Amongst the principal woods imported into Bremen Cedar, Mahogany, and Walnut hold a prominent place. The former is the produce of Cedrela odorata, and is imported almost exclusively for manufacturing cigar boxes. The best quality and the largest quantity comes from Cuba, and during the year 1882 as many as 90% cubic metres were imported, and 8522 cubic metres sold—a larger quantity than has been sold for the last fourteen years. Of Mahogany the imports amounted in the same year to 1318 blocks from Cuba. Broad Cuban wood was in great demand, and was readily sought for by cabinet makers. Walnut was also in great demand during the year, and blocks of large size were largely bought, while the narrow widths were comparatively neglected.

- GARDENIA FLORIDA. - Admirers of this warm-house shrub-and who does not admire its bright foliage and deliciously scented ivory-white blossoms?may be interested in learning the early history of the plant, and in finding to what an extent it was appreciated about a century and a quarter ago. The following memoranda were written by PETER COLLINson, and published by Mr. DILLWYN in his Hortus Collinsonianus:—"A most fragrant beautiful ever-green shrub, given me this year (1761) by my friend, GORDON; first found and brought to England by Captain Hutchinson, anno 1755; taken up in the country of Soldaina, near the Cape of Good Hope. As the Captain was surveying the country, not far from the shore, he was surprised with a rich odoriferous smell ; turned about and saw this fine shrub in flower : next day brought his men and took it up, and put it in a tub; brought it home and gave it to his curious friend, Mr. WARNER, of Woodford, Essex." July, 1758, I was at Mr. WARNER'S, and saw the Cape Jasmine in great perfection. Mr. GORDON, gardener at Mile End, from cutting and then laving, has a great many; at first sold for five guineas a plant, and now, anno 1761, for two guineas and two and a half," "This year, in May, 1764, a Jasmine raised from seed by Mrs. LEE, at Tottridge, is now in flower, and proves to be the Cape Jasmine with a single flower."

—— BIOTA ORIENTALIS PYGMÆA. — Under this name there are in the Isleworth Nursery of Messrs, C. Ler & Son plants not more than 8 inches in height and as much through, perfect hemispherical masses of green, bronze-tinted twigs. We were somewhat surprised to learn that these plants were about a score years old; the original ones, imported from the Continental oursery in which the form was first noticed, do not exceed the dimensions above stated, In a miniature shrubbery border or on rockwork, where larger things would be out of place, these tiny forms are certain to command the admiration of lovers of the curious.

- CLEMATIS ÆTHUSIFOLIA VAR. LATISECTA -The genus Clematis may, under favourable con-ditions and in favourable seasons, supply flowers nearly every month in the year. The South European C. cirrosa, and the still more showy C. balearica, are now brightening up many a wall in some southern gardens. It is more than a month ago since we saw the first speckled Hellebore-like sepals of C. balearica. C. æthusifolia and its varieties, on the other hand, are late autumn-flowering plants, and most graceful ones they are. The white blossoms, from half to three-quarters of an inch in length, and between bellshaped and cylindric in form, are produced in extraordinary profusion, and are pendulous from stiff erect stalks. Few more graceful and beautiful objects statist. Few more graceful and beautiful objects exist in October in any garden than the long wreaths of leafly stems studded thickly with flowers afforded by this species. It is perfectly hardy in this country. In a wild state it ranges from Pekin to the Amur River. The form whose name appears at the head of this note was figured in the Botanical Magazine, tab.

CARTERS' "PRACTICAL GARDENER." — Messrs. JAMES CARTER & Co. have just issued the eleventh edition of their Practical Gardener, which, having reached a sale of over 80,000, requires no word of commendation from us. The same firm has also issued a very useful essay on the formation and after-management of lawns, lawn-tennis and cricket grounds, which they issue free to all applicants.

- THE WEATHER .- General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the ending March 17, issued by the Meteorological Office, London: — The weather has been unsettled and rather rainy in Ireland and on the extreme western coasts of Great Britain, but dry and exceedingly fine in most parts of Eogland and Scotland. The temperature was about equal to the mean during the first two days of the period, but subsequently rose rapidly and became unusually high for the season in almost all parts of the kingdom, the excess for the whole week being 8° in the "Midland Counties," 7° in "England, N.E.," and 5° or 6° in nearly all other districts. The maxima which were recorded on the 16th, were as high as 70° in " England, E.," and the 'Midland Counties," 68' in 'Scotland, E.," "England, N.E.," and "England, S.," and "Fugland, S.," and "Scotland, N.Y." in 'England, N.W.," and "Scotland, W. f" in "Scotland, N.Y." however, the highest reading was only 55°. The minima were registered on the 11th, and varied between 28° and 30° generally, while in the "Channel Islands" 37° was the lowest temperature. The rainfall has been more than the mean in Ireland, but less in all parts of Great Britain, while in the Channel Islands it has equalled its normal value. Bright sunshine shows a further increase in duration in most places, the percentages ranging from 58 in the Channel Islands to 38 in "England, E.," 37 in "England, S.," and 14 in "Scotland, W." Depressions observed .- During the whole of this period the barometer has been comparatively high and steady in all the east and south-east parts of our area, while depressions have been moving in a northerly direction outside our western coasts. The only depression noticed over our islands has been a small subsidiary disturbance which travelled north-northeastwards over our south-eastern counties and the North Sea as the week commenced. Southerly winds have prevailed on all our coasts, and, though light or moderate in the south-east and east, have blown strongly in the west and north-west, and at times risen to a moderate or fresh gale.

GARDENING APPOINTMENTS. — Mr. F. GOUGH, late Gardener to H. WILSON, Esq., Burntwood, Cheadle, Cheshire, as Gardener to R. II. BANKES, Esq., Kingston Lacy, Wimborne, Dorset.—Mr., JAMES EWING, for the last few years Kitchen Garden Foreman at the Gardens, Taymouth Castles, as Gardener to Andrew Coates, Esq., Pitcullen House, near Perth.—Mr. W. Crunn, formerly at Beaurepaire Park, Basingstoke, as Gardener to J. P. CURRIE, Esq., Sandown House, Esher, Surrey.—Mr. McDonald, lately in Ross-shire, as Gardener to R. Johnstone, Esq., Boulogne-sur-Mer, France.—Mr. JAMES TAYLOR, lately Gardener at Storrington Rectory, Sussex, as Gardener to J. PATRICK, Esq., Hunstanton.

THE WEST INDIAN LIME.

THE flowering and fruiting by the Earl of Ducie, F.R.S., of the Lime of the West Indies (Citrus medica var. acida), affords an opportunity of making better known a fruit which has been much misunderstood. I should premise that the word Lime is promiscuously applied to fruits very different to this, especially in British India, where the Sweet Limes of various forms are universally spoken of under that name, and that all these, together with the West Indian Lime, are varieties of the Citrus medica of Linnæus, which includes the Lemon, Citron, sweet and acid Limes of the East Indies, and the small globose-fruited plant here figured (Bot. Mag., t. 6745). C. medica is so closely allied to the C. aurantium, Linn., which includes the sweet Orange, the bitter or Seville Orange, the Bergamotte, &c., as to have been classed with it, as forms of one species, by several excellent authors, together with other fruits which do not concern us here.

The genus Citrus is essentially an Eastern one, and the forefathers of Oranges, Lemons, Citrons, and Limes, are certainly Tropical Asiatic, and may be found (though whether always in their pristine contition as opposed to escapes from cultivation is not easy to determine) in the hot valleys of the Himalaya, of the mountainous districts of Eastern Bengal and of the Decean.

From Tropical Asia they have, in their numerous cultivated forms, been transported into Africa, Australia, and the New World, where the Orange extends into the temperate zone, and the Lemons also, but with less power of enduring cold, whilst the small acid Lime seems confined to tropical or subtropical zones; hence, I do not find any plant exactly answering to the latter in the magunificent work of Risso and Poiteau, illustrating the South European Oranges and Lemons, whilst in the floras of the East and West Indies it is always included.

The first good account of it is by Rumph (Hortus Amboinensis, vol. ii., p. 107, t. 29), published in 1750. He describes it under the Latin name of Limonellus, alias Limontenius, or thin-skinned Lemon, answering to the Malayan name of Limon Nipis (in Dutch, Liemis Boom), as a spinous bush with small leaves much brighter than those of the other Lemons, small flowers with the odour of those of the Lime of Martinique, five petals, spherical, smooth, fruit the size of an Apricot, skin citroncoloured, extremely thin, pulp greenish white, gratefully acid, having a delightful odour and taste. He adds that it is found in all the Oriental islands, but never in the woods, always near bouses, implying that it is not indigenous. The only author who has definitely taken up Rumph's plant is Hasskarl, who, in his first Catalogus Horti Bogoriensis, published in 1844, has C. limonellus with two vars .- a pointed fruited and a rounded fruited; and in the edition of the same work (1866) he publishes C. limonellus var. globosa from Amboyna. B. Hamilton had previously alluded to it in his Commentary on Rumph's Hortus Amboinensis (Wern. Trans., vol. vi.); and the name C. limonellus, Ham., accompanies specimens of a plant collected by him in India, and distributed by Wallich (Cat., n. 6386), which is probably the same species. C. limonellus is also described by Miquel, who says that it is cultivated everywhere in the Dutch East Indies. Curiously enough, whilst Rumph describes the petals as five, he figures invariably four, and this and its other characters indicate his plant being the same as the Rungpore Lime of Bengal, the sixth variety of Roxburgh's C. acida, which includes the sweet and sour Limes (not the Lemon), characterised as a small hush, with a small pinkish flower, usually four petals, and a perfectly spherical fruit, having a thin skin of a lively yellow colour and pale acid juice.

Dr. King has had the kindness to send me copies of Roxburgh's drawings of the Limes cultivated by him in the Calcutta Botanical Garden, and they confirm this identification, both as to flower and fruit. This plant is very well figured by Wight as C limetta, Risso (Lones, t. 958), who says it is certainly wild in the Nilgherry Hills, forming a low, erect, thorny shrub, with a profusion of fragrant white four-merous flowers. He adds, however, that the juice is "watery acid," sweetish, "or occasionally slightly bitter"—a variation not likely to occur in a native plant.

When preparing the Forest Flora of Central and North-Western India, Dr. Brandis asked me to help

settle the synonymy of the genus Citrus, so that it should be in harmony with the Flora of British India, and after a long study we concluded that the various forms grouped themselves under three generally recognised species, of which two were indigenous to India, and one had been introduced. The native are C medica (the Citron, Lemon, and Limes), and C. aurantium (the Oranges, and the Bergamotte); the third, C. decumana, Wild., is assumed to have been derived from Polynesia, and is the Shaddock (Pumalo, Pomplemoes, sometimes called Forbidden Fruit). think this arrangement holds good, except possibly in the case of the Bergamotte, which has the highly-scented skin of the Oranges, but its pale-coloured skin and sub-acid juice are those of the Limes. Turning to the West Indies, which is the great second home of the Lime, and the principal area of its cultivation, I find it described by the exact McFadyen as C. lima, McF., a thorny shrub with ovate leaves, pentamerous white flowers, small nearly globose yellow fruit, with thin skin and an abundance of pure acid juice; it is naturalised in Jamaica, forming strong fences: all characters precisely accordant with Lord Ducie's plant. Grisebach unites with it C. spincsissima, Meyer, and refers both to a variety of C. aurantium, L., in which he is certainly mistaken. Brandis alludes to the West Indian Lime, following Grisebach as to its position and synonymy, but adds that the fruit is very much like the small acid Lime of India, and suggests the removing of it from under C. aurantium. The C. spinosissima of Meyer (printed by a lapsus "acidissima" in Brandis) is no doubt a subvariety differing in its very small leaves, flowers, and Other authors refer the West Indian Lime to C. limetta, Risso, which is its nearest European representative, but which differs in its sweet juice. The last reference which I have to make is to a woodcut in the Gardeners' Chronicle (n. s., vol. v., p. 690, fig. 123) of what appears to be the fruit of this plant, under the name of "the Bijou Lemon," with unfortunately no history attached. With the exception of this woodcut, I know of no other published figure of the Lime than that here given. It is a favourite fruit in the West Indies and Southern United States, the acid being far more grateful than that of the Lemon; and it is hence universally used for flavouring soups, &c., and in the preparation of many alcoholic and acidulated drinks. In my younger days it was imported in vast quantities into city of Glasgow, providing an indispensable material for the brewing of the famous Glasgow punch. That it is now so seldom seen comparatively is due to the declension of that social and family intercourse that once was so intimate between the great city and the Spanish main. It is still the principal source of citric acid, and is cultivated in the West Indies for its manufacture, especially in Montserrat and Dominica.

Earl Ducie, to whom I am indebted for the specimen figured, informs me that he purchased the plant, and is not aware of its origin; it fruited in January, 1883, and the flowering branch was sent in the following April. Both were very fragrant. Plants at Kew from the Montserrat estates of Messrs. Sturgess, presented by the firm, have smaller, more membranous, and darker green leaves; others from the same source, grown in Mr. Hanbury's garden on the Riviera, have ovate-lanceolate long-pointed leaves. Sir J. D. Hooker in the "Botanitaal Magazine."

THE BOLEYN NURSERY, UPTON.

THIS nursery, in which everything connected with the business of an essentially trade establishment is rushed with an energy that is combined with much acute apprehension of essentials, is at all times of the year worthy of a visit. Not established more than six years, in an increasing neighbourhood, it has made rapid progress, and at the present moment the numerous glass structures occupy the major portion of the original site. These are simple in style, roomy, and moderately low, precisely the kind in which to grow dwarf stocky stuff, when standing close, and being arranged, as one may say, in "columns of companies. they are easy of access and convenient for working. First to be noticed of popular plants, grown here large numbers are Palms. Whole houses are devoted to these plants, beginning with numbers of boxes, io which are the small two leaved plants, going on through little larger plants in thumbs and 60's, to stocky specimens in 48's boasting of having a few characteristic leaves each. Of Kentias

there must be close upon 6000 in pots alone, the sorts being K. Belmoreana, K. Canterburyana, and K. Forsteriana. Corypha australis is also much grown, and pretty dwarf well furnished plants were observed in various stages of development. Seaforthia elegans, Caryota urens, and the beautiful Euterpe edulis are met with in great numbers, all small, admirably grown, without an unhealthy plant among he Palms receiving the greatest attention are them. T Cocos Weddelliana, Geonoma gracilis, Latania borbonica, and the handsome Areca lutescens, of these last two there being at the lowest computation 20,000 in the houses. These are ever in request, the unsuitable treatment they get at the hands of those who must perforce grow them in rooms being answerable for much of this great demand. Palms in hoxes of about 18 inches by 12 are to be seen in most of the warm houses, under stages, on hanging shelves, or on the shelves at the lower angle of the roof, but everywhere having a perfectly healthy look, saying much for the correctness of their treatment here. Perhaps next in quantity to the Palms are the Crotons and Dracenas, the latter consisting mainly of D. Baptisti, D. amabilis, D. Guilfoylei, and the true form of D. rubra, but all as quite young stuff in small pots, and the propagation is being pushed on at a great rate. The Crotons are not so numerous as regards the sorts, the more choice and elegant forms being selected rather than a heterogeneous collection of the more bizarre-growing ones, pleasing marking, compactness of growth, and general handiness for decorative purposes, being the leading ideas apparent: such are C. augustifolius, C. pictus, C. Johannis, C. majesticus, C. Queen Victoria, C. Weismanni, C. interruptus, and C. Voungi.

A houseful of rooted store pots in the best of condition, with no failures in any pot, was a sight to rejoice the heart of many an amateur, who with his unfortunate makeshift appliances seldom meets with entire success. These were mainly of a "soft" character, such as Salvias, in fourteen sorts; Fuchsias in 140 : Coleus, all the best and most distinct, inclusive of two new ones - Pompadour and Congress, beautifully spotted kinds; Dahlias, single and double; Marguerites, blue and gold; Chrysanthemums of all kinds; Petunias, including those splendid acquisitions of Continental origin that were shown at Paris and Lille in the autumn of 1881. Lobelia pumila Ingrami, a pretty, dwarf floriferous white kind, is much grown, as are all the best sorts of Verbenas, Heliotropes, especially General Garfield and White Lady; Bouvardias in great numbers, and Acalypha musaica, this last seemingly a plant that finds many admirers.

Next to the Palms the Ferns are the most important class of plants grown by Mr. Crowe. These are to be found in immense numbers, from mere germinating spores, clothing pots and pans with a mosslike mantle of green, to the mature plant in the market When it is said the Ferns follow 60's or 48's. the Palms, that must be understood as meaning in importance, certainly not in numbers. The chief kinds grown are Blechnum corcovadense, of which last a splendid lot in large 60's was seen; Doryopteris palmata, Phlebodium aureum, Cheilanthes elegans, and many forms of Maidenhair, the handsomest of these being a variety called Adiantum Victoriæ, the foliage reminding one of A. Farleyense, but being less heavy and stiffer, and, therefore, better adapted for bouquet and vase work; A. Legrandii, a pretty confused looking, tufted kind, in general appearance not unlike the pretty A. cuneatum deflexum shown at the Royal Horticultural Society's meeting on March 11, excepting that it has tufted pinne that render it very distinct looking. Pteris cretica is well done, and especially fine was a large batch of Polystichum angulare in 48's, and a lot of Lygodium scandens, which last appears to be taking the popular

Azalea mollis is grown in great numbers, as are also Eucharis candida, and Begonias of the Rex section, the finely-marked, very sturdy, and dwarf-spreading B. President Bolle being very noticeable. Carnations, both border and tree, form a feature of the stock here, their cultivation having been one of the earliest taken up by Mr. Crowe. And so we find their propagation and culture being carried on at the present time with his characteristic energy. Amongst the newest of the latter are Prince Imperial, a robust growing red sort of excellent form, and very useful for cutting purposes; Sarah Bernhardt, also a well formed flower of a buff colour, flaked with red maroon; and General Roberts, a very full large

flower of a deep buff ground, edged and heavily flaked with red. Mr. Crowe has collected a large collection of all the best varieties of zonal Pelargoniums, and over 300 sorts of fancy and show kinds, the whole of which are pictures of health, and the foliage entirely free from spot. Some capital plants were to be seen of the remarkable Pelargonium Madame Sillerai—a variety bearing much resemblance to the well known Dandy, but which has never borne a bloom. It makes an excellent edging plant where a distinct greyish tint is wanted. The fine varieties of Pelargoniums sent out by Lemoine, both single and double-flowered, and those also of Mr. Pearson are here represented. Tuberoses are grown in masses, and are well done.

HYACINTH SHOW AT EXETER.

THE seventh annual exhibition of Hyacinths, held under the auspices of the firm of Lucombe, Pince & Co., took place on Friday, the 14th inst. The plants were arranged as usual in one of their large show-houses, and the whole of the houses of the establishment and grounds were thrown open to the public as on former occasions. The weather was delightfully fine, and the public largely availed themselves of the kindness of the firm in opening their premises. The Hyacinths, &c., which were more numerous than usual, were arranged on one side of the show-house in three rows, supplemented by over 200 Hyacinths grown by the firm. These were backed up with Ericas, Epacrises, Arums in large quantities, Palms, Tree Ferns, and Camellias.

The opposite side was filled with a mixed display of Cinerarias, Hydrangeas, Spireas, &c., backed up with plants similar to the other side, thus production of the competitors were quite up to the form of preceding exhibitions. The 1st prize was awarded to Mr. Snell, gr. to J. B. Lawless, Esq., The Cottage, Topsham Road, his collection being many points ahead of the others; 2d honours were accorded to Mr. Perkins, gr., Crediton; and equal 3d prizes were awarded to Mr. J. Sloman, gr. to Captain W. Fane Tucker, Braddon Tor, Torquay, and Mr. Viney, gr. to Mrs. Norris, Beacon Downes, Pinhoe. A collection staged by Mr. Counter, gr. to Mark Farrant, Esq., Exeter, contained a very fine tot of spikes, dwarf and well grown, and well worthy of notice. Another collection, put up by Stafford N. Green, Esq., was very creditable. Collections were put up by several not for competition, and with the addition of those staged by the firm the display was really grand.

The Orchid-houses contained a fine lot of Dendrobium nobile, some dozens of large plants covered with bloom; also in flower were specimens of Cypripedium barbatum, Dendrobium crassinode and D. densiflorum album, Lycaste Skinneri, Cattleya Mossiæ, &c. One half of the large Heath-house was occupied by flowering plants of their Cineraria Wonder of the West, a strain which the firm has grown and sent out for several years, and which is remarkable for the size of the bloom, some measuring $3\frac{1}{3}$ inches across. A fine batch of their Primula Ruby Queen, a fine ruby colour, and large in the trusses, is becoming very popular. The house devoted to Anthurium Scherzerianum and its varieties contains many seedlings just coming into bloom, some of which, by the size and thickness of their spathes, are destined for distinction; some of the spathes were 63 inches long and 4 inches wide.

A good plant of the fine new Nepenthes Mastersiana, assuming a fine colour, was suspended in this house. The houses devoted to pot Vines, Roses, &c., showed signs of good cultivation; so also did the large house devoted to the show and regal Pelargoniums. The fine Lucombe Oak at the entrance to the nursery was still thick with foliage, which fact refutes the erroneous impression sometimes seen in priot that it is deciduous in winter; it does for a week or two in the advanced spring shed a great deal of its foliage, but only for a very short period does it fail to don its nevertieen amenators.

don its evergreen appearance.

Mr. Elliott, to whom the business has been transferred, must be congratulated on the success of this his first Hyacinth exhibition; the fact that a spring exhibition, when this charming and attractive flower is in bloom, not being held in Exeter otherwise, it has become very popular.

Home Correspondence.

Chionodoxa Luciliæ,—Those who have experieoced disappointment with this bulbous plant would be well repaid if they could see the beds of it at present in flower in the York Nurseries. Certainly it would be difficult to imagine a sight more lovely than to see thousands of these large blue and while Scillalike blossoms all expanded together. The bulbs which form this charming display have been planted for three years, and have not been disturbed. We may safely consider it one of the most beautiful of all spring flowers. It prefers a deep sandy but rich loam in which to grow. R. Potter.

Clerodendron trichotomum.—Your figure of Clerodendron trichotomum does not do justice to that splendid shrub. I have seen it in Northern Nipon, very high up the mountains, amongst the Beeches, with panicles of 18 inches and more. To grow it to such a size it ought to be planted in rich vegetable mould. From its native habitat it will certainly be hardy even in Belgium. Kew Gardens received it several years ago from Dr. Regel. Jean van Volxem, Brussels.

Growth of Pinus Pinaster.—The accompanying sketch (fig. 73) was forwarded to us by Prof. Henriquez, of Coimbra, and shows a forked condition

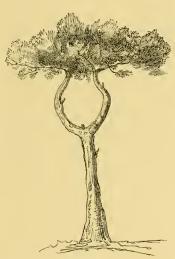

FIG. 73 .- ABNORMAL GROWTH OF PINUS PINASTER.

arising from the destruction, from some cause or another, of the leader.

Old-fashioned Flowers.—I send a list of garden flowers which appear to have been common about 150 years ago. It would be interesting to know what existing flowers (if any) were known once by these old-fashioned names:—Flower Geutle, of many colours; Memorables, Bacchus Bole, Royal Shuttlemaker, Dianea, Pluvion of Rome, Silver-capped Spanish Moley, Double Velvet Rose, Marble Rose, Virgin Silk, Moley of Huogary, Virgin Rose, Dorothea, Melancholy Gentleman, Garden Patience, or Monk's Rhubarb. The list could be greatly lengthened. £. V. B.

Peculiar Tree Growths.—I have several times met with singular tree growths, similar to the one mentioned by Mr. Webster. I have seen one kind of tree growing out of the stem of another, and I thought it possible that some birds might have dropped the seed of the one into a hole in the trunk of the other and that it had germinated there, for I had known of an old Apple tree with a fine Fern growing in its side and I also knew of a Holly tree and an Ivy growing on one stem. Both trees must, from the stem of the Ivy, be very ancient, and they present a

most curious appearance. There appears at the first glance to be but one crown as well as one trunk, but a closer look shows the two kinds of foliage and the two sorts of betries. Helen E. Watney.

British Ferns.—I am quite at a loss to imagine, after reading Mr. Druery's and Mr. A. D. Webster's interesting remarks on this subject, where all the native Ferns collected in some of our rural districts, and packed off to town in large hampers, can possibly go to, since the cultivation of our native plants seems, by your correspondents' accounts, to be much neglected. I thought that there must be a very great demand for English Feros in the market, as every lane, bank, dell, and wood for miles around the part of the country I reside in have been rifled of their of the country I reside in have been rifled of their chief attractions—Feros, Mosses, and Primroses—by "collectors." Mr. Webster may well laud the Carnaryonshire Feros. I remember obtaining some fine specimens at Dolbarden a few years ago, but I almost regret that he should have drawn attention to them, for it would not astonish me to find that a couple or more "collectors" put in an appearance this spring on the Carnaryonshire mountains, and make a raid upon the Ferns, not with a view of cultivating them, but of selling them, as they do the Hampshire Ferns, in Covent Garden. The distance is considerable, and I sincerely hope that it may deter them. Heller E. Watrey.

able, and I sincerey with the letters of Messas. Helen E, Waney,
— I am pleased to see from the letters of Messas. Druery and Webster that these plants are by some still considered worthy of being mentioned in "the public prints." Whatever may be the reason, it is certain that they are less popular now than twelve or fifteen years ago. Unlike Mr. Webster, however, I do not ascribe this indifference to the high (?) prices at which they are sold (if at all) by murserymen; on the contrary, the comparatively high prices are the consequence, and not the cause, of the limited demand. Let the public show a taste for this class of plants—or, indeed, any other—and a supply will quickly be forthcoming. Your readers will understand that it will not pay a nurseryman to propagate a plant by the thousand when has only the chance of selling perhaps a dozen or a score of plants, no matter how low be may offer them. One may visit hundreds and hundreds of nurseries, great and small, without coming across one decent collection of British Ferns; if any are met with at all it will probably be a few wretched stunted plants of the commoner kinds, planted out-of-doors in some out-of-theway corner near the rubbish-heap, and looking anything but encouraging to the would-be Fern grower. The ordinary nurseryman gives no attention to them, for the simple but sufficient reason that it does not pay him to do so. The most beautiful varieties are frequently sucered at by the superficial as "monstrous" and "unnatural" | As ii, forsooth, any production of Nature's could be unnatural! Not about the improved varieties of fruits? To be "natural" ought we to be content with the wild Crab instead of the inproved varieties of fruits? To be "natural" ought we to be content with the wild Crab instead of the user varieties of fruits? To be "natural" ought we to be content with the wild Crab instead of the busions Victoria or Magnum Bonum? Again, those who have not studied the subject have no idea how beautifully he law of the evolution of species is illu

Fruit Prospects in Devonshire.—Our fruit prospects as regards Apricots, Peaches, Nectarines, and Pears, are very promising. The first-named have been opening their blooms for the last ten days; the weather has been very rainy, and the temperature low, with but little frost, and that not sufficient to injure the blossoms. As we are approaching the period which proved so disastrous to the crop last year, it behoves us to guard against being caught enapping, by having in readiness, besides the copings to the walls, protection for the front also, to put up should occasion require. It is not only the keeping of the bloom quite dry, but the guarding of it from cold, cutting winds, which the tender qualities of the bloom cannot resist, that is necessary to secure them from danger. In the absence of glass for front protection Frigi-Domo, baize, or the stout shading manufactured of the purpose; these may be bought of any length or width. I have in use a thick shading manufactured and sent these materials for the purpose; these may be bought of any length or width.

out by Messrs. B. Eddy & Co., Porthlevin, Cornwall, which I have found more durable than Frigi-Domo or baize. Peaches that were taken off from the walls before Christmas are much later than those not so treated, the latter opening its bloom, but the former quite a fortnight or three weeks later, which is a great consideration. D. C. Powell, Powderham Cautle.

Myosotis dissitiflora alba. — I have been amused to read Mr. Diver's self-complacent claim to have been the raiser of this pretty Myosotis. Seeing that it appears to have broken out as a sport in more than one place almost simultaneously, it is difficult to understand how any one can claim to be the raiser. Here it sported in one small shoot on an old plant four years since, and from that tiny piece I have obtained a large stock; yet it would be absurd were I to claim to be the raiser, seeing that it has not been "raised" at all. Almost at the same time the large-flowered kind named Perfection broke here, and similar forms have sported elsewhere, A. D., Bedfont.

Fruit Prospects in Suffolk, — Mild as the winter has been, trees do not appear to be any forwarder than usual, for though we have little frost and scarcely any cold, there has been a remarkable absence of sun, which, after all, is the propelling force that sets vegetation in motion. If this luminary breaks through the clouds now, we shall see a great change in a short time, as buds are fast swelling, and Apricot blooms are now expanding, which, with us, is about the same period as last and other years, as they are generally open by the middle of March, and unless cut off, set-to swelling by the end of the month. We can afford to spare many this season, as the trees are very full of flower, which look as strong and promising as I ever remember. Peaches and Nectarines are also equally good, but Pears, that had much fruit on hem last autumn, are thin of blossom. The heavy cropping does not appear to have had any effect on Apples, which everywhere, so fat as I have seen, are crowded with hud, and the chances are therefore much in favour of another very fine season. Plums and Cherries are in the same satisfactory state, and all we want is a warms settled spring, which gardeners are all hoping we may have, although the weather prophets are predicting all sorts of evils, founding their fore-tellings on the absence of cold up to the present, and which they say is yet to come; but if so, may it keep away till the close of the year, when we shall be more indifferent to the sting in its tail. We had much such a winter last year as we have passed through this, and, excepting for Plums, fruit was more abundant during the summer than it had been for a very long period, and may be plentiful again in the one one before us. If so, we shall cease to lament our not being visited by hard frosts, which, by many, are looked on as necessary to keep things back, although short days and absence of light do this, as may be seen by the state fruit and other trees are now in. J. Sheparate.

Plant Labels.—It has been said that however willing people are to acknowledge that flowers can be better grown by others than by themselves, every one is convinced that his own labels are superior to all others. The two enclosed labels lay no claim to novelty, but they are cheap, easily made, and of a convenient shape, which also suits for cutting them out without waste of material. Four pounds of zinc makes nearly too of the larger size; 3 lb. nearly roo of the smaller ones. They can be cut with a common pocket-koile, or a chisel, 100 in from an hour to an hour and a high. But one thing is probably felt by all who use zinc labels, namely, the inability to write a label on the spot, when a plant is seen which requires one. If no indelible pencil is to be had for writing on zinc, could not a larger sized stylograph be made (which could be carried about in the pocket), to hold a good supply of zincink, and of some material that would not be injured by it? Seeing a suggestion some time ago that a common lead pencil was suitable (as though the writing looked faint at first it became more distinct in a few days), we tried it, but it was a complete failure. Many a plant is left unnamed if a label is not at hand to be written on at the moment; yet few things add more to the interest of a good collection, than having he plants clearly and correctly named. Zinc labels are sufficiently inconspicuous to be largely used without interfering with the beauty of a garden or rockery, as white painted wooden labels must do. In this damp climate we find wooden labels must do. In this damp climate we find wooden labels must do. In this damp climate we find wooden labels must do. In this damp climate we find wooden labels must do for years. White painted wooden labels must do for years when it looks faint. Usually they remain sufficiently distinct to trust to for years. The ink we now use is made from a rectipe kindly given to me by Mit. Neitl rost. The proper is made from a rectipe kindly given to me by Mit. Neitl or of water. Car

when this is not the case. After trying various sizes in zinc labels of this shape I prefer the smaller one of the two enclosed (or one a little shorter) for use on rockwork, and the larger one for other parts of the garden, where labels are more likely to be disturbed; a longer label is apt to get bent, a very short one to get buried. C. M. Owen.

Setting Peach Blossoms .- I am of opinion Setting Peach Blossoms,—I am of opinion that a great deal too much importance is attached to the artificial setting of Peaches, which in the majority of cases is quite unnecessary, as it is next to impossible for the numerous grains of pollen contained in each anther to fall or float off in the air without one, at least, lodging on the stigma of each flower, and although I am not sure that it is so probably the single grain is quite sufficient to fertilise the ovule and cause the ovary to set. The thing I am always most particular about is the condition of the atmosphere, which, when the trees are in flower, ought to be light. which, when the trees are in flower, ought to be light, which, when the trees are in flower, ought to be light, dry, and bouyant, which condition may be ensured and maintaiced by having just a little heat in the pipes, with a "crack" of air on the ventilators by night, which air it is necessary to increase early in the morning and during the day, according to the state of the weather. If this is done, and a temperature ranging between 45° and 60° be maintained, the pollen cannot fail to ripeo and be fertile, and it is only when the internal air is close and humid that its only when the result of the control of pollen cannot sail to riped and be testing, and it is fore and humid that its functions are not carried out, as then it remains a close inert mass without fertility. This may easily be seen by placing the anthers under a magnifying glass, when the pollen grains will be found sticking together, in which state they soon decay, as also do those outdoors on wall trees, where, if the weather is wet and cold during the time the blossoms are open, the pollen quickly perishes, and there is no set. If it is needful to set free and disperse the pollen when the air is quite still and calm a gentle shake or tap of the trellis with the hand will do all that is wanted, and effect as much good as hours or days spent with a camel-hair brush in impregnating the blooms, which in the ordinary way is carried out by the wind, and sometimes by insects, although these latter get the credit of being more useful than they really are, though many tegard them as of such importance that they set a hive of bees in their of such importance that they set a hive of bees in their of such importance that they set a hive of bees in their Peach-house, and like to have many others at work in the gardens. For my part I do not care to see them so busy, as they draw out and remove the ocetar that nourishes the embryo fruit, for which purpose it is no doubt placed there, and the bees are only robbers, obeying the laws of Nature and their own instincts to live. Not content with the honey, they steal the pollen wholesale, and fly away with it oc their legs to make and build up the comb they so dexterously form in their hives. deterrously form in their hives. Any one having any doubt of this may soon satisfy themselves by watching these busy workers on a Peach or Apricot tree, ing these busy workers on a Peach or Apricot tree, where they will soon see them hastily gathering and packing the yellow grains in the deftest of ways, and when loaded flying off to their homes. Some growers of Peaches and Nectatines indoors aver that instead of keeping the air light and dry they syringe, and attribute their success in getting the fruit to set to the action of the water, which is very doubtful, and it is more than likely that the "set" had taken place previously or occurred after. but not from any help reviewing the concurred after. but not from any help previously, or occurred after, but not from any help the water rendered, although it might appear to expedite matters by the rapid swelling of the frinit, which often takes a quick turn after being wetted, when it seems to rush on at once; and this is often very apparent with trees in the open, when subjected to an April shower. J. Sheppard.

Achimenes in Baskets. — The time will soon approach when gardeners will be turning nover their Achimenes in store pots to see how they have passed the winter, and to start a few for early flowering. A Cucumber-leame or other hotbed in work will be a capital place in which to give them a start. The strongest tubers being sorted from the weaker ones, they should be placed an inch apart on the surface of a mixture of half-rotted leaf-mould and peat, containing one-fifth sand. Pans or shallow boxes are the most suitable receptacles, as the Achimeos are but shallow ronters. If the mould was moist the tubers will require no water before the plants appear above will require no water before the plants appear above it, and even then watering must be done with care so long as they stay in a hotbed. If sorts are scarce now is a good time to take the young tips, when they have grown to 3 inches long, and make them into cuttings. They will root readily in the same mixture, taking care to put a thin layer of silver-sand on the soil in the pans in which they are to be struck. One of the prettiest methods of growing these plants is in baskets or shallow pans, or Orchid pots with interstices in the side. Thus suspended and allowed to hang down quite freely, these plants, which are not meant to be marshalled into a stiff upright growing mass, as they are too often seen growing, do well. The plant is and remains a trailer, rooting at every joint when lying on the soil in a warm temperature, like a Philodendron. In moss-lined wire baskets filled with a

soil containing in addition to the before-named mixture a little retentive loam, sifted fine, and somewhat less sand and decayed cow-dung, the young plants, each with its adhering ball of earth, can be planted in the surface of the soil, and also inserted through the moss of the sides. For a basket having the capacity of a peck measure from tweoty-four to thirty single plants may be used, or proportionately fewer when planted in bunches, which after all, perhaps, disturbs the young plants the least. Living Selaginellas of the weaker species can be used to fall over the edge of the baskets, which may be hung in any forcing-house at work, where the shade is not dense. Achimenes do not like heavy syringing, but a moist atmosphere suits them admirably. The different varieties of Achimenes are beswhen grown in a moist warm stove up to flowering time, when a warm dry one suits them better. In fact, they then seem to delight in conditions that are peculiarly favourable to the propagation of red-spider, and will flower then most abundantly; but at the same time the cool conservatory is well adapted for them when in flower during June, July, and August. The old Achimene picta, with a scarlet tubular blossom, and woolly leaves, looking rather more like a Gessera, is well worth growing for winter flowering. Great advances have been made in the direction of variety among the Achimene, still some of the earliest known kinds remain among the handsomest, such as A. patens a lovely blue; A. patens alba, A. longiflora, a violet, very large and beautiful; and A. longiflora alba should be in the possession of every grower of these plants, M.

Transplanting Evergreens.—As the winter has turned out so mild, it would have been quite safe to have transplanted evergreens in the autumn, although, taking the generality of years, that is a risky season, especially if the plants are moved late, as then they have no time to form roots before sharp frosts and bitter blasts are upon them, the combined influences of which search them through and through. Transplanted in spring they escape all risks of that kind, and instead spring they escape all risks of that kind, and instead of standing dry and withered, with little or no sap left in stems or leaves, they look fresh, plump, and full, and start off to grow at once as they receive little check beyond the inevitable disturbance of the roots, which they quickly get over, for directly the buds begin to burst on the branches, fibres form and send up the requisite water. The most trying month for evergreeous is March, which I like to see the last of before lifting any large plants, as the easterly winds we sometimes get are very trying; but when April sets in, with its sunshine and showers, the work may be carried on in real earnest. The only drawback in waiting till this season is, that it leaves but a short period for conducting operations; but by teking in hand the ing till this season is, that it leaves but a short period for conducting operations; but by taking in hand the earliest growing evergreens first, and putting all available strength on the job, a good deal may be got through in the space of two or three weeks. The way to economise labour is to have two gangs of men, the one disping the holes and nation; and the through in the space of two or three weeks. The way to economise labour is to have two gangs of men, the one digging the holes and planting, and the other taking up the shrubs, which division of labour has another advantage, as the plants are moved from place to place quickly, and are not kept long out of the ground. This is much in their favour, as when there is no delay there can be no rost when there is no delay there can be no rost drying or loss of sap by evaporation through the leaves and bank, which goes on at a rapid rate when plants are lifted and exposed, as may be seen by the way they flag and the distressed look they have when so neglected, the effects of which are felt long after, as once the tissues shrivel, it takes some time for them to assume their proper condition again. In digging up evergreens for the purpose of transplanting, it is always advisable to open nut a good wide trench around each plant at a fair distance off, into which opening the soil can be forked out from among the points of the roots and kept shovelled out so as to keep the space clear till the ball has been sufficiently reduced to be small and light enough for illing with the tackle or appliance at command for the purpose. For moderate-sized plants a couple of stout levers are very handy, as they may be thrust under and the shrub lifted bodily out and conveyed at once to the sire where it is to be planted. The best implement I have had to do with for such work is a curved marrow truck with strong sides and handles on low wheels, and by tipping the end of this truck noter the ball of truck with strong sides and handles on low wheels, and by tipping the end of this truck noder the ball of any small tree or evergreen and pulling down the and by tipping the end of this truck noder the ball of any small tree or evergreen and pulling down the handles the plant may easily be hoisted and dragged away by two or three men. In planting great care should be taken of the roots, so as not to bend or bruise them in the straightening nut, and when they are laid regularly and covered with the finest and best of the soil, it is a good plan to dash over them a deantity of water, the force of which will carry the earth in under and fill up any cavities that may exist in any part of the ball. This filling up of such spaces is very important, as any hollows contain and let in air, and cause such a rapid drainage that it is almost air, and cause such a rapid drainage that it is almost is very important, as any nonows contain and let in air, and cause such a rapid drainage that it is almost impossible to keep the ground moist. To ensure its being in this condition it is necessary to mulch, which should be done by scattering a good layer of half

rotten dung or hiter so as to extend 2 feet or more around the stem of each plant. This will prevent evaporation and maintain the soil in a uniform state that will be highly favourable to the roots, which can then find all they require. Should the plants flag, as they are likely to do when the atmosphere is dry, the foliage ought to be wetted during the evening, which may quickly be done by the use of a garden engine or syringe to squirt and distribute the water. What prevents freshly transplanted trees and shrubs growing more than anything else is wind-waving, a motion that is very trying to the roots, which strain and move in the ground, and this constant friction prevents fibrils forming, or, if formed, they are chafed off again. To be safe and secure, all newly moved plants should be kept steady by proper supports, the best for tall subjects being long stout stakes or poles set triangularly in the ground and brought sloping for their points to meet about three parts up the stem of the tree or shrub, and there made fast by binding and ties, which will hold the plant rigid. J. S.

COLONIAL NOTES.

TORONTO, CANADA: March I .- When I awoke this morning the tips of my ears and nose and my eyelids momentarily occupied my attention, and, like an electric shock, their chillness conveyed along the train of thought the inevitable verdict-"Rather sharp last night." On consulting the thermometer the verdict was corroborated with a registration of 10° below zero. This was not altogether unexpected, as the previous night it was 5° below. On entering my coolest house—a vinery and plant-house—containing Calceolarias, Cinerarias, Primulas, Lettuce, and a general collection of successional plants and delicacies for table and conservatory, overshadowed by the Vines, which are just about coming into bloom, the thermometer stood at 55°. This is the end house in a range of lean-to's, about 120 feet long by 15 feet wide. The conservatory is at the other end, next to the family residence, and is what would be called in England "a large conservatory," have included its length in the 120 feet I may here say that it is about 25 feet wide. This construction supplies me with my winter's work, in which I find enough to keep me busy, including my battles with "Jack Frost," which was not quite so risky this season as in the past, as we got in one of Hitching's corrugated fire-box boilers in the autumn-an excellent acquisition, which obviates much of my former time and trouble. When I read in the Gardeners' Chronicle the correspondents' notes with regard to the mild weather you have in England, Primrose gathering, the blackbirds song in the catkin-covered boughs of the Willow, and their mistaken identity of the season, why, I seemed transported at once to some sunny slope on the Berkshire hills, or enjoying a ramble through the flowery hedge of a Kentish orchard; but my attention is drawn towards a tapping at the glass overhead. It's a solitary English sparrow that seeks a drink from the melted ice as it runs down the glass under the direct rays of the noonday sun. Allow me to admire it for a moment, as it is some weeks, nay, months, since I saw a bird of any other species; a hardy little thing, but very destruc-tive, and is now condemned to be "Boycotted," or to be totally exterminated by Canadian agriculturists.

It is now mid-day, and I will see how the thermometer stands. The sun strikes rather hot against that back vinery wall. I can't give air just yet though, as the ventilators are frozen down; but I find, on going out, that I had forgotten to dry my hands thoroughly, and they are now frozen to the latch of the outer door, and I declare the thermometer has gone up to 3° above zero. That's pretty good for us. We'll soon have some stray redbreast or beautiful woodpecker come to see us, and although it's too far west for the cuckoo to come, the whip-poor-will, or little bumming-bird, will usher in the foliage and fruit blossoms.

The first time I saw a humming-bird I was sitting on a pair of double steps thinning away in the vinery, Presently I heard the constant buzz caused by the little creature's wings, and I thought the sound was produced by the wheel of the old sawmill close by, which by some sudden cause was set going—but no; I looked round again, but nothing new or uncommon greeted my view. Thoughts again took flight, and brought to my memory the hollow-sounding wind rushing through the passages and tunnels of an old English residence during the absence of the family; but no, 'twas nearer this time, simpering round the bloom of a Black Hamburgh, and while on the wing passed round the bunch, and searched each nectary with its long delicate bill. H. R. Lee, Oaklands, Toronto, Canada.

Çhe Kosery.

SPRING WORK.—All the prognosticators and prophets have been sadly wrong, who predicted for us a severe winter; it was, perhaps, natural to expect that we should have a different one this season, but the unexpected has again happened, and unchecked mildness has been its character, and as yet there are no signs of the recurrence of that severe blast of cold weather we experienced The consequence, as far as regards the last March. Rose, is that in many gardens the plants have started into growth, and even buds have been formed on the end shoots, suggesting a waste of effort which many regard as seriously affecting the prospects of the bloom, and perplexing growers as to what is to be done in the matter of pruning. There cannot be much doubt that there is a considerable waste of sap in such early growth; but I think growers will hardly mourn over it when they remember what a bard winter is for their favourite flower, when they have to cut back as bard as possible because the blackness of the pith tells them too plainly how the frost bas caught hold of the plants; moreover, the experience of last year teaches us how great is the recuperative power of the Rose, even of those kinds which are generally considered delicate. Thus I saw at Mr. George Baker's, at Holmfels, Reigate, a row of Marie Baumann, on the seedling Brier, which for vigour and excellence of bloom could not have been excelled. Now these plants had shared with all others the effects of the forward winter, and as it is the habit of the Reigate Rose growers to prune early. they had been pruned before the severe weather above alluded to in March; the consequence was that they had to be pruned again, and yet, after all this, they were models of beauty; and Marie Baumann is generally considered a delicate Rose, and if it could withstand, such an experience it is quite clear that the general run of hybrid perpetuals can do so. And I do not think that any gloomy anticipations need be indulged in because of the forward state of the terminal buds, for if the plants be examined it will be found that all the buds at the base of the shoots are dormant, and these are the only buds which will be left when the pruning is done. When is this to be done is the question that now will be most pressing on growers. It is a general practice, I fancy, to prune about March 20. Of course I write for amateurs, for nurserymen, with their large numbers, are obliged to do it when they can, and I do not think it would be well to commence before that; after it we are hardly likely to have severe frosts, and those which affect the young shoots we are hardly free from till May is over,

As to the character of the pruning opinions differ, whether the plants should be cut hard back or not. My own practice, and that of many other growers, is to cut hard, that is, to three or four eyes, and by this means to encourage the plants to throw up from the underground buds; these shoots have then almost the character of maiden plants, and the blooms from them are generally very fine; but others, again, prefer not cutting so hard, leaving the shoots about 9 or 10 inches long. If this is done no eye that has started should be left, and the plant should be cut below the last started one. There are a few very rampant growers where hard pruning would be unadvisable, such as Madame Clémence Joigneaux, Etienne Levet, Edouard Morren, &c., for it would have the effect of throwing them all into wood. Delicate growers, on the other hand, cannot well be pruned too hard.

Teas will have to be dealt with a little later.

Few gaps can have been made in the rosery during the past season, and those who made up their beds in natumn will have nothing to do in this respect, for not only has the winter been mild, but dry, less rain has fallen than usual, and the roots have not become soddened; but I have been of opinion, and am still, that unless you can get your Roses from the nurserymen carly—i.e., the latter end of October or beginning of November—that it is better to lay them in and plant in the spring. I was told that the plants would have emitted a large number of rootlets, that these would be injured, and that damage to the plant would ensue; all I can say is that I did not find it so, and that both plants and flowers were all that I could desire for a first season's planting. I believe that the iden which Mr. Fish started in the Rosarian's Year-

Book, of moving the plants in the autumn, is gaining ground, that it stimulates root-action, and thus tends to the well-heing of the plants. Should there be gaps in the beds and no reserve stock laid in, the only way to remedy it is to procure plants in pots, which the nurserymen have always in hand.

There are two ways of treating the Rose beds at this time of the year—one is to take off all the long straw in the mulching with which they have been littered during the winter, and, indeed, in some cases, to give fresh mulching; those who go in for exhibiting will most likely do this, and not care for the appearance of the beds. I prefer, myself, not being an exhibitor, to take off the long straw in the litter, and then gently fork over the beds; this prevents blackbirds from scattering the manure about, and I think that it is equally good for the plants, and the beds have certainly a more tidy appearance. Of course mulching can be kept tidy, but it involves more trouble than most amateurs would care to give.

It is useless at this time of the year to write anything as to the choice of varieties, but should Roses be required to fill up spaces there are a few which it would be well to obtain - such, for example, as Merveille de Lyon, which, whether it be a sport or seedling from Baroness Rothschild, is likely to be a valuable acquisition. Bennett's Earl of Pembroke also promises well, as do Henri Schultes and Lady M. Fitzwilliam, of the same raiser-the first somewhat like Maurice Bernardin, the second a purplishrose, and the third a light pink. Mary Pochin is a good Rose, but I fear that its habit will not long allow it to be retained on the lists. Amongst Teas there are two or three perennial varieties, but of these we must wait to see more. The Hon. Edith Gifford is a white slightly tinted with rose, said to be like Devonianum, and a free grower. Prince of Wales (Bennett's white) I saw well exhibited several times last season is, and as far as one can see, a good new Rose, yellow and rose. Souvenir de Thérèse Levet has been described by one nurseryman as a crimson Niphetos! Il it at all corresponds to this description, it must be a grand acquisition; for although Niphetos is a very undependable flower, and is apt to throw its petals about, yet they are so large and of such good substance that a red flower of that character would be very valuable. Wild Rose.

ROSE COMTESSE DE CAMANDO.—A II.P. Rose of the Général Jacqueminot type, sent out by M. Lévêque, of l'aris. It is stated to be a free flowerer, whose blooms are largely used by the bouquet-makers of Paris. The flowers are large, regularly imbricated, bright red, shaded with carmine. It is figured in the March number of the Journal des Roses.

∯loqists' ∯lowers.

THE HYACINTH season is at hand, and as I admire the large massive spikes of beautifully formed and exquisitely perfumed flowers, in all their bright and varied colours, I feel that we owe a deep debt of gratitude to those who have brought this flower to such a high point of perfection. It seems to me rude and unthankful in the highest degree to speak or write of the florist as one who has abused or spoiled, rather than aided Nature in improving her own handiwork. A globular Rose, or a globular Chrysanthemum, has been produced by long and patient watching and waiting; thousands of people are delighted with them; but here is what I read in a contemporary. Writing about Chrysanthemums of the Empress of India and Mrs. George Rundle type, the writer says, "They are altogether repellent, rather than attractive, to tasteful and artistic people;" and further he informs us that "The florist of to-day has lost his power of forming public taste; his mission as a floral schoolmaster is gone-a result mainly brought about by the market growers, who have educated the public to admire flowers really beautiful by producing them in large quantities at a cheap rate." The writer in question does not seem to appreciate the work of what he calls the "florist proper," whatever that may mean. But I wonder what our gardens would be without the flowers that have been improved by the florist! The greater part of the work of the market gardener would be gone, too. The market

gardeners find it answers their purpose to grow Chrysanthemums of the Mrs. Rundle and Princess of Teck type by the thousand; and they grow them because it pays to cut the flowers and sell them. Every florist's window in Covent Garden market is full of the globular flowers in November. The tasteful and artistic people are evidently in a minority at the West End at Chrysanthemum time. But we find all through the season that the "market grower" is rate," if you like—the plants provided to his hand by the despised florist. Now it is the Hyacinth and Tulip, soon it will be Fuchsias and Pelargoniums, Roses, Carnations, Pinks, &c. I do not think a man can be sufficiently interested in his own work if he has time to leave off and abuse the work of others that he does not quite understand. The florist has a fixed purpose in his mind's eye. He works for something difficult to obtain-a flower better formed and more beautiful in all its parts than any of his predecessors or compeers have attained. The object may not be achieved, but the pleasures of anticipation are very great.

" Hope springs eternal in the human breast, Man never is but always to be blest."

The work of raising and improving florists' flowers has been going on for ages, and ages yet unborn shall continue the work their fathers have handed down to Some writers of the present day, and workers as well as writers, seem to have got it firmly fixed in their heads that if a man is a "florist proper" he is good for nothing else but pottering over his few fanciful flowers. Perhaps they do absorb more than a fair share of his time; and I should say better is it so than that he should spend his spare time in interfering with and disarranging the work of his neighbour in another part of the vineyard. Let every man be fully persuaded in his own mind what his work is, and let him do it with all his might. I believe that the florist of to-day does his work better and more quickly than it was done some years ago. Take the Amaryllis as an illustration. Some ten years ago Hippeastrum Leopoldi was introduced to our gardens-placed in our hands as a leaf from the book of Nature. Not long did it remain in its pristine beauty. The hybridist was speedily at work crossing and intercrossing, with results more remarkable and more speedily accomplished than the whole age of flori-culture has yet seen. The vigour of the plants, the form and colour of the flowers, have been improved, to a degree that is simply marvellous, by Art and Nature walking lovingly hand in hand. Go to Chelsea, inspect the large show-house, now full of Amaryllids in flower, in Messrs. Veitch's nursery; carry the mind back for ten years, and compare the Amaryllis then with what it is now, and say, if you can, "that the florist of to-day has lost his power of forming public taste." F. Douglas, Great Gearies,

THE AURICULA. - The mild weather is causing the alpines out-of-doors to develope their flowers, and if the weather continues favourable there will be an early and strong bloom. It seems to me that to grow choice alpine Auriculas or any other choice border flowers out-of-doors they require more attention than they do under glass. Slugs are constantly prey-ing upon them, and they cannot be satisfactorily dealt with in any other way than by catching and killing them-not a very pleasant occupation on cold winter nights, or before daybreak. choice compost is usually placed round the roots, which attracts large worms; these also do harm, so that it is only by stirring the soil amongst the plants, and carefully watching them during winter, that they will do well. Seedlings are now coming up thickly from seeds sown on a hothed about six weeks ago; the tiny plants require attention during the early stages of their growth. As soon as the first leaf is seen projecting from between the seed-leaves they may be pricked out in fine soil, using small 60-sized pots for a dozen or more plants. Some fine sand should be sprinkled over the surface, and it must be made smooth and level, the young plants to be watered with a very fine rose. The trusses on plants in the general collection are now developing very freely, and no good results will be obtained unless the plants are kept on growing without any check to their growth. It is easy enough to care for the plants that are in a heated house: those in frames should be carefully covered with mats, as damp is injurious to the opening flowers, but not so much so as frosts.

THE CARNATION AND PICOTEE .- A grower of these flowers met me a few weeks ago with the question-"Do you still recommend potting so early in the year as you did?" I was able to answer that we had potted our plants earlier this year. I found the plants had made plenty of roots, and, as they were sheltered from heavy rains by glass lights, they could not be injured in any way. They did not receive any water for about ten days after being repotted; by that time the plants had begun to root freely into the fresh compost, and a good supply of water was necessary. Many growers place the plants out-of-doors as soon as they are repotted, in that case they ought not to be interfered with until the end of March. Even then I have seen the plants covered with snow in less than twenty-four hours after they were repotted. This would scarcely fail to be injurious. Tree or perpetual flowering Carna-tions have gone out of bloom, but they were very useful during the late autumn and winter months. Cuttings put in about two months ago should now be potted off separately into small pots, and be grown on carefully in the greenhouse. We potted on the large plants about a week ago; they will furnish a quantity of blooms next season if the plants are well cared for. Such old plants that have bloomed during the winter may be planted out against a low wall or fence. They like rich soil to aid in fully developing the flowers.

THE GLADIOLUS,-In a few weeks it will be time to sow the seeds of the hybrid forms of G. gandavensis. The best way is to sow them in pots, and start them in a gentle hot-bed. The seeds will be up in two weeks; an ordinary two-light frame will be sufficient to raise between 2000 and 3000 plants. Seven-inch pots answer well to sow the seeds in. The general collection should now be planted out, if the ground is in good condition; but I would rather wait for a week or two, if the ground was not sufficiently dry. It is not well to plant them too deep, and whatever may be the nature of the soil it answers well to place some clean sand under and over the bulbs. The hardy species and varieties should be taken up and planted again, if it is intended to do so. My own experience suggests that it is best to leave them alone, at least for twenty years. In that case they will not require attention often during an ordinary lifetime. I plant the roots of these hardy kinds in soil composed of two parts good turfy loam, one leaf-mould, and one of sea sand.

PHLOXES.—March is the best month in which to put in cuttings of these. They will form roots in a cold frame, or on a shelf near the glass in a greenhouse, but more speedily in a hothed. Put each cutting separately in a thumb-pot or small sixty. When they have formed roots and are inured to the open air, they may either be planted out or grown in pots. If planted out in beds they should be a foot apart, next year they would be close enough at 2 feet from each other. Six-inch pots are the best size to flower them in; and there are few more useful plants to place in the greenhouse or conservatory in August. The plants must be grown out-of-doors until they arrive at the flowering stage.

PENISTEMONS.—The rooted cuttings of these preserved through the winter should now be planted out either in the herbaceous borders or in beds. The old plants have passed through the winter in the open ground almost iotact this year, so that the cuttings would not be wanted unless more ground is to be planted. The Pentstemons require much the same treatment as bedding Calceolarias; the cuttings to be put in at the same time in October. J. Douglas.

FORESTRY.

PLANTING WASTE LAND.—A considerable amount of public attention is again being directed to the vital subject of planting the waste lands of our country, indeed the attention the question has already received clearly shows the deep interest that is felt in the matter.

That there are vast unproductive tracts of land in the British Isles is well known, and it is certainly surprising that up to the present time so few of these bleak wastes and hungry moorlands have been transformed into good arable land by the genial protection afforded to them by a well arranged system of plactations. There are some, however, who go so far as to say that Great Britain is over-wooded at present, and that to this cause is to be ascribed the excessive rainfall, and consequent bad seasons from which we have suffered in late years; but a glance at the "Statistical Atlas" of André and Peschel clearly reveals the fact that Great Britain contains a far less percentage of woodland in proportion to its area than any country in Europe. Thus:—

In Sweden woo	dland oc-	Per cent.	In France wo	odland o	
cupies		39	cupies		17
., Russia ,		31	,, Italy	31 31	16,9
,, Austria and		•	,, Belgium	27 47	¥5 8.9
		20	" Spain	39 99	
	29		,, Portugal	12 22	7
"Germany "		25.5	,, Holland	,	7
" Switzerland,	, ,,	19	, Denmark		5
" Greece "		18 (?)	, Gt. Britaio	19 31	2.4

Although these figures must only be considered as approximately correct still it is particularly noteworthy the small percentage of woodland that Great Britain contains. We may safely say, and that without fear of contradiction, that the area of woods and forests in the British Isles might be doubled by the planting of waste or otherwise worthless tracts of ground, with the result of not only benefiting the country at large, but vastly increasing the value of land.

That the getting up of shelter would improve the condition of the agriculturist, and tend to make his home on the dreary treeless plain or bleak exposed upland a more desirable one, we cannot doubt; indeed, in viewing the matter from a disinterested standpoint, tree planting is a necessity, and is urgently required, not only for the amelioration of the climate, but for the sake of the shelter and genial warmth it affords to man and heast.

One of the most discouraging features in planting mountain districts, and one that has seldom been pointed out, is the expense of enclosing the ground. This, in most cases at least, is very considerable, indeed in some cases the principal item in the formation of such plantations, for it is well known to those who have had any experience with mountain sheep that none but a fence of the most substantial quality, whether this be of stone or wire, need be erected to prevent their incursions to enclosed ground. This to many may appear somewhat strange, but to those acquainted with the habits of these sheep it is readily understood, for they are not only more destructive, but being of smaller size are consequently more agile than lowland sheep, and can clear or jump a fence that the latter would never think of attempting. The temptations offered to sheep in newly-formed mountain plantations are also considerable, for not only is the grass in such places tender and sweet, but the little shelter afforded by both fence and trees is at times a welcome retreat from the cold monotain blast to which they are generally exposed. Another deterrent cause, that is frequently pointed out, is the many unsuccessful attempts that have already been made to form such plantations, and which has engendered the idea that the soil or situation is not adapted for the growth of trees, and that further attempts in the same way would no doubt end in a like manner. This may be true in some cases, but a careful examination as to the cause of failure would in nine cases out of ten reveal the fact either that the plants were unsuited to the soil, or that, through carelessness, the roots had become dry or frosted previous to planting-in short, that experienced skill and judgment had not been employed in conducting the work. In choosing plantation sites it is well to bear in mind that the nature of surrounding circumstances, such as soil, aspect, exposure, and several other matters, are of primary importance, and should in all cases be taken into consideration.

That the value of home-grown timber will increase as foreign supplies diminish is beyond a doubt, so that the planting of waste lands may not only be relied upon as a safe investment, but also for the supply of timber—a matter of national importance. A. D. Webster, Penrhyn Castle, North Wales.

ERICA CARNEA. — This, for some weeks, has flowered splendidly out-of-doors, and it is a valuable kind because of its early flowering habit and real beauty, as well also for its good nature in flourishing almost in any soil. At Cambridge, where nearly all Ericaceæ require specially prepared beds, this does well in the ordinary soil.

Reports of Hocieties.

Scottish Horticultural Association. — The annual meeting of this Association was held in Edinards in Deservation of the Association was held in Edinards in Deservation of the Association was held in Edinards with the Association was held in Edinards with the Market and the State of the Association was the Association with the Association was the Association was the Association with the Association was the Association of Mr. D. P. Laird, resigned; Vice-was Leiburg was the Association of Mr. D. P. Laird, resigned; Vice-was the Association of Mr. William Priest, and Mr. A. D. Mackenzie. The retiring President, and Treasurer, Mr. William Priest, and Mr. A. D. Mackenzie. The new Fersident, on its flourishing condition, and trusted it would have a long career of usefulness and prosperity.

Variorum.

THE MANUFACTURE OF VIOLINS IN GERMANY. —In the No. 3 Museum at Kew a very interesting series is exhibited illustrating the manufacture of violins in Germany. It seems from the descriptive label which accompanies them that the woods used in this manufacture are the following :- Norway Spruce (Picea [Abies] excelsa) for the resounding cover, technically called the belly, the vertical fastening of the body, and the sound-post; Maple (Acer Pseudo-Platanus) for the back, the corners, and the neck; Lime (Tilia europæa) for the horizontal fastening of the body, Beech (Fagus sylvatica) for the bridge, White Beam tree (Pyrus Aria), dyed black, for the body of the finger-board; and Ebony (Diospyros Ebenum) for the tailpiece or string-holder, the surface of the finger-board, and the pegs. The following interesting description accompanies this series :- On the road from Munich to Insbruck, the last Bavarian population, is the small townlet of Mettenwald on the Isar. Situated at a high elevation at the entrance of the Alps, its agriculture is poor, and the inhabitants derive their livelihood principally from the forests where the Spruce Fir and the Beech predominate. The former yields in its wood the principal (resounding) material for musical instruments, and the whole of the male population of Mittenwald is occupied in this manufacture — the younger and infirm people through the whole year, the able-bodied at all times when they are prevented from working in the mountains. Every stranger passing this spot will be struck by the sight of hundreds of violins—tenors, violon-cellos, double basses, guitars, and zithers — hanging about the doors, in sunshine and wind, in order to dry the varnish. This branch of manufacture is some centuries old, dating from the time when the famous fiddle-maker, Jacobus Stainer, brought the art from Italy and established himself at Absam, near Insbruck. His pupil, Klotz, and his sons after him, were the first who carried on the manufacture of these instruments in Mittenwald, and it has gradually increased so much that at the present time an astonishing number of such instruments are sent nut from this locality to the whole world, viz., 15,000 violins, 400 violoncellos and tenors, 80 double basses, &c., annually. The manufacture of the single parts, their composition for an entire instrument, its adjustment and regulation, are taught in a practical school established in the reign of King Maximilian II., and skilful and experienced men are occupied in going from house to house to overlook the work, and help by their advice. Several tradesmen who carry on the sale of the instruments furnish the workmen with the wood, which must be carefully selected, dried for many years, prepared and cut with particular tools; the other materials are also supplied by them.

The genuine pattern of the most renowned Italian The genuine pattern of the most renowned Italian masters being procured, and every traditional particularity followed with scrupulous care, it is not rare to see produced here instruments of first quality, and manufactured with particular care, claiming to be of the highest merit, and equal to the old AMATI, GUARNERI, STRADIVARI, and MAGGINI. But the inferior qualities are asked for in the greatest number, and are supplied at astonishingly cheap prices.

ORCHIDS BETWEEN THE POMEROON AND THE ORINGO,—Orchids, as might be expected from the damp character of the district, are unusually abundant; but these are not very different from those of other parts of Guiana. Probably because the district has been less visited and less despoiled than many others; executed Orchids houses, which were appreciations. several Orchids, however, which were apparently once abundant throughout the colony but are now rare abundant throughout the colony but are now rare elsewhere, are here abundant. As an example of this kind may be mentioned Oncidium Lanceanum, which, common as it is in quasi-cultivation in the gardens of the coast, is now rarely to be seen in a wild state, except in this district, in which it is fairly abundant. One very beautiful little yellow Orchid (Oncidium iridifolium), occurring sparingly and in very small clumps on the Pomeroon, grows wonderfully abundantly, and in very much larger clumps, on the Barima. The plant is fan-shaped, like a tiny Iris plant, generally not more than an inch high, and as much across, from which riese, well above the leaves, a delicate stem, on which unfold, one at a time, many yellow flowers. Generally, each plant consists of one, or at most two, fan-like tufts of leaves, but on the Barima plants are to be found composed of a dozen or more tufts, but so small that one can hold the larima plants are to be found composed of a dozen or more tuts, but so small that one can hold the whole clump, root, and leaves in the hollow of both hands; and yet there may be on it, besides buds, from thirty to forty open flowers, each an inch long and three quarters of an inch across, of brillian yellow, and like, but of more brilliant tint than single florets of Oncidium altissimum. Another peculiar and somewhat puzzling Orchio cocurs in this district, resembling in the general habit of plant and leaf (though these latter are broader and of a darker shade). But just point a candida, but with a uendent wreath of (though these latter are broader and of a darker shade) Burlingtonia candida, but with a pendent wreath of greenish-white flowers, like a long, down-hanging spike of Mignonette, rather the wild English Migno-nette than the sweet kinds of gardens. A beautiful pure yellow (lemon-coloured) variety of Gongora is also noteworthy; a violet-flowered Sobralia grows, though sparingly, on some of the tree trunks; and in the shady creeks the lovely Stanhopea grandifora hangs down many of its great white delicate flowers. From "Timekri,"

London: Atmospheric Pressure.—During the week ending March 15, the reading of the barometer at the level of the sea decreased from 29.61 inches at the beginning of the week to 29.25 inches by 9 A.M. on the 10th, increased to 29.42 inches midnight on the same day, decreased to 29.26 inches by 9 A.M., on the 11th, increased to 30.16 inches by 9 A.M., and decreased to 30.11 inches by 3 P.M. on the 15th, increased to 30.13 inches by 9 A.M. on the 15th,

decreased to 30.07 inches by 3 P.M. on the same day,

and was 30. to inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.77 inches, being 0.16 inch lower than last week, and 0.31 inch below the average of the week.

of the week. Temperature. — The highest temperature in the shade in the week was 68°, on the 15th; the highest reached on the 11th was 49°.5. The mean of the seven high day temperatures was 55°.3. The lowest temperature was 55°.5. The mean of the seven low night temperatures was 40°.6. The greatest range of temperature in one day was 22°.5, on the 15th; the smallest was 11°, on the 9th. The mean of the seven daily ranges was 14°.7. The mean temperatures were—on the 9th, 43°.7. The mean temperatures were—on the 9th, 43°.7. The mean temperatures were—on the 9th, 43°.7. The mean temperatures were—on the 9th, 43°.7.

on the 10th, 43°.4; on the 11th, 4°; on the 12th, 4°.3; on the 15th, 4°.8; on the 15th, 5°.8; and on the 15th, 5°.5; and these were all above their averages by 3°.2, 2°.8, 0°.3, 6°.5, 7°.8, 10°.6, and 1°; 1 respectively.

The mean temperature was 47°.5, being 6°.5 higher than last week, and 6°.6 above the average of

higher than last week, and 6.0 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 122°,5, on the 15th. The mean of the seven readings was 100°.1.

The lowest reading of a thermometer with its bulb placed on short grass was 27°.9, on the 12th. The mean of the seven readings was 32°.6.

Kain.—Rain fell on two days to the amount of 0.81 inch, of which 0.59 inch fell on the 11th.

ENGLAND: Temperature. - During the week ending ENGLAND: Temperature, — During the week ending March 15 the highest temperatures were 68°; at at Cambridge, 68° at Blackheath, 63°, 5 at Bristol and Leicester; the highest at Sunderland was 54°, and at Plymouth and Braddord 56°. The general mean was 60°, 5.

The lowest temperatures in the week were 30°, at Truro, 30°, 1 at Wolverhampton, 30°, 2 at Cambridge; the lowest at Brighton was 37°, at Blackheath 30°, 5, and at Plymouth 36°, 2. The general mean was 33°, 5, and at Plymouth 36°, 2. The greatest ranges were 38°, 3 at Cambridge, 31°, 5 at Blackheath, 30°, 8 at Blothor; the smallest ranges were 10°, 8 at Plymouth, 21° at Sunderland, and 21°, 8 at Blighton and Bradford. The general mean was 27°, 3.

27°.3.

The mean of the seven bigh day temperatures was highest at Blackheath, 55°.3, at Cambridge 55°.1, at Truto 54°.7; and was lowest at Sunderland, 47°.8, at Bradford 48°, and at Wolverhampton 48°.2. The general mean was 51°.4.

The mean of the seven low night temperatures was highest at Brighton, 41°.4, at Plymouth 40°.9, at Truto 40°.1; and was lowest at Wolverhampton, 34°.9, at Bloton 36°.1, and at Nottingham 37°. The general mean was 38°.5°.

The mean daily range of temperature was greater.

The mean daily range of temperature was greatest at Cambridge, 17°.6, at Blackheath 14°.7, at Truro 14°.6; and was least at Bradford 9°.7, at Brighton 9°.9, and at Plymouth 10°.5. The general mean was 12°.9.

9°.9, and at Plymouth 10°.5. The general mean was 12°.9.

The mean temperature was highest at Blackheath, 47°.5, at Truro 40°.5, and at Brighton and Cambridge 45°.4; and was lowest at Wolverhampton, 40°.6, at Sunderland 41°.6, and at Bolton 42°. The general mean was 44°.1.

Rain.—The largest fall was 0.81 inch, at Blackheath, 0.74 inch at Truro, 0.73 inch at Bristol; the smallest fall was 0.28 inch at Cambridge, 0.39 inch at Wolverhampton, and 0.40 inch at Nottingham. The general mean fall was 0.54 inch.

SCOTLAND: Temperature .- During the week end-SCOTLAND: Temperature.—During the week ending March 15, the highest temperature was 56°.8, at
Leith; at Dundee, Greenock, and Paisley the highest
was 52°. The general mean was 53°.7.
The lowest temperature in the week was 26°, at
Perth; at Aberdeen the lowest temperature was
32°.1. The general mean was 20°, 3.
The mean temperature was highest at Leith, 44°, 3;
and lowest at Perth, 40°.1. The general mean was
42°.1.

Rain .- The largest fall was 1.35 inch, at Greenock, and the smallest fall was 0.27 inch, at Leith. The general mean fall was 0.78 inch.

LONDON: March 19.—Messrs. John Shaw & Sons, of 37, Mark Lane, report that there is a stendy business now passing in field seeds, the improved weather having naturally increased the sowing demand. Red Clover seed sells at the moderate rates current; white continues unchanged. There is more doing in Alsike, but Trefoils are neglected. Perennial and Italian Rye-grasses realise late quotations. Sanfoin is still in small supply. Tares meet a ready sale at the recent advance. Hemp seed is scarce and dear. There is no variation io Canary. Linseed firm.

CORN.

CORN.

At Mark Lane on Monday the Wheat trade was exceedingly duil, and transactions were only of retail extent, at prices for the most part in favour of buyers. Flour was very quiet, and the sales not of sufficient extent to affect quotations. Barley, though not in large request, was tarily steady in value. Beans and Peas were in good denand. Lentils, at 311. to 321. were 11. of 3d. lower. Maize was dull and barely supported.—On Wednesday there was barley sufficient business to test quotations of either Wheat or flour, and they were written cominally as on Monday, but with a weaker tendency. Barley, with light arrivals, was steady in value, and Alazie has there was not much passing in any position. Malzie has there was not much passing in any position, and Oats quantile. Beans and Peas steady in value, and Oats quantile. Hosens and Peas steady in value, and Oats quantile. Wheat, 371. vd.; Barley, 313. 3d.; Oats, 193. dd. For the corresponding period last year:—Wheat, 331. vd.; Oats, 221. 5d.

At the Metropolitan Market on Monday prices ruled lower by 2d, per stone for cattle generally, although the assortment was fairly suitable. Danish cattle sold at 4s. 6d, to 5s., and Swedish 3s. tod. to st. 4s., 4s. Sheep were equally dull of sale, and mostly 2d, per stone lower, except for very choice small; 6s. 6d, was the top price, except for very choice small; 6s. 6d, was the top price, except for very choice small; 6s. 6d, was the top price, for good Swedish. The pig trade was very slack.—Thusday's trade was much about the same as on Monday, business being very quiet. Beasts were perhaps a shade better; sheep dull, and calves and pigs sold slowly.

HAY.

HAY.

Tuesday's Whitechapel market report states that supplies were not large, but trade was very dull and rather lower for straw. Quotations:—Prime old Clover, 65t. to 1955; jest readow hay 80s. to 86s; inferior, 60s. to 75s; jest meadow hay 80s. to 86s; inferior, 40s. to 65s; and straw 28s. to 37s. per land. The demandance of the straw 28s. to 37s. per land. The demandance of the straw 28s. to 19s. to

POTATOS.

The Borough and Spitalfields Markets reports state that good supplies were on offer, but trade dull, as follows:—Magnum Bonums, 8or. to 1000.; Regents, 6or. to 801; Champions, 5or. to 602; and Victorias, 7or. to 852, per ton.—The imports into London last week consisted of 27 bags from Boulogne, 152 Hamburg, and 11 boxes from Malta.

COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 145, 26, 1841 Walls End—Hetton, 145, 64; Hetton (1908, 135; 15an)-ton, 145; Wear, 136; Tunstall, 135; Tees, 145, 6d.; Tyne (unscreened), 115; Hulam, 136, 6d.; East Hartlepool, 136, 9d.; South Hartlepool, 136, 3d.

Government Stock.—Consols closed on Monday at 101 to 101 for delivery, and 101 to 102 for delivery, and 101 to 102 for the account. The final quotations of Tuesday, Wednesday, and Thursday, were 101 to 102 for delivery, and 102 to 102 for the account.

NATIVE GUANO.

Extracts from the Eighth Annual Collection of Testimonials from persons who have used this Manure for Farm and Garden Crops:-

VEGETABLES, VINES, FRUIT,

KITCHEN GARDEN CROPS.

ALIGICIA UARIDEN URDES,
A. G. BARRON, Reyal Horricultural Sciency, Chimick,
December 18, 1883 — "Used for Cabbages, Celevy, Tomatols,
and other green Vegetables, also on Lawn Grass, Resulture
—Very favourable, manifest improvement wherever used, the
chage assuming a much deeper colour, and growth extended.
Without doubt a very valuable manure, and one easy of
amplication."

HV. CLARK, Head Gardener to His Grace the Duke of Mariborough, Elenhuim Palace Gardens, Woodstock, December 41, 1883.—'Used for Plant Growing, Fruitgrowing; also for Vegetables. Results:--Very satisfactory. For cheapness and general use your manure is invaluable."

THOS. CARLTON, Gardener to Sir C. H. Mills, Bart., Wilden ness Fack Gardens, Servenoaks, February 4, 1884—"Used for Vioes. Uelly ordinary stable-manue had been used to be supported to the servenoak of the serve

ALEXANDER BISSET, Gordoner to Sir J. Whittaker Rilse, Bart, Byftet, December 19, 383,—"Used for Grape Vines, Orchard House Culture, and Katchen Garden Cyng Grass Laod, &c., at the rate of 10 cwt. per acre, applied early in the spring. Results:—In all cases I have used it, it has proved highly satisfactory, both in fruit and foliage; the results abe enwooderfully good, which my employer can testify. I have used your Native Guano all ways, and it has proved the best I used, from its cooling nature, in all my experience of twenty years in England and Scotland."

EDWARD PEARS, Gardener to Mrs. Jerome, Holland House, Sutton Coldfield, December 14, 1883.—"Used for Potatos, Goioso, Celery, Cucumbers, Melons, Grape Vines, and Pot Plants. For Potatos and Omons I used, on the average, 5 cwt. per acre: oot hawing used your Native Guano before, i was afraid to give too much. Results:—Potatos and Omons, avery good crop joideed; Celery, very fine, gave it a little ach time of earthing up; Cucumbers and Melons, I find your Guano usits those first-rate; it does not burn the roots, no one coed usits those first-rate; it does not burn the roots, no one coed usits those first-rate; it does not burn the roots, no one coed suits those first-rate; it does used but for the roots, no one coed some very good fruit. I also used it for pot plants, and I coosider it a very valuable manure for any kind of pot plants."

SWEDES, MANGELS, &c.

JAS. DAVENPORT, Meaford Hall Farm, near Stone, December 13, 1893—" Used for Swede Turnips at the rate of 6 cwt, per arcs. Results: -About 19 tons of good sound roots to the arce. My roots were sounder than some in another field, with farmyard manure applied previous antuma, about 12 tons to the acre. Should say it is a useful manure, and cheap."

RICHARD FOWLER, Broughton, Aylesbury, December, 1883.—"Used for Swedes, at the rate at 5 cwt. per acre. esults:—Very good."

JOHN BETTLEY, Downhell Farm, Barton, Oxford, December 18, 1883.—" Used for Turnips and Swedes, at the rate of 3 cwt per ares. Results: -Excellent, giving every satisfacteroommend from the the tune of a capital metture, and discovered the commend it, more especially when mixed with a little superphosphate."

CHARLES BEESON, Glovy Farm, Fenn, Amersham, Bucks, December 16, 1883.—"Used for Swedes and Maogle Wurzel, at the rate of 4 cwt., per acre for Swedes, with burnt ash, and 6 cwt. for Maogels, with ditto. Results:—Swedes very fine crop and large roots; Mangels very good plant and large roots. I have used Native Guano for years, and have been every successful in taking prizes with roots grown where I applied it. I have taken five first Pitzes this year, 1883, being first in all the classes I showed in."

JAMES KITLEY, Farm Steward to the Rt. Hoo, the Barl of Derby, Wilter Fark, Hasleners, Surrey, December 14, 1883 — "Used for Traes, as the rate of 4 to 6 ovt. perca. Results: —Very good; could see to an ioch where the land was not sown. No other manure was used. The Native Guano was harrowed in with the seed, and I am well satisfied with the results."

GEORGE STONE, Cashio Eridge Farm, Watford, January 1, 1884—"Used for Swedes Results:—I was well sathsfied with the Native Guano. I used 5 to 6 cwt. to the acre; my Swedes were very good indeed. Send me 3 toos more; I shall give it another trial."

GEO. STRATTON, Princes Risborough, December 13, 1883.—"Used for Mangels, at the rate of 3 cmt. per acre. Results:—A very good crop. I have always had a good crop of Mangels after using the Aylesbury Native Guano."

H. WYATT, Walton Grange, Aylesbury, December 14, 1883.

—"At the Royal and Central Bucks Agricultural Show, held at Great Marlow in September Iast, I was awarded the First Prizz, value £, io, for the best general crop of roots of not less than to acres. And at the same show I was also awarded the First Prize, value £5, for the best crop of roots of not less than 5 Prize, value £5, for the best crop of roots of not less than 5 on the Broughbon Pastures and Walton Grange Farms, and were manured with Native Guano purchased of your Company."

JOHN COX, Coombs Farm, Hughenden, December 18, 1883.

—"Used for Maagel Wurel and Swedes, at the rate of 5 cw.,
per acre. Result: "One-fourth extra produce. I consider the
bulbs were much fiber, and cleager growth, and generally
sound."

JOSEPH HUTCHINGS, Forest Farm, Hansloje, December 20, 1833—" Used for a crop of Swedes, at the rate of cow, per acre. Tee to twelve loads of yard-macure, soward to the Market The Market Guano, where sown, has given me great satisfaction. I hope to be a customer text season,"

GRAIN, GRASS, POTATOS, &c.

AUSTIN BUTLIN, The Woodlands, Shipton, Lee, December 18, 1883.—"Used for Maogels, drilled under the seed on the flat. The land was manured from the farmyard in the autumn. Oats with Clover-seeds top-dressed at the rate of 4 cut, per acre. Results: -Oats and Mangels good. I never had a more promising crop of young Clover. I think it a good manute at the price."

ROBT. KEENE, Emmington, Tetsworth, December 15, 1883.—"Used for Mangels and Oats, at the rate of 7 cwt. per acre. Results:—Both crops remarkably good."

Rev. C. SOAMES, Mildenhall, December 14, 1883. —
"Used for Oats Mangel Wurzel, Potatos. Results:—Oats
very good, Mangel ditto."

D. T. sad W. H. BYFOED, Costalion, Surry, January, 5, 1884.—"Used for Oals at the size at Seven persons. Results:—Very good on poor land; 1918 not threshed, yet to give an account of quantity frown to the acre. We consider the Native Guano a very good top-dressing for spring Corn as far as we have tried it."

L: T. HAYNES, Upper Heylord, January 15, 1884—
"Used for Oats, Wheat, and Potatos, at the rate of 4 cwt. per acre. Results:—Oats yielding about 7/4 cp. pre acre; Wheat, about 3 cp.: Potatos, about 5 tons per acre. I was perfectly satisfied with the macure on the Oat cropt.

GEO. COOPER, Kingswood Lane Farm, near Aylesbury, January 2, 1881.—" Used for Wheat at the rate of 5 cwt. per acce. Results:—Had a very good crop of Wheat."

C. B. SELL, Leighton Buzzard, December 18, 1883.—
"Used for Barley at the rate of about 4 cwt, ter acce. ResultsGood Your Native Guano I believe good for top-dressing, and
general use. The difficulty is mixed gradeness to come into
general use. The difficulty is mixed gradeness to come into
trial. You must give each gradeour a bag and ask them to try
it and give you their opinion."

Captain GEORGE G. SANDEMAN, Roche Court, Salti-bury, Wilts, December 18, 1883.—"Used for grass at the rate of 10 cmt. per acre: Managels, Swedes, Potatos, at the rate of 9 cmt. per acre. Results:—Grass was much better in quantity and quality, Managels at the rate of 45 toos per acre, Potatos at the rate of 12 toos per acre, Swedes good. It was also used for Peas, Vines, Strawberries, with good results. Some Potatos were planted with farmyard manute, but those planted with Native Guano were equally 12 grood."

J. SIMMS, Weilington Terrace, Aylesbury, December 17, 1883.—"Used for grave at the rate of 5 cout.per acc. Results 18. Cot 3 cout.pt. acc. fice used to the period of the parish they never saw a better crop of grass in the field. I shall require some more in February."

JOSEPH FRANKLIN, Scottgrove, Thame, December 27, 1833 — "Used on old pasture at the rate of 6 ewt per acre. Results: -A good crop of hay. I cousider the A B C Maoure, if applied on grass land early in the spring, a good manure and showing good results."

JOHN COLLEDGE, Patchett's Hill Farm, December 21, 1883 — "Used for grass and Potatos, and garden produce generally, at the state of 6 cw., per acre for grass, and 8 cw. for Potatos. Results:—Grass, fair crop; Potatos and Onions, good. The early part of the season was not favourable for artificial manures, dry east winds prevailing."

At the Birmingham Show TWO SILVER CUPS and NINETEEN PRIZES were taken by EXHIBITORS who use NATIVE GUANO.

Price, £3 10s. per Ton, in Bags, at the Railway Station, Aylesbury.

HILL AND SMITH'S BLACK VARNISH,

for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced unwards of thirty years ago by the Advertisers, and its geouoe good quality, notwithstanding a host of unprincipled mitators, is fully attested by its coastantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used to the grounds at Windsor Castle. Kew Gardens, and at the seats of many factoring testimonials have been received.

Sold in Casks of about 30 galloos each, at 15. 6d, per galloa at the Manufactory, or 12. 8d, per gallon carriage paid to any Station in the Kingdom.

Unsolucture Testimonials.

Station in the Kingdom.

"Piercefield Park, Time 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefield, Park, Chepstow.—I am, Sirs, yours respectfully, Ww. Cox."

CAUTION —Hit. & SMITH Would particularly warn their CAUTION —Hit. & SMITH Would particularly warn their CAUTION —Hit. & SMITH Would particularly warn their consoners against the various Cheap Varionhes now so much

Customers against the various cheap Varonhes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; of the large estates in the kingdom for upwards of thirty years; and the large estates in the kingdom for upwards of thirty years; Testimonials they receive, stump it as a truly genuine articles. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is geouine.

WARDE'S

CAPILLARE.

The Editor of the Pictorial World says:—"The other day my barber recommended a certain preparation, and assured me that he had tried it himself. I stared at him with incredulity—a doctor taking his own endicine, I thought—so, as a reward for took it home. It remained on my dressing table for some time. I posh-poohed the idea of using it—called myself all the bad oames I could think of for wastiog my mooey—but in a moment of extreme confidence. I did apply it to the top, and, continuing its use, I am bound to say (contrary to my expectation) it has had the desired effect, and my barber never tells me that I am ladies, that sex makes so difference to this wonderful preparation; and to the youth who sighs for whiskers I would say, sigh no more, but try this Hair-producing Elixir. Now, as baldness is generally looked upon with uneasigness or aversion, and it requires greater fortitude than is generally given to human ature to regard the time who we shall be deduced of our hyacinthice locks—for baldness is, said, like poverty, to make man attained to the position of the posi

stance for the benefit of others who may or 'thin on the top, as being the result of my own experience.' 22. 64. per bottle; three, 65. 6d.; 5 xx, 125. 6d.; dozen, 245. Obtainable through all Chemists, Perfumers, Hairdressers, &c. Sent to any address by the Chief Apeuts, H. WELMAN AND CO. 4., Who Office Court, Feet Street, London, E.C., upon receipt of remittance, post-free. Families (bould ootice the reduction for quantities.

THE AMERICAN GARDEN

IS A RICHY ILLUSTRATED, ELEGANTLY PRINTED,
AND CAREFULLY GOTTEN-UP MONTHLY PUBLICATION DEVOTED TO THE GARDENING INTERESTS OF AMERICA.

INC. INTERESTS OF AMERICA.

EDITED BY DR. F. M. HEXAMER.
To any one who owes a Flower-Pot, a Carcin, or a Farm,
It is Indisponsable,
because it gives all the latest and best information about everythior pertaining to the cutture of Flower-Predict Potential County
the care and Potential Improvements, and all kinded subjects.

It is Reliable,
because its Editor and Contributors are all experienced Horticulturists, who write from actual experience and can prove
the correctness of their teachings.

It is always Seasonable,
breause it forestalls its readers' wants by giving in every issue
practical seasonable hints for the wr fk of the month, which alone
are worth more than the price of the paper.

It is Clean and Pure,
because no paper is more carefully scruptinised before it meets

because no paper is more carefully scrutinised before it meets the eyes of its readers, and because all objectionable and quack medicine advertisements, as well as everything that could in the least effend the most refined tastes, are scrupulously excluded from its pages.

Premiums.

least offend the most refined tastes, are scrupulously excluded from its pages. Premiums.

In addition to all these good things, every yearly subscriber receives a beautiful coloured floral picture, and may take his choice of any one of the many valuable articles offered in our Premium List-enther Seeds, Plants, Books, or Implements.

Subscription Price, 5s. per year, including foreign postage. Sample Copy Free. Remit by Post-office Order on New-York or London.

Another Cure of Bronchitis (this week) by

DR. LOCOCK'S PULMONIC WAFERS.

Lamburgh writes:—"March 17, 258, 1 have always recommended Dr. Locock's Pulmone Wafers to my freeds for Bronchitis, and received as grateful thanks as though I had compounded them." They instantly relieve and rapidly acceptable them. They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Phiegm, Pains in the Chest, Rheumatism—and taste pleasantly. Sold at 12.1½d. and 22.9d. per box, by all Druggists.

pleasantly. Sold at 1x.1½d and 2x.9d, per box, by all Druggists.

I of modern times,—This incomparable medicine increases the appetite, strengthens the stomach, detaness the liver, corrects the appetite, strengthens the stomach, detaness the liver, corrects the energy and reinstates sound health. The enormous demand for these Pills throughout the globe astonishes everybody, and a single trial convinces the most sceptical that no medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race. They are a blessing to the discussion of the convent of

WM. GORDON has much pleasure in offering the following ORCHIDS; they are all nice established plants and growing freely. The demand is so continuous that it is difficult to keep a large stock of all varieties, still there is no reason to doubt that the majority of these plants and growing freely. The demand is so continuous that it is difficult to keep a large stock of all varieties, will be obtainable during the coming season, as the importance of time fill up the gaps in the stock which Mr. Goroon trusts will be made; and in confidently recommending these to his customers be begs to assure them that to the best of his belief many very fine and possibly very valuable varieties are to be under the stock which will be the stock which the stock which will be made; and in confidently very whalble varieties are to be in flower and showing bud are so quickly you'd at the understand the stock which will be sufficiently to the stock which will be sufficiently the sufficient varieties. If customers will give a week's notice and fix a limit in price Mr. Goroon wan doubtless it is the flowering season.

Mr. Goroon having found enquiries for TEAK ORCHID BASK ETS so numerous, quotes for these as follows:—34'-incb, 41': 4'-inch, 51': 5'-inch, 61': 35'-inch, 61': 5'-inch, 61'

THOMAS S. WARE. HALE FARM NURSERIES, TOTTENHAM, LONDON.

NEW MUSKS.

HOW is it these two Musk Mimulus do not sell without advertising them? They have both received Horticates from the Floral Committee of the Royal Horticultural Society. One is nearly a red in colour, and the other a very large yellow flower, quite away from the other variety. 6d. each, post-free.

STREPTOSOLEN JAMESONI.

A LL are familiar with the Heliotrope, its treatment and value; and although this plant possesses no scent, and rather more bash-like, yet in growth it is very similar and its culture nearly identical, produces very large or scent, and exactly identical produces very large or orange and scarlet colours that all who see it exclaim "Well, this is beautiful!" Awarded a First-class Certificate by the Royal Horticultural Society (Floral Committee). Small plants, 1s. each; larger, 2s.; post-free, 3d. extra.

OLD AND CURIOUS POLYANTHUS (PANTALOON).

THE calyx is as brilliant as the flower, and when out of bloom remains an object of great beauty, and all say it is not only a beautiful plant, but one of great interest. Plants in flower, 15.; established plants, 22. each, post-free.

SHANKS'S PATENT LAWN MOWERS FOR 1884.

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines.

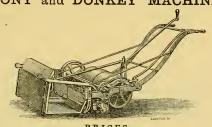

These Machines are in use in the Royal Gardens at Kew, Hampton Court, Osborne and Balmoral, in most of the Public Parke and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawn. They have now been before the Public for many years, and stand unrivalled. These Machines are easily worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

SPATENT HYDRAULIC RAMS. JOHN BLAKE

FOR RAISING WATER FOR THE SUPPLY OF

TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, and FARMS.

No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams. NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet. SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Galions passing through them.

APPLICATION OF BLAKE'S PATENT HYDRAULIC RAM B.

This Ram is worked by impure river water whilst pumping pure water from a well and forcing it to a small reservoir on the hill, at an elevation of 295 feet, and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

RECENT AND OTHER TESTIMONIALS.

From Mr. A. J. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middletorouseh, September 50, 1683—" Dear Sir.— I am glad to say that the Rams you and the september 50, 1683—" Dear Sir.— I am glad to say that the Rams you always the september of the sept

From Mr. HENRY ROBINSON, Engineer to the Stockport Djurict Waterworks Co.,
Softember 8, 1883.—"Dear Sir,—I can now report well of the two Hydraulic Rams we have
fixed to your instructions for the supply of Diselye Village, 4,0000 gallons per day was the quantity
you promised they would force to a height of 68 feet, but on testing them I am convinced that
good gallons is not the limit of their power, whilst the quantity of waste water used indriving
them is not equal to half the expacticy of the 6-inch pipe by which they are fed, and I am inclined
to the belief that a more simple and efficient pump cannot be found.

From Captain TOWNSHEND, Winchant, February 10, 1877.—" In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during this winter, forcing up water through a delivery pipe 900 yards I log at the rate of 80,000 galloos per day, although you only promised 60,000."

From J. SPENDER CLAY, Esq. Ford Manor, Lingfield, Surrey, August 9, 1880.—"In reply to your letter of inquiry I am glad to be able to say that the two Hydraulic Rams which you fined there are working satisfactorily, and that out of 1 gallons 3 quarts per minute, of maximum yield of the spring, they deliver to the top of my boase, distant a full mile from the spring, 4 gals, 10 per minute, or 1 sing gallons per 2 ghours, heng 2 ros gallons show the quantity you guaranteed.

From Mr. JOHN ARCHBOLD, Engineer to Messas, Barber, Walker & Co., Entitwood, Wotts, October 2s, 1882.—"I am glad to inform you that the Hydraulic Ram you fixed for Thomas Barber, Esq., whilst working with a fall of 30 feet, and forcing to a height of 50 feet, through 200 yards of delivery pipe, is working exceedingly well, throwing up 9 pints out of every 35 pints passing through it, thus giving 77 per cent. of useful effect."

assing unrough, thus gring 77 per cent, of usefur elect.

From Mr. T. BARHAM FOSTER, C.E. 2,3 folin Dalion Street, Manchester, October 12, 883.—" Dear Sir,—I have tested the Ram you contracted to fix on the Hints Estate, Stafford-hire, for James Chadwick, 882, to force 1,000 og allons per day of spring water through 800 yards of delivery pipe, to an elevation of 208 feet, whilst worked by river water falling 5 feet 5 inches, and am pleased to had that when at full power the Ram sends up 13,500 gallons per day to the eight and distance nagued, and though the Ram is now adjusted to work at only three-fourths its ower, the work done represents over 5 per each of useful effect.

From HORATIO R. B. PEILE, Esq., Commissioner to Sir Michael Shaw Stewart, Bart.
Manuton House, Greeneel, daynust 13, 1883.—"I am glad to any the Ram you fixed at Castle
The smallness of the driving water—"If gallous per minute—"is not more woulderful than the large
proportion of water it sends up, viz., 720 galloos per day, through about 400 yards of delivery pipe,
to an elevation of 75 fect."

From FRED. J. TURNER, Esq., Agent to His Grace the Duke of Portland, Mansfield Wooddonse, August 20, 1883.—"Dear Sir,—I have much pleasure in stating that the Hydraulic Rams which you erected last; year for His Grace the Duke of Portland, at Lyadhurst, near Mansfield, and at Skeldon, Ayrshue, are working very well, and they are most satisfactory in every way."

and at Skeldon, Ayrshue, are working very well, and they are most satisfactory in every way."

From Mr. E. W. STREETER, F. R. S., Diamond Merchant, Bond Street, Leudon, and
Sackville Park, Sussex, October 1, 1883.—"Dear Sir.—When you surveyed the site at Sackville
Place, Buxted, for the purpose of fining a Ram with one mile of collecting and distribution from the
resources available. My bailift prepared the ground to your instructions, and in twelve days
from the arrival of your men, the Ram was in operation, seeding up to per cent, more water thay
you promised to a height of 1 to feet, and distributing a supply to a farm and several cottages on
the way. I have pleasure in recording my caliure approval of the work.

From Sir A. WOODIWISS, The Pastures, Derby, January 15, 1883.—"Dear Sir,—In reply to your caquiry, I have much pleasure in informing you that the Hydraulic Ram you supplied and fixed for me in July last is working as a satisfactorily as could be wished, and has fully realised my expectations, and I have no hesitation in saying it is a decided success."

From Sir ROBERT MENZIES, Bart, of Mensier, Rannech Lodge, Rannech, August 20, 180,—"The Hydranlic Ran which you fixed for me to supply water to Rannech Lodge extreme distance the water is carried is 2ff with a fixed fully to the certain distance the water is carried is 1ff wile, and it is raised fully too feet, and though the elevation of the two houses are different, there is a regular supply of 7 quarts per minute to each house, which has never ceased since the Ran was set agoing, about three months ago. Your Ran took the place of one previously tried on the same spot, and which did not succeed, and was in fact a complete failure."

From Mr. WILLIAM LAIT, Architect and County Surveyor, Compton Verney, Warnick, January 16, 1882.—"I have much pleasure in stating that the Patent Hydraulic Ram I had from you for the Rev. J. Cardwell Cardener, of the Vicarage, Bullers Marston, and which you fixed there, is, I consider, remarkably successful, as indicated below:—410 gallons of water per day are passing through the Ram with a descent of 13 feet 8 inches. Out of this small quantity rolo gallons are sent up to a height of 4 feet, showing 78 per cent. of useful effect, and the noise of its working is 50 slight as to be almost insudified.

SATURDAY, MARCH 29, 1884.

THE KEW MUSEUMS.

N OT one but many and frequently repeated visits must be paid to Kew to realise the enormous amount of material there accumulated and classified. The museums alone demand prolonged examination-and there are three of them-to say nothing of Miss North's picture gallery. Very soon life will be too short to gain a grasp of what there is at Kew! Those who wish to refer to special subjects appreciate the way in which the objects are classified for ready reference, and their knowledge enables them readily to find what they are in search of, while the conrteous aid of the assistants is always at the service of the student. But for the public desirous of obtaining a general idea of the treasures at Kew, and the reasons why they are collected and brought together some guide-book is indispensable. For the larger of the three museums, that immediately opposite the Palm-stove, a guide has been recently issued which appears likely to supply just the informa-tion required by the casual visitor, and to put those desirous of further information on the right track to obtain it.

"The object of the musenms," we are told, "is to show the practical applications of botanical science. They teach us to appreciate the general relations of the vegetable world to man. We learn from them the sources of the innumerable products furnished by the vegetable kingdom for our use and convenience, whether as articles of food, of construction and application in the arts, of medicine, &c. They suggest new channels for our industry; they show us the variety in form and structure presented by plants; and are a means of direct instruction in most important branches of useful knowledge. We see from them the particular points upon which further information is needed, especially as to the origin of many valuable timbers, fibres, and drugs, in order to perfect our knowledge of economic botany; in brief, the museums show us how little, as well as how much, we know of the extent to which herbs, shrubs, and trees contribute to our necessities, comforts, and numberless requirements."

The Museum No. 1, to which exclusively the present guide refers, contains the collections illustrative of the products, &c., of the Dicotyle-donous and Gymnospermous divisions. The arrangement is eminently practical, the con-tents being systematically arranged, numbered, and labelled, while maps and occasional appropriate illustrations greatly facilitate the task of the enquirer. A book of reference is a good thing no doubt, and often is the only means available; but the information given by a museum like this, carefully arranged and correctly and conspicuously labelled, is, of course, incomparably better. Such a museum, also, is of value not only directly from the point of view of economic botany, but it affords most valuable indications into the social life, habits, and history of the nations of the world, civilised and

uncivilised. Under the head of Cotton, for

instance, we find not only illustrations of the plants supplying the raw unaterial and samples of the manufactured product, but specimes showing the use of Cotton by nations now no longer in existence—as, for instance, in the case of cotton cloth from Peruvian mummies.

408

Then, as illustrations of our own history, we have the tinder-box and tinder, which were in universal use in this country within the memory of many still living, but which are entirely superseded by the lucifer matches, the material for which latter are in their turn shown in the cases devoted to coniferous products and manufactures. Side by side with the now obsolete tinder is the cotton-cake, produced from the crushed seeds of the Cotton, and used as food for cattle—a comparatively recent application of this most useful genus of plants. Similarly the cases devoted to the rubber and caoutchout producing plants of various orders illustrate another phase in our national history, or rather in the history of civilisation.

It is thus seen how deep and how wide are the interests attaching to these museums. Where all is so admirable it is difficult to suggest improvement; but in any future rearrangement it would be worth while considering whether it would be practicable or desirable to effect a more complete separation between the specimens illustrative of structure or classification and those of purely economic interest. We would not advocate the removal of any specimens from their appropriate cabinet, but merely their allocation on separate shelves. We would suggest also that the claims of horticulture should, if practicable, be more fully recognised by the exhibition of dried specimens or pictures of the plants from which cultivated varieties have become developed. A specimen of a wild Pelargonium or Begonia side by side with one of the most "improved" modern garden varieties would be a valuable means of instruction.

BLECHNUM RUGOSUM, n. sp.

FRONDS linear-lanceolate, acuminate, about a foot long, the surface rugose, and covered with glandular hairs, pinante, the pinnæ with a very short stalk-like base below where the frond is searcely narrowed, adnate in the middle parts, and in the upper portion confluent into longish attenuate apex; pinaæ oblong, blunt, or sometimes abruptly acute, falcately curved, the lower ones shorter and stightly deflected, unequal, and cordately rounded at the base, the anterior side subauriculate; sort linear, medial, extending from the base nearly to the apex of the pinna; indusium narrow, entire, glandular, hairy; stipes 3 to 6 inches long, brown, with a few rusty ovate and lanceolate acuminate scales near the base, densely clothed above, as is the rachis, with short glandular hairs.

A very distinct-looking evergreen Fern, remark-able for the opaque palish green colour, and the harsh-feeling rugose surface of its prettily arcuate fronds. It is of moderate growth, about equalling the smaller forms analogous to B. occidentale, such as B. cognatum, to which it is, no doubt, related. has a short, erect caudex, from which the fronds rise to some 6 or 7 inches in height, the tips spreading out to a breadth of 15 to 18 inches. The stipes are 3 to 6 inches long, glandular pubescent, dull brown in the lower part, this colour extending to the rachis in the older fronds, the basal inch or two invested with acuminate reddish-brown scales. The linearlanceolate fronds are scarcely narrowed at the base, and run out into a long attenuate or caudate undivided apex, the lamina being from 7 to 9 inches long and 11 to 2 inches broad; they are distinctly pinnate, the pinnæ in the centre of the most developed fronds rarely exceeding 1 inch in length, the lower ones about half an inch apart, the upper ones gradually becoming closer; these pinnæ are oblong, blunt, or bluntish, sometimes slightly falcate, occasionally a little irregular at the edge, as il depauperate, the surface hard and rough, marked by numerous depresas if irregular lines and points had been roughly inscribed on both surfaces, which, as well as the rachis and margins, are furnished with short stiff glandular hairs. The fructification consists of two

lines of spore-cases lying closely alongside the costa, and extending from the base nearly to the apex of the whole of the pinner, running out into a similar double line in the caudate apex. The rachis is densely glandular, hairy. The rough, uneven, rugged surface and harsh texture of the frond are very peculiar.

Doodia Harryana, n. sp.

Fronds dwarfish, pinnate, dimorphous; sterile ones shorter, spreading, membranaecous, linear-oblong acute, the pinnae oblong, blunt, the lower ones distinctly stalked, with a blunt auricle on the anterior, and sometimes also on the posterior base, so as to become subhastate, serrate, the veins once or twice forked, free, with club-shaped apices terminating opposite the serraters just within the narrowly marginate edge. Fertile fronds taller (about 10 inches), erect, lanceolate, with an attenuated apex, stouter and firmer in texture than the sterile, the pinnae distant, the middle ones x inch to x inch long, narrow linear, obuse, serrate, with the base autriculate, especially on the anterior side, the auricle sometimes separated into a lobe, the upper ones adnately decurrent, the sori also running down the sides of the rachis; sori occupying the whole length of the pinnae and of the attenuated apex; indusion narrow, arcuate, becoming reflexed; caudex short, erect; stipes short, purplish at the base, and, as well as the rachides, slender and bearing a few scattered hair-scales.

This is an exceedingly elegant evergreen greenhouse Fern, ol dwarf stature, closely allied to D. caudata, but of a stouter and firmer texture, and of somewhat larger growth, the fronds reaching from 8 to 10 inches in length, and assuming a gracefully spreading character. The caudex is short and erect, throwing out on all sides the dark glossy green fronds, which have a lanceolate outline, with a long acuminated apex, short stipes, purplish at the base, and a slender green rachis. Like those of D. caudata, the fronds are dimorphous, but the plant is larger, and the fertile fronds are spreading, instead of being erect. The sterile smaller fronds have the lower pinnæ shortly stalked, bluntly oblong, with a small blunt lobe on each side of the base, the upper ones becoming larger and sessile, and the uppermost adnate. The fertile fronds have the pinnæ more distant, the lower ones stalked and hastate, the blunt linear pinnæ and the hastate base being alike soriferous; the pinnæ in the middle part of the frond have shorter and shorter stalks, and have the basal lobes smaller, gradually becoming adnate and at length decurrent, every portion to the very apex being covered with sori, having the usual Doodioid involucre. The venation in the fertile frond is distinctly Doodioid, while in the few sterile ones the coalescent veinlets are rarely pro-duced, though often indicated. Though resembling ouced, though often indicated. Though resembling D. caudata, it is a distinctly bolder plant, and likely to be more useful for decorative purposes—its aspect, as we have said, being extremely elegant. The plant appears to be of garden origin, probably the produce of a sporting spore. T. Moore.

MASDEVALLIA MOOREANA, n. sp. "

A very interestiog Masdevallia, nearest to Masdevallia elephanticeps, but smaller by one-third in all its parts. It has a flower 3 inches long, yellowish or light green outside, with greenish darker nerves, a reddish hue under the lateral sepals. The lower lip formed by the lateral sepals is deeply blifd, with long triangles and well developed tails, their inner surface being very rough, all nearly chocolate-brown. The upper sepal has a very short triangular blade and a very long tail. The petals are rhombic, with a strong ridge in the middle line. Lip oblong, nearly covered with asperities. Bract narrow, much shorter than the stalk of the ovary. Peduncle and stalk of a very yellowish-white, with numerous small reddish freekles. Leaf exceeding a span in length, oblong ligulate, bluntacute, with a narrower petiolar base.

acute, with a narrower petiolar base.

The first flower I obtained was quite alarming. Its odd sepal had a very broad tail. I asked for a second, and it had the tail narrow as it is in all the affinity. I had it from my excellent colleague, the Curator of Glasnevin Gardens, Mr. F. W. Moore, whose name it justly bears. H. G. Rehb. f.

GLASNEVIN BOTANIC GARDEN. — The number of visitors to these gardens last year (1883) was 326,329, showing an increase of 28,263 over that of the preceding year, and of no less than 76,418 over the attendance of 1881.

GLADIOLI.

CULTURE AND TREATMENT OF IIYERIDS OF G. OANDAYENSIS.—As there are some material points in which I differ with a writer, p. 285, in a recent issue of the *Credeners' Chronicle, when treating of Gladioli, and as the present is a good time to make a planting for those who have not hitherto essayed their growth, a few observations on culture and after-treatment—essentially an important point—may be *apropos*. To make my remarks consecutive, I propose placing them in the following order:—

Gladiolus Disease. - I deal with the above hybrids first, because if a grower succeeds with them he may be sure of doing so with the hardier G, brenchleyensis; while G. ramosus, G. Colvillei, &c., once planted take care of themselves-often increase and multiply so as to become a nuisance. The writer referred to says, "directly the least sign of disease appears in the beds, pull them up in toto and burn them, and thus so far put an end to it." Well, this recommendation has, to me at least, the charm of novelty, and seems to proceed on the assumption that what is called the disease-I must guard myself from admitting any disease, at least until something more definite is applied than that generic word-is contagious, and that therefore it should be stamped or burned out. I commend the point to Mr. Worthington Smith, as it may be a fungus he means, but so far as my experience goes—and I have in my mind the most expensive and highly developed hybrids—I admit no contagion and no disease. I am satisfied with my success, and do not think the loss of one or two in a score is enough to flaunt a scarcecrow with the label "disease, and, for fear that was not enough, to put "contagious" before it. Those who wish for a glorious autumn flower, which will favourably contrast with the tints of the finest Orchids, will do well not to be afraid to spend some money on Gladioli because some one has cried out "disease" or "failure." The road to success is often that of failure at first. I have had Duchess of Edinburgh for three successive years, with a spike containing twenty-two flowers, and each flower you could run your closed hand into, fully 6 feet high, and one that bloomed late—the end of November—brauched off into three spikes. James McIntosh, started in a pot in a cold frame, bloomed in July, and another, planted later, in the be-ginning of November; so of Democedes, Helenor, Dr. Hogg, and Madame Desportes. Now, if the corms of those, and dozens of others equally fine and as highly developed—and I might challenge any man to name finer—instead of getting diseased or degenerating, actually increase, and give year by year more magnificent spikes, am I not justified in having my doubts about those bugbears? While I write thus confidently of my own experience, I am well aware that "Delta"-whom I implicitly credit-has told in a contemporary how Mr. Banks, of Sholden Lodge, near Deal, after losing 50,000, had finally to give up their culture. Before I part from this view of the

subject, I must refer to

English and French Corms.—I regret to find such
excellent authorities as Mr. Douglas and "D., Deal," seeming to favour the latter-especially Souchet's. This is not my experience, and though an Irishman, I am proud to he able to give the preference to those English-raised. I am an humble individual, and my collection probably does not exceed 500, so I will collection probably does not exceed 500, so I will take other testimony. One of the most successful growers in Irelavd is J. F. Lombard, Esq., Dublin (Rathmines), who has won the Cup at the Royal Dublin Society's Horticultural Exhibition for several years. He told me there last September that he had tried every grower among French raisers, and had finally settled down with our countrymen, Messrs. Kelway, of Langport, Somerset. At the same exhibition Messrs. Drummond showed, for Vilmorin, Andrieux & Co., a stand of those hybrids, but it will be in the recollection of the thousands who saw them side by side that they were nowhere beside Mr. Lombard's, or in the really splendid stand shown by the Rev. Mr. Tymons, Baskin Hill, Dublin. I must remark in regard to this last collection that some of the finest spikes were seedlings raised by the reverend gentleman himself, so that had an illustration of my preference for the former to the latter without going as far as Langport.

If I am not to take up more space than you are likely to have to spare, I must turn to—

Culture.—My advice would be, let every lover of flowers try lo grow the Gladiolus. There is an addi-

^{*} Masdevalila Mosreana, n. sp.—Aff, M. elephanticipiti; minor; folio a petiolari basi oblongo ligulato obtuse acuto; pedanculo uniforo; bractae pedicello bene breviori artic cupula brevi, mento obtusangulo, triangulo, impari breviori in caudam longam extenso, triangulio, paribus bene longologo apperio in caudas brevio extensi; repais rione in colongo obtuso asperio.—Cl. 7, W. Mooreeficata. H. G. Rebs. J.

tional zest, because success is said to be problematical, that should lure the courageous. The expense need not deter the humblest, and increase can be tried by seed and hybridising, but more certainly by "spawn, even if one cannot afford to add to their collections every year. I never considered there was any mystery about the method of attaining reasonable success, at the same time I am inclined to think both aspect and soil (natural) has something to say in the matter. Kelway succeeds so well, to my mind, because of the large percentage of sand, even though comminuted and seemingly imperceptible. Sand around the corm, above and below, I make a sine qua non, and never plant a corm without it. I would strongly recommend that you send the stem, or great flagger-like leaves for analysis, and see the relative amount of silica Gladioli require. In this you might have the secret of the unaccountable failure with some growers.

I have tried this year and last some corms in pure drift sand alone, and the wonderfully vigorous growth made would simply astonish you. Indeed, I can readily lift some of my transplanted corms, thus started in January and transplanted a month ago, and send them to you should you so desire. Another thing I noticed is that a few of those have thrown the stems above the ground already—Anthony Waterer, for instance—and, contrary to what is usual, they seem so strong and vigorous that frost (we have had a few degrees lately) seems to do them no harm.

I plant from February to April; some of Kelway's best and newer hybrids have not been in the ground yet. Perhaps you will permit me to digress here, to say that though I have mentioned Messrs. Kelway more than once, and though they have probably the finest and largest collection in the world, I have a distinct recollection of the magnificent spikes raised and shown from Newcastle at the Manchester International Exhibition, and I am aware as far north as Dundee Messrs. Laind & Sinclair are acclimatising for their locality Messrs. Lemoine's new hardy hybrids. There is, therefore, to my mind, no part of the British Isles where Gladioli, and some of the finest, may not, with a tolerable chance of success, be tried.

The beds and borders where I plant are naturally rich. This season I incorporated with them about loads of a weed-compost, last October, twenty turned all out and dug deep, giving now perhaps a uniform depth of 3 feet of prepared soil. Roses, Dahlias, Pæonies, &c., are planted at intervals in front, and the Gladioli at the back, being the tallest, As they are gross feeders, I bury beneath each corm, but not at present touching, a quantity, say a spadeful, of very rotten old manure, some soil over that, then the corm surrounded above and below with a large handful of common river or drift sand; cover up, so that the corm may be 2 or 3 inches from the surface. I should have said I consider a southern aspect, and, if possible, a slope, very desirable. It is of vast importance to feed the plant after the flowering is over, as well as before, with liquid manure; and of considerable importance also to remove the seed-pods if you do not want them, and if you do, leave only two or three to each spike. Having already exceeded my intended limit, storing must stand over, W. J. Murthy, Clonmel.

HYACINTHS, NEW AND OLD.

HAVING been a grower and exhibitor of Hyacinths for competition during the last fifteen years I have often felt desirous of growing some of the new varieties for the purposes of exhibition as well as for home decoration. Some of them I have tried, but I cannot say the result has been entirely satisfactory. Not a season passes without new varieties of IIya cinths being exhibited in considerable numbers, and apparently distinct in colour or better in quality than the older varieties. Many of them receive First-class Certificates-a guarantee that they are thought to be better by those best qualified to judge of their merits. I visited Messrs. Veitch's collection at Coombe Wood a few days before the plants were exhibited, for the purpose of carefully comparing the new or recently introduced varieties with those of a much older date, and in justice to our old and tried friends I am bound to say that the new ones did not endure the ordeal so well as I expected.

Taking the single light blue varieties first there were several seedlings not yet named which will have to be grown again before an opinion can be passed on their merits. There were two named ones, however, which deserve very high commenda-

tion. Electra, a superb variety, with an immense spike of large finely-formed flowers of a pale blue, and quite distinct in colour. Lord Derby Improved, of which there were two good spikes, did seem in comparison to be superior to the first of that name, which is also a very fine clear light blue variety. Princess Mary of Cambridge forms the most stately spikes of all this light blue section, and it is second to none in the form of the bells. Ctar Peter is distinct and good. Enchantress is very distinct, the tips of the petals being spotted and clouded with a deeper blue. Grand Maitre forms a large handsome spike, the centre of the petals being of a deeper blue than the others.

Amongst the dark blue varieties, taking all the points, probably none excel King of the Blues. Every bulb of this variety may be expected to produce a good spike. General Havelock, a black-blue variety, that can always be depended upon. Marie, a very old sort, of a peculiar purple-blue colour, is well to the front. It must be admitted that the following new varieties in this class hold a foremost Souvenir de J. H. Veen is the best of them. This year, as well as last, nearly every spike was good, and the colour a beautiful distinct deep purple-blue. The Sultan has massive bandsome spikes of dark blue flowers, with large pips. Masterpiece is now plentiful enough to be put into the catalogues; it is one of the most dusky Hyacintbs ever raised, forms a neat spike, but it is not large enough. I was pleased to see Prince of Wales amongst the dark blue varieties; I exhibited it for the first time at South Kensington eight years ago, and gained a Certificate for it; it is bluish-purple, with a wbitish eye, bells finely formed, and compact spike. Double Prince Albert is a fine variety, darker than Laurens Koster in colour, and quite as good in other respects. Lord Mayo is very fine this year, it is a reddish-purple flower, with white centre and well shaped bells, but as a rule the spikes are too small.

The best and most constant of all the red Hyacioths is Koh-i-noor; it is semi-double, has large, finely formed bells and a splendid pyramidal spike of rosy-red flowers. Von Schiller is an old and constant favourite, always giving good spikes. Lord Macaulay, deep red, does not hold its position; the flowers are generally too much crowded, but the pips are well formed, and it sometimes gives an exhibition spike. Princess Helena, pale rose, forms a long handsome Garibaldi sometimes gives an immense spike of bright crimson flowers, and it is very desirable for its deep colour. Vurbaak is not in the collection this year, but it is unequalled for its bright reddish-crimson colour; good bulbs of it are not easily to be obtained. La Joyeuse, rosy-peach, forms a very stately plant; the spike is not usually compact enough, but, nevertheless, it is a very distinct and good Hyacinth. Piok Charles Dickens seems to be a sport of that well known light blue variety; it is exactly like it, except in colour. General Roberts, a distinct deep clear rose-coloured variety. La Franchise has a good many of the characteristics of the old Grandeur à Merveille, and has even larger bells, which are rather paler in colour. The most striking in colour of all the red varieties is L'Incomparable; the flowers are quite scarlet in colour, spike medium-size, and very neat. Distinction is quite unique in regard to colour, The spikes are larger this year than I have ever seen them; the bells are large and well-formed, of a deep crimson colour, with a dark band in the centre of each segment of the petals. Princess Louise is a very good double red, generally forming a compact spike. La Grande Concurrente, double pink, well deserves a good place, as also does a variety named Van Hobooken, with very double pale pink flowers and large spike. Duke of Albany is also a distinct and good double red.

It is rather remarkable that very few good single white Hyacinths are brought to our notice, except varieties that have been in circulation for many years. It will be very difficult indeed to beat La Grandesse, it is a splendid Hyacinth, forming a massive, compact spike of large well-formed bells. I grow but three white varieties—the above, alba maxima, and Mont Blanc. The last-named variety I place second in merit, but it has the fault of producing cockscomb spikes of flowers too much crowded. Baroness Van Tuyll is a very pretty white, and Snowball has the best formed bells of any of them, but it generally gives a spike formed of closely compacted flowers, which is seldom symmetrical or pleasing. In the collection was Florence Nightingale, a very good

double white variety. Amongst the yellow, straw-coloured, or buff varieties, some recent introductious hold a prominent position. I feel inclined to place King of the Yellows at the top of the list; it forms as good a spike as any of them, and the colour is better. Ida is very fine, and sometimes gives a grand spike. Grand Due de Luxemburg forms a tall good spike, but this and Bird of Paradies seldom flowers without many of the bells near the top of the spike being tipped with green. Ohelisk is also a distinct and good yellow variety, and Marchioness of Lorne is the best of the buffs; the segments of the petals are sometimes striped.

A rather new variety, named Challenger, forms a distinct feature in the collection. It is described as violet, but there is a coosiderable suffusion of red and purple in it. There are very few flowers of this colour. Sir Henry Havelock is the best of the old varieties, but it is not so bright as Challenger.

Messrs. Veitch grow their Hyacinths in a flat spanroofed house, stages on each side with a path in the centre, so that the plants are within a few inches of the glass. The ventilation is ample, air being admitted freely above and below. One very seldom has an opportunity of inspecting such an even lot of IIyacinths as this. As a rule you get three, four, and sometimes six moderate spikes for one really good; but here were varieties of which six bulbs had been obtained, and out of these four, and even in one case five spikes were good enough for exhibition. were some 300 spikes in the house, making a brilliant display when they were seen in all their freshoess and heauty. Before these lines are in print they will bave been exhibited twice in London, and afterwards they will be arranged in some of the houses at The weather has been very trying during the last few years for the out-of-doors culture of Hyacinths in Holland, and it is astonishing how the quality of the bulbs is kept up-there seems no falling off whatever in the quality of the blooms. The present season is an exceptional one, the weather being finer than usual in Holland, and the bloom early and very good. J. Douglas.

THE PROPAGATOR.

GESNERAS, EUCODONIAS, BIGLANDULARIAS, AND PLECTOPOMAS. -- There are but two sources from which increased supplies of Gesneras and Biglandularias can be drawn, viz., I, from cuttings; 2, from seeds. The plants intended for cutting purposes should have been set apart, and prepared for propagation, early in the season. The plants must now be cut down to the first leaf above the pot, and made into cuttings. The first cutting should be taken from the top of the plant, and must have four leaves attached to it, and the section should be made about inch below the last pair of leaves. The next and following cuttings that are made should be divided down the middle of the stem longitudinally, thus making two cuttings of one, as it were, each having an eye and a leaf, with a 1 inch of stem attached to it. They are now ready to be placed into long thumb-pots. The soil should be composed of half turfy loam, a quarter peat, and a quarter sand, which should be well mixed together and passed through a To this mixture should be added about a fine sieve. 48-sized potful of finely broken crocks. The soil should be pressed firmly into the pot, and the cuttings must be buried therein half-way up the leaf-stalk. After having watered the cuttings they must be put into a frame over a gentle bottom-heat. It may be well to call attention to the importance of burying the eyes of the cuttings beneath the soil. If the cutting is left to form a bulb from the bottom of the stem only, without an eye, it would never form a growth. Therefore it becomes necessary to cut the cuttings of the round-bulb varieties to a joint, and then reduce the stem to such lengths as will favour the formation of the bulb from the eye. When the cuttings have rooted they should be removed from the frame and potted into large 60-sized pots. It is worthy of remark that the round-bulb varieties do not form bulbs in sufficient quantities to make this experiment profitable, but the above method is the best when only small quantities are required.

From Seed,—When large quantities of Gesneras and Biglandularias are required they are best obtained from seed. It should be sown in January. Some well-drained and flat pans should be filled with the soil named above, which should be well watered with a rose-pot previous to the sowing of the seed, in order to make the surface level. The seeds should be sown thinly upon the surface of the soil. The pans must now be placed upon a warm shelf, which should be covered with a layer of river sand kept in a constantly moist state. In order to prevent the seed being injured by the drip of water from the roof, it is a good plan to protect them with a pane of glass supported by four thumb-pots placed so as to form the four corners of a square — the seed-pan being placed in the centre of the four pots, and underneath the pane of glass. When the seeds commence to spring up they should be pricked off and placed into pans, each seedling an inch apart from the other; the pans to be replaced upon the shelf until the seedlings are strong enough to be potted into thumb-pots. When next they require a fresh pot they should be potted, tied up, and placed in a half-spent dung-frame or hotbed. Great care, however, must be exercised to see that they receive plenty of air, and that they are protected from the rays of the sun; and it is dangerous to syringe them overhead.

HYERID GESNERAS AND BIGLANDULARIAS. — It has been noticed that most of the round-bulb varieties come true from seed, and it is advisable to make a selection of the plants for bybridising purposes, and place them about a yard or more apart on a front platform in a warm airy house. They must be placed in a position out of the range of a syringe. When true varieties are required each plant should be fertilised with its own pollen, and care should be fertilised with its own pollen, and care should be taken to prevent any other reaching the pistil. The largest flowers only should be fertilised, and the remainder removed from the plant, so as to concentrate the strength in the fertilised flowers. When the seeds are ripe they should be gathered, but on no account should they be removed from the pods until it is time to sow them.

Culture.—The soil around the old bulbs should be reduced, and the bulbs potted into small 60-sized pots, placing them on a platform in a warm airy house. The best soil for this purpose is that composed of balf loam, a quarter peat, and a quarter sand, and adding thereto about a 48-sized potful of ballast. So soon as the bulbs throw out a growth 4 or 5 inches in height they should be potted into a 48-sized pot, and repotted as necessity dictates. Wheo, however, a 24-sized pot is reached if will not again be necessary to pot it. The plant will grow for two or three years in this size pot, and it is only occessary to look to the surfacing and drainage.

EUCODONIAS. - In the propagation of Eucodonias from cuttings the same instructions must be followed as for Gesneras, but the following must be carried out in propagation from the leaves:—Fully developed or "hard" leaves should be selected for the cuttings. They should be severed with a sharp knife close to the main stem of the plant. The cuttings should be placed in the cutting-pot in an upright position, the whole of the leaf-stalk to be buried in the soil. Forty-eight sized pots should be used for the cuttings, and should be filled with soil consisting of half turfy loam, one-third peat, and a quarter sand. After passing thissoil through a 4-inch sieve, a 48-sized potful of finely broken shreds, or ballast, should be added, and the whole well mixed together. The cutting-pots should be filled to within a quarter of an inch of the top, and the rest with sand. Before putting the cuttings in the pots should be watered with a rose-pot to make the soil more compact and the surface level. The cuttings should be arranged around the edge of the pot, and the pots placed in the cutting-frame. When they have rooted they should be potted into separate pots, and placed on a gentle bottom-heat. When these plants are strong enough they can be removed to a cool and airy house.

From Corms.—Ripe tubers should be chosen and "scaled"—i.e., each tuber should be separated into the scale-like particles of which it is composed. This process should be commenced at the large end of the tuber—the scale-like particles to be sown upon the surface of the soil, like seeds, and partially covered with soil. The soil to be the same as mentioned above. The pots to be watered and placed in the cutting-frame. When the young seedlings grow to the height of half an inch they should be potted into thimble-pots and placed upon a gentle bottom-heat. As they increase in size and strength they must be repotted as necessity demands. The same remarks

made respecting the culture and seed of Gesneras will apply also to Eucodonias.

PLECTOPOMAS are propagated in the same manner as Achimenes (see p. 218). The whole of these Gesneraceous plants are very beautiful, and useful for conservatory and indoor decoration; but unless the keeping up of the stock by propagation be well attended to they, like many other plants, are liable to die out and be lost to a garden. 7.0.

GUMMING IN FRUIT TREES.

In the Gardener's Chronicle for February 23, 1884, p. 238, a communication upon this subject appeared from Sir James Paget, in which the researches of Dr. W. M. Beijeriock were alluded to. These observations show that gummosis is a disease due to to the presence of a parasitic fuogus, belonging to the genus Corynium. It was found that when gum was introduced into wounds in the bark of the young branches of Peach and Cherry trees the wounds instead of closing, exuded gum. It was further found that the

the gum for forty-eight hours I was fortunate in finding one spore in the act of germination The process had only just commenced, (4). but the germ tube which was emitted from one of the terminal loculi had already received into itself the endochrome from the compartment from which it sprang. The green bark surrounding the wound from which the gum exuded was environed (2) by a discoloured zone of a bright yellow colour, which bore a strong resemblance to the golden-yellow zone that surrounds the patches of Rhytisma maximum on Willow twigs, so vividly pourtrayed by Sowerby in bis figure under the name Sphæria aurea, t. 356. This yellow zone can only be seen on the young bark, and, as far as my experience goes, is not observable when the older parts of the trees are affected. I have noticed it at present only upon Peach twigs. Having since examined gum from Plum, Cherry, Peach, and Apricot trees, I have found the same mycelium and spores, although the latter not so abundantly as in the specimen, Professor Oudemans sent me; still I have no doubt of the identity of the structures. Professor Oudemans' specimens were exhibited at the

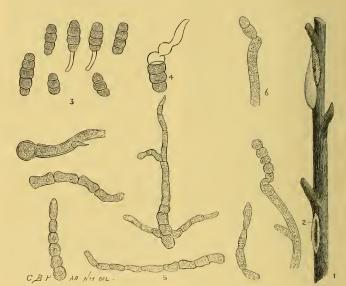

FIG. 74.—CORYNIUM BEIJERINCKII: FUNGUS PRODUCING GUMMING.

References:--1, Twig with gum; 2, gum-producing wound; 3, Spores of Corynium of various ages; 4, Corynium spore germinating; 5, Spawn-thread (mycelium) from gum; 6, Branch bearing spore of Cladosporium.

exudation was not induced when the infection was made with gum that had previously been boiled for some time or otherwise disinfected by heat. The production of the gum is accompanied by the development upon the bark of various spore forms of the fuogus, io fact the fungus is the cause of the disease. This fungus was described* by Professor C. A. J. A. Oudemans. Being interested in the subject I applied to this gentleman, who in reply kindly sent me two specimeos of gumming in the young branches of a Peach tree, in which the Coryoium was present. Upon soaking a few fragments of the gum in water and examining them numerous phases of the life-history of the Corynium were at once encountered, the most abundant of which were mycelial hyphæ, or spawnthreads, of a rich brown colour, variously septate (5); many of these were branched and articulated, others bore Cladosporium spores (6). The true Corynium spores (3) were also encountered, these were not, however, so uniform in size and septation as might have been expected from the description; in some the pedicels were still attached, but in most they had disappeared—some were only biseptate, while a few were 4-septate. After macerating a piece of meetiog of the Scientific Committee on the 11th inst. One point concerning the spread of this disease seems clear—the fungus cannot itself penetrate the bark, there must be some abrasion or laceration of it before the germ tubes can enter. These idjurites may clearly arise from many causes; but how do the spores which are undeveloped in the viscid gam gain access to them? That they cannot be blown there by the wind is obvious. If the gumming occurs upon the upper branches, of course they may be washed down by the rain, but how do they spread from tree to tree? Obviously they must be carried—most probably by insects. From some observations I have recently been making upon canker in Apple trees, I feel almost certain that the form of that disease which is produced by Nectria ditissima—which, by the way, is the commonest form in this district—also originates in the first instance from some injury to the bark, by which the sources gain admission to the host.

the commonest form in this district—also originates in the first instance from some injury to the bark, by which the spores gain admission to the host.

Corynium Eejerinkii, Oud.—Pustules very much punctiform, black, crowded, spores (conidia) oblong or oblong-ovate, pale olive-brown, commonly triseptate (4-loculate), constricted at the septa, 28—32 mk. long by 11—13 mk. wide, terminal locali slightly smaller and paler, pedicels colourless, cylindrical or slightly enlarged at the base, about the length of the spores; paraphyses absent. Charles Plowright, 7, King Street, King's Lynn, March 25.

The Arboretum.

PICEA AJANENSIS, -" This is in several respects the handsomest of all the species of Picea (Spruces), in so far at least as can be judged from somewhat young specimens. Though wanting the drooping Larch-like habit of the Himalayan P. Morinda, and the graceful branching of the Caucasian P. orientalis, it excels these and all others in the bold habit, the dark green of the shining foliage that clothes the upper sides of the io Abies Nordmanniana and A. amabilis, and the beautiful glaucous blue-white of that which appears on the under-side [really upper]. This effect of contrast is much heightened in bright sunshiny weather when the tips of the branches turn up, disclosing to the eye the pale surface of the leaves. Add to this the rich vinous purple of the colour of the young cones, which is not surpassed in beauty by the violet of those of A. Webbiana, or the red of some of the young Larch cones, and it will be allowed that it has many attrac-Mag. (1884), t. 6743, refers, is a native of the Valley of the Amoor, extending into Japan. The full history of the tree-one of two or three species commonly grown as P. Alcockiana-and the curious mobility of the leaves, the presence of the silvery pore-bearing surface on the upper, not the lower surface of the leaves, formed the subject of various articles and illustrations published in these columns in 1880.

PRUNUS TRILOBA. — One of the handsomest of hardy ornamental early spring flowering shrubs is undoubtedly Frunus triloba, with its numerous double rosy-red or pink-coloured flowers. Against a wall it produces a greater profusion of blossoms, and also flowers earlier, than when treated as an ordinary member of the shrubbery horder; but even in the latter position it is a very desirable plant. In the Prunus collection at Kew an earlier variety of similar habit, but one in which duplication of the parts of the flower has not been carried to such an extent as in the species as it is generally met with in gardens, has been in flower some time; indeed, in the open border this form was in flower almost earlier than the type against a sheltered wall. Prunus virgata—for so this early form is named in Continental gardens (the Kew plant was received from Belgium under that name)—is referred to P. Mume by Mons. Lavallée, in his Arboaceum Segrecianum. There is no doubt, however, that it is a mere variety of the plant which LINDLEY called Amygdalopsis triloba, and which is now almost universally referred to a Prunus triloba.

GREY-LEAVED SHRUBS, -The different shades of grey are some of the most useful that are employed in the combinations of the flower gardener in his colour arrangements in the flower-hed proper, and especially in the arabesque or carpet beds. hues are equally as requisite for diversity and relief in the larger fields of garden scenery that the mention of a few of the choicest of them may be thought of use to planters at this season. Unless for especially deserved effect the grey tint should not predominate nor be too pronounced in any part of the garden, and unless the place is of great extent its repetition ought to be avoided. Near the margin of a quiet pool, where the water is still and clear—blue. a quiet poon, where the water is still and clear—blue, not green or white, like rushing water—the grey foliage has pretty effects. Amongst shrubs of large growth good for the purpose are Eleagnus argenteus and E. angustifolius, both with neat lancet-like leaves, inconspicuous yellow flowers of a peculiar odour, which are succeeded by oval red berries. growth is dense and rapid, the plants soon making fine grey masses-E, angustifolius being rather the more pleasing of the two in habit and general effect, and the foliage a little longer, and consequently more drooping, so that more leaf-surface is seen. Hippo-phäe rhamnoides forms pretty half trees or robust bushes, depending on locality and exposure, being specially suited for the sea-side. In favourable seasons they are loaded with orange Pyracantha-like berries, that lend a cheerful look to the plant in late autumn and winter. The habit of the plant is somewhat straggling and unconfined, and on that account, as also for its colour, it will form an admirable contrast planted in the vicinity of the dark prim-looking Thuias and other species of Coniferæ.

Prchid Notes and Cleanings.

IPSEA SPECIOSA.—A fine panful of this beautiful terrestrial Ceylon Orchid, which has been in bloom for more than six weeks with Major Lendy, of Sunbury House, Sunbury-on-Thames, serves to remind us of its worth, and also to furnish us with the specimen from which our illustration (fig. 75) was taken. The plant bears a dozen spikes of bright yellow flowers, with orange lines on the labellum. In habit it resembles a small Bletia. Many fail with this plant, but Major Lendy finds it very easy to grow if potted

Fig. 75.—IPSBA SPECIOSA: FLOWERS YELLOW.

in about equal proportions of turly loam and peat mixed with sand. His plants are placed in a light, airy part of the Cattleya-house, and are unsparingly watered while growing, and kept moist and cool while at rest.

ODONTOGLOSSUM EDWARDI.—In a genus in which whites and yellows predominate to a remarkable extent, this species is conspicuous by reason of its violet-coloured flowers. A strong plant in bloom at Kew is at present one of the most striking objects in the Kew Orchid collection. This specimen has two large panicles, one of which bears upwards of eighty flowers, richer in colour and larger in size than those of any other plant of the same species we have yet seen. In addition to the peculiarity of its colour, O. Edwardi deserves mention on account of its free-flowering character, and also for the length of time which the flowers last.

Phalenopsis Schilleriana.—Comforting news as to the longevity of this plant, and of its extraordianay beauty when grown to perfection, comes from the gardeos of C. Perkins, Esq., Kirkley Hall, Pontendand, Newastle-on-Tyne, in whose Orchid collection are now to be seen two fine plants of it which have been in the family for over twenty years, and always with steadily increasing vigour and floriferousness. The plants have each nine leaves, varying in length from 12 to 15 inches. The one plant now has three flower-spikes, bearing in all 255 fully expanded blooms, and the other has two spikes, bearing between them 263 flowers, the pair of plants presenting an enchanting sight not likely to be forgotten by any who see it. The variety at Kirkley Hall is, moreover, stated to be far more fragrant than the ordinary form. The plants are grown in an ordinary lean-to house, which seems to suit them well, for in addition to their annual heavy crop of flowers, the flower-spikes furnish young plants every year.

DENDROBIUMS AT WELHAM HALL, RETFORD .-When visiting these gardens on the 19th inst. I was delighted to find Dendrobes so well cultivated and in such large numbers for a private establishment, one house being nearly full of them, and the plants flowering in a most profuse manner-Dendrohium Wardianum having several growths, with thirty to forty blooms fully expanded. D. nobile was also doing good service and flowering well. D. crassinode is flowering from fourteen joints, which is more in number than I have previously noticed. Passing through the various houses I noticed that Mr. Wynch, the head gardener, gives only a small quantity of material for the plants to grow in, consequently they must derive most of their support from the atmosphere of the houses, which seems to suit them well, as several of the growths are very fine, and must have been thoroughly ripened up, hence the profuse blooming of the plants. J. Jefferson, Worksop.

ORCHIS ROBERTIANA.—In a recent number of the Gardeners' Chronicle a correspondent asks about Orchis Robertiana. I may inform him that it grows wild here in this neighbourhood, but is not very common. The only place in which I myself have found it is in a sort of ravine on the north side of a wood belonging to Sir John Lubbock. Mumby, in his Catalogue of Algerian Native Plants, gives it also the name of Accras longibracteata. It grows about 12 to 16 inches high, with a large bunch of light coloured lilac flowers with dark spots, and flowers in the month of January—the earliest of all Orchis, A. S., Mustapha Suppricave, Algierue, Algierue,

CALANTHE REGNIERI .- This seems to be a very distinct and useful species. Amongst the importations from Cochin China there is considerable diversity in the colour of the flowers, some being much deeper in colour than the others. The season of Calanthes has been greatly prolonged through it. We have, first, in November, C. vestita and the variety rubra; flowering with it there is the handsome C. Veitchii; these carry the flowering period into the new year. From the middle of December, and flowering a month later than the above, we have C. Turneri and C. Turneri nivalis, two very fine varieties, quite distinct in the form of their flowers from the vestita section; and more nearly allied to the subject of this note, C. Regoieri, of which there are at least three varieties in flower at present in Messrs. Veitch's nursery. In their time of flowering they follow the C. Turneri group; and before these are well out of bloom the distinct and fine hybrid, C. Dominii, will be opening its flowers; followed, and sometimes preceded, by C. masuca and C. veratriflora; the first pale lilac, and very pretty, the latter of a pure delicate white. All of them like turfy loam to grow in, rather than peat. 7. D.

CATTLEVA TRIANÆ VAR. LEEANA.—A First-class Certificate at the Royal Horticultural Society on Tuesday, and a Botanical Certificate at the Royal Botanic Society on Wednesday, should proclaim that this grand Cattleya is one of the first merit. In point of size it is one of the largest flowered of its class, and for its striking beauty it comes into the first rank; but there is over and above these qualities a certain something about it that renders it distinct and debarsone from finding another variety sufficiently like it to compare with it. The tube of the labellum, for example, has a peculiar form, its edges are brought together at the top in a sharp ridge which allows of a greater surface

on the outside for the display of its lively purplishrose colour, which assists so materially in showing off
to advantage the very broad lower portion of the
labellum, and its glowing colour of vivid magentamauve. Another of its peculiarities is, that it has no
y-llow in the throat, but only pure white, with crimson rays. This, and the fact of the clean plain-edged
labellum being edged with pale rose, presents the
high coloured portion of the labellum very distinctly,
The sepals and petals are of fine substance and of a
pleasing rose tint, and altogether it is an extraordinary
and lovely variety. Messrs. F. Sander & Co., of St.
Albans, were the lucky importers, and, on dit, that
Mr. Lee's plant was valued at 250 guineas.

ODONTCGLOSSUM OERSTEDII. — This charming little cool-house Orchid, with its snow-white flowers—ft companion for the bright scarlet Sophronitis grandiflora—was awarded a First-class Certificate at the Royal Horticultural Society on Tuesday, March 25. The pretty pair of plants were exhibited by William Lee, Esq., of Downside, Leatherhead, who grows them very successfully in suspended pans in a cold-house, in which Lycaste Skinneri, &c., are grown. When grown into large tufts like Mr. Lee's plants, and covered with the neat white flowers with orange blotch in the centre, few plants are more attractive, or, by reason of the durability of the blooms, more useful. The same plants were much admired at the Royal Botanic Society's Gardens on Wednesday.

LACHENALIAS.

FROM Mr. Ware, of Tottenham, we have received numerous specimens of these pretty Liliaceous plants, which are not so much grown as they deserve to be,

- L. PENDULA has oblong acute channelled leaves, and very stout speckled flower-stem, bearing at the top a crowded raceme of flowers, each about 1 inch long, with a cylindric red calyx, from beyond which protrudes for a short distance the oblong obtuse rounded petals, green at the tips with a purplish blotch.
- L. AUREA has oblong lanceolate leaves of a deep green colour, the edges and tips being purplish. The flower-stalk is slender, purplish, covered with glaucous bloom, and bearing at the summit a somewhat loose raceme of shortly stalked orange-coloured flowers, in which the petals are half as long again as the sepals.
- L. LUTEOLA MACULATA is a large form with oblong lanceolate spotted leaves and long flowerstalks, 8—fo inches high, green, with purple spots, and bearing at the summit a raceme of greenish-yellow flowers, each about I inch long, and with the petals half as long again as the sepals.
- L. NELSONI × has long oblong lanceolate leaves, purple flower-stalks, 8—10 inches high, and with terminal racemes of rich orange coloured flowers, each rather more than 1 inch in length, with the petals half as long again as the sepals, and marked in the centre by a green rib.
- L. TIGRINA VAR. WAREI.—A relatively low-growing form, with oblong lanceolate acute green leaves, faintly spotted; flower-stalks 6 inches long, with loose racemes of flowers, each about 1½ inch long, the sepals yellow, with green tips, the greenish-yellow petals half as long again as the sepals, oblong, rounded, with a reddish margin.
- L. TIGRINA.—A robust form, with broad oblong lanceolate deep green leaves; flower-stalks S-10 in-hes high, purplish, with a glaucous bloom and terminal loose racemes of yellowish flowers, each abut I inch in length, and with the greenish petals protruding beyond the sepals.

AZALEA OBTUSA.—Mr. Hudson has this charming type in flower at Gunnersbury House, just now. It reminds one of a scarlet amena, or something between this and A. indica; of dwarf, free banching growth, very free, the colour bright scarlet-cimson. It appears to be one of the new American types raised by Mr. C. M. Hovey, having a very close resemblance to A. Little Beauty, shown by Messrs. Veitch & Sons at the last meeting of the Royal Horticultural Society, but differing io colour, Hudson hinks very highly of it, and states that it can be got into flower with A. amoena. It appears to be an excellent forcing plant.

The Henbageous Borden.

Double Daffodils Producing Seed .- In a note from Mr. Brockbank, which recently appeared in the Gardeners' Chronicle (p. 309), it was suggested that the large double Daffodil of English gardens (N. Telamonius flore-pleno) may frequently have been reproduced from its own seed. The idea was new to most of us, and I at once began to make inquiries, the result of which has convinced me that Mr. Brockbank is right. A well-known amateur of long experience in gardening sent me last autumn a quantity of bulbs of both single and double N. Telamonius, which grow together in the orchards of Cornwallwhere he lives. He informs me that the semi-double flowers amongst them produce seed plentifully, as do also the single flowers. He has grown both kinds from seed, and finds that the double flowers bear seed which produces double flowers, and the single flower seed which produces single flowers, with few exceptions. Another correspondent, near whom typical N. Pseudo-Narcissus, both double and single, and N. Telamonius, both double and single, with many intermediate forms, grow mixed up together, tells me that lately he was surprised at observing pollen emitted from a flower of the large double Daffodil; he examined several, and shook out from them enough pollen to colour his hand. I am not at liberty to give the names of my correspondents, but am certain that both are trustworthy. C. Wolley Dod, Edge Halli Malpas, March 26.

AUBRIETIAS, &c .- How very early and strikingly effective are big clumps of Aubrietia violacea, apparently the very earliest of all the family; indeed, such kinds as Ingram's Pink, deltoidea, and others, have hardly a bloom open, and yet violacea is a perfect mass of flower. For spring gardening, to match, for instance, with the white and blue forms of Myosotis dissitiflora, early Daisies, and Violas, it would indeed be difficult to find a more useful hardy bedding plant. Perhaps transplanting would check this precocity to flower, for Aubrietias transplant badly, but much depends upon the soil and its attachment to the roots. Aubrietia violacea not only seeds well, but comes almost perfectly true from seed; and if sown now a pinch would give a fine lot of big plants for next autumn planting. The variegated Forget-me-Not is a charming winter bedding plant, and will match well with variegated Daisies, but it is much later in blooming than is dissitiflora; indeed, pieces that have reverted to the original form show that it is a sport from sylvatica, and not from dissitiflora, as is sometimes supposed. It is strange that double Daisies are not more largely used for winter bedding than they are. I see the large red and white kinds on the hawkers' barrows, but seldom or never any of the pretty variegated kinds, or of the very charming pink, carmine, and mottled flowers. One of the prettiest of all is called Beatrice, a quilled flower of a bright carmine hue, and in a mass it is truly lovely. A bed planted solely in panels with various Daisies, something after the fashion of a carpet hed, would look very pretty, especially if the dividing lines were formed with the golden blotched kinds. *Quercus*.

SCILLAS. - Amongst the groups of Chionodoxa Lucilize from newly imported bulbs I see there are a large proportion of the self blue, differing from Mr. Maw's original discovery, which had a white centre like the Nemophila. The new variety is not so pretty as its cousin, but it is the same plant, and thus forms an interesting variety. There are also some examples of S. nivalis amongst the clumps, and which were thus named by Mr. Potter, of the York Nurseries. This is a very pretty Scilla, after the manner of bifolia. The varieties of S. bifolia are just now amongst the most interesting of our spring flowers. There are many varieties to be selected from any large lot of bulbs, the names and the assortments having got into confusion. We have for the last three years carefully noted the Scillas, and marked off the varieties at There are three well-marked shades blooming time. of blue in S. bifolia, and a double form much larger than the ordinary variety, and with two distinct rows of petals. A true double in S. bifolia would be as pretty as a double Hepatica. The white variety of S. bifolia is much smaller than the blues, and seldom carries more than three flowers on a scape. Is there any larger variety of it? Wm. Brockbank, Brockhurst, Didsbury. [See article on the varieties of Scilla bifolia in Gard. Chron. 1868, p. 157. Ed.]

SCILLA SIBIRICA.—If these, or indeed any of the species of Squilis are planted in good garden soil, as a rule they increase as freely as Crocuses and Snowdrops. I planted some small patches in our garden at Loxford, very light gravelly soil, about nine years ago; six bulbs were planted in each patch, and when they were lifted last year I counted about sixty bulbs in each clump. They seem to do equally well in the heavy soil of our new garden. Some persons are disappointed with Chionodoxa Luciliæ; one geatleman wrote to me enquiring what it was like, because he could not see that it differed from Scilla bifolia. The fact is, that even if the bulbs are purchased from the best seedsmen, the Scilla is mixed with it. The Chionodoxa is a much more beautiful plant than any species of Scilla. It also seeds quite freely; the best way is to let the seeds sow themselves, and as soon as it is seen that they are scattered, cover them over with fine sandy soil. We have the young plants coming up now round a fuft of it like a bed of Onions. The plant itself in its young state has a marked resemblance to the Onion plant, 7. Douglan, Great Geardes.

FORESTRY.

INTERNATIONAL FORESTRY EXHIBITION, EDIN-BURGH.-Since our last report the Executive Committee has made good progress with the arrangements for commencing the more serious part of their undertaking. The applications for space have nearly reached the limits of the contemplated area of the buildings, and if the applications at the close of the last day for entry (the 31st inst.) exceed anticipations, the committee will have to consider the enlargement of the covered space for exhibits. The plan of the exhibition easily admits of this, and the committee have abundance of ground at their disposal for such an extension of the buildings. The open-air space is of great extent, and is not likely to be overcrowded even by the numerous and extensive entries of articles ich have been made for that department of the Exhibition. For open-air space most of the leading firms in the tree nursery trade have applied, and their exhibits of living trees and shruhs will form one of the most instructive and pleasing features in the Exhibition. Among those who will contribute to this most interesting display of living plants are Messrs. Veitch & Sons, of Chelsea; Dickson & Sons, of Chester; Little & Ballantyne, of Carlisle; Rodger, McLelland & Co., of Newry; Hartland, of Cork; The Lawson Company, Messrs. Methven & Son, Dickson & Sons, Dicksons & Co., Laird & Sons, and Ireland & Thomson, of Edinburgh; Ben. Reid & Co., of Aberdeen; Palmer & Son, of Annan, and others, with valuable collections more or less numerous.

At a meeting of the Executive Committee held on the 19th inst. the tenders for erecting the Exhibition buildings were opened, and the estimate of Messrs. Beattie & Sons, builders, Edinburgh, was accepted. The buildings are arranged to cover an area of about 3 acres, and are to be erected from plans prepared by Mr. Robert Morham, Superintendent of the City Public Works, Edinburgh. They combine elegance and lightness of design with the greatest capacity for the purposes of the Exhibition. The site of the main buildings is on the lawn in front of Donaldson's Hospital, in the western suburbs of Edinburgh, and commanding an extensive view of the scenery of the Firth of Forth, Fife, and the Lothians. The main building will run the whole length of the lawn, about 300 yards, and will be intersected at regular intervals by three transepts, running to a depth of about 100 feet from either side. The cotrance to the Exhibition will be by the western gateway of the Institution, entering through a covered way at the west end of the main gallery. Doorways, with flights of steps, will lead from each end of the transepts into the grounds, which will be furnished with numerous seats and rustic arbours, where visitors may rest and enjoy the landscape. Rising over the centre of the building will be a large handsome dome, flanked by cupolas of smaller dimensions. By these and by a zone of glass along the ridge of the roof the interior will be amply lighted. The buildings will be of wood, with incombustible felt roofing, the walls being constructed of dressed 6-inch boards placed in an upright position. To make the interior more ornate, the boards in the gables of the transepts will be arranged diagonally; and a numerous series of arches will also add effectiveness to the design. The roof will be of open woodwork. At the back of the main building—in the recesses between the transepts — refreshment rooms and kitchen and lavatory accommodation will be provided. A number of other smaller buildings, chiefly of an ornamental nature, will be dotted about the grounds. One of these, from Balmoral, is designed to represent a Swiss châlet, which Her Majesty has specially taken under her patronage.

To secure the privacy of the Exhibition, the railings dividing the ground from the street will be boarded up, and a wooden screen, 8 feet high, will be erected round the open sides of the field occupied by the Exhibition outside of the Hospital grounds. The buildings for the Executive Committee are to be put up near the entrance, and immediately to the west of the main gallery. It was announced at the meeting that a printed list, containing twenty-six pages, had been forwarded by order of the Government of India, showing the publications and maps relating to forest administration in that country, and which had been sent to the Exhibition. A further com-munication from the Government of India had also been received, applying for space for wood, Bamboos, &c., which were in course of transmission. It was also stated that the Maharajah of Johore is to be an exhibitor in almost every class; that the Governments of Chili and Denmark had applied for 630 and 600 feet respectively; and that the Scottish Papermakers' Association had asked for a space of 400 square feet in the Exhibition. The number of contributions promised by the foresters of this country, as well as the models, carvings, &c., from private individuals, point to a most exhaustive and interesting display of the arboricultural resources of the country. It was also mentioned that Mr. Peter White, M.P., was moving in the direction of having Caoada properly represented at the Forestry Exh bition, and that the Hon. Duncan Wilmot, the Lieutenant-Governor, had intimated to the New Brupswick Legislature that he deemed it expedient to send a display of the forest wealth of New Brunswick to the Exhibition.

FRUITS UNDER GLASS.

MELONS .- The average time that these take under ordinary treatment, from the period of their setting until they are fit for gathering, is from five to six weeks, therefore, where any are required at an early date, the first batch which have set their fruits should be pushed forward with all possible speed. They will enjoy a high humid temperature, and especially warmth derived from the sun, consequently no opportunity should be lost to make the most of this by closing early, and syringing the plants overhead; syringing in the morning is not desirable, but the beds and other surfaces should be damped early in favourable weather, so that humidity may be maintained. There is much variation in kinds with respect to the netting of the fruits, the finest marked being the most appreciated, and in order to aid in accomplishing this, atmospheric moisture should be cautiously employed, and the ventilation be so conducted as to anticipate the fruits sweating whilst the transition is taking place. The practice of shading, followed by some cultivators, is far from a good one, and should not be imitated, as plants properly reared and attended to not only withstand full exposure to the brightest sunshine, but are greatly strengthened and in every way benefited by its influence. In preparing plants for ordinary frames or pits, in which trellises cannot be used, their points should be pinched out at the second joint, and in planting they should be arranged at equal distances apart upon a ridge of soil placed somewhat nearer to the back than the front of the frame; two plants will be enough for each light of about 4 feet in width, and two shoots only should be allowed to extend from each plant—the one direct to the back, the other to the front of the frame.

VINES.—In mild weather vineries generally should now have a circulation of air at night, and if it can be passed over the warm pipes before it disperses through the structure so much the better. The back sashes should be slightly opened before, or at least as

soon as the sun affects the temperature, and be increased as the sun gains power. Let them be closed before the power is gone, and at the time of closing all Vines which have not reached the blossoming stage should be carefully syringed with chilled rainwater. Houses in which the fruit is swelling should be damped down at closing time, and if a little guano is dissolved in the water it will strengthen the texture of the foliage. Syringing in the morning should not be practised, but all dry surfaces near the pipes, &c., should be damped early. No time should be lost in com-mencing to thin the berries in successional houses, and no better time than the present could be selected for spring planting, and if cut back canes prepared for that purpose are swelling their buds they will be in the best condition for turning out into borders, which should have been formed as has been recommended. In planting carefully remove a sufficient portion of the ball of soil to permit of the roots being thoroughly disentangled; they should then be equally spread out and covered with about 6 inches of the compost. Each plant should be provided with a stake, have its roots mulched with short manure, and receive enough tepid water through a rose to close the soil. Permanent Vines should be afforded a space of 4 feet between their rods.

PEACHES AND NECTARINES,-In clear weather the fires should now be checked early in the morning, and the valves be closed at the same time for the day. The trees in the early house now stoning must not be unduly hastened until that period is over, when the trees will safely withstand harder forcing. A night temperature of 60°, with 10° more from fire-heat in dull weather, and still 10° more on bright sunny days, are the figures to be aimed at for the present. Now that bright weather has set in, syringing will be of great importance, and should be thoroughly attended to twice daily, viz., early in the morniog and at closing time. Disbudding should now be attended to, and the shoots will be growing freely, and should have received their first tying. Any that are very strong should be stopped. Although there is not much danger of well-managed trees casting their fruits, it is best to be on the safe side, and reserve the final thinning until they are stoned. The weight of the crop must necessarily be regulated by circumstances, but it is a step every way in the wrong direction to overburden trees. Successional houses should be gradually brought on in the manner that has been advised for the earlier ones. The borders will claim watchfulness to keep them in a proper state of moisture, and should be mulched with short manure when the fruits commence to swell freely, while the trees that require it should be properly assisted with tepid liquid manure. Thomas Coomber, Hendre Gardens, Monmouth.

Plants and thein Jultune.

GENERAL REMARKS .- Now that we have the power of the sun's rays daily increasing in strength it will be necessary to get the blinds fixed as soon as possible to avert any injury by scalding, and also to relieve any plants that are showing symptoms of distress, looking as if they wanted water, but that really not being the case. When there is a prevalence of easterly winds and bright sunshine sufficient to run the temperature of the house up somewhat unduly high it will be better to let the blinds down for a while rather than give any air when the methods of ventilation are such as to cause the cold air to come in direct contact with the plants. Some roofs, owing to their peculiar construction, are almost inaccessible to roller-blinds; these should be shaded in a permanent manner with scrim canvas or hexagon netting, such as one would use for the protection of fruit trees. This will admit of a tolerable amount of light passing through, yet being sufficient to counteract the risk of injury from scalding. The shading of roofs in any form with applications in the way of paint, whitening, or other material that is applied with a brush, should only be resorted to in the case of emergency; even then it oftentimes does more harm than good, especially if we should have a few weeks of dull cloudy weather intervene, when all shading might be dis-pensed with. The blinds will also be an assistance

at night when a bit cold and gusty, allowing the fires to be eased and so prevent such rapid evaporation, but take the precaution of drawing them up the first thing in the morning. During the absence of blinds from temporary causes some fish-netting laid over the roofs will be of assistance.

STOVES.—Satisfactory progress should now be apparent in the growth of plants in this department; the opportunity of early closing should be taken advantage of during bright sunny weather. The temperature may be run up to 85° or even 90° for a while at such times without any fear of injury when the plants have had a good dewing with the syringe and all available spaces damped down. This will give us what may be termed a fine growing condition of things that will do more towards that end than maintaining a high night temperature at any time. The plants should also have another light syrioging before leaving-off time; this, we think, is not so frequently taken advantage of as it might be. The evaporating troughs should be kept regularly filled; if troughpipes are not provided, very good substitutes can be made from zinc that will last several years. The night temperature of the stove may now be maintained at about 55° as trifle less if very cold, or a little higher if very mild, will be immaterial to the well-being of the plants. With the increased temperatures, especially during the day-time, the mealy-bug will make rapid headway; measures should be taken without delay to keep in check this insect pest, or else it will soon spread throughout the house, causing almost endless labour and watchfulness. Remedies have been so often given that it is quite unnecessary to repeat them, but reference should be made to advice already given. Occasional fumigation will keep in check both thrips and aphis, whilst scale can be kept under by spongling, &c., if not too widely spread throughout the house.

STOVE FLOWERING PLANTS.—The Gardenias will now; to be coming on rapidly under ordinary stove treatment; to such as have heavy crops of bloom-buds occasional doses of weak liquid manure will be a great assistance. One or two of the backward plants may assistance. One of two of the backward parts may with advantage be moved into a trifle lower temperature, to come on as a succession. Young stock should be pioched a few times, to prevent any strong shoots from taking the lead. Some promising looking shoots may also be taken off as cuttings; by securing these with five or six stocky growths, some few weeks will be gained at the commencement of their career—the foundation also for a good plant in the future will be laid; branches, in fact, that look large enough to be in 6-inch pots, can be struck as large enough to be in o-more post, each be stude as easily as the smaller ones, with a brisk heat at command. These can be struck in 3-inch pots, and shifted on into a size larger when established. The Stephanotis that made good autumn growth; will now be pushing forward their trusses; these will be useful when the Gardenias become scarcer. Take the opportunity of planting out a promising young plant if the circumstances are such as to need a good supply.
Where two or three warm, houses are accessible, one Where two or three warm, houses are accessible, one plant may with advantage be kept in each. In this manner, with a slight variation in the temperatures, a longer succession can be had. A well established plant in a pot can be kept in check by removing it to an intermediate house, to be worked in later on as may be required. Such a plant might have a moderate pruning in a few weeks time; it will break all the better, and flower more freely also. Allamandas, Clerodendroos, Bougainvilleas, and Dipladenias, should all be making good breaks by this time. Keep them at the lightest end of the house, and elevated as near to the glass as possible. No tying-in of young shoots extending a little distance elevated as near to the glass as possible. No tying-in of young shoots extending a little distance beyond the trellis should be practised yet. The three first-named genera will not need any support for some time, the last one named will require to be traised on strings near the glass for support. The bush Clerodendrons must be kept pinched a few times, treated in fact like Pelargoniums in this respect, and in potting also. The Vincas will require constant pinching to get a nice stocky bottom. Medinila magnifica will require a little stimulating when the flower trusses are developing, and attention must be given to keeping them free from insects. These remarks will apply with equal force to the Ixoras that made a good autumn growth, and are now or soon will be, showing for flower. Of plants that are gone past their best, and are for the time being relegated to the background, look after Poinsettias, Euphorbias, Plumbagos, and the like, that are invaluable for the winter season. Do not let them take their chance in a cool house, or some dead ones will be found at starting time. Be careful with them take their chance in a cool house, or some dead ones will be found at starting time. Be careful with the Amaryllis as they go out of flower; do not let them be crowded among other plants so that their foliage becomes drawn up to such an extent as to cause it to break down sooner than would otherwise be the case. James Hudson, Gunnersbury House Gardens, W., March 25.

FROM an early period in the history of VEGETABLE ANATOMY-from the time that GREW and MALPIGHI demonstrated the varied internal cellular construction of plantsexperiments to demonstrate the use of these varied structures have been made. now, when this department of botany has taken a sudden bound onwards, and chemical reagents have come to the help of the microscope, it may be hoped that substantial progress may be made in this direction. The structure of plants, like their outward conformation, is partly an hereditary endowment from generation to generation, partly the result of progressive adaptation to certain conditions. So long as the power of adaptation or accommodation to circumstances remains, so long is there room and opportunity for variation as occasion may demand. On the other hand, it is conceivable that plants which have for a long series of ages become adapted or accustomed to one uniform set of conditions remain unaffected, do not vary when those conditions are altered, or, being unable to accommodate themselves to new circumstances, die out. On some such principles. probably, depends the fact that the gardener can grow certain plants without difficulty, while others defy all his efforts. But to descend from the region of speculation to that of practice, we may point out that the internal conformation of plants sometimes offers as good hints to the cultivator as to the conditions under which certain plants may be expected to thrive as the more easily observed external appearances do.

By way of illustration we may mention the presence in the leaves of certain plants of what are termed palissade-cells. These are oblong cells, arranged vertically, that is, at right angles to the surface of the leaf. Their form and direction may be indicated thus ||||||, the ordinary leaf-cells being more or less globular or branching, or, if elongated, then elongated horizontally in a direction parallel to the surfaces of the leaf. The term "palissade-cells," then, very well expresses the form and arrangement of a certain class of cells packed closely together, like the wooden rails of a park fencing. A very low power of the microscope is sufficient to allow these cells to be seen, and in some cases an ordinary pocket lens, if of tolerably high magnifying power, is sufficient to enable them to be seen. These palissade-cells are usually filled with "leaf-green," or chloro-

We cannot here pursue the subject from the point of view of the anatomist or physiologist, it must suffice to point out the practical deductions which are insisted on by STAHL, VESQUE, and other students of this particular structure. When a gardener, says M. VESOUE. in substance, receives a new plant of imperfect or unknown history he does not pay much heed to systems of classification, as a botanist would do, for they afford him little help. He judges by the external appearances of the plant what is likely to be the appropriate treatment, and so, for instance, he submits to the same general conditions Stapelias and Aloes, Agaves and Mesembryanthemums, and so forth-plants, in fact, whose "habits" and requirements are the same, whose adaptive characters, that is, are

identical, although their more purely hereditary peculiarities are widely different. In the case of succulent plants, such as those just mentioned, the matter is easily determined; but in those cases where the exterior appearance gives no indication of the habit and requirements of the plant then a microscopic examination must be made, and this will enable the observer to say with something like certainty whether the plant naturally grows in the sun or the shade-whether its internal structure is such as to allow of free or of relatively little transpiration-whether it is likely to demand frequent and copious waterings, or whether it is capable of living long without any. We may give a few illustrations. If the palissade-cells are abundant and well marked the probability is that the plant requires a proportionate amount of exposure to light; if, on the other hand, the palissades are scanty or not present the inference is that the plant requires to be grown in the shade. Between these two extremes is a group of plants of variable and inconstant nature : such plants obviously are enabled by Nature to adapt themselves more or less successfully to different conditions.

In the case of moisture, the subject may be divided into the discussion of the arrangements for, in the first place, the supply of water; and, secondly, for its retention and storage. Indications as to the supply, great or little, may be gathered from the thickness of the cuticle, and the number and position of the pores or stomata.

As to the faculty of storage, that may be judged of from the nature of the epiderm or skin beneath the cuticle, the abundance of cellular tissue—that is, the succulence of the leaf, and other characters. The first set of characters supply hints as to the absolute quantity of water required; for instance, the thinness of cuticle and abundance of stomata would naturally suggest frequent and copious waterings; the second set of characters suggests the abundance and frequency of water, whether little and often, or a large quantity less often. Plants whose thick rinds indicate a relatively little amount of transpiration naturally require a hotter temperature and a fuller exposure to light than others.

A plant with small pores or stomata transpires less than one with large or with numerous pores. Hairs on the surface check transpiration, spongy construction of the leaf is also an indication of relatively little transpiration. Obviously, the more fleshy the plant the less need there is for watering frequently.

Hard woody cells, such as those which constitute the grit of a Pear, and which serve as a sort of skeleton to support the tissues, are taken by M. VESQUE to indicate that the plant is exposed to bright sunlight and occasional drought, as Proteas, &c., or to occasional excessive losses of water, and indicate the necessity for copious watering at intervals, as in the case of succulent plants.

Pursuing his subject M. VESQUE goes on to show how the epidermal cells, or those subadjacent to them, in some cases act as reservoirs for water; and how in the tissues of some leaves may be found other structures having a similar office, so that the thick rind, the deficiency of stomata, the dense hairs with which plants growing in dry places are provided, indicate the quantity of water which traverses the plant, while the reservoirs for water furnish indications as to the frequency of watering and the length of interval between the operations.

The intelligent observer, adds M. VESQUE, will know how to avail himself of the indications presented to him, which will be varied and combined in a thousand different ways, but from which he will be enabled with accuracy and judgment to regulate the delicate operation of watering.

We have no doubt whatever that M. VESOUE

is on the right track, but we fear it will be long before our young gardeners will avail themselves of the help of the microscope rather than of the rough-and-ready measures that they are accustomed to practise. In any case, it will be admitted that there are few operations in practical gardening which are carried out with less intelligent judgment than is watering, and any means which may serve to obviate this will be a boon to head gardeners.

Lastly, we may mention that we have put M. VESQUE'S notions to a partial test with reference to the leaves of Orchids, which present remarkably great variations of structure, and in some cases of great interest. We have examined one or two dozen species, with the general result of confirming M. VESQUE's notions, or, at least, of satisfying ourselves that "there is something in them." On another occasion we may speak more fully on this point.

- DÆDALACANTHUS NERVOSUS, a very old inhabitant of our stoves, though few will recognise it under the above cumbrous name. As Justicia or Eranthemum it would be more familiar, but as we feel bound to accept BENTHAM and HOOKER's nomenclature till we can show sufficiently valid reason to the contrary, we are constrained to adopt the new name. The novelty of the name will account for the fruitless search made by one of our correspondents in the Treasury of Bolany and other books of reference. Be this as it may, the older generation of gardeners will recognise it as a valuable stove plant, for two reasons—it is winter-flowering, and it has blue flowers, set off by the white veined bracts. Though of shrubby habit, it may be flowered in quite a young state. Like many other good things, it has been elbowed out by things of less interest, but more suitable for cutting or for room decoration. Its culture is of the simplest, and if it be rather apt to fall a prey to mealy-bug, that pest is easily kept in check in the case of this Those who are addicted to microscopical pursuits will find the pollen-grain very elegant and peculiar. The specimen engraved (fig. 76) was sent to us by Mr. WYNNE, gr. to E. S. TRAFFORD, Esq., Wroxham Hall, Norfolk.

- International Health Exhibition, LONDON .- The Exhibition will be opened by the President, His Royal Highness the Prince of WALES, on Thursday, May 8, at 3 P.M.

- Professorship of Horticulture,-We have not an exact equivalent for the title of "Professeur de Culture," whose functions were so long and so devotedly carried out at the Jardin des Plantes at Paris by our late friend and contributor, Professor DECAISNE. Director of the Garden would be our December 2 December 2 Det. the Garden would be on nearest equivalent; but, the occupant of the Chair in Paris has, besides the administration of the garden, to give lectures, some popular, others addressed to botanical students, and to provide generally for the highest requirements of science and the pleasure of lovers of gardening. We are glad to learn that M. MANIME CORNU has been appointed to this important and difficult office. M. CORNU's reputation gives ample justification for the hope that he will prove a successful administrator, and speedily reorganise the establishment committed to bis care, which, to say the truth, sadly needs regenerating. M. CORNU has good material to work on, and a splendid opportunity. Let us hope that he will be enabled to exercise his admitted talents to the best advantage. At the same time three of the principal members of the staff, having completed their term of service, have retired from their duties. To Eoglish horticulturists M. HOULLET is perhaps the best known of these, and their hearty good wishes attend him in his well-earned retirement.

- PEACH BLOSSOM .- It has been the all but universal custom of ralsers of Peaches, if not to proceed quite haphazard, at least to consider the fruit only. Whether this is wise or not will be made manifest by the precautions taken to protect the blooms from spring frost, and by the fact that, with all our care, a good crop on the walls is the exception rather than the rule. We might suggest that raisers should pay increased attention to hardihood. Again, it might be well if they regarded matters from

Fig. 76.—DÆDALACANTHUS NERVOSUS: FLOWERS BLUE. (SEE F. 414.)

a botanist's point of view, and pay more attention to the arrangement of the buds, whether single, or in pairs, or clusters, and for this reason-when the flower-buds are in pairs the two are not of the same age or generation, but one is older and in advance of the other, as may easily be seen when the flowers are young or only partially expanded. Would it not be well to encourage the development of such varieties as show the greatest tendency to produce clustered buds, as by the difference in time of expansion we might secure a crop from the side or younger buds, even if the older one had perished? thought that the difference in time would be too small to be of any practical importance, and no doubt that would be the case now, but our point is that by forethought, and judicious cross-breeding ad hoc, the desired result may be obtained as surely as any other for which we employ like means. Meanwhile, as the double or triple flower-buds occur, as a rule, on the strongest shortest-jointed shoots, and the single buds on the long weak shoots, alternating with leaf-buds, we may realise part of our programme hy selecting the most robust varieties.

- THE FISHERIES EXHIBITION .- At the final meeting of the General Committee, held on Saturday last, the Prince of WALES in the chair, Mr. BIRK-BECK stated that the total number of visitors was 2,703,051, showing a daily average of 18,388. With regard to the financial results of the exhibition, so far as these could be at present ascertained, up to that date the total expenditure had been £131,392 6s. 1d., and the total receipts £140,346 13s., thus leaving a balance of £8,954 6s. 11d. Adding to this balance rent due by Health Exhibition, £5000; advance to ditto, £1000; valuation of furniture £1564 5s. 8d.; due by railway companies, &c., £234 10.; the total balance was £16,753 25. 7d., against which there were liabilities amounting to £1510 15. 11d., leaving a balance of assets over liabilities of £15,243 os. 8d. With regard to the disposal of the surplus the President moved, "That a sum of £10,000 be invested, with a view to applying the proceeds to the assistance of families who have suffered the loss of a father or husband in the prosecution of his calling as a sea fisherman; and that a further sum of £3000 be applied to the formation of a Fisheries Society, such as was suggested by his Royal Highness the President in his reply to the report of the Executive Committee on October 31, 1883." Earl DUCIE seconded the resolution, which was carried unanimously.

- MARSHALL WILDER, -We have received full reports of the banquet given to the Hon. MARSHALL WILDER on the eighty-sixth anniversary of his birth, on September 22 last, and which have been published in book form. MARSHALL WILDER is one of those men who, while diligent in business, have known how to find time to serve the public in very varied capacities, as testified to by numerous speakers on the occasion in question. Mr. WILDER's reply was marked with his customary eloquence, and dealt with a subject on which he never tires of expatiating -the marvellous progress of his country in horticultural and other matters. While as President of the New England Historic-genealogical Society, Col. WILDER is a laudator tempor is acti, cleaving to what is good and noble in the past, so in his presidency of not one but many societies, having each in its own department progress as its object, he is abreast of time present and prophetic in his forecasts of the

- NEW HVACINTHS .- But few new varieties were shown at the meeting of the Royal Horticultural Society on Tuesday, and perhaps it is not to be won-dered at, as the additions of late years have been both many and valuable. What there was of decided novelty was contributed by Messrs. VEITCH & SONS, and in regard to one of these-Harlequin-there was no room for doubt as to its extraordinary novelty, and everybody admired the stout, well formed bells and handsome symmetrical spike; but the colour was condemned, and yet it was its peculiarly distinct colouring, in common with other high qualities, which gained for it the distinction of a First-class Certificate of Merit; and it is difficult to describe it with anything like accuracy. Really it was of a lively purplish-puce, with a pale centre, fine bells, well formed segments, and a spike of the most approved form. It is single-flowered, and will find a place in the mauve class. Of the two new single blue varie-

ties General Gordon had the First-class Certificate, but General Graham had decidedly the best of it in point of quality. It is a pity the committee did not see their way clear to make this award to both. General Gordon is of a rich shining black-blue, with finely formed bells and a close symmetrical spike, but thinner than one likes to see a new Hyacioth now-a-days. On the other hand, General Graham has a singularly dense and symmetrical spike, the colour glistening reddish violet-purple; something in the way of Duke of Connaught, finely formed segments and good bells. A double yellow variety named Minerva deserves some attention, because a decided addition to a class restricted to very few really good flowers; the colour is of a pale creamyvellow, with a slight tint of reddish-pink along the segments; the segments stout and smooth, the fine, and thickly set on the spike, which is unusual in the case of the double yellows. This is said to be an old seedling, developing unusually good qualities. It deserved a First-class Certificate of Merit. Lady of the Lake is a pale single yellow, with a well-formed spike, and stout symmetrical bells. This is a variety Lord Derby that will improve by cultivation. Improved is an unfortunate name, deeper in colour than Lord Derby, the reverse of the segments quite a rich blue, the surface of the bells slightly tinted with purple-fine and handsome spike. In Messrs. W. CUTBUSH & Son's collection was Marchioness of Lorne, a distinct single yellow of a pale creamy hue, and a slight fleshy stripe, handsome bells and spike, a variety that under good cultivation should be very acceptable for exhibition purposes. In the collection shown by Mr. B. S. WILLIAMS were J. S. Mill and Leonora, two pale yellows, as shown too much in the way of Bird of Paradise. Messrs. VEITCH superb collection of Hyacinths was of incom-& SONS parable quality, the selection almost unique, the spikes massive and splendidly coloured. When before were such examples of La Grandesse, S.W., shown at South Kensington? It is the most perfect white Hyacinth in cultivation.

- NEW EARLY SINGLE TULIPS .- A collection of early single Tulips shown by Mr. B. S. WILLIAMS, on Tuesday last, deserves a passing notice, because it contained a few varieties fresh to English growers. A yellow variety named Ophir d'Or is a large and finely-formed flower of a rich deep yellow colour, beating Canary Bird in size and depth, as well as in richness of colour. Adeline is of a rich cerise-crimson colour in the way of Proserpine, but deeper in colour, though not quite so large in size or fine in build, Hector is an edged flower in the way of Duchesse de Parma, but with a distinct salmon-bronzy base, and a feathering of deep gold; the flowers as large as those of Keizer Kroon, and a good companion to it. These are all varieties well worthy attention. It may be mentioned that among the purple-flowered varieties there is nothing that can touch Van der Neer, both for its rich colouring and splendid build.

- Pelargonium Dresden China. - Quite incidentally some information has been supplied by the raiser of this very interesting floral subject. It would appear that Dresden China was the result of very careful crossing by the Rev. A. RAWSON of two of his seedlings-viz., Maid of Kent and Queen of Stripes. It would appear that Queen of Stripes was a distinctly striped variety, but Mr. RAWSON was always dissatisfied with it, owing to the tinge of pink in the white ground; and his object has been to get rid of this by crossing Queen of Stripes with Maid of Kent, so as to get the required purity of the white and still retain the crumpled edges. In Dresden China Mr. RAWSON believes he has succeeded, but all flaked flowers of this type have a tendency to throw self flowers if not carefully managed, and, therefore, they should be grown in a poor soil. Mr. RAWSON is endeavouring to produce a Pelargonium of the Dresden China type, but with blue instead of pink variegation, and he does not despair of eventually becoming successful. The presence of a bluish tint in the Pelargonium is not new to this flower. In FOSTER's Blue Bell, as also in Blue Boy, by the same raiser, there are to be found shades of blue; so there is reasonable ground for believing that the blue stripe may be secured at no distant date.

MAGNOLIA CONSPICUA.—The large specimen of this striking Chinese species to be seen in the grounds of Gunnersbury House, Acton, is now in the full flush of its early vernal beauty; and, while gene-

rally very free of bloom, it appears this season to have put forth its utmost to produce its snow white blossoms in plenteousness. When half grown the blossoms remind one of an erect form of Lapageria alba; they are then singularly pure, and they are so numerous, as every twig of an immense bush-like tree is covered with flowers. This specimen is growing on the elevated ground on the east side of the mansion, but unhappily exposed to frosty influences, and it may be said never to escape the scathing influences of the spring frosts. They are already leaving their disfiguring mark on the flowers: it is one of the penalties Nature enforces in consequence of its precocity. Perhaps this is the reason why it is so little planted now-a-days, though it makes a handsome bold-leaved plant in summer. And, however large the specimen becomes, it is always characterised by a bush-like growth, and, being symmetrical in outline, takes on when in full bloom the appearance of a pyramid of snow. Some protection from frost might be afforded to a small plant, but when it grows into large size this is a difficult if not almost impossible matter. Perhaps in planting it would be wise to place it on the south or south-west side of a line of tall trees, or a high building, that would afford it some protection; but when it gets into size and widens the area of its growth it gets beyond the confines of the friendly protection, and suffers in consequence.

—— MATTHEWS' STRAWBERRY TILE.—At the two last meetings at South Kensington Mr. John MATTHEWS, of Weston-super-Mare, has exhibited an ingenious tile for placing under Strawberries, and which so completely circumwents the snails and slugs that no longer can they dine or sup on the luscious berries where these tiles are used. They are made of earthenware, in the form of quoits, but convex on the under-side, and cut in two, so that when in position they surround the collar of the plants. Mr. MATTHEWS makes them in two sizes, viz., 15 inches and 18 inches in diameter.

- WHAT'S IN A NAME?-It was rather hard upon a very sweet young lady, Miss MARY CHAN-NING, of somewhere, that the papers should have unanimously described her as POLLIE CHARMING, though doubtless the unintentional compliment was in excellent keeping. In old days we used to terminate the common alias of MARY with a "y," now "POLLY" is "POLLIE," the which, if less endearing, is more fastidious, and it may be refined, hut of that we are far from being assured. However the point for correction, in justice to POLLY, is that, howsoever charming, still the intended appellation of the plant in question was that of Pollie Channing, but by an incorrect rendering upon a card the lady lost the fame which was hers. Yet may not the lady console herself with the reflection that same -and such fame, too-is very fleeting? To how many pretty faces, and to how many manly hirsute ones, too, have plants not been dedicated to be heard of for a year, then disappear for ever? We sometimes wonder whether, in undertaking the onerou work of naming a number of new plants, say, Pelargoniums, Cinerarias, Roses, or similar things, raisers reflect on the questionable compliments they are paying friends, perhaps some near and dear, or others for whom they entertain warm esteem, in thus giving their human appellations to pet flowers, the favourites of to-day, to be chased into eternal oblivion by the favourites of to-morrow. Names, of course, we must have, but there are myriads of appellations that have no personal associations, and in soon forgetting them no heartstrings are strained. The beautiful floral wreath is to-day laid as a loving tribute on the tomb of some dear departed one; a few days and it is withered-a sad memento of grief that, too, is withered and dried. It is hardly worth while to lay appellative wreaths, that too soon decay, on the brows of the living.

— VARIETIES OF RHUBARE.—Mr. EWING's question with reference to the work of the Royal Horticultural Society, in his interesting communication on Rhubarbs, at p. 372, was, to some extent, answered on Tuesday by the exhibition before the Fruit Committee of samples of all the varieties grown at Chiswick. Mr. BARRON classified the varieties as they appeared to stand in relation to one another, and the result amply confirmed previous convictions, that the number of names in circulation is out of all proprition to the number of really distinct varieties.

Taking them as they stood, the Early Red, or Albert, came first. This is the early sort most generally cultivated by market growers, and is distinguished from the next type, Linnæus, or Johnston's St. Martin's, in having the upper side of the stems concave, while in the latter they are convex. To the Early Red or Albert section clearly belonged the sorts sent to Chiswick under the following names by the firms indicated:—Early Red (Lawson), Prince Albert (Lawson), Albert (Barr and Osborn), Royal Albert (Lawson), Albert (Barr and Osborn), Royal Albert (Mitchell and Carter), Salt's Crimson Perfection (Osborn), Linnæus (Barr), and Scotch Mammoth (Bunyard). The next in point of earliness, and distinct as a variety—" Osborn, and Carter), the Victoria (of Lawson), Buckley's Crimson (Barr), Salt's New Empress (Barr), Goliath (Barr), and Johnston's St. Martin's (of Barr, Osborn, Carter, and Lawson). Next came a variety, apparently distinct, grown at Syon House under the name of Bucks Early Red, a small sort hy comparison with the Early Red of the market growers; Dancer's Early Red (Osborn), also distinct; Hawkes' Champagne (Buoyard), and Champagne (Barr), which are the same; Baldey's Scarlet De-fiance, and Crimson Perfection (Carter), which are identical; Victoria Late, Victoria (Barr), and John-ston's St. Martin's (Osborn), all alike, and late; and latest of all, only now a few inches high, Stott's Monarch (Lawson). Hawkes' Champagne is an old sort, which, on account of its sterling good qualities, has been kept pure by Messrs. Bunyard, and one or two other growers; and the committee, by awarding it a First-class Certificate, confirmed the opinion of those who knew its merits, that it ought to be more widely cultivated. It is early, of a good colour, very tender, and a very free grower.

— A VEGETABLE BOUQUET.—Quite a novelly in the way of a bouquet was produced by Mr. ALDOUS, florist, of South Kensington, a few days since. A lady was desirous of presenting a gentleman with a bouquet—this being the ladies' privilege in Leap Year—and gave the order that culinary vegetables only were to be employed in its fabrication, which was tastefully carried out. It consisted of the following items, in their smaller forms:—Forced Carrots, in two shapes, long and short; Radishes the same, Brussels Sprouts, variegated Scotch Kale, curled Endive, and the broad-leaved Datavian variety, Parsley being used instead of the usual Fern fronds seen in ordinary bouquets. The whole, including the holder, measured rather more than 15 inches in diameter, and was mounted in the usual way with the help of wire.

- STRAWBERRY MARGUERITE. - There have been some extraordinary large examples of this well known variety brought under our notice by Mr. A. SHARPE, of West End Gardens, Thorpe, by Egham, which are certainly worthy of special mention, the more so, as is well understood by growers, market or otherwise, that if Strawberries are obtained early in March they are not usually either remarkable for size or colour, and when such kinds as Vicomtesse Héricart de Thury, Sir J. Paxton, or Sir Charles Napier are grown for early purposes the produce may be abundant in numbers but is not of any great size. The fruit from Thorpe is grown at first in brick pits close to the glass, plunged in a mild hotbed of leaves, and when coming into bloom are moved to shelves about 2 feet from the glass in Cucumber-houses and early vineries. The plants in 32's are placed in corresponding saucers, and are watered two or three times sponding saucers, and are watered two of three than weekly with a mild dilution of Clay's Fertiliser and other nitrogenous manures. By the time the fruit has set, in which it is aided in all cases by artificial impregnation, the roots have got down into the saucers, which are seemingly not allowed to become empty, so that a constant supply of food is at hand. This has, of course, a tendency to develope a large even crop of berries, although the compost in which the plants are potted must also have a certain effect, notwithstanding the fact that that has been in the pots since August last, and has therefore become partially exhausted by the plant, and by having its fertilising properties washed out of it by rains and watering. The compost consists of the ordinary loam of the garden, night soil in a decayed state, in the proportion of a shovelfull to a barrowload, and a little salt and lime. The plants as they stood in closely packed array on the long lines of shelves, made quite a picture of robust health and fruitfuloess not often seen, the fruit being of all sizes, from those of 2 inches deep and as much in breadth, and under; and as many as sixteen being seen on a plant. About 20 lb. had been picked on two occasions this month—those from the first gathering being those which came under our notice. At an early date, we shall have the pleasure of giving some useful items of practice in market growing, culled from this garden, that may be of interest to our readers.

"Garden Work." — Oae of the principal difficulties in the way of garden work now.a-days is the necessity of reading the numerous chronicles, journals, magazines, illustrations, dictionaries, cyclopedias, assistants, epitomes, and other publications of the difficulties arising from abundant supply, and the consequent embarrasment as to selection. As to this last matter, things have a way of settling themselves by a process of natural adaptation or accommodation to circumstances, hence we have no doubt our young friend, Garden Work, which made its first appearance with a bunch of Narcissus, under the auspices of the Journal, on Wednesday last, will speedily fall into its allotted place and worthily fill its own appropriate niche. It seems to us an excellent pennyworth, and we do not think that those who invest in this pennyworth of wisdom run the slightest chance of being "pound foolish" in consequence.

- MARKET GREENS .- With all kinds of winter greens a drug in the market—and, indeed, so abundant that, to use the words of a grower, "You can't give them away "-it would be interesting to learn how far the people of the metropolis and surrounding districts, the vast army of consumers, are benefited by the exceeding plenty. The season has been marvellously favourable to the development of all kinds of greenstuffs, so much so that almost ere the end of March is reached Turnip-tops will have become useless, so very precocious are they, and in such haste to bloom. One of the most popular and widely grown of greens, purple-sprouting Broccoli, has come in with a rush, so that immense breadths are being cleared off with wondrous rapidity; indeed, the delay of a few days means spoiling. Then, to make matters worse, not only all kinds of Kales, and the Brussels tops, but even autumn-planted Cabbages are bolting, and there seems in the Brassica family an unanimous haste to be seeding. We learn of loads of Turnip-tops going at 4d. per sack-a price that leaves the grower the interesting problem to solve of how to get rich out of Not a few are having their breadths eaten off with sheep, and are thankful that a flock of these very profitable animals are to be had. We shall no doubt have to pay the piper presently for this present abundance. In a week or two only the white Broccoli and Cabbages will remaio, and when those useful kinds are gone-and the mild weather will not spare them either-there must be a long interregnum ere Peas, Beaos, and other largely grown vegetables, are ready. Blessed indeed will those be who have good stocks of early Cauliflowers and Spinach, with Seakale and Asparagus, to fill up the void Nature has thus so arbitrarily created.

- THE RANUNCULUS .- While the fine varieties of the Anemone coronaria are receiving a good share of attention, the beautiful forms of the Ranunculus are sadly neglected. It is not that there is any difficulty in obtaining roots, for fine mixtures of the Persian Rapunculus and the Turban varieties in colour can be had from the seedsmen who import Dutch bulbs in the autumn. Possibly some of the fine varieties raised by the late Mr. Tyso and others are extant-a few Northern growers probably have them, but they are not propagated for sale as they were years ago. The usual time for planting Ranunculus is in March, and the best way is to prepare a bed which should be fairly rich, and as soon as the weather is dry and mild plant. Planting is done in rows, 6 inches or so apart, and the roots 4 inches or a little more apart in the lines. They should be placed 11 inch below the surface, pressing the roots firmly into the drill drawn for planting, and then covering level. An ordinary garden trowel can be used for drawing drills. Those who grow flowers for market are planting Ranunculus more extensively than they used to do, finding that the flowers obtain a ready sale and are much esteemed. The roots must be lifted at the end of the summer, dried, and put away till planting time comes round again.

- THE ROYAL HORTICULTURAL SOCIETY. -"A Late Fellow" writes :- "Permit me to call atten-tion to the mismanagement on the part of the officials ol the Royal Horticultural Society in not providing for the public, on the occasion of their Hyacinth show, the slightest clue either how to get into their gardens, or, when there, how to get to the Hyacinth At the only opened entrance, the so-called 'orchard-house entrance,' a most dilapidated structure, the only notice-board outside and inside belonged to the 'Ecclesiastical Art Exhibition,' consequently ladies bound to the 'Hyacinth show' went wandering down Exhibition Road to the other entrance, and, when there, had, much to their disgust, to retrace their steps to the 'Ecclesiastical Art entrance' again! Why could not the officials have put a few handbills outside that there was a show? And inside the same confusion existed, the corridors being in the hands of workmen preparing for the 'Food Exhibition.' wonder the Horticultural Society is at such a discount; and what can be more absurd than during the afternoon for an official to propose to the general public attending the show a list of names of candidates for the Fellowship, and asking the public whether they shall be deemed worthy of admittance? How different (quantum mulatur ab illo) from those days when one used to drive down to Chiswick and listen to the music of some six of the finest bands; now we only hear half a band! March 26,"

- THE WEATHER .- General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending March 24, issued by the Meteorological Office, London: - The weather has been rather unsettled and showery in the extreme west and north, with hail or sleet on the 20th and 21st, but in all other parts of the kingdom it has been generally and other parts of the kingson in the sector generally fine and dry. The temperature has varied from 4, above the mean in "Eogland, E.," and the "Midland Counties," to 1° above it in "freland, N." At the commencement of the period readings were uniformly high, but gradually fell, till at its close they were rather low for the season. The maxima, they were rather low for the season. The maxima, which were registered in most places on the 18th, ranged from 66' in "England, S.," 64' in "England, E.," and 63' in the "Midland Counties," to 55' in "Freland, N.," and 54' in "Scotland, N." The minima were generally recorded on the 23' or 24th, and varied from 27' in the "Midland Counties," to 32' in the north and west of Scotland and the south of Ireland, while in the "Channel Islands" the lowest reading was 44'. The rainfall has been a little more than the mean in "Scotland, N.," and about equal to it in "Ireland, N.," but less in all other districts. Over England the fall has been very slight. Eight sunships has been more N.," and about equar to less in all other districts. Over En prevalent than for many years past, the percentages of possible duration ranging from 24 in "Scotland, N.," and 26 in "Ireland, N.," to 48 in "England, E.," and 60 in the "Channel Islands." Depressions Depressions served :- Pressure has been generally bigl France, and lowest to the nort-westward and ward of our islands and over Scandinavia. The ward of our islands and over Scandinavia. The only depression of importance which came within our immediate neighbourhood was one which made its appearance off our north-west coasts on the 19th, and, travelling slowly in a north-easterly and east-north-easterly direction, dispersed over Scandinavia towards the end of the period. The wind during the early part of the week was between S. and S.W., but subsequently vecred to W. and N.W. The southerly to south-westerly wind blew strongly at our western and north-western stations on the 18th and western and north-western stations on the 18th and 19th, and the westerly wind on the day following fached the force of a fresh or strong gale at many of our more northern stations, but the north-westerly wind was generally light or moderate.

— Gardening Appointments, — Mr. James Chaplin, lately gardener to General Sir John Douglas, Eart, of Glenfinart, Ardentiny, N.B., to William B. Leaf, Esq., Heathlands, Streatham, London.—Mr. Stuart Compton, lately Foreman at Preston Grange, Dalkeith, N.B., to A. S. Palmer, Seq., Usworth Hall, county Durham.—Mr. Edward Nicol, lately Gardener at the Elms, Berwick-on-Tweed, to Cecil H. Browne, Esq., Comber House, Clandy, county Derry.—Mr. Charles Sheppers, lately Gardener at Kingsbury House, Middlesen, as Gardener to E. Crabb, Esq., Great Glemham House, Saxmundham, Suffolk.—Mr. W. G. WILSON as Gardener to W. F. Spencer, Esq., Spring Grove, Ibewiley.—Mr. James Godperey, late Foreman at Sulby Hall, Rugby, as Gardener to Mrs. Fickering, Brightwell Park, Tetsworth.—Mr. C. Marshall, lately Gardener at Derrystone, Abergavenny, as Gardecer to C. N. Newdegatt, Esq., M.P., Arbuy Hall, Nuneaton, Warwick,

COLONIAL NOTES.

Mr. JOHN FERGUSON has published, through Messrs. Sampson, Low & Co., a small volume entitled Ceylon in 1883, with a heavy title-page so laden with detail that it might almost serve as a table of contents of itself. Dealing with Ceylon from the time of Solomon to that of Sir Arthur Gordon, it gives brief accounts of the history and physical con-formation of the island; its progress, the principal crops, Coffee, Cocoa-nuts, Cinchona, Tea, and a great variety of more or less cognate subjects, no fewer than forty-eight pages being taken up with a description of an elephant "kraal" held at Labergama for the entertainment of the Princes Albert Victor and George of Wales. The contents of the volume were intended to form the subject of a paper to be read before the Colonial Institute, and the pages have not had the advantage of the author's revision facts it is requisite to bear in mind in gauging the merits of the volume. What we have, in fact, is an interesting sketch, rather than a complete monograph. The coffee industry is in a depressed condition owing to the prevalence of leaf-disease, but as some compensation Cinchona now occupies 40,000 acres, yielding 6,000,000 lb. of bark, and Tea 1,500,000 lb. Cocoa and Caoutchouc are also being introduced, and promise satisfactory results.

OUR NATIVE FERNS.

My plea for British Ferns has, I am very pleased to see, touched a sympathetic chord in the breast of your frequent contributor, Mr. A. D. Webster, whom I thank for so kindly seconding my effort to obtain for this much-neglected branch of our native flora the recognition it so certainly merits. I see, however, that he refers to expense as an obstacle to the popularisation of most of the beautiful and curious forms which I named, and I therefore may be permitted to point out that the list I gave was intended to indicate the most marked and contrasted varieties, by way of giving an idea, however meagre, of the scope of fancy in which Dame Nature indulges with these special pets of hers, despite the oblivion to which scientific botanists would, apparently, permit them to be consigned. Take, for instance, two extremes of variation which occur in the genus Athyrium (Lady Fern), viz., A. f. f. var. kalothrix-i.e., filix' feemina (beautiful hair)-Stansfield, and A. f. f. var. velutina, Stansfield, the former of which is of normal shape, but is so delicate in structure and division that the Ironds appear to be formed of filaments of the finest spun glass of the daintiest emerald hue, forming when well grown a gem of vegetation which, I can boldly assert, none of the much-prized exotics-except, it may be, a few of the filmy Ferns -can ever approach in its special type of beauty. The other form, named A. f. f. var. velutina, varies, on the other hand, in an altogether different direction, forming what may be termed the ne plus ultra of cristatum, the rachis of the fronds ramifying to such an extraordinary extent that they form together a spherical mass of finely divided toliage exactly resembling a compact ball of velvet, whence the specific name.

I have instanced these two forms for a special reason, viz., because though so extreme in their variation from the one normal type whence they both sprang, they are not the outcome, as are our florists' triumphs, of long-continued selection from generation after generation of slightly varying seedlings, born of repeated crossings of already varied types, but are both the immediate offspring of two wild sports from the normal, viz., A. f. f. plumosum, Horsfall (parent of kalothrix), and A. f. f. acrocladon (parent of velutina), both found in Yorkshire; thus, though a greater contrast can hardly be imagined in one family than these two plants present, it will be seen that the apparent extreme of variation [in one particular direction] has been reached in two strides. Another equally extraordinary departure from the same normal form, yet beyond all doubt the direct offspring from it, is A. f. f. var. Victoriæ, in which all the pinnæ are double, and set upon the rachis at nearly right angles to each other, while the apices of the frond and the pinnæ are beautifully crested; even the ultimate divisions (pinnules) of the original froud, part of which it possesses, are divided and the divisions set at the same angle to each other as are the pinnæ. This Fern was found wild by a roadside in Scotland, and no intermediate form has yet been discovered. Did space permit many instances could be given of this singular faculty possessed by our common British Ferns of producing at one leap forms differing so widely in character as at times to puzzle even the experienced finder as to the family to which they belong—a faculty which becomes the more striking when it is borne in mind that in the large majority of cases they reproduce their peculiarities perfectly from their spores.

Every one with a hobby is apt to regard his geese as swans, and to estimate as beauties what to un-biassed eyes are merely abnormalities, and perhaps ngly ones. I must, however, deprecate the idea that this is the case with the majority of our British Fern varieties, many of which, like those I have cited, possess an individuality, a delicacy, and a heauty which is all their own, and need not the roseate spectacles of the specialist in order to be appreciated.

Referring again to Mr. Webster's communication, I would point out that since the bulk of even the best varieties are reproduced truly from their spores, while many are capable of being multiplied by division, or by means of the curious viviparousness which characterises many of the abnormal forms, it is manifest that the cost of even the best is ruled by the demand, which, all inadequate as it is at present for the merits of these lovely plants, is yet sufficient to enable the few nurserymen who make them a speciality to supply them at prices (in some cases a few pence) which multiplied tenfold would not be grudged for plants of a tithe of their merits, but which happen for the moment to bask in the sunshine of fashion.

Finally, I would adduce an additional plea for the culture of our native Ferns which goes far sã a set-off against possible costliness, viz., their longevity. A house flower of almost any kind soon becomes drawn up and unsightly; a Fern, on the contrary, needs only parting from time to time, its divisions forming welcome gifts to admiring friends, and with ordinary acre it will live as long as its owner; thus virtually becoming, not merely "a thing of beauty," but "a joy for ever" into the bargain. Charles T. Druery, Horticultural Club.

- I quite agree with Mr. Stansfield that the high price of British Ferns is mainly owing to the limited demand for these plants, other hand, he must admit that the demand is to some extent regulated by the price. Allow me to ask the question, Have popular Ferns of late years been reduced in price? I should answer No; and in corroboration of the statement would draw attention to the Killarney Fern (Trichomanes radicans), which, although eagerly sought after, is quite as high priced in most lists to-day as it was a dozen years ago. No doubt this may to some extent be accounted for by its rarity, but then it is readily enough propagated, and if plants were offered at one-half their present price I have no doubt the demand would equal the supply. Mr. Stansfield also places a query to my statement regarding the high price of Ferns, but that this is perfectly correct when compared with that of other plants is fully exemplified in Mr. Stansfield's own consecutive catalogues of British Ferns and Hardy Perennial and Alpine Plants, where the average price of these latter is exactly one-fourth that of Ferns. Now to any one about to stock a garden this difference in many cases must be a serious consideration, and weigh heavily in favour of discarding the Ferns for the more showy, though far less interesting, alpine and herbaceous plants. Mrs. Helen E. Watney need not despair of the Carnarvonshire Ferns becoming extinct by the too pressing attention of " collectors. for the Snowdon range of hills is far too extensive, as well as difficult of access, to render anything like extermination, at least of most species, an utter impossibility. One or two, such as the forked Spleenwort (Asplenium septentrionale), alternate-leaved Spleenwort (A. alternifolium), and Woodsias, may and will no doubt ere long become Ferns of the past in Carnarvonshire, for their habitat is recorded pretty accurately in at least half a dozen books on British Ferns; but I should be extremely sorry did any note of mine lead to the extermination of even a single species, and this has been my special reason for not recording the exact locality of several rare plants on which I have communicated notes of late. In conclusion, I think all lovers of our native Ferns should feel grateful to Mr. Stansfield for the untiring energy he bestows on the raising and cultivating of these plants, and their numerous distinct varieties, and of which his collection is certainly second to none of its kind in the country. A. D. Webster.

SAXIFRAGA OPPOSITIFOLIA.

THOSE who have wandered in our Welsh and Scottish mountains will remember the delight with which they welcomed the rosy-liale flowers of this little gem; the Swiss tourist also will recognise it as familiar; but what shall we say of the variety we now figure (fig. 77), from the Pyrenees, and which is the variety known as pyrenaica? Its flowers are twice the size even of the largest oppositifolia, and the habit Is more erect. How fine a thing it is for the rockwork, or for pot-culture in a cool frame, our fullustration will show. We are indebted to Messrs. Backhouse, of York, for the opportunity of figuring the plant, and trust that in the interest of the flower-loving public they have a large stock of it.

Home Correspondence.

Resting-spores of Peronospora ganglioniformis (Berk.).—I have received some magnificent preparations of these curious bodies from the Rev. J. E. Vize, of Forden, Welshpool. Mr. Vize remembered seeing some Lettuces last year invaded by the Peronospora, and thinking the dead Lettuce stems might carry the oospores, he went to the spot and found them in considerable numbers. The oospores occur between the spiral vessels and the external shell of the cld Lettuce stems. They grow in enormous conglomerated masses; so profuse is this, their natural habit of growth, that under the microscope the masses of oospores look like the roe of some fish, W. G. S.

Daffodils: Primrose Peerless: Butter and Eggs.—I send five flowers from the only plant we have of Primrose Peerless (as the old large Daffodil with the short cup of deeper yellow was formerly named). These five flowers show the gradual doubling of the whole thing. The one pure single bloom is the only one untainted with doubleness that has appeared this season upon the plant. Next year the old name will certainty be a misnomer, for the beauty of the flower will have vanished with its singleness. We have now divided the roots, and separated quite the only part that bore the single flower. Nothing will, however, stop, it is to be feared, this tendency to double, E. V. B. [The flowers received are all forms of Narcissus incomparabilis aurantius plenus, the Butter and Eggs of English gardens. Primrose Peerless is Parkinson's name for the single form, which "F. V. B." need not fear will become double, the tendency in Daffodils being for double ones to become single, and not for single ones to become double. Ed...]

Weigela hortensis nivea.—This is a very handsome hardy shrub for out-of-doors culture, and bushes of it laden with its white flowers out-of-doors are very attractive. Some bushes of it now in flower in Messrs. Veitch's nursery at Combe Wood prove it to he an excellent hardy shrub for forcing; a few plants of it forced and arranged in the greenhouse or conservatory would be welcome at any season, but especially so in the early spring months. S. D.

Resting - spores of Peronospora Schleideniana (Ung.).— I have received from Mr. Vize the oospores of the Peronospora which sets up putrescence in Onions. They are few in number, and isolated in growth. They are a little larger in size than the oospores of P. ganglioniformis, as was to be expected, the acrospores being larger. Mr. Vize found these bodies in a wet, decayed patch of Onion. He attributes their rarity to the rarity of the Peronospora last season. W. G. S.

Old-fashioned Flowers.—I can remember two of the Roses mentioned by "E. V, B." growing in the dold flower garden at my own house. There was the Double Velvet, a very rich, dark claret colour, with petals as soft-looking as the best Genoa labric, and the Marble, a red and white single Rose, which my mother called the Lancastrian Rose, but which the gardener termed Marbly Rose. The Velvet was a lovely flower; I oever meet with it oow, though I have often looked for it in old gardens. I do not think I have ever seen a Rose to compare with it in point of real beauty, but perhaps it is the "distance of time that lends enchantment" to my memory. If I were to see it again it might possibly be a case of "Harrow mutton pies," as a relative of mine used to tell me when I expressed disappointment at not finding fondly remembered things and places unaltered. He had gone into the army after leaving Harrow, and on his return from foreign service arranged with a brother officer and former chum to go down and taste the mutton pies they had often and fondly talked about when camping out.

They went—the old shop was there, and a goodly show of pies graced the counter; but their taste in respect to pastry, and mutton pies in particular, had greatly altered, and so may my floral affections—the Double Velvet Rose of my girlhood, and the Double Velvet Rose of the present day (if it exists) may appear in very different aspects. I have a dim sort of idea that I have heard Finks called Gentles. Ben Johnson wrote of the Clove Pink as Sops in Wine, Chaucer terms it Clow Gilofre, but I cannot find the name of Flower Gentle. Very probably your correspondent may discens something of these old flowers in Hone's Year Eook or Hone's Everyday Book; my volumes are packed up: if this were not the case, I would look them over. Helen E. Walney, P.S.—You know that according to fable all Roses were originally white, but Venus run their thorns into her feet and dyed them. feet and dyed them.

Chionodoxa Luciliæ. — So lovely a flower as this would surely need no words of praise were it as well known in our gardens as it should be. On its first appearing, about two weeks ago, we felt a little disappointment; too weak and small a flower this

see Dr. Hance's papers in the Journal of Botany, 1870, pp. 274, 275, and 1878, pp. 6-8. F. B. F.

Anthurium Rothschildianum,—In the houses devoted to new plants in Messrs. Veitch's nursery there are a number of small plants in flower of this distinct and very pretty hybrid. They vary much in the form of the spotting, and as the plants increase in strength so do the spathes increase very rapidly in size. The more one sees of this plant the more is its heauty discerned and appreciated. A. ferriernes x. also in flower, is ruite distinct from anythine in ense x, also in flower, is quite distinct from anything in form and colour. It is a showy plant and a good addition to this class. It is between A. Andreanum and A. ornatum, the spathes being rosy-red in colour.

Anemone apennina,—This charming plant is now at its best in the South of England, and merits a passing word of comment. When seen growing shorad patches in a wild, or (should we say?) semi-wild state, and associated with other subjects of a kindred nature, it becomes at once an object of singular interest and beauty to lovers of Nature who happen

and, like the latter, it does not appear to be at all fastidious as to soil, climate, or situation, so long as it is left pretty much to itself. Broad patches of some yards in extent are very showy when in flower, and may be seen from a considerable distance, giving one that impracing of a cloth of gold. 3. the impression of a cloth of gold. 7. H.

Royal Horticultural: March 25.

Royal Horticultural: March 25.
SCIENTIFIC COMMITTEE.—Sir J. D. Hooker,
K.C.S.I., in the chair. Present: Messrs, MacLachlan, Ridley, Pascoe, Murray, Mangles, W. G.
Smith, Boulger, Houston, G. F. Wilson, E. S.
Loder, Grote, Drs. Lowe and Masters, and the
Rev, G. Henslow (Secretary).

Potato Disease.—A conversation took place as to
the experiments to he carried out at Chiswick this
season, and a committee was nominated to watch the
results.

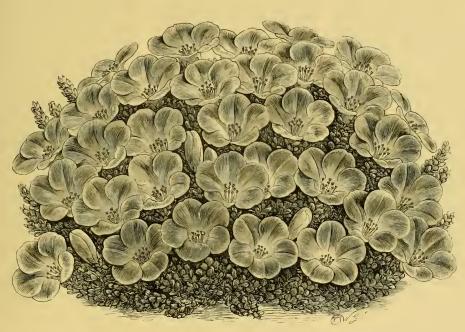

FIG. 77.-SAXIFRAGA PYRENAICA SUPERBA: FLOWERS ROSY-LILAC. (SEE P. 418.)

seemed to be called the "Glory of the Snow!" Since then, however, it has arisen in full and perfect beauty, to meet the hot glow of sunshine that has lately blessed the country. We have as yet only one little round bed filled with it, but another season it must glorify in masses the dull brown of our borders. If the common blue Squill has hitherto satisfied us with its common due scaps of long unfaded, how much most blue, which stays so long unfaded, how much most shall we rejoice in the surpassing beauty of this newer flower, when once it has become numerous caough to take its place amongst the usual early flowers of March 2 L. V. B., March 19.

Abies Fortunei .- Dr. Hance in the Journal of Abies Fortunei.—Dr. Hance in the Journal of Botany, 1882, p. 39, came to the same conclusion as you with reference to the genus of this plant, and alludes to the deciduous character of the seed-scales. Specimens were collected at Foo-chow by Dr. Hance's son in 1873, and by Mr. Hancock, of the Chinese Customs Service, in 1881. As to your inference, that this tree was introduced to Foo-chow because it was found near a temple, I believe the very reverse is the truth, as the fact that any given tree is found growing around temples is looked on as the strongest proof that the trees form and of the indigenous were proof that the trees form part of the indigenous vege-tation of the district, and which the Chinese have been destroying for fuel and house-building. As to this

to have the good fortune to meet with it. Its flowers, which are of a beautiful celestial blue in colour, are such as cannot fail to attract the attention of the merest tyro in gardening or botanical pursuits, and the only wonder in connection with it is that we do the only wonder in connection with it is that we do not meet with it more frequently in our English gardens than we do, seeing that it is so well adapted for growing on rockwork, in the herbaceus border, or in any odd corner and out-of-the-way place. Probably it has the most pleasing and natural effect when seen growing on the steep slope of some deep and precipitous ravine with an awe-inspiring look, and far away out of arm's reach, or in some diligie or delil underneath the overhanging branches of trees, or, again, by the sides of woodland walks. Certain it is that, wherever it grows, whether under cultivation or that, wherever it grows, whether under cultivation or in a wild state, it is one of our prettiest early spring flowering plants. J. H.

Anemone ranunculoides.—Like the foregoing, and which may appropriately be described as its worthy congener, is a plant richly deserving the attention of cultivators of hardy herhaceous and alpine plants. Being of a deep vellow in colour, and, as its specific name implies, resembling to a certain extent our common field Buttercup, it forms a striking contrast when growing side by side with A. apenoina,

Rhododendron Wightii, var. ?—Mr. Mangles showed a white-flowered Rhododendron, presumably the white variety of R. Wightii. The leaves are oblong-acute, with rusty down on the under-surface, the flowers in a compact hemispherical truss, each of medium size, translucent, white, with a reddish spot within at the base. The R. Wighti, as figured in Hooker's Sibkim Rhododendrons, has yellow flowers thickly spotted with reddish spots. In 1856 it is noted in the Gardeners' Chronicle, p. 213, that R. Wightii bloomed in Messrs, Standish and Noble's nursery at Bagehot. "The flowers of Wightii are not equal to those represented in the Rhododendrons of Sibkim Himalaya... When first opened the blooms of Wightii are of a pale prinnrose, changing, howeer, in a day or two to pure white. They are of good shape, 3 inches across the mouth, and the petals have a very singular and beautiful appearance from being nearly transparent." The perfume of the flowers is also alluded to. In the Kew Herbarium is a specimen from Lachen in Sikkim, alt. 12,000 feet, labelled by Sir Joseph Hooker as R. Wightii (flower white). There is also a record of its having flowered at Combe Royal, but the flowers were white. Herr Otto Forster also flowered the plant some years ago, the blossoms being white. Mr. Mangles' specimen from an impoverished

plant seemed to be identical with R. Wightii as ligured, except, as above said, in the colour of the flowers.

Howers,

Disease of Orchid Leaves,—Mr, W, G, Smith exhibited leaves of Vanda and Cattleya inlested with "black spot," in which spots the fungus named Protomyces concomians, B, was present.

Oranges with Smith Fanguss.—Mr, Smith also exhibited Oranges blackened with the smut fungus—Concodiumestri

Capnodium citri.

Cappodium citci.
Germination of Bunt Spores,—Mr. Smith drew attention to the fact that the Rev. M. J. Berkeley, in vol. ii. of the Journal of the Royal Horticultural Society, 1847, had described the secondary conjugating spores of Tilletia caries, Tul., as furnished with septa. Tulasne, seven years afterwards, in an elaborate paper, Ann. des Sc. Nat., 1854, illustrated them as nonseptate; but quite recently Dr. Oscar Brefeld in his work on Smuts and Bunt had again shown them as distinctly sentate, and so after a large of nearly forty.

work on Sneus and Dinn had again shown them is distinctly septate; and so after a lapse of nearly forty years confirming Mr. Berkeley's views as to the septa. Corn Mildew and Barberry Blight.—Mr. W. G. Smith said it was generally admitted that the Puccinia of Corn mildew was perenoial or hereditary, as in the Puccinia of Celery, Hollybooks, Sweet Williams, &c., but it was more difficult to prove that the Æcidium fungus of Barberies was hereditary, on account of the Barberies but his fungus. Mr. Plowigens who however, last summer forwarded however, last summer forwarded the berries of Mahonia Aquifolium invaded by the Æcidium; and Mr. Smith, think-ing these berries might possibly produce seedlings dis-eased with Æcidium berberidis, had them planted during the summer and autumn in three series, allowing each successive overlapping series three months for germination. Not a single seed germinated, series of twelve berries was then sent on to Mr. E Williams, of Holloway, who attempted, under favourable circumstances, to cause them to germinate, but not one cane up. Mr. Barron is now experimenting with others at Chiewick, Mr. Smith thought these experiments indicated that the plasma of the parasite had reached the seed, and that if the berries had been less badly affected, diseased seedlings would have appeared, as in the well known cases of the diseased Celery, Sweet William, and Hollyhock seedlings. The berries, being badly affected, were killed by the fungus. Under these circumstances, the deductions made from the germination of spores on leaves, said Mr. Smith, should be received with caution, as the lastic separemented upon were already saturated with able circumstances, to cause them to germinate, but not one came up. Mr. Barron is now experimenting plants experimented upon were already saturated with hereditary disease. Primula elatior.—Mr. Boulger exhibited a depauperated specimen grown in a north aspect in a

London garden.

Cardamine hirsuta. — Mr. Houston showed a flower-bud in the position of one of the short stamens

in a flower of this plant.

Plants exhibited .- Messrs. G. F. Wilson, Loder, and Dr. Lowe exhibited numerous specimens of interest ing hardy plants, the mere enumeration of which would be of no interest. Among Dr. Lowe's plants was an annual, Cerinthe major, grown from seed collected near Naples. About the same time seed from a finer an annual, cerimine major, grown from sect confected mear Naples. About the same time seed from a finer variety with brown spotted flowers was obtained from Albano. The seeds from each source produced yellow flowers, and this yellow colour was maintained year by year in the seedling plants until this year, when the brown form has suddenly re-

Diseased Apples.—Some Apples were shown with cracked rinds, the work of a lungus, Cladosporium dendriticum, and with black patches produced by Septoria Ralfsii,

FLORAL COMMITTEE .- Present in Section A .:-FLORAL COMMITTEE.—Present in Section A:—
Thomas Moore, Esq., in the chair; Messts. J.
Fraser, H. Herbst, J. Iludson, H. Ebbage, H. Williams, H. Ballantine, J. Dominy, T. O'Brien, E.
Hill, J. Woodbridge, F. Kinghorn, and the Rev. G.
Henslow. Section B:—Shirley Hibberd, Esq., in
the chair; Messts. H. Bennett, W. Bealby, J. James,
J. Child, G. F. Wilson, D. C. Lathbury, and W. B.
Kellock. The display on this occasion was superior
in every respect to the last, as was to be expected,
most of the thines here staged being available for most of the things here staged being available for "the Park" show on Wednesday. The wondrous show of Daffodils gave us a foretaste of the Narcissus show of Dationis gave us a foretaste of the Nacissus efectival which is yet to come in the course of a few days, in the large collections shown respectively by Messrs, Barr & Son, of Covent Garden; Mr. Thomas Ware, Tottenham; and Messrs. Collins Bros. & Co., Waterloo Road. Anemone fulgens, in single and double forms, added brilliancy to Messrs. Barr & Son's interesting stand; while various other plants and the control of the standard of the control of the standard of the control of the standard of the sta & Son's interesting stand; while various other plants lent additional attraction, such as Puschkinia libanotica compacta, two varieties of Triteleia, a few Muscari, among which M. Helderichii was of an attractive blue tint; and a few spikes of the curiously marked Fritillaria tristis. This collection was awarded a Silver Banksian Medal. Mr. Ware's stand contained many pretty early-flowering useful subjects for the horticulturist, other than Narcissus, in much variety. We draw attention to a few of the

more striking, such as Lachenalia pallida, L. tigrina, the singularly coloured Muscari violaceum, of greenish shaded lilac, the tube mouth purple, with white anthers; the bright-tinted dwarf Primula rosea, a fine rock plant; the pretty Irid, Morea fimbriata, pale lilac, with a broad orange band on two opposite petals; the pale yellow Erythronium grandiflorum; the white Sisyrinchium grandiflorum album; Chionodoxa Luciliæ, Iris tuberosa, and various Muscari and Triteleias. Mr. Ware obtained a Bronze Banksian Medal for his Mr. Ware obtained a Bronze Banksian Medal for his exceedingly interesting collection. The collection of Messrs. Collins Bros. & Co. was nicely put up in elegantly shaped small bottles. The Narcissi were enhanced in effect by the addition of a number of scarlet Anemones. The group of Hyacinths, consisting of 130 plants, exhibited by Messrs. Veitch & Sons, exceeded in beauty perhaps anything that has been shown in that way, the spikes being massive, the colours in several instances quite novel, and the selection and arrangement of the various colours in the group well done. A more detailed account of these the group well done. A more detailed account of these plants will be found in another columo (p. 409). They were awarded a Silver-gilt Eanksian Medal. Mr. B. S. Williams, Victoria and Paradise Nurseries, Holloway, deservedly obtained the Society's Gold Medal for a fine general collection of plants, of which the leading feature was decidedly the superb lot of Hyaleading feature was decidedly the superb lot of Hyacinths, consisting of 180 examples, among them being very fine specimens of such old well-known sorts as Mont Blanc, Von Schiller, Czar Peter, Lord Derby, King of Blues, Ida, one of the finest of the yellow section; La Grandesse, Gigantea, Captain Boynton, a pale blue single, with very large starty bells; De Candolle, Lord Macaulay, Starlight. Less well-known sorts were Obelisk, a pale primrose; Master-piece, a fine blackish-purple; Lord Mayo, a purple, with a white centre; and Roi des Belges, a bright crimson. Some fine large pots of Lily of the Valley, and a group of well bloomed Azalea mollis in several colours were attractive, as were also some pots of single Tulips, alluded to in another column. A pale yellow Narcissus of the Jonquil section, named Newton; N. gloriosus, white with an orange cup, and Sir Walter Scott, a single white Narcissus with an orange cup, were each excellent examples, dwarf, an orange cup, were each excellent examples, dwarf, and full of bloom. Some good varieties of Cyclamen persicum of the usual colours were also showe by this exhibitor. Messrs, W. Cutbush & Son showed two specimens of Hyacinths that evidenced superior culspecimens of Hyacinths that evidenced superior culture, and excellent spikes were to be seen of Kiog of the Blues. The Shah, Senora, Koo-i-noor, Linneus, Florence Nightingale, Margo, Grand Maître, Lord Macaulay, and other well-known kinds. Single Tulips of such sorts as Proserpioe, Joost von Vondel, Vermilion Erilliant, and Queen of Violets. A pretty Narcissus, named Phyllis, was shown by the firm, yellow, sweet-scented, and well bloomed. For the above collection Messrs. Cutbush & Son were awarded as Silverchil Enghisian Medal. To Mr. the above collection Messrs. Cutbush & Son were awarded a Silver-gilt Banksian Medal. To Mr. Anthony Waterer, Knap Hill, a Bronze Medal was awarded for a well-chosen collection of bardy Primroses and Polyanthuses, Primrose Hyde Park Yellow, a telling yellow hose-in-hose variety; and three plants of Fieris japonica, an attractive hardy shrub, which we have seen often of late, and of which too much cannot be said in praise. Mr. R. Dean, Ealing, showed a beautiful pan of Aubrietia violacea—a plant that mut prove of value in the spring flower garden, both for its earliness, its colour, which is more purple than is designated by its name, and its abundant bloom; a very double lemon-coloured Chrysanthemum cornarium, several seedlings of Primals Sieboldi, the a very double remon-control of Primula Sieboldi, the most useful Myosotis dissitifiora alba (in good bloom), and M, dissitifiora Perfection; also his own particular strain of Wallflower, Bedfont Vellow, which as seen stands unrivalled for compact growth, perfume, and colour—just the plant for massing, instead of the "leggy" things too often used. Mr. Dean had several 'leggy" things too often used. Mr. Dean day retty Primroses and Polyanthuses, and a new Auripretty Primroses and Polyanthuses, and a new Auricula, Hetty Dean (Horner), a novel and pleasing show flower, of a greyish-orange tiat, with a good tube, and the paste pure. Mr. Burnett, gr., The Deepdene, Dorking, showed several fine trusses of Rhododendron blooms of the R. arboreum and R. abybridum sections; and from J. H. Mangles, Esq., Valewood, Haslemere, came five noble trusses of Rhododendron grande, which has flowered well this year in his canvas-house. Mr. A. Harding, gr., Orton Hall, Peterborough, exhibited a quantity of blooms of Maréchal Niel Rose, particularly robust for the season, and showing the effect of using the white Banksian Rose as a stock for this variety. Mr. J. Banksian Rose as a stock for this variety. Mr. J. Walker, nurseryman, Thame, exhibited a boxful of Walker, nurseryman, Thame, exhibited å boxfal öt cut Roses, looking fresh and perfect—Climbing Devoniensis, Sir G. Wolseley, Helen Paul, Sénateur Vaisse, La Marque, Cheshuot Hybrid, Lord Macau-lay, Souvenir de la Malmaison, Thomas Mills, Niphetos, Souveein d'un Ami, and some pretty buds of Madame Falcot; also a box of Maréchal Niel buds and blooms. Str. Turner showed some blooms of sclf-coloured Tree Carnations, large and full, purple, rose, and scarlet, about which prob-ably more will be heard in due season. New plants were forthcoming in fair numbers, and

included some really good things, especially in Amaryllis. The Messrs Veitch again sent a selec-tion from their wonderful collection and received awards for Mrs. Hibberd, a fine form of the Leopoldi type, deep rich crimson in colour, with the tips of the segments white; Colonel Burnaby, an immense flower of a pure searlet colour, and unexceptionable shape; Sir Redvers Buller, of similar proceedings and the content is colour with a white bendering the colour with the portions, dark scarlet in colour with a white band down the centre of each segment, a very showy flower. The same firm also had the fine new Adiantum rho-dophyllum described at p. 372; and some new Hya-cinths, the best of which were General Gordon, single cinths, the best of which were General Gordon, single blue, a fine deep shade of colour, almost black, and the spike of massive proportions; and Harlequin, single red, a most peculiar shade of colour, the red being suffused with purple, and the centre of the bells of a lighter colour. Mr. B. S. Williams had a handsome (? hybrid) Odontoglossum, named macrospilum, with two grand spikes of crispum-like flowers, white fairly shaded with violet, and boldly spotted with chestnul-red. From the Downside collection, Mr. Lee seat a fine variety of Cattleya Trianæ named Leeana (see p. 411), and the pretty little white flowered Odontoglossum Oerstedii, not often seen in such fine condition, Mr. Ballastyne pretty little white flowered Odontoglossum Cerstedii, not often seen in such fine condition. Mr. Ballantyne brought up from Baron Schreeder's garden the hand some Ledia callistoglossa, with narrow rosy-pink-coloured sepals and petals, and the large lovely labellum rich rosy-purple. Mr. II. Beonett showed several abundantly flowered examples in pots of the white Rosa polyantha, Anne Marie de Montravel, a decided Rosa polyantha, Anne Marie de Montravel, a decided acquisition to the cut flower growers. Amongst other things worthy of notice, did space permit, was a well bloomed plant of the singular Clirrhopetalum picturatum, an old species, the long slender flowerstalks of which bear at their summit a flat spreading umbel of flowers, each of an eloogate oblong form and creamy-brown colour. The upper sepal and the lateral petals are oblong and relatively small, but the two side sepals are very long, oblong lanceolate, cream-coloured, twisted and deflexed, so as to occupy the same position as the lib. The true lip is very the same position as the lip. The true lip is very small, purple and mobile. The mechanism of the flower with regard to insect fertilisation would be worth investigating. It was exhibited by Major Lendy, who received a Cultural Commendation. The awards made were:—

FIRST-CLASS CERTIFICATES.

Section A.

To Messrs. Veitch & Sons, for Adiantum rhodophyllum.
To William Lee, Esq., for Cattleya Trianæ var.

Lecana.

To William Lee, Esq., for Odontoglossum Oerstedii.

To Mr. B. S. Williams, for Odontoglossum macro-

To Baron Schreeder, for Lælia callistoglossa.

Section B.

To Messrs. Veitch & Sons, for Amaryllis Mrs. To Messrs, Veitch & Sons, for Amaryllis Colonel

Burnaby.

To Messrs, Veitch & Sons, for Amaryllis Sir R. Buller,
To Messrs, Veitch & Sons, for Hyacinth General

To Mrssrs. Veitch & Sons, for Hyacinth Harlequin.
To Mr. H. Bennett, for Rosa polyantha Anne Marie
de Montravel.
To Mr. R. Dean, for Wallflower Bedfont Yellow,
To Mr. R. Dean, for Auricula Hetty Dean (Horner).

FRUIT COMMITTEE.—Present: John E. Lane, Esq., in the chair; Messrs, John Lee, J. Robetts, J. C. Mundell, W. Denning, S. Lyon, C. Silverlock, H. J. Veitch, G. Bunyard, and P. Crowley. The committee inspected a collection of Rhubarbs grown at Chiswick (see p. 416), and awarded a First-class Certificate to an old but little known variety called Hawkes' Champagne. Mr. Gilbert, of Burghley, again exhibited samples of a new Savoy called Gilbert's Universal, a rather plain-looking variety, about the size of a large Cabbage Lettuce, but said to be very hardy and of good quality. Mr. Gull, Dereham, Norfolk, sent a good sample of Dwarf White Broccoli, and from Mr. Thomas Oldham, gr., Friern Watch, North Finchley, came well preserved samples of eighteen varieties of Apples. COMMITTEE .- Present : John E. The awards made were:-

FIRST-CLASS CERTIFICATES.

To Messrs. G. Bunyard & Co., for Rhubarb Hawkes Champagne.
To Mr. Gilbert, for Savoy Gilbert's Universal.

Royal Botanic : March 26 .- This, the first meet-Royal Botanic: March 26.—This, the first meeting of the above Society for the year, brought together an extensive collection of floral productions, foremost among these being the fine collections of Dutch bulbs, Narcissi, Anemones, and Cyclamen that had done duty at the Royal Horticultural Society 6 Garden on the day previous. The same remark will apply to the new plants also, with the same remark will apply to the new plants also, with the Messrs. Vettch & Somnthelson, for the following plants:—Masdevallia Chelsoni (hybrid), a highly coloured

flower, on a long flower-stalk; for the distinct Adiantum rhodophyllum, the bronzy young growths of which are very attractive; and for the effective Dieffenbachia Jenanni, with green foliage, prettily solatshed with pure white continuous spots on the line of ribs and main arress of the leaf. Mr. B. S. Williams received Botanical Certificates for Odontoglossum marcespillum or the property of the line of ribs and main arress of the later, strong me proton; and Adiantum darkest strength of the proton; and Adiantum as was the later strong me proton; and Adiantum, as was W. Lee, Esq., Downside, Leatherhead, for his magnificent Cattleya Trinane Lecana, and for Masdevallia Schlimii, Mr. Chelsoni, and Odontoglossum Oerstedii. A Botanical Certificate was awarded to Mr. F. H. Hill, gr. to H. Little, Esq. Hillingdon, for Odontoglossum Wilckeanum Littletii, a pretty yellow ground kind, having large brown irregular blotches. Floral Certificates was awarded to Mr. F. Horlard, for Auricula S. W. Hewit, a large, dark purple self; Auricula General Gordon, grey-edged, purple body opon and a continuous of the purple body control of the purple body of the purple body of the same strong of the purple body of the same strong of the purple body of the same strong of the

Noakes, Esq., Hope Cottage, Highgate; 3d, Mr. F. J. Hill, Hillingdon.
Roses in pots, six specimens (nurserymen). — 1st, Messrs. Paul & Son, the Old Nurseries, Cheshunt, with Claude Bernard, Catherine Soupert, Alba Rosa, Mrs. Laxton, La France, Souvenir d'Elise. This was the only award which was made in this class. A collection of Roses by Messrs. Paul & Son received the Small Silver Medal. There were pretty plants of Alignonette, Alphonse Soupert, Helen Paul, Lecceq Dumesnil, Madame Cusins, President, and others.
In the open class for twelve Cyclamens Mr. H. B. Smith, Ealing Dean, was 1st; Mr. F. J. Hill, acj, Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston, 3d. In the anateurs' class for twelve Cyclamens, Mr. J. Wiggins, was 1st, and Mr. F. J. Hill, 2d. All of these exhibits were shown in excellent condition, and were fine samples of good culture. A collection of Cyclamens shown by Mr. F. J. Hill, consisting of smaller plants than the above, and of generally darker colours, was awarded a Large Bronze Medal. In the nurserymen's class for twelve pots of Hyacinths, Messrs. Williams & Sons, Fortis Green, came in 1st; Messrs. Cuthush & Son, Highgate, 2d; and Messrs. Gregory & Evans, Longlands Park, Sideup, 3d.

In the open competition for the best six Amaryllis Mr. J. Douglas was 1st. his Femrees of Lodie. Six in the competition of the competiti

Highgate, 2d; and Messrs. Gregory & Evans, Longlands Park, Sideup, 3d.

In the open competition for the best six Amaryllis Mr. J. Douglas was 1st, his Empress of India, Sir J. Cathcart, Suitan, and Endymion being the most marked examples; 2d, Mr. F. J. Hill; 2d, Mr. Buller, St. Dunstans. For twelve pots of Tulips (open).—1st. Messrow & Evans; 2d, Messrs. Cuthush & Son. In the amateur class for an equal number of Tulips in pots, 1st. Mr. H. Eason, gr. to B. Noakes, Esq.; 2d, Mr. J. Douglas. In the open competition for the best twelve pots of Narcissus Mr. J. Douglas was 1st. Messrs. Veitch & Sons were awarded a Small Siver Medal for their grand display of Hyacinths in pots, and the same award was made to Mr. B. S. Williams for Tulips and Cyclamen persicum. Messrs. Cuthush & Son a Large Bronze Medal for a collection of Hyacinths in pots. Hardy herbaceous plants were shown by Mr. J. Dougles well and the pots.

Cyclamen persicum. Messrs. Cutbush & Son a Large Bronze Medal for a collection of Hyacinths in pots. Hardy herbaceous plants were shown by Mr. J. Douglas, who received the ist and only prize; the same exhibitor was also rst for a collection of hardy Primulas. In the open class for the best six Chinese Primulas, Messrs. H. Williams & Sons were rst; Mr. W. Todman, gr. to A. Heaver, Ezq., Upper Tooting, 2d; and Mr. Odell, Gould's Green, Hillingdon, 3d. Messrs. H. Williams & Son were also the winners of the 1st Williams & Son were also the winners of the 1st Williams & Son were also the winners of the 1st Williams & Son were also the winners of the 1st Williams & Son were also the winners of the 1st Williams & Son were also the winners of the 1st Williams & Son were also the winners of a message with the Son Williams of the 1st Williams & Son Were also the winners of the 1st Williams & Son Were also the winners of the 1st Williams & Son Were also the 1st Williams & Son Were also the 1st Williams & Son Were also the Williams & Son Were also the 1st Williams & Son Were also the 1st Williams & Son Were also the Williams & Williams & Son Were also the Williams & Will

Cavendishiana, E. ventricosa minor, and E. ventricosa magnifica. The collection of hardy Polyanthuses and Primulas and Pieris japonica shown by Mr. A. Waterer, Knap Hill, took the large Bronze Medal.

Knap Hill, took the large Bronze Medal.

Among the more prominent lieus in the miscellaneous class may be mentioned Messrs. Barr & Son's collection of Narcissi, Anemones, Miscari ; Messrs. Carter & Co. Spoppy Anemones, Mr. Thomas Ware's Narcissi, and other hardy subjects. A group of Cinerarias from Mr. J. Douglas, rich in colour, regular in markings and form; also a collection of Auriculas. Mr. Walker, of Thaue, had the boxes of Roses which had been at Kensington on the Tuesday. Mr. Todman's group of Cinerarias, of medium height and enormous blooms; Messrs. Collins Bros. & Gabriel's collection of Anemone fulgens, Triteleia, Narcissi—all of which, plaots and cut flower, added much to the interest and instructiveness of the show.

added much to the interest and instructiveness of the show.

Liverpool Horticultural Association,—The second annual Spring Show of this successful Society was held under the most favourable auspices in St. George's Hall, on the 17th 18th, when a fine display of plants and flowers was crowded into that nobe and spacious building. The properties of the state of the sta

premier award was gained by K. Singlecturst, Esq., Algiburth (gr., Mr. J. Kelly), with a splendid lot. Class 8, six poits Narcissus, not less than three varieties, for which there was a keen competition, seven lots being staged; but the premier place was assays, with every fine poits of Mont Blanc, Bacelman major, Soleil d'Or, Grand Prima, &c. Class p, twelve pots single Tulips in six varieties.—1st, C. W. Neuman, Esq. Class 15, six stove and greenhouse plants, three flowering and three follage.—1st, C. W. Neuman, Esq. Class 15, six stove and greenhouse plants, three flowering and three follage.—1st, C. W. Neuman, Esq. with a grand lot, viz., Clivia miniata maxima, Rhodo-dendron Victoria Regioa, and Azalea Bernard André, flowering, and Croton Williamsi, C. Disraeli, and Latania borbonica, follage; the Clivia was especially very fine, with large high-coloured flowers and massive foliage. Class 16, one stove plant in flower, the premier award being again taken by the last prize-winner with a magnificent specimen of Clerodendron Balfourianum, even and thickly flowered all over. Class 19, four Orchids, distinct.—1st, John Woolwrigh Esq., Mossley Hill, Will good popenius for the properties of the propert took the lead, with grand specimens of Alsophila Moorei, Davalla Mooreana, Adiantum formosum, and Gymno-gramma chrysophylla—the first and third being particu-larly fine specimens. Class 24, four Araleas, distinct.— C. W. Neuman, Esq., again took the lead, with splen-didly grown specimens, well feathered with foliage between the flowers in every part; that of Souvenir de Prince Albert is especially noteworthy, for it is seldoun that such a specimen of that variety is seen. Class 3, six hardy plants, forced.—rst, C. W. Neuman, Esq.,

with Deutzia gracilis, Dielytra spectabilis, Azalea annæna, Rhododendron fragrans, &c. Class 33, three Palms or Cycads.—rst, F. Gossage, Esq., Woolton [gr., Mr. J. Jellico], with fine specimens of Latania borbonica, Areca lutescens, and Pritchardia pacifica. Class 35, six Cinerarias, distinct, in which there was good competition, the premier award being given to Mrs. Watk, Aigburth (gr., Mr. J. Agnew), for six very fine plants, most of the plants being very fine selfs. Class 36, six Primulas.—1st, David Walker, Esq., with small plants, but well flowered and with good high colours. Class 39, six pois of Lily of the Valley, in which there were not less than ten exhibitors, the 1st prize being awarded to L. L. Abbott, Esq., St. Michael's [gr., Mr. G. Bennett), for six well grown pots.

Abbott, Esq., St. Michael's (gr., Mr. G. Bennett), for six well grown pots.

MISCELLANEOUS EXHIBITS.—Messrs. R. P. Ker & Son, Aigburth Nurseries, Liverpool, staged a magnificent bank of Hyacinths, containing 350 pots, creating quite a feature in the extractional state of Tulips; the same properties of the properties

Edinburgh Botanical: March 13.—The meeting had been adjourned on February 14 in consequence of the death of Professor J. H. Balfour, W. B. Boyd, Esq., President, in the chair. Before proceeding to business the Chairman expressed regret at the irreparable loss which the Society had sustained in the death of Professor Balfour. He was the founder of the Society—it was in bis house in Dundas Street, in 1265, that the Society took form; and ever since it bad gone on increasing in usefulness, very much of this success being due to the took form; and ever since it had gone on increasing in usefulness, very much of this success being due to the untiring energy of Professor Balfour. Professor Dickson had undertaken to prepare an obituary notice for the Transactions. On the motion of the Chairman the following minute of the Council was unanimously adopted, and a copy of It was ordered to be sent to the family of Professor Balfour:—'It is with profound regret that the Council has to record the loss of Emeritus Professor John Hutton Balfour, the honoured founder of this Society, who had from the commencement till a very recent period taken the deepest interest in its welfare, and may be described as having been its mainspring. Of Professor Balfour's services to botanical science and education it is impossible to speak too highly. His earnest devotion to botany and his inexansithle energy have borne abundant fruit, not only highly. His earnest devotion to botany and his inexhaustible energy have borne abundant fruit, not only in the direct scientific result of his labour, but in the vast number of pupils dispersed over the globe who have attained important positions in connection with botany pure or applied. Professor Balfour's death will be deeply deplored by all who have had the privilege of studying under him, and who will retain lively and affectionate remembrance of his enthusiasm, and of those personal qualities which endeared him to all with whom he came in contact."

he came in contact."

The following communications were read:—
I. "Oblivary Notice of the late James Robson Scott, N. Dilwary Notice of the late James Robson Scott, N. D. Woodside, Relso. M. D. Weyler and Scott, S. D. Weyler raised from a seed found in a fleece, "by H. Cyelpare, M.D. III. "On the Progress of Open-air Vegetation at the Royal Botanic Garden," by Robert Lindsay, Curator:—
"The month of January, 1894, was remarkable for the almost unprecedented high night readings of the thermometer, and the altogether unprecedented low reading of the barometer, the lowest reading ever recorded in Britain having occurred on the evening of the 26th, when the barometer fell to 27,333 inches. The total amount of frost registered during the month was only 20°, The lowest readings were on the 6th, 47°; 20th, 20°; 18th, 47°; 19th, 48°; 20th, 47°. On the 22d and 23d there was heavy rain, accompanied by high winds from the west and north-west. On the 24th and 25th a coosider-

able fall of snow took place, and it seemed as if winter had set in at last. This, however, did not last long. On the night of the soft had making of the most had not the hight of the soft had more of the most plent and destructive gales that ever visited this country occurred, causing enormous damage throughout the country. In the Botanic Garden not much damage was done beyond the loss of a few branches and some broken glass. The effects of the storm were most conspicuous on the had rigid leaves of Yucca gloriosa, of which there are a large number in the rock-garden, those in exposed situations having had their leaves bruised and bruised and broken off, thus rendering them unsightly for a time. Of the forty plants whose dates of flowering are annually recorded, fourteen came into bloom during the month, while three only were in flower at the same date last year.

which three only well in more a constraint when year.

"The following table, giving the dates of those plants which flowered during January this year, show an average of about a fortnight earlier than last season:—

Dates when the following Plants came into flower during

			188	3.	188	4-
Rhododendron atrovir	ens	 	Feb.	10	Jan.	10

IV. "Report on the Vegetation in the Garden of the oyal Botanic Institution, Glasgow;" by Robert Bullen, Curator :-

frost, also, nearly corresponds, being 25° for this and 28° for last year. The day temperature has been at or above 40° twenty-four times, the highest being 49°, on the 9th. The lowest day temperature was 33°, on the 3d. Generally, the first half of the month presented a contunuation of the genial weather experienced last month, when fickle Nature made dupes of such numbers of our hardy plants by easing them to grow and bloom hardy blants by causing them to grow and bloom hardy blants by causing them to grow and bloom hardy blants by causing them to grow and bloom hardy blants by causing them to grow and bloom hardy blants by causing them to grow and bloom hardy blants by causing them to grow and bloom hardy blants of the state of the s

putation, and numbering hundreds of grand old trees, of which the owners had occasion to be proud.

"February.—The thermometer has been at the freezing point once, and below it twelve times during the month, the lowest reading being 25°, or 7° of frost, during the night of the 7th. The highest day temperature was 50°, on the 4th; the lowest 31°, on the 29th—this is the lowest day temperature recorded here isnee December 15, 1882. Total frost for the month, 41°. Although the total frost this month exceeds that recorded for February last year, the difference between the mean temperature for the two months is very little. The weather (excepting the last few days) has been very changeable; rainy days being frequent, little outdoor gardening could be done. A most severe storm was experienced during the night of the 20th great damage being done to property, of 4, inches ten many places. Show fell to a depth and the standard of the control of t

drops, "Observations on the Oil Bodies of the Junger-vi." Observations on the Oil Bodies of the Junger-mannie, Illustrated by Microscopic Preparations; "by John Rattray, M.A., B.Sc., communicated by Professor

Dickson.

Garden, and from Mr. John Campbell, Ledaig.

Garden, and from Mr. John Campbell, Ledaig.

Royal Meteorological: March 19.—The usual monthly meeting of this Society was held at the Institution of Civil Engineers, Mr. R. H. Scott, F. R.S., President, in the chair. The President read a paper entitled "Brief Notes on the History of Thermometers." He stated that the subject had been handled in a comprehensive manner by Mons. Renou a few years ago in the should merely manifest of the facility of the stated that the subject had been handled in a comprehensive manner by Mons. Renou a few years ago in the should merely manifest of the facility of the head of the the should merely manifest of the state that he should merely manifest of the state that he should merely manifest of the state of the should merely manifest of the state of the sta

scales, &c.; and, 12, miscellaneous thermometers. In addition to those there were also exhibited various patterns of thermometer screens, as well as several new meteorological implements, together with drawings, photographs, &c.

floqists' flowers.

CINERARIAS AT WOODSIDE,-If in fixing his habitation some half-a-dozen miles from a railway station Mr. James has given the admirers of his beautiful florists' flowers a somewhat lengthened pilgrimage to the shrine of floral beauty at Farnham Royal, certainly the superb quality seen in the huge batch of Cinerarias now so finely in flower amply compensates. There can be hardly less than a thousand plants to greet the visitor's eyes, growing in long low houses that seem to be so well adapted for their culture, as also for myriads of capital Cyclamens and Chinese Primroses. Mr. James has first-rate strains of Cyclamens, his whites especially being peculiarly compact, and wondrously flowered; and of Chinese Primroses, some half-dozen kinds, chiefly of Messrs. Sutton's selected strains, are seeding marvellously, the plants having quite huge heads of pods, flowers being nearly past. Not the least feature in the selections is their remarkable purity of character and evenness of quality. Herbaceous Calceolarias are in great abundance, and about the month of May will give a brilliant display of colour. What is so remarkable of the large collection of Cinerarias, the greater portion of which are seedlings, is the massive character of the flowers, their broad, well rayed petals, and sturdy compact habit of growth. There is not a small flower to be seen, whilst some are of remarkable size. Still, the most perfect form and quality-and better it seems hardly possible to create now-are found in flowers of good average size. Not only all those kinds which from time to time have been certificated, but many others as good, and in some cases better, have been preserved by propagation, and thus the high quality of the strain is year by year becoming enhanced. No strain is richer in sells, and of these the fiery crimsons, rich reds, magentas, purples, and blues, in many shades, are wondrously beautiful. Still, edged or ringed flowers are abundant, and some selected ones excel all yet seen in other strains in form, massiveness, and beauty. Mr. James is working and selecting for the production of dark eyes, and is succeeding well. Pale and grey eyes will soon become things of the past. Some few propagated plants grown in large pots are not yet at their best but they serve to show what beautiful objects are Cinerarias as exhibition plants, and how much frequenters of flower shows have lost in the general decadence of spring exhibi-tions. With low airy houses, thinly shaded during sunny days, good pot culture and regular attention in watering, the Cinerarias seem to enjoy life here under peculiarly pleasant conditions, special evidence of which is seen in the total absence of those insect parasites which will prey upon plants, and on Cinerarias especially, when they can get a footing. Some day, perhaps—and it can hardly be too soon— Mr. James will put into commerce a dozen of his best kinds, and there can be little doubt they would be eagerly sought for and widely grown. Of this batch one half have received First-class Certificates, and of the others most, perhaps, are better than some the Floral Committee have honoured. Of self flowers Princess of Wales is a bold flower, bright rosy-magenta in colour, fine form, very free, and has a dark eye; Col. Clarke, a superb maroon-crimson flower, shaded with violet; Lord Wolseley, a singularly perfect flower, colour rich violet-purple, with red base to the petals; purple eye. Venus, also a most perfect and beautiful flower, of an intense fiery crimson, flushed with rose; dark eye. Royal Standard is a splendid flower, of the liveliest rosy-crimson, shaded with puce. Sir F. Roberts is a flower of perfect yet flattish form, in colour rich maroon-crimson; and Eastern Empress is a finely formed self of medium size, colour rich bluish-purple, eye dark, and habit compact. All these self flowers seen in the clear Woodside light are beautiful almost beyond description. The selected ringed flowers are Mrs. Herrin, Mrs. Cox, Captain Edwards, and Ellen Terry, all first-rate but varying in depth of colour of the ground, and breadth of the white ring round the eye. Lastly comes one of the rare tricolor

[&]quot;Report on Temperature, &c., for January, 1884—
The thermometer has been at the freezing point once and below it seven times during the month, the lowest temperature registered being 7° on the night of the 2d; 7° was the lowest for January last year. The total of

forms, Lottie Williams, the best, most enduring, and regular in character yet seen, the ground being almost black, and the parti-coloured ring round the eye very clearly defined.

MARKET CYCLAMENS .- No notice of the Cyclamens of the year seems complete without some reference to the very fine strains grown by Mr. Richard Clark, of Twickenham, who deservedly ranks amongst the very best and also largest cultivators of this lovely winter flower. Naturally it may be said that the turn-out at Twickenham ought to be first-class, because the Cyclamen is the floral speciality of Mr. Clark's establishment, and so the result equals the endeavour to produce it. Even now, after some four months of continuous market sale, the stock of plants seems inexhaustible, for house after house of exceeding length is filled to the utmost, presenting scenes of gaiety and floral beauty such as the Cyclamen in masses only can produce, and which can only be seen at some large market growing place. The great features of the strains here are found first in variety of colouring, and second in the superh quality of the flowers. To these elements, of course, is allied the very best culture. It is true only a very few men can do the Cyclamen well. Whilst ninety growers out of a hundred can do all other kinds of market or decorative plants admirably, it is but the remaining ten who can do the Cyclamen in first-class form-perhaps hardly so many. Their culture is a speciality, so also is the cross-breeding, the seed saving, and the selecting, so that few need fret if, because not being Cyclamen specialists, they unhappily fail. With a plant at once so ductile in the hands of the hybridiser, so fertile of pollen and of seed, and, not least, so quickly reproduced from seed, it is not to be wondered at if every year brings forth some slight improvement in diverse kinds, in size of flower, in breadth of petal, in rotundity, or substance, or, perhaps, in purity, or greater depth of colour. Still, the improve-ment hetween a fair example of the Cyclamen of ten years ago and that of to-day, is enormous; and though between that of the preceding year and the present it is very trivial, still the improvement, if in minute shades, is going on.

A seedling white of the present year's blooming shows all those fine developments of size, substance, purity, and form that marked Mr. H. B. Smith's Dame Blanche. Another gives not merely a beautiful even head of bloom, but the petals of each flower are more than usually distended-a very useful feature. Why light flowers always show the greatest size, and the deep coloured ones the least, is not easily explained; but certainly deep hues and vigour are not often found in conjunction. All the intense reds and crimsons-and many of these cannot be excelled anywhere-belong to what here are termed the Improved Brilliant strain; and plants of the old Brilliant in flower, the blooms small and petals narrow, very clearly assist in showing that Improved Brilliant is a marked advance on its namesake.

Here and there stand out some rich coloured kinds, the flowers of which approach to the size seen in the giganteum compactum section. These are of a rich rosy-red hue, dense and even throughout. From them presently will assuredly come a strain of grand flowers, and it is but a matter of a few years ere the whites will be equalled in size by these glowing hued kinds. Next the whites come the giganteum compactums, all of the finest habit, and producing white blooms, with bases of some dark rich colour. Description fails to convey the marvellous beauty and high quality of the straio, which is in Mr. Clark's hands unrivalled. Then comes the pretty Rosy Morn, a very lovely section, because all the petals are suffused with rosy-pink, the flowers large and remarkably good. This strain originated with Mr. H. B. Smith, and does not seem to be as well fixed as some others, but it is a charming kind none the less. Then almost insensibly the next division, classed as giganteum purpureum, shades off into petals heavily suffused with purple, though still retaining all the features of the giant persicum strain. The character of this section is well fixed, and, indeed, of strains of his own raising and selection Mr. Clark states that any break

away into some other colour is most unusual. Next come the deep self purples, some of which have flowers that are almost blue - a very distinctive and rich coloured strain; and, lastly, the crimsons, or Improved Brilliants, the depth of hue in many of the flowers being literally of a blood-red.

Of course, in these days of trade enterprise it is not

possible for any trade grower to remain long isolated from others in regard to strains, and, therefore, finding that seed might pay as well as marketing plants, Mr. Clark sets apart several hundred picked ones every year for the production of seed. Of course, it might be possible for any one to go into the market and purchase a few dozens of plants, and soon get plenty of seed for their own use; but from out of 10,000 or 12,000 plants it is not difficult to set aside a few hundreds of more than average merit, and those now annually become the producers of the Twickenham strain of seed. Very striking in the large house set apart for these was it to note the various sections and colours in selected masses, the very best, not only of the place, but hardly to be excelled in the world.

The market sale of the Cyclamens begins early in November and ends early in May. All that time, however, probably thousands of bunches of flowers in colours are pulled and sent to market also, so that in seed, pulled flowers, and plants we find three sources of trade. Already the early stock for the next winter's blooming is being shifted into the regulation 48's, and the autumn sowing is just about to follow into 60's. Generally on sunny days shading is employed, for the Cyclamen is not partial to heat or sudden changes of temperature. Houses depleted of their plants are in turn being filled with Strawberries in pots, for the culture of which Mr. Clark is not less famous; and these two things constitute the specialities of this secluded but admirable market-growing establishment.

The Wenther.

SEEDS.

SEEDS.

LONDON: Manch 26.—There is now a steady sowing demand for all the leading descriptions of farm seeds. As regards red Clowr seed the sale is moderate, at the comparatively low rates characteristic of the present season. In neither Alsike, white, nor Trefoll is there this week any quotable variation. For imported and perennial Rye-grasses the trade somewhat improves; both descriptions are this year exceedingly cheap. Spring Tares find buyers at last week's currencies. The recent advance in Rape seed is well maintained. Hemp seed continues scarce and dear, feeding Linseed steady, Jónn Shau gr-Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

CORN.

At Mark Lane on Monday there was a slack trade for English Wheat, at barely the rates of Monday week; in foreign the tendency was downwards. Flour dragged heavily, and prices were week. Grinding Barley was considered to the state of the state of

CATTLE,

CATTLE.

At Copenhapen Fields on Monday a firm tone prevailed in the beast trade, and a fair clearance was effected at rather better prices occasionally. The Danish cattle solid at 4s. 6d. to 5s. 2d.; the Swedish at 4s. to 4s. 8d. per 8 lb. The sheep trade was steady, and prices ruled at fully previous rates to occasionally rather dearer. Shorn sheep touched 6s. for choice small. Lambs sold from 8s. to 8s. 6d. The few English calves on offer obtained steady prices, foreign solid slowly, Outoations: —Beasts, 4s. to 5s. 2d., and 5s. 4d. to 6s. 6d.; calves, 5s. 8d. to 6s. 10d.; sheep, 4s. tod. to 6s. 6d.—Thursday's cuttle trade was very quiet. Beasts sold slowly, at about Monday's prices. Sheep were quite as dear as on that day, with a moderate demand; lambs were steady, and calves and pigs sold on former terms. former terms,

HAY.

Tuesday's Whitechapel Market report states that good hay was short, supplies of Clover large, and trade very dull, at the following quotations: —Prime old Clover, 95t. to 1075; inferior, 605. to 755; prime second cnt, 905. to 1055; best meadow hay, 805. to 865; inferior, 405. to 655; and straw, 285. to 375. per lond.—On Thursday there was a fair supply on offer. The trade was steady, and prices were firm, especially for best hay, which was 1x. dearer.—Cumberland Market quotations: —Superior meadow hay, 845. to 925; inferior, 655. to 7525; so 1745; inferior, 705, to 886; and straw, 345. to 385. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that there were good supplies but only a dragging trade, Quotations:—Magnum Bonums, 80s. to 100s.; Regents, 60s. to 80s.; Champions, 50s. to 60s.; and Victorias, 70s. to 85s. per ton.

COALS.

The following are the prices current at market during the week:—East Wylam, 15.: Bebside West Hartley, 15. 9d; Ravensworth West Hartley, 15. 9d; Ravensworth West Hartley, 15. 9d; Walls End—Hetton, 15.: Hetton Lyons, 13. 6d.; Lambton, 14.6. 6d, and 15.5.; Wear, 13.6. 6d.; Tunstall, 13.6. 6d.; Thornley, 14.: 3d.; Tees, 15.5. 3d.

Government Stock.—Consols closed on Monday at 101½ to 100 for delivery, and 102 to 102½ for the account. Intestay's figures were 102 to 100½ for the account. On the 100½ for the account. On Wednesday the quotations were 102½ to 102½ for delivery, and as on the previous day for the account. On Thursday the quotations were 102½ to 102½ for both delivery and account.

A. F. BARNOM, Reyal Harrianthural Society, Chimnic, December 3, 1853.—"Used for Cabhages, Celery, Tomatos, and other green Vegetables, also on Lawn Grass. Results.—Very favourable, manifest improvement wherever used, the foliage assuming a much deeper colour, and growth extended, Without doubt a very valuable manure, and one easy of

HY. CLARK, Head Gardener to His Grace the Duke of Marlhorough, Blenkeim Palace Gardens, Woodstock, December 14, 1882—"Used for Plant-growing, Fruit-growing; also for Vegetables. Results:—Very satisfactory. For cheapness and general use your manure is invaluable."

general use your manure is invaluable."

IAMES DART, Gardener to the Right Hon. Lord Carlingford, K.P., The Priory, Chewton Mendig, Bath, December 17, 1883.—"I used your Guano in the gardens, spinkling it on ownsof part in hiquid for Cuembers, Roses, and many other plants. I used no other manure but yours, and could tell to a foot where it was used, dry or wet. If grow many kinds of Potatos, and my garden is very poor ground. Last spring I hought 12th. of White Elephant Potato Seed, and when they were up 8 inches high I sprinkled some of your Guano along the rows, then earthed them up, since which I have dug up agd h. of as good Waldegrave's and Lord Carlingford's Head Gardener at Strawberry Hill, Twickenham, and here at The Priory for just tweety-eight years, and in that time I have used many kinds of artificial manures, but none has given me the satisfaction vor Native Guano has, and I intend to have more later on."

THOS. CARLTON, Gardener to Six C, H, Mills, Bart., Wildeness Park Gardens, Sevenasks, February 4, 1884 — "Used for Yunes. Only ordinary stable-manuer had been used for some years until last spring, when I applied two dressings of presented itself, and the fruit was much larger in bunch and berry than had been the case for some few years. I attribute these good results to the Native Manure. I have also used it for Canlidowers, Peas, &c., and have no hesitation in saying that the result was very apparent in all cases where applied."

ALEXANDER BISSET, Gardner to Sir J. Whittaker Ellis, Bart, Byfleet, December 10, 1883.—"Used for Grap Vines, Orchard House Culture, and Kitchen Garden Crop, Grass Land, &c., at the rate of 10 cott per acre, applied castly proved highly satisfactory, both in fruit and foliage; the result has been wonderfully good, which my employer can testify. I have used your Native Guano all ways, and it has proved the best I used, from its cooling nature, in all my experience of tventy years in England and Scotthard."

EDWARD PEARS, Gardener to Mrs. Jerome, Holland House, Sutton Coldifield, December 14, 1883—"Used for Potatos, Guions, Celery, Cucumbers, Melons, Grape Vines, and Pot Plants. For Potatos and Onions I used, on the average, 5 cett, per acre: not having used your Native Guano before, I was afraid to give too much. Results:—Potatos and Onions, a very good crop indeed; Celery, very fine, gaze it a little ach time of earthing up; Cucumbers and Meloos, I find your Guano suits those first-rate; it does not burn the roots, no one need fear using it. I had some splendid well-finished fruit; Grape Vines, I used it mixed in the border, also as I fiquid, and I adone very good fruit. I also used it for pot plants, and I consider it a very valuable manure for any knd of par plants.

SWEDES, MANGELS, &c.

JAS. DAVENPORT, Meaford Hall Farm, near Stone,
Deember 13, 1833.—" Used for Swede Turnips at the rate of
6 cwl. per acre. Results:—About 3c tons of good sound roots
to the arce. My roots were sounder than some in another field,
manure applied previous autum, about 12 tons to the acre.
Should say it is a useful manure, and cheap."

RICHARD FOWLER, Broughton, Aylesbury, December 12, 1883.—"Used for Swedes, at the rate at 5 cwt. per acre. Results:—Yery good."

JOHN BETTLEY, Downhell Farm, Barton, Oxford, December 18, 1833.—"Used for Turnips and Swedes, at the rate of 3 ewt. per acre. Results: -Excellent, giving every satisfactors and the state of the state

CHARLES BEESON, Glory Farm, Penn, Amershans, Bucks, December 16, 1883.—"Used for Swedes and Mangel Wurzel, at the rate of 4 cwt., per acre for Swedes, with burst ash, and 6 cwt. for Mangels, with ditto. Results:—Swedes very fine crop and large rosts: Mangels very good plant and large roots. I have used Native Guano for years, and have been every successful in taking prizes with roots grown where I applied it. I have taken five first Prizes this year, 1883, being first in all the classes I showed in."

JAMES KITLEY, Farm Steward to the Rt. Hon. the Earl of Derby, Wildly Fark, Haslemers, Surrey, December 14, 183, "Used for Tark, Haslemers, which where the land was not sown. No other manure was used. The Native Guan ot sown. No other manure was used. The Native Guan was harrowed in with the seed, and I am well statisfied with the

GEORGE STONE, Cashio Bridge Farm, Watford, January 1, 1884.—"Used for Swedes. Results:—I was well satisfied with the Native Guano. I used 5 to 6 cwt. to the acre; my Swedes were very good indeed. Send me 3 tons more; I shall give it another trial."

GEO. STRATTON, Princes Risborough, December 13, 1883.—"Used for Mangels, at the rate of 3 cwt. per acre. Results: "A very good crop. I have always had a good crop of Mangels after using the Aylesbury Native Guano."

H. WVATT, Walton Grange, Aylesbury, December 14, 1883.—"At the Royal and Central Bucks Agricultural Show, held at Great Marlow in September last, I was awarded the First Prize, value £10, for the best general crop of roots of not less than 10 acres. And at the same show I was also awarded the First Prize, value £5, for the best crop of roots of not less than 5 acres. The whole of the above-named roots were grown by me on the Broughton Pastures and Walton Grange Farms, and were manured with Native Glano purchased of your Company."

JOHN COX, Combit Farm, Hughredn, Detember 18, 1883,—"Used for Mangel Wurel and Swedes, at the rate of 5 cent, per acre. Result: "One-found extra produce. I consider the bulbs were much finer, and cleaner growth, and generally sound."

JOSEPH HUTCHINGS, Forest Farm, Hanslofe, December 20, 1833—"Used for a crop of Swedes, at the rate of cott per acre. Ten to twelve loads of yard-manure, sown broadcast. Results:—The Native Guano, where sown, has given me great satisfaction. I hope to be a customer next

GRAIN, GRASS, POTATOS, &c.

AUSTIN BUTLIN, The Woodlands, Skipton, Lee, December 18, 1883.—'Used for Mangels, drilled under the seed on the flat. The land was manured from the farmyard in the autumn. Oats with Clover-seeds top-dressed at the rate of 4 cwt. per acre. Results:—Oats and Mangels good. I never had a more promising crop of young Clover. I think it a good manure at the price.'

ROBT. KEENE, Emmington, Tetsworth, December 15, 883.—"Used for Mangels and Oats, at the rate of 7 cwt. per cre. Results:—Both crops remarkably good."

Rev. C. SOAMES, Mildenhall, December 14, 1883.— "Used for Oats, Mangel Wurzel, Potatos. Results:—Oats very good, Mangel ditto."

D. T. and W. H. BYFORD, Carshallon, Surrey, January, S. 1884.—"Used for Oats at the rate of 8 cwt. per acre. Results.—Very gown of the Results.—Very gown to the acre. We consider the Native Guano a very good top-dressing for spring Corn as far as we have tried it."

"Li: T. HAYNES, Upper Heyford, Yanuary 15, 1884.—
"Lic dor Oats, Wheat, and Potatos, at the rate of 4 cwt. per acre. Results:—Oats ylelding about y/6, rp. eacre; Wheat, about 9 qr.; Potatos, about 5 tons per acre. I was perfectly satisfied with the manure on the Oat cropt.

GEO. COOPER, Kingswood Lane Farm, near Aylesbury, January'2, 1884.—" Used for Wheat at the rate of 5 cwt. per acre. Results:—Had a very good crop of Wheat."

C. E. SELL, Leighton Busuard, December 18, 1883.—
"Used for Barley at the rate of about 4 cwt, per acre. Results:—
Good Your Native Cuano I believe good for top-dressing, and
only requires a trial amongst our market gardeners to come into
general use. The difficulty is persuading people to give it a
trial. You must give each gardener a bag and ask them to try
it and give you there opinion.

Captain GEORGE G. SANDEMAN, Roche Court, Salisbury, Wilts, December 18, 1883.—"Used for grass at the rate of 10 court, per acre; Mangels, Swedes, Potatos, at the rate of 9 cwt. per acre. Results:—Grass was much better in quantity and quality, Mangels at the rate of 45 tons per acre, Potatos at the rate of 12 tons per acre, Swedes good. It was also used for Peas, Yines, Urawberries, with good results. Some Potatos with code and the rate of 12 tons per acre, Potatos at the rate of 12 tons per acre, Swedes good.

J. SIMMS, Wellington Terrace, Aykabury, December 17, 1883.—" Used for grass at the rate of 5 cwt. per acre. Results:—Cut 30 cwt. per acre, fine quality. I only took the farm in 1882. Was told by some of the people in the parish they acver saw a batter crop of grass in the field. I shall require some more in February."

ISSEPH FRANKLIN, Scottgrove, Thame, December 27, 283-" Used on old pasture at the rate of 6 cwt. per acre. Results: -A good crop of hay. I consider the A B C Masure, if applied oo grass land early in the spring, a good manure and showing good results."

JOHN COLLEDGE, Patchet's Hill Farm, December 21, 253—"Used for grass and Potatos, and garden produce potations of the product of the product

VINES AND VINE CULTURE.

By ARCHIBALD F. BARRON, Superintendent of the Royal Horticultural Society's Gardens.

Opinions of the Horticultural Press:-

The Journal of Horticulture says "It is the most complete, and it will be accepted as the standard work on the Vine."

The Gardeners' Chronicle says :

'It is emioently practical and useful."

The Garden says :

"It is undoubtedly the most exhaustive volume upon Vines and Vine culture ever published."

The Gardeners' Magazine says:—
"It will certainly take, and probably keep a leading place in the class of literature to which it belongs."

The Florist and Pomologist says:—

"There is nowhere to be found in our language so complete and thorough a descriptive list of the best varieties of Grapes."

The Midland Counties Herald says:—

"The whole subject is dealt with exhaustively and authoritatively in plain, expressive, and singularly concise language."

The Irish Farmers' Gazette calls it: "The most complete work of its kind that has ever been issued from the British Press."

JOURNAL OF HORTICULTURE OFFICE,

171, Fleet Street, London, E.C.

Also to be had of A. F. BARRON, Royal Horticultural Gardens, Chiswick.

THE AMERICAN GARDEN

A RICHLY ILLUSTRATED, ELEGANTLY PRINTED, AND CAREFULLY GOTTEN-UP MONTHLY PUB-

AND CAREFULLY GOTTEN-UP MONTHLY PUBLICATION DEVOTED TO THE GARDENING INTERESTS OF AMERICA.

TO any one who owns a Fiver-Pot, a Garcea, or a Farm,
It's Indispensable,
because it gives all the latest and best information about everything pertaming to the culture of Flowers, Fruits, Vegetables,
because all spins, out of Laws and Pleasure Grouteds, Window
Gardening, Rural Inn.

It is Reliable
because its Editor and Coatributors are all experienced Horticulturists, who write from actual experience and can prove
the correctors of their teachings.

It is always Seasonable,
because its forestalls its readers' wants by giving in every issue
practical seasonable hints for the work of the month, which alone
are worth more than the price of the paper.

It is Clean and Pure,
because up opaper is more carefully scrutinised before it meets

It is Clean and Pure,
because no paper is more carefully scrutinised before it meets
the eyes of its readers, and because all objectionable and quack
medicine advertisements, as well as everything that could in the
least offend the most refined tastes, are scrupulously excluded
from its pages. Premiums,
In addition to all these good things, every yearly subscriber
receives a beautiful coloured floral picture, and may take his
choice of any one of the many valuable articles offered in our
Premium List-either Seeds, Plants, Books, or Implements.
Subscription Price, 5s. per year, including foreign
postage, Sample Copy Free, Remit by Post-office Order
on New York or London.

EPPS'S COCOA.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Coco, Mr. Epps has provided our breakfast-tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution tendency to disease. Hunderdeed of suttle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal safet by keeping ourselves well fortified with pure blood and a properly nourished frame." Civil Service Catestic.

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—

JAMES EPPS & CO., Homeopathic Chemists, London, England.

Liordon, England.

Liore Complaints.—The digention cross be long or seriously disordered without the deraugement being perceptible on the countenance. These Pills prevent both unpleasant consequences; they improve the appetite, and with the increase of desire for food, they augment the powers of digestion and assimilation in the someth. Hollowery S Pills deal most satisfactorily almonic the sounds. Hollowery S Pills deal most satisfactorily in extracting nourishment for our bodies from our various detained to the sound of the sound

Special Offer of Orchids,

FOR PREVIOUS ADVERTISEMENT,

see "GARDENERS' CHRONUCLE" of March 29,

W.M. GORDON has much pleasure in

offering the following ORCHIDS: they are all nice
stabilished plants and growing freely. The demand is so continuous that it is difficult to keep a large stock of all varieties,
plants will be obtainable during the coming scason, as the imported plants are growing very quickly, and will in due course

of time fill up the caps in the stock which Mr. Gornon trusts
will be made; and in confidently recommending these to his
made; and in confidently recommending these to his
made with few exceptions the whole are unflowered. Plants
in flower and abosibly were value to the charles are to be
had, as with few exceptions the whole are unflowered. Plants
in flower and showing bud are so quickly sold at the ourseries
that it is difficult to keep any stock of these, but where it is
newer and showing bud are so quickly sold at the ourseries
that it is difficult to keep any stock of these, but where it is
supply all requirements of flowering plants, provided of cours
it is the flowering season.

NOW is the TIME to PLANT CARNATIONS, TWO NEW VARIETIES.

TWO NEW VARIETIES.

MARY MORRIS,—One of the most valuable of modero introductions. Of a strong, vigorous habit, producing monstrons flowers, often 3½ inches in diameter, of an attractive deep rose colour. Has been awarded a First-class Certificate.

WHITE CLOVE "GLOIRE DE NANCY."

—Without question the finest White Clove ever introduced. It as a very robust habit, like that of the old immense faired flawers, which are pure white and deliciously Clove-scented. Has been awarded a First-class Certificate.

CATALOGUE, containing fuller descriptions of the above, with a vast number of other choice Carnations, as well as every other section of HARILY FLORISTS' FLOWERS, is now ready and shall be sent free to all applicants.

SHANKS'S PATENT LAWN MOWERS FOR 1884.

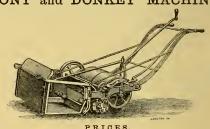

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines, These Machines are in use in the Royal Gardens at Kew, Hampton Court, Osborne and Balmoral, in most of the Public Parks and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawns. They have now been before the Public for many years, and stand unrivalled. These Machines are easily worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

TOWN CLOSE NURSERIES, NORWICH.

SEASON 1884.

In again calling the attention of Market Growers, Gardeners, and Amateurs to Clay's Fertiliser, we feel a pride in stating that it has increased in popularity year by year, until it has attained the position of being considered an absolute necessity for the production of Fruit, Flowers, and Vegetables of the highest excellence.

Unfortunately, this success has induced some unprincipled persons to adulterate the Manure, causing great disappointment to and serious annoyance to ourselves. We have therefore decided, after the 1st of January, 1884, to send out all Manure (except 1s. packets) in Scaled Bags; and we trust buyers will, for their own protection, insist on having it in our baes with our Trade Mark and Seal attached, for which alone we shall be responsible.

Gardeners' Chronicle.

SATURDAY, APRIL 5, 1884.

THE NARCISSUS.*

N the following columns we give the substance of Mr. Burbidge's lecture on the Narcissus, delivered before the Royal Horticultural Society on the 1st inst., omitting only the introductory portion devoted to the legendary history of the plant. For some comments on the subject, an abstract of the discussion which took place, and for the report of the show itself, we refer to other columns of the present issue.

STRUCTURE.-The Narcissus is a genus of bulbous plants belonging to the natural order of the Amaryllis; indeed, these flowers may be said to represent for us here in Europe the Eucharis and other beautiful crowned genera common to the New World. A Narcissus flower consists of an inferior ovary situated at the base of an obconical or cylindrical tube. From different points along this tube spring six perianth segments (in two series), and beyond these a cup or crown is prolonged.

Now we find among the Narcissi generally two well marked and distinct variations in their flowers. In the Daffodils, for example, the six stamens are of equal length, and have the same point of insertion low down near the base of the obconical tube. When a flower of the true or Poet's Narcissus is examined, however, we find some marked differences. It will be observed that the tube is here much longer and quite cylindrical, and when we make a section of the flower we find the six stamens are divided into two sets of three each, and that each set has its own locality or point of insertion-three near the mouth, and the other three a little farther down the tube.

I have not time to go into minute details, but I need scarcely say that there are good reasons for these variations; they are especially fitted for-owe their origin, it may be, to-insect fertilisation, and, as we shall soon find, these two distinct species are not unfrequently crossfertilised in a wild state: and this has happened much more frequently in our gardens-or perhaps it may be that in gardens the hybrid progeny has been more carefully preserved. Before I leave this part of my subject I wish to point out that nearly all the variations in form of which a Narcissus flower is capable, are owing to the sliding, as it were, of the whorl of perianth segments along the tube of the flower; thus we find the length of the cup or crown, and the length of the tube, always, or nearly always, vary in inverse proportion.

I ought to point out here, that some superficial distinctions are produced by the manner and degree of expansion usual to the perianth In the Hooped Petticoat (Nardivisions. cissus Bulbocodium), for example, the perianth divisions are narrow and inconspicuous, lying as they do in the same plane with the corona margins (fig. 80, A, D, E). In the common Daffodil the perianth lobes are broader and

^{*} A paper read by F, W. Burbidge, F.L.S., Curator of the Trinity College Botanical Gardens, Dublin, on April 1, in the Royal Horticultural S ciety's Gardens, South Ken-suggton.

more expanded (see fig. 80, C, H); in N. incomparabilis and in N. poeticus they are expanded at right angles to the tube, and so become star-like (in fig. 80, G, K serve to illustrate this arrangement); so also in the "Little Cupped Italian," or Narcissus Tazetta group; while in the case of this "bonnie" gem (Narcissus triandrus) we get a very distinct Cyclamen-like blossom, seeing that the perianth lobes are sharply reflexed or turned back, so that they lie parallel with the pendent flowertube (illustrated by fig. 87, p 450).

In colour the Narcissi are not so variable as many other bulbed flowers. We get all shades of yellow and of white in the perianth-one species, N. viridiflorus, known to Parkinson, and recently reintroduced by Mr. George Maw, has green blossoms. In N. incomparabilis we find cups richly tinted with orange-red, so also in some forms of N. Tazetta, while N. poeticus has a red or purple rim to the crown.

NOMENCLATURE AND CLASSIFICATION .- We have in all about twenty species of Narcissus, which are known to exist in a wild state.

LIST OF THE SPECIES OF NARCISSUS, SHOWING

Species. 32. N. Bulbocodium	Native Countries. Spain, Portugal, France, S.W. to Bordeaux to N. Africa
z. N. Pseudo-Narcis- sus	Sweden, England, Portugal, Spain, Italy, and Transylvania
	Isles of Glénan, Brittany Spain
o. N. poculiformis	•
4. Macleaii	Not wild

Spain, S.W. France, Tyrol Spain, S. France, Italy, Dalmatia Spain, S. France, Italy, Dalmatia S. France (Touloce Spain, S. France, Touloce, Avignon, Mar-seilles, Nice) S. Europe, Cashmere, N. Iodia, Chioa, Japan Spain, S. France, Italy to Dalmatia Flance, Switzerland, Italy, Tyrol Spain, S. France, Italy to Dalmatia Flance, Switzerland, Italy, Tyrol S. Europe, France to Greece Spain, S. France to Greece Spain, S. France to Greece Spain, S. Europe, Farnce to Greece, and Palestine N. odorus .. N. juncifolius N. dubius .. II. N. Tazetta

ao. N. jonquilloides (Willk. Fl. Hisp.) 15. N. Broussonetii ... 16. N. capariensis ... Spain Magadore (Africa) Canary Islands

I may here mention that among generally acknow-ledged species there are two or three which have never heen found wild. These are N. Macleaii, N. (montanus) poculiformis, and N. gracilis. It is questionable if these are really species, my own opinion being that they are old and well marked garden hybrids. N. pachyholbos and N. canariensis should, I think, he considered as outlying geographical forms of N. Tazetta. N. jonquilloides of the Flora His-panica (Willkomm) I have not seen alive, but in the plate it resembles N. intermedius. N. calathinus must now be referred to N. triandrus. Others, again, which really do exist wild without a doubt, have also had their exact counterparts produced in gardens. Thus, on the authority of Dean Herbert and others, N. incomparabilis and N. odorus, both well known as wild in Southern Europe, have been produced in gardens by hybridisation.

HYBRID NARCISSI.-When we come to speak of Narcissus hybrids, it is a matter of regret that the workers in this fertile field have left us scarcely any data or detail of how their numerous seedling and hybrid forms were produced. Dean Herbert (in the Journal of the Royal Horticultural Society, vol. ii., p. 1) has told us more than any one, and the late Mr. W. Backhouse, of St. John's, Walsingham (who raised the Empress and Emperor Daffodils), contributed an interesting paper to the Gardeners' Chronicle, June 10, 1865, p. 530. The late Mr. Leeds, of Longford Bridge, Manchester, who raised more new kinds than any one, gave us no information whatever; nor did Horsefield, the Lancashire weaver, who raised the "Bicolor Horsefieldii Daffodil," decidedly one of the most robust and beautiful of its race. The late Mr. Nelson, of Aldborough Rectory, near Norwich, raised a few varieties of especial merit, notably the noble sulphur Daffodil named Gertrude Jekyll, and a white form of the dwarf Daffodil (N. nanus). Mr. Nelson kindly told me by letter, only a few days before his death, that cross-fertilisation was not resorted to; so Mynheer de Graaff, of Leiden, ipforms me that his

fine new kinds are seedlings or wind-fertilised hybrids. These remarks corroborate what Mr. Backhouse wrote in the Gardeners' Chronicle nineteen years ago; when speaking of artificial crosses between the Daffodil and the Poet's Narcissus, he says :- " Seeds I have sown from plants not artificially impregnated produce the same result, some showing the Daffodil and others the N. poeticus type. "e. The moral here would seem to be, Raise seedlings—hybrids if you can; but raise seedlings.

GEOGRAPHY .- Nearly all these kinds are found wild in Europe. Spain and the South of France seem to he the focus of the genus, but a few are found

Fig. 78.—NARCISSUS PSEUDO-NARCISSUS VAR MINIMUS: LEAST DAFFOOLL.

in Northern Africa, and N. Tazetta is most ubiquitous, growing all over Southern Europe and Northern Africa, and then going off at a tangent, through Persia, Cashmere, and India, as far east as China and Japan.

CLASSIFICATION .- Parkinson, who, in 1629, described or figured ninety-six species and varieties, seems to have been the first to attempt any classification, and he is very particular that we should distinguish Daffodils from Narcissus proper, and is equally careful lest we should confound the flat-leaved with the Rush-leaved kinds. At

FIG. 79. - NARCISSUS X DR. MASTERS.

a more recent date Salisbury, Haworth, and Herbert all worked among these flowers; but their methods of classification, although most interesting to students, are perfectly obsolete to-day. We are in-debted to Mr. J. G. Baker, of Kew, for a clear and useful system of grouping, published in the Gardeners' Chronicle in 1869. Mr. Baker's plan depends on the relative length which naturally exists between the perianth segments as contrasted with the cup or corona, and I have divided those three main divisions into flat-leaved and Rush-leaved groups.

The three main divisions, as characterised by the varying size of their cups or crowns, may be thus CLASSIFICATION OF THE GENUS NARCISSUS. Large Trunked.

Group I .- Magnicoronatæ, or "Coffee Cup" section.

Medium Cupped.

Group 11 .- Medicoronatæ, or "Tea Cup" section.

Small Crowned.

Group III .- Parvicoronatæ, or "Tea Saucer" section.

Group I .- Magnicoronata.

Crown as long, or longer, than the perianth divisions.

TRUMPET DAFFODIL. -HOOPED PETTICOAT DAFFODIL.

Flat-leaved.

Rush-leaved.

N. Pseudo-Narcissus var.

2. N. Bulbocodium var.

Flat-leaved.

I. N. Pseudo-Narcissus.—The type of this species is the common Daffodil of English meadows and orchards, and of this there are innumerable forms, ranging from the tiny N, minimus (fig. 78) up to N. maximus, which is the tallest and largest of its race. All the varieties have flat glaucous leaves.

Rush-leaved.

2. N. Bulbocodium. —The type of this species is N Bulbocodium, the "Rush-leaved" or "Hooped Petti-coat" Daffodil of Southern Europe. There are many varieties, all easily recognised by the expanded crinolinelike corona, narrow perianth-segments, declinate stamens, and green Rush-like leaves.

Group II .- Mediocoronatæ.

Crown half or rarely three-quarters as long as the perianth divisions.

MEGIUM CUPPED NARCISSUS.

Na	cissus 10comparabilis Macleaii dubius montanus	7. 8. 9.	Narcissus odorus ,, juncifolius ,, triandrus ,, calathious
**	montana	10.	,, Catalinous

Flat-leaved.

3. N. incomparabilis.-1-flowered. Leaf ½ inch broad,

glaucous.

4. N. Macleaii. — 1—2-flowered. Leaves broad, greenish; crown bright yellow, three-quarters as long as

greenist; crown origin years, three-quarters as on, as the spreading white perianth-segments (? hybrid).

5. N. dubius.—Many-flowered, with flattish, glaucous leaves. Perianth-segments 3—5 libes long. Cup 3 lines deep.

6. N. (montanus) poculiformis. — r—2-flowered, all white. Crown half as long as the perianth divisions. Flower "dog-eared," but 3 to 4 inches in diameter.

N. odorus (Campernelle Jonquii).—All yellow;
 5-flowered, with bright green Rush-like leaves.

8. N. juncifolius.—1-5 flowered, much smaller than N. odorus, with a flattish corona.

9. N. triandrus.—t-5 flowered; perianth divisions reflexed, like a Cyclamen flower.
10. N. calathirus.—t—2-flowered, with reflexed segments, like the last; perhaps only a geographical form

of it, having larger flowers.

Group III .- Parvicoronatæ.

Crown tess than half as long as the perianth divisions. SMALL-CROWNED NARCISSUS.

ī.	Na	rcissus Tazetta	17. 1	Varcissus intermed
		pachybolbus		" gracilis
3•	**	biflorus	19.	, Jooquilla
4.		poeticus	20.	, jonquilloides
5. 6.	**	Broussonetii	21.	,, viridiflorus
6.	**	canarieosis		,, elegans
			23.	serotinus

Flat-leaved.

11. N. Tazetta.-Many flowered, with flat glaucous leaves, very variable.

icaves, very variance.

12. N. pachybolbus.

13. N. biforus.—I—3-flowered, flowers like N poeticus, creamy-white, cup pure yellow.

14. N. poeticus.—I-flowered, white, with a purple or

red edge to the crown.

15. N. Broussonetii.—Crown nearly suppressed.

16. N. canariensis.

Rush-leaved.

17. N. intermedius.—A many-flowered yellow N Tazetta with Rush leaves.

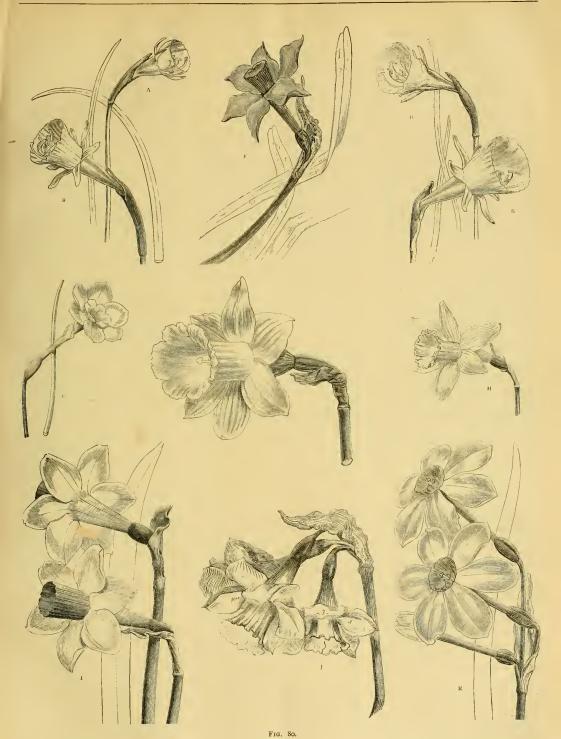

18. N. gracilis.—1—2-flowered; flowers pale yellow, as large as N. poeticus.
19. N. Jonquilla.—Many-flowered.
20. N. jonquilloides.—Flowers deep yellow, very

fragrant.

Autumn-flowering.

21. N. viridiflorus .- Many-flowered, perianth greenish.

22. N. elegans.—1—3-flowered, pure white.
23. N. serotinus.—Flowers after the leaves, very like the last, with broader perianth segments.

A, Narcissus (Bulbocodium) nivalis. B, N. Bulbocodium. C, The Tenby Daffodil (N. Pseudo-Narcissus var. obvallaris). D, N. (Bulbocodium) Graelsii. E, N. Bulbocodium a sulphur-coloured variety. F, A natural hybrid, flowers yellow. G, N. rupicola. H, N. (Pseudo-Narcissus) minor. I, N. Macleaii. J, N. tridymus x. K, N. gracilis.

Here is a list of all known type-hybrids, so far as we at present know them :-

were some conditions so favourable to the development of Daffodils that the singles became doubles

DERIVATIVE HYBRIDS .- Some of these have again yielded seedlings, so that the variations now observable are of the most divergent and perplexing kind; so much so, indeed, that some have complained that there is too much sameness among the newer kinds of Narcissus. This much is true of Roses or Auriculasindeed, of nearly all florists' flowers; and after all it is easy to use one's eyes on a day like this, noting the most beautiful from one's own standpoint, and resolutely avoiding those which do not please our taste. To my mind the delicate chromatic scales, the subtleties of form and of colour, these new seedlings afford us, are most beautiful; and a garden tastefully planted with them would afford its owner beauty of a most satisfying kind, even if it did not prove a "joy

CULTURE .- The culture of all the Daffodils, and of nearly all the Narcissi, is not difficult. Most of them are robust enough to increase in beauty from year to year, if planted at the proper season in well tilled soil. Some of the dwarf and tender species, as N. triandrus, N. juncifolius, N. Bulbocodium (especially the paler forms), N. viridiflorus, N. elegans, and N. serotinus succeed best in pots in a cool house or frame. The white race of Daffodils also do best on a warm supply border, but the yellow or bicolor Daffo-dils, and nearly all the hybrid kinds, will luxuriate in the open-air borders almost anywhere. The proper time to transplant Narcissus generally is in June, July, or August. They may be dug up as soon as the soliage has withered away, and if replanted immediately in good well-drained soil they do not suffer much, if at all, by removal. It is a good plan to mulch well with rotten manure just before flowering time, and if you want very fine fresh flowers for show or decorative uses, cut them whilst they are in the bud stage and place them in water indoors to expand. If you post flowers to your friends pack them in the bud stage; you can thus send many buds, which will each and all open fresh and fair if placed in water immediately on their arrival.

DOUBLE DAFFODILS.

In my former notes (pp. 309, 376) the opinions were expressed that double Daffodils produced seeds, and that their increase was, in many cases, thereby, and not from root-growths only. I am now in a position to offer proof.

It has generally been assumed that in double Daffodils all the stamens and pistils were transformed into petals, and that as the reproductive organs were thus eliminated, there was no chance of seeding; consequently, upon this we had the theory put forth that single Daffodils became double by culture, rich soils, and favourable conditions, which fostered these "monstrosities" as they were called. Dean Herbert carried this idea so far asto lead him to remark (Amaryllidacca, p. 302), "I am informed that the Polyanthus Narcissus, in the vicinity of Naples, is oftener found in a wild state with double than with single flowers. Such plants, I think, must be the vestiges of ancient horticulture. The Dean evidently believed that doubles were only gardeners' productions, and not Nature's own varieties. If he had examined a few double Daffodils as I have been doing, by cutting them down through the centres, he would have found amongst the crowded petals, which fill the space usually vacant in the tube. the tripartite style, and the numerous anthers bearing pollen, and if he had sought for them later he might have found the actual seeds in the ovary.

This knowledge does not appear to have been acquired by Herbert, who confined his attention to single forms, all of which he dissected with the most minute care. The florists and botanists of our own day have held the like views, and believed that there under them. Our friend Mr. Wolley Dod was not convinced of this doctrine, and offered five pounds to any one who could produce a double from a single, and this reward he has persistently offered for some years without any such proof being brought forward.

When the Editor placed a query to my remarks (p. 309), that "double Daffodils come as seedlings may happen any year from any single plant, and "that it is possible that a double Daffodil is a species having the power of perpetuating its quality by seeds," I set to work to study the question with the view of adducing proof of my position. This proof I have now arrived at in several ways, but perhaps the simplest and clearest is taken from our wild Lent Lilies, N. Pseudo-Narcissus. It is well known that in some parts of Great Britain these occur, both single and double, in the same meadow. I therefore sent a competent person to such a locality to examine the flowers, and to send me examples of every variety of the Lent Lily, from single to double, and especially to note if the doubles produced seeds. and appeared to spread and increase by seeds, or by root growth alone.

The proof came as I expected, but I was not prepared for its completeness. The single and double forms were found growing in the same field. Whereever the doubles occurred there were also singles, but always in bunches, but there was every variety of doubling. To commence with, there was the ordinary single Lent Lily, and at the other extreme was the full double form of it, N. Pseudo-Narcissus fl.-pl., in which the tube was filled with petal growths. Between these was every stage of doubling; some had extra numbers of petals, others had a slight doubling low down in the tube, but in every case there were extra petals, only the pistil and stamens being always present; and there were two examples of the full double, where the flower was nearly over, and in these the ovary was plump and was filled with Here, then, is proof that the Lent Lily, in its double form, produces seeds and increases by these as with the single form,

My friend Mr. Archer Hind also bears testimony to the same effect in a letter, from which I extract the following:--"I have been reading your remarks about the seeding of double Daffodils. Of course I knew that double Stocks, &c., had been raised from the semi-double flowers, but it never occurred to me that the same might happen in the case of double Daffodils. In some cases I should imagine it next to impossible—e.g., in such as Queen Anne's Daffodil, N. capax, and Queen Anne's Jonquil; but I find that in some of the double flowers, both of the garden and wild Daffodil, there are retained amongst the petals what are apparently quite perfect stamina and pistils; and in a spot where I used to find the double wild Narcissus in some quantity, the groups of bulbs appeared to indicate that each group must have sprung from a separate seed, and that the several groups were not solely due to offsets. The groups were just at such a distance from each other as you would expect to find if they had sprung from seed. Whether these seeds were from the double plants I cannot say, but the probability seems to be that way. I think Mr. Archer Hind is right about N. capax, as I cannot find any traces of stamens or pistil in its centre, but in the double Jonquil they do exist, and the ovary is filled with seeds in an example I have just examined. Indeed all the double garden Narcissi except capax are furnished with the reproductive organs, however full the doubling, showing that there is no conversion of stamens and pistil into petals, as is usually supposed.

I am glad to note in the last Gardeners' Chronicle that my friend Mr. Wolley Dod agees with me in these views, and confirms them by the experience of others. William Brockbank, Brockhurst, Didsbury.

SINGLE WILD DAFFODIL TURNING TO LARGE SINGLE WILLD DAFFOOIL.—About ten years ago I wrote to the Gardeners' Chronicle asking whether it was generally known that the single wild Daffodil of our fields and copes would in cultivation turn to the large double Daffodil of gardens? Correspondents replied to this that the idea was absurd, because the double of the English wild Daffodil is a distinct flower; but other correspondents came forward and declared that in their experience the transformation I deciared that in their experience the transformation is had mentioned really took place. These statements were received with incredulity by the Editors, and set down to imperfect and intermittent observation. Knowing, however, that vegetable physiology abounds with facts more paradoxical than this, I resolved to try, but after five years gave up the attempt as hopeless, and became myself incredulous. I have continued since the to receive assurances noperess, and pecame myself intereducions. In have continued since then to receive assurances from different quarters that this change actually takes place, and I now write to say that I regret my former incredulity, and am converted to a belief that under certain unconstrained conditions of belief that under certain unconstrained conditions of soil and climate the single wild Daffodil becomes, without the intervention of seed, the large double Daffodil. I also apologise to all those who have taken the trouble from time to time to write on the subject, and whom I have told that "there must be some mistake." If they will write again to me on the some mistake." If they will write again to me on the subject. I shall be most grateful to them. I now send extracts from a letter received last week :- "I have extracts from a letter received last week:—"I have been much interested for the last two years by your letters about Daffodils, as you always doubt the single ones becoming double. We made a new garden four or five years ago, and put in it quantities of single Daffodils out of a wood in this neighbourhood. They all became double. I still doubted and planted more, with always the same result. I now send you roots and blooms, and would like to know your opinion. I have not more than twelve single-blooming plants left, and these only where they are storaged. in gplants left, and these only where they are starved in very poor soil. They hecome double in one year." Accompanying this letter were flowers which I ake to be typical single N. Pseudo-Narcissas and double N. Telamonius. It is possible, of course, that the wild Daffodil may have degenerated from flowers which were once double, but for all that in size and colour they exactly resemble the wild form. G. Wolley Dod, Llandudno, March 31.

— The plant mentioned at p. 418 from which the five Daffodii flowers were taken, was originally single-flowered; it has year by year been doubling, this is an undoubted fact. The same thing is happening with a somewhat similar Daffodil, growing under an Elm tree close by. The tendency of most flowers in this garden is to double. The Daffodils with the long-shaped cup, however, do not, if originally single, become double. This is my experience in a "Buckinghamshire Garden." May I be allowed to state, that the Narcissus with the long tube grows wild at Mentone, where it was pointed out to me under the name of Narcissus incomparabilis, by the late Mr. Moggridge. I remember well the little grassy orange-shaded ledge; above the stream in the Mentone valley, where it great above the stream in the Mentone valley, where it grew and I do not forget my disappointment in finding a "common Daffodil" instead of the real Narcissus of my lancy. The leaves and stalk were somewhat shorter than in the garden sort, as far as I remember, no other difference. E. V. B.

[The doubling of Daffodils arises, not from one, but

The doubing of Dataous arises, but from one, tait from several causes, treated on pretty fully in our columns in vol. iii., 1875, April 17 and April 24. In the former number we gave a figure of the true double Daffodil, referred to by Mr. Wolley Dod, and in the volume just referred to will be found numerous letters on the subject from various correspondents. The history of the so-called N. capax, or Eystettensis, together with an explanation of its peculiarities, is given in the Journal of the Linnean Society, vol. xw., p. 463, note. Ed.]

THEOBROMA CACAO, THE COCOA BEAN.— In the Royal Botanic Society's Garden, Regent's Park, there are now in one of the stoves two plants of this species bearing, one five fruits, and the other two—a fact that has rarely been observed in this country. The plant, which is a native of the Orinoco wo—a fact that has rarely been observed in this country. The plant, which is a native of the Orinoco region, blooms freely under warm-house culture, but seldom "sets," owing probably to the blooms requiring here artificial impregnation, in the absence of the particular insect or small bird that may assist at this operation in its tropical habitat. The flowers, which are produced abundantly in autumn and winter, expring directly out of the older bark of the stems and branches; these are small, whitish, and quite insignificant, rendering the plant, an evergreen with large green foliage, of bat small dccrative value. The fruit its 5 inches in length, and 2 inches in diameter in the middle; in shape a pointed oval, with a few well-defined longitudinal ribs running from the stalk to the apex of the fruit. Colour at the present time is green mottled with Colour at the present time is green mottled with

ODONTOGLOSSUM IOPLOCON, n. sp.*

I saw this as long ago as March, 1880, but with nothing but monstrous flowers. It has nearly the panicled flowers of Odontoglossum ramosissimum, but the sepals and petals are narrower, mauve, and wavy. The lip has at each side of the base a projecting blunt divaricate angle and the mid-lacinia is linear triangular. There is a peculiar system of orange calli at the base. Two large knobs stand parallel and contiguous at the Lase, having a small tooth on each side at the anterior side of the base, and three small teeth stand in front of the odd one in the middle. The flower is mauve, the apex of the mid-lacinia of lip Column bright mauve at the top, light green at the base, with two very small triangular wings at top. It was sent by Mr. W. Bull. If it be a mule, it might be derived from Odontoglossum Edwardi and ramosissimum, but it may as well be an independent species. H. G. Rehb. f.

LÆLIA ANCEPS LEEANA, Hort. Sand.

A curious thing, that can only be judged after having flowered repeatedly. Its flowers are smaller by one-fifth than usual. The sepals and petals by one-fifth than usual. The sepals and are white, the petals narrow and very acute. The lip is not so well cut as in all the flowers of anceps (alas ! too many !) seen till now. The side laciniæ are blunt, and grow in the very small tri-angular, wavy, anterior lacinia. The thick median ridge is well developed, and runs very far, nearly to the apex of the lip. The interior part of the sidelacinize is yellow, white outside. There are reddish stripes running obliquely over the yellow zones on both sides of the mid-line, two reddish-purple stripes on either side of the mid-line, and the small areas at the top of the side-laciniæ are fine light purple in colour. It has flowered with Mr. Sander only, and that gentleman expresses his satisfaction at having found in Mr. Lee a purchaser for this unique specimen by giving it the above garden name, H. G. Rchb. f.

DENDROBIUM NOBILE (Lind.) TOLLIANUM, n. var.

DENDROBUM NOBILE (LIMA) ACLUMNOS, Mr. This is a very fine variety. Mr. George Toll, Hullard Hall Nursery, and 358, Stretford Road, Manchester, "picked it up" at one of Mr. Stevens' sales five years ago, and has sent me flowers every year since March, 1882, and which, by-the-bye, improved very much. Mr. Toll may, however, be surprised to learn that Mr. William Lee, of Downside, Leatherhead, Surrey, sent me the same treasure. The bulbs was a Stringe shigh in 1882, and nendulou, The head, Surrey, sent me the same treasure. The bulbs were 18 inches high in 1882, and pendulou. The great feature is, that the petals have a very pretty border of purple, and some fine spots and streaks of purple on the disc and at the base. It is a common feature of Dendrobium nobile for the very base of the flower to have a certain development of epigynous disc. This is enlarged into a wide three-lobed body in our plant. The column is exceedingly thick, has a very small anther, scanty pollinia, and the cells of the tela conductrix appear not to form any mucous

Mr. Toll's last flowers show a certain tendency to become twisted, and if the plant is well taken care of it will no doubt produce surprises of many kinds, at least I hope and I suspect so. We must admit that the petals are assuming the character of the lip, and when the three lips are fully developed the fovea will disappear, and when the column is reduced there

disappear, and when the column is reduced these will appear a flost flems.

The flowers should be sent to Dr. Masters, who is eagerly expected to find leisure for a new edition of his Veyetable Teratology, the first one being said to be totally exhausted by our booksellers. A German translation would be acceptable. H. G.

ROYAL HORTICULTURAL SOCIETY OF ABER-DEEN.—It is reported that the Prince of Wales has presented to the Royal Horfuchural Society of Aberdeen a silver cup to be competed for at the exhibition of the Society in Aberdeen to be held during the visit of the British Association next year.

ROMAN HYACINTHS.

THE origin of the Roman Hyacinth (varieties of H. præcox and H. albulus), and of its introduction into cultivation, have been told in our columns by M. Krelage and others (p. 145, vol. xi.). But while some are interested in the history, many more are delighted with the beauty and fragrance of these varieties, and with the facilities they present for early forcing. Their use as border plauts is not so well known, yet if we may judge from some specimens sent us by Messrs, Hooper & Co., of Covent Garden, they ought to have a future before them. Messrs. Hooper send us from their trial grounds, where they have been grown without the slightest protection, the following varieties :-

WHITE ROMAN seems to be the ordinary form, but the flowers are rather larger than when forced-a little less than I inch in length, and pure white. The bracts at the base of the short flower-stalk are ovate acute. This is the earliest single white.

WHITE ITALIAN, with more numerous flowers to the raceme than in the preceding, while the individual flowers are rather larger, exceeding 1 inch, and of a creamy-white flushed with pale rose. The little bracts at the base of the flower-stalks are linear, This is a stronger grower than the White Roman, and

DOUBLE ROSE ITALIAN has numerous pale rose or cream coloured flowers, each about t inch long, with two flower-stalks shorter than in the two preceding, and short roundish shell-like bracts which gradually pass into mere threads in the case of the uppermost flowers; it follows the White Roman. The doubling is due to the appearance of a number of supernumerary segments, some of which bear imperfect anthers; the true stamens occupy their usual position, but the pistil is somewhat leafy. Messrs. Hooper speak of this as a good white, and so it may be in a fresh state, but unfortunately we were not able to examine it till the flowers had somewhat faded, when the blooms had a rose tint.

BLUE ROMAN.—In this the scape is deep purple-blue, the flower-stalks about ½ inch long, each spring-ing from the axil of a shallow cup-like bract; the individual flowers are rather less than t inch long, deep purplish-blue.

HOME GROWN ORANGES.

WE are indebted to Mr. Rivers for an excellent series of specimens illustrative of various kinds of Oranges, Lemons, &c., grown in his orchard-house at Sawbridgeworth. Amongst them are the following, all of which were juicy and well flavoured :-

Bergamot Lemon. - A robust-growing spineless shrub or tree, with shortly-stalked, oblong leaves, crenate-serrate, the largest ones measuring 4 to 5 inches in length by $2\frac{1}{2}$ in breadth. The flower-stalk is about $2\frac{1}{2}$ inches long, cylindrical, with a broad, circular, cup-shaped calyx. The fruits are about 3 inches in diameter, globose, strongly flattened at the top, rounded at the base, the rind pale yellow, smooth. At the top of the fruit is a slight circular depression, suggestive of the nipple-like prejection characteristic of ordinary Lemons.

Excelsior Orange.-Branches slender, leaves with a winged petiole about 4 inch long, the blades 3 by 11 inch, oblong, lanceolate, acuminate, wedge-shaped at the base, faintly sinuate at the margin, flowerstalks cylindrical, a inch long, slender; calyx flat, fruit $3\frac{1}{2}$ inches long by 3 inches broad, oblong, obtuse at both ends, slightly depressed at the base, still less so at the summit, bright orange, rugose and pitted on the surface.

The White Orange,-Branches slender, leaf-stalks scarcely winged, less than 1 inch long, blades 3 inches by I inch, lanceolate, acuminate, tapering towards the base, and very slightly undulated at the margin. Flower-stalk slender, cylindrical, & inch long. 27 by 21 inches, elongated, globose, depressed at the tip, and slightly so at the base, deep orange, rugose,

Silver Orange.-Branches slender, leaf-stalk & inch long, scarcely winged, leaves 32 inches by 14 inch, lanceolate, acuminate, slightly rounded at the base, margin undulate. Flower-stalk ½ inch loog, cyliodrical and slender. A very pretty globose fruit, 2½ inches in

diameter, orange, scarcely depressed either at the

diameter, orange, scarcely depressed either at the base or at the apex; rugose.

St. Michael's Orange,—Branches slender, leaf-stalk scarcely winged, \(\frac{1}{2}\) inch long; leaf lanceolate, acuminate, rather acute at the base, entire or faintly undulate at the margin. Flower-stalk less than \(\frac{1}{2}\) inch and \(\frac{1}{2}\) inch sacross, slightly depressed at the apex, scarcely so at the base, deep orange, coarsely rigose, uneven and pitted. The identity of this with the true St. Michael's Orange is open to question.

Long Orange.—Branches slender, leaf-stalk not winged, it inch long, leaves 4 inches by 14 inch, oblong,

winged, ½ inch'long, leaves 4 inches by 1½ inch, oblong, or oblong lanceolate, shortly acuminate, rounded or tapering at the base, undulate at the margin. Flowerstalk ½ inch thick, cylindrical. Fruit oblong, 3 by 2½ inches, slightly depressed at the base, less so at the top; bright orange, coarsely rugose, and pitted. Maltese Blood Ovange.—Branches slender, leaf-stalk slightly wioged, ½ inch long; blades 4½ inches by 1½ inch, lanceolate, broadly acuminate, obscurely simuste, dentate, taperiog at the base. Flower-stalk ½ inch thick, cylindrical. Fruit oblong, globose, 2½ by 2½ inches, slightly depressed at the base, less so at the apex; bright orange, rugose, pitted, perfume strong, flavour excellent. flavour excellent.

Egg Orange.—Branches slender, leaves broadly lance-shaped, acuminate, tapering at the base, faioily serrated. Flower-stalk 3½ inches thick, cylindrical, club-shaped, calyx shallow. Fruit depressed, globose, 2½ to 2½ inches long, depressed at the base and at the apex, marked more or less deeply by longitudinal furrows. Yellowish-orange, coarsety rugose, slightly aromatic.

Sweet Brazilian Lemon .- Branches slender, leafstalk ½ inch, not winged, leaves broadly lanceolare, acute, scarcely acuminate, creante, serrate. Flower-stalks, solitary axillary, erect, dilated at the upper end, calyx cup-shaped, ½ ioch deep, globose, shallow, triangular; petals five, nearly I inch long, oblong, trangular; petals nve, nearly I inch long, oblong, sub-acute, stamens very numerous, filaments free, styles confluent into a column, terminated by an oblong button-like projection. Fruit oblong, rounded, and furrowed at the base, with a projecting nipple at the apex, 2½ inches long by 2 inches broad, lemonyellow, coarsely rugose and pitted.

Bijout Lemon.—Branches slender, leaf-stalk \(\frac{1}{2}\) inches his total \(\frac{1}{2}\) inches his total \(\frac{1}{2}\) inches his total \(\frac{1}{2}\) inches his talk \(\frac{1}{2}\) inches h

not winged, 2 inches by 1½ inch, ovate, or obovate, acute, or slightly and abruptly acuminate, serrulate, slightly broader than long. Flower-stalk ½ inch, slerslightly broader than long. Ftower-stalk ½ inch, slerder, cylindrical, calyx a flattened cup with a five sided der, cymanical, caryx a natenero cap with a new slote border projecting into five short points. Fruit sub-globose, 1½ to 1 inch deep, rounded at the base, flat-tened at the top, smooth, with a small nipple-like promisence in the centre, pale primrose-yellow, fragrant.

veet Lime .- Fruit 1 inch long by 11 inch broad, slightly longer than broad, oblong, obscurely angular, scarcely depressed at the base, flattened at the top, with a central dome-like prominence; colour pale yellow; very fragrant, smooth.

About the same time we received from our ex-cellent correspondent, Dr. H. Bennett, an Orange, of which we give the description here, referring the reader for a fuller account to Dr. Bennett's letter in

St. Michael's Orange. - From Mentone. st. micnaets orange. — From Mentone. Calyx broad, cup-shaped, regularly 5-sided, with shap points. Fruit globose, 24 inch in diameter, rounded at the base, scarcely flattened at the apex, rugose, and pitted. Deep orange.

MESSRS, LAING'S BEGONIAS.

A VISIT paid to these nurseries during the month of March enables one to gain some idea of the popularity of this section of flowering Begonias. Not only are seedlings of the present year being pricked off by the thousand, but the work of potting off the tubers kept through the winter is also in course of performance. As inquiries are sometimes made as to the best mode of wintering the tubers, it may be stated that Messrs. J. Laiog & Co. plant out many thousands of seedlings during the summer, and as a matter of course the best of these that flower are marked for trial another year. At lifting time the bulbs of the selected seedlings are put singly into small pots filled with cocoa-fibre, and then piled up in layers with cocoa-fibre between them on the stage of a bouse to winter. A very small percentage indeed is found to decay. The remainder of the bulbs are stored away in boxes after the soil has been shaken from them, and they have dried somewhat, and cocoa-fibre in a dry state is mixed with them; a few of these decay, but the losses are very slight. The cocoa-fibre holds moisture enough to keep the tubers from shrivelling, while there is not sufficient to cause it to ferment and burry them into premature growth. On turning out the lubers it is found they are beginning to start into

Odouteglossum iophoon, n. sp.—Paniculatum, sepalis cuneato-laceolatis acunicatis undulati; tepalis subsequalibus, sepalis lateralibus divuntist is habel idanimis lateralibus divuntistis is habel idanimis lateralibus divuntistis in mediana lineari securita, con divuntisti unitati propositi della propositi di propositi della propositi di propositi della propositi di propositi della propositi de

growth, and they are at once potted in suitable soil, and stood in an airy greenhouse, and for a time somewhat sparingly sprinkled overhead with water. The visitor noticed that at the time of potting the tubers are quite covered with soil. Some of the tubers, being three and four or more years old, require good-sized pots, but it does not matter if they nearly touch the sides if they have adequate root-room beneath. The best tubers to make fine exhibition plants are those about two years old; and if skilfully handled these can be grown into specimens 2 to 3 feet through. Some tubers potted at Christmas are already coming into flower, for it is necessary to have a succession of blooming plants.

Just now the work of pricking off seedlings from the seed-pans is in full swing. The seeds are sown as thinly as possible in pans of light soil in the month of February, and when they put forth their third and fourth leaves they are pricked off into other pans. This is a very interesting process. The operator has a thin piece of lath, rounded, a foot or more in length, pointed at one end and with a cleft at the other end, forming a kind of fork. With the point a small hole is made in the soil of the pan to be filled; then by dexterously turning the stick the fork is placed under a tiny plant, removed from the soil, and dropped in the bole already made. Then by rapidly turning it again the soil is pressed about the tiny roots. A proficient transplants with wonderful quickness. Seed-lings are pricked off in this way two or three times, giving them more space each time, until they are strong enough to be potted off or planted out. matter of course it can scarcely be expected that seedling plants placed in the open ground would grow into great size the same year, but a great number of them at least will bloom, enabling the grower to select what is good and reject what is indifferent. Since the introduction of B. boliviensis and B. Veitchii, nearly twenty years ago, what a marvellous improvement has taken place in this class of plants, and how great the perfection to which they have been brought during the last three years ! R. D.

PROFITABLE GRAPE GROWING.

In growing Grapes for market the profitableness or otherwise of the crop will depend on the season at which it is sent to market. Growers in these [Channel] Islands have very great advantages in the matter of forcing, and where the vinery is well situated and the Vines well managed and gradually worked up to proper condition, it is not a very difficult matter to have ripe Grapes before May 1, and the small amount of forcing required to get them thus early would astonish many gardeners used to the practice in the neighbourhood of London or further north.

It must be confessed there are not many vineries worked so early, and considering the inducement of 122. or 155. per pound, this is a matter of some surprise to us, and shows that much more might be made than is now being done, except by a very few growers. Some growers are for ever crying out that the thing will be overdone—we don't believe it, as far as these islands are concerned; with all our advantages of soil and climate and cheap and rapid communication with London and all the large centres of population, there will always be a profitable market for all the Grapes we can supply, and none can drive us out of it. And it is consumers' own fault if their tables are not well supplied during the latter part of August, and all September with good Grapes, at 15. or 15. 3d. per pound, and that price would give the grower a fair profit if he conducts his business on a large scale.

Last season inferior samples fetched less than 6d, per pound, but we doubt if these were sold to the consumers at less than 1s. The average prices returned for Hamburghs during nine months are as follows:—April, 15s. per pound; May, 7s. 6d, per pound; June, 5s. per pound; May, 7s. 6d, per pound; August, 1s. 6d, per pound; September, 1s. 9er pound; October, 2s. 6d, per pound; November, 3s. per pound; October, 2s. 6d, per pound. Mosents, if good, will fetch more, yet these can be grown to the highest perfection in an unheated house, and therefore equally as cheap as Hamburghs. We inspected a vinery last season about 200 feet long, unheated, which contained a truly magnificent crop of well-ripened Muscats of Alexandria. They were ripe in August, but were not sent to market till October, and paid well for keeping. The Persey Gardener.

MR. JENSEN ON THE POTATO

PRACTICAL DEDUCTIONS.

In the communications upon the Potato disease which have recently appeared in the Gardener's Chronicle, many important and interesting observations have been given in detail, the interest of which is perhaps greater to the scientific botanist than to the Potato grower. The following remarks are principally confined to the practical deductions to be derived therefrom.

It will be remembered that certain objections of a theoretical character have been raised against the advantages of high-moulding, which I did my best to condute as they arose; my present object, however, is to explain what "high-moulding" is, why it protects the tubers from the disease, how and when it ought to be done. In order to do this intelligibly it is neces-

FIG. 81.-HIGH-MOULDING, WITH BRECT TOPS

Fig. 8z.-High-Moulding, with Bent Tops.

Fig. 83.—HIGH-MOULLING, WITH SLIGHTLY BENT TOPS, DONE EARLY.

Fig. 84—moulding as it is often done by the flough. (See F 447, c.)

sary to state first that the Potato disease is due to a parasitic fungus (i.e., a fungus which can only subsist upon living Potatos—foliage and tubers, and a few nearly allied plants, notably upon the Tomatol; that this fungus reproduces itself by means of spores—and not only reproduces itself with incalculable rapidity, but also spreads itself far and near by the same means—far in the sense of travelling from one plant to another, near in the sense of spreading from one part of the same plant to another; that although these bodies are produced in such enormous quantities, yet each individual spore has only a very limited duration of life, being easily destroyed (1) by heat at any temperature above 77° F.; (2) by dryness, being kept in dry air for a few hours; (3) by germinating upon any and every substance other than a living Potato plant or tuber.

Lastly, that the fungus spreads from the foliage to the tubers by the spores being carried by the rain, through the soil covering them, to the Potatos. Now while this is true, yet it is a matter of common observation that the disease travels down the stem to the tubers. The reason for this is obvious to the

most cursory observer. Naturally the rain, falling upon the foliage, is conveyed along the leaf-stalks to the stem, and by it to the underground stems and roots, on which point the Potato does not differ from any other plant. But in the case before us the foliage is that part of the plant where the disease-spores are produced, consequently the water conducted by the stem to the roots is, in this instance, charged with spores. Moreover, the constant oscillation of the stem by wind and weather * loosens the earth in contact with its base, so that in course of time a crater-like cavity is formed, from the centre of which the stem emerges. It has been shown that the earth covering the tubers, if it be of sufficient thickness, has the power of filtering out the spores and retaining them, bereby protecting the tubers from the disease; hence it follows that in any attempt at protecting the tubers by "high-moulding" this crater-like cavity at the base of the stems must be taken into account. If it be desired to grow Potatos in such a way as that none of the tubers shall be diseased, it can be done easily enough in the following manner:—About the middle of July, before any disease has appeared at all upon the foliage, bend the tops of those roots you wish to protect, well over to one side, so that instead of heing upright they hang over the adjoining furrow (fig. 82), and at the same time increase the height of the moulding, so that 5 inches of earth cover the most superficial tuber. Leave the plants thus treated with perfect confidence until the whole of the foliage and stems have been completely destroyed by the disease, and you will find the tubers perfectly healthy, and absolutely free from disease. If you have left a number of control Potatos grown in the ordinary way, you will find them more or less affected with the disease, according to the kind of Potato employed and the virulence of the outbreak. But you will also find another thing, namely, that although the high-moulded tubers are free from disease, yet they are inferior in point of size to those grown in the ordinary way. This arises, not from the high-moulding itself, but from the bending of the Mr. Jensen thinks it mainly due to the foliage being less exposed to the sunshine, for one-half of it is always thus in the shade. For my own part, I think it is also due to the injury necessarily done to the lower parts of the stems in the act of bending, whereby the free passage of the fluids between the roots and foliage is interfered with. It must also be remembered that, by bending the stem down, so that the foliage is close to the ground, the fungus spreads much more rapidly upon it, the atmosphere immediately around it being damper and more stagnant. Of course our object in the above experiment was to grow Potatos free from disease, and therefore was perhaps rather more theoretical in its purpose than practical. We learn, however, from it two things-first and mainly, that it is possible to combat the disease; and at any rate we have a clear and definite principle upon which to go; secondly, we learn that we must not be too rough in our treatment of the tops-we must not bend them too energetically. The great point gained, however, is to have learned the fact that it is in our power to control the ravages of the disease, to have a clear and defined principle upon which to act. There are many conditions under which this may be most valuable; for example, a severe outbreak of the disease may have taken place, by which it is obvious that the crop must be destroyed almost entirely. Up to the present time only two things have been done; either the crop has been lifted then and there, regardless of the fact that the tubers are immature, and that in the very act of lifting a great quantity of the tubers will become infected and destroyed by "after-sickness;" or else the tops have been cut off, to the great detriment of the tubers themselves, irrespective of its comparative inutility in arresting the spread of the disease.

We now know that instead of adopting either of these procedures, by protective moulding being applied to the crop we shall save whatever tubers have not already become infected, and also we shall be able to prevent the "after-sickness" by not lifting the tubers until the tops have been thoroughly destroyed.

Is it possible to apply the principle of protective moulding without diminishing the yield? This is naturally the question which every Potato grower will ask. Last year Mr. Hansen grew at Hverringe Kjorteminde, Denmark, the following three varieties, as under:—Four rows, 108 feet

^{*} Possibly aided by its revolving nutation—circumnutatory movements.

(Danish) long, were grown of each sort, with protective moulding and bent tops, while four other rows were grown in the ordinary manner. The results are given in Danish pounds ($101\frac{1}{2} = 112$ lb. avoirdupois):—

Protective Moulding - Bent Tops.

		Sound.	Diseased	Total.
Early Rose	 	1463	28	1491
Prima Donoa	 	1592	9	1601
Early Goodrich	 	1524	7	1531
		4579	44	4623

Ordinary Moulding.

		Sound.	Diseased.	Total.
Early Rose	 	961	389	1350
Prima Donna	 	1344	201	1545
Early Goodrich	 	1192	195	1387
		3497	785	4282

The soil was a strong clay, in good garden condition. The crop, obtained by the ordinary method of Potato culture, was equal to 640 cwt. per acre, while that obtained by the protective moulding, although the tops were bent, was equal to 693 cwt. per acre. Of course this was an exceptional crop in point of quantity. The common moulded rows were diseased to the extent of 117 cwt. per acre, the protective moulded rows only 7½ cwt. per acre.

The time at which the bending of the tops is done has a considerable influence upon the yield, as the following results obtained last year by Mr. Jensen will show: —

Protective Moulding with Bent Tops.

Moulding,		Date			Disease. Per Cent.		Earth cover- ing.		Average Pro- duce in lbs.	
				Early Late.		Early.	Late.	Early.	Late.	
High		July	_,	19	1.5	In.	In.	41 8	26.4	
,,		1,	15	00	0.4	41	5	318	22.6	
13	٠.	,,	23	03	0.9	41/2	5	34.1	22.7	
**	٠.	Aug.	16	0.2	0,0	43	5	45 I	26.0	
18		Sept.	I	69	22 3	42	5	45.2	30.2	
Common		July	ī	12.7	25 6	3	3	41.0	30.5	
Flat		June	20	29.5	49-5	1/2	1/2	44-0	27.2	

From the above it will be seen that there is a very marked diminution of the produce in those plants which had their tops beat on July 15 and 23, but this diminution did not take place when the bending was done either before or after those dates. The obvious conclusion is that this operation should not be done while the plants are flowering. In looking at the percentage of disease we see that this varied from 0.0 to 1.9 per cent, in those plants high-moulded between July 1 and August 16. On September 1 the disease was widely spread upon the leaves, hence the protection afforded was but slight as compared with the previous instances. It should be remarked that the ordinary moulding in this instance consisted of an earth cover of 3 inches, which is fully an inch more than is usually given to Potatos. By comparing the thickness of the earth cover in the three different kinds of mould-high, ordinary, and flat-in the above table, and the amount of disease, we see at a glance the increased protection that each additional inch affords.

Protective Moulding with Erect Tops.

Moulding.		Date.		Disease. Per Cent.		Earth	Cover.	Average Pro- duce to lbs.	
				Early.	Late.	Early	Late.	Early.	Late.
High	-	July	x	1.9	10.4	In. 4½	In. 41	37-9	25.0
.,		,,	15	1,0	10.4	41	41	38.4	25 9
,,			23	0.2	50	41/2	41	39-9	26.2
		Aug	1	2.5	10.4	41/2	41	36.4	24 0
Common		July	1	59	17.9	31/2	3	36.3	26.2
Flat		June	20	173	418	1 1	r 1/2	417	22.0

By the above table we see that the late variety got three-quarters of an inch less earth cover than the late variety did with the bent-tops experiment; hence the protection was less marked than it would have otherwise been. The interesting point, however, is to contrast the effect upon the yield. If we omit those plants which had their tops bent on July 15 and 23, we find that with *--

		Tops bent.	Tops erect
Protective moulding	 	Lb. 35 8	Lb. 3 ·7
Common moulding	 	35 8	31.2
Flat moulding	 	35.6	31.5

Some experiments were last year made in Scotland with protective moulding upon a pretty large scale,

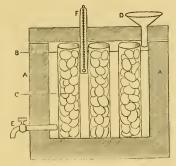

Fig. 85.—APPARATUS FOR DISINFECTING POTATOS BY WARM WATER.

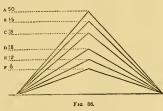

A, A, Double hox, packed with chaff or any other non-conducting material. B, Water, at 100 - 120 F. c, Cylinder coataining the Potatos to be disinfected. D, Opening in the lid for replenishing the water. B, Opening for letting out the cooled water. F, Thermometer.

extending over a quarter of an acre, the moulding being done with a plough. The drills were sixtyeight in number, 25 feet long, and the results obtained were as under:—

One pound per drill is equal to 61 cwt. per acre. The high-moulding was done at different dates,

A, 50', Compact earth; B, 45', Well-drained clay; c, 38', Dry sand; D, 28', Vegetable mould; E, 22', Wet sand; F, 16', Wet clay.

between July and the middle of September. Mr. Shirriff says, in a communication to the East Lothian Farmers' Club:—"The results of these experiments show that hending over the stems lessens the percentage of the disease, but diminishes the produce, and the moulding with erect stems only very slightly diminishes the produce. The average results per

* As I understand Mr. Jensen, this includes both diseased and sound tubers.

drill between ordinary and protective moulding, both in the early and late varieties, gives exactly \$\frac{1}{4}\$ lb. per drill, or about 12 stones per acre of total produce in favour of ordinary moulding." The yield per acre of the early sorts was between 7 and 8 tons per acre, and that of the late sorts between 10 and 11 tons, compared with which 12 stones is a mere trifle compared to the quantity of tubers destroyed by the disease.

Mr. Shirriff further states that-

	3.1	o. of d	-ille	Yield per acre in hundredweights.

16				 185 <u>11</u>	103			

The fact that high-moulding, per se, does, under certain circumstances dlminish the produce, be it ever so little, is one which deserves consideration. This seems to arise from the fact that io high-moulding the extent of surface is increased so that evaporation is augmented; heace, in dry summers, upon sandy soils, this diminution attains its maximum, while, upon the other hand, in stiff soils, and in damp situations, the reverse is the case, and under such circumstances an increase and not a decrease in the produce accrues from high moulding.

It is of course a well-known fact that sandy soils are better suited for Potato culture than clayey soils, but the cultivators of Potatos do not all happen to have the good fortune to dwell in districts of this description. In like manner we cannot predicate the amount of rainfall which we shall have in any given year, but we do know that certain parts of the United Kingdom have annually a much greater rainfall than others—Ireland for example, which country offers, for this reason, peculiar attractions for protective moulding. It may be suggested that only known disease-resisting varieties should be grown, but these are nearly all of inferior quality.

It should be remarked that there is a physical limit to which high-moulding can be carried. The natural slopes of various kinds of earth are well known to engineers, and the accompanying diagram (fig. 86), constructed from the data given in Molesworth's little book, shows these slopes graphically. is measured from the horizon. It will be observed that while compact earth will stand at 50°, dry sand only stands at 38°, but both these are liable to be washed down by long-continued rain; wet clay sinks as low as 16°, while well-drained clay stands at 45°. The angle which Mr. Jeosen recommends is about 35°, which will probably be about the average of various kinds of cultivated soils; but it is obvious that, in order to get the high-moulding of a ridge to be tolerably permanent, the drills must not be too close together. The accompanying diagram shows (fig. 81, p. 446) high-moulding with erect tops; fig. 82, high-moulding with bent tops, which gives the greatest degree, practically absolute protection to the tubers, but diminishes somewhat the produce; fig. 83 shows high moulding done early from one side: the tops were at first slightly heat, but soon recovered an erect position; fig. 84 shows a not very uncommon form of moulding seen in Potato fields where the operation has been carelessly performed by the plough. The earth thrown up from the furrow on either side the ridge has not been sufficient in quantity to meet on the top, so that instead of a sharp point to the ridge, a shallow groove is formed. I noticed this in several fields last year. It is simply an invitation to the conidia to attack the tubers. Besides the groove originally left, the stalks have in this diagram by oscillation worked for themselves a funnel-shaped hole leading directly to the

The subjoined rules have been drawn up by Mr. Iensen:—

1. The rows must be a least 30 inches apart.

2. High-mould from one side only, with a view to cover the uppermost tubers with at least 5 inches of loose mould. This covering will as a rule be obtained when, immediately after the moulding has been done, the ridges have a height of 11 or 12 inches measured perpendicularly from the bottom of the furrows.

3. High-mould as soon as the plants are high enough for it. The tops must not be bent more than is necessary for allowing the mould to enter and fill up the space between the stalks to the full height of

the ridge. The plants will in a few days reassume the erect position as nearly as possible.

4. If for any reason the high-moulding has not been given to the Potatos before they have commenced flowering and an attack of the disease necessitates a protective moulding, this had under these circumstances better be given from both sides without bending the tops.

AFTER-SICKNESS.-This most important subject must not be lost sight of. It ought to be borne in mind that the tubers are as easily infected by the spores falling upon them when they are first taken out of the ground as they are while still in it. Hence the obvious importance of not thinking about lifting a crop until the tops are thoroughly dead. Lifting should never be begun until at least a week after the leaves are all ground and well protected with a sufficient earth covering from the spores of the disease, but if they be uncovered in an atmosphere filled by countless myriads of spores, many tubers are sure to fall a prey to the destroying fungus. Fortunately, we know that although these spores are present in such enormous numbers, yet in a very short time they become harmless, either by the heat of the sun or the dryness of the air, or by germinating upon the damp ground.

DISINFECTION OF THE SEED POTATOS .- Ia a recent communication upon the Potato disease it was shown (1) that an early outbreak means a small crop, not only from the number of diseased tubers, but also from the relatively small size of the sound ones, due to the destruction of the foliage in an earlier state of the plant's life; (2) that the earliness of the outbreak is not wholly dependent upon the rainfall, but principally upon the number of diseased sets planted in spring. It follows, then, that if we can reduce the number of diseased sets planted we shall retard the general outbreak of the disease. It may be thought that the disease is so well known and so much dreaded that diseased sets are practically never planted, but a very small patch of mycelium may hybernate through winter, so inconspicuously as to be overlooked unless the Potato be washed, so as to remove the adherent dirt. Mr. Jensen has shown that a temperature of 77° F. kills both the mycelium and spores of the Peronospora, provided it be continued for a sufficiently long time, and that the germinating power of the Potato is not in any degree impaired by a considerably higher temperature than this. After a number of experimental investigations upon this point it has been proved that the exposure of tubers to a dry heat of about 100°-105° F. for four or five hours is the best and safest way of disinfecting them. On a large scale this may be done in a properly constructed oven where the temperature is carefully watched during the whole time. It is necessary that the heating procass be continued for some hours to ensure the deeper parts of the tubers being raised to the requisite temperature. On a small scale the most convenient apparatus is the following (see p. 447):—A double box is constructed capable of holding water in its interior: the space between the inner and the outer box being filled with some non-conductor of heat, chaff for instance. The inner box is filled with water at a temperature of 100°-120° F. Into this are placed tin or zinc cylinders about 5 inches in diameter, containing the tubers to be disinfected, where they are allowed to remain. By the employment of narrow cylinders like the above the Potatos are more readily heated than is the case if wider ones are used. A thermometer in the water is, of course, essential to ascertain its temperature. It may require an addition of warm water once or twice, according to the heat of the surrounding atmosphere and the efficacy of the nonconducting medium employed.

In my last communication upon the Potato disease two tables were given showing the rate of growth of the tubers from July to September. Now, as soon as the Peronospora destroys the foliage, it follows that this growth of the tubers ceases; hence it is obvious that any cause which shall retard this destruction of the foliage, even for a few days, will proportionately iocrease the produce. In this same communication I also gave Mr. Jensen's observations upon the rate at which the disease spread in his garden at Neuilly, Here the first diseased shoot, which was intentionally produced, appeared on May 29, and it took thirty-three days (i.e., till July 2) for the disease to spread 3 feet, and twelve more (July 14) before it was sufficiently advanced to be observable from a distance, but the disease was not general in the district until

July 29, that is to say, Mr. Jensen, by planting diseased sets, had the disease forty-five days before the general outbreak came. Hence it is obvious that one diseased set planted in a field is a powerful agent for evil to that field before the general outbreak comes.

It would appear that hy planting only such tubers as have been disinfected a gain of about fourteen days may be anticipated; this might be further augmented to perhaps double the time by allowing the disinfected tubers to sprout in a warm, dry, light place before they were planted. According to Köoig and Ham-merbacher's table, the young tubers on July 16 weighed 25.10 grammes, on July 30, 57.45; and on August 6, 84.13; so that if the disease could be staved off until July 30 they would be more than double the size than would be the case if they lost their foliage on July 16; and, further, if the disease could be staved off seven days longer, instead of weighing 57.45 lb. (or grammes, as the case may be), they would weigh 84.13 lb. Mr. Jensen proposes conducting further experiments during the coming season in this direction, the result of which will be anxiously looked for. Charles B. Plowright, 7, King Street, King's Lynn.

VALE ROYAL.

THE gardens at Lord Delamerc's Cheshire residence are always a treat to see. A new conservatory has recently been erected worthy of imitation, inasmuch as it is in every particular admirably adapted for the cultivation and exhibition of plants and flowers. How few conservatories there are connected with our great gardens in the country of which this can be said! Is it not a notorious fact that more than two-thirds of the conservatories in existence at the present time are quite unfit for the purpose for which they are erected-namely, to be the home for plants? Is it not a fact that, as a rule, these structures are unfit to put plants into? And why is this? Simply because the architect-who knows nothing about the requirements of plant life-is listened to before the gardener; or, in other words, the architect sacrifices everything for effect, regardless of the fact that his "effect" very often means death to the inmates of the building.

The building at Vale Royal is an exception to the rule, the reason being that practical men have had to deal with its erection. I have had the pleasure and privilege of seeing this house in all its glory during the last six months, and I have also seen most of the large establishments throughout the country, can safely say that I never saw two more lovely pictures than this house presented on the two occasions referred to. On the first occasion the main feature among the flowering plants was the Celosias. Among plants which have recently become popular these are not the least interesting; for whether considered in relation to their adaptability as single specimens, the elegance of their habit, or the desirableness of their rich masses of colour for conservatory decoration, they are certainly among the most useful tender annuals which has of late years been brought into notice. For rich colour there is nothing to surpass these feathery and plume-like Celosias. I saw about 150 splendidly grown plants judiciously distributed amongst other plants remarkable for brilliancy of colour or beauty of form, and, as I said before, the picture was one I shall not readily forget.

On the other occasion the main feature amongst the flowering plants consisted of some glorious examples of Calanthe Veitchii. Imagine about 200 grand spikes of this most lovely coloured flower scattered up and down, intermixed with Clivea miniata, small Palms, and Adiantums—and there also you have a picture of floral beauty not to be easily forgotten.

In the other departments (the fruit-houses and flower-garden) good cultivation is the rule; and Mr. Milne, the head-gardener, deserves great credit for the excellent keeping of the gardens, and it is gratifying to know that his services are highly appreciated by Lord and Lady Delamere. B. F.

CANISTRUM ROSEUM.—A Bromeliad with oblong leaves dilated at the base, acute at the apex, spinoso-dentate, dull green, with darker spots. The flower-stalk is shorter than the leaves, bearing pink bracts, the upper ones clustered around a head of small flowers. It is supposed to be a native of Brazil, and is figured in the Belgique Horticole, t. xiv., 1833,

Prchid Notes and Hleanings.

THE PICKRING LODGE ORCHIDS.—At the present time there is in Mr. Hardy's establishment a mass of Dendrobium Wardianum, consisting of twenty-three plants, bearing over 3000 flowers of extraordinary size and quality. These form a grand exhibition in themselves, but I would also mention that there is also to be seen here a marvellous plant of Aërides Veitchii carrying two spikes, one 3 feet long, with nine branches 10 inches long each; the other 18 inches to 2 feet long, with its branches 9 to 10 inches long. This plant will be grand in about a month's time. S. 9, Ascot.

DENDROBIUM LITUIFLORUM.—Now that many of these lovely Dendrobes are in bloom, we often come across one of this variety with flowers strongly suggestive of D. nobile, as well as seeing the high-coloured forms of D. nobile which come from the same locality, with a cast of countenance which immediately calls to mind D. lituiflorum. Possibly Nature has mingled the varieties by cross-fertilisation, for some of the forms of D, lituiflorum seem to be just what one might expect from D, transparens crossed with D, nobile. Mr. Cypher sends a three-flowered truss, which seems to illustrate the notion.

CATTLEYA TRIAN.E, POPAYAN VARS.—A pure white, with only an orange blotch in the throat, and one of the best of the high coloured varieties, with violet-crimson fringed labellum, both of the highest merit and possessing distinct features, come to us from Mr. Cypher, together with the most flattering account of his plants which have flowered out of Chesterton's collections, and also of those which have flowered in other establishments in the neighbourhood. We have seen several of this variety of Cattleya from different parts of the country, and all have been good.

DR. PATERSON, of the Bridge of Allan, sends some fine blooms of Lycaste Skinneri—probably the most generally valuable of winter and spring-flowering Orchids. A specimen of Cymbidium Lowii, with remarkably brightly coloured segments and spotted lip, comes from the same source, as well as spikes of the beautiful Chysis bractescens and Ceologyne ocellata maxima. Rodriguezia planicaule, though less showy than those just named, is interesting in having a dense pyramidal raceme of greenish flowers, with the lip in the normal position, that is, at the upper part of the flower. In most Orchids, owing to a twist in the flower-stalk or in the ovary, the lip gets twisted out of place, and occupies the lower part of the flower.

THUNIA MARSHALLIANA.—An Orchid of Reed like habit, but with deciduous oblong-acute leaves, from the axils of which proceed the large transversely oblong flowers, the sepals and petals spreading, lancolate, pure white, the lip convolute at the base round the column, the anterior disc of the lip roundish, somewhat spreading, marked with radiating orange lines, and with a narrow undulate white edge. The plant is a native of Moulmein. A coloured figure is given in the Orchid Album, 1. 130 (1884).

ODONTOGLOSSUM NEVADENSE.—A rare and beautiful species with ovate compressed smooth pseudobulbs, with a pair of narrow oblong acute leaves tapering the base. The raceme springs from the base of the pseudobulb, and bears 6—8 star-shaped flattish flowers; the sepals and petals lanceolate, rich chestnut-brown, with a narrow yellow edge; lip shorter than the segments, with two small broadly wedge-shaped white lobes, spotted with chestnut, the anterior lobe white, much larger, cuneate-obovate acuminate, the basal portion with three Pear-shaped purplish blotches, the edge deeply laciniate. The species is a native of New Grenada, and requires the same treatment as O. crispum (Alexandræ). Orchid Album, t. 131 (1854).

LELIA DAYANA.—A Brazilian species with short thick cylindric or clavate stems invested by leaf-sheaths; leaves oblong acute. Flowers one on a stalk, large, transversely oblong, sepals and petal, oblong, rosy-lilac with the ribs of a deeper colours lip rather larger than the other segments, convolute at the base, the disc rich magenta coloured with purple radiating streaks, and a white blotch in the throat. Figured in the Orchid Album, t. 132.

THE required stock of plants for filling the summer garden should now be complete and every means should be employed to thoroughly harden the plants by exposure, simply screening them from frost, so that when transplanted in May they will suffer no perceptible check; such plants, however, as Coleus, Alternanthera, and Iresine may still be propagated and kept growing, as they cannot with safety be planted out till the beginning of June, by which time the ground is generally sufficiently warmed to induce them to grow freely. In many establishments there is not sufficient pit and frame accommodation for the summer bedding plants, they are consequently too often crowded together in the vineries, Peach-houses, and other unsuitable structures through the spring months, where their constitution is so weakened by excessive heat and moisture as to make them quite unable to bear any sudden change of temperature, or even bright sunshine, after they are transplanted, without receiving great injury. Under such circumstances it is far better to place them out-of-doors now rather than continue to keep them in such unsuitable places. A warm corner of the garden should be selected where they can be placed on a dry bottom of ashes or gravel and hooped-over and carefully protected by stout mats or Frigi-Domo, and if kept moderately dry at the root they will soon become hardened and suffer no injury even should slight frosts occur.

Annuals,—This is a suitable time to sow seeds of the best kinds of hardy and half-hardy annuals. Many of these are now so popular, and the improved varieties are so beautiful, that no garden should be without them. To enamerate them here is not necessary, as accurate descriptions can be found in nearly every seedsman's catalogue. The tenderer kinds should be sown either in pans or boxes, and placed in gentle heat till they vegetate. When large enough they should be potted off or pricked out separately into frames; others less tender may be sown in cold frames at once, and in fine weather, when the soil is moderately dry, they may be sown in the open borders, simply placing a little fine soil over them, and as the plants appear above-ground they should be thinned to suitable distances, according to size and habit of growth.

HERBACEOUS PLANTS .- . As most of the plants are now making rapid growth, all fresh plantations should be completed as quickly as possible; some of the late kinds may yet be divided, but the sooner this work is finished the better. After planting they should receive water, and subsequently be well mulched with decayed manure or leaf-mould. Where the young shoots are very thick they are greatly improved by timely thinning, by which means not only are the blooms increased in size, but the plants are rendered less stiff and formal in outline. As the plants grow they should be kept tied, so as to prevent breakage by wind and storms. The surface between the plants should be loosened frequently, so as to clear away weeds, and at the same time secure a free passage to the roots for air and rain.

Gladioli, Persian Ranunculuses, Anemones, Tigridias, &c., may now be planted, for doing which a moderately day and mild day should be chosen; the ground also should, if possible, be in a rather dry con-dition, otherwise many of them may decay by suddenly absorbing too much wet. The most suitable soil for the first-named is a deep sandy loam, well enriched with thoroughly decayed manure. There is, perhaps, no plant more deserving of extensive cultivation, whether for summer or autumn decoration, than is this glorious flower. A flower garden without it is indeed shorn of one of its brighest gems. Whether planted in mixed borders either in groups or lines, it is very effective, but its real value is best seen when massed in distinct and separate colours. It can now be procured in these separate colours so cheaply that there no longer exists a reasonable excuse for not planting it largely. The Anemone, Ranunculus, and Tigridia also make very effective plants, whether mixed in the herbacenus borders or when planted in separate beds. The soil best suited to them is rich sandy loam; in planting a liberal dressing of sand should be given, and the soil should be pressed firmly round them during dry weather; when growing they should be occasionally watered, and when in bloom the Ranunculus should be shaded from bright sunshine. Bulbs now showing bloom should have their bloom-spikes carefully tied, otherwise the first heavy shower will break them off.

Roses.—These must now be pruned, as they have already made considerable growth. Many of the back buds, however, are still dormant, and if the shoots are cut back to these buds they will break freely, and although by leaving them nonpruned so long a portion of the strength is undoubtedly sacrificed, still it is better so than to lose all the buds, as if requently the case when early pruning is practised. Where grown as dwarfs, instead of pruning back so far, the ends only should be cut off; dead and useless shoots should then be taken out, and the remaining shoots pegged down. The young growths, as well as the buds, should also be thinned; these pegged Roses will then give earlier blooms, and equally as fine as those that are pruned back severely.

LAWN.—This will now require particular attention. To the labour devoted to it and upon its judicious management at this season depends, to a great extent, its after-beauty. All sticks and stones should be carefully removed, as should also Plantain and other coarse weeds, either by grubbing them up or by the application of vitriol. A mixture of the finest grass seeds should then be sown over it and a light dressing given of finely sifted wood-ashes, lime, or guano; the roller and mowing-machine should then be frequently employed to produce a firm and even surface. T. S. C.

The Pitchen Garden.

ASPARAGUS PLANTING .- The ground having been prepared as previously recommended, mark off the necessary number of beds 4 feet wide, with an alley 2 feet wide between each bed, then draw two drills about 4 inches deep at 9 inches from either side the centre of the bed space, and in these plant the roots, taking half of them in one hand and half in the other, with the crowns slightly raised, 18 inches apart in the row. Press the soil firmly about the roots with the hand; afterwards the plants should be tied to sticks, and the surface of the soil mulched with 'decayed manure, which will preserve the roots in a healthy growing state. For the supply of plants for forcing, plant in drills 15 inches apart, and the same distance from plant to plant in the row, and in such a way that those in the second row stand angle-wise to those in the first-this remark also applies to those in bedsas by so doing the plants have more room to grow than if planted opposite to each other. Those wishing to give the French system of growing Asparagus trial should open shallow trenches 5 feet wide, 9 inches deep, with 21 feet alleys between the trenches, and in these trenches make three rows of low hillocks, a couple of inches high and 3 feet apart, on which lay the roots of the plants, spreading them out equally in every direction, and then cover them with a few inches of soil, and subsequently with a little well decayed manure. In the meantime rows of Cauliflower or Cabbage can be planted between the trenches without in any way interfering with the growth of the Asparagus.

SEED SOWING, &c .- Sow the early crop of Beet (Pine-apple Short-top, when obtained true to name, is the best variety) in good open soil, in drills 15 inches apart. A sowing of French Beans should now be made out of doors in a warm border, in drills 2 feet asunder, where provision can be made for protecting them from late spring frosts. Slugs and grubs are often very destructive to freshly planted Cauliflower, Cabbage, and Lettuce plants, which should therefore be looked over every morning and evening with a view to destroying them, and filling up vacancies they may have made, which work must be attended to until the plants have established themselves, when they will be better able to resist the attacks of these pests. When the roots and stems of plants have been eaten away by the grub, the drooping leaves soon indicate the fact, and search should be made at the roots for the depredator before planting anew. To prevent the ravages of slugs on young seedling crops of Turnips, Cabbages, and small Lettuces, if the beds and drills are dusted over when the leaves are damp with a mixture of lime and new soot, it will not only effectually check the ravages of slugs, but, the application being persisted with when necessary, will entirely prevent their being interfered with by birds or the Turnip flea. Carrots and Turnips will require to be thinned-out to a couple of inches in the rows, and to be finally thinned-out a few weeks later, which, in case of mishap to the plants while young, will be the safer practice. Use the Dutch-hoe freely between the rows of young crops, as also between those of autumn-sown Onions, Spinach, Cauliflowers, Cabbages, and Broccoli, and in every place where weeds appear.

GLOBE ARTICHOKE.—Now that the plants have made sufficient growth to admit of offsets being taken to make good any vacancies that may have been occasioned during the winter, and also for making new plantations, it is a good plan to destroy a few rows of the oldest plants every year, and to plant an equal number of rows of young ones. These may be planted in clumps of three plants set triangularly, in rows of clumps 4 feet apart, and at the same distance from clump to clump. When planting, the soil should be made firm around each plant with the hands, after which they should be watered to settle the soil about the roots, and the ground between them should be afterwards mulched with a few inches thick of rotten dung. These plants will yield a good supply of Artichokes late in the autumn, and tong after those planted a year or two previously have ceased to bear. Any old mulch left on the surface from last year should now be forked in, the blanks, if any, having been previously filled. H. W. Ward, Longford Castle

The Bandy Hruit Garden.

THE MULBERRY is the latest of all our fruit trees to come into leaf, and does not generally put forth till the second week in May; therefore, if not pruned it may still be done, thinning out the branches where the tree is grown as a standard, which form is found to answer perfectly in southern localities. The tree is easily propagated by cuttings, but as it takes half a generation to make a good fruitful tree, it is the better plan to get them of a mature age from the nursery; as there is little or no difficulty in transplanting the trees. For the first year or two the ground around them may be cultivated, but directly the trees commence to bear it should be laid down in grass, as by so doing the falling fruit is saved from injury and kept clean.

STRAWBERRIES, —Pass the hoe once more through the plantation, to kill any weeds coming up. This is always advisable previous to mulching them down, which can be better dooe now than later on, and with less injury. For years we have used long litter from off the early Vine borders, the plan answering perfectly for the very early kinds on a south border which have run together in beds. We generally at this time spread the dung from old Mushroom beds over the ground, brushing it in with a broom; this provishes the plants and keeps the fruit clean.

over the ground, Dussing it in whith a profest, this noursiness the plants and keeps the fruit clean.

As fast as the fruit is cleared off plants in the forcing houses get them planted out in rows a yard apart and 18 inches apart in the rows, and be particular to reject all which proved unfertile; and as the plant has a tendency to raise itself from the ground deep planting is advisable when turned out of pots. The black slug is very partial to the Strawberry, and we know of no better plan than to keep a brood of young ducks in the kitchen garden for the destruction of these pests. Eggs hatched now will be in time for that purpose; the wild duck pintoned is best. We keep some in the garden, and hind them of great service.

FRUIT TRRES. — See that all the fruit tree stakes are sound, and that the espalier trees are securely fastened to their supports. In many localities grafting may still be done. In selecting scions for the purpose keep in view the late kinds as those that are very useful during the winter. Such kinds of Apples as Mère de Menage, Northern Greeniog, Winter Greeniog, Sturmer Pippin, Winter Queening (usually known in this county as Duck's-bill), are worth much more than the sorts ripe in October and November.

A bive or two of bees are most useful in the garden in helping to set the blossoms, therefore at once secure a stock and place them in a sheltered aspect—they will be a profitable investment. 9. Rust, Eridge Cattle, Sussex.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, April 8

Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Sale of Orchids, its rothere & Morris' Sole of a Grand Collection of Orchids in Footbere & Morris' Thursday, April 19

Sale of a Grand Collection of Orchids in Flower, at Stevens Rooms of Flower, at Stevens Rooms of Flower, at Stevens Rooms, &c., at Prothero & Morris' Rooms. Sale of Imported Orchids, Stove and Greenhouse Flants, &c., at Stevens' Rooms of Flants, &c., at Stevens' Rooms.

WE are not in a position to report what the Daffodils conferred about, but at any rate we are constrained to say something as to DAFFODIL CONFERENCE, held in the Gardens of the Royal Horticultural Society on Tuesday last. This was, as it were, an extra meeting, not provided for in the ordinary programme, and in its inception and in the way it was carried out it was akin to the two evening meetings held last year. Like them, and like the Apple Congress, it may be chronicled as a success, and as a welcome indication of vitality in the Society, and of the interest taken in its proceedings by the general public. If it serve to obviate the formation of another special Society it will do good, as it certainly did in raising the tone of horticultural discussion. The ball was opened by a paper read by Mr. BURBIDGE, the historian and portrait painter of the genus. We give the substance of the paper in another column, and in order to add to the interest we reproduce several illustrations that we have given from time to time, and add some not hitherto published, from the pencil of Mr. FITCH.

The discussion was opened by Professor MICHAEL FOSTER, who set out with the condemnation of the common idea that "ignorance is the necessary setting of beauty." The remarks which followed from the various speakers were in keeping with this key-note, and may, indeed, be said to have covered wellingth the whole field of Daffodil fore from its legendary history to the discrimination of the various forms and the practical details relating to their culture. Our space will not allow us to give a verbatim report of what transpired, but we can at least give a general idea of the ground traversed.

Mr. Burbider's paper speaks for itself. We need only point to the practical suggestion which he, following Parkinson, threw out as to the classification, according as the leaves are flat or more or less cylindrical and Rush-like. These divisions are subordinated to the now generally adopted classification according to the relative length of the cup or corona—long, medium, or small, or, as it was wittily suggested by a visitor, long-nosed, short-nosed, and pugnosed Daffodils respectively.

Mr. SHIRLEY HIBEERD followed with a few remarks on classification, pointing out that "the weak points in Mr. Baker's classification are strong for the purpose of instruction." Mr. HIBEERD, mixing up Daffodils with Narcissus, proposes, instead of the twenty species recognised by Mr. Baker, to adopt five only as really distinct—the Basket Daffodils, represented by the Corbularia or Bulbocodium section; the Trumpet Daffodils, including the wild form of Pseudo-Narcissus and its allies; the Chalice Daffodils, comprising N. incomparabilis; the Cup Daffodils, represented by N. juncifolius, Tazetta, and Jonquilla; and, lastly, the Cymbal Daffodils, in which are included N. poeticus, N. serotinus, and others.

Mr. HIBBERD then proceeded to demolish his quiarry scheme by admitting that the distinctions between them are imaginary rather than real. It depends from what standpoint we look at the matter. If we go back to the original form, so far as we know it, of the Narcissus, we have no doubt Mr. HIBBERD is more correct in advocating consolidation than others are in supporting multiplicity of types. If, for instance, we consider the way in which the flowers of all

the Narcissi originate—a point overlooked by all the speakers—we shall find Mr. HIBBERD nearer the truth than the others who took part in the discussion.

If we go back to the very early form of the Daffodil—to the Daffodil in its baby state, when it is so young, and its parts so unformed, that none but a practised manipulator and accomplished botanist can hope to see them—though this stage, of course, is preceded by simpler ones still, to which we need not refer here—then we shall find, certainly in some, presumably in all, this state of affairs—six flower-segments without any corona at all, six stamens, and a three-parted ovary, which at this early period is not enclosed within the end of the flower-stalk. Then, as growth goes on, and the several parts become more distinctly mapped out, we find the ovary becoming gradually more and more embedded in the top of the flower-stalk, till at length it becomes completely sunk within it, producing the condition known as the

and in what manner they shall be defined. And in this matter we cannot, as it seems to us, do better than follow Mr. Baker, who has made a special study of the genus for this very purpose, and whose arrangement and definitions were published at length in these columns in 1869, and subsequently reproduced with numerous coloured illustrations by Mr. Bureidge in his book entitled, The Narcissus; its History and Culture.

Practically, Mr. ELWES, in his remarks on this subject, considers as species all those forms which are constant in a wild state in the countries where they grow; and this is as practical a test as we can find, though unfortunately it is, as Mr. ELWES himself admitted, a very insecure one, owing to the natural tendency to vary in all plants more or less, and particularly in those that are subject to cultivation. For it is a curious point, that those species which vary little are unsuited to cultivation, because, as we pointed out last week, not

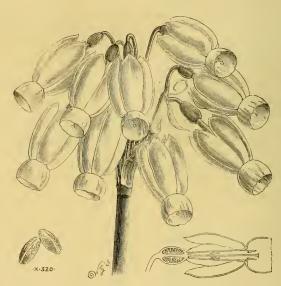

FIG. 87.—NARCISSUS TRIANDRUS VAR. PULCHELLUS. (SEE P. 442.)

inferior ovary and characteristic of the great order of Amaryllidaceæ, of which the group Narcissus forms but one genus.

The crown or cup which forms the most conspicuous feature of the adult flower, even in cases where it is small, is a late outgrowth from the tube of the flower, having little or no genetic importance, but of great physiological significance in relation to the fertilisation of the flower by insect agency. Structurally, then, the cup is of little moment, as it does not exist till a late period in the development of the flower, is not part and parcel of the typical flower, but is, as it were, an after-thought, a superadded outgrowth developed for a particular purpose. No matter, then, what may be the form that is ultimately assumed, we start from a six-parted flower of a regular type, like a Squill, and all Daffodils, all Narcissi, all Corbularias, Ajaxes, Telamonius, and all the rest of them, start in like manner and with this very simple structure. So far, then, Mr. HIBBERD is right. But, for purposes of practical convenience and discrimination we are compelled to adopt subdivisions, and the practical point is to settle how many there shall be

having the power to vary and accommodate themselves to circumstances, they prove rebelious in the cultivator's hands, and die out; while, on the other hand, those endowed with greater powers of adaptation are cultivated with readiness, and vary very widely. Rightly to judge, then, of the value of a species, properly to estimate its limitations, and effectually to circumscribe it for purposes of practical description, the aid of the cultivator must be combined with the observation and tact of the botanist, and the Conference will bave done some good if only it brings home to people's minds this important point, upon which we have been continually insisting since the Gardeners' Chronicle was established forty years ago and more — viz., the necessity for co-operation between the botanist and the cultivator.

Before passing from the subject of classification we must not omit to allude to the clever, energetic speech of Mr. BAKER, who took the point of view of the practical rather than of the speculative botanist, and insisted on the necessity of clear ideas as to the species, which he termed the unit, of the groups of species forming genera, tribes, and orders, in ascending series, and of the races, sub-species, and varieties in descending series, and which, instead of being groups of species or units, are fractions of that unit. Mr. Baker drove his conclusions home by the familiar illustration of the decimal point and the different value to be attached to figures according as the decimal point is placed to the left or to the right of them. All to the left of the decimal point are species or aggregate groups of species, of greater or less value the further you go to the left; all to the right of the point are fractions of species, smaller

of editorial eyes. There is a recognised code and order of precedence known to and acted on by botanists, laid down in books, discussed and re-discussed at congresses and societies, and which has been over and over again treated of at the Royal Horticultural Society and in the pages of the horticultural journals. If the Conference should have the happy result of enforcing uniformity in this matter, much future confusion may be saved, but we own we are not very sanguine.

Closely allied to this question is that of nomenclature, We all know the terrible state

adopted by florists, and not in the manner adopted by botahists."

A supplementary meeting was held on Wednesday to put this resolution into effect, the opportunity of so doing being exceptionally favourable. With the potent aid of Mr. Bakera a list of all the known names, garden and otherwise, of Narcissi, classified according to their botanical position, was framed and discussed at the adjourned meeting, and will shortly be made public. The principal novel feature of this list is the relegation of all the known or supposed hybrid or cross-fertilised forms in a

in proportion as they extend further to the right. Oh! that gardeners would but learn their botanic numeration-table, and act upon it; but they don't, and even after Mr. BAKER'S energetic protest, we heard subsequent speakers mixing up genera, species, families, and the like, with utter disregard of their real meaning. What would be said of one who in ordinary converse mixed up indiscriminately continents, countries, provinces, counties, cities, villages, parishes? And yet that is just what most people do when they talk of plants or animals, and if in the printed page this confusion is not always so apparent the reason must be sought for in the watchfulness

of garden nomenclature—some of us, at least, are familiar with the efforts that have been made to reform it. The course to be adopted is clear enough, it has been codified and recommended repeatedly, but in practice who but professed botanists stick to it? We cannot now afford space—and it ought surely to be unnecessary for us to do so—to explain the simple Linnean code and its method of application; it must suffice now for us to note one practical outcome of the Conference, in the shape of the following resolution:—

"That in the opinion of this Conference garden varieties of Narcissus, whether known hybrids or natural seedlings, should he named or numbered in the manner class by themselves. At present the register takes this shape, subject of course to final revision:—

	Genuine species.	Hybrids of orimany rank
Magnicoronatæ (True Daffodils, ¿	2	۰
Mediocoronatæ (medium cups)	5	6
Parvicoronatæ (small cups)	6	3
	13	9

Of the thirteen, five are practically out of court as garden plants, while, as we have said, in this enumeration no note is taken of the very numerous cross-bred mongrels, which will be dealt with in the revised list under a special heading.

Whether this scheme will be adhered to is another matter, and one we think, with our not inconsiderable experience, extremely doubtful, for others will do—as Mr. BARR confessed he did—what they think right in their own eyes. It is only fair to Mr. BARR—to whom the warmest thanks of Daffodil lovers were very properly tendered—to say that he does not adopt this course till he has consulted other authorities, and, finding them vain, has been compelled to act on his own judgment.

Mr. BARR, indeed, effectively replied to the attack made upon him as to this point by reminding the audience that when he substituted the vernacular for the classical he was abused by one set of folk, while he was vilified by the other when he adopted the converse process. However, the feeling of the meeting was entirely and unanimously in favour of giving vernacular names to what we may for brevity sake call garden varieties. This practice was recommended also by M. KRELAGE, the eminent Dutch horticulturist, who advocated it in an English speech of remarkable force and fluency. Practical man as he is, he further insisted on the necessity for having these names short. He pointed out that the trained eve of the cultivator sees distinctions which elude the vision of the ordinary botanists, and he claimed the right to give such varieties distinct names -garden names, that is; for, said he, if the distinctions prove insufficient, and the variety is worthless, it will surely disappear, while if it prove distinct and good every one will be pleased, And this is good sense, only we need not cumber botanical catalogues with such names, but confine them to the trade lists of the nurserymen. An excellent start in this direction was made on Wednesday, when the whole of the flowers exhibited were renamed in accordance with these principles. The only objection we see to the employment of vernacular names for garden varieties is the difficulty arising from the Babel of nationalities. Dutch, Flemish, Russian, Hungarian nurserymen, on Mr. KRELAGE'S plan, have the right to name their productions, but who will tell us Anglo-Saxons how to write them, or how to pronounce them ?- and how are we, in our turn, to render our Smiths and Llewellyns intelligible and pronounceable by those of other nationalities? A Latin epithet, if not too long, is from this point of view better for all

The other principal points in the discussion related to the mode of doubling of these flowers, to the discovery by Mr. BROCKBANK of seedcapsules of the large double form of Pseudo-Narcissus, to the geographical distribution of the species (a point on which Mr. ELWES brought out some highly interesting and valuable facts), to the mode of culture of certain cannot treat these matters as their importance species and varieties, and to the possible future of the Daffodils. It is obvious that we deserves in one article. We purpose, therefore, reverting to some of them on another occasion. reverting to some of them on another occasion. In the meantime we may safely venture to say that no more useful discussion, nor one of wider general interest, has been held at the Royal Horticultural Society; for if it be said, as it may by cut bono people, that the absolute value of a discussion on Daffodils is slight, we may remind those not over-intelligent folk that the great principles discussed apropos of things of such relatively small economic importance as Daffodils are just the same as those which should regulate the culture, discrimination, and nomenclature, not only of food plants, but of all those which serve in any way to contribute to the welfare of mankind.

— KALANCHOE FARINACEA,—One of Dr. BAY-LEY BALFOUR's discoveries in Socotra, and figured in tab. 1143 of the Gartenflora (1884). It is a succulent plant, about 10 inches in height, with opposite

spoon-shaped fleshy grey leaves and a terminal muchbranched cyme, the slender ultimate branches of which, about three-quarters of an inch in length, bear cylindrical scarlet-red flowers, divided at the border into five shallow ovate acute segments.

PRESENTATION TO MR. J. II, KRELAGE, OF HAARLEM.—The Haardem Society of Wholesale Builb Growers and Florists presented their President, Mr. J. II, KRELAGE, at a recent meeting, at which every firm connected with the Society was represented, with a magnificent centre-piece of silver and glass, bearing a suitable inscription. This testimonial was presented to Mr. KRELAGE in recognition of his efforts to secure the introduction of bulbous plants into Germany, and to promote the action of the Dutch Government in giving its adhesion to the Berne Phylloxera Convention. By these means the Dutch horticultural trade with Germany and other countries most seriously threatened has again been rendered possible.

- ANEMONES .- It is so much the fashion to refer to the large and very beautiful single Poppy Anemones as French, thus leading to the impression that the strain is entirely of French growth. It is true that large quantities of French flowers are sent over here and exhibited, but it is equally true that quite as fine flowers can be, and are, produced in this country, not from any particular Continental strain, but from such as some of our own growers have had in this country for years, and during that time have been carefully improving by selection. At the Bedfoot Seed-grounds a quantity of these very beautiful single Anemones has been in bloom for a long time, and recent sunny weather has brought up a display of flowers that are glorious to behold-so large, finely formed, and richly coloured are they. A curious impression prevails, that none of the Anemones of the coronaria section can equal the rich colouring of the fulgens; but that is a mistake. The truly superb scarlets and crimsons in the Poppy Anemones are beyond compare, and excite the warmest admiration. Whilst very rich in these glowing hues, purples, and almost blues, are, too, in great force, and exceedingly beautiful. Then the whites also are not less lovely; and between these decided hues come a score of others, and not a few blotched and striped flowers, the markings of which beggar description. Truly we can grow glorious Anemones in this country if we will, and it is to be deplored that so much apathy towards one of the grandest of early hardy flowers should result in seeing literally thousands of gardens without one within its borders. Raised from seed sown now, or even later, either in the open ground or in pans, and the seedlings presently dibbled out, the securing of a large stock of plants is simple enough.

- BERBERIS DARWINI. - What a beautiful shrub this is, and how much it would be missed were it to disappear from British gardens. Scarce a better plant could have been selected to bear the name of its discoverer, the most celebrated naturalist of recent times. If Messrs. VEITCH, who introduced the species (through their collector, THOMAS LOBE) from South Chili, had done nothing else towards beautifying our gardens, the introduction of this single species would be enough to earn them the gratitude of the gardening world, in England at any rate. It is somewhat surprising that a plant so widely grown should show so little tendency to sport into distinct varieties. Comparatively little has apparently been done by the hybridiser, and yet the result in one instance has been such that further efforts in this direction might have been expected. B. stenophylla, the result of a cross between the tiny B. empetrifolia and the larger vigorous growing B. Darwini, is certainly a very handsome garden plant, indeed it would be difficult to decide whether it or B. Darwini itself was the most beautiful.

SCHLUMBERGERA LINDENI, E. Morren,—
This is the Massangea Lindeni of ANDRE, in Illustration Horticole, April, 1879. It is a Peruvian Bromeliad,
with arching oblong strap-shaped channelled leaves,
of a greenish-yellow ground colour, marked with fine
transverse sinuous purplish lines approximate at the
base, arranged in bands separated by green intervals
towards the upper end; flowers clustered in the axis
of bracts, the clusters arranged along the sides of
elongated spikes,—Belgique Horticole, tt. x.—xi.
1882

CLIANTHUS PUNICEUS.—In the Isle of Wight, and in some other favoured spots in the British Isles, in the New Zealand "Flower of Glory" flourishes in the open air, and even in gardens round London where the roots are protected—say, by overhanging caves—against superfluous moisture during the winter months, it often braves the English winter, and produces a profusion of its handsome flowers and produces a profusion of its handsome flowers during spring and early summer. As a rafter plant for a cool conservatory there scarcely exists a more desirable plant. It seems somewhat strange that this species, which was discovered by Sir Joseph Banns in the interior of the northern island of New Zealand in 1769, and which is commonly cultivated round the houses of the natives, should never yet have been found truly wild either in that or in any other country.

- PANSIES IN BEDS .- It is surprising bow rapidly plants of Pansies that were put out in beds in autumn are putting up their flowers. open warm and sunny weather has greatly helped them, and, should it last a few days longer, the beds will be aglow with beautiful flowers. It is in early spring that the grower gets the fine yellow and white ground varieties in superb condition if only he culti-vates with care. The beds need now to be gone over, the surface - soil carefully loosened to the depth of I inch or so, and broken up finely, and especially round the plants, then a top-dressing applied of rich soil to the depth of 2 inches, placing it well about the necks of the plants. Then when rains come this will be carried down to the plants, and greatly assist their development, and the leading shoots should be pegged into position, fixing them securely. Without this, where sweeping March winds blow they are in great danger of being broken off or otherwise damaged. A few sprigs of Spruce Fir placed about the bed on the north and east sides will do wonders in affording shelter for the plants when the biting winds come; or effective protection may be provided in other ways, such as placing a low fence of tiffany, &c., around the bed. Any seedlings kept through the winter in cold frames or in store boxes should be planted out, giving them some light sandy soil to root into quickly, and pressing the plants firmly into the ground, securing them against wind at the same time if the position of the beds be at all exposed. It is decidedly best to keep the seedling-bed of the show varieties distinct from the fancy kinds, especially if it is desired to save seed. The disadvantage of growing both classes together is seen in the fact that many seedlings are intermediate between the two, and neither altogether one or the other, and there is a fear that the fine yellow grounds and white grounds with their rich margins are being less cared for than they should be. The bold and fantastic fancy varieties prove very attractive, and there is this point in their favour— that they will endure when the less vigorous show varieties fade away and perish.

—— BEGONIA LUBBERSI.—This is a Brazilian species, described in the Belgique Horticole, t. xiii., 1853. It is an undershrub, with peltate, lanceolate leaves, very oblique at the base, dark green above, mottled with white, the under-surface wine-red. The flowers are in loose panicles, white, each 2—3 inches across, the sepals of the male flowers broadly ovate acute, the petals linear-oblong, much smaller, stamens in tufts; in the female flower are five oblong petals.

--- FRUIT BLOOM,-- Happily after a week of heavy sky and easterly wind a change to brighter weather and softer air came in good time to relieve gardeners of anxiety with respect to the prospects of the bloom on wall trees, early Pears and Plums, and also the bloom itself from the ill-effects of that continuous low temperature, the which, if not so far accompanied by frost, at least was calculated, if much looger endured, to produce infertility. Whilst those timorous gardeners who dreaded frost were somewhat aggravating the evil by covering up the trees, others more confident found it wise to give their trees all possible light and air, so that any slight helps to fertilisation might not be hindered. So far Apricots seem to have set in great abundance, and there will be ample occupation for nimble fingers in thinning should all continue to go well. Peaches and Nectarines, too, are setting fast, the bloom showing size and endurance that is characteristic of healthy fertility. There will be little room this season, if no severer weather comes than we have yet encountered,

to hoast of crops saved by this form of protection or of that. Perhaps we shall by-and-bye have to chronicle of wall fruit, that the present year has been marked by one of the best crops known for many That we have so far had a wonderful season cannot be denied, but still some of our hopeful prospects are due to the beautiful ripening season which preceded the winter and created for us blooming wood and buds in an unwonted degree; indeed, a feature not common, but seen now largely, is the abundance of good healthy bloombuds both on Plums and Pears on the yearling growth, and in some cases the same thing may be seen on Apple trees, though with some kinds we know termical buds on young wood are the chief fruit producers. Another noteworthy feature is the large amount of prospective bloom on Apples in spite of the remarkable heavy crop of last year. On bushes the promise of bloom is of the best, and altogether indications are abundant that only bad weather can prevent the production of a wondrous fruit crop.

- CRANSTON'S NURSERY SICK FUND .- We are pleased to hear that the sick fund established last year by the employes of the Cranston Nursery Com-Hereford, has proved a great success. learn from the balance-sheet before us that the receipts from all sources were £40 12s, 10d. Of this sum £15 14s. 7d. were paid to sick members, £2 13s. were refunded to members on leaving the nursery, and 12s. 9d. were spent in expenses, leaving a balance in hand of £21 12s, 6d. For the information of employes in other establishments who may be inclined to organise a fund of a similar character, and who may be glad to have details, we may state that at the annual meeting, held on March 20, it was resolved, on the recommendation of the committee, having regard to the substantial balance in hand, to increase the weekly allowance from 5s. to 8s. for men, and from 2s. 6d. to 4s. for boys, for the first six weeks of their illness, and half that amount for the next six weeks should their illness extend over so long a period. In case of death the allowance is to be increased from £1 to £2 10s., the contributions to remain as before, viz., 2d. per week for those who are in receipt of Ios. and upwards per week, and 1d. for those receiving less than 10s, per week. These contributions are deducted in advance once to every three weeks out of the employes' wages, and to this arrangement all readily agree. After placing £7 10s. 71d. to the reserve fund a bonus was declared amounting to onehalf the amount of the contributions.

- FRUIT PROSPECTS IN THE MIDLAND DIS-TRICTS .- Should the spring prove favourable to the setting of the blossom, there is at present every prospect of an excellent fruit season. Apricots are flowering most abundantly, with a freedom not observed for years past. Peaches and Nectarines are following suit, and should injurious frost not occur, there should be a rare crop of wall fruit. Plums on walls and in the open are blooming most abundantly, and this seems general all over the country, and especially round London. Morello Cherries are full of bloom-buds, and other Cherries promise to be prolific of blossom also. All the Pears are flowering with remarkable freedom; trees are seen full of clusters of buds, and soon the landscape will be exceedingly gay with blossom. The Apples are full of blossom. In the case of a kitchen garden where there is a very extensive collection of bush trees as well as extensive orchards the branches are laden with flower-buds. Whether this luxuriant bloom is characteristic generally of the country remains to be seen. In regard to bush fruits it is too early to speak at present, but old gardeners say there will be heavy crops of fruit if the season prove favourable.

— THE NATIONAL ROSE SHOW: SALISBURY MEETING.—We are informed that it has been decided by the committee to give, in addition to the money prizes, two Silver Cups, value £5 each, in the premier nurserymen's and amateurs' classes. Liberal prizes are also oftered to local exhibitors residing within a radius of 10 miles of the city, as well as to others who reside outside of this and within 25 miles.

WREATHS,—There is no diminution in the number of wreaths, crosses, and other floral devices employed in funeral decorations, and the fashion rather grows than contracts. With this growth also may now be seen a tendency to break away from

the use of flowers that are white in colour or nearly so. Of course, as with the marriage rites, so with those of the grave side, those flowers which, from their snowy whiteness, are esteemed emblematic of purity and sweetness, will ever also be most largely in request. Still, flowers in season, such as Violets, Primroses, Daffodils, Camellias, and many others, give diverse and not unsuitable hues, and specially they help to give life and colour to the monotony consequent upon the very abundant use of pale blossoms. It is perhaps strange that, having regard to the common use of wreaths and other simple designs in flowers, holders of a kind that might facilitate construction, and also help to preserve the flowers, have not been introduced. Those made of zinc or tin, and painted externally, might somewhat resemble narrow troughs, the stems of the flowers and other dressing being fixed in these troughs with the aid of damp moss; there should be holes on either side, through which fine wire, or pins, or twine, could be run, and thus simply but effectively help the uninitiated to produce floral designs far more pleasing than is commonly seen. Perhaps the loading of coffins with a pile of floral mementos of love or good feeling is hardly in keeping with the solemnity associated with funeral obsequies. Any mere dis-play on such occasions is sadly out of keeping with the circumstances. It is true the flower growers profit by this fashion, but the burlesque of a beautiful custom may soon lead to its extinction.

we have received a few flowers of Gold-laced Polyanthuses, a very good strain of border flowers which seems to improve in quality year by year. In many of the blooms before us the lacing is pure and well defined, the hody colours, black and red, solid and good, and the centres very bright.

- SINGLE-FLOWERED CAMELLIAS AT KEW. -It is probably in but very few gardens that any of the single or semi-double Camellias are now grown. That they are highly ornamental plants—and, in the opinion of some ardent flower lovers, superior in beauty and general attractiveness to the more popular but more formal double forms-is incontestable. Some fine bushes planted-out in the beds in the Winter Garden at Kew, are now extremely handsome "I wonder what people want with double Camellias," was the remark of a practical horticulturist and a grower of Camellias into the bargain, on seeing the bushes just mentioned some time ago. long account of the early history and introduction of these almost forgotten varieties is given in vol. vii. of the Transactions of the Horticultural Society.

--- ANDROMEDA FLORIBUNDA.-There are not a few subjects coming under the denomination of common plants of great usefulness that, owing to some reason or the other, are not nearly so widely grown as they deserve to be. One of these is Audromeda floribunda. Quite large plantations of it can be seen io Messrs. VEITCH & SON'S Combe Wood Nursery, lying in the hollow formed by a portion of the nursery, and flowering abundantly-nice little bushes covered with panicles of white flowers. In growth it forms a dense leafy bush, spreading laterally more than upwards; and it is attractive at once in its flowers, its foliage, and its habit of growth. It may with truth be said to succeed best in a peaty soil, but it is not fastidious in this respect, and will do well in a fibry loam mixed with leaf-mould. In how many of the villa gardens that are daily being laid out round London will you find Andromeda floribunda planted? In but few, unfortunately; and really it would appear as if the refuse of nurseries was quite good enough for such places. This Andromeda is now regarded as being perfectly hardy, but in exposed places it is best to afford it any shelter in the way of buildings, other shrubs, &c., that can be made available for the

—— SENECIOS.—There is no doubt but that seedsmen would be found bearing an almost unanimous testimony to the fact that the Jacobeas that were warmly welcomed in gardens many years ago are in but little demand. More's the pity, for they are very pretty and aseful. They were unfortunately overborne by the bedding-out epidemic, and with many other good and useful things they had to retire into obscurity. Some have already come to the fore once more, and others are in course of doing so. The varieties

grouped under the head of S. elegans are of various shades, all double-flowered, and growing to a height of 15 inches or so, and they can be so easily raised from seeds, all that is required being that they be sown early in a moderate heat, and grown on liberally with care, hardened off, and bedded out in the proper time. Small beds of one colour, or beds of mixed colours, are equally attractive, and they might be made a groundwork for some taller plant rising above them. Some old gardeners used to grow specimens in pots for the decoration of their greenhouse, and make very nice examples of them. There is now a dwarf section, several inches shorter than the common type, that are better adapted for small beds than the taller varieties. But both have their uses, and are well worthy of a place in the garden.

- Pyrus sinensis .- Although it cannot claim to be in any way of value from a strictly utilitarian standpoint, the Sand Pear is certainly an ornamental tree, worthy of more general cultivation than is at present accorded to it. The rich bronzy-red of the young shoots and leaves in spring render this conspicuous amongst all the other members of the genus. A tree of P. sinensis is now in flower in the Kew Arboretum; indeed, it is the first of all the species to Following closely upon it comes open its blossoms. the narrow silky white-leaved P. salicifolia, a neat habited and small tree, which is thoroughly at home in the ordinary shrubbery. An illustration of the fruits and foliage of P. sinensis, drawn from specimens sent us from the Isleworth nurseries of Messrs. C. LEE & SON, appeared in our columns for 1875, vol. iv., p. 457.

- THE WEATHER,-General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending March 31, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: -The weather has been very cloudy or dull in nearly all parts of the kingdom. Very little rain has, however, fallen over Scotland and the greater part of England, but in Ireland and the south-west of England some rather heavy falls of rain or sleet occurred towards the end of the period. The temperature has been below the mean in all districts except "Scotland, N.," the deficit ranging from 2° to 4°. The maxima, which were recorded on the 25th in Ireland and Scotland, and on the 31st at most of the English stations, varied from 50° in "England, N.E.," to 55° in "Scotland E.," and "England, E." The minima, which were registered on different days in the various parts of the country, ran from 26° in "England, E.," and 27° in "England, N.W.," to 32° in "England, S.W.," and 38° in the "Channel Islands." The rainfall has been slightly in excess of or about equal to the mean in Ireland and the south-west or Engenon, elsewhere, Bright sunshine shows an increase in duration in "Scotland, N.," but a considerable decrease in all other places. The percentages ranged from 7 in Ireland and the south-west of England, but less in all other places. The percentages raoged from 7 in "England, N.W.," and 9 in "England, N.E.," and "England, S.," to 31 in the "Channel Islands," and 35 in "Scotland, N." Depressions observed.— During nearly the whole of this period an area of high pressure has existed over Scandinavia, the North Sea, and the more northern parts of our islands, while the barometer has been relatively low in the south and south-west. Light or moderate breezes from between south-east and north-east, have consequently been general over England and Ireland, and southerly breezes the north of Scotland. Towards the close of the week, however, a depression appeared off our western coasts, the high pressure area at the same time receding north-eastward, so that the wind in our islands shifted to the southward and increased considerably in force. At some of our extreme western and northern stations a slight gale was experienced.

— GARDENING APPOINTMENTS. — Mr. II. MARKHAM, for the last three years Foreman in Longford Castle Gardens, Salisbury, as Gardener to Viscount FALMOUTH, Mereworth Castle, Maidstone, in succession to Mr. EVANS, who leaves to manage Sir HERNY HAWLEY'S gardens at Leybourne Grange, near Maidstone.—Mr. JOHN WYKE, formerly Gardener to J. P. KIDSTON, Esq., Barnet, as Gardener to Captain ALCOCK, Henby Grove, Westbury-on-Trym, Bristol.—Mr. J. ANNING, for upwards of five years Fruit Foreman at The Poles, Ware, as Gardener to W. S. BROWY, Esq., Digswell, Welwyn.

PARADE BEDS OF HYACINTHS.

In his Florists' Directory (1792) John Maddock begins his introduction with the following words:— "The finer flowers more particularly demanding our attention are the Hyacinth, the Tulip, the Ranunculus, the Anemone, the Auricula, the Carnation, the Pink, and the Polyaothus." This was the general opinion of the florists of the former century; so, for example, George Voorhelm, in his Treatise on the Hyacinth (the English edition was published in 1753), names as the favourites of the day the Hyacinth, the Tulip, the Auricula, the Carnation, the Ranunculus, and the Anemone. In the course of time many other flowers have become favourites for a shorter or longer period; some of the old flowers have been temporarily neglected, but with all these variations of taste the bulb growers of Haarlem and its vicinity have kept in honour the oldfashioned flowers, and yet at this moment their register is, at least partially, the same as it was in Voorhelm and Maddock's time, a century ago and hefore. Maddock's time, a century ago and before. At that time they say—"The fine flowers more par-ticularly demanding our attention are the Hyacinth and the Tulip." The fact that these flowers, being among the oldest introduced into European flower gardens, are always in fashion, and that their culture on an extensive scale is possible, gives the best proof how, by the exertions of the Dutch growers, these plants have been perpetuated in the lapse of time, so that in spite of the crowning of so many other new fine and elegant florists' flowers which have been introduced and cultivated since, they still form objects of interest and trade.

Although the way to treat these plants has taken in many instances a different direction from that which used to be the case in the eighteenth century, there are some good things which, temporarily neglected, are again found acceptable. return to what our forefathers have admired, so it has been the case with the parade beds of Hyacinths, of which we subjoin a figure (fig. 89). We find them already described by Maddock, and previously by George Voorhelm and the Marquis de Saint Simon, in 1768. They were at that time more moderately arranged than at present, but the general system was the same as now-a-days. In Holland such parade beds were popular, and in the first part of the present century they were found in every first-rate nursery at Haarlem. The last firm who used to plant them annually was that of Messrs. Krelage, who used to do so perhaps twenty years ago. Then the spring shows in Holland, where large collections of Hyacinths were required, gave another direction to the taste, and caused the temporary abandonment of parade heds. Five years ago some bulb growers combined to again arrange such a parade bed, and Mr. Krelage at the same time opened his heds at the Kleine Houtrey. This was in 1880, and since that time the parade beds have been planted and admired every year.

They are covered when in bloom by a large tent, which is in the middle about 14 feet high, at the sides 8 feet, and at the ground 32 feet wide. The length of the tent is 82 feet, that of the entrance pavilion 14 feet — together 96 feet. The length of the beds wherein the Hyacinths are planted in October is 50 feet; they are 4 feet broad, and about 6 inches above the level of the ground. Wooden frames are placed round the beds, I foot high, which can be made higher if necessary by a second frame of 5 inches high. The back part of these frames remains to give a good background for the examination of the Hyacinths. When the beds are in bloom the covering of the tent is rolled up during the night, and then the frames are put around the beds, and covered with mats.

In each bed there are planted 102 rows of Hyacinths, six bulbs in each row, in the former bed planted only with single blooming sorts of the medium season. In every row only one variety is planted, and the arrangement is such that, when in flower, the back rows show above the front ones, and that the whole bed forms a regular curved line, of which the highest point is in the middle. The succession of colour in the arrangement is red, white, and blue, but among the reds are found all gradations of that colour, as well as the shades of violet, mauve, and purple. With the whites are found the rosy-whites, yellows, and orange; and with the hlues all the shades of that colour, from the lightest lilac to the darkest black. It is quite obvious that this row-bed,

as it ought to be called, by translating the Dutch term, makes a splendid effect, and is the admiration of every visitor, especially as the plants are carefully arranged so as to flower all at the same time.

The other bed, which may be called the dressed bed—again using the expression popular in Holland—is more the delight of the true connisteur. Here the same number of bulbs is planted, but in pairs of the same variety, one next to the other, so that in the two neighbouring rows there are twelve plants in six varieties. Also here the same succession of colours is observed as in the other bed; but, by a different arrangement, the double lines of red, white, and blue, show themselves in a sloping direction, as is well represented in the figure. In this bed are planted the later single varieties as well as the best double ones. This bed is equally interesting, because here are to be found, besides many novelties of the establishment anot yet in the trade, all those new sorts which have been lately introduced for the first time, and others for trial, as far as it can be expected that they will do honour to the collections.

As in general no variety is planted twice in the beds, and the row bed containing all varieties different from those in the other, visitors can see in these heds at once about 400 of the hest varieties known, among them many at present not in general cultivation have such merits as will ensure them becoming favourites in future times. It is an extended field for study for the large number of Hyacinth growers of the neighbourhood of Haarlem, who, as well as the amateurs of fine flowers in general, visit regularly this flower show at the time it is opened, which is for foreigners every day from 10 to 12 o'clock in the forenoon, and from 2 to 4 o'clock in the afternoon, year the show, which is usually somewhat later than the general flowering in the open fields, will be opened during the whole month of April, and the best period for visiting it will probably be between April 6 and 20. For those who visit Holland this month it will be well worth while to pay a visit to these beds. A catalogue is published and obtainable by the visitors, giving the names of the Hyacinths planted in the beds, with the numbers, so as easily to find that of every variety. Such parade heds of Hyacinths are to be found in no other establishment, and the whole arrangement is more splendid than has been seen before under similar circumstances.

QUERCUS ILEX SERRATUS AND Q. I. AUSTRIACA SEMPERVIRENS.—These two beautiful varieties of a favourite tree, and one that does very well in the London district, look in beautiful health and vigour at Messrs. C. Lee's nursery at Isleworth. In the strong loam there the Q. Ilex seems quite at home, as they used to be at a distance yet nearer to town, at Messrs. Osborne's, at Fulham, the many trees once to be found there existing no longer. Both the abovenamed varieties have much larger foliage than the commoner Q. Ilex, but which, being hard and of considerable substance, remains uninjured by severe winds. Q. austriaca sempervirens possesses foliage of a very pleasing shade of green, and is rather the handsomer plant. M.

GREY-FOLIAGED SHRUBS AND TREES.—In the article on these (p. 411), the, to my mind, best of all silvery-greys has been omitted, Salix sericea, naturally grown, is a prostrate shrub; grafted on a stem it forms a distinct, irregular head. The medium-sized leaves are quite silvery. It comes into leaf early, and remains late in beauty. Planted in special positions—in rockwork, for instance—it is singularly beautiful, and associated with ordinary evergreen and other trees and shrubs, effects are produced which are quite unique. Pyrus salicifolia is also a first-rate silvery-grey-leaved small tree, much whiter than either of the subjects mentioned in the article in question, and is, moreover, when grafted high, one of the most graceful and distinct of weeping trees. T. Smith, Neury.

Home Correspondence.

Rhubarbs.—Following up your admirable summary of the Rhubarbs and their classification as growing now at Chiswick, I would like leave to take growing now at Uniswick, I would like leave to take exception to the appellation Johnston's St. Martin's being added to that of Linnæus, inasmuch as the latter, and doubtless the only correct name, was given to this Rhubarb I hardly know how many years since. I admit it is due to the firm whose name is associated with the St. Martin's that no stock seems to have gone to Chiswick from them, and if they feel aggreeved they have it in their power to remedy the error. If the St. Martin's Rhubarb really is distinct error. If the St. Martin's Rhubarb really is distinct from Linnaus we cannot know it too soon. There is another Rhubarb that has a reputation, but still has another Rhubarb that has a Paragon. It would not got to Chiswick-I mean Paragon. It would have added much interest to the collection shown at South Kensington the other day could that kind have been included. The very peculiar colouring of the Albert noted in the hollow sides of the stems should always mark that kind where any doubt exists, whilst anways mark that kind where any doubt exists, whilst the red hue of the back of the stems runs over and colours the edges of the inside; the hollow is of a beautiful clear pale green, very distinctly defined; the stems in each case in this kind were of even and moderate length, and of even size. In the stems of Linnaus, whilst the inner sides were less hollow, the Linnaeus, whilst the inner sides were less hollow, the colouring was more confused and irregular, and there was just a slight increase in length and diameter over those of the Albert. In other respects it was not a specially attractive form. Certainly of the dozen assumed kinds shown all were too exactly alike to admit of any doubt. But if in colouring Hawke's Champagne was a great beat upon either of the preceding kinds, so also was it materially longer than the stems of the Albert, so that the claim of the latter to be regarded as the explicit seems division. the stems of the Albert, so that the claim of the latter to be regarded as the earliest seems dubious, Still further, the peculiar characteristic of the Champagne is that the insides of the stems are not hollow in any sense, hut are distinctly flat, so that, given sticks of even size, that of the Champagne must weigh much heavier than that of any kind in which the stems are grooved or hollow. Judging by the samples staged at Kensington it did seem strange that Baldney's Scarlet Defiance (Osborn) should not have received the same award which fell to Hawke's Champagne (Bunyard), inasmuch as the Defiance was even deeper in colour than the latter, and apparently in even deeper in colour than the latter, and apparently in all other respects as handsome and good. Of course, there may be points in growth not known to the public, but only to the Fruit Committee; still, if I wanted a deep rich-coloured Rhubarb, I should prefer Defiance to others. Crimson Perfection (Carter) came near to Defiance, but lacked size; I observed, how-ever, one characteristic of the leaves of this kind that ever, one characteristic of the leaves of this kind that was seen only besides in those of Buck's Early Red—that they were somewhat glaucous, or presented a whitish of rosted appearance. That peculiarity may have been due to the youth of the leaves, or it may be due to sort. If the latter, then I think the two kinds named must be identical. In the case of the colouring matter in the stems of Scarlet Defance, I noted that it ran more densely into the ribs of the leaves than was seen in any other kind. Those fine leaves than was seen in any other kind. Those fine leaves than was seen in its useful condition beau. leaves than was seen in any other kind. Those fine late kinds, Victoria, in its useful condition beamtiful in the richness of its colouring, and Stott's Monarch, were too late to admit of useful comparison. Perhaps Mr. Barron will give us another Rhubarb exhibition later on, and it would be not less interesting were true samples of Johnston's St. Martin's—if those at Chiswick be not the real Simon Pure—to be sent up also by the raiser, and also samples of Paragon, and, indeed, of any assumed distinct kinds. There are many locally named kinds of Rhubarb about the country, samples of which it would be interesting to see also. A. D.

Rhubarb Paragon.—Mr. J. E. Ewing, comparing the earliness of different varieties of Rhubarb at p. 372, says that Paragon and Stott's Monarch were only one year planted, and all the others two years; this accounts for the lateness of Paragon with him. I planted a plot of it last year, and it is only now (March 27) just ready to pull, whilst from old-established plants I have been pulling in quantity for some time. The one-year planted is quite a fortnight later. I send a few sticks of Paragon pulled from a 3-acre field in a cold bigh situation without the slightest protection or even a hedge to shelter it, and here in this cold part of Yorkshire everything is much later than in the South. Charles Kershaw, Slead Syke Nurseries, Brighouse. [No exception can be taken to the specimens received, which were as large as any naturally grown Rhubarbs in the market. Ed.]

Spawning Mushroom Beds, — When this is done some gardeners let the workman make holes in the Mushroom bed with a dibber or a pointed stick. This is a very faulty way of doing a simple act, and is frequently answerable for poor crops, or none at all, as the case may be—a state of things which people

are only too ready to lay at the door of the spawn maker or purveyor, whoever he may be. If a hole is made round, and has besides a funnel-shaped bottom, it is quite sure a rectangular plug will not fit it, and as spawn bricks are usually broken up into suchlike morsels, there must be several portions of each that do not come in contact with the manure, and therefore as the mycelium in those parts has nothing in the shape of medium to which it can become attached it perishes, and that possibly the more readily as such air spaces in the holes are filled with ammoniacal seam. Only spawn in direct contact can grow, so that a hole scooped out with a trowel or the hand is a much better receptacle for the spawn. The depth of manure over the lump may vary from 2 to 4 inches, and this material should be made quite firm over it. M.

Anemones.—These are among the most valuable of our hardy spring flowers, as they are almost the first out, the varieties of A. coronaria being very early, especially if sown every year, which is a good way of managing and treating them, as they seed freely, and germinate readily at this season if the soil for the

water, when if stood anywhere in a light, warm room they will expand and last a long time in perfection. Some I have now before me have been in a glass over a fortnight and are still fresh, and look as if they would remain so several days yet to come. A. fulgens is a grand species and should be in every border, as its brilliant scarlet flowers, with their full middles, are very showy and striking, and look quite dazzling when the sun is upon them. Where the soil is light, dry, and suitable, it is best to leave the roots in the ground, but in cases of a reverse nature it is safer to take them up after the tops die away and bury them in damp sand, in which they keep plump till the time arrives for planting again. 3. S.

Our Native Ferns,—Mr. Druery's letter in your issue of March 29 to some extent obviates the necessity for my replying to Mr. Webster's communication which is published in same column. I feel also that Mr. Webster's theme, "price of Ferns," is a somewhat delicate subject for a nurseryman to touch upon in the columns of a public journal. I will, therefore, content myself with saying that Mr. Webster's com-

Webster's motive in writing is an excellent and laudable one, and if he can only persuade the public to take an interest in British Ferns he may depend upon it that "cost" will be no obstacle to their being enjoyed by the poorest as well as the wealthy. F. W. Stansfield, Sate, Cheshire.

Strawberry Marguerite.—In your last issue you notice this old Strawberry as being well adapted for early forcing. I fully endorse your remarks with respect to its merits for that purpose, having used it for my first batch for many years, generally gathering fruit from it the last week in February. It is a first-class cropper, of first size and good quality. Black Prince and Vicometesse Héricart de Thury—good Strawberries that they are—do not come near it in my estimation, and cannot be grown where fine fruit is required. I have gathered as fine fruit from Marguerite in February as any for the season indoors or out. One drawback to it is that it is not a good packer, but for home consumption it is not surpassed for early lorcing. I make use of it also for the first supply outside, and in the neighbourhood it is grown

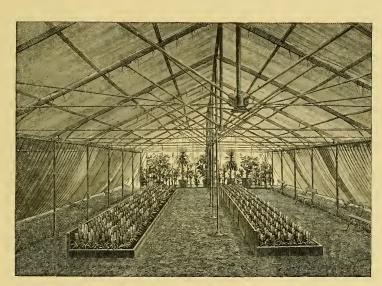

Fig. 89.—Show beds of hyacinths at messes. E. H. Krelage & son's nursery, haarlem. (see p. 454)

bed is light, and the situation chosen to grow them is warm and sunny, as it should be, as then they bloom the greater part of the winter. A few years ago we had a border of plants begin to flower in October, and he heads of the flowers were at times standing quite thick, peeping up through the snow, against which he scarlet and blue petals, when the sun drew them open, formed a great contrast. This border was a sloping one, facing south-east, with a high wall at the back, and the quantity of blooms we got from it was something enormous. This freedom and vigour with the plants does not seem to last after the first season, and the best plan is to dig up and sow gain, but in another place, where the ground should be prepared by working in plenty of rotten manure, leafmould and sand, and after being raked level the seed may be sown in drills I foot or so apart, and when the plants are up they should be singled out and left about the same distance asunder. Some sow thickly on a bed and transplant, but the removal of the plants, even if done very carefully, causes a check, from which they are some little time in recovering. What makes Anemones so valuable, in addition to their hardiness and decorative beauty outdoors, is their adaptability for cutting, as the flowers may be taken from the plants at nearly stage and put in

parison of the price of bardy Ferns with those of herbaceous and alpine plants is scarcely a fair one, considering the difference in their respective capability of propagation. Any ordinary Saxiftage or other free growing alpine, planted in suitable soil, may be easily divided into a dozen plants during one season, but there are few Ferns which do more than double their "crowns" during one season, and frequently a grower may have to wait for many years before he gets a single division. Again, in the case of seedlings, the patience, skill, and care required in the raising of Ferns is nut of all proportion to that required by the majority of herbaceous and alpine plants. Moreover, Ferns, to keep them always bright and fresh, require a certain amount of glass or other shelter which alpines do not. In place of Mr. Webster's example of Trichomanes radicaos as a "popular" Fern I would mention Adiantum cuneatum. I think I am quite within the mark in saying that for one plant of the former sold in the United Kingdom a thousand of the latter are sold. The consequence is that the "Maidenhair" is sold in the markets at the lowest rate at which it can possibly be produced, the grower knowing that every plant is sure to sell, and that consequently there is no risk of the stock being left upon his hands. I ne conclusion I am sure Mr.

by the acre by the market gardeners; being the earliest in the market it, of course, fetches the best price for the season. We have it opening its flowers by the hundred at the present time on a south border. Owing to its early blooming period it is often subjected to the cold changes of the weather, which occurse, very much deforms the fruit, otherwise it has a very handsome conical shape. Our early beds are well mulched with half-decayed manure, and wites are stretched horizontally about 18 inches from the plants, on which a cloth is placed at night as a protection from the early spring frosts, and which will repay us for the trouble. D. C. Powell, Powderham Castle, Devon.

Magnolia conspicus var. Soulangeana,—This beautiful early spring flowering shrub does not seem to be much grown. Why is this? There can scarcely be a grander sight in a garden in early spring than an established plant carrying some hundreds of its creamywhite flowers tinged with purple, that would worthily hold their own in an epergne or vase amongst the most choice flowers of our stoves or greenhouses. It is perfectly hardy, but flowering as it does so early in the season it requires protection from frost when in bloom. When space can be spared to grow it on a south

wall it will flower profusely, and can be more easily protected than when grown as a bush. Alex. Miller, Rood Ashton Gardens, Wilts.

Old-fashioned Flowers, - Flower Gentle is Amaranthus caudatus, and the name is also given to Amaranthus in general; Molly is Allium, Double Velvet Rose is Rosa holosericea flore-pleno, Virginian Silk is Periploca, Virgin Rose is Rosa alpina, Melan-choly Gentleman is Hesperis tristis, Garden Patience choly Gentleman is Hesperis tristis, Garden Patience is Rumex patienties, Monk's Rhubarb is Rumex alpinus, &c. Can Marble Rose be identical with Marble Flower? if so, it would be a form of Papaver somniferum. For the meaning of such old names may be consulted Nemnisch's Allgemeiner Polyglotten Lexicon der Naturgeschicht, Hamburg, 1793; Priot On the Popular Names of British Plants, 2d ed., London, 1870; Britten and Holland A Dictionary of English Plant Names (English Dialect Society, ser. c.), London, 1878, &c. J. H. Krelage, Haarlem, March 24.

Myosotis dissitiflora alba .- What I stated about Myosous dissilinora aira,—what is sacca anount bis plant at p. 316 appears to have amused "A, D.," who states that a sport appeared on an old plant about four years since with him and some others at about the same time. I was quite aware of this long ago from other correspondence, but at that time I had already a stock in hand both of seeds and plants, which from the first ware a distinct white in entire from the first were a distinct white in which from the first were a distinct white in entire plants that I grew from seed. This I mentioned in the Gardeners' Chronicle, at the same time asking the question if any one were in possession of a true white variety of disstiflora; if not, I should claim to be the raiser of that variety. To this no one replied; bad they have done so, it would have placed me on a different footing. From my stock seed was distributed. Will "A. D." say this is not being raised at all? Some time after Mr. Fish and Mr. Cannell, and others I knew, thought they had the same variety; the two former bad blooms from mine to compare, but neither came to the front, so I expect it was not the same. As I knew long ago, there are plenty of other white came to the front, so I expect it was not the same, As I knew long ago, there are plenty of other white kinds, so I thought it was not dissitifiora. I may state that I have this season a sport of quite a different kind on part of a plant of dissitifiora alba. The flowers are blue with white stripes, like a star. If I get seed from this which retains that character will that be raising a new variety or not? W. Divers, March 25. [Yes, provided no one has done it before, as they have done in the case of on allied species, ED.]

The Weather and Fruit Buds,-The Weather and Fruit Buds,—The coid north-easterly winds have greatly assisted in retarding the orening of the flower-buds. The Plum, which is grown extensively in this neighbourhood by the market gardeners, was fast assuming a snowy appearance, and I fear that those expanded have suffered much, as the wind rose nearly to a gale. Those buds which remained closely encased in their scales were remarked from opening and we true consent. prevented from opening, and we trust are preserved for weather more congenial for fructification to take for weather more congenial for fructification to take place, and that we may once more have a good crop, which has not been the case for many seasons. Early Cherries, Peaches and Nectarines, and Pears, Gooseberries and Currants, are now opening fast, the propects being most promising. Though the Apple crop was so great last year, there is every indication at present on most trees that we may have a good one this year if the weather, upon which so much depends, proves favourable. D. C. Powell.

Setting Peach Blossoms: Bees and their Relations to Fruits and Flowering Plants,—Your correspondent, Mr. J. Sheppard, has, I think, been wanting in respect to my friends the honey-bee. been wanting in respect to my friends the honey-bee, I should not care to place a bive of bees in a Peach-house; it would be, without doubt, good for the Peach blossom, but bad for the bees. It is generally admitted that bees play a very important part in the fructification of our fruit blossoms, for the special reason that many of them are protognous, that is, the stigma comes to maturity before the authers. Windfructified or anemophilous flowers are, as a rule, secantless, honeyless, and inconspicuous. I question much if the nectar was placed in the blossoms of flowers to nourisb the embryo fruit. Flowers that require the aid of insects must invite their visits, hence require the aid of insects must invite their visits, hence nectar—to be converted into boney—is offered, and the sweet perfume and bright colours of the flowers attract them, Regarding bees as only robbers obeying the laws of Nature and their own instincts to ling the laws of Nature and their own instincts to live is, to say the least, a very narrow-minded one.

"J. S." also grudges the pollen they take home; there is of this generally enough and to spare. Nature has providentially given breadstuffs with a liberal hand, and in many forms to suit all sorts and conditions of the animal creation.

"J. S." has made a misther Beas do not read-commentative hash made a mistake. Bees do not and cannot make comb from pollen—that has been proved from the time of Huber downwards; and I should have thought that educated gardeners knew better than that. From the time of Aristotle it has been noticed that a bee in gathering pollen confines herself to

the kind of blossom on which she begins, although the kind of blossom on which she begins, although from the same hive different bees may be gathering pollen from different flowers; for illustration, say at the present season, one may be gathering from Peach blossoms, another from the Wallflower, another from white Arabis. From this fact we see why the bees cause no intercrossing of species of plants; they only intermix the pollen of different plants of the same species. The Creator has stamped the seal of His infinity on all His works, so that it is inpossible, even in the minutest, "by searching to find out the Almighty to perfection." North Norfolk.

Hyacinthus orientalis var. Single Red Charles Hyacinthus orientalis var, Single Red Charles Dickens (the single red sport reverting to the original blue variety).—The single blue Hyacinth Charles Dickens is one of those varieties generally known and appreciated. It is cultivated in Holland on the largest scale, and not only tens of thousands, but hundreds of thousands of bulbs are sold anoually to foreign buyers. As is generally known in Holland, occasionally a single plant of Hyacinth will change its colour, although grown in the same way as others—a form of "atavism," or reversion to the colour of one of the parents, from which the variety was raised from seed. The usual alteration in colour, although others occur, is from blue to in colour, although others occur, is from blue to white or red. So among the plants of the blue variety Charles Dickens, plants here and there have been found which gradually or at once become red, and to this red variation, as is the custom in such instances generally—and a good custom, too—the same name is given as to the original variety, but qualified by a statement of the new colour—thus, "Single Red Charles Dickens." However, as this red sport of the blue Charles Dickens was found at the same time in more than one good name of the same time. the blue Charles Dickens was found at the same time in more than one garden, several different stocks of the single red Charles Dickens were grown and multiplied at the same time, the form and colour of the flowers of all of them being the same. After a time it became evident that the constancy of colour was different. In my nursery collection I possess these different stocks. There are among them some which have never changed, and of which all the offspring keep the pure red colour. But there is one among them which proves changeable, and in which some of the blooms are half-red, half-blue. Such variation was observed perhaps only in one bulb out of a hundred. It seems that these variations do not become fixed, as the balf-blue, balf-red flowers are sometimes totally red in the following year. For the future such specimens [?] will be cultivated separately for some years, to ascertain what their future behaviour may be, F. H. Kyelage, Haarlem, March 29, [The specimen was shown at the Royal Horticultural Society on Tuesday last, Ed.] Society on Tuesday last. ED.]

Asparagus Kale.-Of all the Kales, this, in my opinion, is the very best, as, besides being good in colour, it is of a hardy constitution, and delicious in flavour it is of a hardy constitution, and delicious in flavour when cooked. Besides these qualities, the habit of the plant is dwarf and branching, and therefore by careful picking of the sproats, when they are fit, the stalks continue to yield a long uninterrupted succession. To have this Kale strong, seed should be sown thinly at once in a well-prepared bed, and the plants pricked or planted out 2 feet apart in deep-dug or trenched land that has been heavily manured, as, like all the Brassica tribe, they are fond of good living, and if they get this it is surprising what a difference there is in the quality of the sprouts over those gathered from plants that are starved, the latter of which have more fibre, and are never so tender and which have more fibre, and are never so tender and

Potatos,—The following memoranda respecting some new Potatos may at this season of the year perhaps be of some interest to some of your readers. In the spring of 1882, 1 lb. each of the following varieties of Potatos was obtained, viz., Adirondack, Late Beauty of Hebron, Queen of the Valley, and White Elephant, and planted on April 24, in light loamy soil which for some years previously had been highly cultivated and manured with farmyard muck: the rows were placed 2½ feet, and the sets about 1 foot rows were placed 2½ feet, and the sets about 1 foot apart. The crop was not lifted till autumn, long after the tops had died down:—

1b. of Adirondack, cut into 35 sets, produced 5 stones 12 lb.
1b. of Late Beauty of Hebroo, cut into 55 sets, produced 6 stones a lb.
1b. of Queen of the Valley, cut into 34 sets, produced 3 stones 12/5 lb.
1b. of White Elephaat, less 1 tuber, cut into 33 sets, produced 4 stones 3 lb.

The one tuber taken from the 1 lb. of White Elephant was on April 8 cut into sixteen small sets, each set having a single eye, and placed in a greenhouse, each set in a separate thumb-pot. At the end of April these had made shoots from which sixteen cuttings were taken and each cutting inserted separately in a thumb-pot; thirteen of these grew, and were when well-rooted planted-out, on June 1. The sixteen sets were turned out of the pots into the open ground on May 4, and at lifting time produced 1 stone 13 lb. The thirteen cuttings planted out on June 1 grew fast, and made fine healthy vigorous tops, but partly on The one tuber taken from the 1 lb. of White Elephant

account of damage to the haulm when in a tender account of damage to the haulm when in a tender condition from quick growth received from high wind, and partly from disease, these turned out a failure. By the above trial Late Beauty of Hebron not only proved to be the most productive of the four sorts, but while the other three were of good quality when tested on the table, this kind was in every way super-excellent. According to my experience of it there is no Potato in existence of superior quality, and it is among the most productive. In 1833 four more single pounds were procured for trial, with results as follows:—

Brownell's Best, 1 lb. miaus 1 tuber, cut into 38 sets, produced

So far my experiments with Potatos in light, dry, but So far my experiments with Potatos in light, dry, but highly cultivated soil, tend to show that as improvement in Potatos goes oo, the whole crop of tubers may in future (if not now) be consumed by men and animals, with the exception only of a small quantity of peelings, which will be all that will be necessary to reserve for seed purposes. I am also rather inclined to consider that peelings from large, well-formed tubers are superior for seed purposes to entire but under-sized tubers. That much-needed personage, the horticultural chemist, must be much more freunder-sized tubers. That much-needed personage, the horticultural chemist, must be much more frequently before the public ere we are fully able to judge which is really "all round" the best Potato. Surely there is a great demand for horticultural analytical chemists; i fear, however, that the demand is to a great extent latent at present; perhaps when it wakes into life an adequate supply will be forthcoming. J. E. Ewing, Eaton, Norwich.

Sprouting Broccoli.—Sprouting Broccoli are not half so much grown as they deserve to be, as there is nothing in the whole range of vegetables that affords so many dishes from the one plant, for when well grown the yield is something enormous, and one may pick and come again and again to the same plant and still find the sprouts pushing out in spite of the plucking or weather; and its habit of turning induring the winter or very early spring makes it doubly value. the winter or very early spring makes it doubly valu-able, as then green vegetables are generally scarce and dear to the consumer. Like the Asparagus Kale, Sprouting Broccoli should be sown at once, and in the same way, but instead of planting it out in rows the same way, but instead of planting it out in rows at 2 feet apart it is better to give it 4 feet or more, and to plant Potatos between, by doing which the plants attain a much larger size, and, being stronger, yield a great number of sprouts. Another advantage in growing these and other of the Brassicas in the same way is, that the stems become not only stouter, but more woody and hardy, and are therefore in a condition to bear hard frost, which often kills those drawn up and made tender through being planted so closely tocether. Y. S. closely together. J. S.

ACACIA PULCHELLA. - In the conservatory at ACACIA PULCHELLA. — In the conservatory at Kew a fine specimen of this wonderfully pretty West Australian species is now in bloom. It is very distinct with its twiggy branches beset with spines and clothed with tiny pinnate leaves, and a profusion of globular heads of orange-yellow flowers. Very different in general appearance but equally effective as a cool conservatory decorative plant, especially when planted out, or where its roots are allowed plenty of space, is the lemon-yellow flowered A, verticullata, a native of Tasmania as well as of Australia. plenty of space, is the lemon-yellow flowered A, ver-ticillata, a native of Tasmania as well as of Australia. From the former country this species was one of the very first plants to find its way to British gardens, having been introduced in 1780. Large pyramidal bushes of A. verticillata with their dark green linear Gorse-like phyllodia, and the numberless spikes of lemon-yellow flower beads, are amongst the most attractive of all the plants now blooming in the Winter Garden at Kew.

Foreign Correspondence.

ORANGE TREES ON THE GENOESE RIVIERA.— In a recent number of the Gardeners' Chronicle a correspondent, Mr. J. Douglas, writes in favour "of a high temperature to bring up the flavour of the Orange during the ripening period," My experience on the Genoese Riviera (Mentone) may be of some use in elucidating this question.

The Oranges usually grown and sold on the Riviera are not very good, to say the least, and their deficiency in flavour and sweetness is generally attributed to the climate-to the heat thereof not being sufficiently great. My experience proves that such is not the se, and that the poor quality of the fruit is owing to inferior sorts being grown, and to defective cultivation. About fifteen years ago I planted seeds from an Orange tree at Monaco, no longer in existence, which was justly reputed to grow better fruit than any other in the district, as also seeds from a St. Michael's Orange purchased by a friend at Covent Garden. These seeds came up, formed nice young plants, were carefully grown, and planted out in the open ground, more as ornamental trees than with the view to fruit. I accepted the generally received opinion that good Oranges could not be grown in this region, because the climate was not warm enough in winter. Three years ago, when the trees were probably about twelve years old, they began to flower. I have read that this is generally the case with seedling fruit trees—that they do not flower and fruit until they have attained about a mature age, unless grafted. Left to themselves they have to attain maturity, like animals, before they begin to reproduce themselves. Such, certainly, was the case with my Orange trees. The first two years only a few sparse flowers and fruit were produced, but this last year they produced a full crop of beau tiful Oranges, large in size, perfect in sweetness and flavour-several hundred on each tree. The St. Michael's are exactly like the best we buy in Covent Garden, smooth and thin-skinned, sweet and Three years ago I grafted a number of ordinary seedlings with grafts from the St. Michael's tree, which have done well, and promise to flower and fruit this summer. I thus hope to have introduced the St. Michael's Orange into this part of the world. The Orange trees here flower in April and May, set and grow their fruit during the heat of the summerand ripen during the winter with a rather low temperature. When I arrived here, at the end of October, the Oranges were beginning to turn colour, but were still greenish. By the middle of December they attained their golden hue, but were still quite sour. They remained so until the beginning of March, when they became eatable, and now (24th) they are quite sweet and good. Thus the ripening process has taken place under our winter temperature, which is rather low for a tropical fruit like the Orange. According to my meteorological observations, taken during a period of above twenty years at Mentone, the November minimum is 49°.2, maximum, 60°.1; the minima and maxima for December are 44°.2 and 55°.1; those for January are 42°.8 and 53°, those for February are 43°.5 and 55°.7; those for March are 45°.3 and 59°.3. It must be remembered, however, that these are porth shade temperatures, that the sky in winter is generally clear, and the sun radiant and very warm. The Orange trees are all grown in full sunshine, and sheltered from all winds, so that they are exposed to great sun-heat all but constantly from 8 A.M. to 4 P.M., certainly five days out of six.

It is a notable fact that the Orange free cannot bear wind from any quarter whatever; even from the south it must be sheltered. Wherever it is found thriving there shelter from wind exists. In the Balearic Islands all the Orange groves are in crater-like depressions, or in clefts in the rocks. In Spain, near Valentia, the Orange trees are grown as bushes, not more than 12 or 15 feet in height, sheltered from the sea winds by groves, forests of Carouba and Olivetees. In my garden at Mentone, which is on the mountain side facing the south-west sea, they do well if protected by the Olive trees; but if I cut down the latter, the Orange trees they protected begin to fing and to suffer. I have just cut down a fine, previously healthy, young tree, fifteen years old, which drooped and faded ever since it lost its shelter some four years ago. Its roots are quite healthy, but the branches were turning, from the sea wind which caught it, and dying one after the other. All over the Mediterranean islands and shores Orange trees,

healthy and in full bearing, are seen growing in courtyards behind walls (Cordova, Seville, Malta, &c), but then the surrounding buildings must not be too high to prevent the suo's rays reaching them summer and winter. Our summers at Mentone, and in the Mediterranean generally, are very warm day and night for four months, which has probably much to do with the winter maturing of the fruit.

Such a tree, courting, as it were, confinement, ought, one would think, to do well anywhere under glass with artificial heat, but probably it would require more heat in summer, when growing its fruit, than in winter, when merely ripening it. Heat in winter would no doubt hasten the process, as in Grenada. Henry Bennet, M.D., Torre di Grimaldi, Mentone.

FORESTRY.

PLANTING .- General forest planting should now be brought to a close for the season, although the transplanting of evergreens and young nursery stock may be successfully pursued until the end of the month. In removing plants during the present month great care must be taken to prevent the roots being exposed longer than is avoidable to the dry cutting winds usually experienced at this season; indeed, as the month advances the risk from continuous dry weather after planting increases, so that quick removal and a thorough puddling of the roots of all transplants can alone insure safety and success in the operation. When removing large trees and shrubs to a new site nothing succeeds equal to a copious supply of water used not only at the root, but syringed over the foliage as well; and this operation repeated at intervals during dry weather, until the tree shows signs of having got established io its new abode.

NURSERY WORK should now proceed in earnest, seed-beds being prepared, coniferous tree seeds sown, and deciduous seedlings of all kinds transplanted into lines. As the month advances seedling evergreens, such as Holly, Yew, Privet, and Firs, may also be planted out into soil previously dug and well broken up. Give ample room between both lines and plants, so that long fibrous roots and a strong bushy habit may be induced. Close planting is injurious, and should never be tolerated. The ground intended for seed-beds should be deeply dug over some time previous to sowing, and all lumps or hard clods broken over and the whole made smooth and fine with a rake. Mark off the beds 4 feet in width, and leave an alley 12 inches wide between each for convenience in weed ing, and keeping them in proper order. The seeds should be sown thinly and evenly over the beds, and covered according to their size with finely riddled soil. Any plots or borders not required for re-filling should be heavily manured or enriched by leaf-mould, lime, or nursery refuse, and dug roughly over previous to cropping with Turnips or Potatos.

THINNING .- The general thinning of plantations will now be completed, and any timber, firewood, or branches should be cleared out at once, and either lotted for sale or disposed of to the best advantage. Proceed with the marking of Oak, as owing to present mild weather we have every prospect of an early spring, so that bark-stripping will, in most districts, soon commence. Every preparation ought to be made beforehand, so that the work may proceed without interruption when once begun. Owing to the stormy nature of the weather during the past few months there must have been considerable damage done to woods and plantations throughout the country by the uprooting of trees and breaking of branches. All available hands should now be employed in having such trees and branches removed. The handiest and most simple method for disposing of the roots of upturned trees is to dig a hole of suffi cient size immediately behind these, into which they will fall when severed from the trunk. The hole should be made large enough to allow a covering of at least 12 inches of soil on the root. Where, however, it is intended to substitute other trees for those blown down all the soil adhering to the root should be removed with a pick or spade, and the root carted to some convenient out-of-the-way place usually reserved for such rubbish. All broken and twisted branches should at once be removed, as such work cannot be performed without damage after the buds begin to expand. Dress neatly the wounds caused by

amputation, and in such a manner as to avoid the lodgment of water.

FENCING.—If possible all new iron, wire, and wooden lences should now be erected before the ground gets bard, after which the placing of uprights will be both difficult and expensive. To prevent trespass, the hedges and fences of woods adjoining pasture-land should be examined and put in a good state of repair previous to cattle being turned out. Where young and unfenced plantations are exposed to the depredations of hares and rabbits, it may be found necessary to wash those parts of the stem and branches within their reach with Davidson's Compost, which generally proves efficacious if properly applied during dry weather. Attend to the staking, tying, and fencing of newly transplanted trees and shrubs.

TREE-GUARDS in paddocks will require frequent examinations, to see that all is right, as when left in a dilapidated condition they are not only unsightly but expose the trees to the gnawing propensity of young horses. A good tree-guard or hurdle that will fit close to the tree may be made from Larch rails 5 feet in length, held together by two bands of boop-iron or wood. These, when well made, are not in the least unsightly, and will last for many years.

ROADS AND WALKS.—This is a good time to edge drives and walks, as the sharp outline made by the edging-fron is soon hidden by the spring growth of grass along the margins. Gravel or other material for binding should now be laid on thinly, and a heavy roller passed over the surface, which will greatly tend to consolidate it. This is best done after a heavy shower of rain. Such plaotation drives as have been cut up by heavy traffic during winter, and that are not likely to be much used in summer, may now be put in order and well rolled down. Grass seed will soon vegetate if sown on bare spots along the margins of such roads, the ground being previously prepared by a slight raking. As time permits ground-work operations, such as levelling, road and walk making, excavating, &c., may now be proceeded with and carried on during favourable weather.

DRAINAGE.—The excessively heavy rainfall of the past winter, although beneficial to newly transplanted trees and shrubs, has necessitated a more than ordinary amount of care and attention being bestowed on drains and culverts. The banks of streams and rivers that have been damaged should be put in repair, and all closed drains examined and the obstructions, if any, removed. Clean and repair woodland watercourses where this cannot be left until warmer weather and when the flow of water is at the lowest ebb,

GENERAL WORK.—Bind faggots in the woodland and have them carted home and stacked during dry weather. Branches for this purpose should be lotted alongside the margins of plantations or woodland drives as the work of thinning proceeds, and after becoming dry may be bound ready for use. It is well to have a large shed for the storing of faggots when dry, and from which they can be carted to the mansion as required. Larch branches alone are used for making small faggots for fire-lighting, but those of larger size and intended for oven-heating may be made of any wood that will burn well. Those about to make charcoal by the old method of kiln-burning should make all preparatory arrangements, so that the work may be commenced during next month. We have enjoyed, during the latter part of March, weather of phenomenal mildness for the season of the year, but the question is, Will it endure long? the general remark in reply to which is "It's too good to last," which is a pretty accurate prognostication to make in a changeable climate like that of ours. A. D. Webster, Penryhn Castle, North Walcs.

FORESTSANDWASTE LANDS (IRELAND).—Amongst the Parliamentary papers recently issued is a preliminary report on the re-afforesting of Ireland, by M. D. Hewitz, forest conservator, of Copenhagen. This is the result of an actual survey which leads M. Hewitz to the conclusion that at least 5,000,000 acres are well suited for forest cultivation. "Many hundreds of thousands of acres," says he, "do not pay an interest of 6d." a year, and the greatest part of the 5,000,000 of acres are waste ground, and pay not 1d. There is much grassland and many fenced paddocks on the ranges where the Heather and Brake is in uch force, and where tocks, stones, &c., cover the

ground to such an extent that the actual gain per acre is not more than 1s. to 2s. Would it not be better to cultivate these vast areas, so eminently suited for forest, and to obtain a yearly rental of at least & r per acre instead? The calculation is easily made, and without entering into details, which would be out of place here. Cultivation, including cost of nurseries, purchase of seed, preparation of ground, purchase of tools and buildings, fencing, labour, and superintendence, should for, say, 100,000 acres, he about £4 per acre, or £400,000. This first cost, calculated with 4 per cent. interest for thirty years, £17 per acre; add to this expense for superintendence, roadmaking and repairing, maintenance of fences and drains, as well as all incidental expenses, made up as follows :- First cost after thirty years, £1,700,000; one superintendent at £500 a year, fifty forest-rangers at £50 to £75 a year, and repairs of buildings, tools, &c., at £300, £125,000; road-making and repairing, and fences, drains, and incidental expenses, £35,000; total, £1,860,000. And to put the expenses with a round sum at two millions, the cost per acre will be, at thirty years of age £20, this allowing for the highest wages, and I firmly believe that the expenses will be 25 per cent. less." He thinks the Lough Neagh catchment should be cultivated first; at the same time plans should be prepared for the cultivation of the Shannon, and other basins; and also a number of smaller trial plantations should be commenced in the more difficult highlands and coast areas of Donegal, Leitrim, Sligo, Mayo, Galway, Clare, and Henry. After setting out how nurseries may be made to supply the great plantations, the report proceeds to explain how the whole scheme of re-afforesting should be put into operation, and closes with an assurance that the work would be profitable in every direction. appendix is a list of forest trees suitable for cultivation, with remarks on their character, habits, utilisation, and cultivation.

The Kosery.

Noisette Rose Cloth of Gold.—This has been well described as a truly magnificent Rose when brought to perfection. The important point is how to do this. It is a particularly tender Rose, and one of the most reticent in producing flowers; at the same time it is of so vigorous a habit that, under good treatment, it will make shoots from 10 to 15 feet long in one season. This very vigour of development has induced some cultivators to rush to the conclusion that a repressing or starving system of treatment should be adopted, with a view to forcing it into bloom. All such attempts have failed more or less. What is required is good cultivation, and the encouragement of a vigorous and healthy growth; in a few years, when such wood becomes well ripened, then flowers may be looked for. A few years ago one of our then leading Rose growers recommended that the border in which it is planted should be well drained. and the soil made of good condition; there should be an ample top-dressing of turfy loam and well decomposed manure, it scarcely matters how strong. This dressing should be repeated annually, and copious waterings of weak liquid manure be given immediately after the blooming season. In the case of this Rose close pruning should not be resorted to, the knife should be called into requisition only for the purpose of removing small and over-crowded branches, and such unripe shoots as might be produced late in the season. "A shoot ought never to be shortened, but rather encouraged to grow to its utmost extent; if it overtops the wall before it has attained its full length, it may be twined and trained downwards, as fruitful buds are, for the most part, produced at or near the ends of these vigorous shoots." Of late years we have witnessed the introduction of fine yellow Tea and Noisette Roses, but Cloth of Gold, because of its superb colour, regal beauty and doubleness, will remain a favourite for years to come: what is needed is that its proper management be clearly understood.

REFORM IN PRUNING ROSES .- It has always seemed to me that much valuable time is wasted in gardens over Rose-pruning. A Scotch friend lately told me he should have no time next week for other gardening work, as he should be pruning his Roses, I recommended him to adopt my plan of pruning them with hedging-shears—a plan by which 200 or

300 may be pruned in an afternoon, and since the adoption of which I have found them flower quite as well as when each shoot was pruned separately with a knife. He wrote to say that he had adopted my recommendation, which reminded him of the follow ing local anecdote. A Scotch minister, fond of his garden, could never persuade his old-fashioned gar-dener to understand hybrid perpetuals; much time was wasted every year in pruning, but the flowering was indifferent. One year, just before pruning time, the minister's donkey got into the garden, and finding these new-fashioned Thistles to his liking, ate them off nearly to the ground. That year they flowered splendidly, and on a friend congratulating him on his fine Roses the minister drily remarked "Formerly I had a gardener who was an ass, but now I have found an ass who is a gardener." [Oh!] C. Wolley Dod, Llandudno, March 28.

Keports of Societies.

The Daffodill Congress.—It was no slight pleasure that was reserved to the frequenters of the Royal Horticultural Society's Gardens on Tuesday last, and no less a great gratification to those who dwell habitually in the country, to have had such an interesting and beautiful show of Narcissus. To one one well acquainted with these pretty spring flowers, and to one who knows but few beside the flower of his childhood, the old-fashinoned Daffodil, or Daffodowndilly, these many varieties were a pleasant surprise. These are seen in most woods and meadows in England, growing up uncared for usually, as wild flowers do, among the grass and low herbage. The conservatory in the Society's gardens had a glow of warm yellow on either side of the middle area, differing very much from the parti-coloured scene witnessed at other floral displays there. Flowers for cutting are so much the fashion at the present time, we must be excused if our first visit was paid to the cut flowers and bouquets. We all like to see the possibilities of any flower when used in the ret steeper recores. The Daffodill Congress.-It was no slight pleaand bouquets. We all like to see the possibilities of any flower when used in the cut state for our rooms, and although we knew the effect to be got from the common form of Daffodil, it was an agreeable surcommon form of I Antodil, it was an agreeable sur-prise to note what pretty arrangements were made with the less known kinds. Miss Jekyll's arrangement with these, which she had intermingled with much ever-green foliage of Ivy, evergreen Oak, Berberis Aqui-folium (the rich warm purple of which contrasted admirably with the deep yellow of the Irish maximus). Howeving sprays of Laurustines Puseus sections, and admirably with the deep yellow of the Irish maximus), flowering sprays of Laurustinus, Ruscus racemosus, and others, seemed negligic and good of its kind, and suitable for a sombre-hued apartment or a front hall; but to our taste it was too roughly devised and carried out to fit harmoniously into the decorations and appointments of a pleasantly furnished living room. Some bouquets from Messrs, Hooper & Co., of Covent Some bouquets from Messrs. Hooper & Co., of Covent Garden, were also not precisely the most pleasing in design, nor were Mr. Dickson's or Mr. Margam's. The basket of Daffodils, with an Ivy-covered handle, and a large bouquet, lightly put up, both by Mr. Aldons, of South Kensington, were well done, and perhaps he had performed as good a piece of work as could be with not the most promising of materials, for with all our liking for the flower in its many forms and varied hues, it will not lend itself to the bouquet with so much grace as many other flowers do.

hues, it will not lend itself to the bouquet with so much grace as many other flowers do.

Our Dutch friends, to whom so much is owing in bulb culture and bulb raising, were represented by Mr. Krelage, of Haarlem. This gentleman, we noticed, had the sorts N. lobularis plenus rugilobus and Tazetta, gold and sulphur in double varieties. Mr. Moore, of the Glasnevin Botanic Gardens, had several pretty varieties—Eyenstettensis, a starry bloom, small, and primrose-yellow in tinge; and the Tenby Daffodil, N. obvallaris.

Contrary perhaps to the usual practice, we reserved our inspection of those we had heard were the finest collections at the show till we had inspected the

our inspection of those we had heard were the finest collections at the show till we had inspected the flowers shown by others. It must be allowed that Mr. Walker, a grower of cut flowers for the market, quite distanced every other exhibitor. The blooms were cut and shown with prodigality, which must prove an impossibility to any one not having great resources, and not only so, but they were so attractively arranged in fan-like bunches; that every beauty was visible from the front; and the flowers themselves appeared to be the prefection of good culture. selves appeared to be the perfection of good culture, selves appeared to be the perfection of good culture, and had been in nearly every instance cut just at the right moment, so as to show the purest white or the proper yellow tint. Mr. Walker evidently could teach us many useful lessons about his flowers, not only how to grow them, but when to cut them, and how and where to place the flowers to get them to expand. The kinds which Mr. Walker brought to the show were so numerous that we cannot hope to give their names within the limits of this notice; but

we cannot forhear touching on a few that seemed to be but little known by any one out of the select circle of Narcissophiles. Shirley Hibberd, a yellow sort that is large and distinct; the white N. cernous, of a that is large and distinct; the white N. cernuus, of a pleasing silvery-white; and the double N. cernuus plenus, also white; and N. cernuus pulcher, a white with a pale yellow trumpet which turns to white; bicolor Horsfieldi, Corhularia conspicua, or Hoop Petticoat, a pretty low-growing, early flowering bulb; Cambricus, of a sulphury-white and yellow trumpet. It was almost too late for this and some more of this It was almost too late for this and some more of this section. A very distinct one is William Goldring, a white, with a trumpet of primrose. N. lorifolius and N. l. Emperor are fine grand blooms, the colours of gold and primrose. Of Narcissus with chalice-shaped crowns were N. odorus, of a deep golden tint, having a deeply lobed corona; N. Leedsi argentea, having a white crown—a very distinct flower in its class. a white crown—a very distinct llower in its cuas-many N. incomparabilis sub-varieties were seen in Mr. Walker's collection, many of them being dis-tinctly beautiful, and ranging in colour from deep orange to white—of this last colour being the early blooming N. i. Stella; N. Minoine Hume, white, but having a golden crown; N. i. pallidus. Princess Mary of Cambridge is a fine large flower of a pale printrose. The true Narcissus, so well known in its form, of N. poeticus, was shown in this collection by N. poeticus ornatus, pure white, with an orange-scarlet margined corona; N. poeticus tripodalis, similar but rather more stellate than the first-named; N. Butbidgei minor, a sulphur-white blossom, with an N. Burbidgei minor, a sulphur-white blossom, with an orange crown; and a still more lovely tinted one in N. Burbidgei sulphureus stellata, in which the crown

N. Burbidgei sulphureus stellata, in which the crown is margined with scarlet, while the perianth is sulphur. Next in beauty to this collection, but far larger in quantity, we must place that of Messrs. Barr & Son, of Covent Garden, an exhibitor than whom in love for this class of plants none stands higher. He seems verily to have made them his, and the numerous examples which he can place on view prove that he thoroughly understands their culture, and is in possession of a great number of varieties. Here he had arranged them in the groups as they are found in his arranged them in the groups as they are found in his list: these were formed on mossy hills with the list; these were formed on mossy hills with the dividing valleys between, so that the uninitiated could discern which were Hoop Petticoats, bicolors, and N. incompatabilis, and which were those of the N. poeticus type. Among the more noteworthy of Mr. Barr's collection were Rebecca Syme, a form with pale yellow flowers, with a delicious fragrance, Leeds' hybrids and forms of the incomparabilis section were shown in quantities, remarkable mostly for the contrast between the pale segments and the golden or orange-coloured and red-edged cups. He also had the Queen Anne's Jonquil, a pretty, small-growing kind. In the N. poeticus varieties this collection was noted as being particularly rich, as also in the N. Burbidgei section. The same, and other kinds, Mr. Barr had placed in bottles, and arranged them as is usually done, and thus had appropriated the major

usually done, and thus had appropriated the major share of space for his exhibits. The collection that Messrs. Veitch & Sons, of the Chelsea Nurseries, placed on view was greatly to be admired, and as this firm had been as free with their blooms as Mr. Walker was with his, although the arrangement differed from his they had produced a fine colour effect in the mass, and the individual flowers were particularly good and fresh; they numbered about thirty kinds. Mr. Ware, of the Hale Farm, Tottenham, had also a collection of kinds of great beauty, amongst them being flowers of N. bicolor hervifolius, a sulphur-white, with a golden-coloured crown; N. bicolor longifolius, N. Flumei concolor. Smaller lots of cut blooms were seen, such as the so-called Welsh forms of Narcissus, which J. D. Lleweilcalled Welsh forms of Narcissus, which J. D. Lieweilyn, Esq., of Penllergare, Swansea, had sent up : seven
bunches sent from the gardens of the Earl of Essex, at
Cassiobury, and some from the garden of G. F.
Wilson, at Weybridge, these last being several varieties
of Hoop Petticoats, N. integratus fi.-pl. of HarpurCrewe, and a variety of N. Vincenti, N. princeps, and
a few others. There were thirty varieties exhibited by
the New Plant and Bulb Company, Colchester, but
being mostly the same as those seen in the collections
of others we mention no names. Cantain Nelson's of others we mention no names. Captain Nelson's flowers were remarkable for their purity and refine-ment, although not showing evidence of such careful cultivation as was seen in some cases. His "Gem" cultivation as was seen in some cases. His "Gem" was a very lovely form, white, and almost like a Eucharis. Minnie Hume was also a lovely flower, with white segments and a "primrose-coloured cup Volutus, one of the true Daffodlis, is remarkable for its very large hold cup and twisted perianth-segments. Mrs. Vivian, Singleton, Swansea; E. G. Loder, Esq., of Floore, Weedon, complete the list of those who sent their contributions of Narcissi to that which turned out a very successful floral file.

Shropshire Floral and Horticultural.—The fifth annual spring exhibition of the above Society was beld in the Music Hall, Shrewsbury, on the 27th ult., when the place was well filled with a wealth of flowers excelling the results of other years in the abundance of bloom. Numeroug entries were made in most of the classes, and although not so spirited a competition as

could be desired existed yet there were not wanting those kindly evidences of rivalry which go a long way to make our exhibitions what they really are. Most of the exhibits were creditable, and some of them of the first order, especially the trained Azaleas. For this show the committee depend largely upon the support of the local nurserynea, who are evidently in harmony with the former, and materially assisted to afford a treat to the good people of Stirewsbury, who evidently were not slow to appreciate it, for during the greater portion of the day the place was comfortably filled, and at times crowded with people; hence the efforts of the committee were met with a hearty response.

Azaleas.—The premier position for six (distinct) was

mittee were met with a hearty response.

Azaleas,—The premier position for six (distinct) was gained by Mr. Thurtle, gr. to Mrs. R. S. Burton, and a similar award for six trained specimens (distinct) was given to Mr. H. Purser, gr. to J. Watson, Esq., the specimens being nicely trained and well flowered. Criterion was especially fine. These classes were open, In the amateurs' class the 1st prize for two untrained specimens was awarded to E. Pond, Esq., Newport House. Hyacinths,—In the open class for eighteen varieties (distinct), pots not to exceed 6 inches, there were four comectiors, the premier position being rained varieties (distinct), pots not to exceed 6 inches, there were four competitors, the premier position being gained by Messrs, Jones & Son, Coton Hill Nursery, Shrewsbury. In the class for twelve (furserymen excluded) by Messrs, Jones & Son, Coton Hill Nursery, Shrewsbury, In the class for twelve (furserymen excluded) to Miss Bannerman (gr., Mr., J. Sheppard) with a very nice lost. Miscellaneous plants in flower, pots not to exceed 70 inches, there were four entires, the leading position being secured by Messrs. Pritchard & Son, Frankwell Nurseries, Shrewsbury, in whose collection was a very fine variety of Civia miniata, with large richy coloured flowers in a compact umbel; Rhododendrons, Azalea mollis, forming a very conspicuous display. The other batches staged were also very creditable. For six Cyclamens in flower there were three entries, the last exhibitor being again 1st, with excellent plants, grand flowers and colours. Six Cinerarias, distinct, pots not o exceed 8 inches,—1st, Miss Bannerman, whose plants were not sa compact as the others; but the flowers were very fine. Six Roses in pots,—1st, James Watson, Esq., very fine. Six Roses in pots.—1st, James Watson, Esq., with very nice specimens. Twelve pots of Tulips, in which there was close competition, each lot being very which there was close competition, each lot being very even and well grown; but the premier position was gained by Messrs. Pritchard & Son. A collection of bulls in flower, fifty post, the pois not to exceed 6 inches, two lots were staged, and constituted a most interesting display—rst, Messrs. Pritchard & Son, whose collection included nice posts of Trilliam grandifform, Amarylises, Narcissus, Scillas, Tulips, &c.; while the ad collection contained specimens of the charming old Lilium candidum. Collection of twenty-four spring-flowering hardy plants. The same exhibitor again took the 1st prize with a fine lot of Ghent and Mollis Azaleas, Rhododendrons, Deutzia graculis, &c., forming a very bright and attractive group, the hardy Azaleas being especially well grows.

grown.

Miscellaneous Exhibits. — Messrs. James Dickson & Sons, of Chester, staged two dozen Auriculas in flower, which were greatly admired. Amongst the batch were good trusses of Spalding's Mary Grey, Taylor's Glory, Read's Aeme, Simonite's Frank Simonite, Campell's Pizarro, &c. The same firm also staged a collection of those charming Japanese Maples, very rich in foliage, and most atturactive. A Special Certificate of Merit was awarded both these lots. Mr. A. Myers staged magnificent trays of zonal Pelargoniums, and the Roses arranged with Maidenhair Fern, to which a special prize was given. Mr. Maunton (one of the Hon. Secs.) exhibited a nice tray of Maréchal Niel; and James Watson, Esq., also staged a tray of Roses, amongst which were some good flowers. (*Correspondent.*)

Torquay Horticultural: March 20.—The spring exhibition of this Society was held in the Bath Saloon, and was a very successful one—horticulturally considered. and was a very successful one—horticulturally considered. The nurserymen of the town and surrounding district united to make the exhibition attractive, and their efforces qualified to make the exhibition attractive, and their efforces equalled in that part of the country. The contributions of both nurserymen and amateurs in the various classes open for competition showed superior cultivation all round, and gave the judges plenty of work. The leading prize-winners were Mr. H. Yelland, gr. to Coloned Campbell; Mr. Hunt, gr. to P. B. Drinkwater, Esq.; Mr. Tucker, gr. to J. Price, Esq.; Mr. Sloman, gr. to Captain Fane Tucker; Mr. Cole, gr. to W. B. Fortescue, Esq.; and Mr. Griff, gr. to Grant Norris, Esq. The nurserymen who cootributed were Mr. Small and Messrs, Phillips, Messrs. Veitch & Son, and Messrs. Lucombel; and Mr. Burridge, of Paignton; and nice collections of Orchids, &e., came from the gardens of the Earl of Kinnoul and Moreton Sparks, Esq.

Variorum.

COFFEE TREE IN FRUIT AT KEW .-- One of the most interesting plants now in the Palm-house at Kew-one at least which would probably attract a larger number of untravelled Englishmen than any other in that huge structure-is a fine healthy tree of Coffea arabica bearing hundreds of its large Cherry-like fruits. The plant in question is growing in the corner of a bed in the central transept, and the symmetrical habit, the dark glossy leaves, and scarlet berries form a combination which cannot fail

to please any one who has any perception of beauty When in flower the rich aromatic fragrance exhaled by the Jasmine-like flowers is very noticeable; indeed all that part of the Palm-house in which the plant is growing is suffused with the delicate and pleasing perfume. Little more than two centuries and a quarter have elapsed since Coffee was first used in Britain, and it has now become one of the most important household articles in many European countries. It is believed that Coffee was first used in Arabia about 1450, and in a century its use had spread to Egypt and other parts of the Turkish empire. For two centuries from its introduction into Arabia the use of Coffee seems to have been confined to the Mahomedan nations of Western Asia; and, considering its rapid spread and popularity among the European nations, it seems remarkable that it has not, like Tobacco, extended to the Hindus, the Hindu-Chinese, the Japanese, or the tribes of the Indian Archipelago, who no more use it than the Europeans do the Betel preparation.

TOBACCO IN PUERTO RICO,-The Tobacco crop of Puerto Rico for 1882 is reported to have been a very good one. Part of the produce, it is further stated, goes to Cuba, where it is manufactured, and passes in Europe as Havana weed; the remainder is purchased by the Government monopoly for consumption in Spain. Tenders are invited yearly for the supply to Government of from 800 to 1000 tons of Tobacco, growth of the island. Some 945 tons of Tobacco, value 308,046 dols., were exported in 1882 for Cuba; and 1015 tons, value 330,914 dols., for Spain. Some of the best qualities of Tobacco, when properly dressed and turned into a well-shaped cigar, surpass, perhaps, in flavour the choicest Havanas. A Tohacco manufactory has been established in Puerto Rico under the name of "Las Dos Antillas," where superior qualities of cigars are sold which can vie with the best Havanas, and at one-third less price.

Obituary.

WE regret to have to record the death, on March 26, at Dulwich Wood, Norwood, of Mr. EDWARD MILNER, the eminent landscape gardener. Edward Milner was born at Darley, in Derbyshire, of a good old family, his ancestors having owned land there since 1600. He was well educated at Bakewell Grammar School, and apprenticed to Sir Joseph Paxton, then steward and head gardener to the Duke of Devonshire. After his apprenticeship he went to Paris to study for four years, chiefly at the Jardin des Plantes, and with the Professors attached to that then flourishing institution. After travelling through Europe he returned to England, where he visited and reported on many of the principal gardens for Dr. Lindley, then Editor of the Gardeners' Chronicle. In 1844 Sir Joseph Paxton entrusted to him the work of superintending the laying-out of the Prince's Park, Liverpool, the first park made with the view of increasing the selling value of the surrounding land, This work was most successful, and was the heginning of Mr. Milner's professional work. When the Crystal Palace at Sydenham was decided on Sir Joseph Paxton gave over to Mr. Milner the carrying out of the extensive garden works connected with it. Since their completion Mr. Milner has most successfully practised himself, His works, artistic samples of the natural style, were not confined to this country, but are well known in France, Belgium, the Rhine Provinces, Denmark, and Sweden. Among his many works in England are the public parks at Preston, Halifax, and Buxton; Ashwicke Park, Bath; Wroxall Abbey, Warwick; Fenton Park and Longridge Park, Berwick; Manley Hall, Manchester; Bodnant and Bryn-y-Neuadd, North Wales; Osmaston Manor Stancliffe Hall, Derbyshire; Oakley Park, Basingstoke; Singleton Park, Lancashire; Range-more Park, Burton-on-Trent; Gibbstown Park, Ireland; Highbury, Birmingham; Iwerne Minster Park, Dorsetshire; and Ashstead Park, Epsom.

In 1881 the Crystal Palace Company organised a School of Gardening, of which Mr. Milner was asked to be the Principal. He undertook the work in connection with his son, Mr. Henry Milner, who, having been his principal assistant for several years, was now taken into partnership. Mr. Milner's teaching must leave a stamp on the coming younger members who have received their landscape gardening training in the school.

LONDON: Atmospheric Pressure, — During the week ending March 29, the reading of the barometer at the level of the sea increased from 30.05 inches at at the legisling of the week to 30.12 inches by 9 A.M., and decreased to 30.10 inches by 9 A.M., on the 23d, increased to 30.17 inches by 9 A.M. on the 24th, decreased to 30.14 inches by 9 A.M. on the 24th, decreased to 30.14 inches by 9 A.M. increased to 30.15 inches by midnight on the same day, decreased 30.18 inches by midnight on the same day, decreased to 30.14 inches by 3 P.M. and increased to 30.15 inches by midnight on the 25th, decreased to 30.15 inches by 9 A.M. on the 25th, increased to 30.05 inches by 9 A.M. on the 25th, increased to 30.05 inches by 3 P.M. on the 25th, increased to 30.10 inches by midnight on the same day, and was 29.97 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.11 inches, being 0.08 inch higher than last week, and 0.16 inch above the average of the week.

Temperature. — The highest temperature in the shade in the week was 53°, on the 23d; the highest reached on the 27th was 42°. The mean of the

reached off the 2/th was 42. The mean of the seven high day temperatures was 46°.9

The lowest temperature was 35°, on the 25th; on the 23th the lowest temperature was 40°.5

The mean of the seven low night temperatures was 37°.3.

The greatest range of temperature in one day was $14^{\circ}.2$, on the 24th; the smallest was 5° , on the 27th. The mean of the seven daily ranges was $9^{\circ}.6$. The mean temperatures were—on the 3d, $45^{\circ}.3$;

27(ii. The mean of the seven usiny ranges was 9.0. The mean temperatures were—on the 3d, 45°,3; on the 24th, 42°.8; on the 25th, 40°.2; on the 26th, 40°,4; on the 27th, 38°,9; on the 28th, 39°,7; and on the 29th, 41°,5; of these the first two were above their averages by 3°,3 and 0°,7, and the rest were below by 2°.1, 2°.1, 3°.8, 3°.3, and 1°.8 respectively.

tively.

The mean temperature was 41°.3, being 7°.9 lower than last week, and 1°.3 below the average of

lower than last week, and 1°,3 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 103°,5, on the 24th. The mean of the seven readings was 76°.6.

The lowest reading of a thermometer with its bulb placed on grass was 25°, on the 24th and 25th. The mean of the seven readings was 29°.4.

Rain.—Rain fell on the 25th to the amount of 0.03 inch.

ENGLAND: Temperature,—During the week ending March 29 the highest temperatures were 59°, at Truro, 56°,2 at Plymouth, 54°,2 at Bristol; the highest at Sunderland was 48°,9, at Bolton 49°,1, and at Sheffield 50°. The general mean was 52°,5. The lowest temperatures in the week were 26°,8 at Cambridge, 27° at Hull, 28°,4 at Wolverhampton; the lowest at Blackheath was 35°, at Bradford 34°,8, and at Leeds and Sunderland 34°. The general mean was 32°,5.

was 31°.5.

The greatest ranges were 29° at Truro, 26°.6 at Cambridge, 24°.t at Nottingham; the smallest ranges were 14°.9 at Sunderland, 17°.4 at Bradford, and 18° at Blackheath and Leeds. The general mean was 2t°.

The mean of the seven high day temperatures was The mean of the seven high day temperatures was highest at Turto, 51°.3, at Plymouth 50°.2, and at Nottingham 49°; and was lowest at Bolton, 42°.8, at Sheffield 44°, and at Sunderland 44°.6. The general mean was 47°.1.

The mean of the seven low night temperatures was highest at Plymouth, 38°, at Brighton 37°.9, at Blackheath 37°.3; and was lowest at Hull, 31°.3, at Wolverhampton 32°.3, and at Bolton 33°.2. The general mean was 35°.3.

The mean daily range of temperature was greatest at Hull, 16°.6, at Nottingham 15°.1, Cambridge 14°.7; and was least at Liverpool, 8°.5, at Sunderland 9°., and at Brighton and Blackheath 9°.6. The general mean was 11°.8.

mean was 11°,8.

mean was it's. S.

The mean temperature was highest at Truro and Plymouth, 42°.9, at Brighton 41°.5; and was lowest at Bolton, 37°.3, at Sheffield 37°.7; and at Wolverhampton 37°.9. The general mean was 40°.

Kain.—The largest fall was 0.12 inch at Preston, 0.09 inch at Sunderland, 0.03 inch at Blackheath; the smallest fall was 0.01 inch at Nottingham and Bradford. No rain fell at Truro, Plymouth, Bristol, Leicester, Cambridge, Wolverhampton, Sheffield, Liverpool, Bolton, or Leeds. The general mean fall was 0.02 inch. fall was 0.02 inch.

Scotland: Temperature,—During the week ending March 29, the highest temperature was 56°.3, at Edinhurgh; at Aherdeen the highest was 49°.7. The general mean was 53°.

The lowest temperature in the week was 28°, at Perth; at Greenock the lowest temperature was 34°.5. The general mean was 31°.1.

The mean temperature was highest at Glasgow and Edinburgh, 41°.4; and lowest at Perth, 39°.3. The general mean was 40°.6.

Rain.—The largest fall was 0.09 inch, at Greenock, and the smallest fall was 0.01 inch, at Edinburgh. The general mean fall was 0.01 inch, at Greenock and the smallest fall was 0.01 inch, at Greenock Glasgow, Dundee, Leith, or Paisley.

Glasgow, Dundee, Leith, or Paisley.

Melons and Peaches: Subscriber. To have Melons
ripe early in September, you must sow the first week
in June, and in the case of very large varieties even
earlier than that. The weather will exercise much influence in forwarding or retarding the maturing of the
crop, and a constant and regular bottom-heat of 85
must be maintained from first to last. Peach trees
under glass require regular attention as to watering.
Soak thoroughly when started, see that they are well
watered previous to the flowers opening; water again
when the fruit is thinned, and at intervals, when required up to the colouring period. Well made porous
borders for the Peach want frequent watering, stift,
adhesive, ill-drained borders much less; and do not let
a border get dry in autumn and winter.

NAMES OF PLANTS: T. F. E. The Red Cedar (Juniperus virginiana).—G. Batten. Your Rhododendron appears to be a hybrid between R. ciliatum and R. formosum, and we cannot say if it has been aamed.—A. P., Tembury. Astrantia maxima.—C. P. Catt. Trachystemon orientalis, an escape from gardens. It was figured in our vol. kiv., p. 17.—S. T. M. I. Not recognised; 2, Iberis coriilolia; 3, Pelargonium, probably Rollisson's Unique; 4, Ionopsidium acaule.— Yohn Leman. Ornithogalum umbellatum.—W. Craik. I. Deudrobium imbriatum oculatum; 2, Ccologyue Cummingii; 3, Leptotes bicolor.—Y. Earl. Lycaste Skinueri, Vanda tricolor, and V. tricolor insignis, are correctly named; the Mexican plant is Maxillaria uniflora.—H. M. H. I., Dendrobium nobile; 2, D. nobile, probably the Burmese variety; 3, D. Linawianum.—T. Catark. Doronicum columnæ and Eranthemum auro-creticulatum.—H. C. I., Vriesia pisttacina; 2, Antirrhirum assarina; 3, Eabiana stricta; 4, Cotyledon retusa?; 5, Abulion vexillarium; 6, Erica carnea; 7, E. carnea vat. mediterranea.—H. H. K. I., Asclepias curassavica; 7, Philanthus nivosus; 3, Erica vernix.—L. S. A. I., Gasteria verrucosa; 2, Manillaria pusilla?; 3, Cercus serpentinus; 4, Aloc frutescens; 5, Salvia hybrid?; 6, no fruit.—G. H. I., Fuchsia splendens; 2, Mousoa incias; 3, Nephrodium velutiamu.—I. Fatteriospora ericoides of gardens; 2, S. E. Wangeriana of gardens, a state of Thuia occidentalis.—E. F. A. Adiantum cuneatum; 2, Anthurium leuconeurum; 3, Sclagianella, no fruit; 4, Trichopilia suavis.—S. E. C.

Narcissus incomparabilis albus plenus sulphureus, of Mr. Barr, the "Codlings and Cream" of the old authors, Sulphur Crown of the Dutch florists, and Sulphur Phoenix of some English growers.— $W.\mathcal{F}$. Arcrissus Pseudo Narcissus var. Hudbras.

NAMES OF FRUIT: W. Foster. Cluster, or Twin-cluster Golden Pippin.—J. Day. Pear: Catillac. Apples: 1, Beauty of Kent. The other varieties were too much bruised for identification.

NARCISSUS: C. M. O. We do not quite understand your question. We see no tufts on the tips of the perianth segments.

PLANTS IN FLOWER: A. M. C. 7. C. Many thanks; but we regret we have not room.

POTATO: E. Fox. A very good example of the kind, showing how new growth takes place at the expense of the food materials stored up in the old tuber. Although new growth has taken place, there is, of course, no increase in weight, as there is no means of the new growth obtaining supplies of food other than those supplied in the old tuber.

WELLINGTONIA: James Hope. Fungus was, no doubt, the cause of death. In the bark sent there is plenty of spawn, probably of some species of Polyporus, and very likely derived from the old Elm roots, which should have been removed.

WHITE ARUM: G. C. Maynard. Double-spathed Arum are not at all uncommon now-a-days, try to fix it. You should

Markets.

COVENT GARDEN, April 3.

[This subjoined reports are furtished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices que day averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Eo.]

THERE is no alteration to quote, the market being dull, with heavy supplies. New Grapes are to hand, but meet with little demand, the old samples being still good. James Webber, Wholesale Apple Market.

CUT FLOWERS .- AVERAGE WHOLESALE PRICES.

.* These prices cannot be relied on for Easter week.

SEEDS.

SEEDS.

London: April 2..—The attendance of buyers on to-day's market was somewhat thin, and the business doing small. For Clower seeds there is a steady request at unchanged rates. The feeling for Alsike shows some improvement, some seed having been reshipped to Hamburg. Trefols continue exceedingly cheap. There is a better sale for both perennial and Italian Rye-grasses. Spring Tares realise fall values. There is no alteration this week in bird seeds. Scarlet Runner Beans are offering on very low terms. Yohn Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

CORN.

At Mark Lane on Monday English Wheat barely supported the previous Monday's prices, and where sales of foreign were effected they showed 1s. decline. Flour also was saleable only on easier terms for buyers. Malting Barley was inactive and unchanged in value. Grinding descriptions were barely so well supported as recently. Beans were steady in value, with a moderate demand Peas were rather scaree, and 1st. dearer. Oats, with moderate receipts, were rather firmer, and Maize was very slack, and fully 6d. lower. On Wednesday there was little or no demand, and prices were nominal, but to have effected sales of either Wheat or flour lower rates must have been taken. Barley was flat. Beans and Peas were unaltered in value. For Maize prices were drooping. Oats were quiet, and receipts moderate. Average prices of corn for the week ending March 20; —Wheat, 30s. 1d.; Barley, 31s. 3d.; Oats, 19s. 1od. For the corresponding week last year: —Wheat, 42s.; Barley, 33s. 1d.; Oats, 21s. 9d.

CATTLE,

CATTLE.

At Copenhapen Fields on Monday very little chauge was observable in the beast market. Sales progressed slowly, at about previous rates to rather under. In foreign Danish realised 4s. 6d. to 5s. 4d.; and Swedish were quoted 4s. to 4s. 6d. Sheep sold rather unevenly, but mostly rather worse than on Thursday last. Lambs sold at 8s. to 8s. 8d. English calves brought about late rates; Danish and Swedish showed prices in favour of buyers. Pigs met little or no demand. Quotations:—Beasts, 4s. to 5s. 2d., and 5s. to 6s. 8d.; calves, 5s. to 6s. 1od.; sheep, 5s. to 5s. 6d., and 6s. to 6s. 8d.; calves, 5s. to 6s. 1od.; sheep, 5s. to 5s. 6d., and 6s. to 6s. 8d.; calves as were difficult to move at Monday's prices. Sheep were quiet, and lambs sold less freely, whilst calves and pigs were about the same.

HAY.

HAY.

Tuesday's Whitechapel Market report states that supplies were large, and best qualities of hay and Clover in demand. Quotations:—Frime old Clover, 955, to 1075.; inferior, 605, to 755.; prime second cut, 905, to 1055.; best meadow hay, 805, to 875, inferior, 405, to 655, and straw, 285, to 375, per load.—On Thursday three same same moderate supply. The trade was quiet at Tuesday's rates.—Cumberland Market quotations:—Superior meadow hay, 845, to 924, inferior, 605, to 7445; superior Clover, 1055, to 1145, inferior, 705, to 845, ; and straw, 345, to 385, per load.

POTATOS.

The average prices during the week have been:— Magnum Bonums, 60s. to 90s.; Champions, 40s. to 65s.; Roses, 60s. per ton; and Snowflakes (foreign), 4s. do. to 5s. 6d. per bag.—The imports into London last week consisted of 10 bags from Hamburg, 10 bags from Boulogne, and 298 sacks from St. Nazaire.

NATIVE

GUANO.

Extracts from the Eighth Annual Collection of Testimonials from persons who have used this Manure for Farm and Garden Crops:-

VEGETABLES, VINES, FRUIT,

KITCHEN GARDEN CROPS.

a. F. BARRON, Repat Hart cultural Society, Chiswick, De ember 12, 1833 - "Used for Cabbages, Celeny, Timatols, and other green Vegetables, also on Lawn Grass. Results - V-vy favourable, manifest improvement wherever used, the foliace assuming a much deeper colour, and growth extended. Without doubt a very valuable manure, and one easy of application."

HY. CLARK, Ilead Gardener to His Grace the Duke of Marlborough, Elenheim Palace Gardens, Woodstock, December 14, 183.—" Used for Plantgrowing, Frunt-growing, Jas for Vegetables. Results:—Very satisfactory. For cheapness and general use your manure is invaluable."

general use your manure is invaluable."

JAMES DART, Gardener to the Right Hon. Lerd Carlingford, K.P., The Priory, Chewton Mentify, Eath, Detember 17, One to, Best, Peas, Pease, Celery, and many other things. I used no other manure but yours, and could tell to a foot where it was used, for or wet. I grow many kinds of Petatos, and my garren is very poor ground. Last spring I bought 12 lb, of White Elephatt Potato Seed, and when they were up 8 inches high I sprinkled some of your Course of the towns, the high I sprinkled some of your Course of the Petatos as one could with for. I lave been the late Courses Waldegrave's and Lord Calingford's Head Gardener at Strawsberry Hill, Twickersham, and here at The Priory for just twerty-eight years, and in that time I have used many kinds of artificial manures, but none has given me the satisfaction your Native Ginano has, and I intend to have more later on."

THOS. CARLITON, Gardners to Six, C. H. Mills, Bart, Wildeness Fask Gardens, Sevenada, February 4, 1834.
Wildeness Fask Gardens, Sevenada, February 4, 1834.
Wildeness Fask Gardens, Sevenada, February 4, 1834.
For some years until last spring, when I applied two dressings of presented teelf, and the fruit was much larger in burnch and berry than had been the case for some few years. I attribute these good results to the Native Manure. I have also used it for Cauliflowers, Peas, &c., and have no hesitation in saying that the result was viry apparent in all cases where applied."

ALEXANDER BISSET, Gardener to Str J. Whittaker Ellis, Bart, Epfret, December 19, 1883,—"Used for Grape Vines, Orchard House Culture, and Katchen Garden Crowner, Orchard House Culture, and Katchen Garden Crowner, or the strength of the str

EDWARD PEARS, Gardener to Mrs. Jerone, Holland House, Sutton Coldfield, December 14, 1883.—"Used for Potatos, Onions, Celery, Cucumbers, Melons, Grape Vines, and Pot Plants. For Potatos and Onions I used, on the average, 5 ceth, per acre: not bawing need your Native Guano before, 1 was afraid to give too much. Results:—Potatos and Onious, avery good crop indeed; Celery, very fine, gave it a little ach time of earthing up; Cucumbers and Melons, I find your Guano unit those first-rate; it does not burn the roots, no one need four using it. I had some splendid well-finished fruit. Grape Garden up of the commerce of the control of t

SWEDES, MANGELS, &c.

JAS. DAVENPORT, Meaford Hall Farm, near Stone, December 13, 1833—" Used for Swede Turnips at the rate of octu, per acre. Kesults: "About 25 tons of good sound roots to the sere. My roots were sounder than some in another field, with farmyard manure applied at time of sowing. Farmyard with farmyard in a form of the sowing to the sere. Should say it is a useful manure, and cheap."

RICHARD FOWLER, Broughton, Aylesbury, December 12, 1883 - Used for Swedes, at the rate of 5 cwt. per acre. Results:-Very good."

JOHN BETTLEY, Described Farm, Barton, Oxford, December 18, 1833.— "Used for Turnips and Swedes, at the rate of 3 cut. per acre. Results: -Excellen, giving every satisfaction. I think your Native Gnano a capital mixture, and quite recommend it, more especially when mixed with a little superrecommen phosphate

CHARLES FEESON, Glovy Farm, Pentt, Amersham, Bucks, December 16, 1883.—"Used for Swedes and Mangel Wurzel, at the rate of 4 cwt. per acre for Swedes, with bursals, and 6 cwt. for Mangels, with ditto. Results:—Swedes very fine crop and large rosts; Mangels very good plant and large roots. I have used Native Guano for years, and have been every successful in taking prizes with roots grown where I applied it. I have taken Five First Prizes this year, 1883, being first in all the classes I showed in."

JAMES KITLEV, Farm Steward to the Rt. Hoo. the Earl of Derby, Wittley Park, Haslemere, Surrey, December 14, 1882.—"Used for Tares, at the rate of 4 to 6 evt. per acre. Results:—Very good; could see to an inch where the land was not sown. No other manure was used, The Native Guano was harrowed in with the seed, and I am well satisfied with the results,"

GEORGE STONE, Cashio Bridge Farm, Watford, Sanuary 1, 1884.—'' Used for Swedes. Results:—I was well sanuarished with the Native Guano. I used 5 to 6 ewt. to the acre; my Swedes were very good indeed. Send me 3 tons more; I shall give it another trial.''

GEO. STRATTON, Princes Risborough, December 13, 1883;—"Used for Mangels, at the tate of 3 cwt. per acre. Results:—A very good crop. I have always had a good crop of Mangels after using the Aylesbury Native Gunno."

H. WYATT, Walton Grange, Aylesbury, December 14, 1883
—"At the Royal and Central Fucks Agricultural Show, held at
Great Marlow in September 18st, I was awarded the First Prize,
value £10, for the best general crop of roots of not less than 10
acres. And at the same show I was also awarded the First

JOHN COX, Combi Farm, Highenden, December 18, 183, -- "Used for Mangel Wursel and Swedes, at the rate of 5 cut. per acre. Result: --One-fourth extra produce. I consider the builts were much finer, and cleaner growth, and generally sound:"

JOSEPH HUTCHINGS, Kerest Farm, Hanslope, December 20, 1883.—" Used for a crop of Swedes, at the rate of 5 cwt, per ance. "Ten to twelve loads of yard-manuer, sown broadcast. Results:—The Native Guano, where sown, has given me great satisfaction. I hope to be a customer bext season."

GRAIN, GRASS, POTATOS, &c.

AUSTIN BUTLIN, The Woodlands, Shipton, Lee, December 18, 1881.—"Used for Mangels, drilled under the seed on the flat. The land was manured from the farmyard in the antumn. Oats with Clover-seeds top-dressed at the rate of 4 cwt. per acre. Results:—Oats and Mangels, good. I never had a more promising crop of young Clover. I think it a good manure at the price."

ROBT. KEENE, Emmington, Telsworth, December 1, 1883.—"Used for Mangels and Uats, at the rate of 7 cwt per acre. Results:—Both crops remarkably good."

Rev. C. SOAMES, Mildenhall, December 14, 1883.—
"Used for Oats, Mangel Wurzel, Potatos. Results:—Uats very good, Mangel ditto."

D. T. and W. H. BYFORD, Carshallon, Surrey, January 5, 1834.—"Used for Oats at the rate of 8 ew, per acre. See the second of the

L. T. HAVNES, Upper Heylord Fanuary 15, 1884— Upper Heylord for Oats, Wheat, and Potatos, at the rate of 4 cwt. per acceptable per per per service. Wheat, and act statistics with the manure on the Oat cropped with the manure on the Oat cropped.

GEO. COOPER, Kingswood Lane Farm, near Aylesbury, January 2, 1884.—" Used for Wheat at the rate of 5 cwt. per acre. Results:—Had a very good crop of Wheat."

C. B. SELL, Leighton Buzzard, December 18, 1883—
"Used for Barley at the rate of about 4 cwt, per acre. Results, and Good. Your Native Cuano 1 believe good for top-dressing, and only requires a trial amongst our market gardeners to come into general use. The difficult is persuading people to give it a trial. You must give each gardener a bag and ask them to try it and give you their opinion.

J. SIMMS, Wellington Terrace, Avlesbury, December 17, 183—"Used for grass at the tate of 5 cost, per acre, Results 7 cost, and the state of 5 cost, per acre, Results 7 cost, and the state of 5 cos

JOSEPH FRANKLIN, Scottgrove, Thame, December 27, 1883 — "Used on old pasture at the rate of 6 cwt per acre. Results:—A good crop of hay. I consider the A B C Manure, if applied on grass land early in the spring, a good manure and showing good results."

JOHN COLLEDGE, Palsher!, Hill Form, December 21, 883,—"Used for grass and Pot-ar, and garden produce generally, at the rate of 6 owt, per acres and garden produce Protatos, Results:—Grass, fair crop; Potatos and Onions, good. The early part of the season was not favourable for artificial manures, dry east winds prevailing."

At the Birmingham Show TWO SILVER CUPS and NINETEEN PRIZES were taken by EXHIBITORS who use NATIVE GUANO.

Price, £3 10s. per Ton, in Bags, at the Railway Station, Aylesbury.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

(Registered Trace Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertises, and its genuine good quality, notwithstanding a host of unprincipled mitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nohilly and Gentry, from whom the most according to the control of the Castle of the Cas

VINES AND VINE CULTURE.

By ARCHIBALD F. BARRON,

Superintendent of the Royal Horticultural Society's Gardens,

Opinions of the Horticultural Press :-

The Journal of Horticulture says :-

"It is the most complete, and it will be accepted as the standard work on the Vine."

The Gardeners' Chronicle says :-

"It is eminently practical and useful."

The Garden says :-

"It is undoubtedly the most exhaustive volume upon Vices and Vine culture ever published."

The Gardeners Magazine says :-

"It will certainly take, and probably keep a leading place in the class of literature to which it belongs."

The Florist and Pomologist says :-

"There is nowhere to be found in our language complete and thorough a descriptive list of the best varieties of Grapes."

The Midland Counties Herald says :-

"The whole subject is dealt with exhaustively and authoritatively in plain, expressive, and singularly concise language."

The Irish Farmers' Gazette calls it -

"The most complete work of its kind that has ever been issued from the British Press,"

JOURNAL OF HORTICULTURE OFFICE,

171, Fleet Street, London, E.C.

WARDE'S

CAPILLARE.

The Editor of the Pictorial World says.—"The other day my barber recommended a certain preparation, and assured me that he had tried it himself. I stared at him with incredulity—a doctor taking his own medicine. I thought—50, as a reward for the mm's pluck I invested in a bottle of Warde's Capilare, and took it home. It remained on my dressing table for some time. The start of the market of the market of the market of the market of extreme confidence. I did apply it to the top, and, continuing its use, I am bound to say (contrary to my expectation) it has add the desired effect, and my barber never tells me that I nm 'getting thin on the top' now. I may add, for the benefit of the ladies, that sex makes no difference to this wonderful preparatom to more, but try this Hair-producing Elixir. Now, as biddoess is generally blocked upon with uneasions or aversion, and it requires greater fortitude than is generally given to human atture to regard the time when we shall be denuded of our hyscinthiae locks—for baldness is said, like poverty, to make men addiculous—I think it only fair to mention the above circumbering the producing the result of my own experience."

22. 6d. per bottle; three, 6: 6d.; six, rat, 6d.; dozen, 24.; obtainable through all Chemists, Perfumers, Hairderssers, &csent to any address by the Chief Agents, H. WELIMAN NON CO., 4, Wine Office Court, Fleet Street, Londons E.C., upon recapit of tentiance, post-free. Families should notice the reduction for quantities.

London, England.

London, England.

—In all nutward complaints a desperate effort should be made to at once remove these annoying infirmities, and of establishing a cure. The remarkable remedies discovered by Professor Holloway will satisfactorily accomplish this desirable result, without any of those dangers or drawbacks which attend affections, and sorbutic annoyances. The most timid tuvalids may use both the Ointment and Pills with the tumnst safety with certain success, provided a moderate attention be bestowed on their accompanying "Directions." Both the preparations storbe, help, and thruth The Companying and their most acceptance of the properties of the properti

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1884.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881,

The "Yournal of Horticulture," of June 9, any: — "Nowing Machines.—After a
critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs,

T. Green & Son, O Leeds and London. As the Machines are known in all lades where good
lawss are cheriabed, it is quite unnecessary to give any description of them."

Upwards of 115,000 of these Machines have been Sold since they were first introduced in the year 1856, And thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

18t. Simplicity of Coostruction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order.

2th. They make little or no onise in working. 3th. They will cut either short or long Grass, we tor cry.

SHANKS'S PATENT LAWN MOWERS FOR 1884.

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines.

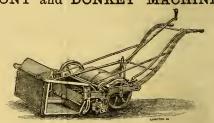

These Machines are in use in the Royal Gardens at Kew, Hampton Court, Osborne and Balmoral, in most of the Public Parks and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawns. They have now been before the Public for many years, and stand unrivalled. These Machines are easily worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

seed, or does it indicate some effect of climate still existing, or which did once exist, and by virtue of which growth was stimulated at this unusual period? In any case it is a marked character of the plant, which owes its state-liness to this peculiarity; and it is one, moreover, that is sometimes enhanced by repetition. Miller mentions some dozen or more varieties, but we doubt whether we could find as many now, though we still have deep and pale coloured varieties, from pale yellow to deep redvarieties with variegated leaves, besides those before-mentioned. Assuredly it is a grand plant, but for reasons we need not repeat it will not do for cutting, and, therefore, is not likely to find favour with modern gardeners or their employers. The best method of culture is to lift the bulbs when the leaves are withered in summer, leave them to dry, and replant in autumn in light but rich well-drained soil.

CALANTHE PROBOSCIDEA, n. sp.*

A NEW Calanthe, imported from the Sunda Islands, by Messrs. J. Veitch & Sons. It stands nearest C. fur cata, Bat., but its great feature is, that the anterior part of column is bent down in a curve, like the snout of certain insects. The very short nail of the lip descends, and the great blade of the lip stands under a right angle with it, having four laciniæ, the superior ones being a little narrower, all contiguous at the sides. The anterior ones are separate by a deep sinus in the middle. A system of calli stands at the base, very like that of Calanthe furcata, but they are looser in front where they are broken up into papular bodies. The hairy spur is curved, and nearly equal to the hairy Its apex is sometimes oblique, sometimes a little bilobed, and usually with lobes of unequal length. The flowers of the present edition are a very little smaller than those of Cattleya furcata. Their colour is white, changing to lightest ochre. The calli are fine vermilion; there is a vermilion borse-shoe-like mark painted at the place of calli outside. Whether it is constant for the lip's blade to be bent upwards I of course do not know. H. G. Rehb, f.

CYPRIPEDIUM PORPHYROCHLAMYS, n. hyb. Art.

To me this is a very nice flower. It is one of the innumerable horticultural children of Mr. Seden, and was kindly sent me by Mr. H. Veitch. It is raised from Cypripedium barbatum biflorum and birsutissimum. Leaf linear ligulate, very acute. sepal transverse, blunt, elliptical, very shining as petals, with much projecting nerves, reddish-purple with white borders. The latteral sepals are a triangular greenish body, not equal in length to the lip. Petals descending, broad, ligulate, blunt acute, with some small undulations at the base outside and inside, yellowish at the base, with innumerable small freckles of purest mauve-purple (far superior to that of the upper sepal) on exterior half. Lip of C. barbatum, but colour better. Staminode nearly of C. barbatum.

I regard this a very good thing. It offers a good deal of the charms of Cypripedium hirsutissimum, though it has much more of its colours than of its forms. As to Cypripedium hirsutissimum I would, indeed, nuch like one or a few fresh flowers, I never having sketched it myself. Mr. Day alone supplied me with wild materials. My seventeen garden flowers would be regarded signs of an alarming superficiality by some who are now in the trade. At least three new species, which some might name in their own honour with their own on ame, might be established. Luckily the Cypripedium hirsultisamum may reappear upon the market when the imminent protest against the application of names of individuals for indifferent varieties may have some transitions. varieties may have swept away numerous superfluous names and the propensity for such ephemeral creations. HYBRID CAPE GLADIOLI.

DURING the past winter I have been busily engaged in working out the characters of the Cape Iridaceæ for Mr. Thiselton Dyer's continuation of Harvey and Sonder's Flora Capensis-a task which I am glad to say is now finished. I am wishful to devote about a page to defining briefly the names which have been given in Latin to the hybrid types of Cape Gladioli, but I have so little practical acquaintance with them that I am greatly afraid of blundering. Would you, therefore, oblige me by printing the rough draft I have sketched out, with a view of asking the criticism of specialists upon it before it is put into book form?

The hybrid types of primary importance which have originated from Cape species, to which Latin names have been given, are the following :-

1. G. gandavensis (figured Flore des Serres, tome 2, liv. 3, t. 1, in which the psittacinus element strongly predominates). - The flower is just the shape and size of that of psittacinus, but the red is purer and brighter, instead of heing mixed with yellow, in fine lines and dots. (I want a short definition to explain how brenchles ensis may be distinguished from psittacinus.)

 G. citrinus (figured Flore des Serres, tab. 539).
 Flower the shape of that of psittacinus, but bright yellow. (How has this originated?) There is also a plant called gandavensis albus, with a white flower.

3. G. Wilmoreanus (figured Flore des Serres, tab. 639).—Said to be a hybrid between gaodavensis and oppositisforus, an idea which its characters support. Flower the shape of that of psittacinus, white with radiating streaks of pink.

4. G. ramosus (figured Paxton's Magazine, vol. vi., p. 99).—A type in which the blandus element pre-dominates; said to be a hybrid between cardinalis and oppositiflorus. Flower pink, with dark blotches at the base of the three lower segments. A closely allied type is G. Spofforthianus, raised by Herbert

by crossing cardinalis with blandus.
5. G. pudibundus (figured Faxton's Magazine, vol. ii., p. 97).—A type allied to G. floribuodus, Jacq., with erect pink-white flowers, with obovate segments, with a faint darker blotch at the base of the three lower.

6. G. Colvilles (figured in Sweet, Brit. Flow, Gard., 155).—Raised from seeds of tristis var. concolor, fertilised with the pollen of cardinalis. bright scarlet, with oblong acute segments, with a lanceolate blotch of bright yellow at the throat of the three lower ones.

The following are hybrid types, of much smaller horticultural importance, to which Latin pames have been given, viz. :-

7. G. Mitchamensis .- Hybrid between tristis and hirsutus; figured by Herbert in the Transactions of the Horticultural Society, vol. iv., t. 2.

8. G. rigidus .- Hybrid between tristis and blandus; figured in the same plate as the last.

9. G. propinquus. - Between floribundus and blandus, which are two species very closely allied to

begin with begin with fragrans.—Between recurvus and tristis, 10. G. fragrans.—Between recurvus and tristis, which are also very closely allied.

Parlackianus and delicatus.**—Between recurvus and tristis.**

tween recurvus and blandus. 13. G. Herbertianus .- Between tristis and Spof-

fortbianus. 14. G. odoratus. - Between birsutus and Spof-

forthianus. 15 and 16. G. candidus and incarnatus.-Between blandus and cardinalis.

Into some of the hybrids of recent origin I believe

G. cruentus and Saundersii enter.

The plates in the Floral Magazine that represent hybrid Gladioli are as follows, viz. :-Old series-36, 77, 123, 171, 184, 222, 266, 315, 363, 364, 405, 419, 463, 464, 507, 508, 556. New series—43, 102, 295, 296. J. G. Baker.

GARDENERS AND FORESTRY. - Forestry is at last beginning to obtain the attention in England that it deserves; but at present it has no recognition in the ordinary exhibitions connected with the culture of the ground. Neither agricultural societies nor horticultural societies, as a rule, offer prizes in arboriculture. The subject seems to belong to the horticultural societies, as arboriculture is certainly, in many cases, a part of a gardener's duty. Bedfordshine

BELRATH BURY.

ABOUT 11 mile from Kells, in Co. Meath, stands Belrath Bury, the commodious residence of C. A. Nicholson, Esq. It is a fine substantial dwelling, recently built by its present owner, who (since he became possessor) has done so much in improving the estate generally. From the principal entrance on the Kells road is a winding carriage-drive, on each side of which are planted choice Coniferæ, Rhododendrons in variety, the latter in fine condition, and literally covered with flower-buds, and intermixed with them are fine examples of forest trees The mansion is oblong in form, and the principal entrance is from the north, in front of which, on a rising piece of ground, is the flower garden, laid out in good-sized beds, and interspersed with gravel paths, which does not show off the colours so well as if grass had been employed; but the beds being large, and immense masses of separate colours used, the effect in a short time will doubtless be very fine. More than 70,000 spring bedding plants were put out last autumn, and the winter having been so mild, very lew of them have succumbed. Most noticeable now is a large bed of Valeriana Phu aurea, the bright yellow foliage of which is very effective; Erica carnea is also very showy, and Webb's Giant Primroses and Polyanthuses have been in bloom all the winter. Other plants in use for spriog effect are Blood-red and Bel-voir Castle Wallflowers, Primroses (double and single), Sedums, Saxifrages, Alyssum saxatile, Doronicums, Violas of sorts, Ajugas, &c., the whole being arranged so as to give fine masses of colour in their respective varieties.

The kitchen garden, about 3 acres in extent, lies to the north and east of the flower garden, and is in two divisions, the upper one containing the glassbouses, pits, &c., which consist of a large show-house, T-shaped, 55 feet long, and of proportionate width, and 30 feet high, filled with a general collection of fine-foliaged and flowering plants both in pots and planted Noticeable among the pot-plants are some nice half-specimen Azaleas, well bloomed, and in good condition; fine plants of a good variety of the popular Clivia (Imantophyllum) miniatum, finely bloomed; Epacris, Cytisus, Arums, Cinerarias, Deutzias, Epacris, Cytisus, Arums, Cinerarias, Deutzias, Spiraeas, Primulas, Begonias, &c. In the centre of this house is planted out a magnificent specimen of Camellia alba plena, 14 feet high and 15 feet through, which this season carried upwards of a thousand blooms, and four times that number of buds were thinned from it. On either side of this is a red Camellia, each about 10 feet bigh, and well furnished. A great variety of creepers adorn the roof and supporting pillars of this capacious structure, some being in bloom at the time of our last visit (March 14), and included Clematis indivisa lobata, which hanging from the roof gives the appearance of wreaths of Paris Daisies; Habrothamous elegans (very fine), Acacia Riceana, A. Chandleri, Lasiandra macrantha, Bignonias of sorts, Hibbertia dentata, Clianthus puniceus, C. magnificus, Tacsonia exoniensis, T. Van Volxemi, Lapagerias (red and white), Chorozemas, and Mandevilla snaveolens, as well as a selection of climbing Tea Roses, &c.

No. 2 is a range of plant-houses, stove, intermediate-house, and greenhouse, all filled with healthy young plants, including a good strain of Cyclamen persicum, some of the plants in 6-inch pots carrying upwards of three dozen fine blooms. A collection of Orchids is also being formed, and although growing in houses along with other plants they seem quite at home with the treatment given them by Mr. Kettlewell.

No. 3 is a forcing-house, filled at present with Gardenias, Ixoras, Amaryllis, &c., while against the back wall are some Fig trees, planted in a prepared border, which annually give a good yield of frult. The remaining houses consist of vineries, Peachhouse, and fernery, and a greenhouse, the roof of which is covered with a fine Marechal Niel Rose in good condition. Planted out in a heated pit is a fine batch of white Arums, from which dozens of very large blooms are being cut, and, judging from the healthy appearance of the plants, they will continue to throw up their spathes for some considerable time. In another of these pits were a fine healthy lot of cool Orchids, including Disa grandiflora, Odontoglossums, &c.

In the kitchen garden is a fine plot of Read's new hearting Borecole, which is bighly spoken of by Mr. Kettlewell, and gives great satisfaction when cooked.

Passing through the kitchen garden we come to the new pleasure grounds, 3 acres in extent, which have been made during the last three years, and are made up of beds and borders of various sizes and shapes, each planted with shrubs and plants in variety. The collection of herbaceous subjects consists of close upon 500 species and varieties, all named, the labels used being those manufactured by Mr. Smith, of Stratfordon-Avon, and which, besides being imperishable, have a neat appearance. Noticeable in bloom at present are Lithospermum prostratum, very effective on rockwork, Iris stylosa, I. reticulata, several Helleborus, Primula rosea, spring Snowflake, Grape Hyacinths, Anemone apennina (blue), A. palmata (yellow), A. coronaria, various Narcissi, Omphatodes verna, Doronicums, Aubrietias, Scilla sibirica, S. taurica, Primroses; and among shrubs are Andromeda floribunda, Daphne Mezereum and the variety alba, Cytisus sempervireus, Polygala chamæbuxus, The gravel paths throughout this delightful

buds. Instead of returning through the kitchen garden we pass along a shady walk, the banks of which are now very pretty with Anemones, Daffodils, Crocus, and various other hardy plants, naturalised, and which have a charming effect. We cross the carriage drive to the south front, where again Snowdrops, Crocus, Daffodils, &c., are planted in the grass with fine effect, and here are large breadths of Ghent Azaleas, St. John's Wort, hardy Heaths, &c., while further down is the little church, against the side of which was a plant of Coronilla glauca in bloom, which had been out-of-doors about two years. Many other tender plants are also left outside, including Choisya ternata, Woodwardia radicans, &c.; but during severe weather these, as well as Tree Pæonias, Dicentra spectabilis, &c., are protected either with woollen nets or branches of Fir trees. A short distance across the deer park is the wild garden, planted with tall growing herbaceous plants, hardy Ferns, shrubs, &c. Altogether this extensive gardenment Act, 1866, at a cost, including expense of formation, of £310,000. The annual cost of maintenance of the parks (together with £9000 interest) It is believed that the parks amounts to £19,250. have contributed to the health of the neighbourhood. They are situated between one and two miles from the centre of the town, in easterly, westerly, and southerly directions. From the facts cited in the report alluded to, we find that the proportionate acreage of open space (park area) to town area in Glasgow is 1 in 13; the proportion in relation to population may be expressed by saying that there is 1 acre of park to 1293 persons, the total population being estimated at 578,156; and if we were to tack on the adjoining burghs, which are reaping all the benefits of open air enjoyment and promenade, it would swell up to 120,000 souls more. These burghs-namely, Govan, Partick, Kinning Park, Maryhill, Govan Hill, Pollokshaws, Hillhead, Pollokshiels and Pollokshiels East, and Cross Hill, have each a munici-

FIG. 90 .- THE GARDENER'S COTTAGE AT BELRATH BURY.

piece of ground are in our opinion much too narrow, being only 4 feet in width, but the more we wander about in them the more there appears to be seen, large beds of choice Rhododendrons, rockeries filled with alpines, hardy Orchids, &c., extensive borders of herbaccous plants, Rose heds—now a mixed shrubbery, then we look on a healthy young Wellingtonia or Picca, beds of Spirca Lindleyana and Deutzia Fortunei, golden Elder, which during the summer has a fine effect; and in a quiet corner stands the head gardener's house—and what a house it is !—not a miserable shed such as, I am sorry to say, a great many gardener's houses are, particularly on this side of the Channel, but a well built, comfortable, and substantial domicile (see fig. 90), having every convenience, besides being very pleasantly situated. It was recently built by the present owner of Belrath Bury.

Leaving this picturesque cottage we again pass on towards the kitchen garden, and leave a fine bank of Azalea mollis on the right; this bank is 100 yards long and 6 yards wide, and the plants, though young, are in a thriving condition, and well set with flowering establishment is kept in good order by Mr. Kettlewell, who has had charge of it for about three years. It may also be remarked that both Mr. aod Mrs. Nicholson take a great interest in their garden, and it must be satisfactory to them to know that their treasures are presided over by a practical and persevering man, thoroughly master of his profession. W. J. Ireland, Headfort Gardens.

THE GLASGOW PARKS.

REVERTING to our notes on the amount of open space available to the citizens of our large towns, we find that, according to the Fortieth Annual Report of the Registrar-General, Glasgow contains 6033 acres, and an estimated population in 1879 of 578,156. It has four parks, covering an area of 447 acres, about one-fourth of which is planted with trees, shrubs, and flowers. The parks were purchased by the Town Council of Glasgow as trustees under the Glasgow Public Parks Act, 1859, and the Glasgow Improve-

pality of their own, and are attached to the city proper as much as one street is to another, and each avails itself of the enjoyment of park promenading, to the no small discontent of the city taxpayers. The parks themselves are pretty equally divided, having the Glasgow Green in what might be called the east centre of the city, the Queen's Park in the south, Kelvin Grove Park in the west, and Alexandra Park in the extreme east. If there were to be any additional park it would fall to be made in the north side of the city, and although some proposals of this kind have been made, the municipality has not seen its way to carry out the scheme. All these parks, it may be said, have been created during the rangership of present respected superintendent, Mr. Duncan McLellan, which counts now thirty years. The Green was a large open space without any attempt to make it amenable to the landscape gardener's art until Mr. McLellan took it in hand, and Kelvin Grove and the Queen's Park have been mainly, if not altogether, laid out under his personal supervision. The Alexandra Park is of modern date, and the squares and disused graveyards have been improved consistently with the modern ideas of what these things ought to be.

The GLASGOW GREEN covers an area of 136 imperial acres, and is bounded by the Clyde on the one side and surrounded by the thick of the business of the city in the shape of public works, business places, and so on, on the three other sides. This is the Hyde Park of Glasgow, wherein the people can air their grievances, and although about 100,000 people passed into this park on Sunday, July 9, 1883, and a corresponding number every other good day of rest, the lawn has been kept in very good order. There are certain byelaws which prevent the uniform use of all this acreage for games, and consequently the amenity of the park and its trees, shrubs, and flowers has been more particularly conserved. Considering the vast amount of smoke and dirt that rests upon tree and plant life here, there is a fair show of selected deciduous trees. The common Elm, the common white and Russel's Willow, Thorns, Ashes, Elders, Alders, and Laburnums do much better than other hard-wood trees. There is no better field for testing their endurance than this central park, and Mr. McLellan has found almost every other description of hard-wood, even the Occidental Plane, succumb and die. Among evergreens the Aucuba japonica and the hybrid seedlings of Rhododendron catawbiense do much the best. A great attraction is supplied in the spring and summer bedding, and although the groundwork for this sort of work is situated alongside of the public drying ground there is little or no inclination to Vandalism; indeed, we were told that the East-enders, which comprise mainly the working bees, do not destroy or pilfer the growing plants.

THE QUEEN'S PARK comprises an area of 141 imperial acres, of which there is feuable, or, in other words, let or lotted for building purposes, some 42 acres, so that practically the park is about 100 acres in extent. This divides the burgh of Crosshill from the city, and lying as it does on an elevated position, and comparatively free from influence of smoke, it is better adapted for showing trees, plants, and flowers to' advantage than any of the other parks. The main portion, looking citywards, is laid out in terraces, and double lines of trees, boulevard fashion, guard the spacious walk on either side of the central avenue. Moreover, being a portion of rural landscape before the city extended there are many large trees which, of course, have been preserved intact, and which add very much to the other attractions. Here we find almost every description of tree, and few showing any symptoms of giving way. The evergreens comprise some as good specimens of Hex maderiense and Hodgin's Holly as one can see anywhere for their size; and then the grass-the green grass, unlimited in breadth -gives a hue to rank vegetable life. Added to this are the summer attractions of abundance of flowers and excellent designs in carpet hedding. We understand that more strangers visit this park than any other round about; and this is not to be woodered at, when we look at the great variety of plants that are disposed over its surface. In this park there are several glass-houses for storing and propagating work. About 40,000 people visited this park on Sunday, July 2, of last year, abundantly showing how the parks are appreciated. well to note here, for the information of strangers, that from the heights of this park the best "bird'seye" view of the city is to be had.

KELVIN GROVE PARK is probably the most fashionable and best frequented park, excepting, of course, the Green, about the city. It has for its adjuncts Glasgow University and the Western Infirmary, with the ornamental grounds about and around them, which swells the breathing space in that direction to the extent of about 30 acres. Kelvin Grove Park proper covers an area of 81 acres, of which about 8 acres are feued for building. From the proximity of this park to the city only certain species of trees will thrive. As the Superintendent says in his report, "Time and smoke are making great ravages in this park as in the Green. Among the oldest and finest trees which give both a character and name to the Park, Chestnuts, Limes, and Beeches appear to suffer most, as they are susceptible to the effects of a smoky atmosphere impregnated with chemicals. Each year suitable trees and shrubs are being planted in the room of those which had to be removed." G'asgow, like most large cities, is pressing westward, consequently any large trees that have been dotted down in the rural landscape have been preserved and utilised where brick and mortar have not ruthlessly compelled their ren. val. The Elm is the only very large bulky tree that bids fair to eke out a respectable existence among smoke, smut, and other hostile drawbacks to tree life, and there are some really excellent examples of this tree on the banks of the Kelvin. This was once a pure stream, flowing in the midst of green fields; it is now more or less impregnated with sewage, although the City authorities have done much to keep it pure by intercepting and conveying it in a culvert 5 feet in diameter, to be discharged lower down the reaches of the stream. The river itself has been recently widened and a more artistic turn given to its windings, while the slopes have been planted with such trees as Elms, Poplars, Willows, Thorns, &c., the groundwork brightened up with groups of Aucuba japonica, which luxuriates best of all among its compeers, although Rhododendrons, particularly of the Catawbiense breed, do exceedingly well-much better, in fact, than ponticum or any of the other breeds. The drives here are laid out, full advantage being taken to suit the undulating ground through which they are formed. What about ten years ago was an ugly "coup" between the recreation grounds at Clayslaps and Gilmorehill has been transformed into a beautiful breadth of lawn, and that at a profit, too, some 83,000 carts of rubbish from foundries, &c., having been deposited and a charge of 4d. per cart made for the privilege. A new bridge and carriage drive have also been made in connection with this, which gives increased facilities for promenading, and adds to the attractions of, considering its position, a highly ornamental and judiciously arranged park. ding out and carpet bedding here are remarkably well done-as the Superintendent says, "all classes continue to take a great interest in them, the carpet bedding, as usual, receiving a large share of attention. On July 2, 48,611 persons were enumerated as passing in by the several entrances; and during the usual weekly musical performances there was an average attendance of about 8000.

The ALEXANDRA PARK is the youngest of the batch, and farthest from the city proper. It has been made for the working classes living in the east end of the city, which, by the way, is crowded with public works, and consequently the artisan element preponderates more in this than in any other section of the This park covers an area of 85 acres, 16 of which have been retained for feuing purposes, although, like the Alexandra Park of London, slow in being taken up. The site is good, and the arrangement of the park shows the usual good judgment of Mr. McLellao. A spacious drive, with a suitable entrance, leads into it; and the drive is continued round to its loftiest peak. It is a pity that the Blocharn Works are so near its boundary, as the smoke from them must play havoc with almost every description of tree life. However, the plantations forming an irregular sort of belting here and there being thickly studded, one plant nurses the other, and the whole are benefited. As should be the case in all large parks, there is a great breadth of lawn, on the soft green of which the hard-toiling multitudes can rest the eye with infinite pleasure. and walks are numerous and well made, and the drainage provided for in the most efficient manner. The cesspools, which are used for running off the water into the drains and catching the sediment, are about the best that have come within our cognisance. They are made of fire-clay, so that a grating can be fitted on the top, and being made all in one piece they make a much handier job than if they were built of brick. The large flat panel opposite the retiring-rooms is formed into a geometrical garden, and is a telling piece of work when suitably adorned in About 20,000 people visited the park in summer. one of the census days, when the number is taken of all who pass within the gates. The music is always a great attraction, and it is discoursed by bands every saturday during the four snmmer mooths, and commands an audience of over 30,000 persons. Aswimming pond is provided for the multitude, and about 20,000 availed themselves of it during four summer months. The public taste is being educated quietly but surely, and in the autuma some 5000 plants are given away, some for their front plots, and some, as the late Dr. Guthrie said, for the broken tea-pots along the window-sill, which was always evidence of a happier, more contented home.

THE SQUARES have recently undergone considerable alterations and improvements. In addition to good roads substantially railed off there have been the thinnings of the Alexandra Park and other of the parks, chiefly Willows and Alders, which, along with the base of grass, now in an unusual tone of greenness, make them look like the living places of mannot the homes of the dead. Cathedral Square, near the famous Barony, and overlooked by the Necropolis, with its piles of monuments to the dead as varied in design as they are conspicuous in appearance, has been very much improved, and will form a continuation of the Alexandra Parade, which in time may become a boulevard to and passing the well-known Cathedral. George's Square is quite picturesque, and large numbers of the old and Infirm take advantage of the seats provided to see the bustle and stir of an intensely occupied city.

THE DISUSED BURIAL GROUNDS, instead of the grim-looking patchy things of yore, have been beautified by trees, shrubs, and flowers. To this day there stands in some of them the square watch-house where relatives, or other people employed by them, were accustomed to look after the safety of the dead bodies until the watching became unnecessary. In one particular graveyard, named the Ramshorn, quite in the centre of the business part of the city, the lairs -and they will number hundreds-are enclosed with cast-iron rails, like cages for lions and tigers, some 12 feet aboveground, and nearly as much, we were informed, under the surface-all this because of the body-snatching of Burke and Hare-a fear which took hold of the people at the beginning of the century, but which is now, in process of civilisation, dispelled; and thank goodness, if it were for nothing else than to get rid of these hideous cages!

VIOLETS.

WEE and modest as these are, there are no flowers held in greater esteem, either by rich or poor, being about the first with which most of us become acquainted in our rambles by the hedgerows. It is not the wild variety, however, that I wish just now attention to, but the cultivated sorts, of which there are many, and all of them are more or less desirable, according to the convenience for growing them or the purposes to which they are put. The hest for market are the Czar and Queen Victoria, which are remarkably free blooming, robust, hardy kinds; and as the individual blossoms are supported on long stout stems, they can be gathered and bunched up quickly, and so rendered ready for sale in the market. The prices realised may not seem much, but the aggregate profit on an acre of plants must be something enormous, as the yield of flowers, when they are well cultivated and the season is favourable, is prodigious.

To get as much out of the plants as they are capable of producing the land must be in good heart, and the aspect and shelter such that they receive plenty of sun, and are out of reach of cold cutting winds. A border under a wall or fence, facing south, or a piece of ground sloping in the same direction, suits best, as the solar rays soon bring them into bloom in the early spring, when they are of the greatest money value. The ground where they are to be grown need not necessarily be entirely occupied by the Violets, as they do remarkably well between fruit trees or bushes, the shade from which during summer is very congenial to them, and makes the conditions much the same as those the plants get in their natural home on the banks, with other vegetation above to shield them from the blaze of the sun. In the first part of the season, when they require the aid of this luminary, foliage is absent, and they thus get all they require to stimulate them into fresh life, and induce them to push forth their blossoms.

It will be seen from this that many bare spots about gardens may be turned to very profitable account, and that spaces under Apple trees, or between Gooseberry and Currant bushes, may be made to yield something of more value than weeds; but those who would have the Violets must soon be up and doing, as it is getting time for them to be planted if they are to be afforded a long season to grow and get well hold of the ground. The quickest and readiest way to form new plantations is to dig up any old roots, and divide the plants into as many as there are separate crowns, which may then be dibbled in in rows or beds at about 9 inches apart. This should be done, if possible, during

showery weather, as then the plants sustain less check, and start away quickly, and become re-estab-

Besides being grown in the situations described, Violets form admirable edgings to walks, a striking instance of which I have just seen, where along the two sides bounding the centre path of a garden long broad rows are now quite crowded with blossoms, These same edgings have stood for years, and have given no trouble, as all the attention they have had is a little trimming with the spade to prevent any further extension; but as they are getting very crowded they are to be divided, and after manure has been dug in planted afresh.

The sweetest and best of the double kinds is the Marie Louise, which has flowers quite as large as the old Neapolitan, and of a richer, darker hue, and the

plants are also hardier, although, like the Neapolitan, they are only adapted for frames, where, if protected by lights, any one may have them in the greatest per-fection. To get them in this desirable state they must be well treated now, as next season's display of flowers depends entirely on the crowns or hearts the plants form, as the blossoms that are to come must be all centred there before autumn sets in. The first ners; and to encourage these the plants should have a little fine leaf-mould scattered among them, and be a little fine leaf-mould scattered among them, and be kept a trille close and warm, which will not only aid the formation of runners, but assist them to root. As soon as they have done this it will be necessary to select a nice shady border on which to make the beds, and to prepare for these the soil should be enriched by digging in a good dressing of rotten hotbed dung in which there is plently of decomposed leaves, as Violets are particularly fond of that kind of vegetable matter, in which they root and grow with the greater in which they root and grow with the greater.

matter, in which they root and grow with the greatest freedom.

The proper time to plant out is about the middle of May, and the treatment requisite during the summer is to keep the plants well watered, which should always be done overhead, and the foliage should always be done overhead, and the foliage damped daily towards eveolog, either by sprinkling through the rose of a pot or syringing, which damping is a great help in preventing red-spider or keeping it down. What these insects dislike more than anything is soot-water, which if used quite clear is one of the safest and best stimulants that can be applied to the plants, the leaves of which it causes to develope hue that betokens good health. To and assume a and assume a nue that betokens good health. To force the whole strength of the growth into the crowns, runners should be nipped off as they show, and if this course is pursued all through the summer the plants will be bold and good for lifting to pot up or put into frames in the autumn. For the first supply of flowers a little artificial warmth is needed, supply of flowers a little artificial warmin is needed, and nothing answers better than fermenting material, the gentle heat from which keeps the roots moving, and these cause the crowns to push up a succession of blossoms. For the plants to be enabled to yield these they must be lifted with care, so as to have good requisite at all times whenever the weather is favour-able. Should long continuous met balls; and that the blooms may not damp air requisite at an times whenever the weather is navour-able. Should long continuous wet prevail, or the atmosphere be moist, it is a good plan to keep the surface soil stirred, and add a little fresh dry earth, cocoa-nut fibre, or charcoal dust, either of which will prevent mould, and maintain all fresh and

sweet.

To have Vinlets late, all that is needed is a few old lights to cover and shelter the plants, which may either be left standing where they grew, or lifted and put into a frame or pit where they can be raised well up to the glass. J. S.

∯loqists' ∯lowers.

AZALEAS.-We are getting now a good selection of double forms of the Azalea, many of which will be valuable for decorative purposes, being quite as useful as the single ones to place on the stage of a greenhouse, and much more useful for cutting flowers from. The double white varieties have had a good addition made to them in the introduction of Deutsche Perle, a well formed and, when well grown, the best of all the double white varieties, but I do not find it so vigorous in constitution as Flag of Truce and A. Borsig. These double white varieties, if grown on to bloom early and retarded to keep up a succession, are greatly esteemed for all purposes. The plants of all Azaleas that have finished flowering should now be placed in a hothouse, to make their young wood. This will cause the buds to set early, and is the right preparation for an early bloom next season. If repotting is required, it is a good time to do so, before they are placed in heat. While making their growths any strong vigorous shoots may be pinched back to promote the formation of three or four others not so strong, on which flower-buds will Those plants that are not potted will be improved by spreading some fertiliser on the surface of the soil in the pots. Thrips and red-spider must be destroyed, as previously advised.

CINERARIAS.-These are now the great feature in our greenhouses, in fact they are indispensable where a good display of bloom has to be kept up. We had the earliest plants in flower during November, and a continuous succession has been kept up ever since. This has been done partly by named varieties and partly by seedlings. We sow the first lot of seeds in April, and again about the end of May or early in June. The offsets are taken from the named varieties in May and June. They do not require any heat to strike them, in fact they do much better without it, as heat and a close atmosphere are sure to bring greenfly. A close hand-light behind a north wall is the best place for them when danger from frost is over, but these are unlikely in May - at least, a mat thrown over the light will be sufficient to protect the plants. Seedling and propagated plants all require plenty of air when they are well estab-The early propagated plants will grow into very large specimens if they are potted on into 8 and 9-inch pots.

CHRYSANTHEMUMS. - The specimen plants are now having the foundations laid on which are to be built the gorgeous masses of bloom so much admired at the exhibitions in November. At the right time instructions were given for the selection of plants to form the largest specimens; these are now of large size, with a clear single stem seen distinctly above the mould. The plants are now in 9-inch pots, to be repotted into II12-inch sizes some time in May. In the meantime the growths should be trained out regularly by placing a few sticks in the pots, to which the centre growths are trained, the outer ones being gently drawn further outwards by a wire being fastened under the rim. By a little practice it is easy to avoid tying the growths down too close. The object is to form a natural looking specimen, and this cannot be done with the lower stems drawn down to a horizontal position. The plants raised from cuttings propagated early will now be of large size and require training in the same way. Those for the production of large blooms have been potted into 5 and 6-inch pots to be placed in their flowering pots about the end They are still protected by glass lights, which can be removed while the weather continues

PELARGONIUMS .- These are now pushing vigorously into bloom, and will require attention, if they are intended for exhibition. Should the size of the house admit of it the plants should be raised on pots from the stage to allow of the air getting more freely amongst the leaves. The flowers will also be much nearer to the glass roof, which gives them a better colour with greater substance. The growths will have been tied-out and trained into form as recommended in February. Now the sticks must be placed to the stems to support the flowers. It requires a great number of sticks to train a large specimen-so many, indeed,

that there is no room to insert them in the pot, and they have to be tied on. We do not now see such large specimens in London; they are useful for exhibition, but for no other purpose. The smaller densely-flowered specimens in 6-inch pots are much more useful plants, and more creditable to the grower. A large plant, which has its roots packed firmly in the pot requires a large supply of water; and if this is not kept up, even twice a day in hot weather, many of the lower leaves will turn yellow and drop off. It is a good plan to thoroughly sumigate the house before the flowers open; if this is not done, the plants may be injured by greenfly before the flowering time is past. They cannot be fumigated when in bloom, as tobacco smoke causes the petals to drop very much. J. Douglas, Great Gearies, Ilford, E.

THE PROPAGATOR.

PROPAGATING BY ROOT CUTTINGS .- Many plants are easily propagated by roots—that is to say, by taking off spare roots and placing them on a gentle hottom-heat until they start into leaf-growth, and also begin to form fresh rootlets. With plants with which this means of propagation is practicable it is desirable, as it ensures healthy young plants through which the sap can flow freely, by reason of their being free from the hard wood usually found in many things propagated by cuttings, and the plants so obtained are freer and cleaner in consequence. The present is a good time to put in root cuttings, and by the propagation of its roots, when carefully performed, is the most successful method of increasing many of the Bouvardias, particularly Bouvardia Hogarth, B. elegans, B. Vreelandi, which, when propagated from the roots now, will form excellent winter flowering plants the same season. The spare roots should be taken off in spring-time, or when the old plants are being potted up, and cut into pieces 11 or 2 inches in These must be placed in the cocoa-nut fibre in the cutting frame, the cocoa-nut fibre being always kept damp. When the pieces of root begin to break into growth, and the shoots are half or I inch in height, they should each be carefully potted into thumb-pots and placed upon a gentle bottom-heat. The soil should be composed of three-quarters turfy loam, and one quarter leaf-mould. To every barrowful of this soil a 48-sized potful of Clay's Fertiliser, and a 32 potful of ballast, which should be broken into pieces about the size of Walnuts, should be added -the whole to be well mixed together.

As the plants grow they should be kept pinched back all over the plant, indeed when they make two joints they must be pinched back to one. As soon as the plants are strong enough they can be potted into larger pots; but they must be replaced upon the bottom-heat. After a few days they can be removed and placed upon a front platform in a warm house. Too great importance cannot be attached to the pinching back of the plants. So soon as they have a sufficient number of shoots it is no longer necessary to stop their growth, but they should be allowed to grow for flower, the last pinching back usually taking place about the middle of September. If they are grown in pots it should be in those of large 48 or 32-size. In the middle of May, or first week in June, those to be planted out should be planted in a well dug bed, where they should be as carefully attended to and kept pinched back as if they were in Sometimes it happens that the plants are attacked by fly or thrips. To destroy these pests the plants should be syringed occasionally in the evening with a mixture of weak tobacco-water and soap To a quart of tobacco-water and a piece of soft soap about the size of a Walnut-after the soap has been dissolved in hot water-2 gallons of rain-water must be added, to compose the mixture required. The plants not set aside for propagation should he syringed now and then with this mixture, to keep them free from insects.

About the middle or end of September the plantedout plants should be potted up and placed in a cold frame to establish them, and at the approach of frost they should be taken to their flowering quartersa warm greenhouse; they will then flower in the winter and spring. Many fail with Bouvardias, some not being able to keep them clean or flower them at all, and others never being able to get them to bloom in winter and spring when they want them most. Let all such try B. elegans, B. Hogarth, and B. Vreelandi from strong root-cuttings, planted out, liberally treated, carefully watered (a little liquid manure once a week in the evening), and they will get clean bushes of Bouvardias to flower naturally in winter and spring. T. O.

COLONIAL NOTES.

WE have received the second part of Field and Garden Crops of the North-Western Provinces and Outli, drawn up by Dr. Duthie, the Superintendent of the Saharunpur Botanic Garden, and Mr. J. B. Fuller, the Director of Agriculture of the Central Provinces. We have already spoken of the scope and purpose of this work, so that we need now only say that the present part contains figures and descriptions of numerous cereal grasses, pulses, and Cucurbits. The drawings are faithful, and the descriptions contain, in addition to information condensed from well-known sources, the results of personal observation which will render the work useful as one of reference, not only to botanists and cultivators in India, but also to students of economic botany in this country.

Some few years ago we had occasion to figure Melon-Cucumber, which excited some attention at the time, and was, we believe, received by some with something like incredulity. In plate 54 of the present publication, however, we find a fruit represented which might be taken for that of a Cucumber; it is, however, entered as Cucumis Melo var, utilissimus, and concerning which we extract the following notes: — "This is another of the extreme forms or varieties of the Melon, differing in the shape of the fruit and the uses to which it is applied. fruit varies from short oval, or cylindrical, to elongate, and is either straight or curved, like some varieties of Cucumber. Some specimens grown this year in the Saharunpur Garden measured over a yard in length. They also vary in colour from dark green to nearly white, usually changing to a bright orange colour when The seeds, like those of 'Phunt,' are rather smaller, and more slender, than true Melon seeds.

Roxburgh, Flora Indica, I.c., makes the following remarks on this plant :- 'This appears to me to be by far the most useful species of Cucumis When little more than one-half grown that I know. they are oblong, and a little downy; in this state they are pickled. When ripe they are about as large as an ostrich's egg, smooth and yellow. When cut they have much the flavour of the Melon, and will keep good for several months if carefully gathered without being bruised, and hung up; they are also in this stage eaten raw, and much used in curries by the natives. The seeds, like those of other cucurbitaceous fruits, contain much farinaceous matter blended with a large portion of mild oil. The natives dry and grind them into a meal, which they employ as an article of diet; they also express a mild oil from them, which they use in food and to burn in their lamps. Experience, as well as analogy, prove these seeds to be highly nourishing, and well deserving of a more extensive culture than is bestowed on them at

It appears from these plates that Cucumbers in India have sometimes egg-shaped fruits, while some Melons have long cylindrical fruits of the shape we at home associate with the Cucumber. It will be remembered that M. Naudin conclusively proved the specific identity of these forms by the experimental culture of every obtainable variety—a striking instance of the valuable results to be got from botanic gardens. We strongly commend the perusal of this work to the notice of those of our colonists whose lines may be cast under climatal conditions suitable for the growth of these Cucurbits, which are grown in certain parts of India on a scale which will excite the surprise of the reader.

LACHENALIA NELSONI.—This is somewhat largely grown by Mr. William Ingram, at Belvoir, for spring decoration, and it is one of those subjects that deserve a place in any greenhouse. The plants are treated in the usual way in regard to their culture, and they throw up remarkably fine spikes of golden-buff flowers. All the Lachenalias are well deserving of culture; but L. Nelsoni has a marked individuality of character, which commends itself to the lovers of spring flowering bulbous plants.

The Henbageous Honden.

BIENNIALS.-Rarely have we had for all kinds of hardy biennials a more favourable winter; for do we not see the unwonted sight of Pentstemons, Antirrhinums, Brompton and other semi-hardy Stocks, and some other things that, as a rule, succumb to frost, now standing robust and full of growth, and promising a show of bloom presently, that will help materially to beautify our gardens? It Is sorely disappointing when, after much cost and labour in getting out breadths of biennials, to find them fall a prey to excessive frost or rain, and too often two or three such failures lead to the entire abandonment of their culture. The recent winter has been so generous and so kindly, that all kinds of biennials will again rise in popular favour, and some of the most effective and useful denizens of our garden borders will be widely cultivated. Especially pleasing is it to note that biennial Stocks have stood so well, even though these are not grown so largely as The grand old scarlet Bromptons, unformerly. happily, are far less seen than in old time, because several winters proved too destructive to them. Queen Stocks are chiefly seen in market orchards, where, beneath the overhanging trees, they find protection from frost, and specially from cutting east winds. In all ordinary gardens it is well, as none can foretell the nature of the winter, always to plant in sheltered spots, or beneath walls and fences, and specially where the soil is naturally dry. Stiff clay soils-even in soft winters-commonly prove fatal to biennial Stocks. Very nearly allied to these in softness of wood are the much favoured Snapdragons, and although these are so amenable to cultivation that they make excellent annuals, yet really noble spikes of bloom can only be got from biennial plants. These have often been killed, even after getting through the winter, by fierce bitting east winds in March. Happily so far they have been spared, and some noble spikes of flowers may be looked for to grace our midsummer flower shows. It is just as well with old plants of Antirrhinums to let the wood stand till danger is past, then cut it clean down to where the new shoots are breaking up from the base. A sowing of seed early in the spring gives a fine lot of plants to bloom in the autumn, and where the winter is passed safely even a finer show in early summer, so that gardens may well be graced with gay Antirrhinum flowers from May till October. Pentstemons have stood through the winter bravely, and as wondrously green and vigorous. No plants turned out from pots in the spring can for a moment compare with the abundance of bloom got from biennial seedlings; a mass of shoots break up from the lower stems, and these produce a wondrous quantity of beautiful Pentstemons should be sown under glass in April, and be dibbled out into the open ground as early as can be in the summer; then ln good soil they will bloom well into the winter. Thus they may have a long season if properly provided for. The Canterbury Bell, again, is another singularly beautiful biennial, and the newer race, which includes double flowers and so many charming colours, serves to make the culture of these plants doubly interesting. have stood remarkably well, and, indeed, are already breaking up flower-spikes, so that an early bloom may be anticipated. To get these Bells in fine form seed should be sown at once, and thus give the plants ample time to get strong ere the winter sets in. gloves are not to be despised amongst biennials, and very effective and beautiful are the spotted flowered kinds. It is a matter for surprise that tens of thousands of these superb Foxgloves are not grown in wild gardens and extensive mixed borders. In many places the mild winter has not proved so favourable to Sweet Williams, fungus-the bane of these dear old biennials-having largely prevailed. Still, they are one of our very best and most attractive of border flowers, and fine strains, such as are now to be had, are so beautiful that they deserve cultivation in every

ANEMONE CORONARIA.—I am glad to see the Poppy Anemones so favourably noticed, as they are beyond compare among spring flowers, for they are not only effulgent in their colours, but so large, bold, and showy, as to produce a most splendid effect, especially when seen in beds or borders, growing in large masses, when, with the sun on them and fully

expanded, they make a grand show. Besides being so valuable for outdoor decoration, they are fine for cutting; for if taken just before opening they expand, and remain so in water, and, if kept in a cool room, they last almost, if not quite, as long as they do on the plants. Here they are greatly prized, and have been in use a long time, and are preferred even to the double A. fulgens, which, though brilliant, is quite outdone by some of the single scarlet A. coronaria, the petals of a few of the best of which are exceedingly bright and vivid, so much so as to be almost dazzling with the full light upon them. Those who have not grown these kinds should make a point of doing so, and lose no time in sowing the seed, either in pans or on the open border-the first perhaps, the best, as by putting the pan in a warm frame the plants will soon be up, and may then be pricked off under glass, to be nursed on ready for dibbling out where they are to remain and show If sown in the open border, or hed, the soil should be prepared by being made rich and light, which may be done by digging in a good dressing of leaf-mould, rotten dung, and sand; and if the situation is a warm dry one the plants so favoured are sure to do well. Those who have grown Anemones hitherto have been content to plant the roots, and take them up or let them stand; but when so managed they are far behind seedlings in point of strength or freedom of bloom, and it is far better to sow every spring, and treat them as annuals or biennials, as after they reach those ages they are never so good; and seed is so abundant in a fine season that there is never any difficulty in saving and securing plenty. 7. S.

Che Arboretum.

PINUS (LARICIO) KARAMANA. - This is a Pine concerning which some doubts have been expressed. All are agreed that it is a form of Laricio, but all are not agreed that it is sufficiently distinct to warrant keeping up the name as a variety. We believe the discrepancies may very probably be accounted for by the circumstance that very few botanists really know the true Karaman Pine at all. What does duty for it both in books and pineta is some form of Laricio like P. romana, and not very different from any other form of this protean species. Our attention was drawn to the subject by the difficulty of ascertaining what a particular tree of considerable size, grown at Kew as Pinus neglecta, really was. The Pinus neglecta of Low is a garden name for P. Pinaster, which has clearly nothing to do with the present variety. After considerable search and repeated comparisons we have at length identified the P. neglecta of hort. Kew with some specimens in the Kew Herbarium from Gay's Herbarium, and some cones in the Kew Museum, presented by Mr. Bentham. Gay's specimens are labelled "Pinus Laricio, Poiret, ex Caramania, Jardin de Froment le Mai 26, 1826;" and it is further stated on the ticket, that M. Soulange possesses a single specimen raised from seed brought from Karamania (a province of southern Asia Minor, having Karaman as its capital), by Ollivier. The cones in the museum, presented by Mr. Bentham, were probably derived from the same source, for they bear this inscription, "Pin de Caramanie: Soulauge-Bodin, 1831." Mr. Elwes has also contributed to the Kew Museum an imperfect specimen gathered at Boydagh, which I am inclined to refer to the same form, although the evidence in this latter case is by no means good enough to enable me to speak with much confidence. The forms enumerated by Delamarre and Vilmorin. as cited by Loudon, Encyclopædia of Trees and Shrubs, p. 957, all refer to another form of Laricio, said to have been introduced into France from the Levant in 1820. As to the synonyms cited, it would be impossible to pronounce upon their applicability, still less so as to those given by Gordon, Pinetum, p. 240. Carrière places Caramanica of Spach (Hist, Veg. Phan., xi., 385, where it is mentioned as a trifling form of Laricio), under P. Pallasiana, also quite distinct from our present plant.

Whether or not this identification prove correct, it may still be advisable to put on record the characteristics of the Kew tree, which, in any case, differs rather markedly from any other form of Laricio known to us.

It is a tree of moderate height, branched from the

base; the branches rather remote one from another, the lower ones spreading, the upper ascending, all relatively thicker and longer in proportion to the dimensions of the trunk than in Laricio. The bark of the trunk is pale brown, cracking off in long oblong

varieties; each leaf is about 6—8 inches long, dark green, both lighter in colour and longer than In the varieties Taurica and Pallasiana. The structure is the same as in P. Laricio; the buds are, some globose or dome-shaped, with a long point, others more

FIG. 91 .- PINUS LARICIO VAR. KARAMANA (NEGLECTA HORT. KEW).

flakes, as in P. silvestris. The young rind is dull olive-brown, with prominent pulvini. The pairs of leaves of each fascicle are arranged in tufts at the ends of the upturned branches, the form of the tuft being somewhat pear-shaped, retuse, denser and thicker than in pyrenaica and other elongated, all reddish-brown, resinous. The male flowers are in clusters, radiating from the centre and twisted, and each about \(\frac{2}{3}\) inch long. The anther-bearing scales are yellow, tipped with pink. The cones are solitary or in pairs, divergent, spreading, 4 inches long, by 1\(\frac{1}{2}\) inch in diameter and upwards,

elongate, ovoid-conic, curved at the tip, greyishbrown. The seed-scales are oblong, rounded at the distal end; the apophysis or thickened knob at the end roundish, with a transverse ridge, and a small, shining brown, slightly apiculated boss or umbo in the centre.

On the whole, the cone is most like that of the black or Austrian form of Laricio, but it is much larger, while the leaves and buds are widely different. M. T. M.

ARAUCARIA IMBRICATA .- I am preparing a list of the finest Araucarias growing in Normandy and Brittany, and I should be glad if some of your correspondents would oblige by stating in your columns the heights of fine specimens of the tree to be found in England, Ireland, and Scotland, or in any other country where the tree grows in the open air. According to my experience, the trees of candelabrum-like form with remote branches are females, while those with denser branches and foliage are males. I think the male trees will never form such fine trees as the females; at any rate this is stated to be the case in Chili. All the Araucarias which I have observed are diœcious, the two sexes never appearing on the same tree. Have any exceptions to this been noted in England? Yes; one was figured in our columns, 1873, p. 291, fig. 58, from Bicton, and we believe a similar occurrence has been met with elsewhere. Ed.] I should be grateful for information on the following points :- Date of planting and height at that time points:—Date or pranting and neight at that time; 2, present height; 3, girth of the trunk at 1 yard above the soil; 4, sex of the tree as observed from the catkins or cones; 5, production of fertile cones; 6, habit of the tree, candelabra-like or dense; 7, have the trees preserved their lower branches? P. N. L. The height of the fine Araucaria at Dropmore, in 1881, was 61 feet. The original tree at Kew, which is in bad health, is a female, a round-headed form, and the trunk denuded of branches at the base. Ed.]

Orchid Notes and Hleanings.

ONCIDIUM LANCEANUM LOUVREXIANUM.—The bandsome O. Lanceanum, with its thick oblong acute leaves, spotted on the under-surface, and its many-flowered racemes springing from a root-stock without pseudobulbs, is, though an old plant, seldom seen in gardens. The present variety differs from the type in its lip, the anterior stalked lobe of which is white, the two shorter lateral lobes being violet. The lateral sepals and petals are greenish-yellow, with reddish-brown spots, and with a large brown blotch at the base. The flowers have a perfume of vanilla. Mr. Williams attributes the spotting of the leaves, which is apt to disfigure these plants, to an excessive amount of heat and deficient ventilation. The species is a native of Guiana. The present variety is figured in the Orchid Album, tab. 129 (1884), from a plant in the possession of M. Massange, of Louvrex, near Marche, Belgium.

DENDROBIUM BARBATULUM (FYTCHIANUM).—
A very fine spike of this, bearing the extraordinary
number of thirty-two pure white flowers, each about
an inch across, comes from Mr. James Cypher, of
Queen's Road Nursery, Cheltenham. It is a very
pretty and distinct thing, but it has the reputation of
being a bad grower. Mr. Cypher, however, does not
find it at all difficult to manage, and now that most
Orchid growers have conquered the peculiarities of
Dendrobium Falconeri, D. devonianum, and many
others which were formerly considered unmanageable,
we may reasonably hope that better success may
attend the next importation of D. barbatulum than
has been met with by previous arrivals.

DENDROBIUM PANTONI.—Amongst the Orchids belonging to A. K. Maiowariog, Esq., Oteley Park, Ellesmere, there is just now a fine plant of Dendrobium Paxtoni with 1216 blooms. This is a grand old Orchid when seen in such perfection as this. S. Ş.

ODONTOGLOSSUM SHUTTLEWORTHII.—Under this name a very pretty hybrid of O. crispum was exhibited by Messrs. Shuttleworth, Carder & Co. on Tuesday last at South Kensington. It was awarded a First-class Certificate. The ground-colour of its flowers is pure white, the sepals are reddish-brown tipped with white, and the petals and labellum white blotched and spotted with reddish-brown, the labellum having a hright yellow base. It is a very telling variety.

MASDEVALLIA SHUTTLEWORTHII.—The pretty pan of this lovely dwarf species, bearing over seventy-five buds and rose and yellow blooms, with their bright yellow tails, for which Messrs. Shuttleworth, Carder & Co. were awarded a Cultural Commendation at South Keosington at the last meeting, presented it in its true character, viz., as one of the prettiest and neatest of our cold-house Orchids. In a shady, cool place, too, it is very free-growing, and almost perpetual-blooming.

ODONTOGLOSSUM WILCKEANUM FALLENS.—A fine variety of this beautiful Orchid was sold by auction by Messrs. Smith & Dewar, in Edinburgh, on the 3d inst., to Mr. Buchanan, Oswald Road, Edinburgh, for £27 6r. The purchaser is forming one of the finest collections of Orchids in the northern capital, and which is well worthy of inspection. We may add that the pleasure of a visit is greatly enhanced by a heartly welcome from both Mr. Buchanan and his enthusiastic gardener, Mr. Grossart.

PRUNING ORCHIDS. - The advocates of pruning Orchids still continue to force before us in a contemporary fancied proofs of the inconsistency of old and experienced Orchid growers. They continue to state that we are, one and all, afraid to put their theory into practice, and, I suppose, by this infer that we condemn their system because they are its advocates. It has several times been stated that we have tried, and seen their system tried by others, years ago-in fact, long before they pushed their supposed new discovery before the public; also that we find their system wanting. Are we, then, inconsistent to give up a practice we have found attended with evil results? The latest proof that pruning away old bulbs is the proper thing to do with all Orchids is deciduous Calanthes, and that the advocates of not pruning have before recommended the practice of cutting away the old bulbs when potting the young ones to start in spring. We admit that we have done so, and con-tinue to do so now, because in this case we found no evil results attend the practice. There is a great difference between Calanthes and Coologynes. In one There is a great case, while the plant is at rest all its roots die, and the young breaks depend but a short time upon the old bulb for support, but begin to form young roots before the growths are half an inch high. In Coelogynes it is different. They first form a long rhizome, and at the end of this leaves, and, lastly, a bulb, before a root appears from the new rhizome or at the base of the bulb. In conclusion, let me say that few Orchid growers know so much that they are unwilling to learn, no matter from what source the information may come, but we are unwilling to ruin our plants again to prove what we already know. W. B. B.

VANDA TRICOLOR .- The lovely Vanda tricolor is flowering here, but there would be nothing remarkable about that, were it not for the fact that the plant is grown in the intermediate-house, where, during winter, a temperature of about 58°-63° is kept up during the daytime, the night temperature being 30-4 lower. For several years the plant was kept in an East India-house, where a temperature of 70°-80° is maintained during the winter; but it did not grow at all. It was kept close and moist, received the very best peat and sphagnum an even temperature was eagerly maintained, but all in vain; the plant did not grow well, nor did it flower, but was always in a very poor condition. In the beginning of March last year my master said once, "This will not do any longer-try it in the Cattleya house; never mind if it does die there altogether." I protested, for I knew the place designated for its reception was not the best one—the temperature was too fluctuating there, and sometimes very low. "No fear," replied my master, "try it there; the sooner we know whether it will grow or die outright the better it will be." So I brought it into a temperate-house, where it was hung high up under the glass in a corner, very hot in summer, and rather cool in winter, but always The result was most astonishing; the plant improved quickly and wonderfully, making leaf after leaf, as stout and green as could be desired, and plenty of roots, and it is flowering now freely. plant appears to be by no means particular about temperature, as I knew it to be very fluctuating in

that corner. I attached a thermometer to the plant and watched it carefully. In the winter, early in the morning it went down often as low as 50°, while two or three hours later it marked 70° to 75°, and a sudden gust of wind would bring it down to 50° again, and sometimes even lower. In the summer the fluctuations were still more heavy, sometimes 55° early in the morning and 90° to 100° two or three hours later. But notwithstanding that the plant always grew well, and is in the best possible condition now. The same may be said of Vanda suavis, which was treated just the same, and with the same result; it is not flowering at present, but is showing bloom. C. Wissenbach, Royal Gardens, Wilhelmshohe, near Cassel, Germany.

CORYANTHES MACRANTHA .- "This superb Orchid is abundant in Sante Comapan: and can you guess in what company? We think the reader will be troubled to guess. At the summit of trees, above those which bend over a ravine or rivulet, there are nests inhabited by very large ants. The diameter of these trees is often from half to one mètre; their upper part is usually covered with Coryanthes; on the side Bromeliaceous plants, and sometimes an Epidendrum may be seen between the two, pendent spikes of Coryanthes, with from two to four pure yellow flowers, mixed here and there with red-spotted varieties, with various sized spots. Nothing can be more remarkable than the conformation of the lip; at first sight it might be mistaken for a Cypripedium, In this sort of pitcher or slipper a sweet-tasting liquid is contained, probably much appreciated by epicures among the little colonies of ants established in the neighbourhood; it is a delicate sweetmeat factory close at hand. Unfortunately—doubly unfortunately for those who audaciously endeavour to remove a plant from the spot where it grows-the ants have worse stings than our wasps. For the rest, neither the explorer por his assistants dream of climbing the tree to obtain the elegant ornament which decorates it; the ape-like agility of the wild Indian is required for such an enterprise to be successful, There is thus no other means of obtaining possession of the desired plant than by levelling the tree with a hatchet, but the task is neither free from difficulties nor danger. At each shake which disturbs the tree the ants become furious; one might almost imagine that they are aware that their hive or their colony is endangered, they rush infuriated and exasperated upon the daring individual who ventures to disturb their rest. Then an extraordinary fight begins : the besieger, attacked on all sides by little creatures, whose bites, though not deep, are nevertheless very painful, gets wild, ejaculates at each fresh sting one or other of those energetic oaths of which the Spanish language offers such an ample and rich store, then either flies from his little tormentors in despair, or plies his axe like a madman, in order to hasten the fall of the tree and to put an end to his miseries. When once the tree is felled he is obliged to work very quickly, as it is against the whole colony that he bas now to defend himself. A final blow with the hatchet separates from the summit the branch bearing hatchet separates from the summit the branch bearing the nest, a lasso is firmly fixed on it, then the whole is dragged towards a neighbouring stream, where it is left for some hours, with the nest and the horrible colony that inhabits it. When it is supposed that the prolonged submersion has put an end to these wretched little animals, it only remains to detach the plants by the aid of a pruning-knife and—the work is over. Unfortunately, it seems as if a close connection joins the Coryanthes to the nest, and perhaps to the ants, like Castor and Pollux of old, for the plant once drawn from its natural phaliate and no perhaps to the ants, like Castor and Pollux of old, for the plant once drawn from its natural habitat can no longer thrive, in spite of the help of the old abandoned nest; so that we cannot help coocluding that the acts are absolutely necessary to its normal development, but I should hardly be favourable to adding this new vermin to all those already imported. I leave the explanation of the phenomenon to the Darwinians, and content myself with stating that the cultivation of this curious Orchid has but rarely succeeded in our conservatories." B. Koczi, in "La Belgique Horticole," 1883, pp. 171-2." [Illustrations of the structure of these remarkable plants, with an account of their adaptation to insect life, were given in our columns, 1882, vol. xvii., p. 593. ED.

ARBORICULTURE IN ALGERIA.—In connection with the subject of arboriculture in Algeria, it is stated that on December 31, 1852, the plantations of trees made in the three provinces consisted of 32,000,000 trees of all kinds, of which nearly half were fruit trees, and that this showed an increase of 335,759 over the previous year.

FRUITS UNDER GLASS.

STRAWBERRIES.-The finest examples of forced Strawberries are usually forthcoming this month, when the weather is generally most favourable to their production. Such early varieties as Vicomtesse Héricart de Thury are now getting over, and President and similar kinds will be succeeding them; these being of a robust habit of growth require considerable space to prevent them from hecoming drawn and weakened, and their somewhat tall flower-spikes should have such support as will give to the fruit the full advantage of the sun's rays, although in times of intense sunshine it is indispensable to shade fruits reaching maturity, in order to bring them to a high degree of perfection. Overcrowding is a mistake not unfrequently made, and probably arises in many cases from the erroneous conception that the greatest weight of fruit can be produced from a limited space by placing in it the greatest possible number of plants. The primary care now will consist in watering, which, if strictly followed up as successful culture necessitates, will entail much attention, particularly on bright days, when the plants must be examined several times; it is during such weather that the turves under pots afford most valuable service. Especial attention should also be observed that a warm flow of air is maintained, for anything approaching stagna-tion accelerates mildew—a destructive enemy, to which that esteemed variety, President, and others are very susceptible. Late kinds of the British Queen type are especially impatient at being much forced during their early advancement, and may be quietly brought forward to the point of blossoming in cold frames, where they should be arranged on a firm surface into which their roots cannot penetrate.

PINES,-Plants now swelling their fruits should have every encouragement to do so to the fullest extent, and this can only be achieved by diligent attention. To preserve them in an invigorating condition they should be individually examined twice a week, when any that are dry should be properly supplied with diluted liquid-manure. In applying this the bottom portion of the stems should be wetted, so that the axils of the leaves may retain some of the liquid, and the plants will be thereby assisted to enlarge their fruits. Endeavour to maintain a genial atmosphere, so that moisture rests in the axils of the leaves; and regulate the damping and syringing by the state of the atmosphere and the progress of the crowns. If the fruits do not enlarge proportionately with these, it may be determined that too much moisture, combined with defective ventilation, or an excess of stimulating fluid, is made use of. The blinds should be run down during the middle hours of clear days, which will, independently of preventing scalding, avert an extreme rise in the temperature of the house, and thus obviate the necessity of admitting an influx of external air, which causes an aridity, than which nothing else is more damaging. A minimum night temperature of 70° should be upheld, while that for sunless days may range 10° higher, and in bright days it may reach 90°. All fruits that are not erect should be staked so that their crowns may keep perpendicular, the gills should be carefully severed from the footstalks of the truits, and superfluous suckers be likewise removed, leaving sufficient to meet requirements. The plants prepared for winter fruiting should have every inducement to make a sturdy growth, to effect which a steady bottom-heat of 85° to 90° should be maintained, regular application of weak liquid-manure administered, and constant attention be paid to their various minor requirements.

VINES.—The borders of houses in which the fruit is about to change colour must in no case be allowed to approach dryness, so that no impediment accrues on that account to this important process. It is manifest that to dryness at the roots may be correctly attributed one of the various causes of imperfection. During the course of colouring the back and front ventilators should be kept more or less opened continually, the growth of laterals should be encouraged so that perfect vitality in the Vines may be sustained, and the extra shade thus occasioned will be very helpful to black varieties. White kinds colour best who fully or partially exposed to the sun's action, and to advance this the Ioliage should be carefully drawn aside from over the bunches. Houses containing suc-

cessional Hamburghs which have recently had their fruits thinned should have a night temperature of 65°, which may safely rise from 85° to 90° in the daytime from solar heat, and be closed with that temperature if accompanied by adequate atmospheric moisture. See that the horders are well mulched with short manure, and that they also receive copious supplies of good liquid manure, especially where the Vines are old and weak. Muscat-houses nearing the blossoming stage should have their laterals carefully brought down to the trellis, their young growths stopped, and useless bunches removed before the flowers commence to expand, so that no check may occur in attending to these during the time the Vines are in blossom; when this stage is reached the night temperature should be kept at yo', and a correspondingly high day temperature be maintained, accompanied with a free temperature be maintained, accompanied with a free circulation of warm air, so conducted that superfluous moisture is expelled by mid-day, when, to accelerate perfect fertilisation, the camel-hair brush and pollen from Hamburghs, if accessible, should be brought into use. Lady Downe's and similar late varieties, which take a long time to ripen perfectly, should be encouraged to make their growths early, which should be stopped and brought down to the trellis, so that every portion is well covered, but not crowded; a night temperature of 60° will be the correct practice until the blossoms open; that for the day may attain from sun-heat, 85°. The Vines should be syrioged over when the structures are closed for the day, and this should be early, so that the temperature may this should be early, so that the temperature rise a few degrees. Thomas Coomber, The E. Gardens, Monmouth. The Hendre

Plants and thein Cultune.

STOVE PLANTS FOR CONSERVATORY DECORA-TION DURING THE SUMMER MONTHS .- There are many occupants of our stoves that may be advantageously used for this purpose during the above period of the year; those of the fine-foliage section will be, as a rule, of the most service, imparting a tropical appearance to this structure, which will be found most pleasing as well as affording a relief to the eye after beholding the wealth of floral beauties out-of-doors. A quantity of flowering plants when massed in the conservatory during the summer will not in a general way meet with that admiration which is bestowed upon such of this section as are worked up to give a display during the autumn, winter, and spring months. By utilising the hardier of the stove and intermediate-house plaots a far greater amount of novelty will be afforded, besides which more room will be found in these latter structures for the better growth and display of those plants which are not of a permanent character, such as the Caladiums and other bulbous genera. We make it a practice to follow out this method of procedure early in June, finding thereby very great relief in the other houses and no injury to the plants that we use.

It may be thought that we are somewhat premature in treating of work for June and the following summer months; it Is, however, necessary to anticipate future arrangements at once, so that preparations may be made accordingly to meet the requirements when the time arrives. No plants from the warmer houses should be used uotil they are well established, after having received their last shift. Over-potting of such plants will be more likely to result in failure, the other extreme will be much the safer plan to follow, the roots will more readily assimilate the food necessary for the proper sustenance of the plant. to be derived from artificial manures will afford sufficient nutrition to plants that are pot-bound. following among the foliage section will be found very useful for the object now under consideration, viz., the Dracænas of the bardier types, of which Youngii is one of the most noble and effective when well grown, its dark leaves of metallic lustre are most striking; D. Baptistii and D. Shepherdi are both fine species, being counterparts of D. Youngii in habit but quite distinct in markings to that kind, as well as being better known to most cultivators. With us most of the hybrids that we have grown are of too delicate a constitution for this kind of work. D. gracilis, D. cannæfolia, and D. umbraculifera among green-leaved kinds are the most durable and effective. All of the Pandanads that are usually grown may be safely used; so also may he Crotons with leaves of good substance, especially those with broad foliage, The Aralias again will impart a distinct character, whilst the South African Asparagus, A. plumosus nanus, will also thrive in a temperate-house in the winter even, leaving nothing to fear in using it for the conservatory during the summer. Cupania filicifolia, more elegant in growth than Jacaranda mimossefolia, is another plant that we have used without being injured. Erythrina marmorata is also a good decorative plant, that will withstand nearly as much rough treatment as Ficus elastica. The Rhopalas with their distinct foliation are another durable class of plants, not so much cultivated as they deserve to be. These are among the best of the stove plants with variegated or ornamental foliage. The best of the Palms were treated of in a previous Calendar (January 19, p. 83).

A good stock of Cyperus alternifolius and C. laxus will at all times he useful, and will repay for present attention for summer uses. Curculigo recurvata in goodly number will prove of much service. Some pots of cuttings should be got in of Panicum varie-gatum, Tradescantia discolor, and T. zebrina; these will be useful where any stages or ornamental baskets have to be filled to impart a finish to the front in association with Isolepis gracilis. When there is room in the propagating pit, a few potfuls of Fittonia argyroneura and F. Pearcei should be got in for use later on in room decorations in conjunction with the dwarf-growing Club Mosses (Selaginellas), of which a stock should always be coming on when much decorative work has to be performed-all the more so where fresh green moss is not readily obtained. Of flowering stove plants that are available for the conservatory, those of the bulbous section are among the most useful. Gloxinias, when not brought on in a high temperature, will last a good time; so also will the Achimenes, the Hæmanthus, the Imantophyllum, the Amaryllis, and the Eucharis even. with careful attention. Some well-grown plants of the Hedychiums will be noble objects when in flower, and at all times effective by their ornamental growth The comparatively new species of Impatiens, I. Sultani, is a most valuable flowering plant, the good qualities of which are now being more fully recognised. It is a capital plant to use in association with Torenia Fournieri, both of which may be easily raised from seed, and if so done as previously advised they will now be ready for pricking off, or even for potting singly into small pots if good progress has been made. Some of the bulbous plants from the greenhouse are excellent additions to the class of plants that we have been advising for conservatory decoration. Chief among these are the Liliums in well-known varieties-their growth and flowers standing well above many of the surroundings displays them to the very best advantage. With good management their season may be prolonged from early in June till October with ease. Our latest are now in the open air, whilst the forwardest ones are coming on in a late vinery just started. The Gladioli furnish us with excellent subjects; specially valuable is the white form of G. Colvilli, which for pots in early summer is quite a distinct feature. The later kinds with the Liliums as they advance in growth should have a top-dressing of good soil to encourage the surface-roots. The Blandfordias, too, are well worthy of more extended cultivation, whilst later on the Nerines, to which attention should now be given to ripen off a healthy leaf-growth, will he of much service in the late summer. Pots of Vallota purpurea that require a shift should now be seen to; they will soon be growing away freely, and will then quickly lay hold of the new soil. Tritonia aurea is another beautiful autumn flower for the conservatory; we cannot, however, succeed with it to our satisfaction. Our houses are not congenial to its well-being, or else our management has been at fault. James Hudson, Gunnersbury, Acton, W., April 7.

The Orangery.

ORANGE TREES IN POTS.—Reference was made to reporting the trees at p. 179; this is an important part of the culture—indeed, it may be said to be the foundation upon which the cultivator builds his future successful practice. Many persons fancy that peat is the best material to pot with—a notion founded, no doubt, upon the practice of French or Belgian growers, who send over the fancy varieties in a black hoggy kind of soil, which does not possess sufficient lasting properties to produce good fruit as well as good blossoms. The trees do well if allowed to

remain in the same pots three or four years in succession, but then the drainage must be good to begin and this is secured by placing the potsherds in carefully, and over them some very fibrous turf from which the particles of earth have been well shaken. The potting material itself is the turfy part of good loam, a liberal sprinkling of crushed bones, and some charcoal broken into bits from the size of a Hazel-nut to that of a Walnut; a little rotten stable manure may be used, but I am not sure whether this does not cause a more rapid decay of the loam. The crushed bones seem remarkably well adapted for the culture of this tree, and sufficient can be applied to sustain the vigour of the trees for at least three years. surface-dressing is applied in the form of powdered bones, charcoal reduced to powder, and loam, when the fruit is set and swelling. At this time of the year they cannot have too much heat and moisture; 65 night is a good minimum, and not a particle of shade is necessary. Syringe vigorously on opening the ventilators in the morning, and again when the house is shut up in the afternoon. 7. Douglas.

The Orchard House.

In the early house the fruit is now swelling rapidly. It set very thickly indeed, and required a great deal of thinning out. After this time there is no daoger of it dropping off, if the trees receive ordinary attention. The roots are now in a state of active growth, and require much water, especially if they are grown in In two or three weeks surface dressings should be applied, but not too much at a time; two doublehandfuls should be enough for a 15-inch pot; as much more should be applied about every ten days or a fortnight. The dressings seem to disappear very rapidly, but hy constantly adding to it we get a depth of about 2 inches, which In time becomes quite permeated with roots. If the house is a small one a good syringe will be sufficient to wash the trees with twice daily; but in large houses a garden-engine is necessary, and the water must be applied with considerable force under the leaves as much as possible, as it is there that red-spider first establishes itself, In the late house the trees are just going out of bloom, and the blossoms seem to have set there as well as they have done in the early house. A great deal depends on the weather; cold, dull days at the time of flowering means a bad set; but the cold is not injurious if the days are sunny. In clear sunshine never mind the east wind blowing through the house. Some people are afraid to open the side-ventilators, and depend upon the top-lights only. This is mistaken kindness, especially when the trees are in flower; indeed, I do not care to grow Peaches and Nectarines under a high, moist temperature, except during the time of the second swelling after stoning is over, admitting more air, and lowering the temperature when the fruit begins to ripen off. Plum trees do not set their fruits quite so freely as Peaches, and Pears are more difficult to deal with than either. Some years ago I had to do with an orchard-house in which it was difficult to keep a sufficiently dry atmosphere at the flowering period, owing to the number of other plants requiring water which had to be accommodated in the house, and it afforded an opportuoity of ascertaining the relative degrees of hardiness of the different varieties of Peaches and Nectarines, as well as the relation which they bore to the setting qualities of Plums, Pears, Cherries, Apricots, and Apples. Cherry blossoms never set well in the moist atmosphere, and Apples set as freely as Peaches and Nectarines, while Apricots would set with much the same relative freedom as Plums. J. Douglas, Great Gearies, Ilford.

DAVALLIA VEITCHIANA, — This appears to be the most perfect thing in the way of a basket Fern that one can well imagine. It is a sport from D. tenuifolia, and is most elegant. There are now several plants of it growing in baskets in the Exotic Nursery at Chelsea, the elegant fronds haoging down in the most tasteful manner, and nothing more appropriate can scarcely be selected. It does well in an intermediate house. If it succeeds as well in a pot as in a basket, it should make a telling subject in a collection of exotic Ferns. Groups of these are met with frequently in exhibition tents about the country, some of which are sadly wanting is subjects of a lighter and more elegant character.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, April 17

Linnean Society meets at 8 p.m. Papers to be read;—1, Mago. Fungal a Lichen to the read;—1, Mago. Fungal a Lichen J. N. Crombie: 2, "Ornithology of New Guinea (No. 9;);" by Rev. Bowdier Sharpe, 3, "Variation in Leal of Banksia margi-nata;" by J. G. Otto Tepper. Roberts Sharper and Spring Show. Sale of Imported Orchids, at Stevens' April 18 Sale of Imported Orchids, at Protheroe

N our last number we gave a summary account of the discussion which took place at the highly successful Daffodil conference, but there were a few points touched upon which, for want of space, we could then only indicate, but some of which are of sufficient interest to advert to again. One of the most interesting and important points brought out by Mr. ELWES, was one relating to the geographical distribution of these plants. The genus Narcissus is confined to the western half of the northern hemisphere of the Old World-a circumstance connected by Mr. ELWES with the fact that the roots of Narcissus in a wild state are not truly deciduous except in the Corbu-laria section. The consequence is that underground growth goes on more or less all the year without that arrest of growth during the

FIG. 92.-THE TRUE DOUBLE WILD DAFFODIL.

dry season, such as is characteristic of Crocuses and Tulips, whose roots dry up and wither. The Narcissi, then, are fitted for a relatively moist climate, and will not, except in a few instances, bear the drought that some other plants endure. Some species, like Narcissus triandrus, do not like a limestone soil, but rather one that is peaty or sandy. N. calathinus seems to need the propinquity of the sea. Many of the more tender species, said Mr. ELWES, would do well in Holland if protected from frost-an opinion corroborated by the experience of M. KRELAGE, who recommended their culture, where possible, in sandy well drained soil. Incidentally, Mr. ELWES alluded to the great variation that takes place in Tulips when cultivated. To such an extent does this take place that no one would recognise the plant after a few years' cultivation to be specifically identical with that planted in the first instance. This statement was also confirmed by M. KRELAGE, who adverted to the singular fact that some Tulips revert in a measure to their aucestral form, and remain constant to it thereafter, probably because the conditions are such as better suit the original form than the developed one. But this is a matter environed with difficulty, because if one Tulip behaves in this way, why not all? We can only fall back upon individual proclivities, which,

however, is the expression of a fact, not the explanation of one,

Among the species difficult to cultivate, probably because they are not able to accommodate themselves sufficiently to circumstances, as before explained, Mr. ELWES cited the curious Mogador species, N. Broussonetii. Mr. SHORT, however, mentioned that he had grown the plant in the open, but protected it in winter. The leaves attained a length of 2-3 feet, but up to the present the bulb had not flowered. It was surmised that this plant, of which a figure is given in BURBIDGE'S Narcissus, might really not be a Narcissus at all. With reference to the beautiful white Hoop-Petticoat Narcissus, N. monophyllus, Mr. ELWES said that Mr. HAMMOND, of St. Alban's Court, near Wingham, grew it to perfection. His system was to give abundance of water during the growing season, and to dry up the bulbs thoroughly afterwards. Mr. BARR had succeeded by growing the plant in the open border, putting a frame over it in summer.

Mr. FRANK MILES mentioned having crossed

done with the subject for the present. Doubling in Daffodils, as in other plants, depends on various circumstances, sometimes merely on the repetition of the perianth segments in various degrees, sometimes on the more or less complete substitution of petals for stamens, or for stamens and pistils, very frequently to the combination of both these methods in the same flower. It is but rarely that the change is so great as entirely to obliterate the stamens and pistils; the ovules indeed are usually perfect in these flowers, so that fertilisation is possible, though few of us had the luck, like Mr. BROCKBANK, of seeing seed-pods. A further complication is shown by the fact that the cup is sometimes present in these flowers, sometimes absent; thus in the double N. Eystettensis (fig. 93) the perianth segments are repeated over and over again in regular order, but the corona is not developed at all. In the "Codlings and Cream" the perianth segments are repeated over and over again, and the corona is sometimes present, sometimes absent. In the "Butter and Eggs," the deep orange corona thus repeated in alter-

FIG. 93.-NARCISSUS EYSTETTENSIS.

N. triandrus with N. Pseudo-Narcissus, the result of which we should be glad to see. Daffodil of the future, in his opinion, should have larger flowers, more distinct in colour.

One thing is clearly indicated by the display of Daffodils and the comments made on them, and that is, that Daffodils, even wild Daffodils (and the remark applies, of course, to other plants), were not created as we now see them. They are the descendants of an earlier and a different form, and which have gradually become modified to suit particular circumstances. There are various ways of proving this, that is so far as such matters can be proved; but the most direct evidence is to be sought in that which we mentioned last weekthe development of the individual flower from its origin to its fully developed condition. Those species which are most highly endowed with this power of adapting themselves to circumstances are those which are most likely to vary: the gardener has caught them in the act, and has encouraged the propensity to the extent we now see.

A word or two about doubling, and we have

nation with the pale perianth segments, gives the parti-coloration to which the plant owes its popular name. In the double wild Daffodil proper (fig. 92) the original cup is entire, and encloses a mass of petal-like stamens and pistils. Carry the process further, and the outer corona bursts like the calyx of a Pink, and sometimes the flower becomes "quartered" like a Rose, as in some forms of Telamonius. We have even seen tier after tier of double flowers one above another, each separated from its fellow by a short stalk or prolonged axis, but this was in the days before Daffodils were in fashion, and such a flower would have been considered an ugly monster, despised even by the botanist. Now, the public are evidently not disinclined to mix a little philosophy with their love of beauty, and, as Professor FOSTER well put it, are no longer satisfied with the maxim that "Ignorance is the proper setting of beauty."

- HORTICULTURAL MEETINGS IN GHENT .-The first of the montbly meetings inaugurated by the Syndical Chamber of Belgian Nurserymen was held at the Casino, in Ghent, on Monday last. These meetings, it will be remembered, are established on

Fig. 94.—Group of Crown imperials. (see p. 475.)

somewhat the same lines as the Fruit and Floral Committees at South Kensington.

—A ROSE AND LILY EXHIBITION will be held at the Hague, kingdom of the Netherlands, from July 10 to 13 next. The exhibition will be held in the building devoted to Arts and Sciences under the direction of the Hague division of the Netherlands Horticultural and Botanical Society, under the patronage of the King, The prizes amount to 1682 guilders for Roses, and 438 guilders for Lilies. Specimens grown in pots and cut flowers of both subjects are invited, and a number of medals will be awarded.

— THE INTERNATIONAL MEALTH EXHIBITION.—The Fruits of all Countries is the title of one of the handbooks now being written for the Health Exhibition authorities. The anthor is Mr. W. T. THISELTON DVER, of Kew.

- EPPING FOREST .- At a meeting of the Common Council on April 3, Mr. C. H. STEWART (Chairman of the Coal, Corn, and Finance Committee) brought up a report with reference to Epping Forest, and said that for the acquisition and maintenance of the Forest up to the end of the year the sum expended was £277,317. The committee estimated an expenditure for 1883 at £6045. They had, however, spent upwards of £9792, of which £3250 was upon extraordinary expenditure, but the greater portion was that which would bring in a good annual income. The Council would require from the Epping Forest Committee in future an estimate of probable expenditure in each year, and that they should not exceed the estimate without obtaining the sanction of the Court. It was hoped that the committee would alter the Forest as little as possible. The report was adopted.

— ROYAL METEOROLOGICAL SOCIETY. — At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 16th inst., at 7 F.M., the following papers will be read:—"On the Origin and Course of the Squall which Capsized H.M.S. Eurydice, March 24, 1878;" by the Hon. RALPH ABERCROMEY, F.R.Met.Soc., "Waterspoots and their Formation;" by Captain I. W. C. MARTYR. "The Weather Forecasts for October, November, and December, 1883;" by CUTHBERT E. PEEK, M.A., F.R.Met.Soc. "On Certain Effects which may have been Produced in the Atmosphere by Floating Particles of Volcanie Matter from the Eruptions of Krakatoa and Monnt St. Augustin;" by WILLIAM F. STANLEY, F.R.Met.Soc., F.G.S.

- Blackthorn .- A writer in a sporting paper, treating of the opening of the fishing season, and describing the waterside where he proposes to operate, alludes to the dark Blackthorn twigs that are "covered with a pale snow of blossoms for miles down the sheltered glens of southern shires." At present our home counties, and no doubt others further afield, are gay with hedgerows crowned with numberless blossoms of the Blackthorn. The whole of the Plums appear to be wonderfully free of bloom this season. Our fruit gardens, and especially those in which certain sorts are largely grown, are shrouded in white flowers; and looked at from a distance it seems as if a wealth of snow had fallen densely on some parts of the country. In the bedgerows Sloe is flowering in "happy plenteousness," and it is interesting to note how in the same hedgerow, fully exposed on all sides, while some of the bushes are in full bloom, with scarcely an unexpanded bud, there are some so much later that scarcely an expanded flower meets the eye. There appear to he inter-mediate forms also. If the early one were in a shel-There appear to he intertered or more favoured spot, the difference in time of flowering would not be so remarkable; but close together, apparently under the very same conditions of development, were three distinct periods of full bloom. Nor did the difference appear only in isolated places, but it could be noticed at intervals in a hedgerow of considerable length. This was in the southern part of Hertfordshire.

—— AERIAL ROOTS OF GARDENIAS.—In St. John's Nursery, Mattock Lane, Ealing, Mr. GEORGE WEEDEN some sixteen months ago planted out some Gardenias in a small house previously used for growing Cucumbers. The plants have done well, and are

producing large numbers of flowers, and at the points of the branches, where the young shoots have come out of the leaf-axils, the plants are developing aerial roots very freely. As soon as the buds are set at the points the shoots are cut from the bushes just below the roots, potted in small pots, and plunged in a hotbed. In a few days these are nicely rooted plants, and Mr. WEEDEN has several small specimens, 9 inches or so in height, bearing several flowers. It may be that, the house being small and low, with an abundance of moisture at a high temperature, the plants are induced to put forth aërial roots, which they do with remarkable freedom. In this way Mr. WEEDEN is able to increase his stock rapidly, and possess saleable plants in a very short time.

-- Times of Plums Flowering.-In a large fruit garden near Chiswick three sorts of Plums are grown somewhat largely, viz., Prince of Wales, Victoria and Pond's Seedling. The blossom of the former has withered in the ordinary course, and the young fruit appear to have set plentifully. The Victoria has perfected its flowers, and a few more days will see it withered. Pond's Seedling is in full bloom, but it is noticeable that while the blossom of the two former was plentifully distributed all over the trees, and notably in the interior of them, the blossom on Pond's Seedling is mainly on the circumference, the points of the branches being thickly set with it; but there is little distributed over the interior of the trees. Standard trees of the Green Gage and Orleans are thickly set with blossom also,

- LARCH IN SPRING,-What a striking hue of young, fresh, living green is afforded by the Larch in spring. Well and truly has it been remarked that for picturesque beauty the Larch is almost unrivalled. Looking across a stretch of verdure, on the opposite side could be seen a line of woodland, bare of foliage, except that furnished by some specimens of Larch in the foreground, shapely and of smooth outlines, with a graceful droop peculiar to this member of the Pine family. As soon as the Larch begins to assume the dimensions of a tree it is elegant in appearance, and though it may not be termed a beautiful tree, "it though it may not be termed a beautiful tree, "it has," remarks Mr. A. J. DOWNING, "what is perhaps more valuable, as being more rare—the expression of boldness and picturesqueness peculiar to itself, and which it seems to have caught from the wild and rugged chasms, rocks, and precipices of its native mountains. There its irregular and spiry top and branches harmonise admirably with the abrupt variation of the surrounding hills, and suit well with the gloomy grandenr of those frowning heights." But it has its uses in valleys also, and especially when dotted about the foreground of woods, composed of trees that are later in bursting into growth. But it needs to be planted sparingly, it is so unvarying in form that if planted numerously it becomes monotonous, and a defect in the landscape. Just now the Larch can be seen to the best advantage, and in all its earlier stages of growth it has a singularly cheerful green appearance, eminently vernal in its Ireshness and life.

- RHODODENDRONS AND NATURAL SOIL .-Looking through a Hertfordshire garden a few days ago, we were struck with the luxuriance of some Rhododendrons growing in a sandy loam on a bed of sand. They were planted in beds of native soil, with which had been mixed plenty of leaf-mould and decayed matter from the rubbish heap. Into this they had rooted deeply, and flourished like the traditional riverside tree. Immediately after flowering a summer mulching of very rotten manure is added, with great advantage. Beds of Rhododendrons planted at an earlier date were also to be seen, doing well; but if a bed shows signs of exhaustion the plants are taken up, and alter well breaking up and renovating the soil they are replanted: previous to placing the summer mulching of manure on the bed, the surface is lightly forked over, care being taken not to injure the roots near the surface. The bed is also pricked over with the fork in autumn, so that any of the manure remaining may become incorporated with the soil. Many Rhododendrons fail through being placed in unsuitable soil; a timely preparation of of the compost would prevent failures of this character.

— CITY AND GUILDS OF LONDON INSTITUTE,

—A cumbrous name for an establishment which should
be of the highest importance to the commerce and
manufacturing industry of this country. Science is
making such rapid strides in old departments, and

breaking ground in so many fresh directions, that unless our manufacturers keep pace in their degree they stand a chance of being well beaten in the race by our American and German competitors, and so, we ven-ture to say, it will be with agriculture and horticulture in the luture. Although in the vast pile erected at South Kensington as in the report before us we see no hint that anything is to be done for these important branches, we cannot believe that the practical sense of the country will long permit agriculture, and specially horticulture, to be unrepresented in the course of progress. At the new Institution large sums are being expended to supply theoretical and practical instruction in most branches of manufacturing industry. Why foud industry and horticultural industry, the commercial importance of which latter is enormous, though but little known to the general public, should be left norepresented is a mystery. The main object of the Iostitute is to train, not merely instruct, teachers in mechanical and electrical engineering, in the arts of construction and decoration, in chemical and other manufactures. Professor HUNLEY, quoting HARVEY, the great anatomist, says "Those who fail to obtain by means of their senses and observation an exact knowledge of the objects with which they are concerned, fill themselves simply with inane fancies and empty imaginations," HARVEY applied the observation to his own subject, that of anatomy; but it is clearly of general application, and applies as forcibly to botany, vegetable physiology, and chemistry, as the basis of progressive plant-culture, as to any other branch of knowledge whatever.

- MASSACHUSETTS HORTICULTURAL CIETY, Boston. — The annual Azalea and Rose exhibition, which is the first of the series given each year by the Massachusetts Horticultural Society. opened at Horticultural Upper Hall, recently. exhibition, says a correspondent, who sends us the account, was the finest of the kind which the Society has ever given. Although this was called the Rose and Azalea show, these two flowers did not monopolise either the space or the attention, and a brilliant feature of the exhibition was a fine display of Orchids. In the centre of the hall was a display of Orchids, the largest ever given by the Society, which was composed of contributions from the conservatories of Mr. F. L. AMES, Mr. GILMORE, Mr. PRATT, and Mr. HUNNEWELL. At the entrance to the hall was a special exhibit of the hybrid Narcissns, from Woolson & Co., of Passaic, N. J. Mr. Woolson is a graduate of the Massachusetts Agricultural College, and is the largest grower of her-baceous plants in the country. In his exhibition were 110 distinct named varieties of the Narcissus, which was the best show ever made in Boston, besides twenty varieties of spring flowers. Among the plants of the Narcissus were several novelties, and there were also shown spring Anemones and alpine plants. The two principal exhibits of Azaleas were made by MARSHALL P.WILDER and by HOVEY & Co. The exhibitions were on opposite sides of the hall, and were specially attrac-tive features of the display. Mr. WILDER showed twenty-six varieties, among which those of special interest were the Marquis of Lorne, a showy bright red plant; the Countess of Bedford, pink, with dark centre; Criterion, light pink; and Baron de Vern, an elegant white plant, which is very showy. Mr. Hovey showed about twenty-five varieties, of which the more noticeable were the Comte de Kerchove, white flowers, striped with red; Suzette, an extremely large-sized plant, with light purple flowers; Triumph of Double Whites, a double white flower and very elegant; and Madame Leon Mahant, which is of the very best and bas a red flower; and Sigismund Rucker, with light pink flowers,

"POPULAR MICROSCOPICAL STUDIES,"—A short time since we had occasion to mention the direct practical value likely to ensue from an examination of the microscopical structure of plants. Up to this time the microscope has been left to professed botanists, and to a large extent this must still be so, as the manipulative skill and patience required are hardly compatible with the practical labour of the professed gardener. Nevertheless if it can once be made manifest that practical results are likely to accrue, we shall no doubt find some enterprising gardeners availing themselves of the instrument, and not content to rely wholly upon the observations of other people. An immense help to practical men and amateurs is afforded by Mr. Arthura Cole, who is publishing a work in parts under the title above-

mentioned. The issue of each part is accompanied by a properly prepared microscopic slide, the descrip-tion of which is given in the letterpress, together with a coloured lithograph taken from the specimen itself or from one of a similar character. For lecturers or students of particular subjects this publication likely to be of the highest service. We hope Mr. COLE, or some competent person, will see his way to the preparation and issue of a series of slides illustrative, say, of the structure of particular families. It so bappened recently that we had occasion to examine superficially some twenty leaves of different species and genera of Orchids, and though not wholly inexperienced in the matter we were surprised and delighted at the great variety and interest revealed by cross sections of the leaves of various species. We can but earnestly commend the further pursuit of this matter by those whose leisure and skill enable them to do so.

THE

NEW AZALEA INDICA AT SOUTH KENSING-TON.—The very interesting group of these shown at the meeting of the Royal Horticultural Society on Tuesday last by M. Louis van Houtte, of Ghent, carries one back to the time when a similar group from the same source was exhibited, a dozen or so years ago. Each collection marks a period of decided advance in the way of Continental enterprise, not, however, that there has been by any means a pause in the work of production, for almost yearly since English nurserymen going over to Begium in the spring brought back with them some useful and acceptable novelty. That out of a group of some eighteen or so new varieties, nine of them should have secured First-class Certificates of Merit is a remarkable occurrence. The varieties so favoured are Souvenir du Prince Henri, semi-double, bright rosymagenta, clear in colour, good shape, large flowers, very free and showy; Baron Nathaniel de Rothschild, semi-double, pale bluish-purple, good full flowers very free; John T. D. Llewelyn, double, very delicate flesh, margined with white, bright crimson spots in the centre, and markings of the same, finely formed petals, distinct and very free; Souvenir du Duc d'Albany, very large, pure white, fine form, very attractive; Mdlle. Marie Stockman, semidouble, pure white, very free and good; Comte de la Torre, single, delicate pink, with a regular margin of white, the upper segments richly marked with crimson and slight flakes of deep piok, very pretty and distinct; Comte de Paris, single, very fine in shape, white, with a broad flame of pink on each segment and slight rosy flakes on the upper segments, and also spotted with bright crimson; Comte Adrien de Germiny, single, the lower segments deep brick-red or dull pale crimson, the upper petals having a broad wedge of purple, and also spotted with black, a very distinct but decidedly dull-looking variety, large flowers of fine shape; and Mr. B. S. Williams, single, very rich magenta, slightly shaded on the edges, slight dark spots on the upper segments, very large, stout, and extra fine. The following appeared to be the best of the uncertificated varieties:-Sir T. Spencer Wells, single, bright crimson, crimped edges, large and showy; Mrs. B. S. Williams, semi-double, white, with slight rosy flakes; F. W. Moore, semidouble, bright rosy-crimson, fine in colour, very free, but the flowers were not sufficiently expanded to judge of their true character; and John Hawkesworth, semi-double, pale orange-scarlet with finely formed petals. Mr. B. S. WILLIAMS exhibited one of M. Louis van Houtte's new varieties of 1883, viz., Madame Estelle Cavelier; this is of a rich orangecrimson shade, fine form, and very free, and well descrying attention for its obvious good qualities.

— PLANTS IN BLOOM AT MR. B. S. WILLIAMS' NURSERY. — Here we recently saw an immense bot of sheaths throwing up in the fine collection of Cattleyas (1100); few have really opened, but they will begin doing so in a few days. A fine specimen of C. Mendelli was seen with blooms quite 7 inches across the petals, of a very pure white, and deep purple-frilled lip; a very finely marked Lycaste, L picte, having a prettily spotted lip of a high colour; Cymbiotium eburneum Dayanum, a white form, prettily spotted; and the white Dendrobium Draconis, so charmingly contrasted with its orange-crimson throat. Of Cypripediums a few were in bloom, the choicest of these being C. Jævigatum and C. Argus. The Zipopetalalms are represented by the late-blooming species, roseum and ceruleum. Many

plants of Vanda suavis and V. tricolor were in bloom, carrying strong racemes of their richly-marked flowers. Several Odontoglossums adorn the houses devoted to these favourites, consisting of such as O. Hallii leucoglossum, O. cucullatum, and O. Alexandræ gigantea, this last carrying some very long spikes of its large, white, beautifully spotted flowers. This sort, with its much branched habit of flowering, was quite a feature in the house. Of other plants in bloom some pretty Francisea calycina were carrying each a robust head of flower on quite small plants, unbranched as yet, and growing in large 60's. not see so much of this lovely dark purple flower in gardens as we ought to do. A beautiful hybrid between Azalea and Rhododendron was in bloom in the house devoted to hybrid Rhododendrons bearing large rosy-white heads of flowers, decidedly more Rhododendron-like than otherwise, but with the coriaceous foliage of an Azalea. The strange Cochliostema Jacobianum bore two large spikes of rosy-purple and blue flowers. The rare Ochna multiflora was fruiting abundantly in a warm stove, the scarlet berries and orange-green calyx making it a pretty decorative object; this should prove a capital table plant, and it will be a change from what is seen generally. It is easily grown, and fruits on small young plants-another desideratum. Some very superior hybrids of Clivia miniata were throwing up massive heads of bloom. of these, now open, are Madame Van Houtte and Martha Reimers, the colours gold and scarlet; and the great substance, regularity, smoothness of outline of the petals marked them as great advances in this favourite genus. These are both of Belgian origin, and will not be unknown to visitors at London exhibitions. Here much is made of Azalea mollis, the show-house being gay with these, and many fine Hyacinths and Tulips, some of which were shown at the "Park" and the Royal Horticultural Society's recent

— CATERHAM HORTICULTURAL SOCIETY. — The annual summer exhibition of this Society will take place on Wednesday, July 23.

— THE OXFORD ROSE SOCIETY'S thirty-third annual exhibition will be held in New College Gardens on Thursday, July 10.

- INDIA-RUBBER IN PARA. - Reporting on the trade and commerce of Para, Mr. Consul GREEN says the chief article of export is india-rubber, and that this trade has increased so much of late years, owing to the high prices the article has been realising in the consuming markets, which has induced immi-grants to apply themselves chiefly to its collection. Should the demand continue for the article," Mr. GREEN says, "I see no reason why the yield should not go on increasing, as there are new fields being continually opened. From Peru now comes a class of rubber 'Caucho,' in slabs or sheets of about 4 inches thick and 2 to 3 feet long. It ranks a little higher in value than the coarse quality, i.e., Sernamby, and I should estimate that 400 to 500 tons of this quality come to market every year." From a table showing the india-rubber crops from 1870 to 1882, it appears that in the former year 4794 tons were produced, which steadily increased till 1881, when it showed 8936 tons, rising in 1882 to 9624 tons. The increase in value in the twelve years was about £1,749,011 13s. 4d.

— PROPAGATION OF DOUBLE-FLOWERED GOREE AND OTHER DWARF SHRUBS.—Cuttings of double-flowered Gorse made from the current year's growth, and put in under a hand-glass in September, will be rooted by June, when they may be taken up, and the cuttings should be from 4 to 5 inches in leogth, and have the leaves stripped, or rather cut off, for half the length. A prepared sandy border, close to a wall, on a north aspect, is a good place for the hand-glass. The St. John's Worts can be propagated in the same way as may Eupleurum fructicosum and Santolina Chamæcyparisus and Gaultheria Shallon, all of them useful subjects for gardens and pleasure-grounds.

FALSE SCAMMONY.—It is well known that scammony, the resin of Convolvulus Scammonia, as usually found in the English market, is very much adulterated; all sorts of substances are mixed with it, as it is prepared in Asia Minor. Of late years, however, the root itself has been brought into English commerce, and the extract prepared from it by our

own manufacturing chemists, so that genuine scammony can be obtained. This, however, is not the case in India, that sold in Bombay is said to be all fictitious, without the slightest resemblance to genuine scammony. It is somewhat translucent, of a bright greenish colour, has a resinous smell, taste, and fracture. It is said to be made in Surat. A black kind is sometimes met with, which is equally spurious. Gennine scammony is described as being met with in Persia, but it does not seem to be known whether it is produced in that country or imported. A native authority, however, says that artificial scammony is made from the juice of Calotropis gigantea, mixed with flour prepared from a pulse known as karsanah." According to this writer scammony loses its aperient properties when baked, and becomes powerfully diuretic. This baking process consists of enclosing the powdered drug in a bag, and then placing the bag inside an Apple or Quince, which has been hollowed out for the purpose; the Apple is then enclosed in dough like a dumpling, and baked in an oven."

THE ORCHID MARKET.—There was a large show of Orchids in flower at STEVENS' Rooms on Wednesday, especially of Odoatoglossums; but most remarkable of all was a superbly flowered piece of Dendrobium aggregatum majus. The plant, which was growing in a basket, was one of the Button Constable specimeos, secured by Messrs, BACKHOUSE, of York, and bore thirteen spikes of flowers—a perfect sheet of golden-yellow.

GIGANTIC TRICHOMANES. - Those who admire the well-known Killarney Fern (Trichomanes radicans) can scarcely fail to appreciate the beauty of its noble congener from the high mountains of Java-T. maximum. This princely Filmy Fern makes lovely arching fronds, 2-3 feet in length, and 9 or 10 inches wide! Its highly divided fronds are of a paler green than those of the Killarney Fern, and its creeping rhizome is more sturdy. It grows freely in a shady fernery with a temperature ranging from 55° (or occasionally 50°) in winter, to 65° (or occasionally 70°) in summer; liking, of course, a humid atmosphere. Two varieties of this fine species are in every sense "at home" in the York Nurseriesimported years ago direct from their mountain soli-The var. umbrosum has more dense and somewhat shorter fronds, and it is difficult to say which of the two is the more charming. Both are fine additions. Another beautiful ally of the Kil-laraey Fern is T. Luschnathianum, from elevated regions in the Western World. This climb up trunks or rockwork with great rapidity, its rhizome being more slender than that of T. radicans. In texture it is exquisitely transparent, the fronds, which "feather" almost from the base, often hanging with moisture like glittering emeralds. The fronds vary from 6 to 15 inches in length, and are highly decompound. In its native forests it climbs like Ivy to a great elevation, and in cultivation festoons stumps, trunks, &c., in a fashion which is simply eachanting. The same cool temperature suits them

— A BULB SHOW AT HAARLEM.—At a meeting of the Dutch Society of Bulb Cultivators, held on March 31, it was decided to hold an exhibition of flowering Hyacinths, Tulips and other bulbous and tuberous rooted plants at Haarlem, from March 20 to 24, 1885, on a larger scale than has ever been attempted in Holland before. This is the third of the quinquennial series of exhibitions organised by the Society, and it will also commemorate the twenty-fifth year of the Society's existence. We hope shortly to be able to announce further particulars.

—— GARDENING APPOINTMENTS,—Mr. EDWIN BECKETT, lately Gardener at Sandown House, Esber, as Gardener to Hr. Hucks Gibbs, Esq., Aldenham Park, Elstree, Herts.—Mr. George Brown, late Foreman, as Gardener to His Grace the Duke of Buccleuch, Bowhill, Selkirk, N.B.—Mr. CHARLES BLICK, Foreman at Hayes Place, Beckenham, as Gardener to F. Narburger, Esq., Summerfield House, Elstree, Herts.—Mr. Blackburne, lately at Snowden, Ryde, Isle of Wight, as Gardener to JAMBS SCOTT, Esq., Elmstead Grange, Chislehurst.—Mr. Ch. CATCHPOLE, late Gardener at Ravensbourne Park, as Gardener to Miss FANNY HILL, Acacias, Dulwich.—Mr. MESENGER, as Gardener to HY, WATERS, Esq., Langley Lodge, Beckenbarn.

Notices of Books.

Supplément aux Fleurs de Pleine Terre, &c. Par Vilmorin-Andrieux et Cie.

Messrs, Vilmorin's book, entitled Les Fleurs de Pleine Terre, consisting, as it does, of carefully drawn up descriptions of garden flowers, and copiously illustrated with small but characteristic woodcuts, is a book of unquestionable utility-a fact made evident, amongst other things, by the large use that has been made of it by subsequent compilers. The last edition of that work, we are surprised to find, dates as far back as 1870, since which time numerous additions have been made to our hardy plants. In the present supplement the authors have extended their programme, so as to include plants which can be grown out-of-doors for the greater part of the year, but require the protection of a frame or heated pit during the winter in Northern France, and may be cultivated throughout the whole year in the open ground in the extreme southern and western districts. MM. Vilmorin tells us that a selection has been made so as to exclude plants of inferior merit, of delicate constitution, those which are not yet sufficiently tried, or which are otherwise unsuitable for general cultivation.

It may serve at once to illustrate the nature of the present supplement, and the progress of horticulture, to say that Begonias necupy seventeen pages, Chionodoxa finds a place as also do single Dahlias, the so-called double Gaillardias, hybrid Hellehores, Papaver umbrosum, the newer kinds of Petunias, Phloxes, Primula rusea and other species, China Asters, and many others. The descriptions have evidently been drawn up de visu, and are not merely paraphrased accounts taken from books, as is the case with so many garden compilations, while as to the illustrations we cannot better indicate their character than by reproducing some of them-for the privilege of doing which we are indebted to Messrs. Vilmorin.

Fig. 95 shows a bunch of the Chrysanthemum Anemones (A. coronaria var.), in which the outer perianth segments are relatively small, while the stamens and pistils are more or less completely replaced by narrow strap-shaped petaloid segments. The first varieties of this section were, we are told, raised some fifteen years ago by M. Bahuaud Liton, nurseryman, of Nantes, and now there are many named varieties of different colours. Fig. 96 represents flowers of the Caen race, called in England Poppy Anemones (A. coronaria var.), a robust strain similar to the preceding, but in which the outer perianth-segments are large. Anemone fulgens (fig. 97), the A. hortensis of some writers, is wild in the South of France, and even in the wild state is extremely variable in colour. "In addition," say MM. Vilmorin, "to the numerous lilac and reddish-flowered forms often cultivated under the name stellata, there are two others so distinct as by some to be considered as distinct species. One is the Peacock Anemone, with broad flowers of the richest colour, but with a yellow eye; the other is the Pyrenean form of A. fulgens, in which the flower is self-coloured of the must brilliant scarlet bue. This variety is rather less tender than that which grows in Provence, and requires less heat to enable it to flower. The first leaves are thrown up from the dark fleshy root-stock in the autumn, and are more or less five-lobed; those produced subsequently in spring are much more divided, and reduced to linear segments. Growth ceases about the end of June, and the plant goes to rest for six or eight weeks—a period most favourable for division and transplantation. Anemone fulgens is easily reproduced from seed, the seedlings producing flowers of varied hues from white to bloodred, and sometimes with the stamens and pistils replaced by petaloid segments, as shown in fig. 98.

Home Correspondence.

What is Raising?—I am tempted to ask for a clear definition of the term "a raiser" as applied to plants. That all gardeners are raisers in a certain sense there can be no doubt, but in this case the

FIG. 95 -CHRYSANTHEMUM ANEMONES.

appellation is intended to refer only to new plants of any kind. Generally all who raise distinct novelties from seed have the merit given them of being the raisers, even though the raising was accidental on their part. In the case of newly imported

FIG. 96,-POPPY ANEMONES,

plants the importer may well claim to be regarded as plants the importer may well claim to be regarded as the introducer, but certainly not as the raiser. Then there remains that section of novelties the product of plant variation, and as these are not the creation of any man's labour, but really are the accidental products of Nature, it is not fair that any one should have the title of raiser given for such novelties. Such plants originate, but are not raised. Even with seedling raised novelties there are marked differences in

the merit of origination. Thus one man may labour through careful cross fertilisation for certain ends and obtain them. To such breeders the claim of being obtain them. To such breeders the claim of being regarded as a raiser is an indefeasible one. No matter whether it be a stove or greenhouse plant, a florists flower, a fruit, or even a new vegetable—as, for instance, Peas or Potatos—the producer is the raiser incontestably. But many very good novelties come into the world by mere chance, as it were, without the originator, who sowed the seed, having done the least thing, or made the slightest effort to originate. The novelties may be meritorious, but the person who got them in the first place can claim no merit. Before any one's claim to place can claim no merit. Before any one's claim to be regarded as a raiser is admitted, it should be shown that he laboured to obtain what had resulted.

An Old Gardening Book,—I picked up lately an old gardening book—black letter—which has some of the must remarkable hints in it possible to imagine. It occurred to me that a few of them might fill a spare corner in the Gardeners' Chronicle with acceptance to the general reader, so I take the liberty of sending you a copy of title-page and introduction. If you think it desirable I would with pleasure copy a little of the contents. Wm. Swanston, Belfast.

"The Orchard, and the Garden CONTAINING CER-taine necessarie, secret and ordi-narie Knowledges in Grafting and Gardening

Wherein are described sundrie wais to graffe, and diuerse proper new plots for the Garden

Gathered from the Dutch and French Also to know the time and Season, when it is good to sow and replant

London Printed by Andrew Islip 1597.

Here follow certaine common instructions, how the stump must be chosen, whereupon you will graffe or

"Every diligent householder who will plant, should chuse lhereto a convenient place, to the end that the wild beast chaw not, nor paire the plantes, or if they be young, wholly eate in peeces, which to avoyd, is need-full to be in a towne or closed orbitant, where there be not too much shadowes, wherein be a sweet ground well muckt, tilled and turned.

" Every plant will have foure things.

"First moistness, so that the seedes or stump be moist or greene.

or greene. "Secondly a convenient place, which hath such earth as will lightly be rubbed to pouder, and that the sunne may come to it. for where there is fithly lone, a leave ground or sandy, or dry, burned, or salt ground, there is nothing good to be planted, to have any continuance: Neverthelesse where the ground is lean, there you must give him more dung. In a fat ground not so much. You must take heede, that the ground be not too moist nor too dry. You must not muck the trees with hog's dung.

nor too dry. You must not muck the trees with hog's dung.
"Phirdly. Amediate water or nourishing moystnesse, therefore be those orchards best which are situated between two waters, for those that are placed by a water side, remaine still yong and fruitful, and have commonly the barke smoother and thinner than the others. And those trees are more fruitfull than others which are planted in a valley, or in the lower part of a deep thill: for from those hils may come to them nourishment and moistnesse, and the ground which is so situated, is such fruitful but hee that cannot get for his trees such a ground, must with difference seeke, if he may bring to his trees a little springe or pond, of which the trees may sometimes find some reviving, and if you may not have any of those, and have a garden, who by it self is naught; the trees will grow with thick rootes, which hindereth the growing of them, and diet them at reason.

length.

"Fourthly, The aire is required, which must be agreeable to them, and of complexion to beare, for there be some trees that doe prosper in all aires; to wit, apple and peare, cherry and plumtrees. Some will have a cold aire, to wit, thess-nut trees; and some a very warm aire as the palm and pepper-trees; therefore they be rare with us. That plant which hath these foure thinges shall prosper; and if they want on or more of these foure things, they will decay and their prospering perish."

Tillandsia usneoides,-The woodcut in the Gardeners' Chronicle, p. 145, probably represents, not the Lichen Usnea, but the Bromeliad Tillandsia usneoides, which grows in the situation mentioned.

Ellam's Dwarf Spring Cabbage.—Of the many varieties of spring Cabbages that I have grown, I find this to be the best, as regards hardiness, earliness, and compactness of shape—it is, in fact, the *lean ideal of what a Cabbage for a gentleman's table should be. Sown on July 27 jast, with the following varieties:—Early Heartwell, Improved Nonparell, Battersea, Early Vork, Imperial, &c., we are now cutting splendid heads

[—] Kohler's "Medizinal Pflanzen,"—We mention this work, which is coming out in parts, for the sake of calling attention to the coloured plates, which are excellent representations of plants of medical interest.

Wilkomm's "Hustrationes Flore Hispanie insularumque Balearium" (Williams & Norgate) has reached its eighth part. The plants figured are Slaymbrium Assoanum, Umbilicus Winkleri, Saxi-raga eriobatas, S. Cossoanian, Valeinan Jongifiora, Centranthus nevadensis, Digitalis nevadensis. D. dubia, Chænorbinum macropodum, C. robustum, C. aregnoa dubia, Narcissus minutiflorus, and N. cernuus.

of Ellam's fully three weeks in advance of the other varieties, and while 20 per cent. of the other varieties have bolted, not 2 per cent. of Ellam's bave done so. I can fully reccommend this variety to all who have not given it a trial. ? ?. Lowry, Edment, Mill Hill. [The Fruit Committee recognised its merits by awarding it a First-class Certificate on Tuesday. Ed.]

Bees and Intercrossing of Species. — At p. 456 a correspondent signing himself "North Norfolk," after commenting on bees gathering pollen from different flowers, goes on to say, "From this fact we see why the bees cause no intercrossing of species of plants; they only intermix the pollen of different plants of the same species." This statement surely cannot be the result of his own observations, if so, they are certainly of a somewhat superficial character. A bee on leaving its hive for the purpose of collecting pollen, will occasionally return with pollen from different genera and species of plants, and will sometimes during a single journey visit two species of the same genus, thereby becoming a likely agent, where possible, in the intercrossing of species. For the purpose of fortifying myself with facts for a reply to your correspondent, I have, since reading his note, been closely watching bees collecting pollen in a greenhouse filled with flowering plants, and here are the first three cases, which may perhaps be taken as typical ones. Bees No. 1 and 2 gathered pollen extended.

animal creation. Does "North Norfolk" suppose that when bees are visiting flowers they have any other object in view than in satisfying their hunger and laying up stores for future use? Or is he of opinion that they make themselves thus busy and work hard to collect honey for him and others to take from them and enjoy? Surely he cannot think this; and although much has been written to show their utility in fertilising and setting flowers, I very much doubt if their agency is required at all. "North Norfolk" avers that bees do not, and never can, make comb from pollen, but if not, will he tell us what they gather it for and what they do with it? as I, and perhaps others, would be glad to be enlightened on that bead. "North Norfolk" may know a good deal about the little friends he stands up for, but it is evident be has much to learn about plants, or he would not possess the erroneous idea that it is possible for one distinct genus to cross with another, as he appears to suppose would be the case if bees went from a Wallflower to a Peach tree, as no doubt many of them do, although he seems to think that a portion of the bees, when they leave the hive, go to no kind of flower, and confine themselves to that, and the others to quite different blooms, and so on; but, if my observation is correct, instead of this they just take all, as it suits them, that comes in their way. It strikes me that we should have things rather mixed if we had to trust to

which requires no explanation like that lately suggested by "C. W. D." M. \mathcal{F} . B.

The Setting of Fruit Tree Blossoms.—There is an old saying that one should not hallou till he's out of the wood; and though it is as well to be cautious, and oot over-jubilant, while there is danger, we yet have cause for some degree of rejoicing, for just at the nick of time when things seemed most critical through the cold winds, and fruit trees of the early flowering kinds were in great danger, a change came, and the weather set in warm on April 1, and has continued so ever sioce. The effect of a bigher temperature, accompanied with sun, has been magical, as at once Apricots that had been hesitating about swelling could stand still no longer, but went away with a rush, increasing in size at such a rate that the difference could be plainly seen from day to day, and now there are many as big, or bigger, than the top of the finger. If we get no frost after this, and no adverse change, the crop will be great, as trees were literally smothered with bloom, the larger portion of which set, and therefore the work of thining will take up much time, and afford quantities of green Apricots for cooking and tarts. Apricots are not the only trees benefited, for Peaches and Nectarnines were in full blossom at the end of last month and they look much strengthened by the solar rays and the nice warm state of the air, the combined

FIG. 97.—ANEMONE FULGENS.

Fig. 98.—Double-flowered anemone fulgens. (see p. 488.)

clusively from Spiræa (Hoteia) japonica, and in something like ten minutes they were laden and on their return journey. No. 3 was really a ubiquitous little gentleman, the first flower he visited being Begonia semperflorens, afterwards Cyclamen persicum, and in quick succession, Deutzia gracilis, Azalea indica alba, and a second white variety belooging to the same geous and species. If "North Norfolk" has access to a greenbouse in which are flowering specimens of the plants above mentioned—and of course a hive of bees near at hand—he will doubtless be able to convince bimself of the accuracy of what has just been stated. In the study of both bees and flowers there is a wide field for research, and it may seem hardly necessary to say that many of the theories of such old writers as Huber and Aristotle, whom your correspondent mentions, are nearly if not quite ignored by many of the more recent authorities. J. Horsfield, Heytesbury.

bury.

— Under the above heading a correspondent signing himself "North Norfolk" takes me to task for what he is pleased to call my want of respect for his frieads the honey-bee, and the narrow-minded view, as he terms it, I take of them as only robbers, obeying the laws of Nature and their own instincts to live. I know there is a good deal of sentiment in this world of ours, and it is all very well in its way, but neither he nor any one else can get away from the fact, that my statement is a pretty correct one, and that it not only applies to the industrious insects named, but to the whole of the

the forbearance of insects in their visits to certain flowers to prevent crossing; but in matters of this kind great wisdom is shown, and "Thus far shalt thou go, and no farther," is the veto of II lim; and it is just as safe for bees to flit where they will as it is for sparrows to be in the fowl-yard with the hens and turkeys, for though they are so nearly allied, who ever heard of a cross? J. Sheppard.

Double Daffodils.—It is a popular notion that if single Daffodils are brought into a garden from the wood they will in a few years become double. Though this is not true, it is equally incorrect to infer that single species and varieties never become double. I have for years cultivated Narcissus semi-partitus, and it has always remained single to this year, but now within the divided crown new laminar are formed, resembling tather the external divisions than those of the crown, and of a paler colour. They arise partly from the style and partly from the upper stamens, and in one of the laminar there is already a dishatothement or oulning—a point which often requires notice in the consideration of double flowers. No biforus is often regarded as a good species, but the remark of Haworth is perfectly correct, that in the capsules there is not a trace of seeds, at least in the cultivated plant. Patches of this Narcissus were extant in the old garden of Fotheringhay Castle, near the river Nen, twenty years since, but now they have vanished. Parkinson's clipt Narcissus is a curious form, which I had from Mr. Wilson Saunders, and

influence of which have decided matters, and caused a fine set of fruit. Plums seem to be taking advantage of the favourable times, as they are hastening to unfold their bloom, and many sorts on suitable aspects have already done this, and look quite white, so full are they with their clusters of flowers. Standards are crowded with buds, and will soon be a sight, as well as Cherries, for none can lag behind now the warm breath has passed, and keeps passing, giving new life to all vegetation, which seems fairly to have awakened now, and will no longer be checked. Pears are opening fast, and the genial atmosphere will just suit them, as the anthers will come strong and full of pollen, when there is sure to be a good set. Apples will not be in bloom for another fortnight or more, and we can only hope that the fine weather we are now enjoying will last on till then. 7. S.

Which is the Best Table Potato at Present?—Would you allow me to ask this question through your columns? I find the Champion (Scotch), when cooked from this forward, black and patchy as if bruised, and this complaint is general. I am aware Magnum Bonum heads the London market, and is both tender and sweet, but it is not "floury" enough for me and others. Reading Hero seems to fill the void in that respect, but my experience of it is limited. Schoolmaster and Paterson's Victoria would come next, but are rather liable to disease. Cosmopolitan is more of an early kind, and I have found White Elephant and Ecauty of Hebron liable to

the same objection as Magnum Bonum, Perhaps some of your correspondents would give their experience. W. J. M., Clonmel.

Propagating Dracæna Goldieana (see p. 155).

Early in the winter I cut four tops off, put them singly in small medicine bottles filled with water, and singly in small medicine bottles filled with water, and plunged the bottles in a bottom-heat of 80° to 90°. A small piece of charcoal put in each bottle prevented the water from getting foul. Six to eight weeks afterwards the cuttings had nice roots, when they were potted, and are nice little plants now. C. Wissenbach, Royal Gardens, Wilhelmshöhe.

Reports of Societies.

Royal Horticultural: April 8.

SCIENTIFIC COMMITTEE. - Dr. Maxwell T. Mas-SCIENTIFIC COMMITTEE.—Dr. MAXWEII 1. Massettes, F.R.S., in the chair. Present: Messrs. G. Murray, W. G. Smith, Pascoe, Smee, A. W. Bennett, Houston, Colonel Clarke, A. Grote, G. F. Wilson, and Rev. G. Henslow, Secretary.

Fingus Causing Cracks in Apples.—This was determined to be Septoria Ralfsii.

Datata Experiment of Chimich.—It was reported.

determined to be Septoria Ralfsii.

Potato Experiments at Chiswick.—It was reported that an experiment designed to test the validity of the Jensenian plan of protection had been instituted at Chiswick, on March 29, in the presence of some members of the sub-committee appointed for the purpose. Tubers of Adirondack and of Recorder were carefully examined, and those which appeared free from disease were planted in two series. Each series consists of six rows 3 feet apart, and of fifteen series consists of six rows 3 feet apart, and of fifteen tubers in each row 20 inches apart. One row is planted with cut tubers of Recorder, the next with whole tubers of the same variety, then come two rows of Adirondack to correspond; the fourth and fifth rows of each series are control rows, intended to be moulded in the ordinary way. One series is to have the haulms bent over at the proper time; in the other series, consisting of the same Potatos treated in the same manner, the haulms are to be left erect. The rows are further divided horizontally into five divisions each containing three tubers, and which wishes each containing three tubers, and which wishes each containing three tubers, and which wishes each containing three tubers, and which wishes. sions, each containing three tubers, and which will be moulded up on the Jensenian plan on June 15, June 30, July 15, July 30, and August 15, respec-tively, or as near those dates as possible, the requisite proportionate interval of time being in any case

attended to. Podisiona Juniperi.—Mr. Smee showed specimens of this yellow fungus on the branches of Juniper, which led to a discussion as to its alleged connection with Roestelia lacerata on the Hawthorn.

Calceolaria.—Mr. Smee also exhibited monstrous

flowers of this plant : referred to Mr. Henslow for

Calceolaria.—Mr. Since also exhibited monstrous flowers of this plant; referred to Mr. Henslow for examination and report.

Crossed Primross.—Colonel Clarke showed a variety of hybrid and crossed Primroses, showing great diversity of colon. Colonel Clarke mentioned that he had for years repeated his experiments with a view to fertilise the Cowslip and the Primrose, and view to fertilise the Cowslip and the Primrose, and view to fertilise the Cowslip and the Primrose, and view to fertilise the Cowslip and the Primrose, and view to fertilise the Cowslip and the Primrose, and view to fertilise the Cowslip and the Primrose, and to view to fertilise the Cowslip and the Primrose, and to view to fertilise the Cowslip and the Primrose, and Company and the Primrose, and Uromyces are exceedingly common upon Dean plant during summer and autumn, but the Acidiospores of this fungus have been much less frequently seen. Of course it is to Professor de Bary that we owe the elucidation of the fact that the life cycle of the Bean Uromyces is coludes an Ecidium. It is none the less interesting to repeat his experiment of sowing germiating teleutospores of the Uromyces upon a healthy Bean plant, and watching the development, first of the spermogonia and then of the Ecidiospores. If any one still doubt the late that certain Uredines are the spermogonia and then of the Æcicliospores. If any one still doubts the fact that certain Uredines are heteroccismal in their habit, and attempts to justify their doubts, as has been the case in times past, "because the teleutospore has not reproduced itself, but a totally different fungus—an Æciclium," it would be interesting to know by what perversion of the powers of the human intellect the fact that the teleutospore of the Uromyces in question gave rise to this Æciclium, and not to a Uredo or teleutospore, can be got over. Persons possessing high imaginative power have suggested that these parasitic fungi exist in the tissues of all plants, especihigh imaginative power have suggested that these parasitic fungi exist in the tissues of all plants, especially those which have been long under cultivation, in the form of "plasms," and that when the spores of any Uredine—it does not appear to matter much which—fall upon the surface of the leaves of such plants in the surface of the leaves of such plants are to the surface of the surface and the surface of the surface of the surface of the surface and the surface of they so irritate the structures of the host plant as to cause the latent plasma to produce the fungus. This cause the latent plasma to produce the fungus. This we are asked to believe, although not a single fact can be adduced in its support! It would be as reasonable to say that a crop of Onions does not arise from the Onion seed originally sown but from an inherent Onion-producing power which exists latent in our garden and which can only be called into action by sowing Onion seed which when it germinates so irritates the surface of the ground that it bears a crop of Onions. The four Bean plants sent herewith of Onions. The four Bean plants seen nerewin were infected with the germinating teleutospores of the Uromyces on February 6; on the 29th the spermogonia began to appear. It was not until the end of the month that the perfect Æcidium was developed. Canker on Apples.—Mr. Flowright sent a series of specimens of Apple twigs affected with canker, and more or less covered with the fungus Nectria ditis-

sima, to whose growth the disease is now attributed by some observers. The remedy is to cut out the diseased patch and paint over the wound with warm coal-tar. Further remarks on the subject are de-ferred till we have the opportunity of publishing Mr. Plowright's sketches.

Assam Tools, &.c.—The Chairman exhibited some tools used by the natives of the Naga Hills, consisting tools used by the natives of the Naga Hills, consisting of a dao, or knife, and its scabbard, an iron boe, sundry comb-rakes made of Bamboo or light wood, &c. Rice is the staple food plant, grown on the slopes of the mountains, by aid of an elaborate system of irrigation. The tools had been sent by Mr. Horace Livesay, and attracted much attention. Seeds of various kinds of Rice, Millet, and Pulse were also exhibited. The natives were spoken of as a fice race, showing considerable civilisation, but over-endowed with nurreality. with pugnacity.

FLORAL COMMITTEE.—Present in Section A.:
John Fraser, Esq., in the chair; Messrs. T. Moore, J.
Laing, F. R. Kinghorn, J. Woodbridge, H. Herbst,
J. Hudson, H. Williams, H. Ballautyne, J. Dominy,
J. O'Brien, E. Hill, and the Rev. G. Henslow.
Section B.: Shirley Hibberd, Esq., in the chair;
Messrs. H. Turner, H. Bennett, W. Bealby, G. F.
Wilson, J. James, G. Duffield, J. Douglas, H.
Cannell, and W. B. Kellock. In the new plant way
the special feature of the meeting was a group of new
Iodian Azaleas, exhibited by M. Louis van Houtte,
of Ghent, and which formed a centre of interest for
the entire day. M. van Houtte brought out his lodian Azaleas, exhibited by M. Louis van Houtte, of Ghent, and which formed a centre of interest for the entire day. M. van Houtte brought out his plants in excellent condition, and received no less than nine First-class Certificates, vix., for Souvenir du Duc d'Albany, an enormously large single white, individual pips measuring 4½ inches in diameter, of remarkable substance for the size, and of great purity; Comte de Paris, pink and white, with some rose stripes, and nicely spotted with dark crimson, extra fine single; Comte de la Torre, white, flaked with lake, a single flower, with a few of the flaments petaloid; Comte Adrieu de Germiny, single, dull salmon colour, with cinnamon spots, and blotched with bluish purple on the upper segments; John T. D. Llewelyn, double, flesh tinted white, the centre prettily spotted, a fine shaped flower; Souvenir du Prince Henri, a very good shaped double, bright rose; Mr. B. S. Williams, a large single, bright rose with pale spots; Mdlle, Marie Stockman, a double white, pretty in shape, but somewhat flimsy in texture; and Baron Natbaniel de Rothschild, the same variety as Mr. Tartner and Messrs. Vettch received a First-class Certificate for on May 8 last year. In a small group of Orchids from Sir Trevor Lawrence, specially noticeable were flowering examples of Odontoglossum crispam guttatum, a very pretty variety of medium size, spotted with rich chocolate-red; Oncidium noticeable were flowering examples of Odontoglossum crispum guttatum, a very pretty variety of medium size, spotted with rich chocolate-red; Oncidium cucullatum giganteum, an enlarged form of the ordinary type, and very bright in colour; and Cypripedium ciliolare. Messrs. Shuttleworth, Carder & Co., in addition to a splendid mass of flowering plants of the pretty Masdevallia Shuttleworthii, sent a good showy Odontoglot, also named Shuttleworthii, sent a crispum with broad senals and petals, white, heavily a crispum with broad sepals and petals, white, heavily blotched with chocolate or warm brown, the lip blotched and fringed. Messrs, Veitch's contributions included Davallia Mariesii cristata, a form with the tips of the fronds crested; a most interesting hybrid Orchid, Phaius irroratus purpureus, the result of a cross between Phaius grandifolius and Calanthe vescross between that of a Phaius, and the flowers itia, the habit being that of a Phaius, and the flowers a close resemblance to Calantbe, white, with the lip dull purplish brown—it was first raised by Mr. Dominy dull purplish-brown—it was first faised by Mr. Dominy and lost, but has again been produced by Mr. Seden; Amaryllis Virgo, a medium-sized scarlet, with white nervation, and a white band up the segments; and Amaryllis Murillo, a medium-sized, rich deep crimson. Amaryllis Nurillo, a medium-sized, rich deep crimson. Mr. B. S. Williams, amongst other new plants, had a new form of Adiantum cuneatum, named strictum; and Mr. W. Nicol, The Nursery, Lower Merton, Surrey, showed a very nice double white Indian Azalea named Princess of Wales, a full double, and remarkably pure. Messrs. Barr & Son again sent a fine display of Daffodils, and received Certificates for three new ones, viz., Narcissus incomparablis Queen Sophia of the Netherlands (a popular name, that surcly will not meet the views of M. Krelage as to brevity), yellow, with orange crown; N. Dicolor, white, primrose coloured trumpet; and N. Leedsii Queen of England, white with yellow crown. Mr. Herbst, of Richmond, had a nice batch of cut blooms of Narcissus poeticus var. biflorus, a fine variety with two flowers on a scape. Yet another addition to the magnicoronate group came from addition to the magnicoronate group came from Messrs, James Dickson & Sons, of Chester, in Narcissus incomparabilis James Dickson, a noble flower in all respects, and of a clear yellow colour. In a

small stand of Auriculas Mr. Turner had Mr. Douglas' new white-edged flower called Conservative; and a new shaded alpine, maroon shadir g to dark rosy-purple, called Mungo McGeorge. Messrs. Veitch & Sons had also Azalea ledifolia, a double flower of a soft rosy-lilac colour, a distinct ard conspicuous plant, that would prove of great use as a decorative object where soft undecided colours are decorative object where soft undecided colours are desired, being the very counterpart of another Azaka shown by them, and named A. Caldwelli ignea, an abundantly flowered ragged looking subject, useful for cutting or for planting out as a foil to Azalea indica alba. This is evidently a sport from the older A. Caldwelli, which has purple flowers. A pretty pure white Cœlogyne occlata nitida, with just the faintest tinge of yellow in the throat, and a Cypripedium microchilum, a hybrid between C. niveum and C. Druryi C. vernixium, a bronzy-green flowered variety, with a dark purple striped dorsal sepal—a distinct looking bloom, of a large size; Leila flava and Deodrobium barbatum, a white flowered kind from Western India, of a large size; Jacka hava and Decutionium barola-tum, a white flowered kind from Western India, Mr. B. S. Williams, Holloway, showed a beautiful variety of Cattleya Mendelli gigantea of rare form and colouring, the small white Angræcum dependens, &c. Messrs, Cutbush & Sons, nurserymen, Highgate, colouring, the small white Angræcum dependens, &c. Messrs. Cutbush & Sons, nurserymen, Highgate, showed an interesting group of flowering plauts, among them being many of the New Holland section, now so little found at exhibitions, such as Boronia pinnata and B. tetrandra, Eriostemon scabra, Pimelea Kippergiana, Leptospermum bullatum, and Plumbago rosea, Kennedya Comptoniana and K. Iliacioa; a panful of Choisya ternata; Epacis compacta, a slender flower of a vivid scarlet; Darwinia fuchsoides, a small well-bloomed plaut; Hypocalymna robusta, a Boronia-like subject, and others, for which they obtained a Silver Banksian Medal. Messrs. Barr & Son, Covent Garden, again showed a collection of Narcissi, including such new varieties as N. Barri albus, John Nelson, Tridymus, Tridymus aurantius, incomparabilis natrantius, incomparabilis Leedsi, Mr. T. B. Llewelyo, Backnousei, and others that will be found mentioned in our list of certificated plants. Mr. Heory Bennet brought fine large cut blooms of the Rose Her Majesty, for which he received a Vote of Thanks, Mr. R. Dean, of Ranelagh Road, Ealing, exhibited his sport from Myosotis disstititora, with a great quantity of red-bloom flowers mixed with the blue; and his Bedfont Yellow Wallflower, which loses nothing by comparison with the Belvoir Castle variety, which was also shown for comparison; for these he was awarded a Vote of Thanks. Mr. Woodbridge, gr. to by comparison with the Belvoir Castle variety, which was also shown for comparison; for these he was awarded a Vote of Thanks. Mr. Woodbridge, gr. to the Duke of Northumberland, Syon, showed fine cut blooms of a Crioum-like plant, Hymeocallis macrostephana. These were of great substance and deliciously scented. Mr. T. Sibbald, nurseryman, Eishop Auckland, had Herniaria glabra aurea. A Vote of Thanks was given to Sir Charles Struckland, Hildenly, Malton, Yorkshire, for two plants of Cattleya citrina in bloom, the one in a basket and the other fastened to a block of wood. Mr. S. Cook, gr. to De B. Crawshaw, Esq., Rossfield, Seveooaks, received a Vote of Thanks for Dendrobium Cambridgeanum. A showy collection of Rhododendrons and Ghent a Vote of Thanks for Dendrobium Cambridgeanum, A showy collection of Rhododendrons and Ghent Azaleas came from Messrs. Lane & Son, to which was awarded a Silver-gilt Knightian Medal. Mr. Thomas Ware, Tottenham, obtained a Silver-gilt Banksian for his collection of Narcissi and hardy flowers, which were shown by him in a beautifully fresh condition. A Bronze Medal was awarded to Messrs, J. & J. Hayes, ferrists, Edmonton, for their collection of varieties of Pelargoniums.

The awards made were :

FIRST-CLASS CERTIFICATES.

Section A. To Sir Trevor Lawrence, Bart., M.P., for Cypri-pedium ciliolare. To Sir Trevor Lawrence, Birt., M.P., for Odo its-

ossum crispum guttatum.

To Sir Trevor Lawrence, Bart., M.P., for Oacidium

To Sir Trevor Lawrence, Bart., M.P., for Oleidium eucullatum giganteum.
To Messrs. Shutleworth, Carder & Co., for Olonto-glossum Shutleworthi.
To Messrs. James Veitch & Sons, for Phaius irroratus

purpureus X.

To Messrs. James Veitch & Sons, for Davallia Mariesii

cristata.

Mr. B. S. Williams, for Adiantum euneatum

strictum.

To Messrs. Barr & Son, for Narcissus incomparabilis

Queen Sophia of the Netherlands.

To Messrs. Barr & Son, for Narcissus bicolor J. B. M. To Messrs. Barr & Son, for Narcissus Leedsii Queen

of England.

To Messrs. James Dickson & Sons, for Narcissus incomparabilis James Dickson.

To Mr. H. Herbst, for Narcissus poeticus biflorus.

Section B.

To M. Louis van Houtte, for Azalea indica Souvenir Duc d'Albany.
To M. Louis van Houtte, for Azalea indica Comte de

To M. Louis van Houtte, for Azalea indica Comte de

To M. Louis van Houtte, for Azalea indica Comte trien de Germiny. To M. Louis van Houtte, for Azalea indica J. T. D.

Llewelyn.
To M. Louis van Houtte, for Azalea indica Souvenir

To M. Louis van Houtte, for Azalea indica Mr. B. S. Williams.
To M. Louis van Houtte, for Azalea indica Mdlle.

10 Mr. Bours van Frotzen Marie Stockman, To M. Louis van Houtte, for Azalea indica Baron Nathaniel de Rothschild. To Mr. W. Nicol, for Azalea indica Princess of

ales. To Messrs. James Veitch & Sons, for Amaryllis Virgo.
To Messrs. James Veitch & Sous, for Amaryllis

Mr. Turner, for alpine Auricula Mungo

McGeorge.
To Mr. Turner, for show Auricula Conservative (Douglas).

FRUIT COMMITTEE .- Present : Mr. H. J. Veitch, FRUIT COMMITTEE.—Present: Mr. H. J. Vettch, in the chair; Messrs. John Lee, J. Willard, S. Lyon, G. Goldsmith, G. T. Miles, W. Denning, R. D. Blackmore, and Geo. Bunyard. A collection of Apples that were, as a whole, in usable condition, was exhibited by Messrs. Rivers & Sons. The number of dishes shown was considerable, and on a future occasion we shall notice the sorts which have kept the team we to kind the M. Coldesith, Hollanden. best up to this date. Mr. Goldsmith, Hollanden, showed Winter Queening, Northern Greening, Golden showed Winter Queeoing, Northern Greening, Golden Knob, Ribston, Court-pendu Plat; Mr. G. Fennel, gr., Fairlawn Park, Tonbridge, Brabant Bellefleur; and Mr. W. Horley, Toddington, Beds, six seedling Apples. Messrs. Veitch & Sons again exhibited some good examples of Ellam's Dwarf Spring Cabbage, a valuable early variety raised by Mr. Ellam, now of Cliveden, and sent out a year or two ago. It was awarded a First-class Certificate.

Royal Caledonian Horticultural.—The spring show of this Society was held in the Waverley Market, Edinburgh, on Wednesday and Thursday, April a and 3, and that it was a great success in a popular and commercial aspect may be judged from the fact that during the two days 21,000 visitors passed the turnstiles, the amount taken at the gates being about 4,75. It may be said that the general opinion was, that in the history of the Society there had never been such a fine display of blossom. And this favourable verdiet is applicable to all departments. For instance, as to Orchids, we question whether a larger number in excellent condition were ever staged in Edinburgh. The Azaleas formed a special feature, and alike in size of plants and profusion of bloom were exceptionally fine. Rhododendrons showed fewer evidences of over-forcing than has been witnessed on former occasions, but they were none the worse but all bloom were exceptionally fine. Khodoofendrons showed fewer evidences of over-forcing than has been witnessed on former occasions, but they were none the worse but all the better for that, and the display was more than creditable. Of spring plants it were difficult to speak too highly. Hyacinths, though not so numerous as we have seen, were good both as to size and form, and the same remark applies to the Tulhis, Narcissi, and other bulbous flowers. Herbaceous spring flowers were never better represented, and their popularity was testified to by the crowds which at all times surrounded the tables. Occupying the greatest space, and having the place of honour in the central line of staging, were the competitive collections of nurserymen, for the table of plants for effect—so feet by ro feet. At the eastern end was the table of Messrs. Ireland & Thomson, Craigleith and Comely Bank Nurseries, who, as on many former occasions, were deservedly placed 1st; the 2d prize was active to the contract of effect, 'open to gardeners and amateurs, there was, it not a keen, at least an interesting competition. Mr. R. Grossart, gr. to Mr. Buchanan, Oswald Road, easily obtained the rst award, his stand including many good Orchids. Mr. Andrew Paul, Gilmore Place, was 2d, with a stand showing great taste in arrangement. The same gentleman also competed for the best six Orchids, and but this indexe could be the decided which were best as

with a stand showing great taste in arrangement. The same gentleman also competed for the best six Orchids, and here the judges could not decide which was best, so they gave them equal 1st, For a single Orchid Mr. J. Paterson was placed 1st, with a large plant of D. nobile, very freely and handsomely flowered, Mr. Wilkins luck again securing only 2d place, though his D. Paxtoni had some thirteen spikes of lovely blooms.

Turning now to the larger plants, it may be said that the competition for the collection of Comiferre is never extensive, seldom have we seem more than two entries. On this occasion Messrs. T. Methyen & Sons were 1st, in a very handsome and eveo lot of the rarer and newer sorts. Messrs, Cunningham, Fraeer & Co. were 2d, in a collection which was unequal, the best plant by far being a remarkably nice Thuioppis dolabrata. The Lawson Seed Company exhibited a very handsome collection of large plants, including Conifero, Palms, Dracenas, Yuccas, & E. Laf the collections of Rhodedendron's Messrs, R. E. Laf the collection of Rhodedendron

pots Messrs, Ireland & Thomson took leading honours with a lot finely grown and freely flowered. Nor were the plants staged in this class by the gardeners less well done, especially Mr. R. Gireve's 1st pitze lot. An interesting competition was that for twenty forced plants in bloom. First place was justly given to an attractive table furnished by Mr. W. Priest, Newbattle. The plants were evenly grown, well flowered, and not overforced, and included Lilacs, Deutzias, Gueldres Roses, Rhododendrons, Kalmiss, Azaleas, and the beautiful scarlet Salvia coccinea. The 2d lot was not so level in quality. Next in attraction to the Orchids for brilliancy of bloom, even if second to them, were the Azaleas. Here Mr. J. Paterson occupied his wonted place in the front rank. For the best four his huge pyramidal plants, one mass of evenly opened flowers, which hid the foliage, commanded admiration for cultural skill. Mr. Pratts and proper development of the property of the pro

about in the interestylenes class for the best weeks, and they were thoroughly worthy of the prize for quality of flowers and size of head. Mr. J. Pearson was 1st in the gardeners' class for the best dozen, his spikes quality of Howers and size of head. Mr. J. Pearson was 1st in the gardeners' class for the best dozen, his spikes being large and fully developed. Some thought Mr. H. Sime's 2d lot were more even than the 1st; but, taking them on the whole, they were not so large. For the best white no fault could be found with Mr. R. Lawrie's 1st, nor with Mr. George Lawrie's 1st prize six, there not being an indifferent spike in the latter. R. Stewart had an easy victory among the amateurs. The Tulips were well grown and equal, and the same may be said of the Polyanthus Narcissus. Cut flowers arranged in a greenhouse, exhibited by Mesrs, Mackenzie & Moneur, were of first-class quality, and in most cases the judges had a very invidious task in awarding the prizes. Of Ferns there was a fine display, occupying two large tables. The Challenge Silver Chup for four exotic Ferns was secured by Mr. G. Mackinnon, Melville Castle—his lot comprising normous, but far from coarsely-grown, specimens of Davallia Mooreana, D. bullata, very compact; D. insignis, handsomely shaped; and Leucostegia immersa. Foliage plants were well represented, especially Palms and Draceanas.

As night be anticipated from the season the fruit was not of muthe processure.

especially Palms and Dracænas.

As might be anticipated from the season the fruit was not of much account, yet the few Grapes forward were well kept and carefully finished. The two Pines were good, and the Apples were of more than ordinary excellence. A special prize was accorded to Mr. J. Brunton, Gilmerton, for a display of sixty-two varieties of Apples—all firm, smooth, and in admirable table condition. The vegetables were also worthy of commendation, more especially the collections, the Salads, the Lecks, and the early Potatos.

Sevenoaks Horticultural and Floral Society: April 2.—The second spring show of the above Society was held in the large ball-room at the "Royal Crown" Hotel. The day being very fine the attendance was large. The exhibits, which were numerous, were of a class unusually good for local shows, but were the same as this district is noted for. The Azaleas, arranged in line down the centre of the tables, were a feature admired by all, they being profusely bloomed—one in the "specimen plant" class, a white of large size, with an occasional pink stripe, being a mass of bloom, so close that but little foliage was seen; this plant was not tied down for show with numerous sticks, and was exhibited by Mr. Gillett, gardener to S. L. Devitt, Esq., Golden Green, Sevenoaks. Another noteworthy plant was Mr. Bolton's (gr to Mrs. Spottiswoode, Coombe Bank, Sevenoaks). Clivia miniata, in the stove and greenhouse plants, bearing twenty-live very fine spikes on well grown crowns. To describe the, numerous good things would take too much space, but the above pair words of the control of the complete of the control of the co Sevenoaks Horticultural and Floral Society : drobum nobile Wallichanum and two others; 3d, Mr. Bolton, with the not-offen-exhibited Brassia verrucosa and two others. Mr. Bolton was deservedly placed rist with four stove and greenhouse plaats, including the above mentioned Clivia, Azalea Criterion, Antunium Scherzerianum with twenty spathes and numerous buds, and Statice profusa, being a handsome quarettet; ad, Mr. Goodman with Rhododendron Dalhousianum, a fine thing; Caladium Meyer-

beer, &c.; 3d, Mr. Halton, gr. to Mrs. Swanzy, The Quarry, Sevenoaks. In the class for specimen plants Mr. Bolton again took 1st prize, with a very fine plant of Francisea calycian major, Mr. Gillett being ad with the Azalea; just above spoken of; Mr. Goodman 3d, with Clivia miniata. Mr. Bolton was the only competitor for Gloxinias. For four Azaleas Mr. Bolton was once more "in the van," being olosy followed by Mr. Gillett, and Mr. Halton took 3d prize. For Cinerarias Mr. Halton took 1st place, with a fine half-dozen, one purple one having a very massive head of bloom; he also had a very fine white variety: these two were well backed up by the other four—Mr. Staples, gr. th. Oppenheim, Esq. Chipstead Place, being 2d, and Mr. Goodman 3d. There were six entries in this class, and they formed a very fine three dozen plants. Amarylis, two plants for Dettinas Mr. Bolton was 1st, with a fine four, Mr. Gillett 2d, and Mr. Goodman 3d. For Dettinas, Mr. Goodman 3d. For Spirceas Mr. Staples was to the front, with four plants nearly 2 feet over—Mr. Beach, of the Borough Green Nursery, being 2d, and Mr. Bolton 3d. Por Roses brought but two competitors, Mr. Gillett taking 1st, and Mr. Halton 2d prize. Cyclamen (only one entry) fell to Mr. Cooke by but in Primulas competitors were seven, all told—the 1st prize being taken by a fine our doubles and two singles, grown by Mr. Staples; six P. ameena being ad—Mr. Goodman; 3d, Mr. Gillett. For nine Hyacinths Mr. Bolton was 1st, Mr. Staples 2d, Mr. Blundell, gr. to G. Christie, Esq., Westerham, 3d. Mr. belands for six Mr. Halton was alone. For four pots

six P, amoena being 2d—Mr. Goodman ; 3d, Mr. Gillett. For nine Hyacinths Mr. Bolton was 1st, Mr. Staples 2d; Mr. Blundell, gr. to G. Christie, Esq., Westerham, 3d. In the class for six Mr. Halton was alone. For four pots of Tulips Mr. Staples had a fine quartette, being 1st Garrying over seventy flowers; Mr. Bolton, with a fine lot, being 2d; Mr. Halton 3d. Narcissi, alpines, Auriculas were well shown, the 1st prize in the former and latter falling to Mr. Bolton; Mr. Staples' alpines being a very fine six of double Primoses and Polyandus in variety. These plants only require exhibiting more to become a rage again, as they were once before. For six cut flowers Mr. Cooke was 1st, with a box containing Odontoglossum Alexandre, Dendrobium chrystotoxum, Cypripedium Boxalbi, Cattleya Warsceniczii, and others; Mr. Bolton was 2d, with Dendrobium nobile, Hippeastrum anlicum, Statice profusa, &c., Mr. Goodman 3d, with Rhododendron Countess of Haddington, Bugmansia, Dendrobium nobile, &c. The pergrase and baskets of flowers were most tastefully arranged, especially the arrangement of Miss Kither, of Sevenoaks, being almost entirely wild flowers, and exceedingly light—Miss Tooth's basket and Mr. Halton's pergne being 1st prizes. Epergne.—2d, Mr. Beach; 3d, Mrs. Halton. Miss Kither's two arrangements ever set aside by the judges into a special class, and consequently were awarded two special prizes.

Beach; 3d, Mr. Bolton. Baskets,—2d, Mr. Beach; 3d, Mrs. Halton. Miss Kither's two arrangements were set aside by the judges into a special class, and consequently were awarded two special prizes.

The non-competitive exhibits included a group of plants from Mr. Carlton, gr. to Sir C. H. Mills, M.P., Bart.; twelve Hyacinths from Cutbush & Son, Highgate, being very fine; decorative arrangements by Mrs. Seale, the well known "exhibitress," of Vine Nurseries, Sevenoaks; Roses in boxes from Mr. Beach. All were highly commended. (An occasional Correspondent.)

Crystal Palace: April 5 and 6,—The first show of the year held at the Palace, if not quite so large as some spring displays in former years, was at least remarkable for the general excellence of the plants and cut blooms exhibited. The stands of cut flowers shown of the year held at the Palace, if not quite so large as some spring displays in former years, was at least remarkable for the general excellence of the plants and but blooms exhibited. The stands of cut flowers shown by Messrs. Barr & Son, of Covent Garden, could vie in quality with anything they have brought before the public at other places this season. Their display of Narcissi and Anemones, occupying a semicircular table round the entire front of the prosenium of the theatre in the central transept, was well set off by a line of dwarf Palms in the background. Messrs, Barr & Son cereived an extra prize for the collection, as did Mr. T. Ware, of Tottenham, for his more miscellancous collection of cut blooms. In this lot, besides the fine varieties of Narcissus, there were blooms of the rare Erythronium existing the standard of the standard sta from frequent removals; and to Mr. R. Clarke, Twickenham. A few stands of Amazyllis were to be found, but in comparison with the splendid examples now brought into notice elsewhere they were poor indeed. Nice, well bolomed, medium sized plants were shown in the competition for the best twenty-four Pelargoniums, Messrs. H. Williams & Son obtaining the 1st prize. Among their varieties were Scarle Gem, Albini, Defiance, Messrs. H. Williams & Son obtaining the 1st prize. Among their varieties were Scarle Gem, Albini, Defiance, Messrs. H. Williams & Son obtaining the 1st prize. Among their varieties were Scarle Gem, Albini, Defiance, Messrs. H. Williams & Gont Marchael and Marchael and Scarle Gem, Madame Favart, Wirginalis, and Mirandidre. In this lot were Eve, Rosetta, Edith, Triomphe de St. Mande, Lady Blanche, Metalliac, and Vivandidre. Cinearias formed one of the most brilliant features and most admired portions of the show. Mr., James, Woodside, was 1st for twelve; Messrs. Carter & Co., Holborn, and J. H. Hill, Hillingdon Place, 3d. Owing to the lateness of the season Primula sinensis was not in any great force, nor were the examples shown of much merit. The 1st prize was awarded to Messrs. Carter & Co., who had all their noted Holborn varieties, and the sorts Prince of Wales, a deep rose, having the beginnings of a double flower; and Snowtlake, a sort exhibiting a similar tendency. For the best tweety plants of Lily of the Valley the 1st prize was awarded to Mr. W. Watson, Newcastleon-Tyne, of Stough, for countering a similar tendency. For the best twenty-four plants, all of them being well flowered aslos for alpine varieties. Some neatly trained small specimens of Indian Azaleas were also shown by Mr. Curner, who was awarded the 1st prize for the best wenty-four plants, all of them being well flowered examples. Very good were Irma, a grand rosy-mauve; A. Borsig, Mrs. Turner, a pink margined with white, that plants rather smaller and more globular in shape. The competition for the best groups of stove and gree

VEGETABLE PRODUCTS OF SMVRNA

SESAME (SESAMUM INDICUM) .- This oleaginous seed is much cultivated in Asia Minor, chiefly in the seed is much cultivated in Asia Minor, emery in the valleys of the Meander, Cayster, and Hermus, also in the islands of Mitylene and Cos, and along the coasts of Caria, Lycia, Pamphylia, and Caramnia, but the produce of these coasts, that of Mersina excepted, is of a very inferior quality. Generally the Sesame of Asia Minor is exceptionally good. cultivation is extending to meet an increasing demand; and the chief consumers are France and Italy, then Holland and Russia. England and America take none. A considerable portion of the crop is consumed on the spot in the shape of oil. In France and Italy the cold-drawn oil of Sesame is used for salad, and also for perfumes, as it keeps longer than Olive oil, and is free from offensive smells. In France it is also in request to make soap and to grease machinery. The seed alone is exported and in sacks containing about half an imperial quarter each, the price averaging from 35 fr. to 40 fr. the sack, or 19s. the quintal (124 lb.), free on board. At Smyrna and Scala Nuova the oil is badly made, yet it is extensively consumed either in the manufacture of the local sweet called "halva" or for cooking purposes.

GALL-NUTS (QUERCUS INFECTORIA) .- The galls are formed by an insect (Cypips quercus folii) on the leaf of the native Oak, and are gathered when the insect is in the larva state. They are gathered chiefly at Magnesia, Alasheir, Koular, Ushak, and Pergamus. In Europe they are prized not only for their tanning properties but also for the valuable black dye which they yield. The galls are exported in sacks containing from 80 to 100 okes each (220 to 280 lb.) and are worth on an average £4 to £6 5s. the sack. There are three qualities, distinguished by their colours-black, white, and green. The export is one of small value, never exceeding 3000 sacks a year, valued at from £12,000 to £18,000. The largest share of it is taken by England and France. The export is sometimes largely increased by the crop from Mosul, shipped at Smyrna in transit for Europe.

VELLOWBERRIES are the fruits of a small shrub (Rhamnus infectorius) which grows chiefly in the neighbourhood of Kaiseria, Karahissar, Angora, and Chouem. Its fruit grows in clusters of berries not larger than Currants, and of a green colour; yet the juice expressed from them is a bright yellow, which is prized as a dye, and when mixed with Indigo gives a most brilliant and durable green. The berries are picked when young, [for they lose their colouring matter when fully ripe; the best qualities are in request in Switzerland, which they reach vid France and Italy. The greater portion of the remainder is taken by England. The berries are exported in sacks, containing about 300 lb. each. In the first three years of the series their price was about 40s. per cwt., free on board. In 1881 the price rose to 50s., and has since made a considerable advance, the peculiar yellow of this dye having become fashionable in Europe. Some twenty or thirty years ago, before the dye was imitated by aniline, these berries used to fetch £15 or £16 per cwt.

GUMS .- The Gum Tragacanth of Smyrna is more in repute than that of Greece, Egypt, or Syria. It is the sap of certain shrubs. Species of Astragalus grow wild in the mountainous districts of Anatolia, chiefly at Karahissar, Isbarta, Kaiseria, Jalovatch, and in Caramania, and the north of Syria. The best quality is sent to Europe and America for confectionery; the inferior qualities to England, France, and Switzerland, chiefly for dressing leather, and partly for giving substance to linen and calico. The other consumers of Smyrna gums are Austria, Holland, Italy, The export reached its climax in 1879, and Spain. when its value was nearly 480,000. In 1880 and 1881 it fell to less than one-third of that sum. The best qualities are packed in cases, the inferior in sacks, in both instances weighing about 21 quintals, or 300 lb. The best quality is white, in thin flakes, and is worth from £14 to £18 per quintal; the second is a whitybrown, from £8 10s. to £12 8s.; and the third is a dirty brown, and in thick flakes, fetching only from £6 to £8 per quintal.

GUM MASTIC is obtained from the bark of Pistacia lentiscus, an evergreen shrub which abounds in Chios. The bark is gashed in crosses, and the gum exudes in tears. What falls to the ground and becomes mixed with earth is used on the spot to make the spirit called "mastic," by flavouring alcohol with it; while the pure gum, carefully cleansed, is selected for exportation, chiefly for the manufacture of varnish. A large portion of the crop is consumed in Turkey and Egypt, where the women are in the habit of chewing this gum to sweeten their breath. The crop of Chios averages 4500 to 5000 quintals a year, but the portion of the crop exported does not exceed £1600 to £2000 yearly

SCAMMONV.-Thisdrug, a very powerful acid, much prized in some European pharmacopæias, is the juice of a creeping plant (Convolvulus scammonia), somewhat resembling the Jasmine, but bearing a pale blue flower. The juice is obtained by gashing the stem and catching the juice in a shell, which after two or three weeks is found to be white, resembling milk, which in time turns a greyish-black. This juice, when boiled to inspissation, forms a paste which is the scammony of commerce. It is very valuable, and consequently is frequently adulterated by the peasantry before it reaches Smyrna. The first quality, or "lacryma," is worth at Smyrna about 25s. per pound, the second about 17s. It is packed in boxes of various sizes, lined with tin. The average value of this export for the five years in question did not reach £5200. The demand for scammony has declined of late years. It was formerly worth £8 or more per oke (23 lb.), now it never fetches more than 43 Ios., the depreciation being owing to the shipment from Syria of the root itself, instead of the inspissated sap. England takes the larger half of this export; the rest is taken by France, Italy, and Austria.

Obituary.

LOVERS of herbaceous plants will be sorry to miss from their ranks the venerable JAMES ATKINS, of Painswick, who died on April 2, aged eighty-two years. Mr. Atkins was originally a nurseryman—and one, too, of the old school, who, while not neglecting his business, grew his plants for the love of them, and when, several years ago, he retired from business, he still pursued his hobby, and from time to time contributed to our columns observations betokening great shrewdness of perception. Cyclamen Atkinsi, a hybrid between C. Coum and C. persicum, will perpetuate his name, while no one who admires Myo-sotis dissitiflora, first described in these columns in 1868 by Mr. Baker from specimens brought from Switzerland by Mr. Atkins, will dispute his claims on our gratitude.

The Meather.

April 3.—Rain in early morning. Fine bright day. Dult night.
Rain began to fall at 10.30 P.M.
4.—Fine bright day; rain falling from 8.30 P.M.
5.—Fine day; bright and clear at times. Slight rain
at 10.30 P.M.
6.—Fine bright morning. Dull day and night. Rain
7.—Wet morning. Dull day and night.
8.—Fog in early morning. Fine day and night; uvercast
ad dark mostly.
9.—Fine bright day; cloudy at times.

London: Atmospheric Pressure.—During the week ending April 5, the reading of the barometer at the level of the sea decreased from 29.97 inches at the beginning of the week to 29.52 inches by 3 P.M. on March 31, increased to 29.71 inches by midnight on April 1, decreased to 29.61 inches by 3 P.M. on the 2d, increased to 29.63 inches by midnight on the same day, decreased to 29.45 inches by 9 A.M., and decreased to 29.35 inches by 9 A.M., on the 3d, increased to 29.36 inches by midnight on the 4th, increased to 29.37 inches by midnight on the 4th, increased to 29.37 inches by 1 P.M. on the 5th, decreased to 29.37 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.57 inches, being 0.54 inch

the level of the sea was 29.57 inches, being 0.54 inch lower than last week, and 0.36 inch below the average of the week.

or the week.

Temperature. — The highest temperature in the shade in the week was 69⁴, on the 2d; the highest on March 30 was 51⁸. The mean of the seven high day temperatures was 60⁴.4.

day temperatures was 60°.4.

The lowest temperature was 38°.5, on March 30; on April 3 the lowest temperature was 48°. The mean of the seven low night temperatures was 43°.3.

The greatest range of temperature in one day was 23°.5, on April 2; the smallest was 10°, on March 31.

The mean temperatures were—on March 30,

44°.3; on March 31, 47°; on April 1, 51°; on the

2d, 26°.7; on the 3d, 55°.7; on the 4th, 52°; and on the 5th, 49°.3; and these were all above their averages by 0°.6, 3°, 6°.8, 12°.3, 11°.1, 7°.2, and

THE

4°.4 respectively.

The mean temperature was 50°.9, being 9°.6 higher than last week, and 6°.5 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 127°, on April 2. The mean of the seven readings was 107°.4.

The lowest reading of a thermometer with its bulb placed on grass was 31°.50 on March 30. The mean of the seven readings was 35°.

Rain.—Rain fell on five days to the amount of 0.50 inch, of which 0.27 inch fell on April 5.

ENGLAND: Temperature,—During the week ending April 5 the highest temperatures were 69°,5 at Cambridge, 60° at Blackheath, 66°,2 at Nottingham; the highest at Plymouth was 52°,7 at Turto 56°, and at Sunderland 58°. The general mean was 62°. The lowest temperatures in the week were 33° at Sheffield, 33°.7 at Wolverhampton, 34° at Hull; the lowest at Plymouth was 59°, at Blackheath 38°.5, and at Brighton, Leicester, and Preston 38°. The general mean was 36°.2.

The greatest ranges were 32°.5 at Cambridge, 32°.0.

and at Brighton, Leicester, and Preston 38°. The general mean was 36°.2.

The greatest ranges were 32°.5 at Cambridge, 30° of a Nottingham, 30°.5 at Blackheath; the smallest ranges were 13°, 7 at Plymouth, and 21° at Truro and Sunderland. The general mean was 25°.8.

The mean of the seven high day temperatures w:5 highest at Cambridge, 62°.8, at Blackheath 60°.4, at Brighton 56°.9; and was lowest at Sunderland, 50°.3, at Plymouth 51°.t, and at Bradford 51°.5. The general mean was 54°.6.

The mean of the seven low night temperatures was highest at Brighton, 44°.5, at Blackheath 43°.3, at Preston 42°.9; and was lowest at Wolverhampton, 38°.t, at Sheffield 30°.5, and at Bolton 40°.2. The general mean was 41°.6.

The mean daily range was greatest at Cambridge, 22°.4; at Blackheath 17°.1. at Sheffield 16°.5, and was least at Plymouth, 8°.4, at Sunderland 50°.9, at Cambridge 50°.3, at Brighton 49°.4; and was lowest at Wolverhampton, 44°.4, and was lowest at Wolverhampton, 44°.4, at Sunderland 44°.4, and at Bradford 45°.4. The general mean was 46°.9.

Raim.—The largest fall was 2 23 inches, at Truro, 2 02 inches at Plymouth, 147 inch at Wolverhampton; the smillest fall was 0.77 inch at Cambrampton; the smillest fa

nam.—Ine targest fall was 2 23 inches, at Truto, 2 02 inches at Plymouth, 1 47 inch at Wolverhampton; the smillest fall was 0.17 inch at Cambridge, 0.50 inch at Blackheath and Ilull, and 0.51 inch at Brighton. The general mean fall was 0.95 inch. Rain fell on every day in the week at Truto.

SCOTLAND: Temperature,—During the week ending April 5, the highest temperature was 63°.8, at Edinburgh; at Dondee the highest was 55°.9. The general mean was 57°.7.

The lowest temperature in the week was 30°, at Perth: at Greenook the lowest temperature many 30°, at 10°.

The lowest temperature in the week was 30, at Perth; at Greeoock the lowest temperature was 34°. The general mean was 32°.3.

The mean temperature was highest at Edinburgh, 46°.3; and lowest at Perth, 42°.8. The general mean was 44°.5.

Rain.—The largest fall was 1.47 inch, at Aberdeen, and the smallest fall was 0.41 inch, at Edinburgh. The general mean fall was 0.97 inch.

Enquiries.

"He that questioneth much shall learn much."-BACON.

"He that questioneth much shall leave much,"—BACON.
MYROBALAN PLUM.—Can any reader say why the
Cherry Pum of gardens, described by Linnæns as
Prusus Myrobalaua, and used chiefly as a stock in this
country, is so called? A statement has got into the
books, and was recently repeated in these pages, that
some part of the tree is used in India to dye blck.
Most probably this is an error arising from a confusion
with the Myrobalan (Terminalia Chebula), the fruit of
which is used in India with sulphate of iron to make ink.
Large quantities, however, of Plums or Damsons are
grown in this country for the sake of the dye they yield.

BOOKS: R. T. F. Thomson's Handy Book of the Flower Garden (Blackwood & Co.), and Mr. Graham's Guide to the Royal Gardens at Hampton Court.

Guide to the Royal Gardens at Hampton Court.

INSECTS: W. F. The insect sent as feeding upon the young Vine leaves is the perfect state of the wireworm (Elater sputator), which is so injurious in the larva state, but which has not generally been regarded injurious as a beetle. I. O. W.—Constant Reader. We have found no insects on your Violet leaves, the edges of which exhibit patches destitute of the green parenchyma, as though the interior of the leaves had been eaten by the subcutaneous larvae of a small two-winged fly, similar to that which infests the Marguerie leaves figured in our last year's volume. I. O. W.

LAWN MOWERS: A, B. C. We cannot undertake to

discuss the merits of rival American mowing machines. Consult our advertising columns.

LIGHTNING, EFFECTS OF: X. The injury done to trees is supposed to result from the rapid conversion of the fluids of the stem into steam; the consequent expansion splits the tree.

Tobracco Cultivation.—In answer to "C. H." (p. 469), enquiring as to the "title of a work on the cultivation of Tobraco in South Anerica," I may perhaps say that I do not know of any work specially relepting to South Anerica. Dr. Forbes Watson's Report on the Cultivation and Preparation of Tobraco in India, with plates (London, India Museum, India Office, 1871), may perhaps be of the top of the cultivation of the Proparation of Tobraco in India, Products of the Vegetable Kingdom may also be useful Products of the Vegetable Kingdom may also be useful C. H., however, will find references to numerous books on Tobraco in Mir. B. Daydom Jackson's Vegetable Technology, p. 348. John R. Jackson, Museum, Kew.

SEEDS.

SEEDS.

LONOON: 1/pril 9,—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, report to-day's market without feature. For Clover and other seeds there is a small steady inquiry. Values generally remain without alteration, but occasionally the turn of prices is against the seller, Not much foreign red will probably be kept over. Italian Rye-grass is firmer. Trefoil continues exceedingly cheap. Tares met a slow sale. Bird seeds show no quotable change.

CORN.

CORN.

At Mark Lane on Monday the limited business concluded showed 1s, reduction on the week, excepting for the finest white Wheats. Flour was saleable only at a proportionate reduction. Malting Barley was inactive, and grinding descriptions quiet, and without quotable change. Beans and Peas were in moderate request at late rates. Oats hardened in value, and on the week were 6d. to 9d. dearer. Average prices of corn for the week ending April 5:—Wheat, 3rs, 7d.; Barley, 3rs, 3d.; Oats, 1g. 6d. For the corresponding week last year:—Wheat, 4sr.; Barley, 33; 2d.; Oats, 21s, 8d.—On Wednesday very little was passing. Wheat was in 3d. For the control of the weak ending 4sr year in the weak properties of the pro

At Copenhagen Fields on Monday trade in beasts was dull. Sheep net a slow sale at barely the rates of Monday se'nnight. Rather a large number of lambs were on offer, and prices were steady at 8t. to 8t. 6d. per 8 lb. Prime calves realised full value; plain sorts sold unevenly and pigs were not in denand. Quotations:—Beasts, 4t. to 5t. and 5t. 2d. to 5t. 6d.; calves, 5t. to 7t.; sheep, 5t. to 5t. 10d., and 6t. to 6t. 6d.; pigs. 4t. to 4t. 6d.

HAY.

Tuesday's Whitechapel Market report states that trade was dull and supplies large. Good qualities of hay and Clover were in request. Quotations: —Prime old Clover, 95s. to 105s.; inferior, 6os. to 75s.; prime second cut, 90s. to 105s.; is the meadow hay, 8os. to 87s.; inferior, 40s. to 65s.; and straw, 28s. to 37s. per load.—Cumberland Market quotations:—Superior meadow hay, 81s. to 92s.; inferior, 6os. to 74s.; superior Clover, 105s. to 114s.; inferior, 7os. to 92s.; and straw, 34s. to 38s. per load.

POTATOS.

The average prices at the various markets during the week have been: — English Champions, 45. to 55.; Irisb do., 45. to 50.; Victorias, 60. to 80.; Regents, 50. to 60.; Roses, 50. to 55. per ton; German Reds, 21. 6d. to 31. 6d. per bag. — The imports into London last week were 64 cases 90 boxes from Malta, 88 cases Bordeaux, 44 tons Barfleur, and 104 sacks from St. Nazaire. Nazaire.

Government Stock.—Consols closed on Monday at 100g to 102g for the divery, and 102g to 102g for the account. Tuesday's prices were, for delivery, as on the previous day, and 102g to 102g for the account. The intal quotations of Wednesday were 102g to 102g for delivery, and 102g to 102g for the account.

SEND FOR A PRICE LIST OF

YDRAULIC RAMS. JOHN BLAKE'

FOR RAISING WATER FOR THE SUPPLY

TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, and FARMS.

No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams. NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

SHEFFIELD UNION NEW WORKHOUSE .- MR. JAMES HALL, Architect, Sheffield. Application of two of BLAKE'S PATENT HYDRAULIC RAMS for the supply of water to the Workhouse (1880).

Mr. James Hall, the Architect, reports that in December last he tested the Rams which force the water to a service tank in the rear of the house at an elevation of 110 feet, and found that the quantity of water delivered was at the rate of 33,000 gallons per day-3000 gallons per day in excess of the quantity guaranteed.

RECENT AND OTHER TESTIMONIALS.

From Mr. A. J. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middleisborough, September 64, 1883—" Dear 814.—I am glad to say that the Rams you and down on the Hambledon Estate, to say the September 184.—I am glad to say that the Rams you and down on the Hambledon Estate, to say the September 184.—I am glad to say that the Rams to the Rams at full power, see a say to page 2010 as a day, and with enough water to work the Rams at full power, see gallons, and when working full power 1950; gallons per day are seed up to a height of nearly 400 feet. They made a clear start and have gore well since.

The Delivery Tipe, in the above case, it speco feet in length.

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Cc., Soptember 8, 1883—"Dear Sir,—I can now report well of the two Hydranile Rans we have fixed to your instructions for the supply of District Wiley Village, a, ooo gallons per day was the quantity you promised they would force to a height of 68 feet, but on testing them I am covinced that coopies in a tribe him of their power, which the quantity of waste water used in driving them is not equal to hat the capacity of the 68 rich pipe by which I by are fed, and I am inclined to the belief that a more simple and efficient pump can to the found.

From Captain TOWNS HEAD, Wirelaum, February 20, 1877.—"In answer to your it quity 1 am glad to say the Hydraulic Rem you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been reveral times during this water, forcing up water through a drivery pipe 50.3 yards 150g at the rate of 80.000 galloss per day, a though you only promeed 50,000.

gallons per day, although you only promised so,coo.

From J. SPENDER CLAV. Eag., Ford Manr., Lingfield, Surrry, Anguett, 3 [8:.—" In Freply to your letter of inquiry I am glad to be able to say that the two Hydrault. Rams which you fixed of the spring, they deliver to the top of my house, distant a full mile from the spring, a gals, 1 qr., per minute, or five galons per ray hours, begin joe gallons above the quantity on guarantee.

From Mr. JOHN ARCHHOLD, Engineer to Messre, Parber, Walker & Co., Eastmoof, Notto, October 21, 1882—" I am glad to intoin you that the Hydraulte Ram you fixed for House Barber, Esq., whist working with a fall of 30 feet, and forcing to a height of 30 feet, through song through it, thus giving 77 per cent. of useful effect."

From Mr. T. BARHAM FOSTER, C. E. .. 3, 3 folia Dalton Street, Manchester, October 1, 1873—" Pear Str.—I have tested the Ram you contracted to fix on the Hims Estate. Stafford-shae, for Janes a thatwick, Eagle of 50 feet, which which worked by view water falling 5 feet o inches, and am pleased to had that when at full power the Ram sends up 13,500 gallons per day to the height and distance camed, and though the Ram is now adjusted to work at only three-Curths its power, the work done represents over 57 per cent, of useful effect."

From HORATIO R. B. PELLE, Bsq. Commissioner to Sir Michael Shaw Stewart, Bart., Manxion Honse, Greeneck, August 13, 1883.—"I am glad to say the Ram you fixed at Castle Farm in November last for Sir Michael Robert Shaw Stewart, Bart, continues a great success. The smalleess of the driving water—3½ galloos per minute—is not more wooderful than the large proportion of water it seeds up viz., 730 galloos per day, through about 400 yards of delivery pipe, to an elevation of 75 feet."

proportion to water it sodus up, viz., 7 to gainous per day, introdga about 400 yards of delivery pipe, to an elevation of 75 feet.

From FRED. J. TURNER, Esq., Agent to His Grace the Duke of Portland, Mansheld Woodkone, Angust 30, 1883.—" Dear Sir,—I have much pleasure in stating that the Hydraulic Rams which you erected last year for His Grace the Duke of Fortland, at Lyndhuru, near Mansheld and at Skeldon, Ayishin, are working very well, and they are most satisfactory is every way.

From Mr. E. W. STRETEE, FR. G. S., Diamond Merchant, Bond Street, London, and Sachwille Park, Sunsex, October 1, 1883.—" Dear sir,—When you surveyed the size at Sackwile Place, Eusted, for the purpose of having a Ram with one mile of collecting and districtly and the size of the siz

realised my expectations, and I have to hesitation in saying it is a decided success."

From Sir ROBERT IMENZIES, Bart, of Menies, Rennech Lodge, Rennech, Angust 20, 1820.—"The Hydraulic Ram which you fixed for me to supply water to Ramooch Lodge and Camesurich, two houses three-quarters of a nile appril, is a complete success. The elevation of the two houses are different, there is a regular supply of y quarts per minute to each house, which has never ceased since the Ram was set agoing, about three months ago. Your Ram took the place of one previously triad on the same spot, and which did not succeed, and was in fact a complete failure."

in fact a complete lailure."

From Mr. WILLIAM LAIT, Architect and County Surveyor, Compton Verney, B'arwick, J'ansary 16, 1882—"I have much pleasure in staint that the Patent Hydraulic Ram I bad from you for the Rev. J. Cardwell Gardener, of the Vicarage, Budiers Marston, and which you fixed there, is, I consider, ten arkably successful, as indicated below t—4100 gallons of water per day are passing through the Ram with a descent of 13 feet 8 inches. Out of this small quantity 1080 gallons are sent up to a height of 41 feet, showing 28 per cent, of useful effect, and the noise of its working is so slight as to be almost insufolible."

DANIELS BROS.'

PLANTS and ROOTED

CUTTINGS FOR SPRING, 1884.

We have much pleasure in offering the following choice Florists' Flowers in strong well-rooted stuff, true to name.

Free and Safe by Post at Prices quoted.

BOUVARDIAS-Beautiful varieties, CHRYSANTHEMUMS — Largeflowered incurved and reflexed varieties. Superb 0 standard sorts
CHRYSANTHEMUMS — Japanese. 2 6

Magnificeot class of highly improved varieties, should be grown extensively. Fine exhibition 0 CHRYSANTHEMUMS — Japanese.

CHRYSANTHEMUMS — Japanese.
Good popular sorts, our own selection
...
CHRYSANTHEMUMS — Pompon.
A fine selection of beautiful varieties ...
COLEUS — Beautiful and distinct
varieties, our own selection
DAHLIAS—Show and Fancy. A
spleadid collection. New and select varieties,
our own selection
DAHLIAS—Show and Fancy. Very
fine varieties, our own selection ...
DAHLIAS—Bouquet. Our own selection, includer new varieties of 1883.

Bardeners' Chronicle.

SATURDAY, APRIL 19, 1884.

CANKER IN APPLE TREES.

THERE are probably several diseased conditions of Apple trees known as canker. During the past two or three months 1 have been looking into this disease somewhat attentively, and I have come to the conclusion that the commonest and most serious form is due, as was pointed out by Goethe, to a sphæriaceous fungus, Nectria ditissima (Tul.).* The various members of Sphæriacei occur, as a rule, upon dead wood-not upon the living tissues of plants. There are, however, many important exceptions-such, for example, as the Valsa parmularia, described many years ago by Mr. Berkeley, upon living Oak twigs. More important, from an economic point of view, is the Sphæria morbosa of Schweinitz, the cause of black knot in Cherry and Plum trees in the United States: closely allied to which is Gibbera vaccinii upon living branches of Vaccinium Vitis-Idæa in our own country. The Dothideaceæ, too, occur, many of them, upon living leaves and branches, as the genus Phyllachora for example. Although there is nothing impossible in the notion that a Nectria may be parasitic upon living branches, yet I must confess my first impression was, that the fungus found a suitable home upon Apple twigs which were already dead rather than that it was the cause of the death of the affected branches. It is well known that winter and spring are the seasons in which the Sphæriacei as a rule are found in the best condition of fructification. I have, therefore, closely examined cankered Apple trees during the past two months wherever I have had an opportunity of doing so, and in no single instance have I failed to find the Nectria upon every tree examined. It is not implied that every cankered patch was found producing perithecia (spore cases); at the same time the majority of the cankers upon each tree were found bearing the fungus in abundance : and, further, it was not found upon any other part of the trees. The trees were not confined to one garden nor to one locality. The specimens which I submitted to the Scientific Committee recently were gathered from (1) Mr. J. Bird's nursery at Downham; (2) Mr. S. N. Marshall's garden at West Lynn; (3) Mr. J. T. Stevenson's garden at Clench Warton; (4) Mr. C. Peek's orchard at Tilney St. Lawrence; (5) Mr. G. B. Ffolke's garden at Wolferton; and (6) Mr. T. Piney's garden at King's Lynn. When the parasite gains an entry into the bark of a medium-sized branch, which it often does through a lateral twig having been broken or cut off (fig. 99), it at first causes the death of the bark and subjacent wood to only a limited extent. The bark cracks concentrically; in the cracks and upon their edges the perithecia are most commonly found. It is obvious that a certain time must elapse

* Nectria ditissima, Tul., Carp., iii., p. 73, t. r3, f. 1-4 (= N. coccinea of many authors).—Perithecia widely scattered or densely gregarious, globose-obtus then papillate, oaked blood red asci cylindrico-clavate, 8 x × 8 mk.; spordia ovate-obloog, unispetute, 14 × 6-8 mk, hydine.—Conidia tuber-cularia crassostipitata, Fuckel, Symb. Mycol., p. 180. Condia ovate-oblong, continous, 6-8 × 3-4 mk.

between the period of infection and the time at which the mycelium or spawn can develope its perfect fruit. This probably takes some months, for it will be seen by inspecting the specimens themselves that the perithecia are most abundant in those cases in which this devitalised area has become surrounded by an enlarged and swollen margin (fig. 100, A, B) of healthy bark. When the parasite attacks a small branch shoot of the last year it kills it outright for some inch or two downwards; especially is this the case when the end of the shoot has been cut off (fig. 100, B); but with the older and thicker branches attacked lower down the disease gradually but surely works its way through the branch, eventually cutting it quite through (fig. 100, A). this case a callus above and below, as well as surrounding the canker generally, is observable. Thus the distal part of the branch becomes in course of time strangled by the fungus. It is useless to look for perithecia on those places in which the disease has only just made its appearance. As far as I can judge, the cankers made last autumn produce the perfect fungus in spring.

In the Gardeners' Chronicle, March 8, 1884, p. 312, Goethe's paper in the Monatschrift des Deutsche Garten for 1880 is referred to, in which the author has shown that Nectria ditissima is capable of producing the disease on Apple, Beech, and Sycamore respectively. The remedy is to cut out the diseased parts and to seal the wounds thus made, which would otherwise remain as vulnerable points inviting the attack of the fungus-spores, by painting them over with warm coal-tar.

The injuries which branches receive by rubbing against one another may, of course, open the door to the fungus spores; but unless the latter be present, a true canker is not produced by this means.

At a recent meeting of the Scientific Committee a very curious form of canker on Hawthorn was exhibited, in which the disease resembled a honeycomb. Whether this was due to an insect or to another fungus, I cannot at present certainly say. It, however, bears some resemblance to the cicatrix of a wound caused by a fungus, Rœstelia lacerata, attacking a young twig last summer, and the presence of some brownish spores in the bottom of some of the cells seems to favour this view. There were also, however, found some spores very like those of a Fusisporium. By further observation I hope to clear this up. Charles B. Plowright, King's Lynn, Afril 7.

DENDROBIUM (STACHYOBIUM) PROFUSUM, n. sp.*

This is reported to have the general habit of Dendrobium superbiens (macrophyllum, Lindl., the Rhubarb-smelling plant), but the bulbs are said to be much thinner. The leaves are stated to be deciduous. On both sides of the stem, in presence or absence of leaf-blades, appear the slender peduncles of seven to nine flowers, which are as large as those of a very good and large Dendrobium amoenum, having at once a narrow, long, incurved perula. The sepals and petals are yellowish-green, with fine purple at the base inside, and purple dots on the petals. Lip fine yellow, "with a dark spot in the middle." The blade of the

lip is pandurate, anterior part very broad, toothletted and wavy. Petals dentate. It will no doubt prove an elegant, chaste thing, as I judge from numerous dried flowers kindly sent me by Herr Consul Kienast, who received them from the discoverer, the Swiss investigator of the Philippines, Mr. Röbelen. H. G. Rebb. f.

AERIDES ROBBELENII, n. sp.

This would appear to be a fine thing with some new features. It is described as having the growth of Aërides quinquevulnerum, with four to six crect (!) peduncles reaching a foot in length, with as many as tweety-five very fragrant flowers. Sepals and petals whitish-greenish, with white tips. Lip with rosy hue and yellow lacinize.

The flowers are equal to those of Aërides quioquevulnerum. The petals have a curous tendecoy to become toothletted. The oblong side lacinize of the lip are usually lacerate on the upper border, as is the oblong, curved, much longer mid lacinia. The spur is rather short, conical, with a transverse linear callus on each side.

It bears the name of its assiduous discoverer, who lately had the success of finding a nest of the most glorious dark variety of Phalænopsis Sanderiana. I had my dried specimens from Herr Consul Kienast, of Zurich. H. G. Rchb. f.

TREE TOMATO.

THIS is the popular name of a fruit naturalised in Jamaica, and found in many old gardens of the Coffee districts of St. Andrews and Manchester. By the kindness of Sir Joseph Hooker it has been determined as Cyphomandra betacea, DC.,* a native of South America, including Peru and Chili, where also it is under cultivation. The plant (belonging to the natural order Solanaceæ) is of shrubby habit, about 5 or 6 feet high; the leaves are large (sometimes a foot long), broadly cordate, and softly pubescent, generally confined to the termination of the branches. The fragrant flowers appear as sub-axillary cymes, of a pale fleshy colour, with bright yellow stamens, followed by an obconical or ovate fruit, which at first of a greenish or purplish tint, gradually assumes a warm reddish colour as it approaches maturity. The bilocular fruit is of firm texture, about 2 inches or 21 inches long, and about 2 inches in diameter. The pericarp is about 4 inch in thickness, of a pale colour. It is not generally known, and seldom used in Jamaica, but it is without doubt a fruit that should be more largely cultivated, as it answers in every respect the purposes for which the ordinary Tomato is esteemed. On the mainland it is known as the Tomate de la Paz, here as the Tree Tomato, and sometimes, on account of its supposed beneficial action on the liver, as Vegetable Mercury. Plants are easily raised from seed, which come into bearing in about two years. It is a very prolific bearer, and the fruit is available during the winter months-November to March-when ordinary Tomatos are not so easily obtained. If the fruit is allowed to fully ripen on the trees it may be eaten raw, and it has somewhat the flavour of Gooseberry. If the skio is removed and the fruit (without the seeds) stewed with sugar, it resembles Apricot, but with a slight suhacid flavour which is very refreshing. In my own household it takes the place of Apple in Charlotteaux-pommes, and it is preferred in this form to real Apples, especially such as grow in the Blue Mountains, or are imported from America. I notice the plant is under cultivation in the South of Europe, but I am not aware to what uses the fruit is there applied. Sir Joseph Hooker informs me that it is now in fruit in the Temperate-house at the Royal Gardens, Kew. As I have lately distributed seed of this Tree Tomato to numerous correspondents at Madeira, India, Ceylon, Hong-Kong, the Cape, and the Australian colonies, the above remarks will no doubt prove of interest to them, no less than to other readers of the Gardeners' Chronicle, who may desire to secure a hardy perennial Tomato plant of more than ordinary merit. I may add the plant flourishes in Jamaica at elevations of 2000-5000 feet; the mean annual temperature of these districts ranging from 72°-63° Fahr. D.

Morris, Famaica, March 25. [This fruit may occasionally be seen in Covent Garden Market under the erroneous name of Granadilla. It is we believe imported from the Azores. Ep.]

GLENCORMAC, COUNTY WICKLOW.

GLENCORMAC, the residence of James Jameson, Esq. (see p. 517), is situate close to the Rocky Valley, and almost between the large Sugar Loaf and small Sugar Loaf Mountains. The locality is one of the most picturesque of the County Wicklow, the scenery on all sides being grand and imposing. Standing within a demesne of 80 acres of land is the newly constructed residence of Mr. Jameson, from the windows of which most charming views of mountain and valley can be obtained. In the immediate vicinity of the house, Art has been successfully put into operation to increase the beauties of Nature. Over five acres have been laid out in pleasure grounds by Mr. W. Sheppard, Landscape Gardener, of Dundrum, County Dublin, who has been very successful in the work. The place being in an exposed position, Mr. Sheppard's object was to provide as much shelter as possible, and for this he treated the ground at his disposal with great skill. He ignored terracing, and, as is his custom, adopted undulations, which have turned out most effective, and have given entire satisfaction. plantations, of which I purpose speaking more in detail further on, have prospered in a remarkable degree, and although in the ground scarcely three years, the display of foliage is very luxuriant, the plants being in the most healthy condition. On proceeding through the principal entrance, which is off the road leading from Bray to the Glen o' the Downs, the visitor's attention is at once attracted to the lefthand side by a magnificent group of Cedrus atlantica and evergreen Oak, which in the course of a short time will be one of the principal features of the place. The growth of these plants has been unusually rapid. To the right hand is the gardener's house, built in the Elizabethan style. It is a substantial and handsome building, in keeping with the mansion itself, which, it should be mentioned, is in close proximity to Glencormac Hill, from which it takes its name. Further on to the lelt of the main avenue are a number of majestic Beeches, which cannot be less than one hundred years old. Going a little further on, a full view of the Sugar Loaf is had, and, with its head towering into the clouds, the effect is very grand. At this point the house also comes into view, but we will turn off the main avenue to a path leading to the right, through clumps of Juniper and Arbutus Unedo, carpeted with Berberis Aquifolium. This path brings you to an avenue of old English Yews, which are greatly prized by the owner, and which are supposed to have been standing for over 200 years. Under these same Yews, it is said, many years ago, the well-known song of "Robin Adair" was composed by a Scotch lady who had fallen in love with the lord of the soil, the property then being in the hands of the Adair family, and known as Grove Hill. It was at this very spot the love-sick lady composed those touching verses, which so plaintively told of her woe at her lover's change of feelings towards her. At the end of these Yews a neatly-constructed summer-house is pleasantly situated. Turning to the left, we come to a very fine group of large-leaved Sorbus (Pyrus Aria) carpeted with green Hollies. The white leaves of the Sorhus contrast very effectively with the sombre hue of the Holly underneath. To the right are some splendid specimens of the Beech tree, and then we come on a group of Pinus Massoniana (?) of fine growth, Portugal Laurels, Berberis, Hypericums, &c. Then comes a path leading to the gardens and lawn-tennis grounds, and here is another group of Cedrus atlantica, Cupressus Lawsoniana, with undergrowth of Ligustrum japonicum, Ligustrum lucidum, Eucoymus japonicus, and Berberis Aquifolium. On the left is a group of Weymouth Pine and Cedrus Deodara, with undergrowth of Arbutus Unedo and Portugal Laurels. We are back again on the main avenne, which winds round gracefully from the gate to the forecourt, from which point the ground has been made to rise gently towards the mountains, the effect being as grand as it is natural; indeed, the designer has throughout copied Nature most successfully. If terraces had been adopted here the result would, no doubt, have been very unfortunate, as the view from the hall door and front windows would be simply destroyed; as it is, the result is very happy.

^{*} Pionandra betacea, Miers in Hook, Lond. Journ. of Bot., vol. 4, 1845, p. 336; Solanum betaceum, Cav. 16, p. 15, n. 99, l. 534; Ann. de Hist. Nacl., i, p. 44, Dun. Sol., 169, n. 70, syn. 7, n. 16; Andrews, Botan. Rep., t. 511; Solanum crassilolium, Ortega, Dec. 9, p. 117; Solanum crassilolium, Ortega, Dec. 9, p. 117; Solanum crassilolium, t. 125, in H. DC, nec. Ruiz et Pav.

On the right and left band of the slope are plantations of Austrian Pines, Birch, Abele Poplars; and standing about in the grass are choice specimens of Abies Pinsapo, Wellingtonias, Cupressus Lawsoniana, and Abies Nordmanniana,

From the forecourt there is a path leading to the vegetable garden, and on one side of this we pass a splendid group of Aralia spinosa, Mountain Ash, Silver Queen Holly, Hodgins' Holly, with undergrowth of Escallonia macrantha. On the left are double flowering Cherries, Golden Queen Holly, Picea Menziesii, Caucasian Laurel, and angustifolium ditto, Passing on further there is next observed a magnificent group of Larch, which acts as a shelter to the mounds.

Turning from the entrace to the kitchen garden we proceed along the wall, passing the vinery and Peach-house, which show a very fine range of glass, and then we are in a winding path, which passes in the distance opposite the front of the house. This perhaps was the most exposed portion of the grounds, but the difficulty was successfully overcome by Mr. Sheppard, who placed the mounds in such order as give the place a very cosy aspect. Along this winding path are planted Silver Queen Holly, Heath, scarlet Horse Chestnut, Cupressus macrocarpa, Austrian Pine, and Scotch Laburnum. It is while proceeding along this path the lovely vistas are par-

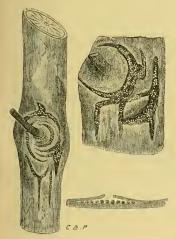

Fig. 99.—Canker on Ribston Pippin, showing the cracks in the bark, with the fungus-capsules, or perithecia: half nat. size.

ticularly conspicuous, and, although from some points the mounds appear continuous, the mountain dells come on us frequently in pleasant surprise. The clothing of one or two mounds next reached is of beautiful specimens of Laurustinus, large plants of angustifolium Laurel, Berberis Darwinii, and Rhus Codinus.

The plantation to the left is continued with silver and variegated Hollies, Sweet Bay, Heaths, and Caucasian Laurels. These Laurels deserve particular mention, owing to their beauty and robustness, and, being rarely cut by the frosts, they are largely used by Mr. Sheppard, who looks on them as the premier Laurel. Comiog on further another vista is reached, and through this there is a full view of the small Sugar Loaf; and Hollywood, the residence of Sir George Hodson, is discerned. A triangular raised bed has been laid out close to this point, one path leading on to the Sugar Loaf, and the other back to the main avenue. On the right of the latter path are some fine Horse Chestnuts and Scotch Firs with an undergrowth of rotundifolia Laurels and Berberis Aquifolium. Bearing to the left, at the apex of the triangle we come to an ingeniously planned dripping pool (of which we give a woodcut, p. 517). The rocks, which correspond with those of the surrounding mountains, are very effectively set, and are clothed with Ferns, Banksian Roses, Osmanthus, white-leaved Brambles, &c. There are a series of drops, and the water is subsequently treated as an open

rivulet running through the pleasure grounds and under the public road into a stream in Sir George Hodson's grounds,

Leaving the pool, we come to groups of Pampasgrass, New Ze. and Flax, and Tritonias, all of which are in luxuriant growth, and make a very fine display. We next find ourselves close to the side of the house, where is a two-sided terrace, the corner of which is hidden by a plantation of Abies Nordmanniana, variegated, Hodgins' and Minorca Holly, and Grislinia littoralis. There is now a full view of a very fine piece of rockwork, which was constructed to hide a dead wall. This rockwork is a very remarkable feature, owing to the admirable manner in which it has been constructed. In it are found hold projections,

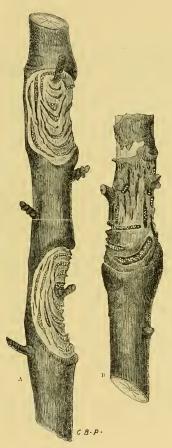

Fig. 100.—A, R, Canker in Apple trees, showing progress of the disease: half nat. size.

some of the stones weighing over 2 tons, and all of which were obtained from the side of the mountain. The terrace we descend by a flight of steps, arranged in rather a novel fashion, for instead of having the usual cut stone side bases, they are made of ornamental rockwork, clothed with a splendid display of Aubrietias of sorts. The rockwork at the dead wall is set off with rare plants, and at the end the rainwater from the adjoining buildings is made to serve for a dripping pool, which can be set in motion by turning a concealed handle. At the base of the rocks there are Hollies, Austrian Pines, Cupressus of sorts, Chinese Junipers, dwarf Spruce and Yews, New Zealand Flax, Yuccas, Escallonias, Vincas of sorts, Sedums, Hydrangeas, Ivies of sorts, Roses, &c., all combining to give effect to the workmanship. At the end of this rockwork the lawn-tennis ground is laid out. On one

side of this ground there is a fine plantation of Sycamores, scarlet Chestnut, Picea Menziesi, &c. In this ground there stood a fine Sycamore tree, fully 50 feet high, which was removed and transplanted some 50 yards away, and it has not been checked in any way by the change. There is close by a bed of hybrid Rhododendrons. This path brings you to the summer-house at the end of the Yews. Returning towards the house, the conservatory is well worth a visit. It is spacious and lofty, and contains numerous pockets filled with Degonias and Ferns, all splendid plants. There are also Passifloras of sorts, Tradescantias of sorts, Tacsonias, Clematis, Abutilons of sorts; Dracenas, and Selaginellas. From the conservatory there is a door leading into the drawing-room.

Returning to the range of glass already referred to, we find it is divided into two vineries, a stove, and two Peach-houses. To the rear of the stove there is a very pretty fernery, in the grotto style, in which the plants are doing very well. In the stove there are some very fine plants, including specimens of Pandanus, Crotons of sorts, Allamandas of sorts, Stephanotis, Orchids, Draccenas, Anthuriums, Davallias, and Palms. The Peach-houses contain very fine trees.

The kitchen garden is very extensive, and is divided into the usual quarters. The walls are lined with

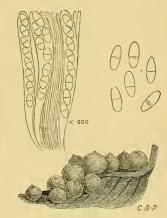

Fig. 101.—Below are shown the fungus-capsules, or perithecia of Nectria ditissima, enlarged. Above the asci, or sporecontaining tubes, and the spores magnified 500 diam.

hrick and wired. In the centre is a curvilinear house, in which are Peaches and Nectarines in robust health.

This notice would be incomplete without giving credit to the head gardener and steward, Mr. Angus McIntosh (who has been in the service of the Jameson family for many years), for the admirable manner in which he keeps the grounds. Owing to bis great experience the place could not he in better charge. It may also be mentioned that Mrs. Jameson is quite a conneisseur of trees and shrubs, and takes a great interest in the grounds. The manner in which the work at Glencormac has been carried out by Mr. Sheppard is an additional testimony to his ability and skill,

WARWICK AMATEURS' AND COTTAGERS' HOR-TICULTURAL SOCIETY. — The annual exhibition of this Society is fixed for Wednesday, July 30, and a very good schedule of prizes has just been issued. It is a remarkable one, too, because it includes an industrial department, under the management of ladies, in which prizes are offered for various kinds, of needlework, with classes also for children, also for home-baked bread, plum cake, jam tart, jam, &c., and special prizes are offered for the best specimens of cottage handicraft or other industrial work. These are valuable additions to a cottagers' show, and prizes of this character might be given in many districts with great advantage. They are said to work in a very beneficial manner at Warwick,

NEW SPECIES OF CAR-MICHÆLIA.

CARMICHÆLIA UNIFLORA, p. s.—Forming large patches I inch high. Stems creeping underground, and giving off slender branches; branchlets crowded, compressed, glahrous, 2—1 inch long, 32—23 inch wide; ontches few, distant. Leaves not seen. Flowers solitary, 2 inch long; peduncles slender, puberulous, jointed about the middle. Calyx glabrous, teeth short, acute; vexillum reflexed; wings shorter than the keel; ovary glabrous. Pod (immature) linear oblong; style recurved.—Hab. South Island, New Zealand, Vailey of the Poulter, Canterbury, J. D. Enys.

The most slender species yet discovered. Closely allied to C. nana, Hook, f., from which it differs in the lax habit, narrow braoches, longer peduncles, smaller solitary flowers, and shorter wings.

CARMICHÆLIA ENYSII, n. s.—Forming dense hard compact masses, scarcely 1 inch above the surface, 1—4 inches in diameter. Root and lower branches stout, secondary branches 1 inch long, branchlets ½—2 inch long branches 1 inch long, branchlets ½—3 inch long branches 1 inch long stand flowers not seen. Pods solitary, on short erect or decurved peduncles, orbicular ovate, with a short straight or curved beak, compressed, 1-seeded, seed reniform, black; replum thick. Pod dehiscing by a single valve partially separating from the replum and remaining attached at the apex.—Hab. South Island. Terraces of the river Porter, Canterhury, 2500 feet. J. D. Enys and T. Kirk.

One of the most remarkable plants in the flora; the branches are so densely crowded that it is not possible to thrust the flogers between them. Rarely the pods are 2—3-seeded, never more, although the ovary conains four to five ovules. A young plant raised from seed, at this date (February 29) has developed small orbicular, emarginate leaves on short petioles. In all probability these will be succeeded by scales, until the plant assumes its permanent leafless condition. T. Kirk, F.L.S., Wellington, New Zealand.

MARKET GARDENING.

The comparatively new market garden at West House, Egham, the property of Mr. A. Sharp, consists of 20 acres of strong loam overlying gravel. The growing of fruit for preserving and for the London market is the main idea that is being realised, still at the present moment a part of this area is under vegetable crops that have partially covered the working expenses whilst the fruit bushes and trees were arriving at a bearing condition, and possibly interlining with light catch crops will continue to be practised, as in other similar undertakings. The land has been treached to 2 feet deep, and heavily manured—an expense that is now well repaying itself in the heavy crops of Strawherries, Raspberries, and vegetables taken from it.

The land being much exposed, and open country surrounding it, Mr. Peckham, the manager, informed me he had found much good from making use of the turf, originally covering the land, to construct many long rows of turf pits. These are used for all purposes which are intended to forward the early growth of plants, or to protect them from cold during the winter. It is only in new gardens that have taken the place of old pasture land, which is frequently the case in the suburban districts, that sufficient turf is available for this end, other growers using earthen or decayed dung linings; but where sound turf is used no boxes are required, a light frame-work of wood being placed on the turf walls to form a support for lights, or shutters of wood or felt. making the walls it is a good practice to drive sharppointed stakes through them at intervals of 5 feet to keep them upright, and to which the frame may he nailed, and which help to keep the front and back walls from falling outwards.

In some of these the soil had been manured, dug over afterwards, and was beiog planted, in rows about 18 inches apart, with American Wonder Peas. These had been raised in warmth in small 48's, sufficiently hardened off in cold frames, and were promising-looking stuff, stocky and vigorous. They will get protection at night when frost may be imminent either by a sprinkling of old Pea haulm or the felt shutters will be placed on them; but the frost we may expect after the third week in March is not likely to be very damaging. The chief measure of advantage

lies in the warmth that is attained by the slope of the soil—about 40°—and the surrounding turf wall, which tops the beds at the back by about 1 foot. This little amount of protection works wonders in producing a quiet warm interior area, by which the plant growth is considerably accelerated. The usual fault seen in garden frames used for forcing purposes, such as salad, Radishes, Carrots, Celery, Cucumbers, Melons, is that the sides, and especially the front wall or boards, are made too high, by which the plants near the front are quite in shadow, and, moreover, everything grown in them becomes "drawn."

The frames that are used for plant-growing are usually too deep for the earliest forcing purposes. A back made of a foot-broad wheeling plank, and a front of a 9-inch one, and long enough to accommodate six or eight lights, with a slating lath nailed on the front one to keep the lights in the proper place, make the best dung-bed frame; they need no paint only white-wash; can be made to take to pieces very easily with stout latches or hooks at the ends, and last many years if 2-inch stuff be used. In other turf pits were Strawberries, such as President, Marguerite. and others, which, without any forcing, will be much in advance of those in the open ground, many of them already showing stout bunches of bloom just coming up (March 19). These had no protection this winter, and will only receive it if frost should threaten when they are in bloom. Other pits filled with the same varieties were interplanted in autumn with Hicks' White Cos Lettuces, Endive of the broadleaved section, and Cabbage Lettuces.

These latter turf pits had glass lights, and appeared to have been treated less coldly, for Lettuces were in many instances full grown, and the many gaps showed where these and Endive had been drawn for marketing. Under this management not only were the Strawberries much forwarder, but the Lettuces and Endive were very fine for the season, the Cos Lettuces being quite I foot in height, and of great The season had been hitherto very favourable for these plants; with snow and frost, results must be poorer, owing to the longer periods of darkness, either from not being able to uncover at all, or because it would be taken off late, and put on again early in the afternoon. Endives are blanched with concave pieces of pottery like Seakale-pot lids, but larger, the diameter being 10 inches, and they are 4 inches high to the top of the dome, which has a knob to lay hold of. I saw only Batavian under these, but I should think that the finer moss-curled would rot very readily under them. There is a benefit from their use, for every morsel of the plant gets blanched, and is, therefore, made edible, which is not the case when the plant is blanched by tying up.

This garden is planted chiefly with Raspberries (Kentish Fillbasket), which have borne enormous crops in this heavy loam, and which still continued to make strong wood. The horse-hoe is used to keep down weeds after the intervals between the plants have had the weeds drawn out of them on to the middle space. After the ground has been cleaned a plentiful mulching of strong manure is given. Strawberries, Currants, and Gooseberries are the other sorts of fruits grown. Rhubarb is forced in sheds, also under tall earthenware pots in the open quarters. These pots are quite 2 feet in depth, and have a lid like a Seakale forcing-pot. They are roomy, strong utensils, costing at Bournemouth, where they are made, £12 10s. per 100. Johnson's St. Martin's is a sort much liked here. There are earlier ones, but this possesses the three great desiderata, colour, size, and great cropping qualities.

The land under Seakale forms a considerable portion of the garden, and the crop is well managed, as was evidenced by 183 seedlings being sufficiently large to force this winter, many of the crowns measuring 1½ inch in diameter—a size rarely seen in one-year-old plants.

The one want of the garden is shelter, the country for miles round being without wood; and, although fruit trees in rows are planted across the quarters, something more is wanted to break the force of the wind to make the ground warmer, and to hinder the parching up of the soil. Nuts, for which the land is suited, would form capital wind-breaks if planted in the lines of fruit trees. An excellent concrete wall has been built to shelter the land on the north side, and this is planted with Peaches, mostly early varieties; other fences are of wood, and are covered with vigorous trees of Plums and Pears trained in the fan

style. Two vineries, each of 30 feet, and two Cucumher-houses of the same length, make up the only range of glass at present existing. The Vine-borders lie high, and slope steeply from the front wall. The Vines, mostly Black Hamburgh and Muscat varieties, are planted inside, but having an almost unrestricted run they have taken possession of both inside and outside borders—a proof that they can find their requirements in each. The Vines were breaking strongly, and looked in good condition.

PULVERISATION.

WHEN during hard winters the frost literally locks up the soil for a time from the labour of man it is performing no mere natural eccentricity, but, by causing expansion of the water within the soil, is splitting, crumbling, and in the most effective manner pulverising the earth for the benefit of those who cultivate and for that of the crops which it is to produce. It is not, however, till the thaw, the sudden change from a low to a high temperature, comes, that the influence of the frost is seen; for then the hard tenacious earth is found to be free, loose, pulverised, and in the happiest possible condition to receive seeds. We have had during the past winter no frost to perform those agreeable functions, but, on the other hand, we have had a remarkably small winter rainfall. Still heavy soils will become stiff, surfaces will become set and hard, and a general breaking up is sadly needed. What the frost, in its harsh and unfeeling way, usually accomplishes so thoroughly, March winds and drought did in more gentle mood. The earth was not frozen, but baked, and whether turned up to the air, or lying dormant from its previous year's work, the effects of a dry baking March were identical, and the absorption of molsture removed the chief adhesive element. April comes, with its intermittent and genial showers, literally thawing the baked earth with warm softening moisture, and there follows that pleasing condition of pulverisation and prospective fertility that gladdens the cultivator and renders work enjoyable. There are few positions in life fraught with more difficulty than that of a cultivator of harsh, stiff, wet land, that is either in a condition resembling that of brickclay, or which is baked into the consistency of brick-March brought much soil into the latter stage of difficulty; April, so far, has left it in the most delightful coodition. We have, however, had a very dry winter, and it may be that Nature, with her tendency to produce compensations, may yet give us a heavy rainfall ere the summer is upon us. Should such be the case, much, perhaps, as the abundant moisture may be welcomed on light gravel soils, through which it can percolate as through a sieve, it would be a misfortune for the stiff land gardeners, and materially hinder the cropping at present so admirably in progress. With all so well, we can but hope it may so continue that a glorious winter may not he marred by an ungenial spring.

foreign Correspondence.

THE HISTORY OF A PASSIFLORA ON THE GENORSE RIVIERA. - All writers who describe tropical forests mention as one of their most remark. able features the existence of creeping plants, or Lianas, which run up the trees like ropes, without a leaf or a flower, to expand at the summit of the tree into branches, leaves, and blossoms when they reach the light and the sunshine. It would appear that these Lianas, passing from tree to tree, form an inextricable network of rope-like stems, which constitute an obstacle to progress through the primeval forest, where there are no roads, and that they have to be cut with a hatchet to admit of a passage. In our northern climates these creepers are represented by the Bramble, the Clematis, the Bryony, the Honeysuckle, the Ivy, &c., and never attain a development like those of tropical climates. When travelling in South Sardinia a few years ago in magnificent forests, probably primeval, I found, however, that these Northern creepers, including wild Vines, emulated their tropical congeners, making desperate and successful efforts to take possession of the trees against which they grew. I scarcely recognised our humble Northern plants, so audacious had they become, developing themselves with extraordinary luxuriance, ascending to the upper regions of majestic old trees,

and throwing themselves gracefully but powerfully from one branch to another. Evidently was approaching the regions of tropical vegetation.

On my return to my Riviera garden I was fired with the desire to produce some such results, and chose for the experiment a Passiflora, which thrives very well with us, flowering in autumn, winter, and spring. It is here called Tacsonia ignea, but a London horticultural authority told me that it is properly P. manicata. The flowers are numerous, and of a deep red, whence the garden name "ignea." It is generally grown as a bush, trailed over another plant, or on It flowers freely in autumn, sparsely in a trellis. winter, and again freely in spring, but only in the most sheltered positions, such as my garden; with me it flowers all winter more or less freely. I chose a vigorous plant, and placed it at the base of an old

covered in this manner with myriads of lovely flowers, forming a floral carpet high up in the air. Thus is forming a floral carpet high up in the air. explained the rope-like Lianas met with below. They are all rushing up to light and sunshine, and that once attained they burst into life and beauty. This tropical effect excited universal interest and admiration, and all my friends came to see the tropical invader that had taken possession of the poor old Olive tree.

I designedly use the words "poor old Olive tree," for a sad change came over the spirit of thiogs as far as he was concerned. Every year many small branches died. They were at once covered over, it is true, by fresh vegetation, but they formed a kind of mat, the weight of which was increased by a new luxuriant vegetation yearly, whilst some of the branches began to invade the neighbouring trees. They hung down,

branches in our Northern fashion, without trying

branches in our Northern fashion, without trying again to get a tropical effect.

I have another Passifiora of the same kind growing as a trailing bush in and out a mass of Opuntia vulgaris, or Prickly Pear. It has nearly buried the latter, but the Opuntia is a very rough customer, and can, I think, hold its own; so I mean to let them fight it out without any interference. The Solanum jasminoides seems to do very well with us as a tree climber, and not to run riot in an unseemly way, like the Passiflora. Henry Bennet, M.D., Torre di Grimaldi. Mentone. maldi, Mentone.

ANEMONES.

THOSE who are familiar with the Riviera go into ecstasies, as well they may, over the heauty of the wild or half wild Anemones there to be seen in

FIG. 102.-ENGLISH WILD ANEMONES.

Olive tree, in a locality where there was plenty of earth for it to root in. Against the advice of my then gardener, who said I should kill it, as soon as it was well established I cut off all the branches but one, which I trailed up the Olive tree. I continued for several years to cut off all laterals, until it was about 15 feet from the ground. Then, left to itself, divided into three or four stems, each rapidly ran up separate branch, and having arrived at the top of the tree, about 30 feet from the ground, they very soon spread over the entire tree like a sheet of verdure, at the same time flowering most freely and abundantly. I was perfectly delighted. Whenever I looked out from my Saracenic tower, which is 65 feet high, there I saw, far below me, a sea of green covering the Olive tree, and studded with hundreds of lovely scarlet flowers. It was quite a revelation of tropical forest vegetation, I then understood how gorgeous these forests must be, seen from on high, if the summits of the trees are

swayed by the wind, until a stronger blast than usual carried them to the trees adjoining, which they seized, beginning at once the same parasitical extension.

The old Olive tree began to bend as if he were about to give way entirely, and also to droop. I saw that if this went on much longer, and the weight increased much more, he would be broken and killed outright by the embrace of the lovely Liana. So with a sigh the order went forth to have him cleared of his burden. One of my men-an old quarryman-climbed up the tree like a tropical monkey and cut off nearly a waggon-load of branches. It was not surprising that the Olive tree was bowed down by the weight, and he now looks very haggard and forlorn. I have not cut the Liana to the ground, only to about 15 feet from the base. I trust it will shoot forth and flower again as freely as ever, but in a more modest, becoming manner. I shall let it run in and out the large

lustrous splendour in early spring. In this country we cannot, it is true, point to such a flush of colour among our wild species; but he must be strangely insensible who does not recognise the singular elegance of the common wood Anemone, so common at this season in our woods. Rose-coloured, and even blue forms may occasionally be met with. The double form, moreover, unlike most double flowers, is scarcely less elegant than the simple form. These are easily grown in a shady nook, or along woodland walks, in the fashion represented in Mr. Fitch's sketch, and with them may be mixed the blue-flowered Anemone blanda and A. apennina and the nowered Ahemone blanda and A. apennina and the yellow-flowered A. ranunculoides. A. Pulsatilla, with its deep violet flowers, we should not expect to see just where Mr. Fitch has placed it, but rather on chalky downs fully exposed to the sun. On the rockery we find it does best, growing in pockets with plenty of mortar rubhish fully exposed to the sun, but at the same time sheltered from side-winds end autoret. winds and currents.

Notices of Books.

Scripture Botany: A Descriptive Account of the Plants, Trees, Flowers, and Vegetable Products mentioned in Holy Writ. By Leo H. Grindon. London: F. Pltman. 8vo, pp. 362.

To all who have an interest in plants, even though it be but feeble, and unaccompanied by much acquaintance with them, the plants of Scripture appeal with special force. The Palm, the Cedar, the Vine, the Olive, acquire fresh interest from the certainty we experience that we do indeed know the very trees. On the other hand our curiosity is roused to know what the Hyssop on the wall, what the Rose of Sharon, or the Mustard tree could have been. We yearn to know what were the Lilies of the field, while other plants from their strictly personal associations, if we may so say, with the Saviour, seem invested with a sanctity which, if it does not forbid inquiry, at least is out of harmony with anything like controversy. Mr. Grindon has special qualifications for the task he has undertaken; he is erudite and sensible in interpretation, his style is correct and agreeable; above all he is reverent. Preachers making use of the botanical allusions in Scripture too often fail in their purpose from ignorance of what was really in-tended, from an inability to look beyond the letter of the text, or to penetrate the symbolic meaning of the utterance. They endeavour to teach a lesson which is not the one that was intended, and draw inferences from a basis that will not hear investigation. Mr. Grindon steers clear of these defects. In the matter of fact spirit of a scientific observer, he sets to work to sketch in a few pages the climatal and other features of the Holy Land, and the general character of the flora as dependent on those conditions. Then he puts before us readable accounts of the agricultural plants, the Palms, the Cedars, the Oleanders, the Sycamores, the Vines, and other plants concerning the identity of which there can be no question. After the manner of an historian of the modern pattern, alive to the importance of details of agriculture and commerce for the com-prehension of the history of a nation, he points out the plants cultivated for food or clothing, and links together for the purposes of instruction details supplied by philology and botany. By way of illustration, we may note in passing the allusion to the Sanskrit word for Cotton labric in the Book of Esther, i., 6-a circumstance of great interest as showing concurrently with negative evidence that Cotton was not grown in Palestine, and that very early communication with India must have existed. Again, in the spirit of a poet, or a philosopher, he very properly insists on the symbolic or figurative sense which is to be attached to several of the plants named. It is worse than waste of time—it is to ignore the whole significance and point of the lesson to be conveyed-to quibble over the identification of the particular plant in such cases. The appeal has to be made to the intelligence and sympathy of the reader, and the means by which the appeal is to be conveyed is, under these circumstances, a mere detail of very subordinate importance. Mr. Grindon then, as it seems to us, has well fulfilled the object he had in view of presenting to the unbotanical reader a correct and agreeable treatise on Scripture plants—one that may be relied on where strict textual accuracy is needed one that will not mislead when figure or metaphor is the main point to be considered. A good index adds A good index ad to the usefulness of the book to the many, while the few will appreciate the list of Hehrew names ap-pended, and wish that the very numerous Greek names and epithets scattered through the book had been similarly brought together.

Onions.—The following experiment with Onions is quite suggestive. The soil was thoroughly pulverised over a small plot of ground, and an adjoining plot equal size was packed as hard as possible by repeatedly pounding it with a heavy maul. The surface of both plots was then covered with finely pulverised soil to the depth of half an inch, and on June 3 three rows on each plot were planted with seed of the Large Red Wethersfield Onion. Late planting was disadvantageous to the yielded 9 lb, 7 oz. of merchantable bulbs, while the three rows on the compacted soil yielded but 3 lb, 3 oz. The percentage of vegetation in the two plots was not noticeably different, although the vegetation was prompter on the compacted soil. E. Lewis Sturtevant, New York Agricultural Experiment Station.

Orchid Notes and Cleanings.

DENDROBIUM THYRSIFLORUM, - A very fine variety of this heautiful Dendrobe is now in flower at Lord de Lisle's, Penshurst Place. It is an imported plant, and last year gave promise of being a fine sort, but it was only a very small bit of flower that appeared, still there was enough to show that it was something out of the common run of varieties. This year it has thrown up a fine strong raceme, to inches long, about 51 inches wide, with forty-one flowers on it; each individual flower is 2 inches across. The great beauty of the flower, of course, is in the colouring; the labellum being of an intense dark orange, while the petals and sepals are of a pure white, a combination that makes it a most attractive flower. this is another good thing among the many that have turned up in this collection is certain. Among others may be mentioned two fine varieties of Odontoglossum Alexandræ, that are in flower at the present time; the white one, having a bold erect spike, with great substance in the flowers, and with very broad and flat sepals and petals-the other is equally good, but different in the markings, and has a beautiful drooping spike. All the Orchids are in splendid health, the Odontoglossums especially; grown, as they are, in low pits, almost on a level with the ground, air being admitted night and day (excepting in the severest weather) - they present example of really good cultivation, having stout bulbs and foliage, with that ruddy colour so sure a sign of health. W. H., Redleaf.

"LES ORCHIDÉES."-Under this title Madame G. VAUGET, of Geneva, has published a series of large folio coloured plates, which for correct draught-manship and grouping are all that could be desired. As pictures they are admirable for their general fidelity the management of leaf-perspective and light and shade, but for strictly botanical and horticultural purposes there is a want of definition as to points of detail, which from that particular point of view impairs their usefulness. The leaf-coloration also would ensure the dismissal of any gardener whose plants were in such condition. But it is probably as an artistic study that the author would wish these plates considered, and as such we have nothing but praise to bestow. It is rare indeed to see such boldness of treatment associated with an equal amount of general correctness. Messrs, Lechertier, Barbe & Co., of Regent Street, are the agents.

CALANTHE VESTITA WILLIAMSI.—A form which originated in the Holloway Nurseries, and which is very remarkable for the deep crimson lip—the other flower segments are flushed with the same colour. It is the brightest coloured Calanthe yet known.

LæLIA AMANDA.—An evergreen species with broad oblong leaves, and erect panielses of flowers. The segments are narrow, oblong, pale rosy-lilac, the lip, convolute at the base, expands in front into an oblong crenulate disc marked with deep purple lines. It is a native of Brazil, and is figured in the Orchid Album, t. 135. Mr. Williams recommends it to be well raised above the pot or basket in which it is growing, and to be provided with plenty of moisture in the growing season.

ANGULOA EBURNEA.—The Anguloas are remarkable for their large egg-like flowers, the yellow A. Clowesii being that most commonly met with. The present species has ivory-white flowers, and is figured in the Orchid Allum, I. 133, from the collection of Sir Trevor Lawrence. Mr. Williams grows them in the cool Odontoglosum house, transferring them to the Cattleya-house wheo showing bloom. Pot culture in rough fibrous peat, with good drainage, is recommended.

CYPEIPEDIUM CALURUM X.—A cross between C. longifolium and C. Sedeni X. and a useful plant, from the beauty of its flowers and the length of time they remain in perfection. The dorsal sepal is reddishgreen, striped with pale purplish crimson; the petals also pale crimson, with a central green vein; the lip is deep crimson externally, greenish-white internally, and spotted with dull purplish-crimson. It does well grown in pots with rough fibrous peat and good drain-

age, and a moderate supply of water at all periods, as the plants have no pseudobulbs to support them.

THE ORCHID MARKET.—At the sale of Orchids in flower at Stevens' Rooms on the 9th the highest bid made was 26 gs. for a very dark variety with large flowers of Odontoglossum vexillarium. Other prices realised were:—Cattleya Trianæ eboracensis, §g.; Cattleya Mendelii, dark-flowered variety, §g. gs.; Odontoglossum Alexandræ, mægnificent variety, 14 gs.; another grand rose-coloured variety, 24 gs.; Odontoglossum Pescatorei, a grand specimen with five spikes and 180 flowers, 21 gs.; Odontoglossum Andersonianum, 10 gs.; Dendrobium Jamesianum, 15 gs.; Cypripedium lævigatum, 5 gs.; Lycaste Skinneri alba, 14½ gs.; Masdevallia ignea, 5 gs. and £5 15:.

DENDROBIUM WARDIANUM.—That this is one of the most beautiful of this charming penus is, I think, very geoerally admitted; and, owing to the large importations which have come to hand during the last few years, is now to be met with in every collection. I had the pleasure a few days ago of seeing some grand examples of this lovely plant in the collection of John Heywood, Eaq., of Stretford, near Manchester. Some of the varieties were much better than others, but taken as a whole I have not seen a more magnificent display of this lovely Dendrobe in any collection. Speaking of varieties, in Orchid culture variety, of course, is everything. The fact of the varieties superior makes the plant valuable, and that collection will be the most choice in which the hest varieties are found. I remember the late Mr. J. A. Turner, of Manchester, when asking what Orchids any one had in bloom, and when told replied, "But what is your variety?—the variety is everything." Now that these plants are getting as common as bedding-out plants, cultivators will no doubt keep only the best kinds. Alpha,

SELDOM has the spring garden presented a better and gayer appearance than it has done this year; this is no doubt to a great extent due to the absence of severe frosts during the past winter, as well as to the exceptionally fine spring we have enjoyed. There is this year no unevenness in the growth of the plants, and no unseemly gaps to deplore and rectify. All the beds are perfectly filled with luxuriant plants, which at the present time, in connection with the very numerous and most charming bulbous plants, produce such a pleasing variety ln colour, and such a softness in tone, as to quite eclipse the effect produced by the more gaudy summer plants. Daily attention is now requisite to keep the beds trim and clean, as well as to protect the plants from injury; at the same time no labour or pains should be spared in keeping walks and the surrounding lawn in the most perfect order possible.

SHIMMER BEDDING PLANTS should now be hardened off by gradual exposure to the open air, so as to fully prepare them for the operation of transplanting as soon as the bloom on the spring plants decay. Calceolarias are especially benefited by early exposure and removal to their permanent positions, for unless they are planted out sufficiently soon to enable them to obtain a good hold of the soil before hot weather ensues they will most assuredly fail, and as the summer garden without the presence of the Calceolaria is shorn of one of its brightest gems every means should be employed to ensure its success. The beds intended for its reception should receive a liberal dressing of well decayed cow manure and fresh sandy loam; after heing dug they should be trodden somewhat firm, and the plants introduced as soon as possible. Should severe frosts occur they should receive the protection of a garden mat placed over hoops or wire netting strained just above the plants; the foliage may possibly become somewhat discoloured by planting t early, but on the approach of mild weather they will quickly recover their healthy appearance.

VIOLETS.—These now demand the little extra care and attention to which they are so justly entitled. As the plants cease blooming the strongest young growth or crowns only should be selected for future propagation; if these can be found with young roots emanating from their base so much the quicker will

they become established in their new positions. In choosing a suitable summer situation for these some care and discretion should be exercised, for while they are partial to a limited amount of sunshine, they exceedingly dislike either a hot situation or a dry or loose soil. In such un wholesome quarters they not only refuse to grow satisfactorily, but they quickly become a prey to red-spider and other insects from which no amount of watering or syringing will free them. In exceedingly hot summers even a north border is far preferable to such a position, but in ordinary seasons, while they will grow well in such a border, they do not receive sufficient sunheat to fully ripen and develope their crowns, and consequently they do not produce such an abundance of flowers as when grown under more suitable conditions. A border situated either on the eastern or western side of a wall I believe to afford the best aspect for them, in which position they seldom fail to thrive satisfactorily, for while they receive sufficient heat they are at the same time partially screened from cold, cutting winds. In preparing the border for them, it should receive, if p a moderate dressing of thoroughly decomposed hotbed manure; but if the soil be rich, a dressing of fresh loam and sharp sand will be preferable, as in too rich a soil the plants do not form those stout, sturdy crowns so essential for the production of abundance of bloom. If the soil is light it will be advisable to give a dressing of marl or well pulverised clay, and after being dug it should he trodden thoroughly firm before the young plants are inserted; this highly important, as no plant suffers more quickly during summer in a soil of loose texture than the Violet. Having selected the strongest young crowns, dibble these into the horder at intervals of 12 inches; when planted prick over the soil between the plants just deep enough to prevent a hardened surface impervious to rain and air, but by no means loosen the plants. If dry weather ensue it will be more conducive to their growth to shade them during the day for a short time by laying mats over them rather than give water; taking off the mats at night, when not frosty, so as to expose them freely to the moist air at night. As they grow the surface of the ground between them must be frequently loosened either with the hoe or fork, for although they root freely in a firm soil, they cannot succeed if the surface will not admit air and moisture. As the side shoots appear pinch them off persistently so as to produce as large and bold a crown as possible, or if they are required for potting in the autumn, six or eight of these lateral growths may be allowed to form crowns round the parent so as when potted to hang over the edge, where they not only partially hide the pot but produce abundance of flowers. An occasional watering with liquid manure will be found very heneficial during the period of growth.

The Pitchen Garden.

PLANTING, — Advantage must now be taken of genial showers to plant out good breadths of Cabbage, Cauliflower, and Lettuce plants, also Brussels Sprouts, which should be planted in rows at from 2 to 2½ feet apart, and the same distance in the rows in rather shallow soil—say from 12 to 15 inches deep where the plants will make a dwarf, sturdy growth and close compact sprouts, in striking contrast to the large loose ones produced by plants which have been set in deep rich soil.

SEED SOWING.—Another sowing of Turnips and Lettuce should now be made; also a sowing of Salsafy and Scorzonera should be made in drills an inch deep and a foot asunder. Where Cardoons are in request the seed should be sown at once in a box or pan, and placed in a frame, and as soon as the seedlings have come through the soil they should be gradually hardened off and subsequently planted in trenches of I foot in depth and 16 inches wide, and 4 feet from centre to centre, and the plants be put in at 16 inches apart. The trenches are prepared similarly to those for Celery. The present will also be a good time to make the main sowing of Broccolis and Kales in beds 4 feet wide with an alley 1½ foot wide between the beds. The ground should be trodden over and raked before the beds are marked out. The seed should be covered with a quarter of an inch thickness of soil from the alleys, or, what is better, sifted potting-hench soil, which should then be neatly

levelled, and the surface of the beds patted with the back of the spade so as to compress the soil and seed. After this the attacks of chaffinches and sparrows must be guarded against, as recommended in our last Calendar. The following excellent varieties, which I will divide into four classes, and in the order in which the respective varieties come into use, may be depended upon viz.:—Autumn varieties: Veitch's Self-protecting, Grange's Early White Cape, and Early Purple Cape. Early winter varieties: Snow's Winter White, Backhouse's Winter White, and Early Penzance White. Early spring varieties: Sprimstone, Chappell's Cream, and Frogmore Protecting. Late spring varieties: Cooling's Matchless, Carter's Champion, Cattell's Eclipse, Richmond Late White, Model, and Ledsham's Latest of All.

SCARLET RUNNER BEANS .- As our mode of growing these is somewhat different from that generally practised, and the results are thoroughly satisfactory, I will briefly state it. We grow two rows, each about 60 yards long and 8 feet asunder, which run east and We plant our first row on or about April 24 (a few days earlier or later is of no consequence), in drills 3 or 4 inches deep, and the second row about two months later, and in front (south) of the first row. And instead of using sticks 8 or 9 feet long as supports for the haulm, we use Ash poles as long as we can get them without being too thick and heavy-say from 12 to 13 feet long-which are stuck firmly in the ground I foot apart, on either side of the runners, and braced together by a line of bean-sticks fastened longitudinally on either side the upright sticks at 6 or 7 feet from the ground by means of cross-ties made of tarred string, by which means the rows of sticks are made secure. Instead of stopping the runners, as is generally done with a view to hastening the formation of pods, we allow them to grow uninterruptedly, and so cover their allotted space, thereby prolonging considerably the supply of runners, inasmuch as the individual plants yield a succession of Beans from hottom to top, the finest Beans being on the top. gather good supplies of Runners to the middle and end of November, by the aid of a long pair of steps, from the row sown at the end of June, which is protected by the shelter afforded by the first row from the effects of cutting winds and autumn frosts.

GARDEN WORK .- This will coosist in the earthingup of Cauliflower and Cabhage plants, and rows of Peas and Broad Beans; sticking the former and stopping the haulms of those coming into flower, which owing to the temporary check the plants thus experience, causes them to pod quicker than they would otherwise do. All Peas which have been earthed-up and sticked, should now have a good mulching of rotten dung put on either side the rows, which will act as a manure, and also prevent the soil from getting too dry. Beans are benefited by the same treatment. This done, it will be advisable, on light soils, to give both crops a good watering at the roots. Prick out in nursery-heds on a warm border, young plants of the first sowing of Cauliflowers, Cabhages, Brussels Sprouts, Savoys, Leeks, and Lettuce, the last named 3 inches apart every way, and the other sorts 6 inches; and water them through a finerosed pot, if the weather is dry. Thin out Turnips, Carrots, and Spinach, to a few inches apart in the rows, and subsequently thin them out to 9 inches. Vigorous use must now be made of the Dutch hoe, not only with a view to accelerating growth in the rising crops, but the cutting down of weeds wherever they appear, an operation for which the weather which we have been having has been highly favourable. Potatos just coming through the soil should have a little of the latter drawn up to them, and a slight protection in the shape of a little Fern or straw afforded them when there is likely to be frost. Failing a readier, though not a more efficient means of protection, a flower-pot may be placed over each haulm (where the plantings are not extensive) at night, and removed in the morning.

THE HERE BORDER.—As the demand for herbs is a constant one, in order to maintain a young and plentiful supply it will be necessary to make fresh plantations of the respective kinds, those most required being Tarragon, Mint, common and Lemon Thyme, Sage, &c. These are easily increased by division of the roots and slips, and should be planted in rows at from 10 to 15 inches asunder; and this, like all other departmental work, should be performed neatly. Seeds of herbs may be sown this

month, to be afterwards thinned out, or planted in beds, as may be found convenient.

FORCING DEPARTMENT. -Trophy Tomatos of the sowing made at the end of February for planting outof doors in May, and subsequently potted off in small 60's, should now he shifted into 48's, and grown on steadily for a few weeks longer, so that they may become good sturdy plants for planting out on south walls or fences by the third week in May. Another batch of French Beans should be sown in pots, to be transferred to pits later on; and see that those at present in Peach-houses and vineries are kept free from red-spider by giving them copious supplies of water at the roots, and syringing the plants overhead thoroughly a couple of times a day. See that Celery plants in frames have sufficient water at the roots, and have the lights taken off on warm days, and tilted up at night, so as to prepare them for planting out shortly. H. W. Ward, Longford Castle Gardens.

The Handy Fruit Garden.

THE weather so far has been favourable for the blossoming and setting of our hardy fruits. Plums are quite a sheet of bloom, Pears and Cherries are equally so, while Apples promise well, and the blos-

soms are fortunately not open as yet. Apricots and Peaches have set well, so that with another fortnight or three weeks of fine weather and freedom from frost we may hope for an ahundant crop of fruit. For the present do not remove the coverings from the wall trees, the second week in May being soon enough in the Southern and Midland Counties. Apricots will soon require thinning, leaving the fruits which are finest and best placed; the thinnings make excellent tarts. This operation should be carefully done at three times in as many weeks. Stop any overluxuriant shoots, especially in the centre of young trees, as it is desirable to restrain these and to promote the growth of the side branches. It should be boroe in mind that the foliage of the Peach tree is more susceptible to injury than the blossom, and that with continued cold weather and harsh winds in exposed localities the disease known as "curl" is almost certain to appear, and this is generally followed by a host of aphides, which multiply very rapidly, sucking the very life out of the tree; therefore have a good supply of some trustworthy insecticide at hand, such as Gishurst Compound, Fir-tree oil, or home-made Tobacco-water and soft-soap, or Quassia-water. Any of these used in time will save much labour in the future, and the first growth of the trees, which in turn will produce better hearing wood for next year, will be rescued from destruction.

The unusually dry weather will render the watering of newly-planted Strawberries a necessity, so let this be done effectually. Where the Strawberries have not been mulched, no time should be lost in getting it done; the time-honoured practice of using straw is the hest, the worst material is lawn grass, which in wet weather becomes mouldly, spoils the fruit, and rots too quickly. Any digging of fruit tree borders which remains to be done should be performed with care, using digging forks in preference to the spade, more especially in the case of trees like Cherries, Figs, and Plums, whose roots are near the surface. J. Rust, Eridge Castle, Sussex.

THE TRITOMAS. — Without presuming to indicate the exact position these fine hardy herbaccous plants should occupy in the flower garden and pleasure grounds, it may be stated that the plants from their large growth and pendulous foliage, that reaches to the ground, require much free space around them, so that they can be advantageously seen, and this consequently fits them much less for the border than for solitary plants or groups on the turf of the lawn. By this kind of planting we also get rid of the bare earth, as it is only necessary to leave quite a small circle free of grass round each plant to prevent injury when mowing. Planted in this way five or more together, leaving enough space between each for proper development, the Tritomas make fine effective masses in garden landscape, almost equal to the Pampas grass when at its best; and as the Tritomas are never seen in the shabby state a Gynerium presents after a severe winter, they should be preferred in sites seen from the windows, or they may be used with advantage planted around the Pampas grass to screen its foliage in part.

APPOINTMENTS FOR THE ENSUING WEEK.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, April 21

Sale of the late Mr. R. Hanbury's Collection of Stove and Greenhouse Plants, at Stevens' Rooms (Harrier days).

TUESDAY, April 22

FRUIT AND THE STATE OF THE S

THE ANNUAL REPORTS of the ROYAL GARDENS, KEW, have of late years so largely developed in interest that they have become not only the formal record of work done in that establishment, and in the colonial gardens more or less closely connected with it, but constitute a sort of year-book of economic botany. It is with regret, therefore, that we have only now received the report for the year 1882. Pressure of work, the ill health and absence from duty of the Curator, whose duties thus devolved in a great measure on others, as well as other personal reasons of a similar regrettable character, account for the delay-a delay, moreover, for which the officials are not wholly responsible, as, to make matters worse, nearly six months have elapsed since the report was sent in. The most important matter (from a purely horticultural point of view) alluded to in this report is the formation of the new rock garden. The history of this undertaking is alluded to, and fitting tribute paid to the memory of the late Mr. JOAD, whose fine set of herbaceous plants was handed over to the Kew authorities, and served as the nucleus for the collections now displayed. We have more than once referred to this very satisfactory piece of work, to the rapidity with which it was constructed, and have given illustrations of it, so that it is not needful now to say much more than that the rockwork improves apace, and that it constitutes, as we expected it would do, one of the most popular features of the garden. The association in its formation of rocks and stones with tree-stumps has been criticised adversely by some, and no doubt the roots are objectionable as harbouring insects and slugs, and promoting the growth of fungi. Against these objections may be set the fact that the association in question is very picturesque and perfectly natural, as any one who has traversed a Swiss mountain road knows, and that by means of the different conditions of soil, shelter, shade, and moisture thus afforded it becomes possible to grow in association plants which otherwise

could not be brought together. The "Wild Garden" formed on the slopes of a mound near the Cumberland Gate, is to our thinking, scarcely so satisfactory. The idea is an excellent one, which we should like to see carried out at Kew on a much larger scale, but in its present conspicuous position near the dressed portion of the ground, close to formal walks, and in the immediate vicinity of the rigid architectural lines of the Museum, it scarcely seems in place. If carried out at all in such a situation we should have preferred planting a mass of some one thing which should give a great breadth of colour, such as Anemones, Crocuses, and the like in their season, rather than isolated patches of particular things which give a sort of impression as if they wondered how they got there; but this is a matter for individual opinion.

The gradual development of the Arboretum is matter for unmixed satisfaction. An accurately named collection of hardy trees and shrubs is essential to a public establishment of this kind. Private arboreta get neglected, or,

as in the case of the once celebrated one at Chiswick, disappear altogether, and our nursery establishments are necessarily tied by business considerations, so that really admirable plants go out of cultivation, and become lost because they are no longer the fashion. The consequence is that when by chance some of them reappear there is great difficulty in naming them correctly. Some day or other the taste for hardy shrubs will revive, and then the value of the Kew collection will become more than ever apparent.

Into the details of the colonial correspondence relating to economic botany we cannot now enter, as we may have occasion to make some extracts from them at a future time. We cannot, however, help adverting once again to the splendid service to humanity that Kew and those associated with it have been enabled to effect in the case of the Cinchona in India. Ceylon, Jamaica, and elsewhere, to which may now be added the introduction of the three most important sources of indiarubber into our Eastern dominions, where it has now been proved that they will yield products in no wise inferior to those yielded in the native countries of the trees in question. The commercial importance of this subject can under the existing demand for rubber hardly be over-estimated.

The intimate relation between botanical science and practical utility is singularly borne out in the history of these two enterprises, Even the question of nomenclature, a dry enough subject, apt to be looked on by the profane as at the best laborious trifling, and to be slightly considered by the new biological school of botanists, is incidentally shown in the pages of the present report to be a point of first-class importance, to the full as necessary for the successful carrying out these great and beneficent schemes as any other department of

botanical science.

In quitting for the present the consideration of this report we must not omit to mention one of its most valuable features, which, like the traditional postscript to a lady's letter, occupies the appendix. This is a list of the Palms cultivated in the garden, amounting in all to 420 species. These have, so far as circumstances permitted, been identified by Sir JOSEPH HOOKER, who here gives us a list of the names HOOKER, who here gives us a list of the names and localities of the species classified under the several tribes, sub-tribes, and genera, adopted by him in the last volume of the *Genera Plan-*tarum. In many cases the dimensions also are given, and references made to the illustrations of the plants in the "North Gallery."

One more postscript, devoted to figures.

One more postscript, devoted to figures. The number visiting the garden in 1882 was 1,244,167 !—the largest number on any one day

being over 95,000.

— THE GARDENERS' ROVAL BENEVOLENT INSTITUTION.—During the past week the annual list of subscribers, which seems to increase in bulkiness every year, has been issued, together with the following special and important appeal, signed by Mr. EDWARD TIDSWELL, the Treasurer, and Mr. JOHN LEE, Chairman of the Committee :- " Referring to our letter of December 15 last, we beg to remind you that the committee have had under their consideration for some years past, the question of augmenting the pensions by the sum of £4 each, but before this desirable object can be carried out they consider it necessary that the reserve fund should be raised to £20,000. For the last three years they have caused collecting cards to he issued among gardeners, nurserymen, and others interested in horticultural pursuits, and the result has been that the sum of £2400, including the 'Arthur Veitch Memorial' Fund, has been sub-scribed. A further sum of £2250 is required before the committee can recommend the proposed increase of the pensions. The sum of £1312 was distributed in pensions last year. tleman (who for the present wishes his name withheld) has promised that if the sum of £1750 be raised before the end of the year he will give the munificent sum of £500 to complete the amount required. have had a legacy of £500, and we have at the bankers the sum of £150; with these amounts in hand only £1100 remains to be secured. Under

these special circumstances we take this opportunity of bringing the matter prominently hefore the subscribers, feeling assured that those who take an interest in the Institution will second, to the hest of their ability, the exertions of the committee in their endeavours to alleviate the distress and minister to the comforts of old and deserving horticulturists. To the affluent and generous lovers of horticulture we appeal with confidence, and to gardeners we also appeal, in the hope that they will assist their poorer brethren. Friends to the cause will kindly fill up the enclosed form and return it to the Secretary (Mr. E. R. CUTLER, 14, Tavistock Row, Covent Garden), who will on our hehalf gratefully and thankfully acknowledge any contribution, no matter the amount."

- BOTANIC GARDEN, GHENT .- M. A. VAN EECKHAUTE, son of one well known in connection with the nurseries of M. VAN HOUTTE, has been appointed Curator of the Ghent Botanic Garden in place of M. VAN HULLE. We trust that M. VAN EECKHAUTE may succeed in inducing the authorities to remodel this garden or establish it on another site, for, to say the least, it is not worthy of the city of flowers in its present condition.

- M. LUDDEMANN, -The death of this famous Orchid-grower on the 15th. ult., at Bourg la Reine, demands notice. He was formerly gardener to Mr. PESCATORE, at St. Cloud, and subsequently established a husiness in Paris. His name will be long remembered by Orchidists.

- NEW ZEALAND PLANTS.-Mr. JOHN F. ARMSTRONG, of the Public Gardens, Christchurch, has published a useful list of timher trees, alimentary, fibre, fodder, medicinal, oil, and dye plants, plants for tanning and basket-work, for binding sand-drifts, and for making hedges suitable for cultivation in New Zealand.

- BOMAREA CONFERTA. -We had the pleasure last week of seeing a splendid tuft of flowers of the handsome new Bomarca conferta, figured and described in our vol. xvii., p. 187. It consisted of fifty-six perfectly developed crimson blossoms, and was the finest example of home growth that has yet come under our notice. As a cool greenhouse climber it must, when better known, become a very popular plant. Messrs. Shuttleworth, Carder & Co., who introduced it from Bogota, have every reason to be proud of their acquisition.

- A NEW HYBRID ANTHURIUM. -Mr, ERNEST BERGMANN informs us that another hybrid Anthurium has been raised at Ferrières, and is now in bloom. It is the result of a cross between A. Andreanum and A. Lindeni, the produce being a Lindeni with a cherry-red spathe and violet spadix.

 SAXIFRAGA STRACHEVI ALBIFLORA PUBES-CENS. - Herr LEICHTLIN has just flowered an interesting new form of the Saxifrages of the Megassea group. It is a white-flowered form of Stracheyi, with oblong sepals, and very hairy peduncles, and calyx closely allied to var. Milesii, and matches a plant gathered by Dr. AITCHISON on Mount Sikaran in Afghanistan, at an elevation of 11,000 feet ahove sea-level.

 KEWGARDENS.—The Royal Botanic Gardens at Kew received 53,000 visitors on Monday last, all respectable and orderly. Last Easter the number was only 38,000; the previous year it reached the high total of 56,600. With that exception so large a return as Monday's has not been reached on any Easter Monday, at least since 1878.

GIANT INCOMPARABLE ! - Since the Daffodil Conference a giant among the incomparabilis section has made its appearance. Some correspondents have obligingly given us the history of the plant, and fowarded us drawings. As the name is not quite settled, we defer mentioning it for the pre-It rather looks as if the Peerless Daffodil was not satisfied with its condition, but had puffed its cup out to emulate that of the Maximus variety of Daffodll.

DAPHNE GENKGUA, -A charming species, of dwarf habit, having the appearance of a small Lilac (Syringa). It is a Chinese plant, requiring the protection of a greenhouse in winter, but the pot may be GARDENERS' CHRONICLE

sunk in a bed of sand or ashes in summer in a situation sheltered alike from too much sun and

- STRAWBERRY CULTURE.-The cheap little brochure about Strawberries, in which Mr. W. DOUBLING about Strawberries, in which Mr. W., LOVEL, of Driffield, Vorkshire, gives particulars of their cultivation in garden and field, has reached a fourth edition. With such a recommendation we need only add that the publisher is Mr. G. R. JACKSON, of Driffield.

- BEGONIA REX VAR. COMTESSE LOUISE ERDÖDY.—A remarkable plant, the issue of a cross between the Begonias known as Alexander von Humboldt and B, argenteo-cupreata. The leaves are sowing it to come in between the Onions stored away for winter use and the autumn sown Tripoli varieties. It is a most useful variety when the stock of it is true and good,

- STEPHANOTIS FLORIBUNDA. - It is well known that some varieties of this popular stove plant bloom more freely than others, and this characteristic is strikingly apparent in the case of a plant in the Priory Gardens, Warwick, the residence of THOMAS LLOYD, Esq. Mr. GREENFIELD, the gardener, has forwarded the terminal point of a shoot, not more than 4 inches in length, which contains sixteen very fine expanded flowers and ten unopened buds, in clusters issuing from the leaf axils. The plant, which covers the inside of the roof of a lean-to house, is at present

the hands of those interested in the show. That the show is fixed some three weeks later than usual will cause no regret, and northern growers specially may benefit. The Civic patronage vouchsafed to the Potatos is still continued, and it is hoped that whatsover may he the fortunes of the old London Corporation, the new one may not be less interested in our national tuber. Following within a few days of the close of the Crystal Palace show comes the Potato competitions at the National Health Exhibition, arranged by the Royal Horticultural Society, and the liberal prizes offered show that the right influence has been at work in the preparation of the schedule. Special interest attaches to these South Kensington classes, because they include garden kinds, field kinds, English raised kinds, American kinds, and others,

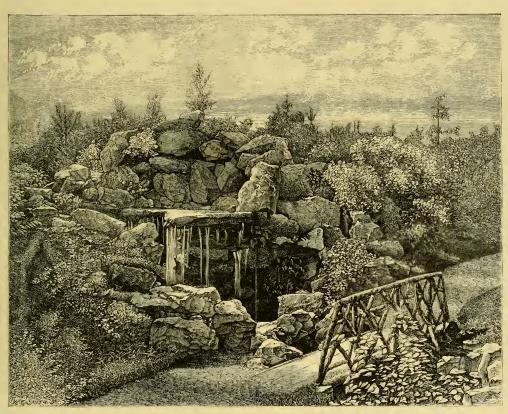

FIG. 103.—THE DRIPPING POOL AT GLENCORMAC, CO. WICKLOW, (SEE P. 510.)

obliquely cordate, ovate-acute, the smaller of the two basal lohes twisted in a spiral manner, with as many as four coils. The upper surface is silvery, with the veins deep green, the lower surface reddish, pilose. The spirally coiled lobes of the leaf give to the latter an appearance of a funnel or of the filtering-paper used to line funnels, only the coils are separate, not an approximation. Illustration Horticole, t. 516.

- THE WHITE QUEEN SILVER - SKINNED -This is a most valuable Onion for autumn sowing, for already it is bulbing-in quite fast. Mr. BARRON has it at Chiswick from two or three sources; the best is that from Messrs. VILMORIN, ANDRIEUX & Co., of Paris. Long before the Tripoli or Lishon varieties show signs of forming bulbs, the White Oueen partakes of this character, and is ready for use early in April, Gardeners should make a point of

a compact mass of bloom, and is surprisingly free; he has been cutting from it for a month past, and he expects to be able to cut abundantly up to June and even July. It is treated to copious supplies of liquid manure, and the more liberally it is treated in this respect the more floriferous it is.

- POTATO EXHIBITIONS .- As the schedule of the International Potato Exhibition is somewhat late in appearing this year, many growers have begun to fear that the annual gathering of Potato exhibitors at the Crystal Palace had fallen through. They will, however, he reassured on learning that the schedule of prizes-which promises to be an admirable one, and may possibly include some classes for those exhibitors who hitherto have been unable to secure first prizes, and thus may find more encouragement than they have in the past-is nearly ready, and may soon he in

thus creating distinctions that are somewhat novel on the show table. How far the distinctions may in some cases be clearly defined is uncertain, but at least the kinds, whether specially suitable or not, can hardly be the same. It is to be deplored that with so many able and practical cultivators brought to London at the same time, as will be the case in October next, no effort should be made to utilise so much knowledge in a conference or some other gathering. Surely the cultivation of the Potato, especially In relation to protection from disease, is of as much importance as the cultivation of Daffodils, and some may think it to be even more so.

THE STAPHYLÆAS. - One of these bandsome deciduous shrubs, S. colchica, has heen introduced of late years for forcing purposes and from its beautiful appearance is likely to be yet

more largely grown. The sprays of the purest white, resembling tapering bunches of small Snowdrop bells, are set off by cheerful green compound foliage, making it even more effective, and decidedly a more graceful plant than forced Lilac of any colour. As yet the major portion of the plants seen are of continental growth, but our growers on warm soils in the southern counties should succeed with the plant equally well. S. pinnata is a rather more common shrub, still not everywhere met with; the flowers are quite as numerously produced, the racemes being as long, but they are less purely white, still the shrub is a bandsome one in flower and foliage, and is a vigorous grower, attaining a height of 12 feet or more. S. ternata is similar to the last-named, but smaller in all its parts. In warm situations seed is freely produced from which plants can be raised. The seeds of S. pinnata are the size of small Horsebeans—those of S. ternata about half that size. When seed is not obtainable propagation may be carried out by autumn cuttings and layering, or by suckers. The plants are handsome subjects for a grass plot.

- ROSACEÆ.-Messrs. VEITCH have sent us from that garden of delight, Combe Wood, specimens of flowering trees of this order, which show that they are fit associates for the Rose.—Pyrus spectabilis is a Japanese tree with tufts of rose-coloured Apple-like flowers, most freely produced, and quite hardy .-Cerasus avium multiplex is the double-flowering Cherry, of which there are two varieties, one of which is better than the other, though both are very lovely; and Cerasus Sieboldi rosea is a Cherry of profusely flowering habit, the flowers large pale rosepink, semi-double, but not quite symmetrical enough to please the florists .- Spiræa prunifolia, fl.-pl., is a delightful little shrub, with its compact balls of white petals on long slender stalks. It is an excellent plant for forcing, as well as being perfectly hardy.-Pyrus Maulei: It is still the opinion of some that this fine species, described and figured by us at p. 756 of our volume i, for 1874, is no other than a form of P. japonica. In any case, it is abundantly distinct for garden purposes, and the peculiar shade of orangecrimson is quite uolike anything we know of among varieties of Pyrus japonica. Moreover, in foliage and fruit it is quite distinct,

- AUBRIETIAS .- The large collection of these which Mr. BARRON grows on the rockwork at Chiswick is now in flower, and affords a good opportunity for comparison and selection. Taking it for granted that the deep coloured varieties are preferable, the three best are Campbelli, Eyrei, and violacea, the last-named having the largest flowers and deepest colour. They form excellent patches on the rockwork, and are very gay in the spring sunshine. But it is at Belvoir that one sees Aubrietias used with marvellous effects in spring. Here Mr. INGRAM trusts mainly to seedlings of his own raising, and in course of selection he appears to have endowed them with wonderful precocity—"educated them," as he terms it. On the warm sunny slopes of Belvoir they grow and flower in native freedom; they pour themselves over the rockwork in large patches, looking like a cataract of blue; and they run themselves over the sides of raised beds with all the profusion vigour can impart. There, amid surroundings so congenial to early flowering, they bloom a great part of the winter, and are at their greatest beauty when, else-where, scarcely more than the earliest flowers are putting in appearance. At Belvoir, mingling with the blue flowers, can be seen some approaches to rose-coloured varieties; but the best of these falls a long way behind a most charming rose-coloured form that can be seen in Mr. INGRAM's interesting reserve garden. This came from Mr. MAX LEITCHLIN, of Baden-Baden, and adds another to the list of valuable novelties which have already come from the same source, and not only are the flowers novel in colour, but they are also large and finely formed.

—— COTTAGERS' SHOWS,—Is it not time that the element of surpicion which always seem to float about in the minds, not only of horticultural committees, but equally so in the minds of writers on cottagers' shows, was obliterated? If anything could tend to counteract the attempts at good, always kindly and well meant, though often misdirected, put forth by cottager patrons in the interests of the labourers, surely it is that constant expression of doubt and distrust which seem to pervade horticultural committees as to the honesty and integrity of those they would

seem desirous to benefit. Quite recently a wellknown and kindly intentioned writer suggests that cottagers' gardens should always be visited the day before the show, to ascertain whether their exhibits arc bond fide their own or not. Is not that offering a boon with one hand and with the other giving a nasty slap in the face? Is a man necessarily dishonest because he is poor? or do cottagers' exhibitions or their competitions with garden produce for many prizes of necessity lead to deceit? If this latter position be admitted then better quash the exhibitions at once than maintain that which only tends to cheating and deception. We venture, however, to believe that not only is this carping suspicion unwarranted, but that the constant expression of it, in the shape of visiting committees, and of warnings by writers in the Press, are calculated to lead to the very evil it is desired to keep in check. An intelligent cottager said with much truth the other day, "Why select us only for the honour of visits from a committee, and not serve amateurs and gardeners the same?" The indignation thus expressed at the humiliation sought to be imposed upon one section of the exhibitors only is just what is largely felt by cottagers, who desire to do that which is right and honest, and yet know that if they are ever so virtuous they cannot escape the degrading suspicion that they are less so than their superiors.

— EXAMINATION IN FORESTRY, — At the recent examination of candidates for the certificates of the Highland and Agricultural Society there were only two in the Forestry Department—Mr. Peter Reid, Waulkmilton, Linlithgow, and Mr. John Wilson, St. Andrew's—and both obtained First-class Certificates.

- MISPLACED CONFIDENCE .- Whilst admitting that some deceit was practised, it is yet difficult to avoid laughing over the consternation of the would-be cultivator of cheap flowers who, caught by an advertisement of "100 kinds of flower seeds for one shilling," invested that sum, and got bit for his pains.
Of course it is not possible to regard such tempting yet impossible offers to the public as other than baits for the unwary and deliberate attempts at deception. Still, not only our complainant, but probably many others, were wanting in ordinary common sense and discretion when they ordered so attractive a shilling's worth, in the full expectation of getting a hundred distinct packets of seed for their money. tiser carefully excluded all reference to packets, mentioning only as a bait a hundred kinds of flower seeds, and his response to purchasers was found to be a most incongruous mixture of flower seeds of perhaps almost a myriad of kinds, all tumbled into one considerable-sized packet, about as useless and perplexing a collection as could well be desired. It really is not possible to avoid a strong sense of merriment when we reflect upon the puzzled aspect of the recipients of this novel shilling's worth, or to help moralising over the little cupidities which now and then, as in such cases as this, manifest themselves in the human family. The vendor no doubt meant to convey to the ignorant public the impression that his hundred kinds were in separate packets, though nothing was said about them. On the other hand, he may have practically fulfilled the bargain made in sending the number of kinds of seed named without rendering himself amenable to legal punishment. It is surprising that there should be found any so silly as to be taken in by such craftiness. It is even more surprising that, having regard to the marvellously cheap rate at which flower seeds are now offered by respectable seedsmen, tradesmen of dubious business morality should receive patronage. Clearly in the case above quoted, if the vendor was a knave, the purchaser was hardly less than a fool.

—— PROPAGATING EUPHORBIA, FICUS, &c.—
Most of those plants that exude gummy or milky
juices are amongst those which are found rather difficult to root from cuttings, if the cuttings have not
been exceptionally treated before being inserted in the
cutting-pan or bed. It has been found by long practice that the rooting process takes effect sooner and
with better results if the viscous juices are allowed to
ooze out—a process that may take from twelve hours
to four weeks, according to the species. As a rule the
cuttings are best taken off just as growth has commenced, and therefore when the juices are rather
abundant, still less so than during full growth. In
the case of species with ligneous structure the cuttings

may be of one, or two, or three years old wood, and should never be less than one year old. These cuttiogs, after being made fit for insertion, should be buried completely head downwards in a pot sufficiently large to contain them without bruising, and then be covered with some moderately moist soil or leaf-mould. They should remain till all sweating-out has ceased, when they should be taken out and washed clean with a soft sponge, when they can be inserted in the usual way. Cuttings so treated will be found to succeed in a shorter time than those not so handled, and there will be fewer losses in the cutting-pans.

- A MAST FOR THE TURIN EXHIBITION .-Our Naples correspondent writes :- "A magnificent mast has been sent from Verona to the Agricultural Department of the Turin Exhibition. The tree grew in the woods of Cadore, and five other majestic Pines had to be hewn down and cut to pieces before the one destined for the mast could be removed. When the lower branches had been cut off, this fine trectrunk was divided into two pieces, the bottom part measuring more than 120 feet, and the top part, still adorned with its green branches, 18 feet. The weight of the tree, after being thus prepared, was 41 cwt. On examining the base it was found that that part was 205 years old; while the summit was only sixty-three years old. The mast was dragged from the forest to the station on two waggons, drawn by eight horses, and the whole of it took up seven railway trucks. Three days were employed in the transport by rail, as the special train could only travel by daylight, proceeded very slowly on account of the curves, and had to stop continually, not being able to pass another train. The mast is slender in comparison to its height, being 65 centimetres at the base and 15 at the summit. The stem preserves an equal width up to the height of about 90 feet, after which it diminishes rapidly. Including the expenses of transport, the mast will cost more than £50 sterling."

—— PLECTRANTHUS FGETIDUS.—In the Palm-house at Kew a fine plant of this handsome Australian Labiate is now in fine flower, and a figure prepared from it will appear shortly in the Botanical Magazine. It makes a very fine pot plant for warm-house decoration; the Kew plant is about 5 feet in height, and each branch is terminated by a densely flowered slightly branched panicle of brilliant blue Salvia-like flowers.

— THE WEATHER,—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending April 14, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:
—The weather during the first part of this period was very fine and dry, but subsequently it became rather cloudy or dull generally, with a few slight showers of cold rain or hail. The temperature has continued a little above the mean in "Scotland, N.," but elsewhere it has about equalled its normal value or been from 1° to 2° below it. The maxima, which were registered during the first few days of the week, varied from 56° in the "Channel Islands," and 57° in "Scotland, N.," to 64° in the "Midland Counties" and "Ireland, N.," and 66° in "Ireland, S." On the 13th and 14th the thermometer in many parts of Great Britain did not reach 50°. The minima, which were recorded in different ratio in the various districts, ranged from 25° over central northern and northwestern England to 35° in "Scotland, N.," and 41° in the "Channel Islands." The rainfall has been less than the mean in all districts. Bright sunshine percentages show a considerable increase in nearly all places, ranging from 30 in "Scotland, E.," to 53 in "Ireland, N.," and to 69 in the "Channel Islands." To Epperasions observed,—During the earlier days of this period pressure was highest over Scandinavia, and relatively low in the south and southwest. As the week progressed, however, the area of high pressure was transferred to the north-west-ward of our islands, while over Scandinavia and relatively low in the south and southwest. As the week progressed, however, the area of high pressure was transferred to the north-west-ward of our islands, while over Scandinavia and relatively low in the south and southwest. As the week progressed, however, the area of high pressure was transferred to the north-west-ward of our islands, while over Scandinavia and relatively low in the south and southwest. As the week progressed, ho

— GARDENING APPOINTMENTS, — Mr. JAMES MACKAE, late Foreman at Harefield, Cheshire, as Gardener to Viscount MASSEREENE AND FERRARD, Oriel Temple, Co. Louth, Ireland, — Mr. J. VICKERY, formerly Gardener at Potter's Park, Shenley, Hetts, as Gardener to WILDMAN CATTLEY, Esq., Oak Dene, Holmwood, Surrey.

CLIVIAS.

In few plants has a greater advance been made Truly it was a noble than with the Clivias. Truly it was a noble subject to begin with, but our gardeners, or some of them, have done their best to aid its development. In the first place we must explain why we 'adopt the name Clivia in preference to that of Imantophylium or Imatophyllum. The only difference that we are aware of between the two so-called genera resides in the fact that in the original Clivia, of which C. nobilis is the type (and which was called Imantophyllum Aitoni by Sir W. HOOKER), the flowers are pendulous, and rather more open at the throat, while in Imantophyllum proper they are erect, as in Vallota, of which also they have the form, but from which they differ in their succulent, not capsular, fruit. Botanists, therefore, have generally adopted Clivia as the geous, and this course is followed in BENTHAM and HOOKER'S Genera Plantarum, to the ruling of which work we hold ourselves bound to adhere, unless we can supply valid reason to the contrary. Moreover, on the Continent, whence, till lately, we have derived our finest specimens, the plants are usually called Clivias, As, therefore, for various reasons, Clivia is the preferable name, we trust it may be adopted here. Its shortness should give it the preference over the longer name. Clivia miniata was first described, and in these columns, by the late Dr. LIND-LEY as Vallota? miniata. (See Gardeners' Chronicle, 1845, p. 119.) The plant was shown by Messrs. at one of the meetings of the Horticultural Society, who obtained a Banksian Medal for it. Messrs. BACKHOUSE, of York, however, were the first to introduce the plant from Caffraria. At that time the flowers were described as smaller than those of Vallota purpurea, and of a "clear delicate brilliant vermilion colour, passing into indian-yellow in their lower half." So showy a plant was sure to become popular with gardeners, the more so as its cultivation is simple; but it is only comparatively recently that attention has been paid to the raising of varieties, and more especially in Germany and in Belgium, Those who visited the last Ghent Quinquennial noted as among the greatest differences between the exhibition on that occasion, as compared with its predecessor, the great development of these Clivias. Some of our English gardeners, we are glad to see, are turning their attention in this direction, and among them Mr. DAVIDSON, of the gardens, Iwerne Minster, who sends us two fine trusses from seedlings grown by himself from native seed, one of which is particularly good. The first of the two-that nearest to the type of the species -has a truss or simple umbel of about a dozen flowers, the flower-stalks 2 inches long, flattened. The flowers measure 4 inches across, and in place of being funnel-shaped are markedly trumpet-shaped. outer segments rather narrower and more pointed than the inner, but all of good texture, and of a rich orangesalmon colour, with the throat yellow. The stamens are of equal length, shorter than the segments, and all spring at the same level from the short tube. The style is longer than the stamens, and declinate. second variety, though it has smaller flowers, is really superb. The truss consists of about a dozen flowers, with subangular or compressed stalks, each about 1 inch long. The flowers themselves do not much exceed 3 ioches across, and are of a bright orangesalmon colour, with a yellow tube. What especially characterises this noble variety is the outward curva-ture or rolling back of both the outer and the inner segments, their regularity and substance, and the breadth of the inner segments. Owing to the recurving of the flower segments, the clear yellow tube is shown to great advantage.

Mr. Davidson writes:—The enclosed trusses of Clivia blooms are from plants raised from seeds gathered by Colonel Tufnell in South Africa. The seeds, seven in number, all germinated freely in heat under a bell-glass; and when the plants were big enough to handle they were potted off in small pots, in three parts of peat and one-third of loam, placed near the glass in a temperature of from 60° to 70°, where they soon made strong plants fit to transfer into 6 inch pots, this time in equal parts of loam and peat, adding each time a little sand and small pieces of charcoal. The final shift was into 10-inch pots. When the pots are full of roots we water about twice a week with Standen's manure or guano-water. Excepting when in a very young state they only require cool greenhouse treatment. I have found them invaluable for conservatory and house decoration. P. Davidson, The Gardens, fewerne Minster, Shaftesbury.

Çhe Kosery.

MARÉCHAL NIEL ROSE.-How often has one been asked the question, "If you were only to grow one Rose which would it be?"—a question which seems always to me on a par with that of the bashful young man once described by Mr. Punch, who in striving to get up a conversation with his partner asked her if her brother liked cheese, and on being told that she had no brother, nothing daunted, again asked, "If you had a brother, do you think he would like cheese?"-for I cannot imagine that if any one could grow one Rose he would be contented with that. The reply very often is made—"Oh, of course Gloire de Dijon," as if it were the most popular Rose; but I think the palm of popularity must be given to the Rose about which I now want to say something— Maréchal Niel, a Rose in which I have somewhat of a personal interest, for how vividly do I call to mind the morning when at my hotel in Paris M. Eugène Verdier brought me some of his new Roses to see. and when, after showing me some reds and crimsons which have long since faded from memory and from nurserymen's catalogues, he brought out from the bottom of his box a golden goblet which he said he was going to send out under the name of Maréchal Niel; how I gazed in astonished rapture at its heauty, and could not help exclaiming, "That Rose, if you manage properly, will make your fortune." He did not manage properly, but sent it out as a bribe to those who would take his other lot; but it has been a mine of wealth to the Rose nurserymen ever since. Whatever other Roses may be left on hand Maréchal Niel never is. Tens of thousands of it are raised every year, and are exhibited all over the world. Go into the central avenue at Covent Garden, and you are sure to find it in abundance, ever meeting with a ready sale, and ever attracting the passers-by by its rich golden-yellow flowers; and yet there are mysteries connected with it which we can hardly You are told that after a few years it perishes, and hence consequently the demand for it; that it is not an out-of-doors Rose, and that it will not withstand the vicissitudes of our climate; that some winters kill it, or that it smells unhealthily at the junction with the scion; that canker supervenes, and the Rose languishes and dies.

That it is not an out-of-doors Rose in one respect at least I am quite willing to grant-nay, have always insisted upon; it has, as all who know it (and who does not?), one great defect—the foot-stalk is not stout enough to bear its massive blooms, and consequently it always hangs its head down; thereby the outer petals become damaged by weather, and looking at it from a distance it seems as if the tree were covered with decaying flowers; but go to it, gather one of its blooms, and you will see that when held up or placed in a vase this only extends to two or three petals, and that the rest of the flower has benefited by its very defect, for probably had it held its head upright it would have received so much moisture in its ample folds that it would have become soddened and never opened; nevertheless, as an object of beauty it is not in this position to be compared with such a Rose as Rêve d'Or or Belle Lyonnaise, but that it will stand our climate and not succumb to our severest winters I have ample evidence close by in this county (Kent). There is in the adjoining parish to this a row of cottages which face the south, and on these the Maréchal, which has been introduced from a neighbouring man sion, flourishes à merveille. There is one tree of it which I have seen every year for the last thirteen or fourteen years; during that time it has had to endure the severe winters of 1880 and 1881, which destroyed thousands and tens of thousands of Roses throughout the country, and yet it is as vigorous and full of bloom These trees are worked on standard Briers, as ever. and quite cover the walls of the houses. Contrary, too, to all that we are told about not pruning Noisettes, they are pruned sharply every year, and if not actually cut with a pair of shears, as Mr. Wolley Dod suggests, they are cut as hard as Gooseberry bushes are, and yet they bloom, as I have said, pro fusely. On the other hand, there is one on a neighbour's house, which has much of the same position, which did well for a couple of years, but ever since has been so subjected to mildew that it is quite useless, and rarely produces a bloom worth looking at. It would thus seem that there is a capriciousness

about it, which is very puzzling in an out-of-doors plant. [We find it useless on a cold clay soil, even against a wall. Ed.]

The true position for it is doubtless planted out in a conservatory, where it can be trained overhead, and its golden cups hang down to be looked at in all their beauty and purity, and yet here it too often displays the same capriciousness. About nine or ten years since I gave a plant of it to a neighbour who planted it in a conservatory at the back (it was on a standard Brier). the house being about 16 feet wide; it grew most rapidly, covered the back wall, and then the entire roof, from whence hundreds of blooms hung in great profusion and beauty; and so it went on for some years. Two years ago it began to show symptoms of goutiness at the junction, and last year it entirely perished. I know, on the other hand, trees which have lived in the same conditions for a much longer time, but I believe the general testimony concerning it is that is not a long-lived Rose; and that they who wish to continue to grow it should be prepared, after a few years, with a young plant, which may take the place of the old favourite when it begins to decay.

For the encouragement of those whose space is limited I would like to say that at the back of my small annexe to my greenhouse, where I grow a vine, I planted two years ago in a large pot a plant of this Rose, and another in the same way in a small house where I bloom my Pansies in pots, and these have grown very well, have pushed their roots through into the soil, and have this, their third year, fully fifty or sixty blooms on them; they do not interfere with the Vine, for before that begins to grow their blooming time is over, and the wood gets sufficiently ripened during the summer to enable it to throw out good shoots for the following year. The soil in the pots is renewed each year by a thorough good top-dressing of loam and manure as far down as one can get without much disturbing the roots.

I have said that Marechal Niel is the most popular Rose grown, and so I think it is; perhaps Niphetos runs it very close, and being a white flower is in much request; but, withal, I think ninety-nine persons out of ahundred would prefer the Maréchal. It is well known that many have built houses on purpose to grow them in, and in two or three years have paid for the bonse by the sale of blooms; these golden days are gone for People say that these Tea Roses are not so popular as they once were, but this is not so; the fact is that the thing has been overdone, and by the inevitable laws of supply and demand, the former being in excess of the latter, prices have gone down; as many are sold, but they do not now fetch one fourth of the price they did some years ago-the admiration is as great as ever, but there are more means of gratifying it.

I cannot conclude this brief record of the Maréchal without telling a story I heard the other day concerning two brothers whose names are as well known in Rose world for their love of the flower, as in their native town for their benevolence and largeness of heart. They were driving out together one day in the neighbourhood of M ----, when one of them caught sight of a Maréchal on a small cottage, the horse was pulled up and one brother went in to look; when he came out he was met with "Why, what an unconscionable time you have been in?" "I never saw conscionable time you have been in? such a sight in my life," was the reply. "Gave the woman half-a-crown." This excited the brother's curiosity; he too went in, he lingered and when he came out was met by the same remark. "Ah! well, was the reply, "never did see such a sight. Gave the woman another half-a-crown." Thus dnes Maréchal win favour, not only from the fashionable frequenters of balls, &c., but from every true lover of beauty and fragrance, that he is ever likely to be dis-placed from his high position is exceedingly unlikely: it has but one fault, and I do not fancy we are likely to get a Rose equal to him in other respects and more such than he is: he is as yet facile princeps, Wild

CONVOLVULUS CNEORUM.—Of all the numerous wall plants now in bloom at Kew, the subject of this note is one of the most beautiful. A native of the south of Europe, it succeeds well io sheltered spots in the open air in this country, and only succumbs during exceptionally severe winters. The persistent lancolate foliage, clothed with silvery hairs, and the terminal bunches of large whitish flowers, facely produced during the spring months, combine to form a charming effect; and as cuttings root freely it is always worth while to put in a few each autumn in a cold frame, so as to guard against the risk of losing so charming a shrub.

A FLORAL REGISTER.

THE following register of spring-flowering plants, showing the dates of flowering at the Royal Botanic Garden, Edinburgh, during 1883 and 1884, has been obligiogly sent to us by the Secretary of the Edinburgh Botanical Society:—

ORCHIDS AT LAURIE PARK.

WHILE not pretending to rank with the first collections in the country, that contained in the well-kept little span-roofed houses here frequently furnishes rare and beautifully-flowered specimens, of which even the most ambitious cultivator might be proud, while at all times an abundance of bloom is given in each department by healthy well-grown plants of more than average merit. Mr. Sillem has been an Orchidgrower for many years, and the interest which he has taken in his plants is plainly to be seen in many of the oldest inhabitants of his Orchid-houses, among many other evidences on this point being a remarkably fine mass of the beautiful scarlet Sophronitis grandiflora, with seventeen blooms, which has been grown from a small scrap obtained nearly twenty years ago. It is needless perhaps to say that the plant was always grown cool and moist, although years ago it was most likely the only representative of its species so treated. It would be interesting to know how many importations this plant has seen killed by heat while it has been growing into its present robust beauty in the more congenial cool temperature. The Odontoglossum-house is a well arrayed mass of bloom, the mingled spikes of the numerous well-flowered Odontoglossum Pescatorei, O. Alexandræ, O. Andersonianum, O. phans, O. Halli, O. luteo-purpureum varieties), O. cordatum, many varieties of Masdevallias, &c., making the whole house look like the Orchid display at one of our leading flower shows. In this cold house, too, the large pans of Disa grandiflora are very healthy, and showing well for bloom; the Dendrobium Jamesianum are vigorous, short and stout bulbed, and a large pan of the fleshyleaved Nanodes Medusæ suspended overhead, gives

another instance of what careful treatment, extending over a number of years, can do with a slow growing and reputedly capricious plant. The Cattleya and Lælia house is now spare of bloom, but the good appearance of the plants more than promises that each section will be well represented in its season. Some of the difficult things are grown to perfection, viz., C. Acklandiæ, C. Regnelli, C. superba (this flowers twice every year), and the different varieties of Pleione which are grown in shallow pans suspended near the glass. Coelogynes, Cymbidium eburoeum, &c., and many showy plants of Anthurium Scherzerianium, make that bright appearance in the house, without which no Orchid grower is content-each house must have a show of bloom. The several intermediatehouses are enriched by a plenteous display of most of those thiogs which flower at this season, noteworthy being some grand Dendrobium crassinode, D. Wardianum, D. thyrsiflorum, D. superbum, the pretty D. triadenium; Masdevallias of the M. chimæra section, Cattleya citrina, Colax jugosus, Oncidium Marshallianum, and many Cypripediums, which are well cultivated here, among them being one of the finest forms of that noble C. Lawrenceana in existence, both as regards size and beauty of the leaves and flowers, and a very good example of C. caudatum.

The Barkerias are well grown here without trouble or losses by growing them on rafts with only a little sphagnum to hold the moisture, and by keeping them continually moist. They are suspended on the light side of a cool, rather dry intermediate-house. Leaning to

Fig. 104 -PHAIUS TUBERCULOSUS

the houses is a very pretty adjunct in the form of a case about 25 feet in length and 5 feet in width, containing a very fine collection of grand specimens of Filmy Ferns—Todea superba, T. Fraseri, T. pellucida, &c., and many varieties of Trichomanes and Hymenophyllum, and all beautifully clean and verdant. The case is provided with a hot-water pipe to use in the event of hard frost, but artificial heat is found to be more harm than good. The Phalænopsis-house, although containing the object of our visit, comes last. It is a span house, which was formerly what is called "close," but as it is glazed with large squares Mr. Billiald got over the difficulty by passing strips of thick sheet lead between the laps, and in consequence it is now well ventilated, and the Phalænopsis, Aërides, &c., which occupy it are in fine order, notwithstanding that the temperature is what many would consider cool and airy for such plants.

Here, too, is the subject of our illustration (fig. 104), Phains tuberculosus, which Mr. Sillen's gardener, Mr. Billiald, has succeeded in growing so well and flowering so freely that several Orchidgrowers have expressed a desire to know the conditions under which his plants were brought to such perfection, while theirs have dwindled away. P. tuberculosus was collected in Madagascar by the Brothers Humblot, and introduced, together with the equally beautiful P. Humblotti and P. Henryi, by Messrs. F, Sander & Co., of St. Albans. In 1881 Sir Trevor Lawrence flowered it, and obtained a First-class Certificate for it in March of that year. Since that time the best efforts of most of the growers

have been defeated by the plant, Mr. Billiald alone having continued success and progress with it. year again all his plants flowered, one of them (a very grand variety) having eleven flowers on two spikes. His plants are in a shady corner of the Phalæ-nopsis-house (temperature 65°-70°), where they get plenty of air, but no cold current. They are kept moist all the year round, and, what is considered as important, they are generally sponged over once a week, as that has been found to be the only means of keeping off the thrips which seem so fond of this plant. The manner in which the plants are potted is peculiar, and it may supply a clue to others by means of which they may get better success in future. The pots (which must be amply large) are filled two-thirds with crocks and charcoal, a layer of peat is placed on this, then the plant is held in position and filled round with living sphagnum moss. When so fixed the plant is in precisely the same condition as would be if growing on the surface of a bog, and it is would be it growing on the surface of a log, and it is prohable that that is its natural position. So potted, it may receive coplous waterings with rain-water and never get sodden. The chief points to be observed after the plants are so potted, are to keep them shady and always moist, and to sponge them frequently, and keep them in a warm but not close place. There is great variety in the plant—sepals and petals white, lip crimson, rose, and yellow in different shades. shades.

A CHAT ABOUT CEYLON FRUITS.

MANY, and widely spread over the length and breadth of Ceylon, as are its indigenous, its introduced and acclimatised fruits-highly salutary, too, as they are acknowledged to be in the dietary, both of the European and the native inhabitants-it is remarkable that, owing to an almost total neglect of culture, even of the roughest kind, how poor in size and coarse in quality they are mostly found to be, and how very badly they compare with the same fruits grown in other tropical latitudes even less favourable to their habits and idiosyncracies. The Pine-apple of Ceylon, except we can manage to secure it from the botanical gardens near Kandy, or from some experienced cultivator, is as a rule a hard, skinny, tough, and sour production, vastly below that same Ananas of the West Indies, the Bahamas, the "White Man's Grave," in Africa, and other places we have visited.
The very "first chop" Mango, which the Low country Cinghalese or the Kandyan grower will bring to market, is, in one word, trash, as compared to the large yellow fleshy Bombay fruit overflowing with luscious juice, or even with the smaller but equally delectable "No. 11" of Jamaica, and when you find a Ceylon Mango quite free from stringy fibre and without the smell and the taste of turpentine more or less strong, make a gustatory note of it-it is a rara avis of its At Jaffira, in the Northern Province of the island we are dealing with, and there only from the garden of the late Mr. Dyke—an expert in horticul-ture—have we ever tasted Mangoes worthy of the name. The Pummelow, or Shaddock (Citrus decumana), that cannon-ball sort of an orange which nowa-days we so frequently see in the windows of our fruiterers' shops, when grown in the West Indies is a tender fleshy fruit, a regular bonne bouche, overrunning with an abundant sub-acid refreshing juice, delicious to revel in when fevered. But if we happen to meet this same Brobdingnagian Orange in Colombo, Kandy, Trincomalee, or elsewhere in Serendib (the old name for Ceylon) -and meet it we are sure to do, for it is common enough-cave, for ninety-nine times out of every hundred it is a cannon-ball outside and a cannon-ball within, the pulp contained in its closely packed tough, leathery sections, being hard, bltter, and as dry as a bone. And apropos of the Orange itself, how seldom does the thirsty traveller get one as succulent, sweet, and refreshing as those grown in other of their well-known habitats, even though he, the traveller, tramp all over the island for the cooling fruit. The Ceylon Orange tree is a deception and a It blossoms as sweetly, it bears as freely, its product is as enticing to the eye as any of its species anywhere, but barriog the Mandarin, and one other variety, which now and again, literally and metaphorically, crop up, the ordinary native-grown fruit is an Orange by name only—vox et praterea nihil. Better to call it the "sweet Lime," and by which appellation indeed it is sometimes known.

Alas I that in our chat anent the fruits of "the spicy isle," where, according to Bishop Heber, "man

alone is vile," we should still continue to disparage, but io truth the Tamarind and the Lime, the Guav -that emperor of fruits, for its toothsome jelly, and "dolce" of the West Indies-the Cashew (Anacardium occidentale), who does not know the kernel of its roasted nut as an after-dinner wine flavourer? The Papaw (Carica papaya) and the Plantain-we are enumerating the commoner fruits found in almost every native's garden-are very much below par with those same flourishing wild around the hut of any West Indian or African negro.

Space is wanting for our specifying in what particular characteristics the differences between the fruits we have alluded to exist, but, nevertheless, our statement may be accepted as fact—"'Tis true, 'tis pity, and pity 'tis 'tis true."

And now, if we take a very rapid glance at two or three of the fruits which are less common, and upon which some horticultural pains have been bestowed, or they would not be there at all, we shall yet see that these, too, fall far short of the every-day quality of their kinds in other lands. The Avocado Pear (Persea gratissima), the Subaltern's Butter of the West, is here in the East a smaller, harder, less buttery, thicker-skinged, and more stony production. The Custard Apple (Anona reticulata) is the worst of its kind we have ever eaten or tried to eat in "all our walks abroad." The Anona squamosa (Sweetsop) and the A. muricata (Soursop) are wretched, sapless, "cottony" imitations of their saccharine and inifrateroity in Jamaica. And as for the Grenadilla (Passiflora quadrangularis)—I had a vine of the plant growing in the compound (yard) of my quarters in a certain up-country station; I treated the sparse but yet white jelly-like contents of the soft green capsules as systematically as I had seen them treated and enjoyed them in other tropical climates, but I could never get rid of a sort of uncanny twang-spice, wine, and sugar the stuff as much as I pleased.

From the remarks I have made it can be quite understood that a dessert table in Ceylon spread with its fruits, decorated with its brilliant many-hued flowers, and adorned artistically with leaves and the ivory-like spray blossoms of the Cocoa-out Palm, which latter the Cinghalese or Jamil never omits to use liberally, is, indeed, an attractive picture to look upon—very I but it is eye-taking to the guests, and that only, for save and except certain dainty dishes of fruits, to be spoken about, be included, the whole collection, from the aristocratic Pine to the plebeian Plaiotain, will be left untouched. And why this? Because, as we said at starting, even the most rude, haphazard cultivation has been pertinaciously neglected. The tree once planted must take care of itself, to hear, or not to bear, as Heaven chooses. And this laissez-aller sort of unconcern is somewhat remarkable too-at least, among the natives, who are Buddhists in religion, for their sacred books tell them, and Gotama Bhudda, their high-priest in Ceylon, encouraged them to plant fruit trees in bighways and byeways for the use of all itinerants—to plant unquestionably, say they—but never a word of tending they

Just now we wrote that if certain fruits happen to lie upon the dessert-table they were sure to find favour in the mouths of the epicurean guests. Primus ante et inter omnes will be the Mangosteen, that most delectable of all Eastern fruits, and which Sir Emerson Tennant lauds as in delicacy resembling "perfumed snow," Be certain if host or hostess has got for love or money Mangosteens they will be pounced upon and devoured. Some of our readers may not know this, the alpha of fructaceous edibles. It is the fruit of the Garcinia mangostana, natural order Guttiferæ, a native of Java, the Straits of Malacca, and the whole archipelago thereabouts, but introduced and cultivated sparselyalas I sparsely,-in Ceylon. It is about the size of a small Orange, purplish-black in colour when quite ripe—if any one has seen the Star Apple, Chryso-phyllum Cainito of the West Indies he may form a very good idea of its appearance-and three-celled, each cell containing a seed thickly enveloped with a pure white pulp of exquisite odour, and a taste entirely its own. We have eaten a vast number of the fruits of the tropics and know not one which at all resembles it. Some say the Sapodilla-credat Judaus.

Another fruit which treads closely upon the heels of the Mangosteen is the Rambutan (Nephelium Lappaceum), of the Sapindaceæ or Soapwort tribe. about the size of a large Date, oblong or roundish in shape, grows in thick clusters on the tree, and consists of a seed stone, covered with a white pulpy substance within a fibro-elastic capsule, reddish-brown in colour, and from which many soft, long spiculæ or points spring. When this indiarubber-like capsule is bitten through, the seed has a great tendency to be forcibly ejected, and we have seen it thus catapulted into a neighbour's face.

If the eater can get over the highly offensive civetlike smell of the Durian (Durio zibethinus, nat. order Sterculiacese)-but it requires much nerve to do so-there is hardly a greater treat in Ceyloo than this The real Durian is not indigenous to island; it comes from the same localities as the Mangosteen, and was introduced by the Portuguese in the sixteenth century, but it has another and more odoriferous brother, the Sterculia feetida, to which the name of Cinghalese Durian has been applied. And now that we think of it, the Mangosteen has a very near relation in the Goorka, found wild in the juogles, uneatable save by the not-over-particular The despised and rejected by Europeans, Jak (Artocarpus integrifolia) is by no means as bad as it is made to be, bar again the effluvium of its ripe and freshly cut fruit, which is the largest of all the edible ones in the world, and is made up of an infinity of stones, around each of which is a toughish, straw-coloured substance, sweet almost to mawkish ness, and overflowing with juice. The Eastern substitute for roasted Chestouts are its seeds aforesaid.

Lastly, one little word of chat about the Cocoanut, not as we know it in this country, but as we gather it-young, unripe, from its Palm in one of the thick belts by the sea, where it flourishes so luxuriantly—nowhere better than in Ceylon. white, soft, gelatinous pulp scraped gently with a spoon from the yet unsolidified inner lining of the shell and mixed with the sweet, turbid, and cool " milk " is as nectar, and not so intoxicating. Old wives say that it is unwholesome-ne crede Teucros.

Home Correspondence.

Daffodil Names. - About four years ago I had my say on this question, and as the subject seems to have got into good hands, perhaps it is superfluous to say more. I proposed, however, to limit fancy Daffodil names to four letters, and pointed out that it would be easy to find a thousand such combinations which would be easily written, easily pronounced, distinct, and distinguishable, and there would then be no excuse for not writing them legibly on the labels, As for retaining Haworth's names, we must first know to what they were applied by him, for some of them are now applied to varieties very far from answering to Haworth's description. Besides, there are many undoubtedly natural varieties which Haworth probably never saw, and certainly never described, which would have an equal right to claim classical names.
As an instance of the divergence of Haworth's descriptions from the modern appplication of his names, he describes N. nanus as having leaves half an inch wide (" folia semiuociam lata "); which of us can identify this? C. Wolley Dod, Llandudno,

The Balsam Poplar .- Why is it that this tree is ot more planted in and around gardens? The fragrance of the opening bud is very agreeable, and during the evening or morning is perceptible a long way off. It is a good grower, preferring a rather moist situation, and comes into leaf quite a month before most of the species, thus making a good shelter tree, and as the foliage lasts well in the autumn and changes to a bright yellow it is also useful in the landscape, the tree is a much neater grower than most of its kind, and is in every way a desirable object near walks and boundary fences. We grow it here, and the other evening just before rain I remarked that its balsamic fragrance scented the whole garden. 7. Rust, Eridge

lensen on the Disinfection of Seed Potatos —In the communication upon this subject at p. 446 I was rather ambiguous in my statements as to the necessary temperature. It must be borne in mind that the object to be attained is to raise the temperature of the tubers, not only upon their surface, but also for some distance towards their interior. For also for some distance towards their interior. For this purpose a rather higher temperature is required than would be understood from my communication. The tubers must for not less than four hours have a temperature not below 104° F., and if this rises to 115 F. no harm will be done to them. If the cylinders are 5 inches across it will be found even with narrow vessels that a thermometer placed in the middle of the tubers a few inches below the uppermost layer, will take a considerable time to rise to 104°, even if the water placed outside the vessels has a temperature of 110° to 130°, beyond which point it is not safe to go. Respecting the experiments to be made with disinfected seed-tubers Mr. Jensen has, during the coming season, made arrangements with experimenters lo several European countries, including Denmark, Germany, Norway, France, &c. In Denmark alone more than a hundred experiments will conducted, so that we shall be in a position to judge of the value of this process from pretty extensive data. In this country we are not, as a nation, fond of experimental investigation; we have many excellent critics amongst us, but experimentally we are slow to move, and somewhat hard to convince that anything new can be true in mycology, at any rate we have a wholesome dread of new-langled notions concerning the life-history of parasitic fungi. Charles B. Plowright, 7, King Street, King's Lynn, April 9.

Mignonette in Pots (Single Plants).—Havirg been remarkably successful with Mignonette during the past twelve months, and knowing how many there are who are anxious to cultivate it well, I send you a note of the mode of treatment I adopted. In the last week in April, 1833, I made a sowing of Miles' Pyramidal, and when the plants were strong enough I potted them io 60-size pots, and afterwards shifted them ioto 48's, in which pots they made compact little bushes after being stopped or pinched back three times. They flowered in June, and lasted until the end of July. When going out of bloom I cut them back, and potted them into 24-size pots the first them back, and potted them into 24-size potenthe first week in August. They again started into growth, and flowered throughout October and November, averaging thirty spikes of bloom each. In the begio-ning of December I again cut the plants back, and potted them on into 16-sized with the same good results, for in March, 1884, they again bloomed with results, for in March, 1834, they again bloomed with about sixty bloom-spikes each, and they are now, and are likely to be for some time, beautiful bushes, averaging 18 inches across. The former mode of proceeding 1 shall continue to repeat, in order to see how long it will answer. The plants were always grown in an ordinary cold greenhouse, and at each potting I used turfy loam and leaf-mould mixed with a little Clay's Fertiliser. To the use of this excellent manure I attitute in a great measure my success. manure I attribute in a great measure my success. Its beneficial effects are wonderful on all plants, and It have never yet used it on a plant, either mixed with the soil used in potting, or afterwards for top-dressing, which did not at once show how well it liked it. The action of Clay's Fertiliser on plants is natural and auton or Clay's Fertiliser on plants is natural and lasting, and oot spasmodic and quickly passing away, as with volatile manures. I shall be glad to know if any of your correspondents have had any such experience with Migoonette as a perential and almost perpetual blooming plant. F. King, The Gardens, Kenton Grange.

Hova carnosa. - About seven years since I had a specimen plant of Hoya in the stove near a blank wall on the east side. The young shoots, instead of heing trained in the wire trellis, took hold of the wall, and I found had sent out roots in the cemented surface of the wall. They were allowed to grow. After a time we required to move the plant, and I cut one of the shoots, to see if it would stop its growth. As I found it made not the slightest difference I severed all the shoots and removed the old plant. severed all the see a flourishing Hoya covering a wall to feet by 18 feet without soil or pot. It is very healthy, and blooms well every year. T. Hughes, Wyehdon Lodge, near Stafford.

Roses out of Season .- Some of your readers may be interested to know that I gathered on the morning of April II (Good Friday) a bud from a Gloire de Dijon Rose-arch, and that I also saw a bud already showing crimson on a Charles Lelevre trained upon a south wall. Surely these are much earlier than usual. Leirion, Ealing, W.

Preparing Plants for Winter Forcing: Moss v. Soil.—During the last few years we have treated the plants lifted for forcing in a manner that we think is not usually followed, and the results bave been far superior to those obtained by the old method. Instead of potting the evergreen and deciduous plants which on potting the evergence and declared plants when. We lift them from the open with a large ball, so as to cut the rootlets as little as possible; then with a special tool in the shape of a curved table-fork we remove all unnecessary soil, but take great care not to hurt the unnecessary soil, but take great care not to hurt the roots. In this manner we reduce the ball to a reasonable size. Before mossing, if the ball is at all dry, we plunge it and leave it for five or six hours in water. The plants must not merely be plunged for a few miontes and then be taken away; this is a bad practice, as the water could not in such a short time go thoroughly through the balls, and the result might not be up to expectations. The ball being thus pre-pared it must next be carefully mossed and tied round

I fear that is a query very difficult to answer, simply

with thin galvanised wire that can be as easily worked as string. If during the process of forcing a ball is noticed as getting dry it will be necessary to plunge it again in water for a few hours. It is essential to have in the forcing-house itself a tub or tank of some sort or other full of water, which will adurally be of the same temperature as that of the house itself. However, this is seldom necessary, as the frequent syringing required to induce the buds to open is, as a rule, onlie sufficient to keep the balls moist. When syringing required to induce the bods to open in as a rule, quite sufficient to keep the balls moist. When the plant has done flowering the moss is taken away, and the plant can be put in the same place it occupied before being forced. If care is taken to plant with good sound soil and not to touch the roots the plant good sound soil and not to touch the roots the plant will recover, and grow sooner and quicker than if it had been potted. With this mossing system smaller balls are easily obtained, and this renders the plants more movable for use in furnishing rooms or houses, and also for cutting flowers from. There is no doubt great economy in this method, as the moss costs very little, if anything at all, while pots cost much and are easily broken. The best moss for this work is that gathered on our lawns with a rake. We get a lot in a short time, and at the same time clean the lawns. It is easily understood that success is greater in working as described than in the potting system. In potting plants you cannot avoid cutting roots to reduce the balls to an ordinary size. It seems also as it the moss afforded some kind of nourishment to the plants. We often notice when we take the moss away that the roots have grown in it, and look plants. We often notice when we take the moss away that the roots have grown in it, and look plump and healthy. We have proceeded in this way with Rhododendrous, Azalea indica and mollis, Hoteia japonica, Deutzia gracilis, &c. This year we have been able to compare both systems with Rhododendrons. Those potted gave less flowers than those mossed, and the latter did not drop a single bud. Ernest Bergman, Ferrières.

Stimulants for Chrysanthemums .- Last year I Stimulants for Chrysanthemums.—Last year I was induced to try an experiment in Chrysanthemum growing, and for this purpose I purchased I lb. of sulphate of ammonia, which I bottled and corked up, as the ammonia evaporates very rapidly. I then selected four plants from my collection, and put them by themselves, and gave them a teaspoonful of ammonia in a gallon of water twice a week. In a fortnight's time the result was most striking, for although I was a support to the contract of the cont night's time the result was most striking, for although I watered the others with liquid cow-manure they looked lean when compared with the ammonia-watered plants, whose leaves turned to a very dark green which they carried to the edge of the pots until the flowers were cut. As a matter of course the flowers were splendid. The ammonia which I used is rather expensive, as I bought mine from a chemist's shop; this year I intend getting agricultural ammonia, which is much cheaper. I have also tried it on Strawberries, with the same satisfactory result, the crop being nearly double that of satisfactory result, the crop being nearly double that of satisfactory result, the trop pening fearly advanced in the others; it is very powerful and requires to be used with caution. I would suggest that others would give it a trial, and don't forget the corking business to stop evaporation. I have never heard of sulphate of amevaporation. evaporation. I have never near or surpluse or ammonia used in this concentrated form, so I think the idea is quite original. A. McMillan, The Gardens, Oakley Park, Norfolk. [By no means original. It has been used for years by some of our readers, and with the best results in careful hands. Ed.]

Myosotis dissitiflora alba,—We have in the York Nurseries the blue and white striped form of the above. It has originated here, being a seedling of M. dissitiflora alba sown last autumn. It is yery the above. It has originated here, being a seedling of M. dissitifora alba sown last autumn. It is very pleasing, and is, I consider, worthy of propagation. R. Potter.

Nectarine Brugnon.—Your correspondent "X.," Gardeners' Chronicle, p. 423, March 29, asked a question as to the first use in England of the word Nectarine and Brugnon in France, when, where, and by whom? I looked anxiously in last week's issue for replies to his query, wishing for information on the subject, but was disappointed at the non-response. I had taken some little trouble to try and answer the question myself, but failed to do so satisfactorily. Howsubject, but was disappointed at the non-response. I had taken some little trouble to try and answer the question myself, but failed to do so satisfactorily. However, in my research I obtained some facts which may be interesting to your correspondent, and perhaps assist him. The Nectarine, which is a most delicious fruit, obtained its name from being compared to nectar (the supposed drink of the gods), but upon whose authority, or by whom, I have failed to ascertain. Pliny (Pliny, lib. xw., cap. 11, 262) calls the Peach the Persian Apple, and in the next chapter describes the variety "duracinus," which is to carry off the plam as the best variety; this is supposed to be our Nectarine, from the firmness of its flesh as compared with the Peach. Martyn, in his notes upon a passage in one of the ecloques of Virgil's Bucolies (Martyn's English translation and notes upon Virgil's Buc. Eccl., 11, 51), questions this quotation of Pliny's, and doubts whether Peaches or Apricots are mean; ignoring Nectatines altogether, but certainly his further argument tends to strengthen the fact that Nectarines were the "duracinus" of Pliny, and not Apricots, as he would, at first, imply.

In a further chapter (lib. xv., cap. 13) Pliny describes the Peach as having been introduced from describes the Peach as having been introduced from Persia into Egypt, thence of late years, with considerable difficulty, into Italy. Our own Certard (Gerard's Left-bad, Johnson's ed., 1633) says.—"Mr. Mullen, Old Street, hath also of that kind of Peach which some call Nucipresica or Nectorins these following kinds (6)," but as my edition is the revised one of Johnson I am not sure whether I quote the former or the latter. Parkinson, in 1629, in Paradins, p. 582, under Nucipersica—Nectorins—says:—"I presume the name Nucipersica doth most rightly belong unto that kind of Peach which we call Nectorins; and although they have been with us not many years, yet have they been known both in Italy to Matthiolus (Matthiolus, b. 1500, d. 1577) and others before him, who it seemeth knew no other than the yellow Nectorin, as Dalechampilis, Delechampius, b. 1528, who it seemeth knew no other than the yellow Nectorin, as Dalechampius (Dalechampius, b. 1528, d. 1597). But we at this day doe know five severall sorts of Nectorins, &c.," He adds, "the fruit is more firm than the Peach, and more delectable in taste, and is, therefore, of more esteem, and that worthily." The word Nectarine, as we now have it, was used by Evelya in his Kalendarium Hortense in 1679, under February. "In the Nectarine and like delicate mural fruit the later your pruning the better—and in March. Now also plant Peaches and and like delicate mural fruit the later your pruning the better—and in March. Now also plant Peaches and Nectarines early, but cut not off the top rootes as you do of other trees, for it will much prejudice them." Ray, in his History of Plants (Hitt. Plant, 1685), p. 1516, mentions it as the sixth of the seven species of the Peach given by C. Baubin in his Pinax, 1623 (b. 1560, d. 1624), which he thus describes:—"VI, Nuclpersica, quod mucum Juglandium faciem representet. C. B." "Nuclpersica. Park., Parad. J. B." "THE NECTARINE sapore delicatissime nectareo." Of this he describes twelve varieties. Ray also says that Theophrastus saw the Peach in Persia, and brought away plants. Ædile.

Bees and their Relations to Fruits and Bees and their Relations to Fruits and Flowering Plants—At present I will not reply in detail to your correspondents Mr. J. Sheppard and Mr. J. Horsfield, as other correspondents may possibly wish to relate their experiences of this, to me at least, very interesting subject. The meaning I intended to convey was that by bees generally confining themselves to one particular kind of flower when gathering pollea, they thereby fructified another flower with pollen, not its own but of the same species or variety of the same, thereby preventing inbreding, and in cases when the sexual organs of the flower do not come to maturity at the same time, insect agency by visiting flowers in various stages of develop-ment would accomplish that which otherwise would remain undone, and sterility would be the natural conremain undone, and sterillity would be the natural consequence. The apparent reason why bees confine themselves to one kind of flower when gathering pollen is that the pollen grains of different genera are of different shapes, sizes, adhesiveness, and consistency, or, in other words, they would not mix well. Mr. J. Horsfield had better not arrive at hasty conclusions, by watching three bees in a greenhouse, his bee number three might have been gathering pollen, or honey, or both. If "J. H." will be kind enough to refer me to the "more recent authorities," in which Huber's theory of wax making by the honey bee, and Aristotle's theory of bees confining themselves gener-Aristotle's theory of bees confining themselves generally to one particular genus of flower when gathering pollen is contradicted I shall be much obliged. ally to one particular genus of flower when gatheriag pollen is contradicted I shall be much obliged. To Mr. J. Sheppard I will plead my ignorance and consess that I have much yet to learn about plants (and bees also,) but if I said anything to lead him to suppose that believed inheterogeneous impregnation I regret having done so. My experience in that direction is quite the reverse. I "1," S. "have the opportuoity and the liking for observation he can convince himself that the pollen balls conveyed by the bees are of a uniform colour throughout, which would not be the case if they collected pollen "just as it comes in their way," and they instinctively avoid "having things rather mixed." To me there is evidence of design in the creation of the honey-bee for some special purposes, and I have yet to learn, that in the earlier period of man's existence, a suitable substitute could be found for honey or beeswax. For the enlightenment of "J. S.," I believe the generally received opinion based upon experiments is, that pollen is gathered by the bees to feed their larva, after undergoing a process of mixing, &c., and what they do not require for immediate use they store. If any proofs were wanting of the evidence of design as manifested in the creation here is one. Let it be required to find what shape a given quantity of matter must take, in order to have the generate the same time the Let it be required to find what shape a given quantity of matter must take, in order to have the greatest capacity and strength, occupying at the same time the least space and consuming the least labour in its construction—when this problem is solved by the most refined mathematical process, the answer is the hexagonal cell of the honey-bee. North Norfolk.

The Best-keeping Potato.—I presume in asking the question he did at p. 489, "W. J. M." really desired to know which is the best-keeping Potato, cropping and quality being taken into consideration,

I fear that is a query very difficult to answer, simply because Potatos vary so much in diverse soils and localities. Still farther, each locality seems to have its favourite, and by these, without perchance knowing much of others, local growers will swear. Now we can hardly hope to get any very first-class old Potatos in the spring. Our winters now are so mild that it is almost impossible to prevent the tubers, store them how we will, from pushing more or less; and during the past winter, for instance, more has been the rule. In such case we cannot expect to have old tubers possessing good quality, as the starchy compounds in them disappear fast when growth sets in, and, what is almost worse, frequent moving to rub off the shoots, In such case we cannot expect to have old tubers possessing good quality, as the startopy compounds in them disappear fast when growth sets in, and, what is aimset worse, frequent moving to rub off the shoots, or help check growth, does but serve to bruise or blacken the tubers, so that when cooked they are anything but pleasing in appearance. We can keep seed tubers fairly well in check by storing them thinly, and in a dry, airy place, but such storing would render other Potatos unfit for food; the obvious remedy seems to be cultivating some kinds that are late in pushing their growth for late consumption. But against that suggestion we have to set the difficulties presented by the operations of the disease, which not only necessitates early planting, and the culture chiefly of early maturing sorts, but disease, which not only necessitates early planting, and the culture chiefly of early maturing sorts, but foliage, and thus checks the growth so early as a rule, that even these late kinds find their eason accelerated, for if matured in August, rather than in September, they are thus all the much more precocious in the following spring, if not in growth in the ground, at least in the store. At the present moment, out of some sixty kinds, I have not a sort in commerce that has not some time since pushed its buds, though kept as exposed as pressible, and under the coolest conditions the season will afford. Of course tubers required for consumption must not be so exposed, and they suffer from the higher temperature necessarily found in pits, boxes, tubs, or other places in which tubers are in bulk. Of one kind not yet in commerce I may say that more than any other it presents evidences of unusual good keeping qualities, though all others have pushed. This kind has not an eye-bud yet showing signs of vitality, indeed it is the very latest to make growth wheo planted, so that it is usually a fortnight behind even the latest of other kinds, although not so late at the end of the season. Many growers, I fear, would re able acquisition, especially as the Kinu exhibits appear table quality. Most of the American kinds are bad keepers, indeed, when they push at all, it is not one or two, but nearly a score of eyes that start into growth, and thus exhaust the tubers in a short time. One peculiar value of smooth, handsome kinds is that they have as a rule tewer eyes, and the prominence of these coables the shoots, when they start, to be very easily rubbed off. Even this operation, which may be quickly done occasionally as the season advances, still necessitates much moving of the tubers, and from ne quickly done occasionally as the season advances, still necessitates much moving of the tubers, and from this motion or friction between one and another, of course they greatly suffer. Seed Potatos in bulk are now being offered at absurdly low prices. Purchasers must be careful lest such stocks have been already exhausted in pits by two or three growths. A. D.

Which is the Best Table Potato at Present? Which is the Best Table Forder at Fleschir, W. J. M.," p. 489, has done good service in raising this question just now, as the majority of cultivators have not enough of new Potatos yet to meet all demands, and the old ones must still form the bulk of have not enough of new Folatos yet to meet all demands, and the old ones must still form the bulk of the eatable tubers. As most of us know, at this time of the year there are old Potatos and old Potatos, some kinds being pasty, bitter, and nauseous, while others are dry, floury, and sweet—better, indeed, than many of the new ones are at first; and growers would profit by bearing these facts in mind when planting late Potatos at this season. What "W. J. M." says of the Champion is true of it here, as, besides being black in the centre, it is too often hollow there, especially if the tubers are of a large size. Magnum Booum has not these faults, but it is not always as mealy as could be desired. The Victoria is most subject to disease, and this is its worst fault. White Elephact and Beauty of Hebron are behind dezens which could be named for quality. I eschoolmaster we cannot admit a fault for a spring Potato of the highest quality. Here not 1 per cent. of it is lost with disease; it crops uncommonly beavy, and from January until new Potatos are fairly in it is not to be surpassed on the table. I send you an ordinot to be surpassed on the table. T send you an ordinary sample of our roots, of this variety that you may judge of its merits croked and uncooked. 7. Mair, Margant Park, S. Wales. [We are stannch advocates for the schoolmaster—a good one—in more senses than one. ED.]

Fruit Prospects .- These have seldom been more promising, and the promise of plenty may be said to extend to all sorts of fruit. Apricots have been literally white as a sheet; Peaches and Nectarines have followed suit, with such a show of pink as to make the red bricks pale in contrast. And now Plums of all sorts—from Golden Drop to Damsons—are smothered with bloom. Cherries are also all that can be desired. Apples are most promising, and Plurs a good average show. Bush fruits and Raspberries are full of embryo fruit or opening blooms, and Filberts are plentiful. With anything like a favourable spring, a full fruit basket will be one of the most pleasing features of the current year. As we are now well into April, and every day's sunshine adds to the chances of saving the crop, these probably are now greatly in favour of a full crop. Up till now too, there have been few or no insects. The aphides, that seem either to come on the wings of the east winds, there have been few or no insects. The aphides, that seem either to come on the wings of the east winds, or, if not, to thrive so vastly upon that hard fostering as to seem as if they did—have not yet appeared on Peaches or Plums, though a week of south-east wind has prevailed. But we must not halloa till we're out of the wood, and it is a fact that the aphides seldom come till the wood-buds have so far developed and the section of the section of the wood will be wood with the wind the section of into shoots as to furnish them with a sufficiency of food. This correlation between the advent of insects food. This correlation between the advent of insects and the growth of their food is one of those mysteries of Nature that are most difficult to unravel. The ants are, however, already about the Peach trees, rushing about in a very restless manuer, as if looking for something they cannot find; and, no doubt, should they be able to pick up a few aphides they will soon post them most advantageously on the Peach trees, on which they would feed and thrive like bees in Clover. It is to be hoped the ants may not find any aphides, and that thus the trees may escape their blighting influence. Few things at first sight may seem more independent of each other than the growth of Peach trees on walls, the development of aphides, of Peach trees on walls, the development of aphides, and the revival of ants in the spring, and yet the safety or wreckage of the Peach crop depends on the safety or wreckage of the Feach crop depends on the meetings or missings of these three at a certain stage of growth. Hence, vitally important as the weather is, it is not the only factor that ensures success or causes failure directly. How far its indirect effects on growth, and the fostering or checking of insect lile, contributes to either, is a far more difficult matter to determine. As growth advances and hardens it to determine. As growth advances and hardens it becomes less attractive to insect pests; the latter also make far lessimpression upon it. In this composing make far lessimpression upon it. In this composing way genial spring weather favours the freedom of fruit trees from insect pests, and also enables them to withstand them the better should they be attacked. Experience also points to the unexpected fact, that cold rather than warmth promotes the multiplication of aphides. No doubt it is a popular error that they come on the wiogs of the east wind, though few can doubt the fact that when the east wind is the coldest the aphides are the strongest and the most numerous; the fact being, I believe, that the checking of the sap sweetens it the more, and renders it more palatable to the aphides, and probably also more easily accessible. Be also that as it may, the abnormal multiplication of aphides during cold winds is a fact with which all fruit growers are only too familiar, multiplication of aphides during cold winds is a fact with which all fruit growers are only too familiar. And hardly have these pests been established on the trees when the ants appear to assist their slow locomotive powers by lifting them up and quickly conveying them from place to place. Thus the distinctive powers of the aphides are virtually increased and extended in the ratio that the ant travels so much faster than an aphide. Up to the present date (April 7) no aphides have appeared on our Peach trees, and should they continue clean a few weeks longer trees and crops alike may be pronounced safe. Notwithstanding all the modern remedies for aphides there is nothing less hurtful to the trees or more effective against the modem remedies for aphides there is nothing less hurtful to the trees or more effective against the insects than tobacco in powder or in liquid. In the former case the infected branchlets must first be sprinkled, and the tobacco-dust or snuff applied through a dredge-box. In the latter the liquid should be dashed on with a springe. It is good practice first to dash as many aphides off as possible by the mere force of pure water applied through a garden engine, and thus, while the leaves are still wet, and the aphides are half disammed and balf dead by their battering and bruising, apply the tobacco liquor, which speedily destroys the aphis, already three-quarters killed. There is another great advantage in applying killing mixtures to wet leaves and branches; they prove far more penetrating, and reach every part of the leaves and branches with more facility, and certainly tobacco-liquor, parafin oil, or other insect the leaves and branches with more facility, and certainly tobacco-liquor, parafin oil, or other insect destroyer, applied to dry leaves and branches, are resisted by the dryness, as if they were protected by oil. Much of the mixture glides off insects and foliage alike, doing little execution on the pest; but, applied to thoroughly wet leaves and branches, the distinctive agents mix with the water, and are thus brought into direct contact with the insects. From the amount of moisture already on the trees, the observative or other insect destroyers may also be the amount of moisture already on the trees, the tobacco-water or other insect destroyers may also be applied stronger than when used on dry trees. This, however, will not involve any loss of material, but rather the contrary, as much less of it will go further; and a larger proportion of that applied being brought into closer contact with the applieds will prove far more destructive. D. T. Fish.

FORESTRY.

INTERNATIONAL FORESTRY EXHIBITION .- The Executive Committee have been very busy during the last fortoight completing arrangements for laying-out the buildings and grounds, and the contractors (Messrs. BEATTIE & SONS) for the erection of the galleries have already made considerable progress with their portion of the works, so that all promises to be ready in good time for the reception of the exhibits early in June. The applications for inside space are much in excess of the accommodation originally provided, and considerable extension of the galleries will be necessary to make room for all the valuable and interesting exhibits which have been entered. Large as the open-air space is, it is being rapidly filled up, the large number of applications coming in at the last moment rendering it a matter of some importance how hest to accommodate and display the various extensive collections. The list of foreign countries who will exhibit is by no means complete, but it includes Canada, New Brunswick, Mississippi State, Columbia, Denmark, Persia, Chili, Boroeo, Japan, Salvador, and Honduras, The Ducal Government of Coburg, and other Governments who have not time to send actual collections of timber, will send administrative reports and maps. The collections of the Scottish foresters will be placed in a separate court, and already the chief landed proprietors or their managers have sent in applications for space. Side by side with the Pines of Scotland will be exhibited a large section, 8 feet high, of one of the gigantic Sequoias of the Yosemite Valley. The tree from which this is taken measures 18 feet in diameter, or nearly 40 feet in circumlerence.

Sweden and Norway will only he officially repre-sented by collections of forest seeds and contributions of maps and charts, but the timber and pulp and paper industries of these important countries will occupy a space of from 1500 to 2000 square feet. From Italy, France, Russia, and Germany many applications are being daily received. In the last-named country Mr. Charles Hugo, Hamburg, has been appointed official agent; the Government of Denmark has appointed Mr. Lauritz la Cour their commissioner; and other countries and colonies bave made similar appointments. Further telegrams from the Viceroy of India have increased the space already applied for, so that the court will now include 6500 square feet. The preparation of the Timber Trophy from the Andaman Islands, which embraces some grand specimens of the native woods, has been entrusted to Mr. Shillinglaw, Edinburgh, who may be expected to do it ample justice. The time for receiving exhibits has been fixed between June 10 and 18, but already the secretary's office is beginning to wear a foreign aspect from the contributions sent from Canada and India, and a large store-room at the Great Northern Depository is getting gradually filled with exhibits from foreign residents who have been unaware of the date of opening.

Che Arboretum.

ARAUCARIA IMBRICATA,—In answer to your correspondent, "P. F. L.," I have an Araucaria imbricata here and a good specimen. Tradition says it was planted in 1822. The present height is 55 feet, girth of trunk 3 feet from ground, 6 feet 6 inches. a male tree and bears every year abundance of catkins, but a few years since it hore one cone from which I raised several plants. It is very dense in habit and a few years since looked as if it had finished its growth, the top of the tree looking almost flat. Last year, however, it made a start again though a small one. The bole is clear of branches for 12 feet from the ground line, but none the less the ends of the branches nearly touch the ground. I have many Araucarias here, but no two alike in habit; one, a female with twenty-three tiers of branches feathered to the ground is the most graceful tree of the kind I know, it must he close upon 40 feet high, and was planted in 1851, being then about 4 feet high. It is much finer and more delicate both in the wood and "leaves." The large Araucaria is very badly placed, only 14 feet from the conservatory, and for some time it has looked as

if the following year it would reach the conservatory, but it fails to do so, the weight of the branches bringing them down. W. Rolles Fryer, Lytchett Minster, Poole. [We shall be glad to receive details of dimensions, &c., from other correspondents. ED.]

FRUIT NOTES.

ROYAL RUSSET APPLE,-This may be said to be the most ornamental looking Apple that could be selected for the table, the subdued richness of its colouring not being equalled by that of any other variety, the russet-brown, dark crimson, and amber tints being harmoniously bleuded, the crimson seeming to glow like a smouldering fire in a dark place. texture of the skin is rough, like that of a Regent Potato, and, like it, having excellent qualities under the rough coat. The shape is also just what is to be seen in a good race of Apples, being bluutly pyramidal, as in Golden Spire, but rather more acute.

RASPBERRY LORD BEACONSFIELD,-The January number of the Florist and Pomologist, t. 602, contains a plate of this new Raspberry, raised as a chance seedling in the garden of Mr. Faulkner, of Inkpen, near Hungerford. The canes are stout, nut-brown, leaflets very pointed, silvery beneath; fruit very ahundant on the summer branches, large, roundish, or somewhat conical, crimson,

APPLE REINETTE ROUGE ETOILÉ. - A remarkable German or Belgian Apple of medium size, globular form, with a short stalk in a deep basin and a shallow eye. The colour is a reddish-crimson, streaked, and a few lighter specks. The flesh shows 5-rounded white lohes forming a central cinquefoil surrounded by a broad belt of a reddish colour. The tree is productive, and the quality of the fruit good. Season, January-March. Figured in the Bulletin d'Aboriculture, January, 1884.

Reports of Societies.

Edinburgh Botanical: April 10.—The Society met in 5. St. Andrew Square, Mr. W. B. Boyd, President, in the chair. The death of Professor Allen Thomson, M.D., a son-resident Fellow, was noted. The following communications were received:—
1. "The Development of the Organs of Reproduction in the Jungermannie." Part II. By John Mac-

The following communications were received:—

1. "The Development of the Organs of Reproduction in the Jungermannie." Part II. By John Macmillao, Sc. B., F.R.S.E., Perth.

II, "On Some of the Methods of Geographical Botany, with a Proposal to Resuscitate the Committee for Local Observations, Suggested in 1876 by Mr. Buchan." By Andrew Taylor, Secr.

The Committee noticed in the title had been formed to investigate the influence of the sea on selected plants, specially along the coast of the Firth of Forth from North Berwick to Grangemouth. It included the names of Sir Robert Christison, Professor Balfour, Messrs, Gorrie, Sadler, and Alexander Buchan, who was now the ooly surviving member. From illuess and other causes no work had been done. The attention of the Society was also directed to the Petrage sur Phânologie, by Drs. Ihne and Hoffman, of Geissen, just issued, in connection with a sub-committee charged by the Council to prepare a new scheme of phenological observation and report—an enlargement, in truth, of the meteorological observations so long issued in the Society Transactions. Dr. Pickering's Chronological History of Plants also showed a method of investigation susceptible of local applications. The islets of the Forth were, as is well-known, occupied by religious orders for lengthened periods, and the Society might investigate their floras, contrasting those introduced by such human ageocies with indigenous species.

periods, and the Society might investigate their floras, contrasting those introduced by such human ageocies with indigenous species.

In view of Blackford Hill being acquired as a new public park for Edinburgh, means should be taken for conserving its local flora, and the same care indeed was needed for the native plants of the Queen's Park.

III. "On the Progress of Open-air Vegetation at the Royal Botanic Garden," by Robert Lindsay, Curator.
"The month of March has been very mild compared with that of last year, still it has been the most severe of any mouth during this unprecedentedly mild season. The thermometer was at or below the freezing point on twelve nights. The lowest readings occurred on the 3d, 28°; 11th, 27°; 22d, 29°; 21th, 28°; 26th, 27°; the highest morning readings ranging from 47° to 53°. Collectively 29° of frost were registered for this order of the state
ceous plants are on an average a fortnight earlier than last season. Trees and shrubs are developing their leaf-buds about a week earlier. Thoms were in full leaf by the end of the month; Poplar, Llae, Horse Chestnut, and Maple being far advanced. Magnolia conspicua and purpurea, which last year at this date were in full flower, are not yet expanded. These plants are trained on south walls. Their lateness in flowering can only be accounted for hy their wood being insufficiently ripened last summer and autumn. To the same cause may be attributed the lateness and poor condition of several other flowering plants on walls, notably Prunus triboba.

"Of the forty spring-flowering plants whose dates of flowering are annually recorded, the following six came into flower, which now completes the list, viz.:—

March	24
	-
	30
April	3
p	2

Saxifraga oppositifolia, varieties

"Such favourable weather for outdoor work rarely

"Such favourable weather for outdoor work rarely occurs as that of the past month has been."

IV. "Report on Temperature and Vegetation in the Garden of the Royal Botanic Institution of Glasgow, March, 1844." By Robert Bullen, Curator.

"The bighest day temperature registered was 64° on the r6th, an unusually brilliant day for this season of the year. The lowest temperature was 26°, or 6° of frost, during the night of the roth. The thermometer field below the freezing-point eight times only during the month, giving a total of 21°.

"During March last year the thermometer fell below the freezing-point twenty-three times, giving a total of 115°. Snow lay on the ground during the first four days of the month; since then the rainfall has been light. Another storm of great severity falls to be recorded during the inght of the ryth; these storms have visited us monthly of late, and always at night, doing considerable damage in the way of uprooting trees, &c., when we could least guard against them; otherwise we have experienced one of the most favourable spring months recorded for several years, which has enabled us to overcome arrears of out-the most favourable spring months recorded for several years, which has enabled us to overcome arrears of out-the most savules, smoke-clouded climate, being more fatal than a hard one. The season is quite a normal one as regards vegetation."

V. Miscellaneous communications:—

The following plants in flower were exhibited from the

V. Miscellaneous communications:—
The following plants in flower were exhibited from the Garden:—Narcissus bulbocodium minor, N. moschatus, N. rupicola, N. juncifolus, N. ruhandrus, Primula ciliata Balfour, P. acaulis, varieties having leafy and coloured calyx: Tecophylae cyanocroons, Saxifraga fiagellaris, ec. From 1. Anderson-Henry, Esq., Hay Lodge:—Primula poculiformis, Androsacea roundifolia, Anemone thalictorides flore-pleno. From the Garden were exhibited plants in flower of Pinguicula candata, Corbularia bulbocodium sulphureum, Saxifraga Burseriana, S. Boydil, a yellow flowered form of S. Burseriana; S. Stracheyii, Soldanella alpina, Galanthus nivalis, a late flowering variety, received from Mr. Melville, Dunrobin Castle. Miscellaneous communications :-Castle.

Obituary.

THE death is announced of the DUKE OF BUCCLEUCH on the morning of the 16th inst., at Bowhill, Selkirkshire. The Duke had some connection with horticulture, not only as the owner of two of the finest garden establishments in the country, Dalkeith Palace, and Drumlanrig Castle, as well as half-adozen or more smaller ones, but in virtue of his association with the Royal Horticultural Society, the Royal Caledonian Horticultural Society, and the Gardeners' Royal Benevolent Institu-His connection with the Royal Horticultural tion. Society commenced early in 1862, shortly after the lamented death of the Prince Consort, when, the Queen's wishes being consulted as to the choice of a new President, her Majesty was graciously pleased to recommend the Duke as the person it would be most agreeable to her Majesty's feelings to see holding that position. This office he held until April, 1883, when, with other members of the Council, he resigned, his successor in the office of President being Lord Bury. On the death of the late Duke of Devonshire, the Duke of Buccleuch was

elected President of the Gardeners' Royal Benevolent Institution, and by his death the Institution has lost a munificent supporter.

- We should also ere this have recorded the death, about a month ago, of one of the Duke's oldest servants, in the person of Mr. MATTHISON, the much respected gardener at Bowhill, whose successor's appointment we noted last week. Mr. Matthison, who was ninety years of age, had served the Duke of Buccleuch for fifty years, and was previously gardener for twelve years at Armiston House, Midlothian.

LONION: Atmospheric Pressure.—During the week ending April 12, the reading of the harometer at the level of the sea increased from 29,51 inches at the beginning of the week to 29,64 inches by 3 P.M. on the 6th, decreased to 29,64 inches by 3 P.M. on the 7th, increased to 29,95 inches by 3 P.M., and increased to 29,99 inches by 3 P.M., and increased to 29,95 inches by 3 P.M. on the 10th, increased to 29,95 inches by 3 P.M. on the 10th, increased to 30.07 inches by 3 P.M. on the 12th, and was 30.06 inches by 4 P.M. on the 12th, and was 30.06 inches by 4 P.M. on the 12th, and was 30.06 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.89 inches, being 0.32 inch higher than last week, and 0.03 inch below the average of the week. LONDON : Atmospheric Pressure .- During the week

of the week.

Temperature. — The highest temperature in the shade in the week was 60°.9, on the 9th; the highest reached on the 7th was 51°.2. The mean of the seven high day temperatures was 58°, on the 12th; on the 12th; on the 17th the lowest temperature was 36°, on the 12th; on the 17th the lowest temperatures was 40°. The mean of the seven low night temperatures was 41°.7.

of the seven low night temperatures was 41°.7.
The greatest range of temperature in one day was 10°.4, on the 9th; the smallest was 5°.2, on the 7th.
The mean of the seven daily ranges was 12°.5.
The mean temperatures were — on the 6th, 50°; on the 7th, 48°; on the 8th, 47°.7; on the 9th, 49°.1; on the 10th, 44°.6; on the 11th, 44°.8; and on the 12th, 43°.7; of these the first four were above their averages by 5°, 2°.8, 2°.3, and 3°.5; respectively, and the last three were below by 1°.1, 1°, and 2°.2 respectively.

The mean lemperature was 46°.8, heing 4°.1 lower than last week, and 1°.3 above the average of the week.

the week.

The highest reading of a thermometer with blackened hulb in vacuo placed in the full rays of the sun was 122°,5, on the 9th. The mean of the seven readings was 90°.

The lowest reading of a thermometer with its hulb placed on grass was 30°,2,2 on the 12th. The mean of the seven readings was 34°,4.

Rain fell on the 6th and 7th to the amount of 0.45 inch, of which 0.27 inch fell on the 6th.

ENGLAND : Temperature .- During the week ending April 12 the highest temperatures were 63°.4 at

Cambridge, 62° at Truro, 61°.4 at Nottingham; the highest at Bolton was 57°.7, at Brighton 58°, and at Bristol 58°.5. The general mean was 60°.

The lowest temperatures in the week were 28° at Sunderland, 29°.5 at Wolverhampton, 31° at Cambridge; the lowest at Blackheath and Bradford was 38°, and at Sheffield 37°. The general mean was

bridge; the substitute of the great mean was 38°, and at Sheffield 37°. The greatest ranges were 32°.4 at Cambridge, 32° at Sunderland, 29°, 5 at Wolverhampton; the smallest ranges were 20°.6 at Bradford, and 22° at Brighton and Sheffield. The general mean was 25°.5.

and Shenied. I he general mean was 25.5.

The mean of the seven high day temperatures was highest at Truro, 59°, at Plymouth 59°, at Nottingham 56°.3; and was lowest at Hull, 52°.7, at Sheffield 53°.2; and at Blackheath 54°.2. The general

field 53°.2, and at Blackheath 54°.2. The general mean was 55°.2.

The mean of the seven low night temperatures was highest at Sunderland, 43°.5, at Blackheath 41°.7, at Bradford 41°.5; and was lowest at Wolverhampton, 36°.4, at Bolton 38°.3, and at Nottingham, 39°. The general mean was 40°.4.

The mean daily range of temperature was grealest at Wolverhampton, 19°.1, at Truro 18°.3, at Nottingham 17°.3; and was least at Sunderland, 11°.4, at Sheffield 12°.5, and at Blackheath 12°.5. The general mean was 14°.8.

The mean temperature was highest at Truro.

mean was 14.'8.

The mean temperature was highest at Truro, 48°.3, at Plymouth and Sunderland 47°.7; and was lowest at Wolverhampton and Hull, 44°.5, and at Bolton 45°.2. The general mean was 46°.3.

Rain.—The largest fall was 0.57 inch, at Hull, and 0.45 inch at Blackheath and Sheffield; the smallest fall was 0.60 inch at Truro, 0.07 inch at Liverpool, and 0.09 inch at Plymouth. The general mean fall was 0.28 inch.

SCOTLAND: Temperature.—During the week ending April 12, the highest temperature was 60°.9, at Dundee; at Greenock the highest was 55°. The general mean was 58°.

The lowest temperature in the week was 26°, at Perth; at Leith the lowest temperature was 36°. The general mean was 32°.

The mean temperature was highest at Edinburgh, 46°.4; and lowest at Perth, 43°.4. The general mean was 45°.1.

Rain.—The largest fall was 0.09 inch, at Aberdeen, and the smallest fall was 0.09 inch, at Greenock. No rain fell at Glasgow. The general mean fall was 0.19 inch. SCOTLAND: Temperature.-During the week end-

o. to inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

ASPHALT COURT: ? Raine. You have put too much tar, and your materials are too finely comminuted. Use ½-inch spar gravel, &c., quite dry—autificially dried at this time of the year. Put only enough tar to coat the material well, and do not make it like soft mortar. Do not use any fine material; we do not see the use of lime. It will not slake with the tar, and will absorb moisture afterwards. You can sprinkle Derby spar on the surface, and ram it smooth; the appearance will be improved thereby. For really good work some bitumen ought to be added to the tar while boiling, as it causes the stuff to set quicker, and is hard in hot weather. hard in hot weather.

BOOKS: Hortus. British Grasses, by Miss Plues (Lovell Reeve & Co.). What do you mean by horticultural engineering? Please state more distinctly what you want.

What you wall:

CRICKETS: W. C. Large flower-saucers, or the like, half-filled with treacle, form a good trap for these pests. There are phosphorus beetle-pastes, which crickets will eat; they then die in their holes in great numbers, causing a noisome stench. Treacle is cheap; they like it, get in it, and seldom get out again. When it gets foul renew the store.

gets foul renew the store.

CUCUMBER LEAVES DISEASED: J. A Breeze. The leaves were covered entirely on the underside with mildew; even the youngest leaves showing signs of it. You will be able to do nothing with the plants so as to effectually get rid of it, although you might keep it in check with sulphar used in the water with which you syringe, and also by keeping saucers filled with water in which the same has been mixed. It would be better to clear out all soil and manure, then burn sulphur in the pits, and limewash all brickwork, and make a fresh start with healthy plants and soil. We fancy your top-heat is not quite sufficient, or the ventilation was excessive in cool weather.

DENDROBIUM CAMERIDGEANUM. — Mr. De B. Craw-shay's specimen of this Orthid, exhibited at the last meeting of the Floral Committee, was awarded a Cultural Commendation, and not a Vote of Thanks, as stated by us last week.

FUNGUS: J. Gregory. We have heen unable to identify the specimen.

Fungus on Plum Trees: T. S. Ware, Fungus known as Hypoxylon concentricum.

INSECTS: 7. 7. The caterpillar found boring into the stem of an imported Leelia is that of a moth, and looks very like that of one of our common English Switt moths (Hepialus sp.). Has the burrow made by the insect the appearance of having heen made before the

plant was imported, or more recently? In the former case the insect would most probably be an American. I, O, IV, P, P, IV, T. A weeval (otion/puchus) very common in gardens, and very destructive. They mostly feed at night, and if on trees are existly caught by spreading a cloth underneath the tree and giving it a good shaking. In your case we can only recommend you to capture them by hand picking. In doing this, make as little noise as possible, as the weevis sham death when disturbed.

LICHEN AND SYCAMORE: H. H. It should be pronounced like Lyken. Sycomore is so spelled in the revised version of the New Testament, because that is in accordance with the original Greek.

revised version or the New 1 estament, because that is in accordance with the original Greek.

SEEDS.

London: April 16.—Messrs, John Shaw & Sons, Seed Merchants, of 37, Mark Lane, report a quiet, steady inquiry for field seeds. Of choice red Clover seed the supplies are not over abundant, but some quantity of low seed will have to be carried over. For Trefoil the demand has been disappointing throughout; fine white, being exceedingly scarce, is substantially dearer. Alsike is without change. Bird seeds sell slowly on former terms. Linseed steady.

CORN.

Monday heing Bank Holiday there was no market held at Mark Lane. On Wednesday, at the early mar-ket, Wheat was firm, but not much business doing. Flour steady, Maize held for slight advance, Oats tending dearer, Barley and other articles quiet. Weather dull. At the close of the market, prices of Wheat remained the same as last week. The week closed nearly at the morning's figures.

CATTLE.

At the Metropolitan Market on Monday, fully 2d. per 8 lb, advance was realised in the current trade for beasts, and more in some cases for prime qualities. Lambs were very scarce, and fully as dear as on last market day. A good supply of sheep met a steady sale at rather better prices. Very few calves were on offer. Quotations:—Beasts, 4t, to 5, 6d, and 5, 8d, to 5t, 10d.; calves, 5t, 8d, 10, 7s, is sheep, 4t, 8d, to 5t, 2d, and 5t, 4d, to 6t, 1 lambs, 8t, to 8s, 8d, 10g, 5t, 4d, 6d.—On Thursday beasts met a slow sale, at Monday's prices. Sheep were dull, and hardly so strong; but lamb maintained its value. Calves and pigs sold on former terms. former terms.

HAY.

HAY.

Tuesday's Whitechapel Market report states that supplies were mederate, and trade very dull. Quotations:
—Clover, first quality, 90s. to 1082; inferior, 60s. to 755; prime second cut, 90s. to 1062; jebst meadow hay, 80s. to 87s; inferior, 405. to 65s; and straw, 28s. to 37s. per load.—On Thursday there was a rather large supply offered. The trade was very quiet, at late rates, Quotations:—Prime Clover, 80s. to 108s; inferior, 60s. to 80s; prime meadow hay, 70s. to 87s; inferior, 60s. to 60s; and straw, 30s. to 36s. per load.—Cumberland Market quotations:—Superior meadow bay, 84s. to 90s.; inferior, 63s. to 74s; superior Clover, 10s. to 112s.; inferior, 70s. to 88s.; and straw, 34s. to 38s. per load. per load.

POTATOS.

From the various market reports we learn that there bave been plentiful supplies on offer, but trade slow at the following prices: Flukes, Magnums, 70x. to 80x.; Victorias, 80x. to 90x; Regents, 60x. to 80x; Chambians and the following the forms and the following the forms and the pions, 50s. to 65s. per ton.

COALS,

The following are the prices current at market during the week:—Lambion, 152. 6d;. Lyons, South Hartle-pool, and Wear, 143. 6d;. Hetton and Tees, 16c; Ravensworth and Hartley, 143. per ton. Owing to the cold weather prices seem to have improved about 11. per ton all round.

VINES AND VINE CULTURE.

By ARCHIBALD F. BARRON,

Superintendent of the Royal Horticultural Society's Gardens.

Opinions of the Hortlcultural Press :-

The Yournal of Horticulture says :-

"It is the most complete, and it will be accepted as the standard work on the Vine."

The Gardeners' Chronicle says :-

"It is emicently practical and useful."

The Garden says :-

"It is undoubtedly the most exhaustive volume upon Vines and Vine culture ever published."

The Gardeners Magazine says :-

"It will certainly take, and probably keep a leading place in the class of literature to which it belongs."

The Florist and Pomologist says :-

"There is nowhere to be found in our language so complete and thorough a descriptive list of the best varieties of Grapes."

The Midland Counties Herald says :-

"The whole subject is dealt with exhaustively and authoritatively in plain, expressive, and singularly concise language."

The Irish Farmers' Gazette calls it:-

"The most complete work of its kind that has ever been issued from the British Press."

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled initiators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thirning, and is used cold. It is used in the grounds at Window Castle, New archiver of the control of the c

Station in the Key, or in on, per ganda taminge pass to any station in the Key, or in on, per ganda taminge pass to any station in the Key, or in the Key, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Kiercefield ask, Chepstow.—I am, Sira, yours re-CAUTION—HILL & Surris would particularly warn their Customers against the various cheap Varnishes now so much advertised. A varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years and their constantly iccreasing trade in it, and the cumers Testimonials they receive, stamp it as a truly genuine atticked Tevery cask is legibly marked with their name and Registered Trade Mark as above, without which once is genuine. Here Trade Mark as above, without which once is genuine, lee, Field and Entrance Gates, &c, sent free on application to HILL AND SMITH, Briefley Hill Ironworks, Staffordshire; 138, Queen Victoria Street, London, E. C.; and 196, St. Vinceet Street, Glasgow.

SUPERIOR VARNISH.

ELACK, RED, GREEN and CHOCOLATE.

It is applied cold, and may be laid on by the laid on book equally as well as oil paint, yet at one-fourth the cost.

MOWERS FOR 1884.

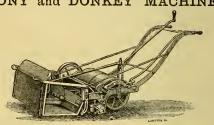

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines, These Machines are in use in the Royal Gardens at Kew, Hampton Court, Oaborne and Balmoral, in most of the Public Parks and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawns. They have now been before the Public for many years, and stand unrivalled. These Machines are early worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

PRICES.							
To cut 10 inches wide	£3 10 0 1 To cut 19 inches wide	£8	0 0				
o cut 12 inches wide	4 10 0 To cut 22 inches wide	8 1	0 0				
To cut 14 inches wide To cut 16 inches wide	5 10 0 To cut 24 inches wide	9	0 0				
The two smallest sizes can be worked by a boy; the 14 and 16 in. by a man;							
the 19 in, by a man and a boy; and the 22 and 24 io, by two men.

UPPER THAMES STREET, LONDON. E.C. 36,

Messrs. CASSELL & COMPANY have had in preparation for some time past an entirely NEW PRACTICAL WORK on GARDENING in all its Branches, and have now the pleasure to announce,

In Monthly Parts, Price 7d.,

CASSELL'S POPULAR

GARDENING.

Edited by Mr. D. T. FISH.

ILLUSTRATED THROUGHOUT

PART I, now ready, Price 7d.,

Including a Handsome Coloured Plate.

(To be Completed in about 24 Parts.)

THE rapid advance made in the art and practice of gardening The rapic advance made in the six at this practice or gardening during recent years, has rendered existing treatises to a great extent out of date, and created a widespread desire for a thoroughly comprehensive and practical Work, fully up to the present standard of knowledge, and issued at a price which places it within the reach of all.

CASSELL'S POPULAR GARDENING will supply this requirement in every respect. It will embrace full and practical information upon every subject connected with the Cultivation, Propagation, and Production of Flowers, Plants, Shrubs, Fruit, Vegetables, &c., and aims at becoming THE STANDARD WORK OF REFERENCE on this most interesting pursuit.

In CASSELL'S POPULAR GARDENING the fullest and In CASSELTS will be a considered to the construction of the rules and the tate information and maintenance of artificial climates, through the erotion and wars the planting of glass houses or other structures; the building of walls: the planting of flower, and the planting of flower, and fruit garden, orchards, pleasure-grounds, shrubberies, plantations, agraden landscapes, and the propagation by every known was a graden landscapes, and the propagation by every known the construction of the plant of the garden.

The culture of flowers and decorative plants will be treated from various points of view. The general formation of the flower-garden, with methods of keeping up an attractive display throughout the changing seasons, will be dealt with. In detail will also be described the plants themselves, with better special methods of culture and propagation; greenhouse and partere receiving equal attention, and Roses being treated in a series of special articles. Selections of the choicest varieties will be given with hints on their culture, training, pruning, and uses; the enemies of the garden, and bow to varaquish them; garden appliances, tools, and operations, will all be discussed; in a word, it is intended to teach every reader bow to form, furnish, and cultivate his garden in the best way at the least cost, and to most profitable and pleasant purpose. most profitable and pleasant purpose

The requirements of small gardeners will receive full and special attention, and ample guidance will be given to those whose gardens may be found in the front aback yard, area, or house. Suburban gardening will have a series of articles to titself, as also will window gardening and other forms of horticulture in or about the home.

Wood Engravings will be freely introduced wherever they can assist, either to give adequate idea of flower or plant, to excan assist, either to give adequate idea in nower or plant, to ex-plain the details of pruning, gratting, or other operations, to elucidate a system, or to make clear the structures or ap-pliances described; whilst Original CoLOURE PLATES will be given at intervals during the progress of the Work. In short, CASSELI'S POPULAR GARDENING will be a full and safe guide for gardens of all sizes, and for all sorts and conditions of

CASSELL'S POPULAR GARDENING will be Edited by Mr. D. T. FISH, who will be assisted by the following Contributors :-

SATURDAY, APRIL 26, 1884.

PRIMROSES.

THE Narcisso-maniacs have had their fieldday, as we duly recorded at the time. Some devotees of the Primrose cult had theirs on the 19th., but however excellent their motives, we fear they did not advance the knowledge of Primroses beyond the modicum possessed by Peter Bell, of established renown. Poor Peter, we fear, is not held in much esteem by the members of the National Auricula Society, Southern Section, and most assuredly the earnest members of that body would scorn the idea of degrading the object of their predilection into a political badge. Long may they continue in that frame of mind. The culture of flowers and political partisanship have nothing in common, save that the devotees are liberal in their practice, and conservative in their principles. While they are generous and free-handed, they are apt to resent innovation upon the "properties," as an attack upon the British Constitution, whatever that may be. In any case, the worshippers carried out their "function" at South Kensington on Tuesday last, as the Daffodil lovers did theirs a week or two previously. The record of their proceedings is given in another column. In this place we desire to call attention to the very interesting collection of species of Primula shown by Mr. Llewellyn and others, and trust that the excellent example set by those gentlemen will be followed on other similar occasions. There is no need for us to enlarge upon the beauties of Primula Sieboldi, the elegant drooping flowers of P. sikkimensis, the chaste purity of P. nivalis, the lovely tint of P. rosea, or the striking appearance of P. denticulata-for all these are, it is to be presumed, well known to plant lovers and growers. Our object now is to show that our resources are not yet exhausted-that many more remain to be introduced, some of which will bear comparison with any now in our gardens, and possibly are destined, by the skill of the gardener, to play a large part in the gardens of the future. illustrations at p. 545, have for the most part been made from dried specimens by the skilled pencil of Mr. Fitch, but we introduce them here with the view of stimulating inquiry and pro-moting their introduction. Most of the species in question were described by Dr. Watt in the Fournal of the Linnean Society a few years ago, and these, as well as others, were illustrated by Miss Smith in that publication.

Beginning at the upper left-hand corner of our illustration, the large-flowered species is P. ELWESIANA, a Sikkim Himalayan species, with entire oblanceolate leathery glabrous leaves and solitary hairy flower-stalks, each bearing a solitary large purple flower, having much the appearance of a single Dianthus, though, it need hardly be said, the resemblance is quite super-ficial. To the right of this is P. GAMBELLIANA, a species with orbicular, cordate, toothed, glabrous leaves, on long stalks. From the centre of the tuft of leaves rises a slender shaft, bearing at the top a simple umbel of purple flowers, in shape like those of the common Primrose, but with a more open

throat. This is also a native of Sikkim Himalaya.

Beneath P. Elwesiana, towards the centre, is P. PULCHRA, a species with oblong lanceolate crenate glabrous leaves, glaucous on the under surface, and raised on long stalks. The purple flowers are borne in simple umbels at the end of a simple flower-stalk. This also is from Sikkim.

To the right, below P. Gambelliana is the very striking P. UNIFLORA, a Sikkim species with a tuft of long-stalked ovate toothed glabrous leaves, from amid which rises a single flowerstalk, bearing at the top one, or sometimes two, sessile horizontal flowers, of a pale lilac colour. No other species, we are told, has flowers so large in comparison with the foliage. resemblance to Shortia galacifolia will be seen by those who refer to our figure of this rare species in volume xv., 1881, p. 596.

To the left, again, beneath P. pulchra, is the low-growing P. SAPPHIRINA. In this the tusted leaves are not more than a quarter of an inch in length, obovate, coarsely toothed. From their centre rises a slender stalk, bearing a simple umbel of small pale blue flowersvery elegant little species," collected in the Lachen Valley by Sir J. D. Hooker.
Below this, in the lower left-hand corner,

is P. MUSCOIDES var. TENUILOBA. leaves are something like those of the common Daisy, but smaller. The flowers are solitary, sessile; the corolla lobes are deeply two-lobed. The colour of the flowers is not stated. Next to it to the right is P. MUS-COIDES, "much the smallest of the genus forming moss-like tufts among the roots of creeping alpine plants," and in the centre at the bottom is P. TENELLA, "a remarkable little species, very unlike any other," native of the Chumbi Valley between Sikkim and Bhotan. Its leaves are obovate or trapezoid, tapering to a slender stalk, and from the centre of the tuft springs a solitary flower-stalk, with a single bluish-white flower nearly an inch across the limb. Lastly, in the lower right-hand corner is P. SOLDANELLOIDES, a small species, with ovate, wedge-shaped, crenate leaves; the flower-stalk is thread-like, and bears a solitary nodding white flower, with a long cylindrical tube and bilobed segments. This, like all those above-mentioned, is a native of Sikkim.

TULIPA GRISEBACHIANA, Pautoesek, in Oester. Bot. Zeit., 1873, p. 265.

The following is a description, drawn up from a living plant which has just flowered at Kew, of this new Tulip. It is a native of Gliva, near Trebinje, in the Herzegovina, and we are indebted for it to Herr Leichtlin. I should class it as a variety of T. sylvestris; bulb middle-sized, ovoid; outer tunics brown, glabrous, stem a foot long, one-flowered, lacte, very glaucous; leaves, three, placed near together below the middle of the stem, lorate, very glaucous, erect, deeply channelled down the face, quite glabrous, 6-7 inches long, the outer 4 inch broad, the inner 4 inch, flower faintly scented, erect, oblong-infundibuliform, an almost uniform pale lemon-yellow, under 2 inches long. Peduncle erect, overtopping the leaves; perianth segments, all acute, the outer oblong-lanceolate, ½ inch broad at the middle, only faintly tinged with green, especially towards the pubescent tip and base; inner twice as broad, ovate-spathulate, bright lemon-yellow with a slender green keel. Stamens, bright yellow, i inch long; filaments hairy at the base; ovary cylindrical-triquetrous, stigmas minute. 7. G. Baker.

SACCOLABIUM MINIATUM (Lindl.) CITRINUM, n. var.

An old acquaintance of mine. I had it as early as December, 1867, from my then excellent correspondent, Mr. Wentworth Buller, indicated as coming from the Philippines. I wrote on my label " Philip. (?)." No doubt, however, my correspondent There are now very fine inflorescences at was right. hand, which show very narrow organs in the dried state; when, however, softened they are like what we are accustomed to see. The fine inflorescences are very rich, dense, widely spread, and having leaves with very strong sharp teeth at the top. It is said to have dark stripes on the leaves, and lemon-coloured flowers with a dark centre (mouth of spur?). It was collected by Mr. Röbelen, and kindly forwarded by Herr Consul Kienast-Zolly, of Zurich, whose skill in growing Orchids is appreciated even higher by orchidists. H. G. Rchb. f.

NOTES FROM BROCKHURST.

NARCISSUS (CORBULARIA) BULBOCODIUM. your issue for October 13 last, p. 460, I referred to the fact that the hardiness of this Narcissus, in our climate, had been doubted; and pointed out that after flowering the bulbs broke up into bulblets; and as few of these flowered the following season, it was probably this that gave rise to the idea, that the plants did not survive. I carefully observed the bulblets thus arising from a clump of this Corbularia, which has been growing now out-of-doors for four years, and I find that at the end of the second year they bloom again. If therefore left undisturbed, the clumps of this Narcissus will reappear, and flower again plentifully in two years. Mr. Smith, of Guernsey, told me that these small bulblets are planted out in Guernsey, after the Potato crop is gathered in, and the ground is thus used a second time in ripening the Corbularia bulbs for the English market. It is these ripened bulbs that we buy in the autumn: they bloom plentifully, and then break up into bulblets, as thus described. they require in our English gardens is a sandy soil, and sunny position, with shelter from cold winds.

THE INDIAN PRIMULAS, and more especially P. Cashmeriana, have been unusually fine with us this season; one clump has thrown up a dozen stout scapes from I to 2 feet high, and each bearing a globular truss of flowers of great beauty. I find they do best with a north aspect on a sloping bank, but where they get a moderate amount of sunshine. The plants growing in our bog beds are not so fine as those in strong but sandy soil, and well manured. Our best clumps are over four years old, and they increased fast by the root growths.

RANUNCULUS AMPLEXICAULIS, a difficult plant to keep, is now blooming beautifully with the Primulas, in the drier situation where it has now lived and flourished three years. In the bog-beds it is all lost,

PRIMULA PUBESCENS is generally credited as being one of the wild alpine forms, from which our show Auriculas bave been raised, and we have now a plant in flower, gathered by Gusmus in Transylvania, which confirms this. Its flower is large, with a good centre; and its colour a rich crimson-maroon, exactly resembling the well-known self Auricula Lord of Lorne. With this flower before us it is easy to see whence our "self" Auriculas emanated. P. Sieboldii, both in its cultivated and in its wild form of P. cortusoides, is a capital spring flower. Even the choice varieties sent out by Mr. Dean four or five years ago, are spreading freely in our wood walks and upon the rockeries. The hybrids raised by Mr. Brownhill of Sale, some years ago from P. viscosa and our show Auriculas, is far better than any true Auricula for gardening. Its dwarf habit and plenteous flowering derived from P. viscosa, added to the rich purples and pinks derived from the Auriculas, make them very showy. The attention of florists should be turned in this direction.

The varieties of Anemone nemorosa are especially lovely, and they grow well in sheltered situations and spread freely. The large Irish form is quite twice the size of our English wood Anemone, and has almost a double row of sepals, the outer sides of which are The variety Robinsoniana has a blue shade, and the double form, A. nemorosa, fl. pl., has its centre fitted with small narrow petals. Mr. Barr lately sent me a nemorosa bracteata, which is both pretty and curious. Here the sepals show an inclination to resume their green form, but are split up into narrow segments of green, edged with white; and within which is a close boss of narrow petals, as in the centre of the double wood anemone. These

cannot be the result of the conversion of the stamens into petals, as the stamens still appear in a ring of yellow, with a small green dot in the centre. is a most interesting flower and will form a good subject for a jecturer on botany. [Figured in De Candolle's Théorie, many years ago. ED.] There is another Anemone of this class which in my opinion is the prettiest of them all, A. trifoliata, native of the Alps. It resembles our own, but has three-lobed leaves, and its flower is whiter and of more substance. It also comes a little later. The variety of Anemoue blanda, sent out by Messrs. Backhouse this year, is far superior to Froebel's. It is larger and much deeper in colour; you generally get only a large form of appennina for blanda, but the true plant is vastly superior to this. A ranunculoides, the yellow form, should have a passing notice. It grows well in the wood, and spreads there in shady situations.

ARNEBIA ECHIOIDES is now in flower for the first of its three times of annual blooming. Of the Androsaces, pactea and sarmentosa are now in bloom, and of the Saxifrages several of the cordifolia or megasceas, S. [Wallacei, and S. Lindesiana; the latter is one of the very best of its class. Lychnis alpina is also in bloom. We are quite a month earlier than usual, but the cruel north-east winds which have prevailed for ten days, with frequently 12° frost at night, have done immense damage. I never saw the tall shrubs so cut about, and in many cases we have Hollies and other exposed shrubs quite destroyed, and many more disfigured. The young growths in the herbaceous borders are everywhere nipped, and the few remaining Daffodils are shrivelled up. W. Brockbank, Brockhurst, Didsbury, Feb. 21.

GINGER BEER PLANT.

THE Editor of the Gardeners' Chronicle has several times been requisitioned by correspondents (mostly anonymous) for a scientific description of the "Ginger Beer Plant." The correspondents want to know its botanical name and native country. The writer of this note has also been tormented weekly, almost daily, on the same subject for two or three years. Every one has been asking him for the "regular Latin or Greek name" of the "Ginger Beer Plant." Benevolent old ladies, clergymen and officers of the Blue Ribbon Army, have called upon him, or written for a scientific explanation, hoping to make the "Ginger Beer Plant" a boon for the poor. One person wished to feed paupers with it; another hoped by its means to knock all the publicans on the head; a third to send it in barrels for the army in the Soudan. When such persons have been told it is merely a form of German yeast they have turned away disappointed and disgusted. Something more must evidently be done for this rum shrub, of which I have recently had applications for slips, rooted cuttings, and seeds.

The last letter sent to the Gardeners' Chronicle was to this effect:—"I cannot learn anything more about it than that it is an American plant. Cannot find out where it is procured—only how to make it. Empty the contents of the small bottle into the wine-Empty the contents of the small bottle into the wine-bottle. Bruise about half an ounce of ginger, two table-spoonfuls of white sugar, put in a jug, pour boiling water over it, let it stand till nearly cold, then put the plant in the bottle of ginger, sugar, and water. Cork it tight, and when it begins to ferment the cork will filly out. The plant will grow if fed every day, and soon be enough for two bottles. It is best to empty it once a week into a pan and wash it with cold water, then put it in the bottle again."

To the unaided eye the Ginger Beer Plant looks To the unaided eye the Ginger Bear Plant looks tike a lump of pasts, and when placed under the microscope it is seen to consist of more than one of the Yeast fungi, in a mucilaginous medium. It belongs to the group of fungi termed Saccharonyces, of which there are many species, the one used for beer being S. cerevisite. Mr. Berkeley, Mr. Hoffmann, Mr. Huxley, and many other gentlemen, Psitish and foreign, have written about yeast in its different forms and conditions. The "Ginger Beer Plant" like all other yeast fungi, excites fermentation in sweet solutions and sets free carbonic acid gas. The carbonic acid gas formed

free carbonic acid gas. The carbonic acid gas formed in the process of fermentation at length causes the cork of the ginger beer bottle to fly out as a sign of maturity.

As all the correspondents insist on this "American plant "being a new species I propose to humour them by calling it Zingibeerophora spumacephala! W. G. Smith. [Mr. Smith favours us with a Latin description which, to avoid possible perplexity, we omit. Ep.]

"MEETING HORTICOLE."

THE first of the meetings held under the auspices of the Chambre Syndicale des Horticulteurs Belgee. took place, as we announced, at Ghent on April 7. The jury was divided into sections:—Section 1— President, M. J. Lioden, Brussels; Secretary, M. Lubbers, Brussels; MM. A. Van Geert, Ghent; and A. Peeters, Brussels. Section 2-President Count Henricourt de Grunne, President of the "Flora" Society, Brussels; Secretary, M. Vict. Cuvelier, Ghent; MM. L. Desmet and Ch. Spae, of Ghent.

Certificates of Merit were awarded to the Compagnie Continentale for Calamus Lindeni, Alocasia Dendrobium thyrsiflorum album, Vricsea heliconiodes.

To M. Louis Van Houtte, for Azaleas Comte de Paris and Souvenir du Prince Henri.

To M. C. Vaylsteeke, for Odontoglossum guttatum

splendidum, and O. crispum fastuossum.

To M. G. Pynaert, for Begonia olbia. To M. Paul Deschryver, for Azalea punctulata,

fl.-pl. A Cultural Certificate to the Compagnie Continentale, for a fine specimen of Masdevallia Lindeni,

with fifty-eight flowers.

Honourable mention was awarded to M. L. Desmet for Clivia miniata eminens, Asparagus comorensis, Athyrium Goringianum tricolor, Anthurium Scherzerianum macrospathum.

To the Compagnie Continentale for Gynogramma schizophylla, var. gloriosa, and Odontoglossum triumphans splendens.

To M. Desmet Dudivier, for Aralia rotunda.

To MM. Jakoh-Makoy, for Kerckhovea floribunda. To M. A. Van Geert, for Odontoglossum Alexandræ. var.

To MM. Deshois et Co., for Begonia gogoensis. To M. C. Vuylsteeke for Odontoglossum Wilcke-

anum, O. mulus, tincticulatum (sic), and hebraicum To M. L. Van Houtte, for Azalea souvenir du Duc d'Albany, and Baron Nathaniel de Rothschild.

To M. Desmet, for Daphne genkwa, and Pinguicula caudata.

To M. Alexis Dallière, for Coleus, Berceau de Venus (for the peculiar form of the leaves).

Some other plants were not adjudicated upon, a wish being expressed that they should be shown again when further developed. The meeting was very successful, as we learn from the Illustration Horticole, twenty-five of the nurseries of Ghent being represented. The next meeting will be held on the first Monday in May. As a matter of course members of the jury take no part in the discussion concerning, or in the awards made to the plants exhibited by themselves, and M. Linden, as interested in the Compagnie Continentale, took no part in the deliberations concerning the plants exhibited by the Company.

THE PROPAGATOR.

AT the present time, and whenever stout healthy cuttings can be got for the next month or six weeks, all those useful plants which are so much needed for winter-flowering require attention, and, like most other matters connected with the raising of plants for a special purpose, it must be attended to in the proper season, or the flowers will not be forthcoming when they are wanted. Among the best plants for winter flowering which require much the same treatment are Poinsettia pulcherrima, Euphorbia jacquininæflora, Eranthemum pulchellum, E. purpureum, Scutnellaria Moccipiana, Sericographis Ghiesbrechtii, Thyrsacanthus rutilans, Centropogon Lucyanus, Libonia floribunda, L. Penhrosiencis x, &c. These all require treating as cool stove plants while growing on and until they flower, but afterwards they last in perfection longer in the conservatory or when used for indoor decoration, and hence their value as decorative

Cuttings of those plants enumerated and of all of a like habit should be taken off (in many cases cuttings with what is called a heel are best) and inserted into cutting pots and placed in a close case until rooted. The cutting pots in this and in all other cases are better made up the day before, well watered, and left to stand until the next day before the cuttings are inserted; the cuttings will then not require watering for two or three days, and a sufficient time will then have elapsed to allow of the fresh cut wood sealing over. It is a mistake to water cuttings or grafts as soon as they are put in; with very free things the bad effect may not be visible, but with difficult plants it is a matter of great importance.

When the c: tings are well rooted they should be potted off three in a 60-size pot, and afterwards potted on as they require it into large 48's and 32's, special care being taken the whole of the time to keep them clean and free from insects. When well established these plants succeed best in a warm close greenhouse, and are even better prepared for their winter display by being placed in a cold pit during the latter part of the summer, care being taken not to leave them there too long. T. O.

THE SEASON.

[MR. GLAISHER favours us with the following remarkable particulars as to the temperature of the past quarter at Greenwich. ED.]

The mean temperature of January was 43°.9, heing 7°.4 and 5°.3 above the averages of 113 years and forty-three years respectively. Back to 1771 there have been but only two instances of a mean temperature for January being as warm as 43°.9, and in 1796, 45°.3; and 1834, 44°.4.

The mean temperature of February was 41°.9, being

3°.2 and 2°.4 above the averages of 113 years and forty-three years respectively. Back to 1771 there have been twenty-four previous instances of a mean temperature being as high as 41°.9, viz.—

BOUGAINVILLEAS.

THESE handsome plants in some places are found to be rather shy in blooming, so that it may be of use to describe a method of treating them which involves the least possible amount of trouble and cultural skill, and yet never fails to bring an abundance of bloom. The usually adopted warm-house method of growing the plant will afford a great quantity of vigorous growth, but too often few flowers. This unsatisfactory result arises from giving the plants an exciting temperature at all times, combined generally with a great deal of shade, two conditions that are fatal to good flowering. Shading is very greatly in use now, since the stove is in many instances almost filled with shade-loving foliage plants to the exclusion of a great many flowering species; in fact, the two are incompatible in one and the same house. The Bougainvilleas will flower in the stove, but they demand exceptional treatment; they must have plenty of sunshine to mature the wood, and they require a thorough and a long rest in a lower temperature, two conditions only attainable when the plants are growing in a pot or other receptacle, but not when planted in the hothouse border. If they bloom in such a place when planted out, this result is only gained after the lapse of several seasons, and when the roots have quite filled the allotted space, and become, as it were, root-bound, and then only when the other essentials have been attended to. But strong plants put into a not over-rich border on the sunniest part of a greenhouse wall, will flower beautifully in a season or so after planting out, the flowering season extending from July to the end of October. The other noteworthy points of treatment being cool rest without any water, from November to March, if the border is deep and capacious; early winter pruning and spurring back; and at this season the shoots should be securely fixed with ties or shreds, as they will be called on to carry a considerable weight of flower and leaf in the ensuing summer. In the growing period the border will require copious watering from time to time, as appears requisite, and the top must have all the sun and light it is possible to Ventilation should be given freely, but it is found better, where practicable, not to allow the air to come in direct contact with the plant : therefore it is a good plan to put it at the end of a structure, where some of the ventilators or lights can be allowed to remain closed. With these leading directions of management, there should be no difficulty in bringing them to flower on pot-grown plants in a cool house, the lengthening and retarding of the blooming season being quite a matter of early or late starting. Planted out with an almost unlimited root-run, there is no plant less fastidious, for after exhausting the soil in which it was originally planted the roots will, if not prevented, wander among the rubbish with which the interior floor of a greenhouse is made, with no great benefit to its blooming, as it will then be liable to rot from overmuch water and the cold ungenial soil, or it will not be possible to bring about the proper state of rest, so that restricted borders will be found to be the best.

ARTOTROGUS.

In the pages of the Gardeners' Chronicle at different times for nearly forty years a complete record has been published of the gradual advance of knowledge in reference to the Potato disease. It is, therefore, known to most of the readers of this paper that Dr. Rayer, in the first years of the Potato disease in France, discovered bodies in spent Potatos not to be distinguished from the resting-spores of Peronospora. Dr. Montagne termed this fungus Artotrogus hydnosporus. He doubtlessly guessed at its true nature, as is indicated by the name he gave it. Artos is Greek for bread, and tregos stands for eating or consuming. Dr. Montagne had in view the fact that this Artotrogus (like the Peronospora) consumed the Potato; hydnosforus simply means spiny-spored. The Rev. M. J. Berkeley, in 1846, with lar-reaching knowledge, referred these bodies, called Artotrogus, to one state of the Potato fungus itself.

When, in 1875, I lighted on the ogonia, oospores or resting-spores of Peronospora infestans attached to the mycelium of that fungus, I was surprised and pleased to find that my ogonia exactly agreed in size with the Artotrogus, that the mycelium was septate (consisting of jointed threads), and that the

male organs or antheridia were often borne on threads, which were distinct from the threads that carried the female organs, oogonia, or resting-spores,

Professor A. de Bary, of Strasbourg, when he criticised these facts in the Fournal of the Reyal Agricultural Society, vol. xii., for 1876, said, in reference to Artogrogus, at p. 257, "There is not sufficient evidence to prove that they are sexual organs or oogonia. There is no reason whatever to consider them as belonging to the Potato fungus, unless we base it on the fact that I (!) found them close to that fungus in course of experiments in search of oospores." On p. 256 he says, "They were always restricted to those regions which were occupied by the Phytophthora (Peronospora) mycelium." At p. 260 Professor De Bary objects to my illustration of the antheridium arising from a thread distinct from the congonium; he says, such cases are "at least a great rarity, if, indeed, they ever occur." On p. 262 he objects to the septent mycelium, and more than once amusingly refers to my oogonia as "bladders."

This was Professor De Bary's "treatment of the oospore question" in 1876 (see *Gardeners' Chronicle*, December 15, 1883, p. 752).

Now let us turn to a more recent "treatment of the osspore question," also from the pen of Professor De Bary, and found in the Beitrage sur Morphologie und Physiologie der Pilze, Von A. De Bary und M. Woronin.

In plate 1 the Professor's latest views are given. I have reproduced in Fig. 105 one of his latest illustrations of Artotrogus hydnosporus, Mont. The engraving shows the Artotrogus in actual contact with an antheridium, A; the autheridium has thrust a thick fecundating tube, B, right through the outer wall of the Artotrogus. This illustration is a confirmation of the Correctness of Mr. Berkeley's original views and of my own, and entirely overturns the whole of De Bary's own criticism of Artotrogus as published in the Journal of the Royal Agricultural Society. It must

FIG. 105.—ARTOTROGUS AS A TRUE OOSPORE, AFTER
DE BARY.

be noticed also that the supporting thread of the oogonium at C is perfectly distinct and free from the supporting thread of the antheridium at D, precisely as I described it in the Gardeners' Chronicle, although Professor De Bary in his criticism doubted (in 1876) whether, in Nature, such a state of things could ever exist. In fig. 22 of De Bary's illustrations the mycelium is shown unusually septate, again confirming my original observations.

In the new description it is stated that the Artotrogus was taken from Lepidium, a cruciferous plant, and it is not likely that the fungus of the Potato disease would grow on Lepidium; although if it did, it would not be so wonderful as the case reported upon by Mr. George Murray of the Cabbage Peroosopora growing on Melons, see Gardeners' Chronicle, June 16, 1883, p. 768. The fact is the Artotrogus, now correctly illustrated by Professor De Bary, is probably not A. hydnosporus at all, but the second species of Artotrogus also illustrated by Professor De Bary, is probably not A. hydnosporus at all, but the second species of Artotrogus also illustrated by Professor De Bary, is probably and found by Mr. C. Edmund Broome in 1849. It is peculiar to cruciferous plants, is illustrated in Gardeners' Chronicle for November 17, 1883, p. 625, and is the resting-spore of Peronospora parasitica. Every intermediate stage occurs between the perfectly smooth and the echinulate forms, as described under A. hydnosporus by Montagne. It is, perhaps, curious that Professor De Bary has found these bodies in the cotyledons of Lepidium, still Peronospora often grows inside plants without fruiting outside. Practical men sometimes detect incipient Peronospora in Potato plants by the putrid odour some days before the fungus shows itself outside the foliage. W. G. Smith.

VENTILATION BY SUN-HEAT, — M. Dumesnil has introduced a plan of ventilating unbeated frames by inserting ventilators along the front, which can be opened or closed at will. In one corner at the back a pipe is fixed like a chimney. The lights are kept fixed. The heated air escapes by the chimney, fresh air being admitted by the ventilators in front. It is alleged that shading and opening and closing the frames, except for watering purposes, may thus be dispensed with.

PLANT APPROPRIATORS.

A WELL-TIMED protest against the alas! very rapid clearing of our woods and hedgerows of Ferns, Primroses, and other favourite wild plants, has just been made in the columns of a daily paper, and none too soon. At the present rate of clearance some localities will soon be utterly despoiled of all wild plants worthy of regard, and we shall have left to beautify Nature just her weeds, and nothing more. The protest against the wholesale destruction of Ferns is peculiarly needful, because these are not the creatures of a year or two, and once removed it is long ere their places are occupied by others—if, indeed, new ones ever have the chance to get established. The trade may be to some extent responsible for this wholesale destruction, just as it is for the now almost complete disappearance from many districts of the Dog Rose; but the chief offenders, no doubt, are those peripatetic plantcollectors and hawkers who, with hamper slung over the back, trudge many weary miles in search of marketable plants, and get them up somehow with little enough of soil or roots, selling them to credulous residents in our town suburbs, who find to their cost that within a year their purchases have died. How to check this wholesale plundering of woodlands is a problem that can only be solved by landowners or local authorities. Stealing plants from a hedgerow or wood, whether enclosed or not, should be made a felonious act, and were a few convictions to follow, no doubt the horde of plant-plunderers who now infest the kingdom would soon disappear. be a grave misfortune were the institution of Primrose leagues, or other forms of floral worship, to result in the speedy extinction of the flower to be beatified; and whilst it is to be hoped that Primrose worship may soon fall into desuetude, it is equally to be desired that no other of our beautiful wild flowers may fall a victim to any political or national craze. Wild flowers may well exclaim, "Save us from our friends ! "

COLONIAL NOTES.

THE following letter has been banded us for publication by Mr. Burbidge, who may feel reasonable pride in this instance of the influence for good effected by his work on the Improvement of cultivated plants:—

BRISBANE, QUEENSLAND .- My most successful efforts in hybridisation have been in the production of two Grapes between European forms and the American Isabella. One is by a Sweetwater male parent; is a white Grape, with flavour something like what is called here Cape Gooseberry (Physalis peruviana). A second is by Black Hamburgh; ripens early, and promises great vigour. In this latitude (27°.5) we find, on the seaboard, that European Vines have little constitutional vigour; in vineyards a patch of European Grapes looks pale and dying compared to Isahella and other American Labrasca Grapes; Iona is the next favourite. Scuppernong we are supposed to have, but it has small foliage, and produces very rarely a small, leathery, austere, useless fruit. It is curious that the Southern Fox-grape should be unsuitable, when the Northern succeeds so well; but our latitude is not that of the Southern States, but corresponds to the centre of Florida and Mexico.

A few European Grapes come into the market; Pinsan Blanch is one, and Early Sweetwater. These early Grapes do best of all European forms, as they have not to tolerate the heat of the summer sun. Inland, at 2000 feet elevation, particularly in the drier western country, where the soil is volcanic, good Grapes are grown. I am continuing hybridising experiments in the coming season, and hope to discover Grapes that may be suitable to the latitude. We have a law that forbids the importation of Vine cuttings, from fear ol introducing Phylloxera, so I content myself with getting seeds only; some from Iodia, Dowlootahad and Cabul Grapes, are spoken highly of. Dr. Dymock, of Bombay, sent me seeds that are thriving well.

With reference to Wheat, Indian grain sown at the same time and place fruit with us one month earlier than European Wheat, and so escapes rust; yet European Wheat is successful in Adelaide (lat, 35°.5).

I am laid-up just now with a wound in the foot from a ray, and cannot get about; so, brought to reflection, I write to thank you for the many interesting sugges-

FIG. 106.-HIMALAYAN PRIMROSES (SEE P. 541.)

tions in your valuable book. With us (in lat. 27°,5) few European plants are successful, and when they are can only be grown in winter, when we enjoy Turnips, Cabbages, and the like. Peaches that fruit are Chinese; Apples are from American sources; two new Plums, Newman and Wildgoose, just introduced, came from a gardener in the Southern States of America. The only Pear that fruits is a large Chinese Pear. This succeeds to admiration, but the

fruit is only fit for baking. Hybrids of it ought to be

Irut is only fit for baking. Hybrids of it ought to be tried. I am told that some have just been introduced by a great gardener here, Mr. Cribb.

We have a powerful growing Clematis, but it has no petals, so far as I recollect, but produces loog feathery fruits. One might perhaps get a cross with the showy flowers grown in Europe.

Brazil, and other parts of South America, should yield us some good fruits. I do not doubt in years to

come fine fruits will be grown here, especially by irrigation, as in some years we have no rain for months together, as in the present season. We are moutus together, as in the present season. We are now very busy making dams, erecting windmills to pump water, and sinking wells by boring machinery. At other times for years together there may be plenty of rain, and no scarcity of water, so variable is the climate. Yoseph Bancroft, M.D., Vice-President of Royal Society, &c., of Queensland.

The Kosery.

ROSE CULTURE IN POTS .- The successful culture of Roses out-of-doors is dependent to a considerable extent upon the weather. The numerous ills that Rose life is heir to, cannot be so successfully overcome out-of-doors as they can under glass; they are likewise greatly aggravated by frost and cutting winds in the spring months. An earnest cultivator of the Rose is not to be deterred by the difficulties peculiar to our insular climate. The bud-worm must be attacked in its early stages, a keen eyesight with a sharp-pointed needle are the hest appliances. Greenfly may be washed off or removed with an aphis-brush, while dry flowers of sulphur, or a solution of sulphur and soft-soap applied with a syringe, will destroy mildew. With all the difficulties to be contended against, Rose culture out-of-doors is associated with such happy memories, that it cannot be other than a pleasure. Everybody has heard or read of the magnificent pot Roses grown by the great trade cultivators, and their method of producing them has not been kept a secret. Indeed, it has been proclaimed from the housetops in years gone by, and yet amateurs and others seldom grow Roses well in pots. If prizes are offered for them either in London or in the country either no exhibitors appear to claim the prizes, or should any competitors come forward, their productions are seldom better than second or third-rate. There is this to be said for the would-be exhibitor of Roses, that it is very difficult to get a group of plants all in flower, in good condition at one time, unless three or four times more plants are grown than is required.

The growing of Rose trees for exhibition is not nearly so important as their culture for the decoration of the greenhouse or conservatory, and to supply choice cut flowers when they cannot be obtained outof-doors. For this purpose large bushes are not required. A big Rose tree that four men could manual A big Rose tree that four men could move required. with difficulty, would be as useless in most gardens as the proverbial white elephant. Indeed they have scarcely a place in any garden, public or private. In a large exhibition tent they have their place of honour; they have been grown, trained, and watched over with anxious solicitude for this, and when people have admired them, and wondered how they were brought there; their work for that season is finished; they have shown what skill and science can accomplish; and what the Rose is capable of being grown to by years of patient and trying labour. A big exhibition pot Rose may have been in training for a quarter of a century. Few people would covet such plants, and if they did it is not likely that they would obtain The kind of Roses that every owner of a greenhouse might have are those that can be grown and flowered in pots from 8 to 11 inches in diameter, inside measure; as a rule, the plants are budded or grafted on the Brier or Manetti stock, but they are often also on their own roots; and I must confess that after a quarter of a century's experience in the culture of Roses in pots, I like them best on their own roots Some Roses do not strike so freely from cuttings as others, but the largest proportion of them can be propagated in this way with but little ftrouble. The mistake is ofttimes made by neglecting to put in the cuttings at the right time. I fancy the best time to do so is early in the autumn. The cuttings should be taken off with a heel attached, and they must not be too long; about 3 or 4 inches of stem may be inserted in the ground, and two or three eyes above ground. If a greater length of stem is left to dry up above the surface, the cutting may die off altogether.

One of the best lots of Tea Roses we ever had I propagated from cuttings early in August; it is probably more than fifteen years ago, but the results were so excellent that they are not likely ever to be forgotten. About six or eight cuttings were put in 5 and 6 inch pots in fine sandy soil. Some close handlights were placed in a shady part of the orchard-house and filled with the cutting pots. Such glasses get very moist inside by the evaporation of moisture, and it is necessary to wipe them once in twenty-four hours. As the glasses are kept close, the cuttings do not require water very ofteo, probably not more than once or twice in a week. As the weather is very warm in August the cuttings soon form roots, and in less than a month they may be potted off singly in 4 or

5-inch pots. It is only right to say that if they are propagated early they require more care than they do if put in a month later. The right kind of cuttiogs should also be taken off; what may be termed halfripened wood, taken off with a heel attached, will form roots most readily. If the cuttings seem rather stuhborn a gentle bottom-heat will aid greatly in the formation of roots. Some of the early propagated plants I have alluded to produced a nice lot of blooms the following spring. Some people may find a great deal of pleasure in propagating their own Roses, and it is quite as well to say how it ought to be done, but good plants can he purchased at a cheap rate from the nursery one year from the bud, and those who would like to have good plants at once can purchase them ready for forcing in 8-inch pots at prices from 21s. to 36s. per dozen.

Really good Roses cannot be produced in the spring unless the plants are well prepared in the previous summer and autumn months. The manner of this preparation need not take very long to tell. The potting of the plants is the foundation of all other details of the work. Good substantial loam, or rather the turfy parts taken from clayey loam, suffi-ciently decayed to kill the grass and weeds, mixed with some crushed hones and a fourth part of decayed stable manure. For Tea Roses a third part of turfy peat should be added. The pots must be clean and well drained. The time of potting is not very material, but for early blooming in the spring the work should be done early enough in the previous autumn to allow of the plants being well established before the winter. I have usually potted ours in August, and find it answers very well to do the work in that month. Hybrid perpetuals may be placed in a sheltered yet open and sunny position out-of-doors. Tea Roses ought always to be kept under glass; I cannot say our own are so favoured, but if a choice can be made, I would prefer to grow them under glass all the year round.

It will be found that mildew, as well as greenfly, is a constant source of annovance while the wood is ripening. These pests to the Rose grower are very much more difficult to deal with on the outside Roses, and they often greatly impair the vigour of the plants. The importance of destroying them on their first appearance cannot be too strongly urged. The Orange fungus which appears on the leaves in patches of bright orange, if it were more common would also he a trouble to the grower, but I have seen it once only in our garden, where it had spread freely over a number of pot Roses before my attention was called to it, but it was easily exterminated by picking off every affected leaf and burning them. The plants were then thoroughly washed with the soft soap and flowers of sulphur preparation; this doubtless destroyed every incipient particle of the parasite that might be lingering on the leaves, for I fancy if softsoap and sulphur will not destroy fungoid growths patent preparations will. dreaded Hollyhock fungus will succumb to persistent use of sulphur and soft-soap.

By careful potting, as advised, cleanliness and care in watering, laying the pots on their sides to avoid injury from continuous cold autumn rains, the Rose bushes will be in good condition for forcing. Quite half the work is accomplished when the Roses have successfully arrived at this stage. If forcing is begun on the first day of the year the Roses should be pruned in November, at a time when the roots are comparatively dry, not dusty dry; in that state they should never be. They need not receive any water for several weeks after being pruned, and the wounds will dry up without bleeding; but the best growers dress the cut portion with styptic. There is no need for a special house to force them in; few people can afford that. They can be placed in an early vinery, the gentle heat of about 45° to begin forcing with just suits the Roses, and as the temperature is advanced, first to 50°, then by degrees to 55° by progressive stages, it will answer for the Roses equally well with the Vines. I like to go into the house early in the morning, and find the tiny dewdrops regularly arranged on the serratures of the leaves. One difficulty has to be faced when the vinery is used as a The plants are not in flower before forcing-house. they are shaded by the leaves of the Vines. This can be managed sometimes by placing them in the second house. They ought to be placed as close as possible to the glass lights during all the time of their growth. Light and fresh air are most essential to their well being. J. Douglas Great, Gearies.

STANDARD ROSES IN POTS .- The group of these shown by Messrs. Paul & Son, of the Old Nurseries, Cheshunt, at the meeting of the Royal Horticultural Society on the 22d inst, is deserving of notice for two main reasons: one, because of their fine cultivation and the admirable way in which they were flowered; the other, because of the mode in which the heads were trained. Some of the Tea-scented varieties had ample foliage and fine flowers, such as Madame Falcot, Madame Lambard, Marie Van Houtte, and Souvenir d'un Ami; and the following Hybrid Perpetuals hearing fine blossoms :- The Shah, Catherine Souport, La France, Maréchal Vailliant, Hippolyte Jamain, Paul Verdier, and Charles Lesehvre. in so far as the training of the heads is concerned there was the entire absence of the prominent stakes that sometimes disfigure these plants when grown in pots. Three slight sticks sufficed to train the heads to, and these were hidden from view by the leaves and flowers. One of these stakes was an upright one, tied to the main stem just below the head, and reaching to the top of it. Then two other stakes formed a horizontal cross just below the main shoots, and these were tied out to these stakes, but so arranged as to form a circle. This enabled perfectly symmetrical heads to be formed, displaying the flowers to the best These standard Roses must be set down as one of the cultural successes of the year.

Prehid Notes and Cleanings.

PELORIA IN ORCHIDS,-Some years ago in writing on the subject of Peloria, or that tendency which irregular flowers have to become regular, we pointed out that there were two ways in which this happened : one in which regularity was produced by the absence of irregularity-in which, in other words, all the parts were regular-and that in which regularity was induced by increased irregularity, as in those cases where all the parts of the flower become irregular, and thus a regular whole is produced of irregular units. The first case is botanically one of "reversion"—the flower retains the condition it had originally. This condition may, therefore, be looked on as an arrest of development, and it shows not only the original state of that individual flower, and all others of the same generation, but it also furnishes a clue to the probable condition of the ancestor from which they sprung. The second condition, so far from being an arrest, is a case of exalted development —a new departure—and it is one which, if it prove advantageous to the plant, will, on Darwinian principles, survive. Major Lendy has lately furnished us with two excellent illustrations of these opposite tendencies in two flowers of Phalænopsis Stuartiana; in the one there was a tendency for the lateral petals to assume the guise of lips; in the other the tendency was to regularise the flower by the suppression of the lip. In some cases we have seen all six of the flower segments flat and regular, and in others-Cattleya, Lælia, &c .- we have seen three distinct lips instead of one.

PHAIUS MACULATUS. - The stately erect stems and hold conspicuous flowers of the members of the genus Phaius gain their admittance to gardens generally, but the above-mentioned species possesses attractions of a superior nature. The ample foliage is handsomely spotted with creamy-yellow, irregular sized blotches, character altogether unusual in this order of plants. A specimen flowering in the Odontoglossum-house at Kew, in a comparatively small pot, has three flowerspikes, each hearing from eight to ten flowers. The well defined clear yellow sepals and petals, with the orange-brown, much crisped limb of the labellum, are features that should recommend the species to every Orchid grower whose collection even is limited. The plant, moreover, has long been introduced to this country, and was figured in the Botanical Magazine, It has been figured and described under other names, as Bletia Woodfordii and B. flava.

"CASUALTIES AND DISEASES OF VEGETABLE LIFE" is the title of a pamphlet by Mr. Bruce Findlay, Curator of the Royal Dotanical Cardens, Manchester. It will be published by Mr. John Heywood, at the modest price of td.

FRUITS UNDER GLASS.

VINES .- The scathing north-east winds which have lately prevailed at a time when the occupants of numof fruit structures are in a delicate stage of advancement, has taxed the energy of those in charge to prevent any injurious consequences. Increased artificial heat has had to he employed, while it has been impossible to ventilate without in some degree promoting a cold draught, and as both of these conditions are conducive to red-spider, a watchful eye should be kept on the foliage of Vines for this pest, and sponging be resorted to on its appearance to prevent its establishing itself. Muscats, when their blossoming period is over, should have a night temperature ranging from 65° to 70°, while that for the day may gradually reach 85° or more from sun-heat, early closing with a brisk, moist atmosphere, so that the thermometer runs up to 90°, should be adopted, and dispense with as much fire-heat, consistent with safety, as possible. Keep the sublaterals well pinched in after the trellis is covered with foliage. Defer thinning the berries until the perfect ones can be distinguished from those that are stoneless, and see that the Vines are well nourished, and their roots kept near the surface of the borders by substantially mulching them with short manure, and liberally supplying them with tepid liquid. When Alicantes and other late varieties requiring similar treatment come into blossom a temperature of 65° at night should be afforded them. This, with a day warmth agreeing with it, and other conditions favourable, will cause the bunches to lengthen, and insure their proper fertilisation. Alnwick Seedling has been pretty generally planted as a late but it is a question if it does not become popular as a companion to the Hamburgh for early and mid-season use. Diverse opinions have been expressed respecting its setting qualities, and this has arisen from the fact that while with some it has produced glutinous exudations on the stamen, with others it has not, the difference doubtless being caused through degrees of strength in the Vines. When the matter is present fertilisation cannot take place until its removal is effected, which is best achieved by the syringe, and if this operation is followed at mid-day when the Vines are dry by a camel-hair brush charged with alien pollen being passed over the bunches there will be no complaint as to bad setting. Late Hamburghs should be brought forward slowly with sufficient fireheat to keep them healthy, and when they come into blossom he treated as has been advised for the earlier

PEACHES AND NECTARINES .- Where ripe fruits are required particularly early, both night and day temperature in the first house should be raised a few degrees as soon as the stoning process is completed; this will be especially essential where such kinds as Royal George Peach, and Elruge Nectarine have not been displaced by Lord Napier Nectarine, Hale's Early Peach, or similar first early varieties. The fruit should also be entirely exposed to the sun so that perfect colour may be obtained, and this is best insured by the common custom of carefully raising each above the trellis upon a thin piece of lath. Much may be done by closing early and husbanding sun heat, and if this is attended with an abundance of atmospheric moisture, and frequent copious drenchings of weak tepid liquid manure at the roots if the drainage is perfect, the second swelling of the fruit will be greatly expedited, and the strength of the trees be preserved. The shoots as they lengthen will require to be ticd-in occasionally, and should be stopped as they reach their range, while strong ones already stopped should have their laterals removed, or laid-in if required to fill thin spaces. A night temperature varying with the weather, but not exceeding 60°, should be imparted to houses in which the fruits are stoning, and their other claims must not be disregarded; insect pests should by no means be allowed to gain a footing, as they are not only detrimental to the crop of the current year, but to the following one also through distorting and weakening the growths which should produce it. The trees in the latest house on account of a minimum of artificial fertilising being brought tn bear upon them invariably set their fruits very liberally, and the thinning should therefore be freely and executed early, before the trees age subjected to needless strain; at all times those most promising and best placed should be reserved, and the weight of the crop be regulated in proportion with the strength of the trees. Where fruits are in request late in the season and there is no outdoor supply, free ventilation should be allowed through the night, except during spells of inclement weather, when it may be necessary to use a little fire-beat. The employment of atmospheric moisture must be directed by the state of the weather, and the syringe should be used with discretion early in the afternoon, so that the trees do not remain well for any length of time.

MELONS .- If satisfactory progress has been perfected, the most forward crop will now be nearing maturity, and the fruits should have (if they have not already had) some kind of support; our practice is to secure the laterals, when the fruits are young, to the trellis with ties of raffia, cautiously avoiding the hazard of their beeling as the weight increases, by placing the ties near together and looping one around the loot-stalk of the fruit, and extra support is given as they approach ripeness by two thick strips of raffia being securely placed under them at right angles to each other, so as to receive the entire weight. The partial severing of the fruit from its stem is a true indication that it is ready for gathering, and a dry state should be maintained both at the roots and in the atmosphere, accompanied with a continual free circulation of air and a lowering of the temperature for some days previous to that stage being arrived at. The splitting of the fruit, a defect to which some varieties (notably Scarlet Gem and Hero of Bath) have a tendency, should be evaded by close attention being paid to the above directions in their management, for the evil inevitably follows a reverse practice, particularly that of closing the structure with a high temperature and a moisture-laden atmosphere. best remedy for canker - the most prevalent and dreaded disease to which Melons are liable, and which generally originates from a sappy growth produced either in a moist, close atmosphere, or an exces-sively nutritious soil—is to cover the affected part as soon as it appears, which it usually does near the base of the stem, with a cone of quicklime, or charcoal powder, which should be preserved perfectly dry, while the best preventative is to maintain a brisk temperature with a circulation of warm air, to expose the stems fully to the sun by drawing the foliage from them, and keeping the soil dry immediately around them, Thomas Coomber, Hendre Gardens, Monmonth.

Plants and thein Jultune.

STOVE FINE-FOLIAGED PLANTS .- These should now be making satisfactory progress aided by the in-creased temperature and brighter weather, likewise by the encouragement given to fresh root action in the case of all those plants that have been recently re-Look well after their condition now that young foliage is being developed, do not allow them to become excessively crowded or the growths will not be satisfactory; instead of being sturdy and compact, they will become elongated and drawn up out of character. Under these conditions the leaves will more readily become a prey to insect pests, the ample shelter and refuge for them being calculated to bring about this undesirable result. Plants that are grown expressly for the beauty of their foliage should always be kept as clean and bright in appearance as possible. Frequent sponging of the foliage of Dracænas and of small plants of Crotons will be a great belp in keeping in check both thrips and scale. Dracænas, too, are oftentimes attacked by either the green or black aphis in the heart of the plant; these should be dislodged at once; a soft camel's-hair brush being about the best thing to use, dipping it occasionally in an insecticide. Slugs (chiefly small ones) are also very destructive to the young leaves; laying a bait of some tempting green food and hunting by night, is the best way to reduce them. A little later on the Alocasias will be liable to attacks of the red spider, so also are the finefoliaged Anthuriums; a soft piece of sponge and a weak solution will be the best means to employ for their removal. In the case of large specimen Crotons that are harbouring a colony of insect pests, we advise the trough to be brought out and the plants laid over it. For the benefit of those who may not have read our remarks and advice respecting this trough we will again describe it. Ours is made of stout zinc, and measures about 6 feet by 4 feet, and 4 inches deep, with an iron strengthening around the upper edges. A hole at one corner of the bottom and a cork to plug the same provides a means of running off the insecticide into a galvanised pail (no vessel with a coating of paint ought at any time to be used) to be used over and over again. In this manner the undue waste of the composition is prevented; this alone will very soon repay the cost of the trough. Not being troubled with any mealy-bug here we hardly ever use ours now, except in cases of scale on plants that are not easily sponged. An occasional fumigation will keep in check any stray thrips or aphis that have escaped detection. A free use of the syringe, too, should be made, chiefly among such plants as will bear it with impunity. The older of the leaves of the Alocasias, Marantas, and Pandanads should be removed to make room for the perfect development of the younger foliage. Any of the first-named that have not been repotted should have the surface material taken off and a top-dressing then given them of fibrous peat and sand, with an admixture of sphagnum moss, in which their young roots will delight to roam. Except in the case of Maranta Warscewiczii all of that genus should have the flowerspikes removed as soon as they are large enough to handle. That one exception has a beautiful and novel appearance when in flower, the spike of which, when faded, leaves behind the future groundwork of a young stock if desired. Specimen Crotons that are in want of attention for training should have that operation performed before any considerable amount of young growth is made. The extreme of formality should be avoided by all possible means. Tar string should also be used as a tying medium; raffia or other similar material should not be employed, as it so soon becomes rotten when exposed to heat and moisture. Any of the Cycads that have been wintered in a cooler house than the stove would be quickly induced to push up a fresh crop of leaves, provided no growth was made late in last season, by being introduced into the moist, growing temperature of the stove. When these young leaves are being formed, and onwards till they reach maturity, the greatest care must be exercised not to damage them in any way; neither should the growths of any other plants be allowed to interfere with them as they are pushing up. When the leaves are become fairly hardened the plants should be removed to a temperate house again, but where they will receive shade during bright sunshine for some months to come.

some months to come.

In the arrangement of the stove plants some little modification might with advantage be made in a few weeks in order to accommodate the shade-loving plants, where they will more easily receive that necessary attention, and vice veria for those plants that succeed best in a greater amount of sunshine. If the stove plants are becoming too much crowded, some other house could perhaps be made to accommodate a few of the hardier kinds, provided the temperature be not much lower. With the cold easterly winds that we have been experiencing of late, we have not attempted to raise either the day or night temperatures the sunshine and interest the superature sheyond the directions last given when treating on the same subject, neither is it advisable to do so till a change in the weather intervenes. It is a waste of fring to keep up high temperatures during very cold and windy weather. With the extra firing that is required, even to maintain an average heat, it is necessary to damp down more frequently than usual, in order to keep a growing condition in the atmosphere.

GREENHOUSE FINE-FOLIAGED PLANTS.—Any of the succulent section of these that are in want of a shift might now be seen to with advantage. Such as the Agaves should have a thorough soaking in a tub of water if on the dry side before they are repotted. There plants do not always got the attention they properly deserve, both in this and other wants also. They are rather awkward customers to manage for giving a shift, as the pots or tubs in which they have been for some years will not easily come away from the balls of the plants. In such cases it is far better to sacrifice as the pot or tub than to injure the plant. Any suckers around the base should be removed with care. In mixing up the soil good sound tury leam should be the staple compost, a little peat might be added; but we would rather prefer a few knots of charcoal and crushed hones with sittle peat might the greater part of the greenhouse foliage plants will thrive in nearly the same mixture. Many of these plants are subject to white scale, which, when the potting is being seen to, should have the proper attention given to reduce the same. James Hudson, The Gardens, Gunnersbury House, Acton, W., April 22.

APPOINTMENTS FOR THE ENSUING WEEK,

TUESDAY, April 29 Floral Meeting in Town Hall, Manchester, Special Sate of Flowering Orchids, at Protection of the Prote

bacia of Cretaceous Age; "Professor P.
M. Duncan.
Sale of Imported Orchids, at Protheroe &
Morris' Rooms. FRIDAY.

THE ARRANGEMENT OF WALKS AND PLANTATIONS NEAR THE HOUSE is a subject about which a great variety of opinion may and does exist; still, in the carrying out of any of the different methods, and these necessarily must change with the circumstances of each particular house, the broad conditions laid down by the great landscape gardeners are usually adhered to. Where deviations from their ideas have been made, they have too often been carried out in a nervous, half-hearted way, as if in dread of being considered too unorthodox and innovating. So we see but few arrangements in English gardens made in the style seen in some very charming Continental establishments. In such places as do not pretend to be in the so-called English style, the arrangement of the indispensable groups of trees and shrubs and walks is totally different to what we are used to observe at home. There is less turf margin and but little foreground to groups, or, more likely, none whatever, the edging consisting perhaps of succulent plants or low-growing flowering plants, sunk in pots in the soil or gravel, sometimes of ornamental leaf-like tiles or some other artificial edging. The shrubs approach the walks closely, so that there are more surprises, especially more of them in a small garden than would be possible with our system of planting, every few paces opening up new prospects, not extensive perhaps, but still pleasing, because unexpected. In sunny weather, when shade is always grateful, it is pleasant to place a seat on the shady side of such groups, and close up to them; there there is no draught, such as is always found under trees.

A pleasant feature that is worthy of consideration even here, where shrubs, and especially evergreen ones, are so abundant, is to have small groups made with the hardier Palms, Dracænas, Aralias, Oranges, and Yuccas placed together so as to form tolerably close masses. To save watering, and also to preserve the plants from too sudden variations of moisture and drought, the pots or tubs are sunk in beds of coarse sand or gravel to half or the whole depth of the pot, &c. These arrangements admit of being varied in form and position, and can be made very effective, especially when flowering plants such as Lilies, Tube-roses, Gladioli, Canterbury Bells, Sweet Williams, and a host of tender and hardy annuals and bedding plants, grown in pots or boxes, are placed during the summer near the margins.

Another feature in some foreign gardens is the shade screen, not necessarily provided with a roof, but merely a something behind which a seat may be placed out of the sun, and through which the warmth penetrates, but not the direct rays. These are not usually set on turf, and here would be always better on the gravel for the sake of greater dryness. These are planted with Aristolochia sipho, Ampelopsis hederacea, Clematis, Periploca græca, Ivies, the Vine, climbing Roses, or with summer Creepers, which may be cleared away, trellis and all together, in winter.

For this latter purpose ornamental Gourds, Nasturtiums, Bryony, Sweet Peas, Calystegia pubescens, and single Convolvuluses, are employed. Sometimes Thuias or Junipers are planted in the segment of a circle for the same purpose, and if a wavy upper line is made with their tops the effect is not too stiff.

Our climate is favourable for the production of good turf, which even in the hottest weather, with due attention, seldom burns so as to become an eyesore; therefore, turfy margins and green lawn slopes, and broad masses of grass in front of groups of bushes and trees, will always be found in our gardens.

It is far different in many continental countries, in which it is easier to grow anything in a pot or a tub than it is to preserve presentable turf during the summer time, so the less there is of the grass the better,—at least, just under the windows of a house. This will partly explain the reason for the difference of treatment, and will supply us also with motives for occasional deviation from the commoner practices in laying out the garden in proximity to the dwelling, as it may be that we have for a dripping climate too much turf and too few dry paths on which to walk.

- ROYAL HORTICULTURAL SOCIETY: THE LATE DUKE OF ALBANY .-- At a general meeting of the Society held on Tuesday last, the 22d inst., the following letter of condolence to Her Majesty the QUEEN on the lamented death of His Royal Highness the Duke of ALBANY, and the reply thereto, were read :-

"Royal Horticultural Society, South Kensington, S.W., April 12, 1884.

"Lord ABERDARE presents his humble duty to your MAJESTV, and begs, on behalf of the Council of the Royal Horticultural Society, to express their deep griet and heartfelt sympathy with your MAJESTY and the royal family on the death of His Royal Highness the Duke of ALBANY: a Prince whose great gifts and noble qualities had stirred in them, as in the whole nation, a sense of respect and admiration which deepened as they watched the development of his character, and marked his determination to walk in the footsteps of his illustrious father, and to use his high rank and influence as instruments in improving the condition and ennobling the lives of his fellow countrymen."

" Windsor Castle, April 15, 1884.

"Dear Lord ABERDARE,—I am commanded by the QUEEN to ask you to thank the Council of the Royal Horticultural Society for their kind and touching address. The QUEEN is very sensible of the warm feeling shown by them for her in her sorrow, and is much gratified by the terms in which you have alluded to her son.

"Yours very truly, "HENRY F. PONSONBY,"

— A MONSTER CATTLEYA SKINNERII,—An immense mass of this beautiful Orchid, weighing about 12 cwt., and measuring 7 feet in diameter, and over 6 feet in height, has just been successfully imported by Messrs. F. SANDER & Co., of St. Albans. It is certainly by far the most wonderful mass of any Orchid ever imported, and it is probable that no other such specimen will ever be obtained again, seeing that no specimen ever remains in one mass for the requisite number of years in a wild state. The specimen was originally planted by a native many years ago in the crown of a tree belonging to the species Euphorbia, in his garden near the city of Cartago, Costa Rica. He carefully tended it, and it flourished under his care and soon became one of the sights to which our botanical travellers in that part of the world were irresistibly drawn. SKINNER, the original collector of the species, saw it and was amazed. ROEZL states that at one time he counted over 1500 fully expanded flowers on it at one time; and many other travellers have seen and tried to purchase it, but to all their offers the simple owner returned the same answer, and refused to part with it.
At last Messrs, F. SANDER & Co. made him a fancy bid, which proved too much for his desire to gratify his love for his pet monster by keeping it, and the result was that the tree was cut off above and below the plant; it was placed in an immense case, and with infinite labour and great cost conveyed to Puntas Arenas, and from thence by Royal mail steamer Medavay to Southampton. As soon as it was known that the huge specimen was well on its way, a suitable house was commenced for it at St. Albans, from the roof of which it will be suspended by a strong chain, and in all probability it will prove as great a source of gratification and attraction on this side of the water as it did on the other. We have seen the wonderful specimen at St. Albans, and it is in the most

perfect condition, in fact as neat looking and compact as the illustration shows it in its native home. Considering the great difficulty there is in importing even small specimens of this plant, Messrs. SANDER must feel happy in their success. Our illustration shows the plant "at home," with its late owner at the foot of it, axe in hand, about to fell the tree.

- HENFREY'S "ELEMENTARY COURSE OF BOTANY."-The fourth edition of this well known text book will be published early in May. The sections relating to the morphology and classification of flowering plants have been revised and largely extended by Dr. MAXWELL MASTERS, who has also made great additions to the physiological portions, while Mr. A. W. BENNETT has rewritten the sections relating to cryptogamia and histology generally. This new edition will he still further enriched by numerous additional illustrations. The plants used in medicine, agriculture, and the arts are specially alluded to, and reference made in the physiological portions to those points of particular interest in the cultivation of

- "THE HANDBOOK OF BRITISH FUNGI," by Dr. M. C. COOKE, is out of print, and we understand that no second edition will be published.

"FLORA OF BRITISH FUNGI (HYMENO-MYCETES)." — The Rev. JOHN STEVENSON, of Glamis, author of Mycologia Scotica, and Honorary Secretary of the Cryptogamic Society of Scotland, has a work in preparation bearing the above title, and which will be illustrated by Mr. WORTHINGTON G. SMITH, F.L.S. It will be published in two volumes, and will contain full descriptions of all British Hymenomycetes (chiefly Agaricini, Mushrooms and Toadstools), with habitats, seasons of growth, &c. Edible and poisonous species will be specially noticed and commented on, and all genera and sub-genera will be figured. The illustration of sub-genera will supply a much felt want, and will greatly facilitate the study of Agarics. The issue of the work will depend on a sufficient number of subscribers being received by an early date-in which case the first volume will be published without delay.

--- Mr. Joseph Ashby, of the firm of John STANDISH & Co., of Ascot, was, we much regret to hear, on Monday last seized with an attack of paralysis. Mr. ASHBY, who is much respected in the trade, has the sympathy of all who know him.

"LES ORCHIDÉES,"-By a slip of the pen the name of the lady publisher of a series of large folio coloured plates of Orchids was given at p. 514 as Madame G. VAUGET, instead of Madame E. Vouga.

- " HAMBURGER GARTEN UND BLUMEN ZEITUNG."-This old established periodical is now under the direction of Dr. E. GOEZE, the Inspector of the Botanic Garden at Griefswald, and who takes the post so long filled by Mr. E. Otto, who retires from ill health.

- MR. JOHN MATTHEWS, of the Royal Pottery, Weston-super-Mare, was last week unanimously elected chairman for the ensuing twelve months of the Weston Town Commissioners. Mr. MATTHEWS has long been known as a warm advocate for the incorporation of the town, and it is hoped that some effort will be made to raise Weston from a mere parish to the dignity of a borough during Mr. MATTHEWS' year of office.

- THE FROST AND THE FRUIT CROPS .- Mr. BARRON, writing from Chiswick on Wednesday, reports that 10° of frost there have sufficed to destroy all the fruit blossoms. We regret to hear that the same fate has befallen the blossoms in many other districts.

- REMARKABLE FROST ON THE CONTINENT. -Daily News correspondents report that a phenomenal wave of cold swept over part of Switzerland on Monday night without any premonitory warning, the thermometer falling many degrees below freezing point. The damage to agricultural interests is enormous, and at least one-third of the vintage has been destroyed. A disastrous frost on Tuesday morning has devastated the Vines in the Saone Valley, and the damage is estimated at many millions of francs.

Fig. 107.—MASS OF CATTLEYA SKINNERII, 7 FEET THROUGH AND 6 FEET HIGH, NOW AT ST. ALBANS. (SEE P. 548.)

--- TURNERACEÆ,-This order has now had a new genus added to it by Mr. R. A. ROLFE, of Kew (Linnean Society, April 3). The specimens on which it is founded are from the north-west of Madagascar, the peculiar characters, among others, being its glassy transparent calyx, which is totally destitute of chlorophyll or other colouring matter. Mr. ROLFE, referring to the latest authority, Dr. J. URBAN, mentioned that the order consists of five genera and eighty-three species distributed in America from North Carolina and Mexico to the Argentine Republic, and in Africa from Abyssinia to Mozambique and the Cape of Good Hope, while others are found in the island of Zanzibar and Rodriguez. The unique example now added to the order as a new genus and species, Hyalocalyx, was obtained by Dr. C. RUTEN-BERG on Nossi-bé, a small island on the north-west of Madagascar, and which Mr. ROLFE regards as holding a position midway between Mathurina and Turnera.

- THE NATURE OF LICHENS .- A paper was read at the Linnean Society, on April 3, by the Rev. J. M. CROMBIE, "On the Algo-lichen-fungal Hypothesis." The author gave a brief sketch of the Hypothesis as enunciated by SCHWENDENER, BORNET, and others, noticing the various arguments and illustrations which had been obtained from experiments in Lichen cultures, whether from the spore or by synthesis, observing that in both cases these were confessedly but small, owing to the very great difficulty of cultivating beyond a rudimentary stage except under the same atmospherical conditions in which they grow in Nature. Two fatal objections, he said, might be taken to the theory: - 1, The one having reference to the very peculiar nature of the parasitism it assumes; and the other, 2, the fact that, notwithstanding a similarity of appearance, there were in reality no true fungal-mycelia nor true algae colonies in Lichens. As to any direct genetic, or any indirect parasitical connection between the gonidia of Lichens and the hyphal filaments, it was further pointed out that none such existed, but that on tracing the evolution of the thallus from the germinating spore it is seen that the gonidia originate in the cellules of the first parenchymatous tissue formed upon the hypothallus, and that subsequently through the resorption of the lower portion of the cortical structure they became free, and constituted the thin gonidial stratum. Where seen lying amongst the medullary they are often attached to these, not as the result of any copulation, but by means of the lichenin which permeates the whole thallus. The origin of the gonidia and their relation to the rest of the Lichen thallus, the author stated in conclusion, thus belonged to the very elements of morphological botany.

- DARLINGTONIA CALIFORNICA. - This remark. able plant is now in bloom in the nurseries of Mr. W. BULL. Though allied closely to the Sarracenias, many of which are also in bloom, it presents some striking differences. In the first place the flowerstalk has two or three sheathing-bracts at wide distances apart, and which perhaps, represent the three smaller ones found close together beneath the flower in Sarracenia, the five sepals are oblong greenish-yellow and pendulous, the five oblong concave purplish-brown petals instead of being spreading or reflexed are valvate (i.e., touch by their margins) and thus form a broad tube surrounding the stamens and pistils, an arrangement quite unlike that of Sarracenia. Still more unlike is the style divided into five short stigmatic rays vastly different from the huge umbrella-shaped expansion of Sarracenia. No doubt, these arrangements are connected with variations in the process of fertilisation. Gardeners complain that the insects caught by the pitchers of these plants disfigure them, as undoubtedly they do, and some, more-over, find in this circumstance an argument against the alleged utilisation of the captured insect as food. We do not attach much importance to this latter objection, inasmuch as new pitchers are constantly thrown up to replace those which get damaged in the service, and the greater the damage in one way the greater the consequent vigour. It is a matter for astonishment that these plants are not more popular for the sake not only of their pitchers, but for their remarkable, very handsome, and fragrant flowers. We gave some years since a series of large illustrations of several of the finest in Mr. Bull's collection, to which we refer the reader. Most people we imagine fight shy of these plants from a mistaken notion that

they require a great deal of heat. With the exception of S. Drummondi, perhaps, this is not the case. The plants have to endure in their native bogs a degree of cold in winter to which no English plant is called on to submit. During the summer they should have abundance of water. They will catch the flies for themselves.

- PANDANUS ODORATISSIMUS. - The great Screw Pine in the Palm house at Kew is now showing flower for the first time. Two years ago, to prevent its breaking through the glass, or obviate the necessity of cutting it down, it was lowered from a large tub on the floor level to a brick enclosed bed, mostly below the floor level. The inflorescence, of which there are two cone-like masses, proves it to be the female plant, and reminds one of a Pineapple minus its familiar terminal tuft of leaves. The specific name of the plant was applied on account of the odour, said to be the richest and most powerful of all perfumes, given off when in flower. This volatile resides in the spathe-like bracts, chiefly of the male spadix. The latter inflorescence is branched in a thyrsoid manner, bearing the stamens in subwhorled spikes. The species is figured in ROXBURGH'S Plants of the Coast of Coromandel I, t. 94-96, and was originally introduced to this country more than a century ago.

—— PYRUS SPECTABILIS.—An example of this is now in full bloom in the grounds of Gunnersbury House, the residence of H. J. Atkinson, Esq., J.P. It is a large-sized specimen, and it is literally loaded with, and, indeed, almost groaning under the weight of the innumerable blossoms, which are red and white. It is said that this species is not so free of bloom as Pyrus malus floribunds, but nothing could be more generous in its service of flower than this Chinese Crab. They are larger and more showy than P. malus floribunda, and the bright red exterior makes them conspicuous for a considerable distance. Perhaps it is necessary a plant should become of mature age, as in the case of the specimen under notice, before it is thoroughly profuse of flower.

— ASPARAGUS PLUMOSUS NANUS.—A remarkably fine example of this exceedingly graceful evergreen plant can be seen in one of the plant houses at Gunnersbury House, Acton. Mr. HUDSON has it in one of the largest sized pots, and be has surrounded it with a cordon of upright iron stakes about 4 feet in height, to which the leading growths are tied. When this specimen becomes fully developed it will be of extraordinary size and great beauty. As an exhibition plant it should be highly serviceable. Small plants of it make very charming subjects for table decoration, and Mr. HUDSON uses it with great advantage in not a few of the effective arrangements for which he is so famous.

- DOUBLE-FLOWERING PEACHES, -The double crimson and double pink varieties have been objects of great beauty in the London parks, the former especially, because of its brilliant colour. It is, in consequence, a conspicuous object for a considerable distance. Like the double-blossomed Cherry it is too seldom planted, probably because it and the other varieties are expensive trees, and they find a place only in select collections. They have a further value in spring, in that they follow the Almond and take up the floral succession with Kerria japonica and Ribes sanguineum until such time as the Lilacs and other early flowering shrubs 'put in an appearance. This appears to be a season characterised floriferousness generally; the double yellow Kerria is singularly free of bloom, Laurels are flowering very early and abundantly, the Ribes is laden with blossom, while Laburnums, Lilacs, Chestnuts, &c., promise a rich harvest of flowers also.

— Rose Stocks.—At present Rose stocks appear to be doing wonderfully well. Several thousands growing in a stiffish clayey loam appear plump, and breaking into vigorous growth. It is said that a soft, mild, moist winter suits the stocks best, provided there are no rain floods when they are growing in heavy ground; it tends to keep them plump and full of sap, and when the spring comes they put forth shoots, and are enabled to stand the effects of drought, Seeing that the stocks are almost entirely devoid of roots when they are planted in autumn, it is matter for wonder that losses by death should be comparatively few. There is no doubt that a light sandy soil is hest

adapted to encourage the production of fibrous roots; but in the case of a dry spring the trees are apt to suffer. Roses do best in a stiffish soil provided they be well rooted, and probably no living rosarian ever before saw the Roses breaking into growth better than they are doing this spring, and especially is this true of those budded last summer. They are putting forth wood of astonishing vigour; happily, though the nights are cold, and the north winds cutting, there does not appear to be anything in the way of a check incurred by the pushing shoot. The cold weather is having this beneficial effect, that it tends to keep the growth in check, hardening it as it developes, so that it may be prepared to bear the rigours of nipping spring frosts.

— WANTED, A GOOD EARLY FLOWERING, VELLOW, HARDY SPRING PLANT.—This is an absolute necessity, and while many had hoped there had been secured a race of early flowering Violas that would flower in March if not earlier, that hope appears to have failed. At Belvoir Mr. INGRAM uses yellow Crocus, Doronicum austriacum, yellow Tulips, Narcissi, and yellow Cowslips and Polyanthus, with yellow Wallflowers of that early Dwarf type known as the Belvoir Castle. But it is with Cowslips and Polyanthus that Mr. INGRAM gets his leading yellow colours. Some time since a singularly early flowering Cowslip came into his hands bearing the name of Primula macrocalyx, and he did with this what he has done with Arabis, Aubrietia, &c. ; he selected the very earliest to flower, seeded from these, and by following up this process he has his finely improved Cowslips in bloom very early in the year, and he has secured varieties with rich colours also. But what is wanted is an early, dense, golden-flowered plant like Alyssum saxatile compactum or Aubrietia, but earlier in flowering than the former, and as con-tinuous in bloom as the latter. Violas are not early enough, and early ones are uncertain in their time of flowering. Yellow foliaged plants like Pyrethrum Golden Feather or Valerian Phu-aurea are not nearly effective enough. Such a yellow-flowering plant as that above sketched is badly wanted, and it would be welcomed as a great boon by gardeners could such an one be raised or introduced.

· DOUBLE FLOWERING CHERRIES .- A very fine specimen of the large double-flowering Cherry in a forecourt garden of the High Street of Ealing, is now an object of great beauty. Old inhabitants state that they have never before seen such a wealth of bloom on the specimens; the flowers are produced in enormous clusters along the branches; they are of large size and of snowy whiteness. This particular Cherry is of the Bigarreau type, with extra-sized The ordinary double blossomed Cherry flowers. has smaller flowers, less in size, and scarcely so double, and it may be said to represent the Morello type. Still, it is very free and pretty, and appears to be some days earlier. there is WATERER'S double Cherry. This variety is large and full, and has flowers tinted with blush or pale lilac. This may be said to be of the Bigarreau type also. Beautiful as these trees are, yet how seldom are they planted in gardens. The former, when it gets into size, appears to flower with great freedom year after year, and a more conspicuous object in April can scarcely be imagined, save and except Magnolia conspicua.

- PUVA CŒRULEA.-A reference to the number of the Gardeners' Chronicle for October 1, 1881, where a full page illustration of this remarkable Bromeliad is given under the name of Puya Whytei, will show what a grand plant this is for greenhouse or conservatory decoration. A fine specimen, with large very richly coloured flowers, is now blcoming in the Succulent House at Kew. The drawing published in the Gardeners' Chronicle was prepared from a plant which had been grown in the open air in the garden of Mr. TYERMAN, at Tregony, in Cornwall. TYERMAN's plant was planted in a dry sunny spot in the open border, in 1874, and seven years later produced a stout flowering stem 4 feet in height. It is difficult to describe the extraordinary colour of the] flowers. In the Botanical Magazine they are spoken of as being of a "dull metallic blue shot with Mr. TYERMAN says "malachite green." The narrow, spinous, rigid curved leaves—the upper surfaces of which are green, and the lower somewhat silvery-are produced in a somewhat dense rosette, and the lateral inflorescence is not so tall in the

Kew plant as in Mr. Tyerman's open air specimen. The bright orange-yellow anthers form a striking contrast to the peculiar colour of the inner perianth segments.

—— DORONICUM PLANTAGINEUM VAR. EXCELsux.—A full page illustration of this remarkable
perennial will be found on referring to the Gardeners'
Chronicle for September 8 of last year. Unlike the
other members of the genus, which are essentially
early spring flowers, this blooms continuously from
March to October. The huge size of the plant too
furnishes a striking distinctive character; in Mr.
WOLLEY DOD's garden it attains a height of 5 feet.
In the new rockery at Kew, a nice clump is in full
flower and its large heads cause it to be one of the
most conspicuous of all the numerous things now in
bloom. It is also a striking object in one of the
borders at Chiswick.

—— Crassula Quadrifida. — This is a pretty free-flowering plant of the easiest cultivation, and is worth growing for the winter decoration of the greenhouse or conservatory. Some interest attaches to the species on account of its exceptional structure; in the Crassulas the flowers are nearly always pentamerous—that is, the parts of the flowers run in fives; in C. quadrifida, however, the normal number of the floral divisions is four. It grows about a foot in height, produces a profusion of thyrsoid panieles, bearing star-like white flowers tinged with red on the outside. To sum up the merits of this plant, it is easily grown, it flowers freely, and lasts a long time in bloom. There are good specimens in the Kew collection of succulents, C. punctata of Continental gardens is identical with C. quadrifida.

RESEDA ODORATA PVRAMIDALIS GRANDI-FLORA.—The group of this fine red-flowered Mignonette, shown by Mr. WARERN, of Isleworth, on Tuesday last, afforded a capital illustration of the admirable way in which Mignonette is grown for market. There are such things as market preferences, and one of these is in favour of red Mignonette. It is said to be much more popular than the white, and it is doubtful if the double white variety will ever become a popular market plant. In growing Mignonette for this purpose some growers make the soil much more firm than others. That growing in the firmest soil lasts the longest in good condition, which is a matter of some importance.

— THE ORCHID MARKET,—At Messis, Pro-THEROR & MORKIS' sale on the 18th, a number of extra fine varieties of Odontoglossums unnamed (from Mr. SANDER's collection), came under the hammer, and realised good prices. A hybrid in the way of Ruckerianum, realised £22; another hybrid, 15 guineas; two varieties of Alexandra, 11 guineas and 19 guineas; a supposed distinct species, 15 guineas; and a hybrid in the way of Wilckianum, 12 guineas;

-- NEW VARIETIES OF PRIMULA SIEBOLDII. -A very interesting group of these was shown at the meeting of the Royal Horticultural Society on Tuesday last by Mr. GEORGE GEGGIE, Waterloo Nursery, Bury, Lancashire. For a few years past Mr. GEGGIE has been a successful raiser of new varieties, and, in conjunction with M. VICTOR LEMOINE, of Nancy, appears to be the only person engaged in this work at present. The group shown on this occasion comprised about two dozen varieties in the form of small but hardy and well flowered plants, giving a good representation of the varieties. Two of them were selected for First-class Certificates of Mcrit by the Floral Committee, viz., Brilliant, a variety with flat smooth flowers of fine shape and of a bright magenta colour, like laciniata in hue, but with smooth segments-a real acquisition; and Purity, pure white, flat and smooth, but as shown with a tendency on the part of the flowers to droop; but this might have been a result of the long journey the plants had to make. Then other pleasing and distinct varieties were as follows:—Nellie, a very pretty variety with slightly laciniated petals; Mrs. Crossley, pale lilac-rose, large flowers of fine form; Arthur, pale magenta-purple, very smooth, and fine form; Crimson King, sparkling magenta, having more life in the flowers than is seen in Brilliant, but yet scarcely so deep in colour; Pearl, pure white, but slightly tinted with lilac on the reverse of the petals like Mauve Beauty; Purple King, pale purple, large well-formed smooth flowers, very pleasing; Polly, bright pinkish-rose, large, and of good form; and Othello, lilac and rose, small-flowered, very pleasing. One feature noticeable in these varieties was the smoothness of edge seen in the flowers, though a few had pretty laciniated segments. It may be stated that one satisfactory mode of culture of these plants is to divide the crowos soon after the plants have done flowering, and plant them out in a good free soil, forming a bed in a cold frame. Here they may be wintered, giving plenty of air on all suitable occasions; and in spring, when the plants begin to throw up their flower-stems, they may be carefully lifted with balls of earth to the roots, and be placed in pots to expand their blossoms.

- David Jackson, the Middleton Florist. -The Rev. F. D. HORNER, Mr. BARLOW, Mr. GORTON, and Mr. BROCKBANK have formed themselves into a committee for the purpose of raising a small sum to be applied towards the support of this "During the last fifty years," say these veteran florist. gentlemen, "there has been no better known or more remarkable florist amongst the working men of Lancashire than our old friend DAVID JACKSON. Mr. Douglas published his book on Hardy Florists Flowers he singled out DAVID JACKSON for special notice, and stated that in many points he had anticipated CHARLES DARWIN in his knowledge of the fertilisation and the methods to be adopted for improving plants. In his hands the Tulip, the Auricula, and the Polyanthus were successfully cultivated, and so exact was his knowledge and so sound his judgment that no one was more frequently chosen to act as judge in floral matters. DAVID JACKSON is respected by every one who knows him as a sterling, honest, and upright working man, and a first-rate florist. He has been a weaver by trade, his wife also plying the shuttle by his side in their humble cottage. Hand-loom weaving is now slack; trade is bad, and the aged couple cannot further pursue their calling. Their hardly earned and carefully saved store is nearly exhausted, and the time has arrived which throws a duty upon those who have the means and are willing to help so deserving a couple in their old age." Mr. W. BROCKBANK, Brockhurst, Didsbury, is the secretary.

- THE WEATHER.-General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending April 21, issued by the Mcteoro-logical Office, 116, Victoria Street, London, S.W.:

—The weather has been cloudy, dull, and very cold in all parts of the kingdom, but with some decided intervals of bright sunshine; a few slight showers of rain, hail, or sleet have fallen locally. The temperature has been below the mean in all districts, the deficit ranging from 2° or 3° in Scotland to 6° in "England, N.W.," and the "Channel Islands," 7° in the "Midland Counties" and "England, S.W.," and 8° in "England, E.," and "England, S." The maxima were recorded on different days in the various districts, and were generally low, as at several stations in Great Britain the thermometer did not reach 50° during the whole week, while at scarcely any station did it exceed 53°. In "Scotland, W.," however, the maximum was 58°, and in "Ireland, S.," 60°. The minima (which were registered on the 18th, 19th, or 21st) were as low as 24° in "England, E.," 25° in "England, S.," and between 28° and 32° in most ther districts. On the grass, readings were, of course, much lower. The rainfall has been considerably less than the mean in all places. Bright sunshine shows a decided decrease in all districts, the percentages of possible duration ranging from 13 in the "Midland Counties," and 15 in "Scotland, E.," to 27 in "England, N.W." Depressions observed:— Pressure has continued highest over the northern and north-eastern parts of our area and lowest over France and our southern coasts, but there have been no de-pressions of importance in our immediate neighbourhood. The wind, which has been generally light or moderate in force, has varied between north and east, but at the close of the period a light southerly breeze had set in at our north-west stations.

— GARDENING APPOINTMENTS, — Mr. WILLIAM PRENTICE, lately Gardener at Shouldham Hall, Norfolk, as Gardener to R. WHITEHEAD, Esq., Paddockhurst, Worth, Sussex.—Mr. WILLIAM SIDALL, Foremao to Mr. J. HARDIMAN, Lyme Hall, Stockport, as Gardener to Mr. LOWTHER, Shrigley Hall, Macclesfield.

The Benbageous Bonden.

METAMORPHOSES OF SINGLE WILD DAFFODILS. Not many years ago a philosopher, believing that the turning of the divining-rod was a piece of wilful imposture, was playing with one, and was astonished to fied it suddenly making the magic indications by twisting in his hand whilst he endeavoured to hold it still. This led to further investigations on his part, and he found by experiment that only about one person in forty possessed the required qualifications for handling the divining-rod successfully. The account of this is found in Carpenter's Mental Physiology, but I mention it as an illustration of something in gardening. Botanists, as well as many leading horticulturists, have discredited the statement that the wild single Daffodil, when planted in rich soil, will in some gardens change to a larger variety of Daffodil with double flowers. It may be that not more than one garden in forty possesses the required conditions for producing this change; but some day some of those who are now incredulous, will find that the change has taken place under their observation, and they will then believe it. During the last three weeks I have investigated the circumstances under which, in at least four gardens, this change persistently occurs. The witnesses have allowed me to cross-question them, and their testimony remains unshaken. These were not statements casually made; but the observation of the change caused as much surprise to them, as it could do to any who read this, and the experiment was carefully repeated with the same result. The season being so far advanced, I have been able to obtain only in two cases both the single wild flowers and the double converted flowers. In both cases, however, the single flowers were typical N. Pseudo-Narcissus, and the double flowers-not the double wild Daffodil, as found wild in Devonshire, and occasionally in other places-hut the double of a major variety. not feel sure that they could rightly be called Telamonius, I sent both single and double flowers to Mr. Baker, of Kew. He pronounced the single to be true N. Pseudo-Narcissus (type), but the double he cousiders to be N. pscudo-narcissus var. lobularis. opinion makes it still more unlikely that any mistake has been made in the observation, because neither garden had ever had the double N. lobularis introduced into it. It may also be remarked that what is sold by English dealers as double N. lobularis is called in many Dutch catalogues double N. Pseudo-Narcissus. But I will not discuss the question farther this season, having stated the facts as I have ascertained them, and having put together for future reference all the correspondence I have collected on the subject. C. Wolley Dod, Edge Hall, Malpas, Cheshire,

P.S. Since writing the above I have received some more letters containing the same assurances of wild Daffodil changing to large double garden Daffodil, I have sent bulbs from the Welsh mountains in every case to wait the result.

THE GREAT WELSH PEERLESS DAFFODIL, "SIR WATKIN,"—The conclusion of our Daffodil season has been marked by the advent of a new Daffodil, which is, of its class, superior to any other, ranking with Emperor and Horsfieldli in size and beauty. It was exhibited at the late meeting of the Horticultural Society under the name of "James Dickson," and received a First-class Certificate; but as Messrs. James Dickson & Sons had nothing whatever to do with the raising of the flower, and as Mr. Pickstone, its raiser, desires to call it by a Welsh name, Sir Watkin, I suppose they will willingly agree, that it may in future bear the name so dear to all Welsh-

The history of this Daffodil is a curious one. About sixteen years ago Mr. Wm. Pickstone, of Manchester, leased an estate in Merionethshire, and it was there that this Daffodil originated as a chance seedling in his garden. This was before Daffodils were fashionable; but Mr. Pickstone recognised its merits, and took the propagation of it under his care, About six years, later he went to live at Hampstead, near London, and he took a supply of his Daffodil to his garden there, where it was grown on for some time. A few years ago he bought the estate of Maesmynan, in Flintshire, and here the bulk of his stock of this Daffodil was removed, though it was still grown on at its original birthplace in Merionethshire.

During these sixteen years the stock has increased, until it is now a large one, no less than 5000 blooms having been supplied to the florists last week. Mr. Pickstone is a gentleman farmer, and had no idea of ever selling his Daffodils until he was applied to by a Manchester florist who happened to see the wealth of blooms as he passed by the garden. In this way a good many blooms of it came to Manchester last spring, and they attracted considerable notice in the flower shops. I took the flower to be Mr. Barr's Princess Mary of Cambridge, which had just been certificated, and of which I supposed the blooms were being sold, in advance of the bulbs, by its raisers. In this way it escaped my further notice at that time.

this way it escaped my further notice at that time. This season, however, our flower shops have been full of it for several weeks past. At first, again, I mistook it for Emperor, which it greatly resembles; but at last it became evident that we had amongst us a giant Daffodil which had been unheard of at the Daffodil Conference, which our Barrs and Wares and Walkers knew not of, and which excelled every other rival for the florist's purpose. At last the name of its owner transpired, and next came an invitation to me to visit the garden where it grew. It is a long way to go, over 100 miles, to see a Daffodil, but I went, in the hope of tracing out its history. The origin of Emperor, Empress, and Horsfieldil is in each case veiled in obscurity, and here was a new-comer of equally grand form about which it would be interesting to know as much as possible whilst the subject was freshly before us.

Massuynau is on the skirts of the Welsh mountains, being about 350 feet above the sea, in a lime-stone district, and about 5 miles from the central peak of Moel Famman, the mother of hills. The soil is a strong marl with lots of boulders and pebbles in it, and here the Daffodils appear to thrive in the pure mountain air in a way I never saw before. They were everywhere, amongst the Rhodoendron bushes, and along the borders in thousands. The flowering time was nearly over, but there was enough to show how graad the sight had been. There was but this one variety, the stock having been kept as pure as precible.

My principal object was to find out the origin of Sir Watkin, and on talking the matter over with Mr. Pickstone I found that there were but three other Narcissi grown in his Merionethshire garden at the time of its appearance. These were a Trumpet Daffodil, very like Rugilobus, having a rich yellow tube and very stout and broad perianth-segments of a pale primrose colour. N. biflorus in a semi-wild state was also plentiful, and it is also believed that the common yellow variety of N. incomparabilis in its single and semi-double states was there. From these three, therefore, the new variety was probably derived, and I believe it was ultimately from a cross with the wild biflorus.

The colours of Sir Watkin are exactly like those of N. Emperor. The spread of the perianth is about 4 inches, and it has a beautiful pale-primrose colour. The tube is shorned and widened at the mouth, and richly fringed, and is of a rich golden-yellow. Emperor is scentless, but Sir Watkin is most fragant, and here you trace the scent of N. biforus most distinctly; and lastly, the outer tube below the perianth, which is yellow in rugilobus, is green in Sir Watkin, again like the tube of biflorus. The cup of biflorus again has the colour of perianth of Sir Watkin. There are thus many points of agreement, the only one to the contrary being the absence of the white in the perianth of the seedling. I believe the cross from a wild form like biforus will always produce fine progeny. It is considered in Lancashire that Horsfield improved bicolor by a cross with a fine wild form of N. pseudo-narcissus, and the small Macleai is credited with some of the finest of the incomparabilis and the wild poeticus with many more, and why not, therefore, the same results from N. biflorus?

I looked over the whole of Mr. Pickstone's flowers ose if there were any other varieties or one.

I looked over the whole of Mr. Pickstone's flowers to see if there were any other varieties, or any sigo of doubling in the flowers of so large a stock, which had thus been carefully cultivated for sixteen years; but there was no variation either in the form or the petalling of the flowers. It is fortunate for the floral world that there is so large a stock at once available, and that we shall neither have to pay long prices nor wait our turn for an odd bulb of questionable character. Here we have thousands of bulbs all true to name waiting for distribution. It is to be hoped that whoever is so fortunate as to become the distributor of the stock will not ask us too long a price for

It thus happens for the third time that we are to be indebted to a Manchester man for a grand Daffodil. John Horsfield and Thomas Leeds each gave us a grand variety of bicolor, Horsfield's being now called

the King of Daffodils. Mr. Pickstone follows with another grand variety, which is fitly called Sir Watkin, it being certainly the King of the Welsh Daffodils. William Brockbank, Brockhurst, Didsbury, April 12.

NARCISSUS INCOMPARABILIS JAMES DICKSON.—
This remarkable flower, which I consider the finest Daffodil novelty of the season, was exhibited at the meeting of the Koyal Horticultural Society on April 8, and obtained a First-class Certificate. During the previous week flowers of the variety bad been sent to me from three different sources, and it seemed surprising that so grand a Daffodil, which appeared suddenly to have become so common, had not attracted more notice, especially as it was exhibited at the Conference; but I traced all the flowers of it to one garden. Its merits consist not so much in the wider expanse of the flower as in its great substance; but the most remarkable character is the width (t½ inch) and depth (t¼ inch) of the crown, as compared with the proportions of that of the common K, incomparabilis. This leads me to suspect that it is a second cross between N, incomparabils and one of the larger Trumpet Daffodils. It has the additional merit of dwarf habit, the height from the crown of the but the top of the flower, which stands well out from the leaves, not exceeding 12 inches. C. Wolley Dod, Llandundo, April 11. [With this communication Mr. Wolley Dod obligingly favoured us with the drawing from which our illustration is taken. As to the name proposed by Mr. Brockbank we must point out that the flower has been exhibited, certificated, described, and figured (in the Journal of Morticulture) as "James Diecide, but the case is one for the Daffodil Nomenclature Committee to decide, Ed.]

TRUG BASKETS.

THE oldest of the several wood industries of Sussex is that of trug basket making, which is carried on at Hurstmonceaux by the grandsons of

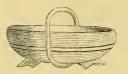

FIG 168.—GARDEN BASKET.

the original inventor, or improver of the trug-Thomas Smith, of the same place. Hurstmonceaux is known to the inhabitants of Eastbourne and Hastings, and to occasional tourists, for its grand old unroofed castle of red brick, the seat in Henry VIII.'s reign of the "Dacre of the South," who lost his head for the same reason that modern landlords, according to Mr. Henry George, ought to lose their land-because the estate was required for some one else. In literature Hurstmonceaux is known for its accomplished rector-Archdeacon Hare, for his curate, Sterling, and for his friend and guest, Thomas Carlyle; and Chevalier Bunsen lived bere with his family several years. It has another claim to notice, and other residents of mark—the herons, which annually build on the tallest trees of the highest ground in the parish; and although we may not mention the timber which once clothed its slopes, and which fell before the cruel fate of poverty on the part of a former family of owners, the poble landscape is still with us, the long smooth line of the South Downs in the west, the sea due south, 6 miles distant, and Pevensey Marsh between it and us-a level lawn stretching from below the hill where the village stands.

But so lar as utility is concerned Messrs. Smith's basket factory is of more consequence than all the matters we have named. The exact meaning of the word trug is suggested by the German words, tragen, to carry; trog(trough); and Messrs. Smith's baskets, varying from 6 inches to 4 feet long, and holding any quantity, from a bushel to a pint, are, in the larger sizes, most cheap, strong and handy for farm and garden, or light and elegant for holding flowers or whatever else a lady may wish to deposit in them. The little ornamental trugs, square, oblong, or circular in shape, are made of strips of Willow, white and light. The poles are cut into proper lengths,

and split and planed and bent, after being moistened, and then ingeniously formed into baskets. At the Exhibition of 1851 Her Majesty observed Messrs. Smith's collection, and ordered a Willow trug for herself, and one for each of the Royal children, the Prince of Wales getting the largest of the set. These particular speciméns were made with silver nails. Both at the Great Exhibition and that of 1855 at Paris, prizes were awarded to the little trugs. It is singular that the largest number of trugs of all kinds are sent abroad to all the countries of the Continent, and more in proportion are distributed in Scotland than in England. Can it be that Scotch gardeners and farmers are more canny and quicker to appreciate a good article than their brethren of the South? This refers to the larger, stronger trugs, which are useful in gardens and on farms, in stables, wood-houses, coal-houses—anywhere, for carrying Potatos, Turnips, stones, rubbish, Apples, Pears—anything. Trugs of this class are either made of hard wood entirely, or, for the sake of reducing their weight, they are made of Willow, with handles, braces, and rim of Ash. A Sussex gentleman who burns wood has a trug in every room in his house to hold the fuel, and these are made with feet instead of being round at bottom.

We are happy to notice the trug for its usefulness and low price, and also in connection with the increasing wood industries of Sussex. In the present state of agriculture such industries should be encouraged.

The Weald of Sussex has been diminished, no doubt, by the persistent attacks upon its timber on the part of the iron smelters and their successors in the work of destruction-the agricultural improvers of thirty years ago. But the woods of Sussex still measure 110,990 acres, according to the Agricultural Returns, and their area is not unlikely to extend. A considerable part of Sussex is admirably adapted for the growth of many kinds of timber-from the Oak, which affects the bottomless clays, and supplies materials for ships, and "shingles" used in covering clutch spires, and for planks, paves, lathes, and builders' stuff, to the Beeches of Goodwood. As a builders' stuft, to the Beeches of Goodwood. As a reat-paying product, however, underwood is more productive than timber, yielding, as it does, Hoppoles for the "gardens" of Sussex and Kent, hoops of all sizes for casks and kegs, poles for hurdles and wattles, faggots for fuel, and materials used in making brooms, or required in gardens, with Alder for charcoal and powder-making. Every kind of wood is grown, according to the soil-Ash in the moister, heavy land, Oak in the clays, Chestnutadmirable for Hop-poles-on the warmer, light land, especially on the loams of Midhurst. II. E.

Home Gorrespondence.

Ellam's Dwarf Spring Cabbage,—I am'rather surprised, after the mild winter we have had, to find that no one has given an opinion regarding the best varieties of spring Cabbage to grow. Most people here are crying out, "Nearly all my Cabbages have bolted!" and no doubt it is the same in most parts of the country. All I have seen in the market grounds around and near Portsmouth are certainly in this condition. I am growing four varieties, and send you a few particulars respecting their behaviour. They were all sown in the second week in August. Of Heartwell Early Marrow, 75 per cent. have bolted; Shilling's Queen, 25 per cent.; Wheeler's Imperial, 20 per cent. have bolted, but of Ellam's Dwarf Spring not one has gone wrong. I had 300 of each variety planted, and I must say it is a real treat to see the six rows of Ellam's by the side of the other "Egyptian recruits," I am not going to say that this is the earliest of all Cabbages, but it is the band-somest Cabbage I have ever seen, and well deserves the bonour it has received from the Fruit Committee. I have sent you a few as a sample of what I have been cutting these last three weeks. John Hepper, Gardener and Bailtif to Mrs. Sandeman, Wesfield, South Hayling, [Very good indeed. Ed.]

Bees and their Relations to Fruits and Flowering Plants,—"North Norfolk" is evidently anxious to "tread up," as he seems to wish for delay, and says he will not answer in detail, as other correspondents may like to relate their experience. This looks like shifting the burden on to other shoulders, and it is perhaps wise of him to do so, especially after such a statement as that he distinctly made, viz., that a bee gathering pollen conlines herself to the kind of blossoms on which she begins; although from the

same hive, different bees may be gathering honey from different flowers. To make this more clear, "North Norfolk" tries to illustrate bls meaning by further adding, "one may be gathering from Peach blossoms, another from the Wallfower, another from white Arabis;" and then he propounds the startling theory, that it is only by the abstinence and forbearance of bees, that one distinct natural order of plants is kept

what they are worth. I know it is the generally conceived opinion of apiarians, that bees collect pollen to make bee bread, but if it is only used for that purpose, will "North Norfolk" tell us what wax for the comb is composed of, and can he prove that pollen is not converted into, or forms part of that substance? Unfortunately, many of those who write about the habits of bees, do so, not from their own observation

Fig. 109.—NARCISSUS "JAMES DICKSON," ALIAS "SIR WATKIN." SEGMI CUP RICH GAMBOGE-YELLOW. (SEE P. 552.) SEGMENTS PALE CANARY-YELLOW,

from being crossed with the other, for he goes on thus to remark, "Irom this fact we see why the bees cause no inter-crossing, they only intermix the pollen of the same species." All this will be quite new to most people, and if it is the teaching of Huber and Aristotle, I am glad I have not read the books of those authors. As to what bees do with the pollen when they have collected it, it is easy to say, as "North Norfolk" does, that they never did, and never can, make wax from it, but statements like that can only be taken for

and experience, but copy, in a great measure, from others, and this is how it is the errors of old authors are perpetuated, and sometimes added to and enlarged. J. Sheppard.

Tar and Canker on Fruit Trees. — It is fre-quelly asked if tar or pitch will so far injure the bark of a tree as to cause the death of the tree so acted on. I may say that, so far as I know, there is no record of a robust tree with sound mature bark having been

killed by it, although doubtless its effects would be decidedly injurious if the application was made over the major portion of a tree's bark surface. When tar is placed over wounds caused by removing large limbs it acts beneficially in stopping up the pores of the wood, and thus preventing air and moisture acting on the tissues so as to cause decay in them. This protective effect can be made to last till the natural growth of the bark has covered the place, which will generally happen, if the tree has not approached maturity, in a few years, more or less, according to the rate of growth. With regard to the usefulness of the riese, it has been found that in trees so affected, if the infected portions of the bark, and even the wood, be cut away till sound tissues are reached, and tar (coal) or pitch be well rubbed into the wounds thus made, it has a fatal action on the particular fungus, which is the cause of the disease called canker. Of course it will kill the germs of the fungus only where it touches, will retard the spread of the disease on the particular trees which are manipulated on, and will lessen the number of attacks on neighbouring trees. But the trees which are manipulated oo, and will lessen the number of attacks on neighbouring trees. But the real remedy in the case of young trees, and those of a manageable size, is to lift them out of the soil, that by its nature predisposes the trees growing in it to the disease, and to plant them in more congenial soil. Shallow or surface planting over an impervious floor, and in the case of small trees occasional trans-planting and root litting,—and enough manure to ensure vigorous growth and superior fruit,—will be discovered to be the best treatment, M.

A Floral Calendar,—With reference to the Floral Calendar published at p. 520, may I state that it is a continuation by Mr. R. Lindsay, curator of the Edinburgh Botanic Garden, of the work of his predecessor, Mr. Sadler, vide Transactions of the Botanical Society of Edinburgh, vol. 14, part 3, where the Calendar is given for the preceding fourteen years. Andrew Taylor, Edinburgh.

where the Lalendar is given for the preceding fourteen years. Andrew Taylor, Edinburgh.

The Best Table Potato at Present?—Allow me a line to thank Messrs. J. Muir and A. Dean for so promptly [6, 522) replying to the above. Your endorsement of Mr. Muir's selection—Schoolmaster—induces me to plant the remainder of the small stock that I have on hand to give them a further trial. Mr. Dean's views in reference to 'late keeping" are not only instructive, but this year too accurate; as almost all late kinds exhausted themselves in premature growth—Champion worst of all. With me Magnum Bonum has kept best, and if it was as I said drier in the flesh ("floury") I should ask no better now. We shall look forward to the introduction of the variety referred to—that which of so many varieties kept best. W. J. Murphy, Clonnel.

—— This is a question which should be carefully answered, for all have their favourites. I may state that I grow over a hundred varieties, and I have been a successful exhibitor in London, Manchester, and elsewhere. I have grown most of the leading sorts as they have been sent out, and have had many varieties that are beautiful to look at, and that is all. The American varieties are in general great croppers, and some are good early varieties, but I have falled to find a good late sort amongst them. The coming Potato, in my opinion, is Reading Hero. It is an excellent cropper, and for eating is at its best from now onwards. It is in great repute in this neighbourhood. Then we have our old lavourite, the Schoolmaster, an excellent Potato at this season, second only to the Hero. Magnum Bonum is not all that could be desired, although an iovalnable variety. Champion is an excellent variety, but too deep in the eyes. I may sum up by saying that Reading Hero, when better known, will be the Potato for this season, Schoolmaster, on excellent Potato at this season, second only to the Hero. Magnum Bonum is not all that could be desired, although an iovalnable variety. Champion is an excellent coming next, then

Cottagers' Shows.—Referring to remarks on this subject at p. 518, I may be allowed to say that I have for many years been a member of a provincial horticultural Society, which has a separate class for the productions of cottagers, and of these productions it may generally be said that, so far as they go, they compare favourably with those of amateurs or professional gardeners; and I believe there has never been cause to entertain anything like suspicion of their fessional gardeners; and I believe there has never been cause to entertain anything like suspicion of their acting in any way unfairly—that is, in showing productions as their own which were not produced in their own gardens; so that the visit of a committee previous to the day of the show has never been considered at all necessary, and would, I believe, be regarded by the cottagers themselves as far from being complimentary to their honesty and their love to fair play. Indeed, were anything like unfair means resorted to on the part of any individual, rival competitors would be almost sure to detect the fraud, and would not be slow to expose the same, when, if proved, the delinquent would in future be refused the privilege of exhibiting. The society referred to, in

addition to giving prizes to cottage garden productions, gives also prizes for the best cultivated cottage gardens; and here it is, of course, necessary that the gardens should be carefully inspected; and this is done by members of the society, who are annually appointed for the purpose at the annual or general meeting of the same. The surrounding parishes being divided into three districts, and the cottagers in each who may wish to compete, are invited to sead in their name wish to compete, are invited to send in their name and address by a given date, when the two appointed judges for each district are expected to visit the various gardens once or oftener during the season, and to decide as to their merits, taking into due consideration the quality of the soil, the favourable posistate at the sarden, or otherwise, as being circumstances which the owner cannot always control. Making due allowance for the difference which may exist in the extent of the various gardens, so that the larger should not necessarily be placed before those of less extent, unless there exists a superiority in the culture and condition of the same. In each district the and condition of the same. In each district the judges are empowered to award four prizes, viz., 20s., 15., 10., and 75. 6d., with permission to give a gratuity of 55. to each of the remaining competing gardens, which they may consider as deserving. This, however, is not quite all, for at the annual dinner however, is not quite all, for at the annual dinner of the society (and it may, by-the-by, be observed, that there is nothing which stimulates an Englishman's generoisty like a good dinner) it is by no means unusual for gentlemen to offer additional prizes in kind, to accompany or to supplement the prizes given by the society. These prizes generally take the form of useful garden tools, or implements; as well as serviceable articles of household furniture. Sec. So that taken altereater the prize ments; as well as serviceable articles of bousehold furniture, &c., So that taken altogether the prizes, although small, nevertheless tend to keep alive the interest which it is so desirable that the cottager should take in his garden and in his home. In this respect it may not be too much to say that the society in question has done, and continues to do much good. Yet strange to say the clergy, even the clergymen of the various parishes where the commuch good. Yet strange to say the ciergy, even use clergymen of the various parishes where the competing cottagers reside, with a few exceptions, decline to encourage, or, at all events, to subscribe to the funds of the society. Hortus,

Wall Flowers and Wall Trees .- Nature, nn-Wall Flowers and Wall Trees,—Nature, nn-aided sometimes, forms very beautiful wall gardens, in which the native Wallflower (Cheiranthus cheir) plays, as might be expected, a very important part. A very remarkable example of this may now be seen upon a portion of the massive ruins of the ancient monastic establishment at Bury St. Edmunds. That monastic establishment at Bury St. Edmunds. That portion of the ruins is the one that abuts upon the old churchyard, and faces the west, and at present comprising the "will office" and one or two private residences. The ruins are exceedingly picturesque, are draped by sundry kinds of climbing and other plants, and are at the present time rendered recyclicity beau. draped by shandry kinds of climbing and other plants, and are at the present time rendered peculiarly beautiful by the profuse flowering of numerous patches of the pretty yellow Wallflower, which in spite of the long spell of dry weather which has been experienced here are all growing luxuriantly; these patches, which are all, of course, self sown, and many of them are at a very considerable altitude—probably not less than our so feet from the surface of the self as what one all, of course, self sown, and many of them are at a very considerable altitude—probably not less than 40 or 50 fect from the surface of the soil, so that one can hardly help wondering how the plants manage to obtain the necessary moisture or nourishment required for their support. There are, however, many other plants, and even trees, which appear to take kindly to such situations, to which their seeds have in some way been conveyed by the agency of birds, or been wafted by the breeze to where they somehow vegetate, and become established. Among flowering plants which appear to readily make themselves at home in such situations may be mentioned the Achilleas, Alyssums, Arabis, Aubrietias, Antirrhinums, various kinds of Diaothus, Erinus alpinus, and many other varieties of alpine plants and annuals, &c., while various berry-bearing trees, such as the Mountain Ash, the Vew, the Holly, &c., are frequently found to take possession of walls, ruins, rocks, and inaccessible cliffs. I have even seen a Gooseberry bush take possession of walls, ruins, rocks, and inaccessible cliffs. I have even seen a Gooseberry bush take possession of walls, ruins, rocks, and inaccessible cliffs, and there ripen its fruit, while on a similar wall a blich tree attained to such dimensions as to endanger the wall by its oscillation during sions as to endanger the wall by its oscillation during windy weather, so that it is quite possible to render unsightly walls or ruins very ornamental by scattering the seeds of desirable species of plants upon their surfaces, and this should be done soon after rain has fallen upon them, or when they are in a moist con-dition, when the seeds will be likely to adhere to fallen upon them, or when they are it a must con-dition, when the seeds will be likely to adhere to them, while to further assist the fixing and germi-nation of such seeds a portion of fine soil should also be scattered over them. Crumbling walls, if at all damp or more or less shaded, are almost sure to be become clothed with the more common kinds of Ferns, but by shaking the fronds of the more orna-mental species upon the wetted surfaces of such walls or ruins they will generally be found to vegetate, and the more common or unduly free-growing kind may, the more common or unduly free-growing kind may, when found desirable, he weeded out, and such walls, &c., be thus rendered exceedingly interesting. P. G.

Canker in Apple Trees. - Accepting all that Plowright affirms on this subject confess to some difficulty in understanding why it is that of a number of Apple trees growing side by side, that of a number of Apple trees growing side by side, and of the same age, growing under the same conditions, some, though comparatively but a few, should suffer very much from canker, a few others only slightly, and the majority be absolutely free of the affection, robust, and healthy. We find, as a rule, that other vegetable fungoid diseases affect all the plants of the kind attacked equally. Thus the Peronospora infestans serves the plant growth of all Potatos alike first or last; the Hollyhock fungus is hardly less districtive when it once appears, and the Oidium Tuckeri treats all Vines alike when it gets a footing in a vinery. But here we find the canker fungus picking out a tree here and there only, and leaving the contractive treatment of the canker fungus picking out a tree here and there only, and leaving the contractive treatment of the canker fungus picking out a tree here and there only, and leaving the contractive treatment of the canker fungus. the majority quite unhurt. [As happens in analogous cases in the human subject]. Looking over a row of filty Apple trees of various kinds, some thirten years planted, I find not more than one-fifth to be affected planted, I had not more than one-hith to be attected with canker, all the rest, varying in robustness according to sort, yet all clean and healthy. The two worst cankered kinds are Reinette du Canada and Northern Spy, both curiously enough North American sorts. These have been almost killed, and are no longer worth retaining. Then Lord Burghley, Royal Russet, Gloria Mundi, Keddleston Pippin, Royal Pearmain, Natson Cedin, and Stumer, Pircin, are all worst. Gloria Mundi, Keddleston Pippin, Royal Pearmain, Nelson Codlin, and Sturmer Pippin, are all more or less affected, the first named being the worst. Margil shows some few big cankers in the main branches, the remains I had fondly thought of the hard weather some few winters back, but the rest of the wood is sound and clean. Mixed up amongst these trees, coming, indeed, next to some of the worst cankered, are Reinette Elanche, Stamford Pippin, Winter Peach, Old Winter Pearmain, Red Australian, Golden Noble Cellini Pippin, King of Pippins Flower of Kent, Kentish Fills. King of Pippins, Flower of Kent, Kentish Fill-basket, and many others, all as sound as can be desired. Now the question to be asked is this: why does this canker fungus attack certain kinds why does this canker fungus attack certain kinds only and leave others; or put it in this way, is the wood of certain kinds of Apples more amenable to the fungoid attacks than that of others. We have in the past credited the weather chiefly with the canker, and have explained that the reason why some trees suffered from it and others did not, on the ground that the wood of these kinds was more tender. Perhaps that explanation was so far imperfect that we should have said the wood of certain kinds needed either a warmer season to mature it, or else, and doubtless it comest to heasone thing in the ad-that the code in the control of the control o less it comes to the same thing in the end, that the roots of the trees producing this wood, were not in soil favour-able to the production of wood that was fully matured. Specially have we ascribed the dying bark of yearling wood, both on Apples and Pears, to defective root action, that in fact the wood died simply because it was imperfect or immature, and for no other reason. Still this form of decay has nearly always been termed or classed with canker. I remain of the opinion that unsuitable soil for particular sorts remains the chief cause of decay in such cases, whatever may be the primary cause of canker in big branches, or old hard wood. If a fungus be the cause, it should be exwood. It a linguist be the cause, it should be plained how it was that a recent severe winter produced canker wholesale where canker had never been seen before, literally destroying trees previously robust and healthy. I should like to learn the seen before, literally destroying trees previously robust and healthy. I should like to learn the opinions of some practical fruitists on this interesting subject, as we want not to be confirmed in deception but to be convinced of that which is true when proved. A. D.

Prunes, Servian and Hungarian, - Apropos of Prunes, Servian and Hungarian,—Apropos of what was recently stated concerning these fruits, and the failure to sell them here at a profit, I know from personal knowledge that the fruit, which is from the seedling Schwetche generally, for the natives seldom bud or graft it, is dried by the peasantry in their bakeovens. These are somewhat primitive contrivances, and being nasully without ventilation otherwise than what is present in an ill-fitting door, the fruits acquire a tarry flavour, slight certainly, but enough to place what is present in an in-neting door, the rituits acquire a tarry flavour, slight certainly, but enough to place them at a lower value than the more carefully prepared French goods. The overs are heated strongly, as if for baking a heavy batch of bread, but are allowed to cool so that a feather will lie on the floor without scorching; then the Prunes that have been lead out think on wooden trays are put into it seweral laid out thinly on wooden trays are put into it, several layers deep if necessary, spaces being left between the trays to permit of the escape of the moisture. The oven having been heated strongly will retain its warmth for two or three days, but the fruit is kept shut up for perhaps twelve to eighteen hours only. When cool they are usually placed in net or coarse canvas bags, hung up within the house in a cool place free from damp. Cheries are preserved in the same manner, but they are then little more than stone and skin. This method of drying fruits might be adopted in our country, so that instead of selling fruit at a loss, as is elfen done when there is a glut, it could be harvested for the short years that nearly always follow years of plenty. The l'ershore Damson laid out thinly on wooden trays are put into it, several

does not differ largely from the Servian or Bosnian Schwetche, and should make a dried preserve good enough for ordinary use. The Southern Europeans make a preserve from these Plans that keeps for years, and that, too, without the addition of any sugar. The fruits are picked and stoned and boiled in an iron vessel for twenty-four hours unceasingly, being kept stirred during the whole time to prevent the stuff getting burnt. The result is a brown blackish substance, slightly acid in taste, that is found to be good for all the purposes for which we use jams; with this advantage—that it can be sweetened to suit the palate, and which makes a pleasant acidulated summer dink when mixed with water, especially for young persons. I knew a dandy water, especially for young persons. I knew a dandy lieutenant who served in the Bosoian campaign using it instead of boot blacking when the latter article ran out with very lustrous effects, so that we may say its uses are somewhat varied. M.

Fruit Prospects in Yorkshire.—It is, perhaps, too soon to speak decidedly about the fruit prospects, but present appearances indicate beavy crops of all but present appearances indicate usary crops kinds. Apricots and Peaches had a splendid show of bloom and the fruit appears to have set well. Pluns, 11 everywhere, have been a sheet of white blossom. If the set be good the crop will be enormous. On Pears there has been also a fair amount of blossom, especiatly on pyramids and standards. Apples promise well, but, after the experience of the last few years it would but, and the experience of the last lew years it would be premature yet to speak with any certainty of the state of the crops. Apples were a poor crop in this country last year, so the crop stands a chance of being Strawberries and hush fruit promise to The weather on the whole has been a good one. e abundant. days the winds have been cold and the mornings have been frosty, but not sufficiently severe to do much damage to the fruit crop; altogether the fruit propects are at present cheering and with a fine season we may with confidence look forward to good crops, we may with con M., Saul, York.

Fruit Prospects in Lincolnshire. - Our fruit Fruit Prospects in Linconsnire. — Our fruit prospects up to Sunday morning, the 20th inst., was all that could be wished, in fact we had a better show of bloom, and the trees were in better health than we have seen them during the last six or seven years, but we are again doomed to disappointment. A sharp fact set in a Saturday avening on Sunday morning. frost set in on Saturday evening, on Sunday morning, the 20th, the thermometer registering 9°, and on Monday morning 3°, and this morning 6°. Plums, Pears, and Cherries are very much destroyed, and the full extent of mischief is not yet apparent. Gooseberries, which were set, are at least one half destroyed. Wall fruits which we have carefully protected with Wall finits, which we have carefully protected with covers on rollers, are safe, and an excellent crop. Spring gardening has also suffered with us. The Myosotis dissitiflora, which was in excellent bloom, Ayosolo dissilidora, which was in excellent bloom, is scorched as if by fire, and other plants have suffered more or less. We have had old N.E. by E. winds for the last ten days, and up till now we have no alteration. D. Lumsden, Bloxholm Hall Gardens, Stafprid, April 22.

Double Cinerarias,-I enclose you a few blooms of double Cinerarias, —I enclose you a few blooms of double Cinerarias. I have fifty plants in 24-sized pots with an average head of flowers 20 inches in diameter, and very compact. I am induced to send these for your inspection, having heard that they are considered not worthy of cultivation as they come considered not worthy of curivation as they come small; but I find them very useful, as they make a grand show just now, coming in between the single varieties now about over, and Pelargoniums which are not yet in. T. Piedger, The Gardens, Woodcote House, Exton. Afril 22. [Blooms large and good. Etc.]

CAPE BULBS .- A wrong impression prevails CAPE BULBS,—A wrong impression prevails in Europe respecting the treatment of Cape bulbs. It is commonly thought that, being indigenous to South Africa, they must require great heat to grow them to perfection; but this is not the case, for the reason that they begin to grow with the first rains in our autumn, and make their growth during the Cape writer flowering early in string, and are going flowering early in spring, and are again at rest before our hot weather sets in. Consequently an English summer is quite hot enough to bring them to English summer is quite hot enough to briog them to perfection. In Europe they would commence to grow about March, and should be protected under glass until May, and theo brought into the open air and placed in a sunoy position. They delight in a light sandy soil, well drained, and when at rest should be kept fairly dry and warm. Charles Ayres, Seedman and Florist, Cape Treen, South Africa.

ARAUCARIA IMBRICATA.— The largest of the Araucarias growing here is about 40 feet in height, with twenty-four tiers of branches, the lowest of which is lying on the surface bedded in moss and grass, and is perfectly green and healthy. They

which is lying on the surface bedded it most and grass, and is perfectly green and healthy. They measure 21 feet from tip to tip. It is a beautiful specimen, forming a perfect pyramid. T. Leslie, Ardarroin, Carelochhead, N.B.

Reports of Societies.

Royal Horticultural: April 22.

SCIENTIFIC COMMITTEE, -A. Grote, Esq., in the SCIENTIFIC COMMITTEE,—A. Grote, Esq., in the chair. Present:—Messis. Pascoe, Mangles, Mac lachlan, Glaisher, Wilson, Smith, Boulger, Ridley, Loder, Houston, and Rev. G. Henslow. Rhododndron Hybrids.—Mr. Mangles exhibited a large basketful of beautiful Rhododendrons, including the following remarks the bubbids.—Anderson House.

large basketul of beautiful Khododendrons, including the following remarkable hybrids: -Anderson, Henry, a triple hybrid, raised by Mr. A. Henry from R. formosum crossed by R. Dalhousia, crossed by R. Nuttalli; and with very large white funnel-shaped flowers with yellow throat—the foliage is dark green; B. Waitbil; second by B. Edwardthi, with home flowers with yellow throat—the foliage is dark green; R. Veitchii crossed by R. Edgeworthii, with large crimped petals and wide mouth—highly scented; it is called Otto Forster; a hybrid between R. Thomsoni and R. Fortunei, of crimson flower and dark foliage, Its stamens have "contabescent" or imperfect anthers, not unfrequently seen in hybrids. Another called the Countess of Haddington is the offspring of R. Dalhousiæ crossed by R. ciliatum and Princess Alice; raised from R. Edgworthii crossed by R. ciliatum. Ite also showed the following species:—R. vigratum a species with small lowing species:—R. virgatum a species with small pink axillary flowers interspersed amongst the leaves, not unlike a Weigelia; R. pendulm, a rare species, described as an epiphyte upon Oaks, and remarkable for the closely tomentose under surface of the leaves. It refuses to hybridise.

The Weather of the Winter 1883—4.—Mr. Glaisher

The Weather of the Winter 1883—4.—Mr. Glaisher read an interesting paper on the remarkably high temperature of the last winter. See p. 543: Arum proboscideum, —Mr. Wilson exhibited a blossom of this curious lower, a native of Italy. Equiretum telmateia. —Mr. Houston exhibited specimens showing spikes with branched apices, eovered with sporangia in every case. Narcissus Eulbocodium (Monstrous).—Mr. Boulger showed a species of Narcissus Bulbocodium with several flowers confluent, and the parts variously multiplied in consequence.

multiplied in consequence.

Potato Disease and Artotrogus,—Mr. W. G. Smith

Folato Disease and Artotrogus,—Mr. W. G. Smith made a communication on this subject, see p. 541.

Calceolarias,—Mr. Henslow reported on the monstrous Calceolarias brought by Mr. Smee at last meeting. They both consisted of two flowers combined, but while in one case the two "slippers" were distinct, in the other the two adjacent sides of the two slippers were coiled up into a spiral, and thrust into the common interior of the two petals.

Ferns Grezon in the Dark,—Mr. Henslow showed several petioles of fronds (the lamina not being developed) crown in total darkness in a temperature varying.

loped) grown in total darkness in a temperature varying from 60° to 90°. They were of a pale green colour, while Peas germinated with them were void of

chlorophyll. Whip made of Seaweed.—He also showed a whip ade by twisted fronds of a Fucaceous Seaweed, made by twisted fronds of a Fucaceous Seaweed, probably a Laminaria, and a pipe made in the Hartz Mountains; the stem of a braoch of Pinus, a head carved formed the bowl, with a head composed of Usnea barbata, and tassels of fruit of Alder. Ornithogalium, sp.—Hon. and Rev. Boscawen sent a spray of handsome species, with large white scented flowers, It was referred to Mr. Eaker for determination.

FLORAL COMMITTEE.—Present in Section A...
John Fraser, Esq., in the chair; Messrs. E. Hill, J. O'Brien, H. Ballantine, H. Williams, H. Herbst, J. Woodbridge, F. R. Kinghorn, and the Rev. G. Henslow. Section B.: Shirley Hibberd, Esq., in the chair; Messrs. W. B. Kellock, H. Beennett, G. F. Wilson, W. Bealby, J. Child, D. C. Lathbury, G. Duffield, H. Cannell, H. Eckford, and J. T. D. Llewelyn. The meeting held on Tuesday was an interesting and enjoyable one, a nice misscellaneous collection of plants in bloom being brought out. In Section A., some choice Orchids were exhibited by Sir Trevor Lawrence, Bart, M.P., viz., a small plant of Angræcum fastuosum, introduced from Madagascar by Mr. Sander; an extremely rare plant, if not actually the only one in the country. The habit of the plant shown was very compact, with the white blooms nestling quite close down amongst the foliage: Dendrobium Harryanum, a heautifuly golden, delicately fringed bloom, borne on a slender spray; D. cionamomeum, and Cypripedium oiveum. Messrs. Veltch & Sons, Chelsea, sent five seedling forms of their strain of Amaryllis; Cupidon, a deep crimson, having a white band on each segment deep down in the tube; Admiration, a large white ground, flower striped with lake, the centre green; Prince of Wales, with creamy-white upper segments, suffused and striped with cherry-red, the colour becoming more intense in the lower part of the tube—this was of a particularly pleasing form, and firm substance; Cirrus, a flower with ivory-white glound, which was striped with a dull red colour, and very distinct; Clytie, a crimson, very much reflexed bloom. FLORAL COMMITTEE.-Present in Section

Messrs. Cutbush & Son, Highgate, showed the rare Messrs, Cutbush & Son, Highgate, showed the rate Daphne Genkwa, a native of Japan, the sparsely placed blooms of pale lilac not making a plant of any great decorative value — if one may infer anything from the diminutive plants shown, Mr. B. S. Williams, the Victoria Nursery, Upper Holloway, exhibited several hybrid forms of Sarracenias, S. Mitchelliana×, a cross between S. Drummondi rubra and S. purpurea; S. Tolliana×, a hybrid from S. purpurea and S. flava; and S. Maddisonia×, the result of a cross between S. variolaris and S. psittacina. For these interesting plants of a genus that is far too little grown Mr. Williams received a Vote of the result of a cross between S. variolaris and S. positacina. For these interesting plants of a genus that is far too little grown Mr. Williams received a Vote of Thanks. The same exhibitor had also the pale green Ceologyne Tarishii, Epidendrum bicornutum, and a pale lilac small blossomed Rhododendron named odoratum, also a very deep rose-coloured Odontoglossum vexillarium splendens, a heautiful thing, which found numerous admirers amongst orchidologists and others. Mr. E. Wilson, gr. to II. M. Follett, Esq., Fernside, Bickley, had a fine form of Odontoglossum Ruckerianum insigne, O. polyxanthum, and O. Juteo-purpureum, for which he was awarded a Vote of Thanks, as was also Mr. J. Jackson, gr. to Sir Charles Strickland, Hildenly, Malton, for Cattleya citrina. A Vote of Thanks was accorded to Messrs. Wimsett & Co., Chelsea, for a curious Oncidium named provisionally carthaginense, for Odontoglossum hebraicum, Cattleya speciosissima and Cypripedium Roebellenii. For the beautiful Phalænopsis casta x., a cross between P. leuchoda and P. amabilis. Mr. Adlous, gr. to G. Heriot, Esq., Cholmley Park, Highgate, was awarded a Vote of Thanks, the same being also received by Mrt. L. Black, for a pretty seedling Adiantum, somewhat similar to A. gracillinum, but more robust. In section B. Messrs. Veitch & Sons exhibited a curious looking Ghent Azalea, named Diamant, having pale rose lower petals, and a radiated blotch on the upper, of a deeper rose colour; Azalea indica having pale rose lower petals, and a radiated blotch on the upper, of a deeper rose colour; Azalea indica Paul de Schryver, a smooth, well-formed flower, rosy-crimson in colour, having the upper part of the throat spotted with a deeper tint. Mons. A. L. Rossel, nurseryman, Ghent, exhibited a pretty Azalea indica Souvenir de Marie Rossel, a double flower of a pale flesh colour at the upper portions of the petals, and a much deeper colour at the base; this is a decided acquisition to the class, Mr. T. S. Ware, Tottenham, brought a good collection of Narcissi and other hardy flowers, amongst the latter being several other hardy flowers, amongst the latter being several noteworthy plants, such as Iris sibirica, Tritelia uniflora lilacina, Orchis morio, Trollius altissimus, and Frimula Sieboldi rosea alba, A beautiful single Narcissus is N. poeticus poetarum, which worthily carries on the poeticus varieties to a late period of the spring. For this display Mr. Ware was awarded a Silver-giil Banksian Medal; and Messrs. Lane & Son, of Berkhamstead, received a similar award for a grand display of Rhododendrons and Roses in pots. The colours of the former were chosen with great judgment. consisting of generally appreciated varieties. The colours of the former were chosen with great judgment, consisting of generally appreciated varieties. Their Roses were numerous, many well known lavourites being amongst them. Very well bloomed were Madame Burney, La Rosière, Celine Forestiere, Edward Morren, Glory of Waltham, and Princess Mary of Cambridge. Messrs. Faul & Son, The Old Nurseries, Cheshnut, had for the period of the year a heautiful collection of Roses, large in size, well furnoished with vigorous foliage and very generally with excellent blooms, the dwarfs certainly exceeding the standard forms in every point; very fine being Madame Therese Levet, La Souvenir d'un Ami, Inocente Pirola, Madame Falcot, Catharine Mermet, Comtesse Riza du Parc, Marie Van Houtte, Marguerite de Romain, Hypolite Jamain, Duke of Teck, and Alba rosea. A Silver-gilt Eanksian Medal was awarded for this admirable collection. Messrs, James Carter & Co., were awarderd a Bronze Banksian awarded of this admirable colection. Messis, James Carter & Co., were awarderd a Bronze Banksian Medal for a collection of Cinerarias in considerable variety of colour. The form in most cases was fairly good, but the habit less compact than is seen in the exhibits of other first-class growers. A Bronze Banksian Medal was bestowed on a splendid group of Reseda odorata pyramidalis grandiflora, exhibited Mr. Warren, Worton Gardens, Isleworth, Messrs, Barr & Son, Covent Garden, were awarded a Silver Dark son, Golden Gaude, refer hardy flowers and Narcissis, among the former being the curious Tulipa cornuta, Scilla campaoulata, Ixiolirion tartarieum, a deep blue violet-coloured bloom, quite a gem. Mr. R. Dean, Ealing, showed the unique Myosotis sylvestris elegantissima, a pretty thing where an edg-ing of variegated oeat foliage is wanted, the white variegation setting off the blooms in a capital manner. This exhibitor showed also Anemone coronaria var. This exhibitor showed also Anemone coronaria var. Celestial, as proving that seed from single flowers is capable of bringing blooms that are distinctly double. Mr. George Geggie, Waterloo Nursery, Bury, Laocashire, showed a considerable number of seedling forms of Primula Sieboldi, in which there was much variation of colour through different tints of rose, lilac, crimson, blue, &c. One kind, Novelty, was very prettily fringed, and was markedly different from any of the others. Messrs. Veitch & Sons showed six

boxes of cut blooms of Narcissus bicolor Empress and N. longifolius Emperor, two very showy varieties, looking particularly so as shown. A Cultural Commendation was given to Mrs. E. Weatherill, Woodside Nussery, Finchley, for four striking varieties of decorative Pelargoniums, named respectively Queen Mab, Alice, Excelsior, and Woodside Gem. Mr. W. Slogrove, gr. to Mrs. Crawford, Gatton Cottage, Reigate, received a Cultural Commendation for cut blooms of Chrysanthemums, and for a scarlet zonal Pelargonium, Mrs. Crawford, Mons. V. Lemoine, Nancy, had a plant of a double, blue-flowered Lilac, a very distinct subject indeed. The spikes were compact and of a medium size, although, as the bush had been grown in a pot, the whole habit of the plant may have become dwarfed, and it may therefore develope characteristics somewhat differing from those boxes of cut blooms of Narcissus bicolor Empress and lope characteristics somewhat differing from those seen if planted in the open.

The awards made were :-

FIRST-CLASS CERTIFICATE.

Section A.

To Sir Trevor Lawrence, for Angræcum fastuosum. To Sir Trevor Lawrence, for Dendrobium Harry-

anum.
To Sir Trevor Lawrence, for Odontoglossum cinna-

momeum.

To Mr. B. S. Williams, for Odontoglossum vexillarium splendens.

Section B.

To Mr. H. Bennett, for Tea Rose Standard de

To Mr. G. Geggie, for Primula Sieboldii Purity.
To Mr. G. Geggie, for Primula Sieboldii Brilliant.
To Mr. G. Geggie, for Primula Sieboldii Brilliant.
To Mons. V. Lemoine, for Syringa flore-pleno To Mons. V. Lemoine, for Syringa flore-pleno Lemoiniana.
To Mons. A. L. Rossel, for Azalea indica Souvenir de

FRUIT COMMITTEE.—Present; II. J. Veitch, Esq., in the chair; Messrs. J. Lee, G. Paul, C. Silverlock, J. Smith, J. Roberts, J. Willan, R. D. Blackmore, G. Bunyard, S. Lyon, A. Howcroft, and P. Crowley. Mr. Thrower, High Canons, Shewley, Herts, showed a seedling Apple in a good state of preservation, It was named High Cannon, and was awarded a First-class Certificate. Mr. W. Divers, Wiletton, Maidstone, showed a collection of thirteen awarded a First-class Certificate. Mr. W. Divers, Wierton, Maidstone, showed a collection of thirteen dishes of Apples; and Mr. Dean, gr. to G. Levison Gower, Esq., Titsley Park, Reigate, a collection of nine dishes, for which votes of thanks were awarded. From the Society's garden at Chiswick came excellent examples of Rhubarbs—the finest and heaviest sticks were of the Victoria variety, the others being Hawkes Champagne, Early Albert, and Linnæus.

National Auricula (Southern Section). - The exhibition held on Tuesday was, from all points of view, the best that has been held in the Southern division. The flowers generally—that is, the show division. The flowers generally—that is, the show and alpine Auriculas—were in good form all through, and we were glad to note a larger number of them, as well as an augmented list of competitors—a certain sign of growing prosperity. The Northern growers were represented in person by the Rev. F. D. Horner, Mr. R. Gotton, Mr. En. Simonite, Mr. Pohlman, Mr. Mellort, and others; all were competitors except Mr. Gorton. Mr. Horner had, we believe, some difficulty in getting his flowers in, but, nevertheless, well held his own throughout, though Mr. Douglas ran him very close for the Veitch nevertheless, well held his own throughout, though Mr. Douglas ran him very close for the Veitch Memorial Medal. Mr. Simonite had but very few plants, Sheffield smoke and the east winds heing too much for anything growing on his "bony strip" of a garden at Rough Bank. The Northern flowers are all late, so that the Manchester show should be a good one. Mr. Douglas and Mr. Turner were well in, but the amateur again beat the nurserymen in all but the class for twelve alpines, and with these Mr. Turner's well ship to hold his own. The nurserymen in an but the class for twelve alpines, and with these Mr, Turner is well able to hold his own. The Polyaothus classes brought little change from the usual order of things, a thin competition, and it was a matter of regret generally expressed, that through indisposition Mr. Barlow was not able to he present. The dozen Fancy Polyanthuses shown by Mr. Douglas were much admired for their high cultivation, and expect feith possibilities the measure feith possibilities the superh finish, considering the season. Perhaps the most interesting class of all, that at least, that took the popular faocy most was that for species of Primula, which brought out by far the nicest lot of plants we have seen together, and the greatest amount of variety,

have seen together, and the greatest amount of variety, and it introduced us to new competitors in this field in the persons of Messrs. Paul & Son, of Cheshunt.

New Auriculas were exhibited in considerable numbers, and Mr. Horner again proved the strength of his position as a raiser by taking the lead in all the show sections, while Mr. Turner was facile princeps with alpines. In the green-edged section the 1st and 2d prizes were won by Mr. Horner, with, 1st, Mr. Simonite's Rev. F. D. Horner, a very good green-edge without spot, black ground colour, and the paste slightly angular, a good all-round flower; and Kestrel (Horner), a very neat flower with a good green outline, rather faulty black ground colour, paste dense and circular, and the tube pale. The 1st

prize for a grey-edged seedling went to Mr. Horner for Merlin (Simonite), an improved form of Ajax, with a good greenish-grey edge, black ground, perfect paste, and pale tube. Mr. Douglas was 2d bere, with Marmion, a good silvery-grey edge, rather lacking in ground colour, but good in the tube. In white edges, Mr. Horner was again 1st, with Magpie, a very symmetrical flower, white pure, ground colour black, paste white, tube pure yellow. The same exhlbitor was 2d with Miranda, rather rough as shown, being irregular in outline. The best self was Mrs. Horner, also raised and shown by Mr. Horner. It is a fine violet self of the finest form. The 2d prize in the same class went to Mr. Horner also, for Enchantress, a pale violet self, with rather thin paste and pale tube. The best gold centred alpine was Mr. Turner's Unique, a large flower of first-rate properties, maroon, shading to dull red, with a good golden-yellow centre. Mr. Douglas was 2d, with J. Laiog, a very bright reddish-maroon, shading to crimson, with yellow centre. In creamy or white centres Mr. Turner to kob both prizes, with Rainbow, maroon-purple, a very refined flower: and Placida. reddish-maroon, shading to dull maroon-purple, shading to pale purple, a very refined flower; and Placida, reddish-maroon, shading to dull red. First-class Certificates were awarded to Mr. Horner for the show varieties, Merlin, Magpie, and

Horner for the show varieties, Merlin, Magpie, and Mrs. Horner.
Mr. Brockbank was the only exhibitor of novelties among gold-laced Polyanthuses. In the black ground section he gained a 1st prize with John o' Gaunt, a fine showy flower, beautifully laced. With an unnamed seedling Mr. Brockbank was also 2d. In red grounds, he was also 1st with Lord Derby, a fine flower of the Exile form.

nne showy flower, beautifully laced. With an unnamed seedling Mr. Brockhank was also 2d. In
red grounds, he was also 1st with Lord Derby, a fine
flower of the Exile form.

TWELVE SHOW AURICULAS, DISSIMILAR. — The
special prize given in this class, a Veitch Memorial
Medal and £5, was won by the Rev. F. D. Horner,
Lowfield, Burton-in-Lonsdale, Carnforth, with F. D.
Horner (Symoniet, Colonel Taylor (Leigh), Monarch
(Horner), green-edged; George Lightbody (Headly),
grey-edged; John Simonite (Walker), Magpie (Horner),
Monolight (Horner), Miranda (Horner), white-edged;
and Mrs. Douglas (Simonite), Mrs. Horner (Horner),
Mars (Honner), and Heroine (Horner), sells. The first
of the Society's prizes was won by Mr. Douglas, gr. to
F. Whitbourn, Esq., Great Gearies, Illord, with Colonel
Taylor (Leigh), Prince of Greens (Traill), Lancashire
Hero (Lancashire), Jumbo (Douglas), green-edged; George
Lightbody (Headly), Marmion (Douglas), grey-edged:
Frank Simonite (Simonite), Smiling Beauty (Heapl), whiteedged; and C. J. Perry (Turner), Pizaron (Campbell), and
Blackbird (Spatiding), sells. 2d, Mr. E. Pohlman, Halifas,
with Frince of Greens (Traill), Lancashire Hero (Lanedged, George Lightbody (Headly), grey-edged; Early
(Traill), Regular (Ashworth), Acme (Read), and Countess of Wilton (Cheetham), white-edged; and C. J.
Perry (Turner), and Kingdove (Horner), sells. 2d, Mr.
Turner, Slough, with Lovely Ann (Oliver), Talisman
(Simonite), Lancashire Hero (Lancashire), and Beauty
(Traill), green-edged; Stapleford Hero (Headly), Mrs.
W. Brown (Turner), grey-edged; Layd Sophia Dumaresque (Lightbody), Frank Simonite (Simonite), whiteedged; Meteor Flag (Lightbody), Topsy (Kay), and
True Briton (Hepworth), selfs. 4th, W. Brockbank,
Esq., Didsbury, Manchester, with Colonel Taylor
(Lancashire), green-edged; George Lightbody (Headly),
and Alex. Meiklejohn (Kay), grey-edged; Smiling Beauty
(Headly), John Simonite (Mellor), and
Res, Meiklejohn (Kay), grey-edged; Smiling Beauty
(Headly), Tone (Greens), and George
Lightbody (Headly),

(Lancashire), Confidence (Campbell), Lord of Lorne (Campbell), and Pizaro (Campbell).

(Lancashire), Confidence (Campbell), Lord of Lorne (Campbell), and Pizaro (Campbell).

Two Show Auriculas, Dissmilar,—ist. Mr. T. E. Henwood with George Lightbody (Headly) and Mrs. Douglas (Simonite). ad. Mr. E. Shaw with George Lightbody and C. J. Perry (Turner). 3d. Mr. C. Phillips, Hamilton Road, Earley, with Richard Headly) and C. J. Perry. (Turner). 3d. Mr. C. Phillips, Hamilton Road, Earley, with Richard Headly) and C. J. Perry. 4d. Mr. C. Phillips, Hamilton Road, Earley, with Richard Headly) and C. J. Perry. 4d. Mr. C. Phillips, Hamilton Road, Earley, with Richard Headly in the Company of the

and Alex. Menagouin.
TWELYE DISSIMLAR FANCY AURICULAS,—1st, Mr. James Douglas, with all yellow ground flowers; 2d, S. Barlow, Esq.
THE PREMIER AURICULA was Traill's Prince of Greens, exhibited by Mr. Pohlman.

ALPINE AURICULAS.

ALPINE AURICULAS.

TWELVE DISSIMLAR.—1st, Mr. Turner, with Garnet, Mrs. Llewelyn, Mrs. Thomson, Unique, Comet, Purple Gem, Luna, Napoleon III., Aurora, Mrs. Ball, Gem, and Murillo, all of his own raising; 2d, Mr. Douglas, with Sensation, Mrs. Llewelyn, Mrs. Mciklejohn, Ada Hartwidge, Dolly Varden, Mrs. Cope, and the remainder unnamed seedlings.

SIX DISSIMLAR.—1st, Mr. Turner, with Mrs. Ball, Troubadour, Comet, Lavinia, Rainbow, and Bayard; 2d, Mr. Douglas, with Mrs. Llewelyn, Rosanond S. Fellowes, Mrs. Meiklejohn, Queen Victoria, Amelia Hartwidge, and Ada Hartwidge; 3d, Rev. E. L. Fellowes, and two seedlings.

SINGLE SPECIMENS.—Gold Centres: 1st, Mr. Turner, with Unique; 2d, Mr. Douglas, with ascedling; 3d, Mr. Turner, with Unique; 2d, Mr. Douglas, with seedling; 3d, Mr. Turner, with Unique; 4th, Mr. Douglas, with Sensation; 1st hand 6th, Mr. Turner, with Unique; White or cream centres: 1st and 3d, Mr. Turner, With Unique; Alph, Mr. Douglas, with Queen Victoria and Ada Hartwidge.

POLYANTHUSES.

POLYANTHUSES.

SIX DISSIMILAR, GOLD-LACED. — 1st, W. Brockbank, Esq., with Lord Derby (Brockbank), Exile (Crownshaw), Prince Regent (Cox), John o'Gaunt (Brockbank), President (Hilton), and Black Diamond (Brockbank), President (Hilton), and Black Diamond (Brockbank), Qf. S. Barlow, Esq., Stakehill House, Castleton, Manchester, with John Bright (Barlow), Exile, Prince Regent, President, Cheshire Favourite (Saunders), and Model (Barlow), gd. Mr. James Douglas, with Exile, George IV, (Buck), Lancer (Bullock), President, William IV. (Buck), and Cheshire Favourite. 4th. Mr. R. Dean, Ealing, with Model, John Bright, Lancashire Hero, Lancer, Lord Morpeth, and a dark ground seedling.

ling.

THREE DISSIMILAR, GOLD-LACED.—1st. S. Barlow, Esq., with John Bright, Cheshire Favourite, and Exile; 2d. Mr. Douglas, with George IV., Exile, and Lancer.

3d. W. Brockbank, Esq., with a dark ground seedling, President, and Cheshire Favourite. 4th. J. J. D. Llewelyn, Esq., with Lancashire Hero, Rev. F. D. Horner (Jackson), and President.

The best single specimen was a Cheshire Favourite, shown by Mr. Brockbank.

TARLINE DISSIMILAR FANCY POLYANTHUS.—1st. Mr.

TWELVE DISSIMLAR FANCY POLYANTHUS.—1st. Mr. Douglas, with a grand lot of plants, well flowered, clean, and fresh, white, yellow, and parti-coloured varieties. Mr. R. Dean was 2d not in his usual form, his best

PRIMULAS.

PRIMULAS.

TWELVE PRIMULAS (at least six distinct species)—
1st, J. T. D. Llewelyn, Esq., with well-flowered examples of Primula Sieholdii and P. Sieholdii alcninat, p. japonica, P. verticillata simensis, P. silkdimensis, P. japonica, P. verticillata simensis, P. silkdimensis, P. cortosoides, P. rosea, P. obconica, and pulcherrima; 2d, Mr. Douglas, with a pretty lot consisting of varieties of P. Sieholdii, P. Munroi, P. obconica, and P. marginata, &c. Messrs. Paul & Son, Cheshunt, were 3d, with smaller examples, but more variety, their sorts being P. denticulata, P. japonica, P. acaulis alba (Purity), P. ciliata purpurae, P. rosea, P. Munroi, P. imbricata, P. viscosa, P. pubescens, P. farinosa, &c.

P. viscosa, P. pubeseens, P. farinosa, &c.
P. viscosa, P. pubeseens, P. farinosa, &c.
Royal Botanic: April 23,—This, the Society's second show of the season, was held in the new glass corridor and the adjoining conservatory, and brought a considerable quantity of useful plants together. The new plants which were considered by the judges as being fit subjects for a Botanical Certificate were Phalenopsis Casta, shown by Mr. R. Aldous, gr. to G. Heriot, Esq., Cholmeley Park, Highgate; Sarracenia Mitchelliana x. S. Tolliana x., Kentia Lindeni, Ptycosperma Seemannii, shown by Mr. B. S. Williams, Victoria Nursery, Upper Holloway; and Cypripedium insigne Sylhetense, shown by Mr. B. S. Williams, Victoria Nursery, Upper Holloway; and Cypripedium insigne Sylhetense, shown by Messrs. P. Veitch & Sons, Chelsa.

Was bestowed were Azalea Sonvenir de Marie Rossel, shown by Mns. A. L. Rossel, nurseryman, Ghent; Amaryllis Mrs. Hird, shown by Messrs. Paul & Son, The Oil A Investries, Chebanut; Azalea Paul de Schryver, and Amaryllis Admiration, and Princess of Wales, shown by Messrs. J. Veitch & Sons; Syringa Lemoiniana, a double variety shown by Mons. A. L. Rossel, nurseryman, Ghent; Amaryllis Admiration, and Princess of Wales, shown by Mr. Salea indica Antigone, shown by Mr. C. Turner, Royal Nursery, Slough. Cineraria Princess Ida, adark purple-crimson self; Beadsman, a rosy-maue self; and Pioneer, a rosy-purple, having a white circle round a dark eye, shown by Mr. J. James, Woodside, Farnham Royal. Cyclamen Hillingdon Rival, a white circle cound a dark eye, shown by Mr. J. James, Woodside, Farnham Royal. Cyclamen Hillingdon Rival, a white circle cound a dark perple-crimson self; Beadsman, a rosy-muse self; and Pioneer, a rosy-purple, having a white circle round a dark eye, shown by Mr. J. James, Woodside, Farnham Royal. Cyclamen Hillingdon Rival, a white circle cound a dark eye, shown by Mr. J. James, Woodside, Farnham Royal. Cyclamen Hillingdon Rival, a white circle cound a dark eye, shown by Mr. J. Hill, gr. to H. Little, Es

bloom.
In the amateurs' class for the best six Roses in pots, 1st, Mr. J. Perry, gr. to W. G. Powlett, Esq., The Woodlands, Cheshunt, who staged Ed. André, Madame V. Verdier, Ed. Morren, Magna Charta, Marie Baumann, and C. Joigneux; 2d, Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston, For the best six greenbouse Azaleas in the amateur's class, 1st, Mr. G. Wheeler, with medium-sized plants; 2d, Mr. H. Eason, gr. to B. Noaks, Esq., Hope Cottage, Highgate; 3d, Mr. R. Bruter.

with medium-sized plants; ad, Mr. H. Eason, gr. to B. Noaks, Esq., Hope Cottage, Highgate; 3d, Mr. R. Butler.

In the nurserymen's class, for the best six greenhouse Azaleas, rst, Mr. C. Turner, Slough, whose exhibited plants consisted of specimens in no case exceeding 4 feet in height, well bloomed throughout, the sorts being lean Vervaene, Comtesse de Flandres, George Loddiges, Duc de Nassau, Mons. Thibaut, Madlle. Marie Lefebvre; 2d, Mr. H. James, Lower Norwood, who showed very beautiful Apollon and punctulata maculata. For the best twelve Amaryllis (open), rst, Mr. J. Hill, Hilligdon Place, with Burtoni, Firefly, Admiral Hornby, Hercelles, Prince of Teck, scarlet varieties; Jules Favre, Baron von Beust, and Princess Dagmar, white grounds and bright coloured stripes; 2d, Mr. R. Butler, gr., St. Dunstans, amongst this collection there being a variety of a deep blood-red colour, the petals of which were curiously twisted, and thereby rather adding to its beauty than otherwise. Madame Trietjens, a white ground having crimson stripes, was also a conspicuous flower. For the best nine Cincarias (open), rst, Mr. J. James, Woodside, Farnham Royal, Slough, its selfs and various coloured flowers being as usual very superior in every point; 2d, Mr. J. Hill; 3d, Mr. C. Turner, who had Rosy Morn, Kingston Eeasty, Joe, Decorator, Duchess de Morny, &c.; 2d, Mr. J. Hill, in whose lot where the brilliant Dr. Diamond and Emily Everard.

In the open class, for the best twelve show Auriculas

Filli, in whose lot where the brilliam Dr. Diamond and Emily Everar class, for the best twelve show Auriculas—1st, Mr. [as. Douglas, Great Gearies; ad, Mr. Pohlman; ad, Mr. C. Turner (each exhibitor showing probably the identical plants which had taken honours at

South Kensington the previous day). In the miscellancous class, Messrs. Paul & Son, Old Nurseries, Cheshunt, showed a large group of Roses in pots, beautifully flowered for the season, and were awarded a large Silver Medal for the same. A collection of Primula species and hybrids from the same firm received a Certificate. A Silver-git Medal was awarded to Messrs. W. Paul & Son, Waltham Cross, for Roses in pots, and Clematies R. Hanbury and Countess of Lovelace, also for five large boxes of cut Rose blooms, inclusive of a handsome one full of big Maréchal Niel Rose blooms, Messrs. Lane & Son were awarded a large Silver Medal for a collection of Roses in pots. Messrs, W. Cutbus & Son, Highgate, received a large Bronal Messrs and collection of mixed stowed a large Bronal Messrs and collection of mixed stowed a large Bronal Messrs and collection of mixed stowed a large Bronal Messrs and collection of mixed stowed a large Bronal Messrs and collection of pixel blosoms of which are quite ernamental; two Statices—Butcheri and Bondelli; Pavonia Wiotii, a Diosma or two, Pimelea Nieppergiana, Eriostemons in variety, and many other pleasing plants new and old. Mr. B. S. Williams, Upper Holloway, obtained a large Silver Medal for a collection of plants in which the warm-house section predominated. The same handsome Odontoglossum vexillarium spendens that had been shown at the Horticultural Society's meeting on Tuesday, Cochlostema Jacobiannyn, Oncidium leuchochilum, Dracsena Lin. predominated. The same nandsome Odontogiossum vexillarium splendens that had been shown at the Horticultural Society's meeting on Tuesday, Cochilostema Jacobianum, Oncidium leuchochilum, Dracema Lindeni, Gleichenias rupestris glaucescens, Mendeli, several Adiantums, Palms, &c., which assisted in making a very effective whole. Mr. Rumsey Joyning's Nursery, Waltham Cross, obtained a large Silver Medal for an admirable collection of Roses in pots, and for boxes of cut blooms of the same; and Messrs. Paul & Son, Old Nurseries, Cheshunt, were awarded a large Silver Medal for a group of standard Roses. A small Silver Medal was awarded to Mr. C. Turner, for his choice collection of show and alpine Auriculta; a Pronze Medal to Mr. J. Wiggins, for a group of Cinerarias; a large Bronze Medal to Messrs. Carter & Co., for a collection of Cinerarias; Messrs. Barr & Son a small Silver Medal, for Narcissus and hardy flowers; and to Messrs. Lane & Son, for a collection of hardy Rhoddendroms in pots, a large Silver Medal was awarded; Messrs. Carter & Co., receiving a Certificate for a wonderfully comprehensive and beautiful collection of cut blooms of Amenones and Ranuncultuses.

 23.—Fine bright day, overcast at night, cold wind.

LONDON : Atmospheric Pressure .- During the week ending April 19, the reading of the barometer at the level of the sea decreased from 30.06 inches at the beginning of the week to 30.03 inches by 3 P.M. on the 13th, increased to 30.11 inches by midnight on the same day, decreased to 29.83 inches by 3 P.M. on the 16th, increased to 30.03 inches by midnight on the 17th, decreased to 29.85 inches by 3 P.M. on the 19th, and was 29.92 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.95 inches, being 0.06 inch higher than last week, and 0.03 inch above the average of the week.

Temperature. - The highest temperature in the shade in the week was 52°, on the 13th; the highest

reached on the 17th was 45°.1. The mean of the seven high day temperatures was 48°.6.

The lowest temperature was 35°, on the 13th; on the 15th the lowest temperature was 41°. The mean of the seven low night temperatures was 37°.2.

The greatest range of temperature in one day was on the 13th; the smallest was 8°.8, on the 15th. The mean of the seven daily ranges was 11°.4.

The mean temperatures were - on the 13th, 42.6; on the 14th, 43.7; on the 15th, 43.3; on the 16th, 43.3; on the 17th, 39.5; on the 18th, 40.1; and these were albelow their averages by 3.5, 2.6, 3.2, 3.6, 7.3, 6°,9, and 7°.4 respectively.

The mean temperature was 41°.7, being 5°.1 lower than last week, and 4°.9 below the average of

the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 105°.3, on the 18th. The mean of the seven readings was 92°.5.

The lowest reading of a minimum thermometer with its bulb placed on grass was 27° on April 13. The mean of the seven readings was 29°.2.

Rain.—Rain fell on two days to the amount of

ENGLAND : Temperature .- During the week ending ENGLAND: Temperature.—During the week ending April 19 the highest temperatures were 56° at Truro, 55° at Plymouth, 54°,3 at Nottingham; the highest at Bolton was 49°, at Wolverhampton 49°,2 and at Liverpool 49°.6. The general mean was 51°,9. The lowest temperatures in the week were 24° at Camhridge, 29° at Hull, 29°,3 at Bolton; the lowest at Sunderland was 36°, at Blackheath 35°, and at Truro 33°. The general mean was 31°.1.

The greatest ranges were 29°,6 at Camhridge, 23°,6 at Plymouth, 23° at Truro; the smallest ranges were 14° at Sunderland, 17° at Blackheath, and at Liverpool 18°,0. The centeral mean was 20°.8.

14° at Suoderland, 17° at Blackheath, and at Liverpool 18°.9. The general meao was 20°.8. The mean of the seven high day temperatures was highest at Truro, 52°.3, at Plymouth 51°.4, at Cambridge 49°.5; and was lowest at Sheffield 45°.9, at Bolton 46°.2, and at Sunderland 46°.7. The general mean was 48°.3.

The mean of the seven low night temperatures was highest at Sunderland, 38°.9, at Truro and Plymouth, 38°.6; and was lowest at Cambridge and Wolverhampton, 33°.5 and at Bolton, 34°.4. The general mean was 36°.4.

The mean daily range of temperature was greatest at Cambridge, 16°.0, at Truru 13°.7, at Wulverhampton, 13°.4; and was least at Sunderland, 7°.8, and at Sheffield and Liverpool, 9°.5. The general mean

ffield and Liverpool, 9°.5. The general mean

as snenen and exception, 9.5. The general mean was 11°.9.

The mean temperature was highest at Truro, 44°, at Plymouth, 43°.5, at Preston, 41°.8; and was lowest at Wolverhampton, 38°.7, at Bolton, 38°, and at Hull, 39°.9. The general mean was 46°.3.

Rain .- The largest falls were 0.54 inch, at 0.27 inch at Nottingham, 0°.25 inch at Leeds; the smallest fall was 0.01 inch at Brighton, 0.03 inch at Plymouth, and 0.08 inch at Blackheath. The general mean fall was 0.16 inch. No rain fell at Truro.

SCOTLAND: Temperature.—During the week ending April 19, the highest temperature was 55°, at Greenack; at Aberdeen the highest was 49°.5. The general mean was 52°.9.

The lowest temperature in the week was 32°, at Perth; at Leith the lowest temperature was 38°.8.

The general mean was 38°.5.

The mean temperature was highest at Glasgow, 44°.8; and lowest at Perth, 42°.5. The general mean was 43°.8.

Rain.—The largest (all was 0.35 inch, at Perth, and the smallest fall was 0.04 inch, at Greenock and Leith. The general mean fall was 0.12 inch.

JAMES GLAISHER, F.R.S.

Obituary.

A CONSIDERABLE blank has been created in the ranks of the northern florists by the somewhat sudden death, last week, of Mr. GEORGE RUDD, Undercliffe, Bradford. He suffered a great bereavement a few months ago by the death of his wife, which preyed upon his mind. It is only quite recently that he had taken to raising seedlings of his favourite flowers, Carnations and Picotees, the climate of Bradford being very unfavourable to seed-saving. He was also a grower of Auriculas, and hybridised the flowers from which the late Mr. Thomas Woodhead's seedlings were raised. He has left a young family to mourn his loss, including an infant, which came into the world with the death of his wife.

Answers to Correspondents.

ALPINE AURICULA: J. C. Your seedling is perhaps good enough for a border flower, but it has nothing to recommend it to a florist.

ANTHURIUM: J. Hibbard. Of a form, and very good in colour. considerably larger. Of good average size and our. We have seen many

COOL VINERY: T. L. We cannot recommend you to use the rolled glass. You want the clearest glass you can get for a cool vinery—that which will admit the greatest amount of light and heat.

CROTONS: W. B. The leaves most probably fall off from the plants having experienced a sudden lowering of the temperature. We can see no appearance of disease.

GRAPE VINES, DISEASED: Vitit. The same appearance has been noticed on many samples of Vine foliage sent to us, and it is a matter which scientific men have not cleared up as yet. Something about your houses, or the soil the Vines grow in, or the manure given them—liquid or solid—perhape favours this particula allment. That is not work the property of any Vine so long as it is in vigorous growth.

GRASS: J. Buckland. It looks like Dactylis glomerata, Send again when in flower,

HOLLY LEAF INSECT: 7. M. The leaf-mining insect is Phytomyza ilicis. Collect the leaves as they fall off and burn them. We are still in the dark as to the cause of the other disease

INSECTS: W. M. P. & Co. A common weevil in gar-dens (Otiorrhynchus sulcatus). They feed at night, and should be captured by shaking the plants over a sheet or a newspaper.

LAWN MOWER: Vego. Consult our advertising

MESSRS. PROTHEROE & MORRIS' ORCHID SALE.— The Publisher desires to express his regret for a mispriot by which April 22 was stated as the date of the sale instead of April 29.

prot ty which April 22 was stated as the date of the sale instead of April 29.

NAMES OF PLANTS: A. B. Odontoglossum pulchellum. — S. B. Oxalis valdiviensis. — T. Mackir. 1 and 2, Primula capitata; 3, Aubrietia deltoidea; 4 doronicum Columne; 5, Narcissus incomparabilis, flore-pleno. — Old Subscriber. Violet Duchesse de Parma. The purple flower is a Phytolacca, but we have been unable to make it out. Can you oblige us with a good specimen and its history? — C. K. P. 1, Athyrium filix-feemina; 2, Berbens aquifolium; 3, Daphoe pontica; 4, Ribes aureum; 5, Corydais solida; 6, Primula cortusoides. — G. F. Eucharis candida, not Sanderi. — H. Odontoglossum crisquam 11. Suuan. 1, Odontoglossum crisquam 11. Suuan. 1, Odontoglossum crisquam 12, 2, O. Wilckeaum. — F. Neuman. Odontoglossum Rossii rubescens—a very good vatiety. — T. Cornelium. Epidendrum aromaticum. — T. W. Vanda Roxburghin. — J. K. L. Lyvaets and Odontoglossum Lindleyana. — W. B. Teffrey. Datura Stramonium. The Orchid flower is abortive — send a perfect one. — T. T. C. Helleborus viridis. — T. C. 1, Rubus spectabilis; 2, Pyrus salicifolia. — M. P. Aemonoe fulgens flore-pleno. — I. Capman. 1, Sella italica; 2, Cattha palustris. — G. O. 1, 2, 3, Not recognised; 4, Forsythia viridissima.

Oncidium Marshallianum: IV. G. A form with three lips; the two side ones probably represent two of the six stanens which a perfect Orchid flower should (theoretically) possess.

TENANTS' FIXTURE: Ponto. The district surveyor is, we believe, right. We know nothing of the case you

"All communications intended for publication should be addressed to the "Editor," and not to the Publisher or to any member of the staff personally. The Editor would also be obliged by such communications being urritten on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 47, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post Office, Druy Lane, London, W.C.

INTELLIGENT READERS, PLEASE NOTE: — Letters re-lating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT Paper, should to the Editor.

Markets.

COVENT GARDEN, April 24.

No alteration from last week, and no signs of recovery at present. The open weather of the first quarter of the year has inundated our market with all classes of goods both indoors and out, at a time when least required, and no improvement can be expected till a better demand is met by a more proportionate supply. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: April 23.-The market to-day was thinly attended, with but a limited business passing. As regards values, no material change can be noted. For Clover and other seeds there is a consumptive demand at unaltered quotations. There is rather more inquiry for auered quotations. There is rather more inquiry for Italian and perennial Rye-grasses. Spring Tares move off slowly on former terms. A little less money is asked for Hempseed. Feeding Linseed is flat. Other articles call for no remark. John Skaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

POTATOS.

A quiet trade has been done with a moderate supply, at the following quotations:—English, Champions, 45s. to 55s.; ditto, Regents, 50s. to 60s.; ditto, Roses, 50s. to 55s.; ditto, Victorias, 60s. to 80s.; Irish Champions, 405, to 505, err ton; and German reds, 25, 6d, to 35, 6d, per hag. The import into London last week consisted of 1275 bags from Malta, 340 Antwerp, and 96 bags from Harlingen.

The following are the prices, current at market during the week:—Walls End—Hetton, 16s. 6d.; Hetton Lyons, 15s.; Lambton, 16s.; Wear, 15s.; East Harthepool, 15s. 9d.; South Hartlepool, 15s. 3d.; Tees,

SEND FOR A PRICE LIST OF

JOHN BLAKE'S ACTING HYDRAULIC RAMS.

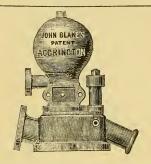

FOR RAISING WATER FOR THE SUPPLY OF

TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, and FARMS.

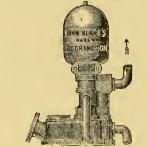

No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams. NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

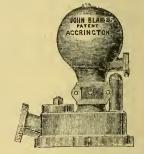

SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Galions passing through them.

Blake's Special Ram, to work under small falls The patterns vary with the different sizes.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, is capable of sending up two gallons out of every five gallone passing through it.

BLAKE'S HYDRAULIC RAMS

A MOST BEAUTIFUL NOVELTY

GOOL GREENHOUSE OF SHELTERED GARDEN

This lovely terrestrial Orch d is as yet comparatively unknown, but we find that it was figured in 1840, in the Botizze petals form so topod a background for the white lig, which they so much relieve, that this species is certainly more worthy of cultivation than C veratrifolis fand other? "We have successfully imported good stout buds, and offer them, whilst unsold, at 22.6d each; 6 for 122: 12 for 212.

HOOPER & CO., Covent Garden, Londoo, W.C.

OUR FRUIT CROPS.

OUR great dramatist's "cloud-capt towers" have hardly become a more apt illustration of the baseless fabric of a vision than has the glorious promise of a magnificent crop held out to us but a week or two since. Nay, so terrible has been the fierce grip of a succession of intense frosts that hardly a wreck of the fruit germs have been left alive. An old market fruit-grower who then was thought to be but a croaking raven, not long since remarked of the Plum bloom, that when the trees were so gayand rarely have they bloomed more abundantlythey never looked so well again the same season. There was the same old-world wisdom in that remark that is often found in those of weather observers, who say sometimes of a fine morning, that it is too proud to last. As a rule, the remark proves prophetic, as the sky soon becomes overcast and the glory of the morning is turned to weeping.

Our market friend was also a keen observer of Nature and the seasons, and his prognostication has too soon been verified. Alas! the trees have looked beautiful once this year, and they will look so no more. We shall look in vain on Plums, Pears, Cherries, or even Apples, for the rich displays of beautiful and profitable fruits. Not merely the hope, but the realisation has vanished. The destroying angel came not with fire and sword, but with piercing frost, and it entered even into the hearts of our fruit blossoms. Even now do we see the Apples opening their rosy-red blossoms in masses, clothing the trees with loveliness and beauty, but all is lifeless, soulless, dead. Perhaps here and there, in some favoured spots, or on hardier kinds, a few blossom-buds have been spared. but with the mass the bloom will be hollow mockery, as already we know that it is barrenuseless. It has been remarked of both Plums and Pears, that owing to the long spell of low temperature which prevailed, the foliage remained undeveloped, and thus no natural protection was given to the bloom. That may be to some extent true, but it is equally probable that the very abundance of the bloom on so many trees of itself checked the earlier bursting of leaf-buds. It is also certain that on few trees where there then happened to be little bloom and much leafage, the destruction has been equal; indeed the power exhibited by the frost in piercing and destroying the germs of even the most unobtrusive of bloom-buds on standard trees, seems to have been unusually potent, perhaps, nevertheless, that it was exercised with unrelenting force night after night.

We cannot yet tell how far bush fruits, Raspberries and Strawberries may have suffered; as much has depended upon exposure or otherwise. Still, with some certain loss, we may well hope that these fruits will still give to us a fair average crop. Gooseberries were singularly full of fruit, and fortunately were well leaved — still further less exposed to the keen, cutting winds. If the crop should not prove too heavily hit, something at least will be left to market-growers out of the general wreck.

To whatsoever meteorological cause we owe this disaster to our fruit crops, it is certain that it cannot be wholly, if at all, due to our insular position. Even whilst our later frosts were killing what previous ones had left alive, a bitterly cold wave of air passed over certain portions of the continent of Europe and worked cruel mischief amongst the Vincs in the wineproducing districts, creating perhaps more loss in many localities than has been produced here, where our market growers wisely have, as a rule, more than one string to their bows. Still, we should like to know more about the causes which operate to produce these depressions of temperature at such unseasonable periods than we do at present, and specially as to the future nature of our spring seasons, as if these are to display year after year the treacherous aspect shown this year, and in not a few previous ones, planters of fruit trees in the open will but sow the wind to reap the whirlwind. After all, what a reflection does this almost inevitable destruction of our fruit trees make upon the oft urged advice to plant far more fruit trees. Sanguine persons, and specially those who seem to exist on hope, may believe that good fruit crops will come sometimes, and that they will then pay. But year after year goes on, and a really good fruit season seems to become more and more an ignis fatuus, as this year - just within grasp, and then suddenly disappearing. In the meantime the labourer must be paid, the stock must be maintained, the landlord will call for his rent, the parson for his tithes, both ordinary and extraordinary, the rate and tax collectors will have their dues, and the unfortunate tenant and planter must live. And what upon? Your genuine market grower is a man of hard experience, and happily, as a rule, lets off the bitter disappointment he feels in nothing more harmful than expletives; then he presently accepts the position, and fights on as best he can. He does not go to Parliament with a wild cry for relief, for local subventions from the imperial taxes, for Acts of Parliament to shut out the contagion of the deadly east wind. The prospect of a great crop of fruit, that was to recompense for previous years of leanness-to furnish a nest-egg against coming ones, and to truly set him on his legs as a prosperous man-has faded out, and he must buckle-to, cutting down here, paring there, and grinding himself until the hard time is tided over. One large grower told us the other day that he had got a monster pile of new sieves and half-sieves in for Plums only, and had others in hand, but that he must stop the making now, and his baskets must remain goodness knows how long on his hands, as sunken capital, incapable of employment. How this fact illustrates the far-reaching effect of such a dire disaster to our fruit crops as that we now deplore! Apart from the grower and his army of labouring men and women there are the basket maker, the salesman, dealer, costermonger, jam maker, sugar merchant, the vast body of fruit consumers, indeed, who does not suffer?

We learn from private gardeners from all parts of the kingdom of the losses each one's fruit crops have experienced, and perhaps each one thinks his own case the worst. At least they may find some consolation in the fact that they are not growers for market and for a livelihood; that they have not a score or perhaps 100 acres of fruit orchards on their hands, the crop of which was to bring to them wealth and happiness, the destruction of it perhaps misery and ruin. If ever the market fruit growers of the kingdom merited our hearty sympathy they do so at the present moment. He would be, indeed, a courageous man who would, in the face of the terrible facts we have written of, still venture to advise farmers to turn fruit cultivators for market. Better for them ten times let well alone. Probably as it

is their Wheat plants and their pastures have brought them anxiety enough, and to add to those troubles the burthen of a destroyed fruit crop would be but to break the camel's back. We may plant and may water, but other power alone gives the increase, or, as now, withholds it. Let those who complain of our great importation of fruit from other and more favoured climes take that injunction to heart. Willingly would we grow ten times what we do, but as long as Nature refuses the increase we shall do wisely to direct our labours to more assured ends.

THE KAURI GUM FIELDS.*

SOMBRE, solemn, and grand are the Kauri forests of Northern New Zealand. If you want beauty of mixed foliage, of wide-spreading, branching trees, all interlaced with knotted vines and tufts of rosy blossoms—forests where the golden sunlight steals in delicately-divided rays through the exquisite canopy of tall Tree Ferns, to fall in radiant gleams on the carpet of all manner of silver-backed and other lovely ground Ferns—you will find these in perfection wherever the grievously "improving" hand of the settler has spared the primeval bush. Alas 'that we should have to say, such precious visions of Eden are already few and far between—only to be found in the least frequented districts.

But the Kauri forests are a thing altogether apart; and alas! indeed, of these also we must say that they are rapidly diminishing before the too busy axe of the lumberer. The Kauri [Dammara australis] is the Pine tree of New Zealand, one of the few repre-sentatives of the Coniferous family, and a very noble representative it is, though by no means answering to our ordinary notions of Pine trees, inasmuch as its foliage consists of leaves instead of needles; but it is tall and straight as a mast, and a very majestic mast, for these stately trees range from 15 to 50 feet in girth, and attain a height of from 100 to 200 feet ere they commence throwing out the branches which form their crown of sombre green. This is a special industry peculiar to Northern New Zealand, and the precious gum is a semi-fossilised deposit which is found buried at a depth of 5 or 6 feet below the surface of the ground, or tracts of open land, where in bye-gone ages grew Kauri forests which have long since disappeared. It is thought probable that these forests have been burnt, and that the exceeding heat liquefied the resio and caused it to flow more freely, for the digger is sometimes rewarded by finding a lump as big as his own body, though more frequently it lies buried in fragments from the size of an egg to that of a man's head.

The value of the gum varies with its colour, which is sometimes of a rich brown, sometimes bright amber, and ocasionally almost like pale crystal. Sometimes it is clouded, sometimes quite clear, revealing flies and tioy beetles which, perhaps for ages, have been enshrined in its transparent depths. The clearest and most crystalline pieces fetch the highest prices, and are carved into ornaments hardly to be distinguished from amber, but very much more brittle. When these extra fine pieces have been selected, the rest is sold in the Auckland market at from £30 to £40 a ton, and is purchased by English and American manufacturers of varnish. The amount collected must be enormous, as the value of the annual export from the colony ranges from £70,000 to £200,000. None is found in the Southern Isle, nor, indeed, to the south of latitude 37° 30′, which is the southernmost limit of the growth of the Kauri.

Whether the special qualities of the buried gum are due to old age, or to the possible action of fire, is unknown; but that which is obtained from the living tree is altogether worthless for the market, being soft and sticky—in fact, simple resin. Large quantities in this condition are sometimes found about the roots of growing trees in the forest; but of this very little can be turned to account.

At one time as many as 2000 men made their living as professional gun-diggers, but in these more settled days other occupations are found to be more remunerative, and a comparatively small number now adopt this as their regular employment—those who do so being for the most part the unsettled roving members of the community.

FLOWERS IN SEASON.

RHODODENDRON AUCKLANDII, - The annual flowering of this magnificent Himalayan species, and the comparative freedom with which flowers are produced, renders it of great value for the decoration of a cool house. In the Winter Garden at Kew, where it flowered about the same date last year, it is now very conspicuous, amongst several others, by its immensely large white blossoms. On first expansion the campanulate corolla is copiously suffused externally with rosy-pink, and to a certain extent also on the interior of the lobes, but after a time this gives place to pure white. The crimson bracts replacing leaves on the basal half of the young growths is another remarkable feature of this species. Plants in the open ground, with several inches of young wood, have had this almost completely destroyed by the 8' to 10° of frost we experienced lately. This species is figured in Dr. (now Sir Joseph) 11ooker's Rhododendrons, t. 11, and a painting of it (No. 257) is to be seen in the "North" Gallery at Kew. It is also known as R. Griffithianum.

MELASTOMA HETEROMALLA. - It is matter of regret that the flowers of Melastomads generally are not more durable, and the more so where, by reason of their great size, the number is so reduced that a succession can only be maintained for a short time. The subject of this note, to be seen flowering in the Palm-house at Kew, has terminal panicles of large flowers, so intensely purple as to appear of a fine blue. The habit of growth is rather tall and straggling, but the "leggy" appearance of this may be obviated by standing the plant amongst others of like proportions when the conspicuous and showy flowers will be seen to best advantage. It is figured in the Botanical Register, 644, under the above name, but according to the most recent authorities it is included amongst the Pleromas on account of the stamens being nearly equal in size, and the nvary free from the calyx-characters which are reversed in Melas-

CALOCHORTUS BENTHAMI.—Although this will not rival in beauty some of the other species, it is yet one that the plant lover will by no means pass over. It is of dwarf, slender habit, with lanceolate, long-tailed sheathing bracts, and pale yellow flowers, t\(^1_2\) inch across. The three petals are broader and rounder than the outer segments, and thickly studded with erect club-shaped glands. At the base of each is a purple spot in a shell-like depression. The anthers burst before the stigma is ready. We are indebted to Mr. Ware for this little gem.

OPHRYS TENTHREDINIFERA.—Very like our Bee Orchis, but the segments have little or no pink in them; the petals are undulate at the edges; the column is very short, and not hooked, as in the Bee Orchis; the lip is oblong, with two rounded lobes, separated by a shallow notch, and of the colour of brown velvet, marked with an H-like marking nf a deep metallic blue colour. From Mr. Ware, Tottenham.

HYPONIS STELLALA, — This is a Cape bullt, with grassy leaves and rich, bright yellow, star-like blossoms. Good pots of this with masses of dark green grass-like leaves and numerous flowers make a very fine show in the cool conservatory at this time of the year. This species and its allies like plenty of light; indeed, it is only during sunshine that they exhibit themselves in all their beauty. The attention of lovers of bulbous plants needs only to be called to this charming species, which would hardly be deliberately discarded after being once fairly tried.

GREVILLEA FUNICEA is a handsome neathabited shrub, with slender branches, clothed with oblong entire leaves, and terminated by short umbelliform racemes of brilliant scarlet loog-styled flowers. It is now flowering in the Winter Garden at Kew, and only needs to be better known to be much more widely grown. A good figure of the species is to be found in the Botanical Magazine, t. 6608.

GREVILLEA LINEARIS.—This is interesting as being one of the earliest of Australian plants introduced to cultivation in Britain. It was brought to England by Sir Joseph Banks, on his return from the celebrated voyage in which Botany Bay was first discovered. It flowers almost throughout the year,

^{*} From the Oil, Paint and Drug Reporter.

The foliage is narrow, and the clusters of flowers vary on different individuals from white to pale lilac-purple. In company with G. Thelemanniana and a number of other species of widely different aspect, G. linearis is now flowering in the Winter Garden at

THE WALDSTEINIAS .- These are charming oldfashioned Potentilla-like herbaceous plants, of dwarf stature, with large golden-yellow flowers. geoides and W. trifolia, both natives of eastern Europe, grow well in the ordinary garden border, and will take care of themselves in shady spots in the wild garden or by the woodland walk. They are thoroughly deserving of a place in any rockery, and will succeed almost in any soil or situation.

MUSCARI HELDREICHI. -- Perhaps the most pleasing of all the Grape Hyacinths in the large collection at Kew is M. Heldreichi, a charming species with bright sky-blue flowers. It flowers, too, later than many of its allies, grows as freely and flowers as profusely in the open border as our native species, M. racemosa, or the widely cultivated M. botryoides. M. Heldreichi is a native of the mountains of Greece, from whence it was introduced by Messrs. Backhouse not very many years ago.

PAMPISFORD HALL.

THE residence of W. Parker Hamond, Esq., is situated on the main road from the Whittlesford station of the Great Eastern Railway to Newmarket. It is about 2 miles distant from that station, 8 miles from Cambridge, and 50 miles from London. The mansion, which stands on a slight eminence, has lately been remodelled from designs by Mr. G. Goldie. It cootains a magnificent entrance hall, anteroom, library, dining and drawing-rooms, the ceilings of which are beautifully decorated in the Italian style, The library contains about 15,000 volumes, and in the hall and ante-room are splendid collections of rare china, minerals, and fossils. The estates came into the possession of the Hamonds about the seventeenth century by the marriage of Sir W. Hamond with the beings of the Parkers, from whom the present owner is directly descended. Ilis father, an ardent lover of hardy plants, laid the foundation of the magnificent and unique collection existing here, and which the present owner is continually increasing. The grounds were improved some years since under the direction of Mr. R. Marnock, who, besides other alterations, laid a new carriage-drive from the Whittlesford Station side of the Newmarket road, leading past the mansion into the same road about a mile further on.

To describe the collection of Conifers, extending over an area of 150 acres, and comprising over 400 species and varieties, it will be necessary to divide it into sections. I will, therefore, ask the reader to start with me from that which I will call the Whittlesford entrance.

Plantations on either side of this entrance of a semicircular outline meet at the mansion, the intervening space of several acres being park, judiciously planted with groups of Conifers and other trees. In these plantations we find grand examples of Pious Laricio. forty years old, So feet high, with fine and well proportioned stems 4 feet in circumference at 6 feet from the ground. P. L. calabrica, is a very striking and noble tree, much more dense in habit (the branches curving upwards) and more conical than P. Laricio; P. pyrenaica, 50 feet high, is oval in outline, and of much brighter green, with rich brown bark; P. monspcliensis, is said to be synonymous with pyrenaica, but is here much more upright in habit and of a duller green; P. excelsa, 40 feet high; P. mugho, 16 feet hihgh by 16 feet diameter of branches. Here olso are fine specimens of Thuiopsis borealis, Juniperus virginiana, Thuia occidentalis, evergreen Oaks, and English Yews, all from 30 feet to 40 feet high. A good Abies cephalonica, and a group of five Pinus Laricio, 80 to 90 feet high, towering above all others, deserve especial mention. As an ornamental tree P. Laricio should be extensively planted, being of rapid growth, and making fine straight and well proportioned trunks. If cut in a comparatively young state it would have a large proportion of sap growth, but when of mature age the timber is said to be equal to that of the Larch Fir. Continuing our walk through the plantations running parallel with the Newmarket road we find them intersected by grass walks, one of which, 2 yards wide and 130 yards long, is planted on either side

with Cupressus Lawsoniana erecta viridis, about 5 feet high, in a straight line. Other winding grass walks divide the plantations into sections, which are planted with young examples of choice Coniferæ, as well as numerous specimens of Abies nobilis, A. Nordmanniana, Cedrus atlantica, and C. Libani, 12 to 20 feet high, all healthy and thriving.

We have now reached the Newmarket entrance and carriage-drive to the Hall from the Newmarket side, about half a mile in length, having an avenue planted with single trees of Cedar of Lebanon, and English Oaks in groups of three, now from 10 to 15 feet high. On each side of the drive are two rows of Conifers between the road and the avenue; those next the drive being planted with Golden Yews, 30 feet apart, for the entire length. Between them are examples of many species and varieties of the smaller growing Coni'eræ, such as Cupressus Lawsoniana compacta, C. L. alba spica pyramidalis, C. L. ochroleuca, Piceas, Abies, Pious peuce, and others of dwarf The second rows contain Conifers of stronger growth, and include Pinus Benthamiana, P. Jeffreyi, P. macrocarpa, P. Bolanderi, P. Beardsleyii, and many others, forming at the present time an interesting collection and nursery from which, in the future, specimens may be taken to enrich the plantations, which even now abound with so many choice examples. From this new drive we enter the older plantations, and the first examples worthy of note are two fine trees of Pinus taurica, 30 feet high, a dense growing variety of the Laricio section. It is of conical habit, and a fine dark green colour. This variety is generally considered synonymous with P. Pallasiana, and by some with P. romana; but the examples growing here, of which there are several of each kind, are certainly very different in habit, although io a young state they might be difficult to identify. Following this carriage-drive to the mansion we note on either side fine young specimens of Abies Nordmanniana, A. Pinsapo, and A. lasiocarpa, Libocedrus decurrens, Juniperus chinensis, 15 to 20 feet high; Picea orientalis, 25 feet, a bandsome tree, which deserves more extensive cultivation; Pinus Gordoniana, a Mexican species, now 5 feet high, and doing well; two fine examples of Abies Pinsapo, 25 feet high.

Having now made a tour through the plantations on the north-east of the mansion, we pass to those on the south-west and south-east. There is a terracewalk on each of these sides, and the lawn and pleasuregrounds. A sunken Italian garden adjoins the terrace on the south-western side, in which are fine examples of Cupressus Lawsoniana erecta viridis, the lawo beyond and on the south-east having grand examples of Cedar of Lebanon planted fifty years ago, and now 50 to 60 feet high, magnificent trees, furnished with branches to their base; a fine Red Cedar, 40 feet high by 30 feet wide; Pinus excelsa, 50 feet, braoched to the ground; Thuiopsis borealis, 20 feet, a grand specimen; Pious Lemoniana, 25 feet; Pious pumilio, 30 feet diameter; Pinus escarena, 25 feet high; Picea mucronata, a very dense-growing and handsome variety of Spruce Fir, 20 feet; Abies Pinsapo, 60 feet, a magnificent specimen; Abies Hookeriana, 9 feet, and grand examples of Thuiopsis dolabrata, Thuia Lobbii, two fine Wellingtonia gigantea, each over 40 feet; Abies Pinsapo Hamondii, free-growing dwarf variety, only 2 feet high in the centre, and having a diameter of 10 feet; grand English Yews, 30 feet by 30 feet, branches sweeping on the grass; Chinese Junipers, Thuias, and Cupressus. Nor are fine examples of deciduous tree wanting to diversify in outline and colour, the more formal shapes and sombre hues of the Conifers, for we find groups of elegant Birches, a magnificent Turkey Oak, Copper Beech, and other equally pictorial trees amongst them.

This judicious grouping is most picturesque and beautiful, and whether seen in the glory of their summer foliage or in the depth of winter (as I once had the good fortune to see them), laden with snow, are equally interesting and beautiful. From the southern corner of the lawn a gradually descending pathway, planted on either side with Yews and Box whose branches meeting overhead form a covered way, leads to a disused chalk-pit. The sides have been sloped and planted with masses of Laurustinus, Mahonias, Golden Yews, and other dwarf growing plants. bottom is grass relieved with a few beds of Conifers and specimens, the latter are also planted in groups at the foot of the slopes and partly on them. Here are Thuia Lobbii (gigantea), 35 feet; Thuiopsis borealis, 35 feet; Chinese Juniper, 25 feet; Golden

Chinese Juniper, 6 feet; Juniperus virginiana glauca, J. virginiana Chamberlainii, J. macrocarpa, J. neoboracensis, J. cracovia, Thuis pendula, and a fine example of Libocedrus decurrens, 30 feet in height. On the level above are groups of Birches, Limes, Beeches, and deciduous trees in variety, intermixed with Pines, Thuias, Junipers, and other Conifers, making a charming background. A Roman dyke leads from the chalk-pit through the plantations for more than a mile towards the south-east. The sloping banks are planted with Yews, Box, Pines, and deciduous trees. The plantations are of Larch Fir, Austrian Pine, Oaks, Beeches, and some undergrowth of Hazel, Chestnut, &c., affording shelter to the hundreds of choice Conifera, the principal of which I will briefly describe.

From the terrace on the south-east front of the mansion there is a fine view of the woods, which are divided by a grass promenade 600 feet long and 100 feet wide. Cedars of Lebanon, now about 15 feet high, are planted on either side; they are growing well, and will in time form a grand avenue. Magnificent specimens of Wellingtonia, over 40 feet high, stand on each side as you enter the avenue, and will eventually form a conspicuous object to mark the entrance. In the plantations, extending over many acres, are numerous groups of healthy growing Conifers, the principal of which are Abies lasiocarpa, Nordmanniana, Pinsapo, and nobilis, Pinus macrocarpa, P. Jeffreyi, and P. Sabiniana, all from to to 20 feet high, and thriving so well as to inspire the hope of their making noble trees in the future. Fine trees in single specimens are distributed over the whole area, and include a handsome Abies cephalonica, 40 feet high, in vigorous health; a noble Pinus Laricio calabrica, 50'(eet; Thuia Lobbii (gigantea), 30 feet; Abies Gordoniana, 20 feet, an especially handsome species, a native of Vancouver's Island (a form of A. grandis); examples of the Mexican Pinus Hartwegii and P. Montezumæ, now about 12 feet high, and doing well; with representative examples of many other equally choice and interesting species and varieties. Spaces from a quarter to half an acre in extent have been cleared and treoched, in which are young plants of most of the newer kinds, now affording to the rambler through these charming woods an almost infinite number of interesting subjects, and presently will supply additional examples whereby this already large and unique collection may be enriched.

The lines upon which the planting of this large area has been carried out are grand in conception, and complete in their unity, whilst the arrangement and disposition of the various groups and specimens has been effected with great judgment and good taste. A few years hence, when the representatives of the foreign Conifers can dispense with the shelter now necessary for their protection, and when they themselves approach the majestic size to which it is possible for them to grow, then will the woods around Pampisford Hall be ranked amongst the grandest and most beautiful in

this country.

To enter into details of the immense number of species and varieties contained in this great collection would require more space than can be allotted to a general notice. A few of the most noteworthy, however, deserve mention:—Picea Parryana glauca (pun-gens), of a beautiful glaucous blue, and robust habit; Pinus densiflora, c'vigorous growth, deep greenfoliage particularly long white buds; a magnificent es pobilis glauca, silvery-blue in colour; and a Abies nobilis glauca, silvery-blue in colour; and a perfect specimen Thuiopsis dolabrata, o feet high-and well proportioned; Abies Finsapo glauca, a hand-some variety; Cryptomeria pungeas, smaller in foliage than C. Japonica, of pale green colour, and which does not turn brown in winter; Pinus parvillora, of the Strobus type, a native of Japan, where it makes a small tree of about 25 feet, the foliage is of a silvergrey, very distinct, the young cones on the specime here are formed round the points of the shoots of last year's growth, from there to five in number, now about half an ioch in length, and ripening the following very ricea excelsa perthensis. a pendulous about halt an lone in length, and referming the coroning year; Picea excelsa perthensis, a pendulous variety of the common Spruce, of vigorous habit, and going off with a good lead; Abies brachphylia, a species from Japan, promising to make a fine tree in our climate. Ficea politica, also from Japan, one of the

species from Japao, promising to make a nne tree in our climate. Fieca polita, also from Japan, one of the finest of all Spruces.

The collection of Junipers contains about one hundred species and varieties, all healthy and in free growth. There are fine specimens of J. Reevesiaoa, 15 feet; J. japonica, 8 feet; J. japonica albo-variegata, 8 feet, a handsome variety of a blush tint, the branches being spotted with creamy-white; J. oxycedrus, 9 feet; J. tigida, a distinct and handsome species, 6 feet; J. Berkeleyi, 7 feet, a strong growing variety of the fragrans type; J. diupacea,

15 feet, one of the finest of all the Junipers, J. neoboracensis, 8 feet; J. communis pendula, 20 feet, a perfectly formed and magnificent specimen. There are several varieties of Juniperus virginiana (the Red Cedar), of which J. Chamberlainii is perhaps the finest. A specimen here, 30 feet high, is of compact babit, the ends of the shoots being pendulous.

The Junipers seem lately to have been almost ignored in ornamental planting, which is to be regretted, as they have many qualities to recommend them, the chief of which are that they are very hardy, have great variety in outline and colour, and in growth range from species which creep on the ground to others that attain a height of, perhaps, 40 to 50 feet.

Cupressus Lawsonian raised from seed produces more variety in colour and habit than any other Conifer. Its tendency to sport into variegated forms is also well known. About fifty varieties have been obtained from various sources to form the collection here. The most

known. About fifty varieties have been obtained from various sources to form the collection here. The most remarkable amongst the strong growing kinds are C. L. intertexta, 12 feet, of vigorous growth; C. L. gracilis pendula, 3 feet, elegant and distinct; C. L. patula, 10 feet, a glancous variety of slender growth and branching habit; C. L. erecta viridis and C. L. Fraseri are good representatives of the upright growing varieties, C. L. minima glauca, C. L. compacta nana, and C. L. densa are of dwarf globular habit; C. L. alba 'spica, the white-tipped variety, appears in several forms; C. L. alba spica pyramidalis and C. L. alba 'spica, the white-tipped variety appears in several forms; C. L. alba 'spica pyramidalis and C. L. alba 'spica nana are dwarf growing kinds—very distinct and beautiful; C. L. lutea is of bright golden colour, free growth, and a most desirable plant.

bright golden colonr, free growth, and a most desirable plant.

The advantages to be gained by an inspection of this splendid collection are numerous. The grandeur and beauty of the larger specimens must be admired, the investigation of those of more recent introduction and consequently smaller size is interesting, whilst the facilities afforded for the comparison of the various species and varieties, which have been from time to time sent out under different names, is invaluable, Maurice Young, Milford, Godalming.

THE CEDAR FOREST OF CYPRUS.

IN 1879 Sir Joseph Hooker communicated to the Linnean Society "the unexpected discovery of a form of the Cedar of Lebanon (Cedrus Libani var, brevifolia, Hook. f.) by Sir Samuel Baker in Cyprus. The following extract from a letter lately received by the Director of the Royal Gardens, Kew, from Sir Robert Biddulph, K.C.M.G., C.B., the High Commissioner, and published in Nature, gives a more detailed account of the forest, and will no doubt be interesting to many readers: interesting to many readers :-

detailed account of the forest, and will no doubt be interesting to many readers:—

"Cyprus, March 25.

"With regard to the Cedars I went last summer all through the thickest part of the forests, including the Cedar forest, and I am able to give you some of the particulars you ask for, having noted them at the time. The Cedar forest occupies a ridge on the principal watershed of the southern range, and about 15 miles west of Mount Troodos. The length of the forest is about 3 miles, its breath very much less. A few outlying Cedar trees were visible on neighbouring hills, but on the ridge they were quite thick, and probably many thousands in number. I took the height have the sea by an aneroid barometer, and found it to be 4300 feet. The trees are very handsome and in good condition, but comparatively young. The smallest seemed to be from ten to fifteen years old; the largest, I am told by the principal forest officer, are probably not over sixty or seventy years. The context is that there were no seedlings or young trees under ten years; and, indeed, this is the same with regard to the Pine forests. It would seem as if the great influx of goats has been comparatively recent. I made a tour through the heart of the forest last August. I started from a point on the west coast, and from thence ascended to the main watershed, and kept along the top till I reached Mount Troodos, taking three days to do it. The coontry through which we passed on the first day was perfectly uninhabited, and a mass of hills and forest. The trees are the summary of the same sort of country as searcity of young trees, and most error of the was a seried of the main watershed, and kept along the top till I reached Mount Troodos, taking three days in the less and through the part of the principal of the princ

NEPENTHES CINCTA (Mast.), n sp.* WITH some hesitation we are led to consider this beautiful Nepenthes as an undescribed species. The material at hand is incomplete, but after due com-

Borneo by Mr. Burke for Messrs. Veitch. Burke, it appears, never noticed the plant itself, which was considered by those gentlemen to be a hybrid between N. Northiana and N. albo-marginata, and, indeed, it does to some extent possess the characteristics of those does to some extent possess the characteristics of those two species. Be its origin what it may, it is a very distinct and handsome form, and a great addition to a genus already rich in handsome forms. The plant is glabrous, or nearly so. The stems cylindrical, stont, the leaves approximate, as in N. Northiana, 12 by 3

FIG. 110.-NEPENTHES CINCTA.

parison with living and dried specimens, and with the descriptions and figures in books, we can come to no other conclusion than that it is an undescribed species. The seed was collected with that of other species in inches, coriaceous, oblong-lanceolate, tapering to a broad dilated base, dark green, midrib somewhat angular on the lower surface. The base of the leaf is intermediate between the sessile leaf of N. Northiana and the long tapering stalk of N. albomarginata. The venation is obscure, but there are two ribs on either side of the midrib parallel with the margin. The tubular, slightly ventricose, rounded at the base, pitchers measure 7-8 by 2) inches, their colour is green flushed with red, and with numerous irregular purple blotches; the rim is

^{*} Journ. Linn. Soc., Bot., xvii., pp. 517-19.

^{*} Nepenthes cincla, u. sp.—Glabra; caulibus teretibus; foliis pedalibus coriaceis oblongis supra basin dilatatam angulatis, nervo medio angulato, apice subpeltatis obuste bilobulatis; ascidiis 7—8 poll. longis tubulatis basi parum dilatatis, dorso aceivo purpurero valde promiencei notato, alis latiusculis margine laciniato dentatis, deotibus longibus, acutissimis, ore obliquo refexo undulato regulariter straito, subtus fascia albida notato; operculo suborbiculari a-costato calcarato calcari brevi bilobato; floribus hand vists.

very oblique, 4 inch broad, undulate, lobed, not entire as in N. albo-marginata, and finely ribbed, with a narrow whitish band around the top of the tube. The lower half of the pitcher is thicker in texture than the upper, the wings deep, extending nearly to the base of the pitcher, and fringed with long sharp teeth; the lid arches over the mouth of the pitcher—it is suborbicular and two-ribbed. The back of the pitcher is marked by a prominent purplish rib. At first sight it resembles N. Boschiana, but has glabrous leaves. M. T. M.

LÆLIA CRAWSHAYANA VAR. LRUCOPTERA, n. var.

A most lovely novelty. Take a small flower of Lælia autumnalis with light rosy sepals and petals, a rather uarrow lip, blunt at the top. The sulphur keels of the disc run to the base of the middle lacinia. The dark divaricate veins at the base have some branchlets; middle lacinia fine mauve-purple, side lacinia white. Column slender, white with some purple lines on the

sessile, rather leathery in texture, dull green, minutely hairy over the surface, distinctly crenate, white, and minutely ciliated on the margin, the largest about 3 inches long by 2 inches broad. Scape 2—3 inches long, terete, green, finely pubescent. Flowers 8—12 in an umbel; bracts minute, deltoid, whitish, pubescent; pedicels cernous, $\frac{1}{2}$ —\(\frac{1}{2}\) inch long. Calyx green, pubescent, \(\frac{1}{2}\) inch long; segments oblong, equalling the campanulate tube. Corolla a uniform bright lemon-yellow; tube cylindrical, \(\frac{1}{2}\) inch long; is gements obovate, deeply emarginate, \(\frac{1}{2}\) inch long, twice as long as the entire collar. Style short in the specimen seen, and anthers reaching nearly to the top of the tube. \(\frac{7}{2}\). Eaker.

DENDROBIUM NOBILE (Lindl.) SCHNEIDERIANUM, n. var.

This is a very interesting variety, having a yellow hue over the lip, and a quite novel, dark mouve.
