Houlletia. It has a stout upright spike of large flowers, the centres white and the outer halves of the segments reddish-brown. The curious three-lobed lip is yellow and white, with purplish spots. Mr. Moore also sent a spike of the curious *Megacalium falcatum* and flowers of *Lycaste fulvescens*.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. Simpkins), sent a curious and pretty supposed new species of *Odontoglossum* with white flowers, the lip handsomely marked with bright rose; also *Brassia brachiata* and *Masdevallia Hinciana* X.

Ed. Moon, Esq., Cassiobridge, Watford, exhibited *Dendrobium infundibulum*, *Cassiobridge* var., a fine form with remarkable development of petals and lip. G. R. Le Doux, Esq., Langton House, East

Moulsey, sent *Odontoglossum triumphans*, Le Droux var.

Sir Trevor Lawrence, Bart., M.P., Burford Lodge, Dorking, staged plants of *Dendrobium speciosum* ♀ × *D. Kingianum*, which had small white flowers.

Messrs. Heath & Son, Cheltenham, sent flowers of *Cypripedium Argus* Moenchii.

A. H. Sme, Esq., The Grange, Hackbridge (gr. Mr. G. W. Cummings), sent a fine spike of the rich crimson *Epidendrum Frederici* Guillelmi.

C. J. Lucas, Esq., Warrnam Court, Horsham, staged the little *Masdevallia simul*, *Dendrobium nobile nobilior*, and cut flowers of *D. n. nobile* and *D. n. cærulescens*; and C. E. Smith, Esq., Silvermere, Cobham, Surrey, sent for name *Dendrobium hedyotum*, *Lælia* (*Brassavola*) *glauca*, and other cut Orchids.

Fruit and Vegetable Committee.

Present: P. Crowley, Esq., in the chair; and T. Francis Rivers, G. W. Cummings, J. Willard, G. Bunyard, W. Warren, J. Wright, T. J. Saltmarsh, A. Dean, J. H. Laing, G. H. Sage, G. Norman, G. Wythes, J. Smith, J. Hudson, H. Balderson, G. Reynolds, Harrison Weir, and Dr. Hogg.

But few exhibits were brought before this committee. C. E. Smith, Esq., Silvermere, sent fruit of a seedling orange of a medium size; and Mr. C. W. Leach brought Tomato Lady Bird from Albury Park. This is a small Tomato borne in clusters.

A dish of well-grown Mushrooms came from Mr. Miller, gr. to Lord Foley, Esher; and a brace of Cucumbers from Mr. D. Roberts, gr. to H. Packe, Esq., Prestwold, Loughborough; the latter were of good shape, medium size, and were said to be a cross between Beeson's Prolific and Lockie's Perfection.

A bundle of forced Asparagus was exhibited by Messrs. T. and W. Poupert, Mortlake.

A paper on the "Cultivation of Melons," by Mr. C. Ross, was read by the Rev. W. Wilks at the afternoon meeting. The paper was of a practical and interesting nature.

ROYAL BOTANIC.

MARCH 23.—The first spring exhibition of the Royal Botanic Society was held in the Society's Gardens, Regent's Park, on the above date. The entries in some classes were by no means numerous, but the exhibits combined made a fair display.

Messrs. B. S. Williams & Son, Upper Holloway, staged a fine group of *Azalea mollis* and *Clivia*, for which a large Silver Medal was awarded; and several other things were sent by the same firm. Messrs. Laing & Sons, Forest Hill, S.E., were also awarded a Silver Medal for a group of miscellaneous plants, which included several new *Caladiums*; and Messrs. G. Paul & Sons gained a similar award for *Roses*.

A collection of cut *Camellia* blooms and *Roses* came from Messrs. W. Paul & Sons, Waltham Cross; and *Narcissi* and other bulbous plants were well staged by Mr. T. S. Ware, Tottenham, and Messrs. Barr & Sons, for which medals were awarded.

Messrs. H. Williams & Son, Fortis Green, Finchley, were to the fore with *Hyacinths*, *Tulips*, and *Narcissi*; and *Cyclamens* were extensively shown by Messrs. C. Elmonds, Hillingdon; T. Walker, Hounslow; T. Prestidge, Brentford; J. Odell, Hillingdon; and the St. George's Nursery Co., Hanwell. Medals were awarded all these firms; also to Messrs. James & Sons, Slough; and Cutbush & Sons, Highgate, were similarly honoured for a group of *Cinerarias* and miscellaneous plants respectively. Messrs. Veitch & Sons, King's Road, Chelsea, showed a collection of *Amaryllis*.

For six greenhouse *Azaleas*, Mr. H. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, was 1st in the amateurs' class, and Mr. Henry James, Castle Nursery, West Norwood, secured a similar honour in the open class.

The best six Chinese *Primulas* were shown by Mr. J. Odell, Hillingdon, and the best twelve *Hyacinths* in the amateurs' class by Mr. Douglas, Great Geier, Iford. Mr. Douglas was also 1st for six *Deutzias*, and twelve pots of *Freesias* and *Narcissi*, and won minor prizes in other classes.

Messrs. H. Williams & Son, in addition to their other exhibits, staged the best twelve pots of *Tulips* and *Hyacinths* in the open class; and Messrs. G. Paul & Sons were awarded 1st for six *Amaryllis* and six *Roses* in pots.

For twelve pots of *Cyclamen*, Mr. D. P. Phillips, gr. to P. W. Mann, Esq., Langley Broom, Slough, was placed 1st; and Mr. R. Scott, gr. to Miss Foeter, The Holme, Regent's Park, similarly, for twelve pots of *Crocuses*.

The best pots of *Lily of the Valley* were shown by W. B. Marle, The Grand Floral Depot, Regent's Street, W.

HYÈRES.

THE illustration which we give on p. 408 will convey to the reader a better notion of the climate of that lovely district than many pages of description. The Palms are Date Palms, hundreds of which have been planted along the Boulevards, one avenue alone, about a mile long, reaching from the railway station to the town, is lined with them, and hence the name, *Hyères-les-Palmiers*, finds ample justification. For the rest, the vegetation is of the same rich and varied character as in the Riviera generally—a vegetation which, like the visitors, is mostly of exotic origin. The *Pall Mall Budget* of last week contains numerous illustrations of *Hyères* and its neighbourhood in connection with the visit of the Queen to that delightful locality.

Obituary.

SERENO WATSON.—It is with very great concern that we publish the following letter from the President of Harvard College. In our next issue we shall give some further details as to Mr. Watson's career:—

"Harvard University, Cambridge,

"March 9, 1892.

"Sir,—It is with great regret that I inform you of the death of Sereno Watson, Curator of the Herbarium, which occurred on the 9th instant, in the sixty-sixth year of his age.

"The funeral services will be held in Appleton Chapel on Friday, March 11, at 2:30 P.M.,

"Your obedient servant,

"CHARLES W. ELIOT."

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.			
	Above (+) or below (—) the Mean for the week ending March 19.	ACCUMULATED.				10ths Inch.	Ins.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 3, 1892.		
		Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 3, 1892.	Below 42° difference from Mean since Jan. 3, 1892.						
Day-deg.	Day-deg.	Day-deg.	Day-deg.	More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 3, 1892.	Total Fall since Jan. 3, 1892.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.

4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending March 19, is furnished from the Meteorological Office:—

"The weather continued cold and somewhat unsettled during the earlier part of the week, but subsequently became considerably warmer, especially during the daytime, and very fine and bright, with drizzle.

"The temperature varied greatly. During the earlier part of the time it was very low, the absolute minima (observed on the 13th in Ireland and England, and on the 16th in Scotland), ranging from 3° in 'Scotland, E.' (at Braemar), 10° in 'Scotland, N.' (at Glenarron), and 15° in 'England, S.W.' to 22° in 'England, E.' and 31° in the 'Channel Islands.' During the latter part of the week the thermometer was much higher, the absolute maxima (which occurred on the 18th or 19th), ranging from 65° in 'Scotland, N.' and 61° in 'Scotland, E. and Ireland, N.' to 60° in 'Scotland, W. and the Channel Islands.' The range of temperature was consequently unusually large, but the average for the week did not differ materially from the normal value for the time of year.

"The rainfall slightly exceeded the mean in 'England, S. and S.W.' 'Ireland, S.' 'England, N.W.' and the 'Channel Islands'; elsewhere it was less than the mean.

"The bright sunshine was fairly abundant, and exceeded the normal for the time of year very generally. The percentage of the possible amount of duration ranged from 25 over Ireland, to between 42 and 48 in most of the English districts, and to 56 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, March 24.

[We cannot accept any editorial responsibility for the unpublished reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, &c.]

BUSINESS quiet. Grapes coming shorter with prices steadily rising. James Webber, Wholesale Apple Market.

POTATOS.

The market is not quite so healthy as per last report; and, except for best quality, there is a tendency to lower prices. *J. E. Thomas.*

SEEDS.

LONDON: March 23.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that many country seedsmen seem resolved to postpone the bulk of their purchases until the sowing season is close upon them; this will make business next month a great rush; if intending purchasers would operate at once, they would find their wants more carefully and advantageously attended to, than will be possible later on. Meantime, values all round, especially for Alaska White, and Red Clover seeds, keep exceedingly firm, and there are indications that the rapidly augmented demand would result in an enhancement in prices. There is no change this week in Rye-grasses. Sainfoin is cheap and good. A very choice new variety of holling Peas, excellent cookers, called Green Scotch, is now obtainable at tempting rates. Mustard and Rape seed are firm. Bird seeds show steadiness. For Tares there is an improved request.

POTATOS.

SPITALFIELDS: March 22.—Quotations:—Maggums, 60s. to 70s.; Imperators, 60s. to 80s.; Hebrons, 60s.; Bruce Magnums, 80s. to 75s.; Main Crop, 75s. to 90s.; Snowdrops, 60s. to 80s. per ton.

BOROUGH: March 22.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 90s.; Bruce Magnums, 60s. to 90s.; Dunbar, 60s. to 105s. per ton.

STRATFORD: March 22.—Quotations:—Maggums, 52s. 6d. to 80s.; Imperators, 60s. to 85s.; Bruce Magnums, 65s. to 80s.; Scotch do., 65s. to 90s.; Main Crops, 100s. to 110s. per ton.

NOTICES TO CORRESPONDENTS.

AMOUNT OF LABOUR: *Subscriber.* We can only estimate approximately the number of men, besides the head gardener, that would be required. The kitchen-garden of $\frac{1}{2}$ acre, with the 200 yards of fruit wall, and the orchard of 1 acre under apple cultivation, would require three men, if the head man prunes and nails his wall trees, and the edgings of Box. Light land might be managed if there is no Box clipping or weeding of walks, by two men and one lad. The lawn and conservatory, and 2 acres of clumps, borders, and shrubs require one man and one boy, with a donkey or pony for the mower. It will greatly depend on the water supply, if convenient or otherwise, the kind of land, the service expected to be rendered by the gardener to carry out work in the dwelling. He may have to supply labour to pump water, help the cook, butler, and coachman; furnish beaters in the shooting season, beat carpets, &c.; in which case the force above given would not be equal to the work.

ANONAS: *J. L.* The plants rarely fruit in this country, and it is not likely that the stopping of the shoots would help the matter, rather the contrary. Try root-pruning or root-cramping in pots or tubs, giving the plants all sunlight possible, and no shade at any time.

BOOKS: *Risque, Greenhouse and Stove Plants*, by Thomas Baines, published by John Murray, Albemarle Street, London. *Rivers' Rose Amateurs' Guide*, London: Longmans, Green, & Co. *Villa Gardening*, by E. Hobday, London: Macmillan & Co. will supply you with the other information required.—*A. H.* *Bulbs and Bulb Culture*, by Mr. D. T. Fish, published at the Bazaar Office, 170, Strand, London, W.C.

CHOISYA TERNATA: *J. Colebrook.* On the Sussex coast the plant will go through almost any winter without injury, especially if it have the protection of a wall, not necessarily trained to the latter, but standing just in front of one.

CINERARIA ACANTHIFOLIA: *Paddy.* The silvery hue of the leaves is more decided the second year than the first. To give the plants a bushy habit you may cut them back to the point named. This cutting back will induce bushiness, and will not cause the plants to flower more than if it were not performed. The flower heads can always be removed, together with a large portion of the flower stalk, when they show. It may be removed in April, whether it be in the open ground or not. Take cuttings in August.

DOUBLE SPATHED ARUM: *J. W. W.* Not uncommon. We receive numerous specimens every year, and have often figured it.

ERRATUM: "TWO FAMOUS GARDENERS." In the last column of this article on p. 362, after "the appointment of royal gardeners apparently died with him," read "so far as regards the firm which he did so much to enlarge."

FIG TREE IN A PLANT STOVE: *A. H.* The plant stove is hardly the proper place in which to grow a Fig tree. The plant is almost hardy in this country, and although it may be afforded a good deal of heat whilst it is growing and carrying its fruit, it requires rest during the autumn and winter, in a low temperature. Can you not take up the tree and put it into a large tub or pot? It will then be more under control, and will, in time, bear fruit.

FRENCH HORTICULTURAL JOURNAL: *Risque, La Revue Horticole*, published at Paris, Librairie Agricole de la Maison Rustique, 26, Rue Jacob. M. H. Martinet has assumed the editorship of *Le Jardin*, published by M. Godefroy, 5, Rue d'Edimbourg, Paris.

FUNGUS FROM VINE BORDER: *J. C.* It is a species of fungus that is often found in Mushroom-beds, and which is rather injurious than not, to the Mushrooms, starving the soil, and crowding them out. If it is abundant in the Vine border, it is likely to do harm, and, as it is usually found at or near the surface, it should be sought for and got rid of. The fungus-spawn has been brought in old Mushroom-bed material, or it has found favouring conditions in fresh horse-droppings dug into the border.

GREENHOUSE STANDING ON A CONCRETE FLOOR: *W. C.* Consult your solicitor.

HOLLY HEDGE: *W. D.* The hedge may be cut as hard back as you please; it will break all right, but will not be a very sightly object for some time afterwards. The cutting back should not be delayed. The young shoots should be left untouched till next Spring, when they may be shortened and the weakest ones removed entirely.

LAND SPOILED BY AN OVER-DRESSING OF MANURE: *J. R.* Of nitrate of soda, 125 lb. per acre would be a sufficient dressing, and that should be afforded the crop in a general way whilst in full growth. The quantity afforded is in your case about five times as great as it is safe to use, but having been already ploughed-in, much of it will be carried away by water to levels out of the reach of plant roots. It will cause excessive leaf growth in cereals, but the root-crops will be benefited—12 cwt. of superphosphate of lime is more than double the proper quantity even for fruit trees. We should say that whatever you sow or plant, unless the land was of the poorest description, will grow largely to leaf, and much out of character; but if a subsoil plough or a deep cultivator could be set to work to deepen the tilth and break up the pan formed by the plough-sole, much of the excess of manure would sink into or be commingled with a much larger body of loose soil, and thereby rendered, at least, innocuous.

LARGE INVESTMENT OF MONEY IN A GARDENING PROJECT: *W. C.* We should not like you to go into the business solely on any advice that we might give you—the responsibility is too great. All that we can say is, that money is made by cultivating the subjects you have named; but other things besides money are required—skill, industry, enterprise, knowledge of markets, &c. There is a large and growing demand for the produce named, and fair prices are obtainable for good stuff.

MARKET PRICES: *W. J. B.* The prices which are quoted in our pages are merely approximate, and rarely agree with those really given. Covent Garden prices vary greatly with the quality of the goods sent, the time of day when the latter arrive, the demand at the moment, and in other ways. We must suppose that the prices generally paid to growers give satisfaction, or we should not find this market so well supplied as it is with the best obtainable productions.

NAMES OF FRUIT: *A. A. R.* Too much decayed to name with any degree of certainty.

NAMES OF PLANTS: *C. Bellis.* Also variegata.—*G. S.* The Winter Aconite, *Erantia hyemalis*.—*T. M.* *Coccoloba platycladon*.—*G. S.* *Domaria Williamsii*; certainly not *Patacoensis*, which has the

outer segments one-fourth shorter than the inner.—*R. C. H.* *Snowdrop*, *Galanthus Elwesii*.—*E. D. L.* 1, *Davallia Mariesii*; 2, *Pteris cretica albo-lineata*; 3, *Polypodium Billardieri*; 4, *P. nigrescens*; 5, *Scopolopendrium vulgare assum*; 6, *Asplenium alatum*.—*W. S.* 1, *Pelargonium echinatum*; 2, *Pteris cretica albo-lineata*; 3, *P. adiantoides*; 4, *Adiantum formosum*; 5, *Pteris tremula*; 6, send when in flower.—*A. R., Bedford.* 1, *Pteris argyrea*; 2, *P. cretica albo-lineata*; 3, *Cyrtium falcatum*; 4, *Oncidium japonicum*; 5, *Laestrea Sieboldii*; 6, *Doryopteris palmata*; 7, *Pteris adiantoides*; 8, *Laestrea atrata*; 9, *Pteris hastata*; 10, *Laestrea aristata variegata*; 11, *Polystichum angulare proliferum*; 12, *Nephrolepis pectinata*; 13, *Pteris chinensis*.—*White Dendroble.* *Dendroble infundibulum*, the largest form we have seen.

PALMS GROWING IN HOUSES INFESTED WITH MEALY-BUG, SCALE, AND THIRPS: *A. X.* There are plenty of insecticides sold by nurserymen for ridding plants of thrips. Fumigation with tobacco or some of its preparations will also do that. Scale and mealy-bug give more trouble, and are rarely ever got quite rid of on Palms. See Answers to Correspondents in our issue for March 12, recipe for making a petroleum emulsion which is suitable for your purpose.

PELAGONIUM IVY-LEAF VAR.: *G. F.* So far as we can tell from the specimen sent, it is very good and distinct, and quite worth propagating.

PHOSPHATE OF LIME: *A. P.* "Under the name of calcic phosphate a great many different products are understood. For a long time nothing but the calcic phosphate obtained from bones was used for agricultural purposes. At the present time, the greater part of the phosphate used as manure is obtained from the mineral kingdom, being found in practically inexhaustible quantities. All the phosphates used in agriculture are formed of phosphoric acid and lime. We know of three principal sorts of calcic phosphate, and that one called *tricalcic phosphate* is the most important, and has received the name of superphosphate of lime. It is prepared commercially by treating bones or mineral phosphates with sulphuric acid. The acid phosphate is then mixed with calcic sulphate, and under this form receives the name of superphosphate of lime, or calcic superphosphate. It contains 15 to 18 per cent. of phosphoric acid, and is sold at about 4s. 6d. per cwt." Extract from *Artificial Manures*, by Mons. Geogheville. The above descriptions dispose of the questions in your two letters.

PLANTS WHICH WILL GROW WELL TO FILL UP HOLES IN THE BOTTOM OF AN OLD QUICK HEDGE: *Subscriber.* Plants which grow fairly well in the shade of others, viz.:—Common Holly, Butcher's Broom, Common Laurel, *Pontic Rhododendron*, *Spurge Laurel*, common Box. The first named is the best to keep animals out, but where effect is sought, and that only, any of the others may be chosen. Whatever is planted must have proper stations made for it by excavating holes as large as may be, without greatly mutilating the roots of the Quick, and filling these holes with fairly rich loam. Plant from now to the end of May, and make the soil firm about the roots. Water and mulch, paying attention to the plants during the first summer, and supplying them with water once or twice a month. A hedge bottom is mostly a dry place.

TEXAS GRASS: *J. J.* Enquiries made at some of the large wholesale seed houses might elicit an answer to your question.

VINES: *S. V.* The soil sent is of a healthy nature, and no trace of disease of any kind was detected on the roots. Is it possible that some trick has been played, the shoots and leaves showing traces of scalding or what is much like it?—*Wardianum.* We do not see any trace of disease. The leaves have the appearance of having been forced too hard without enough air.

VINE LEAVES BY POST: *G. L., Broom Park.* Please send other leaves, packed in damp Moss, and in a box.

of teachers."—*N. Y. Tribune.*

Garden & Forest

1892—Fifth Year.

Is acknowledged throughout the
world to be the leading American
authority in the field of Horti-
culture, Landscape Art, and Forestry.
Its contents are original through-
out, of the highest literary charac-
ter, and its writers are the foremost
European and American authori-
ties. It is invaluable to the Owners
of Country and Suburban Homes,
Landscape Gardeners, Botanists,
Horticulturists, Lovers of Nature,
and to all who would cultivate a
correct taste in matters pertaining
to the disposition and management
of gardens and grounds, whether
public or private. The illustrations
are original and artistic.

Permeated with a spirit of knowledge and
refinement.—*Gardeners' Chronicle, London.*

The foremost journal of its class, keeping
in touch with every advance in the scientific,
artistic, and practical phases of horticulture
and arboriculture.—*Boston Herald.*

Holds one of the very first places in
periodical horticultural literature.—*Revue
Horticole, Paris, France.*

Its arrival is the coming of a wise and in-
telligent and entertaining friend, who en-
ables us to live more happily because more
harmoniously with Nature.—*Harper's
Weekly.*

Its character is at once dignified and
pleasing, and its contents are scholarly and
scientific in the exact sense.—*Chicago Even-
ing Journal.*

No new book on horticulture can for a
moment be compared in value to the bound
volume of *Garden and Forest*. It is a com-
pendium of new information.—*N. Y. Herald.*

Published weekly. 21s. a year.

A specimen copy may be had free
on application to Messrs. **SAMPSON,
LOW & CO.,** St. Dunstan's House,
Fetter Lane, Fleet Street, London,
England, to whom orders for subscrip-
tions may be forwarded.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the
year is so great, we are compelled to state
that advertisements received after 6 P.M. on
Wednesday will, in all probability, be held
over to the next week.

Advertisers are cautioned against having letters
addressed to initials at Post-offices, as all
Letters so addressed are opened by the
authorities and returned to the sender.

SANDERS, St. Albans, can thoroughly
RECOMMEND several first-class HEAD GARDENERS.

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester
(Limited), are always in a position to RECOMMEND
MEN of the highest respectability, and thoroughly practical
at their business. All particulars in relation to
Telegraphic and Postal Address—"DICKSONS, CHESTER."

Head Gardeners.

HOLLOWAY'S OINTMENT and PILLS need only a single trial to make known their capabilities. No outside sore or inward inflammation can long withstand the cooling, purifying, and healing influences exerted by these twin Medicaments. Be the mischief recent or chronic, great or slight, painful or simply annoying, it will succumb before the curative virtues of these noble remedies, which can be rightly applied by any person who will attentively read the accompanying directions, which are prepared in the plainest language, void of technical terms, and printed in the most legible characters. To the man of business, confined to his counting-house, and harassed by engagements, these Pills are invaluable; for the man of pleasure, addicted to free living, they are peerless.

Preliminary Notice.—Isleworth and Hounslow.

VERY IMPORTANT SALE of FREEHOLD, COPYHOLD, and LEASEHOLD ESTATES, of which some are ripe for building development.

By order of the TRUSTEES of the late J. WILMOT, Esq.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to submit for PUBLIC COMPETITION, at the Mart, Tokenhouse Yard, London, E.C., about the last week in MAY NEXT, the following VALUABLE ESTATES:—

THE FREEHOLD ESTATE, known as PINE HOUSE, ISLEWORTH, within 5 minutes' walk of Spring Grove and Isleworth Railway Stations. Area about 6 acres, with valuable existing frontages to the London and Great Northern Railway. Described Residence, numerous Greenhouses, Vineries, Four Cottages, Stabling, &c. The Land is stocked with thriving Orchard Fruit Trees, and would be valuable for Building development.

THE LEASEHOLD MARKET GARDEN in rear of Pine House, comprising an area of about 54 acres, of which about 36 are pasture and are abundantly stocked with Fruit Trees of the best description.

The very valuable FREEHOLD MARKET GARDEN and FRUIT GROUND, ripe for Building, elegantly situated in the Cromwell Road, Hounslow. Area about 9 acres. Well cropped with Orchard Fruit Trees.

The compact FREEHOLD and COPYHOLD MARKET GARDEN and FRUIT GROUND, opposite the preceding lot. Area 12 acres.

Two LEASEHOLD MARKET GARDENS, situated in Staines Road, Hounslow. Area about 6 acres. Stocked with Orchard Fruit Trees.

THE LEASEHOLD MARKET GARDENS, known as Lampton Farm, situated in the Heston Road, Lampton, Middlesex. Area about 44 acres. Stocked with Market Garden Produce. Also a MARKET GARDEN of about 30 acres, at the Woodlands, Isleworth.

Note.—The Leasehold Market Gardens can be treated for privately, and taken over as going concerns. Full particulars of the Auctioneers, at their Estate Offices, 67 and 68, Cheapside, London, E.C.

Finedon, Northamptonshire.

TO FRUITERS, BUILDERS, and OTHERS. VALUABLE FREEHOLD PROPERTIES, consisting of upwards of Seven Acres of productive ORCHARDS, situated near to the centre of the above increasing village.

MR. G. F. BEARN will SELL the above by AUCTION, at "The Gate Inn," Finedon, on THURSDAY, April 7, 1892, at 5 for 6 o'clock in the evening (by order of the Trustees, under the will of Mr. Richard Jacques, deceased), and subject to such conditions of Sale as will be then produced.

An eligible and well-known ORCHARD, adjoining the Back Road, now and for many years past in the occupation of Messrs. Jacques, Fruiters and Gardeners, containing 5 a. 1 r. 14 p., or thereabouts.

And also another ORCHARD, adjoining, and containing 2 a. 0 r. 22 p., or thereabouts. These orchards are well stocked with highly productive Apple, Pear, Plum, Damson, and Cherry Trees, and have long been noted both for the quantity and quality of Fruit grown thereon. They also possess very important building value, being close to the village, and having a long frontage to the road.

To view, apply to Messrs. JACQUES, Finedon; and for further particulars to Mr. JOSEPH HARLOCK, Finedon; Mr. SAMUEL BROWN, Rauceux, Northamptonshire; the Auctioneer, Corn Exchange, Wellingborough; or to Messrs. SHARMAN, JACKSON & ARCHER, Solicitors, Wellingborough.

Public Sale.—Important to Horticulturists, Landed PROPRIETORS, LANDSCAPE GARDENERS, NURSERYMEN, &c.

The LARGER PORTION of the MAGNIFICENT and WELL-KNOWN COLLECTION of Grand examples of stately GOLDEN YEW, specially fine Pyramid ENGLISH YEW, rare specimens of GOLDEN, SILVER and GREEN HOLIES, handsome ARBUTUS, RHODODENDRONS, &c.

at present growing in the Ormston Park of Gowbank, one mile south from Avonbridge, near Falkirk, N.B., and planted by the late Sir James Gowans at very great expense, will be EXPOSED FOR SALE by PUBLIC ROUP on FRIDAY, 8th April, 1892.

This superb Collection of Ornamental Plants, selected with superb reverence from the first nurseries in Great Britain and the Continent, are unsurpassed for health, beauty and colour. They have been nurtured and trained with endless constant care, and will only require to be seen to be appreciated. Messrs. R. B. LAIRD & SONS, Florists to the Queen, Edinburgh, say:—"Such a number of fine specimens are seldom met with in a private establishment. . . . We are confident, from the nature of the soil, purchasers may rely on all living with good bills, and have been frequently transplanted."

Catalogues in preparation, and to be had from the Auctioneer. Sale to begin at 12 o'clock noon, prompt.

CHARLES STIRLING NELSON, AUCTIONEER, FALKIRK.

Mr. NELSON would beg to draw attention to this most important sale; such a unique collection has never before been offered to the Public.

A Brake will await the arrival of forenoon trains at Bathgate Station; also one will leave Gramhamston Station (Falkirk) at 10.35 A.M., to convey purchasers to the Sale. Horses and Lorries can be arranged for, to be on the ground for removal of purchases to Avonbridge Station.

Peacocks, Peahens, Stove and Greenhouse Plants.

MESSRS. BRANCH and LEETE will SELL by AUCTION on SATURDAY, the 8th instant, at "Oxford Road," Aigburth, near Liverpool, the contents of the late Sir Thomas Edwards-Moss, Bart., the collection of STOVE and GREENHOUSE PLANTS, ten PEACOCKS and PEAHENS, &c.

Catalogues can be had from the Auctioneers, the Hanover Rooms, Liverpool.

THE

Gardeners' Chronicle.

SATURDAY, APRIL 2, 1892.

SHOBDON COURT.

THIS fine estate, at Leominster, the residence of Lord Bateman—for forty years past the Lord-Lieutenant of Herefordshire, and a comparatively young man still in mind, manners, and appearance—is one of the noblest seats in the county. According to old Fuller, Herefordshire is famous for woods, wool, and water, and all of these good gifts are abundantly possessed by Lord Bateman, in the timber of his park, the heavy coats of his Shropshire sheep, and the streams of the Lugg and Arrow which water his estate.

In *Domesday*, Shobdon was written Scopadune, or sheep hill, owing, perhaps, to the fact that the high ground in the northern boundary of the park is of limestone, dry, and suitable for sheep. The surrounding plains, pastoral and well watered, are now the home of the famous white-faced Hereford cattle. The history of Shobdon has been handed down from the Conquest. In fact, the original church, a wooden edifice, seems to have been a Saxon building. Two others have followed it—one built in 1140, and pulled down in 1753, when the present church was erected. Some very remarkable columns and arches belonging to the old building, and sculptured with the signs of the Zodiac by foreign artists, have been re-erected in the park by Lord Bateman, their beauty rivaling their rarity, and arresting the attention of all who pass them. As early as the time of Edward II., the manor of Shobdon was held by a knightly family of the same name. We need not trace its further history beyond the year 1705, when it was purchased by Sir James Bateman, whose son was created Viscount Bateman. This title became extinct, and the estates passed to William Hanbury, who was raised to the peerage as Baron Bateman in 1837.

The house in the Queen Anne style is a square block built by Viscount Bateman, time of George I., with handsome balustrades added by the present owner, on the south, east and west fronts. Like many of the houses of that style, it is a model of comfort and convenience. The church stands close to the front door, within the garden gates, in the old English style befitting the residence of a Lord-Lieutenant. But there is nothing funeral about this edifice and the little God's-acre surrounding it. From the front door you observe only the little old building, with a glimpse of mossy tombs in the midst of a thick pinetum of Cedars of Lebanon and Yews, each tree a specimen courting admiration, and each worthy of the long, admiring gaze of the tree lover. The noble owner of this beautiful place understands and loves arboriculture, and, as an accidental introduction had brought me to his house, he wished to show me the grounds.

Before commencing our walk, a noble retriever brought his master's hat by request, and then returned through several apartments from the drawing-room to the hall and fetched his lordship's stick, and then his gloves. We then set forth, and immediately a rabbit was started from a clump of Rhododendrons, and we all started in pursuit. The dog ran, the Lord-Lieutenant ran, and I ran; presently a squeak from a neighbouring clump of shrubs was heard, and the rabbit was retrieved and delivered up unhurt.

The park around the house is ornamented with several ponds, where water-fowl of all kinds abound in winter. Many of them breed here; swans come to Shobdon, and, finding it quiet, stop to breed. Herons abound, and it might be supposed that the tall trees would tempt them to remain for the nesting season; but in this respect herons are shy birds, and they usually build in places nearer the sea, or at the outlet of some tidal river, where their food abounds. The best windows of the house look eastward to the distant Malvern Hills, and southward across the lower part of the park, where the heavy foliage of great timber trees is massed upon the banks of a sheet of ornamental water. From the higher ground of Shobdon Hill, outside the park, the view is still more extensive, embracing the valleys of the Teme, Lugg, and Arrow, with the hills and woods around Ludlow, Leominster, Weobley, Kingston and Hereford. The list of places seen from this high ground might, in fact, be considerably extended, since they include the Malvern and Dinmore Hills, Foxley, the Meerbatch Hills, Garstang, the Moccas country, the Black Mountain, Brecon Beacon, and the hills lying around Abergavenny. In the other direction there is a wide view over Shropshire, Montgomeryshire, and Radnorshire, and in the foreground, 2 or 3 miles distant, is the historic spot where the last battle of the Roses was fought at Mortimer's Cross. A column marks the spot where the fight took place on Candlemas Day, February 2, 1461.

The Oak is the most abundant tree in the park, but every kind of English timber tree flourishes here, and specimens of great size everywhere meet the eye. The Yew is a big tree here, and its foliage is particularly rich. On the side of the carriage-drive, leading from the village of Shobdon to the house, there are many large Yews, a hundred years old, and they still grow with vigour, though the stems were covered up with earth 4 feet deep when the road was embanked some years since. Even the Apple, full of vitality as it is, would have been killed by such treatment. It is a cheerful and delightful park, sloping generally to the south, too unlevel for monotony, and planted with noble trees of various families—the Larch, Silver Fir, Lime, and Ilex, grouped in fine contrast; Cedars of Lebanon near the house, tall and graceful Sycamores, full of light-coloured foliage, and, contrasting with them, clumps of dark Yew trees, with tall and sturdy Oaks overtopping them. There is no stint in the number of the trees; all the sorts are abundant, and giants are plentiful among them. The Sweet Chestnuts measure, many of them, 22 feet in girth, and the ring-doves, abounding as they do, and cooing in the midst of the foliage of these great trees, are hidden as if in a thicket. These grand Oaks with their long boles, with every kind of timber tree of the largest size, are pleasing evidence of rich land. Big spreading Oaks are found even on poor clays, but tall trunks, with great measurement of timber, are unmistakable proofs of fertility. The kitchen garden, too,

resembling the park in its limestone soil, was full last autumn of ripe and ripening Pears and Apples; while several tender Conifers, such as the Cryptomeria, flourish therein, and the brown Turkey Fig carried last year a great crop of ripe fruit on the walls.

A meeting of the Woolhope Naturalists' Field Club, held at Shobdon Court, was noticed in the *Gardeners' Chronicle*, April 14, 1877, and among the trees in the ground then greatly admired were several specimens which I have measured. Among them are a Cedar of Lebanon, 21 feet 8 inches girth, and 36 yards spread, a noble tree, close to the west front of the house; a fine deciduous Cypress, and a yellow-flowered American Chestnut (*Castanea flava*), a pair of Sweet Chestnuts, 20 feet in girth; a Cedar of Lebanon, 22 feet in girth; and last, and most remarkable of all, several Occidental Planes, one on the lawn, 12 feet in girth, with a spread of 36 yards, the lateral branches extending horizontally to a great distance. Their habit of growth is very singular, and the branches must have broken with their own weight long ago if they had not been carefully supported.

Among the products of the country, I have yet to mention the grayling and trout which abound in the streams, where the otter still lingers. Another product, as well as ornament of the park, is a fine herd of red and white Herefords, as good a breed as any in England, and as handsome. *H. E.*

NEW OR NOTEWORTHY PLANTS.

PELEXIA WENDLANDIANA, Kränzlin, n. sp.*

A BOTANICAL Orchid in the strict meaning of the word. A tall stem of about 2 feet in height, bearing at the top a spike of twenty greenish-brown flowers, with a white lip. Nobody can admit that for beauty's sake the plant claims any a place in our stoves, but as far as botanical interest is an award of merit, this plant, as well as *Stenorhynchus speciosus*, and others, may be admitted. The peculiarities of the flower consist in the long filiform sepals, which resemble, to a certain degree, the petals of *Epidendrum nutans*, Sw.—a species, the flower of which resembles those of our species as much as a terrestrial Orchid of the Neottieae tribe can resemble an *Epidendrum*. *Dr. F. Kränzlin.*

AGLAONEMA COSTATUM, N. E. Br., n. sp.

This is a very pretty stove foliage plant, recently introduced by Messrs. J. Veitch & Sons from the region of Perak. The leaves are broadly ovate, of a dark shining green, densely or sparsely marked with clear ivory-white spots, and with the midrib also of ivory-white, a variegation that is at once effective and pleasing. The following is a description of the plant:—

Petioles $2\frac{1}{2}$ to 3 inches long, $\frac{1}{2}$ inch thick, terete, narrowly channelled down the face, green. The blade of the leaf is 4 to $5\frac{1}{2}$ inches long, $2\frac{1}{2}$ to $3\frac{1}{4}$ inches broad, broadly ovate, acute or shortly and some-

what abruptly acuminate, obliquely cordate at the base; the midrib stout, prominent and rounded on both sides, with seven to nine primary nerves on each side, which are ascending and strongly curved; the upper surface is of a dark shining green colour, with very numerous or sometimes only a few small spots of a pure ivory-white; the midrib and a very narrow irregular border on each side of it are also ivory-white. The scape is 2 to $2\frac{1}{2}$ inches long, and $\frac{1}{2}$ inch thick, compressed-terete, light green, the basal half enveloped by two sheaths. The spathe is $\frac{1}{2}$ inch long, obovoid, and closely folded round the spadix, light green. The spadix is stipitate, 1 inch long, the male part $\frac{1}{2}$ inch thick, protruding from the spathe, milk-white; the ovaries few in number, in two whorls, globose, pale green, with large, circular, table-like, yellow stigmas. A native of Perak. *N. E. Brown.*

RODRIGUEZIA PUBESCENS.

THIS elegant species has lately been reimported, both by l'Horticulture Internationale, Parc Leopold, Brussels, and Messrs. F. Sander & Co., St. Albans, and the name was determined for both firms by Mr. R. A. Rolfe, by comparison of the fresh specimens sent with the type specimen (*Bowlington pubescens*) in the Lindley Herbarium at Kew. Since, however, M. A. Cogniaux, after careful consideration, has formed the opinion that it is a new species, and he has described it in the *Journal des Orchidées* of March 15 as *R. Lindenii*.

It is a welcome introduction, being one of the most profuse flowering of dwarf-habited Orchids, and, moreover, very easy to cultivate, if placed in an intermediate or Cattleya-house.

A TRAVELLER'S NOTES.

(Continued from p. 373.)

BOMBAY.

Early one morning I called on Mr. Carstensen, the Superintendent of the Victoria Gardens. The gardens and museum are situated some distance from the European quarter.

Just inside the gate is a little bedding-out; the effect is not so brilliant as what one sees in England, but it is tastefully done. *Alternantheras* are of little use, having only an occasional tinge of red; in the rains they all turn green. A good substitute is *Arca sanguinolenta*, a small purple-leaved plant, which stands clipping well; its leaf, though much smaller, is the shape of the purple *Berberis*.

Acalypha torta, with its pretty dark, curled foliage, as well as *Croton elegantissimus* and *Panax multifidus*, are here used for bedding; the *Croton* is particularly neat, and clipping does not seem to harm it.

From the inner gate, a broad central walk leads to the centre of the garden, on either side of which is a narrow border very tastefully planted. The groundwork is *Nephrolepis tuberosa*, growing with great freedom, in which are arranged triangles of various plants, such as *Torenia Fournieri* (now in flower), *Hemigraphis colorata*, purple, yellow, and white variegated; *Eranthemums*, and others.

On the right of this road, and close to the gate, is a piece of water, with a small island near the centre. The island is entirely occupied by a gigantic *Pandanus odoratissimus*; its branches twist and curl in every direction, many of the outer ones being partially submerged; it cannot be less than 100 feet through. Near, on the bank is another, with similar, though certainly distinct foliage. Round the edge of this pond, Bamboos form nice clumps, some 20 to 25 feet high; whilst *Papyrus alternifolius* and *Caladium tuberosum* grow freely.

On the other side of the road, amongst many others, is a bed containing some twelve species of *Brownia*; they are all small plants, too young to flower yet, but the young pinnate leaves are most

* *Pelexia Wendlandiana*, Kränzlin, n. sp.—Scapo elato ad 60 cm. alto, 3 mm. diametro; squamis 5-6 longe vixinantibus adpressis acutis acuminate vestitis ruberulis; spica multiflora densiuscula; bracteis linearilanceolatis acuminatissimis, ovario leviter arcuato aquatibus; sepalis dorsali petalisque lateralibus accretis galeam cochlearum lanceolatum acutum formatibus; sepalis lateralibus angustissimis linearibus fere filiformibus antice paulisper dilatatis acutis in pseudoclar gracile, ovario aequilongum connatis; labelli pedae auguste linearis, lamina late triangulari reflexa rectangula, stramineo limbo cornu laterali dilatato albis spuris effidente; gynostemio generis; anthera plana antice producta acuta; rostellis linguiformi acuta, pollinis massula 2 angustata efficientibus; toto flore glandulo-piloso fere 4 cm. longo, 1 cm. diametro; sepalis coactis cum pseudoclaris 3 cm. longis. Patria? E. caldarit horti Herrenhausen, mist H. Wendland de scientia Orchidacearum optime meritis. Ab omnibus Pelexia speciosis (omissis ceteris characteribus) praesertim singulari labelli fabrica diversissima. *Dr. F. Kränzlin.*

striking, appearing, as they do, in a perfectly developed condition, and beautifully tinted. Here is also the *Opuntia*-like plant cultivated in the Brazils for the preservation of the cochineal insect; it has a curious, small, deep crimson, cup-shaped flower. Close by, *Saraca indica*, a handsome tree, with large, pinnate foliage, was in flower; the blooms are of the same colour, about the same size, and are borne in heads like an *Ixora*—the resemblance was most striking. The tree is particularly thick and bushy, and some 15 feet high.

The plants not indigenous to India planted in the gardens are mostly South American; few Australians do well, with the notable exception of *Metrosideros semperflorens*, a nice tree, or rather bush, some 15 feet

Ficus elastica is fair, as is also a very similar Australian species, *F. macrophylla*. *Ficus indica* (Banyan) is naturally the best; there is more than an ordinarily good specimen in the gardens. A large cut-leaved *Solanum* near the centre walk has moderate-sized, dull blue flowers; it is a massive and striking plant, by name *S. maroniense*.

Round the base of some of the single specimens, *Nephrolepis tuberosa* edged with *Pilea muscosa*, forms a nice and thick carpet. *Quisqualis floribunda* is a strange plant now in flower; it produces large heads, each flower with a long tube, in colour either a crimson-red or a pure white; whether this is a matter of age, I cannot say, but I noticed no intermediate shades. It is a climber, growing over other

All this class of plants form neat and effective undergrowth at the edges of large beds, or elsewhere, under the taller trees.

Mr. Carstensen has flowered *Bignonia regalis* alias *Otodenia speciosa*, which is a good thing, with numerous salmon-coloured flowers. *Pothos aurea* is here grand; it is growing on the stem of a Toddy Palm (*Borassus flabelliformis*); it is a most effective plant. *Ipomoea Leari*, with large blue flowers, very similar to our own *Convolvulus*, trails freely over two stumps at the end of a walk, and is flowering freely. I also noticed *Eranthemum pulchellum* and *Cassia alata* in flower, a fair specimen of the Bread-fruit tree, *Datura suaveolens*, and moderate-sized *Crotona*. Ceylon is undoubtedly the

FIG. 60.—*RODRIGUEZIA PUBESCENS* = *R. LINDENI* OF COGNIAUX. (SEE P. 426.)

high, which is now in flower; its leaves and red flowers, though numerous, are small. Mr. Carstensen has often tried to propagate it by cuttings, but without success, and has to depend on layers. *Eucalyptus globulus* will live but three years; it always dies in the rains. *E. citriodora* and *rostrata*, on the contrary, flourish. *Grevillea robusta*, of which there are one or two nice trees in the garden, does well.

Mr. Carstensen tells me Candytuft, Pansies, China Pinks, and Verbenas do fairly well. I saw also a nice little bed of *Coreopsis*. *Ravenala madagascariensis* (Traveller's Joy) does not do here as in Ceylon; I only noticed one plant, a moderate-sized, fair specimen. Close to the museum is a good specimen of *Pithecolobium saman* (the rain tree); it grows here with almost the same extraordinary rapidity characteristic of the tree in Ceylon. The plant now in question is some 35 feet high, its spread of branches is more than 50 feet in diameter, its stem must be 3 feet through, and it is twelve years old.

trees with freedom, and popularly known as the "Rangoon Creeper."

Bougainvillea splendens is here fine; its flowers are rich purplish-blue. What Mr. Carstensen calls *B. lateritia* is also in flower; the blooms are smaller, and of a reddish brick tinge. A small plant of *B. glabra* is likewise in flower in a pot.

Mr. Carstensen has a nursery, where he grows all kinds of plants for replacing purposes; he has also two moderately-sized canvas-houses, in which are *Adiantums*, a few *Orchids*, and various plants of no especial interest. Rather a nice variety of *Acalypha* may here be seen; it is exactly like *mausica*, but instead of the foliage being brown and red, it is green and yellow; the effect in the distance being not unlike *Abutilon Thompsonii*. *Acalypha torta*, though it allows itself to be cut to within a few inches of the ground for bedding purposes, will form a nice dense shrub, if allowed to grow, as will all kinds of variegated *Eranthemums*,

place for these, as far as I have had means of judging yet. *Amaryllis* succeed in pots, and Tea Roses give very fair results. *Ipomoea Horsfallii* is a mass of bloom, as is *I. sinuata*.

On leaving the gardens, Mr. Carstensen pointed out to me a handsome tree, *Spathodea campanulata*, belonging to the *Bignoniaceae*, bearing large brilliant yellow and scarlet flowers, and with long pinnate foliage with round broad pinnae.

And now a word about the Palms, some of which are fine, though not so fine as in Ceylon. *Oreodoxa regia* (Cabbage Palm) is represented by a noble specimen some 20 feet high, and *Corypha umbraculifera* (the Talipot) by two or three somewhat smaller. *Arenga saccharifera* (the Sugar Palm) is here very fine, its large massive *Phoenix*-like leaves rising at a slight angle from the base, often 10 to 12 feet in length, render this a particularly graceful and impressive object. *Cocos plumosa*, some 20 feet high, has a nice even head, and *Caryota urens* (in

flower) and *C. sobolifera*, with broader leaflets than the former, are represented. A handsome *Palm Martiusia caryotactifolia*, with *Caryota*-like foliage, covered with long black spines, is to be seen in a pot in one of the canvas-houses, as is a fair specimen of a rather handsome *Calamus*.

The vegetation immediately round Bombay is not exceptionally remarkable. The plants one mostly sees are *Thespesia populnea*, a moderate-sized tree, with foliage resembling a Canadian Poplar, and large yellow cup-shaped flowers, which turn to delicate salmon during the evenings; in some parts this is very common. *Carica papaya*, with a large pod in the axil of each of its fig-like leaves, is also frequently met with; it forms but one stem, and does not seem to grow very high. *Chavica betel* (the Betel tree), the leaf of which is sold in the bazaars and streets for chewing with the *Areca* nut, is also fairly common.

The chief weed is the Fibre plant (*Malachra capitata*); in this the government hope they have a plant of great economic value. They are doing all they can to push its cultivation in various parts for the manufacture of fibre. *Antigonon leptopus*, a handsome climber, with pink flowers, not unlike a Japanese *Spiraea*, is also common; whilst *Pisonia alba* (the Lettuce tree), with *Brugmansia*-like foliage and white bark, grows everywhere.

February is the great month for flowers in Bombay; in that month the majority of trees and shrubs, &c., have completed their growth, and are ready to produce their flowers before the annual, and only, rainy season sets in, in May, for four months.

Near the Reservoir are the Dakhas, or Towers of Silence. These are used by Parsees for the disposal of their dead. One cannot enter into the grounds in which these towers are built without special permission. The towers are some 90 feet in diameter and 15 feet high. In these are exposed the bodies of the dead, the rest is left to the innumerable vultures flying about. The skeleton is allowed to remain for some three or four weeks, when it is placed in a common well. No distinction is here made, rich and poor are all laid in the same place. *J. H. V. (November).*

MULTIPLE PARENTAGE OF FERNS.

UNTIL recently, Mr. Drury's interesting paper on "Multiple Parentage of Ferns," p. 87, Jan. 16, had escaped my notice; let me, however, add a few remarks. Singularly enough, Mr. Drury recommends a plan likely to secure the impregnation of a prothallus from male organs of other prothalli, which has long ago been adopted by me, i.e., the mixed spores were sown in pans (covered with flat glass), and when moisture seemed requisite, the pans have been plunged to the rim in warm water, but instantly withdrawn on the moisture touching the prothalli. The water used has had a temperature of 80°, and this is not too warm, for with the soil, say, at a temperature of 56°, it will only be raised some 3° or 4°, and this shows why we sometimes fail in the endeavour to destroy animal and vegetable life contained in the soil that has been prepared for spores. Boiling water poured on the soil, which seems to kill all other animals, is not certain destruction to worms. A quart of leaf-mould and loam, plunged into a gallon of boiling water, and then left to cool, has not proved effectual, nor even a second immersion, though a third has succeeded; the water is much cooled by the soil, and also the half-decayed leaves protect the worms from the heat. Baking, and then boiling, or boiling alone over a fire, is destructive to all animal life. I am bound to say that, in using pans without holes, which, of course, cannot be watered from below, have yet produced plants showing multiple parentage. There is one fact not to be lost sight of in an endeavour to obtain an increased number of distinct varieties from the mixed spores of four varieties. If these four varieties have been the result of previous crosses, if of only two varieties each, then we start with the crosses of eight, in addition to the four

again selected, and we may expect to obtain the characters of twelve. No doubt there is difficulty in the male organs of several prothalli coming into contact with the same female cell. Were it not so, we should find many more wild varieties, and this is also proved by the small number of seedlings showing the characters of three or more male parents, whilst an increased number show those of two, and a still larger proportion those of one; yet as all the seedlings exhibit the characters of at least two parents, the spermatozooids must have travelled from one prothallus to another, notwithstanding the generally conceived idea that impregnation can only take place on the same prothallus.

I cannot see why it is insisted upon that only one spermatozoid is required to fertilise the mother-cell, when we find in microscopic animal life a crowd of male organs is thus employed. Years ago, when Moore, Clapham, and others, would not allow that Ferns could be crossed, it was my good fortune to fertilise two varieties of the Lady-Fern, viz., *Victoria* and *proteoides*,* and to obtain a gradual series of forms, having *Victoria* at the one extreme, and *proteoides* at the other, and so convincing was this cross, that Mr. Clapham acknowledged it as beyond contradiction; one spermatozoid alone (to each plant) could not have produced this result. Again, in sowing a normal form of *Nephrodium filix-mas* with *N. paleaceum* var. *cristatum*, if only one spermatozoid impregnated, then part of the seedlings would be normal, and part crested; whilst, as a matter of fact, in several hundred examples all are crested. By thickly sowing together spores of a muricate, a branched, a spiral, and an undulate form, seedlings have been obtained that are muricate, undulate, spiral, and branched. Again, from a muricate, a branched, and a cup-bearing form, seedlings have resulted, having muricate, branched fronds, bearing cups on each branch. From a mixture of eight varieties of the Lady-Fern, three plants show the lax pinnae of *uncum*, the cruciate pinnae of *Victoria*, the projected pinnae of *proteoides*, the lunulate pinnae of *Erizelia*, the cruciate pinnae of *crucipinnulum*, the truncate terminals of *truncatum*, and occasionally the crested of *multifidum*, i.e., showing the characters of seven distinct varieties. Younger plants from other mixtures already give promise of startling varieties, and all being well, in 1893 there will be developed more than fifty distinct mixtures in further proof of multiple parentage.

Turning for a moment to my experiments with single Dahlias, when six brushes were filled with the pollen from a white Dahlia, and one from a pink flower, and this pollen mixed on a larger brush, and then applied to a white Dahlia (i.e., in proportion of six to one), a very large number of the seedlings were white, whilst with six brushes loaded with pollen from a pink flower, and only one from a white one, and afterwards applied to a white Dahlia, then as large a proportion were coloured seedlings. This surely shows impregnation from more than one pollen-grain.

Artificial things may be accomplished which would not occur naturally, still, Nature will supply means to guide the spermatozooids to the ovum-cells. The antheridium, on its envelope bursting, will doubtless by some means spread spermatozooids some little distance, and if this is less than a tenth of an inch, it would still be sufficient to land them on several prothalli, for from a group a quarter of an inch square as many as thirty plants have been obtained. Spore-cases on bursting have the power of throwing spores a distance of several inches.

A small, exceedingly active insect, is nearly always to be found in abundance amongst the prothalli, and may assist, as Mr. Drury suggests, in conveying the spermatozooids. There are also thread-like plants that are common (too common) amongst

* *Proteoides* has been confused by Jones and others with protein; the latter was found in Cumberland in 1886 by the late Mr. Clapham of Scarborough; the plant had half its fronds normal, and half cruciate, hence its name. *Proteoides* was raised by myself from one of the cruciate fronds of protein, and is distinguished by having no normal fronds,

the prothalli, which are only rendered visible by the amount of moisture upon them. The prothalli and the young frondlets have an abundance of minute golden-looking drops of water, formed in the case of the frondlets at the termination of every veinlet, providing the pans are kept moist with protecting-glasses. These drops are not unlike the appearance of the golden refraction of *Schistostegia pinnata*.* Every now and again the prothallus becomes so thoroughly wet, that spermatozooids can readily swim about, and thus find the neck of the archegonium, and so reach the ovum on its own prothallus; but this does not account for the spermatozooids being transferred to other prothalli.

There is another possible manner of producing variety of form to a certain extent. In sowing thickly, assimilation may take place, for here and there prothalli of a bush-like character are found, and these can be divided after a cluster of frondlets have been formed, and in all these cases the divisions are invariably of the same variety. The doctrine of probability has, to my mind, proved the fact of multiple parentage, mathematically speaking at least, to a remote decimal. There are so many difficulties to be surmounted in a microscopical examination, that it may be years before the microscope discloses multiple parentage.

The fortunate microscopist, who shall at the right time succeed in a thorough examination of an impregnated Fern ovum, may probably see not a single spermatozoid, but the ovum bristling with a crowd of these tadpole-like organs, and thus explain the usefulness of large numbers of spermatozooids.

In every pan some prothalli are more robust growers than others, throwing up fronds some weeks, or even months, earlier; but when grown to maturity, the latest ones are far more abnormal, and from them a larger percentage of distinct varieties are obtained. The plan has been to thin out the young Ferns in groups, waiting until stronger before dividing them into single plants. These are then pricked out into separate pans, according to size, i.e., large, medium, and small. By this method the smallest are not crowded-out by the larger ones, and this arrangement has proved the above assertion.

In answer to an enquiry as to the mixtures sown last autumn for the further proof of multiple parentage, I may mention there are twelve pans of *Scolopendrium*, nine of *Polystichum*, twelve of *Athyrium*, four of *Nephrodium filix-mas*, and eight of other species. There is one pan of fifteen varieties, four of eight, three of seven, three of six, five of five, five of four, fifteen of three, and eighteen of two previously crossed varieties. *E. J. Lowe.*

ORCHID NOTES AND GLEANINGS.

STAUROPSIS WAROCQUEANA.

THIS is a new species described by Mr. Rolfe in the *Lindleya*, sub-tab. 319. It is a native of New Guinea, whence it was introduced by L'Horticulture Internationale. The genus is allied to *Vanda*, and the species resembles *V. lissocilioides* and *Stauropsis gigantea*, but it may be distinguished by its dense panicle, 5 to 7 inches long, of smaller flowers, as well as by numerous differences in their structure. The flowers are light buff-yellow in colour, with numerous light red-brown spots. The lip is white, with a few rusty spots both on the front and side lobes.

CYPRIPEDIUM ORNATUM ×.

THIS is a hybrid between *C. Harrisonianum*, the pollen-parent, and *C. villosum*. The upper sepal is claret coloured, shaded with bright sepia, and tipped with clear green, finely fringed and bordered with white; the lower sepal is very long and yellowish-green. The upper part of the petals is dark ma-

* A minute luminous moss, found in the Nottingham sandstone caves, and in much more abundance on coal-shale near Todmorden. In the semi-darkness of the caves, the roofs sparkle like diamonds.

hogany-red, and with a highly glazed surface, the lower part is gamboge, or clear amber, veined with violet-brown. The lip is large, chestnut-brown on both surfaces, and with a well-marked golden-yellow band round the orifice. The staminode is flat, and spoon-shaped, yellow, with a bright golden sheen over it, with a greenish-amethyst coloured spot in the centre. The dark green foliage is much spotted with brown round the base. This fine hybrid won a Certificate of Merit at the meeting of the Ghent Société Royale d'Agriculture et de Botanique, and the Chambres Syndicales des Horticulteurs Belges. It is a noteworthy hybrid, very creditable to M. Jules Hye, of Ghent, who raised it. *Ch. De B.*

ODONTOGLOSSUM ROCKEBIANUM.

We have seen three beautiful natural hybrids of this Orchid in the houses of M. Peeters, of Brussels: 1st, the petals bore redder and larger spots than those of the type; 2nd, a finely-branched cluster, bearing thirty-five broad flowers, remarkable for the profusion of spots over all the parts; 3rd, with spots rather widely apart, giving a very bright look to the flower. In the same establishment there is a *Dendrobium Phalaenopsis* var. *Schroederiana* in bloom; this is a remarkable novelty. *Ch. De B.*

ORCHIDS AT BOCKING PLACE, BRAINTREE.

The Cattleyas in the collection of Sydney Courtault, Esq., are now in fine condition, the varieties of *C. Trianae*, of which there are some superb forms, making, at the present time, a fine show. Among them a specimen of *C. T. Courtaultiana*, which is one of the richest-coloured forms of this favourite species, has a dozen flowers in which the brilliant hue of the labellum is a gorgeous feature. It is of the *C. T. Osmanti* section, but in different lights the showy portion of the lip looks either purple, crimson, or blood-red, or a combination of the three colours; it is of fine shape, too, and a free grower. Another distinct form, of which there are two good specimens, is a pure white, with the faintest tinge of blue on the front of the lip; and other specimens, some with twenty to twenty-five flowers each, are characterised by the fine crimping and frilling of the lip and petals. One very singular form of *C. Trianae* has flowers of a clear rose-pink, with no other colour than a pale yellow mark in the centre of the labellum. The whole points to the fact, that although imported *C. Trianae* always bring a number of indifferent varieties, a good selection can scarcely be valued too much as a means of giving showy flowers in the winter.

Mr. Courtault also possesses one of the most complete collections of *Masdevallias* in the country. Amongst others, the rare *M. Lowii*, and *M. picturata* have recently flowered, and at present *M. Schroederiana*, *M. fulvescens*, *M. cupularis*, *M. Arminii*, *M. Shuttleworthii*, several fine varieties of *M. ignea*, *M. Harryana*, *M. Veitchiana*, *M. caudata*, *M. xanthina*, *M. pulvinaris*, *M. Mooreana*, *M. platyglossa*, *M. tovarensis*, *M. Hinckiana* ×, *M. Cheloni* ×, *M. Fraseri* ×, are in bloom. The curious *Pleurothallis Barberiana*, *P. ornata*, and other species of *Pleurothallis* and *Restrepia*, are also flowering.

The intermediate-houses have a fine show of *Colo-gyne cristata*, including a large specimen of *C. c. Lemoniana*, and another of *C. c. alba*, with seventeen spikes of its spotless white flowers. In these houses we also noticed some fine forms of *Lycaste Skinneri*, many well-flowered *Dendrobium Wardianum*, *D. crassinode*, and *D. Jamesianum*; *Oncidium nguiculatum*; and in a cool corner a specimen of *Cypripedium Schlimii*, which is said to have produced flowers continuously in greater or less quantity for ten years. All the species and varieties of *Cypripedium* thrive well at Bocking Place, and there the new *C. Chamberlainianum* has already acquired an established appearance. The best of those now in bloom is a magnificent specimen of *C. Wallii*, with flowers much larger than those of its ally, *C. caudatum*, and in which the rich markings on a white ground makes it a remarkably handsome plant.

The *Dendrobium*-house is well-furnished with bloom, the best being *D. Ainsworthii* ×, *D. Dra-*

conis, *D. primulinum*, *D. crepidatum*, *D. Cassiope* ×, *D. bigibbum*, *D. Findlayanum*, *D. lituiflorum*, *D. capillipes*, and *D. aggregatum*. The *Phalaenopsis*-house has a few good sprays of *P. Schilleriana*, and *P. Sanderiana*; the cool-house some good spikes of *Oncidium macranthum*, *Ondotoglossum triumphans*, *O. Rossi majus*, *O. Cervantesii*, and *O. Edwardii*, and in some of the other houses are well-bloomed specimens of *Cymbidium Lowii*, *Ansellia africana*, *Cattleya citrina*, and a fine spike of *Phajus tuberosus*, cut to save the plant.

Nor are other branches of gardening neglected at Bocking Place, as witness the fine collection of Ferns, in which the large specimens of rare *Platycerium*s are conspicuous; the *Nepenthes* or Pitcher plants, and the new range of fruit houses.

THE USTILAGINEÆ, AS REPRODUCTIVE PARASITES.*

(Continued from p. 397.)

SMUT.—The diseased condition of cereal plants called smut has been known from remote times. The fungi included by botanists under the Ustilagineæ afford more instances of reproductive parasitism than does any other group. In Saccardo's *Sylloge*, the genus *Ustilago* embraces 111 species, of which more than eighty are known to specially affect some part of the reproductive organs of their hosts. Some of those species attacking the reproductive organs are very particular in their selection of a nidus; others destroy the whole of the floral organs. Of the latter, the most familiar is the common smut of our cereals; others, again, prefer to locate themselves in certain structures of their host-plant in which to develop their spore-beds, but they do not confine themselves exclusively to the structures first attacked.

THE BUNT OF WHEAT (TILLETIA TRITICI).

Probably this species is the most widely-known Ustilagineous parasite. It occurs in the ovules of the Wheat plant; not only does it destroy those which it attacks, but, owing to its offensive odour, a small percentage of diseased kernels is sufficient to spoil a large quantity of sound Wheat. The bunted kernels retain the outward form and colour of the healthy grain. They are smaller and plumper in outline, darker in colour, and lighter in weight. Owing to their lightness, a very large portion of them can be blown out of the Wheat by the winnowing fan; but in this process, as well as in the previous one of threshing, a considerable number become broken, and their sooty contents scattered upon the sound Wheat. The spores adhere to the healthy Wheat kernels, and are exceedingly difficult, even by the most improved methods of milling, to remove.

The structure of bunt has long been known to botanists, and it is unnecessary for us to go into its details, beyond remarking that the bunt spores are exceedingly beautiful microscopic objects. They are spherical bodies, with a dark, spore-wall, upon the exterior of which a beautiful network of hexagonal areolæ are observable. At the commencement of the present century, Prevost (1807) observed that, if the spores of bunt be placed in water, they will, in the course of a day or two, germinate, by emitting a "promycelium" bearing H-shaped spores and gonidia. Kuhn and Wolf, the two botanists who first investigated the entrance of these spores, both agree that this can only be effected during the very early stages of the germination of the grain. In 1833 Brefeld published his researches on the Ustilagineæ, and showed that if the spores of the bunt fungus be cultivated in a sterilised decoction of herbivorous excreta, the primary and secondary spores are produced more abundantly, and of somewhat larger size, but also that a mycelium is formed from the primary spores, which, as the nutrient solution becomes exhausted, produces gonidia at those points where the mycelial hyphae come in contact with the air. He thus established the fact,

that the bunt fungus has two modes of existence—saprophytic as well as parasitic. This most important discovery shows how difficult an enemy the agriculturist has to contend with. If bunt spores be applied to the exterior of Wheat kernels when they are sown, the plants they produce infallibly become diseased. Moreover, if the seed Wheat be dressed by applying to it a solution of copper sulphate, the disease is almost certain to be prevented; hence, dressing Wheat with copper sulphate is well-nigh the universal practice. Here and there one comes across a farmer who, strange as it may appear, allows grown bunt Wheat; if you talk to him, he is very likely to say that he has no great faith in Wheat-dressings, and you will very likely find that he performs the operation in question in a more or less perfunctory manner. Such an one told me recently that he had dressed his seed till he was tired of doing so, and that he did not believe it was of any use; that sometimes he dressed his seed Wheat, and sometimes he did not, and that really he could not see any difference. The only explanation of such cases is to be found in Brefeld's researches.

THE CEREAL SMUTS.

Until the last year or two, the smut on Wheat, Barley, and Oats, as well as on certain grasses, was regarded as belonging to the same species of *Ustilago*. We now know, however, that each plant has a species of the parasite peculiar to itself; some of them more than one, and that these several species differ from each other, in the way they affect their hosts, in the form, colour, and size of their spores, in the manner in which they germinate, and in the method by which they infect their several hosts.

THE OAT SMUT (USTILAGO AVENÆ, PERB.).

This well-known species occurs upon the cultivated Oat in all parts of the world, where the Oat is grown. It is mentioned and figured by the early writers, Tragus in 1552, and Lobelius in 1591. The affected plants have their panicles more or less converted into a mass of brownish-yellow dust. The typical form of the spores is oval, although many are found which are subglobose, subangular or irregular. In size, the spores vary more than in the case with any of the allied species. Placed in water, the spores germinate in a few hours by the protrusion of a promycelium from the pale side, at first continuous, but becoming twice or thrice septate. Gonidia are formed at the apertures, but they are few in number. In shape they are narrowly elliptical, and usually attenuated towards their attachment to the promycelium. They soon fall off, and frequently bud off secondary gonidia. The promycelia have a great tendency to fall off the spores.

In nutrient solutions, Brefeld found the production of gonidia to be much more abundant than in water, they are somewhat larger and multiply themselves by budding after the manner of the yeast fungus (*Saccharomyces*), as long as the nutrient material is abundant. As the nutrient solution becomes exhausted, the sporidia cease to bud, instead of which they throw out pointed germ tubes. He found that in about four days these colonies of sprouting gonidia had reproduced themselves to such an extent as to form a distinct sediment at the bottom of the culture glass, and had exhausted the nutrient material from the solution. By dipping a needle, which had been sterilised, into such a colony he was able to infect another flask of nutrient fluid and to start a fresh culture. For more than a year he kept up a continuous series of cultures in this manner, by starting a new one every fourth day. At the end of this time the gonidia ceased to bud. *C. B. P.*

(To be continued.)

KEW NOTES.

THE VICTORIA-HOUSE.—The tank in the Victoria-house at Kew has attractions at all seasons, and its contents at the present time are perhaps even more striking than when the Victoria distracts attention from other things. In truth, the collection of plants around the sides of the tank is noteworthy. At one end is a fine clump of *Uva-grass* (*Glycerium saccharoides*),

* Abstract from a lecture by Dr. Plowright at the Royal College of Surgeons.

like a Pampas-grass on a large scale; at the other end is a fine plant of *Prionom Palmita*, a giant Rush from South Africa, with tufts of bold sword-shaped foliage. Round the sides are Palms of various kinds, such as *Socratea exorrhiza*, with bold oblong leaves, cut up into broad, wedge-shaped segments. The emergence of the roots from the interior of the stem through cracks in the rind is strikingly displayed.

Among other Palms are *Borassus flabelliformis*, *Licuala grandis*, *Bismarckia nobilis*, *Hyphæba thebaica*, the *Doum Palm* of Egypt, *Mauritia flexuosa*, the *Ita Palm*, and *Versaffellia splendida*, all remarkable plants, to describe which would be tedious. *Pholidocarpus thur*, a Palm from Madagascar, and of which there are two specimens, is too remarkable to be passed without comment, even in so cursory a notice as this. It is a Palm with deep green fan-like blades, supported on stout three-sided leaf-stalks which are marked with longitudinal bands of yellow, while their margins are beset with very large, formidable, woody, disk-shaped spines, dilated at the base, and tapering into long curved points. *Cyclanthus cristatus*, like many of its congeners, has a forked midrib, which gives the leaf a very characteristic appearance. Two huge Bromeliads, looking more like some caulescent *Croton* in habit and appearance, are also placed in the tank. They bear the names of *Vriesia Glazionsana* and of *V. imperialis*, respectively. On one side the *Amorphophallus titanum* uprears its canopy of foliage—a grand object, even without its flower. The side benches are occupied with Bromeliads, dry and powdery, and mostly destitute of flower at this season.

The *Show House* (No. 4) is gay with spring flowers—including Tree Peonies, among them a double white variety, of great beauty; *Clianthus puniceus*, *Lachenalia*s, with others too numerous to mention. Although the most generally attractive house, this is not the one which will longest detain the connoisseur or the botanist.

The *Herbaceous Ground*.—Among the improvements carried out during the last winter may be mentioned a direct entrance to the Herbaceous Ground by means of a path leading at right angles from the main walk to and from the Cumberland Gate. A gateway has also been constructed in the middle of the wall in the herbaceous ground, communicating directly with a flight of steps leading into the centre of the rock garden. This is a convenient arrangement for the visitor, and has a special fitness, as linking the rockery with the herbaceous ground, which is to a large extent the nursery for the rock-garden. It may be expected that the herbaceous ground will not in future be the desert waste it has hitherto been as regards visitors. There will also be less excuse for the difficulty which some people complain of in finding the whereabouts of the rock-garden.

In the Succulent-house some *Bomarea*s are in flower, such as *B. Caldasiana* and *B. frondea*, which make one wonder why they are not more grown. *Senecio macroglorus* shows its flower-heads like stars of gold pendent from the firmament. It is an old plant, but we do not remember to have seen it to such advantage. A large *Pitcairnia*, *P. ferruginea*, is throwing up its flower spike, which promises to be a very conspicuous object shortly, while *Calpurnia lasiogyne*, a Laburnum-like shrub, with pinnate leaves, is very attractive.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By G. WYTTES, Gardener, Syon House, Brentford.

TOMATOS.—These, if sown as previously advised, should not be left in the seed-pans longer than is necessary, that is till the first rough leaf is formed. In potting, use large 60's, and a light, rich compost, and put them in a warm house after potting, and shade for a few days. If there is a little bottom-heat, it will bring them on rapidly. Repot into 6-inch pots when the small pots are filled with roots, and grow on as near to the roof-glass as possible in an intermediate-house; anything higher than this induces a thin growth. To get good plants well set

with fruits, afford another shift, this time into 9 or 10-inch pots, and employ a stronger kind of soil and a smaller quantity of manure, and grow them as sturdy as possible. A late fruit-house or Peach case is then a suitable place for them, finally hardening off and planting out in the middle of the month of May. A few of the plants may be afforded still another shift, and he in the ground still in the pots against a south wall at that date, and well supplied with manure. These will give good returns some weeks before the others. Seed may be sown for succession, and if the plants are given liberal treatment, they will be in 6-inch pots by the usual planting-out time. The best mode of training Tomatos is with one stem, taking away all side shoots, and providing stakes for properly securing them from the first shift.

FRENCH BEANS.—Those early sown will need manure-water of some kind, and others sown last month should be supported by means of twigs or splints and bast, and top-dressed, but should not receive any manure till a good set of pods is secured. Before flowering and after setting, syringe the plants freely in fine weather, which will help to keep under red-spider. For the early forcing of Beans, small pots are necessary, but from this date 8-inch and larger pots will be better. If a house can be spared for these plants which has a bottom-heat bed, much larger crops may be had by sowing or planting out on a bed of prepared soil; and if the house is at present occupied, the Beans may be sown in pots or boxes, and transplanted afterwards. Beans with larger pods may now be sown, and Canadian Wonder is one of the best of these large Beans, and which, with a top-dressing of rich earth, will give a second crop if the plants are kept healthy, and they are cut back slightly after gathering the first crop of pods, and are kept closer for a few days. I have also found it useful in late springs to sow a few dozen pots at this date, either in 12-inch or in 48-pots, and plant them out when ready into 12-inch, and plunge them in a cold frame. If sown in frames in rich soil, Canadian Wonder often makes a gross top growth, and does not come in much before those in the open, so that pots or boxes to keep check the growth, are best to promote early bearing. Some Beans may be sown in 48-pots in heat, and hardened-off for planting out in the open. I sow them in cold frames kept close, and plant out early, using hand-glasses to protect them for a time, and these plants come into bearing as soon as the forced Beans are over. Mohawk is the earliest Bean I have grown, and it is one of the best for the early crop.

MUSHROOMS.—The last Mushrooms in most heated houses will be got from beds which are made in March or early in April, but in cellars, Mushrooms may be grown much longer, and indeed, at any season. An open shed, facing north, is a good place at this season, better than the usual Mushroom house. Preparations should also be made for beds to the open. If made under cover, the size of the bed is of little consequence; but when in the open, more material is necessary, and a shape adopted that will throw off the rain. A good place is the foot of a north wall, and the depth of the bed about 2 feet. The material should be put up firmly, and made to slope from the wall. Spawning may take place when the heat has fallen to 50° and a covering of loam, 2 to 3 inches thick, put over the bed, then a good thickness of dry litter, to maintain the proper degree of warmth in the bed. In wet seasons, I have used waterproof coverings, but when the bed stands against a wall, these are not so necessary as for ridges in the open.

SEAKALE.—The root cuttings of the forced plants having been preserved for planting, no time should now be lost in planting them.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

PEACHES AND NECTARINES.—The young shoots of trees in the late houses are now pushing on rapidly, and may be reduced in numbers. Old trees usually produce fewer shoots than young ones, and on this account they may safely be relieved at two instead of three thinnings, removing those not required to form the fruiting wood of next year. In performing this operation, however, those shoots which have a likely-looking fruit at their base, and which are likely to be wanted to assist its proper development, may be left on the occasion of the first thinning of shoots, and stepping them at

the second thinning by pinching off the tip. If the directions as to temperature afforded in a former calendar have been followed, it may now be allowed to gradually fall to 45° at night, the house being well ventilated when warm weather permits. The month of April is notorious for bursts of bright sunshine, and occasionally cold winds, both of which call for great watchfulness on the part of those in charge of forcing houses to prevent the evil effects arising from sudden changes of heat and cold. In inclement weather it will be prudent to make use of the upper ventilators of the houses when affording air. Syringe the trees in the morning, and again about 3 P.M., and afford water at the roots when the conditions of the soil are such as to render watering necessary. Lay in the young shoots on the early-forced trees when about 7 or 8 inches long, leaving a space of about 4 inches between them. Any laterals which may spring from these can be stopped at one leaf from the starting point, except where there are blank spaces on the trellis to be filled, when the required shoots should be allowed to grow, as by encouraging the lateral shoots a large area of trellis may be quickly covered, and a check put on exuberant growth. This kind of wood will fruit freely the following year, provided it can be well ripened. Keep a sharp look out for red-spider and aphids, and if any should make their appearance syringe the trees with soapy water applied with force by the garden engine, and repeat the syringing for several successive nights, always following the application with one of clean water.

APRICOTS.—The fruits may be thinned when they are the size of Hazelnuts, and the thinning carried out over a period of ten days or a fortnight, going over the trees twice or thrice, according as the number of fruits is few or many, the state of health and vigour of the trees should be taken into consideration in deciding the distance at which to leave them apart. If they are exceptionally vigorous, a fruit may be left on every square of 6 inches, in ordinary vigour at 9 inches square, and a weakly tree may have one fruit to every square foot. Trees thus cropped must have manures applied as mulches or waterings, and a close watch kept to note if the trees show signs of being over-taxed, and consequently the prospects of a good crop for next year lessened. If growth seems to be at a standstill, the fruits must be still further reduced, when they have become large enough for culinary purposes. If very large fruits are looked for, the thinning must also be rather severe. Keep the ventilators open night and day in mild weather, and only partly close them if frosts threaten, and make free use of the syringe in the afternoons of bright days.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

HARDY CLIMBERS AND PLANTS SUITABLE FOR FURNISHING WALLS AND LATTICE-WORK.

If not already done, all climbing and semi-climbing plants should have the shoots or branches thinned where necessary, and rearranged. Those on walls and fences make secure with nails and shreds, employing small tarred string and Rattia-grass for subjects trained over old trees and lattice-work. Allow sufficient room in both shreds and ties for the due development of the branches. The following subjects are admirably adapted for covering high walls, trellises, arches, and old trees:—*Vitis aestivalis*, *Clematis alpina*, *C. florida*, *C. Jackmanni*, *C. montana*, *C. fammula*, *Lonicera flava*, *L. flexuosa*, *L. fragrantissima*, *Jasminum officinale*, *Bignonia capreolata*, *Ampelopsis japonica*, *A. hederacea*, *A. Veitchii*, *Rosa arvensis*, and both the yellow and white varieties of the *Bankian Rose*. The above-mentioned plants are all deciduous. *Lonicera brachyoda*, *Jasminum fruticans*, producing glossy leaves and yellow flowers, and *Rosa sempervirens*, are evergreen. All these plants should be allowed to make a free, semi-wild growth, simply supporting the principal branches, and guiding young shoots over space desired to be covered. A more formal method of training should be observed with the same plants when growing against walls and trellis-work, and at pruning time spur back the lateral growths to within one or two buds of their bases. The gold and silver-edged and blotched varieties of the Ivy are most suitable for covering walls and fences on which flowering plants are not likely to succeed. For clothing low walls, lattice-work, &c., *Escallonia macrantha*, *Eucynthus radicans* variegated, *Berberis Darwinii*, *Ceanothus americanus*, *C. azureus*, *Chimonanthus fragrans*, *Magnolia grandiflora* exoniensis,

and *M. ferruginea* are very suitable; the five last-mentioned subjects require a south wall in the southern and western counties of England and Ireland. As all the above-mentioned plants can be obtained in pots, the present is a good time to plant them. Make good-sized holes, and give ample drainage where necessary, and plant in a mixture of three parts light loam and one of well-decomposed manure. Before planting disentangle the roots, shorten them back a little, and then spread them out evenly. Make the soil firm about the roots, and water to settle it about them.

INDOORS.—Sow seed of *Pyrethrum* (Golden Feather), and prick out in shallow boxes filled with light soil, *Wigandias*, *Eucalyptus*, *Nicotianas* (Tobacco), *Solanums*, and *Hemp*. Pot off *Castorolis*, *Verbenas*, &c., and shift seedling *Cannas* into larger pots when necessary, giving them a light rich compost. Water and return to heat, and shade all from sunshine for a few days until the roots have taken to the soil.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

MORMODES, CATASETUMS, CORYANTHES, STANHOPEAS, AND CYCNOCHES.—Any attention required by these Orchids should be now given. They are best grown in baskets; those for *Stanhopeas* should be without crocks at the bottom. Peat and sphagnum are the most suitable materials to plant them in. Light, heat, air, and moisture combined are most requisite during the growing season, and they will do well suspended near the roof-glass in the *Dendrobium*-house. The *Mormodes* should occupy the coolest part near a ventilator. *Cythis* are also best grown under the above treatment. These are now pushing forth their flowers from the young growths.

GENERAL WORK.—At this season work is plentiful and pressing. The system of going through houses in rotation, however, is bad, if, as I have sometimes observed, every plant is top-dressed or potted, regardless of the proper time. Various plants in any section should be potted if such attention is necessary. Shading should now be in use on bright days. Insure even the Mexican Orchids the sun by degrees, for after the long dull winter they become somewhat unused to it. Now we have bright sunshine by day and frost during the night, it is advisable to maintain a sufficient amount of moisture, as the plants sometimes suffer very much during such weather, if too dry.

THE MEXICAN HOUSE.—The species of *Laelias* with short pseudobulbs thrive best in the house of Mexican Orchids, which is of an intermediate temperature, with plenty of air afforded, and sunshine admitted. These *Laelias* are now potted up and arranged where light is abundant, and the roots are now in an active state. The supply of moisture at the root must be in great measure withheld, just keeping the plants moderately moist by affording them, say, one good watering once a week. The air of the house should be fairly moist, and the night temperature for this and the other intermediate-houses should range about 60°, according to the weather—even less than this will do no harm; and by day it may range between 60° and 70°, but it is not well to let it reach the higher degree of warmth by fire-heat alone; in cold weather, without sunshine, 60° to 65° will be found sufficiently high. *Laelia harpophylla*, *L. cinnabarina*, *L. superbiens*, and some others, to be found mentioned in the calendar for January 30, are at home in the Mexican house. Amongst others, *Cattleya citrina* is well suited here. I also grow *C. gigas*, *C. aurea*, and *C. Warneri* in this place. *C. gigas*, and its varieties, should receive but little water as yet, or it will be less likely to produce flowers; *C. Warneri* is further advanced at this period, and will accordingly require more. There are several blinds on this house, but we rarely use them, except when the sun is very bright and powerful, and it is to be feared the leaves will become scorched, which is the case after a long period of sunless skies, when some degree of habituating the plants gradually to sunlight is advisable. If a portion of the house is more heavily shaded than another, there are many other *Cattleyas*, and other species of Orchids, which find a place in it, which grow freely.

THE INTERMEDIATE HOUSE.—The cool and Mexican Orchids now being put into trim for the

season, and the plants growing in the intermediate house, will next claim attention. Plants of *Madevalla tovarensis*, *Oncidium macranthum*, and other *Oncids*, *Odontoglossum grande*, and any others just beginning to put forth new growth, may be potted, if found to need it, but the various houses of Orchids should not be taken in rotation, and every plant re-potted regardless of the proper time for doing this operation. *Cattleya Trianae*, whose new roots are showing, should not be allowed to grow to any great length; and *C. Percivaliana* may be repotted in peat and sphagnum moss. I prefer to pot the *Cattleyas* very firmly, but to do this, good fibrous peat must be used.

THE HARDY FRUIT GARDEN.

By H. MARCKHAM, *Gardener, Mereworth Castle, Maidstone.*

PROTECTING WALL TREES.—With a favourable change in the weather, the fruit buds of *Apricots*, *Peaches*, *Nectarines*, &c., will soon be open, and be in full bloom. They therefore will need protecting against frost, hail, and cutting wind. Glass coping is probably the best of all protections, but in the absence of this, canvas blinds, drawn up and let down by the means of pulleys, will answer, as also will folded fish netting fastened to poles let in the ground, with the top resting a few inches above the wall; but in either case avoid heavy shading, as this weakens both flower and shoots. In the case of a few trees, *Spruce* boughs may be used, but should be placed on thinly. If the buds are not too advanced, they may be slightly syringed with diluted tobacco or *Quassia*-water, as a preventive against green and black-fly. Keep the alleys free of weeds, and slightly prick up with the fork the soil that is likely to bake and crack open in dry weather. Do not dig the borders with a spade for other crops, as by so doing many of the best roots get destroyed. Young late-planted trees, or those which may have had their roots lifted, should have a final treading before being secured to the walls. In fastening the branches, leave the ties or shreds loose, so that they do not cut the bark. Take care when driving in the nails, as an accidental knock on the bark with the hammer very frequently leads to gumming. Pull all the shoots into position, so that the nails do not touch the bark. Should dry weather prevail, water, if needed, to give the trees a good start.

NUTS.—These should be pruned at once, if not done. Nuts, like many other fruit, should not be over-fed to produce too strong wood, or they seldom fruit satisfactorily. Keep the bushes trained basin-shape, leaving each branch with plenty of fruitful wood. Suckers should be removed, and the ground slightly pricked up to form sufficient loose soil for hoeing, &c. Young trees should have attention first, and all pruning carefully done. I like a clear stem of 15 inches, from which three to five shoots should be trained, always cutting to a bud pointing outwards. Where the Nut thrives, with good attention few fruits pay better.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Garden, Swansea.*

BOUVARDIAS.—Cuttings of these plants early struck will now be ready for potting singly into 48s, in a compost consisting of two parts loam and one part each of leaf-mould and rotted manure, with a free addition of sharp silver sand. *Bouvardias* may be grown successfully in low pits or houses where a temperature of 50° to 55° can be kept by night, and a proportionate rise by day afforded. It is necessary to keep them rather close until they get established, when air must be admitted—gradually at first—when the weather is favourable. Should still more plants be needed, no time may now be lost in getting cuttings put in, and for these choose the young shoots when they are about 3 inches in length. Insert four or five round the sides of a 4-inch pot filled with a sandy compost, and surfaced with silver-sand, placing them in the propagating-frame; they will speedily make root under ordinary care. Old plants of *Bouvardia* which may have been cut back, and have now made some amount of growth, may be shifted into slightly larger pots, using a rich compost. Grow them in a genial temperature until the roots have taken to the new material.

HARD-WOODED PLANTS.—These plants, native mostly of the Cape and Australia, will now require attention in the way of potting and re-surfacing. Specimen *Pimeleas*, *Boronias*, and *Acacias*, which

have done blooming, should be cut back after being but moderately watered for several weeks. Cut back the first two to within about 4 inches of last year's growth; and straggling growths only of the last-named plants, so that the plants may be kept in somewhat regular shape. Water must be afforded not very abundantly to these plants until the new shoots have reached a length of from 1 or 2 inches. Specimens in need of more root space should be shifted forthwith. *Acacias*, *Telopeas*, *Banksias*, *Melaucias*, *Ficus australis*, &c., should be given a compost consisting of two parts fibrous peat and one of fibrous loam, with sand in sufficient quantity to keep the whole porous; and all plants having very fine roots should have a compost consisting wholly of fibrous peat, with sufficient sharp sand to ensure porosity; and good drainage is necessary for all of these plants. Previous to repotting any plant, loosen the roots on the outside of the ball with a sharp-pointed stick, or any specimens which have attained the desired size and require repotting, may have the sides and bottom of the ball pared off. Young plants may go into pots two or three sizes larger than those previously occupied. Always pot firmly, and leave sufficient space over the ball for affording water. Repotted plants may be kept somewhat close for two or three weeks, and light syringings performed morning and evening, with a light kind of shading employed in bright weather from 11 A.M. to 2 P.M.

THE GREENHOUSE.—There will be no difficulty in keeping this structure gay, there being no lack of flowering-plants in season. Re-arrange these weekly, replacing those past their best with fresh ones from the reserve and forcing-pits. Keep everything neat and clean about the house, especially the foliage of *Camellias*, *Oranges*, and others with hard-shining leaves. Regulate the shoots of the various climbers as growth proceeds, watering and shading as may be required.

THE APIARY.

By EXPERT.

ARTIFICIAL POLLEN.—Where there is a dearth of early-flowering plants, artificial pollen feeding is necessary, which acts as a stimulus to colonies, the avidity with which bees will gather and carry home *Pea*-flower that has been placed in the cups of *Crocus* blossoms, being a proof that it is a suitable substitute for the real substance. Another plan adopted by bee-keepers is to mix the flour with chaff or something of a similar nature and place it in a box in a warm sunny place, sheltered from the wind. The bees are attracted to the spot, by placing a little honey in the comb on the top, after which they will need no further inducement to seek the flour. Outdoor feeding with pollen is only available in fine weather, but the *Pea*-flower can be given inside the hive, either in candy or by hanging a frame of comb by the side of the cluster, the cells having been filled with it. Wallflowers, where grown in quantity, yield much early pollen, but this year's blossom will not be available, the plants having been destroyed by frosts in most districts.

WATER.—Bees are not able to get along without water, and in spring they often have to fly long distances for it. Failing a supply close to the apiary, it should be provided, and shallow pans in which moss, cork-dust, stones, or something of the kind has been placed to provide a foothold, answers the purpose very well, and will soon be taken advantage of.

MARKETING HONEY.—A reverend gentleman has hit upon what is likely to prove a good idea for helping to create a market for honey. It is often disappointing to persons who have honey for sale, how difficult it is to find a ready means of disposing of it, mainly owing to the ignorance prevailing as to its various uses and value as a wholesome article of food, this being more especially the case amongst townfolks. The gentleman referred to has written an interesting and instructive pamphlet, entitled, *Honey, and Its Uses*, in which it is explained what honey is composed of, &c., and how it may be usefully employed as a medicine or an article of diet, either in its ordinary form or for cooking purposes, various recipes being given. He suggests that the pamphlet should be distributed by bee-keepers, and it would be easy to do this, if only with the honey they sell, his own experience being that he has found it so successful that he has succeeded in finding a market in his immediate neighbourhood for the produce of an apiary consisting of between thirty and forty stocks, and at a good price. *Expert.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, APRIL 7—Linnæan.

SATURDAY, APRIL 9—Royal Botanic.

SHOWS.

TUESDAY, APRIL 5 { Brighton and Sussex "New" Horticultural (two days).

WEDNESDAY, APRIL 6 { Royal Caledonian Horticultural (two days).

SALES.

TUESDAY, APRIL 5 { The Hickox House Collection of Orchids, by Protheroe & Morris, on the Premises, Hickox House, Preston (four days).

The late Mr. E. A. Roberts' Collection of Orchids, at Protheroe & Morris' Rooms; also an Importation of *Ocimum tigrinum*, and other Orchids, at the same place.WEDNESDAY, APRIL 6 { Tree Carotations, *Lilium longiflorum*, *Gladiolus*, Greenhouse Feros, Roses, Herbaceous Plants, at Protheroe & Morris' Rooms; Choice Collection of Orchids, at Stevens' Rooms.

Clearance Sale of Plants, Heres, Carls, &c., at the Priory Nursery, Acton, by Protheroe & Morris (two days); Carnations, Begonias, Lilies, &c., at Protheroe & Morris' Rooms.

FRIDAY, APRIL 8 { At the Pond Lane Nursery, Clapton, N., Hollies, Privet, *Daphne Mezereum*, *Myrtles*, &c., by Protheroe & Morris.Imported Orchids, also 350 *Dianthus grandiflorus* superba, at Protheroe & Morris' Rooms.

SATURDAY, APRIL 9 { Roses, Fruit Trees, Carnations, and other Border Plants, Begonias, Tuberoses, Conifers, Shrubs, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—46°·7.

A PAPER of considerable importance has recently issued from Rothamsted, by the able pen of Sir J. B. LAWES and Dr. J. H. GILBERT, on the above subject, of which we give an abstract.

There can be no doubt, that both the scientific interest and the practical value of our leguminous crops depend very much on the amount of nitrogen which they contain, and on the sources of their nitrogen; and especially on the great differences in these respects between them and the representative of the other families of plants with which they are grown, either in alternation in our rotations, or in association in our meadows and pastures.

It is well known that under the conditions in which farm and garden crops are grown nitrogenous manures have very direct effects in increasing the produce of Wheat, Barley, and Oats, of Turnips, Mangel, and Potatoes. This is the case, notwithstanding the fact that in the cereals the increased produce consists characteristically of the non-nitrogenous substances starch and cellulose; in the root crops, of the non-nitrogenous substance sugar; and in Potatoes, of the non-nitrogenous substance starch. Leguminous crops, Peas, Beans, Clover, &c., not only accumulate much more nitrogen over a given area of land under equal conditions, and contain a higher percentage of nitrogen in their dry substance, than the crops above enumerated, but there is abundant evidence to show that they also derive much nitrogen from the combined nitrogen of the soil and subsoil, and further, that they probably take up much as nitric acid; but in spite of this, it is generally recognised, that direct nitrogenous manures have comparatively little effect in increasing the produce of such crops.

The Rothamsted experiments reveal this apparently anomalous result, that the crops which are characterised by yielding a comparatively small amount of nitrogen over a given area, by containing a low percentage of nitrogen in their dry substance, and by yielding large amounts of the non-nitrogenous products—starch, sugar, and cellulose—are especially benefited by the application of nitrogenous manures, and under their influence yield greatly increased amounts of those bodies; whilst the leguminous crops, which contain a much higher percentage of nitrogen, and yield much more nitrogen over a given area of land, under the same soil and season conditions, are much less benefited by such manures.

The authors say, without attempting to give an adequate physiological explanation of this curious result, some of the facts bearing upon it may be briefly stated, as follows: the non-leguminous crops having comparatively limited power of accumulating nitrogen under given soil conditions, they generally require nitrogenous manuring; the amount of nitrogen assimilated to a great extent rules the amount of chlorophyll formed. Chlorophyll formation is an essential condition of carbon assimilation; the amount of carbon assimilated is the chief measure of the quantity of produce; and since the more special or characteristic products of the non-leguminous crops are the non-nitrogenous substances—the carbohydrates—the natural result of the increased assimilation of nitrogen, and the consequent greater luxuriance, is an increased formation of the bodies which are their essential or characteristic products.

Thus, while it can hardly be said that there remains an unsolved problem in the matter of the sources of the nitrogen of our non-leguminous crops—of Wheat, Barley, and of grasses, as representatives of the great family of the Gramineæ; of Turnips, representing the Crucifere; of some varieties of Beet, representing the Chenopodiaceæ; and of Potatoes of the Solanaceæ—it must be admitted to be quite otherwise, so far as our leguminous crops are concerned.

It is nearly a century ago since the question whether plants took up, or evolved, free nitrogen, became a matter of experiment and of discussion; and it is just about half a century since BOUSSINGAULT commenced experiments to determine whether plants assimilate free nitrogen. From his results, he concluded that they did not; and those obtained at Rothamsted about thirty years ago, confirmed the conclusions of BOUSSINGAULT. In fact, the authors concluded, that under the conditions of those experiments, which consisted of sterilisation and enclosure, in which, therefore, the action both of electricity and of microbes was excluded, the results were conclusive against the supposition that the higher chlorophyllous plants can directly fix free nitrogen, either by their leaves or otherwise. Nevertheless, it has long been admitted that existing evidence was insufficient to explain the source of the whole of the nitrogen of the Leguminosæ; that there was, in fact, a missing link.

According to some even recent experimenters, gain of nitrogen is not limited to our leguminous crops, and the modes of explanation of the gains which have been observed are extremely various. Thus, it has been assumed that combined nitrogen was absorbed from the air, either by the soil or by the plant; that there is fixation of free nitrogen within the soil by the agency of porous and alkaline bodies; that there is fixation by the plant itself; that there

is fixation within the soil by the agency of electricity; and, finally, that there is fixation under the influence of micro-organisms within the soil, both with and without the accompanying growth of higher plants.

But of all the recent results bearing upon the subject, those of HELLRIEGEL and WILFARTH, with certain leguminous plants, seem to be by far the most definite and significant, pointing to the conclusion that although the higher chlorophyllous plants may not directly utilise free nitrogen, some of them, at any rate, may acquire nitrogen brought into combination under the influence of lower organisms, the development of which is, apparently, in some cases a coincident of the growth of the higher plant whose nutrition they are to serve.

The results obtained by these German experimentalists were of such fundamental and far-reaching importance, that it seemed desirable the subject should be further investigated with a view to their confirmation or otherwise. Accordingly, it was decided to take it up at Rothamsted, which was done in 1888. The investigation was continued in 1889 and 1890, and is still (1892) in progress.

Having briefly described their earlier experiments, which, under conditions of sterilisation and enclosure, showed that neither Gramineæ, Leguminosæ, nor other plants, directly assimilate the free nitrogen of the air, the authors give an account of their recent investigations which do show fixation of free nitrogen. The plants dealt with included four annuals, namely, Peas, Vetches, Beans, and yellow Lupins; also four plants of longer life, namely, white Clover, red Clover, Sainfoin, and Lucerne.

The results with Peas, Vetches, and yellow Lupins, were very definite and striking. They abundantly illustrated the fact that under the influence of suitable microbe-seeding of the soil, there was nodule-formation on the roots, and coincidentally, increased growth, and gain of nitrogen beyond that supplied in the soil and in the seed as combined nitrogen, presumably due to the fixation, in some way, of free nitrogen.

With some of the other plants the growth was not so satisfactory, partly owing to failure to ensure suitable infection of the roots.

As bearing upon this curious and interesting point, the authors refer to some experiments and results of Professor NOBBE, who undertook an investigation, in the first place to determine whether leguminous trees, as well as our agricultural leguminous plants, were susceptible to microbe infection and nodule formation; and, secondly, to ascertain whether there is one nodule-forming bacterium, or whether many bacteria have the property—each description of plant, or perhaps each group, having its special bacterium.

The plants experimented with were Peas, yellow Lupins, and Beans; also, as trees, Robinia pseudacacia (Locust tree), *Cytisus laburnum* (Laburnum), and *Gleditsia triacanthos* (Honey Locust). To each of these were applied microbe-seeding from various sources; in some cases only soil extracts, and in others pure cultivations, either from soil-extracts or from the root-nodules of different plants. When soil-extracts only were used, the results were somewhat irregular. For example, with Peas, a better result was obtained by the use of *Gleditsia*, Robinia, or *Cytisus* soil-extract, than of Pea soil-extract. With Robinia, on the other hand, the best result was obtained with Robinia soil-extract.

But when pure cultivations were employed, the general result was, that more effect was pro-

The Sources of Nitrogen of our Leguminous Crops.

duced on any particular description of plant by the bacteria obtained from the same description, than by those derived from other descriptions. Thus, with Peas there was more produce, and more nitrogen assimilated, by the application of pure cultivations of Pea-nodule and Pea-soil

of the microbe infection from another than from the same description of plant. In some cases infection had more effect than manuring with ammonium-salts or nitrate. NOBBE concludes, however, that the results can leave no doubt that the Pea and the Robinia bacteria have different

BERT say that obviously much more evidence is needed in regard to any difference in character or relative prevalence, at different periods in the life and growth of the plant, and under different conditions of soil, both so far as mechanical state and porosity, and richness or otherwise in

FIG. 61.—ARISTOLOCHIA CLYPEATA: FLOWERS, CREAM-COLOURED, WITH PURPLE SPOTS. NATURAL SIZE. (SEE P. 435.)

bacteria, than by that of Lupin nodule, Lupin soil, Robinia nodule, or Robinia soil bacteria. On the other hand, the Robinia nodule bacteria, which showed no action with Peas, had marked effects on Robinia. Still, this did not apply in all cases, there being sometimes more produce, and more nitrogen gained, under the influence

physiological actions, which indicate, if not different species or varieties, at any rate different race or nutrition modifications.

The conclusion drawn from the experiments of NOBBE, that there are various nodule-forming bacteria, is consistent with the results obtained at Rothamsted; but Messrs. LAWES and GIL-

available supplies of combined nitrogen are concerned, before any clear conception can be attained of the connection between nodule-formation, luxuriance of growth, and gain of nitrogen. How the fixation of nitrogen is to be explained must be left to a future occasion.

LINNEAN SOCIETY.—At an evening meeting, to be held on Thursday, April 7, 1892, at 8 P.M., the following papers will be read: 1, "On the Phenomena concerned in the Production of Forked and Branched Palms," by D. MORRIS, F.L.S.; 2, "Gland-like Bodies, &c., in the Bryozoa," by A. W. WATERS, F.L.S.

LIST OF CULTIVATED ORCHIDS.—In the *Revue Horticole*, M. MOTTER gives the commencement of a list of the genera of Orchids in cultivation, evidently founded on the list given by Mr. BURBIDGE in a special supplement to the *Gardeners' Chronicle* on May 9, 1885, though the fact is not stated.

SERENO WATSON, whose death we announced in our last issue, was one of those quiet retiring men whose value can only be estimated by his immediate associates. He was born in 1826, and originally practised medicine, but became botanist to the United States Geological Expedition for the Exploration of the Fortieth Parallel of Latitude. Subsequently he became Assistant to Dr. ASA GRAY at Harvard, and devoted the remainder of his life to continuing and extending the work of the master. Botanists looked to him to complete the enumeration of the plants of the United States left incomplete at the death of GRAY, and a good deal has indeed been done in this direction. So far as horticulture is concerned, WATSON'S chief title to respectful memory lies in his *Botany of California*, in the elaboration of which he took the largest share.

HYBRID ANTHURIUM.—Among the raisers of these very showy flowers, M. DE LA DEVANSAYE, of Angers, is one of the most prominent. Among his more recent successes are A. M. de la Devansaye, a hybrid between A. Wardi and A. Titanum; A. Marie Thérèse, raised between Andegavense and Mr. Hardy. To these First-class Certificates were awarded at the last meeting of the National Horticultural Society of Paris. Thirty-five hitherto unnamed seedlings were also shown. A First-class Certificate was also awarded to the same enthusiastic amateur for twenty spikes of Vanda tricolor, with 150 flowers. M. DE LA DEVANSAYE also showed specimens of Vanda Schilleriana, aurea, Pescatorei tricolor (Luxembourg variety), tigrina var. pallens, formosa, Veitchii, cœrulescens, &c.

A NEW FERN.—Messrs. DICKSONS, of Chester, send us a specimen of a Maidenhair Fern, *Adiantum Capillus-veneris* var. *imbricata*, which was described and illustrated in our columns so long since as 1888, but which has only now been sent out. Its hold wedge-shaped pinnules are not unlike those of A. Farleyense on a small scale.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—Among the many gardeners' societies in operation in the present day, that of Reading appears to be one of the most useful and successful. It has just issued its fourth annual report, which shows a steady increase of members, there being now 140 on the books. The meetings are held fortnightly, and are made of greater interest by exhibits of plants, fruits, &c. The Society possesses a library, the books being largely read by the members. Papers on subjects of interest to gardeners are read, and discussions encouraged; and the attendance of members is always large. Summer excursions are also made to places of horticultural interest, large numbers of the members joining in them.

THE ROYAL HORTICULTURAL SOCIETY OF SOUTHAMPTON.—The members of this Society held their annual meeting on Thursday, March 31, and, according to the annual report and financial statement, the Society is not in a very flourishing condition. Last year was an unfortunate one for the Society, resulting in the addition of over £80 to the already heavy debt. Over £60 of this deficit was incurred in the endeavour to re-establish the Chrysanthemum show. The spring show for the current year will be held on Whit Monday, June 6, and the summer exhibition on July 30 and August 1.

MR. W. T. THISELTON-DYER.—We are glad to note that the Royal Society of New South Wales has awarded to the Director of the Royal Gardens, Kew, the Clarke Memorial Medal for special services rendered to the Colonies and India. Mr. DYER'S talents for organisation and administration have been conspicuously evident in his endeavours to bring about cohesion and co-operation between the several botanical establishments of the colonies, and between them all, with Kew as a centre. Mr. DYER, in acknowledging the receipt of the medal, gracefully acknowledges the continuous and loyal assistance of every member of the staff, and continues:—"The connection between Kew and the Australian colonies has always been peculiarly close, and I find that this is no less than the third occasion upon which it has been recognised by your Society. That connection began in the last century by Sir JOSEPH BANKS, who, although not actually connected in any official way with Kew, was virtually its Scientific Director. It was resumed by the splendid work on the elucidation of the Australian Flora of my immediate predecessor in office, Sir JOSEPH HOOKER, and it culminated in the preparation at Kew by Mr. BENTHAM of his classical description of the whole Australian flora. It is, I feel, no small distinction to be associated in the eye of Australian scientific men with these two eminent recipients of the Clarke Medal. My own work has, I feel, been the much humbler one of continuing a tradition which, by the wisdom of the Government, has made Kew as much an imperial as a local institution. The services to which you allude have become so much a matter of routine that they scarcely seem to possess any exceptional merit. Their reward, if they deserve any, continually manifests itself in the kindness and sympathy which Kew never fails to receive at the hands of its colonial correspondents. If anything is needed to lighten the continuous and, perhaps, sometimes onerous labours of the Kew staff, it is the feeling that they are working not merely for a limited section of the home community, but for the welfare and gratification of intelligent persons in every part of the Empire. Kew has undoubtedly in the last half century been successful in effecting much for the advancement of many material interests. Its highest work has, however, perhaps, been accomplished in the encouragement and help which it has been able to afford to the cultivation of science in England beyond the seas. In Australia, with its splendid universities, energetic scientific societies, and fine botanic gardens, it sees an offshoot of the best home intellectual life, which must always command its warmest sympathy."

RAIN AS A SOURCE OF NITROGEN FOR VEGETATION.—In connection with the question of the nitrogen compounds that are at the disposal of plants, a German scientist, C. F. A. JUXEN, has recently been inquiring whether there are any nitrogen compounds in the rain which can be made use of during the growth of vegetation. Of course, rain, *per se*, is only water, but in its passage through the atmosphere it finds various gases, volatile substances, and finely comminuted solids, arising from various sources, and being a great solvent, many of these are carried down by it to the soil. JUXEN collected a large number of samples of rain-water, and analysed them. He found that a good deal of nitric acid and ammonia occur, which, when calculated out to so many pounds per acre, reach to considerable figures. These figures are given in tables in the original paper, but are too many for quotation here. We refer our readers to the *Forsch. Gebiete Agronomie* Phep., xiv, pp. 367, 368, for further details. But it may be observed that the results seem rather high, because the rain was collected from the neighbourhood of a populous village, where the production of ammonia and nitric acid due to the decomposition of organic matter would be probably greater than in the open country.

EARTH WORMS.—We read in the *Wiener Illustrierte Garten Zeitung* for March, that if a

spade be pushed into the soil in a perpendicular position and shaken rapidly to and fro by the handle, the worms will creep out of the earth for a considerable space round about, when it is an easy matter to catch and put them into a vessel. For the domestic fowl these form a nourishing food and delicacy. If a bed of vegetables, or what not, is regularly searched in this manner, an enormous number of big and little worms can be caught, and no trouble will be experienced for several weeks.

ELECTRIC LIGHTING FROM WINDMILLS.—Messrs. CARWARDINE, of City Road, E.C., some time ago erected a Halladay windmill on the top of their building, and within the last few weeks have installed the electric light, which may now be seen burning brilliantly each night, and which is produced simply by the power of the wind. The installation consists of a dynamo capable of developing a current of about thirty amperes, at a pressure of about seventy volts, and by means of an automatic apparatus the output is kept constant though the speed of the mill may vary, and the accumulators are thus charged at an uniform rate of speed. The charging circuit is switched on when the speed is high enough, and switched off when it drops too low. The whole apparatus is automatically governed, so that a steady and uniform current is forced into the cells. Any of our readers who may care to inspect this novel installation are invited by Messrs. CARWARDINE & Co. to do so.

ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO BRIDGE ROAD, S.E.—In aid of the funds of the above Institution, the LADY MAYORES intends to hold a Rose Show and Fruit and Flower *Fête* at the Mansion House on June 24.

MAIDSTONE ROSE SHOW.—The Maidstone Rose Club have decided to hold their annual show on Tuesday, June 28.

EUADENIA EMINENS.—In one of the side-shelves of the T-range at Kew is a plant in a 48-pot of this very remarkable Caprariaceae shrub in full bloom. It is not showy enough in colour to please some folk, but in form it is calculated to please the eye, and stimulate curiosity. The plant, which is remarkable for the great length of its two upper petals, which are of a greenish-yellow colour, was introduced from West Africa by Mr. BRILL, and was figured in our columns on April 29, 1882, since which time we have scarcely seen it. It is satisfactory to find that so fine and curious a plant can be flowered in a small state.

THE CHANGES WHICH RIPENING CHERRIES UNDERGO.—A developing fruit appears to be comparable with a chemical laboratory on a small scale; and, for the matter of that, as in any portion of a growing plant. Here we have inorganic matter converted into organic matter, and the latter changed by the life-processes into other varieties of organic matter, in a way which we can only marvel at. Last summer, ripening Cherries were made the subject of a special study by W. KERN, who has recently published the details of his research, and the conclusions arrived at, in the *Zeitschrift für Analytische Chemie* (vide xxx., pp. 401–407). He specially examined the changes which take place in the chemical composition during the growth and maturity of *Prunus cerasus*. The variety studied was the early Griotte, specimens of which were gathered from a single tree, at intervals of seven to ten days, and analysed. We may notice that, as the fruit ripens, the percentage of water decreases, the dry substance increases, so does the acid, and of course, too, the total amount of sugar. In the earlier stage of maturity, citric acid (the acid of Lemons), malic acid (the acid of Apples and succinic acid are present), but nine days before perfect maturity is reached, the latter quite disappears. Invert sugar is present from the start, and in the last stage is 10 per cent of the entire weight. Dextrose and levulose (two sugars) are present, with inositol, another sweet substance at first, but towards the end the inositol occurs merely as a trace. The progressive

increase in the percentage of acid during the whole period is not in harmony with the old view that the sugar is formed at the expense of the acid. The disappearance of succinic acid, as ripening is approached, suggests the theory that the other acids are formed synthetically. Cane-sugar is present only in the leaves, in proportions which increase as the ripening is approached, but subsequently diminishes. No starch was detected at any stage in the growth of the fruit, though the parenchyma cells of the peduncle showed starch granules increasing in amount as the fruit ripened.

THE JERUSALEM ARTICHOKE.—In a paper contributed by M. G. LECHARTIER to *Annales Agronomiques* for February 25, and dealing with the various mineral constituents of the Jerusalem Artichoke, the author thus epitomises his observations:—"The leaves of the same plant are found to present great diversity of composition as regards mineral matters, according to the year, the nature of the soil, and of the manures, the stage of growth, and the position on the stem. Such variations are much more considerable than in the tubers or seeds. There is no relation between the proportion of mineral principles in the various organs of a plant, and the amount of the crop. A plant which formed part of a heavy crop is not always richer in phosphoric acid and potash than one forming part of a smaller crop. Whenever any one of the essential constituent principles of the leaves of a plant, phosphoric acid or potash, falls below a certain ratio, they alter, turn yellow, and die. This alteration is prematurely effected in many leaves, the more so in proportion as the soil is poor. A comparison of the component parts of prematurely sere and of green leaves respectively, renders it possible to estimate the nature of the principles which are especially lacking in cultivated soil. The leaves elaborate and store mineral principles which are afterwards utilised for the nutrition of the youngest parts of the plants, and especially the tubers and seeds. This fact explains the variations which can be induced in their composition by subjecting them to differing influences."

SELF-HELP EMIGRATION SOCIETY.—Secretary, E. WILSON GATES. The objects of this Society are to assist, by means of grants or information, in emigrating to Canada and other colonies, those suited to become colonists. The Society gives information gratis to all comers, as to which colony the applicant is most likely to succeed in. It investigates the character of applicants as far as possible, and declines to help those who are unlikely to become good colonists; but it takes by the hand those who are suitable, and helps them to obtain the amount required. The fundamental principle of the Society is self-help, which means that every intending emigrant must provide, personally, or through friends, a contribution towards the cost of his or her emigration; and usually the larger portion of the cost is thus provided. The Society also gives Canadian introductions to persons of a class superior to the ordinary emigrant, who, though able to pay their own expenses, are glad to avail themselves of the Society's help in the way of guidance and advice. The Society does not merely assist them to the port of landing, and there leave them to take their chance. It has more than fifty voluntary agents and correspondents in various parts of Canada, to whom the emigrants are sent. These correspondents inform the Committee in London as to what class of emigrants they can receive, and how many they can find employment for. They are also provided by the Committee with sufficient funds to enable them to supply the Society's emigrants (in case of need) with food and lodging until they can find employment, which is usually obtained in a day or two at most. The Society has, in addition, seventeen correspondents in Queensland, Victoria, South Australia, Tasmania, and New Zealand. All able and willing to work on the land are most readily received in Canada, and other British colonies. Many more domestic servants are required than ever apply. For artisans of all kinds there is a limited and varying demand. Clerks, professional men, and those ac-

customed to mercantile pursuits are not wanted. Contributions will be thankfully received and acknowledged by the Treasurer, 54, Lombard Street, E.C.; or by the Secretary, at the office, Memorial Hall Buildings, Farringdon Street, E.C.

M. BALANSA.—The death of this renowned botanical collector is announced. M. BALANSA had travelled widely in Asia Minor, South America, New Caledonia, and at last met his fate in Tonquin. M. BALANSA's collections are esteemed by botanists for their general excellence, and the care with which they were prepared.

THE ROCK GARDEN AT KEW.—The *Revue Horticole* for March 16, contains an appreciative notice with plans and good illustrations, of the rock garden at Kew, certainly one of the most delightful and interesting features of our noble garden.

HOW TO GAIN SPACE.—Seeds of *Cocos Weddeliana*, in small pots, are sunk in a bed of sand, which is spread over the stages of the greenhouse, and then covered with another layer about 3 inches deep, on which are stood small pots containing cuttings of *Araucaria excelsa*, each covered with a bell-glass. When these cuttings have rooted, they are taken away, as is also the sand which covers the seeds of the *Cocos*, which by this time have germinated, and are just ready to be brought to the light. This ingenious plan is pursued in the houses of MM. DE SMET FRÈRES at Ledeborg, near Ghent.

BRABEA ROEZLI.—The only specimen of this plant which exists in Belgium is growing in the houses of MM. DESMET FRÈRES, and has about twenty leaves.

MR. W. J. GRANT.—The friends of this gentleman will be glad to know that he is making satisfactory progress towards recovery, after the very serious accident which befel him on December 3 last.

THE HISTORY OF KEW GARDENS.—An authentic history of Kew Gardens has been so long wanted, that its appearance in any form is a matter for which we cannot be too thankful; but it has seemed to me, and doubtless to many others, that it ought to be sent forth into the world in, at all events, a decent dress. This is not the case with Mr. THISELTON-DYER's exceedingly valuable *Historical Account of Kew to 1841*, which is not provided with any dress at all, and with not so much as a title-page. Those who care anything for the subject, would be glad to pay a few shillings for a book of so much interest, and of such permanent value. It would then take its proper place on one's bookshelf, and not be relegated to the inferno of miscellaneous pamphlets, which have a tantalising and temper-trying habit of getting lost or mislaid, which is pretty much the same thing. The form of Mr. THISELTON-DYER's pamphlet is no doubt due to the inexorable requirements of governmental red-tapeism. As, however, we are at present compelled to accept the great variety of out-of-the-way information in its pamphlet form, perhaps you will kindly allow me to point out a few additional facts which I have come across in my rambles among old books. In the first place, Mr. THISELTON-DYER does not seem to know of an interesting little book entitled *A Description of the Gardens and Buildings at Kew*, to which is added a *Short Account of the Principal Gardens in and about Richmond and Kew*, which is undated, but was printed at, and sold by, P. NONNAR, Brentford, about the year 1760. There are two copies in the British Museum, one of which is an exact reprint issued a few years—perhaps ten—after the earlier one. This little book is illustrated with eight good engravings "in perspective," arranged as follows:—(1), The Palace from the Lawn; (2), The Menageries and Pavilion; (3), The Aviary and Flower-garden; Lake Island; (4), Temple of *Æolus*, Bellona, and the House of Confucius; (5), The Wilderness, Alhambra, Pagoda, and Mosque; (6), Lake and Island seen from the Lawn, the Bridge, Temple of Victory, *Arethusa*, and Pagoda; (7), North Ruin;

and (8), South View of the Ruin. The authorship of the book is now unknown, but it was evidently written by one who knew the gardens well, and it is very likely that HORNE TOOKE if he did not actually write it, had something to do with it. As regards the fine view, to which Mr. THISELTON-DYER refers, of a portion of Kew Gardens, which occurs in HORNE TOOKE's *Petition of an Englishman* (1765), and of which view a slightly-altered copy appeared in the first number—May, 1767—of the *Political Register*, a reference to the *Public Advertiser* would have obviated the necessity for repeating the *Political Register's* wrongly-quoted allusions. "Anti-Sejanus" was one of those political ranters with unreasoning animosities to which every period gives birth. He was a frequent contributor to the *Public Advertiser*, and was in his best "form" when denouncing some real or imaginary abuse. In that Journal for August 3, 1765, he brought a charge against Lord BUTE of erecting palaces, &c., out of the public moneys. A reply to his aspersions appeared in the same newspaper for August 26, 1765, by a correspondent who signed himself "J. J." In this instance, as in so many others, the Earl of BUTE was most unfortunate in his advocates, who, it seems to me, did him much more harm than many of his most violent assailants. It may be mentioned that this letter of "J. J." with those of "Anti-Sejanus," and of many other writers, were reprinted in book-form, in two volumes, under the title of *A New Collection of Interesting Letters and Papers, Selected out of the Public Prints, from the Accession of his present Majesty to May, 1767*. Mr. THISELTON-DYER's copy of the *Political Register* is apparently a mutilated one, for he says "the second initial [of the letter signed 'J. J.'] is lost, but it may be conjectured that the writer was JOHN HAYFIELD, who was a protégé of Lord BUTE's." In my copy of this periodical the second initial is there plainly enough, and so it is in the original quarter—the *Public Advertiser* of August 26, 1765; so that, if initials go for anything, the letter was not written by JOHN HAYFIELD. The points I have touched upon appeared to me to possess a certain amount of interest, and therefore worthy of being recorded in connection with Mr. THISELTON-DYER's valuable "account" of the garden. W. Roberts.

INJURY BY FROST TO FRUIT TREES.—Mr. HANSNERE, the gardener at Beaumont Park, Loughboro', Leicestershire, sends us the following:—"I have enclosed a few shoots of Pears, Plums, and Apricots for you to kindly examine, and note the effects of the severe frost on the bloom and wood-buds. These were taken from the central parts of well-established wall trees 14 feet in height. We had on February 17, 37° of frost, or 5° below zero, the readings being taken from four thermometers, and all were exactly alike. I have never before experienced anything like it before. I should be glad to hear if any other readers of your paper have similar experience." [The buds were in all cases dead or dying.]

ARISTOLOCHIA CLYPEATA.*

The drawing from which the cut, fig. 61, was taken, was sent us by a continental correspondent, whose letter we have unfortunately mislaid, under the name of A. Duchartrei, and indeed the two plants are very similar in foliage. The flowers are, however, widely different, though belonging to the same section. *A. clypeata* is one of the most handsome of a handsome group, but one which does not find favour, probably because of the offensive odour exhaled from the flowers, and partly because their subtle and subdued coloration does not commend itself to a generation accustomed to crude tints and magenta dyes. The present flower, the form of which is sufficiently indicated in our illustration, has a yellowish-white or cream-coloured ground, thickly beset with arborescent purple spots. A large elliptical black blotch immediately over the tube is

* *A. clypeata*, Loudon and André, *Illustr. Horticolæ*, 1870 t. 40.

a characteristic feature of the flower, and serves as a beacon to attract insects. The flower-tube is lined with white hairs pointing downwards, so that while entrance is easy, exit is difficult. The insect thus trapped scatters the pollen on the stigma in its efforts to escape, and thus effects its fertilisation. Some insects, it is clear, must escape, else they could not be pollen-carriers; others remain prisoners, and meet a miserable ending in the tube of the flower.

FOREIGN CORRESPONDENCE.

A LARGE AMERICAN NURSERY.

ALLOW me to make a few remarks concerning one of the most extensive nursery and florist's businesses in the world, viz., that carried on by Mr. John Lewis Childs at Floral Park, New York. Floral Park is one enormous garden and park, laid out with great taste, and is situated about 12 miles from the cities of New York and Brooklyn, in the richest and most fertile part of Long Island, having the L.J.R. Railway running through the gardens, and Floral Park station, where the two main buildings are situated, with thirty trains daily running to and from New York City and Brooklyn. The park is about 9 acres of ground in extent. Mr. Childs has, bordering on the railroad, 150 acres, all covered with the leading kinds of seeds, bulbs, fruit, &c. The *Gladiolus*, the largest stock of the kind in the world, will this summer cover 50 acres. The greenhouses, which are in most cases 200 feet in length and 40 feet wide, cover several acres of ground. More than 200 men are employed in the months of March, April, and May. The establishment is worked to its full capacity most of this time both by night and day.

Mr. J. L. Childs, besides being a nurseryman, is the editor and publisher of the *Mayflower*, a periodical appearing monthly, which has a circulation of over 250,000 copies. His catalogues this year number 400,000, requiring 140 tons of paper, and worth, when printed, 35,000 dollars. The covers, coloured plates, and engravings cost more than 29,000 dollars; add to these items the cost of postage, 5 cents per copy = 20,000 dollars, and there is the large total of 84,000 dollars.

THE WINTER AND THE ROSES.

It cannot be so much the frost as the changes in the weather, which have been so sudden, going from one extreme to another, that have injured our Roses, many of which are hard hit, and probably not a few dead; but the full extent of the mischief done can as yet scarcely be estimated, and will only be apparent when they ought to begin to grow, and when, I fear, many of the Teas will be found to have perished. Some of this state of things is, no doubt, owing to the immature condition of the wood, which was far from ripe. It may be that Teas which now show little signs of life will break from the base, if own-root plants, as they often do, and it will be well to defer the pruning to as late a period as possible. J. S.

BIARRITZ.

THOSE who came to Biarritz last January expecting to find the first three months of the year all sunshine have been much disappointed, though their disappointment has been somewhat modified by reading the daily reports of the weather in England; rain and wind we have had here in plenty, but no snow, and not much frost, and the daily temperature, both highest and lowest, has generally been 10° above that of London. When I left Cheshire on January 18 there was 1 foot of snow lying in England; but here on the 20th, and for two or three days after, we had weather which would have done credit to an English May; butterflies were flying about in the town, lizard hunting insects about the walls, and standard Camellias in full flower in the villa gardens. Since that time we have not been favoured with more than two or three such days in each week; and

excursions are planned only to be put off, as there have rarely been two fine days together.

The country here can hardly be called pretty, excepting the view of the Spanish coast line of mountains, and the distant high Pyrenees in their white winter dress. To the north we soon get into the monotonous sand dunes covered with Pinaster, all with a slice of bark cut off to collect the turpentine. These woods reach with little intermission nearly to Bordeaux. Southwards the country is hilly; the hills, rising with steep slopes to 300 or 400 feet, have along the intervening hollows deep gullies, and streams giving evidence of frequent flooding. The rainfall is, in fact, two or three times that of London, and as the soil is mostly alluvial clay, mixed with drift, walks across country are not to be accomplished in winter without braving plenty of mud. But besides this, though more than half the area of these hills is unenclosed and uncultivated waste, there are no footpaths from village to village; the lanes follow the contour of the steep hills, and when passable, generally end abruptly in a homestead with two or three barking dogs, and a peasant proprietor, who would resent his fence being surmounted, though there is no other way of getting through. These fences, moreover, are steep banks, mostly topped with Gorse, and bounded by a deep ditch. You cannot take a line in any direction without coming upon these unsightly little farms; and you are further interrupted by coppice-woods, often of great extent, the growth being very thick, and containing a large proportion of thorny Robinia. It is better, therefore, to keep the high road—those dull French roads, lined with shorn Planes and Poplars—and to make such *détours* as appearances may invite you to try.

We are taking a walk of this kind about the middle of February, and noticing the flora of the district. Ferns and moss are abundant on the banks, especially *Asplenium trichomanes* and *A. adiantum nigrum*, *Scolopendrium*, and varieties of *Polystichum*. The low boggy ground is full of large plants of *Osmunda regalis*, on which the dry leaves remain. The unenclosed hill-sides are mostly covered with Heather and short Gorse, which is mown every two or three years, perhaps in the hope of improving what little pasturage there is. I have seen no kind of winter-flowering Heath, but recognise *Erica vagans* and *Menziesia polifolia* in abundance. English spring flowers there are in plenty, but far earlier than we know them at home. The wet ground is full of *Cardamine pratensis*, out from January onwards; the "Palm" or sallow catkins are all yellow at the same season. The lane banks are as full of *Primroses* as they are in Devonshire; amongst these the pure white variety is common. I sometimes observe a red one in the bunches, thousands of which are sold in the streets to English visitors; and I am told that these, too, are found wild, which is likely enough.

The common English Daisy is in all profusion wherever there is short grass, and many other flowers and weeds remind us of home; but mixed with them is a good deal that is absent or rare in England. The narrow-leaved *Pulmonaria* abounds everywhere, both on banks and in woods, the flowers being very rich in colour. Here and there through winter, the little blue stars of *Lithospermum prostratum* appear amongst the yellow of the Gorse; it is abundant on the commons here, but is not at its best till April. The hedges are commonly festooned with the evergreen *Smilax aspera*, and on the stony banks *Rubia perigrina* abounds. Both woods and roadsides are overgrown with miniature forests of *Ruscus aculeatus*, which often has the monopoly of a large space; it still retains its large scarlet berries. The Wood-Anemone does not seem very abundant here, but it is common near Bayonne, where a large proportion of the plants belong to the blue-flowered variety, the *A. Robinsoniana* of gardens. Dogtooth Violets and Hepaticas occur sparingly, but not very near the town. The Barfield Oxlip, too, grows along some of the water-courses, but the Cowslip is absent. *Fritillaria meleagris* is local. There is an island in the Adour nearly covered every spring-tide, four miles above Bayonne, on which it grows almost like

a planted crop. I found it in full flower there early in February; roots I had from there several years ago, continue to flower in my garden in Cheshire more than a month earlier than others collected for me near Reading. Amongst many thousands I could not find one with white flowers.

Everywhere, on the road-side banks, in company with Dog-Violets, and wild and barren Strawberries (*F. vesca* and *F. fragariastrum*), is a pretty creeping Potentilla, I think called by native botanists *P. splendens*; it has very pure white flowers, and white anthers, by which it attracts notice amongst the Strawberry flowers. A little Oxalis, called, I think, *O. corniculata*, is also very plentiful, flowering all the year round. Then there is a *Ranunculus*, with flat, three-lobed, horizontal root leaves, gaily marbled with red and white. I am told it is *R. nemorosus*. It might be worth cultivating, if it would retain its gay character in a garden. *Trichonema Bulbocodium* must not be omitted—it is abundant on all the sandy downs throughout the district, a white variety being also plentiful; it makes the racecourse here bright on sunny days, from January onwards. But perhaps the most interesting flower in the district is the parasitic *Lathraea clandestina*, common where Alders grow in stiff, wet soil; it began to show itself before the beginning of March, and abounds along the valley of the Nive. It is said to be satisfied with Poplars, or one or two other trees, as hosts, but all I have seen were on Alder.

Besides the plants I have mentioned, there are others which, though not in flower, are so easily recognised, and so common in the district, that I may speak of them; one is *Asphodelus albus* (*ramosus* var.). This is so universally abundant both in woods and on waste lands, pushing up its leaves with the new year, that one gets weary of the sight of it. English visitors have an idea that Daffodils, of which I hope to speak another day, are common near here, and in spite of my assurance that they will find none, go out to hunt for them; they come back and report that they have found woods full of leaves of Giant Daffodils, not yet in flower, being, of course, *Asphodels*. The predominant shrub of all roadsides, lanes, commons, and sand-dunes, growing almost in the streets of Biarritz, is *Cistus salviifolius*. It grows largest in the sea-sand of the Fir woods, the trees not being so close as to exclude the sun. I have seen broad masses of it there nearly 3 feet high, but on the common it scarcely reaches 1 foot. It does not flower till May. This and *C. alcyonoides*, which also grows close to Biarritz, but is more local, are the only rock-Roses of the district. *Daphne Cneorum* and *D. Laureola* are also plentiful; the one close to the town on wet commons to come out in April, the other, already densely covered with flowers, in woods. Above the esplanade a facing wall of loose stones, the only place on which I have yet observed green frogs, is green with *Parietaria*, *Cithrum maritimum*, *Frankenia laevis*, and a very near-growing species of *Statice*. I think the same which grows on the rocks of Llandudno; Bentham names it *Souriculaefolia*. There are two or three rare sand plants which I have not noticed elsewhere, but which I cannot mistake, and which are common close to the high water mark near the lighthouse. One is *Dianthus gallicus*, a very local species; another, *Alyssum montanum*. Both of these I have tried in vain to cultivate in Cheshire. A third is *Helichrysum stachas*, *Vinca major* and *V. minor*, and the foetid *Hellebore*. I have got through the more conspicuous of the plants which are visible here. The *Narcissus* tribe I have not included, as my investigations about them are as yet by no means complete. C. Wolley Dod.

NURSERY NOTES.

MESSRS. CANNEL & SONS, SWANLEY.

AMONG English nurseries, the well-known establishment of Messrs. H. Cannell & Sons, at Swanley, Kent, occupies a prominent position, and it has been

so frequently noticed in these pages that further reference seems almost superfluous. Such, however, is not the case. There is always something of interest to be seen at Swanley, even in winter; and a recent visit there not only revealed the fact that Messrs. Cannell & Sons continue, in the face of keen competition, to maintain the high reputation which they have always held, as regards novelties in flowers, but that they are making rapid strides towards further improvements in various subjects, where such are really possible.

Tuberous-rooted Begonias afford an example of what is being done. These have for years been a special feature at Swanley, but hitherto they have been regarded as summer and autumn-flowering plants only. A break, however, has been made, and at the present time a batch of Tuberous Begonias in full

and produces large bold trusses of delicately-tinted flowers. King of the Purples has a decided bluish-purple tint when seen in a good light, and it is said to be a very free-bloomer. A new colour, a rose, shaded magenta and white eye, may be found in Cannell's Favourite, a capital variety for cut purposes; and Lord Rosebery, bright crimson, is also deserving of notice. The above varieties are singles, and specially adapted for winter flowering. A batch of a French spotted or decorative Pelargonium named Venus, a fine white, was in full flower, as also was a new semi-double, named fimbriata alba, of the same type.

The Cinerarias, too, were making a good show, and are well worth a visit. The plants were very compact in habit, and carrying fine heads of bloom. The flowers were noteworthy for their size, as well

seed farm is situated, numerous glass structures are now being built, the extensive ranges at Swanley being now found inadequate for the rapidly increasing business. Thousands of annuals for seed purposes are grown at the Eynesford establishment, as also are many Tea Roses in pots. Hardy fruit trees, Roses, and the production of vegetable seed also receive special attention at this branch establishment.

THE GRIMSTON PLANT PROTECTOR (Fig. 62).

Most gardeners have to use protection in one form or the other for the various crops in the kitchen garden, either in spring, autumn, or winter. The old handlight is well known, and the useful *cloches* or bell-glasses less so—the former is expensive to buy and keep intact, and the latter very liable to be broken, though both when used intelligently are exceedingly useful appliances.

In the Grimston Plant Protector we have a simple, inexpensive form, equally adapted to cover rows of Peas, Beans, Lettuce, Strawberries, Violets, Primulas, Tulips, and many other things which we may want to preserve from injury by frost or rain, or to hasten the growth.

Mr. W. Denning, writing in our columns on June 15, 1872, from Grimston Park, Tadcaster, where he was then gardener, says that they forward crops about five weeks in the spring and early summer, and preserve them for about a like period in the autumn. By their use he was enabled to supply good, firm, well-blanching Cos Lettuce by the end of February in that year. He also found them useful for Potatoes, Carrots, French Beans, Turnips, Radishes, Parsley, Mint, early Celery, &c.—in fact, everything that comes early in the season from warmer climes than ours. These appliances are made usually in 8-foot lengths, costing about 10s. each complete, and they require no putty or glazing in the ordinary sense of the term, and are readily ventilated, the ventilation being regulated in accordance with the weather. They may be made use of singly, or several put end to end. The ends, whether of a single protector, or several together, are closed with pieces of board, over which the glass is made to slide. Plants under them require plenty of water when the sun has gained power in April and May, and later, and this is readily afforded by tilting the protector.

HOME CORRESPONDENCE.

GREENHOUSE BLINDS.—Having recently erected a 2-span greenhouse, about 40 feet in length, which is so far advanced that little remains to be done but to make some arrangement for shading in sunny weather, I shall be much obliged if any of your experienced contributors can advise me on this point. On an older, but smaller house, I have for many years used light canvas, stretched on two poles, one being fixed, the other serving to roll up the blind on. This plan has two rather serious disadvantages. One is, that in order to protect the glass, and prevent constant breakage, a stout spline of wood is required to be fixed across the lower end of the rafters, which is an objectionable feature. The other is, perhaps, less serious—unless the path in front of the house be very narrow; the ends of the poles project beyond the eaves, and, under certain circumstances, are a nuisance. They must be of a fair length, or a long pole cannot be easily manipulated. Where the ridge of the house is surmounted by a crest, it is next to impossible to adopt the old horizontal roller, which is pulled up by a cord into a box at the summit. I take it for granted that no one but a market gardener will think of distemping the inside of his glass. The disadvantages of this are too obvious to require stating. Some two or three years since, something was said and written concerning a stading made of thin laths or splines. I think of German origin. Can any of your correspondents report favourably of this system, or give any practical details about it? The question of shading is one which concerns so many amateur horticulturists, and others, that I trust I shall be

FIG. 62.—THE GRIMSTON PLANT PROTECTOR.

bloom forms a striking feature at Swanley. The plants, at the time of our visit, were growing vigorously in 5-inch pots, and were bearing blooms $5\frac{1}{2}$ inches in diameter. All those opened were of the single-flowered type, and of various colours. The tubers were potted early in the year, and had been brought on in a brisk heat.

Another specialty at Swanley just now is the house of zonal Pelargoniums. This is a span-roofed structure of the ordinary type, but it presents a very gay appearance. The plants are noticeable for their dwarf habit, and the trusses and pips of bloom for their enormous size. Many of the latter were fully $2\frac{1}{2}$ inches in diameter, and of good form and substance. Numerous varieties, all of which are good, are grown, but pressure on our space precludes mentioning only a few of the best of the recently-introduced kinds. For brilliancy, a bright scarlet, named *Brilliantissima*, was most conspicuous; while among the salmones, Mrs. Robert Cannell will be a certain favourite. The last-named is very dwarf in habit,

as brilliancy and variety of colour. Named varieties of Cinerarias are a feature here, and affords proof of the care and attention taken in selecting and keeping the various kinds true. Improvements in this direction are made every year, and the result is, than an extensive list of capital varieties are now to be seen at Swanley. A few good kinds are, Baron Schroder, magenta colour, white ring around dark centre; Emperor William, a rich bluish shade, rose tinted at base; Mechanical, magenta; and the better known March Past. For general decorative purposes, the ordinary seedlings are exceedingly useful, the plants being of good habit, and well flowered.

Numerous other things are made a specialty at Swanley, and amongst them the house of winter-flowering Begonias is just now worthy of notice. This includes all the best known varieties, and conspicuous among the hundreds of plants grown, we noticed a variety named *President des Bonnelis*, a rich bronzy-leaved kind, with reddish flowers.

At Eynesford, where Messrs. Cannell's extensive

exposed for troubling you with these up to date queries. *T. W., Ipswich.*

PLANTING POTATOS.—The present is a seasonable time to discuss the best various methods of Potato culture. Some growers prefer to use farmyard manure, and others object to it, but the finest crop that I remember having observed was one of Magnum Bonum, which produced ten tons of tubers to the acre. They were planted in the ordinary field manure on land that had been well worked, and which was in a good state of tilth. A heavy dressing of partly-decayed farmyard manure, mainly that from the stables, was spread in the trenches struck out by the plough, and on this manure the sets were laid, 15 to 18 inches apart, and 3 feet space was afforded between the rows. The haulm grew nearly a yard high, the plants just touching each other across the furrows. It was a sight to be remembered, so evenly was the growth of the plants disposed. For garden cultivation, where the soil is generally richer, I prefer to dig in the manure in the autumn, turning up the soil as roughly as possible. At the end of March, or the first week in April, we get the bulk of our varieties planted, but afford no further manuring, merely dig over the land again, breaking the clods so that the roots may in every direction run in easily. By this method the ground is put into good tilth in spite of its being rather of a heavy nature. Where some persons make a mistake in growing Potatoes is by allowing too many tubers to grow from one tuber, by which means they crowd one another, and the stems have not sufficient space for their full development. One strong growth is better than half a dozen weaker ones. Two shoots is a fair number to leave when the tubers are looked over and selected for planting. If any should by chance get missed, the best plan is to pull up some of them as soon as they appear above the soil. *E. M.*

CAMELIAS.—Were it not for Messrs. William Paul & Son, of Waltham Cross, but few blooms of Camellias would be seen at the meetings of the Royal Horticultural Society; and an enumeration of a few of the leading varieties shown comes appropriately after the article by "J. C." on p. 342. If some of the blooms were small, they were yet fresh and bright, and any lack of size could be accounted for largely on the ground that the blooms were not fully expanded. Of dark-coloured varieties, *Machiana* was the premier, several blooms being shown of large size, and beautifully imbricated. *Iubricata* is of a good shade of scarlet, and its white form was equally attractive; indeed, the white varieties abounded, among them, *Montirani*, *Princess Charlotte*, with its beautiful shell petals; *Centifolia*, a fine white, handsomely reflexed; and the old *Alba Plena*. *Reine des Fleurs* was of a pale salmon-red colour, though it is generally regarded as being of a much deeper hue, from vermillion to a deep rich crimson. *L'Amour*, pale pinkish-red, is a very fine variety; *Comtesse de Derby*, soft pink, flushed with red; *Adeleide Benvenuto*, delicate blush; *Comtesse d'Hainault*, delicate pink, margined white, very pleasing indeed; and the old *Donkelaar*, still one of the freest, made up a select collection. The latter is a good grower, and though the leaves are somewhat small, the flowers are large, and they are produced in great profusion. As a conservatory specimen, it has few superiors; the flowers when in their best form are of a warm rosy-crimson colour, handsomely mottled and flaked with white. There is reason to fear the *Camellia* is just now passing through a period of something like neglect, and it is well public attention should be called to this valuable greenhouse evergreen shrub by such exhibitions as that above alluded to. *R. D.*

CULTURE OF ORCHIDS.—I thank "E. H. W." for his letter on p. 364 of the *Gardeners' Chronicle*, though I have long ago learnt his lesson, that "to make each plant happy in its own way" is the secret of success with Orchids, as with alpinists, and with all other plants which in Nature affect stations with variety of soil, aspect, and climate. The point I had in my mind in my previous letter was, rather, that once having made a plant happy, amateurs like myself should be shy to alter their treatment on the strength of *dicta*, however authoritative, since it would seem that different growers produce equal results by the most diverse modes of treatment. As long as a plant is not happy, experiment, and experiment, and experiment. I found, for instance, some three years ago, that my bushes with a southern aspect were killing by inches my *Odontoglossums* of the crispum type, in spite of shading, damping, and all else

I could do. At last I removed them for the summer months into a cold frame facing north, where they began to form healthy growths, and after a second summer, I put a 2-inch pipe round the pit, to exclude frost, and the plants have just wintered in the same pit. Of course, after such plants have been brought to death's door, as mine were, much patience is necessary before I can speak of success. I also last summer transferred to this pit all my *Sophronitis*, just as "E. H. W." recommends. When I heated the pit, I put iron rods along close to the glass, from which the plants are suspended by copper wires, completely circumventing the slugs which used to do damage. I do not think it is usually known that slugs have a regular feeding-time (10.30 p.m. here in Rugby), at which hour I nearly always visit my houses and look round, especially after I have noticed the trail of a slug in the morning, with the result that I hardly ever fail to find the enemy the same, or, at furthest, the second evening. Perhaps some other amateurs may be ignorant that the flowers of *Catleya aurea* have a remarkable fascination for slugs. Last autumn, the very first night it opened, the flowers were completely ruined by a large slug which I caught in the act the second night. My houses are, of course, very small, or I might have to adopt some other slug trap. *L. C., Rugby.*

MIGNONETTE.—It would be difficult to name any flower more generally appreciated than good Mignonette in mid-winter, and to obtain the desired results, the method I adopt is simple. About the middle of August is the best time for sowing the seed, and a 4½-inch pot is a suitable size for sowing in. These should be carefully crocked, a layer of coarse siftings of soil laid over the crocks, it being very necessary that the drainage be as good as it can be made. Over the siftings, some charred refuse may be put into the pots, as it is a substance that the roots take to, and for filling the rest of the space, good sandy loam should be used. As soon as the seedlings are large enough to handle, thin out all but five of the strongest in each pot, and grow them on in a cold frame, removing the lights entirely on all favourable occasions, until the damp and frost of the autumn are likely to injure them, when they should be removed to a light, airy place, where an equable temperature of about 47° is maintained. Mignonette dislikes a damp, confined air; still, the soil must not be allowed to get dry, as a check from this source is much against the proper development of the flower spikes. *G. B. Claydon, Holbeck.*

POTTING CALANTHES.—As a rather large grower of this class of plants, perhaps you, Sir, will kindly allow me to detail my experience in the culture of Calanthes, as it may interest some of your numerous readers. In potting we use nothing but loam and dried cow-dung, the pots are of a size specially made, being 1 foot in diameter at the top and 9 inches deep; few crocks are used, as I find Calanthes are gross feeders and require plenty of space for their roots. In pots of this size eight bulbs are placed, and they are so arranged that the young growths starting from their bases grow towards the centre of the pot; our Calanthes are grown in a Muscat vinery, where they seem to be at home under the shade of the Vines, for the bulbs of those of the Veitchii type grow from 9 to 15 inches long, and about 2 inches in diameter near the base. Often such bulbs as these produce two spikes each, which grow from 3 to 4 feet long, and are studded with their delightful flowers for the greater part of their length. Manure-water is used freely during the growing season, and a top-dressing of dried sheep-droppings greatly assists the bulbs to swell. *C. H.*

GLADIOLI IN ROSE BEDS.—It matters not whether one grows hybrid perpetuals or Tea Roses, there is always a partial cessation of flowers in the autumn, but by planting some Gladioli amongst the Roses, the beds may be rendered gay at that season, and nowhere else do Gladioli look better or more at home with their surroundings, the tall flower-spikes coming clear above the Rose bushes, which form a suitable setting for them. The Gladioli which I planted last year in this manner were the new hybrids of Lemoine, which are better adapted for the positions named than *G. gandavensis* or *G. brencchleyensis*, being taller and having branching spikes, and the flowers are handsomely blotched, and thinly set on the stems. The corolla are said to be hardy, and on the strength of that statement I had left the whole of them in the soil. I am glad to find, on examining some of them the

other day, that they are quite safe; but being amongst the Tea Roses, the ground was slightly protected by Bracken laid in between the branches and over the tops of the bushes. If these Gladioli should, after further trial, prove quite hardy, they will be largely grown, lifting and storing being thus got rid of. As it will be interesting and of use to know how they have stood in other places, and under what conditions, perhaps some of our many correspondents will kindly report. *J. S.*

REQUESTS TO DOMESTICS.—Under this heading "F. S." writes, on p. 406, in reply to a question raised by "W. P.," as to "Whether a gardener can claim to participate in legacies given to a testator's domestic servants?" I think that there is little doubt but that he may prove his right to the legacy, providing the testator's will states, "domestic servants," or, "all my domestic servants," without any other qualification. As stated by "F. S.," everything turns on the exact wording of the bequest. A few years ago, my then employer died, leaving legacies to servants, worded thus in his will: "One year's wages to all my domestic servants, and servants employed in the stables." In this instance, I applied to the executors' solicitors for payment of the legacy. They replied, "The question is one of considerable difficulty, and we have advised the executors to take the opinion of the judge as to whether gardeners and under-gardeners are entitled to any legacy under the will." Eventually they brought the case before Mr. Justice Stirling, who, looking at the special words in the will, decided against my claim. From his ruling, he implied that had the wording been simply "domestic servants," without the clause relating to the stables, he would at once have decided in my favour. I should advise "W. P." to obtain the exact words relating to this part of the legacy, then he can better determine the strength of his case. *C. H. D.*

NEW PEA, SUPERABUNDANT.—As its name implies, this variety of Marrow Pea is a heavy cropper, and it grows about 2½ feet high. The seeds are of a dark green colour, and of excellent flavour. I observed a good breadth of it at Wem last August, the plants forming broad sturdy brushes, growing from 15 to 18 inches apart, which needed only short sticks to support them. A nice dish of Peas could have been gathered from each plant. It is a seedling of Mr. Eckford's raising, and it will doubtless make its mark. *W. D.*

A TRIO OF PEAS.—I was pleased to read in the *Gardeners' Chronicle* the favourable remarks upon the Peas which I selected as a trio, especially as I know Mr. Markham to be an authority on vegetables. With Peas, as with Peas, it is almost impossible to choose a given number from amongst many good varieties without clashing with the choice of other cultivators, as locality and soil have much influence on these and other vegetable productions. Since my note appeared, a friend writes me that I "made a mistake in preferring William I. to Veitch's Extra Early." Well, perhaps, if I were favoured with the soil of my friend's garden, I might alter my opinion—but as it is, I like Extra Early; but as here grown, side by side, and under the same treatment as that afforded William I., it is harder and a better cropping Pea than its companion, whereas if our soil were a warm one, Extra Early might be the favourite. I have only praise for Autocrat, Mr. Smith's favourite Pea, its constitution, flavour, and bearing properties being alike excellent, and our soil, when it is properly prepared for Peas, admirably suits main crop and late varieties. Criterion, however, whilst possessing the good qualities of Autocrat, continues in good bearing condition much longer, and I choose it for that reason. Like your correspondent, I have no difficulty in procuring peackits. *T. Coomber.*

GLADIOLIUS BRENCHELEYENSIS.—I knew the raiser of this variety, it was Mr. Hooker, of Brencley, near Tonbridge, in Kent, hence the name. It was a chance seedling from Gandavensis, but it was preceded by a variety called Bowiensis, one not so good in colour of flower, size, or length of spike and pose—by which I mean position of flowers on the spike, the tendency of many kinds being to produce their flowers on all sides of the spike instead of in two rows, all facing well to the front, a *sine quid non* from a florist's point of view. Where Bowiensis originated I do not know. Before Mr. Kelway came to the front, the only European raiser of meritorious seedlings was the ex-gardener to the Emperor Napoleon III., Monsierr Souchet. He used a few acres of ground close to

the forest of Fontainebleau as a nursery, and he sent out many superb kinds, whilst his cornus were always large, firm, and free from disease. Some of his first seedlings were distributed in 1863-4. James Veitch, Eurydice, Madame Furtado, Miltou, Meyerbeer, Newton, Molière, Dr. Lindley, and Shakespeare, the last now one of the finest Whites, but, as a rule, too early for exhibition. Souchet found his worst enemy the ver blanc, or larva of the cockchafer, but he also suffered from the ravages of the disease which I have called "chlorosis," by what authority I forget. Without doubt, certain varieties are particularly subject to it; I may say, speaking generally, the white-flowered kinds, and it is more fatal in cold and dry seasons than in moderately wet and growing summers. I have not found that moderate manuring is hurtful, but the dung used should be quite decayed, and should not touch the corn at the time of planting, indeed it is best dug in the autumn before, *Thomas Bunyard, Ashford.*

JOHN RUSKIN STRAWBERRY.—I thank your correspondent heartily for bringing under the notice of your readers an account of my forced Strawberries, every word of which is true; but I may mention that I was particular in penning the paragraph alluded to, that the fruits weighed half an ounce each. I have received quite a number of letters on the matter, casting doubts on my statement that I got 40s. a pound for them, and, in reply, I have referred them to my salesman, Mr. G. Munro, Covent Garden Market. John Ruskin Strawberry is remarkably good all round, being an excellent setter and bearer, and beautifully perfumed, and of fine flavour for the season. *R. Gilbert.*

CORNUS SANGUINEA.—Mention of this plant recently, by Vegabond, with reference to the "blood-red colour of the branches," leads me to ask whether *C. alba* is not intended. This is the plant that makes such a telling effect, and is by far the more worthy of the two of the name "*sanguinea*." *C. alba* has blood-red branches, and white fruit, on account of which the name is given; while *C. sanguinea* is so called by reason of the intensely dark red of the leaves before they fall in autumn; it has dark purple fruit. *R. Irwin Lynch.* [The kind of the young shoots is red. Ed.]

COCKLE PIPPIN APPLE.—I have looked in vain for this delightful Apple in the catalogues issued by Messrs. Bunyard & Co. and Messrs. Rivers & Son, and yet it appeared to me, judging from what I have recently been eating of my own growth, that it well deserves the character given of it in the *Fruit Manual* as "an excellent dessert Apple of the finest quality." Its proper name appears to be Cackle's Pippin, it having been raised by a person of the name of Cackle, at Godstone, in Surrey, and it has become somewhat extensively grown in this and the adjoining county—Sussex. Perhaps the warmth of the southern counties suits it better than colder and moister localities. *R. D.*

CLUB IN BRUSSELS SPROUTS.—When recently at Boune-mouth, my attention was called to a piece of Brussels Sprouts. It is said that in this neighbourhood the Cabbage tribe are greatly subject to club, the Brussels Sprouts especially. In the case of the piece I saw, the young plants were put out in trenches about 4 inches in depth. Then comes the time when club sets in, the plants soon showing evidence of it. The trenches are at once filled with soil, which is practically earthing-up the plants. The result is, the bottom of the stalk throws out a number of young roots, and a new lease of life is given to them, they become vigorous, and bear excellent crops. One of the plants was lifted for my inspection, and I found all the original roots and base of the stalk had rotted away; but the new roots had fastened upon the soil, and a saved and useful crop rewarded the cultivator. *R. D.*

SCARLET BERRIED AND OTHER ELDERS FOR SUBTROPICAL GARDENING.—Primarily, a tree which grows as freely as the common Elder (*Sambucus nigra*), having large pinnate leaves, with deeply serrated pinnae, forming a splendid appearance when covered with panicles of Grape-like fruit, brilliant scarlet in colour, is deserving of general culture. Such is *Sambucus racemosa*, yet how little and seldom seen in gardens. An old writer suggested budding it on standard stems of the common kind. Apart from the ornamental

character of this species, and of the variegated forms of *Sambucus nigra*, when grown as ornamental shrubs or trees, I suggest their usefulness as ornamental foliage plants in connection with summer subtropical gardening. The fact that *S. racemosa* is much grown in the gardens of Paris goes far to support the idea. As an inhabitant of the uplands of Siberia, as well as the south of Europe, it is necessarily fairly hardy, whilst the free-rooting characteristics of inserted cuttings or truncheons assure ready propagation. The stately contour of young plants of *S. racemosa*, and the ornamental character of the leaves, especially of *S. racemosa laciniata*, constitute them rivals to *Aralias*, *Grevilleas*, &c. In the gold and silver-leaved varieties of the ordinary *S. nigra*, the former more particularly, a volume of colour can be produced early in the spring and throughout the summer, second to none amongst free-growing foliage plants, suitable for hands in large beds, &c. What I suggest is, that plants of suitable sizes be maintained in pots for this particular purpose, by which means variety in grouping can be easily resorted to each planting season. The *Sambucus* delight in free highly-enriched soil; the work of potting the stock occasionally would, therefore, be a trifling matter, whilst, owing to their proverbial early growth, it would only be necessary to transpose them from the reserve ground out-of-doors, wherein they had been wintered, to the summer quarters, to insure ready and immediate display, along with the many more tender subjects requiring so much more preparation and house-room throughout each long winter. *William Earley.*

ARE AMERICAN APPLES POISONOUS?

I NOTICE that a number of articles have appeared in the English press, stating that American Apples are poisonous because of the arsenic used in fighting the Codlin moth. While it might seem probable that we are willing to poison our friends in England, we should have some hesitation in poisoning ourselves, for everyone eats the very same kinds of Apples which we ship to England, and no one ever thinks of them being poisonous! In fact, there has never been a case of poisoning reported from the eating of sprayed Apples. The following statements appeared in an English paper some time ago, and as most of them are untrue, I cannot refrain from calling attention to them. There is no doubt an uneasy feeling about American Apples, arising from a lack of knowledge of the facts. Among other things, the article in question says that "it is admitted that the American Apple-growers are compelled to depend upon the use of arsenic in solution as an insecticide in their orchards, that this insecticide is used upon the fruit itself until it is completely saturated, that it is applied to the fruit several times before it arrives at maturity, and, if the weather continues dry, the arsenic clings to the fruit, and what is not absorbed through the skin remains on it, forming a fine coating, which most evidently be detrimental to health, especially where the fruit is consumed to any extent."

Instead of being used until the fruit is "saturated," the Paris Green or London Purple is never used more than twice, and often only once; and when used twice, the last application is made when the Apples are smaller than the end of one's thumb. From three to four months intervene between this last spraying and the harvesting of winter fruit, and every trace of arsenic is washed away before the Apples are half grown. Repeated chemical analyses have failed to detect any poison on the edible fruit; and the fact that every American eats Apples in profusion without thought of any poisonous qualities, and absolutely without injurious results, is sufficient proof that the above insinuations are false. The "fine coating" of arsenic, to which the article refers, is nothing more than the wildest fiction.

The article continues as follows:—"The best three sorts of Apples as regards quality that are put upon the English markets are those raised at home and those consigned by the Tasmanian and American growers. Our own take the lead, and the others in

the order assigned them above. Now, if we compare the three together, we find a delicate tint about the American fruit which is not to be found upon either of the others. Again, if the American Apple, before it has been handled in the barrel as it comes first to hand from the vessel, is carefully rubbed with the finger, it will be seen that a fine delicate powder in most cases is removed. This is the arsenic adhering to the skin, and, if the fruit is eaten at all, it should certainly be wiped first with a cloth. We assert that the delicate and unnatural tint referred to is produced by the arsenic which is absorbed through the skin. Medical men inform us that, when arsenic is administered in small doses, it stimulates the action of the skin and gives clearness to the complexion, and it is for these reasons, especially in America, that it has been extensively used by the fairer sex for years."

I shall not dispute the statements as to the relative merits of English, Tasmanian, and American Apples, as that subject is not now under discussion; but all the references to arsenic upon the American fruit are absolutely without foundation. The arsenic is not absorbed into the fruit. *T. H. Bailey, Cornell University, Ithaca, N.Y.* [There has been no excess of arsenical poisoning in this country, in spite of the vast quantities of Apples received from America. We believe the danger to be mythical. Ed.]

SCOTLAND.

THE HORTICULTURE CLASS IN THE HERIOT-WATT COLLEGE, EDINBURGH.

This class, which has met every Friday evening during the present session, has just closed. The lecturer, Dr. Wilson, in concluding the course, made the following remarks:—"You are aware that recently in the gardening press, notably the *Gardeners' Chronicle*, the subject of the education of gardeners has been discussed. The present movement is for good, and good only; hence, all who have decried it must, by whatever motive inspired, be doing the profession disservice. Some of the correspondents have shown a lamentable want of sympathy with their brethren, while others have shown much ignorance of the wants of the rising race of gardeners. The proposition largely debated is this, that it is impossible to teach horticulture by lectures. Whoever raised this absurd proposition, set up the proverbial man of straw, in want of something better to belabour. Seeing that nobody ever dreamed of attempting the feat, there was no cause for alarm. Nevertheless, for the sake of precision, it may be asked, What operation in gardening could not be explained in a lecture-room so as to enable the uninitiated to understand and practice it? Are not gardeners constantly beholden to the silent teachers, books, for their knowledge of new and improved methods? The shades of the great departed have been invoked to testify that it is lost time to enquire into principles, and that we dare not hope to make advancement beyond their standard. We have been told that scholarship is of little account, when a man may be a very good gardener although hardly able to write his own name. We have been implored to keep the faculties of our young men dull, in case they should be made to realise the horrors of a small salary. We have been informed that if gardeners attend to their practical duties, they have no time to study. It is certain that as time goes on we shall hear less and less of this twaddle, which is simply ignored by all earnest workers and thinkers."

"The editor of *Garden and Forest*, New York, thus puts the matter:—'Of course, the way to learn an art is to practise it rather than to read about it. But, if in addition to this practice the pupil is judiciously instructed in some of the principles of the sciences related to the art, he ought to be a more intelligent practitioner and a much broader man.' Actuated by a similar belief, it has been my proud privilege to conduct this class for three sessions."

We have cordially to thank Mr. A. D. Mackenzie, of Messrs. Mackenzie & Moncur; Mr. A. Mackenzie, of the same firm; and Messrs. James Wilson, jun., and T. Berwick, of Greenside Nursery, St. Andrews, for special lectures."

GLASGOW SPRING SHOW.

Wednesday, March 30.—Though competition was by no means strong at this popular exhibition, nevertheless a fine floral display was observed, nurserymen and florists coming strongly to the front with long tables of foliage and flowering plants of a varied and attractive character. Mr. Meston, gardener at Murchie House, was 1st, with a fine display, on a square table, his collection being rich in *Dendrobium Wardianum*, *D. nobile*, *Anthurium*, *Palme*, and *Crotons*. Mr. Millar, Castlemilk Gardens, was 2nd, with fine *Dentizias*, *Crotons*, *Dracenas*, *Amaryllis*, *Azaleas*, and *Dendrobiums*.

A fine table came from Mr. Wilson, Bantaskin (gardener, Mr. Mitchell), for exhibition only, consisting of some finely grown *Orchids*, *Cattleya Triane*, *C. Mendeli*, *Vanda tricolor*, *Odontoglossum crispum*, *Cypripedium* in variety, *Anthurium*, &c. This was a very creditable table, that was much admired by the visitors.

Palms were in great profusion, large in size and in excellent health; a long table of them was edged with *Cinerarias* and *Spiras*.

A fine attractive exhibit were the round baskets filled with flowering plants; 1st, Mr. Millar, his finest flowers being *Amaryllis*, *Spiras*, *Tulips*, *Primulas*, *Hyacinths*, &c., interspersed with *Ferns* and other foliage plants; 2nd, Mr. Muir, gardener to Mr. Anderson, Hazelden, Mearns. These exhibits would have been much improved if the baskets had been covered with *Panicum quadriflorum*, *Ficus repens*, or some other choice plants of pendent habit. Long tables were loaded by Messrs. Austin & McAslin, and Smith & Simons with a brilliant display of *Azaleas*, *Rhododendrons*, other shrubs in great variety; finely-grown bulbs, *Tulips*, *Hyacinths*, and *Daffodils*, especially were largely represented. On Messrs. Smith & Simons' table was a fine collection of new hybrid *Daffodils*, conspicuous among which were *Golden Spur*, *Courtesy of Annesley Maximus*, very fine, of deep orange colour; *Golden Plover*, *Henry Irving*, *Cervantes*, and others which created much interest.

Orchids, in specimens of three, were really of great merit—the 1st prize being justly awarded to Mr. H. Reynard, gr. to the Rev. M. Paterson, his *Dendrobium thysiflorum*, with nine finely-developed racemes, and others opening, was in fine health and of much excellence. *Dendrobium nobile pendulum* and *Cattleya Mendeli* were also in fine form; 2nd prize, Mr. Reid, gr. to W. Campbell, Esq., *Williamswood*, who had *Dendrobiums nobile* and *Wardianum* finely flowered with large spikes.

In the collection of six specimen stove and greenhouse plants were huge *Gleichenias*, in grand health.

Tulips were largely represented, in pans of about three dozen bulbs in each; also *Crocus*, in great variety, *Polyanthus*, and *Daffodils*.

Hyacinths, arranged on a table about 50 feet long, had many admirers, and were, on the whole, good. Mr. Millar was 1st for twelve, and he also carried off the 1st prize for six.

Bonquets were few; the 1st prize was awarded to Mr. Murray.

Sprays and *buttonholes* were numerous and good.

Mr. Peter McKenzie, florist, &c., exhibited wreaths and crosses in great numbers, also *bouquets*, forming a very attractive exhibit.

The vegetables consisted of a solitary collection of eight sorts, in which was a fine dish of forced *Ash-leaved Potatoes*, good *Celery*, *Rhubarb*, and *French Beans*. Fruit was represented by some fine *Strawberries*, *Pines*, and a few *Apples* and *Pears*, by Mr. McKenzie, florist. M. T.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

MARCH 22.—Present: W. Blandford, Esq., in the chair; Rev. W. Wilks, Mr. Lynch, Mr. Michael, Rev. G. Engleheart, Dr. Hogg, Prof. F. Oliver, and Dr. Masters.

Hybrid Narcissi.—Rev. G. Engleheart exhibited further specimens of his reciprocal crosses between *N. triandrus* and *N. monophyllus*, which showed that the same results accrued in whichever direction the cross was effected. A Botanical Certificate was awarded to Mr. Engleheart, in recognition of the interest and success of his experiments.

Swellings on Ribes.—Mr. Michael reported that he had discovered no *Phytoptus* on the specimens submitted to him.

Basal Disease of Daffodils.—Rev. W. Wilks exhibited specimens of this disease, which Mr. Michael considered as very likely to be the result of the attacks of a mite, *Rhizoglyphus Robinii*. Mixtures of sulphur and soft-soap, or of carbolic acid, were recommended as likely to be beneficial.

Sugar-cane Attacked by Boring Insect.—Mr. Blandford showed specimens of canes attacked by a boring beetle at the nodes. The direction of the perforation was from within outward.

Birch Bark.—Mr. Burbidge sent specimens with the following letter:—

"I beg to send for the inspection and consideration of your committee some fragments just taken fresh from the trunks of *Betula papyracea*, reared here from seeds kindly sent from the Royal Gardens, Kew, some ten or twelve years ago. It can be written upon with ease with an ordinary pen and ink, as these examples will show. Its texture is very soft and fine, except here and there, where transverse corky lentils occur. It would be interesting to know the part this exquisitely finely-textured bark plays in the economy of the tree, as contrasted with other barks of a more rough and corky texture, such as, say, *Quercus*, *Sabur*, or *Cork Oak*. Both are, no doubt, identical in their being practically impervious to water, either from within outwardly, or vice versa. As a contrast, I send a small piece of stem of *Araucj* (*Schubertia*), or *Physianthus grandiflorus*, with settled, rugose, corky bark, arranged around a stem quite green, and doubtless rich in chlorophyll.

"*Ginkgo Seeds.*—I also enclose seedlings of the 'Maiden-hair' or 'Ginkgo Tree' of China and Japan (= *Ginkgo biloba*). Dr. E. B. Wright, M.D., F.R.S., Professor of Botany in the University of Dublin, saw the ripe fruits in one of the public gardens at Rome last autumn, a crop of golden Plum-like fruits among the Maiden-hair-like leaves, and succeeded in obtaining a supply of the seeds through H. M. Ambassador, the Marquis of Dufferin and Ava.

"I am enabled by the courtesy of Dr. Wright to send a few of these fresh seeds for the inspection of the committee, as well as seedlings raised from the same, sown on December 8, 1891, in a mean temperature of 60° Fahr. The fleshy covering of these seeds, analogous to that of our native *Yewberry*, is edible, and is used as dessert in China and Japan according to Siebold and other authors. It is well known that this tree rarely if ever fruits in Britain, a fact due to its diocious character.

"These seeds also illustrate a very interesting physiological fact mentioned by Sachs (*Zeit. Book*, p. 655). 'If the temperature is sufficiently high, the green colouring substance [chlorophyll] is found in the cotyledons of Conifers, and in the leaves of *Ferns* in complete darkness, as well as under the influence of light.'

"I am by no means certain that *Ferns* and *Conifer* seeds alone possess this peculiarity, which is common to other seeds, as notably to those of *Acacia pseudo-platanus*, the common *Sycamore*, the *Sea Kale*, *Crambe maritima*, and possibly others which I have not examined.

"*Doryanthes excolata.*—It may be of interest to state, that the *Spear Lily* of New South Wales (= *Doryanthes excolata*) is just now opening its flowers in this garden, the crimson Lily-like flowers being congested on a scape 10 feet high and 2 inches in diameter."

Other specimens sent by Mr. Burbidge comprised *Candollea cuneiformis*, *Erythronium Hartwegi*, *Asparagus plumosus* in flower, *Masdevallia chimara* var. *Rozeili*, *Arisema ringens*, *Stapelia deflexa* in fruit, *Coccoloba platycladon*, *Acer macrophyllum* (buds), *Begonia corallina*.

Obituary.

THOMAS BRETT COWBURN.—We are sorry to have to record the sudden death of Major Thomas Brett Cowburn, F.R.H.S., aged fifty-three, late of the 52nd regiment of Light Infantry, and which occurred on the 22nd inst. He was a county magistrate of both Gloucestershire and Monmouthshire, and his residence, Dannel Hill, near Chepstow, is situated on

the wooded cliffs immediately above the Wye, opposite the Wyndcliffe, commanding extensive views of both the Severn and the Wye. He was a great lover of *Orchids*, stove and greenhouse plants, as well as herbaceous plants and British *Ferns*.

Major Cowburn was, perhaps, better known amongst *Fern* cultivators, and partly from his discovery on a wall at Dannel Hill of that bold and beautiful form of *Scolopendrium crispum* named *Cowburni* (Lowe), which received a First-class Certificate from the Royal Horticultural Society at the *Fern Conference* in 1890. He took great interest in the *Fern* show that is to be held this summer at the Royal Horticultural Society. During the past few years he had been engaged raising crossed *Ferns* to further prove multiple-parentage, and looked forward to the present year for the development of a large number of plants. His sound judgment, amiability, firm friendship, added to his desire to help on any good work, will cause him to be long remembered, especially by those to whom he was personally known. E. J. L.

WILLIAM BROWN.—The greatly respected gardener and estate manager at Elmdon Hall, Solihull, near Birmingham, for close upon forty years, died on March 22, from apoplexy. The deceased gardener received his gardening training chiefly in Warwickshire gardens, and amongst other places he was at Walton House, Sir C. Mordaunt's seat in that county, under Mr. Cobb. On Mr. Hamond, the former gardener to—Alstone, Esq., resigning, Mr. Brown was offered the situation at Elmdon, which he took, and subsequently the charge of the home farm and woods were added to his charge. The Elmdon Hall specimen stove and greenhouse plants were famed in the Midlands for a great number of years, but for some few years past they had ceased to be exhibited for prizes. A large number of Mr. Brown's gardening friends attended his funeral.

SIR WILLIAM BOWMAN, BART.—We greatly regret to have to announce the death of this gentleman, one of the most eminent surgeons and oculists of the day. Sir William first achieved distinction at King's College, London, as a physiologist and microscopist in the days when microscopy was young, and his papers contributed to the Royal Society are still standards in their way. Subsequently he was associated in the chair of physiology with the late Dr. Todd, and served the hospital as assistant, and ultimately as full surgeon. To horticulturists he will be known for his taste in gardening and his love of plants, his garden at Joldwynds being one it is always a delight to visit. But, outside his own family circle, it is only those who were privileged to have been his pupils and assistants who could fully realise the character of the man behind whose modest demeanour and gentle kindness there was a noble spirit, zealous in the quest of all that is beautiful, good, and true. To us indeed his seemed an ideal life, so gentle was he, so helpful to his students, whether as teacher or as friend, so conscientious in his work, so pure and lofty in his aims. Sir William, who was born in 1816, died on Tuesday at Joldwynds, Dorking.

MARKETS.

COVENT GARDEN, March 31.

MARKET steady, prices remaining as last week. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

POTATOS.

First public sale of new crop from Canary Islands on Tuesday. Sold at prices from 7s. for small to 11s. 6d. for large. Markets firmer; tendency to harden prices, especially for best goods. Best samples, 90s. to 110s.; medium, 65s. to 75s.; inferior, 55s. to 65s. per ton.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending March 26, is furnished from the Meteorological Office:—

"The weather during this period varied a good deal from time to time. Over the Kingdom generally it was dry, but some showers of rain or snow were experienced in most places. Over the greater part of 'England and Scotland' it was frequently fine and bright, but in most parts of 'Ireland' a great deal of cloud prevailed.

"The temperature slightly exceeded the mean in 'Scotland, N. and E.,' and just equalled it in several of the more north-western districts; in the east and south however, it was below the normal value, the deficit in 'England, E.' being 3°. The highest of the maxima were (as a rule) recorded towards the end of the week, and ranged from 61° in 'Scotland, E.,' and 60° in 'England, S.' and 'Scotland, W.,' to 55° in the 'Midland Counties' and 'England, N.W.,' and 51° over 'Ireland.' The lowest of the minima, which occurred at the beginning of the period in the southern districts and at its close in the north, ranged from 21° in 'Scotland, N. and E.,' to 28° in 'England, S.W.,' 29° in 'Ireland, N.,' and to 39° in the 'Channel Islands.'

"The rainfall was a little more than the mean in 'England, E.,' but less in all other districts. In most of the western districts and over central 'England' the fall was very slight.

"The bright sunshine exceeded the mean in the north and north-west of Great Britain, as well as in the 'Channel Islands,' but showed a slight deficit in the south and south-east, and a considerable deficit in 'Ireland.'

NOTICES TO CORRESPONDENTS.

CHRYSAETHREUM AND BLACK APHIS: *F. B.* Syringe with, or dip the plants in a solution of tobacco-water, say, 1 quart of commercial tobacco-juice to 1 gallon of warm water, in which 1 oz. of soft-soap is dissolved. One or two applications will clear off the insects.

CINERARIA AND VIOLETS: *H. T.* *Finchshade Abbey.* Fine blooms of Cineraria, almost too large; the Violet Marie Louise is well known to be one of the best varieties; your soil seems to give a particularly rich shade of colour to it.

CYCLAMENS: *W. S.* Yes, large, but not larger than many we have seen.

DENDROBIUM WARDIANUM: *W. P.* The flower sent is that of a fairly good variety.

DOUBLE SPATHED ARUM: *Hon. A. C.* Not a distinct species, but only a variation. The change is very common, scarcely a week passing in the season but one or more are brought to our notice. Mark the plant, to see if it behaves in the same manner next year, as it would be desirable to perpetuate it if possible.

EEL-WORM: *R. D.* You are mixing up two totally different things. The worm you mention is 4 to 5 inches long; the eel-worms are only visible under the microscope.

JAPANESE WINE BERRY: *T. D.* This is *Rubus phoenicolasius*, and may be obtained at some of the larger fruit nurseries. We cannot as a rule recommend dealers.

LILium LONGIFOLIUM HARRISII: *H. W.* It is very likely that excess of water, due to a loose soil in the pot, is the cause of the blooms becoming diseased.

MANURE-HEAP: *P. A.* Superphosphate of lime will fix the ammonia of manure-heaps if put on the top, or better, in layers between the manure. Peat will do the same, also charcoal, ashes, dry loam, and gypsum. Manure-heaps are best made under cover, but if out-of-doors, they should have a clay bottom.

MELONS: *F. B.* Sow at once in a hot-house or hot-bed frame, three seeds in a 60-pot, and preserve the strongest, pulling up the others. When the roots touch the side of the pot, repot carefully, low down, in a large 48 or 32 pot; just cover the ball with fresh soil, and fill up with soil in twice as the plants gain strength. They will form roots

up the stem in this stage. Always use warmed compost—sandy loam, with a little leaf-mould. Melons always grow best with bottom-heat, and they should be kept close to the glass, or drawing will ensue.

NAMES OF PLANTS: *G. H. M.* 1, *Narcissus pseudo-Narcissus*, var. major; 2, *N. pseudo-Narcissus* bicolor; 3, *N. odoratus*; 4, *N. incomparabilis*; 5, *N. incomparabilis*.—*G. H. K.* 1, *Daphne Mezereum*; 2, *Skimmia japonica*, the *S. oblata* of gardens; 3, *Thuya dolabrata*; 4, *Retinospora plumosa aurea*; 5, *Pseudo-taxa Douglasii*, the *Douglas Fir*; 6, *Cryptomeria japonica* var. Lobbi; 7, a *Picea*; probably *P. nigra*.—*F. A. G.* *Sansevieria zeylanica*.—*R. Y. A.* 1, *Pelargonium*, double zonal—we cannot give you the name; 2, *Lotus pterophyllus*.—*G. M.* 1, *Polemoniumeruleum variegatum*; 2, *Sedum Sieboldii*; 3, *Alyssum variegatum*; 4, *Alternanthera versicolor*; 5, *Alternanthera*, probably aurea. Poor scraps when gathered; think what they must be when they reached us.—*B. W.* We are unable to name your plant.—*T. H. W.* 1, *Culogyne cristata*; 3, *Justicia carnea*; 4, *Acacia* species, send when in bloom; 5, *Ficus stipulata*; 6, send when in bloom; 7, *Skimmia Fortunei*, generally, but erroneously, called *S. japonica*; 8, *Cytisus fragrans*.—*A. D.* 1, *Dendrobium pulchellum* of gardens, syn. *D. Loddigesii*; 2, *Maxillaria variabilis*.—*R. W.* *Lælia Lindleyana*. The *L. Harrisii* have had a check of some kind.—*Canellius*. 1 to 5, send to some nurseryman who makes a specialty of them; 6, *Polypodium nigrescens*.—*G. H.* 1, *Cupressus Lawsoniana*; 2, *Retinospora obtusa*; 3, *Cupressus (Retinospora) obtusa*; 4, 5, *Retinospora plumosa*; 6, *Thuopsis dolabrata*.—*Droctonia*. 1, *Dracena Lindenii*; 2, *Pilea muscosa*; 3, *Ficus Parrellii*; 4, *Streptosolen Jamesoni*; 5, send when in flower.

PHEASANT-EYED NARCISSEUS: *Narcissus*. The second year of flowering, when the foliage begins to turn yellow, the bulbs should be taken up and sorted, and the larger ones planted on land that was manured for some earlier crop. Plant these 6 inches apart in the lines, and the lines made 1 foot apart. Deep ploughing is good enough; they do not like loose soil. The next size plant in nursery lines to grow for two seasons, when they will probably produce flowers; these need not be disturbed till they have flowered twice. The young brood may be grown on.

SPAWN ON VINE BORDER: *A.* The mycelium or spawn of one of the Hypogæa Truffles, probably from its smell, that of *Melanogaster ambigua*. The rounded bodies which have the appearance of *Hymenogaster* are really masses of soil compacted and covered by the spawn. *C. B. P.*

TOXICOPHILA THUNDERB: *Tori*. Very good spikes of this charming plant.

TWO GLASS HOUSES: *G. W. S.* All things being equal, we should suppose that the warmer situated house would be less costly in the matter of fuel, and the produce slightly earlier, with healthier internal conditions, as with a much exposed house the fires would have to be driven harder than is necessary in cold weather with a house warmer placed.

VINE DISEASE: *L. D.* and *R. H. B.* The Vine sent shows no fungoid disease, but a morbid development of the cells, which grow out into long hairs. The appearances seem to indicate an excess of heat and moisture, and deficient ventilation.

COMMUNICATIONS RECEIVED.—*G. W. W.* D.—*F. V. M.* Melbourne.—*R. H. B.* T. F. D.—*T. F. A.* I. D.—*Angers*.—*G. M.*—*Dickson*.—*J. S. M.* H. Melbourne.—*W. W. N.* A. MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus.

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSINGER & COMPANY, LOUGHBOROUGH.

WANT PLACES.

TO GARDENERS, AND OTHERS
SEEKING SITUATIONS.

The Pressure upon our space at this season of the
 year is so great, we are compelled to state
 that advertisements received after 6 P.M. on
 Wednesday will, in all probability, be held
 over to the next week.

Advertisers are cautioned against having letters
 addressed to initials at Post-offices, as all
 Letters so addressed are opened by the
 authorities and returned to the sender.

SANDERS, St. Albans, can thoroughly
 RECOMMEND several first-class HEAD GARDENERS.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of **HEAD GARDENER, BALIFFE, FOREMAN, or JOURNEYMAN.** Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BALIFFES, or GARDENERS, JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 257 and 258, High Holborn, W.C.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—**JOHN DOWNE**, Seedsmen, 144, Princes Street, Edinburgh.

Gardeners, Farm-Baliffs, Foresters, &c. DICKSON'S Royal Nurseries, Chester (Limited), are always in a position to **RECOMMEND MEN** of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

Head Gardeners.
JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of **GARDENERS and BALIFFES** and **HEAD GARDENERS** for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gentlemen seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

THOMAS BUTCHER can recommend several **HEAD and UNDER GARDENERS** of first-rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to **THOMAS BUTCHER**, Seed Merchant and Nurseryman, Croydon.

GARDENER (HEAD); age 33, married.—**J. E. McLEAVE**, eight years Head Gardener to R. Heywood Jones, Esq., Baisworth Hall, is open to re-engage ment with any No-homes, as he has acquired a thoroughly practical Gardener. Has had nineteen years' experience in all branches; is thoroughly conversant with the requirements of a good establishment. Testimonials of the highest order.—Catsclough, Walsford, Cheshire.

GARDENER (HEAD).—**Mr. Hall** wishes to recommend a thoroughly efficient Head Gardener, where five or more are kept.—**Mr. BEEVERS**, The Gardens, Farham Chase, Slough, Bucks.

GARDENER (HEAD), where two are kept; age 27.—**J. ANDERSON**, Gardener, Chairman, Dean, Worthing, wishes to recommend his Foreman, J. "Kilmer," to any Lady or Gentleman requiring a good practical man. Twelve years' experience. Abstainer.

GARDENER (HEAD), in good establishment.—**Married**, no family. Abstainer. Life experience in Early and Late Forcing all kinds of Fruits, Flowers, Vegetables, Mushrooms; also Kitchen and Flower Gardens, Pleasure Grounds. Eight years' experience as head employer, and sixteen years' experience.—**J. D.**, Myrtle Cottage, Wick Road, Hampton Wick, Middlesex.

GARDENER (HEAD), where two or more are kept; age 23.—**J. BOWDEN**, Gardener, Keston Court, Sudbury, wishes to recommend G. Saunders, who has been with him for six years, to any Lady or Gentleman requiring a good all-round Gardener. Life abstainer.

GARDENER (HEAD); age 33, married.—**Mr. WILLIAMS**, Blenheim Palace, Woodstock, wishes to recommend John Coles to any Lady or Gentleman requiring an efficient and competent Gardener, who thoroughly understands the management of a large Establishment; for the last seven years Principal Foreman at Blenheim.

GARDENER (HEAD), where three or more are kept; age 30.—**C. HEWITT**, Gardener to C. E. B. Young, M.P., Daylesford, Chipping Norton, can with confidence recommend his Foreman to any Lady or Gentleman requiring a thoroughly practical man.

GARDENER (HEAD), to any Lady or Gentleman requiring practical all-round man.—Age 42, married, no family; over twenty years' experience.—**E. W.**, 31, Bridge Street, Witney, Oxon.

GARDENER (HEAD).—Middle-aged, married, no incumbrance; fifteen months in present situation, two years in previous, where no only was enforced, and all surplus produce sold. Land and Stock, or Cretaker, if required. Excellent ex-acter through life.—**S. G.**, The Lodge, Otlands, Hovey, Surrey.

£10 will be paid to any one furnishing the Advertiser with information of any Gardening changes that will lead to obtaining an engagement as **HEAD GARDENER** where six or more are kept. Well versed in every branch of Horticulture. Character will bear strict investigation.—**LAWRENCE**, Mr. T. Huish, Coxwell Road, Faringdon, Berks.

GARDENER (HEAD).—Age 30; well up in the Cultivation of Plants and Fruits under Glass, Flower and Kitchen Garden. Excellent references.—**J. J.**, 165, Denmark Hill, Camberwell, S.E.

GARDENER (HEAD); age 32, married, two children.—A **GENTLEMAN** wishes to recommend his Head Gardener. Life experience in all branches of the profession. Two and a half years' good character.—**G. CANS**, Ashwick Hall, Marshfield, Chippingham.

GARDENER (HEAD); age 34, married, no family.—**E. T. DODAT**, Esq., can highly recommend his present Head Gardener, who has lived with him five years, as a thorough practical man for a large establishment.—Please reply to **E. W. RUSSELL**, Wood Green Park, Chessnut, Herts.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 27, married; no incumbrances. Has a thorough knowledge of Vines, Peaches, Stove and Greenhouse plants, Flower and Kitchen Gardening; one year's good character, five years' previous.—**A. MATTHEWS**, Hill Crest, Addlestone, Surrey.

GARDENER (HEAD WORKING); age 29.—**W. GOWAR**, Gardener to A. Aker, Douglas, Esq., Chelston Park, Maidstone, can with confidence recommend to Forests, W. Andrews, to any lady or gentleman requiring the services of a thorough practical and reliable man.

GARDENER (HEAD WORKING).—**F. CORNISH**, The Gardens, Holdwinds, wishes to recommend his Foreman, James Pullen. Thoroughly practical in all branches, including Orchids, Stove and Greenhouse Plants, Fruit, Hardy Herbaceous Plants. Excellent character.

GARDENER (HEAD WORKING), where two or more are kept.—A **GENTLEMAN** is desirous of recommending his Gardener, who has been with him for six years. Thoroughly understands Grapes, Peaches, Melons, Tomatoes, Greenhouse Plants, and Chrysanthemums. Flower and Kitchen Garden. Married, no children.—**F. H.**, Wilfield, Berkhamstead.

GARDENER (HEAD WORKING).—Age 46, married; well up in all branches. Flowers, Fruit, Vegetables. Protestant. Good character.—**W. M.**, Miss Gibbs, Upper John Street, Kilkenny.

GARDENER (HEAD WORKING).—Age 30; sixteen years' practical experience, including eleven for Exhibition.—**Mr. HUGGARD**, Gardener to Viscount Downe, Dingley, Market Harboro', can with confidence recommend his Foreman, George Phillips, as above. The Viscount Downe kindly permits reference.

GARDENER (HEAD WORKING).—Single; trustworthy, intelligent, and possessed of an excellent knowledge of all branches of Horticulture. High testimonials from counties preferred.—**J. H.**, 60, Gordon Place, Kensington, W.

GARDENER (HEAD WORKING), where one or two are kept.—Age 27; thoroughly experienced in Vines, Peaches, Melons, Stove and Greenhouse Plants, Flower and Kitchen Garden. Excellent character and testimonials.—**W. D.**, 40, East Street, Reading, Berks.

GARDENER (HEAD WORKING).—Others kept. Age 26, married, no family; life experience in forcing Grapes, Peaches, Melons, Cucumbers, Tomatoes, Stove Plants, Flower, Fruit, and Vegetable Garden; Chrysanthemums a specialty. Taken over 100 prizes for exhibits; five years' character, and references; offers invited.—**A.**, Newton, Tisbury, Glos.

HOLLOWAY'S PILLS.—In general debility, nervous tremor, and mental depression, these unrivalled Pills have a marvellous effect. They have won the confidence of millions in all parts of the civilised world. Conductions caused by sexual excess, or by long residence in unwholesome climates, or by sedentary habits, are wonderfully relieved by a course of this extraordinary medicine which, powerful as is its action on the whole system, is perfectly harmless to the tenderest frame. The Pills are composed of pure balsams, without the admixture of a grain of any mineral whatever, or of any other deleterious substance. They operate directly, powerfully and beneficially upon the whole mass of blood, and can we question the fact when we are indigested, cured, liver complaints arrested, the oppressed lungs brought into healthful play, and every physical function renewed and strengthened by their agency.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketing, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from *Hood, on Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

KEITH'S PATENT
RAMS &
Self-acting,

HYDRAULIC
RAM-PUMPS,
For Raising Water.

The very HIGHEST EFFICIENCY attained in Self acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS,
For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

International Horticultural Exhibition,

THE PATENT

SILICATE MANURE.

This manure is chemically distinct from all
other Manures, and has been proved to supply
the place of sunshine, and has the power of
hastening the colouring and ripening of Grapes,
Tomatoes, Peaches, &c., beyond any other
Manure.

If you Try It Now

You will Order later on.

The Gardens, Chatsworth, January 14, 1891.
"I have tried your Manure on soft-wooded plants, and am
much pleased with it. It may be used with perfect safety by
the most inexperienced. (Signed) O. THOMAS,"
Gardener to the Duke of Devonshire.

Mr. O. Thomas has, since expressing this opinion, been ap-
pointed Head Gardener at Windsor to Her Majesty the Queen.
Prices in Sacks, at Works, 10s. per cwt.; £2 per
½ ton; £3 15s. per ½ ton; £7 per ton.

IMPORTANT

TO GARDENERS, AMATEURS,
AND OTHERS, WHO FUMIGATE HOUSES
TO KILL "FLY," OR "THRIP."

You will shortly be ordering your Spring Supply of
Fumigating Material. Why lay in a heavy stock of tobacco
paper, uncertain in quality, often disappointing, and very
unpleasant to use, when you can have a SAFE, RELIABLE
article, and one that is pleasant to use?

THE FIRST
OF ITS
CLASS,
AND STILL
THE ONLY
ONE

On which you
can thoroughly
depend. The
manufacture is
much improved,
and it can be
ordered without
any risk of the
disappointments
often attending
other fumigating
materials.

PRICES:—
For houses with 1000 cubic ft., No. 3 Roll, 1/2 each; Post
a capacity of 2000 " " " 1/9 " " Free.
The Rolls may be cut for houses of a smaller capacity, or
to make up required quantities, of any length.

LEMON OIL INSECTICIDE.—The safest and most
effective Liquid Insecticide for dipping or spraying.

quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN.

CLIBRAN'S OLD-FIELD NURSERIES, ALTRINCHAM;

10 & 12 MARKET STREET, MANCHESTER;
And Principality Nurseries, Dewdney, Llanidno.

GISHURST COMPOUND used since 1859
for Red Spider, Mildew, Thrips, Greenfly and other
blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a
winter dressing for Vines and Orchard-house trees, in latter
from cake for American blight, as with an emulsion when
paraffin is used. Has outlived many preparations intended to
supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on
wet ground. Boxes, 6d. and 1s. from the Trade.
Wholesale from PRICE'S PATENT CANDLE COMPANY
(Limited), London.

For Green and Black Fly, American Elight, Camellia
Scale, Red Spider, Mealy Bug, Brown and White Scale,
Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887:—"Dear
Sir, I have thoroughly tested a sample of a new Insecticide
which you were so good to send me. At the rate of 1 oz. to a
gallon of water at a temperature of 95°, I find it kills Green
Fly immediately. Double this strength, or 2 oz. to a gallon at
120°, sends the fate of Scale of all sorts in a few seconds;
while 3 oz. to gallon at same temperature effectually dissolves
Mealy Bug, and so far as I have yet observed, without the
slightest injury to leaf or flower, and it is withal a most
agreeable medium to work with. All our insect remedies
are applied through common syringe, or garden engine, a much
severer test of efficiency than when applied by hand-washing
or spray.—I remain, dear Sirs, yours truly. (Signed) A.
MACKENZIE," of Messrs. Mathew & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London,
January 7, 1888. "GENTLEMEN—I have given your Insecti-
cide, 'Picrena,' a good trial in competition with many others,
I am pleased to say that I have found it to be more effective
in destroying Mealy Bug and other insects than anything we
have ever used. It ought to command a good sale. (Signed)
B. S. WILLIAMS,"

Sold by Chemists, Nurserymen, and Florists,
in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2
gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and
upwards, 8s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen,
Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise
Nurseries, Upper Holloway, London, and from
WILLIAM EDWARDS AND SON, 187, Queen Victoria
Street, London.

FOR DESTROYING WEEDS, MOSS, &c.

ON CARRIAGE DRIVES,
GARDEN WALKS, ROADS, STABLE-YARDS,

WALLS, STONEMWORK, &c.

Saves more than twice its cost in Labour. No Smell.

One application will keep the Walks and Drives
clear of Weeds for at least Eighteen Months.

Mr. W. G. HEAL & CO., Palace, says:—"We are so satisfied
with your composition and its price that we have used it abso-
lutely. I have every confidence in recommending it."

Mr. R. IRWIN LYNCH, Curator, Botanic Gardens, Cam-
bridge, says:—"There can be no question with regard to its
efficacy."

Gardeners' Chronicle.

SATURDAY, APRIL 9, 1892.

AMONGST THE ROSES.

EXCEPT in the case of those who grow Roses under glass, the month of March in this year of grace gave little scope for writing about them; as, however, we may be soon hoping to have weather more favourable to our getting amongst the Roses, it may not be an unfavourable time to take stock of the past, and look so far as we can forward. Although the winter has not in any way equalled its predecessor in severity, we have had some hard times for the Rose garden; there were some very severe nights in the early part of February, but some fine days at the end of the month led us to hope that we had passed through the worst. Some of us (I know I did) took off the mulching from our beds, and our feelings were very much worked upon when we found the thermometer sinking to 18°. We thought of our poor beloved shoots, and wondered how they fared; but the days were longer, the sun was bright, and there was a good deal of sunshine; and on looking round to-day and examining some of the hybrid perpetuals, I do not see that they are injured judging from the non-discoloration of the pith or bark. Of course, pruning has been entirely out of the question, unless some persons have, in the more favoured districts, performed the operation in February. A good deal has been written lately upon the artificial character of our modes of treating Roses—that we induce an artificial and unhealthy type of tree, and that it would be better to prune less. Well, if a multitude of pretty but medium-sized flowers is all that is aimed at, this result can be obtained. Where space is to be had, the pegging-down is, no doubt, a good plan to obtain a large quantity of bloom; but quantity is thus obtainable at the expense of quality. For a garden show, no plan is better than that of pegging-down, but as that can only be done properly in the autumn, it forms no part of the operations now to be thought of.

The first of these is pruning, about which a great deal has been written, and concerning which various opinions are held. There is one thing which to me is pretty clear—that this year must be one of hard pruning. In many localities the wood has been, I hear, very materially injured, although I have not, as yet, discerned any discoloured pith in my plants; but one must not be deceived by the apparent soundness of the centre of the shoots. What I am afraid of is, that as some of us took off the protecting mulching, the buds at the base of the plants may have been injured, for although it may not have lasted long, yet a frost of 14° is something to reckon with; a great deal will

depend on locality, and one is constantly hearing of puzzling facts, for which it seems difficult to account. Thus, Mr. Ben. Cant, of Colchester, the veteran Rose grower, says that while his dwarf Teas have been considerably injured, his half-standards have not suffered, and these half-standards have not been protected. Mr. George Bunyard, of Maidstone, tells me his Teas have suffered more by the frosts of last month than from any during the previous part of the winter; even *Homère*, one of the hardiest of them, being severely handled.

It will now be time to get at the hybrid perpetuals for pruning, as I have already in the autumn cut out the old flowering-wood, and left only those shoots on which I depend for this year's bloom, the operation is not quite so troublesome a one with me. When pruning is properly done, it is a long and painstaking operation; a rough-and-tumble way will not do. Roses must be treated according to their several constitutions and habits. You may have a few *Etienne Levets*, and then, perhaps, some *Reynolds Hole*. Now, to rush at these with a pruning-knife, and treat them in exactly the same manner would be an unwise proceeding; the one is a strong grower, and the effect of cutting it hard would be, and often is, to make it throw out a number of shoots, but little flower. This, therefore, must not be cut hard; but, if you treat *Reynolds Hole* in that way, you will get little growth, and nothing to supply you for next season. There remains, therefore, now only the strong shoots to be pruned, and these the careful amateur will use his discretion about, although I am afraid this season will not allow him very much discretion in the matter, as Mr. Frost has been before him with his particularly keeo pruning-knife.

Then, as regards Teas, they have had another trying time of it, and the late March frosts, have, find, severely injured mine. We must give up the notion that the Teas are as hardy as the hybrid perpetuals, for the havoc that has been wrought amongst them makes this fact unpleasantly palpable; and where deaths have not ensued, they have in many cases been severely crippled, and I imagine *Madame de Watteville* retains the had character of being the most tender of Teas, for I hear on all sides of its having perished. However, the pruning of this class may very well be postponed for some time.

When the beds of hybrid perpetuals have been pruned, they should be made clear for the summer. Where exhibiting is the main object, there are some amateurs to whom this is a very secondary consideration, and they give the Roses a fresh mulching, which is left on during the summer months. This is a practice I never followed but once, but then to such manifest discomfort of some friends who were staying with us, and so destroyed their pleasure of looking at the Roses, that I have never since ventured to try it. My plan, as soon as the pruning is over, is to gather up the cuttings, rake off the larger portion of the winter mulching, and then to what is called in this county "pitter" in the shorter portion of the manure, and then make the beds neat for the summer.

It is a curious proof of the revulsion of feeling that has taken place with regard to the French Roses, that while in former years there used to be a rush to get a sight of any catalogue that professed to furnish us with an account of novelties, the matter is now treated with indifference. The results of the past six years are not encouraging, we have had so few additions of any account to our exhibition Roses, especially amongst the hybrid perpetuals, that we now exhibit a stolid indifference, and in truth there does not seem any prospect of much further improvement. Has it happened with them as with the *Pelargonium*, the *Fuchsia*, and other flowers, we have reached so high a standard of excellence, but little scope seems to be open for further progress. Nothing of late years has excelled some of our old favourites, and then some of our choicest additions have come

from our own shores, where we have the opportunity of seeing them before they are sent out, can see them in their own quarters, and hear much of them from others, advantages which we cannot of course possess with regard to the French Roses. *Wild Rose*.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × CLEOPATRA (*Hookera* × *cananthum superbum*), new var.

The foliage of the first plant of this cross which has flowered, and which is not yet a strong one, much resembles that of *C. Hookera*. The surface of the leaf presents that handsome mosaic of dark green and ivory-white so well known in that species. Also in the matter of the tall scape and in the general conformation of the flower too, *C. × Cleopatra* greatly resembles *C. Hookera*, but it has larger flowers, in which the influence of the handsome *C. cananthum superbum* ×, is at once remarked in the lurid glow of the purplish-crimson colouring on the upper portion of the dorsal sepal and the outer halves of the petals. The dorsal sepal has green radiating lines from the base upwards, which change their hue as they pass into the bright purplish-crimson of the upper half, which itself gets lighter as it approaches the narrow white margin.

spending one's time in training bushes?" the answer would obviously be, independently of the better appearances attained, to spread outwards the branches, so that the middle part or inside of the crowns would receive their due share of sunlight and air, and in this way be made as fruitful as the outside parts.

There are some Apples, as for instance, *Cox's Orange Pippin* and *Ecklinville Seedling*, which naturally grow in a spreading manner; these of course need no training, either as bushes, standards, or half-standards, but others on the contrary, as *Schoolmaster*, *Baumann's Red Reinette*, *Annie Elizabeth*, and *Margil*, which naturally have a more or less erect habit are much improved if their branches are trained outwards whilst young, say up to six years from the graft, and whether the trees stand in the orchard or kitchen garden by the sides of the paths, it matters not, the training is just as easily performed.

Stout stakes driven into the ground a few feet away from the stem of the trees opposite the branches to be trained, afford the readiest means of securing them in position, fastening the branch with tarred cord. Seldom will all the branches on one tree require training at the same time, and after two years, those which have been tied down may be loosened from the stakes, the acquired position having become fixed. At no other time can this kind of training be better carried out than the present. *E. Molyneux*.

[Beside the bush form, the cordon is finding much favour amongst those cultivators who prefer an

FIG. 63.—DIAMOND FENCE OF APPLES.

The lower sepal is greenish-white tinged with rose; the petals are greenish at the base and bright purplish-crimson at the tips; and on the upper and lower margins are a few chocolate warts. The petals are ciliate, and there are a few scattered hairs on their surface at the base. The lip is yellowish-green tinged on the face and sides with purple, and with numerous purple dots on the infolded lobes. The staminate is of a yellowish colour tinged with rose, and marked with green in the centre. It is a very pretty variety, which was raised and flowered by Charles Winn, Esq., The Uplands, Selly Hill, Birmingham. *Jas. O'Brien*.

FORMING APPLE BUSHES.

ALTHOUGH this form needs but small amount of attention from the gardener beyond what may be accomplished with the pruning-knife, it cannot be denied that time spent with this view in the early spring does much to lay the foundation of the future bush. Although a scientific method—as it were—of pruning the last year's shoots to buds pointing outwards or inwards has its uses when properly carried out, it is not sufficient for all varieties to give or preserve the desired form. Some Apples have an erect habit which is not too favourable to the crop that they may carry. Some persons may feel inclined to ask, "what is the advantage of

average quantity of large, well-coloured fruits to great quantities of small ones. The cordon in its several forms (see figs. 64, 65 and 66), on account of the small space it occupies, admits of it being planted by the sides of walks, and in such positions and because of its comestableness, the thinning of the fruits, stopping of the shoots, and measures to keep it free from insects, can be readily carried out. The diamond fence of Apples (fig. 63), is merely a variation of the double cordon, the stems being trained right and left in an oblique direction, and so closely planted that they cross each other, forming diamond-shaped spaces. *En.]*

THE HISTORY OF KEW GARDENS.

(Continued from p. 394.)

THE year 1820 was eventful for Kew. George III. and Sir Joseph Banks both died, and the library and herbarium of the latter (who had been permitted to retain the dried collections made by the Kew collectors) were bequeathed to the British Museum. It was the desire of Sir Joseph Banks to found a herbarium and botanical library at Kew, and it is believed that Hunter House, afterwards occupied by the King of Hanover, was purchased for the purpose, and one of the rooms on the ground floor was fitted as a library. But the project fell through. Nevertheless, the idea has been realised, for the library is

now contained in the same building, and the herbarium in part, but chiefly in a large extension to the north.

George IV. at first took much interest in Kew, but the high character of the gardens was not maintained. A foreigner, Professor Schultes, in an account of Kew (*Philosophical Magazine*, 1824), expresses his disappointment, especially with regard to the naming of the hardy plants. But after all, the botanic garden and arboretum at that period were very small.

FIG. 64.—DOUBLE HORIZONTAL CORDON APPLE. (SEE P. 458.)

On this point, we may quote the Director's history verbatim: "About 1823, when Professor Schultes visited Kew, the aspect of the small portion of the grounds to the north, near Kew Green, which then constituted the whole of the botanic garden and arboretum, must have been very singular and totally different from what it is at present. It consisted in fact of a series of inclosures surrounded with brick walls, the greater portion of which have since been removed." The arboretum was only about 5 acres in extent, and occupied the area between the entrance

were nearly all that broke the view; and the pond lying between the Palm-house and museum was of much greater extent, covering the site of the Palm-house, and stretching westward in the form of shallow lagoons.

During the reign of George IV., no regular collector was employed, but some of the Kew gardeners in the colonies contributed to the gardens. Thomas Frazer, who went to St. Helena in 1821 to cultivate vegetables for the East India Company's ships,

returned in 1825, and brought home a twig of the Weeping Willow which grew by the tomb of Napoleon, and this twig developed into a tree, near the Director's residence, which will be remembered by many, and before which many a Frenchman removed his hat with emotional feelings. Frazer also introduced *Buddleia madagascariensis*, and the "Cabbage Tree" of St. Helena.

William Morrison, another Kew gardener, went to Barbados about 1824, to superintend a Sugar plantation, and, on returning, in 1828, he visited

FIG. 65.—SINGLE CORDON APPLE. (SEE P. 458.)

on Kew Green, the orangery, and the glass-houses to the south. As already mentioned, the fine Cedar of Lebanon and the Turkey Oak, near the Temple of the Sun, are survivors of what even thirty years ago was a dense wood. There still remains also the conspicuous *Pinus Laricio* immediately to the left on entering; and a *Celtis australis*, a *Salisburia*, a *Vistaria*, a *Persimmon*, a *False Acacia*, and *Buxus balearica*, date back to the same period; the grand old *Sophora japonica*, and the *Ostrya vulgaris* further to the south, as well as the dilapidated

Trinidad, whence he brought home a large quantity of seeds, living plants, and dried specimens. On the foundation of the West Australian colony, Morrison was taken out by Capt. Stirling, the first governor, as gardener, and later he collected seeds and sent them to this country for sale. In this way Kew acquired many additions to the collection of *Proteaceae*.

William IV. took a warm interest in Kew, but Aiton the younger had now become director-general of all the royal gardens, and Kew did not advance as a botanic garden. During this reign

In 1831 George Aldridge went from Kew to Trinidad, but his health failing he returned in 1833, bringing with him a collection of living Orchids; and in 1836 a small house was built specially for the cultivation of this class of plants.

This brings us nearly to the foundation of the gardens as a public establishment, and the appointment of Sir William Hooker as first Director in 1841. For many years previously, however, the gardens were accessible to the public on certain days, at certain seasons; and in 1838 they were open daily except Sundays, and the Pleasure Grounds from Midsummer to Michaelmas. About this time there were rumours of the gardens being abandoned, which aroused the public interest in them, and led to the appointment of a committee, consisting of Dr. Lindley, Mr. (afterwards Sir Joseph) Paxton, and Mr. Wilson, gardener to Lord Surrey, to inquire into the management and condition of the gardens. The report of this committee describes the hardy collections, the glass-houses and their contents, and the general condition of the gardens, but it was not presented to Parliament till 1840. In the meantime, however, several influential persons interested in the maintenance of Kew as a scientific establishment, had so exerted themselves, that a very brief discussion in the House of Lords decided in favour of it. A letter written by John Smith to A. B. Lambert, a prominent patron of botany and horticulture, who had a fine garden at Boyton, Wilts, and brought out the *Pinetum*, known under his name, was laid before Her Majesty and Prince Albert; and, as the Director says in the concluding paragraph of this part of the *History of Kew*, "It seems probable that, after all, the continued existence of Kew was rather due to the interest of the Sovereign than to the influence of popular agitation." *W. Betting Hemsley.*

COOL ORCHID CULTURE.

MOST of the cool Orchids, especially the *Odonoglossums*, *Masdevallias*, and some of the *Cypripediums*, delight in a very moist atmosphere, as well as copious and frequent watering at the roots, providing the drainage is good. The majority of them may be grown in pots, and this mode I should always prefer, although patches, clumps, and even margins of rockwork may be adopted when rustic and natural appearances are desired; care must be taken, however, that the pots are of a proper size. It is not possible for any cultivator to fall into a greater error than over-potting.

Newly-imported plants should be laid out singly on a shelf, and kept a little moist till they begin to grow; or they may be placed in small pots upon clean crocks. When they have made new roots and commenced growing, place a small quantity of very fibrous peat mixed with sphagnum, and a sprinkling of silver-sand around them, say, about an inch, adding according to the aftergrowth of the plant. If potted in 60-sized pots, filled within an inch of the top with clean crocks, and go on well, they will require a shift into small 48's the second season. These pots should be filled about two-thirds full of crocks; then move the plant carefully from one pot to the other, making up with the compost advised to a moderate height—say, about an inch. I have a great objection to high-potting; the plants dry quicker, and there is more difficulty in watering them.

During the growing season keep the house rather close, and maintain a moist atmosphere. It is a bad practice to stand the pots on moss, as it interferes with the egress of the water, although moss may be placed between the pots to retain moisture.

Established plants should be treated in the manner recommended for the second potting above. These should all be looked over twice in the course of the season, and repotted where necessary. In many cases the compost will require removing, and the plants put into the same size, or even a smaller pot, that it previously occupied. This should be done when the plants have not been growing freely.

In ventilating, care must be taken to avoid

original *Araucaria imbricata*, stood in the herbaraceous ground of that time. The temple of the sun was near the centre of the whole garden, and near it grew the first introduced plant of *Aucuba japonica*, dating from 1783. Outside of this comparatively restricted botanic garden were the pleasure grounds, and there were few trees between the palace and the pagoda. The row of now somewhat storm-beaten Elms, called the seven sisters, in allusion to the daughters of George III., some trees on the mound to the east, and Weeping Willows around the pond,

a spacious Palm-house was planned by Sir Jeffrey Wyattville, only to be abandoned, but what was called the architectural conservatory, immediately on the right, entering from Kew Green, now occupied by Aroids and other tropical plants, was removed from Buckingham Palace thither. In the first place it was used as a Palm-house, and after the erection of the present Palm-house and before the erection of the large Temperate-house in the Pleasure grounds, it was filled with the larger Australian plants.

FIG. 66.—DOUBLE CORDON PLUM. (SEE P. 458.)

draughts. Reduce the ventilation gradually, finally closing the light before the sun gets on the house. Cool Orchids are often brought into bad health through the sudden change from a cool, free ventilated house to a moist tropical one. Copious waterings, and damping the paths, stages, &c., morning, noon, and afternoon, are what the plants require during the growing season. In winter, much less water is required, but it ought not to be withheld altogether, and the plants should at no time be allowed to get very dry. Generally speaking, the colder the weather, the less moisture will be required, but avoid a dry and harsh atmosphere, or the plant will suffer.

Shading during summer will be required, and, if it can be so arranged, 6 inches above the rafters, to allow a free current of air to circulate between the glass and the shadings, so much the better. *A. Evans, Haslemere.*

THE ROSERY.

THE TEA ROSES IN THE FLOWER GARDEN.

It is one of the greatest merits of Tea Roses that they thrive almost equally well outside as indoors. Anyone building a Rose-house would naturally fill it with Teas, with a *Maréchal Niel* or two thrown in for early golden Roses, but there are those who still exclude this richest of all golden Roses from this class. But exquisitely beautiful as Tea Roses are under glass, they are equally or more beautiful in groups, beds, or borders in the open air. In such positions the Teas should all be grown on their own roots, and planted in considerable masses, so as to support each other, and so allow the better for a little winter or spring protection of Fern fronds.

I know that not a few rosarians deprecate any protection. They say, "No matter if the Roses are cut back to the ground line, the closer they are pruned back by the frost or knife the stronger the breaks from underground and the finer the flowers." Well, perhaps. "What of that," some may say, "our shows are not till ——" But I and thousands more grow our Teas and other Roses for personal pleasure and the embellishment of our beds and borders, and already I am longing for early Tea Roses in bud and blossom, and, with fair spring weather, I shall soon cut Roses from those masses of protected branches.

But supposing they had no protection, these would mostly have been cut to the ground line, which means that some of them might have been killed, and all put back for six weeks or two months. Hence, as nothing succeeds like success, and everyone will welcome early Tea Roses, alike in bud and blossom, I say emphatically, that a slight protection of the tops and crowns of Tea Roses pays many times over. It keeps them safe, makes them earlier, and enables them to break into new shoots with greater vigour and certainty. *Rosa.*

EARLY MARÉCHAL NIEL ROSES.

In preparing pot plants for very early forcing, it is of the utmost importance that they be grown so as to form some long, robust shoots in summer, and these should be thoroughly matured through exposure to air and sun during the autumn. If this cannot be properly accomplished in the open air or against a wall or fence, the plants should be placed under glass, say in a Peach-house, and their shoots spread out on the trellis-work. Good plants with shoots, varying from 9 to 15 feet, may be put into heat early in December, and by extra pushing a few blooms may be secured at Christmas, but they will not come so fine or freely as in January or February. The plants will be assisted by a slight bottom-heat, and the growing temperature at first should not exceed 55° or 60°, but as the bloom-buds show, the temperature may be increased 7° or 10°. At first, water must be applied sparingly, but when in full growth large quantities will be required at the roots,

but do not keep the foliage too moist. Plenty of light and air should be admitted. I am of the opinion that it is a mistake to force large *Maréchal Niel* plants very early in the season. If a succession of young pot plants are kept up for early forcing from Christmas to the end of March or thereabouts, the permanent plants will, by that time, be giving a supply. I will give as an instance the growth of some young *Maréchal Niel*s made with me last year. In February they were grafted, and turned out of 48-pots in June, where there was a little bottom-heat. Each plant made four and five growths of good size, varying from 15 to 23 feet in length, by November. These will produce a fine lot of bloom, and if grown along successfully this year, they may be had in flower by next Christmas. Good plants for forcing can be grown in 10 and 12-inch pots in a mixture of turfy loam, a few half-inch bones; and, if the loam is not very substantial, I find a little fibrous peat is beneficial. A little artificial manure mixed with the soil will keep them growing and blooming a long time. Plants which have been growing in the same pots for some years should have their drainage seen to before forcing is commenced, and a top-dressing applied. A 4 or 5-inch potful of artificial manure to each bushel of loam makes an excellent mixture for that purpose. A moist atmosphere at 55° will induce the growths to push forward, but when they are fully out, a drier atmosphere will be preferable. *A. E.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS IN THE UNITED STATES OF AMERICA.

In the fine collection of F. L. Ames, Esq., Langwater, North Easton, Mass., U.S.A., there are now many specially fine Orchids in bloom, including the new hybrid *Odontoglossum* (*Miltonia*) *Bleu* ×, superbly flowered.

Among the *Cattleyas* are *C. Trianae* in abundance, grandly grown specimens and full of bloom in all shades of red, rose, and mauve, and also some pure whites. The handsomest at the time of my visit were the varieties *Sanderæ*, *Leeana*, and *Backhousiana*.

Of what are now called the white *Laelia anceps*, there were no fewer than eight varieties in flower, the best of which were *L. a. Schroderiana*, *Stella*, *Sanderiana*, *Dawsoni*, *Williamsii*, and *L. a. Amesiana*, the last-named with a tinge of rose on the petals and a very deep maroon-crimson lip, the like of which has not appeared in any other variety.

Many magnificent spotted and hybrid forms of *Odontoglossums* were flowering vigorously, including *O. excellens*. These are grown in a north lean-to house, sunk about 2 feet in the ground. This is necessary in the United States of America, where the summers are very hot and the winters unusually severe. Grown thus, the plants are cool in summer, and can be kept warm enough in winter without being roasted with fire-heat. *Masdevallias* are also well done, and among those I noticed were *M. Courtaldiana*, *M. Lauchena*, *M. Hinciana*, and the superb *M. Schroderiana*.

Dendrobiums are special favourites of Mr. Ames, and all the finest are to be found at Langwater. In flower were *Schneiderianum* ×, *Cybele* ×, *Murrhinianum*, *Cassiope* ×, *Wardianum* *Schroderi* var., *Leechianum* ×, *D. Phalaenopsis Schroderianum*, and the fine *D. Robinsonianum* ×, the best of the splendissimum section. Many superb forms of *Swainson's* old *Cattleya labiata* were in flower.

What struck me most was the really grand condition of the plants in this wonderful collection. F. L. Ames, Esq., is the Baron *Schroder* of America. These are two of the greatest Orchid lovers, but they reign in different hemispheres. One great advantage the American grower has over his British compeer is in the tobacco ribs (midribs of the leaves of *Nicotiana*), these can be bought here at one half-penny per pound, and it is the very best and safest

insecticide. The grower may strew his floors with it; put the ribs in the evaporating-troughs, place them over the hotwater-pipes in wire trays, or pour boiling water on them, and use the liquor for immersion and so keep his plants perfectly clean for a ridiculously small outlay, while the British grower has to pay from 6d. to 1s. 6d. per pound for a vile material that is not tobacco at all, and contains only a small amount of nicotine. *Visitor.*

DEUTZIA GRACILIS.

This is an easy plant to grow, but it is seldom seen in good condition in a private garden, owing to the plants being grown in the same pots for a number of years. No wonder, when given this treatment, we hear gardeners say their *Deutzias* do not flower well. If given the following treatment, plants with abundance of good flowering-wood will be the result.

Put in good strong cuttings now, about twelve in a 32-size pot, using half loam and half leaf-soil, with plenty of sand. Plunge the pots in a hotbed, and grow the cuttings on till about 6 or 8 inches high, then gradually harden off; then about the end of June plant them on a south border, not of too rich soil, 15 inches apart each way, and keep them clear of weeds till the following March, when cut them down within an inch of the soil. Serve them the same way every year till the third year. The plants will then be ready for potting by the middle of September. Take them up, and shake off part of the soil, and pot in 16-size pots, using a rough compost of two parts loam, one part leaf-soil, a little sand, and some soot—about a 32-size pot to a barrow-load of compost. After potting, put them behind a north wall for a few days. Give them a good watering, and syringe two or three times a day, but do not sodden the soil. About a week or ten days later put the plants out in the full sun to ripen the wood.

For very early forcing, it is advisable to grow a few plants in pots. The way we serve them is to pot up some of the two-year-old ones, and instead of using them for flowering, we cut them down to an inch of the pot, grow them on in plenty of heat, gradually harden off, and stand outside in full sun in the summer. These are fit for forcing in October. After flowering they all go to the rubbish-heap, but we strike about a hundred cuttings every spring, and if treated as above, ninety out of every hundred will make good plants. *Practice.*

CULTURAL NOTES.

MIGNONETTE GOLDEN QUEEN.

A CORRESPONDENT speaks highly of the above variety of *Mignonette*, which he observed recently in the gardens of Spy Park growing in capital condition in 4½ and 6-inch pots. Probably the gardener had sowed seeds in August or September last in the same pots that the plants were flowering in, and kept the plants from drawing by growing them in a low pit, the tips of the stems but a short way from the glass, and not applying more heat than was needed to exclude frost. It is no use to attempt to grow *Mignonette* in the ordinary potting compost. The best kind consists of light loam, a little charcoal dust, and one-sixth of old mortar or plaster broken small, mixed well together. Good drainage, with a handful of horse-manure nearly or quite fresh, placed over it, and the soil filled in firmly; in fact, it should be rammed hard, and sufficient space left on the top for water to permeate the whole. Slight wetting of the soil is dangerous, the feeding roots of quite young plants going to a good depth, and to afford less water than will go to the bottom of the soil is to starve them, and eventually cause their destruction. The plants must have plenty of air whenever it is prudent to afford it at all, and every means should be taken to preserve an atmosphere about the plants as free as may be from moisture; therefore, to stand them in a disused Melon-pit with the moist soil and

manure of the Melon-bed below them, or even on boards or staging over a water-soddened bottom is bad practice. A pit for winter Mignonette should be filled up with brickbats, and on the top of these a thick layer of coal-ashes should be placed and beaten down firmly; and on no part should this be more than $1\frac{1}{2}$ foot from the lights. *M. Doria*.

FORESTRY.

BERRY-BEARING COVERT SHRUBS.

The spiny-leaved *Pernettya* (*P. mucronata*) is a native of Cape Horn and many parts of South America, and since its introduction into this

within bounds in such situations. There are several varieties of the species in cultivation, which differs considerably in their habit of growth, and colour of their fruit from the type; in short, they exhibit many shades of colouring, from brilliant scarlet to pure white, and they are all suitable alike for pot culture when desirable. When the plants are wanted to decorate balconies, halls, and other places during winter, they can be removed from the open ground when loaded with their berries in autumn without any risk of injurious effect whatever. In spring the plants should be re-planted in the open ground.

The narrow-leaved *Pernettya* (*P. angustifolia*) is an interesting species, introduced into this country from Chili in 1840, which has proved to be quite hardy in most situations in Great Britain and Ireland. Like the former species, it is capable of accommodating itself to a great variety of soils and situations, and thrives well as a covert plant under the shade of trees. When fully established, its contour is that of a well-furnished evergreen bush some 4 feet high, and densely clothed with leaves of a lesser size than those of *P. mucronata*. It flowers in early summer, and its berries, which are of a light pink colour in autumn, and as these often remain on the bushes for a considerable time, the plant has an ornamental value. In all cases the ground where *Pernettyas* are to be planted should be thoroughly drained where requisite; and if the subsoil is hard and impervious, it should be broken up with a pick and allowed to lie exposed to the weather for some few months before planting. Stiff soil should have some bog earth or light friable soil mixed with it, which will assist the plants to start better at the first. *J. B. Webster*.

GRAFTING CAMELLIAS.

How often must the gardener regret his inability to make use of some variety of Camellia, cuttings of which, perchance, have been given him by a friend,

grafting being better adapted for headed-back old plants.

If the gardener have no close propagating-case, let him place a hand-light or a small garden-frame with close-fitting lights within a well-glazed brick pit, and place his grafted stocks in it, keeping them shaded till a union has taken place between stock and scion, which is readily ascertained by the latter commencing to grow from the end. The grafter should observe to let a leaf or two remain on the stock above the point of grafting, cutting back the stem on which these grow when the union is complete. As with Camellias, so with *Rhododendrons* of the *Noblesnum*, *arboreum*, *Catawbiense*, and *pontic* races, which grow well on stocks of *R. ponticum*, the whole process, as illustrated in figs. 67—69, being identical with what is recommended for the former.

BRITISH GUIANA.

THE Report on the agricultural work in the botanical gardens for 1890, which has only just reached us, is a very important document, and one which every one interested in tropical cultures should consult. The highest temperature in the shade is noted

FIG. 67.—SIDE GRAFTING, SUITABLE FOR RHODODENDRONS AND CAMELLIAS.

FIG. 68.—WHIP GRAFTING.

FIG. 69.—SADDLE GRAFTING.

country in 1828, has proved to be not only quite hardy, but likewise capable of growing on a great variety of soils and situations. It makes an excellent covert-plant under the shade of trees, but attains its best form of development when planted along the margins of plantations where it has the advantage of light and sunshine, as well as the shelter of the trees. In such positions it produces its pretty white bell-shaped flowers from April to midsummer in great abundance, and as these are followed in autumn by bright red berries, which often remain on the bushes for a considerable time during winter, are attractive. I have planted it with success on all classes of soil, from deep peat-bog to hard gravelly soil. Established plants form evergreen bushes about 5 feet high, well clothed with small sharp-pointed leaves, thick in texture, dark green in colour, and glossy of surface. It is not apt to be eaten or peeled to any serious extent by hares and rabbits, which is a point in its favour. It is a good lawn-plant, and well adapted for planting about suburban villas, and where space is limited, as it bears the pruning sometimes needed to keep it

from lack of a stock on which to graft them. The single-flowered or seedling forms, as well as some of the double-flowered forms of the Camellia, root readily in sandy soil, with a bottom-heat of 75° to 80°, and these when potted up may be employed for stocks in two years, if they are encouraged to make strong growth. Grafting may be done in June and July in any of its forms, but tongue or side-grafting are the more convenient ones; crown and whip-

as 89° in October, the lowest temperature 69° in July. One hundred and twenty-five inches of rain fell, the largest amount (26 inches) occurring in January. Of the total amount of 28 millions and a quarter (roughly) pounds of water per acre, there were 221 pounds of nitrogen as ammonia, and 252 in the form of nitrates. The excessive rain was unpropitious to the development of the Sugar-cane. A valuable series of experiments on the culture of this plant was undertaken, and elaborate analyses of soil, of manures, and of canes are recorded. It was found that canes of the same variety and of the same degree of maturity varied greatly in their sugar and glucose contents, so that there is scope for the "selector." Seedlings vary very greatly also in their characters, so that the old notion that the variation in the canes was due to bud-variation only is no longer tenable. The majority of the canes "arrow," that is, produce flowers freely, others less so, the amount of perfect seed that is formed being very variable. The bulk of the seedlings so far are inferior to their parents in the quantity of sugar, a few only being better.

Referring to Mangos, Mr. Jenman declares good Mangos to be fruit for the gods, while bad ones are only fit to feed hogs. A principal want in the cultivation of the plants is a dwarf variety to use for stocks. Mr. Jenman urges the culture of suitable varieties in our fruit houses, where they might readily be grown, and in a few years' time Mango cultivation might become as firmly established an item of hot-house culture as Pine-apples. "No Peaches, Apricots, Grapes, or Pine-apples in the world, rival those grown in English glasshouses," says Mr. Jenman, who suggests the possibility of British Guiana and other colonies eventually looking to England for their supply of Mangos! The remarks on Bananas and Plantains are very interesting, and to them we must refer on a future occasion.

FLORISTS' FLOWERS.

OXFORD CARNATION AND PICOTEE UNION.

THE annual report of the Union for 1891, just issued by Mr. E. S. Dodwell, is, as usual, full of interest for Carnation growers especially, and for all who admire these flowers. In that portion dealing with reports from cultivators as to the "incidence of the season," many suggestions are made of a valuable character. Mr. Dodwell—referring to the destruction of stock wrought by the sunless summer of 1890, followed by the long and severe frosts and fogs of November and December of that year, and of January, 1891, and these, again, by the blizzard of March 9—states, that these "wrought a destruction of stock, or induced a debilitation, without a parallel in the memory of florists of the longest standing." So retarding were these occurrences, that potting for bloom was not performed until an abnormally late date, and which made growth very late also; and so, instead of the usual "one-shift system—the normal rule for Carnation growth—we went upon successive shifts, giving the plant additional room only when its ball of soil had been filled with healthy roots." This is a practice Mr. Dodwell recommends in the case of all weakly-rooted or partially-ripened layers. "Let the plant have just so much food as it can healthily assimilate whilst it is sweet, bracing and strengthening the root-action with the aëration through the sides of the pot, which, however, should be plunged (say, in Cocoa fibre), and it speedily gets power of digestion, and so rapid and robust growth."

This appears to be excellent advice for growers who are troubled with weakly growers, and who, by such means as those set forth by Mr. Dodwell, can lead on debilitated plants until they can reach a more robust stage of growth. Can any more weighty testimony be added to the lateness of the season 1891 than that mentioned by Mr. S. Barlow, that he exhibited a fine stand of forty-eight Carnations at the Middleton Agricultural Show on September 18 last, R. D.

[We may add to the above, that much interesting matter for the cultivators of Carnations and Picotees is afforded by Mr. Samuel Barlow, Messrs. W. Bacon, J. Ball, A. R. Rowan, R. Ellis, J. F. Kew, R. Sydenham, Ben. Simonite, and other growers, but for which we must refer our readers to the interesting report itself. Ed.]

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Meworth Castle, Maidstone.

THE STRAWBERRY BEDS.—Assuming that these were properly attended to after last year's crop of fruit was gathered, by the timely removal of the runners, weeds, and some of the lower leaves of the plants, and mulched with rich manure, good crops of fruit, barring bad weather, may be expected. This kind of attention is the chief secret in fruiting the plants and making strong and well matured crowns. Our plants, especially those that are tender, notably

Sir Charles Napier, have suffered from frost and winds, and appear at the present time as bad as they did in 1889 and 1890, a state of things which I attribute to the mild weather we experienced before the frosts came. All the beds of bearing plants should be at once put in order for the coming crop; treading firmly the soil about the plants when it is in a dry state, clearing off the weeds, and affording a good mulching of manure if the soil be light and porous, thus ensuring long continuance of bearing and large fruits. Plants put out late in the autumn, or recently, may be cropped between with Lettuce or other low-growing plants for this season, but they should not be allowed to crowd the plants. Those layered early last July, and put out on good land in August, will have fine produce this year. This is undoubtedly the best method for keeping up a healthy lot of Strawberry plants. The ground may now be got in readiness for the plantation to be formed by the plants which have been forced in pots, and these should not remain in their pots a day longer than is necessary to harden them off. Trench, or deeply dig the ground, applying manure according to the requirements of the land, road-scrappings being applied to land which is very heavy, and heavy loam to that which is light, and the latter should be trodden firm before planting it.

RASPBERRIES.—These should be cut back to from 4 to 5 feet and a little more in height, if not staked, and those which have been planted this season should be cut down to within a few inches of the ground-level, so that good canes will be made. Baumforth's Seedling is a good-flavoured and useful variety, and will be more commonly grown as it gets better known. The autumn-fruiting varieties should be cut down, and only six canes to each stool allowed to grow. Belle de Fontenay is a first-rate Raspberry, which, when not cut down, produces fine berries for preserving, of a fine bright colour. All of the beds should be afforded a top-dressing, and Mushroom-bed manure, leaf-mould, and well-rotted garden-refuse, any of which will greatly improve the size of the fruit and the canes, especially if the soil be shallow and hot. Remove all useless suckers as fast as they appear, reserving only about as many as may be wanted for next year, and for the increase of stock.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

VINES which may have been started at the beginning of March, and afforded a minimum temperature of 45° at the start, with a rise of 2° each week since that time, and have been well syringed until the rods broke, will now be required to be disbudded. In doing this, where more than two breaks occur on a spur, the weaker ones should be removed, and to avoid giving the Vines a check, the thinning should be accomplished by degrees, only a few shoots being removed at one time. Subsequently, when it can be seen which of the two shoots left is the stronger, or has the best show for fruit, the other should be cut off, and the remaining shoot on the spur should also be relieved of all bunches, except the best one, which by preference should be that bunch which is nearest to the stem. With longer days, and a larger amount of sunshine, these lateral growths will grow quickly, and will require to be drawn in towards the main stem or cane, but great care will be needed in doing this at first, for it only requires a very little strain to sever them apart from the canes, and even when all may look well during the day on which the operation is performed, the following morning will reveal much loss. While this work of tying in the laterals is in progress, the sublateral may be stopped just beyond the first leaf, or, if very small, entirely removed. I would recommend the latter course being taken when the bunch-bearing shoot is allowed to extend to 3 or 4 feet in length. Continue to increase the temperature at the rate mentioned previously until a warmth of 65° is reached, which should occur about the time that the Vines are in bloom, and make free use of the syringe in the house, but not on the Vines, so as to secure humidity in bright weather until that stage is reached. These temperatures are not recommended for Muscat of Alexandria, or those requiring similar treatment in regard to warmth, and which require a temperature of 5° higher at all stages of their growth. Beds of manure may now be turned out for the vineries on the first occasion favourable for allowing the doors to stand open for that purpose, and the borders should have

the surface stirred with a digging-fork, and those which are well-drained, or are made of porous soil, will stand in need of a good soaking with warm water, which may contain some small quantity of manurial aid to growth. Vines with a tendency to gross growth and the production of small bunches, should be supplied with some of the phosphatic manures which do not contain nitrogen.

MUSCAT VINES.—The flowers of these varieties will set better under partial shade than when exposed to the sun's rays, and to secure this condition the plants should be encouraged to produce ample foliage at this stage. As their leaves are smaller and more deeply cut than those of most other Grape vines, a greater number are necessary to obtain the desired degree of subdued light during flowering. When, through inability, the Vines yield too few leaves, a substitute may be found in a thin shading thrown over the roof for a few hours in the middle of the day, when the weather is bright. The fertilisation of these shy setters may be assisted by cutting off superfluous flowering bunches from those Vines which freely produce pollen, and shaking them over the bunches when the flowers first expand. Gradually withdraw the artificial shading which may have been employed, when flowering is over, and follow the treatment advised at the beginning of these remarks.

DUKE OF BUCKLEIGH AND WHITE TOKAY.—These are two varieties which call for a few remarks with regard to the system of procedure needed to secure the best results. Both make exceptionally strong growth, but when the Vines are grown on the spur system, i.e., every lateral cut hard back when the Vines are pruned, they not infrequently fail to satisfy the cultivator in regard to the number and size of the bunches. But this state of things may be reversed if sufficient young wood be laid in to form a chain the whole length of the cane, and not cut away in the winter months. Thus, by securing shoots at this season from the spurs, something like 2½ feet apart, and on alternate sides of the stem or rod, and training these so that they may be placed close in to the rod at the winter-pruning, the best means will have been taken to obtain good crops from these two varieties of the Vine.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

GENERAL WORK.—There are always many arrears of work to be done at this date, and no time should be lost in carrying them out, and all other work that has been touched on in previous calendars. The main crop of Potatoes must now be planted, notwithstanding that it was advised at an earlier date, when in some cases the soil was not in a fit state for treading upon. I think there is nothing gained in delaying this work till late in the spring; on the other hand, the sowing should be started and not in too forward a state of growth, and rank manures should be avoided. The earliest planted lot on the warm border are now breaking through the soil, and these will require to have some fine soil drawn over the tops, or some dry Bracken or long light litter may be used instead at night, but uncovering them during the day. This kind of covering takes some little time in doing it, but it will often save the crop when merely drawing the soil over the tops is of no avail. Strawed hurdles are used by some.

SALADS.—Seeds should be sown without delay of Lettuces and Radishes, and Mustard and Cress, on a narrow border at the foot of a south wall, covering the seeds with a mat or straw till they germinate. Radishes must be protected from the attention of birds, and growth will be quicker if the plants are covered at night. Autumn-sown Lettuce plants should be transplanted to a richly-manured south border, care being taken to preserve a small ball of soil with the roots. By shading these for a few days, if bright weather occurs, they will more readily get established; more especially is this the case when the plants have been wintered in frames. If there is a deficiency of plants, those sown in heat last month will be found useful. These should be pricked out in a light, rich compost in a frame placed in a warm bed, before finally planting them in the open. If Lettuce is required in large numbers, sow an early variety thickly in boxes or in a mild hot-bed frame, and cut it for use whilst still young, and thus save the others for a time. Lettuce may be sown every three weeks for a constant supply. Veitch's Golden Queen is a desirable variety, of quick growth, and dwarf, compact habit, and it is

one of the earliest Lettuces I have grown; for later sowing, Perfect Gem is very good.

BEEF.—A small sowing of the Turnip-rooted, of Egyptian or Eclipse, should now be made, the latter being the better keeper, but it is not quite so early as the other.

WATERCRESS may be available from April to October by sowing seeds in a warm frame, and pricking out the seedlings into boxes, and later direct into a bed of light sandy compost, out-of-doors, affording it partial shade during the day, and watering or syringing the plants twice or thrice daily. The variety called Sweet Erfurt is a good one for summer use. Watercress may be planted in bunches of plants at 12 inches apart.

EARLY-BOWN CELERY should be pricked out before it becomes drawn, and if but a small quantity is required, the ordinary shallow cutting-box may be used. The compost should be light, with plenty of leaf-soil in it, and the boxes placed in full light, so that no drawing of the plants may occur. A garden-frame is much the best place for the bed. The main-crop seedlings should be thinned early, if the seed was sown thickly; and neither early or late Celeries should suffer from lack of root moisture.

HERBS.—The species of sweet herbs that are usually raised from seed may now be sown; Mint roots may be divided and replanted on well-manured land. Mint, either Spear or Pepper, should not remain for longer than three years without transplanting. Pennyroyal roots may be divided and replanted in a light compost; this plant makes a good border to the herb quarter. Chervil needs similar treatment, also Tarragon. Sage may now be increased by taking slips of the side branches with a heel, and inserting them firmly in a sandy soil. Sweet Basil that has been raised in heat may be hardened off, preparatory to planting it out on a warm border in May. Bush Basil and Sweet Basil for later use may now be sown out-of-doors. Sow Parsley thinly in quantity, and in gardens where this herb fails, the ground should be well dressed with soot and wood-ashes before the sowing.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Gardens, Swansea.

ANTHURUM SCHERZERIANUM.—Plants which have been raised from seed last summer will now require to be potted into 4-inch pots, employing as a compost fibrous peat, chopped sphagnum moss, and a small amount of charcoal and sand. After potting, stand the plants on a bed of fine shells or gravel. Large specimens of this plant, which are now throwing up their spathe, should be afforded abundance of water, and syringed overhead twice daily with tepid water.

FINE-LEAVED VARIETIES OF ANTHURIUMS.—These plants require repotting each year, and the best time for this operation is just previous to fresh growth being made. Entirely remove the old material from the roots, and as these plants do not require any great depth of soil, deep earthen pans are preferable to the ordinary flower-pots, but if the latter be made use of, they should be half filled with crocks. A compost of fibrous peat, clean crocks, and sharp sand will make a good compost for these plants; and in potting them, keep the collar of the plants well above the compost, and surface the whole with living sphagnum moss. If it be desirable to increase the stock of the plants, this may be done by dividing the crowns themselves, or by taking up the growths springing out round about the crowns of the root; the latter will generally be found to have formed independent roots, but in removing them, care should be taken to do as little damage as possible. Put these singly in pots which are just large enough to hold them, and make them secure by fastening them to a stick until established, and till then they should be kept in close frame or case, so as to prevent flagging. Anthuriums are liable to the attacks of red-spider, and as a preventive, the syringe should be freely used at closing time. During bright sunshine some light shading should be put over them, but at all times they should be grown in a light situation.

WINTER-FLOWERING BEGONIAS.—Cuttings of the above may be put to strike as soon as obtainable, giving preference to the side shoots on the main stems. In 4-inch pots, well-drained and filled with a sandy compost, insert four or five cuttings

around the edge, placing them in the propagating-frame. When well rooted pot them singly into small pots in a compost of three-parts rich loam, one of leaf soil, and sand in proportion, and pot firmly. Cut back old plants, and when they break, shift them into pots two sizes larger than they previously occupied. Grow them in a pit where the night temperature does not fall below 55°, with a proportionate rise by day. Keep the plants well up to the glass, and use a light shade during bright sunshine. The following are mostly good species for autumn and winter blooming, *Begonia nitida*, *B. odorata*, *B. insignis*, *B. Knowlesiana*, *B. fuchsoides*.

PRIMULAS AND CINERARIAS.—Seeds of the above may now be sown to furnish plants for early blooms, sowing in a mixture of two parts rich loam, and one of leaf-mould, passing it all through a fine sieve, and adding a fair proportion of sharp sand.

The seed-pans must be well drained, some of the sifting being placed above the crocks. Before sowing the seed, make the surface of the soil firm and level, and after watering it with tepid water, and allowing it to settle for an hour, sow the seeds evenly over it, and cover very lightly with sand, or some of the finest particles of soil. Place a sheet of glass over the pan, and over this a little damp moss; place the pan in a hotbed frame, whose heat has declined, and the seeds will quickly germinate.

DOUBLE CHINESE PRIMULAS.—Now that most of these have finished flowering, no time should be lost in preparing the plants for propagation by division by cutting away the decayed leaf-stalks. After this is done, mould-up the stems as far as the lower leaves with a mixture of leaf-mould, sharp sand, pressing it firmly about the stems, and standing the plants in a close pit till roots have pushed into the fresh material about the stems, which generally takes place in four or five weeks. When rooted, the crowns of plants must be divided, each with its roots, and potted singly, and kept rather close until established, when more air should be degrees be given. Shift the plants into larger pots when the roots have reached the sides of the pots, using a compost consisting of two parts rich loam, and one each of leaf-mould and decayed manure, with enough sand as will keep the soil porous.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

THE CATTLEYA-HOUSE.—The plants of Cattleya Trianae which brighten up this house for nearly three months, are now nearly over for this season, and the not less beautiful *C. Schroderae* will take their place. It is not easy to say which is the more lovely of the labiate section of Cattleyas, or which the most useful; certainly all of them are worth growing well, and if this house contain groups of the different varieties, as it should do, there will be but very few days during the year that a Cattleya labiate of some sort will not show a flower. Cattleya Lawrenceana is another species which is now about to open its beautiful, rich rose-purple flowers. It is a very desirable species, and one that is easily grown, but likes more heat than most other Cattleyas when growing. I therefore have it removed to the Dendrobium-house as soon as growth commences, keeping it there during the summer months in company with Cattleya eldorado and *C. superba*, both of which must also have plenty of heat. *C. amethystoglossa* is another very pretty species now in bloom; the warmth of this structure is sufficient for its requirements. With sun-heat the thermometer in the Cattleya-house may now run up from 70° to 85°, provided the house is well ventilated, for anything approaching the close heat of a plant-stove should be avoided; the warmth at night should be about 60°, rather less than more. None of the Cattleyas must now be allowed to get very dry at the roots; but, on the other hand, a great supply of moisture is not yet necessary, the plant being not as yet in active growth.

THE EAST INDIAN-HOUSE.—The Phalenopsis will now rapidly be making roots and foliage, and should be well supplied with moisture and heat, and whilst direct sunshine injures these plants, they should be too thickly shaded, or placed far away from the light, these practices having a tendency to make spiny leaves, because they cannot become well matured, the evil effects of which will be remarked in the winter time. *Angraecum Sandersonianum* is a species which is now in flower, and it

is one of the prettiest of the genus, with its graceful drooping racemes of snow-white flowers, which are useful for cutting. It is a plant that should be grown in well-drained pans or baskets, in sphagnum moss, and suspended near to the roof-glass in the warmest compartment. Other occupants of the East Indian-house will generally require a good supply of moisture at this season at the root and in the air, and for the Phalenopsis a night temperature of 70° is not too warm; while that for other East Indian Orchids may range from 65° to 70° by night, unless the weather be very cold.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

PENDING OPERATIONS: THE HERBACEOUS BORDERS.—Now that the whereabouts of most of the plants in the borders are discernible, the winter surface-dressings of short manure or leaf-mould may be pointed in with a fork, taking care not to damage the roots of the plants. In cases where the borders have got low, fresh soil 2 inches deep might be added to the border with advantage, spreading it over the dressing without forking over the soil. The same remarks will apply to borders of shrubs in which clumps of herbaceous and bulbous plants are planted. Lilies of various kinds generally do well in such positions, as also Spiraeas, Tritomas, Foxgloves, Funkias, and with patches of Daffodils, Primroses, and Snowdrops.

TREES AND SHRUBS.—Recently-planted trees and shrubs, especially those standing in light soils, should be mulched, and afterwards watered at intervals, as may be considered necessary, until the plants show signs of the roots having pushed into the new soil. Timely attention being given in this direction will be rewarded by the trees and shrubs making healthy growth; it is labour well applied.

LAWNS AND WALKS.—Brush over and roll the lawns in preparation for mowing the same, and at the same time make a vigorous attempt to rid the turf of any Dandelions, Plantains, and other noxious weeds, by using Wilkes' Dock Eradicator charged with Smith's Weed-killer [We shall publish our correspondent's description of this implement next week. Ed.]. If the turf edges of walks are cut (with the edging-iron) now, the operation need not be repeated for another year, the shears if brought into use fortnightly, will keep them nice and trim during the next six months. In cutting the edges (which are easier and better done after rain has fallen), care should be taken to preserve them of the original width, if this be correct; and the curves of the walks should be accurately struck. This done, pull up all weeds that may be in the walks, and afterwards roll them. But the easiest and cheapest way to keep walks free from weeds is to water them with Smith's Weed-killer, at the rate of 1 pint of it to 3 gallons of water, being careful not to let any of the mixture touch the grass or other live edging. The effect of this preparation is not immediate, no matter in whatever way applied, but it is complete ten or twelve days after application. This preparation being very poisonous, it must not be used on walks or yards which are frequented by pigeons or domestic fowls.

INDOORS.—The propagating of *Alternantheras* and *Mesembryanthemums*, *Ageratum*, *Verbenas*, *Lobelias*, &c., should be pushed on, boxing or potting-off the rooted plants, affording them a space of between 1 or 2 inches from plant to plant in the boxes. If returned to heat, and properly attended to in regard to water and air, they will soon re-establish themselves, when they should be transferred to a cooler place. It is surprising what a large stock of *Alternantheras* and *Mesembryanthemums* can be struck in shallow boxes filled with light soil, and surfaced with sand between this and the middle or end of May, providing sufficient forcing-houses or hot-beds are at command. Attend to the watering of *Pelargoniums* and other bedding subjects, giving them plenty of air in the daytime, where this can be done without interfering with the permanent occupants of the houses in which they are still located. Where cool pits and frame accommodation are abundant, the hardening-off of bedding plants is readily performed. Prick out and pot off seedling *Begonias* as soon as they are ready, returning them to a moist growing temperature, watering through a fine-sprayed rose, and shading from sunshine until fresh growth is made.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, APRIL 12th National Rose Society: Meeting of Executive Committee.
Meeting of the Royal Horticultural Society at the Drill Hall, James Street, Westminster: all Committees.
Lecture by the Rev. G. P. Haydon, on "Diffidilis." Flowers in season, Fruit, &c., will be shown.

THURSDAY, APRIL 14th Brighton and Sussex Horticultural Society meets.

SALES.

MONDAY, APRIL 11th Clearance Sale of Greenhouse Plants and Utensils, at The Vineries, Framfield, Uckfield, Sussex, by Protheroe & Morris (two days).
Store and Greenhouse Plants, at Dulwich Common, by Protheroe & Morris.

TUESDAY, APRIL 12th Sale of Greenhouses and Stock at Elm Cottage, Grove Road, Kingston-on-Thames, by Protheroe & Morris.
Sale of Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, APRIL 13th Palm Seeds, Lilies, Begonias, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—47°·8.

International Horticultural Exhibition.

The International Horticultural Exhibition, which will be opened on May 7 at Earl's Court, London, S.W., so far as can be at present

judged, bids far to be a success; at least, so far as commercial horticulture is concerned. The London public will be provided with an agreeable promenade; and, if the weather prove fairly good, no doubt the results will be correspondingly favourable. The term "international" may, for aught we know, be strictly justified; indeed, we know that considerable efforts have been made to render the Exhibition what its name strictly implies. An extension of meaning has, or did, at one time apply to the term, but which we expect will hardly be warranted in the present instance. The Exhibition must be looked on solely as a commercial venture, in which the District Railway and other parties are specially interested, and if these limitations are clearly recognised, no one will have cause for complaint. Enthusiasm on the part of the executive committee is not wanting, and rapid progress is being made in the preparations. Already the greater portion of the vast space available for exhibits is taken, and it is anticipated that in a few weeks one of the finest displays of commercial horticultural produce and sundries ever seen will be got together.

The huge building, which, by the way, covers an area of some six acres, will be chiefly devoted to horticultural sundries and glass structures. Exhibits of interest to the general public will also be forthcoming, inasmuch as, among other things, art, in the shape of picture-galleries and statuary, will be well represented. Near to the main West Brompton entrance a grotto is being constructed, and on either side of this, banks of Palms, Ferns, and other choice foliage and flowering plants will be formed. A

fountain, which will be continually playing, and decorated with variously-coloured electric lights, is being made in the centre of the building, near the band-stand, which is likely to prove a great attraction. High-class music has also been secured.

The most striking feature, horticulturally concerned, in the building, however, is the charming garden, which has been laid out under cover (see plan on p. 467). This is upwards of an acre in extent, and by skillful manipulation appears to be considerably larger. The walks curve beautifully, and on an undulating surface, the green turf and numerous beds, which will be devoted to subtropical gardening, will present a charming appearance. This undoubtedly will be a favourite resort on wet days, when it is impossible to enjoy the pleasures of an outside garden.

In the grounds, too, which will be brilliantly lighted by electricity, the work is going on apace. The gardens, which have been remodelled by Mr. H. E. MILNER, the eminent landscape-gardener, are very tastefully laid out, and cannot fail to be most attractive during the summer. Examples of gardens of all ages, including Egyptian, Greek, Italian, Jacobean, &c., are in course of preparation, and the numerous other features are being pushed forward in accordance with the plan.

As previously mentioned in these pages, there will be special exhibitions and *fêtes*, and lectures on practical gardening will be given regularly. The schedule for exhibitors is now published, and may be had on application to the Secretary, International Horticultural Exhibition, Earl's Court, London, S.W. It comprises a statement of the arrangements proposed for the Great Summer Flower Show, on May 27 and 28 (the days following the Temple Show), and when ninety-two classes are set down for competitors to show their prowess in. The prizes offered are very numerous and very liberal, so that no doubt an excellent show will be the result. On July 5 and 6 there is to be a show of Roses, Begonias, herbaceous plants, table decorations, and fruit. On August 1 to 3, Carnations, Picotees, and cottage garden produce are to be on view. Autumn flowers will be shown on September 9 and 10; hardy fruit on October 5 and 7; trees and shrubs on October 26 to 28; Potatoes will be shown from October 5 to October 13, and for which a special schedule will be issued.

It is to be hoped that the arrangers of this show will do something more than get together heaps of clean-washed specimens of the tuber. Something should be done to teach visitors which varieties are good for eating and which for exhibiting only, and at what part of the season they are at their best; the generally best forcing, early out of doors, mid-season, late, and latest Potatoes; what kinds of soils suit the Potato, and request exhibitors to name the kind of soil their tubers were grown in, and the sort of manure employed. Irishmen who still possess the famous kinds of Potatoes written about in these pages recently by Mr. BAYLOR HARTLAND, would greatly benefit and interest the Saxon by exhibiting well-grown tubers of these.

RANUNCULUS CORTUSIFOLIUS.—Although only a Buttercup, this plant excited much attention when shown at the last meeting of the Royal Horticultural Society. It is an old inhabitant, having been figured at t. 4625 of the *Botanical Magazine*, but is rarely seen in gardens. It is a native of Madeira and the Canary Islands, and remarkable for its noble foliage, the lower leaves being stalked orbicular, slightly lobed and notched at the margin. The

upper leaves are deeply three-parted and sessile. The numerous flowers are borne in a loose, erect, much-branched cyme, they are of a rich shining yellow colour, exactly similar to those of our common Buttercup, but twice the size. The plant shown was exhibited by Mr. Woon, gr. to Lord HYTON, Merstham.

THE ROYAL SOCIETY.—No fewer than sixty-four candidates are proposed as Fellows this year, out of whom the Council will select fifteen to be recommended for election. Among the sixty-four we do not see the name of one botanist.

ROSE SHOW FIXTURES IN 1892.—In addition to those fixtures which were given in our column on March 5, Mr. EDWARD MAWLEY kindly furnishes us with these:—June 28 (Tuesday), Maidstone; July 1 (Friday), Brockham; July 5 (Tuesday), Bagshot, Diss, Earl's Court (two days); July 23 (Saturday), New Brighton. Mr. MAWLEY will be glad to receive the dates of other Rose shows, for insertion in the next list, which will appear early in May.

'JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.'—The last part, issued in March, contains the papers read at the Conference on *Asters* and *Sunflowers*. Professor GOODALE's paper on the genus *Aster* is a useful summary of the genus. It appears that the plants are as variable in their native homes as in our gardens, and that by selection alone, or by cross-breeding, great results may be compassed by the horticulturist. The variability of the *Aster* is curiously shown by the illustrations which are given from various sources. Mr. DAWAN's paper on *Sunflowers* is an honest piece of work, for which those interested in the correct nomenclature of these plants will be thankful.

NATAL BOTANIC GARDEN.—Mr. J. MEDLEY Woon continues his useful labours in this garden. In his last report he tells us that he has definitely ascertained that the source of *Natal Aloes* is *A. ferax*. With a view to supply fruit for the Johannesburg market, the culture of Pine-apples has become a matter of importance, and Mr. Woon details the steps he has taken to secure a supply of suckers. Some confusion exists as to the nomenclature of the varieties—a confusion that perhaps might be dispelled if Mr. Woon placed himself in communication with the Royal Horticultural Society, and one, moreover, that suggests the desirability of adding to the Lindley Library a series of coloured illustrations of the principal types of Pines.

M. ALF. VAN IMSHOOT'S ORCHIDS.—M. VAN IMSHOOT possesses a collection of Orchids which, as regards the number of species and varieties, is one of the most remarkable in Ghent. He is a true collector. Such amateurs are becoming increasingly rare. This orchidist has now in bloom:—1. *Epidendrum Wallisii*, a very fine variety, with golden-yellow petals, speckled with chestnut, which is so dark as to be nearly black; 2. *Dendrobium Kingianum* album; a very rare and charming variety of *D. Kingianum*—the petals are white, and the lip white striped with bright carmine; 3. *D. splendissimum grandiflorum*, a hybrid raised by Mr. SEZEN of VIERUM's establishment; in appearance it is similar to *D. Ainsworthii* X, but it is more coloured, and the flowers double the size; 4. *A. Zygopetalum*, apparently new; the pseudobulbs are round, terminated by narrow leaves like grass leaves; the raceme is over 3 feet long, and bears fifty flowers; the lip dark blue, and somewhat resembling the flower of *Z. Gauthieri*; 5. *Lycaste laelioglossa*; a large flower, with yellow petals and brown sepals, the lip, which is yellow, seems covered with whitish down; 6. *L. fulvescens*, large flower, clear brown in colour, the base whitish—the orange lip fringed with fine whitish hairs; 7. *Ceoloyne Parishii*, an exceedingly pretty Orchid, the flowers of which resembles *C. pandurata*; the petals are tender green, the lip white, slightly tinged with green and barred with black.

TURNER MEMORIAL PRIZES.—The following prizes are offered by the trustees of the above for the present season, viz., a Silver Cup of the value of £5, for twelve single tuberous Begonias in flower,

from the Royal Horticultural Society's schedule of prizes for 1892. Two Silver Cups, each of the value of £5, are also offered through the National Dahlia Society, at the exhibition to be held at the

Royal Nurseries there by intending exhibitors. Mr. J. DOUGLAS, Ilford, is the Secretary to the Trustees.

CHICAGO EXHIBITION.—We have received the

FIG. 70.—*RANUNCULUS CORTUSIFOLIUS*: FLOWERS, YELLOW. (SEE P. 461.)

to be exhibited at the Conference on Begonias to be held at the Chiswick Gardens of the Royal Horticultural Society on August 23 and 24. A Silver Cup of the value of £5 is also offered for nine double tuberous Begonias in flower on the same date and at the same place. Further particulars may be obtained

Crystal Palace, September 3, 1892—one for twenty-four show and fancy Dahlias, and the other for twelve bunches of Cactus and decorative Dahlias. The prizes are open to amateurs only. These four cups will be in the custody of the late Mr. CHARLES TURNER's family at Slough, and may be seen at the

following letter for publication: "The Department of Horticulture, realising the importance of the Pansy, and the prominent position it holds as a spring and summer flowering plant, is desirous of having them displayed to the very best advantage during the early months of the Exposition in 1893. With this end

in view, the Department solicits donations of seed in order to carry out their plans, and show to the vast number of people who will visit the Exposition during these months, the immense strides that have been made in the cultivation of this flower during the past few years. Seeds of only the very best varieties are desired, in quantities to ensure at least 250 plants of each at the time final planting is made. All varieties, such as Emperor William, Beaconsfield, and others, that come true to colour, should be separate, and the colours marked plainly on each package. Varieties sent in mixture should have marked on them the habit of the plant, whether bushy or spreading. Two sowings of each kind will be made, one in July, and one in August. All seed should arrive not later than July 1, 1892, addressed to Department of Horticulture, World's Columbian Exposition, Chicago, Ill., U.S.A. Duplicate invoices of varieties will facilitate the work of recording. Those contributing seeds will receive credit for same by having their names and addresses advertised in connection with the display, and in other ways." JOHN THORPE, Chief, Bureau of Floriculture; J. M. SAMUELS, Chief, Dept. of Horticulture.

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—The exhibition of the National Auricula and Primula Society will be held in the Drill Hall, James Street, Westminster, on Tuesday, April 19. At the luncheon, which will be provided at the Hotel Windsor, Victoria Street, at 2 p.m., for the judges, members, and their friends, Sir JOHN T. D. LEWELYN, Bart., is expected to preside.

INTERNATIONAL FRUIT EXHIBITION, 1892.—The schedule of prizes of this exhibition, which is to take place on the Thames Embankment, and which will be opened on September 28, is now rapidly approaching completion, and will be issued shortly. It contains several novel and interesting features; among them, nurserymen are invited to contribute collections of fruit trees, showing the various types, and also modes of training for different purposes, so as to have an educational value. It is thought desirable to give intimation of this in advance of the issue of the full schedule, that nurserymen may make the necessary preparations. Other classes for nurserymen have been arranged as follows:—Collection of trees bearing fruit, in pots, with dishes or baskets of hardy fruits, artistically arranged on a space 24 ft. by 6 ft. Collection of hardy fruits, in baskets or dishes, arranged on a table 15 feet by 6 feet. Collection of English market fruits, including Tomatoes and Cucumbers, arranged on a table 12 feet by 6 feet. It is intended to award medals in each of the above classes at the discretion of the judges. The Secretary of the Exhibition is Mr. RICHARD DEAN, Ranelagh Road, Ealing.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the committee of the above took place at Anderson's Hotel on the 31st ult., Mr. R. BALLETINE in the chair, there being a large attendance of members, including representatives of affiliated societies. A letter was read from Mr. LEOPOLD DE ROTHSCHILD, "regretting exceedingly he is unable to comply with the request of the National Chrysanthemum Society to become its President during the present year, owing to his numerous engagements." By a unanimous vote, the Secretary was instructed to invite Sir EDWIN SAUNDERS, Fairlawn, Wimbledon, to become the President of the Society for the present year, and he, as we subsequently learnt, has accepted the position. The Secretary reported that the schedules of prizes, as amended, had been accepted by the annual general meeting, and were in the hands of the printer, also that a considerable number of advertisements had been received. As one-third of the fifteen members forming the Floral Committee go out of office annually, but are eligible for re-election, the Secretary reported the retiring members to be Messrs. L. Castle, J. P. Kendall, E. Sanderson, H. Shoesmith, and J. Wright (Temple),

Messrs. H. Shoesmith, J. P. Kendall, J. Wright, E. Sanderson, G. S. Addison, C. E. Shea, D. B. Crane, E. Vince, and W. Herbert Fowler, were nominated, and on a show of hands being taken, the first five named were declared duly elected. An additional meeting of the Floral Committee will be held in the month of September, owing to the great increase in the number of early varieties, making seven meetings in all. Seven new members were elected, and the proceedings terminated with a vote of thanks to the chairman.

DIE NATÜRLICHEN PFLANZEN FAMILIEN.—This work progresses steadily. The last issued part contains the Polygonaceae by Dr. UNO DAMMER, and the Chenopodiaceae by Dr. VOLKENS, both freely illustrated.

FLOWERS IN SEASON.—Some particularly bright and fresh-looking *Viola* blooms have reached us from Messrs. DORRIS & Co., Rothsay, N.B. The plants, they inform us, have been grown in a cold greenhouse for two months, and at present they are full of flower. As subjects for the south country amateur's greenhouse, these *Violas* are to be recommended, for, blooming as they do, before the sun gains power, the flowers last a considerable time on the plants, and do not run out.

LATE FLOWERING OF APRICOTS.—In a communication just received by one of our correspondents from Mr. J. KIPLING, The Gardens, Knebworth, Herts, he alludes to the backwardness of vegetation, and remarks that "not a single blossom of Apricot was expanded before the month of April came in, a circumstance that has not happened before in my twenty-five years' experience here. I have known Apricots to be bursting into blossom the latter end of January, and frequently in February, and generally before March was out, but never before so late in April; indeed, all the fruit trees are very late in blooming this season, a good augury, I hope, of escaping damage from late frosts." Trees may now be said to be leaping into leaf and blossom, and exhibit unwonted activity of growth.

THE COLOURING OF FRUITS.—Contrary to the general belief, a correspondent, well-known as a fruit grower in Mid-Kent, says that in spite of the great quantity of rain that fell in the early autumn months last year, and the prevalence of cloudy skies, his Apples, Pears, Peaches, and Nectarines were never of better colour. We remarked the same in the various collections of fruits seen at various exhibitions. It may be that the slow rate at which fruit ripened last autumn, and the consequent long exposure to such sunlight as was vouchsafed us, had in the end results, so far as colouring is concerned, equalling those observed in sunny years.

MESSRS. SUTTON AND SONS IN TASMANIA.—We notice in the *Launceston Examiner*, of February 20, that no fewer than thirteen First-class Awards were gained by Messrs. Sutton and Sons, of Reading, at the Tasmanian Exhibition.

BEAUFORTIA SPARSA.—Those who may require an autumn-flowering shrub for the greenhouse should obtain this brilliant crimson-flowered West Australian plant, figured in the last number of the *Botanical Magazine*. The flower is of the bottle-brush form, resembling *Callistemon* or *Metrosideros*, but the bundles of flowers are pendulous, the shoot being proleged, as in those through and beyond the flower. The cultivation required by the plant is the same as that found to answer with *Acacia*.

INTERNATIONAL BOTANICAL CONGRESS AT GENOA.—We have received the following communication from Professor PENZIG:—"The city of Genoa wishing to solemnise the fourth centenary of the greatest geographical discovery of all time, the work of her renowned citizen, CHRISTOPHER COLUMBUS, considers the most appropriate way of accomplishing this would be to assemble in an international congress the societies of geography

and of natural science. The Italian Botanical Society has therefore the honour of inviting the botanists of every nationality to a general assembly in Genoa in order to communicate and to discuss the latest discoveries and new ideas, and to increase the good feeling amongst scientific men. The Congress will be held in Genoa from September 4 to 11, 1892. Nearer the time fixed, a paper will be sent to botanists to which those wishing to attend will sign their names; at the same time they will receive a detailed programme of the projected meetings as well as of the public excursions and festivities offered by the Municipality of Genoa to their visitors; the Italian Botanical Society will also offer its colleagues various excursions on the shores of the Mediterranean and in the Maritime Alps. At the time of the Congress will also take place the inauguration of the new botanical institute built and presented to the University of Genoa by the munificence of the Comm. THOMAS HANBURY, as also the opening of an exhibition of horticulture, and of products exchangeable between America and Italy. Italian botanists cordially invite their colleagues of every nation in order that their presence may render this Congress more important, and give it an essentially cosmopolitan character, for above all things it aims at strengthening by the powerful influence of science the bonds of fraternity between nations. All enquiries and communications concerning the botanical congress should be addressed to Professor O. PENZIG, R. Università, Genoa.

COCKLE PIPPIN.—This excellent late dessert Apple is synonymous with Nutmeg Cackle, Nutmeg Pippin, Brown Cackle Pippin, and White Cackle Pippin, and was figured and described in these columns in the issue for May 7, 1846. It is there stated to be one of the few late-keeping Apples which acquired anything like their usual favour in that unfavourable season. Dr. BOLL, in his *Hertsfordshire Pomona*, says that the tree is an excellent bearer, and hardy, but apt to canker.

THE INFLUENCE OF SUGARS ON PLANTS.—Some very curious experiments have recently been performed by MONTEVERDE with branches of Lilac, Monkshood, Peas, and Vetches, in order to determine what effect, if any, the carbohydrates, e.g., the sugars, have upon the accumulation of asparagine in these plants. Asparagine is a substance of complex constitution which occurs in numerous plants. It is most abundantly found in Asparagus, the Marsh-mallow, and Mangel Wurzel; but it occurs in many other plants, especially in the cereal grasses, Peas, Beans, &c., and communicates to them a particular property. MONTEVERDE plunged branches of Lilac in distilled water and in a 4-per-cent. solution of glycerol, and then kept them in the dark; at the end of fifteen days they contained an abundance of asparagine, but neither starch nor mannitol. Branches of the same plant kept in solution of glucose, cane-sugar, or mannitol formed no asparagine in a month, but contained much starch and mannitol. Peas, Vetches, and Monkshood, which do not stand the dark well, were kept in the light in an atmosphere deprived of carbonic acid; when plunged in solutions of glucose or cane-sugar, they were completely deprived of asparagine in ten days (*vide Annales Agronomiques*, xvii., pp. 376, 377).

THE ACTION OF SOME SOIL CONSTITUENTS ON FRUIT AND VEGETABLES.—It appears that the constituents of the soil influence the constitution of fruit and vegetables to a greater extent than has hitherto been believed. An illustration of this occurs in the *Annales Agronomiques* (xvii., pp. 352–354), in a paper by A. GASEND, who states that he has found traces of boric acid in Grapes, Apples, Potatoes, Radishes, Lettuces, and in some Peas. In all these cases, the soil also contained boric acid. It is curious to notice that GASEND could not discover boric acid in all the kinds of Peas which he examined, even when the soil upon which they were grown contained a marked amount of this substance. The obvious conclusion is, that some selective action has taken

place. Saffron also appears able to reject boric acid. The Grape is evidently a considerable absorber of this acid, and wine made from the juice has been found to contain as much as five or even ten milligrammes per litre.

BROWN SPOTS.—The occurrence of brown spots on leaves grown under glass without trace of fungus or insect is familiar enough. They have been generally attributed to scorching, from the sun acting on a wet surface, to imperfections in the glass, or to drops of water acting as burning-glasses. A Swedish naturalist, Mr. JONSSON BENGT, has, as we learn from the *Botanical Gazette*, been re-investigating the matter, with the following results:—"The true burnt spots are easily distinguished by their most frequently elliptical form, with the longest diameter often from east to west, and if they occur

become able to cause a kind of burning—for instance, when hanging down from the inside of a glass cover. The author has come to the conclusion that in most cases the burnt spots are due to the poor quality of the covering glass, by the air-bubbles of which the sunlight becomes concentrated so as to produce burning of the leaves.

REMOVAL OF THE LEAVES.—M. MUNTZ has been making experiments with a view to ascertain whether the removal of the leaves of Vines, as frequently practised in the vineyards of France, is advantageous or not to the vintage, and he records his experiences in the *Comptes Rendus* for February 22. In certain regions of France, especially the South-East and West, it is customary just before the Grapes are ripe, to pick off the leaves which shade them—that is, those on the lower part of the stock—sometimes

in hindering the action of some of the leaves. Then, again, the leaves taken off are the adult ones, which have no further need of sugar-forming materials, and therefore the sugary matter formed in their tissues passes to the fruit. The author's experiments were made in a comparatively dry season, and he thinks that the results might be different in a wet year, when the water might cause the Grapes to rot, were the leaves to shadow them and check evaporation, and so induce mildew; therefore, he prefers to pass no absolute judgment until he has studied his subject under other climatic conditions. It may, however, be safely stated, that any higher temperature to which the bunches may be subjected decidedly does not imply a greater proportion of sugar. Growers should, if they deprive their Vines of leaves, do so in moderation, bearing in mind the suggested drawbacks that such a plan may involve.

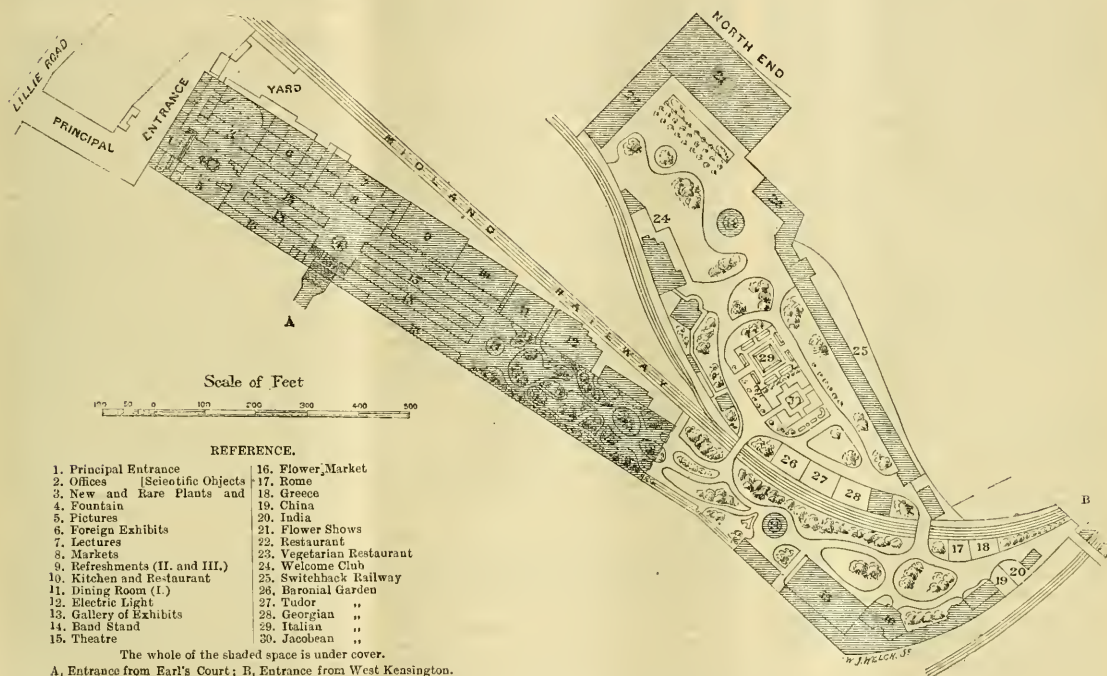

FIG. 71.—PLAN OF EXHIBITION GROUND, EARL'S COURT, LONDON. (SEE P. 464.)

several together on one leaf, they form always longitudinal rows from east to west, the spots in the middle being the largest. He has made a series of experiments so as to test the different theories which have been enumerated above. It has been thereby proved that drops of water are unable to cause any kind of burning by their own heat. Further, as shown by SACUS, the vegetative cell of land-plants is able to stand a heat of 51°C . All the experiments made by the author in that direction gave negative results, so that NEUMANN'S theory cannot be correct. Some experiments were made with water of a temperature above 60°C , but even this did not affect the leaves. As regards the supposition that drops of water might have the same effect as lenses, it is quite clear that drops which have fallen on leaves merely represent half-lenses—a fact to which already DE CANDOLLE has called attention. And it is shown by experiments, that only when the drops of water were out of contact with the leaves, do they

in the proportion of 25 or even 30 per cent. of the whole foliage. If, on the one hand, the direct rays of the sun, the freer circulation of air, and the more rapid evaporation of moisture condensed on the Grape, all of which are consequent upon the loss of the leaves, are favourable to the ripening, it may, on the other hand, be asked whether, at the season when the Grape should be forming sugar, the removal of so many leaves still in full vigour, and whose chief function it is to assist in elaborating sugary matter, will not be more injurious than useful? The author inclines to the latter opinion, after experiments made in the vineyards of Vergnes and Beaulieu (Gironde), where the practice has been followed from time immemorial, and where this year the Grapes on examination were found to be acid and deficient in sugar, yielding wine poor in colour and quality. In fact, the effects of a deficiency of leaves may be compared to those consequent on a late attack of mildew, which has a similar effect

ROOT-HAIRS.—An important part of the report of the Research Association for the North-eastern Counties of Scotland for the year 1891, just issued by Mr. JAMIESON, the Director, to the members, is taken up with a description of root-hairs, and the precise action of phosphorus on and in plants. During his investigations, Mr. JAMIESON discovered luminous points or protuberances from which a clear light was strongly reflected. The protuberance, on closer investigation, was found to be the margin or lip of a well-defined aperture, such as GASPARINNI long since thought he had detected. Turning to the mineral matter which is assimilated by plants, examination of the finely-divided insoluble mineral matters which are applied to plants as manure, showed, that while a large proportion of the particles are too large to pass into the aperture of the root-hair, another large proportion is sufficiently small to pass through the aperture. This is supposed to be a confirmation of the doctrine, that plants take up

their solid food in the solid form through the root-hair apertures, because in the numerous experiments that have recently been performed on phosphates, no point has been more satisfactorily proved than that the degree of effectiveness corresponds with the degree of division; for it is evident, that if the aperture doctrine be true, only such particles as can pass through the aperture will be available. It is known by experiment, that whilst the amorphous phosphates, such as coprolite, can be used by the plant, the crystalline phosphate, apatite, has very little effect. This has been proved distinctly by very many experiments, although hitherto no very satisfactory explanation was known why it should be so, but the inability of the particles to glide up the slippery tube of the hair may explain it. DARWIN has shown that earth-mould is formed by worms swallowing particles limited in size to the size of the worm's mouth. These particles are first smeared by the worm with an alkaline fluid, and then made use of to triturate its food, and finally are ejected on the surface of the ground. Similar, Mr. JAMESON ventures to suggest, may be the action of the plant root-hair, namely, that potash is essential to provide a glutinous slippery fluid, and that when the root-hair comes in contact with a particle sufficiently small, the particle—by gentle suction upwards—is drawn bodily into the root-hair. We would, however, counsel an attitude of philosophic doubt on the matter till further investigations be made.

WEEDS.—Professor HALSTED, who has charge of the Exhibition of Weeds at the Chicago Columbian Fair, has sent out a circular requesting specimens from all States and Territories. Seeds are especially desired, as well as seedlings in various stages of development. The root-system, flower and flower-cluster and seed-vessel are also essential. If the weed is large, specimens must be procured while they are small enough to mount the whole plant, roots and all, upon a herbarium-sheet not over a foot in length. The collecting must be done during the present season, and the specimens sent in for mounting, labelling, &c., by December 1. This is the first time an exhibition of weeds on such a scale has been attempted. If properly carried out with the aid of diagrams, it should be the means of conveying a great amount of useful information.

DAFFODILS.—At the Exeter Gardeners' Improvement Society on Wednesday evening, March 30, an interesting paper was read by Mr. A. HOPE on "Daffodils," in which the origin, classification, and cultivation of the flower, were minutely described. A more extended cultivation of the bulbs was strongly recommended.

A GOOD PRICE FOR A TREE.—At a sale of trees at Langford Grove, Witham, Essex, recently, a large Willow was knocked down at auction to Mr. PERRY, of Sible Hedingham, for £46. Several other trunks fetched high prices.

BECKENHAM HORTICULTURAL SOCIETY.—This society has just been re-organised, and promises to become a very successful institution. The leading gentry and growers of the neighbourhood have given it their assistance. A summer show is fixed for July 27, and prizes to the value of £70 are offered. Mr. T. W. THORNTON, 42, High Street, is the secretary.

PLANT PORTRAITS.

ANTHURIUM HYBRIDUM, O. J. Quintus. — A cross between *Anthurium Andreanum*, and possibly, *A. ferrierense* X. *Gartenflora*, t. 1367.

COLOEUS LENTIGINOSA, *Orchid Album*, t. 442.

CYRIPEDIUM (hyb.) GODSEFFIANUM. — A hybrid raised by Mr. Norman Cookson out of *C. Boxalli* by pollen of *C. hirsutissimum*. *Revue de l'Horticulture Belge*, April.

DENDROBIUM ATRO-VIOLEACEUM, *Orchid Album*, t. 441. — A comparatively new species from New Guinea, described by Mr. Rolfe in *Gardeners' Chronicle*, 1890, vol. vii., p. 512. Segments oblong, white thickly beset with purplish spots; lip 3-lobed, rich green, striped with purple.

DENDROBIUM BIGIBIUM, *Lindenia*, t. 317.

DENDROBIUM CRYSTALLINUM, *Orchid Album*, t. 441.

LILIA EXONIENSIS X, *Orchid Album*, t. 443.

LESPEDeza BICOLOR and **L. SIEBOLDI**. — Hardy, ornamental shrubs. *Garden and Forest*, March 9.

PANCRATIUM FRAGRANS, *Revue de l'Horticulture Belge*, April.

PLUM "CHAROT". — A Japanese variety, with purple fruit; said to be of good quality. *Revue Horticole*, March 16.

SORBARIA VIOLEACEA, *Lindenia*, t. 319.

STAUROPSIS WAROCQUEANA, *Lindenia*, t. 318.

STREPTOCARPUS GALPINI (a new species), figured in the *Garden*, March 19.

BOOK NOTICE.

ANNALS OF THE ROYAL BOTANIC GARDEN, CALCUTTA.

THE third volume, recently issued, contains monographs on the species of Pedicularis inhabiting the Indian empire, by Dr. Prain; on the Magnoliaceae and Myristicaceae of British India, by Dr. King; and of the genus Gomphostemma, by Dr. Prain. Each monograph is copiously illustrated.

The monograph on Pedicularis is very elaborate, both as regards morphology and geographical distribution. Floral characters alone can be depended on in this genus for the distinction of nearly-allied species, says Dr. Prain. It is to be hoped that some histologist may take up the subject, as it is not unlikely the microscopical characters of the plants might supply other points of distinction, or, more probably, of characters available for synthetic purposes, and certainly for physiological use. The geographical distribution of the species, and the inferences to be derived from observed facts, are very lucidly discussed. The species are distributed throughout eight provinces, as follows:—Circum-polar, with a percentage of fifty-two endemic species; European, with 85 per cent. of endemic species; Siberio-Turkestan, with 65 per cent.; Japanese, 66; American, 87; Caucasian, 73; Chinese, 71; and Himalayan, 89 (fractions omitted in each case). Maps and drawings accompany a most conscientiously elaborated monograph.

As an illustration of the manner in which species become extinct, we quote what Dr. King says as to *Magnolia Campbellii*, the flowering of which in this country has heretofore proved somewhat disappointing:—

"This is in every respect one of the most superb trees of the semi-temperate forest zone of the Eastern Himalaya. Specimens of it, 150 feet in height, used to be common at the time of Sir Joseph Hooker's visit to the province in 1849; most of these larger examples have long since been converted into timber, for the wood is of excellent quality . . . The flowers are of the most lovely rose colour (occasionally they are white), and are sweetly scented. They appear while the plant is leafless, which detracts much from their effectiveness." The figures in Dr. King's monograph of the Indian Nutmegs (*Myristica*), will prove valuable aids in determining the species of a very difficult group.

HOME CORRESPONDENCE.

EUCALYPTUS FRUITING.—I was somewhat interested in a short paragraph in your issue of February 6, p. 180, from "C. H. H. Sparkhill, Birmingham," in which he speaks of some young plants of *Eucalyptus globulus* that flowered there, and asks if they flower often. A correspondent replied from Bournemouth in your issue of February 13, stating that some young plants about 10 feet in height flowered there. Again, in your issue of February 20, a correspondent wrote from North Wales, saying that some plants of *Eucalyptus globulus* flowered there and formed their seed capsules, but they were much larger, about 40 feet in height; but in all three reports I am very sorry to hear the frost of last winter has killed the plants. Now with regard to the flowering of *Eucalyptus globulus*, I was much surprised to read in the two

first instances that it had flowered on plants so young, as I have never known it to flower under about fifteen years, unless under very favourable circumstances. I have one tree, about twenty years of age, which flowered for the first time two years ago, and some younger trees about twelve years of age which had not flowered up to last winter, when they were much damaged by the frost; but older trees than these flower every year, also do other varieties, and form plenty of seed vessels, the seed of which will germinate very well. *Eucalyptus globulus* flowers in the gardens here about the end of July, *E. resinifera* or Red Gum flowers in the gardens here about the end of May, *E. pipirita* or Peppermint Gum in June, *E. pallens* or White Gum in May, *E. robusta* or Stringy Bark in July. I have also *E. saligna*, *E. macrocarpa*, *E. leucocorymbus*, *E. platycarya*, *E. glauca*, *E. corymbosa*, *E. corymboxyl*, *E. carophylla*, and *E. citrifolia*, but these have not flowered yet. Some of the sorts of *Eucalyptus* flower earlier than *E. globulus*. I will try and get a photo, if it will come out well, of a large *Eucalyptus globulus*, and send it to you, the tree is about 110 feet high and 10 feet round the trunk. T. Shorman, The Gardens, Roselle Bay, Jersey.

PARCEL POST AND GARDEN PRODUCE.—There can be no doubt whatever but that the high anticipations formed as to the benefits likely to accrue to gardening through the establishment of the Parcel Post, have not been justified. The reasons are pretty obvious. With the exception of flowers, all garden produce is heavy, and its transit costly. Still further, much fruit is so soft, that it could only be sent, with any degree of safety to other parcels, in air or liquid-tight boxes or tins. Even for fairly hard fruits, such as Apples, Pears, green Gooseberries, &c., it is needful to have stout boxes or baskets; and for such fruits as ripe Gooseberries, Currants, wall fruits, Plums, Cherries, or ripe Apples and Pears, even stouter packages are needful, and the quantity of packing material must be considerable. Thus, at the outset, a box or basket capable of carrying six pounds of fruit, would cost threepence at the least, and it would certainly take threepence more for its transit. Then with six pounds of contents, the postage would amount to 1s. 1½d., adding 3d., cost of box, would be 1s. 4½d., so that, were but 2d. per pound charged for the contents, the total cost of what would doubtless be, at the end of the journey, six pounds of much damaged fruit, would be 2s. 4½d., and if we add another 1½d., for probable total weight of the package, there would be a cost of 2s. 6d., for what could be purchased in any ordinary shop for a much less sum. To send fruit in a light or thin package would be to court absolute destruction to the whole. In the case of vegetables, it is difficult to assume that any could be sent per post at a profit to the purchaser, except, perhaps, good Sea-kale, Asparagus, shelled Peas, or Cucumbers, for package and postage would add fully 30 per cent. to the cost. To enable the Parcel Post to be made useful to gardening, it does seem to be absolutely essential that there should be a very material reduction of existing rates. Whilst useful enough for dry goods, light, easily-packed articles, and even for flowers, yet the rates, as at present, are almost prohibitory for fruit and soft produce. If the Post-office cannot carry goods of this description cheaper, then is there little hope that the Parcel Post will ever be of much service to our vocation. As to selling garden produce by Parcel Post samples, I fear we have a good deal yet to learn in respect of common honesty, so far as not mere samples, but of actual stocks are concerned. It is a matter for humiliation to find that such is the care taken by senders or packers of fruit abroad to our markets, that consignments can always (?) be relied upon to come fully up to anticipations, whilst at home we invariably strive to give a meretricious aspect to so much of our produce by placing the best on the top and the poorest below. What wonder, in such case, that the foreign brands find ready purchasers? When, in regard to all descriptions of market products, sample and average stocks are identical in quality, better results may be looked for. The great aim, however, should be to excel the foreign producer in quality as well as in quantity, especially in having the whole of a consignment equal to the best sample. We have not at home, as is the case in France, any intermediaries in the shape of wholesale packers, who purchase from myriads of small growers, assort carefully, and as carefully pack all fruit, and send it over here in the very best form and condition. Such intermediaries may or may not be desirable. In any case, there is so much room for improvement in the

matter of evenness, and assorting of our garden produce for market, that we cannot too soon take it in hand. A. D.

STINGING OF THE SKIN BY PRIMULA OBSCURA.—In a Birmingham nursery, where this plant is grown extensively, the young men who were engaged in potting the plants experienced an itching sensation in the arms and hands, followed by blotches, and it occurred to the manager's wife that an application of Condy's fluid might be beneficial, and half a wine-glassful was placed in cold water, and the arms and hands were bathed with it, allowing the lotion to dry on the skin, and relief very soon followed, and soon afterwards the itching and blotches disappeared. I recommend all who have to do with *Primula obscura* to have a little Condy's fluid by them in readiness. It is not every one who suffers, but those who do will find nothing better as a remedy. W. D.

LITTLE-KNOWN APPLES.—I trust you will permit me to support Mr. Wilks' appeal to those who have good but little-known Apples, and especially those of good local reputation, to send grafts to Chiswick, that they may be there collected for trial, and be either identified, or be otherwise distinguished. I made the suggestion originally at one of the meetings of the Fruit Committee, and was pleased to learn that it was about to be acted upon. There is an admirable illustration to be found in the fine Apple, Albury Park Nonsuch, which Mr. Leach has had a Certificate of Merit for; and the very handsome, good-flavoured variety, May Queen, Certificated to Mr. Crump of Madresfield Court at the last meeting. Both appear to be very valuable late-keeping varieties, but, all the same, it would be well if grafts were sent to Chiswick for growth. It is all very well to plead that we have too many Apples already. That may be so; but, on the other hand, there are many really fine local Apples of which generally little is known, and which have merits that would, for good keeping or late market purposes, place them in the front rank of varieties. It is these we want to see rescued from comparative oblivion, and put into general cultivation. In doing that, we are but doing what the Canadians have done for themselves—seek for the best. O! varieties that ripen before Christmas we have plenty. It is the late keepers which it is so desirable to hunt up and offer to the public. Our fault in relation to late varieties for market is, that we do not grow enough of them in sorts to be able to put large quantities on to the market, all sampled and well preserved. It is really too absurd to suppose that we cannot do so well as the Canadians in Apple production, if we will but try. A. D.

SCILLAS.—Hardy Scillas are among the most beautiful of spring-flowering bulbous plants, and are deservedly worthy of extensive cultivation. They are very hardy, will succeed in almost any soil or situation, and require to be planted in early autumn, when the bulbs are resting. There is nothing, I think, more beautiful for edgings in the early spring than the rich blue of *Sibirica*, which flowers at the same time as the Snowdrop, and, if associated with it, the rich blue and the pure white make a charming and effective display. It is also admirably adapted for planting in masses or clumps, the effect of its superb colour when so employed being very beautiful. *Scilla sibirica* is also well suited for culture in pots, but they must be kept in a cool-house or frame, and not subjected to heat. G. Parrant, Ashby Saint Ledgers Lodge, Rugby.

RODRIGUEZIA PUBESCENS, Robt. f.—Reference is made at p. 426 to my determination of this species having been called in question by M. Cogniaux, who is of opinion that the recently-introduced plant is a new and distinct species. Cogniaux says of *R. pubescens*, "Gynostème très finement et densément pubescent," and of *R. Lindenii* "Fleurs entièrement glabres," which must include the column (gynostème), as no character to the contrary is given. Now this only confirms my determination, for of seven racemes kindly sent by M. Linden every one has a pubescent column, and certainly all belong to *R. pubescens*, Robt. f., the original *Burlingtonia pubescens* of Dr. Lindley, with whose type specimens they have been carefully compared. There is some little variation in length and density of the racemes, size of flowers, the paler or deeper yellow of the crest, and the amount of pubescence on the column; and in one case the latter was so reduced in amount, that at first I thought the column

was really glabrous, though there was not a shade of difference in other respects. More careful examination, however, revealed the minute pubescence at the base of the column. The other characters pointed are those between a small and a large specimen of the same species. The figures and specimens certainly belong to *R. pubescens*, a most beautiful and floriferous species, which, unfortunately, is now burdened with an additional synonymy. R. A. Rolfe.

ANONAS: ARE THEY EVERGREEN? (see p. 376).—In the "Notices to Correspondents," in No. 273, it is stated that *Anona squamosa* is an evergreen plant, and that if the leaves fall, it is owing to lack of sunshine or heat. So far I have seen in South America, Venezuela, Demerara, Dutch and French Guiana, I consider the *Anona muricata* to be evergreen. *Anona squamosa*, A. Chirimolia, A. loxensis are among those plants which, after a short rest, cast off all their leaves. His Excellency Aristakes Azarian, of Constantinople, has grown in his plant-houses for several years tropical fruit trees. The different kinds of *Anona* are planted out in a temperate-house, and, as I have said, during a period of about five weeks, the tree is without any leaves. After this growth re-commences. Fruit was produced here two years ago which ripened in the month of December, and about 80 per cent. of the seeds produced nice plants. Joh. Dekkers, Chief Gardener, Buyguydere, Constantinople.

APPLE STURMER PIPPIN.—I am quite in agreement with every word that your correspondent has said in favour of Cockle's Pippin Apple, and would like to recommend a companion to it in the shape of Sturmer, the flavour of which is equally good, and which will keep in most years till June. A great mistake is often made in gathering late kinds too early; the end of October, and even later, if the weather is mild, is soon enough for these. Here, in Sussex, they often leave the Golden Knob till the leaves are falling from the tree. It is the first few weeks after gathering that late keepers suffer most, more especially should the weather prove mild; and were it possible to keep the Apple-room under 40°, the period to which many kinds could be kept would be extended for that reason. I much prefer a fruit-room inclined to be damp rather than dry, and most certainly it should have a north aspect, and be provided with shutters to exclude the light. This year I placed my Sturmer Pippins in barrels, and filled up between the fruit with clean sand, and it has answered very well indeed, and they come out as fresh and plump as when gathered; next autumn I intend to try sea sand and Cocoa-nut fibre, just to see the effect. But before I close, I must not forget to mention that Sturmer, which, by-the-by, is a seedling from the Ribstone, is of good flavour, a free bearer, and the tree a hardy constitution. Some thirty years ago, I was going to raise some seedlings from it which would even distance the parent, but, alas! I used the wrong tree for the female parent, and the six big trees in the orchard live to tell my mistake. J. Rust, Eridge Castle.

CHOISYA TERNATA.—This evergreen has for some years now been looked upon in this garden as an acquisition as a plant for a wall, and the warmer position it is planted in the better, provided water is freely supplied at the root during growth; for if the roots suffer from lack of it, red-spider is apt to infest the plant, and cause the leaves to be discoloured, to the loss of much of its beauty. The foliage is useful for placing in small vases with flowers, especially white ones. South Hants.

HYLURGUS PINIPERDA, THE PINE-BEETLE.—It used to be considered a good remedy for this devastating insect to dust the points of the Pine trees infested with it with flowers-of-sulphur; at any rate, it prevented the beetles from eating out the centre of the young shoots. Miss Ormerod, in her book on insects and means for their destruction, does not mention this fact. What do our foresters say to it? M.

PRUNING DENDROBIUMS.—Your correspondent, "B. P.," in his letter, renders, I think, but little real service to the generality of growers of these plants, most of whom will require something more substantial than his bare assertion. How is it that "B. P.," being a grower of such gigantic specimens as he describes, has not proclaimed long ere this his methods, so that others might, by following his directions, have similar results? "B. P." should come out from behind his sheltering *nom de plume*,

and then we should all be better able to judge of his methods, and take the measure of his successes. On pruning of *Dendrobiums* my ideas are well known, and no purpose will be served by repeating them here; but there are two facts worthy of notice in "B. P.'s" letter. The first may help to account for his remarkable plants and extraordinary cultural skill; I refer to his wonderful powers of imagination, for he evidently looks at my Bamboo-tips and fine wire through a magnifying lens of strong power, so that the first look like rods fit for staking a *Chrysanthemum*, and the other wire strong enough to suspend an Orchid basket. Probably the Bamboo-tips will soon grow into hop-poles, and the wire into bars of iron. Those who have read my remarks on these plants in some of my former *Calendars* will readily understand which are the species I cultivate in heat, and it was to these that I was referring. H. A. Burberry.

CALANDRINIA UMBELLATA.—This *Chilian* plant is not an annual although generally it is treated as one, but it may be kept in the greenhouse through the winter; *C. grandiflora* is even more amenable to greenhouse treatment, and becomes shrubby. Both species make lovely beds early in the summer, if seeds be sown at this season, six in a large 60-pot, thinning out the seedlings to two in a pot, and growing them on in a cold frame or the greenhouse, and affording them one shift into larger pots if they are likely to become cramped at the root. The bed should be deeply dug and manured with leaf-mould or Mushroom-bed dung, and the undivided plants put out in May, 1 foot apart. A. B. C.

EUCALYPTUS TREES FLOWERING IN ENGLAND.—From 1845 to 1851, in the gardens at Braxted Park in Essex, the seat of the late Sir Charles Da Cane, there were growing in the open trees of *Eucalyptus pulverulenta*; from 1849 to 1851, when the trees were from 30 feet to 40 feet high, they bloomed freely. The late Mr. Robert Marnock of the Royal Botanic Gardens, Regent's Park, who paid me visits during these years, expressed himself much surprised and pleased to see these trees so hardy, and blooming so freely. Geo. Taber, Rivenhall.

NOTES ON CURLED KALES.—The seeds of some of Messrs. Sutton & Sons' of Reading, varieties sent to me for trial, and reported by you last March, were sown, and the following is my opinion of the produce. Sutton's *Exquisite Green-curved Kale*, dwarf: A very good strain indeed, beautifully curled, and quite hardy, not one plant being injured in a fair-sized batch after the long trying winter we have experienced; when cooked, these were of good flavour, not at all strong. Sutton's *Extra Green Curled Kale*, tall: A very good strain, and true to name, but, to my mind, it is not likely to prove so useful in ordinary-sized gardens as the above named variety. Sutton's *Exquisite Dwarf Curled Kale*, purple: is an excellent strain, quite hardy, mainly useful, as I take it, for decorative purposes, being quite distinct in this respect from most of those I have seen. For culinary purposes, it has no advantage over the *Green Dwarf Curled Kale*, and in appearance is not its equal. Henry J. Clayton, Grimston Park Gardens, Tadcaster, Yorkshire.

NURSERY NOTES.

ORCHIDS AT MESSRS. LEWIS & CO'S, SOUTHGATE.

THE Orchid nursery of Messrs. Lewis & Co., Chase Side, Southgate, London, N., is as yet but a young establishment, whose main object may be said to be the supplying of amateurs, principally, with healthy and good novelties. For the amateur of limited means who is desirous of adding rare species to his collection when they get down to prices within his means, it is of great assistance to correspond with such an establishment. For the Orchid nursery at Southgate, which was begun by providing suitable new houses for the plants which were going to be in them, a good future is in view; and as it is under the management of one so well acquainted with the requirements and value of Orchids as Mr. P. Weathers, a guarantee is afforded that the subjects cultivated will be true to name.

For Cattleyas and Lælias a new house is in course of construction. At present they occupy a roomy span-roofed structure, and are remarkable for their good condition, and especially the large number of plants of hitherto undowered *Lælia purpurata*, which are well furnished with flower-sheaths, the development of whose flowers for the first time in England, on these particular plants it will be interesting to watch. Here, also, are some very peculiar forms of *Lælia elegans*, some of which are about to flower; and on one side of a house the stock of *Odontoglossum vexillarium* is thriving, while on a shelf overhead are plants in flower of the handsome Madagascar *Disa incarnata*, with its singularly-shaped yellow and scarlet flowers, and which flowered at Southgate this season for the first time under cultivation. There are also some very fine imported *Dendrobium Wardianum* and *D. spheerium*, the latter showing flower freely.

In the Cattleya-house, the first of the C. Mendellii, C. Schroderae, some C. Trianae, *Lælia harpophylla*, a large specimen of *Brassia verrucosa*, *Dendrobium aggregatum* mjsus, and other *Dendrobies*, and many specimens of *Trichopilia suavis* were in flower.

In a small lean-to at the end are some splendid specimens of *Phalenopsis Schilleriana* and *P. amabilis* in grand health, some of the leaves being 12 to 15 inches in length. There are also smaller plants of *D. grandiflora*, some of which are in flower; and a fine batch of *Angraecum sesquipedale*, *A. articulatum*, and other species—many with stout flower-spikes. Here, too, are some rare *Cypripediums*, viz., *C. niveum* × *Lowii*, *C. delicatulum* × *C. Juno* ×, and some seedlings, which have not as yet flowered; and coming into bloom are a number of *C. Volontanum*, *C. Haynaldianum*, and *Dendrobium Phalenopsis Schroderianum*.

In the *Dendrobium*-house—a lean-to with a glazed partition at the back above the stage—there is a good show of a very fine and richly-coloured strain of *D. nobile*, which came into the country some years ago, and which is yet equal to most of the newer varieties which have appeared in recent importations of this plant. The strain of *D. Wardianum*, too, is very good, the flowers large and round; and *D. primulinum* and other species are in bloom, while at one end is a large batch of *Ada aurantiaca*, many of which are blooming; and, suspended from the roof, a quantity of *Sophranitis grandiflora*.

The *Odontoglossum* and *Masdevallia* houses are well stocked, and the whole place shows neatness and careful arrangement, and is kept in the best order possible which the presence of the workmen engaged on new extensions of the houses will allow.

CHINESE PRIMULAS AT FOREST HILL.

On paying a visit to the nurseries of Messrs. Carter & Co., of Forest Hill, I noticed that the firm's manager, Mr. Sharnan, has succeeded in producing some very beautiful varieties. The various improvements in the colour, form, and substance of the flowers are carefully noted, the numerous span-roofed glass-houses being filled with plants arranged in the various colours, all of them for seedling purposes.

The blue *Primula* originated with Messrs. Carter about twelve years ago, and they have greatly improved it year by year. It came as a chance seedling by crossing a pinkish-coloured variety, named *Roy Morn*, and a white kind. At first the flowers were small, but now they are 2 inches across, and of a lovely porcelain-blue colour. Another characteristic of this blue *Primula* is the form of the seed-pods, which are quite conical; the variety, too, requires a little more warmth to develop its beauties than the ordinary varieties do. The greatest advance in this colour is the Holborn Porcelain.

Messrs. Carter & Co., are also endeavouring to obtain a yellow *Primula*. We have distinctly blue and yellow varieties of the common *Primrose*, and there cannot be any reason why there should not be a deep yellow variety of the Chinese type. Messrs. Carter have a white variety in which quite half of

the flower is formed of its bright yellow centre, and they have another with yellow foliage; both of them are fixed, and come true from seed. In one case I found a bloom in which there was a streak or two of deep yellow in the white margin. Here is surely a good beginning, if it could be followed up by crossing such a flower with its own pollen. It may, therefore, be reasonable to suppose that we shall yet have a bright yellow self. The variety with the enlarged yellow centre and white margin was crossed with Holborn Blue. All the seedlings produced rose-coloured flowers with the exception of one, which was blue. Nones were white; they are of a pale rose, and a few are really fine.

A curious break has produced what is termed the Fern-leaved type, with the leaf-stalks a blackish-red, and salmon-coloured flowers with orange centre. It has been named *Negro*.

Many of the most beautiful varieties are chance sports. I noticed a singularly beautiful white variety named *Elaine*, the flowers a pure ivory-white, the leaves a dark green. This was an accidental sport from a variety with deep crimson-red flowers. The progeny has retained the deep dark green leaves and red footstalks; nothing is changed but the flowers—the rich crimson is gone, and has left not a tinge of colour in young or old flowers. Now, in many of the white varieties there is a flush of colour as the flowers decay; there is none in this. These rich crimson-red varieties, I believe, were originally from Nice.

There are about 7000 plants in all the various colours, in single and double varieties, set apart for seedling. Rose and pink colours are well represented, bright deep pink and rose to pale blush. A variety with delicate salmon flowers of much substance and handsome form was conspicuous. There are other forms of white besides *Elaine*, but, as a rule, the white varieties are readily distinguished by the paler green of the leaves, which have also green foot-stalks. Other colours are carmine, magenta, and vermilion. The last-named colour may be thought by some not to exist in *Primulas*, but no other colour so well describes these bright forms obtained from what was first termed the Chiswick Red. All the colours are arranged in groups by themselves, and it is really astonishing how true they are to each other. The plants are similar in habit; the flowers are of great substance and circular in form, and by measurement about 2 inches in diameter, less or more.

The semi-double varieties are now to be found in as great variety of colour as the single. They are probably more useful as cut flowers, and they produce seeds as freely as the single varieties. *J. Douglas.*

SOCIETIES.

ROYAL HORTICULTURAL.

Tuesday, March 22.—List of Awards.

ORCHID COMMITTEE.

MEDALS.

Silver Banksian.

To Messrs. F. Sander & Co., St. Albans, for a group of *Orchids*.
To Messrs. Charlesworth & Shuttleworth, Clapham, for a group of *Oncidium sacrodes*.

To E. Miller Munday, Esq., Shipley Hall, Derby (gr., Mr. W. Elphinstone), for a group of *Dendrobium Phalenopsis Schroderae*.

First-class Certificates.

To Moorea irrurata, Rolfe, from Royal Botanic Gardens, Glasnevin.

To *Dendrobium Phalenopsis Schroderiana* var., shown by E. Miller Munday, Esq., Shipley Hall, Derby (gr., Mr. W. Elphinstone).

Awards of Merit.

To *Dendrobium infundibulum*, Cassiohridge var., shown by E. Moun, Esq., Cassiohridge, Herts.

To *Dendrobium Phalenopsis Schroderiana* delicata, shown by E. Miller Munday, Esq., Derby.

Botanical Certificates.

To *Epidendrum Leachianum*, shown by Messrs. F. Sander & Co.

To *Megacallium falcatum*, from Botanic Gardens, Glasnevin.

FLORAL COMMITTEE.

MEDALS.

Silver Floral.

To Messrs. G. Paul & Sons, Chebunt, for a group of *Azaleas* and *Lilacs*.

Silver Banksian.

To Messrs. James & Sons, Slough, for a group of *Cinéraires*.
To Messrs. Barr & Sons, Covent Garden, for a group of *Narcissus*.

To Messrs. Cutbush & Sons, Highgate, for a group of miscellaneous plants.
To Messrs. B. S. Williams & Son, Upper Holloway, for *Clelveas* and *Azaleas*.

Bronze Banksian.

To the Duke of Northumberland, Syon House (gr., Mr. G. Wythes), for a group of plants.
To G. E. Smith, Esq., Cobham, for a group of flowering shrubs.

First-class Certificates.

To *Ranunculus cortusifolius*, shown by Lord Hilton, Mersham (see p. 465, fig. 70).

Awards of Merit.

To *Amaryllis Eclipsa*, shown by Messrs. J. Veitch & Sons, Chelsea.

To *Euoymus japonica compacta*, shown by Messrs. B. S. Williams & Son.

To *Rosa Caroline Testout*, shown by Messrs. G. Paul & Sons, Chebunt.

To *Rosa Damask*, shown by Messrs. W. Paul & Sons, Waltham Cross.

To *Amaryllis Silver Queen*, shown by Messrs. G. Paul & Sons.

FRUIT AND VEGETABLE COMMITTEE.

Award of Merit.

To Seedling Oranges shown by C. E. Smith, Esq.

Cultural Commendations.

To Mr. H. Roberts, Prestwold, Loughborough, for Seedling Cucumbers.

To Mr. C. W. Leach, Albury Park, Guildford, for Tomato Lady Bird.

To Messrs. J. & M. Poupart, Mortlake, for Asparagus.

THE LIVERPOOL HORTICULTURAL ASSOCIATION SHOW.

MARCH 15, 16.—The ninth spring show of Hyacinths, Tulips, Azaleas, and forced hardy plants, under the auspices of the Liverpool Horticultural Association, was held in St. George's Hall. Mr. O. H. Williams carried all before him in the Hyacinth classes, obtaining the first prizes for eighteen distinct varieties, and for a group of twelve distinct varieties, and also for six. Amongst the specimens he exhibited, all of which were rich in bloom and of a very fine size, the most noticeable were Queen of the Blues, King of the Blues, Odalique, John Bright, Fabiola, Isabella, and La Graudesse. This gentleman also secured 1st prize for a group comprising six pots of *Polyanthus Narcisus*; for eighteen Hyacinths, three bulbs in a pot; and for an exquisite bouquet of cut flowers of different varieties. In the Hyacinth class, the 2nd prize was secured by Lieut.-Col. Gaskell Wootton; and the 3rd by Mr. John Aikin, Prince's Park. The comparatively few exhibits in Orchids were very good, the 1st prize being secured by Mr. T. Sutton Timmins, for a magnificent plant of *Coleogyne cristata*, which had on it as many as 520 separate blooms. Other plants which were noticeable for their beauty of colour and symmetry of appearance were *Dendrobium Wardianum*, *Cattleya Trianae*, and *Cattleya labiata*, the latter, which was exhibited by Mr. R. N. Dale, commanding particular attention. Another interesting feature of the show were four tables of miscellaneous plants, all of which were much admired. That exhibited by Mr. Alfred L. Jones won the 1st prize.

There were only two entries in the class devoted to Grapes, Sir A. B. Walker securing the 1st prize, and Mr. A. R. Gladstone the 2nd. Azaleas and Rhododendrons were not as plentiful as sometimes is the case, although the former class was represented by some very beautiful plants. The Tulips also were meagrely represented.

A word of praise is due to the excellent exhibition of flowers and plants by nurserymen. In particular, the group of *Amaryllis* exhibited by Messrs. R. Ker & Sons was considered as one of the most attractive features of the whole exhibition. Messrs. T. Davies & Co., and the Liverpool Horticultural (Cowan) Company, also exhibited magnificent collections of flowers, and Messrs. Fishlock Brothers contributed a number of beautiful bouquets. *Liverpool Mercury.*

CRYSTAL PALACE.

MARCH 19.—The usual features which characterise spring shows were to be seen at the Crystal Palace exhibition, which was held on this date. The Hyacinths and Tulips, as a whole, were good, and the Azaleas and similar plants made a bright display. The competition in several classes, however, was not very keen.

Messrs. H. Williams & Son, Fortis Green, Finchley, was placed 1st for thirty-six Hyacinths in the open class; and Mr. H. Shoemith, gr. to

M. Hodgson, Esq., Shirley Cottage, Croydon, was a good 2nd. Mr. Shoemith also gained 1st prizes for twelve Hyacinths, Tulips, and Narcissi, showing in each class remarkably good produce. Mr. C. Nunn, Maze Hill, Greenwich Park, was 2nd for Hyacinths in the amateurs' class; and Mr. J. Lambert, gr. to II. W. Segeleke, Esq., 2nd for Tulips.

Messrs. H. Williams & Sons were 1st with Tulips and Narcissi in the open classes, and Mr. W. B. Morle, Regent Street, W., 2nd.

Cinerarias were very fine, especially those shown by Mr. J. Ford, gr. to Sir C. Pigott, Bart., Wexham Park, Slough, who gained 1st prizes in the open and amateurs' classes. The plants shown were fully 3 feet in diameter, and remarkably well flowered; Mr. J. Slater, gr. to T. Northard, Esq., York House, Lower Sydenham, was 2nd in both classes.

Various collections of Cyclamen were shown, the best being staged by Mr. D. Phillips, Langley Broom, Slough, and Mr. C. Edwards, Hillingdon. The St. George's Nursery Co., Hanwell, Messrs. J. Odell, Hillingdon, and Mr. Thos. Pesteridge also showed Cyclamen in good form.

Azaleas were best shown by Mr. C. Nunn, and Mignonette by Mr. W. B. Morle. The last-named exhibitor was also 1st for Lily of the Valley, and Mr. Jannoch, Dersingham, a close 2nd.

The best group of stove and flowering plants was put up by Messrs. J. Laing & Sons, followed by Mr. H. James, Castle Nursery, West Norwood, and Mr. Nunn, Greenwich Park. In each case the plants were tastefully arranged.

Miscellaneous groups, of course, made the best display. Messrs. Cuthush & Sons, Highgate, staged a collection of spring-flowering plants; W. Paul & Sons, Waltham Cross, Camellias and Roses; G. Paul & Sons, Cheshunt, Roses, Lilacs, and Amaryllis; B. S. Williams, Upper Holloway, Cliveias, Azaleas, &c.; J. Peed & Sons, Norwood, wreaths, bouquets, &c.; P. End, cut flowers and wreaths; and Mr. T. Jannoch, Dersingham, a charming group of Lily of the Valley, for which a Silver Medal was awarded.

First-class Certificates were awarded to Mr. T. S. Ware, Tottenham, for *Shortia galacifolia*; Mr. T. Jannoch, Norfolk, for *Adiantum Capillus-veneris*; Mr. J. Odell, Middlesex, for *Cyclamen King of the Crimsons*; The St. George's Nursery Co., Hanwell, for *Cyclamen Brilliant*; Messrs. Paul & Son, Cheshunt, for *Canna Souvenir de François Goulem* and *Miss Sarah Hill*, and *Amaryllis Strawberry Queen* and *Scarlet Queen*; Mr. B. S. Williams, Upper Holloway, for *Euonymus japonicus compactus* and *Amaryllis Ophelia*; Messrs. Laing & Son, Forest Hill, for *Dracena Bartelli*, *Bertolonia*, *Madame Auguste van Geert*, *Argyreauna*, *Comte de Kerchove*, *Souvenir de Gand*, and *Anthurium atro-sanguineum*.

BRIGHTON AND SUSSEX HORTICULTURAL ASSOCIATION.

MARCH 29, 30.—This old association is going to hold four exhibitions during the present season, and their first spring show was held on the above dates. There could not be better or more suitable rooms than those of the Brighton Dome and Corn Exchange, and we were sorry to see so few competitors. In many classes there were no entries, and only a very few contained more than two competitors; while several were only represented by one exhibitor. The exhibits were of fair merit, and only needed more of them to make a first-class show. The following is a short list of the prizes:—

Open.—A group of plants for effect, Mr. Meachen, gr. to Mrs. Armstrong, Woodale, Preston, 1st; no other competitors. For another group, Messrs. Peed & Son, of Norwood Road, S.E., were awarded 1st; Mr. H. James, Castle Nursery, West Norwood, 2nd. These were two really good groups, and prettily arranged. They contained Palms, Acacias, Orchids, Azaleas, Anthuriums, Spireas, Crotons, Cyclamen, &c. In the open class for pot Roses, there was only one exhibitor; the prize going to Mr. Meachen. No one competed in the amateur's class for pot Roses. For 12 Cinerarias, 12 Mignonette, 12 Cyclamen, 12 Primulas, and 12 Lily of the Valley, Messrs. Peed & Son were 1st. Mr. Meachen being 2nd; this order was kept throughout these five classes, no 3rd prizes being awarded. Mr. Meachen was the only exhibitor in a class for 6 *Deutzia gracilis*, also for a small group of plants arranged for effect, for 6 Primulas, for 6 greenhouse Azaleas, and for 6 Cyclamen; the 1st prize being awarded him in each of these five classes. For 12 Hyacinths, Mr. Hodgson, Shirley Court, Croydon, was 1st with good specimens; Messrs. Peed & Son being placed 2nd. Mr. Hodgson

was also 1st for Tulips, and showed some fine examples. The same gentleman was 1st for 12 pots of Narcissus, being followed by Messrs. Peed & Son; no 3rd prize awarded. For 6 pots of Hyacinths, single spikes, Mr. Shoemith was 1st, Mr. Anderson 2nd, and Mr. J. Sykes 3rd. The last named was the only competitor in a class for 6 pots of Tulips.

Amateurs.—For 6 pots of Hyacinths, Mr. Hodgson, Croydon, was 1st; T. B. Rogers-Tillstone, Esq., Moulescombe, 2nd; and J. Sykes, Esq., Preston Road, 3rd.

Special prizes were awarded to Mr. Meachen, for a group of Orchids; Mr. G. Miles, Dyke Road Nurseries, for a group of plants; and to Mr. G. W. Piper, the Nurseries, Uckfield, for a box of ten-anted Roses. This box had excellent examples of Catherine Mermet, The Bride, White Perle, Sunset, Souvenir d'un Ami, Niphotos, Mdme. de Watteville and Jean Ducher.

Messrs. Barr & Son, of Covent Garden, exhibited a collection of Narcissus, &c., that were staged in their usual style, and received much admiration.

BRIGHTON AND SUSSEX "NEW" HORTICULTURAL.

APRIL 5, 6.—This newly formed society held its first show on the above dates in the Corn Exchange, and far exceeded general expectation, considering the unfavourable season and other adverse circumstances. There were six groups of plants arranged down the side of the hall, made up of excellent material. 1st, Mr. Geo. Miles, nurseryman; 2nd, Mr. Turner, gr. to Sir Greville Smyth; 3rd, Mr. Fry, gr. to C. W. Catt, Esq.

There was a spirited competition for the prizes given for groups of Callas in bloom, Messrs. W. E. Anderson, A. Netley, and F. Collis taking the awards in the order of their names; Mr. E. Murrell showing a large bank of fine plants not for competition.

A fine group of Azalea indica was sent by Mr. G. Miles; and Mr. Vigor, Withdene, had a large collection of Boronias, Azaleas, Ericas, and other generally useful plants, making a praiseworthy exhibit.

Messrs. Batchin sent some splendid plants of Orchids, Palms, Acacias, Azalea indica, which they had arranged with good taste, filling a large space in the middle of the hall; and at one end of the hall they had arranged, in varieties, a group of *Tetratheca ericoides* forming a feature seldom seen at exhibitions. These plants were in fine condition. This firm exhibited a fine group of named Narcissus blooms and some other plants. Messrs. W. Miles also had a large collection of plants tastefully arranged for effect, Palms being used largely.

Mr. G. W. Piper sent splendid Tea Roses, consisting of two stands of eighteen each, and one of twelve, three blooms in a truss. These were very fine, as good as June Roses. There was only a moderate number of Hyacinths and Tulips, Messrs. Fry, Netley, Collis, Simms, and Miller taking the higher awards.

Lily of the Valley were not largely shown, and the chief prizes were taken by Messrs. Gore, G. Miles, and Netley. *Lachenalia*s were well done, and made a nice exhibit, the plants being dwarf and the blooms well coloured, Messrs. Wickham, Fry, and Fairs taking the awards in the order of their names.

A fine group of *Gloxinia*s was shown by F. Mowatt, Esq. (gr. Mr. House), and some beautifully grown *Anemones* came from M. Wallis, Esq. (gr. Mr. Hill). Mr. W. Miles' Cyclamens were very fine, and he easily secured the first place. Dr. Moore taking the same position in the smaller exhibit.

Dielytras spectabilis were nice plants, Mr. Hill taking first with plants of dwarf growth. Messrs. W. Miles had the best Spireas, and some good pots of Mignonette were shown by Messrs. Grelly, Fry, and Miles. *Primula sinensis* were well grown plants, of very compact growth, and with numerous blooms, including also double forms. A nice lot of plants of *P. obconica*, shown by Messrs. Collis, Fairs, and Simms, took 1st and 2nd prizes in this class for these plants, which was a well contested one. Azalea mollis and Stocks were well shown by Messrs. W. Miles & Co., and *Cytisus* in quantity and of excellent quality by Messrs. Miles and Fry. Amongst the *Deutzias* and *Pelargoniums* shown by Messrs. Miller, and Gore, no variety was remarked in the latter, the Pearl, a fine white, being the only one shown.

There was good competition for the best stand of cut blooms, and some choice Orchids and Rose blooms were observed in the winning lots, Messrs.

Gore, Baker, and Miller, took the prizes in order as named. The other cut flower classes were not much contested.

Mr. Gore had a nice group of flowering plants well arranged for effect, but not in competition. Mr. Hefman, gr. to Viscount Gaye, sent good specimens of Cucumbers, and a dish, quite ripe, of the Noble Strawberry. Messrs. Cheal, Crawley, sent a collection of Apples and Pears, the former in good condition for the season; and they exhibited, moreover, plants and cut flowers, filling a large amount of space.

This, the first exhibition of this society, formed a great contrast to those which were held early in the year, the large hall being filled with really good subjects; and it was most creditably managed by the committee and the society's secretary, Mr. Mark Longhurst. *A Correspondent.*

ROYAL CALEDONIAN, EDINBURGH, SPRING SHOW.

APRIL 6.—This was considered one of the finest shows the Society has held in April, in a cultural sense (competition being also keen); but the absence of the usual large Palms, Rhododendrons, &c., gave a somewhat meagre appearance to the Waverley Market. The exhibits which created the larger share of attention were the classes for Orchids—a large table being filled with specimens of great size and much excellence:—1st, Mr. McIntyre (Glen Gardens) had in the class of six, fine examples of *Dendrobium Wardianum*, *Cypripedium Boxallii*, with about fifty open flowers; *Cymbidium Lowii*, with eleven spikes; *Odontoglossum Edwardii*, *Cologyne cristata* var. *Lemoniana*, *Cymbidium eburneum*, with about twenty open flowers. 2nd, to fine *Cattleya Lawrenceana* and *Trianae*, and a *Vanda* *suavis* in fine form. In the 3rd prize lot was an immense specimen of *Dendrobium nobile* full of bloom.

In the class for three Orchids, Mr. A. Findlay exhibited a most creditable trio—a large plant of *Dendrobium thyrsiflorum* finely flowered, *Cymbidium Lowianum*, and *Cypripedium Boxallii*. For the best single specimen, Mr. Findlay was justly first with a fine *Vanda suavis* with seven spikes.

The tables from nurserymen filled a large space, and the floral display was attractive with the usual flowers of spring, Azalea mollis, A. indica, Cliveias, Ericas, Cyclamens, Rhododendrons, and bulbs. Messrs. Methven, Ireland & Thomson, and Dickson & Co. being the leaders in the tables for Exhibition only, and Messrs. Dickson & Sons had a fine collection of *Confera*, very effective, in which were *Rut-nospora plumosa aurea*, *Thuopsis dolabrata*, *Cupressus Lawsoni* *aurea*, very distinct and well grown. This exhibition took first prize in this class.

Mr. Ker, of Aigburth, near Liverpool, had a splendid display of *Amaryllis*, which was greatly admired. They were interspersed with *Spirea astilboides* with pleasing effect; *Eurydice*, *Amphion*, *Puritan*, *Daphne*, *Impator*, *Seraphis*, were among the finest. The tables, for gardeners, for arrangement, were only two in number, the first prize being awarded to Mr. G. Wood, Oswald Road. He had fine *Dracenas*, Palms, *Odontoglossums*, *Anthuriums*, &c. Mr. Chrichton, gr., Southfold, had a good and close 2nd.

Azaleas were numerous, Messrs. Laird, nurseryman, exhibited extensively in the various classes for nurserymen. Their first prize A. mollis were very fine, both standards and dwarfs. In the other classes Empress of India, Stella, Mrs. Turner, and Marshal McMahon were among the best.

Rhododendrons of the greenhouse class were of much merit. *Frangantissima*, *Gibsoni*, *Princess Alice*, and *Countess of Haddington* were in fine form. Foliage plants of large size were well represented. Mr. Chrichton was awarded 1st prize. A table of beautiful *Malmaison Carnations* of sorts, interspersed with Ferns, made an attractive display. They were exhibited by Messrs. Laing & Mather, Kelso.

Pelargoniums were finely flowered, and in great numbers. Mignonette, alpine plants in pots, Spireas, *Deutzias*, *Primula obconica*, *Primula Sieboldi*—this variety was exceedingly fine in pink, white, and carmine colours; and Cyclamens were strongly represented in their classes, and the competition strong.

The 1st prize Cyclamens were of special merit. Mr. Kirk, of Norwood Park, Alloa, had an extra fine twelve—one plant had over seventy-five blooms; and the same exhibitor was awarded 1st for six pots,

also finely in bloom. Mr. McIntyre, Darlington, was a good 2nd.

Hyacinths, as usual, made a fine and attractive display. The 1st, in the class of twelve, was awarded to Mr. D. McLean, Craigends. The same exhibitor took 1st also in the class for eight; General Havelock, Cesar Peter, Marie, La Neige, and King of the Blues were among the best. Messrs. Laird took the lead in the nurserymen's class for twenty-four sorts, which were even and finely grown.

Polyanthus, Tulips, with other showy bulbs are, as usual, in strong force, and covered large table space.

Cut flowers were represented mostly by Orchids, Roses, and Gardenias. In this class, Mr. McIntyre, who had 1st prize, had a very rich exhibit of *Odonoglossums*, *Dendrobiums*, *Lycaste* Skinneri, and *Cymbidiums*. Mr. Sharp, Freeland, had also a fine display, forming a good 2nd.

Sprays, bouquets of forms and sizes, were largely represented by choice Roses and Orchids; and some fine exhibits were in this class, and added greatly to the brilliancy of this excellent exhibition.

Fruit and Vegetables.—Fruit was fairly represented by four exhibits of Grapes, two bunches of each, 1st prize being awarded to Mr. Smith, gr., Oxenford Castle, with fresh and tempting Lady Downes, which is still the best for use as the latest Grapes. Allcantes were fine in colour, but footstalks were dried up, and this Grape is generally represented at this season with fine-looking skin only.

Strawberries were tabled in the finest form ever seen at a spring show in Edinburgh by Mr. W. G. Pirie, gr., at Selkirk, who had a fine dish of Laxton's Noble, very large in size, and rich in colour. The same exhibitor took the lead admirably with six pots of the same kind.

Apples were very fine for the season, fresh, and mostly richly coloured, especially Reineette du Canada, Galloway Pippin, Cellini, Cox's Orange Pippin, Blenheim Orange, and Ribston Pippin; Mr. Potter and Mr. Dow took the lead among over fifty dishes.

Pears would have been much better at home—they were shabby.

Vegetables were good, and made a very attractive display on a large table—Asparagus, Green Peas, Seakale, Tomatoes, Potatoes, were good among forced kinds. Mr. Robertson, gr. to Lord Campbell, had 1st, for a collection of twelve sorts; Mr. Johnstone, gr., Hawick, was 2nd. Roots of all kinds, Leeks, and Rhubarb, were good, and strongly represented.

DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY FUNGI.

(Continued from p. 367.)

INFECTION OF HOST PLANT BY *U. AENEÆ*.

This subject is not so completely understood as could be wished. In the first place, in this *Ustilago* and most of its allies, the spores mature on the host-plant, ripen, and become scattered by the wind and weather, long before the grain itself ripens; whereas with bunt the spores do not mature until the Wheat is ripe. The smutted ears have entirely disappeared by the time harvest arrives, but the spores germinate as soon as they become moist, or at any rate, in the course of a day or two; and unless they happen to come in contact with a newly-germinated Oat, they perish; but there can be no Oats, in the ordinary course of Nature, in this condition, at this period of the year. There is no question but that the host-plant is infected by the gonidia, and there is no doubt that the gonidia are produced within a short period—it may be hours, or it may be days—of the time when the spores are sufficiently moistened. An advance was made by decorticating the seed and dusting the spores on the bare kernel. This method was adopted by Mr. A. S. Wilson some years ago, and also more recently by Mr. Jensen, of Copenhagen. On April 12, 1889, I dusted twenty decorticated kernels (Exp. 996) with *U. aeneæ*, and obtained, on July 25, 60 per cent. diseased plants; twenty-two control plants being all healthy (Exp. 1006). The fact of the smutted ears maturing and scattering their spores at the time the healthy Oat plants are flowering, seems to point to the possibility of infection taking place simultaneously with the fertilisation by the

pollen. On July 14, 1888 (Exp. 934, 935), I dusted the spores of *U. aeneæ* abundantly on the heads of some Oats which were flowering. The seed was saved and planted in the following spring (exp. 988), forty-five plants came up all of them perfectly healthy. The same year Swingle performed the same experiment, but on a much larger scale at Manhattan, Kansas; his result was practically the same. The idea that the parasite in this case enters its host plant's seed at the time of fertilisation must be abandoned.

Brefeld did a number of infection experiments by applying the germinating gonidia produced in nutrient solutions to very young Oat plants. He was very successful, obtaining from 17 to 20 per cent. diseased plants when the application was made to Oats in the very earliest stage of germination, and he found the percentage of successfully infected plants rapidly declined as the infection was made upon Oats in which the germination had advanced further, until the green leaves had pushed 1 cm. through the sheath-leaf, after which time no infection took place. That with Brefeld successful infection of the embryonic plants should occur is not to be wondered at, when he speaks of their epidermis being "riddled by drill holes" by the germ tubes of the gonidia; rather the surprise is, that he did not get a large number of diseased plants as the result of this infection (only 17 to 20 per cent.). He found, however, by mixing the spores with fresh horse-dung, applying this to the soil and planting Oats in the mixture, that he got from 40 to 46 per cent. smutted plants. According to Brefeld's investigations, the gonidia exhaust the nutrient solution in about four days, hence it is necessary to employ fresh dung for such an experiment.

These observations of Brefeld supply then the missing link in the life cycle of *U. aeneæ*, bridging over the interval between the ripening of the spores and the infection of the embryonic plant. If the spores when they are scattered, fall upon the leaves and straw of the Oat, they will remain there in a dormant state until the straw be eaten by animals (e.g., horses), in their excreta, the gonidia multiply themselves, and if an Oat germinate in or near the dung it will become infected with the smut.

This, however, is not the only way in which infection can occur, for as we have already seen, the application of the spores to the decorticated kernel, or even soaking the Oats in spore charged with water, will have the same effect. And further it has been conclusively shown by Jensen, that the disease can practically be prevented by dipping the seeds for a short time in heated water; and also, although less effectively, by dressing them with a weak solution of copper sulphate. The efficacy of the warm water treatment has been confirmed by other observers, notably by Swingle.

WHEAT SMUT (*USTILAGO TRITICI*, Pers.).

This resembles the previous species in converting the ear which it attacks into a pulverulent mass. The colour of the spore-mass is black, but with a distinct tinge of yellow—an olivaceous hue. In shape, the spores are more regular than those of the previously-described species, the majority are oval, although some are subglobose or subangular; they present the same appearance of being lighter on one side. The epispore is echinulate, excepting a small area on the lightest side, through which the promycelium emerges.

In water, they germinate rather more slowly than do those of *U. aeneæ* and Hordei. The promycelia attain their full size in about twenty-four hours (18 to 45 by 3 to 4.5 mk.); they are usually septate, always remain attached to the teleutospores, and do not produce gonidia. In pure water the percentage of spores which germinate is small. In nutrient solutions, germination is much more rapid and vigorous. Numerous branches are given off from the segments of the promycelium near the septa, which soon form a tangled mass, difficult to trace out. No gonidia or free segments are produced. It is not very common in this country, and does not seem to be prevented by the copper-sulphate dressings.

THE COMPACT BARLEY SMUT (*USTILAGO HORDEI*, Pers.) = *U. TECTA*, Jensen.

This differs from all its allies by not converting the affected ears into dusty masses. Each grain remains enveloped in a whitish membrane, consisting of the metamorphosed remains of the glumes, palea, &c., of the diseased florets all matted together; usually the awns escape. The investing membranes is whitish in colour, not very fragile, and allows the escape of the spores through fissures which occur in it. The spore-masses themselves are compact, and contain a fair amount of the tissues of the host-plant, which have escaped destruction by the disease, in the form of whitish shreds. The spores, moreover, do not readily fall apart, so that it is never dusty like its congeners. The spore-masses are quite black; the spores are almost always spherical, or subangular. The epispore is perfectly smooth.

In water, the spores germinate after a few hours; the promycelia in twenty-four hours become once or twice septate. They now produce gonidia pretty freely; these fall off almost as soon as they are formed. The gonidia are narrowly cylindrical or subovate; they frequently bud off secondary gonidia, either when detached, or sometimes while still attached to the promycelia. The promycelia frequently become detached from the spores in such quantities as form a white sediment in the culture-drop. Germination ceases at about the end of the fourth day.

In nutrient solutions the spores behave in a similar way, but the gonidia are more abundant, rather larger, and had more profusely.

According to Jensen, this species, like bunt, infects its host from those spores, which adhere to the exterior of the seed. It is really prevented by treating the seed with copper sulphate, or by the hot-water treatment.

THE COMMON OR DUSTY BARLEY SMUT (*USTILAGO NUDA*, Jensen).

This differs from the preceding (*U. Hordei*) very much in the appearance of the affected heads, they being, in fact, reduced to dusty masses, in the centre of which the rachis alone escapes. The spores, which have no tendency to cohere *en masse*, have an olivaceous hue, and are mostly oval in shape, generally regular in size, and from 4.5 to 8 × 4 to 5 or 6 mk. The paler areas are very distinct, and comprise a quarter to half the spore. The epispore is echinulate, the germ-spore large, and the spore contents homogeneous.

In water the spores germinate rather more slowly than those of *U. Hordei*. The first appearance of the germ-tube is as a minute elevation on the surface of the spore; in twenty hours it is from 20 to 46 mk. by 2.5 to 4 mk., continuous or septate, sometimes bunched, but always remaining attached to the spore from which it originates; in ten hours more it attains its full length. No gonidia are formed, but from some of the segments of the promycelium, or from a knee-joint fusion, long slender germ threads are thrown out, 50 to 150 × 1.5 to 2 mk., the tips of which are filled by protoplasm. These germ-threads grow for four or five days, and attain a length of 300 to 400 mk. They never branch. No gonidia are ever formed, nor does the promycelium break up into segments.

In nutrient solutions after forty-eight hours the free ends of the branches and promycelium become swollen, and other segments of the latter become empty of protoplasm, but no gonidia are ever produced.

Little is known with regard to the entrance of the fungus into its host, although it is a parasite which causes great injury to the Barley crops in this country. Dressing the seed with copper sulphate will not prevent it. Jensen found, however, that the treatment by hot water was effectual.

With regard to the exact mode of infection, I performed the following experiment (Exp. 985): The smut spores were applied to some Barley plants which were just flowering in 1888. The resultant seed was planted March 23, 1889. On April 11 the plants were well above ground; on July 2 it was found that there were 120 healthy ears, and forty smutted

ones. It may be added that all my previous experiments of applying the spores to Barley seeds and germinating grain had been failures. It is quite possible, however, that although it does not produce gnomia either in water or in nutrient solutions, that it may be a dung-spread species. The disease is exceedingly common on the Barleys in Norfolk, and it is possible that the previous sheep-feeding of the Turnips may have some connection with its production; at any rate it is quite a subject for the Board of Agriculture to take up, and to inquire by circular from cultivators as to whether it is more common on Barley grown on land which has been fed off or not.

Jensen draws attention to a very curious circumstance in connection with these two Barley smuts. Prior to 1888, this one, the *U. nuda*, was by far the most common in Denmark. In the following year, 1889, it became much less common, while the other species, *Hordei or tecta*, is now the more frequently met with; *tecta* is now not only the most common in Denmark, but also in Sweden, and in the north of Germany. With regard to the practical application of the warm-water treatment for the prevention of *U. nuda*, Jensen recommends soaking the seed Barley for six hours in cold water, letting it remain damp for four hours longer, and dipping in water at 53° C. By this means, not only are both kinds of smut prevented, but he adduces evidence from seventeen experiments that the yield is increased per acre to the extent of 114 per cent. as far as Oats are concerned. This increase is partly accounted for by those plants which would otherwise have been destroyed by smut producing perfect Oats. *C. B. P.*

(To be continued.)

THE HERBACEOUS BORDER.

PENTSTEMONS AND ANTIRRHINUMS.

ALTHOUGH classed as hardy plants, the winters generally play havoc with Pentstemons and Antirrhinums in the borders if they are unprotected, and this year it is very doubtful if any have escaped destruction, unless in favoured parts of the country. In the event of cuttings of the above not having been taken last autumn, and wintered in cold frames, much loss will have to be deplored; but fortunately, we need not be long without some of one sort or another, as Pentstemons and Antirrhinums come freely from seed, and the various strains have been so much improved of late, that one may now depend on having very fine flowers, if the seed is obtained from a trustworthy source. As the season is now advanced, no time should be lost in sowing seeds, which is best performed in well-drained pans in sharp, rich, finely-sifted soil, made firm and level on the surface, watering the soil, and as soon as it is become settled, the seed should be scattered thinly and evenly, and covered with a sprinkling of sand, when, if a pane of glass is laid over the top, and the pans stood in gentle heat, the plants will soon be up, and ready for pricking-off, which may be done on a warm border, under handlights, from whence the plants may be taken, and placed out in the borders. The practice here is to put three in a patch, planting them triangularly about 6 inches apart, and if any are found to be inferior when they show bloom, these should be pulled up; but if all are fairly good, the clumps may remain, to make a fine display in the autumn, as the mixture of colours is often effective. To get Pentstemons and Antirrhinums into flower early, seed ought to be sown in the autumn, and the plants kept on a light airy shelf in any cool house or pit, and if cuttings are taken, they should be treated in the same manner. *J. S.*

FRUIT NOTES.

PEAR FERTILITY.—A coloured figure in the February number of the *Bulletin d'Arboriculture* gives a very good idea of this Pear, and of the appropriateness of the name applied to it. It is one of

Mr. Rivers' seedlings. Mr. Burvenich says of it, that it is an improved Beurré de Capiaumont.

THE BLACK CURRANT AS AN ANTIDOTE TO THE GOOSEBERRY CATERPILLAR.

The following striking case is recorded for confirmation or otherwise, from the experience of your many readers:—One portion of a large Apple orchard sub-cropped with Gooseberries, had suffered greatly from the ravages of Gooseberry caterpillar. On pointing this out to its owner, and in talking of preventives and remedies, he told me that he had found what promised to be a perfect cure, and would show it to me presently in another part of the same orchard. Arriving there, we found the Gooseberry bushes perfectly healthy, and free from the slightest trace of the ravages of caterpillars. What was the antidote? This. Here each alternate row of bushes or each other plant in the row were of Black Currants; there was no other division nor difference; and as soon as the insects reached the Black Currant cordon, their odour, or their presence—for the caterpillars never taste Black Currants—seems to say to the invading hosts, "Thus far shalt thou come, and no further."

How many readers of the *Gardeners' Chronicle* have tried this antidote, and with what results? I have tried Broad Beans, between Gooseberries with more or less success, as antidotes to the same pests. Perhaps correspondents will be so good as to name these or any other modes of planting or cropping out caterpillars, when giving their experience in regard to Black Currants. If such a persistent, hard-skinned, strongly-developed pest as the wire-worm can be mustarded out of our gardens and off our farms through persistent cropping, the practice of cropping out other pests may only be a matter of fuller knowledge and longer time. *D. T. F.*

GLAZING CLIP.

Our illustration (fig. 72) shows an ingenious and a simple device for securing sheets of glass on the roofs of glasshouses without the use of outside putty.

FIG. 72.—METAL CLIP, TO SECURE SHEETS OF GLASS ON GLASSHOUSE ROOFS.

These clips are made of a variety of sizes, to suit the different dimensions of sash-bars or rafters, and they can be readily fixed by any handy man. For orchard houses, where the sash-bars might be channelled to prevent drip, there is no need to bed the glass in putty; but in other kinds of houses, required to be to a certain degree weather proof, the glass may be bedded in thick white lead paint or putty. Mr. Bones, of Tower House Gardens, Chiswick, is the inventor.

VEGETABLES.

NOTES ON BROCCOLI.

I HAVE yet to learn the good qualities of Adams' Early White, notwithstanding the very favourable accounts given of it in the different seed lists. I have grown it twice, and have been disappointed on both occasions. It grows very tall, and, according to my experience, seldom produces a head worth cutting. Perhaps, however, I was supplied with an indifferently strain. To follow the Autumn Giant Cauliflower, I find Veitch's Self Protecting invaluable, and always plant it largely. With care and timely attention in the way of lifting and transplanting the best, and those about to heart, on a warm sheltered border, and with good protection during severe weather, we usually maintain a very

good supply of capital white heads throughout January and the early part of February. Snow's Superb Winter White is good for winter use, and gives every satisfaction. Osborn's is a dwarf useful variety, and usually produces good solid heads. These, however, like Veitch's Self Protecting, require to be well looked after, and as soon as they form heads, protection of some kind must be afforded. A good supply of frames, in which the plants may be heeled-in, is probably the best method of protecting; but, in the absence of these, the plants may be lifted and transplanted on a warm border, and protected. Knight's Self Protecting is too well known to need description, it being one of the best of all Broccolis in its season. Cooling's Matchless is also well worthy of notice.

For late use, the best are Veitch's Model, Gilbert's Victoria, Lauder's Late White Protecting, with Lesham Latest of All. The latter variety is, in my opinion, one of the best flavoured Broccolis in commerce, although not so late as the Model and Victoria, these two being usually good till the earliest Cauliflowers are fit for use. In the cultivation of this valuable vegetable, there are two very important essentials necessary, viz., the planting on firm land, and non-crowding of the young plants. *H. Markham.*

POTATO THE GENTLEMAN.

Now that planting is in full swing, it may not be out of place to say that those wanting a really good variety of Potato cannot do better than secure a supply of The Gentleman. I was much taken with the hardy look of the variety when it was sent out by Messrs. J. Veitch & Sons, and I purchased it, planting it largely, and being amply repaid by the goodness of the crop and its power of resisting disease. The flavour is good, either boiled or baked. Grown on heavy land, side by side with Beauty of Hebron and Covent Garden Perfection, which is one of its parents, I found no diseased Potatoes with The Gentleman, whilst of Beauty of Hebron half the crop was diseased, and Covent Garden more so. It is a Potato that if kept true will, I think, run the Magnum very hard for first place as a late variety. *John Chinnery.*

LAW NOTES.

WHOLESALE FERN PILFERING.

AT the Aximinster Petty Sessions, on Tuesday, James Durey, of the West Quarter, Exeter, was summoned for doing damage to underwood on land belonging to Sir W. Pole. Mr. Tweed, of Honiton, stated that defendant was one of a gang of pilferers who, by their depredations, did much damage to the grounds of country gentlemen. The offence at present under consideration was committed on March 19. In broad day, P. C. Gervis came upon defendant at Morwenhayes Copse, pulling up Ferns, and 2 acres of land were laid bare, and 1080 Fern-roots extracted. This flower and Fern pilfering, Mr. Tweed continued, was become a general nuisance, and he hoped an exemplary punishment would be inflicted. P. C. Gervis bore out this statement. Defendant was sent to prison for a fortnight. A second charge was preferred against him for damage to the fence by creating a gap, and evidence having been adduced by the constable and gamekeeper, a fine of 15s. inclusive was inflicted. *Devon Weekly Times, April 1, 1892.*

Apologies of the above condemnable practice, our correspondent sends the following (we purposely omit the names and addresses), culled from Exchequer and Mart, March 21, 1892:—

FERNERY.—Beautiful varieties of Devon and Cornish Ferns, 40 good roots, free, 1s. 6d.
Hardy Dorset Fern roots, various varieties, carefully packed in moss, 50 1s., 100 1s. 9d., free.

Magnificent assortment of Devon and Cornish Ferns, elegant varieties, 40 healthy plants, free, 1s. 3d.

Ferns from Cheviot Hills, mixed sorts and sizes, some evergreen, all hardy. English and Latin names attached to one of each kind, 25 1s., 50 1s. 6d., 100 2s. 6d., sent post free with hints on growing.

Forty rare hardy Devonshire Fern roots, 1s. 2d., carriage paid, 10 varieties, Maidenhair, Ceterach, Adiantum, Polystichum, Rutamurra, Scolopendrium.

Everyone is waking up to the fact, that the strong arm of the law has become necessary for checking reckless Fern pilfering. The sentence passed by the Axminster magistrates will, we think, act as a salutary warning to persons who wander about from place to place, rooting out and destroying wherever they go the most interesting plants of the country-side.

COLONIAL NOTES.

MELBOURNE.—The garden is about a mile south of the city itself, and lies on the narrow river, the Yarra, which flows through Melbourne. The situation is good, but the soil in some parts is far from the best. The Australian flora is represented by fine old specimens, if one can call anything old in such a new country, and by young plants which have been added in recent years.

The garden abounds in effective views, which are much appreciated by the citizens. As in all new countries, for instance, our own, there is a good deal of pleasant rivalry between the larger places; in the botanical gardens of Australia there is found a convenient object for comparison. The judicious visitor cannot go far wrong in his answers to anxious inquiries as to respective excellencies of the gardens, where there is much to please, and so little that calls for unfavourable criticism.

In the Melbourne Garden the most attractive groups of plants are (1) the Proteaceae, composing a striking mass of shrubs and small trees, many of which happened to be in flower; (2) the Eucalypts, by no means all of them equally good as representatives, but most of them having distinctive characters recognisable as a whole; (3) the Myrtaceae and the Acacias.

The director is much embarrassed by the peculiar condition of the labour question in Australia. Somewhat similar difficulties arise wherever the one in charge cannot employ or dismiss the workmen for whose good work he is chiefly held responsible.

Mr. W. R. Guilfoyle, the director, with his capable assistants, is organising a Museum of Economic Botany, and bringing together other appliances for the illustration of botany.

Not very far from the garden lives Baron Ferdinand von Mueller, Government Botanist. He is surrounded by his herbarium and library, to which he has devoted his life and fortune. The correspondence which he carries on is incredibly voluminous, and it is understood to be conducted wholly with his own hand. His handbook of Victorian plants is easy to use after one becomes accustomed to the dichotomous arrangement, and it is very helpful in the minuteness of its descriptions. The Baron has done hard work in economic botany as applied to Australia, and in the endeavour to make the useful plants of the colonies better known in the old world and in America. As everybody knows, such work is always a thankless and ungracious task, for the mistakes and failures in the introductions are likely to outnumber the successes. In everything concerning the advancement of the colonies, Baron Mueller has taken a hearty interest, and is in every way identified with his adopted home.

Besides the incipient economic museum at the Botanic Garden, and the large collections under the charge of Baron Mueller, there is an interesting botanical department connected with the Melbourne Museum. This is under the direction of Mr. J. Cosmo Newbery, and is now being rearranged previous to its final disposition in the new museum building. The specimens which illustrate the cereals and their products were nearly arranged at the time of my visit, and indicated that the new system would be successful from an educational point of view.

The environs of Melbourne include many munici-

palities which are commonly counted in with Melbourne proper, when the city is compared with its sister cities. Passing outside the circle of associated communities, the botanist comes upon very instructive botanical ground. One does not have far to go by rail to stand before the giant specimens of Eucalyptus, and by boat to be in the presence of queer Australian plants, like Epacris and so on, growing wild. G. L. G.

Obituary.

BENJAMIN MORGAN, on Monday, March 28, at the age of ninety-three years, at Franche, Kidderminster. The deceased was a market gardener in his later years, but he had formerly been a farmer, and at one time carried on the business of seedsman, the only one at that time in Kidderminster. He worked in his garden till last year, and retained his faculties unimpaired to the end.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

RULES and BULB CULTURE, by D. T. FISH.—This book is out of print. Will any reader of the *Gardeners' Chronicle* kindly inform A. H. C. where a copy may be obtained.

DIMENSIONS OF WISTARIA SINENSIS.—Will any of our correspondents kindly give us the largest area of conservatory wall covered with a single plant of *Wistaria sinensis*? and also inform us if the once magnificent specimen at Syston Park, is still in existence. This plant at one time covered a space of 6800 square feet, and bore in one year 5000 bunches of flowers from 9 to 12 inches in length; and the stem at 1 foot from the ground was 3 feet in circumference.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; 11, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 2, is furnished from the Meteorological Office:—

"The weather was rather unsettled, with local falls of cold rain or snow at the beginning of the week, but soon became very fine and dry in all parts of the Kingdom.

"The temperature remained low—especially at night—during the earlier part of the period, but subsequently the day readings rose rapidly, and became very high for the time of year, although the nights continued rather cold. The lowest of the minima were recorded in most places, either on the 27th or 29th of March, when the thermometer fell to between 14° and 18° in the 'N.W.' and 'N.' districts, to between 20° and 25° in the more 'S.' and 'S.E.' districts, and to 34° in the 'Channel Islands.' The highest of the maxima occurred either on the 1st or 2nd of April, and ranged from 73° in 'England, N.E.', and from 72° in 'Scotland, E.' and the 'Midland Counties,' to 67° in 'Scotland, N. and W.' and 'England, N.W.', and to 59° in the 'Channel Islands.' The range of temperature for the week was thus extremely large, but the average values for the week were in nearly all cases below the normal value for the time of year, the deficit in most of the districts ranging from 2° to 4°.

"The rainfall was much less than the mean in all parts of the Kingdom; the only days on which any was experienced being (except in the far North) at the commencement of the week.

"The bright sunshine greatly exceeded the mean. The percentage of the possible duration ranged from 48 to 59 in 'Scotland,' from 65 to 74 in 'Ireland,' and from 51 to 71 over 'England.' These percentages are higher over the Kingdom as a whole than those recorded in any week since that ending April 5, 1890."

MARKETS.

COVENT GARDEN, April 7.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal dealers, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

BUSINESS quieter, prices giving way. *James Webber, Wholesale Apple Market.*

POTATOES.

NEW POTATOES.—At public sales this week prices advanced, Cucary Island produce, Rs. to 16s. 6d.; Malta (first arrival), Kidneys, 17s. to 20s.; Rounds, 13s. For Old Potatoes the market is dull. J. B. Thomas.

SEEDS.

LONDON: April 6.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that a stream of sowing orders is now coming to hand, which are executed at the moderate currencies prevailing; stocks in consequence are all round getting reduced into quite narrow compass limits. American red, on account of its brightness, cleanliness, and cheapness, continues in special favour. Perennial Ryegrasses keep dear, but imported Italian is slightly easier. Sanfoin in this season cheap and good. For These seeds is an improving sale. Hemp seed is firm at the recent advance. Rape seed, the market is strong. Mustard and Rape seed are without change. Scarlet Runners are now unappreciatedly low.

FRUITS AND VEGETABLES.

BONMARK, April 5.—Quotations:—Savoy, 4s. 6d. to 6s.; Broccoli, 7s. 6d. to 12s. 6d.; per tall; Sprouting do., 2s. 6d. to 3s.; Turnip-tops, 3s. to 3s. 6d.; per bag; Spinach, 3s. to 4s.; per bushel; Brussels Sprouts, 1s. 6d. to 2s.; per half-sieve; Greens, 2s. 6d. to 3s.; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. 3d. to 1s. 9d. per dozen bunches; English Onions, 10s. to 12s. per cwt.; Apples, 2s. to 6s. per bushel; Canadian do., 14s. to 20s.; and Newtown Pippins, 15s. to 28s. per barrel.

SPITALFIELDS, April 5.—Quotations:—Seakale, 1s. to 1s. 6d.; per punnet; Curry Kale, 4d. to 6d.; Spinach, 1s. 6d. to 2s.; per bushel; Greens, 2s. to 3s. 6d.; Carrots, 2s. to 3s. 6d.; Sprouting Onions, 2s. 6d. to 3s. 6d.; Parsley, 4s. to 5s.; per dozen bunches; Brussels Sprouts, 1s. 3d. to 1s. 9d. per half-sieve; Turnip-tops, 2s. to 3s.; Swede-tops, 2s. to 3s.; Sprouting Broccoli, 2s. to 3s. per sack; Parsnips, 4d. to 6d. per score; Cauliflowers, 2s. to 2s. 6d.; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 6d. to 1s.; Leeks, 2s. 6d. to 3s. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 8s. 6d. to 9s. 6d. per cwt.; Belgian do., 7s. to 8s.; Dutch do., 7s. to 8s. per bag 110 lb.; Spanish do., 8s. to 10s. 6d. per case; Celery, 4d. to 1s.; Horse Radish, 1s. to 1s. 1d. per bundle; English Apples, 2s. 6d. to 5s. per bushel; American do., 10s. to 18s. per barrel; foreign Tomatoes, 1s. to 2s. 3d. per box; forced Rhubarb, 1s. 3d. to 2s. 6d., natural do., 2s. 3d. to 3s. 6d. per dozen bunches.

STRATFORD: April 5.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Savoy, 2s. 6d. to 5s. per tall; Carrots, household, 30s. to 40s. per ton; do., cattle-feeding, 15s. to 20s. do.; Parsnips, 9d. to 1s. per score; Turnip-tops, 2s. 6d. to 3s. per bag; Broccoli, 2s. to 3s.; Cauliflowers, 2s. to 2s. 6d. per dozen; Rhubarb, 2s. to 2s. 6d. per dozen bunches; Mangels, 15s. to 20s. per ton; Swedes, 22s. to 2s. 6d. do.; Onions, English, 30s. to 20s. do.; do., Dutch, 8s. to 8s. 6d. per bag; Apples, English, 2s. 6d. to 6s. per bushel; do., American, 14s. to 20s. per barrel.

POTATOS.

BOROUGH: April 5.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 90s.; Bruce Magnum, 60s. to 90s.; Dunbar do., 90s. to 105s. per ton.

SPITALFIELDS: April 5.—Quotations:—Magnum, 50s. to 70s.; Regents, 50s. to 70s.; Imperators, 55s. to 80s.; Hebrons, 65s. to 80s.; Snowdrops, 50s. to 70s.; Sutton's Abundance, 65s. to 75s.; Main Crop, 65s. to 80s. per ton.

STRATFORD: April 6.—Quotations:—Magnum, 52s. 6d. to 70s.; Imperators, 55s. to 80s.; Bruce, 60s. to 75s.; Scotch Magnums, 60s. to 90s.; Main Crops, 90s. to 110s.; Scotch Bruce, 70s. to 90s. per ton.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 102s.; inferior, do., 40s. to 75s.; hay, best, 60s. to 92s.; inferior, do., 28s. to 50s.; and straw, 20s. to 38s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, Imperial measure, for the week ending April 2, and for the corresponding period in 1891:—Wheat, 32s.; Barley, 27s. 8d.; Oats, 20s. 5d. 1891: Wheat, 36s. 5d.; Barley, 27s. 10d.; Oats, 18s. 11d.

NOTICES TO CORRESPONDENTS.

AZALEA BLOOMS: A. W. Send to some nurseryman who grows Azaleas largely.

CARNATION SOUVENIR DE LA MALMAISON: J. B. The plants may be had in flower late in the summer by striking them in February in heat, and treating them in a cool but airy situation in a frame or out-of-doors during the summer months.

CHILD'S NURSERY: W. E. G., see p. 436. In the notice of this American nursery it was not stated that from it came the Amorphophallus, the Wineberry, Rubus phoenicolasius, and marvels of such a nature that had we remembered the circumstance, it would have been quite unnecessary to have added any further notice.

CHOISYA TERNATA: T. D. An excellent truss of this pretty plant.

CINERARIAS: F. R. Those plants which you wish to cross and save seed from, should be placed in a house or frame by themselves, and at some distance away from all others. Fertilisation will take place without your agency, and is aided greatly by free ventilation during bright weather. The separation of these seed bearers should take place as soon as possible after the first blooms have expanded. By proceeding in this manner for several years, and by exercising discrimination in selection, a very good strain can be obtained. There are a few points to be borne in mind in doing this, viz.: to select only those that have a fairly dwarf compact growth, and dense corymbs of flowers; well defined colours, regularity of forms, and not so great size of flower as will cause flabbiness.

CORRECTION: "J. Ruskin Strawberry." Mr. Gilbert desires us to say that it was the "firsts" only which averaged $\frac{1}{2}$ oz. a-piece. See p. 439, ante.

CREEPERS FOR COVERING THE WALLS OF A HOUSE: X. Uxbridge. In your locality (south) you may plant on the south side Magnolia grandiflora in variety, Camellia azures and its varieties, C. floribunda, C. rigidus, Chimonanthus fragrans, Berberis stenophylla, Clematis in great variety, Rose Madame Lambert, R. Gloire de Dijon, Marechal Niel, Jeanne Desprez, Climbing Devonensis, many strong-growing Teas. On east and north, Wistaria sinensis, Clematis flammula, C. vitalba, Isabella vine, Menisperm canadense, Passiflora corulea, Cydonia japonica, and its many varieties; Virginian Creeper, Hedera (Ivy) in variety, and certainly the Irish, Regeneriana, rhomboida ovata, digitata, japonica, argentea, &c. West wall: Lonicera flexuosa, L. fragrantissima, and L. sempervirens; Bigonia radicans, B. grandiflora, the finer hybrid Clematis, also more Roses, Smilax aspera, and Stauntonia hexaphylla.

FERTILISATION OF WHEAT: D. S. Müller in the *Fertilisation of Flowers*, English edition, 1833, p. 563, citing the observations of Delpon, has the following:—"Triticum vulgare. Anthers and stigmas mature simultaneously, but the flowers only expand partially and for about a quarter of an hour; they then close permanently. The flower opens suddenly, scattering all its pollen, about one-third of which remains within the flower, while the other two-thirds are shaken out. . . . Self-fertilisation leads to the production of good seed. The flowering period lasts four days, and since each flower only expands for a quarter of an hour, a very small fraction of the flowers are expanded at any one time.

GENTIANA DAVARICA, &c.: A. L. D. The best soil for the plant is bog earth, mixed with loam and sharp grit; and a wet place fully exposed to the sun would be found for it. It may be grown in pots plunged in sand, or stood in saucers. Water abundantly. Like most of the species it dislikes disturbance at the root. For Epilobium obovatum, a mixture of peat and loam, and a place in the mixed border; the flowers are rosy-pink.

MARKET LAND: Narcissus. The plants that you mention will with but two exceptions, Asparagus and early Rhubarb, bring but little money, if disposed of to salesmen or commission agents, although they all might fetch remunerative prices if supplied direct to customers. Your early Potatoes will be heavily handicapped by the supplies from Sicily, Channel Isles, Algiers, Malta, and other places. Tomatoes, Strawberries forced early, forced Asparagus, Seakale, Mushrooms, would suit your small area of garden land better. If you could obtain security for your holding, the planting of a few acres of Lord Suffield, Lane's Prince Albert, Wellington, Blenheim Orange, and Cox's Orange Pippin, would pay you better than vegetables. Say 1 acre of each variety, with Raspberries, black and red Currants, Winham's Industry Gooseberry, for picking green; Strawberries, Rhubarb, Narcissus, Anemone fulgens, Scillas, and Wall-flowers grown beneath the fruit trees, or rather big headed bushes.

MELONS: L. F. Mr. Ross' paper will be published in the *Journal of the Royal Horticultural Society*, but we cannot tell you at what time.

NAMES OF PLANTS: R. S. D. Anemone spennia var. blanda. — C. B. S. (*Capetown*). Woodfordia floribunda. — F. J. *Catmose*. Diosma alba. — *Trollius*. Daffodils: 1, N. incomparabilis; 2, N. grandifolius; 3, N. Telamonia plenius. — F. S. 1, Muscari botryoides; 2, Gymnogramma ochracea; 3, Erythronium dens canis; 4, Chionodoxa Lucilla. — *Ezenoth*. Cricium asiaticum. — J. M. Dendrobium litiiflorum. — J. S. R. T. Tropaeolum tuberosum. — S. M. *Banbury*. 4, Scilla bifolia; 2, Scilla sibirica. — *James Payn*. 1, Pteris tremula; 2, Asplenium bulbiferum; 3, Cyperus alternifolius; 4, Pteris cretica albo lineata; 5, Pteris serrulata; 6, Adiantum capillus veneris; 7, Asplenium trichomanes; 8, Neprolepis tuberosa. — *J. Urquhart*. Dendrobium Pierardi. The other is probably a species of Inga; send when in bloom.

TOMATOES: F. Holdrup. No complaints of any difficulties experienced by growers of Tomatoes in raising these plants from seeds have reached us; but we hear many of the plants dying off, or becoming attacked by fungus diseases at a later stage; and some of these diseases have been figured and described in our columns.

TREE GUARDS: J. T. B. *Port Elizabeth*. Hill & Smith, Briery Hill, Wolverhampton, Staffs.

TULIP-TREE: An Amateur. Propagation is by stratified seed, that is, seed which has been laid in layers or strata with sand or loamy soil between, or mixed with the same and left in a heap. It is as well to keep seed in this state under some kind of protection. Named varieties are grafted on seedling stocks. Layering may also be adopted as a means of increase, but the plants for some years retain a bush-like character.

VANDA TERES: A Constant Reader. Being epiphytal, the conditions should be such as will cause the development of aerial roots, i.e., moist, warm, and sunny, with Sphagnum Moss beneath them, that should be kept moist. The plants should be kept near the light. When resting much less moisture is required, but they must never be very dry. Grow them in pots or narrow borders.

VINES: H. N. The leaves show signs of over-sulphuring or fumigating. They are also very thin and wanting in size and substance—in fact, just the kind of leaves that would readily suffer injury from these causes.

COMMUNICATIONS RECEIVED.—Old Man, writing on Peas, must send his full address before we can publish his note, not necessarily for publication, but as establishing his bona fides.—C. W. D.—W. H. A.—H. NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender: this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week must reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months: Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

NOTICE TO ADVERTISERS.

FRIDAY NEXT, April 15, being GOOD FRIDAY, the "GARDENERS' CHRONICLE" will be published on THURSDAY, April 14.

ADVERTISEMENTS for NEXT WEEK must therefore reach the Office not later than WEDNESDAY MORNING, April 13.

PARTNERSHIP.—A young Man, with twelve years' experience, and a fair connection, wishes for Partnership, or Situation, in a good Seed Establishment, where £500 or £700, and active service, would meet with a fair return.—T. W. G. *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

MUSHROOMS.—A gentleman wishes to know of a place where he could learn the process of Mushroom culture. State terms.—Address, E. H. M., 90, Elm Park Gardens, London, S.W.

W. G. BAKER, Botanic Gardens, Oxford, in reply to the numerous (94) applicants for situation advertised in last week's issue, begs to inform them that HE IS SUITED.

WANTED, a thoroughly reliable WORKING MANAGER (married), for Scotland. Must have good practical experience in Growing for Market, under Glass, Early Fruits, Cut Flowers, Plants, Vegetables, &c., also Outside Fruits and Kitchen Garden. Must be a good Manager, pushing, and well up to his work. Character and ability must bear strictest investigation. Good wages to competent, trustworthy man. Full particulars as to character, ability, &c., with references, to S. W. *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD WORKING GARDENER, with good practical knowledge of Vines, Peaches, &c., and the Care of Stock, &c. Must be vigorous, active, and willing. State age, number of family, and wages required. Only a few miles from London. Will have three under him. Excellent cottage, coals, gas, milk and vegetables found. Copies only of testimonials to be sent.—R. M. *Gardeners' Chronicle Office*, 41, Wellington Street, Strand, London, W.C.

WANTED, a good all-round WORKING GARDENER.—Vines, but no forcing. Under-man kept. Lodge for man and wife without incumbency.—Rev. G. H., Drayton House, Ealing, W.

TO FLORISTS.—Re-engagement desired by a young LADY, thorough good all-round hand; also had good experience in Fruit & highest references.—THWAITES, 49, Chesterton Road, Ladbrook Grove, W.

HOLLOWAY'S PILLS.—Weary of Life.—Derangement of the liver is one of the most efficient causes of dangerous diseases, and the most prolific of those melancholy forebodings which are worse than death itself. A few doses of these noted Pills act magically in dispelling low spirits and repelling the covert attacks made on the nerves by excessive heat, impure atmospheres, over-indulgence, or exhausting excitement. The most shattered constitution may derive benefit from Holloway's Pills, which will regulate disordered action, brace the system, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these Pills, and obediently putting them in practice, the most despondent will soon feel confident of a perfect recovery.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
THE EMPEROR OF RUSSIA,
The Late EMPEROR OF THE FRENCH, The EMPEROR OF AUSTRIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856.

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady	£1 15 0
To cut 8 in., do.	2 10 0
To cut 10 in., do. by a strong youth	3 10 0
To cut 12 in., do. by a man	4 10 0
To cut 14 in., do.	5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man	£5 10 0	To cut 22 inches, can be worked by two men	£8 10 0
To cut 18 inches, do. man and boy	7 10 0	To cut 24 inches, do.	8 0 0
To cut 20 inches, do.	8 0 0		

These Mowers are the "No Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	15 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.

PRICES, With Grassbox.

To cut 6 in.	£1 5 0
To cut 7 in.	1 13 0
To cut 8 in.	2 5 0
To cut 10 in.	3 0 0

For Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths, &c.

Suitable for Hand or Horse Power.

Prices of Rollers in 2 parts.	
Diam. Length	£ s. d.
16 in. by 17 in.	2 5 0
20 in. by 22 in.	3 5 0
24 in. by 26 in.	4 10 0
26 in. by 28 in.	5 0 0
30 in. by 32 in.	7 10 0

Special quotations made for Rollers, 3 feet, 3 1/2 feet, and 4 feet Diameter, fitted with Shafts for one or two horses.

GREEN'S PATENT GRASS EDGE CLIPPER

Size and Price, 7 inches wide, 7 1/2 in. diam., £1 16s. Packing Case, 3s.

Specially designed to meet a want which has long been felt in cutting the overhanging grass on the edges of walks, borders, flower-beds, &c., and do away with the tedious operation of cutting with shears.

A very useful and serviceable Machine.

MAKERS OF PATENT STEEL OR IRON ANGULAR CHAMBERED AND TUBULAR

HOT-WATER BOILERS

AND OTHERS WITH SHELVES, AND HOLLOW OR ORDINARY CAST-IRON GRATE BARS.

VERTICAL SADDLE BOILERS, &c.

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders completed the same day as they are received.

The above Machines are warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND

DESCRIPTIVE ILLUSTRATED PRICE LISTS Free on application to

THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON; or they can also be had of any Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

SALES BY AUCTION.

Wednesday Next.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **WEDNESDAY NEXT**, April 20, at half-past 11 o'clock, **LILIES** in variety, 2000 Single and 1000 Double **BEGONIAS**, a splendid strain, from a well-known Nursery; **PALMS**, Greenhouse **FERNS**, Standard and Dwarf **ROSAS**, **GLADIOLI**, **ANEMONES**, **DARLINGS**, **CARNATIONS**, **HERBACEOUS PLANTS**, &c.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. SANDER, St. Albans, to **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT**, April 22, at half-past 12 o'clock, a splendid importation of an entire **NEW ONCIDIUM**—a free-growing and free-flowering species; the plants are in grand order, and in fine principal show.

Also a fine lot of the beautiful **ONCIDIUM BARBATUM**, never before offered in quantity.

A new and striking-looking **BRASSAPHYLLOM**.

A new and striking-looking **LEUCOTHALIS**.

A new and freely-flowering **BRASSAVOLA**.

A grand lot of the lovely pure white **BURLEIGHIA PULCHERRIMA**.

A new **MILTONIA**, provisionally named **ILLUSTRIS**, but amongst which the grand variety **MORELLIANA** may be found.

VANDA TERES, Waddesdon Manor variety.

DENDROBIUM NOBILIS, from the Shan Hills.

SACCOLABUM CURVIFOLIUM.

DENDROBIUM DALHOUSIANUM, &c.

Also.

THE TRUE L. LABIATA.
Eighty-three plants selected, marked and described while in bloom by our own Collector, with the dried flowers of same. Every plant will be offered as received. The plants are in the finest possible condition, some of them being magnificent specimens. The plants now offered are specially recommended by us, being the pick of many thousands of plants from the habitat of the true old, bright, large, and incomparable autumn-flowering **L. Labiata**. We draw buyers' special attention to this grand lot of plants.

On view morning of Sale, and Catalogues had.

Tuesday, April 26.

By order of Messrs. F. Horsman & Co.
MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION** at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **TUESDAY**, April 26, at half-past 12 o'clock, two to three thousand **ODONTOGLOSSUM CRISPUM** and its varieties, collected by Mr. John Carder (late partner in the firm of Messrs. Carder & Co.), &c.

On view morning of Sale, and Catalogues had.

Milford Hill, Salisbury.

UNRESERVED SALE of the well-known **COLLECTION** of **EXHIBITION STOVE** and **GREENHOUSE PLANTS**, formed by Lieutenant-Colonel FEPPER, and which have been so successfully exhibited at the principal shows.

MESSRS. PROTHEROE AND MORRIS are instructed by Lieutenant-Colonel FEPPER (who is giving up exhibiting), to **SELL BY AUCTION**, on the Premises, Milford Hill, Salisbury, on **WEDNESDAY**, April 27, at 12 o'clock precisely, a valuable and complete **COLLECTION** of **EXHIBITION STOVE** and **GREENHOUSE PLANTS**, including fine examples of **Kentias**, **Latanias**, **Arecas**, and other **Palmæ**, **Cycas** circinalis, with 30 leaves; **C. revoluta**, one with 40, and another with 44 leaves; **Uncinula**, 25 leaves; 300 Established **Orchids**, consisting of **Dendrobiums**, **Cattleyas**, **Cymbidiums**, and others; specimen **Alamandas**, fine exhibition Plants of **Eriose** of sorts, **Lappageria** rosea and alba, 100 **Crotone**s of sorts of the best varieties; fine plants of **Anthurium Schzerianum**, **Devallias**, **Disconias**, **Micropleis**, **Blechnum**, and other Specimen **Ferns**; good examples of **Fuchsia** and **Azaleas**, **Rhododendrons**, **Begonias**, **Celatanas**, and other **House Plants**. Also a **Gold Metal Boiler**, **Large Plant Pots**, &c.

Plants may be viewed one week prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Peasemarsh, Sussex.

TO MARKET GARDENERS, FRUIT GROWERS, and OTHERS.
MESSRS. PROTHEROE AND MORRIS in conjunction with Mr. J. J. FRUIN, will **SELL BY AUCTION**, at the Castle Hotel, Hastings, on **THURSDAY**, June 9, 1892, at 5 o'clock precisely (unless an exception be made previously), the exceptionally choice and productive **FREEDHOLD MARKET GARDEN** and **FRUIT GROUNDS**, known as Little Lea, Peasemarsh, Sussex, comprising an area of 14 acres 1 rood 7 poles, abundantly stocked with the best marketable kind of top and bottom Orchard Fruit Trees. Convenient detached **RESIDENCE**, **STABLES**, and **OUTBUILDINGS**.

The Auctioneers will be pleased to send full particulars and price on application.

Auctioneers' Offices, 67 and 68, Cheapside, London, E.C.

Elmdon Hall, Near Birmingham.

MESSRS. POPE AND SONS have received instructions from the Executors of the late Mrs. Alston, to **SELL BY AUCTION**, on **TUESDAY**, April 26, at 12 o'clock to the minute, the whole of the **STOVE** and **GREENHOUSE PLANTS**, which include a number of well-established **Orchids**; 8 or 10 fine specimen **Lappageria** alba and rosea; 2 immense **Gleichenias**, grand exhibition plants. A fine lot of **Adiantum Farleyense**, including one specimen 4 feet through; 1 grand specimen **8 to 12 feet**, including **Kentia Belmoreana**, **Latania borbonica**, &c.; large **ecimen Crotone**s; **Filmy Ferns**, including 1 **Trichomanes radicans**, **Adiantum**, &c., with 1000 fronds; a lot of old-fashioned **Cazellias**, including **Dunkelarii**; a large quantity of fine **Hybrid Azaleas** in flower; 1 grand specimen **Imantophyllum** princeps; and the usual collection of stove and greenhouse plants. Please note that the whole will be sold without reserve.

Elmdon is about 2 miles from Solihull Station, G. W. Ry., where vehicles can be obtained; 2 miles from Marston Green Station, L. & N. W. Ry., and 7 miles from Birmingham. Catalogues from the Auctioneer, 6, Phillips St., or Herald Office, Birmingham.

Wednesday Next.

THE

Gardeners' Chronicle.

SATURDAY, APRIL 16, 1892.

A NATURALIST'S GARDEN AT CANNES.

THERE are many well-appointed gardens in
the Riviera, much celebrated for their
beauty and the variety of the plants they
contain. Some such have often been de-
scribed, and I propose adding one more to
the number. Though not a very large one, it
probably contains a greater variety of foreign
shrubs and trees for its size than many others.
It is that surrounding the villa of M. A.
Constant, a well-known naturalist, who pos-
sesses a beautiful collection of European
Lepidoptera. He is also a good botanist, a paper
on "the Specialties of the Flora of the Esterels"
having lately appeared from his pen in the *Revue
Horticole*; and in the number for April 1, he
figures and describes *Rhododendron florida* as having
flowered in his garden. Like so many others,
the grounds are carved out of the natural forest
on the slope of the hills, which continues up to
the summit some 320 feet above the sea. The
garden abuts against the main road from Cannes
to the village of Golfe-Juan, and overlooks the bay
of that name. Starting from the Lodge by the gates,
a broad road winds in a zig-zag manner up to the
villa, the walls of which are covered with many
sorts of flowering creepers and trailing plants
such as *Hoya carnosus*, *Thunbergia coccinea*,
Bignonia, the purple *Bougainvillea*, a plant
which here, as in Cairo, covers whole sides of
villas with a purple sheet, and a large single-
flowering white Rose, *Rosa sinica*.

After reaching the villa, a terraced walk runs
along the front, from which a fine view of the
"Golfe" is obtained, the little promontory of the
Cap-Antibes being on the left, with the snow-
capped maritime Alps further off. Other paths
conduct one to various groups of varieties at
the back of the villa, and little steps up to higher
regions, till the boundary wall is reached, on
which Citrons are trained, and which are now
thickly covered with scores of beautiful green and
yellow fruits, while Oranges and Lemons are
in their neighborhood.

As in all the gardens of the Riviera, Palms
form the most striking feature to a visitor from
England. There are seven or eight species,
with several examples, and some of them are very
handsome. There is an avenue of *Pritchardia*
(*Washingtonia*) filifera, from California, with
its curiously swelling base to the trunk, alternat-
ing with Tree Ferns, *Asplenium australis* and
A. Moorei; its congener, A. robusta, is, per-
haps, even more elegant, with its shiny
leaves. *Areca sapida*, the southernmost of
all Palms, from New Zealand, and *Kentia
Belmoreana*, with magnificent pinnate leaves;

Cocos flexuosa and *C. campestris*, *Seafortia elegans*, *Brabea Roezli*, a fan-leaved Palm from Peru; *Sabal umbraculifera*, and *Jubaea spectabilis*, the most southern Palm of South America, from Chili. Mixed with these Palms, are various Australian trees, species of phyllodineous *Acacias*, such as *A. melanoxylon*, curiously unlike the trees in the temperate house of Kew, in having no blades at all; the so-called "Mimosas," or *A. dealbata*, scenting the air. Of *Proteaceae*, there are *Hakea eucalyptoides*, with its curious fruit like wooden legumes, *Rhopala*, and *Grevilleas*, as well as gum trees. A fine *Aralia*, several *Magnolias*, but not in flower; *Araucaria excelsa* from Norfolk Island, *Persea gratissima*, the Avocado Pear, which ripens its fruits here. Fine clumps of Bamboos (*Bambusa arundinacea*), with their graceful foliage, growing at the rate of a foot a day; *Bananas*, or *Musa paradisiaca*, so called because it was fancied to be the forbidden fruit, with large clusters of green fruit; a *Vigandia*, with clusters of blue flowers; *Camphora officinarum*, the Camphor tree of Formosa; *Psidium Cattleianum*, the purple Guava, probably a native of Brazil; as also *P. guava*, the true Guava, which ripens its fruit here well. Of more herbaceous kinds, there are large clumps of *Strelitzia regina* and *S. augusta*, as well as fine plants of the New Zealand Flax, *Phormium tenax*.

Aloes, *Agaves*, *Dracenas*, *Dasylirions*, *Bromelias* and their kith and kin are abundant in the Riviera, and are, of course, well represented in M. Constant's garden. Numerous flowering shrubs lend their quota to adorn it with colour, such as the scarlet-flowered *Habrothamnus*, shrubby *Veronicas*, *Brachychiton acerifolia*, the "Flame tree" of Australia; *Coprosma*, the white-flowered *Retama monosperma*, from Spain; *Buddleia madagascariensis*, with orange-flowered panicles; large bushes of a purple *Polygala*, *Spartanum africanum*, *Poinsettias*, *Erythras*, *Abutilons*, *Camellias*, *Erythrina coralodendron*, *Ingas*, *Clianthus puniceus*, 4 feet high, with numerous racemes in bud; *Nandina domestica*, with a profusion of scarlet berries. The small-leaved *Blumenbachia*, with white flowers, forms an excellent covering for rock-work, giving a very pretty effect. A plant of *Erica mediterranea*, 6 feet high, was one mass of flowers. Lastly, giant *Euphorbias* with their fleshy trunks stood erect in various angles of the walls.

Of herbs, there is the usual display; of *Violets*, *Stocks*, *Pelargoniums*, *Oxalis*, as an edging plant, *Jonquils*, *Roses*, &c. These fill up the interstices.

M. Constant has devoted one portion of his ground to a "native" garden, some of the plants and shrubs of which provide board and lodging for his caterpillars, several muslin-bags betraying their whereabouts. Of these there are fine specimens of *Euphorbia cyparissias*, spinosa, and dendroides, *Laurus nobilis*, *Daphne Cneorum*, *Coronilla emerus*, *Opeponax Chironium*, the only species; *Ferula communis*, a noble-leaved plant, very common on the rocky ground in Malta; *Globularia alysium*, and the following plants, which are found close around in the forest itself; *Cytisus triflorus*, *Arbutus unedo*; the "Bryère" of the French, *Erica arborea*, from the roots of which the "Briar" pipes are made, being collected in the Esterel district.

The above enumeration does not by any means complete the list, but it will suffice to show to the reader how varied and interesting is the collection, nearly all parts of the world appearing to have been put under contribution. Although many of the Palms and *Aoacias* are now quite large trees, the garden was only made and planted twelve years ago. The *Washingtonias*, for

instance, having been planted in good soil, grow from 16 to 20 inches per annum. It has been called the "Eucalyptus" of Palms. Its swollen base has attained to more than 4 feet in circumference. *George Henslow*.

NEW OR NOTEWORTHY PLANTS.

CALANTHE VESTITA FOURNIERI, n. var.

THE discovery of a variety of the Burmese *Calanthe vestita* in Borneo was a very interesting matter, not only from the point of view of geographical botany, but also because of two or three well-marked characteristics, which, while proving it to be a distinct geographical variety, also gave it an enhanced value to cultivators. A second very interesting form has now been discovered in the same country, and flowered with M. Fournier, of Marseilles, which has also several very distinct features, though its affinity to *C. vestita* is such, that I think it must be considered as a geographical variety rather than a distinct species. It is a smaller form than the others, as the flowers range from $\frac{1}{4}$ to $\frac{1}{2}$ inch across their broadest diameter. They also vary in colour from pure white, through blush and pink, to a deep rose-pink, with the column and lip of a deeper shade, the latter forms recalling *C. x Veitchii*, rather than *C. vestita*, with its white sepals and petals. The pseudobulbs approach those of the varieties *Turneri* and *Ragneri*, being elongated and strongly constricted above the middle. That it is no mere accidental variation, but a distinct race is clear, from the evidence derived from five racemes, from different plants, and two pseudobulbs, sent to Kew by Messrs. F. Sander & Co., of St. Albans, who have acquired a stock of it.

C. vestita and its varieties, together with two or three allied species, and the hybrids between them, form a very useful and interesting group, which flower from November to April. The original form, *C. vestita*, though discovered as long ago as 1826, did not appear in cultivation until 1848. In November of that year it was exhibited by Messrs. Veitch for the first time, when it was awarded a large Silver Medal. This was the form with the red eye, since known as var. *rubro-oculata*, and was sent from Moulmein by Dr. Kuno, together with the yellow-eyed form, sometimes considered as the type. The variety *Turneri* was also sent from Moulmein, by Lobb, at a somewhat later date, together with the two forms just named. It differs in its longer constricted pseudobulbs and somewhat smaller flowers, which appear later in the season; it is not clear to what these differences are due. The variety *Ragneri* resembles the last, except in the colour of its flowers; the sepals and petals are white, and the lip rose, with a crimson-purple blotch. Coming from Cochin China, we can more easily understand these differences, and recognise in it a distinct geographical variety. The Bornean variety now described is clearly allied to the two latter, but on the other hand, it possesses some affinity with *C. rubens*, Ridley, from the Langkawi Islands, off the west coast of the Malay Peninsula, according to the description of that plant. The remaining Bornean variety is wonderfully distinct. It is larger in all its parts, the pseudobulbs persist for two or three years, instead of perishing when the new one is developed. The leaves are also persistent till the time of flowering, and the very large flowers have a flame-coloured throat to the lip. This is the variety *igneo-oculata*, of Reichenbach, and has also the later names of var. *oculato-gigantea* and var. *grandiflora*. Wild specimens collected by Beccari at Sarawak show the same peculiarities as do the cultivated plants. This, too, is a very distinct geographical variety. The two other species of the group, namely, *C. labrosa* and *C. rosea*, are natives of Burmah, and though now rare in gardens, are specially interesting as having participated in the parentage of the distinct race of hybrids, which now so greatly surpass them in beauty. The distribution

of *Calanthe vestita* is rather interesting, because each geographical area has its own peculiar forms, and in geographical varieties we may readily recognise incipient species. Reichenbach speaks of typical *C. vestita* occurring in Java, but I have seen no specimens; and as he spoke of the variety *Turneri* as also coming from that region, there seems some slight suspicion of a mistake. *R. A. Rolfe*.

CLEMATIS BREVICAUDATA.

THIS pretty Asiatic species, figured in *Garden and Forest* for March 23, is a decided acquisition to the climbing autumn-flowering plants which can be cultivated in northern gardens. Botanically, it is closely related to the familiar *Virgin's Bower*, and, like that species, belongs to the section *Flammula* of the genus, distinguished by cymosely panicle, dioecious, apetalous flowers, with white, spreading, petaloid sepals, and stout, blunt anthers. It is a graceful plant, with slender stems, climbing 10 or 12 feet high, puberulous, dark green, ternately divided leaves, their divisions long-stalked, and divided into three ovate-acute leaflets, sharply and deeply cut above the middle, entire, and gradually rounded at the base, or three-lobed, and sometimes almost entire. The flowers are produced in ample pubescent panicles, rather shorter than the leaves, and open during the first half of September; those of the pistillate plants are followed by abundant showy fruit, with bright brown akenes, covered with pale hairs and slender plumose tails.

Clematis brevicaudata was sent to the Arnold Arboretum from the Museum d'Histoire Naturelle, in Paris, in 1836; in the same year seeds were sent to the arboretum by Professor Brooks, of the Agricultural College at Sapporo, in Japan, which have produced the same plant, although this species does not appear to have been found before in Japan. It has also come to the arboretum from the Späth Nursery, at Berlin, under the name of *Clematis paniculata*.

It flowers regularly every year in the Arboretum, and usually ripens an abundant crop of fruit early in October. *C. S. Sargent* in "Garden and Forest."

HIMALAYAN RHODODENDRONS AT PENLLERGARE.

THE Rhododendrons of the Himalayas are well represented in Sir J. T. D. Llewellyn's gardens at Penllergare, and when I beheld the various fine specimens, and observed the vigorous growths they have made for years past, and the grand foliage of the different species, I thought it remarkable that the only preparation found necessary, or that was made for the plants, was to trench the ground, the soil being very suitable for the growth of this genus.

My attention was at the first drawn to a fine specimen of *R. Thompsoni*, growing in a spot with a full south aspect in the kitchen garden, partially sheltered by a range of forcing-house, and this bush is about 14 feet in height and as much in diameter; it was covered with flower-buds, which, when fully expanded, will be worth going many miles to see. Planted round about this fine plant are some twenty of its seedlings, from 18 to 24 inches in height, and all as robust as the parent plant.

The main part of the collection is situated at one end of the pleasure-grounds, and in front of a belt of Scots Firs, some of the younger ones being planted between the Firs, thus obtaining the necessary shelter. Noticeable was a fine young plant of *R. Campbelli*, some 6 feet in height and diameter, which was about to open its flowers. *Rhododendron Aucklandi* was represented by a fine healthy bush of some 6 feet high, and as much in diameter. *R. Simonianum* was noted as being in vigorous health, and well set with flower-buds. Of this variety there were several specimens which will average from 7 to 8 feet in height, and the same may be said of the specimens of *R. ochraceum*. There are also several more fine young *R. Thompsoni* growing in the general collection, each of which is from 6 to 7 feet in height, and, like the specimens named first, smothered with

flower-buds. There are three varieties which call for mention, namely, the crosses between Thompson and Fortune, which Mr. Warrington, Sir John's able gardener, speaks very highly of.

Next to these are four other crosses between John Waterer and Aucklandi, which stand quite as high in Mr. Warrington's estimation as the others. That fine variety, *R. barbatum*, is represented by fine specimens, which range from 15 to 16 feet in height, and these are healthy and thickly studded with flower buds. Besides the above, scores of named varieties have been planted in various parts in the grounds, looking the picture of health. Some hundreds of seedlings are raised every year; many of these turn out to be of very good quality, and these are planted on the banks and slopes at the sides of the chief carriage roads, where they will in a few years make a magnificent show. *R. Milner*.

THE ROSERY.

ROSES FOR WALLS.

A WELL-CLOTHED wall of Roses is one of the prettiest sights imaginable, and with a little care in selecting the varieties most suitable for special soils and situations, this pleasing feature is not very difficult to attain. In the first place, it is almost impossible to succeed with a wall having an eastern aspect, unless this is sheltered from direct north-east winds by a building or stiff hedge. There are two periods during the year when any keen winds from this direction are particularly injurious to Roses, viz., during the hard frosts of winter, and again when the plants are commencing growth. Frost, accompanied by wind from this quarter, is doubly injurious; and later on in the spring, easterly winds will induce mildew, and many more of the ill effects are subject to. Providing the easterly wind cannot play directly upon the wall, it does not so much matter.

The best aspect for Roses on a wall or fence is due south. There is not sufficient attention given to the class of soil strong-growing Roses are grown in, this having a great influence upon their permanent usefulness. Such vigorous growers as Madame Bérard, Rêve d'Or, Madame Chauvy, and Maréchal Niel, must perforce have their growths properly ripened before winter sets in; but if these kinds are grown in damp and cool soil, they continue to make young wood up to the time they are checked by frost, consequently the long rods of growth are not matured, and the frosts of winter have a disastrous effect upon them. More than this, such wood as survives does not carry nearly so good a crop of flowers as would be the case in well-ripened growth.

In cool soils, Roses do not commence growth nearly so soon as upon warmer and more sandy composts; they also continue in growth much later in the season, with the injurious results I have already mentioned. Most of the climbing varieties do not commence to throw out their very valuable and sucker-like growth until the summer has well advanced, and the bulk of their flowering season is over. As these vigorous shoots are the most valuable part of climbing Roses, it is very essential that they be well matured, and I find a warmer or more porous soil induces them to break into growth earlier, and at the same time is not so conducive to late autumn growth as is the case with those having a moist and cool subsoil.

Whether one is cultivating the strongest-growing Tea-scented and Noisette, or the Banksians, I believe it to be much better to avoid too sappy and late a growth. Provided the wood is well ripened, flowers may be expected from almost every eye; to say nothing of the more satisfactory manner in which the growth will come through the winter.

We often hear our strongest growers described as being shy-flowering, but I am convinced this is more often than not owing to their wood not having been properly matured; when such is the case, I know of no shy flowerers among the climbing Roses.

Roses on a wall are exposed to sudden changes in the way of frost and thaw, and this is very injurious to any wood, more especially if not thoroughly ripened. Then, more care should be given to the pruning of these varieties than is generally the case. Far too often there is not enough of the old spur-

quite healthy wood. When treated in this way nothing can surpass the beauties of our strongest climbing Roses. I have more than once known the vigorous autumn growths to be cut away entirely, under the mistaken idea that they were useless, and, in short, were robbing the plants. Such is not the case, however, and even when one cuts them away, the main energy of the plant goes towards producing more of the same description of growth; so that no gain is secured by that style of pruning, and large quantities of good flowers are lost. *A. P.*

MOOREA IRRODATA.

Our illustration gives a representation half natural size, and a single flower of the actual size, of this fine and distinct new plant, for the full description of which we refer our readers to *Gardeners' Chronicle*, July 5, 1890. So far as is at present known, there is but one specimen of it, which was acquired out of an importation of Messrs. F. Sander & Co., by F. W. Moore, Esq., for the Royal Botanic Gardens, Glasnevin, Dublin, and in whose honour the generic name was given. The plant, which bears the nearest resemblance to a *Houlletia*, sends up stout spikes 2 feet in height, and this year it bore two of them; and on being exhibited at the Royal Horticultural Society on March 22, a first-class certificate was unanimously awarded it. The sepals and petals are bright reddish-brown, white at the base. Lip straw coloured, with blackish-purple markings, and the whole flower is waxlike in texture and very attractive.

THE BULB GARDEN.

THE HIPPEASTRUM (AMARYLLIS).

SOME remarks were made at p. 404 about the flowering of these plants being late this year. The early spring weather was unfavourable for the rapid development of any class of garden plants, and near London we have had as usual to contend with lack of sunshine. The flowering period of the garden varieties of *Hippeastrum* may be determined to a certain extent by the will of the cultivator. The flowering plants for instance pass into their resting period early in the autumn, and they are kept in a greenhouse temperature and dry; they are repotted some time in January, and a good deal depends upon their treatment after being repotted. We try to have our blooms about the third week in March, and I find the best flowers are obtained at that time; but in reference to this time of flowering and one or two other points of interest, I find some interesting remarks in the first volume of *The Florist*, published in 1843. It is well known that Dean Herbert was an enthusiastic cultivator of the *Amaryllidaceæ*, and produced very many beautiful garden varieties, most of them being unfortunately lost to cultivation. The article in *The Florist* was written by Mr. Carton, who was gardener to the Dean of Manchester at the time of his death. Mr. Carton states that the time of flowering of the *Hippeastrums* was between Easter and Whitsuntide. Now, we have the bloom nearly over by the middle of April, the plants in full growth, and plumping up their bulbs. Mr. Carton also states that many varieties were very fragrant; this is a point about which our plants cannot claim to equal the *Spofforth* and *Highclere* seedlings, and as Dean Herbert had collected many species now lost to cultivation, we almost despair of obtaining anything like them now; but we may be quite sure that the modern varieties far surpass them in regularity of form, and brightness and variety of colours.

Mr. Carton's system of culture half a century ago was much the same as I have recommended in these pages; but we may learn something from his method of treating seedlings, as with all our aids to cultivation, we do not gain, but are rather behind in the time required to flower seedling bulbs. Mr. Carton's directions are as follows:—"As soon as the seeds are ripe, sow in pots or pans, and place in a good heat;

FIG. 73.—MOOREA IRRODATA: SPIKE, HALF-SIZE; FLOWER, NATURAL SIZE; COLOUR, PALE BROWNISH-RED; LIP, WHITE-SPOTTED. (FROM A DRAWING BY MR. WEATHERS.)

like wood removed, and the younger and more vigorous shoots laid in their places. In fact, these strong growers should be pruned upon the same lines as a Morello Cherry, and care taken to retain as much as possible of the well-ripened wood of the previous summer, even to cutting away older but

cover the seeds with a little sand; when the leaves are 3 inches long, pot off, three in a pot, still keeping them plunged in heat, and shifting as required. Indeed, the treatment afforded to the Pine-apple, when properly grown, will nearly suit the Hippastrum. The leaves should never be allowed to die down before the bulbs have attained a flowering size, which will be in two years, if properly treated, after they are potted from their seed pots. A few will throw up their flower-stems the previous autumn, when the bulbs are in great luxuriance." No allusion is made to the system now generally followed of plunging the pots in which both the full-grown bulbs and small seedlings alike are growing, over the rims in a bed of tanner's bark, with hot-water pipes beneath; but this is a cultural method which is pursued by the best growers, and which gives the most satisfactory results. We plunged all our finest bulbs in this way on March 31, and the roots will soon begin to run over the edge of the pots, and to such an extent that the entire tan-bed will become full of them. I am now fertilising the best flowers, and expect to obtain ripe pods in July, the seed from these being sown towards the end of that month or in August. The sooner the seeds are sown the better, the earlier plants making the finest growth before the winter sets in; these young bulbs always retain their foliage during the first two winters, but they lose them when the bulb becomes fully grown.

The production of flowers seems to exhaust the bulb a good deal, which visibly shrinks as the flower-stalk grows and flowers are produced, until the outer coatings hang quite loosely about it, and this shrinking continues till the flowers are developed, and when these are removed, the bulbs rapidly get plump again; and in order that this accretion of materials in the bulb may continue steadily, the bulb should be grown under healthy conditions. If the plants get infested with thrips, red-spider, or bug, which are not at once cleared off, the check received is sufficient to prevent their flowering to a large extent the following season; whereas if they are grown in a stove temperature, and kept clean, at least 95 per cent. of them will flower. It is easy to know when to apply water to the plants if they stand on the plant stage, but when plunged over the rims, it is an uncertain proceeding; in any case, if water be afforded once a week, it will generally be sufficient. The tan-bed should receive a good watering once a week. It is better that the soil should be rather dry than wet, as in that case the roots have a greater tendency to run over the edge of the pots into the bark bed. If the tan should become, as it will generally, full of worms, if some quicklime be mixed with it, they will be destroyed.

J. Douglas.

DAFFODIL "PALLIDUS PRÆCOX" PREFERS SHADE.

During recent researches at Bayonne, where I have been for the first time in the flowering-time of Daffodils, I found pallidus præcox entirely confined to woods, generally to coppice so dense, that it must be entirely shaded early in April, and almost always on a northern or north-western slope. This led me, on my return to England, to examine the position of those in my garden, where they do well in some places, but not in others. Some planted on the north side of a tall shrubbery, where they rarely or never see the sun, have been named for at least twelve years (I had many pallidus præcox in my garden before the variety was in commerce in England), are still healthy and full of flowers. Many amateurs and nurserymen complain that they cannot manage this variety, and to those I would suggest that they try planting in the shade. C. Wolley Dod, Edge Hall.

MELONS AS CORDONS.

To obtain a quick and satisfactory crop, Melons in houses may be grown as cordons, especially when a number of varieties are to be grown in the same structure. It is not always an easy matter to get the full crop of fine fruit set and evenly swelling simul-

taneously, when the plants are trained with numerous side branches.

The plan in growing Melons as cordons is to plant thickly, say, about 15 inches apart. Train the leader up to the top of the wires, without pinching it at all if it shows signs of throwing out side shoots early; if not, pot, to it, to induce these side growths, and thus give an opportunity to obtain an early crop of fruit. Of course, it should be understood that I do not recommend this plan where the finest fruit is required, but only where a very early and quick crop is desirable. Instead of waiting for the setting of the full crop, I am content with two fruits, or, at the most, three to each plant, and which can easily be secured from the early formed side-growth. This individual thinness of crop is fully made up by the extra number of plants, from which a full crop of fruit can be obtained.

Directly the fruit is set, and safely swelling, the shoot growth is checked by pinching, thus preventing them extending beyond their limited space. By timely attention in this way, the foliage and growth does not become crowded, as might be imagined. By the concentration thus early of the growth of the plant into the swelling of the fruit, a crop is early brought to maturity. I am aware that some varieties are not adapted to this mode of treatment, owing to the vigorous growth they make during their early stage. For instance, William Tillery will seldom show fruit on the first bracts, and also being of great length between the joints in its growth, this variety is not adapted to this mode of culture, neither is it for the earliest crops in any form. For cordon culture, such sorts as Hero of Lockinge, Conqueror of Europe, Blenheim Orange, or the old Scarlet Gem, are most suitable for growing as cordons. S.

ORCHID NOTES AND GLEANINGS.

DENDROBIUM CRYSTALLINUM.

This is a deciduous plant, its young growth coming up at the time of flowering, so that the plant is not entirely devoid of leaves when this event takes place. During the growing season the plant should be kept in the East Indian-house, but when growth is completed, less life is necessary than during the period of active life, and at the same time the plant should be removed to a cooler temperature, with an abundance of air, sun, and light; here it may remain until all the leaves have fallen, and should then be kept cool and dry through the winter months. When spring returns, a little more heat and moisture may be given with advantage, which will start the young growths and the flower-buds into activity. The plant is best grown upon a block of wood or in a hanging basket, in good brown peat fibre and chopped sphagnum moss, but it does not require a great quantity of soil about its roots. *Orchid Album*, vol. x., part iii.

CHELONE LENTIGINOSA

may be grown either in a hanging basket or in a pot or pan; but in whichever it is planted, the drainage should be kept in thoroughly open order, using for soil good brown peat fibre, from which all the finer particles have been shaken, and with this a fair proportion of chopped sphagnum moss, the whole to be well mixed and pressed down firmly, leaving the plant a little elevated above the pot's rim. It should be grown in the East Indian-house, having a fair share of sun and light, and a plentiful supply of water to its roots, as well as in the atmosphere, but in the winter season much less will be necessary. *Orchid Album*, vol. x., part iii.

DENDROBIUM ATRO-VIOACEUM

is a robust and noble-growing plant, with persistent leaves, but it has not been in this country long enough to establish itself, and display its beauty in the fullest degree. The pseudobulbs are clavate, tapering downwards, where they become terete; they are furrowed, and have near the top two or three somewhat stout leathery leaves. The flower-

spike or scape is sub-terminal, erect, and the flowers large and nodding, the pedicels white, and the sepals and petals thick and fleshy in texture, ivory-white, or a creamy-white ground-colour, the petals especially being spotted with deep purple, the inside fainter in colour; the lip is of an intense deep violet-purple, the front lobe having a narrow marginal border of green.

This plant grows naturally in a hot, moist atmosphere, and one would imagine from the size of its pseudobulbs, that it was endowed with the means of withstanding a severe dry season; but this does not appear to be the case, for the moisture which arises, even in the dry season, enables this plant to bring its leaves and bulbs through without much injury. It should be potted or planted in baskets, and hung up near to the roof-glass, in order to allow all the sun and light possible to get at it; but yet a thin shading should be available during the very hottest part of the day in summer. It should be well drained, potted in good peat-fibre and sphagnum-moss, and the plant grown in the stove with *Crotons* and such-like plants, which require great exposure to sun and light, or in the hottest part of the East Indian-house, the atmosphere in either position being kept well charged with moisture. In the winter, although much less water will be necessary, it must not be allowed to suffer from drought. *Orchid Album*, vol. x., part iii.

DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY FUNGI.

(Continued from p. 473.)

MAIZE SMUT (USTILAGO MAIDIS).

MAIZE is not a crop grown in this country. It presents certain points of interest which render it worthy of our attention. In the first place, Maize is a very important food-stuff for animals with us, even if its annual consumption by the human subject in our own country is but small. Then, again, the smut itself has been recommended for use in medicine as a substitute for Ergot, although on insufficient grounds. It is, however, chiefly owing to facts elucidated by the study of its life-history, and the manner in which it gains entrance to its host, that renders this species of interest to us. It attacks the upper part of the stems, the upper leaves, bracts, but especially the ovaries, which it hypertrophies and destroys in a striking manner. The spore masses are dusty, olive-brown in colour, the spores subglobose, pale brown, as seen by transmitted light, and have the epispore closely covered by minute spiny projections. Brefeld found that they germinated much more freely in nutrient solutions than they do in water. The process consists of a protrusion of a germ-tube, some eight or ten times the length of the spore, which soon becomes septate, and produces numerous, narrowly elliptical, or fusiform gonidia. These very rapidly and very profusely bud off bodies similar to themselves—so rapidly that they form a whitish precipitate to the culture drop. Brefeld applied the gonidia to young plants just after they had emerged from the seed; he found the germ-tube of the gonidia entered freely into the embryonic tissues of the growing axis, and in the course of from two to three weeks produced spore-beds, which, in many cases, killed the plant. This process of rapid development of spore-beds in the growing tissues of the young plant, and not in the mature ovaries, is quite contrary to what happens with hant and smut, &c., where infection of the embryo causes disease of the adult plant. He therefore tried the effect of applying the gonidia to older plants, and found that, although they were powerless to infect mature tissues, yet they could and did the growing parts, the buds, and the heart of the plants. Plants of Maize a foot high were made use of for experiment; the opening leaves were unfolded, and the solution containing the gonidia sprayed into them, so that it came in contact with the growing point. In fourteen days the plant began to show signs that the experiment had been successful—spore-beds were

found wherever the gonidia had come in contact with the young tissues, but they had no effect on those leaves which were already developed. Many of the plants died outright; those which survived were greatly distorted by the fungus, so that they were bent down by the weight of the hypertrophies. In another series of experiments, it was found that by applying the gonidia by opening the sheath of the female flower, the whole ear became converted into a mass of smut as large as a child's head. That it was a purely local affection was shown by the fact, that if the infection was made into the ears at the lower part of the stem, they alone became diseased, while the ears on the other part of the same plant remained perfectly healthy.

THE ANTHR SMUT (USTILAGO VIOLACEA).

Reference has already been made to this species, which occurs in the anthers of *Lychnis diurna* and *vespertina*, with regard to the effect it has upon modifying the sex of its host; it will be remembered that under its influence the long recurved styles of the normal female blossom become replaced by short erect styles on the top of the ovary. The spores of

the very structure which insects have so many appliances for conveying from flower to flower. I had growing in my garden, not only diseased plants, but also a female plant which had been recently transplanted, and was free from disease. During the summer of 1888 this plant produced none but healthy flowers, with the long stigmata. To these stigmata I applied the spores of the *U. violacea*, with the object of seeing whether the seed produced would yield smutted plants. The plant died down in the winter, came up again, and opened its first flower on May 22, 1890, which, to my astonishment, had become stamiferous with all the anthers smutted. In the following year I repeated the experiment, and found that healthy adult plants can be thus infected.

Here, then, we have evidence of yet another manner in which the *Ustilaginæ* can, and do, infect their hosts, namely, through the flowers. Moreover, when the infection is once accomplished, the plant remains, as far as I have observed, permanently diseased. The only other point worthy of notice is this, that the affected plants appear to me to have the joints of the internodes of their stems larger and more swollen than those of healthy ones.

FIG. 74.—*DAPHNE BLAGAYANA*. (SEE P. 493)

the fungus are subglobose in form, from 6 to 9 m μ . in diameter, and of a violet colour. The colour is, of course, due to the epispore, which is further characterised by being covered by its network of elevated ridges. When placed in water, they germinate very readily, and emit a promycelium, which soon becomes divided by two or three septa from its walls laterally, as well as from the apex, gonidia are produced. These gonidia may emit germ tubes, capable of penetrating the host; or they may, according to Brefeld's observations, multiply themselves by budding in his nutrient solution.

The idea naturally presents itself that the fungus enters its host in an early stage of the plant's life, like the common smut and bunt. I, therefore, tried a number of experiments by infecting the young seedlings, but without success. Having the opportunity of watching the growth of the affected host-plants, I was struck by the number of bees which visited the diseased blooms, and it occurred to my mind that as the fungus located itself invariably in the reproductive organs of its host, that these insects might be the means of conveying it from one plant to another, especially as the fungus replaces the pollen,

THE FIG SMUT (USTILAGO FIGUM).

Another economic species of the *Ustilaginæ* which presents itself to us as a reproductive parasite is one affecting the common Fig of commerce. It occurs in the interior of the fruit, and makes its presence evident by converting the contents into a sooty mass. The affected Figs have a very unattractive appearance, so that when they are badly affected they are quite unsaleable. When the disease is less pronounced the external appearance of the fruit is unaltered, but on cutting the Fig across, the disease becomes very evident. It is found most frequently in those cheaper kinds, which are known in the trade as "natural Figs," but sometimes one comes across an example in the best varieties. The spores appear black in colour, but they are really a very dark violet. They are smooth externally, globose in form, and measure from 6 to 8 m μ . in diameter. I found they would germinate in pure water at a temperature between 10° and 13° C., but below this no efforts at germination were made. The process consisted in the emission of a promycelium, which was subcylindrical in form, from 20 to 150 by 4 to 5 m μ .; but, as far as my observation went, no gonidial development took place.

THE DATE SMUT (USTILAGO PHŒNICEA).

Dates, too, are also subject to the depredations of an *Ustilago*, the *U. phœnicea* of Corda. It, too, is met with in this country on the cheaper kinds of Dates. It closely resembles the Fig species in its spores, being dark violet, and of a similar form, but of rather smaller diameter—4 to 5 m μ . C. B. P.

FRUIT NOTES.

THE TRUE NORFOLK BEAUFIN, RED AND STRIPED.—Is it true that these valuable long-keeping English Apples are now hardly saleable in some of our markets? and can the Editor of the *Gardeners' Chronicle*, or some of his many experienced readers, say how it comes about that the Normandy Pippin, full of core and pips, has almost driven the Beaufin as a dry and pressed Apple, out of our markets. I have recently tried to purchase Beaufins at various large grocers overflowing with Normandy Pippins, and not one kept nor knew anything about them?

A gentleman also told me the other day that he could not sell his Beaufins, because the dealers said they had no flavour. Well, of course, that might be true if eaten raw, in contrast with such fine Apples as we get from the States, Canada, Tasmania, Africa, But well stored Beaufins—dried or pressed, or even in pies late in the season, are not to be despised, and I should personally prefer them to the much-lauded Normandy Pippin which I should characterise as small, spotty, seedy, I had almost said mealy.

THE NORTHERN SEY APPLE.

Having lately seen some fine samples of this excellent Apple from Canada, I should be glad to hear the experience of the readers of the *Gardeners' Chronicle* in the culture and marketing of this fine Apple in England.

THE NEWTOWN PIPPIN APPLE.

Similar experiences concerning this Apple would greatly oblige. From the large proportion of inferior samples of this in the English market this year, it does not seem to prosper so well in America as it used to do, and it surely seems possible to succeed with it in favourable sites as a profitable market Apple in England. D. T. F.

VEGETABLES.

CELERY—IVERY'S NONSUCH.

I BELIEVE it was fifty years ago when Seymour raised the first solid Celery, and ever since then we are yearly having new kinds brought under our notice, until now there is no difficulty in having Celery at the table during seven months of the year. I usually grow Sandringham for my first crop, which is followed by other white kinds, lasting until the new year, when we have a large breadth of the pink or red kinds, which are, I think, harder than the white, and stand the winter better. But my latest variety is Ivery's Nonsuch. This is really a delightful variety, hardy and late, large, solid, and sweet and tender, although it is now the middle of April. I think I must mention one more kind, a great favourite here, viz., Early Rose; it is delightfully tender, and has a fine nutty flavour. It is well to encourage the garden labourers to grow Celery where there is a market for it; some of my men pay half their rent with it, but it is needless to say that it is greedy of moisture and all sorts of good things, so that in sandy soils, or where there is a scarcity of water, it would not pay cottagers to grow it for market. J. Rust, Eridge Castle.

SPRING GROWTH OF TREES.

READING the whole of your article, p. 336, carefully, I arrived at what appeared to me very definite conclusions. Taking the first case advanced by Mr. Mer, viz., young trees of twenty-five years and under, growing in plantations, he says the first signs of growth appear in the youngest shoots at the top branches, thence spreading into the older portions of the branches, and lastly into the centre and base of the stem, or trunk.

Growth, here shown to take a downward course, appears in the roots from ten to fifteen days later. The conclusions I arrived at regarding this can, I think, be accounted for in no other way than this,

viz., that the top branches and their extremities being the only portions exposed to direct sunlight and heat—the all-powerful agents in animal as well as vegetable growth—are by their influence forced into active growth first; indeed, to me it would be very singular if a tree in such a position should first show signs of growth in any other portions.

Taking the second case—young trees in isolated positions—the facts given are somewhat different, and may not be quite so readily understood, but may, I think, be still accounted for, and by the same agency. Trees, young or old, when isolated, are entirely different in their manner of growth; instead of the attenuated, upright branches, as exhibited by nearly all trees in thick plantations, they will here show a truer form. The lower branches will extend in keeping with the head; this will be broad and round; the whole of the branches will, more or less, have that graceful, pendulous habit, so characteristic in a well-grown Lime or Beech, as an isolated tree on many an English lawn.

This pendulous habit of the branches would thus favour a more equal distribution of sunlight and heat along their entire length; and besides, as is well known, branches of this character, or those whose tips are depressed by artificial means, at once exhibit a more uniform growth, by checking, as gardeners say, a too free flow of the sap towards their extremities. This can be clearly seen in the case of trees trained on the horizontal principle. By attention to this we can, even at the extreme top of young healthy trees, where gardeners say the sap flows freest, and where, at any rate, we invariably find the strongest shoots are made (although this, in the case of trained trees, can be easily accounted for) by depressing a strong shoot give additional strength to a weaker, so much so by a lengthened continuation of such treatment as to reverse their original positions; and not only this, but we can so regulate the growth in such a shoot in its earlier stages as to cause the buds to break from its base upwards instead of downwards. In fruit trees against walls, and those trained to trellis work under glass, or in such a position that the branches are evenly distributed to secure an even growth, and also secure an equal amount of sunlight and heat, we do not find growth begin in the manner as set forth by Mr. Mer. As an instance of the above, take Apricots on walls and Peaches inside. We find the flower-buds on the bottom branches quite as forward as those nearer the top, and even the basilar buds on these branches as forward as those at their extremities.

I had an excellent object lesson on this fact the other day while walking along the public highway in Sussex. The road was bounded on the north side by a belt of high trees; on the sloping bank were Briars, Blackberries, Gorse, Heath, &c., in wild profusion. These, under the influence of a mid-day sun, were freely breaking into bud and leaf. I examined these carefully, and found that the branches, where exposed their whole length, and sloping hither and thither athwart the bank, were breaking equally all over, but much more forward where the rich, warm, red soil here and there formed the background; where this was formed by grass, the buds were considerably more backward, but were still uniform where equally exposed. I looked in behind and amongst the shoots, but there the buds were scarcely broken, and in many cases not at all.

Presently, the boundary wood came to an abrupt termination, but the sloping bank continued, and this was surmounted by an old splashed hedge of Hazel, Oak, &c. It was just here that I obtained pointed proof of what I wish to advance with regard to this question of the progress of growth. At the lower edge of this bank, and right up to past the middle, growth was here as well developed as in the sheltered portion opposite the wood, but beyond this and at the top of hedge it was very far behind. Briar shoots, and especially Blackberries, had their buds well developed in the lower portions, the latter almost an inch in length, while the top portions where these shot up into and amongst the thin twigs of the Hazel had scarcely moved a bud, the Hazel also showing

this in a most marked manner, as I pulled several branches down to satisfy myself.

When Mr. Mer examined trees growing singly, and those in plantations sparsely enough that their woody layers were thicker at the base, he found that growth commenced at the swollen portion of the trunk almost simultaneously with the extremities of the upper branches; where, however, this basilar swelling was not sufficiently marked he did not find this to be the case. When it is observed that isolated trees, and trees in thin plantations, are the only ones invariably accompanied by large basilar swellings, the earlier growth here may, I think, be safely attributed to the same agency and forces. An isolated tree with large basilar development, forming an angle in some cases as much as 45°, upon which the sunlight and heat can play for the greater part of the day, presents a striking difference to one embedded in the heart of a forest. That the other parts of such a tree, *eg.*, middle, top, and centre, and base of branches springing therefrom, should show a more retarded growth, is what we should expect, as those essentials and necessities of plant life, heat and light, are here so much more obscured. *Pomum.*

(To be continued.)

THE SEED TRADE.

NEW PEDIGREE PEAS AT READING.—An old seed grower of large experience remarked a few days ago that there were a great many so-called new Peas being introduced, but he considered they were no better, if as good, as those grown thirty years ago. One could not but accept his opinion with great respect, but it had to be taken with large deductions. It is, no doubt, true that the natural sportiveness in the Pea has enabled selections to be made, and the large majority of our new varieties have been obtained in this way. But some of them—those obtained by Mr. H. Eckford and others from systematic cross-fertilisation, and several of the carefully-made selections, have certainly added some fine sorts to our Peas, though they leave much yet to be accomplished. This fact has for several years past impressed upon Messrs. Sutton & Sons, the well-known seed merchants of Reading, and in 1886 they carried out a series of important crosses with two definite objects in view among others: one was to improve the early varieties by obtaining Peas as early as Ringleader, with large well-filled pods of the finest quality, and free cropping; and also to add to the main crop varieties, Peas as fine in quality as the best of the tallest of them, but of dwarf, branching growth; sturdy, heavy croppers, large pods, and of the most approved table quality. Several crosses of the well-known varieties were made, some account of which appeared in the *Gardeners' Chronicle* last year, and one that has proved pregnant with the best results, was that made between American Wonder and Royal Jubilee. The former is well known as an early and very dwarf Wrinkled Marrow; Royal Jubilee is one of Messrs. Sutton & Son's main crop varieties, remarkable for the size and fullness of its pods. The seedlings from this and other crosses, of which mention was made at the time, were carefully tested and selected in 1887, 1888, and 1889, and last year a number of them were full of rare promise.

A further trial this year, in a season somewhat hostile to presenting to view the seedlings in the best character, has tended to confirm the favourable impressions of last year; the most promising of the selections made in 1890, have improved, rather than retrograded, and it must be admitted that Messrs. Sutton & Sons have in their hands selections of very early, dwarf, round, and wrinkled seeded Peas of a very high order of merit. Two of these early types have been named, owing to the stock carefully selected year after year, having increased in bulk sufficient to warrant their being sent out the next season. One will be known as Sutton's Bountiful, it is as early as the Earliest Blue or Improved Ringleader, decidedly larger in the seed, and considerably larger in the pod; the latter is deep

green, and comes near to those of Telephone in size, long pointed, and it is a particularly prolific cropper—height about 2½ feet. A large extent of this Pea, not supported by sticks as in the case of the trial samples, was being grown for stock; and here it was as good in every respect as in the trial rows, and remarkably uniform in character. This variety promises to make a revolution as far as the Pea-pods seen at early exhibitions are concerned.

Fine and promising as this variety is, there are yet remitted for further trial selections as good in every respect as Bountiful, but remarkably dwarf and singularly prolific; 18 and 21 inches in height in a season when the plants went much to haulm in the pod of Telegraph, and other varieties. In breeding for these dwarf early Peas, Ringleader for earliness, and Chelsea Gem for dwarfness, earliness, and quality combined, were employed, and with the best results. The great task which Messrs. Sutton & Sons have to master is to decide what to reject; the average goodness makes the matter of selection one of difficulty. That a pod of Peas saved from a fertilised flower should present such extraordinary variations is one of those incidents which in the gardeners' practice comes very near to the miraculous.

Another very fine early variety is named Empress of India, which will be distributed next spring. It is from Sutton's Improved Early Champion and Telegraph. Here, again, a highly interesting and most promising batch of seedlings resulted, varying in a remarkable degree in height, colour, and shape of the seed, colour, shape, and size of the pod, &c. Empress of India grows from 2½ to 3 feet, bears large, long, white pods, remarkably well filled, as large as those of Telegraph, but so much earlier, and the seed wrinkled. A number of very fine types from this cross will undergo another test this season; and it is only by growing them together for several years, and carefully noting their varying characters, that the best selections can be made.

The new seedling main crop varieties are not less remarkable. President Garfield, Sutton's Perfection, and others of the finest types of mid-season Peas, were used as seed and pollen parents, and from a number of seedlings, one which has received the name of Sutton's Main Crop has been selected for distribution next season. In height it is about 2½ feet, with very large and handsome pale green pods, filled with ten large Peas of excellent flavour; it is very productive. As an exhibition variety this must take a high place, and as a garden Pea it seems to be perfect in every respect. But it is only one of a number of others equally worthy of being named, some with pale, others with deep green pods; some blunt at the tip, others pointed, but all of superb quality.

Messrs. Sutton & Sons are to be congratulated on these important results. The labour of planting and selecting the seedlings year after year has been great, and they are to be commended for having sedulously grown and selected their seedlings for several years, subjecting them to a severe test, in order that a thorough fixity of character should characterise those selected for naming and sending out. *Pism.*

CHINESE ECONOMIC PRODUCTS.

A GREAT deal of attention to economic products seems to have been given of late by the British Consuls in China, from some of whose reports to the Foreign Office the following notes are obtained.

TABLET TEA.

Referring to tablet tea, a subject recently taken up in the *Kew Bulletin*, the Consul at Hankow writes:—Tablet tea is manufactured at Hankow in factories belonging to Russian firms here. It is made of the finest tea-dust procurable. The selection of the dust is the work of skilled experts, the cost of the dust varies from 10d. a pound upwards. This dust is manufactured into tablets by steam machinery. About 2½ ounces of dust are poured into a steel mould on a steel cylinder. The dust is poured in dry without steaming

and the pressure brought to bear is 2 tons per tablet. Great care is required in the manufacture and packing of tablet tea, and the cost is comparatively high. The tablets are wrapped first in tinfoil, then in expensive and attractive paper wrappers, and finally packed in tin-lined cases for export to Russia. The tea, it is stated, loses none of its flavour by being pressed into tablets, and as tablet tea is only one-sixth of the bulk of leaf tea, it is most convenient for travellers, and also for importing into the remotest parts of Russia.

It is suggested that it may be worth the while of our commissariat to test this tablet-tea, with a view of supplying our army with tea in a portable form.

The export of tea-dust from Hankow rose from 140,933 lb. in 1889, to 736,729 lb. in 1890, which is said to be due to the fact that, while Indian and Ceylon teas are ousting Chinese tea from the British market, many consumers being accustomed to the flavour of Chinese tea wish for it. To meet this demand, the grocers use Chinese tea-dust to flavour Indian tea. All the tea-dust exported finds its way to Great Britain.

Under the heading Brick-tea, the Chinese customs class what are really two commodities, which resemble each other in being shaped like bricks, and in being made of tea. The first is made of tea-dust, and is consumed in Russian Siberia; the second is made of tea leaves, stalks, and refuse of the tea-dust bricks, and is consumed in Mongolia. Both are manufactured at Hankow in factories belonging to Russian firms. Tea-dust brick-tea is made from common tea-dust, and adheres by pressure, after being steamed in a cotton-cloth bag for a moment. The pressure is hand-pressure, i.e., the quantity of tea-dust required is placed in a bag, and after being steamed is poured into a wooden mould, and is pressed to the required consistency by blows from a heavy mallet wielded by one of the labourers. The cost of the common tea-dust is between 1½d. and 1¾d. per lb. The cost of manufacture, export duty, packing, &c., about doubles the price; so that the cost on board ship for export from Hankow amounts to about 2½d. per lb. About 300 lb. to 400 lb. of brick-tea go to a basket made of light bamboo. Two baskets form a camel-load. Brick-tea is in bulk about one-sixth of ordinary tea. Formerly much of the brick-tea reached Urga by going up the Han River, and thence through the Ning-usia gate in the great wall of China. In 1890 all the brick-tea exported from Hankow through the Imperial Maritime Customs went by steamer to Tientsin, whence it found its way—the tea-dust brick-tea to Russian Siberia, and the other brick-tea to Mongolia, through the Chang-chia gate in the great wall. In Mongolia, where the nomad population of herdsmen have little use for money, their tents, clothing, food, and temples, being supplied by their flocks, brick-tea forms a standard of value, and convenient medium of exchange, as it is in universal demand for food. A brick or half a brick of tea is placed in a copper coffee-pot-looking vessel, and boiled up with mutton-fat and butter, and the food is eaten hot in a liquid condition.

Quite recently, a new commodity has appeared on the Hankow market, to which the customs give the name of log tea. It is an inferior tea, with stalks, packed in the shape of logs, which weigh from 8 lb. to 80 lb. each log. The tea is wrapped in the leaves of the *Bambusa latifolia*, and then reduced in bulk by binding round the log with lengths of split bamboo. This log tea is sent to the Chinese ports for consumption, and is packed thus from motives of economy both of packing and of freight.

JAPANESE VARNISH.

On the subject of Japanese varnish, or lacquer, obtained by tapping the trunks of *Rhus vernicifera*, the following remarks are made:—"On this tree, before daylight, incisions are made; the gum that runs out is collected in the dark, and strained through a cotton-cloth bag, leaving behind a large amount of dirt and refuse. This operation can only be performed in the dark, as light spoils the gum, and causes it to cake with all the dirt in it. It cannot

be strained in wet weather, as moisture causes it to solidify. When the Chinese use this varnish, they rub it on with a sort of mop or swab, made of soft waste silk. It should only be used in wet weather, for if the atmosphere is dry when it is rubbed on, it will always be sticky. As used by the Chinese, the varnish takes about a month to dry. It is possible that the celebrated Cremona varnish may have had in it some of this gum as one of its ingredients. It might be worth the while of our musical instrument makers to make experiments with this gum, with a view to producing a varnish that would give a mellow instead of a glassy sound."

The writer of the above paragraph seems to be unacquainted with what has recently been done in experimenting with violin varnishes, and also with the fact that the Rhus varnish requires special treatment, the secret of which seems to be known only to the Japanese. Moreover, the varnish itself is more of the character of a lacquer than a true varnish, as we understand the term.

WHITE WAX.

White wax, the produce of *Coccus Pala* on twigs of *Fraxinus* and *Ligustrum*, is described as "particularly hard, and used in China for casing tallow candles." The export of this wax decreased in 1890 nearly 40 per cent., the causes of which are said to be, first, the increased use by Chinese of kerosene-oil, causing a decreased demand for tallow-candles; and, secondly, in England the extended use of paraffin candles and of electricity, reduced the selling price of white wax in Shanghai to below its cost of production. It would seem, therefore, that unless a cheaper mode of production can be discovered, or other uses for the commodity be found, the interesting industry of producing white wax is a doomed one.

CAMPHOR.

Writing from Tamsin under date of April 10 last, Consul Holland thus speaks of the camphor industry: "Next to tea, camphor is the most interesting, and might be the most important export from this district. The supply seems, for the present at all events, to be inexhaustible, though with their usual improvidence the natives make no attempt to plant young trees in the place of those they cut down, and the natural consequence is, that camphor has to be looked for further and further inland, that is in the savage territory. The Chinese camphor burners are protected by soldiers supplied by the governor, who repays himself for the expense by levying a tax of 80 dollar-cents (about 2s. 6d.), a month from each furnace. The camphor, which is in the form of a dirty white powder, is taken to certain depôts, where it passes into the hands of the camphor headmen, through whom it reaches the foreign purchaser. Last year, camphor was supposed to be in great demand for the manufacture of smokeless powder, but as a matter of fact it was simply a speculation on the part of some firms in England, and its market value at Hong Kong went up enormously, reaching as high as 50 dollars (about £8 10s.) per picul of 133½ lb. avoirdupois. At that time, when camphor was a Government monopoly, there can be no doubt that the Governor must have made a lot of money, seeing that he was paying about 8 dollars (say, £1 8s.), a picul to the producers. That monopoly has now been broken up, and foreigners are free to purchase camphor under a transit-pass. The price in Hong Kong has gone down considerably, but it still pays a handsome profit of over 30 per cent., and a very large increase on any previous year's shipments is confidently anticipated for the present year. The loss of weight between Tamsin and Hong Kong is sometimes as much as 20 to 25 per cent., owing to the crude way in which the camphor is prepared. If foreigners could only get permission to introduce machinery, and show the natives how to express the oil—which is valuable—and compress the residue into rock-camphor, a business might be started which, for a time at least, might well replace the decaying tea trade. The improvident waste of material is most deplorable, seeing that it takes nearly fifty years for a camphor

tree to grow to a size that will pay for the extraction of its camphor, and meanwhile, not a tree is ever planted in the place of those cut down."

The remarks here made throw a new light on the camphor industry in China; indeed, they are contradictory to what is generally believed in England to be the state of the case, where it is authoritatively stated that the great demand for camphor in the manufacture of smokeless gunpowder is the chief cause of its scarcity and high price.

FORESTRY.

BERRY-BEARING COVERT SHRUBS.

(Continued from p. 461.)

The common Bearberry (*Arctostaphylos uva ursi*) was at one time known by some botanists as an *Arbutus*. The genus comprises several species which are natives of different parts of America and the North of Europe, where they inhabit dry, rocky ground at high elevations; and when planting Heather ground in the deer forests of Scotland, I have found the above species in similar situations. It is an evergreen, the stems, branches, and twigs of which creep along the surface of the ground among the rocks, and as they are well clothed with small glossy leaves of an obovate shape, they present a furnished appearance to such places. It is a remarkable hardy plant, in every sense of the word; it neither fears the cold of winter, nor the heat of summer. It is quite at home on the elevated and wind-swept spurs of the hills where the soil is thin and scant, and consists principally of the abraded particles of rocks almost of a pure inorganic texture; it is proof against the attacks of hares and rabbits, while in winter it is generally loaded with pretty red berries, which are eaten by all kinds of winged game with avidity. In early summer it produces its pretty pink or reddish-coloured flowers in racemes on the twigs and branches, which imparts an ornamental appearance for some time. Such being a brief outline of the merits of this shrub, it is to be regretted that it is not used to a larger extent than it seems to be as a covert plant for the embellishment of dry banks, and clothing bare rocky places, and improving woodland scenery. Amateurs should use this plant along with others to furnish their small rockeries and other places where space is limited.

The Alpine Bearberry (*A. alpina*) is a deciduous species indigenous to many parts of Northern Europe, Canada, and some of the mountain ranges in the Highlands of Scotland. Like the former species, its natural home is on poor Heather-ground at high elevations above sea-level, where it forms a creeping or trailing shrub, clothed in summer with dark green leaves of an obovate shape, and serrated around the edges. In autumn, when these begin to lose their vitality, they assume a reddish colour, which makes a fine contrast with other plants in their vicinity of a different tint of colour. It produces its pretty little flowers of a light pink colour in early summer; the berries, which are of a black colour, are generally ripe in autumn, and much relished by winged game of all kinds during winter. Being deciduous, it cannot be recommended as an ornamental plant all the year round; its principal merits are, that it grows on poor, thin soil, on cold, inhospitable situations on the hills, and affords food for game where few other plants could exist. *J. B. Webster.*

TREES AND SHRUBS.

DAPHNE BLAGAYANUM. (See Fig. 74.)

THE above is a perfect gem, and to-day (March 22) I have counted upwards of one hundred expanded trusses on one plant of deliciously scented and creamy-white flowers. Those in want of an evergreen shrub of procumbent habit about 10 inches high, quite hardy and suitable for planting on a rockery or the front lines of a shrubbery, will not

err by adding this one to their collection. Here in the west of Ireland we have it planted on the rocky in a mixture of peat, loam, and sand. It is afforded a south aspect, as by so doing the young growths get well ripened. To heighten the effect of the plant when in bloom, a number of bulbs of *Scilla sibirica* were 'planted last season, and the contrast of deep blue and creamy-white add greatly to the beauty of the whole. The *Scillas* are planted round about the shrub, and where the branches are a few inches apart. *H. May*, Markree Garden, Collooney, Ireland.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

COOL ORCHID HOUSE.—Success in this department, as in others, depends to a great extent upon the condition of the atmosphere maintained therein, for Orchids may be well potted, and the potting material may be of the best, but unless due regard be paid to ventilation, damping-down, and shading the houses, and the maintenance of a suitable atmosphere about the plants, they will fail to grow satisfactorily. The proper admission of air from without is an important factor in Orchid culture, but it must at all times be admitted carefully. The weather we are now having is rather trying to the Orchid cultivator, the cool, drying winds and the bright sunshine calling for constant attention on his part. It is then better to shade well, and admit but little, if any, air, by means of the ventilators at the top of the house, and to keep the paths, stages, and other surfaces moist, and as the nights are still cold, a little artificial heat should be afforded. *Vanda Amesiana* and *V. Kimballiana* grow best in this house; and the necessary renewal of the sphagnum moss in which they are planted should be carried out now, the roots, which love to ramble at will in the damp atmosphere, having begun to grow anew. *Vanda cœrulea*, a beautiful Orchid, and considered by many to be the best of the genus, is not one of the easiest to cultivate, it being found to grow freely under certain conditions in one garden, while in another it will fail partially under identical conditions. As with other difficult Orchids, it is generally a question of experiment before the right place can be found among any of the existing structures for growing it. My own experience with this species of Orchid is, that it requires a good rest while inactive; but during the growing period, it should have all the encouragement possible in the matter of extra heat, light, and moisture. I therefore rest the plants from about the end of October to March, in a cool or intermediate temperature near to the light, and where they get a good deal of fresh air, and afford them enough water to preserve the leaves from shrivelling. In March the plants are removed to a warmer house and placed in a sunny position, and abundant moisture supplied. When the lower leaves of the plant drop off it has a somewhat bare look, but it is better to let it be so than to cut the stem at the bottom in order to lessen the height of the plant, a practice that greatly weakens it, and entirely does away with the possibility of new side growths coming from the stem which would re-clothe it in due time.

CELOGYNES.—These for the most part grow best in an intermediate house; *C. speciosa* and *C. Dayana*, however, do better with more warmth than that house affords. *C. cristata*, though easily grown, should not be parted or disturbed, as it resents it, but this is sometimes necessary, as a large mass of pseudobulbs becomes at length debilitated, and the new pseudobulbs grow less and less. When this time has arrived, the mass should be re-potted in peat and sphagnum, and not more broken up than is really requisite. *C. cristata* can be cultivated in a cool house, but it grows best in the intermediate house, and after re-potting it should be kept somewhat shaded and moist, so as to favour quick re-establishment. This species delights in supplies of weak liquid manure while growing.

DISAS.—These having been kept in a cool greenhouse during the past winter, may now be removed to a cool frame facing north, be well shaded from the sun, kept generally moist and cool, and syringed or sprayed with a fine rose water-can night and morning. *Disas* are also strengthened by the use of weak liquid manure at intervals.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Mereworth Castle, Maidstone.*

FIGS.—These being usually supplied from the nurseries in pots, may be turned out on their arrival and planted, taking care that the soil about the roots is thoroughly moist throughout, and water should be afforded again after the soil is returned to the hole. In planting them, the roots should be disentangled, and evenly spread out on the soil at the bottom of the hole, and not buried deeply. A border for Figs should be made of the best enduring materials, and for the purpose there is nothing better than fibry loam, burnt earth, old mortar, a good sprinkling of bones, or some decayed manure, all of which should be well mixed together, and firmly trodden when in a moderately dry state. Figs do well in some parts of the country if not much restricted in growth. Brown Turkey and Brunswick are varieties very suitable for south walls, and there they usually fruit well.

Pruning may now be done, taking care not to tip the leading shoots, as it is on these that many of the fruits are produced; the branches should not be allowed to get crowded, but all sappy and useless shoots should be cut away, remembering that the shorter the growth the better it will ripen and fruit. Trees whose roots are restricted require assistance almost annually, and the best way of affording it is by top-dressing them with a compost like that given above, first removing a part of the top soil, and tramping the new soil after it has been put on and levelled. During the growing season a few applications of tepid manure water should be afforded in good quantity.

GRAFTING.—This work should be finished with despatch, now that the bark will "run" well. Keep the scions with their butt ends in water till required, and then carefully put them on the stocks, and bind moderately tight with wet, broad strips of raffia bast, or ordinary matting, and clay them over carefully. Of varieties of Apples of which it is desirable to graft, the following are excellent:—Prince Albert, Lord Grosvenor, Lord Derby, Stirling Castle, Tower of Glamis, Caroline, Biemark, Warner's King, Ecklinville Seedling, Filbasket, Northern Greening, Brmsley's Seedling, Gooseberry Apple, and Wellington, where it does well. Amongst dessert varieties are Margil, Summer Goldings, Cox's Orange Pippin, Ribstone, King of the Pippins, Blenheim Orange, Golden Knob; red Quarringtons are useful Apples of good quality. Pears, if espaliers, may be worked on the upper sides of the branches, which should be shortened back, but it is useless to graft old Pear trees, for, although they may fruit well for a time, they soon give out. Early grafted trees should be examined to see if the clay has cracked, filling up the cracks, if any, with fresh puddle.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Gardens, Swansea.*

SEEDLINGS.—The seedlings of the following kinds of plants should be transplanted, and potted on as soon as they are large enough to be conveniently handled, viz., *Gloxinias*, *Petunias*, tuberous *Begonias*, *Coleus*, *Celosias*, *Cockscombs*, *Torenia*, &c. Those of *Cockscombs* should be potted in thumbs or small 60's in a light rich soil, never allowing them before they show bloom to become the least pot-bound, that is until they are in their flowering pots. *Gloxinias* and tuberous *Begonias* should be pricked off into boxes or pans, and when large enough to be potted off they should at first go into small 60's. It generally happens that some of the seedlings are stronger than others, and these should be lifted carefully, without disturbing the others, which should be left till they are also large enough to pot. The *Torenia*s, so well adapted for pot and basket culture, when the seedlings are large enough, should be pricked out singly into small pots, repotting them into larger-sized pots as soon as their growth requires it, and support the young plants by tying them to neat sticks. A hotbed-frame is the most suitable place in which to grow all of the above plants whilst small, keeping them well up to the glass, and shading them during the bright weather.

POINSETTIA PULCHERRIMA.—Plants which have been at rest may now be started by placing them at the warmer part of the stove, and syringing them twice a day, to ensure the shoots breaking freely; and if the soil in the pots has become very dry, thoroughly soak it with tepid water. When the plants are fairly started into growth, occasionally apply manure water.

MISCELLANEOUS.—Young plants of *Stephanotis floribunda*, and *Allamanda* of species, which were struck from cuttings towards the end of last summer, and wintered in small pots, may now be repotted into 9-inch pots, for the potting making use of a rich compost, and potting firmly. Also, young *Croton*, which have been propagated this season, may be shifted into 5-inch pots as soon as sufficiently well rooted, employing a rich fibrous loam, with plenty of sharp sand added to it. Rich colouring is indispensable in *Crotons*, and to obtain it, the plants should be grown in a brisk humid temperature, and in as light a position as possible. *Draenas*, *Dicentra*, *Alcaeos*, *Pandanus*, *Maranta*, *Ficus* *Parcellii*, *Sanchezia nobilis* variegata, *Crotons*, &c., will require to be freely syringed to keep the foliage clean, and should any of the specimens become infested with red spider or thrips, the foliage should be thoroughly cleaned with soapy water and a sponge. Close the ventilators of the stove and its supply pits about 2.30 p.m., so as to husband as much sun-heat as possible, and freely syringe the plants and bare surfaces, as walls, paths, &c.

GREENHOUSE RHODODENDRONS.—Any which have finished blooming, and need more root-space, should be repotted, but over-potting must be avoided, and the most vigorous varieties will not require pots more than two sizes larger than those they were previously growing in. One important point in the cultivation of these plants is good drainage; and the best compost is fibrous peat of good quality, to which should be added sufficient sharp sand to ensure porosity. When potting the plants, make the soil firm round the old ball, by means of a potting-stick, and ensure enough space being left to hold sufficient water to thoroughly moisten it. It will be advisable to keep repotted plants somewhat close until the roots have commenced to grow, and if they are syringed lightly overhead in the afternoon on bright days, it will be very beneficial. Any shoots which may be taking an undue lead may be slightly bent downwards, and made secure in that position. The newer varieties are a great improvement on the older sorts in colouring, size of truss, and of bloom, and, with a judicious selection, these plants may be had in bloom during the greater portion of the year.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

VASES.—Well-filled vases are conspicuous objects in most flower gardens in summer, and the earlier that these are filled with plants the better will be their decorative value. Where the vases are not yet filled with spring-flowering subjects, they should have a layer of crocks placed at the bottom, with a few rough pieces of the compost put over these. The compost may consist of three-parts best loam, and one of leaf-mould and horse-droppings, the latter being sifted in a 3-inch sieve; to these some coarse sand or road-sweepings may be added. Tastes differ in the manner of planting vases. In geometrical gardens, with beds in pairs of separate colours, the vases, if standing near the beds, may also be planted in pairs; that is, each pair of vases are filled with one colour only, say scarlet, pink, and white *Pelargoniums*, &c., these sometimes being edged with blue *Lobelia*. Some people fill their vases with mixed colours, using as plants for the centre *Fuchsias*, *Pelargoniums*, *Marguerites*, *Heliotropes*, and the fern-like *Grevillea robusta*, planting round the edges *Mignonette*, *Petunias*, *Lobelia*, and such gracefully-growing trailers as *Marrubium*, *Barclayana*, *Thunbergias*, *Tropaeolum*, *Lobelia*, *Mesembryanthemum cordifolium* variegatum, and *Madame Crousse*, and other *Pelargoniums* of the Ivy-leaved section. Vases thus planted are certainly more picturesque and preferable to those filled with one colour only. But whichever style be adopted, the vases might with advantage be filled at once, watered, and stood in some of the houses for a week or two, when they could be stood in a sunny sheltered situation out-of-doors, where a little protection can be afforded them at night until towards the middle of May, when they may be placed in position. Or where sufficient accommodation does not exist in the vineries, &c., the vases may be stood in sheltered positions as soon as they are planted, treating them at night as advised above.

SOWING SEEDS OF HARDY ANNUALS.—A good display may be made during the summer and early autumn by annuals alone, as well as by making judicious use of them in conjunction with other plants. The seed may be sown in rows, patches, or

separate beds, as the sower pleases. In any case the ground, assuming it to have been manured and dug, should be trodden, and the surface raked over prior to sowing the seed thinly. This should be covered to the thickness of a quarter of an inch, with light, sifted soil, made firm with a board or the back of the spade to compress seed and soil, afterwards watering it through with a fine rose. The plants should be thinned out when large enough to handle, so as to give them space to properly develop. To want of attention in this matter is to be attributed many of the failures experienced with annuals. Dull, showery weather should be chosen for thinning the plants, and, in the absence of rain at the time the work requires to be done, water should be afforded before and after the thinning as occasion may require. In addition to the list of annuals recommended to be raised under glass in the *Gardeners' Chronicle* for March 12, p. 335, the following species and varieties are well deserving of a place: *Chrysanthemum* Cloth of Gold, a showy golden-leaved variety, height 2 feet; *C. coronaria*, double white flowers, height 3 feet; *C. Dunneii*, double golden, 2 feet; *C. modorum* plenissimum, pure white flowers, 18 inches; *C. purpureum*, purple flowers, varying slightly in shade, 2 feet; *C. segetum grandiflorum* (Corn Marigold), bright yellow, 2½ feet; *Clarkia pulchella marginata pleno*, bright magenta, margined white, 1 foot; *Collinsia bicolor*, lilac and white flowers, very attractive; *C. candidissima*, pure white, excellent for clumps in borders, ribbon lines, or as an edging to beds, 9 inches; *C. grandiflora*, showy dark purple, 1 foot; *Cereopsis tinctoria*, flowers yellow and brown, 3 feet; *C. atrosanguinea*, dark red flowers, 3 feet; *C. Drummondii*, large yellow flowers, produced in abundance, 18 inches; *Erysimum arkanasanum*, bright yellow, 18 inches; *Linum campanulatum*, beautiful large yellow flowers, 18 inches; *L. grandiflorum album*, white, 18 inches; *L. perenne*, blue, 18 inches; *Love-lies-Bleeding* (*Amaranthus caudatus*), the dark crimson drooping plants (2 feet high), being very effective; *Lupinus nanus*, blue, 1 foot; *L. subcarneus*, deep blue, 1 foot; *L. Hartwegii albus*, pure white flowers, 2 feet; *Malope grandiflora*, dark crimson, 2 feet; *M. grandiflora alba*, white, 2 feet; *Godefia Lady Alberman*, crimson-rose, 1 foot; *G. White Pearl*, is quite an acquisition to the older varieties of this plant, 1 foot; *Mignonette Golden Queen*, and *Garaway's Double White* are everything that can be desired in the "fragrant weed"; *Nasturtium* Tom Thumb, gold-orange colour, 1 foot; *N. Crystal Palace Gem*, sulphur-yellow, 1 foot; *Nigella damascena* (Love-in-a-Mist), lavender-blue, a very beautiful Larkspur-like flower, 1 foot; *Poppy* (Papaver) pavonium (Peacock Poppy), scarlet with black ring, flowers in clusters, 1 foot; *The Shirley*, is a beautiful selection of the *Ranunculus-flowered Poppy*, the range of colours extending from pure white through the most delicate shades of pale pink, rose, and carmine, to the deepest crimson. To the above list should be added *Nemophila insignis* and its varieties, including *N. atomaria atro-cerulea*; and being only 6 inches high these hardy annuals are most suitable and useful and effective subjects for small beds, edgings, vases, &c.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

TOMATOS.—The earliest batch of Tomatos will require almost daily attention in the way of keeping down lateral growths, so as to confine the plants to single stems, and tying the growing points to the wires or stakes. I prefer to have the stems on the top side of the trellis, as they are then secure against a possible break-down when heavily loaded with fruit, should the ties give way. Top-dress the beds whenever the roots are in full possession of the soil, and supply the plants abundantly with water on the first signs of dryness. Plants in pots may be assisted with bone-meal to which about one-third of superphosphate of lime has been added. For succession crops, the bare spaces in Peach or orchard-houses may be utilised, and planted with seedlings raised this spring. The best results cannot be expected in such places; nevertheless moderate fruit are obtainable. Pots or tubs can, however, be used, and the plants grown in these instead of in the border at the cost of a little extra labour.

CUCUMBERS now in bearing will be benefited by a more extended root range, and the frequent applications of liquid manure. In top-dressing the beds,

a richer compost may also now be employed than that in which they are growing. In order to augment the supply of fruits, stop all shoots at the second leaf, and repeat the practice with the growths which spring from these. The lower laterals may be allowed to spread themselves over the border, and a crop may be taken off them also. Another plantation may be made, to come in later on; also another sowing for planting in frames. The varieties which I grow are Rollison's Telegraph, Lockie's Perfection, and Tender and True, all of which do well in houses or frames. This spring I had a variety sent me for trial which apparently has no name, although it is a variety held in esteem by some gardeners because of its hardy constitution, and freedom to bear; it is represented to be a cross between *Ne Plus Ultra* and *Syon House*, and so far it seems to be worthy of the good opinion expressed of it by the gardener who gave me the seed.

MELONS.—These plants are now growing apace, requiring frequent stopping, tying, and fertilising. Fruit swelling should be early provided with supports, and the plants themselves liberally treated. At this stage a good surfacing should be afforded of the same kind of ingredients as those of which the hills are formed, together with a fair proportion of horse-droppings. This will induce strong growth, and enable the plants to swell large fruits. Repress all subterminal shoots. Plants fruiting in pots may be supplied with a mixture of farmyard liquid manure and superphosphate, the whole being well diluted with water. At first every alternate watering may be of this kind, but its strength may be increased, and the frequency of its application accelerated with the age of the plants until a period when the fruits are near ripening. Another planting of Melons may be made, and seeds sown for succession. It is still early to commence frame culture, so if there is accommodation in a house for them, even although only for a few plants, it will be better to leave the frames for another month. Otherwise, hotbeds, 3 feet high at the back, and 2 feet at the front, should be got ready, and in preparing them a margin of 2½ feet beyond the frames all round ought to be allowed for linings. After placing the frames on these hotbeds, put a good barrow-load of compost in the centre of each ash, and allow it to become warm before the plants are transferred to it. Allow two plants for each heap, and plant them so that the soil reaches their cotyledons; well water the soil, and damp the whole interior of the frame when the work is finished. A little shade may be necessary for a few days if the weather be bright, and the plants must be stopped at their fourth leaf, which will secure six or eight breaks under each light, and will enable the grower to obtain the same number of fruits on the same space; shut up the frames in the afternoon, and cover them with mats at night.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

THE MAINCROP CARROTS.—This crop should be sown in drills, 12 inches apart, and for the longer-rooted sorts, 15 inches apart is not too much. For winter use and good keeping generally, the Intermediate type of Carrot is the best, and the best of these is Veitch's Matchless Scarlet, which is an improvement on the old Intermediate variety. For summer use a few rows of the Early Scarlet Horn may be sown. If the ground is in good condition for sowing, and the "maggot" is troublesome, the drills should be drawn, and a dressing of wood ashes and soot spread over the land before the seed is sown. As a top dressing, guano has advantages, if care be taken to use it in wet weather, as the grub is then less troublesome and growth is rapid. Fresh unmanured ground should always be selected for Carrots.

TURNIPS.—A larger sowing should now be made of Early Snowball, and to succeed it, the Red Globe. Sow in drills, 15 inches apart, and let the plants of the first stand at the same distance apart, the Red Globe at 18 inches. Rich land, fully open to the sun, is necessary to promote quick growth, sowing the seeds thinly, after first covering them with linned oil, and then with red lead. Earlier sown Turnips should be thinned, and the Dutch hoe passed through the lines frequently, but these roots being intended for using when quite young, will need much less thinning than maincrop roots.

CAULIFLOWERS which were wintered in frames

and are now planted on borders, will be making progress and should have the soil drawn up to the bottom leaves. Another lot may now be planted in the open quarters to follow the earlier planted ones. If the plants are of small size, draw drills before planting them; this will protect them from wind, which is the more necessary if the plants were raised in heat. A sowing should be made of the Walcheren for late use. The Autumn Giant, if it was sown in heat, should be pricked off in a good compost in a sheltered place, and covered for a short space of time with lights or hand-glasses, an open quarter being reserved for the plants.

CABBAGES.—Those raised in heat will require similar attention to Cauliflowers, and should be planted before they get "drawn." The autumn-sown plants should be kept clear of weeds, and the gaps in the lines made good. As soon as the first lot of Cabbage is used, no time should be lost in clearing the ground, in readiness for some other crop, digging it deeply, and well manuring it for some shallow-rooting crop, or reserving it for Celery.

BORCOLE AND SAVOYS.—Seeds of these plants should now be sown in beds thinly, to prevent weak growth. Sow broadcast, and thin them out when large enough for pricking out, an operation of great assistance in light soils, although it causes a little more work. The Borcoles or Kales being very valuable winter vegetables, good breadths of them are desirable. A small sowing of early Broccoli should also now be made, viz., Veitch's Self-protecting Autumn Broccoli, Snow's Winter White, and some of the sprouting varieties, for early and late use. I do not advise sowing the main crop of Broccoli till the first week in next month.

THE APIARY.

By EXPERT.

TWO QUEENS IN ONE HIVE.—At the last conversation (March 16) of the British Bee-keepers' Association, a Kentish Bee-keeper (Mr. Wells) gave an interesting account of his system of working his stocks by having two laying queens to each hive, and by which means he achieved some extraordinary results last season. He stated that in the spring he had twelve stocks, one of which, however, was found to be queenless, and gave no surplus, so that it need not be taken into account. From the remaining eleven his yield of honey was 312 one pound sections, and 1069 lb. of extracted honey, making in all 1381 lb., or an average of 125½ lb. per hive. In addition, he had ten swarms, each too large to go into any skep he possessed, and no doubt if swarming could have been prevented, his take would have been much larger, as the one hive that did not swarm yielded between 180 and 200 lb. The honey and wax sold realised £35 16s. 9d., and after deducting the year's expenditure, £8 9s. 8d., a balance of £47 7s. 1d. remained to the good. His mode of procedure in arranging to have two queens to each stock was to form several nuclei the year previous, and in the autumn these were put into the other hives, but divided from the bees therein by a perforated wooden divider, the holes not being large enough for either workers or queens to pass through. They wintered in this way successfully, and were very strong in the spring, except the one stock previously mentioned. When the time for supering came, a queen excluder was placed over the frames, and all the worker bees had access to the upper chambers. The hives necessary for working on this system must be very large, and capable of being storified to an almost unlimited extent, as the population is enormous, and, of course, two entrances would be necessary. The results obtained are all the more remarkable as last season was not a really good one, and other bee-keepers in the immediate vicinity were stated not to have obtained any surplus from their hives worked in the ordinary way.

FEEDING.—The bees have been revelling in the glorious weather we have lately experienced, and have made great inroads on their stores. It is most important to see that none runs short; and if a regular supply of food is kept up, no check will occur in the egg laying of the queens, and the hives will be in a fair way to be crowded with bees when the time comes, not far distant, to put supers on. Syrup, in the proportion of 10 lb. of lump sugar to seven pints of water, is the best food to use now, and should be given at the rate of about half-a-pint a day, and, preferably, warm.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, APRIL 19.—Royal Horticultural Committee, at the Drill Hall, James Street, Westminster.

THURSDAY, APRIL 21.—Linnean Society.

SATURDAY, APRIL 23.—Royal Botanic Society.

SHOWS.

TUESDAY, APRIL 19.—Auricularia and Primula Society's Show, at the Volunteer Drill Hall, James Street, Westminster.

SALES.

WEDNESDAY, APRIL 20.—Begonias, Ferns, Roses, &c., at Protheroe & Morris' Rooms. Collection of Border Plants, Coif-fers, Laurels, &c., at Stevens' Rooms.

FRIDAY, APRIL 22.—New and other Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—48°·9.

Colonial
and Foreign
Fruits, &c.

It says much for the enterprise of the growers, and of our merchants and shipowners, that on one day recently there were on sale in London Oranges from Florida, Palermo, Jaffa; Pears, &c., from the Cape; Tomatoes and Potatoes from Teneriffe, and varied contributions from Spain, Portugal, and "elsewhere." It goes without saying, that all were in good condition; the prices are known to the consumer. One unaccustomed to the thing—say, "from the country"—would be apt to get confused in his ideas as to the time of year; the weather, however, seldom leaves us long in doubt as to that. Respecting the approaching arrivals from the Antipodes, Sir EDWARD MADDER, the Agent-General for the Tasmanian Government, tell us that the P. & O. steamer "Victoria" will be the first vessel to arrive from Hobart with Apples. She was due in London on the 13th inst. She will be followed at weekly intervals by the following vessels of the Orient Steam Navigation Company and Peninsular and Oriental Company:—"Oroya," "Oceana," "Orizaba," "Valletta," "Orient," "Aroadia," "Ormuz," "Ballarat," "Orotava," "Parramatta." (The names of the Orient Company's steamers all commence with an "O.") In addition to the foregoing steamers, the steamships "Elderslie" and "Port Pirie" were to load in March,

and the "Port Victor" in April, sailing from Hobart direct for London.

A London newspaper last year gravely informed its readers that arrangements were being perfected by which luscious fruits from Italy would "shortly be hawked about the streets of the metropolis at prices which would bring them within the reach of the very poorest;" and it was added, that the poor Italians of such localities as "Saffron Hill" and "Back Hill" would be endowed by some unknown benefactor with oster-mongers' barrows from which they could dispense the aforesaid luxuries. But, alas! the seasons have come and gone, the barrows have not been put in evidence, and the poor of London are still without cheap Italian fruits. But Rome was not built in a day, and Robert Bruce is not lacking imitators in all walks of life; and it may come to pass, that even if our own ordinary "oster" has to take the matter in hand, we may find the Italian grower competing with his English fellows by the edge of metropolitan kerbs. A gallant effort has been made by an Italian-British company to bring fruits and vegetables from Italy to this country in ships provided with refrigerators of ample size, but owing to some miscalculation—one cannot get at the exact facts—there ensued a lack of success—to put it mildly. But the Company deserves to succeed, and if they have made careful note of all the circumstances surrounding their failure, they may soon have to score a win. But will the Italian grower back those who are trying to stir him up? That is a moot point, the answer to which is somewhat dubious. Growers in the north of Italy have been offered help to enable them to extend their operations, but they appear to be satisfied with the existing condition of things. They can sell all they grow at home. They object taking any risks in competition with foreigners—they are satisfied with their own sunshine. Is it not enough? Again, it had been suggested that Italian wares should be better or differently packed. Men were sent out from London to teach the packers for shipment how to do it. They remained for a season, and when they returned to Monument Yard, things are stated to have fallen back into the old rut! And so the matter rests—or is supposed to rest, for it is possible that a surprise is in store for us; and, so far as we are permitted to see, it will be one.

Fruit
Prospects.

THESE are, on the whole, most promising, the promise consisting of two special features—the lateness and the abundance of the bloom. We have lately had special facilities for noting both features over considerable areas, and this enables us to confirm all that Mr. KIPLING, of The Gardens, Knebworth, says as to the exceptional lateness of Apricots and other blooms this season. It is a most unusual thing not to find a single Apricot, Peach, or Pear in bloom until April, even in counties and districts so widely apart as Suffolk and Sussex. As closed buds of these and other species are safe against 10° or 15° of frost, we may hope for good in the forthcoming season, unless, indeed, the brilliant sunshine that distinguished the last two days in March has caused the tree to come into blossom so swiftly as to endanger the crops. But here the stinging East wind blowing abreast of the summer-like warmth of the sun, comes in as a possible saviour of the bloom. The touch of ice in the night air succeeding the summer heat of unclouded April sunshine also moderates the speed, and may thus do the fruit-grower a good turn. Anyhow, a late-

blooming time mostly means a plentiful harvest of fruit. Plums, too, notwithstanding the break-down crops of last year, show well. Apples, also, are full of flower, and exceptionally backward. And as favouring the theory of the mutual help afforded by Apple trees and Mistletoe to each other, it may be mentioned, that the most promising and earliest Apple tree seen by the writer this year in the county of Sussex was one thus aided and fostered with the parasite. Has anyone tested by direct experiment the correlative action of lichens and moss on fruit trees? To see the extent to which these latter are tolerated in many orchards, one might imagine that the novel doctrine of symbiosis had been firmly rooted in the faith and practice of British horticulturists for years. Certain it is, the life of lichens, mosses, &c., has freely mingled with that of Apples, Pears, Plums, Cherries, Currants, etc. for years, whatever may be proved in the future with regard to Apples and the Mistletoe living in romantic fellowship—for their mutual good. We should be disposed to clear off the lower or lesser forms of life from the stems, branches and twigs of fruit trees, and so reduce the harbour and egg-laying ground of hosts of moths and caterpillars, and thus rendering the smearing, washing, dusting, and spraying of such pests out or off much more easy and efficient.

ROSE BANK, MALVERN.—In our issue for December 5 of last year we gave an illustration from a photograph of a view in the garden of Mrs. Wilmot. The special feature as described at p. 677 of our last volume by a correspondent, consists in the summer bedding, and, in particular, in the extensive use of tuberous Begonias. That the garden is not dependent on such attractions alone is shown by the companion illustration which we now give (fig. 75), and which shows a wealth of foliage and a diversity of surface which must be very pleasing.

LINNEAN SOCIETY.—At the evening meeting to be held on Thursday, April 21, 1892, at 8 p.m., the following papers will be read:—"On some New Plants from China," by W. B. HEMSLEY, F.R.S.; 2, "On the Relation of the Acaridae to the Arachnida," by H. M. BERNARD.

CYPRIPEDIUM CHAMBERLAINIANUM.—Amid the multitude of objects shown at the fortnightly meeting of the Royal Horticultural Society on Tuesday, the one that excited most interest was a plant of *Cypripedium Chamberlainianum*, exhibited in flower by Messrs. SANDER. It justified all that has been said of it, and showed that our figure, p. 241, did no more than justice.

VANDA DENISONIANA.—Another specimen, remarkable for its good cultivation, was the white-flowered Vanda known as V. Denisoniana, and which was grown by Mr. G. HANSFORD, gr. to J. ELVES, Esq. A better testimonial to Mr. HANSFORD's skill could not be desired.

MOSELEY ROSE SHOW, BIRMINGHAM.—This is an entirely new addition to the Rose exhibitions held in the month of July, and will take place on the 19th and 20th. It will take place in the grounds of Moseley Botanical and College Gardens, and in addition to valuable prizes for cut Roses, there are classes for groups of plants and bouquets. The show arrangements will be carried out by Mr. WILLIAM DEAN, Sparkhill, Birmingham.

THE "BOTANICAL MAGAZINE" for April contains coloured figures and descriptions of the following plants:—

Lilium primulinum, t. 7227, is a very pretty new species of Lily from the Shan States in Upper Burma, and which had been confused with *L. neilgherrense*. It differs from that species, says Mr. BAKER, in its shorter and more open tube, brown anthers, and style as long as the perianth segments.

The flowers are 5 to 6 inches long, pale yellow, with a broad funnel-shaped tube, and strongly recurved segments. It was introduced by Messrs. Low & Co.

Habenaria longicalcarata, t. 7228.—A native of the western mountains of the Indian Peninsula, and remarkable for the large three-lobed white lip, and especially for the greenish spur at its base, which is prolonged to a length of 5 to 6 inches. Introduced by Sir Mountstuart Grant Duff, who flowered it at York House, Twickenham, formerly the residence of H.R.H. the Comte de Paris, once famous for the

Journal of Horticulture, November 5, p. 388, fig. 76. It differs from any previously described in the very short, broad, curved corolla-tube. The interior of the tube is white, the limb spreading, with five broadly ovate lilac lobes. The solitary leaf is none other than one of the two seed-leaves developed into an ovate, oblong, subcordate, downy leaf. It was discovered in the Transvaal by Mr. GALPIN, who describes it as growing in crevices of cliffs and under rocks, only on the tops of the mountains. Kew.

Beaufortia sparsa, t. 7231.—A West Australian

savine plant is *Lychnis floecuculi plenissima* semperflorens of Ad. Muss. Should it come before the Floral Committee, we trust that body will refuse to recognise so objectionable a name. A more excellent way would be to call it *L. floecuculi* Muss' variety.

INTERNATIONAL FRUIT SHOW.—Honey is intended to take a prominent place at the International Fruit Show to be held on the Thames Embankment next October. A schedule of prizes has been pre-

FIG. 75.—VIEW IN GARDENS AT ROSEBANK GARDENS, MALVERN. (SEE P. 496)

collection of terrestrial Orchids, so well grown there by the gardener, Mr. NEEDLES.

Cirrhopetalum ornatisimum, t. 7229.—An extraordinary species, with four-sided pseudobulbs, from the top of which a solitary leaf is produced, while the tall, slender flower-stalk springs from the base, and bears at its apex a tuft or umbel of reddish-orange flowers, each of about 3 inches long, $\frac{3}{4}$ inch wide. The upper shorter sepal, and the two side-petals, bear fringes or tuft of bright red scaly hairs. The two side-sepals are deflected downwards, are twice the length of the upper sepal, and are pink-spotted. The lip is minute, fleshy, and crimson. Kew.

Streptocarpus Galpinii, t. 7230.—This is a new species, described by Sir JOSEPH HOOKER in the

Myrtaceous shrub, with ovate-lanceolate leaves, each about half an inch long. The flowers are borne in the axils of the leaves near the top of the stem, and are densely crowded, so as to form cylindrical masses, surmounted by the upper extremity of the branches, the leaves of which have no flowers in their axils, so that the axis appears to grow through the flower-spike. The flowers are crimson, and each bears five stamens, each of the five dividing into numerous subdivisions. Kew.

A HINT TO THE NOMENCLATURE COMMITTEE.—We note in the *Gartenflora* a figure and description of a double-flowered "Ragged Robin, *Lychnis floecuculi*." The name given to this unoffending but

pared, more than £50 being offered, and it is expected that most of our colonies and other honey-producing countries will be represented as well as all parts of the United Kingdom. There are several classes for cottagers, and the other classes include prizes offered for collections of comb and extracted honey of not less than 50 lb., or more than 150 lb.; twenty-four 1 lb. sections; twelve 1 lb. sections, best design in comb honey, &c.

FOLIAGED PLANTS FOR ROOMS.—While there are several handsome-leaved foliated plants which are well adapted for culture in rooms and halls, the one best suited to the purpose is *Aspidistra lurida* and its variegated variety. Well suited as some of

the Palms are, and the India-rubber plant, still the *Aspidistra*, with its thick and somewhat leathery leaves and shining surface, from which a dust deposit can be cleansed so readily, seems to claim to take the top of the list. A plant known to exist in good condition for two years in a room, seems to illustrate all the characteristics of a first-rate subject. The variegated variety appears to last as well as the green type, and they both will stand a good amount of shade and imperfect light. Too often the *Aspidistra* is allowed to suffer for want of water, and it should not be in too great a dry warmth of atmosphere. It is more of a moisture-loving plant than is generally supposed, and we have found plants do well when standing in an earthenware pan, with about an inch of water in it; it is a plant that well repays attention and cultivation. Next to the *Aspidistra* comes *Ficus elastica*. It is an excellent subject for culture in living-rooms, as gas, a dry atmosphere, and dust, do not seem to affect it; it grows quickly, and when well looked after, is always ornamental. We have seen examples grown in this way, in comparatively small pots, that have kept their leaves in good health right down to the base, and of a good green colour. It is a matter of attention. What is required is, that a damp sponge be passed over the leaves daily to remove the dust; it is an attention that has an important bearing upon the well-being of the plant. It is a subject requiring plenty of pot-room for the first three or four years, shifting to larger sizes as fast as the pots become filled with roots. It is a large absorbent of water, and a very slight dressing of some fertiliser, such as Standen's Manure, once a week or ten days, will be found of great value. The best Palms for rooms are *Geonoma gracilis*, *Scaevola elegans*, *Phoenix rupicola* and *reclinata*, the *Kentias*, and *Latania borbonica*. *Phoenix reclinata* is of a stiff habit, but there is a toughness about the foliage which adapts it for house culture. The broad dark shining green leaves of the *Latania* are well known. All three are plants of slow growth; the soil should be fairly stiff and well drained, and a deep rather than a wide pot appears to suit them best, as they go down and afterwards spread laterally. *Yucca recurva* should be placed among the best indoor evergreen plants. Its long lance-shaped recurved leaves are of a thick texture and easily cleansed. It is a subject of graceful habit, and looks remarkably well on a side-board. It does best in a rather strong loam, well drained, and the pots standing in an earthenware saucer containing some water. It is the dry atmosphere of rooms that tells against plants, and so the daily sponging is a matter of supreme importance. And they always seem grateful for a summer shower. They can be stood out in it for a short time, and then returned to the house greatly refreshed and invigorated for further service.

THE BARTRAM HOUSE AND GARDEN.—In the old stone house the great fireplace has been filled up, but few other changes have been made. The building is full of curious turns and cubby-holes. Back of the sitting-room, in the wing of the building, is an apartment with large windows looking toward the south, which was the botanist's conservatory. Here were reared such plants as could not stand a Pennsylvania winter—gathered in Florida or the Carolinas, or sent from Europe. In 1853 a *Handbook of Ornamental Trees*, by Mr. THOMAS MEERHAN, was published, the main purpose of which, as stated in its preface, was to describe the trees then in the Bartram garden. After Mr. EASTWICK's death, the fate of the garden was for some time dubious. In 1882, Mr. THOMAS MEERHAN became a member of the Common Council of Philadelphia, and at once introduced a scheme for the establishment of small parks for the city, in which the Bartram place was included. Repeated re-elections enabled him to follow the matter up, and finally, in the spring of 1891, the city took possession of the property, and put a superintendent in charge of it. The great gale of September, 1875, and some fifteen years of neglect have had their effect among the trees, but

many planted by the botanist's own hands yet remain. It should, says *The Popular Science Monthly* for April, be a source of gratification to all cultivators of science that this relic of the beginnings of botany in America is now assured of preservation.

AGRICULTURAL STATISTICS.—The Board of Agriculture has issued, in pamphlet form, a statistical record, showing the estimated total produce, and the average yield per acre, of the principal agricultural crops of the United Kingdom in the year 1891. The general results are shown in the annexed table:—

Crops.	Estimated Total Produce.		Yield per Acre.	
	1891.	1890.	1891.	1890.
Wheat	Bushels. 74,127,700	Bushels. 75,995,883	Bushels. 31.30	Bushels. 30.66
Barley	79,555,089	80,793,525	34.72	35.23
Oats	166,472,428	171,296,404	40.46	41.54
Beans	10,694,376	11,559,633	29.83	32.77
Peas	5,777,445	6,312,910	28.23	28.71
Potatoes	Tons. 6,090,047	Tons. 4,829,214	Tons. 4.74	Tons. 3.83
Turnips	29,741,587	32,002,201	13.40	14.27
Mangels	7,558,216	6,708,889	18.60	17.76
Hay from Clover, Sainfoin, &c. ...	Cwts. 85,566,162	Cwts. 97,045,740	Cwts. 31.39	Cwts. 33.19
Hay from permanent pasture ...	187,832,776	192,375,600	28.13	30.81
Hops	436,716	285,629	7.78	5.26

The estimated results, when thus contrasted, show that less Wheat, Barley, Oats, Beans, Peas, and Turnips, and very considerably less hay, are reported to be available this year (1891) than last (1890). Against these reductions an increased production of Hops, Mangels, and Potatoes has to be set. The Potato increase occurred almost wholly in Ireland, where this crop has yielded 4 tons to the acre in place of 2½ tons in 1890. The reduced produces in most other items is largely due to the smaller acreage under certain crops. Thus, while the estimated yield per acre of the Wheat crop is reported somewhat to exceed that of 1890, there were over 90,000 fewer acres carrying Wheat in the United Kingdom. In the case of hay, a series of lower yields, and, it may be added, a generally poor condition, are rendered still more important by the large reduction of well-nigh half a million acres in the surface mown in 1891. It must be further borne in mind that the unit of measure, viz., the imperial bushel, employed by the collectors of these statistics, is believed to have generally represented in 1891 a considerably lighter weight of grain than would in average seasons be its customary equivalent. The tables show that in the past year's harvest only one corn crop in Great Britain presented an excess over the acreage yield of 1890. Subject to the not unimportant qualification above referred to, Wheat is reported as exceeding by half a bushel per acre the yield of the preceding season. Barley shows nearly a bushel less than in 1890, and Oats are upwards of 2½ bushels below that crop. Beans are materially, and Peas slightly, below the yields of 1890, and both these crops are also below the standard. In root crops the reports place Mangels above and Turnips below the estimate for 1890, while Potatoes, with an average yield of 5.73 tons to the acre, are somewhat above the 1890 figure, but below the high level of 6.19 tons reported in 1889, and below the 6.11 tons taken six years ago as the normal standard of production in Great Britain.

THE ALMOND.—Everywhere round London the Almond may now be observed to be very full of blossom. Can we accept the fact as prophetic of a good bloom on fruit trees all round? Perhaps as far as the stone fruits are concerned, we may. Everywhere Plums appear to be covered with blooming buds, judging from what one can see in the fruit gardens of Middlesex. A correspondent states that he has a standard Green Gage Plum that last year gave the best crop he ever had, and yet it promises

to be as full of blossom as then. From what may be seen and heard, on walls and in the open alike, Plums show a rich promise, but whether the harvest of fruit will be equal to the promise remains to be seen. The Almond is one of the very best of our spring flowering hardy deciduous trees, and is well adapted for forecourt gardens. It succeeds well on the gravel and on the clay, but it is more fruitful on the former than on the latter. Objection may be taken to the Almond on the ground that it is too large for small forecourt gardens; but judicious pruning, thinning and shortening, can keep the head within bounds, and prevent to some extent, what is frequently seen in the case of trees utterly neglected in the matter of pruning, where the blossom is towards the circumference of the tree, and but little in the centre of the head. But by careful thinning and shortening, a compact head can be maintained with blossoms all over the bare branches. It is a good suburban tree, doing well in gardens in thickly-populated districts, even where a good deal of smoke abounds.

FRUIT CULTURE IN LANCASHIRE AND CHESHIRE.—The extension of the culture of small fruits in Lancashire is said to be largely on the increase; the Apple crop is not large in either county, but Gooseberries, Currants, and other small fruits are produced in large quantities for the Manchester and Liverpool markets. From 1890 to 1891 the small fruits acreage in Lancashire has increased from 1794 acres to 2162 acres, there being included in the latter return 1288 acres of small fruits grown in orchards, which indicates that Lancashire fruit-growers are making the most of land at their disposal, by cultivating Apples, Pears, Plums, and Damsons with small fruits on the same ground. Land other than that used for orchards or market gardens has also been utilised for the growth of small fruit to the extent of 400 acres. In Cheshire the acreage of small fruit lands is much less than in Lancashire, though it is said the lectures on fruit growing recently delivered in that county by direction of the county council, have awakened interest in the subject, and it is said will lead to an increased output. In Lancashire the greatest increase in the fruit area may be said to have taken place in the Fylde and on the Cheshire boundary, where the climate is more suitable for successful fruit culture than in the more exposed parts of the country. In his book on fruits and fruit-trees, Mr. LEO H. GRINDON points out an interesting fact. In dealing with the Gooseberry, he points out that the value of the nrispe Gooseberry can hardly be over-estimated. "To those classes in particular, of the working community whose occupations keep them much indoors in shops and manufactories, Nature, in early summer, supplies few things more healthful. Indoor workers require a larger amount of the description of acid such fruits contain than is needed by people who get plenty of fresh air, and for them the green Gooseberry comes in abundantly and cheaply."

PRIMULA FORBESII, as shown from Kew on Tuesday last, is a new Chinese species, with oblong, long-stalked leaves, and with wiry-flower stalks, with whorls of flowers as in *P. japonica*. The flowers are small lilac with a yellow eye. Probably after a short time the plant will improve under cultivation.

A MONSTER TREE FOR THE CHICAGO EXHIBITION.—A Californian big tree has been selected in Tulare county to be shown at the Exposition. A committee of the Board of Trade, after an extended tour of inspection, picked out a tree measuring 87 feet 9 inches in circumference at the base, 85 feet at 5 feet above the ground, and 65 feet at a height of 16 feet.

ERICA HYEMALIS.—In the columns of *Garden and Forest*, Mr. WATSON gives an account of this popular plant. The most singular circumstance about it is, that no one seems to know how, when, or where it originated. The Latin name given to it would lead the unwary to suppose that reference to

a botanical text book, or local Flora, would supply all necessary information. But this is not so. Some careless horticulturist gave the plant a Latin name instead of a garden name, and, consequently, has entailed unnecessary trouble and vexation of spirit upon his successors. Mr. WATSON concludes that it is a winter-flowering form of *E. perspicua*.

MANITOBA.—Those desirous of information respecting this wonderful Canadian province should consult the official *Handbook*, issued by the Manitoban Government. That its statements are not exaggerated, will be admitted by those who remember the wonderful display made in the Indo-colonial exhibition a few years ago. The Government agent is Mr. A. J. McMILLAN, 33, James Street, Liverpool, from whom this pamphlet may be obtained.

CARDIFF HORTICULTURAL SOCIETY.—The fourth show of the above, which is to be held on August 17 and 18, says Mr. H. GILLET, the secretary, promises well, the committee having carefully revised the schedule and added to the amateur and fruit classes. Energy, however, is greatly lacking on the part of many would-be exhibitors, which if it could be created and applied in the right direction, would make the show one of the best in the provinces.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of this Society was held at the Caledonian Hotel, on Monday evening last, and the chair was taken by Mr. G. W. CHAMBERS. The election of new members was first proceeded with, ten more being added to the list. Two cheques were granted to the nominees of members who have died, viz., Mr. BENJAMIN COOMBE, who died at Victoria, Texas; and Mr. WILLIAM ROSIE, late of Putney. The sick-list was very heavy during the first two months, but at the present time there is not one on the funds, which shows that the general health of the Society is extremely good. The usual business being concluded, a hearty vote of thanks to the Chairman ended the meeting.

TEETH OR TASTE.—An American gentleman, giving his experience of things in England for the benefit of his countrymen, speaks of our Apples as inferior to those grown in the States, and we can and do grow world-renowned Apples in this country! But he lets us gently down by adding that our Plums and Strawberries are the finest he ever tasted—of course. To our thinking the soundness of his judgment is dominated by that of his mastication. He so readily admits the superiority of our soft fruits that we are inclined to think that in the matter of Apples it may be a question not of taste but of teeth.

LINNEAN SOCIETY.—At the meeting held on April 7, Professor STEWART, President, in the chair, Professor D'ARCY THOMPSON and Mr. W. SOMERVILLE were admitted Fellows. Mr. SPENCER MOONE exhibited and made remarks upon some samples of Maté, or Paraguayan Tea, recently brought by him from South America. Mr. W. S. D'URBAN exhibited specimens of the shell-slug (*Testacella maugei*) from Devonshire. A paper was then read by Mr. D. MORRIS, "On the Phenomena concerned in the production of forked and branched Palms," the conclusion arrived at being the following:—1. Branching is habitual in certain species of *Hypophyllum*; occasional in others, and occasional also in the genera *Areca*, *Rhopalostylis*, *Dictyosperma*, *Oreodoxa*, *Leopoldinia*, *Phoenix*, &c. 2. Branching in many cases results from injury to or destruction of the terminal bud, causing the development of axillary or adventitious buds below the apex; these buds, when lengthened out, produce branches. 3. In some cases, as in *Nannorhops Ritchiana* and *Phoenix sylvestris*, branching is caused by the replacement of flowering-buds by branch-buds. In such cases the branches are usually short, and are arranged alternately along the stem. The terminal bud is

apparently neither injured nor destroyed. A paper by Mr. A. W. WATERS, "On the Gland-like bodies in the *Bryssa*," was, in the absence of the author, read by Mr. W. PRECY SLADEN.

BOOK NOTICE.

THE FRUIT-GROWER'S GUIDE. By John Wright. (Published by J. S. Virtue & Co., Limited, 294, City Road.)

We have before us several numbers of what promises to be an exhaustive treatise on the cultivation of such hardy fruits as will grow to perfection in these islands. We may pass over in view of the amount of contemporary discussion on the subject, the somewhat lengthy introductory chapter, noticing merely the *raison d'être* for the publication of the work—the desire on the author's part to put fruit culture in its proper light before the country, and to refute many of the impossible theories which some enthusiasts have sown widely in the country. We are of course convinced that the fullest measure of fruit-growing by our farmers will not of itself save their occupation from ruin, and we do not believe there is any true farmer who is foolish enough to suppose it would so do. Their salvation as a class must come from a more intimate acquaintance with the methods by which science can aid practice, by the economical management of crops and animals, and constant supervision of their workpeople, and perhaps by some method of real co-operation or co-partnership with these. To small holders and occupiers, the matter appeals much more strongly.

The author admits to the full, despite some disadvantages of climate, (the general adaptability of this country, meaning, we assume, England and Wales, and parts of Ireland and Scotland, for fruit culture. In support of this contention, he remarks on the prodigious crops borne at times by Plum, Damson, and Cherry trees. But these fruit trees are in other countries much more prolific than here. Still, we will not quibble, and we have reason to know that his statement with regard to the good quality, generally, of the fruits of such kinds as we mainly cultivate, is not exceeded by those of any other land, with the exception, perhaps, of Pears, and some of the finer varieties of Plums. If we have failures, apart from frost, hail, &c., he ascribes them to man's agency, and rightly so.

The details given as to the conformation, anatomy and physiology of plants are mostly those current a century ago. Errors of fact are, of course, less numerous than faulty interpretations, but should a re-issue be called for, as from the general excellence of the work may be expected to be the case, this portion should be entirely re-written.

In regard to the storing of fruit, and sending it to market in attractive guise, much useful information is afforded, and although there is nothing new to be said, it being a well threshed-out subject, we can pardon the reiteration for the sake of its great value, to the market grower.

The chapter on pruning contains much that will be found of use by the young fruit-grower and the inexperienced enthusiast, who, having more money or enterprise than knowledge, engages in this kind of supposed money-making with a light heart, only to find, too late, that he was ill-equipped for the business. Many admirable, if roughly-executed, woodcuts illustrate these chapters, and will be found of great use to the learner. Both root and branch pruning are illustrated, and the good results pointed out which follow the various practices. Those who have to deal with gravelly or other dry soils will find their particular cases dealt with in a succeeding chapter.

In the chapter on soils, the rather doubtful hypothesis that "meteoric" agencies have assisted in the formation of alluvial drift-soils from rocks is maintained, but perhaps the author uses the term "meteoric" in a somewhat different sense from what

is usual. This chapter appears to be needlessly long for a work of this kind, and might be much reduced, it being of small use to the run of cultivators. The statement that soils are stirred by the plough to a depth of 6 inches only, requires qualifying, the Champion or turn-wrest plough turning it over to twice that depth.

Drainage of land is well dealt with, but is it necessary to exclude moles from entering drains at their outlet? What could these animals find that would entice them into a wet drain-pipe?

In the part dealing with the preparation of soils, our author is quite at home, and much useful information afforded; as also in the chapter on manures. In this the several mineral manures, as potash, kainit, saltpetre, are brought under notice, and trustworthy data are given as to quantities to be used. The dung of fowls and pigeons, commercial guano, humus, farmyard manure, and the methods of applying them as a top-dressing, come in for a share of notice, and in popular terms.

Contrary to recent teaching, the author pins his faith on walls as aids to fruit-growing rather than on glass structures, and we think with some reason; but he does less than justice to his preference for the former, by omitting to mention the initial greater costliness, and the cost of labour in management, besides omitting to state that much of the hardy fruit grown under glass is handsome but flavourless. As a fact, we do not make half use enough of our walls. How much, for instance, is wasted of the large pieces of walling in the old-fashioned farmhouses and the gardens attached to them. If these now almost-unused areas of soft heat-imbibing brick and stone were covered with Apricots and Pears, fine varieties of Plums and Peaches, an additional source of income would accrue to the oppressed farmer.

We are afforded a plan of a model fruit garden which we are almost inclined to call too complete, in which all kinds of fruit, tree and bush, and almost every known form of training is calculated to find a place. As a product of the imagination, an ideal creation, it is all very well; but we greatly doubt if such a garden will ever be formed. It measures, if drawn true to scale, 768 by 576 feet.

A much needed subject, the renovation of old and neglected orchards, has a chapter to itself, in which there is found a good deal of useful information. Orchard planting is a pet subject with Mr. Wright, and he handles his subject as one who is thoroughly conversant with the various operations of land preparation, planting, choice of kinds and varieties, and whether these are intended for market or private use.

The raising of new varieties of fruits comes in for treatment, and much praise is bestowed on the two Messrs. Rivers, the present proprietor of the celebrated nursery at Sawbridgeworth, and of his father Thomas Rivers; and mention is duly made of the various fruits raised from seed by them. Some of these are even at this comparatively early period coming to the fore, possessing as they do either great earliness or lateness of ripening, combined with other desirable good qualities. We may mention in this connection, *Advance Nectarine*, which ripens in July, a fortnight before Lord Napier; the improved *Downton Nectarine*, with the flavour of the Stanwick, ripening in August; Newton, a splendid September Nectarine, also with Stanwick flavour, if but slight; and Victoria, a large richly-flavoured variety, ripening at the end of September. Here we have Nectarines which give us fruit during a period of ten weeks. Of Peaches raised at Sawbridgeworth we will give the earliest, which is *Early Beatrice*, middle of July; *Golden Eagle*, the latest, a very large, piquantly-flavoured fruit, ripe early in October.

In Plum *Early Favourite* we have a fruit that is ripe at the end of July; *Monarch*, ripening late in September; and *Grand Duke*, in the third week of October, making a very long season of Plums, with many good varieties to fill the interval. What has been done for Nectarines, Peaches, and Plums, Mr. Wright wishes to see carried out with other kinds

especially Apples. We stand in great need, he says of well-flavoured Apples, that have good constitutions, and are free and early croppers; and, we will add, that have tender flesh and attractive appearance.

The various operations of budding, grafting, and other methods of increase, are well treated of and copiously illustrated. Stocks on which to bud and graft fruits have a chapter to themselves. Here we note a slip that requires correction. After telling his readers that stocks of Continental origin are too tender in constitution for our climate, a statement which, by the way, is open to doubt, as the winters of the Apple-growing regions of Europe are much colder than ours, he remarks that the so-called free stocks are taken from, amongst other sources, the most of Normandy cider-presses.

The illustrations by Miss May Rivers are excellent, effective, trustworthy, and accurate as to detail. Of course we want more. What reviewer does not? and we should like to see additional sketches, showing the habit of the individual tree, the form of the buds, and the colour of the young wood.

The method of publication is peculiar, the issue being "confined to subscribers, and supplied by the publishers' agents only." This arrangement, which is presumably adopted to secure the publishers against loss, is very suitable in the case of a recondite work, appealing to the few, but is hardly so well adapted to a book which to do good must be widely circulated, and one which appeals to a large constituency. The work will be completed in three volumes each, with fifteen coloured illustrations.

If we rightly infer the author's intentions, from the numbers before us, to take seriatis all the more valuable varieties of hardy fruits, describing and illustrating them by woodcuts or coloured sketches, the whole work, when completed, will furnish an admirable book of reference, especially if it be provided with a good index.

NURSERY NOTES.

CLIVEIAS AND HIPPEASTRUMS at B. S. WILLIAMS & SONS' NURSERY at UPPER HOLLOWAY.

It was mainly to see Messrs. Williams' very fine collection of these plants, that we went to Upper Holloway recently, and the show they presented was such that we were amply repaid for our journey.

The Cliveias occupied a span-roofed house of good size, and were furnished with healthy dark green foliage, and most of them were carrying large strong scapes, with from ten to upwards of twenty flowers upon each. Besides these, we observed another batch of these plants, which were being retarded in a cool house, so as to furnish a succession, and it surprised us to find that they were kept perfectly dry at the roots, although they had scapes about 2 inches high, and yet the plants showed no sign of injury. It may be that such a practice would be fraught with danger to plants in a less healthy condition. The varieties most noticeable were among the newer ones. Ambrose Verschaffel, which is large-flowered, and has a very fine umbel, containing, at least, twenty flowers. Meteor, whose flowers are darker, especially at the tips of the petals; and General Gordon, which is by far the most distinct of this group of Cliveias. The flowers of this last-named variety are small, but the fact of the throat being white, and the rest of the flower of a deep orange, make it a most desirable variety.

The Hippeastrums were standing in a house adjoining, and here, again, the results of successful culture and skilful hybridising were observable. The following are all new:—Crimson Banner is a fine dark crimson flower, with clearly-defined white lines running from the throat upwards; Dazzle is somewhat similar to this one, but the tips of the petals are of a deeper colour; Model is of a very dark crimson colour throughout; Princess Victoria is a charming variety, the three bottom segments being all but white, whilst the upper one is veined

a little with light red; Geo. Wainwright, Distinction, Indian Chief, and Red Prince, are all very pretty flowers, of good quality.

In the Orchid-houses were good spikes of *Vanda suavis*, *V. tricolor*, and *V. insignis*; a very good form of *Cypripedium Morganæ*, and two good broad-petalled *Odontoglossum Alexandræ*.

HOME CORRESPONDENCE.

THE CARROT GRUB.—Can anyone suggest a means of destroying the Carrot grub? I have been much among cottagers and others of late, speaking to them about the culture of vegetables, and on every hand I hear complaints of the harm done to Carrots by the grub. This grub is the larva of the Carrot fly (*Pila cauda*), and it proves very destructive by boring into the roots, causing what is called the rust, and sometimes the death of the plant. At a gathering of cottagers, allotment-holders, and farmers that I recently attended in the neighbourhood of Reading, I was informed that in the district of Sunfield the Carrot crop was severely injured by this grub, so much so that it is difficult to get roots of much value. One farmer told me he had dressed the land with lime, soot, and other materials, but the ravages of the grub were unchecked. Gas lime, he had found, destroyed the crop as well. What is experienced at Reading is the experience of others in many parts of the country. It is true of some of the allotment gardens in Ealing, and whether the soil be heavy or light, and however treated, the Carrot crop appears to be the most difficult to rear with any chance of success. Mr. R. Thompson, in the *Gardeners' Assistant*, recommends "a dressing of sand, saturated with spirits of tar, scattered over the ground, previous to digging, at the rate of a gallon of the spirits of tar to 60 or 70 square yards, as preventing the attack of the maggots. Quicklime dug into the ground, after lying two or three days on the surface, is also a good preventive." And he further recommends trenching the ground in the previous autumn, immediately after the former crop has been removed. But much of this the farmers at Sunfield had attempted without materially abating the injury done by the grub. In some parts of the country the wireworm is very troublesome, but Messrs. Sutton & Sons in their book on *The Culture of Vegetables* say they have little faith in nostrums and specifics, and recommend judgment in choice of ground, deep digging, and the preparation of the beds in good time, as the best preventives. They add, "It has been observed that main crops sown early in April suffer more than those sown late, and the lesson is plain; and it has also been observed that where the crops have suffered more severely the land was made ready in haste, and the wild birds have had no time to purge it of the insects which they hunt for so persistently as their daily food." Any information which can be afforded as to the best means of destroying the grub without doing injury to the crop will, I am sure, be greatly acceptable to many. R. D.

GARDEN POLYANTHUSES.—I find it very difficult to follow Mr. Douglas when, in the same paragraph he writes, "Laced Polyanthus are amongst the most beautiful of hardy plants, but for border plants in the South of England they are absolutely worthless." I am free to admit that there is beauty of its particular kind in perfect gold-laced flowers, but then these are really good only under glass anywhere, whilst the great bulk of any ordinary strain are under glass or outdoors absolutely worthless. Why then affirm that these gold-laced varieties are of the most beautiful of hardy flowers? In the matter of either beauty or decorative effect, there is really no comparison between the gold-laced strains and good border strains. I venture to place good forms of these border Polyanthus in the very front rank of hardy plants—indeed for spring-blooming plants they are not excelled. The public have found that out, and for one who grows the gold-laced forms, either in pots or out in the garden, fifty grow the various and larger-flowered border varieties. Those who have seen the comparatively insignificant poor unpretentious-looking things shown as gold-laced at the James Street Drill Hall, have regarded them as very ineffective indeed when they have seen the beautiful heads of bloom the fancy varieties have produced. What folly is it, therefore, to label the gold-laced forms only as Polyanthus, just because a

few fanatics will regard them as being only florally elect. The chief value of these gold-laced forms, so far as I have seen, is found in their capacity to win some prizes, but from a true floral point of view, money was never more entirely wasted than when so applied. If the plants had in themselves enough inherent beauty to render them popular, they would not want prizes to keep them in existence, as it is competitions for these small rewards almost alone that keep gold-laced Polyanthus in cultivation. When we see a good pip of Exile, Cheshire Favourite, or Lancer, we see the very best the gold-laced forms can produce, and really high class pips or flowers even on these are none too common. But worst of all is the fact, that all the efforts of raisers of almost hundreds of thousands of seedlings have never yet enabled them to get beyond what these old varieties produce. The gold-laced section is a played-out strain. It has reached the end of its tether, and has run its course. Now, the hardy-border section (of which plants should never be grown in pots, but which may be lifted into them just when they show new growth early in the spring, for house flowering), are so susceptible of development, that it is practically impossible to check the tendency, unless only the most worthless forms be employed as seed-producers. Now, when seed is saved from the very finest of gold-laced forms, the product almost invariably is, as compared with the seed-parents, rubbish; but save seed from the finest of the border varieties, and the product will assuredly be some improved forms, and few, if any, inferior to the parents. Even the very poorest, however, will make a robust plant, carry fine heads of bloom, and give a finer effect than will a dozen of the gold-laced seedlings. If anyone doubts what I have said, let them get packets of seed of the best strains of both sections, sow it in shallow boxes or pans under glass early in March. It will germinate freely early in April, and give a lot of plants to dibble out thinly into specially-prepared beds about the end of May. The seedlings can remain in these beds until October, and then be transplanted to wheresoever found most desirable for blooming the following spring. Very much is gained by sowing seed thus early under glass, as germination is quicker and more even. It is a still better plan to sow the seed well fresh on a shady border early in the autumn, and let the seedlings so remain until the spring. A. D.

REMOVAL OF THE LEAVES.—The remarks in the *Gardeners' Chronicle* of last week, p. 467, on the removal of the leaves in France during the later stages of the growth of Vines, with a view to hastening and heightening the maturity of the Grapes, have an additional interest to me at this moment, as I find the market growers of Strawberries in Sussex almost invariably cut off the leaves so soon as they gather the fruit. It must be forty years or more since Dr. Lindley, the Editor of the *Gardeners' Chronicle*, in his usual sledge-hammer style, utterly destroyed, and figuratively danced upon this cruel, wasteful, and unnatural practice; and yet, here it is, in full swing in a county within fifty miles of your office, and by those who live by fruit growing. All horticulturists know when and how we are to learn the techniques or nice points of practice in horticulture. But I was not prepared for this whole removal of Strawberry leaves, though I will partially try to maintain an open mind until I hear a modern defence of the practice. One of the most powerful defences against the onslaught of Dr. Lindley on the practical men who aided and abetted him in the establishment of the more rational and natural method of leaving the leaves alone to finish their dual work of maturing the crowns and keeping them warm during the winter, was that the young leaves would be more efficient and more potent in both directions than the old ones. The wholesale destruction and absence of old Strawberry leaves in Sussex in the first week of April this year totally disproves this contention. I have never seen a more wholesale destruction of Strawberry foliage, nor, on the whole, less promising crowns; but the effects of locality on appearances is very marked, and as the local growers seem hopeful of their crops, it is to be hoped that the yield may favour present promises. But if this is the best that the removal of Strawberry leaves can promise for the protection and fuller development of the crowns, then it does not strike strangers as worth the candle—that is, the cost—to say the least of it. D. T. F.

THE HARD PRUNING OF ROSES.—Since writing the notes that appeared last week on p. 460, I have

seen an exhibitor's Roses, or rather the rich ground a yard deep, naturally a capital Rose soil, and further enriched with bone-meal for colour, and nitrate of soda for verdure and size of foliage. It is quite true I did not see the Roses, for the all-sufficient reason they were stripped quite back to the

looked at a few yards distance like a piece of fallow ground waiting to be cropped with Potatoes, few of which are yet planted in some districts. Now, as nothing succeeds like success, and these Roses have won many special and other prizes at the National and other shows, it will be wiser not to condemn

restrictive culture also limits the duration of the life of Roses and other plants to the shortened limits. But the grower for show, pure and simple, cares for none of these things. His nursery for rooting Briars (he will have none of the seedlings), is near to lines of stamps, and he has also his con-

FIG. 76.—RHODODENDRON CAMPYLOCARPUM: POLLEN-GRAIN MAGN. 200 DIAMETERS. (SEE P. 502.)

ground line, and some of them, notably the Tea and Briar cuttings, beyond the ground line, so that here, whilst there was any amount of Rose force underground, there were no Rose shoots above the ground line. I beg pardon, there were a few, such as the Duke of Edinburgh, which needed long pruning, and after careful examination these were found with two or three eyes to a shoot. But the others, of which there was a large number,

the practice of such extremely hard pruning. But in the face of it, it does seem such a sad waste and suppression of beauty. Here are Rose plants by the thousand, overflowing with suppressed energy and decapitated force, crowded together about 2 feet by 1, or less, and capable of clothing with beauty, and filling with fragrance, an area of six times the extent. It really seems like carrying the theory of the concentration of forces to cruel extremes. Such

inconveniences for grafting, and budding, and keeping up his stock of exhibition Roses, as well as cash to spare to purchase novelties or additions as wanted or desired. And so long as he continues to carry off the chief prizes, all is well so far as he is concerned. And yet it is somehow impossible to look upon his Rose garden of stumps without a feeling of pain, and to exclaim in a whisper how are the mighty fallen, and what a wealth of frustrated fragrance

perished in the faggots formed of these vigorous tops. But then, on the other hand, by the concentration of the vital force of those twenty or thirty short power roots into three or five, by tying each shoot to a stake, by disabusing even the few left to one bloom or so to a shoot, by feeding with liquid or solid manure during the development of these few buds, the results are prodigious in size, and may prove almost perfect in colour, texture, and finish. But it still more widens the breach between growing Roses for show as distinct from the pleasure of growing them for the sweetening and enrichment of our gardens and landscapes. *Rosa*.

FERN STEALING.—This neighbourhood swarms with a gang of Fern-tramps carrying large sacks. In districts like ours, where there are large woods (Wentwood, Forest of Dean, &c.) great damage can be done before the tramps are seen. Near Chepstow, *Cystopteris fragilis* var. *Wynensis* has been all carried away; fortunately another habitat exists that has not yet been discovered by the thieves. These men evidently know but little of the Ferns they gather, as the common male Fern shares the fate of all other species. The neighbourhood of Bristol, Glastonbury, &c., is equally overrun, and thousands of the *Osmunda regalis* have been carried away. As long as there is a market for the plants, these marauders will endeavour to procure them. *E. J. Lowe, Shirenewton Hall, Chepstow*. [We saw a few days since many bushels of "Devenshire" Ferns, exposed for sale on cormormongers' barrows, in Farringdon Street, at 5d. and 1s. the dozen. At this rate, there will soon not be a Fern left. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

APRIL 12.—The display of plants and cut blooms of various plants, of Roses, Orchids, Amaryllis, Narcissus, and New Holland and Cape, was one of a most creditable kind, and occupied much of the usually available space. Albeit the weather had changed from warm to chilly, with a northerly wind in exchange for the balmy gales of a few days previously, the attendance of visitors was satisfactory. Novelties were noted in Orchids, Roses, Narcissus, and Magnolias; and, altogether, the meeting was replete with interest.

Floral Committee.

Present, W. Marshall, Esq., in the chair; and Messrs. B. Wynne, R. Dean, R. Owen, J. Laing, Owen Thomas, W. Ruzze, G. Nicholson, R. B. Lowe, N. Davis, T. W. Girdlestone, E. M. Breeley, C. E. Pearson, G. Philipson, F. Ross, G. F. Breeley, C. E. Suter, W. Bain, T. Baines, C. Noble, H. H. D'Ombraim, J. Fraser, H. Turner, G. Paul, and G. Gordon.

The exhibits with which this committee had to deal were attractive and good. Messrs. Hugh Low & Co., Clapton, were awarded a Silver Flora Medal for a group of New Holland plants, which was composed of very useful hard-wooded stuff, and shown in first-rate condition. *Erica ventricosa coccinea* minor was there in abundance, *Boronia heterophylla* and *B. megastigma* also were remarkably well-grown little examples; *Pimelea spectabilis*, with its lovely bluish-white flowers, had a very charming effect; as also had *Aotus gracillima* and *Erica Cavendishii*.

A Silver Banksian Medal was awarded to Messrs. B. S. Williams & Son, Upper Holloway, for a group of miscellaneous plants, including a very choice collection of Amaryllis and Cliveas. The *Hippeastrum* (Amaryllis) created quite a blaze, and showed ample evidence of good culture and selection. The best of these were perhaps *Princess Victoria*, a variety with good-sized blooms, the greater part of which is white, but with which is mingled a little pink; Dr. Masters, a dark crimson flower, rather small, and of a dwarf habit; and B. S. Williams, a wholly-white flower, which has been out some time. Among the Cliveas, the most noticeable were *General Gordon*, with a white throat, but the rest of the flower a very dark red; and *Surprise*, which was a beautiful soft flesh colour throughout.

Awards of Merit were granted to Messrs. J. Veitch & Sons, Chelsea, for their Amaryllis *Crimson King*, which had very fine colour; and to Messrs. G. Paul & Son, Cheshunt, for their fine Amaryllis *Firebrand*, a variety with dark-coloured blooms, mingled with white.

Messrs. Paul & Son, Cheshunt, staged a group of

hardy herbaceous plants, amongst which were *Magnolia stellata plena*, a very pretty plant, with ten to twelve blooms, and about 18 inches high; *Primula denticulata* and *P. rosea*, a very nice *Canna* (Miss Sarah Hill), and *Saxifraga oppositifolia*.

A very excellent group of Anthuriums was staged by Sir Trevor Lawrence, Bart. (gr., Mr. Bain), containing a few fine seedlings; one of these has a clear white spathe and a pink spadix, and another had a very large deep-red spathe and a white spadix. For this group the committee awarded a Silver Banksian Medal. A double-flowering *Cyclamen*, with upwards of fifty blooms, was shown by Mrs. Everfield, Denne Park, Horsham; and *Hyoscyamus orientalis* by F. M. Barton, Esq., Highfield, Gainsborough.

Primula Forbesii, a small lilac flower, about 18 inches high, came from the Royal Gardens, Kew; whilst Mr. Jas. Hudson, gr. to Messrs. Rothschild, Gunnersbury House, Acton, exhibited cut flowers, and a photograph of "The Yulan" (*Magnolia conspicua*). Messrs. J. Veitch & Sons had also *Magnolia stellata* (syn. *Halliana*) and *M. s. rosea*.

Messrs. Robert Veitch & Son, Exeter, were awarded a First-class Certificate for *Rhododendron campylocarpum* (see fig. 76, p. 501), a very pretty variety of a delicate yellow colour. By the same firm were exhibited *Lonicera pelorhynchus*, the blooms of which were not fully expanded, *Azalea Daviesii* and *Richardia athiopica* compacta, with bloom about 21 inches high.

A well-grown lot of Roses as bushes and standards, fairly well bloomed, and several boxes of cut Rose blooms, came from Mr. W. Ruzze, Joyning's Nursery, Waltham Cross. The cut blooms, mostly Tea and hybrid Teas, were remarkable for freshness and purity of colour. We may mention *My Rivers*, a creamy-white full flower and nice form; *Grace Darling*, *Princess Beatrice*, fawn, with a pink centre.

The new Tea Rose, *Waban*, was shown by Messrs. W. Paul & Son, Waltham Cross. It is a small Rose of cerise-pink, looking like a useful bouquet or button-hole variety; the H.P. Spenser, a full globular bloom of good substance; and *Medea*, a whitish Tea of medium size as seen, and their less novel variety of Tea Rose *White Lady*.

From the nursery of Messrs. W. Cutbush & Son, Highgate Hill, came a group consisting of *Erica persoluta*, *E. Cavendishiana*, *E. hymalis*, several white Indian *Azaleas*, which were intermingled with tall-growing *Narcissus*, the whole being supported at the back with small *Palms* and *Dracenas*. As a study in colours it could hardly be called effective. The firm contributed *Epiphyllum Mackoyanum*, a variety with deep red pendent flowers, having a marked resemblance to the other novelty in *Epiphyllums* *Gertneri*.

Mr. W. C. Leach, gr., Albury Park, Guildford, showed some excellent *Mignonette* *Princess of Wales* and *Her Majesty*, both equally meritorious, and nine pairs of well-bloomed *Lily of the Valley*. Some flowering shoots of *Rubus spectabilis* came from the same gardens, with Mr. Leach's opinion appended, that it was excellent for planting under trees, and was one of the earliest plants to flower in the open air. The colour of the flowers is rosy-purple.

A fine basketful of a pure white *Cineraria*, named *Snowflake Improved*, was shown by Messrs. J. Carter & Co., High Holborn, London. It is not like the older *Snowflake* furnished with a purple disc but is wholly white.

Messrs. J. Laing & Sons, Stanstead Park Nursery, Forest Hill, S.E., sent a pan planted with a variety of *Primulas*, as *P. acutis* *Crousi*, *P. a. lilacina*, *P. a. platypetala flore-plena*, &c., surrounding a plant of *P. denticulata*, which as a whole was pleasing. From the same nursery were remarked a plant of *Tecophylea cyncrococcus*, a mite of a thing, with a Gentian-like blossom. This got a First-class Certificate; another good plant shown by them was *Dracena Barteti*, which is a plant furnished with bronzy-green leaves, broad and semi-erect, and edged with bright crimson, of which hue are also the leaf-stalks and midrib. A good table and general decorative variety. A basket of great *Niphetos* Rose flowers came from Mr. H. Turner, for which he received a vote of thanks.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. J. O'Brien, C. De B. Crawshaw, H. M. Pollett, T. W. Bond, H. Ballantine, W. H. White, C. J. Lucas, J. W. Schroder, J. Douglas, E. Hill, M. T. Masters, S. Courtland, H. Williams, and T. B. Hayward.

Notwithstanding the coldness of the day, an extensive and interesting show of Orchids was staged by nurserymen and amateurs, Messrs. F. Sander & Co. showing a very fine lot, among which the new *Cypripedium Chamberlainianum*, which was unanimously awarded a First-class Certificate, was the gem of the whole show. There is a quaint beauty about the markings of this plant, and a richness of colouring in the bright rosy-crimson spotting of the lip which is unmatchable; and among its other merits is its distinctness from those of any other known species. Messrs. Sander & Co. had a grand specimen of *Oncidium ampliatum majus* with six spikes; many of the beautiful *Dendrobium Phalaenopsis Schroderianum* of all tints; *Masdevallia Courtlandiana* X, *M. Gelengiana* X, *Ondotoglossum Cervantesii roseum*, many fine *O. crispum* and *O. Pescatorei*, some good forms of *Masdevallia Harryana*, *Cypripedium cordatum*, *Dendrobium Venus* X, and other species.

A like award fell to Messrs. B. S. Williams & Sons, Upper Holloway, for a fine group of Orchids, in which were eight specimens of *Vanda navis* and *V. tricolor*, some very fine *Dendrobium Wardianum*, many good *Ondotoglossums*, *Cypripedium Morgana* X, *C. Schroderi*, *Oncidium superbien*, *O. sarcodes*, *Ada aurantiaca*, *Dendrobium Phalaenopsis Schroderianum*, a fine *Cochlidium vulcanica grandiflora*, &c.

Messrs. Hugh Low & Co., the Nurseries, Clapton, E., had a group of Orchids, comprising various forms of *Cattleya Mendelii* and *C. Trianae*, the *C. Mendelii* *albena*, a pure white-petalled form being very pretty. In Messrs. Low's group also there were some fine *Ondotoglossums*, *Angracum sesquipedale*, *A. fastuosum*, *Cattleya Lawrenceana*, *C. intermedia amethystina*, *Cypripedium volutatum*, *C. levigatum*, *Lycaste plena*, *Measuriesiana*, *Vandas*, *Saccolabium bellinum*, *S. bigibbum*, &c.

Among the amateurs, Sir Trevor Lawrence, Bart., M.P., took the lead with a small group of rare things, among which the best was his hybrid *Cypripedium Lawrellianum* X (*Lawrenceanum* X *bellatulum*), a most beautiful thing with flowers shaped more like those of *C. Lawrenceanum* than the other parent. The whole flower was of a rich rosy-crimson with a tinge of green at the base of the sepals and petals, and a pure white white margin to the upper sepal. The petals were spotted with chocolate colour, and there were numerous purplish-brown lines radiating from the base of the upper sepal. Fully like some forms of *C. Lawrenceanum*, but with the markings closer or smaller in pattern. Sir Trevor Lawrence also staged the richly-spotted *Ondotoglossum crispum pardalinum*, two *C. Elliottianum* (one with eight flowers), *C. Fraseri* X, *C. Patersoniana* X *C. Clivenfordi* X, much like a *C. selligum majus*; and the pretty bright yellow *Bolbophyllum* (*Sarcopodium*) *Sillemanum*.

C. J. Lucas, Esq., Warham Court, Horsham (gr., Mr. Duncan), had a group of well-grown Orchids, comprising two fine *Angracum Sanderianum*, *A. articulatum*, *A. Leonis*, with eighteen flowers; *Pescatorea Klaborchorum*, *Masdevallia chimera*, *Ondotoglossum Cervantesii decorum*, with over twenty flowers; *Saccolabium ampullaceum*, *Cirrhopetalum puncturatum*, *Ondotoglossum*, *Miltonia Moreliana*, &c.

G. R. Le Doux, Esq., Langton House, East Moulsey (gr., Mr. B. Bowyer) had a select group, in which prominent were a very fine form of *Ondotoglossum Wilckeanum*, a rich yellow-spotted *O. excellens*, a fine *O. triumphans* and various other *Ondotoglossums*, *Cattleya citrina*, and *C. c. virens*, a curious green-flowered form; a large and well-bloomed *Dendrobium primum*, and a magnificent variety of *Miltonia Rozelliana* (Silver Banksian Medal).

H. J. Elwes, Esq., Colesborne Park, Gloucestershire (gr., Mr. G. Hansford) exhibited an extraordinary specimen of *Vanda Denissoniana*, with several growths with fresh green leaves down to the base of the plant, and eight spikes of clear ivory white flowers. A Silver Banksian Medal was awarded for its fine culture.

Messrs. Linden (l'Orticoltura Internazionale), Parc Leopold, Brussels, sent *Ondotoglossum Pescatorei* *Lindeniana*, a noble purple-spotted form; *O. maculatum*, also spotted with purple; *O. triumphans chrysanthum*, *C. Cervantesii decorum*, *Cypripedium insignis* *slamense*, and the fine new hybrid, *C. van Molianum* X (*Spiracium* X *hiracanthum*).

Messrs. J. Veitch & Sons, Royal Exotic Nurseries, King's Road, Chelsea, staged the beautiful *Dendrobium atro-violaceum*, *D. crassinode-Wardianum* X, which was raised by them, and serve to verify the previously imported natural hybrid of the

same parentage; their new hybrid, *D. Euryclea* × (*lituiflorum* ♀, *Wardianum* ♂), the reverse cross to their *D. micans*; and *D. Adrasta* × (*Pierardii* ♀, *superbum* ♂), a pretty variety, with pale pink sepals and petals, and primrose lip.

Messrs. Heath & Son, Cheltenham, again sent their new *Cypripedium Swinburnei* ×, which has improved much since first exhibited; also *O. Roezlii* magnificent.

Mr. H. A. Tracy, Twickenham, staged a finely flowered *Cattleya Lawrenceana*. Messrs. F. Ross & Co., Bletchingley, a large form of *Dendrobium Falconeri*; Malcolm S. Cooke, Esq., Kingston Hill, a good variety of *D. Wardianum*; R. I. Measures, Esq., Cambridge Lodge, Camberwell, the new *Cypripedium insigne* siamense; Sir Wm. Marriott, Down House, Blandford, an interesting hybrid named *Laelio-Cattleya Marriotiana*, (*L. flava* × *Cattleya Skinneri*), with upright spikes of yellowish-pink flowers, the younger ones having a brownish tint; and Baron H. Schroder, The Dell, Egham, staged grand cut examples of fine spotted and hybrid *Odontoglossums*, including *O. Lecanum*, of which no second plant has as yet, we believe, been imported; and Chas. Ingram, Esq., Elstead House, Godalming (gr. Mr. T. W. Bond), showed *Dendrobium Euryclea* ×, similar to that exhibited by Messrs. Veitch, but with smaller flowers.

The Daffodil Committee.

This meeting took in part the form of a competition, and a 1st prize was awarded to H. B. James, Esq., The Oaks, Carshalton, for a small lot, consisting of *Narcissus Empress*, *Emperor*, *maximus*, *albicans*, *Nelsoni*, and *Barri conspicua*, all well-opened blooms.

Mr. H. J. Adams, of Roseneath, Enfield, was 1st for six *Narcissus*, showing *Ajax cernuus*, *A. torulosa*, *A. Emperor*, and *Henry Irving*.

In a group consisting of thirty-six varieties, the Rev. J. E. Bourne, Dunston, Lincoln, took 1st prize. In this lot were many of the less common varieties, as *Bishop Mann*, *Princess Colleen*, *Bawn Capax plenus*, *Queen Bess*, *Golden Plover*. The flowers all over the group were remarkable for a general evenness of size, and all were fresh-looking. Mr. A. Kingsmill, of Harrow Weald, Middlesex, was placed 2nd and had a nice lot of good varieties; as had the winner of the 3rd prize, Miss Reeves; as the Rev. G. P. Haydon came 4th.

A number of cross-bred seedlings came from Rev. G. H. Englebart, Appleshaw, Andover, of which the more remarkable were a seedling from *Narcissus Empress* and *N. triandrus*, where the perianth is of a pale shade of yellow, and the corona a lemon-yellow. In size it is intermediate between its parents. Another cross was from *N. poeticus* and *triandrus*, one from *cernuus* and *triandrus*, one from *cernuus*, *pulcher*, and *triandrus*, and several others.

Messrs. Barr & Sons, as is their wont, came out strongly in Daffodils, showing in good masses of well-grown flowers.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. John Lee, R. D. Blackmore, Harrison Weir, G. T. Miles, J. Cheal, G. Bunyard, G. Taber, T. J. Saltmarsh, T. F. Rivers, R. Hogg, P. C. M. Veitch, W. Warren, A. Dean, J. Wright, W. Bates, J. A. Laing, G. Wythes, H. Balderson, F. Q. Lane, J. Smith, G. Norman, J. Hudson.

Mr. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, showed several nice-looking Cucumbers, that the committee do not regard as being better than any existing varieties. He also showed a seedling Strawberry that has been grown at Syon for several years past as a forcer. It is stated to be derived from Keen's Seedling, but it has a more tapering shape and firmer flesh. The habit of the plant is very dwarf, it crops well, and has but few leaves. Vicomtesse Hélicart du Thury Strawberry was likewise shown for comparison, probably, and obtained a Cultural Commendation.

A Tomato, Gilbert's Satisfaction, was shown by Mr. R. Gilbert, High Park Gardens, Stamford. It is a small fruit, ribbed, and well-coloured, the plant being apparently a heavy cropper, if one might judge by the clusters of fruit sent.

Lecture by the Rev. G. P. Haydon on "Narcissi."

Mr. Haydon, at the afternoon meeting, advised small growers not to buy the bulbs unless they could plant them and leave them undisturbed for at least three years. He recommended the

early ones to be planted in front of the spring-flowering shrubs, and that the late ones should be placed by themselves. To large growers he would say, that generally only the more robust kinds would succeed on the flat, the smaller and the white varieties should be planted on rockeries. On the West Coast they could be done more easily than on the East. They should learn which varieties resent interference and those which do not. The period during which the roots rest is very short in a damp, wet season. Where *Narcissi* are forced, he would throw them all away each year, except the most valuable varieties. In choosing varieties, the grower should choose the one most suitable to it, and if possible get them from a nurseryman whose soil is like his own. The speaker deprecated the tendency to increase the number of so-called varieties. Climate and soil will alter the colour and habits of *Narcissus* a great deal, but in two years they will revert to their original form and colour. The lecturer did not believe in sports, and during nine years' experience had never met with one. He gave a detailed account of the best method of hybridisation, and useful hints to those who would wish to engage in the work. Beginners should commence with natural species, and effect the crosses in both directions. The seed should be sown at once, and covered with a quarter of an inch of soil. The points to be obtained were size, colour, shape, and constitution. He objected to the craze for extra large flowers, and said that the colour should be such as could be referred to some class, the shape to some ideal, and the constitution should be such as could be called a general hardiness, or easily adaptable to climatic conditions.

Mr. Haydon condemned the manner in which they are often staged at exhibitions, and would have them less artificial. *Narcissus* mite, he regarded as the sequel and not the cause of disease.

Rust is the worst disease they are liable to. The real cause is not certain, but the lecturer thought it might be attributed to a superfluous amount of moisture in the bulbs. All infested bulbs should be thrown away except the most valuable, which should be scraped and washed, and then put into lime for a time. The lecturer in strong terms denounced the manner in which these and other plants were becoming extinct through the ruthless way in which they were being carried away by the day-tripper (whom he described as a destructive beast), and other people who have no love for the flowers they carry away. Plant collectors should have a licence similar to a game licence.

The Chairman (Mr. Morris) said the matter of plant-collecting, mentioned by the lecturer, was a very important one. He did not know if the licence suggestion was a practical one or not, but the question should be ventilated.

A gentleman asked if the lecturer had had any experience in growing the white varieties in peaty soil, but Mr. Haydon regretted that he had not.

The Rev. Mr. Wilks said that *N. cernuus* increases as well as any of them with him. He thought the White Trumpet Daffodils did not like to be in the ground all the damp autumn, and he attributed his success to the fact that he lifted the whole of his during the first week of July, and planted them again in the first or second week in September. He discontinued the rush for size, and said that for artistic beauty the large ones could not compare with the smaller ones. The most beautiful of the whole lot is *N. triandrus*, and it is one of the very smallest. He had never experienced such a bad season as the present, and he thought it was due to the extremely cold weather, being suddenly followed by the warm weather, we have lately been experiencing. The roots have been unable to keep pace with the tops, and it has affected the colour.

List of Awards.

ORCHID COMMITTEE.

Silver Bankian Medals.

To Messrs. F. Sander & Co., for group of Orchids.
To Messrs. E. S. Williams & Son, for group of Orchids.
To Sir Trevor Lawrence, for group of Orchids.
To G. J. Lucas, Esq., for group of Orchids.
To G. R. Le Doux, Esq., for group of Orchids.
To H. J. Elwes, Esq., for *Vanda Denisoniana* (cultural).

First-class Certificates.

To *Cypripedium Chamberlainianum*, F. Sander & Co.
To *Cypripedium Lawrelianum* ×, Sir Trevor Lawrence.

Awards of Merit.

To *Dendrobium Euryclea* ×, Messrs. Jas. Veitch & Son, and Chas. Ingram, Esq.
To *Odontoglossum Pescatorei* Lindenii, Messrs. Linden.
To *Cypripedium Swinburnei* ×, Messrs. Heath & Son.
To *Laelio-Cattleya Marriotiana* ×, Sir Wm. Marriott.

Botanical Certificates.

To *Bolbophyllum Sillemianum*, Sir Trevor Lawrence.
To *Masdevallia Wendlandiana*, Sir Trevor Lawrence.

Cultural Commendation.

To C. J. Lucas, Esq. (gr., Mr. G. Duncanson), for *Odontoglossum Cervantesii* decorum, with over twenty flowers.

BIRMINGHAM SPRING FLOWER SHOW.

APRIL 6, 7.—the twelfth annual exhibition was held in the Town Hall, and the universal opinion expressed was that it was the best the society has yet held. Orchids, both in groups with Ferns and as specimens in the classes, were a very attractive feature. Two superb groups were set up; the 1st prize being easily won by the Right Hon. Joseph Chamberlain, M.P. (H. A. Burberry, Orchid grower); the 2nd prize was won with an excellent group from the gardens of G. H. Kenrick, Esq. (W. A. Powell, gardener).

The specimens in the classes for six and three Orchids were a grand lot. For six, W. Bown, Esq., was 1st with *Dendrobium thysiflorum* and *Wardianum*, *Oncidium scarodes*, *Odontoglossum Alexandrarum*, *Cypripedium villosum*, and a richly-coloured mass of *Cattleya Lawrenceana*; the Right Hon. Joseph Chamberlain, M.P., was 2nd with a fine lot. In the class for three Orchids the same two exhibitors won, in the same order. For a single specimen, Mr. Finch, gr. to Mr. Alderman Marriott, Coventry, was well 1st with a magnificent *Dendrobium thysiflorum*.

Mr. Finch also took 1st honours for bouquets in the gentleman gardener's classes; and Messrs. Pope & Son in the open classes for bouquets.

A very fine lot of *Azaleas* were exhibited, Mr. Brown being 1st for six, and Right Hon. J. Chamberlain, M.P., 2nd. The stove and greenhouse plants were also fine and well done; Sir Thomas Martineau (gr., Mr. O. Brasier), taking the 1st prize. A very fine specimen *Eucharis amazonica* was staged by Mr. J. Black, and a remarkably fine example of *Hydrangea Thomas Hogg*, quite 4 feet through, and grandly flowered, was staged by Mr. Cryor, gr. to J. A. Kenrick, Esq.

There was a great display of *Cinerarias*, *Deutzias*, and other spring-flowering plants, especially mollis *Azaleas*.

There was a very large display of *Hyacinths* and *Tulips*, and Mr. Robert Sydenham staged a fine collection, not for competition, some of them very fine indeed.

Messrs. R. Ker & Son, Liverpool, sent 100 pots of *Amaryllis*, a very fair lot in which greatly improved form and substance of the flower was perceptible, and many other honorary exhibits of considerable merit was staged by the local nurserymen and others. Messrs. Thomsons' had a very artistic group of plants; Messrs. Hewitt & Co., Messrs. Pope & Son, and Mr. R. H. Vertegans also contributing, the latter some interesting alpine and hardy plants; Messrs. Cutbush & Sons sent down an interesting group, as also did Messrs. R. Smith & Co., of Worcester. It was a remarkable exhibition in point of merit and held in glorious weather.

SCOTLAND.

SPRING FLOWER SHOW AT FALKIRK.

THE annual spring show of the Horticultural Society of Falkirk was held on March 25, and it is admitted on all hands that it was the most successful exhibition which the Society has promoted. The entries numbered over 300, and some of the classes were remarkably well represented by creditable exhibits. These spring shows are on the increase among the more advanced citizens, who think that flowers on plants in pots, or cut and arranged artistically, should be fully appreciated by the community at large.

The chief feature of the show was the class in which a table of plants was to be arranged for effect, and four gardeners tried their strength, making a creditable display. Mr. Airdrie, gardener at Larbut House, was awarded 1st prize; his plants were all of choice character, and were most tastefully arranged. Orchids were judiciously interspersed with Palms, *Dracenas* (the old terminalis still distinct and showy), *Caladiums*, Ferns, and *Crotons*, Cooperi

and Thomsoni appearing to much advantage. The centre plant was *Cocos Weddelliana*, hanging gracefully over *Dendrobium Wardianum*, one spike about 4 feet long, and *D. nobile*. *Phaius grandiflora* appeared well among the foliage. Well-flowered dwarf *Azaleas*, *Spiræas*, *Tulips*, &c., completed a chaste arrangement.

In the 2nd prize collection, exhibited by Mr. Mitchell, gardener, Bantaskin, were some choice Orchids—*Cattleya Trianae*, in fine form; *Odontoglossum crispum*, *Vanda tricolor*, *V. suavis*, *Dendrobium Wardianum*, and *D. nobile*, were conspicuous among *Crotons*, *Palms*, *Dracænas*, *Ferns*, *Lily of the Valley*, *Tulips*, and many bright spring flowers. The other tables were made up chiefly with flowering and choice foliaged plants.

Other tables, with plants for exhibition only, made a great display; a lot, hiding up a dingy part of the hall, was made up with hundreds of flowering and foliaged plants of sizes suitable as sale plants; numerous dwarf *Heaths*, double-flowered *Azalea indica*, *Daffodils*, *Lilies*, *Spiræas*, *Hyacinths*, and most of the popular spring-flowering plants, with a due proportion of *Ferns* and other species with striking foliage, made a great display, and one most creditable to Mr. Dow, nurseryman, Falkirk. A 1st prize for the best plant in the hall was justly awarded to Mr. Mitchell for a tall healthy plant of *Vanda suavis*, on which were four fine spikes. A specimen plant of *Caladium Veitchii* of great size and in perfect health secured a 2nd prize for Mr. Mitchell also.

Palms and *Ferns* were well represented with fine specimens, which toned down the glare of the great breadth of flowering plants, especially *Tulips*, *Daffodils*, *Crocuses*, *Primulas*, *Spiræas*, *Dentizas*, double *Azaleas*, as dwarfs, with some well-flowered old favourites, *Mrs. Turner* being very telling.

Roses were not numerous, but a specimen, densely clothed with foliage, and loaded with flowers, out full, and in bud, was much admired. This was the useful *Niphetos*, a plant about 4 feet high, and covering the pot with foliage and flowers, which was shown by Mr. John McMartin, Lanrison, an enthusiastic amateur. *Hyacinths* covered long breadths of tabling, but there was nothing among them of great merit, and they had a sombre appearance, so many dark varieties being amongst them, especially *Blue King*, which in verity gave this class of exhibits the blues! A very handsome *epergé* of choice flowers was exhibited by Mr. Walker, gardener. Bouquets, generally done remarkably well about Falkirk, were represented by over three dozen of various shapes and sizes. The bridal, table, and hand bouquets were composed largely of Orchids (*Dendrobiums*, *Odontoglossums*, and *Coleogynes* predominating), *Rosebuds*, and *Lily of the Valley*. Buttonholes and sprays, in threes and sixes, were in great numbers, Orchids, *Rosebuds*, and *Spiræas* were largely used. Mr. Edwards (an amateur, and the treasurer of the society) was a leading prize-taker, and always is so in these classes. Great numbers of everlasting bouquets were exhibited. *M. T.*

FORESTRY LECTURES IN EDINBURGH UNIVERSITY: SESSION 1891—92.

The course of lectures on Forestry, in the University of Edinburgh, which have been conducted during the past two months by Colonel Fred. Bailey, R.E., ex-Director-General of the Forest Department of India, were brought to a close on the 30th ult., when the students who had passed their examinations were presented with the certificates they had gained. That the lectures attracted a number of earnest and diligent students was well exhibited by the marked success of those who came up for examination. This gratifying result indicates the progress that forestry, as a science, is making. The expounding of the natural laws and scientific principles which underlie and guide practical forestry in its most successful issues has many attractions for students; but the need of a knowledge of forestry in all its details, particularly those applicable to Britain, is impressing itself on the minds of owners of land and those engaged in its management. In

addressing his class at the conclusion of the last lecture, Colonel Bailey explained the circumstances in which, at short notice, he had undertaken to deliver the course just ended. He had confined his attention to the utility of forests, and the fundamental principles of forestry. These were the same for all kinds of trees, growing in all countries, although the application of them should be varied in accordance with the peculiar characteristics of each species, and the climatic and other conditions under which each grows. It was therefore of great importance that a thoroughly sound knowledge of these principles should be acquired. The special treatment to be adopted for each species in Scotland should be regulated in accordance with the most careful local observations of agricultural facts; but the existing record of such facts was, generally speaking, very meagre indeed, and did not extend continuously over any lengthened period of time. A commencement to supply such deficiencies should be made, and the lecturer urged that members of his class, and others who were in a position to do so, should make careful notes of physiological facts relating to Scottish forest trees in all their various stages of life. Such notes he observed, would be of the greatest value to the Professor of Forestry, who would thereby be enabled to direct his teaching in full accordance with the ascertained requirements of the various species of forest trees in this country. An accurate account of all work done, of produce removed, and receipt and expenditure of money in connection with every wood, should be kept on all estates. Colonel Bailey then explained the arrangements he proposed to make for the session of 1892-93, commencing on October 26 next. The class list of the past session shows the names of forty students, and the average attendance during the whole course has been twenty-nine. Of the twelve students who presented themselves for examination, one gained a First-class Certificate, while seven have gained Second-class Certificates—an excellent record considering the shortness of the session.

HIEING WESTWARD AND SOUTHWARD TO MEET THE SPRING.

WITH a continuance of summer sunshine such as ushered in the first week of April, spring plants and spring prospects will soon be common as Blackberries. But such was far from being the case in East Anglia on April 4. Winter flowers were then still trembling on the verge of winter rather than spring ones, lightening up gardens and landscapes with their brightness and beauty. And seldom or never were field and forest, meadow or lawn, more lifeless, brown, and bare. A run, however, of less than 50 miles from East Anglia into Hertfordshire showed a marked progress in the season. The brown meads gave place to green grain, short, it is true, but still green, with the rollers at work upon its surface. But, on the other hand, I have not yet seen a lawn-mower at work on the greenest lawns, though with the present sunshine all will be needed on the back of the first shower.

Passing through London, and running south, through Surrey and Sussex, I met for the first time this season unmistakable evidences of spring-tide in the welcome presence of the common Furze in bloom, and golden banks of varnished Celandine. A meadow was also seen—only one, however—clothed over with a thick covering of the flowered *Narcissus*. And observing in the open, Peaches and Pears on walls were seen in full blossom. Apples, too, whether hastened with the help of the Mistletoe or not, seemed a week or ten days in advance of their fellows in East Anglia. Gages and other Plums are on the point of bursting into blossom, and common or other *Primroses* are not in full bloom, but fresh and perfect leafages; but the Blackthorn, impatient to start, yet holds back its spring-tide spread of spotless whiteness, though the tips of the Horse Chestnuts, varnished with transparent resins, sparkle in the sunlight like rounded pearls. It is worth travelling a hundred miles or

more to anticipate the pleasures of spring by a fortnight or more. True, all such pleasures come in due course to those who wait. But it is a new sensation to plunge out of winter into spring by train. Less than a week since, the world was shut in, and the spring shut out through a silvery covering of snow. To-day, almost within sound, smell and sight of the sea, spring, summer heat has come, and one can also hear the rush of the opening buds of fruit trees and *Roses* as they rush forth to face the hand of spring-tide and summer. *D. T. F., April 4, 1892.*

Obituary.

MR. JAMES SMITH.—We regret to record the death of Mr. James Smith, which took place at his residence, Darley Dale Nurseries, Derbyshire, on the 29th ult., at the age of eighty-two. Mr. Smith commenced business as early as 1827, with some three or four acres under his control; but his patrons rapidly increased until, at the time of his decease, his nursery contained 200 acres, which is devoted to the growth of general nursery stock, although *Rhododendrons* and *Heaths* have been his specialities. Mr. James Smith is succeeded by Mr. Arrow Smith, who has been the practical head of the firm during the past ten years.

FOREIGN CORRESPONDENCE.

STEAM HEATING.

I HAVE noticed several inquiries among your readers about steam heating, as applied to horticultural purposes, and having had some experience that way, perhaps a few remarks thereon may not be out of place. I know that in England there is a prejudice against it for such purposes, but I think the reason is, because the right conditions required are little understood. I adopted it in the first place, not from choice, but owing to houses I have put it into being partly below ground, and at different levels, where it would have been awkward to use hot-water. There are various systems of using steam for heating purposes, the principal being high-pressure, and low-pressure, or the gravitating system. It is the latter only that should be employed for heating horticultural structures. The boiler is of American make, and the highest pressure that is ever likely to be required is 3 lb., but in practice I find that I get all I require with a pressure not exceeding $\frac{1}{2}$ lb. per square inch, and even below that when the boiler is not hard pressed. The radiating pipes are $1\frac{1}{2}$ inch wrought iron gas pipes, galvanised, branching off in the different houses from the mains, which are laid under the paths in a covered-up trough, properly lagged, to prevent radiation. The flow main is $2\frac{1}{2}$ inches in diameter where it leaves the boiler, and is gradually reduced in size the further it is from the same, and the furthest end of one of the houses is at least 300 feet from the boiler, but the circulation, even at the above low pressure is perfect. I forgot to mention that the boiler is fitted with an automatic-acting damper, that regulates the pressure required to a nicety, and can be set to act to any pressure required. This does away with one objection that is often raised against the use of steam-heating, viz., owing to careless attention the heat may be suddenly raised or always varying. A more important point still, however, and the one in fact between which rest success and total failure, in my opinion, is the construction of the house itself, or I should say rather the stages therein, and also attention to the ventilation. The main thing is to prevent the heat as it is radiated from the pipes reaching the plants direct, and with the ordinary greenhouse stages this would not be the case. I have, therefore, adopted double stages, the bottom consisting of galvanised corrugated iron sheets with sheet iron sides, about 7 inches high, the whole being made water-tight, and on the top rest ordinary Teak wood gratings. The space between I at first filled with coke kept moist

with water, but this proved a very bad failure, as the sulphur in the coke was evidently converted into free acid and ate right through the galvanised iron. Now I fill in the space with partially decomposed leaves, and find that these hold off sufficient moisture, and the decomposing gases given off by the decaying vegetation proves most beneficial to the plants in the house, and the Orchids in particular. These leaves are renewed every year, the old ones coming in very well for ordinary potting purposes. By the adoption of this system, the heated air is charged with a sufficient amount of moisture before reaching the plants, and the whole atmosphere of the house is of a most genial and moisture laden nature, and the temperature is as steady and constant as in the houses in which hot water is used. With respect to the comparative cost of fuel with the two systems, I have not yet had an opportunity of going into that, but when I have, I shall be glad to report results. As I have before stated, however, it was not with a view to economy in fuel that I adopted steam, although, so far as I can judge, steam is the cheaper of the two, *S. Cocking, Yokohama.*

HYACINTHS AT HAARLEM.—Hyacinths are now in fine flower at Haarlem, Holland, and will be at their best during the Easter holidays. The public sales of Hyacinths will begin on April 19, and will go on every day till the beginning of May. The show beds of Hyacinths and Tulips at Meesters. KRELAG's nursery will be opened to the public on Easter Sunday, and admittance is permitted daily from 10 to 12 A.M., and from 2 to 4 P.M. The show will probably last till the middle of May, but it will be at its best during the remaining part of April. A pamphlet containing historical notes on the Dutch show beds, and the names of the varieties exhibited, has been issued.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.				
	ACCUMULATED.									
	Above 42° for the Week.		Below 42° for the Week.							
	Day-deg.	Day-deg.	Day-deg.	Day-deg.

The districts indicated by number in the first column are the following:

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 9, is furnished from the Meteorological Office:—

"The weather continued extremely fine and bright throughout the period over all the southern and south-eastern parts of the kingdom. Over the western and northern districts, however, it was cloudy or dull, with slight falls of rain, for a few days soon after the commencement of the week, but later on very fine weather was again experienced in those regions.

"The temperature was much above the mean in all districts, the excess ranging from 4° in 'Scotland E.' and 'England N.E.' to 6° in 'England S.' and many of the western districts, 7° in the 'Midland Counties,' and to 8° in 'England S.W.' This excess was due to the unusually high reading during the daytime, the absolute maxima during the week varying between 66° and 69° in Ireland and Scotland, and between 70° and 75° over England. The lowest of the maxima (which were generally registered on the 3rd), ranged from 27° in 'Scotland, E.' to 36° in 'England, S.W.' and to 39° in the 'Channel Islands.'

"The rainfall has again been much below the mean. In nearly all the English districts the weather was quite rainless.

"The bright sunshine shows a considerable decrease in the west and north from the very high values recorded there during the previous week, but in the 'E.' and 'S.' it was even more prevalent. The possible amount of duration ranged from 35 to 40 in most of the northern and north-western districts to 71 in the 'Midland Counties,' 62 in 'England, S.W.' 78 in 'England, S.' 79 in 'England, E.' and to 80 in the 'Channel Islands.' The highest percentages at any individual station was 82 at Cambridge, Hastings and Jersey, 83 at Eastbourne, 85 at Geddstone, and 87 at Westbourne (Sussex). In London the percentage was 70."

MARKETS.

COVENT GARDEN, April 13.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

BUSINESS very dull. *James Webber, Wholesale Apple Market.*

POTATOS.

NEW POTATOS.—At public sales this week prices advanced. Canary Island produce, 8s. to 16s. 6d.; Malta (first arrival), Kidneys, 17s. to 20s.; Rounds, 13s. For Old Potatoes the market is dull. *J. B. Thomas.*

SEEDS.

LONDON. April 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that a steady sowing demand now prevails for farm seeds. Clovers and Grasses find buyers on former terms. Sainfoin being scarce and much wanted, has advanced 2s. per qr. For Tares there is a good inquiry at the moderate rates current. In Canary seed a substantial rise is noted: existing London stocks are less than one-fourth of what they were this time last year, and moreover, prices in Liverpool are higher than those in London, which is most unusual. Hemp seed keeps firm. Full figures are obtained for Mustard and Rape seed. Haricot Beans are rather more inquired for, but Blue Peas are neglected. The imports into the United Kingdom of Clover and Grass seed: last month, were 57,228 cwt., value £130,312, as against 11,547 cwt., value £28,551 for March, 1891.

FRUITS AND VEGETABLES.

SPITALFIELDS, April 12.—Good supplies of all kinds, but the demand only moderate. Potato trade very languid, prices falling. Quotations:—English Apples, 2s. to 4s. 6d. per bushel; American do., 12s. 6d. to 15s. 6d. per barrel; foreign Tomatos, 1s. to 2s. per box; forced Rhubarb, 1s. 6d. to 2s. natural do., 2s. to 2s. 6d. per dozen bunches; Seakale, 9d. to 1s. 6d. per punnet; Curly Kale, 1s. to 1s. 6d.; Spinach, 1s. 6d. to 2s. per bushel; Greens, 2s. to 2s. 6d.; Carrots, 2s. to 2s. 6d.; Spring Onions, 3s. 6d. to 4s.; Parsley, 5s. to 6s. per dozen bunches; Turnip-tops, 1s. to 3s.; Swede-tops, 1s. 6d. to 2s. 6d.; Sprouting Broccoli, 2s. to 3s. 6d. per sack; Cauliflowers, 6s. 6d. to 10s. per tally; Endive, 9d. to 1s. 6d.; Cabbages, 1s. to 1s. 6d.; Beetroot, 6d. to 8d.; French Cos Lettuce, 2s. to 3s. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 5s. to 8s. 6d. per cwt.; Belgian do., 6s. to 7s.; Dutch do., 6s. to 7s. 6d. per bag of 110 lb.; Spanish do., 8s. 6d. to 12s. per cwt.; Celery, 6d. to 1s.; Horse Radish, 1s. to 1s. 6d. per bundle.

BOROUGH, April 12.—Rather a steady trade in green stuffs, and the Potato market still very slow. Quotations:—Savoy, 4s. 6d. to 6s.; Broccoli, 1s. 6d. to 12s. 6d. per tally; Sprouting do., 2s. 6d. to 3s. 6d.; per bushel; Brussels Sprouts, 1s. 6d. per bag; per half sieve; Greens, 3s. to 4s.; Turnips, 1s. 6d. to 2s.; Carrots, 1s. 3d. to 1s. 6d. per dozen bunches; English Onions, 3s. to 5s. 6d. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 11s. to 20s.; Newtown Pippins, 15s. to 28s. per barrel.

NOTICES TO CORRESPONDENTS.

A METHOD OF FASTENING WALL TREES: A. B. We cannot judge of the adaptability of your system unless you afford us some idea of its main features. If you do not feel disposed to disclose these, you should get it patented at the Chief Patent Office.

BOOKS: A. W. O. Floral Decorations for Duelling Houses, by Annie Hassard (Macmillan & Co.). *W. C. Villa Gardening,* by E. Hobday (Macmillan & Co.).

COPPER SOLUTION: P. Probably the best form of using this is the following:—Dissolve in a wooden tub 2 kilogrammes (say 4½ lb.) of sulphate of copper, in 15 litres of water (say 3½ gallons); then add 3 kilos. (say 3½ lb.) of carbonate of soda; the addition of this causes the

oxide of copper to be precipitated. Then add $\frac{1}{2}$ lb. of treacle. Stir occasionally, and after 12 hours dilute with 100 litres (say 22 gallons of water, and use with a spray pump. The addition of the treacle causes the copper-oxide to adhere longer to the leaves, and the causticity of the solution is less than that of the ordinary Bordeaux Mixture, so that the young foliage is less liable to be injured by its use. The spraying should be done two or three times in the course of the season, once when the Tomato plants are about to flower and before any mildew is visible, and then once or twice afterwards, taking care not to use it on the ripe fruit. When the fruits begin to colour, no more spraying should be done.

DAHLIA CUTTINGS: *Dahlia*. The failure to root the cuttings is probably due to your having cut them off the root stock instead of pulling them off. Select shoots of 3 inches long; do not trim the end, and put them into pots of sandy leaf-mould, plunged in a bottom heat of 80°. If in a house, cover them with a hand-glass, but in a frame no covering is needed. They must be watered, shaded, and aired like other cuttings under glass.

DIGMIA UNIFLORA: *C. B.* We will explain the method to be followed in striking this plant next week.

GARDENERS' ADDRESSES: *Calanus*. Two such are published—*The Garden Annual, Almanack, and Address Book*, at 37, Southampton Street, Strand, W.C.; and the *Horticultural Directory*, at 171, Fleet Street, E.C.

MAZES: *W. C.* We greatly doubt if there is any work, at least a modern one, on the art of making mazes; nor do we know if the maze we illustrated on March 5 still exists. The same kind of plants as are employed for hedges against stock would do for a maze—Quick, Holly, Hornbeam, Beech, Privet, Yew, &c., and the preparation of the land would be the same.

NAMES OF PLANTS: *Agave*, 1, *Agave mexicana* var.; 2, *A. xylonacantha*; 3, *Mamillaria pusilla* var.—*Amateur*. *Odontoglossum crispum*, var. *guttatum*.—*G. H. I.* *Retinospora pisifera*; 2, *Cupressus* next week; 3, *Cupressus Lawsoniana*; 4, *Acer platanoides*, the Norway Maple.—*L. G. P.* An *Epidemium*, we cannot name the species from a leaf only.—*Poppo*, 1, *Nerium Oleander*; 2, *Cupressus Coreana*; 3, *Abies pectinata* (Silver Fir); 4, *Juniperus* (next week); 5, Young plants of Garlic; 6, *Chives*, *Allium Schoenoprasum*.—*A. THE MYTHE CASTLE GARDENS,
Tewkesbury, Aug. 13th, 1891.

Gentlemen,—I have given your "Climax" Insecticide a good trial on tender foliage, Orchids and Ferns for Bug and Scale. In every instance I found the Bug and Scale dead and the foliage bright and clean. I found it most effectual for Black Fly on Peach trees. The "Climax" Insecticide ought to be better known, it is the only one I have found to kill Bug on tender plants without injury to the foliage.—I am, yours faithfully,

W. MACKIE.

Prepared Solely by
The Boundary Chemical Co., Ltd.,
LIVERPOOL.

FOWLER'S GARDENERS' INSECTICIDE.

For Destroying Blights and Mildews infesting Plants and Trees. It is easily applied by dipping, spraying, sponging, or as a winter-dressing. Will not stain or injure any more than plain water. RHEUMATIC AFFECTIONS

Positively yield like magic to the marvellous healing properties of mild, continuous currents of electricity, imperceptibly applied to the system by wearing

HARNESSE' ELECTROPATHIC BELT

This genuine appliance is comfortable in wear, and may be relied upon to speedily invigorate the debilitated constitution, assist digestion, give strength to every nerve and muscle of the body, and effectually prevent rheumatic pains. It seems, and is, a simple remedy; but it is, nevertheless, a most reliable one; and the number of convincing testimonials we have received from all classes of society amply prove that we do not exaggerate when we say that HARNESSE' ELECTROPATHIC BELTS have completely cured thousands of men and women in all parts of the world.

AN INESTIMABLE BLESSING TO ALL WHO SUFFER FROM IMPAIRED VITALITY.

It Cures all
NERVOUS
Disorders.

HARNESSE' ELECTROPATHIC BELT

It Cures all
RHEUMATIC
and Organic Ailments.

MR. C. B. HARNESSE,
the President of the Institute, together with other officers of the Company, may be consulted, **FREE OF CHARGE**, either personally or by letter, on all matters relating to Health, and the Application of Curative Electricity.

SOLE PROPRIETORS, THE MEDICAL BATTERY CO. LD.

A BOON TO SUFFERERS.

HARNESSE' ELECTROPATHIC BELTS are an improvement on the galvanic cure of the celebrated German, Professor Hummel. They are excessively simple in their construction, very comfortable to wear, and from their constant action, most efficacious as a self-generating reservoir of electricity. They are entirely unique as a therapeutical adaptation of electricity, as they consist of a series of constant-current electric generators, which are in continuous action while the belt is worn. They contain also all the essential elements of the dry compress, so well known and appreciated in hydropathic treatment. Acting, as they do, upon all the most important organs of the body, they rarely fail to alleviate most of the disorders resulting from local or general debility, impaired digestion, weak circulation, or defective organic action.

CHEQUES and POSTAL ORDERS should be "Crossed" "London & County Bank."

52, OXFORD ST., LONDON, W.

FOR DESTROYING WEEDS, MOSS, &c.

ON CARRIAGE DRIVES,
GARDEN WALKS, ROADS, STABLE-YARDS,
WALLS, STONEWORK, &c.

Saves more than twice its cost in Labour. No Smell.
One application will keep the Walks and Drives
clear of Weeds for at least Eighteen Months.

Mr. W. G. HEAD, Crystal Palace, says:—"We are so satisfied
with your composition and its price that we have used it abso-
lutely. I have every confidence in recommending it."

Mr. R. IRWIN LYNCH, Curator, Botanic Gardens, Cam-
bridge, says:—"There can be no question with regard to its
efficacy."

Prices:—In 1 and 2-gallon Tins, 2s. per gal. (Tins included);
in 5-gallon Drums, 1s. 6d. per gallon. 10, 15, and 20
gallons, 1s. 4d. per gallon. Special quotation for larger
quantities. Carriage paid on 10 gals. and upwards.

Used in the proportion of one gallon to twenty-five gallons
of water.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

"One of the most winning and delightful, as well as the most accurate and scientific of teachers."—N. Y. Tribune.

Garden & Forest

1892—Fifth Year.

Is acknowledged throughout the world to be the leading American authority in the field of Horticulture, Landscape Art, and Forestry. Its contents are original throughout, of the highest literary character, and its writers are the foremost European and American authorities. It is invaluable to the Owners of Country and Suburban Homes, Landscape Gardeners, Botanists, Horticulturists, Lovers of Nature, and to all who would cultivate a correct taste in matters pertaining to the disposition and management of gardens and grounds, whether public or private. The illustrations are original and artistic.

Permeated with a spirit of knowledge and refinement.—Gardeners' Chronicle, London.

The foremost journal of its class, keeping in touch with every advance in the scientific, artistic, and practical phases of horticulture and arboriculture.—Boston Herald.

Holds one of the very first places in periodical horticultural literature.—Revue Horticole, Paris, France.

Its arrival is the coming of a wise and intelligent and entertaining friend, who enables us to live more happily because more harmoniously with Nature.—Harper's Weekly.

Its character is at once dignified and pleasing, and its contents are scholarly and scientific in the exact sense.—Chicago Evening Journal.

No new book on horticulture can for a moment be compared in value to the bound volume of *Garden and Forest*. It is a compendium of new information.—N. Y. Herald.

Published weekly. 21s. a year.

A specimen copy may be had free on application to Messrs. SAMPSON, LOW & CO., St. Dunstan's House, Fetter Lane, Fleet Street, London, England, to whom orders for subscriptions may be forwarded.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

TO FLORISTS.—Advertiser (age 30, single) desires engagement; good experience in Growing, Decorating, Selling, &c. Excellent references.—M. W., G. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT AND PILLS. Diseases and casualties incidental to youth may be safely treated by the use of these excellent Medicaments according to the printed directions folded round each pot and box. Nor is this Ointment alone applicable to external ailments; conjointly with the Pills it exercises the most salutary influence in checking inflammations situated in the interior of the body; when rubbed upon the back and chest it gives the most sensible relief in asthma, bronchitis, pleurisy, and threatening consumption. Holloway's remedies are especially serviceable in liver and stomach complaints. For the cure of bad legs, all sorts of wounds, sores, and likewise scrofula and scrofulic affections, this Ointment produces a cooling and soothing effect most acceptable to the sufferer.

EXCELSIOR

THE PATENT "EXCELSIOR."

THE SIMPLEST AND BEST LAWN MOWER
FOR ALL REQUIREMENTS.

HAS NEVER
BEEN BEATEN
IN OPEN
COMPETITION.

The Best and Lightest-running Hand-power Mower in the Market.

Tuesday Next.

By order of Messrs. F. Horsman & Co.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, April 26, at half-past 12 o'clock, two to three thousand ODONTOGLOSSUM CRISPUM and its varieties, collected by Mr. John Carder (late partner in the firm of Shuttleworth, Carter & Co.).

On view morning of Sale, and Catalogues had.

Milford Hill, Salisbury.

UNRESERVED SALE of the well-known COLLECTION of EXHIBITION STOVE and GREENHOUSE PLANTS, formed by Lieutenant-Colonel PEPPER, and which have been so successfully exhibited at the principal shows.

MESSRS. PROTHEROE and MORRIS are instructed by Lieutenant-Colonel PEPPER, who is going by AUCTION, on the Premises, Milford Hill, Salisbury, on WEDNESDAY NEXT, April 27, at 12 o'clock precisely, the whole of the valuable COLLECTION of EXHIBITION STOVE and GREENHOUSE PLANTS, including fine examples of Kew, London, Aachen, and other Palms, Cycas circinalis, with 30 leaves; C. revoluta, one with 40, and another with 44 leaves; C. undulata, 25 leaves; 300 Established Crotons, consisting of Dendrobium, Cattleya, Cyathodium, and others, specimen Almandas, fine Exhibition Plants of Erias of sorts, Lapageria rosea and alba, 100 Crotons of sorts of the best varieties, fine plants of Anthurium Scherzerianum, Dieffenbachia, Discolia, Microlepia, Eleocharis, and other Specimen Ferns, good examples of Fuchsia and Azalea, Rhododendron, Begonia, Caladium, and other Plants. Also a Gold Medal BOILER, Large PLANT POTS, &c. Plants may be viewed one week prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Friday, May 13, 1892.

MESSRS. PROTHEROE and MORRIS have received instructions from Mr. F. SANDER, St. Albans, to SELL by AUCTION, at their Rooms, on FRIDAY, May 13, the following VALUABLE ORCHIDS:

CYPRIPEDIUM EXUL, SPS. NOVA, Ridley.

Introduced by us through H. M. Ridley, Esq., M.A., F.L.S., Director of the Botanic Gardens and Forests Department, Singapore. It has been introduced by R. I. Measures, Esq., and R. H. Measures, Esq., the former gentleman, gaining an Award of Merit from the Orchid Committee of the Royal Horticultural Society at the Society's last meeting for a well-grown and beautifully-flowered specimen. We beg to offer a fine and highly-prized plant, and one which has been in the early part of last year. We also offer for the first time:

A NEW and MOST REMARKABLE DENDROBIUM from the Celebes, the bulbs measuring in some instances 8 feet in length; the numerous flower-seeds show that the blooms are large, and the plant exceedingly profuse.

A grand lot of a CYPRIPEDIUM resembling C. STONEI, from Sulu and North Borneo; some of the leaves are enormous, and vary greatly in size, &c.

A splendid importation of the new and beautiful ONCIDIUM GRAVEANUM SPS. NOVA, Sander, in grand masses and perfect health. This fine New SPECIES received an Award of Merit at the Royal Horticultural Society's last meeting, April 19, 1892, when it was much admired for its rich and various shades of brown and yellow combined; the e colours are deservedly the most popular.

Also many other RARE and VALUABLE ORCHIDS, particulars of which will appear in the *Gardeners' Chronicle* of April 30.

THE

STAND HALL COLLECTION OF ORCHIDS.

ABSOLUTELY WITHOUT RESERVE.

HIGHLY IMPORTANT SALE

of the whole of this Renowned Collection.

Including many plants matchless in point of rarity, the whole being unsurpassed for culture and condition.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from the Executors of the late Thomas Statter, Esq., to SELL by AUCTION, on TUESDAY, May 3, and THREE FOLLOWING DAYS, at 12 o'clock each day, on the Premises, Stand Hall, Whitefield, near Manchester, the whole of the

CELEBRATED COLLECTION of ESTABLISHED ORCHIDS.

A List of the principal plants appeared in the *Gardeners' Chronicle*, April 2, 1892.

Catalogues (15 copies returnable to purchasers), may be had from Mr. JOHNSON, Head Gardener, on the Premises, and of the Auctioneers, Estate Agents, and Valuers, 67 and 68, Cheapside, London, E.C.

FRIDAY NEXT, APRIL 29.

A SENSATIONAL SALE.

By Order of MESSRS. LINDEN, Brussels.

ANOTHER OF LINDEN'S GRAND INTRODUCTIONS.

CATTLEYA ALEXANDRÆ, LINDEN and ROLFE.

(H.R.H. Princess of Wales' new Cattleya.)

A drawing made by the Collector will be in the room the day of Sale. MESSRS. LINDEN have dedicated it to H.R.H. the Princess of Wales, paying this homage to an illustrious patroness of the personification here the English nation to which MESSRS. LINDEN are indebted for the kind welcome given to their efforts in the cause of introducing in Europe new plants, and especially Orchids. CATTLEYA ALEXANDRÆ is a most splendid and distinct Cattleya, very remarkable on account of the elongated peduncles, 1 to 1½ foot long, which bear a bouquet of 10 to 12 flowers at the summit, not unlike in form to L. Leopoldi, but with the colour of Cattleya elegans Turcz.; and in some varieties to Lælia grandis tenax, with violet on the margins. Pseudobulbs, of quite distinct appearance, are cylindrical, stout, 1 to 1½ foot long, generally 3-leaved. Leaves very fleshy and rigid, narrowly elliptical-oblong, 3 to 5 inches long.

Never before have any importations of Cattleya been offered in better health or condition. The plants are at rest, and prove a most first-class offering for flowering. It does excellently other Cattleya, as the numerous strong old spikes and flower-seeds on the plants offered prove. The drawing and a photograph made by the Collector give an idea of its immense free-growing quality. Mr. Rolfe writes to MESSRS. LINDEN:—"I congratulate you on having obtained so splendid a plant."

Also, 64 Semi-established plants of the marvellous

CATTLEYA REX,

Cattleya "The King."

⚡ The grandest discovery of modern Orchids till now. MESSRS. LINDEN are offering the rest of the plants they were unable to offer a few months ago, as they unfortunately had some of the leaves frosted in transit from Bordeaux to Brussels. They are now semi-established, commencing to root freely, and producing very strong spikes, and altogether in splendid condition. Every plant offered is guaranteed true.

Also a fine importation of the gorgeous

CATTLEYA MOSSIE CHIRGUENSIS,

Many years ago Mr. LINDEN had the pleasure of offering an importation of this magnificent form of C. Mossie, the finest of all. Flow very freely and petals bluish; lip dark purple, beautifully veined with orange, margined with white.

And of

CATTLEYA SPECIOSISSIMA,

Collected in a new locality, where no Cattleya have yet been found.

Also some nice imported plants of the rare and lovely

ONCIDIUM POLIOCHRYSUM.

And some good plants of the new

RODRIGUEZIA LINDENI (A. Cogn).

Also a splendid importation of

CATTLEYA AMETHYSTOGLOSSA,

Cat. guttata Prinzl.

Also many plants of the soon popular and favourite ODONTOGLOSSUM (COCHLIODA) NETZLIANA, &c., which will be SOLD by AUCTION by

MESSRS. PROTHEROE and MORRIS, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 29, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Wednesday next.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, April 27, at half-past 12 o'clock, 100 lots of PALMS and other plants, variegated, GREENHOUSE FERNS, LILY BULBS, HERBACEOUS PLANTS, 10 cases of TANGUTUM ZEYLANICUM; 700 GLADIOLI LEMOINEI; 1000 double and 2000 single BEGONIAS, a splendid strain; CARNATIONS; thousands of ANEMONES, BEGONIAS, GLADIOLI, &c., the surplus stock of a wholesale London Seed Merchant; 400 BAMBOO CANES, about 7 feet; BAMBOO LADDERS, WOOD TRELLIS, RUSTIC WORK GARDEN SEATS, &c.

On view morning of Sale, and Catalogues had.

East Dulwich—Thursday Next, April 28.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION on the premises, The Orchid Nurseries, East Dulwich, London, S.E., by order of Messrs. SEGER & Thorpe, on THURSDAY NEXT, April 28, at half-past 12 o'clock.

A fine importation, just received in splendid condition, of ODONTOGLOSSUM ALEXANDRÆ.

Also another set of about 100 VANDAS (tricolor and variegated types) as yet unfowered, but with several in bud, and the whole of them are in a condition to flower shortly. Also a magnificent specimen of the finest and most distinct of VANDA CERULEA; a grand collection of CYPRIPEDIUM, embracing all the leading kinds; the rare CATTLEYA INTERMEDIA ALBA (First-class Certificate); LÆLIA PERUVIANA ALBA; SOBRALIA BOOTHIANA ALBA; CÆLOGYNE MASSAGIANA, enormous specimen, with many flower-spikes; MASDEVALLIA SCHROEDERÆ; CATTLEYA SCHROEDERÆ; MASDEVALLIA UCULLATA; and DAVIDSONIA, a beautiful and distinct Orchid, fine specimen; and many other ORCHIDS of value, the whole in best possible health and condition.

All will be sold without the least reserve, excepting those marked in the Catalogue with an asterisk.

Plants will be on view the morning of sale, and Catalogues obtained on the premises; also of the Auctioneers, at their Offices, 67 and 68, Cheapside, London, E.C. Messrs. SEGER and TROPPE'S ORCHID NURSERIES are within five minutes' walk of East Dulwich Railway Station, L. B. and S. C. Railway.

Bimdon Hall, Near Birmingham.

MESSRS. POPE and SONS have received instructions from the Executors of the late Mr. Al-tou, to SELL by AUCTION, on TUESDAY, April 26, at 12 o'clock to the whole of the above and GREENHOUSE PLANTS, which include a number of well-established Orchids; 8 or 10 fine specimen Lapageria alba and rosea; 2 immense Gleichenias, grand exhibition plants. A fine lot of Adiantum Farleyense, including one specimen 4 feet through; fine Palms 8 to 12 feet, including Kentia Belmoreana, Latania borbonica, &c.; large a cimen Crotons; Filmy Ferns, including 1 Trichomanes radicans (Killarney Fern) with 1000 fronds; a lot of old-fashioned Camellias, including Double-lane; a large quantity of fine Hybrid Azaleas in flower; 1 grand specimen var. Imantophyllum princeps; and the usual collection of stove and greenhouse plants. Please note that the whole will be sold without reserve.

Bimdon is about 2 miles from Solihull Station, G. W. Ry., where vehicles can be obtained; 2 miles from Marston Green Station, L. & N. W. Ry., and 7 miles from Birmingham, Catalogues from the Auctioneer, 8, Phillips St., or Herald Office, Birmingham.

Unprecedented Nursery Sale.

Owing to the Ground being required for Building purposes,

MESSRS. R. B. LAIRD and SONS have instructed Mr. DAVID MITCHELL, Horticultural Auctioneer, to DISPOSE of the above by AUCTION, on WEDNESDAY, THURSDAY, May 5, each day at half-past 11 o'clock, the whole of their immense stock of STOVE and GREENHOUSE PLANTS growing in their numerous Glass-houses at West Coast Nurseries, Haymarket, Edinburgh (previous to the Houses being removed and re-erected at the Nurseries, Murrayfield). The Stock consists of magnificent Specimen Greenhouse Rhododendrons, such as Fragrantissima, Princess Alice, Bencaissi, Countess of Haddington, &c. Also fine examples of Indian Azaleas, in all the leading sorts, in splendid health, and many of them coming into flower. Choice lot of Palms, Crotons, Eucharis, magnificent Pitcher Plants (rare kinds), also large Tree Ferns, and many others, and without exception the grandest lot of Camellias ever offered for Sale by Public Auction. For size and descriptions see Catalogues, which are now ready.

West Coast Nurseries, Edinburgh, April 4, 1892.

Dolphin Sale Rooms, Market Place, Doncaster. HIGHLY IMPORTANT SALE OF SPECIMEN AZALEAS in flower; ORCHIDS, PALMS, PITCHER PLANTS, CALADUMS, ANTHURUMS, STOVE PLANTS, FERNS, and many others (rare kinds), also large Tree Ferns, and many others, and without exception the grandest lot of Camellias ever offered for Sale by Public Auction. For size and descriptions see Catalogues, which are now ready.

MR. HERBERT ATHERTON will SELL by AUCTION, the above, at his new and commodious sale rooms, Dolphin Chambers, Market Place, Doncaster, on WEDNESDAY, May 5, at 2 o'clock.

The Plants will be on view same morning from 10 to 1 o'clock.

To Capitalists and Others.

FOR SALE, as a GOING CONCERN, the large well-established and thriving business of a **NURSEYMAN, SEEDSMAN, and FLORIST**, lately and prominently situated in the best suburb of London, and only 6 miles from Covent Garden, and doing a very large and increasing general business. There is a large Bulb, Seed, Plant, Sundry, and Landscaping, and General Business done, with an excellent high-class wide-spread and staple connection. The Home Nursery comprises large commodious Dwelling House, and well-stocked and fitted double-fronted Shop, 13 well-built modern Glass Houses, some nearly new, 7 of them being the property of the Tenant, all well heated with nearly new boilers, and crammed with a magnificent assortment of many thousands of valuable **PALMS and ASPIDISTRAS, STOVE and GREENHOUSE PLANTS,** and an immense stock of well-grown **BEDDING PLANTS** in all kinds to suit both the Retail and Wholesale Trades. About 3 acres of thoroughly well-stocked out-door Nursery, well-fertilized with Composts, Roses, Fruit and Forest Trees, Shrubs, and Climbers, and a fine collection of Herbaceous and Alpine Plants, and all worked by a good staff of competent assistants. Pits, Frames, Horses, Vans, Carts, Sheds, and all the necessary Stock in Trade.

Also a very desirable **SUBURBAN BRANCH BUSINESS**, excellently situated, in a busy main thoroughfare, and doing a most lucrative trade, and is well stocked, established, and fitted up.

Also a **WEST-END BRANCH BUSINESS**, situated and being one of the first positions in London, comprising magnificent large corner Double-fronted Shop and Offices, doing a very high-class profitable, yearly increasing trade, is well-established, and has an excellent connection. The whole concern doing at present an annual turnover of £5000, and which may be doubled. Separate sets of books are accurately kept, and may be inspected, and every other particular given on application. This is probably one of the finest opportunities ever offered of acquiring a thoroughly genuine business. For full particulars apply—

Apply, in first instance, to **HORTUS, 41, Wellington Street, Strand, W.C.**

Hampton-on-Thames, on the Marling Park Estate.
LAND FOR NURSERIES!!!

MR. F. G. HUGHES begs to call the attention of Nurserymen and Horticulturists about to commence in Business, to the exceptional advantages offered by this Estate. For full particulars apply—
The Estate Office, as above.

Competition.
THE LOCAL BOARD for the District of BROADSTAIRS and ST. PETERS, invite DESIGNS for a LIVING FOUNTAIN, as an ORNAMENT to the GARDENS, the ground between Chandos Gardens and the Louisa Gap, Broadstairs, at a cost not exceeding £450.

Instructions, together with a lithographed plan of the site, may be obtained from the Town Surveyor, on payment of half-a-guinea, which will be returned if a design be submitted. Designs (under motto) must be accompanied by an estimate of the probable cost of the works, and must be delivered at my Office before Monday, May 9, 1892.
The Board does not bind itself to accept any of the submitted designs; but should a design be accepted, the successful competitor will be employed to carry out the work on a commission of 5 per cent. on the cost of such commission to include the cost of all designs, plans, &c.
L. A. SKINNER (Clerk to the Board).
Local Board Offices, Broadstairs, April 6, 1892.

CHRYSAANTHEMUMS,
AND HOW TO GROW THEM.

The large and increasing demand for this popular work has made it necessary to print a new and revised edition (11th thousand). This contains a practical and scientific treatise on Culture, and also a critical analysis of the new varieties of the present season, by C. E. Shen, Esq.; a short history of the Chrysanthemum, by C. Harman Payne, Esq.; and a Chrysanthemum Calendar, by Mr. H. Shoemith. In addition to above, illustrations of two of the best new varieties of the year are included in this new Chrysanthemum Catalogue, which also contains the most complete list of new varieties ever brought together, and embraces selections from all the known Chrysanthemum world. All the secrets of successful culture given, making this the most valuable work on the Chrysanthemum ever published. Post free, nine stamps. To Secretaries of Societies, for members, 6s. for dozen.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 18, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen
Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

May be had through all Seedsmen and Chemists.

Prices:—1 Gall. 3/- (tins included), 5 Galls. 2/6 per Gall., 10 Galls. 2/6 per Gall., 20 Galls. 2/3 per Gall., 40 Galls. 2/- per Gall. Carriage paid on 5 Galls. and upwards.

Kills all Weeds on Garden Walks, Carriage Drives, &c., &c. Brightens the Gravel. One application will keep the Walks Clear of Weeds for a whole Season.

Prepared Solely by

The Boundary Chemical Co., Ltd.,
LIVERPOOL.

SAVE HALF THE COST.

"THE SLUGICIDE CO.," 6, Maryleport Street, Bristol.

FRIDAY NEXT, APRIL 29.

A SENSATIONAL SALE, BY ORDER OF MESSRS. LINDEN, BRUSSELS.

ANOTHER OF LINDEN'S GRAND INTRODUCTIONS.

CATTLEYA ALEXANDRÆ (LINDEN & ROLFE)

(H.R.H. PRINCESS OF WALES' NEW CATTLEYA).

A DRAWING MADE BY THE COLLECTOR WILL BE IN THE ROOM THE DAY OF SALE.

MESSRS. LINDEN have dedicated it to H.R.H. THE PRINCESS OF WALES, paying this homage to an illustrious patroness of horticulture, personifying the English nation, to which Messrs. Linden are indebted for the kind welcome given to their efforts in the course of introducing into Europe new plants and ESPECIALLY ORCHIDS.

CATTLEYA ALEXANDRÆ is a most splendid and distinct Cattleya, very remarkable on account of the elongated peduncles, 1 to 1½ foot long, which bear a bouquet of ten to twelve flowers at the summit, not unlike in form with C. LEOPOLDI, but with the colour of CATTLEYA ELEGANS TURNERI, and in some varieties with LÆLIA GRANDIS TENEBROSA, with violet on the margins.

Pseudobulbs, of quite distinct appearance, are cylindrical, stout, 1 to 1¾ foot long, generally three-leaved. Leaves, very fleshy and rigid, narrowly elliptical-oblong, 3 to 5 inches long.

Never before have any importations of Cattleya been offered in better health or condition. The plants are at rest, and prove a most free-doing Orchid; and, as for flowering, it does excel any other Cattleya, as the numerous strong old spikes and flower-seats on the plants offered prove.

The drawing, and a photograph made by the collector, give an idea of its immense free-flowering quality.

MR. ROLFE WRITES TO MESSRS. LINDEN:—

"I CONGRATULATE YOU ON HAVING OBTAINED SO SPLENDID A PLANT."

Also 64 Semi-established Plants of the Marvellous

CATTLEYA REX (CATTLEYA— "THE KING.")

THE GRANDEST DISCOVERY MADE AMONGST ORCHIDS TILL NOW.

MESSRS. LINDEN are offering the rest of the plants they were unable to offer a few months ago, as they unfortunately had some of the leaves frosted in transit from Bordeaux to Brussels. They are now semi-established, commencing to root freely, and producing fine strong growths, and altogether in *Splendid Condition*.

Every plant offered is guaranteed true.

Also a fine importation of the gorgeous

CATTLEYA MOSSIÆ CHIRCUENSIS.

Many years ago MESSRS. LINDEN had the pleasure of offering an importation of this magnificent form of C. MOSSIÆ, the finest of all. Flower very large, sepals and petals blush; lip dark purple, beautifully veined with orange, margined with white.

And of CATTLEYA SPECIOSISSIMA,
Collected in a new locality where no Cattleyas have yet been found.

Also some nice imported plants of the rare and pretty

ONCIDIUM HOLOCHRYSUM.

And some good plants of the new

RODRIGUEZIA LINDENI (A. COGN.).

Also a splendid importation of

CATTLEYA AMETHYSTOGLOSSA

(CATTLEYA GUTTATA PRINZI).

Also many fine plants of the soon popular and favourite

ODONTOCLOSSUM (COCHLIODA) NÆTZLIANUM.

WHICH WILL BE

SOLD BY AUCTION BY MESSRS. PROTHEROE & MORRIS,

AT THEIR

CENTRAL SALE ROOMS, 67 & 68, CHEAPSIDE, LONDON, E.C.,

On FRIDAY, APRIL 29, at HALF-PAST 12 O'CLOCK.

SATURDAY, APRIL 23, 1892.

GLANUSK PARK.

THIS noted Park, in Breconshire, the seat of Sir Joseph Bailey, Bt., M.P., is well situated, saving the unavoidable defect that the house, like Deepdene and many another splendid residence, looks in the wrong direction. The site was selected by the first baronet, the grandfather of the one now reigning hereabouts over a wide extent of country, and he built thereon a fine three-storeyed mansion, in the early English style, on the slope of a hill, with terraced flower-gardens and lawns reaching from the windows almost to the banks of the Usk, which runs through the park below. A sloping garden of many acres, and a river valley verdant with grass, are in themselves beautiful objects, but the landscape is far more extensive, for beyond the valley is a range of bold hills rising from their bases a mile distant, and clothed to a certain height with pastoral farms and woods. Table Mountain and Darent Mountain are the two most prominent peaks, and when the holiday folk of the district have climbed to the level top of Table Mountain, where picnics are frequent, one may admit that a mountain has been ascended not a mere hill. The slopes of the range broken with woods and pastures, and dotted here and there with white homesteads, brighten the landscape from Glanusk.

There are six acres of lawn and pleasure garden, the house occupying a good position on the higher ground. There is still higher ground behind it, on its southern side, so that if the house were turned round by some of those unseen intelligences which are now so much in evidence among spiritualists, it would front the right way for the sun, and for the blessings of light and warmth, but the view would be blocked. So far as the landscape is concerned, therefore, "tis better as it is." The house commands a down-hill view, which continues as far as the river, and the incline is sufficiently steep to admit of a terraced garden, a desirable arrangement suggesting a dry and healthy site, and lending prominence to the house. The surroundings are as good as the house itself. A series of terraces, connected by flights of stone steps, lead from it to the lower level, where the boundary between the spacious lawns and the deer park is formed by a very handsome and costly stone wall, low on the garden-side, and planted with creepers. The house, too, is well clothed with creepers, some of which, at the time of my visit (October 7), had assumed the rich tints of autumn. Some great Oaks stand in the pleasure-garden on the west side of the lawn, and a lofty row of still more remarkable Sweet Chestnuts flanks one of

WEBBS', WORDSLEY, STOURBRIDGE.

the drives leading to the main entrance. These magnificent trees would rival even those at Cowdray, many of them measuring 15 feet in girth, and it speaks well for the climate of this western country that the fruit produced by them in good seasons is not to be despised.

The trees on the lawn include a handsome *Picea Menziesii*, which Mr. Ballard, the gardener, pointed out with pride. The fountain is a very appropriate ornament of the lawn. It is approached by the main flight of steps from the house, and is surrounded by flower beds, and hedged by boundary lines of Yuccas and low Hollies standing on the grass. The lawn embraces the eastern side, as well as the northern front of the house, and on the east the drawing-room looks down the valley of the Usk towards Abergavenny, and looks, too, upon a very charming garden, the perfume of whose sweet-scented flowers enters the windows, to charm the senses of the happy folk for whom the luxuries of Glanusk are reserved. The most effective creepers on the walls of a grand house like this are often similar to such as one may see sometimes on the walls of much more humble residences. Among them I noticed a Banksia Rose which could not blossom more beautifully than it does on many a farm-house in Surrey and Sussex. The Cotonaster and Virginian Creeper are still more common, but not the less beautiful on that account, and the Magnolia grandiflora here could hardly excel one which covers the front of a plain house in the main street at Dorking. Another notable creeper on the mansion of Glanusk is Clematis montana, and one likes to feel that such lovely objects are not reserved for the walls of mansions, or the eyes of the wealthy only. The same creeper grows as well on a small house, close to Messrs. Carters' nursery at Forest Hill, covering the wall each succeeding spring with a white sheet of flowers. The vegetable world is as democratic as knowledge, which all who take the necessary pains may acquire, and a good nursery, therefore, always proves, in its influence, a centre of "light and leading" to the gardens of its neighbourhood.

The Myrtle blossoms well at Glanusk, but it requires covering in winter. The climate is mild, and a dish of Strawberries was picked outdoors in the last week in September, but the spring frosts in the river valley, and the cold winds from the adjacent mountains, are bad for fruit trees, and for all kinds of bedding-out plants, which cannot safely be planted in the borders before June. In spite of the frequent showers, which naturally damped one's ardour a little, we visited every part of the pleasure-grounds, pausing longest at the Swiss cottage, a lovely cot, covered with various kinds of Clematis, and other creepers. This is the most ornate and interesting spot in the whole domain. The flower gardens of the young ladies are here, and close by are some gorgeous masses of that beautiful flower, *Tropaeolum speciosum*, covering several Fir poles placed for its support, and growing with great luxuriance. The moisture of the West seems to suit this lovely creeper, which grows almost as freely in several of the Western counties as in Scotland, covering some of the cottage porches. Mr. Ballard found some difficulty, however, in getting it established, but he obtained his handsome specimens by potting the plants in January, starting them in a greenhouse, and planting them out in spring. Until he adopted this plan, he met with no success, though several attempts were made, the roots in each case, coming from Scotland. It now grows very freely in the garden at Glanusk, parish of Crickhowell,

and springs up at a distance from the parent stock, running far underground. Close by is a very pretty fernery, filled chiefly with Maiden-hair for decoration, with *Goniophlebium subnuculatum*, a Fern from Madeira, loving moisture and thriving well in the neighbourhood of waterfalls. It is grown here in baskets with a hoop to spread the fronds which droop in rich profusion, reaching a length of 12 feet. A handsome *Taxodium sempervirens* grows near the fernery, and invites measurement and close attention. The trunk, wrapt in a coating of soft red bark, is 9 feet in girth, and holds its size many feet upwards, forming a pyramid of bright green 60 feet in height, the lower branches drooping on the ground. Another notable Conifer in the grounds is a handsome *Araucaria imbricata*, sixty years' planted. In the kitchen garden two large houses are devoted to two Vines, one of them being a cutting from the Hampton Court Vine with a stem 12 inches in diameter. There are nine other houses, numerous pits, and fourteen gardeners. H. E.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM ROLFEÆ.

PRIMUM ♀, NOBILE ♂.

THE flowers of this new hybrid have the usual shape of those of *D. nobile*, including its lip and broad petals; the sepals are of a delicate blush in colour, white at the base, and light blush-pink at the apex. The petals are white, tipped with rose-pink; the lip of sulphur-yellow and white, tipped with bright rose; the fleshy disc is bluish-white, with numerous maroon radiating lines, some broad, others very narrow, on either side, but no maroon blotch in front. The column is bright pea-green, with the anther-case light rose-purple. Thus it partakes very largely of the pollen parent, and has large, well-formed, delicately-coloured flowers, over 2½ inches in diameter from tip to tip of petals; petals and lip over 10 lines broad. The influence of *D. nobile* is very marked in the free growth and blooming character of the plant. It is one of the most charming of the many Dendrobies yet raised, and is dedicated by the raisers, Messrs. F. Sander & Co., of St. Albans, to the wife of our British Orchidist, Mr. R. A. Rolfe, of Kew.

VANDA ARBUTHNOTIANA, n. sp.*

This new Vanda was sent from the Malabar coast to Messrs. F. Sander & Co., St. Albans, who flowered it in the winter months of this year. In its general appearance it resembles *V. serrulata* or *V. Roxburghii*, but it differs in so many characters from both of them that it must be considered as a new species. The leaves are bright green, and thinner than in other Vandas. The point of the leaf is not irregularly toothed, but two-lobed, with a little point in the middle rib of the leaf. The flower-stalks are the same as in other tall-stemmed Vandas. The flowers are narrower and more compressed than usual in other Vandas, even the spur is compressed and sharpened on its upper and lower side, the lip is smaller, the side lobes not very developed, and the middle lobe fiddle-shaped, with three or five elevated lines running downwards from the base to the point of the lip. The colour is a more or less intense golden-yellow, with purplish stripes across the leaflets, but by no means tessellated. The full expanded

* *Vanda Arbuthnotiana*, Kianzlin, sp. n. sepalis curvato-obovatis, obtusissimis margine reflexis undulatis, intermedio recto lateralibus subobliquis falcatis antice curvatis; petalis lateralibus oblique spatulatis valde undulatis; labelli lobis lateralibus parvis semiovatis extus rotundatis, intermedio angustiore pandurato antice et postice, fere aequali disco 2-3 lamellis vix prolixius intracto, calicari compresso utrinque (infra et supra) acutato, toto flore luteo, lineis purpureis transversalibus irregulariter fractiflexis confusiusculis vel non confluentibus; foliis linearibus non abscissis apice bilobis utrinque acutis apiculo interposito.

flower is 2½ inches in height and about 1½ inch across. The plant is dedicated to Mr. Arbuthnot of Bexley, who was the first to flower the plant. Kianzlin.

CATTLEYA ALEXANDRÆ (L. Lind. and Rolfe), n. sp.*

Living plants of this handsome *Cattleya* have now been imported by Messrs. Linden, of Brussels, from one of which, together with ample dried material, the following diagnosis has been prepared. In that its botanical characteristics are clearly set forth, but it may be well to add a few words as to its affinities, and the peculiar features it presents. It has one very remarkable character, namely, the great length of the peduncles. There are ten on the plant, and these range from 15 to 18 inches long, and bear from six to ten flowers each. The longest shows a clear interval of 15 inches from the base before the first flower is reached. The plant is very robust, and the pseudobulbs bear generally three, but sometimes two, very rigid fleshy leaves at the summit. The individual flowers bear some considerable resemblance to those of a large *C. Leopoldi*, and the shape of the lip shows this to be its true affinity; the front lobe is very broad, and the side lobes cut down half way to the base, their tips just overlapping the front one when flattened out. The sepals and petals have the colour of those of *Lælia grandia tenebrosa*, tinted with violet on the undulate margins, and the lip is violet-rose in colour. It is a very interesting addition to the genus, and is dedicated, by request, to H.R.H. the Princess of Wales. R. A. Rolfe.

TRADESCANTIA (?) REGINÆ.

Under this provisional name, Messrs. Linden and Rodigas describe in the *Illustration Horticole*, t. 147, what appears to be a very handsome stove-foliaged plant. The flowers are not yet known, so that the genus cannot be told with certainty. The stems are purplish, glabrous, the leaves in two rows, with sheathing-stalks, each blade about 6 inches long, 1½ inch broad, cordate lanceolate acute, greenish-white, the central portion marked with closely set, straight, narrow dark green stripes on either side of the midrib, like the barbs of a feather. The lower surface of the lip is claret-coloured. The plant is stated to be a native of Central Peru.

DIFFENBACHIA (?) OLIVÆ.

A Peruvian plant introduced by the *Horticulture Internationale* of Brussels from Peru. It is figured at t. 148 of the *Illustration Horticole*, and is remarkable for its bold habit and large leaves, each about 18 inches long, 6 to 8 inches wide, green, with a broad white midrib and numerous large white spots. It will make a noble foliage plant.

CYPRIPEDIUM EXUL, n. sp.†

This plant was first noted by Mr. H. Ridley in the *Gardeners' Chronicle*, July 25, 1891, as *C. insigne* var. exul. "This *Cypripedium* insigne is a native of Nepal, so that it was surprising to me to obtain from a native collector a large quantity of a species closely resembling it from so far south as Siam. It

* *Cattleya Alexandræ*, n. sp.—Pseudobulbs cylindrical, covered with white sheaths, 1 to 1½ foot long, 2½ inch diameter, somewhat sulcate when old, generally three-leaved. Leaves very fleshy and rigid, narrowly elliptical-oblong, obtuse, sub-erect and concave, or flatter and more spreading; 3 to 5½ inches long by 1½ to 2 inches broad. Sheath linear-oblong, sub-obtuse, strongly keeled behind, 3 to 2½ inches long. Peduncles 1½ to 1½ foot long, stout, six to ten-flowered at the apex. Bracts triangular-ovate, rigid, spreading, 2 to 3 in. long. Sepals and petals spreading, linear-oblong, sub-acute, undulate (in dried state), 1½ to 2½ inches long, 5 to 6 in. broad. Lip three-lobed, 1½ inch long, 1½ inch broad; side-lobes semioval, obtuse, 1½ inch long, upper half free; isthmus 6 lines long by 4 broad; front lobe suddenly dilated, fimbriate-recurved, retuse, minutely ciliate-sub-undulate, 1½ inch broad, the nerves a little thickened, but scarcely verrucose. Column clavate, curved, 1½ inch long. Capsule fusiform oblong, nine-angled, 1½ inch long by ½ inch wide. Colour of the undulate sepals and petals described as of the same tint as those of *Lælia grandia tenebrosa*, tinted with violet at the margin, and the lip violet-rose. Native of Brazil.

† *Cypripedium exul*, O'Brien, syn. *C. insigne* var. exul. Ridley, in *Gard. Chron.*, July 25, 1891.

is very distinct as a variety, both in form and colouring. The leaves are shorter and more crowded; the scape shorter, the flower rather smaller than that of the typical form. The general colouring is similar to that of the Nepal plant, but the white margin of the standard is broader, and runs down to the base; the purple spots are crowded into the middle of the bright Apple-green centre. The petals and lip resembles much those of the Indian form, but the lip is more yellow. The shield is different in shape; instead of being cordate, with a notch at the apex, it is almost ovate, with, at the most, a depression at the top."

It is certainly very distinct, and the deviation amounts, I think, to a specific difference. When first I saw the plant imported, it reminded me in some degree of *C. Druryi*, and on its flowering I still see some resemblance to that species in the arrangement of the floral segments, and especially in the more or less clearly-defined dark band down the middle of each petal. Another approach to *C. Druryi* is the projection or tooth in the middle of the indentation in the front of the staminode, and which is not found in *C. insignis*.

Probably no *Cypripedium* has ever had so many importers in a year as this one had in 1891. Early in the year Messrs. F. Sander & Co. got it; then a large lot came direct to Messrs. Protheroe & Morris, and later Mr. Osmer brought what I take to be the same plant; and now Messrs. Linden have it. Meanwhile other growers got a few over direct, and so the plant should not be very scarce if the different importations have grown satisfactorily.

The specimen from which Mr. Weathers made the drawing from which our illustration was prepared, was obtained from R. I. Measures, Esq., of Camberwell, who has the best specimens of it in cultivation. Mr. Ridley's name "*exul*" fits it for a specific name, as well as it would for a varietal one, for it seems an alien from all other species. James O'Brien,

are to bloom, the ordinary varieties requiring about 8 to 10 inches of space, and the dwarf kinds doing well with somewhat less. Treated in this manner, the plants will be already in bloom by the beginning of May. Another method is to sow the seed on a sheltered bed, and to transplant in spring. Although by this plan the flowers naturally develop somewhat later, as it is only in exceptionally severe and withal snowless winters that the alpine *Forget-me-Nots* are affected by frost, we consider autumn-planting decidedly preferable. By sowing in spring, no really useful early flowers can be obtained, and this method is, in our opinion, not to be recommended.

M. sylvatica is an annual, and *M. oblongata* is treated as such, the first being sown at the beginning, and the latter at the end of March, under

grown in pots. They naturally thrive best by ponds or brooks; but planted in stiff soil, and copiously watered, they will bloom long and abundantly anywhere in the garden, although the leaves do not assume quite their normal dark green hue. They are also admirably adapted for forcing, to which end strong plants are potted in September, and by applying at first a gentle heat, and then gradually increasing the same, the grower will be rewarded by obtaining plants in time for Christmas.

M. azorica is a splendid free-blooming species, more especially suitable for pot culture, but also adapted for cutting and for bedding out. It is, however, much more tender than the sorts we have been discussing, and is sown either in autumn or during January and February in pans or boxes of light compost. The seedlings are pricked out into similar soil and kept under glass at a moderate temperature until April, when they are ready for placing in pots. The weather rarely permits them to be planted out of doors until May. They are then usually placed about 8 inches apart, and thrive well if put into a rich and not too stiff garden soil, with copious watering during the period of most rapid growth. Autumn seedlings are hardy, and can be easily wintered.

The *Myosotis* suffer occasionally from mildew, which most frequently makes its appearance when very hot weather immediately follows a period of moisture, but by sprinkling the plants with flowers-of-sulphur this pest can be usually got rid of.

For market gardeners the careful culture in pots of all the above-described varieties of *Forget-me-Not* is a profitable undertaking, as they command a constant and ready sale. With the exception of the *M. azorica* (from which slips are taken), all the sorts may be propagated by division of the plant, more especially the marsh *Forget-me-Nots*.

Referring once more to the alpine *Forget-me-Nots*, it may interest your readers to hear of a custom of utilising these favourite flowers which is very prevalent in Germany. Bereaved relatives seeking consolation by paying a floral tribute to the memory of the departed, avail themselves of the sentiment popularly attached to the plant in the following manner. They take a shallow vase whose broad open shape specially adapts it for the purpose, fill it with water, and put therein as many cut flower-stalks of the blue Alpine *Forget-me-Not* as it will conveniently hold. The vase is then placed in a shaded position on the grave, and a most beautiful and effective floral display is obtained, which without any further care or attention will last for several weeks, if the weather be not too hot.

Another method is to arrange on the grave a number of pots containing plants of the dwarf variety, the plants being then hidden by a layer of moss, which forms a carpet of green, and shows off the delicate blue flowers to great advantage. With this latter arrangement a daily watering is, of course, necessary. The attractiveness of this system of decoration can be readily imagined. *Fr. Benary, Erfurt.*

FOREIGN CORRESPONDENCE.

BAMBUA METAKE.

ALTHOUGH this fine plant is considered hardy in Holland as well as in England (see *Gardeners' Chronicle*, p. 407), it was severely injured in the winter 1890-1891 here. A plant, placed in a protected situation, and very stout, with shoots of perhaps 8 to 10 feet, was frozen to the ground. All their shoots have been lost, and although the underground shoots pushed nicely during the summer of 1891, it will be some years before it regains its old beauty. *J. H. K., Haarlem.*

FORGET-ME-NOTS.

Myosotis alpestris, the alpine *Forget-me-Not*, is one of our best biennials, and belongs to the very early and free-blooming section of garden-plants which give such gratifying results when effectively grouped in spring. Dwarf, compact varieties of this beautiful plant have been recently obtained, viz., *M. a. nana compacta*, and the especially charming *M. a. Victoria*, and these, both for borders and for pot-culture, are far preferable to the older forms.

M. a. elegantissima is a fine semi-dwarf variety, of a pyramidal habit. The old sort, however, by reason of its longer flower-stalks, is the best to grow for cut flowers, and when placed in water, yields a graceful profusion of bloom. The magnificent large-flowered *M. a. robusta grandiflora* (Elisa Fourbert), and the *M. a. Victoria*, are amongst the best of the alpestris section, they being the so-called "Hen and Chickens" *Forget-me-Not*, of which the centre flowers are double, and a figure description of which appeared some time ago in the *Gardeners' Chronicle*. The culture of *M. alpestris* is extremely simple. They may be sown under glass from July to August, the seedlings thinned out to about 1½ inches apart, and finally, in October, planted out where they

FIG. 77.—*CYPRIPEDIUM EXUL*, O'BRIEN - *INSIGNE EXUL*, RIDLEY. (SEE P. 522.)

the same conditions as the alpine *Forget-me-Nots*, and both give a continuous and rich display of bloom from the end of May onwards. If desired, however, all the above-mentioned *Myosotis* can be sown where they are intended to flower.

The splendid and much admired large-flowering *M. dissitiflora* is grown in the same way as the Alpine *Forget-me-Nots*, but not being so hardy, requires careful protection against spring frosts.

M. rupicola, on the other hand, a charming miniature *Forget-me-Not*, barely 5 inches in height, is only suited to culture in pots; or, if planted in the open, it requires a very shady situation, and a rich sandy vegetable mould.

The marsh *Forget-me-Not*, *M. palustris*, and its garden varieties, are also easily raised from seed, either by spring or autumn sowings, and give equally gratifying results, both as cut flowers and when

DORYOPTERIS AND PTERIS.

This interesting group, which is now included with *Pteris*, consists of about half-a-dozen useful little Ferns, very distinct in character and general appearance from other species of *Pteris*. They are chiefly from tropical America, and, therefore, require stove treatment, but should not have an excessively high temperature. During the summer they will do well in the cool fernery. With the exception of *D. palmata*, they do not appear to come freely from spores, and consequently are very scarce, as it is a very slow process to propagate from divisions. They succeed well in a compost consisting largely of loam, with some peat and leaf-mould, and a good sprinkling of sharp sand. The compost should be used in a rough state, the pots well-drained, and the

plants potted moderately firm; over-potting should be avoided. None of the *Doryopteris* grow large; *D. nobilis* is the largest growing, and I have never seen a specimen of this which would require anything larger than a 6 or 7-inch pot, and for *D. pedata* a 4-inch pot is large enough. *D. palmata*, too, is better when confined to the same size. Exceptionally well-grown plants will fill a 5-inch pot, but I have never seen it looking well in anything larger, except when several plants have been grown together. *D. sagittifolia* and *D. hastata* are desirable species; *D. pedata* closely resembles the pretty little *Pteris grandifolia* in general appearance, but the fronds are thicker, and the veins are reticulated. *Doryopteris ludens* is a very distinct Fern, the barren fronds are undivided, broad, and thick; the fertile ones palmately divided, and have long stalks or stipes. The most useful of the group is *D. palmata*; this is extensively grown for market, and is a pretty Fern for decoration. It will stand well, except in very cold weather; when exposed to cold the fronds blacken quickly. It is one of the best Ferns for the small fancy pots which are now so much used. I have also seen it grown in combination with *Onychium japonicum*. The two sorts grown together in the same pot are very effective. It may also be grown in the same way with other slender-fronded Ferns, including some of the *Adiantums*.

While writing of combinations, I am reminded of *Pteris argyrea* and *P. straminea*; this is one of the prettiest I have seen. The former, when grown by itself, is rather straggling and loose, but grown in combination with the latter, which is of a bright fresh green, the pale shade of green with the white variegation of *P. argyrea* is shown up to great advantage. *P. serrulata* may also be grown with *P. argyrea*, the former making a nice undergrowth for the tall fronds of the latter. Many other combinations might be recommended. In this, of course, individual taste has to be considered. To those who would try for themselves I would say, the choice should be from those which are most likely to succeed well under the same treatment, and to select only free-growing sorts. These combinations may be made while the plants are quite small, or after they are more advanced. By rubbing away a portion of the soil on one side of the balls, and pressing the crowns as closely together as possible, the fronds may be brought to mingle with each other in a natural manner, and after they have made a few new fronds they will be ready for use as decorative plants, *Pteris*.

OLEA FRAGANS.

An old plant, and one not often met with in present day collections—although one occasionally comes in contact with a well cared-for, well-grown specimen—is *Olea fragrans*. Perhaps the chief reason for the neglected state in which we so often find it is owing to the popular craze for highly-coloured plants and flowers, and to which property this subject cannot lay the slightest claim; although, if sweetness of perfume be considered, it should hold a very respectable position amongst greenhouse plants, for, without exception, it is about the sweetest little thing one could wish to meet with. This fragrant Olive is an evergreen greenhouse plant, belonging to the natural order Oleaceae, and is a native of China, from whence it was introduced in 1771. It grows to a height of from 4 to 10 feet, according to the quality of the soil in which it is planted and the position in which it is placed. The leaves are oblong, bright green, and serrated, and the small white inconspicuous flowers which are produced in axillary corymbs are highly fragrant. In China the plants are greatly esteemed on account of the very delicious *fruits* which is imparted to tea by mixing the leaves and flowers of this plant with those of the ordinary tea.

When well grown, *O. fragrans* is a very pretty and desirable subject, the foliage being fresh and

beautiful, and supposing it had no other favourable qualities it might be grown as a decorative foliage plant, and would answer very well for the purpose. In addition to being very easy of cultivation, it is not troubled to any marked degree by insect pests; thus much labour and anxiety are saved.

I have found a compost of three-fourths turfy loam, and one-fourth well-decayed manure, with a little sand added, a very suitable soil for growing it in. The plants may be placed in a sheltered position out-doors during the summer months. Propagation is effected by cuttings of well-ripened wood placed in sand, and given a gentle bottom heat; from these nice little plants can soon be obtained. *C. H. B.*

DISEASES OF THE REPRODUCTIVE ORGANS OF PLANTS, CAUSED BY FUNGI.

(Concluded from p. 491.)

ERGOT.

There are few fungi which have attracted more attention than that known to botanists by the name of *Claviceps purpurea*. From the investigations of Tulane, published in 1853, we were made acquainted with the life history, as well as the structure, of this fungoid parasite. To the professional mind Ergot consists of an assemblage of dark coloured, somewhat curved sub-cylindrical bodies, possessing a peculiar but not altogether an unpleasant odour. To the botanist these bodies shrink into insignificance in comparison with the living fungus. The Ergots, or, as they are technically called, sclerotia, lie upon the ground during the winter months in a dormant state, but in the spring begin to evince signs of vitality. Each Ergot produces one or more sporophores. These are spherical bodies, borne upon stalks like microscopic drumsticks. The spherical head is not smooth, but covered by a great number of elevated points, each of which corresponds to the mouth of a flask-shaped receptacle, the base of which is embedded in the fleshy substance of the sporophore. In colour, these structures are purple—hence the specific name; they are fleshy, and vary in size according to the size of the Ergot from which they are produced. Thus the *Claviceps* of the larger Ergots, such as those of Wheat or Rye, are very much larger than those of the minute Ergot of Reed or of *Anthoxanthum*. The perithecia contain a number of filiform sporidia, which escape from the ostiola, and are carried by air currents, or possibly by insects, to the flower-heads of the grasses on which their subsequent development is to take place. The filiform sporidia give off very narrow thread-like branches, which penetrate the epidermis at the base of the young flower just below the ovary, and give rise to the development of spawn-threads or mycelium, which permeates the tissues, and occupies all the lower part of the flower. In the course of ten or fourteen days, delicate spawn-tubes project from the surface of the affected parts, and at their tips produce myriads of very minute colourless gonidia, which are mixed with a sticky saccharine secretion. The exterior of the mass (sphaecelia or gonidiophore) has a wrinkled appearance, from a number of elevated vein-like ridges which are formed upon it. In this condition sphaecelia are visited by insects, which are attracted by the sugary secretion.

The formation of the Ergot itself takes place in the following manner:—The mycelium occupies at first the base of the young ovary in the flower of its graminaceous host. It then, in the ordinary run of cases, extends upwards, so as to occupy the entire ovary, with the exception of the apex, changing it into a whitish body, wrinkled externally by elevated veins, like ridges; on this body the gonidia are produced. The mycelial hyphae also penetrate downwards into the floral pedicel, according to Kuhn's observations. The gonidia are produced in great numbers from the tips of the hyphae. They are oval in form, and accompanied, as we have seen, by an abundant saccharine secretion, which is much sought after by insects, and by this means the

gonidia are transferred to healthy florets. The gonidia germinate freely; sometimes they emit germ tubes, sometimes they produce from the end of the emitted tubes, secondary gonidia. After a time, the formation of gonidia ceases. The hyphae, of which the gonidiophore consists, become compacted towards its base, so as to form an elongate rather dense body resting on the base of the floret below, and surmounted above by the gonidiophore, which carries on its apex the remains of the ovary, at first surmounted by the stigma. The surface of the sclerotium soon acquires a violet hue, and the cells forming its exterior gradually assume the character of a cortex. The growth of the gonidiophore ceases as soon as the Ergot begins to be formed. The formation of the Ergot takes about four weeks. During the growth of the Ergot, drops of sugary fluid are still formed, but more limpid than the saccharine secretion of the gonidiophore is. Sometimes these changes take place lower down, so that the aborted ovule is carried upwards almost entire upon the summit of the Ergot.

Ergots occur upon a vast number of graminaceous plants; perhaps on none more frequently than upon Rye, Ergot of Rye being the most familiar to us by name; but the other cereals are similarly affected by the fungus. Perhaps the next most frequent host is Wheat. All varieties of Wheat are not, however, equally subject to it. The Bearded Wheat, a sort not very largely grown in this country, because it is not so suitable for making the better kinds of flour, is much more frequently ergotised than the other varieties, but in a district where grasses are allowed to luxuriate in the hedge-banks, or more especially in ditches surrounding Wheat-fields, all kinds of Wheat become affected. It is commonly said that a damp season favours ergotisation, but this is not necessarily true, all our common grasses are liable to it, such as *Lolium perenne*, *Dactylis glomerata*, *Glyceria fluitans*, and *G. aquatica*, and above all the common Reed, *Phragmites communis*. Any of these may convey the disease to the Wheat crop, but, unless the Ergot has been allowed to mature itself upon the grasses, no amount of rain will produce it. Hence the necessity of cutting down the grasses on the borders of fields, and particularly of not allowing the grasses and reeds to fructify in the ditches, because if the grasses be cut down before they flower, the Ergot must perish.

Barley is much less frequently ergotised than Wheat, and it is doubtful if Oats ever are. The allied *Avena elatior* is, however, very frequently affected. The influence of improved cultivation has had a great effect upon the production of Ergot, especially the adoption of the system of growing crops in rotation. This has been especially remarked by Riva in the Rice fields in Northern Italy, where its introduction and general employment has wonderfully reduced the quantity of Ergot. That Rice should be ergotised is not at all surprising, because it is a grass which requires a very damp soil to grow in, and most of the grasses, liking this kind of situation, are easily ergotised; for instance, the *Glyceria*, the Reed, and the aquatic *Poa*. As long ago as the last century, it was noticed that an epidemic of ergotism which occurred in 1749 near Lille was much more severe on the south side of the town, which was marshy, than on the north, which was drier. The grass, which in this country, perhaps, suffers more frequently from the disease than any other, is *Lolium perenne* (Rye-grass), but, owing to the fact that a large number of its Ergots are of such small size, that they barely extend beyond the florets, this fact often escapes notice. Ergotisation of the *Lolium* occurs, too, late in the summer, so that the hay crop escapes, but if any road-side be examined in September and October, scarcely any unaffected plant will be found. It is quite possible to distinguish the Ergots of many of the different grasses and cereals after they have been separated from their host-plants. Thus a Rye Ergot is very smooth, curved, and tapers somewhat at either extremity. Wheat Ergots are much stouter, more blunt, and frequently split at the upper end. The Ergots of Twitch

(Triticum repens) are very much more slender than either of the above. Lolium Ergots are short, small, and obtuse. Reed Ergot is very small, smooth, dark, and tapering; the Ergot of Alopecurus is curved, dull in colour, and deeply grooved longitudinally, while those of Glycemia are dark, plump, smooth, and shining. The smallest Ergots are those of Anthoxanthum odoratum. With regard to the properties of the various Ergots, an interesting field for study is open to us. Wheat Ergot, which, by the way, is frequently found mixed with Rye Ergot in commercial samples, has been recommended as a substitute for the official kind, principally because it contains less oil and more extractives. No doubt, Ergot of Wheat is an active poison, and the reason that we do not hear more of its effects is twofold: firstly, because the variety most liable to it (Rivett's Wheat), is not much used for milling purposes; and, secondly, because of the great improvements which have been effected not only in the dressing of the Wheat by the grower, but more particularly by the miller. Scientific milling, as it is called, has now arrived at such a degree of perfection that almost every foreign body is removed from the corn before it becomes flour, by a series of mechanical appliances. If the Wheat contains Ergot, the ergots are removed, and it is surprising to what a large quantity they amount when those removed from many tons of Wheat are collected together. Thus it is that our flour and our bread are far more free from admixture with this dangerous substance than they ever were in bygone times. The subsequent history of the refuse is, however, worth tracing. It consists of Barley, Oats, Peas, Beans, Maize, and a large proportion of various foreign seeds, as well as Ergots. The whole is ground so fine that it cannot be recognised, and it is used for the manufacture of oil-cake of inferior quality—a compound which must be dear at any price. C. B. Plowright.

[The remainder of Dr. Plowright's lecture was devoted to the medical history of Ergot, a subject beyond our limitations. En]

KEY NOTES.

PLANTS IN FLOWER, &c.—*Susum antheiminticum*.—This is a plant of considerable botanical interest, and also sufficiently ornamental to be worth a place among stove plants. It is one of the three genera which now constitute the order Flagellariaceæ, but which were once included with the Rushes (Juncaceæ). *Susum* may be described as a Dracæna-like plant, the leaves being lanceolate, elegant, dark green, and from 2 to 8 feet long. The flowers, which are small and green, are borne on a branching panicle, produced from the top of the stem. The plant grows in swamps and marshy places in Ceylon and various parts of India, its large submerged floating stems and stolons suggesting the "Palmite" (Prionium), which in South Africa completely covers the rivers and streams with a stout network of stems, capable of supporting a man. There is a small plant of the *Susum* now flowering in the T range at Kew.

Monodora myrsina var. *grandiflora*.—A specimen 15 feet high of this large-flowered variety of the Calabash Nutmeg has just bloomed in the Palm-house, probably for the first time in England. The type is represented by a figure in the *Botanical Magazine*, t. 3059 (1831), prepared, however, from a plant which then grew in Jamaica. The variety was figured and described as a species by Bentham in the *Transactions of the Linnean Society*, vol. xxiii., t. 52, 53. It has flowers fully twice as large as those of the type, and larger leaves. The Kew plant is about 15 feet high, well branched, and clothed with oblong leaves a foot long by 6 inches in width; they are bright sage-green, and when young are tinged with red. The flowers are axillary, and pendent on the young branches; the peduncle is 4 inches long, and the flower is composed of six segments, the three outer ones $\frac{3}{4}$ inches long, 1 inch wide, curved, wavy, and covered exactly like the labellum of *Oncidium papilio*; the three inner segments are pale

yellow, cordate, an inch wide, and incurved. The whole flower is totally unlike any other flower known to me. It is fragrant, and remains fresh on the plant about a fortnight. A figure of it has been prepared for the *Botanical Magazine*. The genus is composed of three species, natives of Central Africa, and it belongs to the order Anonaceæ.

Pitcairnia ferruginea.—This gigantic Bromeliad flowered for the first time at Kew in 1860, and it has bloomed there frequently since. The largest specimen was removed to the Temperate-house a few years ago, where, planted in a peat bed in a sunny position, it is quite as happy as it was when in the Succulent-house. The plant now in flower is in the latter house, and is a smaller example, which was once in the collection of the late Prof. E. Morren at Liège. It has an inflorescence 6 feet long, branched, and forming a panicle of long yellowish-white flowers. Its most striking feature, however, is the rich red-brown coating of short spines, which

the spring of 1888. A figure of it has been prepared for the *Botanical Magazine*.

Acacias.—Several specimens of exceptional size are now in full flower in the Temperate-house; there are also good examples of *A. armata* and *A. pulchella* in the greenhouse (No. 4). A considerable number of the cultivated species of *Acacia* are not seen at their best except when grown into large plants. Thus the following, which at Kew are from 15 to 20 feet high, are exceedingly handsome, viz.:—*A. verticillata*, *A. salicina*, *A. armata*, and *A. pulchella*. Large bushes of *A. retifolia* and *A. Drummondii* are also attractively in flower, whilst *A. strigosa*, *A. cordata*, and several others are pretty little pot shrubs. There have been *Acacias* in flower in the Temperate-house at Kew since January. Planted out in peat beds in a sunny conservatory, most of the species do very well and flower freely; they are nearly all powerfully fragrant. W. W.

VEGETABLES.

EARLY'S CURLED SPROUT.

In the absence of colour, we are not sure whether some enthusiastic florist might not think our illustration (fig. 78), was intended to represent an eccentric Hollyhock! It is not so, however; what it does show is a very promising new form of Sprouts raised by Mr. W. Earley between the Brussels Sprouts and the Curled Kale. Judging from the specimens sent to us, the new-comer has some excellent qualities. Its good looks well commend it to the exhibitor, its firm substance to the cook, its flavour to the consumer. In addition, Mr. Earley tells us that it is perfectly hardy, and the specimens he sent us recently quite bore out that statement.

HIGHBURY, NEAR BIRMINGHAM.

THREE is an extensive collection of *Cleaves* here, including some fine seedlings, and the following are now in flower:—*Distinction*, Marie Reimer, Mrs. Laing, robustum, Surprise, a very fine variety; some of Mr. Williams' seedlings, in addition to seedlings raised at Highbury, amongst the latter a very rich deep-coloured orange-red, named Mrs. Chamberlain, a superb variety.

Anthuriums are well-grown, and the original plant of *A. Chamberlainii*, growing in the rockwork of the fernery, is now furnished with spathes, as are also *A. Scherzerianum* and *A. magnificum*, the latter a grand variety, with very broad spathes $7\frac{1}{2}$ inches long.

The conservatory is bright with a grand lot of *Azalea mollis*, *Lilium Harrisii*, *Magnolia Soulangiana Alexandrina*, and a host of other plants. In the conservatory are three centre groups of plants planted out. In one is a superb *Musa ensata* planted three years ago, which has reached to the roof, and is showing a large cluster of fruit. The stem is 7 feet high and 6 feet in circumference at the base. In the centre group is a grand specimen *Chamærop. Fortunei*, 20 feet high, with other Palms around the base. In the third group is a fine *Areca paludosa*, 10 feet high, in fine condition, with smaller Palms, and *Canna Engelmanni* and *Hedychium giganteum* about the base.

The display of Orchids at Highbury, is just now of much interest, and the collection is in admirable health. The *Phalænopsis* in the double glazed roof house are in excellent condition. Amongst the most noticeable species now in bloom are *Cattleya Lawrenceana*, very rich and deep in colour; a very lovely variety of *C. Schroderae*, a *Cattleya Trianae*, very highly coloured; and *C. T. virginialis*. Amongst *Dendrobiums*, there are *Phalænopsis Schilleriana*, *P. aggregatum majus*, plenty of *Wardianums*, with one variety especially fine and with extra strong growth; and *D. Venus*, a hybrid betwixt *D. nobile* and *D. Falconeri*. Several plants of *Dendrobium Devonianum* and others are also in bloom.

A good example of *Chysis bracteescens* is a striking object, and some plants of *Ada aurantiaca* are con-

FIG. 78.—EARLY'S HARDY CURLED SPROUT.

clothe the whole of the inflorescence except the petals. The spines rub off easily, and are almost as irritating to the skin as the spines of the Cowitch—*Mucuna pruriens*. The leaves are a yard long, stiff, channelled, with strong brown marginal spines. The plant is a native of the Andes of Peru.

Capparis flexuosa.—This is one of several species of the large genus *Capparis*, which are cultivated for the sake of their handsome flowers. It is a stout, erect shrub, about 1 yard high, with stalked, lanceolate leaves, a foot long, and a terminal erect inflorescence 6 inches long, bearing a cluster of about twenty flowers, the petals of which are green, and reflexed, so as to appear like a flat disc, from the centre of which spring numerous stamens an inch long, white, rose-purple at the base. According to Lemaire, in the *Jardin Fleuri*, where there is a figure of this plant, t. 303, it was introduced from the woods in the neighbourhood of Rio de Janeiro in 1850, and flowered in 1852. It is now flowering in the T range at Kew. I saw some very fine examples of it in flower in the Brussels Botanical Gardens in

spicuous with their drooping racemes of rich orange-scarlet flowers; a fine plant of *Lycaste plana*, has fourteen blooms upon it, and a specimen *Dendrobium vexillarium*, very deep in colour; and *D. Falconeri giganteum* with blooms 4 inches across, as well as a *D. Findlayianum*, a lovely pale coloured kind with a rich orange blotch on the lip, are all very beautiful. There is a good collection of *Madevillias*, *M. Harryana* being conspicuous amongst these just now. Some fine plants of *Odontoglossum Roezlii* and *O. citrosum*. Many others are in bloom in the numerous houses devoted to Orchids. *D.*

VARIORUM.

THE CULTIVATION OF COFFEE IN EAST-CENTRAL AFRICA.

"An interesting book has lately been published, entitled *The Martyrs of Blantyre*. The three 'martyrs' were Henry Henderson, Dr. John Bowie, and Robert Cleland, of the Church of Scotland Mission there. Henderson was a son of the manse of Kinclaven, Perthshire, and all three died less than a year ago, within a period of three months—the first deaths that had up till that time occurred in the staff of the Mission during its fifteen years' service. The story of the history of the Mission is told in the book, and the following interesting passage, as having reference to Muthill men—Messrs. Buchanan and Duncan—is worth quoting:—

"Very interesting is the story of four little slips which Mr. Duncan, the gardener, took out with him from the Botanic Gardens in Edinburgh—one Tea and three Coffee plants. If these would grow, how much it might mean for the new country! Carefully they were tended, and anxiously watched and watered; and we can understand with what feelings those who watched them saw first one, then another, then another of them die. Only one little tiny struggling slip was left, and it looked as if it were to die too; but it didn't—it lived; and that one little slip has grown into the Coffee plantations, not only of the mission at Blantyre, but of Buchanan Brothers at Zomba, of the African Lakes Company at Mandala, and of Messrs. Sharrer, Duncan, and others, till in this year (1891) we learn that the Messrs. Buchanan have in their plantations alone 1,000,000 Coffee plants, and that the highest price quoted in the London Market for the season has been for this very Shiré Highland Coffee! That little tiny slip, so feeble-looking, and once so nearly dead, yet so marvellously fruitful, is a fit emblem of the Mission itself." *Strathcarr Herald*.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

THE ORCHARD HOUSE.—The fruits of Cherries and Plums, when the crop is a heavy one, must be thinned in accordance with the apparent ability of the trees to bring them to maturity, and of a presentable size. The lateral growths of Plums must be stopped when they are 2 inches long, and the plants syringed twice daily. Employ phosphates and some manures containing nitrogen when watering the plants which are bearing heavy crops of fruit. Free fruiting varieties of Pears in a promising condition, will also be benefited by root stimulants, and a few of the smaller fruits being removed when it is seen which are likely to swell the best. These trees, too, may be syringed in the afternoon of fine days. The setting of Apples may be aided by gently shaking the plants in the middle of the day when the pollen is dry, or the flowers may be brushed over with a rabbit's tail. At this stage the atmosphere surrounding the trees should be kept dry, and for this reason the different sorts as well as varieties of fruits are best arranged in their respective sorts and according to their times of flowering. The borders in which the pots are placed or the plants growing should not suffer lack of water, and a sharp look-out must be kept for aphids, which should they appear on the shoots must be destroyed by fumigation with tobacco or

some of its preparations two or three nights in succession after the plants have passed out of bloom; but as it sometimes happens that Plums and Cherries become infested with black or green fly before the Apples and Pears have finished flowering, some means of fumigating the trees must be adopted; or tobacco water in a diluted state, but still fairly strong, may be made use of on four or five consecutive nights, and the plants washed with clean water the morning following. Medicated tobacco paper is one of the safest and most effective kinds to apply. Admit air freely to the house at all times when there is neither frost nor cold dry, cutting winds.

FIGS in pots, and when only a limited number are forced at one time, may have their shoots stopped beyond the fifth or sixth leaf, but in houses of moderate size well filled with trees growing in borders, this operation may be performed on certain proportions of the shoots once a week. By thus deviating from the usual course, and adopting this system of only pinching a few shoots at a time, the time during which a supply of ripe fruit may be had will be extended, and the plants be less checked, and the demand of the crop on resources of the trees spread over a longer period, and severe in none. Plants in narrow borders and bearing heavy crops, should be liberally supplied with water, and a certain amount of warmth at the root, and a steady temperature maintained in the house, both of these factors being of importance. It should be remembered that violent changes from heat to cold will cause the fruit to drop, and a cold border will tend to the same result. The temperature may be 65° to 70° at night in warm weather, with a fall of a few degrees when it is cold, which will suit all plants that were started at the new year, if given a moisture laden atmosphere in the daytime.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Peirce Gardens, Swansea.

CAMELLIAS.—Plants which have finished flowering, if they have become thin in the branches, should now be cut hard back (not into very old wood, that being best done in October), and if the roots are in bad condition, the plants should be turned out of the pots or tubs, the soil removed in great part, the ball dusted over heavily with sharp sand and repotted in fresh compost, using pots of a size smaller than those they previously filled. The drainage must be good and in sufficient quantity, Camellias not liking to be disturbed annually. Rich fibrous loam, with sufficient sharp sand to keep the whole porous, suits them, but heavy loams should have one-third of fibrous peat added to every two parts of loam, and sharp sand in proportion. After repotting, stand them in a house having a genial atmosphere, not exceeding at night 58°, and syringe them twice daily with tepid water. The watering of the soil must be carefully done for some weeks, so as not to cause soddening, which is apt to occur in the period that elapses before many new roots are formed. Plants in large tubs should have the surface soil taken away down to the roots, and be topped dressed with good fibrous loam, to which a sprinkling of Thomson's manure has been added, and the whole made firm with a rammer. Whilst the plants are growing, Thomson's Manure is very beneficial to old Camellias, as is also weak soot-water. Keep the plants free from scale and mealy-bug, and clean the foliage by sponging it with water, or dry rubbing it. Use a light shade over the plants during bright weather when the plants are making growth.

SOLANUM CAPSICASTRUM.—Cut-back plants which are breaking, may be shifted into pots two sizes larger than those they are in, and be grown on in a close pit for a few days until they get established, when air may be afforded them in increasing quantity. Solanums grow well in a compost consisting of two parts of rich loam, and one part each of rotted dung and leaf soil and some sand. Solanum cuttings put in during the spring should be potted singly, when rooted, and afforded a light rich soil, keeping them close till they have formed fresh roots, and when the pots are fairly filled with roots give them a shift, their final one, using 5 or 6-inch pots, and the same kind of soil.

IPOMÆA MORFALLIÆ.—When choosing cuttings of this plant select those shoots which are firm and of three or four joints in length. Place these singly in well-drained small pots of sandy soil, surface

with half an inch of sharp sand, place the cutting pots under a hand-glass or bell-glass in the stove, and when the end of the cuttings has become callused, remove the pots to a propagating frame, with a bottom heat of 80° to 85°, keeping them close the while, shading them in bright sunshine, and not allowing them to flag. A good compost for established plants of this species of *Ipomœa* consists of equal parts fibrous loam and peat, with a liberal addition of sharp sand.

THE ORANGERY.—To have Oranges, Citrons, Lemons, Shaddocks, &c., fit for use, the plants should be grown in a higher temperature, than that in which they are generally cultivated, that of the intermediate-house being the most suitable for them. In the case of plants which have for some years been left undisturbed at the roots, the soil is sure to have got impoverished and sour, the plants should be turned out of the pots or tubs and have much of the soil cleared away, also cutting back decayed roots and repotting them in fresh soil. If many roots have been lost owing to the bad state of the soil, smaller tubs or pots should be made use of, and these should be clean, and in the case of the former, if of wood, the inside should be charred. As a potting compost, turfy loam, burnt earth, leaf mould and a fair proportion of sharp sand make a suitable one for all the Citron tribe. If the loam be heavy, or burnt earth be not used, some rough fibrous peat should be mixed with the compost. A bottom heat of 75° is of use in encouraging root action in plants with but few roots, and without plenty of roots healthy top growth is not possible. Syringe the plant once a day whilst growing, and keep the house moderately moist, shading the plants with a thin screen when the sun is powerful. Any that may require larger pots or tubs may also be repotted now. Great care must be taken to have good drainage, and to have the top covered with lumps of loam or peat make it impossible for the finer particles of soil to get amongst the crocks. Brown and white scale and mealy-bug are often troublesome, so that the plants will require watchfulness to clear them of these insects, which increase fast in warmth.

CONSERVATORY AND GREENHOUSE CLIMBERS.—When the borders have got exhausted, the work of renovation may be taken in hand at this season, so that the plants may have a long period of growth. Climbers in these structures have, in some instances, but little direct sunlight, owing to the shade thrown by neighbouring plants, and it becomes necessary to plant only such creepers as have attained to good size, or progress will be slow and unsatisfactory. In narrow borders, good drainage and the best of soil being essential to success, and these should receive attention. The composts in which the different subjects are grown should be moderately rich, but the use of much manure is not to be advised, it causing a too luxuriant growth for a time, and it is better to give annual top dressings and manure water while the plants are in active growth. Climbers are important features in the conservatory or greenhouse, which make it the more needful to have them in the best condition. Those which are grown in pots, and are already large enough, should be assisted every fortnight or three weeks with weak manure water or some well tried fertilizer, and the old soil picked out down to the roots and replaced with new. Any which require more root space may now be repotted. Keep all creepers clear of mealy-bug, thrips, brown and white scale.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

HOLLYHOCKS.—This back-row border plant is not cultivated so extensively as was once the case, yet few herbaceous plants are more useful in certain positions, or give better returns for good and generous treatment. Given a piece of well-manured, deeply dug ground to grow in, and mulching the plants as soon as planted and watered, and supplying water freely during very dry weather, the results are most satisfactory. It may be planted in groups of mixed colours in the pleasure-grounds, dotted among shrubs in the shrubberies, or planted in large beds intermingled with *Fuchsias*, on a ground-work of *Phlox Drummondii* or blue *Viola*, with plants of the striped Japanese *Maize* and *Salvia patens* near the outside, and edged with *Tom Thumb Dahlias*; the effect produced is very telling. Young plants raised from seed sown in January, and potted singly into small 60's as soon as large enough, and grown steadily on, afterwards shifting them into small pots of a light rich compost, which should be kept uniformly moist,

and syringed overhead twice daily with tepid water, are now at this date well established, and in process of gradual hardening off. Plants treated in this manner grow and flower very well, and keep free from rust. I may remark that my plants are afforded weak liquid manure whenever water is needed. Where strong plants raised from cuttings or potted-off offsets are available, they should be planted out as soon as a favourable change in the weather occurs, and the soil made moderately firm about them, affording water, and mulching as advised above.

LILIUM AURATUM, ETC.—Bulbs of *Lilium auratum* and other species which were started in pots with the intention of transplanting them into the herbaceous borders as soon as the weather permitted, should be planted among other plants whose height ranges from 2 to 4 feet. When planting the bulbs, sifted light soil and leaf-mould should be placed around them and made firm. A spray or two of evergreens stuck round about each bulb or group of bulbs for a few days will preserve them from injury by strong sunlight. A mulch of short manure or leaf-mould may be laid on the soil over the roots and nearly close up to the stems.

FRAME GROUND.—See that all plants of *Pelargoniums*, *Verbenas*, *Lobelias*, *Ageratum*, *Calceolarias*, *Leucophytums*, &c., being hardened in frames and pits, as well as those still in growing temperatures, are kept well supplied with water at the roots. The propagation of *Alternantheras*, *Golden Feather*, *Lobelia erinus*, and *Cannas*, should be pushed on with despatch; also the pricking off and potting of the same, following previous directions in regard to these operations. Shift seedling *Ricinus*, *Cannas*, *Melanthus* major, *Tobaccos*, and other sub-tropicals, into larger pots, using rich soil and good drainage. Keep all of the above in the warm-houses, to promote quick growth.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE MEXICAN-HOUSE.—*Barkerias*, although not largely grown, are pretty and useful as autumn and winter flowering plants, and they are of easy growth and flower well if rightly treated. They should be grown in shallow pans or wooden baskets, supported on sphagnum moss, and the receptacles suspended in full sunshine, and an abundance of air allowed to circulate round them. The roots of *Barkerias* rarely go down into the moss beneath them, but grow as aerial roots. After the flowering season is passed, the plants should be kept very cool and dry, only having water supplied them occasionally till March, when the water supply may be increased; and now that the young growths are pushing forth, and until these have finished, copious supplies of water are necessary. Yellow thrips are sometimes troublesome on these plants, but these can be quickly dislodged with tobacco-water, as they do serious injury to the young growth, and often ruin the flower-spikes which come out from the apex of the young pseudobulb. *Barkeria Lindleyana* and *B. Skinneri* are, I think, the species that are the best and richest in colouring, but when well grown, all are pretty. The other occupants of the Mexican-house, which are those that require the greatest amounts of sunlight, and a buoyant atmosphere, are now generally becoming active, and new roots pushing freely into the compost. If cockroaches are troublesome, Chase's Beetle Poison should be employed to destroy them. I use but little shading, if it can be avoided, for these *Orchids*, but as mentioned in my last Calendar it is sometimes preferable to shade plants, and is the lesser of two evils.

THE INTERMEDIATE-HOUSE.—*Odontoglossum Phalaenopsis* is an *Orchid* not always found in the most luxuriant health, although one may sometimes find it growing freely. The warmth and conditions of this house suit it, but I have had it growing well in the cool-house during the summer months, removing it to a warmer house to pass the winter; but, on the whole, the intermediate-house may be said to be its proper place. It is best placed in sphagnum moss and peat, in pans, and placed near the roof, affording it during the summer a liberal supply of moisture, and it enjoys being syringed overhead; but in the winter, this syringing must be discontinued. Like *Odontoglossum vexillarium*, it is safer to keep the plant on the dry side, or the tips of the leaves will turn black. *Oncidium concolor*, *O. Marshallianum*, *O. curtum*, *O. varicosum*, and similar varieties are best grown at the cooler part of this house, well up to the light.

THE EAST INDIA - HOUSE.—*Odontoglossum Roeblii* requires a moist position and a good amount of warmth, syringing it overhead occasionally, but the compost in which it is planted should not be kept in a saturated condition. The *Calanthes* are making strong growths, and must be watered very carefully for the present, as overmuch water now would probably mean failure. *Dendrochilums* (*Platyclinis*) I find to grow very freely in this house if potted in peat and sphagnum in well-drained pots, and they will take a good supply of water when growing. *Aganisia cyanea* is also best suited here, and should be grown on a Teak raft; the same treatment will apply to *Broughtonia sanguinea*, a plant of which is now in flower.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Mereworth Castle, Maidstone.*

PEACH AND NECTARINE TREES.—These trees will have made good progress, and in the warmer parts of the country set their fruits. Where the growth is forward enough, disbudding should be commenced and carried on at intervals, at first only removing just so many as will not check the fruits. In doing this, it is good practice always to make sure that one shoot exists at the base of all of last year's shoots, and if it be on the upper side of these, it will be easier to train the resulting shoot into its proper place when it becomes long enough to allow of this being done, these new shoots being the fruit-bearers of next year. Others should be left at about 4 inches apart, the leading shoots laid in at their full length, except when the allotted space is filled, when the point must be pinched out, the shoot at its base subsequently taking its place at the end of the season. These leaders, if weak, may be stopped at intervals all over the tree, so as to induce them to make better wood for another year. Much care is required in disbudding, so as to preserve an even balance in the branches, and not to let one part of a tree grow at the expense of another. For this reason, disbudding should take place first at the upper part of the tree, as it is here that the shoots begin to grow. Always begin to thin the shoots betimes, and avoid wholesale thinning, which frequently leads to the loss of the fruits when they are about the size of Peas.

WALL-FRUIT TREES.—Although most trees on walls started in favourable weather, and at one time looked full of promise, the frosts which occurred first on the night of the 15th, and have continued up to the time of writing, have killed most of the bloom, and it is very likely that the fruits that were set and the flowers that were expanded will fall off; at all events, the present outlook is a gloomy one. Those who have good blinds and glass-cupping for their trees may have escaped in part, especially where blinds are in use, as these may be lowered and drawn up on occasion. For the present, and as long as the inclement weather lasts, little work can be undertaken, unless it be the staking and securing of recently-planted fruit trees and bushes. In fastening standard trees, precaution should be taken against any injury to the bark by friction, by employing some soft material as a pad between stake and stem. The proper labelling of the trees should not be forgotten, the nurserymen's parchment labels soon getting illegible. Gooseberries and Currants that were in flower likewise suffered from frost. The contrast observed on April 16 between the deep green colour of the leaves and flowers and the snow is one which, luckily, is rarely seen, and I have not seen before in my twenty-three years' experience. On each night, since that date, we have had from 7° to 9° of frost.

APPLES.—There is still room to hope that a good crop of fruit will set, the flowers not being open in this part of the country, and nearly every variety is full of fine strong flower buds, in fact, a better promise could not be desired, and the trees, moreover, are clean, and free from insects.

THE FRUIT ROOM.—This place should be thoroughly cleaned out as soon as it is empty, the walls whitewashed, the shelves and tables scrubbed, and everything put in order for the season. Full ventilation should be afforded, if convenient. If fruit stores are to be built, it should be remembered that Peas acquire their best flavour if the store be kept dryer and warmer than that where Apples are stored, the latter keeping best and longest if frost be merely excluded, and the place is somewhat damp.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syn House, Brentford.*

PEAS.—These crops should have close attention in the matter of sowing seeds regularly, if the supply of green peas for the table is expected to last the whole season. Another matter that must not be overlooked is the watering of the plants, and afterwards mulching them in dry warm weather. Peas cultivated in trenches prepared as for Celery rarely fail to produce heavy crops of fine Peas. For sowing about this date, *Champion of England*, *Criterion*, *Prodigy*, and *Veitch's Perfection* are excellent varieties, to be followed a month later by *Ne Plus Ultra*, *Success*, and *Walker's Perpetual*. Late sown seed takes but little time to germinate at this season, and thinner sowings may therefore be made. The rows may also be so arranged that other crops may be taken in the between spaces. *Ne Plus Ultra*, and others that grow as tall, need not be provided with very long sticks, as when the haulm is 4 to 5 feet high it may be topped. Early kinds should have sticks put to them as soon as they are well through the soil, previously moulding them up and dusting them with dry soot if the weather be showery. This early sticking of the rows protects the plants from the ravages of birds and from wind; and even varieties that grow but 1 foot high are the better for a few twigs being placed alongside of the rows, the pods being thus kept clean and more readily gathered.

ASPARAGUS.—The beds should have been raked over and all large stones and clods removed before any Asparagus shoots appear above ground, the alleys being also made tidy. New beds may now be planted, growth having commenced. Asparagus seed may be sown if not already done, sowing it thinly.

FRENCH BEANS.—Plants raised in pots in cold frames may now be transferred to a spot on a south border, planting them in rows, and covering them with frames or hand-glasses for a time, at night. When planting these Beans, a light soil, siftings from the potting-bench, or the like, should be strewn about their roots, the latter being made firm by pressure of the hand. Beyond affording them a light watering after planting, little water will be required for some time. Sow seeds of *Mohawk* or some early variety for succession, and again in a fortnight *Ne Plus Ultra* and *Canadian Wonder*, the latter coming into use after the former. Another sowing may still be made for indoor supply, this time sowing *Canadian Wonder*. The seeds may be sown in larger pots than hitherto, and be placed in frames which should be carefully aired, and the points of the Bean stems pinched out to induce early podding.

BROAD BEANS.—Sow on a cool border *Broad Windsor* or *Longpod* in rows, single or double, 3 or 4 feet apart.

SPINACH.—Sow on a cool quarter or border which is richly manured a few rows at fortnightly intervals. The *Victoria*, round-seeded, is one of the best Spinaches I have grown for summer consumption.

ONIONS, if for pickling or using whilst small, may now be sown on well-trodden soil, and rolled or trodden afterwards. The hoe should be in constant use amongst the rows of early-sown Onions, Parsnips, and other crops to kill weeds and stir the soil. Vegetable Marrows may be sown, choosing *Pen-y-Byd* and *Long White*, placing three seeds in a 4-inch pot, getting the plants up quickly, and hardening them off in a cold frame before planting them out in May. Nothing is gained by starving Marrows in pots, as is often done before planting, but when ready they should be planted out on a warm bed and protected with glass for a time. This vegetable well repays frame cultivation, and *Pen-y-Byd* is an excellent variety for frame culture.

RIDGE CUCUMBERS.—If these are grown, seeds may be sown in the same manner as Vegetable Marrows, planting them out at the end of next month.

TOMATOS which were sown for growing in the open air should be repotted, using more loam in the compost at this shift, and keeping the plants near the light in an intermediate-house. Another sowing in heat may be made for the main crop in the open air.

CAPSICUMS for fruiting in frames or on hot-beds in the open should be sown, and grown in heat for a time, hardening them off before fully exposing them.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 51, Wellington Street, Covent Garden, London. Communications should be written on one side only or tree paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—50°.

Fruit Culture.

POSSIBLY one of the first and not the least useful results of the technical education lectures on this and other horticultural subjects, now being given under the auspices of county councils in various parts of the country, will be the breaking up of the general monotony of practice that prevails in this most important industry. It matters little where you go—to London, or a hundred miles around it in almost any given direction—fruit-gardens and orchards are very much alike; the heights and sizes of the trees and their distance apart vary considerably, but standards on the Crab, sub-cropped with Gooseberries or Currants, are still the prevalent rule. And this monotony of practice seems less the result of prejudiced adhesion to stereotyped practice than to a general absence of knowledge of other methods. After all that has been written and illustrated about pyramidal, bush, single or multiple cordons of various forms, such as the diamond, spiral, &c., and the value and importance of dwarfing or fertile stocks, such as the Paradise, in hastening and heightening fertility—the general public seems profoundly ignorant of most of these things. Not, however, that they are unwilling to learn, or indisposed to try new methods, or forms or sizes of trees; quite the contrary. In lecturing over a rather wide area on fruit culture within the last few months, nothing, one of the lecturers tell us,

excited more interest than drawing illustrations and thorough explanations of the mode of producing such forms of trees, and others of which opportune illustrations were given on pp. 458, 459 of the *Gardeners' Chronicle*. These were also supplemented with specimens of maiden trees on dwarfing stocks, illustrating their rapid progress for growing shoots with full fruit-bearing spurs and branchlets.

Naturally, samples of early fertility had a special interest for audiences largely composed of those that live out of the proceeds of their orchards, and there seemed a willingness to test other forms and sizes of trees and different modes of culture and training, at least on a small scale. And this is all that is desirable for the present. Changes so vitally affecting the lives and prosperity of large classes should be introduced tentatively. Travelling through various fruit districts, one is constantly hearing of returns ranging from £30 to £100 per acre for the present head-crop of Apples, Pears, Plums, Cherries, and ground crop of Gooseberries, Currants, Raspberries, the latter occasionally sandwiched, though less now than formerly, with Strawberries.

The practical question then amounts to this: Can we improve such returns by growing smaller trees on dwarfing stocks, that hasten as well as heighten fertility? And the answer is less simple than it seems, since the discovery of root-pruning. This practice still seems but little understood and less practised by the majority of orchardists, nevertheless, skillfully practised root-pruning goes a long way to bring the Crab stock up to the high fertile level of the Paradise or other stocks; and in the exact ratio in which root-pruning intensifies the fertility of the Crab, it checks or suppresses its capacity for wood-making. Both are vitally important in various ways, but chiefly in enabling more Apple trees of smaller size on the Crab to be grown in a given area. Root-pruning is, in fact, but another and a clumsier method of dwarfing such strong-growing stocks as the Crab and the seedling Pear, and it acts in a similar way, though hardly to the same extent towards the augmentation of the yield per acre. Surface-rooting stocks, with a multiplicity of fibres, hasten and heighten fertility in virtue of their natural characteristics. Imagine vertical rooted stocks as the Pear and the Crab pruned into horizontal form and fibrous character, hasten, and heighten fertility in virtue of their change of form and of character. Hence, while the Paradise or common stock is naturally the best and most fertile for the growth of cordons and other small Apple trees, these can also be grown on the Crab or other Apple stock under a skilful system of root-pruning.

While believing that by doubling or trebling the root force in orchards, by growing twice or three times as many trees per acre, and also through doubling the average ratio of fertility, and greatly raising the quality of our fruits, greater profits would be realised, yet there is no pressing necessity for any general or wholesale clearance of old orchards, with a view of planting others with pyramids, dwarf bushes, or cordons.

It will be better, safer, and in the end far more successful to run the two systems abreast, and let the more profitable win the day, and occupy the greater breadth of our fruit ground. Meanwhile, there are thousands of waste nooks and corners around every cottage and farm throughout the country, thousands of acres of railway embankments, and any number of waste walls and fences that could be clothed and filled with cordon bushes or pyramidal Apples, Pears, Plums, Cherries; and few gardens or or-

chards that might not be fenced around with multiple cordons or espaliers, the walks being edged with single, double, or diamond cordons. In almost every cottage garden-allotment, small holding, and farm garden, space might be found for a dozen or score, fifty or a hundred of small fruit trees—in fact, to such great length has the hastening and heightening of fertility, and the concentration of fruit-bearing force been carried, that it is hardly an exaggeration to write that every yard of ground may support its fruit-bearing tree. As one practical result of the technical education lectures on horticulture, active efforts are being made to establish fruit-tree clubs to enable labourers to purchase the best varieties at wholesale prices, and to pay for them at the rate of a penny a week or more, as they can afford.

One objection raised against the planting of orchards with small trees, is that it would prevent the sub-culture of Gooseberries and Currants. This in the end might prove a gain to both fruits. But, without staying to argue the point, it may prove useful to point out enormous areas for the cultivation of Gooseberries, now wholly usurped by unprofitable plants. These are the White Thorn, Black Thorn, or other hedges between arable fields or farms; they are mere boundary lines, not needed to resist the ingress of stock. A tithe of these boundary-lines planted with Gooseberries, and many of these, such as the Warrington, are well-furnished with spines, would give a hundred times more Gooseberries than all the orchards and gardens now furnished with this crop.

Of course, an outcry will be raised against the birds and the boys. But with the fruit grown in this wholesale way in hedges, the raids of both would hardly be felt. Besides, fully half, perhaps three-fourths, of all the Gooseberries grown in England to-day are gathered, bottled, and eaten green. It is most encouraging to those who have long been engaged in various ways in the extension and improvement of fruit culture, to note that the committee of the International Fruit Show on the Thames Embankment next September purpose offering special prizes for collections of fruit trees in fruit, in pots, dishes, or baskets of hardy fruits artistically arranged, and of English market fruits, including Tomatos and Cucumbers. But this most important class, from a practical and pecuniary point of view, will probably prove to be that of the nurserymen's collections of fruit trees, showing the various types and modes of training for the several purposes with a view to enhance the educational value of the exhibition. In every case it is desirable that the character of the stock and of the root culture employed should be specified, as well as the age of the trees from the date of the budding and grafting. An exhibition of fruit-tree stocks of different sorts, sizes, and ages, root-pruned or otherwise, showing the effects of constitution and culture, would prove of much value to cultivators, and of great interest to the general public. The roots might be preserved fresh in clean water, or by means of frequent sprinklings. But to derive anything like the full technical or practical instruction from an exhibition of fruit-tree stocks that it is capable of affording, the whole plant and especially the number, size, and character of the roots, must be open to inspection. For it is in and through the roots far more than by any of our many methods of top-pruning, training, or special culture, that the foundation of early and permanent fertility is well and truly laid.

FIG. 79.—*PRUNUS DAVIDIANA*, THE PRESUMED SOURCE OF THE CULTIVATED PEACH. (SEE P. 530.)

PRUNUS DAVIDIANA.*—Among the most striking plants exhibited in the early spring months before the Royal Horticultural Society by Messrs. VITCH was the above species, both in its pink and in its white form. Of the latter we give a figure on p. 529, fig. 79. The plant was first described by M. CARRIÈRE so long ago as 1872. M. CARRIÈRE recognised that it was distinct from existing Peaches and Apricots, and this opinion has been upheld by M. FRANCHET. The great value of the plant for garden purposes consists in the early date at which it flowers, it taking precedence in this respect of the Almond. Of its beauty those who saw the specimens in the Drill Hall can warmly testify; and the Abbé DAVID, who introduced it to Europe, speaks of it as lighting up the country in the neighbourhood of Pekin in the spring. As a fruit tree it is of no importance, unless, as there is good reason to suppose, this may be the prototype of our cultivated Peaches. M. CARRIÈRE appears to be "writing sarcastic" when he says, "Il diffère tellement par son écorce et par son aspect, que pas un praticien serait ce même un *Pichieriste* ne le prendrait pour un Pecher, surtout lorsqu'il est dépourvu de feuilles." As to the Chinese origin of the Peach, the reader should consult the very interesting arguments of M. A. DE CANDOLLE, which he will find summarised at p. 221 of the *Origin of Cultivated Plants*, English edition (1884).

HORTICULTURAL CLUB.—The usual monthly meeting and *conversazione* took place on Tuesday evening at the Hotel Windsor. There was a large attendance of members and visitors; and amongst those present were Mr. J. LEE, who occupied the chair; Dr. Masters, Messrs. Wallis, Selfe Leonard, H. Pearson, C. E. Pearson, A. J. Pearson, Martin, Marshall, Soper, Cheal, H. E. Milner, H. Turner, Rivers, Crowley, Drury, Cockett, Cousens, H. Williams, Cutbush, Phippen, and James Laing. The discussion was opened by an address by Mr. H. E. Milner on "Landscape Gardening," and elicited warm approval. The point, however, on which most of the discussion afterwards turned, was the opinion expressed by Mr. Milner, that the opinion generally held, that a house situated on clay must be necessarily unhealthy, must be taken with limitation, as well as that in which he contended that the principle of landscape gardening might be carried out even in small villa gardens. A vote of thanks was cordially awarded to the lecturer, and also to Mrs. Harry Turner, for a beautiful basket of *Niphetos Rose*, which she sent to ornament the table.

THE GARDENERS' ORPHAN FUND.—The annual dinner will be held at the Hôtel Métropole, on Tuesday, May 17, 1892, Sir JAMES WHITEHEAD, Bart., in the chair. The president is Sir Julian Goldsmith, Bart., M.P.; treasurer, T. B. Hayward, Esq.; chairman, W. Marshall, Esq.; and hon. secretary, A. F. Barron, Royal Horticultural Society's Gardens, Chiswick. We shall be pleased to receive and transmit any amounts that may be forwarded to us for the benefit of the charity.

NOTTS HORTICULTURAL AND BOTANICAL SOCIETY.—The annual general meeting of the members of this Society was held on the 5th inst. in the Exchange Hall, Nottingham. Mr. E. BARBER, the chairman of the committee, presided. The chairman presented the tenth annual report. The various exhibitions and meetings under the auspices of the Society were referred to, and it was stated that the Society had sustained considerable loss by the death of several of its oldest members. The balance showed that the income had amounted to £230 7s. 8d., £82 1s. having been received in subscriptions, and £54 10s. 6d. from the excursion to Eaton Hall. The expenditure reached £229 9s. 10d., leaving a balance in hand of 17s. 10d. The sum of £48 18s. 6d. was paid for prizes, £31 6s. 8d. went in show expenses, and the excursion to Eaton Hall cost £82 0s. 6d.

* *Prunus Davidiana*, Franchet, *Plant. David*, part I. (1884), p. 103; *Prunus Davidiana*, Carrière in *Revue Horticole* (1872), p. 75, fig. 10.

STEIN'S "ORCHIDEENBUCH."—Mr. PAUL PAREY, of Berlin, is about to issue, in ten parts, a work on the description and cultivation of the Orchids most worthy of cultivation. The work will be entrusted to the highly capable hands of Mr. STEIN, of the Bresslau Botanic Garden. As regards the botanical characteristics, Mr. STEIN follows the system of Professor PRITZER, of Heidelberg.

TERCENTENARY OF THE BOTANICAL GARDEN OF MONTPELLIER.—In 1593 HENRY IV. sanctioned the formation of a garden and of a professorship of botany in this city. This event will be commemorated next year, on which occasion the Botanical Society of France will hold a special session at Montpellier.

FREEMANTLE AND DISTRICT GARDEN PROTECTION SOCIETY.—The fourth annual meeting of this society was held on Tuesday evening, when Mr. PESCON, the president of the society, occupied the chair. The very fact of the existence of this society, said the president, had acted as a deterrent to many would-be garden robbers, because they know full well that the society would not hesitate to prosecute, however small the value of anything stolen from a garden might be.

SEVERE WEATHER IN FRANCE: GREAT DAMAGE TO FRUIT TREES.—The *Daily News* telegraphs:—An icy wind has been blowing over Provence for some days. The fruit trees having blossomed early, the prospect of a fine crop is at an end. The probable loss to the fruit gardeners is estimated at millions of francs. The Vines of the Loire are as if scorched by the hard frosts which succeeded the summer weather of the beginning of the month, and the consequent splendid burst of vegetation. Our neighbours, then, have been no better off than ourselves.

"THE AMERICAN FLORIST COMPANY'S DIRECTORY."—Those of our readers who have business relations with the United States and Canada, should become possessors of this useful directory of florists, nurserymen, and seedsmen. A third edition has just been published by the American Florist Company, of Chicago.

BATH.—We regret to read that the Sydney Gardens, Bath, established about 100 years ago, have proved so unsuccessful that the Company under whose management they were has been wound up.

LYNN HORTICULTURAL SOCIETY.—This Society, as Mr. HAMPTON, the secretary, informs us, has now fixed the dates of their annual shows as follows:—Rose Show, June 29 and 30; Summer Show, August 17; and the Chrysanthemum Show, November 10.

AMATEUR GARDENERS' ASSOCIATION.—The effort inaugurated in the middle of February to establish in Liverpool a branch of the National Amateur Gardeners' Association has been attended with a gratifying measure of success, over eighty members having been enrolled. Professor HARVEY GIMSON is the President of the branch. At the monthly meeting held in the Common-hall, Hacksinney, Mr. DAN. E. YATES, one of the Vice-Presidents, occupied the chair, and a paper was contributed by Mr. JAS. SMYTH on "Our Advantages and Possibilities." He pointed out that up to the present time the existence of amateurs had almost been ignored at flower shows, and one of the benefits of the Association would be that it would endeavour to obviate some of the disadvantages which impeded the path of the true amateur, and also prevent flower shows, if organised by florists, degenerating into mutual reward societies. Something, too, might be done as to the interchange of plants and cuttings among the members by the formation of what might not inappropriately be termed a plant clearing-house. There were also the questions of obtaining a special rate of tariff for seeds, and the right of tenants to remove their greenhouses. In all these things he need not remind them that union was strength. Alluding to the possibilities, he said

that amateur gardeners should study to be artists, as well as mere plant growers. The Association might be able to do something to improve the channels by which fresh flowers could reach the poor and the suffering in our great institutions, and he trusted that during the winter months steps would be taken to hold classes on subjects appertaining to horticulture.

ORCHIDS AT BRUSSELS.—Another variety of *Odontoglossum Ruckerianum* is in flower in M. PEETER'S houses, quite uncommon and of a peculiar rosy-lilac colour. The two inferior sepals have a rosy ground spotted with brownish-red, clearer at the base, with large spots also of brownish-red; the third sepal less deep, similarly marked, the two petals larger than the sepals, the edges wavy, bordered with white, and with smaller spots of the same colour, the lip is white deeply spotted with brownish-red. The numerous flowers are large, and form a close cluster. *Cattleya porphyrochloa* (C. *intermedia* × *superba*), from Messrs. VERRIER, has two large and fine flowers more than 5 inches across, the lip is about 2 inches wide, white flushed at the tip with bright purple, the rest of the flower rosy-lilac, an excellent hybrid. *Odontoglossum Warscewiczii*, from Costa Rica, very rare in Belgium. *Cypripedium Winneanum*, Rehb. (C. *Druryi* × *villosum*), still rare, resembles both parents, the long central streaks of *villosum* much marked, so are the size, colour, and glossiness of the flowers. *Cattleya Lawrenceana*, excellent in depth of colouring; in this respect one of the finest specimens that we have seen.

DISEASES OF MELONS.—In the current number of the *Journal de la Société Nationale d'Horticulture de France*, M. PRILLIEUX describes a species of ulceration, or rot, very destructive to Melons, and which he attributes to the action of a fungus, with the horrible name of *Scolecotrichum melophthorum*. M. PRILLIEUX recommends the use of copper-solutions in the form of spray, but cautions experimenters to take care that the copper-solution is not acid, or it will corrode the leaves. A fragment of litmus-paper will indicate whether the liquid be acid or not.

CHICAGO EXHIBITION.—The Secretary of the Royal Commission writes:—"May I ask you to give publicity to the fact, that Her Majesty's Government having increased to £60,000 the grant of £25,000 originally made for the purposes of the British section at the Chicago Exhibition, the Royal Commission for that Exhibition are enabled to dispense with the revenue it was proposed to raise by charging the exhibitors in proportion to the extent of space occupied, and that therefore all space in the British section will now be granted free of charge."

—From the Royal Nurseries for Ireland, JOHN THORPE, of the Bureau of Floriculture, has received information that two cases containing 1,550 plants have been shipped to the World's Fair. The announcement came through ALEXANDER DIXON & Co., who maintain the nurseries. Mr. THORPE believes that his flora display will eclipse anything of the sort which the world has ever seen.

CLEMATIS INDIVISA LOBATA.—A fine specimen of the above has been in bloom recently at the Roseville Nursery, Harrowgate. The plant is trained on the roof of a greenhouse, and the effect produced by the thousands of white flowers hanging down in festoons 2 or 3 feet long, may readily be imagined. The flowers being pure white, it proves a useful addition to flowers grown for cutting, coming on as it does at a time when white flowers are scarce. The above plant expanded its first flowers about six weeks ago, and there are still many of them open. For furnishing the roofs of lofty conservatories, it is an admirable subject, being a quick grower, and not requiring a great amount of heat. Messrs. BACKHOUSE & Son, who have now acquired this nursery, will be happy to allow any one desirous the opportunity of seeing the above plant.

DEVON AND EXETER GARDENERS' ASSOCIATION.—The first annual business meeting of this association was held at Exeter on April 6. In their report the committee stated that the association had been a success from the first, and had gone on extending its scope and increasing its usefulness. The position to which it had now attained was the best possible proof of the need of such an association in Exeter, and the interest awakened, and the generous support given had been the cause of deep satisfaction. At the present time there were 104 members—ordinary and honorary—and there was a balance of £8 14s. on the right side. The committee were pleased to report that the Devon and Exeter Horticultural Society had acceded to a suggestion from that society, and offered for competition at their exhibitions this year a series of prizes for *bond fide* amateurs. The committee had accepted the offer of the *Journal of Horticulture* of a silver medal for the best essay by members of the association on "The Principles and Art of Pruning."

APRIL HORTICULTURAL MEETING AT GHENT.

—This meeting was unusually interesting. Certificates of Merit were awarded for the following plants:—1, *Saccolabium bellinum*, a rare Orchid, well grown, with very curious flowers, shown by M. Petrick, of Mont St. Amand. 2, *Adiantum grandiceps*, a graceful Fern, with drooping fronds, ending in a large and close tuft, shown by M. L. Desmet-Duvivier. 3, *Azalea dindiflora*, with deciduous leaves, flowers double, purplish, from the same exhibitor. 4, *Azalea dindiflora* Mr. Jacquet, from the same, with persistent leaves; well bloomed, of good habit, flowers clear lilac, and also double. 5, *Odontoglossum triumphans* var. *nigrum*, to M. Jules Hye; the parts of the flower are much spotted with blackish-brown, and are most effective when massed. 6, *Trichopilia suavis*, to the same orchidist; there is a large cluster of bloom at the base of the plant, which attracts much attention, owing to the curious colouring of the flowers, the marks on which suggest the spotted blooms of some varieties of *Gloxinia*. 7, *Odontoglossum Halli*, from M. L. Desmet-Duvivier; a fine plant, with four large and handsome racemes of bloom. 8, *Cattleya Trianae* *virginialis* (alba), from the same; in full bloom, the flowers not numerous, but exceedingly pretty and in full vigour. 9, *Lælia lobata* from MM. Edm. Vervae et Cie., a fine and well-bloomed plant, like *L. anceps*. 10, *Cypripedium Huybreckianum*, a hybrid from *C. hirsutissimum* × *Spirerianum*, from the same, the whole flowers recalls *C. hirsutissimum*, the white of *Spirerianum* being everywhere suffused with pale brownish red; the appearance of this beautiful variety is very remarkable. 11, *C. grande*, from the same; the bloom beautiful and curious. 12, *Oncidium apheclataum*, also from the same exhibitor; this was in full bloom, with six flower-spikes, of beautiful yellow, a splendid plant. 13, *Criminum amabile*, from the Société Horticole anonyme Louis Van Houtte père; a magnificent truss of fifteen flowers and seven buds, excellently bloomed. 14, *Masdevallia ignea*, from M. J. Hye; flower deeply coloured with rich red, in full bloom. 15, *Cymbidium Lowi*, from the same amateur; a fine plant with numerous flower-stems and about 5 feet across, the leaves entire. 16, *Odontoglossum Pescatorei*, also from the same exhibitor; a very fine raceme, the parts of each flower lightly spotted—most effective. 17, *O. Chamberlainianum*, from M. J. Hye; blooming remarkably. 18, *O. excellens illyeum*, from the same; much spotted with a pretty shade of brown, the clear yellow ground much streaked also. 19, *O. crispum insigne*, from M. J. Hye; the flower beautifully spotted with blackish-brown—an excellent variety. 20, *O. Andersoni*, still from the same; the flowers much spotted. 21, *O. Edwardi*, from M. Hye; a fine plant, with two exceedingly handsome trusses of bloom, the flowers large and dark, of a deep mauve colour. 22, *Cypripedium selligerum*, from M. A. Van Imshoot, having large flowers, with a large and dark standard. 23, *Cyclopogon Parishii*, from the same; the flower like that of *C. pandurata*,

petals greenish, lip marked with black. 24, *Sibthorpia europæa*, fol. var., to M. Ed. Pynaert; shown in a pan—the plant droops gracefully, and is most effective. Honourable Mention for: 1, *Vanda suavis*, to M. Hye; two fine stems bearing numerous flowers. 2, *Odontoglossum triumphans splendens*, to M. Ed. Pynaert; a beautiful yellow colour, with deep brown spots. 3, *Masdevallia levis*, to M. Hye; flowers very large. 4, *Odontoglossum Wilckeanum* to the same; a fine floral raceme, well developed and regular. 5, *Dendrobium Kingianum* album, to M. A. Van Imshoot; a charming little plant, the flower has white petals and a carmine lip. 6, *Cattleya lobiata Warocqueana*, to M. A. Van Imshoot; very deep in colour, flower large. 7, *Pteris Victorica*, to Mr. Arthur Van den Heede, of Gendbrugge. 8, *Lycaste plana Measuresiana*, to M. A. Van Imshoot; the lip white, spotted with carmine. 9, *Dendrobium Wallisi*, to the same; flower vivid yellow, spotted with brown. 10, *Lycaste lasiogloma*, also from the same; petals dark chestnut-brown, lip yellow, hairy.

THE BRITISH FRUIT-GROWERS' ASSOCIATION.

—The first Conference of the season will be held under the auspices of the Northumberland and Durham Horticultural Society and the Northern Allotments Society, in the Hall of the Literary and Philosophical Society, Westgate Road, Newcastle-on-Tyne, on Monday, April 25, at 3 P.M. and 7.30 P.M. The subjects for discussion will be as follows:—3 P.M., "Apples for Market: gathering, packing, storing, and marketing fruits"; 7.30, Chairman's opening address: Fruit Culture on Small Holdings, Bush Fruits for Profit, Prospects of Extended Fruit Culture in Great Britain and Ireland. Papers will be contributed by Mr. GEORGE GORDON, F.R.H.S., Vice-Chairman of the British Fruit-Growers' Association; Mr. A. H. PEARSON, F.R.H.S., Member of the Fruit Committee of the Royal Horticultural Society; Mr. WM. GOARING, Lecturer to the Hampshire County Council; Mr. JOSEPH CHEAL, F.R.H.S.; and Mr. LEWIS CASTLE, F.R.H.S., Hon. Secretary to the British Fruit-Growers' Association. Many of the leading fruit growers in the midland and northern counties are expected to take part in the discussion. Further particulars may be had from Mr. LEWIS CASTLE, Hotham House, Merton, Surrey.

FRUITS FROM TASMANIA.—We have to report the arrival and discharge of the following vessels from Hobart, with a consignment of Tasmanian Apples:—The "Oroya," with, from Melbourne, 485 cases; Hobart, 7616 do.; total, 8101 cases. The "Victoria," with 369 cases of Apples from Sydney; 424 do., from Melbourne; and 8984 cases from Hobart: total, 9777 cases. These two foot up 17,878 cases, and make a very good beginning for the season 1892.

FRUIT FROM THE CAPE.—Whilst we were busy getting our last issue to press, in view of the holidays, the steamship "Danottar Castle" was busy discharging her cargo of fruit from the Cape, consisting of Grapes, Pears, &c., so as to catch a market before the advent of Good Friday. The condition of all was reported as good. The "Athenian" arrived on the 18th, but brought no fruit, and it may interest some of those interested in the trade to learn that Messrs. BUCKNALL (Limited), do not at present intend fitting their Cape steamers with refrigerators for the carriage of fruit.

OPENING OF A NEW PARK AT CHESTER.—A few days since, at Chester, in the presence of a number of the leading citizens, the Mayor of Chester formally opened the new recreation park and grounds given to the city by the Duke of Westminster. The park, which has cost 4000*l.* to lay out, and an additional 1000*l.* as an endowment fund, is locally styled Edgar Field, owing to its proximity to a building, now in ruins, regarded as King Edgar's Palace. It was from this that eight tributary princes are supposed to have rowed King EDGAR on the Dee when he attended service at the ancient cathedral of St. John the Baptist. A vote of thanks

to the Duke was proposed by the county court judge, Sir Horatio Lloyd.

THE JODRELL LABORATORY AT KEW.—We learn from *Nature* that Dr. SCOTT has accepted the charge of the Jodrell Laboratory at Kew, and that he will in consequence resign his present appointment in the College of Science at South Kensington. We trust that this appointment may be taken as an indication that the histological and physiological sides of botany will receive more attention than hitherto. The investigation of the microscopical peculiarities of the orders and genera, nay, of the species, is an enormous task to contemplate, but it will have to be done, and Kew should take the lead. The investigation of what are known as the "adaptive" characters, or the relations between structure and climatal conditions, is again a matter of the utmost consequence to practical cultivation. The systematic study of the diseases of plants is also a subject we hope to see thoroughly taken up at Kew. Altogether, the Director of the Laboratory will have his hands full.

MR. JOHN BARRY.—We understand that Mr. JOHN BARRY, for so many years connected with the Royal Horticultural Society, has been appointed traveller in the South of England to the firm of Messrs. W. CLIBRAN & SON, Oldfield Nurseries, Altrincham, and Manchester.

THE NOMENCLATURE QUESTION.—We have received the following important communication from M. ALPHONSE DE CANDOLLE: "I have read with pleasure your articles relating to this subject, and in connection with it, I may say that I have been looking back to the twenty-six families which I have specially elaborated for the *Prodromus*, or its continuation. In these twenty-six families Mr. KUNTZE propounds twenty-eight changes in the names of the genera. In studying these proposed changes one by one, I find that twenty-two are unacceptable, for the reason that they are based upon incorrect foundations, such as, for instance, the adoption of a generic name unaccompanied by any adequate description, as if it were a genuine name associated with appropriate descriptive characters. A young and learned fellow-countryman of mine, M. BRIQUET, has also ascertained that, in the family Labiata, the names of fifteen genera are by KUNTZE required to be changed. Of these fifteen, ten, however, are invalid; indeed, we may estimate that two thirds of Mr. KUNTZE's proposed changes are uncalled for. Mr. KUNTZE also errs in taking the first edition of LINNÆUS' *Systema* (1735) as the starting point for the nomenclature of genera instead of the *Genera* of 1757. In my *Nouvelles Remarques* de 1853, I have stated why LINNÆUS' *Genera* (1757) should be taken as the starting-point. Nobody has raised any objection. I may add one illustration of the practical inconvenience that would result by taking the earlier date (1735) as our commencement. If we did so, we should apply the generic name *Tragacantha* to the 1200 species published under *Astragalus*. Mr. SCHUMANN has just published in the *Naturwissenschaftlichen Rundschau* of 1892, n. 13, an article in which he gives his adhesion to the "Lois" of 1866, and to the opinions I expressed in 1883 with reference to the "*Genera*" of LINNÆUS. He adds, that he has consulted the Berlin botanists and others before publishing, and that he finds himself in accord with them. Mr. COULTER, the Editor of the *Botanical Gazette*, and M. CARNUEL, of Florence, are of the same opinion.

Horticulturists may be recommended not to adopt newly-proposed names until they have ascertained whether those names are likely to be generally adopted by botanists. I have, for instance, seen catalogues in which the names proposed by KLOTZSCH for his dismemberments of the genus *Begonia* were taken up. Now, the genus *Begonia* is a very natural one, and when I retained it entire in the *Prodromus* citing KLOTZSCH's names as sub-divisions merely, the course I took met with general approval. It will be worse still if horticulturists attach any importance to the genera proposed by Mr. GANDOGHER for certain

sub-divisions of the genus *Rosa*.* The author, who does not rank high among the botanists, that the Roman Catholic clergy has produced, proposes to do away with the well-known group *Cinnamomeae*, and to constitute in its place a separate genus under the name *Scheuchzia*, and to which he assigns no fewer than ninety species! I suppose that for the thousands of species which he admits in the genus *Rosa*, he will be unable to find a sufficient number of adjectives or adverbs for the specific names."

IRELAND.

XANTHOCERAS SORBIFOLIA.

That handsome shrub *Xanthoceras sorbifolia* is now blooming most profusely, trained to one of my walls, while as a bush or standard it refused for years to grow at all, or do more than barely exist. I counted as many as eighteen bunches of its beautiful white blossoms with a brownish centre on one of my terminal shoots see fig. on p. 533. [Fig. of the fruit is given at p. 205, August 14, 1886.] *Genista Andraea* is also now covered with its beautiful blossoms in my greenhouse, and much admired.

Myosotidium nobile, the giant New Zealand Forget-me-not, has proved quite hardy with me, and is now coming into flower, with four spikes or bunches of bloom, in my garden, with simply a wall behind it. It seeded with me last year, and I have a fine lot of young plants of it. *W. E. Gumbleton, Belgrove, Queenstown, co. Cork.*

SCOTLAND.

BOTANIC GARDEN, GLASGOW.

REPORT FROM THE BOTANIC GARDEN, GLASGOW, BY ROBERT BULLEN.—The spring month of March was in reality the winter of 1891-92. Frost and snow were in excess of anything we have experienced in the same month for many years, not even excepting March of last year, which was an unusually cold month. Frost was registered on twenty-three nights, and the total registered for the month was 120°. Night frosts were continuous for the first half of the month, and heavy snow fell during the second week. On the 16th a misty rain and thaw set in. On the 19th frost was again recorded, and continued with more or less severity to the end of the month. The day temperature, especially during the latter half of the month, was above the average, hard frosty nights being succeeded by bright sunny days, the sun thermometer frequently registering from 70° to 76°. Very dry weather prevailed after the heavy snowfall. All vegetation is much retarded.

BOTANICAL STUDY IN GLASGOW.

The publication of the terms of the Steven Trust has led Professor F. O. Bower, the present occupant of the Chair of Botany in Glasgow University, to bring a suggestion before the trustees for applying part of the property to purposes which are both scientific and technical, and calculated to confer a benefit upon the University, and to exercise a wide influence on the general public of Glasgow. Prof. Bower points out pathetically that while the City has provided for the purchase and upkeep of the Botanic Gardens, the Botanical Department of the University has no home there, but at present consists of two small rooms and an attic in the University building. There is no class-room, and the laboratories are so small that the practical work has to be repeated three times daily to successive relays of students. The valuable herbarium lies unused in an inaccessible attic. The best scheme, in the Professor's opinion, would be the erection of a building in the Botanic Garden, the control of the building being in the hands of the Professor of Botany. On these lines Professor Bower appeals to the Steven Trustees to set aside a sum for the erection and endowment of a

building to be called the Steven Botanic Institute. The building, he says, should contain:—1. A large lecture-room to hold about 300 persons. 2. Two large museum rooms and central hall. 3. Herbarium. 4. Laboratories and private rooms for the practical work of the professor and students. An income of £400 would meet the necessary expenses of the institute. Professor Bower estimates that the cost of the building and internal fittings would amount to about £12,500, and a similar sum would give an endowment of about £400, so that a total of £25,000 would place his scheme on a satisfactory footing.

HOME CORRESPONDENCE.

NORTHERN SPY APPLE.—In answer to "D. T. F.," permit me to state that this fine variety succeeds well with Mr. R. D. Blackmore, at Teddington. The fruit grown there and tasted by me to-day is perfectly sound, crisp, and of excellent flavour. The Newtown Pippin is a failure here, and it succeeds only in certain districts in America. Washington, American Mother, Wealthy, and Melon Apple arrive at great perfection with me here, but they all require a favourable situation. It is from Tasmania that we shall get Apples of the finest quality at this season, as the climate of that colony somewhat resembles our own, with the addition of more sunshine. The fruit is, moreover, grown on young trees and unexhausted soil. *W. R. Streatham Hill.*

APRIL WEATHER IN SOUTH DEVON.—Seeing your remarks in the leading article of last week's issue of the *Gardeners' Chronicle* regarding the probable safety of our fruit crops, owing to the lateness of the spring, I fear that we in South Devon are only too early, according to my experience, for this morning we had 14° of frost, after having enjoyed perfect summer weather for three weeks, when the thermometer daily registered 65°, and on Wednesday week last it stood at 72° in the open. We have had no rain for more than a month; Pears, Plums, and Strawberries in full bloom on the south walls and borders, and on examination this morning I fear the damage done will be found considerable—in fact, almost a complete wreck of one's prospects. The Apricots were of the size of Peas, and I am hoping that they have escaped destruction—they appear to be uninjured; but the red Currants and Gooseberries are blackened, and some *Rhododendron* bushes that were in bloom are spoiled. Roses, of which many were showing flower-buds, are quite ruined as regards the early blooms. I may say, that during the previous afternoon we had a slight fall of snow, with the temperature of the air down to 40°. I hope the damage to the crops is not general. *A. Willis, Sandford Leigh, Newton Abbot, April 15.* [From many parts of the country we have received information as to the phenomenally low temperatures occurring after equally abnormal high readings. The amount of damage remains to be seen. En.]

ERICA HYEMALIS.—In a recent issue, Mr. Watson says no one knows the origin of *Erica hyemalis*, or where it came from. There must be some people alive who knew Mr. Willmore, and can tell a great deal about him. He was before my time, but my late father used to tell me about the wonderful things he did in the way of hybridising, and how, after he became blind, he still continued to conduct hybridising operations through his old gardener—old Tom Williams. Among the great number of things he raised was *Erica hyemalis*, *E. Wilmorea*, many *E. ventricosae*, *Amaryllis*, scarlet, white throat (this was as fine as some of the best of to-day); a striped *Gladiolus*, and an endless lot of things; which some one surely can give particulars first-hand. Helived in what is now part of Birmingham, Hunter's Lane. *John Pope, Birmingham.*

BLACK CURRANTS v. THE GOOSEBERRY CATERPILLAR.—With reference to "D. T. F.'s" remarks in the *Gardeners' Chronicle* issue for April 9, p. 473, respecting the planting of the Black Currants as an antidote for the Gooseberry caterpillar plague, I am enabled to, from my own observations, to corroborate them. For the past eleven years I have had under my charge an orchard under-cropped with the Black and the Red Currant and Gooseberries, the Currants occupying the lower and damper part of the orchard, and the Gooseberries planted near on the drier part. During that period of time none of the saw-fly caterpillars

have troubled us. The question has often puzzled me, for in the kitchen garden about 500 yards distant in some seasons these caterpillars were very destructive. There are a few Black Currant bushes in the kitchen garden, but not near the Gooseberry bushes, which appears to afford proof that when these are planted together or quite near each other, the former keeps the sawfly at a distance. In this immediate neighbourhood there are two other orchards of eight to ten acres each, the undergrowth of which consists nearly wholly of Gooseberry bushes, and these are periodically devastated by the caterpillars. The occupiers have often appealed to me for advice, but rarely have I been able to afford them any practical help. I have pointed to our orchard as being free from the pest, not thinking that we owe our immunity to having three-quarters of the land planted with Black Currants. Those who intend to plant land with Gooseberries should, by all means, plant the Currants, which also meet with a ready sale. *D. Roberts, Prestwold Gardens, Loughborough.*

BALSAMS IN SMALL POTS.—Balsams may be grown of a useful size for decoration in small size pots, and can be employed in a variety of ways, such as filliug room-vases standing in niches on brackets, as well as in the greenhouse. It is surprising what a quantity of bloom a plant in a 4½-inch pot will carry if it be well supplied with water and manure-water. To obtain these plants dwarf and stocky, the seed must not be sown before the middle of the month of April; and a cool greenhouse is the best place for the seedlings, after they get 2 inches high, needing as they do abundance of air to keep them stocky, and if sown earlier than that it does not admit of their receiving air freely. If afforded a gentle bottom-heat the seed will quickly germinate, and the seed-pots or pans must be put on a shelf directly the plants are above the soil. When the first pair of true leaves is formed, the plants should be potted without delay in small pots, singly, keeping them down low in the pot, but not so as to cover the true leaves. Any light soil will suffice for this potting. When the roots begin to touch the side of the pot, the plants should get their last and only shift, using a compost consisting of two parts fibry loam, and one of partly decayed horse-dung, pressing the soil into the pots rather firmer than is generally recommended for this annual plant. A shelf in the greenhouse will be found the best place for the plants till they show bloom flower-buds, supply them at all times freely with water, and after the pots are full of roots, liquid-manure should be afforded very often, in a weak state. S.

DANDELION, DOCK, AND DAISY ERADICATOR.—This new invention of Messrs. Wilkes & Son will prove a great boon to everyone in possession of, and aiming at, having a perfect lawn. It is simple, very effective, and ingenious in its design, and supplies a long-felt want, as by its use the expense and time involved in the removal of the noxious weeds indicated, is reduced to a minimum. The Eradicator does its work neatly and effectively, no soil nor turf being displaced in the operation. The Eradicator is somewhat like a garden-syringe in shape, and all that is necessary after charging it with Mark Smith's Weed-killer, is to pierce the centre or crown of the individual plants with the "piercer," which protrudes about 2 inches from the nozzle of the Eradicator, and in doing so, the fatal fluid is liberated by slightly pulling the handle, and deposited in the hole thus made, the internally-fixed spring cutting off the supply the moment the "piercer" is withdrawn. I am so thoroughly well pleased with the expeditious and highly effective manner in which the Eradicator does its work, that I have the greatest confidence in recommending it. Ladies, and indeed children, who are old enough to distinguish Dandelions, Docks, and Daises, can use the Eradicator as well as a professional gardener. A measure for filling the Eradicator with the "Weed-killer" through a hole in the side of the barrel at the top, and which has a screw-top, can be purchased with the Eradicator, the price of the latter, which is brass, being 1s. 6d. *H. W. Ward, Longford Castle, Salisbury.*

DRIED AND PRESERVED FRUITS.—It is instructive to learn that the demand for Raisins and Currants has been found during the winter to be comparatively moderate, as compared with the trade in some previous winters, although the fruits are exceptionally good and cheap. Probably this falling off in trade is accounted for by the remarkable abundance now found in grocers' shops of dried and

* *Monographia Rosarum Europae et Orientis*, vol. i., Parisiis, 1892. Autographis.

FIG. 80.—XANTHOCEBUS SORDIDIFOLIA. (SEE P. 532.)

canned or bottled fruits of many descriptions, which are very cheap and good. In dried fruits, the whole and ringed evaporated Apples are coming largely into use; the latter, especially, make capital tarts and puddings when washed and soaked in clean water for a few hours before being used. Some day we may turn to and evaporate Apples at home for home use, but the best now sold come to us from America. We have also on offer Pears, both French and American, but the latter are much the better and cheaper. Stoned Plums and Apricots, the latter being specially delicious when moderately cooked and served for consumption. These fruits are very thin and flat, but they seem to have considerable absorbent properties, as they swell up appreciably after being soaked. The flavour of both Plums and Apricots are excellent. No wonder that the British housewife prefers to buy fruits of this description to a monotonous *menu* of Raisin and Currant puddings. As far as canned and bottled fruits are concerned, so varied and so good are these that it seems almost impossible to excel them. We have now learned to can fruits at home, as I have just enjoyed some Gisborne Plums canned in Cambridgeshire, and they were, if less sugary than are the American fruits, certainly more highly flavoured. It is probable that there is much more room for our extension of the canning and bottling trade than in that of jam making, as in this direction we seem to have all that can be wished for. *A. D.*

FRUIT CULTURE: THE DIAMOND AND OTHER CORDONS.—Permit me to add my testimony in favour of the cordon form of fruit trees, pp. 453 and 459 of the *Gardeners' Chronicle*. Some of the forms are as useful for Pears and Plums, as for Apples. Cherries are more apt to grow on common cordons, and this tendency would be strengthened on diamond cordons where the branches grow into each other at points of crossing, and become as living, and if desired after from 6 to 8 years a self-sustaining fence, distinguished by its beauty and utility. The zigzag and spiral cordon is equally useful in certain positions. The latter is formed around spaces a yard more or less across, formed with three or five stakes. Plant the tree in the centre of the space and train the shoot straight across to any portion of the circumference, the nearest stake being the most convenient. Train it round the stakes till the base line is formed, then lead the one shoot round a second time a foot or 15 inches from the second semi-circular-bearing shoot, and so on shoot after shoot until a circular or spiral cordon 5 feet high is formed. But this takes time, as such cordons mostly begin fruiting the second year after planting. Among the chief causes of this very early fertility is that the maiden shoots are never cut back, but left full length from the first. The object being to form a series of circles at planes of different heights of fruit-bearing wood, there is no reason to stop the leading shoot. Consequently, it is allowed to run on unchecked until the tree has grown to the desired size. The pressure put on the growing leader to keep it in proper form, proves sufficient to break the shoots back to their base or transform them into fruit-spurs. In fact, there never was any difficulty through any excess of growth on these spiral cordons, nor on the diamond cordon fence. The early fertility, and non-stopping of leaders combined, threw the trees so early into fruit-bearing, and kept them at it so persistently year after year, as to thoroughly suppress all tendency to excessive luxuriance, and to teach the most valuable lesson in practical fruit-growing, viz., that as nothing succeeds like success—so that there is no receipt for permanent fertility equal to early and yearly crops of fruit. Baby trees may be led into fruitful ways like children into good habits, and once established both alike naturally repeat themselves. Diamond cordons or Apple fences may be formed of single cordons. Most of ours were so formed to save time, and also on the principle of not cutting back the maiden Apples. Two plants were thus planted in the same holes, one trained to the right and the other to the left, to form the diamonds which were from a foot to 18 inches in the squares. Fruit fences so formed virtually take up no space, are highly ornamental throughout the season, and the produce is prodigious. From this form of training the lines of the diamonds resisting the energy of radiation to a great extent, or some other cause, diamond cordons have often yielded full crops when good horizontal cordon bushes and pyramidal trees within a few yards have failed. The quality of the fruit has also been of the best on the diamond and other forms of cordons, and all that is needed to assure the

more general adoption of dwarf small fruit trees by amateur and professional growers is a trial of the different forms. *D. T. F.*

CLUB IN BRUSSELS SPROUTS.—When addressing a meeting of gardeners at Bournemouth a short time ago, I was informed that many of the Cabbage tribe, and the Brussels Sprouts in particular, are much subject to club in that district, and complete failures of crop are frequent. In the course of an instructive discussion, one gardener said his Brussels Sprouts had suffered so severely from this disease for years, that he had been driven to resort to several expedients in endeavouring to arrest it; but the best plan was that of earthing-up. He stated that he plants his Brussels Sprouts in trenches 4 or 5 inches in depth, and that as soon as they show signs of being affected by club, he earths the soil up to the plants, thus filling up the trenches. The result is, the stems put forth fresh roots of a somewhat dense and fibry character, and, fed by this, the plants enter upon what is really a new lease of life, and grow with remarkable vigour. At a later meeting a plant was brought for my inspection, and I found that the original roots and base of the stem had completely rotted away; but no trace of club had affected the secondary ones, and I was informed that it rarely does so. I do not know if this practice can lay claim to novelty; but that it is efficient for the purpose there can be no doubt. Clubbing, which means the formation of protuberances on the roots, is a very destructive disease, perhaps the most destructive to which the Cabbage tribe is subject. Its appearance is ascribed to one or more species of insects, but maggots appear to be always present in the tubercles. [A slime-fungus is the most usual cause.] Many remedies have been suggested. One of the most frequently urged is an entire change of ground, giving the plot affected a good dressing of lime. A mixture of plenty of wood-ashes with the soil to be planted is strongly recommended by some; others advocate lime and soot; also nitrate of soda and common salt. All these have been tried, but they have not proved generally thorough remedies. One precaution is necessary in planting out from the seed-bed. All plants showing any tendency to club should be destroyed, and only those free from any suspicion of it planted out. Some gardeners recommended making a kind of liquid paste of soot and water, and dipping the roots of the plants into it before they are planted. It does seem as if the Bournemouth practice of planting out in trenches and earthing-up, is one deserving of attention, as it is conclusively shown it answers the purpose of what is practically a cure. *R. D.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

APRIL 12.—Present: Dr. M. T. Masters, in the chair; Mr. Morris, Mr. McLachlan, Mr. Michael, Rev. W. Wilks, Professor Green, Dr. Müller, Rev. G. Henslow, hon. sec.; and Mr. Farmer, visitor.

Galls on Ribes.—A report was received from Mr. E. A. Fitch upon the galls on *Ribes aureum*, in which he observed that "the only sure thing to be said is that the galls are made by an unknown species of Phytomyia, allied to that making the well-known witch-knots on Birches." (See "Entomologist," vol. x., pp. 83-84, April, 1877). He remarks that the species of *Phytomyia* are but little known in this country.

Narcissus bulbocodium, fasciated.—Mr. Morris exhibited a specimen with five flowers united, and remarked that of 12 pots at Kew every plant bore fasciated stems. Mr. Wilks observed that in this species fasciation is constantly occurring.

The Branching of Endogens.—Mr. Morris exhibited specimens illustrative of the apparent dichotomy in certain plants. In *Pandanus*, *Agave*, *Yucca*, and many other plants, the dichotomous arrangement of the branches is due, not to a bifurcation of the bud, as is usually supposed, but to the occasional development of a single axillary bud. The growth of this bud soon equals that of the parent axis, and causes the deflection of the latter, so as to give a forked appearance. This was shown to be the case in a specimen of *Pandanus pygmaeus*. In a specimen of *Aloe acaotrina*, on the other hand, the pseudo-terminal position of the inflorescence terminating the axia had led to the growth of the axillary

buds, which were lengthening out into branches of a dichotomous character. A good example of the forked appearance, caused by the destruction of the terminal bud, was shown in a drawing of a *Coccoloba* Palm; while a similar result in an exogen, due to an abortive terminal bud, was illustrated by the common *Lilac*.

Scale Insects on Palms in West Indies.—A communication was read from Mr. Cockerell of Jamaica explaining difficulties in the way of carrying out experiments for their destruction, as the people there can only test the value of a statement by results, and if these failed, prejudices against future suggestions would arise. Again, since *Coccoloba* are attacked by many enemies, even if a remedy proposed should answer for the scales, the trees might perish from other causes. He doubted whether scale insects ever killed them, though, having weakened the trees, they might then fall a prey to other parasites. Moreover, different scale insects have different habits; some, as *Aspidiotus palmæ*, appears to live only on the *Coccoloba*, while *A. articulatus* infests many other plants, so that if the latter were destroyed on Palms, it would soon re-infest them from other sources. He thinks that all the injurious coccids have reached Jamaica in comparatively recent times; and the fact that their parasites have not been imported as well may account for their increase.

Raspberries attacked by *Dothidea*.—Some canes were forwarded from Mr. J. Willard, Holly Lodge, Highgate, covered with black spots, which have appeared during the winter months for the last five or six years. Transplanting and manuring, and the introduction of new sorts have failed as remedies. The fungus causing the mischief has been recognised by Dr. Cooke as a *Dothidea*.

Narcissus Bulbs Attacked by *Acari*.—Mr. Michael reported upon the bulbs received from Rev. W. Wilks as follows:—"I find two species of *Acari* in large numbers, either of which is sufficient to account for the damage. Both are most injurious creatures, and commence destruction upon healthy plants. One is the large and conspicuous *Rhizoglyphus* (species probably *Echinopus*, but there was no adult male specimen, without which the species cannot be determined for certain). This is a well-known destroyer of bulbs. The other, which occurs in great numbers, is extremely minute, and not to be detected without a microscope. It is a *Tarsonymus*; the species is most like *T. oryzae* (of Targioni-Tozzetti). All species of this genus are most destructive. It is only of late years that their existence has been detected, on account of their small size, the transparent and colourless nature of their bodies, and their habit of burrowing into leaves, stalks, &c. I should say that in this case they were doing even more damage than the *Rhizoglyphus*. This is, I believe the first instance of *Tarsonymus* being found in subterranean structures. A species of this genus, *T. Boxi*, destroyed every Box tree in Turin. *Tarsonymus* is well known to be very destructive to Sugar-canes in Barbadoes and Queensland." A discussion followed as to the best remedies to be applied. Mr. Michael suggested a treatment of soap and sulphur before planting, but added, that it is almost impossible to destroy the eggs by chemical agencies. Mr. Wilks observed that, since it is not till spring time when the eggs are hatched, the application would be difficult, seeing that the bulbs are planted in the autumn; moreover, Mr. Dod had shown that the effect of sulphur upon bulbs is to arrest their growth by the formation of sulphurous acid gas. Rev. Mr. Haydon had suggested, in his lectures on Daffodils, the use of powdered quicklime, and although this might destroy the outer scales as well as the eggs which lie among them, experiments with bulbs of comparatively little value would show whether the interior portions remained uninjured. Mr. McLachlan suggested paraffin; Mr. Wilks remarked, however, that this remedy, though excellent for aerial organs, was fatal to roots, but whether it would be equally injurious to bulbs could only be proved by experiment. It was thought that if the bulbs were subjected to vapourised creosote it might prove effective. Dr. Müller mentioned that oil of cloves and oil of cassia used as a watery solution would probably prove capable of destroying the acari, as they are powerful antiseptics.

Carnations Attacked by *Anthomyia*.—Specimens were received from Mr. Perry of Tottenham of the well-known parasite, *Hylemyia nigrescens*, which attacks the crowns, nodes, and basal part of the stem.

Lettuce Mildew.—The Lettuces grown in the market gardens near Ham, Twickenham, &c., are

much damaged this year by *Brenia lactuca*, formerly known as *Peronospora gangiformis*, *Botyris*, described by Rev. M. J. Berkeley in 1816 as *Botrytis* (*Journ. Hort. Soc.*, 1, t. 4). References to the literature are given in Cooke's *Handbook of British Fungi*. Mr. W. G. Smith devotes a chapter to this parasite (Chap. 34, "Diseases of Field and Garden Crops"), in which he observes that "when frame Lettuces are attacked, a good plan for the destruction of the fungus is to give as much air as practicable, and if possible to leave the frames open for at least a part of one cold night, as a short exposure to cold or slightly frosty air will not materially hurt the young Lettuces. As resting spores are found in old rotting stems, all decayed plants should of course be burnt, especially old stumps, as in them the resting spores of the mildew often exist in myriads."

Primula Forbesi.—A growing and flowering plant was again exhibited by Mr. Vilimorin. This species was shown by him on October 6, 1891, when specimens were presented to Kew and Chiswick. At both establishments the plants are in a flourishing condition.

Schizocodon soldanelloides.—A plant was exhibited by Captain Torres, Poaston Manor, Hayes Common, Kent. It is allied to *Shortia*, both belonging to the order Diapensiaceae. A vote of thanks was unanimously given to the exhibitor.

Angæum sesquipedale monstrosus.—Mr. C. Whitfield King sent a specimen in which one of the lateral petals was spurred, making a supernumerary labellum.

Committee Meetings.

APRIL 19.—The meeting of the Auricula Society added more than the usual amount of interest to the gathering at the Drill Hall, James Street, Westminster, and drew a goodly number of visitors. Contributions of cut blooms of various kinds; of alpine plants, by a hitherto unknown exhibitor of these plants, Mr. Harper, Guildford; of Orchids in flower; of Narcissus in competition, and others merely for exhibition; together with the Auriculas and Primulas, made up an exhibition where almost everyone could find something to admire and talk about.

Orchid Committee.

Present: J. Douglas, Esq., in the chair; and Messrs. J. O'Brien, H. Ballantine, C. J. Lucas, E. Hill, J. Jaques, T. B. Haywood, and M. T. Masters.

Messrs. F. Sander & Co. had a select group of Orchids in which appeared the new hybrid *Cattleya*, *C. Burberryana* × (*imbricata* × *superba*) ♀, named in honour of Mr. H. A. Burberry, the Orchid grower to the Right Hon. J. Chamberlain, M.P., the flowers resemble those of *C. superba* in shape—they are 6 inches across; sepals and petals white tinged with pink, the front lobe of the lip rich crimson. Other new plants in Messrs. Sander's group were: *Oncotoglossum Wendlandianum*, a pretty variety, apparently an *O. wandium* hybrid; *O. Owenianum*, a remarkable species with white flowers tinged with sulphur yellow, the petals showing sometimes a brown blotch, and the sepals being marked with brown, all but their margins. Another fine plant was *Oncidium Gravesianum*, one of the *O. Marshallianum* section, which came over with the true *Cattleya labiata*. The large specimen had several branched spikes of golden yellow and chestnut brown flowers. In Messrs. Sander's group also were a fine lot of varieties of *Dendrobium Phalaenopsis Schroderianum*; *Cattleya Schroderae* and several white *C. Schroderae* virginialis; *Dendrobium Venus* × *D. hercoglossum*, several of their form of *Cattleya labiata*, *C. speciosissima*, *C. gigas*, *C. granulosa*, *C. Lawrenceana*; the fine *Trichopilia crispigrandiflora*; three *Phajus Cooksonii* × *Cattleya intermedia punctatissima*, *Phalaenopsis amabilis*, *Dendrobium Brymerianum*, *Spathoglottis Lobbi*, &c.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited a new hybrid *Cattleya*, *C. Philo* × (*ricolor* ♀, *Mossiae* ♀). The flowers are about half the size of those of *C. Mossiae*; sepals and petals bluish-white, with a faint yellow tinge; front of lip crimson, with bluish-white margin; middle of the lip yellow, the base crimson, with whitish veining. *C. ricolor* is a very rare species, and this hybrid of it a very pretty variety.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (see, Mr. H. Simpkins), exhibited as *Cypripedium exul* the plant exhibited by him at the last meeting as *C. insignis siamense*, it being the opinion of orchidists generally that it is a distinct species (see p. 523); and C. E. Smith, Esq., Silvermere,

Cobham (gr., Mr. J. Quarterman), sent a dwarf plant of *Dendrobium Wardianum*, and several specimens of *Oncidium luridum*.

Messrs. Linden (l'Horticulture Internationale), Parc Leopold, Brussels, exhibited a plant and full-size coloured drawing of their new *Cattleya Alexandrina*—a most wonderful species (see p. 522). The habit of the plant is similar to *Cattleya Leopoldii*, but it has tall scapes, bearing at the top flowers equal in size to those of *Cattleya superba*, and much resembling that species in the lip. The wavy-edged petals and sepals are crimson tinged with orange.

ORCHID COMMITTEE.

List of Awards.

Silver Banksian Medal.

To Messrs. F. Sander & Co., for group of rare Orchids.

First-class Certificate.

To *Cattleya Burberryana* ×, Messrs. F. Sander & Co.

Awards of Merit.

To *Cattleya Philo* ×, Messrs. Jas. Veitch & Son.

To *Oncotoglossum Wendlandianum*, Messrs. F. Sander & Co.

To *Oncidium Gravesianum*, Messrs. F. Sander & Co.

To *Cypripedium exul*, R. Measures.

Floral Committee.

Present: G. Paul, Esq., in the chair; and Messrs. Owen Thomas, B. Wynne, C. F. Bause, H. B. May, G. Phippen, C. J. Salter, H. Turner, G. Gordon, J. Fraser, W. C. Leach, and W. Marshall.

The exhibita with which this committee was concerned were as usual numerous and varied. Mr. W. Harper, of Mill Mead Nursery, Guildford, was awarded a Silver Banksian Medal for two baskets or groups of Alpine plants, which beside being interesting were staged very effectively. The collection included the following:—*Gentiana verna* and *G. verna alba*, *Saxifraga Rochelliana*, S. Boyd, *Primula farinosa*, P. rosea, P. grandiflora from the Dolomites, flowers of a deeper yellow and habit dwarfer than the type; *Pinguicula alpina* (Faldonside seedling), *Primula Auricula*—the ordinary form, and one from the Dolomite range in the Tyrol, which has flowers of a deeper shade of yellow and a much dwarfer habit of growth; it goes under the name of *San Martinus* variety. The ordinary form of *P. Auricula* with broad foliage, 5 inches long, and powdered and pale yellow blooms, several cross-bred forms were shown—one between *P. auricula* and *P. pubescens* had powdery foliage and light yellow showy blooms; *P. pubescens* Peyritschii has lilac-coloured blooms, with a white eye and a dwarf and compact habit; *P. marginata* the Faldonside variety, *Anemone Pulsatilla pallida*, a brownish creamy-coloured variety, and *Polygala Chamæbuxus* were likewise present in this interesting lot of plants.

G. E. Smith, Esq., Silvermere, Cobham, Surrey (gr., J. Quarterman), exhibited a group of *Guedrea* roses (*Viburnum opulus*), and *Acacia hispida*. A Bronze Banksian Medal was awarded.

A very pretty basket of double-flowered *Violets* (*Viola Victoria*) came from J. T. Hopwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers), and received a vote of thanks.

From the Royal Gardens, Kew, came a collection of *Hyacinths* grown there from bulbs in from three to five years, and which had flowered in the open. These spikes of flowers were equal to those obtained from bulbs from Holland; as grown at Kew they continue to improve until the fourth year, when they are said to be at their best, both in strength and colour of bloom. *Rhododendron racemosum*, a Chinese species, from J. Veitch & Sons, Chelsea, obtained a First-class Certificate. This is a pretty, dwarf-growing plant, not being more than 4 to 6 inches high as seen, and each plant was covered with blossoms, which were of a pretty pink colour. These plants had been lifted from the open ground only ten days ago. The same firm of nurserymen obtained an Award of Merit for *Hippeastrum Sylvia*, a hybrid between *reticulata* ♀ and *Bernard* ♀; the flowers, which were of good quality, were scarlet and white, and the leaves were reticulated, as in one of the parents. *Grevillea robusta elegantissima* gained a First-class Certificate; the leaves of this plant are longer and more graceful than those of the type, the leaflets being smaller, and more divided. A very fine *Spiræa* (*Astilbe Thunbergii*), shown by Messrs. Veitch & Sons, was also awarded a First-class Certificate; the blooms were about 2 feet high, but the foliage was dwarf. It had something of the appearance of *A. astilboidea* or *Spiræa aruncus*, but the growth was stronger, and the flowers finer.

From Mons, J. Salier, Paris, came a group of *Tropæolum Lobbi variegatum* (Spitfire), which is recommended as suitable for a cold house. It had variegated foliage, and bright scarlet flowers.

M.M. Eolens Frères, Ledeburg, near Ghent, sent a plant of *Imatophyllum Britannia*, with one spike, bearing an umbel containing twenty flowers. The umbel was dense, and the flower-segments slightly recurved. Another spike was also springing from the bottom of the plant.

Viscoitesa Hambleton sent seven *Hippeastrums*, the best of which, *Charles Penny*, was granted an Award of Merit. This was a flower of good substance, of a deep blood red colour, and slightly recurved in the segments.

Messrs. Paul & Son, Old Nurseries, Cheshunt, sent a group of *Roses*, Tea, and hybrid perpetuals.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. J. Willard, G. Bunyard, A. Dean, G. H. Sage, G. Wythes, J. Hudson, H. Balderson, F. Q. Lane, J. Smith, G. Norman, W. H. Divers, Harrison Weir, J. Cheal, D. Morris, and T. J. Saltmarsh.

A dish of very fine handsome Strawberries, *La Grosse Sucrée*, came from Mr. Gilbert, of Burghley, obtaining a Cultural Commendation. Mr. Frank Lees, F.R.H.S., The Vineyard, Connaught Road, Reading, also obtained a Cultural Commendation for a box of very fine *Vicomtesse H. du Thury* Strawberries.

Mr. Wythes, gr. to the Duke of Northumberland, Syon, again exhibited the seedling "Syon House" obtained from Keen's Seedling, and for which he received a Vote of Thanks.

Grapes were exhibited by Mr. Owen Thomas, gr. to the Queen, the Royal Gardens, Frogmore. One bunch of Black Hamburg, and another of Foster's Seedling, which were said to have been ripe in March. The bunches and berries were of fair size, and the colour of the black variety was very good for the season and the favour particularly rich.

A dish of Apples (*Barnack Beauty*), came from Mr. W. H. Divers, Ketton Hall, and was awarded a vote of thanks.

The Daffodil Committee.

In the competitive classes, Mr. C. W. Cowar, Valleyfield, Pennycook, Midlothian, was awarded a 1st prize for a collection of Daffodils grown in the open air by amateurs. A large and varied collection was staged, which included many of the newer kinds, such as *Glorie de Leiden*, *Madame Plémp*, &c. Some of the varieties, however, were weak, and this is no doubt attributable to the season, which has not been so good for these plants as it might have been.

H. J. Adams, Esq., Roseneath, Enfield, took 2nd prize in this class with a good collection, including *Henry Irvine*, M. J. Berkeley, Cernuus, pulcher, *Thos. Moore*, &c.

For nine distinct varieties of Daffodils, grown in the open, W. H. Berkeley James, Esq., Carshalton, Surrey, was awarded 1st prize, staging very good specimens, including *Sir Watkin*, *Horsfieldii*, *Grandee*, *Nelson major*, and *Maximus*; the 2nd position fell to the Rev. E. Bourne, Dunston Vicarage, Lincoln, whose collection included *albidus*, *albicans*, *Princeps*, *J. Gwyther*, and *Princess Mary*.

W. H. Berkeley James, Esq., Carshalton, Surrey, secured the premier position in competition for six varieties of Daffodils grown in the open, by amateurs, exhibiting *Emperor*, *Empress*, *Barrii conspicua*, *Grandee*, *Horsfieldii*, and *Sir Watkin*; the 2nd prize fell to J. W. Meller, Esq., Seawardstone Lodge, Chingford, who had *Incomparabilis*, *Eggar*, *Princeps*, *Emperor*, *Grandee*, and *Empress*. For a collection of Daffodils (*Polyanthus* excluded), the Rev. S. E. Bourne, Dunston Vicarage, Lincoln, obtained 1st prize for a very excellent collection, including *concolor*, *odorus plenus*, *Horsfieldii*, *Empress*, *Princess Mary*, *Cernuus*, *Rugifolius*, *ornatus*, *albicans*, &c.; H. J. Adams, Esq., came 2nd with a large and interesting collection, including *Duchess of Brabant*, *Exquisite*, *Goliath*, *W. Primer*, &c.; the third position fell to J. T. Hopwood, Esq., Ketton Hall, Stamford.

National Auricula (Southern Section).

The exhibition of this Society, which took place in connection with the meeting of the Royal Horticultural Society, on Tuesday, came as a surprise, both in reference to its extent and the quality of the flowers. Despite the untoward character of the season, Auricula cultivators managed to get their flowers into bloom, though not a few bore the ap-

pearance of having been subjected to high pressure in the way of temperature. When an Auricula show is held unusually early in a late season, it is imperative that some sort of forcing be adopted in order to get the pipe to expand. It is not too much to say on the part of those who grow Auriculas without any assistance from fire-heat, that they will not have their plants well in bloom until the second week in May, and what is somewhat noticeable, the alpine varieties appear to be much later in flowering this season than the show flowers, as they are termed, though the former were much more numerous than might have been expected.

Show Auriculas.—Strange to say, there were as many as six competitors in the class for twelve dissimilar Auriculas of the show type. Here Mr. J. Douglas, gr. to Mrs. Whitbourn, Great Gearing, Ilford, again occupied his old position of former times, taking the 1st prize with the following:—Green edges, the Rev. F. D. Horner, Abbé Lizst, both in very good condition; and Prince of Greens; grey edges, Mabel, (Douglas) Marmon (Douglas) in fine character, and so near a white edge that it might fairly have been included in the section; white edges, Elaine (Horner), Magpie (Horner), very good; and Acme. Sells, Mrs. Potts, Fanny Glass (Douglas), a large dark self, with an inclination to come coarse. Heroine, somewhat shaded on the petal edges, as the dark selfs appear to be generally this season; and Black Bess, all very fine and valuable varieties. 2nd, Mr. T. E. Henwood, Hamilton Road, Reading, whose flowers were wanting in the fine finish which usually characterises them, and showing visibly that the plants had been pushed on into flower. He had of green edges, the Rev. F. D. Horner and Rolit's Red, so named because a zone of red takes the place of the black ground generally seen in the green edges; grey edges, George Lightbody, Richard Headly, Douglas' Visit (Barlow), large in size, and somewhat rough in appearance, and George Rudd; white edges, Mrs. Dodwell, Dr. Kidd, and John Simonite; selfs, Mrs. Bentley (Barlow), fine and smooth, but much shaded; Black Bess, and Mrs. Potts. Mr. Charles Turner, Royal Nursery, Slough, was 3rd, having, among his green edges, the old Colonel Taylor. P. J. Worsley, Esq., Rodney Lodge, Clifton, Bristol, was 4th; and two other prizes were awarded.

There were six competitors also in the class for six show varieties, and again Mr. J. Douglas was placed 1st, with green edges, Rev. F. D. Horner and Abbé Lizst; grey edges, George Lightbody and Marmon; white edge, Acme; self, Mrs. Potts. 2nd, Mr. T. E. Henwood, with green edges, Rev. F. D. Horner and Lancashire Hero, in its green form; grey edge, George Rudd; white edge, Mr. Dodwell; selfs, Black Bess and Mrs. Potts. 3rd, Mr. A. J. Sanders, gr. to Viscountess Chertown, Bookham Lodge, Cobham; and three other prizes were awarded.

In the class for four varieties there were five competitors, and here Mr. William Badcock, Oxford Road, Reading, was placed 1st, with a very good lot of plants, viz., green edge, Rev. F. D. Horner; grey edges, Marmon and Richard Headly; self, Black Bess. 2nd, Mrs. Kyrie-Penson, Dinham Lodge, Ludlow, who had, green edge, Rev. F. D. Horner; grey edges, Marmon and Richard Headly; self, Black Bess. 3rd, Mr. Charles Phillips, Hamilton Road, Reading, with a seedling green edge in the way of the Rev. F. D. Horner, but a little weak in the paste; grey edges, George Rudd and Dr. Kidd; and a seedling self from Heroine, brighter in colour, and with a better paste.

The competition was good in the class for two varieties. Here Mr. Badcock was again 1st with green edge the Rev. F. D. Horner, and grey edge Richard Headly; 2nd, Mr. Charles Phillips, with green edge F. D. Horner, and self Heroine; 3rd, Mr. W. L. Walker, with white edge Mr. Dodwell, and self Black Bess.

Single Plants, Green Edges.—1st, Mr. J. Douglas, with the Rev. F. D. Horner; 4th, with Monarch; 2nd, Mr. W. Badcock, with the Rev. F. D. Horner; 3rd and 6th, Mr. T. E. Henwood, with the same. The Rev. Mr. Flood was 5th with General Neill, but it is doubtful if this was correctly named. Grey edges, 1st, the Rev. F. D. Horner, with Samuel Barlow (Bolton), a flower of excellent properties, having a fine black body-colour, smooth, and well-proportioned; 2nd, Mr. W. Smith, Bishops Stortford, with George Rudd; 3rd, Mr. W. L. Walker, with George Lightbody; 4th, Mr. J. Douglas, with Marmon; 5th, Mrs. Kyrie-Penson, with Conqueror of Europe. White edges, 1st, Mr. T. E. Henwood, with John Simonite; 2nd and 3rd, Mr. J. Douglas

with Acme; 4th, Mr. C. Turner, with Beauty; 5th, Mr. A. J. Sanders, with Acme; 6th, Mr. T. E. Henwood, with Mr. Dodwell, Sells, 1st, the Rev. F. D. Horner, with Precision, a very fine smooth self in the way of Mrs. Potts; and Kathleen, differing a little in colour, also smooth and fine, both of his own raising; 3rd, Mr. J. Douglas; 4th and 5th, Mr. T. E. Henwood, with Mrs. Potts; 6th, Mr. C. Phillips, with Heroine.

Groups of Auriculas.—Four collections of fifty plants were staged. Mr. J. Douglas having by far the best, included among his were green edges, Rev. F. D. Horner, Smetherfield, Monarch, Abbé Lizst, Prince of Greens, and Dr. Hardy (Simonite), fine pip, large tube, narrow paste, black body-colour; grey edges, Mrs. Moore, Mabel, and Neatness; white edges, Elaine (Horner), John Simonite, Peri (Douglas), and Acme; selfs, Black Bess, Mrs. Potts, Sapphire, Friar Tack, Dignity (Douglas), and Heroine. 2nd, Mr. C. Turner, who had of green edges, Lovely Ann and Lancashire Hero; grey edges, Colonel Champneys and Duke of Cambridge; white edges, Acme, Conservative, Frank Simonite, and Beauty, with several selfs. 3rd, The Guildford Hardy Plant Nursery Company.

Alpine Auriculas.—Some very fine and promising seedlings were among these. The best twelve came from Mr. W. L. Walker, who had Defiance, Hotspur, T. E. Henwood, Edith, and some valuable seedlings. 2nd, Mr. C. Turner, with Miss Blagburn, W. H. Grenfell, Jewess, H. E. Milner, very fine; Countess, Sunrise, Desdemona, white centre, very fine; Unique, Alarm, and seedlings, a fine and well-grown lot of plants. 3rd, Mr. J. Douglas, with Nellie, Unique, Charles Turner, Edith, Charles, Diadem, and seedlings. With six varieties, Mr. W. L. Walker was again 1st, with seedlings of very fine quality. 2nd, Mr. C. Turner, with Unique, H. E. Milner, Mrs. F. D. Horner, Mrs. Mettlejohn, and seedlings. 3rd, Mr. C. Phillips, also with seedlings; small plants, but of very fine quality. The best four varieties came from Mr. A. J. Sanders, who had Mercury, Sensation, King of the Belgians, and Diadem. 2nd, Mr. C. Phillips, again with seedlings; small in size, but highly promising. In the class for the best good centred flowers, Mr. C. Turner was placed 1st, with John Bewick, very bright in colour; 2nd, Mr. W. L. Walker, with Florie Henwood; and 3rd, with Hotspur; 4th, Mr. J. Douglas, with Unique; and 5th, with Nellie Hibberd, large, and bright in colour. In the class for cream and white centres, Mr. W. L. Walker was 1st, with Mary Frances; 2nd, Mr. C. Turner, with Countess; 3rd, Mr. W. L. Walker, with Edith; and 4th, Mr. C. Turner, with the same.

Fancy Auriculas.—The only exhibitor of twelve plants of these was Mr. J. Douglas; they were remarkable for their rich golden tubes, and gold and yellow body-colours. They occur among seedlings, and appear to be quite fixed in character.

Premier Auricula.—This was the green-edged variety Abbé Lizst, shown by Mr. J. Douglas, in his 1st prize twelve show varieties.

Polyanthus, gold-laced.—These lost much of their significance through being placed next to the more brilliant giant and fancy varieties, which overpowered them with their massiveness and striking colours. The best six came from Mr. R. Dean, Ranelagh Road, Ealing, who had George IV., William IV., Sir Sidney Smith, Lord Beaconsfield, and two seedlings; 2nd, Mr. James Weston, Ravenshoe, Balmham, who had William IV., Lancashire Hero, Chesire Favourite, &c.; 3rd, Mr. J. Nicholson, gr. to J. W. Meller, Esq., Sewardstone, Chingford. In the class for three plants, Mr. A. Mothershead, Slough, was 1st with George IV. and Prince Regent, both in excellent condition; and Napoleon III. In the class for single plants, Mr. Douglas was 1st with George IV., and 2nd with William IV.; Mr. Weston was 3rd with Lancashire Hero, and 4th with Prince Regent.

Polyanthus, fancy.—Owing to the frost and cold winds, these were by no means seen at their best. Still they made a brave display. Mr. R. Dean was placed 1st with twelve pots, and Mr. J. Douglas 2nd, the plants in both cases being of large size, and carrying good heads of bloom.

Primroses.—For the same reason, these were not so good as usual. Mr. R. Dean was again 1st, with twelve pots, and Mr. J. Douglas 2nd.

Primroses, Double.—With the exception of a basket sent by the Guildford Hardy Plant Nursery Co., these were not represented; the crimson Cloth of Gold, white, red, and others, were in good character.

Species of Primulas.—These were as usual of a

very attractive character. With twelve species, Mr. J. Douglas was placed 1st, having remarkably well-grown and bloomed examples of denticulata, Sieboldi var. laciniata, obovata, japonica, rosea, verticillata, Nelsoni, marginata, villosa, nivea, a hybrid between intermedia and an alpine species, and decora; 2nd, The Guildford Hardy Plant Nursery Co., who had their contribution neatly arranged in baskets, and included rosea grandiflora, nivea, auricula, ciliata purpurea and ciliata rosea, viscosa magnifica, pubescens, &c. In the class for six species, O. T. Hodges, Esq., Lachine, Chislehurst, was 1st with marginata, nivea, viscosa, viscosa var., Cashmeriana, and Wulfeniana. There was no other competitor.

Basket of Primroses.—The best came from Mr. R. Dean, the quality of the flowers being very good; and Mr. G. Phippen, Reading, took the 2nd prize.

New Auriculas.—Two prizes were offered in each section for new Auriculas. In the green-edged class, Commander, raised and shown by the Rev. F. D. Horner, was staged, the pip is large and stout, a narrow zone of black body-colour, and fairly good tube. A good deal of objection was made to this award, but the judges could plead that green-edges are scarce, and every encouragement should be given to raisers. In the grey-edged class a 1st prize, was awarded to Mr. Kyrie-Penson, for Dinham, a large well-formed grey that promises to be very useful. In the white-edged class, a 1st prize was awarded to Mr. B. Simonite, for Venus, a chaste and pleasing flower of good quality and promise. Of self flowers, a 1st prize was awarded to Mabel, raised and shown by Mr. C. Phillips, of Reading, a well-finished flower in the way of Mrs. Potts, but redder.

New Alpine Auriculas.—In the golden-centred class, the 1st and 2nd prizes were awarded to Mr. C. Phillips, for Evelyn, rich gold, black ground, shading to brilliant crimson; and Emily, deep gold, dark ground colour, shading to chestnut-crimson. In the white-centred class, a 1st prize was awarded to Mr. W. L. Walker, for Winnifred, dark ground, shading to pale pinkish salmon; and to Mr. C. Turner, for Phyllis, a very pretty and promising flower.

Certificates of Merit were awarded to Mr. Kyrie-Penson, for Dinham; and to Mr. B. Simonite, for Venus; and to Mr. C. Phillips, Mabel. To alpine Auriculas, H. E. Milner, from Mr. C. Turner, good centre, dark ground, edged with bright rosy-salmon—fine pip and truss; to Romulus, cream centre, dark ground, edged with pale pinkish-salmon; to Ben. Simonite, gold centre, dark ground, shading to a kind of pale salmon-blush; and to Perfection, golden centre, dark ground, and pale salmon edge, all from Mr. W. L. Walker, Reading.

Miscellaneous.—The Rev. F. D. Horner sent a collection of new Auriculas, conspicuous among them being his fine new yellow self Buttercup, and a very promising red-coloured self, Mr. R. Dean had a large and showy collection of Polyanthus and Primroses in pots; and from Mr. W. H. Divers, the gardens, Ketton Hall, Stamford, came a basket of the early flowering white Primrose Harbinger; and a basket of what was termed the Old Single White Primrose, which looked a poor thing against some of the fine varieties of the present day.

The Lecture.—The Florists' Tulip.

At the afternoon meeting, the paper was read by Mr. Douglas, in the absence of the Rev. H. C. Horner. Mr. Horner said, that to the inexperienced eye, an ordinary group of Tulips would appear to belong to two distinct species, and explained in florists' terms the phenomena of "rectification," and said that a Tulip might have a self-colour for the first five years of its existence, or even longer, but at about that time it would become rectified, and the flower variegated. All Tulips commenced with a self-colour, and all afterwards would become "rectified." He did not know of any other plant which was the subject of such a phenomenon. The florist divides the Tulip into two distinct classes, those with a yellow base, and those having a white base or ground. The colour of the base always decides the class of the flower. Mr. Horner then went on to describe the markings that should be present in the florist's Tulip, and said that only two kinds were permissible, the one called the "feathered" Tulip, and the other the "flame." If any of the markings interfered with the feather, even in the eyes of the florist it was condemned, and so with the "flame" section. The Tulip must possess neither more nor fewer than six petals, or it would certainly lose

SPITALFIELDS: *April 20.*—Quotations:—Imperators, 50s. to 80s.; Hebrons, 50s. to 80s.; Main Crop, 60s. to 85s.; Snow-drops, 61s. to 70s.; Bruce Magnums, 53s. to 70s.; Sutton's Abundance, 75s. to 80s. per ton.

BOROUGH: *April 19.*—Quotations:—Bruce Magnums, 60s. to 90s.; Dunbar do., 80s. to 90s.; Fenland do., 50s. to 55s. per ton.

STRATFORD: *April 20.*—Quotations:—Light-land, 53s. to 80s.; Dark do., 52s. 6d. to 90s.; Scotch, 70s. to 100s.; Hebrons, 60s. to 70s. per ton.

Averages.—Official statement of the average prices of corn, imperial measure, for the week ending April 16, and for the corresponding period last year:—1892: Wheat, 30s. 7d.; Barley, 28s. 10d.; Oats, 20s. 7d. 1891: Wheat, 39s.; Barley, 27s. 9d.; Oats, 19s. 8d.

SEEDS.

LONDON: April 20.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that there is now a good seasonal demand for farm seeds. Prices all round keep at the moderate level previously ruling. Stocks, moreover, are getting rapidly reduced. Some handsome American and French Red Clover-seeds can now be obtained at very reasonable figures. Fine samples of Alsike and White have become scarce and command advanced rates. There is no change this week in grasses, Sainfoin appears nearly exhausted, and being much wanted is consequently dearer. For Tares there is a brisk sale at last week's low curricula. Canaryseed is strong at the recent advance. Hempseed keeps steady. Mustard and Rapeseed are firm.

FRUITS AND VEGETABLES.

STRAITFORD: April 19.—There has been a plentiful supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Greens, 1s. 6d. to 2s. 6d. per tally; Cauliflowers, 1s. 6d. to 2s. per dozen; ditto, 6d. to 8d. per tally; Turnip-tops, 2s. 6d. to 3s. per dozen; Broccoli, 2s. to 3s. 6d. per bag; Rhubarb, 2s. to 2s. 6d. per dozen bunches; Turnips, 30s. to 40s.; Carrots, household, 32s. to 40s. per ton; do., cattle-feeding, 20s. to 25s. 6d.; Parsnips, 60s. to 70s. do.; Mangolds, 16s. to 20s. per ton; Swedes, 1s. 2d. to 1s. 4d.; Onions, English, 7s. to 8s. per bush; Dutch, 8s. 6d. to 9s. do.; Apples, English, 4s. to 5s. per bushel; Watercress, 7d. to 9d. per dozen.

SPITALFIELDS: April 19. Quotations:—Seakale, 9d. to 1s. 6d. per punnet; Curry Kale, 6d. to 1s.; Spinach, 2s. to 3s. 6d. per bushel; Turnip-tops, 1s. 6d. to 2s. 6d.; Swede-tops, 1s. 6d. to 2s.; Sprouting Broccoli, 1s. 6d. to 2s. per sack; Greens, 2s. to 2s. 6d.; Carrots, 1s. 6d. to 2s. per dozen; Spring Onions, 2s. 6d. to 4s. 6d.; Parsley, 4s. to 6s. 6d. per dozen bunches; Turnips, 1s. 6d. to 2s. per bag; Cauliflowers, 6s. to 12s. per tally; Parsnips, 4d. to 6d. per score; Leeks, 3s. to 4s.; Cos Lettuces, 2s. to 3s.; Cabbage, 9d. to 1s. per dozen; Celery, 6d. to 1s.; Horseradish, 1s. to 1s. 2d. per bundle; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 8s. to 9s. per cwt.; Belgian and Dutch do., 6s. 6d. to 7s. 6d. per bag of 110 lb.; Spanish do., 10s. to 12s. per case; English Apples, 2s. 6d. per bushel; American do., 12s. to 22s. per barrel; foreign Tomatoes, 1s. to 2s. per box; forced Rhubarb, 1s. 3d. to 1s. 9d.; natural do., 1s. 6d. to 2s. 6d. per dozen bunches.

BOROUGH: April 19.—Quotations:—Broccoli, 1s. 6d. to 12s. 6d. per tally; Sprouting do., 1s. 6d. to 2s. NOTICES TO CORRESPONDENTS.

BOOKS: H. B. Kitchin and Market Garden, London: Macmillan & Co.

DIOSMA UNIFLORA, &c.: O. B. The spring propagation of *Diosma* is performed with wood which has grown in the current year, hastened if you like by placing the plant in an airy intermediate house, in which the inmates are syringed, and the house closed about 3.30 or 4 P.M. The wood should be getting firm, but it should not be ripe or hard. The cuttings may be made 2 to 3 inches long without a heel, and should be taken from the circumference of the plant. Prepare well-drained pots, half-fill them with siftings, the size of Kidney Beans, and then on this put finely-sifted loam, peat and sand, and finish with half-an-inch of the cleanest sand; give the pot a watering sufficient to wet the soil throughout, let it dry somewhat, fit a bell-glass over it to mark the space to be occupied with the cuttings, and then insert the latter to about half their depth or rather less, the part below the level of the sand being denuded of leaves by cutting them off, not plucking. Water the cuttings, and when the leaves are dry, put on the bell-glass. A very mild, warm bed should have been made of the old materials of a hot-bed, and covered with a frame of close-fitting lights; and when the bottom-heat of this bed is steady at about 60°, plunge the cutting-pots to the rim. Shade the same in sunny weather, and remove the bell-glasses for ten minutes every morning, wiping them out quite dry. The cuttings may require to be watered before they are rooted, in which case the pots must be removed from the bed, for the purpose, to a place in the shade, and

replaced when the water has drained away from them. If the water can be applied by means of a very fine spout or a goose-quill put through a bit of cork stuck into the spout of an ordinary watering-pot, it is better than employing a Rose, however fine. When the cuttings are rooted they should be potted off into thumba, and kept in the warm frame till roots push into the soil, affording them a little air daily. After establishment they may be grown in an ordinary cold frame till the autumn. *Fabiana*, *Phyllis*, *Camellia* for stocks; *Epacris*, some of the *Ericas*, *Myoporum*, *Coronilla*, *Cassia*, *Myrtles* may be struck in the same manner. This kind of mild-warm bed is excellent for the propagation of *Eunymus*, *Aucuba*, *Spiraea*, *Weigelia*, *Deutzia* from cuttings of soft wood; and for stem cuttings of *Bambusa*, *Yucca*, *Arundo*, &c.

GOOSEBERRIES: T. T. If, as you say, the bushes bear well, you trouble yourself about the red mites? See our columns next week.

HEDYCHUM GARDNERIANUM: B. F. M. M. The stems should be cut down when they show signs of decay. It is only the new growths that will flower. Keep it dry, if from October to March, in a border, by affording no water to that part of the border, or if in a pot by turning it on its side under the greenhouse stage. Intermediate or cool greenhouse. In warm weather outside.

MUSHROOMS DAMPING OFF: W. H. T. Without knowing anything of the methods pursued or the state of the bed, we should suppose that the young Mushrooms die either from want of warmth in the bed, or want of moisture in the soil, or both combined. A bed should be made of such a thickness and of such materials as will preserve a heat in it until the crop of Mushrooms is exhausted.

NAMES OF PLANTS: *Poppy*, *Cupressus* *Corneyana*; 4, *A Juniper* in a young state, which we cannot name.—G. H. 2, *Cupressus* *Goveniana*.—A. D. W. *Nandina domestica*.—Eydol. 1, *Picea excelsa*; 2, *Prunus laurocerasus* var. *angustifolia*; 3, *Thuja Warrena* of gardens; 4, *Thuopsis dolabrata*; 5, *Retinospora plumosa* of gardens; 6, *Cryptomeria japonica*.—E. P. D. *Primula denticulata*.—L. J. A. 1, *Primula veris*; 2, *P. vulgaris*, umbellate form; *Stellaria holostea*; 4, *Arenaria rubra* (perhaps); 5, *Saxifraga tridactylites*.—Subscriber. The dried leaf is, probably, *Aralia Sieboldii*.—F. A. G. *Selaginella cesia*.—W. S. C. P. 1, *Chionodoxa sardensis*; 2 and 3, next week; 4, *Dactylis cespitosa*.—G. S. Small white Orchid, *Cœlogyne graminifolius*, *Dendrobium carliferum*.—J. W. W. *Odontoglossum crispum*, a singular-looking var.; *O. nebulosum* is a very fine variety—few better.—A. B. *Dendrobium primum*.—W. J. *Dendrobium crepiditum*, and the brightest form of it we have seen. *O. E. B.* *Cœlogyne cristata*.—T. *Lonicera caprifolium*.—E. M. 1, *Ageratum Weinmannianum*; 2, *Kennedia rubicunda*; 3, *Ageratum album*; 4, *Salvia generiflora*.

SCARLET PELARGONIUM: *Hazelwood*. We cannot undertake to name varieties of florists' flowers. Send a flower to a nurseryman who grows these flowers extensively.

VERONICA: J. G. Many thanks. The appearances are as you describe them, and are very curious. Such changes in phyllotaxis are not uncommon in some plants, but the explanation is not easy.

WORMS IN GRAVEL PATES: *Senex*. You might use salt (agricultural) or some of the arsenical weed killers. The latter are poisonous to fowls, and are apt to injure animals that roll on the walks, and afterwards lick themselves. Both will kill live walk edgings, which must therefore not be touched with them. Perhaps, the safest remedy would be clear lime-water used over the surface of the walks with a rose-ann. The worms would come to the top soon after a watering with this, and might then be swept up, and the walk well rolled. The watering might be repeated when necessary; but it is the formation of the walk that is at fault.

HORTICULTURAL EXHIBITION, EARL'S COURT.—Young Lady (age 20) seeks engagement as ATTENDANT for STALL.—A. B., 11, Averell Street, Hammersmith, W.

HOLLOWAY'S PILLS are securities of health to all nations, of what climate. They best give a hope, relief, and comfort to millions. In irritation and debility, generated by excess of any kind, or in general prostration of the system, their effect is rapidly soothing, renovating, and restorative. They rapidly drive from the system the morbid cause of ailment, and renew in the frame its pristine animation, health, and vigour. They greatly increase the appetite, give tone to the stomach, assist the digestion, and impart elasticity to the spirits; their essence cures the circulation, and, carried through its course, exerts its cleansing power over every organ. In the lungs they effect most striking changes, converting the impure venous into pure arterial blood, by which the whole frame is recruited.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
THE EMPEROR OF RUSSIA,
The Late EMPEROR OF THE FRENCH,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856, and thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER,
With Improved Steel Chains and Handles.
To cut 6 in., can be worked by 1 £1 15 0
To cut 8 in., do. do. ... 2 10 0
To cut 10 in., do. by a strong youth 3 10 0
To cut 12 in., do. by a man ... 4 10 0
To cut 14 in., do. do. ... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

Catalogues (1s. each, returnable to Purchaser), may be had of Mr. JOHNSON, Head Gardener, on the Premises, and of the Auctioneers, Estate Agents and Valuers, 67 and 68, Cheapside, London, E.C.

The celebrated "Lora" Collection of ESTABLISHED ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY, May 31, at 12 o'clock, the whole of the valuable collection of ESTABLISHED ORCHIDS, by order of E. Goto, Esq., who is disposing of them in consequence of having to winter abroad. The Plants are in capital condition, and comprise many special things that have been sent direct from the Brazils by a counsellor-out there, notably the *Laelia Ootiana* (believed to be unique), first-class certificate R.H.S.; *L. grandis tenebrosa*, fine examples; *L. elegans Schilleriana*, several in gigantic pieces and fine varieties; *L. elegans Turneri*, specially dark variety; *L. purpurata grande* and *Edwardii*, both wonderfully fine forms; *Sophrontes grandiflora* (supposed to be a yellow variety). In addition to these will be found fine examples of *Cypripedium bellatulum*, *villosum*, *aureum*, *Spicerianum* *magnificum*, *calurum*, *Harrisianum*, *Dominicanum*, *albomarginatum*, and others; *Cattleya Skinneri* *alba*, *C. Harrisoni*, *violacea*, *Cattleya* *gigas* (many fine varieties), *C. Dormaniana*, *C. Mendellii* *grande* and *O. M. superbusima* (both specially fine varieties), *Brassia lanceanum longissima*, grand pieces of *Oncidium Marshallianum*, &c.

On view morning of Sale, and Catalogues had.

Tuesday Next.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, May 3, at half past 12 o'clock, the COLLECTION OF ORCHIDS, formed by E. Burnett, Esq., of Kennerly, who is leaving the residence, comprising *Ondoglossum*, *Cattleya*, *Cypripedium*, *Dendrobium*, *Laelia*, *Vanda*, &c., and including *Ondoglossum vestitulum*, extra fine dark variety; *Cypripedium Spicerianum*, extra fine specimen, with numerous growths; *C. Elliottianum*, one growth; *C. Rothschildianum*, one growth; *Cattleya crispa superba*, with two sheaths; *C. gigas*, fine plant; *C. Mendellii*, splendid variety; *C. Trause*, *Guinetiana*, *C. Mendellii* *Lendiana*, nine bulbs; three plants of *Vanda Amesiana*, and other choice varieties.

Also twenty-five lots of various ESTABLISHED ORCHIDS, being the remaining portion of the private collection.

On view morning of Sale, and Catalogues had.

Wednesday next.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, May 4, at half past 11 o'clock, PALMS in variety, *GREEN HOUSE FERNS*, *LILY BULBS*, *HERBACEOUS PLANTS*, *GLADIOLI LEMOINEI*; 5000 double and single *BEGONIAS*; 120 TREES CARNATIONS of the best sorts with flower buds; 30 imported plants of *BOINEXA COULETII*, the Giant Californian white Poppy; 10 *DENDROCALYX RIGIDUM*, the yellow flower-bush poppy; *BAMBOO CANE*; *BAMBOO LADDER*; *WOOD TRELLIS*; *RUSTIC WORK*, *GARDEN SEATS*, &c.

On view morning of Sale, and Catalogues had.

Friday, May 27.

SPECIAL SALE OF ORCHIDS IN FLOWER. Being the day following the Great Temple Show. MESSRS. PROTHEROE AND MORRIS desire to announce that they have fixed the above date for a SPECIAL SALE OF ORCHIDS IN FLOWER, and will be glad to RECEIVE ENTRIES as early as possible.

Friday, May 13, 1892.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. SANDER, St. Athans, to SELL BY AUCTION, at their Rooms, on FRIDAY, May 13, the following VALUABLE ORCHIDS:—

CYPRIPIEDUM, *ONCIDIUM*, *SPIDER PLANTS*, &c. Introduced by us through H. M. Ridley, Esq., M.A., F.L.S., Director of the Botanic Gardens and Forests Department, Singapore. It has also been introduced by R. I. Measures, Esq., and R. H. Measures, Esq., the former gentleman gaining an Award of Merit from the Orchid Committee of the Royal Horticultural Society at the Society's last meeting for a well-grown and beautifully flowered specimen. We beg to offer a high price for healthy and well-grown plants, imported in the early part of last year. We also offer for the first time—

A NEW and MOST REMARKABLE *DENDROBIUM* from the Celebes, the bulbs measuring in some instances 3 feet in length, the numerous leaf-stems showing that the blooms are large, and the plant exceedingly profuse-flowering.

A grand lot of a *CYPRIPIEDUM* resembling C. STONKI, from Sulu and North Borneo; some of the leaves are enormous, and vary greatly in size, &c.

A splendid importation of the new and beautiful *ONCIDIUM GRAVESIANUM* SPS. NOVA, Sander, in grand masses and perfect health. This fine NEW SPECIES received an Award of Merit at the Royal Horticultural Society's last meeting April 12, 1892, for which we much admire its rich and various shades of brown and yellow combined; the colours are deservedly the most popular.

Also many other RARE and VALUABLE ORCHIDS.

Cape revolution.

An IMPORTATION of 25 cases received direct from Japan. They are in excellent condition.

MESSRS. PROTHEROE AND MORRIS desire to announce the arrival of the above, which will be included in an Early Sale.

BORDER PLANTS, TUBEROSES, CHOICE GLADIOLI, BEGONIAS, &c.

MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 33, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, May 4, at half past 12 o'clock, a fine collection of BORDER PLANTS, comprising NEAR CARNATIONS, PICOTEES, PINK, PYRETHRUMS, IRIS, PANSIES, &c.; choice *GLADIOLI* from Holland; Double and Single *BEGONIAS*, Japanese *LILIIUM*, *TUBEROSES*, and *AMARYLLIS* from the Cape, &c.

On view morning of Sale, and Catalogues had.

Thursday Next.

VALUABLE IMPORTATION OF *ONDOGLOSSUM CRISPUM*, in splendid condition, by order of Messrs. F. HORSMAN & CO.

MR. J. C. STEVENS will include in his SALE BY AUCTION, at his Great Rooms, 33, King Street, Covent Garden, W.C., on THURSDAY NEXT, May 5, a fine importation of *ONDOGLOSSUM CRISPUM*, in large mass; and *COMPAETETIA MACROELECTRON* (rare) introduced by Mr. John Carlier. By order of Messrs. F. HORSMAN & CO.

On view morning of Sale, and Catalogues had.

Thursday Next.

SPECIAL SALE OF ORCHIDS IN FLOWER and BUD. MR. J. C. STEVENS will SELL BY AUCTION, at his Great Rooms, 33, King Street, Covent Garden, W.C., on THURSDAY NEXT, May 5, at half past 12 o'clock precisely, a good collection of ORCHIDS in FLOWER and BUD, comprising *ONDOGLOSSUM CRISPUM*, *C. ALEXANDRINUM*, *O. triumphans*, *O. Cervantesii*, *Ada aurantiaca*, *Chelodanthe*, *Masdevallia*, *Pyramis*, *M. Chelodanthe*, *Cypripedium*, *Dendrobium*, *Cattleya*, *Mendellii*, fine vars., &c. Also 10 cases of *LILIIUM* SPECIES from South Africa; a fine collection of *AMARYLLIS* from the Cape, *LILIIUM* from Japan, *TUBEROSES*, and *AMARYLLIS* SPECIES, &c.

On view morning of Sale, and Catalogues had.

Unprecedented Nursery Sale.

Owing to the Ground being required for Building purposes, MESSRS. F. B. SAUND AND SONS have instructed Mr. DAVID MITCHELL, Horticultural Auctioneer, to DISPOSE of, by PUBLIC AUCTION, on WEDNESDAY and THURSDAY, May 4 and 5, each day at half-past 11 o'clock, the whole of their immense stock of STOVE and GREENHOUSE PLANTS growing in their numerous Glass-houses at West Coates Nurseries, Haymarket, Edinburgh (previous to the Houses being removed and re-erected at the Nurseries, Murrayfield). The Stock consists of magnificent Specimens of Greenhouse Rhododendrons, such as *Frage*, *Chloro*, *Chloro* lot of *Palm*, *Crotoneas*, *Eucharis*, magnificent *Pitcher* plants (rare kinds), also large Tree Ferns with fine stems, and without exception the grandest lot of Camellias ever offered for sale by Public Auction, in size and descriptions see Catalogues, which are now ready.

West Coates Nurseries, Edinburgh, April 4, 1892.

Dolphin Sale Rooms, Market Place, Doncaster.

HIGHLY IMPORTANT SALE OF SPECIMEN AZALEAS in flower; ORCHIDS, PALMS, PITCHER PLANTS, CALADIUMS, ANTHURIUMS, STOVE PLANTS, FERNS, and sundry Decorative Plants, from the establishment of a well-known successful private exhibitor.

MR. HERBERT ATRON will SELL BY AUCTION, the above, at his new and commodious sale rooms, Dolphin Chambers, Market Place, Doncaster, on WEDNESDAY, May 4, 1892, at 2 o'clock prompt.

The Plants will be on view some morning from 10 to 1 o'clock.

Catalogues may be had on application to the Auctioneer, Dolphin Chambers, Market Place, Doncaster.

MIDLAND COUNTIES.—TO BE SOLD, at a great sacrifice, to effect an immediate Sale. Close to important Station, on the N. W. Ry. Old established General NURSERY BUSINESS. Very Low Rent. Any reasonable offer will be entertained.

Apply, PROTHEROE AND MORRIS, Estate Officers, 67 and 68, Cheapside, London, E.C.

TO BE SOLD, as a Going Concern, the LEASE (over 19 years), and Seven GLASSHOUSES, 700 feet run, well and suitably heated, situated in a town of over 12,000 inhabitants, and within 20 miles of Covent Garden. Would suit admirably a couple of energetic young men, as it is capable of being largely extended, and is such a genuine chance that those interested should make a note of it by cutting this out, as it will not again appear. The most satisfactory re-ens on giving up will be furnished. Apply, A. B. C., 41, Wellington Street, London, W.C.

To Fruit Growers, Nurserymen, and Others.

GOOD ARABLE and MEADOW LAND to be LET or SOLD. Close to the main road at Poaders End (6 miles from London). Long leases granted. Rent, £12 per acre per annum, with option to purchase the Freehold any time during the first nine years. Several large Market Nurseries are established on the Estate. Full particulars of A. and G. GUYER, Land Agents, Poaders End.

PICTURESQUE ROCK SCENERY.—Forming Waterfalls, Lakes, and Streams, Fisheries, Water Gardens, Alpines, &c., as in hundreds of places about the kingdom, including at Aldenham House, Elstree, so faithfully illustrated in this journal of November 21, executed by PULHAM and SON, 55, Finsbury Square, London, E.C., and Brookhouse, Hert's. Photo Illustrated Book sent for inspection on receipt of twelve stamps.

THE TOWER FURNISHING COMPANY (Limited), SUPPLY GOODS ON HIRE, direct from the Manufacturers; one, two, or three years' Credit without Security. Purchasers have the choice of 100 Wholesale Houses. Call or write for Prospects. Address, SECRETARY, 43, Great Tower Street, E.C.

EXOTIC NURSERIES, CHELTENHAM.

CHRYSANTHEMUMS,
AND HOW TO GROW THEM.

The large and increasing demand for this popular work has made it necessary to print a new and revised edition (11th thousand). This contains a practical and scientific treatise on Culture, and also a critical analysis of the new varieties of the present season, by C. E. Shes, Esq.; a short history of the Chrysanthemum, by C. Harman Payne, Esq.; and a Chrysanthemum Calendar, by Mr. H. Shoemith. In addition to above, illustrations of two of the best new varieties of the year are included in my new Chrysanthemum Catalogue, which also contains the most complete list of new varieties ever brought together, and embraces selections from all the known Chrysanthemum world. All the secrets of successful culture given, making this the most valuable work on the Chrysanthemum ever published. Post free, nine stamps. To Secretaries of Societies, for members, 6s. per dozen.

H. J. JONES, Ryecroft Nursery, Lewisham, S.E.

PERFECTION OF EASY WORKING AND EFFICIENCY.
The only American Lawn Mower fitted with Six Cutting
Blades. It will mow grass closely and smoothly, and with
half the labour of the best English Machines. All
sizes, up to largest (21 in.), can be worked easily by one man.
ONE MONTH'S FREE TRIAL ALLOWED.
Carriage Paid to all Stations.

Gardeners, professional or amateur, who value time and
wish to avoid laborious work, while obtaining the best possible
results in the way of keeping their lawns in perfectly trim
order, should write for Price Lists and Testimonials from—
LLOYD, LAWRENCE & CO.,
34, WORSHIP STREET, LONDON, E.C.,
and all Ironmongers and Seedsmen.

THE "CLIMAX" (CONCENTRATED) WEED KILLER

Is Stronger and Superior to all rivals for permanently destroying all vegetation on Carriage Drives, Garden Walks, Stable Yards, Railway Stations, Ash Tennis Courts, Stonework, &c., &c. Saves many times its cost in labour, and will eradicate the weeds far more thoroughly than the most careful hand-weeding, keeping them away for a whole season.

Has no Smell.—Improves and Brightens the Gravel. Can be applied with an ordinary Watering-Can. Will not Injure the Skin or Clothing.

NOTE.—One Gallon makes 51 Gallons for Use.

PRICES.—In $\frac{1}{2}$ -Gallon Tins, 1s. 9d.; 1 Gallon, 3s. (tins included); 5-Gallon Drums, 2s. 9d. per Gallon; 10 Gallons, 2s. 6d. per Gallon; 20 Gallons, 2s. 3d. per Gallon; 40-Gallon Casks, 2s. per Gallon. 5 Gallons and upwards sent Carriage Paid.

Drums Charged for, but Allowed when Returned in Good Order.

The "Climax" Insecticide.

The CHEAPEST of all INSECTICIDES. NON-POISONOUS, SAFE, & EFFECTIVE.

The only Insecticide that Improves and Brightens the Foliage, while at the same time it completely destroys all Insects and Parasites which infest the Foliage and Roots of Plants.

It will not Injure the most Tender Foliage.

PRICES.—In Tins, $\frac{1}{2}$ Pints, 1s. 3d.; Pints, 1s. 9d.; Quarts, 3s.; $\frac{1}{2}$ Gallon, 5s.; 1 Gallon, 9s.; 5 and 10-Gallon Drums, 8s. per Gallon, Carriage Paid.

THE MYTHE CASTLE GARDENS, TEWKESBURY, AUGUST 13, 1891.

GENTLEMEN,—I have given your "Climax" Insecticide a good trial on tender foliage—Orchids and Ferns—for Bug and Scale. In every instance I have found the Bug and Scale dead, and the foliage bright and clean. I found it most effectual for Black Fly on Peach Trees.

The "Climax" Insecticide ought to be better known; it is the only one I have found to kill Bug on tender plants without injury to the foliage.

I am, yours faithfully, W. MACKIE.

THE GARDENS, MOYALLON HOUSE, GILFORD, CO. DOWN.

DEAR SIR,—In reply to your inquiry, I found the "Climax" a really good and effective Insecticide, completely destroying Mealy Bug, Thrip, and Green Fly on the most tender plants, without the slightest injury to the Plant; in fact, it brightens and improves the appearance of Foliage Plants very much.

Yours, &c., J. LYNAS.

CATTLEYA MENDELII.

MESSRS. PROTHEROE & MORRIS

Have received instructions from Mr. F. SANDER, to SELL by AUCTION, at the Central Sale Rooms, 67 and 68, Cheapside, London, E.C.,

ONE OF THE FINEST IMPORTATIONS EVER OFFERED OF CATTLEYA MENDELII.

There are over 1000 plants, in splendid health, from districts where only the finest varieties are found.

ONCIDIUM GRAVESIANUM

(ROLFE).

A Grand Lot of Plants of this Splendid New Species. Rich Golden-yellow and Chestnut-brown Spikes of Flowers.

Award of Merit last Meeting of Royal Horticultural Society.

CYPRIPEDIUM EXUL

(RIDLEY).

Award of Merit last Meeting of Royal Horticultural Society.

A Superb New Cypridium of very great merit; the flowers are clear, and beautiful Golden-yellow and white, with a band down the centre of each petal.

The Sale will also contain a CYPRIPEDIUM from North Borneo; CŒLOGYNE PANDURATA, CALANTHE VESTITA FOURNIERII, a probably new BRASSAVOLA, CATTLEYA LABIATA true, CATTLEYA MOSSIÆ, RODRIGUESIA PUBESCENS, CATTLEYA DU BUYSSONIANA, CATTLEYA GRANULOSA. The new EPIDENDRUM GODSEFFIANUM, a PERFECT GEM. The new EPIDENDRUM WATSONIANUM, a beautiful yellow and white flowered species, &c., &c., &c.

F. SANDER & CO., ST. ALBANS.

SALE, MAY 13.

200 FINE PLANTS

OF

**CATTLEYA VICTORIA
REGINA (SANDER).**

ON MARCH 4 LAST WE SOLD AN IMPORTATION
OF THIS CATTLEYA, AND WE AGAIN OFFER AN EXTRA
FINE LOT OF PLANTS, IN SUPERB CONDITION,

FOR SALE, ON MAY 13,

BY

SATURDAY, APRIL 30, 1892.

**POTATO DISEASE IN IRELAND:
ITS CAUSE, AND REMEDY.**

IT will be easily understood that a field of corn, after a long rain, will dry through the influence of wind and sunshine in three or four days, whilst it takes as many weeks and longer to dry a forest. Through wind and heat the moisture is absorbed from the soil into the air, ascending into cold regions, thereby becoming condensed to clouds, which are carried by wind to the east. Ireland being next neighbour to America, receives the moisture which comes down as rain during weeks without ceasing, destroying the unripe Potatoes which lie embedded under the surface. The subsoil being too hard to let the water pass through to a greater depth, it remains about the tubers, cooling them to a low degree; and, worst of all, when sunshine sets in, evaporation commences, thereby cooling the leaves and stalks to such a low temperature, that a fungus (*Peronospora infestans*) grows with such rapidity as to kill the foliage in a few days, thereby depriving the tubers of their natural means of getting rid of the moisture; consequently, rot sets in, and destroys the crop.

The depression amongst the workmen of Silesia a few years ago, induced me to study the cause. As a gardener on the largest scale, I had an opportunity to study the climates of Ireland, England, France, and Germany. In order to prove for myself the theory which I am about to put forward, I took several measurements of the temperatures of soils in different places, in good weather, choosing land held and cultivated by peasants, and that of our kitchen garden. In all cases the thermometer was sunk 9 to 10 inches under the surface, and left about an hour completely covered, as if nothing had been deposited there. In our kitchen garden, which is well trenched and well manured, the thermometer, on being taken out, showed 90° F. of heat, whilst the readings of those which were buried in the ground belonging to peasants, amounted only to 71° F. Here we must ask ourselves, Where does this difference come from the different soils being exposed to the full rays of the sun?

The answer is, the kitchen garden soil is cultivated to the depth of 3 feet, the other lands being only cultivated to the depth of 9 to 10 inches the subsoil being in the same state as it was when man first began to till the land.

Deep culture is not new in farming, but too much importance has been attached to throwing the top spit down, and to bringing up the subsoil to the surface. This is the great mistake which was made in this country, and which caused people to abandon deep culture altogether, finding that all sorts of grasses would

starve, their roots being too weak and too short to reach the rich mould which lay at the bottom of the trenched or ploughed field.

I had remarked this here in Silesia, and that is what induced me to try the plan of trenching, leaving the top spit at the surface. The great advantage which agriculture would derive from trenching in this manner is incalculable. In a young state the plants receive nourishment at once; the subsoil, being loosened, lets the water through to the hard bottom, where it remains until the soil above gets warmed and absorbs it, nourishing the young roots on its way to the surface.

In order to put the foregoing theory to a practical test, I received permission from my employer to trench 20 German acres in Neudeck at his expense. I was permitted to choose the land for experiment myself. I selected part of a field which was naturally cold and wet from its position. We commenced at the lower end of the field, which lay on a gentle slope, by throwing aside the top spit quite out of the way; this was found to be about 9 inches deep. As soon as that was removed, we made a trench about 2 feet deep, leaving this soil to fill in the opening at the other end when we should finish. This done, we took a piece, 3 feet wide, and the whole breadth, throwing the top spit over the subsoil we had just thrown up before. Now we had a fair start, and no more mistakes could be made. The soil was left in its rough state, as it had fallen from the spades, till the whole was finished. As soon as the whole was finished, it was levelled, the piece of land taking its former appearance, with the exception that the soil was about 9 inches higher than the other part of the field which had not been disturbed.

It was curious to see how the ground dried under our feet; it got so dry that it was immediately fit to receive farm seeds of any kind, whilst the other part of the field, which lay in its usual state, required at least ten or twelve days to dry it.

Our work being finished, we gave up the field to the Count's land-steward, who followed our doings with much interest, he being afraid that the land would prove too soft for his animals to tread upon; this was a mistake. There was no manure carted on the soil, as it had been manured in the previous autumn, and ploughed in, a circumstance which did not please me much, but I was so confident in the good effects of the work we had done that I did not mind that.

Fourteen acres were laid down with Champion, 1 acre with Ashleaf Kidney Potatoes, and 1 acre with Carrots. I must here mention that the remainder of the field was also planted with Champion Potatoes. On the trenched ground the foliage could be seen ten or twelve days earlier than on the adjacent field. The rest of the season, any one could see that something extraordinary had taken place, inasmuch as the foliage on the trenched ground was of a much darker green than that of the other part of the field.

In the middle of the month of October, the Potatoes were taken up and weighed, the weight amounting to 125 cwt., or 6 tons 500 lb., the ton reckoned at 2000 lb., or just double the quantity which we have in good seasons, and all sound and fit for table. The Ashleaf Kidneys gave 85 cwt., or 4 tons 560 lb., Prussian weight. The Carrots, which were thinly sown, gave a first-class crop.

It is now five years since the piece of ground in question was trenched, and up to this date, no matter what the weather might be, all sorts of crops have been excellent.

If the ever-recurring destruction of the Potato crop, and the consequent losses and disappointment, be taken into consideration, I can see no other means by which it may be averted, than by loosening the subsoil, leaving the top spit at the top, thereby making the soil capable of absorbing the moisture, and lodging it far below the tubers.

There is no doubt that if this is brought home to the noblemen and gentlemen of Ireland, the phrase "No work" will soon cease to be spoken. Ireland would at once have plenty of remunerative employment for her strong and willing labourers, and the surplus of water which during the last forty-five years has proved to be a curse, may then change to a blessing. I beg to say that bog lands are not included. *Neudeck, March 21, 1892.*

NEW OR NOTEWORTHY PLANTS.

KNIPHOFIA NELSONI, *Mast., sp. nov.**
(See fig. 81.)

THE *Kniphofia* which we have dedicated to its discoverer, Mr. William Nelson, is as attractive as it is distinct. There is nothing like it in the Kew herbarium, and it is new to Mr. Baker, who kindly allowed us to consult his manuscript monograph of the genus, compiled for the South African Flora. The plant is of tufted habit, bearing numerous spreading leaves, each about 18 inches long, and springing from a membranous sheath-like base; the upper portions of the leaf are glabrous, linear, almost like those of *Festuca ovina*, furrowed in the middle of the upper surface, convex beneath, and with three prominent nerves, one central, two lateral. This construction of the leaf suggests that the plant is adapted for a dry atmosphere, the form of the leaf and the small evaporating surface ensuring the plant against excessive evaporation. The erect scape, which is of the thickness of a crow-quill, or thicker, is longer than the leaves, and bears at the top an oblong or cylindrical raceme, about 2 inches long, of numerous densely-crowded, deflexed, brilliant orange-scarlet flowers. The bracts are membranous, 3-nerved, oblong-lanceolate, twice the length of the deflexed, reddish, puberulous pedicel, but very much shorter than the flower-tube. The flowers are about $\frac{1}{4}$ inch in length, tube cylindrical, or slightly distended in the middle, 6-nerved, scarcely contracted at the throat, the limb equally divided into six very short ovate lobes. Stamens hypogynous, all included, three outer ones, half the length of the flower-tube; three inner ones, shorter. Ovary glabrous, ovoid, narrowed near the top, abruptly truncate at the apex, and terminated by a long filiform included style, with an absolutely three-lobed stigma. The floral arrangements testify to the necessity for fertilisation by the agency of insects. In foliage, the plant somewhat resembles *K. triangularis*. *K. ensifolia*, from the Transvaal, and *K. porphyrantha*, from the Orange Free State, are both widely different from our present plant. The mode of growth and the circumstances under which it is found are detailed in the interesting letter from Mr. Nelson in our present issue, entitled *Kniphofias*

at Home. *Kniphof*, after whom the genus was named, was Professor of Botany and Medicine at Erfurt, where he died in 1763. *M. T. M.*

STAPELIA WOODII, *N. E. Br. (n. sp.)*.

In this species the stems are $1\frac{1}{2}$ to 3 inches long, glabrous, green, mottled with purple, 4-angled, the angles with stout ascending teeth, $\frac{1}{4}$ to almost $\frac{1}{2}$ inch long. The cymes are sessile, three or more flowered; the pedicels about 1 inch long, and glabrous; the sepals ovate-lanceolate acuminate, 2 to $2\frac{1}{2}$ lines long, and glabrous. The corolla is $1\frac{1}{2}$ inch in diameter, nearly flat, glabrous on both sides, but strongly rugose on the face, of an uniform dark purple-brown colour, marked with a few yellowish dots, and ciliate on the middle portion of the ovate, shortly acuminate lobes, with vibratile, clavate, dark purple hairs, just the base and apex of the lobes being without cilia. The outer corona of five short, nearly rectangular, horizontally-spreading lobes, emarginate or erose, denticulate at the apex, and of dark purple-brown colour; the inner corona of five ovate-acuminate lobes, horizontally incumbent on the top of the style-column, entire, or with a small tooth on each side, and with a small protuberance on the shoulder of a dark purple-brown colour.

This species was sent to Kew from Natal by Mr. J. M. Wood, the Curator of the Botanic Garden at Durban, after whom I have named it, as a slight acknowledgement of the many interesting plants, both living and dried, he has sent to Kew during the course of several years. It belongs to the section *Podanthes*, but is very distinct from any other species known to me. *N. E. Brown, Herbarium, Kew.*

CYPRIPEDIUM X HYDRECHTSIANUM (*Ed. Vervaeke*).

The upper sepal dull yellow, the base very finely speckled with brown, and shading into black, the centre white at the base, with many and minute specks or spots of pink, with a wide border of pure white, the mid-rib deeper pink than are the spots in the centre, in shape rounded at the edges, and the tip green and hooded. The outer surface is evenly tinged with rosy-lilac. The lower sepal straw-coloured, with two lines of black dots. The petals are of medium size, slightly pendent, ground greenish-yellow for two-thirds of their length, spotted with dark chestnut-brown, rosy-purple towards the tip, which is very wide and spoon-shaped, the upper part delicately wavy, and lightly fringed with creamy-white. The lip coppery-bronze, spotted with brown in the centre and round the orifice. The staminoode rosy-lilac, lightly bordered with pinkish-white, the upper part has two white spots, and the centre is citron-yellow.

It is a hybrid between *C. hirsutissimum* X *C. Spicerianum*. The dorsal sepal resembles that of the latter, the rest of the flower and the foliage show *C. hirsutissimum*. This fine hybrid obtained a Certificate of Merit at the meeting of the Ghent Chambre Syndicale des Horticulteurs Belges et de la Société Royale d'Agriculture et de Botanique, on April 3, 1892. *C. de B.*

KNIPHOFIAS AT HOME.

THE excellent article on this noble genus of plants which appeared in your issue of October 3 last, induces me to make a few remarks thereon. The "Cape Colony" created by your worthy correspondent must have proved eminently attractive; personally, the most gorgeous show of these fine autumnal flowers I ever met with in the old country was at Chatsworth, many years ago; but since these gorgeous effects seem so sensational at home, what shall be said of this grand genus of plants hereabouts, where they are numbered by thousands.

The mountain streamlets and rich alluvial valleys at their base were aglow during October and November—their great months here. Our unprecedented rains of last season seem to have suited these plants exactly, for they appear more at home than I remember to have seen them before, which is clearly indicative of their fondness for water and a generous soil. They delight in our breezy uplands of 7000 feet

* *Kniphofia Nelsoni*, Mast., sp. nov. — *Crespitosa glabra, foliis e basi lata membranacea plurimaria erecto-patentibus linearibus 40–50 cm. long., vix 2 mm. lat., supra sulcatis infra convexis, integris vel obsolete denticulatis, tri nerviis, nervis prominentibus; scapo erecto compresso subapicatis folia superante ad apicem racemum pluriflorum, oblongo cylindrico, 5–6 cm. long. gerente; bracteis membranaceis, 3-nerviis, oblongo-lanceolatis, demum arete reflexis, circa 5 mm. long.; pediculis bracteis dimidio brevioribus; floribus, acutis, cuneatis deflexis, sing. 25–30 mm. long., medio, 3 mm. lat., luteo rubro-aureatis, tubo fusiformi-cylindrico, 6-nerviis, ad faucem vix angustato, limbo breviter, aequaliter 6-lobis lobis late ovatis acutis; staminibus 6-hypogynis biserialibus inclusis, 3 externis perianthii tubo dimidio brevioribus, 3 internis parum brevioribus; ovario glabro oblongo, ovoides-superne truncato stylo longo inclusis supero angustato stigmate trilobis, acutis, fructu a me non visto. In ditto "Orange Free State," et Nelson lecta. *M. T. M.**

above the sea-level, and attain to their greatest magnificence in the deep alluvial, unctuous valleys, where the ground is constantly moist, yet well-drained. Many forms occur, some with erect, handsome foliage, and grand bloom-spike, of some 6 feet in altitude; others much resemble a Pine-apple in style of growth, while some are dwarf in character; broad, narrow, and glaucous-leaved forms all occur, in addition to early and late-blooming varieties. It requires but a slight stretch of the imagination to believe many of these forms to be of natural hybrids in all the variations and gradations met with hereabouts. Nothing could seem happier than these hybrid forms, which produce a stately effect, most decidedly their own. Though I have travelled over thousands of miles of South Africa, I never met with this genus so fine as hereabouts—the conquered territory of the Orange Free State—which is essentially their home.

A creamy-white species, that occurs sparingly in Natal, and far in the interior, where the climatic conditions are warmer, does not occur here, which is an exception to the rule; this only grows in hot, moist, valleys, and, I imagine, would at least require some protection at home in winter, whilst any forms growing hereabouts would be quite hardy.

I have deferred sending you this article until I could procure a specimen for your inspection, to accompany it, of a lovely dwarf species that blooms this month (February), and is now at its best. I therefore, enclose a couple of specimens of it. It is new to me, and I regret that it will, at least, lose its colour ere it reaches you. This is a very elegant miniature species with a quaint quiet beauty all its own; it reaches 12 to 18 inches in altitude, has but very slight grass-like leaves, never makes a clump, always grows in single crowns, with never more than one solitary bloom-spike. The flowers are of a rich scarlet colour with a very slight trace of orange, no yellow whatever about it, is uniform in colour, both in exposed and protected sides of the florets, which are uniformly cylindrical, and neither constricted near the base, nor dilated near the mouth, so usual in the large-growing species, and the limb is distinctly six-lobed; this is very rare, and bears no comparison to the forms mentioned above. I met with but a few of this species, which has its own locality, and is peculiar in selecting a position where the sunshine intrudeth not. (See description on p. 554 and fig. 81.) The circumstance that it never makes a stool, and its fondness for shade, distinguish it as quite unlike the other kinds in these respects. To find this plant when not in bloom is simply an impossibility, but when in season its inflorescence draws one as though by magnetic attraction, as its exceedingly chaste and slightly orange-scarlet flowers are unusually attractive. Perhaps it may prove to be the long lost *K. pumila*, though Paxton describes this species as orange, whilst the one under notice is almost entirely scarlet. *W. Nelson, Ficksburg, Orange Free State, South Africa.* [Since writing this letter, Mr. Nelson has removed to Booyesen's, Johannesburg, Transvaal. En.]

BELGIUM.

THE ROYAL CONSERVATORIES AT LACKEN.

SINCE the Royal conservatories have been opened to the Belgian public by King Leopold II. on certain specified days, as many as 15,000 visitors have been admitted altogether, being an average of 5000 or 6000 a day. These figures speak for themselves. We have been permitted, by the kindness of Mr. H. Knight, the Director of the Royal Parks and Gardens, to visit the hot-houses at Lacken, for the purpose of publishing some account of them in the *Gardeners' Chronicle*. We may divide the houses into two divisions—the first, those open to the public; the second, those reserved for propagating purposes.

First Group.—The public is first admitted into the entrance-hall, which overlooks the park; on the side next the light is a stage covered with flowering plants. In the distance may be seen the

many workmen employed in building a new chapel. This is to be octagonal, and in the angles will be circular rooms, opening into the centre; all the roof will be glazed. In the eight circular side rooms, ornamental plants will be arranged, and flowers on *fête* days. Thus, it will be both a church and a conservatory.

From the entrance-hall the visitor enters a gallery leading to a Palm-house, very ornamental in appearance, where most of the plants are planted out and effectively grouped. We cannot enter into details of architectural construction, nor of the electric light used in all the houses, but will pass on to the plants. Amongst others, we saw *Pandanus utilis* with trunks 5 to 6½ feet high; *Attalea speciosa*, from Brazil, with leaves 24 feet long; *Cycas circinalis*, with a trunk 13 feet high; *Caryota urens*, with fine fronds 16 to 20 feet long; a not less fine *C. furfuracea*; a fine Traveller's Tree, *Ravenala madagascariensis*, or *Urania speciosa*; an unusual and probably unique specimen of *Pritchardia pacifica*, a very fine *Kentia Lindenii*, a sturdy sample of *Brownea grandiceps*, &c. A glass gallery leads to the Azalea-house. On both sides of this gallery flowering plants are arranged; among others, fine single and double *Cinerarias*, and well-grown *Pelargonium inquinans*. The double *Cinerarias* were raised in the royal grounds; many are remarkably good.

The Azalea-house is of great size. If the specimens are well-flowered, the choice of varieties leaves something to be desired; the collection must be constantly replaced to keep it in full beauty. In this house, besides *Primula obconica*, which is effective because so profusely in bloom, we saw charming varieties of *Aquilegia chrysantha*, raised from seed from an English variety. These pretty flowers will, doubtless, be soon very popular. The standard *Roses* were in full bloom, and the scent delicious.

We next enter another gallery (the lengths of all these galleries combined reach 3900 feet), where we admire a floral arch and a perfect bower of plants. The climbing plants, which form the arch and border the walls, hang down in graceful profusion, all growing in the common earth of the country; Mr. Knight explains the secret of his success in the circumstance that he uses Thomson's improved Vine and plant Manure, which is composed of the refuse of the slaughter-house dried and ground; this spread over the soil renders it permeable, and when diluted by watering, gives the plants the nutrient necessary, especially where free air is withheld from them. *Fuchsias*, zonal *Pelargoniums*, *Heliotropes*, *Genistas*, and other common plants succeed well all along the gallery. Climbing and trailing plants, such as *Jasminum grandiflorum*, *Akebia quinata*, *Bignonia capreolata*, *Passiflora*, *Tropæolum*, *Rhodochiton volubile*, *Tecoma capensis*, *Cantua dependens*, *Abutilon tricolor*, *Pelargonium hederæfolium*, *Lardizabala biternata*, *Clianthus Dampieri*, &c., are among the many flowers which, shaded with verdure, decorate this gallery. To the right is a Laurel house containing a statue of Diann, beyond this another gallery (there is no monotony felt, for all are differently arranged), in which are many fine plants of *Genista*, a large *Banksian* Rose covered with double white flowers, standard *Roses*, and lastly, an avenue of *Roses*, against a background of herbaceous *Ferns*; while against the wall, which is concealed by *Ficus repens*, a large gallery, with a fine staircase, leads to the celebrated winter garden.

On entering the Congo-house, which we hope will some day contain specimens of the flora of the Congo, we see fine *Palms* rising from a carpet of *Selaginellas* and *Tradescantias*. The *Palms* are *Latania borbonica*, *Chamærops humilis*, *Kentia*, *Livistona australis*, *Phoenix sylvestris*, &c. The winter garden is shaded by a large blind in the centre; it contains *Palms*, which are wonderful, and perhaps unique in Europe. The *Phoenix sylvestris*, with four stems, are fine specimens; and there are *Latania borbonica*, nearly 80 feet high; *Kentia sapida*, in full bloom; *Caryota elegans* about 80 feet

high, and bearing a fine cluster of fruit about 5 feet long; *Livistona australis*, with a splendid trunk, and hundreds of leaves; *Caryota Rumphii*, with a trunk over 2 feet thick; a fine *Aralia dactylifera*, 32 feet high; *Tree-Ferns* rising from a carpet of *Selaginella*; *Brugmansia Knightii*, flowering well, and many other interesting plants. Almost all are in ground heavily manured with Thomson's Manure, and are doing well. It is unfortunate that the electric light is, as at present managed, somewhat injurious to them. There is yet another house containing many fine *Camellias*, not now in bloom, and a large orangery with a *salle de fêtes* adjoining.

The Second Group of Houses.—These are reserved for the propagation of plants for the decoration of the other houses; here are grown pretty and well-coloured *Calceolarias*, *Sonerilas*, *Bertolonias*, *Nepenthes* (well-grown), *Stephanotis floribunda*, a pretty strain of *Mimulus* and of *Anthuriums*. The *Orchid-house* shows careful cultivation, by the health of all the plants. We saw good forms of *Lycaste Skinneri*, *Phalænopsis Schilleriana*, very fine; a slender *Cypripedium Boxalli atratum*, and a well-bloomed *Anellia africana*. There are also excellent varieties of *Vanda tricolor aurea*, and a dozen fine specimens of *V. suavis*, each with four large trusses of splendid flowers. A large house is devoted to *Roses*, containing specimens of all the best varieties. *Ch. De Bosschere*.

A TRAVELLER'S NOTES.

(Continued from p. 428.)

BARODA.

December 4.—The public park of Baroda was chiefly laid out in Mr. Woodrow's time, Mr. Henry's immediate predecessor. Though undoubtedly too much space has been devoted to roads, it is prettily and effectively laid out for the enjoyment of the people. The roads and paths are well kept, and in good condition; the main roads are 25 feet wide, the secondary ones being only from 8 to 10 feet. The park, bounded on one side by one of the main roads of Baroda, and on another by the Vishwamintre River, is almost flat, and entirely under grass, except where buildings stand, or roads have been constructed. The river, in addition to bounding one side, meanders through high banks, and passes along the entire length of the park. In going from one end to the other, one might cross it four times. The park is about 100 acres in extent.

One enters through handsome iron gates supported on either side by stone pillars. On the left under a group of trees is the keeper's lodge, whilst next to the rails on the right is a narrow border planted at intervals with young *Cocon-nuts* (*C. nucifera*), some 20 feet high, with handsome leaves springing from the base and upwards, often 12 feet long; whilst in the border beneath may be seen *Russelia grandiflora* in flower, a pretty little shrub, the long shoots of which are covered at the tips for about 18 inches, with small brilliantly-coloured scarlet flowers—its one fault is, perhaps, its somewhat straggling habit. The stonework supporting the palings is hidden by variegated *Eranthemums* and *Acalyphas*—chiefly *musica*. On the opposite side of this walk are oblong beds filled with various plants, such as *Clives*, now out of flower (the leaves of these look much drawn); Mr. Henry finds that they require shade for successful culture, also *Gaillardias* and *Tagetes signata*. One bed in particular attracted my attention—it contained a very pretty species of *Aster*, dwarf and neat, much resembling *Amellus*.

At the end of this path one comes to the river at the point where it is crossed by a handsome single-arch stone bridge (an engraving of which was recently in the *Gardeners' Chronicle*), (Oct. 3, 1891). On the same bank, but at the further side of the bridge was the first piece of *Ipomœa carnea* in full flower it has yet been my privilege to see. This plant now flowering freely here, though a native of South America, is most common, and seems to adapt itself either as a climber or a moderate-sized shrub. Its

large *Convolvulus*-like flowers of a pale purplish rose are produced in profusion—and though perhaps in England we might call it somewhat washy, it is undoubtedly one of the most effective objects to be seen in Baroda at this season. The purple heads of *Gomphrena globosa* stood out well against the white stone parapets of the bridge; this plant is a weed here.

Starting from this point along the river bank, and passing at the end of the walk, two stumps clothed with *Ipomoea sempervirens*, its pretty palmate leaves and small white flowers faintly tinged with lilac hanging gracefully on all sides of its support, one again comes into the main road leading in a direct line to the white stone pavilion, the only spot in the park that is the private property of the Gaekwar. Between the gate and this pavilion is an exceedingly pretty viaduct or bridge. High arches of *Bougainvillea splendens* or *spectabilis*, covered with flowers, are passed through at each end. The stems are often 3 inches in diameter. The parapets of this white stone viaduct and the pavilion beyond, together with the innumerable brilliantly coloured purple bracts on the shoots of this *Bougainvillea*, often several feet long, in the full tropical sun, produce an effect I should imagine difficult to equal. Many plants of this *Bougainvillea* are scattered about the park and elsewhere. *B. lateritia*, with its brick-coloured flowers is also to be seen.

At the end of this small viaduct, the road divides into three. The one to the right, facing almost due south, has on one side a nice row of Bamboos, chiefly *B. tulda*, and *Casuarina glauca*. Besides *B. tulda*, common in Bengal and used for almost innumerable economic purposes, a variety with greyish stems and large brown hirsute bracts, has also been planted here. The number of Bamboo species is so great that to venture on specific naming is dangerous. The delicate Pinus-like foliage of the *Casuarina* alternating with the long sub-pendulous shoots of the Bamboos gives a charming effect. In the centre road, as already stated, 25 feet wide, a huge Mango, the branches of which are intertwined with *Bougainvillea spectabilis*, catches the eye, whilst a fine specimen of *Tamarindus indica* (the *Tamarind*) is close by. These two trees, together with *Cassia sumatrana*, are those which abound most in the park.

Shortly before reaching the large grass-plot in front of the pavilion, and at a junction with a cross road, is a large oval bed, the prevailing plant being *Ruellia jucea*, about 2 feet high. Its delicate grass-like foliage and scarlet tubular flowers form pretty objects with a background of *Acalyphas* and other shrubs.

A huge circle of grass entirely encircled by the roadway, with a tall *Thuja orientalis stricta* (the only *Conifer* growing in the park) in the centre, and laid out with small beds filled with dwarf plants of an herbaceous description, is immediately in front of one of the four entrances to the pavilion. The grass is very good, and is carefully watered. Its ordinary name is Doob-grass, the *Cynodon dactylifera*, or *Cynodon Dactylon* of science; it is thick, soft, and not coarse. Mr. Goldring has used it in all his work. The beds are filled with small *Nasturtiums*, just planted from the seed-beds, *Calliopsis*, *Ageratum*, &c. I have also noticed in other parts *Angolonia salicariaefolia*; it is a dwarf plant some 18 inches high, with long terminal racemes of purplish flowers. Vines, both red and white, usually a bed of a kind, are also to be seen, as is also (*Enothera Drummondii*, producing its yellow flowers freely. In the centre of some of these beds are Mexican *Agaves* or *Crinum*, whilst in every case there is an edging of *Alternanthera*, unfortunately but poorly coloured.

In one of the angles of the pavilion, *Tabernaemontana coronaria* has been planted, and has formed thick bushes 4 to 6 feet high, in splendid condition. A few flowers were scattered about, but it is not seen in perfection till later. It requires a considerable amount of water, and is much sought after by the natives on account of its scent. In one of the beds near here a *Clerodendron* in flower attracted my attention. Mr. Henr. considers it one of the best

shrubs he has. The individual flowers are not large, but the heads of bloom of moderate size are so numerous as to make it worth planting. In colour it is white. This species, *C. aculeatum*, as well as other *Clerodendrons*, are most useful for ordinary landscape purposes, being sufficiently showy to create a feature, and enduring a continued drought admirably. It is also said that cattle will not touch its bitter thorny shoots; it is hence useful for hedges. *Grevillea robusta* is scattered about, and seems to thrive. At present there are none much over 15 feet. Its foliage is of a darker tint than in Ceylon, possibly because it does not grow so quickly. *Terminalia Catappa*, a handsome and ornamental tree, the bark and leaves of which yield a pigment with which the natives dye their teeth black, and from which they also make Indian ink in some parts. The Country Almond, a specimen of which is near this spot, is a distinct-looking plant; it has large, broad, obovate foliage, much like a North American *Magnolia*, dark green in colour, often tinged with red. The seed is large, resembling an Almond. *J. H. Veitch.*

(To be continued.)

PITHECOLOBIUM SAMAN.

We are indebted to Mr. James H. Veitch, whose letters in the course of his Indian travels are appearing in our columns, for the opportunity of illustrating a branch of the Rain Tree (*Pithecolobium Saman*, fig. 81), showing in the right-hand figure the leaves expanded in the sunlight, and in the other, when folded and bent downwards at night. The tree is a native of Venezuela and the Amazon district of South America, but has been introduced largely through the medium of Kew to most tropical countries as a shade-tree. It is a lofty tree, resembling an Oak, producing an abundance of foliage, which affords most grateful shade; while the pods, filled with sugary pulp, are very valuable as cattle-food. The growth of the tree is rapid, but the timber is not greatly valued.

HOW DID TRUMPET DAFFODILS COME TO IRELAND?

It has often appeared desirable to ask your numerous readers—particularly such as are given to historical research—whether any information can be given as to how Ireland got its single Trumpet Daffodils in such quantity. We have no evidence that similar fine sorts, except one or two, can be traced to England, outside the operations of Herbert, Backhouse, Leeds, Nelson, and some others. The chief varieties I refer to as having been discovered in this country since the Daffodil Conference of 1884—Ireland not even then being suspected of possessing any—are as follows: *Arde-Righ*, the earliest of all large Trumpet Daffodils; *Countess of Annesley*, *Princesse*, *Golden Plover*, and *Sunbeam*, which is a yellow-foliated variety of the latter; *Androcles*, *Goldfinder*, and some others, none of which can be traced to England, and, from a commercial point of view, none more useful for forcing, unless the Tenby and Sir Watkin, both English introductions.

I purposely exclude all garden varieties, as *Horsfield*, *Emperor*, *Empress*, &c., and simply place England against Ireland on the merits as channels of supply for export. The wild *Pseudo-Narcissus* of English coasts to be found in large quantity in England, strange to say, cannot be found in Ireland. [We have it from Belfast. Ed.] As a commercial flower it is worthless, dying out, under garden cultivation. We have no other variety traceable to wild origin except *rugilobus* and *maximus* outside the British Isles—I mean varieties grown for market. As for all the various sorts introduced from Spain and Portugal, except perhaps *Maw's Bicolor*, they are simply of no use; and yet lots of money have been wasted on them. Their collection affords very healthy exercise for the explorer and enthusiast more or less, but in the end they are not sufficiently remunerative. I believe I have got N.

maximus and true *N. nobilis* from their native sources, and *N. princeps* can be traced to Italy; but where are we to seek for the origin of *Arde-Righ*, *Countess of Annesley*, *Golden Plover*, &c., shall I include the Tenby Daffodil, as this can also be traced to the county of Wexford, on the opposite coast to Tenby. I submit that we have not discovered the original source of these varieties, and Ireland certainly holds the field for quantity as regards commercial Daffodils. Mr. Barr and Mr. Ware will acknowledge the truth of this, and may be enabled to throw some light on the subject. Surely these particular varieties were not dropped exclusively from the sky on to Ireland and not on England, in a pre-historic age. Were they not rather brought from the east and south in the wallets of the ancient Christian pilgrims? If so, was not England civilised simultaneously with this country? Or is it merely an instance of the "survival in the fittest?"

Soil and climate will in part, I suppose, solve the mystery of their continuance in the flora of Ireland. The land at *Arde-Cairn*, a deep rich loam, overlies the limestone, and this soil I have caused to be analysed, the results of which I will give if your readers wish it. I have also had a clump of the *Arde-Righ* Daffodil reduced to ashes, foliage and bulbs, so as to get at what it takes from the soil, this is also at your disposal if you wish. [Yes, please.]

The first time that I re-discovered that beautiful white trumpet Daffodil, *Bishop Mann*, it was in a border which for over a century had been undisturbed, and where Beech trees probably 150 years old grew. I had to let some of the bulbs remain in the crevices of the roots of the Ash and the Beech trees. They are still in the same place, and no one could get them without destroying the trees. I think pasture grass, same as tree roots, takes from the soil the impurities that cause disease in Daffodils, and I shall be happy to hear something on this matter. *Wm. Baylor Hartland, Arde-Cairn, Cork.*

FOREIGN CORRESPONDENCE.

CALIFORNIA AS A HOME.

I MUST say I was astonished to receive one bunch of letters after another with every overland mail arriving ever since I wrote the article headed as above in the columns of your journal; they all related one way or another to the matter I had spoken about, and pretty nearly everyone expressed his view about the difficulty with which a gardener can make his way in the old country. It is impossible to answer these letters other than through the columns of this paper (especially those without sufficient postage).

I put everything needful to know about this State into my previous communication, and I repeat, there is place for thousands in this State. But while I advise all those dissatisfied with their surroundings, and yet anxious to make their way, to try their luck in this Golden West, I cannot reach a helping hand to any one. I have been in this State only five years, but have not only found suitable employment, a happy home, and social position, but also a bright future so far as human supposition goes. Why should not others be just as successful?

The position a gardener takes, be it in England or Europe, is a poor one until he climbs a little up the ladder of success, which only one out of five is apt to do. What to do for the rest? I have lost quite a number of dear friends partly in the murderous climate of Africa in employment for the most doubtful colonial undertakings, partly as travellers in search of one plant or another. If they are not dead, they are sure to be put back in their health or ruined for good. I therefore thought it to be a kind measure on my side to draw the attention to this State. I for myself have seen good and bad days, and I must say that in looking back upon the past, I believe it to be a necessity for a man to undergo times a little harder than they face us near home and under the

protection of the paternal purse. I remember the days when I hauled manure for pretty nearly three months in succession through the streets of San Francisco, and how the boys in the stable used to exclaim when beholding me, "Ah, there is the fellow with the golden specks." I had many a laugh, and laugh yet. It did me good to be looked down upon; though a gardener's position is where he has to do stable work, it does him good for a time, provided he does not lose his opportunity.

The position of a gardener is not very different, no matter which country he chooses for a living. I felt that all along, and hastened to better myself. Here is a country where a person can do so. But it would be wrong to believe that positions are open in this State no matter where you apply. A gardener gets about 20 dols. and all found to begin with (per month), in the east only 12 to 15 dols. But any labourer gets more here than in any other country. Then, again, if a person considers the

But it would be foolish for anybody to buy land from agents going about England or anywhere else, unless a person is acquainted with them as friends, and knows for certain that whatever they represent is true. All I can advise is, try for yourself, and if you are in earnest you are sure to succeed better than you can do, as a rule, in the old country. Soft jobs are scarce things in this country, but I have not seen a person yet who minded working hard if he saw the way to success.

Labelling in Botanical Gardens, &c.—Having had some experience with labelling trees, and having seen only too often how much trouble some gardens seem to have in providing a proper labelling, I propose to give you my way. Take the wood of trees found not to be attacked by ants and other insects, and which will resist rot in the ground. We take the Cedar (*Lihocedrus decurrens*) or Redwood (*Sequoia sempervirens*), either of which will resist rotting for thirty years. I have it cut into 3-inch strips,

botanical gardens, or any plantation set out in rows under your charge, take a little trouble in numbering your labels; thus, for instance—

II. means that your label belongs to the second row, and 14 is the fourteenth plant; Late Crawford, the name of your Peach, or whatever is in the place. If you proceed thus, you, or even your most humble working-man, will be able to stake the label right, if through some reason or other it should have been misplaced. The bevelling of the top will prevent splitting to a great extent while you drive the label with a wooden hammer. *Geo. Hansen, California.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

THE BEET-ROOT.—The seed for the main crop of Beet-roots should now be sown. After the seed has been sown in the drills—15 to 18 inches apart—some clean light sifted soil should be scattered along them, or thrown broadcast over the beds. If possible, a border thoroughly exposed to the sun, and which was manured for some other crop last year, should be chosen for Beet-roots; the wider distance between the rows should be adopted for large-growing roots only. I have in some years past grown the Cheltenham Green-top Beet-root, and it is one that requires space and a poorish soil, so as to avoid having coarseness of flesh. For a late supply, none is better than Dell's Crimson, a small long-keeping variety—useful when Beet root is wanted late in the season.

SALSAFY AND SCORZONERA.—Seeds of both of these roots may now be sown in deep, well-worked, rich soil, but one not recently manured, or roots will be badly forked. In a very light soil, they should not be sown before May 10, as they soon grow, and if sown too early, very often half the crop runs. In dry weather, it is advisable to water the drill before sowing. The rows should be 18 inches apart, and the plants thinned to half that distance, or less. The so-called Sandwich Island Salsafy is a good variety, and larger than the older varieties. If only one of these vegetables is grown, the last-named should have the preference. Chicory should likewise be sown, if large roots are required; I find it best to make two sowings—a small one at this date, and another a month later, as in my light soil much of that which is early sown runs to seed. Chicory requires similar treatment to Salsafy, and the roots stored for winter use. The tops, being valuable for salad when forced, should not be cut off close. The Witloef is a superior kind of Chicory, larger rooted than the common one, and is a good winter vegetable, as well as a salad plant, when the leaves are forced in darkness.

WINTER BROCCOLI should now be sown, and as their ability to withstand frost depends upon the sturdiness of their growth, seed should be thinly sown on poorish soil, and for late crops the plants are more hardy if pricked off. I sometimes find a difficulty in getting vacant plots for this crop when the plants are ready for planting, but when they are pricked out they do not suffer much. One of the very best varieties for the latest supply before Cauliflowers come in, in June, is Veitch's Model, a dwarf, very hardy, and compact-growing variety, the head well protected by foliage. It succeeds Catell's Eclipse, Gilbert's Late White, Sander's Late, and Ledsham's Latest, all of which are good.

BRUSSELS SPROUTS.—Those sown and raised in frames will be good plants at this date, and may be planted out on a rich soil deeply dug. I like to have deep drills drawn for this crop, the drills protecting the plants somewhat from the wind, and in dry weather retaining the moisture from the waterings. Care should be taken when lifting the plants to preserve the roots intact and balls of earth with them, the planting being performed with the trowel, making soil close up to the lower leaves firm about the plants. If Paris Market or a dwarf-growing variety is used for the earliest crop, these may be planted in rows 2 by 2½ feet apart, and tall growers 3 feet apart. There is no necessity to prick out the later varieties of Brussels Sprouts if the seed be sown

FIG 81.—PITHECOLOBUM SAMAN, THE RAIN TREE. (SEE P. 556)

favourable climate, as I described it in my previous communication, he can see himself, that California is or will be a garden from one end to the other ere long, and that there is a very poor market for pot plants or the like, when everybody is able to grow himself all he requires for his place. Nothing freezes in winter time, and cut flowers are cheap because they are produced in such abundance. There is another field through which anybody can cultivate and be independent from the first crop, the seed growing. There is no harvest spoiled or influenced through wet autumns, and moisture depends upon your irrigating from the middle of May until November. No more favourable conditions could be asked for. Then, again, does not every little place require some kind of a florist, landscape gardener and fruit tree raiser? Hundreds of towns are rising up everywhere, and whoever settles first has the best chance. And the fruit growing industry, as I said before, is such a promising one, that there is a chance for every man who tries a little hard. It is the easiest way to set up for an independent living and a sure way to success, provided a person understands a little about it himself and sticks to it.

picking out, of course, only the clear lumber. Width 3 inches, thickness 1 inch. I plane it all round, taking care to surface the edges, and bevelling the top a trifle; the bottom is pointed by the saw, and edged by the plane. One side (the one for writing) is more carefully planed than the back. I then set the labels into a solution of blue-stone (sulphate of copper) in water for about three weeks, but take care that the solution does not rise any too high where I intend writing; it will always show through the colour, and make your work unsightly. Winter evenings or rainy days afford opportunities for writing the stake. The cost of white lead must not be too thick, and do not paint too many at a time—not more than you can write—before they get dry. Write with a soft pencil into the colour down to the very wood, and make your work neat and proportionate. After the labels are written, let them dry well before handling, so as not to rub out the minute lines. After drying, give each a good coat of varnish—two if you can afford it; and rest assured you have got as good and cheap a label as any gardener might wish to possess.

Another point. If you have plantations like

thinly. If a very late crop is desired, take the small plants from the latest sowing and plant them on a north border.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Mereworth Castle, Maidstone.*

FRUIT TREE BORDERS.—These should be examined, and if found to be dry, copiously watered forthwith with water that has been exposed to the air for some time. The surface should be pricked over previous to applying the water. At this season, and more especially where glass coping or heavy canvas blinds are made use of to protect the blossom of wall trees of all kinds, the soil is very apt to get dry, the tree suffering in consequence. All bearing trees, particularly if the borders are well drained, should receive a mulching of manure; but in the case of heavy soil, or trees inclining to gross growth, this mulching need not be applied till June or July. All large, late transplanted trees must be occasionally well supplied with water both overhead and at the roots, mulching them with decayed strawy manure—never fresh manure; this mulch being used expressly for keeping the soil moist, and in no way to feed the trees, need not be rich in manurial constituents.

APRICOTS.—These trees should be partially disbudded, by taking some of the young side-shoots and the forerights, or those growing at right angles to the face of the wall, and others should be pinched at the third or fourth joints, so as to induce the formation of bloom-bearing spurs. The fan is the usual mode of training employed for this fruit, the branches which die off being then more readily replaced by others which may have been reserved, or which may be induced to grow to that end. Should much fruit have set in clusters, some of these may now be thinned off, and also all fruits so situated that they cannot develop properly. If the trees are old and full of fruit, as old trees are apt to be, a sprinkling of the soil over the roots with guano or some other approved artificial manure, slightly pricking the same into the soil, and watering it will prove very beneficial to the trees.

SWEET CHERRIES.—The course of treatment in regard to training, &c., is similar to that pursued with the Apricot, bearing in mind the need for keeping them supplied with plenty of young fruitful wood in case the large branches should die. The leading shoots of branches should be laid-in betimes, before their points are injured by the wind blowing them against the wall, and in driving nails into the wall, observe carefully not to strike or otherwise damage the tender bark—nor should the latter come in contact with wire. Early varieties which were in full bloom during the recent severe frost, may have many blackened blooms, but those that were not expanded may yet be safe and strong.

CHERRIES in orchards under turf should have the herbage eaten off by cattle, so as to keep it short; sheep may also be turned out and fed with a little oil-cake, this will greatly benefit the trees.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

ROSES: WATERING AND SYRINGING THE TREES.—Owing to the dry weather, which has prevailed for the last two months, all Rose standards, bushes, &c., especially those in beds and in light soils, should be well watered at the roots, and the watering should be repeated according as the soil is light or heavy, if the weather continues dry. Examine all the more forward Roses on walls and trellises, and if aphid be present syringe them after the sun has gone down with weak tobacco-water, that is, four gallons of water to one quart of tobacco-water. This wash will dislodge the aphid, and render the leaves distasteful to aphid for some time afterwards. If the aphid is not destroyed thus, it is more difficult to deal with. Tobacco powder dusted over the shoots infested with fly while the bark and leaves are damp with rain or dew, washing the trees the following day with clean water, serves the same purpose. For trees growing against or close by dwelling-houses, the latter remedy is preferable, as it leaves no unpleasant odour behind it. The Rose-maggot works havoc among the leaves and flower-buds of Roses if it be not well-searched for. They may be found rolled up in the leaves, which must be unfolded, and the maggots killed, but where time does not permit of this being done, the latter should be killed by squeezing it.

Keep the suckers that spring from roots of Rose stocks persistently removed.

HARDY FERNERIES.—Clear away any leaves that may have accumulated in and about the Ferns, pull up all weeds, and cut off the dead fronds of the Ferns. Thin out plants of Ivy and Periwinkle, or other trailing plants employed as a groundwork to the Ferns, so as to allow the fronds now pushing up space for development. These trailers, it may here be remarked, should be thinned-out several times during the summer and autumn.

WATERING SEEDS, ETC.—Recently-sown seeds of annuals and grasses should be watered three or four times a week if the weather be still dry. This attention to watering such things is especially necessary on light soils. Late-planted trees and shrubs, and turf recently laid, require attention in the matter of watering.

RENOVATING LAWNS, ETC.—It is not yet too late to improve an impoverished lawn by top-dressing it with a mixture of sifted soil and leaf-mould. To an ordinary size garden-barrowful of which mixture a 6-inch potful of Thomson's Vine and Plant Manure, or some other artificial manure, may be added with advantage. A little of this mixture scattered over newly-turfed ground, and then brushed well over it so as to fill the interstices, will amply repay the trouble of doing it. Bare patches of lawn should be sown with fine grass seeds, slightly covered with leafy soil, and then rolled. Wood-ashes mixed with leaf-soil and a little soot, all finely sifted, and used in the proportion advised for artificial manure, make a good lawn-improver. Where turf has been cut in the home park or pastures, the space thus laid bare should be made good with soil, raked level, and trodden firm, sown with good grass seed, and then rolled. If the land is grazed, hurdles should be put around the place.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

DENDROBIUMS.—Many of the species of Dendrobium having already flowered are forming their new pseudobulbs, and upon the proper growth of these will depend the quantity and quality of the flowers another year, therefore the present time is an important one for them. The new growths of *D. Wardianum*, *D. Ainsworthii*, and others, which flowered early, will have reached a good height, and be freely forming roots, and require that watering the plants, and sprinkling the path, floor, and bare surfaces generally, should receive regular attention; but I would again remark, that if manure be applied, it should be with great caution, and if it be of an artificial kind, some knowledge should be obtained as to the proper and safe strength at which to use a solution of it. For my part, I prefer a manure made from cow or sheep-dung, the strength of which can be easily gauged, and with which plants can be treated to a weak mixture without fear of doing harm. As a general rule, the potting compost for Dendrobiums must not be allowed to get too dry, but the plants carefully inspected daily, affording water where the moss is whitish. A genial moist growing atmosphere must be maintained, and a temperature of 65° to 70° by night, and from 80° to 85° with sunbat by day. If red-spider should show itself, which it will do, on the under-surface of the young leaves, causing a whitish appearance on the same, the sponge and soapy-water must be brought into use. Dendrobium heterocarpum is rather liable to be infested with this insect, and needs careful watching accordingly. On bright days, and especially later when the young growths are further advanced, and when the danger from damping-off is less, overhead syringing with tepid soft water, will be found very beneficial to Dendrobiums, but for the present a good deal of discretion is needed in this respect, the young growths of some species being very tender, especially the *D. superbum* (macrophyllum) section, and *D. Bensoni*, which is now in flower. Indeed, the latter is liable to lose its growths in this way when those are nearly matured, and it is not safe at any time to let water lodge in the young growths; indeed, both of the last-named species must be watered very carefully for some time to come, being kept on the dry side, and stood in the lightest and warmest part of the house. The same may be said of *D. Parishii*, a species which will soon be in flower, as will *D. aggregatum majus*, *D. Jenkensis*, and *D. Falconeri*. These last-named three species should be grown on Teak blocks or rafts, and *D. Falconeri* copiously

syringed, although when its growths are mature, it may be rested in the cool division. *D. crystallinum* is another species that flowers late, and it is very pretty. *D. Phalaenopsis*, *D. Digibum*, and other species from Torres Straits, should occupy a place where they get plenty of light and heat; in fact, few species of Dendrobium are heat-loving plants whilst growing, but a few, however, do not require so much warmth as others, and these come chiefly from the eastern coast of Australia, viz., *D. speciosum* and *D. Kingianum*, and *D. Jamesianum* and *D. infundibulum* from the mountains of Moulmein—these may be grown in a cool-house. A few grow well in the intermediate house, the names of which will be found in my Calendar for February 8. The propagation of Dendrobiums is easy, but it is not practised so much as would be the case if many of the most beautiful varieties were not imported in such large quantities, and the low prices at which strong plants can be purchased. The somewhat slow method of propagation is superfluous under these circumstances, unless it be that of some extraordinarily good variety or of a garden hybrid; and when it is desired to raise a stock of these, the old pseudobulbs, which it is supposed may be cut away without injury to the plant, may be laid on sphagnum moss, and from these young growths will appear, which will form healthy young pseudobulbs in due time. I have already described my method of re-potting, and given the most suitable season for the same, which is directly the plant has passed out of bloom. Re-potting, it may be remarked, checks the growth of Orchids a little, but it is a necessary evil, and must be done sometimes, though if the compost consist of the best materials, it need not be done so often as is sometimes supposed necessary. The one main point is to have the materials in which Dendrobiums are grown not too much decayed, or the roots will not enter it, and the consequence is that the new growth is weak. If fibrous peat of good quality is not at hand, it is better to employ sphagnum moss alone.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

HUMEA ELEGANS.—Seeds of this beautiful plant may now be sown, so that well-established plants may winter well. Those plants raised last year, and wintered in 6-inch pots, should now be repotted into others three sizes larger, for if they are cramped for root-space, the lower leaves are apt to be lost, which is always a disfigurement in *Humea elegans*, and must be carefully guarded against. It is a plant which always meets with admiration, and is excellent for indoor decoration, or for placing in the conservatory. It has a good effect as a lawn plant standing in ornamental pots, or in ordinary pots sunk to the rims in the soil. Green-fly is partial to the plant, and should never be allowed to infest the foliage, or it will be quickly destroyed, or, at the least, much disfigured. A rich sandy compost and firm potting, not burying the stem in the soil, are essential.

IVY-LEAVED PELARGONIUMS.—The improvement which has been made in *Pelargonium patatum* is such, that at the present time the plants rank amongst the handsomest soft-wooded plants of the greenhouse. The colours of the flowers are distinct and good, and the trusses larger than formerly, and single and double-flowered varieties should be grown. The double-flowered varieties are, perhaps, not so graceful as the others, but when the flowers of the former are cut from the plants, they last much longer. The plants may be trained, if in pots, to small sticks inserted just inside the rim of the pots, or loosely to trellises; they are also capital for baskets, or planted out in well-made borders for covering the end, side, or part of the roof of an intermediate or cool greenhouse. Old plants which are pot-bound will require re-potting into larger pots, in a compost consisting of turfy loam two parts, one of decayed manure, and sharp sand. Pot them evenly, and do not water overmuch before the roots have penetrated the fresh soil. Pinch out the ends of the leading shoots when growth commences, and till a sufficient number of lateral shoots are formed to furnish them well.

FUCHSIAS.—These plants should be encouraged to make free growth, and any which may stand in need of re-potting should be attended to forthwith, affording liberal shifts, using a rich compost, and at the same time potting the plants with moderate firmness. Stop the leading shoots as they push out to a length of 3 or 4 inches, and

also the leader occasionally, so as to get the necessary number of lead shoots, for furnishing the future specimens. Fuchsia cuttings which were put in as previously advised, will now be ready for potting singly into small pots, keeping them close until they are established. Shift on into larger pots whenever required, never allowing them to become pot-bound until they have reached their final shift.

WATERING AND SHADING.—As many kinds of plants have been recently repotted, water must be judiciously afforded, and when the ventilators of the pits and houses are closed for the day, the plants should be syringed freely, and all the bare surfaces wetted, so as to create humidity. Shading will require constant attention in the prevailing changeable weather, and in this matter the gardener should not be caught napping, or many things will be spoiled for the season. Air must be admitted as early in the day as the state of the weather will permit, and draughts of cold air must carefully guarded against in greenhouse, showhouse, or stove.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

STRAWBERRIES.—The remainder of the Strawberry plants intended for forcing this season may now be brought on in cold frames, if house accommodation be scanty, and without any aid from artificial heat, or that derived from fermenting materials. The ground in the frames should have a layer of fine coal-ashes for the pots to stand upon, and if they are deep, some means must be taken to bring the plants up to within a distance of 8 inches of the glass, which may be effected with inverted pots and pieces of boards. During mild weather, the front walls of the frames may be raised half-an-inch from the ground, thereby securing a free circulation of air within the frames, the plants being syringed, otherwise treated as advised in my former calendar. As it is, however, sometimes desirable to continue the supply of fruit from pot plants till such time as it may be gathered from plants in the open air, a batch with this object in view should be stood outside the frames in which they have been wintered, and some placed at the foot of a wall having a northern aspect, and before these last-named come into flower, and especially if the weather be dull and wet; they should be inured to full sunlight by degrees, and afforded the protection of a cold frame, elevated by having a brick placed under each corner. Besides raising the frame 3 or 4 inches from the ground, the sashes may likewise be tilted at the top and the bottom, and thus the crop may be retarded, and a link formed between the indoor and the outdoor supply of Strawberries.

PEACHES.—Trees carrying fruits approaching maturity should be less liberally supplied with atmospheric moisture, and the syringe brought less into play than in earlier periods of growth, and entirely dispensed with on trees whose fruits have begun to ripen. At this stage the plants are liable to be attacked by red-spider, which if it have got a hold upon them, hard syringing will drive off, but this would injure the fruit; still, seeing that next year's crop depends on the healthy condition of the trees, it will be advisable to remove any fruits that are ready for use, and give the trees a thorough drenching with clean water. The early morning is the best time for this operation, the warmth of the sun soon drying the fruit. The Peach-tree borders at this season usually stand in need of being watered, and where this is found to be necessary, and the plants are not too vigorous, I would advise the use of a liberal dressing of phosphatic manure being first applied, and then washed in with clear water. Tie in all loosely-hanging shoots, and expose the fruits to the sun by bringing the leaves that shade them to the back of the fruit, and, if really necessary, cutting them off wholly or in part. A temperature, ranging from 55° to 60° at night, with a moderate amount of air admitted in accordance with external conditions, should be afforded the trees whilst the fruits are ripening.

SUCCESSION HOUSES. in which the fruits have passed the period of stoning, may be forced a little harder if it be desired to ripen the crop early, and, for this purpose, 65° at night will be a safe degree of warmth to maintain, the house being shut up early in the afternoon, and the temperature allowed to rise to 95°, well syringing and damping down at that time. In houses where the trees are more backward, or

stoning has commenced, strict attention must be paid to ventilation, so that no sudden changes of temperature may occur at this stage, a minimum temperature of 55° being maintained, and air afforded; when the temperature commences to rise above this figure, that is, until they have stoned, a cool airy atmosphere should be afforded them, the plants being well dewed over twice a day, and the borders and paths kept moist. Keep all growths tied in, regularly stopping the minor lateral shoots when these are not required to fill space on the trellis. When the fruits have attained to the size of Hazel-nuts, no time should be lost in proportioning the number to be carried according to the vigour of the trees.

THE APIARY.

By EXPERT.

TWO QUEENS IN ONE HIVE.—Attention having lately been called to the possibility, and in all probability the advantage, of having two laying queens in one hive, a good many beekeepers will be making experiments this season in the hope of clearly defining and perfecting the system by which, perhaps, a much larger yield of honey per hive can be reckoned on than at present. The beekeepers axiom, to "keep all stocks strong," seems more than ever possible to accomplish now it is established that two queens will lay eggs in one hive, divided only from each other by a perforated division board, the worker progeny from both commingling and working amicably together in the supers, which they treat as one common storehouse. To obtain the best results from the new system, the principal difficulty to be surmounted, as with the old, is the prevention of swarming, and the remedies—abundant room, sufficient ventilation, and young queens must be provided for. Probably the kind of hive best adapted for use would be a long one, to contain about two dozen standard frames, to be used as the double-brood nest, with facilities for adding one or two storeys as required, to take sections or frames for extracting. As two entrances have to be provided, these should be placed at each end, and be the full width of the hive. If the floor board is so constructed that it can be let down an inch or so to increase the size of the entrance when the hive gets crowded with bees, and additional ventilation is necessary, it would be an advantage. The perforated division in the centre of the brood chamber can be made of zinc, and to prevent any possibility of its getting out of place, and so defeating the object in view, might be made a fixture. If a hive is got ready somewhat on these lines, any two colonies standing close together could be shifted into it at once, and in a day or two, after the bees become settled down, put the supers on, first using a queen-excluder, to cover all the frames below. Another way of adapting the idea, which may prove useful in more ways than one, will be to use an ordinary storifying hive. Select a strong stock, and take out two of the frames containing brood and the queen, which place in the middle of an empty body-box, filling up with frames of comb. Place this over the old brood chamber, first of all putting on a queen-excluder. The queen will go on laying eggs above, and the bees, finding that she is unable to get below owing to the excluder, will start queen cells there, and the young queen, after she emerges, will be able to fly out, get fertilized, and return, that by this means there will be two laying queens in one hive. If everything goes right, there will be an enormous population later on, and additional room must be given above as required.

FORESTRY.

By J. B. WESTER.

SEASONABLE WORK.—Generally the weather of late has been trying to vegetation of all kinds, and especially to newly-planted trees and shrubs, so that much care will be necessary in watering and mulching these, and shading them where requisite until the roots have become established. I may briefly state that the planter should in all cases exercise his judgment on the spot, and act as circumstances may direct. I may, however, enforce the dictum that all evergreen ornamental trees and shrubs of any considerable size should be mulched as soon as planted; if the situation is an exposed one, a screen of evergreen branches should be erected around the plant. Hill-planting, where the notch-system of planting has been the one adopted, will require much attention, as in many cases the surface-sod will be apt to curl with drought, exposing the roots of the plant to

the air; and if this be not noticed in time, and the notch closed again by tramping it, the plants are sure to perish. In rocky ground, where plants cannot be made use of, the present is the best season in which to sow seeds of trees and shrubs. When looking after my planters on such situations, I generally have a spud attached to the end of my walking-staff, by which means I am enabled to open small slits or holes in the crevices of the rocks, and drop a few seeds or berries, which in due time will make their appearance above-ground, and give the spot a clothed, furnished appearance. In this simple, inexpensive way I have converted some bare gullies among the recesses and shelving rocks of the hills into attractive scenery.

This is the best time to sow *Rhododendron* seeds on prepared mossy ground to raise plants for game coverts, and improve the appearance of bare woods; and for full directions as to the modes to pursue, see my former article on this head in these pages. The seeds of coniferous trees of various species may now be sown on well-worked, friable soil, of a light texture, formed into seed-beds of 4 feet wide. Planters should make sure that their Scotch Fir seed is the produce of the true Highland Pine, as the Continental variety of this tree is in every respect inferior to that type. The seed should be sown broadcast on the surface, and 1 lb. of seed allowed for every 12 lineal yards of a bed the breadth specified above; the covering should be fully one-fourth of an inch in depth. Larch seed may be sown in a similar way to that of the Scotch Fir, allowing 1 lb. of home-saved seed for every 4 or 5 lineal yards of a bed 4 feet wide; but in cases where Continental seed is employed, the seeding should be made much thinner, as foreign seed is generally of stronger vitality than seed collected in this country. Before sowing, the seed had better be spread out some 10 inches in thickness on a floor, and thoroughly saturated with water; they should then be turned thrice a day for a few days before committing them to the ground. To want of this precaution, many failures can be traced. The seed-beds should be carefully protected from birds until such time as the plants are established above ground; and as a precaution against late spring frosts, a few evergreen branches and twigs should be stuck into the beds here and there to shade and screen the plants from the influence of the sun by day, and frost at night, until such time as no further danger need be apprehended. Other coniferous tree seeds may be sown in a similar way, and the quantity of seed used for a given space, and the depth of covering must be regulated in a great measure by the size of the seed.

If not already done, complete the grafting of such forest and ornamental trees as are usually increased by that method; look over and repair any defects or damage that may have occurred to the clay of those grafted some time since, and earth up dwarf grafts, only leaving the scion above ground. Now that cattle are being turned out to grass, fences of all kinds should be examined, and put in repair where necessary. Tree guards in the park or lawn should also be overhauled at this season, and defects made good. Young plantations in Great Britain and Ireland are occasionally damaged to a large extent by the inroads of sheep and cattle, whereas by a little timely attention this might be prevented, which would not only be a saving in capital, but add largely to the appearance of the estate. As the season for barking Oak is almost at hand, and as early saved bark is by far the best, and commands the highest price in the market, no time should be lost in having everything prepared and ready to make a commencement as soon as the bark can be stripped easily. The trees to be removed should therefore be marked as far as possible with the view of preventing mistakes in the hurry of barking, and all the tools used in the job should be overhauled and repaired. The bark of the Larch, Birch, and Spanish Chestnut are all used for tanning purposes, but as the barks of these are not all of the same value, each kind should be kept by itself. Forest trees of a few years growth that have been raised from seed on the spot where they are to remain should be examined at this season, and in cases where two or more plants are growing in proximity to each other, the weakest should be cut out or removed, and the best left. In cases where blanks occur here and there, some of these superfluous plants should be carefully lifted with a spade and inserted where they are wanted, and surface scrub should be cut down in order to allow the plants space to develop properly, and in a uniform manner, according to the height of the plant.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	MAY 3	Royal Horticultural Society's Committee meet at the Drill Hall, James Street, Westminster. Lecture by Prof. M. Foster.
WEDNESDAY,	MAY 4	Royal Botanic Society: Musical Promenade.
THURSDAY,	MAY 5	Linnean Society.
FRIDAY,	MAY 6	Dundee Horticultural Association.

SALES.

TUESDAY,	MAY 3	The Stand Hall Collection of Established Orchids, at Stand Hall, Whitefield, near Manchester, by Protheroe & Morris (four days). Established Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	MAY 4	Border Plants, &c., at Stevens' Rooms. Palms Begonias, 30,000 Palm Seeds, &c., and a large number of Plants, Cape Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	MAY 5	Orchids in Flower, at Stevens' Rooms.
FRIDAY,	MAY 6	Orchids from Messrs. Charlesworth, Shuttleworth & Co., and others, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—51°·7.

Exhibition of British Ferns.

In the recent issue of the *Royal Horticultural Society's Journal*, there was inserted a schedule relating to the forthcoming exhibition of British Ferns to be held in August under their auspices at Chiswick. Comparing this schedule with those which have recently preceded it, we find at once a mass of welcome evidence that these beautiful and interesting plants are at last obtaining a share of that popularity which they so richly merit, but which for many years has been denied them. Hobby-riders are proverbially apt to magnify the virtues of their specialties, but although British Fern fanciers may also be open to the same reproach, a little consideration will show that their fancy is fully justified by its naturally unique character, and the charming results to which their careful culture has led. In the horticultural world there are many hobbies and specialties. Orchids, Roses, Dahlias, Daffodils, Auriculas, &c., have each their multitude of ardent admirers, to whose long-continued competition for supremacy we owe myriad types of floral loveliness, which, unaided by such selective culture, we may assume Nature would never have produced. In these we have not only a practical infinity of varietal forms, but also a marvellous range of colour, which affords the hybridiser an illimitable field for the production of new combinations. In none of these floral branches, however, nor indeed in any other class of foliage plants, can we claim to be so absolutely independent of foreign aid as we are in the case of the multitudinous forms of British Ferns, and on this fact we found our assertion that the hobby is a "unique" one. The fancy Orchids are all foreign; in Roses we are largely indebted to France, and our native wild Rose has done little to swell the catalogue of gems. As to Dahlias, the very name conveys foreign influence, and all are pure exotics; for Daffodils, though we are happy in the possession of native

forms, Mr. Barr has to ransack Spain and other foreign habitats to swell the category to any size, and most of the forms are of foreign origin. Of Auriculas, we may say the same as regards origin, though the great mass of the types are due to selective culture here. In every case, indeed, but that of our native Ferns, the existing varieties are, more or less, due to exotic influence; with these, however, practically the whole of them, numbering, though they do, thousands, are not only perfectly indigenous British plants, but, what is still

chiefly in the adjoining counties of Dorset, Devon, and Somerset, numbering, we believe, about 600, every one of which is perfectly distinct, and a good number perfectly unique in type. In this connection it is necessary to state that it is by no means a question of hair-splitting with regard to these diverse forms. When we hear of thousands, the natural impulse is to assume that the Fern hobbyist, like other specialists, acquires an educated eye which enables him to distinguish and find differences which are quite invisible to the lay eye, but to which

FIG. 82.—CYRTOPODIUM LAUREBEL X: FLOWERS, DEEP LILAC CRIMSON. (SEE P. 561)

more extraordinary, and renders the Fern hobby, as we have said, an unique specialty, all the abnormal types are perfectly natural and wild, having been discovered by careful search, or in some cases by casual passers-by in our Ferny lanes and woods of Devon and Dorset especially, but also in many other counties of Britain generally, where the conditions are congenial to Fern life. This remarkable fact is exemplified by the existence of several collections in the country, which, representing the local finds only, and these of excellent form, run well into the hundreds. Mr. Moly's, of Charmouth, is a typical instance of this, his own finds, now

the specialist gives a long name, and so swells his lists unduly. This, however, is emphatically not the case; put any two recognised distinct finds side by side, and no one could confound them, while often the difference is very great. Collectors, however, are rarely content either with their own finds or varieties otherwise acquired; naturally the next step is to propagate the best forms with a view not merely to disseminate and so perpetuate them, but also to the improvement of the type by selection from the seedlings. In speaking of type forms we should explain that the existing varieties generally may be divided

into sections, each section consisting of sub-variations of one peculiarly distinct abnormal plan of growth. Thus there are the crested or tasselled, plumose or feathered, cruciate or crossed truncate or abbreviated, tortuose or twisted, revolute or rolled up, and eccentric forms of other types which have sported again and again, and have even been mingled by crossing, but

variation through the spore is singularly capricious in its scope. In some cases, thousands of plants may be raised, time after time, and yet the parental form is invariably reproduced; in others, inferior types, or even common ones, only result; in others, after a long period of constancy, there is a "break," and a host of different forms result—this, of course, being the

British Fern varieties, which, after all, would only possess attractions for Nature's curios-hunters, did they not also possess in the large majority of cases a beauty and delicacy of development which places them certainly on an equal footing with their exotic relations of tropical and subtropical regions. In comparison with these, enormous as the range of exotic genera and species is as compared with indigenous ones (some forty odd only), another unique feature appears in the fact that one little group of islands, mere dots on the map of the world, have produced a far larger number of varieties, and these of far greater range of form, than all the other Ferns of the world put together. Thus, while in exotic Ferns the collections consist of specimen plants, representing as many species as possible, varietal forms are few and far between, being absent altogether in the large majority of known species. In British collections, however, with the exception of a few of the rarer species, the normal ones generally find no place, all being varieties. This fact becomes still more striking when we consider how many of the exotic forms have been trade plants, and grown by the million for a long period, during which the culture of British species had been confined to a few amateurs and about as many nurserymen as can be counted on the fingers. Commerce, however, has rarely engendered that careful, niggling, probing, and prying sort of attention which, in the ardent amateur, so frequently leads to the detection and protection of gems in their young state, which, on the wholesale plan, are apt to be overcrowded and killed before declaring their character openly enough for less scrutinising eyes. To this we are inclined to attribute somewhat the comparatively rare production *en evidence* of new exotic types. Some of the *Pteris*, *Adiantum*, and *Gymnogramma* species have sported freely, it is true, but, as we have said, a host of exotics have yielded nothing. If we take one genus, for example, viz., the *Asplenium*, we find this difference very curiously exemplified. Of our few species, *Asplenium trichomanes*, *A. viride*, *A. adiantum nigrum*, *A. lanceolatum*, *A. ruta muraria*, and *A. marinum*, have all produced marked and constant varieties (crested, plumose, depauperate, &c.), *A. septentrionale* and *fontanum* alone being excepted; yet, when we examine the immense number of exotic species, amongst them all we can only muster some half-a-dozen of truly abnormal sports.

When we add to this peculiar capacity the perfect hardiness of our native Ferns (*Adiantum Cap-veneris* and *Asplenium marinum* excepted) which demand no heat in winter, and thrive with a minimum of attention, in shady positions, where flowers would languish, we think it is a matter for congratulation that these beautiful plants are again coming to the fore, and trust that the forthcoming show will be numerously attended, so that their merits may be duly recognised, and their more extended culture encouraged by the memories of the lovely type-forms, which are certain to be exhibited. We understand that exhibits will emanate from several of the best collections, which have, so far, only been seen privately by privileged friends. A truly representative collection may therefore be confidently anticipated.

CYPRIPEDIUM LAUREBEL × (*Lawrenceanum* ♀ *bellatulum* ♂).—This, one of the first crosses with *C. bellatulum*, was raised in the gardens of Sir Trevor Lawrence, Bart., M.P., and exhibited by him at the meeting of the Royal Horticultural Society on April 12, when the Orchid Committee

FIG. 83.—KNIPHOFIA NELSONI, MAST., FLOWERS ORANGE-SCARLET. (SEE P. 554.)

The section through the flower, and the fragment of the leaf, are shown as magnified 2 diameters, the pollen-cells 200 diameters.

which nevertheless maintain persistently the chief peculiarity of the original wild find. It will now be understood what we mean when we say that all the "types" have been found wild, since so far as we are aware, though selective culture has yielded a veritable host of distinct varieties, they have all been modifications or combinations only of really typical wild plants.

The capacity of these wild forms for further

cultivator's opportunity. In other cases, sub-varieties of very distinct character have appeared singly, and these have yielded constant progeny in their turn. When to these peculiarities we add the possibility of obtaining mixed types by sowing spores of two or more distinct forms together, the limits of obtainable variation will be seen to be practically non-existent. So much as regards the multifarious side of the

unanimously awarded it a First-class Certificate. Reference to our illustration (p. 560) will show that in the form of the flower the new hybrid partakes largely of *C. Lawrenceanum*, although in its thicker texture, and in other particulars, it shows ample traces of the other parent. In colour, this beautiful novelty is of a rich rosy-crimson, with a tinge of green at the base of the sepals and petals, and a pure white margin to the upper sepal. There are numerous brownish-purple lines radiating from the base of the upper sepal, and some spots of the same hue on the petals. The name is a combination between those of its parents.

PODOCARPUS PECTINATA.—The *Podocarpus* in the establishment of Messrs. SANDER & Co., of which we made mention in our issue for January 23, 1892, ser. 3, xi, p. 113, as probably the *Podocarpus pectinatus* of BRONNIART and GRIS, was, it appears described in the *Bulletin de la Société Botanique de France*, xvi., 330, as *Dacrydium Pancheri*, with a note to the effect that PANCHER, who collected it in New Caledonia, had attached the name *Podocarpus pectinata* to the specimens (one of which we saw in the New Herbarium), whence the editor of the *Kew Bulletin* notes that we should call the plant in future *Podocarpus pectinata* of PANCHER. It is not a matter of much importance from a horticultural point of view, but we are decidedly of opinion that a manuscript name should not be officially recognised in preference to a published one. A student of the future, meeting with the phrase *Podocarpus pectinata*, Pancher, and desirous of investigating its history, would find in his search, for no such species has been published, but only a *nomen nudum*. Of course, if he could consult the materials and documents at Kew or in Paris, he would soon get on the track, but it is not every one who can enjoy such advantages.

ZANZIBAR.—According to Sir JOHN KIEK, in the April number of the *Kew Bulletin*, the temperature of Zanzibar ranges from 72° as a minimum in August, to 82° Fahr. as a maximum in March, the extreme range being only about 16°. The rainfall only amounts to 43 inches, of which 10 or 11 fall in April and May, and only half an inch in June. April is the specially rainy month, both as to quantity and the number of rainy days.

"THE FIELD CLUB."—We received some time since a volume of this periodical devoted to natural history, edited by Rev. THEODORE WOOD, and published by ELLIOT STOCK. Now that our naturalists are preparing for the summer campaign, we may opportunely call attention to this unpretending but very readable publication, which appeals to naturalists of all kinds and degrees. Margate may not appear very attractive to this class of visitors, nevertheless the perusal of the articles on the neighbourhood of the "Cockney's wash-tub," will show that it is in reality full of interest to those who know how to look.

PALMS AT KEW.—The Palms and Pandanads, which, with the Cycads, now form the most striking feature of the large Palm-house at Kew, have, says the *Kew Bulletin*, increased so much in size, as well as in number, as to necessitate a re-arrangement of the whole of the plants to provide more ample accommodation for the specimen Palms. These now occupy, with other large monocotyledonous plants, the whole of the central part of the house, and the north wing, excluding the side-shelves. The large Cycads, with the large dicotyledonous plants, are arranged chiefly in the south wing of the house. The small Cycads are on one of the side-shelves.

THE DOUBLE COCOA-NUT AT KEW.—Plants of the interesting double Cocoa-nut, or *Coco de mer* (*Lodoicea seychellarum*), have been raised at Kew from nuts, and a germinating plant forwarded to this establishment by the Honourable T. RISELY GRIFFITH, Administrator of the Seychelles, says the *Kew Bulletin*, April, 1892, p. 107. The largest plant is now developing its third leaf; the dimensions of the second leaf, developed last year, are as follows:—

length of petiole, 30 inches; length of blade, 4 feet; width of blade, 4 feet; number of folds in blade, 56. The midrib of the leaf describes a semicircle, and the whole of the divisions, which are a foot long, are recurved. This plant will shortly be placed in the Victoria-house, where there are now young healthy examples of the following somewhat rare Palms in cultivation:—*Mauritia flexuosa*, *Manicaria sacifera*, *Hyphene thebaica*, *Borassus flabelliformis*, *Bismarckia nobilis*, *Pholidocarpus Ihur*, *Licuala grandis*, and *Socratea exorrhiza*.

TORQUAY FRUIT FARM COMPANY.—This new venture is being pushed on with considerable vigour, says our contemporary the *Western Mercury*. A syndicate of gentlemen has started the concern on some land belonging to Mr. R. MALLOCK, M.P., of Cockington Court, and besides the ground landlord, Mr. J. W. WHITEHEAD (hon. secretary of the Torquay Horticultural Society), and several other gentlemen are concerned in the undertaking. Already there are 25,000 different trees and plants in one field, including 10,000 Strawberry plants, and Apples, Pears, Plums, Raspberries, Gooseberries, and Currants. In another place there are 1000 Rhubarb plants, 1,700 Asparagus and Seakale, and any amount of Horse-radish and early vegetables. Mushrooms are to be a specialty, and 2 acres of beds are to be made forthwith. Permanent works are in progress, including ten long glasshouses, comprising vineries, and orchard, Tomato, and Cucumber houses, beside others for pyramid Peaches and Nectarines, late Vines, and Figs. Some of these houses are of considerable dimensions, over 22,000 square feet of glass being used, and 5 tons of sheet lead for putting it in place. There are nearly 6000 feet of piping laid, and special tubular boilers are being erected of exactly the same pattern as are used with so much success at the fruit farm of 600 acres at Lord SUDLEY's estate at Teddington. The progress and development of the farm, of which Mr. LUCKHURST is manager, will be watched with interest.

POPULAR NAMES.—With reference to *Trillium erectum*, Mr. MEEHAN, in his excellent *Monthly*, alludes to the circumstance that this American plant goes by the name of Three-leaved Nightshade, Wake Robin, Bath Flower, and Birthwort. This furnishes a good illustration of the inconvenience of popular names. In this country the Nightshade is *Atropa belladonna*, a widely different plant; Wake Robin is *Arum maculatum*, a plant almost equally remote; and Birthwort applies to *Aristolochia clematitis*, which has nothing to do with the plant under notice. Surely *Trillium erectum* is not more difficult to remember or pronounce than any of the others, while it has the great advantage that the name applies to the plant in every country in the world. There are cases where popular names are desirable, but this is not one of them.

MOSELEY BOTANICAL GARDENS AND COLLEGE GROUNDS, BIRMINGHAM.—A rose show will be held on Tuesday and Wednesday, July 19 and 20 next, at which we note some enticing prizes are offered for groups of plants and cut blooms. The larger competitions are open, and the others are limited to the locality. Mr. H. RICHARDS is the secretary, and Mr. W. DEAN, Dolphin Road, Spark-hill, Birmingham, director of the horticultural exhibition.

MR. JOHN CARRUTHERS has been selected to give the course of botanical lectures at the Agricultural College of Downton during the coming summer. Mr. CARRUTHERS is favourably known by an able paper on the Larch disease, and has for some time assisted his father in his duties at the Royal Agricultural Society.

THE CAPRIFICATION OF FIGS.—We read in the *Australasian* of March 12, that at the Hobart meeting of the Australian Association for the Advancement of Science, Baron VON MUELLER referred to the necessity of reconsidering the caprification question in the new edition of select plants, and brought up also the progress report of the committee

at the Hobart and Christchurch meetings. Baron VON MUELLER has since received an interesting letter on this essentially practical subject from Dr. G. EISEN, the Fig and Raisin expert of San Francisco, wherein occurs the following pertinent passage:—"We have had genuine Smyrna Figs growing here for over twelve years, but so far not a single fruit has matured of its own account. But last July I pollinated some twenty Figs by means of the pollen from the male or Caprifig. The effect was, that four weeks later the twenty Figs matured magnificently, but no others, although there were several hundred trees and thousands of fruit, which all dropped off."

GINGER.—As in the case of so many widely-cultivated plants, the Ginger-plant is not known in a truly wild state. According to the *Kew Bulletin*, attempts have been made to grow it in Fiji, where the plant thrives, but where difficulties arising from inexperience have arisen in the preparation of the root-stock for market.

LINNEAN SOCIETY OF LONDON.—At an evening meeting, to be held on Thursday, May 5, 1892, at 8 P.M., the following papers will be read:—1, "Lichenes, Epiphyllii, Spruceani," by Dr. J. MUELLER; 2, "Notes on the Family Saturniidae, with descriptions of New Species in the Collection of the British Museum," by W. F. KIANV, F.L.S.

ROYAL BOTANIC SOCIETY OF LONDON.—At a meeting of this society held on Saturday, says the *Daily News*, April 25, Mr. J. BALL SEDGWICK in the chair, a flowering specimen of an epiphytic plant of Central America, imported under the name of Spanish Moss [*Tillandsia usneoides*], for stuffing mattresses, with other interesting plants from the society's gardens, was shown.

THE INTERNATIONAL HORTICULTURAL EXHIBITION to be opened on May 7, at Earl's Court, is now in an advanced condition, and will prove of considerable interest to many. The grounds have undergone many alterations since the close of the exhibition held in the same grounds last year, and in them will be found perhaps the most interesting feature, for there are to be representations of the leading historic and national styles of gardening, as the Egyptian, Japanese, Roman, Tudor, Italian, Jacobean, Georgian, &c., all of which it has been tried to reproduce as faithfully as possible, and the gardens are to be planted with (as far as can be done) the plants which were used at the period depicted. To add to the reality of the scene, the boundary walls are painted up to represent the architecture or the landscape of the time and country as is necessary. If carried out well to the end of the season, these representative gardens should prove instructive as well as interesting. A considerable portion of the main building has been planted in the subtropical style, and contains many fine plants. During the continuance of the exhibition, periodical flower shows will be held, two buildings, each measuring 50 by 200 feet, being set apart for this purpose. One of the most attractive features at this Exhibition, will be the so-called "Insectivorous House," (†) where plants which prey upon insects will be exhibited. The house is now being constructed just outside the north end of the main building by Messrs. CROMPTON & FAWKES, of Chelmsford, who are the designers of it. The building is T-shaped, and will be heated by FAWKES' Slow-Combustion Apparatus. The interior will be arranged with staging round the sides and probably rockwork in the centre, and the entrance and exit will be so disposed that the stream of visitors can always be kept in one direction. One other point should be always remembered, and that is, that the net profits are to be devoted to the Gardening Charities.

ORCHIDS AT M. LEMOINIER'S, AT LILLE.—This amateur, a son of the most celebrated of French amateurs, who died recently, continues his father's work. In addition to the various branches of gardening which are followed in his large establishment, M. R. Lemoinier proposes to enlarge his collection of Orchids considerably. Already there are two

large houses entirely filled with these beautiful plants. We have noticed many excellent varieties of *Odontoglossum crispum*, a remarkable new form of *O. sceptum*, the ground yellowish-white, with large spots of different shades of chocolate; a fine example of *O. Andersoni*, with three fine racemes, wonderfully strong, and coming from one bulb; an *Oncidium sarcodea* with 300 flowers, and a second example with 400 buds; the rare *Epidendrum Cooperi* from Brazil, with five clusters of bloom on one stem—this fine Orchid has been in flower for six months; some very fine examples of *Vanda gigantea*, tricolor, Leopoldi, suavis, and other varieties; a fine *Phalaenopsis Boxalli*; a very fine variety of *Cypripedium Curtisi*, with large flowers; *C. selligerum* and *Druryi*; a plant of *Angraecum sesquipedale*, with two stems, bearing five, and a third bearing two fine flowers; beautiful examples of *Phalaenopsis Sandersoniana*; *Odontoglossum citrosomum*, with a stem nearly a foot long; *Oncidium curtum*, and a collection of numerous varieties of *Odontoglossum Cervantes*, &c.

SYSTEMATIC BOTANY.—A course of lectures will be delivered at the Medical School, St. Thomas's Hospital, Lambeth, S.E., by ALFRED W. BENNETT, M.A., B.Sc., V.P.L.S., Lecturer on Botany at the hospital. The lectures will be delivered on Tuesday and Wednesday mornings, at 10 A.M., commencing Tuesday, May 3, and will be illustrated by diagrams and fresh specimens. Tickets may be obtained from the Secretary to the Medical School, St. Thomas's Hospital, S.E. Fee for the course, three guineas.

CHICAGO EXHIBITION.—A young lad, son of the editor of the *Florida Standard*, is making, for exhibition at the Fair, a table, upon which appears an inlaid map of the State, each county being accurately represented by a separate piece of native Florida wood. In the Californian building will be shown a growing specimen of every Californian domestic flower obtainable, and also paintings in water and oil of 600 wild flowers and grasses. A unique exhibit from Pennsylvania will be a map of the United States, 18 by 24 feet, made entirely of pickle, vegetables, fruit, &c., preserved by the company which makes the exhibit. The State lines will be accurately shown, and the lakes and rivers will be represented by vinegar. The larger cities will be indicated by spices. The whole will be covered with a single piece of plate-glass, which is being specially made for the purpose. The expense of this interesting exhibit of the pickling and preserving industry will be 15,000 dollars!

FLOWERS FOR HOSPITALS.—Last week about 5000 *Daffodils* were sent by the Earl of ANNESLEY from the Park at Castlewellan to the North Dublin Flower Mission at St. George's Hall, Temple Street, for distribution among the hospitals of the north side of the city. This week a still larger quantity have been received from the same source.

LABELS.—Messrs BLAKE & MACKENZIE, of Liverpool, send us specimens of their Willaden patent waterproof labels for Roses. In addition to the durability of these prepared cardboard labels, the patentees obligingly print on the label the name of the Rose. What a boon this is, every amateur knows.

AGRICULTURAL CHEMISTRY.—M. P. P. DEHERAIN has just published through G. MASSON, of Paris, a treatise on agricultural chemistry, *Traité de Chimie Agricole*. A volume of 900 pages is not grasped at a sitting, so that we must defer further notice of this book till we have had the opportunity of examining it. Nevertheless, everyone who realizes what M. DEHERAIN has accomplished, will feel assured that this *Traité* is the work of a master-hand.

STOCK-TAKING: MARCH.—The Chancellor of the Exchequer has been taking stock of the past financial year, and finds the actual returns over a million sterling in excess of his anticipations; and

this in spite of all sorts of adverse circumstances—tariffs, wars, strikes. Of course, the excess is not all due to trade and commerce, but it is there, and that is for the present sufficient. Just about the time the Chancellor was thinking of his annual statement, the United States Federal Treasury was nearly empty—one telegram stating that if sundry bills were pressed they could not be met! In respect to the stock-taking by the Board of Trade, we note an excess of imports to the amount of £1,451,118 over those for the month of March last year. The following figures are from the "Summary" of last month's imports:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£31,233,059	£32,704,177	+1,451,118
II. (A.)—Articles of food and drink—			
duty free	10,906,537	12,025,367	+1,028,830
(B.)—do., dutiable	2,051,693	2,319,861	+268,165
VI. (A.)—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	8,111,316	7,926,096	—185,216
VII. (A.)—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,591,726	2,593,041	+1,315
IX. (A.)—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,142,625	1,301,134	+158,519
(B.)—Parcel Post ...	43,541	34,186	—9,355

The following figures relate to the imports of fruit and vegetables during March:—

IMPORTS.	1891.	1892.	Difference.
Fruits:—			
Apples, raw ... bush.	156,941	351,814	+194,873
Cherries	5	+5
Pears	1,754	+1,754
Grapes	777	+777
Unenumerated, ...	20,791	19,528	—1,263
Onions bush.	368,611	251,058	—114,553
Potatoes cwt.	251,075	76,076	—187,999
Vegetables, unenumerated, raw, ... value	£58,110	£31,082	+£2,972

It is needless to say that every line of this table is of interest to our growers at home, some of whom will doubtless have noted the fact that Pears from the Cape, sold the other day by auction at Covent Garden, fetched 10d. each. The Tasmanian Apples are arriving now, and will continue to come in due course. The several arrivals are recorded in our columns week by week.

EXPORTS.

The exports of British and Irish manufactures for month of March show a decrease of £1,997,996, as compared with the figures for the same month in 1891. At that time we were not quite shut off from the American markets, and the French tariff had not been altered to suit the views of French manufacturers. The decrease of exports during the past quarter amounts to £3,827,475. It is very old news to those who read their daily paper that social life in "trade-protected" countries on the Continent is not by any means a happy one—indeed, it is far otherwise; nor can universal happiness and prosperity be noted of such of our colonies as believe in Protection. All this, however, reacts upon us, and we can only hope for sounder political education and its happy results. We have been informed of a bold bargain made by a syndicate of merchants hailing from Lyons, Roubaix, and St. Etienne, which has bought up all the available Indian silk (tassar = Tyseore), leaving only the waste for such as choose to buy it here. It follows that manufacturers wishing to buy the above description of silk will have to go to Lyons for it! Surely our shrewd men of business have been napping. Manufacturers, however, have had their revenge. To-day, if you want the

best figured velvet to be had in the world, you must come to England for it. As long ago, and now, with plush, so now with velvet—the English maker stands alone!

EUCHARIS BAKERI.—"G. H. B." writing in the *Garden* of April 23, says that he has raised E. Bakeri by crossing E. amazonica with E. candida. We hope "G. H. B." and others will repeat this very interesting experiment.

HONOURS FOR HORTICULTURISTS.—Messrs. J. DE COCK and DE SMET, nurserymen, of Ledeberg, near Ghent, have been made Chevaliers of the Order of Leopold.

VERSAILLES SCHOOL OF HORTICULTURE.—M. NANOT has been appointed Director, in the room of the late M. HARVEY.

EPWORTH SHOW AND GALA will be held in the Rectory Grounds on Monday, August 1. Flowers, fruit, vegetables, and farm produce will be exhibited.

YORK FLORISTS' SOCIETY.—The first of a series of shows under the auspices of the York Florists' Society was held in the Exhibition, kindly placed at the disposal of the Society by the Executive Committee. There was an excellent show of Ilyacintus, over 200 pots, the greater portion of which were up to a good standard. Tulips were a special feature of the show, and the exhibits deserve every commendation. Mr. J. T. HINGSTON sent a fine collection of Auriculas, for which he was awarded special prizes; but generally the Auricula and Polyanthus were poorly represented. Nothing being charged for admission to these shows, the attendance of the public is nearly always good.

LINNEAN SOCIETY.—At the meeting held on Thursday, April 21, Professor STEWART, President, in the chair, Mr. HENRY GROVES, was elected a Fellow. Mr. W. B. HEMSLEY, F.R.S., read a paper entitled "Observations on a Botanical Collection made by Mr. A. E. PRATT in Western China, with Descriptions of some new Chinese Plants from various Collections." Mr. PRATT travelled in 1889–90 in Western China, close on the borders of Eastern Tibet, and though chiefly in search of zoological specimens, he fortunately secured the services of a native who had been trained to dry plants by Dr. HENRY, the result being that he was enabled to bring home a very interesting botanical collection. The plants were obtained chiefly at elevations of 9000 to 13,500 feet, in the neighbourhood of Tat-sien-lu, a frontier town, situated in about 30° N. lat. and 102° 15' E. long., and although Mr. HEMSLEY reported that he had not finished working out the collection, he estimated that it contained about 500 species, of which, perhaps, 150 species were new to science. The paper was criticised by Mr. C. B. CLARKE, who remarked, that the mountain ranges of Western China seemed to abound in showy herbaceous plants, rivaling in this respect the richest districts of the Himalayan region, of which, in fact, it is a continuation.

PUBLICATIONS RECEIVED.—*Traité de Chimie Agricole*, par P. P. DEHERAIN (Paris, G. MASSON, Éditeur, Librairie de l'Académie de Médecine, 120, Boulevard Saint Germain). *Iconography of Australian Salsolacous Plants*, decade ix., by BARON FERDINAND VON MUELLER, K.C.M.G.—*The Botanical Gazette*.—*Le Moniteur d'Horticulture*.—*The Species of Ramex* (Professor TRELFORD).—*Müller's Deutsche Gärtnerei*.—*Canadian Horticulturist*.—*Garden and Forest*.—*Le Jardin*.—*Report of the Fruit-growers' Association of Ontario*.—*Annales Agronomiques*.—*Buletino d. R. Soc. Toscana di Orticultura*.—*Agricultural Bulletin of the Malay Peninsula*.—*Agricultural Gazette of New South Wales*.—*Agricultural Science*.—*The American Florist*.—*Insect Life*.—*Bulletin d'Arboriculture*, &c.—*Hints to Emigrants*.—*Fetich's Manual of Orchidaceous Plants*, pt. viii.

NOTICES OF BOOKS.

TRAITÉ D'HORTICULTURE PRATIQUE, par Georges Ballair. (Paris, O. Doin.)

An excellent manual for the practitioner, dealing with market garden culture, and the management of kitchen garden crops, as well as of Orchards and fruit gardens; Strawberries, however, being for some occult reason omitted. Floriculture and arboriculture are also treated of, but less fully, while culture under glass and especially forcing operations are only incidentally referred to. Within the limitations which the author has imposed upon himself, he has produced an excellent work, clear, concise, and trustworthy.

DISEASE IN FOREST TREES.

Under the title of *The Manifestation of Disease in Forest Trees*, Mr. C. E. Curtis has published a short treatise (Field Office). Its brevity is one of its great merits. It may be useful to novices in calling their attention to points deserving their notice, but we can hardly recommend it as a faithful expositor of the manifestations of disease generally. Here is a paragraph taken from the section on bark diseases, which shows that the author has very peculiar views about the cambium:—"From whatever cause it arises, the cambium, or formative fluid which flows between the inner bark and 'albumen,' or sap-wood, is retarded, and does not reach the leaves in sufficient quantities, and therefore is insufficiently elaborated. This engenders disease, which, if allowed to go on unchecked, will end in the destruction of the tree."

LES MALADIES CRYPTOZOMIQUES DES CÉRÉALES. Par Jean Laverdo. (Paris, Ballière.)

This is a little book which may be safely recommended to those who desire to obtain a general acquaintance with the diseases to which our cereal plants are subject. The life-history of the various parasites is sketched, and the inferences of a practical nature which may be drawn from them are duly pointed out. The great caution necessary, but rarely exercised, in the application of farmyard manure, is insisted on. It is clear that this substance furnishes an admirable means of cultivating and of distributing various parasitic fungi, which, in another stage of their growth, prey upon the cereal plants. The troubles of the gardener and the farmer are very largely due to inattention or ignorance of the ways of life of microscopic organisms. If the lecturers on horticulture under the various county councils can only drive this lesson home, there will be no room for doubting the value of such lessons.

SILVA OF NORTH AMERICA.

This third volume of Professor Sargent's *Silva of North America** has appeared with exemplary promptness. In execution and interest it is fully equal to its predecessors. Two orders only find a place in this volume, but when it is stated that one of the two is Leguminosae, the paucity of the orders treated of in this volume will be no matter for surprise. Anacardiaceae comprises five species of *Rhus* and one of *Cotinus*. This last-named genus is usually included with *Rhus*, but Professor Sargent has gone back to ancient usage, and given generic position to *Cotinus*. A well-known representative of this genus is the Venetian Sumac, or Wig-plant, *Rhus Cotinus*. Owing to the, as we think, strained application of the rule of priority in matters of nomenclature, and the adoption of the oldest specific name, without reference to any other consideration, points of which we spoke lately at some length, our old friend, *Rhus Cotinus*, becomes now *Cotinus Cotinus*. This seems rather absurd, but as we are accustomed to *Vere de Vere* and occasional similar reduplications, we may in time

become reconciled to *Cotinus cotinus*.* The American representative of this genus, *C. americanus*, is interesting as showing the wide extension of the genus through southern Europe, the Levant, Cashmere, the western Himalaya, and northern China. The vernacular name, "Chittam Wood," suggests the possibility in the future of uncomfortable confusion with the Chittam wood of Scripture, and of difficulties on the score of priority of nomenclature! Under the head of *Rhus*, we have not only the necessary botanical details, but also interesting notes relating to the varnish tree of Japan, the manufacture of lacquer-ware, and of other economic products. The singular immunity which some people, and some animals, enjoy from the evil effects of the juice of *Rhus Toxicodendron*, is an illustration of the old adage, that what is one man's meat is poison to another.

Rhus typhina is the common Stag's-horn Sumac, whose loose straggling branches and velvety twigs are conspicuous objects in old-fashioned gardens. The foliage is brilliantly coloured in autumn. The shrub has been so long an inmate of our gardens, that we had ceased to think of its native country; and we imagine it will come as a surprise to many to learn that it is a native of parts of Canada and the north-eastern States of the Union.

Of Leguminosae, thirty species are described and figured in this volume with the fulness and accuracy Professor Sargent has led us to anticipate. Of these, several are of great interest. We can only refer to a few among them, such as the *Rhynchospora* or False Acacia, the Locust tree of the United States. The timber of this tree is so valuable on account of its hardness and durability, that it attracted the attention of Cobbett, who advocated its claims with extraordinary and, as is now ascertained, exaggerated warmth. On the Continent it is much used to fix sloping railway banks, to supply stakes in the vineyards, and for ornamental purposes. The author mentions no fewer than thirty varieties, among the most curious of which are the variety with the leaves, reduced to a single pinna, the mop-headed or Parasol Acacia, suitable for street planting, as furnishing shade without encroaching too much on the space. Its formality of outline is, however, such that its employment should be carefully limited, and care should especially be taken to plant it only in appropriate localities. Professor Sargent does not allude to a variety which is especially useful for street planting, *Robinia pseudacacia* var. *Bessoniana*, which is nearly allied to the Parasol Acacia, but possesses some advantages over it. The var. *Dacotense* is remarkable for its pink-coloured flowers. All the varieties are remarkable for the way in which they fold their leaflets as the temperature declines in evening. *Virgilia lutea* finds a place under *Cladrastis*. It is a tree much appreciated in English gardens, but is said to be one of the rarest and most local trees of Eastern North America. *Gymnocladus dioica* (here spelt *Gleditsia*), and *Cercis*, are familiar names to British arboriculturists. Less familiar are some of the natives of Florida, Texas, and the country adjacent to Mexico, all of which, however, find a place in this volume. The account of the Mesquite, or Honey Locust, *Prosopis juliflora*, is particularly interesting; indeed, there is scarcely a page in the book where even the reader not specially interested in trees may not find something to attract his attention. Interesting biographical details are given relating to the botanists and collectors incidentally mentioned in the text, whilst, of course, the interests of botanist, the geologist, and the naturalist generally, have been carefully studied. The facts collected relating to the geological distribution in past time, and the geographical position in the present, will prove of the highest value. Comparative microscopical details are not omitted, but they might be expanded with advantage, with special reference to the adaptation of particular plants to

particular conditions of climate, &c. The illustrations are truthful, comprising sufficient detail to be serviceable to the botanist, whilst the particulars given in the text as to rate of growth, quality, and uses of timber and the like, will commend the book to the notice of planters.

HOME CORRESPONDENCE.

THE CARROT-GRUB.—In reply to "R.D.'s" query in a recent issue of the *Gardeners' Chronicle* (p. 500), asking someone to suggest means of destroying the Carrot-grub, I beg to say that if the ground intended to be cropped with Carrots or other root-crops, subject to the attacks of the grub and other creatures injurious to root-growth, be manured, dug, or ploughed in the autumn, as soon as the previous crop is removed, so as to allow time for the decomposition of the manure, and the absorption by the soil of the ammonia arising therefrom, and the ground surface-dressed with fresh soot immediately before drawing the drills for the reception of the seed in spring, the object in view, i.e., clean roots, will be secured. I have never known this simple antidote to fail. Although its application on ground rendered foul by heavy dressings of farmyard manure being annually laid on a week or two before sowing the seed, may not be quite efficacious the first year, but by manuring the ground at the time indicated above, and repeating the surface-dressing of soot the following year just before sowing the seed, the ground will be freed of all insects that injure the roots of Carrots, Turnips, Potatoes, &c. Moreover, fresh soot is not only a good purifier, but also a powerful fertiliser, of the soil when judiciously applied. H. W. W.

LENT ROSES.—The stalked Hellebores, generally known as Lent Roses, are finer this year than I have ever known them in my garden. They are later than usual, being still, on April 18, at their best, and being entirely uninjured either by the severe weather of March, or by the snow and unusual cold of the week before Easter, when on five successive nights we had minima of 21°, 23°, 20°, 20°, 25°, and 3 or 4 inches of snow and thaw several times repeated. A few years ago I gave up growing this ornamental class of plants, because year after year they were crippled and spoilt by the frosts and east winds of March. I then found that frost did them no harm, provided they could be entirely sheltered from wind, and by selecting spots where this condition is secured, especially close against walls facing north or north-west, or amongst evergreen trees or shrubs. I have a very fine show of varieties in many colours. Seedlings which come up around the plants in abundance, and vary much from the same parent, make the best specimens. I find that it takes plants nearly as long to recover from division as to flower from seed, namely, three or four years. Short-tailed field-mice are very destructive to the young shoots, and as they constantly repeat their depredations, I conclude that the plant, though poisonous to man, is harmless to them. I am told that where Hellebores are grown near water, the water rats are very troublesome. I have not yet tried planting them where rabbits have access; but very few plants are proof against these, the worst vermin against which gardeners can have to contend. C. Wolley Dod, Edge Hall, Cheshire.

SALIX CAPREA.—I never saw a larger crop of catkins of the common Willow or Goat Willow than this year, where, growing in the woods, mixed with the Hazel bushes, and when the ground is sloping, it is certainly showy. The woolly-looking bushes show to advantage from a considerable distance. The wood of this Willow is largely used by sheep-hurdle makers about here, it being very pliable. E. M., South Hants. [*Salix caprea* is a tree which, when not pollarded, will grow to a height of from 24 to 30 feet, with smooth shoots and buds, egg-shaped, or elliptical leaves, which on the upper side are smooth, green, and glistening; and on the lower side blue-green and woolly. The catkins are very large; the male egg-shaped, and the female cylindrical. There is a pretty pendulous form of this species which looks well worked on tall stems. En.]

APPLES NORFOLK BEAUFIN AND NORTHERN SPY.—Your excellent correspondent, "D. T. F.," in the *Gardeners' Chronicle*, p. 491, inquires how it is that the Norfolk Beaufin is hardly saleable in some of our markets. I think the answer lies in the fruit

* Boston and New York, Houghton, Mifflin & Co. (Williams & Norgate).

* As enquiries sometimes reach us as to the proper pronunciation of this word, it may not be inappropriate to say that the o and the i are both short, and that the word should consequently be pronounced as if written—kot tin-us.

being sent to wrong markets, or to improper storing. With respect to markets, one has sometimes to pay dearly for experience. For instance, I have sent Apples to two markets; at the one, the price realised was exactly four times that of the other, though the fruit was in every respect the same. Another point is the unsuitable structures in which fruit is stored; a really good fruit-room is the exception and not the rule, and shrivelled fruit will never obtain a ready sale at good prices. Of this I am certain, that British Apples grown in good districts, properly attended to in every way, and consigned to the right markets, will compare favourably in price with fruit from anywhere. As to the Normandy Pippin, I can endorse all your correspondent states as to its poor quality. The Northern Spy Apple is one which I question if anyone can grow really well and profitably in this country. I have tried it here as a cordon on walls and in bush form, giving them every attention, but the result has never been satisfactory, although our soil and district is a good one for Apples. The same remarks apply to Newtown Pippin, which needs a good wall or orchard-house to get fine well-developed fruits. Fortunately, we have plenty of good varieties suitable for planting for profit, and it is a grave mistake to plant any uncertain kinds in growing for market, but I fear much haphazard planting is done. S. T. Wright.

PRUNING DENDROBIUMS.—Kindly permit me once more to trespass on your valuable space to offer a few remarks on Mr. Burberry's, on p. 463. Mr. Burberry there asks how it is that I shelter myself behind a *nom de plume*? Well, some people write because they like to see their names in print; others because they are paid for doing so; but "B. P." writes in the interest of good gardening, counting no favours; neither does he care for empty honours, or seek his own aggrandisement; such things he leaves for those more ambitious. But he is well known in the gardening world not far from the place where Mr. Burberry resides. As Mr. Burberry seems to doubt that it is possible to grow plants to the size I mentioned, I may tell him that it would give me great pleasure to show them to him, but he would have to make a rather long journey to do so. Possibly he may have an opportunity some day of seeing some of them without travelling so far, as they may be exhibited nearer his home; we shall then see how this "suicidal" person, who cuts off the growths from his plants, will be able to give an account of himself. May be, he will not fare so badly after all. When one of the greatest Orchid critics we have in the country recently saw one of these plants which had been under the care of this plant spoiler, he did not make the same observation that your able correspondent did, but pronounced them excellent. There are one or two words in my last note which, with your permission, I should like to correct. The word "yes" (we decorate), was made to read "yet" (we decorate), and the word "store-house" was altered to "stove-house." I must now beg to take leave for a short time of your correspondent, as before long he may have the satisfaction of not only seeing some of the plants, but making the acquaintance of your humble correspondent. B. P. [The writer of the Orchid Calendar in these pages keeps in mind the needs of all sorts and conditions of growers, and especially of the amateur, and it is the latter who would suffer loss and vexation by following the practice of "B. P." in dealing with Dendrobiums, for if he cut down his plants to the ground, it would be necessary for him to get fresh pseudobulbs by putting the plants in a place with the warmth of a fruiting Pine-stove—a kind of place he is not likely to possess; and for this reason, cutting hard back is not a good practice for him to pursue. Ed.]

GLADIOLUS IN ROSE-BEDS.—I was much pleased to see the remarks of "J. S." on p. 438 of *Gardeners' Chronicle*, drawing attention to the practice of planting Gladiolus in Rose-beds. It has been my custom for the last eleven years to plant Gladiolus of sorts in Rose-beds, taking the choice hybrids up in the autumn, but leaving the corms of *G. Brencleyensis* in the beds all the winter, and this, too, without much loss. The choicer hybrids I generally start in pots, and plant out in May, at the same time placing a stake for tying the flower-spikes to. Two years ago I tested some corms of hybrid Gladiolus for hardiness, by leaving them in the beds all the winter, mulching them and the Roses with manure, and last year and this very little harm ensued. I use plenty of sand and charcoal-dust when planting any Gladiolus intended to be left out in the soil, and

prefer to fill each bed with one variety. All things considered, I do not think *G. Brencleyensis* can be beaten for general effect, and it is cheap. Gladiolus, however, of any sort, planted in Rose-beds, make a show at a time when Rose-flowers are not very plentiful. I will go a step further, and advise that Mignonette should also be planted out from pots, or sown in patches on Rose-beds, and Mignonette Golden Queen produces a charming effect. *John Chinnery*.

PERFECTION BROCCOLI, ETC.—Green crops in the gardens throughout the Midlands were much cut up during the latter part of the winter, and, in many cases, killed. In looking over the garden at Stoneleigh Abbey, it was noticed that Perfection Broccoli, a variety sent out by Messrs. Sutton & Sons, was the only one which had escaped. Autumn-planted Cabbages have suffered severely at that place, and Strawberry plants out-of-doors, in the Kenilworth district, have lost most of their leaves. A fine lot of ripe fruits of the variety Vicomtesse Hélicart de Thury was observed in one of the houses. *W. D.*

PHOLIDOCARPUS INUR.—In the *Gardeners' Chronicle*, No. 275, p. 430, it is stated that this Palm is a native of Madagascar, which is an error, as it comes from Ceram. We have in the Botanic Garden at Buitenzorg some fine specimens of this Palm about 70 feet in height, and which produce plenty of seeds, which have been sent to most of the European botanic gardens. The Palm was introduced from Ceram to Buitenzorg by the late Curator, Mr. Binnendyk. *Wignam, Curator of the Botanic Garden, Buitenzorg*.

EAST LOTHIAN STOCKS.—How very sweet and refreshing is the sight and perfume of a group of these plants at this season, and yet in scarcely one garden in a dozen are they to be found. These Stocks are of easy culture, and amongst those which give us the most pleasure when grown, useful alike for cutting and for decorating the greenhouse. The white variety of East Lothian Stock and double-flowered Raspail Pelargonium are very much appreciated with us. I generally commence to sow Stock seed in the month of July, and go on sowing at intervals till the end of the following one, which ensures me a succession of flowers during the winter and spring. The seeds are sown in shallow boxes, and the seedlings are potted off in small and large 60's, those in the smaller pots being subsequently put into 48's, and those in the larger ones into 32's, in which sizes they flower satisfactorily. *W. A. Cook*.

COMPARATIVE HARDINESS OF GARDENIA FLORIBUNDA.—That this plant is capable of withstanding a continued and very low temperature without injury, I have proved this winter. Two fairly good plants were placed in a cold pit last September, and have received no protection whatever, beyond what the glass afforded, during the winter, water was supplied to them very sparingly, and these plants seemed none the worse for this kind of treatment; in fact, they are at present in the same place, and pushing vigorous flower buds. I may add that the pit has been kept close, and the plants syringed twice daily during the past month. *W. H. Aggett, Oakdene, Guildford*.

DOUBLE WALLFLOWERS.—These are useful plants to possess in winter and early spring, and they do well, like Stocks, in pots, and many flower-spikes on my plants were more than 1 foot long. The single-flowered Wallflowers, red and yellow, are also nice to cut from, and in winter I take these plants up with a ball of soil and plant them close together in boxes, and place them in a cold house, and obtain in this manner a lot of early flowers, which makes variety. *W. A. Cook, Compton Bassett*.

AURICULAS.—In your report of the National Auricula and Primula Society, it is said that it is doubtful if the General Neil was correctly named. I can, however, vouch for it being so, as I had no other green-edge open at the time, and I have several plants of the same now, including the three that were shown, and no two alike. They were early trusses, and had been grown entirely in a cold frame. As regards all show flowers, I am very particular to keep them correctly named. *John Gilbert, gardener to Rev. L. R. Flood*.

GREENHOUSE BLINDS.—Some few years since, I thought out and put in practice an arrangement of greenhouse blinds which was very simple, inexpensive, and effective. Perhaps "E. W. Ipawich" might

find it suitable to his house. Mine is also a three-quarter span, facing south, and needing blinds only on that side. Along the ridge of the roof runs a vertical board about 4 inches wide, with other boards also about 4 inches wide hinged to its upper edge, and fixed by buttons and hooks in a position parallel to the roof. Under this board, forming a sort of eaves, the whole of the blinds are covered up and are kept up all the winter without damage. The width of eaves necessary will depend on the length of rafter—mine is about 9 feet. The upper edge of each blind is tacked to the vertical ridge-board, and extend in width from one main rafter to the next. Down these rafters run galvanised iron wires (B. W. G. No. 14), kept about 2 inches from the roof fixed above to the ridge-board, at the edges of the blinds, and below fixed to blocks of wood screwed on to the rafters. Down the sides of the blinds are fixed curtain rings at about every 6 inches, the ring 1 inch in diameter, and running easily on the wires. The base of the blind is attached to a wooden rod having a screw-eye at each end, which also runs along the wires. The manipulation of the blinds is done by piercing this rod with a hole about 9 inches from each end, to each of which are tied the ends of a loop of thin saab-cord, which passes lengthwise round the blind, just long enough to allow of the end of the loop being fixed by a cleat in the framework of the greenhouse. Each string also passes through a corresponding screw-eye in the ridge-board. On pulling the two portions of the loops which pass under the blind, it is drawn up and tightly reefed under the eaves-board, and in pulling the two which are attached to the rod at the base of the blind, it is pulled down. I trust that in trying to be brief I have not become obscure, but the blinds themselves (of which I did with my own hands all the fitting except the boards at the ridge) work so easily that a child of five years, who often takes with me my morning turn round the garden, operates the blinds. *L. C. Rugby*.

THE RETURN OF WINTER IN THE MIDDLE OF APRIL.—Fortunately, as it has happened, we had but little frost this winter till April began. But this fact so far as sunshine was concerned pulled up the season rapidly at times, and had it not been for the biting east wind blowing parallel with the sunshine, all fruit buds and Roses would have leaped forward into conditions of severe risk and danger. But that cold at night and in the sun-warmed air even by day, of which we all complained so much, has proved to have saved the major portion of our fruit crops and Roses. Those, however, in warm soils and sheltered localities have been much thinned by the late frosts and snow storms, if not wholly destroyed. Neither have they suffered in these matters alone. In our home favoured, climatically, neighbour France, from which I read of new Estates being already dug and eaten, with a sort of envy, the other day, while we had not finished planting at home. I read in the *Daily News* of to-day, April 20, of great damage to fruit in Provence. A chilly wind has been blowing over Provence for days, telegraphs the Paris correspondent, the fruit trees having blossomed early, the prospect of a fine crop is at an end. This probable loss to the fruit gardeners is estimated at millions of francs. The Vines of the Loiret are as if scorched by the hard frosts which succeeded the summer weather of the beginning of this month, and the consequent splendid burst of vegetation. Our hope of a less dismal state than our neighbours lies chiefly in our vegetation making a less sudden and splendid burst. Being so often beaten back by spring frost, our fruit trees have become more shy in making forward movements in the spring, and it may be hoped that much of our fruit and many of our Roses in our later colder districts may have escaped destruction. Even the Blackthorn is not yet expanded, and very few Plums or Pears, while Apple blossoms yet sleep with hardly half a eye open. *D. T. F.*

SOCIETIES.

ROYAL BOTANIC.

APRIL 27.—It was a very bright display of spring-flowering plants, &c., which was to be seen in the large conservatory in the Society's gardens, Regent's Park.

Messrs. J. Laing & Son, The Nurseries, Forest Hill, S.E., was awarded 1st prize for twelve Begonias, which consisted of exceptionally well-grown

specimens of a first-rate strain. Some of the best were Baroness Burdett Coutts, a large flower of deep pink; Princess Christian, a delicate creamy-white; Mrs. Reguart, a good and bright yellow; Princess May, pure white; Stanstead Glory, very large—pink and white; Lady Theodora Gresty, a well-shaped flower, and perhaps, the prettiest of all. The above are all double-flowered varieties, but there were also several good single varieties shown.

For the best collection of six Roses, the 1st prize was awarded to Messrs. Paul & Son, Old Nurseries, Cheshunt, who had thoroughly well-grown and richly flowered specimens of *La France*, *Avocat Duville*, deep crimson, good; *Violet Bouyer* bluish-white, *Alphonse Souper*, *Marquise de Castellane*, and that very useful *Noisette*, *Celine Forestier*. Mr. W. Rumsey, Joyning's Nursery, Waltham Cross, obtained the second position for his specimens of *Magna Charta*, *Madame Montet*, Dr. Andry, *Comtesse de Serenye*, and *Heinrich Schultheiss*.

Six Greenhouse Azaleas, by Amateurs.—In this competition, Mr. H. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, secured the premier award with *Belle Gantouise*, *Magna Charta*, *Roi des Pays Bas*, *Reine des Pays Bas*, and *Ferdinand Kegelany*; the 2nd prize was awarded to Mr. R. Scott, gr. to Miss Foster, The Holmes, Regent's Park.

In the nurserymen's class for Azaleas, there was no competition, and a 3rd prize was awarded to Mr. H. James, Castle Nursery, West Norwood, for six varieties, the merit of which was below that of the amateurs.

Mr. R. Scott was 1st for twelve plants of *Dielytra spectabilis* (in pots), with well-grown examples. Again, in the open competition for twelve *Spiraea japonica*, Mr. Scott was to the front; and Mr. W. Morle, the Grand Floral Depot, 283, Regent Street, was 2nd.

Messrs. J. James & Son, Woodside, Farnham Royal, Slough, were awarded 1st prize for an exceptionally good collection of nine *Cinerarias*, large-flowered, richly coloured, and dwarf of stature; Mr. J. Douglas, gr. to Mrs. Whitbourn, Great Gearies, Ilford, was a good 2nd.

For 12 *Amaryllis*, the 1st prize was secured by Messrs. Paul & Son, Old Nurseries, Cheshunt, with seedlings which showed great variation of colour, and appeared very fresh. Here again Mr. J. Douglas was 2nd, with some really good examples, most of which were varieties of his own raising.

Mignonette, twelve pots. In this class Mr. W. Morle was 1st, with an improved new variety, dwarf, and compact. The flower heads were very strong, and held themselves erect without the aid of sticks. Mr. F. Stansell, 83, Macfarlane Road, Wood Lane, Shepherd's Bush, was 2nd, exhibiting some very fair specimens.

Messrs. Paul & Son, Cheshunt, were awarded a 1st prize for a good collection of alpinas, including *Aubertia Leichlini*, A. Frobellii, *Arnebia echinoides*, *Armeria Lauchiana*, *Primula rosea*, *nivalis*, and *Peyretieria*; *Alyssum podolicum*, A. pyrenicum, *Gentiana verna*, *Saxifraga arietoides* alba, *Hutchinsonia alpina*, *Waldsteinia trifolia*, *Ranunculus amplexicaulis*, &c. The same firm of nurserymen were also successful with a collection of hardy herbaceous plants, which included *Doronicum plantaginifolium* excelsum, *Orobus vernus*, *Pulmonaria saccharata*, *Uvularia grandiflora*, the pretty little *Irish azures*, with its dwarf blue flowers; *Muscari armenica*, *Tulipa sylvestris*, *Geum aureum*, several varieties of *Tulips*, *Violas*, and *Polyanthuses*.

For a collection of twelve plants of *Primula cotinifolia* Sieboldii (*Primula amena*), Mr. J. Douglas was 1st, with plants which were profusely flowered. He was also 2nd for a collection of hardy *Primulas*, several of which were seedlings of his own raising. Mr. J. Douglas was also 1st for twelve *Auriculas*; and Mr. H. J. Sanders, gr. to Viscountess Cheshunt, Bookham Lodge, Cobham, was 2nd.

In the class for twelve alpine *Auriculas*, Mr. Douglas was again 1st; and Mr. C. Turner was 2nd. A 2nd prize was awarded to Mr. J. Douglas, for a collection of twelve distinct varieties of *Polyanthus*.

Messrs. Jas. Carter & Co., High Holborn, were awarded a large Bronze Medal for a group of Cacti, and a Silver Medal for a large collection of *Cinerarias*, of their prize seedling strain.

A Silver Medal was awarded to a group of Roses in pots, and a collection of rose blooms exhibited by Mr. W. Rumsey, Waltham Cross; also to Mr. Jno. Walker, Thame, Oxon, for a collection of cut roses, including a large number of *Maréchal Niel* and *Niphetos*.

Messrs. Barr & Son, King Street, Covent Garden, had an extensive collection of *Narcissus* and hardy

spring flowers, including many of the newer and better varieties of *Narcissus*, and of *Anemones*, *Muscari*, &c. An award of a large Silver Medal was made.

Mr. C. Turner, Royal Nurseries, Slough, exhibited a group of novelties in *Azalea indica*, and he was awarded a small Silver Medal.

From Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, came a group of plants and flowers, principally hardy, including *Primulas*, *Irises*, *Liliums*, *Narcissus*, several species of hardy *Orchids*, *Dielytra spectabilis* alba, &c. An award of a Silver Medal was made.

A choice and tastefully arranged group of miscellaneous plants came from Messrs. John Laing & Sons, Forest Hill, including good decorative stove plants, several species of *Orchids* in flower, as well as *Cannas*, *Ericas*, *Primulas*, *Spiraeas*, &c. A large Silver Medal was awarded.

FRUIT GROWING IN THE NORTHERN COUNTIES.

APRIL 25.—Under the auspices of the British Fruit-Growers' Association, and in connection with the Newcastle Spring Flower show, conferences on fruit-growing were held on Monday in the hall of the Literary and Philosophical Society, Newcastle.

Mr. A. H. Pearson, F.R.H.S., Chillwell, read a paper on "Apples for Market." The qualities of a good market cooking Apple, he said, were size, appearance, free-bearing, quality, and good constitution. The first thing in obtaining size was to select good varieties; and good cultivation, which was the exception rather than the rule, was needed. The trees should be planted in pyramid form, and worked on a Paradise stock.

It had been said that allotments would spoil the chance of the market grower. His opinion was that they would make the business better than in the past, for, however many fruit trees an allotment grower could grow, they would only whet his appetite, and the appetite of his family for more of them.

Mr. Witherspoon said it was only by growing what would excel in the north of England that they could compete with the teeming quantities of fruit sent from the south of England, and the rest of the world. Their misfortune in the north of England was, that they were a month later than in the south. His experience was that the varieties of Apples suited for growing in the north of England were few.

Mr. Harris, Alnwick, said his experience was, that Apples could be grown in the North of England for the market, but not to compare for size and colour with those grown in the South.

A Northumberland grower thought that up the Vale of the Aln there was some of the finest land for fruit-growing in England. He preferred standard Apples (on the crab) to the Paradise stock. Durham was a poor county, he considered, for fruit, on account of its cold and clayey soil.

Mr. Gordon, the Vice-President of the British Fruit-Growers' Association, explained that the object of the Association in holding these conferences at Newcastle was the encouragement and improvement of fruit-growing in the North of England.

Evening Conference.

Mr. William Goaring, lecturer to the Hants County Council, read a paper on "Culture of Bush Fruit." Climate, he said, was important in the cultivation of this fruit, but, apart from climate, patience and industry were most important. He intended to speak mainly on Gooseberries, red Currants, and black Currants. He advised cultivators to unite in planting the same kinds in quantities, and so gaining a good reputation for the neighbourhood. They should not cultivate from cuttings, but buy from a reliable firm of nurserymen who had a reputation to maintain. It was important to pluck fruit in the green state for the first two or three years. The bushes required time to grow, and they could not while growing them take big crops at the same time.

Mr. Goaring gave information also with regard to red Currants, which were, he said, less profitable than Gooseberries, but sometimes yielded splendid crops, and black Currants, which were more profitable than red.

Mr. Witherspoon said their experience in the North of England was against the growing of red and black Currants. He advised the growing of Raspberries and Strawberries instead.

Mr. George Gordon, of the *Gardeners' Magazine*, read a paper on "Fruit Culture on Small Holdings." They had every reason to congratulate themselves, he said, on the attempt now being made to confer on the agricultural labourers better opportunities

of becoming owners and tenants of land. He could not, however, regard otherwise than with grave apprehension projects of bringing townsmen back to the land, because of the risk of failure—that was to say, bringing them back in large bodies as had been suggested in some quarters. The Fruit-Growers' Association had had to devote considerable attention to the misleading statements made by irresponsible persons with the view of attaining popularity. The Association had endeavoured to show that fruit culture, intelligently carried out, would yield a good return for the capital and labour invested; that in districts favourable to hardy fruits, the returns would be in excess of those obtainable from the ordinary farm crops, and that this culture would be especially suitable for small holdings. Over-production was not, in his opinion, within measurable distance. We imported fruit annually to the value of £6,000,000. Some speakers took that as representing the fruit that we could grow in this country; but, as a matter of fact, more than half represented fruit that they must of necessity be dependent on the foreigner for. It was reasonable to infer that, with increased supplies from the home orchards, there would be a lessened demand for foreign fruits were the consumption of fruit stationary. As a matter of fact, the consumption of fruit has very largely increased of late years, and was likely to continue to do so. He advocated the formation of experimental orchards on gentlemen's estates, and perhaps on large areas of ground, such as were devoted to allotments or small holdings. In the Newcastle district, Apples and Plums would be the most suitable of the large fruits, and Currants, Gooseberries, and Raspberries of the small fruits. In many instances, Strawberries also might be grown with good results. Mixed planting of large and small fruits would, in a series of years, prove the most profitable. He spoke on the benefit of supplying local markets before packing and sending fruit to a distance. He explained methods of planting and culture, and advised careful grading and careful packing. (Extract, *Newcastle Daily Leader*, April 26).

NURSERY NOTES.

MESSRS. JAS. VEITCH & SONS, CHELSEA

WHEN visiting these nurseries on a recent occasion, a very fine collection of *Anthuriums* was observed in a span-roofed house near the main entrance. The plants, in all about 100, occupied the centre stage, the bulk of which were in pots varying from 6 to 10 inches, whilst a few large specimens were in pans some 2 feet across. A few plants of A. Rothschildianum, a pretty variety with spotted spathe about 2 inches wide, and yellow spadix, the result of a cross between A. Scherzerianum and A. S. album, had a pleasing effect amongst the scarlet and crimson spathe of the selected varieties of A. Scherzerianum and A. Andreanum. Of Scherzerianum were noticed some excellent varieties, but of Andreanum there were not many specimens in spathe.

In the Hippeastrum (*Amaryllis*) house, some 400 or 500 flower-scapes were observed, in which colour of flower and substance in leaf and flower were conspicuous features. Previous to the spell of warm weather, as many as 800 scapes with blooms were at one time visible.

In passing through a house in which were a collection of *Clivellas*, we remarked a fine variety called *Acquisition*, whose scapes bore from fifteen to twenty flowers upon each, which were a soft flame colour, with white throat.

In another house, a large number of seedling *Streptocarpus* were observed, some of which were just beginning to bloom. The success achieved by hybridisers with this species is highly creditable, and there are few plants that are more beautiful or delicate in their tints than some of these seedlings, and being of easy culture, and useful for cutting, and lasting in bloom for a long period of time, these plants should become popular.

The raising of new varieties is being undertaken with great energy by Messrs. Veitch, and with marked results. The show of these plants may be expected to last six months longer. *Finette* is white, with seven lines of violet; *Virgil* has pure white

flowers, with a deep chocolate blotch; but the most beautiful is *Acia*, a delicate heliotrope colour with a chocolate-blotched throat. The greenhouse was gay with a beautiful and miscellaneous collection of spring-flowering plants, as *Azaleas*, *Ericas*, *Hyacinths*, *Spiræas*, *Pæonies*, *Roses*, *Clematis*, *Lilium Harrisii*, *Andromedæ*, and the beautiful new hardy Broom (*Cytisus scoparius* var. *Andreasus*).

Some very delicate and useful-looking, double-flowered *Rhododendrons* were also in bloom, and deserve special attention. There were three varieties of these named respectively *R. balsaminiflorum* album, *R. b. aureum*, and *R. b. carneum*. *Narcissus* "Gloire de Linden," is a very beautiful variety of large flowering type, the sepals and petals are lemon colour, and the trumpet of a deep yet bright yellow. The breadth of the sepals and petals, measuring from tip to tip, was about 4 inches, and the top of the trumpet 1½ inch.

AMARYLLIS AT AIGBURTH.

The exhibit of new hybrid *Amaryllis* by Messrs. R. P. Ker & Sons at the Liverpool Horticultural Society's spring show, in St. George's Hall, last month, gave promise of their collection being of high quality, and this added to the fact that Messrs. Ker always do well whatever they undertake, led me to make a visit of inspection to their collection of these bulbs.

A house has been specially built for the culture of *Amaryllis*—a span-roofed one, running nearly due north and south, 56 feet in length and 20 feet in width, the width of the sash-bars apart allowing of the use of panes 20 inches in width, and the height inside is sufficient for comfortable walking. There is a stage running down the middle of the house, and one runs round the sides and ends. The system of culture is very simple, most of the bulbs being in 5½-inch pots, and some of the flowering bulbs are thriving admirably in 5-inch pots, having two flower-spikes and eight flowers on some; in others, one spike and six flowers. The culture pursued is what might be termed a cool one. Starting at 50° to 55°, the warmth is increased gradually to 60°, and after the bulbs have started, some slight amount of bottom-heat is afforded. Ventilation is admitted under the stages and on the west slope of the roof, and shading is dispensed with, except a very light kind that is used on very bright days following a period of dull weather. A variety named *Melpomene* is a giant as to its leaves, these being 3½ inches wide. The flowering bulbs of *Amaryllis* exceed 900, which number may be about equally divided into three tints of crimson. *R. G. Waterman, Wootton, Liverpool.*

AURICULAS AT SLOUGH.

A houseful of 2000 or more *Auriculas* is indeed a fine sight, and that is what may be witnessed on the Royal Nursery, Slough, at the present time, and for the next two or three weeks. A long span-roof house, with a broad level stage on either side, is full of plants in bloom, or nearly so, and as many of them are in small pots, and are stood close together, the number stated above is probably under-estimated. There are show and alpine varieties, the former numerous represented, and decidedly earlier in flowering than their alpine relatives; and many of the selected seedlings of the past year will not bloom for a week or so yet, and it not infrequently happens that the choicer flowers are among those which open latest.

Many of the older varieties of show *Auriculas* are still grown, because collections are in great demand, and it is impossible to supply plants of novelties, as they increase slowly. Some of the older ones are scarce also, such as Colonel Taylor, which can be seen in fine condition at Slough, and which is without doubt unrivalled for the brilliant green of its edge. In the new green edges of later years, such as *Talisman*, the Rev. F. D. Horner, *Abbé Lizet*, &c., there are improvements in tube, paste, and body-colour, but they do not compare with the Colonel's edge, General Neill, *Lovely Ann*, Prince of Greens, *Talisman*, the Rev. F.

D. Horner, and one or two others can be seen in bloom, and some less known, of which there is only a plant or two. *Roll's* green edge, also of a bright green, is remarkable for its zone of red, which takes the place of the usual black body-colour. A plant of the grey-edged *George Lightbody* can be seen as a perfect green edge, not a usual occurrence by any means, but which occasionally happens, but it is only an accident, and will not be permanent.

Of grey edges there are *George Lightbody*, *Lancashire Hero*, C. E. Brown, *Richard Headly*, *Alexander Meiklejohn*, *Confidence*, old Conqueror of Europe, *Robert Trail*, and a few others. Some choice varieties, such as *George Rudd*, are as yet in small quantities only.

Among the newer white edges are *Woodhead's* *Mr. Dodwell*—one of the very best when in its finest character, *Conservative*, and one or two others; and such useful older varieties as *Acme*, *Smiling Beauty*, *Beautifolia*, and *Taylor's Glory*.

Of the newer still there are *Heroine*, *Mrs. Potts*, *Black Best*, and *Sapphire*; and such older ones as C. J. Perry, *Clipper*, *Ellen Laocaster*, *Lord of Lorne*, almost our only red self that is procurable; *Pizarro*, *Mr. Smith*, &c. It was pleasant to renew acquaintance with *Spalding's* *Metropolitan*, an old bright purple self that can still put in a good claim to be grown.

The alpine ones are so numerous and so fine, that it is almost invidious to particularise. One notes with satisfaction that the notched segment is rapidly disappearing, and the edge of the pip is now circular and perfectly smooth. The new varieties are in some instances of large size, but of superb quality. The true white centres increase slowly, but selections of 1890 and 1891 are full of promise. Then the alpine ones grow and bloom so freely; many of the plants at Slough appear to be cultivated in absurdly small pots, but they make huge plants, and produce wonderful trusses of bloom. A dozen of the very finest varieties for exhibition will be found in *Bella Wheelwright*, cream centre; *Albion*, white centre; *Countess*, white centre—a charming shaded blue variety; *George Wheelwright*, golden centre; *Exquisite*, golden centre; *Hotspur*, extra fine, golden centre; *Lady H. Grosvenor*, cream centre; *Mungo McGeorge*, golden centre; *Miss Blagburn*, very fine, golden centre; *Magnet*, golden centre, extra fine; *Mrs. Stafford*, white centre; and *Primrose Dame*, bright pale golden centre, also very fine. *R. D.*

MARKETS.

COVENT GARDEN, April 28.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, &c.]

POTATOES.

NEW POTATOES.—Supplies are gradually increasing in amount. Prices are fairly firm at late quotations. *5s. 6d.* Kidneys, 16s. to 18s.; small, 9s. to 12s.; *Rounds*, 12s. to 14s.; *Canary Kidneys*, 12s. to 18s.; small, 8s. to 10s.

OLD POTATOES.—Colder weather, with prospects of late sowing of the new crop, has caused a tendency to raise prices. Current stocks recently on hand have been reduced by 20 per cent. *J. B. Thomas.*

SEEDS.

LONDON, April 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great Mark Lane, London, S.E., write that the meagre supplies of Clover seeds, &c., which now remain unsold, are being further rapidly reduced by a stream of retail orders coming to hand. Prices generally continue at the moderate level previously noted. For choice *Trefoil*, *Alsike*, and *White*, higher rates are asked. *Sainfoin* is as nearly as possible exhausted. *Spring Tares* move off freely on the foregoing terms now accepted. *Canary seed* keeps strong; stocks, however, surprisingly small. *Hemp seed* is firmer. For *Mustard* and *Rape seed* full values are quoted. *Scarlet Runner Beans* continue remarkably cheap.

FRUITS AND VEGETABLES.

SPITALFIELDS, April 26.—Quotations.—English Apples, 2s. 6d. to 5s. per bushel; American do., 10s. to 20s. per barrel; foreign Tomatoes, 1s. to 2s. 6d. per box; forced *Rhubarb*, 1s. 3d. to 1s. 6d.; natural do., 2s. to 3s. per dozen bunches; *Seakale*, 1s. to 1s. 6d. per punnet; *Cabbages*, 5s. to 10s.; *Cauliflowers*, 4s. to 12s. 6d. per tally; *Greens*, 3s. 6d. to 5s. 6d.; *Carrots*, 2s. to 2s. 6d.; *Spring Onions*, 6s. to 8s. per dozen bunches; *Turnip-tops*, 1s. 6d. to 2s. 6d.; *Swede-tops*, 1s. 6d. to 2s. 6d.; *Sprouting Broccoli*, 1s. 6d. to 2s. 6d. per sack; *Endive*, 1s. 6d. to 1s. 9d.; *French Cos*, 1s. 6d. to 1s. 9d.; *Brussels Sprouts*, 1s. 6d. to 1s. 9d.; *Leeks*, 3s. to 4s.; *Beetroot*, 3d. to 4d. per dozen; *Mustard and Cress*, 1s. 6d. to 2s. per dozen baskets; *English Onions*, 7s. to 7s. 6d. per cwt.; *Belgian Onions*, 5s. 6d. to 6s. 6d. per cwt.; *Carrots*, 1s. to 1s. 6d. per bag of 110 lb.; *Celery*, 4d. to 1s.; *Horseradish*, 1s. to 1s. 1d. per bundle.

BOROUGH, April 26.—Quotations.—*Broccoli*, 7s. 6d. to 12s. 6d. per tally; *Sprouting do.*, 1s. 6d. to 2s.; *Turnip-tops*, 1s. 6d. to 2s. per bag; *Spinach*, 3s. 6d. to 4s. 6d. per bushel; *Greens*, 2s. to 2s. 6d.; *Carrots*, 1s. to 1s. 6d.; *Spring Onions*, 4s. per dozen bunches; *Egyptian do.*, 7s. per cwt.; *Apples*, 2s. 6d. to 5s. per bushel; *Canadian do.*, 12s. to 20s.; *Newtown Pippins*, 12s. to 20s. per barrel.

STRAITFORD, April 26.—The supply at this market during the past week has been so good, that a brisk trade was done at the undermentioned quotations:—*Cabbages*, 4s. to 5s. per tally; *Greens*, 3s. to 4s. per bag; *Cauliflowers*, 3s. to 3s. 6d. per dozen; *ditto*, 11s. to 16s. per tally; *Broccoli*, 2s. to 3s. per sieve; *ditto*, 3s. 6d. to 4s. 6d. per bag; *Cucumbers*, 3s. to 4s. per dozen; *Horseradish*, 1s. to 1s. 6d. per bundle; *Carrots*, household, 2s. 6d. to 3s. per punnet; *ditto*, cutting, 2s. 6d. to 3s. 6d.; *Mangels*, 17s. to 20s. *ditto*; *Swedes*, 20s. to 25s. *d.*; *Onions*, 5s. 6d. to 7s. per dozen bunches; *Egyptian*, 140s. to 160s. per ton; *Dutch*, 4s. 6d. to 5s. 6d. per bag; *Lisbon*, 6s. to 8s. 6d. per case; *Apples*, English, 3s. to 5s. 6d. per bushel; *American*, 15s. to 20s. per barrel.

CORN.

Averages.—Official statement of the average prices of corn, Imperial measure, for the week ending April 23, and for the corresponding period last year:—1892: Wheat, 30s. 8d.; Barley, 25s. 11d.; Oats, 20s. 7d. 1891: Wheat, 40s. 1d.; Barley, 27s. 11d.; Oats, 20s. 6d.

POTATOS.

BOROUGH: April 27.—Quotations:—Bruce Magnums, 80s. to 90s.; Dunbar do., 80s. to 90s.; Fenland do., 50s. to 55s. per ton.

SPIRALFIELDS: April 26.—Quotations:—Magnums, 50s. to 70s.; Imperators, 45s. to 55s.; Bruce Magnums, 55s. to 70s.; Main Crop, 65s. to 85s.; Snowdrops, 80s. to 70s.; Sutton's Abundance, 60s. to 70s. per ton.

STRATFORD: April 28.—Quotations:—Magnums, 52s. to 70s.; Imperators, 70s. to 90s.; Hebrons, 60s. to 85s.; Bruce Magnums, 60s. to 70s.; Scotch Maincrop, 70s. to 110s.; do., Magnums, 65s. to 85s. per ton.

THE WEATHER.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:

Principal Wheat-producing Districts:—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S. Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 23, is furnished from the Meteorological Office:—

"The weather continued cold and changeable, with showers of snow or sleet during the earlier part of the period, but gradually improved as the week progressed, and finally became fine, warm, and dry generally, although showers of rain were experienced in the extreme north and north-west.

"The temperature was below the mean in all districts, the deficiency ranging from 1° to 3°. The highest of the maxima were recorded on the 22nd, when the thermometer rose to 70° in 'England, E.' to 69° in 'England, S.' and to about 64° in several other English districts, and in 'Ireland, S.' In 'Scotland, N.' and the 'Channel Islands,' however, the maximum was no higher than 57°. The lowest of the minima were registered during the earlier days of the week, and ranged from 12° to 19° in Scotland, 20° to 22° in Ireland, and 20° to 27° in England. In the Channel Islands the thermometer did not fall below 31°.

"The rainfall was rather more than the mean in 'Scotland, N.' and 'England, S.W.' and equal to it in 'England, N.W.' In all other districts, however, there was again a deficit.

"The bright sunshine, though very considerable, was not so prevalent generally as during the few preceding weeks; it still exceeded the mean value, however, in nearly all districts. The percentage of the possible amount of duration ranged from 59 in 'Scotland, E.' to 38 in 'England, S.' and 'Scotland, N.' 37 in the 'Channel Islands,' and 34 in 'Ireland, N.'"

NOTICES TO CORRESPONDENTS.

ASPARAGUS MANURE: *G. H.* The most lasting and best manure for this plant is that which contains much nitrogenous matter, and is already decomposed when applied, or one that will soon become in that condition after it has been dug into the land, such as nightsoil, stable manure, animal remains, &c. Part of this nitrogen passes into ammonia, or a nitrate of some kind. Therefore, if you would use an artificial manure, it should be either ammoniac sulphate, potassic nitrate, or sodic nitrate, as all of these contain nitrogen amongst their constituents. The French growers use a little sea salt, plaster, marl, and lime rubbish if the soil is deficient in these ingredients.

BOOKS: *B. C. The Handy Book of the Flower Garden*, by D. Thomson (Blackwood & Sons, Edinburgh and London). Fourth edition, price 5s.—*C. C.* We know of no books that would afford you the analyses you seek.

CATTLEYA INTERMEDIA: *J. D. & Sons.* Many thanks. The appearances are due to the union of three flowers, "synanth.".

CHRYSANTHEMUMS GNAWED BY INSECTS: *R. M., Paisley.* The injury has been caused by weevils, which work at night, when you are least likely to observe them. We have frequently explained how they should be caught.

CORRECTION.—See *Gardeners' Chronicle*, p. 523, in eighth line from bottom, in col. c, for *Dendrobium Phalenopsis Schillerianum* read *D. P. Schroderianum*, *D.*

CUCUMBER: *W. F. S.* There is no trace of eelworms on the roots sent; but, the soil can scarcely be called a healthy medium for the roots of any kind of plant, consisting as it does mainly of partially decayed vegetable matters, and therefore liable to breed under-ground fungus, detrimental to plants. We should advise you not to use any more of it until it is laid some years longer, and then only after aeration, by turning it over in heaps frequently, and exposing it a year or more to sun and air. It should be passed through a fine sieve before making use of it.

CUCUMBER FLOWERS: *W. H. I.* The hairs on the flower are greatly dilated at the base. We will endeavour to give you a fuller answer next week.

EUPHORBIA JACQUINIFLORA: *J. Gray.* Take your cuttings from the young shoots about 3 inches long, and put them in small pots (three or four in a pot) in a warm propagating-frame, and keep them close until rooted. Do not take cuttings until the end of May or beginning of June. *Desmodium gyrans*, apply to Mr. Wm. Bull, Chelsea.

HORTICULTURAL VALUER: *W. S.* We should suppose it to be a business to be learned in the old-fashioned way—that is, by being apprenticed to it. We know of no book giving the information required. Enquire of Mr. L. Upcott Gill, 170, Strand, London, W.C.

INSECTS: *T. T., Ladbroke.* Your Gooseberry bushes were so shrivelled up by dryness that we found no red-spiders, but we met with two minute black Nitidulids, crawling about, which feed on young bloom-buds.—*E. M.* Your young Larch trees are attacked by the Aphidium, *Chermes Laricis*, which has distorted the growth of the young buds, and caused an unnatural growth—water well with soap-suds and tar-water. We found no insects.—*W. M., Oakwood.* Your bulbs of *Dendrobium Phalenopsis* bought at an auction, are attacked by a very minute Tomioid-like beetle new to us. Please send some more specimens to Professor Westwood, Oxford. *I. O. W.*

LAWN WEED: *Anxious Enquirer.* What you send is a field Rush, *Luzula campestris*. It is an indication that your soil is poor. A good dressing of manure with a little sulphate of ammonia added would encourage the Grass at the expense of the weeds.

NAMES OF PLANTS: *Gardener.* 1, *Mercurialis perennis*; 2, *Erysimum Alliaria*; 3, *Lamium purpureum*.—The sender of three plants, whose address is mislaid. 1, *Ornithogalum caudatum*; 2, *O. umbellatum*; 3, *Fritillaria contorta*.—*Japonica.* 1, *Retinospora plumosa aurea*; 2, *Thunia nutkanensis*; 3, *Retinospora pisifera*; 4, *Juniperus communis*; 5, *Ephedra alba*; 6, *Thunia plicata*; 7, *Phyllirea angustifolia*; 8, *Salix caprea*; 9, *Myrdalis solida*.—*Boston.* *Tacsonia manicata* (igneae of

gardens).—*B. H.* *Bifrenaria* (Lycaste) *Harrisonia*.—*J. B.* *Oncidium maculata*.—*L. A. W.* *Veltheimia glauca*: we cannot name varieties of *Colera*.—*J. C.* *Dendrobium chrysotoxum*. *Hurst & Son.* *Cypripedium Boxalli*, *Narcissus mont.* *Dendrobium chrysotoxum*, *Lastraea acra*.—*E. D. L.* 1, *Salix repens*; 2, *Olearia dentata*; 3, *Cestrum* (*Habrothamnus*) *Newelli*; 4, *Malva miniata*; 5, *Begonia foliosa*; 6, *Gemeria elongata*: it is not right of you to expect us to name plants without sending flowers.—*L. J. A.* 1, *Veronica chamadrya*; 2, *Ranunculus repens*; 3, *Sherardia arvensis*; 4, *Adoxa moschatellina*; 5, *Potentilla tomentella*.—*T. R.* *Aristolochia scaccata*.

PARIS INTERNATIONAL HORTICULTURAL CONGRESS OF 1889: *A. Chevalier.* No report of the congress was given in these columns.

PLANTING FRUIT FOR MARKET: *Spes.* If we give an answer to your third question, you will then obtain a better reply than we can possibly give you in the limits of our space. The best manuals on the subject are *Fruit Farming for Profit*, by G. Bunyard, Maidstone, and *Fruit Culture*, by J. Cheal (G. Bell & Sons, York Street, Covent Garden). The latter costs 2s. 6d., the other, we believe, is cheaper.

THE WEATHER PLANT: *Acrostis.* This bubble has burst sometime since, and it would be waste of time to go into the matter again. The name of the plant is *Abrus precatorius*. You will find an illustration of a like phenomenon in the Rain Tree, figured at p. 557; but no one has, as yet, been silly enough to suppose that it can be used to foretell the weather days in advance, or to write an acrostic about it.

VINE DISEASE: *A. G.* Your Vines are evidently attacked by a Sphaeria-like fungus, on which we will report later on.—*G. W. D.* Your Vine leaves are affected with the common Vine mildew. Dust them freely with sulphur, and use sulphur on the hot-water pipes, and mixed with water, and placed in saucers under the Vines.

VINE IN COOL-HOUSE: *Non-bearing.* The cool-house that the Vine is in should enable you to gather fruit in October. We are supposing that the Vine has been pruned already on either the close pruned single stem or stems, or the long rod methods, and is established; but, if the Vine is not pruned, you must disbud the shoots instead, for this season. When the bunches show, reserve one on a shoot, and by preference that nearest to the old wood, or in the case of long rods, that which is nearest last year's wood. Twenty bunches would be an ample crop. Pinch out the point of the shoot one leaf or joint beyond the bunch, or if there is ample space for leaf growth two joints beyond it, rubbing off all shoots not wanted for filling the space or for fruiting next season. If the rods are not likely to break well, unfasten them, and bend the uppermost point of each stem till it is as low down as the lowest bud on the stem, and so keep it till all have fairly broken. Keep the vinery moist, syringing the Vines morning and afternoon; the temperature being kept at about 50° to 55° by day; the night temperature must take care of itself in some measure, but if it can be held at 45° for a fortnight by means of covering on the roof, the checking of growth by cold will be avoided. You had better buy a manual on Grape growing—a good one by E. Moyleux is sold for 1s. by L. Upcott Gill, 170, Strand, W.C.

VINE LEAVES AND SHOOTS: *C. E. S.* No fungus; the white appearance is the unusually vigorous growth of the tomentum; and we believe that it is wholly connected with the cultivation of the Vines, of which fuller particulars would be of interest.

VINES: *C. E. S.* Good strong canes may carry twenty to twenty-five bunches, but they must be assisted with manure during the season; that which you mention in your note will be safe and efficient if you dilute it with three times its bulk of water—and the drainage is good. Unless the foliage is strong, thick, and plentiful, and the young shoots vigorous, one dozen bunches per rod would be a safer maximum for this season.—*E. D.* The leaves sent are greatly injured by red-spider, and were in consequence so thin that they were readily injured by strong sunlight and heat.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

Garden & Forest

1892—Fifth Year.

Is acknowledged throughout the world to be the leading American authority in the field of Horticulture, Landscape Art, and Forestry. Its contents are original throughout, of the highest literary character, and its writers are the foremost European and American authorities. It is invaluable to the Owners of Country and Suburban Homes, Landscape Gardeners, Botanists, Horticulturists, Lovers of Nature, and to all who would cultivate a correct taste in matters pertaining to the disposition and management of gardens and grounds, whether public or private. The illustrations are original and artistic.

Permeated with a spirit of knowledge and refinement.—*Gardeners' Chronicle, London.*

The foremost journal of its class, keeping in touch with every advance in the scientific, artistic, and practical phases of horticulture and arboriculture.—*Boston Herald.*

Holds one of the very first places in periodical horticultural literature.—*Revue Horticole, Paris, France.*

Its arrival is the coming of a wise and intelligent and entertaining friend, who enables us to live more happily because more harmoniously with Nature.—*Harper's Weekly.*

Its character is at once dignified and pleasing, and its contents are scholarly and scientific in the exact sense.—*Chicago Evening Journal.*

No new book on horticulture can for a moment be compared in value to the bound volume of *Garden and Forest*. It is a compendium of new information.—*N. Y. Herald.*

Published weekly. 21s. a year.

A specimen copy may be had free on application to Messrs. **SAMPSON, LOW & CO., St. Dunstan's House, Fetter Lane, Fleet Street, London, England**, to whom orders for subscriptions may be forwarded.

Consumption and Asthma in all its stages instantly relieved by

DR. LOCOCK'S PULMONIC WAFERS, which taste pleasantly, and give instant relief and a rapid cure to Asthma, Bronchitis, Consumption, Cough, Whooping Cough, Phlegm, and all Disorders of the Throat, Lungs, and Larynx. In Rheumatism and Nervous Pains "they act like a charm." Price 1s. 12d., 2s. 6d., 4s. 6d., and 11s. per box, of all Druggists.

HOLLOWAY'S OINTMENT AND PILLS.—Consists of the Delicate.—Those to whom seasons of changeable temperatures are protracted periods of trial, should seek the earliest opportunity of removing all obstacles to good health. This cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsy, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, usually prevailing at this season, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. The Ointment and Pills are highly commended for the facility with which they successfully conquer influenza; they allay, in an incredibly short time, the distressing fever and teasing cough.

DENDROBIUM CAMBRIDGEANUM,

A NEW CYMBIDIUM, CATTLEYA LABIATA, AND MANY VALUABLE ORCHIDS.

ON VIEW MORNING OF SALE, AND CATALOGUES HAD.

NURSERY FOR SALE.—3½ vergées (or 1½ acres), subject to a Ground Rent of £24 per annum currency. Gardeners' Cottage, 5 rooms, 2 attics (new); Forcing-house, 150 feet long by 25 feet wide, three-quarter span, cropped with Tomatoes expected to market in May; also Fig Trees and young Vines (Black Alicante), one year inside. Vinery, 200 feet long by 25 feet wide, three-quarter span, planted with Tomatoes expected to market in June; Vines throughout (Black Alicante), one year inside. Fitted with Hot-water Apparatus.

Asparagus beds, one 300 feet by 12 feet, three years old in full bearing; one ditto, 150 feet by 12 feet, one year old; one vergée of bulbs (Narcissi, Gladioli, Ixias), commencing to market at end of April; 30 perch Potatoes, to market July and later; 1000 young Vines (White Muscat, Black Alicante, and Hamburgh), 50 young Fig Trees, 20 Apple Trees, 20 perch Onions, Parsnips, &c.

Three wells on estate. Land in first-class condition, well-drained and kept. Two sides frontage on good road. Enclosed by good wall (new) and dwarf hedge. The estate is subject to no other charges than ground-rent before mentioned. Possession can be had immediately. Anticipated returned value of crops this season, say, £200 net. The land is prepared and levelled, so that other glass can be immediately erected at simple cost of greenhouses only—that is, no cost would be incurred for levelling, trenching, or drainage. Rental offered for estate as it stands, £100 per annum for term of years. Selling price, £1000 currency.

Further particulars of Mr. C. J. WATTS, 13, Saumarez Street, Guernsey.

To Florists, Nurserymen, &c.

FREEHOLD LAND FOR SALE, or TO LET on long lease of 99 years from Covent Garden, remarkably well adapted for Glass, &c., near Hampton Station, L. & S.W. Ry.

Apply at once to Mr. JOHN EMBLETON, Suffolk House, Hampton Hill.

LONDON, S.E.—TO BE SOLD, a compact NURSERY and FLORIST'S BUSINESS, ½ miles from Covent Garden, comprising 5 Greenhouses, and nearly ¼ Acre of Land. Rent £10 per annum. Also House and Shop in main road, close to railway station. Good reasons for disposal. Lease, Goolwill, Stock, &c., £350.—H. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

MOST FAVOURABLE OPPORTUNITY for any one commencing Business. Proprietor leaving England. A NURSERY (4 miles from Covent Garden), for DISPOSAL, containing 10,000 feet super. of Glass in good repair and condition, splendidly heated with 3350 feet run of 6-inch Hot-water Pipes, Valves, &c. It is stocked with many thousands of Palms and Decorative Plants, and the whole would be sold either as a Going Concern, or the Nursery would be let to a responsible tenant on Lease. IF YOU WANT

BEGONIAS,

H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham, S.E.

GUARANTEES to supply BEGONIAS, first-class Quality, at one-third the usual price, as follows:—

12 Good Single Mixed ...	3s.	12 Mixed Double	6s.
12 Extra Good to Colour	6s.	12 Very Fine, to Colour,	12s.
12 Very Finest, equal to named varieties at 5s. ea.	12s.	12 Extra Fine Double,	18s.

I could give a large number of Testimonials, but the following, I think, will be sufficient to prove the excellence of my Begonias:— Hogg House, Buxted, Uckfield, Aug. 26, 1891.

DEAR SIR,—You will be glad to learn that the Begonias I had from you in the summer have turned out remarkably well. The pinks and terra-cotta are specially fine, some of the blooms measuring near 6 inches across. The flowers are of fine form, and good substance in the petals; plants dwarf in habit, and free-flowering; foliage robust. I shall have much pleasure in recommending them to my friends. Yours truly—

H. C. PRINSEP, Gardener to Viscountess Portman.

To Mr. H. J. Jones.

RYECROFT NURSERY, HITHER GREEN, S.E.

BEG to offer the following from their splendid collection of choice named Florists' Flowers, &c., all in sturdy young stuff, mostly from single pots, guaranteed true to name, and sent Post or Carriage Free on receipt of Cheque or Post-office Order.

Abutilons. Very choice sorts ... Per doz.—s. d.
Coleus. All the most beautiful sorts ... 6 for 2s. 6d. 4 6
Chrysanthemums. Japanese and Incurved. Choice sorts from our splendid collection—
per 100, 15s.; 6 for 1s. 6d. 2 6
" **"W. A. Manda,"** the new Golden Yellow Ostrich Plume, splendid ... 6 for 1s. 6d. 4 6
" Six superb new varieties, including "Gloire du Rocher," "Florence Davis," and "Vivand Morel" ... 7s. 6d.
Carnations and Picotees. A very choice collection, including all the newest and finest sorts, 5s., 9s., & 12 0
" Six very choice sorts, including "Germania" ... 5s.
Dahlias. Show and Fancy, a magnificent collection, including all the finest varieties, ... 6 for 2s. 6d. 4 6
" Show and Fancy, new and very choice sorts, 6 for 5s. 9 0
" Cactus-flowered. A superb collection, including the best of recent introduction ... 4 for 2s. 6d. 4 6
" Cactus-flowered. New and very choice sorts ... 6 for 5s. 9 0
" Cactus-flowered. Six grand new varieties, including "Beauty of Arras" ... 8 6
" Single-flowered. A charming collection, including the newest ... 6 for 2s. 6d. 4 6
" Single-flowered. Six new and very select sorts, 5s. 9 0
" Pompon or Bouquet. A very choice assortment, 6 for 2s. 6d. 4 6
" New Marguerite. Single, pure white, very pretty, each, 2s. 6d.; 3 for 6s. 6 0
" New "Tom Thumb." Single, very pretty, only 1 foot high, 3 for 2s. 6d., 6 for 4s. 6d.
Fuchsias. Single and double flowered. All the most beautiful varieties ... 6 for 2s. 3 6
" New and extra choice ... 6 for 3s. 6d. 6 0
" Six superb new varieties, including "Mrs. Charles Daniels" ... 4s. 6d.
Heliotrops, "White Lady." Fine for pot culture, deliciously scented ... 6 for 2s. 3 6
Musk. New double-flowered ... each 9d., 3 for 2s. 2 6
" Harrison's Giant. Splendid variety ... 6 for 1s. 6d. 4 6
Marguerites or Parisian Daisies. Yellow or white ... 6 for 1s. 6d. 2 6
Pelargoniums. New Zonal. All Autumn struck—
" Single-flowered. From our grand collection; splendid for pot culture ... 6 for 2s. 6d. 4 6
" Six new varieties of 1891 (Pearson's) 7s. 6d.
" Double-flowered. Zonal. Grand varieties; fine for pots ... 6 for 2s. 6d. 4 6
" New double-flowered Ivy leaved. Magnificent varieties for pots or hanging baskets, vases, &c., very choice sorts ... 3 for 2s., 6 for 3s. 6d. 6 0
" Gold and silver tricolors. The most beautiful sorts ... 6 for 2s. 6d. 5 0
Streptosolen Jamesoni. Beautiful plant for the greenhouse ... each 9d., 3 for 2s.
Tropaeolum "Comet." Brilliant scarlet, splendid for pots ... each 6d., 3 for 1s. 6d.
Begonias. Tuberous-rooted hybrids. Magnificent single-flowered varieties. Immense blooms of the most beautiful colours. Strong flowering tubers, very choice mixed ... per 100, 30s.; 6 for 2s. 6d. 4 6
" Extra choice sorts, for pot culture ... 6 for 5s. 9 0
" Double-flowered, very fine mixed ... 9s. and 12 0

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1892.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH, THE EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 170,000 of these Machines have been sold since they were first introduced in the year 1856, and thousands of unsolicited testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady	£1 15 0
To cut 8 in., do. do. ...	2 10 0
To cut 10 in., do. by a strong youth	3 10 0
To cut 12 in., do. by a man	4 10 0
To cut 14 in., do. do. ...	5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn	£6 10 0	To cut 22 inches, can be worked by two men	£8 10 0
To cut 18 inches, do. man and boy	7 10 0	To cut 24 inches, do. do.	9 0 0
To cut 20 inches, do. do.	8 0 0		

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-slay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness.—

DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 8 0

GREEN'S PATENT LAWN TENNIS COURT MARKER.

No. 2412.

The Best Marker made. Size with 1 wheel for Ordinary Courts, price 14s. Do., with 3 wheels, 17s.

Size for Clubs and Large Grounds, price £1.

Small Bag of Marking Composition, 9d.

REDUCED PRICES OF GREEN'S Patent ROLLERS,

For Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths, &c.

Suitable for Hand or Horse Power.

Prices of Rollers in 2 parts.

Diam.	Length	2 s. d.
16 in. by 17 in.	..	2 5 0
20 in. by 22 in.	..	3 5 0
24 in. by 26 in.	..	4 10 0
28 in. by 28 in.	..	5 0 0
30 in. by 32 in.	..	7 10 0

Special quotations made for Rollers, 3 feet, 3½ feet, and 4 feet Diameter, fitted with Shafts for one or two horses.

GREEN'S PATENT GRASS EDGE CLIPPER

Size and Price, 7 inches wide, 7 ins. diam., £1 16s. Packing Case, 3s.

Specially designed to meet a want which has long been felt in cutting the overhanging grass on the edges of walks, borders, flower-beds, &c., and to do away with the tedious operation of cutting with shears.

A very useful and serviceable Machine.

MAKERS OF PATENT STEEL OR IRON ANGULAR-CHAMBERED AND TUBULAR

HOT-WATER BOILERS

AND OTHERS WITH SHELVES, AND HOLLOW OR ORDINARY CAST-IRON GRATE BARS. VERTICAL SADDLE BOILERS, &c.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.

PRICES, With Grassbox.

To cut 6 in.	£1 5 0
To cut 7 in.	1 13 0
To cut 8 in.	2 5 0
To cut 10 in.	3 0 0

Delivered Carriage Free at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland. The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day as they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser. N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places. HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON; or they can also be had of any Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

THE QUEEN'S CATTLEYA.

CATTLEYA VICTORIA REGINA, SANDER.

MESSRS. PROTHEROE & MORRIS

Have received instructions from Mr. F. Sander, to **SELL** by **AUCTION**, at the Central Sale Rooms, 67 and 68, Cheapside, London, E.C.,

On **FRIDAY, May 13, 1892,**

125 FINE PLANTS

OF

CATTLEYA VICTORIA REGINA (SANDER).

THE NOBLEST OF THE NOBLE,

the gem of the Genus. We are proud of the honour of such a magnificent introduction, worthy to bear the name of a Royal Lady, the most illustrious and noble of her race.

This new species is from one of my oldest and most experienced exploring collectors. It is a true and abundantly distinct Cattleya, as also a novelty of the first rank and greatest merit, free-growing, free and abundant flowering, lasting in perfection a long time. The flowers are borne in clusters well above the foliage, from eight to twenty on each inflorescence; individually, they are 6 inches across, compact, of faultless shape, and firm lustrous substance.

The sepals and petals are of an exquisite soft rosy-crimson colour, with more or less wavy margins, where the colour is of a deeper shade, the base of the sepals and petals being whitish, and the latter are reticulated with a crimson tracery that is a most charming addition to the magnificence of the blossoms. Over the petals of the flower, when opening, there is a hue of colour resembling new bronze. This is only pronounced when the flowers are in process of development, and sometimes appears as a distinct line in the centre of each sepal and petal; the bronzy glistening hue is sometimes accompanied with spots and blotches of a blood-red crimson and purple, altogether gorgeous and unique. When, however, fully open, the flower loses this colouring.

Of the many grand Cattleyas we have introduced, this is, so far as absolute beauty is concerned, the most beautiful. The grandeur of the spike may be imagined when we can prove by a plant in the sale, that it carries as many as twenty flowers on a spike, and each of these is 6 inches across.

We showed the plant before the meeting of the Royal Horticultural Society on Tuesday last and its beauty was considered such as to gain it the Award of the highest merit as a new species.

It can only be compared to *Lælia elegans* Turnerii, of a lighter colour, with less elongated lip, which, however, is double the width in our new species.

We are indeed pleased to give to such a magnificent novelty, the name of Her Most Gracious Majesty our Queen.

F. SANDER & CO. ST. ALBANS.

THE

Gardeners' Chronicle.

SATURDAY, MAY 7, 1892.

THE WESTERN CAUCASUS AND ITS FLORA.

ABASIA (or Akkhasia) is situated in the western part of the Caucasus, between the shores of the Black Sea and the chief Caucasian mountain range. It extends as far north as 43° 20', and as far south as 42° 20' N. lat. On the north it borders upon the Chelnomorsky Okrug (Black Sea district); on the south, upon Mingrelia; on the south-east, upon Svanetia; and on the east, upon the Kuban district. The greater part of the country consists of a labyrinth of lofty mountains, and only the narrow tract along the seashore is more or less level. At present, only this shore tract (about 15 mile wide) is peopled, but formerly settlements existed everywhere among the mountains. Sheltered from the cold north-east winds by the high wall of the chief Caucasian range, which reaches in these latitudes to a mean height of 9500 feet above the sea, and exposed to the influence of wet and warm south-westerly winds, Abasia enjoys a very mild climate, which may be compared with the south of France or the north of Italy. The mean annual temperature in the low-lying coast part of the country is about 15° C., the mean temperature of the winter months being about 7° C., and that of the summer months about 23° C. Frost below 1° or 2° C. is very rare; the lowest degree registered was 7° C., in 1874. The mean humidity is very considerable, about 60 to 70 per cent. The annual rainfall reaches to about 2000 mm. (about 84 ins.). Such a warm and wet climate gives rise to a luxuriant and very distinct vegetation, an analogy with which we are unacquainted with in Europe. It is true, a considerable percentage of the species forming Abasian woods is made up of common European trees: Beech, Hornbeam, Ash, Chestnut, Elm, &c. But the character of their growth is very different from that of the European species generally. Among the peculiarities of Abasian forests must be noticed, firstly, the extremely high limits of their vertical range, attaining from 7000 to 7500 feet above the sea; secondly, their extraordinary thickness; thirdly, their great variety (the woods are made up of more than 100 different species of trees and shrubs); fourthly, the presence in the lower forest regions of numerous climbing plants; fifthly, a very curious fact of concurrent vegetation, at the same heights and places, of coniferous, deciduous, and evergreen trees, the latter ascending considerable heights, as far as the upper limits of the forests (*Rhododendron ponticum*, *Quercus castanifolia*, *Ilex aquifolium*, *Lauro-cerasus*). In a vertical direction five zones of forest vegetation are to be observed. Their demarcation is rather difficult, all zones gradually passing one into another. The difficulty increases because of the vast limits of the vertical distribution of the chief part of the forest trees, the greater part spreading them-

selves over heights up to 4000 feet above the sea, whilst the vertical distribution of the others is comprised in the widest limits, from the sea-level to the upper boundaries of the woods (for example, common Hazel, Holly, Rhododendron, Azalea).

Along the coast line everywhere in the country grow very thick and almost impenetrable coppices, composed of various spiny and evergreen shrubs, viz., *Barberry*, *Laurus nobilis*, *Ruscus aculeatus*, *Palurus aculeatus*, *Vitex agnus castus*, *Cistus creticus*, &c. This zone presents some analogy with the Maquis of the Mediterranean region.

Then there is the zone of mixed wood, which covers all the coast lowlands and the nearest valleys and hills. This zone is characterised by great variety in the plants it is composed of. The extreme thickness of the woods, and the abundance of various lianas and thorny shrubs are also striking features of this zone. It is very difficult to indicate the prevailing plants peculiar to it, all trees being equally distributed in the wood. Among the most common may be mentioned—Common Oak (*Quercus sessiliflora*), Hornbeam (*Carpinus betulus*), and *Carpinus diuensis*, *Ostrya carpinifolia*, *Ficus Carica*, *Diospyros lotus*, Elm (*Ulmus campestris*), Ash (*Fraxinus excelsior*), *Alnus glutinosa*, *Acer campestre*, *Pterocarya caucasica* (the latter growing exclusively on the marshy river banks). The underwood is represented by various European and oriental shrubs—*Crataegus oxyacantha*, *Rhododendron ponticum*, *Cotoneaster pyracantha*, *Azalea pontica*, *Ruscus hypophyllum*, *Rhus Cotinus*, Holly, *Philadelphus coronarius*, *Cornus mascula*, and *C. sanguinea*, &c. The prevailing lianas are—*Smilax excelsa*, Wild Vine, Ivy (*Hedera colchica*) honeysuckle, Traveller's Joy (*Clematis vitalba*), *Periploca graeca*, *Tamus communis*, *Rubus fruticosus* var. *discolor*, &c.

Among the herbaceous plants growing in these woods must be noticed *Epidemium pinnatum*, *Rhagadiolus stellatus*, *Psoralea bituminosa*, *Argyrololium calycinum*, *Cyclamen Cornu*, *Phytolacca decandra*, *Sambucus Ebulus*, *Hypericum ramosissimum*, great variety of *Orchidaceae*, &c. Ferns are very numerous in this zone. The most frequent is *Pteris aquilina*. This Fern often attains a great height (over 7 feet); it generally covers vast tracts, where formerly settlements existed, and appears, as it were, a sign of decaying culture. *Oncoclea struthiopteris* is also a very common Fern; it grows likewise over large spaces. The other Ferns, such as *Polypodium vulgare*, *Asplenium trichomanes*, *Scelopendrium officinarum*, *Adiantum Capillus-veneris*, *Woodsia fragilis*, *Ceterach*, &c., generally grow on rocks and trunks of trees. In appearance, the forests of the zone we now speak of, can scarcely be called fine ones. It is true that in spring, when the magnificent Azaleas and Rhododendrons are in full flower, and the sweet-scented clusters of honeysuckle hang down everywhere from branches of trees, they are charming. But in summer, when they are full of feverish miasma, the intolerable thorns of *Ruscus*, *Smilax* and *Rubus*, take away all the pleasure of rambling about them.

Much more attractive are the woods of the zone immediately following, which may be called the zone of Beech and Chestnut. These woods do not contain such a variety of plants as those of the preceding zone. They grow much more sparsely, and are generally composed of select timber trees. One may meet here with excellent specimens of Beech and Chestnut, sometimes as much as 20 feet in circumference. The space between the trees is covered with a thick underwood of *Rhododendron ponticum*, *Azalea pontica*, and Caucasian Bilberry (*Vaccinium arctostaphylos*), such woods prevail in belts, while glens are generally overgrown with evergreen forests of Box (*Buxus sempervirens*), and Laurel (*Prunus laurocerasus*), with an admixture of Yew, Beech, Alder, Plane (*Acer pseudoplatanus*), &c. Commencing at the height of 7000 to 7500 feet, extends the zone of coniferous woods. It is made up of fine ship-timber trees of *Abies Nordmanniana*, and *Picea orientalis*, with an admixture of Beech,

Maple (*Acer platanoides*), and Mountain Elm (*Ulmus montana*). The trees grow rather sparsely; between them many plots of various size remain vacant. These plots are thickly covered with various sub-alpine herbs, viz., *Aconitum orientale*, *Campanula lactiflora*, *Cephalaria alpina*, *Teleskia speciosa*, *Lilium monadelphum*, *Symphytum asperum*, *Hieracium pubescens*, which generally attain such gigantic height as entirely to conceal a horseman. The underwood of these forests consists of the same shrubs as in the preceding zone, viz., of Laurel, Rhododendron, Azalea, Holly, and *Vaccinium arctostaphylos*. It is very strange to see these evergreens growing side by side with Fir, Spruce, and other representatives of the cold North. The woods retain this character to the height of 6000 to 6500 feet. At this elevation to the plants just described are added some northern trees and shrubs. Mountain Ash (*Pyrus aucuparia*), *Viburnum laetana*, *Daphne Mezereum*, *D. pontica*, *Ribes petraeum*, *Lonicera orientale*, &c., which form a very characteristic zone at the height of 6000 to 7000 feet. We may call it the liminary zone of woods, for immediately beyond it commences the region of alpine meadows. The upper limits of the woods are generally marked by dwarfish trees, Birch, Hazel, *Acer Trautvetterii*, Mountain Ash, *Sorbus aria*, Laurel, and in many places by *Quercus castanifolia*. We must note as a very curious fact the presence at the utmost limits of Abasian forests both of such southern species as Laurel, *Quercus castanifolia*, Ilex, and of the typical forms of the North, as Birch, Mountain Ash, and *Mezereon*. The alpine meadows of Abasia differ essentially from those of Switzerland. Their herbs grow more luxuriantly, and are generally of a higher stature. Particularly, immediately beyond the boundaries of the woods, does the alpine vegetation of Abasia resemble but very little that of the true alpine meadows, large tracts being overgrown by succulent and tall herbs, as B-I flowers (*Campanula lactiflora*, *C. latifolia*), *Columbaceae* (*Aquilegia olympica*), *Teleskia*, *Monkshood* (*Aconitum orientale*), *Caucasian Lily* (*Lilium monadelphum*), &c.; the greater part of which, as we have seen, occur also in the sub-alpine zone. At higher elevations the herbs grow gradually lower, and at the height of 8000 to 9000 feet the beautiful pastures extend, covered with brilliant flowers, which form a natural carpet of the richest colours.

Among the alpine plants, many are conspicuous for their beauty. In the first place must be mentioned, *Betonica grandiflora*, the queen of Caucasian wild flowers, whose magnificent inflorescence, consisting of great purple blossoms, forms a rich natural bouquet; then a sort of *Geranium* (*G. Renardi*), with velvety, slightly incised leaves, and showy violet flowers; *Colombine* (*Aquilegia olympica*), with its great blossoms of sky-blue; *Hedysarum obscurum*, with magnificent crimson clusters; *Anthemis Rudolphiana*, having fine snowy leaves and golden capitulas, &c. Among the rarer plants are:—*Thalictrum triternatum*, *Daphne sericea*, *Carex tristis* *B. Lasica*, and a series of plants described by me as new ones, viz., *Geum speciosum*, a tall handsome plant, with great cordato-orbicular lyrate leaves and numerous orange flowers; *Ranunculus Helenae* (very curious little plants, with simple oval leaves, having three denticles at their apex, with fleshy roots and a very restricted number of pistils (three to five)); *Delphinium pyramidatum* (fine and shapely plant with large fragrant flowers of pale lilac growing in large panicles); *Scutellaria Helenae* (lovely little alpine plant, with beautiful pink flowers, allied to *S. pontica*, *C. Koch*), &c. The rocks crowning the alpine heights are never bare, but are always thickly overgrown with dwarfish bushes of *Rhododendron caucasicum*, *Empetrum nigrum*, and *Juniperus nana*, or covered by a dense turf of various arctic and alpine plants, viz., *Dryas octopetala*, *Sibbaldia parviflora*, *Saxifraga sibirica*, *S. levis*, *S. exarata*, *Draba imbricata*, *Campanula tridentata*, *Gentiana pyrenaica*, *Potentilla Oweriana*, *Alchemilla sericea*, &c. Among the plants just enumerated, the two latter are the most conspicuous, the first having magnificent snow-white

silvery leaves and roseate flowers, the second being remarkable for its silken leadlets. *N. Alboff*, University, Odessa.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

CATTLEYA VICTORIA REGINA,* *n. sp.*

This remarkable new species may roughly be said to resemble *Cattleya Leopoldi* in its growth, and has flowers resembling those of a good form of *Laelia elegans* Turneri, but with a more wax-like texture and a more flat arrangement of all the segments. It is remarkable, too, that the pseudobulbs, as seen in the different specimens imported, are all more or less compressed, and in some cases exhibit distinctly the two prominent edges seen in some of the forms of *Laelia elegans*. The flowers, which are borne from six to twenty on a spike, are six inches across, and flatly displayed after the manner approved by lovers of showy Orchids. The sepals and petals are of an exquisite soft rosy-crimson tint, white at the base; the petals exhibiting a delicate tracery of light crimson and some minute crimson spots; they are also waxy at the edges. The base of the labellum is white, pencilled with rose; the broad flat front lobe and tips of side lobes being violet tinted with crimson. In its younger stage there is a rich bronzy hue over the sepals and petals, which passes off into the richer rosy-crimson tint as the flower matures, but the presence of the so-coloured younger flowers, and darker mature ones, on the one inflorescence, must make an admirable combination. It is an unexpected introduction, and one would look for the influence of some gorgeous *Laelia*, as it at first sight appeared to me to be a natural hybrid of bi-genetic origin, but examination of the pollinia of one flower gave indications only a pure *Cattleya*. It was imported by Messrs. F. Sander & Co., who first flowered it, and obtained a First-class Certificate for it at the Royal Horticultural Society, on May 3. From the different appearance of the plants of the importation there is every reason to believe that the variation in the flowers will be considerable, and this, first to flower, beautiful as it is, may be surpassed by those which follow. *James O'Brien*. [We shall give an illustration in an early number. En.]

ODONTOGLOSSUM ANDERSONIANUM PULCHERRIMUM, *n. var.*

Among a wonderful series of natural hybrid *Odonoglossums* of the *O. Andersonianum* section, from R. Brooman White, Esq., Arddarroch, Garelochhead, N.B., is the one which I propose the above name, on account of its extraordinary beauty, and the richness of its colouring, the arrangement of which is indescribable. In colour it more nearly resembles that form called *O. Ruckerianum*, but its segments with their long tendril-like recurved tips, call to mind *O. cirrosum*. The sepals and petals are nearly equal at their bases, and in a band up the middle, one-third their length they are cream-coloured, with three to five bright brownish-red blotches. The remainder or the greater part of the sepals and petals are bright rosy-purple with a well-defined lemon-yellow margin, the reverse of the flower being almost as richly coloured as the front. The long narrow labellum, which is serrated at the edge, is clear yellow, with one irregular brown blotch in the centre. It is wonderfully beautiful and elegant, and it is not easy to satisfy oneself as to its right parentage. *James O'Brien*.

* *Cattleya Victoria Regina*, *n. sp.*—Pseudobulbs 1 to 1½ ft., slightly compressed, and exhibiting often two edges; leaves 2 to 3 on a pseudobulb, hard and fleshy, 3 to 6 ins. long, 2 to 3 ins. broad, often slightly concave; peduncle 3 to 9 ins. long, bearing (as seen on the imported specimens) 6 to 23 flowers; flowers 6 ins. in diameter; sepals, oblong, lanceolate, obtuse; petal similar but broader, and slightly wavy at the edge; lip 3-lobed; side lobes ovate oblong; isthmus short; front lobe broadly reniform; colour, soft rosy crimson, with darker veining on the petals and white base to both sepals and petals. Imported and flowered by Messrs. F. Sander & Co., of St. Albans. *James O'Brien*.

ODONTOGLOSSUM PLATYCHEILUM, n. sp.*

On March 22, a new species of *Odontoglossum* was submitted to the Orchid Committee of the Royal Horticultural Society, and an Award of Merit was recommended, subject to the plant receiving a name. At the time but one flower was expanded, but owing to the kindness of Mr. J. H. Simpkins, gardener to Mr. R. J. Measures, of Cambridge Lodge, Flodden Road, Camberwell, S.E., I have been enabled to see the plant later, when two flowers, as represented in the accompanying cut, were fully expanded. The habit of the plant is stiff in appearance, owing to the leaves standing almost erect from the pseudobulbs; but this character may not be constant.

specific name has been suggested in reference to it. It is of a very soft pink colour, with deep crimson-purple blotches scattered over the surface, and giving a charming effect to the whole flower. At the base of the lip (which from the side view will be seen to be furnished with a long claw), there is a bilobed callus, each lobe being itself bidentate. The column is white and wingless, but somewhat distended on each side of the stigmatic cavity.

Unfortunately, it is impossible to record with accuracy the native country of this species, which is probably Central American or the Cordilleras of Colombia. The name of the introducer, and the

tious; yet we may fairly assume these would still apply. Mr. Mer says the larger roots first start into growth; but it must be observed that none of these start until from ten to fifteen days after growth has commenced in the upper branches of the trees. Growth, he says, starts first in the extremities of these larger roots, and that the whole growth underground follows exactly that of the top, only in a reversed order. Now, I presume to account for these facts on the following reasoning, viz., the ground in winter, at a certain depth, is warmer than at the surface. Consequently, the larger roots being more deeply embedded, and their extremities in a more uniform and warmer temperature, at once respond whenever top growth has fairly commenced.

The medium and smaller roots, which will be found quite near, or immediately under the surface, require still more warmth—a longer season, so to speak—to penetrate the cold surface soil, which at this season may have only been recently released from a frozen condition.

To account for these smaller rootlets finishing their growths first, we may infer that these, from their first start, being so much smaller, require less nourishment; again, this nourishment being so much earlier cut off, through the extreme heat and drought in the soil immediately surrounding them, forces on maturity, or cessation of growth, long before the medium, or, at any rate, the larger roots, these being in a deeper therefore moister medium, give up. We get a capital instance of roots starting earlier or later into growth, in a viney where these are allowed the run of outside and inside borders.

A particular instance bearing on the rise of growth came under my notice some seven years ago, while engaged felling large timber—Larch—of from sixty to eighty years' growth. Felling commenced in the earlier part of January. At this time snow and frost covered the ground, but by the middle of February this had given way, and beautiful weather with bright sunshine supervening, growth was easily discernible in the tops as the trees were cut down. Up to this time, I had not as yet discovered what, in a fortnight, became general, viz., a remarkably strong flow of sap, and this, of course, of a strongly resinous character, which made the work of felling extremely laborious. It was from now forward in every tree cut down, and continued to pour out and over the top of the stump for several days.

Since reading your article on Mr. Mer's experience, this instance of the rise of growth or "sap" at once, and forcibly, occurred to me. That the rise of growth, however, is not dependent upon the rise of sap, according to the ordinary supposition, was here demonstrated quite plainly, because for a fortnight or three weeks previously growth in the tops was quite in evidence by the swelling buds and bursting cones (young). Give us every other week, if you can, such problems as Mr. Mer's—good studies for young gardeners. *Pomum.*

FIG. 84.—ODONTOGLOSSUM PLATYCHEILUM: FLOWERS WHITE, WITH PURPLISH BROWN SPOTS.

Only two flowers were borne on the short scape; the sepals and petals are similar in shape, creamy-white, with chestnut-brown blotches at the base, while the two lower sepals are prominently keeled outside. The lip is very large and beautiful, and the

* *Odontoglossum platycheilum*.—Pseudobulbs ovoid, slightly compressed, acropituous, monophyllous. Leaves oblong lanceolate, 8 to 9 in. long, 1 to 1½ in. broad, becoming narrowed and conduplicate at the base. Scape short, erect, two (or more?) flowered, bracts ovate-acute, pale green, ½ in. long. Flowers 1½ to 2 in. in diameter, pedicels 1 to 2 in. long. Sepals oblong-lanceolate, white, with chestnut-brown blotches at the base, the two lower ones with a prominent median keel behind. Petals similar, but without the median keel behind. Lip clawed, with a broadly cordate reniform blade, slightly undulated, pale rose, with crimson-purple blotches scattered over the surface. Crest bilobed, each lobe being bidentate. Column creamy-white, clavate, widened at each side of the stigmatic cavity, *J. Weathers.*

date of the introduction, are likewise unknown; the only trustworthy information we have regarding its history is, that the plant was purchased by Mr. Measures with an odd lot of Orchids when the Downside collection was sold. It may, therefore, be assumed that the plant has been in cultivation for about five or six years at least, and it is interesting that it should have gone even this number of years without flowering. *John Weathers.*

SPRING GROWTH OF TREES.

(Continued from p. 492.)

ROOT GROWTH.

IN regard to the root growth, as mentioned by Mr. Mer (see p. 330), the question seems to me more difficult to account for upon the same deduc-

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM HALLI CRISTATUM.

A FLOWER of this beautiful variety comes from G. R. le Doux, Esq., Langton House, East Monsey. It is a fine form of *O. H. leucoglossum*, but its chief beauty lies in the well-developed and beautifully-tinted crest at the base of the labellum, and which is of creamy white tinged with orange, and the finer filaments are pencilled with red. With this came the beautiful *O. Andersonianum*, a rich yellow, crimson-spotted *O. excellens*, a fine *Miltonia Roezlii* magnifica, and other Orchids, which bespoke the good quality of the varieties, and the culture pursued at Langton House.

ORCHIDS AT CAMBRIDGE LODGE.

Among the plants noticed in flower on the occasion of a recent visit to Mr. R. J. Measures' garden, was a fine form of *Dendrobium nobile* var. *nobiliss.* with many large flowers, which, although new varieties and hybrids are constantly cropping up, may

still claim to hold its own against them all. Side by side with this was a grand plant of *D. Ainsworthii* roseum, the flowers of which are white, suffused throughout with a deep tint of rose-pink, the lip being of rich crimson. Another fine *Dendrobium* was a magnificent specimen of *D. speciosum* var. *Hilli*, a plant that was pushing up seventeen spikes of flower, and will presently make a noble display.

The collection of *Cypripediums* is perfection itself, scarcely a taint being noticed on any one plant—a fact reflecting great credit on Mr. H. Simpkins. One plant in particular to which my attention was called was a specimen of *C. Charles Canham* ×, which had made seven strong growths simultaneously from an old one. A very good variety of *C. Mrs. Canham* × was observed; it had a large, well-shaped flower, *C. leucorrhodum* × is represented by a large specimen, which was pushing up many strong flower-spikes. There is much beauty and character in this Veitchian hybrid which should recommend it to every cultivator of *Cypripediums*.

The collection is rich in seedlings of *Cypripedium*, many hundreds of these being observed in all stages, and many of the crosses effected are very distinct, and will be much valued when they become known. *Cypripedium Sallierii* Hyeanum, when seen to perfection, has a rich colouring, the segments being of pale greenish-yellow, with very dark markings.

A splendid bank of *Odontoglossum vexillarium* consisting of about 350 plants, all of which may be said to be of the best, are just about to open their flowers, many of which, I was told, are exquisite—one in particular, *O. v. Mesuresianum*, being of pure white, and of good size. *Odontoglossum Alexandræ*, and others of that section, are in a fine healthy condition, and make a goodly show. *Cephalotus follicularis* and *Dionæa muscipula* seem well suited in the *Odontoglossum*-house, and on the former numerous pitchers of good size and colouring were observed. *Odontoglossum grande* is at rest, and is kept totally dry for about three months. The plants seemed to be in sound condition, and one could not fail to notice the large size and great substance of the leaves and pseudobulbs.

Many forms of *Cattleya Trianae*, rich in colouring, are going out of bloom; a special variety, called *C. T. Ernestii*, has a flower with striped petals, and otherwise finely coloured. A large specimen of *Coleogyne Massangeana*, 3 feet across, not now in flower, makes a fine show in its season.

In the *Masdevallia*-house were *M. Mooreana*, with its rich long-tailed flowers, and several good forms of *M. chinensis* and its allied species. *Vanda Parishii* Marriottiana, when once seen, is not soon forgotten, and of this charming plant one was in flower; the colour is rich, and the individual flowers larger than those of *V. tricolor*; and a flower-spike carrying eight flowers cannot fail to excite admiration. *Vanda tricolor*, *suavis*, and some of their varieties, were also found in capital order.

CYMBIDIUM Eburneum.

This is probably one of the most useful of its family, as it is a species easy to cultivate, giving a good number of substantial snow-white flowers, which remain perfect for a long time. At Holly Bank, Hornsey Lane (Mr. Reynolds, gardener), there was recently a very fine specimen full of large showy blossoms, somewhat distinct from the ordinary *C. eburneum*, and which resembles a drawing of *C. eburneum* var. *Dayanum*; this latter variety has a larger labellum, and is rather heavily spotted with crimson. It is a desirable variety, and well worth cultivating.

ORCHIDS AT AVENUE HOUSE, SOUTHEAST.

These at the residence of C. S. Harris, Esq., though only a few miles out of the smoke of London, are quite equal to any spot in Surrey or the other neighbouring counties. During the past year big strides have been made by Mr. Harris in horticulture, and he has, moreover, become interested in Orchid culture in particular. Three houses are set apart for these plants, which, under the careful attention of the gardener, Mr. Trowell, are in a very creditable con-

dition. Among the *Cypripediums* worthy of note was, on the occasion of a recent visit, a splendid variety of *C. Curtisii*, which has been in flower for nearly six months, and at the time of writing, the flower looks strong enough to endure as long again (which of course is not possible). *Cattleyas* receive a large share of attention, and the remaining flowers of many good forms of *C. Trianae* were still making gay the *Cattleya*-house. *C. Schroderae* is represented by several lovely forms, and is a general favourite for its beauty and delicate aroma. Several good forms of *C. Mendellii* were in flower, one a magnificent form with sepals and petals, and a large dark heavily-fringed lip. *Dendrobiums* were in full beauty, although it is late for seeing *D. Wardianum* at its best; but fine forms of *D. Findlayianum*, *D. nobile*, *D. Dalhousianum*, *D. simbristatum* oculatum, made the *Dendrobium*-house very bright looking. Special attention is paid to a collection of *Phalænopsis*, among which were noted some good plants of *P. Schilleriana* and *P. grandiflora*, now out of flower; the firm, clean leaves on which can be seen no blemish whatever, testify to the care and skill with which they are treated. *Odontoglossums* and other cool species are well represented, and are pushing up their flower-spikes.

ORCHIDS AT THE GRANGE, HACKBIDGE.

The lover of Orchids always feels himself well repaid for a visit to the garden of A. H. Smee, Esq., for be it the depth of winter, or the height of summer, there is always a good display of well-grown choice species. The warm summer-like weather of the early part of April did wonders in promoting the flowering of plants, and for this alone—forgetting the hard work caused by the drying up of the plants, and the need for much watering—the gardener should be thankful.

A few of the plants in flower worthy of note consisted of a very fine form of *Cattleya Trianae*, having broad segments, and a deep crimson-coloured lip, with a pure white line running longitudinally through the centre of it. This plant is probably one of Mr. Smee's best forms, and a striking variety; several other good forms of *C. Trianae*, and a splendid *C. Mendellii*, flowering for the first time, deserve notice. *C. Walkeriana* was also flowering nicely. The *Odontoglossums* were looking well; and some forms of *O. Alexandræ* and *O. Pescatorei* were admirable. A plant of the rare *O. triumphans aureum*, with three fine golden-yellow flowers, is a plant that is much prized by its owner. Other *Odontoglossums* in flower were *O. facetum*, allied to *O. lateo-purpureum*, but smaller; *O. navium majus*, pure white flowers, with rich chocolate markings; and several well-flowered plants of *O. cirrhosum*. In the same house as the *Odontoglossums* was observed a number of fine healthy plants of *Lycaste Skinnerii* in full bloom.

In the *Masdevallia*-house I noticed that charming little rarity, *Pleurothallis ornatus*, with a dozen or so flowers of microscopic dimensions. A variety of *Epidendrum evectum* had several large panicles of magenta-coloured flowers, each panicle bearing between forty and fifty flowers. *Ansellia africana nilotica* was just beginning to fade, having opened its flowers in January. *Cyrtopodium St. Legerianum*, of which there is a fine specimen, was making grand growths. Mr. Cummings tells me that this plant last flowering season carried 430 flowers. *P. W.*

THE BULB GARDEN.

EUCHARIS SANDERII.

I RECENTLY noted a grand lot of the above at Oakley Hall, Basingstoke. Mr. Weaver, the gardener informs me that he finds it much freer-flowering than *E. amazonica*, and it certainly there appeared to better advantage, as I saw them growing side by side, the latter not carrying nearly so many spikes as *E. Sanderii*, nor being so gross in the foliage. Mr. Weaver attributes his success to the liberal use of crocks and charcoal, which tend to

keep the soil open, thereby allowing a copious supply of water being afforded in the flowering season. Another point in favour of *E. Sanderii* is its freedom from mealy-bug, none being seen on any part of the foliage. This certainly is a thing to be desired, as undoubtedly a great saving of labour would be effected, and though the blooms are not so large as those of *E. amazonica*, still, they possess great substance, which is a point not to be despised in flowers for cutting. *J. Clayton.*

SPRING BEDDING IN HYDE PARK.

THE flower-beds at the east end of Hyde Park, and close to Park Lane, are now gaily dressed with beautiful plants, and lovers of Hyacinths, Tulips, Narcissus, and other spring-flowering bulbous plants should see them at once, when they will be amply repaid for their visit. The Hyacinths are perhaps most developed, and a very pleasing effect indeed is caused by the judicious combination of the various colours. Most of the varieties appear to be those we are familiar with, which it is evidently difficult to surpass, whilst a few of the newer kinds and colours lend a fresh appearance to the whole. Of the whites *Miradolina* is the best, and another good one is *Madame Van der Hoop*. The blues are particularly strong, and include such well-tried varieties as *Baron Von Twyll*, a very dark one; *Regulus*, King of the Blues, which is later than the rest; and *Charles Dickens*. Lord Derby is an excellent light colour, and *H. Priestly* is a good blue, of medium depth. A good red is *Robert Steiger*; and *Gigantea* is the best of the pinks.

The Tulips will not be at their best for another week, but a very neat and good appearance promises a very wealth of bloom in store. Amongst some excellent varieties, are the following:—*Pottebakker*, a good bright crimson; *Comte de Mirabeau*, *Joost van Vondel*, *Dussart*, *Keizer's Kroon*, *Marillo*, *Proserpine*, a very pretty variety; *Wouverman*, very striking from its violet-purple coloured blooms; *Chrysolora*, a lemon-yellow variety; and *Yellow Prince*.

A very charming effect was produced by a bed of mixed *Narcissus*, which was surrounded by a band of red *Daisies*; and two circular beds of *Narcissus Horsfieldii* were a complete show in themselves, and bore striking evidence of good culture. This is a variety with petals and sepals white, and trumpet a good yellow, large and handsome. A bed each of *N. Orange*, *Phoenix* and *N. rugilobus*, were surfaced with *Scilla sibirica*, which is also in bloom, and a very good effect is produced. Some green surfacing would greatly add to the beauty of the Hyacinth and Tulip beds, which are not improved by the dull brown colour of the Cocoa-nut fibre refuse. Some beds of *Wallflowers*, which are just coming into bloom, help to make this beautiful collection of well-kept plants, a sight not soon to be forgotten.

Passing from here into Kensington Gardens, there is very little spring bedding done, but the flower-walk running from the Albert Memorial is already beginning to look spring-like and interesting. Amongst the hardy herbaceous plants are squares of Tulips, *Primroses*, *Muscarias*, *Hyacinths*, *Wallflowers*, *Triteileia uniflora*, and *Doronicum austriacum*, in full flower; whilst *Magnolia Soulangiana*, *Cydonia japonica*, and the double red-flowering Peach (*Persica vulgaris*), are blooming profusely. In the private grounds adjoining the Palace, there are some beds of Tulips, in varieties similar to those in Hyde Park.

Preparations are rapidly going on in the propagating-houses here to supply plants for the summer bedding, and as an instance of the immense quantities of these plants required, there are about 100,000 *Pelargoniums* alone. The *Fuchsia* plants are extra strong, and promise well for the season's display. Several new and interesting features are being included, which will help to make the summer show in these gardens as bright and as interesting as they ever were.

In addition to the beds near the Park Lane boundary of the Park, there is, near the outfall from the Serpentine, a very charmingly-arranged bank of bulbs, Hyacinths, Tulips, Scillas, Narcissus, &c., together with Belvoir Castle Wallflower, and other spring-flowering subjects. It is a bit of gardening of a kind just fitted for the spot, which is a narrow border, elevated above the walk, and backed by low shrubs, and enjoying a southerly aspect. Country visitors should not fail to see this.

FLORISTS' FLOWERS.

THE AURICULA.

APRIL is the month when we begin to enjoy the results of twelve months' labour. The first flowers open very early in the month, and they pass away

blemish, and in some seasons it is much more apparent than in others. No good Auricula-grower would allow a shaded self of his own raising to be placed in commerce; but it is no fault of his if the shading is produced subsequently by influences over which he can have no control. The alpinists have margins resembling the selfs to some extent; but they, so the fanciers say, ought to be shaded, and if the collection of plants here may afford an indication of what they are in other collections, they do not seem to have suffered anything from the east winds, nor have the flowers been checked in their development by the warmth and dryness of the weather. Some persons have better opportunities than others to moderate the influence of unpropitious weather by shading from very bright sunshine, and artificially warming the house or pit on frosty nights. Some growers have no better accommodation for their plants than a garden frame, and

and shaded from hot sunshine. When the plants are grown in frames, a double mat is necessary to keep the frost out on very cold nights, and much care is necessary in opening the lights when frost-winds are blowing. As soon almost as the plants pass out of bloom, they should be repotted, and now that the Auricula aphid (*Trioxys auriculae*) has become so prevalent, this is a much more tedious process than heretofore, for this troublesome pest clusters round the neck of the plants, they whiten the insides of the pots with their woolly covering, and cluster upon every root that has traversed through an open or loose space in the potting soil, and they will penetrate to the centre of the ball of roots. Now every bit of this aggregation of parasites must be removed, either by getting it out with a bit of pointed stick, or if very numerous, all the soil may have to be removed, and the roots washed with soft-soapy water. Clean, well-drained pots must be used to pot the plants in, and the potting-soil should be in good condition, and mixed with—as a celebrated painter said his colours should be mixed with—brains. Loam, for instance, is not always alike; it ranges from the extreme of unctuous yellow loam to quite sandy material, with but little holding power. Medium yellow loam is best, to this add a fourth part of decayed manure, as much leaf-mould, and some sand if necessary. One of the best growers has nothing better than soil from the Potato plot in the kitchen garden. When the plants are repotted, they should be placed in frames on the north side of a wall or dwelling-house in preference to any other position. Firm potting is best. Offsets and seedlings now require careful attention. The seeds, which ought to have been sown early in the year, or in the month of August last year, have now produced nice little plants, and a season will be lost if they are not grown on in good rich soil rapidly, to be flowered in the spring of the year following. Unless the plants are strong, they do not flower, consequently they have to be grown on another year to prove whether they are likely to be worth retaining at all. The offsets taken off in the autumn, and also in the spring of the present year, have also to be well cared for, else the plants will not grow into a flowering size. They must be repotted as soon as they need it, and by August or early in September they may be shifted into the flower-pots in which they are to flower. *J. Douglas.*

FIG. 85.—BASKET OF LILY OF THE VALLEY.

entirely in six weeks or less. I do not know any plant so sensitive to the influence of the weather as show Auriculas. As regards the opening of the flowers of the green, grey, or white-edged varieties, if the plants experience a chill when the flowers are opening—and this they easily do if the east wind blows continuously—the effect upon the half-opened flowers is to fix them at that point of development. On the other hand, the recent warm weather had undoubtedly the effect of preventing perfect development in the flowers, the corolla expanding too rapidly, and the blossoms were smaller than usual. The effect upon the selfs was, in many instances, to produce shaded edges, which fanciers regard as a serious blemish. By a shaded edge is meant the colour gradually becoming paler from the central white paste towards the margin. This shaded edge in the self show Auricula is considered a very serious

in that case it is not easy to get the plants into flower in an adverse season; but this is better than the old-fashioned Lancashire system of protecting the plants from the inclemency of the weather by using wooden shutters in place of the glass lights. The old growers must have been easily satisfied, for what with wooden shutters to flower them under, the use of 7-inch pots even for small plants, and rich compost in which the roots could not thrive, they made a sorry figure. I visited a garden in Lancashire in which the plants were grown under such a frame and planted in large pots, and none of them were anything like so vigorous as those plants cultivated in 4 and 5-inch pots. Handsome flowering plants can be grown in these small pots. When Auriculas are flowering, the trusses should not be exposed to frost-winds, and when the flowers are expanded, they will last longer if kept rather cool

LILY OF THE VALLEY BASKET.

OUR illustration (fig. 85), taken from a photograph kindly sent to us by Mr. Gough, gardener at The Grove, Heigham, Norwich, indicates a novel mode of utilising the Lily of the Valley. In the absence of any particulars, we should suppose that the crowns—i.e., single flowering buds—are started in heat in the usual manner, and when they have shown bloom they are planted in a wire basket lined with fresh green moss, and filled with a light compost. In planting the basket, the heads of bloom are so arranged that when the leaves appear, little or nothing is seen of the basket itself. Similarly, Achimenes, Tydas, Lachenalias, &c., are planted.

CULTURAL NOTES.

ANTHURIUM SCHERZERIANUM WARDII.

ALL persons consider Anthuriums of the Scherzerianum type to be among the most beautiful of stove plants, and worthy of a place in all gardens where there is a stove. Some growers recommend potting them in the spring, and others after the flowering season is over, which is generally towards the latter part of the summer. I have tried both ways, and am in favour of the latter practice, as the plants are given time to get well established in the new soil before the winter sets in, thereby being in a better condition to support themselves during the flowering season. The potting should be very

carefully performed, the pots well drained, and the greater part of the old ball of soil removed, for if left till another year, it would, in all probability, be in a state very detrimental to the well-being of the plants, owing to the quantity of water they require during the growing season. One important feature in their culture is the keeping of the plants well syringed and shaded from the sun during the time they are in flower. By so doing, the spathe keep a much longer time in perfection. A compost consisting of good lumpy loam, fibrous peat, dried cow-dung, silver-sand, and charcoal form a very suitable one. Liquid-manure from the cow-sheds, if supplied once or twice a week in the proportion of one part to three of water will prove beneficial to them during the growing season. I have now a splendid plant in a 10-inch pot carrying twenty-eight flowers, averaging 6 inches by 4 inches. *G. Parrant, Ashby St. Ledgers Lodge, Rugby.*

THE CROWN IMPERIAL FOR POT CULTURE.

APART from the normal beauty possessed by all the varieties of this stately plant, two of them have very pretty variegated foliage, which makes them objects of attraction wherever these are grown—I refer to *Fritillaria imperialis rubra argentea* and *F. i. r. aurea variegata*.

There are at least twelve distinct varieties, ranging in colour between yellow, deep orange, and red, besides a double-flowered red and yellow respectively; also a peculiar form named *Crown-upon-Crown*, having several whorls of flowers one above the other. Unlike Lilies generally, the leaves grow in confused form around the stalks, somewhat elevated above them. On a space of clear stalk appears the crown of drooping blooms, which are surmounted by a tuft or crown of other leaves. A characteristic of the flowers are the six drops of nectar which persistently hang attached to the base of each petal; these Gerarde likened to "faire Orient Pearles." The same old author called these plants "Corona Imperialis," having failed to identify them with the *Fritillary*. It is worthy of remark, that Gerarde asserts the *Crown-upon-Crown* form (a variety already referred to) is due to the age of the roots. The plant is said to be native of Persia, though for centuries it has been widely distributed throughout Turkey and the East generally.

As pot plants for conservatory decoration, the single-flowered and variegated-leaved varieties are very suitable, the wonder being they are not more generally employed for this purpose. One bulb, in a 6-inch pot, grown on under glass, is ample to produce a stately and pleasing plant of some duration. Little or no forcing is wanted to have it in bloom early in the month of May, though it is essential it should be placed and maintained upon a light airy shelf, otherwise the stalks will be blind and flowerless.

Owing doubtless to the length of time these bulbs have been introduced, sundry examples are to be met with in some old-fashioned gardens here and there throughout the country. Such examples, however, seem to have become veritable fixtures therein, and upon certain given sites from whence they are seldom or never removed. It speaks volumes in favour of their power of endurance, that they so exist. They do not appreciate transplanting too frequently, not often than once in three years. It is desirable, however, that all old stools should be taken up, divided, and planted in new soil. They should be planted 3 inches deep, and may, without injury, be planted at a depth of 6 inches. The plant is worthy the attention of hybridists, and, like Lilies, the peduncles, which bend down when the plant is in flower, become erect as the seeds mature.

THE CHEQUERED FRITILLARY.

This plant is very distinct from the above in appearance, being more dwarf, and also narrower in the leaf. *Fritillaria meleagris* is a British plant. These were named by old authorities, "Chequered Daffodils," or "Ginny-hen" flowers. Probably as

many as two dozen distinct species exist, inhabiting countries as wide apart as America, Britain, Siberia, throughout the Caucasus and Persia. Dr. Tristram, not only found *F. persica*, upon the plains in Palestine, but notes a probable new form among the snows of Hermon and Lebanon. The aforesaid *F. persica*, is, by the way, the native or "Persian Lily."

The total number of species in the hands of the trade at this time is probably not more than a dozen, even if we include such large bulb growers as those of Overveen and elsewhere on the Continent. Of these species, the Persian, obtained from Mount Ararat, is the most plentiful and cheapest. The Grecian form, with black flowers, is quaint; and Lusitanica, a soft yellow, is a very desirable plant. But commend me to the lovely, velvety, large, white, drooping bells of the European *F. præcox*, however much it departs from the chequer-like characteristics of the family as a whole.

As do the stately Crown Imperials, so these dwarf species, flower admirably in pots, if four or five bulbs be placed in a 5-inch pot in the month of October, in a light rich compost, and potting them somewhat firmly. The potted bulbs should be plunged beneath a bed of fine coal-ashes, giving, in addition, some slight protection during severe weather; this is all that is necessary; and here they may remain till they grow through the surface of the ash-bed, and as soon as the flowers show, the pots should be removed to the greenhouse. *William Earley.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

VINES.—The borders, especially such as are shallow or ovelie gravel, or are entirely indoors, when the bunches begin to colour, should have a dressing of Vice Manure and a good watering. A slight mulch of spent Mushroom manure may subsequently be spread on the border, thus retaining the moisture afforded, and keeping the air of theinery drier than was the case whilst the Vines were in their flush of growth. At this stage, strict attention should be given to ventilation, in order that the sudden rises in the temperature before a sufficient volume of air is admitted from without, to avert the sweating of the fruits. As a safeguard against mishap of this kind, it is prudent to afford a slight amount of air day and night, for should black Grapes "sweat" after they begin to colour, they rarely take on a desirable finish. When air is thus afforded, a warmth of 60° should be maintained until the fruit is ripe. If red-spider should show itself on the Vines, the leaves should be sponged with water in which flowers-of-sulphur are mixed, but in cases where all the Vines in a house are infested, a more expeditious means of destroying it will be found in syringing the foliage with the mixture. When this measure for eradicating spider is contemplated, it will be necessary to wrap the bunches in fairly strong paper sufficiently large so as to well overlap them, and allow a good margin at both ends. Tie the paper tight round the footstalk of the bunch to prevent the sulphur getting into it, and gather it loosely together, and also tie it at the bottom. Water containing sufficient sulphur to render it no thicker than can be readily applied through a single jet of a syringe may then be evenly distributed over the Vines, wetting both sides of the leaves, continually stirring the mixture the while. This work should be performed after sun-down, and the papers allowed to remain on the bunches until the following morning, at which time the foliage will be dry, if a gentle warmth has been kept up in the heating apparatus. If this work be done between the thinning of the berries, and their commencement to colour, it will not have any bad influence on their finishing. A few grains of sulphur (when dry) will probably fall on the bunches, but these can be blown off before being sent to table.

SUCCESSION VINERIES.—Vines now swelling their fruit should be liberally afforded some kind of manure, and have all the superfluous growth kept removed. Thin the berries of all free-setting varieties when of the size of Peas, but allow a little more time to elapse about which a doubt may be entertained

as to their swelling properly. At this period of growth the temperature should be gradually lowered to 60° at night, with a corresponding reduction in the day. Vines coming into bloom may be given a minimum temperature of 65°, the atmosphere of the house being kept dry at this time. In bright weather the borders, however, may be damped down once or twice during the day, if the external air be dry. Tie down the lateral shoots in late houses, and when circumstances favour the horizontal training of the same, get them gradually into that position. In such positions they are not likely to lose the leaves nearest to the point of junction with the stem; but lateral shoots of robust Vines, when trained in a slanting direction towards the top of theinery, generally lose the first leaves, which unfold prematurely.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

FRENCH RUNNER BEANS.—If seed of the first-named be sown about this date, the produce will succeed without any interval that from the seed sown in the last fortnight in last month. The present time is indeed early enough for the first sowing in cold land and districts. For a first crop in the open I would advise, where produce is required early, to sow in pots, and plant out when large enough, protecting the plants at night. One of the best Beans to sow at this season is *Ne Plus Ultra*, a very dwarf and productive variety, whose pods remain tender for a longer period than others. Mohawk is another early Kidney Bean, but its season is soon over. To follow *Ne Plus Ultra*, a good breadth of Canadian Wonder should be sown in about ten days, which will continue the supply of Beans till the Scarlet Runners come in, when by some persons the Kidney Beans are thought but little of. Runner Beans require a warm open position, and in heavy land it is good practice to dig out a trench and fill in with burnt garden refuse and light soil, placing some rotted manure at the bottom, and incorporating the light materials with some of the staple. The trench, if left partially unfilled, affords protection to the plants, and retains water when watering must be done in a dry season, and which is often required in dry soils, or much of the blossom will fall. The crop is one that requires plenty of space—8 to 10 feet is none too much between the rows; if this amount cannot be afforded, the plants must be topped at 6 feet. I prefer to plant my rows 20 feet apart, and crop between them with low-growing vegetables. Market growers plant much closer than this, and top the rows when the plants are 1 foot high, and using no stakes; but this plan is not so profitable as the other, and the pods get dirty from laying on the ground. The Giant White-flowered, and Veitch's Mammoth Scarlet-flowered, are good varieties to sow at the present time.

PEAS.—The ground between the rows must be stirred with the hoe, and the earth afterwards drawn close up to the plants on either side of the rows, sticks being afforded them when they get about 6 inches high. Seed for succession should be sown in deep drills on richly-manured land, and previous Calendrical instructions carried out.

BROAD BEANS for late use should be sown on a border facing north or east, the variety being the Broad Windsor—that is, if good colour in the Beans is required, and a moderate crop not objected to.

CARROTS.—The middle of April sowing will require to have the hoe passed between the lines, the earlier varieties may be thinned as soon as they are large enough to handle; the Short Horn section of Carrots need less thinning than the main crop varieties, and may be thinned when drawn for use. The main crop of Carrots will require at least two thinnings. If main crop Carrots are required for use before they are fully grown, some rows should be set apart for that purpose, and not severely thinned out.

SPINACH.—When warm dry weather sets in Spinach soon runs to seed, and it is advisable to sow small breadths at frequent intervals, and in spots not fully exposed to the sun at midday; sowing the seed thinly.

CARDOONS.—Seeds may be sown in trenches, dug out and manured similarly to those for Celery, dropping a few seeds at intervals of 2 feet down the centre of the rows, covering the seeds about half an inch, and thinning out the weaker plants when a few inches high. Cardoons may be sown in pots

kept in frames till planted out in the third week in the present month. It is a vegetable that requires liberal cultivation, so as to secure large fleshy stalks, and abundance of water when it is in active growth.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

REMARKS ON VENTILATION, HEAT, ETC.—Much time will now be taken up in attending to the various heats of the different houses, and the general requirements of the plants. The houses will require to be well damped as regards bare surfaces three times a day at least, and the inmates examined each day, and watered only if they are in a condition to need water. It is not good practice to keep an Orchid plant in a soddened condition, and so to do is generally to shorten its life. At this season, slightly spraying overhead may be resorted to in some of the houses, which should be done when the quantity of air has been reduced in volume, and the blinds rolled up when the sun's warmth is declining. After a bright day the Mexican plants may be well syringed, as they seem to like the wetting, and besides, it saves labour in watering, as these plants, which have but little or no shading put over them, get dry very quickly, and it helps to keep injurious insects in check. By reducing the volume of air admitted while the sun has still some power, an amount of warmth is stored up in the intermediate and the other warm-house which will last till late in the evening, when artificial heat will become necessary while the nights keep as cold as at present. The Cattleyas may be gently sprayed at this season on fine days, thereby imparting health and vigour to them, and also many other species of Orchids. When there is no danger of the plants damping off, our Phalenopsis are dewed over at intervals during the day, the atmosphere being kept warm. Masdevallias are just now making a good show with their brilliant colours and wonderful shapes. It is not safe to syringe Masdevallias overhead, as there are generally young growths amongst which the water will lodge and cause to rot. I have frequently heard it said that Masdevallias require much water, because they have no pseudobulbs to serve as a store of nutriment; but this is, I think, a mistake—they should be watered moderately, and with liquid manure sometimes, as I have previously advised. The cool-house must be well shaded and kept very moist, and top ventilation afforded cautiously whilst cold winds prevail, or the weather is very dry.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

RICHARDIA (CALLA) ÆTHIOPICA.—Plants which have done blooming, and are not potted, should be hardened off previous to planting them out in the open air. When planting them pull the roots into good-sized pieces, with one or two buds, and plant about 18 inches apart each way in the soil, to which some good loam, leaf soil, or rotted manure has been added, and make a shallow basin round each. Should the leaf-stalks have become drawn whilst under glass, put a stake to each plant, and fasten them to it by broad bands of bast. The old foliage will die down, and new crowns will form. In dry weather, when the plants are in full growth, afford water abundantly, and occasionally supply manure water.

CYTISUS ATLEANUS AND C. RACEMOSUS.—Plants which were cut back somewhat after blooming and are now making new growth, should be shifted into larger pots, unless they have reached a desirable size, when repotting into the same pots after removing the upper crust as well as some of the roots at the sides may be adopted. Young plants may be shifted into pots two sizes larger than those they were previously growing in, matted roots being loosened and the balls properly moistened before re-potting them. For potting soil use a good fibrous loam, with a small quantity of manure and sharp sand, in quantity sufficient to keep the soil sweet, and be sure that the drainage is good. Do not keep the ball too high in the pot, but leave sufficient space for ample supplies of water, the plant requiring much moisture whilst growing. After repotting the plants, keep them close for a time, and syringe them twice each day to encourage growth; and when established, and the growth of the shoots is finished, gradually harden them off, subsequently placing them in a sunny and sheltered position out-of-doors. The same culture is suited to *Coronilla glauca*, *Acacia diffusa*, *A. affinis*, *A. armata*, *A.*

Drummondii, *A. Riceana*, *A. platyptera*, &c., the last-named a dwarf-growing variety, which flowers in the autumn—a very desirable species.

CHRYSANTHEMUMS.—Late struck cuttings should be potted off into 48's, keeping them close for a few days afterwards, when they will have become established. These plants make very useful stuff for placing on greenhouse and conservatory benches as front-row plants. Plants in 4 or 5-inch pots, and whose roots touch the sides of the pots, should be shifted into 6 or 7-inch pots, according to size, and afforded a rich compost and firm potting, to encourage sturdy short growth of shoots. Frames or cold pits are still good for them for a few weeks longer, but taking off the lights during the day in fine weather, and also at night when frost does not threaten. Plants intended to be grown for affording cut blooms only should have a neat stick placed to each, to prevent damage by wind; and others, to be grown as bushes, must have the points of the leading shoots pinched out. Pay particular attention to the watering of the plants at all times, lack of moisture at the root causing loss of foliage and other evils.

ABUTILONS may be propagated either from seed or cuttings, and in taking the latter, young shoots from 3 to 4 inches in length should be chosen, and after taking off the lower leaves, and cutting them through at a joint, insert four or five cuttings in a sandy compost around the edge of a 4-inch pot, placing the pots under a hand-glass in heat after watering them and letting the leaves get dry. Shade the cuttings from bright sun, and pot them off singly when rooted, growing them in a warm pit or frame. Be careful not to afford much water before the roots have taken to the soil, stop the leading shoots as growth proceeds, and shift them into larger pots as soon as the soil becomes full of roots.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Mere worth Castle, Maidstone.*

PEACHES AND OTHER WALL FRUITS.—If the trees are well protected with nets and heavy shading materials, these must be raised by day, so that the trees may have the benefit of sunlight, or the growing shoots will be rendered weak, and the leaves pale in colour. But for the present, and until the third week of the month, it will be unsafe to remove nets, &c., as up to that time sharp frosts may be experienced, and protected trees are more tender than unprotected ones. Where the fruits have set thickly, remove only a few at the present time, and thin them at intervals of ten days or more, according to progress made. Disbudding also should not be severe for a while, for ungenial weather and weak root action may bring on blister, rendering the loss of many leaves inevitable, as the blistered ones must be pulled off and burned. Insects will soon put in an appearance, and should be destroyed without delay, red-spider being dislodged with the syringe or garden engine and clear water, washing the trees from both sides on the mornings of bright days. Green and black aphids, especially the latter, become very troublesome pests, if not checked in time, crippling the shoots to such a degree that they make but slow progress. Dusting the infested parts with Pooley's tobacco powder is the safest method of destroying both during the early stages of tree growth, and this should be thoroughly done, syringing it off the following morning. By this means the trees may be kept fairly clean until it is time to syringe them with an insecticide. Weak diluted tobacco water is safe and efficient, as is a decoction of Quassia chips, which I have used with good results for several years, and find it both safe and effectual. The chips should be tied up in a cloth, and boiled in soft water, a small quantity of soft soap being added before using it on the trees. If it be made of the strength of from two to four ounces of chips to one gallon of water, the trees will soon be freed of aphids, and if a handful of flowers-of-sulphur be mixed with it, it will check the spread of red-spider. For mildew, dust the foliage with flowers-of-sulphur when it is damp from rain or dew. I would remark that in borders which are well-drained, and are kept moderately moist, the trees seldom become attacked with mildew. If old trees, wanting in vigour, ever become badly affected with it, the sooner they are grubbed up and the soil removed, the better.

PLUMS.—The blooms of these, notwithstanding that they are harder than those of Peaches, Nectarines, and Sweet Cherries, are damaged by the

frosts we have experienced in this part, and it is doubtful if many have escaped destruction that were open when these took place. Those which were not then expanded look promising.

Fan-training of Plum trees should be adopted, for although the tree does fruit readily on spurs, there is more certainty of a good crop if the current year's shoots are laid in after the manner of Peaches. The fruit is also finer on these shoots than on spurs. The young shoots should be laid in when they are about 6 inches long; small shoots may be pinched to four or five buds, so that they may form spurs. If aphids be present on the shoots—and it is generally at the tips of the same that these abound—dip these in tobacco or quassia-water; also dig up any suckers that may have come up from the roots. There is still time to graft Plums, provided the scions have been buried in soil on a north aspect, or where the bark has been preserved in a plump state. For the Plum orchard, Rivers' Prolific, The Czar, and Victoria are good varieties and regular bearers. Pond's seedling and several of the larger-growing varieties fruit better with the protection of a wall. Rivers' Monarch, as a late Plum, is highly spoken of by some, and I have planted several trees of it this season.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

BEDDING-OUT ARRANGEMENTS.—Where the arrangements for filling the flower-beds and borders have not been decided upon, no time should be lost in so doing, so as to provide everything needful with all possible despatch during the few weeks that remain before the work begins. This applies to *Verbenas*, *Calceolarias*, *Pelargoniums* (of all sections), *Ageratums*, *Lobelias*, *Petunias*, *Salvia* patens, and the like plants. Cuttings of the above, excepting *Calceolarias*, should be inserted in sandy soil, watered, and then put into forcing-houses, forcing-pits, or hotbeds, to be struck, the cuttings rooting freely in the close, warm air of these places. The late-struck plants are best employed as the outside rows in the beds and borders that are filled with one colour only. In the case of *Alternantheras* and *Mesembryanthemums*, they may be propagated in thousands within the next four or five weeks in this manner, merely putting the cuttings into shallow boxes filled with light soil, and surfaced with sand, and watering through a fine rose, and syringing the cuttings overhead when syringing the houses, &c., in the morning and afternoon.

MIXED BEDS.—Due consideration should also be afforded the subject of mixed beds, that is, beds filled with light or dark *Fuchsias*, *Lilies*, *Acacia lophantha*, variegated *Maize*, *Balsams*, *Madame Croisse Pelargoniums*, and Eckford's Sweet Peas, the last two supported by a few short *Pea-sticks*; *Salvia patens*, *Ageratum mexicanum*, *Calceolaria alexandrina*, &c. These may be planted on a ground-work of some blue or yellow-flowered *Violas*, or on *Mignonette*, and edged with a good broad band of *Pelargonium Manglesi variegatum*, which may also be effectively used as a groundwork, and *Coleus Verschaffeltii* as an edging plant. Beds thus planted form a pleasing contrast to the masses of colour which generally surround them.

WALL-FLOWERS.—This is the time to raise plants for putting into beds and borders next October, and for growing in pots, these latter being good for forcing at the new year. Carter's variety, *Old Gold*, and Harbinger, a dark-coloured variety, are excellent. The seed should be sown in shallow boxes of light sifted soil, and placed in a cold frame, kept close until the seedlings appear, when plenty of air should be afforded to insure sturdy growth. When the seedlings make a few true leaves, prick them off about 6 inches apart, in a sunny and open spot, gently water them, and after a slight shade till they take root. They will grow and lift better if a layer 2 inches thick of short dung be placed on a hard bottom, and covered with a like thickness of sifted loam.

GENERAL WORK consists in mowing, cutting the grass, fringing the walks, sweeping, watering the plants of which consist the groundwork, and divisional lines and panels in carpet-beds; also the recently-planted trees and shrubs, annuals, &c., all of which should be kept uniformly moist at the roots. The same remark applies to all kinds of bedding plants, those growing in heat as well as those in process of hardening.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

WEDNESDAY, MAY 11 { Royal Botanic Society's Musical Promenade.

SATURDAY, MAY 14—Royal Botanic Society.

SALES.

TUESDAY, MAY 10 { Orchids, from various owners, at Protheroe & Morris' Rooms.

WEDNESDAY, MAY 11 { Ferns, Gladiolus, Roses, Cape Bulbs, &c., at Protheroe & Morris' Rooms.

FRIDAY, MAY 13 { Great quantity of Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—53°·4.

The source whence leguminous plants derive their nitrogen is a subject which is now receiving great attention, and, indeed, is a matter of great importance to cultivators. We need no excuse, then, for again drawing the notice of our readers to it, and continuing from p. 433 our summary of the results obtained at Rothamsted; and foremost comes the question, "How is the Fixation of Nitrogen to be Explained?" Reviewing the whole of the results which have been brought forward, Messrs. LAWES & GILBERT say there can be no doubt that the fact of the fixation of free nitrogen in the growth of Leguminosae under the influence of suitable microbe infection of the soil, and of the resulting nodule-formation on the roots, may be considered as fully established. How the fact is to be explained is a more difficult matter, as there is yet much to learn before a satisfactory answer can be given; for the authors admit that we must know more of the nature and mode of life of the organisms which, in symbiosis with the leguminous plant, bring about the fixation of free nitrogen before the true nature of the action can be understood.

It is a point of importance that it should be established, as it appears to be, that in the development of the parasite, the cortex of the root of the host is penetrated, and so an intimate connection between the two—indeed, a "symbiosis," as it is expressed—is set up. There is abundant evidence that the nodules are very rich in nitrogen, and in certain stages of their development may contain a much higher percentage of nitrogen than that of any part of the growing plant itself, and in some cases, even higher than in that of the highly nitrogenous leguminous seed. Whence, then, comes this nitrogen? Various explanations have been put forth. For instance, it has been assumed that the bacteria acquire their nutriment, including their nitrogen, from the cell-contents of the higher plant, and that the contents of the bacteroid cells are resorbed. But it is obvious that, so far as the nitrogen of the bacteria is derived

from the plant itself, the latter is not a gainer in a quantitative sense by its resorption.

Further, it has been stated, that the activity of the process depends on the quantity of the nitrogenous compounds at the disposal of the roots, the tubercles developing unhindered, and becoming large and typical, in a soil rich in nitrogen, but attaining no great size in poorer soils. The source of the nitrogen of the bacteria is here supposed to be combined nitrogen in the soil. The experiments at Rothamsted clearly show, however, that the nodules may develop very plentifully in a nitrogen-free soil, and that there may, under such conditions, be great gain of nitrogen if only the soil be suitably infected.

Another assumption is, that the organisms become distributed in the soil, both during the life of the host and afterwards, and that the fixation takes place under the agency within the soil itself, rather than in the course of the development of the bacteria in symbiosis with the higher plant.

But, whether or not it may eventually be established that nitrogen is fixed, to any material extent, by microbes within the soil, independently of leguminous growth, there is evidence that in soils and subsoils containing organic nitrogen, lower organisms may serve the higher plants by taking up and bringing into a more readily available condition combined nitrogen not otherwise, or only very slowly, available for the higher plants. For example, it is probable that fungi generally derive nitrogen from organic nitrogen; and in the case of those of fairy rings, there can be little doubt that they take up from the soil organic nitrogen which is not available to the meadow plants, and that on their decay their nitrogen becomes available to the associated herbage. Then in the case of the fungus-mantle, observed by Professor FRANK and others on the roots of certain trees, it may be supposed that the fungus takes up organic nitrogen, and so becomes the medium of the supply of the soil nitrogen to the plant. More pertinent still is the action of the nitrifying organisms in rendering the organic nitrogen of the soil and subsoil available to the higher plants.

It may well be supposed, therefore, that there may be other cases in which lower organisms may serve the higher, bringing into a more available condition the combined nitrogen already existing, but in a comparatively inert state, in soils and subsoils.

Of what importance to practical cultivation is the newly-recognised source of nitrogen to leguminous crops? In reference to this matter the authors aptly ask—"What is the practical importance of the newly-recognised source of nitrogen to the Leguminosae, considered in its bearing on the known facts of agricultural production, and especially on the question of the sources of the nitrogen, not only of leguminous crops themselves, but of crops generally?"

The balance of experimental evidence is against the supposition that the higher plants themselves assimilate free nitrogen. But it is now established that, at any rate, in the case of some leguminous plants, they gain nitrogen coincidentally with the development on their roots of tubercular bodies containing bacteria or other fungoid germs; and the evidence points to the conclusion that it is the lower organisms, and not the higher plants, that fix the free nitrogen.

At Rothamsted, characteristic nodules have been found on the roots of various leguminous plants growing among the mixed herbage of grass-land, and also on those of others growing

on arable land, in the ordinary course of agriculture.

There can be little doubt that, when such plants are growing in soil and subsoil containing an abundance of combined nitrogen, they will obtain some of their nitrogen from nitrates, or other ready-formed compounds of nitrogen.

Assuming, however, it to be established that a greater or less proportion of the nitrogen of our leguminous crops will be due to fixation under the conditions mentioned, it is obvious that such a fact not only serves to explain the source of the hitherto unaccounted-for amount of the nitrogen of those crops themselves, but that it also affords an explanation of the source of the increased amount of nitrogen which other crops acquire when they are grown in association, or in alternation, with Leguminosae.

The fact that, at any rate, many leguminous plants, including papilionaceous shrubs and trees, are susceptible to the symbiosis, and under its influence may gain much nitrogen, serves to explain the source of some, at least, of the large amount of combined nitrogen accumulated through ages in our soils and subsoils, and also the comparatively slow exhaustion of their stores of it, by cropping, drainage, and in other ways.

In conclusion, the authors refer to some of the more directly practical aspects of the subject. In Germany, SCHULTZ, of Lupitz, has for some years devoted a considerable area of poor gravelly and sandy soil to the growth of leguminous crops—various Clovers, Lupins, Serradella (*Ornithopus sativus*) &c.—by means of kainit and phosphatic manures, and he has found the land thereby very much enriched for future cereal and other crops. He finds, however, that it is necessary to vary the description of leguminous crops grown. In various parts of Germany, too, the system is gradually extending of growing leguminous crops, especially on poor sandy soils, with a view to their enrichment in nitrogen; and on a large estate in Hungary it was found that the results of the recent investigations indicating the fixation of free nitrogen in the course of the development of leguminous crops were being carefully studied, with a view to practical application.

In our own country, Mr. MASON, of Eynsham Hall, Oxfordshire, commenced, in 1889, some experiments with various Leguminosae on small plots; and in 1890, a considerable series in specially-built pits, in which he has grown various leguminous agricultural plants, as well as some leguminous shrubs, with a view to the study of their root and nodule development, and the connection of these with luxuriance of growth, and gain of nitrogen. He has also devoted about 200 acres to the practical application of the recently-acquired knowledge in regard to nitrogen fixation. Stated in a few words, this idea is to reduce his area under roots, and to grow instead mixed crops of Leguminosae—Beans, various Clovers, &c.—liberally manured with basic slag and kainit, and to convert the produce in the first year into silage, and in the second into hay. The land is thus occupied for two years, and the assumption is, that in this way highly nitrogenous crops will be obtained with mineral, but without the highly expensive nitrogenous manure, and that the land will be left in high condition, so far as nitrogen is concerned, for the growth of saleable crops, such as Potatoes or grain, which require nitrogenous manuring. In other words, the plan is, just to grow nitrogen-accumulating crops for home consumption, and afterwards nitrogen-consuming crops for sale.

DATURA (BRUGMANSIA) SUAVEOLENS.—The plant illustrated at fig. 86, is an old inhabitant of our gardens, which once was perhaps more commonly grown than is now the case. *D. suaveolens* is a sweet-scented, white-flowered species, with elliptic-oblong, entire leaves, glabrous above, and slightly downy beneath; and it will grow to a height of 15 or 20 feet. It is a handsome plant, and is grown at the present day more commonly than any other of the genus. The plant, like *D. sanguinea*, when it becomes large, forms an effective object either indoors or out, and is well worthy of a warm sheltered nook if it be placed out-of-doors. It serves admirably as a central plant in a bed of subtropicals,

ANGRÆCUM LEONIS.—Messrs. BACKHOUSE send us a raceme of this extraordinary species with five flowers, and at the same time a flower of *Cattleya intermedia* with a dimerous arrangement of the parts of the flower—a common malformation in Orchids. Whether we are to conclude that ancestral Orchids were two-parted or no, is a question too abstruse for discussion here.

TACSONIAS.—We have received flowers of the following species and varieties from Mr. W. SMYTHE, Basing Park, Alton, Hampshire, with the following notes:—

Tacsonia exoniensis x. —This is the most free bloomer

if it begins to grow too freely. It will grow in any good light soil, but the other kinds will do much better.

T. Van Volxemii *superba*.—This seedling is an improvement on the old one. It flowers all through the winter in the same house, and under the same treatment, as does *T. exoniensis*. It blooms freely on a south wall, and the flowers are grand and handsome. It is a plant which ought to be found in every conservatory, as there are no climbers to equal the Tacsonias for beauty and hardiness, besides being very clean, and easy of management.

T. mollissima.—This has a pink flower, possessing a long tube, and is a free bloomer, but does not

FIG. 86.—*DATURA (BRUGMANSIA) SUAVEOLENS*: FLOWERS, WHITE.

or grown as a standard to place amongst Camellias and other evergreens in the conservatory. The plants require a loamy soil of a light character, or heavy loam mixed with a good proportion of peat and burnt earth, and sand or broken sandstone; and the potting should be firmly done, plenty of space being left over the ball for water. Manure is best afforded in the form of a liquid. The plant requires but little water in winter, provided it be kept in a cool part of the conservatory. It flowers in July and August. The photograph from which our engraving was taken was kindly sent by Mr. QUINTIN CHALMERS, gardener at Viewfield, Arbroath, Forfarshire, who stated that it flowered with him from summer till December.

of any bearing blossoms all the year round, and in a lower temperature than any variety yet raised will succeed. It has the handsomest flowers, but the leaves are large and heavy. It is grown here in a conservatory, where on many occasions it was impossible to keep the temperature higher than 34° Fahr., and in the morning it has often stood at 32°. It will do well on a south wall, planted out or in a large pot, if it be taken inside during the winter.

T. manicata.—I had a plant of this from Messrs. J. VEITCH & SONS fourteen years ago. It flowers freely in summer in the conservatory under the same treatment as the other kinds, and it will do well outside if put in a pot, and placed near a south wall. I keep it rather dry at the root

flower here during winter under the same treatment. It grows freely.

ARD-RIGH DAFFODIL BULBS.—A chemical analysis of a clump has been made for Mr. WM. BAYLOR HARTLAND, Ard-Cairn, Cork, and kindly sent by him to us for publication, shows Potash, 12.4 per cent. (low); phosphoric acid, P_2O_5 , 9.6 per cent. (average); soda, 4.7 per cent. (average); sulphuric acid, SO_3 , 7.0 per cent. (high); magnesia, 4.2 per cent. (average); silica, SiO_2 , 3.2 per cent. (very low); iron-oxide, 4.0 per cent. (very high); lime, 28.7 per cent. (very high). The mineral requirements of this plant are, therefore:—Lime, sulphuric acid, and iron, in large proportions; phosphoric

acid, magnesia, potash, and soda, in moderate amounts. Kainit will supply potash, sulphuric acid, and some soda. Gypsum will supply lime, sulphuric acid, and, perhaps, magnesia. Mineral phosphate will supply lime, phosphoric acid, iron, and magnesia. Superphosphate will supply lime, phosphoric acid, sulphuric acid, and probably iron and magnesia. A combination of mineral phosphate, kainit, and bone-superphosphate, ought to supply all its requirements, with the addition of mild lime, when the soil is not a limestone one. *Thos. Farrington M.A., F.C.S., F.I.C., 4, Waterloo Place, Cork.*

GARDENERS' ORPHAN FUND.—The usual meeting of the Committee took place on the 20th ult. Mr. B. WYNNE in the chair, in the unavoidable absence of Mr. W. MARSHALL. The following special receipts were announced:—Mr. J. B. STEVENSON, Bournemouth, proceeds of a dramatic entertainment, £10; young men at Broomhall Gardens, Holmwood, £1 13s.; Mr. J. KIPLING, Knebworth Gardens, fees from skating, £1 10s.; Mr. Alderman B. WATSON, Wakefield, £10; Mr. A. DEAN, proceeds of a concert at Kingston, £10. The annual dinner takes place at the Hôtel Métropole on the 17th inst., Sir JAMES WHITEHEAD, Bart., in the chair, and the Hon. Secretary reports there is every reason to believe a great success will result.

ORPHAN FUND CONCERT.—The concert in aid of the Gardeners' Orphan Fund, given at Kingston, on the 20th ult., resulted in the handing over to the Fund of the handsome sum of eleven guineas. The weather, unfortunately, proved to be wet, or the result would, doubtless, have been much larger. During the evening, handsome bouquets of *Dafodils*, kindly sent for the purpose by Messrs. Barr & Sons, from their grounds at Long Ditton, were presented to the Mayor of Kingston for the Mayoress, both of whom were present, and also to Mrs. G. C. Sherrare, wife of the President of the Kingston Chrysanthemum Society, by the Hon. Secretary, Mr. A. Dean.

CINERARIAS AT FARNHAM ROYAL.—A correspondent, who has seen these plants recently, is in raptures with their beauty, and the enormous numbers which Messrs. JAMES & SONS have in bloom at the present time. Two houses, 110 feet long, are filled with plants in blocks of assorted colours, such as white, blue, crimson, purple, &c., two coloured flowers, cerise, carnation, reds, deep violet, and other tints, besides stumpy and edged flowers in variety. The plants are tiered, 1 foot high, and 20 inches in diameter of crown of flowers, and consists chiefly of stools or side-pieces.

THE SWEET CHESTNUT.—An official document relating to the cultivation of the Chestnut in various parts of Southern Europe has been issued by the India Office. The report has been prepared in order to facilitate the cultivation of this useful tree in those parts of Northern India suitable for it. Those who know how large a part this noble tree plays in supplying the food resources of Italy will earnestly hope that a like boon may be bestowed on India. Sir GEORGE BIRDWOOD has written a characteristically exhaustive historical note, which is so interesting, that we shall venture to transcribe portions of it when our space permits.

PARCELS TARIFF FROM BELGIUM TO LONDON.—The Belgian State Railway now undertakes to forward from any station in Belgium to London forced Grapes and other produce at the following rates, including delivery, viz., 150 francs per 10 kilogrammes, or, say, fourteen pence for 22 lb. Compare this with our Parcel Post at 3d. per lb.!

"ICONES PLANTARUM."—The last part of this publication contains illustrations and descriptions of a large number of plants, mostly of purely botanical interest. *Fritillaria lophophora*, t. 2219, a species of West Szechuen and the Tibetan flora, should be looked after by our collectors. The plant has large yellow flowers, 2 to 4 inches across, and is stated to be intermediate between *Fritillaria* and *Lilium*.

RIO JANEIRO.—Under the title *Plantas Novas Cultivadas, no Jardim Botânico do Rio de Janeiro*, Senor J. BARBOSA RODRIGUES, the Director of the garden, has described and figured two new species of *Passiflora*, which seem to be varieties of *P. edulis*, sundry new *Palms*, and a new *Cattleya*, *C. aquinii*, from Rio Grande do Sul.

PROSPECT HOUSE, WOODFORD GREEN.—The large *Climanthus magnifica* trained to the roof of the conservatory here, previously noticed in these columns, is now at its best; and is very showy with its many bright red clustered blossoms. The double white *Clematis Madame Lemoine* is in bloom by the side, and is a good thing. We also noticed some pretty *Azalea mollis* with large flowers, said to have been raised from seed by Messrs. W. PAUL & SONS. A *Magnolia fuscata*, about 3 feet high, was covered with buds, two of which only partly expanded, were nearly enough to fill the house with their strong Melon-like scent. Among the Orchids and other plants fully or partly in bloom were very fine *Cattleya Mendellii* alba and *Cypripedium bellatulum*, and *Anthuriums*. Amongst an interesting lot of foliage plants, *Tillandsia hieroglyphica* and *Dasyliroton serratifolium* with its tasseled ends, were especially noticeable.

A GOOSEBERRY WITHOUT SPINES.—The *Revue Horticole* of April 16 gives a coloured illustration and a description of a Gooseberry devoid of spines. M. BILLARD, and after him, M. LÉFORT, have, it appears, raised several of these spineless bushes. We are disposed to think that such a discovery may act as a premium to the predatory!

THE EDINBURGH SUMMER SCHOOL OF ART AND SCIENCE.—In connection with this scheme, the following lectures on botany will be given by Mr. R. TURNBULL, B.Sc., Lecturer on Botany, Aberdeen County Council, and Mr. ANDREW HERBERTSON, Demonstrator of Vegetable Physiology, Dundee, assisted by Mr. P. C. WAITE and Mr. T. R. MARR. The course will begin with a survey of the flora of the district, and pass to the practical study of the leading families of flowering plants, with visits to the botanic garden, and other collections. Classification will be treated in reference to the arrangement of type botanic gardens for schools. A series of experimental demonstrations in vegetable physiology will also be given. While special attention is thus given to the needs of the teacher of botany, the course, like that of zoology, is also intended to illustrate the lectures on general biology.

CHISLEHURST GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—A successful social gathering of the members of the above took place on Tuesday evening, May 3, about 150 members and friends sitting down to an excellent repast. The Secretary (Mr. F. BUSHBY), in his account of the progress of the Association, stated that it numbered seventy-five members, and that twenty-two papers had been read at its meeting since October last, when it was started.

THE HESSELE AND HOWDENSHIRE HORTICULTURAL SOCIETY, which is an entirely new organisation, will hold its first exhibition in the grounds of Tranby Lodge, Hessel, on July 27. Handsome prizes are offered for groups of plants, stove and greenhouse plants, Roses, &c. Among them are the Medals of the Royal Horticultural Society. There is every promise of this becoming a very important exhibition in the north-eastern district.

PINUS CLAUSSA.—A recent number of *Garden and Forest* (p. 160) contains an interesting article, accompanied by illustrations, of the Florida Pine (*Pinus clausa*). This was at one time considered to be a form of *P. inops*, but the specimens collected by Mr. DYERS in Florida, and kindly communicated to us, induced us to consider it a distinct species, as also does Mr. G. SONNENKAMP, in the article above alluded to. This Pine belongs to a group in which the cones persist on the branches for eight to ten (or even

many more) years without opening to liberate the seeds. The Florida Pine, we are told, retains its cones so long, that the branches actually grow over and around them, so that the cones become to some extent actually embedded in the branch that bears them. The vitality of the seed is prolonged in this way for several years, although we are told that some of the cones loosen their scales and liberate the seeds, while the majority of the cones on the same tree remain closed. The present species grows on the sandy wastes of the coast of Florida, and rarely attains a height of more than 30 or 40 feet, but inland on stiffer soil, where it gets firmer root-hold, it reaches a height of 70 feet. The timber is not of special value; nevertheless, a tree that will exist in sand hills under similar circumstances to those in Florida is of great value.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—At the meeting held on Wednesday, April 13, the Floral Committee awarded First-class Certificates to the following plants:—To Messrs. De Graaff Bros., at Leiden, for *Narcissus tridymus*, E. H. Krelage (*polyanthus* \times *Ajax minor*), new plant. To Messrs. E. H. Krelage & Son, at Haarlem, for *Fritillaria Sewerzowii*, Regel, var. bicolor, new plant; *Fritillaria latifolia*, Willd., Koning van Zweden, new plant; *Fritillaria latifolia*, G. G., new plant. To Mr. C. G. Vao Tubergen, Jun., at Haarlem, for *Fritillaria Sewerzowii*, Regel, var. bicolor, new plant; *Erythronium Hartwegii*, S. Watson, new plant; *Lachenalia* var. Ruby (*tricolor* \times *superba*), new plant; *Marica* hybr. nova (*gracilis* \times *Northiana*), new plant. To Messrs. Anton Roozen & Son, at Overveen, for *Clivia miniata*, L., var. H. Tort, new plant. Botanical Certificates were awarded to Mr. H. J. van Heijst, at Wijk bij Duurstede, for *Boronia megastigma*, insufficiently-known plant; *Lachenalia pustulata*, insufficiently-known plant; *Orchis tridentata*, insufficiently-known plant. To Messrs. E. H. Krelage & Son, at Haarlem, for *Chionodoxa Tmoliasii*, new plant; *Fritillaria armena*, var. new plant. To Mr. H. D. Willink van Collen, at Breukelen, for *Ophrys apifera*, insufficiently-known plant (!)

SUGAR BEETS.—Experiments, made at the Agricultural station of Purdue University, Lafayette, Indiana, show that very large Beets, such as make a show on the exhibition table, are not those which contain the largest percentage of sugar. Hence, it is recommended that the Beets be planted thickly in rows, the most desirable weight being about 1 lb.

THE ORIGIN OF RYE.—It was stated by ASCHERSON, in the *Flora of Brandenburg*, that the Sicilian *Secale montanum* is the source of the Rye actually cultivated, the *S. cereale*. An important difference between the two plants, however, lay in the fact that whilst the former is perennial, the *S. cereale* is an annual plant. This objection has now been removed by Professor BATALIN, a Russian scientist, who has observed in the country of the Don Cossacks the Rye plant growing during several consecutive years without re-sowing either natural or artificial. *Revue des Sciences Naturelles* for April.

DOCKS.—The third annual Report of the Missouri Botanical Garden contains an account by Prof. TRELEASK of the Docks of North America, accompanied by illustrations.

CYTISUS SCOPARIUS VAR. **ANDREANUS.**—Mr. W. WATSON, in *Garden and Forest*, says at Kew there are now in flower some beautiful examples of *Cytisus scoparius* var. *Andreas*. They are standards, having been grafted upon the ordinary *Laburnum*, and each plant has a head 1 foot through, formed of many long branches, which are clothed for their whole length with beautiful yellow and rich madder-brown flowers. Among the many flowers at Kew at the present time these plants of *Andreas* Broom are, I believe, the most admired by visitors. They are grown in pots all the year, plunged in the soil outside during summer, then

placed in a cold frame for the winter, and forced into flower in March by the application of a little heat.

MR. MALCOLM COOKE'S ORCHIDS.—We learn that Mr. MALCOLM COOKE has recently disposed of his excellent collection of Orchids at Kingston Hill to Mr. MACKUSICK, of Lyttel Hall,

Exhibition, Earl's Court, a Williams Memorial Medal and £5 to the winner of the 1st prize in class 23 in the show to be held on May 27 and 28.

EDWARD VON REGEL.—We deeply regret to announce the death at St. Petersburg, on the 27th ult., of EDWARD VON REGEL, the Director of the Imperial Botanic Garden, St. Petersburg. Dr.

wrote on many subjects connected with physiology and practical horticulture. He was the founder and, for many years, the editor of the *Gartenflora*, now published under the direction of Professor Wittmack. He was the leading spirit in the great International Horticultural Exhibition at St. Petersburg, in 1869. A voluminous writer, he occasionally found time to contribute to our columns, and was at all times a

THE LATE EDWARD VON REGEL.

Redhill, Surrey, and they have, during the week, been removed to their new home. Mr. COOKE's gardener, Mr. CULLIMORE, has been engaged to take charge of the collection.

WILLIAMS' MEMORIAL MEDALS.—The Williams' Memorial Trustees have decided to offer the following Medals this year:—Temple Show, a large Williams' Memorial Silver Medal for best group of Orchids (amateurs).—International Horticultural

REGEL was a most industrious botanist, and his services to horticulture have been numerous and weighty. According to the *Gartenflora*, he was born at Gotha on August 13, 1815. He early proceeded to Zurich, and thence to St. Petersburg. In that capital he devoted great attention to the botany of garden plants, and to the description of the numerous specimens collected by Russian travellers in various parts of the huge Muscovite empire. He did not confine himself exclusively to systematic botany, but

valued and trustworthy correspondent, and most liberal in distributing his treasures among his horticultural colleagues. Our woodcut was taken from a photograph some few years ago.

NATIONAL AURICULA SOCIETY: NORTHERN SECTION.—The annual exhibition was held in the New Town Hall, Manchester, on April 26. Considering the late cold spring the flowers were good, both in quality and quantity. Throughout the

season there had been very few such days as Auriculas expect and delight in, and many of the flowers exhibited were hardly at their best. The date was too early for cold hill districts, such as Tordmorden and Halifax. Both in London and Manchester these flowers suffer greatly in effect from the dull and dreary vastness of the exhibition place, and it is not easy to say which of the two deadens them the more. When, as we have known it, the gas has had to be turned on over Auriculas—in Manchester—the ruinous effect is complete.

FRUIT FROM THE CAPE.—The steamship "Tartar" arrived at Southampton on May 1 from the Cape, and has brought a variety of Grapes and Pears consigned to Messrs. DRAPE & SON, and others.

BOTANICAL MAGAZINE.—The plants figured in the May number are:—

Lilium Lowii, t. 7232.—A species introduced from Burma by Messrs. Hogg Low & Co., and at first considered as identical with *L. nepalense*. The leaves are linear lanceolate, the flowers pendulous, 3 or 4 inches long, funnel-shaped; segments oblong, recurved, greenish-yellow, thickly spotted with red at the base.

Restrepia striata, t. 7233.—A botanical curiosity, with yellowish flowers, the segments of which are marked with red stripes. It is a native of New Granada, and is described in our volume for 1891, p. 137, and in the *Journal of Horticulture*, 1892, p. 275, fig. 45.

Lilium Grayi, t. 7234, a native of the mountains of Virginia and Carolina, with verticillate ovate-lanceolate leaves, and scarlet funnel-shaped flowers, each about 2 to 3 inches long; segments oblong, apiculate, spotted on the inner surface, not recurved at the tips.

Pilocarpus pinnatifolius, t. 7235, a Brazilian Rutaceous shrub, with shortly-stalked, oblong, glabrous leaves, and long cylindrical racemes, bearing numerous stellate flowers, each about a quarter of an inch across, pale purple in colour. The chief interest of the plant consists in the fact that it is the source of the drug known as Jaborandi, and which is used as a sialogogue and diaphoretic. It has long been in cultivation, but it is only comparatively recently that it has been known to furnish the drug.

Didymopanax lacunosa, t. 7236.—A "lovely" little Gesneraceous plant, with intensely violet-blue nodding flowers, introduced from Penang by Messrs. VEITCH. The leaves form a tuft, and are shortly stalked, cordate, ovate, pitted, tomentose. The flowers are borne in a cluster at the apex of a slender leafless flower-stalk. Each flower is about 1½ inch long, tubular, funnel-shaped, obliquely distended in the middle, narrowed at the throat, and with a short-spreading 5-lobed limb.

PLANT PORTRAITS.

ACER CARPINIFOLIUM, *Gartenflora*, April, p. 175.
APPLE SUPRÊME DE PERCE.—A handsome, mid-sized globular Apple, raised in Brabant, and of excellent quality. *Bulletin d'Arboriculture*, 36, March.

BRASSAVOLA OLAUCA, *Gartenflora*, April, p. 177.
CATTLEYA WARDOCHIANA, LIND., *Revue de l'Horticulture Belge*, May 1.

CYPRIPEDIUM GODSEFFIANUM ×.—Ground colour greenish-yellow, richly beset with purple spots. Raised by Mr. Norman Cookson between *C. Boxalli* and *C. hirsutissimum*.

CYPRIPEDIUM NOBE, *Orchidophile*, March.—A hybrid out of *Spicerianum* by Fairreanum, raised by Messrs. Veitch. Flowers intermediate between those of the parent forms.

ELEGANS PARVIFOLIA, *Garden*, April 16.—A specimen figured with small red berries.

HOULETTIA ODOBATISSIMA, *Lindley*, t. 324.

ODONTOGLOSSUM PRÆSTANS, *Lindley*, t. 322.—A Peruvian species, with star-like flowers, segments lanceolate, yellow, spotted red, lip ovate lanceolate, very acute brown.

ORNITHOGALUM PYRAMIDALE, *Garden*, April 23.
PANCRACTUM FRAGRANS, *Revue de l'Horticulture Belge*, April.

PAULOWNIA IMPERIALIS, *Garden*, April 2.

PEAR LEOPONT, *Bulletin d'Arboriculture*, 36, p. 97.

RHODODENDRON "HEXE," *Wiener Illustrierte Garten Zeitung*, April, 1892.

ROSA TRIGINTEPETALA, *Westnik*, April, 1892.

SELENIPEDIUM CAUDATUM VAR. UROPEDIUM LINDLEY, t. 321.—Under this name, Mr. Rolfe designates the curious peloric variety of *S. caudatum* Wallis, commonly called Uropedium.

SOLANUM MACROCARPUM, *Revue Horticole*, April 15.
SPIRÆA MULTIFLORA ARGUTA, *Revue de l'Horticulture Belge*, May.

VRIESIA OBLIQUA ×, *Gartenflora*, t. 1369.—A hybrid raised by Mr. Quintus, of Groningen, from uncertain parentage. Leaves oblong entire, strap-shaped, spike erect, flat, with two rows of closely-crowded oblong bracts, crimson at the base, green at the tips.

ZYGOPETALUM CERINUM, *Lindley*, t. 323.

BOOK NOTICE.

THE OAK: A POPULAR INTRODUCTION TO FOREST BOTANY. By H. Marshall Ward, M.A., F.R.S. (Kegan Paul, Trench, Trübner & Co.)

In this little book, Professor Ward follows the seedling Oak in its career from the Acorn to the full-grown tree. He describes its successive changes in appearance, and the modifications it undergoes in its internal structure. Within its limitations, the work is so thoroughly well done that it may be taken as an excellent introduction to the study of the botany of flowering plants generally. We may feel disposed to think, not that the minute anatomy has too much space given to it, but that the amount is disproportionate. We should not care to have it curtailed, for we do not know any popular book in English in which the subject is so well treated, nor do we know of any book in our language which summarises, as this does, the observations of Hartig on the different manners in which fungi affect timber, so that by mere inspection of the timber itself, it is quite easy for the expert to say which particular fungus has been the culprit. We note that Professor Ward says that it is impossible to distinguish between the wood of *Quercus pedunculata* and that of *Q. sessiliflora*; but this is a point upon which we expect experts would be found to differ in opinion. In the chapter on the relationship of the Oaks, we have a too brief account of the occurrence of Oaks in former stages of the world's history, and of their distribution at the present time; but we miss what surely is a very important matter—any account of the relationships between the Oaks, the Chestnuts, the Beeches, the Hazels, and other close allies. The book before us is the work of a master-hand, and is refreshing in these days of untrustworthy compilations and crams. We can well afford to excuse a certain want of proportion in the face of so much that is trustworthy and excellent.

NURSERY NOTES.

DAFFODILS AT HAM COMMON.

TRULY it is a remarkable change at Ham, to see ground which formerly grew only ordinary farm crops, now converted into a gigantic bulb garden, for Mr. Walker who is at once one of the largest and best growers of Daffodils, has some 25 acres full of those flowers, and they have been at times literal sheets of colour. The cold and somewhat dull weather has assisted to keep the blooms fresh and bright for a lengthened period, hence there has long been a special treat to lovers of Daffodils who have visited Ham. Nowhere else could be seen all blooming at once, and presenting masses of snowy whiteness, some 10 acres of the fine poetical ornatus, truly a remarkable sight; then such varieties as Stella, Dean Herbert, Barri conspicua, Princess Mary of Cambridge, John Stephens, Lorenzo, rugulosus, Mianie Hume, albicans, Emperor, Empress, Horsfield, with the rich-coloured orange Phoenix, In-

comparabilis plenus, poeticus plenus, and many others are grown in more or less extensive breadths, presenting masses of bloom which, if gathered, would literally be wagonloads, and keep myriads of nimble fingers employed picking and bunching for several weeks. Mr. Walker is a stout believer in the practice of lifting Daffodil bulbs, sorting and drying them thoroughly, and of course giving them a change of soil. In that way the finest of bulbs and flowers are produced. The Ham soil is of a deep retentive but sandy nature, and seems to be admirably fitted for bulb culture. That fact is also made very evident in the Tulips, grown in great quantities, the vivid colours of these beautiful flowers presenting long lines of wondrous richness and beauty. These Tulips have been grown here and annually lifted for several years, and are not excelled by the products of Dutch gardens. Of early varieties, Tournesol, Duchesse de Parma, Thomas Moore, La Maculata, Rosamunda, Rose, Gris de Lin, Artus, intense crimson, Canary Bird, and Keizer's Kroon are in great force; whilst there are numerous late forms to follow. Ham Common Bulb Farm is still worth a visit, and during the past month has been seen by hundreds of visitors.

FOREIGN CORRESPONDENCE.

RHODODENDRON EXIMIUM.

Two plants of this rare flowering shrub are now in flower in my nursery at St. Denis-Westrem, Ghent, Belgium, and each bears two clusters of flowers. The plants are eight years old, and they are grafted on *Rhododendron ponticum*. I never cut them back, and they have remained all this time in pots, those which they occupy now being 8 inches in diameter—an extremely small size for the bulk of the plants, and to this fact I attribute the early flowering of the shrub. One of the plants flowered two years ago—that is, at six years old, and it may be said that plants which have once flowered will flower more freely afterwards. A situation in the open air, somewhat shaded, and protected from wind during the summer months, is quite necessary to prevent the destruction of their leaves, which are very ornamental, especially when the young downy shoots appear. To be able to get them outside safely at this time of year, they must be hardened by being kept cool during the winter months. *L. Eeckhaute*, St. Denis-Westrem, Belgium.

HOME CORRESPONDENCE.

VINE AND PLANT MANURE.—In the interesting descriptive notice which appears in the *Gardeners' Chronicle*, of the Royal Gardens, at Laeken, by M. Ch. De Bosschère, he incidentally refers to our Vine and Plant Manure, and says that it is "composed of the refuse of the slaughter-house dried and ground." This is a mistake; no portion of it comes from the slaughter-house. *W. Thomson & Sons*, Clovenfords.

THE FRUIT-ROOM: MAY 1.—Glancing around the nearly-empty shelves at this date, I find a few varieties of Apples still in good order, and one only of Pears, some Catilacs. Generally, Apples have shrivelled more than usual; the following are, however, always plump to the last:—Wellington, Calville Rouge, Calville Malingre, Rambour d'Hiver, Marfitt's Seedling, and Northern Greening. Bismarck is yet well represented, and now is quite a fair table fruit; Belle de Pontoise, firm, and in fine condition; Lane's Prince Albert, fresh as when gathered; Smart's Prince Arthur, sound and heavy; Newton Wonder, very firm and good—this will prove a valuable addition to late keepers; it is as well a sturdy grower. High Canons is still sound and heavy. In desert fruits, Sturmer and Allen's Everlasting are the only good ones left, but Duke of Devonshire keeps its fine flavour to the last. Dutch Mignonne and other usually good lates did not fully mature, and are not good this season. *G. Bunyard*, Maidstone.

NEWTOWN PIPPIN APPLE.—A recent note in your columns calls for a reply. Even in this *Hortus Hortorum* [Kent] we never get a decent fruit, and under

glass it succeeds no better. The tree evidently does not find some element necessary to its proper development, and it should not be planted in this locality. *G. Buryard.*

THE CARROT GRUB.—I quite agree with all that your correspondent, "H. W. W.," suggests, p. 564, as a means of prevention in the case of the Carrot grub, and I would like to add for the further information of your readers who may be troubled with the grub, not to sow for the maincrop of Carrots too early. My practice for years has been to bastard-trench the ground intended for Carrots, if possible, in October, without affording any manure, and to sow about the 8th or 10th of the month of May. When the Carrots are nicely up, I dust them once or twice a week with a mixture of soot and dry wood ashes; and since adopting the above practice the Carrot grub has never once put in an appearance. *Thomas Shingles, Tortworth.*

ORNITHOLOGY IN RELATION TO HORTICULTURE.—A series of papers appeared in the *Gardeners' Chronicle* last year on this subject. The writer on the bullfinch gave it, I think, much too good a character. I think every gardener in this neighbourhood will bear me out when I say that it is an unmitigated nuisance, and one of our worst enemies, and if it were not watched with care, it would speedily destroy all hopes of a fruit crop. Surrounded, as we are, by woods (their home), the bullfinches come in scores, and denude the more forward trees of their fruit buds. To give some idea of their numbers, I have often shot during February as many as eighteen in a walk round the orchard. Happily, their audacity is unique, for on being disturbed, they alight on Laurel hedges in close proximity, thereby affording one an opportunity of settling them, nor does the report of a gun alarm any of them that are at a distance. Some of your correspondents have found lime applied to fruit bushes when moist a preventive; others, black thorns, forming a network through the branches. Both have proved utter failures here, and we find it necessary to cover all fruit bushes with netting, care being taken that the nets are sound, for if a single mesh be broken, the birds will effect an entrance. Mr. Low, gardener at Picards Rough, close by, covers all his fruit trees annually with fine netting, in order to protect them, which entails a good deal of extra labour. The law steps in after February, and prevents any further destruction of the pests, but previous to this, they always receive my best attention. It seems a pity to destroy this, the smartest and most handsome of the finch family, but on account of their destructiveness, they must be kept under. *W. H. Aggett.*

NORTHERN SPY APPLE.—For twenty years we never had a fruit on our nursery trees, though they grew splendidly, and only in rare instances have decent fruit been obtained; hence, this kind stands condemned. *G. B.*

APPLE NORFOLK BEAUFIN.—My experience with regard to the sale of the above, differs entirely from that stated by your correspondent "D. T. F." Grown as a standard on the Crab in Mounmouthshire, the tree with me is all that could be wished for, in never failing to bear a good crop; and the fruit has colour, size and good flavour. After the glut of American Apples was over, it was readily bought up by the dealers at 2d. to 2½d. per lb. according to quality, their customers thinking very highly of it. The dealers would be glad to get a regular supply of the variety in preference to others. It is a much better flavoured Apple in the Western counties, then in the Eastern. It is one of the best late culinary Apples, and deserves to be extensively planted, and especially in strong soils. It does not seem to be so well known as the remarks of "D. T. F." seemed to show, as he says, "None kept it or knew anything about it." *John Chinnery.*

PRONUNCIATION OF PLANT NAMES.—Many estimable persons, and well-educated to boot, yet show themselves capable on occasions of perpetrating shocking atrocities. Take, for instance, that very popular plant—the Dahlia. It was called Dahlia to perpetuate the memory of a Swedish botanist and doctor by the name of Dahl, a pupil of the illustrious Linnæus; yet in spite of this, in spite of the spelling, in spite, indeed, of every good reason, many good people will persist in miscalling a Dahlia a Dalea. Now there happens to be a plant rightly called, as it is also spelled, Dalea. This, however, is something very different to the popular garden flower, the Dahlia. Dalea was so called after Dr. Samuel Dale, an English botanist of the last cen-

tury, and it belongs to the natural order Leguminosæ, while the Dahlia is one of the Compositæ. In miscalling Dahlia Dalea, not only is a gross error in pronunciation made, but a slight is offered to the memory of a Swedish botanist, and a wrong done to that of an English one. [A foreigner would pronounce Dalea as Dahlia, so that the balance is redressed.] There may be excuse for miscalling Cle'matis Clemat'is and Wistaria Wisteria, but none for making Camellia Camilla. Will not the horticultural press make another effort to establish a pronunciation of at least these few popular plant names? *J. E. Ewing.*

PLANT PESTS.—I think it will generally be found that Carrot and other grubs haunt sandy or naturally light loose soils more abundantly than they do stiff soils. On the other hand, very stiff soils are not adapted to the culture of Carrots, and just where the maggot is the most troublesome, so there is the best soil for root production. The point, therefore, is how to assist in solidifying these light soils as to give them some of the imperviousness of clay without altering its texture. I well remember in the South of England that gardeners of half-a-century ago used to correct too light soils for Onions by rolling it very firm indeed, after having been duly prepared, then not drawing drills, but literally beating them out by the aid of stout bent sticks. Perhaps this latter item was of needless trouble, as shallow drills drawn with a hoe would have rendered the surface soil more fitted to receive seed evenly, and to cover it up effectively. In those days gardeners grew a firm, even, well-matured stock of bulbs for use only and not for show, but I do not know that the Onion maggot gave much trouble then. When the farmer finds a piece of young Corn exhibiting evidence of the attacks of wire-worm, he sends the crusher or presser over to it to make the soil as hard as possible. It is about the best course he can adopt. Very likely we should find the use of the roller on soil which lies light and open to be the best remedy against grub attacks. It would seem as if we had insisted a little too much upon the need for deep or high cultivation of soil, and not enough upon the need for its being well solidified, so as to check the action of root pests. Then, presumably, the Carrot and Onion grub-fly deposits their eggs on the plants or in the soil in the spring or early summer. If that be so, is it not possible to saturate the young plants and soil with a solution of soft-soap, quassia chips, soot, lime, or similar noxious ingredients, so as to render the surroundings repulsive to the fly. Without doubt, the turning-up of soil two or three times during the winter so as to allow birds to get free access to it, is excellent practice, and also to scatter over it any old refuse Turnip or Cabbage seed, to encourage the birds to scratch and thus find the insect larvae. *A. D.*

THE ONION-FLY.—Can anyone suggest an effectual remedy for preventing the ravages of the Onion-fly (*Anthomyia ceparum*)? I know of several instances in which the crop was greatly injured, if not completely destroyed, last season, by the action of the fly. Some of us know its method of operation too well. The maggots, on emerging from the eggs, bore through the outer leaf, and descend between the leaves into the bulbs, which they feed upon, and soon destroy. It appears to be much more destructive on light than on heavy land. Is that the general experience? Many remedies have been suggested, such as pulling up the bulbs after the leaves have turned yellow and faded, and pouring lime-water into the holes, which is very much like a recommendation to lock the stable after the horse has been stolen. The sowing of soot or powdered charcoal about the roots is mentioned by some; also saturating the beds with strong soap-suds; the application of soot to the soil before the seeds are sown; deep trenching, and the alternation of crops. I was recently in a part of Berkshire where the land grows the Scotch Fir and Heather, and where the surface is shallow and peaty, and therefore light, and in this district some find it very difficult indeed to grow Onions, owing to the maggot; and when one is asked to suggest remedies, and names those I have just set down, the sorrowful intelligence is conveyed that they have been tried, with results practically nil. Some writers on the culture of the Onion make no mention of the insect pests to which the Onion is liable. I have seen it stated that salt applied to the ground before sowing will prevent the injurious effects of the maggot, giving the soil a good raking, to evenly distribute the salt before sowing. The salt can be applied even if the seed be sown, or the young plants have made their appearance. A thoroughly hard

bottom is recommended by some, but in the district to which I have referred, the soil is stamped down quite hard before the seeds are sown, but the maggot still rules, and works great mischief. I have known on an allotment-garden at Ealing some patches that would not grow Onions owing to the prevalence of the maggot; and yet close by, on other patches of soil of the same character, there would be excellent crops, and many attempts to eradicate it from the former failed almost entirely. In speaking to country audiences on vegetable culture, the matter of the harm done by the maggot is frequently mentioned, and I am quite certain if an effectual remedy against its ravages can be mentioned, the intelligence will be thankfully received by many vegetable cultivators. *R. Dean.*

THE FROSTS OF THE PAST WINTER.—Now that winter is over, we are able to ascertain the amount of damage done by frosts. Taking a few of the most notable instances of the same, we have first extensive havoc amongst the Tea Roses, although these were protected with mulching 4 to 6 inches thick, and with few exceptions are cut down to within 1 and 2 inches of the ground level. The H.P.s are not so badly injured, being the hardier race. Berberis Darwini is much injured. Ligustrum ovalifolium is defoliated everywhere, whereas it and B. Darwini in the previous winter escaped injury. Thuja Lobbi has suffered severely in several places. Cupressus Lawsoniana and the many kinds of Holly are uninjured, so is also the Thuja tatarica, a beautiful plant for hedges and solitary specimens. Cedrus Deodara is badly mutilated. *J. Lovell, F.R.Met.Soc.*

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 3.—The Drill Hall was gay with Narcissus shown in competition, Alpines, Roses as plants, Amaryllis, and some very choice Orchids from various growers, private and other. The visitors were also able to see what kinds of fruits and vegetables go to the Queen's table from Frogmore in the month of May. Mr. Owen Thomas sending an excellent lot of exhibits. The cool weather has kept Narcissus fresh for a much longer period than usual, and the different exhibits of these favourite flowers were fresh and of fine colour.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, H. Herbst, R. Dean, F. Ross, C. F. Baue, T. W. Girdlestone, W. C. Leach, R. B. Lowe, R. Owen, W. Furze, W. Bain, B. Wynne, C. E. Pearson, G. Phippen, H. H. Dombain, C. Noble, J. Fraser, G. Paul, H. Turner, and N. Davis.

A Silver Banksian Medal was awarded to C. F. Still, Esq., Lismore, Wimbledon Park, for a group of seedling Auriculas, comprising some very good specimens of varieties possessing considerable merit. The same exhibitor had a group of seedling Amaryllis, also of much merit; and two plants of *Arisæma fimbriata*, Mast., in bloom (for fig., see *Gardeners' Chronicle*, p. 689, ii., vol. 1884).

W. Furze, Esq., Roseneath, Teddington, exhibited three cut blooms of the hybrid Tea Rose Waban, a pretty well-shaped bloom, of a deep pink colour.

From Mr. R. Dean, seed-grower, Ealing, came a group of "Giant Fancy Polyanthus," showing great variation of colour, and fine distinct blooms. This group was awarded a Silver Banksian Medal. Also a basket of Primroses possessing shades varying from pure white to dark crimson.

Mr. O. T. Hodges, Lachine, Chislehurst, was awarded 1st prize for a neat and good collection of twelve alpines, viz., Saxifraga muscoides, Kanauculus amplexicaulis, Primula Auricula, P. venusta, P. viscosa var. P. Gabelii, Adonis vernalis, Gentiana firma, Androsace sarmentosa, Hacquetia epipactis, Saxifraga globosa, and Anemone apennina.

Sprays of bloom of *Syraca (Jonesia)* Seedling, Macleania insignis, and Brownæ arhiza, came from the Royal Botanic Gardens, Glasnevin, for which a vote of thanks was accorded.

Messrs. H. Lane and Son, The Nurseries, Berkhamstead, exhibited four baskets of pot Roses, R. polyantha Perle d'Or, with flowers a buff colour; R. polyantha Little Dot, with bluish-pink flowers; Gloire de Polyantha, a rose-coloured var.; and R. polyantha Marie de Montravel. A Silver Medal.

Messrs. B. S. Williams & Sons sent three Amaryllis, *Dracæna Coulingii*, a cross between D.

Mooreana and *D. terminalis alba*, a variegated form, possessing good decorative qualities, and adjudged worthy of a First-class Certificate. This form sent also plants of *Asparagus medius* and *Pandanus* considens.

Sir Trevor Lawrence sent a spathe of *Anthurium Rothschildianum* var. maximum, a very fine one, measuring some 3 to 4 inches in width and 6 inches long; also a grand plant, in bloom, of *Lotus peliorhynchus*, which obtained a First-class Certificate. A box of large, well-coloured *Calceolaria* blooms came from Mr. W. Kapley, Hillington Heath, and received a vote of thanks. We had rather seen the plants.

A pretty, dwarf, variegated-leaved plant—*Aglaonema costatum*—was shown by Messrs. J. Veitch & Sons, in which the short, semi-erect, dark green leaves, are spotted and blotched with white, the midrib also being white. (A First-class Certificate.)

They also exhibited *Caladium Souvenir de Paro*, a plant resembling in a certain degree the older *C. bicolor*, but more dwarf than that species; the margin of the leaf is green, mottled with white. (A First-class Certificate.) From the same nursery came *Tilandsia Massangeana superba*, a fine thing, with channelled light green leaves, 1½ inch wide, and slightly recurved and marbled in broad bands of darkest brown. (A First-class Certificate.) *T. Mossii* was another fine foliage plant, coming also from the Royal Exotic Nursery. It has broad-channelled leaves, finely reticulated on the upper side, and slightly recurving. (A First-class Certificate.) Along with these came the Veitchian crosses of *Streptocarpus* in many-varied colours, a pretty lot of blooms, nicely set off by being stuck into some amongst tips of Maidenhair Fern.

Messrs. William Paul & Son, Waltham Cross, had a group of new Roses in pots, including some very fine varieties, viz., *Corunna* (Tea), bright pink; *White Lady* (Hybrid Tea) almost pure white, were granted Awards of Merit.

A very good collection of Ferns came from Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmon-ton, and included *Asplenium*, *Davallia*, *Adiantum*, *Anemia collina*, *Gymnogramma sciophylla* expansa, the beautiful *Pteris serrulata* undens, and *Pteris cretica nobilis*; also a group of *Ficus elastica* alvariegata. All a very good colour.

Some cut blooms of the new Tree Carnation, Mrs. A. Hemsley, from the same exhibitor, were excellent; the colour is crimson, and form and size good.

Orchid Committee.

Present: Dr. M. T. Masters, F.R.S., in the chair; and Messrs. J. O'Brien, S. Courtatou, J. Douglas, T. B. Haywood, Norman C. Cookson, Rev. E. Handley, F. Sander, H. Williams, and W. H. White.

Messrs. F. Sander & Co., St. Albans, exhibited their magnificent new *Cattleya Victoria Regina* (see p. 559), which, although the true *Cattleya*, may be likened to *Laelia elegans*. *Blenheimensis* taken at its best; but all the segments are more waxlike in texture, and not crumpled or recurved. The flowers are over 6 inches across; warm, rosy-lilac, and the lip purplish-crimson. The plants of the same species exhibited, but not in flower, bore evidence of having had twenty flowers on one spike. It is a grand acquisition. Another remarkable plant sent by Messrs. F. Sander & Co. was *Phajus Sanderii*, with flowers more than 6 inches in diameter, the sepals and petals coppery-red, lip yellow at the base, crimson in the middle, this colour running down the middle of the large, abruptly-turned-down, white front lobe of the lip, which is of extraordinary length, and peculiar. Messrs. Sander also showed a fine form of the beautiful *Ocidioid Larkianum*, a supposed natural hybrid of *O. Marshallianum*, but larger and still more handsome than that species; *Cynorchis flexuosa*, and several forms of *Dendrobium Phalaenopsis Schroderianum*.

Norman C. Cookson, Esq., Wylam-on-Tyne (gr. Mr. Murray), exhibited a grand new hybrid—*Laelia-Cattleya Phoebe* (C. *Mossii* × L. *cinnabarinæ*), (the reverse cross to the L. *C. Hippolyta* × of Messrs. Veitch). The flowers were of a rich Indian-yellow colour, the middle lobe of the lip intense purplish-crimson. The record attached to the plant stated that the seeds were sown in 1886. Mr. Cookson also showed a spike of *Cypripedium Rothschildianum*, bearing five flowers; and one of *Odontoglossum Andersonianum*. Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, and Park Road, Clapham, staged the rare and pretty *Eriopsis biloba*, *Laelia grandis tenebrosa*, and the true *Stanhopea insignis*, Frost, which, although it was the species in which the genus was founded, is still rare. W. E. B. Farnham, Esq.

Quorndon House, Loughborough (gr. Mr. G. Cook), exhibited a noble specimen, with many flowers, of a superb white form of *Cattleya Mendellii*, named "Quorndon House variety." The only colour was a shade of yellow in the lip, and some delicate purplish veining at its base; also a group of light coloured varieties of *Dendrobium phalaenopsis Schroderianum*, of great merit.

The Rev. Ed. Handley, Bath, showed cut spikes of two noble white-petalled forms of *Laelia purpurata*, and one of *Vanda teres*.

Messrs. James Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed their charming new hybrid *Laelia Latona* × (*cinnabarinæ* ♀, *purpurata* ♂), in growth like a miniature *L. purpurata*, but with flowers having sepals and petals of a rich deep yellow colour, and the labellum mostly dark crimson. Messrs. Veitch also sent *Cattleya Philo-albiflora* × (*iricolor* ♂, *Mossii* ♀), the white-petalled form of that exhibited at the last meeting, and still more beautiful.

F. A. Gledastanes, Esq., Manor House, Gunnersbury (gr. Mr. H. Denison), sent a fine cut spike of *Cypripedium punctatum*; Walter C. Walker, Esq., Percy Lodge, Winchmore Hill (gr. Mr. G. Cragg), sent *Laelia Boethiana*, and a spike of *Gongora truncata*.

E. C. Wrigley, Esq., Victoria House, Duxfield, Cheshire (gr. Mr. C. Harris), sent a dark form of *Dendrobium nobile*, and four plants of *Dendrobium Phalaenopsis Schroderianum*.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, showed *Odontoglossum citrinum album*, a variety with remarkably fine flowers, of a pure white; and C. J. Lucas, Esq., Warnham Court, Horsham, sent *Epidendrum umbellatum*.

List of Awards.

ORCHID COMMITTEE.

First-class Certificates.

To *Cattleya Victoria Regina*, from Messrs. F. Sander & Co.

To *Cattleya Mendellii*, (Quorndon House var., from W. E. B. Farnham, Esq.)

To *Laelia-Cattleya Phoebe* ×, from Norman C. Cookson, Esq.

To *Laelia Latona* ×, from Messrs. Jas. Veitch & Son.

Awards of Merit.

To *Phajus Sanderii*, from Messrs. F. Sander & Co.

To *Cattleya philo-albiflora* ×, from Messrs. Jas. Veitch & Son.

Botanical Certificates.

To *Cynorchis flexuosa*, from Messrs. F. Sander & Co.

To *Eriopsis biloba*, from Messrs. Charlesworth, Shuttleworth & Co.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. John Lee, R. Hogg, R. D. Blackmore, T. F. Rivers, G. Bunyard, J. Cheal, G. Norman, G. Taber, G. Reynolds, W. Warren, J. Wright, A. Dean, J. Willard, J. A. Laing, G. Wythes, F. Q. Lane, J. Hudson, and H. Balderson.

The exhibits brought to the notice of this committee were more numerous than on any previous occasion this spring. From the Royal Gardens, Frogmore, came an excellent collection of vegetables, consisting of the following twelve varieties:—*Argentuil Asparagus*, *Ellam's Early Cabbage*, sown July 23, 1891, and possessing firm little hearts fit for cutting; *Broccoli Model*, planted in the middle of July, in undug soil, after Strawberries, and Mr. Owen Thomas says that 70 per cent. have survived the past winter; *Veitch's Improved Ashleaf Potato*, *French Beans*, *Major Clarke's Celery*, *Ayton Castle Leek*, *Cottagers' Kale*, *Seakale* which had been moulded up with soil in the open ground, and a dish of *Mushrooms*. Also a box of large well-coloured fruits of *La Grosse Sucrée Strawberry*. Mr. Thomas was awarded a Silver Medal.

Lord Foley, Ruxley Lodge, Esher (gr. Mr. J. Miller), showed three dishes of excellent *Mushrooms*, which had been grown on ridges outside, and received a well-earned Cultural Commendation. He received also a Cultural Commendation for a dish of *Laxton's Noble Strawberry*, the fruit large and of a high colour. A vote of thanks was awarded to the same exhibitor for six Cucumbers, *Gilbert's King*, resembling *Rollins's Telegraph*; and for fourteen dishes of *Apples* which were badly bruised in transit. The varieties included *Wellington*, *Beauty of Kent*, *Norfolk Beaufin*, *New Hawthorn*, *den*, *Ribston Pippin*, *Alfriston*, *Ashmead Kernel*, and a variety called *Eve*.

Mr. Wythes, gr. to the Duke of Northumberland, Syon, showed two dozen *Brown Turkey Figs*, more or less ripe, and received a Cultural Commendation. Some *Lettuce* (*Veitch's Perfect Gem*), came from Mr. W. C. Leach, gr. Albury Park, Surrey, which were grown from seeds sown on February 14, and were

ready for table towards the middle of last month. H. Berkeley James, Esq., gr. Mr. J. Gibson, received a 1st prize for thirty fruits of *Vicomtesse Hélicar de Thury Strawberry*. There was no competition, and it appeared not generally to be known that such a competition was to take place. A new seedling Cucumber obtained from Prizewinner × *Lockie's Perfection*, came from Mr. W. H. Castle, The Gardens, Castlemans, Twyford. A dish of *Plums* was exhibited, remarkable as having been brought from Sydney.

Daffodil Committee.

In a competition for medals offered by Messrs. Barr & Son, Covent Garden, for a collection of *Narcissus* (*Polyanthus* excluded), the 1st prize, a silver medal, was awarded to H. J. Adams, Esq., Roseneath, Enfield (gr. Mr. C. May), who staged 65 varieties, a very strong collection, including most of the best varieties, and staged in boxes which were surfaced with moss, offering a striking contrast to the not very elegant blacking-bottles that one usually sees used for the purpose at these fortnightly shows. The 2nd prize (Barr's small silver medal) was obtained by the Rev. G. P. Haydon, Hatfield Vicarage, Doncaster, and the 3rd prize (Barr's bronze medal) fell to H. Berkeley James, Esq., The Oaks, Carshalton (gr. Mr. J. Gibson).

Mr. Thos. S. Ware, Hale Farm Nursery, Tottenham, exhibited numerous cut blooms of a new dwarf double Daffodil (*Narcissus Talamonius plenus*); it is very handsome, of a fairly deep yellow, but the petals and sepals somewhat paler.

A large and varied collection, comprising excellent specimens of most of the late kinds of *Narcissus*, was exhibited by Messrs. Barr & Son, Covent Garden, who included with their exhibits some miscellaneous hardy flowers, such as *Tulips*, *Anemones*, &c. A Silver Banksian Medal was awarded.

Lecture by Professor Foster, on "Bulbous Irises."

The lecturer said that he proposed to give the facts most interesting to the gardener concerning the bulbous section of the genus *Iris*, and then alluded to several of the species in detail. *Iris asyriacum* was one of the oldest and most wide-spread, and related to the bulbous Irises of South Africa. It is characterised by the bulb being wrapped in a kind of network; it has two narrow leaves, from between which the flower-spike ascends. The flowers open about mid-day, and close about 4 o'clock, three or four slightly fragrant flowers being borne upon each spike. It is not a great acquisition to the gardener, and rather difficult to grow in England. It requires a very hot summer, and severe baking. Professor Foster advised that the bulbs should be taken up and well dried each season.

Iris reticulata has a bulb very similar to the foregoing, but the leaves are linear, and having four sides. The one generally regarded as the type has violet flowers, but the lecturer said that this form is very rare, and he has never yet seen it come with imported bulbs of this species.

Iris reticulata Krelagei is a purple form. The segments are smaller and broader, and it has not the odour possessed by the other. As this is very much more common, he would regard it as the typical form, more especially because, if crosses are obtained between the generally-accepted type and *Krelagei*, the seedlings will chiefly follow the characteristics of the latter.

Iris reticulata purpurea is more handsome than *Krelagei*, and there is another small variety of this group called *cyanea*. *Iris sophomensis*, an early flowering species, *I. Danfordiae*, with which *I. Bornmülleri* is synonymous, were also mentioned as allied to *I. reticulata*, as also *I. Vartani*, an *Iris* growing in the neighbourhood of Nazareth, and flowering in October and November. *Iris histrio*, generally accepted as a different species, is regarded as merely a variety of *reticulata*. The flowers are not of a uniform colour, but are blotched with lilac on a paler ground. The lecturer said that a variety called *histrionides*, although differing in several respects from *histrio*, was certainly of the same species as that variety, while there could be no doubt about it being a member of *reticulata* group also. An *Iris* very like *reticulata*, with similar bulb, and the leaves somewhat the same, is *I. Bakeriana*. The flowers of all these are very beautiful. The plants require plenty of sun, and a good loamy soil, which should be rather stiff. They are liable to the attacks of a fungus, that will—if left in the ground—cause the bulbs gradually to decay. If lifted each year, the fungus

is greatly checked. *Iris Kolpakowskyana* is closely allied to *reticulata*, has bulbs with netted coats, but the leaves are not similar; it has a very beautiful flower, and is difficult to cultivate. *I. Winkleri*, with blue flowers, is very similar to the above; the leaves are more or less linear, and the bulb is covered with membranes. It has a somewhat limited distribution in Europe.

I. xiphioides has blue, purple and white flowers in different varieties, but in none of them can any yellow be seen. It is sometimes called the Pyrenean *Iris*. *Iris xiphioides* (the English *Iris*), requires a more damp situation than the Spanish form. Both are thoroughly hardy, and can be left to themselves to a great extent. The name (English *Iris*) originated through it being first brought to Bristol, and afterwards distributed to the different parts of Europe from the West of England. *Iris filifolia*, is an exceptionally handsome flower—a rich strong purple limb, and orange signal. It is slightly allied to the Spanish *Iris*. It requires a thorough baking, and would be benefited by a little pinching in summer through want of rich soil. *Iris Tingitana*, the lecturer described as a large one, and growing in the neighbourhood of Tangiers. It has a resemblance to the English *Iris*, but is exceedingly difficult to grow. It should be in bloom at this date, but that it requires a very warm spring, and to be dried up in summer. After making a remark upon *Iris tuberosa*, the lecturer went on to describe the Juno group, which differed from the rest in that the ripe bulbs possessed a number of fleshy roots and broad leaves. These roots disappear annually, but if the bulb does not produce a flower, they sometimes remain, because the nutriment contained therein was not drawn upon.

I. alata, or *I. scorpioides*, is a form of this group having broad leaves. The outer segments of the flower have an ear-like projection in each side, and it has a well-formed crest. The bulb is covered with several coats. It may be grown in the open south of London, perhaps, but the lecturer said that it requires the shelter of a greenhouse in the Midland Counties. It has large flowers with various markings, exceedingly fine and fragrant. *Iris persica*, the Professor observed, was a very beautiful little plant, with flowers possessing very characteristic markings. There are many varieties of this lately introduced. They will stand frost, but require well roasting in summer. He would advise that they be lifted each year, and thoroughly dried.

Professor Foster thought that *Iris caucasica*, with its greenish-yellow flowers, was not a great acquisition in the garden, but there are several varieties that excelled it. One of these deserved the specific name of *Orchioides*, a variety that differed in many respects from the type.

Iris rosenbachiana, also belonging to the Juno group, characterised by the fall of the outer segment, its beautiful rich markings at the bottom of the fall, and possessing an exquisite signal. It blooms in February or March, before sending forth any leaves, and sometimes amongst the snow. The lecturer said it looked like a summer flower, its surroundings not being suitable to its rich colour and refinement. In the different plants the colour is exceedingly variable, but the form is fairly constant. Another, belonging to the same group, is *I. fosteriana*, with foliage not so broad, and having less fleshy roots. It comes from Afghanistan. A handsome contrast is presented between the golden-yellow upright part of the flower and the purple fall; it does not take kindly to the English climate.

Iris Sindjarensis is fairly hardy, and grows as well in our gardens as any of this group; a very beautiful and fragrant species. The lecturer concluded by saying that some of the bulbous *Iris*es are not strong to their struggles for life, and he advised would-be growers to grow them by themselves, and to treat them with great care, for if left to themselves to fight their way among other plants, the result would be disastrous. Professor Foster's lecture, which will be reported in full in the *Journal of the Society*, was exceedingly interesting, and was illustrated by living specimens of many of the species, and also by drawings lent from the Royal Gardens, Kew.

lain, M.P., Highbury, Birmingham. He was taken suddenly ill at 4 o'clock in the morning, and died in a few minutes before medical aid could be obtained. His sudden death is deeply regretted by a very large circle of friends. Mrs. Cooper, who had been an invalid for a long time, and for some time had completely lost her voice, regained it on the occasion of the shock produced by the sudden death of her husband.

Mr. WILLIAM DAVIES, the oldest and one of the most respected gardeners in Glamorgan, passed away quietly after a few days' illness, on the 2nd inst., in his seventy-ninth year. Mr. Davies held the situation of Head Gardener under the late Thomas Booker, Esq., and family at Velendra, near Cardiff, for the long period of forty-seven years. He was a good all-round gardener, and an enthusiastic Pine-apple grower up till the time of his death.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 49° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.— (+ Above 49° or below 49° the Mean for the week ending April 30, 1892.)	TEMPERATURE.		RAINFALL.		BRIGHT SUN.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending April 30, is furnished from the Meteorological Office:—

"The weather during this period was cold and changeable, with frequent falls of cold rain or hail; but considerable intervals of sunshine. Thunder and lightning occurred in the east and south-east of England on the 25th, and at night a brilliant display of aurora was observed.

"The temperature continued below the mean, the deficit amounting to 3° in 'Scotland, E. and W.', 'England, S.W.', 'Ireland, S.', and the 'Channel Islands,' to 4° in most other districts, and to as much as 5° in 'Scotland, N.' and the 'Midland Counties.' The highest of the maxima, which were recorded on the 24th, ranged from 66° in 'England, S.', and 64° in 'England, E.', to 55° in the 'Channel Islands,' and to 52° in 'Scotland, N.' The lowest of the minima were recorded on the 29th and 30th, when the thermometer fell to 24° in 'England, S.W.', to between 25° and 27° in most other districts. In the 'Channel Islands,' however, the minimum was no lower than 37°.

"The rainfall slightly exceeded the mean in 'Scotland, N. and E.' and 'England, N.E. and W.'; but, elsewhere it either equalled or was a little less than the normal value.

"The bright sunshine was fairly abundant, and exceeded the normal in all districts. The percentage of the possible duration ranged from 33 in 'Scotland, N.', and 36 in 'Scotland, E.', to between 45 and 50 in most other parts of the Kingdom, to 55 in 'England, S.W.', and to 59 in 'Scotland, W.'"

MARKETS.

COVEANT GARDEN, May 5.

[We cannot accept any editorial responsibility for the above reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but also several times in one day, &c.]

BUSINESS very dull again. Prices of household goods lower all round. James Webber, Wholesale Apple Market.

POTATOS.

NEW POTATOS.—The demand during the week has been brisk, and supplies not equal to expectations, consequently prices advanced. Malta Kidneys, 16s. to 23s.; Rounds, 12s. 6d. to 14s. 6d.; Canary Kidneys, 12s. to 22s. per cwt.

OLD POTATOS.—The indication of last week's tone of the market is confirmed by a rise of 6s. to 10s. per ton. Tendency still upward. J. B. Thomas.

Obituary.

EDWARD COOPER.—We regret to announce the death, on the morning of the 2nd inst., of Mr. Edward Cooper, who for seventeen years filled the situation of head gardener to the Right Hon. Joseph Chamber-

FRUITS AND VEGETABLES.

BROCCOLI, May 3.—Quotations:—Broccoli, 7s. 6d. to 10s. per tally; Sprouting do., 1s. 6d. to 2s. per bag; Spinach, 3s. to 6s. per bushel; Greens, 2s. to 3s. 6d. to 3s.; Carrots, 1s. 3d. to 1s. 9d.; Spring Onions, 4s. per dozen bunches; Egyptian do., 5s. 6d. to 6s. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 12s. to 20s.; and Newtown Pippins, 15s. to 30s. per barrel.

SPRATFIELDS, May 3.—Quotations:—Cabbages, 7s. to 10s.; Cauliflowers, 6s. to 12s. 6d. per tally; Greens, 4s. 6d. to 5s. 6d.; Carrots, 2s. to 2s. 6d.; Spring Onions, 4s. to 5s. 6d.; Parsnips, 3s. to 4s. 6d. per dozen bunches; Spinach, 2s. to 3s. per bushel; Sprouting Broccoli, 2s. to 3s. 9d. per sack; do., 1s. to 1s. 9d. per sieve; Parsnips, 3d. to 9d. per score; Endive, 9s. to 15s. 6d.; French Cos Lettuce, 2s. 6d. to 5s.; Cabbage, do., 9d. to 1s. 6d.; Leeks, 2s. 6d. to 4s.; frame Cucumbers, 2s. 6d. to 3s. per dozen; French Radishes, 1s. to 1s. 3d.; English do., 3d. to 4d. per dozen bunches; Horseradish, 1s. to 1s. 1d.; Celery, 4d. to 1s. per bundle; English Onions, 6s. 6d. to 7s. per cwt.; Egyptian do., 3s. 3d. to 5s. 9d. per cwt.; English Apples, 2s. 6d. to 5s. per bushel; American do., 12s. 6d. to 22s. 6d. per barrel; Tasmanian do., 6s. to 8s. per bushel; foreign Tomatoes, 1s. to 2s. per box; forced Rhubarb, 1s. 3d. to 1s. 9d.; natural do., 2s. to 3s. per dozen bunches; Seakale, 1s. to 1s. 6d. per punnet.

STAFFORD, May 3.—The market has been well supplied with all kinds of produce during the past week, and an excellent trade was done at the undermentioned quotations:—Greens, 3s. to 4s. per bag; Cauliflowers, 1s. 6d. to 2s. per dozen; ditto, 8s. to 12s. 6d. per tally; Spring Cabbages, 4s. 6d. to 6s. per tally; Broccoli, sprouting, 2s. to 3s. 6d. per bag; Turnip-tops, 2s. to 3s. ditto; Rhubarb, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, household, 3s. to 40s. per ton; ditto, cattle-feeding, 20s. to 30s. do.; Mangels, 16s. to 20s. ditto; Swedes, 20s. to 25s. ditto; Onions, Egyptian, 120s. to 140s. per ton; Lisbon, 6s. to 6s. 6d. per case; Apples, English, 4s. to 6s. per bushel; American ditto, 12s. to 20s. per barrel.

NOTICES TO CORRESPONDENTS.

ADDER'S TONGUE FERN: *G. W. E.* The plant is obtainable in small quantities, but to use it in attempting to cure cancer, would only raise false hopes, it being utterly useless for the purpose.

BOOKS: *Flora.* Cucumbers and Melons. Any manual would supply the useful information about these plants, say, *The Forcing Garden*, by S. Wood (Crosby Lockwood and Co., Stationers' Hall Court, London). *The Tomato.* *The Tomato, and its Culture*, by W. Igoulden, published at 171, Fleet Street, London, E.C.—Roses. *T. River's Rose Amateur's Guide* (Longman, Green, & Co., London).—Ferns. *Select Ferns and Lycopods* (B. S. Williams, at the Victoria and Paradise Nurseries, Upper Holloway, London, N.).—Carnations and Picotees. *Florists' Flowers*, by Jas. Douglas. We do not know the publisher, but you might write to the author, at Great Gearies, Ilford, concerning that point.—*R. M. M. Fowkes* on *Horticultural Buildings* will supply your needs.—*A. O. W.* The only other book upon the subject we can think of, is one by F. W. Burbridge, entitled *Domestic Floriculture*, published by Wm. Blackwood & Sons. We are not sure if this is now in print.

CARNATIONS AND DAHLIAS: *J. Adams.* Really, our space is too valuable, and our time too much occupied, to allow of our giving you the names of 25 varieties of show Carnations, and 50 of Dahlias. You had better consult the list of a dealer of these flowers for this kind of information.

CUCUMBER FLOWERS: *W. H. Y.* The Cucumber flowers exhibit no fungi whatever, and we cannot account for the unusual development of the base of the hairs.

EUCARIS MITE: *Eucarhis.* Well wash the bulbs, remove the outer scales, and grow on the plants as well as you can; under these circumstances it is not always necessary to destroy the plants, but watch carefully.

FIGS: *An Anonymous One.* We think that the Figs you sent us are suffering from the effect of draught or in perfect ventilation. They may also be suffering from the attack of a fungus; if we find this so, we will report again.

FRENCH BEAN WITH SPECKLED LEAVES: *Cheltenham.* It is a case of variegation injury, and there is no disease to cause injury.

GAS AND VINES: *G. T. C.* If the fumes can be kept with certainty out of the viney, there is no reason

why gas should not be applied to the heating of the same. We would remind you that the maintaining of a high night temperature is not conducive to the health of the Vines; 60° to 65° is quite high enough, even for early forcing.

HORTICULTURAL SCHOOL: *Enquirer.* At present we only know of the Horticultural College at Swanley, but arrangements are, we believe, in progress for the extension of horticultural education at Chiswick.

INSECTS: *J. T. (Woodhall).* Your Apricot shoots are badly infested with the small flesh-coloured caterpillars of a minute moth allied to the species which attacks and rolls up the leaves of Apples and Pears (*Diitula angustiorana*), which we will try to rear, as it is not a common species. Wash abundantly with lime-water and soap-suds, and pick off rolled leaves in which the larvae are lodged; also wash with strong lime-water or with soft-soap and sulphur alone. *I. O. W.*

LAPAGERIA: *Chickster.* A Chilean twining plant introduced in 1847. Its thick leaves enable it to resist smoke and deleterious vapours better than most plants, hence it grows in the neighbourhood of copper smelting works in Chile, where scarcely anything else will grow. It does well in London greenhouses, and will bear shade. It is all but hardy, but does best in a cool greenhouse. Give plenty of water in the growing season, and keep the plants free from insects and slugs.

LAWN SAND: *Anxious Enquirer.* The substance would appear to be a manure very suitable for grasses, which, when dressed with it, grow at a great pace, smothering, and eventually destroying, other plants existing in the turf.

LETHORION CONES: *Anxious Enquirer.* We cannot say if the fumes will destroy red-spider on Vines without injury to the young Grapes, but we would not advise you to run the risk—better to sponge the under-sides of affected leaves with soapy water, carefully doing so, without touching the bunches.

NAMES OF PLANTS: *T. F. R. Lencuon* (*Acia*) trichophyllum, a native of Portugal.—*W. T. H.* A variety of *Rhododendron ponticum*, and a poor one.—*E. D. H.* *Primula acutis*, double lilac variety.—*H. E. P.* *Cactula articulata*, a candle plant.—*E. P. L.* *Sherardia arvensis*, 2, looks like a scrap of *Veronica hederifolia*; 3, *Cerastium*—send better specimens.—*A. F.* *Juniperus virginiana*, so far as we can tell from such a scrap, also known as red Cedar.—*G. H.* 1, *Adiantum gracilimum*; 2, *A. cuneatum*; 3, *A. formosum*; 4, *Mesembryanthemum cordifolium variegatum*; 5, *Sedum Sieboldii*; 6, *Elagnus pungens variegata*.—*N. M.* *Dendrobium aduncum*.—*S. R.* *Adiantum cardiophyllum*.—*E. D. L.* 1, *Doodia media*; 2, *Aspidium falcinellum*; 3 and 7, forms of *Asplenium premorsum*; 4, *Aspidium capense*; 5, *Aspidium pungens*; 6, *Asplenium Henrici* (*palmatum*).—*G. H.* 1, *Bifrenaria* (*Lycaste*) *Harrisonia*; 2, specimen not sufficient.—*A. F. F.* 1, *Eranthemum sanguinolentum*; 2, *Ruellia Devaiana*; 3, next week; 4, *Acalypha Macteeana*; 5, *Polypodium aureum*; 6, *Begonia incana*.—*L. J. A.* 1, *Erysimum Alliaria*; 2, *Lamium purpureum*; 3, *Cerastium vulgatum*; 4, *Saxifraga muscosa*; 5, *Orobanchis verus*; 6, *Arenaria rubra*; 7, *Cardamine hirsuta*.—*D. S. & Sons.* *Abies* *Pindrow*.

PODOCARPUS PECTINATA: *W. T. T. D. Paucher MSS.* not *Pancker*. Many thanks, next week.

SPRAYING APPLE TREES: *J. W.* As soon as the fruits are of the size of Filberts, and a fortnight later.

VINES: *J. F. Thoday.* There is no mycelium in the Vine roots, and no trace of fungi, except superficial. It looks to us much like what we have seen when the soil is water-logged, and the roots are in stagnant water.—*G. Stokes.* Your Vine leaves have been injured either by fumes from the stove used in heating, or from want of sufficient air during bright sunshine.

COMMUNICATIONS RECEIVED.—*M. M. Vilmorin*, Andrieux, et Cie.—*T. Durant*, Lachen.—*R. G. W. R.*—*I. J. B.*—*W. D. J.*—*D. S. Dowse*.—*A. L.*—*C. B.*—*E. B.*—*V.*—*W. T. D.*—*W. E. H.*—*D. L'HORTICULTURE INTERNATIONALE (LINDEN), LEOPOLD PARK, BRUSSELS.

SPECIAL EXHIBITION OF ORCHIDS

OF THE ESTABLISHMENT, IN CONNECTION WITH THE

GREAT INTERNATIONAL ORCHID SHOW OF THE "ORCHIDEENNE,"

From the 14th to the 20th of MAY, 1892.

THE INTERNATIONAL EXHIBITION of the ORCHIDEENNE will be held in the spacious Winter Garden of L'Horticulture Internationale. The SPECIAL EXHIBITION of L'HORTICULTURE INTERNATIONALE will be held in the Great Show-houses. *Entrance Free.*

OUR ENGLISH PATRONS are especially invited to visit THESE GRAND EXHIBITIONS; it will afford a most convenient opportunity to those who wish to see Orchids grown to perfection, a reputation which has by now become universal.

IMPORTANT NOTICE.—We offer to each Visitor to our Establishment who purchases to the amount of £50, a discount of £5, which will cover the expenses of the journey to Brussels. N.B.—The journey from London to Brussels, either *via* Dover-Calais, or Dover-Ostend, takes only 8 hours. The most convenient Trains are at 10.15 A.M., and 8.15 P.M. from Charing Cross or Victoria.

HEATING! HEATING!! HEATING!!!

THE THAMES BANK IRON COMPANY

H. BRIDGEMAN, Potato Grower, Reading, used for Potatoes, Onions, and Carrots, results:—"Very good; never had better crops."—J. BUTLER, Sittingbourne:—"Used for Potato, Celery, and other Market Garden Crops, with very good results; Potatoes large, clean, and free from disease. Best and Cheapest Manure in the Market."

NATIVE GUANO, FOR FRUIT, ROSES, TOMATOS, &c.
J. PEEB & SONS, Streatham, used for Fruit Trees and Roses, results:—"Very satisfactory. We use no other. Guano now consider yours preferable to Peruvian."—J. FICHO, Orrell Gardens:—"Used for Vegetables, Tomatoes, Grapes, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatoes, and many other things. The Cheapest Manure in the Market."

Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where Pamphlet of Testimonials, &c., may be obtained. AGENTS WANTED.

D. HERTY'S CHRYSANTHEMUM

MANURE is the only Manure on the market having a definite influence on it, is distinct from all other, and is specially prepared for the cultivation of Chrysanthemums intended for exhibition. It is pronounced by the best judges to be the most perfect fertilizer of the root, not only for Chrysanthemums, but for Pelargoniums, Zonal Geraniums, Fuchsias, Eucharis, Cinnams, and Tomatoes.

Testimonial.—"October 12, 1891. To Mr. A. J. Doherty, 'Dear Sir,—I have tried your new fertilizer upon several varieties of Chrysanthemums with great success; in fact, I think it the best fertilizer I have ever used for Chrysanthemums. It produces large blooms, and quantities of Cuttings, and nourishes the plants during the whole growing season. Kindly send me 1 cwt. more, I am in want of some immediately, and I prefer this to any other.' (Signed), A. J. MANDA, F.N.C.S., F.R.H.S., United States Nurseries, Hextable."

Send in sealed tins, with directions for use. Size No. 1—1 dozen, 4s. 6d.; ½ dozen, 5s.; 1 dozen, 15s. Size No. 2—1 dozen, 9s.; ½ dozen, 16s.; 1 dozen, 30s. The large tins contain three times the quantity of the small ones.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sir, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 85°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear Sir, yours truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s., 6d., 2s., 6d., and 3s., 6d.; in Tins (1 and 2 gallons), 10s., 6d. and 20s., each; in quantities of 5 gallons and upwards, 5s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen
Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 167, Queen Victoria Street, London.

"Nothing Succeeds like Success."

HUGHES' (SOLUBLE) INSECTICIDE FIR TREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

H. and A. CHEMICAL COMPANY,
97, Milton Street, Glasgow.
May be had through Chemists or Seedsmen.

Prices:—In Tins, ½ Pints 1/3, Pints 1/3, Quarts 3/4, ½ Gall. 5/6, 1 Gall. 9/6, 5 & 10 Gall. Drums, 8s. per Gall. Carriage Paid.
THE MYTHE CASTLE GARDENS,
Tewkesbury, Aug. 13th, 1891.
Gentlemen, I have given your "Climax" Insecticide a good trial on tender foliage, Orchids and Ferns for Bug and Scale. In every instance I found the Bug and Scale dead and the foliage bright and clean. I found it most effective for Black Fly on Peach trees. The "Climax" Insecticide ought to be better known, it is the only one I have found to kill Bug on tender plants without injury to the foliage.—I am, yours faithfully,
W. MACKIE.
Prepared Solely by

IMPROVER.—Age 19; strong and willing. Four years in situation. Bothy preferred.—W. J. BRIT-TAIN, Britwell Road, Burnham, Bucks.

IMPROVER, Inside and Out.—Age 19.—A Gardener wishes to recommend a young Man as above. Active and willing. Good character. Two years in present situation, three years previous. Bothy preferred.—GARDENER, Chobham House, Woking.

IMPROVER, Inside, in a good Private Establishment.—Age 20; five years' good character from Head Gardener. Bothy preferred.—W. GATFORD, Holtye, Elenbridge, Kent.

TO GARDENERS.—Situation wanted by a young Man (age 19); strong, active, and willing; three years Inside and Out; well recommended.—W. NEVARD, Rythe House, Thames Ditton, Surrey.

TO GARDENERS.—Situation wanted under a good Gardener, or where more are kept; age 21; good characters.—R. NORTON, St. Philips, Bath.

TO GARDENERS.—Situation wanted by an active young Man (age 20) in the Kitchen Garden and Pleasure Ground; good experience; good character.—E. WHITE, Lower Beeding, Horsham.

TO GARDENERS, &c.—A youth (aged 16), wanting to learn Practical Gardening, especially Plant-houses (no experience), would be glad to hear of any one who has the vacancy for same.—Apply, stating terms, &c., to A. Mr. Dean, Newdigate, Dorking.

TO NURSERYMEN.—Situation wanted in Market Nursery; used to Ferns, Roses, Carnations, Bourdais, Palms, Cucumbers, Tomatoes, &c.—J. H. I., Brougham Road, Worthing.

TO NURSERYMEN, &c.—Wanted, a situation by a married man (and, son age 17). Just returned from Sydney, N.S.W. Eighteen years as Manager and Foreman in the two largest Nurseries there. Very smart, and thoroughly practical in all branches. Free trial given as guarantee. Total abstinence. References, &c.—T. LAMARCA, Broom Hall, Holmwood, Surrey.

TO NURSERYMEN.—A young Man (age 22) seeks a situation in a Nursery near London. Has been used to Growing Cucumbers, Tomatoes, and Plants for Market. Willing and obliging. Good character.—F. F., Mrs. W. Slade, High Street, Chesham, N.

TO THE SEED TRADE.—The Advertiser seeks re-engagement as TRAVELLER. Twenty years' experience; higher references. Good appearance and address.—R. N. Y. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO Florists. **MANAGER** of a first-class business of Paris wishes to find re-engagement as **MANAGER** or **FIRST HAND**. Fifteen years' experience; three years in London (West End). Well qualified in every branch of the business; several First Prizes. Liable references.—WILLIAM, 38, Faubourg St. Honoré, Paris.

Nursery, Seed, and Bulb Trade. **TRAVELLER or MANAGER**; age 30.—Engagement wanted by an experienced man. First-class references. Fifteen years' experience. Great Britain, Ireland and Channel Isles. Large annual returns.—H. R., 22, High Street, Lewisham, Kent.

MANAGER or SHOPMAN.—Situation wanted as above. Experienced in all branches; excellent references from West End firms; good Buyer, Maker-up, &c.—W. H., 3/9, Regent's Street, W.

BOUQUETS, WREATHS, and TABLE DECORATOR wants situation in a South-coast town. Well up, too, in Gardening and Forcing.—Apply, stating wages, to B. VISGER, 8 Orchard Street, Chichester.

ASSISTANT, in Seed Warehouse.—A young man, age 22; six years' experience. Good references.—J. T. S., Smith & Simons, Seedsmen, Glasgow.

FLORISTS and FRUITERS.—A young Lady (age 25), thoroughly experienced, seeks re-engagement. First class at Posies, Wreaths, Crosses, Bouquets, &c. London experience. Higher references.—GALE, Holhes, Bishopstoke.

TO FLORISTS.—A Young Lady (age 18) seeks re-engagement in a Florist's Shop. For references, &c., apply to Mrs. BUTCHER, Florist, South Norwood, S.E.

HOLLOWAY'S PILLS.—All our Faculties. —Almost all disorders of the human body are distinctly to be traced to impure blood. The purification of that fluid is the first step towards health. Holloway's Pills recommend themselves to the attention of all sufferers; no injurious consequences can result from their use, no mistake can be made in their administration. In indigestion, confirmed dyspepsia, chronic constipation (the most baneful of all ailments), and in all cases where the blood is impure, the most beneficial effects have been, and always must be, obtained from the wholesome power exerted by these purifying Pills over the digestion. Persons whose lives have been restored to ease, strength, and perfect health by Holloway's Pills, after fruitless trial of the whole pharmacopoeia of Physic, attest this fact.

Also 100 lots of Imported CATTLEYA LABIATA, from Messrs. Charlesworth, Shuttleworth & Co. Owing to the large number of entries, the Sale will commence at 11.30 A.M.

At Leeds.—Thursday, May 19.

Important Sale of a Very valuable COLLECTION OF ORCHIDS, the property of Captain T. C. HYNCKS, Breckenbrough, near Thirsk, who is changing his residence, and has no convenience for Orchid Culture.

MESSRS. HEPPER AND SONS will SELL by AUCTION, in their Rooms, East Parade, Leeds, on THURSDAY, May 19, commencing at 11 o'clock, Captain HYNCKS' well-known COLLECTION OF CHOICE and RARE ORCHIDS, to be removed to Leeds for convenience of Sale, and comprising the following species—*Masdevallias*, *Dendrobiums*, *Cymbidiums*, *Cattleyas*, *Cypripediums*, *Cologues*, *Laelias*, *Epidendrums*, *Maxillarias*, *Trichopodiums*, *Odontoglossums*, *Phaiusopsis*, &c.

The Collection is well worth the notice of Orchid-growers, and is throughout in excellent condition. It contains many fine plants. Special attention, however, must be drawn to the *Masdevallias*, amongst which will be found the beautiful hybrid *Masdevallia Stella* (raised by Captain HYNCKS, and kept entirely in his own hands, and the whole stock of it will be included in the Sale); *Masdevallia Fraseri*, M. Harryana (Bull's Blood), M. Chelsoni, M. Hincskiana, M. rosea, and M. cucullata; there are also some choice varieties of *Cologyne cristata*, *Cattleya Lawrenceana*, and other well-known and well-selected sorts, from which connoisseurs may enrich their houses.

Catalogues may be had of the Auctioneers, East Parade, Leeds.

View day, Wednesday, May 18, from 10 to 4 o'clock.

WANTED, TO RENT, ON LEASE, about 3 Acres of NURSERY LAND. Send particulars to—J. S. 2, Beach Terrace, Exning, Suffolk.

FOR SALE, a NURSERY, near London.—An extensive, quiet, and healthy site, from Stoke and Fog. Large comfortable Dwelling-house, Garden, and an acre of Land; 20,000 ft. superficial, of Glass-house, modern and well-heated. Apply to A. H. Gardener's Chronicle Office, 41, Wellington Street, London, W.C.

LONDON, S.W.—In main thoroughfare, close to Station. FOR SALE, in consequence of ill-health, the LEASE of a promising PROSPEROUS SHOP, together with the GOODWILL. Good Trade attached. Lease, 60 years. Low rent, £35. Full particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London.

KENT.—TO BE SOLD, with immediate possession. COMPACT NURSERY near station. Several Greenhouses. Low rent. Any reasonable offer entertained. Apply to PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

FOR SALE, an old-established HORTICULTURAL BUSINESS, in consequence of severe illness of proprietor, or, if desired, would be taken, having capital of at least £2000. The Property comprises about 20 acres of Nursery Grounds, with 40 Glass-houses, Buildings, and 4 Cottages. Long Lease, at low rent; within one mile of Railway Station, and 20 miles from London. A Sacrifice would be made to an immediate purchaser, or Partner admitted upon favourable terms, if able to take active management at once. Apply to—

NORMAN AND SON, Land Agents, Uxbridge, Middlesex.

TO BE SOLD, by Private Contract, 25 acres of FRUIT PLANTATION (adjoining Fruit Bottling Co.) Situated at Poles, Faversham, large and small trees, 1700 to 800 Pear, 2000 Plum, 4000 Cherry, 16,000 Black, 10,000 Red Currants, and 4500 Gooseberry.

DAN AND SONS, Faversham.

To Fruit Growers, Nurserymen, and Others.

GOOD ARABLE and MEADOW LAND to be LET or SOLD. Close to the main road at Ponder's End (9 miles from London). Long Leases granted. Rent, £12 per acre per annum, with option to purchase the Freehold any time during the first year. Several large Market Nurseries are established on the Estate. Full particulars of A. and G. GUIVER, Land Agents, Ponder's End.

To Capitalists and Others.

FOR SALE, as a GOING CONCERN, the large, well-established, and thriving businesses of a NURSERYMAN, SEEDSMAN, and FLORIST, finely and prominently situated in the best suburb of London, and only 8 miles from Covent Garden, and a very large and increasing general business. There is a large Bulb, Seed, Plant, Sundry, and Landscape, and General Business done, with an excellent high-class, wide-spread, and staple connection. The Nursery is a large and well-kept Dwelling House, and well-stocked and fitted double-fronted Shop, 13 well-built modern Glass Houses, some nearly new, 7 of them being the property of the Tenant, all well heated with nearly new boilers, and equipped with a magnificent assortment of many thousands of valuable PALMS and ASPIDISTRAS, STOVE and GREENHOUSE PLANTS, and an immense stock of well-grown BEDDING PLANTS in all kinds to suit both the Retail and Wholesale Trade. About 2 acres of thoroughly well-stocked out-of-door Nursery, well-filled with Coufers, Roses, Fruit and Forest Trees, Shrubs, and Climbers, and a fine Collection of Herbaceous and Alpine Plants, and all worked by a good staff of competent assistants. To Figs, Framers, Vans, Carts, Sheds, and all the necessary Stock-in-Trade.

Also, a very desirable SUBURBAN BRANCH BUSINESS excellently situated, in a new main thoroughfare, and doing a most lucrative trade, and is well-stocked, established, and fitted up.

Also, a WEST-END BRANCH BUSINESS, situated and being one of the first positions in London, comprising magnificent large corner Double-fronted Shop and Offices, and a very high-class, profitable, yearly increasing trade; is well-established, and has an excellent connection. The whole concern doing a large and profitable business, and all worked by a good staff of competent assistants. Separate sets of books are accurately kept, and may be inspected, and every other particular given on application. This is probably one of the finest opportunities for offering for sale, and doing a genuine business. Principals or their Solicitors only deal with.

Apply, in first instance, to HORTUS, 41, Wellington Street, Strand, W.C.

NURSERY FOR SALE.— $\frac{3}{4}$ vergées (or 1 $\frac{1}{2}$ acres), subject to a Ground Rent of £24 per annum currency. Gardeners' Cottage, 5 rooms, 2 attics (new); Forcing-house, 150 feet long by 25 feet wide, three-quarter span, equipped with Double-fronted Shop and Offices; also Fig Tree and young Vines (Black Alicante), one year in fruit. Viery, 200 feet long by 25 feet wide, three-quarter span, planted with Tomatoes expected to market in June; Vines trained on Pergola (Black Alicante), one year in fruit. Fitted with Hot-water Apparatus.

Asparagus beds, one 300 feet by 12 feet, three years old in full bearing; one 400, 150 feet by 12 feet, one year old; one 300, 150 feet by 12 feet, one year old. Gladioli, Lilies, and other plants in flower. Commencing to market end of April; 30 per cent Potatoes, to market July and later; 1000 young Vines (White Muscat, Black Alicante, and Hambrough), 50 young Fig Trees, 20 Apple Trees, 20 per cent Potatoes, &c.

Three wells on estate. Land in first-class condition, well-drained and kept. Two sides frontage on good road. Enclosed by a good wall (new) and a high fence. The land is subject to no other charges than ground-rent before mentioned. Possession can be had immediately. Anticipated returned value of crops this season, say, £200 net. The land is prepared and ready so that other glass can be immediately erected at simple cost of greenhouses only—that is, no cost would be incurred for levelling, trenching, or drainage. Rental offered for estate as it stands, £100 per annum for term of years. Selling price, £1000 currency.

Further particulars of Mr. C. J. WATTS, 13, Saumarez Street, Guernsey.

TO BE SOLD, the LEASE of a compact MARKET NURSERY, with 15,000 feet of good Glass, plenty of Water, good Dwelling House, splendid Stabling, Loft, Van, Shed, and every other sign of a well-kept and profitable business. Good locality for growing. All the houses well-heated by hot-water. To be had a bargain to an immediate purchaser.

Apply to Mr. W. J. IPIKIN, Land Surveyor, 19, Barbot Street, Lower Edmonton.

CLIMBING ROSES.—Gloire de Dijon, Reine Marie Henriette, Marschal Niel, Madame Bernard, and Cheshunt Hybrid, strong, in 7 and 10-inch pots, 30s. to 60s. per dozen.

H. LANE AND SON, The Nurseries, Berkhamsstead, Herts.

Trade Offer of Large Palms.

W. ICETON has a large Stock of the leading kinds of Decorative PALMS, from 6 to 25 feet high, fit for Conservatory and House Decorations; Dracaenas, Bamboos, & Foliage Plants. Lowest Prices quoted on application.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

PATENT.
They are now universally admitted to be thoroughly uniform in strength, and safe for any plant or flower, even if four times the quantity are used. Scabs and mealy-bug may be completely eradicated by using the Cones double strength.
PRICES:—For frames of 50 to 100 cubic feet, No. 1 reduced to 6d. each; 500 feet, No. 2, 1s.; 1000 feet, No. 3, 1s. 6d.; 4000 feet, No. 4, 5s.

The house should be well secured.
CORRY & CO., LIMITED.
13, 15, & 16, Finsbury Street, London, E.C.

FOR DESTROYING WEEDS, MOSS, &c.

ON CARRIAGE DRIVES,
GARDEN WALKS, ROADS, STABLE-YARDS,
WALLS, STONWORK, &c.

Saves more than twice its cost in Labour. No Smell. One application will keep the Walks and Drives clear of Weeds for at least Eighteen Months.

Mr. W. G. HEAD, Crystal Palace, says:—"We are so satisfied with your composition and its price that we have used it absolutely. I have every confidence in recommending it."
Mr. R. IRWIN LYNCH, Curator, Botanic Gardens, Cambridge, says:—"There can be no question with regard to its efficacy."

Prices:—In 1 and 2-gallon Tins, 2s. per gal. (Tins included); in 5-gallon Drums, 1s. 6d. per gallon. 10, 15, and 20 gallons, 1s. 4d. per gallon. Special quotation for larger quantities. Carriage paid on 10 gals. and upwards.

Used in the proportion of one gallon to twenty-five gallons of water.

THE ACME SUMMER SHADING, White and Green.

FOR SHADING GREENHOUSES, CONSERVATORIES, &c. Does not wash off with the rain. Can be used WARM or COLD. 1 lb. makes 1/2 gall. In tins, 1 lb., 1s.; 2 lb., 2s.; 4 lb., 3s. 6d.

For particulars of ANTI-FUNGI POWDER for Tomato Disease, Mould and Mildew on Roses, Vines, &c.; KENTISH PLANT MANURE, SOLUBLE MANURE, ZINC LABELS, NEW METALLIC INK, &c., apply to the

Begonias. Tuberous-rooted hybrids. Magnificent single flowered varieties. Immense blooms of the most beautiful colours. Strong flowering tubers, very choice mixed	per 100, 30s.; 6 for 2s. 6d.	4 6
"Extra choice sorts, for pot culture"	6 for 5s.	9 0
"Double flowered, very fine mixed"	6s. and 12 0	

BEAUTIFUL HARDY FLOWERS.

A grand collection of Choice Hardy Perennials.

Splendid for Garden Decoration, or for Cut Flowers during the Summer and Autumn.

Strong, established plants for blooming this year, including LYCHNIS, double crimson; ANEMONS PALIDA (the Sulphur Marguerite), PIRETHRUMS, PHLOXES, &c.—all first-class sorts.

Twelve in twelve choice varieties ... 3s. 6d.

Twenty-five in twenty-five choice varieties ... 6s. 6d.

One hundred in fifty choice varieties ... 21s. 0d.

PACKING and CARRIAGE FREE.

IF YOU WANT

BEGONIAS,
H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham, S.E.

GUARANTEES to supply BEGONIAS, first-class Quality, at one-third the usual price, as follows:

12 Good Single Mixed ... 3s. 12 Mixed Double ... 6s.
12 Extra Good to Colour ... 6s. 12 Very Fine, to Colour, 12s.
12 Very Finest, equal to named varieties 15s. ea. 12s. 12 Extra Fine Double, 18s.

I could give a large number of Testimonials, but the following, I think, will be sufficient to prove the excellence of my Begonias:—Hogg House, Buxted, Uckfield, Aug. 26, 1891.

DEAR SIR,—You will be glad to learn that the Begonias I had from you in the summer have turned out remarkably well. The plants and terra-cotta are especially fine, some of the blooms measuring near 6 inches across. The flowers are of fine form, and good substance in the petals; plants dwarf in habit, and free-flowering; foliage robust. I shall have much pleasure in recommending them to my friends. Yours truly,

H. C. PRINSEP, Gardener to Viscountess Portman.

To Mr. H. J. Jones.

RYECROFT NURSERY, HITHER GREEN, S.E.

SALE, MAY 20.

SECOND, LAST, AND UNRESERVED SALE

OF

**CHAMBERLAIN'S
NEW CYPRIPIEDUM.**

A NEW TYPE.

The most exquisitely beautiful of the genus—purple-blue, fawn, and chocolate coloured—thirty flowers on a stalk.

OUR SECOND and LAST SALE.

THE IMPORTATION IS IN MOST MAGNIFICENT ORDER.

This glorious Cypripedium was unanimously awarded a Certificate of the First Class by the Orchid Committee of the R.H.S., April 12, 1892.

The *Gardeners' Chronicle* says (April 16, p. 496), "Amid the multitude of objects shown, the one that excited the most interest was a plant of CYPRIPIEDUM CHAMBERLAINIANUM. It justified all that has been said of it, and showed that our figure, p. 241, did no more than justice. It was unanimously awarded a First-class Certificate, AND WAS THE GEM OF THE WHOLE SHOW. There is a quaint beauty about the markings of this plant, and a richness of colouring which is unmatched, and among its other merits is its distinctiveness from those of any other known species."

The *Journal of Horticulture* says, "To CYPRIPIEDUM CHAMBERLAINIANUM special honours were accorded."

The *Gardeners' Magazine* says, "CYPRIPIEDUM CHAMBERLAINIANUM was the most remarkable Orchid shown. Very distinct and beautiful."

The *Times* says, "Among the Orchids the most striking was CYPRIPIEDUM CHAMBERLAINIANUM."

SATURDAY, MAY 14, 1892.

THE FOREST OF COMUS.

HAVING visited the Hall of Comus in Ludlow Castle, where in 1634 in the presence of the Earl of Bridgewater, President of Wales, and his family, the beautiful Masque of Comus was performed, you may ascend the keep-tower, and survey the rich landscape, with the Teme winding its course from Downton, past Oaklea Park, and through a fruitful country, till it flows beneath the walls of this castle, and skirts the town of Ludlow, as many an artist has depicted on canvas, filled with scenes from these noted precincts. The primæval forest, where the earl's two sons, Lord Brackley and Sir Thomas Egerton, with their sister, the Lady Alice, lost themselves in coming through the haunts of Comus and his band of revellers to Ludlow, begins near the river side, and extends far over the adjacent hills. The high road to Wigmore runs through the forest, gradually ascending from the river, and along this road I took my way, with all those feelings of delight which the "grene wode" still inspires in one's breast. Few can live in the forests now, and few forests are left to live in, but the love of the "grene wode" thrills our race still, and the sentiment must be primæval, derived from the times when our Teuton forefathers made their home in wild forests two thousand years ago. The earliest ballad-writer of the Robin Hood cycle writes pleasingly on this point in the following simple verses, poetical in language, though old-fashioned in orthography:—

"In somer, wheu the sharves be sheyne,
And leves be large and longe,
Ilit is fulle mery in feyre foreste,
To here the foulis songe,
To se the dere drawe to the dale,
And leve the hilles tree,
And shadow him in the leves grene,
Under the grene wode tre."

I left the road to wander through the wood, passing sometimes across little open glades, and sometimes through surrounding copes of trees and underwood, known by our forefathers as sharves, and still called by that name in some districts. And merrily did the "foulis" sing in the bushes, and sometimes the wild deer, startled by my intrusion, crossed the glades to "shadow" themselves in the "leves grene," like King Arthur's knights, who were accustomed in their wanderings to "bide under the shoue" for the purpose of reconnoitring approaching strangers. It is an Oak wood chiefly, but there are Sycamores and Birches, whose branches were quaintly declared by the herbalist Gerard to be, in time of Elizabeth, of great virtue as a corrective for boys at school, though at present I believe the remedy is not much in fashion. The Mountain Ash is sprinkled over the wood too, and amongst the underwood the Hazel is the most conspicuous. As in Wales, the only specimens of Beech are of comparatively

modern planting, that tree not being native to the country. 'So here the Conifers of the last century, the Larch and Spruce, are only found in one or two spots near the road, where they have been planted recently. Among the humble shrubs of this primeval wood, spreading over it a thick carpet, which Robin Hood and his men might have trodden, is *Vaccinium Myrtillus*, called Bilberry in the midlands, Whimberry in Shropshire, Whortleberry in Surrey, and Blaeberry or Blueberry in Scotland and the North, and by other names in other parts of the country. We used to call these deep purple-coloured, lip-staining berries Whorts in Surrey, as did the old English herbalists, a corruption of the Anglo-Saxon *Heort-hyrige*, or *Heort-byrige*, *Hart's-berry*, a name given to the fruit because it was considered a favourite food of the deer. It is the *Hurtil-berry* of Tusser. Among other edible fruits of this classic wood, besides the Strawberry, Raspberry, and Barberry, are various species of Blackberry, one of which, the *Hart's Bramble* (*Heort-brembel*) of Anglo-Saxon physicians, is known sometimes—to the confusion of nomenclature—as Whortleberry.

At length I reached the edge of this "ominous wood" in which the enchanter *Comus* lived—

"In thick shelter of black shades imbower'd."

At this spot, immediately opposite, looking south-west, is the High Vinnall, the highest point of Vinnall Hill, commanding a magnificent landscape, and between the steep and lofty bank on the top of which we stand and this hill is a deep and narrow valley thickly covered with wood, and having a trout stream in the bottom, bearing the name of Sunny Gutter. In this valley, pleasing by day but terribly obscure at night, the lady met *Comus*. Here in the glade below—

"Fairies at bottom trip

By dimpled brook and fountain trim."

And here the guardian shepherd stood—

"Tending on flocks hard by i' th' hilly crofts

That brow this bottom glade."

On the left the wood is thick, but on the right, towards the head of the valley, masses of trees and bushes are scattered more thinly over a grassy surface abounding in all the wild flowers suited to a Sunny Bank, for that is the name given to the spot. Here Milton may have met "a certain shepherd lad"—

"well skill'd

In every virtuous plant and healing herb

That spreads her verdant leaf to th' morning ray."

Agrimony (*Agrimonia Eupatoria*) is still abundant. It seems to have been the *Hemony* of Milton, named in the following verses:—

"Among the rest, a small, unsightly root,
But of divine effect he cull'd me out;
The leaf was darkish, and had prickles on it,
But in another country, as he said,
Bore a bright golden flower, but not in this soil.

* * * * *

He call'd it *Hemony*, and gave it me,
And bade me keep it, as of sovran use
'Gainst all enchantments, mildew, blast or damp,
Or ghastly furies' apparition."

Early writers on herbs have always mentioned *Agrimony* as a plant of good reputation, not perhaps possessing the qualities ascribed to it by Milton, but of "sovran use" as a remedy for wounds. In the time of the early Anglo-Saxons, it was called *Stic-wyrte*, namely, *Pain-wart*, *stic* being the Anglo-Saxon name for a sharp shooting pain, such as a *stitch* in the side. It was formerly asserted that deer, being wounded, cured themselves by eating *Agrimony*. The pointed shape of the stem of this

plant obtained for it the name of *Garclife*, from *gar*, a spear, and this name continued to be given to it till, in the fifteenth century, it was superseded by the modern name *Agrimony*, conferred on it by the French herbalists. *Stachys Betonica*,

FIG. 88.—*DISA INCARNATA*: BRIGHT CINNABAR ORANGE.
(SEE P. 619.)

for which the Anglo-Saxons had no name of their own, calling it *Betonica*, is common in this wood, as it is in woods and thickets all over Europe and Russian Asia, though rare in Scotland. The plant is allied to *S. germanica*, *Downy Stachys*, or *Woundwort*, which is, I

believe, the same plant, or a near ally of the downy white-leaved *Stachys*, which cottagers long since transferred to their gardens, and which has since been invited, on account of its foliage, to take its place among the "edging plants" of most gardens, taking the name of *S. lanata* from its woolly texture.

According to those fanciful authorities before quoted, *Betonica* is a plant of good repute, "good either for a man's soul or his body," and possessing power to "shield him against nocturnal apparitions, and against frightful visions and dreams." *Pyrola* minor blossoms here through the summer, and retains in winter those glossy-green leaves which, showing cheerfully among the fallen foliage, obtained for it the name of *Winter-green*. *Herb-Paris* is here too, a not very common plant, but local and scattered over several parts of England, where rustic sentiment has given it the name of *Truelove*, from the position of its flowers, which are set among the leaves, as love is placed in the centre of the affections.

Steering across the Sunny Gutter for the High Vinnall, I noticed more kinds of wild flowers than I may here enumerate, with many Ferns—some of them rare—and numerous Mosses and Lichens. From the top there is a glorious outlook over the rich scenery of Herefordshire and Shropshire, with the long line of Bringewood immediately before us, including several high spots and slopes which have been planted with Larch by Mr. Boughton Knight, of Downton Castle. It is a fine country as far as the eye can reach, and the British and Roman camps on two of the neighbouring hills serve to remind us what the rival nations must have thought of these rich and watered vales.

The favoured tract which lies around, and which now produces the famous Hereford cattle, the best and handsomest sort for pastoral districts when the grass is good, had for its hero and stout defender, *Caractacus*. A fair slice of Herefordshire and part of Shropshire are within view, and on a fine day one sees the Malvern Hills in Worcestershire, the Cleve Hills nearer at hand, the Black Mountain in Monmouthshire, the hills of Radnor Forest, and those of Breconshire. I left the Teme at Ludlow, but in following the high road to Leintball—a downhill journey through pleasant farms, pastures, and Apple orchards, I again reached the level of the river within three miles of Downton, where, it is said, the Teme looks its best. H. E.

NEW OR NOTEWORTHY PLANTS.

PHALÆNOPSIS AMPHITRITE, *n. hybrid.*

This pretty new hybrid has been obtained by crossing *P. Stuartiana* × *P. Sanderiana*, the latter being the pollen-plant. These two species ranging among our best hothouse plants, it would be expected that their offspring must become a lovely one. The size of the flower is that of a very good *P. Stuartiana*, or a smaller *P. Sanderiana*. The sepals are narrower than in *P. Sanderiana*, pale mauve, or deep nankeen-yellow, with a white margin, and a purplish hue to the base, the lateral ones spotted with minute purple blotches at the very base; the lateral petals are also in the way of *Sanderiana*, white, with a rose-purple blush at the base; the lip is perhaps still more than the other parts that of *Sanderiana*, in the form as well as in colour. The side-lobes are white, spotted with purplish and yellowish colour on the anterior margin; the blade of the middle lobe is pale rose-coloured, with very numerous spotlets of purple; the tendrils of the lip are the same as in *P. Sanderiana*. *Dr. F. Kränzin*,

PHAJUS HYBRIDUS (ORANDIFOLIUS ♀, WALLICHII ♂).

This cross has been raised by Mr. A. J. Keeling in the gardens of DREWETT O. DREWETT, Esq., Willow Wood, Riding Mill-on-Tyne, and it should be recorded, although I find little difference in it from a good variety of *P. grandifolius*. The petals and sepals have traces of the coppery-yellow tint of *P. Wallichii*, and the spur is rather longer than in *P. grandifolius*, but the keels running down the middle of the lip and its general form are very much as in *P. grandifolius*. *James O'Brien*.

CELOGYNE CUPREA, n. sp.*

This species was imported by Messrs. F. Sander & Co., St. Albans, and flowered at Herrenhausen during the spring of this year. I received a very characteristic drawing, and twice fresh material from Mr. Wendland, at Herrenhausen. The bulb is a very strange-looking thing for a *Celogyne*, as from a globular base there arises a somewhat conical brownish-green stem to a height of about 5 inches, where it bears two leaves, the one inserted a little lower than the other, of a more or less oblong or obovate form. The flower-stalk is longer than the leaves, and bears five to eight bracts from about 1 inch in length, the latter fall away at the flowering time. The flowers are drooping, and measure 1 inch in each direction, resembling a somewhat reduced flower of *C. speciosa* in general appearance, but quite different in colour and on other points. The colour is very peculiar, and I had given the specific name, *saluonicolor*, to this plant, as the flowers are almost of that tint. If Reichenbach had not used this name for a *Celogyne*, a description of which was published in the *Gardeners' Chronicle*, 1883, ii., p. 328, at first sight I should have supposed that I had to deal with the latter species, belonging also to the *Filiferæ* group, viz., those *Celogyne*s which possess narrow thread-like petals, but close examination showed me that the two species were as different as possible. I mention here only the one character by which *Celogyne cuprea* can easily be recognised. The inside of the lip is in *C. cuprea* smooth and hairless, and in *C. saluonicolor* it is hairy, as in *C. speciosa*. It is to be mentioned that all the flowers of the same spike are not developed at once, but open successively at long intervals of time. *Dr. F. Kränlein*.

THE FAN-PALMS OF AUSTRALIA.

In the year 1834 it was demonstrated by myself that the most southern place reached by Palms in continental Australia was near the entrance to the Snowy River, at 37° 30', where *Listivona australis* was found by me to reach a height of 80 feet (see my Official Report to the Victorian Parliament, pp. 5 and 15 of that year). At that time the most eastern part of Gippsland was unsettled, and the last eastern habitation was deserted, as of the two inhabitants, the "hut-keeper" had just before been slain by the cannibals of that region, and the "stock-man" had only saved his life on horseback by jumping the fences of the station. The last part of my journey then had to be effected on foot, as I could not get my horses without help across the Snowy River; yet accompanied by one "old hand," I penetrated, armed, of course, for several miles beyond the locality of the massacre, through the dense "bush," the autochthones getting often near us, and being in possession of fire-arms robbed from the hut. I satisfied myself there and then that the Gippsland Palm was the genuine

Listivona australis of my never-to-be-forgotten friend, Von Martius, this species being well known here in cultivation. Already, then, since that time the same noble Palm has been discovered in two other localities, in jungles not very far from the Snowy River, which watercourse, though bearing so frigid a name as coming from the Australian Alps, where I had just before advanced to the glaciers of its courses, flows in its lowest course really through an always winterless country, teeming with sub-tropical vegetation (*vide* Report, 1854).

When a party of the Victorian Field Naturalists Club, at my suggestion, made a tour, some few years ago, through the whole length of the country, from the Snowy River to the Genoa, Professor Spencer, Mr. C. French, Mr. Frost, Mr. Jackson, and Mr. Searl went to one of the isolated spots, where the *Listivona* grows, and under an umbrella, while it rained heavily, a pencil-sketch of the Palm was made, from which hasty drawing the lithographic illustration was taken which appeared in the *Victorian Naturalist*. That under such unfavourable circumstances some inaccuracies occurred in the delineation, cannot be surprising; but while some leaves were drawn rather pinnately, others are shown as quite fan-shaped. Professor Spencer now points out that the sketch was not correctly lithographed, and that he has since seen the *Listivona australis* in South Queensland without perceiving differences between it and the Gippsland Palm.

As regards the particular Australian Fan-Palm, which was referred to in a recent number of the *Gardeners' Chronicle* as having somewhat cuneate leaves, it is not likely to be an extra tropical species. In the *Census of Australian Plants*, I admitted only three species of *Listivona*, inasmuch as dubious or very imperfectly-known species are omitted in that work, and retained for further consideration till another census can be instituted. Thus, I have recorded there besides *Listivona australis*, only *L. Leichardti* and *L. Marie*, concerning which some notes are contained in the *Fragm. Phytograph Austral.* (in vol. iii., 221 and 283, also in vol. xi., 54 and 55). *F. v. Mueller*.

ORCHID NOTES AND GLEANINGS.

DISA INCARNATA, Lindl.

FOR upwards of half a century this handsome *Disa* has been known to science, and now horticulturists will have an opportunity of making its acquaintance (Fig. 88). Messrs. W. L. Lewis & Co., of Southgate, have submitted to Kew for determination a plant which is none other than the one described by Dr. Lindley in 1838 in his *Genera and Species of Orchidaceous Plants* (p. 348), under the above name. It is bearing three racemes, one of which is fully expanded. The flowers are of a bright cinnabar-orange, with the exception of the dorsal sepal, which is deep yellow, with bright red spots. Several species of this large and interesting genus have recently appeared in cultivation, and the present one will be a welcome addition to their number, especially as their cultivation seems now to be better understood than formerly. Individually the flowers are just under an inch in diameter, and are borne many together in a raceme, their bright colour giving a very pleasing effect. It is a native of Central Madagascar, and was originally collected by Lyall, and recently by Baron, Fox, Deane Cowan, and Rutenberg. [See report of Royal Horticultural meeting on p. 343.] *R. A. Rolfe*.

THE ROSERY.

THE PROPAGATION OF TEA-SCENTED ROSES.

THIS is the best season to propagate Tea-scented Roses from cuttings taken from plants which are fully forced, as these will now be found to have a quantity of young shoots, which will be in good condition for striking. By striking cuttings early

the plants get established before the winter sets in. In making Rose cuttings, cut the shoot just below and close to a joint, removing the lower leaf or not, at the same time taking care not to injure the bud in doing so, and take off the centre leaflet, keeping the cutting the while in a watering can with a little water in it. Have clean well-drained pots filled within 3 of an inch of the rim, with a compost consisting of equal parts of fibrous peat-loam and silver sand, and dibble in from five to six cuttings round the edge of the pots, and make the soil firm. A propagating frame, with a bottom-heat of 75°, is a good place for these, plunging the pots in coal ashes or leaves of trees until rooted, when they should be placed in a less warm place where there is slight ventilation for ten days or a fortnight longer, when they may be potted off singly into small pots, and put into a half-spent hot-bed frame till established, shading them from sunshine, and affording air so long as the sun has power. When fairly rooted repot them into 32's or 48's, according to strength and variety, using a compost of fibrous loam three-quarters, of rotted manure one-quarter, and some sand, and pot firmly. When the plants towards the end of the summer are established, stand them in the open on a bed of coal ashes, and do not let them suffer from dryness at the roots. *R. Milner, Penrice Castle*.

PROFITABLE FRUIT CULTURE.

I HAVE recently been going into figures with regard to the returns which may reasonably and safely be expected from one acre of ground, planted with dwarf fruit trees, say Apples, and find that a very handsome profit indeed can be had therefrom. There has been, from time to time, in these pages considerable discussion as to these profits, and, allowing that figures can be made to prove anything, and also that seasons, insects, and other unforeseen impediments, have to be reckoned with, I can still show a large margin of profit—larger, indeed, than can at present be honestly shown by almost any other industry.

There are, doubtless, many who will not hesitate to condemn the above statement as too rash or misleading, but I respectfully ask them to withhold their judgments if they have nothing stronger as a basis whereon to furnish them than the returns from ordinary orchard and garden culture of hardy fruits, hitherto adopted throughout this country.

In isolated places here and there we find them well done, in a few others excellently so, but then only on a very small scale; is it that they are in any place cultivated—as they admit of, and should be—in a thoroughly systematic manner, involving intelligent selection, and energetic and judicious management. It is to these few points that I should wish to direct the attention of all intending to plant. Upon these will the tide flow to its full, or recede to its lowest ebb, according to good or bad cultivation, selection, and management.

A great deal indeed depends upon selection. We must first select the site and quality of the ground, then we must select the varieties, and, lastly, the trees. The first must be of the best, and, naturally, drained; the varieties must be hardy, healthy, noted free-bearers, and the largest of their class, and be few in number; and the trees must be clean and healthy, and, if two or three years old, they must be of good shape of the class you are selecting, but if we could afford to wait it would be better to select maiden trees, and train them ourselves. It is, or has been, rather, the usual plan to plant trees, and give them fair attention for two or three years, and then to leave them pretty much to themselves. This will never do if a profitable investment is the ultimate aim. Unremitting attention year in and out should be bestowed, more especially upon dwarf trees. It is useless to attempt fruit culture for profit in these days on any other lines. Give this, and success is certain. Some day I should like to give details, &c., with regard to the management of an acre of dwarf trees. Fruit-growing as a profitable investment has not, I think, been given the prominence it certainly

* *Celogyne cuprea*, n. sp.—Sepalis ovato-oblongis acutis apiculatis sepalis dorsali obscuris sepalis lateralibus manifeste carinatis pellucidis; petalis lateralibus angustissimis linearibus æquilongis sub anthesi reflexis; labelli lobis lateralibus semi-ovatis obtusis antice rotundatis, intermedio cordato obtuso submarginato, disco lamellæ, 2 erectis antice abruptis et interpositis brevioribus humilioribus inter laterales absconditis instructis; gynostemio apicem versus manifeste alata totos laterales vix excedente. Totus flos cupreus pallidus sepal. pet. lab. 2-5-3 m. longa, sepal. basi 1 cm. lata, labellam sepalis æquilongum. Flores succedanei.

deserves, or brought before that section of the public which is likely to derive most benefit from it—the smaller farmers and cottagers throughout the country districts.

I do not mean to suggest that sufficient has not already been written, and well written, so far as relates to adopting ways and means towards this laudable end, but rather the contrary. In this and other journals, much useful and instructive matter upon this subject appears weekly; still, outside real garden and nursery establishments, how many of those whose lives are, we might almost say, bound up in the soil, ever see any horticultural journal? Very few, indeed, I am sorry to say.

Nor is this all, for we have also the experiences of practical, scientific, and theoretic experts on this subject in book form, and at reasonable prices, considering the amount and value of the information; nevertheless, in my travels I find that the majority of the country population know next to nothing about them, and far less of that of which they teach. I am not to be understood to say by this that the population of the rural districts have no love for fruit culture; on the contrary, I believe this to be deep and wide-spread. What they lack most is general information upon the proper preparation of

tions where alpine plants are grown. The right place is undoubtedly a well-constructed rockwork, exposed all round to full light and air, and on no account under the shade of trees. This should be so arranged as to provide every aspect, for although most plants require a sunny position, there are several which require a north aspect, while others succeed best in an easterly or westerly position. If the work is properly constructed, even the choicest alpine plants will flourish and soon take care of themselves, giving the gardener no trouble, except that of keeping out weeds and giving, perhaps, an occasional watering. But the composition of such a rockwork requires very much greater care than is usually given to it. A few years ago I visited a gentleman's garden not one hundred miles from Exeter, and was shown by the gardener a new rockwork, which he had just constructed for growing choice alpine plants. A round heap of well-manured garden soil, 'was studded at regular intervals of about 2 feet with large stones, all standing upright, and really good alpine plants planted between (a portion of this mound is shown in fig. 89). 'There, what d'ye think of that?' my friend proudly asked, in tones of self-congratulation. But when a year or two later I visited the same spot

in my opinion, it should be (fig. 90). The fissure should be narrower at the bottom, to allow for the soil setting firmly against the sides of the stones, but it should communicate also with the main body of soil, and with the drainage of stones, which is of great importance in every rockery. In filling such a crevice, do not use manured garden-soil, but a mixture of leaf-mould, peat, and loam, with an abundance of limestone chippings and coarse gravel or gritty sand, unless the crevice should be intended for one of the few varieties which do not thrive so well on limestone, and would prefer granite or flint. If the crevice is intended for a moisture-loving plant, add a little sphagnum moss. After almost every handful of soil ram it with a small stick, and every now and then add broken stones of all sizes, placing them in such a way as not to obstruct the passage of the roots into the soil below, but, at the same time, compelling them to touch the stones on their way down. When the crevice is nearly full insert the plant, surrounding the roots with the same kind of soil, but pressing around them small stones, which will prevent the roots from spreading sideways, and force them to grow downwards, where the soil would be cool and moist. Small stones should also cover the surface of the soil around the plants. This is of the

the ground intended for fruit culture; the great advantage to be derived from thorough draining; the rearing and management of dwarf hardy fruit trees; simple descriptions of injurious insects, with the best and easiest means for their destruction, &c. This to be printed in pamphlet form, and published at the lowest possible price, in order to make it easily attainable. *Pennum.*

THE ROCK GARDEN.

We extract from a report in the *Devon and Exeter Gazette* the following particulars as to the best method of constructing a rockwork. They formed part of an interesting lecture by Mr. F. W. Meyer, landscape gardener to Messrs. Robert Veitch & Sons, on "Alpine Plants," delivered in March last before the Devon and Exeter Gardeners' Association. Mr. Meyer first of all gave his hearers an account of the conditions under which "alpine" plants grow in Nature, and of the peculiarities in organisation and structure which were induced by these conditions. The principal reasons for failure in their cultivation were then pointed out, and the lecturer proceeded:—

"To ensure success, beware of fresh importations, and procure already acclimatised plants, which have been grown in this country. A frequent cause of failure may be found in the posi-

the alpine plants were dead, with the exception of one or two of the very coarsest kinds, and the stones might fittingly have been described as tombstones marking the graves of dead plants. The rockery has now been turned into a shrubbery, as "alpine plants won't grow in that part." Why so many people when making a rockwork content themselves by simply sticking long stones endways into a heap of soil seems difficult to understand. As a matter of fact, nothing could be worse. A few of the coarsest plants, which it would be difficult to kill under any circumstances, might possibly thrive in such a position, but fancy an alpine plant from the higher altitudes in such a position as I have roughly shown on this sketch. The stones impede the free access of light and air, and as they are a foot or more apart the roots of the plants would spread close under the surface of the soil, where the slightest excess of moisture or drought would be quickly felt, and result in speedy death. (See fig. 89.)

"The form of rockeries depends upon taste, and no hard-and-fast rule can be laid down for their shape, except that they should resemble Nature, and, at the same time, furnish the conditions necessary for the growth of alpine plants. That it is possible to do both I have tried to prove in the illustrations now before you, depicting rockworks in various parts of the country. In building a rockery, begin with the stones, and not with the soil. The next sketch before you represents a crevice prepared for choice alpine plants, as,

greatest importance for all plants from the higher altitudes, as the stones not only absorb excessive moisture, but also on dry, sunny days evaporate the same, and surround the plants with the moist atmosphere so essential to their growth. Before the plants are fully established, it may be well to sprinkle the stones with water on the nights and mornings of dry summer days for the purpose of evaporation, more than actual watering of the plants. But, when fully established, they will take care of themselves, no matter what the weather may be in this changeable climate, requiring no other attention than being kept free from weeds and the ravages of slugs and snails. Plants which have their leaves arranged in the shape of rosettes, like *Ramondia pyrenica*, *Androsace sarmentosa*, or *Saxifraga longifolia*, should not be planted upright but sideways, so that water cannot rest in the centre of the rosettes. An arrangement of this sort is shown in figure 91. While speaking of *Ramondia*, I may mention that this beautiful plant requires a moist position and a north aspect. The soil, therefore, should contain plenty of sphagnum moss, and should not be pressed too tight around the plant. Other plants again prefer to have the soil firmly pressed around the roots. The beautiful *Gentiana verna*, for instance, prefers a very firm stony loam; while its companion, *G. hvarica*, loves a moist and spongy soil. Plants with spreading stems should be planted so as to allow the pendent shoots to droop over

the stones, and thus allow them to be seen to their best advantage. Many people object to alpine plants on account of their being small in size, but it is this very circumstance that makes them so valuable for our gardens. What other plants would be so permanent, and require so little attention? Some ten years ago I planted a piece of projecting rock with *Androsaces*, *Silene acaulis*, *Saxifraga juniperina*, and others. Nothing whatever has been done to the plants since, and yet they become more beautiful every year without crowding each other, and are likely to remain for ten or twenty years longer without getting too large for their position. Any of the coarser kinds of plants would have overgrown everything, and required renewing a dozen times within the same period. I do not maintain that every rockwork, without exception, should be planted exclusively with these small alpine, but they should certainly predominate, and where here and there larger plants or creepers are introduced for effect, this should be done in such a way that they can never intrude upon the select part of the rockwork set apart for choice alpine. Beware especially of Ivy, which soon kills all alpine plants, and monopolises the whole rockwork, if allowed to spread."

A TRAVELLER'S NOTES.

(Continued from p. 556.)

BARODA.—Towards the pavilion many of the roads converge, always in straight lines; in fact, the general principle of the park seems to be straight lines, all converging to certain points. The Superintendent's office is a small building very suitable for the purpose, one side of which is entirely covered with *Ipomoea Leari* in flower; whilst a nice, though at present small, row of an interesting Palm—*Hyphæne thebaica*—lines a small path on the right. This Palm is said to be branching. The specimens at present are not much more than 6 to 7 feet high, and there are certainly two or three shoots, but whether these come from the base, as they appear to do, or are in reality branches, is an open point. The leaves are handsome, much resembling a large *Corypha*. A little beyond are two paths, each having an avenue of trees; one is *Gaultheria longifolia*, and the other, *Bignonia suberosa*, more popularly known as *Millingtonia hortensis*. The former is a tree of slow growth; its stem is regular and straight, whilst its pyramidal-shaped head of pale green acuminate entire leaves (not unlike in size and colour to a large Peach or Nectarine leaf) make it a most distinct and pleasing object. The latter—a native of S. America—is undoubtedly the handsomest flowering tree I have yet seen in India; the largest specimen is just outside Mr. Henry's bungalow, and I have been careful to photograph it, but those in the avenue in question are not nearly so tall, but all, having been planted at the same time, are regular and shapely trees. It is now in flower. Its stem is clean and straight, the head tall, yet round and even; the foliage is bipinnate, of a dark glossy-green, but its value as a decorative object lies in the innumerable heads of pure white flowers, with which these trees are covered. The individual flower has five unequal lobes, and is about an inch in diameter, with a tube some 3 to 4 inches long; the old flowers turn yellow, but do not immediately drop, as on falling from the calyx they are caught by the pistil-head (stigma), from which they remain suspended for some days. The leaves droop, as well as all those past flowers, the whole effect being most graceful. The biggest tree must be some 50 feet high, whilst those in the avenue mentioned are probably not more than 25 feet. Many other specimens are scattered about, but always covered on all sides with these great heads of white flower.

A few specimens of a handsome shrub—*Duranta Ellisii*, and its variety *alba*—are scattered about in various parts of the park. The flowers of the type are blue, but its chief beauty is in its small round yellow berries, which remain on the plant for a considerable time, and are produced in quantity. Thick bushes of regular habit form a nice change in a shrubbery.
