purpose to give, in the following notes, some account of the more important Botanic Gardens visited by me during a recent journey. The tour carried me from Genoa, through the canal at Suez, to Ceylon, in which country *Peradeniya* and *Hakgala* were examined; thence to Adelaide, in South Australia; Melbourne and Geelong, in Victoria; Hobart, in Tasmania; Dunedin, Christchurch, and Wellington, in New Zealand; Sydney, in New South Wales; Brisbane, in Queensland; Buitenzorg, in Java; Singapore, in the Straits Settlements; Saigon, Hong Kong, and Shanghai, in China; and Tokio, in Japan. With the exception of Shanghai and Tokio, the visits were made at favourable seasons; in Northern China and in Japan the spring was not far advanced, but the early flowers were in perfection.

The journey was undertaken with a view of securing from the establishments in question, for the University Museum at Cambridge, specimens illustrative of the useful products of the vegetable kingdom. In every instance the writer met with a cordial reception, and received innumerable courtesies, for which he desires to thank again the directors, curators, and superintendents of the various botanical establishments. Every facility was afforded for careful inspection of the workings of the gardens and museums, and it should be added, of the educational institutions with which some of them were connected.

A satisfactory photographic outfit rendered it possible to supplement the collection of photographic views which were purchasable at most points; so that the series, now stored in the Museum at Cambridge, may be regarded as one of the largest yet brought together. It comprises views not only of groups of plants, both in gardens and in their wild state, but of individual plants as well. Early next year these illustrations will be accessible to any visiting naturalists.

The present sketch will follow essentially the route outlined in a preceding paragraph, beginning with the gardens in Ceylon.

Peradeniya and *Hakgala* (Ceylon).—After the desert of Egypt and Arabia, and of treeless Aden, have been passed, the traveller comes, by an abrupt transition, upon tropical luxuriance of vegetation. There is, to be sure, a distant

MESSRS. PROTHEROE & MORRIS

Have received Instructions from Mr. F. SANDER to SELL, at their Great Rooms,

67 and 68, CHEAPSIDE, LONDON, E.C.,

A Grand Lot of the above New *Cypridiums*, &c.,

ON FRIDAY, MARCH 4.

glimpse of Socotra, but its shores are too far away to yield anything plainly discernible; and even Minicoy, an island lying between the Maldives and Laccadives, gives only a faint suggestion of plant-life. Its low-lying land is fringed with scattered Cocoa-nut Palms, of which, later, one sees so many. Before reaching Ceylon, the ship passes within sight of the southern point of India, but not near enough to show what its plants are like. In fact, therefore, the arrival in the harbour of Colombo brings a surprise. Coming down to the shore, and extending as far as the eye can reach on either side, are crooked* Cocoa-nut Palms, here and there intermingled with trees having foliage of the deepest green. A botanist is struck at once by the superb capabilities of such a country for a tropical garden. These capabilities were not overlooked by the Dutch, who succeeded the Portuguese in possession. A Botanic garden was founded by them at Slave Island, in Colombo, but when the Dutch were driven out by the British, it fell into neglect. There was, however, at this period, an excellent garden connected with the country place of the first English Governor, near Colombo, which, at the beginning of his century, was under the charge of a naturalist, who gave it somewhat the character of a botanical garden.

In 1810 Sir Joseph Banks sketched the plan for a botanical garden in Slave Island, Colombo, and succeeded in transferring thither from Canton Mr. Kerr, who became its chief. According to the work from which I have derived these facts, the Slave Island garden was subject to floods, and consequently the establishment was moved to Kalutara. One finds here and there in Colombo traces of the old occupancy remaining in the names of some of the streets—"Kew," for instance. From Kalutara the garden was transferred, in 1821, to its present site. Since that time, the large garden has established four branches, in order to secure all the advantages which can come from having land at different altitudes and with different exposures.

The branch gardens are—(1) Badulla, founded in 1886, in the eastern part of the island, with an elevation somewhat over 2000 feet. "The climate here is somewhat drier than on the western side of the hill region, receiving but little rain with the south-west monsoon." (2) Anuradhapura, dating from 1883, about a hundred miles north of the large garden, is the ancient capital of the island. Besides the interesting ruins at this point, which are well worth seeing, there exists the oldest historical tree in the world, *Ficus religiosa* (the sacred Bo), assigned to 283 B.C. This garden has a short rainy season and a hot dry climate. (3) Henaragodda, 33 feet above the sea, and thoroughly tropical, is on the railroad running from Colombo to Kandy. It was founded in 1876. Here certain plants which cannot be grown at Peradeniya, are very successfully cultivated. (4) Hakgala, established in 1890, as a nursery for Cinchona cultivation, is near Nuwara, Eliya (commonly pronounced "Nuwralia") the famous sanitarium. It is almost 6000 feet above sea-level,† in a place of surpassing beauty. Above the garden is a frowning double cliff 1500 feet high, and all around the views are most attractive. The Gate affords one of the best of these. The landscape reaches over the Uva district towards the Haputale gap and the Madulula hills. On entering the garden the bewilderment begins. On every hand one sees species in the most grotesque juxtaposition. Plants from Australia, such as Casuarinas and Acacias, are perfectly at home with East and West Indian, Japanese, and English plants; of the latter there are many which seemed thrifty and well established.

Although the garden is used primarily for experi-

mental purposes, it has been laid out with regard to effectiveness of grouping, and with remarkable success. A botanical visitor is, however, constantly trying to separate in his mind the different plants from the curious collocations which everywhere abound, and demonstrate better than in any other place I have ever seen the wide range of tolerance of climate. The superintendent, Mr. W. Nock, who has had large experience in the West Indies, has carried on some interesting experiments in acclimatizing plants from the western hemisphere, such as "Cherimoyer" and the like. There are few plants in the garden more attractive from an economic point of view than the vegetables of doubtful promise, such as Arracacha, and those of assured culinary position, "Choco" or "Chocho" (*Sechium edule*), for example. Some of the medicinal plants in hand were doing well in every way, while others have proved somewhat disappointing, for instance, Jalap and Ipecacuanha.

The Ferns, especially the Tree Ferns, and the species of *Eucalyptus*, form one of the marked successes at this garden. Mr. Nock stated that the most troublesome weed in the garden is a species (perhaps more than a single species) of *Oxalis*; it is simply impossible to eradicate it. G. L. G.

(To be continued.)

NEW OR NOTEWORTHY PLANT.

CYPRIPEDIUM CHAMBERLAINIANUM,
O'Brien, n. sp. (See fig. 34.)

This is a surprisingly beautiful and distinct novelty, and quite unexpected by its lucky importers, Messrs. F. Sander & Co., of St. Albans, who, when sending their collector to a hitherto unsearched part of New Guinea, had little hopes of gaining such a plant, which, in addition to being an entirely new species, is also the first of a totally new section of *Cypripedium*. The plant is robust, and resembles a giant *C. Spicerianum*, or it might easily be taken for a large *Angraecum pellucidum*, so distinct is its growth from that of any other species.

From the evidence of the dried spikes sent over by the collector, and those which opened immediately after their arrival, and from which our illustration was prepared, it is seen that native specimens have spikes showing from twelve to twenty or even more flowers on a spike, each flower springing from a stout and ornamental bract. The flowers themselves may be likened in colour to those of *C. superbiens* or *C. Morganae*, but in their botanical features there is nothing to compare them with. The dorsal sepal is yellowish-white, with six rosy-purple lines, three on each side of the mid-rib, and the base of the sepal has a profusion of rosy-purple spots. The lower sepal is similar to the upper, but smaller; and a very peculiar feature in both is, that they are strongly pubescent or hairy on the backs. The petals are spreading, curled, and twisted, and beautifully spotted with crimson, the margins undulated and furnished with white hairs at the edges. The labellum or pouch is white, beautifully and densely spotted with rose colour on the lower portion. Altogether it is a charming plant, and well worthy to bear the name of the Right Hon. Joseph Chamberlain, M.P., to whom Messrs. Sander have requested it to be dedicated. James O'Brien.

THE HOTHOUSES OF H.M. THE EMPRESS FREDERIC AT CRONBERG.

THE Empress Frederic's castle at Cronberg is built among most picturesque and mountainous scenery. The air which blows from the adjacent mountains is extremely pure, and doubtless very favourable to the growth of Orchids and alpine. Annexed to the castle are many greenhouses, three of which are over 357 feet long. Each is divided into four compartments, varying from 65 to 97 feet long, by 19½ feet wide, and 10½ feet high. One of these houses is devoted to Orchids, and was selected because of its particularly favourable position. It contains a great number of the rarest and most

beautiful species and varieties, many plants being of unusual size, and now in full bloom or showing great promise for the future. A table 6 feet wide is set apart in the centre of this house, and decorated with hothouse and ornamental-foliaged plants; many choice and beautiful species are represented. On each side of this stand a path, 3 feet wide, leads past all the stages, which are about 3 feet wide and raised 2½ feet above the ground. The space beneath the shelves is bordered with red ornamental tiles.

Between the stages and the wall is a space 3 inches wide, to allow the warmed air to circulate. The shelves are not perforated, but the pots are not stood directly upon them, being raised on a Pitch-Pine lattice-work 4 inches high, so that the air can freely circulate; this arrangement also enables zinc basins full of water to be placed near the plants, so as to increase the humidity of the atmosphere. The house is heated by twelve pipes, six on each side, so that in spite of the extent, an even temperature of 64° to 68° can be maintained. This charming building contains a considerable number of Orchids, all furnished by the Horticultur Internationale, the fine foliage of which fully attests the good care taken of them and the appropriateness of the locality chosen. Among the Orchids we may cite: sturdy specimens of different varieties of *Laelia purpurata*; good varieties of *Cattleya labiata autumnalis*, which have just bloomed well; the rare *Laelia grandis tenebrosa*, so much admired when shown this year for the first time, and which is now in spathe; *Cattleya Mendeli*, *C. Mossiae*, *C. aurea*, *C. gigas*, *C. Percivaliana*, with good promise of bloom; *C. granulosa*, various fine plants of *Phalaenopsis Schilleriana*, *P. amabilis*, *P. grandiflora*, and other beautiful varieties; twelve splendid *Angraecum sesquipedale* covered with buds, showing excellent cultivation, 18 to 24 inches high, and of remarkable beauty; their graceful leaves are of a sombre green colour, entire all the way down to the pot; *Oncidium Lanceanum*, which has recently flowered; a quantity of *Dendrobium bigibbum* which has been in bloom five months, and is still covered with clusters of flowers; *Grammatophyllum Ellisii*, and other good species; *Houlletia odoratissima* Lindeni; fine plants of *Laelia elegans*; of *Rodriguezia* (*Burlingtonia*) *rubescens*, a charming species, the smallest plant of which has borne since the commencement of the season a dozen clusters of pure white flowers, most graceful in form. They began to come into leaf at once, and at the end of ten days some of them had as many as fifteen shoots, all well-rooted. As soon as the blooms were faded, the flower-stems were cut, and the surface of the compost dressed with living sphagnum, in which roots soon formed abundantly; to this treatment, the vigour of the plants may, doubtless, be attributed. The plants of *Rodriguezia rubescens* are hung about a foot from the glass, as are the *Phalaenopsis*, certain *Paphiopsis*, *Stanhopea*, *Miltonia Roezlii*, *M. Phalaenopsis*, and *M. vexillaria*, now in full bloom, and many other species, the vigorous health of which leaves nothing to be desired. Other hot-house plants are doing well in the same house, especially the *Nepenthes*, which are hung near the entrance, and bear many graceful pitchers. The other houses contain various plants; *Stephanotis floribunda* climbs along the rafters; *Cissus Lindeni* and *C. discolor*, the charming *Tropaeolum Lindeni*, newly imported by the Horticultur Internationale, has evergreen foliage of an excellent colour, and promises to take a first place as an ornamental plant; there are also *Passiflora triloba*, another recent importation, and many others. One house is full of *Gardenia grandiflora*, well grown, and blooming abundantly; others are filled with Pinks and other plants requiring a similar temperature. Finally, there is a house especially built for cool Orchids; it is about 65 feet long, 13 feet wide, and 7½ feet high; the shelves to the right and left are about 2 feet above the ground; in the centre is a path about 3 feet wide. The shelves support Pitch-Pine lattices of various heights, on which the pots are arranged on steps, so that the plants may be as near the glass as possible. In this house is a fine collection of *Odontoglossum*, chiefly *O. Alexandrie*

* Crooked conveys the idea of sharp angles, whereas the Cocoa-nut Palms are gracefully bent.

† Somewhat over 5000 feet would be more correct.

selected from good varieties of the type known as Pacho; a fiftieth part are now in bloom, amongst others *O. Alexandræ Trianæ*, *O. Claesianum*, &c., coming from a collection imported last year, and which has done exceedingly well.

A collection of the best species of *Masdevallia* promises an ample harvest of flowers, and we may finally mention *Coleogyne cristata*, placed close to the glass, *Lycaste Skinneri*, *Cypripedium insigne*, full of buds, *Odontoglossum arachnoides*, of wonderful colour, which has been in bloom six weeks, and seems likely to last in full beauty almost as long again; as well as a great number of other choice species, excellently cultivated, and in vigorous health. *Jean Tonel*, in *Journal des Orchidées*.

Harris has purchased a lot of choice Orchids during this time, and amongst some of those in flower recently might have been noticed some very fine pieces of *Lycaste Skinneri* alba and *L. Skinnerii* with seven spikes, grand plants of *Dendrobium Wardianum*, *D. formosum*, *D. giganteum*, *Cymbidium Lowianum*, an excellent form of this; *C. Spicerianum*, *C. Dayanum*, *C. Boxalli*, *C. callosum*, *C. Sedeni*, and *C. barbatum*. Flowers were also to be noticed on plants of the pretty *C. bellatulum*, one plant carrying two spikes of between seventy and eighty flowers; *Zygopetalum intermedium* and *Z. maxillare*; *Masdevallia tovarensis* with sixteen spikes of three or four flowers, each in a 48-pot; *Cattleya Trianæ* and about thirty plants of

Bowden Hill has become an enthusiast in everything horticultural, and he has found a good cultivator in Mr. Deacon, as may be surmised from my short account of what I saw, but much more remained to be inspected when night set in. *W. A. Cook*.

ODONTOGLOSSUM ROSSII FROM CHELTENHAM.

An interesting series of varieties of the above come from Mr. J. Cypher, Queen's Road Nurseries, Cheltenham, and taking the extreme varieties, it is difficult to reconcile them as being of one species. The handsomest is a large light flower of the *O. R. majus* type, and the most curious a rather small flower with sepals and petals spotted alike, except that the petals have a narrow white margin. The lip of this variety is blush-white, and the callus cream coloured. With these also come flowers of a very fine form of hybrid *O. Rossii* with a pale primrose ground colour. An example of *O. crispum* with flowers $4\frac{1}{2}$ inches across, and prettily-spotted sepals and lip; and a spray of noble flowers of *Oncidium splendens*.

ODONTOGLOSSUM CRISPUM VAR. NOBILIOR.

This is another noble spotted variety of *O. crispum*, which has flowered in the valuable collection of these plants in the gardens of Baron Schroder, at The Dell, Egham, and in the care of that clever cultivator, Mr. H. Ballantine. It was exhibited at the meeting of the Royal Horticultural Society, on February 9, when it gained a First-class Certificate, and was much admired. Its sepals are nearly covered with warm reddish-brown blotches, its petals and lip also being adorned with heavy markings of the same colour. *J. O'B.*

CROSSES AND CROSSING OF PLANTS.

This was the subject of a paper read at the late meeting of the Massachusetts State Board of Agriculture by Professor L. H. Bailey, of Cornell University. The paper is too long to reproduce entire, but we give in a condensed form the report as published in *Garden and Forest*. Professor Bailey's language is adhered to in the main, but in some cases a paragraph is summarised in a sentence, and in this way the original loses some of its richness of illustration.

Sex clearly has two offices: (1) To hand over, by some mysterious process, the complex organisation of the parent to the offspring; and (2) to unite the essential characters or tendencies of two beings into one. The second office is the greater, for it insures an offspring somewhat unlike either parent, and therefore better fitted to seize upon any place or condition new to its kind. And as the generations increase, the tendency to variation in the offspring must be constantly greater, because the impressions of a greater number of ancestors are transmitted to it. If, therefore, the philosophy of sex is to promote variation by the union of different individuals, it must follow that greatest variation must come from parents considerably unlike each other in their minor characters. Thus it comes that in-breeding tends to weaken a type, and that cross-breeding tends to strengthen it.

In this discussion the term "cross" is used to denote the offspring of any sexual union between plants, whether of different species or varieties, or even different flowers upon the same plant. There are different kinds of crosses. One of these is the hybrid, or a cross between two species, as a Plum and a Peach, or a Raspberry and a Blackberry. Crosses between varieties of one species are termed "half-breeds," or "cross-breeds;" and those between different flowers upon the same plant are called "individual crosses." Distinct species, however, as a rule, refuse to cross. If we apply the pollen of a Hubbard Squash to the flower of the common field Pumpkin, the fruit will not form. The same is true of the Pear and the Apple, the Oat and the Wheat,

FIG. 33.—ODONTOGLOSSUM CRISPUM VAR. NOBILIOR.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT BOWDEN HILL HOUSE.

This place has quite lately sprung into notoriety owing to Herbert Harris, Esq., the High Sheriff of Wilts, and owner of the place, having taken to the cultivation of Orchids. During the last two years many improvements have been effected in the gardens, a range of Orchid-houses having been put up, besides two Peach-houses and some other plant-houses, and a bit of land taken in from the park to increase the size of the kitchen garden, and a high wall built around the addition. Water has been laid on all about this part of the garden. Bowden Hill House stands out prominently, and lovely views of the surrounding country can be enjoyed. Mr.

the true *C. labiata*; various choice *Denbrobes* were showing profusely for flower, and some *Laelia autumnalis* were in flower, and *L. purpurata* was looking well. In the cool-house were nearly 300 plants of *Odontoglossum*, of which a few *O. crispum* were in flower, as was a large mass of *Cymbidium Lowianum*, the spikes numbering six, and the blooms eighty. The general good health of all the occupants of the various houses struck one at the first view, and it appeared as if Mr. Harris would in a very little time have a beautiful show of Orchids in flower. In the greenhouses a fine lot of tree *Carnations* and *Cyclamen* were remarked, and in the stove some very fine *Crotons* and other plants. The collection of *Begonias* is one of the finest hereabouts, and they are employed for bedding as well as for the decoration of apartments, &c., and none but the best-named varieties are grown. The owner of

and most very unlike species. Or the pollen may "take," and the seeds may grow, but the plants which they produce may be wholly barren, sometimes even refusing to produce either flowers or seeds, as in the instance of some hybrids between the Wild Goose Plum and the Peach. Sometimes the refusal to cross is due to some difference in the time of blooming, or some incompatibility in the structure of the flowers. But it is enough to know that there are characters in widely dissimilar plants which prevent inter-crossing, and that these characters are just as positive as are size, colour, productiveness and other characters. That is, the checks to crossing have been developed through the principle of universal variability and natural selection, just as other characters have been established. The result is simply, that the best results of crossing are obtained when the cross is made between different individuals of the same variety, or, at farthest, between different individuals of the same species. In other words, hybrids—or crosses between species—are rarely useful, and it follows, as a logical result, that the more unlike the species the less useful will be the hybrids.

Again, crossing alone can accomplish little. The chief power in the progression of plants appears to be selection. Selection is the force which augments, develops and fixes types. Man must not only practice a judicious selection of parents from which the cross is to come, but he must constantly select the best from among the crosses, in order to maintain a high degree of usefulness and to make any advancement; and it sometimes happens that the selection is much more important to the cultivator than the crossing. I do not wish to discourage the crossing of plants, but I do desire to dispel the illusion which too often hangs about it.

CROSSING STRENGTHENS EXISTING TYPES.

The improvement of existing varieties by crossing is a more important office than the summary production of new varieties. This is the chief use which Nature makes of crossing—to strengthen the type. Think, for instance, of the great rarity of hybrids or pronounced crosses in Nature! No doubt all the authentic cases on record could be entered in one or two volumes, but a list of all the individual plants of the world could not be compressed into 10,000 volumes. There are a few genera, in which the species are not well defined, or in which some character of inflorescence favours promiscuous crossing, in which hybrids are conspicuous; but even here the number of individual hybrids is very small in comparison to the whole number of individuals. That is, the hybrids are rare, while the parents may be common.

Darwin was the first to show that crossing within the limits of the species or variety results in a constant revitalising of the offspring, and that this is the particular ultimate function of the operation. Darwin's results are, concisely, these:—Self-fertilisation tends to weaken the offspring; crossing between different plants of the same variety gives stronger and more productive offspring than arises from self-fertilisation; crossing between stocks of the same variety grown in different places, or under different conditions, gives better offspring than crossing between different plants grown in the same place or under similar conditions; and his researches have also shown that, as a rule, flowers are so constructed as to favour cross-fertilisation. In short, he found, as he expressed it, that "Nature abhors perpetual self-fertilisation." Darwin's well-known experiments show that crosses between fresh stock of the same variety were nearly 30 per cent. more vigorous than crosses between plants grown side by side for some time, and over 44 per cent. more vigorous than plants from self-fertilised seeds. On the other hand, experiments showed that crosses between different flowers upon the same plant gave actually poorer results than offspring of self-fertilised flowers. It is evident, from all his experiments, that Nature desires crosses between plants, and, if possible, between plants grown under somewhat different conditions.

In extended experiments of my own in the crossing of Pumpkins, Squashes, and Gourds, carried on during several years, increase in productiveness due to crossing has been marked in many instances. Marked increase in productiveness has been obtained from Tomato crosses, even when no other results of crossing could be seen.

(To be continued.)

CALIFORNIA AS A HOME.

I AM writing on January 14. Over in the mild climate of England, my fellow-gardeners are protecting their plants from frost, and sheltering carefully all those potted plants which they are going to force for the market. California is large—twice the size of England, I should say. But if you want to find a place here where you would have to do the like in your profession, you would have to hunt the cool and somewhat treacherous bay-surroundings of our metropolis, or you would have to climb the peaks of our sierras, and then you would have to reach an elevation of 3000 feet before finding places with a real winter. We have no winter here, and what is generally called winter, is understood to be the rainy season. This season is very mild, and we work at our place here in the foot-hills of the Sierras in shirt-sleeves to-day, and call it a most beautiful day. Our foot-hills rival the valley; we have the high mountains at the back of us protecting us from the dry winds of the plains east of them, and giving us the benefit of the warm reflection of the sun, which shines here almost every day. Our Grapes ripen at 2000 feet elevation, but seven days later than those from the Fresno region; while our climate is not so hot, being easier reached by the winds which blow every day from the ocean, we can dry Raisins in the sun in spite of the occasional early rains which set in once in a while in the haying season, at end of July. The highest temperature I have recorded for the last four years was 112° Fahr. in the shade. I must say for a person coming from a cool climate like that of England, this is anything but agreeable. But then 112° up in the mountains feels nothing like that heat in the valley, where no air may blow at the time. Hot spells last usually from three to five days, and then again we record 90° to 95°, or even 85° Fahr., for weeks at a time. By the time a person has been living here for say five years, he gets pretty well used to it, and lives through it just like everybody else. It is healthy here. The air is wonderfully pure, and the fogs which visit us from the ocean are quite pleasant, pure and refreshing. The coast-range is different altogether. It is affected by the evaporation of the ocean, and consequently cooler and temperate. The coast-range cuts the valley sharply from the ocean border, and its peculiarity is best demonstrated by alluding to the fact that, while the Grapes never ripen at San Francisco, 10 miles from it, just behind the coast-range, there lies the land which supplies the city nearly all the year round with the most delicious Strawberries. Most people who come to California usually stop, and stay at San Francisco. The climate is more agreeable, and there are more fellow countrymen, and all the advantages which city life offers. But the most acceptable openings are in the interior. Gardeners as a rule are people who are the least afraid of anything, and if they cannot get a job at their own trade, very well, they try another.

Fruit-growing is at its very best in California, and its climate is adapted to every kind in every part. The Grape will grow and ripen, rich in alcohol, or sour like a Riesling, just as you choose to pick your location. The Orange is at home south and north up to 1500 feet, and wonderful to note! the Apple will ripen side by side with this subtropical fruit. Olives seem to be destined to shade every hill side which now gives ground to Pines and underbrush; and Peaches and Apricots bring such wonderful returns that it is not surprising that English capital seeks investment by the million. If only the ground is kept cultivated, it needs no irrigation, and shoots of 10, 12, even 15 feet length on 2-year-old trees are

something a person may see from the railroad-car while travelling through our glorious state.

The population of California is still small. One million and a quarter is all this State's census gave last year as the number of inhabitants. There will be homes for just as many as may choose to come and work their way. The great danger is that the warm climate and the ease with which the soil gives a return, will make the people too lazy. The young generation springing up at the present is not as energetic as their forefathers, from whatever country they came. Times have been too easy for the old folks: if they did not make any money through labour, they did so in trading, and as a last and most important resource, they can fall back upon their real estate, and turn into money what the emigrants are willing to buy. The estates are too large altogether at present, and the more they are cut up the better it will be. A 10 or 5-acre farm is just as much as a person needs to possess to make a living for himself and family, and the returns are manifold. Wages are very high, though they are coming down, and hired help eats up the profits of a small household. Of all the acreage of this wonderful State only 1 acre out of every 400 has been put into vineyards, and out of every 100, there are but 2 which would be valueless for the working population of the old country. What resources for the overcrowded kingdoms of Europe! The man who comes here ought to know a trade, and be a handy man all round. He should be content to work for other people for a time until he gets accustomed to the ways of this climate. And he should work at the wages which the trade unions have established. As he works for other people, he has the best opportunity to watch his chance without running any risk. And if he has a little something to expect from home, I give him the warning: leave it there. If a man is worth anything at all, he will be able to show it from the first day, even if he does not know the language. As long as any funds from home are at his disposition, he will not feel disposed to work, and of little worth is the money which you have not earned yourself. Whoever has been able to establish himself in California has made his way, if he has not accumulated a fortune, and property acquired is bound to increase in value. Of course, it must be understood that such comparatively rough country has no wants like an old-established commonwealth over in the old country; time will pass by before such wants are developed. But it is a very good thing if anybody living here is acquainted with the ways of Europe, and applies that experience to our surroundings. The advantages of California are unrivalled: the healthiest climate, cheap real estate, rich soil, sure crop, no storms, no winters, free schools, and a bright future. *Geo. Hansen, Foothill Agricultural Station (University of California), Jackson, Amador County.*

THE RICINUS, OR CASTOR-OIL PLANT.

THE Ricinus, like the Croton, is named after an objectionable insect, owing to the resemblance the seeds are supposed to bear thereto. The insect in this case is the cattle-tick, or as it was called in olden times, and probably is to this day in other countries, *kik*. The plant is also known as Palma Christi, though the origin of this name does not seem very clear. I find equal difficulty concerning the origin of the word castor, as applied to the well-known medicinal vegetable oil obtained from the plant, especially as this is the generic name of the beaver, and castoreum or castory is the name of the peculiar liquor found in the beaver's groin; to say nothing about gemini, the fiery meteor occasionally observed on a ship's rigging. Owing to the name Castor-oil Plant, the seeds are also sometimes called Castor Beans. Strange as it may appear, Latin writers named the plant *Cucurbita* and *Hedera*.

Gerarde gives some interesting particulars concerning the misnaming of the plant, which he says, "Whereof mention is made in the fourth chapter of

Jonas, and sixth verse." And he proceeds to say:—"Saint Augustine recordeth in his Epistle to St. Jerome, where in effect he writeth thus:—That name Kikajon is of small moment, yet so small a matter caused a great tumult in Africa. For on a time a certain Bishop, having on occasion to intreat of this, which is mentioned in the fourth chapter of Jonas (in a collation, or sermon, which he made in his cathedral), said that this plant was called Cucurbita, a Gourd, because it increased unto so great a quantity in so short a space, or else (saith he), it is called Hedera. Upon the novelty and untruth of this his doctrine, the people were greatly offended, and thereof suddenly arose a tumult and hurly-burly; so that the Bishop was informed to go to the Jews, to ask their judgment as touching the name of this plant. And when he had received of them the true name, he made his open recantation, and confessed his error, and was justly accused for a falsifier of the Holy Scriptures."

Gerarde, moreover, considered the Ricinus was indigenous in America, and goes so far as to name it Ricinus americanus, though it appears to be of African and Indian origin.

Before I leave this old author, I may add his advice concerning the value of the plant as an antidote to sciatia, with which so many gardeners suffer. He says, in effect:—"The broth of the meat supped up wherin the seed hath been sodden is good for the gout, and for and against the pain in the hips called sciatia."

Reverting to America, it is considered moles will not remain where Ricinus seeds are sown. If this be the case, to any practical extent, the fact may occasionally be turned to good account in gardens, when, as sometimes happens, these singular creatures periodically visit newly-planted Celery in the trenches, Onion, Carrot, and other small seeds when sown, amongst which they create great havoc, and with difficulty are caught, or kept away. The difficulty being greater during arid periods in summer, when their runs are deep below the surface, and trapping is next to impossible. It would be well to drop a few seeds into such injurious runs should they occur, and thus test the statement fully.

Seeds are offered by all seedsmen and at reasonable prices, and apart from such considerations as the above, they are so easily germinated and grown, as to be adapted for amateur culture, whether to grow on in pots, or for planting in open borders for summer decoration of a "tropical" kind. A pot, with seeds, placed inside a sunny window with a square of glass over it, quickly gives pleasing results, and they germinate upon a shelf in the greenhouse, sown about April. *William Earley.*

VEGETABLES.

BRUSSELS SPROUTS.

Of all the Brassicas none will compare with Brussels Sprouts, as, besides their great productiveness, they come in at a season when really good vegetables are scarce, and instead of yielding only a limited supply, the plant goes on affording a succession of sprouts for a long time. This is only so, however, when they are properly managed. In some gardens I find that it is the practice to cut off the tops and use them; and worse still is it with others, who pull up the whole plant, instead of picking the hardest, which are the best sprouts. At one time the run seemed to be on the large varieties, these being showy and taking to the eye; but they have had their day, for instead of being in any way equal to the good old imported stock, they had merely size to recommend them, and lacked the mellowness and mild flavour of the old favourites. It is a great thing to get a good strain of Brussels Sprouts, and keep it good by the selection of the best in a plantation as the seed bearers; and it is only in this way that fine sprouts can be obtained. To have the vegetable at its best, the seed should be sown under glass in March, and the plants afforded plenty of air to keep them sturdy. A good way to plant them is to select

a piece of deeply-dug or trenched land, in rows 4 feet apart, running a row of early Potatoes between the rows of sprouts, as doing so the latter get much light and air, and instead of growing tall and weak, they develop massive stems, which are covered with hard sprouts from bottom to top. *J. S.*

NEW AND OLD VARIETIES OF CELERY.

I have not grown all the newer Celeries, which have now become rather numerous, but those I have grown and tested have been grown on a large scale. Fortunately the autumn was rainy, which, while it curls the plant, does not induce a hardy growth, which will withstand severe frosts. Our Celery did not suffer much from frost, owing to moulding up being done in good time, and some dry bracken and litter placed around the leaves. On the other hand, like "J. S.," p. 180, I do not grow the very tall Celeries; indeed, I see no good in doing so, although some market growers may find it advantageous, especially those who grow for early use. Those who grow for late use would soon see the advantage in having a dwarf variety that would require less protection and moulding. I do not object to large varieties when they are grown for special purposes, but as this note refers more to the intermediate kinds, I will devote a few words to their value, especially to those of recent introduction. This year I grew for first early, Veitch's Superb White in quantity; last year I grew but little of it. It was grown alongside of Sandringham Dwarf White, and I was so pleased with its flavour and the solidity of its stalks, that I resolved to have more of it this season. The wet weather seemed to have suited it, for I never had better Celery. I still have a weakness for the Sandringham, but would prefer the Superb for early use, growing the older variety to succeed it, as it possesses the merit of remaining a long time fit for use before going to seed. Superb White is a pure white Celery, of vigorous habit, and of a medium size, and it may be classed as one of the intermediate type. It is very early—always a gain in a white Celery; it remains good till the last, and I have never seen any inclination to bolt, and no decay in the heart. The flavour is excellent, and the stalks very crisp. Being an early Celery, it was not protected, and I was surprised to remark how well it stood the frost. I strongly advise its culture where an early Celery is desired. White Plume, though distinct is, I consider, inferior in quality to the older kinds, and after two seasons' trial I discarded it. White Gem, an early dwarf white Celery, of good substance, very compact, but of less merit than Superb, the flavour not good on our light soil, although it may be different on other soils; it is a valuable Celery in gardens where space has to be made the most of. White Celeries are by some persons considered to be inferior to red; but I think this is on account of their being grown for early use, and of course they cannot be as well flavoured in the early autumn in warm weather and often suffering from deficient watering. The advance in quality of the pink or red Celeries has been equally as great, if not greater than that of the white varieties, as in the Early Rose. My remarks on Superb White are just as applicable, but it has the merit that it may be grown as for early use if white Celeries are objected to. This kind may be termed rose-coloured outside with a much paler tint at the heart, which if kept till late in the spring, becomes white. It is a plant of medium growth, with a flavour of Walnut, and the sticks are solid and crisp eating. It resembles that sterling kind Colonel Clarke's Red, but is earlier. Among varieties worth a trial may be given Williams' Matchless Red, a good kind, with a crisp, juicy, and fine flavour, with a good habit. There is also Sulham Prize, an excellent Celery of medium growth, large heart in comparison to its size, solid, crisp, and juicy. The heads are of great weight when full grown, and it is one of the best of the reds for late use that is to succeed the early white varieties. The best late red Celery running is Standard Bearer, a splendid addition to our red Celeries, of medium size, robust habit, heavy weight, and a fine nutty flavour, keeping good till May. I use no other for late use, and

when kept late much of its pinkness disappears, therefore making it more valuable for culinary purposes. For late use we sow it thinly in the open, and transplant direct into the trenches about sturdy plants; it is very hardy, an excellent late kind. *G. Wythes.*

CRITERION, AND OTHER PEAS.

I was very pleased to remark Mr. Coomber's favourable comments on Criterion. With us it always does well, and crops immensely, and the large Peas are of excellent flavour; in short, I take this Pea to be one of the best of Peas. I like Veitch's Extra Early as an early variety, it being fit to gather a few days before William I. But for cropping, the latter will hold its own against most comers, and it is in every respect a really good Pea. Ne Plus Ultra will never die out, for when once grown, no gardener ever cares to be without it afterwards. As a late Pea, British Queen has always been good in our garden, as is Champion of England. Mr. Waite, Glenhurst, Esher, sent me a variety for trial, a fine Pea, which I hope to grow again. Mr. Waite might say something about it. After all, I am convinced that several of the best old varieties will be in cultivation long after many of the huge wind-bags are forgotten. Medium-sized well-filled pods are those which I and most gardeners prefer, and for all kinds of seasons these are the best and surest croppers. *H. Markham.*

HARICOT BEANS

These do not appear to be cultivated so much as their usefulness deserves they should be. In hard winters if the gardener can supply them they can be used at table, and thus make green and other vegetables hold out longer; and moreover as food these Beans are very nutritious. To cultivate the plant is simple enough; where other Beans will grow, Haricots can be grown. They should be sown late in April, or early in May, according to the warmth of the locality, so as to afford time for the seeds to ripen. They should be treated the same as field Peas; as soon as they are well filled, and the pods turn yellow, the plants should be pulled up and dried out-of-doors if it be fine weather, or bunched and hung up in an airy shed, and on wet days they can be thrashed out or shelled, and put in bags for use. *W. A. C., Compton Bassett.*

FORESTRY.

THE COMMON ASH AS A TIMBER TREE.

Of late years this valuable tree has not been so much planted as it should be. This is prejudice in a great measure, as it is reputed to impoverish the soil to some considerable extent.

It is of a hardy nature, and thrives in even barren soils, if planted in a moist situation; its roots, spreading wide in every direction near the surface, have a tendency to render the ground dry and firm. The timber has the rare advantage of being nearly as good when young as when old, making it a valuable tree to grow for the market; and our wheelwrights and coachmakers are always glad to get it when they can, although of late years they have had to fall back upon the different American and other foreign woods which continually glut our markets. I sold some recently to a local man for 2s. 3d. per cubic foot in the round, and could dispose of almost any quantity on quite as advantageous terms, providing the quality was good.

Where, then, is there any timber that will pay better? and why not introduce it more freely when planting new, or renovating and overhauling old woods? Let it have the preference to some of the hard woods at present planted, but keep it out of fences adjoining arable and pasture land. *J. Garbett, Hale Park, Hants.*

Planting Hawthorns.—As the buds of the Hawthorn begin to expand in early spring, no time should be lost in completing the formation of hedges, making up blanks where necessary, and planting

standards of different kinds for ornamentation. The whole of the Thorn tribe delight in a deep rich soil, thoroughly drained, and well broken up previous to planting. In cases where the soil has become exhausted, or is of a poor character, a dressing of rich decayed manure may be applied with advantage. Young Thorns should be removed from the seed-bed, and planted in nursery lines 12 inches asunder, and 4 inches apart in the rows. Transplant Thorns from the lines where it has become necessary, in order to give the plants additional space, and promote the formation of stocky tops and bushy roots; do not expose the roots for any length of time.

Sowing Haws, &c.—Take advantage of dry weather to sow Haws on rich well-worked soil of a free, open texture, formed into seed-beds 4 feet wide. One bushel of Haws is sufficient to sow 20 lineal yards of a bed the above width. The seed should be sown in an even and uniform manner on the surface, pressed down with a light roller or the back of a spade, and covered with about half an inch of fine soil. In spring, before the plants appear above-ground, the hard crust on the surface had better be slightly broken up with a sharp rake to admit air and heat, and as young Thorns are easily damaged by frost, a few evergreen branches should be stuck into the ground as a protection. The seeds of other berry-bearing trees, such as Mountain Ash, English and Irish Yews, Holly, Service tree, &c., should now be sown, and as the treatment for these is similar to that described for the Thorn, it need not be repeated. If not already done, Oak acorns should be sown at the earliest opportunity. They are generally sown broadcast, on beds 4 feet wide, and one bushel of seed should be used for every 25 lineal yards of a bed of that width; they require similar treatment to the haws. Cherry stones may likewise be sown in a similar manner, but should be covered with about 1 inch of soil. Horse Chestnuts may either be sown in drills or broadcast on beds. One bushel of nuts should be allowed to sow a bed 4 feet wide and 20 lineal yards long; cover with about 1½ inch of soil. Sow Beech mast on dry friable ground, formed into beds 4 feet wide. One bushel of good seed is sufficient to sow about 40 lineal yards of a bed of that width; cover to three-quarters of an inch in depth with light sandy soil. Sycamore seed and Ash keys may be sown similarly, but only half-an-inch deep; one bushel of seed should be allowed for every 21 lineal yards of a bed 4 feet wide. Seeds of the Scotch Elm (*Ulmus montana*), that have been kept over since last summer should be also sown half-an-inch deep; one bushel of good seed should be allowed for 12 lineal yards of a bed 4 feet wide. Sow Hazel nuts and Spanish Chestnuts an inch deep in light sandy soil; one bushel of nuts is sufficient to sow 30 lineal yards of a bed 4 feet wide.

Cuttings.—Plant cuttings of deciduous trees and shrubs that are usually propagated in that manner, such as Willows, Elders, Poplars, &c. Poplar cuttings may be made from strong shoots of one-year's growth. Cut the shoots across at the base of a bud at the lower end, then at the distance of 12 inches from the base cut off the top with a smooth sloping surface, and insert them 8 inches deep into sharp sandy soil in lines 18 inches apart. When the buds at the top begin to expand, rub them off with the exception of the strongest and most central one, which should be left to form the stem of the tree. Tree Willows should be treated in a similar manner, but make the cuttings 15 inches long, and planted 10 inches deep into the soil. Dwarf Willows for basket-making should be planted where they are to remain, in lines from 18 inches to 3 feet asunder, and the plants about 2 feet apart in the rows. *J. B. Webster.*

FOREIGN CORRESPONDENCE.

HARDINESS OF CALOCHORTI.

Now that Calochorti have become more plentiful than they formerly were, their, at present, very moderate price will, I think, induce many growers

to once more try their hands on these most lovely bulbs. To ensure success in their cultivation, everything seems to depend on the situation chosen, and the soil in which they are planted. A soil which is retentive of moisture, or which has been freshly manured, must not be regarded as a place where Calochorti will thrive, as, for the greater part, they inhabit sandy plains in their native homes. Neither do they flourish in a situation where they do not get the full benefit of the sun's rays; the border where they are planted should, therefore, be a due south one, and not one with a western aspect, where the sun cannot get at them before 12 or 1 o'clock P.M. Considering the many hours of sunshine they thus evidently lose day by day, it is not to be wondered at that the Calochorti at Gunnersbury Park, which could not possibly get properly ripened for want of roasting sun, fell a victim to an ensuing trying winter. That they are sufficiently hardy to withstand without injury even a fair amount of frost, has been proved here by their passing unharmed the severeness of the terrible winter of 1890–91; but these bulbs were well matured, and, moreover, had enjoyed a perfect rest by their having been taken up and kept dry for about a month. Gardeners who have but little time to spare, or who object to the annual taking up and storing of the bulbs, may also resort to the Rev. H. Ewbank's excellent method of promoting the ripening process by fastening a pane of glass over the clumps of bulbs. Among the Calochorti imported by me last year, was also the pink variety of *C. albus* called *C. amoenus* by Greene. Has this ever been flowered in England? *C. G. Van Tubergen, Haarlem.*

FLORISTS' FLOWERS.

CENTROPOGON LUYCYANUS.

These are few, if any, plants that are more useful than this one during the winter, as in the temperature of a coolish stove it will flower profusely, and that not only at the ends of the shoots but at almost every joint for their entire length when the head is cut off. The blossoms are about 2½ inches long, tubular, somewhat after the manner of those of the *Salvias* or *Genesars*, and they are borne in bunches or clusters, making a fine show. Moderate-sized useful plants may be grown from cuttings put in during March or April, and in summer they grow freely trained in any pit or cold frame. *J. S.*

CHRYSANTHEMUMS IN FEBRUARY.

There was so much of an attractive character at the meeting of the Royal Horticultural Society on the 9th inst., that some bunches of pretty fresh Chrysanthemum from Mr. Robert Owen, Floral Nursery, Maidenhead, scarcely got the notice they deserved. There were several sprays of Golden Gem, one of the very best of the late-flowering decorative Japanese, of a deep gold, sometimes tinted with bronze and occasionally self-coloured, but more frequently heavily-shaded in the centre with reddish apricot. Some flowers sent to me by Mr. Owen on February 1 appeared to be fragrant. The other variety was Japanese, W. W. Coles, bright shaded red, with somewhat long drooping florets, a remarkably good late-flowering variety, that opens freely, and is of a shade of colour much appreciated. Both are healthy growers; and they may be propagated at any time up to April. Mr. Owen grows three cuttings or small-rooted plants in a pot, and the shoots are kept continually stopped until the end of July or the first week in August. The plants are well exposed to light and air, in order to thoroughly harden and ripen the wood. They are kept outside until there is danger of injury from frost, and protected from harm when necessary, and housed in November according to the weather. Three plants growing up in a 24 or 32-sized pot, if well attended to, should be from 1 to 2 feet through, and carry from twelve to twenty-four heads of bloom. In this manner suitable varieties of Japanese Chrysanthemums, such as those named above, can be had in bloom at the middle of February. *R. D.*

THE HERBACEOUS BORDER.

HELIANTHUS.

WHEN making up and replanting the herbaceous border, it would be well if some of the best varieties of Helianthus be selected. In a great many gardens these most useful decorative autumnal-flowering plants have been too much neglected, especially where there is a great demand for cut flowers. They are readily grown, and produce an abundance of bloom all through the season. The taller kinds, such as *H. multiflorus*, *H. decapetalus* var. *multiflorus* plenus, and *H. orgyalis*, are best adapted for growing in shrubberies, or at the back of herbaceous borders; the latter, which not coming into bloom in October, produces a quantity of small recurved flowers nearly all the way up the stem, forming a large panicle, and lasting until the frost comes. The dwarf-growing varieties worthy of notice are *H. multiflorus*, fl.-pl., *Rôte d'Or*, *H. Marius*, and *H. rigidus*, the former bearing small double flower-heads like miniature rosettes. They thrive well in any good garden soil, and should be propagated by division in early spring. *E. Newitt, Fulham Palace, S.W.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

MELONS.—Plants of Melons raised from seed sown early in the year will now be developing their true leaves, and occupying the soil in the pots with roots. At this stage of growth, either shift them into 14-inch pots, and adopt the treatment advised in a former calendar, or plant on mounds of soil resting on a hot-bed. In the latter case, a hot-bed of leaves, or leaves and stable litter, should be prepared, and covered with turves, grass side downwards, to prevent the compost mixing with the loose materials. On this place a ridge of soil along the side of the bed nearest the glass, with a larger quantity added to form mounds at 2 feet apart. When the soil has become warmed, transfer the plants to them, planting one in the centre of each mound. If there be a warm and cool end to the structure, the earlier fruiting varieties should be placed at the warmer end. In planting make the soil firm, and give it a good soaking of tepid water when the operation is finished. Allow the main stems to grow until within 1 foot of their allotted extremities before stopping them, and stop all lateral growths at the first leaf on the lower half of the stem. The "breaks" from these laterals will show female flowers, and come into bloom with those at the top of the plants, and afford a good chance of securing four fruits of equal size to form a crop. Suppress all growths that may appear on the laterals, and those beyond the second leaf from the fruits. Maintain a temperature of from 70° to 75° in the house at night, and 5° more with fire-heat during the day, and from 15° to 20° higher with sun-heat. Ventilate with care, and avoid draughts of cold, cutting wind. Well sprinkle the beds and paths with water on bright days; when the external conditions are inimical to plant growth, less air with a moist atmosphere may be maintained.

FIGS that were started in the early part of January will now be making fresh growth. As Figs fruit most freely that have a clear stem emerging from the soil, all growth springing from below it should be cut off. Pinch out the points of all strong shoots at the fifth or sixth leaf, and remove weakly ones not required to fill space. Use water at a temperature of 65°, and apply liquid manure, if the plants are carrying good crops. Maintain a minimum temperature of 60°, with a maximum of 80°, and syringe the trees twice daily. Water may also be freely used in the house during sunny weather, to obtain humidity.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

SOWING SEEDS.—In a former calendar, I advised the preparation of a frame for the sowing of Brussels Sprouts, Cauliflowers, Cabbages, and such like, when early vegetables were required, or a deficiency of the two last named and Lettuce existed. The young plants will now be above ground, and

requires careful ventilation to prevent damping. Carrots and Potatoes in frames will need similar treatment to prevent a spindly growth. Radishes, if sown too thickly, should be thinned. Carrots of the Early Nantes kind may be sown on a warm sheltered border. Cover the seed with a light soil; some of the siftings from the potting-ash answers well. Radishes may now be sown in a similar position.

PEAS—Some of the early wrinkled kinds may now be sown on a warm border. There are none better for this purpose than Veitch's Selected Early, Chelsea Gem, and William the First. Those sown in pots or turves in frames must be fully exposed in fine weather, so as to harden them previous to planting out next month. Those just coming through the ground should have some soil drawn up to them, and then place some Laurel or Spruce twigs on each side of the rows to prevent damage from wind. Ground for the main crops should now be prepared.

BROAD BEANS, if sown in boxes, should get free exposures in fine weather, and be kept as dwarf as possible. These will be ready to transplant early in March. Lift them out in clumps, and plant in good soil on a warm border, earthing-up well to shelter from cold winds. Some rows of the Early Longpod section or Beck's Dwarf Gem may now be sown in rows 3 feet apart. Another sowing should be made three weeks later, using some of the Windsor type for succession.

FRENCH BEANS.—Reserve a warm south border for some French Beans, for although it is out of the question to sow for some weeks, yet it is necessary to get a piece of ground into condition by frequently forking or stirring the surface. Those who have frame room would find it advantageous to sow Mohawk or Ne Plus Ultra in 48-pots in a light compost. If given proper attention, these will be ready for planting out in April, and, if covered with hand-glasses, will produce Beans some weeks in advance of those sown direct in the open ground.

VARIOUS.—The ground for Onions should also be got into condition by frequently stirring the surface. Early Paris Market or Golden Queen Lettuce should be sown on a warm border; also Leeks and Spinach, the latter in small quantities at intervals. Shallots and Garlic can now be planted in rows 1 foot apart, making the ground firm before planting, and pressing the bulbs firmly in the soil. Potatoes may be planted on a warm border, using Veitch's Early Ashleaf or Sharpe's Victor, if protection can be given afterwards.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Gardens, Swansea.

INDIAN AZALEAS.—Plants which were forced early, and of which the flowers are now faded, should be examined, and if there are any signs of thrips, either fumigate, or dip the plants in tobacco-water. Then place the plants in a structure where the temperature ranges from 55° to 60° at night, and a proportionate rise is maintained during the day. Syringe freely twice each day with tepid water, so as to encourage the young growths which commenced to start during the forcing period; stimulants may also be applied with effect at this season. Any plants requiring repotting should be allowed to make some growth first, as the roots of the Azalea do not commence to move until the shoots have started well into growth. Any plants that may have become thin should be cut well back, afterwards growing them in a brisk humid temperature, to encourage them to break, syringing freely on fine days. Care must be taken in watering until root-action commences, and the young shoots are plentiful. Plants required for late blooming should be placed forthwith in a house having a north aspect.

CHRYSAANTHEMUMS.—The earliest batch of cuttings will now be well-rooted, and if three or four are together in a pot, they should be potted off at once. Four-inch pots should be used, and these must be well drained. A compost of three parts loam, and one each of leaf-mould and sand, with the addition of a little manure from an old Mushroom-bed, will be found suitable for them. After potting, place the young plants in a cool pit or frame, keeping them close for a few days, until the roots have taken possession of the fresh soil, dewing them over once each day with the syringe when the outside temperature is favourable. Cuttings may still be put in for furnishing plants for decorative purposes, inserting them in a sandy compost, afterward placing them under hand-lights in ainery or Peach-house.

CALADIUMS.—The first portion of the stock of these plants may now be potted in a compost

consisting of equal parts of good fibrous loam and peat, and a good proportion of sharp sand, the drainage of the pots receiving special attention, abundance of water being required when in full leafage. Place the tubers just under the soil, not deeper, and sufficiently large pots employed to hold the tubers comfortably, with soil below and around them. For this, the first batch, choose the finest and best tubers. Until leaves commence to form, and root-action makes some progress, water must be sparingly afforded, and the temperature should not fall below 60°, with a proportionate rise in the daytime; and if the pots containing the tubers can be plunged in a hotbed of Oak leaves, having a heat of 75° to 80°, it will forward the starting of the roots. To ensure sturdy growth, the plants should be grown at a short distance from the roof-glass, and shaded during the warmest part of the day with some light kind of material.

ACHIMENES.—The first batch of tubers of these useful plants should now be started in shallow boxes or pans, transplanting them when large enough into baskets, pans, or pots. A good compost for these plants consists of one part loam, sifted finely, two parts leaf-mould, and a liberal quantity of silver-sand. Putcocks in the bottom, and rough siftings over them, and then fill to within 1 inch of the rim with compost; make the surface level, and place the tubers 2 inches apart over it, and cover them to a depth of half-an-inch with soil. If the soil be moist, scarcely any water will be required before the tubers have started, as if syringed gently on bright days, it will usually keep the soil sufficiently damp to induce growth. Bottom-heat ranging from 75° to 80° will be found of use in starting Achimenes, but a very moist atmosphere after top-growth has been made, and much syringing are not favourable to the health of the plants; the wetting of the leaves causing brown patches to come on them. There may be two or three successional batches according to requirements.

THE ORCHID HOUSES.

By H. A. BURNETT, Orchid Grower, Highbury, Birmingham.

APHIDES.—These are numerous, and cause a great deal of labour in their extirpation, it being essential for the well-being of the plants that their numbers be kept in check, and as other work is now approaching no time should be lost in taking means to destroy them. The camel-hair brush and a piece of sponge are constantly in request in this direction, and if used by skilful hands there is no doubt they are effectual means of destruction, at the same time to be freed from aphides without other means is well nigh impossible.

INSECTICIDES FOR DIPPING.—Tobacco-water made by soaking common twist with quassa chips and soft-soap in proportion, makes a solution which is both safe and trustworthy, and into which plants may be dipped for a few seconds when thrips or aphides are present. When made strong, and it is washed off the plants with clean water, it is safe to use; or the solution may be made weak, and then it is safe if allowed to dry on the plants, a method which I prefer. But any insecticides whether used weak or strong may cause the young growths to rot, therefore if any of it lodge in the axils of the leaves it must be carefully dried out with a camel-hair brush. The young tender growths of Chysis, Phaius tuberculosa, Colax jugosa, and others with similar tender foliage are very susceptible to injury in this way if care be not taken.

FUMIGATION.—This is a great assistance, and it can now be applied without danger of injury to either foliage or flowers, employed either in the form of Campbell's Kolls or McDougall's Sheets. I use them in every house in accordance with directions issued with them, two or three times in succession, as the case may seem to demand. I have not observed any bad result from the use of these, but the plants and the atmosphere should not be over dry when fumigation is performed, but the foliage must not be wet.

SYRINGING.—The indiscriminate use of the syringe as a check on the spread of insects is not good practice, either with clear water, or water diluted with an insecticide, the result being oftentimes the reverse of satisfactory.

SCALE.—This pest, which clings so tenaciously to the leaves of Saccolabiums and Aërides, should not be removed with a pointed stick, as it is both tedious and dangerous; and if scale exists in large numbers, a good plan is to make a lather with yellow soap, and paint the leaves with it, letting it remain on them about five minutes, afterwards washing it off

with a sponge and clean water. If the scale should still cling to the growths, a little rubbing will remove it. A species of scale which infests Cattleyas and Lælias, is destroyed in the same manner, taking care, however, to place a piece of sponge round the base of the pseudobulbs to prevent the lather getting down to the roots.

COCKROACHES.—The best remedy I have yet found for these depredators is the well known "Chase's Beetle Poison," which should be used at regular intervals, in places where they are most likely to harbour.

WOODLICE.—These should be sought after, and some of the various traps distributed about the houses. The new roots of Orchids will soon be pushing forth, and it is these that woodlice destroy.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Louford Castle, Salisbury.

SEEDLING PANSIES.—There are numerous varieties of this old-fashioned and still popular flower now in cultivation. The Pansy is effective in whatever manner planted, and particularly so when planted in mixed beds of flowering and foliage plants of varying height, forming a nice contrast to other mixed beds having a groundwork of the blue or yellow Viola, Mesembryanthemum cordifolium variegatum, &c. The Pansy grows well in rich soil, inclining to be light and sandy; but for choice varieties which the gardener is desirous to grow thoroughly well, a border having either an east or west aspect should be selected, and soil made suitable for the needs of the plants if not naturally fit, excavating it, and replacing it with rich well-manured soil to a depth of 1½ foot. Before setting out the plants, a dressing of soot or wood-ashes should be forked into it, which will save the roots from the attacks of the grub, wire-worm, &c. Allow a space of 12 inches from plant to plant for weak growers, and 3 inches more for robust ones. Where a stock of summer-struck plants does not exist, seeds of the desired varieties may be sown instead, doing this without delay in pans or shallow boxes nearly filled with sifted light sandy mould. Cover lightly, water gently, and place in a hotbed frame. The young plants will soon come up, and should be pricked into well-drained boxes or pans, at a distance of 3 inches apart, returning them to the warm bed, watering, and shading them when necessary. When the roots have taken to the soil, shade them no longer, and gradually harden them off by planting-out time. I may remark, that for bedding purposes the fancy Pansies are to be preferred to the show section.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Barkham Court, Maidstone.

TOP-DRESSING WALL FRUIT TREES.—This is a very necessary operation, especially in the case of Peaches and Nectarines, also trees that are showing signs of sluggish root-action. We grow many Peaches and Nectarines upon south-west and east walls with excellent results, which may be attributed to top-dressing. The most important point to bear in mind in top-dressing fruit trees is, to bring the new soil in contact with the roots; not just a few roots that are usually found near the surface, but those which have been driven much deeper than is good for the trees. The method I practice is to remove the soil until a nice number of roots are found. The mixture should then be worked underneath and about the roots, bringing the latter up as near the surface as is reasonable; make the soil quite firm in all crevices. Two or three inches only of the new soil should be placed on the top, and do not fill up the border to its usual height. A great bulk of soil placed over the roots is detrimental to the trees, and by no means conducive to good-flavoured and highly-coloured fruit. Where good loam can be obtained, this should form the principal ingredient for top-dressing; but if it is of a very clayey nature, plenty of burnt earth and mortar-rubble should be added. A good compost for Peaches is, four parts of turf and one part of rubble, adding more or less according to the tenacity of the loam. If available, a few half-inch bones, or bone-meal, can be advantageously added, but on no account apply animal manure; this can be more usefully employed as a mulching later in the season. For Apples and Pears, a little thoroughly decayed manure, well mixed with the above materials, can be used. The contents of an old Mushroom-bed make an excellent stimulant for these trees.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING

SATURDAY, FEB. 27—Royal Botanic.

SALES.

MONDAY,	FEB. 22	Hardy Perennials, Phlox, Carnations, Home-grown Lilies, &c., at Protheroe & Morris' Rooms.
TUESDAY	FEB. 23	Nursery Stock Sale at the Nurseries, Ashgate Road, Chesterfield, by Protheroe & Morris (three days). Important Clearance Sale of Nursery Stock, at the Gasfield and Common Nurseries, Richmond, by Protheroe & Morris (two days).
WEDNESDAY,	FEB. 24	Greenhouse Ferns, Palms, Azaleas, Roses, Panormitis, Aspidistras, &c., at Protheroe & Morris' Rooms. Freehold, Fruit, and Market Garden Wood, at 41, the Mart, London, by Protheroe & Morris.
THURSDAY	FEB. 25	Lilium longiflorum, Tree Peonies, Seeding Gladioli, Pearl Tuberoses, &c., at Protheroe & Morris' Rooms. Clearance Sale of Stove and Greenhouse Plants, at Downshire House, Roehampton Lane, S.W., by Protheroe & Morris.
FRIDAY,	FEB. 26	Great Sale of Cattleya labiata, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°.

Few pests are more destructive than the grubs usually known as wire-worms. As is the case generally with popular names, different things are included under the same name, but the name should be applied solely to the true wire-worms which are the larvæ or grubs of the click beetles. Most of our readers know too well the appearance of the long, slender, stiff, wiry grubs, but comparatively few associate them with the small jumping beetles which represent the perfect stage of the insect. Farmers dress their land with salt, lime, particularly gas-lime, and roll the land well, so as to check the progress of the insect, and many grow Mustard or Rape as a cleaning crop. It must be admitted, however, that the measures heretofore adopted, whether of prevention or of destruction, are by no means wholly satisfactory. When, therefore, we took in hand the thirty-third *Bulletin* of the Agricultural Experiment Station of the Cornell University at Ithaca (New York), and saw that it was devoted to the consideration of the best method of preventing the ravages of wire-worms, our hopes were raised. We had not read far however, before we came to this ominous passage:—"We have failed to discover a single satisfactory method of protecting seed, or of destroying immature wire-worms in the soil." In spite of this want of success, the experimenters,

JOHN HENRY COMSTOCK and MARK VERNON SLINGERLAND, the entomologists of the station, have done well to publish their results, which show the futility of certain plans frequently recommended, and may tend to save cultivators from continuing practices that involve considerable labour and expense, and that produce no beneficial results.

We have not space to point out in detail the methods employed by the experimenters, but with a view to show how thorough were their investigations, we cite the following details:—

"In conducting our experiments, both defensive and offensive measures were undertaken. Thus we tried to protect seed by coating it with poisons, and by treating it with various substances that we hoped would render it distasteful to the insects; and we tried to destroy the insects in each of the three stages of their existence, larva, pupa, and adult. Experiments in the destruction of the eggs were not undertaken for lack of opportunity. The following table indicates the scope of our experiments, and the order in which they are discussed:—

"A. Protection of Seed.

"1. By a coating of Paris Green and flour; 2. By a coating of tar; 3. By soaking in a salt solution; 4. By soaking in a copperas solution; 5. By soaking in a chloride of lime and copperas solution; 6. By soaking in kerosene oil; 7. By soaking in turpentine; 8. By soaking in a strychnine solution.

"B. Destruction of Larvæ (Wire-worms).

"1. By starvation; (a), clean fallow; (b), Growth of supposed immune crops, such as Buckwheat, Mustard, Rape.

"2. By the use of Insecticides.

"(a) Substances that act merely as insecticides, kerosene oil, pure and as an emulsion; crude petroleum, pure and as an emulsion, poisoned dough, biulphide of carbon.

"(b) Substances that act also as Fertilisers.

"Salt, kainit, muriate of potash, lime, chloride of lime, gas-lime.

"C. Destruction of pupæ and adults (click-beetles).

"1. By fall ploughing; 2. By trapping."

Full details are given as to these several plans, some of which, such as the use of carbon bisulphide, are effectual, but too costly to be worth carrying out in practice. Salt neither drives the wireworms deeper nor causes them to migrate any appreciable distance. Gas-lime is only partially effective, and its effects are very transient. Autumn ploughing and allowing the ground to lie bare for some months has the effect of destroying the beetles in the soil, and thus preventing their maturing and depositing eggs the following season. If the ground be thoroughly tilled, and pulverised after ploughing for some weeks, a winter crop may be sown, and by this method of short rotation of crops the land may be gradually rid of the pests. This, then, is the method that is recommended by the reporters, and for agricultural purposes it is no doubt excellent. In the garden and in the newly-formed pleasure-grounds the method is not so applicable. Under these circumstances the use of poison is recommended. Small handfuls of freshly-cut clover were dipped in Paris Green water, of what strength it is not stated, and the poisoned herbs placed under boards in various parts of the field. This plan obviously needs to be carried out with much circumspection, to prevent injurious or fatal consequences to other creatures than wire-worms.

Lectures on
Technical
Horticulture.

In spite of adverse opinions in unexpected quarters, we are highly pleased to be able to record that so far they have met with a measure of success greater than might have been

anticipated from a first experiment. Given a lecturer who knows his business, and the exact requirements of his auditory and we believe that the balance of good will largely preponderate, and that the few objectors will hereafter have cause to smile at their own fears. True, the lecturer himself has, in some cases, to be trained and should be sufficiently in touch with the workmen to know not only what they want, but what they ought to want.

From Cambridgeshire, to cite only one out of many instances that have come to our knowledge, we hear that the attendance on Mr. FISH's lectures has been as follows: Feb. 1, Thriplow, 60; 2, Melbourn, 80; 3, Haslingfield, 100; 4, Harston, 70; 5, Barrington, 80. Second week: Feb. 8, Thriplow, 100; 9, Melbourn, 200; 10, Haslingfield, 140; 11, Harston, 91; 12, Barrington, 160.

Illustrations of pruning will be given in an orchard at Mildrith on Tuesday next at 3 P.M., to which all interested are invited.

At these meetings parsons, squires, ministers, fruit-growers, land-owners, and mechanics attend, and deep interest is taken in the proceedings, especially in the practical demonstrations.

Hospitality and kindness meet the lecturer on all sides.

It is impossible to believe that such practical demonstrations in the rural districts, conveying useful knowledge usefully taught, can fail to do good and set cultivators thinking. As we have advocated the course now being followed for years past, we are naturally highly interested in its success, and we should be greatly obliged if the several lecturers, in connection with the County Councils, would communicate to us their names, the districts in which they are at work, and a general indication of the method pursued by them.

The future publication of such details would lead to interesting comparisons, show what to do and what to avoid in future. The very making public the list of those who have undertaken the work would do much to silence objectors, and to show that knowledge and intelligence must not only be the best possible aids to practice, but really the principal means of turning that practice to account.

KEW.—As we have already mentioned, the year 1891 was the jubilee of re-organised Kew. The occasion has been seized to issue in the *Kew Bulletin* an historical account of Kew as it existed prior to 1841. We shall take an early opportunity of making further comment on this interesting document, of which we can at the moment only make passing mention.

HOOKE'S "IGONES PLANTARUM."—The plants figured in part iv., January, 1892, are exclusively Indian Orchids, and chiefly of botanical interest. *Phreatia nana*, a minute flowered species, has regular six-petaled flowers, and an erect column, with a terminal anther—a morphological curiosity, or perhaps a pelorite form. *Ipea Wrayana* is a handsome Malayan species, which should be looked after. *Spathoglottis Wrayi*, t. 2086, is another Malayan species, which our collectors should be on the look-out for. *Ceratostylis malaccensis*, t. 2096, is most remarkable in its resemblance to a Rush *Juncus*, not only in its scapes, but the clusters of minute flowers.

"THE BOTANICAL MAGAZINE."—The plants figured in the February number are:—

Primula imperialis, tab. 7217.—This is a native of Java, with the general aspect of *P. japonica*, but the leaves are more markedly crinkled, and the whorled flowers are smaller and of a yellow colour. It is a

FIG. 34.—CYPRIPEDIUM CHAMBERLAINIANUM, FROM FRESHLY-OPENED FLOWERS. NATURAL SIZE.
COLOURS: WHITE, ROSE, AND PURPLE. (SEE P. 234.)

native of the mountains of Java, at an elevation of from 8,000 to 9,000 feet, and may be serviceable for hybridising purposes.

Hydnophytum Forbesi, t. 7218, is one of those curious plants whose tubercous root-stocks afford a home for ants. The plant does not seem to be injured by the ants, which repay their obligations by keeping off undesirable visitors. The plant in question is cultivated in the Royal Gardens, Kew, where it flowered in 1889 and again in 1891.

Begonia glaucochylla, t. 7219.—A plant of unknown origin—possibly a garden hybrid. In any case, a very beautiful form, with spotted stem, oblong-lanceolate leaves, and pendulous short-jointed clusters of pink flowers. Grown as a basket plant it is very handsome. *Kew*.

Vicia narbonensis, tab. 7220.—The chief interest attaching to this species is that it has been supposed to be the origin of the common field Bean (*Vicia Faba*). Judging from the figure here given, those who indulged in that supposition must have had an extraordinarily vivid imagination, for it is scarcely possible to have imagined two plants of the same genus more different in appearance.

Neo-Benthania gracilis, t. 7221.—A coloured figure of the very singular terrestrial Orchid, described and figured by Mr. Rolfe in our columns in 1891, vol. x., p. 272. It is a native of Zanzibar.

FORESTRY LECTURES: UNIVERSITY OF EDINBURGH.—The Council of the Royal Scottish Arboricultural Society announce to the members and others interested, that the course of lectures on "Forestry" is about to be resumed in the University by Colonel BAILEY, R.E., a distinguished forest officer. The Council urge landowners, foresters, and all interested in forest education to take advantage of these lectures, which began on the 10th inst. Landowners would do well to send one or more foresters to attend the course, and they would thus derive immediate benefit by the employment of men instructed both in the art and science of forestry. The Council point out the excellent opportunity which these lectures provide to intelligent youths for acquiring a thorough scientific knowledge of their profession. To enable them to take advantage of the lectures, the Council have arranged that young men who desire employment while attending the course can obtain it in the nurseries, or elsewhere, near Edinburgh, on applying by letter to W. J. MOFFAT, Esq., Secretary and Treasurer, 5, St. Andrew Square, Edinburgh.

GHEENT HORTICULTURAL MEETING.—Certificates of merit were awarded at the last meeting for the following plants:—1st, *Odontoglossum pulcherrimum* ×, a new hybrid of the *Alexandree* type, shown for the first time; the form is beautifully rounded, the colour white, the edges slightly yellowish, and the entire flower evenly spotted with brown. 2nd, *Odontoglossum Holfordianum leopetrum*, a rare variety with large flowers, the ground golden yellow with large brown spots. 3rd, *Masdevallia ignea perfecta*, an entirely new variety, imported from Columbia and flowering for the first time; it has never before been shown. The flower is exceedingly beautiful and very large, in colour purplish flushed with dark blue; this is one of the most beautiful forms of ignea. 4th, *Masdevallia ignea aurora*, another novelty from Columbia, and flowering for the first time; the habit is very distinctive, the colour flame-orange. 5th, *Amaryllis flammea* ×, a new hybrid remarkable in habit and form, deep red with very fine wavy lines of white. These five fine novelties were from M. CH. VDTLSTREE, of Loochristy. 6th, a species of *Odontoglossum* from M. JULES HYE; a magnificent flower, the ground pink, the sepals and petals fringed, bordered with white, the mid-rib whitish, each sepal and petal having a large brownish-red spot surrounded and underlined with smaller spots of the same shade; the lip has a golden-yellow ground, with tiny spots, the edge white, very finely fringed—the flower is robust. 7th, *Odontoglossum Pescatorei album*, from the same Orchidist, the flowers very fine, pure white, numerous and very fresh. 8th, *Odontoglossum sul-*

phureum, also from M. J. HYE, flowers sulphur-yellow and very distinctive, the several parts of the flower have a small circular spot of brownish-red, which is repeated on the lip. 9th, *Pteris Wallichiana*, from MM. DURIEZ FRÈRES, of Wondelgem, a plant interesting among the many novelties recently introduced. Certificates of Merit were awarded for:—1st, *Adiantum venustum*, to M. SPÆE, Vandermeulen, a very pretty species in vigorous health; 2nd, *Nephtytis picturata*, from the Congo, to M. L. DESMET DUVIVIER, a dwarf plant, with fine leaves of unusual size; 3rd, to MM. E. VERVAET ET C^{IE}, for *Cattleya Masereelii*, a white-flowered variety. Honourable Mention was awarded for:—1st, *Cattleya Trianae*, to MM. VERVAET ET C^{IE}, the lip very dark in colour; 2nd, *Cattleya Trianae*, to the same exhibitors, the lip fringed—very pretty; 3rd, *Miltonia vexillaria*, to M. ALF. VAN INSBOOR, flowers large and dark; 4th, *Microlepia hirta cristata*, to MM. DURIEZ FRÈRES; 5th, *Cologyne Lemoniana?* delicata, to M. J. HYE.

ACREAGE OF FRUIT IN GREAT BRITAIN.—Prominent attention has lately been called to the extending cultivation of fruit in different forms in Great Britain. A relatively large advance is now reported in the *Agricultural Returns of Great Britain* for 1891. The area under small fruits now exceeds that used for Hops, 58,700 acres being returned, compared with 46,200 acres in 1890, and 36,700 acres in 1888, the year when this form of cultivation was first separately recorded. By the introduction of a newly-arranged table this particular area has been more closely analysed than has hitherto been possible, and it will be seen that on 23,416 acres small fruit is grown in plots already returned as orchards; that is doubtless under the larger fruit trees; while 22,510 acres in market gardens, and 12,775 acres of ordinary farm land are now returned as carrying Gooseberries, Strawberries, Currants, and other small fruit. The small fruit area has increased in every county of England and Wales, and in some counties by a remarkable percentage, although nearly a third of the English small fruit area is still to be found in Kent. The changes are not so uniform in Scotland, although there also a larger fruit acreage is reported. The ordinary orchard surface in Great Britain is likewise greater, covering, in round numbers, 210,000 acres. The area, ten years back, was given as under 185,000 acres. A still larger advance appears in the returns of land used by market gardeners for the growth of vegetables, and other garden produce. These were reported as covering 46,604 acres in 1881, while the figures for 1891 make the market garden area 81,368 acres.

TOOPE'S FOG-ELIMINATING PLANT-HOUSE.—As suggested in our issue for November 28, p. 650, when making mention and giving a small illustration of Mr. Toope's invention for mitigating, if not altogether eliminating, the injurious effects of London fog on plants, we have made two visits, and on both occasions have had our previously-formed favourable opinion verified. Situated in the corner of his factory-yard, in one of the foggiest districts in London, viz., Stepney Green, Mr. Toope has erected his experimental house in two divisions. Heated on his own plan, fitted with his chemically-charged air-filters, his charcoal-filters for the water used, and a new and perfect plan of ventilation, it must be said that the plants in the houses, which, it will readily be supposed, could not exist under ordinary circumstances, are in the best health, and progressing well, although the experimenter has fairly enough only begun with small, and in many cases, weak specimens, Orchids being the plants chiefly grown. The evidence of the production and duration of the flowers is a great point; and both in November and December a good show for so small a collection was found. Last week we found some *Cattleya Trianae* in bloom, *C. citrina*, showing flower strongly; several *Dendrobium Wardianum*, a fine *D. crassinode*, *Cologyne flaccida*, *Zygopetalum Mackayii*, *Odontoglossum Rossi majus*, with seven blooms; a fine *O. maculatum*, which, to our certain knowledge,

has been in bloom since the middle of December, and in one corner was a small case in which were plants of *Anacochilus petola* and *Goodyera discolor*, besides others. If regarded only as a system of perfect ventilation, the invention is a good one, and deserves a trial by those who try to grow plants in large cities and smoky manufacturing districts.

SHREWSBURY HORTICULTURAL SOCIETY.—At the annual meeting on the 11th inst., the Mayor presiding, a balance-sheet was produced, showing the income of the Society for the past year to have been £334 10s., as compared with £2963 in 1890—the highest amount ever reached by the Society in one year. The subscriptions for the year amounted to £428 7s., and the receipts at the exhibition in August last were £2796. The amount of prize-money was £428 7s. 6d.; amusements and fireworks cost £421; bands, £253; and the profits on the year's exhibition was £970. A sum of £500 has been added to the invested capital, which now amounts to £3500. Since the Society started, the annual balances have been expended in the improvement of the public grounds in the Quarry, the Free Library, and some money has been given to the charitable institutions of the town, last year £753 being so expended. The balance in the bankers' hands amounts to £747.

BIRMINGHAM GARDENERS' ASSOCIATION.—At the last meeting, an admirable paper on "The Gloxinia, 1739 to 1892," was read by Mr. J. MARTIN (Messrs. SUTTON & Sons), in which the history of its introduction and improvements were sketched, and instructions given as to culture. Anyone who has visited Messrs. SUTTON & Sons' nurseries when the Gloxinias are in flower, will know full well that Mr. MARTIN is an excellent cultivator and cross-breeder of them. On the following evening, the second annual social meeting of members and their wives took place at one of the largest hotels, and about 140 persons were present, Mr. W. B. LATHAM, of the Botanical Gardens, presiding.

THE WEATHER IN THE MIDLANDS.—Mr. J. W. WOODFORD, Atherstone, says that "On February 15, it was snowing hard all day, with gale from north-east, thermometer 26°; altogether, the most wintery day we have had."

A VENERABLE CAMELLIA.—Probably there is no exotic tree or shrub in West Cornwall with a more interesting pedigree than the Camellia at Penvalern, Penzance, writes the *Western Morning News*; and like so many other things with a glorious past, its future is an unknown quantity, except in the rapidity of its decay. It is but a wreck of its former self, and the merest imitation of the blizzard of last March will completely settle it. Half-a-century ago there were scarcely any Camellia trees in West Cornwall, and for a very long period, up to last year, the one in question maintained its reputation as being the largest in the county. When in full bloom, its magnificence could not have been excelled by any single specimen in its native country, Japan. It reached an altitude of nearly 20 feet, and possessed a circumference of nearly three times its height. It was, at its prime, so densely covered with flowers that to photograph it was impossible. The young tree was brought about half-a-century ago by the late Mr. T. S. Bolitho from the gardens of his father-in-law, in North Cornwall, and the vigour with which it grew and thrived in the genial locality of Penzance was little short of marvellous.

"NATURAL SCIENCE."—Messrs. MACMILLAN & Co. announce the publication of a new monthly scientific review—*Natural Science*—devoted more especially to the interests of biology and geology. The first part of *Natural Science* will be published on March 1, 1892.

BRUSSELS BOTANIC GARDEN.—A member of the Belgian Parliament has denounced as excessive the sum expended on the Botanic Garden, which sum we believe is ridiculously small. He pro-

posed that the plants in the garden should be utilised for public fêtes? Why, the Honourable Member asked, should not the State keep such ornamental plants as it requires in its own garden? The Minister of Agriculture judiciously observed that the garden must preserve its scientific character, and furthermore, that it actually grows as many as 40,000 plants, which are used in the squares of Brussels. We can but regret the attacks which are frequently brought against scientific institutions by worthy people who do not understand what they are talking about.

THE THIRTEENTH GHENT QUINQUENNIAL.

The programme of the floral fête to be held in April, 1893, by the Société Royale d'Agriculture et de Botanique of Ghent will be published in March, but we can now mention a few of the new arrangements which have been made. The section devoted to flowering Orchids will include many important competitions, but in each the exact number of specimens to be sent will be mentioned, with one exception—"The largest collection of Orchids of different species, each species to be represented by one example only." There will be no fewer than twenty-five classes open for well-grown and bloomed specimens. In addition to the general classes open for Orchids, there will be twenty-five special classes, to which important prizes will be awarded. This will be a really monstrous exhibition of Orchids. A series of special competitions, with prizes for the finest flowering plant of each of the following genera will be arranged:—Allamanda, Abutilon, Azalea indica, Andromeda, Boronia, Camellia, Choisya, Chorozeana, Citrus sinensis in fruit, Clerodendron, Cliveia, Cochlostema, Correa, Cytisus, Daphne, Diasma, Epacris, Erica, Eriostemon, Euphorbia, Genethyllis, Grevillea, Hebeclinium, Lapageria, Lasiandra, Libonia, Medinella magnifica, Metrosideros, Mimosa, Mirarria, Pimelia, Polygala, Rhododendron, Rose, Sparmannia africana, Stephanotis, Streitzia, Wistaria, &c. Important awards will be given in each of these classes, and a special hall will be arranged for them. The 25th section will be of very great importance; it is reserved for such exhibits as tend to further instruction in botany. It comprehends classes for collections of plants of different type; of Orchids preserved in fluid; many classes for specimens of certain species of plants grown under certain prearranged conditions—without manure, or with chemical manure, in various soils, &c.; specimens of plants obtained by self-fertilisation, the hybrids to be accompanied by the species or varieties from which they have been raised. Microscopic preparations showing the development of the seed and the embryo of a phanerogamic plant, the various stages of development, the various methods of reproduction, &c., of a thallophytic plant. A collection of fifty specimens, giving a complete representation of a plant from the Congo, important from a commercial standpoint. In other ways, also, this thirteenth quinquennial exhibition will certainly not be inferior in interest to those which have preceded it.

SENECIO SAGITTIFOLIUS.—M. ANDRÉ gives, in a recent number of the *Revue Horticole*, an account, with illustrations, of a noble Senecio that he met with in Uruguay. The radical leaves are in tufts, each about a yard long, and often provided on the upper surface with a central crest along the midrib, such as is met with on the under-surface of the leaves in *Xanthosoma*. From the central tuft there rises a stout stalk, 6 to 7 feet high, with lanceolate leaves, covered with white down on the under-surface. The summit of the stalk bears a large, loose corymb of numerous white Aster-like flower-heads. The plant, which will be very ornamental, has been introduced into Touraine by M. ANDRÉ, and it is to be hoped it will resist the climate of Paris if slightly protected in winter.

STOCK-TAKING: JANUARY.—The most remarkable feature in the Board of Trade returns for the past month is the great increase in the amount of imports from foreign countries and British colonies and possessions; this increase amounts to no less a

sum than £4,744,102, and this is spread over nearly every section into which the elaborate returns are divided. Evidently British merchants and manufacturers, having cheap labour, elaborate machinery, a great supply of raw material at a reasonable price, are prepared to fight all foreign tariffs with a pluck which is simply indomitable, worthy of all praise and imitation. Surely this is the way in which to open the year's campaign, unfavourable as the balance may have been for "the year that's awa'." The following is our usual excerpt from the "Summary" of imports for January:—

IMPORTS.	1891.	1892.	Difference.
Total value for month	£33,741,082	£38,485,241	+4,744,162
II.—(A.) Articles of food and drink—			
duty free	9,409,912	11,563,380	+2,153,468
(B.)—do., dutiable	1,929,831	2,006,815	+76,984
VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute),	10,413,376	11,887,376	+1,474,000
VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,378,263	2,423,044	+44,181
IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,124,269	1,414,180	+319,911
(B.)—Parcel Post ...	63,209	54,430	—8,779

How does all this compare with what we read of in the French and Spanish journals respecting the tariff recently formulated there! One is not surprised to find how very rapidly prices to the consumer are going up—nor need surprise be felt if statesmen and capitalists in the "protected" States find a rude awakening from their dream of so-called protection to native industry. That, however, is their business—we can only appease the spirit evinced by our capitalists and statesmen, and cheerfully await the results. We ought not to forget making mention of the deficit on the export side, which amounts to the sum of £687,611—a much lower figure than had been anticipated—compared with previous deficits. We come now to the imports of fruits and vegetables from foreign countries, &c. It may be remarked that in all preceding Returns there have been two very unsatisfactory items—"Fruits, raw, unenumerated," and "Vegetables, raw, unenumerated." It appeared to us that these unsatisfactory records might be amended, and we communicated with the President of the Board of Trade on the subject, drew his attention to the fact that English growers would be benefited by "enumeration." The President promised attention. It will be seen by the annexed table of imports during the past month that the list of unenumerated articles has been reduced in the matter of fruits—vegetables still remain to be dealt with. The figures extracted are as follows:—

IMPORTS.	1891.	1892.	Difference.
Fruits:—			
Apples, raw ... bush.	117,382	326,826	+209,444
Plums	3	+3
Pears	3,742	+3,742
Grapes	334	+334
Unenumerated, value	£15,439	£6,965	+£1,556
Onions bush.	222,672	311,925	+149,253
Potatoes cwt.	53,685	66,268	+12,583
Vegetables, unenumerated, raw, ... value	£30,379	£55,617	+£25,238

TASMANIAN APPLES.—The lovers of Tasmanian Apples will be glad to learn that the crop to be shipped is of excellent promise—good and full; so says Sir E. Braddon, the Agent-General. More than this, he says that freight for 210,000 bushels has been taken up by the Orient and P. and O. companies' steamers. The vessels will

make twelve calls—once a week for three months; and should the market here be a fair one, more than the number of bushels above mentioned will be sent over to the mother country. The first shipment will soon be on the sea—six weeks is the duration of the voyage. Reminded of the very ordinary quality of much of the supply last year, Sir E. BRADDON stated that the Colonial Fruit-Growers' Association had been cautioned as to the result, and he believed they would show that they had not misread the lesson. The reader will have noticed that the amount promised exceeds last year's total by 100,000 bushels. Respecting the supposed disappearance of the best English Apples from the market—supposing such to be the fact—they must be stored away at home, for no refrigeratory company has been approached on the subject, so far as we can learn. The post-office authorities cannot help us in the matter of sale by sample; it would appear useless to try railway companies for information; and inquiries made among growers here and there, again appear to be some diffidence in trying an independent action in provincial towns. To largely preserve fruit in the face of expected imports would not appear to be a very sound policy, and we believe that growers as a rule are quite capable of weighing the chances. Possibly, then, there has been some misunderstanding about the disappearance of good English Apples from the London markets and fruiterers' shops.

THE CARNATION.—A third edition of Mr. DODWELL's handy little treatise on the Carnation has been published by Mr. B. Wynne at the office of the *Gardening World*, Clement's Inn, Strand. We commend it to the notice of Carnation growers for the excellence of its practical hints, but we may be excused for expressing a far less high opinion of the value of Mr. JEANS' so-called philosophy of florists' flowers than does Mr. DODWELL. Mr. JEANS' dicta are irreproachable so far as they go. To pieces of coloured cardboard cut to regulation pattern or any similar artificial production they would be excellent, but their special application to flowers considered as living beings endowed with hereditary "properties," continually subjected to many varied conditions and enervating various purposes, seems to have been almost entirely ignored by the essayist. The difference of habit induced by mode of propagation, whether by means of "piping" or by layers, is an interesting illustration of a phenomenon well-known in other plants, but the reasons for which are entirely almost unknown. The descriptive list will be valuable for reference, and readers will admire the honest enthusiasm of Mr. DODWELL's descriptions, and will reciprocate the kindly feeling which induces him to be tolerant even towards admirers of self and yellow grounds. May he be equally tolerant towards those who abhor the idea of "rule and compass, line and plummet" as applied to flowers, even by so thoughtful a mason as the late Rev. GEORGE JEANS.

PRESERVATION OF POTATOS.—The difficulty of keeping Irish Potatoes in edible condition in late spring is well-known to housekeepers, farmers, and merchants, says *Science*. Professor SCHRIEDAK, of the National College of Agriculture of France, has recently devised a very simple, cheap, and successful method by which he has been able to preserve Potatoes in edible condition for over a year and a half. This process has been adopted by the French Government for preserving Potatoes for the army. The French Minister of Agriculture publishes the details of the process in the official *Bulletin du Ministère de l'Agriculture* for March, 1891. The following is a translation of the essential part of the scheme. The method of preservation consists in plunging the tubers, before storing them away, for ten hours into a 2 per cent. solution of commercial sulphuric acid in water, two parts of acid to 100 parts of water. The acid penetrates the eyes to the depth of about one-fortieth of an inch, which serves to destroy their sprouting power; it does not have any appreciable effect upon the skin of the Potatoes. After remaining in the liquid ten hours, the tubers must be thoroughly dried before

storing away. The same liquid may be used any number of times with equally good results. A barrel or tank of any kind will do for the treatment. The acid is so dilute that it does not affect the wood. Chemical analysis shows that Potatoes treated by this process are as nutritious and healthful after eighteen months as when freshly dug; but they are of course worthless for planting. Attention is called to this method by **GERALD MCCARTHY**, N. C. Experiment Station, Raleigh.

THE HORTICULTURAL CLUB.—The annual dinner of the Club took place on Tuesday, the 9th instant, at their rooms, Hotel Windsor, Victoria Street, Westminster, and was, without doubt, the most successful one it has ever held. The chair was occupied (in the absence of Sir JOHN LLEWELYN, Bart., the Chairman), by **HARRY J. VITCH**, Vice-chairman, who was supported by nearly forty members and their friends. During the evening a selection of music, both vocal and instrumental, was given, under the direction of Mr. **GEORGE BUNYARD**, and several good recitations were given by Mr. C. T. **DEBRET** and others. The Chairman, after the usual loyal toasts, proposed "The Prosperity of the Club," and spoke in strong terms of the excellent work that had been done in bringing together those interested in horticulture, both amateur and professional, thus ably filling an existing void, and he wished it every success. This was responded to by the Hon. Secretary, who said they had reason to be satisfied with their position; they had this year been able to add to their small funded property, and had also been able to receive among them several of those gentlemen who had come to London to be present at the Royal Horticultural Society's meetings, and in many ways to advance the interests of horticulture. Mr. T. W. **GIRDLESTONE** proposed "The Royal Horticultural Society," which was responded to by Mr. H. J. **PEARSON**. The toast of "The Chairman," was given in sympathetic terms by the Rev. W. **WILKS**, whose remarks elicited warm approval from the guests. Some of the friends contributed some excellent dishes of Apples and Pears towards the dessert.

MANSON HOUSE ASSOCIATION ON RAILWAY AND CANAL TRAFFIC (FOR THE UNITED KINGDOM).—A general meeting of this Association, under the presidency of Mr. **DAVID HOWARD**, was held on the 15th inst., at the Cannon Street Hotel, and was well attended. Sir **JAMES WHITEHEAD**, Bt., was unanimously elected President of the Association, now re-constituted as a permanent organisation, and several Vice-Presidents were elected. The Council for the ensuing year were appointed, and it was decided to register the Association as a corporate body. Resolutions authorising the Council to petition to be heard in committee against the Railway Rates Provisional Order Bills recently introduced into Parliament, and expressing regret at the repetition in these Bills of the provisions unacceptable to traders which were authorised by the Railway Rates Acts of last Session, were adopted. The Council were also empowered to take action on behalf of the Association with regard to the revised schedules of rates and tolls, &c., deposited by Canal Companies with the Board of Trade, in accordance with the Railway and Canal Traffic Act, 1888. With respect to the Bill for the transfer of the Hull Docks to the North-Eastern Railway, and other similar Bills, the Council were directed to petition Parliament in opposition to any further acquisition, except under special restrictions, of docks and harbours by railway companies; and they were further directed to petition Parliament against the Medway Navigation Bill, by which the Navigation Company seek power to deal in merchandise which they convey as carriers, it being the opinion of the meeting that the conferring of power to trade in this way would be contrary to public policy. The office of the Association is at Eastcheap Buildings.

DISEASES OF PLANTS.—The following is the Syllabus of three lectures on "The Diseases of the Reproductive Organs of Plants caused by Parasitic

Fungi," to be delivered in the theatre of the Royal College of Surgeons on Monday, Wednesday, and Friday, February 22, 24, and 26, at 4 o'clock each day, by Professor **CHARLES BAGGE FLOWRIGHT**, M.D., M.R.C.S.

Lecture I.—Monday, February 22. Reproductive Parasitism. Introductory remarks. Reproductive Parasites: their apparent tendency to exterminate their hosts; total destruction of seeds exceptional. Indirect effects of Reproductive Parasites on their hosts: favour expeditious fertilization, rapid germination, segregation of hosts, increased root-action, number of blossoms, protection of hosts. Effects on the Floral Organs:—(a) Indirect: (1) Abortion, (2) Starvation, (3) Strangulation. (b) Direct: (1) Destruction of Floral organs, (2) Disease of the Anthers, (3) of the Ovaries, (4) of the Fruit. Concluding remarks.

Lecture II.—Wednesday, February 24. The Ustilagineae as Reproductive Parasites, with special reference to the Economic species. Antiquity of their recognition. Frequency of their reproductive parasitism. Organs affected. Bunt of Wheat: appearance, bunted flour and bread, structure of spores, entrance into host. The Smut of Cereals, not one species. Oak-smut: appearance, germination of spores, infection of host, preventive measures. Wheat-smut: morphology and physiology. The two Barley-smuts. The smut of Maize, infection of its host. The Anther-smut, its mode of attack. Smut of Figs and Dates. Concluding remarks.

Lecture III.—Friday, February 26. On Ergot. **Tulasne's** researches. *Claviceps purpurea*, morphology and physiology. Varieties of Ergot: Rye, Wheat, Dias, *Bromus secalinus*, *Elymus virginicus*. Ergotism, gangrenous and convulsive. Fatal case of Ergot-poisoning. Gangrene of the lung. Cataract, oedema of the skin, changes in the spinal cord. Effects of Ergot on animals: dogs, pigs, cows, horses, birds. Historical notice of Epidemic Ergotism: the Athenian Plague, *Ignis sacer*, *Ignis S. Antonii*. *Thucydides*, *Flodart*, *r. Reims*, *Dumont*, *Thalins*, *Verillart*. Geographical distribution. The Russian Ergot Commission, 1864. *Kobert's* researches. Ergotinic acid, properties and action. Sphaclenic acid, properties, action on fowls, pigs, rabbits. Cornutin, properties, effect on animals, action on the uterus. Concluding remarks.

THE MIDLAND CARNATION AND PICOTEE SOCIETY has issued its schedule for the coming season, in which they say that "it is the ambition and intention of the Committee to make this the largest and most representative annual exhibition of Carnations and Picotees in the kingdom, and should there be a good surplus, to liberally support the Gardeners' Orphan and Benevolent Institutions." The exhibition will be held at the Botanical Gardens, Edgbaston, on Saturday, August 6. Any further particulars may be had from Mr. **WILLIAM DEAN**, the honorary secretary; Mr. **ROBERT SYDENHAM**, Treasurer and Chairman of Committee, Tenby Street, Birmingham; or any other member of the Committee.

MR. BARR.—This enterprising Daffodil-hunter is once more about to proceed to Gibraltar, Southern Spain, and Portugal, back through Northern Spain to France, the Pyrenees, the Maritime Alps, and perhaps Italy.

BOOK NOTICE.

ELEMENTS OF AGRICULTURE. A text-book prepared under the authority of the Royal Agricultural Society of England. By **William Fream**, LL.D. (John Murray.)

In fewer than 500 pages, the Editor has contrived to compile an excellent elementary work, much of which is of use to the horticulturist, as well as to the class for whom it was specially compiled. The general scheme of the work was settled by a sub-committee of the Society, whilst suggestions have

been made, and revision of the proof-sheets have been accomplished by such authorities as Sir John Lawes, Sir John Thorold, Sir Jacob Wilson, Messrs. Ashworth, Bell, Bowen-Jones, Pole-Gell, D. Pidgeon, *Clare Sewell* Read, Dr. Voelcker and Miss Ormerod. The first part is devoted to the consideration of the soil, and the operations connected therewith. The second part comprises a general history of the plant as a living creature, with special references to the agricultural side of the question. In the third part, farm animals are dealt with in a similar manner. In turning over the pages we have been struck with the skill of the editor, who, while he has kept his book within very moderate compass, seems not to have omitted anything of importance. The information is given clearly and popularly, using the latter word in a favourable sense. Those who have endeavoured to condense scientific knowledge, and present it in a form suitable for general reading, will be surprised at the skill with which Dr. Fream has accomplished his task. His statements are not long-winded and prolix; on the contrary, they are clear and intelligible, though sometimes dealing with highly technical matters. A few slips must be expected in such a work, one such at p. 97 requires attention—a cross between two plants of the same species does not produce a hybrid; and fig. 26 can scarcely represent an Onion bulb. It would, however, be invidious to dwell on such minutiae, where the work, as a whole is so well done.

THE AMATEUR'S GARDEN.

THE VEGETABLE QUARTERS.

WINTER having now left us, definitely we hope, at least, as regards his hardest frosts and heaviest snowfalls, although some of our west-country readers who have bitter memories of the snowfall of last March may have their doubts. [Justified, we fear, since this was written. Ed.] Probably much of the outdoor operations of digging, turning gravel, planting and transplanting shrubs and trees have already received a certain amount of attention, but in case the time has hitherto been too short for everything in that way to be wiped off the memory, the present time should be made the most of, the man, boy, or the proprietor himself setting into the various jobs with goodwill. And here it may be said that a little digging is especially beneficial to those who lead sedentary and studious lives, strengthening the nerves and inducing sound sleep; but they must not, at first certainly, greatly fatigue or overheat themselves by digging too fast or for too long periods. We say, at first, advisably, and have the stout gentleman in our eye, as one who is especially apt to overdo the exercise of digging with the idea that the more hard work the less fat; those to whom it is not a new thing will need no caution from us. Here, a hint as to digging in general. Unless the digger possesses a No. 1 spade, which from the nature of things he would eschew, on account of its prodigious size, the digging should be of the kind called "bastard trenching," the word "bastard" in this connection meaning probably, a poor kind of trenching, but which really is a thorough kind of simple digging.

All that it is necessary to do is to line out the ground to be dug into strips 2 feet in width, and as wide as the piece is, the spade being held nearly upright, and thrust into the earth with the foot to the depth of 6 inches, and these spade-thrusts should be made close to each other. Wheeling soil long distances is a wasteful operation, but it may sometimes be necessary in carrying out a big job. It is sufficient if the ground to be dug be divided into half by stretching the line down the middle, and kicking out a small trench to indicate the line of division, then all that is necessary for the digger to do is to throw out the soil of his first trench on to the top of what will really be the last trench of the opposite half. Before this is done, the surface-soil of these first breadths should be shovelled clear of all the weeds and rubbish that may happen to lay on them. Having thrown out this soil in a ridge-like heap, proceed to shovel the top soil of the next

breadth into the hole thus left, and distribute it evenly at the bottom; and having executed this, the now cleaned soil should be thrown in on the top of the shovellings, breaking it up and commingling it, which in stiff soils is best performed with a steel five-tined fork—in a light one the spade is the better implement to use, and so on till the end of the piece is reached, and the last trench thrown out. Into this trench will be thrown the shovellings and soil from number one trench on the opposite half of the piece of ground. It is now too late for the real trenching of the land for early crops, but it is in the above manner that two, and in very good land which has been long under the spade, sometimes three spits are turned over, and capital work it is on frosty days, for those whose backs are strong, and who do not lack muscle. When the soil has settled somewhat, and been dried by sun and wind, it may be forked over, 4 or 5 inches deep, after previously receiving a dressing of soot, lime, burnt earth, sand, and fine coal ashes, if it be heavy, and guano, assuming, of course, that it stands in need of such aids, and has not had a quantity of rich manure turned into the trenches when dug. Just at present there is nothing more to do on such ground; but on ground which was dug in the autumn, a few rows of Broad Beans, and some early kind of unwrinkled Pea, Early Gem, Sangsters, or William I., may be sown. The first-named Pea may be sown 3 feet apart, and the others 5 feet, that is, if the Peas are grown altogether.

The better way, however, is to have a row here and another there, 20 to 25 feet apart, and running north and south, so that the sunshine on both sides of the row and the sparrow do not make it their special preserve. By and by other crops may be put between, say Potatoes, French Beans, Cauliflowers, salading, and indeed, any low-growing vegetable. It is yet too early for other sowings out-of-doors.

(To be continued.)

AMERICAN BLIGHT.

It may be of service to our fruit cultivators to read the following questions put by an American fruit-grower to the Government Entomologist of the United States Department of Agriculture (Professor Riley), and the replies as given in a recent number of *Insect Life*:—

THE WOOLLY ROOT-LOUSE OF THE APPLE.

1. If new trees will cost 4.50 to 6 dols. per 100, would it not be best to get new trees rather than try to cure the disease by hot water and kerosene emulsion?

2. As the ravages of this insect are apparent on all my trees, will it be wise or safe to try a cure and let them stand?

3. Have you any data to show that diseased trees attacked by this louse have been cured and made healthy, strong, and fruitful trees? Would not a doubt still exist, even if a remedy had been administered, that the tree might never amount to anything?

4. Should I be safe in planting new trees in the same old hole when these had died and been pulled up? Would the disease probably be left in the ground on the removal of the diseased tree?

5. Had I better pull these up, take them to some convenient and safe place, burn them, and have a man spade or shovel out the place of setting, and would there then be any danger in replanting?

6. Older fruit-raisers claim that I had better remove the trees, plough up the entire ground and let it be exposed to the action of winter weather; and some even go to the extent of saying that I run risk in planting any sooner than another year. What is your opinion?

7. Some say my ground gave the disease to the trees. If it were in the ground, would the disease be all alike? There is no difference in any part of the orchard, and there was never an Apple tree near it before. It had been forest or bush land previously, all new, and my opinion was and is, that these trees

were diseased and affected before I got them. What is yours?

8. If I take up these trees and burn them, how had I better prepare the ground for the new ones? Can I put on lime or ashes in the same place, and how long before should I be safe in planting?

9. Does this louse attack other trees besides the Apple?

11. Is there danger of leaving the disease in other roots in the ground, such as sprouts of Oak, and returning to new trees set out afterward?

12. I have often seen this white, cloudy appearance on the roots, near the top of the ground, and in and around the young tree's stock or trunk, 1 to 3 inches above the ground. Does this convey disease or infection to other trees near by?

13. Suppose a tree, infected, stands 20 feet from one that is entirely free, or, suppose an infected tree stands 20 feet in an orchard from any surrounding tree or trees, is there any way, by wind, air, fog, dampness, or migration, that these other trees could become diseased or infected?

14. Are ashes (unleached) or lime the best to use in the holes of the displaced trees? *James W. Simpson, Arkansas.*

FIG. 35.—AMERICAN BLIGHT.
(Showing the immature and the winged insect as well as the eggs deposited on the bud.)

REPLY.

1. New trees, costing from 4.50 to 6 dols. per 100, would probably cost less than the application of the remedy suggested, but the labour of taking up the old trees and planting the new ones is at least an offset to the labour of applying the insecticides; and you will find, after all, that the remedy is cheaper.

2. The remedy suggested, if thoroughly applied, will be safe and sure, and it will not be dangerous to let the infested trees stand after they have been treated.

3. Whether the trees will, after treatment, become as strong, healthy, and fruitful as they would if they had not been attacked, is a question which can only be decided by ocular examination of their present condition. The extent to which they have been injured already can hardly be determined at this distance.

4. If new trees were planted immediately in the old holes, the probabilities are that some lice will have been left in some of the holes, and that the new trees will become infested.

5. This plan will answer if the old earth is removed, and new earth taken from a distance of several feet from the infested trees is filled in.

6. The plan proposed by your neighbours will be effectual, but that suggested in the answer to No. 5 will answer equally well.

7. Your ground did not give the disease to the young trees, as the insect occurs only on the Apple and some few allied trees, such as the wild Haw and other species of *Crataegus*.

8. Either ashes or lime placed abundantly in the holes will destroy the few lice which will be left. I should say that a month of this treatment would suffice.

9. This question is answered under No. 7.

11. No. Only of those mentioned in No. 7.

12. The insect is spread by the occasional appearance of a winged generation of lice, which fly for some distance. These usually, if not invariably, develop above-ground on the trunk of the tree or the larger branches.

13. Answered under No. 12.

14. Either will do. I have no idea as to their relative merits in such a case.

On the whole, I would certainly recommend you, if your orchard is as badly infested as I infer from your account, not to plant new trees in the same orchard after rooting up and destroying those now in the ground without first grafting upon some resistant variety. This may take a little longer to renew your orchard, but will in the end be the most satisfactory course. The experience in New Zealand and Australia shows very fully that the Northern Spy and Winter Majetin are practically proof against the insect, and by grafting upon these, and taking care that the new stock does not sucker below-ground, you will in my judgment, most successfully contend against the insect; for, however thoroughly you may now free your orchard, there is nothing to prevent continual introduction in the winged form from other orchards in your neighbourhood, even if miles away. I do not, of course, know whether the two varieties which I have indicated will succeed in your locality; but the probabilities are that they will do very well as stocks, even if they should not be desirable to grow for their fruit. I shall be glad to learn the course pursued by you, and its success.

SCOTLAND.

EDINBURGH BOTANICAL SOCIETY.

THE meeting adjourned from the 14th ult., was held on the 28th, Dr. Cleghorn, vice-president, in the chair.

Mr. Malcolm Dunn exhibited cones of *Cedrus libani* from Lebanon, and gave an account of the trees from which they were taken last year. Mr. Dunn enumerated a number of the finest examples now growing in Britain. Dr. Aitchison remarked on Cedars he had seen in India, in confirmation of the belief that the Cedar of Lebanon, the Deodar, and the Mount Atlas Cedar are varieties of one species. Dr. Paterson, Bridge of Allan, sent flowers of *Vanda Gowerii*. Mr. Rutherford Hill exhibited fruit of *Poinciana regia* and dried specimens of *Andropogon paniculata*.

A paper was communicated by Mr. G. F. Scott Elliot, M.A., B.Sc., on "Notes on Fertilisation, chiefly of British Cruciferae." The twenty-one cruciferous plants tabulated included *Barbarea vulgaris*, *Nasturtium officinale*, *N. palustre*, *Arabis hirsuta*, *A. Thaliana*, *Cardamine pratensis*, *C. amara*, *C. flexuosa*, &c. After careful observations as to the kinds of insect visitors and the frequency of their visits, the author concluded that it seems inevitable that in fertilisation insect visits are chiefly relied upon in every case, and that self-fertilisation is only of occasional and additional assistance.

Mr. Gustav Mann made observations in support of his view that the embryo sac does not correspond to the macrosopore. The plant studied was *Myosurus minimus*. The early development was given, and the conclusion came to that the embryo sac is a sporocyte and not a spore. Reference was made to Guignard's discovery, that the primary nucleus of the embryo sac corresponds to the nucleus of the pollen mother cell; and Dodel's discovery that the synergids may be fertilised and develop into

embryos, giving thus three embryos in an ovule. The author traced minutely the stages in the conjugation of the two primordial cells of the embryo sac.

THE EDINBURGH BOTANIC GARDEN.

Mr. Lindsay's report on "Temperature and Vegetation" at the Royal Botanic Garden during December was as follows:—"This month was for the most part mild and open, with a very heavy rainfall. The thermometer was at or below the freezing point on eighteen mornings, the total amount of frost registered being 83°, as against 121° for the corresponding month of 1890. The lowest readings occurred on the 15th, 24°; 16th, 26°; 17th, 23°; 18th, 24°; 22nd, 23°. The lowest day temperature was 34° on the 11th, and the highest 57° on the 2nd. Rain fell on twelve days, and slight showers of snow on two days. On the rock garden the following plants came into flower during the month:—*Helleborus niger* major, *H. purpurascens* var., and *Primula infanta*. The total number of alpine and dwarf-growing herbaceous plants which have flowered on the rock garden during the year 1891 amounts to 1216, being 137 less than during 1890. The deficiency occurred chiefly during the month of May. The number of species which came into flower each month was as follows:—January, 6; February, 39; March, 40; April, 119; May, 260; June, 359; July, 262; August, 84; September, 41; October, 13; November, 0; December, 3.

GLASGOW BOTANIC GARDEN.

Mr. Bullen sent the following report from the Botanic Garden, Glasgow:—"The weather throughout December was exceedingly mild, but mostly very wet and stormy. The highest day reading on a shaded thermometer at 3 feet from the ground was 53° on the 3rd. The lowest was 24° on the 13th, when a light fall of snow was experienced. The night readings were correspondingly high for the month. The lowest reading was 25°, or 7° of frost, and the total of the readings for the nine nights on which frost was registered was only 31°, but on five or six other nights the mercury was either at or very near the freezing point. Within a mile of the city the temperature was from 3° to 6° lower. The sudden change of wind and weather, frequent rains, and thick fogs were a great impediment to out-door work."

HOME CORRESPONDENCE.

TECHNICAL EDUCATION.—"W.," p. 116, in your issue for Jan. 23, very wisely asks, "Where are we now?" This question goes to the root of the matter. Some elaborate letters have appeared, which, if measured by the foot or yard, must be very valuable. For myself I have endeavoured to read up to date, but I confess, in wading through them, I came to the conclusion that, after the self-education of the writers, the question remains very much "as you were." I would ask our learned technical lecturers to point out how many good gardeners or farmers have been turned out by the colleges, schools, and lecture-rooms which have been in existence for years. [Where? En.] This will be an answer to "W.'s" question, and now, as an "Old Dolt," I am bold to say I think the letter of Mr. Thistleton Dyer is nearer the mark than all the rest put together. N. C. [We have a large number of letters on this subject, but after publishing those now in type we shall close the correspondence. En.]

MISTLETOE ON FRUIT AND OTHER TREES.—The recent statement in these pages that Mistletoe does no harm, but may be rather beneficial to the trees on which it grows, will cause some surprise amongst the readers of this paper. The truth of the statement can be vouched for by persons who have resided in parts where Mistletoe abounds; and who may have remarked on the general healthiness of Apple, Maple, Poplar, and Lime trees, on which it is commonly found growing. The writer has seen Maples which were so overrun with Mistletoe that they looked in the winter almost as green as in the summer, and yet these trees were perfectly healthy. Possibly, the Mistletoe would in time, if it had been left alone, have so crowded the shoots of the Maples as to have caused their gradual extinction, and the trees themselves would in course of time have become unhealthy, and perished before their time. But

more from a wish to provide the numerous roe deer in the neighbouring forest with easily-available food in the winter, than for other seasons, much of the accessible Mistletoe on trees on which it abounded most, was hacked off the branches, and strewn around the trees, or stuck into bushes and crotches of trees, so that the animals might readily reach it. In no case where this was done did any harm accrue to the trees, nor did the removal of the parasitic growth appear in any way to promote finer growth than hitherto. When Mistletoe is found growing in great quantity on unhealthy trees, it will mostly be found that unhealthiness is due to old age, starvation at the roots, or a waterlogged, or, at least, an undrained soil. It may be that Nature intends the Mistletoe plant to be one of the means of bringing about, in company with moss, lichens, canker, and insect attacks, the death of unhealthy subjects, and thus make space for the development of young and vigorous trees to perpetuate the species, or, at any rate, bring about the speedy death of those least fitted to maintain their existence in a particular locality. It seems, therefore, that the presence of Mistletoe on a tree, like that of lichen, &c., shows that the conditions are favourable to its growth, and that it rests with man to let it develop greatly and injure the host-plant, or keep it within moderate bounds, or clear it off in the same thorough manner as the other parasitic vegetation is served. *Mäherer*.

PINUS LARICIO.—Your correspondent, "S.," at p. 174 of the *Gardeners' Chronicle*, for Feb. 6, is full of the praises of the Corsican Pine; but I must differ from him. I really cannot see one thing about this tree to recommend it, the Scots Pine being in every way its superior, in grace as a specimen standing alone, the quality of the wood, and unquestionably as shelter tree. I might add, it is less fastidious as to soil. The timber of *P. laricio* is coarse-grained to a high degree, and the tree has but few roots, and is therefore very liable to be blown down by high winds. Its fast-growing qualities are spoken of, but the Douglas Fir will beat it in the direction, and the timber is twice as valuable. Again, it was said that rabbits would not touch it; but this is not true, for I have seen them frequently barked. Generally speaking, where this Pine will grow, there the Larch will also prosper, and there is no comparison in the quality of the timber; and if it is true that foreign seed produces healthier trees, then let us go in for that, and not discard the Larch, seeing, as I do sometimes here, trees carried out of the wood 110 feet high, without spot or blemish. It becomes landed proprietors to think twice before they give up planting the Larch. Your correspondent, J. Garbett (p. 182), is quite right in his description of the timber—certain soils producing different quality. I have myself specimens of the true Highland Pine (*Pinus sylvestris*), the timber from a damp boggy place, white, soft, and light; and another specimen of the same kind of tree from the mountain's brow, full of turps, and twice as heavy, and, therefore, twice as lasting. I have not a word to say against the Austrian Pine. It is a lovely tree, and the very best of shelter; but I would not plant one for timber while I could get the true Highland Pine, and on this I lay stress, because the spurious variety from Germany, the seed of which can be bought for half the money, is in every way an inferior kind. *J. Rust, Erldrig Castle*.

STANDS FOR JAPANESE CHRYSANTHEMUMS.—In reply to "E. M.," (p. 182), I advised the altering of the size of these to 24 by 32 inches, in order that the change when it is made may be of some lasting benefit; for considering the advance in size of Chrysanthemum blooms during the last few years, I am convinced that this size is not too great. "E. M." writes as if we had attained to the limits of size; but even if that were true, I have seen many stands of flowers during the last season which would have looked very much better on enlarged stands, for each flower was overlapping its neighbours, and the full beauty of the Japanese blooms is hidden when they are crowded together. Moreover, such a stand has not a fair chance in the contest with others where flowers are smaller, and they stand clear of each other. The mountains which "E. M." hints at me are all molehills. The increased size of a box to hold forty-eight blooms would be 6½ inches by 8½ inches, and 5 inches deeper. This would not make much difference on the floor of a cart or a railway van; the distance to be travelled makes no difference whatever in this matter, even if it were double what "E. M." suggests,

but surely very few places are 12 miles from a railway station. And as to the increased length of table required, how much extra space would be required to take "E. M.'s" example? If staged on both sides of a table, as is usual in the large classes, the tables would have to be 12 feet longer and 12 inches wider than the older stands required that they should be. I have seen some crowded Chrysanthemum shows, and venture to say that this increased size of table might easily have been accommodated. The green boards seem to have frightened "E. M." the most; well, he must grow his flowers large enough to cover the greater part of them. A small piece of green around a flower of whatever colour enhances rather than detracts from its appearance generally. *W. H. Divers, Kelton Hall Gardens, Stamford*.

FUEL AND STOKING.—I quite agree with your correspondents as to the cleanliness, durability, and reliability of anthracite. I have used it five years, and should have continued to do so, except for the sudden and heavy rise in the price towards the close of last year. I have four boilers; one driving between 3000 and 4000 feet, two others about 750 feet each, and one small Loughborough, with 100 feet, all 4-inch pipes. I do the banking-up and most of the stoking myself. In my large boiler I used to consume during winter 1½ ton of anthracite per week, and in the two small boilers, 1 cwt. per day; the anthracite cost me 27s. 6d. per ton delivered to the stove-hole. Last December I determined to try coke, with the result that my big boiler consumes 2½ chaldrons, or about 1½ ton per week at a cost of 20s. per ton, and the other two boilers 3 bushels a day each, or a little over half a chaldron per week. My anthracite cost me just over £3 a week, and the coke £2 4s., or a saving of at least 16s. per week. In addition, I have from 4° to 8° more heat in my houses than with the coal, and paradoxical as it may seem, I get more heat from wet or exposed coke than from new, dry coke. Coke and anthracite will not do together, for the coke consumes the anthracite at a terrible rate. There is no mistake about these figures, for they are the result of actual experience, the fuel being measured and weighed, the duration of each, and the temperatures being carefully noted. The great drawback in coke is, it will not last, and I have to turn out at 3 A.M. to renew the fires. My fires were swept twice a year with anthracite, but with coke they must be cleaned every three months. I find but little difference in the amount of sulphur in coke and anthracite. The latter, of course, is perfectly smokeless, the former not so, but I fail to find enough blacks or soot to damage the roof of any house, and my highest stack is only 12 feet from the ground. I clinker out once a day about 2 P.M., the same with the coke as with the anthracite. After all is said and done, more than half depends upon the form of the boiler; many of these are simply fuel wasteful, and require more draught, more cleaning, a higher chimney, and much more fuel than other classes of boiler. A plain saddle with check end, or terminal end with flues through sides, and a good quantity of cross tubes, is the most economical, and will burn anything. My large boiler is of the latter type, 7 feet long, with eleven upright and three cross tubes; size of fire-box, 3 feet 6 inches by 3 feet, with direct heating surface of 9 square feet to every foot of grate, which is important as regards economy. I consider all fired boilers as bad in principle, expensive, and troublesome; they require more draught, more fuel, and more cleaning—in fact, the latter should be done at least twice a week, or the iron will not take up the heat as it passes to the shaft. *R. C. Worstead, Norwich*.

OUR APPLE CROP.—I think the reason that only American and Australian Apples are at present to be seen in shops is, that all the best home-grown fruit was sold last autumn. In my case, I commenced selling White Transparent early in August, following with Ecklinville Seedling, Lord Suffield, &c., the demand being so good that by Christmas I had sold all out—early, mid-season, and late—at prices much higher than those realised by American Apples. Our salesman informed me that he would be glad of 100 tons of such fruit per week. The demand for good home-grown Apples, honestly packed, and carefully graded, is enormous, and there are so signs of the supply equalling the demand, as witness by the quick consumption of the produce of our orchards last year. Apple-growing for profit is much the same as any other business, being remunerative or otherwise, according to the attention bestowed upon it. If fruit trees are planted on suitable soil, and receive careful attention, the fruit

marketed in a sensible manner, there will be no cause to cry out for Protection; in fact, the foreign imports may possibly do good by causing us to be on our metal, and thus grow finer fruit and more of it than otherwise would be the case. *S. T. Wright, Gleuston Court Gardens, Ross.*

THE HARDINESS OF HERBACEOUS CALCEOLARIAS.—The herbaceous Calceolarias are generally regarded as being very tender, and till a short time ago I shared the general opinion; but to my surprise, some surplus plants that I had left over, stood out during the first part of the late severe weather under a small portable frame, in which they had been pricked out in fine rich soil laid on the hard ground, and they had no other covering whatever. As we required the frame to put over some Christmas Roses, it was taken off the Calceolarias, and they have since been subjected to all the snow and frost, and now that the snow has melted from them, I find that they still look fresh and uninjured. This proves that they are quite as hardy, or even more so, than is the ordinary shrubby or bedding kind; but most of us know that to grow them well, they require a temperature ranging between 40° and 50°, with the atmosphere moist and genial, under which conditions they thrive, and, if kept free from aphides—their great enemy—they make fine healthy plants. *J. S.*

PRUNING DENDROBIUMS.—I read with much interest Mr. Burberry's remarks on Dendrobiums in the "Week's Work" of the *Gardeners' Chronicle* for February 6, p. 175. Doubtless he has had great experience in the management of this genus of Orchids; but does he mean to tell us that only those stems that have become unsightly through old age should be cut away? Having to-day packed a large box of flowers with the growths attached, I would here ask him what he calls "unsightly growths." With us all growths are considered unsightly on some species when they have done flowering. At the present time we have plants carrying upwards of a thousand racemes of flowers each, with not an old growth on them. In fact, no growths are more than two years old. I wonder what Mr. Burberry would say to a plant of *D. nobile* 7 feet across, with no growths on it except those made last year, some of which are between 3 and 4 feet long, and carrying from fifteen to twenty racemes each? I should like to hear what he has to say to this. *B. P.*

FUEL: ANTHRACITE COAL.—If every gardener follows the methods of dealing with the above, which have been described in the *Gardeners' Chronicle*, no difficulty would be found in getting it to burn. It is in use at this garden, and we are sorry when we are obliged to fall back on coke, which we have at times to do. Our houses are heated with two of Weeks' tubular boilers, but it is only on very rare occasions that we have to use both; and all through the severe winter of 1890-91, the fires were seen to every night at 10 o'clock, and we found the temperature at the right point at 6 A.M. We labour under the disadvantage of having to burn the house-refuse. *S. S.*

EUCALYPTUS GLOBULUS FLOWERING.—I should say that it is certainly a very rare occurrence for the above plant to flower at such an age, and, indeed, at all in this country, as "C. II. II." mentions in p. 180. Here, two years ago, fine specimens, 50 feet high and upward, and nine years old, from seeds, flowered freely, and formed their peculiar seed-cases, siles, but the seeds they contained were imperfect, and not fully developed. Since then, unfortunately, the last winter (1890-91) was seriously crippled the plants, and I fear this will finish some, if not all of them. *John Roberts, Zan-y-bwch, North Wales.*

NEW GRAPE, MARCHIONESS OF DOWNSHIRE.—I was recently favoured with some fruit of this new Grape, a seedling raised by Mr. Bradshaw, gardener to the Marchioness of Downshire. It is a cross between White Gros Colmar and Madresfield Court, the first-named being the seed-parent, and it is a promising kind, with Muscat flavour. The berries sent were as large as those of a well-grown Muscat of Alexandria, of a beautiful amber colour, and with rather a thick skin. I should think this Grape will find favour with those who require late-keeping kinds, as the bunch sent had been cut on September 7, and placed in water, having thus kept in good condition for more than five months. The Vine being in his earliest house, the raiser was obliged to cut the Grapes at that period mentioned, but they have

certainly kept well. He also informs me he has now got it planted in a late house, so will be able to test its late-keeping properties better next season. I saw this Grape in fine condition at the late International Show at Edinburgh where it was much admired by noted growers, and thought to be a valuable late variety of good flavour. It has also been shown at Chiswick on one occasion, but not in time to get any of the committee to test its merits with other kinds. Next year, Mr. Bradshaw hopes to get it in quantity, and then send it at different dates to show its keeping qualities. When I saw it last year it promised to produce bunches equally as large as those of Muscat of Alexandria, and as free-bearing as most of its parents—the well-known Madresfield Court Muscat. *G. Wythea.*

IRISH POTATOS.—It is nearly fifty years since, when in my first situation with John Macifield, Esq., Bathkollidar, Dunoon, N.B., we had 5 hogs-

Mr. Henderson

heads of seed Potatos from Ballymote, Ireland. The varieties were distinctly different in their appearance. Their names were—English Flats, Black Benifits, Cherry Reds, and the Apple Potato; and they were all first-class eating sorts, and, being my own cook at the time, I boiled them in their jackets, and up to the present day I think there is no better way of cooking Potatos. Although it is nearly half a century ago, these Irish varieties are quite fresh in my recollection, being real "Murphys." These required careful attention in cooking, and when ready, they laughed all over. The first-named was a red-skinned flatish variety, very mealy, and when well cooked, seemed always to part into a half from its dryness. The Black Benifits were a large round sort, the outside being the colour of a Black Hamburg Grape, with a very pale inside, and quite as mealy as the others, although it required more watching in the boiling, or it at once melted into a pulp. The Cherry Red was a more evenly round Potato, and good eating, nearly resembling the smooth Scotch Reds of those days. The Apple Potato was a late one, and the outside was striped or flecked, with deep pink eyes, but I remember little about the quality of this variety, only it had to all appearance quite as strong a constitution as the others. They were all grown on newly-cleared land from the natural Oak copse, the ground being thoroughly drained and trenched, likewise well limed; the manure employed when planting the crop was Peruvian guano, mixed with wood ashes saved from the burning of the scrub. Some of your other correspondents will be glad to learn if any of the above

varieties are still to the fore. I would willingly send almost any distance for "English Flats," if they can be got, as I have never tasted a better flavoured tuber. I may state, that just before the surprise of the Potato disease had developed into a murrain, I had left Bathkollidar. *J. Miller, Rusley Lodge.* [Mr. Baylor Hartland in a note received from him recently, blames us for cooking the Quarries to test their qualities, and telling us that we ought to have planted them instead. He states that it is an early June Potato (in Ireland?), but keeps plump and excellent up to the present time of the year, and probably much longer. For good and long keeping, there were none better than Quarries, Black Mignon, and Red Apple. *Enj.*]

RHODOENDRON.—I have to-day (February 16) cut several trusses of Rhododendron growing in the flower garden on the banks of an artificial lake. Some of the other trusses have more fully expanded flowers than the one enclosed. [The flower sent by our correspondent was one of *R. Nobleanum*, *Enj.*] This is rather remarkable, seeing that we have had a total of 205° of frost since the commencement of the winter. On Sunday morning the thermometer stood at 27° Fahr., and this morning at 26°, with a strong north-easterly wind. *A. Bullen, Gardener, Wakehurst Place, Haywards Heath.*

GARDENERS AND THEIR EMPLOYERS.—Referring to "Vagabond's" criticism of my remarks, p. 147, concerning the best men not being in the best places. I am willing to admit that "employers are not fools or too indulgent," especially where it is a question of profit and loss—that is, where produce is grown to pay garden expenses—as imperfections are more obvious in a gardener when he is placed under such conditions than when he grows for home consumption only. But who will be bold enough to deny that many gardeners retain their situations through the indulgence of their employers, and not through their capacity. Personally, I knew a man who remained in an excellent place many years until the death of his employer. He was known by the latter to be unqualified for the post he was filling, and yet he was not discharged. This gentleman and his family were imbued with a missionary spirit, and thoroughly appreciated the same spirit in others. It so happened that their gardener was full of it, even to overflowing. He was constant in his attendance at all religious assemblies. He lifted up his voice in the choir, having a melodious bass voice; he also displayed his vocal abilities at the village concerts, was strong in the advocacy of total abstinence, and discoursed most eloquently on many subjects, and thus found favour in the eyes of his employers, and it is not wonderful that they spoke of him as such an earnest superior man, &c., and winked the other eye at garden deficiencies. May I ask you if a gentleman is always a fair judge of the merits of his gardener, when the majority of them know nothing about gardening, and could not contradict any excuse a gardener might make concerning failures, which were probably due to his negligence or ignorance? Referring to your remarks on gentlemen leaving the selection of their gardeners to nurserymen, I maintain that they might do worse; but I did not intend to convey the meaning that they should so do to the exclusion of all other means, and certainly not to banish applications to gardeners in responsible positions, or to curators of botanic gardens. I have more faith in our nurserymen than to believe that they would give the preference to those who had been good customers only, unless these customers were good practical gardeners, and fitted to fill the vacant place. *W. E. G.*

Obituary.

MR. MONTGOMERY HENDERSON, formerly gardener at Coleorton Hall, Ashby-de-la-Zouch, Leicester, died, at Ashby, on Sunday, February 14. Mr. Henderson was a Scotchman, having been born at the village of Swanston, near Edinburgh, in 1808. At the age of fourteen years he began his gardening career in one of the market gardens of that city, where he was initiated into the laborious part of the business. Subsequently, he spent two years at Messrs. James Dickson & Sons' nursery at Inverleith; and then he went to Salton Hall, and afterwards to Melville Castle, where he remained but a

short time. In the autumn of 1832, he was sent, by a former master, Mr. Dod, who was then gardener at Cliefden, in Buckinghamshire, to be gardener to Captain Foster, at Warmwell House, Dorchester. Leaving that place in 1834, he served as foreman under Mr. Niel Wilson, at Gopsall Hall, Leicester-shire. In 1838, having left Gopsall, he obtained employment in the nursery of Mr. Joseph Knight, of Chelsea, whence he was sent to be gardener to Sir George H. Beaumont, Cole Orton Hall. Mr. Henderson was famous as a Grape grower, and at p. 719 of the *Gardeners' Chronicle* for December 5, 1874, is to be found, besides an account of his life, of which the above is mainly an extract, a description of the methods he adopted with the Vines at Cole Orton. The deceased had lived retired at Ashby for the past ten years.

LAW NOTES.

LADY GARDENERS.

A CASE, which created great interest in Derbyshire amongst gardeners, occupied the attention of the County Court at Derby for upwards of four hours on Tuesday. It was an action brought by Miss Elizabeth Paterson Campbell against the Misses Grace and Elizabeth Harriman to recover £30 for breach of a contract to instruct the plaintiff in all matters appertaining to an industry carried on at The Grange Gardens, Sawley, called "The Ladies' Fruit and Salad Garden Association," and to provide employment and a home, with sufficient food and drink.

Mr. Noble, on behalf of the Plaintiff, said the action was founded on a verbal agreement made between the parties on the 17th of April, 1889. That agreement was in effect that the plaintiff should go to a piece of land owned by the defendants at Sawley for a period of twelve months, and that she should be instructed there in gardening, and in return should give her services, and also be supplied with board and lodging. There was a very voluminous correspondence. He proceeded to read extracts from letters which made it appear that the plaintiffs formerly resided at Harrow. They had written for the *Strand* and other magazines, with the object of drawing the attention of ladies to a scheme which they desired to float. That scheme was that the piece of land mentioned at Sawley should be changed from turf or grass land to garden land, and that the ladies joining in cultivating it should join in the receipts from the produce. Eventually, on February 25, the parties met, and three courses were suggested to carry out the scheme of the Misses Harriman, which were—(1) that the defendant should give six ladies a ninety-nine years' lease of the ground, and that these should contribute £100 each, and that the house and grounds should at once become their own and that it should at some future time be converted into a company; (2) that the Misses Harriman should take the entire risk, and maintain the ladies, teaching them gardening, for the payment of a fixed sum; and (3) that Miss Campbell might board for thirteen weeks at a guinea per week, giving such services as she felt inclined to do. Miss Campbell made an agreement on the second of the courses proposed, paying £20 for the course of instruction. Mr. Noble went through the correspondence, which was of an interesting, if somewhat amusing, nature. It chiefly related to instructions sent by Miss Harriman to her "dear lady gardeners" regarding the growing of Potatoes, Radishes, Tomatoes, &c., the time when they ought to be got ready for market, &c. One letter caused some merriment in Court, which was in reply to a letter to the Lady Gardeners at Sawley, from Miss Harriman, telling them that they must not expect men of spotless character to dig for Potatoes. In consequence of some delay in some hampers of Potatoes being sent to market, and a loss of £80 on a crop of Radishes, being pulled too late, the relations between the industrious Miss Harriman and the Lady Gardeners became strained, and Miss Harriman was not

residing at Sawley, but wrote her instructions; she went about the country selling the produce. Miss Campbell wrote a letter owing to a wrong inference she had drawn from a letter of Miss Harriman that she was not going to work from 4 o'clock in the morning with men of questionable character, when 4 o'clock in the afternoon was meant.

The matter eventually reached a climax, and the defendant stopped the provisions being sent to the house, and showed the lady gardener out. Mr. Noble contended that the whole of the mischief and the misunderstanding had arisen through the absence of the defendants, which was contrary to the terms of agreement. They left all the responsibility on the lady gardeners and pupils. There was no personal supervision, and the dismissal was unjust. The Judge suggested that the case might be settled between the parties. It would be much better for both. Mr. Noble concurred, and Mr. Hextall also. He, however, would like it to be stated that there was not the slightest imputation of incompetency against the defendants. He moreover entirely absolved the Misses Harriman from all blame. They had acted with the highest and most *bona fide* motives. A consultation was held in the Judge's room, all imputations being withdrawn on both sides.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees = 8 "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending February 13, is furnished from the Meteorological Office:—

"The weather was unsettled, with slight rain, during the earlier part of the period, but subsequently it became dry in nearly all parts of the kingdom. Much cloud, however, was experienced except in the north-east of Great Britain, and slight falls of rain continued in the extreme north-western districts."

"The temperature was considerably above the mean, the excess ranging from 3° in 'England, S. and S.W.,' 'Ireland, S.,' and the 'Channel Islands,' to 6° in 'Scotland, W.,' and 'Ireland, N.,' and to 6° in 'Scotland, E.' The highest of the maxima were recorded, as a rule, either on the 7th or 11th,

and varied from 57° in 'Scotland, E.,' and the 'Midland Counties,' to 52° in 'Scotland, N.,' and 51° in the 'Channel Islands.' The lowest of the minima were registered either on the 12th or 13th, and ranged from 27° in 'England, E.,' and the 'Midland Counties,' and from between 29° and 33° in most other districts to 33° in 'Ireland, N.,' and 41° in the 'Channel Islands.' At the end of the week the temperature was decreasing very quickly.

"The rainfall was less than the mean in all districts, but the deficiency in 'Ireland, N.' was slight when compared with other districts."

"The bright sunshine exceeded the mean in 'England, N.E.," but showed a deficit in nearly all other districts. The percentage of possible duration ranged from 42 in 'England, N.E.' and 31 in 'Scotland, E.' to 10 in 'Scotland, N.,' 8 or 9 over Ireland, and to only 6 in the 'Channel Islands.'"

POTATOS.

Best floury samples, keeping colour, are still sought after, but only small lots are to hand. These realise 8s. to 10s. per ton. Ordinary samples sell from 8s. to 9s., and Blacklands from 5s. to 6s.; B. Bunch, Abundance, and Main Crop, find favour with best buyers. J. B. Thomas.

FRUITS AND VEGETABLES.

SPITALFIELDS, Feb. 16.—Quotations:—Seakale, 1s. to 1s. 6d. per punnet; Savoy, 2s. to 4s.; Cauliflowers, 8s. to 12s. per tally; Greens, 1s. 6d. to 2s. 6d.; Turnips, 1s. 6d. to 2s.; Carrots, 1s. 6d. to 2s. 6d.; Parsley, 1s. 6d. to 2s. 6d. per dozen bunches; Spinach, 1s. to 1s. 6d. per bushel; Turnip-tops, 2s. to 3s.; Sprouting Broccoli, 1s. 6d. to 2s.; per sack; Parsnips, 4d. to 8d. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 3d. to 6d.; Leeks, 1s. 6d. to 2s. 6d.; Beetroots, 3d. to 4d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 6s. 6d. to 7s. per cwt.; Bordeaux do., 3s. 9d. to 4s. 6d.; Spanish do., 6s. 6d. to 7s. per cwt.; Belgian

do., 4s. 9d. to 5s. 3d.; Dutch do., 4s. 9d. to 5s. 3d. per bag of 110 lb.; Celery, 4d. to 1s.; Horse-radish, 1s. to 1s. 1d. per bundle; English Apples, 2s. 6d. to 5s. per bushel; American do., 8s. to 17s. 6d. per barrel; Foreign Tomatoes, 1s. to 1s. 9d. per box.

BOROUGH, Feb. 16.—Quotations.—Savoys, 2s. 6d. to 3s.; Brocoli, 7s. to 10s. per tally; Spinach, 1s. 6d. to 2s. 6d. per bushel; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Greens, 1s. 6d. to 2s.; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. 3d. to 1s. 9d. per dozen bunches; English Onions, 6s. to 7s. 6d. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 11s. to 21s. and Newtown Pippins, 15s. to 20s. per barrel.

STRAFORD, Feb. 17.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Savoys, 2s. 6d. to 3s. per tally; Greens, 1s. to 1s. 9d. per sieve; do., 2s. to 3s. per dozen bunches; Cauliflowers, 9d. to 1s. 6d. per dozen; do., 2s. to 7s. per tally; Turnips, 30s. to 45s. per ton; Carrots, household, 30s. to 45s. do.; do., cattle-feeding, 10s. to 28s. do.; Parsnips, 6d. to 1s. per acre; Mangels, 16s. to 18s. per ton; Swedes, 15s. to 22s. 6d.; Onions, English, 10s. to 120s. do.; do., Dutch, 3s. 9d. to 4s. 9d. per bag; do., Bordeaux, 3s. to 5s. per case; Apples, English, 2s. 6d. to 6s. per bushel; do., American, 18s. to 21s. per barrel; Horse-radish, 1s. to 1s. 6d. per bundle; Celery, 9d. to 1s. 6d. per tally; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; do., 2s. to 2s. 6d. per sieve; Turnips, 2s. to 3s. per dozen bunches; Carrots, 1s. 6d. to 2s. 6d. do.

NOTICES TO CORRESPONDENTS.

ALTERNANTHERA CUTTINGS: *C. J.* The trade do not sell cuttings as a rule. Why not advertise your wants?

AMARYLLIS: *L. M.* The red spots on the scales are accompanied by a minute yeast-fungus, often figured in these columns. Generally the bulb-mite is also present, but we do not see them in your bulb.

CALLA SPORTING: *Vagabond.* Every year specimens are sent to us which exhibit various deviations from the normal flower, and we may pretty safely infer that in most instances the departure may be traced to extraordinary vigour in the plants, caused by the manures now so commonly afforded to the plants. We have to-day received from a correspondent at Stony Stratford some *Calla* spathes, in which the tip of the spathe in one instance is green streaked with white. At one time probably the spathe of *Calla aethiopica* was always green, like the foliage.

CARNATION: *E. H. A.* (Next week.)

DENDROBIUM HILLII: *G. S.* It is a free flowering variety; still ninety flowers on one growth is rare.

EARTH-WORMS IN PALM-TUBS: *L. D.* Clear lime-water employed, when water is needed by the plants, will bring the worms to the surface soon after applying it. The worms should be at once collected. Strong tea will do the same thing. And there is a kind of soap sold which attracts worms in a remarkable manner, and of which they are very fond. It is broken into small pieces, and strewn on the surface of the soil.

NAMES OF PLANTS: *H. P.* *Boronia megastigma*, belonging to the natural order Rutaceae, a native of south-west Australia. The plant requires greenhouse treatment, a little warmer indeed when making its growth; and whilst quite young the same kind of soil as *Erica* are found to do best in, although when it grows into half-specimen size, a little good loam, finely sifted, and in the proportion of one-eighth of the whole may be added to the peat. Failing good loam, charred earth may be used. In the summer months the plant may stand out-of-doors, plunged in a bed of gravel or coal-ashes, or be kept in a cold frame with the lights off, except during heavy rains; in fact, young plants are best in frames. Propagation by means of seeds or cuttings. The latter want much care. They may be struck in pots of sandy-peat, surfaced with the cleanest silver-sand, and should be made either of the half-ripened or the young shoots. Bottom-heat is not needed, but the cutting-pots should be stood in the shade of the front wall of the greenhouse-pit, and the soil kept moist by pouring water round the edge of the pot between the rim and the bell-glass, which the cuttings must be covered with. The bell-glass must be wiped out every morning, and the cuttings aired for five or ten minutes.—*C. W. D.* *Bignonia venusta*.—*W. Chibran*, *Begonia Digwelliana*.—*M. C. I.* *Arbutus Unedo*; 2, *A. Unedo*; 3, *A. Andrachne*; 4, *A. Unedo*; 1, 2, and 4, are different varieties of *A. Unedo*, a species

which varies a good deal.—*J. M. B.* 1, *Doryopteris palmata*; 2, *Pteris serrulata*; 3, *Selaginella involvens*; 4, *Adiantum Pacotii*; 5, *A. concinnum latum*; 6, *A. tenerum*.—*T. H.* 1, *Asplenium bulbiferum*; 2, *Davallia canariensis*; 3, next week.—*E. M.* *Echeveria retusa*, *Salvia splendens*, *Neprolepis pectinata*, *Pteris cretica albineata*; put numbers next time.

NAMING NEW SPECIES OF ORCHIDS: *J. C. Mr. Rolfe*, of the Royal Gardens, Kew, obliges us by naming the greater number of these, and is considered as the referee in such matters. As to varieties of garden origin, there are several experts competent to deal with them.

OBJECTIONABLE BUILDING: *S. W.* The best thing that occurs to us is a trellis, strongly fixed by means of standards securely fastened to the face of the wall, which might be covered with rapid-growing Creepers, as *Glycine sinensis*, *Virginian Creeper*, *Clematis Vitalba*, *Bignonia radicans*, or the stronger-growing vines. Failing these, you could plant pyramidal Elm, Poplar, Oak, or Acacia, or rapid-growing Conifers or Red Cedar.

ROTTEN BANANA ROOT: *T. S.* The appearance of the piece to root sent, point to a water-logged border, and the consequent souring of the soil. It would be advisable to throw out the whole of the old soil, and re-arrange the drainage, filling the bed anew with fibrous loam, to which sand and charcoal may be added. Manure is best left out, and top-dressings and liquid manure afforded when aids to growth are actually needed.

SEEDLING GLOXINIAS STILL GREEN: *A. C.* Grow them on, shifting them into slightly larger pots when the roots approach the sides of the pots they are now in. They should bloom after receiving one shift. Grow them in a temperature of 58° to 60° at night, with 10° to 15° rise, according to the state of the weather. Do not wet the foliage, but maintain a moist atmosphere in the pit. Keep them not far from the roof so as to promote stockiness, and do not crowd them together.

SHOWING PLANTS AT THE ROYAL HORTICULTURAL SOCIETY MEETINGS: *G. S.* No fee; but persons showing anything at the meetings usually make themselves in advance fellows of the Society. Write to the Secretary, 117, Victoria Street, Westminster.

VINES: *A. C.* Last autumn was not favourable for the ripening of the canes, and unless greater attention than usual was given to them, hard cutting back will be necessary. From great exuberance of growth, your Vines failed to show any bunches. Do not apply any more manure for a season or two; keep the surface of the border friable and loose, so as to permit the entrance of sun-heat; see that the outlets of the border drains are not stopped. Employ no mulching, unless the soil is very light, and then only a sprinkling of horse-droppings; keep the laterals 1 foot apart on opposite sides of the rods, which will give ample space for old Vines. Preserve the first foliage that appears in good health to the last. If the Vines are grown on the one or two rod system, let each lateral grow to four or five joints, and pinch out side-shoots from these, and stop the leaders of laterals at one joint each time a new one grows. Give each lateral shoot its own proper space, and have no crowding. Follow the ordinary treatment of the Vine under glass, and you may expect good crops.

WOOLCIE IN THE ORCHID-HOUSE: *G. K. H.* You can trap these marauders by the same methods that are pursued by *Dahlia* cultivators to entrap earwigs, i.e., by lightly stuffing some hay into 60-sized pots, and laying these about on their sides amongst the plants. The woodlice avoid the light, and during the day they will retreat into these nice snug pots of hay, and all that you have to do is to go round some time during the forenoon, and empty the insects into a pailful of scalding water. Follow this method for several weeks, and you will have caught the most of them. Toads like woodlice, but then some persons do not like toads, at least not in the Orchid-house; and as the pots are, perhaps, the better of the two.

COMMUNICATIONS RECEIVED:—*D.*, *Revision der Arten von Trollius*, by Dr. Ruth, shortly.—*W. A. C.*—*G. C. M.*—*J. O'B.*—*W. B.* (next week)—*D. W. A. C.*—*Pteris*.—*Thos.*—*Woodford*.—*W. J. BOOK of Photo-Lithographed Sketches of Winter Gardens, Ranges of Hothouses, Vineries, Architectural Conservatories, &c., of various Designs and Sizes, recently constructed, erected, fitted, and heated complete by us in different parts of the country; with particulars of the most successful Hotwater Heating Apparatus of the century.

Post-free on application.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouse, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

CORRESPONDING CLERK.—JOHN LAING & SONS will be pleased to recommend H. J. Pettit, to any good House in the Trade, requiring efficient service in this capacity, or that of BOOK-KEEPER, combined with an excellent knowledge of Plants and the general requirements of the Trade.—The Nurseries, Forest Hill, S.E.

HOLLOWAY'S PILLS.—Weakness and Debility.—Unless the blood be kept in a pure state, the constitution must be weakened, and disease supervene. These capsules, or Pills, possess the power of neutralizing and removing all contaminations of the blood and system generally. They quietly but certainly overcome all obstructions tending to produce ill-health, and institute regular actions in organs that are faulty from derangement or debility. The dyspeptic, weak and nervous, may rely on these Pills as their best friends and comforters. They improve the appetite, and thoroughly invigorate the digestive apparatus. Holloway's Pills have long been known to be the surest preventives of liver complaints, dreadful dropsies, spasms, colic, constipation, and many other diseases always hovering round the feeble and infirm.

INTERNATIONAL HORTICULTURAL EXHIBITION. LONDON, 1892.

THE great INTERNATIONAL HORTICULTURAL EXHIBITION, to be held this year at EARL'S COURT, which has been secured from the Metropolitan District Railway Co. for this purpose, will be OPENED on MAY 7. It will display the state of progress of Horticultural science, taste, resources, implements, and plant culture at the present date; and, in addition, the various departments and exhibits will serve as models, not only for the possessors and managers of estates, but for each and every one who loves a garden. An abounding profusion of plants and flowers from all parts of the world will display their beauties of form and colour, grouped for effect in a garden charmingly laid out, both under cover and in the open, in one of the few available spaces in London. There will also be Music of the highest class, the buildings and grounds will be brilliantly lighted by electricity, and everything will be done to ensure that this Exhibition—which appeals so much to the great English love of Gardening—shall be a stupendous success.

Chairman of the Executive Committee.

HENRY ERNEST MILNER, F.L.S., Assoc.M.Inst.C.E.

Honorary Secretary.

G. A. LOVEDAY, B.A.

5000 ODONTOGLOSSUM CRISPUM.

Mr. CARBER is a well-known Collector of this plant, and his name has been associated with the finest forms ever imported.

On view morning of Sale, and Catalogues had.

Wednesday Next—Palms, Roses, Ferns, &c.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Chesapeake, London, E.C., on WEDNESDAY NEXT, March 2, at half-past 11 o'clock, 200 AZALEAS, GREEN-HOUSE FERNS, TEA ROSES in pots, PANCRATIUM ZE-LANICUM, 45 AGAPANTHUS UMBELLATUS, choice GLOXINIAS, 500 Single BEGONIAS, Pearl TUBEROSES, 100 lots of LILiums in variety, GLADIOLI, CARNATIONS, DAFFODILS, HERACERUS PHLOX, 250 Standard, Half-standard, and Dwarf ROSES; a quantity of BOUQUET-WIRKS, &c.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their SALE on FRIDAY NEXT, March 4, the following VALUABLE ORCHIDS.

CYPRIPEDIUM INSIGNE MONTANUM.

Spreading piece, full of life and vigour; and all collected in the region from whence came C. L. Saunders and many of the other notable forms.

CYPRIPEDIUM GOLDEN YELLOW.

A few plants of a simply magnificent golden-yellow and white Cypridium insigne. The plants are in fine order.

CATTLEYA VICTORIA REGINA, THE QUEEN CATTLEYA.

A distinguished and splendid New Cattleya. A superb novelty, of the greatest merit.

TREE-GROWING, FREE AND ABUNDANT FLOWERING.

The flowers are of a rich and beautiful crimson, and as many as eight and nine are borne on a spike. Sepals and petals are of a deep rosy-red, glowing and glistening, blotched crimson and purple. The lip is crimson, with a white tube.

CATTLEYA SPECIES.

See Dried Flowers.

CYPRIPEDIUM SPECIES.

This may turn out to be simply a variety of Cypridium Wallisi but it comes from quite a different country. The extraordinary flowers have petals nearly 2 feet long, and are pure satiny-white, excepting the lip, which is rose; in C. Wallisi it is white.

DENDROBIUM DALHOUSIANUM.

In most wonderful masses, and grand order.

DENDROBIUM NOBILE.

From a remote and unexplored district in the Shan Hills. DENDROBIUM SPECIES, from Loosha, Dwarf and free-growing and free-flowering; deep purple flowers.

VANDA CERULEA, Hill variety, a fine Importation, just received.

CELOGYNE OCELLATA MAXIMA, a fine Importation. Also a very fine lot of LELIA ELEGANS, among which will doubtless be found such varieties as Turneri, striata, &c., and a fine lot of LELIA PURPURATA.

An Orchid Species from Loosha, also a grand lot of the lovely BURLINGTONIA PUBESCENS, EPIDENDRUM GODSEFIANUM, CATASETUM, &c.

On view morning of Sale, and Catalogues had.

FRIDAY NEXT, MARCH 4.

NEW ORCHIDS.

GREAT SALE. NO RESERVE.

EXTRAORDINARY NEW LADY'S SLIPPER.

CYPRIPEDIUM CHAMBERLAINIANUM

(SANDER).

GRAND NEW SPECIES.

EVERY PLANT RECEIVED WILL BE OFFERED WITHOUT ANY RESERVE.

A magnificent and beautiful new Cypridium, which we have the privilege to offer; it is dedicated, by permission, to the Right Hon. J. Chamberlain. An altogether unique and absolutely new departure in every way from all known Cypridiums. In inflorescence, in habit, and in leaf, a perfectly marvellous novelty. Its leaves are, in some instances 4 inches across, simple, undulated, and often beautifully tessellated on the upper surface, reminding one slightly of Cypridium Morganii, but much larger and finer. It is altogether a noble plant.

This extraordinary Cypridium produces flower-spikes up to 2 feet high, bearing all along its stem its white, yellow, and purple blossoms, and we are able to show dried flower-spikes which have produced over 30 flowers. The flowers are, in fact, that the flower-seeds are not more than half an inch from each other.

The upper part of the flower is yellow, with about six rosy-purple lines, divided by the veins emerging from a profusion of tiny purple spots; these veins are much denser than at the upper half of the dorsal sepal; the whole is beautifully reticulated, and charmingly transparent towards the margins, densely covered on the border surface with white hairs; any spots or lines; the lower dorsal sepal is similar in its markings, only not so dense, and about half the size of the upper dorsal sepal, which, extraordinary enough, is as broad as it is long, being about 2 inches in diameter.

The two petals are spreading, curled and twisted at the ends like a corkscrew, and spotted in the way of Cypridium superbiens, the margins are charmingly undulated and bear a profusion of white hairs. They are spotted on both surfaces with blackish purple and chocolate spots and blotches, some purple lines also run along them; they are of a lovely shining white and creamy yellow colour. Each of them is nearly 2 inches long, the slipper, shoe or pouch, sometimes called the labellum, is also exceptionally beautiful, it is rose and white more imitated than Cypridium eximiale, and double its size, reminding one of a beautifully spotted bird's egg; so exquisite is the fine blackish purple spotting over two-thirds of its lower part; the upper part and side-lobes are of a shining porcelain white colour, this combined with a purplish black spotting leads it a hue and charm perfectly unique.

We have been asked by several gentlemen to sell the whole importation of this altogether extraordinary and clearing new Cypridium under the name of the above.

Abundant dried material will be on view.

MAGNIFICENT NEW CYPRIPEDIUM.

(CYPRIPEDIUM KIMBALLIANUM, SANDER).

QUITE NEW SPECIES.

This grand new species is now offered for the first time, and no plants have ever been sold of it. It is a grand grower and a grand novelty. Nothing like it has ever been seen, and it has been imported up to now. It is a stately species, its flowers are said by the natives to be of enormous size, and the colours are described as crimson, purple and white. In this description we have been told that it is a terrible difficulty to get plants home alive, and after all our trouble and expense, we got a few plants only. Those offered are in grand condition, and we believe that it will be absolutely impossible for us ever again to offer it. The plants will be the only time it will be on sale. An imported plant had leaves on it fully 2 feet long; the leaves are most beautiful, of elegant shape and heavily mottled and blotched.

CYPRIPEDIUM SPECIES.

This may turn out to be simply a variety of Cypridium Wallisi, but it comes from quite a different country, and are pure satiny white, excepting the lip, which is rose. In Wallisi it is white. It is one of the most stately of Cypridiums we have introduced. In fact it is quite a sensational plant. The contents of 150 cases just received from Japan in splendid condition.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. F. Sander to SELL the above VALUABLE ORCHIDS by AUCTION at their Central Sale Rooms, 67 and 68, Chesapeake, London, E.C., on FRIDAY NEXT, March 4, at half-past 12 o'clock.

On view morning of Sale and Catalogues had.

FORBES' CATALOGUE FOR 1892,

Is the largest, best, and most comprehensive ever issued on
FLORISTS' FLOWERS and HERBACEOUS PLANTS.

It contains full and accurate descriptions of all the best
Antirrhinums, Begonias, Carnations, Dahlias, Delphiniums,
Fuchsias, Paeonies, Pansies, Violets, Pelargoniums, Petste-
mums, Petunias, Phloxes, Pinks, Potentillas, Primulas, Pyre-
thrums, Verbenas, Herbaceous Plants, &c.; also of my true
and reliable strain of

EAST LOTHIAN STOCKS,

which, by the force of their merit, are now justly celebrated
all the world over. In 3 distinct sorts, crimson purple,
scarlet, white, and Wallflower-leaved white, each sort, 1s.,
2s. 6d., and 5s. per packet.

It is an indispensable Reference-Book on all sections of
Florists' Flowers, and should be carefully perused by all buyers
of flowers.

Free on application.

JOHN FORBES, Nurseryman, Hawick, Scotland.

THE OLD BROWN QUARRY EARLY POTATO.

The Oldest Existing Sort in Ireland. In existence here for 150 years; certainly, when I was a child, prior to the famine period. There was no other sort grown for harvest purposes when men worked with a sickle. I am enabled to offer it for redistribution—it never having made its way to England—from a stock preserved for years on peat land, resting on limestone, in a remote part of county Cork. There must be something in the soil that preserved it for years. It is a first-class early June variety, of great substance, 7-lb. bag and postage for 2s. 9d. W.M. BAYLOR HARTLAND, F.R.H.S., Old Established Seed Warehouse, Cork, Ireland.

A visit from intending planters is respectfully invited. Elvaston Nurseries, Borrowash, Derby, only three minutes walk from Borrowash Station, Nottingham and Derby, Midland Line.

A GOOD INVESTMENT.

Last season I sowed a small quantity of Chrysanthemum seed, from which I obtained twenty varieties that I would not sell for one hundred pounds. I have again obtained seed from the same source, and have a small quantity to spare at 1s., 2s., and 6d. per packet. I shall be pleased to purchase at a fair price any good varieties raised from this seed.—H. J. JONES, Ryecroft Nursery, Lewisham.

The best book on the Chrysanthemum is *Chrysanthemums, and How to Grow Them*. Now ready, post-free, 9 stamps, of H. J. JONES, Ryecroft Nursery, Lewisham, S.E.

A SAMPLE OF UNSOLICITED TESTIMONIALS

We are Constantly Receiving.

"January 4, 1892.
"I should like to say I have not found any Manure like your LE FRUITIER for Grapes, especially for Gros Colmar. My Vines carried a fine crop with both large bunches and berries, and well-coloured, for such a season as 1891.

"J. EGGLETON, Eagle House Gardens, "Downham Market."

"February 15, 1892.
"I should very much like to try your Manure—LE FRUITIER—having seen some extraordinary results from its use.
"S. T. WRIGHT, Gileston Court "Gardens, Ross, Hereford."

W. WOOD & SON, F.R.H.S. (ESTAB. 1850),
WOOD GREEN, LONDON, N.

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatoes, Peaches, &c., beyond any other Manure.

Field Crawley, Sussex, Sept. 14, 1891.
"The effect of this manure is most noticeable in the development, ripening, and colouring of the fruit. In consequence of the wet and sunless weather, I could not get my Tomatoes growing in an unheated and rather damp house to ripen; but within three days of applying your Manure they began to colour, and I have been gathering splendid fruit almost daily since."
(Signed), B. C. RAVENSCROFT.

Prices in Sacks, at Works, 10s. per cwt.; £2 per ½ ton; £3 15s. per ¾ ton; £7 per ton.

March 4th next.

NEW ORCHIDS.

GREAT SALE.—NO RESERVE.

Extraordinary New Lady's Slipper,

CYPRIPEDIUM CHAMBERLAINIANUM (SANDER).

GRAND NEW SPECIES.

EVERY PLANT RECEIVED WILL BE OFFERED
WITHOUT ANY RESERVE.

A magnificent and beautiful new *Cypripedium* which we have the privilege to offer. It is dedicated by permission to the Right Hon. Joseph Chamberlain, M.P.

An altogether unique and absolute new departure in every way from all known *Cypripediums*, in inflorescence, in habit, and in leaf, a perfectly marvellous novelty. Its leaves in some instances are 4 inches across, ample, undulated, and often beautifully tessellated on the upper surface, reminding one slightly of *C. Morganæ*, but much larger and finer; it is altogether a noble plant.

This extraordinary *Cypripedium* produces flower spikes up to 2 feet high, bearing all along its stem its white, yellow, and purple blossoms, and we are able to show dried flower spikes which have produced over thirty flowers. Another remarkable feature is, that the flower seats are not more than half an inch from each other.

The upper part of the flower is yellow with about six rosy-purple lines, divided by the midrib, emerging from a profusion of rosy-purple spots; those at the lower part are much denser than at the upper half of the dorsal sepal; the whole is beautifully reticulated and charmingly transparent towards the margins, densely covered on the outer surface with white hairs. The upper half of the dorsal sepal is clear and pure, without any spots or lines; the lower dorsal sepal is similar in its markings, only not so dense, and about half the size of the upper dorsal sepal, which extraordinarily enough is as broad as it is long, being about 2 inches in diameter.

The two petals are spreading, curled and twisted at the ends like a corkcrew, and spotted in the way of *C. superbiens*; the margins are charmingly undulated, and bear a profusion of white hairs. They are spotted on both surfaces with blackish-purple and chocolate spots and blotches; some purple lines also run along them. They are of a lovely shining white and creamy-yellow colour, highly ornate, each of them over 2 inches long. The slipper, shoe, or pouch, sometimes called the labellum, is also exceptionally beautiful; it is rose and white, more inflated than *C. cardinale*, and double its size, reminding one of a beautifully-spotted bird's egg, so exquisite is the fine blackish-purple spotting over two-thirds of its lower part. The upper part and side-lobes are of a shining porcelain white colour; this combined with the purplish-black spotting lends it a hue and charm perfectly unique.

We have been asked by several Gentlemen to Sell the whole Importation of this altogether extraordinary and charming new *Cypripedium*, without reserve, and we will do so.

Cypripediums are most difficult to introduce, and without the right moment is caught, all arrive dead. *CYPRIPEDIUM CHAMBERLAINIANUM* has come home in altogether exceptional order and condition, and the Sale will contain the whole Importation of about 700 Plants.

Abundant dried material will be on view.

MESSRS. PROTHEROE & MORRIS

Have received Instructions from Mr. F. SANDER to SELL, at their Great Rooms,
67 and 68, CHEAPSIDE, LONDON, E.C.,

A Grand Lot of the above New *Cypripediums*, &c.,
ON FRIDAY, MARCH 4.

March 4th next.

NEW ORCHIDS.

NO RESERVE.

CATTLEYA VICTORIA REGINA

(SANDER),

A distinguished and excellent new *Cattleya*. From one of my oldest exploring collectors, and a superb novelty of greatest merit in every way. Free growing, free and abundant flowering. The flowers are, individually, 5 inches across, and as many as eight or nine are borne on a spike. The flower is very compact, and of great substance. The sepals and petals are of a deep rosy-red, glowing and glistening, blotched crimson and purple, the margin lighter, and undulate. The lip is crimson, with a white tube. The importation is in magnificent condition.

CATTLEYA SPECIES.

A beautiful *Cattleya*. See dried flowers on view day of sale.

CYPRIPEDIUM

(GOLDEN YELLOW).

When the beautiful *Cypripedium insigne* Sander was flowered, a few years ago, we instructed our collector to search for it, and are pleased to be able to offer now a few plants of a simply magnificent golden-yellow and white *C. insigne*. The plants are in fine order.

MAGNIFICENT NEW CYPRIPEDIUM.

CYPRIPEDIUM

KIMBALLIANUM

(SANDER),

QUITE NEW SPECIES.

This grand new species is now offered for the first time, and no plants of it have ever been sold. It is a grand grower, and a grand novelty. Nothing similar to it, or in any way like it, has ever been imported up to now. It is a stately species. Its flowers are said by the natives to be of enormous size, and the colours are described as crimson, purple, and white in this description, we believe. It has been a terrible difficulty to get plants home alive; and after all our trouble and expense, we only got a few plants. Those offered are in grand condition, and we believe that it will be absolutely impossible for us to ever again offer it, and that this will be the only time it will be on sale. An imported plant had leaves on it fully 2 feet long. The leaves are most beautiful, of elegant shape, and heavily mottled and blotched.

CYPRIPEDIUM SPECIES.

This may turn out to be simply a variety of *Cypripedium Wallisii*, but it comes from quite a different country, the extraordinary flowers have petals nearly 2 feet long and are pure satiny white, excepting the lip—which is rose. In *Wallisii* it is white. It is one of the most stately of *Cypripediums* we have introduced. In fact, it is quite a sensational plant. The consignment is in fine condition.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 27, 1892.

WINTER RAMBLES ROUND CANNES.

THE towns of the Western Riviera are backed by hills of various heights; those behind the *Hôtel Métropole*, which is a mile or more away to the east of Cannes, rise to about 320 feet. A glance at a map of the world will show that, starting from the west end of the Pyrenees, the great mountain chain continues more or less continuously, till it sinks and disappears in the island of Formosa, off China. The Pyrenees are linked to the Maritime Alps by the *Estérel* Mountains, and these hills, which form the link to the higher mountains of Switzerland. The *Estérel* on the west, and the snow-capped *Maritime Alps* on the east, bound the view on either side. That these hills must have been much higher formerly, is clear, from the enormous amount of denudation they have undergone, as the most abundant rock or "gneiss" is exposed all round Cannes. It is a buff-coloured, easily disintegrated, and aqueo-igneous rock, which forms a poor, hungry soil for the Pines, Heaths, &c., which clothe the entire slope, except where it has been cleared for villas and their gardens, hotels and their grounds, and the winding zigzag roads through and over the hills.

Geologically, it is difficult to say what the gneiss, a sort of streaky granite, represents. The strata immediately upon it, when present, are "triassic" with little patches (outliers) of lias, the oolitic or jurassic limestone; being on the high ground to the east, so that the gneiss may represent anything below the trias. The famous Vallauris pottery manufactory is close by, the clay being supplied by some of the triassic beds, and are of various colours—blue, red, black, and grey. These beds overlook the little bay (in which about ten of the French ironclads are now reposing), known as *Golfe-Juan*. The railway runs along the coast, and about opposite the middle of the bay is the station, and in front of it is a column marking the spot where Napoleon I. bivouacked after his arrival from Elba on March 1, 1815, Corsica being within sight if the atmosphere be favourable.

The slopes of these hills carry a poor vegetation, known as the *Mauvarre Pine Forest*, supplemented by Gum trees (*Eucalypts*), which flourish well. The following form the main bulk of the trees and shrubs. First is *Pinus Pinaster*, familiar to residents of Bournemouth, which furnishes an abundance of cones for lighting the wood fires, as coal is a thing unknown here. The boughs support innumerable bags made of web full of tawny caterpillars, which do great harm in destroying the foliage.

Of other trees there are the Cork Oak, the evergreen Oak, and the common Oak. Of the large Cork trees, the bark has been stripped from

the trunks, whether artificially or not I could not tell, but a new growth has taken its place. This, like the *Quercus Ilex*, is evergreen. Nothing else can be really called a tree. Of bushes, there are fine specimens of *Juniperus oxycedrus*, abounding with large green berries; smaller bushes of *Pistacia Lentiscus*, Bay Laurel (*Laurus nobilis*), Myrtle (*Myrtus communis*), *Phyllirea angustifolia*, two species of *Cistus*, the commonest shrub being the shiny yellow-flowered *Calycotome spinosa*, resembling a *Genista* (of which there is a male species, *G. humifusa*), only the calyx splits in half, the top being pushed off like a cap by the corolla, hence its generic name. *Lavandula stachas*, just pushing forth its quadrilateral spikes, and occasionally *Smilax aspera* scrambles about.

Of the Heath family there is the Strawberry tree, *Arbutus unedo*, *Erica scoparia*, and *E. arborea*, now covered with minute pinky-white bells. This is the *bruyère* of the French, the wood of which is made into "briar" pipes, this name being, of course, a corruption from *bruyère*, and has nothing to do with briars proper. Two other British species, *E. vagans*, the Cornish Heath, and *E. mediterranea*, are recorded as growing in the south of France, but I have not seen them. Now, it is interesting to remember that these last are found in Mayo and Galway, while *Arbutus* occurs in Killarney, Muckross, and Bantry. These plants represent the time when Ireland and Spain were united. Two other members of this Spanish-Irish flora which occur in the west and south-west of Ireland, viz., the two *Saxifragas*, *S. umbrosa*, London Pride, and *S. Geum*, found on the mountains of Kerry and Cork, are also found on the Pyrenees, but do not extend further east. Another glance at the map will show that the west coast of Ireland is on the same meridian as that of Spain; and, apart from geological evidences, the old legends of Ireland record that, "once upon a time," only a river separated Spain from Ireland. This was probably quite true, as an elevation of 600 feet would cause the British Isles to be united with the Continent. When such was the case, the Spanish mountains would be united by land with those of the west of Ireland, while a common flora spread over them both. Thus it is we can account for our own Strawberry tree and Heaths being found near Cannes.

Of weeds of cultivation the following ubiquitous plants abound:—Shepherd's Purse, *Cardamine hirsuta*, *Geranium molle*, Chickweed, *Oxalis corniculata*, Fumitory (*F. parviflora*), Groundsell, Sowthistle, *Lamium amplexicaule* (cleistogamous form), *Veronica agrestis*, *Euphorbia peplus*, and *Poa annua*. Now this list is precisely the same as may be drawn up from the gardens at Cairo, and some of these, such as Shepherd's Purse, *Cardamine hirsuta*, *Poa annua*, and a Dock are the very ones Sir J. D. Hooker unexpectedly met with in the highlands of Sikkim. We now "know the reason why." They are all self or wind-fertilised. Not being dependent on insect aid, they are cosmopolitan in their range, and have long since proved themselves the "best fitted to survive."

In addition are the following English friends, which still put in an appearance in winter:—*Parietaria officinalis*, *Rubia peregrina*, Honey-suckle, which is evergreen, as also in Malta; *Cotyledon umbilicus*, *Plantago media*, *Rubus fruticosus*, and Primroses. There are doubtless plenty more, but they are at present invisible. Of natives may be added *Veronica cymbalaria*, with white flowers; *V. didyma*, *Calendula arvensis*, common in Malta, but replaced in Egypt by

C. egyptiaca, apparently a variety, if it differ at all; occasional tufts of honey-scented *Alyssum maritimum*, a plant common all over the rocks of Malta, and grown as a garden plant in Cairo.

Now for gardens. Australian *Acacias*, almost all phyllode-bearing, excepting *A. dealbata*, with bipinnate leaves, which is always called *Mimosa*, are innumerable; several species of Gum trees, a few *Hakeas*, and a *Banksia*, with four large spikes of flowers upon it; all the preceding being now in bloom. *Agaves* and *Aloes ad lib.*, the latter lately described by Mr. Baker in the January number of the *Kew Bulletin*. Several *Agaves* have flowered, their tall candelabra-like inflorescences still standing; *Dracenas* with branching heads; *Palms* of many species; *Dates* ripen, but produce a poor fruit; *Opuntias* of two or three species; large bushes of *Abutilons*, 15 feet high; also of *Polygala chamaebuxus*; a bushy *Senecio*, *S. angustifolia*; *Castor-oil* plants, and, of course, *Orange* trees in abundance, chiefly grown for their flowers, as the fruit is not first-rate. A species of *Mesembryanthemum* with triquetrous leaves is in every garden, crawls over every wall and rock, and creeps along the roadsides.

With regard to the florist's gardens, which abound, one is somewhat disappointed, as they contain—at this season, at all events—nothing but *Roses*, mostly *Tea*, with a few common climbing red ones; *Marguerites*, yellow and white; *Carnations* to any extent; *Narcissus tazetta* and vars.; white *Stocks*—these latter are all grown in long beds, with a framework round them to support matting, which is laid over them to avoid the ill-effects of radiation. Some florists adopt the barbarous practice of dyeing their white *Carnations* of a greenish-blue colour! *Violets* bear enormous flowers. Such, with *Mignonette*, and sprays of "*Mimosa*," constitute the contents of the baskets sent over in quantities to England. *George Henslow*.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM O'BRIENIANUM.*

HERE we have a very peculiar new *Dendrobe*. The general view of it promises not very much, but the plant when in flower is quite unlike any other species known as yet. The many-flowering drooping racemes of yellowish-green flowers are, in spite of the moderate colours, very nice; and as contrasts are always pleasant, even the contrast with the rose or purplish, or yellow-flowering *Dendrobes*, gives a good effect. The lateral sepals are produced into a long, so-called spur, which in its middle makes suddenly a very obtuse angle like a knee. The plant was gathered by Mr. F. Sander's most successful collector, Mr. Micholiz, in the Philippine Islands, and flowered in the autumn of last year at St. Albans.

* *Dendrobium O'Brienianum*.—Sepalo dorsali ovato-oblongo obtuso, lateralibus multoties longioribus, obliquis, parte superiore libera dorsali subaequilongius triangulari obtusius deinde in pseudocalcar tubiforme longissimum infra subapicatum genuflexum demum acutatum producti; petalis lateralibus sepalis fere aequalilongis oblongis obtusis; labello e pedo longissimo fere lineari sensim dilatato, oblongo lanceolato integro margine serrulato disco lineis 3 elevatis apicem fere longe decurrentibus instructo; gynostemio brevissimo crasso; anthera obtusa plana adnatae rectangulariter abscesse marginibus sub-barbata, androclivio utrinque dente recurvo instructo. Radices crebri crassiusculi albi. Bulbi caulescentes 15–20 poll. longi, 1 cm. v. plus diametro, vetusti cinerei. Folia oblongo lanceolata acuminata papyracea (10–12 cm.), 4–5 poll. longa, 1–1 poll. lata. Racemi pedunculati ad 8 poll. (20 cm.) longi, vel paucum longiores, 30 flori. Bractee minutissimae triangulae acutae. Pedicelli et ovaria 1 poll. (2.5 cm.) longa, sepalis 5 lin. (1 cm.) longa; lateralium partitio superior libera vix 5 lin. (1 cm.) longa, partitio inferior producta 20 lin. (2 cm.) longa; petalis sepalis paucum brevioribus, labello fere 10 lin. longum, partitio antice propria 5 lin. longa. Totus flos viridi laetum sepalis petalisque infra albidis. —*Krönzlin*.

LYCASTE SKINNERI VAR. MRS. F. L. AMES, new var.

Considering the great variability of *Lycaste Skinneri*, and the thousands of it which have been imported, it is surprising how few may honestly be selected as good and distinct; but on that question, in relation to the one now recorded, and to the accompanying record, we are relieved of all difficulty. The sepals are white, tinted with salmon colour; the petals salmon-colour, with an orange tint at the base; the lip at the base, and on the callus and side-lobes, Indian-yellow, and its front lobe is creamy-white, freckled with yellow—extraordinary colours for *L. Skinneri*. The flower is also large and well-shaped. It flowered with Messrs. F. Sander & Co. at St. Albans.

CROSSES AND CROSSING OF PLANTS.

(Continued from p. 236.)

NEW CHARACTERS FITTED TO NEW CONDITIONS.

Almost every farmer and gardener at the present day feels that an occasional change of seed results in better crops. Much of the rapid improvement in fruits and vegetables in recent years is due to the practice of buying plants and seeds so largely of dealers, by means of which the stock is often changed. Even a slight change, as between farms or neighbouring villages, sometimes produces more vigorous plants, and often more fruitful ones. In the cross, a new combination of characters or a new power fits it to live better than its parents in the conditions under which they lived. In the case of change of stock we find just the reverse, which, however, amounts to the same thing, that the new characters or powers fit the plant to live better in conditions new to it than plants which have long lived in those conditions. In either case, the good comes from the fitting together of new characters or powers, and new environments.

Crossing within the variety, and change of stock within ordinary bounds, are therefore beneficial, and the results in the two cases seem to flow from essentially the same causes, and crossing and change of stock combined give much better results than either one alone. These processes are much more important than any mere groping after new varieties, not only because they are surer, but because they are universal and a necessary means of maintaining and improving both wild and cultivated plants. Upon this point Darwin expressed himself as follows: "It is a common practice with horticulturists to obtain seeds from another place having a very different soil, so as to avoid raising plants for a long succession of generations under the same conditions; but with all the species which freely intercross by the aid of insects or the wind, it would be an incomparably better plan to obtain seeds of the required variety which had been raised for some generations under as different conditions as possible, and sow them in alternate rows with seeds matured in the old garden. The two stocks would then intercross with a thorough blending of their whole organizations, and with no loss of purity to the variety; and this would yield far more favourable results than a mere change of seeds."

PRODUCING NEW PLANTS.

The second result of crossing, the summary production of new varieties, is the subject which is almost universally associated with crossing in the popular mind, and even among horticulturists themselves. It is the commonest notion that the desirable characters of given parents can be definitely combined in a pronounced cross or hybrid. There are two or three philosophical reasons which somewhat oppose this doctrine, and which we will do well to consider at the outset. In the first place, Nature is opposed to hybrids, for species have been bred away from each other in the ability to cross. If, therefore, there is no advantage for Nature to hybridise, we may suppose that there would be none for man; and there would be no advantage for man did he not place the plant under conditions different from Nature

or desire a different set of characters. We can overcome the refusal to cross in many cases by bringing the plant under cultivation where new conditions overpower its former antipathies. Yet it is doubtful if such a plant will ever acquire a complete willingness to cross. In like manner, we can overcome in a measure the comparative seedlessness of hybrids, but it is very doubtful if we can ever make such hybrids completely fruitful. It would appear, therefore, that with plants in which fruits or seeds are the parts sought, no good can be expected, as a rule, from hybridisation, and this seems to be affirmed by facts. It is evident that species which have been bred away from each other in a given locality, will

other regions much like each other. Now it follows that if representative species are less opposed than others, they are more likely to hybridise with good results; and this fact is well illustrated in the Kieffer and allied Pears, which are hybrids between representative species of Europe and Japan. We will also recall that the hybrid Grapes which have so far proved most valuable are those obtained by Rogers between the American *Vitis labrusca* and the European Wine Grape, and that the attempts of Haskell and others to hybridise associated species of native Grapes have given, at best, only indifferent results.

(To be continued.)

Dr. Roland Thaxter, Mycologist of the Connecticut Agricultural Station, says, "There is no longer room for doubt that the cause of the disease is a bacterioid fungus, and that, whenever he has examined the disease out-of-doors, it has invariably been found to be visibly accompanied by the growth of an undetermined fungus, at least in its earlier stages; and that this fungus, when cultivated in an absolutely pure condition on nutrient substances, and thence transferred to growing Potato tubers, with the necessary precautions, reproduces in them the disease called scab, from which it was originally obtained, the observations and experiments so far being convincing to the author that the two are directly associated as cause and effect.

Among the many causes of an inorganic nature which have been said to produce the disease, may be mentioned:—

Excessive moisture in the soil, supposed to affect the lenticels, which constitute the small rough dots scattered over the surface of normal tubers, producing an abnormal growth of corky tissue at such points, which may extend to the adjacent superficial tissue, and be associated with more or less decay.

Mechanical irritation, induced through foreign substances in the soil, which may act as a direct irritant to the surface of the tubers; the "scab" being the result of an attempt to repair the injury through an abnormal corky growth at such points, also accompanied or followed by decay.

Chemical action, due to the presence of certain substances in the soil, such as lime, or oxide of iron, which, through an irritant action, might lead to similar results.

Manuring, especially by stable-dung, which has been definitely observed to influence the prevalence of the disease; a fact which has been explained on the supposition that it may furnish conditions favourable for the action of one or more of the supposed causes already enumerated.

Turning to the theories which connect the "scab" with the action of some organism, vegetable or animal, the "insect" theory is one very commonly entertained, especially by horticulturists, "insects" including earth-worms! This idea is based upon the fact that scab spots form an attractive feeding-ground for a variety of insects, especially wire-worms, millipedes, and mites, the common occurrence of which, especially in the deeper scab spots, has led to the belief that the two were directly associated. That this is not the case has been shown by careful observation, the only connection between the two resting on the fact that the injury already existing from a quite different cause is often extended by them very considerably.

The simple fact that scab occurs very commonly on light dry land, entirely free from extraneous material which could produce external irritation, and regardless of lime or other chemical substances in the soil; also that farm-yard manure, not infrequently, at least, yields a clean crop, is sufficient to show clearly that none of these supposed causes is in itself sufficient to account for the phenomenon. The best that can be said of them is, that in some cases they may involve conditions favouring the prevalence of the disease; but the question of its cause they leave untouched. *J. J. Willis, Harpenden.*

FIG. 37.—*CYMBIDIUM GRANDIFLORUM*: COLOUR GREENISH, LIP RICH CRIMSON; FLOWER REAL SIZE, RACEME REDUCED TWO-THIRDS.

have more opposed qualities than similar species which have arisen quite independently in places remote from each other. In the one case, the species have struggled with each other until each has attained to a degree of divergence which allows it to persist; while in the other case, there has been no struggle between the species, but similar conditions have brought about similar results. These similar species, which appear independently of each other in different places, are called representative species. Islands remote from each other, but similarly situated with reference to climate, very often contain such species, and the same may be said of

POTATO SCAB.

It is a well-known fact that the theories and explanations which have been advanced to account for certain diseased conditions of the surface of Potato tubers, generally known as "scab," are nearly as numerous as the experimenters who have studied the disease, but until quite recently no satisfactory demonstration of what the active agent really is which gives rise to the condition has been advanced, although the subject has occupied scientific investigators from time to time for upwards of half a century.

CYMBIDIUM GRANDIFLORUM.*

THIS very striking species, better known as *C. Hookerianum*, excited much attention at the last meeting of the Royal Horticultural Society, when

* *Cymbidium grandiflorum*, Griffith, *Not.*, iii., 312; *Jc. Plant. Asiat.*, t. 321.—Leaves 8 to 24 by $\frac{3}{8}$ to 1 inch; scape very robust, decurved, sheaths lax; raceme six to twelve flowered; flowers 3 to 4 inches in diameter; sepals and petals oblong-lanceolate acute, green; lip yellowish, pubescent, and ciliate; mid-lobe large, suborbicular, waved, and crenate, blotched or speckled with red.

C. Hookerianum, Rehb. i., in *Gard. Chron.*, 1866, p. 7; *Bateau*, in *Bot. Mag.*, t. 5574.

Eastern Himalaya, East Nepal, Sikkim, Bhutan—alt. 5000 to 7500 feet.—*J. D. Hooker in Flora, British India*, Vol. 5.

it was shown by Mr. Ross. It was described by Professor Reichenbach in our columns in 1886, p. 7, but, as will be seen from the appended note, had been previously registered by Griffith. The flowers are greenish, but the lip is of a rich crimson, and crenulate at the margin, as shown in the illustration.

CEYLON.

(Concluded from p. 234.)

PERADENYA.—The gardens are four miles from Kandy, and about eighty from Colombo. The railroad passes through lowlands and Rice-fields, past native villages surrounded by Plantains and Cocoanuts, and through occasional jungles, until it reaches higher ground. The scenery changes rapidly, forests now and then appearing in the foreground, with occasional views of distant castellated mountains. As the mountains rise out of the terraced Rice-fields and from the shrubs of the jungles, the eye catches on every hand glimpses of groups of bent Cocoa-nut Palms and straight Arecas. It is difficult to realise that these Palms mean, perhaps without exception, human habitations at their feet. Through these scenes of enchanting beauty the railroad has made its way, demanding here and there very skilful engineering. The track is lined with Lantana, which is slowly giving way before the encroachments of a still stronger invader, a Composite from Mexico.* *Mimosa pudica* is also widely spread as a strong weed.

The drive from Kandy to the great garden is through a well-shaded street, lined with native houses. These are gathered at short intervals into villages. My first visits to this garden were made, as were those in every other instance save one on the whole tour, without reporting to the Director. In this way a student can take things very leisurely, and look up matters of detail which it is not right or courteous to trouble the chiefs with; later, all special points of interest which have escaped notice are likely to be brought out by a walk with the Director. The establishment at Peradeniya consists—(1) of 150 acres of garden proper and of arboretum;—(2) of a museum and herbarium, with library attached. The Director, Dr. Henry Trimen, widely known as an author and editor, controls not only these, but the branch gardens as well, making his head-quarters at Peradeniya.

Once for all, it may be said, that botanists are made welcome in every way, finding every facility for carrying on systematic work. The climate is healthful, provided one takes ordinary and reasonable precautions against exposure to the direct rays of the sun in the hottest part of the day.

It is impossible to describe the wealth of material placed at the service of every visitor to the two great gardens of the equatorial belt, that under present review, and the one at Buitenzorg to be considered in a subsequent note. It is equally impossible to institute a comparison between the two.

In both these vast establishments the student finds magnificent specimens of all, or very nearly all, the useful plants belonging to hot moist climates. Many years ago the writer had the privilege of seeing tropical plants at the isthmus of Panama; but even the delightful impressions received on that occasion, which had perhaps become deepened with the lapse of time, were forgotten in the presence of the abounding luxuriance of these Palms, Bamboos, glossy-leaved evergreens, and tangled climbers.

At Peradeniya, the most characteristic plants are so placed as to be seen to good advantage. This was frequently observed when in search for points of view for photographing individual specimens. Moreover, the system of labelling is about perfect; Dr. Trimen makes use of a large staff formed out of baked clay, shaped so as to give an inclined surface, on which the name is plainly painted. These brick-red labels with their painted disk are not unattractive; at any rate, they do not detract from the general effect of the broad lawns bordered by gigantic trees.

The most remarkable single tree in the garden is the Seychelles Palm or double Cocoa-nut, now almost fifty years old. The giant and other Bamboos, the grove of India-rubber trees near the main entrance, and the avenue of *Oreodoxa*, are only a few examples of the finer groups of single species. The most imposing group of different species is that of the Palms not far from the gate. The classified arboretum is rich in fine specimens, the principal orders being represented on a generous scale.

The nurseries, kitchen garden, rockery for succulents, ferneries, and clusters of economic plants are on a scale commensurate with the arboretum. As might be expected, the Orchids are by no means so fine as the collections one sees in large private establishments in England and on the Continent; it is not possible to command the conditions of growth for all the finer species with the same degree of certainty as in colder regions, where a stove means something.

At the time of my visit, *Amberstia nobilis* and the great Grape Myrtle were in full flower, and a large Talipot Palm in bloom was one of the most conspicuous objects. I was a little too early in Ceylon for some of the tropical fruits, and too late for a few others, but fortunately was able to remedy this lack further on in Queensland and Java.

Among the finest of the photographic views of the gardens in Peradeniya are the following:—(1) the main entrance, with the long lines of Assam-rubber trees, and the cluster of different Palms; (2) the avenue of royal Palms; (3) the different Bamboos at the ponds; (4) the distant view of the Satinwood bridge. The view from the Herbarium is also one of great beauty.

Visitors to the gardens are greatly assisted by the intelligent native servants detailed to act as guides. They have a fair knowledge of the whereabouts of almost all the important plants, and seldom go wrong with regard to names. It should be stated also that the natives employed in widely different stations in the establishment prove, according to the Director and the Superintendent, generally efficient.

The Herbarium is rich in certain directions, and can be consulted by students under proper restrictions. The Museum is as yet small.

It remains to be said that plants and seeds are for sale at the garden, at moderate prices. A Wardian case, packed with forty assorted plants, is shipped for 40 rupees, say, from 16 to 20 dols.

The influence for good which has been exerted in Ceylon by the garden and its branches is incalculable. The establishment has proved a centre of scientific activity and high economic value. *G. L. Goodale.*

THE AMATEUR'S GARDEN.

POT-HERBS AND FLAVOURINGS.

(Continued from p. 245.)

THE amateur should always look well after his pot-herbs, and above all select a nice, deep, well-drained sunny spot for the Parsley bed. Gardeners with acres of land may sow Parsley by the hundreds of yards by the side of the walks, and admire its beautiful green appearance in summer, but they are often in difficulties with the cook about the Parsley supply in midwinter; therefore, we advise our readers to grow theirs in beds of such a width that they can cover them in winter with frames, which should be banked up with soil to keep out frost; and then with a few armfuls of litter all can be made quite safe, and you may perchance have some to spare for the "professional" in his time of scarcity.

The other pot-herbs, as Borage, which usually looks after itself, turning up everywhere after it has once come into the garden, and which if there are bees, no good apianian, or anyone else, thinks of destroying. Spear-mint, of which it may be said, that once planted, always present, and at times unpleasantly so; generally, it will be sufficient to give it a top-dressing of rotted manure, or rich, or even merely fresh soil, after carefully forking up all roots that have strayed beyond

the allotted space, and burning them. Sage will be much browned by the winter's wind, and hard weather, and had better be cut hard back; slips may be put in of side-shoots. Sweet Marjoram, any of the Thymes, and Tarragon, may be cut over like Sage; or if more plants be wanted, they may be taken up, divided, and replanted. Chives may be similarly treated as regards division of the roots; these are useful flavouring materials at all seasons, and more especially for salads, when they can be had young and tender, as when slightly forced say in a hothouse, or even the kitchen window.

Potato-Onions should be much in request this season, owing to the bad Onion seed harvest of 1891. In northern England, these useful bulbs were, and may still be, much grown. There are several varieties, some round, others pear-shaped, some strong, others mild-flavoured. They are propagated by separation of the sections of the bulbs in March, as are Shallots. These latter should soon be got into the soil, or rather, laid on it, in shallow drills, made with a small hoe, and kept in position, after giving them a squeeze into the soil, by filling the drill with fine coal ashes.

If the amateur have a warm pit or a hothouse, he may sow some Sweet Basil and Pot Marjoram; a painful case of an early Cabbage, another of an early Cauliflower, one or two of Lettuces of both kinds, and one or two of Onions if he wants very big bulbs; and supposing that Celery and Leeks are required in August and September, a small pinch of seed of each may be sown. Choose light soil, shallow pans or boxes well drained for these seeds, and as soon as germination has taken place, put them within 6 inches of the roof-glass, and never let the soil get very dry. Even a sheet of tissue paper laid over them would be permissible when the sun is very hot about midday. Pricking-out must be done when the plants touch each other.

FRUITS.

The Gooseberry bushes, were left unpruned for fear the tomtits would steal the leading buds, and the red, white, and black Currants, should be pruned. The first-named should have the heads kept hollow-basin-shaped; but as Gooseberries differ much in habit, that must be studied. Do not cut back the leading shoots of last year's growth, unless they already touch the soil, and the side shoots which are removed should have only half an inch left at the base. Old spurs which have grown very long may be removed; they will not be missed, and, moreover, the younger ones and the young shoots carry the finest fruits. If the saw-fly caterpillar was troublesome last year, scrape away the soil under the bushes, and bury it deeply somewhere else, putting some clean soil from the vegetable quarter in its place. Red and white Currants may be treated like the Gooseberry. Black Currants should have their shoots thinned, as well as some of the oldest branches; but do not cut back the annual shoots, like the Gooseberry. Strawberry beds should be cleared of decaying leaves, and young plantations should be well trodden, especially close up to the plants. The frost will have thrown them almost out of the soil, and the plant hates a loose soil. Having hoed the land, and raked off the rubbish on beds of more than one year old, apply some kind of much leaf-mould, or decayed stable dung, and let it lay; by and by, it will be covered with litter. Strawberry plants may be bought, and planted, but no fruit can be expected before 1893.

The pruning and nailing of wall fruits should now be finished, for the manipulation of which we would refer our readers to some recent calendarial articles in the *Gardeners' Chronicle*, which are quite applicable in their case.

NEW GUINEA.

IN connection with the remarkable *Cypripedium* figured in our last issue—an earnest of what may be expected in future from that vast region—we print

* The "Californian Daisy," really a perennial Sunflower, is referred to.

the following communication which has just reached us from Baron Sir Ferdinand von Mueller:—

"The latest expeditions of Sir William Macgregor have again afforded material for augmenting our knowledge of the native vegetation of British New Guinea, not only in reference to further systematic records of the flora, but also as regards prospects

Islands, to institute the needful methodic observations in the Papuan forests, guided by special previous experiences. As another instance of trying to turn soon to practical account the scientific information gained, might be mentioned the rubber industry. It seems quite within reach of possibility to find also among the numerous species of

tive value. As gradually so many Urticaceæ trees and shrubs have come under notice from the Possession, new sources for fibre may also become opened up for large actual industries and commerce. Of the genus *Vitis*, now thirteen species are known from British New Guinea, with the possible prospects of some showing cultural capabilities as Grape vines. A *Spondias* there is closely akin to the famous *S. cytherea*. The great variety of timber trees, now already demonstrated to exist, must sooner or later call forth special efforts of timber merchants to closely investigate the wood resources there beyond what is already shipped to our harbours, such as the Red Cedar. The Ebenaceæ are represented, as we now learn, by several kinds in British New Guinea, and thus, perhaps, superior ebony wood could be added to the exports. Some new resin plants may also become accessible, as from specimens with young fruit secured by Sir William Macgregor, a third species of Papuan *Araucaria* seems to exist, but in the highlands only, although Kauri Pines have not yet been found. Of special phyto-geographic interest is the fact, that to the many alpine plants recorded in a former report, now also a species of the New Zealandian and East Australian genus *Quintinia* (*Q. Macgregorii*), as well as *Coprosma repens*, *Geranium pilosum*, and an *Hydrocotyle*, with almost *Azorella* habit, may be added, the two former showing further the extensive alliance of the Papuan highlands flora to that of our most elevated far southern regions. To these Australian types should further be added a new very tall *Grevillea* from lower mountains. The rare *Rhododendron Macgregorie* has, with the new *Aristotelia gaultheriæ* and *Ternstroemia Britteniana*, been described some months ago in *Britten's London Journal of Botany* as got at the summit of Mount Yule, where the vegetation, particularly as regards the numerous Ericaceæ, simulates that of the Owen Stanley ranges in their higher though not in their highest parts, a new *Begonia* from the cool heights being among the novelties from there, so an additional *Quercus* from the middle region.

"As might have been expected, Sir William Macgregor's collections are likewise particularly rich in Gesneriaceæ, Acanthaceæ, Scitamineæ, Orchideæ, and Ferns (one *Monogramme* new) mostly of Sundaic affinities; but it is beyond the scope of this brief document to enter into detail on remarks concerning any of these showy plants, although they comprise many hitherto unknown treasures for future horticulture in any part of the world. *Ferd. von Mueller.*"

NURSERY NOTES

ORCHIDS AT MESSRS. B. S. WILLIAMS AND SON.

WITH the ground outside covered with snow (February 16), the bright effect of the well-displayed showy Orchids in bloom in most of the houses at the Victoria and Paradise Nurseries, Upper Holloway, was all the more marked, and seldom have we seen a better display there, or a more marked appearance of vigour in the specimens of the large house of *Vandas*, and that devoted to the *Lælias* and *Cattleyas*, or, indeed, the whole stock, than at the present time.

The large East Indian-house had a very effective arrangement made up of specimen *Dendrobium Wardianum*, *D. nobile nobiliss.*, and the handsomely-mottled *D. n. Backhousianum*, together with a profusion of *Calanthe Regnierii*, *C. Stevensii*, *C. nivalis*, a charming pure white *C. Sandhurstiana* ×, one of the richest-coloured of the home hybrids, and large specimens of *Cypripedium calceolus*, *C. Sedeni candidulum*, *C. Sallierii* ×, *C. Boxalli atratum*, *Dendrobium endocharis* ×, *D. Jamesianum*, *D. luteolum*, with *Cœlogyne Massangeana*, and a large quantity of other species in bud, and some of the noble specimens, *Vanda tricolor* and *V. suavis*, still in bloom. In the large Intermediate-house was a fine display of selected varieties of *Cattleya Trianae*, *Lælia anceps alba*, and *L. a. Williamsii*, some grand masses of the orange-scarlet *L. harpophylla*, a fine specimen of the

FIG. 38.—*RUBUS PHENICOLASIVS*. (SEE P. 282.)

for new utilitarian resources. We learn from the collections gathered that several Sapotaceæ trees exist in British New Guinea, and therefore the question arises whether special searches for new kinds of Gutta-percha trees could be instituted, all of them belonging to the Sapotaceæ. This might, perhaps, best be accomplished if the services of some one of the many experts were secured who are engaged in tapping and preparing the sap of the various Gutta-percha trees in the Malay Peninsula, or the Sunda

Papuan Fig trees one or more to provide rubber, but it may need an accustomed Caoutchouc gatherer from Assam or some other Indian locality to enter on the search and tests in New Guinea, the sap of the particular Fig trees needing carefully correct treatment for converting it into the mercantile and industrial product. The number of kinds of grasses indigenous in New Guinea proves also much greater than anticipated, some of them, such as the *Panicums*, evidently of tender foliage and great nutri-

rare *Odontoglossum Rossii* albens, a large batch of *Coclogyne cristata* alba, with a profusion of its large snow-white blossoms; *Cymbidium eburneum*, *Brassavola glauca*, which has such a delightful odour, especially at night; *Oncidium Cavendishianum*, *Cymbidium Lowianum*, with six long spikes in bud; *Lycaste Youngii*, and various *Oncidiums* and *Odontoglossums*. In the next house the *Cattleyas* and *Laellias*, and especially the well-sheathed *L. purpurata*, were in splendid condition; and here the show was made up principally of varieties of *Cattleya Percivaliana*, fine varieties of *Oncidium splendium*, *Cypripediums*, *Calanthes*, &c.; and here is one of the finest specimens we have seen of *Oncidium sarodes*, with two fine spikes not yet in bloom.

In the cool houses in bloom were the pretty scarlet *Cochlidium Noezliana*, *C. vulcanica*, *C. rosea*, some bright scarlet *Sophranitis grandiflora*, some good *Odontoglossum crispum*, *O. cirrosum*, *O. maculatum*, *O. Rossii* mejus, and *O. blandum*, *Ada aurantiaca*, *Oncidium Forbesii*, *Madevalia Chelsoni* ×, *M. triangularis*, *M. melanopus*, and other species of *Madevalia*.

In the smaller warm houses we came to, in the first were some showy *Phalaenopsis Schilleriana*, *P. Manni*, *Angraecum hylaeoides*, *A. citratum*, *A. Pandurarium*, *Ornithocephalus grandiflorus*, &c., and here the *Diacrium bicornutum* were freely sending up spikes, and the species of *Utricularia* were flourishing. In the second in flower were *Dendrobium chloropis*, *D. superbieus*, and various other *Dendrobies*.

The next house had a fine collection of *Sarracenias*, and a good show of varieties of *Dendrobium Ainsworthii* × and *D. Leechianum* ×, with some brightly-flowered plants of *D. Dominianum*; and the *Cypripedium-house*, whose supply of flowers never fails, had a good show of *C. Williamsii* ×, *C. Amesianum* ×, *C. Morganii* ×, *C. Lathamianum* ×, *C. Io grande*, *C. gemmiferum* ×, *C. Meirax*, *C. politum*, *C. Dauthierii marmoratum*, *C. reticulatum*, *C. Laforcadei* ×, *C. Fytchianum* ×, *C. Harrisianum vivicans* ×, &c.

Other notable things in the vast and well-grown stock were the splendid *Gleichenias*, the extensive collection of *Nepenthes*, a good lot of *Anacrotichilus*, some plants of the fine blue-flowered *Tillandsia Lindeni*, houses full of green and coloured *Dracenas* and *Crotone*s, and other ornamental plants, some fine fragrant *Daphnes*, a fine show of *Williams' strain* of *Cyclamen*, and a bright display of the ordinary spring flowers.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

PLANTS THAT MAY BE RAISED FROM SEED.—A stock of young plants of the *Antirrhinum*, *Delphinium*, *Dahlia*, *Pentstemon*, *Verbeena*, single-flowered *Petunia*, *Viola*, including *Pansies*, and *Lobelia*, may be readily raised from seed sown now in gentle warmth, and pricked off into pans or boxes when large enough, growing them for a short time in an intermediate temperature, and tiring them by degrees to cool-frame treatment.

PROPAGATING.—The required number of cuttings of *Verbena*s, *Ageratum*s, *Lobelia*s, *Lantana*s, &c., should now be taken off the stock plants and dibbled into 48's, with one big crock at the bottom, a handful of half-decayed leaves for drainage, and filled with light mould, and a surfacing of sand. Plunge the pots when watered and become dried a little in bottom heat, and shade them from strong sunshine until rooted, which, with a brisk bottom-heat and the frame kept close and well-covered at night, will be in about one week. They should then be potted off, putting two plants in a 60-sized pot, using a compost of sifted soil and leaf-mould in the proportion of three parts of the former to one of the latter, with a little sand added, returned to heat, watered, and shaded from sunshine for a few days, after which the shading should be dispensed with, and the young plants be afterwards attended to in the way of stopping, watering, and ventilating, gradually hardening them off by the middle of May next.

TUBEROUS-ROOTED BEGONIAS—Tubers should

now be put into a warm *Pesch-house*, vinery, or other forcing-house, to start into growth. Where large quantities of *Begonia* are grown, it would be better to place the tubers a couple of inches asunder, on a layer of light compost, in frames placed on a gentle hot-bed of leaves. They may then be transplanted direct to the flower-beds towards the end of May or early in June.

PRICKING OUT SEEDLINGS.—Young plants resulting from seed sown as recommended in a previous Calendar, will now be ready for pricking out a couple of inches apart in pans and shallow boxes, and filled with a light compost. Return the seedlings to heat, water to settle the soil, and shade from sunshine for a few days.

SOILING SEED.—Seeds of the under-mentioned plants should now be sown:—*Cannabis gigantea*, *Japanese Maize*, *Nicotiana atropurpurea grandiflora*, *N. macrophylla gigantea*, *Ricinus hybridus*, *R. Gibsoni*, *R. glaucus*, *R. Duchess of Edinburgh*, *R. Cambodensis*, *R. sanguineus tricolor*, and *R. macrocarpus*. All the above-mentioned plants are sub-tropical subjects. Seed of *Carter's Little Gem* (mixed), *Antirrhinum* and *Pentstemon* (choice mixed), should also be sown, and the plants being treated as described for other seedlings.

GENERAL WORK.—Stir the soil between spring-flowering plants with the Dutch hoe as soon as it gets a little dry. Prune and train climbers where not already done. Roses on south and west walls also prune. Level and prepare ground for sowing lawn-grass seeds towards the middle or end of March.

THE APIARY.

By EXPERT.

PRESENT MANAGEMENT.—The temptation to overhaul stocks when sunny days make their appearance at this early time of year is very great. Such a proceeding, however, cannot be too strongly deprecated, and anything approaching disturbance of any kind should be avoided for another month to come. If it is thought that any stocks are likely to be short of stores, which is the only excuse at present for an examination being made, it can be ascertained by quietly turning up the quilt at the ends of the frames, so that the eye can be quickly run along the tops of the combs. If sealed stores cannot then be seen in any quantity, a cake of candy should be given. Make it by putting three-quarters of a pint of water into a saucepan and when it boils, gradually stir in 6 lb. of best white loaf sugar. Keep it well stirred to prevent burning until it has boiled for a few minutes. If a drop of fell on to a cold plate and it sets, it will be done. Take it off the fire, and keep on stirring till it begins to thicken, then pour into cardboard boxes holding about 2 lb. each, or into a soap plate or basin, into which a piece of paper has been previously placed. When cool it can be placed over the feed-hole in the centre of the quilt. So little attention being required outside, it is a good time to go carefully through the various articles of bee furniture in the store-room, and get everything in readiness for the busy time coming. Frames bought in the flat can be nailed together and fitted up with full sheets of broad foundation, there being nothing better for the former purpose than oval wire nails, which can be used without the aid of a Bradawl, and with no fear of splitting the wood. A good supply of frames ready for use should always be kept in reserve. Sections are sure to be required in quantity later on, and these can be got ready now by folding them and inserting foundation. The crates can then be filled, but should be kept covered over to prevent the sections getting soiled with dirt or dust. It is necessary to have two section crates in readiness for each hive intended to be worked for comb honey.

SKIPS.—The writer has a straw skip in his possession from which he hopes to get a good return in comb honey during the next season, in order to demonstrate the possibility of profitably working a hive of this description. For the benefit of those who have a preference for skips, the following is a description of it. It is a large skip with a flat wooden top let into the straw, through which a circular hole about 9 inches in diameter has been cut. This is covered with queen-excluding zinc. A swarm was put in last year which has attached its combs to the zinc. When the proper time arrives, a flat board with a hole in centre will be placed on the skip, and on this will stand an ordinary crate of twenty-one sections. The reason of the difficulty generally experienced in getting bees to take to

sections placed on skips is owing to their not being closely enough connected with the brood nest, which prevents the bees being able to maintain the necessary temperature for comb building.

FRUITS UNDER GLASS

By J. RIDDELL, Gardener, Castle Howard, York.

MUSAS (BANANAS).—Where an increase of stock of *Bananas* is desired, those suckers that have been allowed to develop on fruiting plants will root freely if detached and placed in Oak or Beech sawdust, cocoanut fibre refuse, or sandy soil, if afforded a brisk bottom and top heat, kept moist, and shaded from the noonday sun. A sandier soil, however, will be required in potting those that have been rooted in sawdust than will be necessary when any of the other materials are employed for the purpose. Strong plants may at this period have their final shift, and as *Musas* are cross-feeding plants, some rotted manure and leaf-mould in equal parts should form one-half of the compost used, the other half being good friable loam. *Musa Cavendishi* may be grown in borders or in tubs of wood or slate, which latter should not have a least capacity than 8 cubic feet. These should be well-drained, and be supplied with at least five outlets for water. After tubbing the plants, they should be afforded bottom heat, not exceeding 80°. The soil should not be made very firm, the roots are soft and easily injured, and, moreover, the plants requiring a large supply of moisture; a soil that is loose more readily supplies it. The night temperature of the house in which these newly-tubbed plants stand should be 70° to 75°, a rise in bright weather of 20° or even more being permitted, and damp down the house frequently, so as to maintain humidity, syringing the plants in the morning and at shutting-up time. Plants showing signs of fruiting, that is, when the third or fourth smaller leaf makes its appearance, should not be syringed overhead until flowering is past. Liquid manure may be employed at every watering to all plants in tubs or large pots after their roots have permeated the soil, and its strength increased with the age of the plants, until the fruits show signs of ripening.

THE ORCHARD-HOUSE.—With increase of sun-heat, the occupants of the orchard-house will show some signs of renewed activity, and fresh air must be admitted freely in mild weather, affording the trees an occasional dewing over by means of the syringe. When the roots are allowed the run of a border, the latter should be kept in a moist state.

The flower buds of *Cherries* may be thinned before they expand, and when the blooms are open, they should be artificially fertilised, so as to make sure of a crop. After a sunless summer like that of last year, it may not be desirable to thin the flower buds on *Cherries* to the same extent as may be done when the wood is well matured; but where *Apples* and *Pears* are crowded with bloom buds, a few may be removed so as to lessen the strain on the vitality of the trees. Plants in perforated pots must be kept fairly moist at the roots, as also the soil in which the pots are plunged, but no manure water should as yet be used. Should green or black fly make its appearance in the house, fumigate it on two consecutive nights, following the fumigations with a syringing in the morning.

THE ORCHID HOUSES.

By H. A. BURNEY, Orchid Grower, Highbury, Birmingham.

THE EAST INDIA-HOUSE.—Plants of *Angraecum citratum* succeed best in this house when suspended from the roof in small pans, and the leaves frequently sponged to clear them of red-spider; and so freely does it flower in this position, that it is advisable to remove some of the spikes to prevent exhaustion. *Saccolabium bellinum* is a valuable addition to the genus, and deserves a place in every collection; the flowers are exceedingly pretty. *Phaius tuberosus*, now in bloom, is another very beautiful flower, though it is rather difficult to manage; I have tried it in various structures, and find that it grows best, with me, in a very shady and moist part of the warmest house, and whilst growing it should be afforded a syringing overhead twice daily. The habit of growth is straggling, and the plant should therefore be grown in rather large baskets, with nothing more than a layer of sphagnum moss placed over the crocks.

ORCHIDS IN FLOWER.—The most noteworthy among these are the various varieties of *Dendrobium nobile*. *D. Cassiope* (hybrid) is very attractive and free-growing, promising to become a very useful plant. *D. Schneiderianum* (hybrid) is very pretty, and retains the sweet odour of its parent, *D. aureum*. This house is made bright just now with the very

unusual colours of *Lælia flava*, *L. cinnabarina*, and *L. harpophylla*. Flowering is a very weakening process for Orchids, and this is not surprising when we consider how helpless we are, even by the most approved artificial means, to imitate conditions prevailing in a state of Nature. *Cattleyas*, *Phalætopsis*, and *Odontoglossums*, if not very robust, are plants much exhausted if the flowers are allowed to remain hanging on the plants for too long a time. Mr. Outram's Orchid-holders are useful little vessels to place the stalks of Orchids in, and they are readily disposed about a plant, so that the flowers appear as if still remaining attached to it.

POTTING.—As previously advised, the roots of Orchids should not be often or unduly disturbed, and if the plants are well-potted and in good materials, many of them may remain for two years, and in some cases three, without disturbance; top-dressing and the renewal of the supporting sticks being all that is required in the interval. The proper time for re-potting can hardly be disregarded, if it is the rule to do all that is requisite in this direction immediately after the season of flowering. There are a few exceptions, however, and these are the autumn-flowering *Oncidiums* and *Vandas*, *Odontoglossum grande*, and allied varieties. All autumn-flowering *Cattleyas* excepting *C. gigas*, *C. aurea*, and *C. Warneri*, are best attended to in spring; *Calanthes*, *Pleioneis*, and *Thunias* are also exceptions to the rule. The cool-house *Odontoglossum* I prefer to repot in the month of September. When repotting has become necessary, it should be thoroughly done, all of the old materials cleaned off the roots, and the latter carefully replaced on sphagnum moss and light fibry peat in clean well-drained pots. The materials should be firmly and carefully packed up to the leading growths, so that the young roots may enter it directly they push forth. If the plant is unsteady, make it steady by the aid of some neat sticks thrust into the peat, &c. In repotting, care should be taken, as with newly-imported Orchids, to make neat well-shaped masses, all useless material cut away, and the roots well washed. If a plant is ill-shapen, it may be parted into two, and the growths so placed that they will grow towards the centre of the pot, and form one compact mass, when the plants will grow better, be more self-supporting, need fewer sticks, and occupy less space than would be the case if the growths were wide apart.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Barkham Court, Maidstone.

STRAWBERRIES.—Consequent upon the severe frosts we have been experiencing, it will be very necessary that young plantations should be carefully examined, as some of the plants will be found to be partially lifted out of the ground. As soon as the ground is dry enough to walk upon, these loosened plants should be made firm again by trampling it evenly and regularly round about them. Sickly-looking plants should be replaced with healthy ones, and vacancies in the lines planted up; and in the case of old stools, a few spadefuls of the soil should be taken out round each, and replaced with fresh rich soil made very firm. Dead and decaying leaves for appearance sake, should be cut off, and buried or burned, the hoe lightly used on the beds, and the weeds raked off. The beds should then be covered with a layer, an inch or two thick, of stable-dung, working it well beneath the leaves and up to the crowns, this being important in the case of old plants. Upon light and very dry soils, cow-manure is preferable to horse-dung. See that the crown is not covered with manure or earth.

MISCELLANEOUS DIRECTIONS.—The fruit-room should now get attention almost daily, and any fruit that is showing the least sign of decay should be set aside for early use, and what is too far gone, thrown to the fowls. The best Apples at the present time are Cox's Orange and Royal d'Angleterre; this latter is one of the best late Apples we have for dessert, it is of delicious flavour, yellowish flesh, firm, and as crisp as if only just gathered from the tree. In appearance, it resembles Newtown Pippin, but is a little more conical, and the skin is greener, and very thick. Specimens of Lord Derby are perfectly sound, and of a bright yellow colour; Belle Dubois is here a very large fruit; Brabant Bellefleur, Lane's Prince Albert, which is a splendid acquisition for late use, growing and cropping well where the Wellington fails, and well repaying good cultivation; Lincoln Pippin; Sandringham, a splendid fruit, but a shy bearer here; Kentish Filbasket, Cockle Pippin, Cal-

villle Malingre, a high-coloured Apple, which makes a nice tree, and is a good cropper; and Mère de Moage, which is best grown as a standard. The Pears in use at the present time are Easter Beurré, which in most places requires a wall; Olivier de Serres, the best late Pear; Doyenné d'Alençon, Beurré Rance, and Glout Moreau. So far as my observation goes, Apples and Pears gathered from trees, the branches of which are kept thin so as to allow the sunshine to reach them, produce firm fruits, which, in consequence, keep in good condition to a late period.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Gardens, Swansea.

CONSERVATORY AND GREENHOUSE CLIMBERS.—At this season, these plants should have all surplus shoots thinned out, and those retained must have the necessary amount of tying, so as to keep them in position. As most of these plants have already started into growth, it will be advisable to examine the border in which they are growing, and, if dry, apply sufficient tepid water to thoroughly moisten the soil. In cases where the border has become impoverished, a portion of the surface-soil should be taken off, but not too deep to injure the roots of the plants, afterwards top-dressing with a good compost, according to the requirements of the different subjects. Should any of the plants be infected with scale, thrips, or mealy-bug, steps should be taken to have them eradicated as far as possible.

FERNS.—Although too early to divide or repot any large specimens, there are generally a number of young plants in small pots which have commenced to make fresh growths ere this, and require a shift into a larger size. The pots which they are to occupy should be perfectly clean, and filled to one-third of their depth with drainage. Two parts good fibrous loam, one of leaf-mould or peat, and one of sharp sand to ensure porosity, will be found a suitable compost for them. The plants should be examined previous to potting, and if affected with scale, should be thoroughly cleaned, all decayed fronds, &c., being taken off. A suitable structure in which to grow these plants is a low pit, where they can be kept well up to the light, and where the night temperature ranges between 50° and 55°. Keep them rather close for a few weeks, until the young roots have penetrated to the sides of the pots, when air should be given more freely so as to induce a sturdy growth.

IXORAS.—Early spring is the best time to propagate *Ixoras*. When taking the cuttings, preference should be given to the tops of the stronger shoots, which are thrown from the collar of the plant. Insert the cuttings singly in small pots in a compost of half peat and sand, or in pure clear sand, then water to settle the compost, and plunge the pots in a bottom-heat of 80°, and where the night temperature of the structure does not fall below 75°. Young plants, if not already moved, should have a shift into larger sized pots. Plants in vigorous health, and growing in 6 or 7-inch pots, may be moved into 10 or 11-inch, potting them moderately firm. Keep the plants well up to the light. In favourable weather syringe freely overhead about 2 p.m. *Ixora coccinea*, *I. Colei*, *I. Williamsii*, and *I. Pilgrimii* are amongst the best varieties.

GLORIOSAS.—Bulbs of these which have been wintered in sand should now be potted. A good compost for them is a rich loam two parts, one of leaf-mould, one of decayed manure, and sand in sufficient quantity to keep the whole porous. If strong, plant the bulbs in the pots, in which they are intended to bloom, which may be from 12 to 15 inches in diameter. Otherwise pot them into smaller size, re-potting as the plants gain strength. If possible, grow them under the roof of the stove.

GESNERAS.—Roots of these should be brought from their winter quarters. Place them in a stove temperature, and moisten the soil, which during the time they have been at rest will have become dry.

POINSETTIAS.—The latest plants of this will, ere this, have done flowering, and should be dried off. Store them away in an intermediate-house. If kept in a too low temperature the plants are liable to suffer, and probably die.

FORCING PITS, ETC.—Continue to bring in fresh supplies of such plants as *Staphylea colchica*, *Spiræa japonica*, and *Abutilons*, *Lilac Charles X.*, *Lily of the Valley*, *Lilium Harrisii*, *Freesia refracta alba*, *Indian Azaleas*, *Deutzia gracilis*, *Rosa Tores*, *Tulips*, *Hyacinths*, &c. Plants of *Deutzia gracilis* which have done blooming should be placed in an intermediate-house. Apply weak manure-water occa-

sionally, and syringe overhead with tepid water, so as to encourage the plants to complete their growth. The same remarks apply to *Staphylea colchica*, *Lilacs*, and similar plants.

PROPAGATING FRAME.—Cuttings of *Fraxinea calycina*, *P. c. grandiflora*, *Eranthum Andersonii*, *E. pulchellum*, *Eschynanthus splendens*, and *E. fulgens* may now be inserted; the last-named make most useful plants for growing in hanging baskets. The plants do best in a compost of equal parts of fibrous peat and loam, with sufficient sand to ensure porosity. Also insert cuttings of *Justicia speciosa*, *J. coccinea*, *Libonia floribunda*, *Plumbago rosea*, *Gardenias*, *Viccas*, &c.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

SOWING CELERY.—It is necessary to sow seed now to obtain early supplies of Celery. Sow very thinly in boxes, and place in gentle heat to germinate; much mischief is caused by thick sowing. Dryness at the root or extreme temperatures must be avoided, and when the seedlings appear, give them a place near the glass, with a free circulation of air in mild weather. At this date the boxes can be placed near the front of a house, or in a warm frame. For late supplies, I do not think there is a better plan than sowing the seed in a frame, placed on a warm bed of leaves and litter. If sown thin, the seedlings may be lifted with good balls, and planted directly into the trenches. For early work the white varieties are best, and if only two kinds are grown, Veitch's Superb White and Sandringham Dwarf White will be found useful. To succeed these, Veitch's Early Rose, Colonel Clarke's Red, and Standard-bearer, are good, and will give a long succession; the last-named will keep good till May if lifted out of the trenches and heeled in, in a north border.

CAULIFLOWERS.—There has been less difficulty in keeping the autumn-sown plants this season, especially where they were well hardened, but some have not facilities for keeping them, and are therefore obliged to resort to sowing early in the year. For this purpose, Extra Early Forcig or Snowball are much used, the heads being of a convenient size, and good flavour. If sown thinly in boxes or frames now, good plants will be ready in a few weeks. Take care to water sparingly in dull weather, and avoid cold draughts; and keep close to the light.

CABBAGES.—Should a deficiency in the spring Cabbages be apparent, now is the time to make good the loss, by sowing seeds of some approved early kinds in a box placed in a gentle heat. Ellam's Dwarf Early Spring is good for this purpose, and a rapid grower.

FRENCH BEANS.—Another sowing of Beans in pots should now be made, or the seed may be sown in a warm bed in a house. This latter is the best plan where there is a good command of heat, and the plants can be kept near the light. Ne Plus Ultra and Syon House are good for this work. When pots are used, 8-inch is a useful size, only filling them three parts full of compost, adding the remainder when the plants are a few inches high. No water should be given if the soil is moist till the seeds have germinated.

VEGETABLE MARROWS.—Though seldom grown in frames, I would advise growing a dwarf kind thus when a frame can be spared. Seed should be sown now. I prefer sowing three seeds in a 45-pot, and to plant out at the beginning of April in a good loam on a warm bed—a bed that has been used for raising early seed of any kind answers well. The best Marrow for this purpose is Pen-y-Byd.

TOMATO seed should also be sown to get large plants set with fruit, sowing thinly in pans in a warm house. Prick the seedlings off when in the rough leaf, and replace in the warm bed; repot as they increase in size, and grow in a cooler house.

CUTTINGS OF ROSES.—To be successful in striking these in the open air, the cuttings should be examined at short intervals during the winter, and made thoroughly firm in the soil by trampling it after frosts. Cuttings put in, in October or November, with their bases resting on a firm bottom on a snug border, if kept well fastened in the soil, root with much certainty, half-ripped wood taken up with a heel being the best. In this way, by putting in some cuttings annually, a good stock of healthy plants on their own roots may be kept up. H. Markham.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, MAR. 3.—Linnean.
 FRIDAY, MAR. 4.—{Dundee Horticultural Association.
 Wakenfield Paxton Society Annual Meeting.

SALES.

MONDAY, FEB. 29.—{Hardy Perennials, Peonies, Phlox,
 Carnations, &c., at Protheroe & Morris' Rooms.
 TUESDAY, MAR. 1.—{Sale of 5000 *Odontoglossum crispum*
 and other Orchids at Protheroe & Morris' Rooms.
 {Sale of Nursery Stock, at Lee's
 Nursery, Feltham, by Protheroe & Morris (two days).
 WEDNESDAY, MAR. 2.—{Azaleas, Palms, Greenhouse Ferns,
 Roses, &c., at Protheroe & Morris' Rooms.
 {1500 Roses, Fruit Trees, Lilliums,
 &c., at Stevens' Rooms.
 {Lilium auratum and various other
 Lilies, &c., from Japan at Protheroe & Morris' Rooms.
 {Sale of Nursery Stock at Sea-View
 Nurseries, Havant, by Protheroe & Morris.
 THURSDAY, MAR. 3.—{Nursery Stock Sale at the Church
 Fields Nursery, Chesshant, by Protheroe & Morris.
 {Great Sale of new and other
 Orchids, at Protheroe & Morris' Rooms.
 FRIDAY, MAR. 4.—{Border Plants, Lilliums, Bulbs,
 Fruit Trees, &c., at Stevens' Rooms.
 SATURDAY, MAR. 5.—

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°·8.

Feeding
 London.

How enormous is the task involved in provisioning a city was never perhaps, in modern times, better appreciated than in the days when the German legions thundered at the gates of Paris during the Franco-German War. Notwithstanding the lesson then read to municipal authorities all over the world, we question very much if the art of provisioning a city has been advanced to any extent. Londoners have certainly learnt but little, though they have expressed the determination to learn a great deal—and to practise what they learn. The London County Council has been established to grapple with the subject of "provisioning," gas, water, markets, &c. All sorts of vested interests are set on end in the way of the new municipal body; and it is only thus that it learns how vast is the task it has set itself to accomplish. Only with markets have we here to do, and the London County Council are shut out from interfering with the markets, the property of the Corporation of London; though this is not perhaps an unmixt evil. In the fight before Parliament for power over the provisioning or the feeding of London, way had to be made for the City authorities, and the County Council remains pretty much where it was twelvemonths since—still weak at home; the vestries being, well, not in favour of the new body, and the work of making all things new in the market line can never be properly accomplished until Bumble has been dethroned.

The feeding of London is a mighty concern—even when we take note of fruit, roots, and vegetables only. Five millions of people, to put it roughly, daily appeal to the grower, and he is handicapped in every possible way—very much indeed in the item of market accommodation. As has been often noted in these pages, the grower suffers at the hands of landlord, railway company, and weather; sometimes all three combine to upset his arrangements, though not always does the purchaser in shop or at stall suffer in like proportion. Let us consider for a moment how the work of distribution proceeds from the field or orchard to the stall or household. We take it that there are a million families to be provided with green-stuff, &c.; and there are five great centres of distribution,

Covent Garden being far and away the greatest in every respect—and private property! There are some 1500 greengrocer's shops, 600 fruit and vegetable vendors, nearly 150 fruit salesmen and merchants, or a total of, say, 2300 shops at which the thrifty housewife daily purchases her supplies. In addition to all this, there are some 120 what may be termed "coster" markets, averaging thirty stalls each, adding 3600 to the already enumerated 2300 shops—say, for the sake of even numbers, 6000 vendors in London of vegetables, fruits, and roots. It is a simple matter to reckon how many families each of these vendors cater for, on the average. It may also be readily understood how much friction there is in the great centres of distribution—how much unnecessary expenditure of time, labour, and expense in simply placing before the purchaser those provisions which day by day enter into his bill of fare, whether humble or elaborate. Surely, then, the centres of distribution might with advantage be doubled in number, not separating the goods sold, such as this a fruit and that a vegetable market, but all alike, and so relieving any particular market of pressure, and giving all that chance of success they certainly will not otherwise be found to possess. Thus it is said of Farringdon Market that it is only a one-horse affair, for the vendor has to call in at Covent Garden or elsewhere to make up his full tale. And we do not hesitate to express the opinion that the new structure now rising near the great Central Meat Market will never be worthy of the City of London until it expands its borders very much, and flowers and fruits are covered by its ridge-and-furrow roof. But of this more anon.

The further a greengrocer has to travel for his wares, the less frequent will be his journeys—the less fresh his goods as the week goes on; and here the coster enters into successful competition with him—successful, because he has neither rates nor taxes (save his licence) to pay, only the rent of his barrow. True, the coster very often has the weather against him, but he counts the cost here also. The London County Council, through a sub-committee, are looking over the matter of coster's markets, only, we believe, with the idea of improving them; they will best succeed in doing this when district councils take the place of vestries, &c., and they would do well so to regulate these markets of slow growth as that they will become, not nuisances, but decided acquisitions. A coster's market is a wonderful concern—it contains nearly everything in and out of season, from ginger-beer up to old iron and pickled herrings. Out of 160 barrows counted the other day in one market, only sixty were devoted to vegetables; and such a collection of odds and ends is a wonderful institution in a poor district. It would be a fatal blunder to break up such a concern as this. It is astonishing how enterprising the London coster is, and the number of miles he or she travels every day in pursuit of a livelihood.

It is said that markets grow up and cannot be forced, according to formal outlines. Some markets are very slow of growth—their rate of progress being almost imperceptible. Take Farringdon Market, for instance, to which attention was called in these pages on August 22 last. It was originally the Fleet Market, in Farringdon Street, which was removed to allow of the widening of that thoroughfare, and is once more removed in the hope of bettering its condition all round. But here we may with advantage draw upon the pages of *Old and New London*, by WALTER THORNBURY (CASSELL, PETER & GALPIN,

vol. 2), where we read that in 1829 it was found necessary to widen the thoroughfare from Holborn to Blackfriars Bridge; so Fleet Market was removed from Farringdon Street, and Farringdon Market in the immediate vicinity, but off the line of the street, was opened in its stead. The site of the comparatively neglected mart covered an acre and a half of ground, and was built by WILLIAM MONTAGUE, the City architect at a cost of £250,000. But careful building and liberal outlay, says Mr. THORNBURY, seems only thrown away. At a meeting of the Court of Common Council held on June 29, 1874, to consider the advisability of reconstructing the market, it was stated that the receipts during the previous five years had only averaged £225. No wonder, then, that the Court exhibited very little inclination to expend more money on a site which, exceedingly valuable as it would prove for other purposes, seems little suited for that of a market. Many persons, said a writer at the time, are of opinion that it is desirable to maintain the old Farringdon Market; in fact, the Corporation wanted designs for its improvement, and actually awarded prizes for the best. But it was then, as now, quite evident that the Market was in the wrong place, and in most things quite behind the times. The trade done in it was a fairish middle-class one, and rarely rose above the modest Onion and the plebeian Cabbage, and barely respectable Cauliflower, the homely Apple, and other unpretending fruits and vegetables. Pineapples and hothouse Grapes are unknown to its dingy sheds, and as a sorrowing tradesman remarked, "We never see such things as Pears at 5s. a dozen." The building now rising at the corner of Charterhouse Street and Farringdon Road is chiefly remarkable as being quite unlike the concern it is intended to supplant, and will cover an area of about 170 by 170 feet, built principally of glass and iron, with a ridge-and-furrow roof. But this is not growth or expansion—it is only repetition, which can only mean failure. The aspiring Company of Fruiterers might surely step in here, and suggest better things to the Corporation, if only an imitation of Covent Garden. There is plenty of vacant ground at hand, and a floor could easily be added at any time—at least, we were so informed.

No better illustration of the way in which London is misgoverned could be given than the markets—two are private property, one is carried on by a trust—all are in an unsatisfactory condition; often the tolls are exorbitant. More than 200 provincial markets have of recent years been taken over by an equal number of municipal bodies, to the profit and convenience of all concerned; only the inhabitants of the greatest city in the world remain out in the cold, the remedy being entirely in the hands of those who support—who are compelled to support—the existing monopolies.

VANDA CERULEA (see Supplementary Illustration).—This species is of easy culture, and succeeds with a good supply of heat and moisture in its season of growth, i.e., from March to October, when the day temperature may range from 70° to 75°, with a rise of 10° during warm sunshine, provided the house is shaded. In March and April the night temperature may range from 65° to 70°, and afterwards be increased gradually till it reaches 75°. In the winter, 60° to 63° by night, and a little more by day will be sufficient. Much potting material is not required, but plenty of clean crocks on which to stand the plant, and a small quantity of sphagnum moss. The supply of water during growth must be abundant, and in winter the materials about the

IND. PHOTO. SOPRAN. & CO. 4 & 5 EAST MARK LANE, STREET, LONDON, E.C. 1.

VANDA CORULEA, GROWN IN LORD ROTHSCHILD'S GARDEN.

roots must not be allowed to get dry, although care must be taken that water does not lodge in the axils of the leaves. The flowers appear in the autumn, and last in perfection for five or six weeks. The plant figured in our Supplement this week was grown by Mr. HILL, Lord Rothschild's gardener at Tring Park, and it had, when it flowered in 1891, seventeen spikes, and more than 200 flowers. At the meeting of the Royal Horticultural Society on November 10, 1891, a photograph of this plant was shown in lieu of the plant, and a special vote of thanks was accorded Mr. Hill. It may interest our readers to cite what Sir JOSEPH HOOKER said of this plant in his fascinating *Himalayan Journals*. As we have already said, this is a book which should be in every garden library, and the recent publication of a low-priced edition will now enable this to be done at slight cost:—"Near the village of Lerna, Oak woods are passed in which *Vanda cerulea* grows in profusion, waving its panicles of azure flowers in the wind. As this beautiful Orchid is at present attracting great attention, from its high price, beauty, and difficulty of culture, I shall point out how totally at variance with its native habits is the cultivation thought necessary for it in England.* We collected seven men's loads of this superb plant for the Royal Gardens at Kew, but owing to unavoidable accidents and difficulties, few specimens reached England alive. A gentleman who sent his gardener with us, to be shown the locality, was more successful. He sent one man's load to England on commission, and though it arrived in a very poor state, it sold for £300, the individual plants fetching prices varying from £3 to £10. Had all arrived alive, they would have cleared £1000. An active collector, with the facilities I possessed, might easily clear from £2000 to £3000 in one season by the sale of *Khasia* Orchids. The dry grassy hills which it inhabits are elevated 3000 to 4000 feet. The trees are small, gnarled, and very sparingly leaved, so that the *Vanda* which grows on their limbs is fully exposed to sun, rain, and wind. There is no moss or lichen on the branches with the *Vanda*, whose roots sprawl over the dry rough bark. The atmosphere is on the whole humid, and extremely so during the rains; but there is no damp heat, or stagnation of the air, and at the flowering season the temperature ranges between 60° and 80°. There is much sunshine, and both air and bark are dry during the day. In July and August, during the rains, the temperature is a little higher than that given above, but in winter it falls much lower, and hoar frost forms on the ground. Now this winter's cold, summer's heat, and autumn's drought, and, above all, this constant free exposure to fresh air and the winds of heaven, are what, of all things, we avoid exposing our Orchids to in England. It is under these conditions, however, that all the finest Indian Orchids grow, of which we found *Dendrobium* Farmeri, *D. Dalhousianum*, *D. Devonianum*, &c., with *Vanda cerulea*; whilst the most beautiful species of *Coleogyne*, *Cymbidium*, *Bulbophyllum*, and *Cypripedium* inhabit cool climates at elevations above 4000 feet in *Khasia*, and as high as 6000 to 7000 in *Sikkim*."

COVENT GARDEN LIFEBOAT.—For more than a quarter of a century a handsome sum has been contributed yearly to the Royal National Lifeboat Institution by means of concerts and entertainments, supplemented by a few annual subscriptions, for the support of the "Covent Garden" lifeboat, stationed originally at St. Ives, and for the past thirteen years at Caister, one of the most dangerous parts of the east coast, where it has been instrumental in saving nearly 300 lives, besides rescuing eighteen vessels from destruction. Owing to the interest in the annual entertainments having somewhat flagged, and the profit upon them being quite out of proportion to the outlay, the stewards were reluctantly compelled to abandon them, and were consequently unable to make the usual contribution last year. They think it would be a great discredit, in face of the grand work which has been going on for so long,

if the Fund were allowed to collapse, and therefore earnestly appeal to its supporters and friends to come to the rescue, either by an annual subscription or donation, feeling confident that an appeal made in the interest of such a good and truly national cause will not be made in vain. Mr. J. WEBBER, of Covent Garden Market, is Hon. Secretary.

METROPOLITAN PUBLIC GARDENS ASSOCIATION.—A greenish-coloured map, thickly sprinkled with red spots, is before us. The red spots indicate places in which the Association above-named has carried on its beneficent work. Apart from questions of amenity, the sanitary importance of open spaces in the densely populated parts of London is a matter of urgent importance. London is fairly well off for large parks and wide commons in the suburbs, but the central districts sadly need increased light and air. It is consistent with our way of doing things, that the work of providing and embellishing these minor spaces should be left to a private Society rather than to the Government. In any case good work is done, and the annual report of the Association shows it. The undertakings which have been successfully carried through during the past year may be divided roughly into the following groups:—1. The laying-out of five recreation-grounds. 2. Grants of seats made for the thoroughfares in three districts, and for five open spaces. 3. The temporary opening of two gardens. 4. Drinking fountains erected in two open spaces. 5. The promotion of gymnastic and physical instruction. 6. Successful opposition to two Bills in Parliament. 7. The acquisition for the public use of seven open spaces. 8. Trees placed in boxes on one site, and planted in thoroughfares in eight districts. The Report goes into detail upon these points, and also upon the past work of the Association. In looking over this honourable record, we are tempted to suggest that more care should be expended upon the management and well-doing of the trees when planted than is now the case, and that a better selection of trees and shrubs for planting in tubs and boxes might be made than we now see.

NATIONAL CARNATION AND PICOTEE SOCIETY (Southern Section).—The Committee of this Society is appealing for support in their endeavours to popularise the cultivation of the Carnation and Picotee. Up to the present time the Society has been crippled for want of funds, and all that the Committee have been hitherto able to do was to offer at their annual show a somewhat limited list of prizes. This was last year supplemented by a series of special prizes for border varieties, which attracted considerable attention, and it is hoped that these prizes, which will be continued for some years, will assist in bringing the Carnation into more favour as a border plant. It is the intention of the Society to issue shortly a little manual upon the cultivation of the plant, with information upon the subjects of sowing, propagation by layers and cuttings, pot culture, growing in the open border, crossing, seeding, &c., together with lists of the best varieties of Perpetual or "Tree" Carnations, also florist and border varieties.

INTERNATIONAL FRUIT SHOW.—The promoters of this exhibition, which it is intended shall be held at the end of September or early in October next, went in deputation to the Court of Common Council of the City of London on the 15th inst., to petition the Court to grant them, for the space of four weeks, the use of a plot of ground on the Thames Embankment, within the precincts of the City. The deputation was introduced by Alderman Sir JAMES WHITEHEAD, Bart., the Chairman of the Provisional Committee; and among those forming it were—Messrs. H. R. Williams, T. B. Haywood, F. Crowley, Geo. Paul, J. Laing, F. Q. Lane, H. Herbst, R. Balandine, Geo. Gordon, L. Castle, J. Assbee, B. Wynne, J. Halse, J. Graham, R. Dean (Secretary, *pro tem*), &c. The prayer of the petition was immediately granted by acclamation, and the Provisional Committee will at once proceed to the elaboration of their scheme, making a report in reference to the

same, and ask for the appointment of an Executive Committee to carry out the same.

SEED ORDERS.—A large firm of London seedsmen, writing to us of their experience as seedsmen, deplore, together with, as they believe, the whole trade, the withholding of orders for seeds, &c., when periods of wintery weather like that lately experienced occur, with the result that the large staff provided to meet the expected large amount of business are for the time only partially employed. Then the weather changes, and with the first appearance of sunshine the seedsmen are overwhelmed with orders, and the employes are enforced to work very hard, and for a greater number of hours than would be desired either by the employer or the purchaser, and which we feel sure, if it were brought to the notice of the latter, they would desire most carefully to avoid by sending their various orders as early in the year as possible, without paying heed to the weather then prevailing.

LINNEAN SOCIETY.—At the evening meeting to be held on Thursday, March 3, at 8 p.m., the following papers will be read:—1. "Variations in the Internal Anatomy of the Gametophyte," by A. D. MICHAEL, F.L.S.; 2. "On Vitality of Spores of *Bacillus*," by ALLAN SWAN, F.L.S.

ST. ANDREWS.—This, the most ancient of Scottish Universities, is about to confer the honorary degree of LL.D. upon Professor MICHAEL FOSTER and Dr. HUGO MÜLLER, both well known in the horticultural world, and members of the Scientific Committee of the Royal Horticultural Society.

DUBLIN.—The tercentenary anniversary of Trinity College, Dublin, will be held from July 5 to July 8. This is the University which has claims on the sympathies of horticulturists by its conferment of a honorary degree on a representative horticulturist.

CHISLEHURST GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—This Association, which was formed in October last, has members at the present numbering seventy-one. The members meet each Tuesday evening, and papers are read, and discussion invited, on practical gardening; hitherto there has been no lack of papers, and the association appears likely to meet with success.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, February 29, when the adjourned discussion on the paper read by Mr. J. W. GROVER, C.E. (Associate), at the last meeting, entitled "An Explanation of the London Water Question," will be resumed. The chair to be taken at 8 o'clock.

HYACINTH MONSIEUR KRELAGE.—On January 8 last a Hyacinth was shown at a meeting of the Gartenflora in Berlin by Mr. G. A. SCHULTZ, of Eckhartsberg. It is of a deep rose colour, with large bells, remains for a long time in perfection, and is said to be excellent for early forcing, and that it will certainly displace the old variety, *Homer*, for this kind of work. The fragrance of the bloom is not strong, but it is distinctly that of the Hyacinth.

DEVON AND EXETER GARDENERS' ASSOCIATION.—At a meeting of this Association on Wednesday evening, February 17, Mr. EBBUTT, gardener to the Rev. A. W. HAMILTON-GRELL, at Winslade, provided an excellent cultural paper on "The Violet," which, in the absence of the writer through illness, was read by Mr. P. C. M. VETICH, who also presided.

THE ISLES OF SCILLY FLOWER-TRADE.—In order to meet the requirements of the growing flower trade of the islands, the West Cornwall Steamship Company, says the *Western Daily Mercury*, have been running their new steamer *Lyonesse* three times weekly instead of twice weekly, as required at this season of the year by the Post-office contract.

"PFLANZEN BIOLOGISCHE SCHILDERUNGEN."—Under this title, Professor GOSSET, of Munich, has published a series of descriptive sketches on the

* *Himalayan Journals*, Sir J. D. Hooker, new edition, 1891 (Messrs. Ward Lock & Co.), pp. 319, 320.

natural history of particular plants. The first article is a descriptive account of the "Paramos of Venezuela and their Vegetation." Various adaptations of structure to climatal conditions are described, such as the presence of a dense covering of hair, or a leathery epidermis, or a rolling round of the margin of the leaves, a diminished size of the leaves, contracted growth, and other modifications, which have the effect of diminishing transpiration. A second chapter is devoted to the consideration of insectivorous plants. Numerous illustrations are given. We hope to revert to this interesting treatise on another occasion.

SMALL HOLDINGS.—Should Mr. CHAPLIN'S measure pass into law and a class of small cultivators and yeomen be once more established, the utility of practical demonstrations and lectures will be much enhanced. If the cultivation of small areas is to be commercially successful, it must be by the methods employed by horticulturists rather than by farmers, and the mere routine knowledge possessed by the latter will not suffice to permit the cultivator to make the best of his land, or to meet adverse circumstances, as the recent state of the agricultural industry has clearly demonstrated.

ACREAGE OF NURSERY GROUNDS, AS RETURNED IN THE YEARS 1891 AND 1890, IN EACH COUNTY OF GREAT BRITAIN, IN THE ISLE OF MAN, AND IN THE CHANNEL ISLANDS.—We take the following details from a recently published report of the statistical department of the Board of Agriculture:—

FOREIGN OPINION OF SOME NEW CHRYS-ANTHEMUMS.—The overlanded pure white, hairy-petalled Mrs. Alpha Hardy brought generally disappointment to those who have procured it; but, on the contrary, everyone is pleased with Louis Bœhmer, which has fulfilled everyone's expectations, says *Müller's Deutsche Gärtner Zeitung*. The quilled-petalled varieties, in the way of Gloire Rayonnante, are enriched by the valuable Lilian B. Bird. The colour is lighter than that of Gloire Rayonnante, the blooms attain an extraordinary size, and form an almost complete sphere. It is better for the amateur and the cut-flower trade than for the market grower, owing to the great height to which it grows. The same is true of Volunteer, a magnificent blossom of salmon-rose. Chrysanthemum Superba Flora is, on the contrary, a variety good for every purpose, and especially for cut blooms. The flower is of a regular star shape, of deep rose colour, the habit is vigorous, and

the height medium. A beautiful companion variety to C. Ed. Audigier is Cesar Costa, with the same style of growth, and fresh green luxuriant foliage. The form of the bloom differs from that one in having recurring florets, which shows their broad spoon-shaped form to great advantage. The colour is a shade of purple-brown, with a velvety texture. To grow it well it, like E. Audigier, requires particular attention, but in spite of that it is a grand variety, of which no one could well have too many. Countess of Lytton is a flower of a tender sulphur-yellow colour and a late flowerer, otherwise it does not differ from Ralph Brocklebank, a novelty of 1888. Eynsford White is one of the handsomest novelties of 1891, and by most persons it will be preferred to Avalanche, as with equally beautiful, pure white, loosely-formed flowers it is decidedly more floriferous, is of lower stature, and better for pot culture and cut bloom, which cannot be said of Avalanche. Bouquet de Dame and Belle Poitevine are likewise of value; the first is of the size and form of the good well-known Maiden's Blush, but less tall growing, and better in having a finer habit of growth, and more numerous and better-formed flowers.

THE DEPRECIATION OF MANURE BY EXPOSURE TO WET AND FERMENTATION.—We suppose no sensible gardener needs to be told that every day that his manure-heap is exposed to wet weather he is losing money. But in case he should not attach sufficient significance to this fact, and in case, too, that he should not know that fermentation will rob his pocket, we give the results of some recent experiments by Ronsats and Wino, which are to be found in a paper by them in *Biedermann's Centralblatt*, 1891, pp. 437, 438. Horae stable-manure was exposed to the weather in a box which was placed in a manure-heap, and at the end of the year was subject to chemical examination. It was observed that there was an increase in water, a loss of total weight, and a serious decrease in the percentage of matter valuable in cultivation. When horse and cow manures were treated under similar conditions, but the drainage collected, there was found to be a loss of the nitrogen to the extent of 3.2 per cent., of the phosphoric acid 4.7 per cent., and of the potash 35 per cent. After these results have been duly appreciated, who dare let his manure-heap waste by exposure to the weather and fermentation!

THE WOLVERHAMPTON FLORAL FETE.—The schedule of prizes for the next exhibition, July 12, 13, and 14, is now issued, and throughout the prizes are heavy, and should ensure a fair display. The Rose and fruit classes are extended, and good prizes are offered, and in both classes of the exhibition a large display of exhibits may be expected. The sums of £20, £15, and £10 are offered for sixteen stove and greenhouse and ornamental plants, and the other plant classes are liberally provided for. In the open classes for Roses prizes, to the amount of nearly £70 are offered; and for a collection of fruit, open to all, £7 10s., £5, £3, and £1 10s. are offered. There are also liberal prizes for other fruits and for cut flowers. Several classes are reserved for gentlemen gardeners, open to the four immediate counties, for fruits, plants, cut flowers, and vegetables. The amateurs who do not keep a gardener and reside within 10 miles of Wolverhampton, have several classes with good prizes devoted to them, and cottagers also are liberally provided for.

BIRMINGHAM GARDENERS' ASSOCIATION.—At a meeting, February 17, Mr. A. OUTRAM, of the Holloway Nurseries, London, read a paper on "The Progress of Horticulture in the United States," and he spoke with the experience of an annual visitor for sixteen years past. Allusion was made to the immense progress made during that period of time in plant culture, and of the large number of very fine collections of Orchids and other rare plants which are now so general in the States, and of their high-class cultivation. He referred also to the cut flower trade, which is being carried on to an enormous extent, and the produce generally commanding remunerative prices. Fruit culture is also greatly

extended. Asked about the chances for young gardeners in the States, Mr. OUTRAM replied that there was a good chance for respectable intelligent young gardeners who were prepared to do rough hard work if required, until they could obtain such a situation as they wanted. A very hearty vote of thanks was accorded Mr. OUTRAM for his interesting paper.

THE WEATHER.—In most parts of England and Scotland severe frosts prevailed during the week ending February 20, and in some districts snow fell

gate degrees of frost for the last three months were as follows:— November, 65°, December, 214°, January, 228° or a total of 507°.

Loughborough, Leicestershire.—Last Tuesday night, the 16th inst., the mercury descended below zero $\frac{1}{2}$ °, and at 8 A.M. there were 30° of frost. Such hard frosts have not been known here for more than forty years.

Mid-Durham.—As showing the severe character of the weather in this part of England on the night of the 16th, there were 24° of frost, and it snowed continually. On Thursday, February 17, at night, no

very decided "fresh." Last week's frost seems to have been phenomenal on Decside; at Ballater, on Friday night, the thermometer registered 3° below zero (35° of frost); at Braemar the thermometer sank to within half a degree of zero (31½° of frost), which almost justifies the description applied to the weather as being of "the really rigid Siberian." Serious apprehensions are entertained in the north as to another block on the railway lines, while considerable anxiety is felt by flockmasters."

PUBLICATIONS RECEIVED.—*Bulletin of the Botanical Department, Jamaica, Bulletin of Botanic Garden, Demerara.*—*Mercantile Almanack* (Sir Joseph Causton & Sons).

TECOMA CAPENSIS.

This is an old-fashioned climber, hardy in very favoured localities, but elsewhere requiring cool greenhouse treatment. It is a native of the Cape of Good Hope, and has compound pinnate leaves with ovate leaflets, and tufts of orange-scarlet flowers, whose appearance is indicated in Mr. WEATHER'S drawing. The plant does not flower freely, unless the wood is well ripened by bright light and fresh air.

NOTICES OF BOOKS.

THE BOOK OF CHOICE FERNS FOR THE GARDEN, CONSERVATORY, AND GREENHOUSE.
By George Schneider. Parts I. to XI. (L. Upcott Gill & Co., London.)

This is a fine work, profusely illustrated with engravings, and faithfully prepared coloured plates, and one in which the author gives evidence of his knowledge of the subject in hand, and of his patience, extending over many years, in preparing so complete a work as that which has so far been brought before the public. It is designed to complete the work in twenty-one numbers, of which the first eleven are before us.

In the introduction, the author says:—"The work will deal with the great Fern family in its entirety, retaining all that is essential in the original botanical description, but purposely avoiding technical terms whenever expressions sufficiently significant, but of a more popular nature, and therefore more readily understood by the great mass of readers, for whom this publication is intended, can be used. On account of the popular principle of the work, descriptions of purely botanical species will be carefully omitted, while every effort will be made to bring together all the species and varieties which possess particular interest, either as decorative plants or as subjects partaking of characters sufficiently striking to render them of some importance in a well-ordered collection.

This statement embodies the essential elements for a popular and much-needed work on Ferns, and well has the author redeemed his promise. The earlier numbers deal with the general question in chapters under separate headings, and in them each subject is fully and clearly treated of. In the commencement we have, "Classification for Decorative Purposes," then, chapters on "Tree Ferns," on "Gigantic non-arborescent Ferns," on "Small-growing Ferns," on "Ferns with Coloured or Tinted Fronds," on "Variegated and Crested Ferns," on "Gold and Silver Ferns," on "Climbing, Trailing, and Drooping Ferns," on "Filmy and Transparent Ferns," and on "Fern Fosses, British and Exotic," and on all these subjects the author has much to say that will be new to most people; and what he has to say on these, as well as other and better-known subjects, he says clearly and pleasantly.

Then commences the enumeration and description of the genera and species, alphabetically arranged, and among which Fern-lovers will find many either described, or described and illustrated, whose

FIG. 39.—TECOMA CAPENSIS; FLOWERS, ORANGE SCARLET.

in considerable quantities. Scotland, contrariwise to the experience of last winter, had very low temperatures generally; and in the Hawick district, on the morning of February 19, our correspondent states that the thermometer fell to zero.

Fineshade Abbey Gardens, Stamford.—The frost has done much damage here. There was on the 15th inst. a terrific snowstorm, with 25° of frost, and high wind blowing from the east. The snow lay to a depth of 13 inches. On the 16th inst. there were 14° of frost at 6 A.M.; on the 17th, from 6 A.M. to 8 A.M., 10° below zero, or 42° of frost, were registered by the thermometer, which stands 4 feet from the ground, facing north-east, on the north side of a lake, and another thermometer, standing on the south side at 1 foot from the ground, registered 38°; on the 19th, at 10 P.M., there were 32°. All Tea Roses on walls facing west have suffered, and I fear, says Mr. Turner, a great many of them will not recover. The aggre-

less than 36° of frost, or 6° below zero, were noted; and on the 19th, 22°.

South Devon.—Snow fell in great quantities in South Devon on the night of the 18th inst. In places where it had drifted it lay several feet deep, but the average depth was about 1 foot. Numbers of trees have been overthrown. The storm was accompanied with terrific thunder and lightning. Our correspondent states that the snow is fast disappearing. A few days before the snow fell, 17° of frost were noted.

In the North.—Our Aberdeenshire correspondent, writing on Monday afternoon, February 22, says:—"A renewal of the snowstorm occurred on Saturday night, and yesterday forenoon a heavy snow-storm raged, not alone in Aberdeenshire, but apparently over the greater part of the north of Scotland, and the south of Scotland as well. In Aberdeenshire, yesterday's snow-storm was succeeded by rain, and a

acquaintance they here make for the first time, but which may any day come within their reach, for incorporating in their collections. *Adiantum*, *Asplenium*, *Cheilanthes*, *Acrostichum*, *Dicksonia*, and all the other genera, up to *Doodia* and *Drymoglossum*, with which Part II finishes, have here been dealt with, and when the whole have been so treated, the work will be a handsome and useful one. Not the least of its attractions are the fine plates of celebrated Fern rockeries in various parts of the country, and from which many hints can be obtained by those who wish to furnish back walls or construct rockeries either indoors or in the open garden.

THE FORMAL GARDEN IN ENGLAND. By Reginald Blomfield and F. Inigo Thomas. 1 vol. (Macmillan & Co., 1892.)

This book—it is not a very big one—is, as might be expected from Mr. Reginald Blomfield, ably written; and the illustrations by Mr. F. Inigo Thomas are plentiful, artistically drawn, and numerous. They are very interesting, but the essay is of so partisan a character, as to narrow its usefulness, and the attack on what Mr. Blomfield understands as “landscape gardening,” is so heedlessly made, that the old feud between the architect and those who uphold what has been termed by some the “natural system,” is unhappily emphasised. Like all partisans, pure and simple, the assertions of Mr. Blomfield are frequently unjust, and often betray, not only error in judgment, but of obscured judgment. We have said advisedly “what Mr. Blomfield understands as landscape gardening,” because that is peculiar, to judge from his book. He states that “deception” is a primary object in it; he supposes that its practice is to endeavour to show love of Nature by trying to produce the effects of wild nature on a small scale in a garden; he ignores the fact that “formal gardening” is part of the practice of the landscape gardener; he speaks of a garden laid out by those whom he makes his opponents, “with a strenuous avoidance of all order, all balance of definite lines,” and so on. One fault of the book, however, is superabundant quotation, and we must not imitate it.

What sort of landscape gardening Mr. Blomfield appreciates does not clearly appear, as his one-sided attack on the art seems to blind his judgment not a little, and he misrepresents roughly what he does not wish to acknowledge, and lets his partisanship twist his judgment, or obscure his perceptions. He strenuously advocates the formal system, and the supremacy of the architect, failing to see the use made of formal features by an artistic gardener. He waxes eloquent over descriptions of the old gardens, and their associations—the names of flowers preserved by the past—Gillyflowers, Daffodils, Columbines, Cowslips, Primroses, and all the pretty old plants that our Elizabethan mothers knew, set in their prim square beds, in the formal gardens they then decorated; he would let his associations, his artistic architectural fads end in formulating a law that the garden attached to a house should only be an appendage of the architecture, a walled or edged-in space, with formally treated beds, wherein Nature may expend herself in the beauty of such blossom as is allowed in simplest antique fashion. Does the author seriously maintain that modern needs and modern facts are to be crushed to that theory? He almost ignores horticulture, the immense development of our resources by the introduction of foreign plants; the long acclimatisation of some, and the cultivation that science has given them; and he would apparently seriously advocate retrogression to the restricted means of our ancestors, and even the form of their gardens, with their boundary walls—a remainder of their fortified condition in turbulent times—their vegetable sculpture, and the rest of it. Really the advocacy, as Mr. Blomfield puts it, is misplaced.

A proper estimation and use of the formal style, and particularly a reverent preservation of its old examples, is correct. When we contemplate an

avenue of “immemorial Elms,” it is the natural development of the foliage that we admire. It is age and consequent growth of the leafage that compel our admiration, and we should not have felt like sensations if we contemplated the trees newly planted. Nature, not art, is the mistress. When we are delighted with the quaint monuments, vases, sundials, terrace lines, and the like, in some venerable garden, it is the age that has made them grey, and the Lichen seizing on them that give us the ripe associations we enjoy. We might not have admired their features when they were newly placed, or have appreciated in like degree their cumbrous appearance, or the trickiness of the concealed squirrels, that are now objects of such curiosity, at all events, in their artistic presentment. To estimate such things now is to do so with an advantage due to time and Nature. To propose to return through the years, and to create such things afresh is hardly what will be done, excepting so far as the art spirit of some of the works can be adapted, as it is adapted by worthy landscape gardeners, in the instances of terraces, balustrades, stately steps, and other such features. There are some points in this connection that may be referred to; clipped Yew trees have not been entirely discarded by the landscape gardener, although he maintains that they must be appropriately placed.

What is meant by one brilliant and taking passage, about the chastisement by landscape gardeners of the beautiful Apple tree with its delicious blossom and fruit? It is not banished, but is cared for in the orchard, where its fruit can best be cultured, but the beauty of its abundant bloom is used amongst the delicious spring flowering shrubs, the *Malus floribunda*, the Siberian Crab, *M. baccata*, *Pyrus spectabilis*, the Chinese Crab, the Double Cherry, and replacing with much advantage the ordinary sorts. As to the orchard, old Lawson (1618) wrote of that division in the old formal garden, “What can your eye desire to see, your ear to hear, your mouth to taste, or your nose to smell, that is not to be had in an orchard with abundance and beauty.” It is sheer mis-statement to say that the landscape gardener curves his path, &c., because Nature does not make a straight line. The resources of horticulture have so much developed of late years, that it is only prejudice to ignore them. We cannot have a waste for six months of the year, relying on the Sunflower, Love-lies-bleeding, &c., and other poetical plants of Shakespeare's time to fill them in the remainder. Such love of the old is amiable for an artistic faddist, but hardly practical in modern conditions.

Mr. Blomfield's summary of garden literature is very good, but it does not support his hasty dicta; it rather emphasises the case against him, and isolates the position he assumes. He indulges in an unjust sneer at Kent in writing “no doubt he had to make his living.” As to the artistic question, we may quote one of Mr. Blomfield's sentences, “In matters of taste, there is no arguing with a man.”

DISEASE IN CATTLEYAS.

I NOTICE the answer given to “W. L.” in “Notices to Correspondents,” in reference to a disease having shown itself among *Cattleyas* in various parts of the country, and it is a satisfaction to learn that the matter is to be re-investigated. I hope no delay will occur. It was my opinion at one time that *Orchids* when attacked by disease had been subjected to some kind of check; but, however this may be, the disease in question has revealed itself in a most remarkable manner.

So far, very few of the *Cattleyas* or *Lælias* at this place have been infected, but the fact of a few elsewhere having been victims is a sufficient reason for wariness. Had these been confined to a few weakly specimens, purchased from a collection last summer, no notice would be taken; but within the past year we have had one each of *Cattleya Bowringiana* and *Lælia elegans*, and two plants of *Cattleya gigas*, all vigorous, and in the pink of condition, suddenly fall victims without any apparent reason. It has just

occurred with one of the latter. The facts are these: In a batch of healthy specimens occupying one side of a house in the best possible position that could be found for them during the winter, and judging from their appearance, they were properly placed, one in the centre of the batch appeared to be dying; indeed, so rapid was the progress of the malady, that before anything wrong was noticed, the disease had infected the plant throughout, giving it the appearance of having been frozen, and the pseudobulbs and leaves soon changed from green to yellow and black. Now, why should this particular plant be stricken, and the remainder continue healthy? Certainly, the gardener is not answerable in such a case, and if the cause cannot be traced to some known species of fungus, it is indeed a matter that stands in need of investigation.

The question will naturally arise, Is it communicable to other *Orchids*? This cannot be answered off-hand, and my idea is, that it is not; yet, for safety's sake, I would recommend the isolation of infected specimens, and my idea is based on the fact that if the rhizome is cut through, as in making two or more plants in one pot, one portion only is attacked, while the other remains unaffected.

The other *Cattleya gigas* mentioned was attacked immediately after it flowered last autumn, but it was noticed in time to save the plant. This was probably due to the fact that it is an extraordinarily fine variety, and as such, was placed in a prominent position in the house, and under observation often during the day. Dark lines and blotches showed themselves on the leaves, which were at once cut with a sharp knife on the dark places, one-eighth of an inch deep, with the result that the disease extended no further; and nothing was rubbed into the incisions.

In the case of the *Lælia elegans*, which had become rather severely affected before it was observed, the pseudobulbs and leaves were opened at intervals, and slacked lime well rubbed into the incisions, with the result that most of the leaves dropped off, but the disease seemed to be arrested, so far as the pseudobulbs were concerned, the leading ones breaking in due season, and forming two new pseudobulbs, short, but plump, and to all appearance healthy. *W. Burberry, Orchid Grower, Highbury, Birmingham.* [The diseased portion might be cut out and the wound washed with Condy's fluid or carbolic acid, taking care that the caustic was confined to the diseased portion. We should be pleased if some grower would try this plan and report results. Ed.]

THE ROSERY.

PRUNING ROSES.

OWING to the mild weather of late, Roses had commenced to push into growth. This fact naturally brings us to considering when and how to prune these plants. As so much depends upon this operation being done in a proper and more rational manner than is often the case, I feel no apology is needed for these few words.

It is of no service to grow *Rose* plants well if the system of pruning is faulty. As a rule, too many gardeners prune them all alike, and consequently some varieties are disappointing, and they are inclined to think that the descriptions given to such sorts are exaggerated and misleading. Experience and a little consideration are necessary before one can prune a variety of *Roses* in the most successful way. It is of no use to grow such kinds as *Madame Bérard*, *William Allen Richardson*, and *Henriette de Beaulieu* into grand plants of vigorous growth, and then to act so unreasonably as to cut these long shoots back to within a few eyes of where they broke from. These varieties, and those of similarly strong growth, must be grown and pruned on what may be styled the long-rod system. If treated thus, they will flower very profusely, and scarcely any other class of *Roses* is more satisfactory. The method is to remove the side and weakly growths, and when the crop of flowers is secure these must also be cut away as much as is possible without removing any of the extra strong breaks from towards

their base. These shoots will grow away very rampantly if the plants are generously treated, and will form the flowering wood for the next season. Scotch Roses, Fairy, and China Roses do not require any but very slight pruning, simply removing the dead growth and any superfluous shoots being quite sufficient for these classes. Dwarfing-growing Teas and Noisettes, such as Anna Olivier, Souvenir d'un Ami, and Madame Lambert may be pruned not quite so hard as the medium growers of the Hybrid Perpetuals. More weakly growers of the Teas, such as Princess of Wales, Comtesse de Nadaillac, and others are better if somewhat hardly pruned. These varieties seem unable to support many flowers at once, and, like the weaker-growing Hybrid Perpetuals of the same type as Edienne Levet, Monsieur Noman, and Lady M. Fitzwilliam, are much better when pruned rather severely. Such Hybrid Perpetuals as Mrs. John Laing, Ulrich Brunner, Gabrielle Luizet, &c., are, however, best treated similar to the climbing Teas and Noisettes. These varieties do not flower freely if hard pruned, and such treatment simply results in more strong growths that are often styled blind and useless by the inexperienced amateur. The contrary is the case, for these shoots will flower very freely indeed, if they are left some two-thirds of their length, and pegged down to a horizontal position. Under such treatment, flowers are produced from almost every eye, and the plants will make more vigorous shoots from the base; these should be pegged down the following spring, and the bulk of the older growth removed. The time for

moist air, as in this case, than to heat a large body of water.

For heating small greenhouses, such as are generally found in amateurs' gardens, the system under notice appears to be well adapted. When gas is used as fuel, but very little attention is required; and, moreover, so far as we could see, there appeared to be no danger of back draught—a too common occurrence with gas and oil-heating apparatus. In the case of larger structures, too, the system could be adopted; it would be merely a matter of increasing the size and power of the generator. As we have already said, this system of heating, from a cursory glance, seems to possess a certain advantage over other methods, but at the same time, to give the matter a thorough trial, it would be necessary to fix an apparatus in a plant structure, and there, during an average winter, test its heating powers. Meanwhile, it remains in the hands of Messrs. Fenlon & Sons, Tudor Street, E.C.

BASKETS FOR ODONTOGLOSSUMS.

My system of planting *Odontoglossums*, described formerly in the *Gardeners' Chronicle*, proves very advantageous, as my plants continue to grow and flower very nicely. Many *O. Alexandræ* and *Pescatorei* produce two shoots from a bulb, and some *Alexandræ* shoots have side-shoots like *Pescatorei*. As I always had great confidence in this system of shallow planting, I tried some years ago to

FIG. 40.—MR. O. FORSTER'S ODONTOGLOSSUM BASKETS.

pruning depends very much upon whether your plants are in a warm or cold district, and whether they are sheltered or exposed. No rule can be laid down, but I would caution all against doing this too early. A. P.

HEATING BY HOT-AIR.

We have had an opportunity to see the hot-air heating apparatus, described and illustrated in the *Gardeners' Chronicle* for December 26, 1891, in working order, and, to all appearances, it is likely to prove a useful invention. As was shown in the illustration alluded to, the primary portions of the apparatus are a generator, which is provided with air chambers, a small boiler fitted with tubes for generating heat, and pipes of suitable dimensions, according to the heat required.

The apparatus we saw consisted of a generator 18 inches or so in height, and 9 inches in diameter, a small boiler containing about a quart of water, and some 30 feet of 3 inch pipe, temporarily fixed. The apparatus was heated by one gas burner, which was calculated to consume 8 or 10 feet of gas per hour. About a quarter of an hour after lighting the gas, both top and bottom pipes were quite hot, proving conclusively that the circulation was good; and, further, that it would be possible to raise the temperature inside a structure, heated by this system, in a very limited time.

Not the least important point the inventor claims for this apparatus is economy. It is computed that a very small quantity of fuel is required to generate a suitable heat. As before stated, the fuel may be gas, oil, or, for large apparatus, coke or coal. It is estimated, too, that but little more than a third of the amount of fuel usually consumed in heating by hot-water will be needed by this apparatus. That, of course, remains to be proved; but meanwhile any intelligent reader will see that it is a much easier matter to charge the pipes with hot

make use of it for some unhealthy plants. In order to save room, I had baskets of the following form and dimensions constructed (see fig. 40). In these baskets the plants grew wonderfully, so that some unhealthy plants of *O. Pescatorei*, with small bulbs, $1\frac{1}{2}$ inch broad, produced this year bulbs 4 and even 5 centimetres broad, deep green, and glossy. The roots, well spread out, are sometimes 40 and 50 centimetres long, white and healthy, although weak manure-water is continually made use of. *Otto Forster, Lehenhof.*

HOME CORRESPONDENCE.

LECTURES ON HORTICULTURE.—The exceedingly interesting correspondence upon this subject contains much that is encouraging, and at the same time much that is discouraging, to those who are striving to advance the cause of technical education in rural districts. The fact that the movement is receiving the hearty support of so many practical men, whose long experience and solid achievements in the horticultural art give special weight to their opinion, goes far to dissipate the "damp" from Kew. On the other hand, it is disheartening to note the absurd prejudice—I had almost said childish petulance—which still exists in some minds against anything that savours, to however slight a degree, of scientific or theoretical teaching. Your correspondent, "Under Gardener," appears to be an admirable exponent of the views of this class of persons, although the literary excellence of his letter would lead one to expect better things. He appears to have completely lost sight of the fact that no one more strongly insists upon the absolute necessity of practical experience as a factor in the education of the horticulturist or agriculturist than the so-called "theoretical man" himself. The creed of the advocate of technical education is not "Theory instead of Practice," but "Practice with, and aided by, Theory." "Under Gardener" and his friends are, doubtless, to be commiserated on account of residing in a district where "free lectures" (which, it is presumed, they

are also "free" to attend or not, according to choice) are given on such out-of-the-way and "far-fetched" subjects as the "Fertilisation of Flowers," or "The Manure Heap." Nevertheless, I would venture to suggest, that it is just within the bounds of possibility that something of utility might be learnt by the "practical man," even from an unfortunate lecturer who, perhaps, possessed less practical knowledge than his hearers. A chemist may not be able to crock pots with neatness and despatch, or put up a batch of Ericas in good nursery style, or plough a straight furrow; yet he may, I think, be able to offer some few crumbs of knowledge connected with his special study which can be applied with advantage to the operations of the garden or the farm. Anyone who has seen the irrational and wasteful treatment of farmyard manure (the rich brown liquid running away by gullions, and the air redolent far and wide with ammonium carbonate) by men of many years experience, will, I am sure, agree with me that a plain talk on the "far-fetched" subject of "The Manure Heap" would not be altogether out of place in some districts. A market hand of the writer's acquaintance—the possessor of a quarter of a century's experience and a budget of testimonials as bulky as Mrs. Epton's *Cookery Book*—conceived the brilliant idea of copiously syringing a house of Tomatos in which the disease had appeared, an idea which he carried into execution with results that may be guessed. Would not a little information (if only "semi-scientific") about the Phytophthora have been an advantage here? Actual instances of serious errors in practice resulting from crass ignorance of the scientific principles involved might be multiplied almost indefinitely, but enough has been said, I hope, to show the puerility of those who scornfully reject the teachings of science. The student is content to learn the chemistry of the pigments he uses from one who perhaps cannot draw a straight line; just so, one would imagine that the horticulturist, whose work brings him into continual contact with the complex and marvellous phenomena of plant life, would be eager to draw upon the funds of knowledge placed at his disposal by the botanist or the chemist, who had perhaps spent the best years of his life in mastering his science and applying it to the practical art of culture—a course which the manual worker has neither the time, means, nor inclination to pursue. *Science with Practice.*

WATERING COKE.—My experience differs greatly from that of others which have appeared in the *Gardeners' Chronicle* on the above subject. I have always found damp coke to burn much better than dry, it gets the heat up quicker, and makes a much cleaner fire than dry. When coke comes from the gas-house it is full of moisture, and does not want watering, neither does it when kept outside in damp weather; but if kept in a shed, or in a dry stovehole, and it gets thoroughly dry, I have always found a pot of water improve its burning in every way. What have the under-gardeners or regular stokers got to say about it? *Practice.*

WINTER WEATHER.—On February 15 we had 8 inches of snow, which fell between 9 A.M. and 2 P.M., and, when melted it equalled 70 inch of rain; 94 inch melted as it fell, and the total fall that day equalled 85 inch of rain. The snow was very wet when it fell, and broke down several of our trees and shrubs. Early on the morning of the 17th, the minimum temperature was 0°, and remained at that until 8 A.M.; and again about midnight on the 18th, and early on the morning of the 19th, the minimum temperature was 0°. As doubts are sometimes expressed, and rightly so, as to the trustworthiness of thermometers, I may add that our instruments were tested a short time ago by an officer of the Meteorological Society, and were found to be correct. *W. H. Divers, Ketton Hall Gardens, Stamford.*

TREE CARNATION "WINTER CHEER."—This proves to be one of the most satisfactory kinds I have ever met with. I first saw it in Messrs. Veitch's at Chelsea, last September, where some plants struck from cuttings the previous February were growing in the beds outside and flowering profusely. I was so favourably impressed with it, that I at once procured some plants, and these were in flower when they arrived here a few days afterwards, and they have continued to flower up to the present time, and still have a number of buds to open; the flower is larger than Miss Joliffe, of good form, of a dark scarlet colour; and the habit of growth all that could be desired. From its sturdiness and compactness, it will make a valuable addition to outdoor Carnations also, when it becomes plentiful enough,

even if it has to be protected during the winter, but judging from its robust habit it seems likely to be hardy enough to survive an ordinary winter. *W. H. Divers, Kelton Hall Gardens, Stamford.*

MUSHROOM CULTURE.—It may interest those of your readers, who, while desiring to grow these toothsome esculents, are deterred from the attempt by the prevailing notion that not less than 1 foot in depth of manure is essential to success, to know that Mr. Reid, the gardener at Woodcote Hall, Newport, Salop, not only succeeds well with, but considers 8 inches of manure and soil combined ample depth, and certainly the appearance of his long beds when I saw them a few days ago well justified his conclusions and practice, for their entire surface was studded over with excellent Mushrooms in all stages of development. I need scarcely say that the house is well-heated. *W. R.*

APPLE CROP.—I must beg leave to differ from your correspondent, Mr. Wright, on p. 245 of last week's *Gardeners' Chronicle*, as to all the best home-grown fruit being sold last autumn (in this district at least). I know, at the present time, where large quantities of late fruit is being held back by fruit farms simply on account of the unremunerative price at present offered by buyers for home-grown fruit—and splendid fruit too, highly coloured. When offering home-grown fruit, the answer you get in the Cardiff, Newport, and Pontypool markets is, "We can buy these American Apples and sell them retail at 2d. per lb.; we can do without yours, unless you like to take 1d. per lb. for them. Only wait until the Americans are all gone, then we will buy yours at a better price." Moral: Plant early and late-keeping fruit for sale, and let the mid-season Apples be relegated to private gardens. Mr. Wright was lucky in disposing of his produce so easily, and at good prices. I know his district; also that his fruit is large, of excellent quality and pure colour; and he is well situated with regard to the Midland and Northern markets; but he would never get the price he once named for Peasgood's Nonsuch in this district. Unfortunately, the excessive railway rates prevent people in this district sending fruit northwards. His remarks with respect to Apple-growing being remunerative or otherwise, according to the attention bestowed upon it, also as to sorting and packing, is good advice. We all know that care is required in all those matters, but it will not put aside the yearning kindled in the hearts of the small growers and farmers for some kind of protection when they see their fruit set aside in favour of American. What we want is men of the stamp of the late Mr. Grant, the Technical Instructor of the Monmouthshire county council who preached the consumption of home-grown fruit, and who advised his hearers to plant good sorts; at the same time advising, by all means, to thoroughly drain the land, and not plant on a "pan" of earth, as many have done. I write these remarks from experience, having been a sort of local adviser on fruit tree planting about here, also a large planter myself for private use and experimental purposes. *John Chinnery.*

WIREWORMS.—I read with interest, at p. 240, your article on the various means tried for the destruction of the wireworm, and the utter failure of the same. When the new Royal gardens were formed at Frognor, I think in 1845, there was, if I remember rightly, a good deal of turf-soil used in the formation of the fruit borders, &c., but for some time the wireworm was a sad hindrance to the cultivation of the various crops, when a number of moles were turned into the garden, and the experiment was a success, for they cleared off the wireworm. At that same time a minister in the north of Scotland used to frequently write in the *Gardeners' Chronicle*, and claim protection for the mole from all interested in the cultivation of the soil, offering at the same time to turn out as many on his glebe as they liked to send him, remarking at the same time that they would not stay after their favourite food was finished. I write all this from memory, but believe it is substantially correct. I have been led into this subject, seeing that just lately we have been visited with a snow-storm, and all around the meadows have been dotted over with fresh mole-hills, standing out quite prominently in the snow in hundreds and thousands; and who can estimate the good that these little creatures do in destroying wireworm and other noxious things, in making channels to drain the land, and producing a top-dressing for the ground, which it is not a very laborious job to spread about, and which might be done by schoolboys on the Saturday holidays, or by

aged and infirm labourers. I know it is urged that the hills are an impediment to the mowers, but then the hills are principally formed in the spring, when they can be observed. Again, one often sees moles caught in woods, where surely no harm but good is done. Seeing, as I do occasionally, large sums spent on mole-catchers, I always think it is money mispent, and that is why intellectual farmers do not object to a certain number of partridges and pheasants about their farms, viz., the destruction of insects. *J. Rust, Bridge Castle.* [Our country folk err chiefly through ignorance. Some day before long, it will be thought a disgrace in anyone to do what is now contemned, and those who are acquainted with country life know that no persons need more instruction concerning this overmuch tampering with the balance of Nature than our gamekeepers and their employers. En.]

GARDENERS' TRAINING.—The sensible observations by "Semper paratus" at p. 212, display the whole matter, root and branch. To preach, however, is one thing, to practice, another, and in practice you may depend upon it that employers will, as heretofore, reserve the right of employing whom they like; consequently, the prepossessing and pleasant-spoken will continue to enjoy a prestige over those less gifted, and the clumsy, and those with a disagreeable manner. Hence, ordinary skill with nice deportment will influence employers beyond mere skill when it is combined with rudeness and vulgarity. But it is of the training I wish to speak. "Semper paratus" says, "There is nothing like a nursery for training." This is, I think, wrong, for nursery-bred gardeners generally prove failures in the management of private gardens, and this arises from their lack of experience as cultivators of vegetables and fruits. Such men may excel, however, as specialists, and many of them rank amongst our men of mark. But intelligent boys who wish to become good all-round gardeners should start as garden boys in some well-appointed private garden, and before they become full-fledged gardeners the sharpest among them will have gained the varied experiences only to be learned in private gardens, and those who have spent the last year or so in high-class nursery gardens will know the most, and be the best qualified as gardeners. This is the good old-fashioned way of training gentlemen's gardeners, and with the careful study of good books there can be no better one. *W. Napper, Chelsea.* [We must decline for the present to print any more letters on the above subject. En.]

VARIETIES OF CELERY.—Cases have this season come to my knowledge that Celery has kept badly, and that it is diseased in the heart. This is a great vexation to a gardener who has to keep up with the demand for Celery. I have found that while nearly all varieties may be of good quality in mid-season, there are some which keep in good condition much better than others. Where the late crops have failed, that in some cases may have been that the seed was sown too early. Other instances may be seen that the crops were carried up when in an unfit condition, or it may be the operation was carelessly performed, late Celery requiring more care than what has preceded it, and it should be done in dry weather, and trustworthy varieties planted. For early work, say end of August, as this is as a general rule early enough, and as early as it can be got in anything like good condition, I use Sandringham White and Sutton's Gem. The latter variety I consider is a good type of what early Celery should be, and I have rarely known it to bolt. If the crop be supplied with water at the right time, there is then little fear of either variety bolting. Sulham Prize and Colonel Clark's Red and Giant White may follow, but if one variety alone be wanted, I should choose Colonel Clark's Red, which is always to be relied on; and for the latest crop, there is nothing to beat Standard-bearer, which this winter, in spite of the wet autumn and sudden severe frost, is in better condition than any other. It is sweet, crisp, and blanches readily. *W. A. Cook, Compton Bassett.*

PEA CRITERION.—I can fully endorse all that Mr. Coomber said in praise of Criterion Pea. During the hot, dry season of 1887, it proved itself by far the best Pea that I had that year, and since that time I have grown it for my main crop supply. It is an enormous cropper, the peas of delicious flavour, and of a nice green colour when cooked. In growth it is rather too tall to become generally grown, but to gardeners who, like myself, have a good supply of peacocks at command, I can recommend it. Autocrat is another fine main-crop variety, of strong, robust

habit, growing about 4 feet in height, a heavy cropper, and of excellent flavour. The Peas are of a deep green colour. I am sure Mr. Coomber ought to convert his trio into a quartette by the inclusion of this splendid Pea. *J. V. Smith, Arley Hall Gardens.*

VIOLAS AND PANSIES.—If these are struck from cuttings they are apt to be loosened by frost, and then failures are certain to come if they be not made firm in the soil after a spell of frost. For massing, I find Cannell's Blue Belle and Yellow Boy good and useful varieties, which can be well relied upon during the summer months, and do better on hot light soils than any others that I have hitherto grown. To be successful with Violas in the flower beds, young healthy plants, early and moderately deep planting, and a deeply-worked soil, with plenty of rotted manure, are essential. Some root incorporated with the soil, will also have a beneficial effect in keeping millepedes away, which in some gardens play great havoc with these plants. *H. Markham, Mereworth Castle.*

SEVERE FROST IN NORFOLK.—A severe frost was experienced at Thornham Hall Gardens on Thursday evening and Friday morning, the 18th and 19th. On the 18th there were 25° registered at 8 p.m., and from 1.15 to 2.15 a.m. on the 19th there were 35° or 3° below zero; and at 6.30 a.m. there were 25° of frost. The 35° reminded one of the terrible frost that was experienced on Christmas morning, 1860, when we had 38½° of frost, or 6½° below zero. *John Perkins.*

HARDINESS OF HERBACEOUS CALCEOLARIAS.—I was glad "J. S." at p. 247, called attention to the above, as I am sure many of these plants are ruined by too much heat. I used to exhibit herbaceous Calceolarias in the South, and from the time of sowing the seed till the final plants never had any heat whatever. It is the weak sickly plants that succumb to severe weather. This season our plants have been in an ordinary frame close to the glass, and the leaves covered with ice, the only precaution taken being to prevent the sun thawing them. When grown thus, it is necessary to sow the seed in good time, so as to get robust plants by winter. I like to get them potted into 48 and 36-size pots early in November. By the beginning of March they are ready for shifts. When grown in a warm dry house it is almost impossible to keep them clean; they also grow spindly. But in cold frames near the light they have thick leathery foliage, and are not troubled with green-fly. When in flower, mildew is their worst enemy; but this is easily got rid of by dusting over with sulphur. It is also a preventive to dust occasionally with dry wood-ashes over the floor. This also gets rid of slugs, these latter being very partial to the tender foliage. When grown in cold frames, the plants require to be watered sparingly through the winter months. *G. W. S.*

FUELS AND STOKING.—I would like to say to Mr. H. J. Southgate (p. 180), that if pulling out the fire two or three times a week was an essential part in the successful heating with anthracite coal, it would alone constitute a most serious drawback to its use in any heating apparatus, as such an operation could not be performed without materially checking the heat. Mr. Southgate agrees that it is "smokeless," yet recommends cleaning the flues as often as though he were burning the dirtiest of common coal. It may, however, interest your correspondent to know, that during the whole of last winter I never once drew my fire, nor should I, had the frost continued double the time, while the flues were cleaned once a month. The best system of ensuring clean fire-bars is that recommended by Mr. Stephen Castle, viz., by daily pushing the clear fire towards the back of the boiler; this not only affords means for thoroughly clearing the bars, but provides material for maintaining the heat till the fresh fuel is well alight, and by making this a part of the daily routine, a boiler may be worked for an indefinite period without any need for "pulling out the fire." I always adopt it, no matter what fuel I am using, and find it the only sure way to keep the fire-box clear. In the case of saddle-boilers having a dead plate at back, an iron hoe should be employed to clear it of ash. So far as coal for heat-producing is concerned, I never tried anything to approach "hard steam," by which I mean that employed usually for traction-engines. During the winter of 1890–91, I ran short of anthracite, and knowing my boilers to be heavily handicapped, had grave doubts of maintaining sufficient heat, so I

had recourse to "hard steam," of which I had abundant experience domestically in my kitchen-range. Knowing its fierce nature, I charged my stoker to not more than half-fill the fire-box, and I would give it my personal attention. In less than two hours, and with the usual draught when burning anthracite, the water was boiling madly, a thing unthought of at so severe a time. To check the draught at both points was the work of a moment, and by fully opening the valves in a house from which we were only excluding frost from the pipes, things soon quieted down. On taking the heat I was surprised to find an increase of 5° to 8° over anthracite in several houses, and while using this coal I was certain of a higher heat by several degrees than with anthracite, and this with the damper all but closed, and the ash-pit door quite so during the night. My only objection to it is the smoke and black consequent upon its use, the flues requiring to be cleaned at least once a week. As a heat-producing coal it eclipses all I have tried, and is very enduring, at the same time requiring very careful management. *E. Jenkins.*

VANDA AMESIANA AND V. KIMBALLIANA.—I send you herewith a photograph I have taken of one of our *V. Amesiana*. This, with its near neighbour, *V. Kimballiana*, I consider two of the prettiest of recent introductions. Their culture is of the easiest possible nature; they are quite at home in the Mexican-house, and the same style of potting, I find, suits these as well as the rest of the genus. They grow as freely in a basket on the roof as in a pot or pan on the stage, and flowering, as they do, in the short days, especially where fogs are unknown, as with us, makes them even more valuable. You can judge, Mr. Editor, from accompanying photograph, what the plant was like at the end of November last; its powerful scent pervaded the whole house. *Jas. Brown, Ardarauch, Garloch Head, N.B.* [The photograph is hardly clear enough for reproduction, but it amply bears out our correspondent's remarks. Ed.]

CATTLEYA AND LÆLIA DISEASE.—Your correspondent, "W. L." p. 210, I noticed, has been enquiring about a disease among his *Cattleyas* and *Lælias*. I can sympathise with him, for the same thing has cost me many an anxious hour, and I am almost as much at a loss to account for it as the first time I saw it. With us it is almost confined to one house; in one adjoining, where the treatment accorded is in every way similar, it very seldom appears. It is no respecter of varieties, as far as *Cattleyas* are concerned; but it has not so far attacked the short bulb *Lælia* here of *L. anceps* and *L. autumnalis* type. A *Cattleya Dowiana* resting on the roof is just as liable to an attack as a *Lælia purpurata* in an active state, and old bulbs appear as vulnerable as new growths. So far, I have found flowers-of-sulphur the best thing for checking its ravages. A fine variety of *Lælia elegans* had its leading bulb attacked near the top. I at once cut off the bulb near the break, and dusted the wound with sulphur; this had the desired effect, and the plant is breaking strongly again. This is what I have done for it as soon as it appeared, and I would recommend "W. L." to try it; it will do no harm at any rate. As to whether it is contagious, I cannot say, but I tried cutting the rhizome of a known poor variety of *Cattleya* with a knife that had been used for cutting a diseased bulb, afterwards rubbing the diseased bulb over the wound; this has had no effect whatever after twelve months. It has been suggested that it is a fungus. This may be so; and I sincerely hope some of our scientific men will take it in hand, and tell us what we are grappling with. Once we really know the cause of the mischief, things will look more hopeful. *Northern.*

growths were attributable to insect agency, but on a review of all the circumstances it seemed as if the restriction caused by a shred, and the accumulation of moisture, were the predisposing causes of the growth.

Hellebores.—Mr. Burbidge, in a letter, commented on the circumstance that cut flowers of *Helleborus niger* remain unwithered much longer than those of *H. orientalis*, a circumstance probably due to a difference in internal structure. Dr. Scott undertook to examine and report. Mention was also made by Mr. Burbidge of the circumstance that flowers of *H. niger* gently forced, last in good condition in water much longer than do flowers of the same variety in the open air. The flowers of *H. niger* last longer in water if the stalks be slit lengthwise from below upwards. The result is, that the tension being removed the cut segments of the stem curl outwards away from the centre, and that a larger absorbent surface is exposed.

Snowdrops.—Flowers of *G. Allani*, *G. Elwesi*, and *G. nivalis* var. *Imperati*, were shown from Mr. Burbidge.

Monstrous Flowers.—A parti-coloured Tulip from Mr. Marshall and a curious *Cypripedium Dayanum* from Mr. O'Brien were shown, and will be reported on by Dr. Masters at the next meeting.

Disa grandiflora.—Messrs. Veitch showed a plant with a thick fleshy creeping rootstock, bearing leaf shoots, by means of which the plant could be propagated.

The following list comprises the names of the members of the several Committees for the present year. Members of Council are members of all committees.

SCIENTIFIC COMMITTEE, 1892.

Chairman.—Sir Joseph Dalton Hooker, K.C.S.I., M.D., C.B., F.R.S., The Camp, Sunningdale.

Vice-Chairmen.—W. T. Taiselton Dyer, C.M.G., F.R.S., Royal Gardens, Kew; Professor M. Foster, Soc. R.S., Great Shelford, Cambridge; Maxwell T. Masters, M.D., F.R.S., Mount Avenue, Ealing, W.

Hon. Secretary.—Rev. Prof. G. Henslow, M.A., F.R.S., F.G.S., Drayton House, Ealing, W.

Baker, J. G., F.R.S., Royal Gardens, Kew.

Blandford, W. H. F., M.A., F.E.S., 48, Wimpole Street, W.

Bonavia, Dr. E., 5, Harrington Mansions, South Kensington.

Burbidge, F. W., F.L.S., Trinity College Gardens, Dublin.

Church, Professor A. H., F.R.S., Shelsley, Richmond.

Clarke, Colonel R. Trevor, Welton Place, Daventry.

Clawson, Francis, F.R.S., Wyckfield, Huntingdon Road, Cambridge.

Dee, Rev. C. Wolley, Edge Hall, Malpas, Cheshire.

Ewes, H. J., F.L.S., F.Z.S., Colebourne, Andoversford, Gloucestershire.

Frankland, E., F.R.S., The Yews, Rigate Hill, Reigate.

Gardiner, W., F.R.S., Clare College, Cambridge.

Gilbert, J. H., Ph.D., F.R.S., Harpenden, Herts.

Godman, E. DuCane, F.R.S., 10, Chandos Street, Cavendish Square, W.

Green, Professor J. R., M.A., 17, Bloomsbury Square, W.C.

Lindsay, R., Botanic Gardens, Edinburgh.

Llewellyn, Sir J. T. D., Bart., F.L.S., Penllergare, Swansea.

Lynch, R. Irwin, A.L.S., Botanic Gardens, Cambridge.

McLachlan, R., F.R.S., West View, Clarendon Road, Lewisham, S.E.

Michael, Albert D., F.L.S., Cadogan Mansions, Sloane Square, S.W.

Morris, D. M.A., F.L.S., 11, Kew Gardens Road, Kew.

Müller, Hugo, Ph.D., F.R.S., 13, Park Square East, Regent's Park, N.W.

Oliver, F. W., D.Sc., F.L.S., 10, Kew Gardens Road, Kew.

Pascov, F. P., F.L.S., 1, Burlington Road, Westbourne Park, W.

Plowright, C. B., F.L.S., 7, King Street, King's Lynn.

Russell, Dr. W. J., F.R.S., 34, Upper Hamilton Terrace, N.W.

Salisbury, Robert, F.R.S., Hawksfold, Fernhurst, Haslemere.

Scott, D. H., Ph.D., F.L.S., The Laurels, Bickley, Kent.

Symons, G. J., F.R.S., 62, Camden Square, N.W.

Veitch, H. J., F.L.S., Royal Exotic Nursery, King's Road, Chelsea, S.W.

Ward, Professor Marshall, F.R.S., The Laurels, Englefield Green, Staines.

Weiss, F., Ernest, B.Sc., F.L.S., Birchbank, Christchurch Road, Hampton.

Wilson, Geo. F., F.R.S., Heatherbank, Weybridge Heath.

FRUIT AND VEGETABLE COMMITTEE, 1892.

Chairman.—Philip Crowley, F.L.S., Waddon House, by Croydon.

Vice-Chairmen.—T. Francis Rivers, Sawbridge-worth; John Lee, 78, Warwick Gardens, Kensington; R. D. Blackmore, Teddington.

Secretary.—Archibald F. Barron, Royal Horticultural Society, Chiswick.

Balderson, H., Corner Hall, Hemel Hempstead.

Bates, W., Poulett Lodge Gardens, Twickenham.

Bennett, W., Rangemore Park Gardens, Burton-on-Trent.

Bunyard, George, The Nurseries, Maidstone.

Cheal, J., Crawley, Sussex.

Cliffe, G., Shoreham Place Gardens, Sevenoaks.

Coleman, W., Eastnor Castle Gardens, Leicestershire.

Cummings, G. W., The Grange Gardens, Walsington.

Dean, A., G9, Feltham Road, Kingston.

Divers, W. H., Ketton Hall Gardens, Stamford.

Dunn, Malcolm, The Palace Gardens, Dalkeith, N.B.

Fairgrieve, P. W., The Palace Gardens, Dunkeld, N.B.

Ford, Sidney, Cowfold, Horsham.

Hogg, Dr., L.L.D., F.L.S., 99, St. George's Road, Pinhook.

Hammond, G., Pilgrims Hatch, Brentwood.

Hudson, J., Gunnersbury House, Acton.

Laing, J., Junr., Forest Hill, S.E.

Lane, Fred, Berkhamsted.

McIndoe, James, Hutton Hall Gardens, Guisborough.

Miles, G. T., Wycomb Abbey, High Wycombe.

Moss, A., 39, King William Street, E.C.

Norman, G., Hatfield House Gardens, Hatfield.

Pearson, A. H., The Nurseries, Chilwell, Notts.

Rhynolds, G., The Gardens, Gunnersbury Park, Acton.

Ross, Charles, The Gardens, Welford Park, Newbury.

Saltmarsh, T. J., The Nurseries, Chelmsford.

Smith, James, The Gardens, Mintonmore, Leighton Buzzard.

Sutton, A. W., F.L.S., Reading.

Taber, G., Rivenhall, Witham, Essex.

Veitch, P. C. M., The Royal Nurseries, Exeter.

Warren, W., Worton Gardens, Isleworth.

Weir, Harrison, Sevenoaks.

Willard, Jesse, Holly Lodge Gardens, Highgate, N.

Woodward, G., Barham Court, Teston, Maidstone.

Wright, John, 171, Fleet Street.

Wythes, G., Syon House Gardens, Brentford.

FLORAL COMMITTEE.

Chairman.—William Marshall, Auchinraith, Bexley.

Vice-Chairmen.—Rev. H. H. D'Ombra, Westwell Vicarage, Ashford, Kent; John Fraser, Lea Bridge Road, Leytonstone, E.; George Paul, The Old Nurseries, Cheshunt.

Secretary.—Archibald F. Barron, Royal Horticultural Society, Chiswick.

Bain, W., The Gardens, Burford Lodge, Dorking.

Baines, Thomas, Fern Cottage, Palmer's Green, N.

Bause, F., Portland Road, South Norwood, S.E.

Bennett-Poe, J. T., 29, Ashley Place, S.W.

Bryceon, G., Flora Vista, Plumstead.

Cannell, H., Swanley, Kent.

Cant, F., Braiswick, Colchester.

Davis, N., Lilford Road, Coldharbour Lane, Camwell, S.E.

Dean, R., Ranelagh Road, Ealing, W.

Drury, C. T., 25, Windsor Road, Forest Gate.

Ellis, W. H., Clovelly, Lampton Road, Hounslow.

Furze, W., Roselands, Broom Road, Teddington.

Girdlestone, T. W., Sunningdale, Berks.

Golding, W., 52, Gloucester Road, Kew.

Gordon, G., 1, Style Villas, Gunnersbury.

Herbst, H., Kew Road, Richmond, Surrey.

Ingram, W., Belvoir Castle Gardens, Grantham.

Jeffries, C., Boston House Gardens, Brentford.

Laing, J., Forest Hill, S.E.

Leach, W. C., Aldbury Park Gardens, Guildford.

Lowe, R. B., Ashridge Gardens, Berkhamsted.

Mawley, E., Rosebank, Berkhamsted.

May, H. B., Dyson's Lane, Upper Edmonton.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

FEBRUARY 9.—D. Morris, Esq., in the chair. Present: Messrs. MacLachlan, Michael, Wilks, Weiss, Dr. Scott, Dr. F. Oliver, and Dr. Masters.

Erecescence from Stems of Gooseberries.—Mr. Lister reported that there was no slime fungus on the specimens sent; and Mr. Massee, who also examined the specimens, failed to find traces of fungoid growth. From the presence of one or more maggots in the tumour, Mr. Massee suggested that the out-

Ware, Walter T., Iglecombe Nurseries, near Bath.

Webster, A. D., F.B.S.E., Hollydale, Keston, Kent.

White, Miss, Alexandra College, Dublin.

NEWCASTLE AND DISTRICT HORTICULTURAL.

At a meeting of the above Society, held in the hall, Library Place, Newcastle, on Thursday evening, February 18, Mr. B. Cowan, South Shields, read a paper on "Cottage Gardens and Allotments: how to make the most of them." Mr. Cowan, in the course of his remarks, said that in the Agricultural Returns he found that there were in this country 58,700 acres of small fruits in 1891. In small-fruit cultivation the acreage had risen in Northumberland from 401 in 1890 to 440 in 1891, and in Durham from 263 in 1890 to 337 in 1891. In the five northern counties there were 3120 acres under small fruit in 1890, and 3970 acres in 1891. He would suggest that they should approach the county councils with the object of giving technical instruction in gardening in all districts, and to hold examinations and also grant certificates of merit. Secondly, they should have a committee of inspection or survey to visit any allotments or cottage gardens, and to give the holders advice as to what would grow best. He did not believe in trying to migrate people from the towns to these allotments, as the country people were by far the best adapted to the work. In the third place, growers should have some system of co-operation, whereby the distribution of their produce would be cheapened. In the fourth place, he would at places like Morpeth and Hexham establish jam factories and places for pickling; these, like the means of distribution, should be on a co-operative principle. Then he thought they should offer prizes for the best treatise on what to grow, and what was considered the most suitable for the climate. In connection with allotments, especially where there were daughters, poultry and pigs would become a very valuable adjunct. *Extract from Newcastle Evening Chronicle.*

LAW NOTES.

THE SALE OF "WEED-KILLERS" BY SEEDSMEN.

At the Barnstaple (Devon) County Court, recently, an important judgment was given by Judge Paterson in an adjourned case brought by the Pharmaceutical Society of England against Mr. E. J. Butt, seedsman and florist, of Barnstaple, for selling a certain compound known as "Weed-killer," which contained poison in such quantities that only a registered chemist was permitted to sell. Mr. Bremridge represented the Society as plaintiff; Mr. Flux, London, conducted the case on behalf of the Society; Mr. A. F. Seldon (Barnstaple) defended. In giving judgment, his Honour said:—This was an action brought by the Society under section 15 of the Pharmacy Act, 1868, for selling poison contrary to the enactment. It was proved before him at the previous examination, that the defendant was not a registered pharmaceutical chemist, or a chemist or druggist within the meaning of the Pharmacy Act, but that on Tuesday, October 27 last, he sold in his shop a gallon drum of weed-killer. The drum, which was made of iron, was labelled "poison;" it was also labelled "weed-killer," with directions for its use and "with care." It was admitted on the part of the defendants that the drum contained arsenic in large proportions. The first section of the Pharmacy Act made it unlawful for any person to, *inter alia*, sell poisons unless such person shall be a pharmaceutical

chemist, or a chemist or druggist within the meaning of the Act. The second section declared that the articles named in Schedule A to the Act should be deemed to be poisons within the meaning of the Act, and amongst the articles named in the schedule was "arsenic and its preparations." By the fifteenth section it was enacted that "any person who shall, *inter alia*, sell or keep an open shop for the retailing, dispensing, or compounding of poisons, not being a duly registered pharmaceutical chemist, or chemist or druggist, shall for every such offence be liable to pay a penalty or sum of five pounds." Mr. Seldon, for the defendant, had contended that the Act applied only to poisons pure and simple, and not to a compound which might contain any of the poisons mentioned in the Act. There was no express decision as to whether the Act did or did not apply to any such compound. Mr. Seldon, in support of his contention that the Act applied only to poisons simple, and not when mixed with other ingredients, referred to a dictum of Lord Justice Lush in the case of Berry v. Henderson. The case itself was not in Section 15, but Section 17, of the Act, which made it an offence to sell any poison unless in a wrapper as there required, or to sell any of the poisons in the first part of Schedule A to any person unknown to the seller unless introduced to him by a person he knew. Section 17, however, contained a proviso that "not any of the provisions of that section shall apply to any medicine supplied by a legally qualified apothecary to his patients, nor apply to any article when forming part of the ingredients of any medicine dispensed by a person registered under this Act," if the medicine be labelled and the ingredients entered in the manner there directed. The question in Berry v. Henderson was whether a duly registered pharmaceutical chemist had brought himself within that proviso, and so had become not liable for selling poison contrary to the enacting part of that section. In the course of his judgment, Lord Justice Lush said:—"I observe that the schedule seems to treat all the poisons as sold in their simple state or in some form of preparation alone, and it does not appear to contemplate any of them being mixed up with any other ingredient—it applies to them pure and simple." This was the passage in the judgment which was cited by Mr. Seldon in support of his contention. It was, however, a mere dictum, and unnecessary for the decision in the question in his case. Judgment was given for the plaintiffs for £5 and costs, the costs to be on the higher scale, but plaintiffs were not to have costs of the adjournment. His Honour would, however, give the defendant leave to appeal, as the matter was one of general importance.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

SUITABLE HEEDERS FOR WOODS AND PLANTATIONS.—Perhaps some correspondent will kindly answer the following questions regarding the above:—Whether is Whitethorn or Myrobalan the more suitable to plant? How far from the outside trees should it be planted? Whether in single or double rows, and the distance apart? Whether is plashing or cutting down the better practice? and at what period of growth should it be performed? Any information on the subject will doubtless be of service to others besides *Inquirer*.

MARKETS.

COVENT GARDEN, February 25.

MARKET remains the same, with a good demand for hothouse goods, prices for which are firm. *James Webber, Wholesale Apple Market.*

POTATOES.

A to C of France has been the feature of the week, with a tendency to a slight advance in samples free from frost. Best Magnum, 9s. to 10s.; Imperators, 8s. to 9s.; Bruce, 9s. to 10s.; Abundant, 10s.; Blackland, 6s. to 7s. These are the main prices. Samples free from frost are scarce, J. B. Thomas.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 32° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-growing Districts.—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, S.E.; 4, Midland Counties; 5, England, S.; 6, Ireland, S.E.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending February 20, is furnished from the Meteorological Office:—

"The weather during this period was extremely wintry and unsettled in all parts of our Islands. Heavy falls of sleet or snow, accompanied by strong squally winds, occurred from time to time in nearly all districts; the amount experienced over our south-western counties on the 18th being unusually large.

"The temperature was much below the mean, the deficit ranging from 5° in the 'Channel Islands,' and 7° in 'England, S.W.' and 'Ireland, N.' to 9° or 10° in most other districts, and to 11° in the 'Midland Counties.' The highest of the maxima occurred at most stations on the 14th, and ranged from 51° in 'Ireland, S.' to 45° in 'England, N.E.' and 'E.' During the middle part of the week the daily maxima were but little above the freezing point, excepting in the extreme W. and S.W. The absolute minima were recorded on somewhat varying dates, between the 17th and 20th, and were exceedingly low. In 'Scotland, E.' (at Braemar on the 19th and 20th), and in 'England, N.W.' (at Newton Rigney on the 19th), the sheltered thermometer fell to 2° below zero, while in the 'Midland Counties' (at Loughborough on the 17th, and at Stamford on the 17th and 19th), it descended to zero. A thermometer exposed on the grass at 'Newton Rigney' registered 11° below zero. In the other districts the minima varied from 3° in 'Scotland, N.,' 4° in 'England, N.E.,' and 6° in 'Scotland, W.,' to 18° in 'England, S.,' 21° in 'Ireland, S.,' and to 28° in the 'Channel Islands.' At the close of the week the temperature was recovering.

"The rainfall was less than the mean in 'Scotland, N. and W.,' as well as in 'Ireland, N.,' but more in all other districts. In the 'Channel Islands' the excess was very large, and rather so in most parts of 'England,' and in 'Ireland, S.'

"The bright sunshine was more prevalent over the Kingdom generally than it was during the preceding week, and in most districts exceeded the normal. The percentage of the possible duration varied from 30 in 'Scotland, N.' and 'England, E.' to 21 in 'England, N.E.'"

LECTURES ON TECHNICAL HORTICULTURE.—As we have advocated the course now being followed for years past, we are naturally interested in its success, and we should be obliged if the several lecturers, in connection with the County Councils, would communicate to us their names, the districts in which they are at work, and a general indication of the method pursued by them.

NOTICES TO CORRESPONDENTS.

AMERICAN BLIGHT AND KEROSENE OIL: S. W. The proportion of one wine-glassful of oil to one gallon of hot-water, and a table-spoonful of soft soap to aid amalgamation of the oil and water, will make a safe and effectual wash, if it be stirred up continually whilst being applied.

APPLES IN THE MIDLANDS: W. C. Sedgebrooke. The samples sent were bright, fairly developed, clear skinned, and admirably kept. We may publish your letter on fruit-growing shortly.

BOOKS: T. W. Select Ferns, by the late B. S. Williams, published at Victoria and Paradise Nurseries, Upper Holloway, N.

CARNATIONS: E. H. A. The leaves are full of eelworms. Burn your plants, and get fresh soil.

CLIANTHUS DAMPIERI: A Constant Reader. When the seeds of the Clianthus remain on the plant until they are quite ripe, and then sown and germinated in a greenhouse, the plants are long in appearing. The germ or embryo of the seeds of many species of plants is sufficiently developed to reproduce its kind before the seed is perfectly ripe, and if the seed be sown when it is in the immature condition, germination takes place quickly. This method may be adopted with the seeds of many Australian plants, which have a hard exterior, and including those of Clianthus Dampieri. If seed can be obtained before it is ripe, it should at once be sown, and afforded no more warmth than that of cold frame or cold pit. The soil should be watered and the pots stood on the damp floor, and covered with a bit of close-fitting tile to exclude air and mice,

and to prevent evaporation. The tile should be removed occasionally to ascertain the state of the soil and the seeds, and to remove mould (fungus), which is apt to appear on the surface, if vegetable matter by an oversight, be present in the soil. When the seed is not obtainable before it is ripe it is better to sow it in March or April, and forward the germination by placing the pots on a mild bottom-heat, 70° to 75°, and top-heat of 60°, placing the seed pots in an intermediate-house when germination has taken place. The intermediate-house suits this and other New Hollanders, but not all.

CETOLOGYNE BARBATA: H. T. This species likes cool-house treatment generally, although a warmer temperature suits the plant when making its growth. It requires living sphagnum moss and fibrous peat, and paws or baskets; if in pans, they should be very well-drained, and the plant elevated above the rim. The plant enjoys copious supplies of water when growing, but care must be taken that it does not fall amongst the young growths, or they will rot. When done growing, just enough water should be afforded as will preserve plumpness in the pseudobulbs.

CULTIVATION OF LEMIA ANCEPS: Bournemouth Botanist. Use shallow pans or teak rafts, and hang these near the roof, with only a very small quantity of peat fibre and sphagnum moss. During the growing season the temperature may be 60° to 65° by day and 54° to 60° by night. In bright weather the day temperature may run up with air and much moisture without any danger being incurred. Keep the plant well-supplied with water in bright warm weather, watering twice or thrice daily. When growth is made, the water afforded should be lessened in quantity; and when the pseudobulbs are full-grown none should be given, and no artificial heat afforded. In August and September the plants are benefited by full exposure to the sun.

CORRECTION: Bowden Hill House Orchids. *Gardeners' Chronicle*, p. 235, col. n, line 10, for *Cypripedium bellatulum* read *Calanthe Veitchii*.

CUCUMBERS: C. Vollmar, Frankfurt-on-Main. The leaves sent show that light has been very deficient during the winter, for they are wanting in substance, a condition which renders the plant liable to various ills that more robust plants would escape. The under-surface of the leaves is eaten away all over in patches, and in cases where it is so eaten away deeply, the substance of the leaf falls away, and irregular-shaped holes appear. This injury is caused by a white thrip, of which plenty of specimens could be seen. The destruction of the edges of the leaves is partly due to the ravages of these thrips, and partly to some other cause, fumes from the stable-dung under the plants, or dry air caused by the heating apparatus. The remedies are the destruction of the insects by means of fumigation with tobacco, or syringing with an insecticide—the suppression of strong fumes of ammonia, and keeping the pit in which the plants are growing damper; but, whenever possible, change the air by the admission of just a little fresh outside air night and day.

DENDROBIUM VARIANUM: S. K. Nothing particular. ERGOT IN OIL-CAKE: A. A hitherto unsuspected source of danger, as it is alleged, may occur from the grinding of ergotised Wheat and other grains in the manufacture of low-priced oil-cake under certain circumstances.

EUPHARIS AMAZONICA: H. B. From a leaf or two it is impossible for us to tell you what is the matter with your Eucharis. Kindly send a bulb or two which are not doing as well as they should; and some details of your methods.—Foreman. Your bulbs are swarming with the mite.

FORTY-THREE DEGREES OF FROST: W. T. It is quite likely that so great a degree of cold may have been experienced at Carlisle last week; the thermometer had fallen 10° below zero, or 42° of frost, in the neighbourhood of Stamford about the same time.

GARDENERS' POSITION: W. S. Question 1. Trades union, none. There are free gardeners in Scotland, but we think it is a convivial society rather than a socially political one. Question 2. Wages average £1 10s. per week in England. Question 3. Their position will compare favourably with other trades. Their occupation is a healthy one, and they usually have, in addition to their pay, a cottage or money to pay for one, fuel, and vegetables, and sometimes Potatoes or Potato land, milk, and light. In Scotland and the north, a gardener has lower

pay, but he gets besides oatmeal, Potatoes, or land to grow them, and fuel.

INSECTS: *J. C.* The white fleshy larvæ with a chestnut-coloured head, which have much injured the roots of your *Helleborus niger* (Christmas Rose), are evidently those of one of the Swift moths (*Hepialus* sp.). The single active larva, whitish, with a grey scale-like patch at the back of each segment, is the larva of one of the voracious ground beetles which feed on other larvæ. *I. O. W.*—*W. C. M.* The insects sent as found in sphagnum have evidently escaped out of the piece of blotting-paper in which they had been folded. *I. O. W.*

MUSHROOMS: *May.* Either the spawn was spoiled before use, by age—or the bed was too warm at the time it was spawned, or the warmth may have been right at the time, but it had declined rapidly afterwards. In any case the young mushrooms are killed.

NAMES OF FRUITS: *H. G. P.* Specimens somewhat bruised and rubbed. They appear to be the same variety, viz., *Beurré Sterckmans*.—*E. Sang & Sons*, Stirling Castle.

NAMES OF PLANTS: *G. Southcott.* *Acacia Drummondii*, *Bougainvillea spectabilis*, *W. W.*—*Æquo animo*, *Juniperus thurifera*, *M. T. M.*—*L. C.* *Agavecucum pellicidum*.—*H. S.* *Miltonia cuneata*.—*H. M. E.* *Acacia longifolia*, *Grevillea rosmarinifolia*.—*B. S.* *1.* *Fuchsia procumbens*, *2.* *Origanum dictamnus*, *3.* *Adiantum macrophyllum*.—*W.* *Stanhopea oculata*, *J. O. B.*—*Jarman & Co.* *Malva lateritia*.

PEAR: *F. S.* See answer in "Notices to Correspondents" in our issue for February 6, under the above initials.

PROFITABLE PLANTS TO GROW: *A. B.* Getting as you do the fuel for heating the houses for nothing, you should grow mainly those things that fetch the highest prices when forced. *Dutch Bulbs*, *Narcissus*, *Lilac*, *Gardenias*, *Lily of the Valley*, *Indian Azaleas*, *Q. lantaglossum*, *Dendrobiums*, as noble, *Wardianum*, &c., *Cypripedium*, *Phaias* in variety, *Lælia autumnalis*, *L. anceps*, *L. majalis*, *Cattleyas* that bloom in autumn and winter, *Chrysanthemums* for cut bloom, keeping to a few decided colours and floriferous varieties; *Eucharis amazzonica*. Other subjects that may be mentioned are *Cucumbers*, *Tomatoes*, *early Peaches*, *early Melons*, *early Grapes*, *French Beans*, *Musbrooms*, *Strawberries*. The main things to observe are—to have everything of the best quality, and reasonably early in the year.

SILVER-LEAF IN PEACHES: *Nemo.* The cause of and remedies for this disease were fully described in the *Gardeners' Chronicle* for April 13, 1889, p. 462; and September 7, 1889, p. 278.

TARRING APPLE TREES: *Constant Reader.* Don't, for unless your trees are old and have a thick cork bark, it will injure, perhaps kill them, especially if it touch the buds or younger shoots. You may mix clay, cow-dung, and soot together, with water, adding a little tar to give it a disagreeable odour, and paint the stems. This will do no harm to quite young trees. Rubbing the stems with the fat of bacon is said to deter hares and rabbits. Why not put rabbit-proof wire guards? It is cheap.

THE WINEBERRY: *R. F. & Sons.* We have no definite knowledge of the plant, but it has the appearance of being *Rubus phoenicolasia*. See *Zot. Mag.*, t. 6479, and our illustration on p. 269, fig. 38.

YEAST FUNGUS AND BULB MITE: *L. M.* The fungus and the mite frequently occur on the same plant at one and the same time, but there is no connection between them.

DIED.—On the 22nd inst., at Cairo, EDWIN GRUNDY WROLEY, of Howick House, Preston, and Bury, Lancashire, aged fifty-nine years.

—ROBERT STAYNE HOLFORD, at his residence, Dorchester House, Park Lane, London, on Feb. 22, in the eighty-fourth year of his age.

"Nothing Succeeds like Success." HUGHES' (SOLUBLE) INSECTICIDE FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

Sold by Seedsmen & Chemists, 1/6, 2/6, & 4/6; 1/2-gallon 7/6, 1-gallon 12/6, or less in larger quantities.

A Treatise on FIR-TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the manufacturer, addressed to E. GRIFFITHS HUGHES, Victoria-st., Manchester. WHOLESALE from all the London Seed Merchants and Patent Medicine Houses.

NEW YORK—A. ROLKER & SONS.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sir, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95° F. I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear Sir, yours truly. (Signed) A. MACKENZIE." Of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

SAVE HALF THE COST.

**GARSIDE'S BEDFORDSHIRE
COARSE AND FINE
SILVER SAND**

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade. Consumers should Buy Direct from the Owner of these Celebrated and Extensive Pits, which contain a practically inexhaustible supply of Silvester Sand, and thus save half the ordinary cost. NO TRAVELLERS OR AGENTS. Apply direct to the Proprietor for Samples and Price free on Rail or Carriage, and executed with the utmost promptness and under personal supervision. Special Railway Rates in force to all parts. All kinds of PEAT supplied at lowest possible prices. Sample Bag sent on application to GEO. GARSIDE, Jun., F.R.H.S., Leighton Buzzard, Beds.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in Jaffar from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

SANKEYS' famous GARDEN POTS

* Bulwell Potteries, Nottingham. *

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your Garden Pots, and still find them the best and cheapest."

Largest Manufacturers in the World. No Waiting. Millions in Stock. Carriage and Breakage Free on £10 Orders. Half Carriage on £5 Orders. Samples Free.

THE GARDEN.

All who use our Seeds at once pronounce them superior, not only in strain, but plumpness, colour, and germinating powers. Coming off our rich, warm, calcareous soil, they produce nearly double the weight of the ordinary Seeds. The great success that has attended this department (grown and supplied direct from us, the Growers to the Sowers), make us proud of our registered **TRADE MARK, "PERFECT SEEDS."**

GARDENING APPOINTMENTS.

Mr. WM. HALLIDAY, for seven years general Foreman to Mr. RAPINE, Alton Towers, as Head Gardener to the Rt. Hon. the Earl of DARBYSHIRE, Fatchall House, Wolverhampton.
Mr. J. TULLETT, for the past three years Head Gardener to Sir EDWARD BLACKETT, Bart., Matten Hall, Newcastle-on-Tyne, as Head Gardener at Raby Castle; and Mr. ATKINSON, Foreman at Matfen, takes the Head Gardener's post at that place.
Mr. FRED. P. LUCKHURST, for many years Head Gardener, Sedgley Hall, Prestwich, Manchester, has been appointed Manager to the SOUTH DEVON FRUIT FARM COMPANY, Torquay.

WANTED, a reliable single MAN, to take charge (in employer's absence) of a small Nursery, 4 acres, 4 greenhouses (Yorks), with Jobbing Work. Good Salesman, as he will be required occasionally to take produce to market. Wages, 21s. Give references, and state what he has been used to.—T. J. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a thoroughly reliable married MAN of about 30, as MANAGER in a Market depot. Must have some knowledge of the Seed Trade, and a thorough knowledge of the Cut Flower and Plant Trade. Character and ability must bear the strictest investigation. Liberal salary and commission to suitable man.—MARSHALL BROS. AND CO., Barnham, Bognor.

WANTED, a HEAD GARDENER, who understands all branches, and Packing and Selling Fruit.—Write to Mrs. LEVESON GOWER, Bill Hill, Wokingham, Berks.

WANTED, a GARDENER, sound and practical, to take the entire Management of a Business where Fruit and Flowers are grown exclusively for Market. Must be able to command a few hundred pounds, taking a share of the profits as his own remuneration, which would be good according to his ability and energy. This is a sound and liberal offer.—Write to W. L. May's Advertising Office, 162, Piccadilly, London, W.

WANTED, a GARDENER, married.—Must understand Glass, and manage pony. Small garden; house found in grounds. Apply stating age, wages, &c., to C. Born, 115, London Wall, E.C.

WANTED, a GARDENER.—Must understand cows. Apply, CAPTAIN PAUL, The Highlands, Tadmerton, Banbury.

WANTED IMMEDIATELY, a HEAD WORKING GARDENER, for Ongar, Essex.—Must thoroughly understand the Management of Vines, Fruits under Glass, Kitchen and Flower Gardens, &c. Three men under. Wife as thorough waitress. Good characters for energy, energy, and honesty required. No children.—Mrs. NEWALL, 1, Beach Mansions, Southsea.

WANTED, as GARDENER, an all-round man, for three-quarters of an acre, in London.—Must be married, be between 30 and 45, a Protestant, English or Scotch, and have thoroughly good long character.—Apply, stating age, and wages required, to A. B., care of M. J. Ross, Chemist, 441, Edgware Road, W.

WANTED, a GARDENER, accustomed to Orchard Growing; also a FERN GROWER. State wages required.—Apply to COLLINS AND COLLINS, Cumberland Park Nursery, Wilsden Junction, W.

WANTED IMMEDIATELY, for Northamptonshire, a good SINGLE-HANDED GARDENER, able to look after a Cow. If married, could employ wife as Landlady and Dairymaid. State age, wages, and all particulars.—M. J., 3, Oxford Road, Birkdale.

WANTED, at Lady Day next, Thoroughly qualified WORKING GARDENER. Wife as Landlady and to take charge of Poultry. One mile from Axminster Station, S.W. R. Carter to bear the strictest investigation. Character, English, and letter only, to G. A. SPOTTSWOOD, Esq., 3, Cadogan Square, London, S.W.

WANTED, a trustworthy young MAN as FOREMAN for the Houses; also a young JOURNEYMAN for the Houses, to help occasionally in the Pleasure Grounds. Wages, 18s. and 12s. per week respectively, with both Vines and Vegetables.—Apply, OLIVER, Stuffwood Gardens, Mansfield, Notts.

WANTED, a good practical and trustworthy FOREMAN. Must be well up in the Cultivation of Vines, Peaches, Tomatoes, Cucumbers, Plants, Flowers, &c., both for family use and Market. Must be able to take charge of men. Wages 20s., both milk, and vegetables.—Apply, stating age and experience, to W. BUGGINS, Woodlands Castle Gardens, Clonsilla, Dublin, Ireland.

WANTED, an efficient, industrious, reliable man as FOREMAN WOODMAN, able to undertake proper care and management of Hedges, Coppice, repairs of Fences, Gates, &c., Chelmsford, and connected with outside work.—Address, stating full particulars as to experience, &c., to G. E., Dickinson's Royal Seed Warehouse, Chester.

WANTED, a reliable man, as Outdoor Foreman, in a General Nursery.—Apply, stating wages, references, and full particulars, to V. E., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a MAN, thoroughly up in growing Tomatoes, Mushrooms, Vines, and Plants for Market.—State age, wages, and married or single, to POLLARD, 63, King William Street E.C.

WANTED, several MEN, for Tomatoes, Cucumbers, and Grap. A. Permanency for good steady men.—H. DICKINSON, Sharnlow, near Derby.

WANTED, a young MAN accustomed to Fern Growing, and quick at Potting and Watering.—JAMES WATSON, Hornpark and Eltham Road Nurseries, Lee Green, S.E.

WANTED, a strong, active young MAN, as Journeyman for Fruit Department.—Apply to Mr. BORMAN, Hyle, at Chelmsford, stating age, experience, and references, as to knowledge of above.

WANTED.—Young MAN, for a Market Nursery, with some knowledge of Fruit and Ornamental Plants. Permanent. Wages 12s. to begin.—HARLEY AND SONS, Reform Street, Dundee.

WANTED, a young MAN for Cucumber, and Tomato Growing, and Soft-wooded Plants. Wages, 17s. per week, lodgings, and vegetables.—MANAGER, Fern Bank Nurseries, Wore, near Newcastle, Staff.

WANTED, a JOURNEYMAN, to take the lead in Pleasure Ground work, and to attend to Conservatory.—Must be an experienced hand with Scythe and Machine. Wages 17s. per week and both.—Apply, W. ROWE, Squerrys Court Gardens, Wetherham, Kent.

WANTED, a young MAN to assist Propagator in a small home nursery. Quick at potting, tyng, watering, wreaths, &c. Wages, 20s.; no both; good character indispensable. THOS. MATHESON, Nurseries, Morpeth.

WANTED, a smart active young MAN, for the Kitchen Garden. Able to Mow with a Scythe.—Apply, stating age, references, and wages, Mr. SLADE, Monzeval Gardens, Wallingford.

WANTED, a young MAN, quick at Potting, Watering, &c. Will also be required to help in Propagating-house. State wages, &c.—CRANE AND CLARKE, Hillside Nursery, Merch, Cambs.

THERE IS AN OPENING for a well-educated young MAN in a well-known HARDY PLANT NURSERY. He must have a knowledge of, and a liking for, Herbaceous Perennials, be capable and willing to assist in the Office. Remuneration in proportion to ability.—ALPINE, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, AT ONCE, a strong LAD, used to Potting, Watering, and General Work.—State wages and references to G. BLUNDELL, Oak Villa Nursery, Oakleigh Road, Frieon, Barnet, N.

WANTED, an ASSISTANT SHOPMAN, also an INVOICE CLERK. Good wages and permanent situations to reliable men. A vacancy also for an apprentice.—Apply, J. E. BAINES, The Great Eastern Seed Stores, 8, Exchange Street, Norwich.

WANTED.—H. CANNELL AND SONS are wanting INVOICE CLERK.—In first instance, apply in own hand-writing.—Swanley, Kent.

WANTED, an ASSISTANT SHOPMAN, or young man as IMPROVER, in the Seed and Florist business. Must have had previous experience. Apply, stating age, wages, and references, to THOS. BUTCHER, Seed Merchant, Croydon.

WANTED, a young GIRL, who has just served her Apprenticeship in the Florist business, to make up Wreaths, Bouquets, &c.—Send full particulars to H. STRINGER, late E. & S. Peters, 212, Western Road, Brighton.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

THE LIVERPOOL HORTICULTURAL COMPANY (JOHN COWAN), Limited, The Vineyard and Nurseries, Orston, near Liverpool, wish to recommend to any Nobleman or Gentleman who may require a thoroughly competent and reliable HEAD GARDENER, David Lindsay, who was Head Gardener for the last twelve years to the late Sir Thomas Edwards Moss, Bart., of Otterspool, near Liverpool.—Full particulars on application to the Company.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

Gardeners, Farm-Bailiffs, Foresters, &c. DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address: "DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first-rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to THOMAS BUTCHER, Seed Merchant and Nurseryman, Croydon.

GARDENER (HEAD), where five or more are kept, &c. age 26; well up in the Management of Vines, Peaches, Stone, &c. Highest references. Abstarner.—GARDENER, 8, Deaconsfield Terrace, Catford, Lot 4, S.E.

GARDENER (HEAD); age 33.—J. E. MCCLARY, eight years Head Gardener to R. Heywood Jones, Esq., Badsforth Hall, Pontefract, is open to a re-engagement in a good establishment. Nineteen years' experience in all branches. Testimonials of the highest order.—Catsclough, Winsford, Cheshire.

GARDENER (HEAD).—Mr. CLARKE, Head Gardener to the Earl of Lonsdale, Lowther Castle, Penrith, can with every confidence recommend his Foreman to any Lady or Gentleman requiring the services of a thorough practical man, experienced in all branches.

GARDENER (HEAD), where two or three are kept.—Age 27, single.—WILLIAM KIRBY, Biteswell Hall Garden, Lutworth, can be highly recommended as a very sober, practical man. Understands Grapes, Cucumbers, Melons, Chrysanthemums, and the general routine of Gardening.—Eleven years' good references.

GARDENER (HEAD), where two or three are kept, or SINGLE-HANDED.—Age 25, married; ten years' experience in large establishments. Good references. Abstarner.—G. M., 13, Clifton Terrace, Ashville Road, Leytonstone, Essex.

GARDENER (HEAD); age 31, married, three children.—W. MATTHEWS, Esq., wishes to recommend his Head Gardener to any Lady or Gentleman requiring the services of a thorough practical man, thoroughly conversant with all branches. Leaving through no fault.—W. BEALF, Knowle, Dunster, Somerset.

GARDENER (HEAD), where two or three are kept.—Middle-aged; thoroughly knows his profession. Eleven and a half years' good character. Leaving through death of employer.—W. PEPPER, The Gardens, Tewin Water, Welwyn, Herts.

GARDENER (HEAD), or FOREMAN, in a Large Establishment, experienced in all branches of the profession. Excellent character from previous and present employer.—G. HUBBARD, 3, Cumberland Place, Ken.

GARDENER (HEAD), where two or more are kept, or SECOND in good establishment.—Age 27. Life experience in all branches. Good references.—G. BLAKE, Boreham House, Chelmsford.

GARDENER (HEAD), in a large establishment; age 41, widower, two children, youngest 9 years.—E. S. WILES, who has had charge of the Ercgate Gardens for the last thirteen years, will be engaged on March 25, and is open to re-engage to any Lady or Gentleman requiring a good all-round Gardener. Excellent characters from present and previous employers.—E. S. WILES, Edgemoor, Banbury, Oxon.

GARDENER (HEAD), where one or two are kept.—Age 30, married, no family. Life experience in all branches. Good references.—L. G., Woodcroft Lodge, Mottingham, Eltham, Kent.

GARDENER (HEAD), where two are kept; age 27.—J. ANDERSON, Gardener, Chelmsford, Devon, Worth, wishes to recommend his FOREMAN, Jas. Skinner, to any Lady or Gentleman, requiring a good practical man; twelve years' experience.

GARDENER (HEAD), where three or more are kept; age 31, married, two children.—A GENTLEMAN, breaking up his establishment, wishes to recommend the above. Thoroughly experienced in Stone, greenhouse, Flower and Kitchen Garden. Twenty years' experience in good Gardens. Good reference from previous employer.—JAMES SHEPHERD, 13, Church Road, Bromley, Kent.

GARDENER (HEAD), where five or more are kept; age 38, married, no family.—THOS. LANBERT, Barton Constable Gardens, Hull, can recommend a thoroughly practical man as above, with long experience in the leading establishments in England and Ireland. Nine years in last place.

GARDENER (HEAD), in good establishment.—Married, no family. Abstarner. Life experience in Early and Late Forcing all kinds of Fruits, Flowers, Vegetables, Mushrooms, also Kitchen and Flower Gardens, Pleasure Grounds. Eight years' good character from late employer and sixteen years' references.—J. D., Myrtle Cott'ge, Wick Road, Hampton Wick, Middlesex.

GARDENER (HEAD).—Any Nobleman, Lady, or Gentleman, requiring the services of a thorough practical man, would be suited, by applying to CHAS. FLACK, Head Gardener, Chalmersfield Castle, Malpas.

GARDENER (HEAD), where three or four are kept.—Age 31, single; sixteen years' experience in all branches. Good references.—A. G., Basing Park Gardens, Alton, Hants.

£5 will be paid to any one furnishing the Advertiser with information of any gardening bungs that will lead to engagement as HEAD GARDENER, where six or more are kept. Well versed in every branch of Horticulture. Age 39, married. Own care for leaving. Highly recommended by present and previous employers.—LAWRENCE, Mr. J. Heath, Coxwell Ford, Farrington, Berks.

GARDENER (HEAD WORKING), or good SINGLE-HANDED.—Thoroughly experienced in all branches. Good character and testimonials. Wife good landlady.—GARDENER, Grenn Lodge, Richmond, Surrey.

GARDENER (HEAD WORKING), where one or two are kept, or good SINGLE-HANDED.—Age 31; single. Five years' good character. Flowers, Fruit, and Kitchen Garden.—G. F., 16, Holly Park Terrace, New Southgate, N.

GARDENER (HEAD WORKING).—Seventeen years and ten months' experience in all branches of the profession. Four years and nine months in present place.—J. ROGERS, Beechwood, Huddersfield.

GARDENER (HEAD WORKING).—Abstainer. Excellent references to large establishments as Foreman. Three years in present situation. Leaving for no fault.—E. E., Casino House, Heme Hill, Surrey.

GARDENER (HEAD WORKING).—A young man (married when suited), of good experience, desires to engage with any Lady or Gentleman requiring a good all-round Gardener. References on application.—S. S. DAVISON, The Gardens, Dislington Hall, Newcastle-on-Tyne.

GARDENER (HEAD WORKING).—Age 28; twelve years' experience in good establishments. Present place as Foreman. Character will bear investigation.—F. CHAMBERLAIN, Marbury Hall Gardens, Northwich.

GARDENER (HEAD WORKING).—Age 32, married.—Messrs. WILLS & SEGAR, the Royal Exotic Nursery, South Kensington, S.W., can recommend with every confidence C. Taylor to be in charge of the services of a thoroughly experienced man, where a large demand of Fruit, Flowers, and Vegetables are required, including House and Table Decorations.

GARDENER (HEAD WORKING).—Trustworthy and thoroughly practical in all departments, including decorating and laying out; single; abstainer; high testimonials; home counties preferred.—J. H., 93, Gordon Place, Kensington, W.

GARDENER (HEAD WORKING).—Age 30, or more as kept.—Age 35, married, three children; seven years as Head Gardener in last situation.—G. RIDDLE, Netley Abbey, Southampton.

GARDENER (HEAD WORKING).—Married, no family; thoroughly practical in Stove Plants, Vines, Peaches, Cucumbers, Flower and Kitchen Gardening. Land and Stock.—GARDENER, Toksowa Cottage, Dalwhin Common.

GARDENER (HEAD WORKING).—Age 33, married, no family. Life experience in all branches. Wife could manage Dairy.—GARDENER, F. Chapel Cure, Essex, Ingistone, Essex.

GARDENER (HEAD WORKING).—Age 33, one child; thoroughly practical with Vines, Peaches, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Good testimonials from previous employer as to ability, industry. Two years' present reference.—GARDENER, Foulis Court, Fair Oak, Southampton.

GARDENER (HEAD WORKING).—Scotch. Age under 40, married. Over twenty years' experience. Wishes re-engagement. Excellent abilities and references. Disengaged March 19.—H. GRANT, Hill House Gardens, Heme Hill, S.E.

GARDENER (HEAD WORKING, or SECOND).—in good establishment.—Age 28, married, no family; not object to lodge. Twelve years' experience in Vines, Flowers, Fruit, Flower and Kitchen Gardening. Good references.—A. H., 8, Moore Park Road, Fulham Road, S.W.

GARDENER (HEAD WORKING).—where two or three are kept.—Married, no family; fourteen years' experience in Fruits under Glass, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Good testimonials.—S. A., Loughston Nursery, Caterham Valley, Surrey.

GARDENER (HEAD WORKING).—Age 36, married, one boy, aged 5; Scotch. A Lady wishes to recommend the above. Twenty years' practical experience in all branches. Abstainer. Four years' excellent character.—M., Squerries Lodge, Westerham, Kent.

GARDENER (HEAD WORKING).—A GENTLEMAN having sold his place will be pleased to recommend his Head Gardener to any Lady or Gentleman in want of a thoroughly experienced man in the cultivation of Grapes, Peaches, Melons, Cucumbers, Tomatoes, Stove and Kitchen Gardens.—G. G., Mrs. Read, East Finchley, London, N.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Twelve years' thorough practical experience in Stove, Vines, Melons, Tomatoes, and Flowers. Early and Late Forcing, and Kitchen Garden Work in general. Excellent character from previous employers.—J. DALEMAN, The Grove, Ditton Hill, Surbiton.

GARDENER (HEAD WORKING).—Age 28. Two years Foreman in present situation. Fourteen years' experience. Good references from present and previous employers.—J. SIMPSON, Marton Hall, Marton S. O., Yorks.

GARDENER (HEAD, or SINGLE-HANDED).—No family. Wife could assist in House or with Poultry. Both trustworthy. Good characters.—A. M., 2, Grove Road, Chertsey, Surrey.

GARDENER (SINGLE-HANDED), or where help is given.—Age 40, married, no family; practical in all branches. Abstainer, and both can be well recommended.—GARDENER, South Bank, The Avenue, High Barnet, Herts.

FLORIST.—Situation wanted by a young Lady; first-class hand, with a good knowledge of fruit. References to present employer.—RIGBY, 31, Finkle Street, Kendal.

HOLLOWAY'S PILLS.—Cure for Indigestion.—Indigestion, with torpidity of the liver, is the curse of thousands, who spend each day with accumulated sufferings, all of which may be avoided by taking Holloway's Pills according to their accompanying directions. They strengthen and invigorate every organ subservient to digestion. Their action is purifying, healing, and strengthening. They may be safely taken without interfering with ordinary pursuits, or requiring much restriction in diet. They quickly remove nausea and giddiness in the head, and dispel low spirits and nervous fears. These balsamic Pills work the cure without debilitating or exhausting the system; on the contrary, they conserve and support the vital principle by substituting pure for impure blood.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competitions, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER.

With Improved Steel Chains and Handles.

To cut 6 in., can be worked by { £1 15 0
a Lady ... } 2 10 0
To cut 8 in., do. ... } 3 10 0
To cut 10 in., do. by a strong youth } 4 10 0
To cut 12 in., do. by a man ... } 5 10 0
To cut 14 in., do. do. ... }

Friday Next.

CATTLEYA TRIANE.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, March 11, at half-past 12 o'clock, by order of Messrs. SEGER & TROPP, a specially fine importation, just received, of

CATTLEYA TRIANE.

The plants are in such superb condition, that it is almost impossible for any imported plants to surpass or even equal them. They come from the locality whence all the superb varieties of the past few years have been derived, and from the variability of the bulbs, leaves, and general appearance of the plants, give promise of equalling the best forms in cultivation, such as *OSMANI*, *LEANA*, *BACHOUSEANA*, &c., &c. The whole consignment is profusely furnished with sound green leaves, at once giving the appearance of established plants.

The entire lot will be offered.

On view morning of Sale, and Catalogues had.

FRIDAY NEXT.

By order of Messrs. LINDEN, Brussels, GREAT SALE.

NEW AND RARE ORCHIDS.
EXTRAORDINARY NEW ODONTOGLOSSUM, in flower.

ODONTOGLOSSUM CELESTE
(LINDEN).

GRAND NEW SPECIES.

THE ENTIRE STOCK (ABOUT 500) WILL BE OFFERED.

The plants are established, and one in blossom. The flowers are mauve, and most attractive.

Also a FINE IMPORTATION, in perfect order and condition, of

CYPRIPEDIUM INSIGNE VAR. MONTANUM.

The plants have been collected by the same men, in and around the region whence was obtained the exquisite *Cypridium insigne* sandere and other grand varieties, all in very fine masses.

Also some fine Established Plants of *MORMODES BOLLEAFUM* (new species), *AGANTHIA CERULEA*, *ODONTOGLOSSUM CORONARIUM*, *O. TRIPUDIAN*, *ANGRECHUM SESQUEDALE*, *SACCOLARIUM CELESTE*, *GRAMMATOPHYLLUM SPECIES* from Madagascar, *CORYANTHES LECOCORIS*, *DENDROCHILUM FILIFORME*, &c.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. LINDEN to SELL the above at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, March 11, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Wednesday and Saturday Next.

2000 Choice—standard, Half-standard, Dwarf and Climbing *ROSES*, from a well-known English grower; 500 *FRUIT TREES*, 500 *LABELLS*, *CONFERS*, 1000 choice *BEGONIAS*; a nice collection of *PALMS*, &c.; *LILiums* in variety; a large quantity of *BORDER PLANTS*, *PERL TUBEROSES*, &c.

M. R. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 33, King Street, Covent Garden, W.C., on WEDNESDAY and SATURDAY NEXT, March 9 and 12, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

The Choice Collection of Established Orchids formed by A. SILEM, Esq.

M. R. C. STEVENS has received instructions from AUGUSTUS SILEM, Esq. (who is medically forbidden to frequent the houses), to offer for SALE, by AUCTION, at his Great Rooms, 33, King Street, Covent Garden, W.C., on WEDNESDAY and THURSDAY, April 6 and 7, at half-past 12 o'clock precisely each day, within the least reserve, his entire COLLECTION OF ORCHIDS, which will be found in excellent health, and amongst them may be mentioned—

<i>Phalopsis grandiflora</i>	<i>Vanda fere</i>
" <i>ambigua</i>	<i>Cattleya labiata</i>
" <i>Sturtiana</i>	" <i>Mendii</i>
" <i>Sanderiana</i>	" <i>Aelandiae</i>
<i>Angraecum sesquipedale</i>	" <i>Calceoglossum cristata lemosiana</i>
" <i>Sootiana</i>	" <i>paniculata</i>
<i>Cypridium Stonei</i>	<i>Lycaste Skinneri alba</i>
" <i>Levigatum</i>	<i>Cyclopium eburneum</i>
" <i>Lowi</i>	" <i>Lowi</i>
" <i>Lothchildianum</i>	" <i>Hoebii</i>
<i>Aerides Fieldingi</i>	<i>Odontoglossum Alexandrine</i>
" <i>Sanderiana</i>	" <i>reclivum</i>
<i>Plinia tuberculosa</i>	" <i>Londe-boroughianum</i>
" <i>Bombosii</i>	" <i>hystrix</i>
" <i>Heurys</i>	<i>Dendrobium Ainsworthii</i>

THOMAS B. JAMES will include in his SALE on THURSDAY NEXT, March 10, a choice consignment of Plants from Belgium, consisting of *PALMS* in variety, *DRACENAS*, *ERAS*, *AZALEAS*, *INDICA*, *MOLLIS*, *SOLANUMS*, *CITRUS*, *CROTONS*, *CYCLOMUS*, and other *GREENHOUSE PLANTS*; also THIRTY EXTRA FINE SPECIMENS *AZALEAS*, from a well-known successful Exhibitor. To be sold without reserve.

Horticultural Auction Rooms, 12, Bull Ring, Birmingham.

Catalogues post-free.

THOMAS B. JAMES (many years with Protheroe & Morris) holds WEEKLY SALES at his Rooms, 12, Bull Ring, Birmingham, of BULBS, PLANTS, NURSERY STOCK, &c., every WEDNESDAY and FRIDAY, at 4.20 P.M. Sales of choice Cut Flowers. Fresh Entries invited. Account Sales and cheques daily. Empties and labels found.

MESSRS. J. McLACHLAN AND SONS, of COTTONBURY, Giffarth, S.W., are instructed to SELL PRIVATELY, the superb and well watered collection of Cool ORCHIDS, belonging to the late Sir John Lambert, K.C.B. The specially-constructed HOUSE might also be purchased, if desired.

Apply, for full particulars, to the Auctioneers, as above.

To Noblemen, Gentlemen, Committees of Public Parks, and others interested in Horticulture.

TO BE SOLD by private treaty, owing to the ground having been leased for building purposes, THE MAGNIFICENT CONSERVATORY OR WINTER GARDEN at HAYMARKET, EDINBURGH.

The style of Building is suitable for use as Public or Private Grounds. The structure is principally of Iron. The frontage of Main Building is 140 feet, the Dome rising to the height of 40 feet from the floor. The whole interior is paved with encaustic tiles, and heated with hot water. There is an ornamental fountain, large mirrors, &c. The whole is in capital condition and will remove with safety.

Offers will be received for the Conservatory as it stands, and Photographs and other information can be had from the proprietors, Messrs. K. B. LAIRD AND SONS, Nursery and Seedsmen, Edinburgh; or Mr. DAVID MITCHELL, Horticultural Valuator, 6, Cornhill Bank, Edinburgh.

A SALE BY AUCTION of the specimen and other Plants in the above will be held at a date yet to be fixed.

To Fruit Growers, Nurserymen, and Others.

DAHLIAS, BEGONIAS, CANNAS, &c.—Our CATALOGUES will be sent free on application.
15 First Prizes (10 this year). 5 Gold Medals.
REID and BORNEMANN, Sydenham, London, S.E.

THE OLD BROWN QUARRY EARLY POTATO. The Oldest Existing Sort in Ireland.
In existence here for 150 years; certainly, when I was a child, prior to the famine period. There was no other sort grown for harvest purposes when men worked with a sickle. I am enabled to offer it for redistribution—it never having made its way to England—from a stock preserved for years on peat land, resting on limestone, in a remote part of county Cork. There must be something in the soil that preserved it for years. It is a first-class early June variety, of great substance. 7-lb. bag and postage for 2s. 9d.
WM. EYLAND HATLAND, F.R.H.S., Old Established Seed Warehouse, Cork, Ireland.

BEGONIAS A SPECIALTY.—Awarded
Four Gold Medals, and Gold Cup, and all First Prizes. Seed saved from Prize plants. Our Begonia Seed and Bulbs eclipse all previous years. Choicest mixed, single or double varieties, 1s. 2d. 6d. and 3s. per packet. Collections (Seed)—single, 12 named varieties, separate, 5s. 6d.; 5 ditto, 3s. Turned named singles, from 12s. to 42s. per dozen; unnamed seedlings, 12s. to 21s. per dozen; bedding, choicest, 4s. 6s. 6d., and 9s. per dozen; choicest named doubles, from 42s. per doz.; unnamed, choicest 18s. to 30s. per dozen; choicest mixed, for bedding, 9s. and 12s. per dozen. Catalogues gratis.
JOHN LAING and SONS, Begonia Growers, &c., Forest Hill, London.

A GOOD INVESTMENT.

Last season I sowed a small quantity of Chrysanthemum seed, from which I obtained twenty varieties that I would not sell for one hundred pounds. I have again obtained seed from the same source, and have a small quantity to spare at 1s. 6d. and 2s. 6d. per packet. I shall be pleased to purchase at a fair price any good varieties raised from this seed.—H. J. JONES, Ryecroft Nursery, Lewisham.

The best bank on the Chrysanthemum is Chrysanthemums, and How to Grow Them. Now ready, post-free, 9 stamps, of H. J. JONES, Ryecroft Nursery, Lewisham, S.E.

CHRYSANTHEMUMS.

JAMES VEITCH & SONS ROYAL EXOTIC NURSERY, CHELSEA, S.W.

SUTTON'S New Peas For 1892.

SUTTON'S EMPRESS OF INDIA.

"The earliest wrinkled Pea I have ever grown, of great value, pods large, and Peas of good quality."—Mr. E. BURDEN, The Gardens, Wake Green House.

Per packet, 1s. 6d. and 2s. 6d.

SUTTON'S BOUNTIFUL.

"Sutton's Bountiful showed undoubted advance in size of pod as an early Pea, and a good type of what should now be set up as a standard, as the very small podded whites of the Sangster's No. 1 type hardly merit recognition. If Sutton's Bountiful, which is really a much finer and better Pea, should prove to be as early as Sangster's No. 1, a great gain will be found."—*Gardener's Chronicle*, August 1, 1891.

Per pint, 2s. 6d.

SUTTON'S EXHIBITION.

"A free grower and a grand Pea in every respect. A great bearer of splendid Marrowfat Peas of the finest flavour."—Mr. W. C. LEACH, Gardener to His Grace the Duke of Northumberland.

Per packet, 1s. 6d. and 2s. 6d.

SCOTCH, 1½ to 2, 2 to 2½, and 2½ to 3 feet.
SPRUCE, 1½ to 2, 2 to 2½, 2½ to 3, and 3 to 4 feet.
Together with a large Stock of HAZELS, MOUNTAIN ASH, BIRCH, LAURELS of sorts, RHODODENDRONS, BERBERIS AQUIFOLIA, and other COVERT PLANTS, all of the best quality, and very reasonable in Price. Catalogues on application. Apply to—
JOHN HILL, Spot Acre Nurseries, near Stone, Staffs.

WILLIAM BARRON and SON offer the following well-grown and finely-rooted, which they offer at very low prices:—
ABIES, in variety, 2 to 6 feet.
CEDRUS ATLANTICA and DEODARA, 2 to 7 feet.
CUPRESSUS LAWSONIANA, in great variety, 2 to 8 feet.
NUTKANSIS, in variety, 2 to 8 feet.
PICEA NOBILIS, very fine, 1½ to 2½ feet, 65s. per 100, in variety, 2 to 10 feet.
PINUS AUSTRIACA, over 100,000, 1 to 8 feet.
.. Forest-tree sizes, very cheap, grand specimens, 6 to 8 feet.
PINUS, in variety, 1 to 8 feet.
RETINOSPORA, in variety, 1 to 8 feet.
THUYA OCCIDENTALIS, for hedges, 5 to 6 feet, 45s. per 100, in variety, 2 to 8 feet.
YEW, Common, many thousands, 1½ to 2½ feet.
.. Golden, grand specimens, up to 8 feet.
HOLLIES, in great quantity and variety, 1 to 10 feet.
.. Golden Queen specimens, 4 to 7 feet, very fine.
AUCUBA, green and variegated, 1½ to 2½ feet.

AVENUE TREES.
ACER SCHWEDLERII (scarlet-leaved Maple), 10 to 14 feet.
NORWAY MAPLE, 10 to 14 feet.
SYCAMORE, from 12 to 14 feet.
HORSE CHESTNUTS, very stout, 10 to 12 feet.
POPLARS, in variety, 10 to 14 feet.
PURPLE BEECH, from 10 to 12 feet.
OAKS, Scarlet and other varieties, 10 to 12 feet.
FLMS, fine variety, 10 to 14 feet.
THORNS, Scarlet, Pink, and White, fine standards.
LARCH, very fine, from 2 to 3 feet.
THORN (Quick), strong, 15s. per 1000.
.. very strong, 20s. to 25s. per 1000.
FRUIT TREES, all kinds.
APPLES and PLUMS especially fine.
A visit from intending planters is respectfully invited. Evesham Nurseries, Borrowash, Derby, only three minutes walk from Borrowash Station, Nottingham and Derby, Midland Line.

WHEELERS' NEW POTATO, "THE ALDERMAN."

For Exhibition this Potato is a model of Perfection; the eyes are shallow, the skin rough, and it is of large size, a great cropper, and of the finest possible quality, very mealy, of good colour, and excellent flavour. Being a vigorous grower it withstands disease well.

Price 6d. per pound; per peck, 6s.

"I am specially pleased with 'The Alderman' Potato, and consider it the most valuable introduction since the Magnum Bonum. It is a first-class Potato all round, strong in the haulm, a vigorous grower, tubers large and handsome, and on the table no Potato can surpass it for appearance or flavour.—J. H. FRY."

WHEELER & SON,
Seed Growers, GLOUCESTER.

PIT LIGHTS.

Best quality and workmanship, 2 inches thick, 8 ft. by 4 ft., iron bar across and very strong, 4s. each; free on rail in London. Cash or reference with order.

CUCUMBER HOUSES.

Timber sufficient to build 100 ft. by 12 ft. house, lights, door, &c. Put on rail in London. Low price. Send for detailed specification, to

W. DUNCAN TUCKER,

CAMPBELL'S BROAD REED MELODEONS (Patent). GRAND NEW MODELS.

NO HOME SHOULD BE WITHOUT ONE. CAMPBELL'S world-famed MELODEONS have Organ and Celestial Tones and Charming Bell Accompaniments. The Solemn Psalm, the Soul-stirring Hymn, the Cheerful Song, and the Merry Dance can all be played on these charming instruments. No knowledge of Music is required by the player.

GOOD NEWS!

CAMPBELL'S GOLD MEDAL MELODEON.

AN UNPARALLELED OFFER. To readers of the *Gardeners' Chronicle*. OUR GRAND PRIZE MEDAL "GEM" MELODEON. 6s. 6d. With Two Sets of Broad Reeds, Organ and Celestial Tones, sent carefully packed and carriage paid to any address in Great Britain and Ireland on receipt of P.O.O. for 6s. 6d. Selling in thousands.

CAMPBELL'S GOLD MEDAL MELODEON.

AN UNPARALLELED OFFER. To readers of the *Gardeners' Chronicle*. OUR GRAND PRIZE MEDAL "MINIATURE" MELODEON. 10s. WORTH DOUBLE. 10s. With Two Sets of Broad Reeds, Organ and Celestial Tones, and the Charming Bell Accompaniments, sent carefully packed and carriage paid to any address in Great Britain and Ireland on receipt of P.O.O. for 10s.

NO DECEPTION HERE. 100,000 TESTIMONIALS. Important Testimonial from Professor Brown, the Champion Melodeon Player of Great Britain, Ireland, and Wales—"Campbell's Patent Melodeons are the finest instruments that have ever come under my touch, and only require a trial to advertise themselves." Campbell's Patent Melodeons are the only genuine Melodeons in the market. Beware of worthless imitations.

N.B.—All lovers of music should at once send for our New Illustrated Privilege Price List for Season 1891-2, now ready, 100,000 of those valuable lists sent out yearly. Send 1d. stamp to **CAMPBELL & CO.,** MUSICAL INSTRUMENT MAKERS, 118, TRONGATE, GLASGOW. ESTABLISHED 50 YEARS.

INTERNATIONAL HORTICULTURAL EXHIBITION.

LONDON, 1892.

TO BE HELD AT THE EXHIBITION GROUNDS, EARL'S COURT, S.W.

Chairman of the Executive Committee—HENRY ERNEST MILNER, F.L.S., Assoc.M.Inst.C.E.

Secretary—G. A. LOVEDAY, B.A.

THE EXHIBITION WILL BE OPENED ON MAY 7,
AND WILL
REMAIN OPEN UNTIL OCTOBER NEXT.

SCHEDULE OF EXHIBITS,

FOR WHICH NUMEROUS GOLD, SILVER, AND BRONZE MEDALS AND CERTIFICATES WILL BE GRANTED IN THE VARIOUS CLASSES.

GROUP A.

Plant Houses, Conservatories, Hot Houses, Vineries, Peach Houses, Forcing Houses, Stoves, Fruit Rooms, Frames, Pits.
Systems of Patent Glazing and Ventilation.
Systems of Heating, including Hot-Water Boilers.

GROUP B.

Lawn Mowers (Hand and Horse Machines).
Garden Rollers.
Water Barrows, Syringes, Pumps, Spray Distributors.
Garden Tools and Cutlery.
Thermometers, Barometers.
Rain and Snow Gauges.

GROUP C.

Garden Tents.
Garden Seats, Band Stands.
Flower Stands and Baskets for Conservatory Decoration.
Rustic Summer Houses and Seats.
Ice Houses, and artificial methods of maintaining equable temperature.

GROUP D.

Ornamental Iron Work for Conservatories and Hot Houses.
Ornamental Wire Work, Trellises, Arches, Apiaries, Aviaries, Borders.
Fences, Gates, Tree Guards.

GROUP E.

Shadings (various kinds).
Paints and Wood-preserving Materials.
Labels, Sticks, Bamboo Canes.

GROUP E—continued.

Cocoa Fibres, Refuse Manures, and Silver Sand.
Ropes, Lines and Twines.
Russia Mate, Archangel, Taganrog and Petersburg.
Raffia Fibre.
Fumigating Materials and Processes.
Insecticides and Weed Killers.
Horticultural Glass.

GROUP F.

Orchid and other Peats.
Fuel for general Horticultural Purposes.
Fertilizers and Artificial Manures.

GROUP G.

Ferneries, portable and permanent.
Rock Work.

GROUP H.

Garden Pottery.
Statuary, Fountains, Vases, Edgings, &c.

GROUP I.

Tree-transplanting Machines.
Tree Tubes.

GROUP K.

New or Patent Inventions amongst Garden Requisites.

GROUP L.

Miscellaneous Decorative Requisites, such as Bouquet holders, Papers, Tubes, &c.

GROUP M.

Machinery for Seed Cleaning and Saving.
Machinery for Extracting Essential Oils.
Perfumes.
Fruit Evaporators.
Pumps, Methods of Irrigation.

GROUP N.

Stands exhibiting Models of Produce from Seeds provided by Exhibitor.
Collections of Flower and Vegetable Seeds.
Collections of Agricultural Seeds.
Collections of Grass Seeds.
Flower Seeds.
Vegetable Seeds.
Grass Seeds.
Agricultural Seeds.

GROUP O.

Designs for the Laying-out of a Typical Estate of 100 Acres, bounded by Roads, 5 miles from Town in Midlands, with Ground sloping gradually towards South.
Designs for Improvements of Grounds to Private Residences.
Photographs of Trees and Shrubs and of Garden Scenes.

GROUP P.

Essays on the Progress of Gardening since 1866, and the Practical Education of Gardeners and Foresters.

GROUP Q.

Methods of determining the Nature and Fertility of Soils, the Germinating Powers of Seeds, and the use of the Electric Light in the Growth of Plants.

In addition, there will be Permanent Displays of Groups of Flowering Plants and of Fruits throughout the Season, arranged for effect. Special Cash Prizes will be distributed Monthly in Competition.

THERE WILL ALSO BE A NUMBER OF FLOWER SHOWS, COMPRISING ALL VARIETIES OF FLOWERS AND PLANTS IN THEIR DIFFERENT SEASONS.

Applications for Space should be Addressed to the Secretary of the International Horticultural Exhibition, Earl's Court, London, S.W., from whom all further particulars may be obtained.

extending from Richmond Green to Brentford Ferry; and the gardens were very elaborately adorned with groves, statues, &c.; and there was a "forest walk" running from near the present Kew palace to Richmond Green. Queen Caroline, the consort of George II., is believed to have spent large sums on Richmond Gardens. Rooke describes Kew palace as "a complete Place, very beautiful in its situation, gardens, &c., all laid out at his Highness's expense, and affords a delightful Prospect of ye River and the opposite country."

As already indicated, the boundaries of Kew Gardens and Richmond Gardens have varied at different periods, and the whole grounds have undergone the most complete transformations. Formerly, there was a public road across the middle of Kew Green, from east to west, through the gardens, past the present palace to Brentford Ferry. From the *Bulletin* we learn that "Kew, as it exists to-day, was formed by the fusion of distinct properties or domains, both royal, but with entirely different histories. They corresponded roughly to the west and east halves of the present gardens. The western [waterside] half was known as Richmond Gardens. The eastern half corresponds in great part to the grounds of Kew House, and to this the name of Kew Gardens was originally confined. The two properties were separated by Love Lane, the ancient bridle-road between Richmond and Brentford Ferry. The "forest walk," mentioned above and "Love Lane" must have been nearly parallel, or perhaps even the same road.

It would fill far too much space here to follow the Director of Kew through his history, which itself is so highly concentrated that every paragraph might be expanded into an article of two or three columns; therefore we pass on to the period illustrated by Sir William Chambers in his large folio work (1763), entitled *Plans, Elevations, Sections, and Perspective Views of the Gardens and Buildings at Kew, in Surrey, the Seat of Her Royal Highness the Princess Dowager of Wales*. Many of the buildings there figured still remain; but the general configuration of the plantations and ornamental waters, and the boundaries, are very different. In 1765, George III. obtained an Act of Parliament empowering him to close Love Lane, but this appears not to have been fully accomplished till 1802; and the road from Brentford Ferry, past the front of the present palace, and across the middle of Kew Green, to Mortlake, was not abolished till 1823, when the west end of the Green was added to the Royal property.

Kent and "Capability" Brown both had much to do with the transformations effected in the grounds now constituting Kew Gardens and the Old Deer Park; the former mainly in construction, the latter in destruction. But most of the remaining old buildings were erected from the designs, and under the superintendence of Sir William Chambers, notably the orangery (now museum of timbers), the temple of the sun, under the spreading branches of the noble Cedar of Lebanon, near the main entrance, and the pagoda in the pleasure-grounds.

Immediately to the south of the temple of the sun stood a range of hot-houses (also designed and built by Sir W. Chambers), heated by flues, and having tan beds in the centre. These were lean-to buildings, with gardeners' rooms, potting-sheds, &c., at the back, and a glass-covered border in front for tender bulbous plants. The large Wistaria, on a circular trellis near the present cool Fern-house, covered a portion of the building behind the glass-houses. This block of buildings was removed in 1861, or 1862, after the

completion of the Temperate-house, having stood just a century. During the short period the writer knew these houses, they contained South African and Australian hard-wooded plants. The orangery at the same date was used in winter to house the larger plants from the same regions. Most of these buildings were erected between 1755 and 1761, and they were substantially though quickly built. Even the pagoda, which is a good specimen of brickwork, about 160 feet high, was completed in a year, having been commenced in the autumn of 1760, and completed in the spring of 1761.

Notable among the other structures that have disappeared altogether were the mosque, alhambra, gallery of antiquities, cathedral, aviary, menagerie, Merlin's cave, and the hermitage. The removal of many of these fancies of a somewhat puerile imagination was a great improvement.

Towards the end of the reign of George II., and at the beginning of the reign of George III., John Stuart, third Earl of Bute, and publisher of the costly *Botanical Tables*, of which only twelve copies were printed, was a sort of honorary director of the Gardens; and a print of the date 1765 shows that the houses on the left, from the church to the main entrance on Kew Green, were much the same then as now; and the Princess Dowager of Wales' residence stood in front, and to the south of the present palace. In 1753, Sir John Hill published the first edition of his *Hortus Kewensis*, of which a second edition appeared in 1759. This catalogue comprises 3400 species under their Linnean names, and of these nearly 500 were 'hardy trees and shrubs. In the spring of 1762, Kew was greatly enriched by the removal of all the Duke of Argyll's trees and shrubs from his famous garden at Whifton, near Hounslow; and it is supposed that the noble Turkey Oak and the majestic Cedar of Lebanon, near the temple of the sun, are remnants of that fine collection.

Sir Joseph Banks succeeded the Earl of Bute as Botanical adviser to the King; and in 1772 the first of the long roll of botanical collectors for Kew was sent to the Cape of Good Hope. This was Francis Masson, one of the under gardeners at Kew, and it was he who, under the liberal administration of that period, introduced the numerous Heaths, Pelargoniums, Mesembryanthemums, and bulbous plants figured in the early volumes of the *Botanical Magazine*, and other illustrated botanical works of the end of the last century. In 1773, the afterwards famous William Cobbett was employed at Kew, having, at the youthful age of eleven, walked from Farnham with only sixpence-halfpenny in his pocket, in order to obtain this coveted position. *W. B. H.*

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM BARBATULO-CHLOROPS, *nat. hybr.*

Dendrobium barbatulum and *D. chlorops* are both natives of the Deccan Peninsula, and are known to grow together in certain localities in the Concan, if not elsewhere. Though closely allied, they are abundantly distinct in many particulars. *D. barbatulum* has white flowers, with an acute mentum, several rose-purple stripes on the side-lobes of the lip, and a tuft of loose yellow hairs on the disc in front of the bidentate crest. *D. chlorops* has cream-yellow flowers, with far more spreading, or even reflexed segments, a shorter and blunter mentum, the side-lobes of the lip and base of the front-lobe green, a broader crest, and much shorter hairs in front of the same. A form has now appeared in the collection of Major-General E. S. Berkeley, of Spetchley, Bitterne Park, Southampton, which so neatly combines the characters of the two species,

that I have no doubt it is a natural hybrid between them. The flower is white, and has the shape of *D. barbatulum*, yet all the segments and mentum are shorter than in that species, and the latter organ more blunt, as in *D. chlorops*. The side-lobes of the lip are also wholly light green, and the crest broader, as in the same species, but the tuft of hairs closely resembles *D. barbatulum*. Briefly, it may be described as *D. barbatulum*, a little modified in shape, with the crest and side-lobes of the lip of *D. chlorops*. Good specimens of both the parent species from the same collection enables these characters to be easily traced. Its appearance is very interesting, as *D. crassinodi-Wardianum* is the only other undoubtedly natural hybrid known in the genus.

These two species, and the allied *D. Fytchianum*, Batem., were formerly somewhat confused, but the blunders were afterwards rectified. Unfortunately, at p. 136, Dr. Kränzin once more confuses them, *D. barbatulum*, Wight, *Loves*, t. 910, is *D. chlorops*, Lindl., not *D. Fytchianum*, Batem., which it is not too much to infer Wright never saw, as it is a native of Burma. It is the Burmese representative of the South Indian *D. barbatulum*, and chiefly differs in its larger flowers and rose-purple side-lobes of the lip. Wight's figure is unmistakable, if not very artistic, and his type specimen removes the last fragment of doubt. Since the above was written, Major-General Berkeley informs me that he has seen *Dendrobium barbatulum* and *D. chlorops* growing together in hundreds. *R. A. Rolfe*.

LYCASTE SEINNERII MR. F. L. AMES.

This has noble flowers of the typical form, and it may be likened to an enlarged representation of the best variety of *L. S. alba*, but with a slight bluish hue on the sepals, and with rich crimson feathering up the margins of the petals. The front lobe and outer margins of the side-lobes of the lip are bright ruby-red, and the calyx yellow. It flowered with Messrs. Sander, James O'Brien.

WESTONBIRT.

THIS, an illustration of which we reproduce (see p. 299), is one of the finest seats in the county of Gloucestershire, and was the country residence of the late R. S. Holford, Esq., whose recent death we announced in our last issue. Mr. Holford took great interest in his garden, which, under the management of Mr. A. Chapman, is kept in excellent order. A full description of the place was published in the *Gardeners' Chronicle* for July 9, 1881, to which we refer our readers for further particulars.

CROSSES AND CROSSING OF PLANTS.

(Continued from p. 267.)

HYBRIDS RARE AND UNSTABLE.

Another theoretical point borne out by practice is, that because of the great difference between parents, pronounced hybrid offspring are unstable. Again, because of the unequal and unknown powers of the parents, we can never predict what characters will appear in the hybrids. This fact was well expressed by Lindley a half century ago, in the phrase, "Hybridising is a game of chance played between man and plants." The characters of hybrids as compared with the characters of simple crosses between stocks of the same variety, are therefore ambiguous, negative, and often prejudicial.

The difficulties in the way of successful results through hybridisation are, therefore, the difficulty of effecting the cross, infertility, instability, variability, and often weakness and monstrosity of the hybrids, and the absolute impossibility of predicting results. The advantage to be derived from a successful hybridisation is the securing in combination the most desirable features of both parents; and this advantage is often of so great moment that it is worth while to experiment in the face of numerous failures. From theoretical considerations, it is apparent that hybridisation is essentially an empirical subject, and the results are such as fall under the common denomination of chance. And as it does not rest upon any legitimate function in Nature, we can understand that it will always be difficult to codify laws upon it.

Among the various characters of hybrid-offspring, the most prejudicial one is their instability. It is difficult to fix any particular form which we may secure in the first generation of hybrids; and, therefore, we find that the great majority of the best hybrids in cultivation are increased by bud-propagation, as cuttings, layers, suckers, buds or grafts. In fact, there are few instances of undoubted hybrids which are propagated with practical certainty by means of seeds.

This simply means that it is difficult to fix hybrids so that they will come "true to seed," and makes

the subject. In Pears, there is the Kieffer class. In Apples, Peaches, Plums, Cherries, Gooseberries, Blackberries, and Dewberries there are no commercial hybrids. The Strawberry is doubtful. Some of the Raspberries, like Caroline and Shaffer, appear to be hybrids between the red and black species. Hybrids have been produced between the Raspberry and Blackberry by two or three persons, but they possess no promise of economical results. Among all the list of garden vegetables—plants which are propagated by seed—I do not know of a single authentic hybrid; and the same is true of Wheat

severely for a chance to live, and even then only the very best can persist, or are even allowed to try.

POPULAR MISCONCEPTIONS.

This list of hybrids is much more meagre than most catalogues and trade-lists would have us believe, but it is approximately near the truth. It is, of course, equivalent to saying that most of the so-called hybrid fruits and vegetables are myths. There is everywhere a misconception of what a hybrid is, and how it comes to exist; and yet, perhaps because of this indefinite knowledge, there is a wide-

FIG. 41.—WESTON COURT, THE RESIDENCE OF THE LATE R. S. BOLFORD, ESQ. (SEE P. 298.)

apparent the fact that if we desire hybrids we must expect to propagate them by means of buds.

Let us now recall how many undoubted hybrids there are, named and known, among our fruits and vegetables. In Grapes there are the most. There are Rogers' hybrids, like Agawam, Lindley, Wilder, Salem, and Barry; and there is some reason for supposing that Delaware, Catawba, and other varieties are of hybrid origin. And many hybrids have come to notice lately through the work of Munson and others. But it must be remembered that Grapes are naturally exceedingly variable, and the specific limits are not well known, and that hybridisation among them lacks much of that definiteness which ordinarily attaches to

—unless the Carman Wheat-Rye varieties become prominent—Oats, the grasses, and other farm crops. But among ornamental plants there are many; and it is a significant fact that the most numerous, most marked, and most successful hybrids occur in the plants most carefully cultivated and protected—those, in other words, which are furthest removed from all untoward circumstances and an independent position. This is nowhere so well illustrated as in the case of cultivated Orchids, in which hybridisation has played no end of freaks, and in which, also, every individual plant is nursed and coddled. For such plants the struggle for existence is reduced to its lowest terms; for it must be borne in mind that even in the garden, plants must fight

spread feeling that a hybrid is necessarily good while the presumption is directly the opposite.

There is an old yet common notion that there is some peculiar influence exerted by each sex in the parentage of hybrids. It was held by certain early observers, of whom the great Linnaeus was one, that the female parent determines the constitution of the hybrid, while the male parent gives the external attributes, as form, size, and colour. The accumulated experience of nearly a century and a half appears to contradict this proposition. There are instances, to be sure, in which this old idea is affirmed, but there are others in which it is contradicted. The truth appears to be, that the parent of greater strength or virility makes the stronger im-

pression upon the hybrids, whether it is the staminate or pistillate parent. And it appears to be equally true that it is usually impossible to determine beforehand which parent is the stronger. The common little Pear-shaped Gourd will impress itself more strongly upon crosses than any of the edible Squashes and Pumpkins with which it will effect a cross, whether it is used as male or female parents. Even the imposing and ubiquitous great field-Pumpkin is overpowered by the little Gourd. Seeds from a large and sleek Pumpkin, which had been fertilised by Gourd pollen, produced Gourds and small hard-shelled globular fruits which were entirely inedible. A more interesting experiment with the handsome green-striped Bergen Fall Squash showed a similar propensity of the Gourd.

Uncertainty follows hybridisation, and uncertainty also attaches to the mere act of pollination. Between some species, which are closely allied, and have large and strong flowers, four-fifths of the attempts at cross-pollination may be successful, but such a large proportion of successes is not common. Even the most expert operators fail as often as they succeed in promiscuous pollinating. In my own experience, 234 pollinations of Gourds, Pumpkins, and Squashes, mostly between varieties of one species, and including some individual pollinations, gave 117 failures and 117 successes. But from all the 117 fruits, for some of them turned out to be seedless, and some were destroyed by insects before they were ripe, or were lost by accidental means, a few more than half of the successful pollinations—if by success we mean the formation and growth of fruit—really secured us seeds, or but one-fourth of the whole number of efforts, and this was considered a successful experiment. Referring to a record-book where experiments were made with many species, I find that a total of 312 efforts resulted in 89 successes, 223 failures.

And now the sum of it all is this: Encourage in every way crosses within the limits of the variety and in connection with change of stock, expecting increase in vigour and productiveness. Hybridise if you are curious to know what Nature will do about it, but do it carefully, honestly, thoroughly, and do not expect too much. Extend Darwin's famous proposition to read like this: Nature abhors both perpetual self-fertilisation and hybridisation. *Prof. L. H. Bailey, Massachusetts.*

MODERN MELON GROWING.

Nor only has the modern mode of constructing and heating horticultural buildings made Melon-culture an easy matter, compared to what it formerly was, but it has lengthened its season; and although good fruits are produced in hotbed frames at the present day, the system of heating by hot water is preferred even for the midsummer fruiters, and it is indispensable for very early or very late crops. The form of a Melon-pit or house may be either span-roofed, half-span, or lean-to, the last being, perhaps, the most useful form for early and late crops; but all Melon-pits should be furnished with side and top ventilators, and adequate heating for both top and bottom, tree leaves being the best of materials for forming the bed over the hot-water pipes.

The seed should be sown in fine light soil, which should be moist enough to allow of the germination of the seeds without affording it water, two seeds being placed in a 60-pot, which should be plunged in a hot-bed having a warmth of 75°, a sheet of glass being placed over the pots till the plants appear above the mould; the weaker plant in each pot should be pulled up in three or four days. The temperature of the frame may range from 60° to 65° at night, and 70° to 75° by day, with the usual rise during sunshine, air being carefully admitted when it reaches 80° through a bit of muslin in cold weather, and the amount regulated in accordance with the prevailing weather. The glass must be kept clean, so that the light is unobstructed, and when the plants have formed the second true leaf, they should be shifted into 6-inch pots, or, better, planted in the Melon-bed about 2 feet 6 inches asunder. The soil of the bed should be formed in a narrow ridge, and may consist

of rough strong loam, mixed with a little leaf-soil, and made quite firm by ramming. Plant when the soil has got warmed throughout, and keep the plants rather high—not sinking the roots deep in the soil, which should be firmly pressed about the roots Finish with a light watering of tepid water. Under proper management, rapid progress will be made, and a moderately moist atmosphere must be maintained by syringing the plants, and damping dry surfaces in favourable weather, morning and afternoon, while proper attention must be paid to watering the soil. Keep each plant to one stem, which must be secured to the trellis as it lengthens, and stopped (that is, the point removed) when it has reached 4 feet in length, the laterals being also stopped at one joint beyond the fruit when the latter is set, and the superfluous shoots cut off, to prevent crowding. As the female blossoms expand, their fertilisation must be attended to, if possible that of a dozen or so at one time, and a moderately dry temperature maintained until they are safe, which is determined by their commencing to swell freely. Once the fruit have attained half-size, the plants may be afforded diluted liquid manure. I prefer stable-yard water, or one made from sheep's dung. Top-dressings of a soil like that of the bed should be applied when found necessary, that is, when the roots show on the surface. When the fruit approaches the ripening stage, ventilation should be increased in volume, a warm temperature maintained, with less atmospheric moisture. Melons on trellises must have the fruit suspended with strips of raffia, and it should be gathered immediately cracks are observed round the stalk. Pot culture of Melons answers well for early crops, but I do not practise it, and generally gather good fruit in the last week of April, from beds. Hero of Lockinge, Blenheim Orange, The Countess, and Sutton's Triumph are excellent varieties.

Red-spider, which is sometimes troublesome, may be prevented doing much harm by using the syringe freely. Black aphid, however, when allowed to get a footing, is more formidable, but this insect can be eradicated by repeated syringings with strong tobacco-water. Canker, which shows itself near the bottom of the stem, generally arises from a too-free use of manures, or a close moist atmosphere in the pit, together with a low temperature. As a preventive, these evils should be guarded against; also the lateral shoots which spring from the base of the stem should be rubbed off when young, thus allowing sun to reach the stem, and a continuous circulation of air admitted by means of the front ventilators, and in such a way that it comes in contact with the hot-water pipes before it reaches the plants. Once a plant is affected with canker, the place should be dressed with quicklime, and then covered with a heap of charcoal-dust. *Thomas Coomber.*

THE POTATO CROP OF THE WORLD.

It is quite remarkable, says the *American Agriculturist*, that the crop of Potatoes should be as universally good in 1891, in the countries of chief production, as it was poor in 1890. The results of a special investigation, conducted with the co-operation of the various agricultural and statistical departments, may be briefly summarised as follows:—

UNITED STATES.

More Potatoes were grown in 1891 than in any previous year. The returns make the average yield nearly 94 bushels per acre. This indicates a crop of 244,697,000 bushels. The warm weather of September dried the soil, and checked the incipient Potato rot, which was threatened after the rains of August, so effectually, that it is scarcely reported. The yield was everywhere good, but the comparatively small average in the north-west makes the market in that section better than in cities nearer the principal sources of supply.

CANADA.

This Dominion yielded a magnificent crop, the

following table showing the acreage, the total produce, and the quantity per acre for each section:—

District.	Area under Crop.	Total Crop.	Per Acre.
	Aeres.	Bushels.	Bushels.
Prince Edward Island ...	43,164	6,690,420	155
Nova Scotia ...	65,492	7,859,040	120
New Brunswick ...	51,100	6,694,100	131
Quebec ...	125,000	15,125,000	121
Ontario ...	160,218	20,347,688	127
Manitoba ...	12,457	1,868,550	150
British Columbia ...	9,000	1,305,000	145
Territories ...	2,600	220,000	110
Total ...	485,431	69,109,796	129

BRITISH ISLES.

Ireland had a little over 753,000 acres under Potatoes in 1891; England, Wales, and Scotland, had 532,794 acres, a total of 1,285,854 acres. This was a slight increase over the previous year. The total crop exceeded 235,000,000 bushels, which is a full average yield, and much above the harvest of 1890. The crop at one time was seriously threatened with disease, but better and drier weather arrested the rot, and the crop was harvested in good order. It was these reports that gave the impression in America of widespread disaster to the Potato crop in Ireland; whereas the harvest there yielded more tubers than have been gathered in any year since the famine of 1846. Scotland also had a large out-turn of Potatoes, and the English crop, while poor in some sections, was, on the whole, well up to average.

FRANCE.

Potatoes turned out rather below the average on a slightly increased area, some 3,621,800 acres. The yield varied widely, from 50 to 235 bushels per acre. The average may, however, be placed at 100 bushels per acre, against 109 bushels in 1889, and 106 bushels the year previous. This gives a total crop for the past season of 362,188,000 bushels.

GERMANY.

This is the greatest Potato-producing nation in the world. Her crop of 1889 was five times larger than that of the United States. Prussia alone, in 1891, gave 692,000,000 bushels, against 629,000,000 bushels in 1890, and 758,112,616 bushels as the average for the past ten years. The Potato area of the whole German Empire the past year is placed at 7,217,458 acres, producing an average of 125 bushels per acre, and a total crop of 887,747,334 bushels.

AUSTRIA.

The Potato crop is 50 per cent. greater than that of the United States in average seasons, and the past year was no exception to the rule, as it exceeds last year's crop of 302,204,000 bushels, but did not reach the great product of 1889, which was nearly 332,000,000 bushels.

OTHER COUNTRIES.

Sweden and Norway received a full average product of Potatoes, and neither country will need to import the tubers. Sweden's crop is between 50,000,000 and 60,000,000 bushels, against only 34,942,000 bushels in 1890, 70,735,470 bushels in 1889, and something over 51,000,000 bushels as the average for the preceding ten years.

Along the Baltic Provinces in Russia the crop was so abundant that, in some places, the tubers are used for distilling purposes, the difficulty of transportation to the famine-stricken districts making the movement of the crop to those sections quite slow.

It may be of interest to mention that, from statistics recently collected and published by Dr. J. H. Gilbert of Rothamsted, he found that, of thirteen countries where the Potato is largely grown, their aggregate area under the crop was about 21,000,000 acres, and their aggregate produce about 61,000,000 tons, but not one reached the average produce per acre of Great Britain. Norway, Belgium, and Holland, the most nearly approach our yield, and it is of interest to observe that these and Denmark are the countries that most nearly approach the United Kingdom in yield per acre of Wheat and Barley also. *J. J. Willis, Harpenden.*

A WELL-BLOOMED CYCLAMEN.

Our illustration (fig. 42) shows a Cyclamen excellently flowered, and which was taken from a photograph kindly sent us by Mr. J. M'Ara, gardener at Glassingal, Dunblane, N.B.

THE DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY PARASITIC FUNGI.

[The following extracts are taken from Professor Mowbray's recent lectures at the Royal College of Surgeons. The subject, though somewhat technical, is one of the greatest importance to cultivators of cereals, flowers, and fruit.]

INTRODUCTORY REMARKS.—Foremost amongst the numerous fungi which attack the floral organs are

have become converted into a mass of black dust, so that nothing remains but the rachis; we further find, too, that all the ears given off from the same root are similarly destroyed, so that the total extermination of the Barley plant appears to be only a work of time; but we know for a fact that, although the fungus has been at work for the last two or three hundred years, yet there is more Barley grown now than there ever was. If we take the case of the Oat plant, which is similarly liable to smut, it appears a little more hopeful for the host-plant, since, although the affected ears are as effectually destroyed, yet we do find, now and again, some of the heads have escaped in part, and are able to produce a small proportion of perfect seeds; indeed, it is not so very rare a circumstance that one is able to find an entire

denied, but it is not the case with the truly parasitic species with which we are at the present engaged. Although the reproductive parasites have no special predilection for weakly host-plants, yet they are, by virtue of their parasitic habit, capable of playing an important part in the evolution of their hosts. This may occur in various ways; to take, for example, a widely-distributed and well-known reproductive parasite, namely, the fungus which produces ergot. Certain grasses are more subject to ergotisation than others; Rye, for instance, is more frequently attacked than Wheat or Barley. The explanation of the relative escape of these two last-named is, that their florets remain open but for a very short time, and as soon as fertilisation has taken place, the feathery styles are withdrawn between the palea out of harm's way. Now it is evident that any variety of Wheat whose styles remained longer exposed, would *ceteris paribus*, be more likely to become ergotised than those varieties in which the florets closed quickly. The more rapidly fertilised varieties, by escaping the disease, would be more likely to perpetuate themselves, because they would produce more healthy seed. Those individuals least susceptible to unfavourable conditions of the weather at the time of blooming, such as rain or absence of sunshine, would be the most likely to mature perfect seed. Now it so happens that certain varieties of Wheat are much more liable to ergotisation than others; for example, the bearded variety, called Rivett's Wheat, is almost always ergotised when it is grown in fields surrounded by ditches.

The smut fungus just alluded to, like many others, is capable of gaining admission into the tissues of its host only during a very limited period of the plant's life, namely, between the time the seed germinates and before its first green leaf is put forth, so that those individuals which grow most rapidly during this stage of their existence stand by far the best chance of escaping the disease. There are other ways, however, of which these reproductive parasites are capable of influencing the growth of these host-plants other than by their action upon the rapidity of fertilisation or germination, which, after all, may be only an exceptional mode of action confined to a small number of species. Take the very obvious one of their action upon the local distribution of the individuals of a given species. Their general tendency is to prevent the segregation of individuals, and to favour the wide distribution of the host-plants in a given district. As a matter of experience, when a botanist desires to find any particular parasitic fungus, he knows that his best chance of finding it is to go where the host-plant grows in the greatest profusion, and that his chance of meeting with the parasite is much diminished if he has to search for it in a district where the host only occurs in a scattered manner: although the same number of host plants be examined in both cases.

Let us consider the influence which such a reproductive parasite as *Tilletia* has upon the distribution of its host-plant. In this case the fungus is developed in the interior of the seed, which it totally destroys, so far as its reproductive function is concerned, but the parasite has no further baneful action on the plant. The fungus can only gain admission into the tissues of the host-plant effectively during a very limited portion of its existence, namely, between the time the seed has germinated and emitted the young plant, and the time that the first green leaf appears. Before the seed germinates it cannot enter, and after the first green leaf has appeared the fungus cannot infect the host-plant. It is necessary that the spores of the fungus should be in close proximity to the seed, because they have no power of locomotion, and it is also essential that they should germinate at the exact time that the seed germinates. Practically, it amounts to this: that the *Tilletia* spores must be on the seed and germinate with it. Now the seeds of the Wheat-plant are enclosed in the chaff, and are thus protected in great measure; until the seed matures and falls to the ground it is practically safe. The *Tilletia* spores too are contained in a capsule formed from the external coverings of the ovule,

FIG. 42.—CYCLAMEN GROWN BY J. M'ARA, GLASSINGAL, DUNBLANE N.B.

the Ustilaginæ, although the Discomycetes, the Pyrenomyces, the Peronosporæ, and several others, each afford their quota. The peculiarity of this site for parasitic attack is in itself remarkable, inasmuch as it is evident that the parasite tends not only to injure the particular individual it has attacked, but also to exterminate its host-plant altogether. This suicidal tendency is, however, more apparent than real, as there are several collateral circumstances which require to be taken into account; we shall then see the danger of self-extermination is but a remote contingency as far as the fungus is concerned.

In the first place, the total destruction of all the seeds upon a given plant by a reproductive parasite seldom occurs. The well-known smut of our cereals, the old Ustilago carbo, may be taken as an instance. It is true that in looking at an affected Barley plant we find the whole ear destroyed, all the floral organs

ear on an affected plant which has escaped the disease entirely.

INDIRECT EFFECTS OF THE REPRODUCTIVE PARASITES ON THEIR HOST-PLANTS.

The influence of these reproductive parasites on the economy of Nature must be of necessity very great, acting, as they do, upon the "origin of life" of their host-plants, in limiting the number of embryos by which the stock of the host is maintained. It is a widely-spread but incorrect notion, that parasitic fungi are more prone to attack debilitated or sickly plants than healthy ones; were this the case, the action of parasitic fungi generally, and of the reproductive parasite in particular, would be directly advantageous to their hosts collectively, by weeding out from them the weakly individuals, and so leaving only robust ones to reproduce themselves. That some such process takes place in the economy of Nature through the instrumentality of fungi is not

and are not free to be blown about until this capsule ruptures, which does not happen in a state of Nature until after the Wheat seeds are matured. It is, then, only in those cases where both the seed and the bunted grains have fallen to the ground in proximity to one another, that there is a chance of the parasite infecting its host. Of course, we are now considering the case of an uncultivated plant, as in the artificial process of threshing the bunts get broken, and the whole of the seed dusted with their spores. Neither do the admirable researches of Brefeld, who has shown that bunt spores are capable of growing in the excreta of herbivorous animals, and of reproducing themselves aseptically, materially affect the question, because, however interesting these observations may be, and however important, as giving us a fuller knowledge of the life-history of the fungus, yet we find in this country, as a rule, bunt can be prevented by applying to the seed-corn certain chemical substances (of which the most efficacious is copper-sulphate), which have the power of killing the fungus-spores, but not injuring the Wheat; whereas, if bunt was spread through the agency of animal excreta, such dressing to the seed would be practically useless.

From the above, it is evident that the more scattered individual plants are, the better will be their chance of escaping the disease. A very striking instance of this came under notice during the past autumn: In a wood near Doncaster, during an excursion of the Yorkshire Naturalists' Society, a species of bunt new to Britain was discovered on *Holcus mollis*. The host-plant was common all through the wood in scattered patches, but they were all free from disease, excepting one large plot of the grass, extending over many square yards, in which every plant was diseased and incapable of reproducing itself by its seed. The above is only a single instance amongst many which could be quoted as evidence that the reproductive parasites tend to cause segregation of their host-plants.

(To be continued.)

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILLNER, *Gardener, Peirce Gardens, Swanes.*

EUPHORBIA JACQUINIÆFLORA.—When well grown, this plant is one of the best winter flowers that we have. I sometimes hear complaints of its being a plant difficult to propagate; but if the cuttings are taken off, and treated in the following manner, no difficulty will be found in rooting them. Plants which flowered towards the end of the past year, and have been kept in the stove, will have thrown out a quantity of shoots from the main stems, and when these have attained some 4 or 5 inches in length, they should be taken off with a small portion of the firm wood attached, removing a few of the lower leaves, and placing them on a clean board for about two hours, so as to allow the milky sap to escape before inserting them in the cutting pots, but take precaution to cover the cuttings with hand or bell glasses to prevent them flagging. The most suitable size pot for them is a 4-inch, and in preparing them, place one fair-sized crock at the bottom, and then some smaller crocks over it, and then a little moss, so as to prevent the compost getting amongst the crocks. Then prepare a compost of sifted loam two parts, leaf soil one part, and one of sharp sand, and well incorporating these. The pots should be filled partly with the prepared compost, and the remaining portion with sharp clear sand. Place from four to five cuttings in a pot, afterwards shifting them into larger pots as required, without dividing the plants. The cutting pots should be placed in a structure having a night temperature of 75°, with a proportionate rise by day, and covered with hand or bell glasses. Keep the sand moist, and take precautions not to let the cuttings flag, and during bright sunshine the cuttings should be shaded with some light material; and when rooted, the plants should be ventilated for a few days by lifting the covering of glass before removing it; otherwise the plants will receive a check, which should always be avoided. The plants should be grown in a light position close to the roof-glass, and lowered occasionally as growth

proceeds. If it should be desired to have the plants dwarf and bushy, they may have their points pinched out when they have made about 15 inches of growth, but if potted-on, without disturbing the young plants, they have a more graceful appearance when in bloom, than if stopped during growth. When the required number of cuttings have been struck, last year's plants may be shifted into pots one or two sizes larger than those previously occupied, taking care to disturb the roots as little as possible in removing the loose soil from around the ball; these plants may have the same kind of treatment as that recommended for the young stock.

TENDER ANNUALS.—No time should be lost in preparing a hot-bed for raising from seeds the different varieties of annuals used in furnishing the conservatory and greenhouse in summer and autumn, and in having the required number of seed-pots and boxes got in readiness. A good kind of compost for the different varieties, consists of two parts rich loam, one each of decayed manure and leaf-mould, with a free addition of silver sand, all of which should be passed through a fine sieve. The seeds should be sown thinly and evenly over the surface of the soil, covering them very lightly with the fine portion of the compost; afterwards placing a sheet of glass over each pot or box, and over the glass a little damp moss to be removed when germination has taken place, and the glass lifted for a few days, before removing that. The hot-bed may have a bed of half-decayed leaf-mould, fine coal-ashes, or cocoa-fibre refuse, in which to plunge the seed-pots. When the seedlings are large enough to be handled, they should be pricked off, or potted into small pots, and grown on in a light position near the glass, taking precautions to shade during bright sunshine. The above remarks apply to *Coleus*, *Petunias*, *Cyclamens*, *Cockscombs*, *Globe Amaranthus*, *Balsams*, *Lisianthus Russellianus* (a biennial), *Torenia*, &c.

TEMPERATURES AND SHADING.—At the present time, and all through the coming period of changeable weather, great care is required in giving air. When the weather is bright, the ventilators of the stove should be closed at 2 P.M., so as to husband as much sun-heat as possible, and all available surfaces dampened, so as to create humidity; and *Allamandas*, *Clerodendron Thompsonianum*, and *Stephanotis floribunda*, should be gently syringed with tepid water. The night temperature of the stove may be kept at from 65° to 70°, according to the state of the outside temperature, with a rise of 10° to 15° by day. Examine and make good all defects in glasshouse shadings, and get all the rollers put into good order, so that when bright days do come these shadings will be in readiness.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, *Gardener, Barham Court, Maidstone.*

PROTECTING THE BLOOM OF WALL FRUIT TREES.—Fruit trees of most kinds, especially Peaches and Nectarines, are now showing signs of being about to recommence growth. If a little examination be made, it will be noticed that the bloom buds are plumping up, telling us that a critical time for the trees is at hand. I would advise that this subject should receive full attention from the gardener, as much will depend on bloom protection being afforded at the right time. One often sees good results obtained by the use of very simple and inexpensive contrivances. Fish netting, when doubled and fastened at the top of walls, and by the aid of poles kept away from the blossoms during gusty weather, is a very good protector, and much better than Spruce Fir branches; but if the latter must be made use of, they should be tied thinly to light hurdles or poles placed in a slanting position from the top of the wall, which will allow of a good circulation of air between the branches and the fruit trees. After several years experimenting with the latter, and other cumbersome methods, I have now adopted the following: If there is a coping on the wall, a wire should be strained from end to end, and at intervals of about 9 feet some staples should be driven into the face of the wall to support it. At 5 feet away from the base of wall, and 15 feet apart, stout poles should be sunk into the earth; the two end ones having struts to make them more secure. Upon these another wire strained lengthwise of the wall. If the wall be 10 or 12 feet high, these stakes should not stand more than 5 feet out of the ground. The distance between the two wires will give the width of material required. In the case of a lower wall than 10 feet, the material need not be so wide. The netting is best fastened to the wires by means

of twine and a thin packing-needle. This kind of protection should not be put up until it is ascertained that one or two blooms are expanded. The protection should be very light and airy—what we use is Eddy's of Portleven, Cornwall, No. 3, recommended for this purpose, some of which we have had in use for the last four years. This material can be kept up for four or five weeks according to the state of the weather, and no harm will be done. The posts are left in from year to year, and to these Tomatoes are fastened.

RE-GRAFTING TREES.—Trees intended to be re-grafted should be headed back to about 3 or 4 feet, above a point where the main stem becomes forked, a few of the very small branches being left untouched to draw up the sap until such time as the grafts have got well into growth, when they should be removed. Old worn-out trees cannot be renovated by heading back and grafting, and if it be done, it is usually a waste of time and labour, and young trees are better grubbed up to make room for such ones.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

TRANSPLANTING BORDER CARNATIONS.—Next week we shall plant out our Carnations from the beds in which they were layered last August, in rows 1 foot apart, and at the same distance from plant to plant in the rows, also in patches of three, set on triangularly at 7 or 8 inches apart in the herbaceous borders. Prior to planting, the ground is dressed with soft manure, digging and breaking the soil to a fine tilth; and it is then trodden over and surface-dressed with soot and wood-ashes, which are scratched in with a rake, and the soil made level. This dressing will save the plants from being attacked at the roots by wire-worm and various kinds of grubs. In planting these rooted layers, lift them with good balls of soil and roots; and in planting, sink them in the mould as far as the leaves, and make them firm in it. The plants in each succeeding row should be set between the plants in the preceding row. This mode of setting them out, in addition to giving them more space for growth than would be the case if set opposite each other in the rows, looks better; the plants, if set out with precision, being in a line the whole length of the border, viewed from any standpoint.

GLADIOLUS.—The present is a good time for planting the corms of the Gladiolus, which may be done either in beds by themselves, or in irregular patches in the herbaceous borders, letting the corms into holes made with a dibber, about 3 inches deep and 1 foot asunder, if planted in rows, placing a little finely-sifted rich sandy soil under and over each if the soil is stiff. The best flower-spikes are secured from corms planted in deep sandy loams which are well manured. If the corms are intended to remain in the ground without removal, the holes should be made 2 or 3 inches deeper, which, with a layer of leaf-mould put over them in November, will secure them from frost. Lemoine's hybrids are very effective and hardy varieties of the Gladiolus.

HYACINTHUS CANDICANS.—This hardy bulbous plant, when planted after the manner of Gladiolus, will flower freely, and the tall spikes of drooping bell-shaped white flowers be very attractive. It is a very suitable and showy subject, whether planted in mixed beds in the flower-garden proper, in rockeries, or herbaceous borders.

PROPAGATING VERBENAS, ETC.—Cuttings of *Verbenas*, *Ageratums*, *Lobelias*, *Salvia patens*, *Alternantheras*, and *Mesembryanthemums* should be inserted in 48-sized pots, pans, and shallow boxes, properly drained, and filled with light mould, surfaced with sand. The *Verbenas* and *Ageratums* will do best in pots plunged in a hot bed, and shaded from sunshine for a few days. The other things will do very well in boxes placed in any of the forcing houses.

FRUITS UNDER GLASS.

By J. RIDNELL, *Gardener, Castle Howard, York.*

VINES.—All Vines that have been at rest should now be started by according them the same conditions as those forced earlier, it being important that the current season's growth, as well as the fruit, should be thoroughly ripe by the beginning of the month of September. The means recommended in a former Calendar to be employed for promoting growth in early forced Vines are equally applicable in the case of late ones, and although they will

respond more readily to them now than earlier in the year, a night temperature of 45° will be quite high enough to start with, except in Muscat vineries, which may be 5° higher at the start. Before watering the borders, however, of these late Vines with warm liquid manure, it is advisable to apply a good dressing of quicklime, and lightly fork it into the surface of the same. This will be highly beneficial in the case of borders that have been liberally supplied in former years with strong manures in solid or liquid form.

Young Vines, or those two-years' planted, may have the ends of their canes bent down, and tied to stakes placed in the borders, so that the buds on both sides of the canes shall break evenly and regularly. Clear out any hotbeds that may be in the vineries, and carefully prick up the surface of borders where the Vines are bursting into leaf, and maintain a minimum temperature of 55° to 60°, with humidity in the house in bright weather. Keep the young shoots tied down almost daily of those approaching flowering, and stop any shoots which may have attained the desired length, removing all sub-laterals, or stopping them at the first leaf. At this stage a night temperature of 60°, rising to 65° when they are in full bloom, should be aimed at, and less moisture used about the vinery. Assist shy-setting varieties of Grapes by distributing over the bloom when expanded the pollen from the Black Hamburgs, or other free setters, and cut off all bunches of the latter not required. When a good set of all the shy-setting varieties has been secured, cut off the superfluous bunches, endeavouring at the same time to spread the crop evenly over the Vine, and let the fruit be borne by the stronger laterals, although the bunches on them may not be the largest, weakly shoots often making the best show at first, but lacking the power to perfect it, the bunches remain small. When the berries have become as large as small Peas, thinning may commence, and the number to be cut out of each bunch will depend on the varieties and the strength of the Vines, and the number which have set properly. Such Grapes as Duke of Buccleuch and Madresfield Court Muscat have large berries, compared with the Black Hamburg; consequently, they require to be more severely thinned, if the set has been good. The minimum temperature at this period and until they are ripe should be 60°, with a maximum of 80°; but rather than admit a large volume of cold air, allow it to rise somewhat higher, and keep the atmosphere moist. See that the borders do not lack for water, and when they are found to be getting dry, give a dressing of superphosphate and then liquid-manure.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

MAIN CROP ONIONS.—No time should be lost after the land once gets dry enough to work, in sowing the main crop of Onions. Much time will be saved in the preparation of the land if it has been frequently stirred, so as to expose the upper portion to weather influences; it will in that case be in condition early in March, the weather being dry. If a large breadth of Onions be sown, the making of beds may be omitted, and a row may be missed in sowing the land, which will make an alley wide enough for all purposes. This may be every sixth row if a 12-inch interval is allowed between the rows. Much will depend on the quality and nature of the soil as to the space to allow, and the position in all cases should be an open one; in fact, Onions should have one of the best quarters in the garden, and it should have been well dunged and deeply dug, and dressed with lime, soot, and charred rubbish. In ground that is infested with maggot I have used gas lime with advantage, spreading on the ground in the autumn, but I cannot advise its use just previous to sowing the seed; although soot, guano, and wood ashes may be so used without disadvantage. Where the Onion maggot is usually troublesome, the drills, as they are drawn, should receive a good dressing of wood ashes and soot; then the seed should be sown and covered with the staple and some burnt earth or wood ashes, finally smoothing the rows with the back of the rake, and treading the soil evenly all over or rolling it. Our soil being of a light nature it is trodden before the sowing takes place, and also made firm afterwards by rolling. It is the only way in which we get bulbs with a small neck. In heavy or clayey soil treading and rolling are not so very necessary precautions, but merely firming it with the back of the spade or with a light wooden roller after the drills have been filled in with some lighter material. Much may be done to assist the

crop during early summer with dressings of guano, soot, and common salt, one or all put on in showery weather—in fact, a dressing will often check the ravages of the maggot in its early stages. Those who grow Onions for exhibition purposes should grow such varieties as Atlas Craig, Roussham Park, and some others of that type, but these require, in a general way, sowing in heat at an earlier date. For the crop for early use there is none better than Veitch's Main Crop, and for late supplies take Bedfordshire Champion and James Keeping.

PARSNIPS.—Few words are necessary with regard to the culture of this root. A piece of ground deeply dug, and which was heavily manured for the previous crop, should be chosen and prepared similarly as for Onions. Fresh manure, especially if it be that of animals, tends to produce forked roots and decay of the crown of the root; and a dressing of soot or guano is better than animal manure, if the ground has not been specially prepared. Sow the seeds in drills and in patches of four or five seeds at 18 inches apart, treading the ground or raking the drill over, sow as soon as possible some of the Hollow-Crowned or The Student, the former for large roots, the latter for good flavour.

CARROTS.—Some seeds of the Early Scarlet Short Horn or the Early Nantes should be sown on a warm border to afford an early supply in great quantity. It is not generally necessary to sow a large quantity of seed, as these are only required for summer use. For sowing the main crop the first half of the month of April will be sufficiently early.

TURNIPS.—These may now be sown with every chance of getting good returns, but February sowings often run to seed without bulbing. A heavier soil than that advised for Carrots may be selected for this crop. Our best early Turnip last year was the Early Milano, a quick-growing plant, coming into use ten days to a fortnight before any other. To follow this sowing a fortnight afterwards, Early Whitestone should be now sown, and Veitch's Red Globe for a main crop sowing. This last-named is one of the best Turnips grown, and an excellent keeping root.

GREEN CROPS.—A portion of a warm border should be got ready for the first sowings in the open of Brussels Sprouts, Cabbages, Autumn Giant Cauliflower, and Savoy, and not sowing much seed at this time, as ground may not be at liberty for planting out these plants till the early Potatoes are dug up, and to keep the plants in the seed-beds is to court failure; where that is the case, sowings had better wait till April. Borecole and Broccoli should be sown not earlier than the first week in April and the middle of May. Lettuces should be sown fortnightly after the middle of the present month, and if this be done with regularity up to August the supply of heads for use will not fail. I prefer sowing in drills after April has come in, and sowing thinly and thinning-out the seedlings to 1 foot apart; but early in the year and in the autumn seed may be sown broadcast. My best Cabbage Lettuce last season was Perfect Gem; Superb White Cos, a closely folding variety, was very useful.

THE ORCHID HOUSES.

By H. A. BURNETT, Orchid Grower, Highbury, Birmingham.

THE INTERMEDIATE-HOUSE.—Plants of *Cymbidium churanum* and *C. Lovianum* will soon be in flower. It may be stated that good yellow loam is the best material in which to grow these species, and the coolest end of the house is the right place for them. *Lycaste plana* and *Odontoglossum cirrosum* also do well in the intermediate-house, and these plants are pushing forth their flower-spikes. *Odontoglossum Edwardi*, *O. Harryanum*, *Oncidium macranthum*, *O. Leopoldii*, and many *Lycastes* succeed in it at the cooler part; whilst *Vanda suavis*, *Arides Lindenianum*, and *A. Fieldingii* are at home at the warmer part, and in a spot where light is abundant. The flower-spikes of these plants will be more or less advanced at this period, and must be protected against the depredations of slugs.

CATTLEYA-HOUSE.—The method of growing Orchids on blocks of wood has long since been superseded by the employment of pots, pans, and baskets, and rightly so, I think. A block may seem to some persons to be a natural thing for an Orchid to grow upon, but it seldom does well on one for any great length of time, it becoming exhausted, owing, doubtless, to the great fluctuation of dryness and moistness and temperature felt by the plant; and, the root being exposed, it suffers more than would be the case if it

were in a compost, or standing among crocks, &c., as then the roots are protected from fluctuations. However, there are a few species, notably *Cattleya citrina*, which seem to require a block; but even for this Orchid, some growers prefer a small pan, and let the new pseudobulb creep over the rim, and grow downwards; but be it grown in a pan or on a block, the cultivation of this Orchid is at times difficult, though it grows very freely when first imported. It must be suspended near the roof in a sunny position. I grow it here in the Mexican-house during summer, in company with those mentioned in a previous calendar, and in the Cattleya-house during winter, when it makes growth, and requires more heat than at other times.

WATERING AND TEMPERATURES.—Much uncertainty is sometimes experienced in respect to watering of Orchids, and plants suffer either by reason of being afforded too much, or of not getting water enough; but now that the season of active growth is at hand, it will not be easy to err in this direction, if water be afforded the plant when it needs it, just as with any other plant. This may be known by the compost in which the plant is growing looking whitish; although there are a few exceptions, for instance, care must be exercised in the case of *Dendrobium*, as moisture applied at the roots injudiciously, or lodging in the axils of the young breaks, is apt to cause the plants to damp off. We are placing our *Dendrobium* in one house, and giving them a gentle rise of temperature, and increase of moisture on the path; 60° to 70° will suffice at present. All plants that have flowered should be re-potted if necessary, using pots small in proportion to the plants, as *Dendrobium* dislike a large mass of material round their roots. The *Phalenopsis* are now starting into growth, and must have warmth and moisture; 65° by night, to 75° by day will suffice. The cool and intermediate houses will require but little more warmth than that recommended in January.

ORCHIDS IN FLOWER.—*Cattleya Trianae*, and the variety *alba*, are now attractive, as also are *Lycaste Skinneri alba*, and *Dendrobium*, in great variety. The latter being useful for decorative purposes, are indispensable at this season, and they can be brought on in succession. The stems, however, should never be cut; a more suicidal method can scarcely be imagined. If desired for dinner-table decoration, the flowers may be made to present a natural and graceful appearance by wiring them to small sticks, such as Bamboo-tips.

CONTINENTAL NOVELTY.

VIOLET FRAU HOF GARTENDIREKTOR JÜLKE.

This novelty in Violets, the result of crossing Lee's Queen Victoria Violet with *V. rossica superba*, was brought into commerce in 1890 by H. A. Zeimer, a florist in Bornstedt, near Potsdam. It is said by a correspondent in *Möller's Deutsche Gärtner Zeitung* for January 20, to be the pearl of all hitherto existing varieties of Violets, and to unite the good qualities of both its parents. It is not furnished with runners, and the leaves are of a glittering green colour, which itself must be looked upon as of particular merit. The flower stalk is long, the flowers large, larger than the Russian, the colour light blue, and the fragrance powerful, and in floriferousness it exceeds all other known Violets. Placed in the greenhouse, or in a cold frame in the autumn, it continues to bloom, and if at the end of the month of December or beginning of the new year it can be afforded the warmth of an intermediate house, its season of flowering will be extended into the spring. The time when extra warmth may be afforded the plant must be pretty strictly adhered to, as those plants which are attempted to be forwarded in the flowering at an earlier date seldom unfold their blooms properly. The cultivation of the plant is identical with that commonly pursued with Violets. It is said that this variety will drive out of commerce all others, it possessing every good quality that a florist's variety should have. It is good for forming the once-favourite standard form now so seldom seen in gardens in these islands.

EDITORIAL NOTICES.

LECTURES ON TECHNICAL HORTICULTURE.—As we have advocated the course now being followed for years past, we are naturally interested in its success, and we should be obliged if the several lecturers, in connection with the County Councils, would communicate to us their names, the districts in which they are at work, and a general indication of the method pursued by them.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	MAR. 8	{ Royal Horticultural Society: Lecture on "Plants for Home Decoration;" and all Committees.
THURSDAY,	MAR. 10	{ Brighton and Sussex "New" Horticultural Society.
SATURDAY,	MAR. 12	{ Royal Botanic.

SALES.

MONDAY,	MAR. 7	{ Hardy Plants and Bulbs, Cypridopium spectabile, Tropaeolum tuberosum, Cacti, &c. at Protheroe & Morris' Rooms.
WEDNESDAY	MAR. 9	{ 2000 Roses, Fruit Trees, Liliums, &c., at Stevens' Rooms. Azaleas, Ferns, Roses, 80,000 Cocos Weddelliana Seeds, &c., at Protheroe & Morris' Rooms. Border Plants, Bulbs, Fruit Trees Liliums, &c., at Stevens' Rooms.
FRIDAY,	MAR. 11	{ Disa draconis, D. rosea, and other species; Satyrium, Cattleya Trianae, Odontoglossum Coleata (Linden), and other new and rare Orchids, at Protheroe & Morris' Rooms.

CORROTTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°·9.

Gardening as a Profession.

At a recent meeting at Aberdeen of the North of Scotland Horticultural Association, Sir ARTHUR GRANT, the chairman of the meeting, made some observations on the question of horticultural education which are of special interest at the present time, when this question is exciting so much attention. We may incidentally mention that we have already received several replies to our request for information as to the names of the lecturers employed by the several county councils, and some of them have favoured us with details as to their method of procedure; doubtless, other communications will reach us, and will enable us to give hereafter a general statement on the subject. Meanwhile, the names of the lecturers, so far as we have received them, furnish an ample guarantee that lectures on practical gardening, with appropriate demonstrations, are not going to be the useless things that some people fear. Mistakes are sure to

be committed in a scheme so suddenly brought into practice, but one potent means of avoiding them is to collect and compare information in the way we propose to do. We noticed in the *Gardening World* a paragraph to the effect that there was a proposal to form an association of the lecturers to consider these very points. If such an association be founded, we shall be pleased to be of service to it, and to promote the cause so far as we are able. All this time we are keeping Sir ARTHUR GRANT waiting, so we will at once step aside, and make room for the orator of the evening.

Sir ARTHUR, after a few preliminary remarks, said what he wanted to talk about was the advantages of gardening as a profession to young men rather than about any other point. The prospects of a young man as a clerk were poor in comparison to those who stuck to the country and to gardening. Gardening demanded quite as much education to do it properly as many indoor occupations. It at least developed a young fellow physically a great deal more than any indoor occupations, and it demanded quite as much accuracy of observation. It was absolutely necessary that he should do his work truly and thoroughly. They could scamp a good deal in building, and in nearly every trade, but if they tried to scamp gardening, in a very few months they would be convicted—they might be sure their sins would find them out. Gardening demanded more observation than almost any science or any occupation. It demanded exercises of memory, and it was necessary they should have a good deal of the spirit of order in their minds; and, above all things, they must have their heart in their work, if they wanted to get on as gardeners. In fact, as NAPOLEON said of the art of war—a very different art indeed—the whole thing was just this—being able to do the right thing at the right time, and at the right place. Individual results would not, he dared to say, be always brilliant. It was not given to many men to become Sir JOSEPH FAXTON, one who started from the very smallest beginning, and won a world-wide fame. Not many young men could hope to do that. There were not many great prizes, except to a very few, but the gardener had at least a pleasant outdoor life—a life which could teach him more almost than any other, and he would, even if he had not much money himself, have daily a share of the greatest and purest pleasures which were purchasable by money, and that was, actually living among the beautiful sights, and colours, and arrangements of the garden.

Touching on the prospects of a gardener, Sir ARTHUR gave two instances of the success of young men trained at Monymusk House. One was now employed in India in one of those societies for acclimatising different plants, and trying their scientific and mercantile value, and his salary was £250. The other was engaged in China in the same way, and was soon to go to India; there he was to get £500 per annum. He gave these examples of Scotch boys, born quite close to Aberdeen, growing up, educated, and taking up an outdoor life, and doing as well in that situation as they could possibly hope to have done in many of those indoor employments to which so many young men rushed. He would furthermore say that, besides these two, which were rather good successes in life, a good many had gone from them to America, where there was a great demand for young men who were capable gardeners. They knew that wealth was increasing in America to an enormous extent; and with wealth comes the desire of pleasure, and, to a certain extent, what they would almost call luxury, and there were more situations vacant for young men as gardeners than there were gardeners to fill them in the Eastern States, and where there was a great opening for men to get salaries ranging from £120 to £150 per annum.

He had been asked whether he had any idea to give them as to how they could improve their Society. The only thing that he could say was to increase the scope of the Society, to try and give it a wider

range of interest, and he would suggest that they should do more to try to get not only gardeners but also the numberless people who are connected with forestry, directly or indirectly, whether in growing a cutting or owning the great plantations which adorned Aberdeenshire. He himself took an hereditary interest in forestry, because it was a GRANT of Monymusk who first began to plant on a large scale in this country at all, and when his ancestors first went to Monymusk there were only four or five trees, the fruit which was grown on them being chiefly Highlanders who had been strung up by the scurf of the neck. In that valley now there were millions of trees. He would also hope that before long, now that there was talk about university extension, they would have under that extension all the accessories necessary to the proper study of botany; and he hoped that the intimacy, if he might so express it, which existed between the chair of botany, which was shown by the presence of Professor TRAIL, and the Society would ever continue and increase. He saw in Aberdeen a great many societies of a kindred nature, and he might almost say, hundreds of small clubs or societies for gardening purposes in the county of Aberdeen. He should like, if it was possible, if they could not combine, that, at all events, they might correspond a great deal more than they did, and, by doing so, they would avoid a great deal of friction, and be able to do what they did a great deal more cheaply, and increase the scope of their powers.

Professor TRAIL was then called upon to speak. The advice given by Sir ARTHUR to young men to look to gardening for work, instead of crowding the so-called more genteel professions—which he denied were more genteel—was most excellent advice, and if people would only recognise that work well done in any line that was honourable, was honourable to the whole community, it would be the best education, it seemed to him, that could be given. Many were much more capable of hand work than of head work, if they could only recognise it. When one looked at what horticulture, properly understood, meant, they would see that it was very far from being merely hand work, but that it required to be successfully prosecuted, a clear apprehension, and that meant head work of the best and most honourable kind. There was no study that was more enjoyable in every way. As regards the part that the University could play in assisting the work of the Association, he did not need to say that it would be most willingly done, so far as it was in the power of the University; and he thought he could speak for others as well as himself. The University should be fully equipped in all that pertained to the study of the natural sciences, and he hoped that the time was not far distant when the study of such practical subjects as arboriculture and horticulture would find a place in their university as well as elsewhere.

Fruits, &c., from the Cape.

THE imports into this country of fruits and vegetables from foreign countries, and from our colonies and "possessions," is increasing year by year, and soon there will be no period in the year when fresh fruits and vegetables will be found wanting in our markets. There are heavy supplies from the Canary Islands, from Italy—widely apart localities; from the Mediterranean shores, Portugal, Spain, and now the Cape of Good Hope has shown what may be expected from that quarter of the globe, for an attempt is being made in the early months of this year to import into this country the fruits of the Cape Colony and Natal in a marketable condition. The Cape summer, as will be remembered, is at its height when winter arrests all growth in this country; fruit can, therefore, be obtained in abundance from the Cape when most wanted here. Apricots, Peaches, Nectarines, Grapes, Apples, Pine-apples, and Grana-

dillas have already arrived in good condition, and other fruits, we are informed, will follow in their train. The cool chambers of the rapid ocean-steamers have rendered this possible, the transit being accomplished in from fifteen to

on the way here, and the first cargo may be expected in about four weeks' time. It behoves producers in the various exporting countries to see that they do not overlap each other—to note their most successful products—those making

or retard growth in certain cases, will have carefully to watch the products with which they may have to compete.

The latest thing in imports is Tea from Natal, a consignment of which was offered at Mining

FIG. 43.—*WATSONIA IRIDIFOLIA* VAR. *O'BRIENI*: FLOWERS PURE WHITE;
AND NATIVE WILD PLANTS.

nineteen days. In the present month, and in April and May, weekly shipments of the above-mentioned fruits, as well as other kinds, may be expected.

As already stated, Tasmanian fruits are now

the best prices on this market, otherwise they may only contribute to the production of a glut, by which the consumer only can benefit. Doubtless, things will settle themselves comfortably by-and-by; growers at home, who can forward

Lane on Monday. Some 50,000 lb. were put up, but it is stated that the price obtained was not quite satisfactory to the importers. The cultivation of Tea is not a new thing in Natal, but it would appear that the local demand has for some years swallowed up the amount put upon the market; now, however, that the Coffee crop is threatened, the growing of Tea has received a fillip, one result of which we have just recorded. Doubtless the present market experience will induce greater attention to plant, growth, and manufacture.

WATSONIA IRIDIFOLIA VAR. *O'BRIENI*.—An attractive border in St. George's Park, Port Elizabeth, was one which was filled with native or wild flowers, and backed with the beautiful new white *Watsonia* (see fig. 43). This plant was raised here, and a few corms were sent to Mr. O'BRIEN and to Kew. Mr. N. E. BROWN described it in the *Gardeners' Chronicle* for October 3, 1891, and Mr. O'BRIEN obtained a Certificate from the Royal Horticultural Society for blooms exhibited. We Port Elizabethans think that as Mr. O'BRIEN has so many ways open to him to gain immortality, he might have given poor Port Elizabeth the only chance that was open to immortalise herself, and called it the Port Elizabeth Pearl, the Pride of Algoa Bay, St. George's Beauty, or something similar. It is a superb plant, growing and flowering splendidly. The first flowers to open in this interesting collection of spring flowers (our spring being your autumn) were those of the exquisite *Hypoxis stellata*, flowers which have only to be seen to be remembered; then a fine variety of *Ornithogalum aureum*, *Ixia* in abundance, the beautifully-marked, rich-hued *Sparaxis*; the fragrant and favourite *Gladiolus grandis*, the lovely *Hebea Gladiolus* species, with colours varying from rich purple to ivory-white; the floriferous and

cream-coloured *Gladiolus Milleri*, described by Mr. Brown in the *Gardeners' Chronicle* for October 3, 1891. This year the *velde* is covered in places with G. *Milleri*, of a different colour. Lemon and white-coloured *Ornithogalum*, *Hemeranthus*, *Veltheimias*, *Crimuns*, and *Watsonias* are included in this charming collection of wild flowers from off the *velde*. These instead of wasting their fragrance in the desert air, have gained the appreciation of the visitors to the many parks, and of the tourists, who only make a brief stay here, and could not otherwise see the things of beauty which are scattered here and there in out-of-the-way places, in the kloofs and valleys, on the hills, and in the open *velde* of this, at first sight, barren, dusty, and uninteresting district.

ROYAL HORTICULTURAL SOCIETY.—On Tuesday, March 8, a paper on "Plants for House Decoration," by Mr. JOHN WILLS, will be read at the Fruit and Floral Meeting of the Royal Horticultural Society, in the Drill Hall, James Street, Victoria Street, Westminster.

THE GARDENERS' ORPHAN FUND.—The committee met on the 26th ult. for the first time since the annual meeting, and unanimously re-elected Mr. W. MARSHALL to the office of chairman. The following gentlemen were elected local secretaries for the ensuing year, viz.:—R. Bell, Esq., Tyrone, for Ulster; Mr. George Cooper, Kirkstall, for Leeds and district; Mr. F. Collyer, for Ilkley, Yorks; Mr. Malcolm Dunn and Mr. Matthew Todd, for Edinburgh; Mr. Fairgrieve, for Dundee; Mr. Goldsmith, High Trees, for Redhill, Surrey; Mr. Hussey, Olive House, for Esher, Surrey; Mr. J. B. Stevenson, for Bournemouth; Mr. J. Lyne, for Chislehurst, Kent; and Mr. Upjohn, Worsley Hall, for Manchester. The following gentlemen who retire were accorded a hearty vote of thanks for their past services:—Mr. Furze, Mr. Ellicott, Mr. Frankland, Mr. Lumsden, Mr. F. Ross, and Mr. L. Castle. The following special receipts were announced as having been received during the month:—Manchester Gardeners' Improvement Society, £5; Reading Gardeners' Improvement Society, £2 2s.; Mr. J. Thomson, Hawkhurst, £1 1s.; and Mr. M. Dunn, £1 1s. The sum of £1000 was authorised to be invested; and guardians were appointed for the eleven children who were elected at the annual meeting.

LINNEAN SOCIETY.—At the meeting held on Thursday, February 18, Prof. STEWART, President, in the chair, Mr. Stanley Edwards was admitted, and Messrs. C. Chilton, F. A. Skuse, and J. Humphreys were elected Fellows of the Society. The President exhibited specimens of *Cystocollia immaculata*, an orthopterous insect from Namaqualand, in which the female is far more conspicuously coloured than the male, which is unusual, and the stridulating apparatus of the male differ in certain important details from that of other species. A discussion followed on stridulation in insects and the various modes of producing it, in which Messrs. C. Breeze, E. M. Holmes, and B. Daydon Jackson, took part. A paper by Professor Groom was then read "On Bud Protection in Dicotyledons," and, in his unavoidable absence, the author's views were expounded by Mr. B. Daydon Jackson. Mr. W. T. Thistleton-Dyer, F.R.S., communicated a paper by Herr F. Stephani, entitled "A Revision of *Coleosus* New Zealand Ipeaceæ."

THE SHROPSHIRE HORTICULTURAL SOCIETY.—The schedule of the great annual horticultural exhibition at Shrewsbury, in August next, is most comprehensive in the way it gives encouragement to horticulture, both in the number of its classes and in liberal prizes. Good prizes will be awarded to plants in the various classes, especially for groups of stove and greenhouse subjects and groups of Orchids. Fruit will be well premiated; especially liberal are the prizes for collections, and in the Grape classes. Vegetables are by no means left out. Excellent extra prizes are offered by some of the leading seed

firms. Over 160 prizes are also offered for cottagers' productions. Nearly £600 in cash prizes will be expended, together with certain silver medals.

THE DATES OF ROSE SHOWS IN 1892.—Mr. EDWARD MAWLEY, Rosebank, Berkhamsted, Herts, has kindly communicated to us the following list of Rose shows for the coming season:—

- June 21 (Tuesday).—Westminster (N.R.S.).
- " 29 (Wednesday).—Brighton (two days), Ipswich, and Windsor.
- " 30 (Thursday).—Canterbury, Eltham, Farningham, and Winchester.
- July 2 (Saturday).—Crystal Palace (N.R.S.).
- " 5 (Tuesday).—Gloucester, and Sutton.
- " 6 (Wednesday).—Croydon, and Hitchin.
- " 7 (Thursday).—Bath, Lee (two days), Norwich, and Woodbridge.
- " 9 (Saturday).—Reigate.
- " 12 (Tuesday).—Hereford, and Wolverhampton (three days).
- " 14 (Thursday).—Chester (N.R.S.), and Helensburgh.
- " 21 (Thursday).—Trentham, and Worsop.
- " 23 (Saturday).—Bendale.
- " 28 (Thursday).—Southwell.
- " 30 (Saturday).—Ripley.

We shall be glad to receive the dates of other Rose shows for insertion in the next list, which will appear early next month.

THE "GARDENERS' MAGAZINE," has issued its two thousand weekly number, and worthily celebrates the occasion. The *Gardeners' Magazine* is the direct lineal descendant of Harrison's *Floricultural Cabinet*, a monthly periodical, which first appeared on March 1, 1833. This was carried on till the end of 1859, when the title of the journal was altered to that of the *Gardeners' Weekly Magazine* and *Floricultural Cabinet*, the periods of publication being altered accordingly. In 1861, the late Mr. SMIRLEY HINDEB became its Editor; but it was not till 1865 that the paper assumed the form and title it now bears. In 1890, Mr. HINDEB sacrificed his life to the cause of the *Chrysanthemum*, and since that time the paper has been edited with great freshness, vigour, and ability by Mr. GEORGE GORDON, who had been the associate of HINDEB for twenty-two years, and to whom we tender our hearty congratulations. In an article entitled, "Sixty Years of Horticulture," Mr. GORDON traverses much the same ground that we had occasion to do last year. Incidentally, he remarks that the first Pine-apple was fruitfully in England in 1719 at Richmond; but the generally-accepted version is that JOHN ROSE was the first to accomplish the feat, at Downey Court, Buckinghamshire, and that he there presented the fruit to CHARLES II. There is, or was, an oil painting at Kensington Palace representing ROSE making the act of presentation. Of this picture there was a water-colour copy on a small scale, in the possession of the Royal Horticultural Society. We fear that in the removal from Kensington this was lost; at any rate, we have not heard of its recovery.

CULTURAL ANALOGIES.—In a sermon preached at Sandringham before the Prince and Princess of WALES by Canon FLEMING, on the occasion of the death of the Duke of CLARENCE and AVONDALE, the preacher had recourse to an analogy. This is so common and so effective a practice, that it would not have attracted attention had it not been for the circumstance that the Canon, with a laudable desire to disclaim originality and to acknowledge the sources of his information, has inserted a slip to the effect that the illustration in question "is not his own, nor does he know where he has read it." The illustration reads thus:—"It is said that when skilled gardeners would bring a very choice plant to richest flowering, they deprive it of light and moisture. Silent and lonely it stands, dropping one faded leaf after another, seeming to go patiently down to death. But when every leaf is dropped, and the plant stands stripped, a new life is working

in the bud that lies under (?) every falling leaf [and] from which shall spring forth a richer foliage and a brighter wealth of flowers." What the Canon or his informant can have meant, we are at a loss to conceive. It cannot have been Mushrooms. It is a common practice, it is true, to diminish the amount of water supplied, and to temper the light to which a plant about to flower is exposed, and it is still more common to carry the privation of light and moisture still further after the period of flowering, so as to give the plant a rest. But this does not apply to very choice plants only, and very choice plants are not more silent than others. Can the preacher have had in his mind some distorted account of the production of white Lilac at this season of the year, by forcing the purple one in diffused light or even in darkness, and at high temperature? Contrary to what was at one time supposed, neither the diminution of the light nor the increase in the temperature is absolutely necessary, but in whatever manner produced, the phenomenon is striking enough to serve the purpose of a preacher.

"THE AMERICAN AGRICULTURIST."—What an epidemic of jubilees and celebrations! In addition to those before-mentioned, we have on our table the semi-centennial issue of the *American Agriculturist*. Although chiefly devoted to agriculture, it contained, under the editorship of our late friend Dr. THURBER, a good deal of horticulture and cultural botany, besides much matter of general interest. The present number contains the usual retrospect fitting to such occasions, and an account of the wonderful development of pomology in the United States; together with portraits of our late friend—an old man eloquent indeed—MARSHALL WILDER, and of the present respected President of the American Pomological Society, Mr. P. J. BERCEMAN.

CHRYSANTHEMUMS.—According to Mr. CONDER, cited in *Garden and Forest*, the Japanese cite 269 colour varieties of the *Chrysanthemum*, of which sixty-three are yellow, eighty-seven white, thirty-two purple, thirty red, thirty-one pale pink, twelve russet, and fourteen of mixed colours. A fancy prevails in the country that in this flower the same tint is never exactly reproduced, and that in this it resembles the endless variety of the human countenance.

"THE ENGLISH FLOWER GARDEN."—A new edition of this useful book is in the press.

ARTIFICIAL COLOURING FOR REAL FLOWERS.

—We have already called attention to some artificially-coloured Carnations which have been submitted to us. When the green Carnations were subjected to chemical examination, it was discovered that the tint had been produced by steeping the stems of the freshly-cut flowers in a certain colouring-matter, which, by reason of capillary attraction, ascended the stem, and permeated every little vein in the blossom, when it became oxidised, owing to contact with the atmosphere. The colour lasts for a long time, and is not injurious to the health of any person using it. Here is the story of the discovery of this curious property of absorbing pigment possessed by flowers:—"It seems that one day, some women employed in the manufacture of artificial flowers, poured by accident into a pot, wherein stood white "Pinks" and Carnations, a little of the colour that they were using, and in an hour or two they noticed that the flowers had turned a green shade. MRS. GRAD had been following up this discovery, but so far has only been able to obtain green, violet, and pink. Green is produced by a bright green, or "tetra;" the others—violet, or by methyl-violet, or Paris-violet; pink by fuchsine, or hydrochlorate of rosaniline. A greenish-blue has also been produced by using "tetra." The Parisian press hints that the traditional bridal orange-flowers can now be obtained of a delicate violet, suitable for ladies entering for a second time into the holy estate of matrimony. It will be remembered that the so-called discovery is by no means

new. Many well remember the bunch of "white" Lilies shown some years ago at South Kensington, delicately tinted in various hues.

THE LOSS OF NITROGEN DURING THE DECOMPOSITION OF MANURES, AND HOW TO PREVENT IT.—According to VON KRAUSE (*Journal für Landwirtschaft*, xxxviii., p. 1), superphosphate is an excellent preservative for manure, and is preferable to superphosphate-gypsum, owing to the greater amount of soluble phosphates it contains. In a recent paper by J. H. VOEL, which may be consulted in *Biedermann's Central-blatt*, xx., 562—564, the author refutes these views of VON KRAUSE. Small losses of soluble salts cannot be avoided with farmyard manure. The loss of phosphoric acid is, however, slight, but may be considerable if superphosphate is added to it—so much so, that any beneficial action of the superphosphate is more than cancelled. The very favourable effect of phosphoric acid in preserving manure is due, in the first place, to its power of so changing the fermentation that no free nitrogen, or but very little, is formed. The liberation of nitrogen was shown by DIETSELL to be promoted not only by phosphoric acid soluble in water, but also by phosphoric acid soluble in citrate; and VOEL has already proposed using a preparation which contains, besides calcium and magnesium sulphates, also a large amount of phosphoric acid soluble in citrate. The loss of free nitrogen when gypsum is used alone is in VOEL's opinion, not nearly so great as the advantage which follows from the fixation of the ammonia.

DIAGRAMS OF WILD FLOWERS.—The Society for the Promotion of Christian Knowledge is issuing a series of coloured diagrams illustrative of the structure of various common plants. The figures are accurate and the details correct, but the size is so small that the drawings could not be seen at a distance, and hence are unsuitable for lecture-rooms, though very serviceable for small-class teaching.

WORLD'S FAIR NOTES.—The Horticultural Department of the Exposition is planning to have a magnificent Rose-garden, in which will be fully 50,000 plants, besides large groups in special areas. The garden will be of classic design, with temples, arbours, archways, and trellises.

—The Department of Horticulture of the World's Columbian Exposition desires to obtain fine specimens of various plants, such as Palms, Dracenas, Yuccas, Agaves, Cycads, Bamboos, Tree Ferns, Cacti, and other ornamental genera and species. Only finely-developed specimens are sought, and they must be established in boxes, tubs, or pots, or in such a manner as to insure their growth and convenience for transportation. The Department wishes to know if such plants will be donated, loaned, or exhibited by the owner, or whether they can be bought, and at what price. Address, JOHN THORPE, Chief, Bureau of Floriculture; or, J. M. SAMUELS, Chief, Department of Horticulture.

IMPORTATION OF PLANTS, ETC., TO MEXICO.—In the Customs' regulations, which came into force on November 1 last year in the Republic of Mexico, it is stated that the following articles are admitted duty free:—Living plants, garden seeds, agricultural seeds, when these have the special permission of the Minister of Finance; moss and natural flowers. Duty is to be paid as follows:—Dried fruits, 0.10 pesos; fruit preserved in their own juice, in sugar and in spirits, 0.75 pesos; fruit in salt water, 0.06 pesos; and fresh fruit, culinary vegetables, and tubers which are not in any other manner charged duty 0.02 pesos per kilogramme.

EDUCATION.—The enclosed extract from an auction catalogue seems to show that horticultural education is deficient somewhere:—"1000 first-class greenhouse and other plants, comprising Orchids of the following varieties: Cattlys, cymbidiums, saccolabiums, labias, lycaster, masdaralia, vandas, dendrobiums, odontoglossums, oxalogues, and brassia; stove and greenhouse plants, viz, camelias, tree palms and tree fern, lemon, azaleas, eucharis, stephanotis, cactuses, heliotropes, aurium, lilies,

Jerusalem thorns, passion plants, saclements, bagoniums, bagonias, gloxienias (extra variety), eucsa lilies, imantophyllums, valettas, epiphyllums, asparagus, allamanda, richardia, plumbago pandanus, potted rose trees, variety of fuchsias, geraniums, creepers (gold and silver), maiden hair, and other ferns.

CATTLEYA LABIATA.—The *Journal des Orchidées* contains an account of the reintroduction of this plant as effected by the *Horticulture Internationale*. M. L. LINDEN's account of the inspection of a painting in the Paris Exhibition of 1889, which induced him eventually to despatch M. BUNGEOTH to Pernambuco in search of it, reminds us of the picture of Nepenthes Northiana, which led Messrs. VEITCH to institute the similar successful quest for the Queen of the Nepenthes. BUNGEOTH stated that "no rain had fallen in the district for more than ten years," the sole supply of moisture being furnished by the heavy dew, a statement confirmed by M. CLAES, who is, or was, till recently collecting in the same region.

A GARDENING PAPER FOR QUEENSLAND.—The latest addition to local journalism is the organ of the Horticultural Society of Queensland, the first number of which has just reached us. The *Queensland Horticulturist*, edited by Mr. W. SOUTER, the well-known Curator of the Acclimatisation Gardens, contains sixteen pages, about quarto-demy size, and the first issue includes a number of interesting articles on subjects likely to be of interest to amateur gardeners. We have also to acknowledge receipt of the official report of the proceedings at the conference held in Sydney in June last, to discuss the subject of rust in Wheat. The document contains details of experiments carried out in Queensland, New South Wales, South Australia, and Victoria, and is replete with information which might be studied with advantage by Wheat-growers—both those who are already established in the industry, and those who contemplate embarking in it.

PRIMULA SINENSIS.—We have received from Messrs. VEITCH & SONS, Chelsea, a lot of fine blooms of *Primula sinensis*, which leave nothing to be desired on the score of beauty of colour and symmetry, some being semi-double.

KENT COUNTY CHRYSANTHEMUM SOCIETY.—The members of this Society held their fourth annual dinner at the Bridge House Hotel, London Bridge, on Wednesday evening last. In the unavoidable absence of the President, Mr. STEVENS, the Chairman of the Committee, occupied the Chair, and Mr. T. W. SANDERS, Editor of *Amateur Gardening*, the Vice-chair. About eighty members and friends were present, and during the course of the evening the Chairman, on behalf of the Society, presented Mr. H. A. NEELS, the ex-secretary, with a silver tea-service, in recognition of his past valuable services. After the customary loyal and other toasts, the "Horticultural Press" was proposed and drunk, and Mr. J. WRIGHT and Mr. G. GORDON responded. A capital musical entertainment enlivened the proceedings, and a very pleasant evening was spent. Mr. H. J. JONES, Ryecroft Nursery, Lewisham, is the hon. secretary.

PUBLICATIONS RECEIVED.—Report on the Agricultural Work in the Botanical Gardens, British Guiana. (C. K. JARDINE, Georgetown, Demerara.)

NURSERY NOTES.

ORCHIDS AT MESSRS. SEEGER & TROPF'S.

IN the neat little Orchid establishment at 112, Lordship Lane, East Dulwich, there is a very extensive collection of Masdevallias, and many interesting botanical Orchids, together with representatives of all the showy species of Orchids, and a very valuable series of rare white forms of them, among which we noted the large snow-white *Sobralia macrantha* Kienastiana, the equally pure *Lælia Perrinii* alba, Seeger's variety, and the fine *Cattleya intermedia* Parthenia. In bloom were some Phala-

nopsis Schilleriana, P. denticulata, and P. Stuartiana, Oncidium cheiroporum, with ten spikes; several good O. Forbesii, Cypripedium Seegerianum X, C. Laforcadii X, C. calophyllum, C. Harrisianum superbum, and many distinct forms of C. insigne. Also Masdevallia chelonii X, M. Schroderiana, and other species and varieties of Masdevallia; Saccolabium bellinum, Cirrhopetalum chinense, Vanda Amesiana, &c., and in bud several Angraecum sesquipedale, which, like the fine batch of Vanda suavis and tricolor, seem to thrive remarkably well here.

DENDROBIUMS AT MR. JAMES CYPRES'S NURSERY.

The Queen's Road Nurseries, Cheltenham, have a name for the excellent culture of Orchids generally, and especially Dendrobiums, on which the growth is marvellous; and among those now in bloom are several of Dendrobium Phalenopsis Schroderianum, D. bigibulum, D. splendissimum grandiflorum X, D. Leechianum X, D. Ainsworthii X, all very closely related, but distinct in degree; D. Casiope X, D. Jamesianum, D. Findlayianum, several varieties of D. aureum (heterocarpum), many D. nobile, one of the best being D. n. splendens; and the neat little D. crepidatum.

ORCHIDS AND LILIES AT TWICKENHAM.

Mr. H. A. Tracy, in his Orchid and Lily establishment, well maintains its character for healthy stock, supplied at a cheap rate. The Cypripediums have been making a fine show there all through the past winter, and at present a few of the newer hybrids are in bloom. A fine strain of Dendrobium Wardianum also gives some exceptionally good forms; the Cattleya Trianae have some very richly-coloured varieties; and Cattleya Percivaliana, Lycate Skinneri, varieties of Cologyns cristata and other Cologyns, Odontoglossums, and many varieties of Dendrobium nobile are in flower in quantity. The forced Lilies in the large house are coming on well; and among Orchid sundries may be noted a good sample of Orchid peat, a thing not easy to obtain in these days.

FOREIGN CORRESPONDENCE.

A METHOD OF UNDERGROUND WATERING OF CROPS, &c.

A PERSON I know here (who makes his own gardening implements), has invented a contrivance by which he manages to supply his fruit trees underground with a copious supply of liquid-manure, which—1, Prevents any waste of liquid-manure; 2, obviates the necessity of waiting for rain to moisten the top soil; 3, which reaches the roots about 3 inches below the surface, filtering among the root-fibres direct; 4, the surface-ground is kept parched, and weeds cannot thrive; 5, crops of fruit and vegetables are watered by the same contrivance; 6, watering can take place during the full blaze of the sun at mid-day without any fear of blistering the crops; 8, the crops never get soiled, and it is best for plants to be watered when the ground is very hot. It is most expeditious and effectual; deluges of clear water can be supplied underground, and as the parched surface does not imbibe it, I need hardly point out that weeds are most successfully kept under, and the crops, whatever they may be, exceptionally fine and healthy. It is not an expensive contrivance, and I am much taken with it. Gisors. [See under "Notices to Correspondents."]

AN AMATEUR'S EXPERIENCES WITH ORCHIDS.

HAVE you a corner to spare for a poor amateur gardener, who has for the last seven years been trying to grow the more common and inexpensive Orchids, looking to the pages of the *Gardeners' Chronicle* week by week for instruction. My first duty is to tender you my thanks for the numerous benefits I have received, and am receiving, from you and your correspondents; but it is when doctors differ that I am perplexed. For instance, Mr. Barbery (and everyone knows that a higher authority could not be found) discourages the use of manure-water, which other growers have held beneficial. I was led to adopt it from considering, that under the

conditions of Nature excrement of birds and dead insects must find lodging on the trees which are the homes of the plants, and these must be constantly washed down the trunks by the tropical rains, and nutrition from them might be absorbed by the spreading roots of the Orchids. Acting on this idea, I have dipped, perhaps once a week in the growing season, the block on which is a nice plant of *Cattleya citrina* in weak guano-water, with the result that the new bulbs have increased almost to normal size again, whereas previously they had become smaller and smaller as time went on. I shall therefore be very reluctant to abandon this practice.

Again, there seems a dispute among growers in respect of pruning away the old bulbs of *Dendrobiums*. I have always regarded the old pseudobulbs of all Orchids as reservoirs of nourishment on which the rapidly-growing new bulbs of each year could draw, and have therefore carefully preserved them, never cutting off the bulbs with the flowers, and never pruning off old bulbs till completely withered. It would be good news if one could really believe that these flowering bulbs could be bodily removed without damage to the plant.

Last year, the writer on Orchids in "The Week's Work" recommended a period of drought for *Odontoglossum grande*, and I acted on it, contrary to my previous practice, which had been to keep this and other *Odontoglossum* moderately moist throughout the year. I still believe, from observation, that the plant on which I tried it suffered by producing a rather weaker growth than usual when it started. Of course, I know that generalisation from one particular is always fallacious, and that is why the amateur wants safe guidance, as he has not dozens of a species to experiment on.

As to the temperature in which special plants are to be grown, we find again most opposite views expressed, the tendency on the whole being towards cooler treatment, but I confess I was startled when a week or two back I found *E. vitellinum majus* spoken of as the coolest of cool Orchids. My experience of it in a warm house has not been satisfactory, and I shall now try the treatment recommended. In connection with the same note I may say, I have grown *Odontoglossum Rossi majus* in an intermediate temperature, where it has grown and flowered very well, while side by side with it *O. crispum* all but perished.

May I add to this already long letter one or two cautions which I needed, and suffered from want of? There is an abominable white scale, possibly that known as "stock seed," which infests the pseudobulbs of some *Cattleyas*, getting under the sheaths and so escaping detection. It also forms a colony in the axils of the leaves, where for a time it gets overlooked, but the effect, if neglected long, is the destruction by decay of the base of the leaf, which falls off, the decay often spreading to the pseudobulb itself.

Again, we often see it stated that many Orchids when in bloom may be transferred to the house for decorative purposes. Four years ago, during the Christmas holidays, I transferred two lovely plants in full bloom—an *Odontoglossum grande* and a *Lycaste Skinneri*—to the drawing room. After a very few days the flowers went off (those of *Lycaste Skinneri* should have lasted a month or more) in a most disappointing way, and the plants were sent back to the greenhouse. Little did I know the mischief which had been done, but it was only after three seasons' growth that these plants again formed flowers. My readers will probably say gas, but the room has never in my time had a gas-burner in it, but it was gas, nevertheless. An escape of gas was going on into the ceiling of the room below, and slowly filtering through the boards of the room in which the plants were placed. I can, at any rate, imagine no other cause for the calamity, though the quantity was so small that the escape was only suspected at the time, and was with great difficulty traced a week afterwards. I must, however, be furnished with electric light throughout before I shall again venture to introduce flowering Orchids into my rooms. *L. C. Rugby.*

TREES AND SHRUBS.

CARPENTERIA CALIFORNICA.

This is another evergreen that deserves to be grown more extensively against walls having a south or west aspect in the southern and western counties of England and Ireland than it appears to be at present. It produces *Chimonanthus*-like foliage, and white flowers with yellow stamens, which are very fragrant. Chancellor Swayne has a nice plant of this somewhat rare evergreen growing against a south wall, and covering a space of about 5 feet by 4 feet, and which with him it has proved quite hardy. In the herbaceous borders, which contain an extensive and choice collection of hardy perennials, there is a good display of the white and purple-flowered *Helleborus*, both plants and flowers being large and of good substance. Chancellor Swayne is of opinion that these popular and very useful winter-flowering plants do best in the shade, and in a uniformly moist soil. Several rare varieties of the *Crocus* and *Snow-drop* (*Galanthus*) are very telling in effect just now. These latter include *G. Elwesii*, *G. plicatus*, *G. imperialis*, and *G. Snowflake*; whilst on a shelf in the greenhouse are flowering the pretty little *Narcissus corbularia alba*, *N. cyclaminus*, and *Iris caucasica*, with its silver-margined foliage and pretty primrose-coloured flowers. *H. W. W.*

EVERGREEN ELAAGNUS.

The evergreen Japanese *Elagnus* are more appreciated at this time of the year than in the summer, when flowering shrubs are generally attractive, but their merits are not so generally recognised as they should be. If planted with discretion, as isolated specimens on the grass, they present a warm and pleasing appearance all the year round.

They are of easy culture, and free-growing, thriving in almost all garden soils, except that which is very damp and heavy. I have even fine healthy specimens with strong shoots, plentifully supplied with foliage, growing in dry, sandy soils. When once established, they give very little trouble. The only pruning necessary is to cut back the strongest shoots, thereby causing them to grow more evenly. The evergreen *Elagnus* are admirably adapted for training against walls, and in such positions are really attractive, particularly when the majority of wall shrubs have lost their leaves. They are perfectly hardy, and can stand drought with impunity. If planted in a southern aspect, the variegation is brought out to a much greater extent, which, in many cases, equals that of *Crotons*. Those mentioned below include the most useful kinds.

E. glabra is a distinct green-leaved species, and one of the most accommodating shrubs extant. Although it has been known to English gardens some time, it is very scarce. It is of free growth, and flourishes in poor soils, in many cases where others refuse to grow. It forms a dense bush some 5 to 6 feet high, plentifully supplied with bright green leaves, 3 to 4 inches long. *E. glabra variegata* is similar in growth to the species, but the leaves are variegated. It should always be planted where it can get a full share of the sun, and if isolated on the lawn, it is seen to advantage.

E. pungens aurea is another useful kind. It is readily recognised from the rest by having rich, golden coloured leaves. It is perhaps the finest ornamental shrub we possess, and being of a bardy nature and easy culture, it commands itself to all lovers of hardy trees and shrubs. There is no subject better suited for lawn specimens than this. If planted in a sunny site, and carefully pruned, its neat golden foliage is very beautiful all through the year.

E. macrophylla is a distinct species of great merit, and thoroughly hardy. Its habit of growth is free, with very handsome leaves, which are bright shining green above, with a silvery whiteness beneath, measuring 4 inches long.

E. Simoni is a free and distinct-growing kind, suitable for planting on banks, &c. It has leaves of a light green above, and white on the under surface. Its free habit of growth ought to recommend it to

planters, as it well merits more extended cultivation. There is a variegated form known as *E. Simoni tricolor*, which is of recent introduction, and not yet very widely distributed, but when it is better known it will become a general favourite. It is quite distinct from those hitherto described. The leaves are beautifully marked with a rich sulphur-yellow colour, some having a blotch of yellow in the centre, with a band of green on the outside, whilst others are shaded with soft yellow and pale green; the under surfaces are covered with rusty-coloured scales. If trained to a south wall, it is very beautiful. Altogether it is a very useful evergreen shrub, and perfectly hardy.

E. Frederici variegata, like the last-named, is very scarce. It is a free grower, and very ornamental. The leaves vary in colour, but are usually of a soft sulphur colour, changing to a milky-white, with a border of green on the outside; the lower side is covered with a silvery appearance, which greatly adds to the charms of the plant. Unfortunately, it is unable to withstand the severity of our winters without protection, but will do against a warm wall; nevertheless, it is a capital subject for a cool-house, and if grown as a pot-plant, it is very valuable for decoration. It should be stood in the open air in summer, in a sunny position.

The *Elagnus* are not difficult to propagate, for, if pieces of the half-ripened shoots about 3 or 4 inches long are taken off in August, with a heel of the old wood attached, and with a sharp knife make a clean cut, they will root in a few weeks. The cuttings should be inserted in light soil, taking care that the base of each is made very firm and the pots plunged in warm cases with a temperature of 60° to 65°. When rooted gradually harden off, and place them in cold frames for the winter; and in spring they can with safety be planted out in nursery rows, and a watering given occasionally till they have become established. *H.*

FLORISTS' FLOWERS.

CARNATIONS AND PICOTEES FROM SEED.

THE hybridisation of Carnations and Picotees and saving the seeds is a simple enough process, but the amateur who intends to take up this work should obtain the very best varieties in cultivation, as it would not be worth while to begin with inferior varieties. I have raised many thousands of seedlings, and get most gratification from the work by taking one or two classes or sections only in a season. Say, for instance, the cultivator determines to obtain seedlings from the *Scarlet Bizarre*: select in this case good healthy plants of, say, *Admiral Curzon* and *Robert Houlgrave*. Place a few plants of each variety together in an airy greenhouse, and if the flowers can be induced to open earlier than usual, all the better; allow every flower and bud to remain, and as the flowers open they may be fertilised both ways. It is not necessary to remove the pollen from the seed-bearer, as the flowers are rarely self-fertilised. The two horn-like processes in the centre of the flower, and attached to the top of the seed-pod, are the points to which the pollen must be applied; this has to be sought for underneath the petals. The pollen-cases are attached to slender thread-like filaments, and when the pollen is in a state of powder, transfer it with a small brush to the aforesaid stigmatic part of the flower. If the pollen has been effective, the petals will begin to droop in about twenty-four hours, and when they are quite dead, pull them out carefully, leaving the stigma in its two divisions, for these stand out fresh and sound long after the petals collapse.

About the end of September the seeds ripen, the pod become brownish, and open at the ends. The seeds are usually black, but sometimes a pod of seeds will be entirely cream-coloured, but they vegetate as freely as the others. The pods should be gathered, and a label placed with each, recording its parentage. Lay them out on clean paper in a room to dry, and the seed can be placed in packets of paper until it is time to sow it. I ought to add, that the process of

hybridising should go on until the flowers fade; and it should be performed daily about noon. The pollen will sometimes be found wet and clammy, but in this state it cannot be used. It must always be taken when in the powder form.

Carnation and Picotee seeds can seldom be obtained out-of-doors; the pods mostly rot in the autumn before the seeds ripen. Even under glass a good pod of seeds will decay at the base, and rot before the seeds are ripe. As a preventive of decay, split the calyx down at two or three places; this process will allow any moisture to escape, and admit air to dry the base of the bulbs. Amateurs must be very watchful over these small details. I crossed pure white flowers, with the merest margin of purple colour on the petals, and obtained many deep purple selfs; one is now in cultivation under the name of Purple Emperor. I believe it is the best purple Carnation. From crosses of yellow Picotees, I obtained rose of various shades, scarlet, and maroon selfs. Two of them obtained first-class certificates under the names of Ruby and King of Scarlets. One grower saves seeds from a yellow self, *Pride of Benhurst*, and raised some hundreds of seedlings, and obtained almost every colour but yellow. He had one yellow variety only, but it was worthless. Sometimes an improvement on both parents is obtained, but we have to wait and watch for this. *J. Douglas.*

CHRYSANTHEMUM GOLDEN GEM.

I received this from Mr. Owen, Maidenhead, last spring as a useful late-flowering yellow variety, and it has fully borne out its character, retaining its flowers in good condition until January 11. It is also one of the best varieties for compactness of growth. My plants, which were in 10-inch pots, were only 16 inches high. If grown in the natural manner without disabbling I consider it without a rival for conservatory decoration, and providing flowers for cutting purposes at the end of the season. But it is not likely to please those who only require morn blooms for exhibition purposes. *W. H. Rivers.*

HOME CORRESPONDENCE.

TECHNICAL EDUCATION FOR GARDENERS.—

Some of the statements which have lately appeared in the *Gardeners' Chronicle* in connection with the above, clearly show that a few of the craft have sadly neglected to avail themselves of the opportunities within the reach of most for acquiring a knowledge of the different departments of science bearing on horticulture, which renders their opinion of little value in such matters. Surely no man is entitled to give judgment on subjects of which he is utterly ignorant. We usually find those men who are most behind the times in scientific knowledge, strongest in their condemnation of its use, and this is due, perhaps, in part to a certain amount of jealousy, for "boary" heads usually exhibit great aversion to being taught anything by youths. But be this as it may, there is not the least grounds for doubt regarding the advantages accruing from the acquisition of scientific knowledge; in fact, unless a gardener makes a study of such subjects as [elementary] chemistry, botany, geology, and scientific agriculture, it is impossible for him to discharge his duties economically and well. By chemistry he is enabled to obtain analyses of soils and plants, but the chemist knows nothing concerning the cultivation of plants, or the treatment of the soil on and in which they grow; then what good could result from his labour, unless the gardener is familiar with this science, and is also able to apply his special knowledge? I remarked an article of the issue of the *Gardeners' Chronicle* for Jan. 30, which dealt with fuels, in which the writer alluded to the need of vapour to support combustion. Now, I would like to ask, how long a time has elapsed since the time Bunsen made the discovery that red-hot carbon decomposed water vapour passed over it, and the time when a gardener described the advantages derived from the presence of water in the ash-pits of garden furnaces? Had this gardener not made himself acquainted with chemistry, in all likelihood we should still have been in ignorance of the facts. Any science to be of service to Art, must first be made a subject of study by those whose labours are confined to that branch of Art, then by their practically applied. Had it not been for the costly experiments conducted and carried on by Sir J. B. Lawes and Dr. Gilbert over a long series of years,

we should probably be still in need of trustworthy information bearing on the scientific cultivation of soil. The county councils, then, in fostering a knowledge of the sciences more closely connected with agriculture and horticulture are endeavouring to raise the intelligence alike of the farmer and gardener, so as to enable each to become a more efficient worker in his respective field. Apart from the power which knowledge gives to its possessor, and which may prove an incentive to some to acquire it, there is the question of how young men in gardens should spend their winter evenings. I suppose those railers at science would say, "Sing, play at cards, attend dances, concerts, and other amusements [Each and all well enough in their way, in moderation, En.]; for this is the only way that I have seen young men kill time who did not study." During the last eight years, I have taught some of the young men under me at this place, situated in Yorkshire, either chemistry, botany, or scientific agriculture; and it speaks well for them, and is encouraging to me, to be able to state that all of them have passed the examinations of the Science and Art Department at South Kensington in all the subjects on which they were examined. I may also add that some of these young gardeners are occupying prominent positions as head gardeners in various parts of the United Kingdom, to their own credit and the satisfaction of their respective employers. Let not young men be dismayed by the disparaging remarks of those who are not initiated in scientific knowledge, but let them look around and see which of those who have once been like them, and who have become conspicuous among their fellows, did not attain to their present eminence through study and application. Let our young men remember, too, that in spite of the carpings of those who regard practice alone as being proficiency, science will continue to advance, and unless the subjects enumerated are numbered among these attainments, they will, in all probability, have to content themselves with a labourer's work at a labourer's wage. *R. C. H.* [As all sides have now been heard, we can give no more space to the discussion in spite of the piles of correspondence before us still unpublished, but we shall have an opportunity of reverting to the subject later on. *En.*]

PRUNING DENDROBIUMS.—Your correspondent, "B. P.," asks if I mean what I wrote under the above heading. I recommend that only in which I thoroughly believe. I maintain that the old pseudobulbs are natural reservoirs, storing up during the rainy season all that which is necessary for the sustenance of the plant during the dry or resting season. In *Dendrobium nobile* we have an easily-grown Orchid, which makes no great demand on the skill of the cultivator, and which grows and flowers without any strict and long period of rest, which is so necessary to those I had in view; hence the old stored-up juices in the old pseudobulbs are sometimes not made use of. The deciduous species of *Dendrobium*, as *D. Wardianum*, *D. crassinode*, and *D. Devonianum*, I have actually seen denuded of the whole of their pseudobulbs, only the young growths being left to struggle on as best they could. This is a very erroneous method of treatment. I have also noticed instances of species which flower from the old stems or pseudobulbs that have been cut back very hard. It is quite safe to remove old stems which may have failed to become plump during summer or growing season, and this may occur to those named above when three or four years old, or even older. No admirer of Orchids would consider a well-preserved old pseudobulb unsightly, but quite the reverse. The removal of the flowers with portions of the growth is an injurious practice to advocate generally or without limitation, and would lead to the loss of the plants when much indulged in. *H. A. Burberry.*

SPARROWS AND FRUIT-BUDS.—The sparrow now and then has someone to say a good word for him, but I regard him as an unmitigated nuisance, and if I had my way with him, I would extirpate him altogether, as the evil and mischief he commits far outweigh any good he does, and I much doubt if the latter ever comes in. If he visits a garden, and there are fruit-bushes, you will find him among them taking out the buds, apparently for amusement, as the greater portion is left on the snow or ground, but he takes a portion—just the tender and tasty middle or embryo blossom and fruit, and discards the other, so that, to appease his voracious appetite, he will soon strip a tree, and spoil the whole crop. Not content with the buds of the bushes, he visits the Peas, and gives his attention to them as soon as they are through the ground, nibbling off the leaves or tops as fast as they grow,

till he destroys—if not stopped—or cripples the plants. Later on, when one plants out the young spring Lettuce, at them he goes, and instead of nice thriving plants, you look and find skeletons, with only the ribs, as all else has gone into his maw. Meantime, Gooseberry and Currant bushes must be protected, which may be done by syringing them with moderately thick lime-wash, with a little soot and paraffin added thereto. Bitter Aloes dissolved in water, and mixed with the lime-wash, is first-rate, and a little of that, harmful as it is to the bushes, goes a long way. For protecting Peas, nothing is equal to black-cotton strained along just above the rows in three lines, one over the middle, and the others close to the sides; and if the cotton is kept supported just clear of the Peas, some 3 inches or so from the ground, no sparrow will venture his precious carcass near more than once. *J. Sheppard.*

FRUIT GROWING IN THE MIDLANDS.—I have read with interest the letters on Apples that have lately appeared in these pages, and much has been written and said on this subject, but I fear that much still remains to be done before we can produce the large quantities of good Apples required to meet our ever increasing consumption. The foreigner seems to have pretty much his own way, and foreign fruit seems always to the fore, and it is always in demand, so far as my experience goes. In this part persons who have Apples to dispose of do so at the time of gathering, and even sell them on the trees, being led to do so from fear of their not keeping in the fruit room. It seems to me that is where the mistake lies. If about half-a-dozen really good keeping sorts were planted extensively, and stored well when gathered until they were ripe, they would fetch the best prices. My employer, Mr. H. P. Markham, is an enthusiastic fruit grower, and he has planted largely Apples, Pears, Plums, and Damsons. The Apples for the most part are planted on grass, and the plantations are well sheltered, which, he thinks, a great consideration, especially as the west winds in autumn would otherwise damage a large amount of our biggest and best fruit. Last year we stored many quarters of really good fruit. Our method of storing is in a large spare cellar under the house, fitted in the usual way with shelving, and the cellar is about 6 feet deep from floor to ground-line, and it is lighted and ventilated by means of windows. Into this place the frost never penetrates, and the air is never quite dry, although it is not too damp for the good keeping of the fruit. But with all this lot of fruit we never sell any, Mr. Markham giving all away to his friends what is not required by his own household. The soil not being all that we could wish for fruit trees (for it is shallow and near the rock), we mulch heavily with good rich manure, and supply copious waterings of liquid manure, both now and throughout the summer. All of our trees are kept pruned, but we cannot get such fine fruit from trees that are pruned with the saw alone as from those which are pruned carefully with the knife or *secateur*. Our trees were planted fifteen to twenty years ago. *Wm. Cory, Sedgemoor.*

ODONTOGLOSSUM CRISPUM.—Your correspondent "C. H. B." in "Amateur's Notes," of *Gardeners' Chronicle* for February 13, in giving his experiences of establishing imported *Odontoglossums*, advises their being laid on mats in a stove, and syringed three or four times a day. This treatment may be successful under his own personal supervision, but with the treatment recommended, ninety-nine out of every hundred amateurs would find most of them rotted at the end of a month. Now, as importations of these plants are at the present time rather heavy, and this season of the year is best for getting them established, I would advise those who may intend laying in a quantity to get them as soon as possible; after looking them over carefully, the old roots should be shortened a little, and the plants laid in boxes on a little damp sphagnum, and placed with a sheet of paper over them in a house which is kept at 50° to 55°. Failing the shading of paper, a mat may be laid on the glass. The stage and under and around the boxes should be kept moist; at the end of a week take them out of the moss, and carefully rearrange them, and at the end of a month with this kind of treatment they will most likely be started into growth. If so, carefully pot them, the few old roots left holding them firmly in the pots with the aid of some wooden pegs. I have twisted a piece of thin copper wire round the base of the oldest bulb, secured to a piece of wire kept close to the pseudobulbs, which holds them nicely; keep the plants in the same house, moistening two or three times a week after they begin to root,

and treating them as one would plants which are established. I have been successful with another mode of treatment: A long narrow pit, with a wall on each side of the path, was filled with clinkers from the garden boilers, the same being so arranged that the surface had a sharp slope towards the walls on each side, and on this was placed a layer, 2 inches thick, of peat, moss, and sand mixed together, and on this were planted the *Odontoglossums*, about 6 inches apart. I put 40 imported pieces out this way last May, and at the present time we have 402 growing plants, many of them showing flower spikes, and have made growth double the size they usually do in pots—in fact, the growths are more like those of two or three years old. With these plants there are about 600 plants which were growing in pots, but as they did not do satisfactorily I turned them out, with the result that they are now rapidly improving. I would advise anyone having a pit to spare, and growing a quantity of this species of *Orchid* to try my plan, as I am sure he will be pleased with the result. It is only a tithe of the trouble and labour attached to any other method. *W. Stevens, Walton Grange, Stone, Staffs.*

VICTORIA REGIA.—It may interest some of the readers of the *Gardeners' Chronicle*, as an indication of the peculiarity of the present season, to hear that I had during four days of the past week a very beautiful, though small flower, of my *Victoria Regia* in full bloom, accompanied by eight perfect leaves about 30 inches in diameter. The flower opened with its usual delightful perfume, filling my tropical-house, but only reached a diameter of 5 inches; it remained perfectly white for a couple of days, and then gradually assumed its usual crimson as it approached its end. I have never yet had a bloom of the *Victoria Regia* later than Christmas Day on the old plants, and the new ones rarely flower till May. In my temperate-house the white and red *Lapagerias* have been in bloom ever since June last—and in August they were luxuriantly abundant; the plants will not have been without a few open blooms during the entire twelvemonths. The Japanese *Loquat* is also now open with its delicious odour, and forms a pleasant variety with the *Camellias* and other spring flowers in the conservatory, and the *Anthuriums*, *Cannas*, *Strelitzias*, and other flowers in the tropical-house. *A. Dixon, Cherkeley Court, Leatherhead.*

ANTHRACITE AS FUEL.—No one that I am acquainted with, who has given anthracite coal a trial for horticultural use, even thinks of using aught else afterwards. This coal possesses decided advantages over any other fuel, when we consider the minimum of labour required in stoking, the extra heat given, the cleanliness in its use, and the perfect freedom from smoke. Of course coke gives no smoke, but it does give off a lot of sulphur, which is most disagreeable to the stoker. Another point about anthracite is the small amount of cost incurred in carting as compared with coke, and to many this is a great consideration when two tons of anthracite are of more value than three tons of coke. It is argued against the employment of anthracite for horticultural use that more difficulty is found in stoking, but that is not so where a man is up to his work. In the first place, it is necessary to ensure a good draught, which is given by a well-set boiler and a fairly-high chimney; in our case the latter is about 20 feet high from the junction of the flue to the chimney top. The boiler is a plain saddle, 4 feet long, with a waterway back, one of the best forms of boiler, not only for the burning of anthracite, but for giving heat also. This one boiler works 3000 feet of 4-inch piping, the houses consisting of vineries, stoves, Melon, Cucumber-hills, &c., and for the year just past our coal-bill is £52 17s. 9d., or, in weight of coal, 51 ton 19 cwt. The method adopted here in stoking is to allow the fire to burn down quite low in the afternoon, which gives an opportunity to clean the bars and corners of the flue connected with the end of the boiler and the water-way back. By this means nothing but clear bright fire is on the bars, an entire absence of ashes or clinkers; a thorough draught is thus ensured. The coal is broken in size rather larger than a cricket-ball; the fire is gradually built up until at the last time, say, 9 p.m., the inside of the furnace is full of fire and fresh fuel. From the time the bars are cleaned in the afternoon, no more stoking of the fire is needed until morning, when, if the weather necessitates, it is cleaned, and the draught regulated accordingly, otherwise the fire is checked until afternoon again. The ashes in the pit are removed daily, the ash-pit is kept damp, a

bucket or two of water being placed in this every afternoon. If everyone would adopt this plan, they would find anthracite a boon, not only in giving heat, but in a saving of labour in stoking. Where so many fail is in allowing the fire-bars to be coated continually with clinkers, the flues at the end of the boiler to be choked, and the ash-pit filled with ashes. It is a mistake to break the coal finer than as above-named, for if so done, the fire is inclined to burn dull. Anthracite is a decided boon to those who have boilers too small for the amount of pipes to heat. I know an instance where the boiler was too limited to contain a sufficient quantity of coke to enable the fire to last until morning. A change was made to anthracite, with the result that the fire was always alight in the morning, and the pipes were also warm. Such facts as these prove the advantage of one class of fuel over another. Where people fail in the use of anthracite is by bad stoking, and improperly constructed chimney and flues. *E. M.*

PEAR, BEURRÉ BALYET PÈRE.—Much has been written and said of late on the best varieties of Pears to plant, but in no statement on the subject have I seen the above Pear mentioned. As a mid-season variety, it is excellent as supplied to me; and it succeeds as a cordon or pyramid on the Quince stock, and is a good hardy, free setting, variety. When fully exposed the fruit is streaked with red, and when ripe it is melting, and of good flavour, and by care it can be preserved till Christmas. The above variety was the only one out of twenty pyramids in a fully exposed row, after the late spring frost of 1891, which set and ripened its fruit, which were in some cases nearly 1 lb. in weight. *John Chinnery.*

SWEET PEAS.—It is known that to secure an early supply of bloom, seeds of Sweet Peas should be sown in pots in February, grown on till the middle of the present month, and then transplanted in the pots just as they are, at 10 inches apart, in some well sheltered spot. Forty such pots would supply a large quantity of flowers. Sow the seed of a first-rate strain, even if the seed be sown thickly. Place them in a cold frame, and shield them from frost. White Sweet Pea flowers are much liked. Mrs. Sankey, one of Mr. Eckford's raising, should be grown—a good thing; in fact, I know of no better. When Sweet Peas are raised in pots and transferred to prepared sets in the open, the leaves at first are tender, and liable to be eaten by slugs, which, however, may be kept away by timely dustings of soot; some protection is also needed for a time, and there is no better plan than placing a few spruce boughs around the plants, putting net stakes to them at the same time. To follow these, there should be a sowing made out in the open in well-prepared trenches, sowing the seed somewhat thickly, and when the plants are about 3 inches high, thinning them out. *H. Markham, Mereworth Castle, Maidstone.*

A WIDELY-TRAVELLED AND USEFUL TIN CAN.—Messrs. Miller, plumbers, Haymarket, Edinburgh, have just repaired for me a tin can which I have carried about with me and used during nearly the whole of the extensive and protracted journeyings performed while employed by the India Office in collecting seeds and plants of various species of quinine-yielding trees (*Cinchona*s) of South America, together with the India-rubber trees of Central America and Brazil for introduction and cultivation in India. The waters of the river Jumbaz, and its tributaries in Northern Peru; the rivers Catamayo and Cayuquill, in the Republic of Ecuador; of the rivers Patia, Daqua, Cauca, Caqueta, and Magdalena in the Republic of New Granada; of the rivers Chagres, and Trinidad, on the isthmus of Panama; of the Amazon, in Brazil; of the Nile, in Egypt; and of the Cauvery, in India, have all been carried in this can! When crossing the Cordillera to the westward of Loxa with the collection of Crown bark seeds which formed the original stock from whence have been derived the numerous plantations of this valuable species in India and Ceylon, the seeds were put in the can with the lid firmly tied down during the descent of the slopes in drenching showers of rain, and thus were securely preserved. Nothing short of this expedient would have succeeded, for owing to the high temperature and densely humid atmosphere of the wooded region traversed, every article of clothing and other objects were mildewed or moulded in a single night. Apart from these services, the can has at one time or other—during our lengthened sojourn in those regions—contained all the different descriptions of food and beverages

in use among thirteen different tribes of South American Indians. *Robert Cross, Victor Park, Corstorphine.*

CALIFORNIA AS A HOME.—Believing the letter of your correspondent of Amador County, California, to be misleading to the people of this country, I beg to reply to it briefly. He makes out there are splendid advantages, in the way of cheap land, rich soil, no storms, no winter, sure crops, and free schools; also wonderful returns from Peaches and Apricots. Having lived some time on my own ranch, which is in the best wine county of California, viz., Sonoma, and situated near Santa Rosa, I will give you a few facts: I paid 100 dollars, or £20, per acre for my ranch. The soil is so poor you cannot grow any vegetables, except on a very small patch out of the many hundred acres, where you can pump water enough to irrigate them every day. Having no rain from one December till the next, as your correspondent says, no storms, no winter, and the temperature averaging about 80°, how would you expect to get a green crop under such conditions? Then, as to the wonderful returns for fruit: I could never get more than about 1 cent per pound for Peaches or Apricots, and from 5 to 7 dollars per ton for Grapes, and I have had to take them 10 or 20 miles as the case may be, and then sometimes to be sold at the canneries and wineries, when I got there, that they did not want them, then; so you may dump them out of your wagon where you like, and that, after working your vineyards for five years before you can gather a crop, and running the risk meanwhile of being eaten clean by locusts, or have the crops spoiled by other causes. Your correspondent says Grapes will not ripen in San Francisco; the fact is, there is no place in which to grow them at San Francisco, for it is nearly all sand-hills. Then he states that from 10 to 5 acres is enough land for a man to get a living on. It is absurd. Not one of my neighbours who owned hundreds of acres, with a great part of it in vineyards, but had to turn out on the roads and otherwise to make a living with their teams. Now for free schools: I admit you do not have to pay a direct school fee, but I think your correspondent should have told your readers how they were supported, and that is, by heavy taxation; every man over 20 years of age, and until he is 60 years old, has to pay 10s. 6d. per annum, or what is known there as the Poll Tax; and then everything else which he possesses, whether real or personal estate, even to his chickens or goat, or his watch, if he is fortunate enough to have one—in fact, everything that he owns, whether in coin or kind, and if he should be fortunate enough to live within a city boundary, is taxed, and he has to pay his estate taxes twice a year—i.e., the city tax and the county tax, which combined may mean 3 dols. in every 100 dols., or 1s. 6d. for every £100 of value he owns, down to his wife's brooch or ring, if she have any. Ladies have to pay for themselves where the property is in their own name. I have just received a letter from California, stating there are hundreds of intelligent men with abilities who would be glad to give their services for their board. I would advise all your readers to have all the facts before them before making California their home. *William Carter, Cheltenham.*

TECOMA CAPENSIS IN FLORIDA.—Your excellent engraving of the flowers of this plant on p. 275 reminds me of its great beauty in Florida, where it has been introduced to some of the flower gardens adjoining the residences of the white people. One plant, which I saw had been trained to a pole about 12 feet high, and had grown to the top, forming a column about 3 feet in diameter at the base, and only a trifle less at the top. At the time I saw it (December 23) this was covered, but not too thickly, with bunches of beautiful scarlet flowers, and formed one of the finest sights among flowering shrubs that I have ever seen. The corymbs on the plant in question were larger than your figure, most of them having from eight to a dozen flowers. It has a peculiar habit in that country of throwing out strong horizontal shoots on the surface of the soil; these appear to grow very quickly until they get from 1 to 2 yards in length, and quite away from the original plant, when they strike root at the end, and throw strong upright shoots, which form lateral branches, and flower. The horizontal running stem survives after these natural layers become good-sized bushes. Those plants that had grown naturally were not more than 4 feet high, but were growing in almost pure sand. The trained specimen before alluded to was more favourably situated in this respect, being

in a slight valley, with a good proportion of black earth among the sand, and plenty of moisture. In addition to this, the weather at that date was about the same as we had in England in June, 1887, clear and hot, with a dense fog occasionally in the early morning, which, to some extent, counteracted the excessive drought. Gardenias, *Hibiscus sinensis*, Cotton-plants, &c., were growing and flowering in close proximity. A plant of this Tecoma which I brought home has flowered twice in the stove here, but the colour is not nearly so good, and the same may be said of the whole appearance of the plant under pot-culture at present. Probably it would succeed much better if we could plant it out in an intermediate-house. *W. H. Divers, Ketton Hall Gardens, Stamford.*

FRUIT PROSPECTS, AND PROTECTING TREES.

—At the time of writing (the end of February), I am glad to say the buds of fruit trees are well backward. Apricots and Peaches, however, are at this season fast swelling their buds, and the first-named showing colour, but as they are late, there are better prospects of having a good crop. What has kept trees back so much is the absence of sun, but in forward seasons a check may be given to the progress of the buds by running down or drawing the blinds for an hour or two during the brightest part of the day, or having fishing-nets fixed, so that they just break the solar rays without much obstructing the light. Some think that fishing-nets are of little or no use as protectors, but I consider them of great value, especially if put up double, as then the meshes cross, and if we get pelting rains, hail, or snow-storms, the net forms a sufficient obstruction to stop their force, and so prevents damage. Not only will nets do this in the case of storms, but when keen, cutting winds prevail, as they often do during March, the net acts as a protection to the tree. Helpful as the net is in the way referred to, its value does not end there, as it intercepts radiation, and therefore increases the warmth by night, and so assists in warding off frosts. Given, then, a narrow glass coping and a double fishing-net made fast to it, and below secured to a rail run along and supported to stakes driven into the ground a yard or so from the wall, and one has an excellent shelter for his fruit trees. In my young days, Spruce Fir branches were thought much of for protecting trees, but they are rarely used now, as the trouble of getting them and putting them on or up securely is great, and they shut out too much of the sunlight from the blossoms. On some of our walls we use an open cloth with the sides bound with strong tape or webbing, and rings sewn on, which run on wires strained just under copings, and near the ground, and the coverings are easily drawn and secured. *J. Sheppard.*

WINEBERRY.—There is no doubt the "Wineberry" and *Robus phoenicolasius* (see pp. 269 and 282) are the same plant. I have heard its hardiness questioned, so I give an experience of a large plant trained on a cut Furze hedge at Oakwood gardens. The severe winter of 1890-91 appeared to cut it very hard, and the bark at the base peeled off; it was as bare as a walking-stick, and I thought its fate was sealed. However, in due time it showed itself to be in vigorous health. The beautiful berries were greatly admired by visitors, and had a pleasant taste. We had to net the plant as the birds attacked the fruit, even before it was ripe. *G. F. Wilson, Heatherbank, Weybridge Heath.*

WATERING COKE.—I quite agree with "Practice" in his note of last week, as regards stoking with the above. During the past winter we have consumed large quantities of coke, and I have always found that, using it rather damp is preferable to a dry state. Also, on banking up, a much steeper and lasting heat can be secured by using coke when slightly moistened. I may also mention, that keeping the ash-pans constantly filled with water helps in a great measure to keep the fires clear, and less liable to clinker. At least I have invariably found it so in connection with the large upright boilers in use here. *T. H. Bolton, Milner Field.*

NEW GARDEN HINGE.—On p. 119 of the *Gardeners' Chronicle* for January 23, 1892, you gave an engraving of a strong and durable hinge. I have certainly found it a very useful hinge for many purposes, and I quite agree with Mr. Piper as to its merits, and also as to the worthlessness of the cast-iron butt hinges. I will not take up space to follow him in his other remarks, but only to tell

him that he cannot patent that hinge, or that if he has done so his patent is worthless, for I have used hinges of the same principle for the last eleven years, and they were made and used many years before that. I was making some lately for myself, and anyone can make them. To be fair to Mr. Piper, I will say when I first used them eleven years ago it was to a ventilator for a small shed in the garden of Mr. William Parke, of No. 6, Jessamine Cottages, White Horse Road, Croydon, Surrey, and I have no doubt they could be seen there now, though I have not seen the place for a number of years. *Thos. Cartwright, Gardener, 77, High Street, Fulham.*

SCOTLAND.

BOTANICAL SOCIETY OF EDINBURGH.

FEBRUARY 11.—The Society met on this date at 5, St. Andrew Square. Dr. Christison, President, occupied the chair.

Flowering shoots of *Aconitum venetum* and *Hamamelis japonica* from the Royal Botanic Garden, and *Chimonanthus fragrans*, *Garrya elliptica*, &c., from Mr. Dunn, Dalkeith Gardens, were exhibited.

An obituary notice of Dom Pedro II., Emperor of Brazil, an Honorary Fellow of the Society, by Dr. R. H. Gunning, was read by Dr. Cleghorne. Eulogistic reference was made to the late emperor's statesmanship, erudition, and scientific attainments, and especially to his encouragement of botany.

A paper entitled "Supplementary Notes on the Marine Algae of the Orkney Islands," sent by Mr. Geo. W. Traill, contained a list of many species not previously found in these islands, including *Calothrix pulvinata*, *C. scopulorum*, *Rhodomenia palmata* var. *tenuissima*, *Corallina mediterranea*, and *Dicysiphon suppuroides* var. *fragilis*. The last-mentioned is now first recorded as a British form.

Mr. Arthur Bennett, F.R.S., sent "Notes on the Records of Scottish Plants for 1891." The total number of new stations recorded for the year is 320, the largest number, 59, being from West Inverness, by Mr. Druce. The author recommended careful search in the islands of the Outer and Inner Hebrides as likely to be profitable. Commenting on the paper, doubt was expressed by Professor Balfour and Doctor Craig whether *Eriophorum alpinum* had ever been gathered on Craig Chaillich, Perthshire.

Professor Balfour gave an account of the life-history of the Mistletoe, illustrated by a large number of lantern illustrations.

Mr. W. Etherington Dixon, Associate, read a paper on "Economic Orchids," in which he narrated instances of very high prices given for plants, and gave a review of the medicinal and other uses to which certain species were put.

Report on Temperature, &c., at the Royal Botanic Garden during January.—The weather was exceedingly cold and frosty, with much snow during the early part of the month. Frost was registered every night in succession but one, from the 1st till the 25th, after which the temperature rose rapidly till the end of the month. Such a long continuance of frosty nights is unusual, but at no time was it very severe. The lowest readings were on the 8th, 22°; 10th, 22°; 13th, 21°; 16th, 22°; and 17th, 22°. Although the lowest reading was thus only 11° of frost, the collective amount for the month was 136°, as against 126° for the corresponding month last year. The lowest day reading was 33° on the 11th, and the highest 65° on the 29th of the month. Very few plants came into flower in January. Of the forty selected plants whose dates of flowering are annually recorded to the Society, only one came into flower, viz., *Galanthus plicatus*, on the 26th. At the same date last year, five were in flower, and in January, 1890, as many as eighteen of the forty had flowered. On the rock garden, the following came into flower:—*Galanthus plicatus*, *Polygala Chamæbuxus* var. *purpurea*, *Geum minimum*, *Hepatica angulosa*, *Helleborus purpurascens*, and *Primula variabilis*.

Mr. Bullen's Report on Temperature, &c., at the Botanic Garden, Glasgow.—The temperature was at

or below the freezing-point on seventeen nights, during the first three weeks. The last week was unusually mild, with frequent light rain, and at times stormy; 10° of frost was registered during the nights of the 9th and 15th respectively. The total night frost was only 64°, and four times at freezing point. Owing to the unusually high temperature of the last week, the mean for the month is comparatively high. Snow fell during the night of the 6th, and owing to the continuous frosts, the ground presented a very wintry appearance till the 17th, when the temperature gradually became higher as the month came to a close. The readings for the last eight days varied from 40° to 51°, and at night from 40° to 47°.

ABERDEEN UNIVERSITY NATURAL HISTORY MUSEUM.

The scope of the recent extension at Marischal College, Aberdeen—for which the Government gave £5400—is evident in the extensive improvement and enlargement of the Natural History Museum. This Museum in its unregenerate condition—for its condition hitherto, through no fault of the Curator, Professor Alleyne Nicholson, might fitly be described in such terms—has long been familiar to those frequenting Aberdeen University Buildings. That the elements of a representative museum of natural history were there seemed certain, but from want of space, and from other causes, the collection was neither particularly useful nor pleasant to look at. Under the hampering influences of inadequate funds and meagre accommodation, the Museum has remained till now in an unsatisfactory state, from which no amount of enthusiasm or scientific skill could rescue it. Even by the aid of that portion of the grant to which the department of natural history was entitled, Professor Nicholson has not been able to do what he wished to do, and yet the Museum has undergone a transformation which even to the casual observer bears the impress of the extraordinary painstaking labours of Professor Nicholson and his assistant, Mr. T. W. Ogilvie. For months past they have been engaged on the laborious process of putting the old material into ship-shape, and arranging the new material, much of which Professor Nicholson has presented to the University. The Museum in its present condition looks quite different to the somewhat dingy place it used to be. All the old specimens have been cleaned, and every specimen has been re-labelled. The labour involved in the process of labelling alone has been enormous, but in this way the Museum is rendered extremely useful to the students. The most striking feature of the improvements is the enlarged accommodation. The natural history department now consists of a suite of some half-dozen rooms. With the enlarged accommodation at his disposal, Professor Nicholson has devoted the main hall to zoology. Every inch of space available has been utilised. From floor to ceiling the walls are covered with cases, while along the entire length of the hall run two parallel rows of floor cases. The hall looks very handsome, and bears on every hand traces of the Curator's skill and labour. The re-arrangement of the specimens has been carried out on an extensive scale. In the floor cases, there are the elements of the vast subject which Professor Nicholson has to deal with, namely, the protozoa. The development of the protozoa is carried out in a clear and concise manner, Professor Nicholson's skilled draughtsmanship being conspicuous everywhere. The galleries are devoted to fishes and reptiles, while the mammalia are located in the ground cases. The geological collection occupies part of the extended wing. It is an extremely interesting collection, and is largely the production of Professor Nicholson, who has presented numerous rare specimens to it. This room is perhaps half the size and height of the main hall, but here also all the space is already utilised. The walls are lined with cases, and a series of lower cases cover the floor. In some departments the geological collection is unequalled anywhere, and for the student it will prove extremely useful.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

A meeting of the acting directors of this Society was held in Aberdeen on Wednesday evening, February 24, to consider the arrangements for the forthcoming floral *fête*. There was a full attendance of the directors, Baillie Crombie presiding. After a good deal of conversation, it was agreed to hold the annual exhibition of the Society at Central Park, Kittybrewster, Aberdeen, on Thursday, Friday, and Saturday, August 18, 19, and 20; and that cavalry sports be held in connection therewith. It was remitted to the Secretary (Mr. A. M. Byres), and Sir Arthur Grant to carry out the necessary arrangement for the sports. The other business was routine.

We understand that a requisition is about to be sent to the Secretary of the Society requesting that a special meeting be called to discuss the question of holding cavalry sports in connection with the flower show. The requisitionists are strongly opposed to any such proposal on the ground, not only that the result will be the sacrifice of the flower show, but also on account of the financial risk involved in the venture.

GARDENING NOTES.

THE latter part of the article by "Semper Paratus," p. 212, will, I feel sure, commend itself to every fair-minded, intelligent, and practical gardener, in so far as it relates to certificates and gardeners' engagements.

Seven years ago the same idea occurred to me, and so strongly did I feel with regard to it, that I had serious thoughts of trying to start an association for providing employers with suitable men, and vice versa; but between doubts entertained as to securing sufficient influence for a start, and circumstances at that time arising likely to alter my then position, the matter was dropped.

BUT as "S. P." mentions a society for this purpose, and as no new society which might be created could have half the weight and influence which is already wielded by the Royal Horticultural Society, and as many ladies and gentlemen all over the kingdom are already members or fellows of the Society, they would have no hesitation in resorting to it when in quest of suitable men. Let us hope, therefore, now that the Royal Horticultural Society has (according to your leader in the issue for February 20) passed through the slough of despond—or despair, shall I say? that the grass will not be allowed to grow under our feet until this matter has been taken up in a manner so hearty and enthusiastic as to bode a speedy settlement, on a basis broad enough to include all those grades mentioned by "S. P.," but, at the same time, stringent enough to prevent interlopers and dummies from passing through the lines, and so ensure patrons getting only such men as they may apply for. This may easily be effected by the council of the Royal Horticultural Society creating a committee to formulate a scheme, and to deal with the whole matter in detail.

If I may be allowed a suggestion here, the latter could be carried out on some such lines as these, viz., let all gardeners of every grade caring to patronise it send in their names for registration in their respective classes, giving at the same time all particulars as to age, whether married or single, the number of family, length of service in present and at least two previous situations, and in what capacity, where and under whom they served their apprenticeship, &c.

NOW for the proper test. At quarterly meetings of this committee, all those concerned within a given radius from London to appear before them, when papers would be set each class or grade, to be answered or filled-in in a given time, when Certificates of Merit would be granted individually, according to merit or according to a given number of points gained, as is done in the Civil Service examinations. It will be understood that the papers set should be kept secret until examination day. For outlying centres throughout the country, sub-committees would have to be appointed. Of course, those who failed in these examinations would be eligible to come up again.

THIS, to some, may appear a somewhat tedious and clumsy procedure, but looked at broadly, there appears to be no reason why it should not work smoothly. Our young and middle-aged gardeners would be, I am certain, only too glad to secure, at whatever slight personal expenditure and study it might cost them, one of these certificates which ought—looking at the honour and the source whence obtained—to be an open sesame to the holders in securing such situations as their abilities thus shown ought to entitle them to.

IN the other parts of "S. P.'s" article great inconsistency is exhibited, which cannot fail to attract the most casual reader. After having delivered himself in terms anything but favourable to the lecturers now engaged on behalf of various county councils, he goes on to ask these very men, whom he has so deliberately lashed, to use their eloquence to raise the status of the gardener out of the depths of degradation and obscurity into which he says they have fallen.

We should certainly have thought that "S. P.'s"

me, are all practical gardeners. How, then can "S. P." tax them with giving far-fetched lectures, or propounding false theories? *Pomum*.

THE BULB GARDEN.

GALANTHUS CAUCASICUS.

THIS charming *Galanthus* is now flowering at Tottenham, and although not so useful as *G. Elwesii*, it still possesses sufficient attractions to entitle it to a place amongst the early spring bulbous plants. Being a plant of recent introduction, it is, as yet, comparatively scarce. It is a very distinct species, the foliage being of a deep glaucous green, and the flowers white, with a large and very conspicuous green blotch on each of the outer segments. It is quite hardy, and very free-flowering.

GALANTHUS FOSTERI.

This is a *Galanthus* of recent introduction, in

FIG. 44.—PLAN OF A MAZE. (See "Notices to Correspondents.")

young men, with the fundamental nursery training, &c., and arrived at the mature age of thirty years, armed with that power and knowledge sufficient to excite the envy of professors, &c., would at least have risen to positions far removed from degrading obscurity without the aid of the eloquence of a lecturer. Very many young men have had a nursery training, have had the requisite number of shifts, have also seen the best practice as carried out in gardens both north and south, and having arrived at the age of thirty, yet have never exhibited any powers or knowledge worth speaking of—certainly not sufficient to excite anyone's envy.

There is something more required, I may assure "S. P.," beyond the curriculum laid down by him to enable men at the age of thirty, possessing powers and knowledge which a professor might envy; and unless they possess this something, they will, I fear, still abide in their obscurity, despite the aid of lecturers.

A word as to these latter. If "S. P." means by these, county council lecturers, he is labouring under a misapprehension as to their duties. These lectures, so far as I am aware, were never intended to advance either the status or education of gardeners in the rudiments or otherwise of their profession, but cottagers or allotment holders only, or only those who never have had the advantage of a garden training; and the lecturers now at work, so far as known to

appearance resembling a gigantic form of *G. latifolius*, having broad and very deep green-coloured leaves, and large white flowers, tipped with green; and it is distinct from any other species. Being thoroughly hardy, it is a nice acquisition to the genus. *E. S.*

COLONIAL NOTES.

SPORTS.

IN reading a report of a paper read at the National Chrysanthemum Society in November last, and published by you, I noticed that Professor Henslow, speaking of sporting in plants, puts down climatic changes as being in a great measure the cause of this, and I send you a few facts that have some bearing upon the same thing. I had sent me some seed of *Papaver nudicaule* in the three colours, imported from Tottenham, and was surprised to see at flowering-time that 95 per cent. of the orange-scarlet had changed to yellow, being orange-scarlet only whilst in bud, opening generally a clear yellow, but now and again with orange streaks in them, so that I had to discard this colour altogether in selling them. The whites and yellows were very clear in colour, but very abnormal; about 20 per cent. were semi-double in character, and 5 per cent. as double as a Poppy Anemone. When the last named

came single, they were as large as the Shirley Poppies in many cases. Another batch, grown 30 miles away, by a nurseryman friend of mine, from Cannell's seed, came exactly similar, so that these changes were undoubtedly due entirely to climate. I have seen many new plants imported into the old country when at Kew and Tottenham, but I never saw such a striking case. If selected doubles come true when sown again, I will send some to England, and have their permanency tested. Plants under cultivation with us, of course, have a more generous climate than yours; but when not under cultivation, our summer acts the part of your winter, the droughts killing a great part of the garden plants as well, if they are not well looked after. I have thought several times of sending you an article on Australian gardening, as your past records are very poor in this respect; but in a new country our time for literary work is very limited. [Please do not. En.] F. Elsom, The Nurseries, Canterbury, Melbourne.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

RATING OF GREENHOUSES.—This question came before the magistrates at the Hammersmith Vestry Hall, on February 24. Messrs. Collins & Collins disputed the assessment on their nursery, on the ground that under the Public Health Act of 1890, Orchards and Nursery Grounds were exempt from extra rates, other than that charged on the usual cultivated land. The magistrates decided against Messrs. Collins, on the ground that the Act does not apply to London. This seems a great anomaly. Can you or any of the readers of the *Gardeners' Chronicle*, say whether any cases have been decided elsewhere in the County of London. E. C.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—
Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Cereals, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending February 27, is furnished from the Meteorological Office:—

"The weather during this week was much less wintry, and unsettled than during the preceding week, but much wet fog and mist were experienced during the latter part of the time. The rainfall was generally slight, but some rather large amounts were recorded at Scilly and in 'Ireland, S.'"

"The temperature was a little above the mean in 'England, S. and S.W.', as well as in 'Ireland, N.' and the 'Channel Islands,' and just equalled it in 'England, N.W.' and 'Ireland, S.'; in all other districts, however, it continued below the normal, the deficit ranging from 1° to 3°. The highest of the maxima were registered in most cases on the 25th, and varied from 55° in the 'Channel Islands,' and 54° over Ireland and in 'England, S.,' to 46° in 'England, E.' The lowest of the minima were recorded on the first day of the period, when the thermometer fell to 11° in 'Scotland, E.' (at Nairn), 19° in 'Scotland, N.,' 20° in 'Scotland, W.,' and to between 25° and 31° in most other districts, and to 39° in the 'Channel Islands.'"

"The rainfall exceeded the mean in 'Ireland, S.' and the 'Channel Islands,' as well as in 'Scotland, E.,' and equalled the normal value in 'England, N.E.' In all other parts of the Kingdom there was a deficit. In 'England, S.,' 'Scotland, N. and W.,' and 'Ireland, N.,' the fall was very slight."

"The bright sunshine exceeded the mean in 'England, W.' and in 'Scotland, N.'; but was deficient elsewhere. The percentage of the possible amount of duration ranged from 36 in 'England, S.W.,' 31 in 'Scotland, N.,' and 30 in 'England, N.W.' and the 'Channel Islands,' to 23 in 'England, S.,' 11 in the 'Midland Counties,' and 8 in 'England, N.E.'"

MARKETS.

COVENT GARDEN, March 3.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET quiet, but prices are well maintained. Large consignments of 'Tomatoes, Potatoes, and Beans from the Canary Islands and Madeira to hand, at lower values. James Webber, Wholesale Apple Market.

Herbs, per bunch	0 8-1 0	Turnips, per bunch	0 4-0 6

Best samples still maintain their price. Many lots are coming to hand affected by recent severe weather, which sell at low price. The probable tendency will be upward for lots free from frost. Best, 90s. to 100s.; Medium, 70s. to 90s.; Blackland and Inferior Magoums, 60s. to 70s. J. B. Thomas.

SEEDS.

LONDON: Feb. 29.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report a greatly improved feeling in the trade, considerable quantities of Clover seeds having changed hands at full prices. American red especially exhibits a substantial advance. Other varieties are steady. More doing in Tares. Canary seed is now cheaper in London than Liverpool, which is most unusual. Peas in improved request. Mustard and Rape seed firm. Linseed dull. Haricots unchanged.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending February 27, and for the corresponding period last year:—1892: Wheat, 32s. 8d.; Barley, 27s. 10d.; Oats, 20s. 1d. 1891: Wheat, 32s. 4d.; Barley, 27s. 5d.; Oats, 18s. 2d.

FRUITS AND VEGETABLES.

SPITALFIELDS, March 1.—Quotations:—Savoys, 1s. 6d. to 3s. 6d.; Cauliflowers, 1s. 6d. to 10s. 6d. per tally; Greens, 1s. to 1s. 6d.; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 1s. to 2s. 6d. per bunch; Spinach, 1s. to 1s. 6d. per bushel; Turnips, 2s. to 3s. 6d.; Swede-tops, 1s. to 2s. 6d.; Sprouting Broccoli, 1s. to 2s. per sack; and 1s. to 1s. 6d. per sieve; Endive, 1s. to 1s. 6d.; Cabbage Lettuces, 4d. to 1s.; Leeks, 2s. to 3s.; Beetroots, 3d. to 4d. per dozen; Mustard and Cress, 1s. to 1s. 6d. per dozen baskets; English Onions, 6s. 6d. to 7s. 6d. per cwt.; Bordeaux do., 4s. 6d. to 5s.; Spanish do., 6s. 6d. to 7s. 6d. per case; Celeriac, 4d. to 1s.; Horse-radish, 1s. to 1s. 1d. per bundle; English Apples, 2s. 6d. to 3s. per bushel; American do., 12s. to 20s. per barrel; foreign Tomatoes, 1s. to 1s. 6d.; Seakale, 1s. to 1s. 6d. per p. bunet; Parsnips, 4d. to 6d. per sieve.

BOROUGH, March 1.—Quotations:—Savoys, 3s. to 5s.; Broccoli, 5s. to 7s. 6d. per tally; Sprouting ditto, 1s. 6d. to 2s. 6d.; Turnip-tops, 1s. 6d. to 2s. 6d. per bag; Spinach, 1s. 6d. to 2s. per bushel; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half sieve; Greens, 1s. 6d. to 1s. 9d.; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. 3d. to 1s. 9d. per dozen bunches; English Onions, 6s. to 7s. 6d. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 11s. to 20s.; Newtown Pippins, 15s. to 28s. per barrel.

STRAATFORD: March 1.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Savoys, 2s. 6d. to 6s. per tally; Greens, 1s. 3d. to 1s. 6d. loose; do., 1s. 6d. to 2s. per dozen bunches; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; do., 3s. 6d. to 7s. per tally; Turnip-tops, 2s. to 3s. per bag; Broccoli, 2s. to 3s. do.; Brussels-tops, 3d. to 1s. do.; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; do., 2s. to 2s. 6d. per bundle; Celery, 1s. to 1s. 6d. per roll; Horseradish, 1s. to 1s. 6d. per bundle; Turnips, 2s. to 3s. per dozen bunches; Carrots, household, 3s. to 40s. per ton; do., cattle-feed, 15s. to 32s. per ton; Parsnips, 6d. to 10d. per score; Mangels, 16s. to 18s. per ton; Swedes, 15s. to 22s. do.; Onions, English, 100s. to 140s. per ton; do., Dutch, 3s. 9d. to 4s. 6d. per bag; do., Bordeaux, 3s. 9d. to 4s. 3d. per case; Apples, English, 2s. to 5s. 6d. per bushel; do., American, 14s. to 20s. per barrel.

POTATOS.

SPITALFIELDS: March 1.—Quotations:—Magoums, 52s. 6d. to 70s.; Imperators, 60s. to 80s.; Hebrons, 60s. to 80s.; Main Crop, 70s. to 90s.; Snowdrops, 80s. to 70s. per ton.

BOROUGH: March 1.—Quotations:—Hebrons and Elephant 70s. to 90s.; Imperators, 60s. to 85s.; Bruce Magoums, 60s. to 90s.; Dunbar Magoums, 90s. to 105s. per ton.

STRAATFORD: March 2.—Quotations:—Magoums, 50s. to 70s.; Imperators, 85s. to 75s.; Bruce Magoums, 60s. to 75s. 6d.; Scotch do., 65s. to 75s.; Main Crop, 90s. to 110s. per ton.

NOTICES TO CORRESPONDENTS.

ARSENIC AND WEEDS: *J. A. V.* It will kill vegetation on walks, including the Grass verges, &c., but it is a dangerous substance to employ for the purpose; dogs and cats rolling on it, and afterwards licking their coats, may be poisoned; also domestic fowls, pheasants, &c. It is safer to employ common salt, spreading it evenly and thinly over the surface in dry weather in May, but not nearer than 8 inches to the live edgings. If you have the means of boiling large quantities of water, weeds may be killed at any season and in any kind of weather, by distributing boiling water, in which 1 lb. of salt to the gallon is dissolved. Do not use tinned cans, or those which are painted. Very dirty walks are better if the surface gravel be turned over with a steel digging fork.

BEGONIA SEED: *T. H.* Unless you can afford your seedling tuberous Begonias a humid temperature of 60° to 65° at night, and 75° to 80° by day, progress will be very slow for some time yet.

BOOKS: *F. N. Villa Gardening* (Ed. Hobday), Macmillan & Co., Bedford Street, London, W.C.

BUILDINGS ERRECTED BY TENANT: *S. N.* The buildings being of brick or stone, with foundations in the soil, remain the property of the freeholder, notwithstanding all oral promises, or agreements to the contrary, that your father may have obtained from the previous owner of the land. In any case you should consult a lawyer.

CUCUMBER-HOUSE: *F. N.* Your house, as shown in the sketch sent, will do very well for summer Cucumbers, when no top-heat would be required after the beginning of June; and, although not heated with hot-water or a fire, it could be made to grow early Cucumbers, &c., by means of dung linings, if it be constructed of boards, or with pigeon-holed walls of brick.

EUCHARIS AMAZONICA *syn. GRANDIFLORA.* *W. J. B.* A native of New Grenada. We doubt if its blossoms grow any larger under cultivation than in its native habitat.

FERDINANDA *SPS. SEEDS:* *T. H.* Start them in hot-bed with a night temperature of 65°, bottom heat 80°, day warmth 80° to 85°, with ventilation. Your object should be to get them up quickly. Grow them on afterwards in a somewhat lower degree of warmth, shifting them into larger pots as the season advances, obtaining in that way good strong plants for planting out in June. The second week in March will be soon enough to sow seed.

GLOBIOSA DISEASED: *G. B.* The roots appear to have been injured by woodlice or other insect, and decay has set in at the injured place.

MAZE: *Cherry Blossom.* See p. 312, fig. 44.

MOSS: *Enquirer.* A moss is a plant and it lives upon what it can get, and what it can itself make out of water, earth, air, heat and sunlight. If you mean a lichen such as grows on old apple trees, and which is often wrongly called moss, then, the matter is more complicated, as such plants are really compounds of a fungus and an alga, the fungus lives at the expense of the alga, but the alga probably gets some benefit from the fungus in its turn, and so the two live together, each not for itself only, but for its associate also.

NAMES OF FRUIT: *G. Gilman.* Apple not known—nor any better than a crab.

NAMES OF PLANTS: *T. H. No. 3.* *Fuchsia thymifolia.*—*W. B.* 1, *Cupressus torulosa* var. *Corneana*; 2, *Tsuga canadensis*, probably; 3, *Cupressus Goveniana*. *M. T. M.*—*G. Abbey.* *Cattleya Triana*, an ordinary variety, *J. O'B.*—*Shepherd.* *Iris ambriata.*—*R. W.* *Eucomis punctata.* The bulb sent is strong enough to flower, but it seems to have scarcely had the necessary winter's rest, the growth being so forward for this part of the season. Grow the plant in the greenhouse. It should remain in the soil in the winter, and not get much water. The best place for it at that season is a bed of coal-ashes in a cold pit from which frost is excluded.—*N. J. B.* *Eucharis subcordata.*—*J. Wallace.* 1, *Spirella formosissima*; 2, *Reineckia carnea variegata*; 3, *Olearia Haastii*; 4, *Azara microphylla*; 5, *Stachys lanata*; 6, *Buddleia globosa*—sometimes it gets cut by frost.—*G. Abbey.* 1, *Camellia*, *Targioni*; 2, *C. eximial*; 3, *C. conspica*; 4, *C. Prince Albert*; 5, *C. imbricata*,

W. P. & Sons.—*R. M.* *Mormodes linoxatum* and *Dendrobium Wardianum*, the latter not remarkable.—*G. H.* 1 and 2, Both forms of *Quercus Ilex*. Such question, not being one concerning finance or advertisement business should have been sent to Editor.—*A Constant Reader.* 1, *Abies pectinata*; 2, *Abies pectinata*; 3, *Abies Lowiana*; 4, *Abies pectinata*; 5, Probably the cork Oak; 6, *Berberis Darwinii*. This is the nearest approximation we can make; it is impossible to name such detached pieces.—*E. D. L.* 1 and 2, seedling *Hellebores*; 3, *Polypodium ensiferum*; 4, *Davallia pentaphylla*; 5, *Reineckia carnea variegata*; 6, *Aloe variegata*. *M. T. M.*—*A. W.* *Dendrobium speciosum.*—*Alpha.* 1, *Begonia*, garden hybrid, probably of *D. spatulata*; 2, *Chorozoya ilicifolia*; 3, *Asparagus plumosus*; 4, *Hibbertia dentata.*—*G. H.* 1, *Asparagus plumosus* var. *tenuissimus*; 2, *Gnidia simplex*; 3, *Sparmannia africana*.

ONTOGLOSSUM CRISPUM: *H. W. W.* Very refined flowers, belonging to the set usually called gut-tatum.

POTASH AND VINES: *G. T. B.* Without potash in the soil, the stem of a Vine will not reach a fourth of the dimensions it would attain were it present. The leaves do not reach their full development, and in the hottest time of the year they become red and spotted with black, after which they become dry and are readily reduced to powder under pressure of the fingers. Potash, however, is rarely deficient in garden soil.

ROMAN HYACINTHS AND DAHLIAS: *J. B.* These roots are so cheap that it is scarcely worth your while to save them after blooming; but should you decide to do so, give them less and less water till the foliage begins to change colour, when no water should be afforded. Store in a dry place. Dahlias may be planted whole or divided in early May; or they may be split up with a bud or two to each tuber or tubers, potted in light rich mould and started in gentle heat, and when new roots have formed, put into the greenhouse and then out of doors or in a cold frame; planting them out at the end of May. If cuttings are required, put the roots in boxes or on the floor of a forcing house in a light part, and just cover them with leaf mould, taking the cuttings when they are 3 inches long. Strip them off, do not use a knife, and root them in a mild bottom heat.

TAN CONSISTING OF *MYROBALANS* AND *VALONIA:* *W. J. B.* The first are the fruits of several species of *Terminalia*, and the latter the acorn cups of *Quercus Egilope*, have no value as manure until they are completely decayed, when their value as such would be rather less than that of leaf mould. Dug into the earth in the fresh state they would merely exert a mechanical effect in rendering it porous, and they would doubtless be injurious to plant life in large quantities. There would be no harm in trenching them in—in quantity where the soil is dug three spits deep, turning them into the bottom of the trenches; and as such land would not be trenched again for a period of four or five years, the tan would by that time have been in great part decomposed.

TRECOMA CAPENSIS: *P. C. S.* and *A. P.* Obtainable through any good nurseryman. The flower when well grown is about 2 inches long, so that our engraving is slightly reduced.

TO DISSOLVE BONES: *W. H.* Mix in an earthen pit or on a stone floor with sulphuric acid, and when dissolved mix the acid phosphate with unburnt plaster of paris. Another mode, but which takes a year in its execution, is to place layers of fine woodashes and bones 6 inches thick alternately in a water-tight vessel, with a layer of fine dry earth at the bottom, expose it to the air for one year, when it will be found that the bones have dissolved.

UNDERGROUND WATERING OF GARDEN CROPS, &c.: *Gizors.* The method is not new—in fact, it has been practised in Paris for supplying the street trees with water. Our gardeners also practice a variation of the method in watering Vine-borders, and in supplying diluted liquid manure to Cucumbers, Melons, &c.

COMMUNICATIONS RECEIVED.—*H. W. W.*—*H. M. P.*—*C. D. E.* *Sierre.*—*A. W. B.*—*R. V.* & *Sons.*—*E. P.*—*F. W. M.*—*W. H. D.*—*J. W. G.*—*J. Moody.*—*S. Hardy.*—*W. A. C.*—*J. B. T.*—*W. W. OUTDOOR WORK, CONSERVATORIES, Greenhouses, Frames, &c.

1 Cwt., and Oil Mixture, Free to all Stations. Liquid Non-Poisonous Paints for Inside of Conservatories, &c. Prices, Patterns, and Testimonials, Post-Free.

GROVE WORKS, BATTERSEA, LONDON, S.W.

15, VICTORIA STREET, WESTMINSTER, S.W.; and BACHELOR'S WALK, DUBLIN.—Discount for Cash.

For all **INSECT PESTS** in Greenhouses and Frames, nothing has proved equal to the

LETHORION (VAPOUR CONE),

(PATENT).

They are now universally admitted to be thoroughly uniform in strength, and safe for any Plant or Flower, even if four times the quantity is used.

Scale and Mealy Bug may be completely eradicated by using the Cones double strength.

PRICES.—For Frames, &c., of 50 cubic feet, 6d.; 100 ft., 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each. THE HOUSES SHOULD BE WELL SECURED.

CORRY & CO., Ltd., 16, Finsbury Street, LONDON, E.C.

Prices.—In Tins, 4 Pints 1/3, Pints 1/6, Quarts 3/4, 1 Gall. 5/6, 5 to 10 Gall. Drums, 8s. per Gall. Carriage Paid.

THE MYRTLE CASTLE GARDENS, Tewkesbury, Aug. 13th, 1891.

Gentlemen,—I have given your "Climax." Insecticide a good trial on tender foliage, Orchids and Ferns for Bug and Scale. In every instance I found the Bug and Scale dead and the foliage bright and clean. I found it most effectual for Black Fly on Peach trees. The "Climax" Insecticide ought to be better known, it is the only one I have found to kill Bug on tender plants without injury to the foliage.—I am, yours faithfully,

W. MACKIE.

Prepared Solely by

The Boundary Chemical Co., Ltd., LIVERPOOL.

IMPORTANT TO GARDENERS, AMATEURS, AND OTHERS, WHO FUMIGATE HOUSES

TO KILL "FLY," OR "THRIP."

You will shortly be ordering your Spring Supply of Fumigating Material. Why lay in a heavy stock of tobacco paper, uncertain in quality, often disappointing, and very unpleasant to use, when you can have a SAFE, RELIABLE article, and one that is pleasant to use?

THE FIRST OF ITS CLASS, AND STILL THE ONLY ONE

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatoes, Peaches, &c., beyond any other Manure.

Field Crawley, Sussex, Sept. 14, 1891. "The effect of this manure is most noticeable in the development, ripening, and colouring of the fruit. In consequence of the wet and unseasonable weather, I could not get my Tomatoes growing in an unheated and rather damp house to ripen; but within three days of applying your Manure they began to colour, and I have been gathering splendid fruit almost daily since." (Signed), E. C. RAVENSCROFT.

Prices in Sacks, at Works, 10s. per cwt.; £2 per ½ ton; £3 15s. per ¾ ton; £7 per ton.

THE PATENT SILICATE MANURE CO., THE CHEMICAL WORKS, HEMEL HEMPSTEAD, HERTS.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week must reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

TO NURSERYMEN.—Situation wanted in a Market Nursery; used to Ferns, Carnations, Roses, Bouvardias, Palms, &c., and the general routine of the trade, and could take charge in employer's absence.—S. H., 45, St. James' Street, Brighton.

To Nurserymen and Gardeners.

HANDY-MAN seeks employment.—Painter, Glazier, Handy at Repairs, Carpentering, Hot-water Joints, Any District. Job not objected to. Good character.—G. BAKER, 10, Secretan Road, Camberwell, S.E.

PAINTER, GLAZIER, and CARPENTER.—A young married man requires situation as above on an Estate or Nursery. Good references.—B., Mr. R. Walker, Cranleigh, Surrey.

SHOPMAN.—Age 25. Life experience in Seed and Bulb Trade, Shop and Warehouse. Good references.—O. F., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (ASSISTANT).—Age 22; Paris and London experience. Good references.—LEON G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FLORISTS.—A young Lady desires re-engagement. Well up in all branches. Two years' experience. First-class references.—FLORIST, 14, Clarendon Road, West Green, Tottenham, N.

TO FLORISTS.—Re-engagement wanted by young Lady in a first-class Florist business.—FLORIST, *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W. C.

HOLLOWAY'S PILLS.—Good Digestion. Holloway's Pills are universally acknowledged to be the safest, speediest, and best corrective for indigestion; loss of appetite, acidity, flatulency, and nausea are a few of the inconveniences which are remedied with ease by these purifying Pills. They strike at the root of all abdominal ailments, they excite in the stomach a proper secretion of gastric juice, and regulate the action of the liver, promoting in that organ a copious supply of pure wholesome bile, so necessary for digestion. These Pills remove all distention and obstruction, and from their harmless composition are peculiarly well adapted for delicate persons and young children; whilst casting out impurities, these excellent Pills strengthen the system and give muscular tone.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketing, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hoon, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

KEITH'S PATENT RAMS & Self-acting,

HYDRAULIC RAM-PUMPS, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

BY ORDER OF MESSRS. LINDEN, BRUSSELS.

FRIDAY NEXT, MARCH 11.

"L'HORTICULTURE INTERNATIONALE"

(LIMITED),

LEOPOLD PARK, BRUSSELS, BELGIUM.

ORCHID EMPORIUM.

THE GRANDEST CHOICE OF ORCHIDS IN EUROPE.

AN UNIQUE SPECTACLE IN THE WORLD.

BOARD OF DIRECTION OF "L'HORTICULTURE INTERNATIONALE":—

PRESIDENT—J. DE LANSBERGE, Esq., late Governor-General of the Dutch Possessions in India.

DEPUTY DIRECTOR—J. LINDEN, Esq., Honorary Consul-General.

DIRECTORS—BARON DE BLEICHRÖDER, H.M. of Great Britain, Consul-General; Banker in Berlin.

COUNT ADRIEN D'OULTREMONT, M.P. for Belgium.

EDOUARD OTLET, Esq., Landed Proprietor in Brussels.

G. WAROCQUÉ, Esq., M.P. for Belgium; President of "L'ORCHIDÉENNE."

MANAGING-DIRECTOR—LUCIEN LINDEN, Esq., President of the Brussels Horticultural Board of Commerce.

COMMISSIONERS—N. FUNCK, Esq., late Manager of the Zoological Gardens in Brussels and Cologne.

G. JORIS, Esq., Solicitor in Brussels.

"No one can fail to be struck with the ADMIRABLE CLEANLINESS, ORDER, and ARRANGEMENT which characterise the Plant-Houses of 'L'HORTICULTURE INTERNATIONALE.'"—*T. L., in "Gardeners' Chronicle,"* October 24, 1891.

"The Nursery is a gigantic drawing-room, for it teems with beautiful objects, which may be inspected with perfect ease and enjoyment. In my opinion, THIS NURSERY IS ONE OF THE VERY BEST of the many attractions which the beautiful town of Brussels offers to visitors. . . . To those who want to look at all the best Orchids grown, as only a few can grow them, I WOULD RECOMMEND A VISIT TO MESSRS. LINDEN'S ESTABLISHMENT ("L'HORTICULTURE INTERNATIONALE"). ALTOGETHER, THIS NURSERY IS ONE OF THE MOST INSTRUCTIVE AS WELL AS ONE OF THE MOST DELIGHTFUL TO BE FOUND IN EUROPE."—*Garden and Forest,"* May 27, 1891.

IMPORTANT NOTICE.

We offer to each Visitor to our Establishment who purchases to the amount of £50, a discount of £5, which will cover the expenses of the journey to Brussels (Our Immense Stock at hand, and continuous large importations, enable us to make this exceptional reduction).

A Visit to our Establishment will prove most interesting and instructive. Amateurs and Orchid-growers will find at "L'HORTICULTURE INTERNATIONALE" a wonderful and immense stock of Orchids, grown in perfection, and at 50 PER CENT. LESS THAN ELSEWHERE.

ORCHIDS A GRAND SPECIALTY.

ORCHIDS, ESTABLISHED AND IMPORTED.

ORCHIDS FOR THE TRADE.

NEW AND RARE ORCHIDS.

The LARGEST and BEST STOCK of ORCHIDS in Cultivation.

For CATALOGUES and SPECIAL OFFERS, apply to—

to Mr. HOPWOOD, at the Belle Vue Nursery, 55, High
Street, or the Auctioneers, No. 1, Promenade, Cheltenham.

WANTED, A SMALL NURSERY, six green-
houses and 1 acre of land. A Midland Town pro-
ffered.—J. W. *Gardener's Chronicle* Office, 41, Wellington
Street, Strand, W.C.

JOBBER and FLORIST BUSINESS for
DISPOSAL. Goodwill, Stock, &c., £20.
Apply, CULLEN, Gresham Road, Staines, Middlesex.

**To Noblemen, Gentlemen, Committees of Public
Parks, and others interested in Horticulture.**
TO BE SOLD by private treaty, owing to the
ground having been leased for building purposes.

**THE MAGNIFICENT CONSERVATORY OR WINTER
GARDEN AT HAMMARTON, EDINBURGH.**
The style of Building is suitable either for Public or Private
Grounds. The structure is principally of Iron. The frontage
of Main Building is 140 feet, the Dome rising to the height of
40 feet from the ground. The whole interior is paved with
encaustic tiles, and heated with water. There is an orna-
mental fountain, large mirrors, &c. The whole is in capital
condition and will remove with safety.

Offers will be received for the Conservatory as it stands.
Photographs and other information can be had from the
proprietors, Messrs. R. B. LAIRD AND SONS, Nursery and
Seedmen, Edinburgh; or Mr. DAVID MITCHELL, Horti-
cultural Valuator, 6, Comely Bank, Edinburgh.
A SALE BY AUCTION of the specimen and other Plants
in the above will be held at a date yet to be fixed.

SEEDS & BULBS {VEGETABLE, FLOWER, and FARM. DESCRIPTIVE LIST, FREE. RICHARD SMITH & CO., WORCESTER.

THE OLD BROWN QUARRY EARLY POTATO. The Oldest Existing Sort in Ireland.

In existence here for 150 years; certainly, when I was a child, prior to the famine period. There was no other sort grown for harvest purposes when men worked with a sickle. I am enabled to offer it for redistribution—it never having made its way to England—from a stock preserved for years on peat land, resting on limestone, in a remote part of county Cork. There must be something in the soil that preserved it for 32 years. It is a first-class early June variety, of great substance. 7-lb. bag and postage for 2s. 9d.
WM. BAYLOR HARTLAND, F.R.H.S., Old Established Seed Warehouse, Cork, Ireland.

VINES {STRONG FRUITING AND PLANTING.—The best leading FIGS. kinds, thoroughly ripened without bottom heat. Particulars on application.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, building the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSINGER & COMPANY, LOUGHBOROUGH.
London Office:—163, Palmerston Buildings, Old Broad Street, E.C.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—

HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,

HIS ROYAL HIGHNESS THE PRINCE OF WALES,

THE KING OF THE BELGIANS,

The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,

And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 170,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competitions, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

Special quotations made for Rollers, 3 feet, 3½ feet, and 4 feet Diameter, fitted with Shafts for one or two horses.

GREEN'S PATENT GRASS EDGE CLIPPER

Size and Price, 7 inches wide, 7 ins. diam., £1 16s. Packing Case, 3s.

Specially designed to meet a want which has long been felt in cutting the overhanging grass on the edges of walks, borders, flower-beds, &c., and to do away with the tedious operation of cutting with shears.

A very useful and serviceable Machine.

MAKERS OF PATENT STEEL OR IRON ANGULAR-CHAMBERED AND TUBULAR

HOT-WATER BOILERS

AND OTHERS WITH SHELVES, AND HOLLOW OR ORDINARY CAST-IRON GRATE BARS. VERTICAL SADDLE BOILERS, &c.

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day as they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c.

Descriptive Illustrated PRICE LISTS Free on application to

THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON; or they can also be had of any Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

WEBBS' NEW POTATOS.

WEBBS' NEW POTATO, "RECORD."

5s. per peck of 14 lb.; 17s. per bushel of 56 lb.
Now offered for the first time.

A white, kidney-shaped main crop variety, strong in habit of growth, and for cropping, cooking, and keeping qualities it will be found all that can be desired.

WEBBS' NEW POTATO, "COMPETITOR."

4s. per peck of 14 lb.; 14s. per bushel of 56 lb.
First offered in 1891.

This new Potato is a seedling from the well-known White Elephant, to which it is somewhat similar in character, but rather later in season and stronger in habit of growth. It is a prodigious cropper, and a first-rate keeper. The tubers, which are kidney-shaped, are very large, and in quality all that can be desired.

WEBB & SONS, WORDSLEY, STOURBRIDGE

CARTERS' HOLBORN PRIZE PRIMULA.

The Finest Strain in Cultivation.

Awarded FOUR PRIZE MEDALS by the Royal Horticultural Society and the Royal Botanic Society.
FINEST MIXED, all colours.

Price, 2s. 6d., 3s. 6d., & 6s. per packet, post free.
SEEDSMEN to H.M. the QUEEN and H.R.H. the PRINCE OF WALES.

THE ARTIFICIAL COLORATION OF FLOWERS.

THE excitement about blue Carnations led my neighbour, Mr. W. Dorrington, and myself, to endeavour to solve the mystery by imitating it, and we soon discovered that although flowers could not be tinted by immersing them in dye solutions, they could readily be coloured by placing their stalks in aniline solutions.

Aniline scarlet dissolved in water to about the transparency of claret, has a very rapid action on flowers, colouring them pink and scarlet. Indigo carmine produces beautiful blue tints. The two combined dye various shades of purple, with curious mottled effects, some parts of the flowers becoming pink and other parts blue and purple. Greens are produced by using the blue dye with yellow. We also tried indigo, and cochineal, with partial success. Lily of the Valley flowers became beautifully tinged with pink or blue in six hours; Narcissi are changed from pure white to deep scarlet in twelve hours, and delicate shades of pink are imparted to them in a very short time. Yellow Daffodils are beautifully striped with dark scarlet in twelve hours; the edges of the corona also become deeply tinged, and the veining of the perianth become very strongly marked. Cologne cristata, Lapageria alba, Calla aethiopica, Cyclamens, Snowdrops, Leucojums, Hyacinths, Christmas Roses, Solomon's Seal, Tulips, and many other flowers were successfully treated, and many leaves were found to become coloured very quickly by the process. I send you herewith a number of examples.

The more interesting question of how this rapid change is brought about soon attracted my attention, and proved extremely interesting. The coloration is mainly confined to the vessels.

There is a system of veins in plants, the vein-tubes being clearly seen under the microscope passing through the leaves, petals, and other parts of the flower. In these tubes the motion of the coloured water can be seen, and it became evident that it was by these that the colour is conveyed and left in every portion of the plants. In the case of cut flowers, the action is very rapid, the water-tubes beginning at once to absorb the fluid, which was passed along by either capillary attraction, contraction, or possibly by some more active life force acting within the veins. My experiments in proof of this were made at first entirely with cut flowers. I afterwards tried the experiment by taking a Roman Hyacinth very carefully out of the soil,

CLAPTON NURSERY, LONDON, N.E.

Williams'

AMARYLLIS.

Fine named Varieties from our grand Collection. Dry Bulbs may still be sent by Post. 42s., 63s., and 84s. p. doz. Unnamed Seedling, 30s. and 48s. per dozen. These are the most majestic and beautiful flowers for Conservatory Decoration during Spring.

ACHIMENES.

Our Collection is the finest and most complete in the Kingdom. Dry Corms may still be sent by Post, of all the leading kinds, at 4s. per dozen.

CALADIUMS.

We can still send by Post Dry Bulbs of most of the finest varieties in cultivation, our Stock being very large. We are offering them at unusually low prices. Our Selection, 24s., 30s., and 42s. per doz. Sorts all distinct.

BEGONIAS.

We hold a large Stock of most of the best kinds in cultivation. We can still send by Post our Selections in strong flowering Bulbs, fit either for Exhibition or for Decoration. Finest Named Single Varieties, 30s. and 42s. per doz. "Double," 30s., 42s., and 63s. p. doz. "Unnamed Seedling" in separate colours, 9s., 12s., and 18s. per dozen. Mixed Seedlings, all colours, 6s. and 9s. per doz. These Seedlings are unsurpassed for Bedding-out in the Flower Garden.

DAHLIAS.

Dry Roots by Post, from our magnificent collection of Show, Fancy, Single, Cactus, Bouquet, and Border, to be had at 6s., 9s., and 12s. per dozen.

TUBEROSE.

Finest American Pearl, Selected Bulbs, extra large, by Post, 3s. per dozen.

B. S. WILLIAMS & SON

VICTORIA AND PARADISE NURSERY,

UPPER HOLLOWAY, LONDON, N.

and placing the roots in aniline water. In twelve hours the petals began to colour, and the flowers gradually became pink tinted throughout. This experiment was repeated on many Narcissi and other bulbs. It cannot, however, be said that the root fibres were unbroken, probably they were so, as I have failed to colour any flower by merely watering the soil with coloured water. The filtering appendages to the roots evidently prevent the absorption of much of the colour, as the petals of the flowers do not become either so quickly or so deeply tinted when the plant has its root as with cut flowers. It was, however, clearly seen that the vein-tubes proceeded from the roots, thus completing the water system of tubes from root to flower.

The veins when coloured are beautifully seen under the microscope as clear tubes running in parallel lines, the interspaces filled by cellular matter. The tubes gradually branch out as they proceed, and as they approach the margins they are often finely branched. When the coloured water reaches the margins of the petals they thus become deeply tintured, especially in the Narcissi, illustrating the cause whereby the Daffodil so frequently obtains the deeper colour at the edge of the corona. It is the same with the Leucocum and the Snowdrop.

Very singular results were obtained in the variegated leaves of the Anouba and Ivy—plants which, at this winter season, one would suppose, had the leaves quite dormant. Single leaves, with their stalks placed in aniline dye-water, began to colour in about three hours, and in twelve hours had their margins deeply coloured. They were thus shown to have the absorptive power, quite apart from the stem.

Another remarkable instance was seen in *Lageria alba*, which has a very thin wiry stalk, and a large waxy flower. With the stalk placed in dye-water, the whole flower became beautifully veined with pink in three or four hours—a singular fact, when one considers the minuteness of the tubes through which the liquid has to be drawn. It is difficult to believe that this can be accomplished by capillary attraction only. In *Eucharis amazonica*, which has thick stalks, the flower does not become tinted at all, but the style is dyed a deep red. The pistils of flowers always become deeply coloured, which is an important fact, showing that the solid matter of the colouring solution is thus secreted [deposited in] by the fruiting vessels of the flower.

White Tulips furnish excellent illustrations of artificial colouring, as they can be readily tinted either pink, blue, green, or purple in a few hours. The vein tubes which are thus displayed in the petals agree with the strongly-marked features known as the "flamed" or "feathered" varieties of the florist. It is generally known that all Tulips raised from seed are self-coloured when they first bloom; they are then called "breeder Tulips," and the enthusiastic amateur-florist grows on his "breeders" for six or seven years until they "break" when they become either "flamed" or "feathered" varieties. Now a florist may ascertain in six hours whether his breeder Tulip will become a feathered or a flamed sort, and whether it will be worth growing on for the breaking time, because the veining of the petal is shown by the colour, and it is that which makes the feature when the Tulip is fully matured. Blue Tulips have always been desired, and they can thus be artificially produced for florist purposes.

Daffodils and Narcissi generally can be greatly varied in colour, and especially by showing their exquisite veining when thus treated. The tube and corona take a darker and richer tone of

colour than the perianth, thus agreeing with the fact that all Daffodils are more or less bicolor. The Christmas Rose is also an interesting flower when artificially coloured. Straight tubes cross the petals from base to point, with numerous cross tubes, and the main ones branch out angularly, thus dividing the snow-white petals into a network of red lines. The interspaces are filled with oval cellules, and as the tubes are permeable, the cellular spaces become suffused with a delicate shade of pink. Snowdrops and Leucocums are also very interesting when thus treated. Their petals are veined with about eight tubes at the base, which pass across the petal to its point in nearly parallel lines, strongly and clearly marked. These are branched near the tip of the petal in fan-like form, producing rich pink margins to the flower. The double-white Camellia is another very pretty illustration, as it easily assumes a pink shade throughout. It is difficult to imagine how this is done, as the Camellia has a small woody stalk; and in the case of a double flower, with forty or fifty petals, the attachment of each of them to the tubes in the stalk must be very slight, and yet every petal becomes tinted in a few hours.

White Lilac takes the colour perfectly, becoming either pink or blue at pleasure. The Abutilon has the calyx coloured, but not the petals. These are already strongly veined, and they seem to refuse the new colour. Primulas take the colour readily, but the common wild Primrose will not be changed. Forced leaves of the Swede Turnip, grown in the dark for culinary purposes, are extremely susceptible to coloration. They begin to colour in about three hours, and in twelve hours are beautifully fringed with red, and suffused with rich orange. Thus tinted, they are beautiful objects for table decoration. *Wm. Brockbank, Brookhurst, Didsbury, March 4.* [Botanists have long since availed themselves of coloured liquids to ascertain the course of the juices of plants, and the particular tissues through which the current passes, but our correspondent gives some details of much interest at the present time, and the specimens he sends exceed in interest any that we have before seen. To the botanist they are of special value as showing so clearly the course of the vessels. The value to the florist is also curiously illustrated in the case of the Tulip. Ed.]

NEW OR NOTEWORTHY PLANTS.

PELEXIA TRAVASSOSII, Rolfe, n. sp.*

OVER two years ago, Mr. A. H. Grimsditch, of 5, Clayton Square, Liverpool, sent to Kew a plant of a *Pelexia* which had been received from Senor Travassos, in Brazil. It has since flowered in the Orchid-house on two separate occasions, and as no description can be found which at all agrees with it, I propose for it the above name, in commemoration of the gentleman who sent it. The leaves are olive-green, with silvery nerves, and a few white spots, and are borne in a radical tuft. The erect raceme bears a number of medium-sized white flowers, which are prettily lined with brownish-red, one on either

* *Pelexia Travassosii*, n. sp.—Plant 1 to 1½ foot high, with a tuft of radical petiolate leaves, subspatulate-oblong in shape, obtuse, 4 to 5 inches long, 1½ to 1½ inch wide, olive-green, with silvery nerves, and a few white spots. Raceme with about a dozen medium-sized flowers. Dorsal sepal narrowly lanceolate, acute, joined with the oblique subulate lanceolate subobtusate petals into a cucullate hood about 10 lines long. Lateral sepals spreading, lanceolate, acute, 10 lines long, prolonged behind into a basal extension, which is decurrent along the spur. Lip entire, elliptical, 3 lines long, by 2 lines broad; spur 10 lines long, adnate to the ovary for half its length, the apex being free. Column 3 lines long, white, the two stigmatic lobes dull maroon.—Native of Brazil.

side of the petals near the margin, and several similar ones on the lip, and these anastomose on the sides near the base, forming a sort of network. The habit is, of course, similar to *Spiranthes*, of which it is a close ally. It is one of the prettiest species of the genus. What is evidently the same species was sent from Brazil as a dried specimen, with the number 14,297, by Dr. Glazion some time ago. *R. A. Rolfe.*

TOO MANY SORTS OF APPLES.

I, LIKE "Pomum," consider we grow by far too many varieties of Apples (unless it be those who can afford to have a hobby of that kind), when profit or a home supply of fruit for a long period are the chief points to be considered. Another fault that I have to find is in trade lists, which in many cases contain sorts which are not suitable for growing on every kind of soil. I think more regard should be paid to this matter.

In the absence of any knowledge of the nature of the soil, it is always safer to give the names of such varieties that succeed in unkindly soils, such as are, for instance, heavy and retentive of moisture, although not stagnant, a heavy subsoil being near the surface. Varieties which will grow well in this kind of land would not fail in a lighter one, hence the reason for selecting those varieties which flourish in unkindly soils. It is useless to depend over much on those which make good growth and carry fine crops on light soil, for planting in those of an opposite character. Take Lord Suffield Apple as a case in point; it is one of the best Apples grown in some places, whilst in another it is a failure. In place of this Codlin, I would substitute Lord Grosvenor, which succeeds where the other fails, and for good cropping, and size of fruit, it is its equal, and in one point its superior, in habit of growth; for while the branches of Lord Suffield spread wide, those of the other take an upright direction—an important fact in Apples for profit, as many more trees of an upright habit may be grown on the same amount of land than would be possible if the branches spread wide. The following list of seven Kitchen Apples contains the names of varieties that will supply fruit from the first week in the month of August till May, providing a sufficient number of trees be planted; it cannot be said that any variety is not of good quality and a free bearer:—Lord Grosvenor, Stirling Castle, Ecklinville Seedling, Warner's King, Lane's Prince Albert, Golden Noble, and Bramley's Seedling. The last but one named will succeed on a gravelly soil, and as all of them will not, it is as well for growers to know that this will do so. An equal number of dessert Apples will suffice for an equally long season, viz., Irish Peach, Devonshire Quarrenden, Lady Sudeley, Worcester Pearmain, King of Pippins, Cox's Orange Pippin, and Sturmer Pippin. 4.

MIXTURES FOR SPRAYING FRUIT TREES.

THE attention of English horticulturists and farmers has been called to the fact that the ruinous attacks of fungi and of insects upon our fruit trees may be effectively met by spraying the trees with certain mixtures and solutions. Among those which have been found most successful are the mixtures containing copper employed as fungicides, and those containing arsenic as insecticides. There is one important point in the preparation of the copper mixtures which I have not yet seen noticed. The sulphate of copper must never be dissolved in an iron or zinc vessel, else the copper will be removed from the solution, iron or zinc taking its place. As galvanised iron pails are now so generally employed, this caution is by no means needless. When the Bordeaux Mixture of sulphate of copper and lime is prepared, a wooden vessel, a barrel for instance, will best answer the purpose. When an ammoniacal solution of copper is required, a glass carboy, such as is commonly employed for carrying

acids, will be most appropriate, but if made on a large scale a barrel will have to be used.

The Bordeaux Mixture is the one most troublesome to prepare, but it has the advantage that Paris Green (arsenite of copper) may be mixed with it, so that both fungi and insects may be attacked in one operation. The ammoniacal solution of carbonate of copper has some advantages as a fungicide, but experiments in America show that the addition of Paris Green to this solution yields a compound having a decidedly injurious effect upon the leaves of the trees.

The mixture used with success in Ohio last summer for Apple and Pear trees was prepared as follows:—Four pounds of sulphate of copper were dissolved in 4 galls. of water; 4 lb. of fresh lime was slaked, made into a thin cream with water, and passed through a fine wire sieve; the milk of lime thus obtained was added to the solution of sulphate of copper, both being cold; the whole was repeatedly stirred for some time, and finally diluted with water to a bulk of 50 galls. To this weak Bordeaux Mixture 2 oz. of Paris Green were finally added.

The first spraying is to take place when the first leaves appear. The second shortly after the blossom falls. The times of the third and fourth spraying must be regulated by the appearance of the tree. In the last spraying the arsenite is omitted. When only a fungicide is needed, the simpler ammoniacal solution may be employed; it is prepared by dissolving 5 oz. of carbonate of copper in 2½ pints of strongest ammonia, and diluting to 50 gallons. Care must, of course, be taken in handling the ammonia. The operator should stand in the open air, and see that the wind carries the ammonia gas from him. *R. Warington, Harpenden.*

COLONIAL NOTES.

ADELAIDE.—For a comparatively new city, Adelaide is fairly well shaded with trees. The suburbs are attractive. North-east of the city proper, and within a few minutes walk from the principal streets, the University and the Botanic Garden are found near together.

The Botanic Garden occupies an area of about 40 acres, and adjoins park-lands which are used as an arboretum. From his entrance at the main gate, throughout his whole tour of the garden, the visitor is struck by the more or less successful attempts at decorative management of shrubbery and marble statuary, indicating that there has been a desire to make a place which is easily accessible, very attractive to the public. The result is generally pleasing; in fact, it is all good, except in the case of the water, which leaves much to be desired.

Australian plants are represented by pretty good specimens, but the conditions for culture are not favourable. The soil appeared thirsty and for the most part light; hence the fair success attained shows excellent judgment in cultivating. The large specimen trees would be a credit to any garden, and the groups of European florist-plants are about as good as one could expect to see anywhere. It was said to me that these European groups are among the main attractions of the garden to the citizens. The citizens with whom I conversed were justly proud of the establishment.

The Victoria regia house is one of the principal features of the garden, but the condition of the plants at the time of my visit was a disappointment. It seemed as if the method of heating by water from an open boiler might be at fault. It was not easy to see how the water could contain as much air as in the ordinary method of heating by pipes through the tank, and it appeared as if this was at the bottom of the mischief.

The other houses looked well for the season. The selections in them appeared judicious, and many individual plants were of exceptionally good growth. Considerable prominence was given to horticultural, and, one may say, utilitarian aspects of vegetation. This doubtless serves to augment the interest felt by

the general public, from whom directly or indirectly all the funds come.

A museum for economic botany, well-arranged, and full of good illustrations of the subject, occupies a conspicuous place in the grounds. Its most attractive department is a collection of the leguminous plants which have proved pernicious to stock. The carpological series is good, and the products of the useful plants are well displayed. In a separate apartment was seen the herbarium of the Director, Dr. R. Schomburgk, who was even then prostrated by illness which has since terminated fatally.

Although confined to his room and a great sufferer, the venerable director received me on two occasions, and conversed freely about his plans, all of which looked in the direction of increasing the local interest in botany and horticulture.

Very profitable botanical excursions can be made from Adelaide. The handbook for the neighbourhood is a recent flora by Professor Tate of the University. It is handy and accurate. Visitors

FIG. 45.—HYBRID NARCISUS: FLOWERS, WHITE. (See Text.)

who may have time for botanical studies in any of the Australasian colonies should be reminded that in almost every large city there can be found a botanist or two well acquainted with the most desirable localities for herborising. Judging from my own experience in obtaining their advice, these local botanists are not easily wearied in well-doing. Some of the local collections are enriched by notes taken on the spot, and possess great interest. *G. L. Goodale.*

REPEATED HYBRIDS AND RECIPROCAL HYBRIDISM IN NARCISSI.

The Hybrid Narcissi here figured (figs. 45, 46), possess points of interest apart from the beauty of their delicate white flowers:—

1. The inquiry whether, among plants in general, the same result can be repeated with precision by

crossing the same parents, has been answered in the affirmative by experiments among the Rhododendrons and in other families, but the instance now shown is, I think, the first which has been established in the Narcissi. Professor Michael Foster anticipated me by one year in flowering seedlings from *N. triandrus* by pollen of *N. Corbularia monophyllus*. Flowers raised here from the same cross do not differ from those which he has sent me, or from those produced by bulbs received from him. Both batches of plants run through the same narrow range of variation, it being possible in each to pick out flowers in which the influence of the male or of the female parent slightly preponderates. Thus both batches contain a few two-flowered or even three-flowered scapes, a character drawn from *triandrus*, and both have yielded some flowers which in the wide spread of the corona remind us more of the *Corbularia* or "Hoop-petticoat." But both Professor Foster's seedlings and my own may be said to stand, on the whole, just half-way between the two parent species. Fig. 45 is sketched from an average specimen of this hybrid.

2. The flowers show a distinguishable advance in size beyond either parent, a not unusual result in hybrids, from the added vigour which follows an infusion of fresh blood.

3. I have also raised a considerable number of seedlings from this same cross effected the reverse way, i.e., by making *N. c. monophyllus* the seed-bearer. The plants differ scarcely at all from those grown from seed of *triandrus*, and, like them, are nearly all truly intermediate in feature between father and mother. The specimen drawn (fig. 46, p. 333) was taken from one of the first flowers to open, and would have become more pendulous and more like to the other figure as it aged. Among those which subsequently bloomed I could select some precisely similar to flowers of the former cross. The exertion of the style, so curiously variable in degree in *N. triandrus*, appears to be reduced to greater fixity in the latter cross than in the former, and the plants from seed of *Corbularia* show a smaller proportion of two-flowered scapes than those from seed of *triandrus*. But the differences are so slight in comparison with the general resemblance, that it is not inaccurate to state that, in this case, "reciprocal crosses give identical results." This rule, however, does not always hold good in the Narcissi. Thus from crosses made first one way and then the other between the small rush-leaved *N. triandrus* and large varieties of *N. pseudo-Narcissus*, I have obtained plants which respectively follow the mother most markedly in stature and size of all their parts. *G. H. Engleheart, Appleshaw, Andover.*

DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY FUNGI.

(Continued from p. 302.)

INCREASED VEGETATIVE GROWTH AS A CONSEQUENCE OF PARASITES.—There is another important manner in which the reproductive parasites may influence the propagation of their hosts, that is, by favouring their increase, not by their seed, but by their roots. When one reflects upon the fact that many of these reproductive parasites cause well-nigh total destruction of the reproductive organs of their host-plants, so that the extermination of the host seems almost to be a mere matter of time, one is naturally led to consider how such an extermination can be obviated, and whether by any compensatory effort on the part of the host it will be enabled to propagate itself. It is a well-known fact that some of the commonest species of flowering plants, common not only in their wide distribution geographically, but common also in the sense of numbers in which the individuals are met with, where the plant occurs at all, seldom produce perfect fruit. Such plants as the common field Thistle, and the Twitch-grass, although rarely producing perfect fruit, are terrible pests to the agriculturist, by reason of the rapid

manner in which they spread themselves amongst the crops on cultivated land, and by the extreme difficulty of uprooting them. In the first-named, the development of the flower-heads takes place with great freedom, and immense quantities of Thistle-down may be encountered wafted about in the air during the late summer and autumn. But this Thistle-down, if it is examined on the head before it has begun its aerial voyage, will be found, in most cases, attached to barren seed.

With the other plant (*Triticum repens*), the common Twitch-grass, the bane of our arable land in like manner, perfection of its seeds seldom takes place. The flowering heads are extremely common in our hedges late in the year, standing up amongst the thorns like heads of giant Rye-grass; but upon examination it will be found, that although the ear appears to be perfect, yet rarely does it contain any seeds capable of germination. Both these plants have lost more or less completely their seed-producing power, as we meet with them in this country at the present day.

With regard to the Twitch, it is remarkable that although the production of perfect seed by it is so rare that the ovaries are not developed, yet the ovaries are frequently the seat of disease, by which they become enlarged and converted into ergots through the action of the same reproductive parasite, *Claviceps purpurea*, to which we have previously referred; but more than this, the ovaries of *Triticum repens* are the seat of attack of two species of Bunt, *Tilletia controversa* and *calamagrostis*.

Another root-spreading species, the common Reed (*Phragmites communis*), even more rarely than *Thrift* perfects its seed, but it is pretty widely distributed in England, and abundant wherever it is found. In some districts, so freely does it grow in the ditches, that they have to be cleared out every year or two, yet this does not seem to diminish in the least degree the vigour of its growth. From the ditches, if the land be sufficiently damp, it extends into the corn-fields; and here, although its underground-stems are cut to pieces by the annual ploughing to which the land is subjected in the ordinary course of tillage, the plant flourishes so that its flowering-heads are often as tall as the corn. No grass is more subject to ergotisation than the reed is. The ergots, although very small, are extremely abundant, so that the plume-like heads are often quite bent down by the weight of them.

Here, then, we have three examples of common plants in which sexual maturity fails, as a rule, to occur, and in two of them the sexual organs (the ovaries) are the site selected by parasitic fungi. How far the parasite has been the cause of the plants in question availing themselves of the power they inherently possessed of spreading themselves by their roots, rather than by their seeds, no one can positively say; but the fact remains, that two of our commonest plants, which are essentially root-spreading, are also peculiarly liable to have their sexual reproduction destroyed by special reproductive parasites.

INCREASE IN NUMBER OF BLOSSOMS.

With some species of reproductive parasites, in which the floral organs are the seat of disease, we find another compensatory effort is made by the host-plant. Although the plant is unable to produce perfect flowers and seeds, yet we find that it blossoms more freely than do healthy plants. For some years past, I have had growing in my garden various plants affected with fungoid parasites; amongst them the pink *Lychnis diurna*, affected with *Ustilago violacea*, as well as healthy plants of the same host-plant. These plants were growing within a few yards of one another, and practically under the same conditions. It was quite obvious that the diseased specimens were the finest flowers, and I am inclined to think the colour was brighter. The same is true of *Scabiosa arvensis*, when affected with *Ustilago scabiosa*, so far as the number and size of its flowers are concerned. To a less extent, perhaps, the same phenomenon is observable with *Scabiosa Columbaria* when attacked with *U. floecolorum*. The plant of

Scabiosa arvensis which has been growing with me for several years, is a remarkably luxuriant specimen, producing hundreds of flowers during the season.

PROTECTION OF HOST-PLANT.

Apart from the fact that root-spreading plants have an advantage over those which are entirely dependent upon seed for their increase in the struggle for existence, it is clear that any cause which operates by making a plant less acceptable as food to plant-eating animals will be of advantage to that plant, and to plants sufficiently closely resembling it. We find certain of the reproductive parasites modify their hosts, so as to render them very unattractive in appearance; particularly is this the case with the *Ustilagineæ*, where the affected plants have their floral organs converted into a mass of black powder; but more than this, some of the species have a very repugnant odour, notably, several species of Bunt.

The odour itself has been variously described, but may be taken as recalling a mixture of rancid oil and fish. So powerful is it, that all persons connected with the corn trade, in examining a sample of Wheat, test it by their sense of smell, even when the amount of disease is so small as not to be readily recognised by the eye. Now, man is not endowed with nearly so acute a sense of smell as some of the lower animals, and if to us, with our comparatively obtuse power of discriminating odours, a sample of Wheat is rejected on this account, how much more readily must the lower animals recognise its deterioration by the fungus.

Other reproductive parasites contain active poisons, as the ergot; now, this it will be remembered, attacks only a certain proportion of the seeds on each plant, the others being uninjured, so that it is well suited to protect its host. Animals feeding upon ergoted grasses are known, as a matter of fact, to suffer in a very serious way from so doing. Although to the untrained eye an ergoted grain may not be very readily recognisable, yet it must be remembered that we are not herbivorous animals. But more than by its appearance, ergot possesses a markedly characteristic odour, which chemists tell us is due to Trimethylamine, a substance found in the brine in which fish have been pickled. In point of fact, ergot has a fishy odour.

But we have just seen that Bunt has also a fishy odour. Curiously enough, both these fungi attack the same part of the host-plant—the ovary; in one it is metamorphosed into a blackish hypertrophy; in the other, the whole interior is transformed into fetid black dust. But the connection does not end here, for it has been found that the same kernel of Wheat has been attacked simultaneously by both parasites, the ergot having established itself at the base of the grain, while the rest of its interior has become converted into a mass of black dust.

Here, then, we have two diseased products, both having a fishy odour, one of which is highly poisonous to animals; so it is not so very surprising that the fishy odour should be sufficiently repugnant to animals as to be protective to the host-plant.

We now come to consider more in detail the various ways in which reproductive parasites affect their hosts; their action may be either direct or indirect.

INDIRECT ACTION: ABORTION OF THE FLORAL ORGANS.

The number and quality of the seeds produced by any plant are subject to the operation of many causes, such as the influence of season, of soil, of sunshine, and especially of such conditions as cross-fertilisation demands. All flower growers know that too great luxuriance of the foliage of plants is prejudicial to the production of flowers, and that many plants bloom more freely when they are to some extent pot-bound than when they have less limited room for root development. Then, again, the amount of flower and seed is not proportionate; no more common axiom being heard from the lips of the flower grower, as he removes the fading flower-heads, than that a plant "cannot produce both seeds and flowers."

In order to produce seeds freely, the plant must be healthy; it may be stunted in growth, and partly starved by want of sufficient root-room, but its tissues must not be permeated by the spawn of a parasite, nor must its foliage be injured beyond a certain point by parasitic fungi, even although they cause only local mischief. It has long been noticed that the plants permeated with the mycelium of those species of *Uredinæ* which have perennial mycelia seldom blossom at all. Such, for instance, as *Euphorbia amygdaloides*, when it is infected with the mycelium of *Eodophyllum Euphorbiæ*, although the parasite manifests its presence by the production of spore-beds on the foliage only, yet the affected plants seldom produce flowers. The same is true of *Glyceria fluitans* when it contains the mycelium of *Ustilago longissima*, the spore development of which takes place only on the leaves. *Cnicus arvensis* when deformed by the perennial mycelium of *Puccinia suaveolens* does not blossom, although plants bearing the teleutospores flower as freely as those free from the parasite; the mycelium of this last-named spore being local.

Numerous other instances might be quoted of constitutionally diseased plants failing to develop seeds. In them the health of the plant does not seem to suffer; the foliage is usually somewhat altered in form, but it is produced freely, and the plants live as long as their healthy neighbours, but their reproductive organs are abortive. It would appear that the constitution of the plant is in some way modified by the presence of the mycelium, that the plant never attempts the formation of reproductive organs, or if it does the attempt is abortive.

(To be continued.)

A TRAVELLER'S NOTES.

[We have been privileged to read some of the letters of Mr. James H. Veitch, now travelling in India, and proposing to visit Java, Japan, and other countries for purposes connected with horticulture. From these letters we have been permitted to extract those portions likely to be interesting to our readers, and we do so with the more interest in that some thirty years since we were enabled to print, in the same way, a selection from his father's letters from Japan. Those who are conversant with the history of garden plants, will remember what valuable results followed from the travels of John Gould Veitch. Travelling under most favourable auspices, we trust the son of John Veitch, and the grandson of James Veitch, may achieve as well-founded a reputation as the father and grandsire. Ed.]

Ceylon.

"Three days after arrival I went up to Peradeniya by the 7.30 A.M. train. In the low country there was not much to see, large tracts being under water, the recent heavy rains having quite flooded the district. As soon as the train reached the hilly country, things improved, and the scenery was very fine. On the road we passed numerous gangs of coolies, clearing away the recent landslips. There is scarcely any tunnelling on the line, the train creeping round the sides of all the hills, one getting magnificent views of the country beyond and beneath. Peradeniya is 1700 feet above sea-level, but I did not see much of it on my first visit, having to return by the 2 o'clock train, the last in the day. Two days after, with a portion of my luggage, I went to stay at Kandy.

"On the way up from Colombo one sees numerous Paddy fields. This is the name given to Rice in its growing condition. Owing to partial submersion being essential, it is grown on earth terraces or banks apparently a few feet wide, one tier rising above another to an endless extent; the falls from the hills supply the necessary water. Two crops a year are obtained, chiefly by sowing; though if a piece be thin, transplanting is resorted to. Ceylon does not produce anything like the amount of Rice it requires, on account of the large Tamil population imported from South India for the tea plantations. Interrupted communication with the interior causes great distress. The recent landslips on the railway, whereby the goods traffic

was blocked for eight days, was, I am told, felt in some districts.

"Peradeniya is only 4 miles from Kandy, so I soon paid another visit there, and spent some time with Dr. Trimen. The vegetation in the gardens is certainly very fine, nearly all being left to Nature. The most interesting plant in the garden is *Lodoicea seychellarum*, the double Coconut of the Seychelles; with the exception of the few plants Dr. Trimen has, he tells me it does not exist out of those islands. I was naturally much interested, as I had seen the seeds at Kew, and heard of the failure to raise it. Dr. Trimen has one large plant, and, I think, two or three small ones. The large one, planted by Dr. Thwaites, is forty years old, and is about to flower; it has leaves somewhat like those of a *Sabal*, larger than I have ever seen on any Palm, even here. The plants in the Seychelles are said to be 100 to 150 feet high, and their age must be immense if they grow at the same rate as this one does, which it only some 15 feet high. The seeds

Crotons grow well, though in parts are apt to be aticky. I saw one splendid bed, about 13 yards through, in Colombo; there was a large variety, and the shape of the bed was almost perfect. *Dracenas* are well coloured, but get very sticky. *Acalyphas* make splendid bushes, with highly-coloured foliage, often 10 and 12 feet high. *Amherstia nobilis* is a fine tree; it is now in flower, in fact I think it is more or less so all the year round. Its long racemes bear some eight or ten large flowers, most brilliantly coloured with vermilion and yellow. It was imported here from the Burmese temples, round which it grows, but Dr. Trimen tells me it is never found wild. It seeds in Burmah, but rarely, very rarely, here.

"*Tradescantia discolor* and *Conoclinium* grow well, particularly the former, when once it gets a footing. Ferns also do well. I saw in different parts some really fine plants of *Nephrolepis rufescens trippinatifida*. *Aracaria Cookei* forms handsome trees, and one or two *Dammara*s are very tall. *Ficus elastica* and *Bamboos* are two of the finest sights in the gardens.

Judge Laurie, the District Judge of Kandy, I was able to put up at the Club—a very considerable advantage, as the Grand Hotel was full of tourists, Nuweya Eliya is about five hours' train from Kandy, the line gradually rising all the time; on either side are tea plantations, with a little coffee. It was raining hard and was rather cold when I arrived, thick blankets being required at night and a fire in the smoking-room. It is the great health resort of Ceylon, and is full of English in the hot season—now it is nearly empty.

"The gardens at Hakgala are very remarkable—in extent they are some 550 acres, but only 8 acres are really kept up. The Tree Ferns and *Acacias* are fine, and such plants as the following: *Fuchsia corymbosa*, *Gladioli*, *Arums* and *Heimerocallis fulva*, grow and flower profusely; *Gorse* forms bushes, 3 to 4 feet high; *Vincas*, *Bocconia frutescens*, 8 feet high; *B. cordata* will not thrive. *Cryptomeria japonica* is now much planted, as is *Grevillea robusta*; the latter is also used on the tea estates for shelter. *Spiraea Reevesiana* is used for hedges all round Nuweya Eliya, and answers the purpose admirably. Vegetables succeed more or less; the English Blackberry and the Wilson Junior grow, but do not fruit; our English Cherries form fine trees, but also yield no results.

"The great weed in the low country is *Lantana*; this is everywhere, and I am told, in some parts it covers miles; it is, however, being supplanted by a large yellow Composite, with *Broussonetia*-like foliage, by name *Trithonia*, introduced from California. Another weed is *Mimosa pudica*; this is most difficult to eradicate, as burning has no effect—it springs up through the ashes of burnt jungle with the first shower. *Oxalis* is the chief weed of the hill districts; this, like *Trithonia*, has acclimatised itself. On my return to Kandy, I went to stay with Judge Laurie, who received me most kindly; he grows a great many Ferns, and is very proud of them—also some Orchids.

"I went over tea, coffee, and cocoa estates, and have explained the method of culture in my journal which I will forward from Calcutta.

MADURA.

"Vanilla and Pepper are both cultivated to a limited extent here, the former being grown along the road sides on *Erythrina indica*—the Vanilla clings well to its spiny bark. Owing to the insect necessary to its fertilisation (which is found in the Mauritius) being here absent, it has to be fecundated by hand. Its production is said not to be very profitable.

"Squirrels and white ants are the great pests in the animal world. I went over a cocoa estate belonging to a gentleman, who gives a gratuity for every squirrel skin brought to him, and who also keeps a man employed expressly to shoot these animals.

"The languid muggy heat of this place is not inspiring. I shall be glad to get north, where, though hot, it will be dry. A dry heat I enjoy, but such places as this and Colombo, which are now receiving the end of the rains, rather take it out of one. From 6 to 8 A.M. the weather is perfect, but after that, and when the rain comes down, one might as well be in diluted marmalade." *J. H. F.*

(To be continued.)

VEGETABLES.

SULHAM PRIZE PINK CELERY.

WE grow no other variety, and it lasts in good condition from the first week in September till the beginning of May. Where many persons make a mistake, I think, with their late crops of Celery is in growing the heads too large, these large heads not keeping nearly so well as smaller ones. *E.*

SELECTED PEAS.

Opinions differ according to locality and soil as to the best varieties of Peas to yield a constant supply without unduly multiplying varieties, and I think all things considered, that no three better

FIG. 46.—HYBRID NARCISSEUS; FLOWERS WHITE. (SEE P. 331.)

used to be found floating in many parts of the ocean, and in the Middle Ages before the discovery of the Seychelles they were considered to be a marine product. The seed takes ten years to ripen, and in germinating descends 8 feet. *Corypha umbraculifera*, the Talipot, is another of the floral wonders. This Palm grows with great rapidity, quite straight up until it produces an immense terminal raceme of white flowers, visible in some places for miles; it then seeds and dies. They flower usually when from forty to fifty years old, though one has been known to flower when but thirty-five years old. I was fortunate enough to see two in flower from the railway, and one in seed in the Peradeniya gardens. *Oreodoxa regia* (Cabbage Palm) and *Caryota urens* form noble trees; the latter flowers freely, its pendulous racemes being several feet long. *Artocarpus incisa* (bread fruit) and *A. nobilis* (jack fruit) form fine large foliage; the fruit of the latter, though edible, is not worth much.

"In the gardens some of the undergrowth is handsome. *Sanchezia nobilis variegata* and *Heliconia aurea striata* form, especially the latter, bushes from 4 to 5 feet high. *Heliconia* is certainly one of the handsomest plants I saw in the island.

There is a splendid avenue of the former near the gate, the roots rising often more than 1 foot above the soil, and covering many yards of the surrounding ground. The Bamboos are very thick, and grow some 70 feet in height, especially on the banks of the Kelani-Ganga, the largest stream of water in the island; they are used for a great variety of purposes, from making a curry downwards. Dr. Trimen has formed a kind of house by stretching coarse canvas netting over Bamboos; in it he is able to grow some Orchids and Ferns, which would not do in the open. The former do fairly well, *Cattleyas* and *Lælias* being the weakest point. I suppose it is because it is almost impossible to give a period of rest.

"It is curious to see in flower side by side within a few square yards *Cypripedium Sedeni* and *Haynaldianum*, *Angræcum sesquipedale*, *Oncidium Lancæanum*, *Phalaenopsis Schilleriana*, and others, *Dendrobium macrophyllum Veitchii*, very fine *Chysis bracteescens*, and several others.

" NUWEYA ELIYA

is some 6200 feet above sea-level. Hakgala being a few hundred feet lower. Through the kindness of

ones could be chosen than those named by Mr. Coomber. There are some good selections made by different nurserymen which may be a little earlier than William the First; I think Veitch's Exonian is one of them that would run William the First hard for the first place. However, at the present time, William the First is a tried Pea, and it remains a longer time in bearing. Mr. Smith, on p. 278, mentions four different Peas. Autocrat is an excellent Pea, but for general use, I prefer Success, or Sturdy, if a fourth be added. I have grown Autocrat, Sturdy, and Success each year since they were sent out, and sowed them on the same day in a fully exposed plot, and Success yielded pods a long time after the other two were over. All three do well on strong land. The seeds number from eight to ten in a pod of Success, which boil of a nice green colour, and the flavour is excellent. *John Chinnery.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

PEACHES.—Late Peaches now coming into bloom had better be allowed to carry a fair proportion of their flower-buds, especially if the wood was not thoroughly matured last autumn. Fumigate if thrip or green-fly be about the house. When the object is to have late fruit, undue forcing should not be resorted to, yet, as a certain degree of warmth aids fertilisation, it will be advisable to maintain a temperature of 55° to 60° at night during the flowering period. In the absence of any heating apparatus, the ventilators of the structure may be closed early in the afternoons, and the temperature allowed to rise to 80° if it will. In both cases, keep the atmosphere dry, and shake the trellis frequently daily to distribute the pollen. When the trees are nailed to a wall, draw an old ostrich feather along the shoots from the base upwards. Disbud trees which have passed their blooming, and in the manner indicated in a former calendar. It is generally necessary to give a watering at this period, but no border should be watered until its condition is either ascertained or its requirements understood. A good dressing of wood-ashes and a stimulant may be employed to trees of rather weakly growth when water is applied. The same temperature as advised above should be maintained until the stoning period is reached, the borders and paths well damped in sunny weather, and the plants syringed with tepid water mornings and afternoons. Thin the fruit when they have attained the size of thrush eggs. This is a process which should be regulated by circumstances. If an exceptionally large number is on the trees, remove about a third at first, and leave the most promising and best fruit; in the course of a week remove another third, and give the final thinning six days later. But where the fruits are sparsely distributed over the trees, little thinning will be necessary, and may be done in once, or at most twice. The number of fruits to leave for a crop will depend on the condition of the trees. Exceptionally vigorous trees may be allowed to carry fruit at 9 inches apart; but 1 foot will be sufficient to leave them free of ordinary growth, while for weakly trees the fruit should be at least 15 inches asunder. The stoning period is the most critical time for Peaches, and a temperature of 55° at night, with air admitted when solar heat raises the thermometer to 60° and above it, will be congenial to their well being. When the weather is mild, a chink of air may be left on all night.

THE APIARY.

By EXPERT.

SPRING FEEDING.—In districts where there is much fruit blossom, it is necessary to get stocks in strong condition earlier than in those places where white Clover is the first plant in blossom that yields honey. It takes about six weeks in spring to build up a colony to the necessary strength to take advantage of a honey-flow, therefore, where Gooseberries, Raspberries, fruit, and other early-flowering subjects are a source of income to the bee-keeper, stimulative feeding should be commenced quite by the middle of March. This should take the form of flour-candy to begin with, which is made by boiling 6 lb. of sugar in three quarters of a pint of water, as directed in a previous number, p. 270; and when taken off the

fire, stir in 1 lb. of pea flour, which serves as a substitute for pollen, the nitrogenous food of the colony. As soon as the candy is consumed by the bees, more must be afforded, it being of importance to keep up a continuous supply, or a cessation of breeding will result. Later on, when the weather gets warmer, so that the hive can be opened without fear of chilling the brood, the cappings of the sealed stores can be bruised, a few at a time; or falling this, syrup can be given in one of the many slow feeders sold for the purpose. If it should happen that any stocks are not strong enough when the honey-flow arrives to put sections on, it pays to unite two together, and divide them again later in the season if necessary. Some bee-keepers contract hives in spring to the number of frames the bees are able to cover, with the idea of assisting them to maintain the necessary temperature for brood-raising, but experience has proved that little is gained by so doing, as a frame of comb is almost, if not quite as good a non-conductor as a division-board or dummy would be. In districts where white Clover is the first honey-yielding plant of the year, it is often not necessary to take much trouble to stimulate stocks, as they will generally come along quickly enough, and be ready at the right time with the stimulation afforded naturally by flowers that do not exist in sufficient profusion to yield a surplus, but serve the purpose of keeping up a supply of food that is better than any artificial feeding.

QUEENLESS STOCKS.—Any stock that is found to be queenless in spring, should be united to another having a queen. Queens are dearer to buy at this season than any other, and indeed are not often obtainable at any price, let alone the risk of their travelling without getting killed. It sometimes happens that queens get killed early in the year by being "halled" by the bees; and generally this is caused by injudicious handling by the bee-keeper. If bees get much excited while under examination, it is always better to shut up the hive, and defer it to some future period.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

HINTS ON GENERAL WORK.—This month is a busy one in the kitchen garden. One of the first things to be done is to go over the ground and allot spaces for the season's various crops; and when that is performed, delayed work of all kinds should be pushed on with a finish. I do not advise the gardener to be in a hurry to get his seed sown, as this may be sown with greater advantage in a week or two; still, this work should be kept well in hand, so that there may be no delay when sowing or planting are performed. The great point to be observed in kitchen garden work is, to sow frequently such things as last but a short time at their best; and by always doing this, much anxiety is spared the gardener, and the chance of a failure in supply is averted. In sowing seeds of Peas, Beans, salad plants, little and often is the better rule, and sowing thinly, unless the germinating quality of the seed is doubtful, and then thick sowing is to be recommended. The repairing of the Box edging, or relaying it, should be finished at an early date. Box laying requires well doing, and only those who are expert at it should be entrusted with a big job. The other edgings used, as Thrift, Saxifrage umbroses, require much the same annual attention as Box. Edging tiles, if they have got out of position, should be made good; walks should be regravelled and raked, after affording a light coating of new gravel. Before the walks are touched, all wheeling of manure on to the vacant plots should be finished, and tree mulching and heavy groundwork brought to a finish. And so that the garden presents a tidy appearance, the stems of Brassicas should be cleared off and burnt, and the ashes used on the ground.

CAULIFLOWERS.—Those that were wintered in frames in pots, and in hand-glasses, will be ready for planting, those in pots furnishing the earliest heads, whilst those which were planted thickly under hand-glasses will succeed them. Plant on richly manured land, and on a border facing south. Those which may have been sown in heat early in the year need protection after planting, as they are scarcely so hardy as the others. The ball of earth as possible, planting being performed with a trowel, and the soil made firm about them. After finishing the planting draw a little soil round about the stems with a hoe, as a protection against frost and wind. Good soil, rather light than heavy, and well manured,

is necessary for the early crop. A few of the larger plants if put out at the foot of a south or east wall between the fruit trees, and covered for a time with hand-glasses, will come into use earlier than the rest.

PEAS IN POTS.—These should be planted out if they have been thoroughly hardened off. I sow these early Peas in pots which are larger than those commonly employed, and give little or no heat, so that when planted early in the present month hard weather injures them but little. When they are planted on a south border by preference, or in the open quarter when necessitated, some of the crumbs of the soil should be drawn up close to the rows, and a row of twigs or small Spruce branches placed so as to protect them; even the very dwarf varieties should always be supported by a few twigs. If birds give trouble, the lines of Peas must be protected by means of netting or black thread. Where game-birds abound, wire-netting bent over the rows is the best protector, and it may be used to support mats or litter in the event of very severe weather coming.

BEANS AND PEAS.—Broad Beans raised in heat will require similar attention to the Peas, but will not require any protection if they have been grown on slowly. Lift in clumps of three or four plants if in boxes, and make the soil firm, planting them in rows 2 feet apart, as they will not grow so robust as later sowings. A succession may be sown in rows 3 feet apart of Broad Windsor, or if for exhibition or extra large pods, Bunyard's Long-pod. Peas may be sown, and if possible, in widely separated lines to allow of crops between. As the season advances draw the drills deeper. For present sowing choose Veitch's Perfection, Huntingdonian, Duke of Albany, Prodigy, and Champion of England.

SPINACH should be sown on rich land in small quantities at intervals of three weeks. The Victoria Improved Round is an excellent variety that does not run to seed so soon as some others.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

MANURE FOR ORCHIDS.—I feel indebted to your amateur correspondent, and hasten to explain matters so that he may not be perplexed any longer. The sentence which is misleading occurs in the calendar for January 9, where, under the head of *Odontoglossum Alexandræ*, I wrote, "I cannot conscientiously recommend the general use of liquid manure to these Orchids;" the word "these" being accidentally omitted in printing. Now, as I advised the use of manure for species above and below this sentence in the same calendar, I naturally thought it would be considered generally to refer to the *Odontoglossums* under notice, and took no steps to correct the omission, as at that time of the year at least very little manure is required. I intended when the time arrived for affording liquid manure to these plants with safety and success, to recommend its use on those species only which I have found to be strengthened by it. Rather than discourage the use of manure in the Orchid houses, I would say to every grower, experiment therewith, and find out what is wanted and how to apply it, proceeding cautiously, or great mischief may result. I think that manure may be used in a liquid state on the floors and under the stages, or in evaporating troughs, to the advantage of all species of Orchids during the growing season, taking care that it is not too strongly charged with ammonia.

Odontoglossum vexillarium, which have been treated as advised in previous calendars, should now be in vigorous health, and about commencing to push forth their flower spikes; and as the flowering season is the most exhaustive one, the waterings with manure water, as before advised, should not be discontinued on any account until after flowering. The *Masdevallias* are now becoming active, and these also I have commenced to water with liquid manure. I always use farmyard manure, in other words, that which drains from the manure-heap into a tub or tank. To be successful with liquid manure, it should be applied frequently, but weak; and as a general guide in this concern, I may add that I use it to the extent of from 2 to 6 per cent, according to its strength.

CALANTHES AND THUNIAS.—These are now starting to grow and should be potted, using for *Calanthes*, of the Veitchi and vestita varieties, fibrous loam, peat, and sand, to which chopped sphagnum and leaf soil are added; but I find they thrive equally as well

in the first-named compost. The crocks, with a layer of sphagnum moss over them, should half fill the pot, the remaining half being filled up with the compost, in which I prefer to slightly bury the base of the pseudobulb—say half an inch—and steadying the mass with sticks, and not pressing the compost too firmly, nor employing pots that are too large. One large pseudobulb, or two or three smaller ones, may be placed in a 32-sized pot. Potting finished, a suitable position may be found for these plants on a shelf near the roof glass in the warmest house, and where they have the full sunlight. Very little water will be necessary till new roots have taken hold of the compost, after which time it may be applied more freely, and in due time recourse may be had to liquid manure. The *Thunias Marshalliana* and *Bensoni* varieties, I always think, flower best if grown in small pots, three or four strong pseudo-bulbs being placed in a 32-pot, the compost and mode of potting and watering being similar to the species above mentioned, only it is not necessary to grow them in the warmest house, the warmth of the Cattleya-house is ample, providing they are well exposed to the sun; yet as *Thunias* do not last a long while in perfection, it is well, perhaps, to grow some in both houses, so that the flowering period may be prolonged. It should be said that before potting the old skin must be removed, and the stems well washed, for fear that red spider be present.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Ferriess Gardens, Swansea.

FERNS.—Now that most of the species of Ferns have commenced to grow, the general repotting may take place, and the compost should be prepared, pots washed, and crocks got in readiness, so that once the work is begun there will be no delay. All plants which require repotting should be prepared, that is, if the soil is in a too wet state, water should be withheld for several days, until the soil in the pots has become rather dry. *Davallias* and *Gleichenias*, being surface-rooters, should be grown in shallow pots or pans, having them half filled with crocks, and a compost used that consists of two parts fibrous peat and one of fibrous loam, with the addition of broken charcoal, and sand in sufficient quantity to keep the soil sweet and porous. The rhizomes of these Ferns will require to be pegged down to the soil, which will assist them to form roots quickly. The different species and varieties of *Adiantum* and *Pteris*, which may have got too large, may be divided, and given fresh pots in accordance with their size, employing good drainage, and a compost consisting of two parts fibrous loam, one of peat or leaf-mould, with plenty of sharp sand. Specimens of *Alsophila*, *Dicksonia*, *Cyathea*, *Lomaria*, &c., requiring root-space, should have attention, but it is not necessary to shift them annually; in fact, when growing in large tubs or pots, they will keep in health for a number of years without disturbance, if afforded the proper amount of water, and occasionally a small quantity of weak manure-water. In the case of very large specimens of Tree Ferns, syringing the stems or trunks daily with tepid water during the growing season [Or pouring water on the top of the stem. En.] will greatly assist them. In case any plant has to be retubed or repotted, it will be necessary to keep it in a close house for a few weeks afterwards, and syringe it slightly overhead once every day. The species that are most suitable for baskets are *Adiantum Woodwardianum* radicans and *Goniophlebium subariculatum*; and during the growing season much care is necessary in preserving the proper amount of root moisture. The best method of supplying it to established plants is to immerse them in a tub of tepid water every day. Ferns in borders should have a portion of the surface-soil removed, replacing it with fresh compost. Slugs do much harm to the tender fronds of Ferns, and precautions must be taken in having them trapped before damage is done.

CLERODENDRON FALLAX.—Old plants should be cut back to within 2 or 3 inches of the old wood, and when they commence to break again and have made short shoots, a little of the old soil should be shaken off them before shifting them into pots two sizes larger than those they were previously in. The best way to propagate this plant is by sowing seed at this season in a hotbed, as by that means a long season of growth is obtained. A good compost for this species consists of equal parts loam and leaf-mould, with a largish quantity of silver sand; both potted specimens and smaller plants should be placed in the stove or on a hotbed.

ASPARAGUS PLUMDSUS AND ITS VARIETIES NANUS AND TENUISSIMUS.—No wonder these plants have become so popular when we take into consideration how useful their sprays are for bouquets, and the florist's work generally. The plants may be grown in small pots, when they make very useful subjects for table and other decorations. If grown in an intermediate temperature, the plants grow with great freedom. Now that they are commencing to make fresh growths, those requiring more root space should be repotted. Use equal parts of fibrous peat and loam, to which should be added broken charcoal, and sharp sand in sufficient quantity to keep the compost open. If required to furnish a wall or the roof of the structure, they may be planted out in a prepared border, some 4 feet in length by 2½ and 18 inches deep, placing 4 inches of drainage at the bottom, afterwards filling in with the above-named compost. The variety *tenuissimus* may be propagated freely by cuttings, if these be placed round the sides of a 4-inch pot, in a sandy compost, and placed in the propagating frame. When well rooted, pot them into 5 or 6-inch pots, without dividing, when they will quickly form useful plants for furnishing purposes.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Barham Court, Maidstone.

RE-LABELLING FRUIT TREES.—During bad weather, when the gardeners cannot work out-of-doors, this kind of work should get attention, as it is of no small importance to have all trees correctly named for reference at any time, and more especially at this season when scions are wanted for grafting, or when trees have to be removed, and there is only the label to inform the gardener what the variety is. Where trees have lost their labels, it will be necessary to wait until the fruits are fully developed, when the variety may get correctly named, by send-

FIG. 47.—METHOD OF TYING TREES WITH STRAW BANDS.

ing selected examples, with a number attached corresponding to one fastened to the tree from which the fruit was gathered, to the office of this paper. To fasten the tickets on the specimens sent for naming, the margins of postage stamps make an excellent material, first writing the numbers legibly thereon. Various are the materials employed for labels on the trees, but the most simple, and one which any one may make, is to cut ordinary laths into 6-inch lengths, having previously made them smooth for writing upon. One end should then be rounded, and a small hole made in it with an awl for a piece of copper wire to pass through wherewith to fasten it to the tree. A small quantity of white lead paint should be rubbed on the smooth side, and allowed to get partly dry before being written on. After the name is written, allow the paint to get quite hard, and then varnish it all over with a soft brush. These labels will last for many years.

STAKING FRUIT TREES.—Newly-planted trees should now have the supporting stakes examined, and be securely fastened with withes or tarred cord, taking care to place a pad of hay, straw, or leather between the stake and the bark of the stem. [We give another method, see above, fig. 47. En.] Trees that are much exposed to wind need to have two stout stakes instead of one, placed deeply in the

earth, and standing about 9 inches from the stem of the tree, and facing each other with a cross-piece 1 foot long, nailed on close under the top of the stakes, to which the tree must be securely fastened with hay or straw bands. In the case of pyramid trees, one stake will, in a general way, be found sufficient, but it should be firmly fixed in the soil, several feet away from the tree, and in a slanting position, securing the stem about the middle to a point some three-quarters of the way up.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

ANNUAL FLOWERS THAT ARE BEST RAISED UNDER GLASS.—There are many annual flowers which, when properly grown, form an attractive feature during the summer and early autumn months, and I will therefore mention a few of the best. Foremost among these are *Stocks*, *Asters*, *Salpiglossis*, *Sweet Scabions*, *Zinnias* (double and single varieties), *Phlox Drummondii*, *Saponaria calabrica*, *Limnanthes Douglasii*, and *Clarkia Carteri*. "Morning Glory." The last is a decided acquisition; the flowers are reddish-purple tipped with white, and the habit of the plant is compact, being 9 inches to 12 inches high. *Gaillardias* deserve to be more extensively grown than they are at present; their long-blooming period and splendid colours are particularly sure to make these half-hardy perennials popular. Everlastings, such as *Acroclinium album*, *Ammobium alatum*, *Heliclysums*, and *Rhodanthes* should also be sown.

Plants of the above-mentioned and similar subjects may be easily raised by sowing the seed thinly in pans or shallow boxes, filled with finely-sifted soil, covering with a little of the same compost, watering gently, and then placing them in a close pit or frame, admitting a little air when the seedlings appear, to ensure a sturdy growth. With this object in view, the plants should be pricked out, before they get crowded, into a sifted mixture of three parts light loam and one of leaf-mould and sand, laid 4 or 5 inches deep on a hard bottom, in shallow frames placed in a sunny situation, allowing a distance of 4 or 5 inches between the young plants. Press the soil gently about the roots with the pointed stick in pricking out, and water through a fine-sprayed rose, to settle the soil, and shade from bright sunshine until the roots have taken to the soil. At this stage admit air, and gradually increase the ventilation, to secure sturdily-grown plants. The seeds may also be sown direct in the frames, in drills about 4 inches apart, and a quarter of an inch deep. This last method of procedure is to be commended; the seed takes longer to germinate, but ultimately the best plants are thereby secured. In most places the necessary number of boards or bricks for forming the sides and ends of improvised frames are at hand, as well as the odd sashes wherewith to cover them. If a little sifted coal-ashes are placed outside, and close up to the brick or board temporarily-made walls, a greater degree of warmth will be maintained inside.

TREES AND SHRUBS.

CHOISYA TERNATA.

A few days ago, in looking through Chancellor Swayne's very pretty and highly interesting garden in the Close, Salisbury, I noticed a fine plant of the above very desirable evergreen, which was struck from a cutting received some twelve years ago from a friend residing in the Isle of Wight. It is growing in a narrow border at the foot of a south wall in ordinary garden soil of a light texture, and covers a space of wall 15 feet long by 6 feet high; and I have no doubt, had the wall been twice that height it would have been covered to the top within the time specified. The plant is in fine condition, being literally smothered with large trusses of flower-buds, which, when fully open in July and August, will be a veritable sheet of white fragrant flowers. Here, as also planted against a south wall at Longford Castle (three miles south-east of Salisbury), this so-called "Brazilian Orange" is perfectly hardy; and, therefore it may safely be grown in similar situations in all southern and western counties in England and Ireland. H. W. Ward.

EDITORIAL NOTICES.

LECTURES ON PRACTICAL HORTICULTURE.—As we have advocated the course now being followed for years past, we are naturally interested in its success, and we should be obliged if the several lecturers, in connection with the County Councils, would communicate to us their names, the districts in which they are at work, and a general indication of the method pursued by them.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, MAR. 17.—Lidoenae.

SHOWS.

TUESDAY MAR. 15. Manchester Royal Botanic, First Spring Show (two days).

WEDNESDAY, MAR. 16.—Bath Bull Show (two days).

SALES.

MONDAY, MAR. 14. Hardy Plants Bulbs, Cypripedium spectabile, Tropaeolum tuberosum, Cacti, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, MAR. 16. 10,000 Lilliums of sorts, Cypas, Oldfield, Palms, 4000 Phoenix rupicola Seeds, &c., at Protheroe & Morris' Rooms. 2500 Roses and Fruit Trees, &c., at Stevens' Rooms.

FRIDAY, MAR. 18. Trade Sale of Orchids, at Protheroe & Morris' Rooms.

SATURDAY, MAR. 19. Border Plants, Lilliums, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42°·6.

WE shall shortly be looking for the unfolding of the buds, the rapid current of water through the plant, perhance "the bleeding," and all those striking phenomena which attend the increased length of days and the corresponding increase of temperature. The subject is still shrouded in mystery, but it is not so much so as gardeners who stioek to the obsolete phraseology of a century ago would lead the uninitiated to imagine. The wonderful things that the "sap" does, or is said to do, by gardeners are susceptible of a very different interpretation from what they attribute to them. When we get schools of horticulture, and duly qualified teachers, we may hope that mediæval physiology will no longer be accepted as gospel by the practical gardener, and that he will be enabled, by the facilities he enjoys, to render intelligible much that is now ill-understood, or not understood at all. Mere routine practice will not, however, lead to this result. We have been led to make these remarks by the perusal of an article in the *Comptes Rendus* by an eminent French botanist connected with the Forest Department of France. M. MER, in discussing the renewal of growth that takes place in the growing tissues (cambium) of plants in spring, makes some observations, from which we condense what follows.

M. MER says that, "among the many questions raised by the study of the spring growth of trees, there is one which is peculiarly interesting—that which relates to its periodical rise and cessation. At the end of winter," he asks, "does growth begin in all parts of the tree at the same time, or does it not rather do so at different parts in succession? and in this case, does it follow any regular order? Again, at the end of summer, is the activity suspended in all the organs simultaneously, or successively, and if so, in what order? Lastly, is the rise and fall liable to variation?"

To answer these questions, M. MER examined specimens of different species and ages (Oak, Beech, Hornbeam, Lime, Poplar, and Silver Fir), growing in various positions, and consequently of very different constitutional powers.

In the case of young trees of twenty-five years and under, growing in plantations, M. MER noticed that growth commenced in the youngest shoots of the branches and stem, thence spreading, sometimes successively, sometimes simultaneously to the oldest parts of the branches, as well as into the centre and base of the stem. It did not commence in the roots until ten or fifteen days later, appearing first at the commencement of the largest, then in the lesser ones, and finally in the rootlets. It may be said then, that in the aerial parts the progress of growth is from above downward, basipetal, while in the subterranean parts it is from below upwards, basifugal.

In the case of young trees in isolated positions, the results of M. MER's observations were almost the same as with trees in plantations. However, he noticed one interesting peculiarity. Owing to their isolation, the branches were usually well developed, and at the point of emergence from the trunk was a moderately large swelling. Now, in this swelling the growth was almost simultaneous with that which takes place at the extremity of the branch. In young trees, especially those growing in plantations, the woody rings are often wider in the central and upper part than at the base. This is not the case with older specimens, especially during the season of greatest growth. The branches and roots have at that time attained great size, and almost invariably, except when the plantation is too dense, the growing layers enlarge from the top towards the base of the trunk; which proves the great activity of growth in this latter region. It is interesting to learn what is the method of the rise of growth. For this purpose, M. MER examined trees growing singly in clearances made some years ago; others grown in plantations so thin that their woody layers had become wider at the base; and finally, others in copses of twenty-five to thirty years' growth, having their heads above the plantation, and consequently thick, while their trunks were buried in it. In all these trees he found that growth begins at the base in the swollen portion of the trunk, almost at the same time as at the extremities of the upper branches, and in the swelling at the base of these when this was sufficiently well-marked. It was only developed in the lower branches of the head afterwards. Later on it appeared in the central branches and trunk, later still in the large roots, and finally in the rootlets; therefore, the centres of development were multiple. Hence it follows, that the general progress at the ends of the branches, as in the trunk, is from above downwards, but from below upwards, at the base of the trunk, remaining entirely basifugal in the roots. When the growth of trees, especially Silver Firs, is impeded, either because they grow under shelter, or for some other cause,

the woody rings are very narrow in the lower part of the trunk and branches. M. MER ascertained that in such specimens growth shows itself but tardily, commencing in the tips of the branches. Its course is thus from above downwards.

Just as it increases gradually in the various parts of a tree, so does the growth progressively diminish at the end of the summer, but in a different order. It ceases in the branches before it does so in the trunk. In trees in plantations, it fails first in the lower branches, which are less vigorous than those of the head, and in the lower and central parts of these branches before it ceases in their extremities. Only after this does it come to an end in the upper shoots. In the thick branches of an isolated tree, it ceases sooner at the extremities than in the centre. It is at the level of the basilar swelling that it remains active longest. In the trunk it stops first at the top, then in the middle, and finally at the base. When the vegetation is not very active, it, on the contrary, ceases in the lower portions first. In the roots it sometimes persists for fifteen days longer than in the trunk. It cannot be said that this is because it was slow to arise there, as before it ceased in the larger roots, it failed in the rootlets, where, as has been said, it manifested itself later still. It is in that part of the trunk which is immediately under the soil that the activity of growth is manifested latest. While in the aerial part of the tree, growth ceases from above downwards—it is from below upwards that it ceases in the subterranean part. The stock being the region where growth began, and the place where it ends, is therefore that where the longest duration of activity occurs. This explains the great development which woody layers acquire in that situation. It is plain that it is in the parts of the trunk where vegetable activity is most pronounced, either because they are the youngest, or because they are the best nourished, that growth begins (in the tips of the branches and the crown, the basilar swellings of the branches and the lower portions of the trunks of healthy trees). There also, usually, it ceases last. Contrarily, when any circumstances retard growth, we see the cambial action proceeding sluggishly and ceasing sooner (as in the lower parts of the branches and trunks of trees in plantations, over-shadowed trees, &c.). Hence there is an evident connection between the duration of cambial action and its intensity.

FERNERY AT NANT-Y-GLYN.—The accompanying illustration (Fig. 48) represents a Fernery at Nant-y-Glyn, Colwyn Bay, the residence of ALFRED O. WALKER, Esq. The Ferns most conspicuous in the engraving are *Osmunda Claytoniana* in the centre foreground, *Polystichum munifolium* behind to the right of centre, *Lastrea thelypteris* to the left of the centre, *Osmunda gracilis* to the extreme left, *P. angulare* var., and *Lomaria chilensis* in the back row, and *Rodgersia podophylla* left foreground centre.

FLORISTS' VAGARIES.—Considerable attention was recently excited by the display, in the shop window of a florist in a West End suburb, of some button-hole bouquets composed of Lilies of the valley, and some strange-looking flowers of a deep orange-yellow colour. At first sight it was not easy to say what these yellow blossoms were, for though they were much larger and stiffer, they bore a slight resemblance to the single flowers of the Lilies of the valley. On looking closely they were proved to be the coronas of *Narcissus tazetta*, from which the segments of the perianth had been ruthlessly shorn. It is to be hoped there is sufficient good taste abroad

now-a-days to discountenance this cruel mutilation of a beautiful flower. It is prompted by a different motive to that which clips the anthers from the stamens of white Lilies, whose purity would soon be sullied by the pollen were they to be allowed to remain, and is done merely for the sake of manufacturing a flower of a fashionable colour small enough to be used for button-hole bouquets. The abundance of cut flowers to be had just now for a moderate price in the shops and at the street corners calls forth universal admiration, and surely there is variety enough to satisfy the demands of all reasonable people, without recourse to mutilation or dyeing.

laws to obtain the necessary money? If they borrow it, do not they run the risk, all but inevitable, of being crushed, more or less speedily, by a load of debt? Now, our Tuscan labourers, a very shrewd fraternity, appreciate this problem, and they get round it in this way—they go halves with the capitalists, big or little. 'You buy the land,' they say, 'stock, and plant, and drain it; you pay the taxes and other outgoings, we will give you our labour, skill, and experience, and then we will equally share the produce in kind.' Thousands of holdings are based on this principle. The system succeeds, and has succeeded for genera-

case, a frugal thrifty fellow, in his turn, gets on. He is free from debt and other burdens, and he puts money, as a rule, into the savings bank. His wife and daughters go to mass on Sundays clad in bravery; he can give the latter dowry. He is a contented respectable citizen. One may smile at his primitive plough, at his slow white oxen, at the shallow furrows scratched between Olives, vines, and fruit trees. But he is ploughing land which is dug by the great three-cornered, long-handled Italian spade the *vaiga*, 'with its point of gold,' according to the proverb, every three years. Full of wise economies, clever adaptations of means to ends,

FIG 48. — HARDY FERNS IN THE GARDEN OF A. O. WALKER, ESQ., NANT-Y-GLYN, COLWYN DAY, N. WALES. (SEE P. 376)

SMALL HOLDINGS.—A correspondent writing from Tucany, where the *métayer* system is in operation, says:—"Your short paragraph on this subject on p. 274, presents food for reflection. Why did the class of small cultivators and yeomen 'disappear?' Was it not because from want of capital they could not contend against the difficulties of the situation? How are these to be created by the new legislation likely to be better off? You say by adopting 'the methods employed by horticulturists, rather than by farmers.' But the methods of horticulturists are expensive [the area to be cultivated is less], and where is the class intended to be benefited by the proposed

tions, because it is founded on a just and equitable co-operation between capital and labour. The 'capitalist' is very often a very humble one indeed, a small tradesman or artisan in town or village. He likes to invest his savings in a tiny farm. He likes to spend his money in stocking and planting it, and thence to draw his wine, his oil, his fruit and fresh vegetables in return. He knows that the labourer, who is working on his own account as well as for him, the proprietor, will put his talents into the enterprise without too much looking after. The labourer, being by nature and the necessities of the

frugality and sobriety, he is the creature of a just, durable, and highly-organised system well worth the study of those who would improve the condition of the English labourer." T. C. H., Florence.

LINNEAN SOCIETY.—At the evening meeting to be held on Thursday, March 17, at 8 P.M., the following papers will be read:—1. "On the Vitality of Spores of *Bacillus megaterium*," by ALLAN P. SWAN, F.L.S.; 2. "Notes on the Zebras," by BERTRAM RICHARDSON.

BIRMINGHAM CHRYSANTHEMUM SOCIETY.—It may be interesting to exhibitors and committees

of other societies to know that the committees of the above-named Society have decided to divide their class for forty-eight blooms into two classes, viz., one class for twenty-four incurved varieties, and one for twenty-four Japanese, their usual liberal prizes likewise being equally divided between the two classes. The open class for twenty-four blooms, too, will be divided in a similar manner; this, it is anticipated, will facilitate competition, and simplify the judging, inasmuch as it will be simply Japanese against Japanese, and incurved against incurved, whilst it will afford opportunities for competition to exhibitors who cannot manage to stage forty-eight, but who can manage twenty-four, at the same time admitting, as before, those who are able to exhibit both. The committee have further decided to introduce a rule making the use of gum or other adhesives in cut blooms, or blooms on plants, a disqualification; and further, that all Orchids exhibited at their next Chrysanthemum show and their spring show in 1893 shall be *bona fide* specimens exhibited in the pots as grown, and not made up for the occasion.

GREAT ORCHID SALE.—One of the most important sales of Orchids which has been held for a long time was that of Friday, 4th inst., at PROTHORP & MORRIS' Rooms, Chesham. About 600 plants of the remarkable *Cypripedium Chamberlainianum*—the entire stock imported by Messrs. SANDER, of St. Albans—were sold without reserve. The prices were the reverse of "fancy," owing to the unusually large stock. The best price was paid for a superb specimen, consisting of three very strong growths with eleven broad and long leaves, and one strong break, the amount realised being 11½ guineas. In two cases 11 guineas were paid for exceptionally vigorous plants, and 9 guineas were twice paid for fine specimens. For comparatively inferior plants, but all strong growths, the prices ranged downwards to a guinea. For a fine plant with large bulbs of *Odonoglossum crispum* lilacium, 22 guineas were paid; and three plants of the golden-yellow *Cypripedium* realised an aggregate sum of 70 guineas. The very fine new *Cypripedium* *Kimballianum* was offered for sale for the first time, and the best specimen fetched 40 guineas; two others 30 guineas each, and another pair 21 and 20 guineas respectively.

THE "SILVA OF NORTH AMERICA."—Professor SAROENT's transcendent work grows apace. The third volume, comprising plates 98 to 147, extending from Anacardiaceæ to Leguminosæ, has just been published by Houghton, Mifflin & Co., of Boston. For the moment, we must confine ourselves to the mere mention of its publication, and defer a more lengthy notice.

"DICTIONNAIRE DE BOTANIQUE."—With the thirty-fourth fascicle, M. BAILLON concludes his serviceable and richly-illustrated Dictionary. The labour and care bestowed on the work are beyond praise, though it is impossible to resist the impression that the latter portions have not been quite so fully worked up as the earlier ones. The coloured plates add to the appearance of the book, and have thus, doubtless, a value in the eyes of the publishers (HACHETTE & Co.), but their utility to the botanist is not proportionate to their cost. The work forms four quarto volumes, which the botanist will find he cannot easily dispense with.

"THE GARDEN ORACLE."—This is a year-book, the successive issues of which have served to mark time in a very profitable manner, if not always without a feeling of regret at the rapid efflux of time. The text contains, in addition to the usual calendarial matter, articles on gardening, both retrospective and prospective; a list of new plants of various kinds of the past year; articles on garden-foes, lists of the horticultural societies of the kingdom, and of the principal parks in the provincial towns; and a variety of other information useful to gardeners.

A SCHOOL OF HORTICULTURE, such as that we are still talking of, has been a reality in Belgium since 1849! Our Belgian friends are as "practical"

as we are, but none the less they have seen that intelligence is a better guide to practice than experience alone, which often means routine and stagnation.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—At a meeting of the above on Wednesday, February 10, the Floral Committee awarded a first-class certificate to Mr. C. G. VAN TUBERGEN at Haarlem for *Lachenalia Garnet* (L. quadricolor × L. Nelsoni), new plant; and botanical certificates to Messrs. E. H. KREZLA & SON at Haarlem for *Crocus Korolkowii*, Rgl. (insufficiently-known plant); *Galanthus Fosteri*, Baker (new plant).

FRENCH CUT FLOWERS.—One of the chief trades at this time of the year between France and Russia, according to the *Daily News*, is that in natural flowers, which, being brought to Paris from the south and from suburban hothouses, are arranged by professional florists in fanciful and tasteful manner in baskets, posies, and floral ornaments, and then packed with as much care as though they were costly millinery. Each stem is rolled in wadding, and a ball of Moss is fastened on the end to keep flower and foliage fresh. The Imperial and Grand Ducal Courts are the great customers at St. Petersburg, and the old and wealthy aristocracy at Moscow.

BOMAREA SORORIA.—In the *Illustration Horticole*, February 13, 1892, Mr. N. E. BROWN describes a new species under the above name. It has the habit and general appearance of *B. Carderi*, but the flowers are considerably smaller. Considering the great beauty and easy culture of these plants, it is rather remarkable that they are so little grown.

CRYPTOPHORANTHUS DAYANUS.—If gardeners continue to call this Masdevallia Dayana, they may fairly plead extenuating circumstances. The sepals remain in union, except at the base, where they are free; an interval is left between them, which gives the appearance of the head of a bird, with empty orbits. The plant was figured in our columns, 1887, ii, p. 693, f. 134. *Illustration Horticole*, t. 146.

ISLE OF MAN.—International exhibitions, so called, are the fashion of the day. The Isle of Man, which may be said metaphorically to fall on its feet whichever way you turn it, is to have a display of the kind at Douglas in the ensuing summer. Many of the local magnates are patrons of the exhibition, the general manager being Mr. H. W. PEARSON, of Bellevue, Douglas, Isle of Man, the manager of the exhibitions at Glasgow and Dublin. Section II. of the programme is devoted to horticulture, and includes classes for garden implements, buildings, &c., as well as for trees and flowers. We are surprised to see no mention of fruit, and still more so to note the absence of reference to forest products, and the afforestation of the island, but perhaps these will come later on.

GRASSES OF THE SOUTH-WEST.—Dr. GEORGE VASEY, the Botanist to the Department of Agriculture of the United States, has published a second part of plates and descriptions of the grasses of the desert regions of Western Texas, New Mexico, Arizona, and Southern California. The plates are very characteristic, and the details very clear, so that the book will not only be of great botanical value, but of much importance to agriculturists. The mode of growth—a point too much neglected by botanists, but a knowledge of which is essential to cultivators—is not overlooked in this work, which reflects credit on all concerned in it.

BANANAS v. PLANTAINS AS FOOD.—The general opinion of botanists is that the Banana and Plantain are but forms of one species, this opinion being founded upon the identity of the morphology in both. As a food product, however, the former, according to the *Report on the Agricultural Work in Botanical Gardens*, British Guiana cannot be compared to the latter. The Banana is a pleasant, agreeable, and much appreciated fruit, but the Plantain is regarded as one of the most valuable natural food products in the world, being very rich in starch

and glucose. Plantains are chiefly used by the natives while still green, and are cooked either by boiling or roasting, generally the former. Green Plantains are also used for making foo-foo (an African term, pronounced fufufu on the Gold Coast), by being boiled, pounded in a mortar, and then put into soup. In a mature but green stage, Plantains are delicious when roasted and eaten with butter, pepper and salt, or cheese. If gathered green, dried and ground or pounded, a nutritious meal or flour is produced, which makes delicious custards, puddings, &c. To peel green Plantains, the operation must be performed with wet hands, or the fruit immersed in water. When boiled in a metal pot, the Plantain has a tendency to turn a dark colour; but this may be prevented by boiling a small piece of fat with it. Baked ripe Plantain has much the taste of baked Apple. When not in flower or fruit, it is difficult to distinguish the Banana from the Plantain, but when fruiting it is a much easier matter. In the Banana, after the fruit has set and begun to develop, the succeeding clusters of flowers are deciduous, having a clear naked stem or axis, hanging tail-like 2 or 3 feet beyond the fruit, with the firmly-compacted mass of unopened bracts of flowers at the end; while in the Plantain, the stem ceases to extend more than 12 or 18 inches beyond the fruit, the succeeding clusters of the flowers and bracts all opening to the very end, and remaining attached to the stem. In the Banana, too, the axis continues to grow as long as the fruit hangs, while in the Plantain the growth of the axis is arrested soon after the fruit sets.

ROSE LA VIERZONNAISE.—An extraordinarily floriferous variety, flowering continuously from June to October, in bouquet-like trusses, with fresh green foliage; it is graceful in habit, and fragrant. Raised by M. CHAS. ANDRÉ in Vierzion, and soon to be sent into commerce by M. LEVEQUE, of Ivry (Seine). *Revue Horticole*, No. 3, t. 93.

A CASE FOR THE COUNTY COUNCIL INSTRUCTOR.—We append a letter we have received, which illustrates the need for something more than space-craft in the training of gardeners:—"To The Editor, Gentleman Kindly allow me to ask—through you Columns—is *Moss*—A Plant or an Animal and by what means do moss live as this was a question Discussed a short time Since but the Discision was not satisfactory i beg to be allowed to ask your opinion or Public opinoin. i take your Paper weekly."

THE FORMATION OF NITRATE IN SOILS.—Nitrates are only found in soils in very small quantities, and under exceptional circumstances; whilst, on the other hand, when the nitrifying organisms are introduced, large quantities of nitrates are formed. If calcium-nitrite is added to a soil which has been previously heated for half an hour at 100° Centigrade, in order to kill the nitrifying organisms without killing those which produce carbonic acid, the nitrite, after a few days, is completely converted into nitrate. These experiments are due to that well-known authority, A. MUNTZ (*vide Comptes Rendus*, cxii., pp. 1142—1144), who has recently been describing them in detail before the Paris Academy of Science. He deduces the following conclusion from his investigation. It seems highly probable that the nitrifying organism converts the nitrogen into nitrates, and the latter are converted, without any further action of any organism, into nitrates, by the simultaneous action of the oxygen and carbonic acid which are always present in soils.

A NEW ALKALOID FROM CHRYSANTHEMUM FLOWERS.—Signor F. MARINO TUCCI has recently been exploring the constituents of the *Chrysanthemum* blossoms, and he made the important discovery of an alkaloid. The latter can be obtained in quantity by boiling down the blooms with water and extracting in the usual way amongst chemists. The new alkaloid has been named *chrysanthemine*; it is a heavy, bright red, crystalline powder when in combination, and a colourless syrup full of silky tufts of needle-like crystals when pure. Unlike most

alkaloids it is physiologically innocuous. Many of the alkaloids form valuable adjuncts to pharmacy, and some of them are virulent poisons; it is by no means impossible that chrysanthemum may prove to be valuable medicinally. Perhaps the Chrysanthemum may some day, like its near ally the Pyrethrum, which constitutes the famous insect powder of KEATING, become a valuable crop to grow, apart from the beauty of its blossoms. There is a long account of it in a German scientific contemporary, but the original paper appeared in the *Gazette*, xxi, pp. 516-554.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—On the occasion of the fifty-third annual festival, to be held on Wednesday, June 29, at the Hôtel Métropole, Charing Cross, Sir JULIAN GOLDSMID, M.P., has consented to preside. The Secretary of the Institution, Mr. G. J. INGRAM, will be glad to hear from any gentlemen who are willing to act as stewards on the occasion.

GARDENERS' ORPHAN FUND.—We are informed that Alderman Sir JAMES WHITEHEAD, Bart., will preside at the dinner of the Gardeners' Orphan Fund, to be given at the Hôtel Métropole, Charing Cross, on Tuesday, May 17.

THE BORDEAUX MIXTURE AND THE POTATO ROT.—M. AIME GIBAUD contributed a paper to the "Comptes Rendus de l'Académie des Sciences" (Feb. 1), detailing his "researches concerning the adhesion of preparations of copper to the leaves of plants and especially the leaves of Potatoes when applied as a remedy against disease." He arrives at the following conclusions:—1st, That the preparations of copper intended to resist the Potato disease have very different powers of adhesion to the leaves; 2nd, That it is owing to heavy rains and mechanical agencies that the copper, after having been deposited for some time, partly disappears; 3rd, That among such preparations the one which wastes most is the Bordeaux Mixture; that the diminution in the proportion of lime slightly increases the solidity, and finally, that the addition of aluminous compounds does not produce any appreciable amelioration; 4th, That the soda-copper preparation on the one hand, and that of verdigris on the other, have an adherent power almost twice as great as that of the compounds mentioned, and that the saccharine copper-lime compound advised by M. MICHEL PERRET resists the action of rain in a remarkable degree. Therefore one or other of these three compounds, preferably that which best suits their personal convenience, should henceforth be used by such cultivators as wish to secure their Potato-grounds from disease.

LIVERPOOL AMATEUR GARDENING ASSOCIATION.—The members of this association—a newly-formed branch of the National Association of Amateur Gardeners—it is stated by the *Liverpool Post*, held a meeting on the evening of Friday, March 4, at the Common Hall, Hackins-hey. Professor J. HARRY GIBSON, of University College, attended by invitation; and upon the motion of Mr. D. E. YATES, seconded by Mr. James Smyth, jun., was unanimously elected president. In thanking the society, Professor Gibson remarked that he regarded the association as one worthy of every support, and as fulfilling, in promoting a taste for gardening, a most useful object. In conclusion, he promised for the May meeting a paper on "A Neglected Aspect of Gardening." Mr. W. A. ARDRAN afterwards made some observations on "The Successes and Failures of an Amateur Gardener," uttering especially a warning against the purchase of cheap and inferior seeds as the great cause of disappointment. At the next meeting of the association, Mr. J. M. SMYTH will read a paper on "Our Dangers and Possibilities."

TASMANIAN FRUIT.—The Peninsular and Oriental Steamship Company, says the *Daily News*, have arranged that their steamers shall make twelve visits to Hobart, Tasmania, for the purpose of bringing to England a consignment of 240,000 bushels of Apples. The first lot has been despatched, and will arrive in London towards the end of the present

month. The fruit is packed in cool chambers during the voyage.

DEVON AND EXETER GARDENERS' ASSOCIATION.—Mr. F. W. MEYERS, landscape gardener to Messrs. R. VEITCH & SONS, read a paper on "Alpine Plants" before the members of the above association at the Exeter Guildhall on Wednesday, March 2. There was a large attendance, and the lecture, which was of a practical and interesting nature, was highly appreciated. Before the members of the association separated, it was announced that the proprietor of the *Journal of Horticulture* had offered to give a medal to the gardener who would write the best essay on "The Principles of Pruning," and that the committee had accepted the offer.

CHEAP FRUIT.—Very fine Oranges, said to be from Valencia, have been hawked about the streets of Plymouth during the past week at three a penny. The hawkers have had large barrowfuls.

ANCIENT SOCIETY OF YORK FLORISTS.—A monthly meeting of this Society was held on Friday 1st, Mr. JAMES KEY presiding. There was a good attendance of members. Mr. MCINTOSH read a paper on the "Fertilisation of Flowers, &c.," in relation to their development, which was of a highly interesting

FIG. 49.—EMMENANTHE PENDULIFLORA: HEIGHT, 12 INCHES; FLOWERS, GREEN COLOURED OR YELLOW.

character, and spoken of at its close in very appreciative terms by Mr. W. R. ROBINSON, who moved a vote of thanks to Mr. MCINTOSH.

WINDSOR, ETON, AND DISTRICT CHRYSANTHEMUM OR HORTICULTURAL SOCIETY.—The first annual exhibition of the above Society will be held on Thursday, November 10, at Windsor.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual meeting of the above Society will take place on Monday evening next, at 8 o'clock, at the Caledonian Hotel, Robert Street, Strand, when Mr. R. CANNELL will preside.

LEEDS PAXTON SOCIETY.—The members of this Society held their sixth annual dinner at the "Wheatheaf" Hotel on Thursday evening, March 3, the Mayor of Leeds presiding. There were about eighty members present.

INTERNATIONAL HORTICULTURAL EXHIBITION.—The General Committee, in connection with the Exhibition to be held at Earl's Court, S.W., during the coming summer, met on Tuesday last, Mr. W. MARSHALL presiding. A substantial amount of money has been allocated in prizes, those for the great show to be held in May, amounting to about £750. Rapid progress in forwarding the preparations is being made.

FRUIT FROM SOUTH AFRICA.—The Union Steamship Company's R.M.S. *Mexican*, which arrived

at Southampton on the 6th inst., has brought a further consignment of fruit from South Africa, consisting of Grapes, Pears, Apples, and Melons. This fruit was placed on sale at Covent Garden Market, on Wednesday, 9th inst., when the Grapes realised the highest prices yet obtained for importations from South Africa, boxes containing about 20 lb. fetching 15s. each. The Apples and Pears turned out in first-class condition, boxes containing 30 to 35 of the former realising 7s. 6d., the Pears also obtaining high prices, one case of 42 being sold for 34s. The Melons realised about 3s. 6d. per box.

PUBLICATIONS RECEIVED.—*Report on Experiments made for the Prevention and Cure of the Potato Disease.* By R. VEITCH & SONS, Exeter.—*Sunderland and District Gardeners' Mutual Improvement Society, Annual Report.*—*Reading and District Gardeners' Mutual Improvement Association, Annual Report.*—*Les Fleurs à Paris*, par Philippe de Vilmorin.

EMMENANTHE PENDULIFLORA.*

UNDER the name of California Yellow Bells, a dwarf, bushy annual has been introduced, for the opportunity of illustrating which, we are indebted to Messrs. R. Veitch & Sons, of Exeter (fig. 49). The foliage is deeply cut, covered with sticky hairs; the cream-coloured or yellow bell-shaped flowers are in loose panicles, and resemble in structure those of *Eutoca* or *Phacelia*. The seeds should be sown in heat in boxes, and planted in the open ground when danger from frost is over; or sown in the open ground later.

SCOTLAND.

REMARKS ON SOME KINDS OF VEGETABLES.

AT this season of the year there is in all gardens some anxiety among cultivators (especially if the ground is cold and low-lying) regarding the safety of vegetable crops. Though they may have weathered the elements fairly hitherto, it is during March, and onward to May, that real difficulties often have to be met. Since the severe frost set in during February much damage is observable; after the thaw only, however, can the amount of mischief be noted. Some counties in Scotland have suffered much more than this fertile one (Stirling), but none can say that their crops are unscathed. Those least affected are Borecoles; our own are mostly sound and plentiful, though they are on ground through which a sluggish river winds. Among a number of selections sent us for trial, two of the best are Sutton's Exquisite Green, and Sutton's Extra Curled, a dwarf variety similar to the former, but which grows close to the ground. I hope to save seed of the latter, as I think its general excellence cannot be surpassed.

A purple variety—Sutton's Purple—is uninjured, and would be of value for its hardiness if it could find favour in the culinary department. The Purple Sprouting Broccoli loses caste because of its colour, and I think this purple Borecole will be the same. Downie's Selected, and Veitch's ditto, were in capital order for first cuttings, all Cabbaging Kales being less hardy than the ordinary forms of Kale. A Russian variety, of somewhat ornamental appearance, is very hardy, and of fair quality. To have good Kales at this season of the year, the land should not be manured heavily at planting-time. We generally plant after crops of early Potatoes, the ground being carefully levelled, and trodden firmly. Autumn sowings are generally coarse, and of strong flavour.

Celery.—The Celery crops have passed the damp weather during autumn and early winter remarkably well, and the tops stood up green and robust throughout January and till the second week in February, when they received a severe check, but none, I am glad to find, are injured in the stems

* *E. penduliflora*, Watson, *Botany of California*, I., 1876, p. 514.

below the surface of the soil. Much covering with litter in frosty weather often does more harm than good, especially if the protection is left on after the weather has become genial. We hope to have useful Celery to the end of the month of May. The varieties valued most are Veitch's Pink and Major Clarke's Red. The first-named is grown for furnishing a supply from September to the end of the year, and the latter for the main late crop. In our heavy and low-lying ground the plants are placed nearly on the surface, which not only gives a great depth for the roots, but saves the crop from being injured by damp and severe frost. The ridges are formed to take three to five rows, thus economising much space. I object strongly to the use of loose manure being used for Celery, and always tread the soil firmly before planting, mulching immediately after with half-rotted manure or mowings of lawns. One good soaking of water at planting time is nearly all the moisture given, till a soaking is administered just before earthing-up takes place. I have never found any material difference in the cultivation of Celery in the south of England or midlands of Scotland.

Brussels Sprouts.—Cultivated similar to Borecole (except the earliest crop, ready for use by September), are grown on richer land than those to supply the kitchen during winter and onwards into April. Among selections familiar to us, Downie's for earliest supply, and, for later crop, Veitch's Aigbarth and Dalkeith, have done best this season; but others grown under different names do not differ in habit or usefulness.

Broccoliis for spring and early supply can hardly be fairly judged yet, but many are damaged by frost; Cattell's Eclipse and Gordon's Niddrie are least injured.

Cabbages.—Those who know the value of Drumhead Cabbages, especially the dwarf Glen Drumhead, which forms compact neat heads, and of very fine quality, can always be sure of wholesome vegetables during the winter, but they must be cultivated specially for culinary use; at present, and for weeks to come, they are much valued in the north. Grown in firm soil, not too highly-manured, they are tender and sweet.

Savoy are still in fine condition. Dwarf Green Curled always finds a place in northern gardens, and well it may, as it is hardy, of fine quality, and deep green in colour. Dwarf and large Drumheads have stood well, and are also useful. Most of the early kinds began to die off after the middle of January. The colour of Golden Globe is against it, but its quality is excellent.

Lettuces have suffered considerably, but Brown Bath Cos has stood best, and has been the favourite here for some years for late and early supplies; it seldom gives trouble during summer by running to seed. Many spurious sorts of this old favourite are abroad.

Leeks have been extra good, but I am contented with two kinds only, viz., the best selection I have seen for some years of Musselburgh is our best; Lyon is also good, but not so large as it has often been grown. Leeks are planted rather thickly on well-trenched ground from which Celery has been removed, and they always do well. I have grown nearly every known variety, but none is here equal to the two varieties indicated above. Leeks are more valued in Scotland than in the south, and consequently the cultivation receives more attention. French cooks use Leeks all the year round, and I have had to supply them when not larger than goose quills.

Turnips from late summer sowings are still tender and sweet. These were lifted during November and replanted, covering the bulbs over with the soil. Two kinds which I most favour are Veitch's Red Globe and Golden Ball. Golden coloured Turnips are much valued in Scotland by reason of their fine flavour and pulpy texture. Turnip Tops are little valued in the north. Swede Turnips are turned to good account by blanching the tops, and sending them in for use as one would Seekale. *M. T., Stirlingshire.*

THE ROSERY.

WORK IN THE ROSE GARDEN IN MARCH.

The first part of this paper must be given to seasonable work among these popular flowers under glass. Very few subjects are more easily managed, or so pleasing and suitable for a cool house as Roses, and they are able to stand the severest winters when afforded the slight protection of a cool house. In many places where a lean-to has been built against a dwelling, no means of heating it exist, and it is here that the Rose is seen to great advantage. A cool Rose-house of this kind devoted entirely to these flowers is easily managed, and will soon give the owner pleasing results. Of course, Roses in pots or borders have already been pruned, although, as a rule, the most suitable varieties for this purpose are those that grow and flower without much spring pruning being necessary. *Maréchal Niel*, *W. A. Richardson*, *Madame Bérard*, *Climbing Niphetos*, *Reine Marie Henriette*, and *Gloire de Dijon*, are six of the grandest Roses possible for this purpose, and will give a great number of flowers in spring, if treated as I will describe. Grow them turned out into borders, or else in boxes or large pots. Turned-out plants are much the best, as the varieties named require plenty of space for the roots, to do them justice. Prune hard back the first season, and thus get good wood upon established roots. These shoots must be got well ripened before the winter sets in; then, in the early part of the year, prune off their tips, mulch the roots, and let the plants come along as steadily as possible. I will suppose this is already done for this season. Now comes the trial and test of skill in growing Roses in such structures. It is during the months of March and April that the greatest difficulties occur; for, the house being unheated, it will be found a hard matter to keep the temperature uniform, and a proper temperature for Roses in a cool-house during March should range from 50° to 60°. This degree of warmth can generally be secured with a little care and judgment; the hardest matter being to keep them cool enough upon bright days, when cutting winds from the north and north-east blow, and great care is needed in affording ventilation at such times, and yet the thermometer must not rise too high, or mildew will soon be attacking the young growths; nothing brings this enemy on sooner than sudden changes of heat and cold. The Roses should be carrying shoots of some 3 to 6 or 9 inches in length, and must now receive a good syringing every morning when the weather is suitable for so doing. Always have a small quantity of insecticide in the syringing-water, and let this be about 70° at all times. The plants should be well watered, and when they are a little more forward, liquid-manure is of great advantage. The ammonia from this is a splendid thing for Roses under glass, and will also check the fly to a considerable extent. I prefer the drainings from a cow-stall. Where the smell of natural manures is much objected to, use a little Standen's manure or guano.

A point that cannot be pressed upon amateurs too closely, is not to use these manures so freely. A very weak solution given often is of far greater value than the same amount of manure given during the same time but in stronger doses.

Roses are gross feeders, but their roots are more tender than many suppose. A slight overdose of manure, and the tips of the feeding roots are crippled; naturally this affects the plants very much, and one may often see them looking badly from this cause.

If the weather is very bright, I should advise a slight shading towards the end of the month. By the middle of April, one should have a quantity of good blooms upon plants growing in a cool house, and these will often be of far superior colour and substance to those grown in heat. *Maréchal Niel* in particular comes much deeper in colour when treated in this manner.

As soon as the flowers are secured, I prefer to cut

away the rods that have been carrying the blooms; cutting them back to the strongest eyes breaking from the base of the shoots or plant, applying a little mastic to the wound at once. I do not advise cutting away two or three strong shoots from a plant at one time, but that these be removed gradually. Such treatment will result in some grand shoots being made during May and June, especially if weak liquid-manure be often afforded. From this time onwards the plants may receive air in greater abundance, and soon after the signs of ripening should appear. It is at that time not prudent to keep them dry enough to cause any check. The first autumn frosts will not harm them, and it is these that do so much damage to unripe growths of the strong growers in the open air. After September, water may be withheld, and the plants will get well ripened before frosts sufficiently severe occur to harm them. Even in cool houses that are not devoted entirely to Roses, a few plants of these strong-growing varieties, and grown upon the lines indicated, are a very pleasing feature, with little trouble.

In the outdoor department, there is also a fair amount of work to be done. All litter that was employed as a protection against frost, should have the larger portions carefully collected from among the branches, no further protection being needed. Indeed, for the rest of this month I would allow cold air access to the plants, as the more backward they can be kept until the early part of April, the better it will be. Dress the plants with well-decayed manure, and dig this in at once. You will thus retain the whole of its beneficial qualities, and at the same time give your beds a tidy appearance.

A few of the hardiest of the Hybrid Perpetuals may be pruned towards the end of the month, but as a general rule I prefer the early part of April for this operation. *A. P.*

NURSERY NOTES.

CYCLAMEN AT HANWELL.

For some time past, the collections of Cyclamen staged by the St. George's Nursery Company at the meetings of the Royal Horticultural Society, and other metropolitan exhibitions, have attracted considerable attention; but to see what has really been done in the matter of Cyclamen culture, a visit to the nursery of the above company at Hanwell is necessary. There thousands of plants are grown, and on a recent visit we noted many houses were devoted to their culture. The plants were, without exception, in the best of health, and noteworthy for the immense quantity of bloom they produced. The flowers, too, were remarkable for their size and substance, and afforded ample evidence that the strain is one of the best.

Hitherto the majority of the plants were grown principally for market purposes, but latterly the production of seed has received more than ordinary attention. To facilitate this, and effect improvements in the size, shape, and colour of the blooms, careful selections of the plants are made, the best and most perfect varieties only being retained. These are grouped in sections, according to their colour, in various structures, and fertilisation is now being actively carried on, with a view to obtaining new and improved forms. Last year, it was computed that fully 150 oz. of seed were gathered, but this year's harvest, it is anticipated, will far exceed that quantity.

Regarding the named varieties, it may be of interest to enumerate a few of the best. The whites were specially good, and among these *Mont Blanc*, with long broad petals, was most conspicuous. *Baroness Burdett-Coutts* is another capital white kind, of sturdy habit, with short broad petals, while the same may be said of *Dame Blanche*, which had petals 1½ inches across, and of pearly whiteness. The coloured varieties were also very fine, and comprised shades from the most delicate pink to the deepest purplish-crimson. The most beautiful of

this section was undoubtedly Princess May, a charming pink hue. This is a new variety, and when placed before the public it will, no doubt, become very popular. Another new kind, named Mauve Queen, was noticeable for its distinct colour; while Excelsior, a white, with deep crimson base, is a decided improvement on *Grandiflorum roseum*, the flowers being not only larger but of a better form.

The bulk of the *Cyclamen* at this nursery are raised from seed sown annually, very few old corms being flowered a second year. The seed is sown in August, or as soon as it is ripe, and the resulting plants grown on in a genial temperature till they flower, generally some fourteen months or so from the time of sowing. About 18,000 plants are raised annually, and apart from those now in bloom, there were that number of seedlings coming on for flowering next season.

In addition to *Cyclamen*, various other subjects receive special attention. White Arums are grown extensively for market purposes, as also is *Asparagus tenuissimus*, a large span-roofed house being devoted to the culture of the last-named plant.

ORCHID NOTES AND GLEANINGS.

CATTLEYA ALEXANDRE, Lind.

M. LUCIEN LINDEN states in the *Lindenia* that the collectors of the Horticulture Internationale announce the discovery of a new and most striking *Cattleya*, "which we have dedicated to H.R.H. the Princess of Wales"—a delicate attention, no doubt, accompanied, as it is, by some sympathetic remarks, and by some compliments to English Orchid growers. We cannot, however, but regret that M. Linden should have given a botanical name which will have to be registered in all the botanical catalogues of the future, to a plant which he has never seen (at least, there is no indication that he has done so), and about which he knows nothing but what his collectors tell him. Had he called it *Cattleya Princess of Wales*, that would not have been so objectionable, and would have caused no botanical and literary difficulties; but even then, gardeners do not usually name their offspring before they see them.

DISAS, &c., AT THE CAPE.

In last September the Bathurst-Kowie flats, presented, owing to the splendid season, masses of bloom of hundreds of different kinds of flowers of varied hues, the *Disas*, and other terrestrial Orchids, being especially gay. The altitude is not very much above sea level, and there is abundance of fine white sand in the spongy soil. As I understand many fail to cultivate these plants in England, a few remarks as to their conditions here may be of service. The *Satyrium militare* here are very robust and handsome, and so are the *Eulophias*, which grow in the bush veldt near the coast in an abundance of sand. *Lissochilus speciosus* grows on the sand hills along the entire Bathurst division of the coast line, where they rear their tall spikes of yellow flowers amid the stunted bush. The fragrant *Disa cornuta* grows near the base of the hills, and on undulating flats; they seem to like a fine open situation, and plenty of sand in the soil. *Disa lugens*, a most beautiful species, unlike *D. cornuta*, seems invariably to grow on higher elevations swept by the prevalent S.W. winds, and like many other *Disas*, in very stony places, a knowledge of which may help cultivators. As an instance of this, I noticed that a strip of ground where no stones were to be found was perfectly free from *Disas*, while on either side where the ground was stony, I found *D. lugens* and others in abundance. Many times, in the crevices of huge rocks, with scarcely any soil, *Disas* are found. *Disa sagittalis* is one of the prettiest white Orchids we have; it likes to grow on shelving rocks with a very thin covering of decayed vegetable matter. They flourish best at the edges of the dense bush, and seldom come to perfection when in the open veldt. *Satyrium maculatum*, a local plant, is very pretty, and has pinkish-white blotched flowers, which are very

fragrant. It flowers in December, and grows chiefly on the summits of hills in rocky ground.

Observations on these and other species seem to indicate that those who fail to grow these beautiful plants successfully, fail mainly by not making provision for their partiality to a stony or rocky compost in which to grow. G. S., Grahamstown, South Africa.

CULTURAL NOTES.

TABERNÆMONTANA CORONARIA.

I do not think it is generally known how readily this very desirable stove-flowering evergreen shrub recovers itself after being subject to severe pruning. Looking round a garden in this neighbourhood a short time ago, my attention was drawn to two or three large plants in the open air, which I was informed were stood outside to take their chance, as they occupied too much room in the house. I will relate my experience respecting the management of overgrown plants. Plants that are too large for general requirements, will, if judiciously cut down, become useful for general purposes. They should be kept dry for two or three days, and then all the leading shoots cut down to within one or two joints, then keep the plants well syringed two or three times a day. Watering must be carefully performed till the young shoots begin to appear, when it will be necessary to repot the plants. The old soil should be reduced, and the plants put back in the same-sized pots. Good lumpy loam, fibry peat, dried cow-manure, a fair portion of silver-sand, and small pieces of charcoal, will form a most suitable compost for them. I may say in conclusion, that I served several plants in the manner described about eighteen months ago, and they have now formed some capital plants, and are covered with flowers. Mealy-bug is very troublesome to these plants, but if syringed about once a fortnight with petroleum, in proportion of a wineglassful to 3 gallons of water, they are easily kept in check. G. Parrant, Ashby St. Ledgers, near Rugby.

CLIANTHUS DAMPIERI.

It does not seem possible to bloom this plant successfully by the usual routine of sowing seeds and growing on the young seedlings by successional pottings, and the cause of failure generally is owing to persistence in such practices. My own success, a solitary one, was the result of a trial based on what I had read of others' observations. Having a large one-light frame upon a hot-bed, which had been used in striking cuttings, and which was at liberty in the first week in the month of May, I turned it to account in this wise: having obtained a packet of good seeds of this showy subject, I had a largish mound made, consisting of two parts fibrous loam, one part peat, with a little leaf-mould and sand, and a few bits of charcoal placed upon the bed in a sloping manner from the middle to the back and to front of the frame. I sowed the seeds along each side of the ridge thus formed, but not upon its apex; this was done thinly, and in two rows. From the time when the seeds were sown until the young plants were well through, the sash was kept closely shut, and for a month subsequently air was afforded the frame very freely during the day. On dull cold days the sash was elevated at the back, and on fine days it was tilted at the side, and always on that side whence the wind did not blow. Afterwards the sash was drawn off, and only replaced on the few cold nights that were experienced. The rains which fell sufficed generally for root waterings, as only during one hot fortnight was water afforded artificially. In about four months the plants had made fine growth, being assisted by the partly-decomposed materials below them, and about the middle of the month the clusters of large heavy flowers freely formed. It is only necessary to add that the frame faced the south, and was at the foot of a high south wall.

It would seem, therefore, that the seeds resemble those of the *Perilla*, germinating best in moderate heat with uniform moisture, and that the roots, being impatient of confinement, handling, and injury, prefer an uninterrupted growth, and definitely a highly-enriched, cool, moist base to ramify into. William Earley.

HERBACEOUS PHLOX.

These bright-flowering plants, which have a good effect in the borders, and whose flower-heads are so useful for cutting, and especially the white-flowered varieties, should be grown largely where space exists. The old mode of increasing the plants by divisions of the roots is still followed, but cuttings are better, the plants carrying finer heads of bloom. Cuttings may be taken as soon as they can be obtained, and put five to seven in pots filled with sandy soil, and stood in a moderately warm frame where they soon take root, and when hardened off properly, may be put out into the borders without disturbance. Though gentle warmth hastens the rooting, cuttings will root readily under hand-lights without bottom-heat. I have been successful by lifting the shoots with a heel, and dibbling them in on a warm border at a few inches apart. In all cases the cuttings should be made firm in the soil and well watered, and finally put out on a well, tilled and manured piece of ground. H. Markham, Mereworth Castle.

HOME CORRESPONDENCE.

CULTURAL ANALOGIES.—The Rev. Canon Fleming must have been alluding to the passage in Mrs. Beecher Stowe's most interesting and entertaining work, *The Minister's Wooing*, chapter xxiv.:—"It is said that gardeners sometimes, when they would bring a Rose to richer flowering, deprive it, for a season, of light and moisture. Silent and dark it stands, dropping one fading leaf after another, and seeming to go down patiently to death. But when every leaf is dropped, and the plant stands stripped to the uttermost, a new life is even then working in the buds, from which shall spring a tender foliage and a brighter wealth of flowers. So, often in celestial gardening, every leaf of earthly joy must drop, before a new and divine bloom visits the soul." Strange to say, I saw, when in Russia, something of the same culture carried out with the Rose as here mentioned; also many customs and beliefs regarding seed-sowing, cuttings, and plant-growing, some of them practised by our forefathers, as we read of in old gardening books. C. D. A.

—May not the illustration used by Canon Fleming in his sermon, referred to in your last issue, p. 306, be an allusion to the *Dendrobium* of the *Wardianum* and *Devonianum* type, slightly distorted by the imperfect memory of the preacher? We have in their culture the withholding of water as growth matures, and indeed of light too, if we take into account the waning autumn days, the gradually drooping and decay of the leaves till there remain only the naked stalks—to the ignorant the very corpse of a plant, but to the gardener still a thing of beauty, because he has the power to foresee the wealth of flowers which will shortly spring forth from the scar of every fallen leaf. Can a better analogy be found to enforce the lesson that it, the gate of apparent death, must be passed to reach the higher possibilities of life. L. C., Rugby.

FORCED LILAC.—It would be instructive to have the experience of gardeners in forcing the purple Lilac. In my own, that which is done in the light has no comparison with the whiteness obtained in the dark. C. D. A.

SUITABLE HEDGES FOR WOODS AND PLANTATIONS.—Replying to the enquiry on this matter, which appeared in the *Gardeners' Chronicle* last week, it must be said that much depends upon the situation and aspect of the fences. Whitehorns should always have the preference over any other plant for fencing work, especially if the plantation is new, planting it at the same time as the trees, and 16 feet from the outside line of hardwood trees, the intermediate spaces being planted with under-

wood to within 4 feet of the fence. The Quicks should be planted by preference in double rows, 9 to 12 inches between the rows and 12 inches from plant to plant, done in zig-zag, which will give an average width of about 10 inches. If the soil is good, the plants will grow freely, but it is indispensable that the hedge be kept free of weeds by hoeing from time to time, and not dug between if it can be avoided, as the latter process generally weakens the roots. Now in regard to an established plantation which overshadows a fence, and it is desirable to plant a living fence, Quicks will not grow in the shade of trees, and they should be dispensed with, unless it be in a partially open place where the sun penetrates, where it may be planted with a few common Privet intermixed, say, at intervals of 3 or 4 feet. For a hedge directly under trees, I cannot recommend anything better than the common Hornbeam, which adapts itself to the habit of hedge culture admirably, and forms an almost impenetrable fence. As it retains its leaves all through the winter, it is not unpleasant to the eye, and its dense appearance at that season makes it a good fence against cattle. *J. Garbett, Hale Park, Hants.*

GARDENING AS A PROFESSION.—As an old Aberdeenshire boy, I read with much interest Sir Arthur Grant's lecture to the members of the Aberdeen and North of Scotland Horticultural Association, which was given in the last number of the *Gardeners' Chronicle*, p. 304. All honour to the present proprietor of Monymusk for the encouragement he is giving both to forestry and gardening. I wish that there were more like him who would give their attention to arboriculture and horticulture. By way of encouragement, Sir Arthur gives examples of two young gardeners trained in the gardens of Monymusk, who now hold responsible situations abroad, and he quotes Sir Joseph Paxton as a remarkable instance of ability and success; but I would give him yet another example—Robert Marwick; born of comparatively poor parents, and apprenticed some eighty years ago at a small place called Pittodrie, and near Monymusk, where all the glass in the garden consisted of a three-light pit or frame, and yet this boy, notwithstanding such a small beginning, by dint of perseverance and industry, unaided, rose in his profession till he became noted, not only as a practical gardener, but the best landscape gardener of his day and generation; was for years the Curator of the Botanic Garden, Regent's Park, and the editor of the *Gardeners' Gazette*; and, better than all, he left a name honoured and respected by all who knew him. *J. Rust, Erldrie Castle.*

ELÆAGNUS JAPONICA VARIËGATA.—I find that this species of the Oleaster is not quite hardy in South Hants. We have two plants growing in a somewhat sheltered position, yet fully open to the sun the greater part of the day, and the soil is of a heavy nature. During the summer of 1890, the plants grew very fast, making vigorous shoots, but the succeeding winter's cold killed the branches back to the base, so that even now, after a season's growth they form poor outcrops compared with what they once were. *E. Molyneux.*

CYCLAMENS.—The specimen Cyclamen figured in the *Gardeners' Chronicle* of March 5 reminds me of a fine batch I saw in flower a few days since, when paying Mr. Perkins a visit at Greenlands, Henley-on-Thames. They were remarkable for the quantity and quality of their flowers, and were some of the many things that were well done at that place. *T. H. S.*

PEAS: CHAMPION OF ENGLAND AND SUCCESS.—I was much pleased to see Mr. Markham's note (p. 237) on Peas, in which he states that the above first-named kind for late purposes is always good. On our light soil it is excellent for general cropping. I have tried most of the newer and larger Peas, but cannot find one more reliable than Champion of England. For late purposes I grow Ne Plus Ultra and Success, but on light dry soils these need special treatment. Champion of England is one of the freest-bearing green-wrinkled Peas I know, and is of excellent flavour. Ne Plus Ultra needs no recommendation, being one of the best late kinds. Success is not well-known, being a new wrinkled marrowkind. The pods are much like Ne Plus Ultra in colour, and the Peas are of excellent quality. It may be termed a dwarf Ne Plus Ultra, and those who object to tall Peas should give it a trial. We grow our late Peas in trenches with plenty of manure, for without this, late Peas on very light soils are not always reliable. To get size and abundance of

pods, sowing thinly, topping the haulm, and giving plenty of moisture in dry seasons are the essentials. *G. Wykes.*

PRICE OF LILIUM AURATUM.—That this popular Lily is steadily rising in the public estimation, goes without saying, and of recent years it has been procurable at very low rates, but this season, through the increasing demand, together with rather lessened supplies, prices have gone up tremendously; and the last consignment of 3000 bulbs from Japan, which were sold at Protheroe & Morris' Central Auction Rooms, Cheapside, were keenly competed for by the buyers—not a single bulb being unsold—at prices ranging from 2s. per bulb to the smallest at 75s. and 80s. per 100. It was freely asserted, that never was *Lilium auratum* in such demand, nor met with a better sale. *F. Ross.*

CARNATION. WINTER CHEER.—I can endorse all that Mr. Divers says on the above at p. 217, although I was not well pleased with the first blooms that opened with us. The short sturdy growth soon gives flowers; it is easily propagated, and is altogether a good thing. *T. H. Stale, Morgwell Gardens.*

FUELS AND STOKING.—I am much obliged to Mr. E. Jenkins for his remarks on p. 278, as they go a long way to prove that anthracite coal is not only the best of fuels, but one of the easiest to use in a properly-constructed boiler. The flues which I recommend to be cleaned out two or three times a week are the furnace-flues, or they would get blocked with ash and coal, and stop the draught so necessary to a bright fire of anthracite coal. I still recommend to those who find any difficulty in using anthracite "to pull out their fire," and make all clean; and I maintain that there will be less loss of heat, and less waste of labour and fuel, than if poked and stoked, as one must do, to a sluggish fire. I have one boiler which does not require any such treatment, one that goes month after month, and never requires to be "pulled out." It may interest your correspondent to know that my boiler-flues have only been cleaned once in two years, another saving of labour by the use of anthracite. *H. J. Southgate, Morpeth House Garden, Ipswich.*

—Will Mr. E. Jenkins state the length of piping on his "heavily handicapped" boilers, and the sizes of the latter, for to boil the water madly in less than two hours is a marvellous performance? Either the boilers must be lightly handicapped, or the length of piping very short for any fuel to perform that feat. *R. C.*

PRUNING DENDROBIUMS.—I read with great interest the letter of "B. P." on p. 217, in answer to Mr. Burberry on Dendrobiums. The marvellous plant of D. noble, 7 feet across, with growths 3 to 4 feet long, and others carrying 1000 racemes, each of which would represent between 4000 to 5000 flowers, are exceptional specimens, and I think it would be of great interest to Orchid growers to know the grower's name, and where these marvels of cultural skill exist. *J. S. T.*

LAST CENTURY'S POTATOS IN IRELAND.—I do not think there is one now existing, unless it is the "Brown Quarries," and I do not know that this would have existed unless for certain conditions of soil. What your correspondent, Mr. J. Miller, says is very interesting. It is a matter of great surprise to me, and to many others, as to the origin of the sorts which were in the country prior to 1846. We have never had better ones since. As for the red and black Mignons, White Eyes, Black Coppers, Red Apples, these are late-keeping tubers, and nothing introduced since, from either America or England, could match them; and for harvest work, when men used the sickle to cut the corn, and worked from 6 a.m. to 6 p.m., there was no other food than Potatoes taken three times daily. There were no sorts to compare with the red, white, and brown Quarry. These varieties must have been raised in Ireland long ago in the days of sailing ships and stage coaches, and when we were practically much hemmed in, in our intercourse with our neighbours. I write as one remembering Ireland prior to the famine years. There are no modern Potatoes which have originated from Potato-Apples in this country. *W. Baylor Hartland, Ard Cairn, Cork.*

A BRIGHT WINTER SHRUB.—It is curious how little the Dogwood (*Cornus sanguinea*) is used in the planting of shrubberies. The shrub has a very

telling effect, both at a distance and at close quarters, in mid-winter. If grown in a clump, the contrast given by the blood-red colour of the branches and stems is a great relief to the sombre green of the Laurels and Yews, and brightens the foreground of high deciduous trees in a very eye-pleasing way. There are two places to which my tramps have taken me, where the Dogwood is used extensively; they are Brockleby Park, in North Lincolnshire; and Reigate Priory, in Surrey. In the former, it is used with the brightening effect just mentioned, and seems to extend in a circle in the foreground of the high trees, into which the magnificent lawns there disappear. At Reigate it is planted in dense masses round the lake, and when, as now, there is often a silvery gleam on the water, the contrast with the crimson gariture forms a lovely cynosure. *Vagabond.*

TREGULLOW.—To most persons Cornwall, so far as gardening is concerned, is an unknown part of the country, nevertheless it is the home of many rarer half-hardy exotics, and the district around Tregullow, Mr. Conybear's residence, can show many luxuriant specimens. There the Camellias assume the dimensions of trees, and the *Desfontainia spinosa* is a common free-flowering shrub; there also are the finest trees in England of *Banthamia fragifera*, as well as a famous specimen of the *Sciadopiety verticillata*, whilst *Azalea indica* is quite hardy in the sleepy dells. In addition to these, I have noted some of the most noteworthy plants, which, when planted in favourable positions, thrive in the open air in those parts, as follows: *Agaves*, *Aloxya citrodora*, *Aponogeton distachyon*, *Buddleia globosa*, *Chamaerops humilis*, *Choisy ternata*, *Giantus panicurus*, *Colletia cruciata*, *Daphne indica*, *Diplolappus chrysophylla*, *Dracena indivisa*, *Eleagnus japonica* var., *Embothrium coccineum*, *Eriobotrya japonica*, *Escallonia*, *Erythrina Crista-galli*, *Eulalia japonica*, *Eurybia Gunniana*, *Fabiana imbricata*, *Griselinia littoralis*, *Hedychium Gardenerianum*, *Lapageria rosea*, *Lardizabala biterata*, *Lycesteria formosa*, *Magnolias*, *Metrosideros foribunda*, *Mitrasia coccinea*, *Myrtles*, *Olearia*, *Haastii*, *Orange trees*, *Ozothamnus rosmarinifolius*, *Philasia buxifolia*, *Photinia serrulata*, *Phormium*, *Pittosporum*, *Swammerdamia antennaria*, *Ugenia ugni*, &c. *W. Napper, Chelsea.*

JUDGING POTATOS.—Should Sutton's Satisfaction be classed as a round or a kidney Potato? The variety in question is, as most persons are aware, an excellent Potato, either for exhibition purposes or the table. It was sent out as a round variety, but its shape varies so much that tubers of a kidney shape may be selected and exhibited as such; hence confusion and unpleasantness occur at shows, as was the case at a show where I was a judge last season, in company with two other gardeners. It was a village flower show in Sussex, held in August, and on our coming to the Potato classes it was seen that the best dish of any White Kidney was one of Satisfaction, and although the competition was strong, this dish was a long way ahead of any other, and it was proposed to give it the 1st prize; but I objected to that being done, and the President of the Society was appealed to, and without hesitation, said that in his opinion it should be disqualified, which was eventually done. Passing on to the next class, that for any white round Potato, we again found Satisfaction, and in this case in its true form, and it easily took the 1st place in that class. If my memory serves me aright, both dishes were shown by the same person. Still, another case. A week later I was again acting as judge at a show with two colleagues, and on coming to the Potatoes this same difficulty occurred, and I again demurred, but was overruled, after an appeal had been made to the committee, and in the end we actually awarded 1st prizes to the same variety in both the kidney and round classes. Query—who was right? I feel there was an injustice done somewhere. I should like to hear the opinion of some one in the matter, and, if possible, to settle the point of class. *H. Harris.* [The raisers call it a round variety, but it is not truly round, as they say; also that it is pebble-shaped. *En.*]

CAMELLIAS.

In a general way much disappointment is experienced in the forcing of Camellias, but that is owing to the forcing being carried out at the wrong time, which is after the plants have formed their buds, when heat, by many, is expected to help to

open them and bring on the flowers; instead of which any unnatural excitement at this time referred to, generally ends disastrously, and causes the buds to drop—or if they do not fall, the blooms when they expand always look puny and poor from being so small and thin in the petals. If Camellias are wanted early, the way is to force them into growth at this season of the year, as instead of being impatient of artificial heat now, or immediately the blossoms fade, they like it, and besides it is almost essential to enable them to break freely and make their growth. The heat, however, must not be dry but moist, and that even to saturation, as when the heat is great the moisture must be in proportion; and, therefore, to maintain the atmosphere in the condition referred to, the plants should be syringed twice daily, and the floors or other surfaces kept damped down frequently, and if this is done the growths will be rapid and strong. Shading, of course, is an important matter, as Camellias will not bear the full sun's rays during the middle of the day, but when the house is closed, and syringing has been performed in the afternoon, what they get then will do good, and helps to run up the temperature.

The places where we get our early Camellias are on the back walls of two lean-to vineries, where they are planted out in narrow borders, and get forced with the Vines, and are now full of growth, the situation being very suitable; as besides the natural shade they have, the treatment requisite for the Vines being just what the Camellias require, and we get blooms from October onwards, all through the winter, and that in a position where hardly anything else could grow or do well. If plants are in pots or tubs, the way to manage them is to prune back if they are straggly or too big, and remove as much surface soil as can be done without unduly disturbing the roots, and replace it with fresh turfy loam, when they should be stood in a house where they can be subjected to the conditions mentioned above. I have seen Camellias so managed that were in a bad state before they were taken in hand, that they recovered rapidly and made free growth, and bloomed profusely when flowers were of the greatest value, as they always are in the dead of winter; but there are some sorts that are more adapted for coming in at that season than others, and the old double white is among them, and Lady Hume is also one of the most valuable, although now rarely seen in collections. J. S.

SOCIETIES.

ROYAL HORTICULTURAL.

MARCH 8.—Notwithstanding the low temperature which prevailed on Tuesday last, accompanied by a keen north-easterly wind, there was a nice display of bloom at the Drill Hall, James Street, S.W., while the attendance was larger than usual. Spring flowers naturally formed the bulk of the exhibits, but Orchids, of which mention is made elsewhere, were well represented. Fruit and vegetables were not numerous.

The Lecture.

At the afternoon meeting of the Royal Horticultural Society on Tuesday last, a paper on "Plants for House Decoration," by Mr. J. Wills, was read, and Mr. G. Bunyard occupied the chair. Mr. Wills was prevented being present himself, owing to illness, but the paper was read by Mr. J. Weather, the Assistant-Secretary.

Mr. Wills called attention to the fact that previous to twenty years ago, little in the way of floral decoration had been accomplished, but since then enormous strides had taken place. In 1871, Sir Edward Scott set the ball rolling by placing his house in the hands of the florists for three days. This was followed by elaborate decorations at the town residence of the Marquis of Bristol, at which, among other things, no less than 6 tons of Ivy were used. Rivalry in floral decoration ensued amongst the aristocracy during the next few years, and to such an extent was the fashion carried, that Lady Sutton spent £1000 in one month with the florist; and on another occasion, a gentleman had his mansion in

Belgravia decorated with flowers at the cost of £1400.

Referring to the matter commercially, Mr. Wills in his paper stated, on good authority, that there were at the present time, at least 300 home-growers for Covent Garden Market alone, whereas twenty years ago there were not more than thirty. It was also asserted that 20,000 vanloads of plants for decorative purposes were sent into the Flower Market, Covent Garden, last year, and that Mr. Wills' firm purchased an enormous quantity of plants from that source. Lists of the most suitable plants for house decoration were included in the paper, Palms being specially mentioned. Of these *Latania borbonica*, *Corypha australis*, *Kentia Belmoreana*, and *Cocos Weddelliana*, were, amongst others considered admirably adapted for the purpose, and the last-named was specially mentioned owing to its graceful habit, and Mr. Wills asserted that it may be kept in a cold room for several months without injury, but this does not concur with our experience. Other plants mentioned included *Asparagus plumosus*, *Dracenas* of kinds, *Aspidistras*, *Hydrangea variegata*, *Ferns*, *Crotons*, and others. Stress was laid on the fact that *Crotons*, *Dracenas*, *Palms*, and similar foliage plants might be used for the embellishment of window-boxes, and to illustrate the remarks, photographs of boxes containing such plants were shown. Mr. Wills said that by adopting this plan, window boxes, in addition to affording relief to those containing ordinary flowering plants, could be kept fresh from July till October, but admitted that the plants would require renewing occasionally.

Dr. Masters, in a brief discussion which followed, remarked that an object-lesson in floral decoration such as Mr. Wills could have furnished, would have been appreciated, and regretted that such could not have been arranged. He deprecated the excessive extravagance which had been referred to in Mr. Wills' paper, and hoped that those present would not go away with the idea that any large outlay was necessary to ensure tasteful floral decoration in the home. By judiciously selecting plants which will stand the gas and vitiated air of rooms, such as *Aspidistra lurida* and its variegated form, it was possible to make a good display for a few shillings. Mr. Bunyard concurred, and said that, in his opinion, many of the graceful-habited Conifers, such as *Cupressus Knightii*, might be advantageously used for house decoration.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien, Dr. M. T. Masters, E. Moon, G. R. Le Dux, De B. Crawshaw, Baron Schroder, T. B. Haywood, E. Hill, J. Douglas, H. Williams, F. Sander, C. Pilcher, H. M. Pollett, C. J. Lucas, and J. Jaques.

The following communication was read:—"On February 9, Messrs. Jas. Veitch & Sons exhibited a hybrid *Cypripedium* under the name of *C. Hera* ×, and for which they received a First-class Certificate. They have since ascertained that another hybrid had been previously put into commerce under that name, which they were not aware of; they therefore requested the committee to agree to the name of their plant being changed to that of *C. Adrastus* ×, and that the list of awards be altered accordingly." The committee unanimously agreed to the proposal.

Messrs. F. Sander & Co., staged a fine group, made up of good varieties of *Odontoglossum* triumphans, *O. crispum*, many and varied forms of the fine *Dendrobium Phalaenopsis* *Schroderianum*, *D. nobile*, *Sobralia xantholeuca rubina*, *Dendrobium Brymerianum*, *D. Cassiope* ×, *Phalaenopsis Cooksoni* ×, *Angraecum sesquipedale*, with eight flowers; *Cypripedium Carlieri* ×. Some fine *Odontoglossum* *Edwardi*, *Lelia barphylla*, *L. cinnabarina*, *Masdevallia Estradae* × *Shuttleworthii*; a curious *Dendrobium* intermediate between *D. Farmeri* and *D. thysiflorum*, and a charming series of varieties of *Oncidium Phalaenopsis*.

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, Swanley, Kent, had a group consisting chiefly of rare varieties of *Cypripediums*, together with *Cattleya Trianae*, *Cologne cristata* alba, *Lycastes*, &c. Prominent were a noble form of *Cypripedium Boxalli superbum*, *C. Pavonium* ×, the noble *C. villousum albo-marginatum*, and *C. Schroderae*.

Messrs. Jas. Veitch & Sons, Royal Exotic Nurseries, Chelsea, exhibited *Cypripedium Brysa* × (*Sedeni* candidulum × *Boissierianum* ♂) like a large form of the seed-bearing parent, with a greenish tinge; *C. lanthe* × (*Harrisianum* × *venustum* ♂); *Dendrobium Wardiano-japonicum japonicum* ♀

Wardianum ♂; and *D. eusomum leucopteryum* (noble ♀ *endocharis* ♂).

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, with some fine *Anthuriums*, staged a grand specimen of *Phalaenopsis Cooksoni*, with two spikes; *Dendrobium chrysidatum* ×, *Calanthe Williamsii*, and *Lycaste Skinnerii* delicata.

J. F. Jackson, Esq., Bourne Place, Bexley (gr., Mr. G. Dowsett), sent the pretty purple-spotted *Odontoglossum Pescatorei*, Jackson's var. W. L. Barclay, Esq., The Briars, Keigate (gr., Mr. I. Bailey), exhibited *Oncidium Chrysomorphum*. From Messrs. Hugh Low & Co. came the amethyst-lipped *Dendrobium amethystoglossum*.

F. Wigan, Esq., Clare Lawn, East Sheen (grower, Mr. W. H. Young), sent a form of *Odontoglossum Andersonianum*, with yellowish-white flowers exhibiting but very few spots.

Messrs. Heath & Son, Cheltenham, again sent their hybrid *Cypripedium Swinburnei* ×. W. R. Lee, Esq., Beech Lawn, Ardshaw, Manchester, exhibited a fine form of *Dendrobium nobile* and *D. Brymerianum*, and cut flowers of a similar variety of *Dendrobium* came from J. G. Wood, Esq., Theddle Grange, Alton, Hants (gr., Mr. N. Campany).

Messrs. Lewis & Co., of Southgate, sent a handsome yellow and orange *Disa*—*D. incarnata*, flowering with them for the first time in cultivation.

F. W. Nixon, Esq., Edward Street, Leek, sent a fine four-spiked plant of *Odontoglossum maculatum* near to *O. m. anceps*, and cut flowers of many rare Orchids came from Reginald Young, Esq., Setton Park, Liverpool; Mr. J. W. Wilson, South Cave, East Yorks, a fine series of *Odontoglossum Rosei majus*; and a spike of the same, with fifteen flowers, from Philip Crowley, Waddon House, Croydon.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. B. Wynne, F. Bause, H. Herbst, R. Dean, H. B. May, W. Furze, W. C. Leach, R. B. Lowe, G. Phippen, H. H. D'Umbraun, T. W. Girdlestone, W. Bain, C. J. Salter, N. Davis, T. Baines, C. Noble, H. Turner, J. Fraser, G. Paul, R. Owen, C. T. Drury, G. Gordon, G. Nicholson, and F. Ross.

Numerous exhibits were brought before this committee, the largest being a collection of bulbous and other plants, staged by Mr. G. Phippen, Reading. These comprised *Hyacinthus*, *Tulips*, *Lily* of the Valley, *Scillas*, &c., set up in groups, with a background of Palms. Several new *Tulips* and *Hyacinthus* were staged, and a few pans of the pretty *Hyacinthus botryoides* alba were noticeable. The whole collection presented a very gay appearance.

A nice group of *Narcissus* came from Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, conspicuous amongst which were the large kinds, such as *Sir Watkin*, *Emperor*, and *Golden Spur*. Some pots of *Iris reticulata* and *I. alata* were also staged by the same exhibitor.

Mr. G. R. Davidson, The Gardens, Iwerne Minster, Blandford, sent a group of *Clivias* with fine trusses of bloom. The best varieties were *Her Majesty*, *Duke of Clarence*, *Princess May*, and *Lord Wolverton*.

As on the occasion of the last meeting, Messrs. Hugh Low & Co., Clapton and Bush Hill Park, Enfield, staged a collection of New Holland plants, which attracted some attention. Amongst these were many of the old favourites, now so seldom seen in private gardens.

From Sir Trevor Lawrence's gardens at Burford Lodge, Dorking (gr., Mr. Baines), came some remarkably fine *Anthuriums*. The spathe was of an enormous size, as also were the leaves. *A. Lindenii* flore carminea was most noticeable, the colour of the spathe being a rich dark carmine, and scarcely less can be said of *A. Lawrenceanum*, a bright scarlet variety. Others, specially good, were *A. Leodiense*, *A. Burfordense*, and *A. Andreanum sanguineum*, the latter receiving a first-class certificate.

Messrs. W. Paul & Sons, Waltham Cross, showed twelve boxes of cut *Camellia* blooms, amongst which *Princess Charlotte* (white), *Countess of Derby* (pink), *Reine des Fleurs* (pink), and *Fimbriata* (white fringed edges), were most conspicuous.

Amaryllis were shown by Messrs. G. Paul & Sons, The Old Nurseries, Cheshunt, and Messrs. Veitch & Sons, Chelsea. The first-named firm staged a very fine variety named *Mars*, of a rich crimson colour. One variety, designated *Diores*, a dark self, was particularly noticeable in Messrs. Veitch's collection. Messrs. Veitch likewise staged flowering branches of *Amygdalus Davidiana* alba, and a box of undressed *Cineraria* blooms.

From Messrs. Cutbush & Sons, Highgate, came a

collection of *Richardia aethiopica* Little Gem, a dwarf-growing plant, with small blooms.
Messrs. F. Barr & Sons, King Street, Covent Garden, sent *Iris alata alba*; Messrs. B. Williams & Sons, Upper Holloway, *Dracena Princess May*; and B. Field, Esq., Beech Lea, Sevenoaks (gr., Mr. Edwards), spathe of *Anthurium Andreanum* giganteum.

The Rev. G. H. Engleheart, Appleshaw, Andover, sent blooms of a hybrid *Narcissus* (*N. monophyllus* × *N. triandrus*, see pp. 331, 333); and Mr. J. Crookes, gr. to W. H. Evans, Esq., Forde Abbey, Chard, Violets, Begonias, and *Primula obconica purpurea*, the latter being darker than the type.

Fruit and Vegetable Committee.

Present:—P. Crowley, Esq., in the chair; Messrs. J. Lee, S. Ford, C. Ross, F. Rivers, G. Bunyard, J. Cheal, G. Taber, W. Warren, J. Wright, A. Dean, W. Bates, G. H. Sage, J. A. Laing, G. Cliffe, G. Wythes, J. Hudson, H. Balderson, F. N. Lane, J. Smith, A. H. Pearson, and H. Weir.

Very few exhibits were brought to the notice of this committee. Messrs. J. Veitch & Sons showed two dishes of Apples, named *Welsh Beauty* and *St. David*, selected seedlings from Alfriston, though differing considerably in appearance.

Mr. J. Watkins, Pomona Farm, Hereford, sent a dish of Improved Ashmead's Kernel Apple, which appeared to be a useful kind; and Sir T. Farrer, Abinger Hall, Dorking (gr., Mr. Payne), showed good samples of Apple Annie Elizabeth. Mr. W. H. Divers, Ketton Hall, Stamford, sent some fine Florida Oranges.

Mr. C. W. Leach, Albury Park, Guildford, exhibited clusters of ripe and unripe fruit of Tomatos named *Lady Bird*, which is said to set freely in November to December, also to ripen in the open air in July. The fruits were rather small. From the same source came firm bulbs of Main Crop Onions; and Mr. Poupart, Twickenham, sent some fine samples of Seakale as grown for market.

List of Awards.

ORCHID COMMITTEE.

MEDALS.

Silver Flora.

To Messrs. F. Sander & Co., St. Albans, for a group of Orchids.

Silver Banksian.

To Messrs. Pitcher & Manda, Hextable, Kent, for a group of Orchids.

Awards of Merit.

To J. F. Jackson, Esq., J.P., Bourne Place, Bexley, Kent, for *Odontoglossum Pesentorei*, Jackson's var.
To Messrs. J. Veitch & Sons, Chelsea, for *Cypripedium lanthe* x, and *C. Brya* x.

Botanical Certificates.

To Messrs. Hugh Low & Co., Clapton, for *Deudrobium amethystoglossum*.

To Messrs. Lewis & Co., Southgate, for *Disa incarnata*.

To Mr. W. L. Barclay, for *Odontidium chrysomorphum*.

Cultural Commendation.

To Mr. F. W. Nixon, Leek, for *Odontoglossum maculatum*.

FLORAL COMMITTEE.

MEDALS.

Silver Gilt Floral.

To Mr. G. Hippen, Reading, for a group of Bulbs, &c.

Silver Gilt Banksian.

To Messrs. W. Paul & Sons, Waltham Cross, for a collection of Camellia blooms.

Silver Floral.

To Messrs. Hugh Low & Co., for a group of New Holland plants.

Silver Banksian.

To Mr. T. S. Ware, Tottenham, for a group of *Narcissi*.
To Mr. G. R. Davieson, for a collection of *Cilveias*.

First-class Certificates.

To Messrs. Veitch and Sons, for *Amygdalus Davidiana alba*.
To Sir Trevor Lawrence, for *Anthurium sanguineum*.

Award of Merit.

To Messrs. G. Paul & Sons, Cheshunt, for *Anaryllis Murs*.

FRUIT AND VEGETABLE COMMITTEE.

Cultural Commendation.

To Mr. Poupart, Twickenham, for samples of Seakale.

Award of Merit.

To Mr. J. Watkins, Pomona Farm, Hereford, for Apple Improved Ashmead's Kernel.

NOTES FROM NORMANHURST COURT.

THE pleasure grounds of Lord Brassey's place are full of interesting trees and shrubs, and the beauties of the situation have been the most of by the landscape gardener. From the terrace in front of the house splendid views of the surrounding country and the sea are obtained, the latter being about

6 miles distance. The crowning features at Normanhurst are the magnificent masses of healthy and vigorous *Rhododendrons*, which are planted on a large scale, and in nearly every direction. There are many other flowering shrubs which do well at Normanhurst, and although I visited the place at the dull season, it could be seen that flowers are abundant in their season. *Camellias* trained on the walls here are never injured by frost, and the only drawback is that of earliness of flowering, a very slight degree of frost injuring the blooms. But Mr. Allen, by affording the plants some slight protection, gets many fine flowers. Hardy *Ericas*, *Ghent Azaleas*, and *Andromedas* flower splendidly in a soil that needs hardly any preparation. *Abies Douglasi*, *A. grandis*, *A. Albertiana*, *A. Menziesi*, *Cedrus atlantica glauca*, *Thuja*s of species, and many other plants too numerous to be mentioned in this short note are fine examples, and, standing as they do, at a good distance apart, they show their habits and characteristics in a way seldom seen in private gardens. It is found on this poor soil that all the flowering shrubs, and especially the *Rhododendrons*, are greatly benefited by mulching with cowshed manure. *Pinus insignis* was injured by the frosts of last winter, and some specimens were killed. The soil is but little adapted to fruit growing, nevertheless I observed some fine healthy trees of the Pear, Peach, Nectarine, &c., full of promise for the present year. Mr. W. Allen, who has been gardener at Normanhurst for many years, finds great advantage in keeping the roots of his plants near the surface. The Vines and Peaches under glass have every appearance of yielding excellent crops, and they are in good condition. I would mention that Lord Brassey, unlike many owners of fine houses, has made ample provision for extinguishing fire, there being a steam fire-engine, and a strong body of trained firemen at hand on the place who could be utilised in a very short space of time. Neither is anything lacking that could add to the comfort of workmen, who have a well-furnished reading-room and library, billiard-table; and instrumental music is also provided. *H. Markham.*

LAW NOTES.

A CLAIM FOR WAGES BY A GARDENER.

BEFORE Judge Edge, at the Exeter County Court on Tuesday, the case was heard of Frederick Parker v. Mark Joseph Freeman. The plaintiff, a gardener, formerly employed by the defendant, a gentleman, residing at the Grange, Withycombe, claimed £4 for wages in lieu of notice. Mr. Orchard, Exeter, appeared for the plaintiff, and Mr. Crompton, Exeter, defended. Mr. Orchard said the plaintiff was engaged by the defendant in October last, and worked for him up to January 11 of the present year. There was snow on the ground at the time, and the defendant ordered the plaintiff to clear it away. Parker was ill, and because he did not commence the work at once, his master lost his temper, and told him to "clear out." The plaintiff did not do so, and the police were called in, but could not interfere. The defendant offered the plaintiff £1, but the money was refused. As the police refused to act in the matter, Mr. Freeman applied for a warrant, and the plaintiff was subsequently brought before the magistrates for using threats of personal violence, he having threatened to make Mr. Freeman "pay for it." The case was, however, dismissed. The plaintiff corroborated this statement, and denied using any threats towards his master.

By Mr. Crompton: Mr. Freeman had complained to him previously about his work. Witness did not tell his master that he ought to have six months. What he said was, that he would rather have six months than work for the defendant. Witness had been treated very badly since he had been with Mr. Freeman.

The defence was, that the plaintiff was dismissed because he refused to clear away the snow. He

said to the defendant, "You should have six months; I'll make you pay for this."

Mr. Crompton considered that the defendant had a perfect right to dismiss his servant under these circumstances.

The defendant, who caused some amusement whilst giving his evidence, said the plaintiff refused to do work that he was told to. Such a proceeding, the defendant added, "spell-bound him." The plaintiff then told him that he ought to have six months, and witness, who considered he knew English as well as anyone, construed that into a threat.

His Honour gave a verdict for the plaintiff for the amount claimed, with costs, and added to Mr. Freeman, "I am sorry you get into these squabbles."

The defendant then left the Court, remarking to Mr. Crompton, "I'll close the shop, and get out of the country as soon as I can." *Devon Weekly Times, March 4.*

VARIORUM.

A NATURAL APPLE ORCHARD.—The wilderness of Koolan, in the Sandwich Islands, contains a forest of native wild Apple trees, countless in number, stretching from the sea far up the mountain sides. The trees vary from 40 to 50 feet in height, and in the harvest season, from July to September, are loaded down with fruit, some white, but mostly red. A person standing in the midst of this orchard can look around him for miles, up the mountains and towards the road, and the only thing in view will be one vast grove of Apple trees, literally red with ripe and ripening fruit, the branches of the trees bending to the ground with the bounteous harvest. The crop of this extensive Apple orchard, which Nature planted in the solitary waste, would fill a fleet of 100 steamers. The orchard stretches over a country from 5 to 10 miles wide by 20 miles long and many of the larger trees bear at least 100 bushels apiece. *South Wales Daily News.*

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

WILL some of our readers kindly inform "W. P." if a gardener has the right to claim a legacy left to each of his domestic servants? We fear not. Ed.

Obituary.

MR. THOMAS HOPGOOD.—We regret to announce the death of Mr. T. Hopgood, head gardener to Sir Julian Goldsmid, M.P., Somershill, Tunbridge, Kent, which occurred quite suddenly, on Tuesday, February 28, in the parish church. The deceased was well known as a gardener, and was greatly respected by all who knew him.

MARKETS.

COVENT GARDEN, March 10.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET quiet, but prices are well maintained. Large consignments of Tomatos, Potatos, and Beans, from the Canary Islands and Madeira to hand, at lower values. *James Webber, Wholesale Apple Market.*

POTATOS.

The expectations of last week have been fulfilled, and a perceptible rise in the prices of best qualities has taken place. Good Imperials are worth 80s. to 95s.; Abundance, 95s. to 105s.; Bruce, 80s. to 10s.; Magnum, 60s. to 80s.; Blackland Magnum, 55s. to 65s. per ton; all supposed to be free from frost, and a good sample. J. E. Thomas.

FRUITS AND VEGETABLES.

BOROUGH, March 8.—Quotations:—Broccoli, 7s. 6d. to 12s. 6d.; Savoy, 3s. 6d. to 7s. 6d. per tally; Sprouting Broccoli, 1s. 6d. to 2s.; Turnip tops, 2s. 6d. to 3s. per bag; Spinach, 2s. 6d. to 3s. per bushel; Brussels Sprouts, 1s. 6d. to 2s. per half sieve; Greens, 2s. to 3s.; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. 3d. to 1s. 9d. per dozen bunches; English Onions, 6s. to 7s. 6d. per cwt.; Apples, 2s. 6d. to 8s. per bushel; Canadian do., 1s. to 20s.; Newtown Pippins, 15s. to 25s. per barrel.

STRAITFORD, March 8.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Savoy, 4s. to 5s. per tally; Greens, 2s. to 2s. 6d. per dozen bunches; Cauliflowers, 1s. 6d. to 2s. per dozen; do., 4s. to 7s. per tally; Celery, 4s. to 6s. per dozen bundles; Horseradish, 1s. 3d. per bundle; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 30s. to 40s. do.; do., cattle-feeding, 2s. to 3s. do.; Parsnips, 10s. to 6s. do.; Mangels, 16s. to 19s. do.; Swedes, 15s. to 20s. do.; Onions, English, 120s. to 140s. do.; Apples, English, 3s. 6d. to 5s. per bushel; do., Canadian, 15s. to 20s. per barrel.

SEEDS.

LONDON:—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, E.S., write that regarding the quality of the seeds of the great-fruited American Redclove seed, in particular, continues the favourite article, and the strong and remarkable advance on the other side of the Atlantic—rendering it possible to ship seed back again to New York—coupled with the astonishing smallness of the stocks held in England, have caused a further substantial advance on current prices here. British farmers have for the most part sent to meet all their cover seeds. There is no change this week in either Alsike, White, or Trefoil. Favourite articles are being very dear, move off slowly. Italian Ryegrass is in good request. Tares meet a free sale. Sanfins keep moderate in price. Mustard and Rape seed are unaltered. Stocks of Canary seed prove surprisingly small. The Board of Trade returns give the imports into the United Kingdom of Clover and Grass seeds for the first two months of this year as 95,572 cwt., value £217,912, as against 79,224 cwt., value £179,052 for the corresponding period of 1891.

POTATOS.

BOROUGH: March 8.—Quotations:—Imperials and Elephants, 70s. to 90s.; Imperators, 60s. to 90s.; Bruce Magnums, 60s. to 90s.; Dunbar do., 90s. to 105s. per ton.

STRAITFORD: March 8.—Quotations:—Dark land, 52s. to 65s.; light land, 60s. to 85s.; Scotch do., 70s. to 90s. per ton.

CORN.

Averages.—Official statement of the average prices of corn, for the week ending March 5, and for the corresponding period last year:—1892: Wheat, 33s. 3d.; Barley, 27s. 9d.; Oats, 20s. 5d. 1891: Wheat, 32s. 7d.; Barley, 27s. 7d. Oats, 18s. 5d.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; inferior, do., 45s. to 75s.; hay, best, 60s. to 91s.; do., 25s. to 50s.; and straw, 20s. to 35s. per load.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts:—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending March 5, is furnished from the Meteorological Office:—

"The weather during this week was very cold and the air dry in all parts of the Kingdom. In the E. and S.E. the sky was generally overcast, and frequent but very slight falls of snow were experienced; in the W. and extreme N., however, there were many intervals of sunshine.

"The temperature was below the mean, the deficit ranging from 4° in 'Scotland, N.' to as much as 7° in 'England, S. and S.W.' the 'Midland Counties,' 'Ireland, S.' and the 'Channel Islands.' The highest of the maxima were recorded either on February 28th or 29th, and varied from 50° in 'Ireland, S.' to 42° in 'England, E.' During the greater part of the time the daily maxima (except in the extreme W. and S.W.) were very little above the freezing point. The lowest of the minima were recorded in most cases on March 5th, when the

thermometer fell to 10° in 'Scotland, E.' (at Braemar), to 14° in 'Scotland, N.' (at Lairg), and elsewhere to between 22° in 'England, N.W.' and 28° in the 'Channel Islands.'

"The rainfall was less than the mean in all districts. At most of the W. and N. stations no measurable amount of rain was recorded.

"The bright sunshine exceeded the normal value in some of the W. districts, but showed a deficiency elsewhere—especially over E., N.E., and central England. The percentage of the possible duration ranged from 36 in 'England, S.W.,' 31 in the 'Channel Islands,' and 30 in 'Scotland, N. and W.,' to 17 in 'England, S.,' and to only 5 in 'England, E.'"

NOTICES TO CORRESPONDENTS.

ANDRUCUM LEONIS: R. G. The temperature was too low for the plants in bud. Their health will not be permanently injured.

BETTER IN BROAD BEAN SEEDS: A. D. C. The beetle which came out of the Bean was Bruchus granarius. The egg was laid on the pod whilst it was still scarcely a pod; from this a grub was formed, which pierced the growing Bean, where in course of time it became a chrysalis, and later a beetle which does not always leave the Bean as soon as developed.

FIG. 53.—DEAN WEEVIL (BRUCHUS GRANARIUS).

The insect does harm to the seed by consuming the sub-stance that should go towards forming the future plant. Sort over your seed Beans, and any seed which is infested by the grub, or a nascent beetle, burn. These are known by a round depression, duller in colour, and rather less opaque than the neighbouring parts. A hole in a Bean shows that a beetle has escaped from it.

CANARINA CAMPANULA: C. W. A seedling variety, not worth a name.

CARPENTARIA CALIFORNICA: A. P. It is quoted by some of the larger nurserymen amongst evergreen shrubs; answers to other questions next week.

CLIANthus PUNICEUS: A Constant Reader. The best soil is firm loam, peat, burnt earth, and sand just sufficient to make it porous if the loam be stiff—sandy loam would scarcely require any, if the drainage is good, as it should be. Repot your plant now, reducing the ball a little by pricking off the old soil. If the roots at the bottom of the pot are much matted, cut them off. Keep it close for ten days, afterwards give more air by degrees. Be careful about water, afford enough at first, but do not sodden the soil by frequent waterings; syringe daily in bright weather, it being the only way to keep red-spider at bay.

CORRECTION: California as a Home. Our correspondent who sent us the above, wishes to say that he made a mistake in reference to the poll tax, it should have been 2 dollars, i.e. 8s. 4d. English currency.

DOUBLE FLOWED GLOXINIA: H. B. Could you send the flower-stalk and flowers for inspection?

FLORIST: F. C. B. You could not do better for the boy than to communicate with some large general nurserymen and seed merchants. At a florist's establishment, special knowledge might be gained, but there is a far wider range of subjects, and fuller knowledge would be gained at the former. Modern languages are very useful. If the youth has good physique, a little digging will do him no harm; but it is not so very necessary.

GERANIUMS: *Enquirer.* The Pelargoniums you send have the appearance of the cuttings having been plunged too deep in the soil.

HOT-WATER PIPES IN A GREENHOUSE: *W. W.* For your district three rows of pipes will provide heat sufficient for all purposes, without having to unduly heat them. There should be placed along the front of the house two rows, and one, the return pipe, running from these along one end of the house towards the boiler.

INSECTICIDE: *Marshall Bros.* A wineglass of petroleum to 1 gallon of warm water; and, to assist the incorporation of the oil with the water, add 2 oz. of soft-soap.

LIME IN WATER TO EXPEL WORMS FROM THE SOIL IN POTS: *Amateur.* It will not matter how much you put in a gallon of water, the latter being capable of taking up a certain quantity only. The lime may be used many times if it be shaken up each time that fresh water is added. It will do no harm if used of full strength, and clear.

NAMES OF FRUITS: *C. Ayres, Cape Town.* The fruit resembles *Beurri superfin* somewhat highly coloured.

NAMES OF PLANTS: *A Correspondent* who sent us a *Crinum* from Madagascar, but whose letter has unfortunately been mislaid, is informed that his plant is *C. firmifolium* of Baker. See "Baker's Handbook of Amaryllideae," p. 78.—*S. L.* *Pittosporum undulatum*.—*G. W. E.* *Acacia dealbata*.—*F. P. A.* species of *Strelitzia*.—*E. D. L. I.* *Poly-podium esfolium*; 2, *Adiantum hispidulum*; 3, *Selaginella Brownii*; 4, *S. Helvetica*; 5, *Aloe scotrina*.—*C. W.* *Psoralea pinnata*.—*E. T.* *Laelia (Brassavola) glauca*.—*J. C. C.* *Crinum Mooreanum*.—*J. P. I.* *Retinospora dubia*; 2, *Cryptomeria elegans*; 3, *Thuja Nutkaensis*; 4, *Thuja Standishii*; 5, *Cupressus Lawsoniana*.—*R. C.* *Dendrobium Pierardi*.—*R. G.* *Eria bractescens*, *Pittosporum undulatum*; *G. C. I.* *Primula alysinica*; 2, *Clivia miniata*; 3, *Dendrobium Wardianum*.

ONTOGLOSSUM CRISPUM: *Importer.* The most prized features are broad petals and sepals, of great substance and size, with a ground-colour of the purest white, which may be suffused with lilac, and spotted with big or little spots of chocolate-brown. If the edges of these parts of the flower are elegantly frilled, that is also a desirable feature. The lip should be broad, and the crest well developed, and the orange or yellow crest a prominent part of the flower, as seen in front.

ONCIDIUM JONESIANUM: *R. G.* Grow on a block in a warm house.

PEACH TREES IN POTS: *Amateur.* If the house is heated the trees may be syringed twice daily in bright weather, and early in the afternoon when it is dull.

PHALENOPSIS SCHILLERIANA. *J. C. A.* very fine specimen.

SLUGS AND MAIDENHAIR FERNS: *Amateur.* Fruit and vegetables failing to attract them, you should try the effect of little heaps of bran placed about among the Fern pots. Examine these heaps in the early morning, and by persistence you will greatly thin their numbers. Keep a few loads in the fernery; see that no slugs harbour in the plants. Very choice or delicate species of Ferns should be stood over pane of water, not in them; they will then be beyond the reach of the slugs. Salt strewn round about the pots is a deterrent.

VAPOUR CONES: *L. & S.* Some accident in the manufacture. It should be analysed.

YOUNG GARDENER: *F. S.* Your questions are so numerous, that we should prefer to answer them by letter, if you will send your full address.

COMMUNICATIONS RECEIVED.—*G. Fenech.*—*J. H.*—*Lincoln Society.*—*T. H.*—*E. S.*—*E. C.*—*W. B. Hemley.*—*W. A. C.*—*W. E.*—*M. J.*—*S. J.*—*Bagley.*—*R. A.*—*R. W.*—*S. H. C. P.*—*J. T. Normau.*—*R. WANTED, a sharp, active MAN, for the Kitchen and Flower Garden. One with a good knowledge of Fruiting and Nailing of Fruit trees; and be neat and quick at work. Wages, 18s. per week, and overtime. Apply, with references, to **J. HUGHES**, Wentworth, Woodhouse, Rotherham.

WANTED, a young MAN, quick at Watering and Potting; will also be required to help in Propagating-house. State wages, reference, &c., to **CRANE and CLARKE**, Hildsire Nursery, March, Cambs.

WANTED, a young MAN, well up in Budding, Grafting, &c., and who has a general knowledge of Out-door Nursery Work. References and wages expected, to **GEORGE HAVELOCK**, Abbey Wood, Kent.

WANTED, a Single MAN and MOTHER.—Man to work in Garden, 15s. a week, and house.—Apply to **Mrs. LEVISON-GOWER**, Bill Hill, Wokingham, Berks.

WANTED, a trustworthy and experienced young MAN, to look after small Kitchen Garden, Cow, and Poultry. Bothy, light and firing provided. State wages, &c., to **E. WHELEIGH**, The Gardens, Moray Lodge, Campton Hill, Kensington, W.

WANTED, a young MAN, for Inside and Outside Work, in the Kitchen, bothy, milk, and vegetables. Apply by letter only.—**G. KING**, Canon's Park Gardens, Edgware.

WANTED, a HANDY MAN, for Out-door Nursery Work.—Particulars to **JOHN E. KNIGHT**, Nurseryman, Wolverhampton.

WANTED, an APPRENTICE, not under 18, with some experience preferred.—To live in bothy. Premium required, for two or three years.—**P. Q.**, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED a YOUTH for the Plant Houses.—About 18 years of age; active; one with market experience preferred.—Apply to **Mr. BOWMAN**, Hylands, Chelmsford, stating wages expected, and references.

WANTED, a good GENERAL HAND, in a small Nursery. Must be a good Budder and Grafter, and able to act as Suburban when required.—Apply, with full particulars, **CHARLES RYLAND**, Bold Lane Nursery, Aughton, near Ormskirk.

To Florists.
WANTED, an energetic, pushing young LADY, good at Wreaths and Crosses, for a Suburban Business. Must be a good Saleswoman, and have excellent references.—**SKELTON**, High Street, Leyton.

FLORIST—Young Lady IMPROVER REQUIRED. Out-door. State age and all particulars.—**M. J.**, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 p.m. on Wednesday will, in all probability, be held over to the next week.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

B. S. WILLIAMS and SON beg to intimate that they have at present in their Nursery and on their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, where the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"**DICKSONS, CHESTER**."

Head Gardener.
JOHN LAING and SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

RICHARD SMITH and CO.
beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first-rate character and proved ability. Gentlemen seeking such may have particulars.—Apply to **THOMAS BUTCHER**, Seed Merchant and Nurseryman, Croydon.

THE LIVERPOOL HORTICULTURAL COMPANY (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, near Liverpool, wish to recommend to any Nobleman or Gentleman who may require a thoroughly competent and reliable HEAD GARDENER, David Lindsay, who was Head Gardener for the last twelve years to the late Sir Thomas Howard Moss, Bart., of Otterspool, near Liverpool.—Full particulars on application to the Company.

GARDENER (HEAD).—Life experience in Early and Late Forcing, and the general requirements of large Establishment. Establishment must be of proved and previous employers.—**E. WILES**, Edgware, Bury.

GARDENER (HEAD), where two or more are kept.—Age 34, married. Thoroughly experienced in Stove, Greenhouse, Flower and Kitchen Gardens, Pleasure Grounds, &c. Leaving through breaking-up of Establishment. Excellent characters from present and previous employers.—**JAMES SHEPHERD**, 15, Church Road, Bromley, Kent.

GARDENER (HEAD), or **GARDENER and BAILIFF**.—A GENTLEMAN can highly recommend his late Working Gardener to any Lady or Gentleman requiring the services of a thorough practical man; please state wages and full particulars.—**ALPHA**, Messrs. Cutbush, Seed Merchants, Southgate, N.

GARDENER (HEAD); age 33, married.—**J. R. MCLEAVE**, eight years Head Gardener to R. Heywood Jones, Esq., Badsford Hall, is open to re-engagement with any Nobleman or Gentleman requiring a thoroughly practical Gardener. Has had sixteen years' experience in all branches; is thoroughly conversant with the requirements of a good and established. Testimonials of the highest order.—Oatsclough, Winsford, Cheshire.

HOLLOWAY'S PILLS.—For the cure of debility, bile, liver and stomach complaints this inappreciable medicine is so well-known in every part of the world, and the cures performed by its use are so wonderful, that it now stands pre-eminent above all other remedies, more particularly for the cure of bilious and liver complaints, disorders of the stomach, dropsy, and debilitated constitution. In these diseases the beneficial effects of the Pills are so permanent that the whole system is renewed, the organs of digestion strengthened, and a free respiration promoted. They expel from the secretory organs and the circulation the matter which produces indigestion, pain, fever, debility, and physical decay—thus annihilating, by their purifying properties, the virulence of the most painful and devastating diseases.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, 'STAND FIRST'

require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hoob, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with $17\frac{1}{2}$ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

flowers being large, and of great substance; they
have been greatly admired by all who have seen
them. You have got very fine strains."

WEBB & SONS, WORDSLEY, STOURBRIDGE.

Williams' Shading Materials.

THE MOST SUITABLE FOR
SHADING ORCHIDS, FERNS,
Palms, and Stove and
GREENHOUSE PLANTS.

It is a strong, durable Cotton
Netting, woven in squares so
close as to exclude the
direct rays of the sun,
but admitting the
greatest amount
of light attain-
able through
shading.

It with-
stands the
weather better
than any other
class of Shading,
and may be bene-
ficially used on account of
the thickness of its texture,
during cold weather, to keep
the frost out. The leading
Orchid and Plant Growers in
the country have used this material
for some years, and speak very highly
of it, pronouncing it to be the very best
material for Plants they have ever used.

Blinds made up and fixed complete.
Sold in pieces, 30 yards long by 12 yard wide.
Price 6s. each. Samples submitted gratis.

This new shading is in the form of a white powder,
and is prepared for use by applying boiling water
to the compound, and allowing it to cool,
when it can be applied by means of a brush.
It dries instantaneously, and can be
rubbed off easily when moist. This
shading may be used for GREEN-
HOUSES, SKYLIGHTS,
WINDOWS, &c.

Sold in 1 lb. packets,
with directions for
use, price 1s. each.
1 lb. free by
parcel post for
1s. 4d.

INFERIOR SEEDS.

There are lots of failures this season, and as soon as discovered do not hesitate to write for "**CANNELL'S KENTISH PERFECT GOLDEN SEEDS**," carriage free; or for whatever else is required for the Garden. Testimonials for our Seed supplied this season are fast coming in. See the following:—

Mr. J. MASON, BERKELEY STREET, EYNEBURY, February 24, 1892.
 I find your seeds grown in the South produce the strongest plants.

T. WAITE, Esq., HREAMOOR, PENZANCE, March 3, 1892.
 The Vegetable Seeds arrived. The Peas are up, and looking splendid.

Mr. H. HALE, TROED-Y-RHIEW HOUSE, MOUNTAIN ASH, South Wales, March 3, 1892.
 Your vegetable seeds are fast gaining favour in this district.

Mr. THOMAS PARKES, NEW BARN FARN, CONSFLEY WOOD, WADHURST, March 1, 1892.

I have much pleasure in sending you another order, as the seeds I had of you last year were quite as good as you represented them to be. I believe every seed grew. The Beds of Onions are the best I ever grew.

GARLES MITCHELL, Nurseryman, Stranraer.

THE OLD BROWN QUARRY EARLY POTATO. The Oldest Existing Sort in Ireland. In existence here for 150 years; certainly, when I was a child, prior to the famine period. There was no other sort grown for harvest purposes when men were so scarce. I am enabled to offer it for redistribution—it never having made its way to England—from a stock preserved for years on peat land, resting on limestone, in a remote part of county Cork. There must be something in that soil that preserved it for years. It is a first-class early June variety, of great substance. 7-lb. bag and postage for 2s. 6d.

THE

Gardeners' Chronicle.

SATURDAY, MARCH 19, 1892.

TWO FAMOUS GARDENERS: LONDON AND WISE.

THERE are few more interesting names in the history of English gardening than those of George London and Henry Wise. Bowack, in his account of Kensington (1705), states, that if the stock of their nurseries at Brompton Park were valued at one penny a plant, the amount would exceed £40,000; whilst Evelyn declared their nursery to be "above the greatest works of that kind ever seen or heard of, either in books or travels." Compared with two or three nurseries within easy reach of where the establishment of London and Wise once stood, the above amount is insignificant, but it must be remembered that their nursery was at the time the only one in England worthy of the name, as, doubtless, it was by far the largest in existence. There is a literary as well as a horticultural side to the careers of these two men. Of their lives, comparatively few definite facts are known, and of other than their public work, nothing at all.

Both London and Wise were pupils of a worthy gardener, John Rose, who was considered the most eminent man of his time in the profession. He was successively gardener to the Earl of Essex, at Essex House, in the Strand (where he was in 1665), to the Duchess of Cleveland, to the Duchess of Somerset, and to Charles II., at St. James's; and it was to the gay monarch, his employer, that he dedicated his work, *The English Vineyard* (1672), in which Evelyn had a share in the composition. It is now, apparently, impossible to obtain any information about either the birth or parentage of George London; and even his apprenticeship, Stephen Switzer, confesses, in his *Ichographia Rustica*, that he was ignorant on these points. We do know, however, that (in the words of Switzer) "the early and vigorous appearances he made in business were soon discovered by his master, who spared no pains nor hindered him of any liberty whereby he might improve himself." After he had been with Rose for some four or five years, Rose, who had himself studied in the gardens at Versailles, sent him to France for improvement. France, with the king, Louis XIV., who deemed himself immortal, at its head, was then at the height of its prosperity and magnificence, and gardening was an extremely popular pastime with the higher orders. It was here that London gathered so much knowledge in landscape and other phases of his craft that stood him in such stead in after life. Soon after his return from France, London entered the service of Henry Compton, Bishop of London, who, shortly after London left him, and during the reign of James II., had the most extensive collection of plants in the country.

The Bishop did everything under his own superintendence, but there can be no doubt that his famous gardener contributed vastly towards bringing this garden up to its high pitch of excellence. He remained in the employ of the Bishop for a few years, and left in or slightly before 1681, when he started in business for himself at the Brompton Park Nursery. His partners were at the commencement Cooke, Lucre, and Field, only one of whom appears to have achieved any measure of fame. This exception, Moses Cooke, was the son of a Lincolnshire farmer, and is mentioned in Evelyn's *Diary*, under the date April 18, 1680, as a skilful artist in gardening, as a bit of a mathematician, and as having pretensions to astrology. He was gardener to the Earl of Essex at Cashibury for nearly a quarter of a century, leaving in 1681 to join London at Brompton.* It may, however, be mentioned that of the other partners, Lucre was head gardener to the Queen Dowager, at Somerset House, whilst Field was the Duke of Bedford's gardener, at Bedford House, in the Strand. In 1694 both Lucre and Field died, and Cooke having retired, London was the sole proprietor of the concern, in which he had undoubtedly been all along the leading spirit. From small beginnings, the nursery had at length extended to an area of over 100 acres.

Whilst the Revolution of 1688 was pending, London appears to have had the somewhat difficult and delicate task of conveying the Princess to Nottingham† to avoid "the fury of the Papists," and when the great event was consummated, he was appointed Superintendent of all the Royal Gardens with a salary of £200 per annum, and was made a Page of the Back Stairs to Queen Mary.

Among the Treasury Papers preserved in the Public Record Office is the Report of Sir Christopher Wren, by order of the Lords of the Treasury, in regard to Vice-Admiral John Benbow's petition for compensation on account of the great damage done to the house and gardens of Sayes Court by the Czar of Russia and his retinue. Admiral Benbow had rented the place from John Evelyn to accommodate the Czar during his stay in this country, and Peter the Great left everything in a fearful condition, and the damages were assessed at £350 9s. 6d., of which £162 7s., it was reported, properly belonged to Evelyn to pay. The Report is drawn up under three heads, the last of which consists of "some observations made upon the gardens and plantations" at this place, and is "signed by George London, the King's master gardener." When the Peace of Ryswick (September 11, 1697), was concluded, London accompanied the Earl of Portland, Ambassador Extraordinary to King William, to France, and during this visit he devoted a considerable amount of time to the fruit gardens at Versailles, his observations on which were prefixed to his translations (in conjunction with Wise), of Quintinie's work to be presently mentioned.

* Cooke was the author of two works: *The Manner of Raising, Ordering, and Improving Forest and Fruit Trees*, &c., published with plates in quarto form in 1679, and reprinted in octavo in 1700, 1717, and 1724; the second being a treatise on *The Art of Making Cider*, published in Evelyn's works. Cooke was also a bit of a poet, but his verse has a distinct cupboard-love flavour about it.

† The appearance of London as a guardian of royalty will seem, at first sight, incredible, but a reference to the ninth chapter of Macaulay's *History*, easily explains his presence. One of the two men who were so instrumental in getting Anne out of the city, one was Bishop Compton, London's former master, and the princess's old tutor, so that the present and future "friend at court" whose influence was so great on London's behalf is easily identified. Macaulay, however, does not mention London's part in the transaction.

Johnson (*History of Gardening*, p. 124), and other writers, including Switzer, on the history of gardening in England, state that on the death of William III., the care of the Royal Gardens was given to Henry Wise, London devoting himself to the country portion of the business. But if a number of interesting papers in the Record Office go for anything, Wise must have held the appointment some years before 1702. Accompanying a Report of the Officers of Works to the Lords of the Treasury, dated February 16, 1700, on an estimate of works to be done with all expedition in the parks and gardens at Hampton Court, is Wise's "Proposals" or estimate, the amount being £6638 4s. 3d. The Officer took ten months in considering this estimate, and made several abatements in the prices, besides ordering that payment be made in weekly instalments of £75. In 1702 there was still a considerable balance unpaid, and Wise petitioned to have the debt wiped out. Dated June 18, 1703, there is a Report of the Officers of Works on Wise's work to be performed in St. James's Park; and ten months later his account for work done in several Royal Gardens was minuted "to be paid except £20 10s. 6d., he [Wise] is assessed for the tax." In June, 1704, he framed a memorial for allowances paid by him to the keepers, &c., of St. James's Park for wages, board-wages, and liveries. The Great Storm of November 27, 1703, destroyed a large number of Elms in the Great Park at Hampton Court, and Wise was requested to report on the damage done, and the cost of seventy large Elms for one of the old walks, and a hundred more for another place in the same grounds. Two years after this, Wise got into trouble with the authorities for building a house on a waste piece of ground near Hampton Court, which had been given him in perpetuity by Her Majesty's steward without authority. His claim to this ground was repudiated by the authorities, but the house was allowed to remain.

During all this period, the business of London and Wise had extended into very considerable proportions, and the two men apparently worked together very amicably. London visited once or twice a year all the principal gardens of the country, often riding 50 or 60 miles a day. He performed his northern journey in five or six weeks, his western in about the same period, whilst the southern and eastern only occupied him a few days. Among his last works were the gardens at Wanstead House, for Sir Richard Child, in 1706; and those of the Earl of Carnarvon, at Edger, Hert, which last he did not live to complete, dying after a fortnight's illness—of fever, brought on by over activity—about Christmas, 1717. That London did more than any other man of his time to stimulate the art of gardening, there can be no question, but regarded in the light of to-day, his influence was pernicious. He had, however, to recognise and abide by the execrably bad taste which prevailed at that time in every department of science, literature, and art. He was evidently a man of untiring energy, and with abilities which would have "risen to the occasion," in whatever groove he had been called to exercise them, but he was an interpreter of ideas of other people rather than an originator.

For many years after London's death, Wise's connection with the Royal Gardens continued. About the year 1716—the paper in the Record Office is undated—we find Wise drawing up a comparison between the Royal Gardens of the times of William III., Anne, and George I., and it is evident from this statement that economies of the most rigid character had been

effected. In William's time there were 73 acres reserved as gardens, costing £4163 19s. per annum; whilst at the time of drawing up the statement, 148 acres 2 roods were kept in good order for £2900 for twelve months. At that time over £600 was due to him for garden-work performed during the last two reigns. And this was an oft-repeated tune, each Government attempting to saddle its successor with its liabilities, and all well-versed in the art of shuffling.

In 1716, Wise took Joseph Carpenter as a fully-qualified assistant, and a few years later he became a partner in the concern. From a paper in the Record Office, dated April 26, 1725, we gather that the Surveyor of the Royal Gardens and the two partners were at loggerheads. They planted a number of trees and shrubs in the "Lower Wilderness" at Hampton Court; and when the account was sent in the Surveyor repudiated it, disclaiming any knowledge of the work, and of having given any instruction in the matter. Whether the account was paid history telleth not.

Wise's most important work was probably the grounds at Blenheim, which occupied him three years in completing. He effected a number of alterations in Kensington Gardens, and by converting certain gravel-pits into a shrubbery, through which were winding walks, he earned the praise of no less a person than Joseph Addison, who compared him to an epic poet, and this improvement to an "episode" in the general effect of the garden.

The date of Wise's death appears to be unknown; the appointment of Royal gardeners apparently died with him. He was succeeded in this office by Bridgeman, who, as a garden architect, displayed a much greater taste than either of his predecessors. He eschewed verdant sculpture, and mottoes in Yew, Holly, and Box, and other monstrosities in the way of giants, animals, and so forth. It is not quite clear as to who occupied these famous nurseries at Brompton during the greater part of the last century. From Lysons (the antiquary) writing in 1795, we learn that the place was then in the occupation of Messrs. Gray and Wear; and, according to Mr. W. Carew Hazlitt, the Grays were still there in 1840.

[We believe Messrs. Gray, Adams and Hogg—all, or some of them—were carrying on the business at the time the land was secured by the Commissioners of the Great Exhibition of 1851. The shop, offices, and glass-houses occupying the land near what is now the Kensington Road end of Exhibition Road. Ed.]

A brief account of the gardening books written or translated by London and Wise is reserved for another paper. *W. Roberts.*

NEW OR NOTEWORTHY PLANTS.

CRINUM FIRMIFOLIUM.*

We owe to the kindness of a correspondent the opportunity of recording a Crinum from Madagascar, new to cultivation. On submitting it to Mr. Baker, who has made a special study of the plants of Madagascar, and also of Amaryllids, that gentleman obligingly identified the specimen for us as above. The following is Mr. Baker's description:—"Leaves narrow, lorate, firm in texture, 3 feet long, 1½ inch broad in the middle, tapering gradually to the point, margin distinct, entire. Peduncle a foot long. Umbel, 0 to 8-flowered. Spathe-valves 1½ to 2 inches long; pedicels none; perianth-tube straight, 5 to 6 inches

* *C. firmifolium*, Baker in *Journ. Linn. Soc.*, x., p. 270, and *Handbook of Amaryllidaceae*, p. 73.

long; segments linear, 2 to 2½ inches long. Stamens about as long as the segments; anthers linear, ½ inch long. Style overtopping the anthers. It was gathered on the east coast of Madagascar by the Rev. R. Baron, who has discovered about a thousand new plants in Madagascar."

are almost entirely suppressed. The upper sepal has a circular patch of greenish yellow, on which there are some faint brownish lines, and a broad, pure white margin. The petals and lower sepal are yellow, with some obscure tracing of purplish brown, and the lip is lighter in colour than the

TRICHODESMA PHYSALOIDES.

IN February, 1884, Mr. N. E. Brown called attention in our columns to this Boraginaceous plant as one that nurserymen would do well to look after, and introduce. Acting on that hint, Mr. Adlam, of Pretoria,

FIG. 51.—TRICHODESMA PHYSALOIDES: FLOWERS, SNOW WHITE, WITHIN A PURPLE CALYX.

CYPRIPEDIUM INSIGNE, LE DOUX'S VAR.

This distinct variety may be said to be intermediate between the new *C. i. Bohnhofanum* (*Gardeners' Chronicle*, Nov. 14, p. 587) and the old *C. i. albo-marginatum*, and its peculiarity is that the brown markings in the sepals and petals usual in *C. insigne*

ordinary run of *C. insigne*. It, and also another handsome variety, was sent by G. R. Le Donx, Esq., Langton House, East Moulsey, who flowered them out of the now famous *C. insigne montanum* imported by Messrs. F. Sander & Co. of St. Albans. *James O'Brien*,

Transvaal, has secured a stock, and has favoured us with a specimen, from which the illustration (fig. 51) is taken. The plant is a herbaceous perennial, with a fleshy root-stock, from which are produced annually a number of erect stems, in tufts or patches 2 feet across. The leaves are glaucous green, the

flowers pure white, with a purple calyx. Mr. Adlam further adds: "Trichodesma physaloides grows near Pretoria on sloping, dry, bare hill-sides at an elevation of 5,000 to 5,500 feet; it is a herb, 1 to 1½ foot high, with tuberous roots. The leafy stems, dying down in our dry winter, appear above ground with the first summer rains. The flowers are produced through the early summer; it is a profuse bloomer. Flower stalks and sepals dull purple, petals white. I imagine the treatment accorded to tuberous Begonias would suit its wants exactly."

ORCHID TREATMENT.

PERHAPS another amateur, who, by dint of observation, experiment, and experience, has struggled into something very like success (so he flatters himself) with some of the very Orchids mentioned last week by "L. C.," may give some hints that will prove of use to him and others in like plight.

One of the great difficulties in growing these Orchids, imported possibly from a locality kept secret by the finder, is the impossibility of ascertaining exactly the conditions under which they flourish at home. With the means now at disposal, I think it may be fairly assumed that, given certain requirements, gardeners can, in all country situations and in pure air, satisfy the needful conditions, when they know them.

Like "L. C.," I, too, was greatly perplexed, years ago, by the contradictory recommendations of gardeners who professed to be authorities; particularly with regard to two Orchids he mentions—*Odontoglossum grande* and *Epidendrum vitellinum*; and after several seasons of failure, determined to experiment for myself.

First, however, I ascertained that these Orchids grow on mountains close to the equator, which consequently means that they can have no summer or winter season, as we have; but if they have any changes, they must be twice in the year, for the sun, when vertical twice a year, will bring deluging rains, and there will be two periods of comparative drought when the sun is at the northern or southern limit of the tropic. This is, however, mere conjecture, and so of much less importance than the broad fact, that under the equator there is no winter and no summer season. We then ask, "Are these Orchids 'cool' or 'hot'?" and receive for answer, "Quite cool," as they grow at great elevations.

What I am driving at, then, is this: that these Orchids, if they require a temperature of, say 60°, require it all the year round, and consequently they need the very coolest treatment in summer, and an intermediate one in winter. Acting on this, I have, for the last three years, had a frame made, facing north, the soil excavated, and lined with cement, so as to hold water, and I place all my equatorial Orchids that come from high elevations, in this frame, where they remain from July 1 to the middle of September. During this period, the frame is shaded and closed, or nearly so, when the sun shines, but the lights are drawn off every dewy, still night, and always when it rains. In September the plants are put into a cool plant-house till the chill days of November come, when they go into the intermediate-house, so that they shall always be as nearly as possible at the same temperature.

Under these conditions, *Epidendrum vitellinum*, *Sophronitis grandiflora*, and *Odontoglossums* of many sorts, thrive admirably, and increase their growth and bulbs yearly. A few need some special treatment, and *Odontoglossum grande* is one; evidently its thick, leathery leaves and fat pseudobulbs are intended to withstand drought, and, moreover, we hear it grows on rocks, which must get dry at times. It was not till it was potted in very stony stuff, nearly all drainage, and kept dry from January to the end of April, that it threw thoroughly well with us. It is quite certain that this Orchid suffers from heat in summer even more than from cold in winter, if it be dry; but cool, dewy night air is the tonic these alpine Orchids need in summer, with abundant moisture. I have found most Orchids so very useful for

house decoration, even where a little gas is burned, that I would say, that if the plants be watered even with hard water, or allowed to get sodden and then dry when in the house, we have found no serious damage to occur from bringing them into the house. *Cattleya citrina* is another Orchid that needs warmth in winter, with plenty of moisture, but a dry, cool treatment all summer, so that it must not be put in the moist frame, but hung up in any cool, airy house and allowed to get a thorough rest.

"L. C." will ere long find out for himself, I have no doubt, the varieties of treatment necessary under any general rule; indeed, that is, I think, the pleasure of Orchid-growing—to find how to make each plant happy in its own way. E. H. W.

ORCHID NOTES AND GLEANINGS.

A FINE ODONTOGLOSSUM 'PESCATOREI'.

THERE is a plant of the above in bloom in Mrs. Scaramanga's garden at Shanklin, Isle of Wight, with a fine spike of 130 flowers. The same plant in the two previous years bore spikes with respectively ninety-five and seventy-five flowers. Is the occurrence of spikes with so many blooms unusual? H. Snook. [The photograph of the plant kindly sent with the above note shows a truly magnificent much branched flower-spike. Ed.]

SACCOLABIUM HENDERSONIANUM, *Lindenia*, t. 313.

A charming species, with erect spikes of pale rose-coloured flowers. It is a native of north-west Borneo. It was described in our columns by Reichenbach, in 1875, ii., 336.

CYCLOPSALUM AMESIANUM, *Lindenia*, t. 314.

A native of the Dutch Indies, described for the first time by Mr. Rolfe. The united sepals are white, with light rosy-purple tips, the rest of the flowers being yellow.

STANHOPEA WAROI, *Loddiges*, var. *VENUSTA*, *Lindl.*

A species in which the flower-segments are dull yellow, with the column white, pink-spotted. Fertilisation is effected in the same way as in *Coryanthes*. The plant is figured in the *Lindenia*, t. 315.

LYCASTE LASIOGLOSSA.

Originally described in these columns by Reichenbach, in 1872, p. 215, and now figured in the *Lindenia*, t. 316. The flowers have brownish sepals and yellow petals.

ORCHIDS AT BROOMFIELD, SALE.

In the collection of M. Wells, Esq., many rare and beautiful specimens are now to be seen, and amongst the more noticeable are fine forms of the *Dendrobium Ainsworthii*, a fine specimen of *D. splendissimum grandiflorum* (by far the finest of the section), which had seven strong flowering stems, and when the blossoms are fully out it will be a show of itself. *D. Ainsworthii* and *D. Leechianum*, well represented, are full of promise of bloom. A variety of *D. Leechianum*, Sir William Marriott's Seedling, is a handsome dark form, and superior to the type, which is now found in most collections. *Dendrobium Cassiope*, a pretty hybrid between *D. nobile album* and *D. japonicum*—the flowers nearly pure white, with a blotch of pale purple colour at the base of lip, and whose bloom is nearly as large as that of the first-named parent. *D. nobile*, Hardy's variety, is one of the finest forms of *D. nobile* I have yet seen, with flowers which are perfect in shape, of great substance; sepals and petals very broad, light coloured at the base, the other half of a lovely purple shade. There is also a fine flowering specimen of the finest dark form of *D. nobile nobiliss.* In this house was to be observed the largest flowered form of *D. Wardianum giganteum*, flowering on a bulb made in this country; the flowers are of immense size, measuring 4½ inches across, and tipped with rich purple for a space of three quarters of an inch down the petals. The lip is large. Amongst the *Cattleyas* in flower were a fine *C. Trianae* alba (true),

C. T. Backhousiana, *C. T. splendens*—a very handsome *Cattleya*, the flowers compact and well shaped; petals short, and broad, and fringed, and the front portion of the lip finely blotched with the brightest crimson-purple, and the throat of a bright yellow colour. Some very fine *Coclogyne cristata*—*Chataw-orth* variety, also *C. cristata maxima*, *C. cristata Lemoniae*, *C. cristata*, *Trentham* var., were in full bloom. The handsomest of this section were two fine plants of *C. cristata alba*, with one specimen bearing seven spikes, and the other four spikes, both being objects of good culture. In another house was a fine plant of *Cymbidium eburneum*, with seven strong flower-spikes, and most of the flowers were expanded, and a grand sight it was. Two fine forms of *Lycaste Skinneri* alba and a variety justly named *L. Skinneri gigantea* were observed, the flowers of the latter were of great size, and measured 6½ inches across the sepals; the petals measuring 1½ inch broad, and the lip, a high-coloured one, was correspondingly large. *Cypripediums* were represented by forms of *C. Harrisonianum superbum*, *C. Leezanum superbum*, a very fine variety; *C. Lawrenceianum*, *C. calurum*, dark variety, especially fine. Some fine *Odontoglossum nebulosum* were in full flower, one *O. n. grandiflorum* being a splendid variety; the flowers large and perfectly round; sepals and petals pure white, spotted with reddish-brown. A variety named *O. nebulosum pardinum* was noticed which had heavily spotted flowers—very handsome. Some fine varieties of *Odontoglossum Rosii* majus, all selected carefully by Mr. Wells when they were in bloom. *Zygopetalum crinitum coccineum* is another, a charming thing that was in flower—it lasts a long time in perfection; the sepals and petals are of a greenish colour, marked with brown bars; the lip is large, white, streaked and suffused with bright blue. Many other fine specimens were in bloom, but those above mentioned were the most striking. L. C.

ORCHIDS AT EARLSCLIFFE, BOWDON.

When visiting the small but well-grown collection of Orchids at Earlscliffe, Bowdon, the residence of G. Shoreland Ball, Esq., I was delighted to find such a splendid display of bloom of choice subjects. Certainly, the finest of these was *Cattleya Trianae*, G. Shoreland Ball's variety, which surpasses in beauty the lovely *C. Trianae* Backhousiana. The flower has substance, is well-shaped, and large; sepals and petals are nearly pure white, and beautifully flaked with rich deep purple, and finely serrated at the margins; the labellum large, of a rich deep purple, shaded with the brightest magenta; throat yellow, with bright lines of rosy-purple, and white margin. This is flowering for the first time in this country. I have no doubt whatever but it will prove even better another season. A grand form of *Cymbidium eburneum* in fine condition was just coming into bloom.

The *Dendrobiums* are well-flowered; one plant of *D. Wardianum giganteum* had 115 flowers open; also fine specimens of *D. nobile*, *D. nobile Cooksoni*, *D. Leechianum*, *D. Ainsworthii*, *D. splendissimum*, and a plant of *D. nobile Cyperhi*, which did not strike me as being particularly fine. A good plant of the lovely *Coclogyne cristata alba* was in bloom with two fine spikes; also *C. cristata Lemoniae*, and a fine form of *Cypripedium Leezanum superbum* were in flower, the dorsal sepal having rather more white in it than is usual.

The *Odontoglossums* present a good appearance just now, the plants being thick with flower-spikes. A magnificent plant of the rare *Odontoglossum Andersonianum venustum* was in flower with four fine spikes. There was observed a fine plant of *O. Ruckerianum* with two spikes, an *O. Cervantesii* de-corum var., which was very pretty; also a specimen of *O. Edwardii*, with a gigantic spike of fully open flowers, and many flowering specimens of *O. crispum*. These, with *Lælia Dayana*, *Cattleya citrina*, and a number of other plants in flower, make an exquisite show. The plants are in good health, and very clean, reflecting great credit on Mr. Hay, Mr. Ball's painstaking gardener. Rambler.

THE GYMNOGRAMMAS.

This genus includes some of the most beautiful Ferns in cultivation. It is those covered with the farina or powder which are the most remarkable; the colour of the powder varies from silvery-white to deep golden-yellow. In some the powder is only thinly distributed over the under-surface of the fronds and the rachises, while in others the under-surface is thickly covered, and the upper surface is also covered. Garden varieties are very numerous, and include some fine crested forms. Most of the

they will make large specimens; but the prettiest specimens are those grown from single crowns until they are large enough for from 5 to 7-inch pots. Older specimens generally produce a number of crowns, and do not present such a symmetrical appearance; and as young plants are so easily obtained, it seems hardly worth keeping old stunted specimens about—but, of course, this is somewhat a matter of individual taste or opinion. I once saw a lot of old specimens of *G. chrysophylla* and other varieties offered by auction, and although I should have consigned them to the rubbish-heap, they

may be established by pegging them on to small pots filled with suitable compost. This beautiful Fern may also be obtained from spores, but seedlings vary considerably, both in the habit of the plant and in the colour of the powder. The true form has long, slender, finely-cut, drooping fronds, pale green on the surface, and lightly covered with silvery-grey powder underneath. As the fronds droop over, this can only be grown to perfection when suspended. It is certainly one of the handsomest Ferns we have for suspended baskets, but requires very careful attention, and will not bear exposure to cold.

Of the golden Ferns, *G. chrysophylla* is the best type; this has rather long narrow fronds, growing erect, but slightly recurved towards the points. There are many varieties, *Lauchiana* being one of the most distinct; in this the fronds are nearly triangular in outline, spreading nearly horizontally from erect stipes, which vary in length according to the vigour of the plants. *Alstoni* is a very distinct variety; the pinules curl inwards, thus showing the under surface, which is densely covered with golden yellow powder. *Parsonsi* is a fine crested form. Young plants have a tufted crest at the point of the fronds, and at the extremities of the side pinnae, and as the plants get older, the fronds are more branching and heavily crested; when confined to small pots, they eventually become one dense tuft of multitudinous growths. *Chrysophylla grandiceps* is another crested variety, in which the fronds terminate in a branching crest. *G. decomposita* (fig. 52) has erect finely-cut fronds, not so densely covered with powder as those referred to above. *Martensi* is a very free-growing species, the upper surface bright deep green, and lightly covered with pale yellow powder beneath.

Of silver Ferns, *G. peruviana argyrophylla* is the best, or rather, the most distinctly marked. In this, the fronds are covered on both surfaces with silvery-white powder, in the young fronds hardly any green can be seen; the fronds spread, and are just sufficiently recurved to form a very handsome plant. This is a very delicate Fern, but under good culture it may be grown to a considerable size. In the normal form of *peruviana* the powder is not so white, the surface of the fronds is not so thickly covered, and the plant is of a more vigorous habit.

Among seedlings, numerous intermediate forms will be found. *Mayi* is a vigorous form of the above, with large spreading fronds. I do not know if it is owing to this being of hybrid origin, but it does not come freely from spores. I have sown it many times, yet have never succeeded in getting a really good batch of seedlings.

In *G. tartarea*, the white powder is confined to the under surface, the upper surface being deep green. *G. Wettenthaliana* is a crested form, of similar habit to *Parsonsi*, but having white or sulphury-white powder; the colour varies among seedlings. I have seen plants almost as white as *peruviana argyrophylla*, and others sulphur-yellow. *G. Pearcei robusta* is a fine variety, erect-growing, with very finely-cut fronds, lightly covered with sulphur-coloured powder. This is another which I have not yet succeeded in raising from spores, and I am not aware of anyone else succeeding in doing so. It can be increased by dividing the plants after they have formed several crowns, but it requires great care.

G. trifoliata is a very distinct Fern. I have seen it with fronds fully 8 feet long, and with liberal treatment, I should think this length might be considerably exceeded. The trifoliate pinnae are about 4 or 5 inches long, of a sombre green, with a slight covering of silvery-grey powder underneath; the dark rachises are also slightly sprinkled with the powder.

Of other distinct species, *G. Muelleri* is one of the choicest. This has long pinnate fronds, the broad pinnae are of a pale green, blotched with grey, and destitute of the farina or powder. *G. rufa* and *G. tomentosa* are other distinct species, which, instead of powder, are covered with tiny hairs. These are not often met with, except where large collections are grown, and, although interesting, they are of little value for decoration. *Pteris*.

FIG. 52.—GYMNOGRAMMA DECOMPOSITA.

Gymnogrammas may be obtained from spores, which germinate freely. In some instances the green prothallia may be seen in a few days after the spores have been sown, and they generally come so thickly that it is necessary to divide them at an early stage. Under favourable conditions the young seedlings grow away freely, and make nice plants the first season.

All of these Gymnogrammas like a stove temperature, and a rather moist atmosphere, but the fronds must not be wetted. They should be potted in a light, open compost, and have plenty of drainage. Potted on from time to time as they require it,

realised good prices. Of course, such varieties as do not reproduce from spores must be kept until they have formed a number of crowns, as it is only by dividing these that the stock can be kept up. Where it is necessary to divide plants for stock, it requires great care; previous to dividing the plants, some of the surface soil should be removed, and a top-dressing of new compost, which should be light and sandy, added; in this new roots will soon be made, and it will not be difficult to preserve these when the plants are cut up.

G. schizophylla gloriosa produces a young plant on the rachis towards the point of the fronds, and these

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Gardens, Swansea.*

ROSE-HOUSE.—Established Rose trees growing in borders will now be in full growth, and therefore a thorough soaking of tepid manure-water would be beneficial. Syringe freely once or twice each day until the bloom commences to open. Keep the plants free from green-fly and mildew, and on the first appearance of the latter, apply flowers-of-sulphur to all the affected parts. Any shoots coming in contact with the roof should be loosely tied down. Plants growing in pots should also be assisted with some kind of stimulant, and a fresh batch be brought in to form a succession. The night temperature may be kept at 45°, with a proportionate rise by day, giving air on all favourable occasions, but avoid draughts.

CLIVEIAS.—Plants of these showing bloom may have weak manure-water once or twice a week, until the flowers commence to open. Young plants which have finished blooming and require more root-space, may be repotted, using a compost of three-parts fibrous loam, one of leaf-mould, and sufficient sand to keep the soil open. Any large specimens may be divided, if necessary, as soon as they have done blooming.

SCHIZOSTYLIS COCCINEA.—Plants of this which have become over-crowded in pots should now be divided; the most suitable size pot for them is 7 or 8-inch. A compost of three parts loam, one of leaf-mould and sand will suit them. Grow the plants in a cool pit or frame until there is no danger of frost, then stand them outside on a bed of coal-ashes.

FANCY AND LARGE-FLOWERED PELARGONIUMS.—The pots in which these are growing will now be filled with roots, and applications of weak manure-water may be applied once or twice a week. Stake the plants as may be necessary, but do not use more sticks than are really required. Keep a sharp lookout for green-fly.

HERBACEOUS CALCEOLARIAS which have filled their pots with roots and just commenced to throw up their flower-stems, should have weak applications of manure and soot-water alternately once or twice each week. As these plants are very liable to be infested with green-fly, great care is always necessary to keep them free of this pest.

BULBOUS PLANTS.—When Tuberoses are required for summer blooming, no time should be lost in potting them. Three parts fibrous loam, one of leaf-soil, and sand in proportion, will be suitable. After potting, plunge the pots in a bed of Cocoa-nut fibre or Oak leaves, with a gentle bottom-heat, and where the night temperature fluctuates between 55° and 60°. Introduce into heat more *Gladioli* *The Bride* and *G. Rose Gem*, also *Lilium eximium* and *L. longiflorum* *Harrisii*.

CAPSICUM, PRINCE OF WALES AND LITTLE GEM.—Seeds of these should be sown now in a light sandy compost, afterwards placing the pans or pots in heat. When the young seedlings are large enough, prick off into small pots, keeping them shaded during bright sunshine until established. When the roots have penetrated the outside of the ball, shift them into 5 or 6-inch pots. Grow them on a shelf near the glass, in a structure where the temperature is not allowed to fall below 60°. For the final shift, a compost consisting of three-parts fibrous loam, one each of decayed manure and leaf-soil, and sand in proportion, will be found to suit them well.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, *Gardener, Barham Court, Maidstone.*

PLANTING.—The recent severe weather has probably delayed the planting of fruit trees in some gardens; every opportunity should, therefore, be taken to bring this work to a close. Unless more than ordinary attention can be given, such as watering and mulching during dry parching winds, it will be as well to delay the planting until the autumn; but, providing these essentials are forthcoming, if the ground has been prepared, and the frost is out of it, the trees can be planted at once. All newly-planted trees will be greatly benefited by having 2 or 3 inches of long litter (as it comes from the stable) placed all over the surface of the soil.

Trees planted against walls in the autumn can now be nailed or tied into shape. See that plenty of

room is allowed for the shoots to swell. In these gardens the extent of wall space is 1100 yards, the whole being covered with galvanised wire, consequently we never have any occasion to use nails. I mention this because there is a prevalent idea that wire injures the trees, but so far we have never suffered in the least, except when the wire has been badly galvanised.

FIGS.—When these are grown outside, the pruning should be attended to at once. In pruning, cut back all growths that are not required, retaining the shortest joints and best ripened ones only. Last year's growths should not be shortened back, as it is upon these points that the fruits are generally borne. Do not lay the young shoots in very thick, otherwise the wood will not get sufficient sun and air to ripen thoroughly. As a rule, Figs fruit best in very hard soil, and I have seen excellent crops gathered without very much trouble.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

TOMATOES.—Seedling Tomatoes, when they have developed their first true leaves, should be taken out of the seed-pots and potted in 60's, using a compost of fibrous loam, spent Mushroom-bed dung, and leaf-mould, a small quantity of sifted wood-ashes, and a liberal sprinkling of Thomson's Vine and Plant Manure, and plunge the pots in brisk bottom-heat until the roots seize on the new soil. Not only is bottom-heat of advantage to the plants at this period of their existence, but it favours strong growth and heavy crops at all their stages, provided a dry atmosphere, and a temperature ranging from 60° to 65°, be maintained. At all times when the weather is favourable for giving air, admit it freely, and afford the plants, which are kept in pots, abundance of water at their roots. Plants which may have filled small pots with roots, may be moved into 32's if it be intended to fruit them in pots, or into the border if it be ready for them. In any case, do not starve the plants in small pots. All side-shoots must be cut off as soon as they form. The best results will be obtained from plants grown on a hotbed like Melons, in a soil consisting of the ingredients referred to above, but put together in a rough state, and the plants allowed an unrestricted root-run. When these conditions can be obtained, the plants in 5-inch pots may be put out at a distance of 2 feet apart at once, the soil made firm about the roots as the work proceeds, and afforded a thorough soaking of warm water when it is finished. Cuttings of Tomatoes which have been brought on through the winter, and treated as described, will be about to show fruit, and may be assisted in blossom-setting by tapping the clusters occasionally every day.

Where planting cannot be practised, large pots or tubs may be employed instead, and the aim of the grower should be to afford ample space for the roots. Under this treatment, the half of each leaf must be cut off, in order that sunlight may be able to reach the fruit. Frequent top-dressings of the same materials used for potting the plants and of superphosphate of lime, may be afforded during the season of growth.

CUCUMBERS.—These may be planted in pits or houses, at 4 or 5 feet apart, on mounds consisting of two-thirds loam and one-third of equal portions of leaf-mould and well-rotted manure, and resting on an ordinary hotbed, or some medium for affording bottom-heat to the roots. The main shoot or stem should be directed up the trellis for about a distance of 2 feet, and then stopped, the shoots which result from this stopping being trained fanwise over the allotted portion of the trellis. Top-dress the mounds when the roots appear at the sides, with a mixture consisting of one-half manure and leaf-soil and the other half loam, and maintain a night temperature of from 65° to 70°, and a moist atmosphere. Regulate the day temperature according to the outside conditions, but do not admit any air when cold winds prevail. Sow seeds for succession, one seed in a 2½-inch pot containing leafy soil, and place them in a bottom-heat of 80°. Any seedlings which have got beyond the cotyledon stage of growth may be shifted into 6-inch pots.

MELONS.—Successional sowings of Melons may be made, and the seedlings afforded the same treatment as that advised in a former Calendar. At this time of the year, however, Melon seeds germinate readily, so that two seeds in each small pot will be enough to sow. Attend to the tying and stopping of those Melons which are either planted

out in beds or grown in pots, and also to the fertilising of the first blossoms that open. When a set is secured, top-dress the hills, and feed the plants with some kind of stimulating manure as the conditions of growth seem to demand.

STRAWBERRIES.—Continue to select for forcing the strongest plants, and those with well-ripened crowns—taking in batches of them weekly. Remove dead foliage, and top-dress. At this season a lesser degree of forcing is required, and late Peach-houses or vineries in which a small amount of warmth is maintained, may be utilised to bring on the Strawberry plants. Put them in the lightest place, and where air can be freely afforded, syringing twice daily and effectively performed. Keep the roots moist. If Strawberries are forced on shelves in vineries, &c., and these are so situated that the pots and plants get the fullest exposure to the sun's rays, a thin board as broad as the pots are high should be placed in front of them, which will have the effect of lessening the quantity of water required, and the risks of the plants getting accidentally dry at the roots. Thick pieces of turf may also be placed under the pots, with the grassy side resting on the shelf. Into these the roots will follow the moisture and manures afforded. These turves must not be allowed to suffer for lack of moisture, if once they are taken possession of by the roots. Assist the fertilisation of Strawberry plants in flower, if the weather be dull. Thin the fruits of those that are set, and supply the plants with liquid manure. Plants with fruits nearly ripe may be given a situation near the glass, or where they have unobstructed light, plenty of air, and a temperature of 50°. A drier atmosphere at this period of their growth than the one in which they have been forced, will tend to give firm, well-flavoured fruit, but where fruit can be gathered and placed on the table direct from the forcing-house, a slight syringing in the afternoons of sunny days will tend to a further increase of size. However, where forced Strawberries have to travel long distances, they should be ripened in a dry atmosphere, and no syringing done. For packing Strawberries to travel, boxes 2 inches deep are required, over the bottom of which soft clean moss should be placed, and on this a single layer of Strawberries, each in a piece of Vine leaf, may be firmly packed, and the whole finished off with a light covering of leaves, that will be useful as a garnish.

THE ORCHID HOUSES.

By H. A. BERNARD, *Orchid Grower, Highbury, Birmingham.*

THE COOL ORCHID-HOUSE.—All necessary repotting of the inmates of this house may be now done with safety, and in the case of *Odontoglossum* it should be delayed no longer. My own practice is to leave all those plants that may safely be left until the month of September, but it will sometimes happen that a few—principally those which have flowered and are about to make growth—may be repotted at the present season with good results. No better potting-materials can be found for these species than fibrous peat and sphagnum moss, using these in equal proportions, together with finely-broken crocks intermingled, the plants being very lightly potted. *Cochlidium Noeii* seems to be a plant that will grow well under exactly the same treatment as *Odontoglossum Alexandræ*, as also do *O. nebulosum*, *O. maculatum*, *O. ævium*, *O. Cristeri*, and, indeed, if this so-called cool-house is a light and well ventilated structure, many other species may be cultivated in it. In advising operations, one is apt to forget that many admirers and growers of Orchids do not possess an intermediate-house, and therefore the writer advises the culture of certain species in whatever compartment he finds these to grow best. This is, I suppose, as it ought to be, yet for the benefit of growers of a small number of species of Orchids, it may be well to mention that many of these allied to the inmates of the intermediate-house may be well grown in the cool one if only due consideration be given to the wants of the plants, and the warmest and lightest positions reserved for them. The following species may be grown here with a fair amount of success, though I shall continue to advocate a somewhat warmer treatment for them generally. Suspended near the roof and at the warmest end, should be *Cattleyas* of the *marginalia* type, *Coleogyne cristata*, *Laelia anceps*, *Odontoglossum citrosum*, *O. grande*, *O. Harryana*, *O. Ineziana*, *O. phalanopsis*, *O. vexillarium*, *Oncidium concolor*, *O. crispum*, *O. curtum*, *O. Forbesii*, *O. tigrinum*, and various *Pleiones* may be

grown; while on the stages *Cymbidium*, *Masdevallias*, *Maxillaria grandiflora*, *Cypripedium insigne*, *Boxalli*, *Schlumieri*, and *Sedeni*. *Angulosa*, *Lycastes*, *Odontoglossum cirrosum*, *O. Edwardii*, and *Oncidium macranthum* may have a place.

NEWLY-IMPORTED ORCHIDS.—These plants should be treated carefully, and inured gradually to heat, light, and moisture, as a too liberal and too sudden accession of any of these may cause the foliage to drop and the pseudobulbs to decay. When received, the decayed and useless foliage, roots, &c., should be removed, so that excess of moisture may not affect the plants injuriously, and this done, it is a good plan to suspend them head downwards in a shady, not very moist part of the house, and afford them an occasional syringing; and as the leaves or the pseudobulbs become plump, or new growth and roots appear, they may be potted and treated like established plants.

GENERAL WORK.—The various roller-blinds and shutters should now be put up ready for use, especially that on the cool-house, where bright sunshine at this season may cause the leaves to take on a bronzed appearance, and when this is excessive, it leads to their loss. Fumigate the plants in all houses as previously recommended, at intervals of one or two weeks, as may be deemed necessary. Thrips are now breeding, and their destruction is imperative, if plants are to be kept in good health; and red-spider does much harm to the young foliage of *Dendrobiums*, if not sharply looked after, and sponged off the leaves with an insecticide.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

ASPARAGUS.—When beds of Asparagus are taken up for the purpose of forcing the shoots, it is necessary to renew them by sowing or planting; and though it is yet full early for planting, a good deal will depend on the prevailing weather, as in early springs the roots start into growth early, and in such seasons the planting of roots should begin with growth. New ground should always be chosen for new beds, and it ought to be deeply trenched and heavily manured early in the winter. Asparagus requires high cultivation, but much can be accomplished at a small cost in making the soil suitable for the plant. Where the soil is clayey, road-scrappings, burnt refuse, old plaster and mortar, and woodashes should be incorporated with it. Light soils require good rich manure, marl, heavy loam, and lime rubble. I prefer to sow the seed about the middle of March, and in planting, to give the plants a space of 2 to 3 feet from plant to plant; and on heavy land to make raised beds, and on light soil to sow on the flat. I have employed river sand and sea-weed to great advantage on heavy soils. The seed should be sown sparingly, and the seedlings thinned to 18 inches apart; indeed, some cultivators have the rows 3 feet apart, and the plants 2 feet apart in the rows. It is important to afford the plants liquid-manure, and in dry soils water may likewise be necessary, and in dry weather when the plant is in growth. Plants may stand in the beds in two rows, at not less than 2 feet apart. I prefer, and wide flat drills should be made in which to plant, it being then possible to spread out the roots and place some fresh material over them as the work proceeds. When the work is finished, level the beds, and top-dress with short litter. Before planting a bed, a strong stump should be driven into the soil at each corner to mark the size of it, and alleys should not be less than 2 feet wide at the bottom. Care should be taken when planting to keep the roots moist, and to water them soon afterwards, if the weather be dry.

SEAKALE.—If root-cuttings have been prepared, and kept as previously advised, they will be in proper condition to be planted. To obtain good crowns in one season, ground in good heart, deeply dug and well-manured, should be chosen, and though Seakale will grow in very poor soil, or even sand, it likes strong loam. The sets may be planted in rows 2 feet apart, and half that distance from set to set in the rows; but for forcing on the ground, 3 feet apart is not too much, and 18 inches between the sets. As soon as a few inches growth are made, the stems should be thinned, leaving the strongest ones. The small roots of Seakale which may have been dug and are not fit for forcing, should be cut over, and planted for forcing next season. Seeds of Seakale may be sown this month, but root-cuttings are to be preferred. [Seeds are best sown in boxes, in heat, in February. Ed.]

POTATOS.—The main crop of Potatoes should

soon be planted, unless the situation is a cold or much exposed one, when planting may be deferred for a fortnight. If practicable, the crop should come on land that was heavily manured for some earlier crop, or manured in the autumn, and left in the rough. There is much gained by the use of artificial manures—as fish-manure, in place of the manure of animals, especially in soils that are naturally wet. Change of seed and ground are good for the Potato, and good preventives of the disease. In planting, drills are to be preferred to holes made with the dibber. Strong-growing varieties should be planted in rows 3 feet apart, and the sets at half that distance from each other; whilst those of moderate growth may stand at 2 feet apart, and 1 foot. The Potato quarter should be a fully exposed one, and soils deficient of lime should be freely dressed with it.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

BEDDING ANNUALS.—These annuals are very telling when planted in masses, lines, or clumps, they remain a long time in flower, and are not much injured by rainy weather. A bed of double *Zinnias* has a very telling effect. It is not possible to speak too highly of *Phlox Drummondii* as a bedding plant, that may be used in a variety of ways, as it has richness and diversity of colour, duration and profusion of bloom, together with a dense, free-growing, trailing habit. It is a very manageable plant, and may be planted to form lines or borders, the young shoots being pegged down, and the lines kept cut into shape; but it is when planted in masses that it is seen to the best advantage. It is admirably adapted for planting in beds of standard Roses, as the trailing shoots cover the ground with a carpet of the brightest and softest of colours, and clothe the stems of the Roses, without in any way injuring the latter. The *Salpiglossis* and *Sweet Scabious* are also very showy and useful plants for planting in large beds, attaining a height of from 2 to 3 feet, and in the case of the *Scabious* are rather straggling growing.

GENERAL WORK.—Advantage is being taken of the hardness of the ground to cart in rough materials and gravel of two degrees of fineness for the making of new walks in the grounds. The soil to the desired depth and width was previously excavated. At the bottom of the excavated part, a layer of brick-bats is placed; this forms the drainage of the path, and is followed by two thick courses of coarse, and lastly fine gravel, and a line of flints is put at the sides as an edging. The walk will now be thoroughly well rolled, so as to secure a firm and even surface pleasant to walk and drive upon. In due time *Snowdrops* will be planted behind the flints and close up to them, and still further back, and stretching up to and amongst some trees and shrubs are masses of *Daffodils*, *Blue Bells*, *Snowdrops*, *Hyacinths*, *Primroses*, &c. These and like plants deserve to be generally planted in this manner. The effect of these subjects, when in flower, is as pleasing as it is natural. I refer to the matter now, as the time will shortly be at hand for transplanting some of the subjects mentioned; indeed, the time has already come for disposing of bulbs which have been forced and received the proper kind of treatment to harden them. As soon as mild weather sets in, Ivy may be cut close back to the face of walls or fences on which it is growing. By deferring this operation till the end of the present month or to April, according as the district is early or late, the young leaves which form after the trimming are likely to escape injury by frost. Sow seeds of Eckford's or other Sweet Peas in borders adjoining some of the chief walks in the kitchen garden. They will make useful and good screens to objectionable quarters of vegetables. Among the improved varieties of Sweet Peas may be mentioned the varieties *Queen of England*, large pure white flowers of fine substance and quality; *Princess of Wales*, shaded and striped with mauve on a white ground; *Prince of Orange*, bright orange-pink flowers flushed with scarlet; *Empress of India*, clear rose-pink standard and white wings; and the *Countess of Radnor*, pale mauve standard, with a deeper shading of mauve, wings pale lilac or delicate mauve. A sowing of *Mignonette* should be made in a sunny spot, and in ground previously manured with short dung, and the surface made quite firm and fine.

PRUNING ROSES.—This may be done in March, varying the time from the middle to the end of the month, or early in April, according as the situation is an early or a late one, and the prevailing weather. However, a few of the most favourably situated Roses

may be pruned about the middle of March, with a view to securing early blossoms afterwards, carrying on the pruning generally at short intervals during the period above stated. This is a safe and advantageous practice. The month of April will be soon enough to prune Roses planted last month, and it is a good time to prune Tea-scented and Noisette Roses. If the Hybrid Perpetuals are of the previous year's working, the strength of the shoots will form a guide to the pruner as to what amount of shortening may be required; if vigorous, cut them back to five or six buds, and if weak, prune back to two or three. Tea-scented and Noisette Roses should only have the weaker shoots thinned out, and the strong ones shortened back a little. Older plants of the Hybrid Perpetual class should have the weak shoots cut back to one bud, and the strong ones to two or three buds, according to the size and shape of the head of each plant. The summer Roses, and the varieties of the Moss Rose, should be sparingly pruned. Do not allow established plants of any kind of Rose to get crowded with wood, and, if anything, err on the side of thinness in the shoots. In all cases, prune to a bud pointing outwards. Roses on their own roots, and which are pegged down in their beds, should have some of the old shoots cut out to make room for some of the strongest growths of last year, sparing back the side shoots on the old ones retained to within one eye of their base.

INDOORS.—Push on the propagation of all necessary plants, and prick out and pot off seedlings, and treat as recommended in previous calendars.

FORESTRY.

By J. E. WEBSTER.

In the natural Pine forest, all branches and fragments of wood that cannot be utilised to better account, should be gathered into heaps here and there in open places and burned, the ashes spread out upon the surface, and the spots sown with hardy grass seed, which in due time will afford a welcome bit of grass for deer and other animals. I have found the month of April the best time to burn the rubbish, as by that time the insects are generally busy excavating their burrows below the bark to deposit their eggs, and as they are taken by surprise they are then destroyed in a wholesale manner by the fire. In some cases where the insects are in large numbers, it is likewise advisable to scarify the stumps and larger size of surface roots left in the ground where trees had been felled during winter, to prevent the insects from using them. By this system of management the *debris* or rubbish is converted into plant-food at once, fungus growths and insect pests inimical to the healthy development of trees are kept within bounds, forests and woods have a clean tidy appearance, and last, though not least, pedestrians in search of game can traverse the ground with freedom and comfort. In some parts of the country where Pine woods are extensive, there is sometimes considerable damage done by farmers and others erecting rustic fences with the thinning of Fir plantations without peeling the bark off the posts and rails, and as such forms excellent breeding-ground for insect pests of various kinds, the forester should see that the bark is removed from the poles to be used for such purposes in the vicinity of his plantations.

PLANTING.—The planting of deciduous trees both for ornament and utility should, if possible, be finished for the present month, recently-formed plantations on hill and dell should be examined, and blanks made up where necessary, and in doing so, particular care should be taken not to expose the roots of the trees for any length of time to the drying influence of the weather during the operation. This is a point of much importance as a means of attaining success, and cannot be too forcibly impressed upon the mind of the planter. When making up blanks on dry hilly ground during a spell of dry weather, and in cases where the plants have to be carried a considerable distance to the plantations, the roots had better be puddled in a mixture of earth and water, which will prove highly beneficial in promoting the growth of the plants at the start. Mossy ground, however, or peat bog, can be planted with coniferous trees with perfect success during the month of April, and in doing so I have always found the best results by mixing a small quantity of pulverised clay or earth with the staple at the spots where the trees are to be planted. This gives weight and firmness to the moss, improves its texture, and gives a better ratio of plant food for the trees. I need hardly say that this class of ground should be thoroughly drained, and allowed to lie and drip for a considerable time before being planted.

EDITORIAL NOTICES.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, MAR. 22 { Royal Horticultural Society: Lecture on "Cultivation of Melons"; all Committees meet.
THURSDAY, MAR. 24 { Brighton and Hove Chrysanthemum Society.
SATURDAY, MAR. 26—Royal Botanic.

SHOW.

WEDNESDAY, MAR. 23—Royal Botanic.

SALES.

WEDNESDAY, MAR. 23 { 2000 Standard, Half-standard, Dwarf, and Climbing Roses, &c., at Stevens' Rooms.
SATURDAY, MAR. 26 { Shrubs, Fruit Trees, Border Plants, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—43°·7.

The Nomenclature of Plants.

SINCE the publication, in 1751, of the *Philosophia Botanica*, by LINNÆUS, botanists have had a more or less definite code of rules for the naming of plants, and to it they have more or less loyally conformed. In 1810 the work was taken up by A. P. DE CANDOLLE in his *Théorie Élémentaire de Botanique*, and in the publications of LINDLEY, ASA GRAY, and VON MUELLER, to mention only three of the most important, the subject has from time to time received attention. Throughout, the general principles laid down by LINNÆUS have been followed. In 1867, a congress of botanists was summoned at Paris, under the presidency of M. ALPHONSE DE CANDOLLE, when a new code of laws, based on the ancient models, was propounded by the President, and after discussion, paragraph by paragraph, duly adopted. This code, the general excellence of which is admitted on all hands, is now the guide for students and monographers. Unfortunately, as we cannot help thinking, the working of the code was made retrospective, and consequently, some botanists, in their zeal under all circumstances to uphold an excellent principle, think themselves constrained to change well-known and well-established names—names used for many years, it may be, by everybody concerned—in favour of denominations, obsolete, or never generally adopted, and unknown save to a few antiquarians and bibliographers. The confusion that has arisen in consequence of this, is only beginning, but it threatens to be very serious. If the matter concerned the botanists only, we should not be disposed to discuss so technical a subject in these columns. Unfortunately, the interests of the general public and *à fortiori*, of the gardeners, are greatly concerned in the matter, and this must be our excuse for touching on a subject which is not a very attractive one, however great its importance. It is of course impossible, even if it were desirable, to treat the subject in detail. It must suffice to say, that one of the principal questions agitating the minds of botanists at this time has reference to the application of the "law of priority." The object of this law is to secure the historical recognition and fixity of the earliest

publication of the name of any plant or animal, and thus to obtain a definite starting-point. The publication must be adequate, and as a matter of convention, it has been agreed that the starting-point shall be 1753, the year in which the first edition of the *Species Plantarum* of LINNÆUS was published. This book marked the definite establishment of the binominal system first used by LINNÆUS tentatively in his *Pan Sæcuss*. Previously to that time plants had been occasionally mentioned under two names, one generic, the other specific; but the book in question was the first in which the system was carried out in detail, from "*Acalypha virginica*" to "*Zygophyllum spinosum*."

The adoption of this date as the starting-point is, therefore, something more than a mere matter of convention. How great is the convenience may be judged by comparing the ante-Linnean descriptive phrases of a dozen or more words with the generic and the specific names corresponding to the surname and the Christian name of human beings. The law of priority as generally acted on, does not apply further back than 1753 for the species (or 1755 for the genera). It is true that some sticklers for priority go back to CATULLUS and COLUMELLA. They would be more consistent if they went back to ADAM at once! But in order that our readers may understand the points at issue, we must give a concrete illustration. Let us take the "*Douglas Fir*," generally known in gardens as *Abies Douglasii*. This tree was first discovered by MENZIES at the end of the last century, but the first publication was by LAMBERT, in the first edition of his *Pinus* in 1803. Therein it was called *Pinus taxifolia*, and that is, no doubt, the earliest name, and the one which, according to strict priority, should be adopted, if only one could bring one's self to consider the tree in question to be a *Pinus*. But it was not long before the differences between it and *Pinus* were seen to be so great that the tree was debaptised, and then a period of confusion set in which is not yet ended. Some called it an *Abies*, some a *Picea*, others a *Tsuga*, and lastly came CARRIÈRE, who, finding that the tree did not fit nicely into any of these genera, cut the Gordian-knot by forming for its reception a new genus, to which he gave the name *Pseudo-Tsuga*. Subsequent information has shown that CARRIÈRE was right in his interpretation of facts. The distinction from all the genera above-named is so sharp that it is better and more convenient to frame a new genus with well-defined limitations, than to make one or a few vast and not easily circumscribed genera. The generic name CARRIÈRE gave is intrinsically objectionable, but if we look at it as a mere label, the faultiness of the name is of little moment. CARRIÈRE might have also done better, and would have lessened the burden of synonymy, had he adopted the oldest specific name, "*taxifolia*," and called his plant *Pseudo-tsuga, taxifolia*. But this he did not do, perhaps from a laudable desire to do honour to the memory of DOUGLAS. DOUGLAS, however, was not the discoverer of the tree, and moreover, the object of a name is not to glorify an individual, but to enable us to designate a plant. In any case the name *Pseudo-tsuga Douglasii* is the one now most generally adopted. Sticklers for rigid priority, however, say "No, the oldest specific name was *taxifolia*, this plant ought, therefore, to be called *Pseudo-tsuga taxifolia*. The law of priority amongst other things is devised to render justice to the original describer or introducer." Let us see how this works out in the present case. MENZIES was the discoverer, DOUGLAS the introducer, and LAMBERT, in 1803, the first to

publish any botanical account of the tree. After them came various other botanists who have tossed the plant from genus to genus, till, as we have seen, CARRIÈRE assigned the plant to what is now usually considered the right genus. But owing to the omission of CARRIÈRE to adopt the oldest specific name the tree has once more been baptised *Pseudo-tsuga taxifolia*, and Dr. BRITTON puts his name at the end as sponsor. Now, we do not think we are doing an injustice to Dr. BRITTON when we say that he has had less to do with the tree than any other of the botanists who have dealt with it. They have in various ways contributed to our knowledge of the tree, but he—we beg his pardon, if we are in error—has simply shuffled the cards once more, and added one more synonym to the already overgrown list. It must also be remembered that the specific name is only half of a name, and so it might and does happen sometimes, that one half of a name is correct, the other half of doubtful validity! Surely, the Kew practice, if we may so call it, is preferable to this. That practice is to take as the name to be adopted, that given by the author who assigns any particular species to its right genus. Thus assuming CARRIÈRE to be right, we take the name he gave as the proper name for the *Douglas Fir*. Other prior publications being either incorrect or insufficient are cited in the synonymy.

We have cited this illustration to show the perplexities and confusion that arise from a too rigid adherence to the law of priority. Happy gardeners, who may easily avoid all this entanglement by simply saying "*Douglas Fir*," a name with which no one has quarrelled, but which of course, is not applicable in other countries than our own, or in scientific treatises at home.

Another illustration of the pantomime-like muddle which will ensue, is afforded by the common Spruce—already, like the Silver Fir, blessed, or cursed, with a multiplicity of synonyms. If the new rule is to prevail, this must be called in future *Picea Abies*, because LINNÆUS called it *Pinus Abies*. LINK put it in the right genus, and he called it *Picea excelsa*, and there, in our opinion, the matter should rest.

If the law of priority, of the operation of which we have tried to give illustrations, is to prevail without exception, the changes which will have to be made will amount not to hundreds but to tens of thousands. There is thus safety in numbers! It will be simply impossible to make all the proposed changes, some will be made, a few will be adopted, the bulk will be passed over. This fact is rendered apparent by a remarkable book lately published by Dr. KUNTZE.*

Dr. KUNTZE, in his travels round the world, collected a large number of plants, which he studied and identified in the herbaria at Berlin and Kew. He drew up a complete list of the plants collected by himself, and with Tentonic patience and industry set himself to reform, as he considers, the nomenclature of the plants in question, and of others with which in the course of his investigations he necessarily had in some degree to take cognizance. We need not seek a better illustration of the impracticability of the reforms indicated. Our readers shall judge for themselves by the aid of a few examples. According to Dr. KUNTZE, the genus *Dendrobium* dates from 1799, while *Callista*—a name applied to the same genus—dates from 1790, and therefore should enjoy the rights of priority as to date. Dr. KUNTZE in this, as in all similar cases has the courage of his convictions, and effaces *Dendro-*

* *Revisio Generum Plantarum . . . Secundum Leges Nomenclature Internationalis*, &c. Von Dr. Otto Kuntze. London: Dulau & Co.)

THE CONIFER GROUND AT THE RECENT CONIFER CONFERENCE, R.H.S. GARDENS, CHISWICK.

bium with a stroke of his pen. How long will it be before gardeners abandon *Dendrobium*? They have never taken kindly to the substitution of *Pelargonium* for *Geranium*, in spite of the fact that in that case it was not the date of publication, but an actual blunder, that was attempted to be corrected. *Angræcum* goes under in favour of *Angorchis*, *Lobelia* has to give place to *Dortmanna*. *Calceolaria* is sunk in *Fagelia*, *Nymphaea* becomes *Leuconymphaea*, and the well-known *Lotus* now becomes *Leuconymphaea Lotus*, O.K. The little winter *Aconite*, whose yellow face we are so glad to see, is no longer to be *Eranthis hyemalis*, but *Helleborodes*. Who but Dr. KUNTZE ever heard that name! But Dr. KUNTZE has disinterred it, and, what is more, boldly writes *Helleborodes hyemalis*, O.K. The Tulip-tree, universally known as *Liriodendron Tulipifera*, is turned round into *Tulipifera Liriodendron*, because the name *Tulipifera*, as a genus-name, dates from May or June, 1737, while *Liriodendron* only dates from October of the same year!

But we need not give further illustrations; suffice it to say, they exist by the tens of thousands, and the initials, O.K., are attached to a vast multitude of species, of which it is physically impossible that OTTO KUNTZE can have, in any way whatever, added to our knowledge. Setting aside those cases in which it is possible that Dr. KUNTZE has really advanced science, there remain, according to the author himself, no fewer than 952 genera, the names of which he has changed on the ground of priority, and no fewer than 30,000 species which have been renamed for similar reasons, and to many of which the letters O.K. are duly attached. Happily, the book is thus shown to be such a *reductio ad absurdum* that it will be passed over, save by those conscientious but unfortunate monographers who may deem it their duty to unravel the synonyms of O.K.

Some ten pages of the author's preface are directed at English botanists and their practices. Out of consideration for them, the author has written this portion of his book in what he conceives to be the English tongue. Most English botanists, we fancy, would have preferred it in unadulterated German—but this is a detail. Dr. KUNTZE's comments on the *Key Index* and the *Genera Plantarum* of BENTHAM and HOOKER are interesting if not generous. Indeed, the imputation that BENTHAM "opposed the new international rule, so as not to be obliged to correct himself innumerable times," is so false and so offensive that Dr. KUNTZE will henceforth labour under the stigma attaching to those who attempt to belittle the work of greater men than themselves. Dr. KUNTZE says we English are not "yet fit for international science." We shall not attempt to discuss that point, for most people know that English botanists have taken a fair share in international science, and amongst them none to so great an extent as BENTHAM. We are obliged to admit with humiliation that in our obstinate persistence in the use of FAHRENHEIT's thermometer, and our utterly senseless system of weights and measures, we lay ourselves open to Dr. KUNTZE's chasement. Dr. KUNTZE finds us equally guilty in that we do not adopt the international laws of botanical nomenclature. To this indictment we plead not guilty and, *more hibernico*, extenuating circumstances. What these circumstances are we must, seeing the length to which this note has run, defer stating till another occasion. Suffice it, for the moment, to say that English botanists

can bring forward a body of practical work which even Dr. KUNTZE admires and which no international code can possibly nullify.

THE CONIFER GARDEN AT CHISWICK. (*See Supplement.*)—It is admitted on all hands that for general interest and excellence the Conifer Congress held at Chiswick last October was a great success. Certainly on no previous occasion has so complete a representation of the plants of any one natural order been made. Cut specimens of foliage, and in many cases cones, were received in prodigious quantities from all parts of the British Islands. The Scottish exhibits, thanks especially to Mr. MALCOLM DONN, were very extensive and very remarkable as illustrating the suitability of these trees to the climate of Scotland. One very interesting and beautiful feature of the Congress consisted in the collection of living specimens, sent by leading nurserymen in all parts of the country, arranged by Mr. BARNOS in the open air. The varying forms and colours of the plants were admirably illustrated, and their suitability to particular purposes demonstrated. Unhappily it must be added that pitiless rain ruined the success of the show so far as the attendance of visitors was concerned, and the results of all that labour and intelligence were witnessed by comparatively few. As full details were given in our numbers for October 10 and 17, we need not here repeat them, but merely give voice to the desire that the publication of the Conifer Report will not be long delayed, and that when it does appear, will make some amends for the loss caused by the atrocious weather that prevailed. In addition to the papers read at the Conference, it will, we believe, comprise the names of all the exhibitors, a complete list of the species and varieties shown, and an enumeration of all the species cultivated in this country, with synonyms, and references to plates and descriptions. This latter task has been undertaken by Dr. MASTERS.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society in the Drill Hall, James Street, Victoria Street, Westminster, will be held on Tuesday, March 22. Besides the Floral, Fruit, and Orchid Committees, the Narcissus Committee will also meet for the first time this year for the purpose of adjudicating on *Narcissi* and *Daffodils*, of which there will, in all probability be a fine display in addition to other spring bulbs. At 3 o'clock, Mr. C. Ross will deliver a paper on the "Cultivation of Melons."

"KEW BULLETIN."—As an appendix to this publication is now issued, an alphabetical list of the new plants of the year 1891, with brief indications of the character of the plants, and references to the journal or book in which the plants were described or figured. An inconsistent method of spelling personal names is adopted which is very embarrassing. Thus, *Cocos Pynaertii* has the specific name spelt with a capital, while *Cycnoches rossianum* is spelt with a small letter, and so in many other instances.

The February number is devoted to an exhaustive article on the culture of *Agave rigida* in the Bahamas and elsewhere. The plant in question, together with some allied species, furnishes Sisal Hemp. The botany of the Gambia Frontier Commission is the subject of a note, and a list is given of some of the more important plants met with by the French members of the Gambia Delimitation Commission, and by Dr. BROWN LESTER, the medical officer of the English Commission. The Director reprints his communications to the Middlesex County Council, and to our own columns, on the subject of instruction in horticulture.

INTERNATIONAL HORTICULTURAL EXHIBITION.—It is proposed to hold, at Earl's Court, a great exhibition of Potatoes, from October 5 to 13, scheduled regarding which will be issued in due course.

—A meeting of market growers and salesmen was held at the Hummums Hotel, Covent Garden, on Thursday morning last, to consider the scheme of the Council of the above Exhibition to

make a representative show of market produce at Earl's Court on June 6, 7, and 8. There was a fair attendance, and Mr. WENNER occupied the chair. Mr. MILNER, Chairman of the Executive Council, pointed out that £200 will be placed at the sub-committee's disposal for prizes, but several present did not think the wholesale growers would derive any advantage from it. Ultimately, however, a sub-committee, comprising fruit, flower, and vegetable growers, florists, English and foreign salesmen, was formed, and it was decided to hold the next meeting at the above hotel on Tuesday, March 22, at 10 A.M.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual meeting of this Society took place at the Caledonian Hotel, Adelphi, on Monday, March 14. Mr. ROBERT CANNELL presided over a large gathering of members. The annual report set forth that a considerable addition had been made to the number of members during the past year. That a good deal of sickness had occurred through the influenza epidemic, the amount paid to sick members amounting to £119 10s. 6d., which sum is covered by deductions made from the subscriptions of the two classes of members. Three deaths had occurred, and the amount standing to the credit of these deceased members had been paid to their nominees. The Benefit Fund of the Society had increased by about £600, the Benevolent Fund by nearly £140. The number of honorary members had increased by three, though some had died. The Management Fund showed a balance of £31 1s. 9d. The Treasurer's account was of a very satisfactory character in all its details. The annual dinner of 1891 was one of the most successful yet held, and by means of it, the Convalescent Fund received substantial additions. In moving the adoption of the report and Treasurer's statement, the Chairman contrasted the various items of receipts with those of the previous year, and drew conclusions to the effect that in all its essential features the Society had progressed in the most satisfactory manner. He emphasised the advantages such a Society offers to young members, and urged the claims of the Society upon horticulturists generally. In the course of the discussion, it transpired that the Trustees had, during the year, sold out £500 23 per cent. Consols, and reinvested them in Manchester Corporation stock paying 3 per cent., adding thereto the sum of £700 which had accrued during the year 1891. The total amount paid to the nominees of sick members was £40 9s. 5d. There had been grants from the Benevolent Fund of £24 16s. 6d. Payments to sick members from the Benevolent Fund amounted to £55 3s. 4d., and though there has been an increased expenditure, there has been a corresponding increase in the income of the Society. Messrs. C. W. Knowles, R. Scott, and E. G. Wheeler, out-going members, were re-elected on the Committee; and Messrs. R. J. Chard and W. P. Thomson were elected to fill two other vacancies; and Mr. W. Collins was unanimously re-elected Secretary. Hearty votes of thanks were passed to the Trustees, Auditor, and Treasurer, for their services during the year. The proceedings closed with a cordial vote of thanks to the Chairman for presiding.

MR. PHIPPEN'S FLOWER SHOW AT READING.—Mr. GEORGE PHIPPEN, F.R.H.S., of the Royal Berks Floral Establishment, Reading, held his annual show of spring flowers at the Large Town Hall on Wednesday, March 9. This show has, since its institution, steadily grown in popular favour, until now it commands the patronage and support it so well deserves. Wednesday's show was on the whole finer than that of last year, while the attendance of visitors both in the afternoon and evening, despite the unfavourable weather, was larger than in any previous year. The show of Tulips was about an average one, though the inclement weather has had some deterrent effect upon the flowers, which were not quite so even as in some former years.

STRAWBERRY TEA.—Some of our exchanges are mentioning the fact that, in some parts of Germany, the leaves of Strawberries are dried, and used as tea. We have no knowledge of the fact at first-hand.

HERTFORD HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—Meetings of this Society were held on February 24 and March 9. On the former occasion Mr. E. H. CATERER, gardener to A. F. GRIFFITH, Esq., Elmsfield, Hertford, read a very practical paper on "The Cultivation of Bush Fruits." There was a good attendance, who, at the close of the meeting, accorded Mr. CATERER a hearty vote of thanks for his excellent paper. Mr. D. PHILLIPS, gardener to the Rev. E. E. W. KIRKBY, of Ware, read the paper on the latter date, the subject taken by him being "Peas and Potatoes." Owing to the unfavourable state of the weather the attendance was small. A long discussion followed a very interesting paper.

"BOTANICAL MAGAZINE."—The March number contains coloured illustrations of the following plants:—

Cereus giganteus, tab. 7222.—This plant is well known to the curious for its rigid, fluted, cylindrical stems, thickly beset with tufts of spines, and in many treatises on the geography of plants, mention is made or illustration given of the peculiar appearance these weird stems give to the landscape in the deserts of South California and Arizona. Individual plants are said to attain a height of 60 feet with scarcely a branch, and nearly two feet in diameter; and as if to add to their uncomeliness, the thick, fleshy substance of the upper part frequently rots away, exposing a woody interior frame-work, which breaks up into a crown of brush-like fragments that wave about in the wind. A plant at Kew 14 feet in height, and 4½ feet in girth, weighing, when first imported in 1890, 12 cwt., flowered in 1891. The flowers were produced from near the summit of the stem, each one having the general appearance of an elongated Pear held erect and surmounted by a white frill. The ovary is covered with flat green scales, and is surmounted by a funnel-shaped flower tube covered with green oblong bracts continuous with those on the ovary, and gradually increasing in size from below upwards. The limb of the corolla is about 75 mill. (3 inches) across, and consists of two rows of oblong, obtuse, clear-white petals, recurved at the margin, and encircling a crowd of yellow stamens.

Dianthus callizonus, t. 7223.—A lovely dwarf species, native of the limestone mountains of Transylvania. The leaves are spreading, linear, and about an inch in length, the flowers solitary, each about 1½ inch (35 mill.) in diameter, rose coloured, with a broad central zone of a darker pink spotted with white. It is doubtful whether it is really distinct from *D. nitidus*, which is noted as a taller plant with smaller flowers.

Gongora gratulabunda, t. 7224.—A New Granadan species, with rather long racemes of rather large flowers of a yellowish brown, speckled with red, the lateral petals are very short, sickle-shaped and whitish, and with two slender awns on the base of the lip.

Chrysanthemum rotundifolium, t. 7225.—An Aster-like perennial, with erect, acutely-angled red stems, broadly ovate, toothed leaves, narrowing at the base into a decurrent petiole. Flower-heads 2 inches (50 mm.) across, with an involucre of small green, red-margined bracts surrounding a number of white-rayed florets. It is a native of Hungary, and should be enquired for by the lovers of hardy perennials, as its moderate height, 2 feet, will commend itself to many.—Kew.

Lysimachia paridiformis, t. 7226.—A Chinese species, with whorls of rather long oblong, acuminate leaves and stalked tufts of yellow flowers.—Kew.

STOCK-TAKING: FEBRUARY.—As was almost naturally to be expected, the imports for the past month show an increase of considerable amount—i.e., £1,566,577—even considering there was an extra

day in the month compared with 1891. This indicates cheap foreign produce markets, and a large capacity for production of finished goods at home—seriously threatened by the impolitic action of our coal-getters. Next to brain-power, steam-power is the prime mover in our factories; cripple or imperil coal supply and brain-power suffers in a corresponding ratio—import and export alike will be affected. Of the latter there is a reduction for the month amounting in value to £1,141,868—that is, compared with the same period last year. The following is an extract from the "summary" of imports for the month of February:—

IMPORTS.	1891.	1892.	Difference.
Total value for month	£33,311,351	£34,877,331	+1,566,577
II.—(A.) Articles of food and drink—			
duty free	9,888,414	11,508,697	+1,710,283
(B.)—do., dutiable	2,283,682	2,092,615	—199,937
VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	8,227,299	7,648,183	—579,116
VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,180,652	2,413,257	+232,605
IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,008,787	1,322,575	+313,788
(B.)—Parcel Post ...	55,218	57,325	+2,107

Annexed we give an extract from the general mass of the Board of Trade returns concerning the import of fruits, roots, and vegetables during the past month. The returns are not by any means complete—but this may be achieved some day:—

IMPORTS.	1891.	1892.	Difference.
Fruits, raw	188,408	345,555	+157,149
Apples, raw ... bush.	...	3	+3
Piums (2 months)	2,585	+2,585
Pears	548	+548
Grapes	21,112	+19,110
Unenumerated, ..	369,817	316,765	—53,052
Onions	115,228	78,817	—36,381
Potatoes
Vegetables, unenumerated, raw, .. value	£16,398	£38,609	+£22,211

Both sides to the above account—plus and minus—are well worth noting, and bearing in mind as trade with the Colonies in fruits progresses, there are some very funny stories in the mouths of Steam Shipping Company managers as to what refrigerators will do on board Mediterranean steamers—the unexpected results coming to light on opening them in the Thames. But these stories may be a little overdrawn.

LINNEAN SOCIETY.—At the meeting held on Thursday, March 3, Prof. STEWART, President, in the Chair, a letter was read from the Home Secretary conveying the thanks of Her Majesty the QUEEN for the address of condolence which had been forwarded on behalf of the Society on the death of H.R.H. the Duke of Clarence and Avondale. The President announced the presentation by Sir JOSEPH HOOKER, M.D., K.C.S.I., to the Society of two medallion portraits of Sir JAMES ROSS and Doctor JOHN RICHARDSON, whose names were well known in connection with arctic exploration. A vote of thanks to the donor was passed unanimously. Mr. CLEMENT REID exhibited a collection of fossil plants and seeds which he had found associated with the bones of rhinoceros and other mammals in the neighbourhood of Selsea and West Wittering. By means of diagrams, Mr. REID showed the exact position of the bed, and described the conditions in which the various specimens were deposited. On behalf of Mr. W. E. BECKWITH, of Shrewsbury, Mr. H. SZEOHM

exhibited a specimen of White's Thrush (*Turdus varius*) which had been shot near Shrewsbury on January 14 last. On behalf of Mr. A. CRAIG CHRISTIE, the Secretary exhibited some specimens, as was supposed, of *Lycopodium complanatum* collected in Scotland, on which it was suggested that the plant might be regarded as British. In the opinion, however, of Mr. JAMES GROVES, who had carefully examined the specimens, and other botanists present, they were referable to *L. alpinum*. Mr. CARBUTHENS was of opinion that *L. complanatum* had been met with in the south of England, but not within the last ten years. Mr. E. M. HOLMES was under the impression he had seen it growing a few years ago near Stroud. A paper was then read by Mr. A. D. MICHAEL on "Variations in the Internal Anatomy, and especially the genital organs of the Gamasiina, a typical sub-family of the Acari."

BACTERIA.—Every gardener knows what it is at times to fail in the culture of some particular plant without being able to assign any cause whatever for the failure. The soil, it is now known, teems with microbes or organisms of different kinds, but all of excessive minuteness, some of which act as ferments and bring about the solution of what was previously insoluble, and so render it available for plant food. The difficulty of assigning a cause for the failures above mentioned thus seems lessened. M. NADVIN points out in a note cited in the *Revue Horticole*, that it is very likely that want of success may depend upon the absence of the particular microbe necessary for the conversion of the inert substances of the soil into nutritive matter. Our contemporary speaks of this as an hypothesis, but it appears to us from the demonstrations that have taken place as to the relation between the nutrition of the Leguminosae and the nitrifying organisms studied by M. WARRINGTON and others, that the matter has got beyond the stage of hypothesis, and that further development in this direction is now assured.

CHICAGO EXHIBITION.—To the Department of Horticulture belongs the distinction of the first exhibit, installed, for the World's Columbian Exposition. P. S. PETERSON, a nurseryman, of Rose Hill, Chicago, has recently planted six trees on the grounds near the horticultural building, as a permanent exhibit, and as a practical illustration of the successful methods of transplanting large ornamental trees. They are an Elm, 50 feet high and 2 feet in diameter, commemorative of General SHERMAN, brought from the woods in 1876, then fifty years old, and planted on the nursery grounds at Rose Hill; a Hackberry, 40 feet high and 2 feet in diameter, commemorative of General GRANT, also transplanted from the woods in 1876; a Linden, 40 feet high and 18 inches bole; a Willow, 30 feet high and 30 feet spread; a Sugar Maple, 40 feet high and 10 feet stem; an Ash, 35 feet high and 14 feet stem. It required a force of twenty-two men and twelve horses to transplant the trees, and the cost of the work was about 700 dols.

MANGROVES FROM COLOMBO.—It was announced at the meeting of the Royal Botanic Society, Regent's Park, held on the 12th inst., that a number of Mangrove plants had arrived in safety at the gardens. It is a plant which has seldom, if ever, been grown in this country. The white Mangrove, an allied species, had been growing in the hothouse at the Society's gardens for some years, but its progress was very slow, and the plant was not doing well.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The prize schedule for the annual Floral Fête to be held on August 18, 19, and 20, has just been issued. The classes number 237, with 723 prizes.

HORTICULTURAL CLUB.—The usual monthly dinner and conversazione was held on Tuesday evening, March 8, at the Rooms, Hotel Windsor, Victoria Street, Westminster. The chair was occupied by Mr. HARRY J. VEITCH, vice-chairman of the club, who was supported by the Rev. T. H.

Gale, the Rev. — Pratt, Messrs. W. J. Pearson, E. C. Pearson, Cousins, H. Williams, Harry Turner, W. H. Williams, W. Soper, C. T. Drury, Joseph Cheal, John Martin, Geo. Bunyard, Arthur J. Veitch, W. Marshall, W. H. Fowler, &c. A paper was ready by Mr. W. Soper, which ranged over a variety of subjects connected with horticulture, and which gave rise to a very interesting discussion; and a hope was expressed that at some future time Mr. Soper would speak on the subject of chemistry in its bearing on horticulture. Messrs. H. Williams, H. Selge Leonard, H. E. Milner, John Martin, Arthur Veitch, Stewart Low, Valentine E. Low, and George Gordon have been elected as members.

CAN MANGANESE TAKE THE PLACE OF IRON ?

—This question, in so far as it refers to the nutrition of plants, has recently been solved in the negative by G. SPAMPIANI, who came to the conclusion from the results of a long series of culture experiments. The part which iron plays in the formation of chlorophyll has long been known, and it seemed interesting to determine whether this soil constituent could be advantageously replaced by compounds containing manganese. We cannot follow out the *modus operandi* of the investigation here, but we notice that white Lupins, Maize, Oats, &c. were experimented upon by means of the water culture method, and the appearance of the plants at various periods of their development was carefully observed. All the plants undoubtedly assimilated the manganese, for the ashes of their leaves yielded an intense manganese reaction when chemical tests were applied, but for all that the substance was found incapable of replacing iron in the formation of chlorophyll (*vide Star. Sper. Agrar.*, vol. xix., pp. 5-33, for full details).

PRESENTATION TO MR. COOKE, NANNAN PARK.—MR. COOKE, for the last seventeen years gardener at Nannan Park, Dolgellwy, was, the other evening, on his relinquishing his charge of the gardens there, presented with a purse of money and a handsomely illuminated address, subscribed by his numerous friends and well-wishers in the neighbourhood, and by not a few gardeners in distant parts of the county and elsewhere, who had always found a hearty welcome to Nannan, and Mr. COOKE a thorough practical all-round man, and a genuine and sterling friend.

GARDENERS' ORPHAN FUND.—A committee of gardeners of Kingston and Surbiton are promoting a concert in aid of the Orphan Fund, and have fixed the date for April 20 next. They will have, through the kindness of Mr. W. POPPARD, of Twickenham, the able assistance of the Boston Park Glee Club, of which Mr. HERBERT SCHARSTAN, of Westminster Abbey, is the conductor. Every effort will be made locally to produce a success. Mr. BURRILL, of Claremont Gardens, Esher, is chairman of the committee, and Mr. A. DEAN, Secretary.

"XENIA ORCHIDACEA."—This publication, so long conducted by Prof. REICHENBACH, is now edited by Dr. KRÄNZLIN. Among the plants figured in the last number (part iii. of the 5th volume, tabs. 241 to 250), are *Lycaste xytriophora*, *Phalænopsis Maeanii*, *Chriophallum Wendlandianum*, *Pescatorea Lehmanni*, *Cattleya Skinneri* var. *Bowringiana*, besides others of less interest to horticulturists. As we have been asked on more than one occasion the meaning of the title, we may add, that the word *Xenia* is from the Greek, signifying a present or complimentary gift given to a stranger.

"GREVILLEA."—With the next part, the 20th volume will come to a close, and Dr. COOKE announces his intention to discontinue it by reason of feeble health and diminished energy. The announcement will be received with regret, for Dr. COOKE's services to Cryptogamic botany for many years have been both numerous and important.

"JOURNAL OF THE SCOTTISH METEOROLOGICAL SOCIETY FOR 1890."—This journal is especially valuable for the authentic details it gives

relating to the climate of various parts of Scotland. The present part, published by WILLIAM BLACKWOOD & SONS, also contains an interesting article on the relation between the weather and the spread of influenza in London, the general result of which is to show that influenza and its consequences, even in the case of respiratory complications, are independent of season or weather.

THE ORCHIDÉENNE.—The meeting on March 13 was, in spite of the adverse weather, remarkable for the number and beauty of the specimens exhibited. Diplomas of Honour of the first class were awarded to *Masdevallia Harryana* var. *Kegeliani*, from M. Linden; *Eulophia* (?) *Lindeni*, from M. Linden; *Cypripedium* × *Imshootianum*, from M. Linden.

Botanical Certificate to *Angraecum polystachyum*, from M. Linden.

First-class Certificates to *Odontoglossum Italli leucoglossum*, from M. G. Warocqué; to *Lycaste Skinneri alba grandiflora*, from M. G. Warocqué; to *Epidendrum Wallisi*, from M. A. Van Imshoot; to *Schomburgkia undulata*, from M. A. Van Imshoot; to *Cypripedium Schröderæ splendens*, from M. Martin-Cahuzac; to *Odontoglossum Alexandrae*, from M. G. Warocqué; to *Odontoglossum spectabile*, from M. G. Warocqué; to *Cattleya Luddemanniana*, from M. A. Van Imshoot; to *Odontoglossum Rossi Mommanum*, from M. de Lausberg; to *Cattleya amethystoglossa*, from M. Linden; to *Zygopetalum Lindenii*, from M. Linden.

Second-class Certificates to *Odontoglossum Cervantesii lilacinum*, from M. le Dr. Capart; *Corylogne Parishii*, from M. A. Van Imshoot; *C. cristata alba*, from M. Linden; *Paphinia grandis*, from M. Linden; *Cypripedium hybrid*, from Madame Gibez; *Masdevallia* sp., from M. Linden; *Zygopetalum crinitum*, from M. le Dr. Capart.

Cultural Certificates to *Cattleya amethystoglossa*, from M. Warocqué; *Phalæopsis Schilleriana*, from M. Martin-Cahuzac; *Cypripedium barbatum Crossi*, from M. G. Warocqué; *Epidendrum Stamfordianum*, from M. A. Van Imshoot; *Cypripedium Lindleyanum*, from M. G. Warocqué.

NATIONAL CHRYSANTHEMUM SOCIETY.

A largely attended annual meeting of the members of this Society took place at Anderson's Hotel, Fleet Street, E.C., on Tuesday, March 15. Mr. R. BALLANTINE presided. The report stated that the Society had maintained its position, and that at no previous period in its history was its work better appreciated at home and abroad than at the present. It numbers nearly 700 members and Fellows, and there are ninety societies affiliated to it, with correspondents in many parts of the world. The three exhibitions held during the year were superior in many respects to what was expected, regard being had to the uncongenial season; and at the great November show cut flowers and specimen plants were remarkably good, and the competition in all the leading classes was keen. During the present year exhibitions will be held, as usual, in September and November; and, instead of holding a mid-winter exhibition, there will be a show in the month of October. The work of the Floral Committee has been of a valuable nature, and although numerous flowers are staged, Certificates are awarded with great caution. In reference to the question of increasing the size of the stands for Japanese blooms having been much discussed, the Society is strongly urged to take action, and the committee recommend a conference being held at the time of the October show, in order that the question may be fully discussed. Differences of opinion exist among growers, and any suggested changes should be made only after the matter has been fully considered. The financial statement showed an income from all sources of nearly £800, including about £300 from the Royal Aquarium Company. Members' subscriptions amount to £200, and from affiliated societies for fees and medals have been obtained £108. On the expenditure side about £450 has been paid in prizes, inclusive of medals; and other items made up

an expenditure of £835. The report and financial statement was adopted. Leopold de Rothschild, Esq., was elected President for the current year, and the names of Sir John T. D. Llewellyn, Bart., Mr. R. Smith, and S. Barlow, Esq., were added to the list of Vice-Presidents. Mr. Robert Ballantine was re-elected Chairman, and Mr. E. C. Jukes Vice-Chairman of the Committee; Messrs. R. Dean and C. Harman Payne, secretaries. Twelve members of the Committee retired by rotation, and of these Messrs. T. Bevan, H. Shoemith, G. S. Addison, R. Owen, W. Langdon, A. Taylor, and J. P. Kendall were re-elected; and the following were elected:—Arthur Veitch, W. Herbert Fowler, J. Brooks, E. Rowbottom, and J. T. Turk. Messrs. F. Cobbold and G. J. Ingram were appointed auditors. It was arranged that a general meeting of members should be held on one of the days of the November show to give members an opportunity of making suggestions in reference to the work of the Society. Five new members were elected, and two societies were admitted to affiliation. Hearty votes of thanks to the auditors and the chairman for presiding.

THE HOLMES MEMORIAL FUND.—This fund is, we are informed, now closed, and the two principal objects for which it was inaugurated have been accomplished. A small portion of the fund has been given to another fund raised privately among growers of Chrysanthemums for the purchase of two challenge cups, to be known as the National Chrysanthemum Society's Holmes Memorial Challenge Cups, which will be competed for at the autumn show in November under the same terms as the competition for the society's challenge trophy. The remainder has been vested in trustees for the benefit of the children of the late Mr. WILLIAM HOLMES.

PUBLICATIONS RECEIVED.—*Report of Natal Botanic Garden, Durban.*—*Report for 1891 of the Self-Help Emigration Society.*—*Agricultural Gazette of New South Wales* for December, 1891.—*Jardin Botanique Alpin de la Linzée*, third annual report.—*Contributions to the Queensland Flora.* By F. TEMPLIONIA RETUSA, *Bull. d. R. Soc. Toscana d'Orticoltura*, t. 2, 1892.

TAICHOCHNETHUM TRIQUETRUM, Rolfe, *Lindenia*, January, t. 311.

VANDA CERULESCENS, *Orchidophile*, February.

ORPHIUM FRUTESCENS.

It cannot be said that the genus *Orphium* is well known in gardens. There are, however, a few species belonging to it which are well worth a place in the cool greenhouse. The subject of this note and the accompanying illustration (fig. 53) (which was taken from a plant recently in flower in the temperate-house at Kew), is a very old garden plant indeed, having been in cultivation more than one hundred years—at first, and for a long time afterwards, under the name of *Chironia*, the name applied to it when figured in the *Botanical Magazine*, in 1787, at tab. 37. *Orphium frutescens* belongs to the natural order Gentianeæ, and is a native of South Africa. It reaches a height of 2 to 3 feet, and has somewhat fleshy oblong-linear leaves, which, as well as the stem, are covered with short, soft, silky hairs. The expanded flowers are just about the size of a penny, sometimes perhaps a little larger, and are of a brilliant rose pink, which forms a striking contrast to the bright golden-yellow stamens which stand out so conspicuously in the centre.

It might be mentioned that the plant figured in *Paxton's Magazine of Botany* (vol. xiii. 221), as *Orphium frutescens* does not agree with the above description or sketch, but seems to be identical with that figured in the *Botanical Magazine*, t. 707, as *Chironia decussata*—a plant with much broader leaves and larger flowers. It is hinted, however, that one may be produced by the other, the difference being brought about by cultivation. Another species (or variety) worth the attention of the cultivator is *Orphium* (*Chironia*) *angustifolia*, *Bot. Mag.* t. 818. *John Weathers*. [*Chironias* succeed under the same conditions that are found to suit most Cape and New Holland plants, but may be afforded something more than the warmth of the ordinary cool greenhouse when making their growth, and may then be freely syringed morning and evening in fine weather. Careful watering is very necessary, and a potting soil consisting mainly of peat and clean silver sand, but large plants may have a modicum of fine yellow loam mixed with the peat, and the drainage should be good with quite clean pots. En.]

A TRAVELLER'S NOTES.

(Continued from p. 333.)

MADURA. [November.]—The most striking sight there is the throngs of natives and the variety of their costumes. Here for the first time I saw Hindoos, a people entirely different in face, form, colour, and dress from the Tamils and Telugus. The women wear handsome jewellery in great quantity, the ears being pierced sometimes in three and four places, and large ear-rings are worn in the nostrils.

The sights of Madura are the famous temple, dedicated to and a chosen residence of Siva; the Teppa Kulam, or Great Tank—now only used for washing purposes and committing suicide! the palace of Tirumala, and the Padu Mandapam. The temple is certainly a wonderful sight. [The details concerning which are given by Mr. Veitch we are compelled to omit. En.] Round and close to the temple are bazaars, many devoted to the sale of the famous Madura cloths, and filled with as motley a mob as one could well see.

The Great Tank is some 2 miles out of Madura.

It is $\frac{1}{2}$ mile square; in the centre is an island, on which is a domed temple. On great occasions and festival idols are drawn round this on rafts. The palace of Tirumala is a magnificent building; the courtyard is surrounded by a large gallery, the roof of which is supported by large stone columns. The interior, now used by the government as a justice room, is beautifully carved and very lofty. One gets a fine view of the town and the great gapuras of the temple from the roof.

The Padu Mandapam, opposite one of the entrances to the temple, and now used as a bazaar, is a large pillared hall, the roof of which is supported by four rows of columns, 120 in all, each differently carved. The façade along the entrance is adorned with carved monsters.

Banyans (*Ficus indica* or *F. bengalensis*) grow well at Madura. Many roads, especially outside the town, are lined with them, and they afford a pleasant and effective shade. Owing to their aerial roots being cut, that passers-by may go underneath, they do not increase as rapidly as is their nature. In Judge Weir's garden, I however, saw a very fine specimen

FIG. 53.—ORPHIUM FRUTESCENS: FLOWERS, ROSE-PINK.

with 105 large aerial stems, and seventy smaller ones; all the large stems or aerial roots are numbered, and the plant is carefully looked after.

Cocoa-nuts (*Cocos nucifera*) abound round Madura, and a special variety of Banana is cultivated for food. A small one, only grown in the hills, is particularly sweet and nice.

TRINCHINOPOLY.

From Madura I went to Trinchinopoly, one of the hottest places in India, and one of the worst for cholera. For hundreds of miles of the line from Tuticorin to Trinchinopoly, and, indeed, much further up country, a formidable and impassable hedge to cattle of *Agave americana* has been planted on each side; occasionally, though rarely, a break from some cause or other occurs, but this is always filled up with a strong wire fence in splendid order. Hour after hour one sees nothing but the *Agave*, and the flat, uninteresting country beyond. But where wells are found (the water from which is hauled up by means of cattle) one may see a large tract under Paddy culture. Owing to the country being flat, it is, of course, impossible to cultivate it as in Ceylon,—that is to say tier upon tier; the necessary water

in India is conveyed by small channels to the various fields.

The chief centre of interest at Trinchinopoly is the great Temple of Serlingham, situated on an island some short distance out of the town. The approach through a road lined with Palms and other trees, with the great unfinished gopuram and others behind it, far away in the distance, is most picturesque.

From Trinchinopoly I went to Tanjore to see the temple, said to be the oldest in India. In this temple I think I was more interested than in any other; it is smaller and more compact than the others. The entire temple is surrounded by a gallery, on the walls of which are frescos of punishments and miracles. In one part are 108 stone gods, each god being a short circular piece of stone on a strong base; believers lay flowers on these when praying.

COONOR.

From Trinchinopoly I went to Coonoor, a hill station much frequented by Europeans in the hot season. The nearest railway on the plain is Mettupalaiyam, the remainder of the journey up the Nilgiri ghats (some 18 miles) being performed in a double-horsed "tonga." A "tonga" is a curious contrivance on two wheels arranged to hold four persons; it has a moveable pole, so that, whatever the ascent, the weight of the entire carriage can be thrown on the wheels. The horses go a fast trot all the way, and are changed every 2 miles. This is the ordinary method of making the journey, but owing to two bridges (one a large stone construction) having been washed away about a month ago, some 5 miles of road was rendered inaccessible to tongas, and one had to walk or mount a pony. Coonoor is 6000 feet above sea-level, and is very prettily situated on the side of a steep hill, whilst all around, often hidden in the woods, are the bungalows of Europeans. It is a very pretty spot, and, I believe most popular among southern Anglo-Indians. The vegetation is somewhat similar to that growing in and around Nuvera Eliya. *Habrothamnus elegans*, from 6 to 7 feet high, was flowering freely; whilst *Roses*, *Pentstemons*, *Vincas*, *Verbenas*, *Pheasant-eyed Narcissus*, *Pelargoniums*, *Iris*, and white *Arums* were planted in front of the hotel.

OOTACAMUND.

From Coonoor I rode over to Ootacamund, commonly known as Ooty, situated some 12 miles further up the hills, and a little over 1000 feet higher elevation. The chief tree between these two places is *Eucalyptus globulus*, thousands of acres having been planted to afford fuel. In a young state it burns with great rapidity; but I am told, when old, this is not the case—the seasoned wood is valuable for house purposes. Mr. Lawson, Director of the Botanic Gardens, and of the important Government plantations, has the floor and wincing of his drawing-room made from it. I would like to have seen his *Cinchona* plantations, but as they are several miles away, it was impossible. His method of obtaining the bark is different to that in vogue in Ceylon; instead of shearing it off annually, he removes every three years oblong strips; this, he thinks, does not injure the tree to the same extent, and he obtains more quinine (4 units) than they do in Ceylon. Here, as there, the renewed bark is always the richest in this product. He drove me round the artificial lake, a considerable expanse of water, winding in and out between the hills, and through a portion of the Botanic Gardens.

The two chief trees at Ooty are the Black and White Wattle; both are *Acacias*, the latter being *dealbata*. The specific name of the former I am not sure of. [*A. mollissima*.] Both grow with great freedom, especially *A. dealbata*. This is in parts annually cut down on the sides of the road, which makes it throw up dense masses of strong young shoots.

The Botanic Gardens are situated at the extreme end of Ooty, and are in conjunction with the Governor's house and garden. I was much struck with Mr. Lawson's lawns—though he has to water arti-

specially, they are yet very good. Round the portion of the garden I saw were some good single specimens scattered about of various Conifers, such as *Pinus insignis*, *Cupressus torulosa*, *funeris*, and *Lawsoniana*, *Araucaria Bidwilli* and *Cookei*, and *Cryptomeria japonica*. English Oak does fairly well; I saw rather a nice specimen, some 30 feet high. *Nasturtiums* and *Trifoliums* were flowering freely in one of the borders. The portion of the garden I saw can scarcely be called botanical; it seems more to be laid out with well-gravelled roads and walks, for the gratification of the many Europeans in Ooty.

From Ooty, or rather from Coonoor, I came right through to Bombay, where I arrived on November 22. It is certainly a magnificent city; the railway station, secretariat, and other public buildings, are very handsome. *J. H. F.*

DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY FUNGI.

(Continued from p. 332.)

STARVATION OF THE REPRODUCTIVE ORGANS.

The development of the seed however, may, by the influence of certain parasites, become arrested. We see this in the effect *Puccinia graminis* has upon the Wheat plants affected by it. True, although the mycelium is purely local, yet it always attacks the stem of the plant to a greater or less extent, forming long spore-beds running lengthwise down the stem. Often several are placed parallel to one another. In this case the injury to the seed is proportional to the number of spore-beds. Its action upon the seeds is by causing their starvation, so to speak, for it cuts off the channel of communication between the plant and its seed, and impairs the nutrition of the latter. Sometimes this takes place to such an extent as to render the Wheat crop practically valueless, as the seeds do not fill-out as healthy Wheat kernels do. Those seeds, however, which are formed possess the faculty of germination, and remarkable as it may appear, are capable, not only of giving rise to a healthy crop, but also under favourable circumstances to a crop producing a heavy yield of excellent Wheat. This is because the parasite is a purely local and not a constitutional affection, because it does not attack the Wheat until after the flower-heads have been produced.

Another parasite attacking the stem of its host, so as to produce starvation of its reproductive organs to a much greater extent than happens in the instance just mentioned, is *Peziza Duriana*. The life-history of this fungus has not been worked out in all its details, but sufficient of it is known for our purpose. Its mycelium occurs in the flower-stems of certain Carices, where it manifests its presence in two ways. Towards the upper part of the stem, near the flower-heads, it gives rise to a number of linear spore-beds, which resemble black lines parallel to one another, and to the long axis of the stem; each consists of great numbers of minute spherical black spores.

Lower down the stem, at first enclosed entirely within it, two or more sclerotia are produced, in shape very like an elongated Barley-corn. The lowermost is larger, and the first formed; when fully developed, they bear considerable resemblance to ergots. At first they are hidden within the stem, but their presence may be recognised from the sickly yellow hue of the stem containing them; as the sclerotia mature they rupture the stem, and fall out. The immature sclerotia are remarkable for the beautiful reddish-purple colour of their exterior. They are perfected in June or July, and lie dormant until the following spring, when from each is produced the pretty little *Peziza* to which Tulasne has given the name of *Peziza Duriana*. If the flower-heads of the affected plants be examined, it will be at once seen that they are abortive; the head is formed, but no seeds are ever produced in it.

STRANGULATION.

A well-known Sphaeriaceous parasite is even more destructive to the reproductive organs of its host,

namely, *Epichloe typhina*. This fungus absolutely strangles the stems of its host, so that the floral axis is quite destroyed. It occurs upon a variety of grasses, of which *Dactylis glomerata*, *Agrostis vulgaris*, and *Phleum pratense* are the most frequently attacked. The spawn of the fungus spreads through the entire stem of the plant, and manifests its presence as soon as the plant begins to put forth its flowering heads. This it does, producing a mass of bud-producing threads (gonidiferous hyphae) in the form of a collar, on the sheath of the second or third leaf below the inflorescence. This collar consists of a whitish felt-like mass of interwoven threads, which produce on their extremities multitudes of minute ovoid hyaline gonidia ($4-5 \times 3$ mk.), which form a viscid mass.

FIG. 54.—BLADDER PLUM.

After a time, the gonidia cease to be formed, and the matted hyphae form astroma which becomes golden-yellow or orange in colour, and produces flask-like cases or perithecia, the bases of which are imbedded in this stroma, with their apices radiating outwards. The apex of each is pierced by an opening, the "ostioleum," through which the spores escape. Internally they are filled by a mass of asci, containing eight filiform spuriously septate spordia, without paraphyses. The remains of what would have been the floral axis is generally to be observed as a shrivelled up dead body surmounting the fungus growth.

An allied species, *E. strangulans*, occurs in Cayenne.

DIRECT ACTION OF THE REPRODUCTIVE PARASITES ON THE FLORAL ORGANS.

General and complete destruction of all the floral organs is a very common effect of the reproductive parasites. Very good examples are afforded by the

development of those species of *Ustilago* which cause the respective smuts of Oats, Barley, Wheat, Rye, and various grasses.

Certain of the *Ustilagineae* confine their attacks to the anthers. *Ustilago Succinea* of Magnus, peculiar in having white spores, occurs in the anthers of *Scabiosa succisa*. A better-known species is *Ustilago violacea*, in the anthers of various Caryophyllaceous plants, especially on *Lychnis diurna* and *vespertina*. The dark violet spores replace the pollen grains, but it is particularly interesting, because of the manner in which it modifies the sex of its host-plant. The two species of *Lychnis* in question are what are termed subdioecious plants; individuals bear either antheriferous and pistilliferous flowers only, but occasionally plants occur bearing both. The ovaries of the antheriferous plants are undeveloped, whilst those of the pistilliferous flowers are well developed structures, surmounted by long curved styles, which extend beyond the tube of the corolla.

When a pistilliferous plant becomes attacked by the parasite, it produces anthers, and the styles become reduced to short, erect bodies, about an eighth of an inch long, surmounting the ovary.

Another parasite, *Peronospora violacea*, is sometimes met with upon *Knautia arvensis*; it attacks the filaments of the stamens, and causes such a profound modification of these organs that they do not develop anthers, but become metamorphosed into petals, losing their normal function altogether, so that the blossoms become filled with beautiful violet petals, which have replaced the stamens.

The ovaries and the ovules, as well as the whole of the seed-vessels, are the favourite sites of attack of many reproductive parasites, by which various pathological changes are induced.

Hypertrophy of the ovary is caused by some of the Ascomycetes, for instance, by *Exoascus pruni*, which causes a disease well known on the continents of Europe and America by the name of Bladder or Pocket-plums (fig. 54). De Bary has shown that this diseased condition is due to the presence of the mycelium of the fungus in the tissues of the young fruit, in which it may be detected as early in the year as May. The attacked Plums never come to perfection, but are malformed into yellowish-green, tough, tasteless, wrinkled bodies, having the shape of Plums, but hollow, and without any stone inside.

The mycelial threads ramify in the substance of the affected fruit, especially following the direction of the strands of vascular tissue. They form a network beneath the cuticle, through which there protrude innumerable perpendicular branches, like the pile on velvet. These branches are cylindrical in form, and contain about eight spores enclosed within them, so that they are virtually asci. These asci easily rupture, and permit the escape of the spordia. The free spordia germinate in water, and in saccharine solutions, by budding, after the manner of the *Saccharomyces* spores, but they do not form alcohol.

Another allied species deforms the female fruit of the common Alder, and gives rise to a well-known diseased condition. It differs from a species which occurs on the foliage in having a great number of spordia in each ascus, whereas the foliicolous species has eight-spored asci. *C. B. Plowright*.

(To be continued.)

HOME CORRESPONDENCE.

CELSIA ARCTURUS.—This half-hardy plant is most useful for flowering during the winter in a cool house, from which frost is excluded. It has showy bright yellow flowers, with a brown and purple centre, and the filaments of the flower being of the same hue renders it the more attractive. Strong plants in 5-inch pots produce spikes of flower at this time of the year fully 2 feet long, and these last in perfection many months, as the blooms develop gradually upwards as the lower ones decay. We have plants which have been flowering for the last two years. By sowing a pinch of seed in the spring, a stock of

plants can quickly be raised; or cuttings may be employed, these striking freely in the spring or early summer under a handlight in a cool-house or frame. *E. M.*

DOGWOOD, CORNUS SANGUINEA.—It may not be generally known that this plant succeeds really well under overhanging boughs of tall forest trees, much better than many subjects, and in this respect, in addition to the qualities named by "Vagabond," in *Gardeners' Chronicle*, p. 312, it deserves to be extensively planted. *E.*

WHITE CINERARIAS.—At one time, white Cinerarias were looked upon as decided novelties, but now they are quite common. Amongst about 100 plants obtained from a high-priced packet of seed from a noted house for these plants, quite twenty-five of them have white flowers, a fact which I do not regret, as they not only give variety to the coloured flowers, but they harmonise really very well with them. In addition, they afford useful material for cutting, white flowers being at all times appreciated. These white Cinerarias make up nicely into wreaths, the deep purple shade of colour which suffuses the stamens giving additional variety, and as blue in various shades is now employed in wreath-making these white Cinerarias are useful. *E.*

COTTAGERS' KALE.—Once more has this favourite winter Green proved itself of value where Kale is required during the winter months. It is a plant which pays for good cultivation, and what is of importance, that the seed should be sown early, to enable the plants to have a long season on which to grow, for the taller the stems the larger the crop of sprouts. My plants have this year averaged 3 feet in height, and were clothed with sprouts from bottom to top. The seed should be sown about the middle of the present month, weather permitting, and as soon as the plants are 4 inches high, they should be planted out where they are to stand. A distance of 2 feet 6 inches between the rows is not too much if the ground be in good heart, and the plants in the rows should be as far apart. In hot, dry weather, the seed-bed should be well watered before drawing any of the plants, and watering-in should be adopted. Be sure to sink the stem quite up to the leaves. If possible, a spare piece of ground should be apportioned off for this crop, as better results are obtained in this way than when the plants have to be put out between the Potato and Pea rows, as is very often the case. *E. M.*

SNOWDROPS AND SNOWFLAKES.—I have *Galanthus nivalis-lutescens* in good form just now. It is curious and very interesting. The *Leucuncus* came before the Snowdrops this year, and have been very good. *L. carpathicus* was nearly always twin-flowered. Some seasons it comes single-flowered on a good many stems. I wonder this year it is not cultivated more largely for florist purposes. *W. B.*

APPLE ASHMEAD'S KERNEL IMPROVED.—I have grown this Apple for the last twelve years, and think highly of it as a dessert fruit. The tree is a very strong grower, and evidently requires age before it will crop freely. If it could be induced to come early into a free-bearing state [by grafting on *Paradise*? *En.*] no doubt it would be an Apple much sought after. It is said to be a late keeper, but with us it does not last in good condition much after Christmas. *E. M.*

TITS.—A small open basket containing scraps of bread, fat, &c., is hung up in winter and much frequented by the birds. One afternoon recently a tit instead of helping itself in the usual way was observed to deliberately carry piece after piece of the food from the bottom to the edge of the basket, and thence to drop each to the ground, where, needless to say, sparrows were in waiting. The intention of the tit was evidently to empty the basket, or to get at the larger pieces of food which lay beneath the crumbs which it removed from the top. Is it possible that the tit had an idea of nesting in the basket, or is it now too late in the season? *Leirion.*

ROUND AND KIDNEY POTATOS.—The matter in relation to judging round and kidney Potatoes, referred to by Mr. Harris, may not be a very important one, but in country shows it is constantly cropping up, not so much because exhibitors make mistakes as that they are only too ready, in equivocal fashion, to snatch an advantage, if possible, from their fellows. Now it is a very rare circumstance indeed for any variety of true kidney form, and ordinarily classed as

a kidney, to produce roundish samples. The trouble, such as it is, is chiefly found with those intermediate varieties, which are longish, round, and difficult to classify. These must be classified according to their average form, and of such a sort as Satisfaction it is just to say that its average shape is distinctly round. A large pebble-shaped round, and the elongated form, is of an abnormal character. There are so many distinctly-defined kidney varieties and rounds, that absolutely no difficulty should be presented to exhibitors or judges in determining which section any variety presented at exhibitions belongs to. It would be little less than immoral to exhibit any one variety in the two sections because of its diverse forms or shapes. Whenever judges find any one variety so exhibited by one or more exhibitors, it is their duty to first determine to which section the variety belongs, and then to disqualify it in the other section or class. If they award it prizes in both sections, they stultify their own judgment. Of real kidney-shaped Potatoes, there are International, Ashleaf, Snowdrop, Prizetaker, Mr. Breese, Covent Garden Perfection, Governor, and others, all of which show what true kidney forms are; whilst of rounds, Windsor Castle, London Hero, Reading Rasett, The Dean, Schoolmaster, Abundance, &c., all show as plainly as can be what a round variety should be in form. *A. D.*

TEA AND COFFEE SUBSTITUTES.—"The large fleshy roots of *Niebuhrnia pedunculosa*, Hochst. (*Boscia caffra*, Loud.), furnish a sweet syrup, not unlike 'golden syrup,' and are comminuted and roasted into a substitute for coffee, just as corn and Rye are used when true coffee has run out of stock." (H. G. Flanagan, Prospect Farm, Koraanza, Kei River, in *lit. ad. m.*) *P. MacOwan.*

WINDOW PLANTS.—I heartily concur in the remarks made by Dr. Masters at the Drill Hall on the 8th inst., with respect to the extravagance shown in relation to house-decoration with plants. I have seen plenty of such examples, and have regretted that genuine horticulture should be so poorly served by such costly methods. Especially is this the case in window-plant decoration in the mansions of the wealthy in London, where the most outrageous combinations of colour may often be seen, the result of efforts on the part of furnishers to outvie each other in the production of what they term striking effects. Not in one case in a hundred is any good taste shown. Last summer, in one of the upper or bed-room windows of a house near Grosvenor Square, there might have been seen hanging from a box on the sill, and blooming with wonderful profuseness, a double-blossomed pink-coloured Ivy-leaf Pelargonium. It had been trained by some housemaid, probably, who perhaps had brought the plant from the country, along the sill, and then the branches hung down, showing a rich profusion of bloom. No window-shows made by the furnishers anywhere near could equal that one plant in its beauty. But to see what may be done in the cottage by the wife of the labourer in the shape of window-decoration, one must seek the best examples found in rural districts, where cottagers' societies offer prizes for the best decorated windows, or, perhaps, window-boxes. Some of these latter I have met with at Earley, near Reading, for instance, have shown remarkable taste, and skill also in cultivation. Would that we could have a great country window-box exhibition in London. It would not only be full of deep interest, but give some useful lessons in taste and cheapness in plant decoration. *A. D.* [We have a protest from Mr. Wills, which reached us too late for insertion this week. *En.*]

PREVENTION BETTER THAN CURE OF WORMS IN GARDEN POTS.—Seeing your reply to "Amateur," p. 346, on expelling worms from garden pots, I am induced to mention an excellent thing for keeping the worms out, which consists of pieces of brass wire gauze cut of convenient sizes, and placed over the hole at the bottom before the crocks are put into the pot. If care is used in putting in the crocks afterwards, no worm, wood-louse, or slug will be able to get into the soil. To prevent misunderstanding, it should be mentioned that a patent has been taken out for the above—it is called Porter's Invincible Crock, and is made at Maidstone. Considering the simplicity of the thing, it is next to marvellous that none of us have ever thought of it, and that an enthusiastic amateur should be the lucky person to find it out, and take the wind out of our sails in this manner. Those I first had were made of steel wire, but these were found to get rusty with manure-

water, &c., and brass wire has accordingly been substituted for steel. For plants in pots, such as Strawberries, pot fruit trees, &c., which stand a long time on the soil, I consider the invention extremely useful. *W. H. Divers, Ketton Hall Gardens, Stamford.*

MANURING HOLLY HEDGES.—In some soils Holly hedges do not retain that deep green colour so much admired in hedges of this plant. I allude to hedges which have not been planted for more than a dozen years. These will sometimes lose many of the leaves at the bottom, and small branches go off occasionally from lack of nutriment in the soil, and it is not always practicable to give the necessary stimulus to the plants by means of manure. A way to effect this object without much labour or cost is to soak the soil with farmyard liquid manure about twice, at an interval of a fortnight between, and the present month is the best for the purpose, or just before growth commences. This treatment will generally be succeeded by strong growth from the base, and an improvement in the colour of the foliage. It is surprising to notice the great improvement in the appearance of a hedge after two applications of the manure. *E. M.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

MARCH 8.—D. Morris, Esq., in the chair. Present: Messrs. Elwes, Michael, Professor Green, Professor F. Oliver, Dr. Hugo Müller, Dr. Scott, Dr. Masters.

Adventitious Buds on Ribes.—Mr. Burbridge sent specimens of these productions on *Ribes aureum*, to show that the conjecture advanced on a former occasion, to the effect that the swellings in question were due to constriction and to the accumulation of moisture by a ligature, such as a shred, was not tenable; as in the case now sent, the plant grew as a shrub without any such ligatures, and yet these swellings were produced as in a burknet Apple.

Hellebore.—Dr. Müller stated that he had performed experiments similar to those detailed at a previous meeting by Mr. Burbridge, and, owing to the diversity of the results obtained, concluded that the slitting of the flower-stem longitudinally had no definite relation to the length of time that the flowers remained unwithered. Dr. Scott stated that he had examined the anatomical construction of *H. niger* and *H. orientalis*, and found that the conducting system is much more completely developed in the quickly withering *H. orientalis* than in the long-lived *H. niger*. Possibly the greater amount of transpiration due to the presence of leafy bracts below the flowers of orientalis might have something to do with the more rapid withering of the flowers.

Two-coloured Tulip.—Dr. Masters reported that he had examined the Tulip exhibited at the last meeting, and found that the distribution of the colour was as follows:—One of the outer segments, that nearest the axis, or the posterior part of the flower, was red, the other two yellow. Two of the inner segments were half yellow, half red, the red portions being in juxtaposition with the red outer segment. Of the stamens, the three in the posterior part of the flower, that is to say, one of the outer (opposite the red sepal), and two of the inner series were completely red instead of being, as might have been expected, half red and half yellow.

Cypripedium Dayanum.—Dr. Masters reported on the specimen submitted to him at a former meeting. In this, the true lip was absent, but each of the two lateral petals was partially developed in the form of a lip. The posterior stamen, *a*, 1, which is usually not developed in *Cypripedium* (though it is the only one present in other *Orchids*), was also present in a lip-like condition. The two stamens, *a*, 1, 2, were present in their ordinary condition. The flower in question was, therefore, partly double, and added another illustration of the probable development in the future of "races" of double *Orchids*.

Larve Destructive to Grass in Hong-Kong.—From Mr. Ford came, through the Director of the Royal Gardens, Kew, specimens of the larve and of the perfect insect of a species of *Tinea*, reported to be very mischievous in Hong-Kong. The specimens were referred to Captain Elwes for examination and report.

Hybrid Narcissus.—Rev. G. H. Egleheart sent flowers of a hybrid produced by the inter-fertilisation of *N.*

triandrus and *N. monophyllus* var. *alba*, to show the similarity of the result obtained by the inverted crossing of the two species. See figs. 45, 46 in our last issue.

The Dyeing of Flowers.—From Mr. W. Brockbank came a large series of dried flowers, the venation of which had been rendered apparent by the action of aniline dyes. The cut ends of the flower-stalks were immersed in the fluids, so that the colouring matter was absorbed by the vascular tissue of the flowers. The results were very striking, and likely to be of use to botanists. See ante, p. 329.

Plants Exhibited.—From Mr. Burbidge came *Helleborus torquatus*, from the College Botanic Garden, Dublin; *Mistletoe* from *Pyrus malus* var. *præcox*, on which it is found that the berries are produced more freely than on other trees—the foliage, on the other hand, being less well developed. These effects are analogous to those produced by grafting on a dwarfing stock. *Tellima grandiflora rubra*, remarkable for the rich red colour of the foliage, the colour being especially noticeable in winter time, so that the plant makes a good setting for bulbs. The winter coloration of the leaves of this species is analogous to that observed in some of the Ivies, notably the variety *atropurpurea*, which turns nearly black in winter. A flower of the rarely-seen *Dioscorea viridiflora* from the same garden was shown. It is remarkable for its green colour and the peculiar shape of its large corolla—between funnel-shaped and bell-shaped.

Disease of Mountain Ash.—The Rev. W. Wilks sent a specimen, accompanied by the following letter:—"I noticed a Mountain Ash tree with a very stout large trunk fit to carry a tree of large dimensions, but the actual tree was comparatively very small and stunted, and every twig of every branch was ended in this way, the diseased part being always downwards underneath the line of the stem bearing it. The tree at a distance looked almost like some evergreen, so densely was it crowded with these diseased parts." In the specimen the ends of the branches presented oblong or club-shaped swellings irregularly cracked on the surface, as well as deeply fissured in places. Internally it consisted of woody tissue of harder consistence than usual, the deep fissures being lined with dead wood, around which the new and harder wood was deposited. A similar condition is not very uncommon in the Hawthorn, but the determining cause is unknown, and can probably only be ascertained in the young state, which unfortunately rarely comes under observation. The deep tunnel-like cracks are suggestive of insect injury, and of subsequent efforts to repair the damage.

MANCHESTER ROYAL BOTANICAL.

MARCH 15, 1892.—The opening show of the season was held as usual in the Town Hall. Despite the inclemencies of the weather, it was a much better show than we have noticed for several years previous—better in respect of both quantity and quality of articles on exhibit. All spring shows have a warmth of colour about them that is often wanting later on in the season, and what with gay Orchids, quantities of Cyclamens of every hue, the brightness of Dutch bulbs, and the captivating character of our varied and beautiful Daffodils, not to speak of plants of nondescript character, the beautiful hall was never more gay.

Orchids.—The Orchids were choice, the *Dendrobia* being grandly represented both in Mr. Statter's and in Mr. C. Lee's collections. It was not that the plants were large, but they were copiously flowered, and the eye could scan them without much effort. In Mr. Statter's collection we noticed particularly fine forms of *D. nobile nobilius*, of *Ainsworthii*, and of *Ainsworthii roseum*, which, when under masterly cultivation, "holds the field" against all comers in that particular shade. Good examples of the old noble and *Wallichianum* were shown, and some forms with particularly bright segments. Amongst the lot were superb forms of *Lycaste Skinneri* alba, beautifully flowered, and as white as the snow on the hillsides. *Cologyne cristata* alba was also present in several plants, which, in that way, there is nothing to equal. Some well-flowered pieces of the scarlet *Sophronitis coccinea* were intermingled; and a few of the glazed-looking *Ladies' Slipper*, making up in a groundwork of *Ferns*, a remarkably pleasing whole. Mr. Johnson also brought forward several examples of cut flowers of *Cattleya*, by far the best being Statter's form of *Trianae*—a most brilliant and excellently flowered flower.

Mr. J. C. Lee confined his exhibit to *Dendrobia*

alone, and most effective they are in varied character. In addition to those named above, Mr. Lee had *Wardianum* in many fine varieties, nearly all of which were called superbum—any-way the orange-base of the labellum of some of the sorts were markedly characteristic, and contrasted well with the deep-coloured extremities of both segments and lip. *Cassinoides* was fairly well shown; it seems as if growers found it worse "to do" than its bigger gouty-stemmed neighbour. The white one was an exhibit, but it lacks purity to rank alongside of either *Lycaste Skinneri* alba or *Cologyne cristata* alba. *Darwinianum* is pretty, but scarcely large enough in the flower for the growing taste. Noble *splendissimum* is a rank grower, possibly the best of the breed, and the flowers were large and showy. Contrasting with these were several samples of *Bymerianum*, which has in addition to its golden colour the lip so prominently frayed that visitors "not in the know" were inspecting it with more than ordinary curiosity. The sweet smelling *Heterocarpum* was well grown and flowered, and with its pale lemon segments and nankeen lip, is an excellent contrasting species amongst a lot of *Dendrobis*. The only dressing that Mr. Billington brought for the Lee collection was some *Palms*, the whole being a choice group.

Miscellaneous Plants.—Messrs. Heath & Sons, Cheltenham, tabled a mixed collection, comprising *Kentias*, some *Crotons*, an *Anthurium* or two, one very good *Amaryllis* named *Mars*, several choice Orchids, the best among which was a gigantic form of *Dendrobium Finlayianum*, having both size and quality of flower to recommend it. Also *Odontoglossum Roezlii*, clean and excellently grown and well flowered for the size of plant. The bright orange-scarlet *Lelia harpophylla* looked well beside the sienna and green *Odontoglossum Hallii*, and the pure white *O. Pescatorei*. *Cattleya amethystoglossa* was fairly well shown, and several *Cypripediums* all mixed up with a little greenery which vastly lightens the bare foliage.

Mr. James Mason, of Manchester, had a fairly good mixed lot of *Azaleas* and New Holland plants, nothing more showy than the drooping inflorescence of the yellowish *Acacia Ricena*. Dickson, Brown & Tait had a charmingly flowered lot of *Azalea Mollis*, and some of the best *Hyacinths* in the exhibition. Mr. Thos. Walker, Hounslow, had a grand assortment of *Cyclamens*, grown on the quick-production principle, and they were loaded with flowers, the white flowers being specially captivating. The beauty of the culture is in the small pots; the plants were grown and finished ready for sale. The St. George's Company, Hanwell, had a similar lot, from white to maroon and all the intermediate shades. John Laing & Son had also a good lot of *Cyclamens*, and a varied lot of plants suitable for greenhouse decoration.

Dickson, Chester, put up a very captivating lot of Daffodils—still nothing better was seen amongst the many exhibited than the one-coloured Emperor, and the white-segmented and lemon-cupped *Horsfieldii*. Confronting these were *Squills* and *Primulas*, in varied colours, and the whole, interspersed with the Harris' white Lily, commanded, as they deserved to do, much attention.

Mr. Joseph Brown sent from his gardens at Little Orme's Head, a fine culling of spring flowers, remarkable for sweetness—among which were *Wallflowers*, varied *Primulas*, showy *Doronicums*, *Tulips*, *Snowdrops*, and fine batches of *Glory of the Snow* (*Chionodoxa Lucille*).

Mr. Findlay sent a lot of flowering plants from the Gardens, comprising grand groups of *Cliveas*—a splendid botanic garden plant for flowering in a large house under the shade of other plants—some fine lot of *Daffodils* and *Tulips*, and *Hyacinths*, along with some selected *Palms* of cooler climates, which added much to the general effect.

MARKETS.

COVENT GARDEN, March 17.

No alteration. Market remains in the same condition as last week. James Webber, Wholesale Apple Market.

The market is not quite so healthy as per last report, and, except for best quality, there is a tendency to lower prices. J. B. Thomas.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—i.e., "Day-degrees" signifies 12° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.; 6, England, S.W.; 7, England, S.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending March 12, is furnished from the Meteorological Office:—

"The weather during this period continued extremely cold and wintry, with frequent but not generally heavy falls of snow in the eastern and north-eastern parts of Great Britain, and occasional slight snow showers elsewhere. Many intervals of fine bright weather were nevertheless experienced in all parts of the Kingdom, especially in the west and south-west.

"The temperature was exceedingly low for the time of year, the deficit varying from 7° in 'Scotland, E. and W.,' to as much as 10° in the 'Midland Counties,' and 'England, S. and E.' The highest of the maxima were recorded on the 8th in 'Scotland and Ireland,' and on irregular dates in 'England,' they ranged from 47° in 'Ireland, S.' and 'England, S.W.,' to 41° in 'England, E.' The lowest of the minima were registered at most stations either on the 9th or 10th, when the thermometer fell to 10° in 'England, E.,' 12° in 'England, S.W.,' 13° in 'Scotland, E.,' and to between 15° and 21° in all other districts, except the 'Channel Islands,' where it did not fall below 23°.

"The rainfall (melted snow) was a little more than the mean in 'England, N.E.,' but less in all other districts.

"The bright sunshine exceeded the mean very generally, and was more prevalent than for many weeks past. The percentage of the possible duration ranged from 54 in the 'Channel Islands,' 48 in 'Ireland, S.,' 46 in 'England, S.W.,' and 42 in 'Scotland, W.,' to 29 in 'England, N.E.,' and 28 in 'England, E.'"

NOTICES TO CORRESPONDENTS.

ANONA SQUAMOSA: *J. L.* This species, the Sweet Sop, is, like other species of Anonae, an evergreen, and if your plant loses its leaves it is probably from lack of sunshine or heat. The winter warmth should be 55° to 65°, and the summer 65° to 85°.

BOOKS: *Fruit Congress Report*, W. T. Published at the Royal Horticultural Society's Offices, 117, Victoria Street, Westminster.

CALIFORNIA AS A HOME: *R. G. M.* will be glad to correspond with Mr. W. Carter if he will kindly send us his address.

FRUIT TREE STOCKS: *W. D.* Advertise your wants.

GARDENIA ROOTS: *J. B.* The swellings on the roots are caused by eel-worms, *Tylenchus radialis*, often

FIG. 55.—EEL-WORM DISEASE OF GARDENIAS.

described and figured in the *Gardeners' Chronicle*, as at p. 488, 49, April 9, 1887, where a full description of the insect, by M. Beijerinck, a celebrated Dutch naturalist, is to be found. Our fig. 55, represents a root very severely affected by the worm.

They are probably introduced with the potting soil. There is no cure, short of the entire destruction by fire of the affected plants.

GLORINIA: *H. B.* The malformation, of which you send specimens, is not uncommon, and is sometimes so much developed that a complete second corolla outside the first is produced, as in the case of a Hose-in-hose Primrose, but differing in structure.

GREEN CARNATIONS: *A Subscriber.* The green colour is given by inserting the freshly cut flower-stems in water in which some substance is put that will give it a green colour. The stalk imbibes the coloured water, which gradually spreads over the whole flower. See our last week's issue for full details.

MALFORMED CYCLAMEN: *H. G.* These malformations in Cyclamens, as in most plants, are not uncommon, and prove how intimately all the parts of a plant are structurally connected, so that the accidental arrest of growth of one part may have the effect of turning a leaf into a petal or *vice versa*; or, as in your plant, induce the flower-stalk to branch in a totally abnormal manner.

MELON PEAR: *Enquirer.* The fruit of *Solanum muricatum*.

NAMES OF FRUITS: *Mat. B. 1*, Royal Somerset; 2, Court of Wick. *W. J. C.* Small's Admirable, most probably.

NAMES OF PLANTS: *N. Bros.* Please write to the Editor on such matters, not to the publisher. Your plant is *Myrsiphyllum asparagoides*.—*T. L. B.* *Schomburgkia crispata*.—*A. C.* A very fine example of *Odontoglossum asperum*. The branched spike is only a question of strength and good cultivation. —*H. J. K. 1*, *Vanda tricolor*, and 2 may be the variety of *V. tricolor* you suggest, but the labellum is withered, and we cannot determine it. The *Acridea* is *A. Fieldingii*, but the inflorescence has stopped at one-third of its proper length. —*G. H. 1*, *Myrsiphyllum asparagoides*; 2, *Tradescantia repens*; 3, *Begonia Saundersii*; 4, *Kleinia repens*; 5, *Echeveria* sp.; 6, *Echeveria retusa*. —*T. J. R. C.* *Maxillaria picta*. —*E. D. L. 1*, *Peristrophe angustifolia variegata*; 2, *Sedum tortuosum variegatum*; 3, *Cereus* sp.; 4, *Echeveria*, probably a garden hybrid; 5, *Pteris adiantoides*, 6, *Selaginella Brownii*.

PASSAGE OF COLOURED LIQUIDS IN THE VESSELS: *D.* This is a practice which goes back to the time of Magnol and Duhamel. It is effected by immersing the cut ends of the stalks in solutions containing logwood, madder, cochineal, acetate of lead, ferrocyanide of potassium, followed by a persalt of iron, various aniline dyes, &c. Herbert Spencer employed a similar method in more recent times in his investigations on the course of the sap, and the formation of wood; and botanical lecturers in their yearly lectures have shown the results to their pupils for a century or more.

ROYAL HORTICULTURAL SOCIETY: The Secretary asks us to say, that he would be glad to receive at once copies of the list of awards made at the several committees between 1859 and 1872.

TULIPS: *G. B.* The bulbs were potted two or three months too late. Leave them where they are till there is more root growth.

SHANTUNG CABBAGE: *C. S.* The Pe-tsai of the Chinese—*Brassica sinensis*. In shape it is more like a Cos Lettuce than an European Cabbage. It was introduced some dozen years ago by, we think, Messrs. Carter & Co. It seems to have obtained no favour from our gardeners. If the introducers have it not, it might be obtained from Messrs. Vilmorin, Andrieux & Cie., Paris.

IMPORTANT TO GARDENERS, AMATEURS, AND OTHERS, WHO FUMIGATE HOUSES TO KILL "FLY," OR "THRIP."

You will shortly be ordering your Spring Supply of Fumigating Material. Why lay in a heavy stock of tobacco paper, uncertain in quality, often disappointing, and very unpleasant to use, when you can have a SAFE, RELIABLE article, and one that is pleasant to use?

THE FIRST
OF ITS
CLASS,
AND STILL
THE ONLY
ONE

On which you can thoroughly depend. The manufacturer is much improved, and it can be ordered without any risk of the disappointments often attending other fumigating materials.

PRICES:—

For houses with 1000 cubic ft., No. 3 Roll, 1/- each. Post a capacity of 12000 " " 1/9 " " Free. The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.—The safest and most effective Liquid Insecticide for spraying.

PRICES, post free:—Pints, 1s. 10d.; quarts, 3s. 3d.; half gallons, 5s. 6d.

CLIBRAN'S EUCHARIS KILL MITE.—A truly valuable remedy, has saved thousands of bulbs.

PRICES, post free:—Half-pint, 1s. 9d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN.

CLIBRAN'S OLDFIELD NURSERIES, ALTRINCHAM;
10 & 12 MARKET STREET, MANCHESTER;
And Principality Nurseries, Deganwy, Llandudno.

For all INSECT PESTS
in Greenhouses and
Frames, nothing has
proved equal to the

LETHORION (VAPOUR CONE),

(PATENT).

They are now universally admitted to be thoroughly uniform in strength, and safe for any Plant or Flower, even if four times the quantity are used.

Scale and Mealy Bug may be completely eradicated by using the Cones double strength.

PRICES.—For Frames, &c., of 50 cubic feet, 6d.; 100 ft., 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each.
THE HOUSES SHOULD BE WELL SECURED.

THE MYTHE CASTLE GARDENS,
Tewkesbury, Aug. 13th, 1891.

Gentlemen,—I have given your "Climax" Insecticide a good trial on tender foliage, Orchids and Ferns for Bug and Scale. In every instance I found the Bug and Scale dead and the foliage bright and clean. I found it most effective for Black Fly on Peach Trees. The "Climax" Insecticide ought to be better known, it is the only one I have found to kill Bug on tender plants without injury to the foliage.—I am, yours faithfully,
W. MACKIE.

Prepared Solely by
The Boundary Chemical Co., Ltd., LIVERPOOL.

INNES' FERTILISAS.—THE VINE AND PLANT FOOD.—Of all Nursery and Seedsmen, or direct. 15s. per cwt., carriage paid to all Stations. References and testimonials of the *Succulent*.
W. INNES AND CO., Sunny Hill Vineery, Littleover, Derby.

NATIVE GUANO.—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price 22 1/2s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt., Sample bag, sent Carriage Paid to any Station in England, on receipt of P.O. for 5s.

Extracts from 16th Annual Collection of Reports:—
NATIVE GUANO, FOR POTATOS, VEGETABLES, &c.
H. BRINKWORTH, Potato Grower, Reading, used for Potatoes, Onions, and Carrots, results:—"Very good; never had better crops."—J. BUTLER, Sittingbourne,—"Used for Potato, Celery, and other Market Garden produce, with very good results; Potatoes large, clean, and free from disease. Best and Cheapest Manure in the Market."

NATIVE GUANO, FOR FRUIT, ROSES, TOMATOS, &c.
J. PRED & SONS, Stratham, used for Fruit Trees and Roses, results:—"Very satisfactory; we use no other Guano now; consider yours preferable to Peruvian."—J. FINCH, Orrell Garden,—"Used for Vegetables, Tomatoes, Grapes, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatoes, and many other things. The Cheapest Manure in the Market."

Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where Pamphlet of Testimonials, &c., may be obtained. AGENTS WANTED.

THE PATENT

SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatoes, Peaches, &c., beyond any other Manure.

South Stothem Nurseries, Southampton, Gloucester, October 6, 1891.

"We have tried the Manure in our Vine this season, and are pleased to inform you that whilst in our neighbourhood most of the Grapes have been badly coloured this season, ours have been splendidly coloured, in fact the best we have ever had."

"We hope to be able to induce some of our friends to try it next season. Yours faithfully,
(Signed), OAKLEY and WATLING.

Prices in Sacks, at Works, 10s. per cwt.; £2 per 4 ton; £3 15s. per 4 ton; £7 per ton.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

All Advertisements should be addressed to the PUBLISHER.

Australia.

TO GENTLEMEN with MODERATE
MEANS, in SEARCH of an ACTIVE, PLEASANT, and
PROFITABLE OCCUPATION.—Advertiser desires to meet
with a Gentleman of active habits who would be willing to
PURCHASE a HALF-SHARE, and assist in the work of a
Small Estate of 2200 acres, situated in the New England Dis-
trict, New South Wales, close to two considerable towns, and
on the Railway line between Sydney and Brisbane. The
climate is considered one of the finest in Australia; the land
is well situated, and of fine quality, a large portion being rich
orchard land; about 70 acres are planted in English fruit trees.
The grazing land is occupied by 2500 sheep and other stock.
Price, £5000.—For further particulars, apply to Mr. GEO.
CAMPBELL, 72, St. Vincent Street, Glasgow.

G. KING, Canon's Park Gardens, Edgware,
acknowledges with thanks the APPLICATIONS for
the YACANCY advertised in this paper last week, and wishes
to say HE IS SUITED.

Gordon Boys' Home, Chobham, Woking.
WANTED, a steady, reliable MAN, to
instruct and superintend Lads in Gardening, &c., and
to keep the Grounds in order. Must thoroughly understand
Market Gardening, between Syrops, breaking up rough
ground, &c., and the management of Pigs. Good wages, but
to lodging.—Applying, stating wages required, to Mr. COLLETT
J. B. WALKER, Fair View, Ash Vale, near Aldershot.

SHOPMAN or MANAGER.—Age 28; experienced in Wreaths, Bouquets, Sprays, Plants, Seeds, Nursery Stock, Book-keeping, &c. Good Salesman. First-class testimonials.—A. H., 65, Solon Road, Brixton.

HOLLOWAY'S OINTMENT AND PILLS.
 Much watchfulness must be exercised at the present time, and the earliest evidences of ill health must be immediately checked, or a slight illness may result in a serious malady. Relieved and sore throat, diphtheria, croup, cough, chronic cough, bronchitis, and other pulmonary affections, will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers, and re-established health after every other means had signally failed.

Friday Next.—Established Orchids.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 1, at half-past 12 o'clock, a splendid lot of well-grown ESTABLISHED ORCHIDS, including fine plants of the following—

CYPRIPEDIUM CRISTATA ALBA (HOLOLEUCA).
CYPRIPEDIUM ARTHURIANUM, large plant in flower.
" HARRISIANUM SUPERBUM, the true variety.
" MOIRGANTIE, fine plant.
" TESALATUM EOPHYREUM, very rare.
" SALLIE, fine specimen.
" SEDENII CANDIDULUM.
" STONEI, magnificent specimen, 2 feet in diameter.
EPIDENDRUM CRISPUM CRISPUM, fine specimen.
ODONTOGLOSSUM NIVEUM MAJUS, very rare.
" ELEGANS, true.
" VANDA DENSMANNA HERBACEA.
TRICHOPIA LEPIDA, very rare.

On view morning of Sale and Catalogues had.

Wednesday and Thursday, April 6 and 7.
THE CHOICE COLLECTION OF ESTABLISHED ORCHIDS
formed by A. SILLEM, Esq.

MR. J. C. STEVENS has received instructions from AUGUSTUS SILLEM, Esq., (who is medically forbidden to frequent the country), to offer for SALE, by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY and THURSDAY, April 6 and 7, at half past 12 o'clock precisely, a choice and without the least reserve, his entire COLLECTION OF ORCHIDS, which will be found in excellent health. For names of principal plants see *Gardeners' Chronicle*, March 5 and 12.

Wednesday and Saturday Next.

2000 choice named Standard, Half-Standard, Dwarf and Climbing ROSES, from one of our most successful English Growers and Exhibitors; 500 FRUITFUL TREES, 500 EVERGREENS, and 500 FLOWERING SHRUBS, a consignment of AZALEA INDICA from Ghent, an extensive Collection of BORDER PLANTS, also 100,000 South African TUBEROUS IRIS, all received, LILiums from Japan, BEGONIAS, and CYPRIPEDIES, &c.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY and SATURDAY NEXT, March 30 and April 2, at half-past 12 o'clock precisely.

On view mornings of Sale, and Catalogues had.

Under a Deed of Assignment. — R. Denton & Blunden.
Absolute SALE of the Wholes of the Valence Outdoor NURSERY STOCK, and PLANTS, FERNS, &c., in Greenhouses: Two Tons Seed Potatoes; Capital Mare, Dog Cart, Spring Cart, Light Spring Van, Harness, Two Market Stalls, and Cover; Weighing Machine, Plough, Scullery Harrow, &c. &c. For Sale, Fowls, &c.

MR. W. J. CLARKE is instructed to SELL by AUCTION, at the Nursery, Bedford Road, Northampton, on THURSDAY and FRIDAY NEXT, March 31 and April 1, 1892, the whole of the Stock-in-Trade and Effects of the above-named Nursery, which includes Nursery Stock of almost every description, full particulars of which will be found in Catalogues, to be obtained of the Auctioneer, 12, Guildhall Road, Northampton, one week prior to sale.

May be viewed at any time on application at the Nursery, or of the Auctioneer, from whom further information may be obtained.

N.B.—In consequence of the Nursery being given up at once, the whole will be sold without the slightest reserve, and in lots to suit all purchasers.

Sale to commence each day at 11 o'clock.

Finford, Northamptonshire.

TO FRUITERS, BUILDERS, and OTHERS.
VALUABLE FREEHOLD PROPERTIES, consisting of upwards of Seven Acres of ORCHARDS, situated near to the centre of the above increasing village.

MR. G. F. BEARN will SELL the above by AUCTION, at "The Gate Inn," Finford, on THURSDAY, April 7, 1892, at 5 for 6 o'clock in the evening (by order of the Trustees, under the will of Mr. Richard Jacques, deceased), and subject to such conditions of Sale as will be then produced.

An eligible and well-known ORCHARD, adjoining the Back Road, now laid for many years past in the occupation of Messrs. Jacques, Fruiters and Gardeners, containing 5 a. 1 r. 14 p., or thereabouts.

And also another ORCHARD, adjoining, and containing 2 a. 0 r. 22 p., or thereabouts.
These Orchards are well stocked with highly productive Apple, Pear, Plum, Damson, and Cherry Trees, and have long been noted both for the quantity and quality of Fruiters' goods (for after all it is only a matter of building value, being close to the village, and having a long frontage to the road).

To view, apply to Messrs. JACQUES, Finford; and for further particulars to Mr. JOSEPH FARLOCK, Finford; Mr. SAMUEL BROWN, Ruims, Northamptonshire; the Auctioneer, Corn Exchange, Wellington; or to Messrs. SHARMAN, JACKSON & ARCHER, Solicitors, Wellington.

Without any Reserve.

3000 OLD CATLEYA LABIATA!!!

MESSRS. FRED. HORSMAN AND CO. beg to inform their friends that the above will be SOLD BY AUCTION, at Messrs. PROTHEROE AND MORRIS'S, 67 and 68, Cheapside, London, E.C., on FRIDAY, April 2, 1892. This plant has given rise to a great waste of letterpress in the gardening periodicals, but without entering upon the various controversies on the subject, or saying to which firm the honour of its re-introduction to Europe (for after all it is only a matter of building value, being close to the village, and having a long frontage to the road) is due, we beg to state that the plants to be offered are the true C. LABIATA of JOHN LINDLEY, collected by a Portuguese Planter, on his own estate, where no plants had previously been collected. The truest plant, is the finest of all; on this bays may safely rely—SEE DRIED FLOWERS AT SALE. The colours very exceedingly, and without guaranteeing a WHITE form—to see dried flowers look at the plants, and for us to see the plants are very large, superb, and gorgeous in colouring. Every plant is GUARANTEED TRUE, and none will be sold before the DAY OF SALE, and THEN WITHOUT RESERVE. The excellent and magnificent plants must be sold, this presents to the Trade and Private Buyers the finest opportunity ever offered to secure healthy plants at a nominal price.

Thursday Next.

MR. THOMAS B. JAMES will SELL by AUCTION, without reserve, at his Sale Rooms, Bull Ring, Birmingham, on THURSDAY NEXT, March 31, at half past 11 o'clock, A.M., 2500 DWARF ROSES (H.P.) in variety, 800 STANDARD ROSES, Marchal Niel and other POT ROSES; Dwarf-trained, Pyramid, and Standard CRUITS; Hybrid GLADIOLI, PANSIES, BEGONIAS, GLOXINIAS, PALMS, and GREENHOUSE PLANTS in variety, and Two Tons of GENERAL NURSERY STOCK.

SALES OF HORTICULTURE, FRUITCULTURE are held at the Sale Rooms every THURSDAY at 11 o'clock A.M., and Sales conducted in any part of the country. Catalogues post-free.

Yardley, Worcestershire.

MR. THOMAS B. JAMES has received instructions from the Executors of the late E. Hoskins, Esq., to SELL BY AUCTION, on SATURDAY, April 2, 1892, at 2 o'clock in the afternoon, on the Premises, The Grange, Yardley (one mile from Stockley Railway Station, and 10 miles N.W. Railway; and 4 miles from Birmingham), the COLLECTION OF STOVE and GREENHOUSE PLANTS, being the contents of six Greenhouses, Vinery, Conservatory, and Pits, comprising specimen Palms, Crotons, Dracenas, Azaleas, Camellias, Faintenniums, Eucharis, Lepagaria alba, Tea Roses, Stephanotis, several hundred Zoon Geraniums and Pelargoniums, and endless other Greenhouse plants. Catalogues post free, and Commissions creditably executed. Auctioneer's Offices, Bull Ring, Birmingham.

MR. THOMAS B. JAMES (many years with Protheroe & Morris) will hold his NEXT SALE of ORCHIDS in FLOWER on TUESDAY, April 12, 1892 (for Easter Decoration). FRESH ENTRIES INVITED. Sale Rooms and Offices, Bull Ring, Birmingham.

London County Council.—To Seedsmen.
TENDERS are invited for the SUPPLY of GRASS SEEDS, for the Council's Parks and Open Spaces. Persons desirous of submitting Tenders, may obtain a copy of the specification, Form of Tender, and other Particulars, on personal application at the Office of the Architect of the Council, at Spring Gardens. Persons tendering will be required to declare in their tender that they pay such rates of wages, and observe such other conditions as are generally accepted as fair in their trade. The tenders, which must be on the form supplied from this Office, and be addressed to "The Clerk of the Council," and endorsed "Tender for Seeds," are to be delivered at this Office before 10 o'clock A.M. on April 8, 1892, and no tender will be received after that hour. Any tender which is not fully filled up in every particular will be rejected.

The Council does not bind itself to accept the lowest or any tender.
H. DE LA HOOKE, Clerk of the Council.
Spring Gardens, S.W., March 19, 1892.

ANDREW POTTER, MELBOURNE WORKS, WOLVERHAMPTON.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH. THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 8, says:—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others.—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady	£1 15 0
To cut 8 in., do.	2 10 0
To cut 10 in., do. by a strong youth	3 10 0
To cut 12 in., do. by a man	4 10 0
To cut 14 in., do.	5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man	£6 10 0	To cut 22 inches, can be worked by two men	£8 10 0
on even lawn ...	7 10 0	To cut 24 inches, do.	9 0 0
To cut 18 inches, do. man and boy...	8 0 0		
To cut 20 inches, do.			

* If made stronger, suitable for Dooley, 30s. extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.

PRICES, With Grassbox.

THE HISTORY OF KEW GARDENS.

(Continued from p. 298.)

RETURNING to Masson, it should be mentioned that he made a second voyage to South Africa, remaining there nine years, and sent home many more new plants. On his return, he published a monograph of the genus *Stapelia*, of which he had introduced many species. One of his introductions, a plant of *Encephalartos caffer*, still exists in the Palm-house, having been in the establishment ever since 1775. David Nelson, a Kew gardener, accompanied Capt. Cook on his last voyage, and was subsequently (1788) attached to Capt. Bligh's expedition for the introduction of the Bread-fruit tree into the British West Indies; William Brown, also a gardener, was Nelson's assistant, and he joined the mutineers of the crew of the *Bounty*, whilst Nelson was amongst those cast adrift with their brave and talented captain. Nelson died (1789) at Timor, in consequence of the terrible hardships of the voyage thither in an open boat. Captain Bligh was more fortunate on his second expedition, and on his return to England from the West Indies brought home a large number of living plants, collected by Christopher Smith, for Kew. Captain Cook's voyages, between the years 1768 and 1780, were not very productive, so far as the introduction of seeds or living plants was concerned; but Captain Furneaux, who commanded the *Adventure* on Cook's second voyage, is credited with having introduced *Leptospermum lanigerum*, *Sideroxylon sericeum*, and *Eucalyptus obliqua*. The genus *Eucalyptus* was founded on the last by L'Heritier, in the *Sertum Anglicum*, a folio book, containing thirty-four plates, illustrating plants chiefly cultivated at Kew. Sir Joseph Banks, who was naturalist on Cook's first voyage, is credited, in Aiton's *Hortus Kewensis*, with having introduced the Australian *Casuarina torulosa* and *C. stricta*.

William Aiton's admirable *Hortus Kewensis* appeared in 1789, and may be regarded as a good epitome of what was cultivated at the time; indeed, it is invaluable as a record of the history of the introduction of plants up to that date. Aiton worked in the Chelsea Physic Garden under the even more famous Philip Miller, and was "engaged in 1759 to superintend the Botanical Gardens at Kew." In 1789 the cultivation of epiphyllal Orchids was in its veriest infancy, for three species of *Epidendrum* are the only members of this class of plants enumerated. *E. cochleatum* flowered at Kew in 1787, and *E. fragrans* in 1788; but the number of species had been considerably augmented by 1794. The late John Smith, who entered the gardens in 1820, and retired from the post of Curator in 1861, in consequence of failing eyesight, in his *Records of Kew Gardens*, states that this first edition of the *Hortus Kewensis* enumerates 5500 species; and the second edition, published by Aiton the younger in

1813, about double that number. The numbers are given on his authority, because it seemed unnecessary to check them after one so intimately acquainted with the facts. The elder Aiton died in 1793, and was succeeded by his son, W. T. Aiton, just alluded to, who resigned in 1840.

Mention has already been made of Christopher Smith, who accompanied Captain Bligh on his second voyage to convey the Bread-fruit to the West Indies. He was afterwards appointed botanist to the East India Company, and while in that capacity he prepared a large collection of living plants in the Calcutta garden for Kew. Peter Good, a Kew gardener, was sent out in 1796 to take care of this collection on the voyage to England. Subsequently he was appointed assistant to Robert Brown, botanist to Flinders's voyage to survey the coast of Australia. He died at Sydney in 1803, having in the meantime contributed largely to the living collections at Kew, especially Proteaceæ, at that time so richly represented in the gardens.

Botanical horticulture, if it may be so termed, flourished in England during the last half of the last century and the beginning of the present—to a great extent, no doubt, in consequence of the interest taken in it by members of the royal family. Not only was there great activity in the cultivation of ornamental and curious exotic plants, there was likewise great activity in the publication of books illustrating the many novelties that flowered in English gardens. Some of these works were of a costly nature, and some of them have never been excelled in exquisiteness of drawing and fidelity of colouring. Through the liberality of Sir Joseph Banks, Kew enjoyed the advantage of the services of the accomplished botanical artist, Francis Bauer. An Austrian by birth, he came to England in 1788, and, through the influence of Sir Joseph Banks, he was attached to the gardens as botanical painter to the King. His brother Ferdinand had previously joined Dr. Sibthorp as botanical artist on a tour in Greece, and he afterwards went in the same capacity with Robert Brown on Flinders's voyage. He was equally talented with his brother, and much of his work was published; and he is mentioned here because the work of the two brothers is often confused. Comparatively little of the work of Francis Bauer has seen the light, in consequence probably of the very costly form which he and his patrons adopted. A special Kew publication is entitled, *Delineations of Exotic Plants cultivated in the Royal Garden at Kew. Drawn and coloured, and the Botanical Characters displayed according to the Linnean System*, by Francis Bauer, Botanical Painter to His Majesty. Published by W. T. Aiton. Of this work only thirty plates were published, and they are dated 1793 and 1800—the two first decades are of the former date, and the third decade of the latter. They are of large folio size, representing a selection of Heaths, and beautifully though very laboriously executed.* The Kew copy contains seven of the original drawings. In 1818 Francis Bauer published his *Streptia depicta*, which, however, was never completed according to the original prospectus. His only other published work of importance, *Illustrations of Orchidaceous Plants* (letterpress by Lindley), appeared between 1830 and 1838. This again has never been surpassed in its way, and, indeed, is a triumph in the art of delineating the morphology of Orchid flowers; but only a very small proportion of Bauer's drawings of Orchids were reproduced, as explained by Lindley, on account of the great expense.

Archibald Menzies was attached as surgeon and botanist to Vancouver's surveying expedition (1791 to 1795) to Australia, and made a rich collection of herbarium specimens and seeds, and was the first to transmit cones of Banksia and other Proteaceæ to Kew from Western Australia. It was he, too, who introduced the Chilean *Araucaria imbricata*, though it had been observed and described by several pre-

vious travellers. As the story goes, Menzies was at a dinner given by the Viceroy of Chili to Captain Vancouver and his officers, and part of the dessert consisted of nuts of a kind unknown to him. In spite of the old saying, he pocketed some, and took them on board, and having procured some earth, planted them. Several of them germinated, and Menzies succeeded in bringing home five living plants, one of which was taken by Sir Joseph Banks, and the rest sent to Kew. One of these still exists there, though a wreck, and an eyesore to all but the sentimentalists. Smith (*Records*, p. 288) states that, "In 1833 one of these plants, which had previously been kept in a greenhouse, was presented by King William IV. to Lady Grenville for her collection at Dropmore. It was then about 5 feet high, and growing in a tub; it is now (1880) a fine tree, 60 feet high."

Among the less-known collectors for Kew at the beginning of the present century, were George Caley and William Ker. The former was appointed by Sir Joseph Banks in 1801 collector for Kew in New South Wales, and through him Kew received a considerable number of plants, including *Livingstonia australis*. He is an interesting personage, because he became a collector and botanist without having undergone a preliminary training in gardening. A native of Yorkshire, he began life as a stable boy, developed into a horse doctor, and became interested in plants through collecting them for his medicines. By some means he came under the notice of Sir Joseph Banks, and this determined his career. He spent about ten years in Australia, and was afterwards appointed Superintendent of the Botanic Garden of St. Vincent. Robert Brown, who named the Orchid genus *Caleana* in his memory, describes him as *Botanicus peritus et accuratus*.

William Ker, a gardener, was sent to China to collect in 1803, and he introduced among other plants *Cunninghamia sinensis*, *Lilium tigrinum*, and *L. japonicum*. The elder De Candolle named the familiar *Kerria japonica* after him, though he was not the actual introducer.

For some years, in consequence of wars, no collectors were sent out; but in 1814 there were peaceful prospects, and Allan Cunningham and James Bowie were selected for botanical work in the southern hemisphere. They went together, in the first place, to Brazil, where they spent three years; then they parted company, Bowie proceeding to South Africa, and Cunningham to Australia. Both were highly successful, but Bowie was recalled in 1823, in consequence of the grant for collectors being reduced. He devoted special attention to the introduction of succulent and bulbous plants, many of the latter being described by Haworth. *Clivia nobilis* was one of his conspicuous discoveries. The genus *Bowiea* of Haworth has been reduced to *Aloe*; but Harvey followed with *Bowiea volubilis*, a singular though inconspicuous liliaceous plant, figured in the *Botanical Magazine*, plate 5619. Previous to going abroad, Allan Cunningham, as well as his brother Richard (who was afterwards superintendent of the Sydney Botanic Garden), was employed by the younger Aiton to assist him in the compilation of the second edition of the *Hortus Kewensis*, and this seems to have given him a taste for literary work, which developed in after years in various directions; yet he published comparatively little. He spent many years collecting in Australia, New Zealand, Norfolk Island, and Timor, and made copious notes on the countries he visited, and the plants he collected. He introduced a profusion of new plants to Kew, among them *Araucaria Cunninghamii*, now a conspicuous feature in the temperate house. *Cunninghamia sinensis* of R. Brown commemorates the brothers jointly and James Cunningham, who brought dried specimens of this handsome Conifer to England at the end of the seventeenth century, or quite the beginning of the eighteenth. Allan Cunningham succeeded his brother Richard, who was murdered by natives, as superintendent of the Sydney Botanic Garden, but died in 1830, worn out by hard work.

In 1816 the ill-fated Congo expedition was

organised, and Daniel Lockhart, a Kew gardener was attached as assistant botanist. He was the only member of the scientific staff who survived the disastrous journey up the river above the falls. *Randia longidora macrantha* (R. Bowieana, *Bot. Mag.*, plate 3499) was one of his introductions. In 1818 he was appointed superintendent of the Botanic Garden, Trinidad, whence he sent many living plants to Kew, and he was specially successful with epiphyll Orchids. Amongst other plants he is credited with having been the first to introduce alive are *Stanhopea insignis*, *Oncidium papilio*, *Lockhartia elegans* (*Bot. Mag.*, plate 2715), *Catasetum tridentatum*, *Ionopsis pallidiflora*, and *Pontederia crassipes*. John Smith (*Records*, pp. 229, 230) states that many of the Orchids were sent growing on branches as cut from the trees, accompanied by instructions how they should be treated, and this led to the successful cultivation of this class of plants.

The first of the Himalayan *Rhododendrons* introduced into this country was *R. arboreum*. Dr. Wallich, the superintendent of the Calcutta Botanic Garden, sent seeds of it to Kew and many other places in 1818. It appears from J. Smith's *Records* that the Kew gardeners were unsuccessful in rearing their seedlings, having subjected them to too high a temperature; and an important event in his life was the bringing with him of two plants from Edinburgh for Kew when he first came south in 1820. These plants, on the same authority, are those now in the temperate-house, the largest being nearly 25 feet high. In 1825 the seedling plants raised in this country flowered in more than one garden; the earliest being in the garden of Mrs. Alexander Baring, in the month of April, figured in the *Botanical Register*, plate 890. W. Botting Hemsley.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM DENSIFLORUM CLAVATUM, n. var.

AMONG the comparatively few Orchids which have been reported from the Shan States is a rather peculiar variety of *Dendrobium densiflorum*, which has just flowered with Messrs. F. Sander & Co., of St. Albans. It is characterised by its extremely clavate pseudobulb, which tapers to a very slender base. The flowers are white, with an orange-yellow lip, and thus resemble those of the variety *thyrsiflorum*, which, however, has an elongate and slender pseudobulb. In habit it more nearly resembles the typical *D. densiflorum*, which is diffused over the lower Himalayan zone from Nepal to Assam, from about 2,500 to 3,500 feet elevation, and has yellow sepals and petals. Although to some extent combining the characters of the two forms, yet it has peculiarities of its own, probably owing to the comparative dryness of the region it inhabits, and we may recognise in it another geographical variety. The variety *thyrsiflorum* is a native of Moulemein and of the Kargen district of Lower Burmah. The extension of its geographical area is very interesting. R. A. Rolfe.

CYPripEDUM CALCEOLUS × MACRANTHOS, Barbey.

THE appearance of a genuine natural hybrid in the genus *Cypripedium* is a matter of considerable interest, as, until quite recently, no single example was known, notwithstanding the facility with which they can be raised in gardens by artificial means. Few of the species grow together in a wild state, however, so that few opportunities occur for the flowers to be cross-fertilised by insects. *C. calceolus* and *C. macranthos* are both natives of Siberia, and we now know not only that they grow intermixed, but that they may be cross-fertilised. M. Barbey, of Geneva, has recently published an account of a natural hybrid between them, and given an excellent coloured plate of it, together with its two parents. About ten years ago, the late M. Edmond Boissier obtained a batch of plants of *C. macranthos*, which were planted on the rockwork of the garden at Valleyres. After several seasons they flowered,

* In this, as in some other matters specially interesting to cultivators, the records in the *Kew Bulletin* have been somewhat amplified here.

and among them appeared not only *C. macranthos*, but *C. calceolus*, and a third form, quite intermediate in character, which, after careful examination, M. Barbey was convinced was a natural hybrid between them. It appears that in the Birch forests of Western Siberia, whence the plants were obtained, these two species occur indiscriminately intermixed. The plate amply proves M. Barbey's contention, as the hybrid is intermediate in every respect, just as in the multitude of artificial ones I have examined. The flower is smaller than *C. macranthos*, and much paler in colour, the dorsal sepal narrower, more acute, and shaded with brown, the petals longer, and twisted; the lip intermediate, but slightly fluted, as in *C. macranthos*; and the staminoide and lower

A few hardy plants are grown, but we were informed, on a recent visit there, that ordinary bedding plants and annuals formed the bulk of the summer display.

THE ROSERY.

HYBRID TEA ROSES.

It is a somewhat difficult question to decide what is a Hybrid Tea. Where careful artificial crossing takes place, say between a hybrid perpetual and a Tea, the case is somewhat different, as if the crossing really takes place, the parentage of the progeny is well defined, but even then there is a certain element

but I think we may say that a Hybrid Tea is a Rose in which the foliage, and to some extent the shape of the flower and the perfume, show a leaning towards the Tea Rose. You at once point out Lady Mary Fitz-William or Viscountess Folkestone, as having these characteristics; and when Mons. Guillot, after bringing out *La France* as a hybrid perpetual, transfers it to the Hybrid Teas, we see from these characteristics combined with the prolific character of its blooming that it may well be assigned to this section.

I have been led into this train of thought by some articles which have appeared in a contemporary [which one?] having reference, however, rather to the position which this section is to hold with regard to exhibition. One writer [who?] commences his paper

FIG. 56.—A VILLA GARDEN, ELM LODGE, BECKENHAM, KENT.

sepal also thoroughly intermediate. It is not only extremely interesting, but decidedly handsome. *R. A. Rolfe.*

ELM LODGE, BECKENHAM.

THE accompanying illustration (fig. 56) represents one of the many pretty gardens which abound in and around Beckenham. As is usual in suburban districts, the garden at Elm Lodge is rather small; but, notwithstanding the smallness of the area the arrangement is very effective during the summer months, as may be seen in the engraving. The portion depicted is situated in the rear of the residence, and by the judicious planting of shrubs and trees, Mr. Wilson, the owner, has managed to produce a rural effect, in what is really a thickly-populated district.

of uncertainty; for supposing that the hybrid perpetual used were Captain Christy, it already has Tea blood in it, and indeed the parentage of many of our modern hybrids is an exceedingly moot question. Formerly the French raisers at any rate gathered their seed promiscuously, and it was of course impossible to say how far the bees, moths, &c., had been at work, or how the breezes had carried the pollen from one part of the Rose grounds to another; and hence some May Roses which had Gallica, Bourbon, or hybrid China blood in them, are, to all intents and purposes, summer Roses. Many of us can remember a very pretty Rose sent out many years ago, called *Miss Ingram*, it was ranked as a hybrid perpetual, but had at last to be discarded as being simply a hybrid China. Again, the question forces itself upon us, What is a Hybrid Tea? Now I am very mindful of Archbishop Whately's advice, "avoid definitions;"

with, "It is quite time a more definite classification of this section of Roses," and then goes on to complain that some Roses, which he names, are placed by some nurserymen amongst hybrid perpetuals, and by others amongst Teas; now, with all due deference to our friends the nurserymen, they are not always safe guides in such matters, as may be shown from the fact that one leading grower of Tea Roses had for many years *Souvenir de la Malmaison* placed in that section. The writer then appeals to the National Rose Society to decide the matter, and determine what position they are to assume, that in the case of new Roses they should determine whether they were to be classed as hybrid perpetuals, or where they were to be put.

Some years ago, before Mr. Bennett began his hybridising, and when *Cheshunt Hybrid* was about the only recognised hybrid Tea, the question was

brought before the committee of the National, and as I was the leader of Her Majesty's Opposition at the time, I am, I think, entitled to write with some degree of authority on the matter. The propositions which were brought before us for our consideration were two: 1, That a special class should be made for them as for Teas; or, 2, that they should be allowed to be exhibited amongst Teas. With regard to the first of these, it was strenuously urged in opposition that it would be impossible to draw the line and say which were really hybrid Teas. The force of this objection was curiously illustrated in a case which afterwards occurred. Guillot, the celebrated raiser of Lyons, brought out a Rose which he called a yellow hybrid perpetual, now Gloire Lyonnaise; the Rose in question has the very faintest suspicion of yellow in it, and is really a hybrid Tea, the tinge of yellow being due to its Tea parent. It was asked during the discussion, "What about Captain Christy?" "Oh, of course, that is a H.P." "Oh, no," said another, "if there is to be a class of hybrid Teas, it ought to go amongst them." It was seen that such an attempt would lead to endless confusion; but if they were to be shown amongst hybrid perpetuals, then, as a pure Tea was nearly always easily distinguishable, all except them would be included in that comprehensive term. This plan having been rejected, the question was submitted, should they be admitted amongst the Teas? Here, again, Her Majesty's Opposition interfered; it was not an obstructive policy, but a genuine opposition. It was urged there was the same primary difficulty as in the former plan, viz., that of deciding what were hybrid Teas; and besides, it was urged that such an arrangement would quite destroy the exquisite delicacy and refinement of a box of Tea Roses. One can imagine what it would be to see a box in which Souvenir d'Elise, Comtesse de Nadailac, Anna Ollivier, and Catherine Mermet were mixed up with Cheshunt Hybrid, Reine Marie Henriette, Lady Mary Fitzwilliam, Viscountess Folkestone, &c. The force of the objection was acknowledged, and the National Rose Society, as far as its influence extends, has settled the question, I hope not to be again opened. There was no change of Cabinet in consequence of this opposition triumph, both sides of the house accepted the terms, and if the rule laid down has ever been broken, it has been through the ignorance of some neophyte.

There is no doubt that many of these hybrid Teas, which sometimes appear on a prize-stand, are most valuable as garden Roses, several of them being of a long rambling habit, and doing admirably as pillar Roses. In this light, than as garden Roses, I proceed to notice a few of the best, as far as I am acquainted with them.

Cheshunt Hybrid, the first of the race, said to have been a seedling between Camille de Rohan, H.P., and Madame de Tartas, Tea. This Rose is so universally known and admired, that it is needless to give any description of it. It is of a very free and vigorous habit, blooming very profusely, and manifesting its Tea blood by its very free autumnal blooming. Climate hot or cold seems to make no difference to it, and although some may object to a certain dulness of the colour, there is no doubt it is, and is likely to continue to be a very popular Rose.

Camoens is probably one of the most beautiful garden Roses we have; it is not large enough for exhibition, and therefore must be grown simply for decorative purposes, but for that it has few equals. The colour is that of a bright China rose, very pretty, whether in bud or expanded, and most valuable for cutting, its somewhat loose growth taking off the stiffness which characterises many Roses when placed in bouquets or vases.

Grace Darling is one of the late Mr. Bennett's seedlings; for some time it was doubtful whether it should be classed as a Tea or not—but it was ultimately seen that it could not be called a pure Tea, and it is classed now under the Hybrid Perpetuals. But even now so exceptionally good a Tea Rose grower as Mr. George Prince places it

amongst Teas; other growers of note do the same, although they add at the end of the description, a Hybrid Tea. Messrs. Paul & Son, on the other hand, place it where it ought to be, amongst the Hybrid Teas, and this has been the decision of the Committee of the National Rose Society. It is a very pretty flower, of good size, grand colour, white shaded and edged with pink.

Viscountess Folkestone, another of Mr. Bennett's seedlings; a large bloomer, and very often to be seen in exhibition stands. A satiny-pink Rose, sometimes with a salmon shade in it; it is a very effective Rose, and its large smooth petals makes it very attractive.

Reine Marie Henriette, a climbing Rose, and somewhat like Cheshunt Hybrid, but a little brighter. It makes a good contrast when planted near a Gloire de Dijon, or any of the Dijon race; it is perhaps not so free flowering as the next Rose.

Longworth Rambler, a Rose sent out by Mr. George Prince, of Oxford, and so far as I know, the best dark-coloured climbing Rose that we have, not for its individual blooms, which are not so good as those of Cheshunt Hybrid or Reine Marie Henriette, but for its freedom of growth and flowers. It blooms also freely in the autumn, and a plant of which I have at the south-east corner of my house is a perfect sight in the spring months, and during the summer and autumn its flowers are freely produced; it has a pretty bright-coloured pointed bud, and the foliage is nearly evergreen.

There are other hybrid Teas of which I have heard, but not having seen or grown them, I cannot write of them from personal knowledge. There is one which I am told is very bright, with the curious name of Bardou Job; it is said in Messrs. Paul & Sons' catalogue to be nearly single, but very bright. What are called the Hungarian Roses are hybrids of Gloire de Dijon character, and so far as I have seen they are of no use to us in this country; and I think I have indicated above those of the class which are likely to assuredly please those who wish for something bright amongst their climbing Roses. We have plenty of yellows of the Dijon race, Belle Lyonnaise, Bouquet d'Or, Madame Tride, and the beautiful climbing yellow Tea, Rêve d'Or. We wanted something to contrast with them, and give brightness to the wall or pillar, and these are to be found in the Roses mentioned above.

Wild Rose.

ROSES IN POTS.

As the present is a particularly busy time among these, I think a few practical hints may be welcomed. If pot-Roses are not grown upon the proper lines from the very commencement, they are more often than not one of the most unsatisfactory of all plants under glass. They require a great deal of attention, and this must be given at the proper season, or the results are very far from pleasing.

First of all, there should be a judicious selection of varieties, as it is folly to spend as much time and trouble over half-a-dozen blooms as would be necessary to get fully treble the number, had a more suitable variety been chosen. Owing to the vast improvements among Roses, one can have almost any shade of colour in suitable varieties for forcing purposes. As a general rule, it will be found advisable to keep to the Tea-scented and Noisette classes, except where a few flowers of the very sweet-scented and dark-coloured hybrid perpetuals are in great demand.

Scarcely any of the true hybrid perpetuals flower so freely as the bulk of the Teas, but there have been several improvements among the hybrid Teas, some of which may be considered as our best Roses for pot-work. Lady Mary Fitzwilliam, Viscountess Folkestone, and Augustine Guinoisseau, for example. Although any very dark colours would in a measure seem out of place among the more delicate and chaste colours of the Teas, it would, nevertheless, be a great boon if we could secure the very dark and glowing scarlet colours found among the hybrid perpetuals, and still retain the handsome foliage and excessive freedom of the majority of the Teas.

There are very few of the hybrid perpetuals that are really suitable for forcing purposes, compared to many of the Teas; indeed, it is only such kinds as Prince C. de Rohan, General Jacqueminot, Fisher Holmes, Eclair, Duke of Edinburgh, and Souvenir de Charles Mootault, that I would grow in pots. These varieties will do very fairly; but lighter shades, such as pink, salmon, and white, are much better among the trees. The beautiful shades of yellow, apricot, peach, orange, and in some cases with all of these combined, are not to be found among the hybrid perpetuals.

I consider the best twelve Tea-scented Roses for pot-work to be the following:—Madame Falcot, Annie Olivier, Innocente Firola, Souvenir de S. A. Prince, Niphotos, Francisca Kruger, Perle des Jardins, Cleopatra, Luciole, The Bride, Catherine Mermet, and Rubens. It is difficult to confine oneself to twelve varieties, as there are so many more kinds that seem equally as good.

In growing pot Roses, I take it we want good habit, combined with a very free production of first-class blooms. The varieties I have named in this paper will conform to this, and give a grand variety of colour, from the dark Prince C. de Rohan, down to the two purest white Roses, Souvenir de S. A. Prince and Niphotos.

For pot-work, I do not mind if the Teas are worked (grafted) upon the Manetti or Briar stock; according to my experience, there being little if any choice when using the plants for pot culture. I have always maintained that the soil has as much to do with what stock is suitable for any class of Rose as the stock itself; and the fact of Tea Roses doing so well upon the Manetti when grown in the well-drained soil used for pot plants, is a strong argument in favour of this supposition.

Pot Roses must be well established before any hard forcing takes place; and even then it is very important that they be started steadily. After the growths have reached a length of some 4 or 6 inches, the temperature may be increased with safety. The result of a too hasty treatment at the first, is generally seen in the number of blind growths and more weakly wood than in the former case.

It is also of the greatest importance to keep the plants clean and free from insect pests; if this be carried out from the first, half of the difficulties are overcome. Green-fly and red-spider are the two worst insect enemies of Roses in pots. Fortunately, they can both be killed and kept down by the same means. At the risk of repetition, I must again say how very necessary it is to start on the right lines. It is fatal to Rose culture if you neglect these two pests for a few days, especially at their first appearance. Once allowed them to gain any hold, and it is difficult to eradicate them without checking the tender points of young growth. It matters very little what insecticide is used, so long as you use it in time. Great care will be necessary in mixing the solution, and it will be wiser to err on the side of weakness, and have to give a second application of the remedy, than to syringe with any mixture strong enough to check the growth in any way. The same caution applies to fumigation. A very slight overdose, of either, is the chief cause of the extreme points of the shoots turning black. In this case, the flower from that shoot is lost, and the growth stopped. Such mischief is very easily done, and there is no remedy when once you have given the growth sufficient check to cause this.

Liquid manure is of very great assistance to pot plants, but a slightly too strong an application of this will also cause a check, and with the same results. The growing roots of Roses are very tender, and manure must be given in a weak form; otherwise the tips of the roots will turn brown, and soon rot. It follows, then, that it is much wiser to give the allotted amount of stimulants in weaker doses.

The foliage of Roses feeds upon the ammonia from natural manures, and it will be found of immense benefit if you can damp down the walls and walks with a weak solution of manure water. There is no waste in this, because the foliage enjoys the

ammonia, and this last is also a great check upon insects.

Roses must be kept healthy from the first, and in a steady uniform growth; once allow them to receive a decided check, and failure results. *A. P.*

DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY FUNGI.

(Continue from p. 313.)

DISEASES OF THE FRUIT.

The number of diseased conditions of the fruit due to reproductive parasites is so great, that we must content ourselves with reference to a few of the more interesting. They are caused by many very diverse fungi, even the heteroecismal Uredinea play the part of reproductive parasites.

Æcidium verberidis, etc.

Puccinia graminis frequently forms its aecidiospores on the fruit of the common Barberry, but this site is almost invariably selected by the fungus when it occurs on the common Mahonia. Probably this is due in some measure to the thickness of the cuticle of the evergreen leaves affording an obstacle to the entrance of the germ-tubes. The aecidiospores which are preceded by an abundant development of the so-called spermatia, occur on the outside of the berries, which become distorted by their presence, as the portion invaded by the spawn is unable to expand like the healthy parts of the berry. The affected Mahonia berries will not germinate.

Another heteroecious Uredinea often forms its aecidiospores on the fruit of the garden Gooseberry (fig. 57), and another upon the berries of the wild black Currant; in both cases the affected fruit does not ripen, and behaves in a very similar way to the Mahonia berries.

On the fruit of the Hawthorn the aecidiospores of a *Gymnosporangium* is sometimes found. It causes an extensive hypertrophy of the fruit, whose reproductive functions it abolishes, and so alters it in appearance that one would hardly think the brown shaggy body thus produced could be fruit of this well-known plant. These fungi are probably conveyed to the flowers by insects; they afford an interesting object for study, as it is possible such investigations might throw some light on the function of those organs to which the name apomorphia has been applied, and which are known to be visited by insects on account of the secreted sugar they exude.

The fruits of the Apple and Pear are very subject to a variety of diseases familiar to all of us, which cause black, dry, more or less circular patches on the exterior. To such an extent does this sometimes occur that the fruit is quite spoiled, the presence of the mycelium rendering the affected part of the fruit hard, woody and tasteless. When many points are attacked, the hardening is so great as to quite prevent the expansion of the fruit, so that it does not ripen. The infection takes place very early in the year, almost as soon as the tree has blossomed if not before. So great a pest has this become in the great fruit-growing districts of America, that the State botanists have tried various means for its prevention, the most successful of which seems to be spraying the tree early in the year with Bordeaux Mixture.

PEZIZA PSEUDO-TUBEROSA.

Even the fruit of the Oak is liable to be attacked, and its functions destroyed by a reproductive parasite. The *Peziza pseudo-tuberosa* of Rehm is a pretty little cup-shaped fungus, of a brown colour, about half an inch in diameter, supported on a rather long flexuous stem. The interior of the cup is rather paler in colour than the exterior; the base of the stem grows out from the remains of the interior (cotyledons) of the Acorn, which have been altered by the mycelium into sclerotium-like bodies. The perfect fungus is formed in spring upon Acorns which have laid on the ground during the winter, and which, instead of germinating, bear the fungus. The details of its life-

history are at present unknown, but it is probable that they are not unlike in some points those of the species about to be described on the fruit of *Vaccinium*. Two other *Pezizas*, one on the catkins of the Willow, and another on those of the Poplar (*Peziza amentacea* and *Peziza caucis*), may also here be alluded to.

THE CRANBERRY DISEASE.

From the recent careful study of Woronin, we have learned the full life-history of certain *Pezizas* which occur upon the dead fruit of the various Cranberries; the species are four in number:—

<i>Sclerotinia vaccinii</i> , on <i>Vaccinium vitis idæa</i> ,	
<i>oxycoeci</i> ,	<i>Oxycooccus</i> ,
<i>megalospora</i> ,	<i>uliginosus</i> ,
<i>baccarum</i> ,	<i>myrtilus</i> .

Sclerotinia vaccinii is a small brown *Peziza* found in spring upon a sclerotium formed from the fruit of

FIG. 57.—DISEASE OF GOOSEBERRIES.

Vaccinium vitis idæa by the action of the mycelium of this fungus.

The oospores discharge their sporidia into the air; these, when they alight upon a young green leaf of the host-plant, send out a germ-tube, which penetrates the epidermis of the leaf, and produces a mycelium in its tissues, the presence of the parasite being manifested by a change in colour it produces, and by the development of myriads of moniliform gonidia. These gonidia were found by Woronin to germinate rather differently in various media, such as pure water, rain water, Plum juice, &c. In the natural course of events, however, they are either carried by the wind, or, more frequently, by insects, to the stigmata of the *Vaccinium* upon which they germinate, and emit a germ-tube, which passes with the pollen-tubes to the ovary. In the ovarian tissues it gives rise to a mycelium, which mummifies the fruit, and converts it into a sclerotium, that lies dormant during the winter months, and in spring develops the *Peziza*. *C. B. P.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT WARNHAM COURT, HORSHAM.

THERE is, at Warnham Court, the fine estate of C. T. Lucas, Esq., a most complete and extensive glass garden, arranged in the form of a square, the whole of which may be traversed without once going into the open air. During the last two years, under the guidance of Mr. C. J. Lucas, considerable attention to Orchids has been given, and at present they occupy one side of the above-mentioned aquara.

In one house there is a rich display of *Cattleya Trianae*, one specimen of which, from an imported mass, has produced a pure white variety on the one half, and a crimson-lipped form on the other. Among the other finely-flowered plants arranged with the *Cattleyas*, we noticed a fine specimen of *Miltonia Warscewiczii*, a splendid form of *Dendrobium Farmeri*, some superb varieties of *Dendrobium nobile*, among which the true *D. n. nobiliss* and an equally richly-coloured but distinct variety, named *D. n. nobilior*, were the most beautiful. In this house, too, is a large plant of *Platyclinis glaucaea*, with about sixty spikes of bloom; two fine *Dendrobium fimbriatum oculatum*, the rich crimson-spotted *Lycaste plana Measuresiana*, a fine form of *Madevalla chimera*, and of the nearly black-flowered *M. Roezlii*; *Cymbidium Lowianum*, with nine spikes; the new *Grammatophyllum Measuresianum*, with a fine inflorescence; various good *Lycaste Skinneri*, and many well-flowered *Dendrobium Wardianum*, *D. Findlayianum*, *D. crassinodum*, and the other species to be found flowering at this season; some bright colour being given by the orange-scarlet *Laelia harpophylla* and *L. cinnabarina*, and one of the most beautiful of white Orchids showing up in *Celogyne cristata alba*.

In all places where Orchids are grown there are some things which do better than others, and at Warnham Court, the species of *Angraecum* seems to take the lead in vigorous health and floriferousness. It is pleasant to see the profusion with which the plants of *A. Ellisi*, *A. articulatum*, *A. Sanderianum*, *A. fastuosum*, *A. bilobum*, *A. Leonis*, *A. aequipedale*, and other species produce their flower-spikes. In the same house the varieties of *Miltonia Roezlii* flourish exceedingly well, also *Vanda Sanderiana*, and *Ocicidium papilio*. Some of the last-named are in flower, and are not afflicted with that periodical degeneration which so many growers lament in this species. Other plants in flower with the *Angraecums* are *Ansellia africana*, *Dendrobium Wardianum album*, *D. Dalhousianum*, *D. endocharis* × *D. Ainsworthii* × *D. crepidatum*, *Epidendrum rhizophorum*, *Cypripedium grande* × *C. Sedeni candidulum* × *C. Lathamianum* × *Calanthe veratrifolia*, *Cymbidium eburneum*, &c.

In the *Cattleya*-house the new *C. Rex* and *C. Victoria regina* are to be found. A fine clear variety of *C. amethystoglossa*, a few *C. Percivaliana*, and some *C. Trianae* were also in bloom, together with plants of *Dendrobium litiflorum*, *D. Brymerianum*, *D. Pierardi*, *D. primulinum*, *D. asperum*, *D. devonianum*, and *D. aggregatum*. In the next house the perpetual-flowering *D. rhodostoma* × we noticed in bloom; the large specimens of *Phalænopsis* in fine health, and *Cypripedium Ainsworthii* ×, and other species. In this house some fine specimens of *Gymnogramma schizophylla* arranged with the Orchids are very effective, and conducive to the health of the Orchids grown with them.

In the next house a mass of the pretty little *Epidendrum polybulbon* bears its neat flowers; *Cattleya citrina*, *Madevalla Estradae*, *M. Shuttleworthii*, and various other species, were noticeable; also a fine *Vanda Cathcartii*, just finished flowering.

The occupants of the cool-houses are in the most perfect health, and showing well for flower. Among those already in flower is a very handsome rose-tinted, spotted form of *Odontoglossum crispum*,

closely allied to the fine *O. c. punctatissimum* which realised such a high price when sold at Messrs. Protheroe & Morris' Rooms.

From the general good condition of the Orchids at Warnham Court, and the number of difficult subjects successfully cultivated, a prosperous future may be anticipated for the Orchid collection there; but as every branch of modern gardening is carried out in a very creditable manner by Mr. Duncan, the gardener, evidently the Orchids are not allowed to encroach on the rights of other things.

Especially noteworthy at present is the house of Warnham Court Seedling Amaryllis, noted for their good substance and brilliancy of colour; the tastefully arranged greenhouses, literally a mass of bloom, with greenhouse *Rhododendrons*, *Azalea mollis*, *Cliveias*, *Primulas*, *Cinerarias*, the lofty Palm-houses and stoves with their gigantic *Anthuriums* and other ornamental plants, and the roomy rockery conservatory with its Fern-clad sides and handsome and costly marble statuary.

CONSERVATORY CLIMBERS.

Among the best climbers for a conservatory are the *Tacsonias*, the most suitable of these being *T. exoniensis* and *T. Van Volxemii*; the first-mentioned is the hardier and freer-growing of these two varieties, and it blooms nearly the whole year. The flowers are about 6 inches long and tubular, and being of a bright pink or rosy-salmon shade, they make a fine show. *T. Van Volxemii* is moderately free in growth, and produces flowers of a large size, measuring quite 3 inches across, and of a crimson-claret colour, the tube being much shorter than that of *T. exoniensis*.

The best way of managing these *Tacsonias* is to plant them out in a prepared border, as they require more root-room than can be usually afforded in a pot, box, or tub. Drainage must be provided, placing 6 inches of broken bricks in the bottom, and some fresh-cut sods or turves, with the grass side downwards, over these. Fill up with a mixture of good fibry loam and peat, with a dash of sand to keep the whole porous. All will then be in readiness for the plants. Healthy young plants should be obtained, turned out of the pots, and the lower roots carefully separated, that they may be laid out properly in the soil. After planting, give a soaking of water, and tie up the main shoot. All side growths must be stopped by pinching out the points, as then the strength of the whole plant will be thrown into the centre, which will lengthen fast, and may soon be led up and across under rafter or girder, from which a certain number of side branches should be allowed to run down and depend in their own natural way. Thin out, from time to time, shoots that have become too long or have flowered, and so give room for young growths.

Passifloras, though not so showy, have advantages over *Tacsonias*, inasmuch as they are seldom attacked by any insects, and they are exceedingly graceful climbers, and particularly suitable for all tall large structures. There are many varieties, the hardiest being the good old *P. racemosa corulea*; *Constance Elliot* is also good, and, having white flowers, affords a fine contrast. *Bignonia Cherere* and *B. capredata* are both desirable, and do well for growing on the roofs of conservatories; but to flower freely, they require their roots confined to a small compass. For producing a quick growth, there is nothing to equal the *Cobæas*, the variegated variety being very beautiful. The most suitable compost for the *Cobæas* is a rich fibry loam, with about one-third peat. *Tropæolums* are brilliant when in flower, and do well in light sunny roofs in a warm house.

In shaded positions, and where there is a cool moist atmosphere, nothing can equal *Lapagerias*. Before planting, free drainage is essential, and rough sods or large lumps of peat, with plenty of silver-sand thrown in between, should be used, as during all the growing and flowering season water has to be applied very freely, and it is necessary that it passes readily through.

For back walls or pillars, there are many plants that are suitable, and among them *Habrothamnus elegans* and *H. Newelli*. As *Habrothamnus* flower from the young wood, they should be pruned back when the flowers fade, and fresh shoots encouraged. *Clianthus puniceus* makes a beautiful pillar plant, and should be treated much in the same way as the *Habrothamnus*, but being subject to red-spider, syringing must not be neglected, or the leaves will soon suffer. *J. S.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Peirice Garden, Swansea.

THE PLANT STOVE.—Put up more tubers of *Achimenes* which have been started in heat. The potting compost should consist of two parts leaf-soil, one of sifted loam, and sufficient sand to keep the soil open. Another batch of *Caladium* tubers may also be put into heat, using pots suitable to the size of the tubers, but avoiding too large pots. *Caladiums* do not care to be disturbed at the roots after growth has commenced, which makes it necessary to give them sufficiently large pots at the first. Equal parts of peat and loam, with sand in proportion, will be found a suitable compost for them. Avoid the common mistake of placing the tubers too deep in the soil; they should be just under the surface, not more. Water them sparingly until the leaves have commenced to show, but when the plants get into full growth, they will require a plentiful supply. Pot another batch of *Gloxinias* and *Tuberous Begonias*, and start in moderate warmth. If possible, all of the above subjects should be plunged in a warm bed of sweet Oak leaves, the bottom heat of which should range from 75° to 80° the night temperature being from 65° at night to 70° by day.

Allamandas, *Dipladenias*, &c., which are in full growth, will require regular attention in the matter of regulating the young growth, and a sharp lookout must be kept for mealy-bugs, as with greater warmth this pest will be found to increase rapidly. Liquid manure water in a tepid state should be afforded to *Gardenias*, whose flower buds are swelling, syringing them twice a day when the weather is bright, and until the flowers expand, when it must be discontinued.

THE GREENHOUSE.—Young stock of *Fuchsias* raised from cuttings in the autumn which have been potted, as previously advised, into 4-inch pots, will now be ready for moving into pots of a larger size. These plants require a rich compost and firm potting. Get the plants to grow quickly; and to give them a bushy habit, the side shoots and also the leaders should be stopped occasionally, at the same time keeping the plants well up to the roof-glass. When obtainable, put in more cuttings of *Fuchsias*. The plants will be found useful for furnishing purposes late in the summer and autumn months. Cuttings of the following plants may be put in, viz., *Coleus*, *Petunias*, *Heliotropes*, Ivy-leaved and zonal *Pelargoniums*, &c., which will strike quickly at this season, if inserted in a sandy compost, and the pots plunged in a gentle bottom-heat in the propagating-frame, taking precautions to shade them during the continuance of bright sunshine. When the cuttings are well rooted, they should be potted off singly into small pots, as if left in the cutting-pots too long, they are liable to become spindly, which in all cases should always be avoided. A good compost for the above plants consists of two parts loam, one each of leaf-soil and decayed manure, and sand in proportion to keep the soil porous.

IVY-LEAVED PELARGONIUMS.—These make very pretty basket plants, especially when two or three varieties are placed together. Cuttings propagated in the autumn and potted in 4-inch pots, will now be ready for this purpose. A good compost for them is two parts fibrous loam, and one each of leaf-mould and decayed manure, with a free addition of silver-sand. Plants which are intended for pot-culture, which are at the present time in small pots, may now be shifted into 3½ or large 4½, placing a neat stick to the plants, and support them loosely with matting.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchard Grocer, Highbury, Birmingham.

EVERGREEN CALANTHES AND PHAIUS.—*Calanthes* of the evergreen section thrive the best in a compost of which loam forms the chief ingredient. The intermediate-house suits the plants during the

summer months, but in winter it is better to remove them to another house having a little higher degree of warmth. *Calanthes*, like other Orchids, sometimes get too much water, but it is a rule that all that they require is to be afforded water when they become dry, like most other kinds of plants. When the new growths of *Calanthes* are infested by thrips, a little sulphur dusted down into the axils of the leaves renders their dislodgment easy. *Phaius grandifolius* and *P. Humblotii* are species that are likewise best when grown in a compost that consists of chiefly loam, and the plants should now be repotted. The former will grow in almost any part of the warmest house, but *Humblotii* is not so easy to grow satisfactorily. The plant must be placed close to the roof glass in the warmest house, and where plenty of light may be found.

MORMODES, CATASETUM, CORYANTHES, AND CYCNOCHES.—Sunlight and heat are also indispensable factors for the successful cultivation of these plants, and during the season of growth no better place can be found for them than is afforded by the Dendrobium-house, where, suspended near the roof in pans or baskets, they grow satisfactorily. Like most of the *Dendrobiums*, they should be rested, after the new growth is finished, in cooler and airier quarters.

THE DENDROBIUM-HOUSE.—As previously mentioned, the requirements of *Dendrobiums* must be met by providing them with a house or compartment where sunlight can reach them, and which is lofty, so that any part of the roof may be utilised for hanging up baskets and pans, and a good circulation of fresh air is ensured without causing the air to become arid. It should be provided with roller-blinds of thin texture, which should be put in use no oftener than is necessary to prevent scorching of the leaves. True, these plants often have to be grown in the so-called East Indian-house, with other tropical Orchids which require more shade than they do, such as *Phalænopsis*, *Saccolabiums*, and *Cypripediums*, and when this is the case, much care is needed in order to give to each species its proper place in the house. This house must be a light one, and those species which love shade may be accommodated even in a sunny house; but it is next to impossible to grow those which require much sunlight in a low, badly-ventilated, or dark house. All the necessary work of surfacing or re-potting the *Dendrobiums* is best done when the flowering is over, or very soon afterwards, as much injury will result if the young growth and roots are allowed to get far advanced before doing this. If one part of this house is hotter than another, that will be a good place for *D. Bensoni*, when it has flowered and is about to make growth, and with it *D. formosum giganteum* and *D. Lowii* will be well suited in that part. It is not prudent to let any water lodge in the young growths of *Dendrobiums*, and I think that *D. superbum* (*macrophyllum*) is one of those most easily injured in that way. As a potting compost, nothing but the best of sphagnum moss and fibrous peat should be used, and the best results may be expected from those which are grown in small pans, pots, or baskets—for small plants, pans are always to be preferred to baskets, as the roots encircling the Teak bars of the latter are certain to be damaged when re-basketing is performed. For large plants, earthenware pans are much too heavy to be hung on the roof, and baskets are better.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Darham Court, Maidstone.

GRAFTING FRUIT TREES.—Trees which have been headed-back, as previously advised, will soon require to be grafted. The two best methods of doing this are rind and whip-grafting; the former is generally practised upon standards, or trees that have very large branches to be grafted, and it is also a more simple operation than whip-grafting. For this kind of grafting, select parts of the stem which are smooth, and free from knots, for the insertion of the scions. The grafter should then, with a very sharp knife, slit the bark from the top of the stump downwards, for a distance of 6 inches, and upon opposite sides, two scions being, in a general way, as many as should be placed upon one limb, but more may be inserted, according to the size of the branches. The scions should be about 6 or 7 inches in length, the lower half to be cut slanting, and the edges slightly pared, so that a junction of the two rinds is brought about. The scion should be carefully forced home under the bark, and bound firmly but gently with soft broad strips of bast or raffia, and then be coated over with grafting-clay or pug, or grafting-

wax to exclude the air. Where the stock is small, whip-grafting is the best method, and it may be performed a little earlier in the season than the former. In carrying out this method, the branch should be cut off in a slanting direction, the higher point of this cut being farthest away from the graft; a thin slice of the side of the stock is then cut away, and the scion fitted to this exposed surface. This will leave a snag above the point of junction, which is eventually cut away. To this snag it is necessary sometimes to tie the young growth, to save it from being broken out. The graft should be prepared as advised above, but with this difference, viz., that a thin wedge-shaped piece, or tongue, be cut from the scion in an upright direction, about half an inch from the top of the cut. When this is done, the scion may be wetted, and placed in position on the branch, taking care that the bark of stock and scion touch on one or both sides, binding and claying it over.

GRAFTING CLAY.—This is made from clay or stiff yellow loam, with the addition of a little cow dung and horse droppings. The ingredients should be thoroughly well beaten together with a spade several days before the clay is required for use, and if it will be kneaded with the hands when using it, there will be no cracking of the stuff when dry.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

DESIGNING GEOMETRICAL OR CARPET-PATTERN BEDS AND THE PLANTING OF THE GROUNDWORK WITH HARDY CARPETING PLANTS.—In Italian, and other geometrical laid-out gardens, the style of bedding-cut known for several years past under the popular name of carpet-bedding, generally commands the attention and admiration of visitors when it is not overdone, when the designs are neatly executed, and due regard paid to the habits of the plants employed in forming the panels of the design, as well as the harmony and contrast of colour; but let it be distinctly understood that I only advocate a few of the beds in any one garden to be so planted. They then, in addition to affording variety and an opportunity to those engaged in the work of displaying their skill and taste, contrast most effectively with mixed beds, and beds filled with masses of pink, scarlet, yellow, white, &c., which surround them. In the case of the beds at this place, the groundwork of the carpet-beds remain intact all the winter, the surrounding beds being planted with spring-flowering plants in variety. Next week we shall take up all the groundwork of Sedums, &c., from one set of beds with the turfing-iron, and deposit them in sunny places among the trees in certain parts of the grounds, where they will look well for one year, at least. The beds will then be manured, dug, trodden over, and raked quite level, preparatory to getting out the designs. Each of the several parts of the individual designs should be sufficiently large and well-defined, as to admit of the necessary number of foliage plants of separate and distinct colour for producing an effective and well-balanced whole being put into each piece. In recent years we get out our designs on the beds without making any previous preparation. A geometrical figure, suitable to the size and shape of the bed, is thought out, and at once roughly outlined with the marking-rod, or a large pair of wooden compasses, according as the design is to take the form of straight lines, and points, or curves, afterwards working out the approved design according to scale. This is ever so much easier and quicker than getting out the designs beforehand on paper, and then transferring them to the beds. As soon as the patterns are got out, the groundwork is planted. We use Sedum acre var. aurea for all our oblong beds, as it assumes a beautiful golden colour on the approach of spring; and S. acre elegans and S. Lydium in pairs in our hexagonal beds. These Sedums, together with panels of Golden Chickweed (*Stellaria graminea aurea*), are planted in small bunches, at from 2 to 3 inches apart every way, making the soil fairly firm about the roots; planting, and then watering through a roset can, to settle the soil, repeating the application a few times in the absence of rain until the roots have taken to the soil. Other suitable hardy carpeting plants are *Cerastium tomentosum* (silvery foliage), *C. arvense* (green), *Mentha Pulegium* (gibbularium) (green), *Herniaria glabra* (green), *Saxifraga densa* (green), and *Antennaria tomentosa* (silvery). I may remark that we plant a row of *Echeveria secunda* glauca in the slightly raised edges of the beds in a mixture of cow-manure and loam made to the consistency of stiff mortar before getting out the designs, afterwards planting some in them. *Echeveria* should

be planted so as to nearly touch each other, pressing the soil well about the roots of the plants.

CALCEOLARIAS, ETC.—Where plants of *Calceolaria*, *Leucophyton* Brownii, and such-like are likely to get crowded in their winter quarters, they should be thinned out, planting the thinnings, which should be furnished each with its ball of soil, on beds of soil placed on a hard bottom in a warm situation, making the soil firm about the roots, and afterwards giving water to settle it, and affording shading during strong sunshine for a few days, and matting them over at night.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

GENERAL WORK.—The past severe weather delayed work, but the favourable weather will permit of all arrears being brought up as regards ground work. The sowing of the Parsnip and Onion crops should be completed at the earliest moment that the ground is in condition to tread upon it, but on no account should the operations be begun whilst the land is wet. I advised the planting out of Peas raised in heat, but owing to hard weather, this has been delayed to a later date than usual; if the plants have had free ventilation, no harm will be done them. Peas may be sown for succession crops as soon as the land is fit, staking and protecting the early crop from birds. If slugs are troublesome, dust the rows with sord or dry wood-ashes.

EARLY RADISHES, ETC.—Seeds of these favourite salad plants should be sown on warm borders as soon as the weather will permit, the seeds being coated with oil and then with red lead to prevent loss by birds, which readily occurs from the seed being sown on the surface and slightly raked in. Cover the beds with dry litter to forward germination, mats or dry straw being employed, but whichever it is, it must be removed during the day, and be replaced at night if frost threatens. Early Carrots should also be sown on a south border. The French Horn or the Early Nantes are each good for this, and should be sown thinly. If early Carrots are much in demand, a good bed of the Early Scarlet Short Horn will be very useful early in the season. Leeks for early winter use should be sown thinly, thereby rendering removal possible without loss of roots and with a nice ball of earth. The Lyons Leek is one of the best for early use, and when well grown it comes of a large size and is of mild flavour. For the late crop sow the Musselburgh. Plants still remaining in the trenches should be replanted with a ball of roots and soil in a border, not facing north. If these plants do not become dry at the root they will be good for eating for some time longer. The removal of the plants hinders running to seed.

CELERY.—If seeds were sown as advised, the plants will now require pricking off into frames or boxes, on a mild hotbed, shading them for a few days afterwards. When large quantities of early Celery are required, a bed of tree leaves and litter with a garden frame on it, is the best place for the pricked-off plants. Seed for the main crop of Celery may now be sown, choosing those varieties that are of medium size, a selection of which was given a month ago. If a mild or spent hotbed can be utilised for these seeds so much the better, as then the plants are not crowded, if the sowing be done thinly. These plants will come away with good roots when lifted to be pricked off on a sheltered border, and will not flag like thickly-sown ones. Use good rich light compost for the seed-bed, and never let them be checked in growth in any way. The Celery still remaining in ridges may be dug up and laid in thickly on a north border, taking care to cover it well with the mould, and to preserve most of the roots. I have had Celery, the Standard Bearer, in good condition to the end of the month of May; care must be taken to keep the sticks in an upright position as when growing.

ONIONS for seed-bearing should be planted, and to keep the stocks true the bulbs must be planted in widely separated parts of the garden. The autumn-sown Onions should be transplanted into rich land, making the ground and the roots firm as the work of transplanting proceeds.

ARTICHOKES.—The beds of Globe Artichokes clear of winter protecting materials, and dig with a fork the spaces between the rows, after affording a dressing of manure if the plantation is an old one, and stands in need of assistance. Gaps in the rows make good by dividing the largest roots; but if the plantation is in a bad state, I would advise the lifting of a portion of it, splitting the plants so lifted into good-sized pieces, trenching and manuring

the ground, and making a new bed. There is nothing gained by allowing these plants to occupy a ground for too long a time, the crowns becoming each year less succulent. I would advise the use of fish manure when the plants are in growth, putting it on as a top-dressing, and forking it in; common salt is also beneficial to Artichokes. Seeds may be sown early in the spring—three seeds in a small pot, in a warm house; but suckers are best.

JERUSALEM ARTICHOKES.—Tubers may be planted in trenched ground that was well manured for some earlier crops, planting them in a sunny spot. Sutton's White is much superior to the old kind of Artichoke, being white in the skin, with shallower eyes, and of better shape. Plant in rows 3 feet apart, and 18 inches in the row.

CARDOONS.—Seeds may now be sown in heat—three seeds in a 48-pot, removing the two weaker ones when it is seen which is the strongest seedling. Harden off in a cold frame when the roots get round the sides of the pot, and plant them out in the month of May in trenches 18 inches to 2 feet apart in the trench, and 5 feet from trench to trench. The plants require much water when growing.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

POT VINES.—Some of the Vine eyes put in turves or pots in January, and given a brisk bottom-heat will now be fit to transfer to 6-inch pots. Only those, however, which have made from 5 to 7 inches of growth should at present be dealt with; the potting of the remainder had better be deferred until they have arrived at the same stage. A rough compost of fibrous yellow loam, spent Mushroom-bed, lime, ashes from the burnt refuse heap, and a fair proportion of bone manure will form a good medium for their roots, if of the same degree of warmth as the house in which the Vines are grown when used. Pot moderately firm, and return them to the hot-bed, in which they should again be plunged, and the soil well moistened with tepid water. Support each plant with a stake, and stop all lateral growths at the first leaf. Maintain a temperature of 60° at night, and 80° in the daytime, with sun-heat, and a free circulation of air. Sprinkle the beds and paths frequently in bright weather with water, in order to obtain a humid atmosphere.

ORANGE TREES planted out in beds which have a tendency to make strong growths and bear poor crops of fruit, may now be root-pruned. The size of a plant will determine the radius of root space to leave undisturbed; those 12 feet or 14 feet in height, with 9 feet of spread of branches, may have their roots cut to within 3 feet of their stem, smaller plants being root-pruned closer. On the other hand, sickly plants will be improved in health by removing a quantity of the surface soil, replacing a mixture of loam, leaf-mould, and lime. Alternate dressings of superphosphate and kainit may also be frequently applied to the soil, and washed in. Plants in pots and tubs may be shifted into larger sizes, according to their requirements, and given the compost and treatment advised for those planted out. Syringe the plants twice daily, except when they are in flower, and give them a minimum temperature of from 50° to 55°, with a maximum of 70° to 75°, and admit air freely in mild weather.

FIGS propagated in the early part of January should be in a condition to require larger pots; loam, wood-ashes, old lime rubbish, well-broken charcoal, spent Mushroom manure, and Vine and plant manure will prove an excellent mixture for them. These, however, should be well blended, and raised to the same temperature as the bed in which the plants are plunged before being used. Return the plants to the hot-bed from which they have been taken (after being repotted), and supply them with water to meet their wants. Use the syringe to damp the foliage in the morning and when the house is shut up in the afternoon, and endeavour to secure a saturated atmosphere. When the plants get a hold of the fresh materials with their roots, and make growths 6 inches in length, these may be stopped to induce branching, if plants to fruit in pots be desired, otherwise they may be allowed to extend 15 inches before being pinched. A temperature of 65° to 70° at night is suitable at this period.

PINES.—Any of the Pine suckers put in last autumn and which were found deficient of roots when the general repotting took place, and were then allowed to stand over, may again be examined, and treated according to their requirements.

EDITORIAL NOTICES.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.
 NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see. Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

SATURDAY, MAR. 26—Royal Botanic.
 FRIDAY, APRIL 1—Dandee Horticultural Association.

SHOWS.

SATURDAY, MAR. 26—Crystal Palace.
 TUESDAY, MAR. 29—Brighton and Sussex Horticultural Association (two days).

SALES.

MONDAY, MAR. 28—Hardy Perennials, Carnations, Paeonies, Philox., &c., at Protheroe & Morris' Rooms.
 TUESDAY, MAR. 29—5000 *Odontoglossum crispum*, &c., at Protheroe & Morris' Rooms.
 WEDNESDAY MAR. 30—2000 choice Rose Trees, 500 Fruit Trees, Laurels, &c., at Stevens' Rooms.
 FRIDAY, APRIL 1—Established Orchids at Protheroe & Morris' Rooms.
 SATURDAY, APRIL 2—Liliums, Begonias, Fruit Trees, Rose Trees, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—45°.

In a previous number, p. 368, we made allusion to the dead-lock that will arise if the "rule of priority," or strict chronology of nomenclature is to be adopted without exception. With Dr. KUNTZE's book, on which we also commented last week, before us, we might say the dead-lock has arisen. That book, however, will, we hope, act as a deterrent to the ultra purists. The logic of common sense will surely be allowed to prevail, and what is practicable will be adopted in preference to what is theoretically perfect. With all respect for the rule of priority, and fully recognising the propriety of conforming to it as much as possible, we can but regard it as an arbitrary convention adopted for the sake of its utility, not as an absolute principle of science, such as the law of gravitation or the doctrine of evolution. The spirit must be more regarded than the letter, and a certain amount of latitude in the application of the rule must be allowed; at any rate, it is sure to be taken in the future as it has been in the past.

We commend to the attention of horticulturists the modification of Art. 4 of the "Lois," proposed by Dr. WITTMACK, of Berlin—"A custom contrary to the rules, and contrary in particular to the principles of priority, which does not produce confusion, but which gives greater clearness, may be accepted [continued]." Dr. WITTMACK further suggests that although a generic name may change in accordance with the progress of science, yet it is essential for horticultural purposes to retain the old name, if it be one sanctioned by long custom; thus, both *Sinapis* and *Brassica* may be retained in gardens, although the former name has been suppressed by BENTHAM and HOOKER.

Where custom secures clearness, and chronology produces confusion, there is little doubt to which side the balance will incline. In order to prevent license, however, some check must be imposed, else every one might do as was good in his own eyes, and the confusion would become greater even than that which

O. K. threatens to impose upon us. That check may be furnished by some judicial machinery calculated to secure the interpretation of the rule, and especially its equitable application. Nor do we think the elements of such machinery are far to seek. The *Genera Plantarum* of BENTHAM and HOOKER, complete so far as the higher divisions are concerned, and published in part before the Botanical Congress of 1867 and the promulgation of the "Lois," stands a monument to the industry and sagacity of its authors. Vast as it is, it is no mere compilation, but it is based upon the personal examination, so far as that was possible, of every genus mentioned, as well as of the literature concerning it. There, then, is the standard for generic nomenclature. It is not perfect, it is not free from error of commission or omission, bibliographical or otherwise. Its arrangement hardly conforms with the existing state of our knowledge of botanical structure. What then? It is impossible that a work, the first part of which was published in 1862, and the last in 1883, could be perfect, even though it were effected by botanists of such consummate judgment and unrivalled experience and opportunities as BENTHAM and HOOKER. No book could be. Certainly LINNÆUS'S *Species Plantarum* has its inconsistencies. Corrections of matters of fact and modifications of nomenclature must in consequence be made from time to time, but by whom? Not certainly by the bibliographer, who by accident stumbles across a volume of forgotten lore which invalidates a name in general use and accepted in the *Genera Plantarum*. Let such gentlemen call attention to the matter; botanists will be grateful to them for so doing, but let them refrain from adding another synonym till the case has been investigated by a competent monographer. He is the proper person to decide—not from an isolated example—but from a review of all the facts of the case, whether any change of nomenclature is needed, and, if so, what. But, it will be said, there are monographers and monographers: one man's judgment and experience are much more valuable than another's. Quite true; but these differences soon become perceptible, and the botanical public is not long in distinguishing a trustworthy from an untrustworthy guide. It ignores the leading of the one, whilst thankfully accepting the guidance of the other. A certain amount of confusion, inconvenience, and incertitude is inevitable. It is in the nature of things, but they are less than the corresponding evils arising from the attempted application of a rigidly fixed standard to cases to which such a standard is unfitted. We submit, then, that subject to the requisite changes to be made by competent men after deliberate investigation, the *Genera Plantarum* should be taken as the standard for the nomenclature of genera.

As to the nomenclature of species, the principles are the same. Abide by the rule of priority, so far as possible, but do not set it up as a fetish. The name is but the means to an end, not the end itself; it is but as a word in a dictionary compared to the science of language. For the proper nomenclature of species, we naturally turn to the most recent monograph. The publication of a monograph affords a guarantee that the author has studied his subject in detail, comparatively as well as a whole, and therefore, we accept his decisions till circumstances necessitate their revision—for finality is not to be expected in natural science.

Botanists will have on the completion of the *Index Kewensis*, a great aid in the nomenclature

and chronology of species. This Index, the cost of which was defrayed by the late CHARLES DARWIN and his executors, has been in preparation at Kew for the last ten or more years by Mr. DAYDON JACKSON and his assistants, with the constant aid and supervision of Sir JOSEPH HOOKER. The manuscript is now completed, and the early sheets are in the Press. It is a colossal work, which will be of the highest service to monographers and others; but from the nature of things, it can never have the authority of the *Genera Plantarum*. It will be by far the completest register of names and dates that has ever been published. Every available botanical book, from 1735 downwards, has been consulted, the records of every natural history society at home or abroad have been searched, and the result is the gigantic list above mentioned—but still it is only a list. It will not, so far as we see, in any way supersede the necessity for each subsequent monographer exercising his own judgment, although it will enormously facilitate his task.

SOME years since, a writer in this journal advocated the desirability for selling all produce—greenstuff excluded—by sample only, the sample exhibited at market being guaranteed to truly represent the bulk. This was submitted as one of the many aids to economy which have from time to time engaged the attention of market growers with a desire to market their own goods, and salesmen desirous of enlarging their "sphere of influence." Some good was the result of the agitation, and one would have thought that advantage would to-day be taken of the Parcel Post to widen the direct influence on a wide-extended market or purchasing public by both parties interested. Some remarks on the supposed disappearance from Covent Garden of the best fruit of the past season led one of our correspondents to make inquiry at St. Martin's-le-Grand as to whether fruit-samples were becoming every-day affairs coming under the cognisance of the authorities there. The result was given a month since—there was no knowledge of an increase in that direction. But the answer was so general, that our correspondent persevered in the attempt to learn if fruit samples were to any extent sent through the existing postal channels. The result of a widespread inquiry made by the Post Office officials has been given to us by the gentleman appointed, who has arrived at the conclusion that the Post Office is not used at all by the trade—salesman or grower—in extending the sale of fruit. It is not for us to say whether this is a bad or a good thing—sufficient that we state the fact; those who read are quite competent to form their own conclusion. In the course of conversation, our informant gleaned some satisfactory tales respecting the use made by seedsmen and florists of all postal facilities, many of which are known to the reader—the value placed on the service by the folks in the Scilly Isles—how that for Primrose Day use one firm sends per post no fewer than 3000 parcels, &c. But there is one little item that should be more widely known than it is—it is of little use trying to mulct the Customs officials by endeavouring to smuggle goods through the Post Office as flowers: the parcels are opened by officers detailed for the purpose; and thus it happens that well-laid schemes for evading the payment of duty "gang aft agley," as BURNS hath it. The matter of comparison between fruit and flower growers and the notes concerning these may safely be left for cogitation.

FIG 58.—*NEPENTHES STENOPHYLLA*. FROM A PHOTOGRAPH. (SEE P. 402.)

NEPENTHES STENOPHYLLA.—In our number for August 30, 1890, p. 240, we described this Bornean species, so that we need not enter into detail again. The pitchers are of a green colour, mottled with red, and, as the illustration shows (fig. 58), so freely produced, that it may be commended to the notice of growers who find other and more showy species difficult to manage. The illustration is from a figure by Mr. H. J. VEITCH.

LINNEAN SOCIETY.—At the meeting on March 17, Professor STEWART, President, in the chair, Mr. E. M. HOLMES exhibited specimens of *Phacelocarpus disciger*, a new species of seaweed from Cape Colony, collected by Dr. BECKER near the mouth of the Kowie river. One of the specimens exhibited bore antheridia, which have not previously been described in this genus. The species differ from those already known in bearing the organs of reproduction on the surface of the frond instead of on the margin. Mr. BUXTON SHILLITOE exhibited and made some remarks upon the flowers of *Leucocium verum* and *Helleborus viridis*. On behalf of Mr. ALLAN SWAN, the Secretary read a paper "On the Vitality of the Spores of *Bacillus megaterium*." Mr. J. B. CARILL submitted a paper entitled "Notes on *Zebrias*."

"KEW BULLETIN."—In dealing with a body like the Treasury, one has always to bear in mind that they have to consider the *cut bono* aspect of affairs, and rightly so. But the Treasury may be also expected to exercise some amount of judgment and intelligence. If it be true, as we learn from the *Times*, that the *Kew Bulletin* is to come to an end, we shall be obliged to conclude that the Treasury has very little acquaintance with what is important for the interests of Greater Britain. The *Kew Bulletin* is a publication to be improved, enlarged, more widely diffused—anything rather than discontinued. Such a publication is essential to the full realisation not only of the resources of Kew, but also of the capabilities of our colonies. It should be greatly developed rather than arrested in its course.

DUTCH POTATO CROP.—Our Dundee correspondent, says the *Liverpool Journal of Commerce*, March 21, telegraphs that, owing to the failure of the Dutch Potato crop, large quantities of Potatoes are being shipped from ports on the north-east coast of Scotland to Rotterdam. During the season, it is expected that over 1000 tons will be exported weekly from Dundee, Arbroath, Montrose, and Anstruther, to Holland. The supplies are principally to be consumed, while there is a small quantity to be used as seed. Good prices are being obtained by the shippers.

THE HORTICULTURAL COLLEGE AT SWANLEY.—For some time past (says the *Daily News* of March 17) this College has been in receipt of a grant from Government, and this spring it starts under the auspices of the Kent County Council, which has at its disposal a sum of £23,000 for the promotion of technical education. Of this handsome sum the Council has, after very careful investigation, voted £1200 a year for two years to the College, in return for which they have secured the right to send twenty county scholars, who are to have board, lodging, and training in scientific and practical gardening. These scholars are selected by the Council from residents in Kent who have been educated in elementary schools, or whose parent's income has not exceeded £100 a year. They must be from sixteen to twenty years of age, and are to have two years' training.

MONTHLY HORTICULTURAL MEETING AT GHENT: MARCH.—A Certificate of Merit was awarded for *Cypripedium ornatum*, to M. Jules Hye; also for: 1, *Odontoglossum Alexandræ* var., to MM. Baëns frères, flowers large and pink, with large blots and spots of brownish-red; 2, *Clivia miniata* (seedling 1892), to the same firm, fine trusses of well-shaped flowers of a yellowish-orange colour fading into reddish-orange; 3, *Cypripedium Godeffianum*, to M. Ed. Pynaert van Geert, one of the finest specimens hitherto seen; 4, *Adiantum Birkenheadi*, to the same exhibitor—a very pretty

sample of a species described in the *Gardeners' Chronicle* in 1886; 5, *Odontoglossum crispum fastuosum*, to M. Jules Hye, a remarkable plant, especially in the size and shape of the flowers, which are in very close racemes, and shading from white to rosy-lilac; 6, O. *Wilckeanum albens* (syn. *leopardinum*), to the same grower, an excellent variety, the flower-stem bearing sixteen fine flowers, with effective spots of reddish-chocolate on a white ground; 7, O. *spectrum perfectum*, also to M. J. Hye, a fine variety striped and beautifully glossy, the lip effectively fringed; 8, O. *Andersoni*, to the same grower, flower large, much spotted with large blood-red marks; 9, *Ada anrantiaca maculata*, to M. J. Hye, the black specks on the petals are suggestive of *Lilium Martagon*; 10, *Clivia Madame Romain Desmet*, to M. B. Fortie, of Ghent, of a remarkably dark colour; 11, *Perfection*, to M. B. Spaë, with well-shaped flower; 12, *Odontoglossum Hadweni* (?), to M. J. Hye, a flower similar to that of *Andersoni*, the petals edged with greenish-yellow, and much spotted; 13, *Cypripedium superbiens* × *villosum* fl. *striatum*, to M. Ed. Pynaert, a fine variety, with variegated flowers as remarkable as those of *C. Dauthieri marmoratum*, *Harrisianum polychromum*; 14, *Hæmanthus Kalbreyeri*, to the Louis van Houtte Society, a handsome plant, with a fine cluster of long-stalked, deeply-cut flowers, figured in the *Flore des Serres et de Jardins*, t. xxiv., pl. 2877-78. A Certificate for a finely-bloomed specimen was awarded to *Cologynne cristata alba* from MM. Edm. Vervae et Cie.; the specimen bore ten flower-stems, with about sixty large pure white flowers, the crested lip beset with fine white hairs. Honourable mention was awarded for: 1, *Asparagus compacta nana* (for good cultivation), to MM. Duriez frères; 2, *Epidendrum Stamfordianum*, to M. Jules Hye, an old Orchid bearing four fine clusters of bloom; 3, *Lycaste costata* (lanipes, Ldl.), with seven fine flowers, to the firm of Louis van Houtte.

THIRTEENTH GHENT QUINQUENNIAL, APRIL, 1893.—Proofs of the interest which the horticultural world takes in the organisation of this exhibition are beginning to be shown; in evidence of this, we may quote the following facts:—M. BENARY, the German horticulturist, offers an "objet d'art," value about £20; M. le Baron GASTON DE CHANTON, of Briailles, has given nearly £40; and M. GEORGES MANTIN, of Paris, a large Gold Medal. Added to the prize which your countrymen instituted in memory of LOUIS VAN HOUTTE, to the prize given by the Comte DE GOMER, to the perpetual prize instituted by M. DE LA DEVANSAYE, these new marks of interest are of considerable value. *Ch. De B.*

NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.—The members of this Association held their usual monthly meeting in the hall of the Christian Institute, Aberdeen, on Wednesday evening, the 16th inst. Mr. D. M. SMITH, President of the Association, occupied the chair. Mr. G. Ross, Cranfield, in an interesting paper, opened a discussion on the "Uses and Abuses of Watering and Syringing."

PEACH YELLOWS.—This is a form of disease at present unknown in this country, but which is very rife in the Peach orchards of the United States. The first thing noticed is the red spotting and early ripening of the fruit; and, second, the premature sprouting of ordinary leaf-buds, or of latent buds formed in the bark or cambium. Thus, in the first season, the morbid appearances are chiefly confined to the fruit; but in the following year the buds are seen to push earlier than usual, the foliage is noted to be yellowish-green, stunted, and twisted; a crowd of adventitious shoots are formed, and eventually the tree dies. Dr. ERWIN SMITH, on behalf of the Pathological Department of the United States Department of Agriculture, has proved by experiment that the disease is contagious, only a very small amount of infective material being requisite to induce the disease. Dr. SMITH's report of experiments on the inoculation of healthy trees, and on various methods of treatment, is marked by great prudence, and caution. By some it has been stated that the disease is caused by Bacteria.

FRUIT GROWING IN SYDNEY.—The *Bulletin* of the New South Wales Department of Agriculture for February contains a report of the conference of fruit growers, held in Sydney in February, 1891, to discuss the subject of fruit growing in various aspects. The meeting seems to have been promoted by the Government, and with much success. The practical men compared notes on sorts, and their suitability to particular localities, while the Government entomologist and the Government pathologist respectively gave a popular account of the commonest and most destructive fungi and insects, and indicated the best methods of combating them.

ASSURANCE AGAINST HAIL.—A proposal has been raised in Belgium as to the formation of a syndicate for assurance against hail, which causes often such severe losses in horticultural centres. MM. DESMET FRÈRES, of Ledeberg, Ghent, have not waited for the formation of this syndicate before taking wise measures. To begin with, they have protected the most exposed surfaces of all their houses with an iron net-work trellis, and will complete their arrangements later on. This is a specimen of "self-help" which is worth imitating.

PLANTS AND ELECTRICITY.—Among recent experiments, must be mentioned those made by MM. DESMET FRÈRES, in connection with the cultivation of Kentias. The specimens placed in the line of an electric current have grown neither better nor worse than the others.

GRASSES OF THE UNITED STATES.—Dr. VASEY, botanist of the Department of Agriculture, Washington, U.S., has published the first part of a treatise on the Grasses of the United States and of British America, which will be a boon to botanists, and furnishes another illustration of the activity of the botanical division of the Department of Agriculture.

DIJON.—In consequence of the death of M. WEINER, M. LOCHOT has been appointed director of the interesting botanic garden of this city.

SOUTHERN CALIFORNIA HORTICULTURAL SOCIETY.—We are glad to welcome the first number of the transactions and proceedings of this Society. With very few exceptions the managers of horticultural societies take a very inadequate idea of the functions of their society. They look upon it, if they are amateurs, as a means of winning prizes; if they are traders, of advertising for customers, or some other mercantile purpose; if visitors, as a means of recreation and of display of bonnets—all things beneficial to some individuals, and not intrinsically wrong, but all of which should be made wholly subordinate to the interests of horticulture generally. The Californian Society sets out with legitimate aims, as expressed in a circular from the Secretary, Mr. H. W. KRUCKENBERG, Los Angeles: "The Society, in so far as lies within its power, is earnestly labouring to disseminate a broader knowledge and a keener interest in scientific horticulture, and hopes in this way to not only increase its usefulness and influence, but to show where wear and tear may be saved, useless experiments avoided, how injurious insects and diseases affecting plant life are best abated, and the best results obtained in our horticultural development."

"THE CULTIVATION OF CARNATIONS AND PICOTEES BY AMATEURS."—This was the title of a paper read to an interested audience by Mr. G. B. LANSDALE at the meeting of members of the Exeter Gardeners' Society on Wednesday evening, March 16. Mr. G. B. CARLISLE presided. Mr. LANSDALE said Carnations, and their most recent sisters, Picotees, were held in high esteem by all lovers of flowers on account of their delicate scent, rich colouring, and general beauty. They were easy of culture, and bloomed well either in the greenhouse or open border, and he knew of no plant which would give better results to town growers. The speaker described the properties of a perfect flower, and defended the practice of dressing the flowers as a means of bringing out their full beauty. Messrs.

VEITCH & SON sent some excellent plants under consideration, which showed fine blooms. *Extract, Western Mercury, March 17.*

COCA LEAVES AND EUCALYPTUS OIL.—In the London drug market on Thursday, March 17, remarks Mr. JACKSON, of Kew Gardens, a sample of Coca leaves from the West Indian Island of Grenada was offered for sale. There was only one small box, which weighed 12 lb., and a bid of 3d. per lb. was offered for it. The leaves were described as bold, rather dark in colour, strong, and of fair flavour, and were said to be the produce of young plants which were sent from London to Grenada a few years ago. A parcel of leaves have also been received lately in London from the Niger district, but in consequence of their having been very badly cured, they will probably not be brought into the market. At the same sale, 50 lb. of Eucalyptus oil, which, a few weeks ago, could scarcely be got for love or money, was sold without reserve at 2s. 2d. per lb. and this of good quality.

POTATO CULTURE.—M. AIMÉ GIBARD contributes to the *Comptes Rendus* (February 15) a paper detailing the results of experiments made during the past four years with the Potato, with the object of increasing the yield by improved methods of cultivation. He was able to study the crops of between two and three hundred agriculturists who worked in collaboration with him, and he concludes that the two most important points to be considered in Potato culture are, firstly, the distance apart at which the plants are set, and, secondly, the number of pieces into which each tuber is cut. The Potatoes should be at such a distance from one another that each has free room in which to spread its leaves, but they should be so near each other that there are no bare spaces of earth between them. Thus varieties with foliage such as *Imperator*, *Jersey*, and *Red-skinned*, do best when 330 eyes are set to each 900 square feet (about). Twenty-one of the experimenters, who kept to the old plan of placing 250, 200, 150, or 100 eyes per 900 square feet, reaped harvests which were in every instance smaller in proportion to the greater unoccupied spaces. Other growers, because of the scarcity, and of the often high price which *Imperators* fetched last year, were obliged to use very large tubers, which they cut into two, three, or four pieces. This division with some kinds, and notably with *Imperator*, entails a great reduction in the crop. The cut tubers easily rot and die; this was found to be the case with all growers who planted such tubers, as their crop was reduced, in some cases by one half. Experiments made on so large a scale, and with so satisfactory a uniformity of results, cannot fail to be important to all growers to whom the success of their harvest is of serious consequence.

SNOWDROPS IN CHARBORO PARK.—A man has been sentenced at Wareham for picking *Snowdrops*. It is alleged by some that the conviction is illegal, on the ground that the *Snowdrop* is a wild plant. This will be a difficult matter to prove, and even if true, a question of trespass might arise. We have heard of cases where proprietors have been compelled to withdraw the privilege of gathering *Snowdrops*, *Daffodils*, *Ferns*, and the like, owing to reckless abuse of the privilege in uprooting the bulbs, &c.

FARNINGHAM ROSE SHOW.—The date of the annual show of the above Society, as we are informed by Mr. S. EDWARDS, Hon. Sec., has been altered from June 30 to June 29, in order not to clash with the shows held at Canterbury and at Eltham.

THORNBURY.—The annual show of the Thornbury Horticultural Society is arranged to be held on August 9, when a lecture on Bee Keeping and other attractions will be offered.

DRY GLAZING.—Messrs. SAM DEARDS & Co., Limited, of the Victoria Works, Harlow, inform us that the contract to supply 4000 feet of the "Victoria Dry Glazing" for His Majesty the King of the

Belgians through Mr. JULES MALSEN, architect, has just been received by them.

FRUIT FROM SOUTH AFRICA.—The Union Steamship Company's R.M.S. *Scot*, which arrived at Southampton on the 17th inst., has brought a further consignment of Grapes and Peaches from South Africa. This fruit was placed on sale at Covent Garden Market, when the Grapes realised high prices, boxes containing about 20 lb. net of white Grapes, fetching 10s. to 10s. 6d. each, and similar boxes of black Grapes realising 12s. 6d. to 15s. 6d. per box. These Grapes were packed in cork dust, and arrived in some cases in good condition. The Peaches also realised good prices, fetching 8s. to 14s. per box.

THE ACTION OF COMMON SALT ON THE GROWTH OF THE RADISH.—The Radish contains little or no starch, even during the latter stages of its development. Under certain conditions, however, it has been shown, in a recent paper read at the Academy of Science at Paris by Mons. P. LESAGE, starch is developed. If the Radishes are watered with solutions of common salt, containing from 1 to 20 grammes per litre, starch appears in the endoderm, and also in many cases in the cortical tissue. The results of some experiments were as follows:—

No starch with pure water.

Very little starch with 3 to 5 grammes of salt per litre of water.

A little starch with 10 grammes of salt per litre of water.

Much starch with 4 grammes of salt per litre of water.

A solution containing 20 grammes of salt per litre killed the plants.

In other cases the maximum amount of starch was found with proportions of salt amounting to 5 grammes and 10 grammes per litre.

These experiments are, perhaps, insignificant in themselves, but they certainly indicate that the character of a vegetable may be completely altered by watering it during growth with certain solutions. Is it not worth while to pursue this idea, and to see whether there is anything of a practical nature to be gained by such researches? Those of our readers who wish to consult Mons. LESAGE's work in detail, will find it in the *Comptes Rendus, Hebdomadaires des Séances de l'Académie des Sciences*, cxlii., pp. 373 to 375.

NAMES.—There are those who advocate the propriety of giving significant or descriptive names to plants in all cases where it is possible. The chemists do this, and we are told that one of the substances made use of to dye flowers in the manner mentioned in our last number is tetramethylparadiamidophenyl-orthoxipylmethane. This is a name which indicates the nature of a blue aniline dye very satisfactorily to the chemist, no doubt, but it is decidedly not a popular name. We could not send a messenger for half an ounce of this substance with any certainty that we should get what we want!

INTERNATIONAL HORTICULTURAL EXHIBITION.

—The General Committee in connection with the above exhibition, to be held at Earl's Court during the coming summer, met on Tuesday last, Mr. W. MARSHALL, in the absence of Mr. H. E. MILNER, presiding. Among other business conducted, the draft schedules were revised.

SPRAYING TO DESTROY INSECTS AND FUNGI.

—We take the enclosed summary from *Bulletin No. 35* of the Cornell University Experiment Station (Horticultural Division):—"Spraying to destroy injurious insects and fungi has now come to be a necessity in fruit growing and vegetable gardening. Much of its success depends upon the operator, however. The treatment must be timely, thorough and persistent. Above all things, be ready, and begin to spray the moment the first injury is seen, or even before. Study the question during the winter, and buy the materials before spring opens. Always use the finest and most forcible spray which will reach the desired height. There are two leading insecticides, —the arsenites, and kerosene emulsion. The arsenites are Paris Green and London Purple. 1 lb. to 200

gallons of water is a good proportion for Apples, Pears, Potatoes, &c.; 1 lb. of Paris Green to 300 or 350 gallons should be used on Peaches. Never use London Purple alone on Peaches. For Apple-worm, begin to spray just as soon as the last blossoms fall. Kerosene emulsion is the weapon to use against all kinds of plant lice out of doors. A good formula is soft soap 1 quart, kerosene 1 pint, hot water 2 quarts. Churn the materials by pumping back into the pail for several minutes. Dilute two or three times. There are two leading fungicides, —ammoniacal carbonate of copper, and Bordeaux Mixture. The former is cheaper, and much more easily made and applied. Bordeaux Mixture cannot be thrown on to large trees. To make the former, use 3 oz. carbonate of copper, and 1 quart 22° ammonia. This stock solution will keep, if tightly corked. When used, dilute to 25 gallons. If 26° ammonia can be obtained at your drug store, it is better to use 5 oz. carbonate, 3 pints ammonia, and 50 gallons water. This is the best general fungicide. For Bordeaux Mixture, use 6 lb. sulphate copper, 4 lb. lime, 22 gals. water. Carbonate of copper costs from 40 to 60 cents per pound, and sulphate about 6 cents. The only combination of insecticides and fungicides yet found is made of the arsenites and Bordeaux Mixture. When arsenites and ammoniacal carbonate of copper are combined, the value of each material remains, but foliage is usually seriously injured.

CHRYSANTHEMUM SALAD.—A Japanese writer in *Le Moniteur d'Horticulture* says that the Chrysanthemum is a recognised article of diet in his country. The varieties used bear smaller and darker yellow flowers than do those grown for ornamental purposes, and these blossoms are commonly seen in the green-grocers' shops in the months of November and December. They are eaten raw with vinegar and other condiments as Europeans eat salad, or boiled in water.

COPPER-SALTS FOR THE PREVENTION AND PALLIATION OF THE POTATO DISEASE.—Messrs. ROBERT VEITCH & SON of Exeter have done well to republish their report upon experiments made by them on the influence of the copper-salts. In view of the unfavourable results obtained by Messrs. SUTTON, and the different opinions which consequently prevail, it is, we hope, certain that fuller and more varied trials will be made this season, and Messrs. VEITCH's pamphlet may be read with advantage by those who are intending to try the plan. In any case, it is abundantly certain from the Chiswick experiments, that earthing-up on the Jensen plan is very efficacious, and very suitable for cottagers and small growers, who at present fold their hands and lose their crops. Here is work for the county council lecturers.

—Consul PADNÉFOTE's report to the Foreign Office, on Agriculture in the Department of the Charente Inférieure, France, contains some useful information on the treatment of Potato disease. All over France, the Consul reports, the treatment with sulphate of copper has proved efficacious. The dressing consists of 2 lb. of sulphate of copper and 4 lb. of lime to 25 gallons of water. "In no case," the Consul reports, "have I been able to hear that this application has failed."

PUBLICATIONS RECEIVED.—*Traité d'Horticulture Pratique*, par GEORGES BELLAIR (Paris, O. DOIN). *Exchange List of Seeds*, Royal Botanic Gardens, Glasnevin. *Technica*. — *Förlisch Naturwissenschaftliches Zeitschrift*.

BOOK NOTICE.

HANDBUCH FÜR PFLANZENSAMMLER. Von Dr. Udo Dammer. Mit 59 in den text gedruckten Abbildungen und 13 tafeln. Stuttgart: Ferdinand Enke, 1891. *Handbook for the Plant-Collector*. 8vo, pp. 342.

THAT this book is something more than a mere exposition of the best methods of collecting, drying, preserving, and arranging plants may be imagined

from the size of it. As a matter of fact, it is also an introduction to systematic botany, and constitutes a useful companion to the young botanist, biological phenomena receiving a due share of attention.

In his first chapter, Dr. Dammer contrasts the botanising of to-day with that of the days of Linnaeus, and in the opening sentences falls into a singular error respecting the present resting-place of the great master's herbarium. The Linnean Society of London, is so well-known that such a mistake is a little surprising. He begins:—"In the rooms of the British Museum, in London, there is a sanctuary for botanists, which doubtless the great majority of the 'profession' visiting the immense city take the opportunity of seeing. One enters the room containing the object of the pilgrimage in a devotional frame of mind. 'The Linnean Herbarium' resounds from the voice of the gentleman escorting you, and you approach it with reverential feelings, but turn away disappointed."

Dr. Dammer is quite right as to the fragmentary character of the specimens, and their insufficiency for purposes of comparison; and his estimate of the herbarium serves well as text for his explanation of the requirements of the present day in this direction.

But it is not our intention to submit his work to a close criticism. So far as we have consulted it, it appears to be a trustworthy guide. At the end there is a key to the natural orders, illustrated by thirteen plates of floral structure, arranged according to Bentham and Hooker's *Genera Plantarum*. Cryptogams are treated more in detail in the body of the work, and the figures are almost all borrowed from Lueresen's well-known book. *W. B. H.*

NURSERY NOTES.

FLOWERS AT MESSRS. J. VEITCH AND SON'S NURSERY, CHELSEA.

In most years, since the *Amaryllis* has been taken up by Messrs. Veitch, the middle of the present month has seen the larger portion of the main stock of these plants in full beauty. This year it is otherwise. Winter was long, and frosts severe, and these have, together, delayed the opening of the flowers, by rendering imprudent any great amount of forcing, either at the root or top. In about five or six days from the present time, the plants should be at their best.

We were shown by Mr. Heals, who still rules in this department with so much skill, some few of the seedlings that are flowering for the first time. There is much mild excitement in watching the unfolding of the flowers, whose genesis is the result of your own direct handiwork, and when a beautiful flower is the result, a pardonable amount of pride is justified. But our friend showed neither the one nor the other, and we fear he is becoming callous in these matters from mere familiarity. The big bed of bulbs of flowering age is as full as ever, as are the narrower beds at the sides of the house—a span-roofed one. *Eclipse* is a seedling which is flowering for the first time; it is a solid bloom, of a white ground, on which are scarlet flakes and stripes, and the segments, which overlap each other their whole length, have rounded extremities, that boldly reflex. It is a very distinct variety. Another is *Orion*, a scarlet bloom, of fine big form, having the celebrated *Champion* blood in it. It is reticulated by veins which are slightly deeper in tint than the body colour. *Chromis* is of brilliant scarlet, and middling size, and perfectly regular in shape. *Polyxenes* has nice circular blooms, scarlet, with green stripes. *Glow*, as is proper, has brilliant crimson blooms of a pleasing form. In *Ida* is seen a vigorous-growing plant, whose flowers are chiefly white, with a little crimson netting; *Medon* is a fine deep crimson, with a creamy-white stripe; and *La Superba*, and *Rembrandt* are remarkably fine in colour and symmetry of form.

In some of the other houses there were noted a

splendid show of *Anthurium* coming along, which in ten days will be a fine sight. The *Nepenthes* are still in good condition, the pitchers being fresh and numerous. The masses of *Cattleya Trianae* in the large house have gone out of bloom, except for a few white forms of it. Some fine blooms of *C. Schroderae* were noted; some of the rare *Trichopilia suavis alba*; also *Aërides Savagaeum*, reminding one of *A. Lee-anum*; the rare *Vanda gigantea*, a rather coarse but singular-looking flower in brown and yellow. Numerous small plants of *Cypripediums* were in flower, some of which are rare and costly.

Those which pleased us most were the pretty and varied forms of *C. villosum*, one of the prettiest being *C. Godseffianum*. We remarked *C. Winianum*—rather scarce, a palish yellow flower, and with *C. Druryi* leaves; also *C. Germianum*. Several tiny baskets contained flowering plants of the pure white fragrant *Agrostum fastuosum*; and a tall growing *Calanthe* was observed, with white flowers, having a deep magenta-coloured centre—it is presumably an unnamed seedling of *C. Veitchii*; also the singular-looking *Cirriophetulum picturatum*, *Cymbidium Devonianum*, *Phaius Blumei*, the cream and brown-flowered *Lycaste leucoglossa*, as well as many of *L. Skinneri*, including white forms of it. *Brassavola glauca*, a flower fragrant in the evening.

Space allows us only to allude to the new show house nearing completion, which is being fitted up with rockwork, consisting of tufa, after the fashion of the rocky vestibule between the lesser Orchid houses and the big *Cattleya*-house. This will make a most convenient place wherein to exhibit hard and soft-wooded greenhouse plants when in bloom, and also stove plants in the warmer months. The present show greenhouse was abundantly furnished with *Azaleas*, *Lilacs*, *Spiraeas* of different species, the prettiest being *S. confusa*; *Narcissus*, *Acacias*, *Dutch bulbs*, *Boronia heterophylla*, *Rhododendrons*, *Heathes*, *Epacris*, *Scillas*, &c.

SCOTLAND.

EDINBURGH BOTANICAL SOCIETY.

The above Society met on the 10th inst., at 5, St. Andrew Square, Dr. Christison, President, in the chair. Mr. Dunn, Dalkeith Gardens, exhibited *Tillandsia stricta* var. From the Royal Botanic Garden there were shown *Saxifraga luteo-purpurea*, which is a natural hybrid between *S. media* and *S. aretioides*; *S. Burseriana*, and its variety *multiflora*; and a tuber of *Amorphophallus campanulatus* from Mr. T. H. Storey, Superintendent, Sajjav Niwas Gardens, Oodeypore, Rajpootana; this tuber weighs 26 lb., and produced a stem 18 inches in circumference, and 6 feet high, the spread of leaf being 7 feet.

Dr. Paterson, Bridge of Allan, sent out blooms of *Coleogyne cristata alba*, *Odontoglossum* (five species), *Cinnam Macowianum*, &c. Professor Bayley Balfour exhibited a method of mounting museum specimens by a cement which remains transparent in spirit.

Dr. Christison read an elaborate paper on the "Girth increase of Young Trees for five years (1887-91)," in which he brought forward many very interesting particulars as to the yearly, monthly, and weekly growth of deciduous evergreen trees and Conifers chiefly in the Royal Botanic Garden. A communication on a new South African *Alga*, *Thalacarpus disciger*, Holmes, by E. M. Holmes, F.L.S., was submitted.

Mr. Lindsay read a note on the poisoning of sheep by *Andromeda floribunda*. A case had been reported to him from the neighbourhood of Falkirk, where of a score of sheep which had nibbled the flowers and leaves of this plant two had died. A few similar cases have previously been recorded in England. Dr. Cleghorn stated that in the Himalayas the shepherds had told him of the poisonous qualities of *A. ovalifolia* during vernal, but not afterwards,

Mr. Rutherford Hill gave a list of ericaceous plants from which a specific poison had been extracted.

ROYAL BOTANIC GARDEN, EDINBURGH.

Report on Temperature, &c., for February, by Robert Lindsay.—During February the thermometer was at or below the freezing-point on twenty occasions, indicating collectively 112° of frost for the month, as against 79° for the corresponding month last year. The lowest reading occurred on the 19th, when the thermometer went down to 7°, or 25° of frost. This is the lowest reading that has occurred at the garden since December, 1882. From various districts in Scotland several degrees below zero were registered on the 19th. Fortunately, the ground was well covered with snow, which afforded great protection to dwarf-growing plants during the severe frost. Other low readings occurred, viz., on the 16th, 20°, 17th, 19°, 18th, 23°, 20th, 15°. The lowest day temperature was 33°, on the 16th; and the highest, 54°, on the 9th. Snow began to fall on the 15th, and frequent heavy falls took place till the 21st, and it did not disappear until near the end of the month. A good many plants have been more or less injured by the severe frost. Amongst those which have suffered most are various species of Japanese Bamboos, New Zealand Veronicas, *Olea ilicifolia*, Golden Holly, &c.; *Rhododendron Nobleanum*, and *R. præcox* have had their flower-buds destroyed. The following spring-flowering plants annually recorded to the Society, came into flower in February:—*Galanthus nivalis* on the 2nd; *Eranthis hymalis* on the 6th; *Leucoium vernum* and *Tussilago fragrans*, 9th; *Dundia epipactis* and *Rhododendron atrovirens*, 10th; *Crocus susianus*, *Bulbocodium vernum*, *Scilla sibirica*, *S. præcox*, and *Corylus Avellana*, 12th; *Symplocarpus foetidus*, 23rd; *Daphne Mezereum*, 24th. On the rock garden thirty-one species and varieties came into flower during the month, the most interesting being *Crocus Imperati*, *C. Olivieri*, *Hyacinthus azureus*, *Leucoium carpaticum*, *Colchicum crociflorum*, *Helleborus aschasicus*, *H. olympicus*, *Narcissus minimus*, *Saxifraga Burseriana*, *S. imbricata*, *Galanthus Imperati*, and *G. Redoutei*.

On Temperature, &c., at the Botanic Garden, Glasgow, by Robert Ballen.—The unusually mild weather which prevailed at the end of last month became very boisterous in the first week of this month. Showers of snow and sleet were frequent, and on the first four nights frost was registered. The second week was remarkable for the fine summer weather experienced. From the 9th to the 13th, the mean temperature both day and night was very high for the season, 67° being registered in the sun on the 13th. The third week was the most wintry we have had. Snow fell on the 15th, and a heavy fall took place during the night of the 16th. Night frosts prevailed the whole week, and of the 56° recorded as being the total for the month, 34° was registered during the nights of the 17th, 18th, and 19th. The lowest day reading was 34°, on the 19th. With the exception of cold north and east winds, the last week was comparatively mild. The leaf-buds of most hardy shrubs are in an advanced state.

FORMATION OF A PROTECTIVE UNION BY ABERDEEN GARDENERS.

A largely-attended meeting of gardeners was held in Aberdeen on Friday evening, the 18th inst., for the purpose of forming a Trade Protection Association. Mr. THOMAS NICOL, President of the Aberdeen Trades Council, occupied the chair. Several speakers alluded to the low rate of pay for gardeners of all classes, and the long hours made by nurserymen's employees. The motion that the gardeners present should form themselves into a protective union was then put to the meeting, and was unanimously adopted. The election of office-bearers was then proceeded with, Mr. William Slorach being elected President, Mr. Alexander Fraser, Secretary, and Messrs. Florence, Kinaird, Gray, Duncan, Lawson, Smith, and Kenman, as members of committee. About fifty members were enrolled at the close of the meeting.

TREES AND SHRUBS.

ARBUTUS ANDRACHNE.

PLANTERS pay poor tribute to a beautiful, highly characteristic, and striking low evergreen tree, when they overlook or fail to plant *Arbutus Andrachne*; in other words, the *Andrachne* of Theophrastus. As an introduction from the Levant, it is not as hardy as *Arbutus Unedo*, which covers so wide a range as Palestine, many places in Europe, and Ireland, growing freely on barren limestone rocks in the county of Kerry, notably near the lake of Killarney, from whence, by-the-way, the country people around gather and eat the fruit. Still, *Andrachne* does succeed in this country, when care is taken to plant out tolerably matured young trees of 3 or 4 feet in height. When this species attains to 20 or more feet in height, it bears smooth, coriaceous and shining, and indistinctly serrulated leaves from amongst which project, in more or less pendulous form, large greenish-white, waxy panicles of bloom, and is very attractive. But its striking features do not end here; it has fruit resembling that of its Irish compeer, and, above and beyond all, a boke of abnormal whiteness, from which the outer bark cracks and peels off, in very thin or ribbon-like "papery" layers, annually. As a prominent bark tree it would, therefore, form a fitting associate with the foxy-barked *Sequoia sempervirens*. *William Earley*.

ILEX CORNUTA.

This most distinct and handsome species, introduced from north China forty-two years ago, has not met with a very wide distribution. This is partly accounted for by reason of its growth being rather slow. It is, nevertheless, well worth a place in any garden, and being different in appearance from the rest of the genus, it forms a conspicuous object. It will thrive well in a mixture of loam and leaf-mould, and the soil should be pressed quite firm round the roots. I have found the best time for planting this Chinese species to be April, and, if possible in showery weather. It forms a thick bush-like tree, plentifully supplied with dark green leaves, leathery in texture, measuring from 3 to 4 inches long, and $2\frac{1}{2}$ inches in the widest part, each leaf being terminated by three strong spines. To increase the stock, cuttings may be taken off in September and put in cold frames, and dibbled in light soil. The base of each cutting should be made quite firm in the soil. When this is completed, give a good watering to settle the soil about them; the frame must be covered with tiffany when the sun is shining. When the cuttings are rooted and ready for planting out, take care that the roots are not broken, or the plants will receive a check.

PINUS SYLVESTRIS ACREA.

This is a useful Conifer for brightening up the pleasure grounds during the winter. Though not such a strong grower as the type, it is worthy of more attention than it has hitherto received. No subject is better suited for winter effect than the golden Scotch Fir. Being of a slow-growing nature, it is admirably adapted for planting as single specimens on the lawn. In spring and summer it assumes the normal greenness of the species. It is not very partial to damp positions, and should, if possible, be planted in rather dry soils, and be fully exposed to the sun.

Propagation is effected by grafting, which should be done in spring, on stocks of the common Scotch Fir (*P. sylvestris*). The grafts should be plunged in a close propagating case, where the temperature is about 65°. The glass should be wiped every morning, to clear away superfluous moisture. A gentle syringing overhead occasionally will assist them to break away more freely, but care must be taken not to give too much, or else they are apt to damp off. Shade from the sun with tiffany, &c., and in a few weeks' time the scion will unite with the stock,

when the latter must be cut back, and a small stake applied to each graft. When of sufficient size, plant out in nursery rows. *H.*

VEGETABLES.

PARIS MARKET BRUSSELS SPROUTS.

AT p. 237 of the *Gardeners' Chronicle* large coarse Brussels Sprouts are condemned, and rightly so; for if the quantity and quality of sprouts of the large-sprouted tall varieties are compared with medium-sized ones, it will be found that the latter are the most profitable to grow, and the sprouts are of just the size which most persons like. I have grown at Syon for the last year or two the Paris Market Brussels Sprout, which is one of the best for furnishing early sprouts, which are small, firm, and of fine flavour. This variety was shown by Messrs. J. Veitch & Sons at the Vegetable Conference, held at Chiswick in 1889, and I noted its superiority over others in the matter of being very dwarf in the stem, and also as producing a quantity of firm sprouts of middling size. It was the only dwarf variety which was certificated at that time. I have since grown it in preference to the imported type of sprouts, as the latter does not always come true to character. With Paris Market, the crop shows a very regular dwarf lot of plants that produce sprouts early enough for the first dish. The stems are closely furnished with sprouts, and, being of very low stature, it may be planted more closely together than is desirable with the larger types. For an early crop, it may be sown this month on a warm border; and for the earliest planting, sowings should be made in heat three or four weeks earlier. Veitch's Paragon and Exhibitor Brussels Sprouts form an excellent succession. Paragon is of medium growth, and the sprouts are firm; those of Exhibitor are larger. *G. Wythes*.

EARTHING-UP CULINARY VEGETABLES.

Born in the middle of the Bavarian Krautlande—Cabbage country—in the Circuit Unter Franken, says Mr. Biemüller in the *Gartenflora* for March, 1892, and from my earliest years acquainted with the culture of the vegetables of Bamberg and Schweinfurt, which are well known beyond the frontiers of Germany, I wish to state that the whole of the varieties of Cabbage, Beans, Peas, and Cucumbers are, after being hoed between several times, occasionally earthed-up; indeed, as long as the rows of plants can be manipulated without injury to the leaves.

The earthing-up exerts a great influence on the development of the heads in Cabbages and on that of the fruit of Beans and Cucumbers, as I frequently had the opportunity of observing. It is quite remarkable to observe the difference between earthed-up and not earthed-up plantations—the Cabbage heads are not nearly so large and firm; neither is Kohl Rabi so fine, nor are Kidney Beans so long or tender where not earthed up. The reason for this difference is to be found in the earthing-up, which protects the roots from drought, and likewise allows of more air reaching the plants; and, moreover, it is easier to afford water, owing to the furrow that runs between the rows, and where rain-water also collects; and all this without making either the crowns or stems of the plants too wet—favourable conditions for the plants, as the constant moisture of the soil about the roots greatly aids development.

No farmer or gardener who cultivates these vegetables neglects the earthing-up of the plants, which mostly is performed by women. Large estates much engaged in the growing of Cabbage, &c., possess peculiar implements for hoeing and earthing-up. When planting on well-manured, fresh-ploughed land, flat ridges are made with the hoe, on which the plants are set out, otherwise the plants would in time stand too deep in the loose soil, owing to the repeated hoeings. This is a fact which the practical folk of the district have discovered for themselves.

FORESTRY.

THE NURSERY.

If not already done, the sowing of the seeds of hardwood trees should be completed without further delay, and the ground to be used in the formation of seed beds for coniferous tree seeds next month should be well-worked by digging or trenching where necessary. All sorts of nursery stock that are intended to remain in the nursery another year should be overhauled and transplanted, to give additional space where requisite, and stuff that does not require to be transplanted should have the ground dug between the lines of plants to keep down weeds and promote root action. Specimen ornamental trees that are to be planted out where they are to remain next year had better be transplanted to promote the formation of fibrous roots, which will prove beneficial as a means of attaining success. Ground that has become exhausted by tree culture should be renewed by planting a crop of Potatoes or Turnips in drills of 27 inches wide from centre to centre, and applying thirty-five loads or tons of good farmyard dung per imperial acre. Artificial manures are not to be commended for this purpose. In cases where it is necessary to apply manure to promote tree growth on poor soil, it should always be in an advanced state of decomposition. Ornamental trees that are generally increased by grafting, such as the finer kinds of Oak, Beech, Elm, Laburnum, &c., should now be attended to, and in performing the operation we have found the best results by using an equal quantity of clay and horse droppings well mixed and worked with water until thoroughly incorporated. Extract the seeds of Larch, Scotch Fir, and others so that they may be ready when wanted. *J. B. Webster*.

HOME CORRESPONDENCE.

SPIRÆA CONFUSA.—What a capital variety of the shrubby species of this family is the above for flowering in a cool house during the month of February! It is a pity we do not see more of it in amateurs' greenhouses, considering how simple it is to grow. After flowering, the aim should be to induce the plants to throw up strong sucker-like growths from the base, not interfering with them at all, allowing them to extend in length, and gather strength by the plants being well fed when in full growth, as it is really then that the foundation of the future crops of flowers is laid. Any weakly shoots should be cut clean out after flowering, to give space to those left to enable them to ripen well. The flowers are borne in a round rosette-like fashion, 2 inches in diameter, on short footstalks, and are pure white, and very useful for cutting, either singly or in racemes, for filling taller vases. A mixture of loam and leaf-soil, with the addition of a small quantity of peat, is a suitable compost for this *Spiræa*. When the growth is made after flowering, an open position out-of-doors is the best for this plant until the middle of October, when any cool house will suit it. *E. M.*

POTATOS, ROUND AND KIDNEY.—Some twenty-five years ago a cottagers' show was started here, which has been a brilliant success; but the new Potatoes were a constant source of contention. For years I had been in the habit of purchasing most of the best new varieties of Potatoes as they appeared, and distributing them among the neighbouring cottagers, so that Potatoes became in time quite a feature of the show; but the judging was an occasion of great heart-burning, for no man could say exactly when a round ceased to be a round Potato and take on the kidney form; but we adopted the plan of having three classes instead of two as formerly, viz., round, oval, and kidney, and since that time no difficulties have arisen about the judging. I am quite sure that any practical man will fall in with this plan, which we have found to answer very well, and to have stopped most of the grumbling. I am going to make use of sulphate of copper and quicklime for checking disease next July, which Mr. Robert Veitch of the Exeter Nurseries has so well described in a

pamphlet recently published by him. *J. Rust, Eridge Castle, Tunbridge Wells.*

GREEN CURRANTS.—I was much surprised recently to learn from a well-known Surrey market gardener that a trade in green Currants of the red section was slowly growing up in Covent Garden Market. This will probably surprise many whose notions of green Currants are that, in that condition, they are not only worthless but intensely acid. Now, my informant was careful to say that enquirers for green Currants were perfectly aware of the acidity found in them, but also knew that, like very young green Gooseberries, the acidity was not of so intense a kind in that stage as later, especially in the case of Currants, which seem to be sharpest when colouring. Should this demand for green Currants become considerable, there can be little doubt but that it will give additional impetus to red Currant culture. It is obvious that, for supplying these green fruits, the finest and earliest berries sorts are most useful. Still farther, the sort of culture given by the best growers, that is, pruning all growth back to short spurs, and causing the bushes in winter to resemble mere clusters of rough-looking stumps, and giving liberal top dressings of manure in the spring, is the best way to secure abundant crops of fine berries for early picking. *A. D.*

HOUSE DECORATION, ETC.—On p. 343 of your recent issue you were good enough to give a criticism on my paper, read before the Royal Horticultural Society on the 8th inst. Will you allow me to point out a few inaccuracies. In the first place you make me say that Lady Sutton paid £1000 in one month. I did not name any amount that Lady Sutton paid. Then you went on to question the accuracy of my statement as to the lasting qualities of *Coccoloba* as a plant suitable for house decoration. If you could spare time to call here, I could show you plants which have been in the same position over two years, viz., on the top of the first landing of a staircase in a very draughty position. The plants are now very little the worse for their long tenancy of such an unfavourable position. You remark that I might have given an object-lesson. I think the public have had ample opportunities of witnessing very many of these object-lessons at various horticultural exhibitions in London, Paris, Brussels, and elsewhere during the past twenty years; at any rate, I think I may claim some little credit for having diffused a taste in the arrangement of plants that is now, and has been for many years, largely copied all over the country, even at the most unpretentious country shows. You, in conclusion, strongly condemn the excessive extravagance of people spending such large amounts on the floral decorations of their houses, and say that a good display might be made for a few shillings. It very likely has not occurred to you that it has been the means of giving employment to many thousands of people, and, as the late Lord Palmerston stated years ago, caused, in many instances, more than two blades of grass to grow where only one grew before. If the nobility and gentry have the means of spending sums such as I stated, and these sums feed and clothe many thousands of our fellow countrymen, surely they ought not to be blamed for it, but rather encouraged. *John Wills.* [We said, while paying a justly-deserved compliment to Mr. Wills, that it was a matter for regret that his paper was not illustrated in the way which Mr. Wills could have done it, but we hoped that the audience would not go away with the idea that any excessive expenditure was necessary to secure tasteful decoration. Ed.]

BEQUESTS TO DOMESTICS.—I have hoped that some lawyer among your readers would have replied to the interesting question put by "W. P." at p. 344, for March 12, as to whether a gardener can claim to participate in legacies given to a testator's "domestic servants." As no lawyer has replied, I have just looked up the point in *Williams on Executors*, vol. ii., p. 1063. It seems to have come before the courts on many occasions. In one case, outdoor servants at weekly wages were held to be entitled under a bequest to "servants in my service at the time of my decease." On the other hand, Lord Truro, in another case, held that a head gardener, who lived in one of the testator's cottages, and was not tied by him, was not entitled under a bequest of a year's wages to "each person as a servant in my domestic establishment at the time of my decease." This latter case comes very near to the case of "W. P." Obviously, however, everything turns on the exact wording of the bequest, and "W. P." has put

his question in rather a loose way. If the legacy he refers to is one of any considerable amount, "W. P." would do well to spend a few shillings in taking the opinion of a solicitor. *F. S.*

DOGWOOD.—Your correspondent, "Vagabond," does well in calling attention to the pleasing effect in the garden landscape of masses of this shrub when properly placed, and in no way can it be better utilized than by mass planting upon the margins of lakes, or rivers, in the way your correspondent points out it is made use of at Reigate Priory. At Eastnor Mr. Coleman has produced a pleasing effect by planting it extensively on the margin of a lake, a plan which we have imitated at Hendre to a lesser extent. Not only is this shrub beautiful in winter, but in autumn when the leaves are changing colour, previous to falling. *Thos. Coomber.* [It is a gawky and coarse-growing kind of shrub, and fit only for the less dressed parts of the garden. Ed.]

WEED-KILLER.—It is well to call the attention of seedsmen and others retailing weed-killer, to the case lately decided against Mr. Bott, seedsmen, Barnstable. The Judge in the case, after taking a week to consider his judgment, decided against the defendant, but said he should like to see the case carried to a higher court. In the face of this, should not all those interested in the matter combine to make it a test-case, and so decide, once for all, whether or not weed-killer comes under the Pharmacy Act of 1868? It is a matter of general interest to the trade, and I should like to see some of your readers give their opinion. *Interested.*

FORCED LILAC.—The remarks of "C. D. A." in last week's *Gardeners' Chronicle*, p. 341, regarding the forcing of purple-flowered Lilac, I quite agree with. Lilac flowers when produced of a pure white, look very beautiful. The blanching is best carried out in a cellar or shed from which all light can be excluded, and a temperature of 55° to 60° kept up together, with a moist atmosphere, which will be the right treatment, as it is important, that the flowers should be induced to start a little in advance of the leaves. The one disadvantage connected with blanching is the difficulty of obtaining any Lilac foliage to accompany the flowers, unless it be procured from plants which have been forced in full sunlight. *G. Parrant, Ashby Saint Ledgers Lodge, Rugby.*

WATERING COKE.—Having used coke for fourteen years for heating purposes, I can fully endorse the remarks of "Practice" and "Mr. T. H. Bolton" in your issues of February 27 and March 5, pp. 277 and 311 respectively. I always found by slightly damping the coke before use both its heating and burning properties are greatly improved. However, in damping coke care must be taken not to make it wet. In my experience I find wet coke causes a great waste of fuel, is slow in heating, and altogether unsatisfactory to the stoker. *J. Charlton.*

THE MULTIPLICITY OF VARIETIES OF APPLES.—I venture to think that the Fruit Committee of the Royal Horticultural Society would render a good service to fruit growers generally if it would undertake the compilation of an *Index Expurgatorius* of Apples. To this fruit, *Hogg's Fruit Manual* devotes 252 pages, with three or four sorts on a page; *Downing's Fruit and Fruit Trees of America*, 354 pages; André Leroy describes 527 sorts, the *Horticultural Catalogue* of 1842 has 879 sorts, and the present collection in the gardens is very large. I have over 500 sorts, and others have probably more. I do not, of course, say that all these sorts are generally cultivated, but there are too many of equal quality, and many others of no interest or value at the present day, which might be suppressed entirely, to the great advantage of growers, planters, and of future *Fruit Manuals*. The Royal Horticultural Society is at present in such a flourishing condition, that it could easily undertake the publication of such an index as would consist of names only; and the work, if carried through a series of sittings of the committee would not be exhausting, as a time (strictly limited) might be given at each sitting. *T. Francis Rivers.*

CROSS-BREEDING OF CARNATIONS AND SWEET WILLIAMS.—In the summer of 1890, I hybridised some single Carnations, under glass, with the pollen of Sweet Williams (carefully removing the Carnation stamens before maturity), and obtained twenty-eight seeds. These were sown last year, and I have now about twenty healthy plants showing for bloom, but they present a most remarkable phenomenon—

they have formed woody tubers at the base of the stem about the size and shape of breakfast Radishes. I am anxiously waiting for the blossom. *B. Piffard.* [We mistrust those tubers, there may be a worm in 't the bud. Ed.]

CHOISYA TERNATA.—I notice in the *Gardeners' Chronicle* of the 12th inst., a short paragraph on the above evergreen growing so well in the southern counties of England. I may state, that in the gardens at Belmont, Murrayfield, Midlothian, a fine plant is growing on a south wall, and is in fine condition, and it flowers very profusely in summer. The plant stands on a south wall, and is unprotected during winter. *J. Jeffery.*

CATTLEYA ALEXANDRE.—In the *Gardeners' Chronicle* of March 12, p. 341, is a reference to the Cattleya Alexandre, discovered by our collectors, and surprise is expressed that I should have named an Orchid which I had never seen in bloom. In bestowing the name upon a new plant, I have only done what all botanists do, though I have no claim to walk in their preserves. I am well acquainted with the Cattleya under discussion, since I have had dried specimens to examine, and also an excellent water-colour drawing done by one of our collectors, and now in my possession. The plant is not yet ready to be sent out, but I was desirous to secure for it at once a name which was intended as a compliment to the English nation, and to a Princess whom horticulture is proud to number among its patrons. If I refrain from giving any further information at present, I do so in order that others may not immediately assert that they also have the plant. But the *Gardeners' Chronicle* may rest assured that when the proper time comes I shall place my materials in the hands of a competent botanist, and that the plant shall be accurately described in due form. *L. Linden.*

MOLES AND WIREWORKS.—I read with no small degree of surprise the article on wireworms, by Mr. Rust, in your issue of February 27, p. 278, in which he advocates the preserving of moles to destroy wireworms, because I fear the remedy would prove worse than the disease. Having advocated the destroying of moles for years, in fairness to myself I will, with your permission, offer a few remarks upon my own experience of these troublesome intruders. It was my lot to serve in a garden where our employer took the mole-preserving cause, therefore, I had every opportunity of observing the destruction wrought by that pest. The damage done to crops in the kitchen garden was serious, seed-beds being upheaved in a ruthless manner, while Cauliflower-plants, Pea-rows, and Potato-drills, fared no better; indeed, no part of the garden escaped their destroying-power, and the annoyance caused by their continued upheaval of the lawn and bowling-ground was great. The consequence was, the moles had to be killed, and these gardens have not suffered any degree of harm from wireworm since the moles were destroyed; indeed, I was told by a very intelligent and observing mole-catcher in this district that he had frequently opened moles taken from fields where wireworm was destroying the crop, and he failed to find one wireworm in the stomachs of these intruders. With regard to their channelling and draining the land, I beg to differ from your correspondent. I always found the water to stand an undue length of time in their much-trodden subterranean pathways, and the land much the wettest where these holes existed. I hope Mr. Rust does not seriously advocate moles in our gardens or pleasure-grounds, and if we allow them full scope in parks, fields, or plantations around our gardens, I would like to know how, without destroying, can we keep them out of our gardens? I fear Mr. Rust has allowed his humane instinct to overrule his discretion on this important matter; for in the case of some employers it is not easy to explain away the remarks of some of our able (humane) writers. Therefore, matters of such importance to gardeners ought only to be prompted by sound practical experience, and I will read with interest any remarks that may be made upon this subject by other practical gardeners or land-stewards. *J. Charlton, Farnley Grove Gardens, Corbridge-on-Tyne.*

MILDEW IN VINERIES.—Amongst the funguses and other pests requiring watchfulness in the Vine-grower, mildew is one of the worst. Vines in good health, and which obtain liberal treatment, very rarely are affected by it. Ventilation, improperly afforded, is sometimes the cause of an attack, and it is, as a rule, less harmful to endure a high temperature in the vineries for an hour or two, than to

lower it by admitting a volume of cold air. The reason why mildew is more generally seen in late vineries, I think, is due to the absence of fire-heat. Plants growing in vineries, especially roses, on account of their susceptibility to this disease, should be avoided. Sulphur applied in some form or other is well known to be infallible, and it should always be used in winter-dressing for Vines, also in the annual whitewashing of the walls. Some persons advocate putting it on the hot-water pipes; if this is done, it should not be a large quantity that is so used, for Grapes are often spoiled by strong applications in this manner. Dusting with flowers-of-sulphur, if thoroughly done, has good effects, and clear-boiled sulphur-water used with the syringe is very efficacious. *Thos. Harris, Ashby St. Legers, Rugby.*

BAMBUSA METAKE.—This, though not the most elegant, is the hardiest of all the Bamboos, and never seems to suffer from frost in like degree to other species, and through all the cold and keen winds it may be seen unscathed, and looks fresh and green when the spring comes. It is also a very free grower, its stems running to a height of from 10 to 15 feet, or even more, and under-ground shoots come up at some distance from the mother-plant. These suckers, or rhizomes, may be taken off, and planted at any time, but the best season to remove them is in April, when growth begins. Those who have decoration to do will find this species very useful, as the cut canes, put into big-mouthed bottles of water, stand well, and look like elegant little Palms. *J. S.* [It does well in very smoky districts of London. *Ed.*]

PRUNING DENDROBIUMS.—I am very much obliged to your able correspondent, Mr. Burberry, for his courteous reply to my questions on the above subject; but I must beg to differ from him in nearly all that he says respecting the growth of this extensive genus of Orchids. In my opinion, he has not taken into serious consideration the structure of these plants, which differ as widely in their habit of growth and other essential characteristics as plants can possibly differ. Your correspondent says that the old pseudobulbs are natural reservoirs. Now I insist that this is a great mistake, for I can prove conclusively that the old pseudobulbs of some species do not store up sap at all, any more than the old stems of herbaceous plants store up moisture after a shower. Both will absorb moisture, but neither impart any to the plants to which they are attached, for the moisture contained in these stems is evaporated by the first burst of sunshine. Mr. Burberry says that *Dendrobium nobile* is an easily-grown Orchid, requiring but little skill, hence the stored-up juices in the old pseudobulbs are not made use of "mark the words" (not made use of), if so, what is the use of retaining them? Mr. Burberry may have seen what he would call a good plant, but he has not seen what in my opinion comes up to that standard of efficiency that I should call well grown. The deciduous species he names as being actually denuded of their growths are not only not weakened by the process, but are actually strengthened; and many more might be added to the list, such as *D. chrysanthum* for instance. With me the growths of this species are cut off with the flowers attached; these growths usually measure from 2 to 5 feet in length, and each growth carries from fifty to one hundred flowers, and though the growths are thus cut away, our plants have from fifty to one hundred on each plant. Though the young growths were thus cut away, the young ones that started from their bases are already in such an advanced state that most of them are upwards of 3 feet long. There are no signs of deterioration; on the contrary, though the plants have been fifteen years under my charge they are far more vigorous now than they were at the first, for last season some of the plants carried over 3000 flowers each. We will proceed, Mr. Burberry says that he has noticed the stems that flower persistently from the old pseudobulbs cut back very hard. Surely this could not have been done by anyone who knew anything about those species, for such kinds as those of the *fimbriatum* type will flower out of the old stems for years. Therefore, like those with persistent foliage, they will retain sap so long as there are buds left to flower. But it is not so with those kinds that have flowered from every node, and have shed their leaves, for with these there is nothing to excite the sap. They may become plump in wet weather, but all the moisture is absorbed by the atmosphere—none goes to the roots. It is easy for a practised eye to judge when

a bulb is of no more use to a plant, but not so to the casual observer, who only follows in the line that his grandfathers laid down. A person may be an admirer of Orchids, or any other class of plants, without knowing anything of their structure. Any person may casually take up one of the mosses, for example, that grow on the wall or bank, such as *Hypnum murale*, and admire it, yet without the aid of a powerful microscope he would not be able to understand its structure; just so with *Dendrobium*. I would here like to remind Mr. Burberry that we have for years cut off the growths of some species of *Dendrobium* with the flowers attached, just in the same manner as we should the stems of herbaceous plants, yet these same plants are the picture of health, and are the envy of some of the greatest Orchid growers in the world. Though we have plenty of table decorations, and use some thousands of Orchid flowers in such work, we never use either Bamboo rods or wire for such a purpose; all our flowers are used naturally. Such things as Bamboos are left for staking the *Chrysanthemums* and wiring baskets; were we to use them on the dinner-table, my employers would ask if we intended making a stove-house of their dining-room. Yet, we decorate where some hundreds of the greatest in the land go to admire, but without Bamboos, for we wish our flowers to last longer than a few hours. Let me further remark, I notice that in this Week's Work Mr. Burberry says, "we are placing all our *Dendrobiums* in one house." Surely he does not mean this; there must be some mistake. Are such kinds as *densiflorum*, *thysiflorum*, and all those with persistent foliage that have not yet flowered, to be placed in a house with *D. chrysanthum*, *D. formosum*, *D. phalaenopsis*, and those that are starting into growth, where a temperature of from 60° to 80° is maintained? *D. Wardianum*, *D. crassinode*, *D. Ainsworthii*, and *D. Hillii*, have not yet done flowering, yet all are to go into the same moist atmosphere. *D. Hierardi*, *D. pulchellum*, and the like, whether from very hot country or more temperate, all are to get the same treatment. Perhaps Mr. Burberry will kindly explain how we poor noodles are to manage this. *B. P.*

FINE EARLY STRAWBERRIES.—"A correspondent states that Strawberries have been gathered at Burghley Gardens, the Marquis of Exeter's Lincolnshire seat, since February 17, the variety being the celebrated John Ruskin. The fruit averaged half an ounce each in weight, and were of fine perfume and quality. In Covent Garden they fetched 40s. per lb." The above appeared last week in a local newspaper. Will Mr. Gilbert tell us if he had Strawberries of the quality described at the date named? *Ignoramus.*

RATS AND MICE: PREVENTION BETTER THAN CURE.—The present age appears to be one of invention and discovery, and one in which inventions and discoveries are turned to practical account. Now one meets with inventions for the destruction of flies in the shape of fly-papers, the destruction of rats and mice by chemicals which so work that the animal affected quietly passes away from the scene of its former haunts, and shrivels up and dies, but leaves no smell whatever behind. Notwithstanding all these ingenious discoveries, I am inclined to wonder that no one yet has discovered a system of prevention rather than cure, and it is with a view to set the minds of such discoverers at work that I write. Is it not possible to discover by experiment a chemical, the smell of which would be detected by mice, and which could be so combined in the manufacture of brown paper bags, that when the seedsman had parcelled up his seeds, and neatly tied them, and placed away in his drawers ready for the demand when it may come, no mice would dare advance to make further investigation as to the contents of the same? I feel sure that if this question was taken up by some enterprising chemist, and paper was then manufactured which would contain sufficient of the matter to render it safe from the attacks of mice, a large business might be carried on with the seedsman. *E. Wilson Serpell.*

CHIMONANTHUS FRAGRANS.—This delightfully fragrant hardy shrub annually ripens a few dozen seed-pods, which hang on the tree for a very long time. I enclose a seed-pod and flowers growing on same branch; the pod resembles a Filbert in exterior, whilst inside will be found two seeds very similar in size and appearance to small French Beans. The tree is trained on the wall of my cottage, in a sheltered nook, and annually pruned like a Peach tree. During January and early February, the surrounding

atmosphere is very pleasantly perfumed, being specially agreeable when the weather permits us to open our sitting-room windows. Very sharp frosts destroy the perfume, but fresh flowers continue to open, and a few mild days restores the delightful fragrance, sweeter than the grandiflorous section described by "H." at p. 213. *W. Crump, Naresfield Court, Malvern.*

HIGH RENTAL FOR ALLOTMENT-GROUND AT CLEWER.—It is stated in the daily papers that Lord Carrington is letting land for allotment-gardens to his labourers at Spalding, in Lincolnshire, from 33s. to 42s. per acre. Lincolnshire being a county renowned for its agriculture, and Spalding being one of the best districts, there is no doubt the land is fertile, and every way fitted for the purpose of allotment-gardens. Compare these figures with the price working-men have to pay for allotment-gardens at Clewer in the neighbourhood of Windsor. A few evenings since I was addressing a large gathering of allotment-holders on vegetable culture, and having invited questions, one holder rose and asked me if I thought 1s. per pole—£5 per acre—a fair rental? It was scarcely a proper question to address to me under the circumstances, but I said I thought it a very high rent indeed, and the questioner stated that when rent was paid, manure and seeds purchased, and other expenses met, there seemed to be very little indeed for him who tilled the land. Fortunately, it happened that Mr. E. B. Foster, of Clewer Manor, the county councillor representing that district, was in the chair, and he promised to look into the matter. One of the speakers made the astounding statement that a neighbouring farmer rented the land at 50s. per acre, and sublet it to the allotment-holders at £8 per acre. In addition to the high rent charged for the land, it occupies a low position, and some of the holders reported that at flood-time their gardens were flooded with water, to the almost entire loss of the crops. One could not but sympathise with the allotment-holders, and hope that Mr. Foster would be able to take some action that would result in a decreased rental. This suburb of Windsor is rapidly extending, and becoming a centre for working-class residences; and, these being largely destitute of garden-ground, there is naturally a great desire to acquire allotments, and, could the number be extended, they would soon be taken up. *R. Dean.*

SOCIETIES.

ROYAL HORTICULTURAL.

MARCH 22.—As the spring advances so do the exhibits at the meetings of the Royal Horticultural Society increase, and that held on Tuesday last was no exception to the rule. Orchids were well represented, and some fine groups of spring-flowering shrubs and plants made a good display. Roses, too, were well shown, and the same may be said of Narcissi.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. B. Wynne, H. Herbst, R. Dean, C. T. Drury, H. B. May, W. C. Leach, R. B. Lowe, G. Phipps, C. E. Pearson, H. Cannell, C. J. Salter, T. Baines, C. Noble, H. H. D'Ombain, H. Turner, J. Fraser, G. Paul, and F. Ross.

This Committee had the bulk of the exhibits to deal with, some of the subjects shown being of a specially noteworthy character. Roses were very good, particularly those staged by Messrs. G. Paul & Sons, Cheshunt. Messrs. W. Paul & Sons, Waltham Cross, also sent a collection of pot Roses, neatly packed in shallow hampers.

A collection of Azaleas, Lilac, and other plants, in bloom, shown by Messrs. G. Paul & Sons, attracted some attention, the Lilac *Marie Legrange*, a pure white, being specially good.

Messrs. J. Veitch & Sons, Chelsea, sent among other things, a collection of *Amaryllis*, which included some varieties of sterling value. The best were—*Chromis*, dark crimson self; *The Volunteer*, scarlet; and *Eclipse*, a fine bloom of a white and crimson colour. Some good *Amaryllis* also came from C. T. Lucas, Esq., Warrnam Court, Horsham (gr., Mr. G. Duncan), one named *Warrnam Court Seedling* being particularly good. Messrs. B. S. Williams & Sons, Upper Holloway, also staged a good *Amaryllis* named *Baron Fallas*, a neat dark bloom.

A large group of forced shrubs and plants in bloom came from Syon House, Brentford (gr., Mr. G. Wythes); and Cinerarias were well shown by Messrs. James & Son, Farnham Royal, Slough.

A collection of branches of flowering shrubs, which included *Forsythia suspensa*, *Pyrus Malus floribunda*, and a double-flowered *Pach.*, was staged by C. E. Smith, Esq., Silvermere, Cobham (gr., Mr. J. Quarterman); and a lot of *Acacias* and *Camellia reticulata* blooms came from the Royal Gardens, Kew.

Messrs. Cutbush & Sons, Highgate, staged a fine group of spring-flowering plants, and a basket of Mignonette, named "Cutbush's Scarlet."

The collection of plants staged by Messrs. B. S.

Narcissi, some of which were figured in a previous number, were exhibited by the Rev. G. H. Engleheart, Appleshaw, Andover.

Orchid Committee.

Members present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien, Sec., S. Courtauld, J. Mason, F. Sander, E. Hill, T. B. Haywood, De B. Crawshaw, W. White, H. M. Pollett, H. Ballantine, T. W. Bond, Ed. Moon, C. J. Lucas, H. T. Masters, H. Williams, and A. H. Smea.

E. Miller Mundy, Esq., Shipley Hall, Derby (gr., Mr. Wm. Elphinstone), staged a group of various varieties of the superb *Dendrobium Phalaenopsis Schroderianum*, all cultivated and flowered in ex-

alba, *Batemannia Burtii*, several *Spathoglottis Lobbia*, and many cut spikes of *Dendrobium Dalhousiae*, *Epidendrum anrantiacum*, *Schoenburgkia undulata* and their richly coloured true *Cattleya labiata*.

Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, and 191, Park Road, Clapham, had a fine group, tastefully arranged, and composed chiefly of very fine examples of *Oncidium sarcodes*, with which were *Lælia harpophylla*, *Oncidium citrosum*, &c. A Silver Banksian Medal was awarded.

F. W. Moore, Esq., Curator, Royal Botanic Gardens, Glasnevin, Dublin, sent a fine spike of the unique *Moorea litorata*, n. gen. and sp. (*Gardeners' Chronicle*, July 5, 1890, p. 7). The flowers nearest resemble a

FIG. 59.—PALM TREE AVENUE, HYÈRES. (SEE P. 409.)

Williams & Son, also contained subjects of a noteworthy character, amongst which *Azalea Princess of Wales*, a fine white; a dwarf *Solanum*, named *S. capricastrum nanum*, *Euonymus japonicus compactum*, and *Cliveias* of sorts, may be mentioned.

Some *Cliveias* from the Royal Horticultural Society's gardens at Chiswick were also shown, and Mr. C. W. Leach, Albury Park Gardens, brought a bright coloured *Anturium*, named *A. coccineum* Leachii. *Ranunculus cortusifolius* was shown by Mr. C. Wood, gr. to Lord Hamilton, Merstham House; and a bunch of *Violets* by Mr. Miller, Ruxley Lodge, Esher.

Narcissi were well shown by Messrs. P. Barr & Sons, Long Ditton, whose collection also included several of the early-flowering *Irises*. Various hybrid

celent manner, the large variety to which was awarded a First-class Certificate, and the charming light form to which an Award of Merit was given, being noble examples. A Silver Banksian Medal was awarded for the group.

Messrs. F. Sander & Co., St. Albans, secured a similar award for a fine group containing three varieties of *Phaius Cooksoni*, *Dendrobium Wardianum album*, white, with the base of the lip yellow, and with the usual chocolate blotches; *D. W. virginale*, a fine thing, white without the chocolate blotches on the lip; *Cypripedium Wallisii*; the extraordinary *Epidendrum Laucheianum*, with a long dense drooping raceme of pretty little brown and yellow flowers; *Ansellia lutea*, *Phajus asamica*, *Epidendrum O'Brienianum*, with six spikes; *Cattleya Trianae*
