INDEX OF CONTENTS.

JANUARY TO JUNE, 1892.

A

ABERDEEN, 147; University Natural History Museum, 311
 Acacias, hardness of, 108
 Acreage of fruit in Great Britain, 242; of nursery grounds in 1890 and 1891 in Great Britain, 274
 Action of some soil constituents on fruit and vegetables, 466
 Adelside, 331
Æschynanthus pulcher, 143
 Africa, West, plants from, 146
 Agaves, 146; American, flowering, 54
 Agricultural statistics, 18, 498
 Albury, 147
 Algeria, 115
 Alkaloid from *Chrysanthemum* flowers, a new, 338
 Allotment ground at Clewer, high rental for, 407
 Alnwick Castle, 662
 Aloe aristata, 730
 Alpines at Newick Park, 749
 Amateurs' experience with Orchids, an, 307
 Amateurs' garden, the, 144, 212, 244, 268; notes, 211
 American blight, 245; and kerosene, 281
 American nursery, a large, 436
 Analogue of Spanish Grape soil, 76
Ancistrolobus carneus, 158
Anemone Fannini, 761; *A. hortensis*, St. Bridgid's variety, 760
Angraecum Chaillanum, 45; *A. Leonis*, 593; *A. sesquipedale*, 84
 Anonas, are they evergreen? 469
 Anthracite coal, 247; as fuel, 310
 Anthurium, hybrid, 434; Novelty, 658; *A. Scherzerianum* Wardii, 559
 Apiary, The, 47, 111, 175, 270, 431, 495, 559, 685, 755, 811
 Apple, Ashmead's Kernel Improved, 374; Cockle's Pippin, 430, 466; Newtown Pippin, 491, 596; Norfolk Beauty, 491, 597; Northern Spy, 491, 552, 564, 597; Reinette pomologue Hage, 143; Sturmer Pippin, 469
 Apple bushes, forming, 458
 Apple crops, onr, 177, 246, 278
 Apple grafts, 211
 Apple orchard, a natural, 344
 Apple trees, thinning and cleaning, 148
 Apples, arsenic in American, 84, 439
 Apples, Canadian, 118
 Apples, alleged disappearance of English, 212
 Apples and Pears, in suburban gardens, 20
 Apples, &c., from Tasmania, 243, 765
 Apples, home grown, 211
 Apples, little known, 469
 Apples, multiplicity of varieties of, 330, 406
 Apricots attacked by caterpillars, 600; late-flowering of, 466
 Araliad, a new, 50
 Aralias, 82
Arbutus Andrachne, 405

Aristolochia clypeata, 435
 Arsenic and weeds, 314; in American Apples, 84, 439
 Artichoke, the Jerusalem, 434
 Ash as a timber tree, the common, 237
 Asparagus, 729; French, 790
Aspidistra elatior bearing seed, 22
 Aspleniums, some useful, 109
 Association on Railway and Canal Traffic, the Mansion House, 244
 Aster, China, farm at Erfurt, Mr. T. C. Heinemann's, 172
 Auricula, the, 565, 589, 629, 666; the show, 108; A. white, 694
 Australia, fruit from, 628; perfume-plants in, 73
 Avondale Park, opening of, 759

B

BACTERIA in soil, 370
 Balsams in small pots, 532, 684
Bambusa Metake, 523
 Bananas v. Plantains as food, 338
 Bartram House and garden, 493
 Baskets for *Odontoglossums*, 277
 Battersea Park in summer, 683
 Bean culture, 74; weevil, 345
 Beans, Haricot, 237
Beaufortia sparsa, 466
 Beet, cultivated, origin of, 626, 695; diseases of, 726
 Beets for sugar, 594
 Begonia Princess Beatrice, 734; *B. octopetala-Lemoine* Fleur d'Autonne, 145
 Belgium, 211; Parcel-post tariff, 594
 Bequests to domestic [gardeners], 406, 438
 Berberis Darwinii and *B. stenophylla* x, 728
 Berlin Public Park, 758
 Berry-bearing covert shrub, 461
 Biarritz, 436
Bignonia venusta, 212; at Syon, and others, 157
 Birds, British, 137; of commons and woodlands, 14, 75; and the past summer, British, 54
 Birmingham Rose show, 625
 Black Currant and Gooseberry caterpillar, 473
 Blenheim Palace Gardens, 693
 Blinds for greenhouse, 565
Bocconia cordata, 23, 149
 Bocking Place, Orchids at, 429
 Bodorgan, Anglesey, 75
 Bomarea sororia, 338
 Bones, how to dissolve, 314

BOOKS, NOTICES OF:—Africa, Flora of (*Durant and Schinz*), 18; Annals of Scottish Natural History, the, 50; Annals of the Royal Botanic Garden, Calcutta, 468; Book of Choice Ferns for the Garden, Conservatory, and Greenhouse (*Geo. Schneider*), 760; Botanical Magazine, 50, 240, 496; Conspectus Floræ Africæ (*Durant and Schinz*), 18; Dictionnaire de

Botanique (*Baillon*), 338; Die Natürlichen Pflanzen Familien (*Engler*), 466; Die Veredelungen für die Verschiedenen Bäume und Sträucher (*Von Nicholas Gaucher*), 23; Disease in Forest Trees (*C. E. Curtis*), 564; Elements of Agriculture (*W. Fream*), 244; Fruit Growers' Guide, the (*Jno. Wright*), 499; Fruktuset nied Dertil Horande Kulturer (*M. P. Andersen*), 18; Grasses of the South West (*Dr. Geo. Vasey*), 338; Grevillea (*Dr. Geo. Dherain*), 727; Traité d'Horticulture Pratique (*Georges Bellair*), 564; Xenia Orchidacea (*Dr. Krinzlin*), 371.

Bordeaux Mixture as a Preventive to the Potato Blight, 106

Botanic Garden, Brussels, 242; Glasgow, 532; Institutions in the United Kingdom, India, and the Colonies, 56; Cape Town, 76; Montpellier, 530; Natal, 464; Saharunpur, 76; Trinidad, 172
 Botanical Congress, International, at Genoa, 466; Study in Glasgow, 532
 Bouvardias, 719
 Brebner, Mr. George, 19
 Briar stocks, 149; for standard Roses, 82
 Brighton and Sussex Horticultural and Mutual Improvement Society, 657
 Bright winter shrub, a, 342
 British Guiana, 461
 Brittle timber, 211
 Broccoli and Cauliflower, 633; late, 792; notes on, 473
 Brown spots, 467
 Brussels Botanic Garden, 242; Orchids at, 211
 Brussels Sprouts, 84, 237; club in, 696; B. Paris Market, 405
 Bryngwyn, 103
 Buddleia Colvillei, 788
 Buildings erected by tenants, 314
 Bulb garden, the, 312
 Burleigh House by Stamford Town, 105
 Burness Vanilla, 692
 Butter-nuts, 146

C

CADBAIGES, Ellam's Esly and others, 631
Cassipouia japonica, 143
 Caffeine, new use for, 692
Calandrinia umbellata, 469
 Calceolarias, potting, 438
 Calceolarias, hardness of herbaceous, 247, 278
 California as a home, 236, 310, 556
 California, plants in, 108
 Calceolorti, hardness of, 181, 238; in the open air, 138, 180
Calophaca Wolgarica, 730
 Camellia, a venerable, 242; grafting, 461
 Camellias, 342, 438
 Camphor in Formosa, the production of, 81
 Canary Islands, the, 692
 Cannes, a garden at, 487; Winter ram-bles round, 265
 Canterbury Bells, 694
 Cape fruit, 628
 Cape Town Botanic gardens, the, 76
Carex variegata, 54
 Carnation, an emerald-green, 115
 Carnation and Picotee Union, Oxford, 462
 Carnation, Winter Cheer, 277, 342
 Carnations at Canford Manor, 761
 Carnations, tree, 86
 Carnations and Picotees from seed, 308

- Carrot grub, the, 500, 564, 597, 661
 Castor-oil Plant, the, 236
 Cattleya Alexandra, 340, 406; C. granulosa var. Schofieldiana, 171; C. labiata, 74, 307; and the Gardeners' Orphan Fund, 115; C. l. var. Lud-demaniana, 171; C. Percivaliana, 107; C. E. Southgate var. 180; C. Trianae Cobbii, 220
 Cattleyas, disease in, 275, 279
 Caucasus, and its flora, 685, 686
 Cauliflower, Walcheren, 631
 Cedar of Goa (*Cupressus glauca*), 22, 180
 Celery culture, 140
 Celery, dwarf v. tall, 180; in May, 631; Ivery's Nonsuch, 491; old and new varieties of, 237; Sulham Prize Pink, 333; varieties of, 278
 Celsia arcturus, 373
 Centropogon Luevanus, 238
 Ceylon, 172, 233; Peradeniya Gardens, 268
 Charing Cross Embankment Garden, 210
 Charred refuse, 83
 Cherries, the changes which ripening undergo, 434
 Chester, new park at, 531
 Chestnuts, sweet, 762
 Chicago Exhibition, 146, 370, 530, 563, 625, 658, 789; horticultural building at, 107; monster tree for, 498
 Chimonanthus fragrans, 213, 407
 China, plants of Western, 146
 Chinese economic products, 492; Primrose, the aboriginal, 12
 Chiswick Gardens, 151
 Chloisa ternata, 335
 Chorozenia cordatum var. splendens, 305
 Chou de Burghley, 149, 151
 Chrysanthemum, colours of the, in Japan, 306
 Chrysanthemum Exhibition at Vienna, the first, 18
 Chrysanthemum flowers, a new alkaloid from, 338
 Chrysanthemum Golden Gem, 309; groups, 53; C. Louis Bohmer, 55; C. Mrs. Robinson King, 22; leaves in salad, 403; C. sports in Australia, 312
 Chrysanthemums in February, 238; foreign opinion of some new, 274; show-stands for Japanese, 182; for show and usefulness, 84
 Chysis bracteata, 652
 Cinerarias, 475; at Farnham Royal, 594; crossing and raising, 475; white, 374
 Cirrhopetalum americanum, 364
 Citron culture in Corsica, 149, 182
 Clematis from seed, 729; in pots, the, 305; indivisa lobata, 530, 662
 Clewer, high rental of allotments, at, 407
 Clivanthus Dampieri, 281, 341; C. puniceus, 345
 Climbers for conservatory, 398
 Clove Tree at Zanzibar, the, 81
 Club, Horticultural, 50, 113, 178, 244, 370, 570, 724, 758
 Club in Brussels Sprouts, 459
 Coco-Nut, double, at Kew, 562
 Cocoa leaves and Eucalyptus oil, 403
 Coco-de-Mer, Barré, and the discovery of, the, 649
 Colognye lentiginosa, 490
 Coffee in East Central Africa, 526
 Coke, watering, 117, 180, 277, 311
 Colonial fruit trade, 695
 Colonial notes, 24, 76, 108, 172, 312, 331, 474
 Coloration of flowers, the artificial, 306, 329; of leaves, 691
 Colour of fruits, 663
 Committee of Nomenclature, a hint to, 497
 Conus, forest of, 617
 Conifer garden at Chiswick, 360
 Conifers, introduction of, 52, 74
 Conservatory climbers, 398
 Cooke, Mr., presentation to, 371
 Cooks and gardeners, 118
 Copper salts, for the prevention and palliation of the Potato disease, 403; solution, 505 (see Potato disease); sulphate, and Potato disease, 50
 Cork pavement, 692
 Cornus sanguinea, 342
 Correspondence, foreign (see Foreign)
 Corsica, Citron culture in, 149, 182
 Corsican Pine, the, 174
 Cottager's Kale, 374
 County Council instructor, a case for the, 338
 "Covent-garden lifeboat," 273
 Covert shrubs, berry-bearing, 461
 Creepers for a wall, 475
 Crichtel, Lord Allington's garden at, 810
 Cronberg, hothouse at, 234
 Crosses and crossings of plants, 235, 266, 298
 Crotons in winter, 54
 Crown Imperial, the, for pot culture, 590
 Cryptophoranthus Dayanus, 338
 Cucumbers, 663; for exhibition, 790; Blue Glow, 760
 Cultural analogies, 306, 341
 Cultural notes, 341
 Culture v. Nature, 786, 815
 Curled Kalea, notes on, 469
 Currants, green, 406
 Cyclamen, a well-bloomed, 301
 Cyclamens at Greenlands, 342; at Hanwell, 640
 Cyclone in Mauritius, 759
 Cynoches glanduliferum, 204
 Cymbidium eburneum, 588; C. grandiflorum, 267; C. pendulum, 45
 Cyphomandra betacea, 23
 Cyripedium Bocheianum x, 11; C. calceolus, 760; C. Chamberlainianum, 496; C. x chrysocomea, 781; C. insignis, 107; C. Lawrebek x, 561; C. Nioke, 45; C. ornatum, 428; C. Youngianum x, 74
 Cyripediums, hybrid, 11; in hanging baskets, 781
 Cytisus Ardonii, 632; C. scoparius var. Andreanus, 594
- D**
- Daffodil bulbs, analysis of, 593; disease of, 18; pallidus præcox, 490
 Daffodils in Ireland, 556
 Dablias, Tom Thumb, wanted information about, 54, 118; pompon, 685
 Daisy eradicator, 532
 Daphne Bagayana, 493
 Daphnes, deciduous, 729
 Datura suaveolens, 593, 694
 Davenham Bank, Chrysanthemums and Orchids at, 23
 Decimal system, the, 656
 Decoration-house, 406
 Dendrobium atro-violaceum, 490; D. crystallinum, 490; D. infundibulum, 652; D. nobile, 728
 Dendrobiums at Mr. James Cypher's, 307
 Dendrobiums, pruning, 247, 309, 342, 407, 469, 565, 652
 Deutzia gracilis, 460
 Devon fruit farm, a, 178
 Dew, and its action on plants, 753, 815
 Diagrams of wild flowers, 307
 Dianthus Freynii, 692
 Dickson, Mr. George, made J.P., 19
 Diervilla hortensis, 174
 Diosma uniflora, 538
 Directory, American Florists' Company's, 530
 Disa incarnata, 619
 Disas, &c., at the Cape, 341
 Diseases of plants, 245; of the reproductive organs of plants caused by fungi, 301, 331, 373, 397, 472, 490, 524; of Cattleyas, 275, 279; of Gooseberries, 815; of Melons, 530; of Potatoes, report of Board of Agriculture, 789 (see Potato, copper-salts); of Figs, 663, 666
 Dogwood, 374
 Doronicum, 685
 Dryopteris and Pteris, 523
 Drought Castle, 747
 Dry Glazing, Messrs. Sam Deards & Co., 403
 Dublin, Tercentenary of Trinity College, 273
 Dulwich Park, 807
 Dutch Potato crop, 401
 Dyer, Thistleton, Mr. W. T., 434; and the honour of C. I. E., 693
- E**
- EARLY Peas, 212
 Eaton Hall gardens, 625

Friday Next.

LINDEN'S
GRANDEST DISCOVERY:
CATTLEYA REX,

JAMES O'BRIEN.

THE MOST FAMOUS ORCHID EVER INTRODUCED. J. LINDEN, the discoverer and first introducer of nearly all the finest CATTLEYS in cultivation, viz., CATTLEYA AUREA, AMETHYSTOGLOSSA, GIGAS, ELDOBRADO, TRIANÆ, WAROUQUEANA (LARIATA AUTUMNALIS), &c., confidently recommends—

CATTLEYA REX

as the

FINEST OF THE GENUS.

CATTLEYA REX FLOWERS in DECEMBER and JANUARY. Some amateurs have stated CATTLEYA REX to be a grand form of Cattæya aurea, with white sepals and petals, but it is a QUITE NEW TYPE.

CATTLEYA REX is described by JAMES O'BRIEN in the *Gardener's Chronicle*, D. number 13, 1890. Sepals and petals are creamy-white. The labellum is of the richest crimson, of various shades—from the rose hue to the purple tint—resembling with a very slight yellow, all worked in to form a richly-colouring marbling. "It is a Wonderful Piece of Colouring."

Mr. R. JOHNSON, Stand Hall Gardens, Whitefield, Manchester, writes to Messrs. LINDEN:—"The CATTLEYA REX has flowered with us, and a grand thing it is. We have had some of the principal importers of Orchids here to see it: they think your plate in *Lindens* (English edition, Part I., 1891) a true representation of the flower, but the lip of our flower is FINER than your Plate."

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Messrs. LINDEN, L.Horticulture Intercontinental, Brussels, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, January 8, at half-past 12 o'clock, the whole of the above importation, just to hand in capital condition.

The plants have been collected by Messrs. Linden's intrepid collector, M. C. Eiler, with the greatest difficulties, who has searched with hundreds of natives for two years after this grandest CATTLEYA, and only succeeded in discovering those offered.

He states that "it is impossible to find any more."

A portrait made from a plant flowered in Monsieur Warouque's collection will be on sale of the day of Sale.

On view morning of Sale, and Catalogues had.

Cypripedium Hybrid.

"MURIEL HOLLINGTON."

One of the only Two Plants extant.

MESSRS. PROTHEROE AND MORRIS will include One Plant of this rare and beautiful Cypripedium in NEXT FRIDAY'S SALE, January 8, 1892.

THOMAS B. JAMES (many years with Protheroe & Morris) holds WEEKLY SALES at his Rooms, 19, Bull Ring, Birmingham, of BULBS, PLANTS, NURSERY STOCK, &c., every WEDNESDAY and FRIDAY, at 4.30 P.M. Sales of choice Cut Flowers. Fresh Entries invited. Account Sales and cheques daily. Empties and labels found.

WANTED, a NURSERY.—Six Greenhouses 1 acre of Land; price about £100, or a little more. Must be genuine. Midland town preferred. Particulars to A. J. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, to RENT, near a good town, 600 to 1000 feet run of good GLASS, and about an acre of land. Particulars to J. R., 2, Wavne Hill, Hull.

WANTED, a FLORIST BUSINESS, in a thriving provincial town. Terms moderate. R. W. J. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

FOR SALE.—FREEHOLD DETACHED HOUSE, and 3 ACRES, suitable for Glass. Nine miles from Reading, on Rye, Rotherham. Cost £2,000, will sell for £950, of which £425 is ready money. RIMINTON, Alexandra Gardens, Folkestone.

FOR SALE, a small NURSERY; just suit a jobbing gardener. Two houses, well-stocked pits and frames, &c., at a low price. Apply GARDENER, 12, Perry Hill, Catford, S.E.

TO BE DISPOSED OF, a good FLORIST'S BUSINESS, in large Provincial Town. Capable of doing a large trade. Particulars of M. A., Knight's Library, Chichester.

FOR DISPOSAL, a good paying BUSINESS, in FLORIST, FRUIT, &c. Stock and Furniture at valuation to an immediate purchaser, all in grand condition. This is a genuine thing to one wishing to go into business. About £200. Apply to—W.M. KNIGHT, 7, Holdenhurst Road, Bournemouth.

Tooling.

TO BE LET, about 12 ACRES of MARKET-GARDEN GROUND, in good condition. Near two stations. Rent, £70 per annum. Crops and Tenants-right at a valuation. Particulars of PROTHEROE and MORRIS, 67 and 68, Cheapside, E.C.

TO BE LET, 14 miles from London, on the Bath Road, HEATHROW FARM, Harmondsworth, Middlesex, from Michaelmas next; contains 438 acres of good Arable and 44 of Meadow Land. Let as a whole, or divided into three or four Market Gardens. The Houses and Buildings are 2 miles from West Drayton and Hayes Stations (G.W.R.), also Feltham and Asford Stations (S.W.R.). No Agents need apply.

For particulars, apply to WALTER C. RICHMOND, Wrotham Park Estate Office, Barnet, Herts.

TO LET, a MARKET GARDEN and DAIRY, within ten minutes' walk of Eton College, twenty to Windsor, where a large Business in Fruit and Flowers has been done; containing Dwelling House, Mashroom and Forcing Houses, Show House, and two large Green Houses, stocked with Vines and Fruit Trees, a large Range of Pits, Stable, Barn, Dairy, Poultry House, and Piggeries.

A Lease would be given to a Gentleman for extensions to make it a larger residence, if required.

Enquire of Mr. MARTIN, Castle View, Ragstone Road, Slough.

THE TOWER FURNISHING COMPANY (Limited), SUPPLY GOODS ON HIRE, direct from the Manufacturers; on terms of two or three years' Credit, without Security. Purchasers have the choice of 100 Wholesale Houses. Call or write for Prospectus.

Address, SECRETARY, 43, Great Tower Street, E.C.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSES to BE DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS' HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

ARTHUR L. BULLEN, WHOLESALE FLOWER SALESMAN AND GROWER, 33, EXETER STREET, COVENT GARDEN, W.C. Stands Nos. 271 and 272, Flower Market, Covent Garden, and Highland Nursery, Bromley Common, Kent.

respondence. References required of unknown customers.

CHRYSANTHEMUMS,

And How to Grow Them. By C. E. SHEA, Esq.
A Practical and Scientific Treatise, that will be of great
service, both to the oldest and most successful exhibitor and
the youngest grower of the Autumn Queen. Mr. Shea has, by
the treatment explained in his treatise, had a long series of
triumphs, to which this season he has added, in keen com-
petition with our most noted growers, at the Keet Conny,
Watford, and Crystal Palace, finishing with the difficult test of
1st in the 48 Japanese, at the Royal Aquarium Show, Nov. 10.
In addition to the above, a paper by Mr. H. Sheo-smith is
included in my new Chrysanthemum Catalogue, which also
contains the most complete List of New Varieties ever brought
together, and embraces selections from all the known Chrysan-
themum world.

This valuable work is now ready, post free, seven stamps.
H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham.

Flower Roots.—Carriage Paid.

PALM SEEDS.

SEASON 1892.

I have much pleasure in offering the following Palm Seeds, a large proportion of which are guaranteed to germinate. Purchasers will find these of a very different result to the cheap cougism-nts sent by inexperienced speculators to the London and Continental Markets:—

KENTIA BELMOREANA (Lord Howe Island) ...	20s. per 1000.
" FOSTERIANA " " " " " " "	" 20s. "
" CANTHERBURYANA " " " " " "	" 40s. "
" MOOREII " " " " " "	" 40s. "
ARECA BAUERII (Norfolk Island) ...	10s. "
CORYPHA AUSTRALIS (New South Wales) ...	6s. "
SEA FORTHIA ELEGANS " " " " " "	6s. "
PHYCOSPERMA ALEXANDRE (Queensland), 20s.	" "

As these seeds ripen at different times, and all require immediate despatch, orders should reach here for Kentias and Areca, in February; Seaforthia, in April; Corypha, in August; and Ptychosperma, in November.

All orders accompanied by remittances in full, for not less than £10 worth in one shipment, will be delivered free at Marseilles, Antwerp, Bremen, or London. Consul's Fees to be added to American Orders for free delivery at San Francisco. Also SEEDS and PLANTS of all our NATIVE TREES and SHRUBS.

F. J. FERGUSON,

NURSERYMAN,

DOUBLE BAY, SYDNEY, N.S.W.

The Illustrated and Descriptive Catalogue of Fruits, post-free, 3d.

The Descriptive Catalogue of Roses, post-free.

THOMAS RIVERS & SON,

THE NURSERIES,

SAWRIDGEWORTH, HERTS.

CANNELL'S Kentish Perfect Golden Seeds

ARE CERTAINLY THE BEST SAVED AND SOLD IN ENGLAND.

Why? All our own growing, therefore true! All of a superior character from the best spot in Europe, and by the most careful and expert hands, who have a real interest in the business. They are consequently cheaper; and many of our strains not equalled by any other firm. As an instance—

THE "COUNTY GENTLEMAN," February 14, 1891, says of our PRIMULAS shown at a meeting of the Royal Horticultural Society:—

"They were so luxurious in their growth and blooming, that it was difficult to believe they have relationship with those we are so accustomed to see. They received the highest Award."

It is monstrous waste, in fact the time is past for having Seeds otherwise than direct from the actual and largest growers. All are loud in their praises of our Seeds: see the splendid character, by the greatest experts, in our CATALOGUE, sent post-free, and which will at once confirm the above, and prove of immense value even in the smallest Gardens.

CANNELL'S SEEDS

NONE PERFECT ONLY FROM CANNELL, KENT

BARR'S SURPLUS CLEARANCE SALE OF DAFFODILS

and fresh Seeds only.

It is an established fact that the greater
part of all Seeds Sold in England or America
is grown in Germany, especially in and near
Erfurt, the Garden Town of Germany.

Furnishing you with my Catalogue, I place my
stores at your very door, and enable customers thou-
sands of miles away to obtain their supplies as safely
and cheaply as if they had called in person at my
establishment.

Ordered Seeds will arrive in Great Britain within a
few days, and are offered and sent **Package and
Postage Free.**

MESSRS. PROTHEROE & MORRIS

67, CHEAPSIDE, E.C.,

On the 15th of January,

By Order of

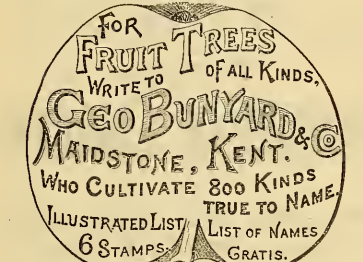

MR. F. SANDER,

GARDEN. BULBS, ROSES, &c.

FOR WHATEVER IS WANTED, mentioned or not in these columns, please to write immediately to **H. CANNELL & SONS**, whose SEED and NURSERY STOCK is very complete and extensive, and where nearly everything for the Garden is grown and supplied in large quantities, in the finest possible condition, at the lowest prices consistent with correctness and superior character. Never has there been such a complete Autumn Catalogue issued of everything required for the garden as the one we are now sending post free; neither has there ever been such a splendid stock of best varieties of the many families of plants necessary to keep the garden in the highest state of perfection as we are now soliciting orders for. Our climate, soil, and facilities give us and purchasers many advantages, and we ask all to send for a Catalogue, and then

H. CANNELL & SONS,
SWANLEY, KENT.

BUYERS SHOULD COME AND VIEW THE STOCK.

PRIVATE SALE.

WINTER and SPRING PRUNING, TRIMMING, and THINNING OUT can be better and quicker done by the STANDARD MANUFACTURED COMBANY'S Celebrated TOOLS, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTICUTTAH", and other useful appliances, than by any means. They were shown in actual use at the recent International Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency, coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.

Sold by the principal Ironmongers and Seedsmen, the leading Stores, and kindred Trades throughout the world, of whom ILLUSTRATED CATALOGUES may be had; or of the PATENTERS and MAKERS, at their works and depot, ST. ALKMUDE'S CHURCHYARD, DEBRY.

Mr. HERBERT B. BELL, Solicitor, 32, King Street, Covent Garden, London, W.C.

THE MARKET GARDENERS, NURSERYMEN, AND FARMERS' ASSOCIATION was founded in 1829. It was in 1889 incorporated under the Companies Act, 1863 to 1886, with limited liability.

The general objects of the Association may be shortly stated as follows:—

- (A) To consider questions affecting Members of the Association and the Trade in which they are engaged, and to take such action thereon as may be found desirable for the protection and promotion of the rights, privileges, and general interests of Growers and their Trade.
- (B) To assist from the funds of the Association persons requiring charitable aid who are or have been Members, or their families.

With reference to (A), it may be pointed out that the Association has, from its foundation, rendered valuable service by prosecuting and defending, and assisting, with grants from its funds, individual Members and local societies in prosecuting and defending legal proceedings, resisting improper rating, carriers' charges, market rents and tolls; opposing bills in Parliament; giving evidence before Parliamentary Committees and Royal Commissions—and in numerous other ways protecting and promoting the interests of Growers and their Trade in matters in which combined action or support was necessary or desirable.

As regards (B), the Association has given material assistance by grants from its funds and otherwise to many, who, through misfortune, have stood in need of help.

In this connection it may be stated that, the Association has recently adopted a scheme establishing two annual payments of £25 each, out of its income. One being a pension for aged persons, who are or have been Members of the Association, and the other a provision for maintaining and educating a child of any such person. It is proposed to proceed to the first election of recipients of these benefits in February next.

As to the qualifications for Membership, all persons and firms engaged or interested in growing trees, shrubs, plants, fruit, flowers, vegetables, roots, herbs, or other produce for the London or other markets or otherwise, are eligible.

The work of the Association is not confined to the Home Counties or any other district, but, on the contrary, the object has always been to make it as comprehensive as possible, it being felt that the more Members it enrolls, and the wider the field of its labours, the more effectually will its aims be achieved, as the Representative Association of the Growers and their Trade.

The liability of each Member is limited to the subscription, with such calls (previously sanctioned by the Association in General Meeting) as may be required for the purposes of the Association, not exceeding, however, in any year £1 1s. 6d., and in the event of the Association being wound up, a contribution, if required, not exceeding £1. But having regard to the objects of the Association, its well treated and unencumbered funds, and its established position, it may fairly be assumed that the liability is limited to the subscription.

Although the Association now numbers many Members, including leading representatives of the Trade, it is felt that there are many other gentlemen and firms who may properly be asked to become Members, not only in view of the advantages offered to them in their own business, but also of the support which is afforded to the Trade generally, and the charitable assistance which it may be the means of giving to Members who may have fallen on evil times.

All Growers who are not Members are therefore respectfully urged to join the Association, and such as are already Members are begged to use their influence with their friends and neighbours, with a view to securing their co-operation in aid of the Association and its useful and benevolent objects.

A copy of the Memorandum and Articles of Association can be inspected, and all particulars regarding the Association and the Benevolent Scheme referred to, with forms of application for Membership can be obtained on application to the Secretary.

32, King Street, Covent Garden, W.C.—December, 1891.

THE

Gardeners' Chronicle.

SATURDAY, JANUARY 2, 1892.

TECHNICAL EDUCATION.

WE have been favoured with copies of a correspondence on this subject, between the Vice-chairman of the Middlesex County Council and the Director of the Royal Gardens, Kew. The Director, in his reply to the Vice-chairman, who had sought his opinion on the subject of instruction in horticulture, writes as follows:—

"I am sorry to say that I feel great difficulty in seeing my way with regard to the general problem of technical education, and horticulture seems to me to present peculiar difficulties. The cultivation of plants is an art which can only be acquired by practice, and therefore, it appears to me, cannot be taught in the lecture-room any more than painting or shoe-making. I know of no royal or theoretical road to the acquisition of a competent or even useful knowledge of the gardener's art except by beginning at the bottom and going through every operation, from the most elementary to the most difficult and refined. If an intelligent young man does that, and keeps his eyes open, he may become a successful gardener. But the mere reading of books and attendance on lectures will never, in my judgment, make anyone even a moderately competent gardener.

"If you will look at the *Gardeners' Chronicle* for December 12, 1891, you will see a letter of Professor Huxley's which I reprinted. It expresses in a very clear and forcible way with regard to agriculture the same views which, in substance, I entertain with regard to horticulture.

"In the Royal Gardens at Kew, from the necessities of our organisation, we are unable to teach young men the rudiments of their profession. Those we expect them to have acquired before they come to us. What they gain at Kew is the opportunity of seeing a larger range of different kinds of cultivation than they can see in any private establishment. Besides this, we give them the use of a fairly-equipped horticultural library, and lectures on various branches of botany, and on such elementary physics and chemistry as more or less directly bear on horticulture. I very much doubt, however, whether these advantages add very much to the capacity of our men as gardeners. That they must gain for themselves by working in the houses under the skilled direction of able foremen. But I do not doubt for a

moment that the time and pains our men bestow on self-improvement is of incalculable benefit to them, by stimulating and developing their general intelligence. The youthful years of most human beings is a period of receptivity. Knowledge is acquired often almost mechanically, like the multiplication table, or a colloquial knowledge of a language. When man's estate is approached or reached, the judgment comes into play. Most persons, unless they are congenital idiots, begin more or less to inquire and speculate as to the reasons of things. This prompts to study and inquiry as to the causes which bring about effects. It is this temper which we try to encourage at Kew. A man may know the rudiments of his art, and never be anything better than a journeyman. But if he begins to ask the why and the wherefore, then he is on the high-road to become a first-rate workman. And I know no art which affords a larger scope for the exercise of a lively intelligence than horticulture. A gardener tries to grow a plant, with the habits of which he is unfamiliar. He fails. He then, if he is a good man, begins to reflect. He brings to bear upon its culture the experience gained in treating similar "subjects." He tries different methods, and watches their effect: resting, watering, different kinds of soil, exposure to light, &c. The plant responds, and by seizing upon each indication of improvement which such a method of interrogation educes, the gardener ultimately finds the clue to success. The whole method is essentially scientific without making any profession of being so. If, however, a gardener, abandoning the experimental method, yields to intellectual indolence and is content to subject the plant to such physical conditions as he learns from a book exist in the plant's native country, then it may be pretty confidently predicted that he will be saved all further trouble by killing it.

"I am afraid I have treated you to rather a long essay. But this was perhaps necessary to enforce my conclusion that I do not think the County Council can do any good by giving lecture-room instruction in the art of horticulture. I have made inquiries, but I cannot find out that there is any class of persons in this neighbourhood that can be profitably reached by such an enterprise.

"The labourers in market gardens are hardly likely to be induced to attend; and the scattered gardeners in the district would in all probability be, in all practical matters, better equipped than the lecturer.

"In my opinion, the only course the County Council can take is to drop the idea of devoting the funds at its disposal to technical and to apply them to secondary education. Lectures on such subjects as elementary physics, chemistry, botany, and vegetable physiology would aim at nothing more than carrying on general education on subjects not taught, or scarcely taught, in the primary schools. They would be good as far as they go; would do no harm, and if the teachers were moderately competent, would almost certainly do some good.

"(Signed) W. T. THISELTON-DYER,
"Director, Royal Gardens, Kew, Dec. 15, 1891.

"P.S.—I should add, that our Kew system, as a school, is to this extent defective, that it makes no provision for high-class instruction in fruit and vegetable cultivation; this, however, can be obtained at the gardens of the Royal Horticultural Society at Chiswick. There is a useful work open to the County Council in obtaining facilities for passing young gardeners through Chiswick on much the same lines as obtain at Kew."

NOVELTIES OF 1891.

ORCHIDS.—The beautiful *Dendrobium Phalenopsis Schroderianum*, already so prolific in handsome new varieties, flowering out of Messrs. F. Sander & Co.'s importation, must be regarded as the leading introduction of the year. Well it is for a first importation of a good thing in bulk to have such an *avant-coureur* as that which this grand introduction had in the matter of the plants already in cultivation in Baron Schroder's collection. Much was expected of the importation, and the confidence was not misplaced, for now we have varieties of the Elephant Moth Dendrobe with white, blush, pink, and every shade and combination of colours up to rich purple in their elegant sprays of flowers, whose beauties will never pall so long as Orchid growing continues. Probably more satisfaction resulted from the expenditure of the £2000, which the lots of this plant realised at Protheroe and Morris's, than from any like sum spent in Orchids before.

Another great importation of Messrs. F. Sander & Co.'s, embracing new things, is their re-introduction of *Cattleya labiata vera*, which is distinct from other forms of *C. labiata* by its greater breadth of petal; and, singularly enough, the third plant, which flowered in December, produced the magnificent *C. labiata virginialis*, the best of the white-petalled *Cattleyas*, with a glowing violet-crimson lip.

Dendrobium Leeanum also, which flowered as a single specimen out of the importation of D. Phalenopsis Schroderianum, and D. Phalenopsis Lee's variety, are two introductions of the highest order of merit, and the pretty *Thunia Mastersiana*, whose Palm-like foliage and elegant flowers form such a charming object in the Orchid Trophy presented by Messrs. F. Sander & Co. to the German Empress, a valuable addition to a pretty and easily-grown genus. Other fine things, introduced or first brought into notice by the same firm during the year, are the new white *Cecelyne Micholitziana*, the large yellow *Spathoglottis Ericsonii*, the noble *Aërides Lawrencei* var. *Amesiana*, the perfection of a stately *Aërides*; the rosy-crimson *Schomburgkia Sanderiana*, *Dendrobium Richardii* and D. O'Brienianum, the singular *Cattleya granulosa Dijanecana*, the discovery of the faithful but ill-fated collector, Dijanec; *Masdevallia Rolfeana*, a rich dark purple and yellow species; *M. Nilssonii*, *Miltonia vexillaria Sanderiana*, and *M. v. Mrs. H. Ballantine*, both fine and distinct; *Maxillaria Amesiana* and *M. Mooreana*, the profuse-flowering *Lycaste Mastersiana*, with golden-yellow flowers, freckled with orange on the petals; four new and distinct forms of *Odontoglossum excellens*, the beautiful *O. Godseffianum*, which may be a new combination in natural hybrids; the noble *O. crispum Amesianum*, and that most æsthetic and unique *O. luteo-purpureum Amesianum*, whose fine flowers are wholly of a clear citron yellow. With the enumeration of the pretty *Lælia anceps Ballantini*, the charming *Cypripedium insigne Bohnholianum*, and a number of other Orchids of great botanical interest, with—late in the season—the handsome white and crimson *Cymbidium pulcherrimum*, an elegant plant and unique, it will be seen that the St. Albans firm have not been idle as importers; while in the matter of home-raised hybrids, their *Lælia Arnoldiana* ×, which took the Royal Horticultural Society's Silver-gilt Medal, open to all comers, and a First-class Certificate; their *Cattleya Behrensiana* ×, *C. Prince of Wales* ×, *C. Lowryana* ×, *Masdevallia Mundyana* ×, and a

long list of beautiful hybrid *Cypripediums* and other things tell plainly that this active firm have been equally diligent in the home industry of the hybridist.

To Messrs. James Veitch & Son, of the Royal Exotic Nursery, King's Road, Chelsea, as usual, belongs the honour of introducing to our gardens during the past year a number of hybrid Orchids of sterling merit. Foremost among these, ranks their *Disa Veitchii* × (*racemosa* × *grandiflora*), which gained an award of a Silver Floral Medal and a First-class Certificate at the Royal Horticultural Society on June 9. It is what is called the first break in *Disas*, no other cross having previously been effected. Like *D. racemosa*, it is a very free grower, and the profuse manner in which it produces its tall spikes of large rich rosy-crimson flowers will make it a general favourite. In *Phaius maculato-grandifolius* ×, we have another handsome hybrid, of stately habit, and of a colour much wanted in Orchids. Its name expresses its parentage, and the habit of the plants is fairly intermediate between the parents; the tall spikes bear flowers as large as those of *P. grandifolius*, of a clear soft yellow, with a pleasing copper-coloured tinge, the front of the infolded labellum being chestnut-red.

Yet another grand hybrid raised by Messrs. Jas. Veitch & Son is *Cypripedium macrochilum* (*longifolium* × *Lindeni*), and which, by the fact of the pollen-parent having only a small labellum, caused much wonder by the unusually large development of the lip in the progeny. The plant constitutes one of the most striking of the *Selenipedium* hybrids, and its features were well depicted in the *Gardeners' Chronicle* for September 19, 1891. The ranks of the *Cypripediums* also have been further augmented by Messrs. James Veitch & Sons, by *C. Antigone* (*niveum* × *Lawrenceanum*), which, although good when first flowered by Messrs. Veitch, was pronounced the best of its class when exhibited later in the year by Baron Schroder, who had grown it excellently well. *Cypripedium Creon*, also a Chelsea hybrid, may be said to be the first rival of the old favourite, *C. canthum superbum*, which, with *C. Harrisonianum superbum*, were used in its production. The bright mauve and white of the dorsal sepal, and the polished surface of *C. canthum superbum*, are to be found in *C. Creon*, but the flowers are larger. During the year also Messrs. Veitch have produced *C. Niobe superbum*; and the uniform good quality of all their hybrids which are brought out, points to the fact that they have been selected from a goodly number flowered in their trial-houses, and from which none not improvements on other known varieties are distributed—a method of selection which other raisers might imitate with advantage. Among other good services of scientific as well as general interest to be recorded to the credit of Messrs. Jas. Veitch & Son during the year, is the fact that they have flowered home-raised *Odontoglossum excellens* (*Pescatorei* × *triumphans*), and thus proved the correctness of the conjecture that the plants of it already in cultivation are natural hybrids.

During the past year, as in former years, the meetings of the Royal Horticultural Society have been graced by many new or extremely rare and beautiful Orchids from the gardens of Baron Schroder and from those of Sir Trevor Lawrence, Bart., M.P., the President of the Society. Among the most remarkable of Baron Schroder's exhibits may be mentioned the large snow-white *Lælia Perrinii* alba, and the equally clear white *Sobralia macrantha Kienastiana*. From the same ardent

orchidist also came a grand form of *Miltunia Bluntii* Lubbersiana, the fine *Odontoglossum Dellense*, *Cattleya linschootiana*, and new varieties of other known species; while that the all-engrossing interest of hybridising is not forgotten at the Dell, is evidenced by the pretty scarlet and yellow *Epidendrum Dellense* x, raised in Baron Schroder's gardens.

Sir Trevor Lawrence at the December meeting of the Royal Horticultural Society well displayed the excellence of the beautiful Burford Lodge Hybrid *Calanthes*, and several new ones were exhibited, the most distinct of which is *C. versicolor*, a noble variety of the vestita section, and *C. rosea*, a delicately-tinted form of the Veitchii class. Early in the year, his beautiful *Dendrobium melanoticum* x produced two superb forms, viz., the light D. m. pallens, and the richly-coloured D. m. Rainbow; while of imported natural hybrids, or fine forms, there flowered at Burford Lodge the rich yellow *Odontoglossum Pescatorei* Prince of Orange, several new forms of *O. excellens*, the fine *O. crispum*, Burford variety, the rich scarlet, yellow-centred *Masdevallia Harryana* luteo-oculata, *Megacelinium leucorachis*, *Cirrhopetalum*, *Bulbophyllum*, and many other new botanical Orchids. The large-flowered *Cattleyas* have been worthily augmented during the year by *Cattleya Mossie Lawrenceana*, which is like the best white-petalled form of *C. Wagneri*, but with a few dark crimson lines on the lip. The same genus also receives two or three new forms flowered by Joseph Broome, Esq., at Llandudno, of which *C. Mossie Broomeana* and *C. M. Sunning Hill* var., are two noble flowers, and so also is Mr. Broome's *C. Mendelii rubicunda*. Of *C. Mendelii*, however, R. Brooman White, Esq., who has a surprising collection of them, flowered some six or eight new forms, ranging from white to the darkest type, and including a new section, with wholly pearly-white and lavender flowers. Whilst on the subject of the large-flowered *Cattleyas* and *Lælias*, it will be well to mention a few of the leading novelties which these favourite genera have acquired. First the splendid forms of *Lælia grandis tenebrosa*, which have flowered in the gardens of the Right Hon. Lord Rothschild, Geo. C. Raphael, Esq., and Geo. Hardy, Esq., and *Lælia Gottoiana*. Then come the darkest and richest-coloured of its class, *Cattleya Hardyana*, Hamar Bass' variety; *C. Schroderæ*, Temple variety; and *C. Gaskelliana speciosa*, of Messrs. Seeger & Tropp. Among *Lælia anceps*, the largest and most gorgeously-coloured is *L. a. grandiflora*, Chamberlain's variety; and the most curious, *L. a. holocheila*, both imported by the Liverpool Horticultural Company in their fine importation, to which the term "grandiflora" was first applied. *Lælia elegans* has a distinct novelty in the *L. elegans Cullimorei* variety of Malcolm S. Cooke, Esq.; and in the collection of the late Thos. Statter, Esq., at Stand Hall, Whitefield, Manchester, several other new forms of *L. elegans* have bloomed, as also the pretty and distinct *Dendrobium Statterianum*, and the clear white *Cattleya intermedia alba*.

But one of the most beautiful of Orchids yet introduced has to be credited to M. Linden, of l'Horticulture Internationale, Brussels, viz., *Cattleya Rex*, and which will doubtless make a pleasant start for the new year. A beautiful illustration before us shows that this Orchid is even finer than was first stated. M. Linden, too, has during the past year introduced or flowered for the first time a host of fine Orchids, of which *Zygopetalum Lindenianum* is one of the handsomest.

Messrs. Hugh Low & Co., of Clapton, as large

importers, always secure a number of novelties, and among those of 1891 are the very distinct and lovely *Phalenopsis Schilleriana* Curnowiana, the white *Dendrobium Parishii* albens, *Mormodes buccinator aurea*, the charming crimson-lipped *Epidendrum Mooreanum*, *Restrepia striata*, first flowered by Mr. F. W. Moore at Glasnevin, Dublin; *Luisia Amesiana*, a very striking plant; *Cypripedium villosum* Caseyana, a grand flower, well worthy to bear the name of the pleasant and much-respected foreman and traveller of the establishment, the late Mr. Frank Casey. Messrs. Low also imported and flowered *Cattleya intermedia punctatissima*, also imported by Messrs. F. Sander & Co., and figured in the *Reichenbachia*; and the pure white *Cypripedium niveum album*, and the yellow *C. Godefroyæ luteum*. The firm of Messrs. B. S. Williams & Son shine most in their introduction of fine forms of well-known rare and showy species, and in hybrid *Cypripediums*, of which their *C. Adonis* x is pretty, and *C. Pitcherianum superbum* very fine.

In the Orchid-houses of Mr. William Bull also many showy varieties have appeared, and a new dwarf form of *Ansellia africana*, named *A. a. humilis*, which has also produced a variety named *A. h. pallida*, has been introduced. Messrs. Charlesworth, Shuttleworth & Co. introduced the curious and distinct *Odontoglossum Hennisii*, and what is purported to be a fine form of *Oncidium macranthum*, whose flower-spikes are not rambling, as in the type.

Messrs. Pitcher & Manda, of the United States Nurseries, Hextable, Swanley, Kent, have the grand violet-purple spotted *Cypripedium Leeanaum* Maserechanum x, *C. Arthurianum superbum* x, and three very distinct forms of *C. insigne*, viz., *C. i. Amesianum*, *C. i. corrugatum*, and *C. i. Eyermannianum*, with other novelties in *Cypripediums*, which form a leading feature in their collection. With Malcolm S. Cook, Esq., another new and handsome natural hybrid *Odontoglossum*—*O. Cookianum*—originates; appearing from several sources, the distinct *Ada Lehmanni* gets described in 1891. In *Masdevallia falcata* x, Drewett O. Drewett, Esq., raises another worthy addition to the hybrid *Masdevallias*; and the universal provider, Mr. William Whiteley, from his great nurseries at Hillingdon, beats the record for beauty in *Odontoglossum* triumphans with *O. t. Whiteley's* variety.

Messrs. Heath & Son have distributed their *Cypripedium Leeanaum giganteum*, the most massive and stately of its class, and also secured a certificate for their fine *C. Stonei* magnificentum.

At the Royal Gardens, Kew, a number of new Orchids flower every year, and last year the rare event of one of a new genus and species appeared there, which was named *Neobenthamia gracilis*; there flowered here also several other new Orchids, and especially noteworthy are *Bulbophyllum inflatum*, *Cirrhopetalum Colletti*, and the true *Cirrhopetalum Thouarsii*, which latter two (like many other things we record as new), although not unknown previously, are of sufficient merit to chronicle with novelties.

In other places, among other new plants of botanical interest which lack not favour with some persons, and which are admired by all when well flowered, newly described, are *Megacelinium Clarkei*, *Bulbophyllum nigripetalum*, *B. denticulatum*, *Cirrhopetalum O'Brienianum*, *C. elegantulum*, *Habenaria carnea*, *Rodriguezia anomala*, *Pholidota repens*, and *Polystachya bulbophyllioides*.

The following novelties in Orchids have been

illustrated in the *Gardeners' Chronicle* in the past year:—

Cattleya Rex, February 28, p. 273.
Cymbidium Tracyanum, January 31, p. 137.
Rodriguezia anomala, June 13, p. 729.
Habenaria carnea, December 19, p. 729.
Cypripedium insigne Sanderae, December 5, p. 669.
Dendrobium Leeanaum, November 28, p. 641.
Phalenopsis Schroderiana vars., flowers and plant, November 28, pp. 642, 643.
Cypripedium macrochilum, September 19, p. 343.
Neobenthamia gracilis, September 5, p. 273.
Epidendrum vitellinum, Mr. Geo. C. Raphael's double-flowered. August 1, p. 141.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ORCHIDS AS CUT FLOWERS.

In the *Journal des Orchidées*, a vote has been taken to ascertain the opinions of the majority as to the best Orchids to grow on a large scale for cut flowers. The list given by our contemporary as the final outcome of the voting is as follows:—

1. *Odontoglossum Alexandræ*.
2. *Cattleya Warocqueana* (labiata).
3. *Cypripedium insigne*.
4. *Coleogyne cristata*.
5. *Cattleya Trianae* and *C. Mendelii*, equal.
6. *Cochlidia Noetzeliana*.
7. *Cattleya Mossie*.
8. *Lycaste Skinneri*.
9. *Dendrobium nobile*.
10. " bigibulum.
11. *Odontoglossum grande*.
12. *Cypripedium Lawrenceanum*.

HYBRID CYPRIPEDIUMS—C. BOSSCHERIANUM x.

This *Cypripedium* is a seedling raised by M. Ch. Vuylsteke, of Locchristy, and is a hybrid between *C. Spicerianum* and *C. barbatum superbum*. The upper sepal is very large, orbicular, and bent round at the back. In appearance it resembles *C. Spicerianum*; the background is white, deeply flushed with purplish-pink and bordered with white, with a central line of blackish purple-red, clear red at the base. The lower sepal is very small, yellowish-white striped with dark green. The petals are of medium breadth, very wavy, with black hairs, olive yellow, and much spotted with small sepia dots. The lip is much developed, clear blood red, here and there shaded with yellow above and greenish-yellow below. The staminoide is very large, reddish-mauve, marked with two small green spots, and yellow in the centre. The foliage is very pale green, shaded with deep green. This excellent hybrid was awarded a certificate of merit at the meeting of the Société Royale d'Agriculture et de Botanique, and the Chambre Syndicale des Horticulteurs Belges, on December 6.

Cypripedium decorum is a hybrid between *C. Salieri* hyeanum and *C. Lawrenceanum*. The upper sepal is well developed, very flat, deep brown shading into dark green towards the base, the upper part is pinkish-magenta round the border, edged with milk-white; the inferior sepal is greenish-white, much streaked with deep green, the lip brown with a metallic shade over the upper part, clearer underneath. The staminoide is garnet flushed with mauve, the base bearing a pink dot. The peculiar foliage is clear green, much flecked with very dark blackish-green. This hybrid was raised by M. Jules Hye-Leyen, of Ghent, who was awarded a certificate of merit at the meeting (Dec 6) of the Société Royale d'Agriculture et de Botanique, and of the Chambre Syndicale des Horticulteurs Belges, at Ghent.

MAIDENHAIR-FERNS.

THE beautiful genus *Adiantum* includes a large number of distinct species, besides which there are now many very pretty garden varieties. Although

usually the *Adiantums* may be raised from spores, and will come true to the character of the species, and, in most cases, the garden varieties do not vary much. There are some exceptions, however; for instance, I have not been able to obtain *A. Veitchii*. I have raised batches of seedlings, which have appeared to be true while in a young state, but as the plants advanced in growth they proved to be distinct, not only distinct from the parent, but different to any other sort grown, being somewhat intermediate between *A. decorum* and *A. concinnum latum*. Among seedlings of other sorts we often find slight variations. In one instance I found at least six distinct varieties in one little batch of seedlings, which were raised from spores obtained from a single frond of the variety known as *Waltoni diffusum*. Among the seedlings referred to, were some which might be identified with *A. æmulum*, of which *Waltoni* is probably a seedling. *A. Ghiesbreghtii* (generally known as *A. scutum*) is another species from which we have obtained some useful and distinct varieties.

In the following selection I have divided them into groups, and I believe the list will be found to include all the most useful species and varieties:—

CUNEATUM GROUP.

This includes all the most useful Maidenhair Ferns. Either for cutting from, or as plants for decoration, these take first place among all Ferns. The old form of *A. cuneatum*, although there are now many varieties of it, still holds first place, and is grown more extensively than any other Fern. *A. elegans*, with larger and more spreading fronds, is more useful for some purposes, and is extensively grown for market work. *A. gracillimum*: this elegant variety should be grown three or four plants together in a pot. These will make compact masses, and do not drop about so much as when single plants are grown. *A. mundulum*, a very pretty compact-growing variety, the small fronds are useful for small bouquets or button-holes. *A. Pacottii*: sometimes called the double Maidenhair, on account of the pinnules over-lapping each other; of a rich deep green—makes a compact plant. Of the small-growing sorts, this is one of the best. *A. Lambertianum*, very slender drooping fronds, small wedge-shaped pinnules, on fine thread-like rachises. *A. grandiceps* (the tasselled Maidenhair): this makes a beautiful plant when suspended; the long drooping fronds terminate in a tuft of multifid growth, which can only develop properly when raised up. *A. Versaillense* is another pretty crested variety, the erect fronds terminate in a perfect corymb of multifid growths. *A. fragrantissimum* must be included; it is a beautiful Fern, with large spreading fronds—the pinnules are deep wedge-shaped, and lobed, the ultimate ones much larger. It is slightly fragrant in the spring, when the fronds are quite young, but hardly sufficient to merit the name. *A. æmulum*, with the varieties *Waltoni* and *Waltoni diffusum*, are all desirable, the latter especially; it might be considered intermediate between *æmulum* and *fragrantissimum*, but the fronds are lighter, and of a more drooping habit than *fragrantissimum*; it makes a beautiful specimen. *A. Le Grande*, a congested form of *gracillimum*; distinct and pretty.

TENERUM GROUP.

This includes the lovely *A. Farleyense*, which is generally accepted as the queen of Ferns; although most authorities agree that it is a variety of *tenerum*, I think there must still be some doubt about its identity with that species. *A. scutum* (*Ghiesbreghtii*) is undoubtedly closely allied to *tenerum*, and we have many intermediate forms. *A. Lathamii* is one of the prettiest, the fronds are gracefully recurved, and of a soft pale green; *A. Victoria*, dwarf and compact, pinnules large; *A. rhodophyllum* differs in having a deep rosy tint in the young fronds, changing to deep green with age. *A. regina* is a fine variety, with the large pinnules of *Victoria*, and the large spreading fronds of *scutum*. In *A. scutum* we have two varieties, one with pale fronds, and the other rose-tinted when young, and changing to deep green with age. *A. Bausei*, a variety of *tenerum*, in which the pinnules are drooping or deflexed, the fronds

growing erect. Among seedlings here we have this curious deflexed form in *Victoria*, *regina*, and other *Adiantums*. *A. Colliis* is another desirable variety belonging to this group. In this the fronds are large and much branched, but the pinnules are smaller than in any of the others referred to in this group.

DECORUM GROUP.

A. decorum is a most useful Fern, making a good pot-plant. When well exposed, the young fronds have a pretty delicate pink tint. It is one which finds some favour as a commercial plant. *A. Veitchii*, rather narrow, erect fronds, broad pinnules, young fronds richly tinted with red. It is one of the brightest of the tinted Ferns. I have previously referred to this as not being obtained from spores, and, as it has a close tufted caudex, it is slow to increase by division, and consequently is very scarce. *A. rubellum*, another tinted variety, with smaller fronds and a spreading caudex. *A. cyclosorum* is also a good tinted variety with drooping fronds, broad rather distant pinnules, the ultimate ones larger and drooping. *A. concinnum*, a very pretty Fern, but rather delicate. *A. concinnum latum*, a much more vigorous variety, with large erect fronds. This is sometimes grown for market, but is much damaged if exposed to the cold. *A. Weigandi*, a very distinct and pretty Maidenhair, erect in growth, the

FIG. 1.—THE CHINESE PRIMROSE: NATIVE SPECIMEN.
A and B, leaves of two forms; C petal; D E F, various forms of the calyx.

irregular pinnules overlap each other, and are of a rich deep green. It may be recommended as one of the prettiest for decoration, and, being of good substance, it stands exposure better than most of the Maidenhairs.

CAPILLUS-VENERIS GROUP.

Of *A. Capillus-veneris* we have several very distinct and beautiful varieties, some of which might be regarded as distinct species. *A. Mariæ* is one of the most useful; this has the spreading caudex, and the peculiar bluish tint to the stipes, which are characteristic of the species, otherwise, it is very distinct; the fronds grow nearly erect, triangular in shape, and have broad, wedge-shaped pinnules, of a bright fresh green. *O'Brieni* closely resembles the above, but the pinnules are smaller and more distant; both have large spore-cases, the coverings being almost black. *A. imbricatum*, a very fine variety, with spreading fronds; the pinnules are almost as large as in *A. Farleyense*, and deeply cut round the margin. I have not seen this since it was exhibited at a meeting of the Royal Horticultural Society about two years ago, nor do I know if it is distributed. The next in order is *A. grande*: this a fine variety, similar in habit to the species, but having broad, wavy pinnules. *A. cornubiense* and *A. daphnites* are distinct. The variety *fissum* has small erect fronds, the pinnules are cut down into narrow segments; it is

a curious, if not a beautiful variety. The normal form of *A. Capillus-veneris* is also a desirable Fern. Among seedlings, I have found many variations. Of other species which may be included in this group, *A. bellum* and *A. glaucophyllum* are very pretty, with slender, erect fronds, growing only a few inches high—the latter of a pale glaucous-green, and the former of a deeper shade, with a bluish tint to the rachis. *A. Fergussonii* is a most desirable species; the caudex does not spread so widely as in the above-named, but it has some of the characteristics of the *Capillus-veneris*. The long narrow erect fronds have irregular-shaped pinnules, some overlapping each other; the ultimate ones are broad, and deeply lobed. Of other sorts with spreading rhizomes, *A. Williamsii* is one of the most beautiful, and may be particularly recommended, as it succeeds well under cool treatment. *A. æthiopicum*: of this there are two distinct forms—the dwarf form is often grown under the name of *venustum*, but the true *venustum* is quite distinct; the tall-growing variety, *æthiopicum alatum*, of some authorities, is a very fine Fern, growing 2 to 3 feet high. I have also seen this labelled *A. digitatum*, but the true *digitatum* is synonymous with *speciosum*, a very distinct species, with large spreading fronds of a pale soft green; this species is deciduous. Although one of the most beautiful of the genus, it is rarely seen in collections. *A. palmatum* is another beautiful deciduous species, having long slender fronds; the pretty palmate pinnules are borne on slender rachises, and at some distance apart. *A. Moorei* and *A. assimile*, both fine basket Ferns, will complete this group.

MACROPHYLLUM GROUP.

A. macrophyllum is a grand Fern; the erect pinnate fronds have a beautiful rosy tint when young, which, with age, changes to a deep green. *A. m. bipinnatum* differs in the lower portion of the fronds, being bipinnate; it also has a more bronzy tint in the young fronds. *A. Seemaani* is a choice species with large, deep green pinnules. *A. peruvianum*, a beautiful Fern with large drooping fronds; the large broad pinnules are borne on long, slender, thread-like rachises, and when well treated, it makes a noble plant. All of this group require stove treatment, and a position where the damp does not settle on the fronds. *Pteris*.

(To be continued.)

THE ABORIGINAL CHINESE PRIMROSE.

On various occasions we have mentioned the interesting discovery of the aboriginal Chinese Primrose by Dr. Henry and by the French missionaries, in the mountains of I-Chang. We have also noted how, at Appleby Towers, near Ryde, Mr. Myles, the gardener, last year showed us some seedling plants from the same locality, which we at once recognised as belonging to the same species.

Now we have the pleasure to give an illustration (p. 13) of a flowering specimen, grown by Mr. Jones in the garden of Edmund Hyde, Esq., of Ealing. The conditions under which it grows in nature are very different from those under which it is cultivated here, and anyone who will compare our fig. 1, taken from the wild plant, will be interested in seeing how great a change has been effected in one season only, and without any cross-fertilisation. It is such changes as these which bear witness to the process of evolution. There are many mysteries yet to be solved, and one of them is the reason why some plants are so much more variable than others. Not many plants would respond so soon to the attention of the cultivator as this Chinese Primrose. We must refer for further details to our previous articles, on January 26, 1889, p. 115, and November 15, 1890, p. 564, and to Mr. A. W. Sutton's paper on Chinese Primulas in the *Journal of the Royal Horticultural Society* for March, 1891, vol. xiii., p. 99.

The stock of this interesting progenitor of the race of Chinese Primroses is in the hands of Messrs. Sutton & Sons, Reading.

THE HELLEBORES OF THE ANCIENTS.

Drugs prepared from Hellebore were so famous amongst the ancients as a remedy for madness, and, indeed, for many other ailments—Pliny gives a list of them quite worth the notice of advisers of patent medicines—that the plant has acquired for

infer that it was formerly used here. At Constantinople, a popular drug, called Zoptane, is made from *H. orientalis*, which is common on the mountains of Eastern Turkey. In Gerard's time, our native *H. foetidus*, the rankest of all the genus, was employed medicinally, though known to require great caution in using, and it is still retained in veterinary practice for outward application.

they came; and were priced and trusted accordingly. Hellebore was of two kinds, distinguished as black and white. The best black came from Mount Helicon, and the best white from Mount Ceta. The town most famous for its preparation was called Anticyra, but this name was ambiguous.

There is a well-known passage in *The Art of Poetry*, written by the Roman poet Horace, in

FIG. 2.—THE WILD FORM OF *PRIMULA SINENSIS*, AFTER ONE YEAR'S CULTIVATION: FLOWERS, PALE ROSY-LILAC; POLLEN, MAGN. 300 DIAM. (SEE P. 12.)

itself a literary as well as a botanical interest. We know that different species have been used in different countries for their medicinal properties, which are, perhaps, essentially the same in them all, though varying in strength. The Hellebore of the modern English *Pharmacopæia* is the root of *Helleborus niger*, the common Christmas Rose. In Germany, *H. viridis*, the green Hellebore, is said to be preferred, and from its frequent occurrence in England in the neighbourhood of old ruins, we may

The physicians of ancient Greece, who for some centuries before and after the Christian era were famous throughout the civilised world for their skill, were very fanciful about the locality from which the herbs used by them were collected. The kind of herb might be the same, but when gathered on a particular mountain or in a particular forest, it was thought to have additional virtue. Drugs of the same name were classified as first, second, third, or fourth quality, according to the source from which

which he says, that to gain a reputation as a poet, a man must be so mad that three Anticyras cannot cure him, and must never have his hair cut. Multiplying by three was a common superlative figure of speech in Latin, as in other languages, and perhaps Horace meant no more than this; but, on the other hand, he may have known that there were in Greece three towns named Anticyra, and possibly they were all places where the drug hellebore was prepared. One Anticyra was on a narrow strip of the land of the

Locrians, between Ætolia and the sea. Strabo, an ancient writer on geography, and Livy, a Roman historian, both mention it. It was taken by the Romans in the second Punic war, and given over to their allies, the Ætolians. We know nothing of it as connected with Hellebore, though Pliny tells us that Ætolian Hellebore, which was of bad quality, was used to adulterate the better Parnassian kind. There was another Anticyra in the south-eastern corner of Thessaly, 3 or 4 miles from the sea, near the base of Mount Æta and the famous pass of Thermopylae, but we do not hear of this town as producing Hellebore except on the slight authority of the lexicographer, Stephanus of Byzantium, who lived in the sixth century of our era. The third Anticyra, the only one which we know to have been famous in classical times for the manufacture of this drug, was situated on the southern coast of Phocis, not far from the base of Mount Parnassus, and within a few miles of Mount Helicon. The position of it is well known, and it is now named Aspra Spitia; it was not an island, as Pliny and others have wrongly said, and never can have been so in historic times; but it stood on a peninsula, and had a good harbour. In Horace's day, it was a place of resort for insane or epileptic patients, who went there to take a course of Hellebore under resident physicians. Hence, to say "You should go to Anticyra," was a polite way of telling a man he was a fool. Amongst others who had gone through this medical course there, Pliny mentions the philosopher Carneades, who went there for intellectual training before publicly declaiming against the dogmas of the Stoics, apparently supposing that a medicine which could make madmen sane, would make sane men still wiser. Also, Drusus, a famous popular leader of the Romans, was cured there of epilepsy. The same writer adds that this drug, which retained its virtue for thirty years, and once was thought so formidable, had now become so "promiscuous" in its use, that students often took a dose of it to sharpen their intellect, when they were puzzled by difficult passages in their reading—a valuable hint, by the way, for candidates before a competitive examination! I recollect a virtuous freshman at Cambridge who, with a similar object, laid in a large stock of "Reading biscuits," which he saw advertised in a window!

The next question is, what were the kinds of Hellebore called black and white, and found respectively on Mount Helicon and Mount Æta? We ought to be able to answer this, because Edmond Boissier has told us, in the preface to *Flora Orientalis*, that, thanks to the labours of the botanists, Orphanides and Heldreich, the flora of Greece is now better known than that of any other country within the scope of his work. The Hellebore which is found to prevail on Mount Helicon, Mount Parnassus, and the neighbouring country, is one to which E. Boissier gives the name of *H. cyclophyllus*. It is intermediate between *H. viridis* and *H. orientalis*, having been confused with the latter both by Sibthorp and by Heldreich. Perhaps it is not in cultivation in England, but it is described as being taller, and having larger flowers, and broader segments to the leaves, than the green Hellebore, which in other characters it resembles.

As for the white Hellebore, it is evident from the vague descriptions of Theophrastus and Pliny, that neither of them knew a living Hellebore by sight, but Pliny says that he had been told that the leaf of the black Hellebore was of the shape of a Plane leaf, but divided into several segments, and that the white Hellebore had leaves resembling those of the Beet, and deeply channelled at the back. He attributes to it a bulbous root like that of an Onion, with fibrous tunics. Ancient and modern botanists have generally identified this with *Veratrum album*, which is figured in Gerard's *Herbal* as the White Hellebore; but perhaps the best evidence is that of Heldreich, who explored Mount Æta in 1879, and found *V. album* growing there in abundance, confirming his previous opinion that this was the White Hellebore of Theophrastus. The different effects of the two kinds of Hellebore taken

medicinally, as recorded by ancient authorities, corresponds with modern experience; the black is a powerful cathartic and the white a strong emetic. This is a summary of all that is known or likely ever to be known of the famous Hellebores of the ancients. *C. Wolley Dod, Ridge Hall, Malpas.*

BIRDS OF THE COMMONS AND WOODLANDS.

(Continued from p. 758, vol. x.)

PIPITS.

Towards the middle of April it is not an uncommon thing to hear a song which reminds you of the canary. If you look at the singer you will see that he rises from one of the highest boughs of the tree on which he is perched, hovers in the air for a moment, and then descends on to the branch from which he started, singing all the while. He is a small brown bird, in colour like the lark; but in many respects you will notice that he resembles the wagtail, to whom he is much more closely related. This bird is the tree pipit, a very characteristic woodland species, and fairly plentiful from April to September throughout England wherever the country is well supplied with trees. The meadow pipit, or titlark as it is commonly called, closely resembles the tree pipit, but is far less particular in the localities which it frequents. It seems to be most at home on moorlands and low-lying damp ground, although it may also be found on heaths and in cultivated districts. Unlike the tree pipit, the titlark is resident with us throughout the year, but in cold weather there is a general movement to warmer localities.

WOODLANDERS.

The members of the crow tribe possess between them as much intellect as all the other birds put together. They are most of them bated by gamekeepers, especially the magpie and jay. Everybody knows these two birds by sight; both are beautiful, which is to many men in itself a good reason for killing them, and both sometimes destroy the eggs and young of other species; therefore they are shot and trapped everywhere. The jay, in addition to being considered an ornamental bird for a hat, has a further attraction in the fact, that the brightly coloured blue feathers on its wings are valued by fishermen for making flies. It manages, however, to hold its own fairly well, for it is extremely wary, uttering its hideous scream long before an intruder has time to get anywhere near it. As a matter of fact, it is probably not as destructive as the magpie or crow, though its reputation is about as bad. This species is handicapped in the race for life by being so conspicuous. Many conspicuous birds protect their eggs from destruction by building their nests in places which are inaccessible or hard to find, but the magpie's nest is a great structure of sticks, with a dome, so that it is about as conspicuous as it is possible for a nest to be. The only other two birds of the crow tribe are the jackdaw and the rook, both very sociable, not only among themselves, but also towards mankind. The jackdaw can hardly be said to be a real bird of the woodlands, but it does occasionally nest in hollow trees. They prefer cliffs and old buildings, where they may be seen flying about in large flocks, sometimes performing the most wonderful evolutions in the air, especially on windy days, when they always appear to be most thoroughly happy. *A. H. Macpherson.*

(To be concluded.)

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

MANURING APPLES AND PEARS.—The manner in which manure is applied to the roots of fruit trees may be thought by some growers of very small importance, but, to my mind, after several years' experience, the method adopted has much to do with the production of good fruit. One has often heard it remarked, "Get the manure into the ground, the roots are sure to find it." This may be quite true, but the very fact of having to dig it into the ground, and then the roots to search for it, is a great drawback to the production of large fruits. Why not place the manure in such a position that the rootlets do not have to search much for it, and so save them the time (if I may use such an expression), that so soon as the fibres begin to work, and consequently need

nutriment in some form, they may have it close at hand; nothing remaining for them to do but root away, to nourish bloom-bud, bloom, and fruits, and which eventually (all other points being right, such as plenty of space between the branches and spurs) may become fine specimens. The best way to apply manure is to take a three-pronged Canterbury hoe, draw the soil away from the stem of the tree, say a distance of from 2 to 3 feet all the way round, until the fibres are seen. If the tree is on the Paradise stock, and not planted too deeply, these will be found close to the surface, and here let me say that I lay great stress upon the importance of keeping the roots close to the surface. In the basin thus formed place the manure, or manure and soil mixed. Throw the soil back on to the top of the manure, and, finally, give all a good treading. If artificial manure is to be used, it should be mixed with a little fresh soil, and not applied till later in the season. The above remarks are only intended to apply to such trees as annually carry heavy crops of poor fruit, or trees that may have become straggled, either by want of proper nourishment or by constant digging around the roots. The intervening spaces between the trees should be slightly forked over, just sufficiently to make a crumb for flat hoes. Bush fruits may be improved in the same manner; in fact, all trees that are in any way benefited by manure. Farm-yard manure we find to be the best, and if this be mixed with burnt refuse, it not only makes the manure go further, but helps to give colour to the fruits, especially Apples.

CORDON APPLES AND PEARS.—These are usually planted as edgings to garden walks, making a nice finish to the quarters, and affording good returns when properly managed. The trees can be procured as maidens, and cut back to the required height; or what is better, purchased already formed either as double or single cordons.

A very good distance to plant cordons from the edge of the walk is about 2 feet, and the height of stem about 12 to 15 inches. If double cordons are to be planted, these should not be placed nearer than 20 feet apart, which allow 10 feet on each side for the extension of the branches. Single cordons should be planted at not less than 14 feet. The training can very well be done on the old-fashioned system of driving short stakes into the ground at suitable distances apart, but as these often need to be renewed, the better plan—one that is really cheaper in the end—is to place iron supports firmly in the soil, making the two end ones very secure, and then stretching a wire from end to end, much in the same way as an ordinary iron-wire fence is made. It must be borne in mind that this method of growing trees only allows a very limited growth above ground, consequently occasional root-pruning will be required. Some sorts are better adapted than others for cordons, the following are amongst some of the best: Cox's Orange does remarkably well, so do Emperor Alexander, Belle Dubois, Peasgood's Nonsuch, The Queen, Lord Grosvenor, Lord Suffield, Grenadier, Lane's Prince Albert, Prince Bismarck, Reineette de Caux, and many others. The last-named variety and Prince Albert are very desirable fruits, being heavy croppers, and keeping well to a late period, and requiring but little root-pruning. *G. Woodward, Barkham Court, Maidstone.*

PLANTS AND THEIR CULTURE.

WATERING AND TEMPERATURE.—During the late severe frosts, it became necessary to keep the fire going brisker. In doing this it is always well to avoid as much as possible a too high night temperature, 58° to 65°, with a rise of 5° to 10° by day, according to the outside temperature, being sufficient for the stove; and, indeed, it is prudent to let the warmth decline a few degrees below these figures rather than keep up a dry parching heat by forcing the fires. All watering of plants should be done early in the day, and those plants which are situated nearer to the hot-water pipes than others carefully looked after, as these will necessarily become much dried up. Avoid moistening the foliage overmuch, the syringing and damping-down being performed with care.

FORCING PITS.—Fresh plants should be introduced from time to time in adequate numbers; these may consist of Roman Hyacinths, Paper-white Narcissus, early Tulips, Lily of the Valley, *Richardia athiopica*, *Dielytra spectabilis*, Persian Lilac, a few *Azalea indica*—*Deutsche Perle*, and *Flieder's White*. Continue to lift and pot up clumps of *Helleborus niger*, placing them in a vinery which is just being started, or other place with similar

heat. Here the plants will soon throw off a quantity of blooms, and where a good stock of this species is at hand, some spare lights may be placed over them where they stand, so as to protect them. These roughly-protected plants will afford a succession of blooms to those that were lifted and taken indoors.

CALADIUMS AND GLOXINIAS.—These should be looked over and examined, and if found to be too dry, or inclined to shrivel, a small quantity of water may be afforded them. They should afterwards be returned to their winter quarters for another fortnight, when, should any be required to bloom early, the first portion may be started in gentle warmth.

CHRYSANTHEMUMS.—Cuttings of these plants may now be taken, not delaying any longer to do so; put them in a compost of two parts loam, and one of leaf-soil, and sufficient sand to keep the whole open, passing it through a sieve with a half-inch mesh, filling the cutting-pots to within three-quarters of an inch of the top with the compost, and finish off with a layer of sharp silver-sand.

In taking the cuttings, give preference to those thrown up from the roots of old plants, for, if the cuttings are taken from the stems, they often give trouble by continually showing for bloom throughout the summer. If it can be done, it is best to strike each cutting separately in pots, as by so doing the young plant does not receive any check when re-potted. The best place for the cuttings to root is a cold frame, or hand-light placed in a cool vinery or Peach-house, having the frame filled up to within 8 inches of the glass with coal-ashes. The cuttings must be kept free of decaying leaves, and the glass dried with a cloth every morning, allowing the frame to be ventilated for about an hour daily, which will dry the soil, &c.

CALCEOLARIAS.—Plants in 4-inch pots, with their roots touching the sides of the pots, should be shifted into 6 or 7-inch pots without delay, it being one of the secrets of success in growing these plants not to allow them to receive any check whatever from the time of sowing the seeds till the blooming period. A good compost for the herbaceous Calceolaria may consist of two parts fibrous loam and one each of leaf-soil and dried cow manure, the latter being run through a sieve, and sufficient sharp sand put with the whole to give porosity. Grow the plants in a low pit, or on a shelf in a cool greenhouse from which frost is excluded, and keep them free from greenfly—to which they are very subject—by fumigating with tobacco-paper about once in three weeks. *R. Milner, Penrice Castle, Swansea.*

THE ORCHID HOUSES.

With the new year it is well to review the work done in this department in the year just passed, as each year has its lessons, and every Orchid grower will have added something new to his experience. When Orchids are growing satisfactorily, that is sufficient proof that the conditions under which they are grown are suitable. Sickly plants are to be found in every collection, few or more, and the cause of their unhealthiness invariably is, that some simple want is not attended to, or is not understood. As to the latter I would say, find the right place and the proper treatment for the plants; and the unhealthy plant, if it be not too far gone, may recover. Thrips and other pests find it difficult to increase when plants are doing well. The suitable place for a plant will vary according to the season, and it is a far more important matter than is generally thought, but it is the only way in which Orchids can be readily grown. In addition to remarks on the cultivation of Orchids in general, I will endeavour week by week to show the conditions under which we at Highbury find generally bad growers to succeed. At the present time, there being little or no potting to do, attention is given to cleanliness and ventilation. I would advise amateurs to be cautious in making alterations, and nourish their plants as much as possible on pure air, avoiding any approach to a stuffy atmosphere. I question if the old-fashioned closed stage, with moisture-retaining material kept thereon, is good for Orchids. I say that it obstructs the freedom of air-circulation, and is in that way a mistake, and should be removed in favour of the ordinary greenhouse stage. If stagnant air is detrimental to Orchids, equally so are close stages, and I say, try the others with nothing more than a row of roof-tiles laid just over the pipes, raised from them about 3 inches, and on which some half-decayed leaves are placed. When a plant is doing well, it dries up quickly with proper ventilation, as everyone knows, and there is less fear of over-watering a plant,

or injury from damp. Open the bottom ventilator more or less, and other ventilators according to the state of the wind and weather. I prefer to admit air at the ends of the house by means of the doors or otherwise, in cold weather opening that to leeward only. Fire-heat should be used to temper the fresh air, maintaining the warmth at this season from 60° to 70°.

THE ODONTOGLOSSUMS.—The house containing these plants now in bloom is brightened by having some plants of *Sophranitis grandiflora* and roses put here and there on the stage. Do not let the temperature fall below 45°, and in mild weather 50°, 60° being the highest day warmth with fire-heat and abundance of air.

THE CATTLEYA OR INTERMEDIATE-HOUSE will now be gay with the *Laelia anceps*, of which *L. a. grandiflora* (true) is by far the largest and most substantial form. Where fogs are common, I would advise that in foggy weather, a moist atmosphere be kept, and no evergreen Orchid be allowed to remain very dry at the root, or both leaves and flowers will suffer. Temperature from 55° to 65°, with air, and the house and plants kept much drier than the *Odontoglossums*.

THE EAST INDIA-HOUSE.—If the *Phalenopsis* are grown in this house the warmth must not fall below 65°, otherwise the majority of the plants will not be hurt if 60° is the lowest reading, rising by day from 60° to 70°, and with sun-heat 5° higher. *H. A. Burberry, Highbury, Birmingham.*

THE KITCHEN GARDEN.

At this period the work will greatly depend upon the weather; if it be mild, digging should be pushed on, and when frost prevents this, the wheeling of manure on to the quarters can always be done expeditiously. In selecting ground for certain crops, as for instance, Beetroot, Salsify, Scorzoneria, Carrots, Parsnips, and Onions, heavy manuring, early digging or trenching, turning the soil up roughly are essential to good roots. Onions will often follow Celery, and if the latter can be cleared off in good time, the ground can be got into prime condition for sowing seed by moving the surface with digging-forks several times. By attention to a system of rotation of crops, and choosing the right kind of soil—and in most gardens there is some variety of soils, clabbing and other evils are, to some extent, prevented, and good crops obtained. In some gardens, long under the spade, cabbaging of the roots of Cabbages, Cauliflowers, &c., is often troublesome, and the present time is the best to apply remedies for this evil. The best remedy is the free use of gas-lime used early in the winter, spreading it evenly on the surface some days before digging the land, taking care to powder the lime, as large lumps are apt to be injurious to the roots of plants. When only a light dressing of gas-lime is afforded, it may be dug-in at once without exposure to the air.

ARTIFICIAL MANURES.—By the use of these, much good may be effected in gardens which have for long periods received much animal manure and the soil has become too rich in nitrogen, and I would advise the use of quicklime on land of this kind as an aid to decomposition of the excess of manure in the soil. Wood-ashes should also be made use of in lieu of animal manure for a season or two. Light soils are benefited by the addition of marl, clay, or heavy loam; and old mortar or plaster, charcoal waste, and fine coal ashes are good to mix with heavy soil. For Seakale and Asparagus, I have found that fish-manure produces much better results than salt alone, and may be afforded to other crops with good effect. Peruvian guano mixed with marl or like soils would often give a better return, if used for a season, than farmyard manure. Some gardeners have a difficulty in getting sufficient manure for the garden, and the above-mentioned substances will afford valuable help in its absence, together with deep cultivation of the soil.

EARLY VEGETABLES.—Peas sown in the autumn in the open ground are frequently a loss, whilst those sown in mild heat give good returns. The present is a good time to sow larger kinds of Peas in 5-inch pots thinly, placing the pots in a cold frame, affording no water, if the soil is damp, till they have germinated. Chelsea Gem and Duke of Albany are good varieties to grow in pots, the latter requiring pinching of the points to induce bushiness of growth, and it follows the first-named, and has large pods. Sow Broad Beans shortly for planting out, as advised for Peas. Cauliflowers should be sown if there is any de-

ficiency of plants, the Pearl being an excellent one to sow for early produce. Seed of Onions may be sown in a cold frame, if very large bulbs are required, or when the autumn sowing has failed. Should the supply of salad have run short, seeds of Lettuce may be sown at fortnightly intervals, to be used in a young state for salads; only early kinds should be sown. Seakale, Rhubarb, and Asparagus roots should be lifted and planted in heat, as required; and fresh leaves and stable-litter got in readiness for hotbeds for Radishes and Carrots, and a sowing of Brussels Sprouts, Cabbage, and Cauliflowers. *G. Wythes, Syon House, Brentford.*

THE FLOWER GARDEN.

SUMMER ARRANGEMENT OF BEDS, ETC.—Where the arrangement of beds and borders (on paper) for next summer did not receive attention as was recommended in these columns last autumn, it should be looked to now, in order that the plants necessary for filling the beds may be propagated in sufficient numbers. First determine the number of beds to be filled exclusively with flowering plants in distinct colours—such as scarlet, pink, and white Pelargoniums, blue Lobelia, and Tom Thumb (mauve) and other varieties of Ageratum, and with plants of various heights, and varying in colour of leaf and flower, for what are called the mixed beds, as well as carpet beds, and the sub-tropical plants. As a guide to the species and varieties suitable for use in mixed and sub-tropical bedding, a brief list may with advantage be given here, inasmuch as there is no time to lose in the matter of working up a stock of both descriptions of plants.

MIXED BEDS.—(Oblong or circular beds planted thinly with light and dark-flowered Fuchsias, carpeted with blue or yellow Viola, and edged with a good band of the variegated-leaved pink-flowered Pelargonium Manglesii, are effective; as also the same filled with pyramids of Madame Crousse, Ivy-leaved Pelargonium, Lilium candidum (common white garden Lily), L. auratum, L. tigrinum splendens, Carnations, and Calceolaria amplexicaulis disposed thickly in a groundwork of yellow Viola, with a broad band of *Colerus Verchaffeltii*, or *Iresine Lindenii*, and edged with blue Lobelia. Beds thinly sown with Garaway's White Mignonette and interspersed with plants of scarlet and pink flowered Pelargoniums and variegated Japanese Maize, and edged with Pelargonium Manglesii, are sure to find favour, as also are beds carpeted with *P. Manglesii* and dotted with *Love-lies-bleeding*, the fern-like *Accacia lophantha*, *Abutilon Thomsonii* variegatum, with beautifully marbled leaves, *Nicotiana affinis*, and pyramids of *Heliotrope*, *Campanula pyramidalis*, blue and white, and Eckford's Sweet Peas, Countess of Radnor (mauve), Empress of India (rosy-pink), and Prince of Orange (orange), and edged with blue Lobelia or scarlet Pelargonium. Blue-flowered Violas planted among variegated-leaved Pelargoniums with scarlet flowers, such as Bijon, are very telling in effect, and yellow-flowered Violas intermixed with Pelargonium Manglesii make a quiet and pleasing combination of colours. There are many other easily-raised plants besides those enumerated above which could with advantage be used in this manner.

SUB-TROPICAL PLANTS.—In addition to the harder kinds of Palms, Dracenas, Yuccas, and American Aloes, *Portulacium tenax*, *Funkia Sieboldii*, *F. albo-marginata*, *F. aureo-maculata*, and *Ficus elastica*, a good semi-tropical effect may be produced by the undermentioned plants raised from seeds and planted in well-drained beds, in somewhat sheltered positions as in bays, formed by tall trees or shrubs, namely:—*Solanum laciniatum*, *S. marginatum*, *S. robustum*, *S. pyracanthum*, *S. argenteum*, *Cannas* in variety; *Aralia Sieboldii*, *Arundo conspicua*, *Melanthus major*, *Wigandias*, *Ferula communis*, *Accacia lophantha*, and *Grevillea robusta*. The above being slow growers should be sown at once in strong heat. But seeds of the following subjects need not be sown before the end of February, viz., *Cannabis gigantea*, Japanese Maize, *Nicotiana atropurpurea grandiflora*, *N. macrophylla gigantea* and *Kichius hybridus*, *R. Gibsonii*, *R. glaucus*, *R. Duchess of Edinburgh*, *R. Cambodgensis*, *R. sanguineus tricolor*, and *R. macrocarpus*. *Ficus elastica* and *Abutilon Thomsonii* are increased by cuttings, and the Funkias (which are hardy herbaceous plants) by division of the roots. The same kind of plants recommended as a groundwork and edging for mixed beds, may also be similarly and effectively employed for the sub-tropical plants, the disposition of which will be referred to in due time. *H. W. Ward, Longford Castle, Salisbury.*

EDITORIAL NOTICE.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

SATURDAY, JAN. 2.—Wakefield Paxton Society.
FRIDAY, JAN. 8.—Duoode Horticultural Association.

SALES.

TUESDAY, JAN. 5.—Great Sale of Lilies, at Protheroe & Morris' Rooms.
WEDNESDAY, JAN. 6.—Plants, Ferns, Roses, &c., at Protheroe & Morris' Rooms.
FRIDAY, JAN. 8.—Imported Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36°.4.

It is a fact, not without significance, that the re-organisation of the Royal Gardens, Kew, and the establishment of the *Gardeners' Chronicle* were contemporaneous. The Jubilee Year for the two institutions is the same. When it is remembered that the re-organisation of the garden begun in 1841 was largely due to the recommendation and counsel of our first Editor, Dr. LINDLEY, and of Mr., afterwards Sir Joseph, PAXTON, who was also one of the founders of this Journal, it will be seen that the connection between the two events is not so purely fortuitous as it might appear to be.

LINDLEY, in his report to the Government of the day in 1838, said:—"A national garden ought to be the centre round which all minor establishments of the same nature should be arranged; they should all be under the control of the chief of that garden, acting in concert with him, and through him with one another, reporting constantly their proceedings, explaining their wants, receiving their supplies, and aiding the mother country in everything that is useful in the vegetable kingdom. Medicine, commerce, agriculture, horticulture, and many valuable branches of manufacture, would derive benefit from the adoption of such a system. From a garden of this kind Government would be able to obtain authentic and official information on points connected with the founding of new colonies; it would afford the plants there required without its being necessary, as now, to apply to the officers of private establishments for advice and assistance."

At p. 179 of our first volume (1841), we find an announcement that Sir W. J. HOOKER, till that time Professor of Botany in the University of Glasgow, had been appointed to the charge of the Royal Gardens, Kew. "We trust that this wise step will be accompanied by such other changes and improvements in this important establishment as will ensure its efficiency, and prove that the ill-advised plan of destroying it last year entertained by certain gentlemen connected with Government, was never approved by Her Majesty's responsible advisers. Previous to that, it appears the plants at Kew had been offered to the Horticultural Society for their garden at Chiswick! Public attention was, however, called to the matter in the newspapers

of the day by the late Mr. HERWARD, and by Mr. W. LILLY, a surgeon of Walworth much interested in natural history.

Sir W. HOOKER's appointment dated from April 1, 1841. By his energy, knowledge, and courtesy, he speedily effected much-needed reforms. His large correspondence with all quarters of the globe, and which had been formerly turned to good account when in Glasgow, were even more fruitful at Kew. On August 9, 1841, the sub-editor of this journal visited the garden, and his remarks at p. 535 of our volume for that year are of an interesting character. It is therein recorded that persons, provided they did not touch the plants, were permitted to walk through the grounds without attendance! that there had been a large increase of "respectable company," and that neither plants nor flowers had been injured by the visitors.

Other details are given as to the changes in progress, and especially as to the unrivalled collection of Proteaceæ—a group of plants, by the way, better represented fifty years ago than now. The changes effected by Sir W. HOOKER were again adverted to at p. 123 of our volume for 1842, where it is recorded that "the well-directed energy of Sir W. HOOKER, assisted by a judicious liberality on the part of the Commissioners of Woods and Forests, will speedily place Kew where it ought to be, and once was—at the head of the botanical establishments of Europe." At that time the kitchen garden was still maintained, and our pages 175 and 523 for 1842 give details of a character we do not now have to record from Kew.

It is not our intention on this occasion to advert in detail to the further progress of Kew, its great extension, the gradual improvements in general cultivation, and in all departments, under the direction of Sir WILLIAM and of Sir JOSEPH HOOKER, and latterly of Mr. THISELTON-DYER; the new houses constructed, the museums built, the herbaria and libraries formed, the laboratory and picture-gallery established; nor need we do more in passing than allude to the extraordinary literary and scientific activity evinced in the numerous substantial volumes that have emanated from Kew. The Colonial Floras, for instance, were projected by Sir WILLIAM HOOKER. Some are completed, others, like the tropical and extra-tropical African floras, will, we trust, speedily be resumed; whilst the unrivalled experience, and the undaunted energy of Sir JOSEPH HOOKER have brought the flora of British India nearly to completion.

To the general public Kew is a pleasure-garden merely. It is that, of course; but it is far more. It is, and has been, for half a century, what LINDLEY wished it to be, the centre of botanical activity—activity not only in purely scientific botany, but in garden botany in particular. It has been a main agency in the collection and diffusion of knowledge of all kinds relating to botany, and has ensured the cultivation and dispersal of economic plants of all kinds in our colonies. We have often had occasion to record, with patriotic pride, the great things for humanity which have been effected, some entirely, others very largely, through the medium of Kew. Commercial men and practical statesmen are not very likely to feel much enthusiasm about botany as a science—they look upon it, if at all, as a harmless pastime; but when they see—as they may at Kew—what it is capable of, and what it has done for the benefit of mankind, they naturally look upon the garden as an institution worthy of their support. The cultivation of Cinchona, Tea, India-rubber, Liberian Coffee,

represents only a few of the industries which have been established and fostered in India and our colonies chiefly through the agency of Kew.

All that has been done at Kew in the way of gardening, systematic study, physiology, or economic botany, has been done in accordance with the letter and the spirit of the recommendations made by LINDLEY, but modified and extended by successive directors; and the latest advances—that of federating the several colonial botanic gardens, and that of establishing botanical departments in the several presidencies of India and in the colonies—are in strict accordance with the general plan. Kew has thus long been the centre of botanical energy in almost all departments. Its steady progress and its present condition are matters which excite the admiration of the most competent judges. We have lately had an illustration of this in the glowing testimony as to the condition of and the work at Kew afforded to us in conversation with the directors of two of the most important gardens in the world—that of Paris and the Harvard Arboretum.

In some points Kew still needs extension and improvement. The subject of the diseases of plants, for instance, is vast enough and important enough to demand a separate staff of microscopists and entomologists with a small space set apart as an experimental area. The laboratory and library would be invaluable adjuncts to such a department. Systematic and comparative study of the minute anatomy of plants is also a need of the times that might be largely supplied at Kew. Anatomists would not only find there what they want in the way of material, but they might also profit by imitating the systematic orderly procedures, and comparative methods of those who devote themselves to herbarium botany, as it is called. The co-operation of the two classes of workers is a thing much to be desired, and we do not know where it could be better carried out than at Kew.

In the garden itself it is recognised that the cultivation, as perfectly as circumstances will allow, of specimens illustrative of botanical structure and affinities, and of such as are of horticultural and economic importance, is preferable to the accumulation of so-called complete collections of specimens which cannot be properly grown or displayed. Such plants would be more appropriately housed in the herbarium, while their portraits might find a place in the picture-galleries. For strictly horticultural purposes, numerous and varied trials should be made of new plants, to ascertain their value; and not only of new plants, but also of some at least of the vast number at present left unutilised by the gardener. Ordinary bedding-stuff cannot, of course, be dispensed with in a public garden, but we do not want to see at Kew what we can see in any of the parks or in the back-garden of any suburban villa residence. What we see at Kew should be—and to a large extent it already is—of educational value, as well as agreeable to the eye.

One of the chief wants of Kew at present is suitable provision for plants requiring an intermediate temperature, between that of the stove and that of the ordinary greenhouse or conservatory, one wherein specimens of many of the economic plants of subtropical lands may be grown. Much of this kind of material is already to be found in the smaller houses, chiefly in the T-range; but the plants, owing to the smallness of the houses, and to their growth in pots of no great size, do not convey to the minds of those seeking information, their true characteristics, and persons interested in commerce go away from their inspection with feelings of disappointment.

PUBLISHED by BRADBURY, AGNEW, & CO., Limited, LONDON.

THE SPORTSMAN'S COMPLETE LIBRARY OF READING.

THIS inimitable series of volumes is absolutely unique, there being nothing approaching to them in all the wide range of modern or ancient literature. Written by Mr. Sturtess, a well-known country gentleman, who was passionately devoted to the healthy sport of fox-hunting, and gifted with a keen spirit of manly humour of a Rabelaisian tinge, they abound with incidents redolent of mirth and jollity. The artist, Mr. Leech, was himself also an enthusiast in the sport, and has reflected in his illustrations, with instinctive appreciation, the rollicking abandon of the author's stories.

"HANDLEY CROSS" SERIES OF SPORTING NOVELS

Embellished with nearly 1000 of JOHN LEECH's best Sketches on Wood, and 88 Hand-coloured Steel Engravings. By JOHN LEECH and H. K. BROWNE. 6 medium 8vo volumes, large margin, cloth extra, price £4 4s.; and in half morocco, with panelled hunting adornments, gilt and finished, price £5 12s. 6d.

These Volumes can be had separately as under:—

HANDLEY CROSS; or, Mr. Jorrocks's Hunt. Many Sketches on Wood, and 17 Steel Engravings. Price 16s.
ASK MAMMA; or, The Richest Commoner in England. Many Sketches on Wood, and 13 Steel Engravings. Price 14s.
SPONGE'S SPORTING TOUR. Many Sketches on Wood, and 13 Steel Engravings. Price 14s.
PLAIN OR RINGLETS? Many Sketches on Wood and 13 Steel Engravings. Price 14s.
MR. FACEY ROMFORD'S HOUNDS. 24 Steel Engravings. Price 14s.
HAWBUCK GRANGE; or, the Sporting Adventures of Thomas Scott, Esquire. With 8 Steel Engravings by H. K. BROWNE (Phiz). Price 12s. 6d.

A NEW, CHEAPER, and HANDY EDITION, to be KNOWN AS THE "JORROCKS' EDITION," of these famous novels is now in course of publication, and will be completed during the season. Each Volume will be complete in itself, and will have a selection of the ORIGINAL WOODCUT ILLUSTRATIONS, by JOHN LEECH, to embellish the text, as well as several Toned-Paper Page Illustrations; and, as a Frontispiece, a Hand-Coloured Steel Engraving. Bound, after an effective design, in cloth, price 6s.

The First Volume in the Issue is—

MR. SPONGE'S SPORTING TOUR.

With 70 of John Leech's Illustrations, and a Hand-Coloured Steel Engraving as Frontispiece.

"Persons unacquainted with Mr. 'Spongy Sponge' will have the advantage of making his acquaintance under highly favourable conditions, since the new edition is handsomely got-up, clearly printed, and illustrated by the inimitable drawings of the late John Leech."—*County Gentleman*.

COMPLETION of "SOCIETY PICTURES" from "PUNCH."

In a handsome and sumptuous half-leather binding, in 2 vols., price 12s. each; also in 4 parts, bound in fine cloth, gilt edges, price 5s. 6d. each.

SOCIETY PICTURES. FROM "PUNCH."

By GEORGE DU MAURIER.

"As one turns page after page of this wonderful collection, admiration is almost lost in amazement that a single brain should have conceived all these truly typical and representative figures, illustrated them with such copious, varied, and unflinching wit, and given them a scenic and circumstantial setting, which brings out all their most salient and characteristic points."—*County Gentleman*.

In three handsome royal quarto volumes, price 10s. 6d. each; also in 1 vol., price 28s.

JOHN LEECH'S PICTURES.

Containing more than 2000 Pictures of Life and Character from the Collection of "Mr. Punch."

"This book is better than plum-cake at Christmas. It is an enduring plum-cake, which you may eat, and which you may slice and deliver to your friends, and to which, having cut it, you may come again, and welcome from year's end to year's end."—*Quarterly Review*.

In three fine royal quarto volumes, handsomely bound, price 2 guineas.

MR. PUNCH'S VICTORIAN ERA.

Fifty Years of the Queen's Reign. Illustrated with 1000 Cartoons selected from "Punch." Drawn by DOYLE, LEECH, TENNIEL, &c.

"A pictorial key to the history of the Queen's reign. It is a never-failing source of instruction and amusement."—*Pall Mall Gazette*.

In royal quarto, finely printed and handsomely bound, price 21s.

CHARLES KEENE'S PICTURES.

Being 400 Sketches selected from "Punch," as illustrating the variety of the Artist's humour.

"A gallery of pictures of English life. They have enlivened the surface of English life for a whole generation."—*Times*.

In large crown 8vo, top edge gilt, price 5s. each. Illustrated. Volumes Now Ready.

F. C. BURNAND'S PUNCH WRITINGS.

VERY MUCH ABROAD. 160 Illustrations.
RATHER at SEA. 116 Illustrations.

QUITE at HOME. 108 Illustrations.
HAPPY THOUGHTS. (Complete). 110 Illustrations.

"Mr. Burnand's writings are well worth collecting. There is a perpetual airiness and gaiety about his work which makes it always pleasant to dip into, and few humourists have the power of making their readers laugh so agreeably."—*Athenaeum*.

In 13 Volumes, 32mo size, printed on toned paper, and enclosed in a case,

THE HANDY VOLUME SHAKSPEARE.

STYLES OF BINDING:—

In fine cloth, red edges, in cloth case, price 21s.

In French morocco, gilt edges, in leather case, price 31s. 6d.

In best red Russia, in an elegant case, price £3 15s.

"This choice miniature edition contains the whole of the plays, the poems, and a glossary, and is the result of a happy thought most charmingly realised."—*Sidon*.

In 25 Elegant Little Volumes, each containing a Complete Novel,

THE HANDY VOLUME WAVERLEY.

Containing the whole of the Waverley Novels enclosed in a case, which measures only 9 inches in height and length, and 5 inches in depth. The Author's Notes are given at the end of each volume.

STYLES OF BINDING:—

In crimson cloth, red edges, in cloth case, price 45s.

In French morocco, gilt edges, in leather case, price £3 13s. 6d.

FIG. 3.—VIEW OF THE TEMPERATE HOUSE, KEW, SHOWING THE WINGS REARED TO COMPLETE THE DESIGN, AND FULFIL THE REQUIREMENTS OF THE GARDEN. (SEE P. 12.)

By the completion of the temperate-house of which we speak elsewhere, the need we have alluded to will be supplied and space will be found for most of the economic subjects whose cultivation in our colonies and crown lands is meeting with so much attention. The plants being planted out in borders instead of cramped and stunted in pots, will attain to fuller development, and show their characteristics more perfectly.

We may mention the names of a few plants that are becoming yearly of increased importance in one or other branch of economy, and which it is desirable to represent on an adequate scale at Kew—Cinchona, Palms which are valuable for their fibre, fruits, or foliage; Mango, Pomegranate, Schinus Molle, S. terebinthifolia, Pistachia, Nephelium Litchee, the Leechee, Cassia fistulosa, Loquat, Michelia Champaca, Diospyros in variety, Cythomandra betacea (the Tree Tomato), Aberia Caffra, Anonas (Custard Apple), Papaw, Carissa, Ceratonia (Carob tree). We do not know how more fittingly the Jubilee of Kew Gardens could be commemorated than by completing the Temperate-house in the manner indicated.

THE TEMPERATE-HOUSE, KEW.—Those of our readers who have visited the Royal Botanical Gardens at Kew, will have remarked the apparent want of completeness of design exhibited by the Temperate-house. The missing parts are two annexes, one at each end, and connected with the main central portion by the octagona which at present form the end portions of the building. The completion of the design has long been desired, but has now, as we have pointed out above, become a matter of necessity. This was indeed felt long ago by Sir JOSEPH HOOKER, when Director, when he remarked, "The wings are as essential to the completion of the collection and the instruction of the public as they are to the architectural design. If the wings are abandoned, so must also be the idea of cultivating a selection of colonial shrubs and trees, which is the great desideratum of our national gardens, and one the supplying of which will be unceasingly urged upon the Government and the future directors of this establishment." The older portions of the building rest on a strong wall, some 4 feet high, surmounted with a dressed stone coping, and glass and iron might be substituted for this, with much advantage to the plants to be grown in the house, and in doing this, there would possibly be a considerable saving in the cost. Besides this modification of the design, which need not injure the architectural symmetry of the building, some, or all of the brickwork, which, in the case of the existing building, throws so much shadow on the plants, and which is especially injurious to them in winter, should not find place in the new building. The dimensions of the building as represented in our illustration are as follow:—Centre portion, 212 feet 6 inches by 137 feet 6 inches. Each wing will be 112 feet 6 inches by 62 feet 6 inches. Total length of the building (including wings when built), 582 feet. Superficies, 48,392 feet. Height of the central portion, 60 feet, and that of the wings 37 feet 9 inches in the centre. The Palm-house at Chatsworth contains about 15,276; that at Kew, 24,300; and the conservatory at Syon, 7,755 superficial feet.

EDINBURGH PUBLIC PARKS.—The Public Parks Committee of the Edinburgh Town Council, at a meeting held on December 24, acting under a remit with powers, gave an order for the supply of 300 guards for the trees about to be planted in Inverleith public park. The cost will be somewhat over £30. The committee also authorised an offer of £35 to be made for the tent belonging to Mrs. WINCHESTER on the Braid Hills, with the view of utilising the building as a cloak-room. It was reported that the

works in connection with the "Ride" on the Brides were now completed, and that it was now available to the public.

THE MARKET GARDENERS, NURSERYMEN, AND FARMERS' ASSOCIATION.—The annual dinner of this association took place on December 17 at Simpson's Hotel, Strand, London, W. POTPART, Esq., the President of the Association, in the chair. About seventy gentlemen, representative of the growers, partook of an excellent repast. A selection of vocal and instrumental music contributing to the success of the gathering. A full notice of the association, its constitution and objects, will be found in our advertisement columns.

AGRICULTURAL STATISTICS.—We have received from the Board of Agriculture details relating to the crops of cereals in 1891 in Great Britain, from which it appears that in Great Britain the estimated produce for the year is as follows:—

Wheat	73,127,263 bushels—
Barley	73,129,095 "—
Oats	112,389,261 "—

The acreage under cultivation for Great Britain was:—

Wheat	2,307,377—
Barley	2,112,798 +
Oats	2,899,129—

The average yield per acre is as follows:—

Wheat	31.26 bushels per acre +
Barley	34.14 " " —
Oats	38.77 " " —

The signs — and + have reference to the corresponding figures for 1890. In 1891 the corn crops have generally been inferior in quality and condition, and an unusually large proportion of grain was shed in the fields.

JASMIN.—By SAMUEL SMILES, LL.D. (JOHN MURRAY) JACQUES JASMIN was a French, or rather a Gascon, poet who, in the first half of the present century enjoyed considerable celebrity in his native land. He was like the heroes of others of Dr. SMILES' biographies, a self-educated man, being born (at Agen) of parents too poor to afford him much schooling. JASMIN was by trade a hair-dresser, and it is said to his credit that even when in later years he became famous and might have been rich, he preferred to earn his bread by the work of his "velvet hand," devoting the pecuniary results of his genius to charitable purposes. "After, perhaps, a brilliant tour through the South of France, delighting vast audiences in every city, and flinging many thousands of francs into every poor-box which he passes, the poet contentedly returns to his humble occupation, and to the little shop where he earns his daily bread by his daily toil as a barber and hair-dresser. His poetry was chiefly written in the "peculiarly expressive and heart-touching" Gascon dialect, then rapidly dying out, but which he strove to perpetuate by proving its beauties to his hearers and readers. So highly were his works esteemed by some, that JASMIN was once said to be "what BURNS was to the Scottish peasantry, only he received his honours in his life-time." JASMIN read his poems before many audiences, travelling for the purpose to Paris, Toulouse, Rodez, and other towns. He was also summoned to recite before LOUIS PHILIPPE and the DUCHESS OF ORLEANS; the former afterwards conferring upon him a pension of 1000 fr. Many other honours were heaped on him, and he was literally surfeited with gilt and silver crowns, Laurel wreaths, and similar trophies. Had he written in French, the Academy would have paid him much honour; as it was, they bestowed on him a prize value "3000 fr., which was made up to 5000 fr. by the numbers of copies of the *Papillotes* purchased by the Academy for distribution amongst the members." JASMIN died, aged sixty-five, in 1864, from a chill taken at Villeneuve, whither he went to "plead most eloquently for the relief of the poor." A few years later a statue was erected to his memory in his native town; this memorial is illustrated in the frontispiece. Of the merits of JACQUES JASMIN, poet

and philanthropist, we have no doubt, but those of his skilful biographer also claim recognition. We are so well used to works of this kind from Dr. SMILES' pen, that "it goes without saying" that this particular book is well put together, and will interest even the most careless reader. The hero's life and work are pleasingly described, and the book includes an index, as well as an appendix composed of English translations of some of JASMIN's songs. The whole is well printed on good paper, of convenient size, and is altogether a welcome addition to the set of similar works by the same author and publisher.

"THE ORCHID ALBUM."—The plants represented in the last number are *Cymbidium pendulum*, t. 437; *Cypripedium Niobe* X, t. 433; *Oacidium laxense*, t. 439; and *Angraecum Chaillanum*, t. 440. We shall advert to these at greater length on another occasion.

EUCALYPTUS FARMING.—The *Pharmaceutical Journal* tells us on what an extensive scale Eucalyptus trees are now grown for the sake of the oil. Mr. BOSISTO, head of the firm of BOSISTO & Co., calculates that "the turn-over of the firm in connection with that article alone is £50,000 a year, and that they have nine square miles of land covered with Eucalyptus trees."

"CONSPECTUS FLORÆ AFRICÆ."—Messrs. DURAND of Brussels, and SCHINZ of Zurich, are about to bring out a work under the above title. The object is to present in a condensed form all the facts as to the nature and occurrence of plants in the Continent of Africa and the adjacent islands. The work will be comprised in six volumes, of which the first will contain generalities and bibliographical details. The fifth volume, which it is proposed to publish first, will contain details relating to 900 species of Orchids, 400 of Irids, &c.

"FRUKTHUSET NIED DERTIL HÖRANDE KULTURER," at M. P. ANDERSEN, Jönköping, Sweden.—A treatise on the culture of fruit trees in orchard houses. Unfortunately we are not able to say much more of the book as it is in Swedish, but the well-known ability of the writer may be taken as a guarantee that there is much valuable information to be found in it.

CULTIVATED PLANTS.—The Orcutt Seed Company of San Diego, California, announce the preparation of herbarium specimens of all cultivated plants. The labels will give botanical and vernacular names, descriptions drawn from the fresh plants, colour, uses, notes on cultivation, &c. Such a herbarium would be a most useful addition to the libraries of our horticultural societies.

AUSTRALIAN FUNGI.—Dr. M. C. COOKE has been commissioned by the governments of the several Australian colonies to prepare a handbook of the Australian fungi in one volume, with plates.

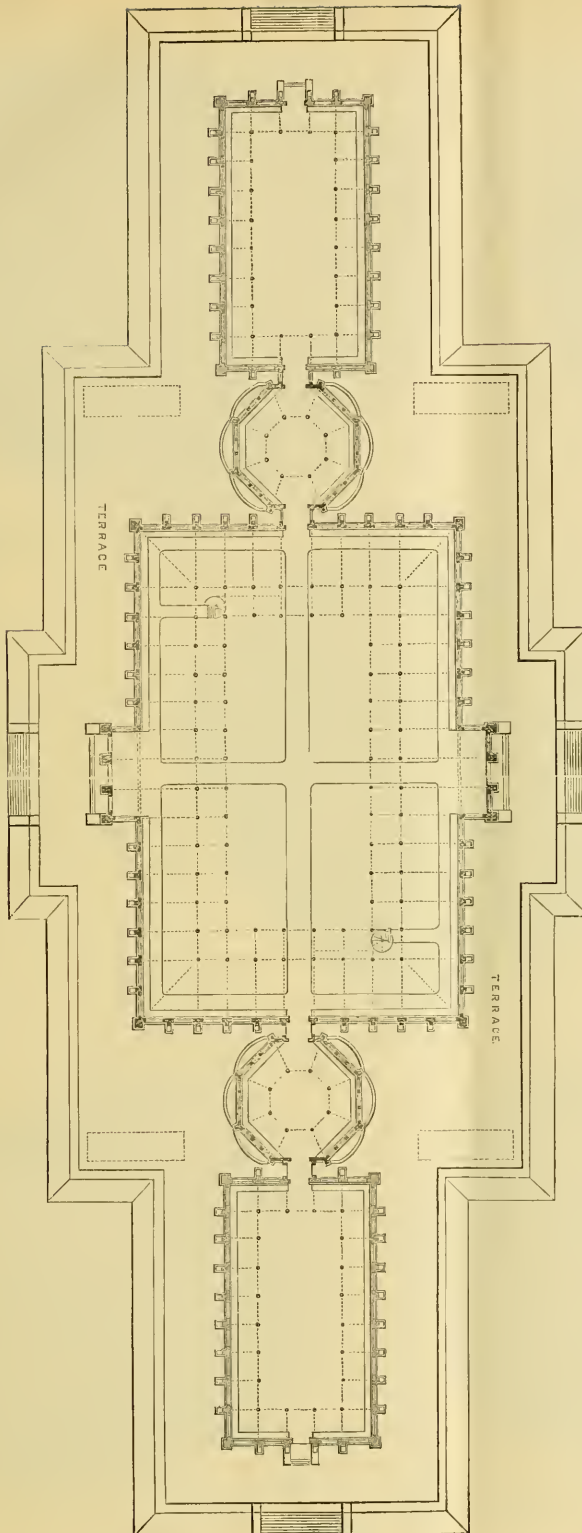

DAFFODIL DISEASE.—Mr. ENGLEHEART, in a recent number of the *Garden*, calls attention to the circumstance that some Daffodils do well in ground penetrated by tree roots.

THE FIRST CHRYSANTHEMUM EXHIBITION IN VIENNA.—The fashion is spreading. A great exhibition has been held lately in the Imperial city by the Danube. Among other exhibitors were Messrs. REID & BORNEMANN, of London.

WEST AMERICAN OAKS.—Dr. ALBERT KELLOGG left at his death a series of drawings of Oaks, Pines, and other trees of the Pacific coast. These drawings, so far as the Oaks are concerned, are now published through the liberality of Mr. McDONALD, whilst Professor GREENE, of the University of California, has furnished the text. A sympathetic memoir of Dr. KELLOGG is furnished by Mr. DAVIDSON, who was the head of the expedition to Alaska in which KELLOGG acted as botanist. The western Oaks, some twenty-five in number, are less well-known than those from the eastern States, and no species is common to both sides of the American continent. The present memoir contains all that is known at present of the West American Oaks,

 FEET

and with the scrupulously accurate drawings will be of the greatest service to the botanist. In addition to the specimens drawn by KELLOGG, Professor GREENE has added a supplement, detailing the results of his own subsequent investigation of the Oaks of the Sierras of Colorado and Montana; his journey in those regions being also defrayed by the generosity of Mr. McDONALD. Ten plates are thus added, these plates being drawn by our old correspondent, Mr. HANSEN, whose teratological drawings are preserved in the Natural History Museum.

A NEW HOLLYHOCK RUST.—In the *Journal of Mycology*, published by the U.S. Department of Agriculture, is a figure and description of a new *Puccinia* growing on Hollyhocks and other Malvaceous plants, closely allied to, but differing from the *Puccinia malvacearum*.

"HANDBUCH DER LAUBHOLZKUNDE."—The second volume of this treatise on hardy trees and shrubs, from the pen of Dr. DIPPEL, the director of the botanic garden at Darmstadt, has just been published by PAUL PAREY, of Berlin, and may be had through Messrs. WILLIAMS & NORGATE. The great advantage of the book for English readers is, the great number of outline illustrations which appeal to those who do not read the German text as forcibly as to those who do. The synonyms and references to the plates are also useful to readers of all nationalities, and reference is facilitated by a copious index.

"HOW TO BE COMFORTABLE WITH ONE SERVANT."—Mrs. J. E. BAKER, whose previous publication on a similar subject has met with general approval, has now issued through Messrs. PARTRIDGE & Co., a second pamphlet, the scope of which may be judged from its title. After a perusal of the multifarious duties prescribed, we feel disposed to think the servant is likely to be more comfortable with one mistress than with many! Inexperienced housekeepers will find many useful hints in the little pamphlet; experienced ones will think their own system the best.

AN ECONOMIC ORCHID.—It may not be generally known that a strong glue or cement is made from the bulbs of *Bletia hyacinthina*. Miss ALICE HART, in the *Manchester Guardian*, says that this is the case, and that the cement is used by the Japanese to affix the wire out-likes to the copper surface of such vessels as are afterwards ornamental with *cloisonné* enamel.

MR. GEORGE BREBNER has been appointed Marshall scholar in the Royal College of Science, South Kensington. Mr. BREBNER is favourably known by his original work on vegetable histology, which, we are glad to learn, will be continued in the Huxley research laboratory.

THE GINGER-BEER PLANT.—Professor MARSHALL WARR has been studying this jelly-like substance, which he finds to consist of various minute organisms in association. Of these the two essential forms are a yeast-fungus (*Saccharomyces ellipsoideus*) and a bacterium (*B. vermiforme*). The bacteria form coils of filaments, among which the yeast-cells are entangled, and the co-operation of both is required for the full development of either, so that the two organisms are analogous to lichens. The paper, which is full of curious details of a very suggestive character, will be published in the *Proceedings of the Royal Society*.

MR. GEORGE DICKSON, OF NEWTOWNARDS, COUNTY DOWN, IRELAND.—Lovers of the Rose, who are so much indebted to this gentleman for the new and valuable varieties he has added to our gardens, will be glad to hear that the Lord Chancellor of IRELAND has been pleased recently to confer on him the dignity of a Justice of the Peace for the county of Down. Mr. DICKSON has filled several public offices, and there can be no doubt that he will fill the duties of his new position with the same satisfaction as he has done his former ones, and his friends earnestly wish him many years of health to enjoy his well-merited honours.

"LA ROSE."—Messrs. BAILLIÈRE ET FILS send us a copy of a little work by M. J. BEL, of Toulouse. It contains the usual details relating to the history and associations of the Rose, of which, if we may judge from their frequent repetition, people never tire. Then follows a chapter on the "Botany of the Rose," and a list of authors who have written concerning it, among whom a strange omission, that of CÆNIPIS, may be noted. A descriptive list of 500 cultivated forms follows, ranged under the heads of Tea, Bengal, Noisette, Bourbon, Hybrid Perpetual, Perpetuals, Centifolia, Provins, and Climbing Roses. Cultural details are then furnished, and a few particulars given as to the principal insect pests. Lastly, there are receipts for the utilisation of the Rose for perfumes, cosmetics, &c.

EUPHORBIA HIBERNA.—Nearly a hundred years ago, ROBERT BROWN, a surgeon in the Scottish Fencibles, was stationed in county Donegal. There, according to the *Journal of Botany*, he discovered *Euphorbia hiberna*. No one else, it appears, has since recorded its presence in the neighbourhood till lately, when Mr. J. HOWARD found it again on the banks of the river Dunree, and his discovery is corroborated by Mr. H. CHICHESTER HART, who comments on the proof it affords of the equable mildness of climate extending around the west coast from north to south. The absence of severe frost in Donegal along the edge of the Atlantic is hardly sufficiently known, and Mr. HART's success with tender garden species has surprised many experienced growers. "I could show," says Mr. HART, "a collection of delicate and half-hardy plants that have lived out with me for several winters which would, I imagine, astonish many English cultivators. Reverting to the Irish Spurge, the editor of the *Journal*, Mr. BRITTEN, adds an extract from R. BROWN'S MS. diary, now in the Botanical Department of the British Museum, dated May 27, 1800, in which mention is made by BROWN of his having found *Euphorbia hiberna* in the very locality in which it has now been re-discovered by Mr. HOWARD. On July 16 of that year BROWN was at Duodalk, and visited "the late Earl CLANBRASSILL'S gardens—a tolerable collection of exotics, chiefly stove plants—few hardy plants." Mr. READ, the gardener, found *Euphorbia hiberna* in "the county of Mayo." Sir JOSEPH HOOKER, in the *Student's Flora*, gives "south and west of Ireland" as the habitat for this species, which, as it now appears, occurs much further north. Sir JOSEPH also adds, "used in Ireland to poison fish."

HERBARIUM PEST.—Botanists, especially those who have to do with Californian and Mexican plants, should be on the look-out for a most destructive caterpillar, described and figured by Professor RILEY in the last number of *Insect Life*, the official publication of the United States Department of Agriculture. The name of the creature is *Carboxera ptelearia*. "It would seem possible, if not probable," says Mr. RILEY, "that it normally feeds on the dead or dry plants of Mexico and adjacent arid regions, and that it has simply adapted itself to the somewhat similar conditions prevailing in herbaria." Corrosive sublimate and arsenic, such as botanists use, are recommended. Still more effectual is the plan of placing the packets of the herbarium for a short time in a zinc box with bisulphide of carbon, taking care to keep any light or flame away.

ROYAL INSTITUTION OF GREAT BRITAIN, Albemarle Street, Piccadilly. The following arrangements have been made public. Friday-evening meetings before Easter, 1892, to which members and their friends only are admitted. January 22, The Right Hon. Lord Rayleigh, M.A., D.C.L., LL.D., F.R.S., M.R.I., "The Composition of Water." 29, Sir George Douglas, Bart., M.A., "Tales of the Scottish Pea-berry." February 5, Professor Roberts-Austen, C.B., F.R.S., M.R.I., "Metals at High Temperatures." 12, G. J. Symons, Esq., F.R.S., Sec. R.M.S., "Rain, Snow, and Hail." 19, Professor Percy F. Frankland, Ph.D., B.Sc., F.R.S.,

"Micro-organisms in their Relation to Chemical Change." 26, Sir David Solomons, Bart., M.A., M.R.I., "Optical Projection." March 4, Professor L. C. Miall, F.L.S., "The Surface-Film of Water and its Relation to the Life of Plants and Animals." 11, Professor Oliver Lodge, D.Sc., LL.D., F.R.S., F.R.A.S., "The Motion of the Ether near the Earth." 18, George Da Maurier, Esq., "Modern Satire in Black and White." 25, John Evans, Esq., D.C.L., LL.D., Treas. R.S., "Pony-rings." April 1, F. T. Piggott, Esq., "Japanesque." 8, Prof. W. E. Ayrton, F.R.S., "Electric Meters, Motors, and Money Matters." Lecture arrangements before Easter, 1892. Lecture hour, three o'clock. Christmas lectures: "On life in Motion, or the Animal Machine," by Professor John G. McKendrick, M.D., LL.D., F.R.S., Professor of Physiology in the University of Glasgow. Six lectures (adapted to a juvenile auditory) on December 29 (Tuesday) and 31, 1891; January 2, 5, 7, and 9, 1892. Tuesdays: "On the Structure and Functions of the Nervous System—the Brain," by Professor Victor Horsley, F.R.S., B.Sc., F.R.C.S., M.R.I., Fullerian Professor of Physiology, R.I. Twelve lectures on Tuesdays, January 19 and 26; February 2, 9, 16, and 23; March 1, 8, 15, 22, and 29; April 5. Thursdays: "On some Aspects of Greek Sculpture in Relief," by A. S. Murray, Esq., LL.D., F.S.A., Keeper of Greek and Roman Antiquities at the British Museum. Three lectures on Thursdays, January 21, and 28, and February 4. "On Some Recent Biological Discoveries," by Professor E. Ray Lankester, M.A., LL.D., F.R.S. Three lectures on Thursdays, February 11, 18, and 25. "On the Progress of Romance in the Middle Ages," by W. P. Ker, Esq., M.A., Professor of English Literature in University College, London. Three lectures on Thursdays, March 3, 10, and 17. "On Epidemic Waves," by B. Arthur Whitelegge, M.D., B.Sc. Three lectures on Thursdays, March 24, 31, and April 7. Saturdays: "The Induction Coil and Alternate Current Transformer," by Professor J. A. Fleming, M.A., D.Sc., M.R.I., Professor of Electrical Technology, University College, London. Three lectures on Saturdays, January 23, 30, and February 6. "On Matter: at Rest and in Motion," by the Right Hon. Lord Rayleigh, M.A., D.C.L., F.R.S., M.R.I. Six lectures on Saturdays, February 13, 20, and 27; March 5, 12, and 19. "On Dramatic Music, from Shakespeare to Dryden." (The Play, the Masque, and the Opera.) With Illustrations, by Professor J. F. Bridge, Mus.Doc. Three lectures on Saturdays, March 26, April 2 and 9.

GARDEN PUPILS.—The regulations adopted in conformity with the will of the late Mr. SNAW for the establishment of garden scholarships in the Missouri Botanical Garden, St. Louis, are as follows:—Pupils will be lodged in the garden, where a good library is also available. During the first year of their scholarship, garden pupils will work at the practical duties of the garden nine or ten hours daily, according to the season, the same as the regular employés of the garden, and will also be expected to read the notes and articles referring to the subject of their work, in one or more good journals. In the second year, in addition to five hours' daily work of the same sort, they will be given instruction, and be required to do thorough reading in vegetable and flower gardening, small-fruit culture, and orchard culture, besides keeping the run of the current papers. In the third year, in addition to five hours of daily labour, they will be instructed and given reading in forestry, elementary botany, landscape gardening, and the rudiments of surveying and draining, and will be required to take charge of clipping or indexing some department of the current gardening papers for the benefit of all. In the fourth year, besides the customary work, they will study the botany of weeds, garden vegetables, and fruits, in addition to assisting in the necessary indexing or clipping of papers, &c., and will be taught simple book-keeping, and the legal forms for leases, deeds, &c. The course for the fifth year, in addition to the customary work, will include the study of vegetable physiology,

economic entomology, and fungi, especially those which cause diseases of cultivated plants; and each pupil will be expected to keep a simple set of accounts pertaining to some department of the garden. In the sixth year, in addition to the manual work, pupils will study the botany of garden and greenhouse plants, of Ferns, and of trees in their winter condition, besides the theoretical part of special gardening, connected with some branch of the work that they are charged with in the garden.

"THE MINIATURE FRUIT GARDEN."—The twentieth edition of a book might make the general reader think that he had to do with a trade catalogue or an artfully-concealed advertisement. In the present instance, this is not so. The little volume contains a succinct account of the practice of the late THOMAS RIVERS, and of his son and successor, T. FRANCIS RIVERS. The book is so good that we do not suppose it will be long before a twenty-first edition will be called for. The recent agitation in favour of hardy fruit culture for cottagers and small farmers has called attention to the matter, and we know of no safer guide in practical matters than the *Miniature Fruit Garden*.

A CHRISTMAS CARD.—An obliging correspondent in British Guiana sends us a photograph of a group of "Ginger Lilies"—*Hedychium coronarium*—as growing in the Guianan forests.

PUBLICATIONS RECEIVED.—PITMAN'S *Shorthand Weekly*.—Pearson's *Almanack*.

APPLES AND PEARS IN SUBURBAN GARDENS.

THE past season, so far as I have seen, on this the western side of the metropolis, was one of the best for some years past, as regards crops grown under ordinary conditions. I mean by this, where no mulching or artificial manures have been employed, or root watering resorted to. True, this latter important aid to growth in dry seasons was not needed, with such rains as we experienced. This, however, points to the fact that such waterings upon our soils would be a great assistance were the season a dry one. Here, all our fruit is grown upon a gravelly subsoil, which in places is not far below the surface. If we trench our ground two spits deep, and break up the bottom, the gravel is more often than not turned up. Last summer's and autumn's rains therefore just suited us, having been none too much, considering the heavy crops the trees bore in most instances. During the average of seasons even, I have found that we very quickly suffer from drought. I find that a moderate system of pruning answers better than a too severe use of the knife. By relinquishing the latter, I have in several instances got rid of the canker in our Pear trees, with which I found them much affected. I consider the prime consideration in fruit culture is good crops of fruit. If this cannot be secured by the rule-of-thumb practice, other means must be adopted. The mere appearance of the trees, without regarding the crops obtained therefrom, is a fallacy. The rains of the autumn, with comparatively few fogs as an accompaniment, no doubt sowed another good purpose—that of keeping the fruits clean. Around here, what we lack most is colour in our Pears and Apples, particularly in the latter; this seems to be an unsurmountable difficulty under ordinary conditions. The character of the soil, without doubt, also contributes to this failing in a greater or less degree. Apples and Pears which possess the best constitutions are the most likely to succeed.

THE APPLE CROP.

The Apple crop now gathered in here was the best and the cleanest that I have had during sixteen seasons. The fruits, taken on the whole, were much finer than we usually have them. Our finest this year were Blenheim Orange, which, with us, must still be placed in the front rank; the fruits were larger and weightier than in any previous year, covering the above period. The trees were large and spreading;

FIG. 5.—GOLDEN NOBLE.

FIG. 6.—CELLINI.

FIG. 7.—EMPEROR ALEXANDER.

FIG. 8.—COX'S ORANGE PIPPIN.

FIG. 9.—COX'S POMONA.

some are in the kitchen garden, others upon grass—perhaps the best crops are from the former. These trees were planted in 1850, and have rarely failed to bear a crop in my time. Another splendid Apple with us is Waltham Abbey Seedling, but I find it to be a periodical bearer, a heavy crop one year and a light one the next. Nevertheless, it is a standard sort, and the tree of good constitution. When fully ripe I prefer it for eating to King of the Pippins. One of our finest late Apples is Alfriston, of which this year we have again a very clear and heavy crop. Gloria Mundi, although a fine Apple, does not often bear so well as the former. As an Apple for a private garden, Golden Noble (fig. 5), is one of the finest of all, the fruits are now (November) turning to a deep golden colour. In a few weeks' time, they would be an ornament to any dessert, and of no mean quality either. The tree is very robust and sturdy in growth, its habit is more upright than in many kinds, and is one of the best sorts to resist a strong wind, the fruits being set firmly upon a short thick foot-stalk. Cox's Pomona (fig. 9), is another most admirable Apple, being just now in good condition. We cannot colour it as many do, but in spite of this it is very handsome; I find it to bear well nearly every season. King of the Pippins is this year a heavy crop, the fruits very fine, and remarkably clear for us. It is oftentimes liable to spot, thus the fruits are disfigured and do not keep so well either. Gravenstein was remarkably fine, the crop a heavy one. I wonder it is not more seen and recommended as a dessert Apple; it is with us the best of any for September and October use. Our trees are large, and the growth vigorous. I do not know how it may do upon the Paradise stock, but if it succeeded, it might probably be had finer still. Braddick's Nonpareil has borne good crops, but the fruits do not partake of that superior flavour with us that it should assume. Cellini (fig. 6) does well, and is most useful for this season of the year. One of our finest early Apples is Ecklinville; in our case it is superior in every way to Lord Suffield, which spots badly, requiring to be used up quickly. Ecklinville on the other hand, can be taken for use quite as early, whilst it will last longer. Wellington was considerably better than usual, although a good bit spotted. Last year it bore better than most kinds; the trees do not, however, look happy. An old tree of Winter Queening usually bears a fairly good crop; last year the fruits were large, and finely coloured. The crop of Beespool was this time a thin one; I do not find it a reliable bearer, but when a good crop is secured, it makes some amends, being so useful in February and March.

Of smaller Apples, Franklin's Golden Pippin, Court of Wick, and Yellow Ingestre should be named as amongst the best. Golden Reinette is, perhaps, one of the best croppers of these smaller kinds; last year, when Apples were scarce, this sort bore well, and again this season. My neighbour, Mr. Reynolds, of Gunnersbury Park, had Stirling Castle in splendid condition; the trees annually bear very heavy crops of unusually fine fruit. Peasgood's Nonsuch also did very well with him, the fruits coming very fine. Of older Apples, and upon old trees also, he had Cockle Pippin, Adams' Pearmain, and Ribston Pippin—all good, the first-named being a splendid cropper. Other first-rate sorts in the same garden are Cox's Orange Pippin (fig. 8), Lord Derby, Frogmore Prolific, Warner's King, and Mère de Ménage, besides most of those I have named as being in my own charge.

THE PEAR CROP.

In our case, as with the Apples, so with the Pears—the crop was all that anyone could wish; and, taken on the whole, but little fault could be found with the flavour. The most disappointing in this respect was Beurré d'Amanlis, this Pear evidently requiring a warm summer. One of the best for flavour thus far was Thompson's; the fruits of this fine Pear have been delicious—so much so, that it has been termed the "honey" Pear. In the case of the first-named, the fruits were extra large; in the latter, smaller than usual—both, how-

ever, bore heavy crops. Louise Bonne of Jersey was in capital condition; here, too, the flavour was good, and the crop a heavy one. Upon one tree the fruit was scabby; it is a tall one, and much exposed—so tall, in fact, that we had to cut off its top, and that may have had something to do with this failing. Williams' Bon Chrétien, in common with other parts, has about here and with us borne a very heavy crop, the sample being also a good one. Jargonelle growing as an orchard tree likewise carried a fine crop of fruit with less grittiness at the core than usual. Where this Pear is pruned here it does not succeed so well. Our earliest was Doyenné d'Été, but it was rather later than usual, not being ripe until the second week in August. Gratioli of Jersey was somewhat acid, but quite passable. Marie Louise was never of better flavour, the fruits mostly being grown upon our free standards have that russetty appearance which in this Pear denotes quality. Pitmasot Duchess was very good from a standard, but the crop was not what it ought to have been. I find the birds are very fond of this sort before it is really fit to gather. Beurré Clairgeau, a Pear which is frequently condemned, ripens well upon our soil and is also of very good flavour, this combined with its good looks recommend it. Duchess d'Angoulême, also from a standard, was much finer than usual, but I cannot yet speak of its quality last year, nor of that of Beurré Diel, which was likewise a good sample. Of the winter Pears, our mainstays are Josephine de Malines and Beurré Rance, these both do exceedingly well, ripening in a satisfactory manner with rare exceptions. Although we do not in these Pears attain to the size of some growers, we secure quality, and that is of first importance.

Small or medium-sized fruit of these late sorts have no doubt more chances of perfect development than the larger ones. Ne Plus Meuris is a good cropper and ripens well, so does Knight's Monarch, this latter sort, however, is given to dropping prematurely. Beurré Superfin from an old tree last season bore a good crop of fruit, being of excellent flavour also. Clapp's Favourite promises to be a good addition to the early kinds coming in between Jargonelle and Williams' Bon Chrétien. The best of all Pears for stewing is Catillac. Our trees are all orchard-grown without pruning; we rarely ever miss a crop, last season we had a very heavy one. *James Hudson, Gunnersbury.*

HOME CORRESPONDENCE.

THE WET WEATHER AND STRAWBERRIES.—The long-continued wet weather has had a marked effect upon Strawberries where the soil is heavy, and it is not for the best for the next year's crop of fruit. For the last month the leaves have taken on a yellow tinge, until many are now quite dead, some varieties being more affected than others. The variety Sir Joseph Paxton appears to be the worst hit, which is rather surprising, when we consider that this is the best wet weather Strawberry when the fruit is ripe. Dr. Hogg and British Queen are also affected in the same way. The latter, I expected, would be so, but not the former. Vicomtesse Hélicart de Thury and Noble appear to stand the wet weather much the best. Upon examination by digging up a few plants, I find all the small fibrous roots are dead, thoroughly rotted by excess of moisture, which is retained for sometime in our heavy soil, rendering it cold throughout the winter. I have had greater success with the Strawberry since we left off the practice of stirring the soil between the rows; but owing to these exceptional circumstances I must have the space between the plants lightly forked over, just deep enough to break the hard crust of the surface, which will allow the air to enter the soil more freely, preventing the moisture from remaining so long in excess in the soil, which is to the detriment of the plants. I find here in this soil Strawberries succeed much better when no manure is laid on the surface during the winter, as practised in some gardens. The plan which succeeds best here is to mulch the surface just previous to the plants throwing up their trusses of bloom, with some light manure, that from a spent Mushroom-bed answering well; and over this some straw

is laid to prevent the fruit being splashed by heavy rains. The goodness from the manure gets washed down to the roots of the plants, and in the case of a spell of dry weather setting in, either when the plants are in flower or later, rapid evaporation of moisture is averted. After the fruit is gathered, all the runners, and a half of the largest and oldest leaves, are cut off, the remnant of the old mulching material with the straw is removed, the plants being then left exposed about the surface for the winter. The past season was the wettest here for ten years, and the greatest rainfall for the year in the period named was 36.0 inches, already up to the present date we have exceeded that by 1.0 inch, the average registered rainfall here being 30.00 inches. Therefore I do not wonder much at the present appearance of the Strawberry-beds in our retentive soil. *E. M., Hampshire.*

CLIMBING NIPHETOS ROSE.—*Apropos* of the letters which have recently appeared in the *Gardeners' Chronicle* concerning the climbing habit of the above Rose, I may be permitted to say that, in looking through Messrs. Keynes, Williams & Co.'s well-stocked glass-houses (which, by the way, are being extended), I noticed some thousands of the climbing Niphetos Rose recently grafted pushing into growth in the propagating-frames in the forcing-house. This led me to inquire after the parent plant, which I described in the *Gardeners' Chronicle* a few years ago. This I was shown in the plant-ground close to the houses growing in the same cask it was in a few years since; the young shoots had been cut hard back for grafting purposes, the main shoots or rods being tied loosely together, and laid in a straight line from the tub, measured exactly 28 feet in length. *H. W. Ward.*

EGG PLANTS.—You have done well in taking up the question of the cultivation of the "Auberger," for why so valuable a vegetable should have been so long neglected is surprising. I grew some in pots last summer under glass without heat, only starting the seeds early with bottom-heat. The plants ripened fruit by the end of June, and the only difficulty was their infestation by green-fly and red-spider—probably my own fault. The seed I used was Vilmorin's variety, Violette Hâtive. May I add to your correspondent's nomenclature and cooking? The Turks call it Badlijan, and the Persians Padlijan, and London says the Arabs call it Bydenjan. As regards cooking, an excellent method consists in splitting longways, filling each division with chopped meat, and frying in oil. I should say that, taking the world round, it occupies as large an area as the Potato, and could be produced in England at the cost of the Tomato. *B. P.*

ASPIDISTRA ELATIORE BEARING SEED.—I have at present in my nursery a plant of above, bearing a healthy capsule of seed, though not yet mature. The flower was pollinated in June. Several attempts to obtain seed were made here, but previously none were successful. The capsule is entirely above the surface of the soil, and in this particular it is unlike the flower, which usually is partially buried. It is spherical in shape, and measures about three-quarters of an inch in diameter. Its integument is thick and fleshy. I should be glad to know if anyone has hitherto been successful in raising seed of this plant, or if it produces seed freely in its native habitat. *James Wilson, F.R.H.S., Greenside Nursery, St. Andrews, N.B.*

CHRYSANTHEMUM MRS. ROBINSON KING.—I note Mr. Blair, on p. 761, vol. x., speaks favourably of this sport from the Queen, but I cannot agree with him where he says, "I have seen several spurious varieties of Mrs. R. King." I always thought plants—or anything else for the matter of that—which were raised from the original stock by cuttings or offsets, could not possibly be spurious varieties. This can only come about when stocks of any plant are obtained from seed. In Chrysanthemums which are annually increased by means of cuttings, offsets cannot produce spurious varieties. If Mr. Blair saw light-coloured blooms, they were the result of defective culture, which will produce much variation in colour in almost any variety of the Chrysanthemum, especially the Queen section, with the one exception—*Empress of India*. *A.*

"CEDAR OF GOA." CUPRESSUS LAUCA (SYN. C. LUTIANICA).—*Apropos* of your illustration of this exquisite and rare plant (p. 761, vol. x.), I should like to say that by far the finest specimen I ever saw exists in a co. Wicklow garden—a fine spreading tree, 30 to 40 feet in height, at least, and feathered

to the turf by its elegant branches, most of which are laden with fruits. As thus seen, fresh, healthy, and fertile, it is one of the most distinct and graceful of all its allies; but the place is sheltered, and near the sea, and the soil of the most fertile in the vicinity. I have not the owner's permission to mention his name, or the estate on which the really noble specimen of this "Cedar of Goa" exists, but if this should meet his eye, perhaps he would himself kindly give us the history of his splendid specimen, so far as it is known to him. *F. W. B.*

SIGNS OF SPRING.—I have to-day (December 26) seen the first Snowdrop flower-bud, one of Galanthus Elwesii, growing on the south side of the rockery. Anemone fulgens has been in flower in the open border for fully a week, and does not seem any the worse for 13° of frost which was experienced one night lately. *E. Molyneux, Hants.*

THE TREE TOMATO (CYPHOMANDRA BETACEA).—Another year's experience with this novelty only enhances my opinion of it as a decorative and fruiting subject combined. In the summer we have its head standing out in striking relief against well-known decorative plants of our English homes. The young leaves are violet-purple, followed, as each leaf increases in size, by a purplish-green tint, assuming more and more of a sea-green hue until, as it approaches maturity, the bright green disappears, giving place to a yellow cast, until the fruit commences to colour, when the plant has then to change its character. Belonging to the same race as the Tomato, it is, when cooked, scarcely distinguishable in flavour from that esculent. The fruit is egg-shaped, 3 inches long, and of a salmon-red colour. When the additional fact is taken into consideration, that this variety fruits from November to beginning of February, it will be apparent to all practical minds what a valuable subject it must prove for an employer's table during the dark winter months. That well-known authority, the Rev. W. Wilks, when he exhibited fruits of this species at the meeting of the Royal Horticultural Society, stated that he had grown his plants, "in a cool orchard-house, from which frost only was excluded." My experience applies to plants grown in an intermediate-house throughout the summer, and conveyed to a drier atmosphere as the plants attained maturity. His experience, therefore, increases its value, by showing that any amateur who has a house from which he can keep the frost is able to cultivate it. Perhaps Mr. Wilks may be induced to give his "summer treatment" of this plant in the pages of the *Gardeners' Chronicle*. *Pioneer.*

RHUS VERNICIFERA.—Is it generally known that the sap of *Rhus vernicifera* is of a very poisonous nature? We have a number of this variety of *Rhus* in the grounds here, raised from seed, brought home by my employer from Japan some few years ago, and are now nice trees from 10 to 12 feet in height. Having occasion to transplant some of these, myself and two men have since been suffering from blood-poisoning of most irritating nature, inflaming the whole body from head to foot, especially the hands and face, and having the appearance of nettle sting, only with more swelling—the irritation being so great that no sleep was to be had for some nights. *Albert Willis, Sandford Leigh Gardens, Newton Abbot.* [All the species of *Rhus* are more or less poisonous. *Ed.*]

CHRYSANTHEMUMS AND ORCHIDS AT DAVENHAM BANK, MALVERN.—The gardens at the above place are always full of beauty and interest. At the present time the conservatory is gay with *Chrysanthemums*, and these are arranged in a freely artistic manner. Prizes are offered in large numbers throughout the kingdom for "groups of *Chrysanthemums* arranged for effect," and the stereotyped masses, dense in substance, stiff in composition, and almost—in many cases entirely—devoid of artistic arrangement, are "put up" year after year. Colours are jumbled together, and good taste is seldom seen. Why cannot we have prizes offered for groups of *Chrysanthemums* arranged for artistic effect? At present competitors feel themselves compelled to produce a jumble of colour in order to meet the rules of judging, which, I think, require that the groups shall be representative, i.e., contain examples of the different sections of *Chrysanthemums*, and variations in colour. Mr. Bradshaw has wisely departed from the old lines of mixing his colours, and produces more delicate and pleasing effects by grouping the tones or shades of one colour. Mr. Perkins, of Coventry, showed us long ago how much richer

effects are produced in that way, by his lovely bouquets of *Chrysanthemums*. Orchids are well represented at Davenham Bank, and many old-fashioned species are found there in large masses. Amongst the most noticeable were *Epidendrum ciliare*, a very large mass; *E. prismatocarpum*, also very large; *Maxillaria grandis*, *Anguloe Clowesii*, *Dendrobium moschatum*, *D. Dalhousienum*, and *D. simbrarium oculatum*. These *Dendrobies* are not very durable when open, but they are very beautiful. The curious and rare *Nanodes Medusae* here represented by a specimen on a block. Here also is probably one of the finest specimens of *Odontoglossum pulchellum* in cultivation. The lovely *Cattleya exoniensis* is represented by a specimen for which "the trade" has offered over 250 guineas. *Cattleya Sanderiana* is represented by magnificent specimens in robust health, and *Lælia purpurea* and *L. anceps* are grown in quantity. The latter are throwing up large numbers of spikes. It is rarely that one sees *Miltonia vexillaria* growing more freely than here. *Angraecum sesquipedale* is showing a number of flower-stems, and Mr. Bradshaw says that he once had one that bore thirteen flowers on one spike. *Cypripedium longifolium* and *Sedenii* are gigantic specimens in No. 1 pots! And the lovely *C. Spicerianum* is smaller and more numerous. *Phalenopsis* are sending up panicles of flowers 3 feet to 4 feet long. The Holy Ghost flower (*Peristeria elata*) blossoms every year, and is a very robust plant. There are three or four very fine specimens of *Vanda teres*, and I learn that they flower very freely. The chief element of success is to see that they make their growth near the glass, and have as much sun-light as they can bear without injury to the leaves. *Cecylogyne cristata*, one of the loveliest white *Orchids* grown, is a great favourite here; like some other *Orchids*, it is improved by weak manure-water. *Thunias* and *Sobralias*, and *Sophranitis* are well grown, and flower freely in their season. *Masdevallias*, an excellent collection are grown in quantity. Great masses of *Trichomanes radicans* are grown in the temperate Fernery, and in that condition the plants are lovely. The beautiful subway which conducts from one part of the garden to another, is a work that is creditable alike to the engineering and artistic skill of Mr. Bradshaw. But description fails to convey an adequate idea of the beauty of this part of the garden. *Hortulanus.*

BOCCONIA CORDATA.—I can vouch for the hardness of this fine foliage plant, as I have a large clump growing in my nursery from 8 to 10 feet through, and which has produced stems 6 to 7 feet high. I consider it cannot be surpassed either in a mixed border or as a companion to the Pampas-grass. I herewith send roots taken from the ground, and others started in a little heat, showing how easily it may be propagated. *James McDonald, Chichester.*

FROST IN WILTSHIRE.—I send you a report of frost that we registered at this place during the latter half of December. On the morning of the 18th, we had 12°; 19th, 12°; 20th, 17°; 21st, 18°; 22nd, 22°; 23rd, 20°; 24th, 15°; 25th, 11°; 26th, 5°; in all, 132° of frost in nine nights. *Wm. Leaney, Chippenham.*

NOTICES OF BOOKS.

LETTERS FROM A COUNTRY HOUSE.

The language of the book is easy and well-chosen, but what does "powerling" along the road mean? And again, speaking of sleep and pleasure respectively, is the phrase, "He had pretty well of it"—a provincialism. To villa-ise is a verb as yet, fortunately, not to be found in a dictionary.

Mr. Anderton pokes a little fun at the "varieties of fruits and vegetables, of improved Peas that are as sweet as sugar, succulent as Asparagus, and the size of marbles," and at the pictures of such treasures in the seedsmen's catalogues. "Somehow," he says, "when I try to produce these wonderful varieties, they do not always come up as the illustrations shown, but I suppose that it is all the fault of my garden and gardening. It can't be anything wrong with the seed. Perish the thought!"

The account of his old gardener is very amusing. This worthy considered a piece of Seaweed far more reliable than any "brometers," and ascribed a spell

of wet weather to the new rain-gauge. But the words he chose were even more remarkable than his opinions:—"I asked him if it would not be well to have more variety among the Pansies, instead of so many of one kind. 'Oh, yes,' he said, 'it will make a nice disparity of colour.' One year my Potatoes did very badly, and I reminded him of this fact. 'Ah,' he replied, 'I must plant 'em somewhere else, this ground is getting "tater-sick".' Once I asked him to put up some sticks in a certain place, to prevent the grass being over-trodden. He did so in rather a fanciful way, on the ground that they would look more 'gothic.' I doubt if he quite knew the meaning of the word he used; but it was decidedly appropriate, since gothic does mean utility and ornament combined."

Writing on many and varied subjects, including fox-hunting, rhapsodies on cloud-effects, the pleasures of feeding (!), how to manage a fire, ploughing, and superstitions, Mr. Anderton has used his leisure to give us a book which is a welcome addition to our book-shelves; for although the sentiments expressed are often common-place, they are pleasantly and chatily written, in a style which does not call for adverse criticism. The "Letters" were originally published in the *Midland Counties Herald*; in their revised form they are issued by Messrs. Simpkin, Marshall, London; and Cornish Bros., of Birmingham. Print, paper, and binding, are all excellent, and the book is of convenient size, and of neat, attractive appearance.

DIE VERDELUNGEN FÜR DIE VERSCHIEDENEN BÄUME UND STRÄUCHER. Von Nicholas Gaucher. (Stuttgart, Julius Hoffman.) (Grafting of various trees and shrubs.)

The progress of horticultural education in this country will necessitate the production of a higher class literature than at present prevails. As a model of what such books should be, we commend Mr. Gaucher's treatise on ennobling or grafting. The language in which it is written is no doubt a serious drawback to many English students, but it may possibly be translated, whilst the numerous illustrations appeal happily to people of all nations, and they are so instructive that much may be learnt from them without looking at the text itself. The various methods of grafting, budding, inarching, layering, &c., are fully described and the latter half of the book contains an alphabetical list of shrubs and trees, together with the best methods of propagating them, and the seasons appropriate to each. Pruning and training are duly attended to, and the work ends with a monthly calendar of operations and a full table of contents.

SEVEN DREAMS. By Annie Trumbull Slosson. (Osgood, Macfivaine & Co.)

This is a collection of allegories—or, rather, to use the expression the authoress prefers, of dreams—which ought to be read by every lover of Nature. The seven "contes" in the book relate the harmless but pathetic manias of simple, humble New England folk. A cynic has said that, to reach the highest ideals of usefulness, one must be a little wrong in the head; these tales, in some measure, seem to bear out this statement. But they are told with such a quiet air of pathos, and such real sympathy, that the most callous reader cannot fail to be deeply moved in perusing them. The second one, entitled "Botany Bay," tells how a gatherer of simples believed that he had a double, or *alter ego*, with only one soul between them. In the silence of the woods he used to converse with his imagined other self, and pray that he might be annihilated, so that the other might inherit the eternal life. This story, as well as two others, entitled "Fishing Jimmy" and "Aunt Randy," abound with wonderfully life-like descriptions of wild flowers and insects. Perhaps the most beautiful "conte" in the book is "Deacon Pheby's Selfish Nature." It is the story of a boy, who, when his twin-sister, a little girl, on whose clinging, loving nature his widowed mother leant,

and when the mother herself was blind from the effects of small-pox, pretended that he had died instead of his little sister, so that his mother should not pine herself to death, and though he was a boy loving all sorts of outdoor sports, forced himself to copy feminine ways. His mistakes, which the blind mother puts down to the effects of the small-pox, are very humorously told.

To show the beauty of the descriptions, and how charming they are to any lover of wild flowers, we will quote the following, which is one only of the many beautiful passages in the same sympathetic strain:—"There are no stately monuments here or cold white tablets, but at the head or foot of many a mound lies a granite block or boulder, softened and made beautiful by moss, and Vine, and tiny flower. No laboured epitaphs are written here, nor are they needed. The bursting chrysalis, setting free the bright-winged butterfly, which shall take wings and soar upward some bright June day. The buried seed, the waking flower, the bursting bud, all are living lessons, and require no letters cut into cold stone to make their meaning clearer. No massive wall or fence shuts in this God's acre. On one side a bank slopes down to a grassy meadow, another side is bounded by a crystal-clear mountain streamlet, along the third is a wild hedgerow of trees, shrubs, and tall herbs, wild Cherries with tassels of bitter-sweet scent, Hazel with odd green tufts which mean to be nuts some day, Shad-blow with leaves of bluish-green, white flowers, or green berries, waiting for the sun to make them red; quivering Poplars with slender white trunks, pointing to the sunrise; Mountain Maple, Birch, and Alder."

FOREIGN CORRESPONDENCE.

THE WINTER IN SWEDEN.

AFTER such a trying winter as the last one, when it was nearly as severe in England as it is generally here, perhaps it may be of some interest to your readers to know what plants proved quite hardy here:—*Acer tartarica*, *A. ginnala*, *A. negundo variegata*, *A. virginicum*, *A. laciniatum*, *Azalea mollis*, *A. pontica*, *Chionanthus virginiana*, *Deutzia scabra*, *D. crenata*, *Hydrangea paniculata*, *Rhododendron ponticum*, *Rosa rugosa*, *Abies amabilis*, *A. Fraseri*, *A. nobilis*, *A. Nordmanniana*, *Picea polita*, *Cupressus nutekensis*, *Libocedrus decurrens*, *Retinospora plumosa aurea*, also most of the American Oaks. Cut down to the ground were, on the other hand, *Ceanothus var.* (they flower well all the same), *Coronilla emerus*, *Crataegus pyracantha*, *Daphne Mezereum*, *Deutzia gracilis*, *Rhus Cotinus*, *Ribes sanguineum var.*, *Robinia Decaisneana*, *Spiraea arifolia*, *Weigela var.*, *Picea morinda*, *Abies grandis*, *Cedrus Libani*, *Prunus laurocerasus*.

POTTING SOIL.—The object in the preparation of a good soil for potting fruit trees is to make it physically and chemically lasting and durable, more than to make it rich. By physically lasting, I mean one able to remain open, porous, and sweet for years; this is best obtained by using good loamy turf, rich in root fibre. As a good substitute for mixing with garden soil where turf is scarce, woollen refuse from paper and shoddy manufactories may be recommended. Chemically durable is the soil when it contains the principal nutritive substances (phosphoric acid, potash, and nitrogen), in such a condition that they are not absorbed at once by the roots, or carried away by water. They should not be, as the farmer demands them, as soluble as possible. The best materials are raw crushed bones, not too fine (phosphoric acid), pulverised minerals rich in potash, as felspath, or sand consisting of these minerals, more soluble, and therefore to be used in smaller quantities; but more often, wood-ashes, kainit, and potash fertilisers are used. Durable nitrogen fertilisers are wool and hair refuse.

STAYING ON.—About the best time for this operation there are different opinions, some say it is when

you close for the day, others say so early that the leaves may get dry before night. The rule here is quite the contrary; we never syringe earlier than we may be sure that the leaves will keep wet through the night. This I consider of much importance, and I do not syringe before the sun leaves the house, half an hour before it sets. My reasons for this are: it is natural for the dew to remain on the leaves till it is dried off by the sun in the morning, and what it is natural I should say is the best. Now it is said that we cannot copy Nature in our cultures under glass, this may be true when our object is different from that of Nature, not otherwise. When we aim at the same end as Nature gains in favoured climates, and we are generally content with that, we cannot do better than use the same means as she does. The other reason for late syringing is, that when the leaves remain wet till next morning it is unnecessary to syringe at that time, as most people, like Mr. Rivers, recommend. Finally we give the trees much more time for work when we syringe at sunset and not at all in the morning than we do when we syringe at 6 to 7 p.m. and 6 to 7 a.m. in June, when the sun rises at 3, and sets at 9, something like five hours is gained. We may very well suppose that when the air in the house is moisture-laden, and the leaves wet, there can be no evaporation, and therefore no productive work going on in the leaves. Perhaps I overrate the advantage to be derived from this gain in time, but it seems to me to be as important to economise the plants' working-time as it is to do it with your own. *M. P. Andersen, Jönköping, Sweden.*

FRUIT NOTE.

NEW PEAR, GHELLINCK DE WALLE.—The *Bulletin d'Arboriculture*, &c., for November contains a coloured figure of a new Pear of first-rate quality, raised in the garden of M. Ghellinck de Walle, near Ghent. Fruit of medium size, oblong-obovate, skin yellowish, speckled with russet; flesh creamy-white, melting juicy sugar slightly acid, and delicately perfumed; eye small, level with the fruit; stalk short, thick, inserted vertically or obliquely in a shallow basin. Season, November. M. Pynaert considers it one of the best autumn Pears.

SCOTLAND.

In Mr. Muir's paper on "Gardeners and Gardening, North v. South," are some things not only hard to be understood, but extremely difficult for a Scotsman to stomach. In England you often hear Scotland spoken of as the knuckle end of England, but though very small in proportion, its successes in those arts, of which gardening is one, have been altogether out of proportion to the size, wealth, and population. Cut out of England any portion of equal size with Scotland, compare the results, and I question if the balance will not fall to Scotland. Mr. Muir gave credit where he could not withhold credit, acknowledging that the English climate was an important factor in making English horticulture easier and possibly better. Scottish gardeners are a smaller hand, much less efficiently accoutred, but have heavier odds to face in cold and storm and briefer seasons. Another point is this, and one with which as a Scotsman Mr. Muir must be thoroughly conversant, that in common with the other free arts, gardening for long was little encouraged in Scotland until within comparatively recent years. England had its exhibitions of paintings years and years before Scotland, so that Scotland has some lee way to make up before being put into the balance by my friend, against our more artistic neighbour, and found wanting. Regarding our table decoration, which hurts Mr. Muir's feelings as much as our Scotch nurserymen's humble representatives, it is all a matter of taste; and as regards our Scottish exhibitions, the Royal Caledonian Society gives the largest amount of prize money of any society in Great Britain.

On the whole, while grateful to Mr. Muir for his kindly criticism of Scotland, which all wise Scotsmen will receive as "the wounds of a friend," common sense and a little experience of both countries soon lead one to think that it is nothing more or less than the fact that Scotsmen are pushing and successful in the south, and that in consequence we hear the occasional bark of partisanship. *J. W. McHattie, Newbattle Gardens, Dalkeith, N.B.*

TRADE NOTICES.

MESSRS. DICKSON AND ROBINSON, MANCHESTER.

By an advertisement in this week's number it will be seen that the following change is being made in the firm of Messrs. Dickson & Robinson, Seed Merchants, Manchester. Mr. Robinson, hitherto the sole proprietor is, on January 1, admitting into partnership, Mr. A. W. Whale and Mr. Henry Hicks, the first-named has, for the last twenty-two years, held an important post in the celebrated German seed house of Mr. Ernest Benary, Erfurt; the latter gentleman has a large circle of acquaintances amongst our readers, having represented the Manchester firm as traveller for many years, more especially in the Midland and Northern counties.

COLONIAL NOTES.

SIERRA LEONE.

MR. G. F. SCOTT ELLIOT, one of our contributors, has been appointed botanist to the Boundary Commission appointed to fix the limits of French and of British territory respectively in Sierra Leone.

THE WEST INDIES.

MR. C. A. BARBER, Demonstrator of Botany at Cambridge, has been appointed Superintendent of the Botanical Department of the Leeward Islands.

CLIMBING SOUVENIR DE LA MALMAISON.

Messrs. Illife & Co., of Sydney, who make a specialty of Rose-growing, have raised and sent out a climbing form of this favourite Rose. Mr. Thomas Milner, a son of the late nurseryman of that name, at Bradford, Yorkshire, has lately joined the firm. A photograph of a standard Niphetos Rose is enclosed. *Correspondent.*

PLANT PORTRAITS.

BILBERGIA FRANZ ANTOINE. *Wiener Illustrirte Garten Zeitung*, December, 1891. B. Windi x B. Kobani.

CALLIARHOE PAFAYER. *Garden*, December 12, 1891.—A malvaceous hardy perennial, with palmately-lobed leaves and long flower-stalks, each bearing a cup-shaped flower, 2 inches in diameter, rosy-lilac with a white eye.

CHRYSANTHEMUM MADAME E. FIENERS. *Revue de l'Horticulture Belge*, December.—An early-flowering Japanese variety, with linear florets of a white colour flushed with rose.

CYPRIPEDIUM FAIRRIANUM. *Orchidophile*, November, 1891.

DORYANTHES PALMERI. *Revue Horticole*, December 1. **IRIS ATROPURPUREA**, Baker, *Gartenflora*, t. 1361.—A Syrian species, with very dark brown velvety flowers.

LONICERA HALTEANA. *Canadian Horticulturist*, December.

ODONTOLOSUM ORTHOGESIANUM x, *Gartenflora*, December 1, t. 1360.—A natural cross between crispum and odoratum.

ONCIDIUM SPLENDIDUM. *Orchidophile*, October.

ROMNEYA COULTERI. *Gartenflora*, t. 1359.

ROSA VICHURIANA. *Garden and Forest*, December 2.

Deceubur.

Obituary.

W. T. ACTON, market gardener, of Bollo Lane, Acton, died on December 17, at the age of sixty-one, from inflammation of the lungs. Mr. Acton was an old inhabitant of Acton, having been born there, and succeeded his father as a market gardener. He grew Pears—Bon Chrétien especially—Apples, Plums, bush fruits, and Mushrooms on a rather large scale in the open air. He was well-known in Covent Garden Market, his geniality and uprightness secured for him a large number of friends. For some years he took an active part in local affairs, and was a member of the Local Board of Health for a considerable period. He was also a member of the jury of copyholders.

JAMES WILLIAMS.—It is somewhat remarkable that we should have had to record the death of Mr. B. S. Williams, of Holloway, several months before that of his father. In fact, all the circumstances of the case are remarkable. Mr. James Williams, who died on Christmas Eve, was born in January, 1797, having thus nearly completed his ninety-fifth year. He entered the service of Mr. John Warner, of the Woodlands, Hoddesdon, so long ago as 1817, and remained in the service of the family at the same place till four years ago, when failing health necessitated his retirement. A service of seventy years in one family is probably unexampled. In former years Mr. Williams was a successful exhibitor himself, and frequently acted as judge. In a future number we hope to give a portrait of this patriarch.

DR. WILLIAM ROBERT WOODMAN.—The Doctor "passed peacefully away" at De-von House, Brondesbury, on Sunday, December 20, 1891, the day following his sixty-second birthday, and was laid in his grave at old Willesden Churchyard on Christmas Eve. He was a prominent figure in gardening and in freemasonry. In 1871 he succeeded his enthusiastic uncle, the late Mr. R. T. Pince, of Exeter Nursery, and carried on under the familiar title of Lucombe, Pince & Co., that famous old establishment, with much spirit and enterprise until 1883, when he relinquished the business in favour of his late tenant. To record all his victories would fill a whole page, for he was first prize-winner in nearly every competition wherever he went, and his magnificent collection of specimen exhibition plants was at that time unquestionably the finest in existence. During 1873 to 1877 he won in open competition upwards of 100 1st prizes and silver cups, the most notable being the 20-guinea Cup at Plymouth for twenty stove and greenhouse plants, and the 15-guinea Cup at Weston-super-Mare for twelve stove and greenhouse plants—both victories he repeated on several occasions; two 1st prizes at Manchester in 1874 for hardy Conifers, the £15 prize at the Royal Aquarium, in 1876, for eight distinct stove and greenhouse plants in bloom; the £20 prize for twenty stove and greenhouse plants at Nottingham in the same year, and the 1st prize for eighteen stove and greenhouse plants at Torquay in 1877; he also for some years "swept the decks" in the open classes at Exeter and Taunton. After 1877 he did not again compete for prizes, but still continued to the last as an honorary exhibitor, his extensive and artistic displays being generally the chief feature of the flower shows he patronised; moreover, his own annual exhibitions of Hyacinths and spring flowers at the Exeter Nursery gave delight to thousands. He spent his time, his learning, and his money, for the benefit of others, and in attempts to reascend an unwholesome business which had passed its meridian.

Mr. Napper, one of his old employes, sends a warm eulogy of the merits of Dr. Woodman, together with a portrait, which we shall probably reproduce.

THOMAS STATTER.—Mr. Thomas Statter, of Stand Hall, was the agent of the Earl of Derby on his extensive estates in Lancashire, at Knowsley and Colne, for a period of fifty years or more. He was a man of peculiar individuality, and a keen judge of character. His position and varied knowledge rendered him powerful in the various districts named, and he has been called upon year after year, as he has told the writer himself, to take part as a witness in the various schemes in connection with these districts before numerous parliamentary committees. He was a keen field naturalist in every sense of the word, fond of all manly sports, and, although a stern disciplinarian, was ready to lend a helping hand to those possessed of talent in their particular spheres. He had gathered together in his quiet residence at Stand Hall no end of art treasures; and latterly, in the afternoon of his life, took to the cultivation of Orchids. How far he has been successful, the pages of the *Gardeners' Chronicle* bear ample testimony. Nothing delighted him more than to have a chat with any Orchidist who knew what he was talking about. Contented with small things at first in the Orchid way, as most Orchidophiles are, he rapidly gathered a collection, which now ranks high among the collections of the country. What he bought lately consisted of gems of the first water. No man of our acquaintance was keener in his appreciation of the beautiful in the more showy Orchids of our time, and no one could sneer more pointedly than the deceased gentleman at second-rate articles. Possibly, his greatest gems were in *Laelias* and *Cattleyas*, and the various hybrid forms which have sprung from them. His *Dendrobies*, too, are a marked lot, and so are his *Ondotoglossums*. It was only quite recently to look to *Cypripedia*. Like many other collectors, he could not see very much beauty about the sorts of yore; but when these finer hybrids came to be offered, there was nothing distinct or good in commerce but what he would have. He was a practical man, every inch of him, and appreciated intelligent gardening practice wherever seen. His garden-r, Mr. Johnson, began Orchid-growing with him, and "bit by bit" acquired his present knowledge by careful watching and intelligent perseverance, showing clearly that that department of gardening practice depends more upon the study of the individual habits of the species than upon any hard-and-fast rule of the elementary cultivation of families of plants.

When he was laid aside, and could not visit his glass-houses, he had the plants brought into his study in the first instance, and latterly into his bedroom. There he took notes, and discoursed upon his grand varieties of *Laelia elegans*, and *Cattleya Trianae*, of *Cattleya labiata*, or *Vanda Sanderiana*, &c., in which the collection was particularly rich. He seemed never tired of discoursing upon a theme of this sort, even when his physical health was rapidly declining. Only about six weeks ago the writer was in his bedroom, where he had been holding an interesting conversation with his gardener on the merits of the particular plants of the day, that were brought up to show him in flower. When the duties of the day were over, and his principal letters read and replied to, then his hobby of Orchids, and how they should be cultivated, came to be discussed. His success he put down to his exposed position, where there was plenty of air moving about to get into the covered ventilators. He advocated bairdhood of culture, and his system of heating and ventilating of houses tended to that end.

His son and successor, Mr. Thomas Statter, told me that his extreme love for Orchids in the latter days of his life kept him so much employed that he was under the impression that it lengthened his days. Opinionative as our deceased friend was, he always cheerfully hearkened to the voice of practical wisdom, and in his gardener, Mr. Johnson, he had a valuable but independent employé. He went to his rest, after doing some of the ordinary routine of business in the morning, at noon on Christmas Day, in the full enjoyment of his mental faculties up to

the last, and his is one of the gaps that we Orchidists have to lament over as years roll on and men pass away. J. A.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

CELERY-COFFER appears to have come into use at Glasgow. Can any reader of the *Gardeners' Chronicle* say what kind of Celery is used, and how the coffee is prepared? D. M.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 45° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for so inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.; 7, England, S.W.; 8, England, S.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

This following summary record of the weather for the week ending D-cember 26, is furnished from the Meteorological Office:—

"The weather during this week was very cold and dry over England, with thick fogs at the inland stations, but with fine, bright sunshine on the coast. Over Ireland and Scotland the conditions, though generally dry, were less wintry; while in the extreme North-west slight rain was experienced at times. Towards the end of the period the weather became milder and damper in all parts of the kingdom.

"The temperature was 3° above the mean in 'Scotland, W.,' but below it in all other districts. In Ireland and the east and west of Scotland the deficit was only 1° or 2°, but over England it was much greater, amounting to 7° in 'England, S and N.W.,' 3° in 'England, E.,' 10° in 'England, N.E.,' and 11° in the 'Midland Counties.' The highest of the maxima, which were registered on the last day of the period, ranged from 55° in 'Ireland, S.' to 45° in 'England, N.E.' During the middle part of the week the daily maxima over all the more central parts of England, were generally below 30°, and at some stations considerably lower; at Bawtry the maximum reading on the 22nd was no higher than 10°, and at York, the thermometer did not rise above 20°. The lowest of the minima were recorded at the meteorological stations either on the 23rd or 24th, when the thermometer fell to 9° in 'England, S.W.,' and to between 13° and 20° in most other districts. In the

Channel Islands, however, the temperature did not fall below 26°.

"The rainfall was less than the mean in all districts, the fall in most cases being very slight.

"The bright sunshine varied greatly in different localities, but was upon the whole, above the mean for time of year. In some parts of inland England—notably in London and at York—it was almost entirely absent. The percentage of the possible duration ranged from 65 in the Channel Islands, to 38 in Ireland, S. and England, S., and 33 in Ireland, N., to 14 in the Midland Counties, 9 in England, N.E., and Scotland, W., and to only 8 in Scotland, N."

MARKETS.

COVENT GARDEN, December 31.

We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who give the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. [Ed.]

MARKET quiet after Christmas. Prices generally unaltered. *James Webber, Wholesale Apple Market.*

POTATOES.

The trade is particularly quiet, and mild weather does not assist to make it better. *J. B. Thomas.*

FRUITS AND VEGETABLES.

BOROUGH, Dec. 29.—Quotations.—Savoys, 4s. to 5s.; Broccoli, 10s. to 15s. per tally; Spinaches, 2s. 6d. to 3s. per bushel; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. to 1s. 9d. per dozen bunches; English Onions, 5s. 6d. to 6s. per cwt.; Apples, 2s. 6d. to 8s. per bushel; Canadian do., 15s. to 25s.; Newtown Pippins, 15s. to 25s. per barrel.

SPITALFIELDS, Dec. 29.—Quotations.—English Apples, 2s. to 6s. per bushel; American do., 10s. to 16s. per barrel; Pears, 2s. to 2s. 6d. per half-sieve; English Tomatoes, 4s. to 6s. per

peck; foreign, 1s. to 1s. 6d. per box; Cabbages, 2s. to 3s.; Savoys, 2s. 6d. to 4s.; Cauliflowers, 5s. to 12s. per tally; Greens, 2s. 6d. to 4s.; Turnips, 1s. 6d. to 2s.; Carrots, 1s. 6d. to 2s.; Parsley, 3s. to 5s. per dozen bunches; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; Parsnips, 6d. to 8d. per score; Endive, 1s. 6d. to 2s.; Cabbage Lettuce, 6d. to 8d.; Leeks, 2s.; Beetroot, 8d. to 8d. per dozen; Mustard and Cress, 2s. per dozen baskets; English Onions, 5s. to 5s. 6d. per cwt.; Spanish do., 6s. to 7s.; Bordeaux do., 4s. to 4s. 6d. per case; Bologna do., 3s. 9d. to 4s. 8d.; Dutch do., 3s. 9d. to 5s. per bag of 110 lb.; Celery, 6d. to 1s. per bundle; Horseradish, 1s. to 1s. 2d. per bundle.

SPITALFIELD, Dec. 30.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under.—Savoys, 2s. to 3s. 6d. per tally; Greens, 9d. to 1s. per sieve; do., 1s. to 2s. per dozen bunches; Cauliflowers, 9d. to 2s. per dozen; do., 3s. 6d. to 8s. per tally; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; do., 2s. to 4s. per score; Carrots, household, 3s. to 4s. per ton; do., cuttie-feeding, 20s. to 32s. do.; Parsnips, 9d. to 1s. per score; Mangels, 16s. to 18s. per ton; Swedes, 18s. to 25s. do.; Onions, English, 12s. to 13s. do.; do., Dutch, 5s. 6d. to 4s. 6d. per bag; do., Bordeaux, 4s. to 5s. 9d. per case; do., Portos, 6s. to 7s. do.; Apples, English, 2s. to 6s. per bushel; American, 11s. to 15s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per sieve; Celery, 10d. to 1s. 2d. per bundle.

SEEDS.

LONDON, Dec. 30.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., write that today's market is as usual at this time, and was thinly attended. Prices all round, in the absence of transactions, are without change. Meantime, an exceedingly firm feeling characterises the market generally. As regards American Red, the rise here has lagged behind the advance on the other side, and spot seed is obtainable under c.i.f. quotations. In Rape-seed the tendency is upwards. There is no change in Mustard seed. Canary and Hemp-seed realise former terms. Blue Beans come slowly to hand. Haricot Beans are firm. The new Königsberg spring Tares are obtainable at tempting rates.

POTATOES.

BOROUGH, Dec. 29.—Quotations.—Hebrons and Elephants, 70s. to 80s.; Imperators, 60s. to 85s.; Bruce Magnums, 60s. to 90s. per ton.

SPITALFIELDS, Dec. 29.—Quotations.—Snowdrifts, 60s. to 70s.; Bruce Magnums, 60s. to 80s.; Hebrons, 60s. to 80s.; Imperators, 60s. to 80s.; Regents, 55s. to 70s.; Magnums, 55s. to 70s. per ton.

SPITALFIELD, Dec. 30.—Quotations.—Magnums, 60s. to 75s.; Bruces, 70s. to 80s.; Imperators, 65s. to 80s.; Scotch Magnums, 60s. to 100s. per ton.

FARRINGTON, Dec. 30.—Quotations.—Bruces, 75s. to 110s.; Imperators, 70s. to 90s.; Magnums, 65s. to 110s.; Hebrons, 80s. to 95s.; Sutton's Abundance, 85s. to 110s. These prices hold also for the King's Cross Market, and supplied by Messrs. Woodward & Bristow.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, during the past week; and for the corresponding period last year.—1891, Wheat, 35s. 6d.; Barley, 29s. 4d.; Oats, 20s. 3d. 1890, Wheat, 32s. 3d.; Barley, 28s. 5d.; Oats, 17s. 11d. Difference: Wheat, +4s. 3d.; Barley, +11d.; Oats, +2s. 1d.

NOTICES TO CORRESPONDENTS.

BOTTLE BRUSH PLANTS: *W. M.* Species of *Metrodieros* (Callistemon). Native of Australia.

CROTONS: *G. H.* We cannot undertake to name the garden varieties of Crotons. Get a nurseryman who grows the plants large to do so from well-developed shoots and leaves.

FIRING SHEETS: *Ignorant.* A stationer or printer would supply any number of these if you would specify the exact form in which you wanted them. Why not enquire of the present gardener at the place you named in your note, to send an example for your inspection?

GRAFTING PEAR TREES: *B. G.* The large tree being in good health, although the fruit is worthless in your climate, might be grafted at the proper time with *Beurré d'Aremberg*, *Jersey Giant*, *Williams' Bon Chrétien*, *Winter Nelis*, *Hacón's Incomparable*, and *Easter Beurré*. The smaller and younger tree on the south wall should be grafted with *Marie Louise*, *Jargonelle*, or *Doyenné du Comice*. The above-named Pears do well in the warmer parts of the North of England, provided the soil is not of a very heavy

nature, is well-drained, and they are placed on any aspect but one facing some point towards the north.

MISTLETOE: *Ancient Druid.* Let fowls eat the perfectly ripe seeds, as the latter germinate better after having been digested by birds. Do not give them too many seeds at one time, as they are somewhat poisonous. The seed may be stuck in a slight cut made on the under sides of branches of Willow, Maple, Apple, Oak, &c. It does not take so well on Oak as on the other trees named. Select, if possible, trees near water.

MUSTARD AND CRESS FOR MARKET: *A Young Gardener.* In the pits that you already possess, you may if they are heated, very well grow these plants in a wholesale manner; but, it will be necessary to bring the surface of the bed on which they are to be grown up to within 1 foot of the glass. The soil on which the seed is sown need not be more than 2 inches thick, and it should be light, rich, finely sifted, and tilted up towards the sun. The seed should be sown thickly, the soil having been watered the day before, and the seed gently pressed into it with a piece of smooth board or the spade, and left uncovered. Cover the pit till germination takes place; keep it close, maintaining an even temperature of 60°. The main object should be rapid growth, but not so rapid as to produce very growth that will go down with damp; afford air in moderate degree to dispel damp, and cut before the true leaf appears.

NAMES OF PLANTS: *G. O. W.* 1, *Thuya Veitchiana*; 2, *Thuopsis dolabrata*; 3, *Cryptomeria elegans*; 4, probably a form of *Cupressus Lawsoniana*.—*J. F. S.* *Diploclappus chrysophyllus*.—*A. P.* *Antrim*. 1, *Cupressus Goveniana*; 2, a form of *C. torulosa*.—*P. & J. R.* 1 and 2, *Cypripedium Schlimii*; 3, *Oncidium unguiculatum*; 4, *Lycaste Schilleriana*; 5, *Cattleya Harrisonia pallida*; 6, *Vanda tricolor*, near to *planiflora*.—*T. D.* *Dendrobium nobile*.—*No name*. 1, *Polypodium glaucum*; 2, *Pteris tremula*; 3, *Libonia*, probably: send when in flower; 4, *Agavea celestia*.

PRIMULUS: *B. S. Williams & Son.* The colour of the Primula sent is rich, the substance of the blooms good, and size above the average.

PROTOPLASM: *Enquirer.* You may obtain an idea of this by likening it to the bricks and mortar of which a house is built, but you must also suppose the bricks to be sensitive and mobile. The latest opinion as to its structure is that it is made up of a complicated network of extremely minute twisted tubes, such as have been for a long time known to occur in the nucleus of the cell.

ROOTS IN DRAINS: *A. P.* The sulphuric acid would not kill all the roots if these have got to long distances. Nor do we know of any substance that would do so, by merely pouring it on the tree stumps. Where trees and Equisetum abound, rubble drains are preferable to pipes. Make them V-shaped at the bottom with a ledge of soil left on each side. Fill up to the ledge with broken stones, and cover with sods, grassy sides downwards. Sods drain might, in your case, be placed over or alongside of the existing pipe-drains, the same main outlets being retained.

ROSES FOR A SOUTH WALL: *Constant Reader.* *Niphotos*, *Souvenir de Sarah A. Prince*, *Gloire de Dijon*, *Maréchal Niel*, *Catherine Mermet*, *W. A. Richardson*, fine for cutting in the bud; *La France*, *Horace Vernet*, *Celine Forestier*, *Lamarque*, *Madame Berard*, *Marie Berton*, *Belle Lyonnaise*, *Solfaterra*.

SIX GOOD TABLE PLANTS: *G. H. Pandanus Veitchi*, *Croton Johannis*, *C. Weissmanni*, *Alafia filicifolia*, *Myrsiphyllum asparagusifolium* (Smilax), *Draecena terminalis*, or other variegated *Draecena*. There are many flowering and berried plants that are equally suitable with the above for the purpose you name.

THE COMMONEST VEGETABLES IN USE IN EVERY FAMILY:—*W. H. S.*, surely, can answer that question as well as we.

COMMUNICATIONS RECEIVED.—*A. J.* Clifton—*W. H. S.*, *C. M. P.*, *W. H. S.*, *J. E. H.*, *W. J. A. L.*, *A. W. C.*, *M. W.*, *H. S.*, *T. C. D. J. R.*, *Piaceenza*, *A. McK.*, *F. L. L.*, *Brussels*, *H. C. Genovese*, *W. L. Monaco*, *W. F. Philadelphus*, *J. T. N.*, *Moss*, *D. J.*, *W. A. R. E.*, *Dr. Engler*, *Berlin*, *W. N. W.*, *B. E. J. J. W.*, *R. A. R.*, *W. A. C. THE PATENT

SILICATE MANURE.

This manure is chemically distinct from all
other Manures, and has been proved to supply
the place of sunshine, and has the power of
bastinging the colouring and ripening of Grapes,
Tomatoes, Peaches, &c., beyond any other
Manure.

September 29, 1891.

"I am very pleased with your Silicate Manure. The effect
upon the Vines is very marked, for they ripen and colour much
better. Your Manure has given me great satisfaction for
Tomatoes; it is all you claim for it."

(Signed) **THOMAS PRICE,**
Gardener to the Bishop of St. Asaph.

Prices in Sacks, at Works, 10s. per cwt.; £2 per
½ ton; £3 15s. per ¾ ton; £7 per ton.

"PICRENA" THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sir, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 90°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear Sir, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons."

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN, I have given your Insecticide, 'Picrena,' a good trial in competition with many others, I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Made by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other blight, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

WANTED, IMMEDIATELY, a young man,
about 25 years of age preferred, as CHRYSANTHE-
MUM GROWER in a nursery; one capable of taking entire
charge of this department, propagating, and growing good
exhibition blooms. None but those seeking a permanent
situation need apply. State previous experience, salary
expected, &c., to M. A. J., Gardeners' Chronicle Office, 41,
Wellington Street, Strand, London.

WANTED, a SEEDSMAN.—One of the
leading Houses in America REQUIRES the services of
an experienced MAN, capable of taking charge of the Ware-
house Department. A good position will be given to an en-
ergetic thoroughly-experienced man. None other need reply.
Address by letter only, stating—age, experience, and references,
also salary required, to GARSDEN, Gardeners' Chronicle Office,
41, Wellington Street, Strand, W.C.

WANTED, a HEAD WORKING GAR-
DENER.—Must be well qualified. Cottage found.—
State wages and full particulars, to F. P., Farnborough
Station, S.W.R., Hants.

WANTED, as HEAD GARDENER.—An
energetic, practical, and obliging Man. He must
thoroughly understand his business, and be able to produce a
constant supply of Fruit, Flowers, and Vegetables. Garden
contains the usual quantity of Glass, and a Foreman is kept.
Preference will be given to a middle aged man without family.
Letters, with all particulars, to H. H. R. Gosden, 77, Tavistock
Street, Covent Garden, London, W.C.

TO GARDENERS.—Can any gardener RE-
COMMEND a good all-round man for the kitchen
garden, that understands the general routine, planting,
pruning, forcing, &c. To live in the lodge; wife to attend to
the gate, but without incumbency. His wages would be 15s.
per week, with lights and coal found, and a good garden.—
G. JESSOP, The Gardens, Hindlip, Worcester.

WANTED, a FOREMAN, for the Houses.—
Good practice. Abstainer preferred.—Copies of testi-
monials, &c., to Mr. GANT, Berwick Gardens, Shrewsbury.

WANTED, an UNDER FOREMAN, in the
Fruit and Rose Department. Must be well up in
Budding, Grafting, and Layering, and know Fruit Trees and
Roses well.—Apply, stating age and experience, to WILLIAM
BARROW and SON, Elvaston Nurseries, Borrowash, Derby.

WANTED, several active MEN, to work
under glass in a Market Nursery. Must be experienced
and wages required.—THOMAS ROCHFORD, Turford Hall
Nurseries, near Broomhouse, Herts.

WANTED, for the Houses, under the Fore-
man, an energetic young MAN, experienced in Fruit,
Wages, 14s. per week, botany, and Vegetables.—A. G.
NICHOLS, Nuacham Park Gardens, Abingdon.

WANTED, a strong active young MAN,
chiefly for the Houses.—Age 17 or 18; must have had
some experience.—Apply, J. COWARD, The Gardens, Haver-
some Priory, Sleaford.

WANTED, an industrious young MAN, as
JOURNEYMAN for the Houses. Wages, 17s. 6d.
per week, with botany, coal, and light.—Apply, stating age and
experience, to G. F. BROTHSTON, Miller
Field Gardens, Bingley, Yorks.

WANTED, strong, able young MAN, of good
character; one who can use the Spade, and who takes
an interest in the foundation of good Gardening, namely,
Outside Work.—W. C. LEACH, Albury Park Gardens,
Guildford.

WANTED, a young MAN, for small Nursery.
—Must be used to Growing for Market. State age,
experience, wages, and references to Mr. MAY, Old Office
Yard, Hampton Court, Middlesex.

WANTED, a young MAN, quick at Potting
and Tying, with a good knowledge of Market Work.
State wages, references, and when disengaged.—MARSHALL
BROS. and CO., Barnham, Bognor.

WANTED, two young MEN, thoroughly
experienced in Falmes and Ferns. Must be quick and
energetic. Also one as STOKER, and to be generally useful.
—J. ROCHFORD, Page Green Nursery, South Tottenham.

WANTED, an IMPROVER in a Provincial
Nursery; 8s. per week. No objection to a foreigner.
—H. H. MOORE, Chichester.

WANTED, a JUNIOR ASSISTANT, for the
General Seed and Bulb Trade. Good writer, accurate,
active, and of good address.—Apply, with references and wages
required, to R. P. K&R and SONS, Bassett Street, Liverpool.

WANTED, a young man, as CLERK and
BOOK-KEEPER.—Must have excellent testimonials.
One with a knowledge of the Cut Flower and Plant Trade
preferred.—Apply, in own handwriting, and state wages
required, to MARSHALL BROS. and CO., Barnham, Bognor.

WANTED, as SHOPMAN, a young MAN,
with good experience in Country Business.—Apply,
stating full particulars, to R. E., Hurst & Son, 152, Houn-
ditch, London, E.

WANTED, an ASSISTANT SHOPMAN.—
Must be well-up in Fencing.—HARRISON and
SONS, Seed Merchants, Leicester.

WANTED, an ASSISTANT SHOPMAN.—
Reply, stating age, experience, and wages expected
to SHOPMAN, Messrs. Hurst & Son, 152, Houndsditch, E.

DICKSONS, Royal Nurseries, Chester (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at all businesses. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

THE LIVERPOOL HORTICULTURAL COMPANY (JOHN COWAN), Limited, The Vineyard and Nurseries, Garston, near Liverpool, wish to recommend to any Nobleman or Gentleman who may require a thoroughly competent and reliable HEAD GARDENER, David Lindsay, who was Head Gardener for the last twelve years to the late Sir Thomas Edwards Moss, Bart., of Otterspool, near Liverpool.—Full particulars on application to the Company.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWDIE, Sec-Man, 144, Princes Street, Edinburgh.

GARDENER (HEAD), where several under are employed.—Age 40, married, one boy 19 years; open to engage with Lady or Gentleman requiring the services of a good all-round practical Gardener. Excellent testimonials for fourteen years as Head Gardener.—W. S., 305, High Street, Acton, W.

GARDENER (HEAD).—A Gentleman recommends an energetic, sober, industrious, reliable man. Skilled in Stone Plants, Orchids, Decorating, Forcing Choice Fruits, Flowers, and Vegetables. Master of his work all round. Won over 100 prizes.—F. E., 20, Oxford Terrace, West Norwood.

GARDENER (HEAD).—F. GRESON, Gardener to the Earl of Egmont, will be pleased to recommend to any Lady or Gentleman a practical man, thoroughly experienced, and capable of the Management of Men, and the usual routine of a good establishment.—Cowdrey Park, Midhurst.

GARDENER (HEAD).—Age 46, married. Life experience in all branches, Land and Stock (fifteen years as Head). Excellent character and testimonials.—A. B., 3, Ferness Cottages, Stanley Road, East Sheen.

GARDENER (HEAD).—Age 40, married, two children. Practical experience in all branches. Nine years' charge of large establishment, leaving through death.—A. GORDON, Manor House, Shepperton, Middlesex.

GARDENER (HEAD).—Age 36, married. A LADY can recommend a steady, sober, respectable man, well up in all branches of his profession.—G. L., 111, Paget Street, Loughborough.

GARDENER (HEAD), age 39, desires re-engagement in a Nobleman's or Gentleman's Establishment. Gardeners' good character from last employer.—O., Caldwell & Sons, Knutsford.

GARDENER (HEAD), where several more are kept.—Age 41. A gentleman wishes to recommend a man who has been with him for the last fifteen years. Well up in Orchids, Ferns, Stone and Greenhouse Plants, and forcing of Fruit, Flowers, and Vegetables.—E. S., 20, Argyle Terrace, Bognor.

GARDENER (HEAD).—Age 36, married, no family; thoroughly practical. Stone and Greenhouse Plants, Orchids, Vines, Peaches, Decorating, Forcing, Fruit, Kitchen, and Flower Gardens. Testimonials with reference to sobriety, honesty, and ability.—A. B., 21, Fort Royal Hill, Worcester.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 40, married.—Mrs. KENYARD can thoroughly recommend her Gardener. Life experience to Gardening. Ten years' good character. Leaving through a death.—G. HENLEY, Thatched Cottage, Hampton Wick.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 33.—A GENTLEMAN can confidently recommend his Gardener; thoroughly practical in all branches. Perfectly trustworthy, and of satisfactory reasons for leaving.—T. NASH, Brewery, Isleworth, Middlesex.

GARDENER (HEAD WORKING).—Age 30, married, one child; fifteen years' experience in all branches. Private or Nursery. Used to Early Forcing, Hard and Soft-wood Propagating.—J. GOODE, 33, Stanley Road, Fulham, S.W.

GARDENER (HEAD WORKING).—Age 41, married. Over thirty years' practical experience in all branches. Fifteen years as Head. Vines, Peaches, &c., Stone and Greenhouse Plants, Flower or Kitchen Gardens. Good character. To PARKER, Potter's Pond, Wotton-under-Edge, Gloucestershire.

GARDENER (HEAD WORKING).—Age 30; fifteen years' practical experience in all branches. Well recommended.—W. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING).—Age 39. Single. Thoroughly experienced in all branches. Excellent references and testimonials as to character and ability. Address, stating particulars, GARDENER, 5, Upper Peljar Road, Woolwich.

GARDENER (HEAD WORKING).—Scotch.—Age 34 married; thoroughly experienced in all branches, also Stock. Leaving through death of employer. Highest references.—S., The Gardens, Beaulieu, Winchester Hill, N.

GARDENER (HEAD WORKING), where three or four are kept.—Age 32, married, small family; thoroughly practical all-round, including Pines, Vines, Peaches, Apples, Cucumbers, Early and Late Forcing, Orchids, and Greenhouse Plants, Flower and Kitchen Gardens.—G. B., 2, Rice Terrace, Cavendish Road, Angel Road, Upper Edmonton, near London.

GARDENER (HEAD WORKING), where three or more are kept.—Married, no family; thoroughly practical in all branches of Gardening. Five years in last situation, and fourteen years in previous one.—C. SAYER, Bramley, Guildford.

GARDENER (HEAD, or otherwise).—Age 35, married; twenty years' experience in Stone and Greenhouse Plants, Vines, Peaches, Mignon, Flower and Kitchen Gardens. Excellent testimonials and character.—S. B., West Mill, Buntingford, Herts.

GARDENER (HEAD, or with Help).—Thoroughly practical in Stone and Greenhouse Plants, Kitchen, Flower, and Laying-out Gardens. Wife experienced Cook and Landress (age 31 and 37 respectively).—H. M., 81, Cleveland Road, Surbiton, S.W.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 26. Thoroughly competent in all branches. Good character from present and previous employers.—G. B., Smith's Library, 25, Hill Road, Wimbeldon.

GARDENER (good SINGLE-HANDED).—Age 35, married. Good all-round man. Chrysanthemums a speciality. Good character. Life experience.—J. MARSHALL, Hillcrest Cottage, College Road, Kewslai, Surrey.

GARDENER (SINGLE-HANDED, or SECOND).—Ten years' experience with Tomatoes, Cucumbers, Melons, &c.—A. BEALE, 58, Garland's Road, Redhill, Surrey.

GARDENER.—Understands Kitchen and Flower Gardening, Carpet Bedding, Stone and Greenhouse Plants, Vines, Cucumbers, Melons, &c. Fourteen years' experience. Good references. State wages, &c.—D. WALTON, Beighon, Rotham.

ORCHID GROWER, or GARDENER (HEAD WORKING). Twenty-six years' general experience.—W. PARSONS, eight years with the late Mr. Bath, North Cray, two and a half years with General Hutchinson, is open to an engagement.—Victoria House, Triangle, Bournemouth.

GARDENER (SECOND), Inside and Out, or JOURNEYMAN, in the Houses.—Age 23; good character. Total abstainer.—G., 30, White Road, Vicarage Lane, Stratford, E.

GARDENER (UNDER).—Three years' experience, Indoor and Out. Wishes to improve, and has good character.—F. SELTIEY, 12, Columbia Street, Cheltenham.

GARDENER (UNDER, or SINGLE-HANDED).—Age 21; good knowledge Inside and Out. One year ten months' good character.—A. CHALLIS, 38, Ravenshaw Street, West Hampstead.

GARDENER, where two are kept, or FOREMAN, in a good establishment.—Age 15, single; previously with Mr. Paddon, Bramley Park.—HINSTEAD, 4, Haslemere Villas, Fuller Road, West Brompton.

PROPAGATOR and GROWER.—Roses, Rhododendrons, Clematis, Bedding and General Nursery Stuff. Practical experience in some of the leading Nurseries.—H. L., 55, Natal Road, Streatham, S.W.

PROPAGATOR or FOREMAN.—Age 25; nine years' nursery experience. Ferns, Palms, Stone, Softwooded, and General Growing; Wreaths, Bouquets, Decorations, Sales, &c.—ALCOCK, 42, Victoria Road, Burton-on-Trent.

To Nurserymen.

PROPAGATOR and GROWER.—Cucumbers, Tomato Plants, and Cut Flowers for Market. Twenty-five years' trade experience.—GROWER, 2, Nursery Place, Northwood Road, Upper Clapton, London, E.

To Nurserymen.

PROPAGATOR and GROWER (ASSISTANT).—Age 21; nine and a half years' experience with all kinds of Hard and Soft-wooded Plants, the Grafting of Roses, Marigolds, and the Double Primula, Cyclamens, Bourdains, Roses, Chrysanthemums, Palms, Ferns, Eucharis and plants usually found in Nurseries. Well up in Bouquets, Wreaths, &c. Excellent testimonials. State wages given.—C. S., 5, Hextable Cottages, Hextable, Kent.

PROPAGATOR and GROWER.—Age 25; eleven years' experience in growing Foliage and Soft-wooded Stuff, Tea Roses, Ferns, Grapes, &c.—F., 1, Baltic Terrace, Portladies, Sussex.

FOREMAN (GENERAL), in large establishment.—Age 30. Experienced in all Departments. Sober, energetic, and capable of taking charge of men. Excellent recommendations.—G., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOREMAN, or PROPAGATOR and GROWER.—Married; nineteen years' experience in growing large quantities of Plants and Cut Flowers for Market, such as Double Primula, Cyclamens, Bourdains, Roses, Chrysanthemums, Palms, Ferns, Eucharis and plants usually found in Nurseries. Well up in Bouquets, Wreaths, &c. Excellent testimonials. State wages given.—C. S., 5, Hextable Cottages, Hextable, Kent.

FOREMAN (GENERAL).—Age 29. Sixteen years' experience in first-class Gardening, including Tree and Shrub Planting. Highly recommended.—ABSTAINER, Mr. Worford, Stationer, Poole.

FOREMAN.—WALTER MARSHALL, Little Sutton, Chester, previously foreman at Guy's Cliffe, Warwick, also Only Park, Salop, would be pleased to hear from any Head Gardener requiring a Foreman.

FOREMAN, in the Houses, or SINGLE-HANDED, where there is Glass.—Age 15, married when sold. Good character from present place.—W. G. WORKS-FOLD, Rose Cottage, Hasely, near Warwick.

FOREMAN, in good establishment.—Age 27; thirteen years' good practical experience. Good references.—M., 19, Bemark Road, Hightate Hill, London, N.

FOREMAN, in the Houses, in a good Establishment.—Over twenty years' present situation as Foreman. Good character from present and previous employers.—J. WELLS, Sherfield Manor, Basingstoke.

JOURNEYMAN, Inside and Out, in a good establishment.—Age 21; four years in present place. Good reference. Both preferred.—W. BUTTERFIELD, The Hoe Gardens, Welwyn, Herts.

JOURNEYMAN, in the Houses.—Age 20; five years' experience. Well recommended. Left through reduction of establishment.—B. MARSH, Sturton-le-Steeple, Lincoln.

IMPROVER, under a good Gardener.—Age 19; five years' experience. Good character.—Both preferred.—C. F., Bushey House, Jerington Road, Eastbourne.

TO HEAD GARDENERS.—Wanted, an engagement under Glass, where one fond of the work can prove useful to the above, and improve himself. Five and a half years' experience in Fruit, Flowers, Orchids, Ferns, Stone and Greenhouse, in large establishment.—Excellent references. Age, in 20th year. Total abstainer.—H. J. SMITH, London Fern Nurseries, Longbarn Junction, S.W.

TO GARDENERS.—Situation wanted by a young man (age 21), as JOURNEYMAN, in the Houses; five years' experience, Inside and Out.—Apply to Mr. LEACH, Gardener, Albany Park, Guildford, Surrey.

TO GARDENERS.—Wanted, by a respectable Lad, age 16, situation in Gentleman's Garden. Two years' experience in Stone and Greenhouse. Both preferred. J. CURRY, Milford Hill, Salisbury.

TO NURSERYMEN.—Situation wanted, by a Youth, age 18, who has had four years' experience in a Nursery, Inside Department.—J. C. ELLISON, The Dell Nurseries, Rock Ferry, Cheshire.

TO NURSERYMEN.—Situation wanted, by a practical man, as WORKING MANAGER, in Outdoor Nursery, with a view to ultimately becoming Partner.—A., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

TO NURSERYMEN and FLORISTS.—A young man (20) requires a situation in the Houses. Five years' experience.—H. S., 3, St. John's Park Terrace, Winchester.

TO MARKET GROWERS.—MANAGER.—Experienced in Grapes, Tomatoes, Cucumbers, Chrysanthemums, Palms, Ferns, Cut Flowers, Grafting, Tea Roses, Clematis, &c. Twenty years' experience.—REX, 1, Grove Road, Mitcham.

TO MARKET GROWERS.—Wanted, situation as FIREMAN. Age 32.—A. B., 14, Stamford Terrace, Stoke Newington, N.

TO SEEDSMEN and FLORISTS.—Situation required as ASSISTANT in Florists and Seed business.—Age 26; practical knowledge of Nursery Work, Book-keeping, &c. Excellent references.—G. F., 24, Kingsbury Road, Brighton.

SHOPMAN, SALESMAN, or MANAGER.—Age 28; experienced in Wreaths, Bouquets, Plants, Seeds, Sundries, Book-keeping, and is a good salesman. Excellent references. Moderate salary.—H. A., 65, Solon Road, S.W.

SHOPMAN.—Age 25. Nine years' experience. First-class reference.—Used to brisk counter trade. Abstainer.—EDWARDS, 275, Stamford Street, Ashton-under-Lyne.

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references. State particulars.—W. HARRIS, Hammerwood, East Grinstead, Sussex.

SHOP-ASSISTANT, or IMPROVER, in the Houses.—Situation wanted by young man (age 10, total abstainer) as above. Two years' experience both ways. Wages 16s. per week.—J. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

PACKER (HEAD), well up in general Packing, Nursery, and Seed Warehouse. Good references.—J. H., 79, Tunis Road, Shepherds' Bush, W.

HOLLOWAY'S OINTMENT and PILLS.—Rheumatism and Neuralgia.—Though the former disease remorselessly attacks persons of all ages, and the latter is usually self-cured, it is nevertheless a fact that the persevering use of the remedies will infallibly cure both complaints. After the affected parts have been diligently fomented with hot brine, and the skin thoroughly dried, Holloway's Ointment must be rubbed in firmly and evenly for ten minutes twice a day, and his Pills taken according to the printed directions wrapped round each box of his medicine. Both Ointment and Pills are accompanied by instructions designed for the public at large, and no invalid, who attentively reads them, can now be at any loss how to doctor himself successfully.

DIXONS' SUPERB GIANT CINERARIA.

THE Strain from which our Seed is taken is unique, and the result of many years' careful cross-breeding—"not mere selection, which in most cases is carried out without due regard to consanguinity, or a strictly definite object in view; the result, weakened power of germination, a constitution not at all strong, indefinite and washy colours, and very many other defects."

Our Strain has been brought to its present perfection by the most careful selection in the first instance, followed by a system of crossing carried on strictly scientific principles, by which we have obtained results unrivalled in this class of plants.

The Habit is sturdy, yet not wanting in grace; it is sufficiently branching to show the true character of each flower to the best advantage, a feature

REPRODUCED FROM A PHOTOGRAPH.

which has been the aim of the raiser. The flower heads are very large in proportion to the size of pot in which the plants are grown.

The Flowers are very large; some have measured from 3 to nearly 4 inches in diameter. The petals are stont and beautifully formed, a point which is seldom gained with very large flowers.

The Colours are of the most varied hues, ranging from pure White to the most intense Crimson and Blue, with a well-balanced proportion of self and parti-colours.

The Plants being vigorous, yet not tall and lanky, they will be found most valuable to the amateur and market gardener alike.

We have no doubt that when our Strain is better known, it will become the favourite.

In Sealed Packets, 1s. 6d., 2s. 6d., and 5s. each, Post-free.

PRICE TO THE TRADE ON APPLICATION.

SALES BY AUCTION.

ABSOLUTELY WITHOUT RESERVE.

GREAT CATTLEYA SALE.

JANUARY 15, 1892,

AT

MESSRS. PROTHEROE AND MORRIS' Rooms, 67 and 68, Cheapside, E.C., at half past 12 o'clock, by order of Mr. F. Sander, including—

2000 PLANTS OF CATTLEYA LABIATA,

Without Reserve. Also a CATTLEYA SPECIES, in superb condition, from a hitherto unexplored district of Columbia. Our Collector encountered almost insurmountable difficulties in getting this lot of plants together, and suffered many hardships and risks before his efforts were successful.

These plants come from the almost inaccessible mountains of Santiaqui, a most perilous journey, and not lightly to be undertaken, owing to the hostile attitude of the neighbouring tribes, as well as the rugged and precipitous gorges that had to be explored.

The flowers of this wonderful Cattleya are white, with a red labellum, richly fringed, and will be a grand addition to the already richly-endowed Cattleya family.

EVERY PLANT IS OFFERED, AND WITHOUT RESERVE. Also a MAGNIFICENT LOT OF CATTLEYSAS FROM THE WHITE AUREA DISTRICT (C. IMSCHOOTIANA).

Our collector states that the varieties to be found among these plants surpass in loveliness anything seen. The varieties, Dryadocystis, Immschodiana, Hardyana, margarita, Massianae, are quite eclipsed.

DRIED FLOWERS WILL BE SHOWN ON THE DAY OF SALE. EVERY PLANT IS OFFERED, AND WITHOUT RESERVE. A CRIMSON AND YELLOW CATTLEYA, with gigantic buds, distinct, and most extraordinary.

Only six plants.

We leg to draw special attention to this marvellous-looking Cattleya.

There will also be included in this Sale a magnificent lot of DENDROBIUM NOBILE, many grand and perfectly-formed masses. The forms are stated by our Collector to be brilliant and varied, with a range of colour hitherto unsuspected in this lovely and most useful Dendrobium.

EVERY PLANT IS OFFERED, AND WITHOUT RESERVE. Also

CYPRIPEDIUM INSIGNE, UPPER BURMA VARIETY.

A yellow one, just in flower, will be on view. We believe this will be even more productive of grand varieties than the mountain section, which has produced such beauties as Sanders, Saccarum, which has produced such beauties as Sanders, Saccarum (now in flower with Baron Schroder), also-sepalum, Bohufulum (white upper dorsal), and

This region has never been visited by any collector before, and it is more than probable that quite new and magnificent types of this widely-distributed species are to be found amongst the plants now offered.

Also a DENDROBIUM SPECIES from northern Queensland, very free-flowering, producing as many as twenty flowers on a single inflorescence; the colour is rose-crimson, quite distinct from D. phalaenopsis Schraderianum or D. Leeanum.

Also a grand lot of DENDROBIUM WARDIANUM, Sander's superb large-flowered form.

A CATASEPUM, SP. NOVA, FROM THE RIALTO.

VANDA OERULEA—Hill Variety.

Compact healthy plants, and probably the largest and darkest form ever seen of this beautiful variety.

EPIDENDRUM WATSONIANUM, N. SP.

From the old habitat country; flowers yellow, buff, and lilac; inflorescence very large, tree-growing and free-flowering.

CATTLEYA SP., resembling Schofieldiana in habit. The variety called Du Baysianum exists among these plants.

Also many other choice, rare, and valuable C. CHIDS.

On view morning of Sale, and Catalogues had.

Friday Next, January 15.
A NEW GOLDEN-YELLOW FLOWERED FORM OF
CYPRIPEDIUM INSIGNE.

MESSRS. PROTHEROE AND MORRIS have been instructed by Mr. F. Sander to SELL BY AUCTION, at the above place, a NEW GOLDEN-YELLOW form of CYPRIPEDIUM INSIGNE, from the importation received last year.

Friday Next, January 15.

MESSRS. PROTHEROE AND MORRIS have been instructed by Mr. F. Sander to include in above SALE—A WONDERFUL FORM OF ODONTOGLOSSUM NEBULOSUM, the MOST BEAUTIFUL EVER SEEN.

Friday Next, January 15, 1892.

A new and beautiful variety of

EPIDENDRUM GODSEFFIANUM.

MESSRS. PROTHEROE AND MORRIS have been instructed, by Mr. F. Sander, to include in their SALE, without reserve, on FRIDAY NEXT, January 15, a quantity of

EPIDENDRUM GODSEFFIANUM.

NEW SPECIES.

In extraordinary condition and masses. This is a very beautiful Epidendrum just to hand, and one that will become, when known, justly popular, the flowers are nearly 2 inches in diameter, and very round, the flower-spikes carry themselves well above the foliage, and are 18 inches high, producing from ten to twenty their large flowers each, the sepals and petals are ovate oblong, of a lovely pale buff colour, veined with very light chocolate, the lip which is nearly an inch long and broad, is rose-white.

Orchid Sale.—Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in the above Sale,
1000 fine TUBES of the brilliantly-coloured Climber
GLORIOSA SUPERBA,
in splendid condition.

Monday Next.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at their Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY NEXT, January 11, at half past 11 o'clock, 1000 CARNATIONS and PICOTEES, PERENNIALS, SPIREA JAPONICA, PALMATA and ELEGANS; 1000 AMERICAN PEARL TUBEROSES; 2000 GLADIOLI LENOIR in great variety, DAHLIAS, a large variety of BEGONIAS, HARDY CLIMB JAS, and an immense number of HARDY PLANTS and BULBS.

On view morning of Sale, and Catalogues had.

Wednesday Next.

40 lots of GREENHOUSE and STOVE FERNS; PALMS in variety; DOUBLE and SINGLE BEGONIAS; 330 STANDARD, HALF-STANDARD, and DWARF ROSES; a quantity of English-grown LILIES in variety; HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other DUTCH BULBS; COCOS WEDDELIANA SEEDS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, January 13, at half past 11 o'clock.

On view morning of Sale, and Catalogues had.

Thursday Next.

1000 LILIUM AURATUM, 500 lots of HERACROUS PLANTS, also BEGONIAS, DAHLIAS, GLADIOLI, CARNATIONS, PICOTEES, PERENNIALS, &c.; 200 lots of HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other DUTCH BULBS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Rooms, 67 and 68, Cheapside, E.C., on THURSDAY NEXT, January 14, at half past 11 o'clock.

On view morning of Sale, and Catalogues had.

Wednesday Next.—(Weather permitting).

500 Standard and Dwarf ROSES, FRUIT TREES, a good Collection of BORDER PLANTS, HARDY ORNAMENTAL SHRUBS and CONIFERS, 50,000 LILY OF THE VALLEY, 50,000 SPIREA, 50,000 fresh KENTIA SEEDS, 10,000 COCOS WEDDELIANA, 10,000 TUBEROSES, LILIUM AURATUM from Japan, and a large quantity of DUTCH BULBS.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, January 13, at half past 12 o'clock precisely (weather permitting).

On view morning of Sale, and Catalogues had.

THOMAS B. JAMES (many years with Protheroe & Morris) holds WEEKLY SALES at his Rooms, 12, Bull Ring, Birmingham, of BULBS, PLANTS, NURSERY STOCK, &c., every Monday and Friday, at 4.30 P.M. Sales of choice Cut Flowers. Fresh Entries invited. Account Sales and cheques daily. Empties and labels found.

Horeham Manor Market Gardens and Farm, Waldron, Sussex, nearly adjoining the Horeham Road Station, on the L. & S. & C. Railway.

MR. J. FLUMER CHAPMAN has been instructed by the Hon. John Lubbock, Esq., of Coyle, who is selling the whole of the Market Garden and Greenhouse Plants, to SELL BY AUCTION, on the Premises, as above, on WEDNESDAY, January 13, 1892, the CONTENTS of the GREENHOUSE, S. comprising 1000 very finely-grown Maidenhair Ferns, 600 Arum Lilies, many being in blossom; Camellias, Azaleas, Valloets, Cyclamen (in full bloom), and other pot plants; several thousand young Red and Black Currant Trees, Gooseberry canes, and Rose Trees, about 6 acres of Paxton and Eton Pine Strawberry Plants, Cucumber Frame, Garden Stakes, 50 sacks of Carter's Imperial Ash-leaved Potatoes, Ransome's Lawn Mowing Machines, Burford & Perkins Water Ballast Hand Roller, Tanks, Greenhouse Fitting, &c., quantity of Flower Pots, in sizes; Water Cans, and Garden and Greenhouse Requisites.

Catalogues obtained of the Auctioneer, 63, High Street, Lewes, Sussex; and commissions faithfully executed by the HEAD GARDENER, The Lodge Cottage, Horeham Manor, Horeham Road, Sussex.

R. OWEN, Floral Nursery, Maidenhead.

CANNELL'S BEGONIAS.

Three Great Victories: The Temple, Crystal Palace, and Edinburgh last year.

At the first-named Great Show we were awarded by the Royal Horticultural Society, as a mark of great excellence, a Gold Clock, an unprecedented and highest prize yet given to this family. Like all our plants and seeds there are none to equal them for real excellence, and as a proof we have received probably more First-class Certificates of merit for diverse varieties than all other growers put together; for full particulars see our Floral Guide, a book of reference, and contains the most accurate information on flowers throughout the world, and is valued for such in preference to all others. Sent post free to intending purchasers.

MR. W. NELSON, Ficksberg, Orange Free State, South Africa, September 2, 1891.

"I have just returned from a tour of some 600 miles through the Free State and Transvaal, and as I had, as a matter of course, a copy of your Floral Guide with me, I feel that I ought to thank you for the rich stores of solid and interesting information contained therein. Many were the hours which it helped to while away, it being so thoroughly characteristic of true British florists."

SWANLEY, KENT.

For PLEASURE and PROFIT.

BARR & SON, 12, King St., Covent Garden, London.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country: an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

SATURDAY, JANUARY 9, 1892.

THE MULBERRY.

THE question was put to me a short time since—"Why did Pliny term the Mulberry the wisest of trees?" The reason is not far to seek; it is because it is late in unfolding its leaves, and thus escapes the sometimes dangerous frosts of early spring. To this day the Gloucestershire folk have a saying that, after the Mulberry tree has shown its green leaves, there will be no more frost. It is quite the end of May, and in some seasons later, before the branches clothe themselves with verdure, and then danger from frost is well-nigh past.

That the Mulberry was well known in ancient times there can be no doubt. It is mentioned by the early Greek writers, and by the Roman also. All these writers are supposed to refer to the Black Mulberry, *Morus nigra*, which, in all probability, some writers say must have been the species first employed for feeding the silkworm after its introduction into Western Asia and the South of Europe. Dr. Prior tells us we get the German name Mulberry by the change of "r" to "l" from the Latin *morus*, a word of unknown origin, and which was introduced into Greece with the tree.

The native country of the Mulberry appears to be doubtful (Persia?). But that the original seat was South-western Asia is, as Mr. Leo Grindon states, eminently probable. He further states that no reference to the Mulberry, as understood in modern times, occurs in the Old Testament Scripture, but that it is mentioned in the New under the Greek name of Sycamine, in Luke xvii. 6. "When the tree was originally brought to England is unknown; but seeing that the Anglo-Saxons had a name for it—*Morbeam*, literary *morus-tree*, it may have been introduced by the Romans. And he goes on to say, "or as Charlemagne, that great patron of the useful, ordered it to be grown upon all the imperial farms, it may have been during his reign, say about A.D. 812, that this tree was first carried across the English Channel by Saxon visitors to the continent. "Mor" got changed into "Mul" by a process of permutation of sounds, exceedingly common in the annals of language, and "beam," = tree, would very naturally in the case of a fruit tree give place to "berry," though the Saxon is retained to this day in Hornbeam and Whitebeam.

The Mulberry, as already mentioned, is one of the latest trees to put forth its leaves. It appears to be susceptible of cold, for it is said to drop every leaf on the night of a severe frost. This has led to its culture against walls, a method

generally adopted in the north, as, owing to the lateness of the tree itself, and the retarding influences of the northern climate, the fruit does not ripen in the autumn except in a favourable season. Trees planted against a south wall are found to produce much finer fruit, and of a decidedly better flavour. When planted in the open, it does best in a good rich loam; and if only to accelerate the ripening process, needs an open sunny position. One can quite understand the old method of planting Mulberry trees on grass, so that when the fruit falls, it should not be damaged as it would be if it fell upon gravel or hard soil. Mulberry trees are generally grown as standards, which is, taking all things into account, the most convenient form. Some fruit-tree nurserymen, if propagating the Mulberry, grow stools, as they are called, and the young growths, after they have become hard enough, are layered in the autumn; the layers remain down for two years, when they are potted, and tied to stakes—but it requires another four years or so before they become large enough to plant out. A vigorous tree seldom exceeds, when fully developed, 30 feet or so in height; the branches are thick, and the general form close and rounded. The rough, coarsely-serrated, and dark green leaves, though usually cordate, are prone to curious changes, often becoming irregularly three or five-lobed. The flowers are produced in separate clusters, yellowish-green in colour, and, like the globular green heads of female flowers, contemporaneous with the young foliage. The tree is of great durability, and seems to be wonderfully tenacious of life. It is remarkable for the density of the shade it affords; it is capable of enduring the smoke of towns. It is an excellent tree for suburban gardens, and will thrive even in little corners among warehouses in cities." Its longevity is illustrated by the examples at Syon and elsewhere, which, it is believed, were planted as far back as 1548. So vigorous and tenacious of life is the tree, that the underside of a trunk of a branch lying on the ground has been known to strike root in the soil, while the branches on the upper side have borne and ripened fruit. This was illustrated some years ago at Syon, where a branch fell from the decaying parent trunk on to the grass, put forth roots, and became a tree bearing fruit.

Our favourite Mulberry is the black. The fruit is distinguished for its sweet sub-acid taste, with a very agreeable aroma superadded. When doing well, the tree is a very heavy cropper. *R. D.*

NEW OR NOTEWORTHY PLANTS.

LEPTOTES BICOLOR, *Lindl.*, var. BREVIS,
n. var.

AMONG a batch of the ordinary form of *Leptotes bicolor*, Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, have introduced a very distinct and pretty little plant, which, though differing both in shape and colour from the typical form, must, I think, be considered a variety of the same, and may be distinguished as above. It has quite the habit and general character of *L. bicolor*, but differs in the following characters. The sepals are only 10 lines long by 3 lines broad, oblong-linear, and subacute. The petals are similar, but a little longer and narrower below. The front lobe of the lip is broadly elliptical in shape, very obtuse, 6 lines long by nearly as broad, and the colour pure white, not purple. The side lobes are very light green, and, as usual, embrace the very short, dark-green column. The only trace of purple is a very minute and faint streak on either side of the two

minute fleshy calli at the lip's base. There is a single dried specimen at Kew, together with the ordinary form, which is very similar to the present one in shape, but it has the purple on the front lobe of the lip, as in the ordinary form; which circumstance seems to show that the species is somewhat variable, and must include the one now described as a variety, though at the first glance it appears to be quite distinct. It is a pretty little plant, much like a minute *Brassavola*. *R. A. Rolfe, Kew.*

"ELECTRO-CULTURE."

IN the two articles which the *Gardeners' Chronicle* has devoted to this subject, "the influence of electricity upon plant life" is made to include two things, which it seems to me are perfectly distinct and unconnected with one another:—1, the effect of electric light upon vegetation; 2, the influence of electric currents upon growing plants. With respect to the latter matter, our knowledge of an exact kind is at present very scanty. Sachs, who has given especial attention to it, sums up what is to be said in the following passage in his *Lectures on the Physiology of Plants*

DR. W. R. WOODMAN.

We are now enabled to give a portrait of this gentleman, an obituary notice of whom was given at p. 25.

(English Translation, p. 201.) "Relatively little is as yet known concerning the influence of electricity on the life of the plant. . . . In general all that can be said is, that very feeble constant currents or induction shocks during short periods produce no visible effects on protoplasm; but that, on the other hand, with a certain strength of the currents, disturbances appear in the protoplasm which resemble those brought about by a high temperature, and that with further increase of strength of the current, the protoplasm is killed." That electricity artificially produced is likely to be of any practical importance in either horticulture or agriculture, I, for my part, do not believe. However, I do not propose to discuss this further.

But what I want to point out is, that the effect of electric light upon vegetation is perfectly independent of electricity. The electric current in passing through substances which offer resistance to its passage raises their temperature, and ultimately renders them incandescent; they then become intense sources of light. But the light though produced by electricity, and, therefore, in familiar language called "electric light," has nothing in any way electric about it; and

in point of fact, it might be produced by other means without calling in the aid of electricity at all.

The "effect of electric light upon vegetation" is therefore nothing more than the effect of artificial light of great intensity. When put in this shape there is really nothing novel about it.

It is now well known that all the rays of different refrangibility which make up the spectrum act with very varying degrees of effectiveness in the cardinal feature in plant nutrition—the decomposition of carbonic acid. The chemical action of light upon green plants is limited almost entirely to the red end of the spectrum. If we take the total amount of carbonic acid decomposed by white light to be represented by 100, the proportion represented by the different rays are the following:—red and orange, 32; yellow, 46; green, 15; blue and violet, 7. The yellow rays, in point of fact, are nearly as effective in vegetable nutrition as those of all the rest of the spectrum put together. It is no doubt true that many kinds of "electric light" are rich in so-called "actinic rays." But these are precisely those at and beyond the violet end of the spectrum which are least effective in plant nutrition.

In an article in *Nature* for March 11, 1880 (pp. 438 to 440), I gave a history of the experiments which have been made on the growth of plants under artificial light. The earliest were those of A. P. De Candolle in 1806, who experimented with the light of six Argand lamps: he found that this was sufficient to develop a green colour in Mustard- and Cress seedlings.

The first experiment with the electric light in connection with vegetation was made by Hervé Mangon in 1861. He succeeded by means of it in developing chlorophyll in young seedlings of Rye, but he did not succeed in demonstrating any chlorophyll activity by the evolution of oxygen.

In 1866, Wolkoff found that seedlings of Cress grown in the dark became green after eight hours' exposure to the flame of a Bunsen burner made luminous by sodium carbonate. This was a crucial experiment as far as showing that the production of chlorophyll was independent of the so-called chemical rays of the spectrum. A few years later, Prillieux completed the demonstration of the competence of light from artificial sources to perform all the sun could do as regards the decomposition of carbonic acid, by showing in M. Jamin's laboratory at the Sorbonne that oxygen was evolved by a water plant, whether illuminated by the electric light produced by a magneto-electric machine, the Drummond light, or even gas-light of sufficient intensity.

That in the processes of plant-life, sun-light can be replaced by light from artificial sources is, therefore, beyond dispute. Whether it is practically advantageous to use the so-called electric or any other form of artificial light in horticulture, literally reduces itself to the question whether the "game is worth the candle?" But in employing any form of arc-light, two things should be borne in mind. First, that it emits a very considerable amount of obscure heat, the effects of which, in producing scorching, it appeared to me at the time, Sir William Siemens did not fully appreciate; secondly, that, as was stated in the discussion at the Royal Society, it oxidises the nitrogen of the atmosphere, giving rise to various oxides of nitrogen, the effect of which on growing plants in a confined space would almost certainly be more or less injurious. For these two reasons, the introduction of any form of arc-light into greenhouses would require some caution. *W. T. Thiselton-Dyer, Royal Gardens, Kew.*

NOVELTIES OF 1891.

(Continued from p. 11.)

STOVE AND GREENHOUSE PLANTS.

ONE of the handsomest of these, is the crimson-spathed hybrid *Anthurium Burfordiense*, which was raised in the gardens of Sir Trevor Lawrence, and where are many others of doubtless equal merit,

but which are not yet in their true character. In these gardens the handsome white *Anthurium Laingii* was flowered better than it had before been seen; and a fine plant of the beautiful *Asparagus refractus* was exhibited.

As of yore, Messrs. J. Veitch & Son, Chelsea, were busy among home-raised novelties, and among these their new strain of *Streptocarpus* deserves special mention, forming, as these plants do, subjects which anyone may grow, neat of habit, rich and varied in colouring, and readily raised from seeds. In *Amaryllis* (*Hippeastrums*), Messrs. Veitch maintain their high place with some grand novelties,

beautiful in colouring, and, doubtless, useful for forcing. Of these, *A. m. fl.-pl. Mecene* is a fragrant double white, and *A. m. fl.-pl. Norma*, a light-reddish orange.

Of Messrs. B. S. Williams & Son's introductions, *Allamanda Williamsii* will prove a showy exhibition plant. Among their new *Cliveias*, *Prince of Orange* is distinct in colour, and among *Amaryllis*, *J. R. Pitcher*, a rich deep crimson-coloured novelty, is one of the best they have yet sent out.

Messrs. Geo. Paul & Son, Cheshunt, have a very distinct strain of *Amaryllis*, obtained from the best forms of the old type, such as *A. Johnsoni*, mar-

arrived strangers), demands notice as flowering at the Royal Gardens, Kew, viz., the wonderful *Aristolochia gigas* (*grandiflora*), which was so much admired by all who saw it; and from the same gardens, *Ornithogalum Saundersiae*, *Tulbaghia natalensis*, *Scilla laxiflora*, *S. Adami*, which flowered with Mr. Tillett; and the distinct pure white *Nerine paniculoides*, which flowered with that ardent lover of bulbous and Orchidaceous plants, R. A. Todd, Esq. *Chorizema Lowii* seems to be the brightest and neatest of the genus, and well worth growing in quantity. The three fine *Azalea indica*, *Pharailde Mathilde*, M. Labrousse, and *Princess Clémentine*, introduced by

FIG. 11.—VIEW ON THE MAGDALENA RIVER, FROM A SKETCH BY THE LATE A. BRUCHMULLER. (SEE P. 48.)

among which the beautifully-formed *A. Olivia*, a clear white with delicate rosy-red lines, and *A. Vandyke*, a grand deep scarlet, may be mentioned as examples of the best flowers that have ever been raised. Of their invaluable new strain of greenhouse *Rhododendrons*, *R. Ceres*, a finely-formed clear yellow, is a fair specimen; and the double forms of the favourite winter-flowering *Begonias* of the John Heal section will be looked forward to with interest, although, as they will have to be propagated by cuttings, some time must necessarily elapse before they can be sent out. Among greenhouse plants may be enumerated the double forms of *Azalea mollis* (are they pure *A. mollis*?), which have been exhibited by Messrs. Veitch, and which are very

ginata, and *Ackermanni pulcherrima*, which, by reason of their exquisite marking, and the large number of blooms on a scape, will find general favour with lovers of easily-grown showy flowers.

Messrs. F. Sander & Co., whose collectors are not unmindful of good ornamental plants when collecting Orchids, have in store several novelties in variegated plants, and have exhibited during the year the most elegant little Palm, *Cocos Pynartii*, and the showy *Crinum Roozenianum* of Messrs. Ant. Roozen & Son, of Overveen, Haarlem, who catalogue a most wonderful collection of miscellaneous bulbs, was described. One of the most extraordinary flowers of the year (which although a re-introduction, as are the greater part of the newly-

Mr. Charles Turner, of Slough, are distinct advances. The beautiful-flowered *Cannas*, exhibited by Messrs. Geo. Paul & Son, are fine subjects, either for the conservatory or the flower garden. Some new *Camellias*, and especially the soft pink variety, *Beauty of Waltham*, were shown by Messrs. W. Paul & Son, of Waltham Cross.

One of the most interesting plants exhibited during the last year was *Roridula dentata*, an elegant fly-catching plant, which had been raised by Mr. Lindsay at the Edinburgh Botanic Gardens; although probably difficult to propagate, it will most likely be easy to grow with *Ericas*, &c.

Among meritorious novelties in tuberous *Begonias* we have a long list from Messrs. Cannell & Son,

and Messrs. Laing & Son; some few new *Caladiums* from Mr. Bause and Messrs. Laing, which latter firm possess a finely-striped form of *Cordylina australis variegata*, and some *Cliveias*, which are improvements on previously existent forms.

PERNS.

So far as the hardy British species are concerned, these were excellently exhibited in quantity at the September 8 meeting of the Royal Horticultural Society both by C. T. Drury, Esq., and E. J. Lowe, Esq., when many new varieties were certificated; but most people considered *Athyrium f.-f.* *plumosum* Druryi the handsomest one shown. Of greenhouse kinds, mention should be made of the new crumpled-fronded *Pteris cretica crispata* of Messrs. Veitch & Sons, the elegant *P. serrulata* of G. F. Standford, Esq., Horsham; and the fine crested *P. tremula cristata* of Messrs. Smith of Worcester. And then we have as a re-introduction by the Fern specialists—Messrs. Birkenhead, of Sale, near Manchester—the handsome *Platycyrium Wallichii*, which was imported on this occasion, as on the last, by J. H. Gilbert, Esq. Messrs. Hugh Low & Co., Clapton, also announce *Davallia assamica*, a plant that will make a good subject for a basket.

As a subtypical plant, the *Nicotiana colosea* sent out by F. C. Heinemann, Erfurt, will probably be given a place in most gardens where sufficient space is allowed to display it to advantage, but those who plant it should be careful to give it a sufficient depth of good rich soil, and abundance of water in hot weather. It would not be fair to starve it, and then find fault with it for not coming up to expectation.

LILIES.

Messrs. Hugh Low & Co.'s *Lilium Wallichianum superbum*, imported from India, and distributed by them in such a large quantity during 1891, proves to be a distinct and handsome plant, producing its large showy flowers freely when it is growing in a pot, and flowers well, but keeps dwarfier in the open ground. Messrs. Low & Co. have two other new Lilies—*L. Lowii* and *L. claptense*, which appear to be good and distinct, but of which there are but few as yet imported.

Following the *Lilium Henryi* from China, which flowered at Kew last year, is another handsome novelty, *L. longiflorum chloraster*. Mr. T. S. Ware flowered the little-known *L. maritimum*, and other rare species; while contemporaneously Mr. C. G. Van Tubergen, Jan., the bulb grower of Haarlem, and C. B. Powell, Esq., of Southborough, Tunbridge Wells, seem to have raised a batch of seedlings from *L. Martagon* × *Hansonii*, of which Mr. Powell's plants produced some beautiful flowers in 1890, and again this year, at which time it also flowered with Mr. C. G. Van Tubergen, Jun., and was described by Mr. J. G. Baker.

HARDY PLANTS.

The first of the genus *Celmisia* has been imported by Messrs. J. Veitch & Sons, and it is hoped that its beautiful dwarf Aster-like flowers may grace our flower-gardens. Of the beauties of this genus, Dr. Kirk's notes, and the figures of C. Chapmani and C. vernicosa in the *Gardeners' Chronicle*, pp. 587, 731, vol. ix., 3rd series, give evidence. Messrs. Veitch also well exhibited *Indigofera Gerardiana* alba, *Elaeagnus pungens maculatus*, a beautiful and varied strain of *Aquilegia*, in which the yellows and orange-reds were specially fine; and who, together with Mr. C. G. Van Tubergen, Jun., of Haarlem, received First-class Certificates for the wonderful *Iris Gatesii*, a plant of which was also exhibited by Messrs. Barr & Son of King Street, Covent Garden, amongst their groups of *Narcissus* and other bulbous plants at the Royal Horticultural and at the Royal Botanic Society.

Among other fine plants from Messrs. Ware's nursery at Tottenham was the neat yellow-flowered *Iris Danfordia*. One of the most charming of plants of the past year for the open garden was the large blue-flowered *Myosotis Victoria*, of W. Marshall, Esq., of Bexley. It is to be hoped that this extra-

ordinary plant will freely bear seed, and so make its way into our gardens, where it is likely to become a lasting favourite.

Of bluish *Primroses*, a specialty of G. F. Wilson, Esq., of Oakwood, he has three new ones, of great beauty, in James Nimmo, a dark blue; *Covenanter*, a blue with red zone and yellow eye; and *Mary Erskine*, a delicate lavender-blue; and in the same field, Mr. R. Dean has two or three novelties, as well as good new *Pinks*, *Carnations*, &c. The hybrid *Sweet Briars* of Lord Penzance promise our gardens a new race of garden *Roses*, in which the colours are effective, and the foliage fragrant. In the other sections of *Roses* we have good novelties from various sources, and with which only a specialist can deal. The *Clematis* Snow-white *Jackmanni* of Messrs. Smith, of Worcester, is really what it purports to be; and M. Lemoine, of Nancy, sends us two fine double-flowered *Lilacs*, in *Madame Lemoine*, a fine white, and *Michel Buchner*, of whitish-lilac colour; a third novelty in *Lilac Léon Simon*, was exhibited by Messrs. G. Paul & Son, who also well displayed the pretty *Saxifraga* *Boydii*, and some other little-known hardy perennials. *Godetia*, white pearl, formed one of a batch of novelties sent out by Messrs. Carter & Co., High Holborn, would make a telling bed or a fine plant for sowing in herbaceous borders, after the manner in which the wise are in the habit of sowing to give variety and effect to the permanent herbaceous plant borders without disturbing the regular occupants; and for the same purpose the new strain of Eckford's *Sweet Peas*, and the wonderful new strain of *Gaillardias* of Messrs. Kelway & Son, Langport, Somerset, come in well; whilst their new novelties in *Delphiniums*, *Gladioli*, *Pæonies*, &c., which have been seen in quantity at most of the leading flower-shows, are up to their usual high standard of quality. Among the host of contributors of new plants of merit may be named—Messrs. Hooper of Bath, and Turner of Slough, for *Carnations* and *Pinks*. Messrs. Cheal & Son, Ware, Turner, Geo. Paul, Cannell, Humphries, Keynes, Williams & Co., Rawlings, and G. Phippen, for *Dahlias* of all sections.

The following novelties were illustrated in the *Gardeners' Chronicle* in 1891:—

Aristolochia gigas (grandiflora), November 7, p. 553.

Celmisia Chapmanii, June 13, p. 731.

Celmisia vernicosa, May 9, p. 587.

Myosotis Victoria, August 8, p. 159.

Nicotiana colosea, January 17, p. 83.

Begonia tuberosa vittata, November 7, p. 561.

Aster White Comet, October 31, p. 525.

Gaillardia Lorenz's Perfection, November 7, p. 561.

Roridula dentata, September 26, p. 367.

Platycyrium Wallichii (figure inverted), December 12, p. 699.

HOTBEDS: HOW TO MAKE AND USE THEM.

ANTICIPATED as this subject undoubtedly is, it is but very imperfectly understood by many amateurs, who would like to raise their own Cucumbers, cuttings, &c., did they but understand the method of procedure; therefore, I shall endeavour to show those readers of the *Gardeners' Chronicle*, who, perhaps, may hitherto have failed, how they may succeed. The first step to take is to throw together to heat a good heap of stable-dung and leaves, using rather more of leaves than dung. This should be turned over twice within ten or twelve days to sweeten, and to allow of the rank steam escaping therefrom before making it into a hotbed. The ground on which the hotbed is to be made should be higher than that surrounding it, so as to prevent the lodgment of water under the bed. Where this is not the case, half-a-dozen faggots placed underneath the bed would answer the same purpose. The hotbeds are best made in front of a wall, fence, or hedge, having a south or west aspect, which will shield

them from the cutting north or east winds, which would otherwise cut into the frames as soon as a little air was put on, to the detriment of the plants growing therein. Make the bed a few inches larger than the frame which is intended to be placed upon it, and sufficiently high (about 6 feet at the back, sloping to 5 feet in the front) to allow of its subsiding, which will be to the extent of about one-third its height when finished. As the work proceeds, beat the dung and leaves well together with a five-pronged fork, and if a few old Pea sticks are placed across and along the bed in the process of making it, they will serve as a means of conducting the heat supplied by the linings to the interior of the bed and frame, thereby in connection with the shell referred to below, supplying top as well as bottom-heat to the occupants of the frames.

When the frame is placed on the bed, put inside it a shell, which should be 6 inches shallower than the frame. This shell can be easily made by measuring the interior of the box, and making it 1 inch less all round, and as I have already stated, 6 inches shallower, and nailing the battens on the outer side of the shell, so that when it is fixed in the frame there will be a clear space of 1 inch between the shell and the frame, thus, as indicated above, supplying a means of admitting top-heat as supplied by the linings, made up at intervals of a week or fortnight, according to the character of the weather and the subjects growing therein, as well as the condition of the fermenting materials at the time of either making fresh linings or freshening up the half-spent ones. Let there be sufficient hot-dung and leaves put inside the frame to make the depth at the back correspond with that of the front, after which a couple of inches thick of short dung should be laid on; following this (if the bed is intended in the meantime to raise Melon and Cucumber plants, cuttings, &c., in) with 4 or 5 inches deep of saw-dust or dry leaf-mould. But, on the other hand, if the hotbeds are intended for producing early Potatoes, Carrots, and Radishes, and for raising young Cauliflower, Cabbage, and Lettuce plants in, 7 or 8 inches thick of light garden soil, should follow the layer of short dung. This, like the leaf-mould or saw-dust referred to above, should be in the frame a couple of days, to become slightly warmed before planting the Potatoes or sowing the seeds in it.

HOW TO USE HOTBEDS PROFITABLY.

Sets of early Potatoes now starting into growth should be planted in rows 1 foot apart, and at about 3 inches asunder in the rows, afterwards earthing-up the plants by laying on 3 or 4 inches thick of light soil of about the same temperature as that in which they are growing. This should be done when the haulms have attained a height of 5 or 6 inches, giving sufficient air on all favourable occasions to ensure a sturdy growth. Carrots of the early Nantes Horn type should be sown thinly in drills about 1 inch deep and 1 foot apart, and between these rows of Wood's Frame Radish may be similarly sown. The soil should then be closed over the seeds and patted with the back of a spade or shovel to make it moderately firm. If steam is likely to arise in the frame, one or two of the lights should be tilted up a little at one side with a label to allow it to escape. A pinch of Cauliflower, Cabbage, and Lettuce seeds may also be sown thinly in square patches without in any way interfering with the growth of the Carrots and Radishes, as the young plants should be removed for pricking-out under handlights in warm corners or in beds prepared for pushing them on as soon as large enough to handle. The Radishes, too, will be removed for salading as they become fit for use, and before the Carrots require the space occupied by the former for developing their growth. These frames should always have sufficient air admitted to prevent their contents from making a weakly growth, and the linings should, as intimated above, be made sufficiently often to maintain a little warmth in the beds, so as to keep the roots active and the plants on the move.

If a surfacing of soil is put over the short dung,

Asparagus roots can be packed closely together thereon, covering with 4 or 5 inches thick of light mould, and then watered with tepid water to settle the soil among the roots. Air must be admitted to the frame on fine days as soon as the "grass" comes through the soil to encourage a sturdy growth in the same, and it will grow to perfection. Cucumbers and Melons can also be well grown in hotbeds by those who understand their management, and those who do not may learn to do so by reading atten-

ORCHID NOTES AND GLEANINGS.

CYMBIDIUM PENDULUM.

This is a bold-growing evergreen plant, which requires a great deal of bad usage before it succumbs. We well remember having some plants of the kind several years ago, which were subjected to a course of treatment which would have quite destroyed any other plant, and the same specimens

thought and care, if the plant is to appear creditable after the resting season. We recommend the plant to be kept in the Brazilian-house during the winter, and during this season very little water will suffice, but during the summer season the plant enjoys an abundance of water and heat; it will not injure this plant if it is stood under the full influence of the sun's rays without any shading whatever. It is a strong-rooting plant, so that larger pots than usual are necessary to accommodate it; drain these well, and use for soil half good turfy peat and loam—pot firmly, and elevate the plants slightly, so as to provide for its pendulous spikes. *Orchid Album*, vol. x., part 110.

CYPRIPEDIUM NIOBE

is a cross between *Spicerianum* and *Fairrianum*, and has distichous oblong leaves, some 6 inches in length, dark green on the upper side, but paler beneath; peduncle erect, bearing a single flower, which is about 3 inches across; dorsal sepal large and handsome, broad and ovate, white, tinged with flesh colour, having a small blotch of pale green at the base. In the centre is a broad line of chocolate, having on either side a few streaks of magenta, which all terminate below the margin, leaving a marginal border of pure white; the lower sepal smaller, creamy white, with a few pale green veins; petals deflexed, the points recurved, ground colour pale green, with a broad central stripe of chocolate, and two or three dotted lines on either side of dark brown, the margins undulated, bordered with dark brown, and fringed with long dark hairs; lip medium-sized, pale green, veined with a darker green, the front portion rich brown. *Cypripedium Niobe* is a plant which thrives best in well-drained pots of a medium-size, and should be potted in a mixture of fibrous light loam and turfy peat, adding a little leaf-mould and sphagnum moss. It enjoys the same temperature as the *Cattleyas* and *Laelias*, and should be well exposed to the sun and light, always remembering that the plants are under glass and liable to be burnt, so shade them lightly during the middle of the day. *Orchid Album*, vol. x., part 110.

ONCIDIUM LOXENSE

is an evergreen plant. The pseudobulbs are Pear-shaped, smooth when young, becoming wrinkled with age, and bearing mostly but a single leaf, which is obtusely ligulate, carinate beneath, and unequally bilobed at the apex. The long-branching flower-spikes bear numerous, very beautiful, and showy flowers, thick and coriaceous in texture, which last a long time in full perfection. The sepals and petals are large, measuring nearly 3 inches across; these are somewhat ovate, deep chocolate, brown in colour, the sepals transversely barred with brown on a greenish yellow ground; lip large, sub-rotund, rich orange-yellow, dotted with lines of red at the base. The plant in question, coming from so great an altitude, naturally thrives best under cultivation in the cool-house with the *Odontoglossums*. We are told that in Quito the rain is abundant, falling generally for a few hours in the afternoon, and rarely so constant or so heavy as to mar seriously the enjoyment derived from the usually bright sky and delicious atmosphere. Further south in Loja, and east in the plains, there is less than at Quito, whilst in the opposite direction, at Barbacoas, it rains nearly every day in the year; but, although in Loja there is less rain than at Quito, enough always falls to keep the plants in a growing state, so that no season of rest need be given this plant, although less water will be necessary in the winter months. The pots should be well drained, and for soil use good peat-fibre and sphagnum-moss, using some medium-sized nodules of charcoal to keep the soil open, and to carry off any excess of moisture, and the plant should be slightly elevated above the pot's rim, in order to carry the damp away quickly from the young growth. *Orchid Album*, vol. x., part 110.

ANORCUM CHAILLUNUM.

Being a native of one of the hottest and wettest parts of the world, this requires to be kept in the warmest house throughout the entire season,

FIG. 12.—STATUE OF BENEDICT ROEHL.

(See p. 51.)

tively and following the instructions given, as occasion requires, in these columns. A few seeds of Telegraph and Stourbridge Gem Cucumber, and Lockinge Hero and Webb's President Melons sown singly in 3-inch pots half-filled with light mould and covered with a little of the same as soon as there is a hotbed ready to plunge the pots to the rims in, being covered with a square of glass, will soon appear through the soil, when, of course, the glass should be removed, and the young plants, when about 2 inches high, top-dressed with soil which has been in the frame a couple of days before being used to get warm. *W. L. C.*

are now thriving and doing well, which gives a convincing proof that some of the Orchids that come to this country last for a number of years. The plant is said to come from Sylhet, and other places in Northern India, and grows well in a medium heat, but it does not object to a pretty strong heat during its growing season; thus we have seen this plant thriving in an ordinary greenhouse and in a Pine-stove in the same garden, but the plant in the latter house was growing the fastest and the best. During the winter season it appears to like a thorough and severe resting, such as few Orchids can withstand; but such treatment should be carried out with fore-

where the lowest temperature does not fall below 65° at night. It enjoys an abundance of sun and light, but yet a thin shading material should be used to break the direct influence of the sun's rays during the middle of the day, and to avoid the effects of burning the leaves, or to prevent their turning yellow, both of which have a bad effect upon the plant. A moist atmosphere must be maintained during the summer months, which are its growing season, and a more moderate amount of moisture in the air in winter will meet all requirements. The plant may be grown in a well-drained pot or in a hanging-basket, the latter being preferable, as in this case the plant can be hung up near the roof-glass, and thus be better exposed to the full influence of the light; but it must be remembered that the plants are under glass, and that if exposed too much, the sun's rays may prove injurious to them, as before remarked. The pots or baskets in which they are grown should be well-drained, and above this material sphagnum moss alone should be used; this should be cleanly picked and made firm, and at the same time, should any decay in this material set in, it must be replaced at once by good fresh living moss, nothing dead, decaying, or sour being allowed to remain in contact with plant or roots. *Orchid Album*, vol. x., part 110.

GRAFTING.

The *Journal de la Société Nationale d'Horticulture de France* for September contains a review of M. Daniel's paper "Sur la Greffe des Parties Souterraines des Plantes." Grafting, says the author, is one of the most important horticultural operations, and, except upon the tubers of *Dahlia*s, is not generally performed upon underground stems or roots. To ensure success in grafting, it is usually considered necessary that the two portions should be of plants of the same genus, or at least of the same family. M. Daniel, wishing to prove if this applied to subterranean shoots, as well as to stems and branches, set grafts of various plants on the roots or tubers of species belonging to different families. In most cases this plan was not successful; however, a graft of *Saponaria*, a Caryophyllaceous plant, with a free or superior ovary struck on the root of *Onochara biennis*, which belongs to a family of Onagradaceae, in which the ovary is adherent or inferior. Hitherto there had been no ground for supposing that this could be done. In the experiments which failed, the grafts were affected in different ways. Under some circumstances, says M. Daniel, the graft at first thrived at the expense of the stock until it developed adventitious roots, which enabled the plant to obtain nourishment for itself; it then grew as does a cutting, and if it lived, the stock was of no further use. This was the case when Cabbage and Burdock were grafted on *Ranunculus tuberosus*, Parsley on *Valerian*, &c. In other cases the graft at first drew its nourishment from the stock, but no adventitious roots were developed, and as the stock died after a few months, the graft perished from want of nourishment. This was the cause of the failure of the trials of Lily of the Valley and Primroses on *Crocus* bulbs. One fact worth notice is, that grafts with a growing bud set on herbaceous stocks, such as Spruce and Cedar on Potato tubers, thrived at the expense of those stocks until they became woody. Grafts made between plants of the same family were successful, but often the graft sent out adventitious roots, and became independent. This was the case when Lettuce and Chicory were put in on Dandelion, Cabbage on Wallflowers, &c. Though the union might be perfect, M. Daniel found that the graft was not sufficiently nourished by the stock, since the suppression of adventitious roots caused shrivelling, and finally death. On the contrary, the graft grew well when *Salsify* was put on *Scorzonera*, *Barkhansia* on Dandelion and *Hypochoeris*, although with few or no adventitious roots. This may be explained by the fact that in the first case the membranes and the graft could not be traversed by the nutritive matters

with which the stock could furnish it, while in the second case they were quite permeable by these substances. M. Daniel believes the following general conclusion to be correct:—that the failure of many grafts is easily to be explained by insufficient nourishment, without its being necessary to take into consideration the more or less problematical relations between genera or between species of the same genus.

There was another unexpected result of M. Daniel's trials. The chief thing in grafting is to connect the graft and stock so as to bring the growing layer or cambium of each in connection with that of the other; a layer which in dicotyledons is situated between the wood and the liber, or fibrous bark. It is, in fact, the young and active tissue which alone is capable of effecting fusion between the two. Now the experimenter finds that this is not absolutely necessary. "In a certain number of grafts," he writes, "I have cut only the bark and liber without going down to the cambium. The union then took place, nevertheless, by the aid of the cellular tissue, which was existent in a state of meristem (that is to say, cellular tissue essentially young and living), as well as the medullary parenchyma of the stock. It is, therefore, sufficient if living tissues are brought into contact—either in a state of meristem, as in the growing layers, or in a tissue which may pass into that condition as the liberian or medullary parenchyma."

THE WEEK'S WORK.

THE ORCHID HOUSES.

THE CATTLEYA AND INTERMEDIATE-HOUSE ORCHIDS.—A close examination of the plants should be made just now for the dreaded Cattleya-fly, which is making its appearance in plants imported during last autumn. Its existence may be known by the young break, when an inch high, becoming very thick at the base, tapering upwards very sharply, and making but little progress. The only means to exterminate this pest is to cut off the infected growth, in the centre of which the young grub will be found in a more or less advanced stage. Two very pretty Cattleyas in flower just now are *C. Percivaliana* and *C. chocoensis*; the former should be grown in the full sun, in order to make it flower well. The *Trianas* will follow in due course, and if flowers of good quality, to be succeeded later by strong growth, are desired, do not force them, the warmth of this house being sufficiently high. The same remark will apply to *Dendrobium*s that may be resting in this house, or in still cooler quarters, and let the flower-buds come on slowly and surely. Very little spotting will occur in plants of *Odontoglossum vexillarium*, and strong growths result if the plants of this species are placed in a warm yet airy position in this house, keeping them moderately dry at the root, and applying occasionally some weak liquid manure; great attention must, however, be paid to them, or thrips will soon disfigure the foliage and stunt the growth. Go over the plants frequently with some kind of insecticide, and a small brush to put it on with. I use a weak solution, and allow it to remain on the leaves.

THE COOL-HOUSE.—*Odontoglossum Alexandrae* and some allied species are flowering, others have bloom spikes, but the majority of the plants are very actively growing, and these must be encouraged, so that strong pseudobulbs will form. Freely ventilate the houses, especially in dull, mild weather, and use the watering-can with a good deal of discretion. I am no advocate for affording *Odontoglossum* over-much water, nor yet for starving them of it; much, however, will depend upon the kind of potting material and the manner the potting has been done. I cannot conscientiously recommend the general use of liquid manure to Orchids, and that they do well without it I have proved satisfactorily. The autumn-flowering species of *Pleione*s, if not already potted, should be attended to, employing a mixture of loam and peat in equal proportions, adding a little leaf-soil and sand. Place the pseudobulbs on the surface in shallow pans, and steady them with wooden pegs, and over the compost and between the pseudobulbs place a thin layer of sphagnum moss; keep this just moist without wetting the soil beneath, and suspend the pans in a light and cool airy house, and when well-rooted, syringe them daily twice, and occasionally

afford them manure water. As *Pleione*s must be grown in the full sun to flower them well, this surfacing of moss will be found very beneficial in preventing the too-rapid drying up of the moisture in the soil. *H. A. Burberry, Highbury, Birmingham.*

THE FLOWER GARDEN.

STAKING TREES.—All young Lime, Laburnum, and similar trees which are likely to grow out of the perpendicular, should have a stout stake put to each. Each stake should be driven firmly into the ground in an upright position at the side not seen, and the tree secured thereto with tarred string, first winding a piece of coarse cloth or a hay-band round the stem.

REMOVING MOSS FROM TREES.—Any trees that are covered by moss should be cleaned at once. It should be scraped off the main stem and principal branches with a piece of lath or hoop, dusting the smaller branches while damp with a mixture of fresh soot and lime. This application will also destroy any insects, and thereby tend to promote a healthy and more vigorous growth in the trees.

STRIKING CUTTINGS.—Where the supply of autumn-struck cuttings of *Pelargonium*s, &c., is inadequate, the plants should be gone over at once, and all the best cuttings removed for propagation. In order to economise space, put the cuttings in about 2 inches apart in shallow boxes of uniform size—about 30 inches long, 9 inches wide, and 4 inches deep, inside measurement. These, being provided with seven or eight $\frac{3}{4}$ -inch holes, with a crock placed over each, followed by a few handfuls of half-rotted leaves for drainage, are filled with light soil, with a surfacing of sand, and the cuttings dibbled at the distance indicated. They are then watered through a rosed watering-can, and placed closely together in one of the forcing-houses, where, in due time, they root, and are then potted off, either singly or twinto 3-inch pots. Cuttings of *Ageratum*s may also be struck in boxes in the manner recommended above.

FUCHSIAS.—A few plants of the light and dark varieties should be put into heat to produce young growths for cuttings. First trim the plants into shape, then prick over the surface of the soil, and give water at the roots. If placed in an early vinery or Peach-house and damped overhead with tepid water, they will soon push into growth. As soon as cuttings having a couple of joints can be secured, they should be taken and put into boxes or pans in the manner described above for *Pelargonium*s. *H. W. Ward, Longford Castle, Salisbury.*

PLANTS AND THEIR CULTURE.

THE CONSERVATORY.—The plants should be rearranged at intervals of a week, with an eye to good effect, and to avoid monotonous appearances, finding suitable places for the various plants. After this time there are numerous plants coming into bloom, either forced or not, to keep up a well-furnished look in this house from now on ward. I may mention a few of these:—*Poinsettia pulcherrima*, *Euphorbia jacquiniæ*, *Cinerarias*, *Primulas*, *Cyclamen*s, *Epiphyllum truncatum* in variety; *Heaths*, and *Bouvardias*; and besides these are *Tulips*, *Hyalanthus*, *Scillas*, *Narcissus*, *Callas*, which should be grown in good quantity. Let the watering of the plants and the cleaning of the floors be done betimes, and care taken not to afford a plant more water than it actually requires. The temperature of this house may be at night—50° to 55°, with a rise of 5° or 10° in the daytime, the greater during sunshine.

THE GREENHOUSE.—Very little water will be required by any plants in this house, unless the heating apparatus has been much in use to exclude frost; guard against damp in rainy weather by affording air freely when the weather is favourable for doing so. When frosty, and easterly winds prevail, the ventilation will need to be carefully done, and it will be advisable at such times to keep the heating apparatus sufficiently warm to temper the small quantity of air admitted by the roof-ventilators, and to dry up moisture. Where *Cape Heaths*, *Epacris*s, *Tremandras*, *Boronia*s, and similar peat-loving Cape and New Holland plants are grown in this structure, they should be examined frequently to ascertain the state of the soil, and the *Heaths* for mildew. If it be present, dust the affected plants with flowers-of-sulphur, and stand them in a part of the structure where a free circulation of air is obtainable. If some species of *Saliginella* is employed for edging beds, and it is getting naughtily from age, remove it, and some of the soil

beneath it—say 6 inches in depth, to be replaced by fresh loam and leaf-soil in equal parts with the addition of a little sand, afterwards replanting it with fresh pieces of the plants. The following species will be found the most suitable for the warm and the cool conservatory, *Selaginella Kraussiana* (denticulata), *S. K. aurea*, *S. K. variegata*, and *S. Wildevitii*, which latter does best in the warmer house. The temperature at night may be from 45° to 50°, according as the weather is mild or the opposite, and 55° by day.

FERNERY.—Examine the plants in this structure, removing decayed fronds, as if these are left, they quickly cause injury to the healthy ones with which they may be in contact, especially is this true of *Adiantums*. Guard against over-watering any of them, or exciting to growth for several weeks yet to come. Young spore-raised Ferns which are abundant under the stages and on walks in the fernery, may be taken up, potted into thumb-pots in loam and peat in equal proportions, and sharp sand, placing them under hand-lights, in a house of moderate warmth, till the roots have seized on the soil. These small Ferns will be found very useful, especially *Adiantums* and *Pteris* for furnishing purposes and dinner-table ornamentation.

THE STOVE.—The stock of the following species of plants may be increased—*Panicum variegatum*, *Tradescantias*, *Selaginellas*, *Peperomias*, *Gynostachias*—by striking cuttings in a light sandy compost in small pots, placed in bottom-heat in a dung-bed frame or the propagating-house proper. They will quickly strike roots, and when a sufficient number has been raised, the old plants may be thrown away.

VIOLETS.—Our plants in pits and frames are now affording us a good supply of flowers, and in mild weather, abundance of air is admitted to the plants, and sometimes the lights are drawn off altogether in the daytime. If slugs are troublesome, a top-dressing of fresh-sifted wood-ashes will be found an effective preventive against their travelling over the soil, and it will act as a slight stimulant to the plants. *R. Milner, Penrice Castle, Swansea.*

THE HARDY FRUIT GARDEN.

BEING now fairly launched into the New Year, work in this department should proceed as rapidly as the weather permits. Pyramids of Apples and Pears should be amongst those to receive first attention, all thin and unripened wood being cut off close to the main branches, and where the main branches are much crowded, these should be reduced in numbers so as to leave them about 18 inches apart. Overcrowding is often a cause of unfruitfulness, inasmuch as the sun and air do not sufficiently penetrate to the interior of the tree. Where spurs are very close together on the main branches, some of them should be cut clean out, leaving a space between those left of about 4 inches or even more, according to the size of the spurs.

Discrimination should be exercised when pruning out the thin wood, as many varieties of Apples, and a few Pears, make thin growths, at the end of which a bloom-bud will be found. These should be retained, for they will bear fruit when the close-cut spurs fail to do so. With a little examination of a tree, these long spurs are readily detected. If it is desirable to extend the size of any tree, last year's growths may be cut back to about three parts or half their length, otherwise 2 or 3 inches of wood only should be left, care being taken to cut to an outside wood bud.

BLACK CURRANTS.—The bushes should be well-thinned, bearing in mind that it is upon the young growths the best fruit and bunches are produced. If the bushes are very large ones, and bare of young wood towards the bottom, the long old branches may be cut down to within a foot of the ground level, and from these stumps there will spring a few nice young growths. By pruning in this manner for a few years a dwarfish bush will result.

RED AND WHITE CURRANTS.—Unlike the Black Currant, these are best spurred-in, much in the same way as grape vines. The bushes in this locality, and in Kent generally, are pruned so that when full-grown, they are basin-shaped. The plant is taken in hand when quite young, cutting the branches to a bud pointing outwards, and by doing this and summer-stopping the shoots, the bushes become very fruitful, the straps of Currants also drying quicker after rain than when they are smothered up in the centre by shoots.

THE FRUIT-ROOM.—Examine all the fruit stored therein, removing at once any that may be decaying. Every precaution must be taken to guard against frost finding an entry into the room. We have no anxiety in this respect, our fruit-room being constructed with double walls, with space between them for a man to walk. A very good plan to adopt if oil lamps are not used in frosty weather, is to place a thick layer of paper next to the fruit, upon this place a little clean sweet dry hay, finishing the whole off by more paper, care being taken that the paper hangs well over the sides. *G. Woodward, Barham Court, Maidstone.*

THE KITCHEN GARDEN.

KITCHEN GARDEN SEEDS.—There should be, for obvious reasons, no more delay in obtaining the supply for the season from the seedsman. If the purchases are made from a firm of acknowledged reputation for seeds of good quality, the young gardener will do well to keep to kinds known to be excellent, and to eschew novelties; not that I object to new varieties of vegetables, but they should be tested in a small way before ordering largely. The wet character of last season was most unfavourable for the ripening of seeds of all kinds, and some seeds are likely to be dear and scarce, and most will require to be thickly sown. The seeds left over from last year should be tested as for their germinating powers, and any with poor vitality thrown away. In ordering seeds, I would advise the list being kept to a few varieties, there being small gain in having a large number. Of early Peas, *Chelsea Gem*, *Wm. Hurst*, and *William I.* are excellent, *Duke of Albany*, *Stratagem*, *Telephone*, *Veitch's Perfection*, *Sturdy*, and *Ne Plus Ultra* coming in after these. In smaller gardens even less variety than this will be better, and the varieties named are good for any sized garden. In Beans, the best are the longpod varieties, with the *Broad Green Windsor* for late use. *Syon House*, *Negro*, *Longpod*, *Ne Plus Ultra*, and *Canadian Wonder* are all good French Beans. Beet is not required in quantity. I prefer *Cheltenham Green Top*, *Nutting's Dwarf Red*, *Pinnell's Exhibition*, using *Eclipse Turnip*-rooted for the first crop. Broccoli should be selected according to the time when it is required for table. A late variety is *Model*—very good, but my preference is for *Paris Market*. Brussels Sprouts should not be large and coarse, nor should Cabbages; *Ellam's Early* is a nice early variety. In Cauliflowers, *Walcheren* is excellent, and mild in flavour; *Veitch's Pearl* and *Autumn Giant* are indispensable varieties of Cauliflowers. The best Carrot last season was *Matchless*, a fine type of an intermediate variety; *Early Nantes* is good for the first crop in the open ground. *Standard Bearer* and *Major Clarke* are two of the best red varieties of Celery, and the *Sandringham Dwarf* is the best white one. Onions require attention in selection, and I have a preference for *Bedfordshire Champion*, *James Keeping*, with *Giant Tripoli* for autumn sowing; of newer varieties *Ailsa Craig* and *Roussin* Park are valuable introductions, and when the seeds are cheaper than at present they will be largely grown. Those who like *Salsify* and *Scorzoneria* should grow *Sandwich Island Mammoth* variety of the former, and the large Russian variety of the latter; these roots should be commonly grown, because of their usefulness in the spring, when other kinds of vegetables have got scarce. I only grow one kind of Spinach, the *Victoria Improved Round Seeded*, it being the best for either summer or winter. Turnips may consist of *Early Snowball* and *Red Globe*, with a late kind for winter; the last-named variety does well for the main crop or for late use. Tomatoes are indoor plants rather than outdoor; for the open air *Conqueror* or *Conference* and *Ilam Green* are very good varieties. The best Vegetable Marrows are the *Long White*, *Prince Albert*, and *Pen-y-Byd*, the last-named a very handsome fruit. New sets of Potatoes should be obtained either by exchange or purchase, as the annual change of land minimizes loss from the disease. When obtained, the tubers should be laid out thinly or put in shallow boxes, if early ones, to sprout. *G. Wythes, Syon House, Brentford.*

FRUITS UNDER GLASS.

POT VINES.—As I have pointed out in my former *Calendar*, the old method of getting very early fruit has much to recommend it, as permanent Vines cannot be forced hard without injury. Besides,

more heat is required in a large permanent vinery, and therefore pot vines are preferable. To get these in a proper condition for forcing was a difficult matter last season, owing to the comparative sunless season, and the Vines, unless thoroughly well ripened, will not start into growth so well as one would wish. In a former *Calendar*, I pointed out the importance of shortening back and doing what pruning was necessary as soon as growth was complete; when this is deferred, it is almost impossible to prevent bleeding. If this has been neglected, it is best to rub off the surplus buds, in preference to pruning.

One great advantage with pot Vines is, that they can be placed in a high temperature. We always give them 5° more than permanent Vines, and this season the canes have broken very well. We always start the eyes early in the new year, to get well-ripened, short-jointed canes; do not use bottom-heat, and put them in good loam, mortar-rubble, and a little of Thomson's manure. For early fruiting, we use one-year cut-back canes. Watering pot Vines is a delicate matter, as often they get too much moisture with the continual syringing overhead in their early stages of growth, and too little when finishing their fruits. Care, therefore, is required to avoid extremes, and to keep the bottom-heat at an even temperature. Use warm leaves and litter when replenishing, and to get the material into condition, it should be placed in a heap, and frequently turned. There is also a great advantage in using a small house or pit for pot Vines, as it can be covered on the outside in severe weather, thus helping to maintain an even temperature. Some Vines require more bending down than others, to induce them to break evenly, and they should be often gone over when breaking, and placed up to the light. *Black Hamburg* and *Foster's Seedling* are the best Vines for forcing in pots. *G. Wythes, Syon House, Brentford.*

THE APIARY.

PUNIC BEES.—It seemed likely, a short time ago, that there was going to be, sooner or later, as the Americans would say, a boom, in the bees to which this name has been given, as their praises had been sung, both here and in America, and queens offered for sale at the big price of five guineas each. The Entomological Society, at a recent meeting, had specimens submitted to them, which they were asked to classify as a new species, under the name of *Apis niger*, and it was there stated that these bees would not sting. The bubble has now burst, however, and truth will out, even when bees are concerned, the *British Bee Journal* having been the means of enlightening most of the beekeeping fraternity on the matter. It appears that this race is already known as a variety of *A. mellifica*, in which species are included the bees of Great Britain, Italy, Cyprus, Carniola, Syria, &c., and that it hails from Tunis. It has also a close similarity to the bees of Minorca, Algeria, and Morocco, and most likely all these are identical. The workers are black, small, bad-tempered, and do not winter well; they also gather large quantities of propolis, with which they stick up everything in the hive, including the entrance, where they reduce the passage-way so that only one or two bees can pass at a time. Their indifferent character is also fully borne out by Mr. F. Benton, the celebrated queen breeder, who is probably the best authority on the subject, as he says of these bees: "I always called them by the most natural name, Tunisian, and never thought best to strain after something a bit fanciful, like 'Punic.' Perhaps, the party who got up this name had in mind the ancient 'Punic faith,' in which the race resembles that of the old Carthaginians, for when you least expect it, i.e., when they have been well, and even royally treated, they will sally out, and cover the manipulator with their tiny javelins. They carry in more propolis than any other race, and are poor winterers. I handled several hundred colonies two different seasons in Tunis, took some to the Orient with me, also had them tested in Palestine, and I tried them in Munich, and came to the conclusion that in no way do they excel Cyprians, and in some points they are behind that race. I would therefore advise to let Tunisian (Punic bees) quite alone."

APPLIANCES.—It is now time to go carefully through all bee appliances, and make out a list of articles likely to be required for the coming season's work, and give the order to the manufacturer at an early date, so as to have everything to hand when it will be required for use. *Expert.*

EDITORIAL NOTICE.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	JAN. 12.	Royal Horticultural Society: Lecture on "Water Vegetables." All committees meet.
THURSDAY,	JAN. 14.	Brighton and Sussex "New" Horticultural Society.
FRIDAY,	JAN. 15.	Gardeners' Royal Benevolent, Annual General Meeting.
SATURDAY,	JAN. 16.	Wakefield Faxon Society.

SALES.

MONDAY,	JAN. 11.	Carnations, Picotees, Begonias, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 13.	Greenhouse Ferns, Palms, Roses, and Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 14.	Lilium auratum, Herbaceous Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 15.	Great Sale of Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36° 6.

In the greedy quest for Orchids at the present day, we have too often to regret a lamentable waste of opportunities on the part of some collectors. Not by any means that we would impute blame to those adventurous men who follow a calling in which the rate of mortality is among the very highest. They have certain allotted work to do, and that work is not, unless indirectly, the collection, still less the publication, of scientific information. They go for a definite purpose, which, for the most part, they execute with conspicuous success under most difficult and dangerous conditions. It is the system, not those who carry it out, that is to be reprehended. What a fund of information on all branches of natural history and geography might be accumulated; what treasures in the way of specimens might be got together were the collectors able to turn their attention to other things besides Orchids. If illustrations be wanted—illustrations which prove the rule—we may refer to the works of HOOKER, of FORTUNE, of ANDRÉ, of BURBIDGE, or to the letters of JOHN VEITCH, published, like those of FORTUNE, in these columns. An account of the wanderings of DOUGLAS was given in the *Companion to the Botanical Magazine*; that of ROEHL in various foreign horticultural periodicals. These few instances will show that collecting and publica-

tion of observations are not necessarily incompatible, and that when fortunately they do coincide, while the world is vastly the gainer, the collector is at least none the worse.

Mr. MILLICAN has just furnished us with another excellent illustration of the good work that a collector can do by publishing the record of his travels.* His book is "a narrative of things seen and experienced . . . while travelling with natives through the forest, sharing with them the hospitality of the wayside hut or the forest shelter and the camp fire, as well as the more agreeable life of the hotels and towns." The narrative is founded on five journeys made to the Orchid districts of South America (that is to say, the Venezuelan and Colombian districts).

The book is illustrated with woodcuts and process-blocks, from photographs taken by the author himself. Some of these are excellent, and all are interesting. The earlier chapters traverse well-known and often-described districts, but presently our author takes us to the Valley of the Magdalena (of which we append an illustration from the pencil of the late A. BRUCHMULLER, see p. 43) and its tributaries, the Lebrija. A curious contrast is afforded by the town of Bucaramanga with its European luxuries, and evidences of advanced civilisation, though high up on the Andes, and only accessible by canoe and mules.

From this town the author proceeded along the valley of La Florida in search of Cattleya Mendeli. "On each side of the valley the mighty peaks of the Andes tower up to the clouds all bristling with forests." At Pié de Cuesta, 3500 feet above the level of the sea, he speaks of the climatal conditions as furnishing twelve hours of day and twelve hours of night all the year round, a mild balmy air which is never oppressively hot or disagreeably cold, an abundance of pure water, and a rich variety of tropical fruits. Here *Epidendrum atropurpureum* covers the walls, and flowers in profusion. A thousand feet higher the plain of La Mesa delos Santos is reached, and here we are told the vegetation consists of a tall rank herbage, with occasional scrub, intermingled with thousands of the beautiful *Sobralia leucoxantha*, with rose and white flowers of the colour and substance of those of *Cattleya Mendeli*, but so difficult to transport, that very few plants are known in England. Proceeding on his course, and leaving the precipices of Subi and the village of Curiti, he came at length upon the object of his search:—

"I had not far to go before I was rewarded with the object of my search in the myriads of Bromeliaceæ and Orchids, which literally cover the short stunted trees and the bare points of rocks, where scarcely an inch of soil is to be found. The most magnificent sight for even the most stoical observer are the immense clumps of *Cattleya Mendeli*, each new bulb bearing four or five of its gorgeous rose-coloured flowers, many of them growing in the full sun, or with very little shade, and possessing a glowing colour which is very difficult to get in the stuffy hot-houses where the plants are cultivated. Some of these plants, considering their size and the slowness of growth, must have taken many years to develop, for I have taken plants from the trees with 500 bulbs, and as many as 100 spikes of flowers, which, to a lover of Orchids, is a sight worth travelling from Europe to see. Apart from the few extraordinary specimens, the Orchids, as a rule, are very much crowded and mixed up with other vegetation."

* *Travels and Adventures of an Orchid Hunter. An Account of Canoe and Camp Life in Colombia while Collecting Orchids in the Northern Andes*, by Albert Millican, Cassell & Co. 8vo, pp. 222. Numerous illustrations.

Like most of his predecessors, Mr. MILLICAN continues, he "was tempted to bear away a large quantity of the coveted plants," and so we may expect this habitat will be denuded, as others have been before. For some reasons we shall be glad when the Orchid fever abates, and the energy devoted to their acquisition is turned into some other channel.

Of Mr. MILLICAN's further research for *Odontoglossum crispum*, the Alexandra Orchid, we need say little here, but refer our readers to the book itself. We may add, however, that these Orchids grow in an excessively wet climate, at an elevation of 7000 to 8000 feet, where they are exposed to a temperature which often falls as low in the night as 50°, and rarely, if ever, reaches beyond 60° in the day-time. Under such conditions, *O. odoratum* and *O. crispum* were found. After about two months' work, Mr. MILLICAN secured 10,000 plants, cutting down to obtain these some 4000 trees! Then the Orchids had to be taken to the edge of the forest on men's backs, and even then they were five days' journey from the town of Pacho, where it is usual to make the boxes to pack the Orchids in for shipment to England. Mules transport the boxes from Pacho to the banks of the Magdalena, and after ten days they reach the port of embarkation. Many of the plants die before they leave the coast, many more before they pass the West Indies; a few reach the Azores, a fewer still arrive in England safely. The statement just made applies more particularly to *Odontoglossum blandum*, but in a degree it applies to most of the Orchids from whatever country they are introduced. At a lower elevation than that at which *O. crispum* is found in the neighbourhood of La Palma, *Cattleya Warscewiczii*, *C. labiata*, *Miltonia Phalenopsis*, *Oncidium Kramerianum*, *Masdevallia Harryana*, *Odontoglossum Pescatorei*, *Anguloa Clowesi*, *Odontoglossum blandum*, and many others, are found. Another chapter tells of the search for *Cattleya Trianae*, *Miltonia vexillaria*, *Odontoglossum Harryanum*, &c.

The risks attendant upon travel in the wilds are illustrated by the sad fate of one of the party, who was killed by a poisoned arrow, and the narrow escape from a jaguar on another occasion. In spite of drawbacks like these, Mr. MILLICAN writes:—"No pen or picture has or ever will be able to give more than a faint idea of the glories of this part of Colombia—of its riches in mines of emeralds and gold and silver; of its agricultural products of coffee, cocoa, and grain; of its trackless forests, with their exhaustless supply of timber and choice woods, its wealth of ornamental and medicinal plants, its bevy of gaudy coloured birds and curious animals, its snow-capped mountains and boundless prairies, where the Indians have always roamed with perfect freedom; or of its commercial cities with their rich and cultivated inhabitants."

The book is dedicated to Mr. WHITE, of Ardaroeh. It lacks a sketch map and an index, and its botanical details, other than those relating to Orchids, are not always trustworthy. Neither *Strelitzia* nor *Acacias*, for instance, are at all likely to be found growing in the forests of Colombia. We have, however, said enough to show that Mr. MILLICAN has given us a very valuable contribution to garden literature, and whilst the general reader will find in it an agreeable and interesting narrative of travel and adventure, the Orchid lover, and still more the Orchid grower, will find it essential to the completion of his library, however modest may be its proportions.

A GOURD GARDEN.—The cultivation of Gourds, more especially in eastern countries, dates from a very early period, and at the present time few vegetables are more extensively grown in this as well as in other countries. To the French growers we are chiefly indebted for the many remarkable varieties now in commerce, and just as florist flowers have been improved in size and colour, so these Gourds have been selected, and developed, until at the present time we have the most distinct colours, and curious shapes, as well as a considerable improvement in the flavour, particularly of the group called "Custard

possible advantage. Where space is limited, this is certainly the best way to cultivate Gourds as ornamental plants, and when the Vines are properly managed, they bear in such quantity that they have to be frequently thinned. All the cultivated Gourds are popularly believed to be derived from *Cucurbita Pepo*, but M. Charles Naudin who has studied them for many years, refers their origin to three supposed distinct species, i.e., *C. Pepo*, *C. maxims*, and *C. moschata*. M. Vilmorin, in his *Vegetable Garden*, remarks that he does not know any form of Gourd that should necessarily be considered a hybrid be-

pical. Our plan, though a troublesome one, and not always convenient, is to sow the seeds in heat in March, pot off singly when ready to handle, keeping them growing freely until they can be hardened off and transferred to the open air. Where convenience may be had for treating them in this way, three weeks or a month may be gained, and this is a great help in the development of the fruits. Of course, the size of the fruit will depend entirely on the quantity left on the Vine, and when a very large size is desired they must be reduced to two or even one. We, however, prefer medium-size, which enable us

FIG. 13.—GOURD-LINED WALK IN THE HERBACEOUS GROUND AT KEW.

Marrows." The varieties now offered by the trade are almost innumerable, and considerably over a hundred varieties may be considered first-class. A large collection of these Gourds have for some years now been grown at Kew (fig. 13), and as they have now succeeded in weeding out the useless or less ornamental kinds, the collection there may almost be taken as a standard for garden purposes, as the selection includes fruits of large size as well as of distinct colours. The collection grown in the Royal Gardens, Kew, forms an interesting addition to the hardy plants in the herbaceous ground, and as they are trained up poles, the—in some cases—extraordinary forms are shown to the best

tween any two of these species. That may be, but the fact that many of those forms grown in the garden hybridise freely with each other, is well known to all who have watched these remarkable plants. We have, indeed, frequently seen two distinctly-coloured Gourds on the same Vine; we have also remarked them of slightly different shapes, and have always attributed this to hybridisation. Some growers, indeed, say that it is almost impossible to keep some few of them true when grown near each other. The treatment usually given, is to sow the seeds in the open ground in May, but this we have found not to answer in this country at any rate, where our summers of late years have by no means been tro-

to make a good show of fruit, and we believe this is the plan adopted wherever they are grown in the ornamental garden. To give the names of even a few would take up too much space, and as they are mostly long French names of little utility to the English grower, selections are given by most of our principal seedmen, and no difficulty will be experienced in procuring the most ornamental sorts. At Kew, the Gourd garden, which is somewhat of a novelty in an English public establishment, has awakened a considerable amount of interest even in the ordinary visitor, and we have no doubt, these remarkable vegetable freaks have a great future before them in this country. D.

A NEW ARLIALI.—Among the Orchids which are to be seen at Messrs. SANDERS' other new plants are to be met with, which, were they seen apart from their gorgeous surroundings, would attract more attention than they do now. At a recent visit, for instance, we noticed an *Arliali* from Guatemala which we hardly venture to name as it was not in flower, and which, as Mr. BROWN pointed out to us, is very like an unnamed species in the herbarium from the same country, and probably belonging to the genus *Oreopanax*. It is not, however, quite identical, and hence it is more prudent to await further information before pronouncing a definite opinion. In any case, Messrs. SANDERS' *Arliali* is a striking plant for the decoration of the warm greenhouse, and would probably bear ordinary greenhouse temperature. It is of shrubby habit, with erect stems and long-stalked, coriaceous, dark-green shining leaves. These are roundish, markedly peltate at the base, palmately three-nerved, with spreading nerves, and three-lobed to nearly the centre, the lobes deltoid acuminate. The leaf before us measures about 7 inches in length by 6 in breadth, but others were considerably larger, and the leaf-stalk is rather longer than the blade it supports.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* will be held at the Windsor Hotel on the 12th inst., when the Rev. H. H. D'ONBRAIN will bring forward the subject of the "Rock Garden" for discussion.

ROYAL HORTICULTURAL SOCIETY.—The first New Year's meeting on January 12 will be held in the Drill Hall, James Street, Westminster, where the Fruit, Floral, and Orchid Committees will assemble at 12 o'clock as usual, and the Scientific Committee in the Council Room at 4 P.M. A paper on "Winter Vegetables" will be read in the Drill Hall at 3 P.M. by Mr. W. JOUGLEND, Marston Gardens, Farnham. The arrangements for the current year and a list of the Fellows of the Society have been issued. Those desirous of becoming Fellows may obtain all particulars from the secretary, 117, Victoria Street, S.W.

BOTANICAL MAGAZINE.—The plants figured in the January number are *Moraea Robinsoniana*, t. 7212, the wedding flower of Lord Howe's Island (see *Gard. Chron.*, 1872, p. 393; 1891, i., 457, with fig., formerly referred to *Iris*).

Chirita depressa, t. 7213.—A dwarf, tufted species, with ovate silky leaves, and purple funnel-shaped flowers, with an almost regularly five-lobed limb of a violet tinge. It is a native of Kwantung, and flowered at Kew.

Cirrhopetalum Thouarsii, t. 7214.—A curious species, with long stalked tufts or simple umbels of long lip-shaped greenish flowers. It is a native of Mauritius and the Pacific Islands, a remarkably wide distribution.

Iris Fosteriana, t. 7215.—A bulbous *Iris*, with 2-ranked sword-shaped leaves. Outer segments of the flower erect, yellowish, inner smaller, deflexed purple.—Native of Afghanistan.

Primula Poissoni, t. 7216.—Tall, glabrous, glaucous, leaves fleshy, oblong, obtuse, finely denticulate. Flowers rosy-lilac in remote whorls, of which as many as from eight to twelve are produced.—Native of Central China.

GARDENERS' ORPHAN FUND.—A meeting of the committee took place at the Hotel Windsor, Victoria Street, Westminster, on the 4th inst., the chairman, WILLIAM MARSHALL, Esq., presiding. The Hon. Secretary, Mr. A. F. BARRON, announced the following special receipts:—The Reigate Chrysanthemum Society, per Mr. W. BROWN, Secretary, £10. From collecting boxes as follows:—The Leeds Paxton Society, per Mr. J. W. FRANKLAND, 15s. 6d.; Mr. J. HUGHES, local Secretary, Birmingham, £2 13s. 4d.; Mr. J. LEMMON, Chichester, 6s. 3d.; the Bradford Gardeners' Mutual Improvement Society, per Mr. R. SCOTT, 12s. 4d.; and Mr. A. READ, The Gardens, Grittleton, 17s.;

the total proceeds from boxes being £25 12s. 11d. Some further applications on behalf of orphan children were examined and admitted, bringing the total up to twenty, the 4th being the last day upon which applications could be received. The annual meeting and election is fixed for Friday, February 5, and will take place as usual at the Cannon Street Hotel. The committee will meet on Friday, the 22nd, to make the necessary arrangements.

— On Friday, January 15, a monster mass, consisting of 250 bulbs of the old *Cattleya labiata*, will be put up to auction by Messrs. PROTHOROE & MORRIS, at their rooms, Cheapside, for the benefit of this Fund. Messrs. SANDER & Co. give the plant, the auctioneers waive their commission, the horticultural press forego their charges for advertising, so that everything is arranged to ensure the handing over to the Fund of a substantial New Year's gift, provided the bidders rise to the situation.

OUR WEIGHTS AND MEASURES.—For a considerable time past efforts have been made to secure uniformity in the weights and measures employed in the various markets of the kingdom. Last Session, a Select Committee of the House of Commons was appointed to consider the feasibility of establishing some uniform weight for grain. The Committee has not finished its labours, but meanwhile, Mr. JASPER MORE, M.P., its Chairman, contributes to the *Journal of the Royal Agricultural Society*, a paper entitled "Sale of Corn by Weight." The advantages which would be conferred upon both growers and dealers in Wheat, Barley, and Oats, by the establishment of uniformity are so obvious as to need no argument. But they are accentuated by a perusal of the many incongruous and practically illogical local customs, the effects of which it is almost hopeless to attempt to reconcile. The universal adoption of the hundred-weight (of 112 lb.) may not commend itself to advocates of the decimal system, but it is a great point to get the principle of uniformity generally accepted. Curiously enough, an American hundred-weight is 100 lb. (the ton being 2000 lb.), whilst in England the hundred-weight of cheese is 120 lb.

SULPHATE OF COPPER AND THE POTATO DISEASE.—The experiments which the Agricultural Society conducted last summer to test the value of sulphate of copper as a preventive of Potato disease are described in detail in the *Journal of the Society*. It appears that, whilst the application has not prevented the disease in any locality, it has lessened its amount. Mr. GEORGE MALDEN, an extensive Potato grower in Bedfordshire, gives details of some experiments directed to the determination of the best time for planting the seed-tubers. He concludes with the advice to plant early varieties in March, or as early as possible in April; to finish planting all varieties in April; but if necessary to plant in May, then to select a late variety. Of late varieties, preference is given to the Imperator, which should be well moulded up.

HOW DO PLANTS OBTAIN THEIR NITROGEN?

— In the new quarterly number of the *Journal of the Royal Agricultural Society of England*, there appear several noteworthy communications upon the highly important problem which is well-known to farmers under the name of "the nitrogen question." Of the various elements with which it is necessary to supply the soil in order that crops may be profitably grown, nitrogen is the most costly, and immense sums are annually spent by our farmers in the purchase of nitrogenous and ammoniacal fertilisers. The first of the communications to which reference has been made comes from Sir JOHN LAWES and Dr. GILBERT, the illustrious investigators whose field experiments, extending over half a century, at Rothamsted, in Hertfordshire, are known throughout the civilised world. In a masterly paper on "The Sources of the Nitrogen of our Leguminous Crops," they adduce a large mass of experimental evidence as to the way in which such crops as Beans, Peas, Clovers, Lucerne, Sainfoin, Vetches,

Lupins, and allied leguminous crops obtain nitrogen from the air. Upon the roots of these plants wart-like nodules may be seen, and these nodules appear to be the dwelling-places of certain lowly organisms (microbes) which have the property—not possessed by the higher plants—of taking up nitrogen from the air within the soil, and of presenting it to the higher plant in such a form that the latter can assimilate it. The microbes cannot be regarded as exactly parasitic upon the roots of Clovers, &c., because they are serviceable and not detrimental to these cultivated plants; hence the association of the two is described by the name *symbiosis*, i.e., a living together. From this newly-recognised source of the nitrogen of our leguminous crops, it is possible that results of the highest practical importance in agriculture may eventually proceed. Indeed, in this same issue of the *Journal*, there is a brief paper entitled "Farming without Live Stock," in which Dr. FREEMAN adduces some striking instances of the employment of leguminous crops as collectors of nitrogen, and of the useful practice of ploughing these in as green manure, and supplementing their effect by the addition of artificial fertilisers containing phosphorus, potash, and lime. Such methods have been successfully followed upon some of the soils of Germany, and are likely to be extended when farmers grasp the fact that, under certain circumstances, they can get nitrogen from the air for nothing. Mr. JAMES MASON, of Eynsham Hall, Oxford, has, it appears, been experimenting for several years in this direction upon his estate. This method of obtaining nitrogen from the air is known in France as *sideration*.

THE NITRIFYING FERMENTS OF THE SOIL.

Dr. MUNRO in the *Journal of the Royal Agricultural Society*, makes clear much that has not hitherto been understood concerning the manner in which the nitrogen contained in farmyard manure, shoddy sulphate of ammonia, and many other nitrogenous fertilisers, is converted into the soluble nitrate of lime, in which form nitrogen enters the systems of plants and thus supplies them with food. This conversion into nitrate was once thought to be an exclusively chemical change, but it is now shown to be the work of two microscopical organisms, one of which begins the change and the other finishes it. A fact thoroughly established in these several papers is, that the soil is teeming with life—that it is the abode of bacteria and other micro-organisms all of which, now that their existence is recognised and something is known of their functions, are capable of being turned to useful ends by the ingenuity of the agriculturist.

THE JARDIN DES PLANTES.—A proposal, which we anticipate, will remain as a proposal for a long time, has been made to remove this historically famous garden to Versailles. No doubt, so far as the living plants are concerned, Versailles would be preferable to Paris, but the removal of the library, herbarium, museum, &c., to so great a distance from Paris, offer difficulties not easily overcome. In the meantime, M. MAXIME CORNO is deservedly earning the admiration of all qualified to judge, by the energy and success of his administration starved though it is by an inadequate budget.

THE "ANNALS OF SCOTTISH NATURAL HISTORY" is a new quarterly periodical, devoted to the recent and fossil biology of Scotland. The botanical portion is edited by Professor TRAIL, of Aberdeen. In the part before us, Mr. ARTHUR BENNETT has a paper on "The Botany of the outer Hebrides," Dr. BUCHANAN WHITE one on "Scottish Willows," while several small contributions are furnished by Professor TRAIL and others. We cordially wish all prosperity to our new contemporary, with which, by the way, is incorporated an old friend, the *Scottish Naturalist*.

NATIONAL ROSE SOCIETY.—The General Committee will meet at the Rooms of the Horticultural Club on Tuesday next, January 12, at 3.30 P.M.

GARDENERS' ROYAL BENEVOLENT.—The annual "Lark-Pudding" dinner of the members of this Institution will be held at Simpson's on Friday, January 15, after the annual meeting, the Rev. W. WILKS, Hon. Sec., R.H.S., in the chair.

SPELLING OF GEOGRAPHICAL NAMES.—The Royal Geographical Society has issued a note relating to the spelling of geographical names, from which we take the following extract. Life would be rendered easier if people would conform to these regulations, and that of editors would be much lightened if the metrical system came into general use here as on the Continent, and if our very absurd thermometer scale were superseded by the Centigrade system:—"In 1885 the Council of the Royal Geographical Society, impressed with the necessity of endeavouring to reduce the confusion existing in British maps with regard to the spelling of geographical names, formally adopted the general principle, that in writing geographical native names the vowels should have their Italian significance and consonants that which they have in the English language. To ensure a fairly correct pronunciation of geographical names by an English-speaking person, an arbitrary system of orthography is a necessity. It is hardly too much to say that in the English language every possible combination of letters has more than one possible pronunciation. A strange word, or name, even in our own language is frequently mispronounced. How much more with words of languages utterly unknown to the reader. The same necessity does not arise in most continental languages. In them a definite combination of letters indicates a definite sound, and each nation consequently has spelt foreign words in accordance with the orthographic rules of its own language. It was, therefore, not anticipated that foreign nations would effect any change in the form of orthography used in their maps, and the needs of the English-speaking communities were alone considered. The object aimed at was to provide a system which should be simple enough for any educated person to master with the minimum of trouble, and which, at the same time, would afford an approximation to the sound of a place-name such as a native might recognise. The charts and maps issued by the Admiralty and War Office have been, since 1885, compiled and extensively revised in accordance with this system. The Foreign and Colonial Offices have accepted it, and the latter has communicated with the colonies requesting them to carry it out in respect to names of native origin. Even more important, however, than these adhesions is the recent action of the Government of the United States of America. Contrary to expectation, but highly satisfactory, is the news that France and Germany have both formulated systems of orthography for foreign words, which in many details agree with the English system. The rules referred to are as follow:—

1. No change is made in the orthography of foreign names in countries which use Roman letters: thus Spanish, Portuguese, Dutch, &c., names will be spelt as by the respective nations.

2. Neither is change made in the spelling of such names in languages which are not written in Roman character as have become by long usage familiar to English readers: thus Calcutta, Cutch, Celebes, Mecca, &c., will be retained in their present form.

3. The true sound of the word as locally pronounced will be taken as the basis of the spelling.

4. An approximation, however, to the sound is alone aimed at. A system which would attempt to represent the more delicate inflexions of sound and accent would be so complicated as only to defeat itself. Those who desire a more accurate pronunciation of the written name must learn it on the spot by a study of local accent and peculiarities.

5. The broad features of the system are:—

(a) That vowels are pronounced as in Italian and consonants as in English.

(b) Every letter is pronounced, and no redundant letters are introduced. When two vowels come together, each one is sounded, though the result, when spoken quickly, is some-

times scarcely to be distinguished from a single sound, as in *ai, au, ei*.

(c) One accent only is used, the acute, to denote the syllable on which stress is laid. This is very important, as the sounds of many names are entirely altered by the misplacement of this "stress."

6. Indian names are accepted as spelt in Hunter's *Gazetteer of India*, 1881.

The following amplification of these rules explains their application:—

Letters.	Pronunciation and Remarks.	Examples.
a	<i>ah</i> , as <i>a</i> in <i>father</i>	Java, Bandan, Soudi, Bari, Tel-el-Kebir, Odeh, Yez, Medina, Levuka, Peru.
e	<i>eh</i> , as <i>e</i> in <i>fate</i>	
i	English <i>ei</i> as in <i>ravine</i> ; the sound of <i>ee</i> in <i>beet</i> . Thus, not <i>Feejee</i> , but	Fiji, Hindi.
o	<i>o</i> as in <i>note</i>	Tokyo.
u	<i>long u</i> as in <i>flute</i> ; the sound of <i>oo</i> in <i>boot</i> ; <i>oor</i> should never be employed for this sound. Thus, not <i>Zooloo</i> , but	Zulu, Sumatra.
	<i>All vowels are shortened in sound by doubling the following consonant</i>	Yarra, Taana, Mecca, Jidda, Bonny.
	<i>Doubling of a vowel is only necessary where there is a distinct repetition of the single sound...</i>	Naulia, Oosima.
ai	English <i>i</i> as in <i>ice</i>	Shanghai.
ao	<i>ow</i> as in <i>how</i> . Thus, not <i>Foochow</i> , but	Fuchau.
ae	is slightly different from above	Macao.
ai	is the sound of the two Italian vowels, but is frequently slurred over, when it is scarcely to be distinguished from <i>ey</i> in the English <i>they</i>	Beirât, Beihil.
b	English <i>b</i>	
c	is always soft, but is so nearly the sound of <i>s</i> that it should be seldom used	Celebes.
	If <i>Celebes</i> were not already recognised it would be written <i>Selbes</i> , is always soft, as in <i>church</i>	Chingghin.
ch	English <i>d</i>	
f	English <i>f</i> . <i>ph</i> should not be used for the sound of <i>f</i> . Thus, not <i>Haiphong</i> , but	Haifong, Nafa.
g	is always hard. (<i>Sott g</i> is given by <i>j</i>)	Galapagos.
h	is always pronounced when inserted, as in <i>what</i> ; better rendered by <i>hw</i> than by <i>wh</i> , or <i>h</i> followed by a vowel, thus <i>Hwang ho</i> , not <i>Whang ho</i> , or <i>Hwang ho</i>	Hwang ho, Ngon hwi.
j	English <i>j</i> . <i>Dy</i> should never be put for this sound	Japan, Jinchuen.
k	English <i>k</i> . It should always be put for the hard <i>c</i> . Thus, not <i>Cores</i> , but	Korea, Khan.
kh	The Oriental guttural	
gh	is another guttural, as in the Turkish	Dagh, Ghazi.
l	As in English.	
m	has two separate sounds, the one hard as in the English word <i>finger</i> , the other as in <i>singer</i> . As these two sounds are rarely employed in the same locality, no attempt is made to distinguish between them.	
p	As in English.	Chemulpho, Mokpho.
ph	As in <i>loophole</i>	
th	stands both for its sound in <i>thing</i> , and as in <i>their</i> . The former is most common	Bethlehem.
q	should never be employed; <i>qu</i> (in <i>quies</i>) is given as <i>kw</i>	Kwangtung.
r	When <i>qu</i> has the sound of <i>kw</i> , as in <i>quies</i> , it should be given by <i>k</i>	
s, y	<i>sh, t, v, w, x</i> , as in English	Sawakin.
t	is always a consonant, as in <i>yard</i> , and therefore should never be used as a terminal; <i>i</i> or <i>e</i> being substituted as the sound may require.	Kikiyu, Mikindini, Kwalé, Zulu, Muzdaha.
z	Thus, not <i>Mikindini</i> , but	
zh	English <i>z</i> , or as <i>s</i> in <i>treasure</i>	
z	The French <i>j</i> , or as <i>s</i> in <i>treasure</i>	Tongatábu, Gaspagos, Palawan, Sarawak.
	Accents should not generally be used, but where there is a very decided emphatic syllable or stress, which affects the sound of the word, it should be marked by an acute accent	

TECHNICAL EDUCATION.—With reference to the observations made on this subject in our last

* The *y* is retained as a terminal in this word under Rule 2 above. The word is given as a familiar example of the alteration in sound caused by the second consonant.

issue by the Director of the Royal Gardens, Kew, we have received the following comment from one of our leading gardeners:—"Those of us who are qualifying ourselves, as best we may, for our new missions of teachers of technical horticulture or agriculture, for virtually they are one, will hardly thank the Director of Kew for his bath of very cold water in your new year's issue. This is so unlike the encouragement that the Editor has given to technical instruction in horticulture, that one can only account for its prominent place in the *Gardeners' Chronicle* of the new year on the assumption that for once the Editor was abroad. [The Editor welcomes expressions of opinion from any competent source but does not necessarily share them. Ed.] What the friends of technical education most urgently need at the present time is not cooling laxatives, but bracing tonics and powerful stimulants. The difficulties and dangers of launching such novel enterprises as horticultural lectureships, especially in the rural districts, are formidable enough in all conscience, without our friends at Kew doing their best to render such difficulties insuperable by discounting our failures in advance or slighting our efforts with their authoritative *non possumus*. It is to be hoped that the energy and enterprise of those engaged in this new departure in horticulture will prove equal to saying that it shall be done. We shall look to Kew and to our botanists elsewhere to help us to popularise horticulture, and to bring the knowledge of its principles and practice within closer touch and taste of all classes of our countrymen, through improved series of illustrations, down to date, of the organs and functions of plants. With illustrations on lantern-slides abreast of our knowledge of the life and work of plants, teachers must be dull, and audiences stolid if horticultural lectures are destined to failure. There may be some mistakes at first, and a few falls between the two stools of giving too little and cramming in too much. But with practice in the presentation of such marvellous stores of knowledge, and the opening up of such boundless sources of pleasure and profit as abound in horticulture, the lectures ought to rival in interest many a novel. With all due deference, it appears as if the Director of Kew condemned lectures on technical horticulture on mistaken or insufficient data. County Councillors, anxious to get to work in their new enterprise, naturally turned to Kew and other scientific centres for men and measures, light and leading, on technical education. Virtually, the answer was, we can help you with neither. Spend the money on secondary education, for you cannot teach horticulture in lectures—for this among other reasons, that the young gardeners at Kew already know more of horticulture than some of the lecturers. That may be; but it is wide as the poles asunder from the point at issue, which is not wholly the effect of those technical lectures, or the education of young gardeners, but on the culture and higher education of all classes of our countrymen, and on the stimulation and extension of the first and most vital of our national industries. It is this apparent failure to grasp the great issues at stake in these tentative lectures on technical horticulture that nullifies the value of the decision against their utility; hence, whilst I endorse most of the remarks on the education of gardeners, I fail to find how they logically lead to the condemnation of any well-planned efforts by lectures, or otherwise, to popularise horticulture, and render it at once more pleasant and profitable to all ages and conditions of men, and women also, amongst us. How far this may be accomplished may perhaps partially appear from a couple of programmes sent at random from several that lie before me, and also from a few pages on drainage from the first volume of *Cassell's Popular Gardening*. Most fortunately, this new departure in the teaching and solid advancement of horticulture has received your warm sympathy and powerful support, as well as that of the Royal Horticultural and other societies, and is not likely to fail, because Kew seems alike unwilling to teach or to be taught the new gospel of commercial prosperity and social amelioration by means of horticulture."

REMOVAL OF THE LEAVES OF VINES.—Under the impression that the shade afforded by the leaf is prejudicial to the full ripening of the Grape, some of the French Vine-growers remove the leaves, and so expose the berries to the sun. This practice has been experimentally carried out by M. MUNTZ, who gives his results in the *Annales Agronomiques*. M. MUNTZ arrives at the conclusion that the increased light and heat to which the berries are subjected by the removal of the leaves exert no appreciable influence on the amount of sugar produced, but slightly diminishes the proportion of organic acids. When the practice of defoliation is carried to an extreme degree, as in some parts of South-Western France, harm is done by the diminished production of sugar, and imperfect ripening.

PEAS AND THEIR GROWTH.—In the last *Bulletin* of the Botanical Department, Jamaica, is an elaborate table detailing the results of observations made on a large number of varieties of Peas supplied by Messrs. CARTER. Forty-three kinds were sown on the 3rd or on the 4th of April, and of these, sixteen appeared eight days after sowing. Thirteen appeared nine days after sowing; nine after ten days, and five after eleven days. The dates of blooming showed a wider range of variation, the shortest period being the thirty-fifth day after sowing (American Wonder or Emerald, Carter's First Crop or Ringleader, and Carter's Blue Express); the longest period was sixty-four days (Emperor of the Marrows and British Queen). No definite relation is observable between the time of appearing above ground and the production of the first bloom, but those which flower earliest are dwarf varieties, and those which flower latest are the taller varieties. The average mean temperature during the experiments was about 65°, the minimum about 53°, the maximum about 70°; the rainfall varying from 28 to 34 inches, according to the length of time occupied by the plant in growth, the number of rainy days 40 to 56, the quicker-growing varieties being exposed to less rainfall and less aggregate heat. Abundance is noted as the best Pea (for Jamaica) the very tall Peas getting battered by the wind, and the short ones by the rain. "Abundance," it may be further remarked, appeared above ground on the 9th day after planting, flowered on the 46th day, produced Peas fit for cooking on the 73rd day, and continued to do so for 28 days. The first seed was ripe on the 102nd day after planting; the last ripe seed was gathered on the 133rd day. The number of pods on each plant averaged eight. The number of Peas in a pod is given as 425; but the column in which this record is given is not intelligible as it stands. The mean average temperature of which this Pea had the benefit was 65°-5 F., with a minimum of 53°-2, a maximum of 77°-4, and a rainfall of 34.3 inches. The number of rainy days during its growth was 56; the height of the plant in feet, 2; the time of cooking, fifteen minutes, and the quality third-class. These details will show with what elaboration the experiment was made. It may be further added, that a second sowing of the same varieties was made on May 18, and the results are recorded with equal minuteness. A series of such experiments, duly summarised, would furnish valuable data for estimating the precise effect of a combination of external conditions on the rate of growth and productiveness of the plant, and would help in indicating what phenomena are inherent in the plant itself as a result of inheritance, and what are directly influenced by external conditions.

THE DEVON AND EXETER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The spring session of the above will commence on Wednesday, January 6, the meetings taking place in the Guildhall, Exeter, at 8 o'clock each evening. Wednesday, January 6, Mr. G. C. CRABBE, Prospect Park, subject: "The Culture of the Chrysanthemum by Amateurs." Wednesday, January 20, Mr. ALFRED GEORGE HEAVITREE (formerly Head Gardener at Bicton), subject: "The Cultivation of the Peach and the Nectarine, with Hints on Pruning." Wednesday, February 3rd, the Rev. A. H. CRAWFORD,

Crawfords Orchard Rectory, subject: "How to Grow and how to Show Vegetables for Exhibition." Wednesday, February 17, Mr. J. T. EMBUTT, Winslade Park Gardens, subject: "The Cultivation of the Violet." Wednesday, March 2, Mr. F. W. MEYER, Messrs. VEITCH'S Nurseries, Exeter, subject: "Alpine Plants." Wednesday, March 16, Mr. G. B. LANSDALE, Oxford Terrace, subject: "The Culture of the Carnation by Amateurs." Wednesday, March 30, Mr. ANDREW HOPPE, at Messrs. VEITCH & SON'S, subject: "Daffodils and Narcissi, Illustrated with Typical Specimens." On Wednesday, April 6, the annual business meeting will be held.

BENEDICT ROEHL.—As a result of the exertions of Mr. F. THOMAYER, Director of the Public Gardens at Prague, a statue to the memory of the adventurous botanical traveller has been erected in that city (fig. 12). We are indebted to Mr. THOMAYER for the opportunity of laying before our readers an illustration of this work of art, the characteristic *poë* and freedom of which will be admired. Naturally the largest subscriptions are from Bohemia, but residents in Mexico, Columbia, Russia, England, Belgium, France, all sent contributions, not to speak of smaller amounts from smaller countries less directly concerned in horticulture. How long are DOUGLAS and FORTUNE—and others might be added—to remain unhonoured in their own country?

PUBLICATIONS RECEIVED.—*Elements of Agriculture*. By W. FREEM L.L.D. (John Murray). An excellent text-book, to which we shall take an early opportunity of advertising more at length.—*Discovery*, a weekly journal of Scientific Discovery, and the application of Science to industrial purposes.—*The Annals of Scottish Natural History*. (Edinburgh: D. Douglas.)—*Proceedings of the Agri-Horticultural Society of India*.

MANCHESTER ROYAL BOTANICAL GARDENS.

BEING in the vicinity of Manchester recently, I took the opportunity of visiting the Botanical Gardens, which afford, even at this dull season, a treat to anyone interested in horticulture. During the last ten years the improvements that have taken place are neither few nor small. The glass-houses having been nearly all renewed and enlarged, massive rockwork erected, and the grounds remodelled, at great expense, operations which have placed the gardens second to none of the kind in the provinces.

On entering, the neatness and cleanness of the walks and lawns attracted notice. Hawthorns have been thickly planted by the sides of the promenade and other principal walks, which during the flowering season will fill the air with delicious perfume. In the exhibition-house there was a good display of Chrysanthemums, arranged on each side, with Palms and Tree Ferns in the centre. The Chrysanthemums are grown mostly as bushes, which is a more natural and far more effective style than some others. The Curator pointed out how much larger this house is than the old one, which formerly stood there. By descending the rocky steps at the end of this structure, the cool exhibition-house is entered, which is bygone years was only the framework of a house temporarily covered with canvas when the Whitsuntide shows were held, but which has been covered with glass at a cost of £2000. This house is well adapted for shows, the exhibits looking better than in any house I have seen erected for a like purpose. At the end of this house is placed a concert-room, which provides accommodation for several hundred persons. By a side-door the flower-garden is reached. Bulbs have been largely planted this season, and a fine display may be looked forward to; and here a sunken rockwork has been added for alpine and other species of plants, around which some nice plants of Tree-Ivy, &c., are freely growing. By ascending another flight of rock steps, the terrace is again reached. On entering the conservatory at this point fine plants of Linum tri-

gynum meet the eye, also a fine lot of late-flowering Amaryllis. Passing on to the principal range of span-roofed houses, which take the place of the old lean-to range, the first division was found to be devoted to plants with graceful foliage, with Lapageria trained overhead, which is a very effective arrangement. The next division contained Ericas, Heaths, Epacris, &c., with a well-flowered lot of Primulas staged on one side, which broke the monotony of the whole. By descending a flight of steps the Fernery is arrived at, which is a very attractive feature, and here were noticed some good specimens of Dicksonia, Cythea, &c. The rockwork is well furnished with suitable species and varieties of Ferns, which possess a thrifty, healthy appearance.

The Palm-house is a lofty building, and although it has been recently erected some of the plants have already reached the roof. There are fine specimens of Scaevola, Chamærops, Pandanus, and at the cooler end are huge greenhouse Rhododendrons, Camellias, &c., interspersed with ornamental foliage plants, all of which are planted out. Passing on to the stoves, in which were observed many interesting exotics, it was noticeable how freely the plants have grown. The Orchid-house contained some choice Cypripediums in flower, and a number of the newer varieties of this popular genus have lately been added.

The Azalea-house adjoins the Orchid-house, and contained some fine specimen Azalea indica. A range of small span-roofed houses contained cool Orchids, Cattleyas, Dendrobies, &c., and many other interesting plants.

The lean-to range for bedding plants is the last addition that has been made, but is not least in point of usefulness. To the casual observer, improvement is seen in the grounds, houses, and plants, showing that horticulture is moving forward apace. W. Forrester, The Knoll, Shipley.

CONIFERS.

THE Conifer Congress of last autumn served, among other things, to elicit some enquiries as to the dates of introduction of some of the more important species. In answer to these questions, we may give the following details:—

Before 1548 the Norway Spruce (*Picea excelsa*), the Cypress (*Cupressus sempervirens*), the Arbor-vitæ (*Thuja occidentalis*), the Silver Fir (*Abies pectinata*), the stone Pine (*Pinus pinaster*) had been introduced, but how long before is not a matter of history.

In 1596 mention is made of the introduction of the Pinaster (*Pinus pinaster*).

Before 1629 the Larch (*Larix europæa*) was introduced. In 1640 mention is made of Taxodium distichum.

In 1663 Bishop Compton introduced the Aleppo Pine (*Pinus halepensis*). About 1664 the Cedar of Lebanon (*Cedrus Libani*) and the red Cedar (*Juniperus virginiana*) were made inmates of our gardens.

In 1697 the Balsam Fir (*Abies balsamea*) is mentioned as having been imported by Bishop Compton, who is also credited with the first planting in this country of *Abies nigra* and *A. alba*.

In 1705 *Pinus strobus* is said to have been first cultivated in this country, but Dr. Bolle supposes it to have been grown in the middle of the sixteenth century in France.

In 1736 *Tsuga canadensis*, the Hemlock of the "primeval forest," was imported by Peter Collinson.

In 1746, *Pinus cembra* was brought from Switzerland.

The date 1752 is assigned for the introduction of the Eastern Arbor-vitæ (*Biota orientalis*), and that of 1754 for the Maidenhair tree (*Ginkgo biloba*).

In 1796 *Arancaria imbricata* was brought home by Menzies.

Between 1800 and 1809, *Cunninghamia sinensis* and *Juniperus excelsa* became inmates of our gardens.

Between 1810—1819, *Abies Fraseri* (Fraser, 1811), *Picea Smithiana* (Dr. Gowan, 1818), were introduced.

(To be continued.)

JAMES WILLIAMS.

We are now enabled to present a portrait of the late James Williams, father of the late B. S. Williams, of the Paradise Nurseries, and whose death we announced in our last issue. Concerning his long protracted career we have been favoured with the following details:—"Not to many men has it been vouchsafed to live such a life as his, and it will not be without interest to know something of it. Brought up as a gardener, he married at the age of seventeen, and, three years afterwards became gardener to the late Jas. Warner, of Hoddesdon, in Hertfordshire, and filled the capacity of head gardener there until the weight of his years forbade further working. He died at the age of ninety-five very nearly, in the enjoyment of his faculties to the last, and able to repeat from memory, as he enjoyed doing even on the evening that proved his last, whole chapters of the New Testament. He had outlived his wife by very many years, and also nine of their thirteen children. Beyond the age of eighty he would allow no one else to thin the Grapes in the houses under his care, and beyond the age of ninety he insisted on still keeping the wages-book and paying the wages weekly.

"He had seen the beautiful grounds of Mr. Warner, at Hoddesdon, grow up into maturity from his planting, and could look up to majestic trees 70 feet in height, that his hand had planted. What wonder was it that he enjoyed, as often as he could, and did up to the last, strolling into the gardens he so loved, and what a keen delight it was to him not long ago to be wheeled in a Bath-chair by willing hands, and amidst a circle of horticultural friends, round the tent of flowers that formed the flower show of the Society he helped to create before any other such Society existed in Hertfordshire, the Hoddesdon and Broxbourne Cottage Garden Society. It was in those grounds, that the firm now famous for its artificial rockwork, first built its artificial rocks. The Orchid-house there was the first to be ornamented with rockwork and falling water. This Orchid-house was designed by the late Charles B. Warner, and in it the late B. S. Williams grew the Orchids, that, year by year, when Orchid growing was in its infancy, triumphed so often in the then highest classes of Orchids at Chiswick and elsewhere. On the afternoon of the last day of the year the earth closed over the grave of 'old James,' as his friends loved to call him; and he now sleeps by the side of his wife in the picturesque churchyard at Broxbourne, honoured and loved by all who knew him.

"Six generations had he seen of the family with whom for more than seventy years he had been so closely associated. 'Well done, good and faithful servant, enter thou into the joy of thy Lord,' might well find place on the stone that marks the spot where James Williams lies."

should be done in February or March. Sets should be put down about 16 inches apart, with about 20 inches between the rows. Some plant them 18 inches apart each way, but it makes very little difference which. The sets are about 16 inches long, and when pushed into the soil (which must not be too hard), they should stand about 5 inches above the ground. I may also add that they are the better for being cleared of weeds and grass once or twice during the first year, so that they may get plenty of light and air. Cutting should be done after the leaves fall off, any time from December to the end of March, care being taken to cut the Willows off close to the stump. Planting along fences will not do, as such growth is generally short and shrubby. They do much better when planted in beds, the centre of which will always be found to be less shrubby than the outside. It is quite a mistake to suppose that Willows will only grow in marshy or flooded ground. The best Willows grow on heavy clay land. Bog land will produce fairly good Willows, but a special kind should be procured for it. Soil with a sandy bottom will not do. It is all-important to grow good varieties. The best are "Black Mules," "Brown Norfolks," "Black-tops," "Spaniards," and "Long-skies." The two former are considered the best, and are more largely

THE LATE MR. JAMES WILLIAMS.

cultivated than any others. The "Long Skins" are chiefly kept for two-year-old growth. "Black Mules," "Norfolks," and "Black Tops" will grow well on either bog or clay land. "Spaniards" and "Long Skins" are not suitable for bog or moor land. Poor varieties bring very low prices, and do not pay so well for growing; whereas, if a good stock is used, the crop is highly remunerative. Willow-growing is carried on to a very large extent in England, particularly in Lincolnshire and Nottinghamshire, where it is not unusual to find farmers with 100 acres planted entirely in Willows. They will produce a small crop the first year, and the third year they will probably give about 5 tons to the acre (English), which, at £3 per ton, should pay the producer well. With ordinary care, the plant will last twenty years. No manure is required; the leaves which fall off (in November) are considered quite sufficient. I shall be very pleased to procure good sets for anyone who finds difficulty in getting them, or to give any further information that may be desired. James H. Hewitt, Manager, Workshops for the Blind, Belfast, in the "Freeman's Journal."

CHRYSANTHEMUM GROUPS.—So long as the wording of prize schedules in reference to the exhibiting of groups of Chrysanthemums is the same as at present, exhibitors will have no alternative but to put up their groups as at present. The favourite clause of schedules is this:—"Quality of bloom and general effect to be considered leading features." It

is all very well for persons who are not, and never have been, competitors in such classes to say that a group which is composed and arranged exclusively of plants grown for the purpose, cut down to get them dwarf, and restricted to the orthodox three blooms to obtain as large blooms as possible, cannot compare—in their opinion, perhaps—with one composed of naturally-grown plants, which are remarkable for the number rather than the quality of the flowers. In my opinion, the two kinds of groups ought to be compared on their merits, one set for quality of flowers, and the other for the natural and effective manner in which they are arranged, without any special talent in arrangement possessed perhaps by the exhibitor, but simply because they cannot be packed close together like the other kind of plants. Exhibitors who wish to win prizes, and who do not when they attempt it, must conform to the schedule of the society at whose show they are exhibitors. Seldom indeed do we hear the committee blamed for one iota of the grumble which the exhibitor has to put up with, while they are really responsible for any defects in the general style of the groups. So many square feet have to be filled, the shape more often a semi-circle than aught else, and so small in superficial area that to carry any chance in the competition the plants must be packed very closely together, because where the "quality" clause tells is in the number of fine heavy blooms. Hence the reason for a close arrangement of the plants, almost irrespective of any taste that may be shown in contrasting or blending colour. No judge with the instructions to follow, could omit a group where the number and quality of the blooms were in advance of another group whose exhibitor had depended upon "bushes," provided, of course, that the plants in the former were of a reasonably dwarf habit, with fairly good foliage, and the group nicely finished off at the front, so as to expose but little objectionable legginess of the plants. To my mind, a long way the best method of arranging Chrysanthemum groups is by associating the plants with others having ornamental foliage, but excluding any other kinds of flowers. A little more space is also needed for a group of this kind, 100 square feet is a more suitable superficial area than the 40 or 80 usually offered. Under the mixed plan, competitors are of necessity compelled to employ plants which have not only fully-developed blooms in every respect, but the plants are required to be sufficiently well clothed with foliage as to be worthy of standing alone. In groups of this kind, there is no depending upon the next row of plants to hide the bare stems of the inner row, but each plant must be perfect in itself. Under this style, ample opportunities are afforded of showing the great value of Chrysanthemums as decorative objects in conjunction with other plants of a totally different style of growth. If more of these classes were encouraged, we should soon hear of fewer complaints about the manner in which groups are staged. Visitors do not go to shows to examine critically all the blooms borne by the plants in the groups, which they can do better in the cut-bloom and other classes, but they look at a group as an entity. The Hull Chrysanthemum Society sets the best example in the matter of groups of any that I know. As much as £6 is added to a 20-guinea cup for competition in this class, and the committee have just reason to be pleased with the response made to their handsome offer, as they have perhaps the finest groups of Chrysanthemums to be seen annually staged at any exhibition in England. The crowding and packing of the plants is thus unknown in the winning groups, and in its place there is a judicious disposal of suitable plants, which small groups of Chrysanthemums admit do not admit of. E. M.

PRUNING FRUIT TREES.—I read Mr. Hudson's article, "Apples and Pears in Suburban Gardens" (p. 20), and among many other practical and interesting remarks, noted the following:—"I find that a moderate system of pruning answers better than a too severe use of the knife. By relinquishing the latter, I have in several instances got rid of the canker in our Pear trees. I consider the prime consideration in fruit culture is good crops of fruit. If this cannot be secured by the rule-of-thumb practice, other means must be adopted. The mere appearance of the trees, without regarding the crops obtained, is a fallacy." My experience concurs with that of your correspondent. When I came here I found that the system of pruning adopted was to stop and pinch with thumb and finger, finally cutting-back very hard. The result was that many of the trees cankered terribly; but

HOME CORRESPONDENCE.

WILLOW GROWING IN IRELAND.—A great deal of money is lost to the tillers of soil in Ireland by indifference, not only as regards poultry farming and fruit culture, but also in the matter of Willow growing, which is a crop that practically looks after itself after it is fairly started. As the time for planting Willows or osiers is now approaching, a few hints on the subject may be valued by many of your agricultural or land-holding readers. There are few crops which pay so well as this, and the following suggestions may prove useful to those who intend trying them. Firstly: the ground, which may be good strong clay, or moor land, or bog, should be prepared in the same way as for any other crop, except that it should be more deeply ploughed, or, what is better still, deeply dug or trenched. This, no doubt, is an expensive course, but in the end it is found to pay, as it cleans the ground and opens the soil, so that the sets get a better chance of shooting well; but in any case it should be thoroughly cleared of all weeds and grass, which would be likely to grow up and choke or hide the plants from light and air. Secondly: planting

since I have had sole charge they have been allowed to extend with exactly the same result as your correspondent states. Moreover, we had last season finer fruit from the same trees than we ever had before, fully convincing me that appearances must be put on one side to some extent if one wants full crops of good fruits. *G. Woodward, Barham Court, Madstone.*

PEAR, PITMASTON DUCHESS.—This fine Pear is now thoroughly established as a very desirable variety, combining beauty, size, and flavour. Your correspondent has given just lately some extraordinary examples, and Mr. J. Howard, p. 742, vol. x., is none behind the rest in extraordinary results, but he is unfortunate in saying that some of the fruit are like the old Duchess. We have no proof that there is any relationship. The old gardener at Pitmaston, who sowed the seed, told a friend of mine a short time before he died that "they knew nothing of its parentage, only that among the many seedlings raised it was the best," and I believe it is still growing on the front of the gardener's cottage there. Dr. Hogg says it bears no resemblance whatever to Duchess d'Angoulême, so that the parent will ever be a mystery. Were I to risk an opinion, I should say Marie Louise is one of the parents, fertilized with some large Pear, and all I have for this is a sort of family likeness and the same smooth flesh, whereas the old Duchess is coarse and gritty at the core. *J. Rust, Eridge Castle.*

UNLUCKY GARDENERS.—I read with very great interest Mr. Burbridge's excellent remarks on this subject in a recent issue. He therein expresses (but in a much more convincing way than I could) exactly my views with regard to the "patronage" view of the case under discussion; therefore I will not further trespass on your space as to this particular point. I should like, however, to say a few words on another most important topic which he alludes to in the same communication. Mr. Burbridge remarks, and I very cordially agree with him, "What we really want is a society that would take up the case of the gardener, &c. Here is a field in which the Royal Horticultural Society might legitimately exercise its functions, and with eminently successful results. Some twenty-five years ago, the society instituted gardener's examinations—some will remember Mr. Burbridge taking part in them. I think I have seen it suggested somewhere that this excellent idea is to be revived. What I am about to suggest would be an extension of the "examination" scheme. Why should not the Society have what might be termed a "Registry," in which (after satisfactory references) could be kept the names, qualifications, &c., of gardeners wanting situations, and from which gentlemen might select, with a most reasonable degree of safety, men who would be likely to do credit to the Society, to their employers, and to the gentle art of which the Society is the practical exponent in this country? Such a tribunal would, I feel confident, serve to act as a wholesome check upon the crowd of so-called gardeners who are ever thrusting themselves forward to catch unwary employers. This national registry would inevitably purge the gardeners as a class of men who bring dishonour, discredit, and disgrace upon the profession, and as a necessary consequence, would have the much-to-be-desired result of "easing" somewhat the present congested gardening labour market. And in connection with the "examinations," would it not be an additional incentive—a strong recommendation in fact—for a gentleman to employ a gardener who had received what might be called the gardener's hall-mark, the certificate—the blue-ribbon of merit—of the Society? Such are my ideas, crude perhaps, or one part of Mr. Burbridge's excellent communication, which I have tried to develop. I think their practical application would do much to bring the Society in touch and sympathy with the present race of gardeners, and likewise show its lively appreciation of a class that has lifted British Horticulture into its present proud position. *X.*

CROTONS IN WINTER.—Now that winter is upon us, more than ordinary care is necessary to keep Crotons in health, more especially young plants intended for table and room decoration. It often happens that one or two badly-coloured leaves spoil the appearance of a whole plant, more especially in plants of the *C. Warrenti* type, and a high temperature, with much moisture at the roots, is required at this time of the year. *C. angustifolius* is the only variety which makes growth of fairly good colour with me during the winter months, and plants struck in August make very useful subjects by the spring-time.

Young plants of this species excepted, both the young and the old Crotons are being kept as cool and as dry as it can safely be done. Our plants are well syringed once daily, little or no water besides this is afforded for some time to come; the plants should be carefully examined, however, in case the lower portions of the balls become too dry. If it is found necessary to propagate strong-growing Crotons at this time, firm ripe shoots only should be taken. The smaller growers as *C. angustifolius*, *C. chelsoni*, *C. elegantissimus*, and *C. Langii*, strike badly in winter; whilst *C. Warrenti*, *C. interruptus*, *C. Prince of Wales*, *C. majesticus*, and some of the broad-leaved species and varieties may always be depended upon to root under favourable conditions and careful treatment. *W. R. Williams, Great Marlow.*

HERBARIUM PEST.—The fact of a geometrid caterpillar feeding on dried plants in herbaria is by no means new. In 1798 Fabricius described a moth, now known as *Acidalia herbariata*, and says of it, "Habitat in herbariis folia plantarum exsiccatarum exedens, Mus. Dom. Bosc." This moth has occasionally been found in England, and has been recorded as infesting herbalists' shops; it has been found nearly all over Europe, and usually in herbaria. A complete account of its transformations by Dr. Heylaerts is given in the *Annales de la Société Entomologique de Belgique*, tom. xxi., pp. 1 to 8, 1878. I offer no opinion as to the possible identity or otherwise of the American insect; but simply point out that an insect of similar habit has been known here for nearly a century. *R. McLachlan.*

CAREX VARIEGATA.—This dwarf grass-like plant is rapidly becoming a favourite. It is chiefly useful for covering the surfaces of pots of foliage and flowering plants employed for table and room decoration, associated with *Selaginella* or common Moss. Our plants are grown in an intermediate house in thumb-pots. A fortnight or so before a plant is required for table, a few pots of the *Carex* are turned out, part of the ball of soil being removed; they are then placed where required, together with *Selaginella denticulata*, a little finely-sifted soil being sprinkled over the whole. The *Carex* and *Selaginella* are allowed to remain as long as the plant is in condition for furnishing. Thus treated they often do duty on several plants during the year. It propagates readily by division. *W. R. W., Great Marlow.*

WANTED: INFORMATION.—**TOM THUMB DAHLIAS.**—Are these an acquisition, or the reverse? I ask this question as one thirsting after knowledge. They were praised so much (I had almost written, "and charged for so much") in our last season's Dahlia catalogues, that I looked for something "good"; but, so far as my experience goes, I cannot, as yet, conscientiously say that I consider them an acquisition in any way. I have now in my mind's eye some dozens of Tom Thumb Dahlias, as I see them daily, in the varieties offered this year; near by them are growing other collections of Dahlias—shows, fancies, Pompons, decoratives, and singles; and whilst each time my vision is refreshed by the charms displayed by the types just mentioned, yet these "Tom Thumbs," as it were, jar upon my feelings. Perhaps it may be my fancy, but, so far, I fail to see any beauty in their dwarfness. To me they appear dwarfed altogether out of character. As a curiosity I can look at them; but as regards being "things of beauty" when compared with their regal brethren, they are simply "not in it!" Nor do I appear to be alone in this adverse opinion, for not one who has seen the group aforementioned, seems to have with a comment certainly not flattering. But perhaps I have not viewed these "Tom Thumbs" under the best auspices—so I therefore venture to seek further information. What do our Dahlia growers think of them? *Pioneer.*

BRITISH BIRDS AND THE PAST SUMMER.—The past winter was followed by a very remarkable summer, noted for its lack of sunshine and superabundance of rain. Many insectivorous birds perished through want of food during the ten weeks of severe weather. All who know this beautiful, well-wooded country can well understand how suitable a home it is for the feathered tribe, and up till last winter very many birds of many species were here in large numbers. The lovely golden-crowned wren, the smallest of British birds, was very common here this season. I have only seen one pair; of the common wren, very few; while many others, such as the tree-creeper, yellow and grey

wagtails, large and small wood-peckers, are all very scarce. These birds are truly insectivorous, as is the long-tail titmouse, which is also very scarce. The other three species of tits and the nuthatch are more numerous; this is owing to their not being purely insectivorous, as in severe weather they will, like the robin, eat scraps of bread, meat, and other refuse from the house, and are very fond of looking over the ash-heap in search of food; but I would also mention that the robin suffered much last winter, many being starved. Blackbirds and thrushes did not suffer much, and all kinds of finches are in full force. In severe weather the finches flock to the farmyards for food, with the exception of the goldfinch, which goes to the woods and marshes, and the hawfinch and bullfinch, which can obtain plenty of food in the way of buds, &c. In many parts the hawfinch is uncommon, but here it remains all the year round, doing much damage to Green Pests during the summer months. The owls, of which some four species are common here, suffered much last season, owing to lack of food in the way of mice, for last winter the mice (I mean the common field-mice) were starved to death, and the owls fed on birds that were lying dead under the trees. The only species of birds that suffered less, and seemed to defy the rigour of an arctic winter, were the jays, jackdaws, and the farmer's friends the rooks and starlings. It is really wonderful how the starlings managed to live, yet in spite of ten weeks' frost, they did live, as did also the jays, jackdaws, and rooks. I would mention in passing, for the edification of those who think the rook does no good, that during the autumn and winter months a vast number of rooks came here to roost in the woods, and during the ten weeks of severe frost last winter, when the soil was snow and frost bound, these birds had to live, and with but few exceptions did live—on Corn or Potatoes, but upon the larvae of insect pests. I did ask a farmer if he could tell me what these black fellows got to eat in such severe weather, as I told him they could not get corn or roots. He said he supposed "they got summat else." What that "summat" else was he could not say; but I could have told him that they scratched the ground with their claws, and probed with their strong bills the soil, to unearth the larvae of insects which lay hidden in the soil. Thanks to the running stream, well stocked with trout, the beautiful kingfisher was able to get plenty of food, and two pairs nested here this season. As to the birds that migrate, such as the nightingale, flycatcher, redstart, cuckoo, turtle-dove, goat-sucker or night-hawk, &c., these, like many other insectivorous birds, were not numerous last season, nor did they stay so long as they usually do. Whether the cold and damp summer had anything to do with their stay, I cannot say. The land-rail or corn-crake was heard but little here last season. This is one of the most useful of birds on the land, and should not be shot, for it is by no means too plentiful. In conclusion, I would beg to mention that the golden oriole was not seen here last season, although for two years a pair were here; but, like many another beautiful and rare bird, may have fallen a prey to the ruthless sportsman. Swallows were not here in great numbers, but many of them remained here up till the first week in November, which is very late. *W. C. Leach, F.R.H.S., Athury Park, Guildford.*

AMERICAN AGAVE.—The *Dublin Express* reports the flowering of Lord Rosse's "American Aloe," which, it says, has taken exactly one hundred years to accomplish the task. As this accidental occurrence will probably make more people ready to believe the mendacious legend of its longevity, a few facts as to the time of its maturity may be interesting to your readers. The only one I have seen to flower in a private garden was at the late Sir Richard Wallace's place in Suffolk. This plant was not eighty years old, although very near that age. In the Scilly Islands, where they are quite common, and often planted in cottager's gardens, and are sometimes grown in rows, forming an impenetrable hedge. The average time of flowering is twenty-five years. In these islands the old "masts" of flowers are sometimes allowed to stand till the following year. It is wonderful to think that every node of these huge scapes has been forming in the bud for twenty-five years. *Pagabond.*

WALLFLOWERS.—Wallflower seeds are scarcer and dearer than they have been for years past. The severity of the past two winters told much upon the plants, and while, in 1890, some seed was saved by no means up to the average—the winter of 1890-91 having played greater havoc—in April of last year

comparative few plants were left to bloom. The consequence is a general scarcity, and prices rule high. Especially is that the case with the pretty and useful dwarf yellow variety known as Belvoir Castle, dwarf yellow, or Ware's Cloth of Gold, which is undoubtedly less robust than either of the larger-flowered yellows, or the dark varieties. I like to associate the name of Belvoir Castle with the early dwarf yellow Wallflower. Mr. William Ingram once told me, when I was admiring his pretty spring garden at Belvoir, that he "educated his plants" to his service, and there is much truth in the remark. By means of careful and persistent selection, he obtained a race remarkable for their precocity of blooming, and the dwarf Wallflower was one of his subjects. R. D.

TRENT PARK, NEW BARNET, HERTS.

THE finely-wooded and picturesque estate of F. A. Bevan, Esq., some three hundred acres in extent, has a fair proportion set aside for the requirements of the gardens, and in which the goodly array of glass structures affords ample scope for the display of the abilities of Mr. B. Phillips, the gardener, as a cultivator of plants and fruits. Lately the Orchids have occupied a good amount of attention at Trent Park, as they did formerly at Ludworth, Mr. Bevan's other place; and many of the great genera, such as the Cypripediums, thrive marvellously well in the old-fashioned houses which are still retained, while new ranges have been built for the *Odontoglossums*, *Cattleyas*, *Lælias*, and other plants, which require more air and light than the old buildings are constructed to give. But such as thrive well in the old houses would probably be not improved by a change to the new ones, for it is difficult to imagine a more perfect condition of health than that in which the collection of Cypripediums in a low lean-to, are the plants of C. *Sanderianum*, and other reputedly difficult species, having thick fleshy foliage, and have produced a very fine show of flowers. In this house at present in bloom are some very fine specimens of O. *Spicerianum* ×, C. *Leeanum* ×, grand varieties of C. *Harrisianum* ×; the chastely beautiful C. *Sedenii candidulum* ×, C. *Schlimii*, which good culture has increased in size nearly to that of C. *Sedenii* ×, C. *longifolium Rozeii*, &c., while among the plants noticeable by their very fine sturdy growth are C. *Morganii* ×, C. *Arthurianum* ×, C. *grande* ×, and other rare hybrids and species.

In the next house, also an old one, with a high back wall, there was a great show of *Calanthes*, mingled with foliage plants and *Anthuriums*; and at the further end is a quantity of noble plants of *Phalaenopsis Schilleriana*, many of them large plants, with leaves over a foot in length. There were also fine specimens of P. *amabilis*, P. *grandiflora*, and other species, but it is said that the strong firing rendered necessary by the continued cold of the last winter affected some of the lesser species, so that they are not now so good as they were a year ago. Here in this house was a grand specimen of the rosy-purple *Sobralia macrantha*, and an equally fine one of a white variety of it of great beauty; also some well-grown specimens of *Dendrobium formosum giganteum*, which many still fail to grow and flower satisfactorily. On the slightly-moist back wall of the house and hanging against it, with a shelf projecting over them, too, it was curious to note a row of perfectly healthy *Dendrobium Falconeri*, another plant which gives trouble in some gardens, but which is here thriving in a situation which few growers would select for it.

THE NEW ORCHID HOUSES.

A range in three divisions have in the first commodious division a fine collection of *Odontoglossums*, the forms of O. *crispum* being evidently of excellent quality, while a plant or two of one batch seemed to display distinct features. The flowers were of the broad-petalled class, and perfect in form, but the labellum had more yellow than usual, and a clear yellow ray extended from the column up each of the segments, giving the flowers a most distinct and attractive appearance. Suspended overhead were

some fine pans of *Odontoglossum Rensii majus* and a few scarlet *Sophranitis*, some of each being in bloom.

The next large division was occupied by *Cattleyas*, *Lælias*, &c., among which the forms of C. *labiata*, and especially the newly imported autumn-flowering forms, were in great force. *Cattleya Schroderae* alba, C. *Gaskelliana odorata* alba, C. *Lawrenceana*, with three sheaths, C. *Trianae* alba, and other rare varieties also were noted, and many well-sheathed plants of the varieties of *Lælia purpurata*, L. *elegans*, &c.

In some of the other houses Orchids form all or some of the contents, for at this season Mr. Phillips wisely uses any of the houses for resting *Dendrobies* or other plants requiring a different temperature to that of the regular Orchid-houses, and in various places were arranged a fine lot of all the leading *Dendrobiums*, the D. *Wardianum* especially having put on fine growth, and showing well for bloom. In one of the intermediate-houses was a large specimen, in bloom, of a very fine and distinct form of *Zygopetalum Mackayii*, the flowers of which are very large, and the lip finely developed, and with a veining of dark blue, and a slightly lighter blue over the whole surface; thus the lip is almost entirely blue, and not white veined with blue, as in the ordinary forms. The forms of *Cypripedium insigne* and *Lycastes* were also good in this house.

Among the other houses is a neat little house with the roof covered with the best white and the finest red forms of *Lapageria* in bloom, the stages being occupied by a brilliant show of zonal *Pelargoniums*, among which Mrs. Saunders, lilac-pink; *Zelia*, crimson; *Lady Roseberg*, cerise-scarlet; *Ferdinand Kaufmann*, purplish-crimson, and *Lord Chesterfield*; *Queen of Whites* improved; and *Belle Lyonaise* are prominent. Another greenhouse had *Carnations*, *Cyclamens*, and *Bouvardias*; another had pot *Roses*, &c.; the pits had a fine lot of *Gardenias*, and other plants for cutting and decoration, and in several houses were fine groups of *Chrysanthemums*, which Mr. Phillips seems to get large blooms on in spite of the number which most of them bear.

Great provision for fruits is made, and especially for Grapes and Peaches. One of the vineries had a noble crop of first-class Muscat of Alexandria and Gros Colmar; and another has the roof covered, by one vine of the true Mill Hill Hamburg, which last bore a crop of over 150 fine bunches.

FLORISTS' FLOWERS.

PANSIES IN POTS.

Who cares to grow such common flowers in pots? some cultivators of exotic plants may exclaim. Many persons do, and more would if they knew how much enjoyment could be obtained from them. Some people value plants as they do books, for their rarity, and not for their use. Some years ago, Orchid fanciers used to purchase plants of *Lælia anceps Dawsoni* at high prices at the auction rooms. The plants were sold and re-sold, and the only individuals who obtained profit from them were the auctioneers; for the bulbs in many instances showed clearly enough that the owner of the plants had never seen them flower. The pleasure consisted in possession and anticipation. Cultivators of Pansies in pots can enjoy the most beautiful velvety sweetly-perfumed flowers from cold frames, when the plants out-of-doors are frost-bound. Strong plants are potted early in September, and grown freely but quite hardy out-of-doors until the middle of October, when the shelter of a frame is necessary. Before cocoa-fibre refuse was obtainable, we found a mixture of equal portions of saw-dust and ashes excellent to plunge the pots in. Ashes by themselves are too heavy and saw-dust is too light, but a mixture of both forms an excellent plunging medium for any plants. Pansies flower well in good light potting material, no peat should be used, and the pots should be 6 or 7 inches in diameter. Some of the better *Violas* are lovely when

well grown in pots. The flower-pots should be plunged to about two-thirds of their depth.

CHRYSANTHEMUM LOUIS BOEHMER.

I find that this variety is admirably adapted for growing in small pots, and can be utilised to greater advantage for decoration in that way than taller-growing varieties. I have a number of it that were raised from cuttings taken at the beginning of July, and these were, at the end of the month of November, at their best, and if plants are allowed to perfect only one flower, they are splendid. The pots used are 4 and 6 inches in diameter, and the plants from 15 to 20 inches in height. Their large "hirsute" blooms look very conspicuous when arranged with *Cypripediums*, *Carnations*, *Roman Hyacinths*, and the other occupants of the conservatory. Plants in such small pots are readily moved under cover in the event of frost threatening. I find from experience that if more than two or three blooms are grown on such small plants, the character of the peculiar flowers is not so well exhibited. W. J. Grace, Bickton, Fordingbridge.

NURSERY NOTES.

A MARKET NURSERY AT CHRISTMAS.

The matter-of-fact establishments which we know and recognise as market nurseries can at this season of the year be regarded in the light of an exhibition, simply because all flowering plants are arranged to follow each other in successive and unbroken batches for as long a season as circumstances permit or require; still, the wholesale production of choice flowers at Christmas time, particularly when produced in considerable variety, involves an amount of looking a-head that those who grow a few specialties can hardly be aware of. Generally speaking, of course, market nurseries are supposed to grow largely a few specialties, but even then there is a wide difference between the stall-holder in Covent Garden and the grower who merely sends his goods to the commission-agent for disposal, the establishment of the former always being the most difficult to regulate and profitably to control. It is of one of these that I wish briefly to allude, that known as the King's Road Nurseries, Upper Teddington, and of which Mr. George May is proprietor. Mr. May is a well-known figure in Covent Garden Market, and to supply his ever-increasing trade there, he has gathered around him at Teddington quite a colony of glass-houses, to the number of about fifty, mostly of a large, spacious character. A few of the originals are small and low, while the majority are large, and vary from 100 feet to 300 feet in length, and about 20 feet wide. Some dozen or so of these are filled to overflowing with *Maidenhair Fern*, exclusively grown for the fronds, in 8-inch pots, and daily picking and bunching throughout the year is indulged in with but little interruption. Another batch of fourteen houses, several of which are 150 feet long, are devoted to Tree *Carnations*, and of Miss Jullife alone some 20,000 plants are here grown in varying sizes, to maintain as near as possible a constant supply of its highly popular flowers; other kinds extensively grown are A. *alegatrice*, scarlet; La *Bella*, white; and *Uriah Pike*, crimson-velvet, and fragrant; to the latter, which is not yet in commerce, some five 100-foot houses are devoted, and the plants are in many stages from those three years old to the present season's stock. It is a noteworthy fact of this plant, that it may be grown from year to year constantly under glass, and in these numbers with a death-rate of less than one per cent., which speaks volumes for its true "perpetual" character, as also its good management; the calyx never bursts, and it sends forth lateral shoots with the greatest freedom, and that naturally. The plants are never stopped, but allowed to grow unchecked from the first. In these respects, however, growers of Tree *Carnations* must study individual kinds to bring out their separate natures or habits of growth,

for many kinds I believe are spoiled, or at least their beauty and commercial value marred by too frequent stopping, and even the kinds here named are so absolutely distinct as to each require a separate treatment to bring out its true character. Not content with producing Carnations from cuttings, Mr. May has devoted a house 80 feet long to seedlings, and from this structure some fine things will issue in the near future. These have already flowered and been weeded down, but are being grown on to prove their constancy.

Some good things appeared last autumn, and among them a few meritorious kinds of the yellow-grown type, and good perpetual kinds of this strain will be a decided step onward. The varieties of *Malmaison* are largely grown, one house devoted to large plants being now in flower, with a profusion of buds for a long supply, if the weather (and fogs in particular) permit. Fogs play great havoc with Carnation buds, a fact which was keenly felt a year ago in many districts around the metropolis. Gardenias are another large item in pots and planted out, these producing an incessant supply of flowers. The houses of *Eucharis* would be difficult to match, and still more so, to surpass. There are five 80-foot houses; of these, one with specimens in 12-inch and 15-inch pots, the remainder being in 8, 9, and 10-inch pots, all being in the most perfect health and luxuriance. Here, contrary to the general rule, the *Eucharis* are grown on open stages, and not on bottom-heat, the houses being well heated, and the plants evidently in thorough enjoyment of the treatment accorded.

We have no more valuable plant than the *Eucharis* in mid-winter, for it defies fogs of the basest sort, in support of which I may state, that the large specimen-house just alluded to was a year ago in full flower during December and January, when those terrible fogs played such havoc among flowers generally. At this time the house was a perfect sheet of bloom, representing many thousands, and are worth going 200 miles to see at such a time. Tuberose are also a large item, some 30,000 or 40,000 being grown to maintain a continuous supply. This is another fog-proof plant which should be noted by all, for the number of white-flowering plants which are absolutely fog-proof are by no means numerous. Of Roman Hyacinths 30,000 are grown, the first cutting being made early in last October. Of Lily-of-the-Valley there are 150,000 grown, the earliest being brought on in darkened houses on a bottom of 90° F., and transferred to the cooler side of the house to develop. Arum Lilies are grown in large numbers, and such things as *Lilium Harrisii*, *L. candidum* and others, these latter being very promising. Roses in pots, as well as planted out, are an important feature, and welcome kinds, such as *Niphetos* and *Catherine Mermet* are never-failing in their supplies. Especially good were the latter, with its indescribably sweet colour and perfectly-formed buds. Here, too, may be seen thousands of young plants coming on, mostly on their own roots, as well as large specimens, filling a couple of houses, each about 300 feet long, while others, somewhat smaller, have their share also. Nor does it end here, for propagation is ever going on, and more room will be wanted another year. Such then, in brief, are some of the most important crops which fill this London market nursery at this season, but the general quality of the goods must be seen to be realised. J.

[The above list has been largely compiled from the *Kew Bulletin*, and it has been obligingly revised for us by the Assistant Director. Ed.]

MAIDENHAIR-FERNS.

(Continued from p. 12.)

HISPIDULUM GROUP.

A. hispidulum, *A. pubescens*, and *A. fulvum* are all closely allied; the latter is the best variety. The young fronds are brightly tinted with rosy-purple, changing to deep green; it makes a nice fern for decoration, and is grown to some extent for market. *A. hispidulum tenerum* is very pretty in a small state. *A. aneifense* may be included in this group, but is quite distinct from any of the above, having spreading rhizomes and longer fronds.

POLYPHYLLUM GROUP.

In this group may be included all the large-growing *Adiantum*s, most of which have spreading rhizomes, and large, much-divided fronds. *A. trapeziforme* is a fine fern of free growth, and, when treated liberally, soon makes a fine specimen. *A. pentadactylon* is closely allied. *A. sancta Catherina* is another of similar habit; the large pinnales are deeply lobed, and the young fronds of a bronzy-red tint. *A. Finckii* is almost identical with this. *A. cardiochloa*, which is synonymous with *A. polyphyllum*, is a grand fern; the large spreading fronds are of a soft pale green, very delicately tinted when quite young. *A. tetraphyllum* is a fine species, with fronds of good substance. Of this there are several varieties, including the beautiful little *A. tetraphyllum gracile*, which has such a lovely crimson tint in the young fronds; *A. Hendersonii* is another

delicate but very pretty variety. *A. rhomboideum* (syn. *intermedia*) is a free-growing, useful fern; *brasilense* and *Kaufmannianum* appear to be closely allied to this. *A. curvatum* is a very choice and beautiful fern; it requires a stove temperature and careful treatment. I have raised seedlings of this, which have made beautiful plants. *A. formosum*, although rather distinct, may be included in this group; it succeeds well under cool treatment, and the large deep-green fronds are of good substance, and very effective.

CAUDATUM GROUP.

This consists of only four species, or rather two species and two varieties; *ciliatum* (syn. *Edgworthii*) being considered a variety of *caudatum*, and *dolabriforme* a variety of *lunatum*. They all have long slender pinnate fronds and are profliferous, each mature frond producing a young plant at the extreme point, and these young plants will grow until they again reproduce, and when grown in suspended pots or baskets they are very effective. *A. lunatum* is the most effective; this is deciduous, while the var. *dolabriforme* is evergreen. These have deep-green fronds and almost black rachises, while *caudatum* and its variety are of a pale soft greyish-green, and have a villous surface. This will complete the list of species and varieties, but, having written chiefly from memory, I may have omitted some which ought to have been included. However, as I have taken up more space than I intended, I will not look for further additions.

TRADE NOTICE.

We learn that Mr. Millard, formerly with Messrs. Sutton & Sons, and who subsequently was in business on his own account as seedman and nurseryman at Reading, Berks, is now associated with Messrs. J. Sharp & Son, of Barbey and Reading, Seed Farmers and Merchants, and is acting as Manager of the Reading branch of the firm.

Obituary.

MRS. GRANT.—It is with regret we have to announce the death of Mrs. Maria Grant, of Hillersdon, Culloompton, Devon, widow of Mr. William Charles Grant, J.P., of Hillersdon, which occurred on December 28. Mrs. Grant was a lover and cultivator of British Ferns, and had a very fine collection of choice varieties, which she successfully grew into very large specimens; indeed, with her, the congested forms ceased to be congested, and developed characters beyond what is usually seen. She was also the discoverer of some distinct and well-marked varieties; notably, the *N. filix-mas* var. *Grantii* (Moore), and the *Asplenium filix-femina* var. *magenticum* (Lowe). Her passionate love of Ferns, her genuine hospitality and liberality, and the great pleasure she experienced in exhibiting her marvellous specimens to fern friends, made a visit to Hillersdon a real enjoyment. Good collections of Ferns are not numerous, and during the last few years death has much diminished the number; this branch of botany can thus ill afford the loss of one like Mrs. Grant, who has done so much, and so well, in the cultivation, propagation, and introduction of our British varieties of Ferns. *E. J. L.*

POTATOS.

Demand for old stock is quiet at lower prices, whereas fresh arrivals are required for even at higher prices. The late severe weather damaged many truck-loads in transit, which throws on the market some hundreds of tons at low rates. *J. B. Thomas.*

SEEDS.

LONDON: Jan. 6.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report increased activity in the seed trade. The favourite article is still Red Clover seed, for which prices continue to move upwards. The advance in England, however, lags behind the rise established across the Atlantic, and spot seed can be bought in London at 2s. per cwt. under c.i.f. values. There is no change in either Carrots, White, or Trefolium. Spring Tares are in improved request. There is a good inquiry for English Rape seed. Mustard shows no alteration. Blue boiling Fens, with a somewhat diminished sale, are firmly held. Canary and Hemp seed move off on former terms. Linseed keeps steady.

FRUITS AND VEGETABLES.

SHALFELDS, Jan. 3.—Quotations:—English Apples, 2s. to 5s. per bushel; common do., 7s. to 12s. 6d. per barrel; English Tomatoes, 4s. to 8s. per peck; let, 1s. 6d. to 2s. 6d. per box; Seakale, 1s. 6d. to 2s. 6d. per punnet; Cabbages, 1s. to 2s.; Savays, 1s. 3d. to 2s. 6d.; Cauliflowers, 6s. to 10s. per bunch; Greens, 1s. 6d. to 2s.; Turnips, 1s. 9d. to 2s. 6d.; Carrots, 1s. 6d. to 3s.; Parsley, 1s. 6d. to 2s. per dozen bunches; Spinach, 1s. to 2s. per bushel; Endive, 1s. to 1s. 6d.; Beetroot, 3d. to 6d.; Cabbage Lettuce, 1s. to 1s. 6d.; Lettuce, 1s. 6d. to 2s. 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Bordeaux Onions, 4s. 6d. to 5s.; Spanish do., 6s. to 7s. per case; Belgian do., 4s. to 5s.; Dutch do., 4s. 3d. to 5s. 6d. per bag of 10 lb.; Celery, 4d. to 1s.; Horse-radish, 1s. to 1s. 6d. per bundle.

BOROUGH, Jan. 5.—Quotations:—Savays, 2s. 6d. to 3s. 6d.; Broccoli, 10s. to 15s. per tally; Spinach, 1s. to 2s. 6d. per bushel; Brussels Sprouts, 1s. to 1s. 6d. per ½ sieve; Greens, 2s. to 3s.; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 1s. 6d. to 2s. 6d.; Parsley, 1s. 6d. to 2s. 6d. per ½ sieve; Parsnips, 1s. 6d. to 2s. 6d. per ½ sieve; Cattle-feed, 2s. 6d. to 3s. 6d. per ½ sieve; Parsnips, 1s. 6d. to 2s. 6d. per ½ sieve; Mangels, 16s. to 20s. per ton; Swedes, 20s. to 25s. do.; Onions, English, 12s. to 14s. do.; do., Dutch, 4s. to 4s. 6d. per bag; do., Ports, 5s. to 7s. per case; Apples, English, 2s. to 6s. per bushel; American, 1s. to 1s. 6d. per barrel; Brussels Sprouts,

STRATFORD, Jan. 5.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as usual.—Savays, 2s. 6d. to 3s. 6d. per bushel; Greens, 9d. to 1s. 3d. loose; do., 1s. 3d. to 1s. 6d. per dozen; Cauliflowers, 1s. to 2s. 6d. do.; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; do., 3s. to 4s. per ton; Carrots, household, 1s. 6d. to 2s. 6d. do.; Cattle-feed, 2s. 6d. to 3s. 6d. per ½ sieve; Parsnips, 1s. 6d. to 2s. 6d. per ½ sieve; Mangels, 16s. to 20s. per ton; Swedes, 20s. to 25s. do.; Onions, English, 12s. to 14s. do.; do., Dutch, 4s. to 4s. 6d. per bag; do., Ports, 5s. to 7s. per case; Apples, English, 2s. to 6s. per bushel; American, 1s. to 1s. 6d. per barrel; Brussels Sprouts,

1s. 3d. to 1s. 6d. per half-sieve; do, 2s. to 2s. 6d. per flat; Horse Radish, 1s. 1d. to 1s. 6d. per bundle; Celery, 9d. to 1s. per roll.

POTATOS.

BONDUKE: Jan. 5.—Quotations:—Hebrons and Elephants, 70s. to 90s.; Imperators, 60s. to 85s.; Bruce Magnums, 60s. to 90s. per ton.

SPITALFIELDS: Jan. 5.—Quotations:—Magnum, 57s. 6d. to 70s.; Regents, 57s. 6d. to 75s.; Champions, 55s. to 60s.; Imperators, 60s. to 80s.; Main Crop, 60s. to 80s. per ton.

STRAITFORD: Jan. 6.—Quotations:—Magnum, 60s. to 80s.; Imperators, 65s. to 75s.; Hebrons, 60s. to 70s.; Scotch Magnums, 70s. to 85s.; Main Crop, 85s. to 100s. per ton.

FARRINGTON: Jan. 6.—Quotations:—Bruces, 75s. to 110s.; Imperators, 70s. to 90s.; Magnums, 65s. to 110s.; Hebrons, 80s. to 95s.; Sutton's Abundance, 85s. to 110s. These figures apply also to the King's Cross (Great Northern) Market.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.			RAINFALL.		BRIGHT SUN.	
	ACCUMULATED.			INCHES.		HOURS.	
	Above 42° for the Week.	Below 42° for the Week.	Day-deg. difference from Mean since Jan. 4, 1891.	Below 42° difference from Mean since Jan. 4, 1891.	Mo. (42° or less) than Mean for the Week.	No. of cloudy days since Jan. 4, 1891.	Percentage of possible Duration for the Week.
1	1	2	27	+ 100	6	143	53.0
2	1	0	33	+ 80	163	2	184

12	4	46	0	+ 15	43	2	201

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
Principal Grazing, &c., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending January 2, is furnished from the Meteorological Office:—

"The weather was unsettled and rainy in all parts of the Kingdom until the period drew towards its close, when it improved considerably over England, although showers continued to fall in Ireland and Scotland. Thunder and lightning occurred at some of our northern and north-western stations during the early part of the week.

"The temperature was above the mean in all districts, the excess ranging from 1° in Ireland, and the north and north-east of Great Britain, to 3° or 4° in most parts of England. The highest of the maxima were recorded on December 30 in England and Ireland, and on irregular dates in Scotland, and varied from 50° in Scotland, N. and W., and England, N.E., to 55° over eastern, central, southern, and south-western England, and to 59° in Ireland, S. The lowest of the minima were registered during the middle part of the week at most of the Scotch stations, and on Jan. 2 in Ireland and England, they ranged from 26° to 32°, excepting in the Channel Islands, where the thermometer did not fall below 39°.

"The rainfall was less than the mean in England, N.E., and the Channel Islands, and about

equal to it in England, S. and Ireland, S. In all other districts, however, there was an excess.

"The bright sunshine exceeded the mean in nearly all districts, the percentage of the possible duration ranged from 25 to 34 over the kingdom generally, to 18 in England, N.W. and Ireland, N., and to only 6 in Scotland, N."

NOTICES TO CORRESPONDENTS.

BLACK KNOT: *H. S., New York.* This is a disease better known on your side of the Atlantic than it is here. It is caused by a fungus now called *Plowrightia morbosus*. We should cut out and destroy by fire all the affected branches so far as possible, and spray the young trees in spring with solution of sulphate of copper wherever you see traces of the disease.

BOOKS: *T. B.* No books exists treating specially of the subject. Obtain *The Forcing Garden*, by Samuel Wood, published by Crosby Lockwood & Co., Stationers Hall Court, Ludgate Hill, E.C.

CIDER APPLES: *C. E. Kingston Black*, the variety you named, otherwise *Taynton Black* and *Taunton Black*, is a valuable variety, making a cider of a rich tawny-red colour, agreeable in flavour, moderately sweet, and pleasantly acid, with an astringent after-taste. The density of the juice = 1.052, and after twenty-four hours' exposure to the air, 1.055. And 100 parts of the juice by weight yielded of sugar, 10.028; tannin, mucilage, salts, &c., 6.792; water, 83.180. Cummy, from Cummy, in Radnorshire, an introduction from Normandy, makes a slightly aromatic bitter-sweet cider. Sugar content in 100 parts = 14.000. Tanner's Red has plentiful juice of a rosy-amber colour; subacid, with some astringency. Sugar contents, 11.424 in 100 parts.

CORRECTION: Owing to a misprint, the show of the Devon and Exeter Horticultural Society is given in our Almanac as taking place on August 9, instead of August 10.

DUTY ON MALE SERVANTS: *C. D.* The excise tax of 15s. per annum must be paid on the head-gardener, and it can possibly be enforced in the case of an under-gardener, or garden labourer, who may occasionally assist in the dwelling.

FRUITING OF STEPHANOTIS: *C. E.* Not at all uncommon. The fruit is poisonous.

LARGE PARSNIP: *G. F.* A root measuring 17 inches in circumference, and 22 inches in length, is certainly above the average size. The best Parsnips are those which have a large development of the crown of the root, this part affording the greater mass of the pleasant eating mealy outer layer of flesh. Roots of the Carrot shape have a thinner layer of this kind of flesh surrounding the inferior watery core. Most of the London market Parsnips are of this class. Perhaps a smooth clean regular appearance which they have is a great thing with those who know nothing of the points of a really good Parsnip.

LAUREL HEDER AND APPLE TREES: *Amateur.* Choose some of the healthiest and best-placed long branches, and layer them in the gaps in the hedge, excavating a small basin-shaped hole, into which the layer must be bent, and secured with a stout wooden hook, or two straight pegs, driven into the soil, one on each side of the layer, and crossing it above. Then cut all the rest of the plants back into the old wood, leaving the branches at a general level of 2 feet from the ground. This may be done now. Put on to the soil on each side of the hedge a layer of rotted manure, digging it in March or April. The old branches would not, as you suppose, strike roots, if treated as cuttings. You may transplant the 12-year old Apple trees safely, if you take them up carefully; i.e., dig out most of the roots and rootlets, taking special care of the latter, swathing them all in damp bandages the while—old mats and sacking answer well for this purpose. Have roomy holes prepared in well-drained land, and a good lot of fresh pasture loam to throw around the roots when planting. Prune off all damaged roots, and reduce somewhat the size of the crown by cutting back the main branches. When planted, see that the trees do not get planted as deeply as they were before, but rather higher, as the soil will sink considerably, leaving the crown of the root in the deepest part of the depression, and this, when filled up level with soil, which

would occur in course of time, would bury that part too deeply for the future welfare of the trees. Stake the trees at once, and if the heads are heavy, put some guying wires to them.

MILDEW ON STRAWBERRIES: *D. U. M.* This malady is more likely to afflict Strawberry plants and fruits in moist soils in walled-in kitchen gardens, where the beds are on the level land, than those on raised banks, natural or artificial, and in open hilly fields. We do not ever remember observing any traces of mildew on south borders that had a good pitch towards the south, their freedom from it being due to the warmth of the position, the good drainage of the soil, and a better circulation of air about the plants than those on the flat enjoy. Old writers on Strawberry culture advocated the use of raised beds, and these were sometimes made terrace-wise, the soil being kept in place by flat roofing-tiles. It may be that, besides the early fruiting of the plants secured by these Strawberry banks, those old observers had discovered that the mildew did not attack the plants, and that fruit could be gathered without stopping. Loudon, in the *Encyclopedia of Gardening*, gives a figure of a Strawberry bank covered with tiles. *W. R.* The causes are a damp, cool, stagnant state of the house—just the conditions that most favour the development of mildew on Vines, Heaths, Roses, &c. As precautions, afford air by the upper ventilators, or if in ordinary pits, by tilting the lights at the back; or what is better, if the front wall-plate is wide, by pushing the lights down a little way, and to keep up the temperature during the day, even when there is warm sunshine, use the heating apparatus, and keep the air buoyant. Keep saucers about filled with sulphur and water, also smear the hot-water pipes with sulphur and whitewash. For milder attacks on out-of-door plants, dressings of the Bordeaux mixture in the early stages before the fruit appears, or whilst it is still quite young would be serviceable.

MOLES: *G. G.* We are unacquainted with the French method of destroying moles by poisoning them, and should deprecate this wholesale method of ridding a garden of these—in moderate numbers—useful animals. With the use of the right sort of traps, moles can always be caught when their upheaval of the turf has become a nuisance. During the cold weather up to March, the mole rests in his fortresses, usually the biggest hill thrown out, and here it is easy to dig him out, if the workman goes about the job quietly and expeditiously. In setting traps of any kind, the hands should be well coated with damp mould, for the mole has an acute sense of smell, and the mould prevents any part of the trap coming in contact with the skin of the hand. A garden workman should be deputed to look after the moles when they begin to burrow in the spring, and he should be furnished with sharp edged steel or iron piddle, about 2½ inches wide, and 6 inches long, fitted on to a straight ash handle. With this implement a burrowing mole can be thrown to the surface and killed.

NAMES OF FRUITS: *John Milburn.* I. Lewis's Incomparable; 2, unknown; *W. J. S.* Autumn Pearmain—*H. L. E.* Wykes Pippin—*J. H. J.* I and 4, Josephine de Malines; 2, Chaumontel; 3, Beurré Rance; *G. W. S.* Pear Glout Morceau, a wonderfully fine specimen.

NAMES OF PLANTS: *J. C. B.* Epidendrum ciliare. Fertilisera Oneida says that the flowers are their best. *W. F.* Zygopetalum Mackaili. Do not pack flowers in cotton-wool.—*No Name of Sender.* Long pink card-board box—*Carludovica latifolia*—like a Palm.

RAINFALL: *Enquirer.* London is included in N. 5 district, where the average rainfall is 30.0 inches. The appendix of the weekly weather report gives a summary of the rainfall and mean temperature for each district for the whole year for 25 years, ending 1890. It may be obtained for 4d. from the Meteorological Office, 116, Victoria Street, Westminster.

VINES: *Anxious.* According to strength, cut them to within 1 or 2 feet of the ground. If very weak cut them to the ground.

With Two Sets of Broad Reeds, Organ and Celestial Tone, sent carefully packed and carriage paid to any address in Great Britain and Ireland on receipt of P.O.O. for 6s. 6d. Selling in thousands.

CAMPBELL'S GOLD MEDAL MELODEON.

AN UNPARALLELED OFFER.

To readers of the *Gardeners' Chronicle*.

OUR GRAND PRIZE MEDAL "MINIATURE" MELODEON. 10s.

With Two Sets of Broad Reeds, Organ and Celestial Tone, and the Charming Bell Accompaniments, sent carefully packed and carriage paid to any address in Great Britain and Ireland on receipt of P.O.O. for 10s.

NO DECEPTION HERE. 100,000 TESTIMONIALS. Important Testimonial from Professor Brown, the Champion Melodeon Player of Great Britain, Ireland, and Wales:—"Campbell's Patent Melodeons are the finest instruments that have ever come under my touch, and only require a trial to advertise themselves." Campbell's Patent Melodeons are the only genuine Melodeons in the market. Beware of worthless imitations.

N.B.—All lovers of music should at once send for our New Illustrated and Priced Price List for Season 1891-2, now ready. 100,000 of these valuable lists sent out yearly. Send 1d. stamp to

For all INSECT PESTS in Greenhouses and Frames, nothing has proved equal to the

LETHORION (VAPOUR CONE),

(PATENT).

They are now universally admitted to be thoroughly uniform in strength, and safe for any Plant or Flower, even if four times the quantity are used.

Scale and Mealy Bug may be completely eradicated by using the Cones double strength.

PRICES—For Frames, &c., of 50 cubic feet, 6d.; 100 ft., 9d.; 1000 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each.

THE HOUSES SHOULD BE WELL SECURED.

LUTON STREET, LIVERPOOL.

THE PATENT

SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatoes, Peaches, &c., beyond any other Manure.

September 29, 1891.

"I am very pleased with your Silicate Manure. The effect upon the Vines is very marked, for they ripen and colour much better. Your Manure has given me great satisfaction for Tomatoes; it is all you claim for it."

(Signed) THOMAS PRICE,
Gardener to the Bishop of St. Asaph.

Prices in Sacks, at Works, 10s. per cwt.; £2 per ½ ton; £3 15s. per ½ ton; £7 per ton.

THE PATENT SILICATE MANURE CO.,
THE CHEMICAL WORKS,
HEMEL HEMPSTEAD, HERTS.

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other blight, 2 ounces to the gallon of soft water, 4 to 10 ounces as a winter dressing for Vines and Orchard-house trees, in latter from cake for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. from the Trade, Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

If set across three Columns the lowest charge will be 30s.

Page, 8½; Half Page, £4 10s.; Column, £2.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

PORTION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week must reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. Foreign (excepting India and China), including Postage, 17s. 6d. for 12 months; India and China, 19s. 6d. Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

IMPORTANT TO GARDENERS, AMATEURS, AND OTHERS, WHO FUMIGATE HOUSES TO KILL "FLY," OR "THRIP."

You will shortly be ordering your Spring Supply of Fumigating Material. Why lay in a heavy stock of an article which is uncertain in quality, often disappointing and very unpleasant to use, when you can have a **SAFE, RELIABLE** article, and one that is most pleasant to use?

CAMPEL'S FUMIGATING INSECTICIDE.

THE FIRST AND STILL OF ITS CLASS, ONE

On which you can thoroughly depend. The manufacture is much improved now, and it can be ordered without any risk of the failures or disappointments which frequently attend all other fumigating materials.

PRICES.—No. 3 Roll, sufficient for a house with a capacity of 1000 cubic feet, 1s. each, post-free. No. 4 Roll, do., do., 2000 cubic feet, 1s. 9d. each, post-free. OR FROM YOUR NEIGHBOUR.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1784.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

WINTER AND SPRING PRUNING. TRIMMING, and THINNING out can be better and quicker done by the STANDARD MANUFACTURING COMPANY'S Celebrated Tools, including the "STANDARD" and "GIANT" TREE PRUNERS, the "MYTIGUTTAH," and other useful appliances, than by any means. They were shown in actual use at the recent Horticultural Exhibition, Crystal Palace, and at the great Agricultural Shows at Bath and Doncaster; thousands of visitors being astonished at their wonderful power and scientific efficiency coupled with great saving of time and labour, and the risk to life and limb reduced. After Stormy Weather, these Tools will be found invaluable for cutting off fractured branches, leaving the ends severed in a vital condition.

Sold by the principal Ironmongers and Seedsmen, the leading Stores, and kindred Trades throughout the world, of whom Illustrated CATALOGUES may be had; or of the PATENTERS and MAKERS, at their works and depot, ST. ALEMMUND'S CHURCHYARD, DERRY.

GARDENER (SINGLE-HANDED or otherwise).—Age 40; married, no family; both total abstinence. Thoroughly experienced in all branches.—GARDENER, 31, Bruce Road, High Barnet.

GARDENER (SINGLE-HANDED, or otherwise).—A young man of good experience. Full particulars.—J. R., 31, Thorne Street, Wandsworth Road, S.W.

GARDENER, where two are kept, or FOREMAN, in a good establishment.—Age 15, single; previously with Mr. Palford, Bramley Park.—MISTEAD, 4, Haulers Villes, Folke Road, West Hamet.

GARDENER, in Flower and Kitchen Garden.—Age 23; married when suited. No objection to pony and trap.—F., Millford Cottage, South Hayling.

GARDENER, where two or more are kept; age 31, married.—A GENTLEMAN is anxious to recommend his Gardener. Five years' excellent character. Family going abroad.—C. GENTLE, Lea Green, Croydon, Derby.

GARDENER (SECOND).—Age 23; ten years' experience inside and out. Good references.—H. H., The Gardens, Farnham Castle, Surrey.

GARDENER (SECOND), Inside, where six or eight are kept, or FIRST JOURNEYMAN in a large establishment.—Age 25; nine years' experience, principally under Glass, in good places. Good character and testimonials.—W. H., The Gardens, Moorhill Manor, Godalming, Surrey.

GARDENER (SECOND).—Age 22; over eight years' experience inside and out; excellent characters.—F. T., 3, Lyndhurst Road News, Hampstead, N.W.

GARDENER (SECOND, or UNDER).—Age 21; good knowledge inside and out. One year and six months' good character.—CHALLIS, 38, Ravenshaw Street, West Hampstead, N.W.

GARDENER (SECOND, or SINGLE-HANDED).—Age 24; eight years' experience in Stone and Greenhouse Plants, also Flower-gardening, Vines, Tomatos, Cucumbers, &c.—W. HAWKINS, Daisy Bank, Knap Hill, Woking.

GARDENER (UNDER).—Age 19; six years' experience, inside and outside. Strong and willing.—W. A., 1, Alpha Cottages, Staines Road, Hounslow.

GROWER (SOFT-WOODED), or FOREMAN in Small Nursery.—Age 31; experienced in Growing Pot Stuff and Cut Flowers for Market. Good references.—Wages, &c., to F., 47, Dempster Road, East Hill, Wadsworth.

To Nurseriesmen.

PROPAGATOR.—Age 23; nine years' experience in Stone and Soft-wooded Stuff for Market. Good references.—B., 41, Wellington Street, Strand, W.C.

PROPAGATOR and GROWER.—Roses, Rhododendrons, Clematis, Bedding and General Nursery Stuff. Practical experience in some of the leading Nurseries.—H. L., 55, Natal Road, Streatham, S.W.

PROPAGATOR or FOREMAN.—Age 25; nine years' nursery experience. Ferns, Palms, Stone, Softwooded, and General Growing; Wreaths, Bouquets, Decorations, Sales, &c.—ALCOCK, 67, Victoria Road, Burton-on-Trent.

FOREMAN, or PROPAGATOR and GROWER.—Married; nineteen years' experience in Growing large quantities of Plants and Cut Flowers for Markets such as Double Ferns, Cyclamens, Bonvardias, Roses, Chrysanthemums, Palms, Ferns, Eucharis, and plants usually found in Nurseries. Well up in Bouquets, Wreaths, Crosses, &c. Excellent testimonials. State wages given.—C. S., 5, Hextable Cottages, Hextable, Kent.

FOREMAN, age 29.—Mr. G. THOMSON, Gardener, Easney, Ware, Herts, should like to recommend his Foreman, H. Carpenter, to any Gardener in want of a good man. Well experienced. Two years in present situation. Active. Abstainer.

FOREMAN, in the Houses, in a good Establishment.—Age 26; good character from present and previous employers.—H. SHETLER, Heathlands, Maybury, Woking.

FOREMAN (Inside, or GENERAL).—Age 27; two years' Foreman in large establishment. Excellent testimonials. Abstainer.—FOREMAN, 23, Cadogan Street, Cadogan Square, S.W.

FOREMAN, in the Houses, in a good establishment.—Over two years in present situation as Foreman. Good character from present and previous employers.—J. WELLS, Sherfield Manor, Basingstoke.

To the Trade.

FOREMAN, or GROWER.—Age 32; abstainer. Well experienced in Tomatos, Cucumbers, Mushrooms, Chrysanthemums, Pot Plants, Bedding Stuff, Bulbs, Cut Blooms, Building and Heating.—J. B., *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOREMAN in the houses, or SINGLE-HANDED, where there is glass, age 25; married when suited. Good character from present place.—W. G. WORSFOLD, Rose Cottage, Hasleley, near Warwick.

FOREMAN, or MANAGER.—Understands Vines, Cucumbers, Tomatos, Chrysanthemums, Stems, Soft-wooded Plants.—A. A., Albert House, St. James's Road, Box Hill-on-Sea.

FOREMAN.—Mr. W. REEVES, Hatfield Park, Cuffham, Surrey, has great pleasure in recommending his Foreman, A. Child, to any Gardener requiring the services of a steady, industrious man, with a good knowledge of the profession.

FOREMAN.—Age 26; thirteen years' experience in good establishment. Excellent Fruit and Plant Grower, including Orchids. Good characters.—W., Cornysborough, Maiton, Yorks.

FOREMAN, in a large establishment; married when suited.—J. HARRIS, Tubney House Gardens, Abingdon, can confidently recommend his Foreman, H. Gibbins. Two and a half years' present place, four previous.

To Nurserymen.

FOREMAN.—Married; fourteen years' experience in Growing for Market, Foliage and Soft-wooded and Cut Flowers. Four years in present place. Good references.—GARDENER, Malver's House, Grove Park, Camberwell Grove, S.E.

FOREMAN (HOUSE), where two or three are kept.—Mr. W. DAVIES would be pleased to recommend J. Hamer as above. Abstainer.—Wingfield Park Gardens, Darby.

FOREMAN, in good establishment.—Age 30; fifteen years' good experience. Excellent testimonials and references.—ASHWELL, Bedford Road, Morhaegher, Sandy, Bedfordshire.

JOURNEYMAN, in the Houses.—Age 21; good character. Bath preferred.—S., Bloomsbury Nursery, Timperley, Cheshire.

JOURNEYMAN (FIRST).—N. E. OWEN, Gardener to Lady Sutton, Conisburgh Abbey, Whitechurch, Salop, can confidently recommend the above to any Gardener requiring one.—S. ROBINSON, Narborough, Leicester.

JOURNEYMAN (FIRST), in the Houses, under Foreman, in a good establishment.—Age 22; both preferred.—H. MIDDLETON, The Gardens, Break-spere, Herefield, Middlesex.

JOURNEYMAN (FIRST).—Age 24; nine years' experience in Fruit and Plant Culture. Two years' character.—H. HARRIS, The Gardens, Hatchford Park, near Cobham, Surrey.

JOURNEYMAN.—Age 24; Fruit Houses preferred, under a good Foreman.—B. TARRY, Ketton Hall Gardens, Stamford.

JOURNEYMAN (SECOND or THIRD), in Houses, in a good Garden. Over seven years' experience. Fourteen months in last place. Both preferred. Total abstinence.—G. CARTER, The Graces, Somerleyton, Lowestoft, Suffolk.

JOURNEYMAN; age 21. Five years' experience inside and out.—E. ASHROX, Gardener to Lord Howard of Glossop, can with confidence recommend a big, strong young man as above.—Glossop Hall Gardens, Glossop, Cheshire.

JOURNEYMAN in the Houses.—Age 19. EDWIN BECKETT, gardener to H. H. Gibbs, M.P., will be pleased to recommend a young man as above, who has lived under him the last five years. Strong, active, and willing.—W. CHILDS, The Garden, Aldenham House, Elstree, Herts.

JOURNEYMAN.—Age 20, German. Orchids, Palms, &c. Worked in Belgium and England. Well recommended. At present, with Messrs. Vincke-Dujardin, Bruges, Belgium.—J. H., *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

IMPROVE, under a good Gardener, both preferred.—Age 19; five years' experience. Good character.—C. F., Bloomsbury Nursery, Timperley, near Mouchester.

TO GENTLEMEN, &c.—Young man wants a Job on Estate, as CARPENTER, &c. Used to Greenhouse Building, Reparing, Glazing, &c.—A. F., 3, Bonmouth Terrace, Folkestone.

TO GARDENERS, &c.—Situation wanted, in a good Garden, by a Gardener's son (age 18). Fair knowledge of in and outdoor Work. Excellent testimonials.—REDDAN, Eynsham, St. Neots.

TO GARDENERS.—Young man (age 22) seeks situation in Gentleman's Garden. Two and a half years' experience in Outdoor Work.—A. CHEESMAN, Watersfield, Pulborough, Sussex.

TO GARDENERS.—Situation wanted by a young man (age 21), in the Houses, under a good Gardener's Gardener. Good knowledge of the work. Good references.—J. BELCHER, Kingham, Chipping Norton, Oxon.

TO NURSERYMEN and FLORISTS.—Advertiser seeks re-employment as Grower of Soft-wooded Stuff, Palms, Ferns, &c. In or near London preferred.—BALDWIN, 2, Victoria Road, Broad Lane, Tottenham.

TO MARKET GARDENERS.—Situation wanted as FOREMAN, by a man who thoroughly understands all branches of the business.—FOREMAN, 8, Tramway Avenue, Chiswick.

TO MARKET and FRUIT GROWERS.—MANAGER.—Age 43, married; experienced in Grapes, Peaches, Tomatos, Cucumbers, Plants, and Cut bloom; also Outdoor Fruit and Vegetables. Excellent references.—J. M., 1, Milligan Terrace, Ayleston Park, Leicestershire.

SHOPMAN, or MANAGER.—Age 32; thorough knowledge of Seed, Bulb, Plant and Flower Trade. Good references. State particulars.—W. HARRIS, Hammerwood, East Grinstead, Sussex.

SHOPMAN (ASSISTANT).—A young Man, having completed four years' apprenticeship in the Seed Trade, seeks engagement as above. Salary not so much an object as getting into a good Retail Establishment.—J. Mieser, Hurst & Son, Houndsditch, London, E.

SHOPMAN (ASSISTANT).—Age 25; nine years' practical experience in Seeds and Bulbs. Good references.—Z., *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT and PILLS.

As winter advances, and the weather becomes more and more inclement and drying, the earliest evidences of ill-health must be immediately checked and removed, or a slight illness may result in a serious malady. Relaxed and sore throat, quinsy, influenza, chronic cough, bronchitis, and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as nearly as practicable to the seat of mischief. This treatment, simple yet effective, is admirably adapted for the removal of these diseases during infancy and youth. Old asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have wonderfully relieved many such sufferers, and re-established health after every other means had signally failed.

THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS, AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.,
HORTICULTURAL ENGINEERS TO HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered and Tubular

HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

The Best Boiler Extant.

— FRONT ELEVATION —

The longitudinal section gives a view of the fire-box, water space, flues, &c.

— LONGITUDINAL SECTION —

The front elevation shows it set in brickwork, which is necessary for this class of boiler.

TESTIMONIALS.

MESSERS. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1886.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 28,000 feet of piping in them, varying in size from 1½ in. to 6 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather. Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

Morley House, Ragot, St. Saviour's, Jersey, November 10th, 1886.

Yours faithfully, (Signed) G. W. BASHFORD.

MESSERS. THOS. GREEN AND SON, LTD., LEEDS.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

LOOK TO YOUR BOILERS,

And replace INEFFICIENT and DEFECTIVE ONES by

WEEKS'S PATENT DUPLEX UPRIGHT TUBULAR,

THE CHAMPION BOILER OF THE AGE.

It is unparalleled for POWER, ECONOMY, and DURABILITY, the WATER-BARS alone being equal to many Boilers.

A TEN YEARS' GUARANTEE given with all Duplex Boilers (subject to printed conditions) when fixed by the Patentees.

The Royal Victoria Nurseries, Holdenhurst Road, SPRINGBOURNE.

Estate of the late Mr. Finch White. MESSRS. REBBECK BROS. are instructed by the Executors of the late Mr. Finch White to SELL BY AUCTION, at "The Mart," Bournemouth, on FRIDAY, January 22, 1892, at 3 for 3.30 P.M., in one lot, the above important long Leasehold ESTATE and NURSERIES.

BUILDING ESTATE AND NURSERIES, carried on so successfully for many years by the late proprietor; an area of nearly 4 acres, situated within half a mile of the Bournemouth East Railway Station, in the most popular district, where there is a large demand for houses, workshops, &c. The buildings on the property which will be included in the Sale, consist of a pair of Semi-detached Cottages; 1 Brick-built Stable with large Loose Box; 2 Cart Sheds, with large Loft and Storage Rooms over. The Conservatories, Greenhouses, Hothouses, Potting sheds, Boiler-house, Pits, and other erections for the purposes of the business are not included in this lot, but parties who may have the option of taking them, as well as all the Stock-in-Trade in and about the Premises and the adjoining Nursery at a valuation. The Property is held under lease for an unexpired term of about sixty-five years, at the very low annual ground rent of £24.

Particulars, Plans and Conditions of Sale may be obtained of Messrs. J. and W. H. DRUITT, Solicitors, Town Hall Chambers; and of the Auctioneers, "The Mart," and Gervis Place, Bournemouth.

WANTED, a NURSERY, 6 Greenhouses, 1 Acre of Land. Must be preferred. Must be genuine. Price low—State particulars to F. C. *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, TO RENT, on LEASE, three or four ACRES of LAND, suitable for Nursery Purposes. Without Stock preferred. Send full particulars to—J. S., 2, Beach Terrace, Exning, Suffolk.

To Market and Cut Flower Growers. (Folio 7568.) LONDON DISTRICT.—TO BE LET, either as a whole or in two portions, a LARGE MARKET NURSERY, comprising about 10 acres being covered with glass. A Lease for 21 years will be granted. Only small Stock planted out to be taken, remainder optional. Full particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

NURSERY TO LET, in South of England, near town of 150,000 inhabitants, consisting of 22 houses (about 2000 ft. run), all well heated and in good condition. Mushroom houses, sheds, three dwelling-houses, hotby, about 10 acres of land, chiefly planted two years since with fruit trees, &c. The above is a chance seldom to be met with, and every facility will be given for a suitable tenant. —ALPHA, *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

London, 12 miles from.—(Folio 7562.) CAPITAL MARKET NURSERY.—10 Greenhouse as at modern and well-heated. Stables, &c., and 1 acre of Ground. Long lease. Rent only £4. Price and full particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

FLORIST AND MARKET-GARDEN BUSINESS TO LET on Lease. Good locality; growing population (Kent), close to railway station. Or growing, offer PARTNERSHIP to a suitable person with small capital at his disposal. Apply to J. *Gardener's Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLOREST.—FOUR ACRES (or more) of LAND, to LET on LEASE, with Option of Purchase. No better land could be obtained in the district. Situated 10 miles from London, and near Railway Station.—Apply to Mr. H. MOORE, 59, Bishopsgate Street Within, E.C.

MIDLAND COUNTIES.—TO BE SOLD (Folio 7561), in an important town, an old-established General NURSERY BUSINESS. Long Lease. Low rental. Capital required, about £2500. Apply to PROTHEROE AND MORRIS, Auction and Estate Office, 67 and 68, Cheapside, London, E.C.

FOR SALE, in a Main Road, Two Newly-erected Greenhouses, 20 feet by 12 feet, and 35 feet by 3 feet. Good chance of a Jobbing Gardener. Must be sold immediately. Cheap. Good reasons for Sale.—2, Dunsford Road, South Wimbledon.

PICTURESQUE ROCK SCENERY.—Forming Waterfalls, Lakes, and Streams, Ferneries, Winter Gardens, Alpines, &c., as in hundreds of places about the kingdom, including at Aldenham House, Elstree, so faithfully illustrated in this Journal of November 21, executed by F. H. and SON, 50, Finsbury Square, London, E.C., and Broxborne, Herts. Photo Illustrated Book sent for inspection on receipt of two stamps.

ERFURT, GERMANY.

ILLUSTRATED CATALOGUE

FRESH & SELF-GROWN SEEDS,
ENGLISH EDITION, is
NOW READY.

Includes all the FINEST NOVELTIES of the Season, and may be had post-free on application (id. post-card). Please quote *Gardeners' Chronicle*.

My business is the Oldest and Largest of Erfurt that supplies private Gardeners and Amateurs only. More than 60,000 parcels are sent yearly to all parts of the World.

I OFFER MY

SEEDS AT MUCH LOWER PRICES

than any English or Continental Seed House of good repute, and guarantee, besides, self-grown, genuine, and fresh Seeds only.

It is an established fact that the greater part of all Seeds Sold in England or America is grown in Germany, especially in and near Erfurt, the Garden Town of Germany.

Furnishing you with my Catalogue, I place my stores at your very door, and enable customers thousands of miles away to obtain their supplies as safely and cheaply as if they had called in person at my establishment.

Ordered Seeds will arrive in Great Britain within a few days, and are offered and sent Package and Postage Free.

Et gravé from a photograph lent by Mr. VICTOR LEMOINE.

NEW CHRYSANTHEMUMS.

H. CANNELL & SONS

Wish to inform all lovers of the above that they are sending out nine new kinds:

Mrs. Robinson King,
Baron de Prailly Improved,
Kentish Yellow,
Miss Cannell,

Emma Hitzeroth,
Eva Hoyte,
Colonel W. B. Smith,
Miss Watson,

Mr. Geo. Lloyd.

Selected with their usual great care and caution. Never has there been a season requiring such acute, cool, and practical knowledge concerning new varieties. Seedlings and sports are as numerous as butterflies, and all are said to be more beautiful. On referring to history, it will be found whatever we have enquired in our Catalogue have, with but few exceptions, always attained the highest degree of excellence, and especially for exhibition—Jubilee set as an instance. Never have we felt so confident of a set doing so as we are of the above. With our numerous collection and great stock, we do not aim to grow and show them to a high degree. Nevertheless we are sure they will cause a great and agreeable surprise when exhibited for our Prize at the next Great National Chrysanthemum Show.

Our CATALOGUE, sent post free, will be found to contain descriptions of the numerous kinds that have been exhibited and shown great promise, and will undoubtedly be of the utmost importance to all those who are desirous of gaining notoriety next season.

SWANLEY, KENT.

SANKEYS' famous GARDEN POTS

* Bulwell Potteries, Nottingham. *

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your 'Garden Pots,' and still find them the best and cheapest."

Largest Manufacturers in the World. No Waiting. Millions in Stock. Carriage and Breakage Free on £10 Orders. Half Carriage on £5 Orders. Samples Free.

CANNELL'S BECONIAS.

THREE GREAT VICTORIES:

The Temple, Crystal Palace, and Edinburgh, last year.

At the first-named Great Show we were awarded by the Royal Horticultural Society, as a mark of great excellence, a Gold Clock, an unprecedented and highest prize yet given to this family. Like all our plants and seeds there are none to equal them for real excellence, and as a proof we have received probably more First-class Certificates of merit for double varieties than all other growers put together; for full particulars see our Floral Guide, a book of reference, and contains the most accurate information on flowers throughout the world, and is valued for such in preference to all others. Sent post free to intending purchasers.

MR. W. NELSON, Ficksberg, Orange Free State, South Africa, September 2, 1891.

"I have just returned from a tour of some 600 miles through the Free State and Transvaal, and as I had, as a matter of course, a copy of your Floral Guide with me, I feel that I ought to thank you for the rich stores of solid and interesting information contained therein. Many were the hours which it helped to while away, it being so thoroughly characteristic of true British flora."

MR. G. SEUR, Rhinebeck, New York, U.S.A., November 21st, 1890.

"DEAR SIR,—Last season my son was working for H. Low and Sons, and on returning to America brought me a paper of Double Begonia seed from your house, and also from other growers. Their seed did not come up, but what a surprise yours was! I had some such as were never seen here before—notably a white 4 tooth, and as fine as any Hollyhock, heating others into a cocked hat."

VEITCH'S NEW LETTUCES

Are most desirable acquisitions, and should be grown in all gardens.

VEITCH'S PERFECT GEM CABBAGE LETTUCE.

The best variety for summer use. A most distinct, compact growing variety, of a rich deep green colour, forming very early a close, solid heart, beautifully crisp, juicy and tender, and of excellent flavour.

Per packet, 1s. 6d.

VEITCH'S GOLDEN QUEEN CABBAGE LETTUCE.

A small early variety of a beautiful and pleasing golden colour, literally all heart, and of a particularly delicate flavour.

Per packet, 1s. 6d.

VEITCH'S SUPERB WHITE COS LETTUCE.

A magnificent self-folding variety, grows to an immense size, is of superior quality, very crisp, and fine flavoured.

Per packet, 1s. 6d.

For full description of the above and other Choice Novelties, see *SEED CATALOGUE* for 1892, forwarded gratis and post-free on application.

WARWICK CASTLE.

THE history of Warwick and of Warwick

Castle is so intimately interwoven with historical events in the Middle Ages, that those who have made only a superficial study of those stormy times in our country must know something of the renowned Guy, the most noted among many famous Earls of Warwick, and also of the stately grandeur of the Castle which has for centuries been the home of some of the first families of England's aristocracy.

There seems to be no authentic record as to the time when the oldest portion of the present Castle was built, but after the Norman Conquest it was greatly enlarged and beautified, and built into something like its present form; and since that time many additions have been made—notably the fine polygon tower, dedicated to Earl Guy, which has walls 10 feet in thickness, a base of 30 feet in diameter, and rises to a height of 128 feet. This was built in 1394, by Thomas Beauchamp, the then Earl of Warwick, who was the son of one of the commanders who led the van of the English Army at Cressy. The view from the summit of this tower, which is reached by 133 steps, is of great extent and beauty. In the distance are seen the spires of Coventry, and the ruined towers of Kenilworth, the Shropshire Hills, and the Saxon Tower on the Broadway Hills, with the pretty and fashionable town of Leamington in the near distance, and the venerable towers of many a village church showing between and above the luxuriant trees of the park. Volumes might be written of the doings of the Earls of Warwick, of the great events which took place in the vicinity; but enough has been written to show that, by reason of its antiquity and historical associations, it holds an unique position among the old homes of England. We may here enumerate the crowned heads who are known to have visited Warwick:—Queen Anne, Queen Elizabeth, and Queen Victoria, who was accompanied by the late Prince Consort.

The gardens and grounds, which more nearly concern our readers, as we saw them in August of last year, formed a pleasing sight. The principal entrance to the castle and grounds from the town is through a massive archway with huge folding doors, passing through which, the visitor enters a sunken road, cut deep in the rock. Stately trees rise from the top of the rocks on either side, forming a leafy canopy overhead; while from the base of the trees a sloping bank of Ivy reaches to the edge of the rocks, from which point the long trailing shoots of Ivy stray downwards, till in some places they have

CLIMBING DELICATESS CUCUMBER.

TO THE TRADE.

100 packets, of ten seeds ... 25s.

Electros will also be lent, if desired.

J.C. SCHMIDT
ERFURT,
GERMANY.

reached the road. This forms a picturesque and striking entrance, and one not easily forgotten.

An abrupt turn of the road brings the visitor in sight of some of the oldest portions of the Castle. On the right rise the ponderous walls of Guy's Tower, referred to above; and on the left is Cesar's Tower, which, built 800 years ago, has withstood the attacks of many besiegers. It still continues, to all appearance, as firm as the rock on which it stands. The two towers are connected by a strong embattled wall, in the centre of which is an arched gateway, secured by a second gateway at the end of the arch. In front of this is the old moat, with an arch thrown over at the gateway, where a drawbridge was formerly situated. Passing the double gateway, the visitor enters the inner court. On the left stands the irregular castellated mansion of the feudal barons of Warwick. The spacious area of the court is clothed with the richest of green turf. On the right are two extremely old and quaint-looking Scotch Firs, in keeping with all that is ancient around them. Opposite the entrance to this court is a colossal artificially-raised mound, which connects the battlements on the right with the Castle on the left. This mound was made nearly a thousand years ago by Princess Ethelfleda, who erected a watch-tower on its summit, from which to observe the movements and keep in check the warlike tribes around.

Passing from the environs of the Castle, a long straight walk leads to the flower garden and pleasure-grounds. On either side of this walk are fine stretches of turf, bordered on one side with a Yew hedge, clipped with mathematical accuracy into the form of a cube. On the other side, on the grass at the bottom of a gentle slope, stands a fine thriving specimen of the English Oak, which was planted by Queen Victoria, June 16, 1858; and a short distance from this point is a Wellingtonia, which was planted at the same time by the Prince Consort; and near by is a promising tree of *Cedrus atlantica*, which was planted by Princess Mary of Teck in October, 1889. Near the above-mentioned trees are many fine specimens of Yew, a tree which thrives at Warwick. Traversing the walk already mentioned, we come upon the terraced flower-garden. This was laid out by the late Robert Marnock. The whole of the beds are edged with Yew and Box, which is kept clipped into regular form. On the upper terrace, in the centre of the flower-garden, is a large conservatory, with a front of glass and masonry, and a ceiled roof. This was originally built to hold the celebrated Warwick Vase.

This house also contains a remarkably fine specimen of *Dicksonia antarctica*, having a trunk 14 feet in height, and 18 inches in diameter at the base, everyone of the numerous large fronds being in perfect health. *Chamaecyparis exelsa* is also represented by a huge thriving specimen, and a plant of the graceful *Acacia plumosa* was fully 15 feet in height. Ivy-leaved *Pelargoniums* occupied the front stages, and these were flowering profusely. On the terrace, in front of the conservatory, an avenue consisting of Orange and Camellia trees, in tubs, were arranged with very good effect. The scene presented to view from the terrace is one that is not easily surpassed in loveliness.

At the foot of the terrace are the flower beds, bright in the season with the glow of many colours; then comes a lower terrace with groups of Roses and flower beds, and immediately in front, for a quarter of a mile in length, is a broad open lawn without beds of any kind, but bordered on either hand by noble Cedars and

Limes extending to the banks of the river Avon, which passes in its course the walls of the Castle closely. On the opposite side of the river, groups of trees rise here and there, which, from the terrace above, appear like a continuation of the avenue of trees just referred to, and as these belts of trees are continued in the distance they gradually curve to the right till they appear to almost meet in the distance; from this point the tops of other trees form an undulating surface, which sweep upwards on either side of the central cavity and extend as far as the eye can reach.

Much of the bedding consisted of bold combinations of *Pelargoniums*, sometimes of zonals, sometimes *Pelargonium peltatum* in variety together with the former. *Clematis Jackmani* is also made use of with very good effect as a bedder.

The Roses near here were in fine condition, their strong healthy appearance and fine blooms showing they were well cared for. Other beds, filled with *Dianthus barbatus*, and *Amaranthus melanocephalus* ruber, each with suitable edgings, contributed variety, and added to the general effect.

From the flower garden the Cedar Walk is traversed. This is lined on either side by a row of grand specimens of Cedar of Lebanon, which grow with such luxuriance here, and it is generally admitted that at no other place in England can so many fine Cedars be found. The trees at Warwick have assumed that table-like form so characteristic of the species when aged, and the branches spread out to a tremendous length, while one of the trunks measures 26 feet in circumference at the base. They are said to have been among the first brought to England. At the end of this walk, we get a fine view of the Mount, which is reached by a winding walk, and from which a panoramic view of great extent and beauty is obtained. We pass onwards. At the base of the Mount to the Castle walls, which, from this point, runs in a line with the river, the walls towering majestically above the stream. Near this point are Lord and Lady Warwick's terraces, whereon many rare shrubs and choice herbaceous plants are fixed, the positions being so warm and sunny that many plants not usually hardy enough to withstand the winters of the midlands, remain uninjured. On the opposite side of the castle, near the entrance, is a charming and secluded roseroy, also a piece of Marnock's work, and it is well worthy of him. The Roses are trained over iron pillars and chains, and some varieties thrive well under such conditions; but many of the best kinds literally refuse to grow when trained close on iron supports—endeavours will be made in the future to remedy this defect.

Both the Earl and Countess of Warwick have long been ardent collectors of trees and shrubs, and have at various times, when returning from their foreign travel, brought back many rare and beautiful trees and shrubs, such as are seldom met with in English gardens. The grounds abound in delightful walks and shady drives, bordered with green sward, and overhung with the long-spreading branches of Cedars, Limes, Planes, Beech, Stone Pines, and Laburnums. A fine avenue of *Cedrus Deodora*, Yews of unusual dimensions, and other subjects not often met with, among which may be mentioned *Salisburia adiantifolia* (the Maidenhair tree), *Catalpa syriacifolia*, *Abies Lowiana*, *Paulownia imperialis*, *Cercis siliquastrum* (Judas tree), *Cistus ladaniferus* (Gum Cistus), *Sciadopitys verticillata*, *Aristolochia siphon* (a deciduous climber), and *Buddleja globosa*. These, to-

gether with a great variety of Conifers of the ordinary description, completes a scene rich in sylvan beauty.

THE KITCHEN GARDENS.

One of the kitchen gardens is situated in a warm sheltered spot on the site of a once-famous vineyard, where so far back as the time of Henry IV. the Grapes were brought to great perfection, and a few Vines of the same variety are still growing in it. Every foot of this garden is closely and judiciously cropped with vegetables. The principal kitchen garden is enclosed by high walls, well furnished with fruit trees, the southern aspect being covered by Apricot, Peach, and Nectarine trees.

GLASS-HOUSES.

The glass-houses occupy a large portion of the walled-in space, and consist of two substantially built ranges, well heated and ventilated, but unfortunately some of the houses are rather too lofty to be well adapted for plant growing, unless large plants for exhibition are required; for that purpose they would answer admirably, but in spite of this weakness they are a fine compact lot. The vineries are four in number; one was occupied chiefly with Muscats, another with Black Hamburgs, the other two with late varieties. Alicante, Gros Colmar, and Lady Downe's were carrying heavy crops, which gave promise to finish well. The Vines in the Muscat and Hamburgh-houses, though not carrying such a weight of fruit, had many fine bunches, the latter being of a beautiful colour. The Peaches were over in the two houses devoted to their culture, but space was found for one tree of Pine-apple Nectarine, and which was carrying some very fine fruits of that excellent variety. Other large houses were occupied by Tomatos and Cucumbers, and a mixed collection of stove and greenhouse plants. I may here remark that in the borders in front of the fruit-houses were layered some thousands of Malmaison Carnations, and of which a goodly number of bushy plants were also growing in pots.

Much, of course, was observed which cannot be incorporated in the present notice; and one could not but remark on the excellent condition in which the whole place is kept by Mr. H. Dunkin, Lord Warwick's head gardener.

NEW OR NOTEWORTHY PLANTS.

CYPRIPIEDUM COWLEYANUM.

C. CURTISII ♀ × C. NIVEUM ♂. (New Garden Hybrid.)

THIS, one of the handsomest of hybrid *Cypripediums* that I have yet seen, was raised in the gardens of F. G. Tautz, Esq., Diddon House, Hanger Hill, Ealing, by his indefatigable gardener and Orchid grower, Mr. John C. Cowley, by crossing C. Curtisii with the pollen of C. niveum. The foliage is fairly intermediate between the two named, that is to say, in strength and general appearance it approaches C. Curtisii, but the foliage is thicker, the markings obscure, and a tinge of purple shows on the under side. The scape is covered with hairs, brownish in colour; the bract (like all the segments of the flower) is also ciliate, and possesses some purplish spots; and the ovary is of a green colour, tinged with brown. The flowers, in their massive proportions, bear much resemblance to those of C. Curtisii, but the petals are wider, and the colouring is different; in fact, the shape of the flower and the spotting have a greater resemblance to that of *Marshallianum* × (C. venustum pardinum × C. concolor), which flowered some time ago with Mr. Tautz (*Gard. Chron.*, April 16, 1887), but the ground is white,

and the spots are darker and more closely set together than in *C. Marshallianum* ×. The reverse side of the flower is wholly white, with a slight tinge of green on the middle of each; the purplish spotting of the petals showing through at the edges. Regarding the front of the flower, the upper sepal, which is white, and is slightly concave in form, with about fifteen clear dark purplish-crimson lines, more or less dotted, and tinged with rosy purple between them, radiating from the

where about an eighth of an inch in length is white, and unspotted. The white lower sepal is furnished with a few purplish lines. The face, sides, infolded lobes, and interior of the lip, are of a bright rosy-purple colour, and the stamens are dark purple, with a white margin on its upper edge. *J. O'Brien*.

CYPRIPEDIUM, ENSION (HARRISIANUM × BARBATUM DIFLORUM) (CROSSII).

A second crossing with a form of *C. barbatum* has

ties of true *Harrisianum* have. It was raised and flowered in the gardens of Chas. Winn, Esq., Selly Hill, near Birmingham, where there are many better hybrids approaching maturity. *James O'Brien*.

PERFUME PLANTS IN AUSTRALIA.

THE cultivation of perfume-yielding plants in Australia is not by any means a new idea. It was

FIG. 15.—VIEW OF THE RIVER AVON AND WARWICK CASTLE. (SEE P. 71.)

base almost to the edge, so as to leave only a narrow white margin wholly unspotted or tinged. The petals, which are not so much deflected as in *C. Curtisii*, are ovate-oblong, their tips curving slightly backwards; they are white, and almost the whole of their surface is covered with small dark purplish-crimson or claret-coloured spots. The base of the petals is tinged with claret colour, which, at a little distance, gives them a shining purplish-crimson colour. The white ground between the spots is more apparent at the tips of the petals,

of course resulted in producing a flower of smaller size than that of *C. Harrisianum*, and with more of the aspect of *C. barbatum*, but it may only be likened to a small form of that known in collections already as *C. Harrisianum vivicans* ×; and it is probable that the cross may have been effected before, but the raisers have included it with the *C. Harrisianum*, of which there are a large number of varieties already. The present variety, however, is a neat flower, with a more shiny surface and a more rosy hue over the petals and dorsal sepal than the varie-

suggested many years ago, and a member of the family representing the well-known house of Piesse & Lubin visited Australia, and took special interest in the subject. It seems, from a paragraph in the *Chemist and Druggist*, that a fresh attempt in this direction has been made in Victoria, where, at Dunolly, the Government has had for some time an experimental flower-farm, for the purpose of growing flowers for use in the preparation of perfumes. Mr. Bosisto, who has done so much for the development of the products of the *Eucalypti* in pharmacy, and

who was referred to in connection with Eucalyptus farming in the *Gardeners' Chronicle* for January 2, 1892, p. 18, on visiting the farm recently, spoke of the French perfume manufacturers, and expressed a hope that a similar industry might grow upon Victorian soil. In considering the establishment of such an industry in Australia, Mr. Bosisto said two questions would arise: "First, have we in Australia any indigenous plants or flowers adapted for the purpose? Second, will the cultivation of imported perfume plants pay? We are not, as is generally supposed by strangers, surrounded with bush-flowing plants, rich in colour, peculiar in appearance, but devoid of fragrance. Many may be so classified. We have a few woods, barks, leaves, and flowers, resins and balsams, containing aromas. Some may be said to be rich and rare; even in the Eucalypti, few leaves of a tree excel the *Citridora* of Queensland. How few aromas excel those of the Wattles or the *Pittosporum* of Victoria, or the *Boronia* of West Australia. From August to December the Wattle varieties are in bloom, scattered over the colony, loading the air with their bouquet, and supplying flowers, not by the pound weight, but literally by the ton. Although the *Pittosporum undulatum* in its forest-home does not bear an abundance of flowers, yet under cultivation the trees become covered with blossom. The *Boronia megastigma*, which is a small shrub, supplies flowers abundantly under cultivation, richly endowed with perfume. The Musk-tree (*Olearia argophylla*), so abundant in many parts of Victoria, supplies an otto, durable in scent, frangipani-like. If our people farmed these odoriferous plants, they would supply new perfumes for Europe, and create an industry in which their young families could find employment. The *Pittosporum* and Musk could be planted around sections of land, and the *Boronia* cultivated in the garden or by the acre. The necessary knowledge to treat the parts of a plant for the scent-product is certainly diversified, but it is not beyond the reach of persons of ordinary intelligence."

We agree with our contemporary in its remarks on the above subject, that there may be some prospect of success in the introduction of new perfumes, but, so far as those already supplied by France are concerned, that there is little or no hope of remunerative competition from the Victorians.

BEAN CULTURE.

ALTHOUGH we have about 350,000 acres of land under Beans in this country, and import from 2½ to 3½ million cwt. of Beans from abroad, it is strange how small is the proportion of the ripe seeds of the Bean tribe used for human food here, compared with other countries. The French Bean and the Scarlet Runner are popular vegetables in their young state, but our home produce and imports of Beans are principally devoted to feeding live stock, for the ripe pulses are very seldom used at table. Beans and Peas are almost alike in the proportions of the two nourishing substances, legumin and starch. The kidney Bean is nearly twice as nutritious as Wheat. The seeds of the field Bean and the Broad Bean or Windsor Bean contain 33 per cent. of starch. On the Continent, and in most Spanish countries, Haricots and "Fleagolets," as they are termed, are the common and ordinary food of the people.

The French consider Haricots far superior to any other *legume*, and in many countries of Europe, as also in North America and Asia, they are cultivated to a much greater extent than in England, and by every cottager who possesses a piece of garden ground, for their ripe seeds, of which they make various kinds of dishes, and consider them of as much importance in their domestic economy as our poorer classes do Potatoes. In India, China, and Japan, various pulse are largely used for food. These comprise different species of *Phaseolus*, *Ervum*, and *Lathyrus*. No Hindoo takes his usual meal without having some of the pulses served up in one or other of the dishes. They enter largely into their food, and as they contain much nitrogenous and nutritious matter, they supply, to some extent, the want of more

substantial meat. When broken into the cotyledons and husked, they are called *dal* in India, this generic designation denoting the split condition in which they are commonly prepared for use, the word being cognate with the English *deal* and *dole*, and the German *theilen*, to divide.

Dried pulse are considered by Payen to be of equal value, weight for weight, with meat, and containing less water.

The Bean farms in the northern provinces of China are very extensive, as the Beans are not only cultivated for food, but grown for pressing oil from. The Chinese Beans are of a smaller size than those grown in Europe, and there are very many kinds; some with white, black, green, red, and spotted seeds.

The white Beans are used for expressing edible oil, and the black ones are crushed for oil for lighting purposes. The extent of the production may be estimated from the fact of 179,570 tons of oil-cakes from these Beans having been imported at Swatow in 1890, to be used as manure for the Sugar-cane fields. The yellow Beans found all over China are used to make Bean-curd, a kind of cheese prepared from the caseine, largely consumed by the Chinese, when vegetables are not very plentiful. To make it the Beans are boiled and coagulated by a solution of gypsum, the curd gradually acquiring the taste and smell of cheese. It is sold in the streets of Canton and other cities, and forms no inconsiderable portion of the food of the people. The green Beans (*Phaseolus angulatus*) are manufactured into vermicelli, or used as a confectionery. In Japan the production of Beans annually exceeds 16,657,000 bushels, and they import 824,500 cwt. from Corean ports. Cakes are there made of Beans, flour, and sugar, which are of a dark reddish colour, and brittle. The Soy Bean (*Soja hispida*) is an extensive article of cultivation in the East, and an important source of food in Tibet and India. It is best known as the source of the sauce called "Soy," so largely employed in the East, and of which considerable quantities are imported into Europe and America, entering into the composition of most of the popular sauces sold. The Soy Bean contains 28½ per cent. of nitrogenous matter, against 25 per cent. in ordinary Beans. Beans boiled all night are sold in the Arab bazaars of Egypt in the morning, and eaten for breakfast with butter and lemon juice. P. L. S.

INTRODUCTION OF CONIFERS.

(Continued from p. 52.)

BETWEEN 1820—1829 many of Douglas's grand discoveries were made, thus: *Pseudotsuga Douglasii* (1827), *Pinus Lambertiana* (1827), *P. ponderosa* (1827), *Abies Webbiana* (1822), *A. cephalonica* (1824), *Pinus excelsa* (1827, Wallich), *P. Gerardiana*, *Cupressus torulosa* (Wallich, 1824).

BETWEEN 1830—1839, *Picea orientalis* (?), *Cedrus Decodara* (1831), *Abies Menziesii* (1831), *A. amabilis*, *A. grandis*, *A. nobilis*, *Pinus contorta*, *P. monotaica*, *P. insignis* (1833), *P. Coulteri*, and *P. Sabianiana* (all by Douglas); *P. austriaca* (Lawson, 1835); *Abies Pinsapo* (1839), and *Pinus Ayacahuite* (Hartweg, 1838); *Cupressus macrocarpa* (Hartweg).

BETWEEN 1840—49, *Cedrus atlantica* (1841), *Cupressus Goveniana* (1846), *Pinus sembroides* (Hartweg, 1846), *Sequoia sempervirens* (Hartweg, 1846), *Keteleeria Fortini*, *Pseudotsuga Kempteri*, *Pinus Bungeana*, and *Cryptomeria japonica* (Fortune, 1846), *Pinus monophylla*, *P. muricata* (Hartweg), and *P. tuberculata* (1847), *Fitzroya patagonica* (1849).

BETWEEN 1850—59, *Cupressus Nutkensis* (1850), *Larix Griffithii* (1851), *Abies concolor* (W. Lobb, 1851), *Abies magnifica* (Jeffrey, 1851), *Tsuga Albertiana* (Jeffrey, 1851), *Pinus Jeffreyi* (Jeffrey, 1852), *P. Balfouriana* (Jeffrey, 1852), *Libocedrus decurrens* (Jeffrey, 1853), *Sequoia gigantea*, *Thuja gigantea*, and *Abies bracteata* (W. Lobb, 1853), *Sciadopitys verticillata* (T. Lobb, 1853), *Pinus Sieboldi* (Siebold, 1853), *Pinus densiflora*, and *P. Massoniana* (Siebold, 1854), *Cupressus Lawsoniana* (W. Murray, 1854).

BETWEEN 1860—69, were *Pinus Koraiensis* (J. G.

Veitch), 1861; *Abies firma* (J. G. Veitch); *A. numidica*; *Thuja Standishii* = *japonica* (Fortune). Between 1870—79, *Abies brachyphylla*, A. Mariesi, A. Sachalinensis, and A. Veitchii (Maries), 1879.

ORCHID NOTES AND GLEANINGS.

A FINE LELIA ANCEPS.

A SPECIMEN of this in the gardens of T. F. Blackwell, Esq., The Cedars, Harrow Weald, possesses thirty spikes, bearing more than one hundred flowers, and is a fine object. The plant has been grown from a small piece by the gardener, Mr. J. Dinsmore; and some time ago the original specimen was broken up, and another, almost as good as the one in question, taken from it. In these specimens Mr. Dinsmore has managed to have the least number possible of unproductive back bulbs, there being, on the average, about one spike of flowers to every three bulbs, and thus a great show of flowers is obtained from plant of a moderate size. J. O'B.

CYPRIPEDIUM YOUNGIANUM X.

A hybrid raised out of *C. superbiens* by the pollen of *C. Roebelinii* (philippinense var.), and quite intermediate in character. It was described by Mr. Rolfe in *Gard. Chron.*, August 16, 1890, p. 183. *Reichenbachia*, t. 31.

MILTONIA HYBRIDA BLEUANA.

A hybrid raised by M. Bleu from *Miltonia vexillaria* by pollen of *M. Roezlii*, and remarkable not only as a beautiful hybrid, but as the first hybrid *Olostoglossum*. *Reichenbachia*, t. 32.

AUSTRALIAN ORCHIDS.

MR. R. D. FITZGERALD has just published the fourth part of the second volume of his most painstaking and useful work. It is of folio size, containing drawings of the plants and copious analytical details, together with observations on the life-history and mode of fertilisation of the flowers, of very great value and interest to botanists. The species figured are mostly terrestrial, and not of special horticultural value. The species of *Caladenia* and *Thelymitra* are remarkable for their nearly regular flowers, which, nevertheless, are fertilised by insects. *Dendrobium speciosum*, a very handsome species, once common near Sydney, is now nearly extinct. The seed, it appears, never grows. Mr. Fitzgerald notes that he has seen millions of seeds in the most favourable localities without success. Are we to infer from this that the plant is becoming extinct from natural causes? If so, the collectors who enable us to grow it in our gardens must not be branded as exterminators. The work is printed at the Department of Lands, Sydney. The species figured in the last part are *Pholidota imbricata*, *Diuris bracteata*, *D. cuneata*, *D. epulata*, *D. Sheaffiana*, *D. platychlus*, *Caladenia Menziesii*, *Leptocarpus fimbriata*, *Prasophyllum densum*, *P. ansatum*, *P. transversum*, *P. longisepalum*, *P. imbricatum*, *P. filiforme*, *P. rufum*, *P. viride*, *P. Woollii*, *P. reflexum*, *P. laminatum*, *P. Eriochilum*, *Dendrobium speciosum*, *Caladenia gemmata*, *C. ixioidea*, *Thelymitra variegata*, and *T. antennifera*.

CATTLEYA LAMINATA.

Many thousands, "*miliers*," of *C. Warocqueana* (syn. *labiata*) have recently been introduced by the Horticulture Internationale of Brussels. The *Journal des Orchidées* tells us that three collectors are employed by the firm above mentioned, and many hundreds of natives. The three collectors are MM. Silver, Claes, and Van der Ley, the last-named being posted at the port to watch over the embarkation of the plants. Twenty-five thousand plants are promised for this month of January, half of which are already bespoke. It is allowable even for free-traders to hope that some restriction will be placed by the several Governments on the ruthless

collection of such plants. It is an important question to ask whether it is not an abuse of our privilege to exterminate any created thing in this manner.

ODONTOGLOSSUM VEXILLARIUM.

Of this Orchid the following story is told in *Reichenbachia* at t. 29, 2nd series. "The late Professor Reichenbach described the species under somewhat difficult circumstances: having had a bloom lent to him by a friend, after a promise was made to him on the following five heads, viz., not to show it to anybody else, not to speak much about it, not to take a drawing, not to have a photograph made, not to look oftener than three times at it." "With respect to the culture of this grand Orchid, beautifully figured at t. 29, much," says Mr. Sander, "has been written. We have found it quite an easy plant to cultivate, and even a rapid grower. Care must be taken to keep it quite clean, and to water the plants only when they are dry. If you have any doubt about their being dry enough, wait a day longer. Always grow the plant in a temperature as near 60° Fahr. as possible and close to the glass, taking care that enough shading is employed in the hot days of spring and summer. If the plants are kept too hot they become infested with thrips, and in winter, if the temperature falls much below 60° Fahr. for any length of time the leaves become spotted, and decay all the apices."

SACCOLABUM COELESTE.

This lovely Siamese species first flowered in 1885 in the Burford Lodge Collection, and was described by the late Professor Reichenbach, in the *Gardeners' Chronicle* for May 30, p. 692. It is quite distinct from the majority of *Saccolabiums* in bearing upright flower-spikes. The flowers are white, with the segments azure tipped, puce, or sapphire. *Saccolabiums* grow with marvellous rapidity, emitting from amongst the leaves new roots in abundance, which grow with great vigour and freedom, apparently absorbing the fertilising air to great advantage. After a time the rain suddenly ceases, and then sets in a scorching dry heat often attended by forest fires, in which epiphytic plants suffer first, and most severely. *S. coeleste* must be grown in a stove temperature of about 65° to 70° F. in winter, and 70° to 75° F. in summer, and even more heat is desirable when the plants are in active growth. The plant should be placed in clean potsherds and sphagnum moss in baskets or pans, and suspended near the glass. A beautiful figure is given in *Reichenbachia*, t. 30, 2nd series.

ORCHIDS AT ROCHESTER, NEW YORK.

Mr. Kimball is an enthusiastic cultivator of Orchids, and his enthusiasm is ably seconded by Mr. Geo. Savage, who has had charge of this fine collection for a good many years. All the plants are in grand health, and perhaps more robust than ever this season, *Cattleyas*, *Lælias*, and *Dendrobiums* being particularly fine. Most notable among the many fine things in bloom was a wonderful spike of *Renanthera Storrei*, a fine dark form of *Vanda Sanderiana*, and a large finely-marked flower of *Cypripedium praestans*, and *C. Celia* ×, a Rochester seedling. The latter is very distinct and pretty. A span-roofed house, about 85 feet long, is filled with *Cypripediums*, mostly *insigne*, showing over 1700 spikes, which will produce a grand display when fully opened. A new *Cypripedium*, named *imperiale*, is flowering in this house. This plant has been in the Rochester collection for some years, but has never flowered until now; unfortunately, the flower came deformed, but it showed sufficiently well to warrant its being very distinct and finely coloured. It is a species, but at first sight looks not unlike *C. Sedeni*. Mr. Kimball informed me the plant was brought from Borneo by a ship captain, who presented it to Mrs. Morgan, of New York. Shortly after this, the Prince Imperial met with his death in Zululand; she then named it *imperiale*, in commemoration of him, and some time before her own demise, presented the plant to Mr. Kimball, in whose possession it has been since. *Traveller*.

BIRDS OF THE COMMONS AND WOODLANDS.

(Continued from p. 11.)

FORESTERS.

There is one other family of birds characteristic of the woodlands—the woodpeckers. There are three species: the first is large and green, and the commonest of the three; this is the bird whose curious laughing cry is so well known. The other two are white and black; one is called the greater spotted woodpecker, and the other the lesser spotted woodpecker. They have a curious habit of attracting attention by rattling their strong bills against the bark of a tree, so as to make a curious vibrating sound. Birds of this family are most wonderfully adapted to the life they lead, climbing the trunks of trees. They have two toes turned forward, and two backward, giving them great additional power for running up and down the stems. Then the feathers of the tail have stiff quills, so that they can gain considerable support from them; and their bills are very strong, so that they can more easily excavate the holes in which they lay their eggs. The whole bird is as perfect a piece of machinery as possible.

A LAND OF SONG.

We have mentioned a good many of the birds which are to be found on our commons and woodlands, and it is impossible not to be struck by their variety. Many of the larger species are, no doubt, regularly persecuted, and their numbers kept down; but the smaller birds are much more numerous here than on the Continent. The reason for this is partly to be found in the fact that England is admirably suited to their requirements—it is so very green. Then, again, we do not eat small birds in the way they do in other countries. And the abundance of small birds is, I believe, in no small measure due to the very cause of the scarcity of the larger ones. The gamekeeper, who, in his zeal and ignorance, butchers every creature large enough to be called "vermin," preserves his woods and coverts during the nesting season with the utmost care; and thus he enables hundreds of small birds to bring up their young unmolested. It is to these small species, it must be borne in mind, almost entirely that we owe the chorus of song which we hear round us every summer. The amount of song varies greatly according to the time of year; it is fullest and loudest in spring. As the summer proceeds, the birds, one by one, become silent, for as soon as the young have become independent, the moulting season commences; but towards the end of August a few of them recommence singing, and you may again hear the chiff-chaff repeating his everlasting two notes from the top of the very same tree on which you saw him in March, when the leaves were coming out.

The willow-wren and other warblers all sing a little in early autumn, but their songs are neither so rich nor so powerful as in spring, and by the end of September most of them have retired to warmer lands, and have left our woods and commons to resident species. The leaves have now begun to fall, and until next spring the woods will be quite silent, except for the occasional song of a robin or wren, now and then interrupted by the harsh scream of the jay, or the call-notes of parties of small birds searching for food. *A. H. Macpherson*.

BODORGAN, ANGLESEY.

HAVING heard much of Sir G. E. Meyrick's gardens at Bodorgan, I determined to visit them whilst staying in that part of Wales last autumn, the day chosen was none of the best, a furious wind blowing off the sea, with rain falling at intervals; such a condition of the weather gives one some idea of the difficulties gardeners have to contend with in that part of the country. All pit and frame lights were made secure against the wind by being wedged or weighted down. The Conifers at Bodorgan have

been for many years celebrated for handsomeness and fine development. These trees stand surprisingly well against the fierce gales from the sea, but as they grow taller the growth becomes denser, and except where they are protected by other kinds of taller trees, their future growth will be for the future more gradual. The majority are, however, of fine dimensions, *Picea Smithiana*, *Pinus insignis*, and *Arucaria imbricata* are splendid specimens, standing well almost close to the sea-front. *Retinosporas* and the *Cupressus* are finely grown. Particularly noteworthy are several beds of dwarf Conifers, chiefly with some kind of golden variegation. These were planted in front of the mansion, the object being to produce a good effect during the winter season whilst the family are residing there. These plants remain undisturbed the year round. The well kept carriage-drive is flanked on either side by large Conifers, whilst choice species are interspersed upon the broad margins of the well-kept turf, good shelter being thus afforded them. On a fairly sheltered wall is an immense plant of *Choisya ternata*, which is evidently quite at home judging by its lustrous deep green foliage. Pears and Apples were a somewhat thin crop, the trees standing in need of much shelter from the sea winds, otherwise in most years much harm is done before the fruit is fully grown. Fruit trees in glasshouses were bearing heavy crops. Here are to be seen some examples of Ewing's glass walls, and my opinion was that they are not constructed in good proportion, being too narrow for their height; they afford, however, good shelter and are to be valued on that account. The head gardener, Mr. Gray, has commenced an improvement with a portion of these which, if still further carried out, will afford him much additional space. He has removed the fruit glass wall and extended the area enclosed by the glass several feet in width, thus obtaining a good length of roof at the ordinary slope. At the same time it affords full light. This wall case is planted with Peaches and Nectarines, the fruit trees outdoors being most untrustworthy, hence the need for glass protection. Moor Park Apricots were a fine crop, the fruits of fine size, so also were Peaches, both upon the glass walls in the old style. Morello Cherries fruit abundantly upon the open walls. The vinerias have been gradually replanted, and are now coming into an excellent bearing condition. Muscats were finely finished and the bunches large, as were those of Madresfield Court, Black Hamburg, and Lady Downe's Seedling, the Vines vigorous and sturdy, and promising well for the future. Numbers of houses are devoted to the growing of plants, a chief feature being the large and healthy stock of late autumn and winter-flowering plants. Of these *Poinsettias*, *Calanthes*, double and single *Primulas*, and *Gesneras*, are largely grown, and looked promising. The *Camellia* plants were healthy and of large size. *Paucetratums* and *Eucharis* are grown in large numbers, and upon the roofs of the warm houses *Stephanotis* and various species of *Allamanda* are establishing themselves; so also the red and white *Lapagerias* in cool ones. A clearance of all the climbing plants had to be made some few years ago owing to their being much infested with mealy-bug. Mr. Gray upon taking charge made a determined effort to rid the place of this pest, and he has been very successful.

Of Orchids a healthy collection is being worked up of useful species. Well-furnished foliage plants of a useful size are grown, consisting of *Crotons* in good variety, and chiefly upon single stems, but *Dracaenas* mostly. Dwarfly-grown plants of *Clerodendron fallax* were good examples of what may be done with this showy autumn stove shrub. The tuberous *Begonias* were thriving splendidly, and the fancy kinds of *Coleus* were still gay. An excellent plan had been hit upon for the culture of *Adiantum cuneatum*. The main stock of this useful Fern was planted out, and that too in large numbers. In some cases the beds were several plants deep, in others only single rows were set out at the fronts of the plant houses and over the hot water pipes; in each instance, however, they were close to the glass, the

growth wiry and hard, and the pinne small, which enhances their durability when cut from the plants. This plan of growing Maidenhair Fern in quantity struck me as being an excellent one for furnishing large quantities of fronds with little labour. Everywhere were observed cleanliness and good order, and the important work of painting the woodwork of the houses, &c., receiving proper attention. H.

COLONIAL NOTES.

THE CAPE BOTANIC GARDEN.

AFTER a long period of misery for the officials, as we learn from a Cape journal, this garden is now placed on a more satisfactory financial footing. In future, says the *Cape Argus*, it is to be under the control and management of the Town Council, the Government continuing its annual subsidy of £500. The Botanic Garden originated in proposals made to the Government by Dr. James Adamson, and a few of his friends interested in horticulture and in botany, especially Dr. Ludwig Pappé, Mr. R. H. Arderne, and Messrs. Kotzé, Clarence, Ross, Fairbairn, and Rutherford. Something of the same kind had been proposed long before, and discussed in the public papers, and mainly on the suggestion of James Bowie, a collector of plants was sent out by the Royal Garden at Kew. The Commissioners were appointed May 5, 1848, and immediately opened a subscription-list, appointed as gardener a local nurseryman of the name of Draper, and set to work in earnest to lay out and plant up the area cut off for their use from the Government Gardens. Draper laid out the land with some skill, seeing that it was nearly a perfect flat, and took advantage of such large trees and plants as he found existing.

The early records show that things were done in a very primitive way. Crops of Potatoes and forage were grown by Draper and his coloured labourers, and sold on the market to assist the funds subscribed and the Government grant of £300 per annum, and it was not until late in the year 1848 that the collection of plants was commenced by purchase from the executors of Baron Von Ludwig of some of the stock accumulated by him. For reception of these, a small greenhouse, of quaint and ornamental design, resembling a birdseye, was constructed. This and other expenditure landed the Commissioners in debt. They also took over the seed-stock of Thomas Draper, and thus began the seed-selling business which has continued to the present year. In 1849, Karl Zeyher, the celebrated botanical collector, was added to the staff, to name and label the plants, obtain seeds and cuttings, and to bring in bulbs and plants from the veld. He was also "to prepare a *Hortus siccus* and seed collection, to instruct apprentices in theoretical and practical botany, and attend to such visitors and strangers as may require botanical information." This highly scientific and extensive commission was rewarded with the wonderful stipend of £7 10s. per month.

The garden was from the first supported by Government in a very inadequate manner, and from *Personalities of Botanical Collectors at the Cape*, p. 21, 8vo, 1887, we find that "The projectors found themselves obliged, in February, 1850, to dismiss Zeyher, whose qualification was botanical knowledge rather than business aptitude, and find an ordinary gardener who understood how to turn the place into a nursery, and make it pay for itself. Dr. Berthold Seeman, knowing little of the hard necessity of the case, was perhaps more witty than just when he wrote in reference to Zeyher, on his visit in 1851, that the Committee had just 'passed a resolution that their Botanic Garden could do without a botanist.'" To Zeyher succeeded James M'Gibbon, an enterprising Scotchman, born at Elgin, and apprenticed in the Duke of Sutherland's garden there. During the long period of his service up to 1881, he carried on the business of the garden with great ability and business

tact, on a kind of partnership system with the Committee, and accumulated a handsome competence. Latterly returning to England, he died at Richmond, in Surrey, about 1886.

Much of the present appearance of the gardens is due to Mr. M'Gibbon's labour. He raised great numbers of Australian shrubs and trees from seeds obtained from Baron F. von Mueller, and planted them, if anything, too thickly in the previously bare grounds of the garden. On his resignation, Professor MacOwan, who had for many years been the friend and correspondent of Harvey and Sonder, was appointed by the Commissioners in 1880, in hope of restoring the garden to a fitting status among botanical establishments. The great herbarium of Zeyher, after remaining in the possession of Dr. Pappé till 1863, had been purchased by the Government, and a portion of it ordained by Dr. Harvey, about the year 1864. The charge of this collection, which had lain *perdu* ever since its return from Harvey's temporary possession, was added to the duties of the new Director. The radical defect of the institution, however, was the utterly insufficient subsidy of £500 per annum to meet an expenditure of about £1400. No scientific enthusiasm could supply that balance of £900. It was, therefore, impossible for any scientific work to be done, save out of business hours, and the whole energies of the staff were incessantly directed to the one object of making money enough to pay the wages and repair dilapidations. This has been done during the present régime for the last ten years, and unlike almost every similar institution in the colony, the garden is this day not one penny in debt. The Director says it is mainly the head gardener's doing; the head gardener turns the statement the other way; as men who have, under circumstances of great difficulty and discouragement, worked together manfully in perfect mutual trust, and kept the institution going by sheer dint of industry. Any further economy was impossible, when everything had been pared down to the quick. There was absolutely nothing to be done but to abolish his office, and reconstitute the garden on lower lines. It was no longer to be a botanical establishment, but merely a town *pleasure* of flowers and shady walks. The necessities of the Agricultural Department were at the same time drawing largely upon the Director's time. The gardens had long been a sort of headquarters, whither came multitudes of queries and complaints on cultural matters. These now poured in from the department, until it became obvious that scientific knowledge and experience were very little wanted in the garden, and very much wanted outside it. The professional charge of the garden falls now to Mr. Henry J. Chalwin, undoubtedly the most experienced horticulturist in the colony, as a department of Municipal concern. The Director will have only one more report to make, and that, we venture to say, of a different kind from the nine sharp-edged documents previously issued. He then goes over to the Agricultural Department in Burg Street, as Government botanist or consultant, or adviser, in matters belonging to his special art and mystery. Thither also, we understand, goes the Cape Government Herbarium, if, indeed, it can be got into the limited space available. We trust that in all these new arrangements the claims of botany will not be forgotten. Parks and pleasure gardens are eminently desirable, but the interests of humanity require that the botanical side of the question be not overlooked.

INDIA.

SAHARUNPUR BOTANICAL GARDENS.

In the annual report for 1890-91, the Superintendent gives an interesting account of his endeavours to meet with flowering shoots of the Sugar-cane in N. India, and to obtain from this source true seed for the propagation of Cane, in the manner that has attracted so much attention in the West Indies. He has so far met with success, that he has obtained seed and grown seedlings from it.

The experiment may have to extend over a series of years before new or improved varieties appear; but its enormous importance is recognised alike by the scientific world and all persons practically interested in the sugar industry. The inquiry has brought to light the highly instructive fact, that the flowering habit of the Cane is well known to native agriculturists, and that superstition leads them to jealously destroy what the man of science labours to preserve and turn to far-reaching uses.

Numerous fruit trees, vegetables, and useful plants of exotic origin are under observation and culture in the gardens, and additions are constantly being made. The beneficial effect of the Saharanpur and Lucknow gardens on horticulture in Upper India is capable of easy verification by anyone who moves about the country, and notes the progress which gardening and fruit growing are making among the native community.

The Sugar-cane has been attacked in Java by a disease, supposed to be of fungoid origin, which threatens to extinguish the sugar industry there, and the Dutch Government therefore went to the expense of deputed Mr. Kobus to visit India with a view of collecting and introducing the Indian varieties into Java, in the hope that they would be found proof against the disease.

Mr. Kobus recognised all the *paunda* varieties (the class of Cane only grown in India for eating purposes) as being the same as grown by the Dutch in Java for sugar manufacture. The *ek* or *ganna* varieties (the class grown in India for sugar manufacture), were entirely new to him, and as they are so very distinct from the *paunda* class, and also very much harder than the latter, he left India in great hopes that these would be found to possess the disease-resisting qualities wanted.

ANALYSIS OF SPANISH GRAPE SOIL.

The following analysis represents the composition of a good Grape soil from the neighbourhood of Morril, in the south of Spain, and the results will be useful to those interested in the production of Grapes:—

Water lost at 212° F.	770
*Organic matter and combined water	2,220
Oxide of Iron	4,673
Alumina	2,432
Lime	1,019
Magnesia	984
Potash	268
Soda	610
Phosphoric acid	970
Carbonic acid ..	440
Sulphuric acid	trace
Chlorine	903
†Silica and insoluble silicates	87,373
.....	100,000

*Containing nitrogen 045

†Containing coarse sand, separated by washing 44,369

Stones left on $\frac{1}{2}$ inch-hole sieve 32,07

Gravel left on $\frac{1}{4}$ inch-hole sieve 15,74

47,81

The soil largely consisted of stones, there being in round numbers 43 per cent. of small stones and gravel having a light brown ferruginous appearance. To those acquainted with soil analysis the above results would indicate, as they certainly do, a really poor soil when compared with our English soils of average fertility. Thus, in the proportions of nitrogen and phosphoric acid the figures are quite one-half what we should find in a soil of average quality, but in regard to potash this soil stands out prominently in richness, and there can be little doubt that one of the greatest qualifications for a good Vine-producing soil must be the presence of plenty of potash in a readily available form. The distinguished French chemist Ville, in his book on manures, lays particular stress upon the importance of potash for Vines. He says: "Where potash is lacking, the leaves do not attain their full development; in the month of July they become red and spotted with black, after which they become dry and are easily

reduced to powder under pressure of the fingers." Further he adds, "if potash be deficient, little or no fruit makes its appearance;" and, lastly, he recommends that Vines should be manured in the autumn. It would be interesting to hear what Vine growers have to say in reference to these remarks. How far do they find it necessary to manure Vines? What manures, or mixture of manures, give the best results? And at what time of the year should these fertilisers be applied? [For these details see Barron and Thomson on Vine culture, or the weekly instructions given in our columns. En.] Compared with farm crops, Grapes, consisting largely of water, with but little nitrogen and mineral matters, cannot be considered an exhausting crop. If the soil is suitable, the situation favourable with plenty of natural sunlight or artificial heat, comparatively little manure should be required. It is true that, with our lower temperature, the soil is colder, and requires some nitrogenous compounds, such as cow-dung, dried blood, or fish guano to assist Nature; but on the Continent, with a warmer climate, such fertilisers would have to be very cautiously employed, or the results would be disastrous, and there would be too much leaf, and but little fruit.

As regards potash, however, the addition of frequent small dressings is likely to be attended with good results, especially if it can be applied in the condition of wood-ashes, particularly when derived from the burning of small twigs and branches, which are richer in potash and phosphoric acid than hard and older logs of wood, in which silica and lime predominate in the ashes. In the absence of wood-ashes, sulphate of potash may be recommended as preferable to muriate of potash.

Where Vines show indications of failure, notwithstanding careful attention and manuring, it would be desirable to have fresh soil, and for this purpose obtain some of the famous red soil so characteristic of the best Worcester Hop gardens—or from Kent or Devonshire. It would be interesting to know if this has been done to any extent, and with what results. Of late years the production of Grapes has been greatly increased, and in the Channel Islands especially—perhaps, in Guernsey—the attention given to this special cultivation seems to be increasing in a most remarkable manner. John Hughes, F.C.S., *Agricultural Analyst*, 79, Mark Lane, E.C.

MAIDENHAIR-FERNS.

(Continued from p. 51.)

CULTURE.

Adiantums are frequently grown in a close moist atmosphere, the consequence is that they are liable to damp off during the winter. This particularly applies to the cuneatum section. These will succeed better if grown in a light open position, where the air can pass through them. They should be potted in a good loamy compost, and will be found to do better than when peat is used. By growing them well exposed to the light, and shading only during the brightest sunshine in summer, the plants will grow more compact, and the fronds will be harder and last well either when cut or where the plants are used for decoration. All of those referred to in this group may be raised from spores, and will make more compact and better-furnished plants than those obtained by divisions.

The above remarks also apply to the Scutum group, excepting A. Farleyense, which, of course, owing to the absence of spores, can only be increased by divisions. The best time to do this is in the spring, while the plants are in active growth. I prefer small plants with short fronds for breaking up. These will start away better than old plants with large fronds, as it is not so easy to obtain healthy young roots, or to retain the fronds when large plants are divided. This beautiful Fern succeeds best when potted in a rough, porous compost, and good drainage; water may then be given freely without fear of the soil getting sour. I believe this

Fern is frequently allowed to suffer from drought. Although it is not advisable to keep Ferns saturated with water, as some do, they should never be allowed to get dry enough to cause the fronds to wither. Most of those included in the decorum group may also be propagated from spores, the exception being A. Veitchii, which may be treated in the same manner as A. Farleyense, but the crowns are larger, and not so numerous, and in breaking them up, it should be seen that each division has a good crown, and that they are not broken or cut through the centre of the crowns.

In the Capillus-veneris group all may be readily increased by division, but such as Mariess, Williamsi, or even the ordinary form of Capillus-veneris, may be more readily increased from spores. All those belonging to the type will succeed well under cool treatment, but to keep the fronds fresh and green through the winter, the temperature should not fall below 45° or 50° Fahr. A. Williamsi should also be grown in a cool-house; Fergussoni should be grown in the stove. All the macrophyllum group require stove treatment; bipinnatum and Seemannii may be divided, and the others can be propagated from spores. All are somewhat delicate, and require great care to keep the foliage fresh and healthy. The Hispidulum group are all very free-growing, and do not require much heat. I have not raised aneitense from spores, but all the others come freely enough. The larger-growing sorts included in the Polyphyllum group all have spreading rhizomes, and require a good surface; for large specimens, pans are preferable to pots—in fact, all the Adiantums which have spreading rhizomes do better in shallow pots. A peaty compost will suit those included in this group, and all except A. formosum require stove treatment. As these large-growing sorts are not wanted in large quantities, sufficient stock may be obtained by divisions, though seedlings make prettier plants, but they do not come very free. A. caudatum and A. lunatum may be raised from spores, but the other two will give plenty of stock from the proliferous fronds. All like a moderate stove temperature, though A. ciliatum is often included with greenhouse Ferns. All the Adiantums are benefited by a little liquid manure during their growing season. Pteris.

FOREIGN CORRESPONDENCE.

THE PUBLIC GARDENS AT MONTE CARLO.

QUITE a botanical reservation encircles the magnificent casino of Monte Carlo—a building which is a salient feature directly fronting the sea, viewed from either the ocean or the land. The grounds are really a horticultural museum of ever-green trees, plants, and shrubs. Of course, the eyes of the directorate have been all along fixed upon plants that retain their foliage all the year, so as never to let Monte Carlo have the appearance of a "fall." As a fact, there is no winter here. In their search for evergreens, and to procure as much variety as possible, the administration has imported specimens from every quarter of the globe—the Latin-American Republics, China, Japan, Siberia, &c. Laying out the grounds, multiplying and planting the species, attendance, &c., have cost enormous sums. Not so many years ago the same place was as wild and rocky as an African coast. And to think that all this has been done out of part—a large part—of the proceeds of the gaming-tables! It shows how the passion for chance-gain (very much of a chance—and an extremely doubtful one—at Monte Carlo) can be made to pay for big works of ornamentation. The vice has proved a blessing in one respect—in beautifying greatly a locality, turning a rugged grass and bush-patched spot into model gardens.

The staff of the casino consists of as many as 400, and of these sixty are engaged in maintaining the gardens, thirty being in the propagating department. J. Vandendaele is the chief gardener. He is from

Belgium—a state which sends out some of the ablest florists and botanists. A good many of the workmen are Italian, from just over the near frontier. They have miserably poor pay—from 3½ to 5 francs daily; the latter sum being considered quite good. The first-named amount is the average; that means from 4 dols. to 4½ dols. per week, and out of that pittance they have to pay for everything. Living is not cheap in the neighbourhood; they just manage to exist—how, they can best tell. Thus, for a lodging, two will sleep in the same room, paying 9 or 10 francs each per month—usually 4 dols. for the pair—each putting up with the inconveniences of strange bed-fellows. As to hours of labour, during the short days they work from 7 in the morning till 5 in the evening; and have their joy at the approach of spring and summer considerably damped by knowing that the long days mean toil from 5 to 7 o'clock. It is hard, yet they will say that even this is better than living in poverty-stricken Italy.

In another division of the grounds which go to form the permanent horticultural Exposition of Monte Carlo, covering a large space, there are hundreds of varieties, and thousands upon thousands of plants, some carefully labelled. A great number of the plants, however, are not named (not one of the extensive varieties of Roses, for example), and many of the name-plates are weather-beaten to unrecognisability.

It is not easy to obtain particulars in this country. Directly a native man of business is approached and asked a few questions, he immediately regards you with suspicion, and, if he holds the idea that you are a writer for journals, he forthwith treats you as an advertising tout. He thinks you are engaged in some underhand trick to get an advertisement, and will be presently sending in a surprise bill of costs; or he sees in you a canvasser for subscriptions, or fears that he may be put under an obligation which will be disagreeable to him. In vain you assure him that there is nothing to pay, that, on the contrary, you ought to pay him something for the information; but, recollecting his unpleasant experience with some organs of the press, he cannot conceive how English periodicals can publish particulars about him without demanding pay for it. G'r.

NURSERY NOTES.

ORCHIDS AT MESSRS. HUGH LOW AND CO.'S NURSERY.

ALREADY the fine importation of Vanda Lowii, which Messrs. Low's collector so carefully brought over at the end of last year, is beginning to make a show, one of the specimens with fine growths, and still in the native vase in which it was established in its own country, having three spikes of unusually bright and richly-marked flowers, the bright yellow, spotted with crimson, of the two odd flowers at the base of the largest spike making a striking contrast to the dark, blood-red and white of the rest of the flowers on the long chain-like raceme. The whole of the plants are rooting vigorously, and have been got over better than any previous lot. Of Vanda Sanderiana there is a small batch, but the tale of this importation is the reverse of that of the Vanda Lowii, for out of 3500 shipped, only some fifty survived the journey. The Phalenopsis houses, which are always a fine sight at the Clapton nurseries, are bristling with hundreds of flower-spikes, and among those in bloom are the rare Phalenopsis Cynthia, P. leucorrhoda, and a splendid form of P. Schilleriana—a perfect model of a flower—which the collector marked as being the nearest to a blue one which he had seen, and which is of a dark purple rose colour, is quite a new tint for the species, and which would doubtless get much darker in bright weather.

Another fine Orchid, of which there is a quantity at Clapton in flower or bud, is Angraecum sesquipedale; and in the house set apart for the lesser Angraecums, is the usual show for flower on the numerous plants

of the neat little *A. citratum*, *A. hyaloides*, and other species.

The Cattleya Eldorado varieties, both white and coloured, and *C. Percivaliana*, are making a good show, and some of the forms are very richly-coloured, but beyond these there are few other Cattleyas in bloom, although the later-flowering ones are in fine condition, and promising well for flower, the stock of *C. Mossiae* alone having been reckoned to bear between 4000 and 5000 flower-sheaths, and as these have not flowered in the country before, there should be fine novelties among them, if they are of the same type as those formerly got over by Messrs. Low.

An importation of *Saccolabium bellinum* has a great number of that quaint and pretty plant in bloom, the range of variety both in size and colouring being very extraordinary, for to compare the extremes, one would scarcely take them for the same species. The *Cypripedium-housea* have in flower, *C. Thetis* ×, *C. Amesianum* ×, *C. nitens* ×, some fine *C. Harrisianum* ×, the true *C. Sedent. candidulum* ×, *C. philippinense*, *C. bellatulum*, *C. tonsum*, and others; and in the large *Dendrobium-house*, the *D. Wadianum* are fast coming on, and here also in bloom is a lot of the curious *D. pycnostachyum*, *D. Ainsworthii* ×, &c. In other houses are a large batch of that handsome and delightfully fragrant winter-flowering Orchid, *Vanda Amesiana*; a quantity of *Odontoglossum Pescatorei* in bud, *Vanda lamellata*, some *Sophranopsis grandiflora*, *Odontoglossum Rossii majus*, *Oncidium anisiferum*, *Platyclinis glumacea*, *P. Cobbiana*, &c.; and showing flower are several plants of the pure white *Trichopilia suavis alba*.

THE WEEK'S WORK.

FRUITS UNDER GLASS,

By J. RIDDELL, GARDENER, CASTLE HOWARD, YORK.

MELONS.—When early Melons are desired, and seed has not yet been sown, no time ought to be lost in getting a few started. If a continuous supply of fruit be wanted, it is necessary to include varieties which ripen both early and late, and although it is unnecessary for me to enumerate the kinds, so many good ones being in cultivation, yet some of the older sorts are hard to beat for certain purposes and for earliness, and I have never found one to equal *Malvern Hall*. The best size of pot for raising them is either 2½-inch or 3-inch, and instead of crocks for drainage, a few leaves will answer quite as well, as the plants are only temporary occupants of their seedling-pots. A compost of loam, leaf-mould, and a little bone-meal, or any other form of plant-food prepared from this material, will be an excellent medium for the seeds to germinate in, and the plants to obtain support during the earlier stages of their growth, their seeds placed towards the centre of each pot, and covered with about half an inch of the mixture, and the whole plunged in a bed having a temperature ranging from 80° to 85°, will result in seedlings pushing up quickly, if the necessary watering be attended to. The warmth of the atmosphere of the pit or frame in which they are raised should be about 70°, raising or lowering it according to the conditions of the weather, and keeping it uniformly moist. When the young plants have shown themselves, the strongest in each pot should be selected for growing on, and the others pulled out; and as Melon plants generally are weak in the stem at this season, they should have thin stakes placed for their support. It is also very desirable to keep the plants as near the glass as possible, and, when the weather is mild, admit the external air for ten minutes or more every day. All the water used for the roots of the plants ought to be of the same temperature as the soil in which they are growing, and this factor requires to be sparingly applied during the first weeks of their existence. The plan adopted by some in growing and fruiting their first batch of Melons in pots is a commendable one, for a crop is obtained in less time this way than when they are planted out; and the only difference in labour is a little extra attention required in watering. Pots 14 inches in diameter is the size most suitable, and into these the plants may be moved when they have occupied the soil of those in which they were sown. The soil employed at this stage of their growth may be less broken up than

that used for the seed, and a small quantity of superphosphates added to the other ingredients will materially aid the plants to gain strength. These pots, too, should also be given a bottom-heat of 80° to 85°, and liquid manure used should the compost prove insufficient in soluble plant food, in order to secure a vigour in the plants which would enable them to carry two fruits each. As soon as they have reached the trellis their points can be stopped, and two laterals encouraged, one on each side, and all others suppressed. With free-fruited kinds these laterals will show fruit at the second or third joint, and may be stopped at the leaf beyond it. At this period care should be taken to have the soil they are growing in moderately dry, that when the flowers open a good set may be effected; and should this be attained, liberal feeding, a saturated atmosphere, fresh air on all favourable occasions, and a temperature of 70° to 75° at night, with a rise of 20° during summer weather in the daytime, will result in large well-flavoured fruit, provided no insect pests have been allowed a footing on the plants.

FIGS.—The present is a good time for increasing the stock of Figs, if plants of this kind of fruit be required for either forcing in pots or planting out next year. Cuttings put in to root now in a temperature of 65° to 70°, will grow into good-sized plants before the autumn, and free-fruited varieties, like *Black Ischia*, *Lee's Perpetual*, and *Brown Turkey*, will yield a crop in August and September, if the plants are liberally attended to for root-room and the free use of stimulating manure. Pieces of last year's wood with three or four eyes, cut close under a joint, and put in singly into 2½-inch pots containing leaf-mould and sand, and plunged in a brisk bottom-heat, will root readily. As they quickly occupy the soil in these small pots, it will soon be found necessary to transfer them into 6-inch ones; but instead of leaf-mould and sand being used alone, this time loam of a strong nature mixed with wood-ashes, lime, or old mortar, well-broken charcoal, bone-manure similar to that used at Cloudfords, and spent Mushroom-bed compost may be added, and will prove a happy laboratory for the roots to ramify in, and find the food they need. Warmth at the root is the most essential thing in connection with Fig cultivation, and when they can be given bottom-heat, and attention to watering, feeding, and stopping of shoots, no plant is simpler to grow, or will yield a more abundant return for labour spent upon it.

POT VINES.—In order to obtain strong and well-ripened Vines for growing in pots, the eyes should have an early start, so as to secure a long season of growth, and time to be thoroughly ripened, which, in cool seasons like the last, is an important consideration. The old method of raising a stock of them by inserting an "eye" in a slanting position in a 3-inch pot, containing a mixture of good fibrous loam and leaf-mould, with a sprinkling of bone-manure added, is still in practice, and is not unfrequently preferred to that of putting two or three eyes into a round bit of turf of 4 inches in diameter and 2 inches thick, and I have obtained equally good results by both methods. When pots are employed, these should be plunged to their rims in a bed having a temperature of about 85°, affording them water then to settle the soil, and afterwards when needed, of the same temperature as the bed. Usually one watering is enough until the buds start into growth, but an occasional dousing over with warm water by means of a fine-rose pot or the syringe will do them good. The critical period for the Vine eye is, when the nutriment stored up in the bud and the bit of shoot it forms part of is nearing exhaustion, and roots are put forth. Much injury is often done at this stage by affording the eyes much moisture, and by repotting before sufficient rootlets have pushed out into the soil. It is well to bear in mind that every rootlet is surrounded by a quantity of prepared plant food at its growing point, and which has been brought into this condition by the action of the acids given off by their organs of nutrition; therefore, should the soil be shaken from the roots, the labour of manufacturing more food by this means must take place previous to the plants deriving any benefit from the shift, and results in a check to the Vines. Once the roots are able to avail themselves of the supply of food in the soil, active growth of the cane will take place, and then is the time to transfer them to 6-inch pots, using a compost for this, and subsequent shifts, of about two-thirds fibrous loam, and making up the other third with spent Mushroom-bed, lime rubbish,

and Thomson's Vine and Plant Manure. Small stakes to support the canes will be required when this stage is reached. Watering must be done with care for a time, and a temperature of 65°, and a saturated atmosphere maintained during bright weather in the structure, air being admitted on all favourable occasions. The only difference between this system of raising Vines from eyes and that of using cuttings for the purpose is in the first stage. The turves are placed in a hotbed bottom upwards, and two or three eyes put into each towards the centre, and attended to in the way of watering until they arrive at the stage for potting them, the strongest growth from amongst them being retained for the Vine, and the weaker two pulled out, all other treatment being the same as that recommended for pot-raised ones. The summer treatment of pot-Vines will be made the subject of subsequent remarks.

PLANTS AND THEIR CULTURE,

By R. MILNER, GARDENER, PENRICE CASTLE, SWANSEA.

THE ROSE-HOUSE.—Roses of all kinds should now be pruned, the woodwork washed with soap and water, or repainted if that be needed, clearing all the old fastenings of bast, &c., from the trellis, and the glass at the sides and on the roof washed with clear water. If the borders in which some of the Roses are planted become impoverished, it will be advisable to shovel off the surface, and replace it with a rich compost of fibrous loam, rotted manure, and 4-inch bones, to something more than the depth to which it has been removed, and afford it a dressing of Thomson's Manure after the plants have got well into growth. Should the borders require watering, this should be done in a manner that will thoroughly moisten them; and before the surface-dressing of soil and manure is applied, dress the walls with hot lime-wash, to which some flowers-of-sulphur are added. Syringe the plants with tepid water on all favourable occasions, which will help them to break freely. The temperature may be kept from 41° to 50° at night, with a rise of 5° or 10° by day, until signs are observed that the plants are beginning to break generally, when there may be a slight increase.

THE GREENHOUSE.—Any varieties of Chrysanthemum, of which cuttings have not been obtained, it will be advisable to place in a little warmth, to cause cutting-shoots to break away; and, if new varieties are to be obtained, they should be bought forthwith. The earliest cuttings will have taken root, and should be placed on a shelf, well up to the glass, in a cool Peach-house or vinery.

PETUNIAS.—Cuttings of Petunias may now be put in to strike for furnishing the conservatory in early summer. The cuttings speedily root in a hot-bed. When well-rooted, pot them in 3 or 4-inch pots in a mixture of loam and leaf-soil and some leaf-sand, and as growth proceeds tying out and pinching the shoots.

MIGNONETTE.—The late-sown plants will now be found of much use, and it will be necessary to keep them well up to the glass to prevent weak growth, and to be careful in affording the plants water, as if this be applied in too large quantities at a time, the plants are liable to damp-off.

FUCHSIAS.—Where cuttings were not taken in the autumn, a few of the old plants should be brought into a little heat, to start them into growth, and provide cuttings for an early strike. Cuttings which were taken in the autumn, and are still in the cutting pots, may now be potted into 4-inch pots, placing them in a little warmth, to get established; and to induce rapid growth, they should remain in heat for some time afterwards.

BOUGAINVILLEA GLABRA.—Undoubtedly this is one of the most useful of flowering plants, accommodating itself on a trellis, or close under the roof of the house, or on wire trellises of any form, or as a bush; and when it is not grown in a high temperature, the plant will last in bloom for a considerable time during the summer. It is often found in the stoves, but it does much better in an intermediate-house, the blooms lasting much longer than if grown in the higher temperature of the stove. If planted in a border, a space of about 3 feet wide by 2½ feet in depth and some 4 feet in length will be sufficient, having some 6 inches of drainage placed at the bottom, covered with round turves, and filling in with a compost consisting of good fibrous loam, a

PICEA NIGRA (THE BLACK SPRUCE), AT WILHELMSHOF.

liberal addition of sharp sand, and a few half-inch bones, having the whole well incorporated together; and during the operation of filling-in, make it fairly firm, which proceeding is productive of sturdy growth in the plant. After planting it, and until the roots have taken full possession of the soil, the watering should be moderate in amount. When the shoots begin to break, it is much better to rub off the weakly ones, so as to throw the strength of the plant into those which are left. Old-established plants should be hard-pruned in, and sufficient tepid water should be poured on to thoroughly moisten it, and those which do not require to be repotted into large-sized pots or tubs, should be top-dressed with the materials given above.

THE ORCHID HOUSES.

By H. A. BURDEREY, ORCHID GROWER, HIGHCHURCH, BIRMINGHAM.

THE EAST INDIA-HOUSE.—No plant of *Phalenopsis* bearing spikes of bloom must be permitted to suffer from want of water, the loss of leaves after flowering being then greater than usual. Liquid manure in a weak state may be applied to these plants with advantage, and decaying vegetable matter placed under the stages, such as tree leaves or tan; sprinkling it with salt, if slugs be feared, is an assistance to growth. As a preventive of spot, I would advise the use of abundant fire-heat, and a free circulation of air from outside, taking care not to let the temperature fall below the point given in my last Calendar; and damping down the house more or less, in accordance with outside conditions, and the degree of artificial heat. *Phalenopsis*, *Oncidium*, *papilio*, and *O. Kramerianum* are really hot-house Orchids, and succeed in the warmest house suspended near the glass, and not too thickly shaded at any time, as then growth becomes well-matured, and the plants will pass through the winter without injury. The other occupants of the East India-house should be kept quiet, and receive as much water as will maintain them plump; and those that are growing should be steadily kept moving. If it be found necessary to bring *Dendrobium Wardianum*, *D. nobile*, *D. Findleyanum*, and *D. retrocarpum* into flower at an early part of the season, place them at the highest and most airy part of the house, and water the plants very carefully at first, but it is best if they have been kept cool to remove them first into a house somewhat less warm than this one.

MASDEVALLIAS.—These handsome evergreen Orchids are frequently observed in an unsightly condition from blackened foliage. Thrips are sometimes blamed for this mischief, but the more general cause of it is insufficient warmth, and too great moisture in the winter. *Masdevallias* are considered cool-house Orchids, yet I would advise the winter quarters of some *Masdevallias* to be warmer than those usually afforded for the general collection, and more especially of the *Chimera* section. *M. tovarensis* and *M. trochilus* should have more warmth. It is safer to err on the side of warmth than that of cold and dryness. A shady position, and a temperature of 5° warmer than that afforded *Odontoglossums*, suits *Masdevallias* best.

DIASAS.—A house set apart for *Diasas* is not necessary; in fact, they are rarely found growing well with other cool Orchids, but suitable places for the plants may be found, until danger from frost is past, on greenhouse shelves close to the glass, and where the temperature is kept at about 40° to 50°. Keep them free from thrip, and water them sparingly, and in the spring place them in a cold frame, and afford them water and air abundantly. *Diasas* should be potted in peat and sand directly flowering is past.

CATTLEYS.—*C. gigas*, *C. aurea*, and *C. labiata*, which are to flower during the coming season, must be kept in a dry position near the glass, affording the plants enough water to insure plumpness in the pseudobulbs, nothing more, the warmth being kept at 55° to 60°—a few degrees less will do no harm if the atmosphere be dry, but remembering that a plant in feeble health will not stand much drought.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, GARDENER, BARNHAM COURT, MAIDSTONE.

ADVANTAGE should be taken of favourable weather to push on with the planting of all kinds of fruit trees, notwithstanding that the autumn is the best season for the purpose. Having decided upon the

spot where the tree or trees are to stand, drive a stake into this position to the depth of about 2 feet; this is to denote exact position of tree. Around this stake a circular hole should be dug out to a depth of not less than 18 inches, the subsoil broken up, and if found to be of a retentive nature, plenty of mortar-rubble, brickbats, corks, stones—such as are raked from kitchen-garden seed-beds—should be added, thereby making the soil drier, and therefore warmer. If it is a maiden tree to be planted, the hole should not be less than 6 feet across, and made convex at the bottom, like a saucer turned upside-down; this will give the roots a downward tendency, which is a point of great importance in the case of large trees. The size of hole may seem to some to be very large in the case of such a small tree, yet I can safely say one will be thoroughly recompensed for doing it thus well. In the case of larger trees, 8 to 10 feet is not a bit too much, for unless one has a thorough knowledge as to what kind of soil the roots are likely to push into, he cannot be said to thoroughly understand the tree. If an old tree has been grubbed up where the new one will go, I would advise the taking out of several barrow-loads of the old soil, replacing it with some good rich earth, such as Cucumbers have grown in, or from a rich part of the vegetable garden. Generally, no manure is required to be incorporated with the soil, unless it be very poor, or the trees are large, and have been root-pruned, and which are likely to crop heavily; in this case a little well-rotted dung may be used with advantage. See that all roots are nicely cut, and jagged wounds made smooth; the larger roots to be cut in a slanting manner, from top to bottom. We always, before finishing off, pour a large can of water about the roots, the better to settle the soil about them; it is better than much treading, which may be done a few days afterwards. If hard, frosty weather continue, see that plenty of manure is wheeled out, to be applied as advised in a previous Calendar.

THE KITCHEN GARDEN.

By G. WYTHES, GARDENER, STON HOUSE, BRENTFORD, W.

SOWING SEEDS.—The digging and trenching of ground should be forwarded when the land is not too wet, some of the warmest borders being got in readiness for seed sowing. I do not advise the sowing of seeds of any kind in large quantities as yet, the risk of loss being too great; but some of the earliest varieties of Peas may be sown on a border with a south aspect, and well laid up to the sun, sowing thicker than usual. No wrinkled Peas should be sown at this early date, unless in very favoured gardens in the southern shires. Amongst early Peas, I have a liking for Veitch's Chelsea Gem, William Hurst, English Wonder, and William I, giving the seeds a coating of red-lead previous to sowing them and spreading them out thinly for a short time for the lead to get hard. A little trouble taken now often gives a good return in earliness, and in heavy soil the drills should be filled-in with a soil lighter than the staple, which may consist of the sifted soil from the potting-shed, or the covering of exhausted Mushroom-beds. After this is done, put in Spruce or Yew twigs on the east side of the rows as a shelter. The rows of Peas should run by preference across the border from front to back. Early December-sown Peas are showing above ground, and will need to be dusted over with fine dry wood-ashes, to protect them from slugs; mice must be trapped, and the rows protected with twigs, as advised above; for the dwarfest-growing Peas, old Birch-broom twigs are useful, keeping the haulm off the ground, and the pods from being eaten by slugs.

Broad Beans may now be sown. The small early Mazagan Bean was formerly much used; sown for early crops it is prolific of pods, and is nice when eaten young, but the flavour is not of the best. Early Longpod and Beck's Gem, are excellent—the latter very dwarf, and prolific; and the former may be sown in boxes or pots, in a temperature of 55° or 60°, and when a few inches high, placed in a cold frame, planting them out at the end of February. Beans treated in this manner and planted carefully, come in as soon as those sown in the autumn, and the loss from mice, &c., is avoided. If Celery is required at a very early date, sow a pan of seed, and keep warm till germinated, and less so for one month afterwards. The plants must be pricked off into other pans before they spoil by overcrowding, and they must always be kept near the roof-glass to avoid

drawing. A mild hot-bed of leaves chiefly, should now be made, and frame put on it, and sowings made of Brussels Sprouts, Cauliflower, Cabbage, Onions, Lettuce, and Celery. When any of these get into the rough leaf, they should be pricked out on to other slight hotbeds to be covered up at night with mats, and nice staff for planting-out will be obtained some weeks before the plants from the first sowing in the open are ready. A mild hotbed should be got ready for sowing Carrots and Radishes, and planting Potatoes. Radishes may also be sown thinly on the Potato bed. In frosty weather these hotbed frames should be well covered up at night, and the lining of fermenting material renewed from time to time.

THE FLOWER GARDEN.

By H. W. WARD, GARDENER, LONGFORD CASTLE, SALISBURY.

RAISING PLANTS FROM SEEDS: SEEDS TO SOW.—As advised at p. 15 of the current volume of the *Gardeners' Chronicle*, there are several plants which play an important part in the summer flower beds and borders which are annually raised from seeds, some of which being of rather slow growth in their early stages should be sown about the middle of the present month. Foremost among these is the tuberous-rooted *Begonia*, which is destined to become a popular bedding plant, seeing that a large number of plants may be raised from seed in the course of one year, and the great variety of colour found in the flowers, if the seed be saved from well-developed flowers and plants of sturdy free-growing and flowering habit. Moreover, *Begonias* are a capital wet weather plant.

PREPARING THE SEED PANS AND POTS.—The first step to be taken in this direction is the preparation of a due supply of crocks for the drainage of the pots and pans. This is best done by placing a $\frac{1}{2}$ -inch, $\frac{1}{4}$ -inch, 1-inch, and 1½-inch sieves one above the other in the order named, the top sieve being filled with well-broken potsherds; give it a few shakes, emptying those retained in the top sieve in a heap by themselves, repeating the operation with each of the other three sieves until the desired quantity of crocks of the several sizes is secured, putting the contents of each sieve separately for use. In order to secure perfect drainage, place one large piece of crock (hollow side down) over each hole in the bottom of the seed-pans, &c., and over this put about 2 inches deep of the various-sized crocks in the order named, finishing off with the smallest pieces and a handful or two of half-rotted leaves or moss. Knowing that due weight is not always given to the manner in which the above simple though important details are carried out, and also that it is by attending to small details that success is achieved, I revert to the matter here. Fill the pans or pots thus crocked to within half an inch of the rims with fine soil, consisting of three parts light rich loam and one of sweet leaf-mould, with a good dash of sand added, making the same quite firm, and watering it through a fine-sprayed rose at least half an hour before sowing the seed evenly over the surface; then place the pans in heat—a forcing-house or hotbed, prepared in the manner described in last week's *Gardeners' Chronicle*, p. 41—and cover them with a square or two of glass, and sufficient moss to exclude light and air. As soon as the seedlings appear, the moss of course should be removed, and the glass slightly tilted up, to insure them to light and air, shading with a sheet of paper from sunshine during the bright part of the day. As soon as the plants are large enough to get hold of, prick them out in pans or shallow boxes prepared, as described above, at a little more than 1 inch apart, pressing the soil gently about the roots, and afterwards watering through a fine rose to settle the soil, returning to heat and shading as before. *Begonia* seed being so very minute should not be covered with soil. The same remark may be applied to *Nicotiana*, *Lobelia*, and other very small seeds. Seeds of *Acacia lophantha* and other similarly large hard-coated seeds germinate quicker if steeped in a saucer of warm water placed on the hot-water pipes for twenty-four hours before being sown, the seed being covered with a $\frac{1}{2}$ -inch thickness of fine sandy soil when sown.

SHAKING THE SNOW OFF CHOICE TREES AND SHRUBS.—In the event of being visited by a heavy fall of snow, Cedars, Thuias, Cupressus, Irish Yews, and such-like trees upon which snow may accumulate should be relieved by shaking the branches whilst the fall lasts and as soon as it is over.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY, JAN. 21.—Linnæan.

SATURDAY, JAN. 23 { Royal Botanic.
Wakfield Fxton.

SALES.

WEDNESDAY, JAN. 20 { Greenhouse Ferns, Roses, Palms,
and Dutch Bulbs, at Protheroe
& Morris' Rooms.

THURSDAY, JAN. 21 { 14,400 Lillies auratum, Iris, Paeo-
nies, and Heriaceous Plants, at
Protheroe & Morris' Rooms.

FRIDAY, JAN. 22 { Imported and Established Or-
chids, at Protheroe & Morris'
Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37°.6

H.R.H. THE DUKE OF CLARENCE.—Heart-felt sympathy will be felt by all classes of the community for the members of the Royal Family under the distressing circumstances attendant upon the death of the elder son of H.R.H. the Prince of Wales on Thursday morning last.

THE opening meeting for the year of the Royal Horticultural Society on Tuesday took place under somewhat chilling auspices. The Drill Hall is not a cheerful place, even at midsummer, and in midwinter it is very much the reverse. Nevertheless, there was an excellent show of Apples from Messrs. BUNYARD, a fine lot of exhibition Onions from Mr. DEVERILL, Banbury, a bright display of well-grown Chinese Primulas from Messrs. CANNELL, a remarkable show of cut Orchids of which note is made in another column, and a pretty group of Lachenalias from Mr. LEACH, of Albury Gardens, which demonstrated the utility of these plants for conservatory decoration at this season. The afternoon meeting, at 3 p.m., was poorly attended, not only on account of the unfavourable weather, but by reason of the numerous committee and other business meetings, which are held on these Tuesdays, and which, however convenient, render these days very laborious to those whose business it is to attend some or all of them. Roses, Carnations, the Education Question, the forthcoming Fruit Show in the autumn, and other matters, absorbed the attention of those present, so that it is not to be wondered at that the audience gathered together to hear Mr. IGGULDEN's excellent paper on "Winter Vegetables," was by no means large.

Those who were at leisure, and who did summon up sufficient courage to sit in a cold draughty building, were amply rewarded by hearing an interesting and thoroughly practical paper read. Mr. IGGULDEN was not present in person, and therefore his essay was read by the Secretary, the Rev. W. WILES. Mr. G. PAUL occupied the chair.

Mr. IGGULDEN opened his subject by remarking

that, as a nation, we do not sufficiently appreciate or realise the value of vegetables, from a dietetic and medical point of view. Choice vegetables, he said, may be had in plenty, if facilities were forthcoming; and even for winter use, twenty-eight distinct kinds were available, and of these only nine were beyond the reach of the average gardener. But, Mr. IGGULDEN continued, much depended upon the cooks, who appeared to be the natural enemies of the gardener. They made excuses of various kinds, and rather than see that the vegetables provided for them by gardeners were produced in a proper manner at their employer's table, many of them would be conveyed through the cook's agency to the waste tub. Mr. IGGULDEN, in the interest of gardeners, strongly denounced the conduct of cooks in this respect, and thought that employers should enquire more carefully into the subject.

Of green crops, Mr. IGGULDEN considered Chou de Burghley a valuable vegetable for use in January and February, especially if sown in April, and treated as Broccoli. Several kinds of the ordinary Cabbage, too, might with advantage be grown for winter use. The seed should be sown in June, and the plants got out early. Brussels Sprouts, with small firm buttons, were preferable to those of larger but looser character, and the plants should be put out at least 3 feet apart. Savoy, Borecole, and Broccoli, were considered good winter vegetables; and in the event of severe weather setting in, Mr. IGGULDEN was of the opinion that it paid to lift and replant Broccoli, and even Savoy, in vineries or frames, if these conveniences were available. Veitch's Self-protecting Autumn, although rather a tender variety, he had found most useful when lifted and protected as advised, and had been able to maintain a succession of heads until January, by which time Snow's Winter was generally ready for use. Leeks, the essayist thought, were not so much grown or used as a vegetable as they should be, and Cardoons and Celeriac were eulogised as being both useful and palatable when properly cooked. Spinach, too, in Mr. IGGULDEN's opinion, was invaluable for winter use, but too many people looked upon it as a high-class vegetable. According to his experience, it should be grown in a rather sheltered position, and a dusting of soot before and after sowing would be beneficial. Sowing the seed too late was the frequent cause of failing to produce a good crop of winter Spinach. Spinach-leaved Beet formed a good substitute where Spinach could not be grown successfully. Endive was indispensable, the Improved Broad-leaved Batavian being much the best for this purpose; and a good supply of Carrots, of the Horn varieties, may be had all the year round without frames, by making a sowing on a warm border in July, in addition to the usual spring sowings. Jerusalem Artichokes, too, were easily grown; as also were tubers of the so-called Chinese Artichoke (*Stachys tuberosa*), but the latter, he thought, would never become a popular vegetable—cooks did not take to it.

Potatoes, Mr. IGGULDEN stated, were seldom cooked as they should be, and the incompetency of the cooks in this matter frequently got the gardeners into trouble that they did not deserve. Mr. IGGULDEN advised employers to provide their gardeners with frames, mats, &c., for protection if they desired an unlimited supply of fresh vegetables during severe winters.

Mr. BUNYARD in the discussion which followed, concurred with the majority of Mr. IGGULDEN's remarks, and mentioned, among other things, a new Cabbage, named "Christ-

mas Cabbage," as being a capital winter vegetable. It originated in France, but was hardy, solid, of a dark green colour and rich flavour. He also thought it very important not to sow seed of Salsify and similar crops too early, this frequently causing the roots to "bolt."

Mr. WYTHES remarked, that he still found the old Walcheren Broccoli as good as any, and he regarded Spinach as a most valuable winter vegetable.

Mr. A. DEAN was glad Mr. IGGULDEN had blamed the cooks in regard to Potatoes, because, as a raiser of Potatoes, he felt it was not always the fault of the tubers, as many people supposed. He did not think it absolutely necessary that Spinach should be sown in sheltered places, inasmuch as in his district it was grown in open fields. A hearty vote of thanks to Mr. IGGULDEN for his paper concluded the meeting.

The Education Question.

THE subject of education for gardeners, though it did not come formally before the meeting of the R.H.S. on Tuesday last, was a subject of conversation among those present, and if we may judge from the correspondence which reaches us, is exciting general attention, a most satisfactory thing to witness. There seems to be a general agreement that whilst a practical training from the beginning is absolutely essential, means should also be devised to quicken the intelligence and increase the knowledge of the rising generation, so as to enable them to meet the new conditions of the times. The question now occupying so much attention is at least two-fold, and comprises the education of the coming race of professional gardeners, and the diffusion of knowledge among those who, by reason of their age and other circumstances, cannot be expected to begin at the beginning, but must receive their mental food in a condition ready for immediate consumption. The two things are widely different, and require corresponding diversity of treatment. The County Councils and School Boards have to provide for the future in the instruction of the young in elementary first principles, and for the present, by demonstrating to the adult the most approved methods of cultivation, and the most suitable varieties to be grown under different conditions and in various localities. The two aims must, in our opinion, be kept distinct. Also other matters must be borne in mind. Practical gardening as such is as fully advanced, if not more so, in this country as in any other; but, admitting this much, it may be doubted whether, if we eliminate the advantages that our present practitioners have over their predecessors in the superior means at their disposal, they have made any substantial advance. From a purely practical point of view, we may ask whether the young gardeners of the present day are any better than their forerunners? From this special standpoint it is not to be expected that they could be; and yet progress is demanded on all sides, and at the same time the ranks of the gardening community are overstocked, so that the weakest must go to the wall. New openings must be sought to provide for the necessities of those who are hampered by existing circumstances. How is that progress to be effected? how are these new openings to be developed, or if developed, how utilised, if our young gardeners are not so educated as to be able to adapt themselves to new conditions?

Another point must be borne in mind, and that is the urgency of foreign competition. It

often happens to us to come in contact with young men from the garden-schools of the Continent, and we are bound to say that in intelligence and general knowledge they are much superior to the general average of the corresponding class of our own countrymen, and no wonder, for till lately we have made no provision for their education. We know it may be said that the youths of whom we speak are picked men, and it is also said that they do not make such good workmen as the Englishmen; but are our people to be always brawlers of wood and drawers of water? Are they to be debarred from the prospect of rising in their profession, and of becoming the directors of other people's labours as these young men do? Some of the foreigners of whom we speak are as highly educated in the scientific branches of their profession as are our own University students. We say this from positive knowledge of both classes. Moreover, they have the great additional advantage of having been trained to practical work. But what prospects, it may be asked, are open to these educated and trained gardeners? Are they to settle down in a cottage, rub down the pony, milk the cow, clean the windows, and make themselves generally useful "at a very modest salary?" If this is to be the fate of the majority, of what use will be their education? and will not their training be beyond the needs of the case? Would not discontent be engendered, and the future be worse than the past? Again, reverting to what we see elsewhere, we do not dread any such results. The lazy and the ignorant and the incompetent will, no doubt, be no better off than they are now, and probably even worse, but for the intelligent, the industrious, and the educated, opportunities arise, and will do so more frequently in the shape of curatorships, directorships, estate managers, stewards, and the like, to say nothing of the openings afforded by the plantations in our various colonies. Whether we look to the prospects of the men themselves, to the urgent necessity there is for turning our home-lands to better advantage, or to the developing the resources of our Colonies, we see the urgent necessity both for a higher technical education, and a wider and fuller dissemination of gardening knowledge generally. The opportunity is now in the hands of the County Councils among other bodies. Most earnestly do we hope they will avail themselves of it for the benefit of horticulture and agriculture—that is, of the people generally, and the advantage of those who have to earn their bread in the pursuit of those occupations.

PICEA NIGRA.—Every visitor to Cassel and the world-famed Wilhelmshöhe Park, and the less-known but not less beautiful Karlse Park, is struck by the beauty of the variety *Picea nigra*, commonly called "Wilhelmshöhe variety," or "Wilhelmshöhe Black Spruce." Of bluish tint, and very compact growth, this tree forms a perfectly pyramidal head. The accompanying illustration (see supplementary sheet) represents a large group of these trees in the Karlse Park, Cassel, in front of a large group of the common Spruce, *Picea excelsa*, the compact-growing bluish *Picea nigra* forming a beautiful contrast to the tall-growing, gloomy-looking *Picea excelsa*. The trees figured are about 30 feet high; they often attain 35 to 40 feet, but their beauty is then usually much diminished. *Picea nigra* is of rather slow growth, and is, therefore, well adapted for smaller parks and gardens, and it is seen to the best advantage when 20 to 30 feet high; it then forms a compact pyramid, as regular as if cut by the gardener's knife. Up to this size the six or eight

main branches become so procumbent as to touch the ground, and to throw out roots. When this is accomplished, the apices of the branches begin to grow upright; the branches now become independent plants, grow luxuriantly, while the main-stem of the old tree, year by year, grows more slowly, till it dies, while a whole colony of young plants is formed around it. There are wonderful examples of this in the Wilhelmshöhe as well as in the Karlse Park, the trees here figured just showing the first signs of this process. *C. Wissenbach, Cassel.* [Our correspondent obligingly sent specimens, which we recognised as the ordinary Black Spruce of N.E. America, and in this we were confirmed by the opinion of Prof. Sargent, who was present at the time. The epithet "Mariana," used as a varietal name, is only a synonym. *En.*]

LINNEAN SOCIETY.—An Evening meeting will be held on Thursday, January 21, at 8 p.m., and the following papers will be read: 1, "Additional notes on the Tick Pest in Jamaica," by D. MORRIS, M.A., F.L.S.; 2, "On the Development of Cautchouc, containing cells of *Eucommia ulmoides*, Oliver," by F. E. WEISS, F.L.S.; 3, "On the Lichens of Manipur," by Dr. JEAN MÜLLER.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The last quarterly meeting of the year was held at the Caledonian Hotel on the evening of Monday, January 11, Mr. NATHAN COLE in the chair. Nine new members were elected, bringing the benefit membership to 423. Four new honorary members joined during the year, bringing the number of these up to 55. Sickness has been very prevalent, seven members being on the funds at the present time, and four deaths have occurred during the year. The committee earnestly ask the co-operation of the members in inducing others in the profession to join this very useful society. The annual meeting will take place on Monday evening, March 14, at 8 o'clock.

THE PRODUCTION OF CAMPHOR IN FORMOSA.—For some time past it has been stated that, in consequence of the great demand for Camphor in the manufacture of smokeless powder, the supply has been decreasing, and fears have been entertained lest the Camphor trees should become extirpated. Referring to the supply of Camphor from Formosa, a correspondent to the *New York Shipping List* entirely refutes the fears that have been thus entertained. He says:—"The trees in the island of Formosa are numbered not by the hundreds of thousands, but by the million. At the present time there is enough Camphor in Formosa to supply all Christendom for a century, yet, notwithstanding these facts, the output of the entire island in 1890 was only about 60 tons. The Camphor expert selects a tree, and scrapes into the trunk in different places, using an instrument somewhat resembling a rake, with teeth of curved, gouge-shaped edges, that cut pulling. This scoops out the wood in little crescent-shaped chips. A tree is not considered to be worth anything for Camphor purposes until it is fifty years old. The yield of a tree is unequal, being greater in and about the roots than higher up the trunk."

THE EMIGRANTS' INFORMATION OFFICE has drawn up the following items of information on the prospects of emigration to the Colonies and to South America at the present time. The ordinary emigrant without means should not go to Canada during the winter, but should be prepared to arrive in April, when the busy season commences. In New South Wales, Victoria, and to a less extent in South Australia, harvest prospects are favourable, and farm and station hands are in some demand, but mechanics are not wanted, except in a few districts. The Queensland Government have withdrawn their assisted passages, and free, nominated or indentured passages can be obtained now only by farm labourers, ploughmen, gardeners, and female servants. A Government Labour Bureau has been lately opened in the Colony. There is no demand for mechanics, and many carpenters, plumbers, and general labourers have been out of work. Western Aus-

tralia offers free and reduced passages to certain classes of emigrants. Work there has been much brisker than for some time past, and there is still a demand for a limited number of farm labourers, men in the building trades, miners, and labourers on railways and public works. In Tasmania the chief demand is for miners, farm labourers, and a few country blacksmiths; the new silver mines at Zeehan, on the West Coast, have given employment to considerable numbers of miners, railway navvies, and small traders. New Zealand still fails to attract as many emigrants as might be expected from its great agricultural, pastoral, and mineral resources, and its excellent climate, and some settlers have lately been leaving the colony. In various districts, however, there is still a demand for farm and station hands, and for miners. Cape Colony and Natal offer reduced passages to mechanics, female servants and others, for whom there is still a limited demand. In all the above-mentioned Colonies there is a demand for small capitalists, farmers, fruit growers, and female servants; and in most of them any competent workman with a little money should obtain work, even in the absence of any special demand. There is no opening at present in Mashonaland for ordinary labourers or artisans, and the journey up country, especially during the present rainy season, is expensive, and not without danger; the Port of Beira is unhealthy, and the route by that port has been notified as at present impracticable. Persons are again most strongly warned not to go to Brazil, where many cases of destitution have lately occurred among British emigrants, and yellow fever has been prevalent. The present conditions of the Argentine Republic also are unfavourable to British settlers. Branch offices are now organised at Bradford, Yorks, Bury St. Edmunds, Cardiff, Devizes, Hereford, Glasgow, Leamington, Liverpool, and Reading, mostly in connection with Free Public Libraries, and where all information can be obtained; also at the *Emigrants' Information Office, 31, Broadway, Westminster, S.W.*

A NEW TYING MATERIAL.—Under the name of "Taroba," the proprietor of McArthur's Nursery, Maida Vale, London, W., imported a new material for tying plants, and the trial having been satisfactory, it is resolved to use nothing else there for that purpose. It is a product of Mauritius, and its qualities, as alleged, are, that it is the cheapest, handiest, and most durable thing ever introduced to use for the purpose, as it stands wet or drought equally well. So far as we can judge by inspection of the material, and the ties made with it a long time ago, it is worthy of a trial on a large scale.

ASCOT AND DISTRICT CHRYSANTHEMUM SOCIETY.—Mr. FRED J. PATTON, Hon. Sec., informs us that the Chrysanthemum show of the present year of the above will be held on Tuesday and Wednesday, November 2 and 3.

THE CLOVE TREE AT ZANZIBAR.—With reference to the recent alterations in the Zanzibar Clove trade, which has attracted some attention in the daily press, it would seem that the declaration of the duty to be levied on the Clove, would apply to all the organs of inflorescence, as buds, flower-stems, fruits, seeds, &c. What the object of the measure can be, seems to be unknown, unless it is either to increase the value of other parts of the Clove plant besides the buds, or, contrariwise, to discourage the exportation of all other parts except the buds.

NATIONAL ROSE SOCIETY.—An adjourned meeting of the General Committee of the above will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 19th inst., at 3 o'clock. The following matters will receive attention, viz., the Chester schedule, dates and time of Committee meetings, and other business.

THE BLACKHEATH AND LEWISHAM HORTICULTURAL SOCIETY.—The twenty-fourth annual meeting of the above Society was held at the Institute, Lee, on Monday evening last, the chair

being taken by Mr. NETTLEFOLD, in the absence of the President, Mr. John Penn, M.P. There was a good attendance of members. The Treasurer, Mr. M. N. Butanshaw (Chairman of Committees), and Vice-Presidents were unable to attend, owing to an accident and other causes. The following gentlemen were elected as new Vice-Presidents:—Rev. S. Bickersteth, M.A. (Vicar of Lewisham), R. Escombe, Esq., and Dr. H. C. Burton. New Patron:—The Dean of Rochester. The Hon. and Right Rev. the Lord Bishop of Lichfield (late Vicar of Lewisham) has kindly consented to remain a patron of the Society. Several Votes of Thanks were passed, including the Special Prize givers, Treasurer, President, Mrs. Penn (for the use of her grounds), Auditors, Press, retiring Committee, the Secretary, Mr. C. Helmer, and his Assistant, Mr. A. Helmer. The balance of £27 4s. 8½d. has been obtained, in spite of bad weather, at the annual exhibition. The dates for the exhibition this year are July 7 and 8.

THE ROSERY.

BRIAR STOCKS FOR STANDARDS.

"R. D." very reasonably called attention to this important matter at p. 355, vol. x., of the *Gardeners' Chronicle*. There are few more important within the entire range of gardening. For notwithstanding the abuses and ridicule that have been heaped on standard Roses, they still survive, and are likely to do so, if for no other or better reason, assuredly for this, that they bring the Roses to within easier reach of our enjoyment. Neither as a matter of fact do standard Roses run naturally into mops, however persistently skilled writers trundle them in that direction; on the contrary, very many of them, in spite of the strong set of the tide of fashion against them, insist on evolving into things of beauty and joys for a good many years, though not for ever.

But I am anticipating. I mean to write of stocks, the bases, and not of the finished standard Rose and its beauty and usefulness in the garden. "R. D." attributes most of the losses among Briars to drought, and I largely agree with him, though hardly with the reasons he assigns, differing from those who attribute the mortality of their stocks during the closing summer to the severities of the previous winter. He triumphantly asks, if the cold could kill twenty, thirty, fifty out of a hundred—why not all? Why, indeed, but the same query may with equal or greater pertinence be put as regards dryness at the roots, for it is conceivable that Briars in heaps may partially protect each other from cold but their roots in the air would be equally and alike dried. The best antidote to both lies in the early collection and prompt planting of Briars for budding. "R.D.'s" illustration of September collection, though probably a month too early—is opportune and important, as pointing to the importance of, say, October planting. The soaking of dry roots before planting was a practice held in high esteem by the older cultivators. The practice of puddling, now almost fallen into disuse, the object of which was to make the mud and water stick longer to the roots, was almost universal in the olden times. Thrusting in the pond, doubtless, also revived the parched roots on the Briars, a question that is assuming there were any fibres to revive. But the latter is the mystery of mysteries about Briars for budding. They have a hardy stem, but no roots proper, and the marvel is to me not that so many perish, but that any live. How to enlarge the percentage of the living, and reduce that of the dead or dying, I have found nothing so useful as early selection and prompt planting. I may also remark in passing, that our Briars never grew more vigorously nor showed fewer deaths than last summer. This goes a long way to prove that it could hardly be the cold that killed them elsewhere.

But my chief object in writing of stocks now is to emphasise the importance of early planting. Vir-

tually they are rootless, and the early autumn is the time when the root production reaches its maximum power, in stem, sucker stem, or root stock. Hence the wisdom of utilizing this power through early planting, and planting where the stock is to remain for budding. The waste of root-producing force and energy through inlaying and future disturbance is incalculable, and responsible for twenty-five per cent. of the losses that occur among Briars.

By planting early in their permanent quarters, all such losses will be avoided. And, besides, the average vigour and strength of the Briar will be greatly raised, and the number of their roots multiplied. After October the root-producing power becomes more feeble, sinking to a minimum, perhaps, in January and February. Spring-produced roots, again, are less fibrous as well as less numerous than those produced in the early autumn. *Rosa*.

CULTURAL NOTES.

THYSANACANTHUS RUTILANS.

This old occupant of the stove is, of all plants that bloom during the winter and early spring months, the most graceful and beautiful, and one peculiarly adapted for indoor decoration. As a table plant, its tubular blooms suspended on long, thread-like stalks, that spring from the top of the stem, show to great advantage on a white cloth by artificial light. Three or more plants grouped on a small table make a pretty object in the drawing-room, or when stood on wall-brackets; in fact, any elevated position is good. Considering the ease with which it may be grown, and the length of time it lasts in bloom, *Thysanacanthus rutilans* is just one of those plants that should find a place in every collection of stove plants, however choice. We strike the cuttings in the month of March, placing them singly in thumbs in a brisk bottom-heat, and when rooted, they are potted into large 60's, and finally into 48's and 32's. When 6 inches high, the tops are pinched out, when three or four branches form. Although a stove plant, it grows well in a common frame during the summer months. A compost of loam and leaf-mould in about equal proportions, with sufficient silver-sand to promote good drainage, and the potting done firmly, suits its needs. It should be afforded soot-water and Clay's Fertiliser occasionally. *D. Elkins, Treasurers House, Cirencester.*

ARALIAS.

Few plants have a higher value as decorative subjects than the stove and greenhouse *Aralias*, and more especially is this so as regards the stove kinds; for what can be more elegant, graceful, and beautiful than *A. Veitchii gracillima*, with its palmately divided leaves and narrow segments, so richly coloured with bronzy-green above and reddish beneath? *A. Veitchii* has long been a favourite with gardeners, and is held in much esteem for the embellishment of dinner tables, for which purpose it is exceedingly useful, and is only rivalled by the more narrowly-divided foliaged ones mentioned above. *A. elegantissima* is likewise a handsome plant, that grows with an erect stem, and has long slender petioles of a dark green shade, speckled with white, the leaves being palmate, and divided into narrow segments, which are serrate at the edges. *A. Guilfoylei* has pinnate leaves made up of leaflets, varying from five to seven, and these are broadly margined with creamy white, which renders the plant exceedingly ornamental and telling. *A. Guilfoylei* is a very free-growing variety, strikes readily from cuttings, and it is therefore often employed or used for a stock to graft others on. All the *Aralias* referred to like a brisk stove heat, and should be potted in sharp sandy soil mixed with leaf-mould or peat, and if kept clean in their foliage they are sure to do well. The chief insect that affects them is the thrip, which if not destroyed or got rid of immediately it appears, very quickly disfigures the leaves, and renders the plants quite unfit for use. Tobacco smoke is the safest and best remedy, as

sponging the leaves, unless it be carefully done, injures them; but, if carried out properly, brightens and improves its appearance. *A. Sieboldii* is a greenhouse kind, and in favoured spots is sufficiently hardy to live out-of-doors, where, if planted in a sheltered place, it forms a noble and striking object, so fine and bright are its leaves. As a pot plant, too, it is very useful, young seedlings of from two to four years old being the most serviceable, as they have fresh healthy foliage almost down to the base of the stems. The variegated form, *A. Sieboldii variegata*, is almost equally enduring, and a more choice thing, as its leaves are broadly marked or margined with creamy white, which, contrasted with the deep glossy green, is very rich looking. Unfortunately, this variety keeps somewhat scarce, as it has to be propagated or increased by cuttings or portions of root; but by heading an old plant back, it soon makes fresh shoots from the sides. *J. S.*

HOME CORRESPONDENCE.

TECHNICAL EDUCATION.—Now that a great impetus has been given to the cultivation of fruit in this country with the Allotments Act in force, and the Small Holdings Bill—to the passing of which thousands are looking forward with great expectations—promised, I am sorry to see such a damper put on the so-called technical education as that of the letter from the Director of the Royal Gardens at Kew to the Vice-Chairman of the Middlesex County Council, which was published in the issue of the 2nd, as it is, I think, likely to do great harm to the cause of fruit and other small cultures. If allotments and small holdings of land are to be of full use to the persons renting them, as they ought to be, and a great blessing to the whole nation, which must benefit those occupying, or who will occupy the land, must be taught how to make the best use of it, and garden crops afford the means of producing the greatest amount of that kind of food which people in cities and towns stand in the most need of, and yet get so little at present. Mr. Dyer writes as if horticulture as a whole hinges on [pot] plant-culture, whereas that is but a very secondary part of it, and if men possess the knowledge of that only, they are of little use in a garden. As to the beneficial effects likely to result by holding classes in horticulture in villages and small towns, everything will depend upon how much "technology" is introduced, and how much practice, the great thing being to make the lessons and teaching as practical as possible by having living trees and branches when fruit culture, pruning, grafting, &c., are being treated of, and the same with other subjects all through the course. This has been the method I have pursued, and I find that the liveliest interest has been excited, and great attention paid, as instead of following by the ear and mind alone, those composing the class I have had the honour of endeavouring to teach can see the operations or modes, and take the whole in. *J. Sheppard, Woolverstone Park, Ipswich.*

LECTURES ON HORTICULTURE.—Judging from the tone of various articles in this and in contemporary journals, it seems to me that considerable misconception prevails as to the real scope of lectures. It has been asserted "that gardeners must learn their profession in gardens or nurseries, and that no man can hope to learn his profession by being lectured at." No one who knows anything of the conditions of gardening will seek to deny this, but neither will anyone with a true conception of the matter ever imagine that horticultural lecturers will ever be required to work under such absurdly impossible conditions. These lectures are being organised with an entirely different aim in view than that of clashing with practical work, but distinctly to go hand in hand with practice by endeavouring to supply the knowledge of theoretical facts which underlie the art of gardening, and to systematise to some extent and make available the mass of facts which a gardener, if he means to reach any status other than that of a mere labourer, must assimilate. Further, some writers have ridiculed entirely the idea of teaching a gardener anything whatever besides what he can pick up in a garden by his unaided intelligence. This must appear an utter absurdity to the great majority of the gardening community. If a man had to be simply a hewer of wood and drawer of water

throughout his career, then there might be some truth in the statement, but it is obvious that some of the young men of to-day must in the future fill important and responsible positions, and surely in such positions men cannot but be benefited by possessing a knowledge of many things, which, though they had been ever so desirous to attain, they could not have acquired in the usual course of training in a garden. Take such subjects as elementary Latin, plan-drawing, or botany. These subjects cannot be taught to gardeners in the gardens where they are receiving their practical training, nor have the majority of youths who select gardening as a profession any knowledge of them previously, yet they are of the utmost importance. Certainly lecturers on horticulture do not profess to teach Latin, nor can they give their students a complete course of plan-drawing or botany, yet they can readily impart much valuable information on the principles of landscape gardening, the fertilization of flowers, principles of propagation, &c., enough to give men, at least, an intelligent conception of the subject to stimulate effort, and prepare the way for fuller knowledge. *Excelsior.*

THE EDUCATION OF GARDENERS.—I have read with great interest, and I am entirely of the same opinion as your correspondent "Hopeful," in a recent issue of the *Gardeners' Chronicle*, that the inducements now held out to gardeners and others who are connected with the trade are inadequate as an inducement to study necessary to make them masters of their business. In nine cases out of ten the wages offered in any branch of the trade are only just enough to live upon; and it is very often the case that ignorant and uneducated men get a situation simply because they have influential friends who will recommend them, thus excluding the more experienced man, and this is more so among persons not engaged in the horticultural trade. I will take, for instance, the wage of an ordinary mechanic, which is from 30s. to £2 a week; now I consider that a gardener has a great deal more to learn and study than a mechanic, and yet he receives about one-half the wages of one. The same also with young men who are engaged in nurseries, who, as a rule, only receive 18s. a week. If £1 is paid, it is considered very handsome. There is a great drawback in the nursery branch, owing to the number of Germans who come over, and who are able, by reason of their great frugality, to work for next to nothing. I have had about thirteen years' experience in the trade, and have done almost everything, from crocking pots to keeping a set of books, and I have during that time come in contact with men of all branches of the profession, and the universal opinion is that the pay is not enough to encourage and allow of advantage being taken of the various means of scientific education in horticulture now available. *Shopman.*

— On this subject, my ideas are altogether different from your correspondent "Hopeful," p. 620, vol. x., of the *Gardeners' Chronicle*, who seems to have written in a desponding frame of mind. True, education is of great importance to us all, for the time is near when even the lowest grade of workmen will possess it; but, even then, those who have made influential friends, and can secure the benefit of their assistance, will then, as now, succeed the best; and at this, none will complain but those who have never been able to make a friend with influence. "Hopeful" says that gardener's situations are secured not by merit but by favour, a statement at variance with my experience, and one which casts an unjust aspersion upon all who take an active interest in recommending gardeners for situations. I know Messrs. Dicksons of Chester, and believe Messrs. Veitch of Chelsea, will not enter the name of an under or a head gardener on their books, with the object of finding either a situation, before they are assured that their characters will bear investigation, and their experience is of a standard to make them worthy of patronage. Further, I venture to predict that if "Hopeful" can produce recommendations to prove that he possesses one-half of those qualifications he says he does, a nurseryman will soon be found who will give his case a very favourable consideration. Notwithstanding the value of education, I would advise young gardeners to concentrate their efforts somewhat, for being a proficient in a few subjects is unquestionably better than to attempt to master many, and not succeed in doing so. Yet I admit I fail to realise how any man, positively possessed of such varied and high-class qualifications, could do other than rise above

his brethren. Although education is becoming every year of more importance, young gardeners cannot do better than first to acquire the art of cultivating all the productions of a garden, for without this knowledge no other will be of much avail to raise them even to a comfortable position in their profession. *Thomas Reid, Woodcote, Newport, Salop.*

CHARRED REFUSE.—Last winter there was, in the *Gardeners' Chronicle*, a controversy going on respecting the properties of charred refuse and burnt earth, and in my opinion more may be advantageously said upon the subject. Last year I tried various experiments with charred refuse, with results more or less satisfactory. A trial of it on outdoor Tomatoes showed, that with these plants its effects were good. When we planted out the Tomatoes, about half the plants were placed in a good quantity of the material, with the result that we had plenty of ripe fruit in the autumn, in spite of much rain and dull weather, and onwards to Christmas from partly ripe fruits cut off and ripened indoors. Those planted on the same aspect (south-west) without charred refuse, failed completely, scarcely ripening a fruit, besides growing much to leaf. I used the materials with the soil in which Strawberries were grown in pots, but affording less of it. I have found that it answers admirably for early forcers, but in the case of Strawberries late forced, I have discontinued its use, as red-spider seemed to attack them very freely before the crop had finished. The burnt earth may or may not have been the cause of this trouble. Another case which deserves notice was that of an early batch of Cinerarias, when at their final shift about 30 per cent. of charred material was used for about half the number of plants; and, as a matter of fact, these are now in full bloom, while those plants which got no burnt refuse, the treatment being exactly the same in both cases, will not be in flower for one month or six weeks. This strengthens the argument of those who hold that the use of this substance hastens the flowering period of plants, and tends to the early ripening of the fruits of the Tomato. *G. B. Claydon, Holbecks Park, Hadleigh.*

EXPERIMENTS WITH NECTARINE AND PEACH TREES.—A large tree, about eighteen years old, of Rivers' Elruge Nectarine had been early forced for several years, and did not fruit satisfactorily, chiefly owing to its position in the house, where but very little sun reached it. Eventually the foliage was attacked by the "silver leaf disease" on some of its lower branches, and it was determined to replace it with a younger tree. The tree accordingly was lifted on October 28, 1890, and temporarily laid in with its roots just covered with soil near some tall trees; here it remained until February 9, 1891, enduring all the severe weather, including 32° of frost on one occasion without any protection whatever. While re-arranging another house, I found room for one more tree, and having only the above specimen at hand, it was decided to give it one more trial. With this intent, the lower branches which were diseased were cut off, and found to be dead in the centre. The head was considerably reduced, and the tree planted in the vacant space on February 9; it flowered very freely in the month of March, and set a heavy crop of fruit. The fruits were left at about 9 inches apart all over the tree, and ripened well, although they were rather small, and more fruit by far was carried than in all the previous six years, thus proving that Nectarines will stand severe frosts without any injury if the wood be perfectly ripened. Up to this date I have seen no more of the "silver-leaf disease," although traces of this malady may still remain in the main branches to reappear at some future time. To fill up the vacancy in the early house when this tree was removed, I selected a nice tree of Crimson Gaiety Peach, about six years old from the bud, which had been grown in a late Peach-house without fire-heat. The tree had not begun to shed its leaves when it was removed on October 30, 1890, and when the house was closed for forcing on November 18, a quantity of green leaves were still to be found upon it. Owing to the unripe state of the wood at the time, I did not expect that it would fruit that season; in this, however, I was deceived, and although some of the flower-buds dropped, as did those of other trees in the house which had been forced early for several years, it ripened a heavy crop. Judging from this instance alone, it would seem to be unnecessary to have the trees at rest before beginning to force them. *W. H. Divers, Ketton Hall Gardens, Stamford.*

PRUNING, AND THE CANKER IN FRUIT TREES.—I read with much interest the remarks of Mr. Hudson and Mr. G. Woodward, in your issues of January 2 and 9, at pp. 20 and 53 respectively, concerning the pruning of fruit trees, in which I notice Mr. Woodward's treatment of fruit trees coincides with that of Mr. Hudson, and the results obtained are the same. What induces me to write, however, is, that my experience in regard to pruning and canker is the reverse of that of both your correspondents. I have a plot of land planted with fruit trees—mostly pyramidal Apple and Pear trees, which are planted rather closely, and consequently I was obliged to prune rather severely; but not being satisfied with the crops of fruit produced, I determined to give a portion of the trees more space, and allow their branches to extend. I selected six Apple and six Pear trees for the experiment, and pruned them very sparingly for two successive seasons; the consequence was, that those trees became very much affected with canker, more especially the Pear trees and Lord Suffield Apple—so much so, that in pruning during the winter of 1889 many of their branches had to be cut back into the old wood, and the cankered portions of the main stem of the trees dressed. This season those trees proved almost fruitless, but they have made nice clean growths of young wood, and the canker is disappearing. Possibly the nature and composition of the soil (mine is stiff loam) in which fruit trees are planted have much to do with the amount of pruning required in the different localities or zones. *J. Charlton, Farnley Grove Gardens, Corbridge-on-Tyne.*

HEAT FOR VINE BORDERS.—A few years ago it was the common practice to afford heat to Vine borders of houses that had Vines in to be forced, the general way being to pile fermenting materials consisting of leaves and stable-dung, which in the most cases did more harm than good, as the weight of it consolidated the soil, excluded the air, and held an excess of moisture in the soil, rendering it unfit to support healthy growth after a time. Others again, where expense was no object, went in for placing hot-water pipes in vaults, channels, or gutters below, and I remember seeing some very fine and highly-coloured Muscats shown, I think, from Deepdene, near Dorking, many years ago, that were produced and grown under that system; but experience has proved that it was not worth following, and I do not suppose that any borders are now to be found that are warmed in that way. The consensus of opinion among the more advanced gardeners now is that artificial bottom-heat is unnecessary; but though that is so, it is very important to conserve what is in the ground by affording the border a very light covering. The best material for the purpose is freshly fallen leaves, and if they can be held in position by corrugated iron roofing, old lights, sail-cloth fastened down, or anything of that kind to ward off rain and snow, the border and roots will be kept in a snug healthy state. The proper time to apply the leaves and cover up an early Vine border in the way referred to, is, as soon as leaves can be raked together in the autumn, as the earth is still warm, and the leaves are good non-conductors. Short litter or half-rotted leaves are very good for later vinery borders, and the visible stems of Vines should be protected with something or other, as when sap is moving, frost often does much harm, and should be kept out of the borders and away from the stems outside the vinery wall. Horse-droppings, or short stable-dung, may be used on Vine borders with good effect, if not overdone; and it is excellent to leave on or apply as a summer mulching, as it is light, loose, and open, and does not, therefore, unduly obstruct the passage of air, which is almost as essential to the soil and roots as it is to the tops. This fact proves how opposed to the well-being of a Vine is a mass of hot manure spread over its roots, sealing the soil against the ingress of air, and which it takes long exposure to sweeten or improve. *J. S.*

WALLFLOWER SEED.—Whilst the present exceeding scarcity of Wallflower seed is undoubtedly largely due to the severity of the previous winter, it is equally certain that much of the scarcity arises also from the attacks of a kind of mould or fungus, which most seriously harms seed-vessels and plants, especially in damp seasons. This fungus has become very prevalent in the well-known Wallflower district of West Middlesex, where hundreds of acres of plants are grown for the production of bloom. The year preceding the last, the stock of seed had been growing less in bulk and deteriorated in quality, because so much of it was imperfectly matured, as

well as being discoloured. It seems now almost obvious that to secure at once good seed and a good class of strain, it will be beneficial for the market growers of Wallflowers of the true blood-red type, to charter some one resident in a warm dry part of the country to grow the stocks specially for them. The flowers do not suffer so much as the seed-pods, as the attack of the fungus commences with the decay of the blooms. It is the practice of the large growers to save a number of the plants of the best dark variety for seed, cutting the flowers of all the rest, and it has happened that in such case no seed has resulted, and the grower of 20 acres, perhaps, of plants, has after all had to buy from some more fortunate neighbour. Of course, in a locality where no other Wallflower is grown it is more easy to keep a stock pure than healthy, especially on the strong Middlesex clay. Wallflowers are almost naturally drought-loving plants, and prefer a gravelly soil. For seed production, seed should not be sown till May, whereas market growers sow in March. The fungus passes from the seed-vessels down the stems, blackening and killing the plants absolutely. *A. D.* [In all these cases of decay caused by mould, the sulphate of copper solution might be tried with success, partial or complete, according to the time that had elapsed before dressing the plants, and the extent or degree of the attack of the fungus. *Ed.*]

BRUSSELS SPROUTS.—There seems to exist in the minds of those who market in a small way at this time of the year the impression that a Savoy Cabbage, for instance, is more profitable to purchase than is the same value of Brussels Sprouts. It does not often perhaps occur to those persons to test the relative quantities of produce after these respective members of the Cabbage tribe are cooked and served to table; the result is, however, in favour of the Brussels Sprouts, for the waste is trifling, whilst as compared with the Cabbage, the comparison is all Lombard Street to a China Orange. Brussels Sprouts have proved to be a capital as well as a most profitable crop, so far, this winter. The weather has done them no harm, the frost has not been so severe as to influence flavour, and the demand has been truly enormous. Market growers, as well as vegetable consumers, owe a debt of gratitude to Brussels Sprouts. *A. D.*

TALL TREE OF LOUISE BONNE PEAR.—In your issue of the 2nd inst. Mr. Hudson, in his remarks on Apples and Pears, says of the above variety, "Upon one tree the fruit was scabby; it is a tall one, and much exposed—so tall, in fact, that we had to cut off its top, and that may have had something to do with this failing." The cutting off its top may be put aside; but the fact that the tree is tall and exposed is significant. The roots will be found far down in the gravel, and perhaps nothing contributes so much to the spotting and cracking of Pears as having the roots in an uncongenial subsoil. *Will Toyler, Hampton, Middlesex.*

PELAGONIUMS AT BOWOOD.—At Bowood at the present time Mr. Nelson has, in a large house, a very good lot of the above in flower, nothing being so much appreciated at Bowood as large masses of scarlet, pink, and white. Amongst some of the best noticed were Mr. W. E. Gladstone, Dr. Urton, Quilame, of the Belgians, Silver Queen, Madame Quilame, Coconette, Souvenir de Margude, W. H. Cannell, Aurora Borealis, and Henri Jacoby. All of these bore splendid trusses, and very fine pips. I also observed a number of Meg Merrilies, which Mr. Nelson values very much; Carew Underwood was also in very good condition for the season. *W. A. C.*

ANGRÆCUM SESQUIPEDALE.—To correct an error in the notes on Orchids at Davenham in a recent *Gardeners' Chronicle*, in speaking about *Angræcum sesquipedale*, it is stated that I once flowered a spike with thirteen flowers on it, but should read "a plant with thirteen flowers on it." Perhaps readers of the *Gardeners' Chronicle* may remember Mr. Sander recording the same fact in these columns a few years ago, but he there said twelve flowers, which he admitted was a mistake when he saw the account, as he counted the thirteen flowers. Of course, a plant with so many flowers on it is rarely seen. *Abraham Bradshaw.*

CHRYSAETHUMS FOR EXHIBITION AND USEFULNESS.—May I be allowed a word or two on this important subject, which I hope will find favour

with some of the many readers of this paper. In no few cases do we find trained specimens condemned on the ground of their presenting a too formal appearance. Now, I would ask all my intelligent brethren of the craft, which looks the most formal, plants grown in 8-inch pots with two mop-like blooms, or plants grown in 11-inch pots, dwarf-trained, with say fifty blooms of fair size. In my humble opinion, Chrysaethum societies ought to give greater encouragement to specimen plants, and much less to cut-flowers, which have very little value except upon the show tables. Such large blooms are costly to produce, and when they are produced, I think it cruel to treat them in such a manner. Not so with the trained plant, which has much besides to recommend it. At the exhibition it has an imposing effect, and at home it is none the less effective. Supposing we have a stage to brighten up in the conservatory, say 12 feet by 3 feet, it will take about seventy plants in 8-inch pots, which must be grown of various heights, to enable the gardener to arrange them nicely, and you cannot mix other plants with them when grown in this manner. Now we will look again at the specimen plant, and see what we can do with it. It will take four nice trained plants to fill the same space, and, if the colours are well-assorted, and a few *Primulas* and *Maidenhair Ferns* added, it will be admitted that the latter is the more pleasing effect; and there is, moreover, a saving of 10s. in pots alone, to say nothing of labour in potting, watering, and carrying about. *J. A.*

ARSENIC IN AMERICAN APPLES.—The daily press is taking up this subject, and apparently endeavouring to produce a "scare" as baseless and imaginary as scares generally are. It is represented that American Apple growers are in the habit of syringing the fruit with arsenic and other deleterious compounds, which render it poisonous. There will not be many of your constant readers who will not smile at these statements, as they will be aware that the syringing is applied to the leaves before the fruit is set, and that consequently no harm can accrue to the latter. That the English fruit sent to market compares disastrously with the fruit sent from America, Canada, and Nova Scotia might, and one would think must, some day lead our home growers to study the why and the wherefore. When they do, they will probably find that in the syringing (now so much animadverted) lies the secret of success. *J. B. Thomas.*

HOW TO MAKE THE BEST OF TEN ACRES IN FRUIT CULTURE.

The first requisite is the right man, and that man must have the qualifications of a solid business man. To make money in fruit-growing requires business talent, and it is a great mistake to imagine that a person lacking in business ability will ever make a successful fruit cultivator. Next to that business ability he requires a knowledge of the business he is engaged in. I will not dwell upon this, although it is a current idea among city people that every man is a born farmer and fruit grower. If you want to find a man who thinks he knows all about agriculture and fruit growing, it will be necessary for you to go in search of him in the centre of some densely-populated city. The men who have followed this business all their lives know very little about it. Although, as I have said, this is a very common idea, it is a mistake. The fruit grower needs a practical knowledge of his business in addition to business qualifications. He also requires pluck, and must be willing to work, and fight weeds eight months of the year. He must hate weeds with an undying hatred, and manifest that hatred every day of the week except Sunday. Having got the right man, the next thing is to locate him in the right place. In the first place I would locate that man near some source of fertilisers. It is necessary to put him near some town or village of considerable size, because, to get the best results out of 10 acres, requires no inconsiderable application of fertilisers. I would also have him near a local market. It is rather a difficult thing to make a fortune out of growing fruit and shipping it exclusively to distant markets. I have myself a very deeply-rooted aversion to wearing out my life in the

behalf of express companies and carriers, and commission men. Yet that is about the history of our business. The carrying companies and commission men have been making money fast, and we have been getting very little. By being located near a local market, we can very largely get rid of that trouble, but it is seldom that a local market alone is sufficient for us, and it is therefore also desirable to be near a good shipping point, one at which there is competition, more than one way of reaching the outside market. From this point, for instance, you have, as a rule, only the steamboat to connect you with Toronto. At the Falls we have a variety of ways: we commonly send our fruit into Toronto, just past your door, as cheap, or even cheaper, than you send yours at the present time. We ship very largely through St. Catharines and Port Dalhousie, and we get it to Toronto just as cheap as the people of Port Dalhousie. Then we have as alternatives this route and the Great Western railway line. It is a great advantage to have a variety of ways of reaching the market. Now, having the right man in the right place, which is near some town or village, you must have for the next thing the right kind of soil, which is a very essential thing. It is quite possible in a small plot where the soil is not right, to make it right, but it would be rather a large contract to undertake to make 10 acres, not naturally adapted to the requirements of the fruit grower, suitable for them. I think it was Henry Ward Beecher who said he never respected a mountain so much as he did after he had attempted to make one, and I would not advise any one to try and make 10 acres of hard clay or very poor sand or swamp into a fruit farm, because you have to compete with men who have suitable soils for the profit of the business, and to do so with any hope of success, you must start on even terms with them. If you start with a bad soil, the chances are that the business will be a failure as a matter of profit; and, as it is evident that the produce of ten acres of land in fruit culture would be more than a single family would consume, it is as a matter of profit we are considering this question. Now we have the right man in the right place, with the right soil, and he goes to work. Another one thing is this, and in this I have failed, though I generally try to practice what I preach: if you are not able to fertilise ten acres properly, sell five and fertilise the other five. Fruit growing requires a great deal of manure, and it is my experience that a great many of the artificial fertilisers are a failure; indeed, I have never yet been able to get 10 dols. back from a 10 dols. expenditure in that line. The preparation of ground for fruit culture is a different thing from preparing it for the ordinary crops. If you wished to secure a good ordinary farm crop of Oats or Barley, you would probably not cultivate very deeply, but with fruit the ground requires to be more deeply and thoroughly worked because the fruit will occupy the same ground year after year, even in the case of Strawberries probably two or three years, and I have never yet been able to turn in manure so deeply that these plants would not find it, so you need not be at all alarmed about cultivating too deeply. The soil should be very deeply cultivated and thoroughly worked, and all the weeds eradicated as far as possible before planting. In planting Raspberries, Gooseberries, and Currants, plant in squares, so that you can cultivate crosswise. Raspberries you put 5 to 6 feet asunder, and about 4 feet in the row, so you can cultivate both ways. With Gooseberries and Currants you may plant closer—it will depend on the richness of the soil; but, as far as possible, get cross-cultivation, by which you will find the expense of cultivation very much reduced, and the results will be better. In some cases, of course, you plant in rows. At the outset, you can plant a vegetable crop between your Gooseberries, Currants, and Raspberries, or Grapes. In Grapes I am favourable to the idea of making the rows somewhat wider asunder, by which you can get through readily with a wagon with manure, and you can utilise the space between by getting a crop early in the season, because some vegetables will be allowable in the case

we are speaking of now. In regard to the varieties of fruit to be planted, that will depend very much on the kind of soil you have. If your soil is entirely sandy, you cannot plant so largely of some varieties as you otherwise could. With a sandy soil my crop of Currants would be less, and my Raspberries greater. One of the things that the possessor of ten acres would be very likely to plant at the outset is Strawberries. I would not advise, however, that any one should do what I have frequently seen done, to plant these with a row of Grapes, because there would be a good deal of difficulty in taking the Strawberries out later on. I do not fancy planting them in the rows. To make a success of planting Strawberries, the soil requires to be made very rich. Another crop is Gooseberries. From Currants I have been able to make almost as much per acre as from any other fruit I have ever grown. No matter how cold the weather, you are almost sure of a crop of Currants, although this year I have a very poor one; but we never

and I get the retail prices and my baskets back. I have no baskets or crates lost or stolen. I can pick my berries at 3 o'clock in the afternoon, and at 6 o'clock in the evening I am home with the money in my pocket. Blackberries can be sold at good prices, and are grown with profit at a few points, but I would not recommend generally the culture of them even on this Niagara peninsula. I have never made a great success of them, but some men have, so it is not for me to say because I have failed with a certain fruit, that no one else will make a success with it; and I find that other people in other places do succeed. Quinces can be grown on a ten-acre plot; they can be planted closely, as I stated before, and other things can be grown between while they are young. I would grow Plums also, especially if I had some clay. I have an immense crop on my trees, and I never fail in having a crop of some kind, although mine is sandy soil, on which we have to fight the

of fruits will prevent the growth of weeds. We can keep weeds down very easily where the land is in thorough cultivation.

THE SECRETARY.—Which would you rather have—ten acres of fruit planted and cultivated in the manner you have described, or a hundred acres of ordinary farm without any fruit?

MR. MORREN.—Well, of late years, farming has been rather a poor business, and it would hardly be fair to make a comparison. It would be a mistake to think that you would get from ten acres of fruit the same profit as from one hundred acres of ordinary farm land with one-tenth of the expenditure; but in farming one hundred acres there is a considerable investment for implements and buildings, and it is difficult to get your interest out of it. If you bring that down to ten acres, of course there are a great many advantages. You may do with a less expenditure for buildings, &c., and there will probably be less hard, heavy labour, but you must not run away with the idea that you can do that without expense. The fertilisation, planting, and caring for 10 acres of fruit, so as to get a profit, is going to take considerable. I think it would be well in a 100-acre farm to devote ten acres to fruit; but if I lived 10 or 15 miles from any market I would be sorry to drop 90 acres of it and devote the remaining 10 to fruit. *Twenty-second Report of the Fruit-growers' Association, Ontario.*

FIG. 16.—LAGENARIA VIRGINALIS: FLOWER AND FRUIT WHITE.

LAGENARIA VIRGINALIS.

This is one of the novelties of 1891, introduced into commerce by Messrs. Dammann & Co., seed growers, of San Giovanni, near Naples, and who have kindly furnished us with the figure. It is one of the handsomest varieties of *L. vulgaris*, with large bottle-shaped fruits, which, contrary to the usual green colour of *L. vulgaris*, are waxy-white and, being seen from a long distance, form a distinct attraction in a garden. The young fruits are edible, and which, when properly cooked, have a fruity flavour. The large blooms are snow-white, and highly decorative. We publish the illustration as appropriate to that given in our last issue from the Royal Gardens, Kew.

FORESTRY.

FORESTRY FOR DEER.

THE open and propitious weather which we experienced in Great Britain and Ireland during the last autumn was highly suitable for the planting of forest and ornamental trees, and in all cases where the ground is naturally dry, or rendered so by a thorough system of drainage, the work if properly executed cannot fail to prove highly satisfactory. Young plantations, however, should be well protected in the early stages of their growth by efficient fences, to prevent cattle and sheep from entering and browsing upon the twigs of the trees, and for want of this precaution, I regret to say many plantations may be found here and there throughout the country that are sadly neglected in this way. The materials used for forming and maintaining fences vary considerably in different parts of the country, so that the planter should exercise his judgment on the spot and act accordingly. I may, however, remark, that in some parts barbed wire has been used for repairing dilapidated fences, but as such has proved over and over again to form a source of danger to man and beast, the system should be discontinued. During dry frosty weather the felling and removal of heavy timber should be prosecuted, as the stuff can be removed at a cheaper rate when the roads are hard and firm in place of being in a soft muddy condition. During inclement weather when out-door work is at a standstill, the hands can be employed to the best advantage cutting up wood into various sizes of scantlings, boarding, and planking, for estate and other purposes.

The stuff should then be placed in a shed, open at both sides to admit a free current of air, but roofed on the top to keep it as dry as possible. When the

get a total failure, and generally get good crops when we give them careful attention, and fight against the worms, which we must do. Just here I may say that I met with a difficulty this year. Hellebore has been the remedy all along, but the hellebore I got this year is so very mild that the Currant worms will be killing the bushes next year. I have planted and grown Raspberries very largely, and make as much money with them as with any fruit. I plant so as to cultivate both ways, and I use cultivators with knives. The sacker question is no matter of difficulty with me. I have been able to get very large returns from Raspberries. I find that although you may get more Strawberries to the acre, Raspberries will give you 10 or 12 cents a basket as readily as Strawberries will 6, and I have always realised readily with Raspberries. One reason perhaps is, that I compete with our American friends in their own markets. Nearly all the Raspberries I grow are sold in the United States. In that I have the local market I have just been contending for, and in operating the local market I have followed the plan of taking orders from private families, which I can very readily do where I am known;

circulo. I would also grow Pears in a limited area like this. Plums, Pears, and Quinces can be grown where your space is limited, because, by giving the care and cultivation I have spoken of, a great deal can be accomplished in a small space where the land is rich. Now, in dealing with 10 acres, you must remember that you are to be confined to that area, and you must not at once plant the entire area with fruit, because the fruit must be renewed from time to time. One of the secrets of success in small-fruit cultivation is the renewing of your cultivation very frequently; with Raspberries and Gooseberries perhaps once in seven years, and oftener in the case of Strawberries, and it is always desirable to have some space reserved for that purpose, which may be used otherwise in the meantime. Anyone who would succeed in the growing of small fruits must be prepared to do an immense amount of cultivation as compared with the ordinary farmer, who puts in his crop of corn or Potatoes, and cultivates it once or twice. I find it necessary to cultivate my ground twelve or fifteen times a year, and to hoe nearly as often, though hoeing is not necessary so often, because if the ground is rich, the shading

wood is seasoned in this way it seldom contracts black ink spots which is a fungus that lays the foundation for rot and decay.

During frosty weather, ground should be prepared for spring planting, and in all cases where large sized plants are to be used, capacious pits should be dug to allow the roots to be spread out to their full length in a uniform manner from the base of the stem without crossing each other. I have sometimes had this sort of work done in a very efficient manner by contract. Of course, the cost varies a little according to the size of pits required and the texture of the soil, but pits about 16 inches wide and one spade deep cost about 1s. per 100, but in cases where the subsoil is of a hard, impervious nature the cost is often from 1s. 3d. to 1s. 6d. per 100. Nothing, however, accelerates the healthy and rapid growth of young hardwood plantations like trenching the ground to admit air and heat, by which means the cold dormant particles of the subsoil are converted into food for the roots. I have had this sort of work done by contract at an average rate of about £3 per acre. When the subsoil is of a very hard impervious nature, it should be broken up to the depth of about 20 inches, and in this case the cost of trenching will be rather more. In overhauling and renovating established plantations, it is often necessary to make up blanks, where they have occurred by deaths or accident, and in doing so, a good large size of plants or young trees should be used; and in trenching the ground or digging the pits, care should be taken to remove all old roots and wooden chips from the soil as the work proceeds, in order, as far as possible, to lessen the risk of fungus growths in the soil, which in due time would attack the roots of the young trees, and cause their death. In this case it is also an advantage to open the pits in early winter, and allow the stuff excavated to lie in a rough state around the edge of the pit, exposed to the influence of the weather, by which means it will become pulverised, cleansed, and sweetened by spring, and in cases where the soil has become exhausted—indeed, I had better say in any case—it is an advantage to add a little fresh soil to the staple to promote the growth of the trees at the start. Old roots, fragments of wood and rubbish should be collected into heaps and burned, and a small quantity of the ashes or charred scorie mixed with the soil at the spots where the trees are to be planted. This increases the fertility of the soil, and gives porosity, and is a very safe manure for all sorts of trees, including Conifers.

When young trees are planted in proximity to old-established trees, they are apt to suffer damage by the encroachment of the roots of the latter, but in order to prevent this, a deep narrow channel should be cut around the young specimen at a reasonable distance from the stem in order to prevent the roots of the established tree from rubbing the stranger of its legitimate food. After the young tree has become established, these channels should be filled up with the stuff excavated. By putting these simple rules into practice, I have been repeatedly successful in establishing fine young trees, to show contrast and variety and improve woodland scenery. Young trees planted in such positions are apt to be peeled and eaten by hares and rabbits, but trees with bare stems may be protected in a cheap and efficient manner by simply placing some small branches in an upright position, about 2 feet high, around the stem, and tying them with a piece of tar twine or willow twig. Trees, however, that are feathered from the ground upwards had better be protected by forming a cage of wire netting a reasonable distance from the plant; and should the soil be of a dry light texture, a mulching of Fern or tree leaves will prove beneficial. I need hardly say that in many cases it is absolutely necessary to stake and tie the trees to keep them in their proper position until such time as the roots take to the soil.

FORESTRY IN 1891.

Taking a retrospective view of forestry for the year

now past, trees and plantations in Great Britain and Ireland, with few exceptions, are in a healthy, progressive condition; prices of timber, on the whole, have been fairly well maintained, and in some cases the prices realised at public sales for trees of matured growth and good quality have been in excess of the estimated value of the lots, and, as usual, fine sound Larch trees in this respect topped the list. I find that good sound Larch, whether in Scotland, England, or Ireland, never fails to command a ready sale and good price; consequently, planters should keep this in view at the time of forming their new plantations. Particular attention should also be paid to the raising of plants from sound seed of full size collected from trees in perfect health, such as we find in Ireland and some parts of Scotland.

Although the cones of the Larch are ripe at this season, yet they should be left upon the trees during winter to be matured by frost, which also loosens the scales to a certain extent and allows the seed to be the more easily extracted. Nature's mode of extracting the seed is by alternate bursts of sunshine and spring showers, consequently the nearer we can follow her unerring ways in this respect the more likely are we to attain success. In my early days, the cones of the Scotch Fir in the natural forests of Braemar and Glentworth, were commonly collected in the month of February, and past experience and observation tells me to still adhere to that practice. *J. B. Webster.*

FLORISTS' FLOWERS.

TREE CARNATIONS.

THESE are very useful as cut flowers during late autumn and early winter, and a few are even now to be had. As long as the Chrysanthemums last (which this year was up to Christmas, though the quality of the flowers at that time was very poor), we were never at a loss for some flowers in almost any colour; but even in the full flush of the Chrysanthemum bloom, Carnations bated not a jot of their value. Our flowers are brought on in a house with a temperature of 50° to 55°, and the perfume, which is delicious, is retained by the flowers when cut if they are put in a warm room. Some persons fail to recognise the difference between ordinary border Carnations, so called, and the perpetual-flowering or Tree Carnations. The ordinary border Carnation is simply a herbaceous plant, which in its season throws up a flower-stem, furnished with a terminal flower, and a number of lateral stems each terminated by a smaller flower. These may or may not form seed-pods, and at the end of the season the stem dies down, leaving a tuft of growths at its base, technically termed "grass." Each of these growths, if layered, will form an independent plant, forming an increase sometimes as much as twenty-fold. Some varieties are not nearly so productive, and I have known plants which would not form any grass, others only one or two growths.

A Tree Carnation throws up a central flower stem exactly as the other does, but instead of the stem dying down, side-growths are produced from it, and the plant will in time form a bush with a central woody stem, and in that state continue to produce flowers all the year round. Many years ago, I tried, with three dozen of plants, to have at least one plant with a flower or flowers upon it every day in the year, and I succeeded. For a large part of the year, we cut a flower every morning. It is this persistent habit of flowering that makes the Tree Carnations so useful; whereas the ordinary border varieties, flowering as they do at the very warmest season, soon pass out of bloom. A member of our Carnation and Picotee Society, not aware of the distinctive character of the summer and winter flowering types, enquired how he could get the Carnations to flower in winter; he added, "I can easily get blooms in July and

August." To obtain a succession of flowers it is well to propagate plants from now onwards till the month of April. I put in cuttings of the small side-growths on January 5, and shall not lose more than five per cent. They are planted a dozen or thereabouts in 5-inch pots, which are well-drained, and filled with three parts ordinary potting soil, and about 1 inch at the top consists of finely-sifted yellow loam, one part leaf-mould, and one part white sand; and on this is laid a very thin layer of sand. The cuttings are put in at equal distances apart all over the surface of the sand. The best place to propagate Carnations at this early season is the propagating-house, if a temperature of 50° or a little more at night can be afforded it, the bottom-heat being 85° to 90°. The pots are best plunged under a hand-light, or in a cutting-frame, as it is necessary that the cuttings be kept plump until roots are formed, and this is best done by keeping them close. The lights should be removed, and the glass on the inner side wiped every morning, to remove the condensed moisture. It will be found that some varieties form roots more freely than others. The pretty rose-pink variety, Miss Joliffe is one of these, and it is also of comparatively dwarf habit, making a nice compact plant by the end of the growing season. When it is seen by the new growth made that the cuttings have roots, all that are in this state should be taken out of the frame, and be placed on a shelf near the glass roof, still in the same place, where they will become well established, and in two weeks afterwards they may be potted singly in small pots. It depends very much upon the treatment these young plants receive in this early stage of their growth, whether or not they will grow into large healthy specimens by the end of the year. In January, February, and March, the weather is usually cold, and young Carnation plants are apt to become drawn in houses where it may even be dangerous to admit much fresh air, so that the best position for them is near the glass roof, and not far from the ventilators. Green-fly should be promptly destroyed by dipping the plants in a solution of soft-soap, 3 oz. to 1 gal. of water; and as soon as the plants have fairly filled the pots with roots, they should be shifted into larger ones. The potting-compost should consist of fibrous loam of good quality, three parts fibrous peat, one part rotted stable-manure, one part of leaf-mould, and a portion of coarse white sand. Any sufficiently open compost might answer, but the above is admirable. The main point in their culture is to keep the plants steadily growing, and to do this effectively, they should be gradually inured to the temperature of a cold frame by the end of the month of April, and in a month more the entire collection may be turned out-of-doors in a position exposed to the sun at noonday. In hot weather the soil dries up quickly, and the cultivator must be careful not to let the plants suffer from dryness at the root. *J. Douglas.*

PHILADELPHUS MICRO-PHYLLUS.

THIS beautiful new Mexican shrub is the smallest *Philadelphus* we have, and at the same time the most distinct member of the genus. Although it has not yet been before the public ten years, it has rapidly come to the front, not only for shrubberies, but it makes a remarkably pretty rock plant, which, perhaps, is the best position for it, and especially if a suitable background can be formed for it; its fragrance is far more agreeable than that of the stronger-growing species. Not being a strong grower, it must not be cut in so hard; in fact, very little pruning is necessary, only the weak shoots from the centre of the plant being removed, so as to allow of a circulation of air through the twigs. The best way to increase the stock is by cuttings taken in August, and made about 3 inches long, leaving a bit of the old wood at the heel, putting them into well-drained cutting-pots of sifted peat, loam, and sand, and making sure

that they are quite firm at the base; a good watering overhead should then be afforded the cuttings, to settle the soil round them, and the pots plunged in close propagating-cases inside the propagating-house, in a temperature of 60°. When roots have formed, the pots should be taken to a more airy position, to harden them off for planting in nursery rows. The soil in which it thrives best is free loam, with a good addition of leaf-mould. In whatever position the plant is placed, it should get plenty of sunlight, so that the shoots will become thoroughly ripened. In appearance it very much resembles the Myrtle; and its leaves, which are opposite, and of a light greenish colour, are produced very plentifully along the slender shoots (fig. 17); the white flowers, which

crossing we know full well, two forms being first combined in each of the parents, another cross may obviously conjoin four. Mr. Lowe, however, asserts positively on the strength of his record, that the sowing of four forms together at one operation yielded a number of offspring which demonstrated the fertilisation of one archegonium or female cell by spermatozooids engendered upon three prothalli other than that which carried the mother cell in question. This upsets not only the general belief, based upon the observations of such botanists as Suminski, Hofmeister, Mettenius, and others, that a single spermatozoid suffices to fertilise the ovum or mother cell, but also that of the difficulty of transference of the spermatozooids from one prothallus to another. Since,

prothalli, they could not cross a gap, however small, and therefore self-fertilisation can only take place under normal conditions. If, however, a drenching shower happens, we can easily see that any travelling spermatozooids might be swept away; and, considering the great number produced by each prothallus, the water would probably be swarming with them, in which case all that would be needed for a multiple cross would be a greater receptivity on the part of the archegonia than that with which they have hitherto been credited. Incidentally, I may point out that such receptivity is further implied by Mr. Lowe's observation, that from these mixed sowings he "never" gets forms true to any one of the parents, which means either that every archegonium is cross-fertilised, or that the parental forms yield diverse progeny without any crossing whatever, which we know to be the case in many instances, and of which he gives no contrary evidence. The natural expectation, however, would be that such a flooding as described would carry the bulk, if not all, of the spermatozooids straight into the soil, to avoid which, the surface, at any rate, must be somewhat retentive. So far, I think, then, we have arrived logically at two points for the guidance of would-be hybridists—1stly, that a volume of water is needed when the antheridium is bursting, to ensure cross-fertilisation; and, secondly, that a loamy surface would give a better chance than the open one of broken pot-material frequently used. Probably, however, the best plan of watering would be to immerse the pots for a short time in warm water, so that it oozes upwards through the soil, and just reaches the prothalli. The spermatozooids under such circumstances would be free to travel abroad as far as their locomotive vigour permitted, and would not be immediately sucked into the yawning chasms of the soil beneath.

The difficulty of systematising research into this question of multiple parentage is increased by the impossibility of identifying the prothalli of the different varieties, those even of different species presenting no plain distinctive characteristics. Ferns, too, however carefully isolated, are almost sure to bear other spores than their own, these being shed upon them from neighbouring plants; hence it is next to an impossibility, when the prothallus stage has been reached, for any individual to be singled out as undoubtedly of this or that variety; and consequently, if it be manipulated with a view to cross-fertilisation, and an unexpected result is obtained, there is no scientific certainty as to how that result was arrived at. A suggestion, therefore, regarding the *modus operandi* best suited to meet this difficulty may not be unwelcome. I would propose then, that, instead of sowing the varieties together, they be gathered as carefully as possible, and sown equally carefully, separately, in small pots. We thus may be certain that the large majority, if not all, of the prothalli in each pot, will be of one variety. When the prothalli have developed, stand the pots in warm water (70° or 80°), as above, until the undersides of the prothalli are submerged. In five or ten minutes we may assume that in that water we shall have a number of spermatozooids of one definite variety. Take now the pot of prothalli which we desire to cross with these, and treat it the same way, only not partially submerging the prothalli, but simply water-logging the soil. If now we close the orifice of the first pot with the thumb, and pour the water from it into the second, we should certainly expect to get a percentage of crosses, of the origin of which we may be sure, and the evidence regarding which would be of scientific value. By systematic transference of this sort, we also know the sexes of the varieties; thus, if we flood the prothalli of a muricatum form with the water from a crested form and get a crested muricatum, we know that muricatum was the mother plant and cristatum the father, while with the higgledy-piggledy system we cannot know this. That at any rate is something gained. Then, as regards the question of multiple parentage, it is clear that by experiments on the lines indicated, i.e., by mixing the fertilising water obtained from several pots instead of one, definite

FIG. 17.—*PHILADELPHUS MICROPHYLLUS*. (SEE P. 86.)

measure half an inch to three-quarters of an inch across, are borne singly towards the top of the branches very freely, and are useful for cutting.

MULTIPLE PARENTAGE IN FERNS.

Mr. E. J. Lowe's very interesting article in your issue of September 19, and his equally interesting collection of the plants therein alluded to which was exhibited at the Drill Hall, Westminster, on the 8th, merits the very special attention of all connoisseurs of Ferns, whether British or exotic, as well as that of hybridisers generally. Though it is difficult for the biologists to accord full credence to the multiple parentage of the plants described and shown, no doubt can exist in the minds of those who are familiar with the very marked parental forms employed, that many of the offsprings bore the salient features of three or four of those forms combined. That such combinations can be obtained by a double

however closely the spores may lie, the resulting prothalli must either have room for their root-hairs to reach the soil or perish, and these root-hairs consequently isolate that portion of the prothallus from which they spring from any other; while the rest or broader portion of the prothallus, on the other hand, if crowded by its neighbours, grows more or less upright, and consequently as this bears the mother cell or cells in its sinus, an appreciable gap obviously must exist between such cell or cells and the neighbouring prothalli behind and before.

The best chance of cross-fertilisation is, therefore, from the sides. When, however, we have a fourfold cross, three neighbours must contribute their influence, and this implies such a heterogeneous and broadcast scattering of spermatozooids that could only be brought about by a general flood represented by a copious overhead watering at a critical period. Clearly, if the spermatozooids can only travel in moisture (of which more anon), and do so normally in the dew-like humidity which, under congenial conditions, is always seen upon the undersides of the

results might be obtained and data formulated which would settle the point one way or another.

In view of the great inherent capacity of variation apart from crossing which Ferns possess, and which was demonstrated at the last Fern Conference by the writer, it will be imperatively necessary in pursuing research into this question to choose very marked and different forms such as those upon which Mr. Lowe has been working, and of course in this case extreme abnormalities, apart from any question of beauty, should be selected. For those, however, who may take up crossing on horticultural and not scientific lines, I cannot too strongly counsel the most careful selection of perfect and symmetrical types as parental forms. Let them, as cattle breeders, dog fanciers, and horticulturists do, cross and breed for improvement sake, and with the sole object of enhancing the decorative beauty of the plants they manipulate. Let them, too, consign ruthlessly to the rubbish heap all imperfect progeny, of which there are sure to be many, growing on only the best. If this be done steadfastly with our British Ferns we shall see in time most of our species not only equalling, but excelling the best exotics, just as a few of them, especially the Shield and Lady Ferns have done already in their finest forms; but if it be not done, and unsightly imperfect forms without an atom of beauty in them be grown on into exhibition specimens, they will swamp the good ones, and prevent our lovely native Ferns from earning their rightful position, i.e., the place of honour in every British conservatory whose owner has an eye for delicacy of form in foliage as a fitting foil to the brilliancy of colour in flowers.

Reverting to the question of the transference of the spermatozooids from one prothallus to another the possibility of the existence of arrangements for cross-fertilisation in Ferns on lines similar to those known to exist in phanerogamous plants, should not be lost sight of. The mere fact that the first-formed antheridia on a prothallus throw off their spermatozooids long before the archegonium is developed while the later ones do so long after it has been fertilised, points to such a conclusion. We have ourselves observed an antheridium in the act of bursting, and scattering its contents at a time when the prothallus which bore it carried also a rooted seedling; while, on the other hand, antheridia often begin to appear upon prothalli when such prothalli are quite small and immature. Again, even in sterilised culture, by the time the prothalli are developed, a considerable amount of minute insect life is found to have been engendered or self-imported among them; and considering the extreme smallness of the spermatozooids themselves, it is by no means impossible, and certainly not improbable, that they may be carried by insect agency far beyond their own radius of locomotion. Hence cross-fertilisation, which among normal plants would have no traceable effect, may occur in Nature much more frequently than has been believed; and the results of which only now come into the area of vision through the wide abnormality of the forms artificially brought together by Mr. Lowe. *Charles T. Drury, F.L.S., F.R.H.S., Fernholme, Forest Gate.*

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 12.—Considering the time of year, and the severe weather which prevailed, there was a nice, if small, display of bloom at the Drill Hall, Westminster, on the above date, but a very meagre attendance of the general public. Orchids, of which special mention is made elsewhere, were fairly well represented, as also were Chinese Primulas and Lachenalias. Apples and Onions, too, were shown in capital condition.

Floral Committee.

Present: W. Marshall, Esq., in the chair; Messrs. G. Paul, H. Herbst, H. B. May, F. Ross, W. C. Leach, C. J. Salter, W. Furze, C. Noble, H.

Turner, B. Wynne, J. Frazer, N. Davis, J. T. Bennett-Poe, and G. Gordon.

Chinese Primulas were the principal features that came before the committee, a large batch being sent by Messrs. H. Cannell & Sons, Swanley. The plants did credit to the firm from which they came, showing a dwarf vigorous habit, with blooms of a large size. Peach Blossom is a variety of a delicate pink colour, that calls for special comment, and the same may be said of Pink Queen. Other noticeable kinds were Swaney Mauve, White Perfection, Kentish Fire, and Eynsford Purple.

Mr. W. C. Leach, gr. to the Duke of Northumberland, Albury Park, Surrey, staged a collection of Lachenalias in pots, which attracted some attention. The pots were well filled with foliage and flowers, and showed to advantage the value of Lachenalias for decorative purposes during winter.

A spike of bloom, with foliage, of a winter-flowering Canna named Alphonse Bouvier, which came from Mr. G. Paul, the Old Nurseries, Cheshunt, was much admired, the flowers being of a very rich crimson hue.

Messrs. Veitch & Sons, Chelsea, staged a box of their Winter Gem Begonia, and three baskets of branches of *Daphne mezereum grandiflora*, *Hamamelis japonica*, *Zuccararia*, and *H. arborea*. The shoots, which were laden with bloom, had been cut from the open ground, which at this time of the year augured well for their usefulness.

Mr. W. Duncan-Tucker, horticultural builder, Tottenham, showed samples of a new sash-bar for glasshouses, specially constructed to prevent drip.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien, C. J. Lucas, Baron Schroder, T. B. Haywood, H. Ballantine, T. W. Bond, H. M. Pollett, S. Courtauld, Lewis Castle, E. Hill, F. Sander, H. Williams, J. Douglas, and J. Jacques.

Owing to the frost, most of the exhibits, which it had been intended to send as plants in flower, were cut by the various exhibitors, who, fearing to risk the plants, exhibited them as cut flowers.

Baron Schroder sent spikes of a number of choice *Ochids*, including the finely-spotted *Odontoglossum crispum* Schroderianum *Phaio-Calanthe* Sedeni ×, an unique form of yellow *Cypripedium* insigne in the way of C. J. Sander; various fine forms of C. Lee-annum ×, and C. nitens ×; a very large C. Lathamianum ×, the very handsome and rare *Odontoglossum Wattianum*, *Laelia anceps* Sanderiana, and other varieties of *L. anceps*.

Chas. Ingram, Esq., Elstead House, Godalming (gr. Mr. T. W. Bond), exhibited a new hybrid *Cypripedium* of great merit; the flower is large and bold, the upper sepal flat and circular, nearly black at the base, the dark colouring extending into the ½-inch wide pure white margin, in purplish lines. The petals and labellum are coloured much like the pollen parent, but they are darker, and the whole surface of the flower is smooth and shining. Mr. Ingram also exhibited C. venustum Spicerianum ×, C. J. Lucas, Esq., Warnham Court, Horsham, sent cut flowers of a noble form of the old but not common *Laelia furfuracea*, and which was distinguished as *L. Lucas* variety; its colour is bright rosy-crimson, and the flowers much larger than in the type. Mr. Lucas also exhibited a fine form of *Pescatorea Klatschiana*, a plant usually found difficult to manage successfully; also *Laelia* anceps Sanderiana, *L. a. Stella*, *L. a. Hillii*; the bright yellow *Dendrobium aureum zeylanicum*, a very fine form; *Cypripedium Ainsworthii* × C. Sedenii candidulum, &c.

The Right Hon. Joseph Chamberlain, M.P., Highbury Moor Green, Birmingham, forwarded a four-flowered spike of *Laelia anceps* Sanderiana.

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, staged *Cypripedium Calypso*, Oakwood var. (Boxalli atratum × Spicerianum), a very fine hybrid. The lip and petals are much the same as those organs in a good C. Lee-annum ×, and the large broad white upper sepal is green at the base, and with a dark maroon band up the middle; from the base radiate feathered bands of rosy-purple. It is a very handsome flower, and a credit to the raiser. Mr. Cookson exhibited spikes of two fine hybrid *Calanthes* (*vestita rubra* × Williams), which the Committee desired to see on the plants when next bloomed.

Messrs. F. Sander & Co., St. Albans, staged cut specimens of new or rare *Orchids*, of which the best was *Cypripedium Lee-annum princeps* ×, which re-

sembled *Maerelei* variety, but the markings common to both on the large white dorsal sepal were brighter, and in the spots not merging into lines. Messrs. Sander also showed C. Sedeni virginale × C. Lee-annum Maereleianum ×, Macfarlanii × (C. calophyllum × Spicerianum); a new *Angraecum* × *polyurum* with white flowers with long curiously-twisted tails; *Cypripedium Lowryanum* × (C. Ashburntonia × venustum); a fine form of C. nitens, raised at St. Albans, and called C. nitens, St. Albans var.; the noble white *Laelia anceps* Schroderiana, &c.

Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, sent a plant of the handsome *Odontoglossum Rosii* albens, one of a very large form of *Laelia prestantis* (Heaton var.), and one of *Maxillaria Sanderiana*.

Messrs. Pitcher & Manda, the United States Nurseries, Hextable, Swanley, Kent, staged plants of *Cypripedium Germianum* (villosum × hirsutissimum), and C. Godseffianum (Boxalli × hirsutissimum).

H. M. Pollett, Esq., Ferneide, Bickley, Kent, exhibited a *Cypripedium Parksianum* ×, a hybrid between C. Spicerianum and C. marmorophyllum; and C. confusidense, a pretty hybrid (Hooker × Lawrenceanum).

Messrs. James Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed another good hybrid in *Laelio-Cattleya Cassiope* (exoniensis × pumila?), a very neat-growing plant, with a proportionately enormous bright rosy-crimson flower; and another fine and interesting production, *Epidendrum Endressio-Wallisi*, which, as its name implies, was obtained by crossing the stately E. Wallisi with the pollen of the neat, dwarf white and violet-flowered E. Endressio, and the result has been a beautiful intermediate variety, which will be more admired when exhibited on the plant.

Mr. John Crook, gr. to W. H. Evans, Esq., Forde Abbey, Chard, Somerset, sent bunches of flowers of *Cologneya corrugata*, and spikes of *Angraecum eburneum* vires. Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome, forwarded a three-flowered portion of a spike of *Vanda Cathcartii*, a grand species, and showing evidence of fine culture.

G. Douglas, Esq., Dalkeith, N.B., sent *Laelia anceps* Ballantini, the nearest ally and rival of the beautiful L. a. Amesiana; and Messrs. Heath & Son, Royal Exotic Nursery, Cheltenham, staged a new hybrid *Cypripedium*, which it is intended to call C. Swinburnei × (C. insigne Maulsi × C. Argo Maosii). It is a very distinct hybrid, and strikingly pretty. Its dorsal sepal is green, distinctly margined with white, the green being handsomely spotted in lines with dark purplish-crimson, and the petals have spotting of the same colour. When stronger it will develop further points and beauty, no doubt.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. J. Lee, R. D. Blackmore, F. T. Rivers, J. Cheal, G. Jabez, F. T. Saltmarsh, W. Warren, G. Bunyard, A. Dean, W. Bates, G. Wythes, J. Willard, H. Balderson, J. A. Laing, A. H. Pearson, G. T. Miles, and Dr. Hogg.

This committee had a very fine collection of Apples brought to their notice by Messrs. G. Bunyard & Co., Maidstone. The collection comprised 110 dishes, and the fruit, as a whole, was of a high-class nature, being exceptionally well-coloured. Among other varieties, Mère de Mésange, Peasegood's Nonsuch, Reineette du Canada, Lene's Prince Albert, Twenty Ounce, and Gloria Mundi, were particularly noteworthy, and a dish of the Catillac stewing Pear was also noticeable.

Mr. A. Dean, Kingston, staged a dish of home-grown King of Tomkins County Apple, and some importations of the same kind purchased from a shop for comparison. The latter, we need scarcely say, were decidedly inferior to the former, both as regards size and flavor. Mr. Dean, likewise, showed a dish of bright-colored Apples, grown in a Surrey cottage garden, for naming, which however could not be accomplished.

Seedling Apples were sent by Mr. W. C. Leach, Albury Park Gardens, and Mr. J. Holmes, Paston Rectory, Peterborough; Mr. Leach also staged two bunches of Mrs. Pearson Grape, and one bunch of Gros Colmar, as grown on Lady Downe's.

A dish of Thoroughbred Pears came from Mr. J. Moore, Seymour Cottage, Sutton; and Tomatoes from Mr. G. Wythes, Syon H. use Gardens, Brentford.

Mr. H. Deverill, Banbury, sent a capital collection of Onions of enormous size. The bulbs, too, were

very solid and firm. Conspicuous among other varieties we noticed Royal Jubilee, Rousham Park, Advancer, Anglo-Spanish (very large), The Lord Kiefer, and Improved Wroxton.

List of Awards.

ORCHID COMMITTEE.

To Messrs. J. Veitch & Sons, Chelsea, for *Lælio-Cattleya* Casiope x and *Epidendrum Endrostachys* x.
To C. J. Lucas, Esq., Hortham, for *Lælia surfaacea*, Lucas var.
To G. Douglas, Esq., Dalkeith, for *Lælia anceps* Ballantine.
To Norman C. Cookson, Esq., Wylam-on-Tyne, for *Cypripedium calypso*, Oakwood var.

Awards of Merit.

To Chas. Ingram, Esq., Gillingham, for *Cypripedium gigas* x.
To H. M. Pallett, Esq., for *Cypripedium encephalodes* x.
To Messrs. Chiversworth, Shuttleworth & Co., Bradford, for *Odontoglossum Rossi* albens.

Botanical Certificate.

To Messrs. F. Santer & Co., St. Albans, for *Anglicum polytrichum*.

FLORAL COMMITTEE.

MEDALS.

To Mr. W. C. Leach, Albany Park Gardens, for a group of *Lachenalia*.
To Messrs. H. Canuell & Sons, Swanley, for a group of *Primulas*.

Awards of Merit.

To Messrs. H. Canuell & Sons, for *Primulas* Pink Queen and Peach Blossom.
To Messrs. G. Pail & Son, Chesham, for *Canna* M. Alphonsa Bouvier.

FRUIT AND VEGETABLE COMMITTEES.

MEALS.

To Messrs. Geo. Bunyard & Co., Maidstone, for a collection of fruit.
To Mr. H. Derrill, Cobhill, Barbary, for a collection of *Onions*.
To Mr. W. C. Leach, Albany Park, Guildford, for seedling Apple, Albany Park Nonsuch.

BERLIN.—The flower market in Berlin presents, year by year, greater variety in the subjects grown, and in particular, Orchids are observed in greater numbers. Also many old well-known plants which had almost vanished from general cultivation have reappeared in large quantities, as, for instance, *Poinsettia pulcherrima*. It is to be hoped that the time is coming when Australian and Cape plants will again be obtainable. The enormous trade done with Italy in cut flowers, the production of which is impossible in the North, compels the gardener to turn his attention to the culture of other plants, and *Ericas*, to the number of forty species, are grown in large numbers, where, not so long ago, not ten species were cultivated. The cultivation of foliage plants has greatly increased, and in Berlin it is mostly *Palms* which are raised, and of these, *Coccol Weddelliana*, *Kentia Forsteriana*, and *K. Belmoreana* are great favourites, they being amongst the most enduring plants for rooms. *Carnations*, of which many novelties of good quality have been raised, are cultivated to a great state of perfection. On the contrary, the culture of the *Cineraria* has much declined.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

CIDER APPLES.—Will any of our readers kindly inform C. E. whether Tanner's Red is in quality, growth, bearing, and freedom from canker, or other disease, a more desirable variety than Kingston Black? From whence may grafts of it be obtained? Is it a desirable fruit for Devonshire? Or should both varieties be employed for the growers and the general good?

WHY SHOULD COKE BE WATERED BEFORE FIRING?
—Will some scientific or practical reader kindly enlighten me as to the rationale of the above practice? Also what fuel suitable for hot-houses furnaces is best, say for a saddle boiler? Weight for weight, which fuel gives out most heat? Is it coal, or coke, or wood? Is anthracite better than common coal? If so, why? This is now a seasonable subject, and information is desired by *A. Stoker*.

Obituary.

MR. B. COOMBE.—We regret to announce the death of Mr. Benjamin Coombe, which occurred at Victoria, Texas, U.S.A., on December 16, 1891. Although a comparatively young man, he had held responsible charges in some of our best private establishments, including Chatsworth, Stancliff, and Aldebrook, which latter situation as Head Gardener he relinquished to take charge of the estate of Señor Dorado, Buenos Ayres, but owing to revolutionary troubles he returned home a few months ago; he had gone out again to Texas with the view to acquire a nursery business there when the fever attacked him, and from which, after a short illness, he died.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

FRUITS AND VEGETABLES.

SPITALFIELDS, Jan. 12.—Quotations:—English Apples, 3s. to 5s. per bushel; American do., 12s. to 16s. per barrel; foreign Tomatoes, 1s. to 2s. 6d. per box; Seakale, 1s. to 1s. 6d. per punnet; Curly Kale, 6d. to 1s. per bushel; Cabbages, 1s. 6d. to 2s.; Savoy, 2s. to 2s. 6d.; Cauliflowers, 6s. to 12s. 6d. per tally; Greens, 1s. 6d. to 2s. 6d.; Turnips, 2s. 6d. to 3s.; Carrots, 2s. to 3s. 6d.; Parsley, 2s. to 2s. 6d. per dozen bunches; Spinach, 1s. 6d. to 2s. 6d. per bushel; Turnip-tops, 2s. to 2s. 6d. per sack; Parsnips, 4d. to 6d. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuces, 6d. to 1s.; Leeks, 1s. 9d. to 2s. 6d.; Beetroot, 4d. to 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 5s. 6d. to 6s. 6d. per cwt.; Horseradish, 4s. to 5s. per case; Belgian do., 5s. 6d. to 6s. 6d.; Dutch do., 5s. to 6s. per bag of 110 lb.; Celery, 4d. to 1s.; Horse-radish, 1s. to 1s. 1d. per bundle.

BOROUGH, Jan. 12.—Quotations:—Savoy, 3s. to 4s.; Broccoli, 10s. to 15s. per tally; Spinach, 2s. 6d. to 4s. per bushel; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Greens, 2s. to 3s.; Turnips, 1s. 6d. to 1s. 9d.; Carrots, 1s. to 1s. 6d. per dozen bunches; English Onions, 6s. to 7s. 6d. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 10s. to 20s.; Newtown Pippins 15s. to 28s. per barrel.

STRAFFORD, Jan. 12.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done as under:—Savoy, 3s. to 5s. per tally; Greens, 1s. to 1s. 6d. per score; Carrots, 2s. to 3s. per dozen bunches; Cauliflowers, 9d. to 1s. 2d.; Turnips, 2s. 6d. to 3s. 6d. per tally; Parsnips, 2s. to 3s. per dozen bunches; do., 40s. to 60s. per ton; Carrots, household, 36s. to 45s. do.; do., cattle-feeding, 30s. to 32s. do.; Parsnips, 1s. to 1s. 6d. per score; Mangels, 10s. to 20s. per ton; Sweden, 22s. to 25s. do.; Onions, English, 120s. to 130s. do.; do., Dutch, 5s. to 5s. 6d. per bag; do., Ports, 6s. to 7s. 6d. per case; Apples, English, 2s. to 5s. 6d. per bushel; American, 11s. to 13s. per barrel; Brussels Sprouts, 1s. 2d. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per sieve; Horse Radish, 10d. to 1s. 4d. per bundle; Celery, 8d. to 1s. per roll.

NOTICES TO CORRESPONDENTS.

ATHROTAXIS: *R. H. S. A. laxifolia*, figured in *Gardeners' Chronicle*, November 7, 1885, p. 585.

BOOKS: *D. L. & Co.* The publisher's name is almost invariably mentioned—the price is not, for two reasons—one, that we do not know what it is; the other is, that such a matter being a pure matter of business, should be advertised. We surely do enough for the publisher by giving a notice.—INSECTS THAT INFEST GREENHOUSE PLANTS: *W. R. Miss Ormerod's Manual of Injurious Insects, and Methods of Prevention*. Swan, Sonnenschein & Allen, Paternoster Square, London; and J. Menzies, Hanover Street, Edinburgh.

CENTUS DEORARA: *W. B.* Please send the photograph for our inspection.

HONEYDEW: *D. M.* It is either the excretion of insects, or the exudations from the plant itself—perhaps both at one and the same time. See *Journal of the Royal Horticultural Society of London*, vol. iv, 1874.

NAMES OF PLANTS: *C. S. Leeds*, 1, Polypodium irioides; 2, Aloe verrucosa; 3, A. socotrana; 4, Maranta bicolor.—*W. Higgins*, 1, Laetrea decomposita; 2, L. aristata; 3, Adiantum Paccotti; 4, Davallia solida; 5, Asplenium bulbiferum; 6, Adiantum cultratum; 7, Platycerium alcicornis; 8, Polypodium aureum; 9, Iris foetidissima variegata; 10, Woodwardia radicans.

PEAS AND BEANS TO PROTECT FROM MICE AND BIRDS: *Constant Reader*, Damp the seeds and roll them about in red lead powder until they become well coated with it. Put the green shoots and leaves of common Furze through the chaff-cutter, and strew the chaff along the drills on the top of the seeds. Netting is a good protection against the depredation of birds; or, covering the soil above the seeds with fine thread, supported 6 inches above the soil by means of forked sticks.

SPRAYING FRUIT TREES: *A. B. C.* There need not be the slightest apprehension as to any injurious consequences to the consumer, provided that the spraying be carefully done at the right season. No sane person would be so stupid as to spray the nearly ripe fruit.

TESTIMONIAL.
"The Whittier, Herefordshire,
"Dec. 23, 1887.
"DEAR SIRS,—I have now had
an opportunity of trying
your FORTUNE TREE
GUARDS, and they seem
quite to answer my pur-
pose, so you may send me
50 more as before. I en-
close cheque for your ac-
count."

Yours truly,
R. H. GREEN
Messrs. Hill & Smith.

WINTER AND SPRING PRUNING,
TRIMMING, and THINNING OUT can be better and
quicker done by the STANDARD MANUFACTURING COM-
PANY'S Celebrated TOOLS, including the "STANDARD" and
"GIANT" TREE FRUNTERS, the "MYTICUTTAH," and
other useful appliances, than by any means. They were
shown in actual use at the recent Horticultural Exhibition,
Crystal Palace, and at the great Agricultural Shows at Bath
and Doncaster; thousands of visitors being astonished at their
wonderful power and scientific efficiency, coupled with great
saving of time and labour, and the risk to life and limb
avoided. After Stormy Weather, these Tools will be found
invaluable for cutting off fractured branches, leaving the ends
severed in a vital condition.
Sold by the principal Ironmongers and Seedsmen, the leading
Stores, and kindred Trades throughout the world, of whom
Illustrated CATALOGUES may be had; or of the PATENTERS
and MAKERS, at their works and depot, ST. ALKMINUS'S
CHURCHYARD, DEREY.

AGENTS WANTED FOR THE SALE OF NATIVE GUANO. The Best and Cheapest Manure for all Farm and Garden Crops. — **THE NATIVE GUANO COMPANY, LIMITED,** 29, New Bridge Street, Blackfriars, London, E.C.

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatoes, Peaches, &c., beyond any other Manure.

"I am very pleased with your Silicate Manure. The effect upon the Vines is very marked, for they ripen and colour much better. Your Manure has given me great satisfaction for Tomatoes; it is all you claim for it."

(Signed) THOMAS PRICE,
Gardener to the Bishop of St. Asaph.

Prices in Sacks, 10s. per cwt.; £2 per ½ ton; £3 15s. per ¼ ton; £7 per ton.

Wholesale from all the London Seed Merchants and Patent Medicine Houses.
NEW YORK—A. ROLKER & SONS.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15s. I have thoroughly tested a sample of a new insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 98°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the face of Scale of all sorts in a few seconds; while 3 oz. to gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear sir, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 8s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen Edinburgh.**

May he had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.**

GISHURST COMPOUND used since 1859 for Red Spider, Mildew, Thrips, Greenfly and other light, 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake for American blight, and as an emulsion when paraffin is used. Has cleared many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from **PRICE'S PATENT CANDLE COMPANY (Limited), London.**

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 28 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

CLEIK, or ASSISTANT; age 27.—Advertiser seeks situation as above. Nursery and clerical experience. Good references. South of England preferred.—**Address**, D. 42, Malmesbury Road, Eow, E.

HOLLOWAY'S PILLS.—When inclement weather checks to a considerable extent the action of the bowels an alternative is required to compensate the body by means of other channels. Holloway's Pills can be confidently recommended as the easiest, surest, and safest means of attaining this desirable end without weakening the most delicate or incommuting the most feeble. When from frequently recurring chills or the inhalation of impure air, the blood becomes foul and the secretions vitiated, these Pills press to a ready and efficient means of cleansing the former and correcting the latter. By this salutary proceeding disease is arrested at its outset, its pains and inconveniences averted, and the nervous structures saved from the depressing effects entailed upon them by an illness.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketing, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from *Hood, on Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

FRIDAY, JANUARY 29, 1892.

NEW ORCHIDS.

CYRTOPODIUM ERICSONII,

MILTONTIA ILLUSTRIS,

New EPIDENDRUMS, New ONCIDIUMS,

New CATASETUMS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. SANBER, St. Albans, to sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, January 29, at half-past 11 o'clock.

A magnificent NEW CYRTOPODIUM, collected in the old Labatia country. Every plant received is offered.

A New and beautiful Miltonia—MILTONTIA ILLUSTRIS, from the Brazil.

A superb lot of the lovely EPIDENDRUM GODSEFFIANUM. This is certainly one of the most charming Epidendrum ever introduced.

A NEW ONCIDIUM,

evidently free flowering, as the old spikes show.

A most extraordinary batch of CATASETUMS, an Orchid species of remarkable appearance from Upper Burma; together with a grand lot of the Upper Burma variety of

CYRTOPODIUM INSIGNE,

and DENDROBIUM Nobile,

just received in grand condition.

A fine impression of DENDROBIUM DENSIFLORUM, an

DENDROBIUM WARDIANUM.

A GIGANTIC SPECIMEN CATTLEYA, No doubt belonging to the old Labatia section, but found very far away from it. The Specimen has over 150 bulbs, about 120 leaves, and 36 flower-sheaths.

Along with this magnificent Specimen came 14 other splendid pieces, every one of which is offered. They are most distinct in appearance.

20 GRAND MASSES of the OLD LABATIA, among them being some decidedly distinct-looking plants. And many other valuable ORCHIDS, including

ANSELLIA AFRICANA NIOTICA,

DENDROBIUM RICHARDI,

DENDROBIUM CASIOPHE,

CELODENE DATANA GRANDIS, &c.

Also a splendid lot of choice Hybrid CYPRIPEDIUMS, among them being C. Nitidissimum, C. Lathamianum niversum, C. Macfarlanei, C. javanicum-superbites, C. picturatum, C. lo grandis, C. Maynardi, C. albo-purpureum, &c.

On view morning of Sale, and Catalogues had.

THOMAS B. JAMES (many years with Protheroe & Morris) holds WEEKLY SALES at his Rooms, 12, Bull Ring, Birmingham, of BULBS, PLANTS, NURSERY STOCK, &c., every WEDNESDAY and FRIDAY, at 4.30 P.M. Sales of choice Out Flowers. Fresh Entries invited. Account Sales and cheques daily. Empty and labels found.

Wednesday Next.

BEGONIA and CYCLAMEN SEED.

From the same raiser whose bulbs were disposed of at our Rooms in December last, The Begonia seed has been carefully hand-hybridised and crossed; it is very heavy, and of strong germinating power, and is of equal mixture of Double and Single. The Cyclamen seed comprises the best mixture of the finest in cultivation.

Also 40 lots of varieties of choice SEEDLING BEGONIAS. MESSRS. PROTHEROE AND MORRIS will include the above in their Sale, on WEDNESDAY NEXT, January 27.

Wednesday Next.

6900 Fls! Bulbs of LILIAM AURATUM, L. SPECIOSUM ALBUM and RUBRUM, and L. LONGIFOLIO. Just received in splendid condition from Japan. 20,000 Fresh PALM SEEDS, 50,000 Clumps and Growers LILY OF THE VALLEY, 100,000 EARLY and SOUTH AFRICAN TUBEROSES, LILIAM HARRISI, L. CANDIDUM, &c., &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 35, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, January 27.

On view morning of Sale, and Catalogues had.

Wednesday Next.

PLANTS and BULBS.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 35, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, January 27, at 12 o'clock precisely, 500 choice-named STANDARD and DWARF ROSES, a fine collection of BORDER PLANTS, HARDY ORNAMENTAL SHRUBS, EVERGREENS, CONIFERS, &c.; AZALEA, JOLLES, from South Africa, IRIS, ANEMONES, ANARYLLIS, choice NARCISSUS, DUTCH BULBS, &c.

On view morning of Sale, and Catalogues had.

THE GARDEN

GARDENERS should look keenly to their employers' interest
both in Seeds and Plants, for upon these the hope, pride,
pleasure, and satisfaction of the garden entirely rest during
the whole year. We have often seen people admire very
inferior productions and have contented, but the moment they
see something vastly superior, then comes the great surprise
and astonishment that they should have been so long satisfied
with what they have had, and probably bought at a high price.
There are many thousands in this lamentable position all over
the country.

Send for our CATALOGUE, showing you that none can touch
our KENTISH GROWN SEEDS, and sent direct from the
actual growers to the sowers.

Come and See

TESTIMONIALS.

MESSES. THOS. GREEN AND SON, LTD., NORTH STREET, LEEDS.

Re HEATING APPARATUS.

Borough Engineer's Office, Municipal Buildings, Leeds, January 9, 1896.

GENTLEMEN,—I have great pleasure in bearing testimony to the efficiency and satisfactory working of the Hot-water Heating Apparatus you erected in these public buildings. The buildings are four storeys high, and we have a total length of about 25,000 feet of piping in them, varying in size from 1½ in. to 8 in. diameter, with their connections, &c. The several offices and rooms can all be in operation at one time or separately, and the heat regulated by means of the valves to the temperature required, even in the coldest weather.

Two of your Patent Municipal Pattern Boilers, No. 4, work the whole of this piping easily, although we have three of them fixed. They are very powerful and economical in the consumption of fuel, and I am pleased to be able to report of them and the apparatus so favourably.

I am, Gentlemen, yours truly, THOS. HEWSON, Borough Engineer.

Morley House, Bagot, St. Saviour's, Jersey, November 10th, 1886.

GENTLEMEN,—The large Municipal Boiler which you sent me last year is doing its work satisfactorily; it is heating 5000 feet of 4-inch pipe in one of my vineeries, and I am quite sure that it has power to work a much greater length, while in cost of fuel it compares favourably with my other Boilers.

I have now five of your Boilers in use, and I cannot speak too well of their heating powers, or their comparatively small consumption of fuel.

Yours faithfully,

(Signed) G. W. BASHFORD.

AND HUNDREDS OF OTHER REFERENCES CAN BE GIVEN IF REQUIRED.

THE

Gardeners' Chronicle.

SATURDAY, JANUARY 23, 1892.

BRYNGWYN.

IN the park surrounding the mansion of Mr. James Rankin, M.P., two houses preceded the present one. Nothing remains of the earliest of these country seats, but the moat surrounding its site in the lowest and least eligible part of the domain, where no landscape could cheer the eye on account of the low level. The site was, undoubtedly, the most suitable for a moated residence; but it was the worst in all other respects. The gas works, erected for the supply of the house, are now concealed amid the trees which spring on the site of old Bryngwyn. It may be mentioned here that Mr. Rankin's residence stands in the parish of Dewchurch in Herefordshire. The name by which it is designated seems to have strayed from the neighbouring principality of Wales, Bryngwyn being a Welsh word, signifying "white valley," though why this spot should be called so it is difficult to conceive, the rocks hereabouts consisting of old red sandstone of the characteristic colour which lends warmth to the landscape of a large part of Herefordshire.

Opposite the present mansion is a sandstone hill, whose colour is concealed by the deep green foliage of the Oaks and Elms, which, with Larch and various exotics, cover it; and at the foot of this hill, within the boundary of the pleasure garden, is the second house, which is, in part, a ruin covered with climbers, while another part of it is occupied by Mr. Nash, who, as head gardener here, has shown his taste alike in the Ivy-covered walls of his dwelling and in many other directions. When the old house was dismantled, it was a good idea to leave the outer walls intact, and plant them with Jasmine, Cydonia japonica, Sweet Briar, and several sorts of Ivy, including Hedera palmata—an indifferent climber, but with large leaves—a handsome variety for ruins. A sort of trellis, formed of Larch poles, has been carried round the house with excellent effect, the poles being completely hidden by Ivy which hangs in luxuriant festoons, amid which the eye detects the ruin behind. Mr. Nash's front-door, with its evergreen Yew porch, is something to envy, or at any rate to admire and imitate. One walks through a doorway in the ruin, and there, on the right, is the porch, and in front of it is a lawn occupying what was once a principal room of the now dismantled house. The old walls, hung with creepers and planted with Ferns, surround the lawn, and a narrow flower border under the wall forms its margin. I hope this rather minute description will assist those who own old ruins to render them as ornamental as that at Bryngwyn. The old Elizabethan mansion, which bore the name just mentioned, has been replaced by

Mr. Rankin by a much larger and handsomer house in the early English style. The old house is now an ornament of the garden, seen from the windows across a wide space devoted to a lawn covering many acres. Naked walls are rarely tolerable, and even the warm and pleasing sandstone of which the house is built, is improved by its drapery of creepers. Not to name them all, what can be more noble in appearance than the *Magnolia grandiflora*? It is the Exmouth variety which commenced flowering in August, and would continue to do so I was told on October 3, till stopped by frost. Another shrub in the house, more fastidious as to soil and site, and not seen where the one is stiff, or the other low, is *Photinia serrulata*, 20 feet high, having coriaceous leaves and terminal panicles of small white flowers. *Escalonia macrantha*, with its shining leaves, flourishes on the same wall. The terrace in front of the house, dry and sunny, and well lifted above the park, is a singularly attractive spot, from which the beauty of the lawn and pleasure grounds may be surveyed. In the flower-beds on the terrace, when I saw them last summer, a variety of yellow *Chrysanthemum* is used as a better yellow and safer plant than *Calceolaria*. Mr. Nash is by no means superstitious in adhering to old and customary ideas and plants when he can replace them by better, which he has succeeded in doing in the use of the *Chrysanthemum*, and in some other instances in his ornamental gardening.

On the east side of the house, at the boundary of the lawn, a gravel walk leads to a conservatory, and thence to a rosary and other ornamental grounds, and to the kitchen garden. There are many different methods of covering a wall and beautifying a flat surface of bricks, but without disparaging other plants which may be used for the purpose, nothing can be better than the different varieties of Ivy, differing, as they do, in colour and habit—golden, silvery, or variegated, with leaves deeply cut or otherwise, and of various sizes as well as shapes. The wall just noticed is Ivy-clad, with a border in front brightened by single Dahlias and other flowers. On the right hand, in passing along this path from the house, are baskets of wire, placed on the margin of the lawn, and edged with Ivy, with Clematis covering the handles, and each basket delights the sense of smell, as well as sight, since it is planted with such sweet flowers as Mignonette, Heliotrope, Tobacco, Stock, and Salvia patens. It is certainly a very pleasing walk, and, hard as it may be to hit on anything new in the art of arranging plants, on which so many minds are always engaged, one may perhaps claim a spice of novelty for the embellishments of this path.

The lawn is extensive, slopes pleasantly from the house towards the ruins, where it ends, and the ground begins to rise. On such a lawn there is space for the largest timber trees, sweet Chestnuts among them. Among many beautiful clumps of shrubs, there is one margined with *Daphne Mezereum*, which grows very luxuriantly here. Another is composed of Ghent Azaleas, edged with *Andromeda floribunda*, which flourishes exceedingly, as most things do on the rich sandstone soil of Herefordshire, where Apples, Hops, and pastures are all in perfection, and woodlands, gardens, and cornfields are as good. Other clumps are of Clematis Jackmani, edged with Japan Honeysuckle; *Tritonia uvaria*, blazing alone; *Ilycinthus candicans*, China Roses, edged with Rudbeckia; *Rhododendrons*, Golden Yews and Conifers, and various shrubs; and, not to be overlooked, a raised bed of Mrs.

Turner Pelargonium, edged with Gazania. The grandest object on the lawn is a tall and spreading Oak of noble dimensions, with a lofty trunk, such as only rich land could produce. This tree alone would furnish the wainscot of a spacious room. The Wellingtonia, from seed brought from California, grows here as freely as the Larch. A specimen planted eighteen years ago measures 55 feet high by 5 feet in girth. On the side of the hill above the ruins there are some stately trees; one of these is a Larch, 80 feet high, with branches drooping to the ground, and spreading 100 feet. There are some big Acacias and great Scotch Firs near it; but perhaps the handsomest of these giants is a Spruce, 10 feet in girth and 85 feet high, and feathered to the ground. In parting the branches in order to get to the trunk, I disturbed a wood-pigeon, sitting hard on two eggs in a nest about 6 feet from the ground, the nest being well secured from observation till the sanctum within the branches was entered. Another of the great Larches stands 100 feet high, and has a circumference of 13 feet at 5 feet from the ground. The bracken on the hill grows 7 feet and 8 feet high. The Yews feather to the ground; and in striking contrast to this sturdy tree, the Birch grows naturally on the hill. The Portugal Laurel fruits here freely, when old, as in the case of a fine specimen covered with red berries, and 20 feet in height. Our walk in this direction terminated at a quarry in the side of the hill, which furnished stone for the building of the house, and has now been turned into a fernery, and provided with a summer-house and rustic bridges.

Returning to the house, we visited the spacious flower garden on the south-east side, where all sorts of flowers are grown in beds and borders, in delightful profusion, without formality. We were too late for the Roses, which, in summer, make a great display, trained in arches and otherwise. Much more might be added on the beauty of Bryngwyn, but these few remarks on its salient features must suffice. H. E.

NEW OR NOTEWORTHY PLANTS.

THRINAX MORRISII, Wend.* (Figs. 20, 21.)

This Palm is one of the few species of *Thrinax* with nearly sessile fruits. Its nearest ally is *T. pumilio*, Mart., from which it differs in the greater number of segments of the lamina, and in the shortness of the lamina itself. The lamina of *T. pumilio*, Mart. (according to a plant received by Loddiges in 1845, and now full grown), is 10 cm. longer, its segments 10 mm. wider, the basal segments nearly as long as the central, and not glaucous beneath; its seed is quite perforated by the testa, as is shown in Martin's *Hist. Nat. Palm.*, t. 103, fig. 4. I have much pleasure in naming this Palm after Dr. Morris, Esq., F.L.S., Assistant-Director of the Royal Gardens, Kew, by whom it was first collected. H. Wendland.

* *Thrinax Morrisii*, Wendl.—*T. (Porotheinax) pumilio*, Mart., affinis, differt autem lamina suborbiculati undulata, subtus glaucescente, laciniiis, circa 30, lanceolatis breviter bifidis, utriusque nervis secundariis 3-4, basilaribus fere dimidio brevioribus, ligula ovata obtusa; semine subgloboso, testem radio simplici conico usque ad dimidium introeunte, haud perforato. Caudex clavatus, 1 m. altus. Folia terminalia; petiolis leviter amplexicaulis, basi compressissimis, superne biconvexis, marginibus acute angulatis; lamina suborbiculata, subtus glaucescente, multipartita; laciniiis acuminatis, 31 cm. longis, 23 mm. latis, nervis transversalibus superne conspicuis, marginibus ochroleucis. Spadix 60 cm. longus, ramis 9 et 12 recurvis. Spathe numerosae, tubulosae, imbricatæ, glaucopubescentes. Fructus subsessilis, globosus, aicâ rugosus, basi perianthio sæciformi persistente cinctus. Semina erecta, globosa, levia, 3 mm. latis; embryonis lacinia; columella coarctata; albumen intrasea. Hab. Anguilla, W. Indies, Leg. Dr. Morris, F.L.S., Dec. 1890; Dr. H. A. Alford Nicholls, F.L.S., Nov., 1891. H. Wendland.

Mr. Morris' account of the finding of this interesting Palm at Anguilla is thus given in the *Kew Bulletin*, May and June, 1891, p. 131:—

"Before arriving at Blowing Point, an interesting little Palm was found growing on broken limestone rocks. It was present in fairly large quantities, and the fan-shaped leaves were used for thatching native huts. The chief interest attached to this Palm is connected with its dwarf habit. The largest and apparently most matured specimen did not measure more than about 30 to 35 inches in height, and the stem was about 2½ inches in diameter. I was unable to find any plants in flower or fruit, but there was no doubt it was a species of *Thrinax*. I brought away with me about thirty to forty plants to be established at the botanical stations at Antigua and St. Lucia. The largest specimen was reserved for the Museum of Economic Botany at Kew, where it was lately seen by Mr. Wendland, an authority on Palms, who is of opinion it is new to science. He has suggested a name for it, but this cannot be published until some of the flowers or fruits are obtainable for a botanical description of the species. It is somewhat singular that only last year a new dwarf species of *Phoenix* of similar habit was discovered in the East Indies, a specimen of which is now growing at Kew. This is likewise about 25 to 30 inches high, with a slender stem, and forms a very attractive plant. The Anguilla *Thrinax* is not yet introduced in the living state to this country, but when it is, there is little doubt it will prove most interesting and attractive in a horticultural sense. I made, as mentioned above, a special search for flowers or fruit of this plant. I was told that it produced a very pretty pink flower. This, when produced, proved to be an epiphytall Orchid, a species of *Epidendrum*, which attached itself to the stem of the small Palm, and pushed its flowers through the fronds."

Dr. H. A. Alford Nicholls, F.L.S., who lately forwarded spadices, with fruit, of the Palm to Kew, writes as follows from St. Kitts, on November 18, 1891:—

"I went again to Anguilla, and this time I was fortunate enough to get seeds, and spathes, and spadices of the dwarf Palm, indigenous to that island. I found a Palm 2 feet 8 inches high—quite a tall specimen, for most of these 'Thatch' Palms are only about a foot high. This Palm had two seeding spadices, and I cut them off with one of the leaves, and they go on to Kew by this mail in a box sent through parcel-post. In a bag I send you a lot of the seeds of the Palm."

"I trust that these specimens you will be at last able to work up. Unfortunately, I could not get flowers, but I notice that the calyx and style are persistent, and you may be able to make out enough characters for identification."

"I am very glad to be able to send on these specimens, as Mr. Morris specially asked me to look into the matter. I had a long hunt through the scrub in the blazing sun, and got 'sun-fever' afterwards."

SEMPERVIVUM THOMAYERI (S. HIRTUM, L., × S. ARACHNOIDEUM).

This plant was sent to me by my friend, M. Thomayer, the Director of Parks and Gardens at Prague. It is a new form of house-leek, differing from any which I have hitherto seen. I was much surprised when I saw it, its peculiar appearance, and its size, so unusually large for a *Sempervivum*, won the admiration of all who saw it. The plant resembles both its parents equally, but, like all hybrids, is much stronger and sturdier than either. It grows in close crescent-shaped rosettes (1½ to 1¾ inch high, and about 3½ to 4 inches across) of leaves, close and overlapping. The leaves are fleshy, elliptical, oblong-cuneate, very glandular, the edges thickly-bordered with hairs. At the tip of each leaf is a tuft of longer hairs than those along the margin. In size, the leaves are from about 1 to 1½ inch long by ½ inch wide at the base, and ½ inch at the tip. This plant has not yet bloomed at Prague, and all are inclined to think that it would flower scantily and rarely. Probably the flowers will be yellow, like those of

S. hirtum. It was raised in the propagating garden at Prague, "Rajská Zahrada." All the plants of this hybrid which were obtained, and which number about a hundred, are like each other. Their unusual habit and handsome appearance render the species eminently suitable for the ornamentation of rockeries, as well as for borders or hanging baskets, such as are to be seen in the State botanic garden at Brussels. We shall hope to hear still more about this new hybrid, *Henry Correvon* (*Bulletin de la Société d'Horticulture de Genève*, December, 1891).

PHALANOPSIS SCHILLERIANA PURPUREA, *n. var.*

This was marked by Messrs. Hugh Low & Co.'s collector as a blue variety, was carefully tended,

more compact, and each segment more uniformly rounded; the side lobes of the lip are broader, and the front lobe broader and shorter than in the type. But the main feature is the decidedly purple hue in its dark richly-coloured flowers, and especially over the whole surface of the column, the upper sepals, the petals, the outer halves of the side lobes, and the front lobe of the lip. There is some pretty spotting on the lower sepals and labellum, and when fading I find the flowers have a decidedly blue tint. It is thought much of at the Clapton Nurseries, because out of the thousands of *P. Schilleriana* which have been imported through Messrs. Low's collectors nothing like it has appeared before. *James O'Brien*.

dissipates all cause for wonder that she was able to wean him from all the spendthrift dissolute habits of his youth. Burleigh House was built by William Cecil, Queen Elizabeth's great "Lord High Treasurer of England," and is a splendid example of the architecture of that reign; the banquetting hall being one of the finest rooms of the kind in existence. It stood a siege by Cromwell, who was magnanimous enough to forbear from sacking the house on account of the widowed Countess.

On two sides the windows of the house look out on a typical English park. This park is of considerable acreage, and is divided into three divisions like "omnis Gallia," the high, the middle, and the low. The last division is free to everybody, and is

FIG. 18.—VIEW OF BURLEIGH HOUSE, STAMFORD.

and is now in flower at Clapton. Flowering as it does in the present dull weather, it is not blue, although there is a decidedly blue tint in the unusually bright dark rosy purple of the flowers, which may possibly develop into a still nearer approach to blue at a time when there is more sunlight, as compared with the scores of almost colourless typical *P. Schilleriana* in flower in the same house, and which are known to assume a rich rose colour later in the season. Its flowers, even as at present seen, are much brighter, darker, and more purple than are other forms of *Schilleriana* when at their best. This variety has other distinct features. Its spikes branch nearer the base than usual; the flowers are

BURLEIGH HOUSE, BY STAMFORD TOWN.

THERE are few of our English ancestral homes so well-known as this; perhaps it is greatly owing to the memory-holding cadence of Tennyson's pretty ballad, where the lines of the heading occur. The true legend of the lord of Burleigh, who, retiring to a country retreat as a landscape painter, there met his fate in the shape of a farmer's daughter, whom he married, she unwitting of her lover's rank, is beautifully worked out in the poem. The picture of the bride by Lawrence, which is a heirloom of the family, proves the wisdom of the peer's choice, and

a very favourite resort of the townsmen. With the exception of Windsor there are few parks with more magnificent avenues, the double avenue near the keeper's lodge being decidedly worth a close inspection.

The grounds are very extensive, and include far-stretching shrubberies and carefully-kept lawns. The main beauty of the place, however, is the large sheet of water, the outline of which has been very gracefully planned. In view of the house, it spreads out into a wide lake, and seems to disappear into the parkland like a broad river. The planting all round is now thoroughly established, and the huge Cedars and other trees seem to have stood there from time

immemorial. From the high ground in the park the grounds look like a large wooded island. The prospect from here with the high trees all mirrored in the water, and the beautiful fresh green foliage of the shrubberies in the background, is very lovely. The flower-garden is near the lake, quite hidden from the house. There is also a large rosary, and a deep dingle which has been turned into a charming sylvan retreat, through which winds tortuous shady walks. The old Oaks and Cedars are most lovingly cared for, and gives a charming old-time appearance to the grounds.

The plantations in the park are in a most thriving condition, and it was quite a pleasure to notice the rapid growth of the Birches. In the High Park a number of choice Conifers have been planted in an opening in the woods; the progress they have made in this sheltered position is quite wonderful. Such fine Douglas firs are not to be found anywhere, except at Dropmore and Murlthly—one I girthed was 10 feet. A *Cupressus sempervirens*, however, surpassed this, being 12½ feet round. There were also some fine Hemlocks, *Arancarias*, and *Deodars*. Costly experiments in pisciculture are being made in the waters of the lake, and the culture of the celebrated American Black Bass has been attended with a fair measure of success.

The reason, however, why horticulturists seldom fail to visit Burleigh is, because it is the scene of the work of Mr. Gilbert. His ready wit and kindly manner are an unfailing charm to all who know him, and a better education in kitchen gardening than a walk in his own garden with the "genius loci" himself, could not be wished for. The kitchen garden is more than a mile from the house, and is nearly 14 acres in extent. Strawberries are most extensively grown, and Mr. Gilbert, who has been a successful raiser of new varieties, has a choice collection of varieties; John Ruskin he finds the best early variety, and for main crop he prefers Burleigh President. It was a great treat to see the old Pines so well grown; he probably has the finest-grown stock of the Frogmore Late Pine and the old Elton in the country. A new variety that, if others can grow it as well as he does, ought to have a great future is Chief Secretary. The Brassica tribe, as all your readers know well, are understood and grown at Burleigh as only an enthusiast like Mr. Gilbert can grow them. Tomatoes are grown in quantity all the year round; both for indoor and outdoor work Mr. Gilbert finds Satisfaction and Criterion the two best varieties. A new Rhubarb—the Champagne—seems earlier, and an improvement upon Kershaw's.

A newly-formed orchard can hardly fail to attract the attention of every visitor. I was so struck with the evenness and health of the trees, that I asked how he had been able to get so many fine trees Mr. Gilbert answered, "I went to the nursery, and picked out every one myself." The ground under cultivation is very extensive, seven acres in all, and rows have been devoted to single varieties. A list of some of these varieties, as fruit culture is now engrossing so much attention, may be welcome. They are Barnack Beauty, Golden Noble, Peasgood's Nonsuch, Dutch Mignonne, Cox's Orange, Dumelow's Seedling, Worcester Pearmain, Stirling Castle, Annie Elizabeth, Stone Apple, Schoolmaster, Duke of Devonshire, Queen Caroline, and Grenadier. The rows are 32 feet wide, and all round is a shelter afforded by plantations. Cherries, too, are well grown at Burleigh. It used to be a local belief that Cherries "wouldn't grow nobow in the district." This fact alone was enough to make Mr. Gilbert determine that they should grow somehow. He had noticed at Bexley Heath the Cherries making enormous growth when growing on stone-heaps. Reasoning from this, he cleared out the pebbly bottom of a ditch, and made a bank of soil, on which he planted the strongest young standard Cherries he could find in Osborne's nursery. The result has been eminently successful, and a full crop of Cherries has never failed at Burleigh since he took the helm. That his shadow may never grow less is the sincere wish of *Tagabond*.

THE BORDEAUX MIXTURE AS A PREVENTIVE OF THE POTATO BLIGHT.

ABOUT four years ago, through the efforts put forth by the Section of Vegetable Pathology at Washington, United States, the use of preparations of the salts of copper—chief of which is the Bordeaux Mixture—was introduced as a preventive of the downy mildew and black-rot of the Grape. So marked were the results obtained by the use of the fungicides, that the Secretary of Agriculture, in his report for 1890, estimates that nearly 5000 Grape-growers in all parts of that country treated their vineyards for mildew and black-rot during the previous year, and that the amount of fruit saved in this way will vary from 50 to 90 per cent. of the crop. From a knowledge of the fact that the fungus which causes the mildew and black-rot of the Grape is very similar in character to that which produces the Potato blight and rot, it was suggested that the remedies found useful in preventing the ravages of the one might prove equally applicable to the other.

It is true that the results obtained are sometimes conflicting in character, but as the work is entirely new, and there is no beaten path of precedent to follow, it is to be expected that failure will sometimes be the result of our efforts.

EXPERIMENTS IN 1890.

A section of a Potato field at Rhode Island State Agricultural Station, where trials of varieties and methods of planting were being conducted, was set apart for this experiment; growing in this section there were sixty rows of Potatoes, each 50 feet long, or two rows each of thirty varieties, including those of early, medium, and late seasons of maturity. The section was planted on May 10, and the growth during the season was unusually even. On July 11 indications of the presence of the blight were discovered upon a few plants, and the following day, July 12, the first application of the Bordeaux Mixture was applied.

The section was divided into four equal plots of fifteen rows each. One plot remained untreated during the entire season, one plot received five applications of the Mixture, and two plots were sprayed three times at intervals of about ten days.

The conclusions drawn from the comparison of the results may be summarised as follows:—

1. The yield of merchantable Potatoes was increased nearly 10 per cent. by spraying the haulms three times with the Bordeaux Mixture.

2. The large yield was due to an increase in the size of the tubers, and not to an increase in number.

3. The per cent. (by number) affected by the rot was one and one-half times, or 150 per cent., greater when no mixture was used than where three applications were made.

4. The yield of merchantable tubers was increased more than 34 per cent. by spraying the haulms five times over the plot untreated.

5. The application of the mixture did not increase the total number of tubers formed.

6. The results, as relating to individual varieties, were more or less variable, which is undoubtedly due to the local conditions, in connection with the peculiarities of the various kinds; that is, the early varieties that had nearly matured their growth before the blight appeared were not benefited by the application of the mixture in so marked a degree as the later varieties, &c.

The plants had grown side by side, and had been subject to the same conditions, except that the haulm of No. 2 was sprayed with the Bordeaux Mixture, at intervals of about two weeks, from July 12 to September 1 inclusive, and as a result, the leaves remained green, and the tubers continued to grow until the date of the photographing.

The haulm of No. 1 was not treated with the mixture, and was attacked by the blight, July 20, which destroyed the vitality of the leaves almost entirely by August 1, and those remaining with the haulm were completely blackened by the middle of

August. The tubers of No. 2, besides being much larger than those of No. 1, were absolutely free from the indications of decayed spots, while among the tubers of No. 1 there was one that was badly decayed, and two others that had commenced to decay. *J. J. Willis, Harpenden.*

FOREIGN CORRESPONDENCE.

BERLIN.

FOR more than fifteen years the horticultural literature of Germany has discussed the question whether an experimental station similar to the *Landwirtschaftlichen Versuch's Station* (Agricultural Experimental Station), would benefit horticulture or not, and the various writers arrived invariably at the conclusion that such an institution would be of the greatest service. But what is remarkable is, that the German gardeners have never followed words by deeds, but have hoped that the State would take the matter in hand. "I have myself done much," says Dr. Dummer, "for the establishment of such an institution," but as he perceived that nothing was to be gained by publicity in the journals, he determined to act, and he has at length brought it to pass that the Berlin Horticultural Society has chosen a committee for the purpose of a closer investigation of the scheme. As it is to be hoped that, from the present time, a new era for horticulture will commence, the names of the members of the committee may be of historical interest. *Handelsgärtner* F. Blüth, *Hofgärtner* H. Hoffmann, and Dr. Udo Dummer. H. Blüth placed his garden and plants at the service of the station; Dr. Udo Dummer offered to superintend the carrying out of research, and H. Hoffmann undertook the duties of secretary. With a view of arriving at tangible results quickly, Dr. Dummer resolved to make a beginning with farmyard manures combined with mineral manures.

He endeavoured to determine if mineral manures especially are suitable for plants that are cultivated in pots, and whether such manures are more advantageously mixed with the potting soil, or applied as a liquid solution at intervals; whether the use of such manures, together with bottom heat, would do away with the expense of large pots; if the time required to raise plants could be shortened by the use of mineral manures; and, finally, if the mixing of carbonate of lime with the soil in which *Ericas* are grown would have any influence on their growth.

The results of the experiments may, in brief, be classed as follows:—

1. Mineral manures in the pot cultivation of plants may be used with good results.

2. Mineral manures in solution, applied in small quantities at intervals of a week, is the most advantageous mode of application.

3. That a manuring of *Erica gracilis* with a solution of 3 per cent. strength, and in the proportion of 100 parts solution to 1000 parts soil once a week, is the most desirable method.

4. By this method of manuring *Erica gracilis*, it was not necessary to employ bottom-heat to start growth in the cutting when potted, because the manured plant grew just as rapidly and as robust as another plant would do on bottom-heat.

5. The manuring renders a later repotting of the plant needless.

6. Manuring retards the formation of flowers, and the more manure, the later the flowering of the plant.

7. Manuring lessens the formation of roots.

8. The addition of lime—75 per cent. of the mass of soil—reduced the length of the growing shoots in *Erica gracilis*.

9. The manuring renders the green colour of the leaves of a deeper tinge.

As a manure, the following mixture was made use of:—20 grammes carnallite, 12 grammes Chili saltpetre, 8 grammes superphosphate, 20 per cent. soluble phosphoric acid in one litre of water. Of

this mixture, each plant received weekly 2 to 6 applications as might be necessary. As the price of this mineral manure is very cheap, its use greatly reduces the cost of cultivation. The use of the same is also very advantageous. Of great value in practice is the knowledge that by its use the formation of flowers is retarded; and possibly it may be found practicable to get a plant whose usual period of flowering is in late autumn to blossom in winter—a point of great value to the gardener.

It was originally intended to make the mixture of the substances employed according to an analysis of the ashes of the various plants, but as these analyses would have been expensive to carry out, and as a sum of only £5 was allowed for the purpose, they had to be abandoned. Still, as the chemical constituents of the leaves differ from those of the flowers and their stalks, these analyses must be undertaken at some future time. It became, however, necessary to determine in particular if mineral manures were of use in the pot-culture of plants. This question is now settled in the affirmative by the researches that have been instituted and carried out, and it must now be determined by further research which kind of mixtures is the best for the various species of plants, and at what period of their growth the manure should be applied. So far the researches have taught us that, by the right kind of investi-

HORTICULTURAL BUILDING AT THE CHICAGO EXHIBITION.

THE accompanying cut presents the front elevation of the Horticultural Hall, designed by W. L. B. Jenney, of Chicago. The building is situated immediately south of the entrance to Jackson Park from the Midway Plaisance, and faces east on the lagoon. In front is a flower terrace for outside exhibits, including tanks for Nymphaeas and the Victoria-regia. The front of the terrace, with its low parapet between large vases, borders the water, and at its centre forms a boat landing.

The building is 1000 feet long, with an extreme width of 286 feet. The plan is a central pavilion with two end pavilions, each connected to the centre pavilion by front and rear curtains, forming two interior courts, each 88 by 270 feet. These courts are beautifully decorated in colour, and planted with ornamental shrubs and flowers. The central pavilion is roofed by a crystal dome 187 feet in diameter and 113 feet high, under which will be exhibited the tallest Palms, Bamboos, and Tree Ferns that can be procured. There is a gallery in each of the pavilions. The galleries of the end pavilions are designed for cafés, the situation and the surroundings being particularly well adapted to recreation and refreshment. These cafés are surrounded by an

about 1 inch in breadth. The flowers are borne on a scape about 1 foot high, and each scape has from three to eight flowers on it. The sepals and petals are of a rich dark chocolate colour, suffused with green; the lip is large and round, of stout substance, pure white, with a crimson blotch on the disc. *P. W.*

CATTLEYA PERCIVALIANA, *Southgate* var.

The above handsome plant is now in flower in the Woodlands' collection, and a charming variety it is. As a rule we find *C. Percivaliana* one of the shyest flowering of Cattleyas, and when in flower to be of such diminutive proportions as to be rather unattractive. The above variety is distinct, and in size it compares favourably with *C. Mendell*, *C. Mossie*, and *C. Triane*; the form of the sepals and petals is all that could be desired, and the lip is proportionately large, with a deep fringe all round the margin. Mr. Measures says that this variety is only equalled by one other in Captain Vipan's collection. It originated with Messrs. Lewis & Co., of Southgate, whence it passed into the Woodlands' collection, where, among many other beauties, the plant may be said to be a home. *P. W.*

CYPRIPEDIUM INSIGNE.

Of this old favourite of our glass-houses—not, perhaps, so commonly grown as it deserves—we have

FIG. 19.—HORTICULTURAL BUILDING AT THE CHICAGO EXHIBITION, 1000 FEET LONG.

gation carried on under the necessary precautions, great results may be arrived at, and horticulture be greatly profited. But not only will researches be made in the manning of plants, for there remain a number of other questions for which this experimental station in the interest of the gardener, in a similar manner if not on a more extensive scale, must find an answer. Before all things, it will be understood that those entrusted with the researches have chiefly to serve the interests of practical horticulture, and that purely scientific questions are excluded. *Our Berlin Correspondent.*

THE NEW ARALIA-HOUSE IN THE BERLIN BOTANIC GARDEN.—Among other plant houses erected during the summer of 1891, was one which will be entirely devoted to the culture of Aralias. It is in two divisions, a large cool one, and a smaller one for Aralias from warm countries. In the middle of the house, a long bed, surrounded by tufa, and capable of being heated, is constructed; and on the walls, stages are placed on which the dwarfier species stand. The collection of Aralias in this garden is one of the most complete existing, and the specimens are in some cases of extraordinary size. A particularly picturesque appearance will be obtained by the use of the branches of trees to which the climbing species of Aralia will be secured.

arcade on three sides, from which charming views of the ground can be obtained.

In this building will be exhibited all the varieties of flowers, plants, Vines, seeds, horticultural implements, &c. Those exhibits requiring sunshine and light will be shown in the rear curtains, where the roof is entirely of glass and not too far removed from the plants. The front curtains and under the galleries are designed for exhibits that require only the ordinary amount of light. Provision is made to heat such parts as require it.

The exterior of the building is in stucco, tinted a soft warm buff, colour being reserved for the interior and the courts. The appropriation for this building is 400,000 dollars. It will probably be built for something less than this sum.

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM MACROCHILUM ALBUM, *syn.*, *E. cordigerum*.

AMONGST the Orchids in flower at Seymour Court, Great Marlow, is the above useful and decorative variety, which, when seen in perfection, as this plant is, it is one of the handsomest of the genus. It is of dwarf habit, with roundish pseudobulbs, and foliage measuring from 6 inches to 1 foot in length, and

at the present time a number of plants in the conservatory which have from thirty to forty flowers each, and many fully 5 inches across. A few years ago we grew them in pots in an intermediate-house, but transferred them to the conservatory, and planted them in wire baskets. Some of the plants measure 2½ feet across. Some plants of *C. barbatum* also flower under the same treatment as the above, but this species does not grow so freely here as in a higher temperature, the warmth often falling as low as 40° in the winter. They are planted in a mixture of fibrous peat and sphagnum moss, with abundance of drainage. *J. Howard, Benham.*

ONCIDIUM PHALANOPSIS.

A spray of a fine form of this pretty Orchid comes from Mr. J. W. Bond, gardener to Charles Ingram, Esq., Elstead House, Godalming, which serves to call attention to the beauties of this species when the plant is grown at its best. The flowers, of which the spray bears four, have a strong resemblance to those of the fine violet-spotted *Odontoglossum Pescatorei* Veitchianum, but they are smaller. The pure white labellum is spotted with purple, and at the base is the crest of a rich yellow colour. Numbers of this plant have been killed by growing it in heat, but it is never safe for any length of time, unless it be grown in a cool temperature, such as that of the *Odontoglossum*-house.

FLORISTS' FLOWERS.

THE SHOW AURICULA.

THE sun commenced his northward course on December 21, and with this return of warmth comes the renewal of the interest for him who cultivates the Auricula. Not that the time for noticing a perceptible movement in the plants has come yet, and it is possible it may be delayed till the end of January, according to the nature of the weather, but soon after the shortest day the Auricula enters upon its period of growth—a time full of interest, of hopefulness, and expectation for the cultivator, for he is not within measurable distance of the April exhibition. In February, warmth becomes perceptible, and it is then the revival comes, if the weather be favourable.

Of late years we have witnessed some remarkable additions to show Auriculas. Among our green-edges at the present time, Simonite's Rev. F. D. Horner is our most generally-grown and best variety in the sense also that it is obtainable. It is good in constitution, of free growth, and very constant in character, and one can say that all who grow it can show it, because it is fairly early in flowering. It has the habit of throwing up autumn trusses—at any rate, it appears to have done so abundantly in 1891; but this may have been in large measure owing to the fact that the plants, having regard to the mild and soft character of the autumn, were late in bringing the period of activity to a close. The resources of the fine and useful green edge are large, for Mr. T. E. Henwood, of Reading, informs me that some of his plants threw up two and three autumn trusses each, and yet he does not despair of getting a good head of bloom in April next. Old Prince of Greens still does good service at exhibition times to those who can grow it, but it takes a long time to grow a small plant into a large one. Mr. Horner has Monarch, undoubtedly a fine green edge, but when it is to be distributed I do not know. Last year Mr. Henwood bloomed two plants of it, but both produced double flowers. I think the most promising among the new green edges is Abbe Lizet, raised by Mr. Douglas. As far as I have seen it, this will become as popular and constant as the Rev. F. D. Horner, while it is to all appearance a good grower. Verdure is another promising green edge raised by Mr. Douglas, and well-named because of the bright deep green of the edge. Attraction is another of Mr. Horner's raisings, sown by him in 1890; last year, owing to the incidence of the season, none of his flowers came southwards. Mr. Samuel Barlow, of Manchester, has two or three new green edges. Mr. T. E. Henwood, shown last year and certificated promises to make an excellent addition to a class sadly in need of strengthening; but then it may be years before there is enough of it to send out. Greenfuch is another of Mr. Barlow's raisings; bright green on the edge, very attractive, and medium size flowers of good quality. If growers could obtain Abbe Lizet they would gladly add it to their collections. Lancashire Hero, which usually has grey edges, will sometimes come quite green, generally from a truss that becomes bare in the autumn, but does not rise up until very early spring.

Of the grey edges, we have the old favourites George Lightbody and Lancashire Hero, and when it can be had early enough, Richard Headley—it is a flower of fine quality when at its best; also George Rudd (Woodhead), Mrs. Moore (Douglas), Rachel (Woodhead), Mabel, William Brockbank (Mellor), a somewhat uncertain but occasionally to be had in good form; and Grey Friar, a seedling raised by Sir J. T. D. Llewellyn, Bart., but apparently only little grown.

Of white-edged Auriculas, which until the past few years was a very limited class, there are Acme, a very constant and reliable variety, and when in its best form difficult to beat—a variety that worthily keeps green the memory of an old cultivator and raiser, the late Mr. John Read, Market Rasen; Dr.

Kidd (Douglas), a most useful flower; Silvia (Douglas), remarkable for its rich gold tube, but sometimes as much a grey as a white edge; Reliance (Mellor), Mrs. Dodwell (Woodhead), Conservative (Douglas), John Simonite, and the following, raised by the Rev. F. D. Horner:—Atalanta, Heather Belle, Maggie, Miranda, and Snowdrift. So few of the flowers raised by Mr. Horner are put into commerce, that there seems little chance of any of the foregoing finding their way into general cultivation; but it is to be hoped Maggie will give sufficient increase to admit of its being sent out. It is a lovely variety, and the remarkable contrast between the rich black of its body colour and the snowy purity of the edge makes its name very appropriate.

The selfs have always been a strong class in point of numbers, though many of the leading flowers possessed points of weakness. Mrs. Potts, with its beautiful violet-blue colour, is generally regarded as standing at the head of the varieties of modern introduction; but it is capable of improvement, especially in the length of its flower stem. Heroine and Black Bess are two very fine dark selfs, which will hold their own for some time to come, and both can be depended upon. Sapphire is valuable as a blue, but, like Ringdove, by the same raiser, has proved somewhat unsatisfactory. Mrs. Douglas, raised by Simonite, when in its best form, I regard as greatly superior to it. Then there remain Charles J. Perry, Lord of Lorne, Pizarro, and one or two others, old, but at times very useful. A good red self is badly wanted, and it is to be hoped the day is not far distant when Horner's Brilliant will have increased sufficiently to admit of its being distributed.

The yellow self Auricula is much more a thing of the past than of the present, and, unusual as it is, and beautiful, too, the English grower for show places its lowest of all in point of quality. Those of us who remember Horner's Buttercup of two years ago will rejoice also when that fine and distinct variety can be offered for sale. R. D.

COLONIAL NOTES.

NEW ZEALAND.

FREESIAS:—Here we experience little difficulty in growing this useful gem. It is sown in rows like Peas, on a sunny, sandy border (with us to the north) as stock bulbs. After the resting period, which is about two months, it starts away again much after the way of Sparaxis, when the strongest are carefully lifted with a trowel in batches and potted in 5 and 6-inch pots, as many as the pots will hold, carefully tended to prevent them being drawn, and supplied with plenty of water; then brought into a warm airy house in April and May, when next month, June, or midwinter month, they commence to produce in quantities their lovely scented blooms, and those left untouched in the beds supply a succession far into spring. T. Smith, Timaru, N.Z.

HARDINESS OF ACACIAS.

It may interest some of the young gardeners of Britain who fire away somewhat mercilessly with their employer's fuel on frosty nights to know that these plants will stand 8° and 10° of frost uninjured. Here we sometimes experience this low temperature for a few nights successively, and Acacias are never injured. Some, as the Black, Golden, and Silver varieties, are grown as timber trees for tanning, which is extracted from the bark; others, as A. lophantha, are graceful pendent bushes; A. armata is sometimes used as a fence plant around villa gardens—and a good one it makes; and A. grandis as an ornamental tree in shrubberies. T. Smith, Timaru, N.Z.

WEST INDIES.

THE TAMARIND.—The pulpy, few-seeded, induricant fruits of the Tamarind tree are extensively used in a variety of ways by the people of Trinidad, especially the Coolie population. In a green state

they are mixed with Garlic, Onions, Mustard, and Pepper, to form a chutney, a dish highly appreciated by the coolies. When ripe, the thin, shell-like covering is broken away from the inner portion, the seeds are also removed, the portion used being the pulpy interior only. This is dried, made into balls of various sizes, and in this state can be kept, for years, being ready for cooking purposes whenever required. Another use, and perhaps one more generally known amongst all classes of the colony's people, is the beverage, or "cool drink," made from the ripe fruit. Owing to the very acid nature, a large proportion of sugar must be added to make it palatable, which is applied sometimes in the form of hot syrup, obtained from the Sugar houses. The drink is cooling, and very agreeable. In both the green and ripe state the fruit possesses strong laxative properties. Tamarind trees grow to a large size, with spreading branches, upon which grow the racemes of small light-coloured flowers, and small pinnate leaves. The wood is made into furniture, and the younger growths, through their toughness, are universal favourites with those who have to use the "switch," either to animals or children. W. E. B.

JACQUINIA ARISTATA.

The small and pretty red-coloured flowers of this spiny-leaved plant are scarcely recognisable as they grow amongst the branches, and are not visible usually on the exterior portion of the tree. They grow from the tips of the young growths, or from the old wood at regular intervals, in short racemes. In the bud state, the colour is first white, changing gradually into waxy-yellow, until the flower opens, when they finally change to red, and are sweetly scented when open. The leaves are either whorled or alternate, very shortly stalked, obovate, tapering to the base, apex surmounted by a stiff black point. The habit of the plant is that of a dense growing shrub. For the reason already stated, the flowers are very inconspicuous, having to be sharply looked for before being seen, but when discovered are bound to court admiration. A native of Trinidad: W. E. B.

POINCIANA REGIA, Bojer (Flamboyant).

In numerous gardens in and around Port of Spain, in open spaces and savannas (parks), a flat-topped, many-branched and low-growing tree is represented in the above species. At the time of writing (May) many of these are bearing thousands of scarlet flowers, large in size, and growing together in large racemose corymbs, giving the tree the appearance as if on fire, and it is from this latter fact that its local name, Flamboyant, is derived, meaning flame-tree. The sepals are reflexed, red above, and green underneath; petals waxy, roundish, long-clawed, scarlet, occasionally variegated yellow and white, the upper petal white and yellow, spotted, streaked, and bordered carmine. The bracts are leafy, compound or pinnate. The long broad black pods from the previous year's flowering are present on many of the trees, hanging amongst the flowers, in length 2 feet, and $\frac{1}{2}$ inches broad at their greatest breadth. When landing at Barbados on the way from England to Trinidad, these trees were then flowering, and struck the writer at that time with no small degree of wonder and surprise. No leaves are present when flowering. The tree is a native of Madagascar. W. E. Broadway, Assist.-Supt., Royal Botanic Gardens, Trinidad.

CALIFORNIA.

For some years an amateur in garden operations, I have made a number of trials of tropical plants, economic or ornamental, and you will easily appreciate the pleasure and fascination there is in growing plants that have never before been tried in the particular locality one resides in. Many sections here are nearly frostless—some absolutely so. At my own home in this city, frost has only fallen twice in seven years, and then but 1½°, and but for a few minutes, just before sunrise. Perhaps a brief list of some of the more tender plants in my garden would interest you, as growing without any protection, some of

them seven years old:—*Tabernaemontana*, double-flowered form, lawn shrub, 5 feet high; *Plumieria alba*, a yellow-flowered species; *Poinsettia pulcherrima*, many stems, 12 feet high; *Theselia nerifolia*, large shrub; *Stephanotis floribunda*, *Schubertia grandiflora*, *Thunbergia Harrisii*, *Stigmaphyllon ciliatum*, *Bignonia venusta*, *Murraya exotica*, *Bauhinia acuminata*, *Rogiera gratissima*, *Lasiandra macrantha*, *Cryptolepis* sp., *Vallisaria dichotoma*, *Hibiscus rosa sinensis*, large bushes; *Persea gratissima*, in fruit; *Crinums*, *Pancratium*, *Hymenocallis*, different species. Besides these, we grow a number of less tender tropical or semitropical plants; as yet, however, there are very few persons who have given the subject much attention, and consequently, we have no such gardens as those in the Riviera, but we can grow more tender plants than can be grown there, beyond a doubt. I do not think many of the plants in the preceding list could be grown continuously in the most favoured spot along the Riviera, as our winter average is some 8° higher, while we never suffer from the extremes occasionally happening there. *J. C. H., Los Angeles.*

SOME USEFUL ASPLENIUMS.

The genus *Asplenium* includes nearly 300 species, many of which are widely distinct, varying from the tiny little *A. ruta-muraria*, *A. trichomanes*, to the noble *A. australasicum*, which has broad fronds from 4 to 5 feet long. Although in the hardy species the garden varieties are very numerous, and include tasselled and crested forms, in the greenhouse and stove species there are few varieties, and so far as I am aware, they do not include a single good crested form, unless *A. palmatum multifidum* may be regarded as such; in this the fronds are much more divided than in the normal form, but they do not continue to grow as in many of the crested Ferns. In the *Pteris*, for instance, the same fronds continue to grow and increase the multifid growths for a considerable time. I think the reason that the crested forms are of rare occurrence in the *Asplenium* is—that instead of throwing up their fronds in tufts periodically, they are produced singly, one unfolding after the other in succession. I have observed in the crested *Pteris* that the multifid growths may be considerably extended by stimulating the plants at the period when one set of fronds are well developed, and before another lot of young fronds have started. To return to my subject, it is to those suitable for decoration that I shall confine my remarks. Although the species are so numerous, the really useful sorts are somewhat limited.

The bulbiferum group include some of the most useful *Aspleniums*, which are extensively grown for market, their greatest recommendation being that they thrive well under cooler treatment than many Ferns, besides which, they are remarkably effective. The true form of *A. bulbiferum* is one of the best. The rich deep green fronds are not so finely divided as some of the varieties often seen under the name; when loaded with the bulbils, or young plants, which are so freely produced on the surface of the fronds, they droop over, and the plants require to be stood up on pots, or suspended in baskets, to be seen to advantage. Younger plants are useful for table decoration. *A. laxum pumilum*, which is sometimes given as a variety of *bulbiferum*, is very distinct; the fronds are finely divided, and they do not spread so much from the base, but are just sufficiently recurved to form a very graceful plant—this variety is not so prolific, the bulbils being produced very sparingly. *A. bifurum* is a stronger-growing form, with long loose fronds, the basal ones having broader segments, the fertile ones being very narrow. This is very prolific, and the young plants will grow to a considerable size while still attached to the parent frond, and without coming in contact with any substance to root into. *A. feniculaceum* (*Fabianum* of some) is another useful form, with broad, finely-cut, recurved fronds; the young bulbils are numerous, but fall off early, making only one little leaflet while on the parent.

A. flaccidum is very distinct, with long drooping fronds, and is a fine Fern for baskets. Under good treatment the fronds will grow fully 2 feet long; and, as they droop over, they cannot be grown properly, except when suspended, or stood on pedestals—the fronds being of good substance, it is one of the best for decoration. *A. Colensoi* (Hooker), is a very compact-growing species, and one of the most useful for market work. *A. viviparum* is compact-growing, with finely-cut, fennel-like fronds. This is prettiest in a young state; the fronds of older plants generally get blackened or disfigured. *A. nobile* is closely allied to this, but has rather more spreading fronds. *A. bifidum*, a pretty little Fern, with small erect-growing fronds, may be included in this group.

The above all being viviparous, or bulb-bearing, there is little difficulty in their propagation; either taken off and treated as seedlings, or the fronds may be pegged down on some light sandy compost, in which the young plants will soon take root, and they may be taken off and potted as soon as sufficiently established, the more vigorous-growing sorts will succeed well in a loamy compost, but more peat should be used for the slender, and more delicate sorts. In all of this group the fronds are produced from a single crown, and in potting the plants this should be kept well down to the surface. With the exception of *A. feniculaceum*, *A. viviparum*, and *A. nobile*, all of this group will succeed well under cool treatment, those named should be grown in the stove. The above form a compact and distinct group, but it is difficult to divide the other useful sorts into groups. I will therefore deal with them separately.

A. lucidum is a most distinct and beautiful species, having broad pinnate fronds, from 1 to 2 feet long; the leafy part is of a thick coriaceous texture, with a bright shiny surface. The only means of propagation is from spores, but these do not germinate freely, and the seedlings are very slow in growth, but when once established it is a most servicable Fern; succeeds well under cool treatment, being nearly hardy.

A. cicutarium, a very pretty stove species, bears fronds nearly erect, 9 to 12 inches long, broad in the centre, narrowing down towards the base and point, finely cut, and of a soft pale green. There is a narrow filament of green on each side of the dark brown rachis. It is a delicate species, and should be grown in a light peaty compost, with plenty of drainage, and should be confined to rather small pots; if over potted, it will soon get into a bad condition. *A. speciosum* is another pretty stove species, with slender recurved pinnate fronds of a soft pale green; this should be treated as the preceding.

A. longissimum is a most distinct Fern, producing long drooping pinnate fronds of a deep green, with a bright surface. A young plant is produced at the point of each frond; must be grown in suspended pots or baskets. There is at the present time a fine specimen of this Fern in the stove fernery at Kew gardens, the fronds being fully 5 feet long. *A. fiabellifolium* is another species suitable for baskets, of very slender growth; the pale green pinnate fronds droop over, and produce young plants at the point. Although an Australian species, it succeeds best in a moderate stove temperature.

A. erectum, with slender pinnate fronds, growing erect, about 9 to 12 inches high; and *A. Fernandezianum*, with deep green, recurved fronds, are both useful species for the temperate fernery. They are too small for ordinary decoration, but deserve a place in any collection; both produce single bulbils towards the point of the fronds.

A. obtusilobum is another pretty small-growing species, with short finely-cut fronds. The young plants are produced on slender stolons or runners, spreading in the same manner as Strawberry runners. It requires stove treatment.

A. Bapsisti is a very distinct species, with broad pinnate fronds on rather long stipes; the long pinnae are deeply lobed or toothed along the margin, and of a deep green. *A. Novæ Caledoniæ* is similar in

habit, with very finely-cut, slightly recurved fronds; when well grown, it forms an elegant plant. These may both be obtained from spores, but are very slow. They should be grown in a peaty compost. The first-named requires a stove temperature, and the latter may be grown in a cooler house, but will do equally well in the stove. *A. pteridioides* is a distinct and choice species, the fronds being produced from a single crown, about 9 to 12 inches long, and 3 to 4 inches broad, recurved, and of a thick texture, with a brownish shade. This somewhat resembles the *bulbiferum* type, but is not viviparous, and as yet I have been unable to raise seedlings.

A. palmatum is a dwarf-growing species, with fronds three to five-lobed, on slender rachises. There is a variety of this with the lobes cut into narrow segments. *A. hemionites* is perhaps the most correct name for this, but it is more generally known as *palmatum*. It may be grown in the temperate fernery, but does better where there is more warmth in winter; it succeeds well in a loamy compost, and should be confined to small pots.

A. nidus (the bird's-nest Fern) is a general favourite. *A. australasicum* is considered synonymous, but the two forms are quite distinct. In *A. nidus* the fronds are club-shaped and spread, and do not grow more than about 2 feet in length; in *A. australasicum* the fronds are nearly erect and do not taper off so much towards the base; in well-developed plants they attain to from 4 to 5 feet in length. These can only be obtained from spores, which do not germinate very freely, but sometimes a good batch of seedlings may be obtained; when once they are well started they soon grow into useful-sized plants. They should be potted in a Young open compost with plenty of drainage.

The above is a good selection of the most useful sorts, but many more might be added to the list, especially for planting in rock-ferneries. The broad-leaved sorts are sometimes attacked by thrips, which, if not speedily eradicated, will soon disfigure the plants. Brown scale is also a troublesome pest. Yet their worst enemies are slugs and snails, which attack the young fronds as they begin to start, and by the time the mischief is discovered the plants may have been permanently disfigured. *Pteris*.

ROOM PLANTS.

THESE, whether standing in a window or on a table or *jardinière*, require a good deal of care during the present and following months; indeed, these months form the most critical period of the year for plants in living rooms. They should be protected from gas and too great a change in the temperature of the room, and from cold draughts. When the room is swept, dusted, and put in order, the plants should be removed to another warm room whilst this kind of work is in progress, and remain there for some time after it is completed, until the room has acquired its usual degree of warmth, and the dust has settled.

Fairly hardy plants should receive fresh air whenever the weather is favourable for affording it. Foliage plants should receive a weekly washing of their leaves with a soft sponge and lukewarm water; and plants of an herbaceous character should be cleaned from dust by means of the bellows or a feather-brush, or be wiped with a soft dry cloth. When any of the plants show signs in February of returning activity, they must receive water more abundantly; and, on the contrary, bulbous plants that may have finished blooming must be kept drier at the root until they gradually are induced to rest.

Fuchsias, *Heliotropes*, *Pelargoniums*, *Hydrangeas*, &c., which have been wintered in cellars or rooms from which the frost is excluded, may in February be taken out, cut back somewhat, and receive a thorough watering; and, after they have broken into new growth, be repotted in fresh compost, and generally in pots rather smaller than those they last occupied, the root also getting a slight cutting-back. The *Hydrangeas* should have the weak upright shoots cut out, the strong growths being left for bloom.

All of these plants should come into the window or other light place, and be sprayed over when the weather is mild, and in the evening and morning following days on which much fire-heat has been made use of, and carefully watered. Tuberous Begonias and other similar plants may be started after re-potting the roots in February. That is also the best month to sow seeds of Gloxinias and tuberous Begonias.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

The atmospheric conditions of an Orchid-house is always an important matter, especially at this time of the year, when the weather is so very variable. Upon maintaining suitable conditions success mainly depends, so that any efforts made in this direction will be well repaid in the well-being of the plant. Observe that the degree of warmth indicated on p. 15 of the present volume is carefully maintained, so that upon entering a house the temperature does not feel to be much below what is really the case when the thermometer is consulted. When much fire-heat has been required, the plants and the air are apt to become much too dry, and this evil must be combated by affording moisture to the former, and by wetting the paths, walls, stages, &c.

THE EAST INDIA-HOUSE.—It is not good practice to disturb Orchids at the root, except for sufficient reason; Cypripediums, however, are plants that soon recover from any disturbance of their roots, and grow freely, and any of these which may require to be re-potted, may be potted in a moderately rich compost, consisting of equal parts of fibrous peat and sphagnum moss, with a liberal addition of clean silver-sand, one-fourth part of fibrous loam and half-rotted leaf-mould, with the finer portions sifted out of it. The roots should not be large in proportion to the size of the plants. If the pot be small, half fill it with clean crocks, and in a large pot put in crocks to the extent of three-quarters, placing a layer of moss on the top and filling in with the compost, making it moderately firm without breaking any of the roots, finally leaving the crown of the roots slightly raised above the rim of the pot; gently water the surface with a fine-rose can, but withhold larger supplies of water until the roots have commenced to take hold of the new materials. The foregoing materials are unsuited, however, for Cypripedium niveum, C. concolor, C. bellatulum, and C. Godefroye, which thrive best in a mixture of equal portions of good loam and very small pieces of chalk; and instead of raising the roots above the surface of the soil on repotting, they should be slightly below the rim of the pot. Always employ water sparingly to these species, and do not permit it to lodge in the axils of the leaves.

THE INTERMEDIATE-HOUSE OR CATTLEYA-HOUSE.—Many of the Cypripediums will do well in this house, and among these are some of the handsomest species and varieties, as C. Spicerianum, C. Boxallii, C. insignis, C. villum, C. Schlimii, C. Sedeni, and C. cactulana, and the beautiful crosses that have sprung from them. *Odontoglossum grande* should now be receiving but little moisture; *O. leopardinum*, which is in flower, and very pretty, will require the same kind of treatment when it has done blooming; *O. citreolum* must also be kept dry and cool, and a close watch must be kept for slugs and other depredators which prey on the flower-spikes. Of *Calogyne cristata*, there are varieties which do not flower so well as some others. The *Chatsworth* variety is, perhaps, the best, and *C. cristata* *Lemoniana* is another. The shy varieties will flower more readily if they are grown in nearly full sunshine, as *a'so* *Cattleya gigas* and *C. lobata*.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

MAKING SPRING-FLOWERING PLANTS FIRM IN THE SOIL.—When the frost breaks up, all autumn-planted spring-flowering subjects should have the soil made firm about the roots, pressing down both soil and plant. The plants which call for special attention are Wallflowers, Polyanthuses, Primroses, Forget-me-Nots, Silenes, Golden Thyme, Gentians, Hepaticas, Carnations, Violas, Aubrietias, Anemones, and Arabis, as well as some bulbous

plants. The same remarks apply to any trees, and shrubs, and Roses, which were planted shortly before the frost set in.

BULBS AND THEIR ENEMIES.—Sometimes at this season the mice, rooks, and blackbirds, work havoc with Daffodils, Crocuses, &c., if prompt measures are not taken against them. The mice should be trapped, and a few of the birds shot, and left on the beds to deter the others.

ANEMONE.—This popular early spring-flowering plant is effective planted either in masses or patches in the herbaceous borders, Rose beds, or on the grass in open spaces among the trees, either alone, or in company with Snowdrops, Hyacinths, Tulips, Daffodils, Crocuses, and Crown Imperial Lily; and if the planting of these subjects has been deferred, no more time should be lost before doing so. Although the Anemone may be planted from October to the end of the present month, it is the earlier-planted corals that give the best returns. A light rich sandy well-drained soil is best for Anemones. If planted in variety, the colours well mixed, and the beds made pretty full in the middle, the effect of the plants when in bloom is a very telling one. Make the surface of the beds level with the rake, and set the tubers about seven inches apart each way, burying them with a trowel two inches deep, keeping the crown upwards, as a matter of course; and cover the beds with some sifted leaf-soil. In planting in turf, use a pointed dibble, and put a small quantity of rich soil under and over the roots.

RANUNCULUS.—This is another popular spring-flowering subject, very floriferous, and the flowers being of the richest and most diversified shades of colour. They are very decorative for spring beds, masses, or clumps, in mixed or separate colours, and useful for cutting. The same kind of soil and treatment as those recommended for the Anemone will suit the Ranunculus.

GENERAL WORK.—As soon as the ground can be worked, the lawns and walks should be carefully swept and rolled, and the interrupted planting of trees, shrubs, &c., taken up and completed. Bedding plants in pits and frames should have every vestige of decay removed from them; and in the case of Verbenas growing in such places, means should be taken to destroy mildew, which is apt to be prevalent in such structures, by dusting affected plants with flowers-of-sulphur when the foliage is damp. Ventilating the pits freely in mild weather, and keeping the plants moist at the roots, hinders the spread of the mildew on Verbenas. Where Violas are wintered in cold pits, mildew sometimes is present, and it should be similarly treated.

FRUITS UNDER GLASS.

By J. RINDALL, *Gardener, Castle Howard, York.*

VINES.—Those intending to close a viney should first liberally supply the inside border with diluted liquid manure at a temperature of 80°, and if the internal arrangements will permit of it being done, form a bed of fermenting materials, and strew some top-dressing of manure over the border, to prevent the loss of warmth and moisture too quickly. The heap of manure, which is best placed on a platform of boards raised a little above the soil, will maintain a humid atmosphere, and afford some amount of warmth. At this time of the year, 45° at night, with a rise of from 5° to 10° with fire-heat, and 15° to 20° with sun-heat, will suffice at the start. In exceptionally cold weather the temperature may fall a few degrees lower than these figures, it being better to do so than resort to the use of excessive artificial heat. The moistening of the Vines should be regulated by the condition of the weather, for when it is bright, the syringing of them may be done four times a day; on the contrary, in dull weather, once or twice will be often enough. In order to have a steady heat from the hot-bed, the materials should be occasionally turned, making additions of fresh dung and leaves already got into a warmed state. As the middle part of the hot-bed becomes dry by fermentation, a few canfuls of water poured over the surface will cause fermentation to go on without check. For Muscats and other kinds of Grapes requiring a higher temperature than Black Hamburgh, Foster's Seedling, Sweetwater, and the usual varieties which are early forced, 5° to 7° more may be afforded at starting. Once the buds have made half an inch of growth, discontinue the syringing of the canes, remove the hot-bed, and carefully prick

up the border. I may here remark that it is a mistake to rake the surface of the borders of any fruit-house. Vines which have made some progress in growth should be disbudded, the strongest laterals being left, provided these show the best bunches. The question of stopping at a certain leaf beyond the bunch is a moot point; some growers do this at the first or second leaf, and allow the sub-laterals to make one leaf only. I allow the bunch-bearing lateral shoot to make 4 feet of growth before stopping it, and rub off every shoot that springs from it. By this method stronger canes are obtained than by the other methods, believing that one large well-developed leaf is of greater benefit to the Vine than several small ones, and the results obtained go far to support my practice, and I would advise its being given a trial by those who have not hitherto adopted it. Besides stopping, the tying down of the laterals will need attention. It is an operation which requires to be done at intervals, so as to get them into their places—a horizontal one being best—without breaking or straining them dangerously. All the smallest bunches, and those on the weaker shoots, should be cut off whenever sufficiently developed to enable the cultivator to select the bunches to be left to grow, and this number should vary, not so much with the length of the cane as with their vigor, and the size of bunches they show. For Vines of medium strength, 1 lb. of Grapes to the lineal foot is a good crop. The floor, and all bars space in the house, may be damped down night and morning, and several times during the day, when it is warm and dry. Ventilate with care when cold winds prevail, giving preference to the means provided at the apex of the house for this purpose.

PINES.—Every opportunity should be taken advantage of to collect leaves for the Pine-beds, where this has not already been done, and if there is any choice of the kind, the leaves of the Oak are best, but other hard-wood tree leaves make a good substitute, except Lime, Sycamore, and Plane.

THE KITCHEN GARDEN.

By G. WATKINS, *Gardener, Syon House, Brentford.*

FORCING SEAKALE.—Early in the month I advised the lifting of roots of Seakale and Rhubarb for forcing. Those who purchase their Seakale roots will lay them in the earth ready for use, covering them with short litter. Seakale roots are, in a general way, the better for being dug up and placed in rows and covered, the check the roots receive by lifting preparing them for forcing. I need hardly point out the value of growing Seakale roots from cuttings in preference to seeds; still the last-named method is still possible, although much time is lost, a root-cutting in March being often as large as a seedling after several months' growth. Therefore, when lifting the roots from the open ground, the strong side-roots should be cut off and tied in bundles of twenty-five each. These cuttings may be made 4 to 6 inches long, the top cut straight and the bottom obliquely, ready for planting early in March. Lay them in trenches till that date, covering as advised for the forcing-roots. A few rows of roots should be left in their quarters for the latest supply. We have roots on a cold border that give us useful heads when Seakale is over in many other places—the roots need only a slight covering of half-decayed leaves, and the shoots come up sturdy and clean and free of slugs. Should the latter be troublesome, a dusting of lime before covering them will do good.

ASPARAGUS.—This is a more expensive crop than Seakale, being of slower growth, and for forcing, permanent beds are best, the first expense being almost the only one. Roots of this vegetable will require to be placed in a warm pit or house at intervals of about three weeks if a daily supply is required, and unless of home-growth, there is often a difficulty in getting strong roots for forcing, and in all cases slow forcing is essential to obtain good heads, rapid growth in strong heat bringing only weak shoots with but little flavour.

FRENCH BEANS should now get more attention, and if they are grown in a suitable temperature good returns are secured. Those who have only limited space at command should not sow before the end of this month or later, and they should sow an early dwarf variety, such as *Syon House* or *Ne Plus Ultra*, if space is an object. The seed may be sown in 60's, and when large enough, transplanted or grown on in 7 or 8-inch pots. If seed be sown in the latter, care must be taken to give no water till the plants are growing

freely. A light fibrous loam and some old Mushroom-bed manure form a most suitable compost for filling the large pots, which should be done to the extent of three-quarters, providing good drainage, and making the compost firm. When the seed has germinated, keep the plants near the light in a temperature of 60°, or higher by sun-heat.

POTATOS should be got in readiness for early forcing by placing the tubers of well-ripened early kinds in boxes to sprout, in Cocoa-nut fibre or leaf-soil, in a warm house. If very early tubers are required, a few pots of boxes may be prepared, and planted with some of the earliest varieties, and grown near the light, three-parts filling the pots with a good rich compost, the remainder of the soil being afforded when the tops are a few inches high. These tubers will be ready for use a couple of weeks or more in advance of those planted out. Frames or pits should be prepared for those planted out, using a large proportion of fresh leaves, so that the bottom-heat is not fluctuating, but lasting.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Gardens, Swansea.

THE FORCING PITS.—With lengthening days and brighter weather, the various subjects brought into bloom in these structures will flower more freely than at the close of the year, and successions of plants should be brought into the pits on alternate weeks. Roses in pots showing for bloom should be afforded weak manure-water occasionally, its application is likewise beneficial to *Deutzia gracilis*, *Spiræa astilboidea* and *japonica*, *Staphylea colchica*, *Richardias*, and the like. When closing the ventilators on bright days about half-past 1 P.M., the plants should be well syringed with tepid water, and the walls, trellises, &c., moistened, so as to make the atmosphere humid. During mild weather, the night temperature may range between 55° and 70°, with a rise of 5° to 10° by day, according as the sky is cloudy or not. If severe frosts prevail, it is better to allow the temperature to fall a few degrees lower than these figures than to over-heat the hot-water pipes.

BEGONIAS AND GLOXINIAS.—By sowing seeds of the above at the present time, the seedlings will enjoy a long season of growth, and make robust, large plants, which will bloom towards the end of the summer and the beginning of autumn. Employ perfectly clean pots or pans, and a compost of fiesifted peat and loam in about equal parts, and sufficient sharp silver-sand to keep the soil porous. Put in enough crocks if a pot to half fill it, and if a pan to cover the bottom all over; place a layer of moss or siftings over the crocks to prevent the soil becoming mixed with them, and fill up to within 1 inch of the top with the prepared soil, water it, and allow the surface to dry a little before sowing the seeds. Sow evenly and thinly, and place a sheet of glass upon each pan or pot, covering the same with damp moss to prevent the surface drying before the seeds have germinated. On germination taking place, tilt the square of glass a little, and remove the moss. These seeds should be raised in a hot-bed or the stove. The first batch of old tubers should now be taken from their winter quarters, afforded water, and started into slight growth, soon afterwards potting them in a compost of loam, peat, and sand, the pots made up of being just big enough to hold the tuber. Place them on a shelf near the glass either in the Pine or plant-stove, and afford but very little water until growth is renewed.

TREE CARNATIONS.—The present and two following months constitute a very good time to strike cuttings of these plants. The cuttings are best when made from side-shoots taken off with a heel, these always striking more freely than those without a heel. Before commencing, prepare the required number of 4-inch pots, filling them with a compost consisting of two parts leaf-soil and one each of loam and sharp silver-sand, the whole being passed through a half-inch meshed sieve. Put half-a-dozen cuttings round the edge of each pot, and water them in with a fine-rose pot. It is advisable to plunge the cuttings in coco-nut fibre refuse where the bottom-heat can be kept from 75° to 80°, covering them with a hand-light. It will take from four to five weeks to root the cuttings, and after that has taken place, they should then be gradually inured to the cold air. When well-rooted, stand the pots on a shelf well up to the glass, or in a low pit, and in the course of a fortnight's time they may be potted off

singly into 4-inch pots in a compost of good fibrous loam two parts, and one each of peat and leaf-soil, and sufficient sharp sand to keep the soil porous. Grow them after the potting in a pit where the temperature can be kept at about 45° to 50°, keeping them rather close for a week or more. During this period a slight shade should be used over them in sunny weather. Established plants must have air on all favourable occasions, and towards the end of April they should be removed to cool frames.

GREENHOUSE CLIMBERS.—These plants should now receive attention in the matter of thinning-out weak shoots, and those not wanted to cover the trellis, &c. *Lapagerias* growing in pots may require larger pots or tubs, and where this is the case, they should get attention forthwith, or the young roots, which will soon form, may get injured. Fibrous peat of the best quality should be used for *Lapagerias*, with the addition of silver-sand in sufficient quantity to keep the soil open. See that the drainage is efficient and carefully put into the pots, as when established, the *Lapagerias* require an abundance of water during growth, and when the drainage is defective, the soil soon becomes sour and the plants unhealthy. When potting, it will be advisable to make the soil between the old ball and the sides of the pot very firm. Old plants either in pots or planted out, which may have become crowded with weak shoots, may have a portion of these with advantage thinned out. The present time, before growth takes place, is a suitable time in which to cleanse these plants of insects, using the syringe and clear water afterwards to prevent the attack of thrips, which are very partial to *Lapagerias*.

ALLAMANDAS.—Plants which have been at rest during the winter should be pruned, and those which may be growing in large pots and tubs should have the drainage put into a satisfactory state—a very important matter with a plant like an *Allamanda*, which requires so large a supply of water during the growing season. Plants which do not require repotting should have all of the loose surface-soil removed, and be top-dressed with fibrous loam and silver sand, and a little of Thomson's manure or some other well-tried fertiliser, making it very firm. If the soil in the pot be very dry, it will be advisable to soak the balls in a tub of tepid water before putting on the top-dressing. Those requiring more root-space should be allowed to break away freely before repotting them, using a compost of rich fibrous loam, with sufficient sharp sand to keep the soil porous, and to make the soil firm by ramming it whilst it is being placed handful by handful in the pot or tub. Plants in borders should also have all the loose soil removed, and be well watered and top-dressed.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Barham Court, Maidstone.

PRUNING GOOSEBERRY BUSHES, ETC.—The main branches of these should be well thinned out if there is likely to be any crowding of shoots, keeping those retained at about 6 inches or more apart, according as the variety is a spare grower or a robust one. Begin by cutting out all branches that cross each other, afterwards pruning all the weak shoots to two or three wood-buds. Bushes that have not been summer-pruned will most likely be found to have some shoots close to the ground, and these should be cut close back to the old wood, as any berries growing upon them would become soiled by splashes from the ground. Encourage all shoots that have a tendency to grow erect, and manure the soil well under the bushes if large fruits are required, and be sure and not dig deeply over the roots, only just prick up the earth so as to aerate it.

Birds are in some gardens very troublesome, and if the plantation is a large one, there is nothing better to be done than to reduce their numbers with the gun. If this cannot be done, lime and soot well mixed together should be thrown over the bushes when wet with dew or rain; or petroleum-oil, at the rate of a quarter of a pint to 4 gallons of water, syringed over the bushes, keeping it well stirred during the operation. This latter dressing will need to be repeated about every three weeks.

Cuttings of *Gooseberries* may still be put in. In doing this, select strong, well-ripened shoots, not less than 15 inches in length, and be quite sure to remove all the buds from the base of the cutting

upwards, leaving four or five at the top to form the first base of the future plant. Put these cuttings in ground that has been deeply dug, and made firm by treading, and place them either in slits made with the spade, or in trenches thrown out, and having a perpendicular front, against which the cuttings should rest. From the lowermost bud to the ground-level the distance may be 5 or 6 inches. Make the cuttings firm in the soil by lightly treading the latter.

YOUNG PLANTS.—These generally have three or four growths about 1 foot in length, which should be shortened back to three or four buds. *Gooseberries* are useful when grown on low walls and fences. If the plants are young ones, plant 1 yard apart, and train a branch to the right, and one to the left, to form the base, and from these train up shoots in an upright position, at about 6 inches apart. In the south and warmer parts of the country much can be done to prolong the *Gooseberry* season, by planting against a north or north-east wall. The best system of pruning such plants is to keep them spurred in, in the same manner as the *Red Currant*. Currants may also be grown, as advised for *Gooseberries*.

WALLS WITH COLD ASPECTS.—Upon walls with cold aspects it is often advised that *Morello Cherries* should be planted, but where the extent of wall is greater than is required for this kind of fruit, Plums of the following varieties do remarkably well, thereby prolonging the season of this fruit:—*Coe's Golden Drop*, *Belgian Parple*, *Washington*, *Angelina*, *Burdett*, *Jefferson*, *Reine Claude de Bayay* (in the south only, En.); and doubtless there are others which would be equally serviceable. The wood should not be laid in so thickly on these aspects as on warmer ones, and the borders must be well drained.

THE APIARY.

By EXPERT.

OUT-APIARIES.—In America, where nearly everything (including bee-keeping) is carried out on an extensive scale, it is found absolutely necessary to have out-apiaries, or bee-yards as they are called, at some distance from the home apiary, as it is found the radius of about two miles which bees fly only embraces a sufficiently large area of bloom to ensure a surplus being gathered by a limited number of colonies. This is not so likely to be necessary, for the same reason, in England, as there are not many people at present who keep so large a number of stocks in one place as to exhaust the flowers; but it is sometimes advisable to adopt a similar plan on a small scale, when the bee-keeper is so situated that he is resident in a bad district for bee-pasturage, such as in the vicinity of a town, or in the midst of trees, where honey-dews are troublesome. It is astonishing what a difference only two miles or so sometimes makes in the quality, and often the quantity, of the honey-yield; and the writer is acquainted with a case in point in a neighbourhood in which are situated two apiaries, distant two miles or thereabouts. In one case there are many trees of various kinds abounding, and no white *Clover* is grown on the farms in the parish, the consequence being, that with one exception during the last four years the honey has been darkened with honey-dew. In the other instance, the apiary is situated in close proximity to fields of white *Clover*, and about the only trees near-by are the *Elms* in the hedge-rows. The difference in the composition of the honey each year has been most marked, and not a single trouble from honey-dew has occurred during the corresponding period. The worst difficulties to contend with in keeping bees at a distance from home are likely to occur at swarming-time, and in getting the necessary articles of bee furniture, such as crates or sections, &c., backwards and forwards. The first difficulty can be got over by finding someone who has a garden or piece of ground adjacent to his dwelling who would be willing to let the hives stand there, and undertake to temporarily live the swarms until the owner could be advised and come upon the scene. With careful management and attention, the chance of swarms issuing ought to be reduced to a minimum, and with the help of the self-hivers lately introduced, trouble in this way could perhaps be entirely obviated. A rent of about 1s. per hive per annum would be sufficient to pay for the privilege of standing the bees, but extra trouble in the way of hiving swarms, or any other attention, would demand a larger payment.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	JAN. 25.	{ Peonies, Anemones, Lilies, Tuberoses and Herbaceous plants at Protheroe and Morris' Rooms.
WEDNESDAY,	JAN. 27.	{ Plants from Belgium, Ferns, Roses, Begonias, &c., at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 28.	{ 15,215 Lilium auratum and £100 other Lily Bulbs from Japan; Tuberoses, Daffodils, &c., at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 29.	{ Imported and Established Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38°·6.

The annual meeting of the Gardeners' Royal Benevolent Institution was held on Friday last, and was of so satisfactory a character as to commend it more than ever to the notice and support of gardeners. The report, which we append, shows that, while the benefits of the Institution have been enhanced, the working expenses have been lessened; still, all the time the number of candidates largely outnumbers the number of pensions that can be allotted, there is urgent need of new subscribers, and of liberal donations.

Before, however, proceeding to the special business of the day, Mr. HARRY VEITCH, who occupied the chair, properly interpreted the feeling of those present by proposing a vote of condolence on the occasion of the death of H.R.H. the Duke of CLARENCE, a resolution seconded by Dr. HOGG.

The adoption of the report and the balance-sheet was then proposed by Dr. Masters, who commented on the loss the Institution had sustained in the death of Mr. Cutler, the satisfactory nature of the work accomplished by Mr. Ingram, the newly-appointed Secretary, whom he hoped would have as long and as successful a tenure of office as his predecessor; and on the facilities the Society afforded for procuring pensions during old age if required, alluding specially to the case of James Wells, the circumstances of which are detailed in the report, and to which we venture again to refer, in illustration of the great value of the Society, and of the desirability of further support on the part of the gardeners. The resolution was seconded by Mr. Wheeler. Other resolutions of a formal character were proposed or seconded by Messrs. Webber, Dickson, Monro, Osborn, Williams, Harry Turner, John Lee, Wythes, Denning, Wynne, and others. The result was, that Mr. Veitch was re-elected treasurer, that the retiring members of the committee, which, it may be noted, must by the rules be largely composed of practical gardeners, were re-appointed, with the addition of Mr. Herbert Cutbush, Mr. Hudson, and Mr. H. Williams, in the room of Mr. Weston, Mr. W. Richards, and of Mr. Roberts, resigned.

The election of pensioners was then proceeded with, six of the candidates being placed on the list forthwith by right of their previous subscription. In the evening the members met at a "friendly" dinner, under the chairmanship of the Rev. W. Wilks, their appetites doubtless quickened by the satisfaction attendant upon good work accomplished.

The following is the text of—

THE REPORT.

In presenting the fifty-third report of the Gardeners' Royal Benevolent Institution, the committee are glad to be able to state that the benevolent objects

for which the charity was founded, more than half a century ago, have been carried out during the year 1891, and they would congratulate the members and subscribers on the continued and increasing usefulness of the Institution towards a deserving class of the community.

The committee desire to draw attention to the successful anniversary festival held in July last, which was in a great measure due to the kindness of the Right Hon. Joseph Chamberlain in presiding, and to whom the committee would express their sincere thanks for the eloquent manner in which he pleaded the cause of the Institution on that occasion. The committee are also anxious to express their grateful acknowledgments to those gentlemen who acted as stewards, and to those friends who so kindly sent flowers and fruit which so materially helped to make the festival a success.

The committee deplored the loss of many friends during the past year, amongst whom were His Grace the Duke of Devonshire (a vice-president of the Institution), Mr. W. Richards (a member of the committee), Mr. Joseph F. Meston (also a member of the committee, and formerly one of the auditors).

A NEW DWARF PALM.

FIG. 20.—THRINAX MORRISII: TO SHOW HABIT. (SEE P. 104.)

All these gentlemen were warm friends of the Institution, and will be much missed.

The committee have also to record the loss they have sustained by the death of Mr. E. Roger Cutler. He had held the office of Secretary to the Institution for fifty years, and was untiring in his energies and indefatigable in his zeal on its behalf, and the committee gratefully recognise his efforts, and take this opportunity of expressing their deep regret at his decease.

During the year now closed, sixteen pensioners have passed away, three of them leaving widows; and these, after full investigation, being found eligible, have been placed on the pension list in succession to their late husbands, in accordance with Rule 7. One of them, however, was not destined to enjoy the pension for long, for she died before the year closed, thus surviving her late husband only a few months.

In consequence of representations made to the committee, they approached the son of a pensioner with a view to his foregoing the pension hitherto awarded to his mother. They are glad to announce that he met the committee in a kindly spirit, and acceded to their requests, thus relieving the committee from any further payments on account of this pension.

The committee desire to draw special attention to the fact that they have been enabled during the past year to expend in pensions and gratuities the largest amount on record, viz., £2739 16s. 8d. This they consider is a matter for much congratulation.

They have also determined to increase the number of pensions now on the books by thirteen, to be elected this day, six of them are recommended to be placed on the list without the trouble and expense of an election under Rule 6, the remaining seven to be elected in the usual manner. In thus increasing their liabilities, the committee would confidently appeal to the many generous supporters of the Institution to strengthen their hands by making its needs and the benefits it dispenses more widely known, so that the funds may receive a larger measure of support.

Mention should also be made of the death of James Wells, at the age of 103. He had been a pensioner for thirty-one years, and during that time had received no less a sum than £521 from the funds. In conclusion, the committee would point out that this is the only Society for granting pensions to gardeners and those engaged in horticultural pursuits in their old age. During the time the Institution has been in existence they are pleased to remind their friends that upwards of £55,000 has been distributed in pensions and gratuities to aged and infirm gardeners and others. They would, therefore, earnestly appeal for continued and increased support, to enable them to add to the number of pensioners, and to carry on the good work in future.

TECHNICAL EDUCATION IN GARDENING AND SPADE INDUSTRY.—The following prospectus has been issued:—"Attention has lately been directed to the importance of more extended fruit culture, and to the further development of gardening, as a means for the better utilisation of the land; and many of the highest authorities, on matters agricultural, have considered that smaller holdings, more carefully and scientifically treated by spade industry, form the best and likeliest solution of the present land problem in this country. In order to promote these objects in the near future, as well as to improve the education of working gardeners in general, the

classes for the practical teaching of the craft of gardening and spade industry in the Society's gardens. The cost for a lad, living at the school, would be about £45 per annum, inclusive of everything except clothing, and for a lad attending the classes only, £10 or £15. To carry out this project, an initial sum of £1000 is required, and a further income of £250 will be wanted for three years, after which time the school should become self-supporting. It is proposed to raise the necessary money by subscription, the Worshipful Company of Gardeners heading the list with a donation of £250. Subscriptions for this purpose should be kept quite dis-

by the Rev. H. H. D'OMBRAIN, the Secretary, on "The Rock Garden." He disclaimed all idea of putting forward anything original; he simply described his own rockery, its position and size, and then enumerated some of the plants which he had placed upon it, and dwelt on some of the more difficult plants and their treatment; he showed what enemies there were to contend with, and encouraged lovers of gardening notwithstanding these, to carry out this mode of culture. An interesting discussion, in which Mr. H. Selfe Leonard, the Rev. W. Wilks, Mr. J. S. Cousens, and others, took part.

"KEW BULLETIN."—The parts for October and November now before us contain an article on Chinese fibres, in the course of which Dr. HENRY gives an enumeration of the various plants used for textile fabrics in China. Great confusion arises from the vague and indiscriminate application of the terms jute and hemp, which are often applied in commerce to plants and products which have no right to be so called. The arrow poison employed by the natives of the Malay peninsula is again discussed, and is supposed to consist of the juice of *Antiaris toxicaria* and some species of *Strychnos*. Further details are promised which will be the more interesting, as previous investigation seemed to show that the poisonous qualities of the Upas tree (*Antiaris*) were more or less mythical. To the present part is appended a series of miscellaneous notes containing what we may call the news of the garden and similar establishments. This is a feature we cordially welcome, and from which we shall frequently make extracts.

TWO NEW PODOCARPS.—From Prof. HENRIQUES of the Botanic Garden, Coimbra, we received long since fruits and leaves of the West African *Podocarpus Mannii*, originally described by Sir JOSEPH HOOKER in the *Journal of the Linnean Society*, vii. (1864), p. 218, but, so far as we know, not previously introduced into cultivation. Here it would require to be grown as a stove shrub. Its leaves vary from 3 to 6 inches in length, and are about a quarter of an inch broad, bright green, shining, linear-lanceolate or sickle-shaped, with a prominent midrib and stomata on both surfaces. The fruit has been described by Prof. HENRIQUES in the *Boletim de Sociedade, Brotariana*, vol. v., p. 216, and some anatomical details are given in vol. vii., p. 122 of the same periodical. A second new *Podocarpus*—new, that is to gardens—we lighted upon in the orchid nursery of Messrs. Sander. It is, we believe, the *Podocarpus pectinatus* of Brongniart and Gris, a specimen of which is in the Kew herbarium, authenticated by one of the authors; but we have not succeeded in discovering whether or no the species has been published. The leaves which measure about 20 mill. long by 2 in breadth (nearly 1 inch by $\frac{1}{4}$ wide), are densely arranged in two ranks, one on either side of the branches. Each leaf is linear, falcately curved towards the acute point, decurrent at the base, dark green above, with a depressed midrib between two white bands of stomata, beneath silvery, with revolute margins, and a broad white stomatic band on either side of the prominent green midrib. The fruit is not known. The plant is a native of New Caledonia, and would make a pretty plant for the decoration of the table.

THE ORCHIDEEAN SOCIETY.—The meeting of the 10th inst. was successful, in spite of the cold and a heavy fall of snow. The most remarkable exhibits were those of *Odontoglossum crispum*, *gloriosum*, *Cattleya Warscewiczii*, *Cypripedium nitens superbum*, *C. Leeanum superbum*, *C. Harrisianum superbum*, and *C. Peteri*, and many others. The awards made were the following:—Diplomas of Honour of the First Class to *Paphinia Lindenii*, from M. Linden; to *Odontoglossum suavisimum*, from M. Linden. Diploma of Honour of the Second Class to *Odontoglossum Lindleyanum* × *Pescatorei*, from M. Linden. Botanical Certificates to *Restrepia striata*, from M. Linden; to *Zygopetalum* sp., from

A NEW DWARF PALM.

FIG. 21.—*THRINAX MORRISII*: PART OF LEAF, INFLORESCENCE, AND FRUITS. The fruit on the left-hand side is of the natural size. (See p. 104.)

Worshipful Company of Gardeners, acting in co-operation with the Royal Horticultural Society of Great Britain, propose to establish a British School of Gardening, where lads of from fifteen to eighteen years of age may receive a thoroughly practical training in all the details of their craft, together with such simple elementary scientific instruction as may be sufficient to enable them to take an intelligent interest in, and gain some little real insight into, the manifold operations of nature with which they will, in their after life, be concerned. The Worshipful Company of Gardeners proposes to furnish a house at Chiswick (in the immediate neighbourhood of the Royal Horticultural Society's gardens) for the reception of students, and to appoint fitting persons to act as instructors and lecturers, and to establish

tinct from those to the Royal Horticultural Society, and should be made payable to the Rev. W. WILKS, 117, Victoria Street, Westminster, by whom they will be gladly received, and most gratefully acknowledged.

HORTICULTURAL CLUB.—The usual monthly meeting of the Club was held on Tuesday evening last at their rooms, Hotel Windsor, Victoria Street, Westminster. There was a good attendance of members. The Rev. W. WILKS presided, and there were present the Rev. F. R. Burnside, Messrs. Crowley, H. J. Pearson, A. H. Pearson, G. Bunyard, J. S. Cousens, H. Percy Hall, E. B. Lindell, W. F. Cooling, H. Selfe-Leonard, G. Prince, E. Prince, and the Secretary. The discussion was opened

M. Linden. Certificates of Merit of the First Class to *Odontoglossum* sp., from M. Warocqué, by acclamation; to *Cypripedium Harrisianum* superbum, from M. Warocqué, unanimous; to *Dendrobium Lceanum*, from M. Linden, unanimous; to *Cattleya granulosa* var., from M. J. de Lansberge; to *Odontoglossum Alexandræ*, from M. le Dr. Capart; to *Cypripedium Harrisianum nigrum*, from M. le Dr. Capart; to *Odontoglossum Audersoni*, from M. Van Noten; to *Cypripedium Rothschildianum*, from M. Treysen; to C. Sallieri Hyeanum, from M. Linden; to C. Lathamianum, from M. Linden; to *Odontoglossum crispum*, from M. Warocqué. Certificates of Merit of the Second Class to *Dendrobium MacCarthiae*, from M. A. Van Imschoot; to *Lycaste Skinneri* alba, from M. A. Van Imschoot; to *Odontoglossum Alexandræ*, from M. Warocqué; to O. Alexandræ, from M. A. Wineq; to O. sp., from M. Van Noten; to *Lælia anceps* Hilli, from M. A. Van Imschoot. Cultural Certificates of the First Class to *Cypripedium nitens* superbum, from M. G. Warocqué, unanimous; to *Odontoglossum gloriosum*, from M. G. Warocqué, unanimous; to *Cypripedium Lceanum* superbum, from M. G. Warocqué; to *Rodriguezia crispata*, from M. Linden; to *Odontoglossum Ruckeri*, from M. Linden.

SALTPETRE AS A REMEDY AGAINST CATERPILLARS.—In the *Erfurt er Illustrirte Gartenzeitung*, a correspondent recommends the use of saltpetre in solution against the ravages of caterpillars, at the rate of 10 grammes, = 0.35 of an ounce (about one-third of an ounce), to 1 litre of water: about 1½ pints. The solution must be syringed or sprayed over the plants twice or thrice.

STOCK-TAKING: DECEMBER, 1891.—As anticipated by all who have followed us in these brief reports during the past six months, the Trade Record for the last month of 1891 shows a large increase in the imports of foreign and colonial produce into this country, and a continued decrease in the exports of British and Irish manufactures. The bad harvests on the Continent, here, and Russia, have necessitated the purchase in more favoured lands of enormous supplies of cereals, and here the speculators, shippers, and shipowners have proved quite equal to the occasion. Hence the great increase in imports for distribution. Here it will be opportune to give our usual extracts from the tabular summary of imports from foreign countries and British colonies and possessions during the month of December:—

IMPORTS.	1890.	1891.	Difference.
Total value for month	£39,434,448	£42,361,980	+3,827,532
§II.—(A.) Articles of food and drink—duty free ...	12,735,321	15,358,933	+2,623,612
(B.)—do., dutiable	2,587,080	2,388,078	-199,002
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	9,900,104	11,607,560	+1,707,456
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,118,735	2,942,990	-175,775
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,556,892	1,811,333	+254,441
(B.)—Parcel Post ...	50,169	67,808	+17,638

The exports for the month show a decrease of £1,544,455, as compared with December, 1890, but there is an increase in the matter of foreign goods exported of £392,717. The decrease in exports has been most marked during the past six months—and this points to the McKINLEY tariff and to South American crises, as the causes to which the reduction is to be attributed. Of this, however, a few lines will be given later on, when dealing with the year's work, and in its usual place we now give the

usual excerpts relating to the imports of fruits and vegetables, for the "last lingerer of the twelve":—

IMPORTS.	1890.	1891.	Difference
§II. Fruit:—			
Apples, raw ... bush.	283,237	579,064	+295,827
Unenumerated, raw ...	51,460	48,420	-3,040
Onions ...	273,697	303,806	+30,109
Potatoes ... cwt.	47,589	60,705	+13,116
Vegetables, raw, unenumerated ... value	£35,094	56,277	+21,183

THE PAST YEAR.

It will be of value now to take stock of the year 1891, taking first in order the figures relating to fruits and vegetables, and so bringing them in sharp contrast with those for the month just placed on record. The figures for the year are as follows:—

IMPORTS.	1890.	1891.	Difference.
Fruits:—			
Apples, raw ... bush.	2,574,957	3,147,373	+572,416
Unenumerated, raw ...	3,584,668	3,490,211	-94,457
Onions ...	3,871,195	4,281,046	+409,851
Potatoes ... cwt.	1,940,100	2,192,836	+252,736
Vegetables, raw, unenumerated, raw ... value	£773,890	932,887	+158,997

These figures carry their own lesson with them—they, with those contained in the general import table, show that every bushel of fruit or corn sent here can find ready sale, together with everything on four or two legs worthy of use as human food. As a companion to the table of imports for the month, we extract the following figures relating to the year:—

IMPORTS.	1890.	1891.	Difference.
Total value ...	£20,885,695	£23,691,279	+14,805,584
§II.—(A.) Articles of food and drink—duty free ...	136,422,110	148,510,208	+12,088,098
(B.) Do., dutiable ...	24,216,864	27,004,982	+2,788,118
§VI.—Raw materials for textile manufactures ...	85,239,289	89,215,855	+3,976,566
§VII.—Raw materials for sundry industries and manufactures...	41,626,155	40,635,435	-1,990,720
§IX.—(A.) Miscellaneous articles ...	14,607,678	14,935,518	+327,872
(B.)—Parcel P. st ...	503,209	581,069	+77,860

EXPORTS.—Here let us briefly note that the exports for 1891 are valued at £247,272,273, as against £263,530,585, or a decrease of £16,258,312. The increase in imports is a large one—the decrease in exports of British and Irish produce is less by ten millions sterling than was prophesied at the beginning of the year left behind. It was predicted that the falling off would be some twenty-six millions, and that our imports would suffer greatly; it was forgotten that we are free traders, with an immense power of development in our internal trade. We had our McKINLEY "boom" in 1890, and for some things in the first half of 1891; then came the staggering blow delivered from South America. We are getting over the latter little by little, the great harvest in the United States and the equally great demand for it on this side of the Atlantic has done much to set up trade again—at any rate the loss is greatly reduced; the necessity on both sides tend to restore the balance of trade. There is all over the world an endeavour after the righting of tariffs, the giving to the best men the best chances. At home here, we are learning that large supplies of cheap raw material will enable us to outlive the disturbing effects of the insane policy of so-called "protective" tariffs; and with thrift at home and an expansion of internal trade, we can afford to wait the release of commerce among our old customers all over the world. Whilst waiting for this, we note that the acreage devoted to cereal cultivation is not extending as perhaps it ought to do, as, in fact, it would do under different tariff arrangements; so that at home

here it will now pay to grow corn of all kinds—pay to give the labourer an interest in the land he helps to cultivate—pay to keep him and his away from towns and the workhouse—pay to treat him and to keep him as a man. If this is to be the outcome of our present experience, then we may have reason to bless even the McKINLEY tariff and the latest French and Spanish arrangements; for it is astonishing how soon we can see our way to do the right thing when we discover that it will pay! Masses of figures as the recently issued Board of Trade Returns are, they contain within them a grand lesson, a story easy to "write large"—in the doing of which our part has been done, though in a modest way, year by year in the columns of the *Gardeners' Chronicle*.

THE LAL BAGH GARDENS.—The Secretary of State for India in Council has selected, upon the nomination of Kew, Mr. JOHN HORNE STEPHENS, to be Head Gardener at the Lal Bagh Gardens, Bangalore, under the Durbar of Mysore.

THE WEATHER.—We take the following figures from the summary of the weekly Weather Reports, obligingly furnished us by the Meteorological Department:—

Rainfall, in Inches for 25 Years.

YEARS.	Principal Wheat-Producing Districts.							
	Scotland, N.	Scotland, S.	England, N.E.	England, E.	Midland Counties.	England, W.	Wales for W. Producing Districts.	Means for 25 years, 1866 to 1890 ...
	43.6	30.9	25.3	25.7	28.8	29.5	28.2	

Mean Temperature, in Degrees, Fahrenheit.

YEARS.	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...
	15.6	46.6	47.2	48.3	48.3	49.3	47.9	

Rainfall, in Inches.

YEARS.	Principal Grazing, &c., Districts.							
	Scotland, W.	England, N.W.	England, S.W.	Ireland, N.	Ireland, S.	Means for Grazing, &c. Districts.	Means for the British Islands generally.	
	45.2	39.7	44.0	35.6	39.9	41.7	35.0	

Mean Temperature, in Degrees, Fahrenheit (for the whole Country).

YEARS.	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...	1866 to 1890 ...
	47.7	48.3	50.4	48.2	49.8	48.9	48.4	

Table showing the Dates of the Driest and Wettest, and of the Coldest and Warmest Years for the Twenty-five years, 1866 to 1890.

Description.	Wheat Districts.	Grazing, &c., Districts.	Generally.
Rainfall:—			
Driest ...	Ins. 21.0 in 1887	Ins. 30.5 in 1887	Ins. 25.8 in 1887
Wettest ...	40.2 in 1872	58.0 in 1872	49.1 in 1872
Temperature:—			
Coldest ...	45.5 in 1879	46.9 in 1879	46.2 in 1879
Warmest ...	50.1 in 1888	50.7 in 1888	50.4 in 1888

BIRMINGHAM AND MIDLAND COUNTIES GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—At a general meeting of the committee of this Association on January 14, 1890, it was unanimously resolved that an annual appeal should be made to the whole of the members for small contributions in aid of the Gardeners' Orphan Fund, and that the amount so raised shall be sent as a contribution from the members as a body, the smallest contribution will therefore be thankfully received at the

general meeting on February 3; and as it is not the intention of the secretary or committee to appeal again this year for contributions, those members who find it impossible or inconvenient to attend on that occasion, should send their contributions to the Secretary, Mr. J. HUGHES, 140, High St., Harbourn, Birmingham, on or before that date. As the orphan of one of our late members has been elected on the funds, it is the earnest wish of all concerned that the amount so raised shall be in proportion to the numerical strength and importance of the Gardeners' Association of the City of Birmingham and the surrounding district, thereby assisting to supply the means for further extending the benefits of this noble Institution. A special tea and social gathering of members and their lady friends will be held at the Colonnade Hotel, New Street, on Thursday evening, February 4, to celebrate the sixth anniversary of the Association, when it is hoped that all members who can possibly make it convenient will attend on this occasion, especially the honorary members. The following is a programme of the lectures to be given at the Society's Rooms, at half-past 7 o'clock on Wednesday evenings. January 20.—"Apples: English Production and Consumption," Mr. J. Pope; "Practical Illustrations of the Art of Pruning," Mr. W. Spinks. February 3.—"The Gloxinia, 1739 to 1892," Mr. James Martin (Messrs. Sutton & Sons). February 17.—"The Progress of Horticulture in the United States of America," Mr. A. Outram (Messrs. B. S. Williams & Son, London). March 2.—"Modern Gardening," Mr. H. Dunkin, The Gardens, Warwick Castle. March 16.—"The Cultivation of Pears in Edgbaston," F. M. Mole, Esq., Westfield Road, Edgbaston. March 30.—"Spring Flowers," E. J. Baillie, Esq. (Messrs. Dicksons, Chester). And presentation of Silver Medal from *Journal of Horticulture*.

ALGERIA.—The Botanical Society of France will organise this year a session in Algeria of a week's duration. The oasis of Biskra, the Cedar forest of the Atlas, and other interesting localities will be visited, while Oran or Tunis can be visited on the return journey. Happy fellows of the Botanical Society of France!

COSTLY ONION SEED.—We learn that recently a well-known Onion trader paid no less than 70s. for an ounce of Ailsa Craig Onion seed, saved by a private grower, from a first-rate stock, though the quantity of bulbs planted should have produced fully a pound weight of seed. The fact serves to illustrate at once the smallness of the Onion seed crop of the past year, and also the great value set upon a choice stock of a new variety, when an adverse season in not a few cases nearly destroys the seed crop altogether. Onions are peculiarly liable to injury from heavy rains and continuous damp weather, even apart from what they are liable to from mildew. Rains both destroy fertility of bloom, and later, rot or decay the stems of the seed-vessels, hence the injury done to a seed crop is often wholesale. Growers must expect to pay a good price for comparatively old Onion seed, and must sow thinly and carefully.

STRAWBERRY CULTURE IN CORNWALL.—The serious question of retaining the population in rural districts has, to a certain extent, been satisfactorily solved in Cornwall. In the fruit-growing districts of St. Dominick the industry of basket-making, in connection with Strawberry culture, has developed to a gratifying degree. Thirty years ago the reputation of Cornish Strawberries had not crossed local bounds; now they are grown extensively for the London and other markets. About 100 acres are devoted to Strawberry culture in the parishes of St. Dominick and Calstock, and it may be computed, says the *Western Morning News*, that 10,000 boxes and 500,000 punnets are required for the marketing of the crop. Fifty baskets are packed into a box, and the fruit is well protected from injury. In addition to local requirements, Mr. J. W. HAWAY, of Bouthwey, St. Dominick, has contracted to supply, for the coming season, 15,000 gross of baskets for Scotland. Women

and children are employed in making punnets during winter, and picking fruit in summer.

JAPANESE BULBS.—The exportation of Lily bulbs from Japan in August last (we cite from the *Journal of the Japanese Horticultural Society*) amounted to 2,992,720, and in September to 7,587,760. Of other plants and shrubs the numbers were—August, 284,570; September, 232,100. The imports of plants (not bulbs) for the same period was larger.

ACADEMY OF NATURAL SCIENCES, PHILADELPHIA.—It was proposed that Mr. THOMAS MEEHAN should be the President of this body in the room of Dr. LEIDY; but Mr. MEEHAN has declined the nomination on the ground of want of time. Those who know Mr. MEEHAN know that this is no empty excuse, and feel that the Academy, which owes so much to Mr. MEEHAN's energy, could hardly have done otherwise. Mr. MEEHAN remains a Vice-President.

CATTLEYA LABIATA AND THE ORPHAN FUND.—By the sale of a specimen plant of *Cattleya labiata*, and to which we referred last week, the Gardeners' Orphan Fund has benefited to the extent of £50. Mr. SANDER, the importer and vendor instructed the auctioneers, Messrs. PROTHEROE & MORRIS, to send the proceeds of the plant to the Fund without any deduction; the auctioneers on their part sold the plant without charging commission, and the sale was gratuitously advertised in the gardening papers. The plant was an enormous specimen, with 250 bulbs.

A CAUTION.—A correspondent from Barnstaple says that a man is calling on the gardeners in that neighbourhood representing himself as being sent by the Royal Horticultural Society to gardeners to invite them to take a book on fruit-growing in quarterly parts at two shillings per month, the taking of which would ensure the recipients becoming Fellows of the Royal Horticultural Society. The canvasser does not take the money but only the order for the book. On enquiry at the Royal Horticultural Society, our correspondent learns that there is no truth in the statement, the correctness of which has been further promptly arraigned by the secretary in a letter to ourselves.

THE ROSARIANS' YEAR-BOOK.—The "Year-book" for the present year opens with a portrait of Mr. T. W. GIRDLESTONE, accompanied by a sympathetic notice by the editor, the Rev. H. H. D'OMBRAIN. The remaining articles are of the usual type, that of Lord PENZANCE on "Hybridisation" affording more novelty; but even that has been discounted by a previous article in the Report of the Rose Congress. Much of the book is taken up with the discussion of the grievances of those who only grow a small number of Roses, and who are consequently at a disadvantage in competing with the masters of big battalions; but they are not obliged to enter into competition unless they please, and the object after all is the improvement of the Rose, not the glorification of the exhibitor, however innocent that may be. Mr. MAWLEY's Meteorological report gives permanent value to a pleasant little annual. That, up to August last year, there should have been 31 hours more sunshine in the Rose year than the average, will surprise those who have dismal recollections of the wet, cheerless summer; nevertheless, the fact was noted at the time.

WHAT IS THE VALUE OF A TREE?—This question, with one or two others connected therewith, has been settled by the Queen's Bench Division for the special benefit of the London and North-Western Railway Company. A gentleman residing in Adelaide Road, Haverstock Hill, near the company's line, and hard by the Chalk Farm tunnel, had two Poplars in his garden, which shielded him from the smoke and deadened the noise of passing trains. These the company desired to remove, because somehow they interfered with the traffic. The owner was willing to lop off branches that were in the way, but, as a screen against the sulphurous emanations, he

desired to retain the Poplars. Negotiations failing the company sent their own men, felled the trees, and then paid £50 into court. Later they increased this sum to £100. Suburban residents who dwell near the ironways of all-powerful railway companies may be glad to learn that the Court assessed the value of the trees at three times this amount, and gave damages for £200 in addition to the sum paid into Court.

AN EMERALD-GREEN CARNATION.—Yes! but artificially produced. This flower is quite fashionable just now in Paris for button-holes and dress ornaments; and by the kindness of Geo. C. RAPHAËL, Esq., we have been enabled to inspect a specimen. The variety used for the treatment is an ordinary white *Carnation*, as the uncoloured just-expanding buds, which have not taken up the chemical employed to produce the green colour, prove. The expanded flowers are white at the base, but the blades of the petals are more or less flaked with that peculiar green tint so much admired in *Ixia viridiflora*. Doubtless some persons might take it for a natural production, but at best it is a very artificial-looking piece of nature.

THE ROYAL DUTCH HORTICULTURAL SOCIETY proposes to organise an international Chrysanthemum exhibition, to be held in November at Amsterdam.

PROFESSOR HUGO DE VRIES.—We learn with pleasure from *Semperparans*, a Dutch gardening periodical, that the Deutsche Botanische Gesellschaft has nominated Professor HUGO DE VRIES, at Amsterdam, to be member of honour. Since 1886 Professor HUGO DE VRIES was corresponding member of that Society.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The seventh ordinary meeting of this Society was held on the 7th inst., Mr. A. HESLOR in the chair. An interesting paper was read by Mr. HARWOOD on "British Ferns," several members joining in the discussion which followed. At the close of his paper, the essayist offered, on behalf of a friend, a prize of six Ferns for the best essay on any subject to be named by the committee. The treasurer announced the receipt of a cheque, value £10 10s., from the president of the society, an intimation which was received with applause. It is intended to hold a grand concert and ball under the auspices of the society on the 24th of February.

HORTICULTURAL MEETING AT GHENT ON JANUARY 10.—In spite of the frost, fifteen exhibits were staged. For each of the following a Certificate of Merit was awarded:—*Odontoglossum Wilkeanum* var. (by acclamation), to M. G. VINCKE-DIJAARDIN—a splendid variety, the flowers nearly yellow, and much spotted with brown. *Odontoglossum Alexandræ* Madame la Baronne Ruzette (Certificates unanimously awarded)—a very beautiful variety, flowers rounded, perfect in form, regularly marked with large brownish-red spots. *Cypripedium Niobe*, to the same (unanimously awarded), now flowering for the first time in Belgium; and a very distinct and good hybrid of *C. Syccarianum*, from which it was raised. The standard is much veined with lilac of a shade unusual in Orchids; it is still more enhanced by the deeply-tinted petals. *Vriesia cardinalis* (V. brachystachys × V. Krameri)—a most remarkable novelty, raised by M. DUVAL, of Versailles, and staged by M. ADG. VAN GELT; the flowering season lasts for two or three months. *Lælia anceps* var., to M. DELANGHE-VERVAENE—a deeply-coloured and most interesting variety. *Lamprocoelus Wielhachii* Ledeb., to M. FOKKMAN-MAENHOOT—a pretty Bromeliad, with deep brown foliage and violet flowers, darker than those of the type. Honourable Mention was awarded to MM. DRIEZE FRÈRES, for a well-cultivated *Perla Rex*, in full vigour.

THE BERLIN BOTANIC GARDEN.—Dr. URBAN has published an account of the Royal Botanic Garden, and of the Botanical Museum of that city, drawn up on the occasion of the uncovering

of the bust of the late Professor EICHLER. It contains a summary of the history, and of the contents of the Institutions in question, from which we learn, among other things, that the Fern Herbarium of the late THOMAS MOORE has been presented to Berlin by the Kew authorities.

MISTLETO.—Up till quite recently it has been assumed that the growth of the Mistletoe was necessarily prejudicial to the tree upon which it grows. With the discovery of "symbiosis," or that arrangement whereby two plants live in intimate association one with the other without injury to either, but perhaps with reciprocal advantage—a different view has been taken and an Apple tree is supposed to be advantageous to the Mistletoe growing on it in summer, while in winter the Evergreen Viscum supplies the deficiency which the Apple experiences by the loss of its leaves. M. GASTON BONNIER has been putting the matter to the proof by estimating comparatively, the changes which occur in the composition of the two plants and of the atmosphere during growth. For half the year it is found that the Mistletoe assimilates food by its green leaves for the denuded Apple tree. We cannot give the details of M. BONNIER'S experiments, but it is sufficient to say that they completely bear out the idea of perfect "symbiosis," or mutual adaptation, and that save by mechanical obstruction, the Mistletoe does no harm to the tree on which it is growing.

TUNBRIDGE WELLS GARDENERS' ASSOCIATION.—On Tuesday evening, the 19th inst., a meeting of this society was held at the Friendly Societies' Hall, Tunbridge Wells, when Mr. B. H. RICHARDSON occupied the chair. The subject of starting the proposed scheme for a Central Delegate or Syndicate Organisation of Gardeners' Societies for the South of England was introduced, and several members present took a lively interest in the various matters which an united body by a combination of effort could deal with for the benefit of those whose business was the study of horticulture and market gardening. The secretary, Mr. D. G. CORNWELL, confirmed the opinions expressed by previous speakers as to the variety of useful work such an organisation, if taken up heartily by the societies generally, would be capable of carrying out. The entire success would rest in the hands of the Societies and their members. In Belgium and the United States it was of great usefulness and benefit, and having been tried and found so there, there was no reason why this country should not reap some useful and lasting benefit from such a body. It was eventually proposed by Mr. L. DUPOND, and seconded by Mr. WANE, "That the Tunbridge Wells Society do start the Central Delegate Organisation, and that the committee make any necessary arrangements to carry out the suggestion." It was proposed by Mr. DONOVAN, and seconded by Mr. CHITTY, "That a subscription fund be opened to entertain the delegates free of expense on their first visit to Tunbridge Wells."

HOME CORRESPONDENCE.

TECHNICAL EDUCATION IN HORTICULTURE.—It seems to many of us that if Mr. Thibault-Dyer had carefully pondered over the Technical Instruction Act of 1889, he would hardly have disparaged the utility or usefulness of teaching horticulture to a very considerable extent, at least, through lectures and demonstrations. In that Act, technical instruction is defined "as instruction in the science and art applicable to industries, and the application of special branches of science and art to specific industries and employments." The expression "manual instruction," defined as instruction in the use of tools, processes of agriculture, and modelling in clay, wood, or other material, is, in other and yet briefer words, as I have described it elsewhere, any or all teaching that makes the hand more skilful and the head more wise. The sciences and arts bearing upon horticulture or agriculture include almost the entire circle of both, and one of the chief things needed throughout the wide fields of British industry is

greater skill in the use of tools, the prevention of the waste of force, and the cheapening and increase of production. To say that such objects can be better taught in schools or by means of secondary education than by competent lectures, which link together the lessons of science and the most experienced instruction in the use of tools in garden and field within sight and touch of the living plants, is at variance with all that is known of the history and progress of gardening. Each botanic or other public garden, our best nurseries, and private gardens have all formed more or less successful class-rooms for the teaching of technical education. The amount of educational and other work done in and through them has been in the exact ratio of the amount of thought put into them, and the measure of skill in the use of tools they exhibited. Now, in order to hold our own in the first rank among the industries of the world, it is of the most vital concern to us that our heads and hands alike should be made stronger through fresh accessions of wisdom and skill. And possibly no better means will be found to promote such desirable objects than the teaching of technical education through itinerant lecturers under the auspices of the County Councils. No doubt the science and practice of horticulture and agriculture ought to be taught in all our [rural] schools, primary, secondary, higher schools, and colleges. But that concerns the future farmers, gardeners, mechanics, labourers, and professional men in the rural districts rather than the present generation, who cannot well go to the day, evening, or other schools or colleges over again to learn the science or practice of replenishing the earth and subduing it on the easiest and most profitable methods. Hence the simplest and easiest methods of reaching our contemporaries of to-day is by means of the lectureships that are being arranged through the County Councils. It is to be hoped that this new departure in technical education will prove a source of pleasure and profit to very many in the country. How comparatively few of those outside our larger gardens have ever received any outside instruction in horticulture. The few specialists among them will, as a rule, rather do things for their neighbours than show the latter how to do them for themselves. In this respect County Council lectures and lecturers will prove the missing-link to bring the pleasures and profits of horticulture within reach of all. It is astonishing how very little is generally known of the many sciences upon which the successful cultivation of the earth rests. And as for skill in the use of tools, how few labourers have yet learned the mechanical rules and skilful application of the same that will ensure the greatest amount of work with the least expenditure of energy from such common tools as the spade, fork, knife, axe, pick, &c., while the ignorance is yet more profound as to the tending earth and the structure and resources of the living plants that constitute between them at once his factory and his machinery in motion, that mould the character and profits of his products. If knowledge is power in horticulture as in all other industries—and it is even more so than in most—no one who knows of its present state among large masses of the people can doubt that every advance of knowledge through technical lectures or otherwise, will add to the wealth and happiness of the nation. I heard my latest about technical instruction in a charming garden at Bishop's Stortford, where Grapes of rich black and gold, enormous Chrysanthemums, and a houseful of bridal-like Eucharis took the prize for perfection. The rise of these Eucharis from the verge of ruin to the present state, proved the subject of the ablest and most vivid exposition of ways and means adopted to raise them from the verge of death that I have ever listened to. Unless the grower of these plants can be persuaded to send you an account in full, I shall be compelled to give you the substance of his lecture to vindicate my eulogism. But to those most conversant with the sayings and doings of our best gardeners, crowded memories prove, were proof needed, that practice and preaching—that is, technical education—have always and everywhere gone hand in hand in the teaching and advancement of horticulture. D. T. Fish, Westgate Street, Bury St. Edmunds.

—Whatever may be the nature of the technical education work taken in hand by some county councils, I can, at least, vouch for the county council of Surrey that it is trying to do a good work. In the best possible way I have the pleasure, under Mr. J. Wright, to be engaged in giving horticultural lectures in diverse and

chiefly rural portions of the county, and can hear warm personal testimony to the exceeding interest shown in the course by the respective audiences. We find everywhere the local elementary schools placed at our disposal, and in each parish, or group of parishes, there is a local secretary (lady or gentleman) who makes all the needful arrangements in conjunction with the county council technical education secretary. Thus when the lecturers arrive on the scene at the appointed hour the rooms are ready and lighted, also well warmed, and the auditors ready, or very quickly so. These consist chiefly of local artisans, cottagers, small farmers, a few small gardeners, and some youths. The gatherings range from twenty or so up to fifty. Just recently the plague influenza has kept many of the earlier attendants at the lectures away. The lecture generally occupies one hour and a quarter. We have no chairmen happily, but can dash at once into the subject. An ordinary black-board easel answers admirably to elevate and expose the diagrams which we usually have for each lecture, from six to nine of large size mounted on rollers, and illustrating all sorts of subjects in gardening in a way that attracts the keenest attention. These to the number of about eighty, Mr. Wright has obtained at considerable outlay. The lecture subjects, to give variety, usually comprise two or three the same evening. The course comprises twelve in all, and are partly written, partly oral. The diagrams constitute splendid texts on which to dilate. I have mentioned so much just to show amidst all the talk of what should be done, what is in a quiet unostentatious way being already done. Richmond.

—Where are we now? I am a little confused in my ideas of English gardening and gardeners, after reading all that has lately been written about them. I had thought that English gardening was the best in the world; that English gardeners were first, and the rest nowhere. They could grow the best of fruit, of vegetables, of flowers, and could make the best of gardens; in short, that they knew the trick, thus application, better than any. It had seemed to me also that the English-trained gardener was in demand all the world over, wherever good gardening was wanted. Even the "superior" foreign gardener came to England to learn the art—to catch the trick. If the "prophets" are right, then I have been utterly and ridiculously wrong. They declare that in general knowledge and intelligence we are much inferior to [some of] the "foreigners," and that, all things considered, we are worse gardeners than our fathers were. The English gardener is "played out." Well, boys, that is a serious state of matters! County Councils have rushed to appoint a number of "Professors" of garden technology to go out into the country and teach the uninitiated how to realise Mr. Gladstone's dream of England for the English in regard to fruit. I do know a few growers of good fruit and vegetables in the country who could, or would try to, teach Mr. Gladstone better. And the Royal Horticultural Society, or that section of it called the Council, has committed itself to a scheme which is to turn out men of the superior character required for £45 a year, bar clothing. The kind of training you and I have had is not the right kind. We have too much potting-bench and spade-knowledge, and too little of what is called "Technology," which appears to be something taught by magic-lanterns and "Professors." I repeat, where are we now? The nurserymen will tell you that they never had so many good men on their books as now. The advertising pages of the gardening papers will show you what a host of men there are begging for situations. Employers themselves know something about it, too, for they can hire gardening skill much cheaper than for any other kind of skilled labour. But the complaint is, that the gardener to-day is not worthy of his hire. Let me here state a case—fact, every word of it. A few weeks ago a wealthy gentleman applied for a head gardener for his indoor department. He would be required to force Grapes, Peaches, Strawberries, Figs, vegetables; to look after the Orchids, and stove and greenhouse plants. A man was found, a good one, and he was accepted subject to terms. The gentleman had been informed that 18s. per week, with rooms, was what he ought to pay. The man thought his ten years' experience in noblemen's gardens was worth a labourer's wage; at any rate, so he asked 20s. The gentleman did not reply to his letter! I believe there are a hundred competent men, at least, who would have taken

that place at £1 a week. What is a gardener? In the name of common sense, let us look at the matter straight. Is it not the fact that for one gardener who is paid £2 per week there are twenty who do not reach that figure? What do you want for 30s.? The "prophets" write as if every man Jack of us could be as successful as Paxton if we were not such dolts. One prophet says he wants "plan-drawing, botany, and elementary Latin;" another says, "Every gardener should qualify for a directorship or an estate manager." Do you want men who know how to grow fruit, vegetables, and flowers? Give me an order for a thousand, and I will find them in a month, all natives too! But I cannot guarantee the elementary Latin and botany. (Oh, Mr. Cannell, Mr. Low, Mr. Williams, Mr. Waterer, Mr. Noble, all you successful ones! what do you think of all this? The poor down-trodden gardener of England; badly paid, treated like a groom, forbidden to marry, how comes it that you have managed to beat the world in your own particular line? Wake up now, and get off to school again, for the prophets have declared that, as you lack polish, you don't know Latin, and haven't digested Sachs, you are not worth your 30s. a week. In the expressive, if not polished, language of the potting-shed, I say to the "prophets," "Look here, just you draw it mild." W.

— At the present time, when the subject of improving the education of gardeners by means of influences outside of the garden is being discussed, I take the liberty of making a suggestion as to a method whereby head gardeners and others who have charge of men might, without any great trouble to themselves, assist them to obtain much valuable information on gardening matters. I have practised the following system for some years, with very marked and satisfactory results to the young men and boys under my charge. My procedure is as follows:—At the beginning of winter, I provide each individual with a note book, in which I write out every week two or three questions on subjects connected with gardening or nursery work. The questions are varied to suit the degree of intelligence and knowledge of each individual. I issue the note-books every Monday, and they are returned to me for correction on the following Saturday; but a longer interval might be given if thought more convenient. I need not here attempt to give a series of questions, as every gardener who might care to try the experiment can easily supply hundreds from the multifarious items which go to make the sum total of his year's work. If once young men can be started to look up the information needed to enable them to answer in a satisfactory manner such a series of questions as I have indicated, they will usually be found taking a greatly increased interest in their duties. Another plan for assisting young gardeners to obtain a hold of their profession is, the practice of keeping a diary in which to note down the daily work. I do not know of any habit which a young man can form which will tend to give him more quickly a grasp of his work; and, moreover, a well-kept diary is of great service to a man when responsibility is thrown on him. A diary suitable for this purpose can be purchased for about 1s. 6d. If a gardener would try and induce his young men to begin such a practice at the commencement of the year, and give them some advice and encouragement, I am confident that much benefit would accrue to both parties. The majority of gardeners are by reason of their living in more or less isolated country districts, barred from sharing in many of the advantages in the way of night classes, which are open to workmen dwelling in cities. They have considerable time on their hands in the evenings during the winter months, and if gardeners can do anything to direct their men's studies they will be assisting materially to help forward the movement which is at present being made to give gardeners a more thorough knowledge of their profession. We all hope to see soon a central horticultural college, where young men can enter for a time and receive a special course of training; but, meanwhile, much might be done in the cause of progress by gardeners themselves working along some such lines as I have indicated. *James Wilson, Jun., Greenisle Nursery, St. Andrews.*

WATERING COKE BEFORE USE.—Advice is sought at p. 89 of the *Gardeners' Chronicle* by "A. Stoker" on the subject of watering coke, &c., and to each of his enquiries I venture my experience as a practical horticulturist. Reverting to his 1st question, "Why

should coke be watered before firing?" it is, in my opinion, not easy to say "Why" though it is assumed by some to be productive of a fiercer heat in consequence. Water, however, is generally supposed to damp the ardour of any fire, and I for one incline to the belief that adding water to fuel is an absurd practice, if it be thought that greater heat from the coke be forthcoming as a result. Anyone who believes in the watering of coke may easily add to his experience by watching the state of his boiler soon after the fire is made up, and further by noting the output from the chimney. A saddle boiler in all cases where watered coke is used, will be seen to be thickly wrapt in condensed moisture, and this in spite of the great heat, more or less, that is therein enclosed. All such moisture has only one chance for escape, and that by the chimney, and considering that before it reaches this point it has to pass through several flues, it seems obvious that so much heat must be uselessly employed in first ridding the coke of this water before the boiler can resume its work. Water, of course, does get upon coke at some seasons through heavy rains and by being exposed, and it is surprising how great an amount of moisture it will thus absorb. It is, however, always a matter for regret to me to see steam instead of smoke or the usual fumes issue from the chimney, for then I feel that for the moment the heating power is contending against an opposition which as far as possible should be studiously avoided. Dry fuel is assuredly the most readily ignited, and if so it follows also that it must be quicker in its action upon the boiler, and the reverse where wet fuel is employed. Purposely watering coke is, therefore, to my mind, unreasonable. 2. What fuel suitable for hothouse furnaces is best, say for a saddle boiler? Weight for weight, which fuel gives out most heat? Is it coal, or coke, or wood?—Replying to this chain of questions in its given order, and for the boiler indicated, I unhesitatingly say anthracite coal is the most suitable of all fuels, and taken "weight for weight" the cheapest also. There are, however, divers adverse opinions on this point, and my apparently sweeping assertion may possibly need qualifying. In the first place, there are those who, without having given this coal a trial, have a prejudice against its use, but their opinion would count for but little; secondly, this kind of coal requires that the stoker should have an interest in making it a success also (at least that has been my experience), before the ordinary stoker becomes impressed with how best to manage it, and it is on the discovery of its management that many men, dependent on their stokers, condemn what, with proper treatment, I regard as the best fuel for horticultural purposes. Of course, there are varying qualities of this, as well as other kinds of coal; but a few trials of this coal from various sources will speedily tell its own tale, and these should always be made before large supplies are obtained. The chief points necessary for success in burning this fuel are (1), a quick draught, best secured by a good high stack, because then the damper need not be much open to obtain the necessary current of air, whereas with an ordinary chimney-stack, the damper needs to be more fully open, and loss of heat is thereby sustained; (2) a stoker is required who will refrain from poking his fire each time he goes near it; indeed, when this is done, the fire quickly turns dead, and there is an excessive loss of the fuel itself, as witness the ash-pit after the operation. Starting with clear fire-bars, the fire-box should be well filled, and then left to do its work. Give plenty of draught in severe weather, till a glow of heat is obtained; then lessen the draught by the damper and the ash-pit door, the preciseness of fit of which will best regulate the draught. Anthracite coal is practically smokeless (i.e., the good veins), therefore a decided advantage lies in this—it is all but devoid of those choking sulphurous fumes so prevalent with coke; while of clinkers or waste, with good management, there is practically entire absence. It is naturally a fuel of slow combustion, being regular and uniform, as well as reliable in its heating, requiring only a minimum of labour in stoking, compared with coke. It invariably does best where the heating apparatus is not enclosed in a shed, but is merely roofed over, or even in the open, with the air playing upon the boiler.

As proof of its lasting powers, I may quote from my diary of last year the results of a series of tests to which I subjected this coal. I had myself often conducted similar tests, but on the occasion to which I am about to refer, my chief motive was to demonstrate to my stoker how unnecessary it was

for him to be visiting his fire (and, I believe, with a desire to poke it) a dozen or so times during the day. Given a temperature to maintain in several houses, the fire was made of anthracite coal at 5.30 P.M. on March 18, and not again disturbed till 2.30 P.M. on March 19, being a total of twenty-one hours; the following is my entry *apropos*:—"Fire of anthracite coal made up at 5.30 P.M. yesterday, lasted till 2.30 P.M. to-day, maintaining a splendid heat throughout. Weather cold, a little snow fell; wind keen from N.E. all day." I continued the trial next day, and my diary runs, "Another trial anthracite coal, and same results; weather bitterly cold, a little snow fell." In each case the actual duration may have been much extended, and in milder weather most certainly so. The result of this experiment proved to my stoker the utility of one fire, and letting it alone to do its work; and afterwards I had but little trouble in this direction. Anthracite is suited to either saddle or tubular boilers. I have no experience in "wood" as a fuel for horticultural uses, and should imagine it to be more expensive, and far less reliable than either coke or coal, and costing considerably more for labour in the requisite attention. These, however, are mere speculations. "Is anthracite better than common coal?" Most certainly! Because it is smokeless, whereas common coal quickly chokes the boiler flues and the chimney, smothers the glass with black and soot, and also any flowering plants the moment the ventilators are open; it is also less durable. I would only countenance common coal for Cucumber growing, or the like, and where brick flues existed, and close proximity to coal pits rendered it very cheap; but where it is desired to grow flowers, "common coal" is the least desirable of all. I have used it in quantity, but the price of the ton, which at the time I allude to was about 4s. 6d. at station, was its only recommendation in my mind. *Ed. Jenkins, Hampton Hill.*

CRACKS AND SPOTS ON PEARS.—In reading "Will Taylor's" remark (p. 84, in last week's number of the *Gardeners' Chronicle*, I am reminded of the old story of the blight coming in the east wind; and I would remind him that it is a fungus that attacks the fruit in its early stage which is the cause of the spots and cracks in the Pears, and not the ungenial subsoil. *Man of Kent.*

THE MULBERRY.—In "R. D.'s" interesting article on the Mulberry (p. 41), one or two interesting items are omitted. One of these is the extreme brittleness of its wood, so often leading to the sudden and complete wreckage of the trees at all seasons of the year, especially in the summer. No doubt this is in part caused by the extreme density and size of the leaves, and the weight of the fruit. Thus heavily burdened, the trees are not seldom rent asunder in full growth in calm weather, while heavy rains and storms of wind add to the wreck and ruin of large Mulberry trees. But the wood is so specially brittle and prone to shiver off from the trunk or boughs, that Mulberry trees are prone to be wrecked even in winter. Hence the practice of binding their main limbs together with iron rods. But these, unless carefully attended to, are prone to cut into the wood, and add to the risks of breakage. The general mode of training Mulberry trees as dwarf standards with the lower limbs, leaving the trees at right angles with the main bole, favours this constitutional tendency to sudden and severe breakdowns. By starting the main limbs at a sharper angle with the bole, they would be more likely to resist accidental disfigurement and premature destruction. Most cultivators who have grown or noted the peculiarities of the growth of Mulberries will probably confirm "R. D.'s" observations about the rooting of fallen branches if allowed to lie where they fell. This interesting fact has led to their propagation by treechons. These are branches that may range from 6 to 9 feet long, firmly inserted 1 foot or more in the soil in the early autumn. Any branch will root, but the roughest and most gnarled branches will root the readiest, always excepting any that may have been partially severed off the trees with a heel or cut into with binding irons, which root most readily. Treechons of medium sized well-ripened fruitful wood form the most fertile and useful trees. The standard form of Mulberries also seems more fertile than dwarfs. The more old trees one is privileged to see the more deeply the conviction grows that the older Mulberries are the more fertile, and bear the finer and richer fruit. The rise, decline, and fall of Mulberry culture in England proves how little can be done after all by royal patronage.

James I. had a craze about silk culture in England, and, it is said, was instrumental in planting 100,000 Mulberry trees mainly in the Midland and Eastern Counties in the year 1609. And it is supposed that some of our ragged or ruined veterans may be survivors of some of that profuse invasion of French Mulberries and planters. F.

WILLOW-GROWING FOR UNDERWOOD.—Not only in Ireland, but in many places in England, a good deal of money is lost which could be avoided if those that have the charge of the planting of new and the renovating of old woods would introduce Willows as underwood in the low-lying places and boggy spots to be found in most land set apart for timber. The planting is cheaply done if sets or "pitchers" are obtainable on the ground, and there is no hole-digging required. Of course, as Mr. Hewitt says in the *Gardeners' Chronicle* of the 9th inst., trenching the ground is expensive, but it is necessary to pay in the end, although it is not absolutely necessary if the ground be drained by ditches. It is the custom to fill up wet bottoms where Hazel would not grow with Alder, but this does not enhance the value of the underwood so much as Willow would do. I have found this out by the spirited bidding at our annual sales of underwood, and the frequent applications I have for a bit of Willow underwood. Willow is so useful for many different things, supplying the place of Hazel in many instances, and the smaller growth is used up to the utmost twig by the basket-maker, and very little of it finds its way to the fire-place. Those which I find to do best in this district and sell well are the Huntington, common grey, and goat or sailer Willow. One of the tenants on this estate recently sold a hedge of grey Willow in a very damp situation for £110s. for ten chains, and I could further illustrate a case where about 7 acres of boggy land—quite useless to the farmer at any price—was taken over by the landlord, and has been planted with Osiers, and let to a basket manufacturer for the respectable sum of £30 per annum, the tenant maintaining the plantation in good order. It should always be borne in mind that Willows, although water-loving plants, do not thrive unless the water drains away periodically. J. Garbett, Hale Park, Hants.

APPLES.—With so much talk about the culture of hardy fruit for public consumption, and to meet the American Apple competition, with our shops filled almost exclusively with imported Apples, it seems to be just now a capital time for the Council of the Royal Horticultural Society to do something in the direction of enlightening public opinion as to the respective merits of home-grown and American Apples. The public just now have practically no choice—no opportunity of choice. They can only purchase the one in imported Apple and home-grown fruits are not in evidence. Can it be that, in spite of the immense crop gathered in last autumn, all is sold, and consumed, or is it the case that there are plenty of Apples yet at home, but which have no chance of sale in the market when the Americans come in? In the one case, then, ample evidence is furnished that we do not, after all, grow half enough Apples for home consumption, even when we have a good crop. If the other case be the correct one, then either our late crop is too inferior in quality and appearance, or else it is very badly treated in the market. In any case it does seem that this is just how matters stand, and I think the Royal Horticultural Society may well devote some attention to the solution of the problems raised. The first thing I advise is, that just now, when the American Apples are in the very height of importation, samples of each kind in the market be purchased, so far as possible correctly named, and submitted for examination and taste to the Fruit Committee at their next meeting. At the same time let examples of home-grown Apples that have kept well, and are esteemed to be good either for dessert or culinary purposes, be invited, also with leave for the committee to examine and taste them. Specially let varieties which show nice colour be sent, as the Americans find one-half their market value in colour. The committee could then draw up a report of the relative domestic values of these imported and home-raised samples, and point out to the public which of home-grown sorts (if any) were the best. I can hardly be doubted but that the Press would give such report the fullest publicity. A. D.

TREATMENT OF THE GRAPE VINE.—May I ask if any of your correspondents have advocated anything similar to the following system? It is not mentioned in any of the works on Vines that I have

read, nor have I seen it practised. I may say the idea occurred to me several years ago, but I have not had an opportunity of testing its value fully. I have tried it on weak Vines carrying a heavy crop, with good results. Suppose a Vine on the spur system has made six or eight leaves, and is forming eyes in the axils for next season, and the shoot has been pinched, say two eyes, beyond the bunch. Take a sharp knife, and carefully cut out all the eyes except the end one, and the two best at the base of the shoot. All the shoots on the Vine should be treated the same, thus causing a concentration of energy to the eyes that will bear fruit the following season. F. R.

CANADIAN APPLES.—Kindly permit me to correct a slight error in your report of the proceedings of the Fruit Committee of the 12th inst. I am in that report represented as having staged a dish of home-grown King of Tomkin's County Apple. These were really placed on the table by Mr. G. Bunyard, who kindly permitted his excellent sample to be tasted by the committee, with the purchased Canadian sample of the same variety which I had presented for the judgment of the committee. Mr. Bunyard's samples, nearly all grown under glass, were not finer than those which I had purchased at 2d. per lb., and were less rounded in form; but on being tasted were much more crisp and juicy, and better flavoured. It would have been more satisfactory could we have had samples from home-grown ordinary outdoor trees. Further than King of Tomkin's County, I also had samples of Ben Davis, and a very handsome and beautifully coloured variety of considerable bristleness and excellence, both of which were of Canadian growth, and purchased at 2d. per lb., sent to test against English varieties. Mr. Bunyard had a very fine collection of nursery-grown fruits at the Drill Hall, but I doubt whether a bushel of any one of all the sorts shown so well could be purchased in the country of equal sample. Could we but have such fine Apples of home growth in quantity, Canadians would not be "in it" with the public. Here we have had a splendid Apple crop at home, and yet the Canadian importations seem to be greater than ever. That shows how enormous now is the demand for good Apples. A. Dean.

RETRIBUTION ON ROBBER RODENTS.—Having recently heard from a leading firm at Haarlem that they were shortly expected to receive from either New Zealand or Tasmania (I forget which) an importation of some handsome forms of Liliaceæ, known under the name of Blandfordia, which are by no means as widely cultivated or as well known in this country as their beauty and easiness of culture entitle them to be, I was this morning sorry to hear that on the case being opened, its only contents were found to be some empty husks and stem-branches, and the dead bodies of twelve mice, who had evidently made their way into the case while on board the ship, and, having feasted on its contents, were poisoned by the fruits of their robbery, which proved to them, at all events, a most undoubted Barmecide feast. W. E. Gambelton.

A HAPPY COMBINATION OF PLANTS.—One of the most effective edgings to a shrubbery border that I have observed was made with a line of Funkia Sieboldii and Campanula carpatia—turbinate, both being hardy plants. The deep purple of the Campanula contrasted admirably with the ashen-grey or glaucous leaves of the Funkia, so as to compel admiration. Where the soil is good this species of Funkia grows large, and plenty of space must be allowed, or its handsome foliage will be crowded, when the effect is rather spoiled. The line of Campanula plants should not be less than one foot in width to have a good effect. E. M.

TOM THUMB DAHLIAS.—If I do not, like "Pioneer," think much of the new race of Tom Thumb single Dahlias, it is because one so naturally looks for boldness, breadth, and effectiveness from all Dahlias plants. Tiny forms, about 15 inches in height, are hardly likely to attract attention when employed to decorate a garden, and they have no value used in any other way. It may be pleaded that such very dwarf varieties can be grown in pots; but then, we can grow during the season when Dahlias will grow and flower with us, far showier plants in pots than Dahlias are—and, still further, they are plants which will always do better in the open ground than in pots. The best dwarf strain I have seen was one growing 2 feet in height, and blooming with wonderful profuseness. The best of

the strain Scarlet Bedder produced brilliant scarlet flowers, of fine form, in such abundance that a big mass of the variety produced almost a remarkable effect. The strain included white, yellow, maroon, lilac, &c., and therefore had in it all the elements of variety. That presented a capital as well as a most useful improvement upon the altogether too-tall older strains of single Dahlias, many plants of these running fully 6 feet in height. When grown quite in the open ground, the bedding strain needed no sticks to support the plants, they were so stout and sturdy. That is a great gain, whilst the tall varieties not only need plenty of supporting, but are most liable to injury from rough winds, if ever so carefully tied. If these latter be too tall, the Tom Thumbs are too short, and thus it would seem as if a strain of Dahlias about 2 feet in height hit the happy medium. We have been getting all sections of Dahlias dwarfer for some time, but we really do not want any more of mere Liliptians. A.

COOKS AND GARDENERS.—The reference at p. 80 to what I said at the close of the discussion on Mr. Iggluden's paper, read at the Drill Hall on the 12th inst., does not clearly convey my views. Whilst I do express the opinion that Mr. Iggluden, in his general indictment of cooks, had maintained that Potatoes, amongst other vegetables, were seldom sent to an employer's table properly cooked, therefore much that had been written about the indifferent quality of many varieties of Potatoes was evidently more due to bad cooking than to inherent defects in the tubers. I said more, because I suggested, that inasmuch as a well-known vegetable gardener had thus publicly formulated so grave an indictment against cooks, the Royal Horticultural Society should, in common fairness, allow the cooks, or at least a representative of that useful body of persons, an opportunity to reply as publicly, and vindicate the cooks from the charge of incapacity in relation to the serving up of vegetables. I am satisfied the announcement that some eminent chef would, at the Drill Hall, strive to exculpate his profession from Mr. Iggluden's charge, would create immense interest. It may be that Mr. Iggluden is amply justified in this assertion. I do not profess to know. Perhaps he would find plenty of supporters amongst the gardeners of the United Kingdom. In any case, whosoever may be right, we ought not only to give both sides a fair hearing, but out of the discussion find means whereby faults on both sides, if there be such, may be amended. Whichever may be wrong, of course employer and consumer are the chief sufferers. Still, every gardener feels that he suffers if his products are badly served, whilst the cook thinks that he or she is as badly treated if the gardener sends him or her inferior products. A. Dean.

THE MULBERRY AS A WEATHER GAUGE.—For fifty years an experienced gardener with whom I have been personally acquainted always took the leafing of the Mulberry as a guide to planting out his bedding plants, and he never lost any of his plants from frost. G. Taber.

A STRONG AND DURABLE HINGE FOR GLASSHOUSE LIGHTS.

The usual practice is to fasten the ventilator to a triangular piece of wood, screwed or nailed to the ridge, called a hanging piece. Doubtless, most

FIG. 22.—HINGE FOR GLASSHOUSE LIGHTS.

ventilators are hung in this way, and it is found that the rain comes in considerably, with evil results to the fruit inside—firstly, through the joint formed by the junction of hanging-piece and ridge; and, secondly, between the ventilator and hanging-piece. Nor is this all; the water finds a refuge between the hanging-piece and ridge, and speedily rots both. Sometimes canvas is used to keep the wet out, but this is not altogether satisfactory. It takes a great deal of time to put on, it is very much in the way when it becomes necessary to replace a broken hinge or to repair the ventilator, and, besides, it is very expensive. The following estimate, which can be verified by anyone in a few minutes, of the cost of hanging each ventilator—firstly, to the hanging-piece, with canvas over, and, secondly, to the ridge direct, with capping over, shows very much to the advantage of the latter:—

	s.	d.		s.	d.
4 feet 6 in. hanging-piece	0	4½	4 ft. 6 in. 1½ × 4½ cap-ping	0	6
4 ft. 6 in. canvas, 6 in. wide, at 2s. 3d. per yard, 2 ft. wide ...	0	10	One pair of the improved hinges	0	6
Cutting out and putting on, tacks, &c.	0	2			
One pair of cast-iron butts	0	4	Balance in favour of the use of the improved hinges	0	8½
	1	8½			1 8½

To reap the full advantage of the use of a capping, it is of course necessary that the ventilator be hung as close beneath the capping as possible. This can be done, as will be seen from the sketch, by using these hinges. With other hinges it would be necessary to leave sufficient space above the ventilator to screw the hinge to, or as an alternative the hinge could be cut into the top-edge of the ridge. There are obvious disadvantages to both these ways; in the former the distance of the capping from the top of the ventilator would prevent the capping from being so effectual as otherwise, and would also necessitate a wider and more costly ridge, besides which the ridge would be proportionately weaker, as it is further from the rafters. In the latter, before it could be possible to replace a hinge or to take a ventilator down, it would be necessary to take the capping off, which would certainly not improve either capping or ridge.

When measuring for ridge, care should be taken to see that the distance from the plough groove to the top of the ridge (see sketch), is neither more or less than would allow the highest part of the knuckle of the hinge, when fixed, to be on the same level as the top of the ridge.

Should it be wished to utilise the advantages of strength which the hinge possesses, for repairing, &c., in cases where the hanging-piece is in use, it can be done by reversing that portion of the hinge which in sketch is screwed to the ridge.

The following are some of the characteristics of the hinge:—

1st. It is very strong, the pin (the weak part of other hinges), is $\frac{3}{4}$ of an inch in diameter.

2nd. The hinge is of wrought iron and will stand a much greater strain than cast iron.

3rd. The pin works easily in its socket, removing the danger of corroding.

4th. There is no cutting into the woodwork, and it can very easily be put on or taken off.

5th. When fixed to the ventilator it is screwed to the stile instead of the top rail, a matter of consequence when we consider the strain that is put on the weak tenons of the ventilator by the old method of fastening hinges to the top rail.

This hinge has been patented by Mr. H. B. Piper, of the Ladywell Nurseries, Worthing.

SCOTLAND.

DUNDEE HORTICULTURAL ASSOCIATION.

The following is the syllabus for the session 1892:—On January 8, the President (Mr. D. Croll) read the opening address. Mr. A. D. Mackenzie, Upper Grove Place, Edinburgh, read a paper on "Heating by Hot Water."

February 5.—"Vegetable Culture, January to April inclusive," by Mr. William Grant, Fernhall Gardens, West Ferry.

March 4.—"Vegetable Culture, May to August inclusive," by Mr. John Wilson, Charleston Gardenst Montrose.

April 1.—"Vegetable Culture, September to December inclusive," by Mr. James Ross, Reresmount Gardens, Broughty Ferry.

May 6.—"Chrysanthemums: Cut-backs *versus* Non Cut-backs," by Mr. John Machar, Corona Gardens, Broughty Ferry; and Mr. Wm. Kennedy, Ardarroch Gardens, Dundee.

June 3.—"Technical Education," by Professor Geddes, University College, Dundee.

July 1.—"The Present Day Gardener, and what is expected of him," by Mr. George Smith, Mylenfeld Gardens, Dundee.

August 5.—"Notes on Exhibiting and Judging by Points," by Mr. William Williamson, Tarvit Gardens, Cupar, Fife.

September 9.—"Horticultural questions previously announced: Discussion on."

October 7.—"The Origin and Evolution of Gardening," by Mr. Thomas Butchart, Elmelen Gardens, Dundee.

November 4.—"Root Pruning," by Mr. John Proctor, Balruddery Gardens, near Dundee.

December 2.—Annual General Meeting.

The above meetings will be held in the Young Men's Christian Association Rooms, 10, Constitution Road, at 7.30 P.M. on the above dates.

The session just closed, though unmarked by any special effort or undertaking, has been in many ways successful. During the year eleven ordinary meetings have been held, and the attendance of members throughout has been gratifying and encouraging.

Twenty-one new members have been added during the Session, and at the present time there are 100 members on the roll. One of the most successful evenings of the Session was occupied with discussions on horticultural questions (previously announced to the members). These proved very interesting, and elicited from the members present much important and useful information.

Ten evenings were devoted to the reading and discussing of papers, and more or less condensed reports of the various papers have appeared in the local newspapers.

During the month of March the Association became affiliated with the Royal Horticultural Society, London, participating in all the privileges of a one-guinea subscriber. These include the journals and transactions of the Society, and other advantages. *Extract from Report of the Association.*

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

JANUARY 12.—D. Morris, Esq., in the chair. Present: Messrs. Michael, Blandford, Professors Green, F. Oliver, Church, Drs. Bonavia, Müller, and Masters.

Thelophora laciniata.—In reference to this fungus, specimens of which attacking *Rhododendrons* were sent to a previous meeting by Dr. Hugo Müller, the following note was submitted by Mr. Masses:—"Thelophora laciniata, Pers., is a very common species as a saprophyte, overrunning twigs and heaps of leaves lying on the ground, at the same time it readily passes on to living branches and superficial roots, especially if the surface has been abraded, and then becomes parasitic in its nature. As a parasite, it has been noted on the living roots and prostrate branches of Ericaceae plants, *Vaccinium*, *Erica*, *Calluna*, in Hungary by Kälchbrenner, also in England. It has also been observed as a parasite on living Conifers in Germany by Klotzsch."

Beetle in Dendrobium.—Mr. Blandford reported that the beetle referred to at a previous meeting was a Scolytid, beetle probably undescribed.

Diseased Gooseberry.—Mr. Burbridge sent specimens of Gooseberry branches, showing globular spongy outgrowths from the bark, of the size of large cherries, and cracked on the surface. Mr. Burbridge stated that these swellings produce roots with great freedom, if treated as ordinary cuttings. Dr. Masters called attention to the similarity in appearance to the growth frequently seen in *Malus* *Nel* roses, and also on Vines and Passion flowers; but in the case of the Gooseberry there were often numerous buds visible. In some of these cases the presence of a slime fungus (*Myxomycete*) had been detected. Gooseberry growers attributed the formation to water accumulating on the branches, and promoting the formation of roots. The specimens were referred to Mr. Arthur Lister.

Black Knot.—Dr. Masters showed specimens of this disease received from the United States. The disease occurs in Plum trees, and is due to a fungus, *Plowrightia morbosus*, which produces a black nodulated outgrowth spongy within, on the surface of the branch. The tissues affected seem to be the inner layers of the bark and the cambium layer, the cells of which are disintegrated and broken up into a spongy mass. The disease has been described by Professor Farlow, and is very common in America, but happily, it is scarcely, if at all, known here. Destruction by fire of the affected branches is the only remedy that can be suggested, though probably spraying with sulphate of copper in an early stage would be effective.

Eucalyptus.—Dr. Masters exhibited a branch of *Eucalyptus* globulus, in which the usually smooth surface of the bark was broken up into an irregularly lobed, corky mass. The branch had been received from Professor McOwan, of Cape Town, and it was considered by him that the disease might be due to

the presence of bacteria. A specimen had been previously sent to Professor Marshall Ward, who has promised to report upon it.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

JANUARY 15.—A number of the supporters and friends of the above estimable organisation met on the afternoon of the above date, at Simpson's, in the Strand, London, for the purpose of receiving the Report and the accounts of the Institution for the present year, and for the election of candidates to its benefits (see p. 112).

The number of candidates elected numbered ten, out of twenty-nine who had applied. Of this number, four had made two previous applications, seven one application, and the remaining eighteen were applying for the first time. The successful candidates were Mary E. Gray, of Reigate, aged sixty-one years, a widow who was unable to support herself by any kind of work, owing to failing sight and other ailments; Henry Martin, of Redlands, Bristol, aged seventy-three years, disabled by old age; Henry Bartholomew, of Hornsey, aged seventy-one, who together with his wife, aged seventy-five years, are very infirm; Louisa Jennings, sixty-nine years, of Hayton Quarry, Liverpool, the widow of a gardener at Knowsley, Prescott, who was a subscriber of one guinea for one year; she is very infirm. These last two had made two previous applications. The widow of J. James, aged sixty-five years, is the widow of J. James, for many years gardener at Collymore; George Medland, Alvington Road, Exeter, aged eighty-three years, a widower, once a nurseryman and seedman at Exeter; Lydia Bostock, of Bootle, aged sixty-nine years, who is in a very delicate state of health, and unable to earn anything; Jimima Grace Truran, of Launceston, aged sixty years, a sufferer from chronic bronchitis. Roderick Elphinstone, of Norwich, aged seventy-one years; he has a wife aged sixty-two, and is unable to work. Elizabeth May, of Bagshot, Surrey, aged sixty-five years, the widow of Joseph May, once a seedman in London, and subsequently foreman to the late Mr. Kernan; he was well-known to gardeners and frequenters of Covent Garden Market.

Besides the elected pensioners named above, six others who had in every way complied with the regulations were placed on the pension list without election, viz.:—John Alvey, of Filey, aged seventy-two years, a yearly subscriber for twenty-four years; Ellen Spore Child, of Clapham Common, Surrey, aged seventy-four years, whose late husband contributed £16 to the institution in 1846; Charlotte Selina Cornwell, of Brentwood, aged sixty, whose late husband had been a subscriber for thirty years; John Mundy, of Hampstead, aged sixty-six, a subscriber for twenty years, and a contributor of £9 to the Augmentation Fund; Simon Ross, of Streep Aston, aged seventy-two years, a subscriber for fifteen years; and James Smith, Temple Coombe, also a subscriber for fifteen years, and a contributor to the Augmentation Fund to the amount of 5 guineas. After the formal business of the meeting was finished, a party numbering nearly 100 persons sat down to dinner. The Rev. W. Wilks, F.R.H.S., in the chair, and who was succeeded later by J. H. Veitch, Esq.

Obituary.

WALTER HOOD FITCH.—The death on the 14th inst., at the age of seventy-five years, of Mr. W. H. Fitch removes from among us a man well-known among botanists and horticulturists until the last few years. As a botanical artist, Fitch had no rival for grace and fidelity to Nature. His vast experience gave him a power of perception and insight such as few, if any, artists have possessed in greater, if equal degree. He did not attempt to improve upon Nature, or represent her products in a conventional or so-called artistic manner, but he estimated at their proper relative value the more important points of structure, quickly grasped their mutual relations and significance, and represented them with rare accuracy and grace. As a colourist he was, perhaps, not so successful as in outline and specially in perspective. Fitch was born in Paisley, and found employment with Sir William Hooker when Professor in Glasgow. He came to London from Glasgow with Sir William Hooker, when he accepted the

Directorship of the Royal Gardens, Kew, in 1841. Sir William himself was an excellent draughtsman, as his firmly and clearly executed sketches, so abundant in the Kew Herbarium, clearly show; but it is evident that a man charged with so onerous a task as Hooker, could devote but relatively little time to the representation of plants. This work was accordingly delegated to Fitch, who had the great advantage of being trained under so clear-sighted a botanist. Accordingly, we find Fitch becoming the artist not only for the *Botanical Magazine*, but also for most of those extremely numerous and varied publications which emanated from Kew as a result of the marvellous energy and activity of Sir William and of Sir Joseph Hooker.

For the *Botanical Magazine*, Fitch acted as illustrator for many years, and also for the *Rhododendrons of Sikkim Himalaya*, the *Illustrations of Himalayan Plants* (one of his finest productions), the *New Zealand and Tasmanian Floras* of Sir Joseph Hooker, the *Linnean Transactions*, *Elwes' Monograph of Lilies*, and a vast number of other publications, the latest being the illustrations for the Palestine Exploration Fund. For years, also, he furnished a large proportion of the illustrations of plants to this journal, and contributed to its pages a series of articles on botanical drawing, which attracted much attention, and elicited the sincerest form of flattery—that of imitation. When, some few years since, his health failed, a Government pension was accorded to him, and his long and most useful career was terminated, after a long and trying illness, by a fit of apoplexy.

LOUIS THIBAUT.—By the death of Mons. Louis Thibaut, which occurred at his residence at Sceaux, near Paris, on Sunday, the 17th inst., French horticulture is deprived of one of its most respected and ablest representatives. Born in 1817, Mons. Thibaut, whose name is very familiar as connected with nearly every horticultural fete on the Continent, and who was formerly a frequent visitor to England, started in Paris in 1848, with M. Keteleer, an establishment for the cultivation of plants in general. Besides stove, hard-wooded, and soft-wooded greenhouse plants, they bought from Mons. Ch. Morel the collection of Orchids which Mons. Thibaut had had under his charge since 1841, and which had been growing in importance every successive year by the plants which Mons. Pinel, then resident in Minas Geraes (Brazil) annually sent to Mons. Morel. These were principally *Burlingtonias*, *Cattleyas*, *Epidendrums*, *Lælia* *Pinellii*, and others; *Maxillarias*, *Miltonia* *Morrelliana*, and others; *Ocidiids*, *Sophrontitis*, &c. These formed the starting-point of a collection which became very extensive, and which was grown with marked success until about 1866, when the seat of the establishment was transferred to Sceaux. The original collection was totally lost in the Franco-German war, during which the plants having been turned out of the houses, these structures were used for shelter by the soldiers of the invading army. A collection as complete as the circumstances would allow was soon gathered together by the help of influential nurserymen on this side of the Channel, headed by Messrs. J. Veitch & Sons, and Mr. H. Low & Co., who had for the unfortunate firm a respect dictated by the straightforwardness of its members. We may add that the spontaneity of this timely help was always pleasantly uppermost in Mons. Thibaut's mind, as he never lost an opportunity of referring to it in terms of gratitude.

Some three or four years ago, the business passed into the hands of Mons. J. Salier, who transferred it to Neuilly, leaving to Mons. Thibaut a select collection of plants which the latter took a special delight in cultivating personally until the time of his death.

PETER MOIR.—There were laid to rest the other day the remains of Mr. Peter Moir, Don Cottage, Kemnay, Aberdeenshire. He was born at Blairdaff in 1834, and from thence the family removed to the Hill of Fetterneer, where he lived until a few years ago, when he and his sister re-

"The weather continued very cold in all parts of the Kingdom, but the conditions were quieter than

CREAUS, PHYLOCACTUS, OPUNTIAS, MAMMILLARIAS, &c.: F. G. These plants want no water during the months of November, December, January, and February, but then they must not be stood near the heating apparatus. The back shelf in a span-roofed greenhouse is an excellent place for them during these months. Mammillarias do best in the stove, and should be kept quite dry at that season.

CHERRIES AND CURRANTS DROPPING THEIR FRUITS: W.P. Fertile causes of fruit dropping in Cherries are injury to the blossoms by frost, and an excessive number of flowers setting. In both cases there is some slight increase in size, then the fruits turn yellow, hang on the trees for a time and eventually fall off. Want of water at the root of wall Cherries in autumn, winter and spring, will cause blossoms, buds, and fruits to drop. In your light soil the watering of the wall-trees is a matter that should always receive attention, especially in autumn and winter. Possibly, dryness at the root may have caused loss of Currants; but last season the spring frosts were answerable for a great deal of the loss.

CHRYSANTHEMUMS AND MILDEW: Cubic. On the first appearance of the small whitish spots on the leaves, strew flowers-of-sulphur over them in the morning early when they are moist with dew; the slow and inviolable evaporation of the sulphurous fumes will be fatal to the fungus.

DUROLINE: A. Chevalier. It would be better for flowering-plants to have colourless Duroline, and such would be the most suitable for a copious to a fruit wall. Experiments some years ago with coloured glass lead to the preference being given to that which was, to all intents and purposes, colourless. The blue-tinted glass has a decidedly bad effect on growth.

FAILURE OF TULIP LA REINE TO FLOWER: R. H. Some of the bulbs have not formed any flower-bud at all, but would probably do so next year. We do not know what has prevented them doing so now.

LATE PEACH FOR A WALL: F. J. Rivers' Princess of Wales, a very large, fine-looking fruit, melting and rich, is better than Walburton Admirable, in being a certain bearer, which that variety is not. Gladstone is a later Peach than the Princess of Wales. It is large and good.

MUSHROOM-ROD: L. J. The fungus you send is the imperfect or barren state of a fungus called *Xylaria vaporaria*. It does harm by crowding out the Mushrooms and appropriating their food. We are sorry not to be able to tell you how otherwise to get rid of it than by raking it off and burning it. Turn out the soil and cart it away, for if you put it on the garden-bed the fungus may overrun the plants as it does the Mushroom-bed.

NOTICE TO LEAVE SERVICE: E. T. W. Failing any agreement, one month's notice on either side.

PANCRAETUM Aegyptiacum, Loddiges: S. Cairo. We do not find the name in Baker's *Handbook of Amaryllidaceae*, nor in any book to which we have access. It is not in Loddiges' *Cabinet*.

PARNIPS ROTTING IN THE GROUND: W. Stevens. If you will kindly send samples we may be able to tell you the cause of the decay.

ROSA BANKSLEY: S. Cairo. This was described by Robert Brown in 1811, in Aiton's *Hortus Kewensis*, ed. 2, iii. 258; Lindley's *Bot. Regist.*, t. 397.

VINES SUDDENLY CEASING TO GROW, AND REMAINING IMMATURE: Subscriber. With proper treatment, this is quite unaccountable, and you must send us fuller information, if we are to assist you. Can you send portion of root, shoots, soil, &c.?

COMMUNICATIONS RECEIVED:—P. Lavis & W. E. G. must send their names and addresses before we can publish their letters on *Gardener's Education*, not necessarily to be published, but as establishing their bona fides.—J. S.—T. C.—H. Markham.—W. W.—W. E. G.—D. M.—W. C. H. M. T.—W. E. R. A. R. J. H.—R. D.—W. Nipper.—W. D.—J. O'B.—C. W. H. G.—C. R.—A. D.—W. E. G.—G. Tabers.—G. S.—D. G. C.—Gustav Brul.—E. T. L.—P. L.—W. W.—J. CHELMSFORD.

BOOK of Photo-Lithographed Sketches of Winter Gardens, Ranges of Hothouses, Vineries, Architectural Conservatories, &c., of various Designs and Sizes, recently constructed, erected, fitted, and heated complete by us in different parts of the country; with particulars of the most successful Hot-water Heating Apparatus of the century.
Post-free on application.

Five 1st Prize Medals recently awarded in open competition.

Five 1st Prize Medals recently awarded in open competition.

R. HALLIDAY & CO.,
HOthouse BUILDERS and HOT-WATER ENGINEERS,
ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Bashes, Hotbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues Free. Customers waited on in any part of the Kingdom.

Our Motto is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

ASPARAGUS, of fine quality—for forcing and planting; 2 yr. old, 2s. 3d. per 100; 3-yr. old, good roots, 3s. per 100; ditto, selected, 4s. per 100; 6d. per 100 less for quantities of 1000 and upwards. For forcing, 4-yr. old, 6s. per 100; 5-yr. old, splendid roots, 10s. per 100; ditto selected, 12s. 6d. per 100; 5-yr. old, extra fine, 15s. per 100. Cash with order. My Asparagus always makes top price at Covent Garden.

Read the following unsolicited testimonial:—"Please send me another 200 of 5-yr. old Asparagus Roots. I may say that the last 200 were the best lot of forcing roots I ever bought, and my employer says the quality is excellent.—C. H. PERKINS, The Gardens, Milton Abbey, Elandford."

J. J. CLARK, Market Gardener, Goldstone, Brighton.

FERNIS! FERNIS!!—Trade.—Greenhouse and Store, 2s. saleable sorts, 12s. per 100; out of pots, 10s. Large A. cuneatum, in 48's, 6s. per doz. Large Ferns, 10 saleable sorts, Aralia Sieboldii, Prunella, Solanum, superior stuff, all in 48's, 6s. 6d. per doz. Palms, Ficus, Erica byemalis, and Cyclamen, in 48's, 12s. per dozen, for bloom and fine foliage cannot be better. P. tremula, and A. cuneatum, selected bushy, for potting on, 16s. per 100. Packed free, Cash with Order. J. SMITH, London Fern Nurseries, Loughboro' Junction, S.W.

HENDER'S PETUNIAS.

The Grandest Strain grown. Seed saved entirely from large flowers, beautifully mottled and striped, 1s. and 2s. per packet. PRINCELYA.—Large frilled flowers, mixed, carmine, rose, white, and blue, special strain, 1s. 6d. & 2s. 6d. per packet. BEGONIA.—Saved from the best-named Double and single flowers, 1s., 2s. 6d., and 5s. per packet.
HENDER AND SONS, Nursery, Plymouth.

CHRYSANTHEMUMS, AND HOW TO GROW THEM.

Now in the Press.

The large and increasing demand for this popular work has made it necessary to print a New and Revised Edition (Eleventh Thousand). This will contain a Practical and Scientific Treatise on Culture, and also a Critical Analysis of the New Varieties of the present season, by C. E. SHEA, Esq., A short History of the Chrysanthemum, by C. HARMAN PAYNE, Esq.; and a Chrysanthemum Calendar, by Mr. H. SHOESMITH. In addition to above, illustrations of two of the best New Varieties of the year are included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.

All the secrets of successful culture given, making this the most valuable work on the Chrysanthemum ever published. Post free, nine stamps; to Secretaries of Societies, for members, 6s. per dozen.

H. J. JONES, Ryecroft Nursery, Lewisham, S.E.

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of (Grapes, Tomatos, Peaches, &c., beyond any other Manure.

September 29, 1891.

"I am very pleased with your Silicate Manure. The effect upon the Vines is very marked, for they ripen and colour much better. Your Manure has given me great satisfaction for Tomatos; it is all you claim for it."

(Signed) THOMAS PRICE,
Gardener to the Bishop of St. Asaph.

Prices in Sacks, at Works, 10s. per cwt.; £2 per ½ ton; £3 15s. per ¾ ton; £7 per ton.

THE PATENT SILICATE MANURE CO., THE CHEMICAL WORKS, HEMEL HEMPSTEAD, HERTS.

PREPARED SOLELY BY

THE BOUNDARY CHEMICAL CO., LTD.,
LUTON STREET, LIVERPOOL.

IMPORTANT TO GARDENERS, AMATEURS, AND OTHERS, WHO FUMIGATE HOUSES

TO KILL FLY, OR "THRIP." You will shortly be ordering your Spring Supply of Fumigating Material. Why lay in a heavy stock of tobacco paper, uncertain in quality, often disappointing, and very unpleasant to use, when you can have a SAFE, RELIABLE article, and one that is pleasant to use?

THE FIRST OF ITS CLASS, AND STILL THE ONLY ONE

On which you can thoroughly depend. The manufacture is much improved and it can be ordered without any risk of the disappointment often attending fumigation.

PRICES:—

For houses with 1000 cubic ft., No. 3 Roll, 1/6 each; Post a capacity of 12000 " " " 4 " 1/9 " 1/6 each. The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.—The safest and most effective Liquid Insecticide for dipping or syringing.

PRICES, post free:—Pints, 1s. 10d.; quarts, 3s. 3d.; half gallons, 5s. 9d.

CLIBRAN'S EUCARIAS MITE KILLER.—A truly reliable remedy, has saved thousands of bulbs.

PRICES, post free:—Half pints, 1s. 9d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN,

And Principality Nurseries, Dewgway, Llandudno.

INNES' FERTILITAS.—THE VINE AND PLANT FOOD.—Of all Nursery and Seedsmen, or direct, 15s. per cwt., carriage paid to all Stations. References and testimonials of the Sole Makers—
W. INNES AND CO., Sunny Hill Vineery, Littleover, Derby.

For all INSECT PESTS in Greenhouses and Frames, nothing has proved equal to the

LETHORION (VAPOUR CONE),
(PATENT).

They are now universally admitted to be thoroughly uniform in strength, and safe for any Plant or Flower, even if four times the quantity are used.

Scale and Mealy Bug may be completely eradicated by using the Cones double strength.

PRICES.—For Frames, &c., of 50 cubic feet, 6d.; 100 ft., 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 5000 feet, 5s. each.

THE HOUSES SHOULD BE WELL SECURED.

TO FLORISTS.—Situation wanted in a high-class Florists' Shop. Thoroughly experienced in all branches. Highest references.—T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT AND PILLS.—Shortness of Breath, Cough, and Cold.—Thousands of testimonials can be produced to prove the power possessed by these corrective remedies in cases of asthma, incipient consumption, and all disorders of the chest and lungs. The Ointment is well rubbed upon the chest and back, penetrating the skin, is absorbed and carried directly to the lungs, where, in immediate contact with the whole mass of circulating blood, it neutralises or expels those impurities, which are the foundation of consumption, asthma, bronchitis, pneumonia, and similar complaints. On the appearance of the first conspicuous symptoms, the back and chest of the patient should be treated with warm brine, dried with a coarse cloth, and Holloway's Ointment then well rubbed in. Its absorption will subdue advancing symptoms, and baffle this formidable foe.

CHILDS' NEW JAPANESE WINEBERRY.

This is the greatest fruit novelty of this generation. The bushes grow 5 to 7 feet in height, and stand alike the cold of northern winters, and the heat of tropical summers without the slightest degree of injury. The fruit is borne in large clusters, often 75 to 100 berries in a bunch. These berries are, from the time of formation and bloom, until they ripen, enclosed in a "burr," which is formed by the calyx covering them entirely. When ripe, the burr opens, exhibiting a large berry of the brightest, light, glossy-crimson colour. The burrs and stems are covered with a heavy reddish moss, like a Moss Rose bud. It is absolutely free from all insect ravages. The flavour of the fruit is entirely different from any other berry, being very sprightly, sweet, and juicy, having no disagreeable sour, but a delicate and luscious flavour peculiar to itself, and superior to other berries. For canning, or preserving, the Wineberry is greatly superior to any other fruit. It is the only fruit which will retain its fresh, sprightly flavour after being cooked, and for cooking in any form there is nothing that can compare with it. The berries are very juicy, and make a wine which for beauty and delicious quality is superior to anything heretofore known. It commences to ripen early in the summer, and continues in bearing for a long time. It is the most prolific berry known, the bushes being literally covered with its luscious fruit year after year. This, the grandest of all berries, grows freely and rapidly from seed, and produces a full crop of fruit the second summer, or twelve to fifteen months from the time of sowing. We can send Seed by Sample Post to any part of the World, at 1s. per packet, five packets for 4s. We can also supply 1-yr. old plants at 10s. per dozen. Also—

- 12 Extra Choice Mixed GLADIOLUS, large-flowering, and a magnificent range of colours 2s.

On view morning of Sale, and Catalogues had.

FRIDAY NEXT, FEBRUARY 5.

MOST IMPORTANT SALE.

By order of Messrs. LINDEN, Brussels, (the first re-discoverers of the Old Cattleya labiata),

ANOTHER GRAND NEW CATTLEYA.

CATTLEYA GLORIOSA, Lind.,

New section of *labiata autumnalis*—numerous varieties.

CATTLEYA GLORIOSA was discovered in December last in a NEW LOCALITY, where no collector or European traveller has been before, and just received in unsurpassed condition, some in fine masses, and all as fresh as any importation of Cattleyas ever received.

THIS IS THE EMPRESS OF LABIATAS.

Messrs. LINDEN's Collector, who started from Europe at the end of October last, when the demand for *labiata* began, and when the 200 beautiful Cattleya Warocqueana (*labiata* var.) were exhibited, states that CATTLEYA GLORIOSA "differs in every way from the varieties collected in Bangerot's or Swanton's hunting-grounds, and is of extraordinary beauty—far superior to the very best forms of C. Warocqueana or other old *labiata*. A large number of white varieties are also found amongst them." Orchidists are invited to inspect the plants for sale; the grandeur of their appearance will speak for itself.

The whole importation, about 600 plants, as received, will be in the Sale.

MESSRS. PROTHEROE AND MORRIS will SELL the above Grand Lot BY AUCTION, at their Rooms, 67 and 68, Chesapeake, London, E.C., on FRIDAY NEXT, February 5, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Woking—Preliminary Notice.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, at the Horsell Birch Nursery, near Woking, Surrey, on TUESDAY and WEDNESDAY, February 16 and 17 by order of Mr. A. Knowles, a fine assortment of NURSERY STOCK, in excellent condition for export, comprising a grand assortment of specimen Shrubs, Begonias, Aucubas, Yews, Rhododendrons, Cupressus, Fruit Trees, &c.

Further particulars will appear next week.

Wanted Flats.—Clearance Sale. IMPORTANT TO FRUIT TREE GROWERS, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Thos. East, who is clearing the land for the purpose of making bricks, to SELL BY AUCTION, on the Premises, the Wanted Nursery, Wanted Flats, on THURSDAY and FRIDAY, February 15 and 16, at 12 o'clock precisely each day, the whole of the thriving and choice NURSERY STOCK, including 2000 choice Dwarf Fruit Trees, consisting of the choicest Hybrid Perpetuals, Teas, &c., 6000 well-grown Fruit Trees, all true to name, and other Stock. May be viewed prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Chesapeake, London, E.C.

Richmond, Surrey.

By order of Messrs. G. & W. Steell, in consequence of the death of the Senior Partner, and the intention of the Vendor to relinquish the Business, SALE OF THE SECOND PORTION OF THE well-grown NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL BY AUCTION, on the Premises, the Common and Gasfield Nurseries, Richmond, Surrey, on TUESDAY and WEDNESDAY, February 23 and 24, the SECOND PORTION OF THE well-grown NURSERY STOCK. Fuller particulars will appear next week.

N.B.—THE LEASE OF THE HOME NURSERY, and the GOODWILL OF THE Old-established Business, is for Sale by Private Treaty. Particulars may be had of the Auctioneers.

THOMAS B. JAMES (many years with Protheroe & Morris) holds WEEKLY SALES at his Rooms, 12, Bull Ring, Birmingham, of BULBS, PLANTS, NURSERY STOCK, &c., every WEDNESDAY and FRIDAY, at 4.30 P.M. Sales of choice Cut Flowers. Fresh Entries invited. Account Sales and cheques daily. Emptyies and labels found.

WANTED, TO RENT OR LEASE, 3 or 4 acres of LAND suitable for Nursery purposes. No objection to a little Glass. Send particulars to J. S., 2, Beach Terrace, Exning, Suffolk.

THE TOWER FURNISHING COMPANY

(Limited), SUPPLY GOODS ON HIRE, direct from the Manufacturers; one, two, or three years' Credit without Security. Purchasers have the choice of 100 Wholesale Houses. Call or write for Prospectus.

CHRYSANTHEMUMS, AND HOW TO GROW THEM.

Now in the Press.
The large and increased demand for this popular work has made it necessary to print a New and Revised Edition (Eleventh Thousand). This will contain a Practical and Scientific Treatise on Culture, and also a Critical Analysis of the New Varieties of the present season, by C. E. SHEA, Esq., a short History of the Chrysanthemum, by C. HARMAN PAYNE, Esq.; and a Chrysanthemum Calendar, by Mr. H. SPOWORTH. In addition to above, Illustrations of two of the best New Varieties of the year are included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.
All the secrets of successful culture given, making this the most valuable work on the Chrysanthemum ever published. Post free, nine stamps; to Secretaries of Societies, for members, 6s. per dozen.

H. J. JONES, Ryecroft Nursery, Lewisham, S.E.

For Exhibition!
BROAD BEAN, BIDDLES' MONSTER
LONGPOD.—Extra long, fine quality. Per quart, 1s. 6d.

CARROT, BIDDLES' SCARLET PRIZETAKER, Intermediate, the finest exhibition Carrot grown. Per oz., 1s.
ONION, BIDDLES' GIANT SPRING.—Too well known as prize-winner to need further recommendation. Per oz., 1s.

BIDDLES AND CO., THE PENNY PACKET SEED CO.,
Loughborough, Leicestershire.

"GOOD THINGS" from **HARTLAND, Cork**, for 1892.—AURICULA, Empress of India, try it for colour, which is deep indigo, magnificent, 2s. 6d. per packet.
COSMUS bipinnata, White Pearl, from America, beautiful, 1d. per packet.

CATALOGUES, and Samples, free on application.
R. TUCKER, Nurseries, Earlsfong, Berks.

Cannell's Primulas. FORCE OF REAL MERIT.

The greatest advance yet made in Floriculture is now to be seen in our eight 10-ft. houses; as a proof, we have been awarded three Certificates this season and fifteen previously—nearly three times more than all others put together (the same may be said of our Double Begonias), thus placing us again in the premier position. What an immense advantage it would be to gardeners, and the encouragement they would receive from their employers, if they could be made to see how absolutely necessary it is to purchase their seeds from those who have the best, and sell the most seeds for the same money.

Mr. E. BROOKS, St. Michael's Home, Axbridge, Somerset.

December 17th, 1891.

"I am glad to tell you the Primula seed I have of you has turned out; talk about as large as five-shilling pieces, I have some would measure half as much larger seeds. They have been greatly admired by all who have seen them, which is not a few, and they all say they are the largest they have ever seen, and so I say."

"I have six different colours—Crimson, Pink, Mauve, White, Lilac, Pink, and Rose Pink, which is a 'smasher'; of course I tell where I get them, which I hope may be the means of your getting orders. I have always well advertised your firm."

CAPT. KEMP, Lymington House, Arundel.

January 22, 1892.

"I take the opportunity of informing you that the seed of Double Begonia you sent me last year exceeded my expectations in every way, the blooms, even in the first year, being wonderful in size and colour."

W. F. MACKENZIE, The Gardes, Thurso Castle, Thurso, N.B. September 28, 1891.

"No doubt you will be glad to hear how the Begonia I had from you last year have succeeded in the extreme north—far beyond my most sanguine expectations. The brilliancy and profusion of the flowers were marvellous, while some of them measured within a fraction of 6 inches across, and were the admiration of everyone who saw them."

H. D. LEAK, Esq., Norwood, Demesne Road, Alexandra Park, Manchester. January 14th, 1892.

"I had some seed of Primula Cannell's Pink from you last year. It is now in bloom and is really magnificent; the flowers are exceptionally large, and of a lovely colour."
Mr. ANTON WILES, Gardener to E.T. Leeds Smith, Esq., C.C., Sandy, Leeds. January 13th, 1892.

"I am very pleased to inform you that the seeds I had of you last year turned out very satisfactorily. I obtained several Prizes at our Sandy Flower Show with exhibits grown from your seeds. The Turnips grown were very large, one measured 32 inches around it, and four of them weighed 33 lb."

H. CANNELL & SONS,
SWANLEY, KENT.

FRUIT TREES.

STEPHEN SPOONER & SONS

can offer the following, in really good stuff:—

NOW READY.

SHARPE'S
ILLUSTRATED DESCRIPTIVE
CATALOGUE
for 1892.

Post-free on application to

CHARLES SHARPE & CO.,
Seed Farmers and Merchants, SLEAFORD.

FIRST-CLASS NURSERY STOCK.

JAMES BACKHOUSE AND SON offer the following stout, well-rooted, transplanted—

Trees and Shrubs.	Per doz.	per 1000;	per 1000.
ALDER, Common, 6 to 7 feet	... 4 0	—	20 0
" Hoary-leaved, 6 to 8 feet	... 5 0	—	—
ASH, Common, 5 to 6 feet	... 1	6	70 0
HAZEL, 2 to 3 feet	... 6	—	35 0
OAK, English, 3 to 4 feet	... 6	—	60 0
" 4 to 5 feet	... 6	—	135 0
" 5 to 6 feet	... 6	—	150 0
PINUS AUSTRIACA, 12 to 18 inches	... 52	6	7 0
" 1 1/2 to 2 feet	... 2	6	12 0
" Laricio, 2 to 3 ft. (ex. trans.)	... 90	0	12 0
POPLAR, Black Italian, 5 to 7 feet	... 2	6	10 0
" Giant Canadian, 4 to 6 feet	... 2	0	80 0
SYCAMORE, Variegated, 4 to 5 feet	... 12	0	180 0
" 7 to 8 feet	... 24	0	—

Evergreen Trees and Shrubs.	Per doz.	per 1000;	per 1000.
ARBOR-VITE, American, for Hedges, 3 to 4 ft.	... 8	0	50 0
" " " 4 to 5 ft.	... 10	6	70 0
" " " 5 to 6 ft.	... 15	0	105 0
BERBERIS Aquifolium, 9 to 12 in.	... 635	1000	1 6
" " 12 to 15 in.	... 1055	1000	2 6
BOX, Compacta, a beautiful form of Tree Box, compact in habit, and bright in colour, 12 to 18 inches	... 4	0	20 0
" 1 1/2 to 2 feet	... 5	0	30 0
" Handsworth Broad-leaved, 12 to 15 in.	... 3	0	18 0
" 1 1/2 to 2 feet	... 5	0	27 0
CEDRUS ATLANTICA, 2 to 3 feet	... 15	0	105 0
" 2 1/2 to 3 feet	... 20	0	150 0
" 3 to 4 feet	... 50	0	—
" 4 to 5 feet	... 60	0	—

CUTRESSUS Lawsoniana, well-grown plants.	Per doz.	per 1000;	per 1000.
" 2 to 3 feet	... 9	0	65 0
" 3 to 4 feet	... 15	0	100 0
" 4 to 5 feet	... 24	0	160 0
" argentea, 3 to 3 1/2 feet	... 24	0	200 0
" " 3 1/2 to 4 feet	... 30	0	200 0
" erecta viridis, 3 to 3 1/2 feet	... 30	0	200 0
" 3 1/2 to 4 feet	... 42	0	—

RHODODENDRON Ponticum, extra bushy plants, 12 to 18 in.	Per doz.	per 1000;	per 1000.
" 1 1/2 to 2 feet	... 9	0	35 0
" 2 to 3 feet	... 15	0	30 0
" 3 to 4 feet	... 24	0	80 0
SWEET BAYS, in pots, 1 1/2 to 2 feet	... 12	0	120 0
" 2 to 3 feet	... 18	0	120 0
YEW, Common, 2 to 2 1/2 feet	... 8	0	50 0
" 2 1/2 to 3 feet	... 12	0	75 0
" Irish, 3 to 4 feet	... 30	0	200 0
" 4 to 5 feet	... 42	0	250 0

Roses.	Per doz.	per 1000;	per 1000.
STANDARDS, fine named sorts, our selection	... 16	0	140 0
HALF STANDARDS, ditto	... 14	0	120 0
DWARFS, fine plants on Manetti, ditto	... 8	0	60 0
" on our roots, ditto	... 10	0	75 0

These are all strong plants. Purchasers can send names of sorts desired, which will be adhered to as far as possible. Descriptive CATALOGUE on application.

Peaches and Nectarines.
STANDARDS, or RIDER-TRAINED, 7s. 6d. to 10s. 6d. each;
extra strong trees, 12s. 6d. to 15s. each.
DWARF TRAINED, 5s. to 7s. 6d. each.

Apples and Pears.
EXTRA STRONG DWARF-TRAINED, 3s. 6d. to 7s. 6d. each.

Special Prices to large purchasers, or the Trade, on application, stating quantities required.

JAS. BACKHOUSE & SON, YORK.

FIDLER'S SEEDS STAND UNRIVALLED FOR EXCELLENCE OF QUALITY, PURITY, AND CHEAPNESS.

Other goods at equally reasonable prices.

Nothing but the best stocks sent out.

UNSOLICITED TESTIMONY.

"Forthmore, Weymouth, January 22, 1892.
"DEAR SIR,—I cannot afford to pay for fancy catalogues, but I can afford to pay my head gardener sufficient wages to make him independent of seedsmen's tips; I therefore apply to you again for my supply of seeds for the coming season, as your prices do not leave a margin for the above contingencies. I was well satisfied with the products of the seeds which I had from you last year. I shall feel obliged if you will forward me the seeds as now ordered with the least possible delay."
"Yours truly,
"W. GARDEN RAB."

Full descriptive particulars in CATALOGUE, sent free to any address on application.

Seed Grower
C. FIDLER, and Merchant, READING.

THE CUCUMBER OF THE PERIOD.

WEBB'S NEW STOURBRIDGE GEM.

1s. 6d. and 2s. 6d. per packet, post-free.
The result of hybridisation between the popular varieties Telegraph and Prince of Wales. It is a remarkably free setter, and very prolific, producing handsomely-shaped fruit, from 18 to 24 inches in length, with beautifully white flesh, which is very delicate in flavour.

From Mr. W. HOLDER, Gardener to R. B. Muir, Esq.
"Your Stourbridge Gem Cucumber is very prolific and a grand exhibition variety—it has no equal. I took First Prize with it at Atherton, against ten more pairs; also First Prize at Burton-on-Trent."

WEBB'S SPRING CATALOGUE, Containing Six Coloured Plates, &c. Post-free, 1s. Seedsmen by Royal Appointments, WORDSLEY, STOURBRIDGE.

PLANTING SEASON. HARDILY-GROWN FOREST, FRUIT, & ALL OTHER TREES & PLANTS, EVERGREENS, ROSES, &c. NURSERIES 400 ACRES: VERY EXTENSIVE STOCK. Inspection Invited! Priced Catalogues Gratis & Post Free. THE DICKSONS NURSERIES (LIMITED) CHESTER.

WHEELER'S CAMBRIAN FAVOURITE MELON.

A grand New Melon, which we believe will prove to be one of the finest standard varieties in cultivation.

Per packet, 2s. 6d.; small pkt., 1s. 6d., post-free.

Mr. J. MUIR, in writing of it, says:—"It is extremely handsome, and the flavour is all that could be desired; indeed, it combines more good points than I ever found in any other Melon."

Wheeler's List of Specialties and Novelties will be forwarded, gratis and post-free, on application.

WHEELER & SON, Seed Growers, GLOUCESTER.

FRIDAY NEXT, February 5th.

MOST IMPORTANT SALE,

By Order of Messrs. LINDEN, BRUSSELS,

(The first re-discoverers of the old *Cattleya labiata*).

CATTELEYA GLORIOSA, Lind.

NEW SECTION OF *CATTELEYA LABIATA AUTUMNALIS*.

NUMEROUS VARIETIES.

CATTELEYA GLORIOSA was discovered in December last, in a new locality, where no Collector or European Traveller had been seen before; and just received in unsurpassed condition, some in fine masses, and all so fresh as never *Cattleyas* have been introduced before.

 **THIS IS THE EMPRESS OF LABIATAS.** 

MESSRS. LINDENS' Collector, who started from Europe at the end of October last, when the fever of *Labiatas* began, and when the 200 beautiful *CATTELEYA WAROCQUEANA* (*LABIATA VERA*), were exhibited, states that *CATTELEYA GLORIOSA*—

"Differs in every way from the varieties collected in Bungeroth's or Swainson's hunting-grounds, and is of extraordinary beauty, far superior to the very best forms of C. Warocqueana or other old labiata. A large number of white varieties will also be found among them."

 **ORCHIDISTS ARE INVITED TO INSPECT THE PLANTS FOR SALE.** 

 **THE GRANDEUR OF THEIR APPEARANCE WILL SPEAK FOR THEMSELVES.** 

The whole importation, about 600 plants, as received, will be for Sale.

MESSRS. PROTHEROE & MORRIS

Will SELL the above grand lot by AUCTION,

At their Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 5, at half-past 12 o'Clock precisely.

As a Supplement
TO THE
GARDENERS' CHRONICLE
FOR
Next Week, February 6,
Will be Published an Ink-Photograph of
HEDYCHUM CORONARIUM,
GLASGOW BOTANIC GARDEN.

THE
Gardeners' Chronicle.

SATURDAY, JANUARY 30, 1892.

THE COMPARATIVE VALUE OF VARIOUS FUELS.

TO enter into a full discussion of the scientific methods by which the relative heating values of the different materials used as fuel are ascertained, would be tedious, and at the same time would possess little practical value to the majority of the readers of the *Gardeners' Chronicle*; but the following general statement of the principles upon which such values depend, may be of interest to many whose business demands considerable outlay in this direction.

It has been found, as a result of elaborate experiments, that the heating-power of any fuel, whether coal, coke, charcoal, wood, peat, or turf, is approximately proportionate to the percentage, by weight, of the carbon which it contains; hence, coke, consisting as it does, almost entirely of carbon, in a greater or lesser degree of purity takes the lead as a heat-producer. Anthracite a good sample of which contains 90 per cent. or more of carbon, heads the list of coals. Its hardness and compactness, and the absence of flame-producing constituents render a strong draught and careful stoking essential for its economical combustion. Other hard Welsh or steam coals have from 75 to 90 per cent., the average being about 84 per cent.; Newcastle coals average 82 per cent.; Derbyshire, 80 per cent.; Scotch, 78·5 per cent.; and Lancashire, 78 per cent. Of course, extreme variations, upwards and downwards, are found in all the above districts. Again, the "heat-value" of any fuel is modified by the presence of (1) water, as such, or of (2) the uncombined hydrogen and oxygen in the proportion in which they unite to form water, i.e., eight parts by weight of oxygen to one part of hydrogen. The greater the amount of water, or of its constituent gases, the smaller becomes the heating power of the fuel.

The reasons for this are not far to seek. The heat disengaged in combination (using the word in its ordinary sense), depends upon the chemical combination of the elements contained in the substance burnt with the oxygen of the air—the carbon with oxygen forming carbonic acid gas, the hydrogen with oxygen forming water. It is clear, then, that any elements existing in a fuel already in a state of combination, are, from a heat-producing point of view, so much waste material.

With regard to the presence of the hydrogen in an uncombined state, the case is somewhat different. Here the hydrogen combines with oxygen (present in the fuel itself, or in the air), the union being attended by the generation of a very large amount of heat, far greater than would be the result of the combustion of an equal weight of carbon. How then can the hydrogen

be considered disadvantageous to a fuel? Simply because a more than compensating amount of heat is used up in raising the temperature of the water to the boiling-point, and in its conversion into steam. This will readily be understood, when it is remembered that as much heat is required to raise a pound of water from freezing-point to boiling-point as would raise a pound of iron to about 900° centigrade (a bright red heat), and that five and a half times as much heat would be needed to turn a pound of water at boiling-point into a pound of steam at the same temperature.

These deductions from theory are fully borne out by the results of practical experiments, it being found that the heating power of a fuel varies directly as the amount of carbon, and indirectly as the quantity of water and its elements, or incombustible ash, contained.

Here we are met by an apparent paradox, which has led to much misconception, and consequent error in practice, and which is therefore deserving of the attention of practical men.

It was first shown by Bunsen, that when steam is passed over red-hot carbon, it is decomposed; the glowing carbon uniting with the oxygen to form carbon monoxide and carbon dioxide, and the hydrogen passing off partly uncombined. The carbon monoxide and the hydrogen unite with oxygen (forming water and carbonic anhydride respectively), and the amount of heat thus generated is found to be greater than would be evolved in the ordinary combustion of the carbon without the intervention of the steam. This application of water-vapour must, however, be carried out with great care, for when present in excess, it decreases, rather than augments, the heat generated. The proper way to apply water for raising the temperature is to place it in an open pan beneath the fire-grate, thus utilising the heat which is radiated downwards from the fire for its vaporisation. Many have fallen into the error of wetting coal before placing on the fire, with the result that the amount of heat has been lessened rather than increased, as is evident from what was said above. It is possible that coke, if fresh, may be advantageously damped in moderation, but it has the power of absorbing a large amount of moisture from the atmosphere without any sprinkling.

Too much emphasis cannot be laid upon the necessity for careful and intelligent stoking, no matter what the class of fuel employed. Careful trial should be made of various kinds used by any particular furnace, and the stoking should be carried out in such a manner as to ensure perfect and complete combustion. If anthracite or other hard coal be used, for instance, thin fires and a strong draught are essential. The importance of stoking was well seen in a case that came under the notice of the writer during the hard frosts of last winter. The furnaces of a market-nursery were stoked for some time by a gardener whose only idea seemed to be to pile on the coal. A man who had had some years experience, an engine-driver in a factory, was then put on stoking duty, with the result that, in much colder weather, the coal consumption was reduced considerably.

In conclusion, the main question as to which is the most economical fuel for glass-houses, is one that can only be determined by actual experiment with each system of heating, and by considering, independently and in conjunction, the heat-value of the available fuels, the cost of each, and the kind of boiler used.

The following table, taken from Scheerer's *Metallurgie*, may be useful, as indicating the

relative heating effects of different fuels, although the figures must be taken with caution, as being the result of theoretical deductions rather than that of practical experiments with ordinary boilers.

Fuel.	Heating Power.
Good coke, with 10 per cent. moisture and 5 per cent. ash	2350
Best coke, 5 per cent. moisture and 3 per cent. ash ...	2400
Best coke, no moisture, and 3 per cent. ash	2430
Air-dried black wood charcoal, 12 per cent. moisture	2450
Anthracite, 5 per cent. moisture, 5 per cent. ash ...	2350
Caking coal, 5 per cent. moisture, 5 per cent. ash ...	2300
Slender coal, 5 per cent. moisture, 5 per cent. ash ...	2350
Lignite, various	from 1800 to 2200
Turf peat (without moisture)	2000
Turf peat, 30 per cent. moisture	1875
Air-dried wood, with 20 per cent. moisture	1875
Kiln-dried wood, with 10 per cent. moisture	1875
Kiln-dried wood, without moisture	1750

C. W. H. G.

NEW OR NOTEWORTHY PLANTS.

EPIDENDRUM GODSEFFIANUM, Rolfe, n. sp.

Among the plants of the old Cattleya labiate—or, to speak more correctly, from the same district in Brazil—Messrs. F. Sander & Co., of St. Albans, have received a fine species of Epidendrum, which on flowering has proved to be new, and for which the above name is therefore proposed. It belongs to the section Encyclium, and to the particular group which Lindley characterised as *Hymenochila biloba*, where it may technically be placed near *E. Hanburii*. It bears some resemblance to this species in shape, but is very different in colour, in which respect it is more like *E. bifidum*, whose shape, however, is very different. The bilobed lip unmistakably places it in this group, though in general appearance it more nearly resembles some other species, whose lip has not this character, which suggests the query whether the species could not be more naturally arranged by some other character. This point, however, may be left for the present. *E. Godseffianum* has the general habit of other species of the group, and the flowers measure over 1½ inch across. Their colour is light green, somewhat nerved with light brown, except the lip, which is white, the front lobe being lined with bright rose-purple. *R. A. Rolfe, Herbarium, Kew.*

CYPRIPEDIUM GHAS (LAWRENCIANUM) ♀, HARRISIANUM NIGRUM (♂).

The foliage of this fine hybrid resembles some of the forms of *C. Harrisianum*. The scape has brownish hairs, and the general contour of the flower, although as usual intermediate, partakes more of the bold form of *C. Lawrenceanum*, and especially in the flat, circular form of its upper sepal, which is dark chocolate or nearly black at the base, from which the same dark colour radiates in lines, passing upward into the emerald-green patch which is seen just below the pure white ½-inch wide margin. The lower sepal is green, with a few brownish lines, and the petals and lip resemble in colour those of *C. Harrisianum nigrum*, but they are larger, and the petals display some traces of the bearded warts seen on the petals of the seed-parent. The staminate is more reniform than that of *C. Harrisianum* ×, but the whole flower has the polished surface which forms such an attraction in a good form of that variety. It is a stately and distinct hybrid, and it will be a favourite. It

* *Epidendrum Godseffianum*, n. sp.—Pseudobulbs conical-ovoid, 2 inches long, 2-leaved. Leaves linear, 12 to 13 inches long, 1 to 1½ inch broad, green, or suffused with purple. Peduncle a little exceeding the leaves. Raceme several-flowered. Bracts minute, broadly triangular. Sepals elliptical-oblong, acute, 3 lines long, by 3½ lines broad, pale tawny-brown, faintly nerved with light brown. Petals obovate-spathulate, 6 lines broad, like sepals, but with darker nervus. Lip 3-lobed; front lobe orbicular, retusely bilobed, 6 lines wide, white, with the disc lined with bright rose-purple; side-lobes suborbicular, obtuse, 4 lines broad, with a short broad claw, closely veined with purple on basal half. Column 4 lines long, apex orange-yellow, wings small and fleshy, yellow. Native of Brazil.

was raised in the gardens of C. Ingram, Esq., Elstead House, Godalming, by his gardener, Mr. Thomas W. Bond, *James O'Brien*.

CYPRIPEDIUM SWINBURNEI × (INSIGNE MAULEI × AEGEUS MOESSLI), new garden hybrid.

With some resemblance in leaf and flower to *C. Ashburntoniae* expansion, we have in this a far more showy hybrid. The leaf is light green, reticulated with dark green, and narrower than that of *C. Ashburntoniae* ×. The dorsal sepal is green at the base, and with a clear white ½-inch wide margin, the green area having a number of lines made up of distinct brownish-purple spots, which are larger at the base, and get gradually smaller as the white apical margin is approached. The petals are greenish-white, tinged with red on the outer halves, and with a number of dark purplish blotches resembling those seen in *C. argus*. The staminate is yellow, with a green veining in the centre, and the lip green, tinged and netted with reddish-brown. It is very pretty, and was raised by Messrs. Heath & Son, of Cheltenham, who request it to bear the name of T. W. Swinburn, Esq., of Cordean Hall, Gloucestershire, a great fancier of *Cypripediums*. *J. O'Brien*.

CYPRIPEDIUM HARRISIANUM ROSEUM × (BARBATUM WARNERI × VILLOSUM).

This cross has resulted in what may be called a dwarfier form of *C. Harrisianum*, having lighter-coloured flowers, which have a decidedly rose coloured hue spread over the petals and labellum; the upper sepal has a clear white margin, and the flower has a bright shining appearance. It is pretty, and easily distinguished by its flowers or by its handsome foliage, which is broader and shorter than in any other form of *Harrisianum*. The leaves are a light green colour, closely netted with bright green, but without the broad transverse markings usually seen in those of *C. Harrisianum*. It was raised by Mr. H. A. Tracy, of Amyand Park Road, Twickenham. *James O'Brien*.

DENDROBIUM CHLOROPS, Lindl.

I am obliged for a spike of this nice little Dendrobe to Mr. W. Lauche, chief gardener to His Highness Prince of Liechtenstein at Eisgrub, Moravia. The flower shows that the description published by Lindley in *Bot. Reg.*, xxx., 1844, *Mist. 51*, is a very accurate one, except, perhaps, that Lindley omitted to describe the tips of the sepals and petals as acute. But a mistake was made by Professor Reichenbach, who, in the sixth volume of Walpers' *Annals Bot. Syst.*, p. 299, adds this "*Dendrobium barbatum*, Lindl.; *Wight, Fr. Fl. Ind. Pr.*, ii., 910, 1844." The plant figured by Wight is, there cannot be the slightest doubt, the true *Dendrobium Etychianum*, Batem.; and the description of it, as well as the plate, belong to a plant quite different from the *Dendrobium chlorops* with which Reichenbach united it. *D. chlorops* hitherto has not been figured. I hope to have the opportunity to publish a sketch made from my fresh material in the next (sixth) fascicle of the *Xenia Orchidacea*. *Dr. Kränzl.*

BRITISH BIRDS.

CAPERCAILLIE.—The most imposing member of the Tetraonidae is the capercaillie (*Tetrao uro galus*), a name corrupted from the Gaelic *caput colle*, or horse of the woods, so called from his great size. A three-year-old male of their species is splendid in his glossy coat of plum colour and beetle blue. He has the war-like port of a great bird of prey, and his powerful bill seems designed rather to tear flesh than for a mild vegetarian diet. A well-grown specimen measures more than 3 feet in height, and sometimes weighs as much as 17 lb. The female (as is generally the case among polygamous birds) is much smaller, usually weighing from 5 lb. to 6 lb. The flesh of the capercaillie is unsatisfactory food, having a strong flavour of turpentine, imparted by his favourite food, the young shoots of the Scots Fir; and, living as he does in large woods, no special address or skill is required in shooting him. But to the naturalist he

is a bird of great interest, because he is an example of the successful re-establishment of a species which had become extinct in this country. Capercaillie were re-introduced at Taymouth by Lord Breadalbane about sixty years ago. They have now spread far and wide, and are plentiful in many parts of central Scotland.

BLACK GAME.

The black grouse (*Tetrao tetrix*) is a more beautiful bird than the capercaillie; in fact, it is difficult to imagine a more fascinating creature than the black cock in spring, when, choosing some bare billock, he struts, spreads his tail, and trails his wings to excite the admiration of his soberly-clad wives. The grey hens will fly several miles morning and evening in the breeding season to receive the

or grouse, and if it existed only in this country the name given to it by naturalists, *Lagopus vulgaris* or common ptarmigan, would be most inappropriate, for it is not to be found now with us except on the loftier ranges of the Scottish Highlands. But the geographical range of the ptarmigan is a wide one; they are found on the high ranges of Italy, Spain, Russia, and Scandinavia, as well as in Greenland and North America. In Norway and Sweden, where they are known as the Fjall ripa, they are extremely plentiful, but they should not be confounded with the Dal-ripa, or willow grouse (*Lagopus saliceti*), thousands of which are exported and may be seen hanging in winter plumage in London poulterers' shops during the spring months, where they are sold as ptarmigan, which they closely resemble. The males of the two species may be

Westmoreland and in Galloway. I have been informed by an aged shepherd that the last time he saw them on the Lamarkan range was in what he called "the year o' the short corn" (i.e., of the great drought), 1827.

THE PHEASANT AND PARTRIDGE.

Now I have left myself no space to do more than complete the list of British game birds by merely mentioning the pheasant and the partridge. Modern sportsmen have been scolded with equal severity by the moralist, the philanthropist, the politician, and the humanitarian, on account of the vast numbers of pheasants artificially reared and shot each year. Well, it is not ideal sport, perhaps, but it entails a degree of skill that might surprise those who have never tried to pull down a good rocketeer; it causes

FIG. 23.—A VIEW IN THE GROUNDS AT ALBURY. (SEE P. 147.)

(As seen from the end of the terrace.)

attentions of their sultan. Black game are remarkable for their capricious distribution in the United Kingdom. In no part of the realm are to be found tracts apparently more suitable for them than in Ireland, yet, strange to say, they have never been known there, and all attempts to introduce them have hitherto failed. Yet they may still be found within 30 miles of London; I myself have seen five grey hens sitting together on a Birch tree in the Hurt Wood, near Dorking. They extend as far south as Dartmoor, and it is remarkable that although the hens, as in other wild polygamous species, are shockingly careless mothers, black game hold their ground on these southern moorlands, where it has been found impossible to establish the far harder and thriftier red grouse.

THE PTARMIGAN.

One more of this interesting family exhausts the list [which we publish. Ed.] of British Tetraonids

distinguished by the small angular patch of black feathers which remains behind the eye of the true ptarmigan when all the rest of the plumage turns white. Few birds can have more romantic associations than the ptarmigan. They lie so close among gray rocks and lichens on the mountain tops, that one may almost tread on them unawares; but if one bird is put up, the whole covey rises at once, and it seems as if the very stones were taking wing. Generally, the brood takes but a short flight, wheeling round the mountain flank, and lighting again; but sometimes they launch themselves upon the gulf separating them from a distant peak, and present a beautiful sight not easily forgotten as they sail, a gaily mottled group, perhaps a couple of thousand feet above the valley below. It would be a task worth accomplishing, and not presenting many difficulties, to restore these beautiful birds to hills whence they have disappeared. It is not very long since they were well-known in Cumberland and

a very important supply of food to find its way into the market; and lastly, if it is objected to on the score of cruelty, it is quite fair to ask whether the birds, could they be consulted, would not affirm with one voice—

"'Tis better to be hatched and shot

Than never to be hatched at all,"

and the latter would be the fate of tens of the thousands of happy little chicks which run through the summer grass if battues were to be put an end to.

The partridge is such a favourite with all of us, that a whole paper might be devoted to the little brown bird which has adapted itself so well to civilisation and improved agriculture, as to multiply almost as fast as our human population. Gilbert White describes with wonder how "for some time after the dry summer of 1740-41, partridges swarmed to such a degree that parties of unreasonable sportsmen killed twenty and sometimes thirty brace in a day. Herbert Maxwell,

WEST INDIES.

MESUA FERREA.

At the time when this tree is pushing forth its delicate pink-coloured young growths, many people are misled at first sight into supposing them to be flowers. Owing to the dry weather in May, 1891, no such growths were to be seen, but flowers instead were being produced. These are by no means unlike the Dog Rose of English hedgerows, their four large petals are white, the centres filled with yellow stamens, and fragrant. Before expanding, the flower-buds are purplish-pink, giving quite a colouring to the leafless, or partly leafless, terminal branches which bear them. The leaves are opposite, ovate-oblong, long pointed, and so densely set that it is nearly impossible to see through the tree from one side to the other. The under-side of the leaf is very glaucous, but green above, and card-board-like in texture. In shape the tree is conical, with a very even outline, to be compared in this respect with our specimen of *Canarium commune* (Parrot nut). The hard wood of *Mesua ferrea* is known amongst other woods by the name iron-wood. During the past three years no fruit has been borne; whether any has ever been produced there is no record to show.

ANCISTROLOIUS CARNEUS.

That something is very attractive to bees and small birds during the period this tree flowers (May and June) is clearly shown by the large numbers present each day. The numerous small red flowers are usually borne in leafy racemes terminating the smaller branches, but occasionally they appear from different parts of the trunk and older branches, where sometimes the racemes are entirely devoid of leaf-bracts. At the base of the three bundles of stamens, present in each flower, alternate three large yellow glands. The tree is not conspicuous for size as grown in the Trinidad Botanic Gardens, as it only attains moderate dimensions. Its chief characteristics are the light brown barkless, or seemingly barkless, trunk and branches which it possesses (due to the dry bark peeling off in flakes), and the number of flowers it bears. The tree belongs to the order Hypericaceæ, and is recorded as belonging to China. According to Benthams and Hooker's *Genera Plantarum*, it should be included under the genus *Cratogeomys* of Blume. *W. E. Broadway, Trinidad.*

GRAPE SOILS.

THE analysis of a good Spanish Grape soil, as given by Mr. Hughes in your issue of January 16, will be useful to Grape growers, giving, as it does, the proportions of different matters contained in soil naturally adapted to the growing of the Grape Vine. It certainly is a poorer soil than is usually employed for Grape-growing in this country, and the great proportion of stones in the soil should be made a note of, and might be kept in view with good results in making up Vine-borders. Stones are not without their uses in the economy of Nature, when mixed with the soil—they tend to keep it from running together in an adhesive mass. Stony soils are generally friable, and favourable to the production of active, fibrous roots. Broken brick and lime-rubble are frequently added to Vine composts, to serve the same purpose. In the case of Vine borders, often from 2 to 3 feet in depth, stones are even more necessary than in the comparatively shallow soil of the fields. In turning out old Vine borders, where the soil is deficient in stony material, the lower portion of the border is often found to be a hard, inert mass, nearly destitute of roots. Had a more liberal proportion of stones been used in the formation of the border, the lower portion would have been better aerated, and better and more numerous roots might have been reasonably looked for, although the best roots, no doubt, should be near

the surface, so as to take full advantage of top-dressings and the sun's warmth.

In drawing our deductions from the analysis of the soil of the Spanish vineyard, we must bear in mind that the Spanish and British Vine-growers are working for different ends, and under different conditions. The former look for a good crop, irrespective of size of bunch or berry to give him a good vintage; and last, but not least, he knows that the price he will obtain for his wine will be largely influenced by the flavour, or bouquet, or whatever his product has acquired a reputation for in the market. He has also the advantage of a great amount of sunshine, which is an important factor in the matter of flavour.

The latter look for a good crop, but the size of bunch, size of berry, colour and flavour, are the chief points he keeps prominently in view. He has to look to the staying power of his Vines, that they may go on year after year producing good crops of high quality; while he has to resort to artificial means to cope with dull skies and low temperatures. At the same time, given a fair amount of sunshine, with good glass structures, and efficient means of keeping up the temperature, the British Grape grower holds his own against all comers, though necessarily at much greater expense than where the fruit is grown out-of-doors. To gain the best results so as to recoup the greater expense of production, the British grower must use a more fertile soil, or if the soil selected does not possess all the necessary constituents, these must be added. It is here that chemistry comes to the Grape-grower's aid, for by having an analysis of the proposed soil, its fitness or unfitness can be determined, and if found suitable, though weak in some ingredients, these can be supplied, and failure, so far as the soil is concerned, reduced to a minimum.

I scarcely think Grape-growers will agree with Mr. Hughes where he says, that "compared with farm crops, Grapes, consisting largely of water, cannot be considered an exhausting crop." Farm crops of some kinds, particularly cereals, may take more out of the soil than Grapes, but then the fields have the benefit of a rotation of crops, white crops being alternated with green crops, along with annual manuring, followed up by a season or two of grass or fallow, before the same crop is repeated. The Vine border has no such rest. The crop is the same year after year, and so must become exhausting, as the demand is always for the same constituents from the soil. Hence the necessity for frequent top-dressings to replace what is abstracted and lost. Many Grape-growers are very much hampered in the matter of soil. It is generally conceded that turf full of fibre, from the surface of an old pasture, is the best soil for Grape-growing. Many owners of gardens stand in their own light in this respect. While they expect their gardeners to produce the finest fruit, they often obstinately refuse to allow suitable soil to be dug, though there may be acres of it on the estate. I remember when in charge of a large fruit-growing establishment in England, there were acres of the finest possible Grape soil in the park within sight of the garden walls. The soil in question was a fine red loam, full of fibre, on a subsoil of red marl. We might have asked the squire for a back tooth with more chance of success than for a few loads of this old pasture. All our supplies in the way of turf, which were very limited, had to be brought about a mile, from an out-of-the-way corner, of hungry light soil, with very little staying power in it. This is a very common experience.

There is no doubt some fine red soil in the Worcester Hop gardens, and in Kent and Devonshire, but few gardeners would be allowed to incur the expense of fetching it, as suggested by Mr. Hughes, unless those living in the immediate neighbourhood.

Suitable soil for Grape-growing can generally be found in most districts where old parks or pastures exist, red soil, being, I believe, from my own experience, the best, though sometimes an indifferent-looking soil may be made a very good material for

Grape-growing. This is notably the case at Clovenfords, where excellent results are produced, year after year, from a soil which many Grape-growers would be slow to use, but which, in conjunction with Mr. Thomson's manure undoubtedly has great staying power. I quite agree with Mr. Hughes that wood-sashes are valuable for mixing with soils deficient in potash and phosphoric acid. Light soils are much benefited by the addition of burned clay or marl. Bone-meal and $\frac{1}{2}$ -inch bones are valuable in most soils. *Sans Peur.*

CALOCHORTI IN THE OPEN AIR.

THESE most beautiful and free-blooming Californian bulbous plants, known to florists under the English names of Butterfly Tulips or Mariposa Lilies, are practically unknown in this country save to a few, and to these mostly from weakly and poorly grown specimens, grown either in pots, frames, or Cape-pits, wherein they will never really thrive, or produce more than a small portion of their loveliness. The chief reason for these bulbs having been hitherto treated as above mentioned has, of course, been that they were not known to be hardy in this country, but now that they have been proved by Mr. C. G. Van Tubergen, of Haarlem (who has grown them for some years past in considerable quantity) to be quite as hardy as an ordinary Hyacinth, and only to require much the same cultivation and treatment as those well-known bulbs, it is to be hoped they will be much more extensively grown and tried by many who have hitherto thought it useless to attempt their cultivation. Having received from the Haarlem firm above named a collection of 103 bulbs in seventeen varieties (two of which, however, turned out not to be *Calochorti* at all, but *Cyclobothus*). I planted them in the first week of November, 1890, in an open bed in my garden, in specially-prepared light sandy soil, and in as sunny a position as possible, and during the whole of the winter they had no kind of protection whatever. They nearly all grew, sending up two or three grassy leaves in March or April, with the exception of *C. Madrensis*, a Mexican species, figured in the *Gardeners' Chronicle* on October 4, 1890; and the first to come into flower towards the middle of May was *C. Benthami*, with small bright yellow flowers, which, owing to my absence from home during that month, I did not see. The next to flower was *C. venustus citrinus*, a most beautiful variety, with large flowers of a deep canary-yellow, with a purple spot at base of each petal; this was followed by *C. venustus ocellatus*, a most beautiful variety, with large cupped flowers of a creamy-white, deeply spotted with purple at the base of each petal. Then came the dwarfier-growing and smaller-flowered *C. luteus*, with bright yellow flowers; but amongst my half-dozen bulbs sent as this variety were two of the much larger and far finer variety, *C. citrinus*, well figured on plate 6200 of vol. ci. of the *Botanical Magazine*. Then came *C. splendens*, which seems to me in nowise to deserve this pretentious name, as its flowers, which are of a light shade of purplish-mauve, are without any kind of marking, and though sufficiently elegant and profusely produced, cannot compare for either size or beauty with either of the fine varieties of *venustus* mentioned above. *C. venustus roseus* is rather disappointing, its flowers being of an indistinct and washy colour. *C. venustus purpurascens* is an exceedingly strong-growing, free-blooming, and handsome variety. It may be mentioned here as curious that all the forms of *venustus* save the type, though quite the smallest and weakest bulbs, proved to be much the strongest growers and the most abundant bloomers of the whole lot. Amongst the *C. Benthami* was a single bulb of *C. Maweanianus*, which, however, is dull and pale in colour, of a whitish shade, with purplish markings, and comparatively worthless.

The varieties which, though most of the bulbs grew, yet failed to produce any bloom, were as follows:—1, *C. macrocarpa*; 2, *C. venustus*; 3, *C.*

Kennedyi; 4, *C. Howellii*; 5, *C. Nuttalli*; 6, *C. Gunnisoni*, and the bulbs of these, on being examined, seem to be perfectly sound, and many of them to have increased in size during their culture

C. Madrensis, alluded to above, bloomed much later than all the others, but both abundantly and well, the flowers being much smaller in size, of a bright deep golden-yellow, opening almost flat in

during the week's snow which has now just left us, and do not expect them to receive any injury therefrom. I have added to my bed half dozens of the following varieties new to me:—*C. Bonplandianus*, purple; *C. flavus*, golden-yellow; *C. flexuosus*, *C. longibarbatulus*, lilac; *C. nudus*, and *C. Palmeri*, white. *W. E. Gumbleton*.

STREPTOCARPUS GALPINI.

THIS is a new species of *Streptocarpus* which flowered in October last at Kew, whither it was sent by Mr. E. E. Galpin, who collected the seeds in the Transvaal in 1890. He wrote, "I am sure you will like the two species of *Streptocarpus* [the second one was *S. Dunnii*, introduced some years previously] if you can succeed in raising them. They both grow in crevices in the cliffs and under rocks, and only on the very tops of the mountains just below the brows of the highest peaks. The red-flowered species (*S. Dunnii*) I found growing in profusion on the granite mountains in Upper Swaziland, whereas here they grow in metamorphic sandstone. Those I send you came from the "Bearded Man," a peak forming one of the boundaries of Swaziland, thirty miles off, where the plants are much finer than here. I send some specimens to show how freely the plants flower."

Out of a score or more plants raised from the seeds of *S. Galpinii*, only one has flowered, the others being evidently too weak last year; they are, however, promising in appearance this year. The character of the species is shown by the illustration, which was prepared from the Kew plant last November. The single spreading leaf was 8 inches long by 5 inches in width, fleshy, with thick nerves and midrib, the whole surface covered with soft silky hairs, the under side tinged with purple. The hairy flower-scapes spring from the base of the midrib of the leaf, and they bear numerous flowers, the plant continuing in bloom over five weeks. The form and colour of the flowers are quite different from any other cultivated species of *Streptocarpus*, the tube being very short and wide, the limb almost regular, and the colour a rich blue with a tinge of purple, and the throat pure white. Although small the plant bore over fifty flowers, each $1\frac{1}{2}$ inch across. It flowered again in December. The capsule of *S. Galpinii* is very much shorter than that of any other species known to me. Various crosses were made between this new one and other kinds, and full-sized fat capsules were matured, but in almost every case they did not contain a single seed. Whether *S. Galpinii* will cross with others of the same genus or not, it is certainly a plant of great promise. In my opinion it is the prettiest of all the species of *Streptocarpus* in cultivation, not overlooking the claims of such kinds as *S. Rexii*, *S. Dunnii*, *S. latea*, and *S. polyanthos*, which, as well as several others of less horticultural value, are in the Kew collection. A figure of *S. Galpinii* will shortly be published in the *Botanical Magazine*. *W. W.*

FLORISTS' FLOWERS.

CHINESE PRIMULA.

I HAVE just been comparing the wild form of *Primula sinensis* (figured at p. 13 of the *Gardeners' Chronicle* for January 2) with the coloured plates figured in the *Botanical Register*, t. 539, and *Botanical Magazine*, t. 2564. In the first-named publication, the drawing was made from the plant which flowered for the first time in England in March, 1821, in the greenhouse of a Mrs. Palmer, Bromley, Kent. This plant cannot be far removed from the wild state. The flowers are described as of a lilac-red colour, and all that seemed to be known of it was, that it was brought to England from the gardens at Canton, the rest being supposition. The flowers are placed on lax footstalks, forming a very irregular truss, and the edges of the petals are slightly serrated, and the segments of the corolla not notched in the centre.

FIG. 24.—STREPTOCARPUS GALPINI.

here, but none of them show any signs of making offsets. Why these varieties failed to bloom like their brethren under precisely similar conditions is indeed hard to understand.

the sun, and quite distinct in form and method of biding themselves from those of any other variety. I planted my bed again about the same time as in 1890, and have left the bulbs quite unprotected

It was registered under the name of *P. prænitenis*. The drawing in the *Botanical Magazine* has flowers with the corolla segments notched, as in the figure in the *Gardeners' Chronicle* of the above date. The specimen figured in the *Botanical Magazine* was produced in Mr. Joseph Knight's nursery in the King's Road, Chelsea, in 1824, and one would judge from that figure that the flower retrograded towards the notched segments of the wild plant. It was treated as "a very hardy greenhouse plant," and was kept growing all the year round, and the plants were seldom out of flower. The result of this would be what might be expected—the plants would never at any time produce well-developed flower trusses or good flowers, and the treatment as a very hardy greenhouse plant would, as it is stated it did, cause the plants to rot off at the neck. I observe at p. 12, *Gardeners' Chronicle*, in the three forms of the calyx, that they have five segments only; and the *Botanical Magazine* specimen had but five segments, whereas the first plant that flowered had, besides the variously jagged corolla, generally more than five teeth to the calyx; and the effects of culture was to produce flowers in a verticillate manner on the stems. The subsequent effect of culture was to change the colour of the flowers, as well as greatly to improve their form; but at first, and for many years afterwards, there was but little change, except to white. It was not until the very highly coloured form termed Chiswick Red was introduced, that a rapid improvement of this fine plant set in. Messrs. Sutton, of Reading, and Messrs. Cannell, of Swanley, have both made great strides in the direction of raising distinct varieties. The pure white varieties are remarkably beautiful, but they are not more charming than the soft rose, pink, and pinky-blush varieties. Much has been learned in the way of superior cultivation also, for the improvement of the strains has not been more rapid than improved culture. Indeed, it would be but little use for dealers to improve their stock of seeds if gardeners were not awake to the importance of doing their best to cultivate the plants to a high state of excellence. Competition at the Chrysanthemum shows has done a good deal to promote special excellence in these plants. Many cultivators err on the side of too high feeding. This, of course, is an error in the case of any class of plants; but more so in those with succulent leaves, like the Chinese Primula. Loom three parts, leaf-mould one part, and decayed manure one part, make a good potting compost, and some coarse white sand and a small portion of bone-meal may be added to it at the last shift. It ought to be observed that the young seedling plants are easily stunted or dwarfed in their growth by delay in repotting them, and when this happens, the plants seldom arrive at a high state of excellence; but no good gardener need be warned of this, for it occurs in every class of plants. Let them be kept steadily growing from the first development of the leaf, until they have grown to their full size, and all through the summer and autumn the plants ought to be in the open-air with the lights ready to be placed over them if the leaves are likely to be bruised and broken by autumn gales, or the compost in which the plants are growing may become hardened or saturated by heavy rains. The flower-pots should be well drained, and it is also very easy to err on the side of over-potting. Many persons have expressed their surprise at the large size of the plants compared to the size of their pots, exhibited at the meetings of the Royal Horticultural Society; but the fact is, if larger pots were used, the leaf-growth would preponderate over that of the flowers. The plants in their comparatively small pots are fed with prepared manure of a concentrated character. The sportive character of these Primulas is still further shown by the numerous semidouble varieties, and which may be raised from seeds almost as freely as the single varieties. They are as variable in their colours as the purely single varieties. There is yet another section with the flowers so double that seeds are never produced from them, and the plants must be propagated by cuttings or division.

Mr. Gilbert, gardener to the Marquis of Exeter, Burleigh, near Stamford, exhibited a set of these double Primulas in London some twelve or more years ago, which were greatly admired, and this exhibit was also the means of extending the culture of them very considerably. I have on a previous occasion fully explained the method of propagating these double varieties from cuttings, and growing them on to a flowering size, but any very choice variety of Primula may be propagated in the same way from cuttings, as soon as they break into several crowns, each crown being taken off at a joint (when the wood has hardened a little, and the moisture has been reduced by keeping the plants dry at the roots), will, if planted singly in thumb-pots in fine sandy soil, soon form roots, and grow into as good plants as the seedlings of the year. The propagated plants are not so likely to become overgrown as are the seedlings. Some remark is made at p. 12 of a mystery to be solved, and it is a mystery "Why some plants of the same genus are so much more variable than others?" It may be that some have not received that amount of artificial culture as would change the form and colour of the flowers. The Primula Auricula has been much cultivated, and received more artificial treatment than any other, and the result is, that it is the most variable of all the Primula family. *P. pubescens*, the supposed parent of the alpine Auricula, is also very variable, but as it has not received anything like the same amount of attention as the other, it has not altered so much from its original form. The ordinary Primrose of our meadows is very variable, and in time *P. villosa* would produce some curious forms. All that is required is for some one to watch the changes in seedlings, and take advantage of them. *J. Douglas.*

CELERY CULTURE.

MANY journeyings about the country during the past season in the capacity of a judge at exhibitions have impressed on me the inferior quality of numerous examples of Celery that I have seen exhibited. Indeed, taken all in all, this particular vegetable was about the worst shown. I make bold to say, therefore, whilst all other culinary products grown in this country have shown a wonderful advance of late years, Celery has remained stationary, or below the average. Yet it would be imagined that the past season was one particularly favourable to the growth of Celery.

On many occasions, when examining a score or two of Celery exhibits, it was found impossible to select examples from merely the apparent external excellence of the heads; and worse still, when the knife was applied, results did not improve, as the best-looking were either "botted," or with leaves split, and somewhat decayed—to say nothing about the many worms that were present, which always caused disfigurements, as do also the common slugs. All these heads were far below the old Manchester standard of excellence, which brought the scale down at 8 lb. and even more.

Celery is not a new vegetable, as grown, blanched, and consumed at present, although it came into use at a later date than some of the other ordinary inmates of the kitchen garden. It was only known in Gerard's day—later, in fact—in Johnson's time, who edited the last edition of Gerard's *Herbal*—as the ditch-plant—Smallage; a "strong-smelling" plant, the leaves of which were occasionally used in "broth," but which were mainly accredited with medicinal properties.

Though there is a dearth of data as to its original use in the blanched form, as at present, the singular fact is, that the best varieties or selections first known were named "Roman" and "Italian," pointing to the belief that the plant was so used on the Continent earlier than in this country. Botanical dictionaries, nevertheless, consider it exclusively a British plant. If, however, it was so used in the above countries prior to its introduction as blanched Celery here, a margin of doubt must follow as to its home being limited to this country alone. Any way,

it is common enough in the more stagnant water-ways of Sussex, &c., and is abundant on the coast of Thanet, which points to its hardiness in a marked degree. There should, therefore, be no great difficulty in upholding the old Manchester standard of excellence, if not, indeed, improving upon it.

But, apart from the fact that it is most commonly found in the wild state in moist land, it will succeed in old disused chalk-pits, wherever time has been permitted to form foothold of rich surface soil. For instance, in such a position, now overgrown with trees, little more than a stone's-throw from the old Frinsbury Church, above Strood, in Kent, it clothes the ground in great luxuriance, having successfully combated and overcome all other indigenous weeds. This, added to other experience, proves to me that calcareous soils are suited to its requirements.

Now, as to its culture. Is there not a prevailing feeling amongst cultivators, explained in some such sentence as the following: "It is only Celery, it will live through the summer, somehow, and when autumn rains fall, and we get longer nights and much dew, it will make up for lost time." Be this as it may, I am convinced that, given proper attention to three or four points, which I will now refer to, it will yield better results.

To grow good exhibition Celery there should be a depth of good surface soil (above the subsoil), of not less than 3 feet; and where such depth does not exist, wide trenches to that depth should be made and filled with the proper materials. Furthermore, to succeed, even such a depth of good soil should be trenched during the previous winter. Some readers may smile at the thought of trenching for Celery, but I assure them, it is no new practice. Older growers, whose successful practices have brought their names into prominence in some of our oldest and best works, habitually trenched for Celery!

Let us, however, examine the subject. It is thought highly proper to trench for Onions, is it not? If, instead of trenching for the Onion crop, the same ground was trenched for Celery it would be in better trim for a succeeding Onion crop, and after the Onions autumn Cabbages, both of which like firm ground; such firmness, in fact, as Onions fail to find on newly-trenched grounds of only a month or so ago.

I am recommending no more work, but an improved preparation generations approved for rotation of crops. Whether the ground be trenched or not, different and better preparation of ground for Celery than that which is too generally in vogue will have to be made, if excellence is to be looked for.

Judging its requirements from those which snit it in a state of Nature, its roots delight in free, fine, loose soils, abounding in moisture; and the best artificial soil for it undoubtedly is, three parts decayed manure to one part good loam, which should be exceptionally well incorporated. Contrast this with the kind of treatment it too generally is subjected to, i.e., a trench is formed only so wide as to admit of the free use of the spade in its preparation, and often the bottom of the trench consists of an ungenial substratum of soil, some kind of strong manure, undecayed, is dug in, and on the top of this the Celery is planted often with a dibble, which jams their roots together in a small hole. That they live and commence to grow when the summer-heat is past goes without the saying; but such treatment desirable or proper?

With such liberal treatment as I previously suggested in this article, there is no reason why the plant should not make vigorous progress throughout the summer-time. Minute seedlings grow most freely upon mounds of rich soil in spring and do not object to a high bottom-heat. The explanation is, the fine rich soil is suitable to the plant. Large sticks, large-hearted and solid, can only be formed by plants that make a large base at first in the spring or summer, and here is the alpha and omega of grand heads of Celery. To ensure this large base, no check to growth must be permitted,

and transplant into the trenches in a well-prepared compost, like that I have indicated, a compost, in fact, equal in fineness and richness to that of the first nursing-bed, and, if possible, superior to it.

As to the proper date for seed-sowing, those who wish to dig properly blanched sticks on September 1, and to ensure an unbroken succession, must sow as early as the month of February, and at intervals of three weeks. For the main crop, however, and later season exhibition purposes, such early sowings are not desirable. Seed for main crops is sown early in the month of March; the seeds soon germinate, and the plants are permitted to become starved in the seed-boxes, for a long time before they are pricked out. By far the better plan is, to sow about April 1, and so soon as the seedlings are fit to "handle," prick them out, and grow them on fast by the kind of liberal treatment that I have sketched out. In proof of this, I may add, Mr. Lancaster, a grower for the Metropolitan markets of "Lancaster's Celery," not only sows broadcast in frames at this seasonable date, but pricks his seedling plants out upon beds of soil in low-roofed glass structures, frames, &c., thereby ensuring rapid progress. The trenches have been prepared long previously—so long, in fact, as to admit of his first crop of French Olive, and other Radishes, Early Lettuce, &c., being sown and grown upon the mounds between them. As regards his estimate of the summer needs of his Celery, he has adopted, at some expense, a perfect system for intermittent irrigation.

Split-stalked Celery is far too common, and is not only an external disfigurement, but materially lessens the value of the crop, causing much waste and loss, an important consideration from the demand-and-supply point of view. Stalk-splitting is undoubtedly caused by alternations of dryness and moisture during growth, and injudicious earthing-up. In this contention I am not far wrong in saying, the exigencies of time and weather, along with misinformed estimates of the importance of certain necessary rules to be followed, are the real causes. For instance, if after a somewhat prolonged dry autumn period a large mass of soil be packed around, splitting of the sticks more or less is likely to follow. The proper plan to follow is to make two minor earthings with a hoe, with about an interval of a fortnight between them. By this means, the covering of the base will be done gradually; the width of the trenches is increased, so that rain or waterings afterwards will reach the roots easier, dew acting meantime more powerfully. Subsequently, in about another fortnight, more substantial earthings-up can be made with less risk.

So general have Celery-fly attacks become, it is necessary to dust the leaves over occasionally with lime or soot during the months of June and July. Lime should also be sprinkled amongst the plants at each earthing-up, and amongst the leaves at the top of the mounds late in November, as a check upon worms and slugs.

The plant appreciates moisture-water throughout the growing season. I stood, some time since, on the elevation near Lincoln Cathedral, when a man passed up the hill, going towards the country, with six huge sticks of Celery, carried upon his back by means of a stick thrust through them, and resting on his shoulder. "You are going the wrong way, my man," I remarked; and he answered, "No, I beant, for they grew on sewage farm. Lincoln folks won't eat 'um, but I knows them as woll." *William Early, Ilford.*

FOREIGN CORRESPONDENCE.

GARDENERS' EDUCATION.

I HAVE been thinking a great deal about this matter, as well before as after Mr. Thistleton-Dyer's papers, and I have had some experience too. It is a very difficult problem, but, all in all, I quite agree with his remarks, that "The cultivation of plants is

an art which can only be acquired by practice, and therefore, it appears to me, it cannot be taught in the lecture-room. . . . The mere reading of books and attendance on lectures will never make anyone even a moderately competent gardener." This is true, especially in the case in question; and as Mr. Dyer recommends physics, chemistry, botany, &c., he cannot be blamed for neglecting theory.

The difficulties lie in the questions—How is the gardener to get opportunities to study the sciences? How much is wanted to be of any use? and, Is it possible for a gardener to acquire, besides a good practical training, a thorough knowledge of all the desirable subjects, viz., botany, vegetable physiology, chemistry, physics, drawing, levelling, surveying, geology, languages, book-keeping, &c.? remembering that most gardeners must commence with merely an elementary knowledge of grammar, mathematics, and geography.

First, as to his opportunities. I have by experience (two years of which time I was in England), and by reading the *Gardeners' Chronicle* for many years, got the impression that it is more difficult to get such opportunities in England than in any other country; it may be a wrong impression, but it is one that is shared by many Englishmen. In most other countries you will find horticultural schools teaching all, or almost all, of the above sciences. Still, it is admitted by everyone that English gardeners are, on the whole, the best in the world. I do not say it is because they have no theoretical school of horticulture; it is in spite of this fact, and because circumstances are more favourable for our art there than in any other country. As to intellectual capacity, I have no opinion; but there is in England a taste for horticulture, money to pay for it, a tolerable climate—still one that demands glass-houses—and good traditions; and in some or all of these respects, many other countries are behind her. It is high-class gardening and plenty of opportunities to learn this in practice, that makes the good English gardeners. What is wanted of science is readily got in a prepared digestible form from without—I mean from the innumerable professors, doctors, reverends who are in some way connected with horticulture, and of whom there are few in other countries, too. Of course, England has many scientific gardeners, and they are so much the better for the greater difficulties they have surmounted in acquiring scientific knowledge, which speaks much for their energy, which is not always the case where the acquirement of a subject is easy. But still I cannot help sympathising with those who demand horticultural schools, where a knowledge of the requisite subjects may be obtained. Horticulture advances, and in connection with so many branches of science, that it is absolutely necessary for the heads of all mercantile, public, and large private establishments to understand some, if not all, of these subjects, to such an extent that they are able to follow them in their development, make use of new discoveries, and on the whole apply science to practice. As instances of which, I will just mention fungi and their destruction, artificial manures, and lately electricity. But that brings us to the other questions—how much is wanted so as to be of any use?—and which subjects should be included? These questions are not easy to answer, too little of each may be worse than none, and a thorough insight into all, would demand too much time for the majority of gardeners. Only a start can be made at school, and afterwards each individual must choose the subjects he most needs, and follow them up after he gets a situation. As to subjects, I should not like to exclude any of the above-named, but would rather add some more, but the list is already a long one, and it will take years devoted to study to acquire so much knowledge in each of these as to be able to follow the advances which are made in any one of them and make use of them. This fact limits attendance, and as many of the pupils will be able beforehand to know which subjects they most require and which not, and as there generally are facilities in large towns for learning those that are required, the

state of things is, perhaps, not so bad after all. Still, we foreigners, with all our State examinations, can hardly understand how you get on without an official test and a standard for State and public officials, and the same in horticulture. The British Empire, with its colonies, is so large and so wealthy, that it stands in need of such a school, and is well able to support one.

But there is great danger connected with such schools in more than one direction. The pupils may get a dislike for practical work, and then they will not be of much use as gardeners. When the examinations give, as they ought to do, access to public and good private places, then the school will attract a lot of—I hardly know what to call them—not really desirable or suitable young men, who have frequented good schools, but those who, from want of ability, or liking for the university, or the more exacting professions, will pass a theoretical examination much easier in such a school than the gardeners, but, at the same time, they will be of much less value as gardeners. The cost of such a school ought not to be of any moment in England, whether the State, the various horticultural societies, or the gardeners themselves, should bear it, as much poorer countries than England and her gardeners are able to do it. The time that such a course of instruction will take, especially when combined with practical work, as it most likely would be, may seem to be of some importance, but I do not think that it is so in reality. It is a long time from 15 to 25 years of age—let the school take 5 years, and there is still time for travelling, both abroad and at home.

Now, as to the possibility of acquiring a thorough knowledge of every one of the above subjects. I should say it is impossible even for a man who devotes all his time solely to them—how much more so for the gardener, who has the other half of his profession, and not the least important—the practical one, to attend to! Now, of course, it depends on how much is demanded of each. It is possible to learn the elements of all, and extend some of them afterwards, and drop the others; and many pupils, may even drop them all, and yet be good gardeners—the most practical, but they will not be representative of the class. On the whole, rather too much is expected from them. I should like to meet the man who is a master in practical work, knowing every branch of the profession: forcing, Orchids, plant culture under glass, kitchen, fruit, and flower garden, landscape gardening, decoration of rooms and tables, bouquets, &c., not to speak of ponies, cows, boats, and general usefulness. And still a man seeking a situation in a private place, is often obliged to understand all these things; when can any man find time for the study of such exacting subjects as chemistry, physics, geology, and languages (if not sojourning abroad)? Yet he may in the evening and other leisure hours take up a few of the other subjects, as botany, plant physiology, drawing; and above all, he must find time for reading the gardening papers. This is good recreation and excellent mental exercise without attending many lectures. It will, together with thorough practical knowledge, tend to make as good a gardener as can be wished for. Give him more theory and he will lose in practice. But as said before, I understand that there must be a want of theoretical educated (still practical) men with a certain standard knowledge, for these a school is almost a necessity; they are the heads of large gardens, but they will be second to the others (the practical men) in smaller places.

It may appear rather peculiar that a foreigner should be treating of this purely English subject, when he has plenty to do for himself. I am furnishing, I am afraid, an illustration to my assertion that too much theory is not an unmixed good. Strange, the Director of Kew does not believe in lectures to an equal extent as the practical gardener (p. 51 of the *Gardeners' Chronicle*, came in after the above was written); it proves how much the theoretical man values practice and the practical man theory—thus paying a compliment one to the other.

I do not exactly know why County Councils are

going to educate gardeners, but if my impression be the right one, it is the holders of small allotment gardens who are to be educated; then I should say get them to work in a garden, and in that department of it of which they most desire a knowledge—say one day a week or a few hours morning and evening, for if they are wholly unacquainted with horticulture, lectures alone will not benefit them. A cheap and good weekly paper, treating of their needs, I should consider to be the best form of assistance. *M. P. Andersen, Jonkoping.*

FORESTRY.

TREES FOR MARSH AND MOUNTAIN.

In a former paper I briefly glanced at the exceptional merits of several species of deciduous trees that were capable of growing and reproducing themselves on marsh and mountain ground; but as the subject is by no means exhausted, I shall now briefly direct the planter's attention to a few evergreen species that I have found capable of growing both for ornament and profit in similar situations.

THE AUSTRIAN PINE.

The Black Austrian Pine, since its introduction into this country in 1835, has proved to be thoroughly hardy, and capable of growing in a great variety of soils and situations, from the flat Irish peat-bog up to the highest point reached by arborescent vegetation in this country. In the Highlands of Scotland I have planted it with perfect success on the top of limestone and granite rocks, where the soil was thin and the situation exposed to the wind from all quarters; and in Ireland I have planted it extensively on reclaimed peat-bog with equal success. It is also well adapted for planting as an ornamental tree at suburban villas and elsewhere in the vicinity of large towns, where the air is contaminated by smoke. It makes a grand specimen tree on the lawn or in the park, and when allowed space to fully develop, it retains its side branches from the ground upwards, and is truly cone-shaped. In spring, when its prominent terminal buds begin to expand, they gradually get enveloped in a white cottony substance, which appear like knobs of burnished silver, which make a fine contrast with its glossy-green foliage, and in this respect it has no competitor among the Pine tribe of trees.

When planting young trees of any considerable size for standards, they should be staked, to keep them firm in the ground until the roots take to the soil and become established, and in doing so drive a stump firmly into the ground, leaving it about 20 inches above it. Place some soft material round the stem to prevent injury to the bark, and tie the stem firmly to the top of the stake. By this mode of staking, the tree can oscillate in a natural way by the wind, which is all important in promoting its best form of development.

Many young trees are ruined by tying them to a long stiff pole, and keeping them in an unnatural cramped position for a series of years after being planted; and, besides, a long stiff pole presents too much surface to the wind, and this explains the reason that we see so many trees, staked in this way, leaning to one side after a gale. This is one of the best Pines for planting in marine situations, where the soil consists principally of loose sand; but when planting the trees in such places, I have found it an advantage to mix a little clay with the staple at the spots where the trees are to be planted to increase the weight and firmness of the soil, as well as to attract and retain moisture, all of which will prove beneficial in promoting the growth and healthy development of the trees. As a timber tree, for thrift and utility, the Austrian Pine is by no means despicable, when its culture is carried out under rational principles. When the tree is grown in isolated positions, the wood is generally of a coarse knotty texture; but when grown in plantations, or blocks by itself, it should be grown at such a distance apart that the side branches gradually lose their vitality

by confinement, and fall to the ground of their own accord. When grown in this way, the stems present fine clean shafts, free of knots or blemish of any kind, for a distance of about three-fourths the length of the stem, from the ground upwards; and when the wood is cut up for use, it is found to be of a close firm texture, free of knots, and well saturated with resinous matter, which adds to its durability. Isolated trees, however, and such as are growing around the margins of plantations, should have their side branches cut off as soon as they lose their vitality, as from their exposure to the air they get carbonised and as hard as horn, and thus lay the foundation for a loose knot in the timber.

PINUS CEMBRA.

Many years ago when overhauling and renovating the natural forests and planting trees to shelter and ornament the Highland home of the Queen, I found the Swiss Stone-Pine (*P. cembra*) to be exceptionally well-suited for planting on poor thin soil, resting upon shingle and gravelly drift. This alpine tree is interesting in many ways, and seems to be able to anticipate the approach of a coming storm in a very accurate manner by gathering up its leaves around its stem, branches, and twigs to prevent as far as possible the accumulation of snow, and thus enable it the better to combat the onset and fury of the elements. But although the mountain air and hard iorganic soil is eminently suitable for the requirements of this tree, it is by no means confined to such, as I have planted it with success under very different conditions as regards soil and climate. The contour of the tree, when fully established, is strictly columnar, and when allowed space it is well furnished with side branches from the ground upwards, and makes a fine specimen tree for a small garden. Amateurs should employ this tree for the embellishment of their villas, planting it in thoroughly-drained ground that has been broken up with a pickaxe. It belongs to the tribe of Pines which contain five leaves in a sheath; these are of a fine texture, and from 2 to 3 inches long, light-green in colour, and slightly tinged with a silvery hue. In Great Britain and Ireland its normal height is about 50 feet, and although its wood is of a fine firm texture, yet it is of too slow a growth to be recommended to the notice of the planter as a profitable timber tree. It freely produces cones and fertile seed in this country, and these are of a pretty large size, and generally lie in the ground dormant the first year after being sown, and vegetate the following season, so that cultivators need not be disappointed at the non-appearance the first year of the young plants. There is a variety of this tree known as the Siberian Stone Pine (*P. c. sibirica*), but I have had both kinds sent me from the same nursery under the same name. This kind, however, resembles the species very much, but may be distinguished by its shorter and stiffer foliage, while the habit of the tree is more upright, and not so spreading as that of the species. This variety is said to attain a height in its native country of nearly 100 feet. In this country it grows equally well under the same conditions as the species, and is interesting as a variety. The dwarf *Cembra* Pine (*P. c. pygmaea*) only attains the height of a few feet, and is highly suitable for amateurs to plant in their small gardens on the grass plot, where, with a little care and attention at the time of planting, it forms a very attractive little specimen. Its contour, when fully established, is that of a close little bush, well clothed with small branches and twigs. Like the species, it delights in a porous open soil, thoroughly drained and well broken up previous to planting. It is also very suitable for planting on dry rocky places to show contrast and variety. *J. B. Webster.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BERNERY, *Orchid Grower, Highbury, Birmingham.*

THE COOL-HOUSE.—Time permitting, examine all the occupants of this house, washing the pots and

cleansing the plants. If the *Odontoglossums* are infested with thrips, sulphur will be found a good remedy if well puffed into the young growths. Sages may also be kept under by the same means, for they are often found in close proximity to the flower-spikes, which will now be coming up.

CALANTHES.—The deciduous varieties, as *Veitchii*, *luteo oculata*, and *rubra oculata*, which may have passed out of flower, should be reated in a pit or house having a warmth of 50° to 60°, and in a light position. To succeed these varieties, *C. Turneri*, *C. Stevensii*, *C. Williamsii*, and *C. Regnerii* should be grown, so that *Calanthe* blooms may be obtained for several months longer.

THE MEXICAN-HOUSE.—In order to keep some species of Orchids, healthy, vigorous, and at the same time to flower them successfully, this sunny house is absolutely necessary. The best kind of structure is one provided with a span-roof, and which is heated so that the temperature may not fall below 50°, with ventilation afforded in the winter. During the summer no shade whatever should be employed. Wooden stages are the best, using "slats," a few inches apart, and the ventilators should be sufficient in number on the roof to prevent the leaves of the plants from being scorched by the sun's rays. This house is suitable for *Laelia autumnalis*, *L. albidula*, *L. anceps*, *L. majalis*, *L. flava*, *L. cinnabarina*, *L. furfuracea*, *L. Goldiana*, and *L. harpophylla*; many of the *Epidendrums*, including *L. atropurpureum*, *E. Parkinsonianum*, and *E. nemorale*; also *Thunias*, and some species of *Schomburgkias*, *Bletias*, *Pleiones*, *Brasavolas*, and *Cattleyas*; the whole of the *Barkerias*, not to mention many other species which need to have a long rest, as *Catascetums*, *Chysis*, *Mormodes*, and *Dendrobiums*. During the growing season we pay particular attention to the watering, dipping, and syringing of the plants, night and morning, and the ventilation calls for a considerable amount of opening and shutting of the ventilators in changeable weather, but when it is mild the house remains wide open, and partially so at night. I may remark that, although this house is a suitable place for plants which are robust and of good size, it is not adapted for weakly specimens.

ORCHIDS IN FLOWER.—To keep the blooms fresh and in perfection for a long period, there should always be a show house set apart for them, and in which it is possible to arrange the Orchids with other plants in a pleasing manner, the floors being kept dry, and everything in nice order. Orchid-houses that are nearly always damp and wet under foot, with the flowering specimens placed widely apart, are not generally pleasant places to inspect.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, *Gardener, Barkham Court, Maidstone.*

PRUNING YOUNG PEACH AND NECTARINE TREES.—These trees may now have their smaller shoots cut back to a triple bud, making quite sure that the centre one is a wood bud. If the wood is well ripened, very little shortening of the main branches or leaders will be necessary, as I have found that by judicious and persistent disbudbing and pinching, the shoots, from 2 to 3 feet in length, have been made to furnish young wood from the base upwards; and by adopting this method, the wall-space is furnished with bearing wood much quicker than when the shoots are cut hard back every year. Young trees generally have a tendency to make very strong wood, and to obviate this, the leaders should be left at full length; and if this has not the desired effect, root-pruning in the autumn will have to be resorted to. If the wood is immature (and I fear it is so in cold districts), it will be necessary to cut back much harder, so as to get those buds to break where they are required for furnishing the framework of branches.

MAIDEN TREES.—I advise that these be shortened back very close, only leaving about three wood-buds at the base, which will have the effect of inducing the bottom buds to push strongly; and it is important, if well-balanced trees are required, that the lower branches should have a good start of the others.

TRAINING.—I have tried various ways of training, but the system I myself have adopted, and which I can recommend, is that known as the fan-shape, without any centre leading shoot to rob the side

branches of their strength, and eventually to become a fruitless bare stem. Generally, young trees from the nursery, have from four to six branches, and these should be nailed or tied equi-distant apart, the two lowest shoots to be tied or nailed almost horizontally.

THE RASPBERRY.—The canes may now be cut back to about 3 feet 6 inches in height, except in the case of very strong growths, which may be allowed a length of 5 feet. Newly-planted canes should be cut down to 6 inches from the soil, and this cutting down will encourage stronger suckers to break up from the roots. Various are the ways of training the canes. The one I have found to answer well, and which is largely adopted throughout this district, is simply to thin out the canes to 8 inches apart, head them back as above described, and do nothing further. Although this mode is not so neat as when the canes are tied to stakes or wire, it answers equally as well.

THE FLOWER GARDEN.

By H. W. WARD, *Gardener, Longford Castle, Salisbury.*

TENDER BEDDING PLANTS.—Stock plants of *Coleus*, *Iresine*, and *Alternanthera* should now be pushed into growth, destroying them after the first lot of cuttings has been taken, afterwards propagating from these the desired quantity of each. Dibble them into shallow boxes filled with light mould and having a surfacing of sand, and at 1 or 2 inches apart; water with a fine rose, and place over the pipes in a Cucurbit or Melon-house, or in any other structure where there is a growing temperature. *Heliotrope*, *Ageratum*, *Lobelia*, and *Petunias* may be propagated in the same manner; or they may be struck in pots, and plunged to the rim in sawdust or leaf-mould near the glass in a hotbed, which should be kept close, and be covered with mats and Fern at night.

PROPAGATING HOLLYHOCKS.—This is effected by sowing seed, by division of established plants, and by cuttings. Fixed types or varieties are perpetuated by means of the two last-mentioned methods, and new kinds are produced by crossing the flowers of good promising varieties. The seed saved from the fertilised flowers should be sown out-of-doors in an open situation in June or July. Where a stock of plants has not been raised in the manner indicated, or by the potting-up of the desired number of rooted offsets early in the autumn, no time should be lost in sowing seeds saved of a good strain, in pans. Cover the seeds with fine sandy soil, watering carefully; place the pans in a forcing-house or hotbed, and cover them with glass and moss to exclude air and light. When large enough, pot the seedlings off, and return to heat; water, and grow them on steadily until the end of May, when, transplant them, after being gradually hardened off.

Cuttings about 3 inches long taken off close to the ground as soon as obtainable in spring, and inserted singly in 3 inch pots, filled with sandy soil, watered, and then plunged to the rims in a hotbed, and kept close, will soon become rooted, when they should be gradually hardened off, prior to transplanting in the open.

Soil of average fertility will suit the requirements of the Hollyhock, but, like most other plants of the kind, it will do better in a good loamy soil, inclining to be heavy rather than light, enriched with well-decomposed manure, incorporated with it in the process of digging.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

PEACHES.—Before commencing to force Peach trees, the condition of the border on which they are growing should be ascertained; also if water is required. Young trees in newly-made borders usually make rather strong growth for the first few years, and clear water need only be given to these. Older plants in feeble health, however, and growing on exhausted borders, will be much benefited by occasional applications of fairly strong liquid-manure at this, and all other stages of their growth. In either case, use the water at a temperature of 60°. Syringe the trees on mornings and afternoons of bright days, and maintain a minimum temperature of 45° for the first week, raising it 2° every week until 60° are reached, which will be about the time the trees are in flower. A corresponding maximum temperature of 5° higher, with fire-heat; and 15° to 20°, with the sun's influence, should also be maintained. Peaches started

earlier and about to open their blooms, may now be fumigated on two successive nights, to kill any green-fly or thrip that may have obtained a footing on the foliage. The most efficacious and cheapest material I have yet found for this work is medicated tobacco-paper. Old and weakly trees can safely be relieved of a large number of their flower-buds before they open, which, to a certain extent, will prevent undue exhaustion, and enable them to start into strong growth. A dryer atmosphere in the house during the time the flowers are open will be conducive to a good set, and gently shaking the trellis on which they are trained several times daily will also be an aid to the same result. Peaches now set and swelling will require attention in disbudding. This operation is best extended over a period of ten days, which averts any check the plants would be likely to suffer were all the buds intended to be removed rubbed off the tree at one time. In starting this work, select the strongest bud at the base of each shoot, and the side nearest the centre of the tree, to take the place next year of the branch destined to bear fruit this, and remove a third of those remaining equally over the shoots. Reduce another third of them in the course of five days, at the same time keep promising growths to fill bare space, and complete the work another five days later. At this stage, and until the fruit begins to ripen, the trees will be much benefited by being syringed in the morning, and when the house is shut up in the afternoon, and the borders and paths damped frequently in sunny weather. Maintain 55° to 60° in the house at night, and regulate the day temperature according to external conditions, admitting air when the thermometer rises 7° above the minimum figure, and increase the ventilation as the maximum of 75° or 80° is reached.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

MUSHROOMS.—When a demand for Mushrooms exists during the spring, the present is a good time to commence preparing the manure. Those who possess cellars or sheds, sometimes obtain a better crop than others who have costly houses, the latter often being overheated. The material for growing Mushrooms, too, may be used in a rougher state than is usually the case in private gardens. When underground houses or sheds are used, the heat from newly-made beds will keep the temperature up sufficiently. In severe weather, place the new litter as brought from the stable on the floor of the house near the door, taking care to avoid sweating. When the beds require covering, dry material should be used, and excessive steam or moisture avoided. Watering the beds in such structures will seldom be required during the winter months; but if heated, more moisture is necessary. I like the temperature of the house to be at 50° to 55°, the first-named in severe weather; and when spawning new beds, from 75° to 80° is none too high, if the heat is declining. When water is necessary, apply it in a tepid state, adding a handful of fish-manure to a large can of water, using the latter in moderation.

TOMATOS.—A pinch of seed should be sown now to produce early plants for fruiting in advance of the general crop. Those who can spare house-room should get strong plants for early fruiting; cuttings struck in the autumn usually fruit before seedlings. If seeds are sown in a light compost in pans or pots and placed in bottom-heat, they will soon come through the soil, and from that time till the end of May will require daily attention. For the early fruiting I prefer *Horsford's* Prelude, as this, according to my experience, comes in ten days to a fortnight before others; *Conference* and *Ham Green* come next, while for later work *Perfection*, *Conqueror*, *Hackwood Park* and *Trophy* are excellent and reliable croppers. Those who like yellow kinds will find *Greengate* and *Golden Queen* good. All should be grown near the light to prevent drawing in their early stages.

SALADS.—If severe weather has destroyed outside crops, a small sowing of *Early Paris* Market Lettuce or *Veitch's* Golden Queen should be made in pans or boxes. The last-named variety is unsuited for forcing purposes, forming small firm hearts of a beautiful light green colour. It is also excellent for sowing in pans every three or four weeks for cutting in a young state. Mustard and Cress should be sown fortnightly in order to maintain a constant supply. Watercress sown in pans or boxes and pricked off, gives nice fresh supplies in a young

state; it can be readily grown in frames. Endive may be had in a small state as advised for the Lettuces. Dandelion and Chicory should be placed in a temperature of 55°, and kept dark to blanch. A warm bed of leaves and litter should be prepared for Radishes, but if a separate frame cannot be afforded for this purpose, a row may be sown between Potatoes in frames, using an early variety of quick growth.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Gardens, Swansea.*

SHOW AND FANCY PELARGONIUMS.—These should now have their final shift, using pots according to the size of the plant. A compost of two parts rich loam, one of leaf-mould, and sufficient sharp sand to keep the soil porous, will be found suitable for them. The drainage must be made perfect, and the pots thoroughly clean. Make the soil quite firm, as this is conducive to a short-jointed growth. Some plants should be grown in small pots, as these will be found most useful for furnishing purposes. A low pit, where a temperature of 45° to 50° at night, with a rise of 5° to 10° by day can be maintained, will suit them well, if given air on all favourable occasions. Keep a sharp look-out for green-fly.

ZONAL PELARGONIUMS.—Sufficient cuttings of these should now be taken to form the stock of plants for blooming next autumn and winter. The required number of small 60-sized pots should be well-drained, and filled to within three quarters of an inch of the top with a compost of two parts loam, one of leaf-soil and sharp sand, running the whole through a fine sieve. Select the best-ripened shoots as cuttings, as these are not so liable to damp off as those which are soft and sappy. Insert one cutting in each pot, afterwards plunging them in a gentle bottom-heat under hand-glasses, where they will quickly take root; when rooted remove them to a pit or on a shelf in the greenhouse near the glass.

GREENHOUSE.—Flowering-plants should be looked over separately once each week, removing any decayed leaves, blooms, &c., and all plants which are past their best. Admit air when the weather is at all favourable, and keep the pipes lukewarm so as to expel damp. Late plants of *Cinerarias*, *Primulas*, *Cyclamens*, &c., which are showing for bloom should be assisted with a little of Thomson's Manure, or some other well-tried fertiliser. Let the night temperature be kept from 45° to 50°, with a rise of 5° to 10° by day.

THE STOVE.—Plants of *Acalypha* which have lost their under foliage may now be cut well in. The ends of the shoots can be made into cuttings, inserting them singly in small 60-sized pots filled with a sandy compost of peat and loam, and placed in the propagating frames. *Croton* cuttings should now be put in. Old plants of *Dracena*, which have got leggy, can also be cut down, and the stems cut into pieces and used as eyes. Place the latter in pots or pans in a sandy compost, and plunge them in a mature hot bed. The tops of the plants root separately in small pots. Also increase the stock of *Isolepis gracilis* by dividing the old plants.

PLANT PORTRAITS.

ESCHVYNANTHUS PULCHER, *Revue de l'Horticulture Belge*, January.

APPLE, *REINETTE POMOLOGUE HAOE*, *Bulletin d'Agriculture*, 1891, p. 353.

CESALPINIA JAPONICA, *Garden*, December 26.—Hardy shrub.

HYPERICUM BUCKLEYI, *Garden and Forest*, Dec. 9.—A hardy shrub suitable for small rockeries or borders. Native of mountains of North Carolina.

RANUNCULUS FASCICULARIS, *Meehan's Monthly*, t. I, 1892.

VIBURNUM TOMENTOSUM, *Garden and Forest*, December 16.

VRIESIA HYBRIDA (B. BARILETTI × SPLENDENS), *Gartenflora*, January, t. 1892.—A very handsome form, with purplish leaves and flat spikes of dull crimson, bracts edged with green.

VRIESIA HYBRIDA CODIENSIS, *Revue de l'Horticulture Belge*, 1892.—A hybrid by pollen of V. Barillett out of V. psittacina.

EDITORIAL NOTICE.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY,	FEB. 1.	Provisional Committee of the London International Fruit Show, at Anderton's Hotel, Fleet Street, at 2.30 P.M.
THURSDAY	FEB. 4.	—Linnæan.
FRIDAY,	FEB. 5.	Gardeners' Orphan Fund: Dinner, and General Meeting.
		Dundee Horticultural Association.
SATURDAY,	FEB. 6.	Wakefield Paxton Society.

SALES.

MONDAY,	FEB. 1.	Dahlias, Carnations, Pæonies, Lily of the Valley, &c., at Frotheroe & Morris' Rooms.
		Palm, Greenhouse Ferns, Begonias, &c., at Frotheroe & Morris' Rooms.
TUESDAY	FEB. 3.	Grand Importation of Lilliums from Japan, 200 (60) Palms, Seeds, &c., at Stevens' Room.
THURSDAY,	FEB. 4.	855 Lillium auratum, Tuberoses, Herbaceous Plants, &c., at Frotheroe & Morris' Rooms.
FRIDAY,	FEB. 5.	Imported Orchids, from Messrs. Linden, Brussels, at Frotheroe & Morris' Rooms.
SATURDAY,	FEB. 6.	Lilliums, Palm Seeds, Border Plants, Rose and Fruit Trees, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°.2.

It may be greatly open to doubt if any class of persons obtains so much unfeigned enjoyment from a comparatively small patch of land as the amateur gardener. Certainly not the country magnate, with his well-trained head gardener and many assistants, and his "ranges" of plant and forcing-houses, and their supplementary pits and frames. The personal interest, ever present in the former, gets much attenuated, or lost altogether, to the possessor of so great an abundance of good things. The one enjoys the works and products of his own labours, or at the most, with the assistance of the "odd man," or boy, and at fitful times the groom, if perchance, he have one; the other's enjoyment is more vicarious, being dependent on the efforts of his staff of gardeners and garden workmen.

In the small plot of the amateur, as in the large garden, spring comes laden with a great multitude of laborious cares, and which may not be neglected, if profitable or pleasurable returns are hoped for. Premising that the greatest number of amateurs in gardening may be found in and round the larger towns, it will be desirable if we advise them as to what the operations are that should be first undertaken in the garden. Let us take the glass structures, greenhouses, cool Orchid houses, if any; hardy fernery under a glass roof, pits and frames.

Long ere the spring has come, the roofs of all these buildings will have become nearly opaque with that oily-coaly deposit the townsman knows too well, and which must be removed before the plants start into growth, if we would have strong, healthy shoots, and flowers of the highest colours. Hitherto, they have rested in growth, so far as outward and visible signs go, and therefore suffered but little, unless it be from fog.

If the structures are small and low, syringe the glass heavily—not in front, but from above,

or sideways, so that the dirty water be not driven in upon the plants, and then with a hair-broom remove the sooty deposit, finishing with another syringing of clear water. Large or tall houses need a ladder and a roof platform to do the cleaning properly. Pit and frame lights are easily cleaned inside and out with clear water, a whitewash-brush and the syringe.

Having admitted the fullest amount of light into the structures, the repotting of such plants that need it may be begun. If no potting-shed exists, make a potting table, about 4 feet long and 2 feet wide, fitted with a 6-inch upright ledge on three sides, which may be placed on a side stage when in use, or on two tressels, fastened together in such a way that they do not become separated. As to soils for potting, these generally will have to be purchased from the dealers, and it is better if each be kept by itself, and the mixing done according to the needs of the plants when soil is wanted for use. Leaf-mould, a rare commodity in the pure state, or, failing that useful ingredient, well-rotted stable manure, loam of a medium degree of heaviness, and which is top spit soil and not the unfertile subsoil, and fibrous peat, two years cut and stacked, and river sand or silver sand. The last-named ingredient is not at all necessary, its use being as well filled by the former, and even in propagation the former is equally good if it be very fine and clean; or pounded brick will do as well for most of the plants the amateur requires to propagate.

Soils, it may be said here, should not be kept in cellars or other underground places, the conditions prevailing favouring the growth in and on them of fungus of various species, which, when allowed to grow, tend to impoverish the soil; but they should be kept in a sunny corner out-of-doors, and each by itself in the form of a neat heap, with a ridge-like top. Such heaps should not be allowed to get weedy, and in case they should become so, pare off the sides and bury the parings in the middle of the heap; or turn it all over, the sides into the middle. In winter, the snow and rain should be kept out of the soil by some kind of pent-house.

In March and April Camellias should be examined, and if the drainage is not quite clear it should be renewed; or, if the soil be sour, or the roots very much cramped for want of space, two conditions that usually are found together, repotting should be performed. Soil for Camellias should consist of rough loam, a little peat and leaf-mould or burnt-earth, and a sufficient quantity of sand to make the whole slightly porous, remembering that a very open soil or too much drainage materials are not good for this plant. Do not bury the old ball more than half an inch; make the soil very firm, and see that the old ball is quite moist before turning it out of the old pot. A few days after potting, water the plant moderately, and let it stand in a part of the house where there is little ventilation, or place it in a frame or pit, and give no ventilation for fourteen days. The same kind of attention will be required by the Orange, Myrtle, Pittosporum Tobira, P. undulatum, Abutilon, and tender Conifers, and the period named is a good one in which to repot these greenhouse plants.

Fuchsias may have their stems cut back if young, and the side shoots stubbed back, and watered slightly; and when they have begun to shoot, it is a good time to repot them in loam, leaf-mould, or manure, and a small portion of sand, using the soil in not too fine a condition. Let the drainage be good—not excessive, or the watering of the plants will become a great tax

on the amateur's time. Some of the rarer and therefore more interesting species and hybrids, as Fuchsia Pominiana, F. serratifolia, F. corymbiflora, F. splendens, F. procumbens, a pretty species for a basket, should find a place in the amateur's collection.

Ivy-leaf, zonal, and tricolor Pelargoniums may be shifted, shaking off much of the old soil; also the scented-leaf Cape Pelargoniums and ROLLISON'S Unique and Quercifolium—all old-fashioned plants, that look well, and are not what the gardener calls "miffy." The soil should be light, moderately rich, and sandy.

When the Ferns in the greenhouse or warm-house begin to show signs of returning activity, no time must be lost, but the whole stock should undergo examination. If the soil be found to be inert, and closely packed, channelled by earth-worms, or the drainage spoiled by the infiltration of particles of mould, the plant should be repotted in loam and peat and leaf-mould, the more delicate in peat and leaf-mould chiefly, not sparing the silver-sand. Surfacing the pot with fresh soil after taking out about 2 inches deep of the old soil is usually sufficient, where the conditions of the ball are found to be healthy.

A word here about "fertilisers" of all kinds. It is prudent not to employ any of these mixed with the potting soil, whatever the plant may be, but to afford these aids to growth in the form of top-dressings in a dry state in infinitesimal doses, or a weak solution in water. Let the amateur be wary of using them at all on his Ericas, Epacris, Boronias, and the like plants with fine twiggy shoots, and fine roots.

The sowing of flower seeds of various species of plants soon demands attention, after March is out—chiefly those that furnish the gay, if somewhat generally evanescent, flowering subjects of the mixed border, although some are of such long duration that they may be employed in beds on the lawn or the gravel parterre without there being ugly-looking patches of bare earth to be deplored in the brighter part of the season. The earliest of these sowings should not be made before the beginning of April, or the plants will get spoiled before they can be planted. We may allude to just a few: Phlox Drummondii, the various Asters, Dianthus diadematus, and others, very beautiful; East Lothian, and Ten-weeks Stocks, these last two making lovely beds or masses; Zinnias, tall and dwarf, and always effective; Petunias for filling baskets or training against a low fence, Sweet Peas for flowering early, and Nemophylla insignis, and others—beautiful subjects for edging a greenhouse shelf or stage. In sowing these fine seeds, rough siftings of soil should always half-fill the seed-pot, just a bit or two of crock at the bottom being then sufficient to assure an outlet for the water. The upper portion may consist of almost any kind of light materials, finely sifted. Always water the soil in the seed-pots and let them stand for two or three hours before sowing. Sow thinly, and barely cover the seeds—such fine seeds as those of Lobelia and Petunia are better when not covered with soil. Put a piece of tile over each pot to keep the seeds dark, for they do not like the light, and to prevent the too quick drying-up of the soil, and place them on a warm shelf, or in the hot-house—it does not matter in what part—till they begin to grow, when a bit of glass tilted at one side may take the place of the bit of tile.

In the hot-house, the general stock of flowering subjects may be repotted. This will apply to Ardisia crenulata, Aechmea, Coffea, Eranthemum, Eucharis if the pots be very light; Euphorbia jacquiniiflora, Gardenia, if old plants,

out of bloom, or very young flowerless ones; to Gloxinia, Hedychium, Hoya, Libonia, Maokaya, Plumbago, Rivinia, Russelia, Torenia, and Thyrsacanthus. As a general rule, no plant that is in bloom should be repotted till some few weeks after it has passed out of bloom. Achimenes are very nice plants for baskets and pans, and some tubers may be started in pans of sandy peat in February, March, and April. When the tubers, which should be laid on their sides, and covered with fine sandy leaf-mould and peat to the depth of $\frac{1}{2}$ of an inch, have grown 2 inches, the point of each should be pinched out; and when they begin to break again, transplanted 3 or 4 inches apart, into baskets or pans of light, rich, sandy compost. Baskets will not want drainage, but pots and pans will want a good deal of it,

which has been secured from the Metropolitan District Railway Company for this purpose, will be opened on May 14. It will display the state of progress of horticultural science, taste, resources, implements, and plant culture, at the present date; and, in addition, the various departments and exhibits will serve as models, not only for the possessors and managers of estates, but for each and every one who loves a garden. An abounding profusion of plants and flowers from all parts of the world will display their beauties of form and colour, grouped for effect in a garden charmingly laid out, both under cover and in the open, in one of the few available spaces in London. There will also be music of the highest class, the buildings and grounds will be brilliantly lighted by electricity, and everything will be done to ensure that this Exhibition—which appeals so much to the great English love of gardening—shall be a

different climatic conditions, and also the careful methodic treatment adopted abroad. Flower and fruit shows will be held periodically. There will be flower *fêtes*, besides special exhibits of American plants, Orchids, the old-fashioned herbaceous plants, &c. Lectures and demonstrations in practical gardening will be given regularly, and competitions in garden design and in gardening operations will be held, and prizes offered. Pictures representing all phases of the art of gardening, as well as photographs of particular trees and scenes, will be exhibited; and a reference library is being collected. There will be exhibits of new and rare and of special collections of plants; seeds, conservatories, greenhouses; methods of heating, ventilating, glazing, and general construction; garden requisites, tools, and all labour-saving machinery; statuary, vases, edgings, rockwork, and ferneries; fountains, seats, tents, and

FIG. 25.—THE TERRACE WALK AT ALBURY. (SEE P. 147.)

Most of the above-named hothouse plants like peat—say, one-half of the whole compost; the rest may consist of loam finely sifted if the plant be small—otherwise it may be broken up by the hand, and leaf-mould and sharp sand. The potting should be firm, and the house must not be much ventilated for a month after the general repotting is done, that is, if many of the inmates have been disturbed. In the case of a few, these may be stood in a part of the house by themselves, away from currents of air. Water sparingly at first, but thoroughly when water is needed, and syringe the plants night and morning, more heavily at night. We may allude shortly to the outdoor department of an amateur's garden.

INTERNATIONAL HORTICULTURAL EXHIBITION, 1892.—The great International Horticultural Exhibition, to be held this year at Earl's Court, London,

stupendous success. Here will be found examples of the gardens of all ages, including restorations of the ancient gardens of Egypt, Greece, and Rome; copies of those in China and Japan; and types of the Baronial, Italian, Tudor, Jacobean, Georgian, and Victorian eras. A large subtropical garden will also form a feature of the attractions offered. The tea-gardens of India and Ceylon will be represented, illustrating the growth of the Tea-plant, and the manner of drying and manipulating the leaves. A model cottage garden and allotment-ground will be shown, demonstrating practically what can be done in a limited area. This exhibition will be not only representative of all that is being done in the United Kingdom to promote horticulture, but, in addition, arrangements have been made whereby foreign countries, especially Belgium, France, Italy, and Germany, will co-operate to show the progress in their respective lands. This will be interesting, not only on account of the display of the beautiful objects sent over, but as demonstrating the manner of overcoming dif-

summerhouses; fencing, draining methods, decorations, and all objects and appliances that tend to enhance the beauty of a garden, or are necessary to its working. Medals, both Gold and Silver, and Certificates, will be awarded by the most capable judges, in addition to considerable money prizes; and the entire net profits will be devoted to such gardening institutions as the Executive Committee may select. HENRY ERNEST MILNER, F.L.S., Assoc. M.Inst.C.E., Chairman of the Executive Committee; G. A. LOVEGAY, B.A., Hon. Sec., Temporary Offices, 11, Grocers' Hall Court, Poultry, E.C.

BEGONIA OCTOPETALO - LEMOINEA FLEUR D'AUTOMNE.—The old Begonia octopetala - Lemoinea l'Heritier, from Peru, has been crossed by MM. LEMOINE & FILS, Nancy, with the pollen of various tuberous Begonias, and a new type of Begonia has been developed. The plant is vigorous and very floriferous. The root-stock is rather long and irregular, the middle portion partly resembling the black roots of *B. octopetala* and

the nearly globular tubers of *Begonia tuberosa*. The stems are herbaceous, short, and luxuriant. Leaves apparently caulescent, leaf-stalk cylindrical, and furnished with strong hairs. Leaf large, almost regular in shape, long, heart-shaped, wavy, with small indentations at the edge, and of a pretty silky-green appearance. Flower-stalks numerous, stiff, and strong, $1\frac{1}{2}$ to 2 feet high, each furnished with five to seven large rose-coloured flowers, 7 to 9 centimetres broad. It flowers in the autumn. Another variety, *La Lorraine*, has scarlet flowers and yellow anthers.

PROFESSOR RUDOLF STOLL, of the School of Viticulture and Pomology at Klosterneuburg, Vienna, succeeds his father, who has been superannuated after many years service, as Director of the Pomological Institute of Proskau.

KENT COUNTY CHRYSANTHEMUM SOCIETY.—The next show of the above Society will be held on Tuesday and Wednesday, November 1 and 2.

WEST AFRICAN PLANTS.—From Dr. ENGLER, the Director of the Berlin Botanic Garden, Kew has received a parcel of novelties, chiefly from the collections made by German travellers in tropical Africa, *Kew Bulletin*.

CHICAGO EXHIBITION.—The following is the text of the classification for Department B, "Viticulture, Horticulture, Floriculture":—

GROUP 20.—VITICULTURE.

Class 119.—The Vine and its varieties—shown by living examples, by cuttings, by engravings, photographs, &c.

" 120.—Methods of planting, staking, and training the Vine.

" 121.—Vineyards and their management.

" 122.—Grapes for the table.

" 123.—Grapes for wine-making.

" 124.—Grapes for drying—Raisin culture.

" 125.—Methods of and appliances for cultivating, harvesting, curing, packing, and shipping Grapes; wine cooperage.

" 126 to 129.—Wines of different kinds.

" 130.—Methods of expressing the juice of the Grape; of fermenting, storing, racking, bottling, and packing.

" 131.—Brandy of all kinds; methods and apparatus for the production of brandy.

" 132.—Literature, history, and statistics of viticulture.

GROUP 21.—HORTICULTURE.

Class 133.—Garden vegetables and their cultivation.

" 134.—Market and truck gardening.

" 135.—Esculent vegetables.

" 136.—Garden tools and other accessories of gardening.

GROUP 22.—FLORICULTURE.

Class 137.—Hardy perennials, flowering shrubs, &c., other than Roses, Rhododendrons, &c.

" 138.—Roses of all varieties.

" 139.—Rhododendrons, Azaleas, and wild flowers.

" 140.—Orchids and orchid-houses.

" 141.—Ornamental leaf plants.

" 142.—Bedding plants and annual flowering plants, ornamental bulbs, &c.

" 143.—Flower and seed trade—methods of testing vitality of seeds.

" 144.—Cactaceae.

" 145.—Aquatic plants and their culture. Nymphaea, &c.

" 146.—Cut flowers and florists' work.

" 147.—Floral designs, &c. Bouquets, preserved flowers, leaves, sea-weeds. Illustrations of plants and flowers. Materials for floral designs. Bouquet materials, bouquet holders, bouquet papers, table decorations.

148.—Receptacles for plants. Flower-pots, plant-boxes, tubs, Fern-cases, jardinières, &c. Window gardening. Plant and flower-stands, ornate designs in iron, wood, and wire.

GROUP 23.—ARBORICULTURE.

Class 149.—Ornamental trees and shrubs—methods of growing, transplanting, &c.

" 150.—Fruit trees and methods of rearing, grafting, transplanting, pruning, &c.; means of combating insects and other enemies.

" 151.—Nurseries and the nursery trade.

GROUP 24.—POMOLOGY.

Class 152.—Fruits of temperate and sub-tropical regions, as Apples, Pears, Quinces, Peaches, Nectarines, Apricots, Plums, Grapes, Cherries, and Melons; cold storage, and other methods of keeping, packing, and shipping. (For Grapes, see Group 20.)

" 153.—Citrus fruits—Oranges, Lemons, &c.

" 154.—Bananas, Pine-apples, and other tropical fruits, except Citrus fruits.

" 155.—Small fruits—berries, &c.

" 156.—Casts and models of fruits.

GROUP 25.—PRESERVED FRUITS AND VEGETABLES. Classes 157 to 165.

GROUP 26.—APPLIANCES AND METHODS OF HORTICULTURE, FLORICULTURE, ARBORICULTURE, &c.

Class 166.—Hothouses, conservatories—methods of construction, management, and operation.

" 167.—Heating apparatus for hothouses and conservatories.

" 168.—Hotbeds, forcing and propagating houses and appliances.

" 169.—Seats, chairs, and adjuncts of the garden and conservatory.

" 170.—Ornamental wirework, trellises, fences, borders, labels for plants and trees, &c.

" 171.—Garden and nursery administration and management. Horticulture, floriculture, and arboriculture as arts of design and decoration. Laying out gardens—designs for the laying out of gardens and the improvement of private residences; designs for commercial gardens, nurseries, graperies; designs for the parterre. Treatment of water for ornamental purposes—Cascades, fountains, reservoirs, lakes. Formation and after-treatment of lawns. Garden construction, building, &c.—Rock-work, grottoes; rustic constructions and adornments for private gardens and public grounds. Planting, fertilizing, cultivating, and appliances.

MEXICAN PLANTS.—From the Botanical Division of the United States Agricultural Department, Washington, there has been received a very fine set of Mexican plants, collected by Dr. EDWARD PALMER, and described and published by various American botanists. The Mexican flora seems indeed almost inexhaustible, every fresh collection abounding in new species. *Kew Bulletin*.

PLANTS OF WESTERN CHINA.—In connection with the botanical collections made by Mr. ANTHEP E. PRATT, in Western China and Eastern Tibet, at elevations of 9000 to 13,500 ft., the Principal Assistant in the Herbarium, Mr. W. B. HEMSLEY, F.R.S., has visited Paris, in order to study the novelties collected by Prince HENRY OF ORLEANS, and published by Professor BUREAU and Mr. FRANCHET. A considerable number of Mr. PRATT's plants proved to be the same, yet the number of different species was even larger. These will be published as soon as possible. *Kew Bulletin*.

BUTTER NUTS.—A large supply of the "butter nut" of British Guiana (*Caryocar nuciferum*) was received from Mr. G. S. JENMAN, F.L.S., Superintendent of the Botanical Gardens, Georgetown, Demerara. The tree yielding these nuts is a very valuable timber tree as well as a fruit-yielding tree, and its successful introduction to the tropical parts of the Old World has been a matter of solicitude on the part of Kew for some years. An attempt made in 1888 appa-

rently failed. The present supply of nuts has been distributed to the botanical establishments at Calcutta, Madras, Queensland, Lagos, Ceylon, Mauritius, Singapore, Natal; while some were sown at Kew. *Kew Bulletin*.

LINNEAN SOCIETY.—At the evening meeting, intended to be held on February 4, at 8 P.M., the following papers will be read:—1, "A Monograph of the *Dianthus*," by F. N. WILLIAMS, F.L.S.; 2, "On the Sponge Remains in the Lower Tertiary Strata, near Oamaru, Otago, New Zealand," by G. JENNINGS HINDE, Ph.D., and W. MURTON HOLMES.

AGAVES.—The Keeper of the Herbarium, Mr. BAKER, has lately proceeded to the Riviera to examine the fine collections of Yucca, Aloe, Agave, Dasylirion, &c., growing in the gardens of Mr. THOMAS HANBURY, F.L.S., at La Mortola, near Mentone, and others. Mr. BAKER has long made a special study of this class of plants, and his visit has proved very instructive. A detailed report of the results will appear in a future number of the *Kew Bulletin*.

VANILLA.—The collection of Vanilla pods in the Museum of Economic Botany (No. ii.) has recently been revised and augmented by a series illustrating the principal kinds now known in English trade, including the following sorts:—Madagascar, Bourbon Réunion, Mauritius, Seychelles, Bahia, Mexico, Java, and "vanillous" (the less valuable sorts of Vanilla). *Kew Bulletin*.

YUCCA FILIFERA.—A very fine, and probably a unique, plant of *Yucca filifera* was presented to the Royal Gardens by Mons. DE FALBE, Villa Valetta Cannes, and placed in the temperate house. This specimen is 25 feet high, and about 3 feet in diameter at the base. It is a magnificent plant in size and character, and although it has lost its terminal crown of leaves, owing to injury during transit, it is hoped that it will eventually recover. The species is figured in the *Botanical Magazine*, t. 7197, from a specimen received at Kew in 1888. When it arrived, it was apparently dead, and the trunk was placed in the Museum of Economic Botany (No. iii.). After remaining there for two years in a dormant condition, it put out rudimentary leaves, and it ultimately flowered. The plant was then removed to the temperate-house, where its inflorescence was fully developed in September, 1890. *Kew Bulletin*.

THE REIGATE AND DISTRICT CHRYSANTHEMUM SOCIETY.—"It may be of interest to some of the readers of these pages," says Mr. H. BAILEY, The Briars, Reigate, "to be made acquainted with the good work done by the above during the past year. It was thought by the committee that it would be enhancing the interests of the Society if we kept our charity near home, and after several suggestions, it was ultimately decided to give 30 guineas to the Royal St. Ann's Schools, Red Hill, an Institution for fatherless children, and one that is much in need of help. We were of the opinion that by making this departure for one year only, we should enlist the sympathies of those who had hitherto refrained from helping us. I think I may safely venture to say that our efforts were crowned with success, for we not only handed over the above sum to the executive of St. Ann's Schools, but were enabled also to give 10 guineas to the Gardeners' Royal Benevolent Institution, and £10 to the Gardeners' Orphan Fund; thus making the total given to the three Institutions during the three years the Society has been established, of £196 10s., as follows:—1889: Gardeners' Royal Benevolent Institution, £52 10s.; Gardeners' Orphan Fund, £50, 1890: Gardeners' Royal Benevolent Institution, £42, 1891: St. Ann's Schools, £31 10s.; Gardeners' Royal Benevolent Institution, £10 10s.; Gardeners' Orphan Fund, £10. The foregoing figures speak for themselves, and are, I think, a guarantee of the success attained." It may be here mentioned that, at the annual dinner of the Society on December 10, at the Public Hall, Reigate, upwards of sixty guests were present."

SIAM.—The *Journal of the Society of Arts* for the 22nd inst. contains an interesting narrative of the travels of Mr. Sawo in the Laos States in the Northern and Eastern parts of Siam. There is incidental mention made of Orchids, but, unfortunately, Mr. Sawo does not specify the kinds. "There are," he says, "about 150 species found in the Chiengmai woods, and the women are very fond of wearing them as ornaments for their hair; the same practice is common in Burmah. Many of the better-known species have their distinctive native names. There is one which is brought every year from Mu'ang Yoom by the Lawas, who inhabit the mountains, and presented to the Chief as tribute. It has an insignificant greenish-white flower, but is much esteemed for its fine odour, which the chief asserted could be recognised in the city while the tribute-bearers were several miles off. . . . One morning we received a summons to the Chief's house, to be present at the presentation of the tribute Orchids already mentioned. The ceremony took place in the audience-hall. We all sat on chairs, ranged in a semicircle, the Chief wearing his every-day dress. The Lawas from Mu'ang Yoom were introduced by an old Lao, who has served under seven successive chiefs of Chiengmai. They brought with them a tassa full of Amaranths, which this old man handed to the Chief, repeating first a long exorcism, during which the Chief held up his hands as if in prayer. Next a long joint of Bamboo, full of arrow poison, and a few skeins of cotton yarn were offered to him. Then a small stone mortar, full of powdered ginger, was handed to the Chief, who put some in his mouth, chewed it, and spat it out, to symbolise the fertilisation of the ground for the reception of the rice seed. The Orchids were there, stuck into two sections of a tree, but apparently no reference was made to them. . . . The Chief stuck an Orchid through the hole in his left ear-lobe, and gave us each a sprig to do likewise, but not being provided with those useful apertures, we had to put them behind our ears, which is, after all, quite as elegant as the native manner of wearing a flower." The principal sources of industry are the Teak forests, of the working of which an interesting account is given. We trust Mr. Sawo may find means of giving us further particulars as to the names of the Orchids he mentions as having been the objects of his search.

BRITISH FRUIT-GROWERS' ASSOCIATION.—The annual general meeting of this Association was held in the Horticultural Club, Hotel Windsor, Victoria Street, S.W., on Thursday, January 21, under the presidency of Dr. MASTERS. Owing to the prevailing epidemic, however, there were but few members present. The committee's report and financial statement for the past year were adopted, and the Chairman moved that they be printed and circulated. Notwithstanding the low rate of subscription, and heavy expenditure, the financial statement shows a balance of £2 7s. 4d. It was announced that arrangements were being made to hold three provincial conferences, and one in the metropolis, during the ensuing year, but the exact places and dates could not be determined, as applications had been received from several important societies.

— At the conclusion of the business of the annual meeting on Thursday, January 21, Mr. LEWIS CASTLE was presented with a gold watch and chain, in slight acknowledgment of the valuable services rendered by him as honorary secretary of the above association.

ABERDEEN.—The Links and Parks Committee of the Aberdeen Town Council had before them on Tuesday, the 26th inst., a letter from Mr. LEWIS ESSON, offering to hand over a valuable collection of botanical specimens, at present on view at the Aberdeen Trades Council Exhibition. Mr. ESSON stated that the collection is worth £100, but that he would give it to the committee for £50. It was remitted to two members of committee, and the head gardeners of the City parks, to examine the

collection, and, if necessary, employ an expert, the feeling being that such exhibits were wanted for the Duthie Public Park Museum.

ALBURY.

Nor far from the pleasant town of Dorking, within easy distance of the swelling downs that intervene between that town and Guildford, lies Albury, the Surrey seat of the Duke of Northumberland. Fine trees, rich woods, green pastures, and clear rivulets lend their charm; an old church, no longer in use, abuts on the pleasure ground. A cavern in the sandstone rock served as a bath-room for the monks of old, and a subterranean passage, leading no one knows exactly where, arouses the interest of the visitor. The trees form the great feature of the place. Among them are fine examples of *Planera Richardi*, Tulip trees, American Oaks, Liquidambar, Sweet Chestnut, and others. One of the Chestnuts we measured girthed over 21 feet at 5 feet from the ground.

A remarkably fine specimen of the American Lime is to be seen on the lawn. Its dome-shaped form is so symmetrical that some visitors are said to have remarked that it must be a very difficult matter to clip so large a tree! The leaves are broad, rather thick, deep green above, and covered with whitish-grey down on the under-surface. It is superior to the common Lime for planting near towns.

Conifers are well represented, the woods being full of fine Douglas Firs, among them several of marked weeping habit, interesting and desirable for variety's sake, but not to be compared for massive grandeur to the ordinary form of *Abies Lowiana* (*lasiocarpa* of gardens), there are several very fine specimens, as also of *A. Nordmanniana* and *A. nobilis* and *Pinus pungens*. A *Deodar*, laid low by the wind, has rooted at one end, and has thrown up a fine stem from the prostrate trunk. The Corsican Pine is represented by some finely-grown specimens, as well as the more recently-introduced *Wellingtonia*. Many of these trees have now nearly or quite reached timber size, whilst of those which may be expected to do so mention may be made of *Thuyopsis dolabrata*, *Cupressus Lawsoniana*, which, however, is open to the objection that it is too bushy in habit. This difficulty might be got over by selecting appropriate varieties, and by judicious management in the young state. But of all the comparatively recently-introduced Conifers, Mr. Leach, who has charge of the gardens, thinks most highly of Lobb's *Thuya*, *Thuya gigantea* (or, as it is usually called in gardens, *T. Lobbii*).

THUYA GIGANTEA.

"This Conifer," says Mr. Leach, "will ere long become one of our finest timber trees, and a noble tree as a lasting tribute to one of our greatest travellers, namely, William Lobb. For my part, I consider a finer tree could not have been chosen to perpetuate the name of one who has done so much in giving us so many grand trees. I am well aware that many practical men have had their eyes open to the value of this tree, particularly as regards its beauty as an ornamental tree; but the credit is due to those who, some thirty years ago, planted this and other Conifer trees, that we are now able to give a sound verdict as to their economic values. Planters in general have been a very long time in making use of this valuable tree as a timber producer. If I had a thousand acres to plant with trees that would give the most remunerative returns in a given time, the above would be my mainstay.

"As regards soil and situation, it will grow anywhere. We have had it here growing in pure sand and in various situations, and in other kinds of soil; many trees being 70 to 80 feet and more in height, or on an average of 76 feet high.

"In regard to its timber, it is fine-grained, and for building purposes I am fully persuaded it will be found good in every way, being of better quality than the Scotch Fir. Where the Larch is often crippled with disease, and in many places refuses to grow at all, the above tree, given a little more room,

would grow and thrive, and in a few years give a good return. After many years' close inspection, I have never seen any harm done to this fine tree by insect pests. There may be places and situations where this *Thuya* will not grow, but I have not seen such places yet, and I have grown it in stiff clay down to pure sand.

"Another point in its favour is, that wind seems to have but little effect upon this tree, unlike many other fine subjects—such, for instance, as *Cupressus Lawsoniana*. The above does not, as a rule, branch out into two or three stems, but has one leader and light foliage. I would invite others who have a knowledge of this tree as growing to a large size, to state their opinions, feeling sure that many who only regard it as a tree for ornamental planting will be glad to hear of its great value as a timber producer."

From what we have seen, not only at Albury, but also at other places in the South, we can fully endorse Mr. Leach's opinion of the value of this tree. How it succeeds in the North we do not so fully know.

That Maize can be grown as a profitable crop in Surrey is a proposition that will be received with a good deal of hesitation; nevertheless, having had the opportunity of seeing what Mr. Leach does in the by no means exceptionally favoured climate of Albury, we can but say that he succeeds in producing fine well-filled cobs, which would be serviceable for poultry feeding and other purposes. What the cost of production may be we do not know.

Our illustrations, on pp. 137 and 145, show views from either end respectively of a long terrace-walk, bounded on the one side by lofty trees, and by a high wall, on the other by a shrubby border, which serves to hide out the kitchen garden. The terrace itself forms a broad grass walk of considerable length, having the gardener's house at one end, and the vineries at the other. With Alnwick and Syon to fall back upon, there is no need for any large conservatory or for any very extensive forcing establishment at Albury; but what there is, is thoroughly well done.

HOME CORRESPONDENCE.

EDUCATION OF GARDENERS.—This discussion to an onlooker seems rather degrading to the gardening fraternity. Head gardeners have always seemed to me to be every bit as efficient members of the community as any other body of men. To say that they have not advanced with the times is nonsense. One has only to consider how Orchid-growing, the culture of hardy fruit under glass, and the use of artificial manures have been successfully taken up by gardeners who were brought up in gardens where quite different traditions reigned, to know how absurd such a supposition is. In this respect, they contrast very well with agriculturists, the majority of whom seem to keep on in the same groove as their forefathers. If the present head gardeners are capable horticulturists, keeping pace with every new development, and calling in aid from other sciences, why should we doubt that young men will be wanting to fill their places? Such has never been the case hitherto in any profession. The young men who are learning to be gardeners now, will do well to learn as did those in the past, that is, by practical experience in a good garden, and, if possible, a year or two in a botanical garden. Merely listening to lectures does not add much to any one's store of information. The remembrance of them is like the remembrance of a sermon. The way to become proficient in an art, so as to make it of use, is to grapple with it in spare time, finding out things for oneself. The gardeners of old were taught by experience their craft; and, depend upon it, it will be the only way in the future. As the standard of requirements gets higher, so will the subordinates in a garden have to acquire wider knowledge. The demand always regulates the supply. Those County Council lecturers, who flatter themselves they further the cause of scientific horticulture in the villages, always remind me of a rustic who said, "Why ain't the cove made his own fortune, if it is such a good thing?" *Vagabond*.

— Having read with much interest the correspondence in your columns on this subject, I

should like to make a few observations. In the first place, it is well-known that the best men are not always in the best places, and never will be until gentlemen are more particular in the selection of their gardeners, and securing them from proper quarters. It may be asked what I consider proper quarters. Well, in my opinion, if gentlemen were to apply to our large nursery firms for men they would be better suited, for the simple reason that a nurseryman generally has means of knowing the capacity of the men on their registers or in their nursery, and in their own interests would hesitate to send men of inferior attainments and wanting in experience to good places. They are acquainted with most of the gardens in the country, or, if not, they can obtain the desired information from their travellers and correspondents, and are enabled to judge whether a situation that may happen to be vacant requires to properly fill it a man skilled in fruit-culture, orchid-growing, or any other of the various branches of horticulture. When a gentleman engages a man through an advertisement, he may possibly get one who is quite unsuited for his place, although furnished with good testimonials. As regards education, I should be the last to discourage it in any form, but when we take into consideration the wages that a gardener usually receives, it hardly seems worth the trouble to qualify him in botany, Latin, &c., especially when we know that only about 10 per cent. can succeed. I should say, at a rough guess, that 60 per cent. of the places are single-handed or where two are kept; 30 per cent. where three to eight men are employed; and perhaps about 10 per cent. where eight to forty are engaged. Now in 60 per cent. of the places, the wages average from 18s. to 22s. per week, with or without house; for these places, where all kinds of rough work have to be done, do we require educated men? I am afraid their knowledge would make them dissatisfied with the little scope allotted to them in which to display their abilities; they would ever feel they were fitted for better things. As it to be supposed, on the other hand, that the wages given in 30 per cent. of the places, which possibly may average from 22s. to 30s. per week, form a sufficient inducement for young men to study? To obtain one of these places, a man must be twenty-seven to thirty years old; he must be married. If his wife can do laundry or dairy work, he stands a much better chance. Perhaps at the age of thirty-five we find him out of place, with a family of three or four children; let him then seek a situation, and he will find if his university education will procure him one, for the gentlemen do not like "encumbrances." He then has to do jobbing gardening to obtain a living. I believe this is the fate of many of our gardeners. Would it not be better to encourage our young men to go abroad to countries that are not so densely populated as ours, and where the competition is not so keen, to carve fortunes for themselves, than to bring them up to a profession in which 10 per cent. succeed, 30 per cent. obtain mediocre places, and 50 per cent. have to go to the wall. *W. E. G.*

— I read with interest "Shoeman's" letter on the above subject. It is true, the wages offered young men in nurseries are barely enough to live upon, and if you want to lay by a few shillings for a rainy day, you have to live in a state of semi-starvation to do so. And yet we find the labour market glutted, not with competent men, but with men whose knowledge of the trade is nothing; and foreigners, who, when they land on our shores, perhaps never worked in a nursery before. I have often known men put in positions where they were not capable of holding them as shoe-black. Employers say it is a difficult matter to find a good practical man who knows the business; and such is likely to be the case so long as there is so much inducement given to inexperienced men and foreigners who are willing to work for the small wages offered in the nurseries. The only remedy that I can suggest is, that masters should employ only those who can produce a certificate showing that they have served a term of apprenticeship; and then we may get a class of men who are worthy of the name gardener, and can do something to raise the trade from the degraded and underpaid state it is in at the present day. *P. Lavis.*

TECHNICAL EDUCATION IN THE COUNTIES.—The lectures given at the present time in various parts of the country by the county councils are intended in the main for the benefit of the working men, cottagers, and holders of small areas of land, market-gardeners, and, indeed, for any who care to avail themselves of the opportunity of

attending them, but for the benefit of the first three more especially. It is open also to young gardeners to attend these lectures, but what is the result of the attendance? From my own experience the results are far from being satisfactory as regards the attendance. In a purely rural locality during a course of six lectures given during one week, the average attendance did not exceed twenty-five, perhaps this may to some extent be accounted for by the severe weather and the prevalence of the influenza epidemic in the neighbourhood. I find also that the class which is the most interested in the lectures, consisted of persons who are amateurs in the strict sense of the word, at least, such as I take it to mean, namely, those who cultivate a garden merely for the love of the work, and for the sole object of obtaining a good home supply of fruit and vegetables, without any thought of sale, and who do the whole of the work, or the greater part of it, without any paid assistance—these persons being what I term amateurs proper. There are so many opinions as to what constitutes an amateur, that I have taken the liberty to here introduce my notions of what constitutes one. Such persons, I find, have a greater thirst for knowledge than almost any others. The ordinary farmer or garden labourer appears to think that he is sufficiently well versed in all the necessary details of the work necessary to manage a garden properly, and that it is not necessary to acquire any further knowledge. The first thing to overcome in such cases as this is to get rid of the prejudices above named. If technical education is to do any good under the rule of the county councils, and it doubtless will in time do this, it must be carried out in a thorough manner. It is useless to tell such people how much money can be made out of an acre of Strawberries, Gooseberries, or Currants, or, indeed, anything else to that extent. If you tell them that the land must be manured to the extent of fifty tons of manure to the acre, this equally is quite beyond their grasp; and to tell them if they cannot find a market in one place for their produce, they must look for another elsewhere, is also absurd, and their interest in the subject wanes at once, and they will not again attend a meeting. The reading of a long, dry paper, full of little else but statistics of what has been made and what can be (2) made from a few rods of ground, is not the right way to create an interest in the minds of those for whom the lectures are mainly intended. Technical instruction in horticulture can be rendered useful in other ways than this. In my opinion, the best way to encourage the attendance of those to whom technical education is especially intended, is to give them at every lecture a few object lessons, in, for instance, the pruning of an Apple tree, or the branch of one, showing them how young fruit trees should be pruned at the time of planting them; examples of moss and lichen-covered branches, and those also which have been cleansed from such growths, and explain how the cleaning is to be performed. The staking of standard Apple trees would serve as another lesson. Then the pruning of Currant and Gooseberry bushes, in all cases showing also the wrong method of doing anything connected with these subjects, as most persons like to know what not to do, as well as what to do. Technical education carried on in this manner would excite an interest, and be the means of furthering the object in many localities; and if the right lines are followed by the lecturer, much useful work will be done in the course of time. I do not mean to say that no suggestions need be made as to the profits that may be derived from the disposal of any surplus produce there may be where facilities are at hand, that would make it pay to give special attention to this matter; but to give a glowing account of the large amounts to be derived from this source is scarcely the right tack to follow. Only persons resident in any neighbourhood, which the lecturers as a rule are not, can afford any trustworthy information as to markets, and other ways of disposal of garden crops. To connect the education of young gardeners with the technical lectures now being held, is not likely to be of much service—not but that many of them could learn much by attending them—but any young man who has the inclination to improve himself will readily find out the best means to do so; and those who do not care to learn cannot be made to do so by establishing lectures. *Practical.*

LECTURES ON HORTICULTURE.—Residing in a district favoured with free lectures on horticulture and allied subjects, I can endorse Mr. Dyer's remarks respecting gardeners having more practical knowledge than the lecturers themselves, and

labourers not caring to go to hear theories propounded by people ignorant of work and workmen. We have such "benefits" as "The Manure Heap," "Physics of a Glasshouse," "Fertilization of Flowers," interesting perhaps when skillfully handled, but nothing more at best, and too far-fetched to be of any real utility. Your correspondent "Excelsior" mentioned hewers of wood and drawers of water. If gardeners are to be drilled and preached at by state lecturers why should "hewers" escape. Surely there is also room here for lectures. That a good practical knowledge of gardening is widespread and general is proved by the excellent cultivation observable in cottage gardens, allotments, and also on railway sidings mostly worked by persons ignorant of the new-fangled technology. A course of lectures by dealers in semi-scientific second-hand knowledge, ventilating theoretical facts obtained by perusing other theorists' writings, seem hardly calculated to improve the general standard. Gardening literature is both cheap and good, and there is no scarcity of it; in fact, it finds its way into most periodicals. There is no end to the works dealing with specialties, dictionaries, annuals, and calendars, besides excellent journals devoted to all branches of the art, which, in the writer's opinion, are far better than any of the lectures yet delivered, as they unfortunately are, by state-aided theorists generally without practical experience. *Under Gardener.*

MELTING SNOW IN THE STREETS.—There has been this winter the usual crop of inventors who, without the slightest knowledge of the subject they advocate, endeavour to enlist the time and money of others, as ignorant as themselves, in a very foolish scheme, i.e., to use ordinary gas to melt the snow which obstructs the streets, some of the sanguine having gone to some expense in demonstrating what was already known, i.e., the possibility of it irrespective of cost. How absurd such a project is, can be easily seen by comparing the known heating value of coal-gas with the work to be done. Six inches deep of average snow, when melted, becomes half an inch in depth of water, 24 square feet of which will weigh 62½ lb., or 234 lb. per square yard. At this rate, the snow on 1 mile (or 1760 yards) of a street 20 yards wide, would, if 6 inches deep, weigh 823 680 lb., or 363½ tons. The heating-power of London gas is 660 units per cubic foot, i.e., 1 cubic foot of coal-gas will heat 660 lb. of water 1° Fahrenheit, and of this we may take it as a maximum that 500 units could be utilised. It has been proved repeatedly and beyond question, that 1 lb. of snow at freezing-point requires 150 units of heat to melt it and raise the temperature of the water obtained to 40° Fahrenheit, and this effect would be produced on 34 lb. of snow by the consumption of one cubic foot of coal gas. From the above data it will be found that to melt the snow in the assumed mile of street would require the consumption of 247 000 cubic feet of gas, costing, at 3s. per 1000 cubic feet, a little over £27, or at the rate of £2356 per square mile. As there are a great many square miles of streets in many towns, and as the snowfall has already been nearly double that assumed, it will be seen that the problem is, most certainly, not one to be solved by this method. Even if we were to assume that the cost of gas and labour were not prohibitive, the fact that the ground itself is usually colder than 32° must be considered, and the ground would also have to be warmed, or a thin surface of glassy ice, of the most slippery and dangerous kind, would remain after the snow was removed; this alone would condemn the project as being unworthy of consideration. *Thomas Fletcher, F.C.S., Warrington.*

THINNING THE BRANCHES OF AND CLEANING APPLE TREES.—It is a very common thing to see Apple trees in orchards and gardens crowded with branches and twigs, and covered with moss and lichens—conditions the reverse of healthy. To get large fruit and a clear skin of a good colour, the trees must have plenty of direct sunlight, and a good current of air playing about among them, these being factors which give that desirable finish to the fruit. With thickly crowded branches, only leaves of thin substance and small Apples can be looked for, but when the heads of the trees are maintained in such a state by cutting out unnecessary shoots and main branches sometimes, that the light and air have access to every part, the fruit is benefited in a corresponding degree. Moss and lichens are also great enemies to the trees, for, like all other parasites, they live at the expense of what they fasten themselves to, and, moreover, they close the breathing pores of the rind of the younger branches,

The cure for these evils consists in removing all branches that interfere with each other, and the best tool to use for the purpose is a fine-toothed saw—rough set, and all the wounds made by the saw should be smoothed with a sharp knife or chisel. Not only should these branches be cut out, but all shoots growing on the main branches in the middle of the head. After this part of the work is carried out, attention may be given to the cleaning of the trees. If the trunks have been much neglected, the better way is to scrape them with some blunt instrument, and then afford a dressing of freshly-burnt slaked chalk-lime, adding water to make a thin whitewash of it, when, if strained through a fine sieve, it can readily be distributed over the trees by means of the garden-engine or the syringe. Not only does this dressing of lime eradicate the moss, but it is a good insecticide, and especially against that scourge of the Apple, the American blight, as the aphids and their breeding-places become plastered up. *J. S.*

CHOU DE BURGHEY.—The merits of this excellent vegetable are being recognised, and as I have had something to say in its favour on several occasions, I was glad to see so good an authority on the vegetables as Mr. Iggleden noticing it in the way he did when treating of winter vegetables in the paper read by Mr. Wilks at the meeting of the Royal Horticultural Society, held on the 12th inst. At one time, Chou de Burghey was derided, as being neither a Broccoli nor a Cabbage—as if that mattered; in reality, that constitutes one of its chief merits, as we get the two kinds of vegetables combined—one an improved, honest-looking Cabbage, possessing all the good qualities of the old sort, with the tenderness and delicacy of the heart leaves of Broccoli or Cauliflower. And what can we desire in one plant? The mistake made with Chou de Burghey at first was, in growing it at a season when it was not much needed, as its greatest value is as a winter and very early spring vegetable. This being so, the seed should not be sown till quite the middle of the month of April; and for still later use, towards the end of May. When plants from such raisings are put out into good soil, they afford a long succession of produce. *J. Sheppard.*

BOCCONIA CORDATA.—I have been surprised at the doubts expressed by some persons as to the hardness of this stately herbaceous plant. Here the difficulty is to keep it within reasonable bounds, so quickly do its roots extend on all sides, and from which the sucker-like shoots are thrown up. On a lawn it is a conspicuous object; and on a lawn with a southerly aspect, amongst some hardy Azaleas and Perennials, it makes a bold show in the summer and autumn, but it is nowhere better seen than at the corner of a Rhododendron border, when there is a clump of it 8 feet in width, the stems of which also reach that height. *E. M., Swanmore.*

SECOND FLOWERING OF LYCASTE SKINNERI.—Mention was made by a correspondent in these columns of a *Lycaste* which had flowered twice in one season. I did not pay much heed to the statement, as at that time I had a plant, a small one, which had had three flowers, which appeared in succession. This season there has again been a crop of flowers, which has passed over, and other flowers have appeared, so that it would seem that the flowering of this species twice in a season is nothing unusual. *W. A. Cook, Compton Bassett.*

THE MULBERRY.—I have been much interested in the remarks found in several recent issues of the *Gardeners' Chronicle* respecting the Mulberry, and should like to mention an instance of the great vitality of the tree which came under my notice in the vicarage garden of Fulham. I well remember some thirty years ago a fine Mulberry tree, to which the Rev. Robert Baker had a stone placed to record the fact that many years previously a new gate had been put up, and the posts were of Mulberry, and to everyone's surprise, one of them took root, and broke into leaf, and formed a goodly tree, which seldom failed to yield fruit. As neither of your correspondents have mentioned anything about the quality of its wood, which is of a fine grain, takes a lovely polish, and is of a dark colour. Writing of wood, I would mention that many woods could be grown in this country, in quantity, which would be useful to the cabinet-maker, and I am led to make this remark from the fact that, some thirty years ago, I set about collecting British-grown woods, and collected eighty

different kinds, cut, planed, polished, and named them, and the Royal Arboricultural Society of Edinburgh awarded me a medal for the exhibit; and there they remain in my office, and many a person interested in timber-growing has found them interesting, if not instructive. I can recommend the study of woods to young gardeners, who may find the knowledge acquired some day of use. *J. Rust, Eridge Castle.*

THE MOORE FERN HERBARIUM.—It is a mistake to suppose that, as stated at p. 116 of your last issue, "the Fern Herbarium of the late Thomas Moore has been presented to Berlin by the Kew authorities." His British collection, which is very rich in varieties and abnormal forms, is still kept at Kew intact as a separate collection. His exotic collection was combined with the general Fern Herbarium at Kew. In the process, duplicates were freely withdrawn from both, and these were made up into sets, and subsequently distributed. One of the best of these sets was sent to Berlin. *J. G. Baker, Kew Herbarium.*

TREATMENT OF THE GRAPE VINE.—Under the above heading, "F. R." enquires at p. 118 of the *Gard. Chron.*, for the 23rd inst., whether anyone of the readers of this journal had previously heard of or practiced the method to which he referred—namely the cutting out of all Vine eyes located in the axils of the leaves during the period of growth except the end and second-best eyes from the base? I beg to say that this practice was recommended to be followed in the pages of the *Gardeners' Chronicle*, in "Fruits under Glass," a few years ago by the writer; and I believe that Mr. Roberts, gardener at Charlville Forest, Tullamore, practiced it in connection with the production of the large bunches of Grapes for which he has been so long famous. *H. W. Ward.*

BRIAR STOCKS.—"Rosa" would scarcely wish to insist upon the rule without exception in the planting of Briar stocks for the succeeding summer budding. Last autumn twelvemonth I gathered in seven dozen at the end of October, and at once prepared them for planting by cutting off or out every morsel of decay. I say "out," because shoots die back deep into the stump. There is also dead bark—an outer coat which is carefully scraped off, for upon these attentions depend the health of the future plant. When planted in the rows they are well dusted with sulphur to prevent or kill lungus, which is of deadly influence if allowed to remain. These were not fixed in their appointed places as the severe weather overtook us, and they remained by the heels till February. They all did well, not more than five or six failed, and are now in a strong and healthy state, with dormant buds or ripened shoots a foot long. Two important features for success are to have a rich and well-prepared position to receive them, and to secure every rod to a horizontal line of Willow or other dry rods made fast to a few stout upright stakes driven firmly into the ground. I do not pretend ignorance, having practised as an amateur for forty years, but am most willing to learn. *Charles Ellis, Lyme Regis.*

ORNAMENTAL TREES AND SHRUBS ON LAWNS.—While giving manual assistance to fruit trees is generally practised, and their vigour maintained thereby, trees and shrubs on lawns are often overlooked in this respect, where a little timely assistance would be of benefit. Where the trees in the park are fenced round at some distance from the stem, a heavy mulching may be spread over the enclosed space; but on the lawn this manner of assisting healthy development is objectionable, and it is necessary that some other should be adopted. The surface of the soil should be slightly loosened with a steel fork, and top-dressed with other and suitable soil, into which the roots will soon find their way, and a thorough drenching of the staple with rich liquid manure should follow this top-dressing. If these operations are carried out at this season, great benefit to the trees will accrue. During the summer months two applications of manure-water will materially increase the rapidity of the growth. *H. Markham, Mereworth Castle.*

CITRON CULTURE IN CORSICA.

The British Consul at Ajaccio furnishes to the Foreign Office, under date of May 16 last, a very interesting "Report on the Cultivation of Citrons or 'Cedrats' in the Island of Corsica." The report commences by stating that the great difficulty in

obtaining reliable information and correct data concerning the cultivation of the Citron or "Cedrat" is principally due not only to the distance which separates the different districts where it is carried on, but also to the reluctance of both growers and buyers to concede information which may conduce to the development of the culture of this very remunerative article of commerce in other parts of the world, in which the conditions of climate and soil might prove suitable. The size, aroma, and general superiority of the Corsican Citron, which always commands a higher price in the market than that produced in other countries, is attributed to a great degree to the Corsican soil, which being not only extremely rich in ferruginous qualities, is also strongly impregnated with the various salts and chemicals necessary for the production of the numerous aromatic plants with which the island abounds. This is evident from the natural growth on the hill-sides of Myrtles, Cistus, Wild Lavender, Heaths, Arbutus, and a variety of highly-scented plants and shrubs, which in spring and early summer not only impregnate the whole atmosphere with their delicious aroma, but can also be recognised for some distance at sea when the wind is off the shore. Another requisite for the successful growth of the "Cedrat" is perfect shelter from the mistral or north-wind, as well as absolute protection from frost. These desiderata, together with plenty of sun, and an adequate supply of water having been obtained, a good crop should be looked for if constant care and attention are given, proper manuring at the right seasons carried out, water supplied regularly morning and evening during the dry season, and the various diseases to which the tree is subject watched for and attended to.

CULTURE.

The site usually selected in Corsica for a plantation or garden is a sheltered valley, at an altitude of not more than 200 to 300 feet above the sea level, facing south or south-west—the north or north-east winds, which blow strongly during the winter months, having to be carefully guarded against—or any equally well-placed hillside not too much exposed. A constant supply of water is an absolute *sine qua non*. A space of at least 12 to 16 superficial yards being requisite for each tree, naturally limits the number of trees to the space available. In many places in the Cap de Corso district in the northern peninsula of the island, where the natives are a harder working people and more intelligent than in the south, the gardens are surrounded by high stone walls, divided by inner walls, and again subdivided by stiff fences of dried brushwood closely wattled. No more than four trees sometimes occupy these small plots, to which the soil has at times been brought in baskets at the cost of much time and labour, in order to take advantage of a sheltered situation. This careful protection is seldom seen in the southern portion of the island, the lazy character of the people resting satisfied with what Nature has done for them in the way of situation, shelter, and the supply of soil and water. Frequently, in the Cap de Corso and Balagna districts, the principal fruit cultivating regions of Corsica, the trees are protected during the winter by branches and mats spread from wall to wall, and in nearly all cases a piece of stiff wattled brushwood is erected as a protection above the walls.

The produce of a Cedrat tree naturally varies in the amount and size of the fruit according to the situation of the garden, the soil, and the care and attention devoted to it, but a single tree of matured growth frequently returns as much as £10 to £12 per annum. These figures alone show how remunerative a culture that of the Citron may be made, although the original outlay for making the garden—which is nearly always terraced, frequently involving considerable labour for masonry, walls, &c., as well as for the tanks and water-conduits—may have been very considerable. The causes which combine to make the culture of the Citron an exceptionally lucrative

enterprise, and those which constantly ensure a high price for this fruit, if produced in Corsica, are, firstly, that the Corsican Cedrat is renowned as being by far the best produced; and, secondly, that the Cedrats of Algeria, Spain, Genoa, and Sicily, have all of them beneath the epidermis a sandy substance which grates against the teeth in a disagreeable manner. Moreover, in Corsica even, only a few situations are completely favourable to the Cedrat tree, the proof of which lies in the fact that not a single plantation in the immediate neighbourhood of the town of Ajaccio has succeeded, as not only does this tree require a low situation, but it is also necessary to shelter it in a valley, the configuration of which protects it from every wind.

The main roots of the tree being very short and feeble, it nourishes itself principally by its smaller branch roots, which require water in abundance—a rare thing in Corsica. It also requires great natural heat in summer, as well as a strong and light soil. Although it is customary to plant the trees at intervals of about 10 feet, it is preferable to give them 13 feet. The trees give a half crop in three years' time, and at from six to seven years of age they produce from 400 lb. to 500 lb. of fruit; at from ten to twelve years they give from 500 lb. to 600 lb.

The small cultivators of Cedrats have to struggle against the buyers in no slight degree. The Genoese merchants have the small cultivators in the district of Ajaccio frequently completely at their mercy, as they have not the necessary conveniences for picking their fruit, and they have not, as in the district of Bastia, a manufactory for candying fruit, the result being that the buyers or middlemen frequently obtain the fruit of the small growers at half or quarter of its real value. The expenses of upkeep consist only of watering, and are not considerable. Pruning has recently been abandoned, as it was noticed that trees grew sickly under the treatment. Besides watering, the only other necessary expenditure is for placing supports beneath the heavily-laden branches. The crop is gathered in November; in March and April there is a second small gathering, that of the "victims" fruit, of very symmetrical form, left on the tree to attain a larger size, in order to sell them to the Jews at Easter, who make use of them for their Passover ceremonies. The victims grow at the junction of the branches or at their extremities.

At Bastia, a candying factory has been started, in order to prevent the continental buyers from entirely controlling the market. It has succeeded fairly well in the undertaking for which it was intended. It would be no difficult matter to treat the fruit in a superior manner to the candying establishments at Bastia and on the continent, where the Cedrats are but poorly preserved. There is a certain method of candying the Cedrat which produces an exquisite fruit, and of whose delicious flavour it is impossible to form any accurate idea if one is only acquainted with the ordinary candied Cedrat of commerce. The preservation consists in steeping the fruit in casks of brine composed of sea-water, with a certain admixture of salt, and possibly other saline chemicals, which remain a trade secret amongst the buyers and preservers, and which differ according to each individual's method of treatment. For the ordinary Citrons the fruit is sliced in halves to permit the brine permeating the inner rind, but the finer qualities of the fruit which weigh from 2 to 3 lb., are frequently preserved whole, and as such form not only an elegant, but extremely delicious adjunct to the table. These whole fruits are in great request in Algeria, Egypt, Turkey, and amongst all Oriental peoples, and high prices are obtained for the choicest fruits thus candied. They differ as much from the ordinary candied Citron sold in grocer's shops in England as the choice vinegars of Bordeaux, such as those of the Châteaux Margaux and Lafitte, do from the *vin ordinaire* or manufactured wine served at an ordinary Continental table d'hôte.

DISEASES.

The Citron tree is subject to various diseases, such as white-root, fumigie, or smut, kermes, &c. but of all the diseases, that of white-root is the one most dreaded and guarded against. It is due to a fungoid growth, which attacks the cortical tissue of the root, exhausts this tissue, and ends by destroying the plant after an interval of more or less time, in proportion to its powers of resistance to the disease. Its first attacks are recognised by the discoloration of the leaves, which turn yellow, and develop ulceration at the base of the stalk. Another sign of attack may be recognised by the condition of the roots of the suspected tree. Exposed to view, these roots appear tender, damp, and inclined to rot. In order to cure the trees of white-root, various measures have been at different times adopted, of which the following are the most approved: The first step to be taken is to prune to the quick all roots deprived of vitality; after which an equilibrium should be established by proportioning the branches to the roots which remain unaffected, the tree should then be surrounded by a deep trench, with a free passage for the overflow of water. A second measure consists in cutting off the affected roots, and applying boiling tar to the exposed stump. This treatment gives the best results, and is, as may be seen, easily applied, and suitable to all plantations. A third method frequently used in Portugal is the aëration of the roots. After carefully trenching round the main stem, in order to expose the principal roots, the hole is filled with stones of the size of the fist, or, still better, with lumps of charcoal, the efficacy of which against decaying matter is well known; after which the trunk of the tree is embedded to the height of 15 inches with the same stones or lumps of charcoal. These stones or lumps are placed at sufficient distances from each other to allow of the passage of the air, which thus penetrates to the roots of the tree, and prevents their being affected by the fungoid growth.

(To be continued.)

THE ROSERY.

A HOUSE OF ROSES.

At the present time, when many will be starting their pot Roses, it may be of some interest to them if I give a brief description of my Rose-house. It is over 100 feet long, 22 feet wide, and varying from 12 to 16 feet high. The reason of this variation in the height is because the ground falls very much, and as I wished the house to be built from north to south, and also wanted to avoid the trouble of making the ground level, I had it built in two sections, and have left the ground inside of the same slope as before.

There are two flows and two return pipes up each side of the lower section; but the upper and larger part of the house only has a single flow and return upon each side. This is just sufficient to keep out spring frosts, and also to dry the atmosphere during dull or foggy weather. More than this is scarcely necessary where one wants a quantity of good Rose blooms. Almost all the flowers cut from this cooler house have much better substance and colour than those which are harder forced. From the end of March until June, I can cut many dozens of grand flowers every morning. The most successful Roses I have grown are, William Allen Richardson, Maréchal Niel, and Reine Marie Henriette.

The last-named Rose is wonderfully superior when grown under glass, and comes of a very deep and bright red, never having the dull washed-out appearance it so often possesses when grown out-of-doors. I know of no better red Rose than this for forcing. It flowers very freely upon the ripened wood of the previous summer, and as the blooms are borne well above their foliage, and upon long stalks, they are well-suited for decorative purposes.

William Allen Richardson has carried over 300

flowers at once, and has had some 700 or more buds upon the tree in their different stages of opening. Like Maréchal Niel, Madame Bérand, and Reine Marie Henriette, this grandest of Noisettes flowers very freely upon the long shoots of the previous summer. With me it is the grandest Rose of all for freedom of growth and quantity of flowers produced. Every spring my plants throw a grand crop; and at intervals all through the summer and autumn, there are a few good flowers to be cut from this variety.

At the present time one of my plants has over twenty long shoots some 15 to 20 feet in length, and which will carry flowers from almost every eye. I think that where one has space no Roses pay better for forcing than these strong growers. True, you only get one good crop of flowers during the season, but as that comes at the most useful time, and well before any Roses can be had from walls in the most sheltered situations out-of-doors, I do not think this is any great drawback. You get far more flowers upon the same amount of wood, and the constitution of the varieties being so good the plants are seldom out of health.

The three Roses named already, with the addition of Kaiserin Friedrich, Climbing Niphetos, Henriette de Beauvean, Lamarque, Madame Chauvy, L'Idéale, and Bouquet d'Or, will give a good selection of colours, and be sure to please where one has the space for them to make and mature their long climbing growths.

The walls of my house are planted with such varieties as Rubens, Catherine Mermet, Madame Lambert, The Bride, and Perle des Jardins; while the centre is filled with the same kinds, and a few other stronger growers. The pillars and cross supports are covered with the strong climbers already described; while the walls around the outside of the centre and side borders are used for pot Roses.

I find Niphetos, Francisca Kruger, Jean Dacher, Madame Falcot, Perle des Jardins, Gombalt, Souvenir d'un Ami, Anna Ollivier, The Bride, Souvenir de S. A. Prince, and Catherine Mermet, the best for this work among the Tea-scented class.

General Jacqueminot, Fisher Holmes, and Gloire de Margottin, are three good dark-coloured kinds for the same purpose; and may generally be depended upon to give a few good flowers.

Frequent syringings with a weak solution of soft-soap, and a generous treatment with a temperature ranging between 55° and 65° while in full growth, is all that Roses require to do them well. They are too often over-coddled for a time, and then when the least disease puts in an appearance, sharp measures are taken which, more often than not, cripple the plants for the season.

If growers would use a very weak solution of some insecticide each time they sprinkled their plants, and avoid sudden changes in the temperature and cold draughts, Roses might be grown as easily and as free from disease and fly, as most subjects. I never force my plants until they show signs of swelling, and this can be induced by keeping the house close and moist for a few days. A. P.

VEGETABLES.

THE TRADE IN ONIONS.

A VEGETABLE that has progressed immensely in consumption in the last quarter of a century is the Onion. Cultivated at home, to the extent of probably about 40,000 tons, we yet have to import now nearly 4,000,000 bushels annually. The progress made in our foreign imports is shown by the following figures for the last three decades:—

Years.	Quantity.	Value.
	Bushels.	£
1870	1,034,161	390,830
1880	2,255,597	614,357
1890	3,571,195	724,000

Nearly three-quarters of a million is a large

sum to pay yearly for this edible bulb to foreigners. The chief countries to which we are indebted for supplies are Holland and Germany, Spain, Portugal, and Egypt. The large and mild Onion forms one of the common and universal supports of life in the Peninsula, and is also an important article of food of the Greeks, Turks, and other oriental nations. Analysis shows that it ranks next to Peas and grain in nutritious properties [?], although its pungent

rainfall in October, when we registered 7.39 inches. It was, however, my intention to draw notice to the utility of Chou de Burghley as a winter vegetable. A good quarter of this Cabbage, or Cabbage Broccoli, as its selector designates it, has proved invaluable to us, and admirably takes the place of Brussels Sprouts on the dinner-table. I, for my own table, prefer the former to the latter. Good breadths planted from sowings made in the middle

PLANT NOTES.

BIGNONIA VENUSTA AT SYON, AND OTHERS.

THE above plant was introduced from Brazil in the early part of the present century, and it remains to this day one of the most beautiful climbers that we possess for planting in a warm greenhouse. It is often called by gardeners a stove climber, but, if given stove treatment, especially in a dry house, it is a difficult matter to keep the foliage clear of red spider, thrip, and other kinds of insects; therefore a house, with a winter temperature of 50° to 60°, just suits its requirements, and I would prefer the lower to the higher degree of warmth, so that a warm greenhouse would grow the plant satisfactorily. There are two varieties of what is usually called *B. venusta*. I have seen a variety which is much paler in colour than others, and which some growers find a difficulty in flowering—at least, freely; but, at Syon, it grows and blooms very freely indeed, the blooms showing in November, and later, although the flowers in sunless weather open with difficulty and drop quickly, fogs accelerating the loss of bloom, and bloom-buds and leaves. In nice weather, it is a charming plant, useful for cutting, the blooms enduring in a cut state for a long time. At Syon it is afforded all the sunshine possible during the summer, and it is not trained in any way, but the shoots are allowed to hang down from the roof of the house, in which manner its beautiful flowers can be seen the best. Our *B. venusta* is interesting on account of its great age, for I have been informed that it was growing about 1830, or earlier, and I have no reason to doubt my informant's statement. The plant is not in a favourable position, the roots being under a high stage, and the stems a long way from the light, getting the drip from other plants; but it has a stem at the base that measures some 6 to 8 inches in diameter, and notwithstanding the disadvantageous position, it does well. There are many beautiful things among Bignonias, as *B. Cherere*, *B. magnifica* (fig. 26), the last-named a Colombian species, introduced in the seventies by Mr. W. Bull, and bears flowers of great size, and is most attractive in appearance, and the plant makes free growth in an intermediate-house. *B. Cherere* is a well-known plant, sometimes called *Tecoma heterophylla*. These plants in their native habitat grow on river banks, and in damp woods, so that when grown in this country in dry houses, they give much trouble if not syringed daily; on the other hand, I find, when shaded, they fail to flower freely, so that light and moisture are essentials if they are to bloom well. Thinning of the shoots is an important matter, as it permits what is left to mature. *Bignonia venusta* is an excellent plant for a roof, as there it gets all the sunlight, and at the same time the growths form a shade for the plants beneath. When starting into growth, more heat and moisture are required. It is best grown in a compost of loam and peat in equal parts, with some coarse river-sand added, and the assistance of some liquid manure is desirable when in full growth. Propagation is by cuttings in the early spring, and, if possible, cuttings taken off with a heel. Place them in a sandy compost, in a bottom-heat, under a bell-glass, and give very little water till rooted. They may also be increased by layers, and do best when planted out in a border. *G. Wythes, Syon House*. [A full page engraving of *B. venusta* was published in these pages on March 1, 1879. En.]

SOCIETIES.

ROYAL HORTICULTURAL. CHRISWICK GARDENS, 1892.

THE Society's Gardens were first established at Chiswick in 1822, and since that time have been looked upon as a leading and important help to horticulture. The new plants discovered by Keates, Potts, Dampier Parks, and Fortune in China and in

FIG. 26.—BIGNONIA MAGNIFICA.

(Flowers ranging in colour from rich crimson to delicate mauve: 3½ inches in diameter.)

flavour has much to do with its enjoyment—or otherwise! *P. L. S.*

CHOU DE BURGHLEY.

Our Brussels Sprouts are far from being satisfactory this season, although they grew well during the summer, and in October were apparently an excellent crop. On being gathered many of the Sprouts were found to be decayed in their centre, and unfit for use; and at the present time, after having on the 9th 19° of frost, and on the 11th 20°, the decay is still more plainly visible. The cause of this may, I think, be truly attributed to the heavy

of the month of April will afford a continuous supply of heads during the winter months. I grow the larger number from the second sowing, and generally select for them a plot that has been previously occupied by Peas, and afford occasionally liquid manure, which causes a quick growth. Grown in company with Rosette Coleworts, I find that the Chou de Burghley equals it in hardiness, and has a milder flavour. At planting time my old kitchen garden man usually reminds me that "Charlie Burghley" is thought much of in the kitchen, which is saying much in its favour. *Thomas Coomber.*

the East Indies; by Don on the west coast of Africa, South America, and the West Indies; by Forbes at the Cape of Good Hope and the Zambesi region; by Douglas in North America; and by Hartweg in Central America, were all first grown at or introduced to Chiswick, and from thence were afterwards distributed over the British islands and the continent.

The council being anxious to make the gardens (as far as the funds at their command will allow) a school of practical and scientific horticulture, and of increased value and interest to the fellows, have devoted careful attention to their present condition, and to a scheme for their better utilisation in future. They desire the gardens to be devoted (1) to the cultivation of such fruits, vegetables, stove, greenhouse, and hardy plants and flowers as are found to be most generally useful or ornamental; (2) to the trial of new sorts side by side with established varieties; (3) to experiments in the culture and treatment of those plants which possess a floral or decorative as distinguished from a merely scientific value and interest. To these may be added (4) the trial of such horticultural appliances and materials which may from time to time be submitted.

The cultivation, trial, &c., of fruits have always been considered as of the utmost importance, and happily forms one of the most valuable features of the gardens. There is an almost unique collection of the best varieties of fruits, and it is intended to maintain and extend it by the trial of such novelties as the raisers may be good enough to bestow on the society.

The cultivation of Grapes is conducted on a large scale, and the Great Conservatory, 180 feet by 30 feet, and 23 feet in height (one of the largest and noblest structures devoted to Grapes in this country), affords at all seasons ready examples of, and instruction in, successful Grape culture, which might be of service to many of the Fellows; and when the fruit is ripe is an object of the greatest possible beauty. House No. 14, lately occupied with Tomatoes, has been planted with Muscats, and will be similarly useful and instructive.

House No. 5, which has Peaches on the back wall, has also been furnished with fruit trees in pots, and their culture will be extremely interesting to many Fellows, as experiments in treatment are more readily carried on with pot plants.

One of the largest houses, No. 6, is devoted to the cultivation of Figs in pots, forming without doubt the finest and most varied collection of Figs to be found in this country, and will well repay the attention of all lovers of this particular fruit.

A large number of Apples and Pears grafted on different varieties of stock have been planted for experiment and trial, and will prove of great value and interest to fruit growers. The different methods or systems of pruning and training fruit trees are also illustrated to the fullest extent, and experiments made in grafting on various kinds of stocks, and the results carefully observed.

A very complete collection of Red and White Currants has been formed, and the different varieties have been carefully studied and classified, and are described in the *Journal*, vol. xiii, p. 134.

A collection of standard and typical varieties and different vegetables will again be grown (as far as space permits) for comparison with new varieties, both to assist the committee in recommending their awards, and for the general information of the Fellows. Besides this general collection, specially exhaustive trials of certain classes of vegetables will be made every few years in rotation, and descriptive reports given. The special classes proposed for 1892 are varieties of Runner Beans, together with new varieties of Peas, Potatoes, and new Tomatoes.

Experiments in regard to the Potato disease will also be conducted.

The floral department will include all plants and flowers of a distinctly decorative garden character, whether for cultivation under glass or out-of-doors. A few classes only can be illustrated each year. For 1892 it is proposed to continue the trial of hardy border Carnations and Pinks; perennial Asters and Sunflowers (of which a very large and complete selection were sent to the gardens from America, in view of the conference of 1891) will be again grown, in order to confirm the nomenclature, and to establish or otherwise the impression already formed as to their value from a horticultural point of view. Cannas, Pinks, Phloxes, are also proposed for trial this year. The very large collection of herbaceous Peonies made a year or two since will be an

object of great and increasing interest and instruction now that the plants are more fully established.

As opportunity offers, experiments will be conducted with and trial made of all sorts of articles and appliances used in the management or work of a garden, e.g., manures, insecticides, mowing-machines, garden tools, systems of glazing, ventilating, heating, &c., and reports will be published thereon.

The condition of the glasshouses has been greatly improved during the past year, although much still remains to be done before they can be pronounced quite satisfactory.

The officials of the Society will give any information and render every assistance in their power to all Fellows. Anyone wishing to study any particular branch of the gardening operations, or to make any special observations on different subjects, should make direct application to the Society's Superintendent at Chiswick; or to the Secretary, 117, Victoria Street, Westminster, S.W.

MEETINGS AND LECTURES.

The following programme has been drawn up for the present year:—

January 12.—"Winter Vegetables," Mr. W. Iggulden.

February 9.—Annual General Meeting at 117, Victoria Street.

March 8.—"Plants for House Decoration," Mr. John Willis. March 22.—"The Cultivation of Melons," Mr. C. Ross.

April 12.—"Daffodils," the Rev. G. P. Haydon. April 19.—"The English Florists' Tulip," the Rev. F. D. Horner. April 19.—Auricula and Primula Show.

May 3.—Lecture, by Professor Michael Foster, F.R.S. May 17.—"Hardy Climbers and Creepers," Mr. W. C. Leach. May 25 and 26.—Great City Flower Show in the Inner Temple Gardens, London.

June 7.—"Summer Pruning and Training of Fruit Trees," June 21.—"The Management of Trees in Parks and Gardens," Mr. W. T. Thistleton Dyer, C.M.G., &c. June 21.—National Rose Society's First Show, 1892.

July 12.—"Orchids for a Cool House," R. E. Handley. July 26.—"Insect Eating Plants," Mr. A. J. Manda. July 26.—"Carnation and Picotee Society's Show."

August 9.—"Fuchsias," Mr. Geo. Fry. August 23.—Exhibition and Conference on Begonias. August 24.—Exhibition and Conference on Apricots and Plums, at Chiswick.

September 6.—"Root Pruning," Mr. Geo. Bunyard. September 20.—"Variation of Some Hardy Plants under Cultivation," the Rev. C. Wolley Dod.

October 4.—"Michaelmas Daisies," Mr. D. Dewar. October 18.—"Cycads," Mr. W. Carruthers, F.R.S.

November 1.—"Fruit Trees in Pots," Rev. W. Wilks. November 15.—"Zonal Pelargoniums for Autumn Flowering," Mr. C. Pearson.

December 13.—"Winter Berry-bearing Plants," Mr. Lee.

—Extract from *Schedule and Arrangements of the Royal Horticultural Society for 1892.*

(To be continued.)

TRADE NOTICE.

THE partnership formerly existing between Samuel Clay and James Levesley, manufacturers of Clay's Fertiliser, having been dissolved, the partnership business will in future be carried on by the said Samuel Clay and his son, Samuel Charles Clay, the proprietor of S.C. Clay's Invigorator; and they will in future manufacture both manures at Temple Mill Lane, Stratford, E., under the title of Clay & Son.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

BRITTLE TIMBER.—Will any of the readers of the *Gardeners' Chronicle* kindly inform R. S. as to which of the two statements is correct, viz., "that the slower the growth the more brittle;" and "that the quicker the growth the stronger the timber."

Obituary.

ROBERT J. PARKER.—We regret to announce the death, at the age of sixty-five years, of Mr. R. J. Parker, of Tooting, which occurred on the 21st inst. The deceased was at one time well known in the horticultural circles—first as the senior partner in the firm of Parker & Williams, and which afterwards grew into the important business of B. S. Williams—and in more recent years as a successful cultivator of herbaceous perennials, and of whose extended cultivation in our gardens he was an earnest advocate.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 45° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.		
	ACCUMULATED.				Total Fall since Jan. 3, 1892.				
	Above (+) or below (-) the Mean for the week ending January 3.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 3, 1892.	Below 42° difference from Mean since Jan. 3, 1892.	More (+) or less (-) than Mean for the Week.	No. of Rainy Days since Jan. 3, 1892.		
	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 3, 1892.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 3, 1892.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 3, 1892.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts:—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties, 5, England, S. Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending January 23, is furnished from the Meteorological Office:—

"The weather during this period was cold and extremely dull in all parts of the Kingdom, with frequent falls of rain or sleet. A good deal of mist or fog prevailed in the English districts, especially in the south and east.

"The temperature continued below the mean generally, but slightly exceeded it in the 'Channel Islands,' and just equalled it in 'England, S.' The highest of the maxima were recorded on the last day of the week, when temperature was rising quickly. They varied from 53° in 'Ireland, S.,' to 45° in 'England, N.E.' During the earlier part of the period the thermometer (except in the west and south-west) seldom exceeded 40°. The lowest of the minima were registered on very irregular dates, and ranged from 19° in 'Scotland, E.' and 'England, N.W.,' to 29° in 'England, S.,' and to 35° in the 'Channel Islands.'

"The rainfall was more than the mean in 'Scotland, E.' and 'England, N.W.,' but less in all other districts. In 'England, E.' the fall was very slight. The bright sunshine was very deficient. In 'Scotland, E.' and 'W.' and 'Ireland, N.,' none whatever was registered; while, elsewhere the percentage of possible duration varied from 1 in 'England, N.E.,' and from 2 to 4 in several other districts, to 11 in 'England, S.W.,' and 12 in 'England, S.'"

MARKETS.

COTYD GARDEN, January 28.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the supplies, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET steady, with prices firm at last week's quotations. *James Webber, Wholesale Apple Market.*

POTATOES.

The improved noted last week, still continues, the market being firm for choice samples. Ordinary sorts are sought for at 65s. to 75s., Medium at 75s. to 85s., and Best at 95s. to 110s. per ton. *J. B. Thomas.*

SEEDS.

LONDON: Jan. 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great West Road, London, S.W., report to-day's market without striking feature. Quotations in demand, and firmness as regards values, now characterise the seed trade. Country buyers generally appear in no hurry to effect their purchases; meantime, prices all round are well sustained. For spring tares there is rather more inquiry. Mustard and Rape seed keep firm. There is no change this week in Peas. The temptingly low prices prevailing for Haricot Beans attract attention. Linseed is dull. For bird seed the sale is slow.

FRUITS AND VEGETABLES.

SPITALFIELDS Jan. 26.—Quotations.—English Apples, 2s. to 5s. per bushel; American do., 15s. to 18s. per barrel; foreign Tomatoes, 1s. to 2s. per box; Saskale, 1s. to 1s. 6d. per punnet; Curry Kale, 6d. to 9d.; Spinach, 1s. 6d. to 2s. per bushel; Savoy, 1s. 6d. to 3s.; Cauliflowers, 6s. to 12s. per tally; Greens, 1s. 6d. to 2s.; Turnips, 1s. 6d. to 2s.; Carrots, 2s. to 3s.; Parsley, 1s. 6d. to 2s. 6d. per dozen bunches; Turnips, 2s. to 3s.; Cabbages, 12s. to 20s. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 9d. to 1s. 6d.; Leeks, 1s. 6d. to 3s.; Beetroot, 3d. to 4d.

per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 6s. to 7s. per cwt.; Bordeaux do., 5s. to 6s.; Spanish do., 1s. to 1s. 6d. per case; Belgian do., 5s. 6d. to 6s. 6d.; Dutch do., 5s. 6d. to 6s. per bag of 110 lb.; Celery, 4d. to 1s.; Horse-radish, 1s. to 1s. 1d. per bundle.

BOROUGH, Jan. 26.—Quotations.—Savoys, 2s. 6d. to 3s.; Broccoli, 10s. to 15s. per tally; Spinach, 1s. 6d. to 2s. per bushel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; Greens, 1s. 6d. to 2s.; Turnips, 1s. to 1s. 6d.; Carrots, 1s. 3d. to 1s. 6d. per dozen bunches; English Onions, 6s. to 7s. 6d. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 10s. to 20s., and Newtown Pippins 15s. to 25s. per barrel.

STRAITFORD, Jan. 26.—Savoys, 2s. 6d. to 5s. per tally; Greens, 1s. to 1s. 6d. per loose; do., 2s. to 2s. 6d. per dozen bunches; Turnips, 2s. to 3s.; do., 3s. to 5s. per ton; Carrots, household, 3s. to 4s.; do., cattle-feed, 20s. to 32s. do.; Parsnips, 9d. to 1s. per score; Mangels, 16s. to 20s. per ton; Swedes, 20s. to 25s. do.; Onions, English, 120s. to 140s. do.; do., Dutch, 4s. 6d. to 5s. 3d. per bag; do., Bordeaux, 4s. 9d. to 5s. 3d. per case; Apples, English, 2s. to 5s. 6d. per bushel; American, 12s. to 16s. per barrel; Brussels Sprouts, 1s. to 1s. 6d. per half-sieve; do., 2s. to 2s. 6d. per tally; Horse Radish, 9d. to 1s. 3d. per bundle; Celery, 6d. to 10d. per roll.

NOTICES TO CORRESPONDENTS.

ALLAMANDAS, POISONOUS: *J. T. L.* Allamanda belongs to the large order Apocynaceae, many members of which have a poisonous milky juice.

AMERICAN GARDENING JOURNALS: *G. M.* Canadian *Horticulturist*. Published at Toronto, Ontario, Grimby, Ontario. Single copy, on spot, 10 cents. *American Garden*. Published in New York. These papers can be obtained through any foreign bookseller.

ANTHRACITE COAL: *Viridis*. We cannot undertake to recommend dealers. Scan the advertisement columns of the South Wales newspapers, or advertise your wants in ours.

ASPIDISTRA: *A. Y. Z.* Pot the roots in well but not overdrained pots, in March or April, in a compost consisting of peat, loam, burnt earth, and leaf-mould or well-rotted manure from the stables, and to this add a small quantity of sand. Keep the root-stock just above the soil, and pot firmly, but use no rammer. Stand them in a close pit, having a night temperature of 50°, and if the plants have much foliage, or they have been much denuded of the soil that was about their roots, employ a little shade when the weather is bright. When fairly got into growth, remove them to an intermediate house, and later, that is, in full summer, the plants will do well in a deep garden or pit. If the ventilation is sufficient, they will not get their leaves burnt by sunshine, but in an unshaded, close frame, they often get disfigured by hot sunshine. In the southern parts of England, Aspidistras may in summer time be sunk in a coal-shed in some partially shady place away from the drip from trees. In winter keep them cool and moderately dry at the root. They need very little light at that season, and may be kept at the back part of the greenhouse or in a frost-proof brick pit. If the drainage be kept in good order, once in three years is often enough to disturb their roots; but an annual top-dressing of fresh compost should be afforded in the spring. The plants are naturally of slow growth, and it is not advisable to try to accelerate it by bottom-heat or much manure-water.

BOOKS: *A. S.* We know of no one book which treats of purely nursery practice. As a guide to the propagation of plants, you would do well to obtain *The Nursery Book*, by L. H. Bailey, published by the Rural Publishing Co., New York.—*Student: Henfrey's Elementary Course of Botany. The Student's Flora of the British Isles*, by Sir R. D. Hooker. *The Propagation and Improvement of Cultivated Plants*, by F. W. Burbidge.

BOOK ON FRUIT GROWING: *A. B.* Mr. Bunyard's *Fruit Farming for Profit* is a good one. A number of small manuals on various hardy fruits are published by L. Upcott Gill, 170, Strand, W.C.

BROWN SCALE ON THE PEAR: *L. T.* A simple inexpensive remedy is to paint the wood thickly with clay, cowdung, and water, with a quart of root and a handful of flowers-of-sulphur added to one painful, and made into a thickish wash. It can be put on with a soft brush, and should be brushed into every part of the tree. It done at once, it will cause no injury to the buds, which are still snug within their enveloping scales.

CINERARIA CANDIDISSIMA: *Paddy from Cork*. If seeds can be obtained, they may be sown in a heat of 60° to 65°, pricking off the young plants when they have made two true leaves, and growing them on for a time in gentle warmth; but seedlings rarely acquire their fine white colour the first season. Cuttings may be made in March and April of the side shoots of plants that have been induced to grow by placing them in moderate warmth. These may be inserted, not too deeply, in pots of sandy soil, and placed in a mild hot-bed frame, plunging the pots. They strike, and grow after they are struck, rather slowly, but when once they are established out-of-doors, growth is quick. From the middle of July to the middle of August is a good time to take cuttings, and then a very small amount of bottom heat is required to strike them, but they should be kept close, and aired every day for fifteen minutes.

FRUITS IN CALIFORNIA: *R. P.* Apply to some of the foreign booksellers.

GRAFTING MEXICAN PINES: *Patula*. Pot up in the early spring some stocks of *Pinus austriaca* or *P. sylvestris*, or, indeed, any hardy Pine—say, four to five years old—and winter these in a cold pit, and graft them, in saddle or cleft fashion, on growing pin in May. Side grafting (vener) not cutting any tongue in graft or stock, but leaving several bunches of needles on the stock above the point of union, is another good style of Conifer grafting. These modes of grafting are best performed in a temperature of 55° to 60°, and the grafted stocks kept in a close case, carefully guarding them against damp by daily airing the case for half-an-hour, and wiping all moisture off the glass. Grafting may be done out-of-doors after growth has begun, but it is less successful.

LEAVING NURSERY: *J. H.* It is customary to allow the tenant one year, and in some parts of the country more, for the proper removal of his stock of trees, shrubs, and other plants in the ground. Fruit and other trees planted for stock or fruiting are not removable.

MOSS ON LAWNS: *J. Cockburn*. Winter dressings of sifted wood-ashes and loam, in the proportion of one of the former to three of the latter. The Grasses will grow with vigour, choking the life out of the Moss. Before dressing the lawn, pull out as much as you can of the Moss with an iron rake. If a lawn be very wet from want of draining, the above remedy will not prove to be a permanent one.

MUSHROOMS: *W. K.* Certainly, Mushrooms may be grown on a large scale, and made to produce good profits, as fine Mushrooms are saleable all seasons. We have heard of one bushel fetching 30s. in the winter months. The Mushroom may be grown in beds made out-of-doors, in September and October, and the produce comes into use during the winter, when it fetches the best price. Summer Mushrooms must be grown in cellars or under-ground places, where the temperature does not exceed 60°, above ground. Mushroom-houses being seldom much good in the warm weather, the produce of the beds being quickly grown, deficient in weight and flavour, and soon over. Wright's *Mushrooms for the Million* is a useful book. It is published at 171, Fleet Street, E.C. The Mushrooms, if they must travel far by road or railway, should be packed in 1 or 2 lb. punnets, which are again placed in boxes of 4 or 5 dozen punnets. Where large quantities have to be sent short distances by road only, the half-sieve basket does well enough. The better and tastier the packing and putting up, the higher the price obtained. We do not know the present wholesale price paid to the grower, it depending on supply and demand, but it is usually found to be remunerative.

NAMES OF FRUIT: *M. G.* Most probably St. Germain—specimen much rubbed and bruised. *A. L. H.* 1, Lewis's Incomparable; 2, Allen's Everlasting; 3, Beauty of Kent; 4, Rymor.

PALMS, &c.: *Subscriber*. It is very probable that the vitiated air of the rooms, and the cold at night, may have caused the injury done to the foliage. The injury from cold would be very likely to follow if there was no previous hardening-off practised.

PARIS MARKET POTATO: *K. L.* The commonest violet-skinned Potato in the Paris market is *Pomme de terre Violette*, or Hundredfold Fluke. It has a deep violet-coloured skin, and yellow flesh. It has erect growing, branching stems, of dark brown, about 2 feet high. The flesh is firm, floury, of excellent quality; and the crop is mature

in September. M. Vilmorin states in his *Vegetable Garden*, "that it is one of those kinds, which, like the Shaw or Regent, and the Segouaze Potatoes, appear to maintain their vigour and productiveness, notwithstanding the very great length of time during which they have been in cultivation."

PEACH-TREES DROPPING THEIR BLOOM-BUDS: *A. B.* The immature condition of last year's shoots, indicated by the greenness of the rind, is the cause of the loss; for if the shoot is not ripened, neither is the wood bud or blossom, although some of the former may develop into weakly foliage or shoots.

POLEMONIUM CERULEUM: *Paddy from Cork.* As yours was not the variegated form of the plant, it was useless to look for variegated leaves.

PROFITABLE GARDENING CAREER: *Student.* What useful purpose should we serve by sketching out a gardening career for you, when you may be destined to become something very different. If you have a mind to stick to horticulture, first get knowledge in some good establishments, public, private, and commercial, and then, after perhaps a dozen years, your chance may come.

ROMAN HYACINTHS: *T. & P.* The bulbs appear to be quite sound and developed. The failure to flower may be due to errors in cultivation, for example, starting them before full root-growth took place.

ROOT PRUNING AND LIFTING A WALL PEAR TREE: *L. T.* A Pear tree being root pruned at thirty-eight years of age would certainly resent it, and but few good fruits could be looked for in the first few seasons following. Unless Pear trees on the Pear stock have their roots examined and brought up from out of the deeper stratum of the border at intervals of three or four years, and encouraged by slight manual top dressings to ramble near the surface of the soil, the operation of root-pruning, unless done bit by bit, is generally harmful.

TENNIS LAWNS: *A. B.* It being boggy land, the drains should be 4 feet deep, and 7 yards asunder. If there are trees near the lawn, use rubble instead of drain-pipes, or the roots will choke the drains in a few years, and put in the former to the thickness of 1 foot—or half that thickness if you use pipes—covering it with Brushwood, Heather, or thick sods. Two men should cut and lift 1000 turves in from two and a-half to three days, but much will depend on the nature of the soil, the number of hours worked, and if it be day or piecework.

TRAINING IN FRUIT GROWING: *A. B.* Yes, certainly, it is very necessary, if you mean to engage in fruit-growing for market, that you have a certain amount of insight into its methods and practices, just the same as a bookbinder or a shoemaker must learn the art of bookbinding or making foot-gear. Two years in a good commercial fruit farm is the least that you will require. Advertise in these columns.

VINES NEW-PLANTED, WHAT LENGTH OF ROD TO LEAVE: *W. D.* The Vines having been planted last autumn, may be cut down to the wall-plate, or to a point just above it if there is a stage or table for plants in that part of the vinery. As a general rule, the lower the point of severance, the stronger will be the leading shoot made, and that is one of the advantages of having a very low front wall, or none at all above-ground, the stems of the Vines then getting light and warmth their whole length, even when planted in an outside border. It cannot do a Vine any good to swathe the part outside the vinery wall in hay-bands or whatnot, which is only a little less injurious than full exposure during early forcing.

NATIVE GUANO.—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price £310s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt., 5s. per cwt., sent Carriage Paid to any Station in England, on receipt of P.O. for 5s.

Extracts from 16th Annual Collection of Reports:—**NATIVE GUANO, FOR POTATOS, VEGETABLES, &c.** H. BRINKWORTH, Potato Grower, Reading, used for Potatos, Onions, and Carrots, results:—“Very good; never had better crops.”—J. BUTLER, Sittingbourne:—“Used for Potatos, Celery, and other Market Garden Crops, with very good results; Potatos large, clean, and free from disease. Best and Cheapest Manure in the Market.”

NATIVE GUANO, FOR FRUIT, ROSES, TOMATOS, &c. J. FEED & SONS, Streatham, used for Fruit Trees and Roses, results:—“Very satisfactory; we use no other Guano now; consider yours preferable to Peruvian.”—J. FINCH, Orrell Gardens:—“Used for Vegetables, Tomatos, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatos, and many other things. The Cheapest Manure in the Market.”

Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where Pamphlet of Testimonials, &c., may be obtained. AGENTS WANTED.

INNES' FERTILISERS.—THE VINE and PLANT FOOD.—Of all Nursery and Seedsmen, or direct, 15s. per cwt., carriage paid to all Stations. References and testimonials of the Sole Markers:—**W. INNES and CO.,** Sunny Hill Viney, Littleover, Derby.

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatos, Peaches, &c., beyond any other Manure.

September 29, 1891.

“I am very pleased with your Silicate Manure. The effect upon the Vines is very marked, for they ripen and colour much better. Your Manure has given me great satisfaction for Tomatos; it is all you claim for.”

THOMAS PRICE,

Gardener to the Bishop of St. Asaph.

Prices in Sacks, at Works, 10s. per cwt.; £2 per ½ ton; £3 15s. per ½ ton; £7 per ton.

“Nothing Succeeds like Success.” HUGHES' (SOLUBLE) INSECTICIDE FOR FREE OIL

The most reliable and best of all Insecticides for destroying Insects and Vermin on Plants and Fruit Trees, also on Animals, and Birds; and as a Disinfectant & Bleacher in Washing Clothes. Full Directions on the Labels of each Bottle.

Sold by Seedsmen & Chemists, 1/6, 2/6, & 4/6; 1/2-gallon 7/6, 1-gallon 12/6, or less in larger quantities. A Treatise on F.R. TREE OIL as an insecticide, its application to Plants and Animals, sent post free on application to the manufacturer, addressed to **E. CRITCHFIELD HUGHES, Victoria-st., Manchester.** Wholesale from all the London Seed Merchants and Patent Medicine Houses.

NEW YORK.—A. ROLKER & SONS.

IMPORTANT TO GARDENERS, AMATEURS, AND OTHERS, WHO FUMIGATE HOUSES, TO KILL “FLY,” OR “THRIP.”

You will shortly be ordering your Spring Supply of Fumigating Material. Why lay in a heavy stock of tobacco paper, uncertain in quality, often disappointing, and very unpleasant to use, when you can have a SAFE, RELIABLE article, and one that is pleasant to use?

THE FIRST
OF ITS
CLASS,
AND STILL
THE ONLY
ONE

CAMILLE'S FUMIGATING INSECTICIDE

On which you can thoroughly depend. The manufacture is much improved, and it can be ordered without any risk of the disappointing results often attending other fumigating materials.

PRICES:—
For houses with 1000 cubic ft., No. 3 Roll, 1s. each; 1st class capacity of 2000 cubic ft., 1s. 6d. each; 1/2 cwt. 1/3 s. 1/4 Free. The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

LEMON OIL INSECTICIDE.—The safest and most effective Liquid Insecticide for dipping or syringing. Prices, post free:—Fruit, 1s. 10d.; quarts, 3s. 3d.; half-gallons, 5s. 9d.

CLIBRAN'S EUCARIS MITE KILLER.—A truly valuable remedy, has saved thousands of bulbs. Prices, post-free:—Half-pint, 1s. 4d.; pints, 2s. 9d.; quarts, 4s. 9d.; half-gallons, 8s.

OR FROM YOUR SEEDSMAN.

CLIBRAN'S OLDFIELD NURSERIES, ALTRINCHAM;

10 & 12 MARKET STREET, MANCHESTER; And Principally Nurseries, Dewdney, Llandudno.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

“PICRENA,” THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—“Dear Sir, I have thoroughly tested a sample of a new insecticide in destroying Mealy Bug and other insects. At the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 160°, seals the rate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually destroys Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sir, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888.” “GENTLEMEN—I have given your Insecticide, ‘Picrena,’ a good trial in competition with many others, I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything I have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS.”

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tin (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 8s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.**

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS and SON, 187, Queen Victoria Street, London.**

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MY GARDENER. Illustrated by H. W.
Ward, F.R.H.S., Head Gardener to the Earl of Radnor,
Longford Castle, Salisbury.

"Clear, sensible, and full of instruction."—*Times*.
"This is the best work on gardening which we have come
across for a long period. . . . and certainly deserves a place
in every gardener's library or bookcase."—*Rural World*.
"As a practical handbook for the million, it has no superior
on the subject."—*Bells Weekly Messenger*.

"The book is replete with valuable cultural notes, indis-
pensable to the millions who are now turning to gardening
as a source of pleasure and profit."—*Gardener's Chronicle*.
"The professional gardener, amateur, and cottager may look
to it as a trustworthy guide in matters affecting the routine of
the garden."—*Gardener's Magazine*.

"It is likely to be most useful and very popular."—D. T.
FISH, Esq., Bury St. Edmunds.
"I hope for the good of the country it may meet with the
extensive sale it deserves."—W. THOMSON, Esq., Cliven-
don.

"I shall consult it myself with pleasure."—T. W. BUR-
RIDGE, Esq., Curator of Trinity College Botanical Gardens,
Dublin.

TO FLORISTS.—A Nurseryman's daughter desires re-engagement as ASSISTANT or IMPROVER; experienced; would assist with books if required.—S., 57, Hulse Road, Aston, Birmingham.

HOLLOWAY'S PILLS AND OINTMENT.—The most effectual Cure for Gout and Rheumatism. A frequent cause of these complaints is the inflammatory state of the blood, attended with bad digestion, indigestion, and great debility, showing the want of a proper circulation of the fluid, and the impurity of the blood greatly aggravated by the disorders. Holloway's Pills are of so purifying a nature, that a few doses taken in time are an effectual preventive against gout and rheumatism; and that anyone that has an attack of either, should use Holloway's Ointment also, the powerful properties of which, combined with the effects of the Pills, ensure a certain cure. The Ointment should be thoroughly rubbed into the parts affected at least twice a day, after they have been sufficiently fomented with warm water to open the pores to facilitate the introduction of the Ointment to the glands.

Friday Next, February 12.

MESSRS. PROTHEROE AND MORRIS will
also SELL, by order of Mr. F. Sander, at their Rooms, 67
and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 12, at half-past 12 o'clock.
A MAGNIFICENT LOT OF THE OLD CATTLEYA LABIATA,
Collected by order of Mr. Sander, from the mountains, woods,
and unexplored wildernesses of the labista country.

The Plants offered are in superb condition, and hardly any
two are alike in appearance, and, coming as they do, from
districts widely apart, we confidently expect a rich crop of
distinct and elegant forms to appear.

Great numbers of the plants are in sheath, and are strong,
vigorous and healthy. It has not been our privilege to offer
a select lot, and we recommend them to Buyers with the
utmost confidence.

On view morning of Sale, and Catalogues had.

Friday, February 12.

MESSRS. PROTHEROE AND MORRIS will
SELL by AUCTION, by order of Mr. F. Sander, at their
Central Sale Rooms, 67 and 68, Cheapside, London,
E.C., on FRIDAY NEXT, February 12, at half-past 11 o'clock,
a grand importation, in extra fine order, of—
CATTLEYA IMPERIALIS,

collected in the same wilds from whence the grand forms that
appeared some three or four years since sprang.
Also a BURLINGTONIA, sp. n., a wonderful free-flowering
species. All the plants collected are offered.

In marvellous mosses—grand new Epidendrum.

SCHOMBURGKIA ERICSONII, new.

A grand importation of VANDA COKULEA,

in simply perfect condition.

A fine lot of MILTONIA WARSEWICZII, in finest
possible order.

Another grand batch of the famous
MONTANUM TYPE OF CYPRIPEDIUM INSIGNE.

A fine lot of a New ANGLOA or LYCASTE species from the old
Labista country. Flowers pure white, and 5 inches
across.

A new CYPOTOPIDIUM from the old Labista country.

A fine lot of ODONTOGLOSSUM WALLISII, ONCIDIUM
BARBATUM, DENDROBIIUM NOBILE, &c. &c.

Also 20 fine plants of CATTLEYA LAWRENCIANA, in
sheath.

On view morning of Sale, and Catalogues had.

CHRYSA nthemums, AND HOW TO GROW THEM.

Now in the Press.

The large and increasing demand for this popular work has made it necessary to print a New and Revised Edition (Eleventh Thousand). This will contain a Practical and Scientific Treatise on Culture, and also a Critical Analysis of the New Varieties of the present season, by C. E. SIEGA, Esq., A short History of the Chrysanthemum, by C. H. PAYNE, Esq.; and a Chrysanthemum Calendar, by Mr. H. SPOONER. In addition to above, Illustrations of two of the best New Varieties of the year are included in my new Chrysanthemum Catalogue, which also contains the most complete List of New Varieties ever brought together, and embraces selections from all the known Chrysanthemum world.

All the secrets of successful culture given, making this the most valuable work on the Chrysanthemum ever published. Post free, nine stamps; to Secretaries of Societies, for members, 6s. per dozen.

H. J. JONES, Rycroft Nursery Lewisham, S.E.

Pure White, per Packet, 2s. 6d., post-free.

STREPTOCARPUS, NEW HYBRIDS.

Beautiful Greenhouse Plants, remarkable for their abundance of bloom, which are produced for about four months in the summer and early autumn. The flowers, which are very graceful in form, are trumpet-shaped, and of rich, striking, and varied colours.

Per Packet, 2s. 6d., post-free.

For full descriptions of the above and other Choice See is, see CATALOGUE for 1892, forwarded Post-free on application.

JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY,
CHELSEA, S.W.

The Best Celery.

WEBBS' MAMMOTH RED CELERY.

6d. and 1s. per packet, post-free.

This is a very large, quick-growing variety; solid, crisp, and possessing an excellent nutty flavour. It is the hardest Celery to summer-grow successfully everywhere, and consequently very popular.

From Mr. J. MOORE, Close Cottage.

"I decidedly prefer Webb's Mammoth Red Celery for a first crop, as it is quick in growth, and will cut a larger heart than Celery twice as thick."

WEBBS' SPRING CATALOGUE,

Containing Six Coloured Plates, &c. Post-free, 1s.

ABRIDGED EDITION, Gratis and Post-free.

SUTTON'S NEW FORCING BEAN.

The demand for Dwarf Beans before it is possible to gather from plants in the open, is now so wide-spread, that a variety especially adapted for forcing has become indispensable, and we are glad to be able to offer a new Bean peculiarly suited to the purpose. Sutton's Forcing is the dwarfest-growing variety with which we are acquainted. It comes remarkably early and is very prolific. The seed resembles that of *No Plus Ultra*, but in growth the plant is quite distinct.

Per Quart, 2s. 6d.

SUTTON'S SEEDS
GENUINE ONLY FROM SUTTON & SONS, READING.

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 6, 1892.

ROYAL HORTICULTURAL
SOCIETY.

THE following are extracts from the report of
the Council for the year 1891—92, which will
be presented to the annual meeting of Fellows,
to be held at the Society's offices, 117, Victoria
Street, Westminster, on Tuesday, February 9,
at 3 P.M.:—

The year 1891 has again been one of steady
work and progress for our Society.

Four Conferences have been held at Chiswick,
viz., on Hardy Summer Perennials; on Straw-
berries, Raspberries, Currants, and other small
fruits; on Perennial Sunflowers and Michaelmas
Daisies, and on Conifers. The attendance of
Fellows and others at these Conferences, as also
at the fortnightly lectures in the Drill Hall, has
been decidedly more encouraging than in pre-
vious years. Fellows would greatly assist the
Council by making these meetings and lectures
better known among the general public.

Seventeen Fruit and Floral Meetings have
been held in the Drill Hall, besides those held
at Chiswick, and lectures have been delivered at
fifteen of them. The number of awards has
been as follows:—On the recommendation of the
Floral Committee, 33 First-class Certificates
against 40 in 1890, 183 Awards of Merit against
117, 4 Commendations against 2 last year, and
8 Botanical Certificates. On the recommenda-
tion of the Orchid Committee, 34 First-class
Certificates against 56 last year, 38 Awards of
Merit against 47, 10 Botanical Certificates
against 9. On the recommendation of the Fruit
and Vegetable Committee, 6 First-class Certifi-
cates against 6, and 7 Awards of Merit against
7 last year; Commendations 1.

The Society's great show, held (by the renewed
kindness of the Treasurer and Benchers) in the
Inner Temple Gardens, and opened by Her
Royal Highness the Princess Christian, was as
great a success as ever, alike in the number of
visitors, the quantity and quality of the exhibits,
the propitiousness of the elements, and the con-
sequent pecuniary result. The best thanks of
the Society are due to all who so kindly brought
their plants for exhibition, or otherwise contri-
buted to the success of this Show.

The Conference on Conifers, held at Chiswick
on October 7 and 8, was most unfortunate in
the weather experienced, and in the consequent
smallness of the attendance of Fellows. In all
other respects it was most successful, the papers
read being most valuable, and the exhibition of
specimens such as has certainly never been
gathered together in one place before. The
report on the Conference is being kept back, in
order that the lists of Conifers may be made
quite complete, with their synonyms and short
descriptive notes, a work which entails an enor-
mous amount of labour and reference. It is
hoped that the volume may be ready in March.

The Society's general work of scientific experiment and investigation, and of the practical trial of various plants, has been going on steadily at Chiswick, under the superintendence of Mr. Barron. Trial has been made of 117 varieties of Tomatoes, 43 of Turnips, 31 of Celery, 33 of Leeks, 43 of Runner Beans, and 49 of Dwarf French Beans. Ninety-seven new varieties of Potatoes, and 72 new Peas have been tested. In the Floral Department 225 varieties of Carnations, 50 of Picotees, and 50 of Pinks, 300 Dahlias, 60 Ivy-leaved Pelargoniums, 59 Violas, and 74 Pansies, 15 different strains of China Asters, 116 Fuchsias, and 32 of Sweet Peas, have been tried. A very large collection of perennial Asters (Michaelmas Daisies) and Sunflowers have been grown, and very carefully examined by a Committee of experts, both in regard to their proper nomenclature, and also their value as hardy border flowers. The confusion found amongst them was so great and so widespread that it has been decided to withhold the Committee's Report until the plants shall have flowered again, and the Committee's decisions verified and confirmed. Experiments have also been made with a Fruit Evaporator, kindly presented to the Gardens by Messrs. Mayfarth, and most satisfactory and encouraging results have been obtained in the drying of both Apples and Plums.

The Society's *Journal* has been continued so as to enable Fellows at a distance to enter more fully into and reap the benefits of the study and work of those more actively engaged at headquarters. Three parts, forming vol. xiii., 646 pages, with 69 Plates of new plants, &c., have been published during the twelve months, and letters are constantly received from the most distant and diverse sources testifying to the Fellows' appreciation of this renewed branch of the Society's work.

The Council wish to repeat *verbatim* one paragraph of their last year's Report, which runs as follows:—

"All these Conferences and Meetings, and especially the work and maintenance of the Chiswick Gardens and the publication of the *Journal*, have involved the Society in a very large outlay, and the Council take this opportunity of endeavouring to impress upon Fellows the absolute necessity there is for them all individually (as many as have the Society's welfare at heart) to endeavour to secure new Fellows to the Society if its work is not only to be continued at its present standard, but still more so if the ever-opening and extended opportunities of usefulness are to be embraced and accepted. The adoption of £1 ls. as one rate of subscription was, no doubt, a popular movement, but the Council desire to remind the Fellows that such a low rate of Fellowship can only be self-supporting if it draws into the Society a very large number (far larger than at present exists) of additional Fellows. The Council, therefore, venture to express the hope that every Fellow of the Society will make an endeavour to obtain at least one new Fellow during the present year."

The figures published in full in the report show a net increase in income, £448 17s. 6d., and a numerical increase of Fellows to the extent of 344.

The most noticeable features in last year's work, besides the Conifer Conference, were the issue of a pamphlet on fruit trees, recommended for cottagers and small farmers; and the improvement of the condition of the gardens at Chiswick. The fruit pamphlet was purposely issued at a price below the actual cost, in order to promote as wide a circulation as possible.

Two editions have been prepared, one for England and another for Scotland. Of these, 52,000 copies have been put into circulation, 13,000 being issued at the expense of the Society.

In round figures, about £1728 has been expended at Chiswick this year on the general work, and repairs and keeping up of the gardens. A further sum of about £200 has been laid out in special repairs, viz., in the rebuilding of House No. 6, and in furnishing a new boiler, &c., to the great vinery. The receipts from the gardens by sale of surplus produce amount to about £630, making the net cost of the gardens about £1300.

The Council of the Society have been in communication with several County Councils with respect to the lectures on gardening which are now being given in many parts of the country, and have undertaken to conduct examinations on behalf of any County Council so wishing it, at the conclusion of these courses of lectures, and to award suitable certificates, &c., to proficient students.

The Council regret that the scheme for the erection of a horticultural hall has, for various reasons, been for the present abandoned, and the guarantors released from their promises of support. It is hoped, however, that at some future time, when circumstances are more favourable, these promises may be voluntarily renewed.

In conjunction with the Lindley Library trustees, the Society's library has received considerable attention. All serial publications have been kept up to date, and a large number of valuable volumes have been bound.

The best thanks of the Society are due to all those who, either at home or abroad, have so kindly and liberally presented books to the library, or plants or seeds to the gardens. A list of the donors has been prepared, and will appear in the next number of the *Journal*. The Council also wish to express, in their own name and in that of all Fellows of the Society, their great indebtedness to all who have so kindly contributed, either by the exhibition of plants, fruits, flowers, or vegetables, or by the reading of papers, to the success of the Conferences and fortnightly meetings. Special thanks are due to those who so kindly contributed Conifer specimens for the Conference in October.

The hearty thanks of the Society are due to the Chiswick Board and to all the Members of the Standing Committees, viz., the Scientific, the Fruit and Vegetable, the Floral, the Orchid, and the Narcissus Committees, for the kind and patient attention which they have severally given to their departments; also to the exhibitors who have contributed to so great an extent to produce the valuable results of the various conferences held.

The Council have the sad duty of recording the death of forty-four Fellows during the year, and amongst them they regret to find the names of the Duke of Devonshire, Earl Granville, Earl of Dartmouth, Sir R. Wallace, The Right Hon. W. H. Smith, J. van Volxem, W. A. Dickson, J. Dornay, C. Haycock, W. Richards, W. Barron.

During the last few years the Council have, amongst other matters, been considering methods of interesting amateurs more in the Society and its work, and of rendering to them a greater personal return for their subscriptions. To this end they have already established the fortnightly lectures, and the great Temple Show; have promoted various Conferences on interesting horticultural subjects, and have revived the publication of the *Journal*. In 1890 they further decided to re-establish the Society's ancient custom of

offering prizes to amateurs, and a Schedule was circulated in the "Arrangements for 1891." The Council regret that these prizes attracted so little competition; but they have decided to continue them again in the year now commencing, and a total sum of £515 will be found offered, as it is possible that the Schedule last year was hardly sufficiently known.

A scheme for the affiliation of local societies was put forward last year, and about forty local societies have availed themselves of it. The Council express the hope that Fellows will promote the affiliation of societies in their own immediate neighbourhood.

Attention having lately been directed to the desirability of establishing a National School for Technical Education in Gardening and Spade Industry, the Council have consented to co-operate with the Worshipful Company of Gardeners in the matter. The Council have not thought it right, without a special mandate from the Fellows, to devote any portion of the Society's income to this purpose; but they think it highly desirable to afford the undertaking the use of all existing facilities at Chiswick. An arrangement is therefore in course of preparation whereby a Home will be opened at Chiswick, in the joint name of the Society and the Company, for students of the age of fifteen to eighteen, and a three-years' course of practical lessons will be given in the gardens, accompanied by elementary lectures on plant-life and chemistry, and other branches of study helpful to gardening, the whole of the expense being borne by the Company, the gardens supplied by the Society, and the management placed in the hands of a joint-committee. The superintendent is of opinion that the work of the students can be so arranged as in no way to interfere with the present use of the gardens.

A proposal has been made to hold an International Fruit Show in London this autumn, and the Society has been invited to join in carrying it out. The Council have appointed the Chairman of the Fruit Committee as a delegate to the Provisional Committee, and they hope to be able to give cordial support to the proposed show.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM BACONIS, n. hybr.*

HERE we have a new hybrid, raised by crossing C. chloropis, Rchb. (hybr. of C. Hartwegii × Pearcei) with the pollen of C. Schlumieri. The best

* *Cypripedium Baconis*, n. hybr.—Folius linearibus acumina-
tis supra laete infra pallide viridibus; capis plurifloro
subdisticho; ovario 2-poll., longi incurvo puberulo; sepalis
dorsali oblongo acuto extus roseo, intus viridi pallide roseo
marginato; sepalis lateralibus cuneatis cymbiformibus apice
viridibus; labellis manifeste trilobis lobis lateralibus basi rotun-
datis extus rectangularibus acutangulis sparsim serrulatis, lobo
intermedio longe triangulari acuminato apice incrassato marginem
omnino integro, toto labello plani viridi margine presertim
ad apicem loborum fuscis, medio in disco bruno-
adspersis; gynostemio brevi dentibus 2 longissimis subulatis
in medio ungue labelli descendebatibus; antheram non vidi, pol-
linis angustis oblongis, caudiculis lineari angustis, glandula
pro genere minus.—Accepta a domino W. Leuchs, principis
Liechtenstein horticulture fautoris hortulano. Dr. Kränzlin.

we can say about this new hybrid is as to its very easy and luxuriant growth. Mr. F. Sander informs us that the seed was sown November 4, 1888. The seedlings sprang up in the first week of March, 1889, and the first flowers were in full development in the last week of January of this year. That is surely the quickest development of a hybrid we have heard of—but alas! the only merit we can mention. The leaves and the habit of C. Pearcei, the spike of C. Schlumieri, and the flowers of C. chloropis, give an idea of this new enrichment of our collections.

There is a proverb in Germany—"Children must be cautious in the selection of their parents"—a frivolous, but, at all events, a correct expression of Mr. Darwin's theory. To apply this theory to a practical point of view, we must admit that good results can never be obtained if C. Pearcei has had a prevalent influence in the crossing. This new hybrid is dedicated to the memory of Francis Bacon (Viscount of St. Albans, the first Englishman who pointed out the merits of practical experiments against purely theoretical research), Dr. F. Kränzlin.

CATASETUM LIECHTENSTEINII, n. sp.*

This new species of *Catasetum* is no doubt the nearest to C. Trulla, and at first sight I inclined to consider it as a mere variety of that species; but the characters of the lip, so constant in all the flowers seen by me, are so different from those of the true C. Trulla, that I resolved to describe it as a new species. It is very difficult to give a good idea of this very striking plant. The old C. Trulla, described in 1840, was never very common in England, and *Catasetum* has never been fashionable in our collections. Imagine a dense pendent raceme of about twenty flowers, each 1½ or 2 inches across. The petals and the dorsal sepal are connivent, and form a sort of cup; the lateral sepals are spreading, and all these parts are dull grassy-green; the lip—the botanical characters of which are pointed out in the diagnosis—is also green, with blackish-brown on the edges and the lower parts of it. Green and brown are not the colours to make a flower bright and attractive, and the plant will never become a serious rival to the Cattleyas and the *Odontoglossa*, but everybody who likes to turn his eyes from these big blotches of purple, and rose, and yellow to the more modest colours will be more than satisfied by the striking forms of the *Cataseta* and several allied genera. It is to be hoped that some amateurs will turn their special attention to this group, the generic peculiarities of which are of the highest interest, and till now unknown for the greater part of the described species. The culture of *Cataseta* is by no means difficult, K.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM VEXILLARIUM.

If amateurs and gardeners will examine any plants of this species not in good health, they will probably find traces of thrips; the tiny insects themselves are not always visible, although they sometimes come out in very warm weather from the axils of the leaves. I was recently looking over a collection of Orchids, and on coming to a group of well-grown specimens of this *Odontoglossum*, I found several plants had damaged leaves, which I

* *Catasetum Liechtensteinii*, n. sp.—Affine C. Trulla, Lindl., C. tridentat., Rchb. f. Racemo compacto pendulo; bracteis oblongis acutis dimidiis ovarii aequantibus; sepalis petalo-
loque intermedio conniventibus; sepalis lateralibus divergen-
tibus omnibus subimbricatis oblongis acutis acuminate
viridibus; labellis manifeste trilobis lobis lateralibus basi rotun-
datis extus rectangularibus acutangulis sparsim serrulatis, lobo
intermedio longe triangulari acuminato apice incrassato marginem
omnino integro, toto labello plani viridi margine presertim
ad apicem loborum fuscis, medio in disco bruno-
adspersis; gynostemio brevi dentibus 2 longissimis subulatis
in medio ungue labelli descendebatibus; antheram non vidi, pol-
linis angustis oblongis, caudiculis lineari angustis, glandula
pro genere minus.—Accepta a domino W. Leuchs, principis
Liechtenstein horticulture fautoris hortulano. Dr. Kränzlin.

was informed happened by fumigating the house with tobacco-smoke. I was convinced from the very first that this fine *Odontoglossum* would not stand the fumes of tobacco-smoke strong enough to kill thrips. The only way to keep them clean is to periodically dip the plants in tobacco-water. We have large specimens about twelve years old that have been kept in good health by dipping the leaves about once in six weeks as a preventive. The last dipping must take place just as the flower-spikes are coming up, and they cannot be dipped again until the flowering period is over, as the tobacco-water injures the flowers in bud. Cool Orchids are often injured by tobacco-smoke, although they are sometimes fumigated. On one occasion I smelt tobacco-smoke in a structure, and enquired of the gardener if they fumigated the cool-house Orchids. "Well," he replied, "we are supposed to do so, and I put in the fumigator to make a smell." J. Douglas.

ODONTOGLOSSUM PHALENOPSIS.

A well-flowered specimen of this species is a very distinct and pretty feature in a collection of Orchids, but it does not seem to prosper so well as O. Roesslii and O. vexillarium do. I remember the late Mr. Snyers saying that it was subject to the attack of a small species of thrip, almost invisible to the naked eye. Probably this is the reason that the plants are seen in good collections to a declining state of health. I have not seen a really good well-flowered specimen since Mr. John Ward exhibited it about fifteen years ago at the summer exhibition in London. The two fine plants grown by him were sold at Stevens' Rooms, King Street, Covent Garden, for 30 guineas each. I have followed his system of culture, and our small stock of plants does well. They are grown in a compost of peat and sphagnum, and are kept near the glass on the shady side of the cool-house. Mr. Ward repotted his plants in February, and they had been grown for many years without being divided. I find they do not like being divided, and we now repot the large plants every second year; merely surface dressing with some fresh clean live sphagnum and fibrous peat when they are not repotted. The plants are dipped occasionally to destroy this tiny insect pest, and it is a good time to do so before surface-dressing them. I use soft scapy-water, with a little tobacco-liquor in it. J. Douglas.

LELIA GRANDIS VAR. TENEBROSA, Reichenbachia, 2nd ser., t. 33.

A very dark and exceedingly distinct form, the sepals and petals flatter than in the type, less undulate, and of a decided copper-bronze tint, and the lip purple, more or less margined with white, with some deep purple at the sides of the throat. Native of Brazil, near Bahia.

CATTLEYA LABIATA VAR. LUDDEMANNIANA, Reichenbachia, 2nd ser., t. 34.

This is stated to be synonymous with C. Dawsoni, and is subject to variation in colour from pure white to light rose-purple, but all are readily distinguishable by the relatively narrow lip. There is generally a pair of pale yellow or white blotches at the top of the throat, with lines of reddish-purple on the disc. Its flowers are produced on the newly-formed growths of the current year, and before the resting season. It should be grown in the Dendrobium-house, a sunny, bright, and very warm position suiting it best.

ODONTOGLOSSUM CORONARIUM, Reichenbachia, t. 35, 2nd ser.

This, says Mr. Sander, is best grown in cradles, thus affording plenty of drainage, in peat and sphagnum, and plenty of moisture, near the roof of a cool moist-house.

CATTLEYA GRANULOSA VAR. SCHOEFIELDIANA, Reichenbachia, 2nd ser., t. 36.

The difficulties to be overcome in collecting this and other Brazilian Orchids are not to be lightly estimated. Growing in the forks of trees, surrounded

by the accumulated *débris* of years, they form the abiding place of myriads of ants—significantly called fire-ants, scorpions, and the diminutive but virulent snake of the country. With these obstacles to face, the collector has oftentimes been brought to a standstill, and has to exert all his eloquence and persuasive powers to induce the natives to venture on a task from which he himself shrinks. More often than not, to settle all doubts, the tree is cut down, and hence is opened the chance for a little nefarious business on the part of his native assistant, who, if so inclined, has the opportunity of substituting some more easily-reached plant, the appearance of which differs so slightly, that to pass it is excusable. The treatment of *Cattleya amethystoglossa* will admirably suit *C. Schofieldiana*; placed in the warmest end of the *Cattleya*-house, with considerable moisture during the growing season, potting in the same way, and keeping comparatively dry during the season of rest, it will do easily and well, flowering freely, and proving itself one of the most attractive objects to be found in any collection of Orchids.

COLONIAL NOTES.

TRINIDAD.

THE Annual Report of the Royal Botanic Gardens for the year 1890 is quite an imposing document, giving full particulars of the garden and its departments, together with numerous photographs of characteristic trees. Mr. Hart has an interesting note on *Coryanthes macrantha*, in which it is shown that while bees effect the fertilisation of the flower, they do not, as alleged, feed on the fleshy plates of the lip. It is the black-beetle (*Blatta occidentalis*) which does this part of the work. The average rainfall is about 65 inches, the greatest fall being in June, 7·8; July, 9·3; August, 10·6; September, 8·0; and falling as low as 1·8 in February and March. The mean annual temperature is 77°·5, average maximum, 86°; average minimum, 69°; highest in September, 89°; lowest, February, 66°.

JAMAICA.

Mr. G. S. Jenman continues his descriptive list of the Ferns of the island in the *Bulletin* of the Botanical Department, Jamaica. It is to be hoped it will eventually be published in some more generally accessible form.

CEYLON.

Mr. J. Alexander has issued a brief account of the timber trees of the Central province, on the occasion of the Colombo Exhibition.

THE CULTURE OF PRIMULA SINENSIS.

WE hear much of the good cultivation of the *Primula* in these days, and our young men are inclined to boast of their exploits, and some old ones as well, who have forgotten the successes of the gardeners of 30 and 40 years ago; and they are apt to imagine that *Primulas* were never so fine or so large as now. The writer knew one of the Wells of Redleaf fame—proprietor and gardener were alike named Wells, who could grow the good ordinary strain of *P. sinensis* for winter blooming up to 2 feet and more in diameter. The seed, mostly home-saved, was sown in April and May in pans that were kept in a Melon-pit or mild hot-bed, and always close to the glass. Here they remained till the seedlings had made a rough leaf or two, when the seed-pans were looked over, and all those plants that had reached that amount of development were lifted with a sharp-pointed label carefully out of the mould, and pricked-off into other pans—generally in a line round the edge; and if there were many, two lines might be made. The middle was always left bare of plants, as it was generally found that they damped-off there from excess of moisture—probably, just as in the opposite way we find seedling tuberous *Begonias* go off near the sides of the pans they are pricked-off or sown in.

These pricked-off *Primulas* went—together with the seed-pans, which had been carefully levelled by putting some sandy loam and leaf-mould into the holes made in transferring the seedlings—into the place whence they had been taken, first affording them all a gentle watering. These plants would stay there for a fortnight, and at the expiration of that time, if the hotbed had not declined much in warmth, they would be placed in a cool pit kept moderately close. This pit was filled up with a coal-ash bed to within 1 foot of the glass in front, and 1½ foot at the back, and the *Primulas* were stood on inverted pots so as to bring them well up to the light. In very hot days a mat might be thrown over them

conservatory, well repaying the gardener for his pains. Of course the gardener had two successions of plants under way at the same time—the one year and the two year—and a considerable amount of glass was occupied with them.

As our readers know, the *Primula sinensis* is not a plant of annual duration, although we choose to cultivate it as if it really were an annual, so that there is nothing abnormal in the plant lasting for two years.

In some places and soils the *Primula* is apt to go off with canker between wind and water, but I have found that a good admixture of burnt earth with the potting soil, sprinkling also a little over the surface of the ball when the potting of the plant is finished, will in a great measure protect the plant from this evil. M.

ZYGOPETALUM LINDENI.

WE here present our readers with a figure of this singular-looking Orchid, which was introduced by *L'Horticulture Internationale*, Brussels, and named in honour of Madame Lucien Linden. For a full description of the plant we would refer our readers to our issue for December 26, 1891, p. 759.

MR. T. C. HEINEMANN'S ASTER FARM AT ERFURT.

THE accompanying illustration (fig. 28), taken from a photograph, supplies an excellent representation of one of the extensive Aster farms of Germany, that of Mr. T. C. Heinemann, of Erfurt. Erfurt is one of the great centres of the seed-growing industry on the Continent, and as Aster seeds are in great demand, it is necessary that the plants should be grown very extensively, in order to furnish an adequate supply. The picture of the Aster beds, given in the representation, may convey to the readers of the *Gardeners' Chronicle* some idea of the large extent of land devoted to their culture. The greatest care is taken to keep the several types true to character, and of uniform fine quality; and the competition among the growers of Asters in Germany and other parts, operates to maintain these features. The introduction of new types during the past ten or twelve years, of which the Comet Aster forms so distinguished an example, has been remarkable.

On the large Aster farms, seeds are sown in pots or pans, or in the open ground. In the case of the latter method, sowing generally takes place at the end of March or early in April; the seeds are placed thinly in drills, and covered with fine soil. Many, probably most of the growers, cover the seeds sown with frames; they are protected by means of straw mats by day, and from the sun by shading, when at its greatest power. Something like ten days are required for the germination of the seeds, and as the seedlings increase in size, air is admitted in order to induce robustness and a hardy character. At this stage insects are liable to injure the young plants; woodlice and a black spider are the most troublesome. The plants are thinned out as required. They are well cared for in all stages of growth, and they bloom during August and September. It is sometimes the practice to make successional sowings, but the most vigorous plants bearing the finest flowers are said to be produced on plants sown at the end of March.

When the seeds are sown in pots or pans, it is usual to cover them with a piece of glass whitened upon the upper side. This is done to temper the sun's rays; it prevents a too rapid drying of the surface, and prevents insects from attacking the seedlings. It is the usual practice to start these seeds in a warm frame or in a house of a temperature of 65° or so. When the seedlings are through the soil the glass is raised on one side to admit air, and the white covering to the glass is washed off in order to admit light. The glass is dispensed with as soon as the leaves of the young plants touch it.

At the end of March these seedlings are pricked

FIG. 27.—*ZYGOPETALUM LINDENI*.

from 12 o'clock till 2, but as a matter of fact, they had to get used to full sunshine by July. When large enough they were potted and repotted, until by the autumn they had got into large 48's, and always kept close to the glass in the cold pit. A little manure-water, guano-water was afforded them, and no flower was allowed to show. In winter the plants were kept in a pit impervious to frost, and always gently moving, no flowers being allowed to develop. In the spring they were shifted into 32's, and in August into 24's, the treatment being similar in every way to that of the previous summer.

In October of the second year they were 2 feet, and some of them nearly 3 feet in their stretch of foliage; and when at last—say, late in the year—they were allowed to flower, they really formed a showy feature in the

in prepared beds in the open. A light rich soil is employed to grow them, and top dressings of vegetable mould given the plants at distances apart according to the character of growth. Some protection is given by night if required, and water early in the day when the atmosphere is warmest. It is the practice of some growers to transplant during the first half of June, giving the plants much more room in which to develop; but this is more particularly the case with those desirous of obtaining extra fine blooms. The plants are cared for in the matter of watering, and the surface is kept stirred and clean. Plants treated in this way will produce a large number of very fine blooms. The foregoing details are intended to impart some idea of the practice generally adopted on the German seed farms, rather than as illustrating the practice of any particular one. There are differences of details in culture, as in the case of our home establishments,

but be this as it may, as gardeners, we must yield to the wishes of our employers, and should meet reasonable requests cheerfully. At the same time gardeners deserve consideration, and ought not to be expected to revolutionise a system of plant culture in a season with little or no additional outlay. Exotic plants do not spring up spontaneously in this country, and time and money are needful if some kinds are to be replaced by others.

Many of the plants, however, that are best for furnishing flowers are readily increased, and, once a stock is obtained, the desired number can be maintained without much difficulty. I will name a few of these, giving a brief description of my treatment of them—at least, of such as we grow in quantity to supply the demand for cut flowers in the dull season.

Of these, perhaps the deciduous *Calanthes* are the most useful, they being not only very floriferous, and their spikes graceful, giving them a charm when

Eucharis are indispensable, and of the several species under cultivation *E. amazonica* is still the best and most free to bloom. Its spikes of pure white flowers are always valued, and they are pretty when arranged alone with suitable foliage, or when associated with those of *Cliveas* or similar subjects. I grow this plant together with *Pancratium*, *Hymenocallis*, and *Phaius grandifolius*, in the stove, where at no time they are allowed to feel the want of water either at the roots or over the foliage, and they push numerous flower spikes twice in the year once at the present time when they are most useful, I am loth to disturb the bulbs of large plants, and only do so when they begin to grow less vigorously, which they usually do in four or five years after being repotted. This failing in health arises from the crowded state of the bulbs and a soured and infertile soil. The potting soil consists of fibry loam, mixed with a moderate quantity of peat and

FIG. 28.—ASTER GROUNDS, IN F. C. HEINEMANN'S NURSERY, ERFURT. (SEE P. 172)

Early blooming is necessary to secure a good harvest of plump, well-matured seed-grains, and it would appear that while the character of the weather in this country during last summer was of a nature to interfere with the proper maturation of *Aster* seeds, the Erfurt seed harvest was generally of a favourable character. One noticeable development in the *Aster* of late is in the direction of greater brilliancy of hue; the ruby, scarlet, and crimson-flowered varieties are now remarkably fine, and of the greatest decorative value. *R. D.*

POT PLANTS FOR CUT FLOWERS.

THE grand specimen hard-wooded plants that required great skill to grow them, and which were the pride of their possessors, have, in many gardens, given place to a more easily-grown class of plants suitable to furnish flowers for vases, &c. Some gardeners consider this to be a retrogressive movement;

mixed with suitable foliage, unequalled by any other cheap and easily managed plant, but the blossoms last a long time in perfection, both on plants and after they are cut. Their culture is simple. The pseudo-bulbs should be potted when growth begins, and placed on a shelf near the glass in a stove, and very sparingly watered till the roots have obtained a good hold of the soil, when more liberal supplies become necessary. Liquid manure should be occasionally afforded the plant at that time. The plants should now be syringed, and although they delight in atmospheric moisture, they must be protected from powerful sunshine, and water gradually withheld as the foliage decays, and entirely so while the bulb is at rest. A good compost for *Calanthes* consists of fibrous peat and loam in equal parts, mixed with a moderate amount of silver sand and dry cow manure. Free drainage is needful, and 6-inch or 7-inch pots should be employed if large spikes are coveted. The varieties and species have become numerous, and we have this season flowered some pretty seedlings raised from seed sown three years ago.

sand; liquid manure and soot water are freely employed during the season of active growth, and bright sunshine is at all times excluded from the plants.

The common white *Arum* is another plant that produces valuable flowers or spathes for cutting, and particularly suitable are these, assisted with their own foliage, for filling large trumpet-glasses or similar vessels. This plant can be well cultivated under different modes of treatment. I adopt the following. Early in June the plants are taken from their pots, much of the soil shaken from the roots, their suckers removed, and any that have two or more stems are divided, confining each plant to a single stem or crown. These are planted out in trenches, where they are carefully watered, and assisted with liquid manure. In September they are lifted, and potted in 8-inch pots, the soil used being loam, to which a little leaf-soil is added. When potted, the plants are placed in a cool pit, and kept rather close, syringed, and shaded, until they have recovered from being lifted, when they are given plenty of air, and

exposed to the sun. They soon establish themselves in the pots, and are then removed to a warm house in quantities as required. Here they demand copious supplies of water and liquid manure. I am growing the miniature form, but have not had sufficient experience with it to enable me to speak with certainty of its merits.

Of *Cypripediums*, *C. insignis* is one of the freest of winter-flowering species, and although frequently neglected, its blossoms are invaluable, and last a long time in perfect condition. During the summer months my plants are grown in a cool-house, where they are partially shaded by Roses on a trellis, and continually have a gentle current of air. Here they succeed well, making luxuriant growth, but in winter they are placed in an intermediate temperature, where they blossom freely. This plant is not very particular about soil, growing well in peat, or a mixture of peat and fibry loam. Plants that are well-rooted, and in good health, enjoy weak applications of liquid manure made of sheep's droppings. *Thomas Coomber*.

TREES AND SHRUBS.

DIERVILLA HORTENSIS.

DURING the summer months the Japanese *Weigela* form a very important feature in the shrubbery-border, the colour of their flowers varying from white to rich red. *Diervilla hortensis* is without doubt one of the finest and freest bloomers of the white-flowered section, and the flowers are borne in great profusion along the shoots for about 20 inches to 2 feet from the tip. A clump of several plants, or a good-sized plant, with its branches radiating in every direction when in full flower, is a sight well worthy of anybody's attention. It is not at all particular as regards soil, flowering freely in most kinds, but it delights in a sunny position, so as to have its wood thoroughly ripened. Unfortunately it is apt to be cut by very severe winters, and more especially when young; but if some slight protection be afforded the plant, it will flower abundantly in June and July. It is very much sought after for forcing purposes, and it does not require a great amount of heat to induce it to flower, for if brought on gradually, and the plants removed to a cooler structure when they are about to open, the flowers will last for a longer period, and stand much longer in a cut state than if it be hard forced. Propagation is easily effected if cuttings be made either in autumn or February, and planted on a warm border, burying the cutting, which should be about 8 inches long, up to a couple of eyes from the top, the soil being pressed firmly round the base of each cutting, and by the following autumn they will have made nice useful stuff, and be fit for replanting. It also strikes root very readily if cuttings are taken off in August of the current year's growth, the wood being well ripened and made about 4 inches long, and dibbled round the sides of an ordinary cutting-pot and plunged in close cases in a warmth of 60°, and in spring these cuttings will be ready for planting out in the nursery. *H.*

THE CORSIAN PINE.

This tree (*Pinus Laricio*) stands ahead of all others of the evergreen tribe for fast growth. Not far from here, about 8 acres were planted with this variety and Scotch Fir, the latter predominating in numbers, about eight years since. It is plain enough to see now which variety grows the quicker. The Corsican shows a yard or more above the Scotch regularly over the piece planted. Many of them are now 11 feet high, which for evergreen kinds is a good growth, allowing, of course, for the time almost lost the first year after planting, as seldom do they make very much growth the first year. The wood of this Fir is said to be of good quality, and valuable for building purposes. If so, this, combined with its rapid growth, should render this tree one of the most profitable to plant. I do not think it is at all particular as to what soil it grows in, but like all evergreen Firs, is partial to a sandy loam. *S.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

TOMATOS.—If cuttings of Tomatos have been grown on through the winter, the beginning of February will be a good time for seed-sowing, but in cases where the first supply of this fruit has to be obtained from plants raised from seed, a start should have been made at the beginning of January with them, or as soon after as possible. If seeds are sown thinly in a rich compost, and given a warm temperature, plants will soon be secured.

CUCUMBERS.—To get Cucumbers by May, the seed should be started at the new year, and the plants in their early stages of growth treated the same as recommended for Melons. No time should be lost in getting the seed sown if not already done.

ROOT STORES.—In many gardens too little attention is paid towards providing a supply of vegetables for the late spring months from roots. I need hardly go into details here, but I may point out a few of the most useful kinds. *Salsafy* and *Scorzenera*: which are not used nearly so much as they deserve, owing, no doubt, to the trouble entailed in cooking. If the seeds are put in too early, half the crop is lost by running to seed, and when sown too late small roots are the result; too much manure, on the other hand, tends to produce forked or stringy roots. The so-called Chinese Artichoke (*Stachys tubifera*), though small, finds favour in a few establishments, and it is an excellent vegetable. I find the tubers keep best in the ground till required for use, taking care to cover with litter in severe weather; they may be had in good condition till late in the spring. Jerusalem Artichokes are too well known to need description, and, when well grown, are not to be despised.

Celeriac is not grown as much as it should be, although it is a valuable winter and spring vegetable. It can be readily grown, and if protected, the roots may be left in the ground till required for use.

Celery, although chiefly used as a salad, is, I consider, superior to *Seakale* as a vegetable, when properly cooked. *Cardoons*, again, are seldom grown in small gardens, but those who can give space and attention to their culture will find them valuable for early winter use; these succumb to severe frost, so require lifting at the approach of frost. *Chicory* is seldom used as a vegetable, but it is deserving of a place in large gardens. The *Witloef*, or large-leaved *Brussels*, may be forced slowly, and used in a similar manner to *Seakale*. The *Asparagus Chicory* is also worth cultivation, and resembles *Spinach*. *Carrots* are valuable for winter and spring use when sown in July, and the roots left in the ground during winter, but covered with litter in severe weather. These late roots, though small, are of excellent flavour, and always in demand in the winter months. The ground should be prepared by frequently forking over, and a free use made of lime or root and wood-ashes, as the roots are more subject to disease than the spring-sown ones.

Seakale and *Asparagus* come under the head of forced vegetables, but the former should be more generally grown on a late border, and covered in February with some light protecting material, to produce a late supply. I have referred to these roots now, so that in ordering the seeds for the year the foregoing subjects may not be overlooked. *Seakale* is best grown from root-cuttings planted in April.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Gardens, Swansea.

EPACRIS.—Plants going out of bloom should be cut back, after the soil in which they are growing has become somewhat dry. The cutting-back should be within 2 or 3 inches of the wood of last year, and any neglected in this respect will result in a few years in leggy and unsightly plants, many of the species and varieties having an erect habit. Great care is necessary in affording water, unless they have begun to emit fresh growth, and it will be much safer to err on the dry side than to over-water. A low brick pit, where the temperature is maintained at from 40° to 45°, until the plants commence to break, will be the most suitable for them. Should any plant require repotting, pot it in turfy peat of the best quality; also see that the pots are washed clean, and have perfect drainage by placing in the pot one-fourth its depth of clean crocks, large ones at the

bottom, finishing with quite small ones at the top. Sufficient sharp sand should be mixed with the peat to keep it open. A few of the roots around the outside should be loosened from the ball with a pointed stick, and when potting, the fresh material should be placed in the pot in small pieces, at the same time making it firm, by using a tapering potting-stick; and precaution should be taken not to place the ball deeper in the pot than it was previously, and sufficient space allowed for holding water enough to thoroughly moisten the ball at one watering, which on all occasions should be rain-water.

TUBEROSES.—In case the first batch of these have not been potted, no time should be lost in doing so; and to form a succession, fresh batches may be potted up at intervals of a month till the end of May. The bulbs may be potted singly in 6-inch pots, or three in an 8-inch, placing them round the sides of the pot, at equal distances apart. A good compost for Tuberozes is one consisting of a rich fibrous loam, with sufficient sharp sand to make it porous. In potting the bulbs, keep the tops a little above the surface of the soil, making the latter moderately firm. The pots should then be plunged in *Coccoa-nut* fibre refuse, or in a leaf-bed having a bottom-heat of 80° to 85°. They will require scarcely any water at the roots till started, and by syringing them occasionally they will receive, in most cases, sufficient water till growth commences. When the leaves have grown several inches, they should be syringed freely overhead with tepid water, so as to prevent the encroachment of the spider, and to serve as an aid to growth. To have large and well-developed spikes of bloom, tepid manure-water, or a light sprinkling of some well-tried fertiliser, should be afforded the plants occasionally.

GARDENIAS.—Young stock intended to be grown in pots, and now requiring more root-space, may have a liberal repotting into a compost consisting of three parts rich fibrous loam, one part leaf-soil or peat, and sufficient sharp sand to keep the whole porous. Grow the plants in a house having a night temperature of 60° to 65°, and by day of 70° to 80°. Syringe the plants freely when the weather is bright, to encourage a freedom of growth; and as mealy-bug is very troublesome, a constant watch should be kept for them. Large established plants which are now swelling their flower-buds should be occasionally assisted with tepid manure-water, or a sprinkling of some fertiliser. Syringe freely about 2 p.m. with tepid water, keeping the night temperature from 65° to 70°, with a rise of 5° or 10° with sun-heat, but do not wet the blooms.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

FRUITING PINES.—The beginning of February is a good time to empty the Pine bed and have it refilled with materials that will maintain a steady and prolonged heat. Oak and Beech leaves are undoubtedly the best things to employ for this purpose, and if obtainable in a fairly dry condition, so much the better. These ought to be made as firm as possible, and when tanner's bark can be easily procured, a foot in depth of it on the surface of the leaves will form an excellent bed to plunge the pots in. Sawdust and *Coccoa-nut* fibre refuse are also used for this work, but all are more a matter of appearance and convenience than as essential items in Pine culture, for good examples of this fruit are grown without the aid of either. When the bed has attained a temperature of 75°, transfer the fruiting plants, and the strongest of those from the succession-house into it; and in doing so, make the material firm around the pots. Bottom-heat thermometers will tell the degree of warmth, and if this does not exceed 90° at any time all will be well; but should it get beyond this point, loosen the pots to allow the heat to escape by their sides. Water applied to the roots once a week will be often enough, but the time to apply it will vary with the weather, and the kind to employ will depend on the plants themselves. For fruiting Pines, nitrate of potash, kainit, or soot, will be found useful, and growing plants will improve with the assistance of nitrogenous manures.

SUCKERS put in last autumn may now be repotted, using a compost of two-thirds good fibrous yellow loam and wood-ash, horse-droppings and bone-manure in a fine state to make up the other third. The compost should be of the same temperature as the atmosphere of the house, and in the condition that when squeezed by the hand the particles cohere but slightly. In potting, use pots 3 inches larger

than the ones the plants have been rooted in, and pot firmly. The succession-house will be the place for these, where a minimum temperature of from 70° to 75°, with a maximum of 5° to 15° higher, and a humid temperature is kept. Admit air when the sun raises the temperature 10° above the minimum, and increase the quantity in accordance with external conditions. Syringe the beds and damp the pathways in the morning, and when the house is shut up in the afternoon.

APRICOTS.—Admit air freely to the Apricot-house at all times when the external temperature is above the freezing-point, and see that the borders are not dry. The trees will be benefited by an occasional touch-up with the syringe on the mornings of fine days.

THE HARDY FRUIT GARDEN.

By G. WOODWARD, Gardener, Barham Court, Maidstone.

APRICOTS.—The bloom buds of the Apricot are very liable to injury by early frosts, and considering that the buds are now plumping so rapidly, owing to the mildness of the weather, no time should be lost in bringing the pruning, nailing, and tying of the trees to a finish. If the spurs are numerous and long, a few of them should be cut back annually, which will give those that are left a better appearance, and the blossoms better protection from the wall. In many gardens, Apricot trees are very perplexing subjects for the gardener, for no sooner has a tree grown old enough to carry good crops of fruit than it begins to gum, with the result that many large branches will die. To get over this difficulty, we use glass coping, and this is what I would recommend, as since this coping has been placed over the trees, we have had no unsightly gaps in the trees, or any lack of fruit.

WORK IN GENERAL.—All fruit quarters where the pruning is finished should now be lightly forked over, just sufficient to bury small weeds, and sweeten the surface; large weeds being hoed up and collected into heaps, to decay, otherwise deeper digging will be necessary to bury them than is good for the trees. Manure put on as top-dressing should have stones mixed with it, as I have found that their presence gives excellent results, either when on the surface or forked into the soil; failing broken bricks, with a few shovelluls of earth, to keep the birds from disturbing it, thrown upon it. Any nails which have been drawn from the walls and are likely to be wanted this season, should be put on an old shovel and heated in a furnace and then plunged into lined oil, and when cool strained through a fine-meshed sieve, which treatment will, in a great measure, keep them from further rusting.

DAMSONS.—These are very hardy fruit trees, and consequently, are usually planted in exposed positions, or as protection for other fruits. For some reason or other, the Damson is often allowed to take care of itself, which is a mistake, as the past season showed, for where the trees were fairly well attended to, larger fruit was gathered, and the prospects for the coming year much enhanced. As much care should be exercised to keep the heads from becoming crowded, and the roots manured as advised for other fruit trees, care being taken not to injure the roots in digging the ground, as this is a fertile cause of suckers springing up. All suckers should now be grubbed up with a mattock, and if the tree is on its own roots, some of the strongest can be bedded in for future requirements. For pruning the Damson, use a *secateur*, it being a much handier instrument than the knife, and more quickly used. Keep the centre of the head quite open, and the branches well thinned; shorten back all long shoots.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

HERBACEOUS PERENNIALS.—Where the arrangement and the division of clumps of these plants have not been as yet attended to, no time should be lost in setting about this kind of work. In the planting or replanting of herbaceous plants in beds and borders, regard must be paid to the colour of the flowers, so that discordant combinations do not occur, such as two or more tints of the same or approaching colours; also the various heights to which the plants grow, and the rate of lateral increase in size, the form of the foliage and its extent. The necessary alterations which will have to be made in the arranging of the plants, as to colour, the following spring, should be noted down when the plants are in flower, the want of harmony in the

different shades of colour and heights of the several plants being then fully apparent. The dividing and transplanting of the bulbous and fibrous-rooted plants must be performed with skill, replanting the divided portions at about the same depth in the ground, assuming that they were not too deep before, and making the soil moderately firm and level about them. A dressing of short well-rotted manure should be laid on the border when the planting is finished, and slightly fork. Most herbaceous plants will do well in any fairly good soil, inclining to be light rather than heavy, and away from the shade of trees, that is, fully exposed to the beneficial influence of the sun all day long; but when given a light, sandy loam, enriched with well-decomposed manure, results of the most satisfactory description in size, form, texture, and colour of flowers may be looked for.

THINNING AND TRANSPLANTING TREES AND SHRUBS.—There is still time to thin out crowded shrubberies, and transplant the shrubs, &c., if these be taken up with good balls in other quarters. In pruning trees and shrubs into any desired shape, care should be taken to leave no visible signs of the pruning-knife or the saw. All that requires to be done is to exhibit them in symmetrical and graceful outline, and the workman to exercise judgment and skill in giving effect to his ideas on these points. There should be no mere cutting and slashing of the branches, with no definite notion of what is wanted; but, on the contrary, if a tree or shrub is lop-sided, or branch is too luxuriant in its development, these points should be remedied by cutting in here and there, and by that means diverting the flow of sap to other parts, and so produce a uniformity of development. Flowering shrubs and trees, to wit Forsythia, Vitex, Guedrea rose, Calycanthus fragrans, Chimonanthus, Syringa, Philadelphus, Quince, Kholerutera, and Laburnum should have most of the weak growths cut back to within one or two buds of their base, and shortening unduly long growths [if not flowering ones]. Use the knife very sparingly on trees of drooping habit, especially in the case of those trees whose young erect growths acquire a drooping form when in flower, being weighed down by their own inflorescence—the Laburnum being one in point. Any dead or decaying branches that happen to be on trees or shrubs should be cut back into healthy wood, and the wounds made smooth.

GENERAL WORK.—This will consist in paring edgings of turf, sweeping lawns, and dressing moss-covered ones with a slight sprinkling of gas-lime. Impoverished lawns may be improved in appearance by top-dressing them with a mixture of sifted loam, leaf-soil, wood-ashes, and a small quantity of fresh soot. If a 6 inch potful of Thomson's Vine and Plant Manure be added to one bushel of fine garden-soil or leaf-mould, a like result would follow. When the dressing has got washed down to the roots of the grasses, the lawn may be rolled—not before. If moss is very thick, and its presence in the grass is disliked by the family, which is by no means always the case, as much as possible should be dragged out with a rake before dressing it.

THE ORCHID HOUSES.

By H. A. BURDELL, Orchid Grower, Highbury, Birmingham.

DENDROBIUM.—For this desirable genus the most suitable house is a lofty one, well exposed to the sun. The summer blinds should be made from very thin material. Many of the genus grow best in shallow pans or baskets, the smaller the better, and these should be suspended close to the glass of the roof. Denobros, in most establishments, will be somewhat scattered in various houses at this season, and there the plants should remain until the sun gains power. *Dendrobium Wardianum*, *D. crassinode*, *D. Finleyanum*, *D. nobile*, *D. Dominianum*, *D. Ainsworthii*, and *D. heterocarpum*, which may be required to flower late, may still be kept in a temperature of 40° to 50°; and those which have flowered or are still flowering may be accommodated in an intermediate temperature, where the growth will be slow till the season is more advanced. In a compartment which is kept at a temperature of 60° to 65°, and the air is moderately dry, we rest the *Dendros* from Torres Straits, viz., those valuable winter-flowering species, *D. bigibbium*, *D. superbiens*, and *D. phalaenopsis*. Since the month of October until the present time, we have had them in flower, and some of the flower-spikes have measured from 2 to 3 feet in length. This division also contains others that will not stand

resting in very cold quarters, namely, *D. stratiotes*, *D. Bensoni*, *D. formosum giganteum*, *D. Huttoni*, *D. aggregatum majus*, *D. Desaii*, *D. Macfarlanei*, *D. Lowii*, *D. superbum*, and *D. rhodostoma*. *D. chrysanthum* is also kept here, as it is a species which has no season of complete rest, and it is now growing freely. If the compost is not in sweet condition it should be renewed, using good peat and sphagnum moss. Some species that are found to grow well in the Cattleya-house, and never removed from it, are *D. thyrsoideum*, *D. densiflorum*, *D. suavisimium*, and *D. chrysotoxum*.

PRUNING DENDROBIUMS.—I cannot recommend this practice. Nothing more than the cutting off of a few of the oldest stems which have become unsightly should be done.

POTTING.—The repotting of Orchids should be pushed forward, and a good supply of clean crocks and pots and baskets, sphagnum, and peat prepared. A commencement may be made with *Laelia anceps*, should any require repotting or rebasketing, especially any which may have begun to form fresh roots. It is a good plan when repotting these plants to place each leading growth so that it may grow towards the centre of the pot, so as to form a natural-looking self-supporting mass. This is better than letting them grow over the rim of the pot, and calling for repotting the next year. The white varieties of *L. anceps* I prefer to repot or rebasket in the month of September, as their roots are active throughout the winter, and these are more inclined than others to stray over the sides of the pot, and on this account the plants should not be repotted unless there is real need for it; but the young roots should be trained or directed so as to enter the compost, otherwise they will be injured in various ways. *Phalaenopsis* may also be repotted, after thoroughly cleaning the roots of all decayed materials. *Phalaenopsis* are best suspended near the light, in baskets or pans.

THE APIARY.

By EXPERT.

CLIPPING QUEEN'S WINGS.—The practice of cutting the wings of queens, with the object of preventing swarms from absconding, has never found much favour in this country, although it is largely resorted to in America, and in this, as in some other of the practices connected with the management of bees, there is no question that they are ahead of our country across the water. Some time ago a beekeeper there, who was evidently in favour of this mutilation of queens, suggested that, if sticks were stuck in the ground, at an angle of about 45°, near the hives, the queen on issuing, and finding herself unable to fly, would run up one of them, where the swarm would find her out and cluster. Unfortunately it happens that the queen is just as likely to go anywhere else as crawl up a stick, although she might do so by accident, and therefore like many another theory, this one is not of much practical value. One of the main drawbacks of clipping a queen's wings is, that the bees will dethrone her when they discover that she is imperfect—this occurring before she has a chance of leaving with a swarm. In such a case, the colony would probably be queenless for a considerable time, and reduced in numbers at a period when it should be gaining in strength. Supposing the bees do not depose the queen in this way, and everything goes right, so that the swarm issues forth, and she goes out with the rest; being unable to fly, she, of course, falls to the ground, where she stands the chance of being snappd up by a toad, or, in all probability, gets lost, unless some one happens to be near to secure her at once. Having secured the queen, the swarm may give trouble, as it has been observed that when queens are detained or unable to go with swarms, the bees seldom "cluster," and remain very much longer on the wing than when a queen is with them, oftentimes spreading themselves out, and alighting all over the apiary. If another hive in the locality happens to throw a swarm at the same time, if anything is amiss with either of the queens, the bees of the two swarms are almost sure to amalgamate and cluster together, so that a neighbouring bee-keeper may unwittingly reap an advantage at the expense of the owner of the clipped queen. It is altogether advisable in the management of bees to work on lines that are opposed as little as possible to their natural instincts and proclivities, and there can be no question that the clipping of the wings of queens does not conduce to the well-being of the bees or the advantage of the bee-keeper, and that it is an unnecessary proceeding.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher, at the above address.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY	Feb. 9.	Royal Horticultural Society, Annual General Meeting, at 117, Victoria Street. Committees at the Drill Hall, James Street.
THURSDAY	Feb. 11.	Brighton and Sussex "New" Horticultural Society.
FRIDAY	Feb. 12.	Wakefield Paxton Society.
SATURDAY	Feb. 13.	Royal Botanic Society's General Meeting.

SALES.

MONDAY,	FEB. 8.	Carnations, Pyrethrum, Anemones, Lily of the Valley, &c., at Frotheroe & Morris' Rooms.
WEDNESDAY,	FEB. 10.	Palms, Greenhouse Ferns, Roses, Daffodils, Amaryllis, Begonias, at Frotheroe & Morris' Rooms.
THURSDAY	FEB. 11.	1000 Choice English-grown Roses, and 1000 Fruit Trees at Stevens' Rooms.
THURSDAY	FEB. 11.	Cypripedium spectabile, Tuberoses, Gladioli, Home-grown Lilies, &c., at Frotheroe & Morris' Rooms.
FRIDAY,	FEB. 12.	Imported and established Orchids at Frotheroe & Morris' Rooms.
SATURDAY,	FEB. 13.	Border plants Tuberoses, Amaryllis, Palm seeds, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°J.

No one can look upon a collection of these garden flowers in all their rich and varied colours without admiring the work of those patient florists who, by skill and perseverance, have been able to so change the appearance of wilding plants, that even experienced botanists are unable confidently to trace the origin of some of the productions of Art with Nature combined. The production of choice florists' flowers from seeds is not a matter of mere guess work, and the cultivator must not trust to chance.

Take the show Auricula, for instance. It is not easy to discern in the curious green, grey, and white-edged corollas, with the exquisite combination of colours and symmetrical form, the simple yellow-flowered *Primula Auricula* of the Alps, or, indeed, any of the alleged original forms mentioned at the *Primula* Conference. We may fairly ask the question, "Why have certain species become improved, while many other alpine *Primulas* have not changed their character?" One reason is, that many of them do not take kindly to cultivation. They will grow fairly well for a few years, but do not increase freely, and cannot long be preserved without the most skilful culture; such delicate subjects are not likely to be improved as garden plants.

Of all the alpine *Primulas*, *P. Auricula* is probably the most amenable to garden culture. It may be, as shown at the Conference, and in the discussions in these columns which followed it, that all the variation in the *Auricula* is not exclusively derived from *P. auricula*. Probably the purple *P. venusta* has become in

some way linked with it. The alpine *Auricula*, as it is termed, must not be in this connection; it is, as much as the show *Auricula*, a garden plant, but it has not yet put on anything like the same amount of variation. One parent of these alpine *Auriculas*, *P. pubescens*, is supposed to be a natural hybrid.

Rightly or wrongly, the florists have pretty unanimously decided that the main point in the standard of excellence of an *Auricula* or other garden flower of this type is "form." This point is essential, and the cultivator works up to this. The seed-bearing parent, at least, ought to produce flowers of rounded and symmetrical form, broad, and of good substance; the edge of the petals without roughness or indentation upon the edge. It is rather remarkable that anything like a perfect green, grey, or self-edged *Auricula*, from a florist's point of view, was not obtained until the production of Lancashire Hero, raised by a Lancashire hand-loom weaver, Mr. ROBERT LANCASHIRE, in the year 1846. Later, even better results were obtained by Mr. RICHARD HEADLY, who produced quite a model show *Auricula* in George Lightbody, a grey-edged variety. Even now, after a lapse of forty years, this kind obtains the prize as the best show *Auricula* in the exhibitions.

The florist, in hybridising for raising new varieties, must be careful to keep the four classes distinct. The green-edge is always placed first, but, according to Mr. Douglas, it is probably the most difficult class to improve. The most interesting way is to deal with one class only at a time; and although the green-edged section is the most difficult of the four, it is as easy for the tyro in the work to deal with that class as with any other. The two best varieties at present in the trade are Prince of Greens and Rev. F. D. Horner; they have both faults, but the one has qualities that the other lacks. The first-named has a weak watery throat to the corolla, which dies off a blackish tint before the other part of it does; Rev. F. D. Horner has a good yellow "tube," as it is termed, but an angular paste, which the florists have decided ought to be circular. By crossing these two, we may hope to obtain a new green-edge with the round paste of Prince of Greens and the golden tube of Rev. F. D. Horner. If we could obtain a seedling with the best points of each variety with the bad eliminated, this would be a vigorous plant, throwing up a full truss with stout footstalk. The corolla well formed, the throat yellow, the paste round, white, and thickly laid on; the ground colour almost black, the edge quite green and free from the farina spots. This is a fault from which many green-edged *Auriculas* are not free; indeed, out of a hundred seedlings from such purely green-edged varieties not more than one or two would have the edge green, minus the small white farina dots.

The grey-edged class, which is intermediate between the green and white-edged, frequently merges into the other. For instance, Lancashire Hero, alluded to above, has often been exhibited and has won first prizes as a green-edged *Auricula*, although it is usually grey. A seedling of Mr. Douglas's, Mrs. Moore, received several First-class Certificates as a green-edge, but it is, we believe, usually grey. The green-edge state invariably comes from a truss which has been formed in November or December, deep down in the axil of one of the lower leaves. The truss slowly develops and the flowers expand about the end of April. Why a centre truss never has a green edge, while a side truss often develops green-edges, is a question we may ask, but who would venture to give a reply? Such questions as

these continually crop up in the daily life of the florist. George Lightbody is a model grey edge, and may be crossed with Marmion or Mrs. Moore aforsaid, both vigorous growing sorts.

The white-edged class contains some good old varieties of vigorous constitution, and grow into full-sized plants, which the best of the new ones, Conservative and Acme, do not. The best seed bearers of these old varieties are Taylor's Glory, Smith's Ne Plus Ultra, and Heaps' Smiling Beauty. Any of them may be hybridised with the pollen of Conservative or Acme.

Although it is right to insist on keeping the classes by themselves, the fancier must not suppose that his seedling plants will be all of the same class as the seeds were saved from. This is by no means the case. There will be yellow selfs, and some from which all trace of the maroon or dark purple colour of the parents have fled, leaving a yellow ground, with a white, grey, or green edge. Many will have lost all trace of edge, and come out as full blown maroon or purple selfs—evidence of the old *P. venusta* parentage. The selfs of the florist seem to be totally distinct from his edged flowers, and although from these edged flowers there are plenty of selfs amongst the seedlings, we never have a reversion the other way, edged flowers being rarely, if ever, produced from selfs. The reversion of the edged flowers to selfs is nothing more than a natural tendency which all cultivated garden flowers had to revert to the primitive state from whence they have been derived.

The time for saving seeds of the *Auricula* will soon be here, and we may conclude with precise instructions, for which we are indebted to Mr. DOUGLAS, how to proceed. Before the corolla (pips) are quite open, take the plant, and invert it, and with a pair of sharply-pointed scissors cut the stamens quite out, the pollen-cases will not have burst; this is to prevent any chance of the seed-bearing parent being self-fertilised. In two or three days the stigmatic part of the flower will be ready to be fertilised with the pollen of the male parent. The pollen should be dry, and be conveyed to the stigma with a fine brush. The flowers upon a truss are not all open at one time, and it may be ten days before one truss is quite finished. The seeds ripen in July, and should be sown at once. They will vegetate during the autumn and ensuing spring months in a shady place under a hand-light.

ROYAL HORTICULTURAL SOCIETY.—The Society's second show this year will be held in the Drill Hall, James Street, Westminster, on Tuesday, February 9. Besides the usual plants, flowers, and fruits to be submitted to the various committees, a Silver Medal, presented by Messrs. BARR & SON, will be offered for the best collection of forced Daffodils, Polyanthus varieties excluded. At 3 o'clock, instead of the usual lecture, the annual general meeting of the Fellows will be held in the Lindley Library, 117, Victoria Street, when the Report for 1891 will be submitted, and officers for the current year elected.

NATIONAL ROSE SOCIETY.—A meeting of the Executive Committee will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 9th inst., at 3.30 p.m.

HYACINTH AND TULIP SHOW AT HAARLEM IN APRIL.—Last autumn, two show beds of Hyacinths were planted in Meers. E. H. KRELOE & SON's nursery grounds at Haarlem, each containing more than 600 bulbs, selected from the best, most choice, and newest varieties. In April next, these beds will present a brilliant show, and be a great

INK-PRINC. SPRING 8.1. 1892. EAST-GLASGOW STREET FETTER LINE, GL.

HEDYCHUM CORONARIUM, GLASGOW BOTANIC GARDEN.

attraction to English visitors on an Easter trip to Haarlem. A spacious tent will be put over the beds during the flowering period. Similar shows were held in the same gardens from 1880 to 1881, and again in 1889, and they have always attracted much attention from native and foreign lovers of the Tulip. Near these Hyacinth beds are two large beds of early florist's Tulips, single and double varieties, and a separate tent will be devoted to them. Messrs. KRELLAGE & SON will endeavour to get their Tulips to flower at the same time as the Hyacinths, as they were able to do in 1889.

THE LINNEAN SOCIETY.—On the occasion of the meeting of the Linnean Society on January 21, Professor STEWART, President, in the chair, Messrs. B. J. AUSTIN, STANLEY EDWARDS, and F. TURNER were elected Fellows of the Society, and Mr. T. J. MOORE, of Liverpool, an Associate. On a motion by the President, it was unanimously resolved that an expression of respectful sympathy should be conveyed to Her Majesty the QUEEN, and to H.R.H. the Prince of WALES, on the loss sustained by the death of H.R.H. the late Duke of CLARENCE AND AVONDALE. Mr. D. MORRIS communicated some further notes upon the tick pest of Jamaica, upon which an animated discussion took place. A paper was then read by Mr. F. E. WEISS, "On the Development of the Caoutchouc, containing cells of *Eucommia ulmoides*, Oliver." He found that the bark and leaves of this tree, used medicinally by the Chinese, and called by them "Tu-chung," contain numerous elastic threads of silky appearance, which proved to be of the nature of Caoutchouc. They are contained in long unbranching cells, somewhat like latex cells which are found in the cortex and in the secondary phloem, and accompany in large numbers the ramifying bundles of the leaf and the pericarp. Unlike the ordinary latex cells, they are not derived from specialised cells of the embryo, but originate in all new growths, and can be seen forming in the cortex, the pith and the parenchyma surrounding the bundle of the petiole. They originate in twos, by longitudinal division of a very granular cell, both daughter cells growing out at their two extremities into a long tube, which makes its way along the intercellular spaces by sliding growth. They never contain more than one nucleus, and the large granules of Caoutchouc, which soon make their appearance, finally coalesce into a single solid mass, which has, when the tissues are broken, the appearance of a silky thread. Mr. WEISS regards these cells as a primitive form of latex cells, similar to those from which the more elaborate ones of the ordinary Euphorbiaceæ may have been derived. The meeting was brought to a close with a paper by Dr. JEAN MÜLLER on the "Lichens of Manipur."

INTERNATIONAL HORTICULTURAL EXHIBITION, EARL'S COURT, LONDON, 1892.—The following preliminary programme has been issued. Flower Shows:—May 7, Groups of Plants (flowering and foliage) from Nurserymen; Medals. June 27 and 28, Great Summer Flower Show; Cash Prizes. June 6, 7, and 8, Market Growers' Show; Medals. July 5 and 6, Roses, Table Decorations, &c.; Cash Prizes. August 1, 2, and 3, Market Growers' and Cottagers' Show (Carnations, &c.); Cash Prizes and Medals. September 7, 8, and 9, Autumn Flowers; Cash Prizes. October, two shows; 1. Hardy Fruits; 2. Hardy Ornamental Trees and Shrubs. In addition, there will be permanent displays of groups of flowering plants throughout the season, arranged for effect. The entire net profits will be devoted to such gardening institutions as the executive may select.

SCHEDULE.

GROUP A.

Class 1. Plant houses (*eg.*, conservatories, show houses, winter gardens), hot houses, vineries, peach houses, forcing houses, stoves, fruit rooms, frames; pits; 1 Gold, 2 Silver, 2 Bronze Medals, Certificates. Class 2. Systems of patent glazing and ventilation. Certificates. Class 3. Systems of heating, including hot water boilers; 1 Gold, 1 Silver, 1 Bronze Medal.

GROUP B.

Class 4. Lawn mowers (hand and horse machines); 1 Gold, 1 Silver, 1 Bronze Medal. Class 5. Garden rollers; Silver Medal. Class 6. Water barrows, syringes, pumps, spray distributors; 1 Gold, 2 Silver, 1 Bronze Medal, Certificates. Class 7. Garden tools and cutlery; Silver Medal, Certificates. Class 8. Thermometers, barometers; Silver Medals, Certificates. Class 9. Rain and snow gauges; Silver Medal, Certificates.

GROUP C.

Class 10. Garden tents; certificates. Class 11. Garden seats, band stands; Silver Medal, Certificates. Class 12. Flower stands and baskets for conservatory decoration; Silver Medal, Certificates. Class 13. Rustic summer-houses and seats; 1 Silver, 1 Bronze Medal.

GROUP D.

Class 14. Ornamental iron work for conservatories and hot houses; Silver Medal, Certificates. Class 15. Ornamental wire work, trellises, arches, aviaries, aviaries, borders; 1 Gold, 1 Silver, 1 Bronze Medal. Class 16. Fences, gates, tree guards.

GROUP E.

Class 15A. Shadings (various kinds); certificates. Class 16A. Paints and wood-preserving materials; Certificates. Class 17. Labels, sticks, Bamboo canes; Certificates. Class 18. Cocoa fibres, refuse manures, and silver sand; Certificates. Class 19. Ropes, lines, and twines; Certificates. Class 20. Russia mats, Archangel, Taganrog, and Petersburg; Certificates. Class 21. Raffia fibre; Certificates. Class 22. Fumigating materials and processes; Certificates. Class 23. Insecticides and weed-killers; Certificates. Class 24. Horticultural glass; Certificates.

GROUP F.

Class 25. Orchid and other pests; Certificates. Class 25A. Fuel for general horticultural purposes (Comparative value and enduring powers of various materials—coal, coke, gas, oil, &c.); Silver Medal.

GROUP G.

Class 26. Ferneries, portable and permanent; 1 Silver, 1 Bronze Medal. Class 27. Rockwork, built in natural stone; do., do., artificial material; 1 Gold, 1 Silver Medal.

GROUP H.

Class 28. Garden pottery; 1 Silver, 1 Bronze Medal, Certificates. Class 29. Statuary, fountains, vases, edgings, &c.; 1 Gold, 1 Silver, 1 Bronze Medal.

GROUP I.

Class 30. Tree transplanting machines; 1 Gold, 1 Silver Medal. Class 30A. Tree tubs; 1 Silver Medal, Certificates.

GROUP K.

Class 31. New or patent inventions amongst garden requisites; Silver Medal, Certificates.

GROUP L.

Class 32. Miscellaneous decorative requisites, such as bouquet-holders, papers, &c.

GROUP M.

Class 33. Machinery for seed cleaning and sowing. Class 34. Do., for extracting essential oils. Class 35. Perfumes. Class 36. Fruit evaporators. Class 37. Pumps, methods of irrigation. N.B.—Practical trials will be made in the various classes, where necessary, in order to arrive at satisfactory decisions.

GROUP N.

Class 38. Stands exhibiting models of produce from seeds provided by exhibitor; 1 Gold, 1 Silver, 1 Bronze Medal, Certificates. Class 39. Collections of flower and vegetable seeds; Silver Medal. Class 40. Do., agricultural seeds; Silver Medal. Class 41. Do., grass seeds (mixtures) for permanent pastures and lawns, according to soil; Silver Medal. Class 42. Flower seeds—12 most popular sorts; Silver Medal. Class 43. Vegetable seeds—12 most popular sorts; Silver Medal. Class 44. Grass seeds—6 sorts, distinct; Bronze Medal. Class 45. Agricultural seeds—6 sorts, distinct; Silver Medal.

GROUP O.

Class 46. Designs for the laying-out of a typical estate of 100 acres, enclosed by grounds, 5 miles

from town in Midlands, with ground sloping gradually towards south. Class 47. Designs for Improvements of grounds to private residences. Class 48. Photographs of trees and shrubs. Class 49. Garden scenes.

GROUP P.

Essays on the progress of gardening since 1866. Do., practical education of gardeners, embracing scheme for a school of horticulture. Do., practical education of foresters, embracing scheme for a school of forestry.

GROUP Q.

Methods of determining the nature and fertility of soils, with tabulated statements of ingredients required to improve under different conditions. Methods of determining germinating powers of seeds. Methods of using the electric light in the growth of plants.

BAY RUM.—It was not known until of late years, from what plant Bay rum was prepared, but it is now ascertained, says the *Bulletin of the Jamaica Botanical Department*, that Bay rum, which one only sees in the hairdresser's windows, is manufactured in Dominica from the dried leaves of *Pimenta acris*. Bay rum is procured by distillation, and this in a very simple manner. The leaves are picked from the trees and then dried; in this state they are placed in the retort, which is then filled with water, and the process of distillation is carried on. The vapour is then condensed in the usual way, and forms what is known as "Bay oil," a very small quantity of which is required for each puncheon of rum. The manufacture of Bay rum is carried on at the northern end of Dominica, and proves a very lucrative business to those engaged in it, as the plants are plentiful in this district. The following is an estimate of rum, &c., required:—

1 puncheon rum—100 gals. about 18 to 19 proof,	
say, at 2s. per gal....	£10 0 0
Empty puncheon	1 0 0
½ pint bottle Bay-oil, pure, to a puncheon of rum	0 16 8
	£11 16 8

The rum must be of the strength of 18 to 19 proof, or the oil will not amalgamate properly.

OUR APPLE-CROP.—Where is it now? Certainly not in our fruiterers' shop-windows, where, as a rule, the only Apples to be seen are the well-known American and Australian varieties. Many papers are discussing the question started by a correspondent of this Journal recently as to what has become of our Apple crop. Thus, the *East Anglian Daily Times* says:—"Can it be, it is asked, that our immense crop is all sold and eaten? Or is it the case that there are plenty of English Apples yet at home which cannot find a purchaser while the foreign Apples are in the market?" Unhappily, the latter suggestion seems only too likely to be the true solution. The correspondent, however, does not raise the cry for Protection, which would probably only foster unskilful fruit-growing, and compel English housewives to make puddings with Apples both inferior and dear.

ENGLISH v. FOREIGN.—Mr. WILLIAM HORNE, of Cliffe, made a suggestion at the British Fruit Growers' dinner, held at the Hotel Windsor, Victoria Street, London, on Thursday evening of last week, that as the Association was formed not only to educate and instruct the masses in fruit growing, steps should be taken to bring the matter before Parliament, to put a stop to unprincipled fruit-sellers labelling fruit other than with its true name, simply on purpose to work off a spurious article on the public. Also that all fruit should be labelled "Foreign" or "English" as the case may be. Mr. ALBERT BATE, Sevenoaks, thought it might be brought under the Food Adulteration Act. The suggestion was well received, and is to be brought forward at the next meeting.

"INDISCHE HEIL UND NUTZ PFLANZEN UND DER INDIAN." VON A. TSCHIRCH.—This is a treatise on Indian medicinal and economical plants by the

Director of the Pharmaceutical Institute of the University of Berne, and is one result of the author's journey in India and Java in 1888-89. Cultivation in general is divided according as it takes place in fields, gardens, avenues (*allies*), and mixed culture where two or more plants are grown together. The plants mentioned are Cinchona, Tea, Coffee, Cocoa, Guarana, Gutta Percha, Tamarinds, Pepper, Vanilla, and various other economic plants. No fewer than 128 photographic illustrations show the plants, their mode of culture, and preparation for export.

HERTFORD HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—This Society was inaugurated on January 7 last. It has for some time past been felt in the neighbourhood that something of the kind was needed to bring together those of all classes who are interested in gardening, and the venture promises to be a success, as already there are about fifty members. The first general meeting of members was held on Wednesday last, when Mr. J. FITT, gardener to Lord COWPER, read a paper on "Apple Culture," which was rendered interesting by a number of Apples exhibited by him. The reading of the paper was followed by a discussion on modes of culture, varieties, storing, &c. The next meeting will be on February 10, when Mr. C. COX, gardener to J. TROTTER, Esq., of Brickenden Grange, will contribute a paper on "Chrysanthemums;" Mr. COX is thoroughly master of the art of growing these plants, and he is also a successful exhibitor.

TECHNICAL EDUCATION IN THE VILLAGES.—It would be a grievous misfortune, says the *Sunday Magazine* for January, if through any mischance the efforts now being made to extend a system of technical education to the country districts should be lightly or impatiently abandoned. We have to feel our way, to make our own paths. We do not find everything already prepared for our coming; and, of course, mistakes are inevitable. But then, as a philosopher has reminded us, the man who never makes a mistake, never makes anything; and this is as true in education as it is in other matters. We cannot expect to hit on the best methods without experience, and to ensure success at the first attempt. Still, in many parts of the country, where the scheme has been taken up with hopefulness and energy, it is already possible to point to a large amount of excellent work. The teaching that has been given may not have done much for agriculture, but it has done a great deal for the agricultural labourer. And it is on men, not on machines, that the success of agriculture, like success in every other calling, mainly depends. The great end at which we have to aim is to reach the men and the women who work on the land, to fill them with new intelligence and interest, to lift them to a higher level of being. When they have learned how their food may be made more attractive and wholesome, when their eyes have been opened to some of Nature's simple wonders that surround them at every step, they will have gained a new inspiration and a new power, that will make its influence felt through the dull round of their daily life. To raise the quality of the work, we must first raise the character of the workers.

ILLUSTRATIONS OF THE FLORA OF JAPAN.—Mr. TOMIARO MARINO is publishing a series of lithographic plates for the use of botanists of the native plants of Japan. The quarto plates are very well executed, and the details carefully and accurately drawn. As so many of the plants are of horticultural importance, this is a publication which the libraries of our botanic gardens should not be without. It is published in monthly parts at Tokio by KINOYOSHA. The text is in Japanese.

A DEVON FRUIT FARM.—A Company has been formed at Torquay, to be known as the South Devon Fruit Farm Company, who have, says the *Western Mercury*, taken 16 acres of ground at Cockington,

where about 9000 fruit trees and bushes are being planted for supplying the town with fruit. In addition to this, about 30,000 feet of glass are to be erected for the production of delicate fruits, Tomatoes, Cucumbers, Mushrooms, &c.

HOOKE'S "ICONES PLANTARUM."—The fourth part of the first volume (xxi. of the whole work) of the fourth series has appeared, completing this volume, which is devoted to the illustration by Sir JOSEPH HOOKE of Indian Orchids of a less conspicuous character than those commonly cultivated. The work is now published for the Bentham Trustees, and sold at 4s. per part, by DELAY & Co., of London. The third series, consisting of ten volumes, containing 1000 figures of interesting plants, is on sale by the same firm at £5 the set. Only a limited issue is printed, and when exhausted, it will not be reproduced.

POTATO DISEASE AND THE COPPER TREATMENT.—With the object of testing the merits of *bouillie bordelaise* as a remedy for Potato disease, says our contemporary the *Morning Post*, the Highland and Agricultural Society instituted experiments last season upon farms situated respectively in Haddingtonshire, Forfarshire, and Renfrewshire. Two mixtures were tested: the one consisting of 20 lb. of sulphate of copper, 10 lb. of burnt lime, and 80 gallons of water; and the other of 15 lb. of sulphate of copper, 5 lb. of burnt lime, and again 80 gallons of water. These quantities were applied per acre, and also in half doses per acre. Repeated observations were made during the growing season, but in no case was any distinction visible among the plots. The drills that were sprayed, as well as the unsprayed drills between them, grew quite uniformly; and when disease appeared on the leaves it seemed to be fairly distributed over the whole area. The report states that the general and quite evident conclusion to be drawn from these experiments is that the Bordeaux spray has entirely failed to have any restraining effect whatever on the progress of the Potato disease. The opinion is further expressed that, if the spray is a protective against the Potato disease, it can only be so when the disease attacks the plants while they are still young, and their entire surface is capable of being reached by successive sprayings. At the same time, it is considered possible that such complete drenching of the young plant with the *bouillie bordelaise* might seriously impair its vitality, and thus prove worse even than the disease itself. The general result of these experiments is such as to afford growers little, if any, confidence in the efficacy of this mode of treatment. On the whole, it may be said that the results of the Scottish trials are decidedly confirmatory of the negative issue of the extensive series of field experiments upon Potatoes conducted by Messrs. SUTTON & SONS at their trial grounds near Reading.

HORTICULTURAL CLUB.—The Annual Dinner will take place at the Hotel Windsor, Victoria Street, on February 9, at 6 P.M., HARRY J. VEITCH, Esq., in the Chair.

PUBLICATION RECEIVED.—*Index Seminum in hortis Musaei Parisiensis, anno 1891 collectorum.* (Paris, Rue Cuvier, 27.)

HEDYCHIMUM GARDNERIANUM.

[SUPPLEMENTARY SHEET.]

OUR Supplementary illustration this week shows a part of the Winter Garden at the Glasgow Botanic Garden, in which a mass of *Hedychium Gardnerianum* in bloom forms at this time one of the most conspicuous features. *Hedychiums*, as most of our readers know, are imposing-looking herbaceous plants, belonging to the Gingerworts, and flowering during the autumn months. They are plants of

easy growth, requiring a good rich loamy soil, large pots if grown in that manner, and plenty of water during the season of growth and flowering. After the bloom is past they require less and less water, and cool treatment, till the stems decay, when they should have the latter cleared off, and be stored away in the greenhouse; or in the case of a plant in a border, the soil around the roots should be allowed to remain dry during the winter.

In warm seasons, *Hedychiums* flower well out-of-doors if grown in pots, and it is then that their powerful aroma is most appreciated; indoors it is apt to be overpowering, and to cause headache. We are indebted to Mr. Bullen, the Curator of the Glasgow Botanic Gardens for the photograph from which the photogravure was taken.

NOTES OF THE DAY.

(From a Correspondent.)

WHAT interests and concerns us most is, On what lines do the Worshipful Company of Gardeners intend working, in order to acquire what I may well call the backbone of their prospectus—the "smaller agricultural holdings?" Granting, for the moment, the proposed scheme to have been started, and carried out as detailed in the prospectus, the effects of which on the gardening community of this country in, say, another two years time, had better be imagined than described.

Let the company first promote a scheme whereby small holdings can be, with the least inconvenience and expense, easily secured at fair rentals—no tithes, rates and taxes paid by the landlord, and above all, fixity of tenure assured. They will then have taken the "bull by the horns," and be on the high road to a correct solution of the present land problem.

This once accomplished, the proper husbandmen would speedily follow. Whether the Company of Gardeners or some other public body take the initiative on similar lines as above, matters little; but until this is done, all such petty makeshifts on a matter of so much importance to the country at large are a mere delusion.

For the guidance of the company, I specially recommend to their notice a paper by the Rev. W. Tuckwell in this month's *Contemporary Review*.

The solution of the land problem will most certainly be a knotty point to deal with, but nevertheless it is one which awaits our legislators of the near future—nearer perhaps than many of them imagine. Until this is satisfactorily settled, and as one means whereby its consummation may be hastened, let every railway company in the country turn to account their immense landed property in the shape of innumerable slopes and embankments, hundreds of acres of which are admirably adapted to the growth and culture of early small fruits and vegetables. It is really pitiable in the eyes of practical people to see so much good land laying in a state which is worse than useless—waste. Were this at once taken in hand by the railway companies in a thoroughly earnest manner, if only in the spirit and hope of swelling their annual incomes, it would ultimately, I am convinced, lead our large landed proprietors to encourage and grant such facilities and terms to small holders as to very materially lessen and even smooth the rough edge of whatever legislation may be required for what we feel is so generally desired—a permanent re-adjustment of our present land laws.

Your monthly stock-taking account is worthy of the most careful study by economists, and all those concerned in the cultivation of the soil in this country. Those items relating to raw fruits and vegetables are very interesting, and should set even the varietal tyro in agri-horticulture reflecting on why such tremendous sums should annually be handed over to foreigners; and more especially so, when he is told that under other conditions—or such similar conditions as those the foreigner enjoys—this country

could produce treble the quantity of the products in question, and those, too, of first quality.

It is simply crying over spilt milk, and too stereotyped to listen to, to bewail, as so many do, our climate. The climate is a fairly good one, and well suited, in a very large majority of our seasons, when combined with intelligent management, and attention to details, to the production of the very best Apples, small fruits, and vegetables. *Pomum*.

THE AUSTRALIAN SPECIES OF LIVISTONA.

THERE has been some confusion in gardens with regard to the proper application of the names *Livistona australis* and *L. inermis*, and perhaps also *L. humilis*, three species described by R. Brown in *Prodromus Florae Novae Hollandiae*, p. 267, the first under *Corypha*. Allan Cunningham is credited with having introduced all three of these Palms into English gardens as early as 1824, but it is exceedingly doubtful whether there are, or ever were, more than two Australian species of *Livistona* in cultivation. It is also probable that his *L. inermis* and *L. humilis* are states of the same species, the latter differing only in having more or less prickly petioles. *L. Leichardtii* of Mueller is also, as Sir F. Mueller himself suggests, the same species, but these questions can only be decided upon more complete material than is to be found in the herbaria at the British Museum and Kew. From an examination of Brown's specimens and comparisons with his descriptions, however, it is quite clear what Palm he intended by *Corypha australis*, and it may be added that he himself suggested that it might, perhaps, be better placed in the genus *Livistona*, to which Martius subsequently referred it.

Brown described *L. australis* as having flabellate-palmate—that is, fan-shaped—leaves, and a globose fruit; and *L. inermis* and *L. humilis* as having pinnately-palmate leaves. These distinctions are so evident in the cultivated specimens, it is somewhat surprising that confusion should have arisen. The leaves of the latter are remarkable, in being intermediate between the fan and feather forms of structure; and the fruit associated with this type of leaf is oblong or ovoid.

Livistona australis appears to have been the only one of the three that long survived their introduction by Cunningham—or, at least, the only one that grew to a large size at Kew. It is one of the few of the large Palms enumerated in the *Guide to Kew Gardens* as long ago as 1851. In 1877, it was figured in the *Botanical Magazine*, plate 6274, where we are informed that it flowered annually at Kew in the spring months for many years. At that date it had outgrown the limits of the Palm-house, and was felled.

This was, undoubtedly, the *Corypha australis* of Brown, the common Palm of subtropical and temperate regions of eastern Australia, found as far south as the Snowy Range in Victoria. Nevertheless, some botanists had conceived that it was the true *Livistona inermis*, and this alteration found its way into gardens, but the late Mr. Denthon rectified the error in his *Flora Australiensis*. Yet even he did not seize upon the distinctive characters of the foliage. Both *L. inermis* and *L. humilis*, with pinnately-palmate leaves, were collected by Brown in the islands of the Gulf of Carpentaria. But the most curious fact is to come: About three years ago an exploring party, including Professor Baldwin Spencer and Mr. C. French, F.L.S., visited Croajonglong, in the extreme east of Victoria, and at about 37° S. latitude, where they discovered a Palm in some plenty, growing to a height of more than 100 feet. This Palm was taken by them to be *Livistona australis*; but from the photographs reproduced in the *Victorian Naturalist*, vi., p. 8, the leaves are pinnate rather than palmate, and have even more of the pinnate character than *L. inermis*. This is shown both in young and adult trees, therefore it seems uncertain what this Palm is that attains such a stature in so rude a climate. It is stated, how-

ever, that directly the heads of the Palms grow out into the open above the general vegetation of the valley, the sun's heat seems to scorch the leaves up, and they have a brown withered appearance. *W. Botting Hemslay*.

HOME CORRESPONDENCE.

TECHNICAL EDUCATION OF GARDENERS.—I have followed with much interest the discussion of the question of technical education for horticulturists which has appeared in your columns during the past few weeks. There is an aspect not yet touched upon by your correspondents, which has much weight in guiding my own feeling, and which ought logically to be considered by all who have to form an opinion on the subject. I allude to the analogy with other arts and industrial occupations. As one of the founders of the Yorkshire College at Leeds, established nearly twenty years since, upon the original basis of giving instruction in such sciences as may be applicable to the manufactures, mining, or agriculture of the district, I have seen the experiment attended with brilliant success in systematic teaching applied to textile manufactures, dyeing, mechanical engineering, coal mining, &c. But our fundamental principle has been to supplement practice, not to substitute it by theory. Our students pass through ordinary workshops as formerly, but they are taught at the college the *rationale* of operations that come within their daily duties. Of course, those who are training for masters and foremen take long courses of daily instruction, but even the younger workmen fill evening classes in each subject. I am happy to know that Dr. Threlton Dyer is intimately acquainted with this work of the Yorkshire College, in relation especially to dyeing and the investigation of new dyeing materials. But the analogy which I wish to press home is based on the more recent inclusion of agriculture as a subject of instruction. An admirable historical article on agricultural education appears in *Whitaker's Almanack* for the present year, and its perusal will repay any reader. The establishment of purely agricultural colleges at Cirencester, Downton, Aspatria, and Edinburgh indicates the sense of need for such instruction in its higher aspects, and its provision for secondary and elementary classes is developing rapidly under the stimulus of liberal grants from various county councils. Supported by subsidies from the three county councils of Yorkshire, the Yorkshire College sends out three travelling lecturers, whose whole time is devoted to teaching agricultural classes in various districts. Professor Muir reports that nearly 300 elementary schoolmasters are attending at five different centres in the county, and he urges that if the education of scholars in country districts better fitted them for rural life, the present flow of the population to the towns would receive a check. Now, the step from agriculture to horticulture is a very short one, and it is absolutely impossible that the combination of "practice with science" demanded by the first of these sister arts should be indifferent to the second. Of the two, horticulture seems to have many facilities denied to its bigger sister. It is attracted by, and serves the great centres of population with their quick-acting brain. It represents the *petite culture*, which other countries have developed earlier than we have done. It is one of the most laudable recreations for our town population. The amateur gardener, of either sex, alike with the intelligent youth adapting this as his daily calling, will gladly welcome sound instruction in the principles of the art. The wants of particular districts would, doubtless, give the bias to the teaching, whether fruit, vegetables, or flowers claimed the first attention locally. I can believe that at first there will be difficulties in finding teachers equipped equally with science and practice, but a few are to be found. That the system will come into operation is as certain as "the flowers in May," and those who help it forward may well recollect Bacon's aphorism, "God first planted a garden." *Richard Reynolds, Cliff Lodge, Leeds*.

—I cannot agree as to "Shopman's" views, that a gardener in a good situation is worse paid than a mechanic, when we come to total house-rent, fuel, vegetables, and perhaps a few other additions to the gardener's advantage; and besides the above things, to a mechanic's disadvantage, he in many cases lives from three to ten miles from his work. Let "Shopman" note this—2s. to 4s. a week taken out

of the mechanic's earnings merely for transit to and fro; moreover, he is constrained to take his mid-day meal away from home, which also entails some extra outlay. Now, "Shopman" must know, as he is in the trade, that all foremen, managers, travellers in trade nurseries, market growers' establishments, &c., are well paid; and does not their usual long service with the firm answer this question, for in nearly all the best establishments there are many under-men who are merely waiting for a rise or something advantageous occurring, at a much less wage than "Shopman" quotes, this being considered by them better than idleness; besides, there is usually much to be picked up of a useful practical nature. The merely book-learned man will never, in a gardening point of view, win the race with the man who alone has done hard work in either first-class private gardens or our go-ahead great fruit and plant-producing establishments. *W. R.*

—There are two rather dogmatically expressed dictums in "W.E.G.'s" letter on p. 147, that many will be disposed to cavil at. The first is, that "the best men are not in the best places." The answer to this, that employers are not as a rule fools or too indulgent masters. If their gardeners fall short of the standard they require, they generally receive peremptory notice to quit. And this is also the case with men who are good horticulturists, but bad managers of men. It is not always the case that the men who are most before the public as writers to gardening papers, or as exhibitors and judges at flower-shows, are the best gardeners and best managers. The contrary is very often the case; of this, I can speak from experience. The second expression of opinion that many will demur at, is the advice that gentlemen requiring head gardeners, should leave the choice to nurserymen. This is surely an impracticable wish; for everybody, who has the dignity of the craft at heart, would like to see gardeners as independent of nurserymen as possible. The morality of business is very much the same in every branch of trade, and nurserymen would very likely recommend good customers of their own. Again, what do nurserymen know of the foremen in large and well-ordered gardens who are the men most likely to make good and efficient head gardeners, or of the promising young men in botanic gardens? *Vagabond*.

—Your correspondent, "W.", p. 116, may well ask the question, "Where are we now?" for a more sensible and crushing reply to those theoretical educated "prophets" I have never read. No sensible man would say a single word against the advantages of education; but if the best situations could only be obtained by examinations in botany, &c., the first-rate places would be available only to the few. Is it not a fact that some of our best and most successful gardeners, now holding leading situations, have justly and deservedly gained those positions by being thoroughly practical in the various branches of horticulture, and yet some of them cannot properly write out the character of a young man? Gentlemen and nurserymen want practical men; gardening is not good enough for parents to educate their sons in Greek and Latin for it. I have yet to learn that gardeners, as a class, are less educated than men of other trades. *Thomas Oldham, Stoughton Grange, Leicester*.

MISTLETO.—If it is as stated by M. Gaston Bonnier that the Mistletoe instead of doing harm to trees on which it grows is beneficial to them, the Mistletoe will be much more grown than it is, as up to the present there has been little or no effort made to cultivate or have it in gardens or orchards, for the reason that it, like all parasites, has been regarded as inimical to the health of the plant it grows on. I am strongly of opinion myself that this is so, and until further experiments are made, and fresh proofs given, I do not think the statement will be accepted, as no one, I think, has ever seen healthy vigorous Apple or other trees that have Mistletoe attached to their branches. If they have, such experience has been different to mine, and it will be interesting and profitable to hear what others have to say on the matter. It seems to me that an evergreen on a deciduous tree must, in a great measure, alter its nature and draw on it for support, independent of what the leaves of the Mistletoe take in from the air, and if so it must be like burning the candle at both ends to keep a deciduous tree at work during the winter. For all this, the Mistletoe is coveted by many, and regarded as a great curiosity by all except those who happen to reside in districts where it is plentiful. Anyone who may desire to have it, may easily get it established by simply rubbing or placing

the seed on the bark of a branch of an Apple, Thorn, Lime, or Poplar, as owing to the viscous matter with which the seed is enveloped it adheres and germinates, although the process is slow and little progress is made in growth the first season. I have been watching some trees that had bruised berries placed on them three years ago, and most of the seeds grew, and the trees now have several bunches of Mistletoe. *J. Sheppard, Woolverstone Park.*

CRACKS AND SPOTS ON PEARS.—The old saying of the blight that comes on the east wind, should not be ridiculed. It is one of those observations of our forefathers connecting certain effects and causes without explaining the process step by step by which they were brought about. And there are many such, which have been handed down to us by those who did not live in times of mutual improvement, as ours. Who shall say how frequently the men of science of to-day have been put on the right track by popular folk-lore? When a long spell of east wind sets in, vegetation is checked in its growth, insects seize the opportunity, and the energies of the tree are still further reduced. There is no more powerful cause of blight than an east wind. The assertion that spots on Pears are caused by fungus, is about as unsatisfactory an explanation of the trouble, and as unworthy of the learning of to-day, as if your correspondent had told us that blight was caused by insects. Plant a Pear tree where there is a gravelly or unsuitable subsoil, and it will, perhaps, bear good fruit for several years. [The Pear suffers much from a dry soil, and soon gets unfruitful. *En.*] Gradually, however, fungus spots and cracks appear and increase. Remove the tree to a fresh site; or if to occupy the same position, cut off all tap-roots, and afford something to tempt the roots near to the surface. As soon as the tree has become established in the fresh soil, its fruit is clear and free from spots, and only after several years, when the roots have again descended into the subsoil, do the cracks and fungus spots re-appear. This would appear to tell us that such a soil is unsuitable to that variety of Pear, and that the strongest predisposing cause to the attacks of fungus is the crude infertile subsoil. Will any other readers of the *Gardeners' Chronicle* state their experiences in this matter, and what it is that induces spots to appear on the rind of Pears? Are these blemishes caused by fungus? *Will Taylor.* [The circular corky spots of a brownish colour, which at first are surrounded by a black ring, which is bordered by a white fine line, are, caused by a fungus, *Fusicladium pirinum*. Reddish-yellow or red patches, on which columnar warts several millimeters long develop, whose cell-walls at last open in a meshed or sieve-like manner, and allow the escape of a yellow dust, are caused by another fungus—*Gymnosporangium Sabinae*. The Pear tree in all its parts is liable to the attacks of many foes, and it is not always possible, from a cursory examination, to say with certainty what has caused a certain injury. *En.*]

DWARF v. TALL CELERY.—The great advantage dwarf Celery has over the tall kinds is shown in an unmistakable way during the winter, when one has to protect the plants. The dwarf varieties may easily have what few leaves there are projecting above the ridge covered, but the tall kinds cannot be well protected from the frost. Not only is tall Celery objectionable on this account, but it involves more labour in earthing up, and after all, there is not more useable material in it than in a good dwarf variety, such as the Sandringham or Locomotive kinds. There are now some excellent intermediate kinds, such as Veitch's White and Veitch's Early Rose; but the long-staked sorts I do not consider are now worth growing. For late work, I think the Rose or Red sorts keep best, and I used to cultivate Major Clarke's, which stands well in the spring, but when the weather sets in warm, most of it will bolt. *J. S.*

WATERING COKE BEFORE USE.—The notes by Mr. E. Jenkins (p. 117) open a very interesting subject, and having had much practical experience in the use of both coke and anthracite coal as fuel, a few remarks from me may be of interest to your readers. Dealing with the real question of watering coke, or even using coke from the open, it will take no very wise head or scientific mind to know, that before any particular unit of heat is obtained, all damp or moisture must of necessity be removed. Mr. E. Jenkins very graphically describes the why and wherefore of this. As an old practical stoker, I can honestly affirm that using 1 ton of coke is far

more laborious than for the same quantity of anthracite. Besides, while using coke, there is always a doubt lest the fire should be below. With anthracite, after twelve hours' burning, days and days go by when but little stoking is required. There are various degrees of quality in coals, but good coke at 15s. per ton will be dearer than anthracite at 20s. Generally, coke will require clinking at least twice a day, and more in sharp weather. Then there is the drawback of loss in heat at banking up time with coke; besides we have to reduce the draught, to keep the fire in, say for eight hours, 10 P.M. to 6 A.M., while anthracite virtually abolishes night stoking. I guarantee a temperature of 5° higher in the latter case, compared with the eight hours of coke burning. Coke, to get its full heating value, should by all means be used dry. How to use anthracite coal is now my purpose to explain. I will be particular, because many fail in the management of this. First of all, the stoker must forget his experience in the use of coke, the anthracite requiring less attention. Once a day is all that is wanted to remove the clinkers. Ashes will be less. After the fire is well alight, put on coal until the desired heat is obtained, then reduce the draught. To get a fire quickly, all that is wanted is to gently put the poker between the bars to remove the dust. In banking-up, push a good portion of the fire to the back, making up the front with coal. By so doing, the present heat is well maintained, and if low at the front in the morning, there will be a good fire in the back to work at. For saddle boilers, I consider there is not the least doubt of economy in the use of anthracite. In boilers up to 4 feet long, nuts or cobbles are preferable, while those 5 feet in length, will take the larger ordinary coal. To give some idea of the intense heat of anthracite, I may say that I have to use leather gloves in stoking. More than once I have been asked if the intense heat in using anthracite will burn out the boiler bars more than with coke, but so far I am not able to say. Bars apparently stand well. While anthracite is well suited for all practical purposes for garden use, I particularly impress on young beginners to give a good eye to the damper. Conserve the heat; it will be there when it is wanted. For cleanliness—as compared with coke—I am certain no one would wish to go back to coke after using anthracite. The only fear, to my mind, is the question of price. Gas coke, I fully expect, will get to a low figure, very much less being used for garden purposes. Anthracite coal, on the other hand, is rising in price, and I cannot see any immediate prospect of improvement. To economise the consumption of anthracite, more particularly if good coke can be laid down at a lower figure than I have quoted, can be used thus: after heat is got up, more particularly in bright weather, the fire can be made up with coke. The only objection to this is that clinkers will have to be again drawn out before tea, to keep up the desired heat. Then we must not forget that, while using coke it is absolutely necessary to clean the flues and boiler at least once a week. They can work three weeks with the entire use of anthracite coal, and even then there will not be so much dust, soot, &c. *Stephen Castle, F.R.H.S., Ashford Vineyard, Fording-bridge, Salisbury.*

FUELS AND STOKING.—I read with considerable interest the remarks of your correspondent on "Fuels and Stoking," in answer to "A Stoker," on p. 89 of the *Gardeners' Chronicle*, and I should like to make a few remarks in reply, more particularly to question No. 2:—"What fuel suitable for hothouse furnaces is best, say, for a saddle-boiler, weight for weight, which gives out the most heat?" My experience convinces me that anthracite coal is the most suitable of all fuels, and taken weight for weight, is much the cheapest. I have used anthracite coal for something over two years, and have found a wonderful saving of labour in using it—certainly not more than half the labour required to drive the same fires with coals. Then there is the fact that it is smokeless, and almost entirely free from sulphur, and it is very durable and uniform in its work, and can be left to burn with perfect safety in the sharpest weather, from ten to thirty hours, according to the size of the boiler, and will maintain an even temperature throughout. My boilers are situate close to the East India Orchid-house, inside the potting-shed, so that the absence of smoke and sulphur fumes is with me a very important matter. When I started to use anthracite, I had to take the stoking in my own hands, as my man said it would not burn, and be wanted some house-coal to light it with, and to renew it with two or three times a day; so I tried it for a few days. At first, I must say, I did

not make it go any better than my man had done, but on the second day I found out the grand secret, viz., that it did not require stoking—that is, poking about at all, but simply to keep the furnace clean, pull out the damper, fill up the furnace, and leave it to do its work, and it did it. I must say, however, that the furnace-bars and flues must be thoroughly cleaned at least three times a week, by pulling out the fire, and cleaning the fire-bars from front to back, and then starting the fire anew. I have inquired of a brother gardener in this town the results of his experiments with this kind of coal, which he has used for twelve months, and he says that it is clean in use, durable, trustworthy, and cheaper than coke. *H. J. Southgate, Morpeth House Gardens, Ipswich.*

WARWICK CASTLE.—In the *Gardeners' Chronicle* of January 16, I was surprised in reading an article on the above to find various mis-statements. It is not my object to point them out, further than to correct the one regarding the tree planted by H.R.H. Princess Mary of Teck. That interesting ceremony took place on January 14, 1888, when the Princess, in presence of her own family, and several members of the Warwick family, planted a Cedar of Lebanon (not atlantica); the tree at that time was 3½ feet high, with a spread of 3 feet of bottom branches. It is most important to all lovers of trees that correct date and name should be given of trees planted as commemorative, memorial, or otherwise, that may be referred to in the future. *C. D. A.*

EUCALYPTUS GLOBULUS FLOWERING.—A plant of this is now flowering in Messrs. Thomson's Nursery, Sparkhill, Birmingham, which was raised from seed three years ago, and is still growing in a 5½-inch pot, and the plant is 7 feet high. There are sixteen flowers and buds, which were formed last June, and remained in the same state with but slight alteration in size until just before bursting. A few days since, when the calyx divides in the centre in a horizontal position, the upper part, resembling a cap, is thrown off; the centre of the flower forming a cup of bright green and yellow, surrounded with hundreds of anthers of a pale lemon colour, the flowers measuring 2 inches across, and emits a peculiar odour. The buds are produced in pairs at the axis of the leaves. I enclose a spray, and should like to know if the flowering of the Eucalyptus is of a frequent occurrence. *C. H. H.*

CEDARS OF GOA.—In a recent issue there was a notice by Mr. Burbridge of this Cedar, the most graceful, perhaps, of them all. The country to see them in their full perfection is Portugal. The Portuguese were the first Europeans to make a permanent settlement in India, and consequently this Cedar was very early introduced into their country from Goa [?]. Many fine specimens are to be seen in the gardens of villas; and at Montserrat, near Cintra, there is a flourishing avenue of them. At Colares also, near Cintra, the high road is lined with towering Eucalyptus trees. During the present dearth of the oil, the inhabitants of the district would do well to try and extract this valuable essence. The vineyards at this place have never been devastated by the Phylloxera. The reason is that the Vines are growing in an alluvial soil, below 3 or 4 feet of sand. The young Vines are planted in pits, and after they have reached the level of the sand, the sand is allowed to fill up the pits. The larvae of the Phylloxera are thus unable to reach the roots. *Vagabond.*

CALOCHORTI IN THE OPEN AIR.—My experience of Calochorti in the open air has been much the same as that of Mr. Gumbleton, as given by him on p. 138. The principal variance that I can think of is with regard to C. Howellii, that blossomed freely here, and certainly has a place in my affections. Its flowers are white. *H. Ewbank, Ryde.*

CATTLEYA PERCIVALIANA, SOUTHGATE VAR.—I am not a little amused to read the remarks of your correspondent, "P. W." in your issue of the 23rd inst., to the effect that Mr. Measures says that his variety is only equalled by one other in Captain Vipan's collection. It reminds me of the old saying, that "It is never safe to prophecy unless you know." How can Mr. Measures have even an idea as to the quality of the many varieties of this Orchid grown in the North of England, which, I submit, might more accurately be described as the home of C. Percivaliana, as immense quantities of were purchased

by the late Mr. Percival and his many friends in the North, and have been more or less successfully grown and flowered by them. I have only to-day seen several plants which, I venture to say, will compare favourably both in size, form, and colour, with either the Woodlands or Captain Vipan's plants, and have suggested to the owner, Mr. George Hardy, that he

assured. Much has been done during the past half century in acclimatising, and it may be that the Calochorti will accommodate themselves to our climate. However that may be, my object in writing this is to give my own experience in their culture. In the autumn of 1879 when I had charge at Gunnersbury Park, I secured a collection of

department of the garden suffered most. I know we lost many choice herbaceous plants that winter, and among them the whole of the Calochorti. A few of the clumps made a futile effort to survive, but their vitality was so seriously impaired that they soon faded away. A portion of the stock was potted, and protected in frames, but these were not so satis-

FIG. 29.—JASMINUM NUDIFLORUM: WINTER-FLOWERING HARDY SHRUB; FLOWERS YELLOW. (SEE P. 182.)

should send you a bloom in support of my contention, that "*Palmarum qui meruit ferat*," F. H. A. [We have a splendid bloom before us. Ed.]

HARDINESS OF CALOCHORTI.—The tribute paid to the beauty of this genus by Mr. Gumbleton on p. 138 is well deserved, and his success in growing and flowering them most encouraging. If we could feel certain of their hardiness, their popularity would be

Calochorti, and planted them on a well-drained sunny border facing west. The soil was a light loam, and had been thoroughly trenched and enriched with well-decayed manure. They were planted in clumps, and the following season I was rewarded with a nice display of bloom, and felt satisfied with my experience for that season. The following winter, 1880-81, proved a most trying one for all kinds of hardy plants, and I think the herbaceous

factory as the plants grown in the open border. They certainly merit extended trials, in various soils and positions, as their beauty is quite uncommon. I hope Mr. Gumbleton's second season's experience with them will prove more successful than mine. J. Roberts, Shepperton.

A TRIO OF PEAS.—An amateur who had a weakness for novelties, and has been a loser in con-

sequence, lately asked me to recommend Peas in a few varieties to give a supply through the season. He annually, he said, perused several seed catalogues, and ordered Peas of new highly recommended varieties, sufficient, as he thought, to supply his wants; but which, after costing a high price, and having been carefully cultivated, proved, in many instances, more or less disappointing. This gentleman is not alone in being unfortunate in relying upon novelties, and will probably not be the last to make a mistake of this kind, notwithstanding cautions upon this point being frequently given by experienced cultivators. But returning to my subject, I gave three as the least number of Peas that we have found will yield a continual supply through the season of Peas, of first-rate quality. Some growers may think this number too few, and possibly, under some circumstances, it may be so, yet here we find it enough, although we yearly test, in a limited way, some of the newer kinds. The varieties I recommend are William I., Criterion, and Ne Plus Ultra and this trio, taking all their qualities into consideration, is difficult to beat. The first-named well-known variety is a few days later than some others, but its general excellent properties amply make up for this drawback. Criterion is unsurpassed as a main-crop kind, and its free-bearing propensity, combined with good flavour, will keep it from being easily beaten; while Ne Plus Ultra for late use is all that can be desired, and although old, is still, in my opinion, unequalled for late crops. *Thomas Coomber.*

STANDS FOR JAPANESE CHRYSANTHEMUMS—If Mr. Divers were an exhibitor of cut blooms, and had to travel, perhaps, 12 miles by road, and 200 miles by railway, to visit one show, I do not suppose that he would advise that a stand for twelve blooms should be of the size he named; and, again, if he were the secretary of a flourishing Chrysanthemum society, which has difficulty enough now to find space to accommodate all exhibitors, I think he would hesitate before advising such an increase in the size of the stands. Fancy eighteen entries in a class for forty-eight blooms, the Japanese in that class alone occupying no less than 96 feet of tabling run! And most likely the present size would be found to be quite large enough for half of the exhibits. I think Mr. Divers does not quite realise what the size of a travelling box would have to be to contain forty-eight Japanese blooms, if the size he recommends were to be made compulsory on exhibitors. By all means, let the present size be increased, but consider that there is a limit even to the space needed for the giants of to-day. Blooms with too much space suffer in consequence—they appear dwarf, and apparently lose in effect; it is not the green boards that we wish to see—there is too much already of that for some persons. I would suggest to those who may be responsible for any alteration, to think the matter well over before deciding, and then not to make any size compulsory—for some time, at least. If any exhibitors are slow to adopt the proper suggestions as to size, let them obtain a lesson or two on the exhibition table by taking a back place, in consequence of having to retire before better taste in arranging the blooms by exhibitors who have advanced with the times. There is nothing like a practical lesson to open the eyes of the dullards, who must be dull if they do not copy what is manifestly superior to their own. A little coaching, as it were, will soon lead those who are prejudiced in any desired direction, as it will in regard to increasing the size of the stands for Japanese. *E. M.*

BRITTLE TIMBER.—Replying to "R. S." on this subject, neither of the statements, in my opinion, can be taken as the rule, although in some cases it may appear so. The variation of soils governs the durability of timber rather than anything else; for instance, take an Oak tree on clayey soil, which grows very fast, the tree itself will be very vigorous, but will, when having attained a good size, have a greater percentage of sap in it than a tree planted on sharp, gravelly soil; the latter tree would be somewhat brittle. Now, with the Beech, the rule is different, this wood is used for handles of tools, mallets, and various articles which sometimes are used violently, and the timber is preferred for their manufacture, which has been grown on a stony or gravelly soil, and has matured slowly. Beech that grows on clay and stiff soils thrives freely, but when it comes to be used generally splinters and breaks. The Ash, which is our toughest timber, varies on different soils as to its rate of growth. In some cases this tree will grow very fast, and make to all

appearances a deal of timber in a very few years, but it will not bear comparison as regards toughness and durability with a tree that has grown half as fast. *J. Garbett, Hale Park, Hants.*

JASMINUM NUDIFLORUM.

THERE are very few plants which have the commendable quality of flowering at the close of the month of December, and even if there were, it is possible that the sharp frosts and dense fogs of that season would soon mar the beauty of their blossom; but a better plant than the above could scarcely be found. *Jasminum nudiflorum* (see fig. 29) is one species out of some ninety others belonging to the genus, which will stand the rigours of our severest winters, and, like a horticultural Mark Tapley, "come out strong," under great difficulties, just at the dull season of the year. This *Jasmin* may be seen in many gardens, either trained on a wall, or up a trellis round cottagers' doors, and nearly always flowering profusely.

Although so hardy, *J. nudiflorum*, or the "Naked-flowered *Jasmin*," as it is called, is not indigenous to our islands, but is a native of Northern China, and is a great favourite with the natives of Nankin, Shanghai, and other towns. Among the numerous useful and ornamental plants introduced from various parts of the world some years ago by the collectors of the Royal Horticultural Society, this one found its way into cultivation through the means of Robert Fortune, who was sent out by the Society to collect plants in the Celestial Empire, and with what beneficial results to our gardens may almost everywhere be seen at the present day. The plant made its appearance in the Royal Horticultural Society's gardens at Chiswick in 1844, and it was first described in the Society's *Journal* (vol. i., 1846, p. 153), by Dr. Lindley, at that time Assistant Secretary. From Chiswick it has been widely distributed, and may be looked upon—after less than fifty years—as one of our most useful and hardy decorative winter shrubs. At first it was thought safer to treat it as a greenhouse plant, but in a few years' time it was found to be quite hardy in England, and in 1852, a plate appeared in the *Botanical Magazine*, t. 4649, from a plant which had survived the preceding winter. Since that time it has been grown as a hardy plant. Although the leaves and flowers do not appear at the same time, the former dropping off in the autumn as a rule, and the flowers appearing in December, I know one plant which bears leaves during the winter months; it is on a sheltered wall, and has flowered about January or February for the past two years, the sheltered situation having probably something to do with this. *J. W.*

It delights in a rich deep loam and good drainage, and in a position fully exposed to the sun, where it will be able to ripen its wood thoroughly. Whilst growing, it should be watered occasionally, and it will greatly benefit by a syringing now and again, as it will help to clear away the dirt that settles on its leaves and shoots. It is principally propagated by cuttings taken off in August, when the wood is about half-ripened, and dibbled round the sides of 5-inch pots in light soil, and afterwards plunged in a close case. In a few weeks they will emit roots, and can be placed in cold frames for the winter, and in spring will be nice little stuff for planting out in nursery rows, which should be in a mixture of loam and leaf-mould. There is a light-yellow coloured form, *J. nudiflorum*, which, when in leaf, has a pretty effect, but it is not nearly so free-flowering as the species. *T. H.*

CITRON CULTURE IN CORSICA.

(Continued from p. 150.)

FUMAGINE, smut, or Citron-black is almost as destructive as white-root; it is described as a black fungoid growth which attacks the bark and upper surface of the leaf. It absorbs the juices and nourishment necessary for the tree, which soon becomes feeble and ceases to bear in consequence.

Fumagine is at present destroyed by a process

efficacious and easy of application. It consists of whitewashing the tree with limewash as far as the bark extends, and in syringing the leaves with the same preparation. Syringing with tobacco-juice and soft-soap gives equally good results. As it is usually in damp and shady situations that smut shows itself, and as the trees affected are generally those which have not been allowed sufficient space, they must be first subjected to moderate syringing, and afterwards to a good pruning in order to give access to air and light.

The kermes disease does great harm to the Citron; the tree affected by this insect presents the appearance of a number of small brown excrescences on its branches, about the size of a Pea. This is the chrysalis of the female insect, which dies shortly after depositing its eggs. In the spring the eggs hatch, the larvæ spread over the young leaves consuming them, and destroying the sap of the tree. Myriads of microscopically small eggs may be destroyed which have been deposited beneath the dried and hardened husk of the dead female adhering to the tree, by rubbing the ligneous parts with a cloth dipped in a boiling decoction formed of 4 quarts of soapy-water, in which are dissolved a pound of soft-soap and sufficient lime to give consistency. An equally good remedy consists in the application, with a brush, of a decoction of tobacco-juice, Walnut husks, and chlorate of lime. In order to guard against kermes, the following treatment has been found successful: Dissolve a quarter-pound of soft soap in 2 quarts of water, add a quarter of a gill of tobacco-juice and three spoonfuls of essence of turpentine. This mixture having been prepared over night and strained, is syringed over the trees every two or three days.

The oseline, or Orange-fly, is an insect which causes white mould, and is the source of much damage to the Citron as well as to the Lemon trees. A large quantity of this fly collects on the under-surface of the leaf and absorbs the sap, the leaves rapidly lose their green tint, and become whitish; the tree sickens, and the young shoots appear feeble, and fall off. Towards the end of May, the winged insect appears. The female fly attacks the young fruit, piercing the rind by means of a borer which she carries like a sting, and deposits her eggs within the pulp of the fruit. The egg produces a caterpillar which decomposes the surrounding substance, giving exit to a gummy issue from the fruit; finally, the fruit detaches itself, and falls to the ground before arriving at maturity. This insect is easily destroyed by a decoction of lupine applied to the leaves by means of a garden syringe. The fly attacks the lower surface of the leaves, and if the plant be syringed so as to affect the fly, it will never resist this excellent insecticide. A mixture of one quart of tobacco-juice with two quarts of water may also be used. A third treatment is to dissolve 2 lb. of soft-soap in two quarts of water, adding 2 lb. nicotine of 12° strength, and spray the leaves with a fine syringe. In all these remedies, and in many others which have been employed to contend with these diseases, the ingredients have always been quicklime, cinders, sulphur, tobacco-juice, and soft-soap. If these agents do not completely cure the disease, they, at all events, prevent the propagation of the insect, and arrest its ravages.

In addition to the diseases mentioned, two other causes tend to the degeneration of the Citron trees, and render them more liable to disease; these are, firstly, the methods employed for reproduction; secondly, the want of proper and suitable manuring. The trees are nearly always reproduced from shoots or slips. This system, no doubt, allows of a quicker return, as the trees arrive sooner at maturity; but these more rapidly grown trees have not so long a life, and soon deteriorate. They are far from having the vigorous, if slower, growth and longevity of trees raised from seed. Daily experience tends to prove that trees imported from G-enoa, and obtained from seed, are in a much better condition than those obtained from cuttings

It is time that this degeneration, which is already assuming alarming proportions, was checked. If, instead of continuing the fatal system of cuttings, seedling nurseries had been established, in the course of ten years a large number of new plants would have been produced, ready to take the place of those trees which had gradually weakened, and become sterile.

The following is the method of procedure for raising seedling trees: The choicest fruit is selected and exposed to the sun in a heap, allowed to ferment from eight to ten days, then thrown into water to soak for a few hours, and then broken up by hand. After remaining a few minutes, the good seeds sink and are collected, leaving the bad ones, which float. When dry, the seeds must be either sown at once or kept dry in sand. They are sown in pots or shallow boxes filled with peat-mould, and covered with a slight layer of leaf-mould and sand, and a layer of straw above. They must be kept sufficiently watered to ensure the moisture necessary for germination. The month of April is most favourable for sowing. The first year it will be sufficient to keep the plants free from weeds, and watered. One or two years after, the young seedlings are pricked out, taking care when removing them, to retain the mould adhering to the roots. They are then planted in the nursery at about 18 inches to 2 feet apart. In the spring of the third year the lower branches are pruned in order to ensure a strong stem.

Regarding the remunerative value of the Citron culture, it is stated that last year's crop, which was a fair average one of fine quality, amounted to about 2000 tons, 300 tons of which were exported in brine to England and Germany, the rest being taken by the Dutch, American, and Italian markets. The value of Corsican Citrons in brine is stated to be about £25 per ton. On the prospects of the successful cultivation of the Citron in the colonies of East and South Africa, the following remarks are made: The question as to whether the cultivation of the Corsican Citron tree could be made equally remunerative in other countries, in some of our colonies, for instance, is one on which it is impossible to express an opinion without accurate data concerning the latitude, temperature, rainfall, condition of soil, &c., in the region proposed. As may be gathered from the opinions quoted, the principal requisites—a suitable soil having been found—are shelter, warmth, water, and manuring. These desiderata apply equally to the cultivation of all delicate trees, and the rich soils which produce the Cardamoms and Cinnamon of Ceylon and the Cloves of Zanzibar would probably be well worth experimenting upon with a view of the cultivation of the Cedrat. The high-lying valleys on the mountain slopes of our newly-acquired protectorates in Africa would probably form an excellent position for conducting a series of experiments in various cultures, of which the Cedrat and Lemon might form a portion, and no great outlay would be necessary for the establishment of an experimental plantation.

SOCIETIES.

ROYAL HORTICULTURAL.

THE new members of Council proposed for election on February 9, are:—Sir Herbert Maxwell, Bart., M.P., Owen Thomas, C. J. Lucas, in the place of Sir J. T. D. Llewellyn, Bart.; Everard Hambro and Martin R. Smith. The officers proposed are Sir Trevor Lawrence, Bart., M.P., President; Philip Crowley, Treasurer; Rev. W. Wilks, Secretary; Harry Turner, Henry Williams, and A. H. Pearson, Auditors.

LIVERPOOL HORTICULTURAL ASSOCIATION.

GREAT interest was taken in the annual meeting of the Liverpool Horticultural Association, which was held in the lecture hall of the Free Public Library on Saturday evening. In the absence,

through indisposition, of Mr. White, the President, the chair was taken by Mr. T. Powell, of the Botanic Gardens, and there was a large attendance. The committee's report showed that the expenditure of the spring, summer, and autumn meetings all exceeded the receipts by £144 6s. 8d., £306 4s. 4d., and £300 respectively. The subscriptions amounted to £537, and the sum of £50 had to be drawn from the previous year's balance in order to meet the expenditure. The attendance at the summer and autumn shows was much below the average, but the competition was keen, and the exhibits very fine. At the spring show there were 3035 visitors, 6007 at the summer, 5558 at the autumn show. The committee thanked the proprietors of the *Gardeners' Magazine* and the *Amateur Gardener* for prizes given; also Messrs. R. P. Ker & Sons for the Challenge Vase. The essays on various horticultural subjects had not been as numerous as was desired. Mr. A. Kime, Woolton, gained the prize for an essay on the "Culture of Cinerarias, Primulas, and Calceolarias;" and Mr. Ed. Williams, Llanfyllin, for the essay on "Cool Orchids."

Great regret was expressed at the death of Mr. Fletcher Rogers, for many years Hon. Treasurer of the Association, and one of its warmest and most valuable supporters. Mr. E. Bridge, who has done valuable work as Secretary of the Association, resigned office, and after keen speaking and voting, Mr. Wm. Dixon, chartered accountant, 25, Victoria Street, Liverpool, was elected Secretary, at a salary of £30 a year. Mr. Geo. Blackmore was re-elected Sub-Treasurer, and the appointment of Treasurer was left in the hands of the committee.

LAW NOTE.

HAMILL v. REID & BORNEMANN.

THIS was an action brought by Mr. R. J. Hamill, a gardener of Sydenham, against Messrs. Reid & Bornemann, nurserymen, of Sydenham, to recover £4 10s., balance of wages in lieu of notice and damages against Mr. Bornemann for slander. Mr. Le Breton appeared for the plaintiff, and Mr. Johnson Watson for the defendants. After the close of the plaintiff's case, Mr. Justice Grantham suggested to Counsel that the matter was one for a settlement, and a consultation thereupon took place with the Judge in his private room, and a settlement of the action arrived at. The defendants, by their Counsel, withdrawing in open Court all imputations against the plaintiff and paying him £25 towards his costs, a juror by consent being withdrawn.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

REMOVAL OF STRAWBERRY PLANTS.—Will some of our readers kindly inform "J. F." if the law permits a market-gardener on leaving his holding to remove Strawberry plants which were planted last year for fruiting.

Obituary.

STEPHEN ROSS.—We regret to have to announce the sudden death of Mr. Stephen Ross, who died from syncope on the morning of January 27, at Hammersmith. Mr. Ross was a native of Banffshire, and started as a lad at Cullen House, a noted place of the Seafield family, after which he came to London and filled various appointments there and in the provinces. In 1859 the firm of John & Charles Lee secured him the appointment as Head Gardener to the late Earl of Carnarvon, in which capacity he spent twenty-five years. While at Highclere he carried out many alterations and improvements in the grounds, and was the raiser of several new Azaleas and Rhododendrons. On his retirement from Lord Carnarvon's service, his lordship granted him a pension. On leaving Highclere his friends and fellow-servants presented him with a gold watch and chain as a token of their regard and good wishes. Soon after

leaving Highclere he went into the service of the Board of Works, Hammersmith, to superintend the planting, &c., of the street trees, where he faithfully served for eight years, and died at the age of 60. He has left a wife and five children to mourn his loss.

THE WEATHER.

By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 45° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.	
	ACCUMULATED.				Total Fall since Jan. 3, 1892.		Percentage of possible Duration for the Week.	
	Above (+) or below (—) the Mean ending January 30.	Above 45° for the Week.	Below 45° for the Week.	Above 45° difference from Mean since Jan. 3, 1892.	Below 45° difference from Mean since Jan. 3, 1892.	More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 3, 1892.	Total Fall since Jan. 3, 1892.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending January 30, is furnished from the Meteorological Office:—

"The weather this week was mild and humid in all parts of the Kingdom; very frequent and heavy falls of rain occurred in the extreme north and north-west, but in the more eastern and southern districts the fall was slight and less frequent, and some bright intervals were experienced.

"The temperature was above the mean in all districts, the excess ranging from 2° in 'England, S.W.' and the 'Channel Islands,' to as much as 5° in 'Scotland, E. and W.' and 'England, N.E.' The highest of the maxima were recorded at most stations on the 29th, when they varied from 59° in 'Scotland, E.' 57° in 'Ireland, S.,' and 56° in 'England, N.E.' to 52° in the 'Channel Islands.' The lowest of the minima were registered either on the 24th or 25th, and ranged from 25° in the 'Midland Counties,' to 34° in 'Scotland, W.' and the 'Channel Islands.'

"The rainfall was considerably more than the mean in 'Scotland, N. and W.,' and rather more in 'Ireland, N.' and 'England, N.W.' In all other districts, however, there was a deficit. Over the eastern and southern districts the fall was very slight.

"The bright sunshine was much more prevalent than during the preceding week, and exceeded the mean in nearly all districts. The percentage of the possible duration ranged from 13 in 'Ireland, N.' and 'Scotland, N.,' and 14 in 'England, N.W.,' to 29 in 'England, S.W.' and the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, February 4.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise their list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, E.D.]

Business still keeps quiet, Grapes being a slower trade. *James Webber, Wholesale Apple Market.*

POTATOES.

Since last reports arrivals have been very heavy, and stocks have increased much. Prices for medium and ordinary sample rule 6s. to 10s. lower. Market very flat. Best samples, 90s. to 100s., Medium, 70s. to 80s., and Blackland, 55s. to 65s., per ton. *J. B. Thomas.*

SEEDS.

LONDON: Feb. 3.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, London, S.E., report a thin attendance of buyers on to-day's market, with but few transactions passing. American cables come firm, but brown and inferior home-grown seeds are lower. Seedsmen of Alaska, white, and Trollid, show no change. Eye-grasses are hardening in value. French and Italian are dull. Sainfoin is advancing. Peas and Haricots move off slowly. In Rapeseed the tendency is upwards. Mustard keeps firm.

FRUITS AND VEGETABLES.

BOROUGH, Feb. 2.—Quotations:—Savoy, 3s. to 5s.; Broccoli, 10s. to 15s. per tally; Spinach, 1s. 6d. to 2s. 6d. per bushel; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Greens, 1s. 6d. to 2s. 6d.; Turnips, 2s. 6d. to 3s. 6d.; Carrots, 1s. 6d. to 1s. 9d. per dozen bunches; English Onions, 6s. to 7s. 6d. per cwt.; Apples, 2s. 6d. to 6s. per bushel; Canadian do., 10s. to 20s., and Newtown Pippins, 18s. to 22s. per barrel.

SPITALFIELDS, Feb. 2.—Quotations:—Savoy, 1s. 6d. to 3s. 6d.; Cauliflowers, 6s. to 12s. per tally; Greens, 1s. 3d. to 1s. 9d.; Turnips, 2s. to 3s. 6d.; Carrots, 1s. 6d. to 2s. 6d.; Parsley, 2s. to 3s. per dozen bunches; Spinach, 9d. to 1s. 6d. per bushel; Turnip-tops, 2s. 6d. to 3s.; Sprouting Broccoli, 1s. to 1s. 6d. per sack; Parsnips, 4d. to 6d. per score; Endive, 1s. to 1s. 6d.; Cabbage Lettuce, 4d. to 1s.; Beetroot, 3d. to 4d. per dozen; Leeks, 2s. 6d. to 3s. 6d. per dozen bunches; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 6s. 6d. to 7s. per cwt.; Bordeaux do., 5s. to 6s. 6d.; Spanish do., 6s. 6d. to 7s. 6d. per cwt.; Belgian do., 5s. to 6s. 6d.; Dutch do., 5s. to 5s. 9d. per bag of 110 lb.; Celery, 4d. to 1s.; Horse-radish, 1s. to 1s. 1d. per bundle; English Apples, 2s. to 5s. per bushel; American do., 10s. to 16s. per barrel; Foreign Tomatoes, 1s. to 2s. per case; Seakale, 1s. to 1s. 6d. per punnet.

STRATFORD, Feb. 2.—There has been a good supply at this market during the past week, and a brisk trade was done at the undermentioned prices:—Savoy, 2s. 6d. to 5s. per tally; Greens, 1s. to 1s. 6d. per sieve; do., 2s. to 3s. per dozen bunches; Cauliflowers, 1s. to 1s. 6d. per dozen; Turnips, 1s. 6d. to 2s. 6d. per dozen; Carrots, 1s. 6d. to 2s. 6d. per dozen; Parsnips, 4d. to 1s. per score; Mangel, 16s. to 18s. per ton; Swedes, 16s. to 22s. do.; Onions, English, 10s. to 13s. do.; do., Dutch, 4s. to 5s. per bag; do., Bordeaux, 5s. to 6s. 6d.; Apples, English, 2s. 6d. to 6s. per bushel; do., American, 12s. to 20s. per barrel; Celery, 8d. to 1s. per roll; Horse Radish, 1s. to 1s. 6d. per bundle; Brussels Sprouts, 1s. 3d. to 1s. 9d. per half-sieve; do., 2s. 6d. to 3s. per sieve.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending January 30, and for the corresponding period last year:—1891, Wheat, 33s. 10d.; Barley, 28s. 9d.; Oats, 20s. 3d. 1891, Wheat, 32s. 6d.; Barley, 28s. 10d.; Oats, 18s.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; inferior, do., 48s. to 75s.; hay, best, 60s. to 92s.; inferior, do., 26s. to 50s.; and straw, 20s. to 23s. per load.

POTATOES.

BOROUGH, Feb. 2.—Quotations:—Hebrons and Elephants, 70s. to 80s.; Imperators, 80s. to 85s.; Bruce Magnums, 60s. to 90s.; Dunbars, 100s. to 110s. per ton.

SPITALFIELDS, Feb. 2.—Quotations:—Magnum, 55s. to 70s.; Regents, 55s. to 70s.; Imperators, 60s. to 75s.; Hebrons, 60s. to 75s.; Main Crop, 60s. to 80s.; Snowdrops, 60s. to 75s.; Bruce Magnums, 60s. to 75s. per ton.

FARRINGTON, Feb. 4.—Quotations:—Bruce Magnums, 75s. to 110s.; Imperators, 70s. to 90s.; Magnum Bonum, 60s. to 110s.; Sutton's Abundance, 55s. to 110s. per ton.

STRATFORD, Feb. 3.—Quotations:—Magnum, 60s. to 80s.; Bruce do., 60s. to 85s.; Imperators, 65s. to 80s.; Main Crop, 90s. to 105s. per ton.

TIMBER.

At a sale of timber at Gaddesden Place Estate, Herts, on the 22nd ult., there was a large attendance of timber merchants from London and the country. The 634 trees, divided into 107 lots, were disposed of at very satisfactory prices, several of the trees realising over £20, and the total of the sale exceeding £3000. The Elm realised about 1s. 6d. per cubic foot; Beech realised about 2s. 3d. per cubic foot; Oak realised from 2s. 6d. to 3s. 6d. per cubic foot; Ash realised about 4s. per cubic foot.

NOTICES TO CORRESPONDENTS.

ARUM LILIES: *J. B.* You may purchase the roots at once, and pot them. Let them come on very gradually in a cool-house, and when they have started well, freely supply them with water, and stand the pots in summer time in full sun, over saucers filled with water, or plant them out in trenches and treat just like Celery. As you desire to have as many plants as possible, put one root in a pot.

CAMELLIA POTS: *G. L.* Washing garden pots with a solution of carbolic acid would do no harm to the roots of the plants, provided the pots were well rinsed with clean water afterwards.

CINERARIAS: *W. H. S.* The white appearance of the underside of the leaf is due to the presence of mildew—a dangerous enemy to this plant, which must be carefully watched for, and on its first appearance, the undersides of the leaves dressed with flowers of sulphur.

COAL: *T. B. T.* The quantity available at a workable depth has been estimated at 146,480,000,000 statute tons, or sufficient to last for 1000 years at a consumption of 146,000,000 tons per annum.—*W. B. S.* Anthracite coal contains little or no bitumen; Culm is another name for it (used in parliamentary returns), also stone coal. By culm, more commonly is meant an impure kind of shaly coal, or anthracite shale. Steam coal is merely a term given to some of the coals from the Newcastle (north side of the Tyne and at Blythe) and South Wales coal fields, which from the relatively large amount of carbon they contain are well adapted for heating marine and other boilers.

FRENCH HORTICULTURAL JOURNALS: *Reillyson.* We published on January 23, p. 118, the names of the principal of these, with in some instances the price per copy, place of publication, and editors' name; and to this list we have nothing further to add. A copy of *Gardeners' Chronicle* costs by post 3½d.

FRUIT ROOM: *J. A. H.* There should be some drains with gratings on the foot of the wall, communicating with the outer air, and a window high up in the wall with a swinging casement. There should be another window to throw light into the room, and both should be fitted with stout shutters. After fruit has been stored in the room, and for a month after the last large quantity has been put into it, the room should be aired night and day, after that little ventilation should be required.

INSECTS: *J. R. P.* The grub which is so destructive to your Christmas Roses, is the larva of the common brown awlet moth (*Hepialus fuscus*). It is omnivorous, and must be killed as soon as possible. *I. O. W.*

LÆLIA: *J. Cowan.* The coloured bloom is a superior form of *L. anceps*, as is the white one of *L. a. Stella*.

MUSA: *X. I. Z.* The appearances of the piece of root sent, are consistent, with a bad state of the soil, arising from want of proper drainage. Dig out the whole mass, and replant in fresh soil.

NAMES OF FRUITS: *C. W. C.* 1, Moss Nonpareil; 2, Lemon Pippin; 3, not recognised, past its season; 4, probably Beauty of Kent; 5, not recognised, past its season; 6, Dunelov's Seedling.—*W. Lucas.* 1, yellow Bellefleur; 2, Pear, Leon Leclerc de Laval; 3, Verulam; 5, Gravenstein; 6, Fearn's Pippin.—*F. S.* Catillac, the best baking Pear grown. As the fruit grew on a standard tree, and last season was less warm than usual, it did not get quite matured, hence its shrivelling before its time.

NAMES OF PLANTS: *R. G.* *Agathae celestia*; *A. W.* *Zygopetalum Mackaii*; *A. B. C.* 1, *Retinospora filifera* of gardens; 2, *Juniperus chinensis*; 3, *Retinospora squarrosa*; 4, *Cupressus Lawsoniana* var.; 5, *Cupressus*, perhaps *Goveniana*; 6, *Cupressus Lawsoniana*.—*G. L. B.* 1, *Asclepias curassavica*; 2, *Streptosolen Jamesonii*; 3, *Juniperus virginiana*.—*A. R.* 1, *Primula sinensis*; 2, *Jasminum gracillimum*; 3, *send flowers*; 5, *Adiantum cucumetum*; 6, *Selaginella Widenovii*.—*W. Lucas.* 7, *Curculigo recurvata*; 9, *Cœloglyna cristata*.

ORCHID: *W. B.* Good ordinary form of *Lælia anceps* Bella.

PEACH HOUSE IN HANTS: *Subscriber.* You should commence the work of fitting your three-quarter span greenhouse for a Peach-house by wheeling out all the soil, to a depth of 1½ foot, and if the sub-soil is retentive, 6 inches deeper, putting in 6 inches of stones, broken brickbats or chalk, the large pieces at the bottom, and the finer on the top. This mass of material should have a slight slope to a rubble or pipe drain emptying into a dry well or pit filled with stones. Then obtain sufficient fibry loam as will make a bed 2 feet thick. This should be chopped up roughly, and thrown in on the drainage; first covering it with the toughest sods, grass downwards. Finely broken chalk or lime rubbish from old buildings, and broken bones should be pretty liberally spread over the surface, and dug into and mixed well into the mass; make the soil firm by treading it evenly all over. In planting the trees, take out shallow holes, say 6 inches deep for small trees, slightly deeper for large ones; fork in and incorporate a small quantity of leaf-mould, or sandy potting-bench refuse soil, with the soil at the

bottom of the holes. Plant the tree with its roots at various levels, mixing some of the lightening materials with the soil thrown back over the roots. If the soil is wet when wheeled in, let it dry considerably before going on with the operations of mixing and treading; but in any case water the soil about the roots before quite closing the holes. Do not mulch the soil, unless it be of a very light description, as this would only tend to cause gross growth, the soddening and souring of the soil, and to keep it cool. Place large pebbles or boulders, or flat roofing tiles over the roots; these retain heat and moisture, and consolidate the loose soil by their weight; and, where they are employed, the roots or many of them keep near the surface. When the feeding of the trees becomes necessary—in perhaps 4 or 5 years—use liquid manure in autumn and winter, affording one good drenching in October or November, and another just before the house is started; and two more may be wanted in June and August. But much will depend on the kind of growth made, and the amount of the crop of fruit. Afford clear water when the test-stick shows that the soil is becoming dry; do not wait till it is dry. The house, unless you heat it artificially, will be merely a protector; and the trees must be retarded as much as possible by admitting the outside air day and night during the latter part of the winter, otherwise the trees will flower unduly early, and there will be a danger of losing the crop by frosts in March, unless you reside near the sea coast. Good varieties of Peaches are Waterloo, Washington, Rath-ripe, Walbution Admirable, Noblesee or its improvement Vanguard, Teton de Venus, Stirling Castle, this and the first named are excellent early fruiters; Sea Eagle is a fine late variety, Princess of Wales and Grosse Mignonne. Nectarines—Spencer, Stanwick Elruge, Victoria, Violette Hative, Pine-apple, River's Elruge, an early variety; Putnam Orange, Humboldt, Hunt's Tawny, and Lord Napier, one of the earliest.

PEACH TREES—PREVENTING BLISTER: *L. D.* If the trees are unprotected with glass, blister cannot be prevented. Unless the malady is very bad, the timely removal of the shoots and leaves affected will prevent any great check to growth taking place, the trees recovering their health when warm weather comes.

ROSES: *G. L.* So far as we are able to understand your question, you require to be informed of the varieties of Roses, which are known in gardens, of the following species:—Noisettiana, a hybrid, probably of indica and some other species; Indica, Centifolia, Damascena, Gallica, Banksia; these have been the parents, on one side or the other, of most of our modern Roses, and to enumerate their number, and give the parentage of these, is beyond our province in these answers to our correspondents. *R. sulphurea*, the double form has been in gardens for a great number of years; the single form, *R. Rapini*, has not been long discovered. Of *R. pimpinellifolia*, one species, one variety; *R. microphylla*, one species; *R. canina*, one species, nine varieties; *R. multiflora*, one species, three varieties; *R. cinamomifolia*, two species; *R. repens* (Ayrshire Rose), many varieties; *R. moschata*, one species, and several varieties.

THE MONUMENT TO ROEHL: *L.* The illustration we gave at p. 45, January 9, is of the model, not from the actual statue, which is not yet erected.

VINES: *Subscriber.* We have examined the soil you have sent, and do not find any trace of insects or injurious matter, although we should term it very poor; also the roots, which appear to be for the most part dead, and the shoot, which is quite green and unripe. We can only conjecture that the soil did not suit them in some way—that the roots never took hold of it—and so the Vines did not grow, not at all an uncommon occurrence with newly-planted Vines. It is one of those cases which require investigation on the spot at the time.

THE PATENT SILICATE MANURE.

This manure is chemically distinct from all other Manures, and has been proved to supply the place of sunshine, and has the power of hastening the colouring and ripening of Grapes, Tomatoes, Peaches, &c., beyond any other Manure.

Field Crawley, Sussex, Sept. 14, 1891. "The effect of this manure is most noticeable in the development, ripening, and colouring of the fruit. In consequence of the wet and sunless weather, I could not get my Tomatoes growing in an unheated and rather damp house to ripen; but within three days of applying your Manure they began to colour, and I have been gathering splendid fruit almost daily since." (Signed), B. C. RAVENSCROFT.

Prices in Sacks, at Works, 10s. per cwt.; £2 per ½ ton; £3 15s. per ½ ton; £7 per ton.

For all INSECT PESTS
in Greenhouses and
Frames, nothing has
proved equal to the

LETHORION (VAPOUR CONE),

(PATENT).

They are now universally admitted to be thoroughly uniform in strength, and safe for any Plant or Flower, even if four times the quantity are used.

Scale and Mealy Bug may be completely eradicated by using the Cones double strength.

PRICES.—For Frames, &c., of 50 cubic feet, 6d.; 100 ft., 9d.; 500 feet, 1s.; 1000 feet, 1s. 6d.; 4000 feet, 5s. each. THE HOUSES SHOULD BE WELL SECURED.

CORRY & CO., Ltd., 16, Finsbury Street, LONDON, E.C.

IMPORTANT TO GARDENERS, AMATEURS, AND OTHERS, WHO FUMIGATE HOUSES

TO KILL "FLY," OR "THRIP."
You will shortly be ordering your Spring Supply of Fumigating Material. Why lay in a heavy stock of tobacco paper, uncertain in quality, often disappointing, and very unpleasant to use, when you can have a SAFE, RELIABLE article, and one that is pleasant to use?

THE FIRST
OF ITS
CLASS,
AND STILL
THE ONLY
ONE

On which you can thoroughly depend. The manufacture is much improved and it can be ordered without any risk of the disappointments often attending other fumigating materials.

PRICES:—
For houses with 1000 cubic ft., No. 3 Roll, 1/- each; Post a capacity of 2000 " " " " 1/9 " " Free. The Rolls may be cut for houses of a smaller capacity, or to make up required quantities for larger houses.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion. POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column. POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER. Advertisements for the current week must reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER. Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months; Post-office Orders to be made payable at the Post-Office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

London County Council.—To Horticultural Builders and CONTRACTORS.

TENDERS are invited for the ERECTION of a PALM HOUSE in BATTERSEA PARK, to be constructed chiefly of iron. Persons desirous of submitting Tenders may obtain a copy of the Specifications, Drawings, Form of Tender, and other particulars at the Office of the Architect of the Council, at Spring Gardens, on payment of a sum of one guinea, which will be returned on receipt of a *bona fide* Tender. Persons tendering will be required to declare in their Tender that they pay such rates of wages and observe such hours of labour as are generally accepted as fair in their trade. The Tenders, which must be on the form supplied from this Office, and be addressed to "The Clerk of the Council," and endorsed "Tender for Palm House, Battersea Park," are to be delivered at this Office before 10 o'clock A.M. on February 23, 1892, and no Tender will be received after that hour. Any Tender which is not fully filled up in every particular will be rejected.

The Council does not bind itself to accept the lowest or any Tender.

H. D. LA HOOD, Clerk of the Council.

Spring Gardens, S.W., February 4, 1892.

TO HORTICULTURISTS.—GREENHOUSE GAS COKE AND SMITH'S COKE delivered in Truckloads at any Station in England and Wales.—Address, G. J. EVESON, 26, Corporation Street, Birmingham.

TO GARDENERS and NURSERYMEN. —A young Man (age 30) seeks a situation in the Houses. Practical experience in Vines, Peaches, and Plant Houses. Seven years' excellent character. —Mr. F. SMITH, The Gardens, Kingsworthy House, near Winchester, Hants.

TO GARDENERS, &c. —A young man (age 20), seeks a situation in the Houses, or Inside and Out. Three years inside in last situation, on first-class estate. Good characters. —GROVES, 1, Cyprus Villas, Isle of Wight.

TO SEEDSMEN. —Wanted Situation for Lad, age 16, under a Gardener to work his way up. Three years' good character. —CHARLES LAWRENCE, Stone House Farm, Brompton.

TO NURSERYMEN. —A young Man, age 20, requires a situation in a Nursery in the Houses; has been used to market and retail business; good character. —A. Z., 2, Maud Cottages, Wolsey Road, Hampton Hill, Middlesex.

TO NURSERYMEN. —Wanted to APPRENTICE a strong youth (age 16). Particularly to G. S. S., Messrs. Deacons, Leadenhall Street, London, E.C.

TO NURSERYMEN. —Appointment wanted in good nursery office; long experience of the business. For many years had charge of correspondence and cash in a large establishment. Highest testimonials from past and present employers. —SCOTT, Old Nurseries, Maidstone.

TO NURSERYMEN. —Advertiser (age 21) seeks a situation in a good Nursery. Well up in Stove and Greenhouse, and all kinds of Hard and Soft-wooded Plants, and Out Flowers for Market. Seven years' experience. Strongly recommended. —T. W. P., 41, Wellington Street, Strand, W.C.

TO NURSERYMEN. —A young Man seeks a situation as PALM and FEEN Grower. Age 21. Well up in all branches, Wreaths, &c. Eight years in the Trade. Good references. —BROWN, 117, Upper Brook Street, Winchester, Hants.

TO FRUIT FARMERS and GROWERS. —An appointment wanted as MANAGER, at Home or Abroad. Advertiser having thorough experience in Fruit Culture, and Management of Men. Age 32, married. —H. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FRUIT GROWERS. —Young Man (age 23) seeks engagement in a Market Nursery, where fruits are the chief things grown; good references. —T. R. *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO THE TRADE. —Advertiser is open for an engagement as NURSERY MANAGER, or GENERAL TRAVELLER, in a good establishment. Has had a thorough practical training in all departments, also in Office-work, and can produce references of the highest order. For further particulars apply to W. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SEED TRADE. —A young man, age 19, five years' London experience in the agricultural seed trade, desires situation as CLERK and ASSISTANT, town or country. Highest references. —E. K., 61, Vicarage Lane, West Ham, E.

SHOPMAN (ASSISTANT). —A young man, well recommended, seeks situation as above in retail seed warehouse. —J. B., Messrs. Nutting & Sons, 106, Southwark Street, London, S.E.

SHOPMAN (ASSISTANT). —Has had experience in Seed, Plant, and Flower Trades, &c.; willing to help in nursery if required. —WHITE, 4, Viney and Street, Garston, near Liverpool.

TO FLORISTS. —A young man (age 23), desires a situation as ARTISTIC FLORIST. Good Wreath and Bouquet hand. Excellent references. —"SNOW-DROP," 34, Westbourne Road, Cloughton, Birkenhead.

TO FLORISTS. —A young Lady, thoroughly experienced, seeks re-engagement; first class at Poses, Bouquets, Wreaths, Button-holes, Sprays, &c. Highest references. Five years in one situation. —ROBERTS, Holyrood House, French C., Southampton.

FLORISTS. —A young Lady requires re-engagement. London or Suburbs. Ten years' experience. First-class references. —FLORIST, 14, Clarendon Road, West Green, Tottenham, N.

CORRESPONDING CLERK. —JOHN LAING & SONS, will be pleased to recommend H. J. Pettit, to any good House in the Trade, requiring efficient service in the capacity, or that of BOOK-KEEPER, combined with an excellent knowledge of Plants and the general requirements of the Trade. —The Nurseries, Forest Hill, S.E.

HOLLOWAY'S OINTMENT AND PILLS. —Dangerous Chest Complaints.—The enumeration of the diseases is scarcely necessary, as, unfortunately, most Englishmen know them by their cods. Coughs, common colds, influenza, bronchitis, asthma, pleurisy, inflammation of the lungs, and even consumption in its early stages, are best treated by rubbing Holloway's Ointment upon the chest and along the back, between the shoulders. It penetrates internally, checks the cold shiverings, relieves the overorged lung, gradually removes the oppression from the chest, and restores the obstructed respiration, hitherto so distressingly disagreeable and highly dangerous. In treating this class of diseases, Holloway's Pills should always be taken while using his Ointment; they purify the blood, promote perspiration, and allay dangerous irritations.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST,"

require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from *Hood, on Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with 17½ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

MESSRS. ELSE AND SON are instructed to SELL by AUCTION (Without Reserve), on TUESDAY, March 1, and following day (if necessary), on the above grounds, an assortment of NURSERY STOCK, including upwards of 100,000 Transplanted Rhododendrons, in sizes up to 12 feet. Also Special Lots of Cupressus, Retinosporas, &c., in sorts; Irish and Golden Yews, Privets, &c., of which Catalogue of particulars may be had free on application to Messrs. ELSE AND SON, Auctioneers, &c., Matlock, Derbyshire.

WANTED, TO RENT, A SMALL NURSERY, in a provincial town; chiefly glass; with shop not objected to. Must be genuine.—No. 1, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED TO PURCHASE, A genuine NURSERY and FLORIST BUSINESS. Capital £200 to £1000, or PARTNERSHIP to same amount.

Reply to H. F. 132, High Street, Poole.

Rare opportunity for Florists and Nurserymen. RE WILLIAM BARRACK, A BANKRUPT.

TO BE SOLD BY TENDER.—All those seven modern GREENHOUSES, with Bolders, Fittings, and Piping complete, along with the full Stock of Palms, Ferns, and Flowering Plants, in great variety, and now in full bloom, as well as general NURSERY STOCK, at Castle Gardens, Kendal, Westmoreland. The garden ground (which can be taken at a reasonable rent) comprises about 2.25 acres of good land, and in addition to the Greenhouses are Potting Sheds, Cart sheds, and every convenience for carrying on the business. The whole must be disposed of without delay, and possession must be given at once.

Do not miss this opportunity, but apply at once to Mr. WM. HEATON, 45, Finkle Street, Kendal, the trustee under the estate of W. Barrack.

45, Finkle Street, Kendal, February 9, 1892.

TO BE SOLD A Genuine FLORIST BUSINESS, with a good General Trade, on moderate terms, as a Going Concern in a popular and Rapidly Growing Neighbourhood, near Richmond, S.W. The Nursery consists of river over 3 1/2 acres of ground, with 4 New Glass

Erectories and a range of pits in splendid condition, and well stocked with things suitable for carrying on the Trade. There is an 8 feet wall round the ground, and a roomy old fashioned Dwelling House with shop in front. To an energetic man the above offers an opportunity seldom met with. A death being the sole cause of selling.

Apply on Premises, Mrs. MARTIN, Northumberland Nursery, Heath Road, Twickenham, S.W.

SEED AND NURSERY BUSINESS FOR DISPOSAL, AT ONCE.—Established forty years. The Seed Shop, Office, Warehouse, and Range are spacious and convenient, situate in a leading thoroughfare of the City of Truro, adjacent to the principal public buildings. The Nursery Ground is fertile, fairly sheltered, well watered, in good heart and condition, and on an excellent site, with a five-acre nut's walk of the railway station; a Cottage, Glass Houses, Packing Sheds, Frames, &c., on the same; a good demand for Fruit Trees, Roses, Shrubs, Decorative Plants, Cut Flowers, &c. The stock at present is low, to be taken at a valuation. Market Stall in the best position. All the premises mentioned are within an hour's distance by rail of the seven principal market towns in the County, thus offering a favourable opportunity to a man or more, of experience and energy, with moderate capital to realise advantageously.

Apply to ROBERT DOBELL, Jun., Solicitor, Truro, Truro, February 9, 1892.

MIDLAND COUNTIES.—TO BE SOLD (Folio 7561), in an important town, an old-established General NURSERY BUSINESS. Long Lease. Low rental. Capital required about £2500.

Apply to PROTHEROE AND MORRIS, Auction and Estate Offices, 67 and 68, Cheapside, London, E.C.

KENT.—In the best District.—TO BE SOLD, a compact FREEHOLD NURSERY, about 4 Acres of Ground. Several modern Greenhouses, specially adapted for Growing Fruit and Cut Flowers. Splendid opportunity. Full particulars of PROTHEROE AND MORRIS, Estate Offices, 67 and 68, Cheapside, E.C.

To Gardeners and Others.

A CAPITAL NURSERY, 2 Greenhouses and Show House. Good JOHNNING BUSINESS. Price for Goodwill, Stock, and Greenhouses, £120.

Apply to J. S. S. New Road, Crouch End, N.

NURSERY, Small, TO LET.—Eight Well-heated Houses, &c., owner retiring, in Upper Holloway, in Centre of a good Residential District, where an energetic man could do an increasing trade. Good opening for Sundries. No opposition. A most favourable opportunity for establishing a Branch Business, & a Ready Money Trade done in the season. Rent, £4 1/2 per annum, on agreement; or Lease for the unexpired term of 15 years, with Houses and Stock, at a Valuation.

Apply, THOMAS FASK, 10, Cullum Street, London, E.C. 1

To Market and Cut Flower Growers. (Folio 7569.) LONDON DISTRICT.—TO BE LET, either

EARLY OFFENHAM CABBAGE PLANTS
for SALE. True Stock. Apply to—
J. H. BROWN, Swinehead, Boston.

THE usual SURPLUS FLOWER ROOTS
(Alpine and Herbaceous), from these Gardens now ready.
Hampers of 50 strong roots, 5s. 6d. each. Interesting variety.
WOOD'S HARDY PLANT CLUB, Kirkstall, Leeds.

THE OLD BROWN QUARRY EARLY
POTATO. The Oldest Existing Sort in Ireland.

I believe this to have been in existence here for 150 years; certainly, when I was a child, prior to the famine period. There was no other root grown for harvest purposes when men worked with it for years, but to offer it for redistribution—it never having made its way to England—from a stock preserved for years on peat land, resting on limestone, in a remote part of county Cork. There must be something in the soil that preserved it for years. It is a fine-club variety, of great substance. 7-lb. bag and postage for 2s. 6d.

WM. BAYLOR HARTLAND, F.R.H.S., Old Established Seed Warehouse, Cork, Ireland.

LARGE QUANTITIES of strong THORNS,
very cheap; 2-year, 2s. 6d. per 100; 3 and 4-year,
250 Stout LIMES, well-grown.
POPLARS, 3 to 4 feet, and 4 to 5 feet.
LAURELS, very cheap.

Ground must be cleared for Building.
WILLIAM TRESEDER, Nurseryman, Cardiff.

FERNS! FERNS!—Trade.—Greenhouse and
Store, 25 saleable sorts, 12s. per 100; out of pots, 10s.
Large Adiantum punctatum, Aralias, Solanums, Cyperus, and
Prinos, all in 48s. 6d. per doz. Palms and Ficus, 1s. each.
Large Ferns, 10 best sorts, 5s. 6d. per doz. in 48s. Cierarias,
Spiraeas, and Cyclamen, full bloom, 9s. per dozen, in 48s.
Adiantum punctatum and P. tremula, extra size, in 24-inch
pots, 16s. per 100. Packed free, Cash with Order.

J. SMITH, London Fern Nurseries, Loughboro' Junction, S.W.

FORBES' CATALOGUE FOR 1892,

In the largest, best, and most comprehensive ever issued on
FLORISTS' FLOWERS and HERBACEOUS PLANTS.

It contains full and accurate descriptions of all the best
Anthrums, Begonias, Carnations, Dahlias, Delphiniums,
Fuchsias, Peonies, Pansies, Violas, Pelargoniums, Pentstemons,
Petunias, Phloxes, Pinks, Potentillas, Primulas, Pyram-
thrus, Verbenas, Herbaceous Plants, &c.; also of my true
and reliable strains.

EAST LOTHIAN STOCKS,

which, by the force of their merit, are now justly celebrated
all the world over. In 5 distinct sorts, crimson purple,
scarlet, white, and Willow-leaved white, each sort, 1s.
2d. and 5s. per packet.

It is an indispensable Reference-Book on all sections of
Florists' Flowers, and should be carefully perused by all buyers
of flowers.

Free on application.

JOHN FORES, Nurseryman, Hawick, Scotland.

Seed Potatoes
H. AND F. SHARPE invite the attention of
the Seed Trade to their fine selected stocks of SEED
POTATOS, comprising all the varieties worthy of cultivation.
They have been grown expressly for Seed, and the samples
will be found very fine and well dressed. The prices will
compare favourably with those of other growers.
Seed Growing Establishment, Wisbech.

WEBB'S

NEW

PEA FOR 1892

"TALISMAN."

5s. per pint, post-free.

A magnificent blue wrinkled main crop Pea, which has been raised on our own Farms, from a cross between the varieties—Culterwell's Giant Marrow and Omega. It grows about 5 feet in height, has stout stems, and large, light-green foliage; the pods are long, straight, very handsome in appearance, and contain about nine extra large, and fine-flavoured Peas. Besides being of first-class table quality, this Pea is of the utmost value for exhibition purposes.

March 4th next.

New Orchids.

Extraordinary New Lady's Slipper,

CYPRIPEDIUM VICTORIA REGINA
(SANDER).

NEW SPECIES.

The Most Extraordinary Cypripedium ever imported.

CYPRIPEDIUM CHAMBERLAINIANUM
(SANDER).

Magnificent New Species of Great Value.

MESSRS. PROTHEROE & MORRIS

Have received Instructions from Mr. F. SANDER to SELL, at their Great Rooms, 67 and 68, CHEAPSIDE, LONDON, E.C., a Grand Lot of the above New CYPRIPEDIUMS, on—

FRIDAY, MARCH 4.

Our researches in New Guinea and Borneo have led to the discovery of Two New Species of LADY'S SLIPPER ORCHIDS, in every way most remarkable and distinct from everything in either Eastern or Western Cypripedes.

CYPRIPEDIUM CHAMBERLAINIANUM
(SANDER).

Is from the MERAPI MOUNTAINS, and of great beauty and distinctness. The flowers, which are produced in great profusion, are of large size, and unlike anything ever seen. According to Collector's description, the flowers are violet-purple and white, produced all along the spike; and although our man had a nice lot when he started, but few were alive, and they were in weak condition when he arrived at port; but he thoroughly established them there, and a captain took great care of them on the journey home. The leaves are 2 feet long and 2 inches wide, and all mottled.

CYPRIPEDIUM VICTORIA REGINA
(SANDER).

Is the most remarkable Cypripedium we have ever seen. We are proud of the introduction into Europe of Cypripedium Sanderae, Rothschildianum, Sanderaianum, &c.; but such an one as this we have never seen; the compact zigzag inflorescence is 2 feet high, and shows upwards of thirty flower-seats, each flower springing from a conspicuous bract; and the remarkable feature is that the flower-seats are not more than 1/4-inch from each other. The upper part of the flower is most lovely; it is white and green, tinged and lined with blackish-purple, very broad and short, the lower sepal light green and dark purple; the petals are spreading, undulate, twisted, and are white, green, and purple, in lines and dots. The whole flower is hairy; the very broad pouch is in shape like C. cardinale, and light purplish-violet, much inflated, spotted with dark purple, with a golden-yellow and pea-green rim; base of the pouch white and green, as also the infolded lobes, inside; the pouch is dotted with purple; staminode black and green, sometimes with a green line through the middle.

The flowers are 4 inches across each way.

Abundant dried material will be shown, to prove the above extraordinary facts.

THE
Gardeners' Chronicle.

SATURDAY, FEBRUARY 13, 1892.

THE WHITTERTN.

ABOUT a dozen years ago Mr. Richard Green, a famous breeder of Hereford cattle, like many other squires and magistrates of Herefordshire, built for himself a house named The Whittern, and situated in the parish of Lyonshall near Kingston. The site is high and delightful, and one looks across the lawn and down the slopes of the hill, on which the house stands, into some deep-lying pastures below and up the slopes beyond, away to Lady Lift, a hill in the distance, feeling that such a landscape leaves little to desire. The pretty green hollow with its steep sides might be a park so far as appearance goes, but it is better than a deer park, since it sustains Mr. Green's beautiful herd of white and red Herefords, and is, in fact, his home farm. One may ask how is it that the pastures of a farm bear such noble park-like timber, and how is it that within the limits of the lawn and shrubbery there are numerous exotic shrubs and specimen trees much older than the house? The answer is, that an old country house stood near the present one, and the owner, though his house was small, was a patron of arboriculture. A Larch tree in front of the present handsome mansion was one of his favourites. It is a very remarkable tree, with pendulous branches spreading over a diameter of 60 feet, and having a great trunk which, at 4 feet from the ground, becomes suddenly smaller, so that the upper part appears to be of later date than the lower. Near the old entrance to the former house, at the rear, are two Sycamores, 80 feet in height, and in front of where the older house stood are three Cedars of Lebanon, which must have stood there scores of years, winning by their grand proportions the admiration from a former generation.

At this corner of the present lawn, near the spot where the roof-tree of the former family, the MoMurdos, stood for several generations, there is a fine clump of Conifers planted by them, such as the Douglas Spruce, Cryptomeria japonica, and Wellingtonia; and between the trees and house were interposed—much too near for modern notions—the stables, and some kennels, where an old gentleman fond of his gun, kept pointers and other dogs. All are gone, and as old Mr. MoMurdo may have said, "sic transit" on the departure of his predecessors, so we may say "sic transit" of him and his dogs and kennels. A thriving Tulip-tree stands on the very site of his kitchen, on what is now the smooth lawn of The Whittern. Greatly to the advantage of the new structure, its material consists of native sandstone, quarried on the spot, and of sober, grey colour. An artist of note has left his mark on a large stone forming part of the front wall of the house, and as long as the wall stands, the hunting-scene carved upon it will be admired, as

it is by all who see it now. The west wing of the house is sheltered by a handsome conservatory, whose chief ornament is a fine specimen of that handsome creeper, *Cobæa scandens*, which can never become "common," though it may be abundant.

Turkey Oaks are among the old trees around the house, and scattered over the park-like pastures at various levels, but always on good land, are fine specimens of English Elms, Scotch Firs, and big Beeches. The newly-planted shrubs flanking the house and its terrace have thriven amazingly in ten years, the soil being rich, and well suited either for pastures bearing the great beoves of the country, or for timber trees and shrubs; and, pleasing as some poor soils may be, rich land has great advantages. Among the Conifers are *Abies nobilis*, *A. pinsapo*, and *A. Nordmanniana*, lending to the site, not exactly novelty, but rich variety and refinement.

A wealth of shrubs arrests attention on the wide lawn between the house and kitchen-garden, *Gaultheria procumbens* and other Americans are conspicuous in some of the clumps and borders, others are filled with *Rhododendrons*, many with English Heather, and some with flowers. *Hyanthus candicans* grows under the terrace-wall which it tops, attracting all eyes. Its bulbs have not been removed for six years. *Andromeda floribunda*, in some of the borders, was manifestly about to fulfil the promise of its name, showing abundant signs of flowering at the time of my visit, September 23. The *Rhododendrons* were looking well, and several sorts of *Meziesia* and the American *Pernettya*, with red bark, looked luxuriant.

The wall bounding the pleasure garden in this direction is well covered with creepers. The Virginia Creeper had already assumed the deep crimson tint of autumn; the *Ampelopsis Veitchii* would be a month later. The border in front of the wall was required to be gay, being within the precincts of high civilisation, and it was made so with *Tritoma Uvaria*, *Helleborus atropurpureus*, Japanese *Anemones*, perennial *Phloxes*, Sweet Briar, *Gaillardias*, *Rudbeckia Newmanii*, *Funkias*, *Michaelmas Daisies*, rock *Cistus*—in flower all through the summer and still in flower, *Lilium auratum*, and other things. It is a border which Mr. Weaving may well be proud of.

Small space remains for the kitchen garden. The site here is high, and the soil strong, and experience does not seem to sanction the cordon system for fruit trees, in this locality. If the trees were lifted every third or fourth year, the result might be more satisfactory. We are here in a district where the Apple grows to the size of a timber tree, and the subsoil is not injurious. Mr. Weaving has tried the methods of pruning Apples and Pears, by leaving them very much to Nature, with slight pruning only, and pruning and disbudding freely, and he has found the former plan more conducive to the bearing of fruit. The site of the garden is 450 feet above the sea, and as Sutton's Perfection Tomato partially ripened out of doors this year, the soil cannot be cold. Hale's Early Peach ripened on a west wall this year before Moor Park Apricot. Sutton's Abundance Potato is yielding this year at the rate of fourteen tons per acre on this rich land, and some of the Potatoes weighed 17 ozs. each. The Winter Nels Pear, growing on an unrestricted pyramid, has cracked badly during the past two seasons, which Mr. Weaving attributes to the damp weather; so it seems there is a drawback even to The Whittier. The Pears must be imported. H. E.

NEW OR NOTEWORTHY PLANT.

CYPRIPEDIUM LEDA, n. hybr.

JOHN C. BOWRING, Esq., Forest Farm, Windsor Forest, has raised a hybrid *Cypripedium*, which has recently flowered in his collection. It is said to be a seedling from *C. X Harrisianum*, the pollen probably being derived from *C. venustum*, as the characters of that species are well represented, both in the upper sepal and the veining of the lip. The upper sepal is broadly ovate, pale green, with a white margin, bright-green nerves, and some dark brown at the base, and on the lower part of the midrib. The petals are rather short and broad, and much like *C. villosum* in colour, with a few dark brown spots at the base. The lip is short and stout, light purple-brown round the mouth, and paler behind; the nerves darker green, and the side-lobes with numerous minute light-brown spots. The staminode is pale green, closely reticulated with dark green on either side of a central fleshy keel. The leaf is pale glaucous green, with transverse dark green reticulated markings. It is fairly intermediate, except that the purple stripes on the upper sepal of the mother plant are almost entirely obliterated.

ORCHID NOTES AND GLEANINGS.

CATTLEYA TRIANÆ COBBII.

THIS variety has by far the handsomest and most perfectly formed blossoms of any of the *C. Trianæ*s of the *Backhousiana*, or feathered-petalled section; the plant has been for some years in the collection of Walter Cobb, Esq., Silverdale Lodge, Sydenham, and it has always been pronounced distinct by competent judges, among whom the late Mr. Frank Casey suggested the advisability of fixing by name a means for its identification. Two fine flowers which have just reached me, finally prove it to be constant. In form these are the same as some other of the best varieties of *C. Trianæ*. The pale rosy-illac sepals are broad and flat, and the nearly oval petals arrange well with the broad and not too long lip. But the striking and superlatively attractive features are the inch-long brilliant mauve-crimson markings on the tips of the petals, which markings are not run or smeared, and heavy, though they scarcely show on the reverse of the petal. In respect to the colouring on the tip of the petals, the present variety differs from *C. T. Backhousiana*, which is splashed with colour towards the middle of its petals, and also from *C. T. Ernestii* with its prettily mottled tip to the petal. The labellum of *C. T. Cobbii* is of an intensely glowing crimson-purple in front, with clear chrome-yellow extending to the base of the pure white column. But with regard to the fine *C. T. Backhousiana*, unfortunately anything with a little splash in the petal is now sold for it. James O'Brien.

SEEDLING FUCHSIAS.

I AM pleased to see that the veteran George Fry is to read a paper on "Fuchsias" at one of the meetings of the Royal Horticultural Society during the summer. No one is so well adapted to deal with the subject, more especially as in many experiments Mr. Fry has made with Fuchsias during the past few years, he has endeavoured to cover new ground by proceeding upon original lines. Therefore, we shall all be pleased to hear, when the time comes, what the veteran has to say upon the subject.

I think the raising of seedling Fuchsias has become almost a past art in floriculture. I can quite understand anyone saying, what is the use of attempting to raise seedlings while there are so many fine varieties in cultivation. But the possibilities of production are illimitable, and I would suggest that if some of the more novel of the decorative varieties were taken in hand and crossed, breaks might be obtained of a singularly attractive and valuable character. Apart from this, the raising of seedlings of any popular flower is one of the most agreeable and pleasant occupations relating to the culture of flowers, and as so few are engaged

in obtaining seedlings of Fuchsias, there is ample room for enthusiasts to undertake the work.

But then it is not worth while going to work unless on the really good seed. One cannot depend upon what is obtained at seed-shops, because a good deal of it is not taken from just such varieties as the operator would desire to work with, and so it would be best to request some one who is noted for growing a good collection to save seed from a few of the very best varieties, especially those possessing some individuality of character. Better still, to select three or four striking varieties and carefully cross-fertilise them, making a note of the crosses, and so far as possible in impregnating the flowers, seeking to secure definite results.

But how to proceed with the work of fertilisation is a matter of the first importance. Having selected the varieties intended for the purpose, the operator should carefully watch the flowers as they expand, cutting away all imperfect ones, and retaining only such as are true to character and of fine quality. The flower to be impregnated must have all the anthers cut away from it, then by means of a fine camel's-hair brush the pollen, at the right moment, is taken from the flower to be crossed on to it, and carefully laid upon the stigma, making a careful note of the cross; then a piece of fine netting should enclose the flower to prevent insects from undoing the work of the cross-fertiliser. The seed will ripen quite as well if the plant is placed out of doors, but I have known birds to steal the seed pod, which is, of course, a great disappointment. The seed pods need to be carefully watched as they approach ripening; indeed, they are apt to drop before fully ripe, and become lost. One old raiser of seedling Fuchsias used to make a practice of rubbing the newly-ripened pods between his hands, then to pick out the seeds from the pulp by the aid of a fine-pointed penknife, and spread them out on a sheet of white paper to dry, placing them upon a shelf in the sun, and cover them with a sheet of glass to prevent them being blown away. After becoming dry, the seeds, mixed with a little fine silver sand, were placed in a small wooden box, and kept until the time of sowing came round. But pods are sometimes disappointing, and though large, plump, and full of promise, when cut open are destitute of seeds, while much smaller ones, on the same plant, will produce forty. There is no difficulty in procuring Fuchsia seeds, as seed pods are freely formed, and they are generally fertile, but it is better to sow twenty seeds obtained from carefully impregnated flowers than three hundred taken indiscriminately from a collection with but poor results flowering from the experiment.

And now comes the question, When to sow? It may be said seed can be sown at any time of the year, but it is best to sow in January or February, as the plants can then be had in flower the following summer. Take some 32-sized pots, have plenty of drainage, place over the drainage a little moss or cocoa-nut fibre refuse, then fill nearly to the top with a fine light rich soil. Sow the seeds thinly upon the surface, and cover with a quarter of an inch of finely-sifted leaf mould and silver sand; giving them a gentle syringing, and then plunge the pots to their rims in a gentle hot bed. But if an ordinary propagating bed be not available, the seeds should be sown a few weeks later if they are to be raised in a dung frame, but care is necessary in covering at night, giving air, &c., for if the heat be too rank, the seeds will quickly germinate, and damp off quite as fast. For three weeks or a month after sowing, the surface of the seed pots should be kept merely moist; and great care is needed that the tiny plants are not eaten by insects. As soon as the seedlings have formed a pair of leaves above the seed leaves, the strongest can be pricked out into 60-sized pots. I am informed by old raisers that at this stage of growth the seedlings feel the removal much less than at any other time. As they grow into size, they will need to be shifted as required, and eventually bloom in 48 or 32-sized pots, according to their size. A stake should be placed to each plant, so that it

may display its habit of growth to the best advantage.

As Fuchsias are now employed mainly for decorative and bedding purposes, it is indispensable they be of a good, free, and compact habit of growth, and thoroughly floriferous, as well as continuous in bloom. I think Mr. James Lye, of Clyffe Hall, deserves great praise for raising seedlings showing such a remarkable freedom of bloom as his new varieties do. They have superb quality, with all that can be desired in reference to habit of growth, and it is these characteristics which cause them to be in such large demand for exhibition purposes. *R. D.*

EUCALYPTUS OIL.

The old saying, that "It is an ill wind that blows nobody good," is being realised by the dealers in Eucalyptus oil, which is strongly advocated as an

future it will remain a regular domestic remedy, as it has become in Australia the home of the plants, which yield it; and it is further an interesting fact, that as the reputation of Eucalyptus oil has grown in public estimation, other sources of supply than Australia have been discovered, and even in Australia the distilling industry is no longer confined to Victoria, all the colonies now sending supplies to this country. Considerable quantities of the oil are distilled in the South of France, and as many as 20,000 lb. of the oil of Eucalyptus globulus are now exported yearly from California.

The growth of the Eucalyptus in California is another example of how rapidly new industries are developed in the far west. The first plantation of any extent was made in 1869, when 55 acres of hill land at the back of the town of Haywards was planted with *E. globulus* seedlings, to supply the want of timber, and to improve the climatic conditions of the locality. As it proved a satisfactory

They had noticed the pleasant odour which came from the boilers, but they were unaware that the leaves contained a volatile body until they were told what a valuable oil they were wasting. Means were at once taken to collect it, and that with the boiler fluid was the beginning of a very respectable industry, which was ultimately taken over by the company. The factory is situated at the San Lorenzo Station, on the Southern Pacific Railway. The trees in the forests and plantations are cut down, and the leaves gathered by men called strippers. From 10 to 12 tons of leaves are operated upon daily, these yielding 1,500 gallons of boiler fluid, and 70 lb. of essential oil. The oil is thus a big product, and during the past two years it has become so important a part of the industry, that the company have appointed a skilful chemist, under whose instructions the purity of the distillate has become greatly improved." *John R. Jackson, Kew.*

MORMODES ROLFEANUM.

We are indebted to M. Lucien Linden for a specimen of this remarkable Orchid, a coloured figure and full description of which appeared in the *Lindénia*, August, 1891, t. 289. The shape of the flower is sufficiently indicated in our woodcut. The sepals and petals in the specimen sent were of a dark nankeen-buff colour, and traversed by numerous conspicuous liver-coloured nerves; the fleshy, curved lip was also liver-coloured. The species was dedicated by M. Linden to Mr. Rolfe, to whom, since the death of Professor Reichenbach, we too have been specially indebted for descriptions of new Orchids.

THOROUGH CULTURE FOR VEGETABLES.

Admitting the extent and adequacy of cultural and calendrical suggestions and advice, so plentifully disseminated throughout the country, in technical serials, papers and otherwise, I think the fact remains that the great advantage attaching to thorough cultivation has not taken hold of the minds of the mass of allotment holders, cottage gardeners, &c., to say nothing of those who possess villa gardens and other lands.

Even though results in this country are, as a rule, twice as profitable as on the Continent, not even excepting the much-vaunted *petite culture* in France, we are bound to confess, Scotland with its inferior climate is as far in advance of England as the latter is in advance of Continental countries. The average productions, per acre, are about as follows:—France £4, England £8, Scotland £15, and it may be added, Ireland, with its greater rainfall, £4 to £5. Against this, instances have occurred in Essex, where exceptional returns, amounting to above £35 per acre, have been affirmed.

Too frequently the very first essentials to thorough culture are overlooked, or dispensed with. This is particularly so in the case of small holdings, throughout the country. It is also noticeable in gardens of greater pretensions: I do not include in this category, gardens where efficient gardeners are employed, though my remarks may prove useful to young men amongst such as are struggling on successfully, not having had the advantages which proper training invariably gives.

Apart from the science of soil amelioration, based on abstruse rules of chemistry and similar standpoints, we act on the principle of utilising obvious mechanical and fertilising natural agencies, at the command of all. I advocate the efficient manipulation or tillage of all grounds intended to grow fine vegetable roots, to a minimum depth of 3 feet, where subsoils so admit, as an all-important primary essential.

It may be said, "This is a necessary and well-known fact wherever good crops are anticipated." My answer is,—If that is so, it is confirmatory of my subsequent proposition, which is this: Each and every piece of ground where vegetable crops are

FIG. 30.—MORMODES ROLFEANUM.

influenza preventive [without however any adequate evidence of its being more than a palliative. Ed.] From our contemporary, the *Chemist and Druggist*, we learn, that owing to the very great demand for the oil, a parcel of a fine brand, which only two or three days previously had been sold for 2s. 6d. per lb., sprung up suddenly to 4s. 4d., since which time quotations have advanced by 6d. per day, or even more, till on January 20 it reached 7s. 6d., and on the following day 8s. was paid for the oil of *E. globulus*, and it was stated that 50 lb. of the same oil had been sold during the day at 12s. 6d. per lb. At that date, nearly all holders who had any merchantable oils to sell had been cleared out, but a vessel was said to be due having a considerable quantity on board, though most of this was already sold before it had actually arrived. Since this was written, the *Ormuz* has arrived with about 2000 lb. on board, and further supplies are expected.

Our contemporary before referred to, speaking of the filip which the influenza scare has given to Eucalyptus oil, says, it is highly probable that in the

investment, yielding a profit of 17-50 dols. per acre per annum, which was increased as experience was gained, the example thus set was quickly followed by others. One large forest was planted seven miles south of Los Angeles, and now the Eucalyptus is found over a tract of 400 miles along the Californian coast, cultivated in fields varying up to 100 acres. The trees, which are chiefly *E. globulus*, grow rapidly, and form a splendid shelter; the other species grown is *E. rostrata*, but this is cultivated chiefly for its timber.

At first no attention was given to the distillation of the oil, and its adoption as a commercial article is thus described:—"In 1883, a Mr. George Downie discovered by accident that a decoction of Eucalyptus leaves removed the scale from boilers. He set about putting a preparation on the market, and succeeded in this. Meanwhile he found that in superintending the manufacture of the boiler fluid, he had lost an asthmatic affection from which he had suffered for years. A friend with whom he was associated in the work was also cured of bronchitis.

to be grown, and which is devoted to such culture, should be trenched, and in conjunction, manured deep down, as liberally as can be done, as a first and primary operation. I affirm that such efficient preparation produces immediate results in the quality and value of the first crops, effecting the improvement referred to, whereby all subsequent crops profit incalculably.

The first essential in preparing earths for root-growth abounding in root-foed, is pulverisation; breaking up solidified deposits of the past ages, thereby admitting air, with its all-powerful disintegrating influences. When once broken up, it changes greatly, continuing such amelioration in favour of food-searching roots all but indefinitely. The change is not one of food-supply alone, however; its mechanical capacity becomes more elastic, whereby moisture and warmth are more freely, and therefore more equally, diffused. Furthermore, such sites, once trenched, always work more freely afterwards, and can be dug more deeply at each subsequent digging or forking, and with less labour, which is no mean consideration.

Contrast long-tined forks or spades inserted into such soils as these, and how freely they work, with those driven down on to hard, previously untamed depths. And imagine roots previously nurtured in good ground, delving down into crude hard, comparatively foodless airless depths, and it is not difficult to decide. Shallow-tilled grounds are much harder to work at all times and seasons, and good crops an impossibility, as compared with what is the case where a more rational culture is practised.

Thorough culture, however, demands further consideration than has yet been given. Beyond working the ground up deeply once, if no more, the value of duplicate forkings in winter is greatly underestimated. The ryots in India put us to shame in this respect. Deficient as are their ploughs and tools, they turn the ground over again and again in season, rarely letting it rest. The usual British plan is to dig it once in a year, and seldom more. This is a system of turning over, not manipulating or stirring, to form those free soft moulds prize Potato-growers value so highly.

Finally, while the result of good culture is a yield of double or treble ordinary crops, with greatly enhanced quality, what about labour or outlay! This, as already shown, would be more than compensated for by ease in working during all the subsequent years. Moreover, owners who cannot turn over the whole of their ground one year, should do a portion each year, until all is in thorough workable, capable order. *William Earley.*

GROWING SWEET PEAS.

THE wonderfully improved varieties introduced lately, in which many lovely shades of colour are found, have given to the Sweet Pea a prominence amongst our garden flowers it had not previously enjoyed. Those, who like myself, have seen Mr. Eckford's fine varieties displayed by him at the Birmingham and Shrewsbury Shows, and elsewhere, can testify to their beauty and to their appreciation by the visitors. As cut flowers they richly deserve attention, and they last so long in a cut state. For dinner-table decoration they are lovely objects, and a bouquet of Sweet Peas is an object the eye can rest upon with pleasure. The American florists have found out the value of the Sweet Pea as a commercial flower, and its adaptability to various kinds of decorative work, and the flower is becoming popular in the States.

The cultivation of the Sweet Pea is the point I wish to draw attention to. It is the general rule to sow in rows very thickly together, but no greater mistake can be made. I went on from the great Shrewsbury show in August last to Wem to see the new varieties of Sweet Peas, and I found myself amongst 2½ acres of them in long rows of a sort, all growing free from each other, and in rows about 6 feet apart. Some plants from 24 inches to 3 feet apart,

from 2 to 2½ feet through, branching and bushy from the bottom, and from 5 to 6 feet high, and each plant a "thing of beauty." By giving the plants ample room, the flowers are much finer, and in Eckford's new varieties, it is not only in the very lovely new shades of colour that we see so much improvement, but it is especially apparent in the size, form, and substance of the flower, and the increased number of blooms on each stem. I mention the bush form of Sweet Pea I saw at Wem to indicate what the Sweet Pea can do as a plant under favourable conditions; and as to general culture, I cannot do better than quote the cultural instructions found in Mr. Eckford's catalogue:—

"In preparing the ground, if not already tolerably rich, a liberal dressing of thoroughly decomposed stable manure should be dug in some time before the ground is wanted, leaving it rough and allowed to consolidate before sowing. When preparing for sowing, all that is necessary is to break the ground thoroughly with a hoe, and draw a drill about 3 inches deep, and sow the seed thinly, and cover with 2 inches of soil, leaving the drill hollow, and gently tread the ground if dry. When the young plants begin to appear, tread the row on either side, making the soil firm for a distance of 18 inches on either side. Sow early in February, and for succession in March, April, and May."

As soon as the plants are well above the ground, they should at once be staked, and this is an important operation, as nice new twiggy sticks, if possible, should be secured, preferring light undressed sticks, as the Sweet Pea delights in clinging to, and hanging from, the points of the twigs; and a mulching of some light material should be given if the weather is hot and dry. Any well-decomposed leaf-mould, spent Hops, or horse-droppings well broken will answer the purpose, or all may be mixed together, and this to the Sweet Pea is infinitely more important than watering. The stakes should be very firm in the ground. It is wonderful what is being accomplished in colours, for in the new variety *Primrose*, we have a very near approach to a decided yellow; in *Mrs. Eckford*, a delicate tint of pale primrose; in *Dorothy Tennant*, a rosy-mauve colour; and in other varieties, very bright crimson-scarlet, rose-claret and pale blue, pale mauve, bright purple-blue, orange-pink, very great improvements in whites, dark maroon-purple, and a host of intermediate shades of colour.

Even the old varieties of white, scarlet, purple, Painted Lady, and striped, are sown much too thickly, and staked far too closely together. When Messrs. Carter & Co. gave us *Scarlet Invincible*, we had a great advance, and this firm, as well as Mr. Eckford, has since devoted much attention to crossing, and with great results. Others are engaged in the same work, and the Sweet Pea will shortly be regarded as a popular flower, and deservedly so, for its long stems and fragrance alone are two great points in its favour. *W. D.*

CYCNOCHES GLANDULIFERUM.*

FURTHER material has just come to hand respecting the singularly sportive genus, *Cynoches*. Dr. Lindley's *Herbarium* contains a rude tracing of what appears to be a life-size drawing of a Mexican plant, labelled "*Cynoches glanduliferum*, Rich. and Gal.," which does not appear to have been anywhere described. It represents a species much like *C. Egertonianum*, Batem., but with the sepals and petals distinctly spotted, as in *C. peruvianum*, Rolfe. Nothing further seems to be known about it. A plant, however, which has just flowered with Mr. W. Bull, F.L.S., of Chelsea, and which has been sent to Kew for determination, with the information that it was imported from Mexico, appears to be specifically identical with the one just named. The sepals and petals are light green, spotted with brown, and the lip white, except the two basal teeth, which are light green. It also flowered with Mr. Bull in

August, 1889, and what is evidently the same species with Mr. J. Charlesworth, Heaton, Bradford, in August, 1888. Both were sent to Kew, but the habitat not being stated, they were not then identified with the tracing in question. Nothing is yet known of the female flowers, but these may appear hereafter, and in any case the re-appearance of the other sex is very interesting.

The re-examination of this and allied species has led to some rather startling results, not altogether unexpected, perhaps, for I have long felt there was something mysterious about the history of *C. ventricosum* and *C. Egertonianum*, though I have been unable to explain it satisfactorily. I am now convinced, however, that a similar confusion has been made to the one I recently pointed out in the genus *Catasetum*. The case of *Cynoches ventricosum* sporting into *C. Egertonianum* has been so often quoted, and has become so familiar, that we need only refer to it in brief. Among Mr. Skinner's earliest Guatemalan collections, was a curious plant with long pendulous racemes of small flowers, which it was thought desirable to introduce into cultivation. Some plants were sent by Mr. Skinner, which on flowering "proved to be merely the old *C. ventricosum*." Some mistake being suspected, a fresh supply of plants was sent, but which "were scarcely settled in the stove before flowers of *C. ventricosum* were again produced." Mr. Skinner being then about to return home, kept one of the plants under his special protection during the voyage. This plant flowered at sea, and the flowers, which were the genuine *C. Egertonianum*, were exhibited on their arrival, thus seeming to preclude the possibility of further confusion or disappointment. The plant was placed in the stove at Kynpersley, but when the season of flowering came round, it only brought with it a recurrence of the former scene of astonishment and vexation, for the flowers "were not distinguishable from the old *C. ventricosum*." These "were still hanging to the stem," when the inexplicable plant produced a raceme of the genuine *C. Egertonianum*.

This story is so pretty that it seems a pity to spoil it, and the facts are so clearly set forth that at the first glance it seems impossible to explain them away. Indeed, it is only after a mature consideration of all the facts now known, and by aid of the experience gained in dealing with the allied genus *Catasetum*, that I feel able to deal with the remarkable phenomenon exhibited at t. 40 of Bateman's splendid work, *The Orchids of Mexico and Guatemala*, a plate which has always possessed for me a peculiar fascination ever since I first set eyes on it. That plate, undoubtedly, shows two racemes, one of *C. ventricosum*, the other of *C. Egertonianum*, growing from the same pseudobulb, and most people will be inclined to think, as I long did, that nothing can explain away the fact, especially as Lindley carried the question a step further by figuring *C. Egertonianum* with a flower supposed to be *C. ventricosum* actually growing intermixed on the same raceme (*Botanical Register*, 1843; *Misc.*, pp. 75, 77). The following facts, however, must be taken into consideration.

There are five other species, of which both sexes are now known, namely, *C. Loddigesii*, *C. chlorochilon*, *C. Warscewiczii*, *C. pentadactylon*, and *C. Rossianum*, in every one of which the column is short and stout, with two fleshy more or less triangular wings, but without the anther. The males, on the contrary, have a long and slender column, without wings, but with a perfect anther. In the first two of these species, the lip is almost identical in the two sexes, but in the other three, the lip of the male flower is totally different, being far smaller, and broken up into radiating teeth. An examination of t. 5 of Bateman's work, which represents the original *C. ventricosum*, will convince any one that the flowers shown are males, and that the lip is analogous with that organ in *C. Loddigesii*, and *C. chlorochilon*. The fruit shown is, of course, from a flower of the other sex of the previous year. The green flowers shown on t. 40 of the same work are certainly identical in every respect, although

* *Cynoches glanduliferum*, Rich. and Gal., ex Hemsl., in *Gard. Chron.*, 1879, pt. 2, p. 268, name only.

from our experience with other species, they should have been females. On turning, however, to Lindley's figure, showing the two kinds on the same raceme, we see that one flower is a female, the other four being *C. Egertonianum*. (This figure was reproduced in these columns in 1843, p. 775.) One or two of the flowers are somewhat in a transition state, and I suspect the female is not absolutely normal. Unfortunately, Lindley has not preserved them. We now turn to *Paxton's Flower Garden*, where, in a note under t. 75, Lindley writes of *C. ventricosum*:—"Sports to *C. Egertonianum*, and even towards the cucullate form of *C. Loddigesii*, as was ascertained by Sir P. Egerton, in 1849." The latter part of the note is more fully explained in his *Herbarium*. On the sheet of *C. ventricosum* are two flowers, both from "Sir P. Egerton," one received "August 30, 1849," the other "October, 1849." They are both females, evidently of *C. ventricosum*, of which there is also a fine male raceme on the sheet, and, I venture to state, much larger and appreciably different from the single female figured by Lindley on the raceme of *C. Egertonianum*.

We may now return to Bateman's figure of *C. ventricosum* and *C. Egertonianum* on the same plant. These, as we have already seen, are both males, and each has been observed to produce flowers of the other sex. Now it would be, indeed, remarkable if any species were found to produce four different kinds of flowers, two males and two females, and with our present knowledge of the genus, we may safely dismiss the idea as impossible; and with it must go the combination shown on Bateman's beautiful plate. But how can we explain its origin? From Bateman's own words, it is clear that the two were not borne simultaneously. The plant is *C. Egertonianum*, and was drawn when in flower. But there were two other flowers "still hanging to the stem," no doubt much too withered to be drawn, and as these had attracted so much attention, and "were not distinguishable from the old *C. ventricosum*"—to cite Mr. Bateman once more—the artist, instead of restoring the withered flowers, borrowed them from some drawing of *C. ventricosum*. But in doing this, he was making the male of one species do duty for the female of another, simply because the two were so much alike that they had been confounded together. Why they should have so been confounded need not be discussed here; the bare fact is sufficient. We need not quarrel with Nature for having made them so much alike, though it has been sufficiently perplexing for poor botanists. Unfortunately, there is no dried female flower of *C. Egertonianum* at Kew, but there is an excellent drawing, by "Hy. Etheridge," sent by "Mariano Montealegre Tijó, Costa Rica," in December, 1880, representing a plant with an erect raceme of two olive-green female flowers on one side of the pseudobulb, and a long pendulous raceme of twenty-two dull purple males on the other, which is so similar to *C. Egertonianum*, that I am inclined to think it belongs to the same species. If not identical, it represents a very closely-allied species, but dried specimens are not yet forthcoming to decide the point.

Not only are *C. ventricosum* and *C. Egertonianum* distinct, but they belong to different sections of the genus, the former to *Eucynoches*, the latter to *Heteranthæ*. Bateman wrote:—"The species (if as such it may be regarded), was named in honour of Sir Philip Egerton, before any of its eccentricities had been discovered, otherwise the compliment might have been deemed a dubious one." It is satisfactory half a century afterwards to be able to establish its claim to specific rank on so firm a footing.
