sangea hieroglyphica; and even now its precise botanical position is not accurately ascertained. It was figured in the *Illustration Horticole*, t. 514.

ODONTOGLOSSUM SCHILLERIANUM, Rchb. f.

It was on January 15, 1854, that I published this in the Bont/landia, ii., p. 12, from a sketch in water-colours prepared by the late Herrmann Wagener. I gave a reproduction of this sketch in Xenia Orchidacca, ii., plate 22. Since that time up to our days the plant has not reappeared. Now, after more than thirty years, I have before me the fresh flower opened in England, and dried racemes and panieles, in excellent condition, all sent over by Mr. F. Sander. It is a kind of connecting link between the group of Odontoglossum newium and that of Odontoglossum newium and that of Odontoglossum buteo-purpureum. It surpasses in extent of flowers the very best Odontoglossum odoratum. The sepals and petals are cuneate oblong-acute, the lateral sepals directed downwards, quite unlike the fashion of Odonto-

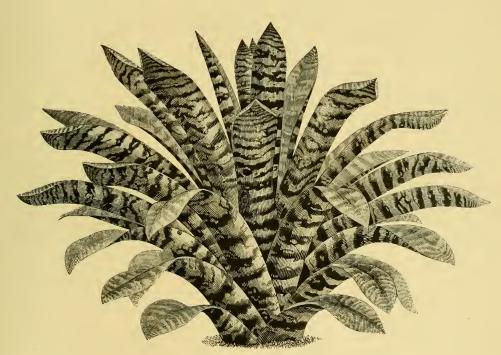

FIG. III. - VRIESIA HIEROGLYPHICA,

base under the fovea. Old bulbs short, ovoid, costate, fresh ones fusiform. Leaves thick, linearlanceolate, I had it from Mr. A. A. Peeters, St. Gilles, Brussels, who also sent a most remarkable Cattleya, that I regard a variety of Cattleya Massangeana itself. H. G. Rehb. J.

PRIMULA DOLOMITIS, Hort. Llewelyn.

The following is a description of this new Auricula, drawn up from a specimen which Mr. J. T. Dillwyn Llewelyn has presented to Kew, and which he exhibited at the meeting of the Auricula Society on April 22 Its affinity is with P. ciliata Moretti, which is identical with P. Balbisii, Lehman, and which is regarded by Nyman and others as a variety of P. Auricula, Linn. The present plant differs from P. ciliata by its more distinctly crenate leaves and longer corolla-tube. It came from Panereggio, in the Tyrol, on the east side of Monte Castellazo, and was collected by Mr. T. M. Franklen. In Haussmann's Flora of the Tyrol, vol. ii., p. 716, this is given as one of the localities for P. ciliata. Leaves 6—8 in a basal rosette, broad oblong, imbricated,

purple mark at the base of the lip. It forms a pendent body with a small included whitish square at the hase. The interior part is like the tail of a heath-cock, I had it from Mr. Oskar Schneider, Cromwell Range, Wilmslow Road, Fallowfield, whose fine Orchids have made a great impression both on the private visitors of Cromwell Range, and on those who saw them at the Manchester Exhibitions. It is great satisfaction to me to give the above name. H. G. Rehb. f.

VRIESIA HIEROGLYPHICA.

This is one of the most handsomely marked Brazilian Bromeliads with a tuft of oblong-acute leaves, chancelled on the upper surface, yellowish-green, marked with irregularly sinuous, transverse, rather broad purplish bars. Each leaf is about 70—80 centimetres long, 0.12 centimetre wide. Great difficulties have attended the introduction of this fine species into Europe, but the "Compagnie Continentale" of Ghent have been fortunate enough to raise a large number of plants from seed. The plant has been variously called Massangea tigrina, Tillandsia tigrina, or Massangea tigrina, Or Massa

glossum luteo-purpureum. The colour is yellow, with small, or large brown blotches; sometimes the flowers are nearly totally brown. The lip has puright basilar laciniæ, which are much reduced, very low, and an oblong-acute, undulate blade, covered with velvet, and two strong blunt calli, each with a small superior apiculus over the upper purple blotch on the disc. The base of the lip is white, the anterior part yellow. The column is slender, with a falcate one-toothed wing at each side of the proboscoid anther. I believe the species will have its success a estime. There are very numerous varieties, as was stated before. H. G. Rehb, f.

Masdevallia anchorifera, n. sp.*

Mr. Hübsch, collector for Mr. F. Sander, discovered this species in Costa Rica. It is near

"Mandevullita aucherițiera n. sp. - Afi. Masdevullius ochindoi, Rehb. f. Pedunculo lzvi, racemo pleiauho distincho sepalo impari trioagulo in caudam aprecem versus distatam exteoso; sepalis lateraihus bene comatis, caudis curvis ascendenti retrozia brevibus, callo utrique antice in utroque sepalo; and cati retrozia brevibus, callo utrique antice in utroque sepalo; cati contrata de la comatica del comatica de la comatica del comatica de la comatica del comatica de la comatica del comatica de la comatica del comatica del comatica de la comatica del comat

M. ochhodes. The pedanole is quite even. The raceme bears numerous distichous flowers, which appear in succession, evidently not all at once. The dried outer perigone is fine purple, the borders of the side sepals ochre with some purple spots, and the same colour at the base of the tails of the odd sepals. Petals fine orange with purple nerves. Lip orange or sulphur. It looks very effective in the recurved tails of the connate sepals; and this suggested the comparison with an auchor. H. G. Rekb. f.

EGYPTIAN GARDENS.

On leaving Alexandria, to take the train for Cairo from the old station of Miniet-el-Basal (great market of Alexandria), 4 kilometres from the Place des Consuls, the road traverses a superb forest of Date Palms, which looks especially well in antumn when these trees are loaded with fruit. The Date Palms are cultivated in forests, and wave their fronds in the air, about 60 or 70 feet above the ground, and with their straight stems, 6 to 9 feet in circumference, produce an astonishing effect, especially upon those who see them for the first time when arriving from Europe, where we see but small specimens of these trees in greenhouses.

The station of Miniet-el-Basal (the Onion market) is now only used for merchandise. Another station has recently been constructed nearer the town with the framework of a conservatory the size of that of the Société d'Acclimatation of Paris, and even larger, and which was ordered by the late Said Pacha during his visit to Paris in 1860. This great conservatory, which remained for fifteen years in the warehouses of Alexandria, has at length been utilised, but covered with zinc instead of glass. From Alexandria to Cairo the journey by express train takes four hours and a half. At Kafr-zayat, a station situated halfway to Cairo, the train stops for 20 minutes; there is an abundantly provided buffet, and a European table-d'hôte. At intervals on the journey the Arab children offer at every station little baskets (made of Juneus spinosus) filled with fruits, such as Mandarin and Blood Oranges in winter, Loquats in spring, Bananas and Figs in summer, and enormous Pomegranates in autumn, which the European travellers buy for one or two piastres. For the Arabs and the Fellahs there are Radishes and green Onions in winter, Chick-peas and Fenugreek in spring, Cucumbers and Water Melons in summer, and Dates in

The chiel garden worth visiting at Cairo is the park of Ezbehieh, situated in the centre of the European quarter, and having an area of upwards of \$5,000 square yards of an octagonal form, with four gates—north, south, east, and west. This garden was reconstructed in 1871 and embanked 6 feet all round, especially in its circular part. In the centre is a great basin fed with water by a cascade, falling from a reservoir, constructed above a grotto, and hidden by a rustic kiosque. There is a concert of military music given there every afternoon, during the promenade hours.

The lawns are formed of Zipania nodiflora. The most remarkable of the old trees of this garden were carefully preserved during the alterations, especially fine specimens of Tamarix arborea, Albizzia lebbek, Cassia fistula, &c. All the other plantations date from 1871, and are specimens taken from the old Khédivial nursery of Ghézireh, established by us in 1868, and which was closed in 1879, on the abdication of Khédive Ismail. After the alterations, the garden of Ezbekieh was thrown open to the public in 1871-72; but the Arabs or Fellahs, who frequented it in great numbers, put themselves so much at their ease there, that the custodians were obliged to put turns'iles at the gates, and charge a copper piastre (about a halfpenny) as an entrance fee to get these objectionable visitors, who made their ablutions in public on the borders of the lake, occupied a whole seat, or two or three chairs, where they stretched themselves to rest, or busied themselves with the capture of sundry parasitic insects, in great numbers, throwing them right and left without killing them, following the Mussulman custom, but leaving them to be swept up by the European ladies with their long dresses. G. Del-hecalerie, in "Elllustration Horti-

Çhe Posery.

MARECHAL NIEL ROSE UNDER GLASS. - The present is the best time for pruning this Rose-or, at least, as soon as the last bloom has been cut; and the best results are desired, it should be done in no balf-hearted way. By this we do not mean that last year's wood or shoots ought to be cut back to about half their length; on the contrary, we would say cut all away to its base. There need be no apprehension as regards the old wood breaking again after being subjected to this apparently harsh treatment, for vigorous young shoots will be pushed forth with freedom. In a three-quarters span-roofed vinery here there is an old tree-planted probably within a year or two of the variety being put in commerce, being at 3 feet from the ground 11 inches in circumferencewhich has for the last four years been subjected to the treatment herein advocated, and that it does not show any symptoms of resentment is evidenced by its having this year produced over 20 dozen blooms of more than average quality. A greater number might have been obtained, but it was thought advisable to resort to a little thinning out when the buds were in a young state. The shoots are trained transversely along three rows of wire fixed to the rafters of the back portion of the roof. Along each wire three shoots only are allowed to grow, and by the end of the year not only have they grown the entire length (24 feet), but there is generally a yard or more to spare; this is cut off towards the latter part of January. I may here say that the roots are outside, and receive nothing in the shape of watering except by rainfall and the uprising moisture from the subsoil, the situation being low and damp. Whether this hard pruning will answer with pot Roses I am not at present prepared to say; but by way of an experiment half of our stock (hybrid perpetuals) were so treated as soon as they had done flowering, and have now young shoots 3 and 4 inches long. After they were cut back, and begun to break again, the plants were repotted into fresh soil; all bloom-buds will be pinched off during the summer, and towards the end of May we shall move them outside into a sunny position, and plunge the pots in ashes. 7. H.

The Illustrated Dictionary of Gardening;
a Practical Encyclopedia of Horticulture. (L.
U. Gill, 170, Strand.)

Cassell's Popular Gardening. Edited by D. T. Fish. (Cassell & Co.)

We bracket these two publications together, not with any view of making comparisons between them, but because the aim of the two is identical, although attained by opposite methods. The Dictionary of Gardening, as its name implies, begins with letter A, and so far as we can judge from the part before us, is intended to comprise a brief account of the most important plants in cultivation, their appropriate treatment, the explanation of the technical terms in common use, the insects injurious in gardens, and so forth. The information appears to be well chosen, and well suited to the class of readers for whom the work is prepared. Necessarily the descriptions are very short, and this leads us to note a defect which it is not too late to remedy in future parts-viz., some indication of the leading work or works where fuller information may be obtained; thus a reference to Bentham and Hooker's Genera, in all cases, to the Botanical Magazine, or other illustrated periodicals, for figures, to such works as Veitch's Manual of Conifers, &c., would be desirable additions, and would take up but little room. Some further botanical supervision is also apparently needed. The account of Abies, for instance, is sadly confused, and the species mentioned do not agree with the assigned characters The species mentioned are all, or of the genus. mostly, Silver Firs, but the character of the genus, if it applies to anything, applies to the Spruce, as really of no particular moment whether we call the Spruces Abies and the Silver Firs Piceas, or vice versa-there are good reasons for either practice, but authors are bound to be consistent, and to tell us in what sense they use the words, or the synonymy

of these genera will be "much confused." The book is clearly printed and copiously illustrated, but the absence of any scale gives rise to the erroneous notion that the Fly Agaric is as big as the American Agave. We have no doubt the Dictionary will be found very useful for reference. The misprint Abaraxis on the first page should be corrected in another edition.

Cassell's Popular Gardening, it is to be presumed, is destined as a candidate for the suffrages of the same class as the Dictionary; but it is clear already that, owing to the different treatment of the subject, the two works will be so different in character that he who possesses the one will not by that circumstance feel himself the less inclined to have the other. The coloured plate which meets our gaze as we open the part may attract some readers, but it find favour with the members of the National Rose Society. "Cassell," does not begin like the Dictionary with A, but with garden pots, of which an interesting account is given touching on their manufacture and variations. Touching glazed pots, the old controversy about which has lately been revived, the writer sums up that the majority of gardeners "shun them as they would the plague." The cost is almost double, and as they are equally or more liable to breakage, the corresponding advantages, if any, hardly make up for the enhanced cost, Following the article on pots is one on levelling-a useful article, much needed by amateurs and young gardeners. Florists' flowers, vegetable physiology, vegetable culture, Roses, sub-urban gardening, with some useful plans; flower gardening, Ferns, herbs, hardy flowers, greenhouse plants-these are among the subjects treated of. Something for everybody. It will not be for want of books if the gardening of the future does not surpass that of

FORESTRY.

WORK FOR THE MONTH, - The past month has been characterised by a continuance of cold casterly winds which have retarded vegetation very considerably, and been anything but favourable to recently transplanted trees and shrubs. The latter, especially where growing in light, dry soils, have fared worst, for the keen penetrating east winds, determined to ransack every corner, and enter where nothing else can find an exit, seem to parch and dry up even the life-giving elements of the plants. Under these circumstances careful and regular watering will have to be resorted to, more especially in the case of newlytransplanted evergreens and large ornamental trees. Where the ground surface around large transplants has not been mulched, it is a good plan to hollow the soil about the tree stems into a sort of basin as a receptacle for the water. Syringing overhead is especially beneficial, and may in all cases be practised with the best possible results.

THE PEELING AND HARVESTING OF BARK WILL he the principal work of the month, and to which everything else must give place. Have all bark put on the drying ranges each night, or oftener if found necessary, the smallest in the bottom and the largest top for covering. Where the stools are intended for coppice insist on the use of the saw in felling, and have the stools well rounded off to promote a free growth of the young shoots. Have timber and branches removed from the woodland as soon as convenient after the wind-up of barking. Finish the sowing of coniferous tree seeds as early in the month as possible, and pass a light spiked roller over the surface of early sown beds, which at this season are apt to get baked and hard, for the purpose of loosening the soil. Keep the hoe going in the nursery, and so prevent weeds coming into seed. Dig between the rows of plants, and trench deeply all vacant horders.

THE TRANSPLANTING OF SEEDLINGS may now be done successfully, indeed the present is perhaps the best time for removing young Pines and Firs. A luxuriant growth of young hedges may be promoted by carefully digging or forking the soil for a couple of feet in width along the line of fence. Paint outdoor work of all kinds, such as fences, gates, doors, &c., during dry, warm weather. Repair rustic arbours, bridges, and seats, at the same time giving a coat of paint or varnish where necessary. Where not already done, put all fences in a thorough state of repair, as stock are usually turned into their summer

quarters during the early part of the present month. The reclaiming of land, fencing, draining, road-making, and levelling may now go on as time permits, this being about the best season for the heavy cartage occasioned thereby. Collect refuse for converting into macure, and turn all compost heaps formed during the early part of the season,

TIMBER FOR HOME CONSUMPTION should be sawn up and placed in a dry, airy position for seasoning. The late storms, so destructive to woodlands generally, will have thrown a quantity of timber on hand, which should be lotted for sale by private treaty or auction. The following are current prices for the various kinds of timber, of average quality, realised on this estate:—

		Pe	r cul	bic	foot.		Pe	r cul	bic	foot
				s.	d.				s.	d.
Oak				1	6	Willow			0	7
Ash				1	8	Poplar			0	7
Beech				0	7	Lime			0	10
Rirch				0	9	Scotch Pine			0	8
Alder				0	10	Silver			0	8
Elm				I	6	Spruce ,,			0	8
Sycam	ore			I	5	Larch			1	2

The above may be considered about the average prices of timber in this district, unless that of Oak, Larch, and Elm, which are to some extent affected by boat-building on the Menai Straits. There is both a railway and port on the estate, thus affording every facility for the removal of timber. A. D. Webster, Penrhyn Castle, North Wales,

SUMMER-BEDDING PLANTS. - Now that the weather has become mild, advantage should be taken of it to remove from the vineries or other heated structures all such plants as will bear removal to the open air with safety, but where cold frames or pits are plentiful it will be safer to make use of them for this purpose for a short time, but as many have not sufficient of these convenient structures all the hardier kinds of plants may be transferred to the open air, provided they are hooped over and carefully protected from frost by mats, Frigi-Domo, or other similar material. The nearer they can be arranged to the flower garden the greater will be the saving in time and labour when the operation of planting commences. They should be placed on a bed of ashes in a partially sheltered position where they will not be fully exposed to cold winds, and where water is conveniently close at hand. The sowing, pricking out, and transplanting of annuals, biennials, and peren-nials, should now be proceeded with. The more tender kinds should be sown either in pans or boxes, and placed in a gentle heat till they germinate. Those less tender should, after sowing, be placed in a cold frame, and the hardier kinds may be sown in an outdoor border, either in seed-beds, to be afterwards transplanted, or they may be sown at once in the positions which they are intended permanently to occupy. As the spring plants and bulbs cease blooming they should be immediately removed to the reserve garden; the beds should then be dressed, dug, and planted with the summer plants, taking care to put out the hardier kinds first, such as Calceolarias, Verbenas, and Lobelias; by so doing the garden will present a neat appearance, and the summer plants will have the advantage of becoming established early in the

HERBACEOUS GARDEN.—Unfortunately many of the more tender plants, which were growing so luxuriantly, have been much injured by the severe weather. The Lilies, Spirzeas, Dielytras, and many similar plants have suffered severely. The borders may now be cleaned thoroughly from weeds, and the surface mulched with well decayed manure, so as to afford them every encouragement to renew their growth, and timely attention should be paid to the necessary thioning, tying, and staking before they become either too thickly grown together or broken by wind.

ROSE GARDEN. — The thinning, pruning, and pegging down should now be completed as quickly as possible. The great advantage of late pruning, especially after a mild winter, has this season been

abundantly proved, as, with few exceptions, the early pruned plants have suffered most severely, while those which have been left unpruned till a recent date have borne the inclement weather comparatively uninjured. After the tying and pegging is finished a good top-dressing of dung will be most advantageous. The climbing varieties, where unprotected, especially the Maréchal Niel, have suffered to a considerable extent—so much so that the earliest and best buds are ruined, showing most clearly the great advantage of a slight protection of Frigi-Domo or elastic netting; as where so protected, not only are the buds safe, but the foliage remains unscathed. T. S. C.

THE bitterly cold east winds and frosty nights (we had 12° here on the night of the 23d), which prevailed throughout the first three weeks in April, considerably checked the growth of all young crops in this department; but under the geoial influence of the recent favourable change in the weather they are now making rapid and satisfactory growth.

TOMATO PLANTING.—Preparations should now be made for getting the earliest batch of plants planted out. The first step to be taken in this direction is to get the necessary number of holes opened between the fruit trees on a south or west wall, and to put into each hole half a barrowload of compost, consisting of three-parts good loam and one of well-decomposed stable-manure. The plants, which should be thoroughly moist at the roots before being turned out of the pots, and previously have been hardened off in cold pits, should then be planted (one in each hole). Press the soil firmly about the roots, and nail the plants to the wall, leaving room in so doing for the development of the shoots. This done, a Spruce bough should be stuck firmly in the ground in froat of each plant for protection from frosts and cutting winds.

RIDGE CUCUMBERS.—For these make a trench 3 or 4 feet wide, 16 or 18 inches deep, and in length according to the number of plants to be grown, and fill it with long stable-dung and leaves well mixed together, raising it about 18 inches or 2 feet above the surface. The whole should then be well trodden down, and subsequently covered with the ordinary garden soil. The mounds should be formed of prepared soil (three-parts of light loam and one of well-rotted dung and leaf-soil), at 5 feet apart along the middle of the ridge, on which hand-lights should be placed, and the Cucumbers planted in them, and watered, and shaded for a few days from bright sunshine until they have established themselves. Damp the plants overhead with the syringe on bright alternoons, and cover up at night with mats.

CELERY PLANTING.—There are various ways of carrying out this operation, but the most preferable is perhaps the following:—The trenches, which should run north and south, and be r spit deep, 16 inches wide, and 4 feet from centre to centre, should be got ready at once for an early planting, and the ridges between should have a good slope, in order to leave the trench well open to the rain. Six or 8 inches thick of the best manure obtainable on the place should be dug into each trench, and the soil broken fine as the digging proceeds. Then, assuming that the plants have been properly hardened off, take them up carefully with a ball of earth. Remove any suckers that may be found, and plant one row in each trench at 9 inches from plant to plant, taking care in doing so that the plants are not buried deeper in the soil than they were before, and that it is made moderately firm about their roots, which should then be watered to settle it. The ridges can be planted before the Celery with two rows of Lettuce 9 inches apart, and 12 inches asunder, from plant to plant in the row. The planting should be done from the treoch before the dung has been put on, and in showery weather.

SEED SOWING.—A good sowing of Peas of such varieties as the following should now be made, viz., Ne Plus Ultra, Champion of England, Telephone, Stratagem, &c., from which sowings Peas will be fit for gathering early in August. Broad and French Beans (Carter's Leviathan and Canadian Wonder) should also be sown to supplement the supplies which previous sowings will yield. With the same object

in view sowings of Turnips, Spinach, Lettuce, Cauliflower (Early London, Walcheren, and Veitch's Au'umn Giant), Radishes, Mustard and Cress (the latter two under handglasses), should be made and duly protected from the ravages of birds, as also a small sowing of Basil (Bush and Sweet), and Summer Savory. Plant out those raised in heat and duly hardened off for that purpose in rows from 12 to 15 inches apart, and at the same distance from plant to plant in the rows. A sowing of Nasturtiums for pickling should also be made.

GENERAL WORK.—This will include the thinning and weeding of Turnips, Carrots, Parsnips, Spinach, &c. The plants should be left at from 6 to 9 inches apart in the rows, excepting Parsnips, which should be allowed 12 inches. The earthing-up and staking of advancing crops of Peas, together with the weeding and rolling of all gravel walks in connection with this department, will, in the ordinary course of routine, receive due attention. Asparagus beds will also require attention in regularly cutting the shoots as they become fit, taking care in doing so not to injure with the knile the crowns of the plants nor the shoots below the surface. Prick out young Celery plants in 2 inches thick of finely sifted soil, which has been placed over the same thickness of short dung on a hard surface out-of-doors. The rows should be 4 or 5 inches apart, and the plants the same distance asunder in the rows. Water and shade the plants for a few days, and see that they have plenty of water when established.

FORCING DEPARTMENT.—Tomatos swelling their fruit should, if not already done, be top-dressed with a mixture of loam and horse-droppings, about three parts of the former to one of the latter; and in addition to this let them have frequent supplies of weak liquid-manure. The shoots and leaves of the plants must be kept well pinched, and the fruit fully exposed to the sun. French Beans, which should now be grown in pits, will require attention in the way of watering and syringing; and Capsicums which are intended to be fruited in pots should now be shifted into larger ones, as they require more room at the roots; and those which are intended for planting out-of-doors later at the foot of a south wall or fence should be gradually hardened off for that purpose.

The Bandy Squit Garden.

THE 9° of frost on the morning of the 22d ult, has been most trying to the fruit crop, but so abundant was the blossom that we still have hopes that there will be an average crop. The gardens here are 400 feet above the sea level, and so escape spring frosts more than those at a lower altitude. Currants and Gooseherries have lost a quarter of the crop, but there is plenty left, and Plums on standards may have the same quantity gone, but we believe there is sufficient for a crop left. Frosts like these show the necessity, as we previously pointed out, of not prucing trees hard, and of leaving more foliage to save the blossom and newly formed fruit. The Peach trees will require constant attention; if the covering for protection has been heavy it will be necessary, if possible, to gradually reduce it, but on no account remove the temporary copings, as nothing is really safe till the Mulberry leaf is as large as a shilling, then the temperature Is sufficiently high to warrant the removal of all protection from our wall trees. The disbudding of Peaches and Nectarines will require to be done gradually. Remove any over-luxuriant or ill-placed shoots, taking care always to retain a promising one near the base of last year's wood. This and the leading shoot are indispensable; the others may be removed from time to time, as the tree and the time of the year will admit of it, but in doing this see that the young fruit is not mubed off. As we pointed out in our last, insects will soon appear, therefore on their first appearance be "up and at them." Apricots will also require their fruits to be thinned, and the forward shoots to be stopped. These require for nailing in, and this will induce the trees to form fruitful spurs for next year. A small caterpillar for nailing in, and this will induce the trees to form fruitful spurs for next year. A small caterpillar often does considerable damage to this tree: we know of no better plan than hand-picking, when they will he found rolled up in several of the leaves tied together; so

I N speaking of the way in which plants utilise the food stored up in their tissues, gardeners very frequently indulge in statements as to "organisable matter" and other vaguely defined substances, which, while they are apt to provoke controversy, do not really tend to elucidate the subject. When a seed, or the embryo plant within it, begins to germinate, and when the bud begins to lengthen into a shoot, as when a Vine rod breaks, a call is made on the resources of the plant. The new growths are not at this time directly nourished by any food taken up by the roots (except perhaps in the case of water), nor can they be (in deciduous plants at least) fed from the leaves at this early period. The food they require is stored up in some part of the plant-in the seed, in the tuber, or, in the case of the Vine, in the cells of the inner bark, and of the youngest part of the wood.

The questions then arise, What is this food so stored up? What is its nature? How does it nourish the plant? Where does it come from? Without going into elaborate detail we may say that the food is of a threefold character—I, water; 2, that which contains nitro-gen as an essential ingredient; and, 3, that which contains no nitrogen. Under the two last categories numerous substances are included, to which we need not further allude, except to point out that while some are liquid. or held in solution in the water, others are solid, and, except under special circumstances, insoluble. Among the latter, starch is, if not the most important, at least the best known. Starch exists in the plant in the form of small grains, easily seen by aid of a moderately high power of the microscope, and easily detected by the action of iodine, which gives a violet tinge to the starch. But starch in the form of grains, as it exists in the cells of plants, is insoluble, and in that state it is not capable of being utilised by the plant, or of being conveyed from one part of the plant to another. It is rendered soluble and capable of transport by the agency of a nitrogenous substance formed in the protoplasm; this substance is "diastase," and it is one of the so-called "ferments"-substances by whose agency the changes known as fermentations occur. How they are formed and how they do their work is not known, but the result of the action of this diastase is the conversion of the insoluble starch into glucose or grape-sugar, or into some similar compound which is soluble, is transferred from place to place, and is used up in the formation of the new cells, by which growth is effected.

Adverting now to the nitrogen-containing substances out of which the protoplasm is created it may be said that, some of the substances containing this essential ingredient being in solution, there is less difficulty in understanding their transport and utilisation, while those that are insoluble are, like the starch in the former illustration, rendered soluble by the agency of other ferments, such as pepsin, to which we need not now further allude. It is enough to say that of the two main groups of plant-food-that illustrated by starch containing no nitrogen, and that illus-trated by substances called by the general name of "albuminoids," containing nitrogenboth are inert prior to the agency of some "ferment." To ascertain the circumstances under which these ferments are formed is thus one of the most important tasks which the chemist has before him, and up to the present time it cannot be said that he has made much progress in this department. The nitrogenous part of the food is obtained, as a rule, wholly from the soil in the form of nitrates, or allied compounds; though under certain circumstances leaves can secrete a ferment like pepsin, which effects the digestion of nitrogenous matters, such as insects, as in the case of Pitcher-plants, Droseras, &c.

Our concern at present, however, chiefly lies with the starch which is stored up so abundantly in Vine rods and other reserve organs, and which is rendered available, as we have seen, by the agency of diastase. Where does the starch come from? To this question the answer given by science is that it is formed in the chlorophyll, or the substance formed in leaves as a result of their exposure to the light and to which they owe their green colour: briefly, it is formed in the leaves, converted into grape-sugar, and thus rendered soluble, by the agency of the ferment diastase, and in that condition conveyed along the veins of the leaf to the bark, or tuber, or place of storage, or is transferred direct to the place where building operations are going on, and where, in consequence, supplies are needed. The presence of starch in the leaves is easily ascertained microscopically, or by soaking the leaves in alcohol to remove the chlorophyll, and then immersing the colourless leaves in a strong solution of iodine. By such means SACHS has lately contributed much to our knowledge of starch formation. An analysis of his researches is given in a recent number of Nature by Mr. MARSHALL WARD, from which we condense the following details as appropriate for our purpose. In the first place Sachs shows that the same leaf may contain very different quantities of starch at different periods of the day, or according to the weather, the increase or decrease being very rapid. In the dark, or when a portion of the leaf is protected by an opaque body from the light, the starch disappears, and the starch formed in the day-time under the influence of the light may disappear from the leaves at night. This depends on the degree of temperature and on the health of the plant, but we are assured occurs normally during the summer in plants growing in the open. This is proved by dividing a growing leaf lengthwise into two halves, at nightfall after a bright day. One half is removed, the other allowed to remain during the night. The half leaf removed is at once tested by iodine as above described, and found full of starch; the remaining half-leaf is tested, early next morning after having been exposed to darkness, and the quantity of starch is found to be relatively very small.

Again, if the leaf be cut in halves at sunrise no starch is found in the half leaf that is cut away; if the other half be allowed to remain on the plant all the day so as to be exposed to the sun, and be tested at nightfall, abundance of starch will then be found.

It would seem, therefore, at first sight, that the formation, or at any rate the action, of diastase in dissolving the starch must take place at night only; and this would be consistent with the now wellestablished fact, that new growth (not mere extension of old) takes place principally at night, or in the dark. SACHS' experiments, however, show that the change from the insoluble starch to the soluble glucose goes on during the day, as well as at night, though these changes are less evident because during the day more starch is formed than is abstracted. SACHS has further endeavoured to estimate the proportionate amount of starch produced in a given area of leaf-surface. The difficulties in the way prevent anything but a rough approximation. Moreover, we do not find any reference to the comparative leaf-structure, to the number of palisade and other chlorophyllcontaining cells, which, as it seems to us, must be taken into consideration, as well as the mere surface area exposed to light.

By combining his experimental results, and taking note of all the circumstances, SACHS "concludes that 20 to 25 grammes of starch per day may be produced by one square metre of leaf-surface as an ordinary occurrence."

It is clear that some very important practical deductions may be drawn from these facts. If the amount of starchy contents of leaves varies during the day, and still more so at night, the period at which such leaves are cut for food or forage, becomes a matter of great importance. The afternoon or evening would thus be indicated as the best periods for cutting vegetables for salad, for cooking, or for medicinal purposes, so as to secure the produce of the day before it is drafted off elsewhere. The experiments, moreover, tend to show that analyses of plants are of little comparative value unless taken at frequent intervals. At present we get evidence of what has been going on in the plant at the particular time when the specimen was taken, but, in view of the migrations of food materials which, as we have seen, take place at regular intervals, and of the different action that goes on at night and in the daytime, in low as contrasted with high temperatures, and so forth, it becomes evident that a single analysis of the plant at any one time, be it never so accurate, really tells us little of the work done by the plant.

What is now wanted is a series of analyses of the same plant taken at various times of the day, under various conditions, and with reference also to the anatomical structure of the plant. By these means we shall gradually attain to a better knowledge of what goes on in that wonderful laboratory, the plant cell.

- WHAT IS AN AMATEUR? - This question cropped up again the other day, but no satisfactory answer was furnished. It is true the one propounded -viz., that a cultivator who neither grows plants nor trades in them for gain, one in fact who, as a rule, loses by their culture—is undoubtedly an amateur; but still it is fair to plead that the moment a man trades, whether he loses or not by his transaction, he is a trader to all intents and purposes. Really the clearest notion of an amateur is of one who, having some other vocation for means of livelihood, takes to the cultivation of flowers as a recreation and means of enjoyment. Such, no doubt, are the vast body of horticultural amateurs, and no doubt also, as a rule, only very few of them trade at all, whilst those who do only do so because their slender means would not allow them otherwise to fully enjoy that which is to them a delightful recreation. We have the greatest respect for the noble army of horticultural amateurs, and we are sure the trader also holds the body in high esteem as the very backbone of true horticulture in this as the very backbone of true norticulture it this country. It is only when certain competitions occur that the status of trader and amateur is called into question, and but for those occasions the distinctions would hardly be needed. Still the distinctions seem to be required in some cases, but not in all—as, for instance, in Auricula, and some other competitions. Pelargonium, Potato, and some other competitions, the amateur can hold his own with the trader, and beat him. With Roses, Carnations, Dahlias, the trader, being the largest grower, has the advantage. Still if the distinctions were swept away from schedules, and classes made for the smaller growers, from which the larger ones were excluded, no harm would be done, and no farther invidious distinctions would exist. Certainly some writers would have one bone of contention the less to gnaw at. For the prevention of disputes, each schedule should contain definition of terms like amateur agreed upon by the committee beforehand.

—— EARLY POTATOS. — The frosts have somewhat rudely discounted the hopes of those who, having early Potatos well through the ground, were in full belief that they would be able to lift a very early crop. It is of no use to urge people to be careful and 'wise; they will only too readily yield

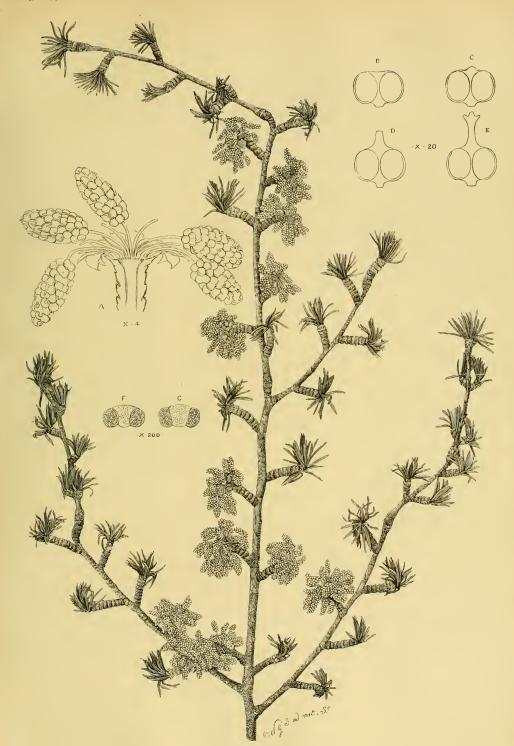

Fig. 112.—PSEUDO-LARIX KÆMPFERI. (SEE P. 584.)

when some prospective but delusive advantage offers. We seldom find very early—and, of course, unprotected—Potatos escaping from late spring frosts; and this season, because the beautiful weather of February induced such early planting, the late frosts have been all the more intense and destructive, Even in Potato culture the race is not alway to the

PRIMROSES AND POLYANTHUSES. - The absence of the former and very indifferent representatives of the border or fancy section of the latter spring flowers at the recent Auricula show, though fairly good prizes were offered for them, shows that here in the south at least, and probably farther north, the end of April is too late a period of the year in which to look for examples of such favourite flowers. The best show of these Primroses and Polyanthuses seen this season was at the ordinary meeting of the Royal Horticultural Society on March 25 last, just four weeks previously, so that offering prizes for them at the end of April seems rather farcical, and to the public somewhat disappointing. No doubt the gold-laced Polyanthuses are fairly in season at the end of April, and specially so in the North; but even these, though abundantly shown, were not up to the customary mark, and most of the flowers looked a little cloudy or stale. Pretty as these are, however, their chief admirers are found in fanciers, those who really understand the points of a gold-laced flower, and can appreciate them. The general public, the hardy flowers in posse, find them perhaps a little uninteresting or monotonous, and always prefer the rich and many coloured border kinds, and the beautiful Primroses when they can be seen. It is too much to expect that the Auricula lovers will permit their prizes for these plants to be offered earlier; it is equally too much to hope that the Royal Horticultural Society, with its improved finances, will offer prizes instead, but if such could be given for Primroses at the last meeting in March, and for fancy Polyanthuses early in April, real encouragement would be given to a meritorious class of flowers, and the public would be gratified also.

- SEX IN PLANTS .- Some interesting experiments have been carried out by F. HEVER (Journ. Microsc. Soc., p. 251) with a view to determine the cause of differentiation of sex in unisexual plants. The result obtained in the case of directious plants, by experiments with 21,000 specimens of Mercurialis annua and 6000 of Cannabis indica, was that external conditions have no influence on the production of seedlings of one or the other sex. In the case of the former plant the proportion of males to females produced was as 105.85 to 100, and in the latter as 86 to 100. In a second series of experiments made with monecious plants, to determine whether external conditions of temperature and soil caused any difference in the proportion of male and female flowers, Urtica Atriplex, Spinacia, Nanthium, and Cucurbitaceæ produced negative results. He also came to the conclusion that sex is determined at an earlier period than the ripening of the seed. A knowledge of the means whereby female plants could be produced at will would be of considerable commercial importance, as, for instance, in the cultivation of Nutmegs, Hops, &c.

-- Russian Apples have proved a disappointment.

—— DAFFODLIS GONE ASTRAY.—Whether the sudden notoriety caused by the Conference has disturbed the equilibrium or no, we know not, but in any case an unusual number of erratic members have found their way to our sanctum. One incomparabilis, not content with having its cup cut into very deep segments (var. semipartita), has only five segments (var. semipartita), has only five segments (var. semipartita), has only five segments, five stamens, and two stigmas, and a two-celled ovary. One Poeticus var. biflora has a five-parted flower, except the ovary, which is in its ordinary condition; another has an eight-parted flower, the ovary here again remaining normal. All these cause from Mr. WARE.

— DAVALLIA MARIESII FOR DINNER TABLE DECORATION.—A great and pleasing change in the character of indoor floral decorations has been effected by Messrs. NIEMAN & CORNISH, of the Poitman Floral Hall, 29, Orchard Street, Portman

Square, by using the beautiful Japanese designs (see p. 46t, vol. xx.) made of this Fern. In some cases recesses and bends in staircases are utilised to arrange beautiful grottoes of this Fern alone, unassisted by any other aid than that given by our native carpet moss, against which the green feathery fronds of the Davallia appear very effective. The defective point in most floral decorations is the appearance of the inevitable flowerpot, and in the fact of their being grown into beautiful shapes without either pot or lies in a great measure the secret of these Davallias being so much admired wherever they are seen-their adaptability for suspending by invisible wire still further enhancing their value in the decorator's hands. On the occasion of a dinner given at the rooms of the Medical Society of London, on Friday, April 26, at which 180 guests were present, the whole of the dioner-table decoration was designed by Messrs. NIEMAN & CORNISH, with these Ferns arranged in pairs, with Odontoglossum Alexandra, Maréchal Niel Roses, Stephanotis, Gloxinias, &c. was much admired, and it would be difficult to conceive anything more elegant or beautiful for such a

- VACCINIUM SERPENS. - This species was added to the Kew collection about three years ago, having been sent there by Mr. H. J. ELWES, who collected it in the Himalayas. The plant is altogether distinct in habit from what we are accustomed to see in this exceedingly variable genus. The comparatively stout branches are loog and arching, slightly branched but very leafy, and originate from a large tuber-like woody rootstock. The leaves resemble those of Pernettya mucronata, but are somewhat larger, and considerably stiffer, or more coriaceous.

The flowers are produced singly in the axils of the leaves, and depend from the underside of the branches in a graceful manner. The tubular strongly fiveangled corollas are of a deep crimson colour, and are similar to those of V. rugosum. As a basket-plant for a cool-house or conservatory it promises to be of great decorative value, and may be seen in the Heathhouse, where it is now flowering for the first time.

Dyson's STOCK .- In all probability this strain of Stock is not very widely known beyond the immediate district of Middleton, but it is one well worthy of notice. It represents a rich crimson intermediate of strong growth, producing very large well formed flowers of great beauty and singularly bright and telling in colour. It is one of many novelties grown at Stakehill, by Mr. S. BARLOW, and in spring and early summer it can be seen in potslarge plants, superbly grown, producing spikes of surprising beauty. The strain is one remarkable for the many double varieties it produces; out of fifteen plants taken from the seed beds not one was single, As a fitting companion to this Mr. BARLOW also grows Mauve Beauty in pots, which is a remarkably fine intermediate-here in the cool moist district of Castleton taking on a wonderful depth of colour under high-class cultivation. Both of these Stocks are bedded out during summer at Stakehill. Here the Daisies which occupy the beds in spring last on much longer in beauty than they do in the South, consequently the summer bedding plants are put out much later. And these Stocks (Mauve Beauty especially) are found to branch freely when planted out, and keep up a succession of scented flowers all through the summer.

-- ANNUAL CHRYSANTHEMUMS. - We have been so very much accustomed to regard that serviceable wild flower, Chrysanthemum segetum, as an autumn-blooming annual that it was with surprise there recently came under our notice, just beneath a cottage window in Middlesex, a fine plant of this Cornflower in abundant bloom-the flowers large and as pure as seen at any time. This seemed to revelation, as showing that what a cottager could have so beautiful thus early in the year could equally be possessed by others caring for such elements of spring garden beauty. The plant had stood the winter well unprotected. The aspect was south-west, yet far from a warm one. How many are there who have taken the trouble to sow seed of this Chrysanthemum at midsummer as well as in March, and thus secure a supply of plants for winter and spring blooming? But for all ordinary purposes where cut flowers are desired, few robust annuals afford more material in the form of flowers than do the single and double forms of Chrysanthemum coronarium, for they bloom profusely, and if the plants have ample space will not cease flowering till killed by sharp frosts. It is an excellent feature of this section of annuals that they may be propagated most freely by cuttings, and any exceptionally good form, double or single, may be increased rapidly in a short time. The tricolor, or Euritdge section, produce very handsomely formed flowers, and of singularly beautiful colours. It is strange that such showy annuals should be so little grown—indeed, we might almost say little known. They make neither bedding nor pot plants, but should be grown in small clumps in mixed borders, or specially with similar plants in a reserve garden the chief object of which is the supply of cut flowers in abundance.

—— PRUNUS PYRIFOLIA.—This variety, although not possessed of such brilliant autumn tints in foliage and fruit as the lately introduced P. Pissardii, is yet deserving of a place where bright tints are valued in the autumn, the foliage dying off in vivid gold and crimson, and being tolerably persistent the display lasts several weeks before the tree is quite bare. It is, moreover, a plant that does not suffer from drought in any apparent degree, and will grow indifferently under the shade and drip of larger trees or quite in the open. Masses of it grown as stemless bushes under trees have a good effect, as have standards standing free; each is good in its way.

—— PRUNUS SINENSIS.—M. CARRIÈRE, who figures this species in a recent number of the Result Horticole, having previously described it in 1869, speaks of it as remarkable alike for "beaut!" and bout!"—beauty of appearance and profusion of fruit. The plant is a bush, bearing clusters of small Hawthorn-like blossoms along the shoots, succeeded in due season by small globular deep red Cherries, of peculiar but agreeable flavour. P. japonica, often confounded with it, has smaller fruits, tipped by the persistent base of the style, and the leaves are rounder at the base.

- THE KODON .- A curious fact is mentioned by Mr. DUTHIE in his second part of Field and Garden Crops of the North-Western Provinces and Oudh, io connection with the Kodon (Paspalum scrobiculatum). The growing plant, it is said, suffers considerably from the attacks of insects, but that it is protected from the ravages of birds by the fact that its ear is partially concealed in the leaf-sheath, as is the case with the coarse varieties of Rice. The grain is liable to produce a kind of intexication, which is vouched for bymany authorities. The settlement officer of Azamgarh writes that instances of intoxication caused by Kodon imported from the trans-Gogia districts (Basti and Gorakhpur) are known to the people, but that no such effects have been noticed from grain locally produced. The reason for the intoxicating effect of Kodon grain under certain circumstances may, perhaps, lie in the fermentation which is undoubtedly brought about in order to loosen the husk and make it more easily removable.

THE ORCHID MARKET.—At Messis. Pro-THERGE & MORKIS' sale of Orchids in flower on Tuesday, some fine varieties came under the hammer, and good prices were obtained. We note a few of them:—Cattleya Mendelli, £31 10s.; Odontoglossum Alexandre, £15 15s.; Dendroblum infundibulum, £5 15s.; Sophronitis grandiflora, £5 10s.; Lælia purpurata, £9 19s. 6d.; Odontoglossum Pescatorei, £6 6s.; O. triumphans, £11 0s. 6d.; Masdevallia Harryana Deoisonize, £5 10s. The best prices obtained by Mr. STevens at the sale of Mr. BOCKETT's plaots on Tuesday were as follows:— Dendrobium Falconeri majus, 10 guineas; Cattleya Skinneri, 13½ guineas; Cypripedium selligerum, 10½ guineas; Leclia purpurata, 10 guineas; La anceps Dawsoni, 9½ guineas; Oncidium mareranthum, 10½ guineas; Odontoglossum mulus, 10½ guineas.

THE LATE MF. R. HANBURY'S LIBRARY.—
The natural history library of the late Mr. R. HANBURY was sold at STEVENS' Rooms on April 25.
There were only 127 lots, but all were in fine condition, and good prices, as a rule, were realised. The pincipal lots were:—CUETIS' Botanical Magazine, a complete set of 111 volumes, £92; a set of seventeen volumes of the same work, vols. 54 to 70, 35 guineas; another set, vols. 1 to 36, £39; GOULD'S The Birds of Creat Britain, a very fine copy,

£95; Gould's Humming Birds, £85; Dresser's History of the Birds of Europs, £50; BOWDITCH'S Frechwater Fishesof Great Britain, £21; Woolf's Zwological Sketches, £15 10s.; LINDEN's Pexadorea, vol. i., 12 guineas; LINDLEY'S Sertum Orchidaceum, 12; guineas; SOWERBY'S English Bodany, 11 guineas; CURTIS' British Entomology, 17 guineas; and PANTON's Magazine of Botany, eleven volumes, 11 guineas. An anabound set of fifty-two parts of LAWSON'S Pinetum Britannicum, belonging to "another property," realised £15.

—— VICTORIA PARK.—We much regret to hear that, on account of ill-health, Mr. McINTYRE is about to retire from the position of Superintendent of the Victoria and Greenwich Parks.

—— FRUIT FARMING: HOP MILDEW.—Messrs. CLOWES & SONS are publishing in a cheap form two admirable papers contributed by Mr. CHARLES WHITEHEAD to the 15th volume of the Journal of the Bath and West of England Society, on "Fmit Farming in Kent," and "Mould or Mildew on Hop Plants,"

-- THE WEATHER.-General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the ek ending April 28, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: -The weather has continued very cold in all parts of the kingdom; in most places, however, the sky has been less cloudy than during last week, although the amount of rain has been rather more. The temperature has again been below the mean in all districts, the deficit ranging from 3° in "Scotland, N.," and 4° in Ireland to as much as 8° or 9° over central, southern, and eastern England. The maxima, which were mostly registered on the 27th or 28th, varied from 53' "Channel Islands," "Scotland, N.," and "Scotland, W.," to 57° in "England, N.E.," and 62° in "Ireland, S." On several occasions the daily maxima were very low, not exceeding 46° or 47° in many parts of the country. On the 23d considerable local differences were observed in the maximum readings over England; at York the thermometer did not exceed 41°, and at Alnwick it only rose to 42°, but over the "Midland Connties" the maxima were between 50° and 54°. The minimat, which were recorded during the earlier days of the week, were very low. In the "Midland Counties" the sheltered thermometer fell to 22°, in "England, S." to 23°, in "England, E." and "England, S.W." to 25°, and in most other districts to Letween 27° and 31°. In the "Channel Islands" the minimum was 39°. The rainfall has been a little more than the mean in "England, E.," "England, S.," and the "Channel Islands," but less in all other districts. Bright sunshine has been much more prevalent than during last week in the east of Scotland, the south-west of England, and the Channel Islands, and rather more so in most other districts. The percentages of possible duration ranged from 17 in "Scotland, N.," to 50 in "England, S.W.," and 65 in "Scotland, E." Depressions observed.—During the first few days of this period pressure continued highest over the north-eastern and northern parts of our area, and lowest to the southwestward of our islands, light or moderate winds between N.E. and S.E. consequently prevailing. As the week drew towards its close, however, two shallow depressions appeared, one travelling northnorth-westwards over Denmark and Norway, and the other in an easterly direction over the southern parts of England. The latter disturbance, which reached the neighbourhood of London on Sunday evening, remained stationary until the close of the period, diminishing in intensity. During its passage it caused westerly breezes on our southern coasts, southerly winds in the south-east and east, easterly at all our more northern stations, and northerly in the west.

—— GARDENING APPOINTMENTS.—Mr. THOMAS GRIFFIN, lately Gardener at Westgate, Beckenham, has succeeded the late Mr. Rose as Gardener to A. J. ADDERLEY, Esq., Davenport House, Bridgenorth, Salop.—Mr. E. H. BRADLEY, for the last nine years Gardener at High Barns, Sunderland, as Gardener to ANGUS HOLDEN, Esq., Woodlands, Bradford.—Mr. JOHN FORBES, for the last four-and-a-half years Gardener to the Princess MESTCHERSKY, as Gardener and Bailiff to J. S. MORGAN, Esq., Dover House, Reehammton.

COTTAGERS' AND ARTIZANS' SHOW AT SOUTH KENSINGTON.

THE Royal Horticultural Society has just issued a comprehensive and very liberal schedule of prizes be awarded at a cottagers' and artizans' show of fruit and vegetables to take place in the gar-dens of the Society at South Keosington on There are thirty-six classes for August 12 next. vegetables and fruit, and, provided sufficient publicity be given to the exhibition, an extensive and interesting show ought to result. There is one class interesting show onght to result. of a special character well deserving attention; it is that which will be called Class A for a collection of garden produce, fruit and vegetables, of not less than six distinct kinds of Iruit and twelve distinct kinds of vegetables, the collection to occupy a space not exceeding 60 square feet. Six prizes are awarded in this class, the highest being £5, and the competition is to be amongst the various local horticultural and cottage garden societies and allotment-holders in the country. Thus the secretary of any society, or any duly responsible person acting on his behalf, is authorised to collect the necessary produce from its members, make the necessary arrangements, exhibit in the usual manner, and to give guarantee that the produce is bond fide grown. Now seeing that of late years there has been a marvel-

lous extension of cottage garden and allotment cultivation through the agency of local horticultural societies, if some of these can be induced to interest themselves in this particular exhibition, it should be one of a very instructive character. But what is to be understood by the term kinds? It is sometimes nsed to designate Cabbage, Potnto, Carrot, Lettuce, Pea, &c., and only one variety of each to be included. Thus, twelve distinct kinds of vegetables under this interpretation would not include more than one representative of each. But the term kinds is very frequently used in the sense of varieties, and a gardener speaks of a "good kind of Cabbage, &c.," variety. But the Royal Horticultural Society's aim is, no doubt, to employ the first of these interpretations, so that they may have the best dish of Potatos, of Peas, Cabbage, Beans, Lettuce, &c., from a district, and not two or more varieties of any of these. And it would undonbtedly be of service if there could be attached to each collection a paper setting forth the district from which the produces comes; whether grown in a cottage garden or allotment, and the nature of the soil; it should be a sine qua non that exhibits be correctly named, and the individual contributing a certain quota should have his name appended to each article. Secretaries of all societies within a reasonable distance of London that embrace cottage and allotment exhibitors can render material assistance by circulating schedules and interesting their members in the competition. The entries for all competitions in this class should be made by the secretary of the local society, and the carriage of the products to London should be defrayed by the same.

Now comes the knotty question of the distribution of the prize-money that may be won. Shall it go to the funds of the local society, or be distributed among the competitors? If the former, it should be used for the benefit of the cottage exhibitors, by offering special prizes for competition at the succeeding show by those who helped to make up the winning collection. If distributed among the exhibitors making up the collection, it can either be pro rata according to the extent of the contributions of each individual, or be equally divided amongst each. This is a matter that can be safely left to each society for itself, but it ought to be a distinct understanding that each exhibitor should in some way participate in any benefits accruing from the competition, or he may not be ioclined to send the best he has towards making up the district collection. One important preliminary step on the part of the authorities of any society that might be disposed to compete would be to call an early meeting of their cottage and allotment exhibitors, and form a management committee among themselves to assist in the matter. The selection of the particular vegetables to form the competing col-lection might be left in the hands of the committee lection might be left in the hands of the committee supplemented by the officers of the society. And it is reasonable to suppose exhibits in other classes will be sent up also from the district; the secretary or com-mittee might render very useful service by collecting these, seeing that they are properly filled up, and for-ward them to Mr. Barron. He or they might also assist by seeing to the careful packing and prompt despatch of all exhibits requiring such oversight.

Floqists' Flowers.

THE AURICULA .- Those intending to save seeds in any quantity from their collection should go over the flowers daily with a small camel-hair brush and thrust it down the tubes of the flowers. The brush carries the pollen with it, and places it on the stigma. Some varieties will not fertilise with their own pollen, and have to be "set" with pollen from a free seeding variety. Few Anricula fanciers save seeds: indeed I do not know any who do, except sufficient for their own nse, and that is carefully crossed to produce the very best flowers. The young seedlings raised from seeds sown early in the year must be encouraged to grow on freely, else the plants will not grow strong enough to flower in one season. I am now pricking them out, about a dozen tiny plants in a small 60-sized pot; they will be there about six weeks before it is time to pot them off again-three or four plants in the same-sized pots. In six weeks more they may be potted singly in small 60's, and again, when well rooted, they may be potted in large 60's, in which they will flower. Mr. Horner, one of the most successful raisers of seedlings, flowers about a dozen or more plants together in a 7-inch pot. established plants should now be removed to frames behind a north wall or in some similar shady position where the sun cannot shine upon them during the hottest part of the day. We have been taking off some offsets from a few of the scarce sorts, but the largest proportion of them will not be disturbed until potting time.

THE CARNATION AND PICOTEE .- I shall not forget a very large bed containing thousands of plants of scedlings in Mr. Barlow's garden at Stakehill House. I saw it in full flower, and the wealth of floral beauty it contained would take loog to describe. The owner of the bed had purchased seeds from some of the principal seedsmen, not florists varieties at all. In this case each plant produced a score or more of fine blooms. Seeds of the best florists' varieties can now be obtained. They should be sown at once, and will produce strong flowering plants to bloom next year. Ours have been pricked out in boxes and pans, and as soon as they are large enough they will be planted where they are to flower. To produce cut blooms there is nothing to beat these masses of seedlings. Most of the better-named varieties will do well in beds, or planted in isolated groups in the herbaceons border. We have now re-moved the pots containing our best selection from the frames, and placed them out-of-doors. They have had sticks placed to them. It is very desirable to fumigate the frames containing the plants before they are removed to the open air. Even if no greenfly is to be seen it is best to do so. The tree or perpetual flowering varieties are now growing freely the greenhouse, but as that structure requires shading to save other flowering plants, we would much rather have them in a cool honse now, near to the glass, and under conditions where the lights could be removed entirely in fine weather. The plants require to be potted on at this season, and encouraged to make good growths. I find that by growing autumn pro-pagated as well as spring cuttings we can obtain a succession of flowers from the time the florists' section are over, all through the winter months. The main object in view at present is to obtain sturdy short jointed growths; this is obtained by keeping the plants clean and well exposed to light and air.

THE DAHLIA,—The very favourable reception accorded to the single Dahlia during the last few years has caused all the sections of the Dahlia to be much more freely enlivated than they had been previous to the introduction of the former. The easiest, and perhaps the best way, to treat the single Dahlia is as an annual. The propagation of the named varieties, whether single or double, ought to have been completed a month ago. The plants should now be in 5 or 6-inch pots, and in cold frames or pix where the light can be removed entirely when the weather is fine. Those intending to grow flowers good enough for exhibition must devote a space of ground specially for their culture. This should be prepared by frequent torking over in fine weather to get the soil into good condition. The plants cannot be planted out until quite the last week in May,

or even early in June, when no danger from frosts is evident. The manner of planting, &c., has been previously given.

THE POLYANTHUSES .- The time to plant out the laced varieties that have been flowered in pots has now arrived. We plant them in a shady position in good rich loam, and under the shade of a north wall or fence. The plants remain more free from insect pests in such a cool shady place as this-at any rate in the southern districts. Seeds ought to be sown at once if a strong bloom is to be expected next year. I sow the seeds in a hotbed, about the middle of April, under the impression that the seeds germinate more freely in a moist bottom heat. The young plants are pricked out into pots and hoxes as soon as they are large enough, and planted out in the open ground soon after midsummer. The fancy Polyanthuses schibited by me at South Kensington were treated in that way. They flowered in the open ground and were lifted and potted about a week before the exhibition. They succeed a great deal better in heavy clayey soil than they do in that which is light.

THE TULIP.—As the Auricula time passes away the show Tulips begin to interest the florist. Usually the one is gone before the brilliant colours of the others open to our view. This year we have Tulips and Auriculas together. Fashion is answerable for many strange freaks, one of the latest being the preference of such monotonous looking flowers as Daffodils to the rich and varied colours of the Tulip. It is a great treat to examine the interior of a first-class Tulim-the ground colour so rich in god It is a great treat to examine the interior of a first-class Tulip—the ground colour so rich in gold, purple, maroon, rose, and scarlet; so beautifully flamed and feathered withal—but Daffodils and Sun-flowers are the fashion, so the few old-world florists must share their pleasures alone. Our bed is not shaded by an awning this year, but being under a wail facing east, and further sheltered by tall trees behind the wail, they have not suffered in the least from the severe frosts we have lately experienced. If from the severe frosts we have lately experienced. If the Tulip could be planted in groups in the herbaceous border, the finer forms would be greatly valued. They are well adapted for that purpose, especially the self (or breeder) forms. Although the "broken" flowers, as they are termed, that is, those that have passed from the self to the "rectified" form of bizare, byhloemen, or rose, are also good border flowers. Their beauty is greatly marred by heavy rains, which dashes the dark pollen about in a pasty mass; in other respects they do not suffer much from the weather. A few plass-lights placed over the beds serve to keep other respects they do not surfer much from the weather.

A few glass-lights placed over the beds serve to keep them in their pristine purity until the flowers fade.

A mulching of rotten manure over the bed, and a good soaking with rain-water, will add substance, size, and lustre to the flowers. J. Douglas, Great Gearies, Ilford.

A PLEA FOR MERCY.-There is no sadder sight in the spring and summer than to see a bird's nest torn from the hedge by the idle hand of some thoughtless boy and thrown by the wayside. We earnestly appeal to our readers to use their influence in every possible to our readers to use their influence in every possible manner, whether as parents or schoolmaster, to prevent the ruthless robbery of birds' nests. It should be pointed out to any boy who has set his heart on making a "collection" of eggs that he can do so without causing pain to the mother-bird, by taking one egg when four or five had been laid. There are three good reasons why we should leave the nests of our wild birds unharmed'—1. Because it is now admitted that though birds do some harm, they do infinitely more good. 2. Because some of our most beautiful English birds are rapidly becoming extinct.

3. Because (and this is the best reason of all) it is right to be merciful and kind to every creature that God has to be merciful and kind to every creature that God has made :-

- " He prayeth well who loveth well Both man and bird and beast,
- "He prayeth best, who loveth best All things both great and small; For the dear God who loveth us He made and loveth all."

The Bicester Deanery Magazine.

THE AMOUNT OF VEGETABLE PRODUCE now THE AMOUNT OF VEGETABLE PRODUCE now annually imported into England is more than double that produced by the soil. To say nothing of the tropical or sub-tropical vegetable products — cork, de-woods, oils, resins, gums; nothing of sugar, spices, Tea, Coffee, Cocca; nothing of Cotton and grasses, of Hemp and Flax, of indigo, madder, and fruits—we import sawn or split timbers, staves, and Mahogany to the value of £15,000,000 per annum, of Mahogany to the value of (15,000,000 per annum, of which the one item that we could not ourselves produce, Mahogany, stands for under £400,000. Our imports of timber not sawn and split, down to 1808 (the last year in which they figure in the Statistical Abstract), stood steadily for some years at about £5,000,000 in value. We look in vain for any corresponding item among our exports. Builder.

PSEUDO-LARIX KÆMPFERI (THE GOLDEN LARCH). "The interest attaching to this plant is truly hoth manifold and great. Messrs. Veitch (Manuxl, p. 129, 1881) speak of it as the most ornamental of all the Larches—note, they call it a Larch. It is perfectly hardy, and is, they continue, "a moderately vigorous growing tree, of pyramidal habit. The branches and branchlets are like those of the common Larch, and the leaves are fascicled in the same way as in that tree, but they are longer and broader; at first they are of a light yellowish-green, with a soft pleasing tint, peculiarly attractive in the spring months; as the season advances they become much deeper and duller in colour, and in the autumo finally change to a bright golden-yellow." For this latter reason it is sometimes called the Golden Larch.

Adverting now to the history of the plant, we may mention that it was in the first instance botanically described by Lindley in these columns, 1854, p. 255 and p. 455, with figure of cone, under the name of Abies Kæmpferi, under the impression that it was one of the plants mentioned by Kæmpfer in Japan. This, however, appears to be a mistake. The tree is not Japanese so far as known, but is a native of the central,

FIG. 113.—CONE OF PSEUDO-LARIX KÆMPFERI. (SEE P. 581.

northern, and eastern provinces of China. It was introduced to this country by Fortune, who calls it a Larch (Larix), although the scales of the cone, instead of being persistent, "are so deciduous that it is scarcely possible to hold them together."

Fortune could not assent to its being called an Abies unless Cedars and Larches are also referred to the same genus. "It is," he says, "apparently a plant exactly intermediate between the Cedar and the Larcb; it has deciduous cone-scales, like the Cedar, and deciduous leaves like the Larch, and a habit somewhat of the one and somewhat of the other.' (Gardeners' Chronicle, 1855, p. 644.) Gordon, recognising its distinctness from Abies, Cedar, or Larch, called it in his *Pinetum* Pseudo-Larix Kæmpferi, thus putting it with a new genus, to which objection was raised at the time, on the score that the name was an "ill phrase-a vile phrase."

A. Murray preferred to keep to Lindley's nomenclature, and was of opinion that it was nearer to the Firs than to the Larches. Carrière calls it Larix Kæmpferi. Lambert and Parlatore group it under Pinus.

It is not necessary to cite other authors, who have only copied what their predecessors have said, but we may now cite the opinion of the venerable Mr. Bentham, who, in the Genera Plantarum, iii., p. 442 (1880), after pointing out its peculiarities, concludes that the tree must be affiliated to the Cedars, or considered as a distinct genus; the male flowers, however, are, he says, unknown, and the position of the plant remains uncertain.

This uncertainty we have now the happiness, thanks to the courtesy of Signor Rovelli, of removing. of the most remarkable trees in that emporium for all that is remarkable in that way — the nursery of Messrs. Rovelli, at Pallanza, Italy—is a tree of this species, and this season it has put forth male catkins, of which we lose no time in submitting an illustration to the reader (fig. 112, p. 581), albeit the speci-men was hardly fully expanded, and its beauty would have been enhanced by figuring the specimen at a later stage. These male catkins settle the point. It is clearly not a Pinus (except in the very widest and practically most inconvenient sense). It is not an Abies (Silver Fir), nor a Picea (Spruce), nor a Cedar, nor a Larch, but, as Gordon said, a distinct genus. In spite of his "ill-phrase," we consider ourselves, therefore, bound to adopt his designation. The male catkins are different from those of any Conifer known to us. To some extent they remind us of those of the Ginkgo, which are stalked, grow in tufts in the same manner, but are mixed with the leaves, needless to say there is little or no other resemblance to the Ginkgo.

The catkins of Pseudo-Larix are arranged in umbels at the apex of short spurs invested by brown membranous scales. Each catkin is stalked, the stalk being recurved, so that the catkin itself is pendulous, oblong, about three quarters of ao inch long, applegreen in colour. The lower anthers are subglobose, almost sessile, the upper ones are prolonged into a long appendage, sometimes lanceolate, sometimes, as long appendage, sometimes anaccount, sometimes, as shown in the drawing, 3-lobed at the apex. The pollen grains, drawn by Mr. W. G. Smith, have each two bladders, as in the Pioes, &c.

The tassel-like catkins, not fully developed in our

specimens, must clearly be very ornamental, and, as we have said, they are quite different from the solitary sessile catkin of the Larch.

Fortune's account of the plant in our columns has often been cited. It will suffice to repeat that he first met with it as a dwarfed pot plant; when at a height of some 18 inches the Chinese contrive to make it assume the guise of an aged Cedar of Lebanon.

Ultimately he found the tree growing in the vicinity of a Buddhist monastery near Chekiang. The trunk of one specimen had a girth of 5 feet and a height of 120 or 130 feet. At Quanting, 20 miles away from the first locality, Fortune came upon a sloping hill "covered with the beautiful object of our search." The trees he notes all appeared to have been planted. "One tree in particular seemed the Queen of the Forest, the trunk height, with the lower branches nearly touching the ground." We note the circumstantial We note the circumstance that the trees appeared to have been planted, for it is of importance with reference to the origin of the tree. Two explana-tions have been offered of the fact that curious trees, tions have been offered of the fact that curious trees, such, for instance, as the Abies Fortunei we lately figured, are found in the vicinity of temples and monasteries in Japan, China, Sikkim, Tibet, and other Buddhist countries. One explanation is that the trees have been brought from elsewhere by the Buddhists—but whence? The other is the view taken by Dr. Hance (whose authority on such a point is very great), that the trees form the remnants of the indigenous forest preserved around the temples, from feelings of veneration, but destroyed for timber or by fire is other parts of the country.

seetings of veneration, but destroyed for timber or by fire io other parts of the country. We have said enough to show that the interest attaching to the Golden Larch is manifold, and we cordially thank Messrs. Rovelli for affording us the apportunity of clearing up one part of its history. M. T. M.

CLIMATE OF ALASKA.

In his remarks on glaciers in Alaska, Mr. Thomas Meehan observed that on the tops of what are known as "totem-poles" in some of the Indian villages, trees of very large size would often be seen growing. These poles are thick logs of Hemlock or Spruce, set up before the doors of Indian lodges, carved all over with queer characters representing living creatures of every description, and which are supposed to be genealogies, or to tell of some famous event in the family history. They are not erected by Indians now, and it is difficult to get any connected accounts of what they really tell. At the old village of Kaigan there are numbers of poles erected, with no carving at all on them, among many which are wholly covered, and these all had one or more trees of Abies sitkensis growing on them. One tree must have been about twenty years old, and was half as tall as the pole on which it was growing. The pole may have been

20 feet high. The roots had descended the whole length of the poles, and had gone into the ground, from which the larger trees now derived nourishment. In one case the root had grown so large as to split the thick pole on one side from the bottom to the top, and this root projected along the whole length to the ground, about 2 inches beyond the outer circumference of the pole. Only in an atmosphere sur-charged with moisture could a seed sprout on the top of a pole, 20 feet from the ground, and continue for years to grow almost or quite as well as if it were in the ground,

We may also understand by incidents like these how tree-life endured so very long in this part of Alaska, and why rocky acclivities, on which no vegetation at all could exist in the dry climate of the Eastern States, were here clothed with a luxuriant fresh growth, so thick that it was almost impossible for one to make a journey through it. Indians had very few trails; most of their journeys were by canoes. At this village he also saw a bush of Loni cera involucrata, which was of immense size as com-pared with what he had seen in Colorado and other places. This was at the back of an Iodian lodge, and alongside of a pathway cut against the hill-side. The plant was growing on the bank, and grew up some 10 or 12 feet, where it bent over, apparently of its own accord, and rested on the roof of the lodge, its numerous branches making a dense arbour under which the road passed. The stems near the ground were, some of them, as thick as his arm, and the whole plant was covered by very large black berries. Stopping in admiration to look at and examine the specimen, brought numbers of Indians to see what was the subject, who smiled pleasantly on being made to understand that only the sight of a huge bush had attracted the traveller. Subsequently another specimen was noted in the woods on a plant of the native Hemlock (Abies Mertensiana). In the woods the plant is somewhat sarmentaceous. It could not climb a Hemlock without assistance. This old Hemlock was bereft of branches to about 20 feet high, but the Lonicera was above the lower branches, and had journeyed along them to the extremities, beyond which it was beautifully in fruit. It could only have been there by growing up with the Hemlock when that tree was young, and was probably of about the

ODONTOGLOSSUM LUTEO-PURPUREUM.

So dissimilar have the varieties of this plant been which have been sent to us lately, and to all of which we have had to give the name O. luteo-purpureum, that we take the opportunity of illustrating two of the extreme forms, in order to show how widely they differ. Other forms, equally distinct, have presented themselves, and now that there are plenty of the species in flower it would be easy to find numerous varieties differing from each other only in shades, but which would, step by step, fill up all the space between the extreme varieties we illustrate, and thus establish the identity of the whole, and point out the necessity of glving them but one title. As with most other variable Orchids, the extraordinary variability of the species may be accounted for in a great measure by the large area over which it is distributed. In this case its stability is still further encroached upon by the great variety exhibited in the flowers of the plants from each locality. Thus it is that varietal names which were well understood when the plant was very rare have now but little meaning. The only one which gives distinct features which run consistently throughout the whole of the plants imported is the one named sceptrum, which Messrs. F. Sander & Co., of St. Albao's, recently imported, and which is distinct enough to warrant its name being preserved. In the neatoess of its habit, in the attractive spotting of its petals, and the almost uniform width of its floral segments, it resembles O. facetum, and is very attractive.

The earliest gatherings of O. luteo-purpureum were made on the western slope of the Central Cordillera by Linden in Quindiu, by Roezl nearer to Medellin, and later on by Shuttleworth and Carder at San Domingo. Apropos of Roczl's gathering, he relates that he employed the native children to collect the specimens for him, and that he derived much pleasure from his business relations with them, and they both pleasure and profit from their new occupation; we can easily imagine the zest with which they pursued such a congenial occupation. Weir found the plant

on the Eastern Cordillera, 100 miles south of Bogota, and a matter of a ten days journey from where it had formerly been collected; and later on Blunt sent it from the same place.

Although so very variable the plants of each locality are easily recognised by those who know them well, and they thrive when grown with the O. Alexan-Our illustration fig. 114 represents a good variety of the Quindiu type, and fig. 115 a rather

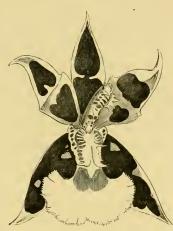

Fig. 114. -ODONTOGLOSSUM LUTEO-PURFUREUM (QUINOIU VARIETY).

narrow petalled variety of the Bogota district, but among the latter many extraordinarily fine and showy things often appear.

What right the plant has to the "purpureum" part of its name does not readily appear, as the flowers of all the varieties are light yellow, in different shades, marked with brown of different tints, the blades of the lips being white, often changing to yellow. Perhaps a form of the Bogota O. luteo-purpureum

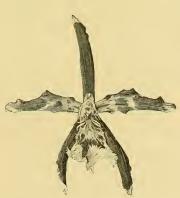

FIG. 11S .- ODONTOGLOSSUM LUTEO-PURPUREUM (BOGOTA VAR ETY).

was the plant Lindley had before him when he described O. crispum for Folia Orchidacea-" a most beautiful species, occasionally as much as 3 feet high; flowers large, yellow, with a purple spotted centre; column deep purple." At all events, the description fits O. luteo-purpureum better than it does the O. Alexandræ, which is reputed to be synonymous with O. crispum. The flowers have a purplish tint when dried, and it is possible that some confusion may have been caused by naming and describing dried

HOME CORRESPONDENCE.

Vellow Spring Bedding Plant.—If Mr. Ingram has not yet tried Viola Yellowboy in his spring garden, I think he may find it not only the very earliest of all yellow-flowered Violas, but a capital bedding-plant for his purpose. This is not only an old friend, but it has never been beaten by much finer flowers in point of earliness or freedom. As the habit is dwarf and dense it makes a capital plant for edgings or yellow carpets. The value of a bedding Viola is that it may be increased in great quantity in a short time; which is more than can be said for the best of Polyanthuses, as the creation of a "big stock of any kind" requires several years. No doubt by planting remote from all others a fairly true strain may be secured from seed, but that is perhaps very difficult in most gardens. Still some of the yellows, especially of the duplex forms, produce splendid masses of colour, and very early, and if a quantity can be had, all of rich hues and of even habit, they can hardly be excelled. A. D.

— I think Mr. Ingram will find that Ranunculus montanus will suit his requirements. R. C. Appleton, Everyley.

— I am much pleased you brought this subject.

— I think Mr. Ingram will find that Ranunculus montanus will suit bis requirements. R. C. Appleton, Exercity.
— I am much pleased you brought this subject into notice (see p. 550), as where spriog bedding is carried out the want is very much felt, and if some one could raise or introduce one similar in habit to Alysaum saxatile or Arabis albida, and to bloom as early as the Arabis, he would confer a boon upon gardeners and all lovers of spring gardening. I have tried Fansies and Violas, but can rarely get them in bloom before the end of April or beginning of May, consequently they are hardly at their best when they have to he taken up to make room for the summer bedding plants. I should like to have a good yellow Cowslip or Polyanthus. Perhaps Mr. Ingram would be kind enough to recommend one, and also state whether he has put his improved Cowslips in commerce. Our spring bedding this year has been lovely, indeed far before the summer display. The plants we chiefly use are Hyacinths, Tulips, Aubrietias, Arabis, Daisles, Myosotis disstitifora, double Primoses (filta and white). My employer and many visitors like the Daisles best of all. I have whole beds of them planted, red and white alternately, which are far more effective than when planted in lines of separate colours, as each colour, when mixed, shows up the other. To those who have not tried the nabove method I would strongly recommend them to shows up the other. To those who have not tried the above method I would strongly recommend them to do so, and I feel sure they will be highly pleased with the result. F. H., B.

Early Melons.—When anything is really well done, more especially by an enterprising young gardener, a note of the same ought to be made and duly recorded in the Gardeners' Chronicie. At Newbold Revel oo Saturday, April 26, I had the pleasure of seeing a very fine house of Melons, which did great credit of Mr. John Coysh, the clever young gardener at this place. There were eighty-five fruits in all, some ripe and cut, and others approaching more or less the ripeoing stage. This variety, which no doubt Mr. Coysh will name the "Newbold Revel Scatel Gem," was obtained by a cross between Conqueror of Europe and Scarlet Gem. It is a handsome fruit. Mr. Coysh describes it as a free setter, of good constitution, and of early proclivities. Two fruits, Mr. Coysh informs me, had been sent to the floral meeting to be held to-day (April 29) in Early Melons .- When anything is really well irec setter, of good constitution, and of early proclivities. Two fruits, Mr. Covsh informs me, had been sent
to the floral meeting to be held to-day (April 29) in
the Town Hall, Manchester. The house in which
these Melons are growing is a neat and useful spanroofed structure, 29 feet long, 7 feet 6 inches wide,
and 9 feet 9 inches high. The space underneath the
beds in which the Melons are grown is available for
the forcing of Seakale, Rhubarth, &c. I need hardly
say, the pit in which these Melons were grown is
adequately heated, but this I should qualify by adding
that for about a week the plants had to comport
themselves in a rather low temperature owing to a
mishap to the heating apparatus. These Melons,
Mr. Coysh informs me, average 3 lb., and some
4 lb. in weight. Last year they gathered fifteen nice
fruits from two plants, which says much for the fruitfulness of the variety; and this from the first fruiting,
not from the second fruiting of the same plants, Mr.
Coysh preferring always to replant. Wm. Miller,
Combe Abbey Gardent, April 29.

Melons in Cold Frames.—As the time is drawing near when frames now containing bedding plants will be vacated, a few remarks as to how a few of them may be profitably used, especially by those not having better accommodation for the purpose, in the production of Melons during the summer months, may not be without interest to some of your readers. The only preparation that is necessary as regards the bed, is to place the frame, or frames, on a south or west border (the former is the more favourable aspect), and under the centre of each light to put a barrow load of soil, consisting of three parts of good loam and one of lime rubble and horse droppings. This

done, the frame should be kept closed for a day or two to get the soil warmed a little, after which the Melon plants, which should be clean and vigorous-growing, should be planted two in each light and about 9 inches apart on the mounds. The soil should be pressed firmly about the roots, and the plants le watered and shaded from bright sunshine for a few days, when it should be discontinued altogether, as the Melon is a sun-loving plant. These plants, bearing in mind that there is no bottom-heat in the frames other than that imparted to the soil by the sun, will require very little water at the roots afterwards; they should, however, be damped overhead, and shut up early on bright afternoons, to encourage a clean growth. The plants should be stopped when they have made the third rough leaf, and three shoots resulting from this stopping trained regularly over the bed will be sufficient for each plant. These, when they have attained 18 inches in length, should have the points nipped out, which will result in fusit-bearing shoots being produced. As soon as the flowers are expanded fertilise them about mid-day when the pollen is dry, withhold the syringe, and ventilate more freely until the fruits have set, when a closer and moister atmosphere should be maintained. Three or four fruits, according to the size which the varieties grown attain to and the condition of the plants, will be a sufficient crop for each plant to bear, and these should be distributed pretty regularly over the plants. The shoots, which should be kept well thinned out and be no closer together in each light than if the latter contained only one plant, should be stopped at one joint beyond the fruit as soon as the latter have set. As soon as the fruit—which should be letwated above the foliage or flower-pot just when they begin to swell—approaches maturity, which state will be indicated by a cracking about the stems, syringing should be discontinued and a freer circulation of air admitted. High Cross Hybrid is a good variety for framework. Cutti

The Frost and the Fruit Crops.—Most saddening indeed is it to examine the fruit bloom throughout this district, as evidences of the effects of the recent sharp frosts are terribly abundant. How the Plum and Pear bloom, so luxuriant, so robust, and so beautiful, had been destroyed only a cursory examination showed. When, however, curiosity led me to examine unopened and most immature Apple and Cherry bloom, I found in almost every case, sort making no difference, that the germ of the fruit was blackened and killed. We shall presently see the Apple bloom expanded, looking doubtless lovely in its rosiness, but it will soon fall because of its lack of fertility. If out of the general destruction any one kind shows life and fruitfulness, let it be known, for if found to equally hardy in other places its possession must be a great boon. Throughout this extensive market garden district the loss will prove enormous, and its effect upon the labouring population will also be unfortunate, as a fine fruit crop gives abundant and well paid employment. Sometimes our fruit trees when in bloom suffer from fierce sweeping cast winds, then we call out for shelter, but this season the wind, though cold enough, really was less to blame than the very low temperature that carried destruction as much where the wind was quiet as where it prevailed. It is worthy of observation that the Blackthorn this spring bloomed most luxuriantly; are, therefore, Blackthorn winters are breader?

is more or less abundant? A. D., Bedjont,

— The week ending on April 26 has proved one
of wholesale injury and total ruin to the major portion
of the fruit crops in this district. As usual, this
abnormally mild winter has decoyed the crops forward
to destruction. As day after day passed on throughtout April—abnormally cold as well as dry—hopes of
a sure and abundant fruit crop rose higher and yet
higher. No doubt, the drought and the cold hardened
the fruit and blossoms for what was coming, for the
majority of the crops bore a frost of from 10° to 12°
with apparent impunity. But when the frosts
increased from 12° to 18° several nights in succession
the bloom was blackened, the embryo fruits frozen
through in the most wholesale way. It is impossible
as yet to write with certainty of the actual state of the
crops. For several mornings in succession the Apple
shoots were so severely frozen through that the entire
shoots hung down as if actually killed. The bloom,
however, being rather late, it is difficult as yet to
divine the effects of such freezing on the future
Apple crops. The probability is that a large
proportion of the fruits are destroyed. Forward
Pears are also frozen through, the embryo fruit
not blackened on the outside, showing a black line or
streak down their centre or core, which is a sure
proof of injury as irreparable as fatal. Cherries have
also suffered severely, but the most cruel cut of all
has been given to the Plums; these never promised a
more full crop, but will now yield little or nothing.
This will be a great loss, especially to those who
depend on their Plums to pay their rents. There was
but a scant crop in most localities last year, and this
year's promise of abundance appeared most oppor-

tunely to make good last season's losses, and now this year's wreck of the Plum crop is complete in this district. Gooseberries, Currants, and Raspherries, all of which were full of promise, are also severely injured. Strawberries were hit so hard several days in succession that the leaves lay quite flat on the surface of the ground. It may be hoped, however, that the embryo blooms were not sufficiently advanced to be scriously injured. Possibly the cold wave may have expended its chief force in the Eastern Counties, as I have heard from Surrey since the frost that the fruit crops are not seriously injured. [We are sorry not to be able to confirm this. Ed.] Assuredly around this district the major portion of the fruit crops have vanished. The effects upon Roses and other plants have been almost equally disastrous; the flowering shoots of Tea Roses showing buds are in some cases quite shrivelled up, while in others they have escaped with but little injury. Forward blooms of Rhododendrons and Azalea mollis are quite destroyed. The early Forget-me-Not, dissitifiora, has every bloom blackened, while Marie Louis Violets that have been in bloom in the open all winter have had the plants severely injured. All Potato tops and Asparagus have been cut down to the ground, while early Peas and Broad Beans have suffered more than I remember to have seen them. D. T. Fijts.

— Fruit prospects in this locality were most promising until the frosts experienced between the 18th and 22 of April set in. Fruits of all kinds have suffered severely, even wall fruits under a covering of Eddy's No. 5 shading are all lost. Early Peas on a north border, with a protection of Spruce boughs, are cut to the ground. Vegetation in this part of Berkshire being so forward, could not stand against such unseasonable weather. 3. H. Rose, Lockinge Garden, Wandage.

Spring Cabbage.—I am growing three sorts of Cabbages for our spring supply — Heartwell Early Marrow, and Wheeler's and Sutton's Imperial. They were all sown on July 16, and in the second week of September 2000 of Heartwell Early Marrow, and 5000 each of Wheeler's and Sutton's Imperial were planted out. Quite two-thirds of Heartwell Early Marrow bolted, and 10 per cent. of Wheeler's Imperial; but of Sutton's Imperial I can only see thirty-five in the whole bed. I find that these three sorts suit me very well in this chalky soil, coming in in succession as named above. We planted another bed of 1500 plants of Heartwell Early Marrow held of 1500 plants of Heartwell Early Marrow for this being, I think, explained by the time of planting. In January, the weather being mild, we planted out the surplus stock of the three sorts, and none of these have bolted. They will carry us on till the spring-sown plants come in, as although I want from 5 to 6 cwt. a week I never leave the stumps to sprout. For a spring-sown Cabbage to turn in quickly I find none better than Sutton's Reading Altheart, as they can be planted over close between Peas and Beans, and grow very fast. C. F. Prangnell, Kensington and Chelsea Schools, Banstead.

Bees and their Relations to Fruit and Flowering Plants.—Mr. J. Sheppard says "Will North Nofolk' tell us what wax for the comb is composed of, and can be prove that pollen is not converted into, or forms part of that substance?" Wax is composed of, say, in round numbers, 100 parts — about 80 per cent of carbon, 13 of hydrogen, and 7 of oxygen. Any beekeeper having an observatory hive (I have two), can if they choose prove that pollen does not in any way, either in a crude or digested state, enable bees to make wax. You may supply them with any quantity or quality you please, naturally gathered and stored by themselves, or artificially produced and given to them, and no wax will be made, for the very good reason—pollen does not supply the uccessary material. Give them caue: sugar, or honey and water, and they will make wax, without having access to pollen. I have "read up" the Gardeners' Chronicle for something over forty years, and it is refreshing to find history repeating itself. It does not follow because Aristotle wrote upwards of 2000 years ago, and Huber something less than a century, that they were not acute observers of bees and flowers. They have also recorded facts that have not yet been called in question by those best qualified to judge. I am in ohaste to reply, this interesting subject will keep, and I hope lose nothing; in the meantime I can "read up" some of the old authorities, such as Evelyn's Sylva, &c. North Norfolk.

Rhododendron "Otto Forster,"—Of all the beautiful-scented Rhododendrons which have resulted from cross-breeding, none can surpass one which is mentioned in your notice of the proceedings of the Scientific Committee of last week. For some years I have carefully studied these plants, and my mature

conviction is that R, Otto Forster is the finest of all I know. My cool greenhouse has been glorious for some weeks with the profuse trusses on three plants of this variety, planted in a peat border. Mr. Otto Forster raised it by hybridising R. Veitchianum with pollen of R. Edgeworthii. He sent me three plants, and made over the rest to the Messrs. Veitch. Undoubtedly, in my opinion, the hybrid surpasses both parents. The blossoms are larger, and the foliage finer than is the case with the female parent. The flower and the habit, again, are better than in R. Edgeworthii, at the hybrid is far more floriferous. Till the present year I had no notion of its capacity in this respect, I had no notion of its capacity in this respect, I had sone before the sent buds. In the summer of last year it formed blossom-buds; the side-shoots then grew, and again formed buds sightly higher than the centre bud. In the spring the three trusses of flowers opened simultaneously, and formed one grand mass of immense fringed white florets with yellow centres, and with the most delicious scent. I ruthlessly cut my plants, and sent basketsful to many friends, who have expressed the utmost admiration. I am always careful not to praise unduly; but I must congratulate my friend most warmly on his most lovely production. J. H. Mangles, Valencow, Hatelmere.

The Best Potato at Present, — There are one or two important things that have not been touched upon by either of your correspondents which I should like to allude to. The first of these is the soil which best suits the Schoolmaster and Magnum Bonum. It not unfrequently happens that a Potato turns out remarkably well in cropping and table qualities off some soil, and we see this Potato recommended as "the best Potato in the world," while no mention is made of the kind of soil that produced these results. At the same time, grown on a soil totally different in character, the same Potato might be almost "the worst in existence." Now I have found this to be the case with Schoolmaster. I have found this to be the case with Schoolmaster. I have found this to be the case with Schoolmaster. I have found this to be the case with Schoolmaster. I have found the torp was not worth digging up. On the other hand, grown on medium and heavy soils, the crop and table qualities have been all that cool have to might soils, but is not floury when cooked. The best Magnum Bonums I ever saw were grown on heavy soil, and this and a medium heavy are the most suitable for these varieties; while for such sorts as the Americans it cannot be of too dry a nature. I grow the Champion for a late supply, and no better Potato can be found for very shallow soils, indeed these are the only soils it should be grown on, when it will be found not to be particularly coarse. The case of its being black bruising the property lawriant balm will, I think, prevent it from becoming a general favourite. T. H., B.

Tree Violets: Double "Swanley White,"—
I received about three years since, immediately on its
introduction, this really fine double white Violet, which
in size of bloom and richness of fragrance, has not, to
my mind, been exceeded by any other, before or since.
Indeed I cannot help thinking with a Sussex friend,
who sent me yesterday a "posy" of Count Brazza,
that they are synonymes. However, my present
object is to ask what you think of growing them like
Tree Ferns—umbrella shaped; or, have any of your
correspondents any experience thereof? I have on
my few plants—I mean the older ones—taken off
every runner or offset as they appeared, with the
result that I have a stem, firm and woody, several
inches long, and with numbers of blooms handsomely
arching all round, and falling gracefully towards the
rim of the pot. W. J. M., Clonmel.

Anemones.—There is little that is new to be said about these beautiful flowers, but a word concerning their frost-conduring qualities is excussible. During the successive severe white frosts that did so much mischief, searing and scorching up flowers of many kinds, and literally destroying them, I found the Anemone blooms laid nearly flat by the frost, to come up again daily under the benign influences of the sun and to be absolutely uninjuned. Really no weather seems to injure the flowers, because if rain prevails the blooms close up, and open only when the sun again peeps out. I have heard from various directions the warmest praise of Anemones from those who, having had seed, have raised them for the first time. They, and probably many others, perhaps little imagined how beautiful a display of rich bloom they could obtain at so little trouble. As there seems still to be some doubt as to the obtaining of really double flowers from single strains, I may say that I get a moderate proportion of doubles from single sonly every year, and many of them are singularly

beautiful. Too many doubles would be undesirable, hecause they do not seed. It na much larger proportion of single flowers may, however, be seen evidences of doubleness, anthers here and there having run out into petals. By simply selecting seed from the finest and richest coloured flowers the properties of a strain are soon greatly improved. I should very much like to see prizes offered for Anemones in pots at some of our spring shows, for a class would be created that would prove singularly attractive. This would in no case be one in which the trade could excel the amanuary or gardener, for from a packet of seed any on might easily raise hundreds of plants, and whilst the first year would enable all to bloom so as to admit of selection, the second year would give very fine roots. It is a good time to sow now, though I, for the sake of convenience, always sow as soon as the seed is ripe, in shallow boxes, dibbling out the seedlings in good ground in rows 10 inches apart, and as soon as large enough to handle. I have a bed of last year's sowing now blooming grandly. A. D., Belfont.

The Berbageous Borden.

THE "SIR WATKIN" DAFFODIL,-The Editor's note at p. 552 raises a question of much importance to all the raisers of new flowers, and as one been successful in raising many new varieties of florists' flowers, I venture to claim for myself and for others the right to name the flowers of our own raising, and at the proper moment, which is when the plant is ready to be sent out. Now what is the history of the double naming of Sir Watkin alias James Dickson? Mr. Pickstone, its raiser, sent blooms to many, and amongst others to Messrs. Dickson. They sent blooms to Mr. Burbidge, who, doubtless thinking they were the raisers, christened the plant "James Dickson," and showed it about privately. Messrs. Dickson applied for more examples, which Mr. Pickstone supplied, and these they exhibited at the Horticultural Society, where a Firstclass Certificate was awarded. All this was without the raiser's knowledge or consent. The name was thus registered as James Dickson. In the meantime, Mr. Pickstone had submitted his flowers to the Wynn family, asking leave to honour his neighbour, Sir Watkin Williams Wynn, by calling the Daffodil Sir Watkin, after him. The compliment was appreciated, and the plant was named accordingly. Messrs. Dickson acquiesce in this, now that they are are aware of it, and the plant will be called Sir Watkin in the agreement by which they are purchasing it from Mr. Pickstone. There will, I suppose, be no difficulty in putting the matter right at the Royal Horficultural Society, by amending the record, and in future there ought certainly to be some rule which would prevent the naming of a plant which thus comes casually before the Society without its raiser's knowledge and consent. IVm. Brockbank.

NARCISSUS "SIR WATKIN."-In addition to the intrinsic merits of a floral novelty there is an added charm when the history and associations are presented at the same time. This induced me to carefully investigate the history of Mr. Pickstone's new Narcissus Sir Watkin, for which purpose I visited the gardens where they are growing, and carefully examined large numbers of cut flowers. Pickstone has since kindly brought me flowers from the garden where the variety originated, and tells me the seedlings are what are known as wind or accidentally cross-fertilised. Amongst those he brought were double and single Telamonius and single and very slightly double incomparabilis. At Caerwys were growing the double and single Telamonius, with the variety of incomparabilis. That the latter is one of the parents is clearly shown by the peculiar fragrance of that species, and still more in the revolute arrangement of the anthers, as shown in the variety figured in last week's Gardeners' Chronicle, while the much enlarged crown and broad perianth leave no doubt that Telamonius or Pseudo-Narcissus is the other parent. (I may here state my opinion that Telamonius, lobularis, and Pseudo-Narcissus are but varieties or geographical forms of one and the same plant.) Among Mr. Pickstone's seedlings are many forms with varying shades of colour from whitish to orange-sulphur, some having very narrow perianths, others broad, as in the form you figure. The cups or corona vary in length and width from that of incomparabilis to Pseudo-Narcissus. This would

indicate a first batch of numerous seedlings, or, what is more probable, there are several generations of self-sown seedlings. That no scientific or artificial hybridising gave rise to this interesting lot of varieties have clearly proved, and the same chance or accidental crossing produced the interesting lot of seedlings grown by the late Mr. Leeds, but with this difference, that Mr. Leeds' collection contained nearly all the species known to cultivation and all growing in close proximity. Several years ago, when I made inquiries into the subject, the only person I could find to have worked on scientific principles since the time of Dean Herbert was Mr. Backhouse, who raised Emperor and Empress, I mention this in hopes that some young cultivators may direct their attention to a field so full of promise when careful hybridising is carried out. I say young cultivators, because it requires long life and diligent care to fully realise the pleasure and benefit of raising seedlings and bringing to perfection such slow subjects as Narcissus. I note your editorial remarks respecting the name of Mr. Pickstone's flower, but certainly think he is entitled to give a name to his own baby. It is his particular wish that it should be called "Sir Watkin," and, as he had received that gentleman's permission to have it so named, it ought at once to be accepted. Had it been known that the flowers were not produced by Messrs. J. Dickson, but only sent to them for identification, I am quite sure Mr. Burbidge would not have named them "James Dickson." J. Tyerman.

NARCISSUS INCOMPARABILIS JAMES DICKSON, ALIAS "SIR WATKIN,"-It is with pleasure I noticed the excellent figure of this noblest and, one may say, best of all Daffodils-for at the present there nothing in the field equal to it. Mr. Wolley Dod's remarks at p. 552 are as near the truth as it is possible to get, on account of the obscurity of its origin; on the other hand, those of Mr. Brockbank on the same and preceding page contain some inaccuracies, to take all of which seriatim would occupy far too much space. First he says Mr. Pickstone was the raiser, afterwards that it originated as a chance seedling in that gentleman's garden. Is that raising? The fact is, it is one of Nature's own beautiful children, and I contend that Messrs, James Dickson & Sons were perfectly justified in adopting the name, which the Rev. Wolley Dod and Mr. Burbidge had simultaneously but independently given it; if I mistake not, it was Mr. Brockbank himself who first suggested to Mr. Pickstone, after it had been certificated (whether he knew of that fact or not I cannot say), the name of "Sir Watkin;" and as it was a very favourite Welsh name, no doubt it was a most agreeable suggestion, and I have no doubt if that name is ultimately adopted it will materially assist to make the variety popular. Mr. Brockbank says he took the flowers on different occasions for Princess Mary of Cambridge and Emperor, the former being very different to the latter, if I know that variety at all; lower down (p. 552) he says it "had been unheard of at the Conference." This is a remarkable statement, if, as I understand, Mr. Burbidge himself showed the blooms of it to Mr. Brockbank, and the latter pooh-poohed its superior value, and Messrs. Barr, Ware, and Walker, all saw and admired them (as well they might); the latter was especially struck with their dis tinctness and value for all purposes. Mr. Brock-bank further says, when he visited Mr. Pick-stone's garden the flowering period was nearly over, yet he was able to decide "there was but one variety," which is only part of the facts; in this respect there is no telling what will turn up, for the end of this Daffodil is not yet. Mr. Wolley Dod has, I believe, suggested its true origin, as between one of the larger trumpets, and the typical incomparabilis. I may add, that I quite think the large trumpet is N lorifolius, if not Emperor; in proof of this I gathered flowers from among Mr. Pickstone's clumps of a large trumpet, which I could not distinguish from Emperor, also another trumpet, which I took to be the typical Telamonius. The Narcissi I saw in Mr. Pickstone's garden, growing with this magnificent variety, were the following :- bicolor, moschatus, single and double Telamonius, single and double incomparabilis, a whiteperianthed form of Pseudo-Narcissus; but after all I feel confident it is a natural cross between the large trumpet and incomparabilis, being much larger than either of them, with a grand cup, and a very agreeable and strong perfume. Mr. Brockbank presumes the scent is inherited from biflorus, whereas I contend it comes from incomparabilis. By whatever name it

may henceforth be known, it is one of the finest Daffodils in the market, for I measured many flowers 5 inches across, and I understand the entire stock has passed into the hands of Messrs. James Dickson & Sons, Newton Nurseries, Chester, who will distribute it during the coming antumn; and although the supply is very large, it appears as if the demand will quite equal it, and without a doubt there is a brilliant future before it. Daf.

DOUBLE DAFFODILS .- Has Mr. Brockbank really seen ripe seed-vessels and seeds (not merely ovaries an ovules) in the double Daffodils? In making this inquiry I would by no means deny the possibility or even the probability of such an occurrence. At the Daffodil Conference Mr. Krelage and Mr. Polman Moy, two of the largest cultivators in Holland, both asserted that they had never seen seed-pods in any double Daffodil. The report of the Linnean Society mentions "that in two of the most double forms ovaries filled with seeds [sic] were present." It is not quite clear from this whether seed pods are intended. E. [We have had a very large number of double Daffodils through our hands, and have always found the todus inrough our nands, and nave always found the ovules present, but we have never had the luck to see the seed-pod or the seed, though doubtless they do occur. Of Narcissus poculiformis we have never seen a perfectly constructed flower, but always more or less deformed; the ovules, nevertheless, are, in our experience, always present, though, so far as we know, no one has seen the seed. E.o..]

Reports of Societies.

Newcastle-on-Tyne Horticultural: April 23 and 24.—The annual spring show of this Society was held on the above dates, in the Town Hall and Corn Exchange. There was a good display in the several departments of flowering plants, cut flowers, bulbs, &c.; the latter were extensively represented, although so far Hyacinths are concerned it was getting somewhat late, and the plants in some cases showed the effects of having been retarded.

late, and the plants in some cases showed the effects of having been retarded.

Stove and greenhouse blooming plants were plentiful and in unusually good condition. In the open class for four there was a close run between Mr. Noble, Woodburn Gardens, Darlington, and Mr. Methven, Heathfield House, Gateshead, both being awarded 1st prizes. The first-named gentleman staged a beautifully flowered Erica Victoria, about 2½ feet across; Tetratheca ericides, about the same size; Darwinia fuchsioides, laden with flowers; and Clerodendron Ballourianum. Mr. Methven had Dendrobium devonianum and D. nobile, both large and profusely bloomed; Occidium sphacels, but the profusely bloomed; Occidium sphacels, the profusely bloomed; Orcidium sphacels, but the profusely bloomed; Orcidium sphacels, and the profusely bloomed; Orcidium sphacels, South-land, and the profusely bloomed; Orci

some fourteen spikes: this was much the finest plant in the exhibition.

Azaleas were nicely shown, Mr. Ford taking the lead with four medium-sized, well flowered plants. Deutitals are always well represented at Newcastle, and on the present occasion were beautifully bloomed, 1st honours for six going to Mr. Ford, who had good examples about 4 feet through. Mr. Methyen was 1st for three specimens, and Mr. Morris 1st with a single plant. Mr. J. Wood, Fenham, was casily 1st in the class for three Genistas with splendidly bloomed plants about 5 feet high well clothed down to the pots. Spircas were present in quantity and in excellent order, large, profacely flowered, and just to the day in the opening of their flowers. In the open class for six the 1st prize went to Mr. Noble, who staged a faulties half-dozen; 2d, Mr. W. J. Watson, Fenham; 3d, Mr. W. R. Armstong, Niveastle, both having well managed groups. In the class for six muserymen excluded, Mr. Noble grant of the class for six muserymen excluded, Mr. Noble grant of the class for six musers were the class for six musers with the class for six musers with the class for six musers with six compact plants of Cincrarias of medium size, full of flowers and healthy of the Valley was shown in beautiful condition by Mr. Noble was 1st vit in another class. Lidy of the Valley was shown in beautiful condition by Mr. Ston, whose half-dozen examples in the open class were the best we have seen for a long time. For six hardy Primores the 1st prize went to Mr. McInty, who had a nice group.

were the too.

In the property of the property

double Tulips.—ist, Mr. McIntyre; 2d, Mr. Morris-Auriculas were shown in considerable numbers and in nice condition, some with the flowers severely thinned in the way admitted by florists, others with larger and consequently more effective trusses. With twelve (alpines excluded) Mr. Adams, Swalwell, was 1st; Mr. T. [E. Hay, Killingworth, who also staged a good dozen, [2d] and Mr. [arrett, 3d. For six (alpines excluded) Mr. Hay, was 1st, and Mr. Adams 3d. Twelve alpines.—rst Mr. W. J. Watson; 2d, Mr. Adams; 2d, Mr. T. E. Hay, Cut flowers included Camellias, Rhododendrons, Azaleas, Roses, show Pansies, fancy Pansies, &c., and the competition in all cases was good. (From a Correspondent.)

National Auricula (Northern Section).—
This was held on Tuesday, the 20th ult., in the spacious Town Hall at Manchester, when a very large number of the favourite flowers was staged, entirely by the Northern growers, for as far as we could ascertain none of the Southern fanciers were exhibitors, the plants being past their best in the South. Mr. H. Wilson and Mr. E. Pohlman, both of Hallidax, ran each other very closely in many instances, the former apparently taking the premier position, and without a doubt his plants merited the honours lavished upon them. There is no mistake about the quality of the blooms many of these growers can bring out. Traill's Prince of Greens was an allound favourite, and especially good in several collections, but was one of the kinds which a few days longer would have greatly improved. John Simonite (Walker) was also very strongly represented, and is assuredly one of the varieties of the future, provided that a sufficient stock can be found to meet the demand already existing and kleyl to a rise for it. "A bonny fine flower, of good breed," as some of the Yorkshire growers expressed themselves, it really is, and more is the pity it is so slow to increase. Read's Acme was also well to the front, and was scarcely ever better shown. There was very keen competition in most of the classes, especially in those provided for single plants of the different kinds; as an example we may mention that for selfs, in which if we mistake not there were over fifty entries, each plant themselves, it really is, and more is the pity it is so slow on increase. Read's Acme was also well to the front, and was scarcely ever better shown. There was very keen competition in most of the classes, especially in those provided for single plants of the classes, especially in those provided for single plants of the different kinds; as an example we may mention that for selfs, in which if we mistake not there were over fifty entries, each plant hiving meritorious points, and the work of the large staff c. judges was by no means light, especially in these single plant classes. New varieties were not very numerous, a ruby self exhibited by Wm. Brockbank, Esq., under the name of Lord Rosebery, was honoured by the premier award in the class for selfs; we mistook it for Dukej of Argyle, but found it was larger, and rather more even, with a good tube and paste, and it promises well; there was also a very fine new green-edged variety, exhibited by the same fraise, crists, even and the self that th

and C. J. Perry, with ten large even pips; 3d, Mr. Wil-liam Taylor, with George Lightbody, and a seedling; 4th, S. Barlow, Esq., Stakehill, Manchester; 5th, Mr. R. Lord, Todmorden; 6th, Mr. F. Shaw. This was also a very keenly contested class, Mr. Beswick running the premier collection very hard, so that the judges had a were difficult task to decide the investment.

R. Lord, Todmorden; 6th, Mr. E. Shaw. This was also a very keenly contested class, Mr. Beswick running the premier collection very hard, so that the judges had a very difficult task to decide the issues.

A PATROF SHOW AURICULAS, DISSIMILAR—"madden "growers only.—There were only two competitors, the leading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading position being taken by Arthur Potts, Esq., with elading the property of the prop

good trusses.

FOUR ALPINE AURICULAS, DISSIMILAR.—Ten exhibitors staged for the most part good collections, the 1st prize falling to S. Barlow, Esq., with strong, well grown plants of President (Turner), Mrs. Llewellyn (Turner), and Mrs. Dodwell (Turner), the second bad an enormous truss; 2d, Mr. J. Beswick, whose best plants were Diadem (Gorton) and Daziel (Turner), the former with fifteen excellent pips; 3d, Mr. E. Shaw, Diadem being again very good; 4th, Mr. Heys; 3th, W. Brockbank, Esq.; 6th, Mr. Prescott. SINGLE ALPINEAURICULAS, SHADED.—Gold centre.—Twenty-nine plants were staged. Premium, Mr. E. Shaw, with a grand plant of Diadem; 1st prize, Mr. S. Heys, with a seedling from Diadem; 1st prize, Mr. E. Pohlman. Esq., with Mariner; the same exhibitor taking the 3d prize; 4th, Mr. G. Geggie; 5th, Mr. E. Pohlman. White centre.—Twenty plants were entered and staged. Premium, Mr. Pohlman, with a grand seedling; the same exhibitor taking the 1st prize, also with a seedling; 2d, Mr. R. Heys; 3d, Mr. Partington, Middleton. POLYANTHUSES: There DISSIMILAR.—Black grounds.—1st, Wm. Brockbank, Esq., with Cheshire Favourite, Exile, with the very fine pips; and Beanty of England, with six pips. 2d, Mr. 10o, Peswick, with Lord Beaconsfield, Exile, and Blackbird; 3d, S. Barlow, Esq.

Of Digitally, when he had been a process of the process of the policy of the process of the proc

tection, the same exhibitor axing the 1st prize for the velve dissimilar Primroses, his being the only collection staged.

THE ROYAL HORTICULTURAL AND BOTANICAL SOCIETY'S portion of the display reflected great praise on Mr. Findlay for enticing so many exhibitors to occupy what would have been blank space. Mr. William Rumsey, Joyning's Nursey, Waltham Cross, staged a magnificent bank of pot and cut Roses, which were really the feature of the exhibition next to the Auriculas, the whole showing the best evidence of culture and selection; the Certificate awarded was well merited. The cut blooms (by the hundred) were remarkably fine, especially Marcehal Niel. Messrs. Fisher, Son & Sibray, of Sheffield, also staged a fine collection of stove and greenhouse plants, including Azaleas, greenhouse Rhododendrons, Asparagus plumosus, several Orchids, &c. Annong the Orchids were Vanda tricolor amabilis, and the variety

ON THE SPREADING OF THE POTATO DISEASE.

IT has given me great satisfaction to see that my theory of the tendency in the disease to alternate between an early and later period of its general outbreak, has been fully corroborated by the tables given by Mr. Plowright in the Gardeners' Chronicle of March I. These tables, based on the reports published in that journal for the last seven years, are very interesting. Mr. Plowright has extracted from them the principal lesson they contain, viz., the demonstration of the above-mentioned alternation. There are, however, still some other facts to be derived from this excellent table, to which I beg to call attention.

I have shown by experiments that the disease commences spreading from its starting points as soon as the Potatos have appeared above-ground, and that it developes slowly at first. If this be true, the disease must, generally speaking, be more advanced in the southern than in the northern districts of a large country at a certain early period of the year, because it was starting earlier in the southern districts. Mr. Plowright's table shows this in a very marked way. Taking the average of all the cases in which disease was reported in the last week of July and the two or three first weeks of August for the years 1877-83, we find that in Scotland 11 per cent. reported disease; in England — northern counties, 25 per cent.; mid-land counties, 58 per cent.; southern counties, 89 per cent. reported disease.

For comparison it ought to be remembered, what a well-known mycologist says on the suddenness of the attack of the disease ; "A field of apparently sound plants of one day may succumb the next, and every plant be prostrate on the ground." (W. G. Smith, in Science for All.) In another quotation from author in the same paper, speaking on the Potato disease, Mr. Smith says: "It generally came suddenly in July, and then increased and multiplied with such extraordinary rapidity, that in a few days it would cover the whole of North-Western Europe.

The table for 1878, however, shows that the disease was present nearly everywhere in the southern counties of England, and in many cases in a far advanced state, while the twenty-three Scotch reports show that up to that period no disease was observable in that country. On looking at the map it will be seen that Ireland is situated pretty nearly in the same latitude as England. When the southern counties of this country are not taken into account, it would, therefore, be expected that as a rule the disease would attain the same degree of development at about the same time in these two districts. This is indeed just what the table shows on an average of seven years. England (excluding the southern counties) reports 58 per cent. of disease, Ireland 53 per cent. Again, it would be expected that the disease would advance rather more rapidly in the western districts because of the greater rainfall, Eastern and midland counties report 60 per cent. of disease; western, 71 per cent.; Wales, 74 per cent.
In Mr. Plowright's table the alternation of the

disease from year to year in the United Kingdom is very obvious. At the end of July, however, the disease is a little too much advanced in the southern counties, and not sufficiently advanced in Scotland for obtaining a perfectly accurate view of the case. The alternation is, therefore, more distinctly shown by excluding Scotland and the southern counties of

	Year.	United King- dom; Disease Absent out of 100 cases in	United Kingdom, exclusive of Scotland and the South- ern Counties of England; Disease Absent out of 100 cases in
Late	1877	50	43
Earty	1878	41	31
Late	1870	44	39
Early	1885	31	2.5
Late	1881	80	80
Early	1882	9	6
Late	1883	68	66

It will be seen that in all cases the difference between two consecutive years is greater when Scotland and the southern counties of England are not included.

In taking the mean of the four late and of the three early years respectively, we have for the United King-dom-in the late years, 61 per cent. disease absent; in the early years, 27 per cent. absent. That this great difference is only due to the natural alternation of the disease is obvious, from the fact that the mean rainfall for each of the two classes of years was, practically speaking, the same.

Rainfall in Inches.

		May.	June,	July.
In the late years	 	 2 51	3-47	3.92
In the early years				3.90

The rainfall in June and July was practically the same; May only gave a trifle more rain (1 inch) in the early years. On the other hand, the weather does undoubtedly exercise a very marked influence in retarding or accelerating the general outbreak of the disease. Want of rain may make an early disease year late, and the disease in a late year will be accelerated by excessive rain, although it cannot by rain alone be made "very early." The accelerating influence of excessive rains is less than the retarding influences occasioned by want of rain.

Mr. Plowright classifies the degrees to which the disease has attained as-1, absent; 2, slightly present; 3, distinctly present; 4, severely present. Upon these points I would remark that if we take the average of these four classes for the early and the late years respectively (omitting the late year 1879, which, indeed, was something between late and early), we find that out of a hundred cases the disease was reported to be :-

		In the Late Years.	In the Early Years.
I. Absent	 	Cases.	Cases.
II. Slightly present	 	15	12
III. Distinctly present	 *	17	48
IV. Severely present	 	2	13

How are these classes to be interpreted as regards the origin of the disease in the respective fields or gardens in which it occurred? My interpretation is the following :-

Division IV., the fields "severely attacked," are those in which the disease originates directly from diseased seed Potatos. The disease has had a longer time for its development here, and therefore it has reached a more advanced stage.

Division III., fields in which the disease was distinctly visible, are, as a rule, those situated in close proximity to the fields originally diseased. They have, therefore, been early attacked by conidia (spores) coming from the originally affected fields. Some of the fields in this division may have had a few starting points in them from diseased sets, but only a very few compared to the size of the fields in question.

Division II. comprises those fields which, being more distant from the original centres of the disease (Division IV.), have only been attacked later, by spores being blown on to them, and were free from diseased sets in the first instance.

Division I. has not been visibly attacked up to the period in question, because they are most distant from the original and secondary disease centres.

I am, however, far from thinking that this interpretation exhausts the subject, for the phenomenon is not quite so simple as that; yet I do not doubt that it gives the leading principles of the spreading of the disease.

The circumstances which have a modifying influence on the propagation of the disease throughout the country especially are:-1, local showers, or their absence; 2, the direction of the wind (spores, of course, are obliged to follow the wind, and cannot go against it); 3, an open or a sheltered position of the field-in a garden, for instance, the disease advances faster than in an open field; this, according to my observations, is occasioned by the relative stagnation of the air in the garden, and not by the greater shade.

When I first found out the means of completely disinfecting the tubers I was not quite sure that this would be of any great practical value, for accepting the current opinion of the rapidity with which the disease developes, one could not help thinking that it was of very little consequence whether the disease commenced from one or two, or from a hundred thousand starting points in a country. Nothing has impressed me more in this direction than the descriptions given on the spread of the disease throughout all Northern and Western Europe in 1845. It commenced, it was said, in Belgium, in July, 1845; shortly after it was noticed in the Isle of Wight, then in Ireland and Southern England, and in a few weeks invaded all that country and Scotland. On the Continent it invaded France, Belgium, Holland, Germany, Denmark, Norway, Sweden, and part of Russia, in the course of two months. If the spread of the disease when it first appeared was at this rate, what could be expected now from the disinfection of the seed Potatos, even if made obligatory in an entire country? Of course, nothing. But fortunately this description is as erroneous as many other things that have been stated about the Potato disease; and the more I have studied the propagation of the disease the more convinced I have become that a general disinfection of the seed tubers will prove to be a most powerful means of checking its progress.

1. I have shown in the experiment made in my garden in Neuilly last year that it took about six weeks from the time the disease first appeared till all the Potatos became thoroughly affected.

2. In many instances I have seen Potato fields badly discased at one end and perfectly free from disease at the other, and have watched them in this condition for a considerable time. To quote one such instance from my diary in 1881 :-

In a Potato field about 40 yards in length I observed some disease spots on August 16; on August 23 I took down the following note:—" About 12 yards of the field badly diseased. Could not find a single disease spot in the opposite end, comprising more than half the field." Later on all the leaves were destroyed by the fungus. From this and similar observations it may fairly be concluded that the disease will spread in a given field with far greater rapidity when it starts from forty or fifty evenly distributed centres per acre than when it originates from only one place in each acre. If these fifty centres were all close together the rapidity of the spreading of the disease would not be materially increased, but the chances are that they would be pretty evenly distributed over the field. J. L. Jensen.

(To be continued.)

OXYLOBIUM ELLIPTICA. - It is not without a good deal of justice that old-fashioned gardeners mourn over old times. Half a century ago or less a host of Australian plants were in cultivation which are now either altogether lost to cultivation or are but rarely met with. Many of these were not only highly interesting, but were ornamental plants of the first rank. Unfortunately, although presenting no great difficulty to the cultivator of ordinary intelligence, they did require a somewhat special treatment, and so rapid growing and easily managed soft-wooded things have taken their places. For cool greenhouse or conservatory decoration some of the Oxylobiums are decidedly acquisitions. O. ellipticum is a neathabited shrub, with lanceolate entire leaves and terminal dense-flowered racemes of lively yellow peashaped flowers, the standards being blotched or feathered with red at the base. Nicely flowered specimens may be seen in the conservatory at Kew.

at Hull 29°, and at Wolverhampton 31°. The general mean was 33°.1.

The mean daily range was greatest at Cambridge, 22°.8, at Truro 22°.7, at Hull 20°.3; and was least at Sunderland, 9°.1, at Preston 13°.1, and at Bradford 13°.2. The general mean was 16°.6.

The mean temperature was highest at Truro, 42°.4, at Liverpool 42°.2, at Plymouth 41°.5; and was lowest at Hull, 37°.5, at Wolverhampton 37°.8, and at Cambridge, Sheffield, and Bolton, 38°.2. The general mean was 39°.8.

Kain.—The largest lall was 0.31 inch, at Brighloo, 23 inch at Truro, 6.21 inch at Blackheath and

Kain.—The targest lail was 0.31 inch, at Digniou, 0.23 inch at Truro, 0.17 inch at Blackheath and Sunderland; the smallest fall was 0.02 inch at Bristol, 0.03 inch at Bradford and Leeds. The general mean fall was 0.09 inch. No rain fell at Sheffield, Bolton, or Preston during the week.

SCOTLAND: Temperature.—During the week ending April 26, the highest temperature was 54°.2, at Greenock; at Leith the highest was 48°.4. The general mean was 51°.2.

The lowest temperature in the week was 28°.8, at Edinburgh; at Greenock the lowest temperature was 35°.2. The general mean was 31°.2. was 35°.2.

was 35, 22. The general mean was 31, 22.

The mean temperature was highest at Glasgow and Greenock, 42°, 5; and lowest at Perth, 40°. The general mean was 41°, 3.

Rain.—The largest fall was 0,33 inch, at Greenock; and the smallest fall was 0,12 inch, at Glasgow and Paisley. The general mean fall was 0,18 inch.

LAMES (17 MARIED) F. S. JAMES GLAISHER, F.R.S.

Obituary.

MANY of our readers must have had business relations with JEAN VERSCHAFFELT, of Ghent, though it is possible that some of them may have been better acquainted with his adopted son, Jean Nuytens-Verschaffelt, who died a few years ago. M. Jean Verschaffelt retired from the business after the death of his son, and after a long and painful illness died on the 20th ult., in his seventy-fourth year. The deceased gentleman was highly respected, not only in his own country, but abroad as well, as is testified by his membership of various titles of honour from foreign Governments.

- WE regret to record the death, on March 14, at Campbelltown, New South Wales, of coosumption, aged twenty-nine years, of Mr. ALEXANDER MOORE, Superintendent of the State Nursery, and late of Dublin, Chelsea, and Kew Botanic Gardens. The deceased was a most estimable young man, and had won the highest respect and esteem of all those among whom he had been living, as evinced by the fact that, although a rigid Presbyterian, on the day of his funeral the bell of the Catholic Church was tolled—a r are mark of respect for a non-Catholic, and the clergy-man of the English Church followed his remains to the grave. The deceased was the first Superintendent of the Government or Stale Nursery, established some four years ago, partly as an experimental garden, but principally for providing young stock of the best kinds of trees for the purpose of re-afforesting the country. He was a nephew of Mr. Charles Moore, Director of the Botanic Gardens, Sydney, and cousin of Mr. F. W. Moore, Curator of the Botanic Gardens, Glasnevio, Dublin.

- We have also to record the death, on April 22, at Ventnor (where he had gone for the benefit of his health), of ARTHUR HERBERT, second surviving son of W. H. DUNNETT, Esq., Stour House, Dedham, aged 29.

Answers to Correspondents.

BEDDING PELARGONIUMS: W. L. The bes The best dwarf

CLEMATISES: IV. L. Please state at what season you want them to flower,

CRESTED VINE LEAF: 9. G. & Co. There is no disease, but rather an excess of growth, like that which occurs in the crested varieties of Ferns, or the Ragged Jack Kale.

Ragged Jack Raile.

CUCUMBERS: 'J. Churchfield, Yours is a had case of
the Cucumber disease, for which, we regret to say, no
certain remedy has yet been found.—Cucumber. We
cannot say what causes your plants to "go off" just
as they commence to fruit. The soil seems good
enough, but the roots are very weak for fruiting plants,
and look as if there was something in the compost

they did not like; what that may be we have no means of knowing.

GARDENIA: E. G. The deformity is not due to any disease, but, we think, must be attributed to some irregularity in the treatment.

GLOXINIAS: T. M. & Sons. Not uncommon. Some years ago there was a race of these double-flowered forms, the doubling consisting in the outgrowth of additional petals from the outside of the corolla instead of the inside. The variety is described in Dr. Masters' Vegetable Terato'ogy.

NAMES OF FRUITS: Englond. Your Apple bears the closest resemblance to Hunt's Deux Ans of any variety we know, but we are not certain of its identity. It is of comparatively little value.

of comparatively little value.

NAMES OF PLANTS: A. IV. C. Cattleya intermedia; the form often imported with Leelia elegans.—G. Steep, Kerria japonica.—John Earl. Odontoglossum luteopurpureum, and a species of Pleurothallis which we do not recognise.—J. L. C. A. Babiana, as near as we can tell from such a poor specimen.—C. S. & Co. Orrithogalum pyrenaticum.—E. R. B. Such scraps are uterly unfit to be submitted for naming. 1, Lomariopsis heteromorpha; 2, Cyrtomium falcatum; 3, Pleopeltis pustulata; 4, Phebodium aureum, probably, but may be areolatum.—E. Yonkins. Broughtonia sunguinea.—J. Spalding. A good ordinary form of Vanda tricolor, not the Dalkelth variety.—E. C. C. D. 1, Tulipa Orphanidea; 2, T. Celsiana; 3, Cardamine pratensis var. parviflorus.

Markets.

COVENT GARDEN, May 1.

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal sales-men, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Eo.]

TRADE still dull, but clearances made at low rates. James Webber, Wholesale Apple Market.

SEEDS.

SEEDS.

LONDON: April 30.—There was but little business transacted on the seed market to-day, the attendance being poor. Stocks generally are reduced to a moderate compass, consequently values for all descriptions show no material change. Trefoils are somewhat dearer, owing to a speculative inquiry caused by the late frosts. Spring Tares realise fortner terms. There is no noteworthy change in Hemp, Canary, or Millet seeds. There is a better trade for blue boiling Peas. Feeding Linseed cheaper. John Shaw & Sont, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday English red Wheat sustained an advance of 1s. per quarter, while of foreign descriptions the improvement of 6d, per quarter noticed on Friday last was upheld. Flour, on the week, was in some cases the turn in sellers' favour. On the spot grinding Barley was quiet, but steady. Beans fully supported late value, and Peas, from searcity, were 1s. higher. Maize was also scarce, at a like rise for the week, the market to-day tending further to harden. Common grades of Russian Oats were 3d. lower since Monday sennight, prime qualities remaining firm, and a fairly good business was done.—On Wednesday, with less inquiry, prices for Wheat were not so well sustained. There was very little doig in flour, and prices were unaltered. Burley on the spot was quiet. Beans and Peas remained at previous value. Maize was inactive without appreciable change in price. Oats, though dull, were not quoted worse on the spot.—Average prices of correfer week ending April 26:—Wheat, 37s. 2d., Barley, 31s. 2d., Oats, 20s. For the corresponding period last year:—Wheat, 42s.; Barley, 32s. 9d.; Oats, 21s. 1od.

CATTLE.

At Copenhagen Fields on Monday a very depressed trade was experienced in every department. Prices of both beasts and sheep gave way, the former 2d., and in some instances 4d., and the latter very generally 4d. per 8 lb. Lambs sold very badly, at 4d. to 6d. decline, and calves were lower. Quotations:—Beasts, 3s. 1od. to 4s. 1od. and 5s. to 5s. 6d.; calves, 6s. to 6s. 8d.; sheep, 4s. 8d. to 5s., and 5s. 4d. to 5s. 8d.; lambs, 7s. 6d. to 8s.—Thursday's trade was dull. Beasts sold slowly at Monday's prices; sheep and lambs were dull; calves were not in demand, and pigs sold on former terms.

HAY.

Tuesday's Whitechapel Market report states that trade was very dull and supplies large. A very heavy tone prevailed for Clover, 95. to 1081; inferior, 601, to 751; prime second out, 901. to 1051. Best meadow hay, 801. to 905; inferior, 402. to 651, and straw, 281. to 375, per load.—On Thursday there was a large supply, and trade was dull at previous rates.—Cumberland Market quotations:
—Superior meadow hay, 841. to 921; inferior, 631. to 721; superior Clover, 1055, to 1141; inferior, 701. to 881.; and straw, 321. to 371. per load.

POTATOS.

The average prices during the week have been:—Magnum Bonum, 60s. to 85s. per ton; Flukes, 80s. to 90s.; Reds, 70s. to 80s.; Snowflakes, 50s. to 55s.; 90s.; Reds, 70s. to 80s.; Snowflakes, 50s. to 55s.; Flourball, 40s. to 45s. 7 Champions, 45s. to 70s.; Roses, 45s. to 70s. per ton.—The imports into London last week were 250 boxes from Cadiz, 220 sacks 80 baskets St. Nazaire, 27 bags Rouen, 3 Ostend, and 65 casks 4860 packages from Malta.

Government Stock.—Consols closed on Monday at 101½ to 101½ for delivery, and 101½ to 101½ for 101½ for baccount. Tucsday's prices were 101½ for 101½ for both delivery and account. The closing figures of Wednesday were, for delivery, 101½ to 101½ for 1010 for the account. The Exchange was closed on Thursday, as customary on May 1.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stoce. (Registered Trade, Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thrids cheaper. It was introduced upwards of thirty years ago by a boat of unprincipled intractors, in fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thirming, and its used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Hobility and Gentry, from whom the most accordance of the control of the

Customers against the various cheap Varnishes oow so much advertised. H. & S. S varnish has been a ratice of common use on most of the large estates in the kingdom for in a most of their years. The common is the properties of the large estates in the kingdom for in a mod the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Register Trade Mark as above, without which none is genuine. Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Berierley Hill Ironwerks, Staffordshire: 105, Queen Victoria Street, Lasgeon, E. C.; and 196, St. Viocent Street, Clasgoon.

PATENT HAND GARDEN PLOUGH and CULTIVATOR.

PATENT HAND GARDEN PLOUGH and CULTIVATOR.
This capital little Implement is now coming into general use, it consists of one light but strong Steel Shovel for marking out rows to plant, or for loosening up the ground after the plants are up. Also a small Steel Plough to be used for hilling up the rows when desired, and a Cutter for exterminating weeds, and Rake for pulverising the ground. These pieces are made separate, and artiched or detached in a smoment by means of a simple lastenessity through the ground, stirring the earth, if required, to a depth of 6 inches. It is exceedingly light, strong, and tasty, and fully adapted to the purposes designed. Price complete with Scheel, Plough, Weedcutter, and Kark, f.2 s. I. Jouith Seed Drill attachment, extra. 131, if with Pony attachment, Testimonials, post-free on application.

 —Shortness of Breath, Wheeing, Coupts, and Colds.—
 Thousands of testimonials can be produced to prove the power possessed by these corrective remedies in cases of astima, incipient consumption, and all disorders of the chest, langs and are passages. The Ointment, well rubbed upon the chest and air passages. The Ointment, well rubbed upon the chest and directly to the lungs, where, in immediate contact with the whole mass of circulating blood, it neutralises or expels those impurities which are the foundation of consumption, asthma, brochitis, poeumonia, and similar complaints. On the appearance of the first threatening symptoms the back and chest of the patient should be fomented with varm brine, dried with all the patients and chest of the patient should be fomented with varm brine, dried with all saborption will check and subdue them.

GREEN'S PATENT "SILENS MESSOR" AND OTHER

LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1884.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881.

The "Yournal of Horticulturs", of June 9, 2012:— "Mowing Machines.— After a critical examination the Silver Medal was granted in the old firm of world-wide faim, there is, T. Green & Son, of Leeds and London. As the Machines are known in all lands where good laws are cherished, it is quite unnecessary to give any description of them.

Ω

Upwards of 115,000 of these Machines have been Sold since they were first introduced in the year 1856, And thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

1st. Simplicity of Construction—every part being easily accessible.

2d. They are worked with much greater case than any other.

2d. They are worked with much greater case than any other.

3d. They are the least liable to get out of order.

4th. They make little or no noise in working.

5th. They will cut either short or long Grass, wether dry.

Double Show and Fancy Dahlias - all the leading varieties, And many others.

HALE FARM NURSERIES, TOTTENHAM, LONDON.

🔵 Come and See. 🕝

IF THERE IS ONE SIGHT more gorgeous than another, it is a roo-feet house of Spotted CALCEO-LARIAS; it at once lays bare the fact how near we are approaching perfection, our knowledge of selection, and use of every scientific means. Brilliant selfs, decided colours, and fourf habits, have taken the place of the ordinary yellow and long growth varieties. It is a sight not easily forgottee.

TEW DOUBLE TROPÆOLUMS. NEW DOUBLE TROPHOULDMS.—INO Tropocolum ever gave such satisfaction as Hermine Grasshoff. But it all lovers and growers of flowers could now see GLOIRE DE EORDEAUX, most brilliant scarlet, and BICOLOR fl.-pl., with its lovely yellow stripes on the same intense ferty scarlet, all would admit their superiority, and justantly say, "How exquisite!" and "What grand acquisitions." At it, eich, the two 1r. 6d., post-free.

ORCHIDS.—The EXHIBITION at Mr. WILLIAM BULL's will be quite astonishing and enchanting; many beautiful kinds new to Science and this country in blossom. The Exhibition is not only upparalleled in connection with Horizulture and Estanical Science, Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

ORCHIDS.—Private View, TUESDAY the 13th, THURSDAY the 15th, and SATURDAY the 17th, and SATURDAY the 17th and SATURDAY throughout May, June and July, of Mr. WILLIAM BULL'S Exhibition of Orchids, to those having received invitations.

ORCHIDS.—Open to the Public, WEDNES-DAY the 14th and FRIDAY the 16th, and every follow-ing MONDAY, WEDNESDAY and FRIDAY through-out May, June and July Admission each day, 2s. 6d.; Season Tickets, 10s.

ORCHIDS.—The Exhibition must be seen to be realised, at Mr. WILLIAM BULL's Establishment for New and Kare Plants, 536, King's Road, Chelsea, London, S.W

WM. CLIERAN AND SON, Olderled Nursery, Altrincham.

DAHLIAS SHOW, DAHLIAS FANCY,
DAHLIAS BOUQUET, DAHLIAS BEDDING,
AHLIAS SINGLE,
The finest named varieties of all raisers. Thousands of roots
and plants in stock, prices low. What lovely exhibition or
varieties for cutting. So easily grown. Indespensable for a gay
garden in autumn. Catalogues free for two stamps.
Show, Fancy, Bedding or Bouquet varieties, 32, per dozen;
Sofe 1111; ro for race, our selection.
Sugle Dahlas, all named certs, 42 per dozen.
WM. CLIERAN AND SON, Oldfield Nursery, Altriocham.

MANGEL WURZEL and TURNIP SEEDS.

MANGEL WURZEL and TURNIP SEEDS.

AND F. SHARPE are prepared to make special offers of all the leading lends of home-grown MANGEL WURZEL and TURNIP SEEDS of 1883 growth, and raised from choice selected stocks. Prices (which are extremely low) and samples may be had on application.

Seed Growing Establishment, Wisbech.

PRIMULAS.—PRIMULAS.—PRIMULAS. WILLIANS:—FRINGLAS.—FRINGLAS.—FRINGLAS.

HERBACEOUS and ALPINF PLANTS.

-CATALOGUE of fifty pages, containing full information as to colour, height, stutution, time of lowering. &c., fiee on application. A capital Collection for Rocks, Stumps, and Borders, from 95, per 100, or 42, per dozen. Most of the plants heing in pots may be despatched at any time, or by Parcels Post when fit.

RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

JOHN FORBES begs to state that his Annual PLANT CATALOGUE for 1884 is now ready, and will be posted on application. It consists of seventy pages of closely printed matter, representing probably the largest and best collections of Pansies, Phlores, Pentstemons, Antirnhums, Edphiniums, Fotentials, Minulus, Caruntions, Pyrethmons, Delphiniums, Fotentials, Minulus, Caruntions, Pyrethmons, Delphiniums, Fotentials, Minulus, Caruntions, Pyrethmons, Pentstemons, P

NEW CATALOGUE of FERNS for 1884, now ready, with Engravings of Newand Rare Varieties, prepared specially for this Catalogue. In the matter of British Ferns, this Catalogue is declared by high authorities to be far superior to any other Trade List yet issued. Post-fee 3

stamps. F. W. and H. STANSFIELD, Sale, Cheshire.

THE

Gardeners' Chronicle.

SATURDAY, MAY 10, 1884.

MAGNA CHARTA ISLAND.

THOSE who love to visit historic scenes I may very easily reach Runnymede, and hear the birds sing and the trout splash close to the spot where King John's signature acknowledged the equal rights of Englishmen in the eye of the law. The nearest station is at Wraysbury, as the word is pronounced and sometimes spelt, though the older orthography is Wyrardisbury. Datchet is the next station, and then Windsor, and therefore the visitor will expect to find himself on the Thames-side among meadows and rows of pollard Willows Wraysbury is a pleasing, retired village, such as Mr. Jesse describes it in his Favourite Haunts, and King John's Hunting Lodge, a quaint old house of many gables, where Mr. Jesse found the two largest Walnuts in England, stands at the Datchet end of the village. The house is several centuries later than John's reign, and now stands among rich and smiling, well-drained meadows within sight of several ornamental new houses across the river and within an hour's ride from London; but this was formerly a capital position for a hunting lodge, the heron and bittern abounding among the reeds, as did the hare and stag on the drier ground above the river. Even now it lies in a good district for outdoor amusements, including angling, which Charles 11., Isaac Walton, and Sir H. Wotton enjoyed on this spot. The Walnuts measure 24 feet in girth at 3 feet from the ground, according to Mr. Jesse.

The well watered soil here carries timber of the largest size, and among the big trees I noticed four other great Walnuts on Magna Charta Island, a magnificent Plane, carrying its girth to a great height, on the lawn of Ankerwyke House; several Huntingdon Willows, one reported 20 feet in girth; and the famous Ankerwyke Yew, in the grounds of the same residence, measuring 29 feet at 4 feet, and bearing still, at the age of many centuries, a grand head spreading 78 feet, and containing many branches and a vast quantity of green foliage.

Ankerwyke House stands hard by Magna Charta Island, a little lower down the stream of the river, and rejoicing in the same soft landscape, and in the same richly enamelled meadows of the Thames. Close to it, with the Yew and several great Cedars of Lebanon at hand, are the remaining ruins of a Benedictine priory of the time of Henry II., a building which supplied materials for the erection of the present house in 1805. A member of the Harcourt family owns this property as well as the island and its ornamental cottage. It is interesting to observe constantly in England the intertwining and strong union of new and old. We may call the owner and late occupier "old" in regard to his connection with this spot, and we may call his tenant, the present occupier, "new." The his tenant, the present occupier, "new." same conjunction by which antiquity finds the material support and substance which it needs from those whose pursuits are commercial, or professional, may be constantly met with in various parts of England; and the remark does not lose its force, however high, socially, the

position of the tenant may be. The younger brother of the present occupier of Ankerwyke House, whose studies were, doubtless, most un-Cambridge, very kindly landed me on Magna Charta Island and then put me over the river where I stept out of the boat in the meadow opposite called Runnymede.

It is not certain whether John signed the Charter here in Berkshire or there on the island, a narrow slip of land on the Buckinghamshire side of the river. Probably the act took place here; the stone on which the parchment was laid, and which now bears an appropriate inscription, is there in an ante-room of the pretty cottage. The lady-tenant of this cottage most kindly showed me, on our landing as I have noticed, the stone and the arms of the confederate barons, the legends on the walls, and the four commemorative Walnut trees, on the lawn before her drawing-room windows. The trees have been described somewhere as dating from the time of the signing. They may be regarded rather as memorials of the incident, but of later date. The island contains from 2 to 3 acres. The stone is octagonal, 3 feet in diameter, and Dearing the Macra "Be it remembered that on this island, 25 June, "Be it remembered Magna signed Magna feet in diameter, and bearing the inscription, 1215, John, King of England, signed Magna Charta, and in the year 1834 this building was erected in commemoration of that great and important event by George Simon Harcourt, Esq., Lord of this Manor and the High Sheriff of this county."

After following the river about half a mile, a road on the left leads to the Long Walk and to Windsor, 4 miles distant. H. E.

DENDROBIUM CRUENTUM, n. sp,*

THE flower is very like that of Dendrobium tridentiforme, Lindl., but it is larger, and nearly reaches the size of a good flower of Bulbophyllum macranthum. The linear acuminate petals, the falcate narrow side laciniæ of the lip, and the very long callus, with its gyrose, brain-like anterior part, are quite distinct from the oblong acute petals, the broad falcate side lacinize, and the very small median callus of the old Dendrobium tridentiserum. Sepals triangular acuminate, the lateral ones with a very well developed, nearly rectangular chio. Petals licear acuminate. Lip most deeply trifid, side lacinic falcate, erect central lacinia ovate apiculate, with a nearly microscopically muriculate border. The large oblong tumid callus has an acterior gyrose surface which may be compared to the surface of the brain; the upper part is not gyrose, but nearly smooth, with five blunt elevations, including the outer ones. The column is broader at the base than at the tridentate top, and has the whole base a little concave, though there is no distinct abrupt cavern-like hollow there, as in numerous Deodrobia. What I see of the colour is that the flower is whitish, with a strongly marked cinnabar callus, and three similar cinnabar ascending lines with two interposed small teeth from the base to the middle of the column. As to this it is positive. Now I see also on the wet flowers some mauve lines on the anther and petals, but I am in doubt as to whether these lines are not products of some chemical change, as I can see no vestiges in the flowers which were not softened. Neither is there any vestige of this in the coloured sketch prepared by the excellent discoverer, Mr. Förstermann, who painted also the lateral falcate lacinize of the lip cinnabar, which looks very pretty.

The plant has slender, furrowed, nearly terete stems, and short oblong bilobed leaves. The young sheaths are like those of the Nigro-hirsuta group, and all the peduocles appear one-flowered. Singularly enough, all the vegetative organs are much smaller than in Dr. Liodley's typical specimen, although the flower is so much greater.

1 have imported plants and dried flowers before me, all kindly seat by Mr. F. Sander. H. G. Rohb. f.

DENDROBIUM PURPUREUM (Roxb., nov. var.? (vel nov. sp.)) MoseLevi, Hemsl.

The singular Dendrobium purpureum is a native of the Moluccas, and was cultivated in the Calcutta Botanic Garden at the beginning of the present century, and more recently at Buiteozorg, in Java; and Miquel has figured it in his Choix de Plantes, but I have found oo evidence of its ever having been cultivated in this country. It differs so markedly from all the other described species of its numerous genus that it is easily recognised. The bright purple flowers are about three-quarters of an inch long, cylindrical in shape, and arranged in dense, spherical, sessile clusters, which are produced from the nodes of the old leafless, spiodle-shaped stems, of many years' duration, and usually 3 or 4 feet long. At Kew there is a plant, bearing one cluster of flowers, that is so like D. purpureum in all its characters, that in the absence of specimens for comparison 1 place it as a variety, though it may prove to be sufficiently distinct to be entitled to rank as an independent species. It differs in having white flowers tipped with green, and apparently less pointed tips to the parts of the perianth. The bracts, too, are ovate-acuminate, not cordate, as described for purpureum. Further, the oldest and largest stem of the Kew plant is only 9 inches long, yet this may be due to the conditions under which the plant exists

Dendrobium Moseleyi is one of a number of Orchids collected by Mr. Moseley during the voyage of the Challenger in the Aru Islands, Amboina, &c., which he sent to Kew about ten years ago. It is a botanical curiosity, though not an ornamental plant. W. B. H.

OLEARIA MACRODONTA, n. sp. = OLEARIA DEN-TATA, Hook. fil., Handb. New Zeal, Flora, p. 126, non Moench.

We have got into confusion about Olearia dentata, There is a well-known Australian plant of this name, which is excellently figured as Olearia dentata in the Botanical Magazine, tab. 5973, It is the old Aster dentatus of Andrews, Bot. Rep., tab. 61, and is described under the name of Olearia dentata in De Candolle's Prodromus and Bentham's Flora Australiensis. Not remembering this, Sir J. D. Hooker, in his Handbook of the New Zealand Flora, gave the name Olearia deotata to a New Zealand species, which in his original Flora of New Zealand had been called Eurybia dentata. This latter Messrs. Veitch have lately introduced. When they sent a plant to Mr. Gumbleton, the latter immediately pointed out that it did not agree with the Botanical Magazine figure. He is perfectly correct, for the New Zealand is a totally different species from the Australian one, and so must have a new name. The New Zealand plant has very conspicuous acute teeth to plant has very conspicuous acute teem to its leaves, and much smaller and less showy capitula than in the rightful claimant to the name dentata, in which the expanded heads, with their crimson-tipped, white ligules, measure an inch in diameter. J. G. Baker.

EXACUM AFFINE.

This is one of the many interesting plants originally introduced from the little known island of Socotra by Professor Bayley Balfour. It is a pretty, warm greenhouse plant with square stems, stalked, opposite, ovate, 3-ribbed leaves, which forbid us thinking it a Solanum, as the bluish-lilac flowers with their yellow stameos might otherwise lead us to infer. flowers are not only grateful to the eye, but they have an agreeable perfume. Our engraving was taken from a specimen sent us by Haage & Schmidt, of Erfurt. These gentlemen received seeds from Dr. Schweinfurth, who visited the island subsequently to Professor Balfour.

The illustration (fig. 116) obviates the necessity ot entering into any further detail as to this summer and autumn floweriog perennial. A description, accompanied by a coloured plate, is given in the Gartenflora, t. 1108.

ROYAL INSTITUTE OF PAINTERS IN WATER-COLOURS.

THE Exhibition of Water-colour Drawings in Piccadilly is a large and most excellent one. remember no exhibition of drawings in London of equal importance. The examination of the large number of pictures-nearly 1100-in the three rooms is almost too wearying for a single visit. The catalogue is itself a sketchy work of art, for it contains eighty-nine reduced copies of original sketches made by the artists whose works are exhibited.

Many of the pictures in this exhibition will have a strong interest for readers of the Gardeners' Chronicle, for not only are there many landscapes of the first class, but there is a considerable number of superb and highly-finished garden views, and excellent pic-tures of flowers and fruit.

Out of more than a thousand paintings we can of course only point out a few which have special horticultural interest. The first picture we stop at is No. 8, "My Lady's Garden," G. S. Elgood, a true masterpiece of skilful and truthful drawing and painting of a beautiful subject. 50, "Mountain Mist," A. Weedon, is a superb drawing of mountains, cattle, water, and mist, with water trickling like a thread of silver down the mountain side. 55, "Poppies," Charles Robertson; these, although described Poppies of our gardens, Papaver somoiferum; this, although a little hard and formal, is a good picture. 70, "Autumo Leaves," W. H. Thompson, is a pleasant departure from some of the two familiar little pots of flowers. Mr. Thompson has treated masterly manner a few branchlets of Beech, with the leaves showing the autumnal tints. 91. "Dawn," 100, "Evening," H. G. Hine. These are two really superb pictures; the first represents a view taken from undulating hill-tops or downs, the valleys being full of the mists of morning; the picture is most powerful and truthful, and altogether excellent. The second picture, of a still summer evening, is equally truthful and good. 98, "Abutilon Pelargoniums," is a pretty little picture by Mrs. Wm. Duffield. 143, "Mushrooms," J. Bligh, is a very truthful and well-executed picture of a basket of freshly-gathered pasture Mushrooms, very different from the plants of our markets. 162, "Polyanthus and Forget-me-Not," Miss Ada Bell, is a most beautiful little work; in every way good in grouping, drawing, and colour. 195, "Ox-eye Daisies," Miss M. Chase, is also very good indeed; so is 219, "Pelargoniums," Mrs. Wm. Duffield. 258, "Gen-tian and Narcissi," Miss R. Wallis, is bard, and shows a weaker appreciation of the beauties of flowers than the works of the other artists we have just mentioned. 259, "A Tumbler of Violets," Miss Ada Bell; we do not like this, the colour is rich, and the painting bold, but the flowers have no form. "An International Congress," B. W. Spiers, is one of the most remarkable pieces of realistic painting we have seen. It is a group of books of all sorts, little antiquities, prints, coins, &c., but so real that one cannot help imagining, on looking at the picture, that the things themselves (and not painted copies) are before one. The book covers with the gold ornaments are especially illusive. 307. "Marornaments are especially illusive. 307. "Marguerites and other Flowers," Mrs. W. Duffield, is in the excellent manner of this well-known artist; the picture contains Roses, Pansies, Violas, &c., as well as Marguerites. 386. "Odontoglossums and Azaleas," by the same lady, is a large and beautifully painted picture of these admired flowers. 408, "Bough of Plums," John Sherrin. Every one who visits exhibitions is familiar with these superbly painted bunches of Plums by Mr. Sherrin, they are life itself-if not better than life; but we confess ourselves a little weary of the iteration of the subjects selected by Mr. Sherrio. 483, "Single Dahlias," Miss M. Chase, we like less than other works we have seen by this skilful artist. 512, "Daffodils and Violets," Miss A. Bell, falls far short of the "Polyanthus and Forget-me-Not" same artist; we esteem this and several other works by Miss Bell, as far too careless and rough, the dash, and gorgeous and harmonious colour does not compensate for the absence of all care and study in the drawsate for the absence of all care and study in the drawing. 558, "Baskets of Flowers," Mrs. Wm. Duffield, is a well executed picture of Roses and Violas; and 664, "Lilies," by the same artist, is a grand group of varieties of Lilium speciosum. 756, "The Terrace Walk," Geo. S. Elgood, is one of a series of beautiful garden pictures in this exhibition;

Dendrobium cruentum, n. sp. — Aff. D. trideutifero, Lindl.: floribus ringentibus telas valida; spealis triangulis, mento obtusangulo; tepalis incaribus accuninatis, labello profunde trido.

Trido de la companio del companio de la companio del companio de la companio del companio del companio del companio de la companio de la companio del co

we have never seen anything better, each is a perfect and powerful work of art. 835, "May," W. J. Muckley, is an admirable picture of Hawthorn blossoms; if any one has ever painted Hawthorn blooms better than Mr. Muckley, it was the late Mr. Hunt, a superb example of whose work in representing these blossoms may be seen in the South Kensington Museum. 866, "Chrysanthemums," Miss F. W. Currey, is exceedingly good and spirited. 939, "The Fish Pond," Geo. S. Elgood, is another

PRIMULA SIEBOLDI.

Ir may well be hoped that the exhibition and introduction into commerce of the new and beautiful additions to this section of hardy Primroses which Nr. Geggie, of Bury, has raised, will serve to draw attention to them more fully than has hitherto been the case, and to render them common and popular denizens of greenhouses and frames in the spring months. It should be one of the strongest

blooming. For that reason it is always found desirable to break up the clumps annually and repot them.

Naturally the creeping crowns or rhizomes strive to force themselves to the outside, and as a result in outdoor chumps the centres become bare, whilst in pots the best crowns get pressed or jammed against the insides, and, of course, are forced into deformed growth. This tendency is specially seen when clumps have remained over a second season of growth in the same pot. To obviate this, not only should the crowns be not too thickly placed, but should also be annually removed. Practically, if the best crowns be selected when the clump is broken up, there is little to choose as to future method of potting. Single strong crowns make nice useful plants in small pots, three or four make a nice clump in a 48-sized pot, and from eight to nine crowns in an 8-inch pot give good results. Smaller stocks of crowns may be planted more densely, or will do well if put thickly into a large shallow pan, in which they find ample space to ruo, and produce fine blooming crowns for the following year.

The work of breaking up and repotting may be best done in the late autumn, after the foliage has decayed. Then the roots literally rest if existing under natural conditions, till about March, but if they be placed in a greenhouse or frame will begin to push in February. No very considerable quantity of new roots is made till the plants are well leaved, and then from that time till the last leaf is gone they are active, needing water and proper attention. As with many Primroses so with this, thrips is a source of some trouble, but still is not much so, as the plants, in good soil, and in a cool position during the summer; will leaf so abundantly. Next to thrips, perhaps, these Primulas have no greater enemy than drip from trees or other overhanging matter; hence, when stood out doors in the summer it is better to plunge the pots in ashes or cocoa-fibre refuse, yet otherwise exposed to the sun than beneath trees, where drip, especially in the autumn, will prove most detrimental. During the growing season a little liquid manure is beneficial, but because of its tendency to produce robust leafage and strong crowns, so also is it well that the plants should have the benefit of some ripeniug

In houses where there is heat, or when kept far from the glass, these Primulas show a natural tendency to develope long flowers and leaf-stalks. For that reason it is not well to force them, but the ordinary warmth of a greenhouse in the spring will always induce fairly early blooming, whilst if others be kept in a cool frame the blooming season may be greatly prolonged. Practically a cool frame with the pots plunged in ashes and near to the glass is the very place in which to keep the plants for the winter till needed in the greenhouse from time to time. In repotting the crowns it is undesirable to bury them deeper than just below the surface, whilst the use of some sharp sand on the surface soil will help to keep that open and loose. Shallow pans or pots are just as favourable for these Primulas as ordinary ones, perhaps more so, as they seldom root deeply. The best drainage is that composed of rubbly turf and pieces of decayed manure, as such material tends to entice the roots downward, and thus the longer maintain the foliage in vigour.

Of kinds we now have so many that are beautiful that enumeration of a few would be but invidious. Most of Mr. Geggie's new kinds differ from older ones, and some may be said to show improvement. The colours run chiefly in mauve, pale purple, and reddish tints, in great variety, whilst the fairly equal distribution of smooth edged and laciniated flowers offers forms for various tastes. So charming, and indeed elegant, are all these feather-edged varieties that almost alone with Chinese Primulas do they seem the more acceptable the more they display that feature. Amidst all the merits of these flowers, however, they possess the defect of want of stiffness in the flower-stems, and from which fault it would be well if raisers could purge them. The result is that in most cases the flowers are of a drooping habit, as though too modest to boldly look about them. This feature is more seen when only one or two trusses emanate from a plant than when a number form a good head of bloom. It is not an absolute fault-some may even think it the reverse, but if it be a fault, it seems to be the only one they

FIG. 116.—EXACUM AFFINE: FLOWERS BLUE. (SEE P. 604.)

of the magnificent garden views that we have before adverted to, from the brush of this accomplished and painstaking artist. We have no space for any notice of the ounerous excellent figure subjects, and, if possible, more admirable landscapes. There are beautiful landscape works by Messrs, Alfred Parsons, Whymper, Wimperis, Thomas Collier, Tulleylove, and other artists of repute.

OXALIS ARTICULATA.—This is one of a large group distinguished by their stout woody rootstock. The leaves are trifoliolate, the flowers pale lilac. Native of South Brazil and Patagonia. See Botanical Magazine, 1, 6748. recommendations of these Primulas that, whilst so apparently delicate and refined in habit and heautiful in bloom, they are yet so hardy and easy of cultivation. On the other hand, though hardy, they are not so well adapted for outdoor culture as may be desired; but then it is not as border plants, but rather as cool-house pot-plants, that they are so worthy of recommendation. Perhaps the well-known habit of growth and increase on the part of the roots tends in some degree to militate against their adaptability for border cultivation, as we know full well if left in clumps in pots or pans they soon become too crowded and cramped to admit of strong growth or free

CARNATIONS AT TRING PARK.

THESE favourite flowers are grown to perfection in Sir Nathaniel de Rothschild's garden at Tring Park, and there-thanks to the admirable system of cultivating them adopted by Mr. E. Hill, the gardenerthey are made to produce their flowers all the year round. The chief aim of course is to get a good supply in winter and early spring, and for this purpose the perpetual flowering kinds are grown, a fresh stock being raised every year, and all the old plants not wanted for cultivation thrown away. This has been found to be the only way of securing a good, clean, and neat-looking house of plants, every one of which may be depended upon to give its share of blossoms, Mr. Hill's plan is to strike the main crop in heat in the month of February, and also to propagate a small lot in the same manner later on for succession. As soon as rooted the plants are potted singly in small pots, and still kept in a gentle heat until they are well established. Later on they are hardened off and shifted into larger pots, and as the spring advances they are moved into the handy light span pits outside, where the earliest plants for next winter's flowering may now be seen together with an immense stock of all sizes to follow on.

The main batch is shifted into large 32-sized pots before the summer sets in, and they are kept in the cold pits until the second week in September, when they are removed to the roomy, light, span-roofed house which they are destined to make gay and useful throughout the whole of the winter and spring. This house is even yet very bright, and plentifully supplied with flowers borne on neat plants of uniform growth, all of which are clean and free from insects notwithstanding that they have been in bloom for so long a time. The perpetuals are followed by the Souvenir de la Malmaison, and half a houseful of these are well furnished with buds and ready to commence their duties. These, supplemented by the latest of the perpetuals, carry on the blooming period until the garden sorts are ready in the open air, and they in their turn keep up the supply until the earliest of the perpetuals come in. The compost used by Mr. Hill for potting his Carnations is turfy yellow loam three parts, and one part of leaf-mould and silver-sand.

The best sorts for winter flowering are naturally sought out where so much trouble is taken with their culture, and the sorts most in favour here are Hermine, Ville de Nancy, Countess of Seston, all whites; Empress of Germany, a very large white, with some-times a prettily tinged edge; The Queen, a snowwhite, with very clean cut, plain edge to the petals, and a perfect form, is, however, the favourite white. The scarlets are Lucifer, Sir George, Le Grenadier, and A. Alegatière. The blush Miss Jolliffe is also grown, but there is another, named Laura, of much the same tint, but having a fringed edge, which is perhaps even more beautiful. Lady Musgrave, a brilliant crimson; Irma, bright rose; Belle Rose, and Governor Wood are also very fine kinds. Valentia is one of the sweetest of Carnations, something like the old crimson Clove in colour, but with heautifully fringed edge and decided tree habit. The yellow grounds are Jean Sisley and Mazeppa, and Andalusia, a variety first introduced at Tring Park-it has lovely sulphur-yellow flowers tinted with pink, and is a great beauty. The old scarlet and white flake Attila still holds its own here; the favour which such old servants as it and the Gloire de Dijon Rose and many others find everywhere goes far to prove that our fancies for particular flowers are not swayed by caprice.

It will not be saying too much to say that there are hundreds of flower lovers in these isles who would gladly take up the culture of winter flowering Carnabut who, having experienced reverses when they have tried it on a small scale, have not persisted in it. Let them again make the attempt on Mr. Hill's plan, and better fortune will attend them if they earnestly carry it out.

TIMBER IN NEW ZEALAND, — It is stated in the Colonics and India that the export of timber, especially Kauri (Dammara australis), from the northern part of New Zealand is very large; numbers of vessels are constaulty employed carrying Kauri to the southern parts of the colony and to Australia, where there is a good market for it. In addition to this several large mills in Auckland are fully employed cutting up the logs into sizes fit for building purposes. cutting up the logs into sizes fit for building purposes. Between 400 and 500 hands are engaged in this work

SPRING FLOWERS AT EDGE

THE end of April in this year is a good time for making a record of plants which stand east wind and frosty nights well when in flower. From the begin-ning to the end of the month cold east winds pre-vailed with very few intervals, and on many nights there were from 8° to 10° of frost; but plants have not suffered nearly so much as they did in the middle of March last year. I find that Japanese plants are most injured by these cold parching winds, to which they seem quite unaccustomed in their own country. On the other hand, early-flowering American plants are, as a rule, unaffected, being liable in their own country to late returns of cold. European alpines seem to suffer from drought more than from cold, and some of them, especially the Dianthus tribe, get withered up. Cytisus Ardoini, which flowers freely for a month from the middle of April, is now very bright. It does not grow fast, and takes three or four years to make a good bush; planted in crevices it seems to hug the stones, from which it does not rise more than 6 inches. It is the dwarfest and prettiest of the yellow Broom tribe, and no weather seems to

Veronica saturæifolia is the earliest, and one of the best of its genus for the rockery, both foliage and flower being very neat. It roots as it spreads, and its pretty compact tufts of purplish-blue come out about the middle of April, and are never spoilt by frost. Phlox divaricata, or canadensis, is the bardiest of the early dwarf Phloxes. The lavender-coloured umbels of flowers are borne on stalks about 9 inches high, and continue for a long time. It requires one precaution, that it must be guarded from slugs, which it attracts as long as there is anything of it left, either leaf or flower. The perforated zinc guards are quite effectual in protecting it. Phlox amoena, in the style of verna, but earlier, and producing far more flowers, is not quite so hardy, but has not suffered much this year. The flower-stalks are not more than 4 or 5 inches high, and the flowers bright pink. Both these Phloxes should be frequently renewed, which is easily done by spreading the shoots and covering the base of them with fine soil, when fresh tufts will readily root. When rooted they do best transplanted to a raised store-bed of fine soil, from which they can be moved to their flowering places in October,

Campanula Wanneri is most successful this season; though the March frosts of last year killed nearly all, it is this year flowering freely and uninjured. biennial; the seed sown in June as soon as ripe comes up at once, and makes good plants for putting in crevices between large stones in warm spots of the rockery in October. They are liable to be killed by very hard winters, and a few should be kept in cold frames for flowering in pots in a cool greenhouse, for which they are well suited. It is very ornamental, its large pale purple flowers, like those of a Foxglove, resting against the stones which support them. These biennials are far too liable to be neglected, but require far less trouble than they are worth.

Ranunculus montanus I have been in the habit of treating too much as a dry soil plant, and it flowers in a stunted way on the higher ledges of a rockery; but some plants facing north-east, at the base of the stones, have been a mass of bright yellow flowers all through this April. The flowers, borne on single stalks, are of the size and colour of R. auricomus, but the plant is only about 4 inches high, and very desirable.

Hesperochiron californicus. I regret to observe that this lovely little plant, which I had from Ware, seems to have disappeared from his catalogue. It does not always establish itself, and out of several planted I have only two specimens which have flowered where they now stand for three seasons. The best plant is in an exposed part of a raised peatbed. It has a sparse tuft of procumbent leaves, round the outside of which a ring of snow-white flowers, like wax, in size and shape reminding one of Stephanotis floribunda, made a wreath of about 6 inches in diameter. In size the plants have hardly increased in three years, and I know of no way of increasing them except by seed, which I have never been able to get. I wish some one in communication with California would help us in this.

Gentiana verna defies the cold, and is remarkably fine this year. I can only grow it as an imported plant, and after doing well for about three years the tufts deteriorate. It must have prepared soil, and

good drainage, and is better for being watered in dry weather. With these helps it does well either on the flat border or the rockery in fully exposed spots, plants of 4 inches square bearing from twenty to fifty flowers at a time. Hutchinsia alpina is perhaps the best of the dwarf Crucifers in April. The flowers are snow-white, and plants grow out of small crevices so as to form a compact tuft upon the stones. Seedlings come up round it, which take so little room that they seldom require moving. Silene maritima has just the same habit of growing from between the stones on the higher parts of the rockery, but it is on a much larger scale than the last. I like the single-flowered far better than the double, which generally is a straggling and untidy plant. It is so easily weeded, and the seedlings so convenient in their plenty for leaving in the right place, that I am never without it.

Androsace sarmentosa has done unusually well. is capricious about flowering, and even about living, turning brown and going off at all stages of growth without any apparent cause, but it is easily increased, and should be planted plentilully. Pockets under overhanging stones, backed by a bank, suit it best, with a southern aspect. It must not be drenched overhead, nor get dry at the root. I have a plant with more than twenty bunches of flowers open. few of the older flowers are discoloured by the sbarp frosts, but the plants do not suffer.

Tiarella cordifolia deserves to be commended for its hardiness, as it suffers neither from cold nor drought. The plants are remarkably well filled with buds this year, and they begin to open about April 20. I find it best to collect the straggling runners into compact bunches towards the end of autumn, and plant them

where they are to flower.

Mertensia virginica does not appear in gardens as often as it deserves. It is a plaot which when established may be left for several years without being moved or divided. The roots are so tough, and th crown so compact, that it is not easy to divide it successfully. Cuttings may be taken in very early spring, and it occasionally comes up from self-sown seed. A moderately retentive, but not hard soil, suits it best. Most of the plants supplied by nurseries are imported from America, and though they seem dry and dead when they arive, they generally recover.

The large Doronicum—which I always call after

Mr. Harpur-Crewe, the raiser—is far more hardy in flower than the better known D. cancasicum. I have it in flower all the year round, ten months in the open it in flower all the year round, ten months in the open air, and two in the greenhouse. By constantly cutting up and transplanting the flowering time is prolonged, and the number of flowers increased. No plant which I have supplies a greater profusion of cut flowers, or any which last longer in winter. It thrives in any soil or situation, and as it has now been in the market for ten years, it is surprising to find any herbaceous border without it.

Two of the prettiest alpine Primroses are the dwarf P. muretiana, with flowers of dark rich crimson, and a mealy-leaved Auricula, with a bunch of goldenyellow flowers the size and shape of the English Cowslip. I am told that this is the genuine and original P. Auricula.

Frimula intermedia, or ciliata, is also very flowers.

Primula intermedia, or ciliata, is also very flowery

and good. It is especially fine now on Messrs.

James Dickson & Soos rockery at Chester.

Rubus arcticus, and Anemone Pulsatilla, always

suffer with me from spring frosts—the former because

it expects perpetual day when it is time for it to

flower; but for the destruction of the flowers of the latter, which is a native of our bleak chalk downs, I can assign oo reason; but it was in full flower early in April, and, as usual, was turned brown by the late flowering again in July. All these plants, with the exceptions I have made, have flowered quite uninjured by the recent frosts. C. Wolley Dod, Llandudno,

Jured by the recent frosts. C. Welley Dod, Llandudne, April 30.

[We awail ourselves of the opportunity of publishing a view of the old Itall (see p. 613), seated in the midst of the rich collections which so often furnish valued notes for our columns. A description of the garden was given at p. 445 of our second volume for 1882, but the number and variety of plants grown is so large that a description written for one week would have to be superseded the next. The garden was the other than the second work of the superseded the next. The garden is one of those places which makes the ordinary visitor feel his ignorance somewhat unpleasantly. The Hall itself is a good substantial specimen of the seventeenth century style, and the illustration (p. 613) we are enabled to give has a special interest, in that it contains the portraits, easily recognisable, of Mr. Wolley Dod, and of the late much regretted Harpur Crewe, and that it was produced from a photograph taken by another great plant lover, Mr. A. O. Walker, of Colwyn Bay. ED.]

NOMENCLATURE OF NAR-

AT the Narcissus Congress of the Royal Horticultural Society, held on April I, 1884, the following resolution, proposed by H. J. Elwes, Esq., and seconded by J. G. Baker, Esq., was adopted, and a committee was appointed to revise the names now in use, in order to adapt them as far as possible thereto :-

Resolved-" That, in the opinion of this Conference, Resolved—"That, in the opinion of this Conference, uniformity of nomenclature is most desirable, and that garden varieties of Narcissi, whether known hybrids or natural seedlings, should be named or numbered in the manner adopted by florists, and not in the manner adopted by botanists."

The Revising Committee met on the morning of the following day, when the names of the flowers then present underwent revision and correction in the sense present underwent revision and correction in the sense of the resolution. Mr. Elwes presided. Mr. J. G. Baker kindly undertook to frame a table showing the botanical relationship between the several plants, while to Mr. T. Moore aod Mr. P. Barr was deputed the further task of filling in the names of other garden forms and monstrosities. The list here printed is the result of their joint labours; the first portion showing Mr. Baker's grouping of the botanical forms, and the second portion the garden varieties, arranged according to their botanical affinities.

THE CONGRESS CATALOGUE OF NARCISSI. SERIES I .- GENUINE SPECIES AND THEIR VARIETIES.

NOTE:—The names printed in the first left-hand column, in small capitals, represent the subgenera, those in the second, in italies, indicate the admitted species, the third column contains the subspecies, and the fourth the varieties as understood botanically. The contents of a fifth column (garden forms) and a sixth (monstrosities) will be printed at the end, our column not being wide enough to take them in their proper position.]

12. poeticus plenus (Gardenia flowered).

It should perhaps be explained, in justice to the real workers in this field, that of the foregoing hybrids, No. 1, Hume's hybrid; No. 5, Barr's hybrid; and No. 8, Burbidge's hybrid, bear names which are merely complimentary, the individuals thus complimented having had nothing whatever to do with the raising of the plants. The merit which attaches to the several productions belongs almost wholly to the late Mr. Leeds, of Manchester, and the late Mr. Backhouse, of Weardale, and it is to the efforts of these gentlemen that we are indebted for so large and valuable an acces-sion to the forms of these beautiful flowers which are now available for the decoration of our spring gardens. The exceptions are very few indeed, consisting mainly of the varieties named Gertrude Jekyll and Dr. Masters, which were raised by the late Rev. J. G. Nelson, and some three or four forms due to the labours of M. Max Leichtlin, of whom we may probably yet hear more in this connection, as we believe that gentleman is still earnestly occupied in the good work, T. M.; P. B.

OAK BARK.

STRIPPING AND HARVESTING, - In the whole routine of forest work perhaps there is no other undertaking of more importance, or one that requires a greater amount of forethought and attention than the stripping and saving of bark; and as the season for such work is now rapidly approaching, a few remarks thereon may not be out of place. The advantages of early stripping are now so well known that any comment on this subject is unnecessary; suffice it to say that immediately the bark commences to "run" freely no time should be lost in making a start, and the work should be prosecuted with vigour and dispatch until completed.

The proper time to commence barking cannot,

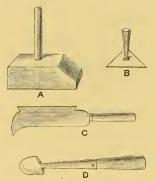

FIG. 117. -OAK-BARKING TOOLS

however, be fixed with any amount of certainty, much depending on the season, whether early or late, as well as district of the country in which the operation is to be performed. During ordinary seasons, and in most parts of England, bark stripping commences during the third week in April, and continues for about a month, or until such time as the trees are in full leafage, whereas in some parts of Scotland, especially the North, the operation is frequently nearly a month later.

No mistake can, however, arise as to the right time to start barking in any locality, as in all cases the period when the bud is just bursting into leaf will be found the proper time for falling to insure easy stripping and the best quality of bark. As the season of bark stripping is, therefore, of short duration, every preparation should be made beforehand-trees marked and numbered, tools in readiness, and, where necessary, extra hands engaged-so that an early start may be made, as by deferring the work beyond the time stated above there is not only a perceptible loss in weight but a considerable deterioration in the quality of the bark as well. Elaborate directions as to the arrangement of squads and tools to be used are unnecessary, as every district has its own peculiarities in this respect. The tools generally in use are heavy axes for felling, hand-bills and saws for pruning (c), peeling-irons or chisels (D) for removing the scrapers for removing moss (B), and light wooden mallets (A) for beating refractory bark, or such as cannot be removed by the peeling-irons alone. The above woodcut (fig. 117) gives illustrations of the tools used in barking. The above being a brief description of the preparatory arrangements for barking, with notes thereon, we will now proceed with the more practical portion of the work, viz., removing, stacking, and harvesting the bark.

Previous to felling the trees, a man or stout lad is sent before, who removes the bark from the root upwards for a distance of 2 or 3 feet, which not only prevents its being injured, but is a convenience for after-stripping as well. Where the stools are intended for reproduction, great care is necessary to avoid tearing or loosening the bark from the root.

After being thus prepared, the trees are felled in the usual manner, those under 6 inches diameter being cut with the axe; above that size it is found economy of both time and timber to fell with the cross-cnt saw. Following in the rear of the cutters should be a squad of men to clear the trunk and larger limbs of all branches down to an inch in diameter, leaving the limbs to be peeled as part of the tree.

Heavy timber and large branches are usually peeled where they fall, but it will be found convenient to have the smaller trees and branches carried out to some clear space adjoining the stacking-ground, and peeled while one end is supported by means of two forked sticks against each other. When the bark of small branches cannot readily be removed by the peeling-iron, a smooth, flat stone is brought into use, beside which the peeler sits, and with one hand holds the branch on the stone, moving it along from one end to the other, at the same time applying the mal-let with the other hand until the bark becomes loosened from the wood. Here it may be well to caution against a too frequent use of the mallet, which should never be brought into use when the bark can be otherwise removed from the wood, as all hammering or beating not only diminishes the quantity of tannin, but has a tendency to blacken the fleshy part of the bark, and cause rapid decay in a bad season. The body or trunk bark is removed in lengths of from 30 to 36 inches, and in pieces as large

nearly part of the bark, and cause raph decay in tabad season. The body or trunk bark is removed in lengths of from 30 to 36 inches, and in pieces as large as possible.

A dry, open and airy situation convenient to the work should be selected on which to harvest the bark, and rather than do so in a sheltered humid spot it should be carted to some distance off. The drying rack or ranges may be about 2 feet in height, drooping somewhat to one side, and formed of forked sticks driven firmly into the ground, while stout rods are placed transversely upon these. It should also hearranged not only to throw the rain off, but so that the ends of the bark may be facing the prevailing wind, thereby insuring a current of air through and beneath the mass. After being carried or carted to the drying ground, the small bark is spread out loosely on the stage to a depth of about 6 inches, and hatched or covered over with the larger pieces as a means of protection against rain. Each day's bark should be cleared up and put on the range the same evening, and oftener if found necessary during damp, showery weather, keeping the white or fleshy side downwards, and using the larger pieces for covers to ruo off the rain. During favourable weather the hark will be ready for stacking in a fortnight from the time it was placed on the stage, but should close, damp weather intervene, it may be found necessary to turn the bark occasionally, thus adding to the length of time required in harvesting. It should, however, be remembered that the less turning the bark receives after being placed on the stage the better will the quality be. Well seasoned bark has he feethy side of a creamy colour, whereas such as has been exposed to sun or rain is of a dull brown, wanting in tannin matter, and consequently deficient wanting in tannin matter, and consequently deficient in value.

wanting in tannin matter, and consequently dencemt in value.

As soon as the bark is thoroughly dry and ready for stacking, which may readily be told by its breaking freely across rather than bending or yielding to pressure, it should be secured in a shed, ricked, or delivered to the tanner. In stacking bark the ricks should not be made too broad—from 7 to 9 feet—but well hearted, so that the side pieces may have a good fall or declivity outwards to throw off the rain.

They may be made of any length, according to the quantity of bark on hand, and of a height proportionate to the width. The largest pieces of bark should be reserved for thatching the rick or stack, and afterwards covered over with a tarpaulin or waterproof-cloth of some kind. In some cases the bark is chipped previous to being sold, but as this necessitates having a large shed at command for storage, the system is not generally adopted. There are, however, several advantages accruing from this method, not the least of which is, that the bark may be chopped up as it is removed from the drying stands, thus saving the expense of stacking.

pense of stacking.

The average price of Oak bark in this district has been for some years from £4 to £4 tos. per ton of 20 cwt., delivered at the nearest railway station or port. A. D. Webster, Penrhyn Castle, North Wales.

Orchid Potes and Pleanings.

VANDA TERES IN EXCELSIS .- The sight of the grand lot of this plant which Mr. Hill, gardener to Sir Nathaniel de Rothschild, Bart., M.P., has at Tring Park, causes one to wonder how it is that so many fail to flower it; indeed, so long have some old specimens been located in gardens without ever putting forth a bloom, that those about them entertain with respect to them something like the popular belief about the American Agave, that they only bloom once in a hundred years, and patiently await the completion of the allotted time. In a sunny, warm, threequarter span, unshaded house at Tring Park, there are upwards of 200 plants each about 2 feet 6 inches in height, and each furnished with one or two very strong flower-spikes. The plants are grown on a novel plan; they are planted out along the front of the house over a hot-water tank, which, however, is very slightly heated. A good layer of charcoal is placed, and the plants planted in living sphagnum moss at about 4 inches from each other on the slab. That nothing could be more suitable for them the regular heavy crop of blooms they supply gives the best of evidence. They are kept moist all the year round. A quantity of plants of Vanda Hookeri, fastened to teak, and plunged in pots, are here growing, and sending out their flower-spikes equally well. Every year after flowering these are cut down, and lowered on the teak blocks, so as to keep them from running into ungainly growth. A good specimen of the terete-leaved Aerides vandarum, with its large snow-white flowers, is also in bloom in this house.

CATTLEYA REINECKIANA SUPERBISSIMA. Plants when well bloomed are so lovely that whenever a very rare and beautiful specimen is produced it is apt to be prououuced the most lovely thing ever seen. If such a sweeping assertion were ever admissible every excuse might be offered for making it when referring to the magnificent white form of C. Mossize section under the above name, which is now in flower in Sir Nathaniel de Rothschild's Orchid collection at Tring Park. It has thirteen lovely pure white flowers without a tinge of colour on them except on the labellum, and naturally arranged as they are without stick or tie the plant presents a most striking picture, and one which the beholder would not easily forget be he Orchid grower or not. The labellum, which is white and beautifully fringed, is marked high up in the tube with violet lines, and in the middle portion with orange, from which towards the edge run a few violet lines and dots. The charm of the whole flower is greatly enhanced by the distinct manner in which the different bright colours are placed on the labellum, they not running into each other as in the other forms of this plant which have flowered in this country; indeed, it seems more like a C. Wagueri with some of the C. Reineckiana marking, and may be regarded as between those The plant is of the stamp that every two varieties. Orchid collector strives for-a compact piece with almost as many leads as old bulbs-and thus it is enabled to give such a grand head of bloom, although growing in a 6-inch teak basket. It must be a great pleasure to Mr. Hill that he has been able to bring this rare and valuable plant up to the standard of perfection of the rest of his Cattleyas, for sometimes these wonderful white forms refuse to be comforted when taken from their native homes. The plant was one of an importation (necessarily small on account of their variety) of white Cattleya Mossiæs got over last summer by Messrs. F. Sander & Co. It is delightfully fragrant.

CALANTHE VERATRIFOLIA. — In the garden at Ardgowan, Inverkip, under the practical care of Mr. Lunt, are some extraordinary fine examples of this good old Orchid—the finest, indeed, I have ever seen. The plants have from twelve to fifteen spikes, each with upwards of eighty flowers. The foliage also, as is not always the case, is in perfect condition. Plants like these are invaluable at this season for cutting from. Alfred Outram.

ODONTOGLOSSUM CRISFUM VAR. ROTHSCHILD-IANUM,—Mr. Bradshaw, Baron F, de Rothschild's gardener at Waddesdon Manor, Aylesbury, has favoured us with a portion of a spike, only 6 inches

long, yet bearing eight of the most beautiful blossoms fancy can conceive.

The flowers are large, the margins of the sepals and petals undulated, the petals white tinted with violet, and unspotted; the sepals more heavily shaded with violet, with one large round or club-shaped blotch of purple-brown on each. The lip is also spotted, and the yellow blotch very pure in tone. It is one of Mr. Sacder's introductions, and certainly one of his most beautiful.

ONCIDIUM LANCEANUM.-Brought from Guiana in 1834 by John Henry Lance, Esq., and since that time frequently imported in quantity, it is a wonder that this, one of the most beautiful and fragrant of Oncidia, should not be more frequently seen in collections; but the fact is, that few Orchids have suffered so much from mismanagement as this has, and hence it is still an uncommon plant. The continued vigour, however, of plants in the hands of those who manage it well, proves that it is amenable to treatment, and the beauty of its large, branched spikes of flowers should ensure its careful consideration from all Orchid growers. O. Lanceanum succeeds best on a block or in a basket, with but little stuff about its roots, and suspended in a moist and shady, but yet light, part of an intermediate-house; indeed, during its growing season, it will do with the Phalænopsis or in the East India-house, but in any case it is necessary when the plant is in bloom, and for a month or so

FIG. 118.-ONCIDIUM LANCEANUM.

afterwards in the summer, to place it in a cool, shady house, so that its large, fleshy, entire leaves may harden and prepare the plant for the next growing season. While growing O. Lanceanum requires abundance of water, and at no period does it like to have water withheld long enough to allow it to shrivel. Its fragrant flowers, often produced two dozen on a spike, have the sepals and petals yellow freckled with reddistb-brown, and the lip in different plants varies from nearly white to dark rose.

DENDROBIUM CHRYSOTONUM.—I enclose you two spikes of flowers of this Orchid, cut from a plant in a 7-inch basket, which is bearing fourteen spikes. The cultivation of this Orchid is of the simplest character. Hang it up in a warm vinery to make its growth, and in the autumn expose it to full sunlight to ripen the same, and it will flower most freely. 7. R. M.

CATTLEYA MENDELII.—The bloom sent herewith is, I think, very distinct. It has what I should call a mauve lip, but the colour has become a little lighter, having been in bloom a fortnight. George Hardy, Pickering Lodge, Timperley. [A very fine variety, but whether sufficiently distinct to be worth a varietal name we should not like to say. Eb.]

Aërides Veitchii with ten branches, the largest spike I ever heard of; of course it has lost a little colour, having been in some time. The plant has one other spike with three branches; it is about 18 inches high,

with thirty-four leaves, and a small growth with ten leaves. The plant came to me amongst a lot of imported Aërides Fieldingii, and has leaves right down to the pot. George Hardy, Pickering Lodge, Timperley, [A very strong spike of a very good Orchid, ED.]

AUSTRALIAN ORCHIDS .- The first part of the second volume of Mr. Fitzgerald's Australian Orchids has reached us, comprising folio coloured plates with copious analyses of the following species :- Caladenia lobata, C. plicata, C. paniculata, C. macrostylis; Sarcochilus rubricentrum, Drakea elastica, D. glyptodon; Dendrobium superbiens, Prasophyllum australe brevilabre, P. alpinum; Bolboelatum, P. phyllum Elisæ, Microtis porrifolia, M. parviflora, Thelymitra rubra, T. luteo-cilium. Many of these were originally described in the Gardeners' Chronicle by Mr. Fitzgerald. The Caladenias are remarkable for their extraordinary flowers, rivalling in oddity of shape some of the Masdevallias, "The contrast between the delicate green and maroon of the flowers is not its only attraction, the curiously fringed purple labellum, constantly vibrating, catches the eye, when the beauty of the flower might otherwise be un-Although the flowers are so bizarre, the vegetative structure is of the simplest, consisting of a single tuber giving off at the summit a solitary leaf at the side, and a terminal flower-stalk with one, or a raceme of flowers. At the base of the new leaf a new tuber is formed apparently each year. and in one of Mr. Fitzgerald's drawings four such are seen in succession, strung on a thread-like rhizome, and each apparently representing the growth of one No root fibres are shown. The Sarcochilus vear. has more the general aspect of a Crucifer than of an Orchid. Drakæas have a vegetative structure, nearly as simple as that of the Caladenias; but, in addition to the tuber, there are some root fibres. The flowers are equally remarkable. The most showy of the series here figured is the Queensland Dendrobium superbiens, with its long overhanging, slender, manyflowered raceme of rosy-lilac flowers. Of this we are told that a plant in the possession of Captain Broomfield continued in flower for thirteen months, producing at least twelve spikes at a time, the individual flowers lasting three months. The Thelymitras are remarkable for their regular star-like flowers, the lip being in no wise different from the other petals in

Notes from Downside, Leatherhead .--Flowering plants in Mr. Lee's collection are particularly abundant now in such genera as Cattleya, Dendrobium, Masdevallia, Cypripedium, &c. In the two houses devoted to Masdevallias there were noted recently, either in bloom or showing a great many forward spikes, M. insignis, Backhouse's variety, a very brilliant and distinct form; M. Roezlii, Benedicti, M. grandiflora Veitchiana, and M. xanthoides, the Wagnerii of some. The very pretty Zygopetalum Sedeni was still in bloom; the predominating bright blue of the lip of this plant is very attractive, and is suggestive of Z. Mackayi. Another interesting and beautiful plant is found in Colax rufinus, a red lipped variety of C. jugosus, which is of a creamy-white; the plant bore three flowers on each scape. Amongst the large collection of Cypripediums we noticed the pretty white bybrid form of the New Grenadan species, C. Schlimii alba, so rarely met with; it was an especially elegant and pleasing plant, with delicately poised blooms on slender stalks, and foliage slightly drooping and dark green in colour; some of the other Cypripediums, carrying a few choice blooms, were C. roseum and C. niveum. The Odontoglossums were represented by O. cirrosum, several specimens of which were carrying its almost erect sprays of beautifully spotted blooms; O. Alexandræ, in variously marked forms; O. mulus, a somewhat rare variety; and O. fulvescens. A beautiful Epidendrum Pseudepidendrum, Marriott's variety, having bright flowers of a scarlet colour, was also a noticeable plant.

SIR TREVOR LAWRENCE'S ORCHIDS, BURFORD LODGE.—Some fine Dendrobiums are now to be seen in bloom here, notably such species as D. Brymerianum, bearing a few spikes on a specimen suspended in a basket close to the roof; the more rarely seen D. sulcatum; also D. thyrsiflorum Walkerianum, which was grand with ten spikes of its golden and white blossoms; D. devonianum, literally a mass of pink and purple flowers, springing from a great number of the nodes. The yellow and white D. cariniferum also makes a fine display; and on a D. Jamesianum

more than sixty blooms of the purest white and gold were expanded. The Masdevallia-house is a beautiful sight, with many varieties of M. Harryana and M. Veitchii now in flower, and giving promise of still great numbers on plants yet to open, and quite bristling with spikes of bloom, remarkably fine being several potsful of M. Chelsoni rosea. Of the Cattleya section we noticed C. purpurata, a grand plant, bearing seven enormous blooms; C. amethystina, C. Skinneri alba, this last having recently been in full bloom, but now past its best, its flowers, of the purest white, having been produced abundantly. The many varieties of Cattleya Mendelii found here, consisting as they do of some of the handsomest obtainable, are classed simply as C. Mendelii, so that the appalling polysyllabic descriptive names usually appended to them are not used by Mr. Baxter. Cattleya Mossiæ several beautifully marked kinds were in flower, and were conspicuous, amongst other points, for their unusually large size. A plant of C. Acklandii, which grows on a raft, and is undivided, just as it was received on being imported, was showing several of its charming, richly coloured blooms, as was also C. nobilior. The finest Aërides Schræderi was also C. nobilior. The finest Aërides Schræderi that probably exists in cultivation is just now pushing up its bloom spikes, and on A. Lobbii nine bunches of its deep rosy flowers have become visible, as were those of A. Veitchii, although not yet open. Aërides Larpentæ, the buff form, and the lovely A. virens, the rich combination of whose colour makes it such an attraction, were also in bloom. This latter species is one of the earliest flowering of all the Aerides. On A. crassifolium twenty-six blooms were about to

Bulbophyllum Deerii, with a beautiful yellow, s'ightly spotted labellum, that is so tremulous when stirred, had a few of its most singular blooms open on a small specimen banging up near the light; these were the first blooms borne by this plant. A striking group of Odontoglossum Roezlii had many of its strikingly attractive blossoms expanded, as had also the rare Schomburgia tibicinis, that is here flowering in its third season. Amongst the Odontoglossums in flower there were numbers of O. crispum, one having a distinct yellow lip; O. Coradinei, a variety of O. triumphans, that was spotted as usual, but in which the brown blotch was absent; O. Rossii majus, and O. coronarium. A variety of O. vexillarium was noticed, whose colour was as deep as that of the plant shown on the 22d ult, at South Keasington.

Several floriferous plants of Utricularia Endresi were flowering abundantly under Odontoglossum treatment, growing in baskets suspended near the roof. The Lycastes were represented by L. Lawrenciana, with the deep rosy throat, and L. lanipes, the greenish-white flower. On a plant of Cypripedium Stonei platytenium were to be seen the rare number of four of its strikingly marked and formed blooms, fully open; C. cordatum was carrying many flowers, and was a very large specimen. Several other varieties and species of Cypripediums were in bloom, amongst them being the handsome C. Swanianum, C. grande, a long-tailed, singular looking, branching habited species; and C. hirsutissimum. Of Lælias there were in bloom L. elegans, with eight blooms, and several of L. anceps, and some large plants of L. Barkeri.

The rare Ceelogyne ochracea, purple and white, was observed in bloom; also Oncidium nigratum, a green-ground flower, having a sprinkling of black spots. The Vandas form an important section of the flowering spring Orchids, and a considerable quantity of them were observed in various stages of flowering. V. Thompsoni had a wonderful quantity of strong bloom clusters, as had many others. The late spring flowering variety of Angraccum sequipedale carried five of its pure white starry blooms, and finely bloomed were Oncidium ampliatum, Phalenopsis Lowiana, and the rosypurple Saccolabium ampliaceum.

Mr. Baxter pointed out many other of his treasures, but the waning light forbade a longer stay, and the exigencies of "space" debar us from making use of our copious notes to a greater extent. M.

THE ORCHID MARKET.—At Stevens' Rooms, on Thursday, there was a brilliant display of Orchids in flower. The room was filled with the choicest of species and varieties, especially of Odontoglossum, Cattleya, and Masdevallia,

Çhe Kosery.

WHITE ROSES.—I was asked the other day by a lady in my neighbourhood to give her the names of some good white Roses, and it was not until I came to think over it that I found how very limited a class it is. I know, of course, that what she wanted were not summer Roses, but when one came to note the hybrid perpetuals and other continuous blooming Roses they were, indeed, rarve aves; and then the fact became patent to one's mind that we have not a really thoroughly good hybrid perpetual white Rose, and it is mainly of these I have now to give a few notes. We have not so pure a white amongst them all as Madame Plantier, hybrid China Bourbon, and a pure white II.P., of good size and form, would be indeed a "black swan," and withal a nugget, to any one who would be fortunate enough to obtaio it.

There is a class of white Roses amongst the hybrid perpetuals which are very floriferous, but which from their small size do not come within the category of exhibition Roses, but which are very serviceable as decorative Roses for the garden; they comprise subvarieties, as Virginale, Boule de Neige, Baronne de Maynard Mrs. Bellenden Ker, and Mademoiselle Baumann. Of these perhaps Mrs. B. Ker is the best, although Baronne de Maynard is the most free. Virginale is almost gone out of cultivation, as it was a poor grower; and Mademoiselle Baumann has that pink flush in it which most so-called white Roses bave, We must look for white Roses rather in the Baroness Rothschild race than in any other, in fact the two whitest hybrid perpetuals we have are to be found there, I mean White Baroness and Mabel Morrison whiter than Madlle. de Lyon, at least, so as I have seen it. A word or two about these three rival claimants may not be out of place, especially as I have before stated (on the authority of French growers) that it was a sport, not a seedling. I had the other day a good opportunity of comparing it and White Baroness (which is confessedly a sport) together in a visit I paid to Messrs. Paul & Son's nurseries at Cheshunt, Cheshunt, and am led to alter my opinion, for the flower is unquestionably of a different build to that of Baroness Rothschild; there are quite twice the number of petals, which are more folded together, somewhat in the way of Madame Vidot: this alone would be, I think, sufficient to constitute it a seedling and not a sport—for my experienc of sports is, that they never become more double than the normal flower. Then, although the wood has some resemblance to that of the Baroness, it is not nearly so thorny, while the foliage itself is distinct in the shape of the leaves-in the one case angular, and in the other pointed; it is also different in colour. I think, therefore, that unless evidence can be given to the contrary, that it must be considered, pace the authorities to whom I have alluded, to be a distinct variety; it is not, however, a pure white-there is a dash of flesh colour in it even when grown in pots, and I imagine it will be more evident out-of-doors. Mabel Morrison is white, but it is too thin a flower. White Baroness is the whitest of the three, and more full than Mabel Morrison, but not so full as Merveille de Lyon.

Madame Lacharme is another very excellent white Rose, very full and very free lowering. It is, like all light Roses, a fine-weather Rose, and hence some who have seen it in bad seasons concluded that it was of no use. It requires somewhat special treatment; the wood has to be thinned out, and air freely allowed; it will then, if the season be good, well reward any care bestowed upon it: it has also at times a flush of rose colour in it, but when pure it is a most lovely flower.

One cannot omit amongst white Roses the lovely Tea Niphetos, which figures in so many a bridal bouquet, and which, with the exception of Maréchal Niel, is oftener to be seen at Covent Garden than any Rose. It is, however, not a good grower, and will never make a decorative flower, being in fact more suited for the house than the open; its large and solid petals, occasionally somewhat sprawly, and its purity of colour, at times with a faint tinge of green in it, make it a very taking flower. And who would like to omit that exquisite gem, the white Moss, White Bath, lovely in the bud, but then hardly to be surpassed by anything for delicate beauty; as a full-blown Rose it is of no use. The newer variety, Blanche Moreau, is very pretty,

and a more vigorous grower. Then there is that charming little Paquerette, or Daisy Rose, and its sister, Aona Maria de Montrayel.

Amongst the Noisettes there are a few climbing Roses of great beauty, and which, when a wall can be given to them, are worthy a place in any garden, such as Aimée Vibert, its more rampant variety Lamarque, which requires a south wall; it has occasionally a yellowish tinge in the centre—at other times it is a pure white. Then Jeanne d'Arc is another pure white, blooming in clusters, but these are not everybody's Roses, and require warmth and shelter: what is wanted is a good stout and free-blooming perpetual.

I think this pretty well exhausts the white Roses There are some flowers which occcasionally approach very near to white, but are of a light flesh colour, such as Madame Hippolyte Jamain, Monsieur Noman, and Queen Victoria; but they cannot be truly considered to be white flowers, and it will be seen that it is a very limited list compared with that of the reds, common pinks, and yellows. Having mentioned the latter, I may mention that on my visit to Cheshunt I saw the veteran Maréchal Niel which has supplied so many fine baskets of bloom to the various shows, and a veteran surely he is, who has received more scars than ever did the soldier from whom he was named; but those which were inflicted for the sake of preserving him have proved ineffectual, and it is now doomed, the greater portion of it being cut away, and only one branch left, to see whether it would still continue to flower; but evidently its days are over. I mentioned that in a neighbouring parish there were some plants of these on a wall of a cottage. I passed by them to-day (May 3), and they were in full bloom, and many blooms had been already gathered from them, and, no doubt, unusually early, but then the season has altogether been an early one, As I have said, these trees must be nearly as old as those at Cheshunt, and yet it seems to be flourishing while Mr. Paul's is perishing, showing what a capricious Rose it is. But beauties are allowed to be capricious; and is he not a beauty when caught in his prime? One regrets that the Rose did not bear some bright maiden's name instead of that of a doughty warrior. Wild Rose.

Notices of Books.

Bromeliads. — The second part of Herr Antoine's noble publication, Phylo iconegraphie der Bromeliaceen, is before us, containing lithographie illustrations, partially coloured, and on elephant folio paper, of various Bromeliaceee. The species figured are Vriesia psittacina (t. 6), V. carinata, the V. brachystachys of the Botanical Magazine, t. 6014 (t. 7); V. heliconioides, exhibited as V. bellula (t. 8); V. regina, also called V. Glaziouana and V. gigantea (t. 9—10). The plants are shown of life-size, the analyses much enlarged. A full descriptive text in German, with synonyms, accompanies the plates. Mr. Antoine would add to the obligations under which he has put gardeners and botanists if he would, wherever possible, add figures of the seed and mode of germination. The countless thrusands of seedlings of these plants in the propagating houses of the Compagnic Continentale at Ghent could doubtless be drawn upon for this purpose.

— Contributions to Phenological Research.

—A German brechure, entitled Beiträge zur Phinologie, edited by Drs. Egon Ihne and Hermann Hofimann, has recently been published. It contains a brief history of phenology, or the study of the chronology or periodic phenomena of plants, as carried out in every country in Europe, and is divided into two sections. In the first are enumerated the different publications that treat of this subject, the place of publication, and the name of the publisher, &c. The different localities from which the observations relating to phenology have been collected are no fewer than 1926 in number, and are situated in every country in Europe, from the most out-of-the-way districts in Eussia to the North of Scotland and the West of Ireland. The second part treats of the researches conducted by Dr. Hermann Hoffmann binnelf during the years 1879—82. Dr. Hoffmann is anxions to receive further trustworthy notes and observations on the times of vernation, flowering, ripening of the fruits, and of the first signs of autumnal change, and gives full directions as to how these observations may best be carried out, and requests that they may be forwarded to Dr. Ihne at Giefsen.

FRUITS UNDER GLASS.

VINES .- Now that the subjects in every department are in a state of activity, there is a constant demand for tepid water, a bountiful supply of which is very essential, and which is obtainable at a small cost. The cheapest mode of warming water is to have a tank large enough to meet the demand, so situated that a coil of hot-water pipes can be placed in it. From thence it should be distributed through pipes, which should traverse the ranges of glasshouses, and be fitted with taps and hose. Such is the arrangement we have here, and which has proved to be a profitable investment. Young Vines recently planted hould have their leading shoots neatly trained and stopped when they reach about 4 feet up the trellis; the laterals should be stopped at the first joint—this will give strength to the best placed buds; the secondary growths should be allowed to ramble over the trellis to encourage root-action. Houses in which the fruit is ripe should be kept cool, with just enough fire heat to slightly warm the air as it circulates through the houses; this will both prevent the Grapes from injury by damp, and will also help to mature the wood. Any laterals should be rubbed out as they appear, and sufficient atmospheric moisture employed to keep the foliage healthy, so that the buds which are to produce the next crop may be fully matured. The borders must still be supplied with enough tepid water to sustain the activity of the roots, and if they can be covered with spent Mushroom dung, or some other similar material that will abate evaporation, the necessity of frequent waterings will be considerably lessened. Vines upon which the fruits are stoniog should not be hastened excessively, as during the course of this process their strength is severely strained, and should, therefore, be supported by frequent waterings with liquid-manure, and by a genial atmosphere charged with ammonia to invigorate the foliage. This can be generated by saturating the manure mulchings at closing time with guano-water; this will in another way be beneficial, being distasteful to noxious insects.

STRAWBERRIES .- To keep up a continual supply of these from pot plants until outdoor fruits are ready tor use is far from being the easiest of cultural At and after the present lime the achievements. keeping of the plants sufficiently supplied with water is in itself no easy task, and if this part of their culture is at all neglected they are almost sure to fall a prey to red-spider, which so impairs their strength that a satisfactory crop becomes an impossibility; and where they are grown conjointly with Vines and Peaches the mischiel extends to these likewise. Nutritious supplies in the form of guano water or other suitable agents are especially essential now, when very frequent waterings become necessary, and all runners should be removed as soon as they start, so that no impoverishment of the plant takes place. If it should be desirable to retard any of the crops the plants may be moved from warm quarters to a cooler house or pit, and if this is inconvenient, slight shading should be used. Care must be taken that the latest varieties which are at present in their winter quarters are not neglected or allowed to become drawn through standing too closely together, or dry at the roots. In order to prolong the supply the last batch might be suitably ripened in unheated pits, providing the weather is favourable, and they would be greatly benefited by being plunged near to the glass in coal ashes or cocoa-fibre refuse. The system of providing Strawberries for the dessert during the autumn has now become almost universally adopted, and the sort Vicomtesse Héricart de Thury is the one usually grown, being the most easily managed, as well as the most productive kind for this purpose. preparing the plants, those that have been forced in moderately small sized pots should be selected, and placed in a cool pit to rest and harden, when they should be shifted into pots a size larger than those they are in, and be gradually inured to the weather. The best situation for them during the summer is upon a hard bed of ashes, open to the sun, where they should be properly supplied with diluted liquid manure, and be daily well syringed overhead.

PINES .- In order to produce fruits of the best quality, unremitting attention must be paid to all points in their culture, as a check from any cause whatever would be prejudicial to them. Where the

bed is over pipes or water tanks, it is liable to much fluctuation in heat, through the hastening or slackeniog of the fires, which is a matter that cannot be avoided when the weather is changeable, therefore the beds should be frequently tested with a plungiog thermometer, and the supply of heat be regulated according to requirements. The plunging material should likewise be examined occasionally, and be well moistened through with tepid water if found to be dry. In watering the plants (I refer to potted ones, and not to those planted out) they should be treated individually and not collectively, as is too frequently the case, for, owing to various causes, position for instance, some dry much more readily than do others, while some varieties are grosser feeders than others. The Cayenne, for example, from this cause, requires more water than the Queen. It sometimes happens that the surface of the soil remains wet, from the constant damping between the plants, while the low portion of the balls get dry, and it is an easy matter for the unobservant attendant to overlook plants that are suffering owing to this. A continuance of the treatment recommended at p. 482 will still be suitable to the plants in the early house until their fruits begin to change colour, when air should be admitted more liberally and less moisture be given both in the atmosphere and at the roots-indeed, little if any will be requisite for the latter after this stage is reached. Proper attention having been bestowed upon the young plants which were shifted into their fruiting in February, they will now be making rapid progress, water may therefore be more freely supplied, but must not be overdone on any account, and a little guano might now be profitably added to the water. The night temperature should be raised to 70°, or it may advantageously be a few degrees higher when the houses have been closed with a high temperature from sun-heat. On clear days the airing should be attended to early, and be gradually increased so that there is a genial circulation (not to the extent of draught) through the houses; at mid-day it should be reduced, and finally be taken off early in the afternoon, so that a temperature of about 90° is preserved, when the plants should be gently dewed over. The air in the houses and pits should be kept in a moist condition so as to assist the production of well developed Ioliage. J. Coomber, Hendre Gardens, Monmouth.

Plants and thein Cultune.

GREENHOUSE FLOWERING PLANTS,-The occupants of this glass department of our houses will now, and for the next few weeks, be giving us the greatest amount of floral display of any one part of the entire season. Unfortunately for us in particular, we have to grow our plants in fruit-houses; this brings many of them unduly forward. The temperature suited to Vines does not tend to a prolonged season of bloom, though earlier in the spring we are are glad to avail ourselves of the congenial atmosphere of a vicery that is advancing in its earlier stages. The want of a good greenhouse or two is more felt at this season of the year, we think, than at any other period. It necessitates a considerable amount of scheming, now all our houses are closed, to keep our greenhouse plants in the condition we should like to see them. We find it by far the better plan to make a prominent feature of such genera as will best adapt themselves to the exigencies of the case. It is useless to endeavour to grow some plants of the greenhouse section, however much we admire their beauty and utility, when the conditions of culture are so prejudical to their well-being. It plants cannot grown in a fairly successul manner, their culture had better not be attempted at all. Out of the immense collection of plants now obtainable, some at least may be found that will give an average amount of satisfaction; such should, when experience has proved their suitability, be the ones to receive the greatest amount of attention. This method of procedure will be sure to give to all concerned the greatest pleasure and satisfaction in the long run. Our Azaleas are all now past their best, and fast making their growths; when these are completed we shall turn them outside, gradually exposing them to the full sunshine. The Epacris and soft-wooded Ericas are likewise making their growths; in a few weeks, however, we shall have to be watchful of these

to prevent their young shoots becoming too much drawn by the shade imparted from the Vines that are last developing their foliage. The Deutzias have made a good growth, and will soon be fit for removal to a sheltered gook outside. The sooner we can ease our houses of some at least of the hardier plants the better we shall like it; we do not, however, believe io unduly exposing plants or giving them sudden changes, even if a little more labour is given to attain the desired ends.

With a well ventilated greenhouse the majority of the Cape and New Holland plants will now be making a good show; many of them will keep this house gay till the end of June, and even later in several instances. It will greatly tend to the prolongation of the blooming period if a thin blind is used over a part of the house, at least where those plants that are in full bloom may receive a partial shade during bright sunshine. Brittain's netting is an ample shade for any greenhouse plants; do not by any means resort to the whitewashing or whitening process for a means of roof shading; better use none at all than have such as cannot be removed in dull cloudless weather. All greenhouse hard-wooded plants should be allowed to develope their flowers in all the light possible; especially is this to be observed in the case of Cape Heaths, Aphelexis, Darwinias (Hedaromas), Boronias, and Statices. Then whilst at their best the shading recommended should be used to preserve their beauty. deem it advisable to recommend the use of such plants as these in the average run of conservatories, which at the best even are not adapted for the well being of this class. There are many other plants that can be used with impunity; on such more reliance should be placed for conservatory decoration. Chief among these for the next few weeks are the Chorozemas, the Eriostemons, the Imantophyllums, and the Trachelospermums (Rhyncospermums), with the later Azaleas; whilst of soft-wooded plants there is an abundant choice in the herbaceous Calceolarias, the Pelargoniums (both show and fancy kinds), and other miscellaneous plants, as annuals, &c., which when out of flower are either pruned back or consigned to the rubbish-heap.

The earlier flowering greenhouse plants that are now past their best should have attention given them for pruning, potting, and cleaning, as may be necessary. The Acacias will bear the knife pretty freely, sary. The Acacias will bear the knile pretty freely, so also will the Coronillas, the Cytisus, Actus gracillimum, Boronia megastigma, and the Chorozemas if getting too large for the requirements. We advise, however, that the latter genus be planted out when of large size. When the plants that have been pruned are again in active growth, any potting that may be required can be advantageously performed, giving to the Coronillas and Cytisus a preponderance of good turfy loam, but in the case of the others the major portion of the soil should consist of peat and sand, with a little loam only. Camellias, too, will now be in active growth; give every encouragement to the development of the same by syringing the plants, and, if possible, keeping them in a somewhat close bouse till the leaves are fully grown, then they can be gradually hardened off to free ventilation again or full exposure in the open air. It will not be advisable, however, to let them then even receive the full amount of sunshine during the heat of the day. Keep watchful eye against any slight attacks of aphis on tender foliage, in fact care in every way is requisite for a few weeks not to injure the young leaves. Do not attempt any potting at present, but leave this operation till later in the season.

Herbaceous Calceolarias will need close attention now; do not let them suffer for want of water nor be now; do not let them stitler for white of whater not be fully exposed to the sun's rays as they advance into flower. An occasional dose of liquid manure in weak solution will help them. For the Pelargoniums the same stimulant may be used but more frequently. In the case of both, one or two fumigations will be the case of both, one or two fumigations will be advisable before many flowers are expanded in order to keep in check any aphis that may be hanging about them. Pot up a sufficient, number of Petunias, Stocks (Ten-week), Musks, Heliotropes either Irom the fragrance they emit or for their floral beauty. Another sowing of Rhodamhes will he found very useful, so also will the same of the Celosias, Browallias, and Globe Amaranths (Gomphrena purpurea). By the time these are of any size, there will be a fair prospect of more room as the bedding plants are cleared out. Another sowing of Primula sinensis should be made to succeed those that are now fit for potting off into thumbs. A pinch of Frimula sinensis should be made to succeed those that are now fit for potting off into thumbs. A pinch of Cineraria seed might be sown, but there has not been any time lost in this case as yet. Yamer Hudson, The Gardons, Gunnersbury House, W.

APPOINTMENTS FOR THE ENSUING WEEK.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, May 12 Size of Natural History Specimens, at Stevens' Known.

TUESDAY, May 13 Size of Natural History Specimens, at Stevens' Known.

FUEL STATE OF THE STATE

THE appointment of Dr. GILBERT to the Sibthorpian Professorship of RURAL ECONOMY in the University of Oxford is an event fraught with good augury for the prospects of scientific agriculture, horticulture, and forestry. It may be known to some of our readers that up till recently the Sibthorpian Professorship of Rural Economy was held conjointly with that of Botany by one and the same person; indeed, the greater portion of the emoluments of the offices was derived from the Sibthorpian endowment.

The contributions to agricultural science of the late Dr. DAUBENY, the first occupant of the combined Chairs, are well known, and were appropriately alluded to by Dr. GILBERT in his inaugural lecture on the 6th inst. After the resignation of Professor LAWSON some muchneeded changes were made under the authority of the Court of Chancery, in consequence of which the duties of the two Chairs were separated, a more adequate salary attached to each, and a new start made by the appointment of Dr. GILBERT to the Chair of Rural Economy, and of Dr. BAYLEY BALFOUR to that of Botany. Both these appointments are excellent, and full of promise for the future. The enactment relating to rural economy is wide enough to cover not only the scientific principles of agriculture proper, but forestry and scientific horticulture; and we may express a hope that the latter department may, at some future time, receive the recognition at the hands of the University that its importance demands. Be this as it may, we congratulate the University on having secured for their first Professor, under the new regulations, a man of such vast experience and insight as the worldknown collaborator of Sir JOHN LAWES. No more suitable appointment could have been made. It is one that does honour to the University, and we cannot doubt that the benefit to the landed interest will be commensurate alike with the dignity of the University and the reputation of the new Professor.

In his introductory lecture, delivered in the chemical lecture-room of the new Museum, on the 6th inst., Dr. GILBERT commenced by giving a brief history of the foundation of the Chair and of the work done by its former occupant. From this he passed to the consideration of the nature and source of plant food, discarding the somewhat inappropriate terms "organic" and "inorganic" as applied to the constituents of plants and animals, and replacing them by the terms "incombustible" and "fixed," and "combustible" or "volatile" respectively. The Professor showed how the analysis of the growing plant varied according to the stage of growth and the part analysed, and contrasted this variableness with the relative constancy of composition of the evenly matured seed, even when grown under different conditions. This circumstance led up to a general review of the work done in the investigation of the chemical history of plants, the lecturer tracing the work of SAUSSURE, BLACK, PRIESTLEV, SENNEBIER, DAVY, and other pioneers, to the time of BOUSSINGAULT, LIEBIG, and DAUBENV. This historical sketch, though brief, brought out the salient facts in a manner that will be very acceptable to those

who have little leisure or opportunity for making the requisite research for themselves, and will, it is to be hoped, be published, with the rest of the lecture, in a separate form. Dr. GILBERT then passed on to notice the establishment of agricultural stations for research, and to a limited extent for experimental culture, in Germany in 1851, and in other European countries subsequently. The total number of which now exceeds 120-a fact which is in painful contrast to our own work in this line, with the one brilliant exception at Rothamsted, and the few others we yet possess. This naturally led up to a notice of the experimental field cultures associated with laboratory work, commenced so long ago as 1834 by Sir JOHN LAWES, and which, ever increasing, have now assumed such truly colossal proportions at Rothamsted. Dr. GILBERT was naturally modest as to his own share in the work which commenced in 1843, though he sketched in outline the nature of the work continuously carried on for more than forty years in that unique establishment. Its extent may be gleaned from the following tabular statement :-

ROTHAMSTED FIELD EXPERIMENTS. Hield Experiments have been conducted for the periods, and over the areas, indicated in the following Table.

Crops.		Dura- tion.	Area,	Plots.
			Acres.	
Wheat (various manures)	• •	 41	13	37
Wheat, alternated with fallow	••	 33,	1,	. 2
Wheat (varieties)		 15	4-8	About
Barley (various manures)		 33	41/2	23

Total root crops	••	 42		
Potatos (various manures)		 9	2	10
Rotation (various manures)		 37	21/2	12
Permanent grass (various manur	es)	 29	7	22

Samples of all the experimental crops are brought to the laboratory. Weighed portions of each are partially dried and preserved for future reference or analysis. Duplicate weighed portions of each are dried at 100° C., the dry matter determined, and then burnt to ash. The quantities of ash are determined and recorded, the ashes themselves being preserved for reference or analysis.

In a large proportion of the samples the total nitrogen is determined, and in some the amount existing as albuminoids, amides, and

In selected cases, illustrating the influence of season, manures, exhaustion, &c., complete ash-analyses have been made, numbering in all more than 700.

Also in selected cases illustrating the influence of season and manuring quantities of the experimentally grown Wheat grain have been sent to the mill, and the proportion and composition of the different mill products have been determined.

In the Sugar Beet, Mangel Wurzel, and Potatos the sugar in the juice has in many cases been determined by polariscope, and frequently by the copper test also.

In the case of the experiments on the mixed herbage of permanent grass land, besides the samples taken for the determination of the chemical composition (dry matter, ash, nitro-

gen, woody fibre, fatty matter, and composition of ash), carefully averaged samples have frequently been taken for the determination of the botanical composition. In this way, on four occasions, at intervals of five years on lour occasions, at intervals of the years

-viz., in 1862, 1867, 1872, and 1877—

a sample of the produce of each plot was
taken, and submitted to careful botanical analysis, and the percentage, by weight, of each species in the mixed herbage determined. Partial separations, in the case of samples from selected plots (frequently of both first and second crops), have also been made in other

Samples of the soils of most of the experimental plots have been taken from time to time, generally to the depth of 9, 18, and 27 inches, sometimes to twice, and sometimes even to four times this depth. In this way more than 1000 samples have been taken, submitted to partial mechanical separation, and portions of the fine soil (that is, excluding stones) have been carefully prepared and preserved for analysis. In a large proportion of the samples the loss on drying at different temperatures and at ignition has been determined; in most the nitrogen determinable by burning with soda-lime has been estimated. In many the carbon, and in some the nitrogen as nitric acid and the chlorine, have been determined. Some experiments have also been made on the comparative absorptive capacity (for water and ammonia) of different soils and subsoils. The systematic investigation of the amount and condition of the nitrogen, and of some of the more important mineral constituents, of the soils of the different plots, and from different depths, is now in progress or contemplated.

Almost from the commencement of the experiments, the rainfall has been measured, for more than thirty years in a gauge of onethousandth of an acre area, as well as in an ordinary small funnel-gauge of 5 inches diameter. An 8-inch "Board of Trade" copper gauge has also been in use, from January 1, 1881. From time to time the nitrogen as ammonia and as nitric acid has been determined in the rain-waters. The chlorine has also in some cases been determined.

Three "drain gauges," also of one-thousandth of an acre each, for the determination of the quantity and composition of the water percolating respectively through 20 inches, 40 inches, and 60 inches depth of soil (with its subsoil in natural state of consolidation), have also been constructed. Each of the differently manured plots of the permanent experimental Wheat field having a separate pipe drain, the drainage waters have been and are frequently collected and analysed.

The nitrogen existing as nitric acid, sometimes that in other forms, and also some other constituents, are, and for some time past have been, determined periodically, in both the rain and the various drainage waters.

For several years in succession experiments were made to determine the amount of water given off by plants during their growth. In this way various plants, including representatives of the gramineous, the leguminous, and other families, have been experimented upon; similar experiments have also been made with various evergreen and deciduous trees.

Having regard to the difference in the character and amount of the constituents assimilated by plants of different botanical relationships, under like external conditions, or by the same description of plants, under varying conditions, observations have been made on the character and range of the roots of different plants, and on their relative development of stem, leaf, &c. In the case of various crops, but more especially with Wheat and Beans, samples have been taken at different stages of growth, and the composition determined in more or less detail, sometimes of the entire

plant, and sometimes of the separated parts. In a few cases the amounts of dry matter, ash, nitrogen, &c., in the above-ground growth of a given area, at different stages of development, have been determined. The amounts of stubble of different crops have also occasionally been estimated.

Experiments were made for several years in succession to determine whether plants assimilate free or uncombined nitrogen, and also various collateral points. Plants of the gramineous, the leguminous, and of other families were thus operated upon. The late Dr. Pughtook a prominent part in this inquiry.

and of rotation of crops, the feeding of animals for the production of milk, meat, or the exercise of force—the conditions, in fact, by which their labour can most profitably be exercised; the sewage question, and various matters connected with taxation and compensation for unexhausted improvements. It will be thus seen that the Professor has traced a programme which, carried out as we have reason to expect it will be, will doubtless result in placing before the world the most compact, yet full statement, of the present condition of scientific principles applicable to the cultivation of plants and the nurture of animals for practical purposes that has yet been made, and the value

Saturdays in May, June, and July, at 3 P.M. Tickets may be had from the Curator of the garden.

— CAMBRIDGE,—The General Board of Studies are about to appoint a "reader in Botany," and a University lecturer in Botany.

— "THE DICTIONARY OF GARDENING,"—
The publisher of the Dictionary of Gardening, noticed in our last number—Mr. L. UPCOTT GILL, 170, Strand—has arranged to issue the parts fortnightly instead of monthly, as originally announced.

POISONING BY YEW LEAVES, — Medical journals narrate a case of fatal poisoning of a servant girl by Yew leaves. The symptoms were those of

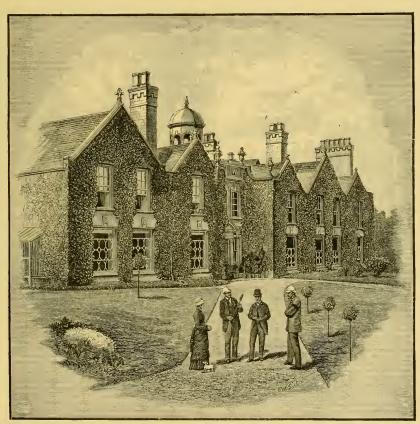

Fig. 119 -EDGE HALL, MALPAS, THE RESIDENCE OF THE REV. C. WOLLEY DOD. (SEE P. 606.)

Considerations of space forbid us from doing more than mention the corresponding series of experiments, elaborated with equal care, on the feeding of animals, the application of sewage, the chemistry of malting, the determination of the amount of rainfall, the nature and quantities of drainage-water according to varied conditions of manuring, and numerous minor but collateral subjects.

In future lectures, to be given at the Botanic Garden, Dr. GILDERT, taking the Rothamsted experiments as a basis, proposes to discuss the sources of the food of plants and animals, the chemistry of the soil and of the atmosphere, the effects of manures, the exhaustion of soils, the effects of fallow of which will be, we may safely venture to say, beyond all precedent.

— Dr. S. SCHWENDENER, Professor of Botady at the University of Berlin, and whose researches in cryptogamic botany, more especially among the Lichens and Algre, are duly appreciated by workers in this country, was at the last meeting of the Linnean Society (May 1) elected a Foreign Member thereof, in the room of the late lamented Dr. G. ENGELMANN, of St. Louis, Missouri.

THE SOCIETY OF APOTHECARIES,—A course of twelve lectures on Botany will be delivered by J. G. Baker, Esq., F.R.S., at the garden of the Society of Apothecaries, Chelsea, on successive

acrid-narcotic poisoning. The report (British Medical Fournal, April 29) from which we cite gives very slight evidence that the "four or five pieces of green leaf" found in the stomach were really those of Yew. They might have been those of Savine. The medical evidence in these cases is usually very defective from a botanical point of view.

—A NEW VINE DISEASE IN SOUTH AFRICA.

—A new and formidable Vine-plague is reported from the Cape. A correspondent, writing from Robertson to the Cape Times, says (according to the Colonies and India), "On a farm recently visited by him two hard-working young fellows had planted last year a piece of new vineyard with some 20,000 Vinestocks. The ground being well trenched, and the soil rich, the result of their labour proved most satis-

factory until very recently, when a strange beetle made its appearance in the vineyard. The insect attacked the Vines first below the soil, biting off the bark all round the Vine-stick, thus stopping the sap from rising upwards, and thereby destroying the Vine. In less than a week more than half the Vines died from the attacks of this pest. Dr. HAHN was immediately communicated with, and went at once to inspect the Vines. He declared the beetle to be an insect known in Italy, where it frequently attacks and destroys vineyards, as the Vine-leaf Eeetle."

--- HORTICULTURAL SOCIETIES, -- Before us there lies the programme of the proceedings of a certain important horticultural society in the South of England, the pretensions of which to occupy a high position in the midst of the many similar bodies so happily abundant in our land, is accentuated by its adding to its name the prefix of Royal. in its locality this body has, through the instrumentality of large and usually well-conducted shows done much to promote a taste for horticulture in its district there can be no doubt. 'Tis true that, owing to the usual practice of keeping the summer show in existence over Tuesday, that the last day (Bank Holiday) might be utilised as a great holiday fête, the society has perhaps from the first assumed a somewhat unprofessional character, and in that respect has had to compromise with many of its sturdiest bond fide horticultural patrons, who felt that pure horticultural work and holiday files scarcely assimilated. Now the society has taken a higher flight. It has at considerable cost secured a valuable piece of land as a habitation, not, alas ! as a horticultural garden, but as a fête ground, devoted not to the culture of plants and to the promotion of horticultural lastes, but rather to the pursuit of sports-lawn-tennis, bicycling, athletics, promenade concerts; in fact, out of a season's programme of some dozen or so of engagements, this Royal Horticultural Society devotes two only to horticultural work, and all the rest to mere entertainment. Perhaps under the new condition of things the designation "horticultural" may well be put aside, and replaced by "recreation and entertainalthough Royal patronage may well wince at the association. Horticulture is a noble and elevating pursuit, and it is difficult to associate it with such matters, innocent enough in themselves, without some lowering of tone. Happily in most cases, indeed in the great majority, horticultural societies are what they profess to be and not something else.

- FLORA OF THE PHILIPPINES AND ITS PROBABLE DERIVATION. - Under this title a communication was laid before the Linnean Society (May 1) by Mr. R. A. ROLFE, of Kew. As recently computed, the whole phænogamic vegetation consists of 3564 species, belonging to 1002 genera. Of 165 Dicotyledonous orders 119 are represented, and of Monocotyledons 25 out of 35; the Gymnosper-meæ are poor in numbers. The preportion of vascular Cryptogams to Fhenogams is nearly oneeighth, chiefly Ferns. Fifty-two species of Ferns are not known elsewhere-a significant fact. The endemic phænogamic plants consist of 917 species, or a proportion of over one quarter endemic; the Dicotyledons showing over one-third to be endemic, and the Monocotyledons a little over onetenth, chiefly Orchids. A striking feature is the large number of endemic species, and the relatively few endemic genera. The flora, in some respects, may be said to have a Malayan aspect, but is wanting in many typical genera, even such as flourish profusely in the neighbouring island of Borneo. There is an appreciable Austra-lian element mingled with the above; yet, taking all data into consideration, Mr. ROLFE arrives at the conclusion that the Philippines are truly insular in the essentials of their natural bistory - this not so much through there being an early separation of the Asiatic continent, which had a dip under the sea (submergence alone causing extinction of genera as Mr. A. WALLACE has inferred), but from their being largely volcanic and geologically speaking of recent origin-presumably what is believed to have been the case in certain other oceanic islands-the vegetation therefore modifying itself accordingly.

THE NATIONAL CHRYSANTHEMUM SO-CIETY.—The annual exhibition of this Society will take place at the Royal Aquarium, on Wednesday and Thursday, November 12 and 13 next, and the schedule of prizes which has just been issued shows that there has been a considerable augmentation of the prizes in many of the leading classes. the class for forty-eight varieties of cut blooms of Chrysanthemums, twenty-four to be incurved and twentyfour Japanese, and the stand to consist of not less than thirty-six varieties, the prizes are now £15, £7, and £4. It could be wished there was not such a very wide difference in the amounts of the 1st and 2d prizes, especially as during the past two or three years the two best competing stands in this class have come very near to each other. The suggestion thrown out last year, that a committee should be appointed to adjudicate on the merits of new Chrysanthemums at such seasons when they cannot be submitted to the Floral Committee of the Royal Horticultural Society, has been acted upon. It is also intended to issue an official catalogue of Chrysanthemums, after the fashion of the Catologue of the National Rose Society; and it is intended that this shall become a reliable guide for Chrysanthemum societies, exhibitors, and judges.

— PINUS COULTERI.—In a specimen of this tree at Kew the lower branches are unusually long and lithe, trailing and interlacing on the ground so as to resemble a number of snakes. In some cases the smaller branches are abruptly bent back towards the trunk, curving again towards the free end, somewhat like the letter S placed sideways.

POLLINATION OF EUCALYPTS .- On this interesting subject, which was discussed in these columns some time sinee, Baron VON MUELLER writes:—
"The pollen is sbed on the stigmas of Eucalypts before the operculum drops; but of course honeyseeking insects may occasionally carry additional pollen from other flowers and even other species, the fruit being polyspermous. Natural hybrids among Eucalypts are probably rare—at least I do not find transitory forms among the several gregarious species of any one locality, but artificial impregnation would not be difficult. Crossing of the large-flowered species, particularly those having red and yellow filaments, with each other, would doubtless produce new horticultural forms, some likely to surpass in beauty the natural ones."

- THEOPHRASTA JUSSLEI. - The flowers of this singular and unique plant are unfortunately, on account of their position, almost concealed from Unlike the allied Clavijas, which flower along the naked stems as well as amongst the leaves, the large deeply bell-shaped dusky white flowers are produced in dense racemes between two closely packed tiers of the upper leaves. From a horticultural point of view the plant is chiefly valuable as a stove evergreen, the large spiny serrate rigid leaves of which are persistent for several years. A large flowering specimen in the Palm-house at Kew is an object of great interest, seeing that it is the only species, and the authorities deserve a word of thanks for the means they have adopted of enabling the visitor to see the flowers which under ordinary circumstances he could not do. It is figured in the Botanical Magazine, t. 4239. The fine-leaved plant familiar to gardeners as Theophrasta imperialis is a species of Chrysophyllum; and other plants labelled Theophrasta in gardens are referable lo Clavija.

- ALPINJA NUTANS .- So highly modified are the flowers of the varied and usually showy order to which this plant belongs, and so developed by insect agency that many of the older botanists experienced no little difficulty in describing what the authorities of to-day recognise as staminodes or barren petaloid stamens, In this instance one is so modified as to form no mean imitation of the labellum of an Orchid. It is large and yellow, distantly flaked with scarlet on the upper half, while the lower is closely streaked or suffused with the same colour. The comparatively small pinkish petals are quite eclipsed by this labellum; but all these, together with the bracts subtending the inflorescence. constitute a suitable and highly ornamental plant for a large house, as the Palm-house at Kew, where it is now flowering.

— FERRARIA UNDULATA. — Amongst the numerous and beautiful representatives of the Iris family from South Alrica, now flowering in the Capehouse at Kew, the subject of this note possesses more than ordinary interest, from the distinct and unusual appearance both of the leaves and flowers. The former are arranged in two ranks and overlap each

other more or less by their inflated sheath-like lower half. The flowers resemble in form those of a Moræa—the lower part of the perianth forming a campanulate cup, while the upper balf is spread out horizontally, and of a purplish-brown colour with waxy, much crisped and green margins. It was originally introduced more than a century ago, and figured in the Estantical Magazine, t. 144; but like many other Cape bulbs, beautiful or interesting, it is apt to get neglected and lost.

YELLOWS .- Looking across a broad belt of deep rich yellow Wallflowers, there is seen beyond big mass of Alyssum saxatile compactum in full bloom; and, curiously enough, we see in these two undoubtedly yellow-flowered plants a contrast of a most striking yet pleasing kind. Somehow, in massing or mixing colours, we, to create strong contrasts, associate yellow with some other very distinctive hue, and vice versa, thus creating combinations that are seldom artistic and too often odious. But if we were to keep our masses of mixed plants to particular hues of colour, what charming combinations might be obtained, as seen in this present instance, where the truly lovely pale soft delicate yellow of the Alyssum seems to find a bold and effective contrast in the deep orange-yellow of the Wallflower. It would not be difficult to mix with these some three or four other distinctive intermediate yellow shades, these skilfully arranged would give a beautiful effect. Pity 'tis the Alyssum is such a common plant, for were it not it would be much more highly prized, and yet in the production during the month of May of a perfect mass of exquisitely beautiful yellow it is unrivalled. It is a curious fact that in the autumn we get our most striking contrasts in yellows in one annual plant, the African Marigold. With this the orange is of the deepest, and the sulphur or lemon hue of the palest, whilst in some good strains several other intermediate hues of yellow and golden are found. Grand, indeed, are the effects obtained from large clumps of these Marigolds in the autumn when planted amidst evergreens, or where they may be seen at remote distances. Pansies, again, give a great variety in yellows, making splendid spring and summer masses. As a rule, however, yellows show best in spring and in the duller months of autumu.

— PHOTOGRAPHS OF FLOWERS,—We are glad to learn that Mr. STEVENS' photographs of flowers, to which we have often had occasion to refer, have met with special recognition on the part of the Association Belge de Photographie.

- THE SCARLET MENICAN THISTLE. - It would be difficult to name, for cool conservatory decoration, a more striking, and at the same time a more uncommon looking and beautiful plant than the subject of this note. Introduced to British gardens about 1829, and at one time pretty largely grown, it had almost, until very recently, disappeared from cultivation. Perhaps this is owing to the fact, that it is not safe to trust the species to the not very tender mercies of an Eoglish winter in the open border, except during exceptional seasons, and under very favourable conditions. Grown in pots or small tubs, however, in a cool house, where it is safe both against severe frosts and excessive damp, few more splendid effects are attainable than those afforded by a few well grown specimens of this Thistle. The large radical leaves are not unlike those of some of our own hedgebank Thistles on a large scale, and the large flowerbeads, about 3 inches long, clustered at the extremity of somewhat slender purplish coloured branches, are especially conspicuous by reason of the bright scarlet involucral scales. In the cool compartment of the new range at Kew there are some nicely grown plants, now in flower. The name formerly applied to the scarlet Mexican Thistle was Erythrolaena conspicua, the name adopted in SWEET's Flower Garden and in the Botanical Magazine, t. 2909, in both of which works the plant is figured, but in neither is anything like justice done to its beauty. Mr. HEMSLEY, having had to study the species and its allies, has recently referred E. conspicua to the genus Cnicus. Cnicus conspicuus is therefore the proper name at present.

—— LILIES OF THE VALLEY, — Messrs, HAW-KINS & BENNETT, of Twickenbam, bave favoured us with a sample of their present season's growth of Lily of the Valley, accompanied by a bunch of flowers gathered from plants allowed to take care of themselves, and a more striking illustration of the advantages of good cultivation could not be obtained. The flowers and foliage are truly magnificent, and great quantities of the same quality are now being marketed at remunerative prices,

- THE HEALTH EXHIBITION .- "I wish you well" is the consummation of good wishes. It is one which the most selfish can reciprocate, and hence every one is bound to wish every success to the Exhibition opened on Thursday last by the Duke of CAMBRIDGE, acting on behalf of the Prince of WALES. Gardening and the provision of ample space for fresh air, are objects so intrinsically in unison with the objects this journal has from the first consistently advocated, that it will be our duty, from time to time, to call attention to those features of the Exhibition which come within our scope. Thanks to Messrs. PAUL & Son, of Cheshunt; Voung, of Milford; CARTER and SUTTONS, and others whom we shall have to mention later on, the importance of horticulture for purposes of food-supply and ornamentation is duly upheld. Messrs. Carter and Messrs. SUTTON show elaborate collections illustrative of the food products of the world. Messrs. SUTTON also show specimens of Ensilage from Lord WALSINGHAM'S farm.

MR. BULL'S ORCHID EXHIBITION opens on Tuesday next, and will be on view to visitors every Tuesday, Thursday, and Saturday during May, June, and July.

- LEIOPHYLLUM BUXIFOLIUM .- A very old favourite, sometimes called a Ledum. It is a dwarf shrub, with small ovate evergreen leaves and terminal clusters of small pink flowers. It is common in the sandy Pine barrens of New Jersey and the mountain tops of Virginia, and found in no intermediate

- THE ROSARIUM, ASHDOURNE.-The business carried on at this nursery during the last two years under the name of A. Godwin & Sons has passed into the hands of Mr. A. W. Godwin, who will trade as "GODWIN & SON."

THE WEATHER. -- General remarks on the temperature, rainfall, and duration of bright sunshine, agricultural and sanitary purposes, during the week ending May 5, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: logical Office, 116, Victoria Street, London, S.W.:
-The weather has been in a very unsettled, changeable condition generally, brief intervals of clear sky alternating with heavy showers of rain or hail. In many parts of England and Ireland thunderstorms have been experienced, that prevailing in the metropolis on Monday afternoon being of unusual severity. Temperature, although higher than of late, has again been below the mean, the deficit varying from 2° in the "Channel Islands" to 3° or 4° in most other districts, and to 5° in "Ireland, N." The maxima, which were recorded on different dates in various which were recorded on different dates in various parts of the kingdom, ranged from \$1° in "Scotland, N." to \$6° in "England, E.," "England, S.," and "England, N.W.," and to \$6° in "Ireland, S.," The minima, which were also registered on irregular dates were as low as 30° in "Scotland, N.E.," "Scotland, E.," and "Ireland, N.," 31° in "England, E.," "England, S.," and threshold of the state of "Ireland, S.," and the "Channel Islands," but nore elsewhere, the excess in "Scotland, N.," and "Ireland, N.," being rather large. Bright sunshine has been rather less prevalent than during last week, the percentages of possible duration varying from the percentages of possible duration varying from about 27 or 30 in most parts of the country to 30 in "Scotland, N.," and 45 in the "Chaonel Islands." observed.—During the whole of this period the barometer has been comparatively high and steady over France, while some large depressions to the steady over reasce, while some large depressions to the westward of Scotland—generally travelling eastwards or north-eastwards—and small subsidiary disturbances further southward, have caused the barometer over our islands and Scandinavia to oscillate considerably. Moderate to fresh winds between S. and W. or N.W. have been experienced generally, but on some parts of our western and northern coasts they have occasionally risen to the force of a gale.

GARDENING APPOINTMENTS. -LIAM GILLES, son of the late Mr. GILLES, Gardener at Northwood Park, Middlesex, has succeeded Mr. SHARPE as Gardener to the Hon. MARK ROLLE, Stevenstone, Torrington, Devonshire,

HONESTY.

In walking through an old - fashioned and long-established Kentish farm-house flower garden I lately saw clumps of Crowa Imperials, Hepaticas, Tulips, double Primroses, Omphalodes verna, Dielytra spectabilis, Lilium candidum, Saxifraga ligulata, and other subjects of such enormous size that they must have been there for years, and happily left undisturbed. But amidst them all the Honestys shone out in real vernal beauty. were to be seen three distinct types-the early flowering, deep crimson-purple, with its dark foliage, dwarfer growth, and bold heads of flower—a variety that is, perhaps, best known as the New Early Crimson; the ordinary pale lilac-purple, of taller growth and later in blooming; and the white. The former is unquestionably the best type for spring gardening, and in this particular garden it seeds itself, and the seedlings come up by the hundred in spring, forming huge patches where there is space for the plants to grow. The soil is a deep and slightly sandy moist loam of good depth, and in this the Honesty send down its fleshy root, getting a good grip of it, forming dense vigorous bushes, producing it spring flower heads of dense size. How is it that these most valuable spring plants are so seldom seen in gardens? Probably many plants are lost by transplanting them to the open ground from the seed-bed. It is a plant that will not bear transplanting well. When the seedlings reach a fair size, they form huge fleshy roots that reach down deeply, and these plants do not trans-plant well. If transplanting must be done, it should be before the roots are formed, and then the plants have a better chance of succeeding. Persons fond of these vernal Honestys should grow a few plants in a well-prepared bed, sowing the seeds thinly, and not think of disturbing the plants, but leave them to flower where they are sown; and it does not matter how hard the soil may become about the plants so long as it is deep and moist, and the roots can gain a good hold of it. The seed should be sown in spring, so as to give the plants a good start, and they will grow into large size by the following autumn, and flower grandly in the spring following. If seed be not sown until July and August no flowers can be expected till the following year, as the plants will not grow into sufficient size to do this; hence the advantage of early sowing. But if transplanting must be done let it be as early as possible, when the plants are small, but sufficiently rooted to lay hold quickly on the new soil.

ON THE SPREADING OF THE POTATO DISEASE.

(Co..cluded from p 589)

In every case where the disease shows itself late in the season there are comparatively few fields originally diseased, and as a rule the disease in them will commence from but very few starting points. It might, therefore, be expected that originally diseased fields in late years will not be so severely attacked at the end of July, as the same class of fields in early years, though the disease in both cases really starts at the same time, namely, as soon as the Potatos have appeared above-ground. Let us now see what the table in the Gardeners' Chronicle of March 1 tells us on this point. 1881 and 1883 were very late disease years. Forty-four reports announce disease as present, but not one of these belongs to the class "severely attacked;" yet it cannot be reasonably doubted that some few of these fields were "originally diseased" in the early years; on the other hand it will be seen that many of the fields were "severely attacked" at the end of July. If, bowever, I had given a report to the Gardeners' Chronicle on the disease in my experimental plot in the late disease year 1883, I should have reported diseased at the end of July, and even in the middle of July I should have said "severely attacked." This was because by planting diseased Potatos I had about 200 distinct starting points per acre. As to the influence upon the produce of the crop in this artificially early and severe attack, it may be stated that I only had a little more than I ton per acre. Had my plot been originally disease-free, there is not the least doubt that I should have grown 8 to 10 tons, or even more, per acre. It might further be added that in the row next to the starting points the produce was only a little more than half a ton, i.e., one fourth less than the seed used; in the rows furthest from these points the

produce was about 2 tons per acre. Of course the Potatos were small, watery, and of very little value.

Concerning the rapid march of the disease through-

out a greater part of Europe in the year 1845 : this was more apparent than real, for the disease was present in many parts of Europe long before 1845. Danish journals began by reporting its presence universally in Holland; then they said it was in Northern Germany, then in Holstein, and lastly in Denmark. The Gardeners' Chronicle followed the disease from the southern districts of England to the northernmost counties of Scotland. But this does not convey the idea of a genuine march of the disease from place to place, but really of a march from south to north, just such a march as annually takes place. Mr. Plowright's tables show that the disease commences its appearance in the south of Great Britain, a little later is visible in the midland counties, then in the northern counties, and then in Scotland. But this is no real march, it is only a formation from the south to the north of the hostile army starting from its winter quarters, the seed Potatos. What about England? I have not had the opportunity of studying the progress of the disease in that country before 1845. can cite one author having written on the subject. In a treatise entitled The Potato in Jersey, the author, C. P. Le Cornu, says :- "Although prevailing throughout England in the season of 1844, the disease was not observed in this country till the latter end of June in the following year."" Another evidence is to be found in Knight's Penny Magazine, Part II., 1846. In an article in this periodical the author (according to a Danish journal) says that he has evidence enough to convince himself that the Potato disease was present in England in the year

In Norway the disease was known at least as far back as 1841. The director of an Agricultural School, Mr. Westrem, says : - "The first time I heard of the Potato disease was in 1841, when it began its ravages in the parish of Vik." And again:—"In the year 1842 the disease appeared in Sogndal (where the author lived), and spread widely." There is not the least reason to doubt that what the author saw and described was the common epidemical Potato

In Denmark it was present at least as early as the ear 1842. In an article written in March, 1844, § Mr. Fjeldstrup, a very able and conscientious agricultural writer, gives more instances in more parts of Denmark. Amongst others, he publishes a letter from one of his friends, a farmer near Sveahorg, who writes :- " For about forty years I have grown Potatos in the field, but never until two years ago (i e., 1841 or 1842) have I noticed the disease described. In the first year he did not see the disease except in one variety of his Potatos. In 1843 it was found, in all kinds cultivated by him. Mr. Fjeldstrup said he knew the Potato disease from his own personal experience from 1842 and 1843. In 1843 the disease must have been pretty general in a part of Western Jutland, for M. Fjeldstrup relates that a local agricultural society held a meeting in Ilolstebro on February 6, 1844, to discuss the calamity."

In Germany the disease was very widely spread in 1840, though not present everywhere, and it had been noticed a few years before that time. Among the many German books and articles written upon the Potato disease before \$845, I only call attention to the treatise entitled Die Kartoffel Epidemie der Jetzten Jahren, von Dr. V. Martius: München, 1842. This treatise is of a classical interest in the history of the spread of the Potato disease. Dr. Martius here describes the Potato fungus, which he had studied

Yournal of the Royal Agricultural Society of England,

^{*} Fournal of the Royal Agricultural Society of England,

13 a 15%,
14 a Cooke's Ruit, Suud, Mideeu, and Mould, ad elistion, p. 145, the auther says :-" It is also exceedingly probable that, in a mider form, the murraio was present a year or two before it broke out to such an abstraing action. A correspondent in the Gardenoche testifies to its occurrence in districts in Item Gardenoche testifies to its occurrence in districts in Item Gardenoche testifies to its occurrence in districts in Item Gardenoche testifies to its occurrence in districts in Item Gardenoche testifies to its occurrence in districts in Item Gardenoche testifies to its occurrence in districts in Item Gardenoche Gardeno

microscopically, and gives a representation of it. The figures (t. iii., figs. 26 and 32), it is true, are not good, yet as to their identity with the true Peronospora infestans there can be no doubt. Whether Dr. Martius was indeed the first scientist who has given a description of the Potato fungus I cannot say, but I may add that Professor De Bary does not seem to have known Dr. Martius' book, when, in 1861, he wrote his treatise, Die gegenwärtig herschende Kartoffelkrankheit, for here De Bary says (p. 7) that the Potato fungus was described for the first time by Madame Libert in a periodical called Organe des Flandres. It is, however, certain that Dr. Martius had described this fungus three years previously, and this is conclusive proof that the Potato disease of our day was spread throughout many parts of Germany as ar back as 1841. Dr. Martius thought it could be traced back as far as 1830; whether he be correct or not in this supposition I have not had the opportunity of critically examining, but it cannot be reasonably doubted that it was present in many parts of Germany in the latter half of the thirties. In his own country - Bavaria-it had not, to the best of his knowledge, appeared east of the Rhine at the time (1842) he wrote his treatise on the Potato disease. It is very remarkable to see how well Dr. Martius at this early period had studied the disease. He concluded - I, that the fungus was the true cause, not the consequence of the disease; 2, that the disease was not likely to disappear again; 3, that when fresh Potato slices are infected with the fungus they become diseased; 4, that when whole Potatos are infected with the fungus they also often become diseased, but that it is a necessary condition that the Potatos should be wet. So long has this important fact been known, and yet it has been recently contested! In France, according to Dr. Martius, the disease was present in different parts as early as 1840; as a proof he cites the Echo du Monde Savant, 1840, No. 563, p. 474.

Alter having convinced myself of the comparative tardiness with which the disease spreads, I of course have taken a very different view of the value to be attached to the means of completely disinfecting the seed-tuhers which I have devised. I hope that one day legislation will make this simple and inexpensive disinfecting process obligatory; for if proper measures be taken to ensure an effective execution of the law there is every possibility that the disease may be stamped out altogether. I am quite sure that, at any rate, it can be reduced to a phenomenon of a sporadic character, to be found only here and there, now in one, now in another part of the country, as it was in England and in Denmark prior to 1845. Under such circumstances the disease will only become developed late in the year, and consequently it will cause but little injury to the crop; and further, the tubers can always he completely preserved from disease by high-moulding. The greatest obstacle to a complete stamping out of the disease is to be found in the fields which have grown Potatos in the preceding year. Some diseased Potatos may remain there, from which the disease may take its start. Yet with proper precautions this danger might be done away with, and from year to year this danger would decrease. In the northern and more eastern countries. like Denmark, Norway, and Sweden, the winter is mostly so severe that all Potatos left in the ground will be destroyed by the frost, and even in England I think this will be the case in most years. Then again it may be thought that the disease would introduce itself in the course of the summer from a neighbouring country. Certainly this cannot be denied, but in the first place the history of the disease plainly shows that it takes more than one year for it to spread in any country, and in Great Britain, by its insular situation, the "silver streak," will afford a most powerful protection against this eventuality.

Even if the disease could only be rendered sporadic by the means of compulsory disinfection of the seed Potatos one thing at least cannot, I think, be reasonably decied, viz., that the very last effect of disinfection would be to make the disease always very last this is, however, just before the general outbreak took place, and this is synonymous with a greatly augmented crop. I think that the assurance of such an economical result cannot be considered an unworthy object for legislation.

Nothing is more calculated to prove the effect of a general disinfection of the seed tubers than the fact that a very early general outbreak of the disease in one year is always followed by a late general attack

in the succeeding year. This late attack, accompanied by a large crop, is the consequence of the natural disinfection of the tubers in the preceding year; and thus it may be said that Nature herself has many times made the experiment on a large scale, and has proved the exceedingly great value of disinfection. The last time this great natural experlment was made throughout the whole of Northern and Western Europe was in the years 1852 and 1883. The natural disinfection, however, is of a more or less incomplete character, whereas the artificial disinfection can be made complete. Hence the effect of compulsory artificial disinfection will be many times greater than that of natural disinfection were iff or the reasons already indicated it prove insufficient absolutely to stamp out the disease.

Even without the assistance of legislation I am sure that great benefit may be derived from the disinfection of the seed tubers. A field planted with disinfected Potatos will not be originally diseased. In Ecgland it will not, therefore, generally speaking, be found in Mr. Plowright's Class III., "severely attacked "at the end of July; but at that period it will generally belong to the classes not attacked or only slightly attacked. In Scotland it will, generally speaking, keep this position for about a fortioiph longer than in Eugland. If, then, the disinfected seed tubers have been properly sprouted beforehand, and if they have been early planted, they will be from ten to fourteen days further advanced in their growth than they would otherwise have been; and this has just the same effect as if they had not been attacked by the disease till so many days later. I therefore think that by the means of disinfecting and sprouting the seed Potatos the farmer may always ensure himself a good crop, even in very early disease years. In such years it is not unusual for the tubers to cease to grow when they have only attained the weight of 2 or 3 tons per acte; if the seed Potatos had been disinfected and sprouted, the same field, I think, might have yielded perhaps Io to Iz tons or more to the acre, and the quality, of course, would be much better, because the tubers are considerably more mature.

tubers are considerably more mature.

In conclusion, I beg to remark that to kill the mycelium the tubers themselves must have acquired and maintained the temperature of at least 40° C. (104° F.) during four hours. The heating process takes seven or eight hours or more according to circumstances, 7. L. Yensen, 141, Rue Perronet, Mentilly-sur-Scine.

THE PROPAGATOR.

WHERE foliage plants are used for indoor decoration a great many of them get shabby while doing duty, and are not of much value again unless for the purpose of giving the means of raising young stock. The worst of it is that the cuttings taken from these unsightly plants which have been used indoors are very stubborn and not easily struck. The reason of this is that the performance of the functions of the plants has been interfered with by the unhealthy atmosphere in which they have been kept, and the first step should be to get them back into the regular course before the cuttings are taken. This is best accomplished by placing them (Dracænas, Crotons, Rhopalas, Grevilleas, Dieffenbachias, &c.), close together where they will not be too prominent in a warm moist house, there to remain for a fortnight or three weeks, at the end of which time the tops will be ready for the cutting-case, and in due time will furnish handsome young plants for next season. The old plants should be allowed to remain in the warm-house until they have furnished as many cuttings as are wanted, and then they should be thrown away at With new plants received it should always he the rule to look out for a cutting or two, to make sure of the stock, as soon as possible after receiving them. The young home-made plant will often beat its parent in a few months, and is always more safe than that which has been treated elsewhere. It is a popular error that nurserymen do not like gardeners to be very clever at raising young stock; nothing could be more fallacious than such a notion. On the contrary the nurserymen know that none are better buyers or give higher prices for plants than those who grow them well and get pleasure out of them, and that the owners of garden establishments where plants of the same species have to be bought in year after year, soon lose all interest in their gardens. So interested indeed are they in the success of the plants they sell, that our leading nurserymen are always ready to send their best men to advise where their client's plants are not doing satisfactorily. T. O.

The Henbageous Bonden.

DAFFODIL NOTES: DOUBLING,—One of the most interesting exhibits at the great Daffodil show (April 1) was that by Mr. Elwes of the double form of 1 N. moschatus, and which he considered to be wild. It had the exact form of moschatus, and was exceedingly pretty, of an even greenish-white. Mr. Elwes told me, as a singular fact, that it only came thus double when grown on very poor soil, amongst the roots of some old Laurels,

Mr. Dilwyon Lewellyn sent me from his grounds at Penllergare this week a similar flower, which he also believes to be wild. He writes, "I have plenty of the single form in the gardeo, and this double is in a poor spot outside, apparently rejected, and growing at the foot of an old Rhododendron. I have no other double moschatus anywhere in the garden, but of course this is no proof whatever that the plant was not already a double, or even that it may not have been planted there purposely many years ago, where it now grows," Mr. Lewellyn had previously sent me word that there were but three bulbs of it, and that it had not been noticed by him before its present occurrence.

The possession of this interesting flower has enabled me to examine it carefully. It is a true moschatus, but the filling up of the tube has shortened it a little, so that the perianth is about a quarter inch longer than the tube. It is an exact double, and no more; the six duplicates of the perianth segments which occur within the tube each project a quarter inch, exactly as in the outside corolla. The doubling of the inner tube is split up, and slightly convolute; the pistil and stamens are present, and the ovary is active.

Here, then, we have a most perfect example of doubling, with direct evidence of the presence of the wild form of single and double in close proximity. Our friend, Mr. Wolley Dod, has told us that most chatus is only an albino form of our native Pseudo-Narcissus, and that he has traced the connection of the two forms in the same meadow, which is prohable enough. He is further a believer in the doubling of the Daffodils by culture. Here, then, I submit are two examples which do not bear out his theory, but rather the reverse. I think these instances rather go to prove that the pollen from the cultivated garden form of moschatus had been carried to the wild original stock, and by the cross-seeding the plant has become a double.

I cannot see how it is likely that a bulb can be made to produce double flowers by culture. A bulb is a bud-it matures and produches a flower; it seeds, and its life is completed thereby. It splits up, and its bulblets in time become bulbs-but these will be like their parent bulb, and no otherwise. If it developes into a higher stage it will he by its seeds, and the progression will be thus: -1, Seed; 2, bulb; 3, flower from single to double. It would be difficult to believe, as in these two cases, that single forms of moschatus planted thus in poor soil amongst the roots of old Laurels in one case, and outside a garden amongst Rhododendron roots in the other, would progress from single to double by root growth only. I sent a copy of the Gardeners' Chronicle of April 5 to my correspondent in Wales, from whom I had obtained the interesting series of the single and double Lent Lilies which formed the subject of my essay in your columns, and of my remarks at the Linnean Society. He wrote me in reply, referring to Mr. Wolley Dod's note which appeared at the same time, as follows:—"I see a chapter by Mr. Wolley Dod about the single Daffies becoming double. They must have been starved in poor soil before planted there, and were gone single through poverty, and when in fresh soil went to their original. Seedlings may come double, and the parent plant remain the same, I say." I think my Welshman is right, and there is a most interesting subject in this quotation from his racy letter. It is certainly the case that doubles do go back to singles, and why may not such a single again become a double, as formerly? I have observed that the double forms of N. incomparabilis, which are so largely imported as fine large ripe bulbs from Holland, and which produce the very full doubles known as Butter and Eggs, Codlins and Cream, and Eggs and Bacon, grow less and less double year by year in my garden.

This was shown in a most remarkable way at the Daffodil Show, where Mr. Walker and Mr. Ware each exhibited as a great novelty, and with the astounding title of N. incomparabilis albus rubro aurantiacus, what was neither more nor less than an old friend—Eggs and Bacon—turned single. It was a lovely form of the Peerless Daffodil, having a crown of a richer orange and scarlet than any Mr. Leeds ever succeeded in raising, and which had evidently been produced by the old Dutchmen of a forgotten generation when singles were at a discount, and the original form of which had been forgotten, whilst the saleable doubles from off it had been propagated by millions. Very likely Mr. Walker had forced the bulbs for Covent Garden market until they had been impoverished, and when planted out in the reserved garden produced only singles. Here then will be an opportuoity of testing the point, whether they still retain in the bulbs the ability to grow doubles after a rest of proper cultivation.

Another interesting point raised at the Daffodil Conference, was the true form of N. Telamonius—the parent of our common double garden Daffodil.

Mr. Llewellyn exhibited a large group of wild Daffodils from his estate at Penllergare, near Swansea, and here were found the types which were accepted by Mr. Baker and the Daffodil naming committee, as the single and double forms of N. Tellamonius.

The next question was the true form of N. princeps, and when these two are placed side by side it is at once evident that they are brothers, the only difference heing the longer tube, and larger size of princeps. I believe the latter is the Irish form of N. Telamonius, the kinder climate and more favourable conditions, continued over a long period, having produced the larger plant. Last week were sent to me a bunch of wild Daffodils from the coast of Cumberland, and from this favourable climate there were both the single Telamonius and princeps from the same locality. The double Daffodil, which occurs wild in some parts of Ireland, is the double princeps, but there is also a good deal of the double Telamonius—probably imported from Holland for gardens. The double form of N. naous also occurs, and was sent to me last week from Cork. It has little value beyond being an interesting variety. The double Jonquils which abound in Ireland in many varieties are exceedingly pretty, and should be sought after. For bouquet purposes their lovely small flowers are most useful. Wm. Brockburst, Dickburst, Dickburst, Dickburst, Dickburst, Dickburst.

PYRENEAN DAFFODILS .- The Pyrenees in spring offer fine hunting grounds to those interested in the natural history of the varieties of N. Pseudo-Narcissus. I lately complained that modern writers seem to have followed Parkinson in referring all Daffodils of which the bistory is obscure to Spaio, and that I had in vain looked for original authority as to their habitat. It is consoling, however, to think that Mr. George Maw is now searching the Pyrenees, and we hope to learn much about Pyrenean Daffodils when he returns. Through the kindness of friends who have visited the Pyrenees, I have this spring received some interesting Daffodil flowers, and gleaned some information about them. With regard to the N. Pseudo-Narcissus pallidus præcox, as Mr. Barr has named it, after Parkinson, I have already said that it abounds in several parts of the Department of the Basses Pyrenees in many shades of colour and different forms of flower, and as several of us have secured a large number of bulbs we shall be able to submit these forms to some future Daffodil Conference.

As we get higher above the sea level, the prevailing Trumpet Daffodil is one named by French botaoists N. muticus, but generally known in England as N. abscissus, being identified with Farkinson's "Daffodil with the clipt truck." The aebompanying woodcut (fig. 120) gives its shape, the dimensions of all the parts being exact to Nature. The crown is yellow, and the perianth pale straw colour. It is one of the latest of the Daffodils, as bulbs from the Pyrences are only now opening their flowers in my garden at Edge. The leaves are broad and thick, as in the bicolor section, to which it belongs. The segments of the perianth are not imbricated, the distinction between interior and exterior segments being hardly perceptible; the tube is longer than in most of the bicolors, and the pedicel

About a week ago I received through the kindness of a gentleman in Norfolk three Daffodil flowers from bulbs growing in his garden, which were collected by him last year in the Pyrenees, whilst flowering in the month of May. The first is abscissus, already described, and is the specimen from which the accompanying figure is taken. Of this he says, "N. abscissus grows everywhere, covering the ground, and quite colouring the mountain pastures in the neighbourhood of Gavarnie." The second flower I have called "bioloto," believing it to answer in all important particulars to the bicolor of gardens, except in size, which may probably be increased by cultivation, and the colour of the perianth, which is the same as in

FIG. 120,-NARCISSUS ABSCISSUS.

abscissus; but the wild bicolor, as represented in Curtis's Bot. Mag, has not a white perianth. The tube of this flower, which is here figured (fig. 121), is remarkably short, and the perianth segments very broad, and so much imbricated that by closing them down to the crown the base of the interior segments is almost hidden. My informant is not sure in what spot this flower was found, as he did not distinguish it from abscissus, but he says, "I suppose growing with abscissus. When I saw a plant which seemed to differ at all from others I generally dug it up." The third and most interesting of the three flowers is that

FIG. 121.- NARCISSUS BICOLOR (WILD).

of the genuine wild N. cernuus—these, white in colour, having rather narrow incurved perianth segments about three-fourths as long as the nodding crown; the flower came too much withered to sketch. The letter says, "The cernuus was found by my brother-io-law while chamois hunting on the Spanish side of the Pyrenees, bigh up on a mountain ledge; there was a considerable quantity of it just at the one spot." All these, as I said, were in flower in May. A very interesting Pyrenean Daffoldil has been sent to me with the bulb and leaves, but the flower nearly withered, by Mr. Frederick Townsend. In colour, shape, and size of flower, and in the massive breadth of the blunt leaves, it comes

nearest to the "lorifolius" of gardens, but the size may have increased in cultivation. Mr. Townsend says, "I gathered it from the top of a high mountain in the neighbourhood of Eagnères de Bigorre, Pyrenees. I believe it has been named N. muticus on French authority." (It is very distinct from the muticus of which I have spoken as synonymous with abscissus.) Mr. Townsend also sends "N. minor, from bushy ground on the hills above Grasse, Alpes martimes."

The flowers of this are past; it might from its leaves and general appearance be the N. nanus of gardens, but to know this I must wait till next spring. C. Wolley Dod, Llandudno.

Home Correspondence.

The South Kensington Shows. —As these Fruit and Vegetable Exhibitions will soon begin, and most probably will attract a large number of gardeners and others from various parts of the kingdom, I would like to suggest that the Council of the Royal Horticultural Society should not only make such arrangements with the Council of the National Health Exhibition as shall ensure that the Royal Horticultural Society exhibitors should get free access to the place of the show without suspicion or hindrance, but also that the former Council should freely advertise the particular place of access to their exhibitions, and the most convenient way to reach such access per rail or otherwise. If one special place of access for exhibitors not used by the National Health people could be had, it would be a great convenience. Last year, for instance, it was not unfrequently the case that exhibitors had to run the ganutlet of two or three Argus-eyed door-keepers and policemen, who seemed to regard us as undoubtedly suspicious characters, whilst if any one wished to remove or take out with him any box, basket, or other package, after he had staged his exhibits, the greatest difficulties were placed in his way, indeed the freedom ordinarily enjoyed in these matters was entirely wanting. If a place of access on show days, or indeed on all meeting days during the period of the National Health Exhibition, were placed in the charge of the employés of the Royal Horticultural Society, great convenience might result. Under any circumstances the more equitable and convenient these arrangements can be made, and the more widely published, the better will it be for exhibitors. An Old One.

Cottagers' Shows.—Allow me to express my great satisfaction with the remarks at p. 518 in your issue for April 19, on cottagers' shows, and the unsidom of some of the regulations attending them. The subject is pregnant of results. Many years ago, when I was first charged with the management of a horticultural society. I gave time and study to a careful investigation of the regulations for the organisation and direction of such bodies, and the exhibitions they were desired to promote; and I soon had reason to know that the harmony of the members and the successful development of competitive effort was in an inverse ratio to the character and extent of repressive and distrustful regulations. I came upon societies with regulations which, with their visiting committees, their formal declarations, and their many and minute restrictions, plainly declared their purpose to regard every man as a rogue, unless he could demonstrate his innocence; and what was the result? I found such societies given over to cabals, coteries, and cliques; united only in their purpose to evade regulations they instinctively felt to be degrading and unjust, though they might not be openly defied—but that achieved all unity ended. The leaven of distrust effectually leavened the mass, and every man sought the personal advantage which distrust of his neighbour and a sense of his neighbour's distrust inevitably sets up. Actions perfectly innocent viewed through such a distorting medium became ominous indeed of aspect, and as one passed from A. to B., C. to D., and so oo, innuendoes, suggestive questions, and more suggestive gestures, came thick as leaves in Vallombrosa. And what else could be looked for? Men subjected to arbitrary and unjust restriction seek naturally the defence of slaves. They lie to your face and plot to your deriment behind your back. At that time I was young in the management of an extensive mercantile and manufacturing house of business, with a large number of "hands" daily under my notice. Many of these were as fond of th

benevolent, but who fail to recognise the inevitable evils begotten of distrust. Such gentlemen would regard as an inexpiable injury any question of their own honour, but they seem to have no perception that that which is the most binding obligation upon them—an appeal to their honour—might be found of equal avail amongst those socially of a lower status. Then, from the point of utility, such regulations have always failed, and always will. They affect a supervision which is not, and cannot, be made effective; and thus, as you well say, they "lead to the very evil it is desired to keep in check." Regulations founded in distrust promote no honour; and I believe where such regulations prevail societies and their shows are a bane, not a blessing, to a community. We cannot gather Grapes from Thorns or Figs from Thistles. E. S. Dedwell, Oxford.

Trug Baskets.—I was glad to see attention called to these most useful implements, which really ought to be in every garden, as they are suitable for so many purposes, such as for carrying away from quarters to the barrows any weeds, stones, rakings, or other gatherings to be wheeled to the rubbish beap, or for disposal clsewhere. They are eminently fitted for this work, as they are not only strong and exceedingly durable, but their shape renders them well adapted for the purpose, as by giving the —caded trug a tip the contents slip out easily, and are at once discharged into any other receptacle. For planting Fotatos, Broccoli, Cabbage, &c., or rather carrying them for that end, and collecting dirty vegetables, such as Tunips, or other roots, nothing can be better; and as they may be had in all sizes no one need be without a trug that will suit them. Some places, however, they are difficult to get, and it would be well if all nurserymen and ironmongers kept them, as then gardens could be supplied without owners or those in charge being put to much trouble. 7, S.

Narcissus biflorus with More than Two Flowers, "Referring to the communications in the Gardeners' Chronicle of May 3 last, (p. \$8a). I beg to observe that irregularities in the number of flowers of the two-flowered Narcissus seem to occur very frequently. Among the various lots of this plant grown in my nursery there is one especially vigorous, in which this season were found perhaps a dozen or more plants with more than two flowers; some of them had as many as six and eight flowers, for the greater part placed individually on a broad flat stem, in some instances a couple of them with a syncarpons ovary. They look like a Narcissus Tazetta, with very large flowers, and seem to be a proof of the alleged origin of the hybrid. The greater part of the individual flowers is regular, but some flowers have a tendency to become double, viz., with eight or nine perianth divisions. They will do then, J. H. Krelage, Haartem, May 3.

A Remarkable Monstrous Fuchsia Blossom was sent to me a few days since by my friend, Mr. II. Bewley, which I enclose for your inspection. At first sight it appears as though the sepals had become partially leafy. The fact is that the corolla and calyx are normal or nearly so, but four bracts have been developed outside the calyx; the lower portion of each exactly simulates a sepal, while the upper extremity is green and leaflike, with well marked veins, and a serrate edge. Of the stamens four are perfect, two are slightly petaloid, many filaments only a staminode, and the eighth (without dissection), appears absent. There was only a single blossom; but if it could be perpetuated it would be a very pretty and striking variety. Greenvood Pim, M.A, F.L.S.

Peziza Disease of Potatos. — It may be of interest, as confirmatory of Mr. A. S. Wilson's observations, to note that the so-called Sclerotium varium, which last season was destructively abundant in Potato stacks, is now producing with me a complete fructification as Peziza postuma. The Sclerotia were placed in moist sphagnum in a warm house. The Peziza is more slender than that figured in the Gardiners' Chronicle for September 15, 183, but still thore can be but little doubt of their identity. P. selerotiorum (Sich.) I have not seen. Greenwood Pim, M.A., F.L.S.

Double Stocks. — In your issue of March 8 a writer on double Stocks describes the various ideas of amateurs as to the manner in which double Stock seed is obtained. Some eight years ago I received a mixed packet of seeds from Messrs. Henderson, St. John's Wood, and amongst the produce was a remarkably fine double white and some single whites of the same strain, which I wished to keep. I gave particular attention to some half-dozen plants of the single variety, keeping them well supplied with water, and encouraging luxuriant growth. As soon

as the flowers began to set I cut off all the sidebranches, leaving the centre spike only, and cut off a few inches of the top of this spike, leaving only ten or twelve seed-pods to ripen. This plan has always answered well, giving me about eighty or ninety per cent, of double flowers. Charles Ayres, Cape Town, South Africa.

Early-Flowering Shrubs .- The mildness of the Early-Flowering Shrubs,—The mildness of the season and the absence of cutting winds has been much in favour of early-flowering shrubs, which this season have been, and are many of them still, very heautiful, while others now opening promise to be equally good. Among the best, few, if any, surpass the different varieties of Ribes, the long, graceful racemes of which render them very striking objects in shrubbery borders or on lawns, where their exceedingly bright and showy colours make them look all aglow. Being so exceedingly bright and floriferous in either a lawc or small state, the wonder is that ingly bright and showy colours make them look all aglow. Being so exceedingly bright and floriferous in either a large or small state, the wonder is that they are not largely grown as pot plants and forwarded under glass, or allowed to come on naturally to supply the market for those who have to live in towns, as neat little specimens would form splendid window ornaments, that would quite brighten and light up a room. For greenhouse or conservatory decoration, too, nothing can be more acceptable, and the cootrast between such as R. sanguineum and Deutzia graculis would be both plessing and charming. Deutzia gracilis would be both pleasing and charming, as they associate well. Another fine plant for pot culture is Berberis Darwinii, and B. stenophyllavis also equally valuable. The richness and warmth of colour of the first-named is quite unique, and B. stenophyllavis manuranesed in the grosefulpers of its babit colour of the first-named is quite unique, and B. stenophylla is unsurpassed in the gracefuloess of its habit, as the shoots arch over and droop in the most easy manner possible. They are seen to the greatest advantage when the plants are growing on rockwork or high on a bank, where the masses of flower show off in a state of perfection. Many find great difficulty in transplanting these Berheris, but if moved just before growth commences, and the operation is conducted carefully, they may be litted with safety, but they should have a mulching, and be kept watered for a time after, till they get a fresh start. Cydonia japonica is also deserving the highest encomiums, as it is one of the earliest and most brilliant of shrubs, and if only tender would be considered quite choice in a stove, as no doubt would also the others mentioned above. The best situation for the Cydonia is against any light bricked house or wall, where, by having wires, it may be trained and supported and made to look well. Plants of it are likewise adapted for rockwork, where they make fine companions to the Bertell extended the safe of the late of look well. Plants of it are likewise adapted for rock-work, where they make fine companions to the Berberis stenophylla, and show off in bold contrast. Kerria japonica is rarely seen now, and yet it is one of the gayest of subjects, the long slender shoots being for a long time studded with bright golden blooms, which are perfectly double, and form quite large, loose-looking balls. The position where this Kerria does best is near or among other shruhs that are low-growing, as then it can get support for its weak stems and branches, and peep out from the tops. We have one growing in this way that has mixed itself up with a Rhododendron, and a remarkably fine looking object it makes. The Magthat has mixed itself up with a Khododendron, and a remarkably fine looking object it makes. The Magnolias again, such as conspicua and purpurea, should be in every garden, where if planted in warm sheltered spots they would be found specially valuable for cutting, especially the first-named, which is a beautiful pure white variety, having a most delicious perfume. M. purpurea is about the same size in its blosoms, which are not sweet scented, but stained on the outer part of the petals with a purplish hue. Planted on a south wall or other sunny situation, both kinds are in flower during March and April, and make a fine show. Weigelas amabilis and Van Houttei are charming shrubs, and both form splendid pot plants that show. Weigelas amabilis and Van Houttei are charming shrubs, and both form splendid pot plants that are of great value for forcing, as with very little heat they may be had in bloom during the early spriog mouths, when they make a magnificent show. For planting at the backs of flower boders in front of evergreen shrubs, there are few deciduous things equal to these Weigelas, which blossom so heavily as to quite weigh the shoots down. The double Gorse must not be forgotten, as no finer object can be seen than a bush of this now with the suo on it, which renders its blossoms clear, and makes the bright yellow look richer than ever. The way to get plants of this Whin is to buy them in pots, as it is next to impossible to transplant them without, the roots being of a long straggling nature devoid of all fibre, so that impossible to transplant them without, the roots being of a long straggling nature devoid of all fibre, so that when moved it is seldom they live. Pyrus malus floribunda will soon be in perfection, and a lovely object a standard or bush of it makes planted out on a lawn, where its drooping branches, laden, as they always are at this season, with their Cherry-like rose-tinted flowers, are sure to command admiration. J. S.

What is an Amateur?—In your last impression you refer to this vexed question, and while agreeing with your remarks on the subject, I was a little surprised that you did not refer to the verdict of the National Rose Society, which, to my humble judgment, effectually cut the Gordian knot, and laid to rest this disagreeable ghost.

The decision of the above-named society, as many of your readers will remember, was that any person who printed or published a list of plants and circulated such list, or advertised it in any way, with the view of disposing of such plants, was de facto a dealer or trader in them, and could not be regarded as an amateur. K.

Primula japonica.—I send you trusses of Primula japonica, in which you will see a very great difference, though the plants which produced them have been grown in pots under exactly the same conditions. Of about a score of plants I have only two that produce the finest flowers, all the others being much smaller and paler. There is not the least appreciable difference in the look of the plants. Would you kindly say which is the true form? [The large one. Ed.] I have a bed containing a large number of plants raised from seed last summer in the same batch as those which produced the blooms sent. These I shall watch with a great amount of interest, and I hope many of them will be of the finest form. John C. Tullack, Prileaux Place, Padstow, Cornwall, May 1.

Clianthus puniceus,—How seldom it is we now see this good old plant'; and yet it is, when well grown, one of the finest things it is possible to have for the pillar or rafter of any conservatory or greenhouse, as in either of those positions it may be trained or tied up loosely, and the lateral branches allowed to hang or droop down in their own natural way under the weight of their load. When thus viewed this Clianthus is a very striking object, as at almost every joint long racemes or clusters of its large a grand show. Cultivated in pots it is at best but a starveling, and is generally more or less affected with red-spider, to which it is very subject; but when planted out it seems to bid defiance to this pernicious insect, and bears handsome foliage, free from the rust so common when the above-mentioned parasite is on it. The soil Clianthus puniceus does best in is a good fresh fibry loam, which, for making the border, should be chopped up somewhat rough, and made tolerably firm over free drainage, when the plant may be turned out, and have its main roots liberated and laid in carefully, after which they should be covered and the soil watered to settle it properly and give the plant a fair start. By planting out at once a whole season's growth may be obtained, and after the flowering that is the time to prune or thin out, as the shortened branches soon break again and make a great number of shoots, all of which will bloom the following year, if matured by proper exposure, 7.5.

Old Potatos Becoming Black, — At pp. 489 and 586 reference is made to Champion Potatos being black. "J. 11, B.," alleges as the cause that the Potatos have been bruised in some way. Certainly a bruise will cause a Potato to get discoloured, just as is the case with an Apple or Pear. But there is a more mysterious cause than this, which has never yet been explained. The soil has something to do with this. Victoria Potatos grown on light sandy soil, if kept on till late in spring, get black when boiled. The only theory I can advance is that there is either an excess or a deficiency in the soil of one or more of the chemical constituents required by the Potato, hence the tubers share the same fate; or, it may be, that when pitted in quantity and stored for a time, the heat generated alters some of the chemical ingredients, and when boiled the black colour is seen. Victorias grown on red clay soil are perfectly white when boiled. I have never heard of the Champions going black before; they are largely grown here (Aberdeenshire), and there has been no complaint of this as yet. Can any of your correspondents give the analysis of a good table Potato? What is the difference of the analysis of a Magnum Bonum and Champion? Would the analysis show the one to be waxy in texture, the other free and meal?? A.

Cutting Pots and Pans,—many iosses result from these not being properly prepared and filled with suitable materials, and although the temperature of the propagating pit or house, together with the proper amount of moisture in the air and in the medium surrounding the cutting has more influence on the well-being or otherwise of the cutting than the soil or sand, still, if the filling is not judiciously done, success is by no means assured. Freference should be given to pass of 7 inches in inner diameter, by 3 inches deep, these being better than pots, which are usually so deep for small things that a considerable portion of earth or other material of an absorbent nature must be added, to the great danger of the cuttings rotting from excess of moisture in close proximity. For cuttings of hand-wood plants, or for any that do not strike very quickly, instead of the usual layer of broken bricks or potsherds, it is found to be a good practice to place a small post over the hole at the bottom, inverted, and so large that its base may be on the level with the rim of the pan. By this means the

placed is more equalised, danger from decay is much reduced, and if the hole is left open in the little pot the heat of the planging bed is permitted to escape into the house, thus adding to its warmth. Some kinds of plants are hastened in the formation of roots if the pot, instead of being inverted in the cuttingpan, stands on its base with the hole stopped, and be kept filled with clean water. When this pot has been put into its place, some broken bricks or crocks in a clean condition should be placed around it to the depth of from 1½—2 inches, and a covering of fresh moss over that. The pan is now ready to receive the kind of soil that is suitable to the plant to be propagated. It will be found in general practice that peat purely or peat and loam in varying proportions, and sometimes pure sand, are the best to use. Care should always be taken to add a little sharp sand to the soil used, and to use no manures, unless in the case of gross feeding plants, that may be required to stay in the cutting pans for some months, and even then such manure is better placed at the top of the moss, and therefore as distant as practicable from the cuttings. In the case of Ericas, Azaleas, Kalmias, so-called American plants, the sidings of peat, of about the size of a Hazel-nut, are better filling materials than finer soil, as in the operation of dividing and potting off the cuttings it will be found that these, if rooted into the peat, have each got its own little ball of earth, preserving the very fragile, delucate roots from injury. When the operation of filling is done the pots must to water them heavily after insertion, by so doing causing the soil to press so tightly around the cutting that rooting is rather hindered than forwarded thereby. Cattings requiring bell-glasses should have these just large enough to cover them, as it is found in practice that the smaller the amount of space enclosed the quicker the cuttings form roots, and as a rule they root much better in company with others than alone. It may sometimes ha

Littering Down Strawberries.—In most cases this work is left till much too late in the season, as by deferring it, not only do weeds grow, but the soil becomes dry, thus preventing the formation of fresh surface roots, which all Strawberries make at this season when they are growing under favourable conditions, and these roots are of the greatest importance to the plants, as they assist very materially in sending up the flower-spikes, and carrying a fine crop of fruit. These are only a portion of the advantages of strawing down early, as by doing it now, while there is little foliage on the plants, the litter may easily and close around the crowns, whereas, when left later, there is always a risk of knocking the blossoms or fruit about, and the operation must of necessity be much longer in hand. The straw we use is what has done other service, such as covering up beds of Seakele for the purpose of blanching the heads, or has been employed in the ice house, or for protecting frames, as after it has been moved about for either of those purposes the weed seeds are shaken out, and it becomes short through the gradual breaking up, in which shape it is just the thing for laying amongst Strawberries. If I had not a supply of this to fall back on I should not hesitate to substitute long stable manure, as this put on now would be washed sweet and clean long before any fruit would be ripe, at which time there aced not be the slightest fear of a taint. Where slugs are troublesome, which they are in most places, there is nothing equal for littering down Strawberries to bracken, that is, after it has been in other use, and is short, as then the ends and all split parts are very pointed or sharp, and no slug can travel on such a bed without cutting its throat, or becoming disembowelled, besides which the Fern, being loose and hollow, dries quickly, and the fruit lying on it is not so subject to rot. The market growers round about here use tan, and on light lands it seems to answer the purpose well and forms a good mulching,

Propagating Euphorbias, Ficus, &c. — Apropos of the note at p. 518, I would like to add my experience, which differs somewhat from the mode of propagation there described, at least in regard to the Euphorbia. Probably no two genera among stove plants exhibit more quickly the suffering they are undergoing after being severed from the

parent plant than do Euphorbia and Poinsettia; and on this account I always prefer a dull, close day or the shade of the evening for taking the cuttings, prior to which everything should be in readiness for their reception, so as to get them into the cutting-box as quickly as possible. In the note to which I refer at p. 518 it is stated that "It has been found by long ctice that the rooting process takes effect sooner, and with better results, if the viscous juices are allowed to ooze out." Having seen so many shrivel and droop to such an extent as never to regain the perpendicular I had thought the reverse, and had perpendicular I had thought the reverse, and had endeavoured to invent means to prevent the almost incessant bleeding to which these plants are prone. Having during the past three months rooted upwards of 300 Euphorbia fulgens without the loss of a dozeo in the whole, I think it may fairly be stated as no ordinary occurrence, and certainly worth imitating. I prefer cuttings (good stout ones) from 2 to 3 inches long, and as substantial as possible, which I immediately dip into some day for silversand; this simple process, owing to the as possible, which I immediately dip into some dry fine silver-sand; this simple process, owing to the gummy nature of the juice oozing from the cutting, forms, so to speak, a momentary plug, which pre-sently falls off on the cuttings being handled again, bleeding rarely ensuing; the cuttings always remain plump, and root freely in from fourteen to twenty-one days; they are then potted and kept close for a few days. When they have attained a height of from ro to 12 ioches, and the lower part of the stem has to 12 inches, and the lower part of the stem has become somewhat firm, I head them back to within become somewhat firm, I head them back to within 3 inches of the pot top. My earliest batches of these thus treated are now pushing forth eight or ten breaks each. This plan of stopping is, of course, only necessary where a quantity of bloom is required, and where an extended raceme would be less valuable. While speaking of Euphorbias I may mention that the several hardy species are equally fastidious in the cutting state. Some ten or twelve years since I pat in a batch of E. myrsinites; these remained in the handlights or upwards of ten months, growing slowly, but without forming any root, and being somewhat disgusted with them I threw them away and inserted another batch, which rooted, and were potted off in three weeks or thereabouts; the first batch were out to a joint, the latter torn off with a heel, the knife never touching them, and io this latter way all the herbaceous and alpine species and varieties may be propagated, though, of course, the majority come freely enough from seed. E. amygdaloides, fol. var., however, must be propagated. amygdaloides, fol. var., however, must be propagated by cuttings. With regard to the Ficus, where they are rooted from eyes, I find the following method to answer well: the most important matter in connecanswer weil; the most important matter in connection with the rooting process, or rather the growing process, is to get good plump eyes, such as are ready to start before being removed from the stock plant, and to ensure these the top shoot should be removed at least fourteen days before the eyes; this will cause the letter to become removed. the latter to become prominent in the axils of the leaves, and as soon as rooted will start into active growth if placed in a brisk bottom-heat of from 75° to 85°. Unless this method be adopted it will be found that many of the batch will remain for weeks tound that many of the batch will remain for weeks and even months after the pots are filled with roots before showing any signs of growing; and, indeed, when this takes place the growth is invariably weak in consequence of the somewhat unnatural and compulsory means by which it has been brought about.

Bougainvilleas,—The writer of the note on these in last week's number has omitted to state which variety he is treating of, which, in the interest of amateurs or young gardeners, is to be regretted, as they might be misled, and made to think that the remarks referred to B. speciosa instead of B. glabra, as I should suppose, for if the first-named were managed in the way stated, there would most certainly be but few if any flowers, as the shoots that would have borne them would be cut away at the pruning. Not only is this so, but it is more than likely that the plants might be lost if subjected to a lower temperature than that of a stove, for though E. speciosa may, under skilful hands, be safely wintered in an intermediate house, it must be thoroughly at rest before being placed there, and after that kept quite dry at the roots. Where I have always seen this superb variety do best is in places where it can have great beat above and below, with plenty of sun and light to check over-redundancy of growth and to harden and mature the young wood. At Swincombe, where it first flowered and caused such a stir, the plant was growing under these conditions, and I sometimes see one at Orwell Park similarly situated, on which the inflorescence is something astonishing, as yearly every shoot is laden with the most lovely coloured bracts, and hardly a green leaf visible amongst them. To flower B. speciosa in the style mentioned, it must not only be favoured in the way referred to, but the pruning must be done early, that is, as soon as the bruning fade, in order that the fresh growth may have a long season to solidify, as it is on that the blossoms come. B, glabra requives different treatment altogether, and though enjoying

the temperature of a stove, it will do well in a much lower heat, and may even be wintered in a greenhouse or shed along with Fuchsias and other things of that class. Instead of flowering on the wood made during the previous year, B. glabra blooms on the young shoots as they form, and therefore the pruning, thinning out, and all that is necessary in that way should be done before the plants start, and any excessively strong growths that show pulled or cut away after. As to restriction, all depends on the space the plants have to cover, or the size they are required in pots, but neither kind needs a great amount of root-room; and B. speciosa cannot well be too much pinched, as the smaller the wood, as a rule, the more abundant the flower, and it is an easy matter to feed with liquid manure should the plants be in want of such help. 7. S.

∯loqists' ∯lowers.

THE NEW DAHLIAS OF 1883 .- The month of May is that in which Dablia orders are given and executed, and it is well to ask, "What of the new varieties distributed last year?" The season was generally so favourable, the plants made such a clean and healthy growth, and produced flowers generally so good in quality, that they were seen to the best advantage. They were not quite so numerous in point of number as is generally the case; but they were generally acquisitions. Those forming Turner's batch were Buttercup (Fellowes), a yellow self, sometimes slightly tinged with red on the edges, rather flat, but a good and useful show Dahlia, with a fine high centre, and a capital habit of growth; Bessie (Turner), a very fine lilac self, of full size, very constant, perfect high centre, the outline not quite complete enough to make the flower faultless; it wants the fine outline of Criterion, only that the latter is so difficult to get in the best form; Bessie is, however, a variety very easy to get. Cecilia (Fellowes), a bright yellow self, when shaded quite a pale yellow, good petal and outline—a useful show flower with a good habit of growth; Consul (Fellowes), a pale orange suffused with yellow-a variety that was not seen to the best advantage in 1883, probably in illustration of a fact well known to cultivators for exhibition purposes, that certain Dahlias have their scasons of perfect and of indifferent development. Consul is quite distinct in colour, but nearly every flower "confused," as the growers term it. Emperor (Fellowes) is a large and imposing crimsonmaroon self, fine in colour, the petals a little irregular, but can be had very good; it was very fine in 1882, but out of condition last year; good habit, and when well developed most useful for show purposes; Lillie Ward (Burbury), a pretty white flower with a tinge of rose near the centre, good outline, centre a little low, fine petal, constant; habit of growth a little straggling. Ronald (Fellowes), a pleasing flower of an orange-buff colour, thoroughly constant, a variety that can be had good without any trouble; bright and attractive in appearance, very free, dwarf growth, and good habit. Rosetta (Fellowes) was seen in excellent form at the exhibition of the National Dahlia Society in September last, bright crimson in colour shaded with purple, dwarf habit, very free and fully constant, and can be had at any time.

A similar number of new varieties were sent out by Messrs. Keynes & Co., of Salisbury, in May last year. They are all of excellent habit, dwarf, free, throwing their flowers well above the foliage. There is very little in these respects to find fault with in the varieties distributed by Mr. C. Turner, and it was noticeable in the case of all the new varieties that there has been a decided advance towards a better habit of growth in the plants. The Salisbury flowers are as follows :- Condor, buff shaded with orange-a flower that was very promising in 1882, which fell off in the centre last year, and has therefore proved wanting in constancy: should it fail as a show variety it will always be very effective as a garden flower-it is very pleasing, and of a good habit of growth; Hope is a very pretty rosy-lilac self, large in size, fine petal, ontline, and substance, high centre, constant and reliable—likely to make a first-rate show flower; Imperial, deep purple with a brighter shade, is a large back-row flower, good petal and outline-perfect in the centre, but with a somewhat loose habit of growth; Mrs. John Laing is a charming French white flower, but when unshaded is heavily tinted with lilac-small petal, good outline

and centre, and very pretty; Seraph is a variety of very dwarf growth, but evidently late, blush in colour -a flower highly thought of by Mr. John Wyatt, and one that earlier in the season came very fine indeed; and Sir Garnet Wolseley, reddish-chocolate in colour -a well formed, large, and useful flower, that will prove quite constant.

Mr. C. Turner did not send out a single new lancy Dahlia in 1883, but Messrs. Keynes & Co. distributed the following: - Madame Souberye, rosy-lilac, of a very pleasing shade, striped with carmine, fine form, and a good exhibition variety; Mandarin, yellow, striped and mottled with purplish-crimson, a good constant flower; Miss Annie Malsome, yellow, with white tip, thoroughly constant, very free, of excel-lent dwarf babit; and Rebecca, lilac, striped with crimson, an extra fine variety, fine petal and outline, and very constant.

The new flowers of 1883 will be found generally worthy the reputations of their raisers. At this period of time, when the Dahlia as a show flower seems to be as nearly perfect as it is possible to get it, the advance is necessarily very slow. But there is an advance, and there is a large demand for plants. New varieties may not realise the high prices they did a few years ago, but exhibition flowers are still sought after and grown by many cultivators up and down the country. R. D.

Obituary.

WE greatly regret to hear of the death, on the 3d inst., at Segrez, of M. ALPHONSE LAVALLEE, the President of the National Horticultural Society of France. In this country M. Lavallée was best known by his very valuable publications on ornamental trees. His Arhoretum Segrezianum is the best and most carefully elaborated recent catalogue of trees and shrubs cultivated with so much care at Segrez, and the accompanying Icones, of which several parts are published, are likewise of the highest value. In his park at Segrez M. Lavallée had got together a collection which for extent and careful nomenclature was without a rival. The planting was begun in 1857, but it was three years later before any scientific classification was attempted, when the trees and shrubs were systematically arranged in lines, avenues, and groups, so placed as to be most in conformity with the natural requirements of the several trees. Each species is carefully named and represented generally by numerous specimens. The shrubs are arranged in squares and borders, the total number of species being estimated at over 4000, without taking note of the numerous garden varieties. Herbaria, catalogues and plans were prepared to facilitate research and study, and in all these matters M. Lavallée had the assistance of the late Prolessor Decaisne and of M. Hérincq. In this manner the nomenclature and synonymy were carefully worked out, to the great advantage of science. The history of this unique establishment is given in the prelace to the Arboretum Segrezianum, from which we made extracts at the time of publication. M. Lavallée's latest publication consisted of a series of lithographic illustrations and descriptions of the large-flowered species of Clematis. M. Lavallée was a frequent correspondent, but was averse to publication, and in view of some remarks made upon the alleged shortview of some remarks made upon the alleged short-comings of nurserymen, and on some questions of nomenclature, it is to be regretted that he did not more frequently put himself into communi-cation with English students, and hence, per-chance, have avoided the publication of some opinions which we doubt not, from the conver-sations we were privileged to have with him on various creations, he would have been discorded to making occasions, he would have been disposed to modify. The latest illustration of this is his opinion as to the origin of Clematis Jackmanni, to which we called attention some time since. Be this as it may, horticultural science has lost by the death of M. Lavallée, one of its most enlightened and hardworking promoters. Our sympathy must needs be deepest his fellow countrymen and members of the horticultural and agricultural societies of France, but we can but feel that the wider world of horticulture and agriculture in general, has sustained a loss, the gravity of which it is not easy to estimate. His loss at this period is the more unfortunate, seeing that as President of the chief horticultural society of France he was eagerly exerting himself to promote the success of the forthcoming

International Exhibition in Paris, in May next. It is to be feared that the sudden death of the President will very seriously embarrass the work of those engaged in the elaboration of the details of this important scheme. M. Lavallée had for some time been in delicate health, and, as we learn, had passed the winter at Cannes, and the announcement of his return to Segrez reached us only a day or two before the note announcing his death. M. Lavallée was a man of enlightenment, an enthusiastic promoter ol horticulture and agriculture, an earnest student, and a courteous, well-bred gentleman. We can appreciate the gravity of his loss, and most unfeignedly tender our condolences to his fellow countrymen and

- The numerous readers who enjoyed Mr. H. A. BRIGHT's scholarly "Notes from a Lancashire Garden," published at intervals in our columns, will be grieved to learn that no more communications from his pen can be laid before them. Mr. Bright died at his residence, Ashfield, Knotty Ash, near Liverpool, on the 5th inst. After a distinguished career at Cambridge, where the removal of the disabilities which formerly prevented Nonconformists from graduating enabled him to take his degree, Mr. Bright became a partner in a well-known Liverpool firm of Australian merchants and ship-owners, of which his father had been the head. From a Liverpool paper we learn that the first impor-tation of Australian gold to this country was made through the medium of Mr. Bright's firm. But it is here rather with the cultivated man of taste and learning that we have to do. Mr. Bright was eminently a man of culture; he acquired and assimilated much of what was best in literature and art, and, as it were, radiated or diffused it abroad for the benefit of others. His "Notes on a Lancashire Garden," though of little importance from a technical point of view, were simply delightful. The reader felt himself strolling through a charming garden with a still more charming companion. With him the library consisted of no mere rows of dusty shelves of unread dulness, but, if we may so speak, it lived and sunned itself in the garden. The literature of horti-culture can, Indeed, ill afford the loss of such an

· Information has also reached us of the death on April 23, at Leeds Castle, Maidstone, of Mr. FREDERICK CORPOULD, aged fifty-two years. Mr. Corbould had previously been gardener at Tandridge Court, Godstone, and Crosswood Park, Aberystwith, and being of a kind and amiable disposition was much

— We are sorry to hear of the death, on Monday morning last, of SARA ANNETTE, wife of Mr. George PRINCE, of Oxford, aged fifty-three years.

May 1 .- Fine bright morning, dull afternoon, occasional rain

at night.

2.—Dull day, slight shower at 2.30 r M. Frequent showers
during the evening.

3.—Rato nearly all day. Fine clear pight.

4.—Bright sunshine at times, occasional showers. Fioe

May 5.—Fine tright morning, severe thunderstorm, with hail and snow from a F.M. to 4 F.M. Rain during the eventual strings of the strings of

LONDON : Atmospheric Pressure .- During the week LONDON: Atmospheric Pressure.—During the week ending May 3, the reading of the barometer at the level of the sea decreased from 29,77 inches at the level of the sea decreased from 29,77 inches at the beginning of the week to 29,62 inches by 3 P.M. on the 29th, increased to 29,82 inches by midnight on the 28th, decreased to 29,73 inches by 3 P.M. on the 39th, increased to 29,75 inches by 3 P.M. on the 39th, increased to 29,70 inches by 9 P.M. on the 1st, decreased to 29,70 inches by Midnight on the same day, increased to 29,70 inches by midnight on the same day, increased to 29,70 inches by 9 A.M. on the 2d, and was 29,36 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.70 inches, being 0.21 inch lower than last week, and 0.25 inch lower than

inch lower than last week, and 0.25 inch lower than the average of the week.

Temperature. — The highest temperature in the shade in the week was 59', on April 30; the highest on the 28th was 50'.2. The mean of the seven high day temperatures was 55'.3.

The lowest temperature was 34'.5, on April 29; on May 2 the lowest temperature was 44'.5. The mean of the seven low night temperatures was 38'.9.

The greatest range of temperature was 24', on April 29; the smallest was 10'.5, on May 2. The mean of the seven low night temperatures was 38'.9.

The greatest range of temperature was 24', on April 29; the smallest was 10'.5, on May 2. The mean of the seven daily ranges was 16'.4.

The mean emperatures were — on April 27, 43'.2; on the 28th, 44'.1; on the 29th, 45'.7; on April 30, 48''.4; on May 1, 46''; on the 29th, 45''.7; and on May 3, 49''.2; and these were all below their averages by 5'.5, 4''.8, 3''.4, 1'', 3''.8, 0''.8, and 1''.2 respectively.

respectively.

The mean temperature was 46°.6, being 5°.6 higher than last week, and 2°.9 lower than the aver-

age of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 120°, on the 29th. The mean of the seven

sun was 120°, on the 2911. The mean of the seven readings was 94°.5.

The lowest reading of a thermometer with its bulb placed on grass was 26°, on April 29. The mean of the seven readings was 31°.3.

Rain.—Rain fell on five days to the amount of 0.39 inch, of which 0.19 inch fell on April 27.

ENGLAND: Temperature. - During the week ending ENGLAND: Temperature,—During the week ending May 3 the highest temperatures were 62° at Prestoo, 61° at Cambridge, 60°,6 at Nottingham; the highest at Bradford was 51°,6, at Botton 52°,8, and at Sheffield and Leeds 53°. The general mean was 56°,5. The local temperatures in the week were 31°,2 at Cambridge, 31°,3 at Nottingham, 31°,6 at Wolver-hampton; the lowest at Liverpool was 30°,4, at Leeds 37°, and at Preston 36°,5. The general mean was 34°,7.

was 34°.7.

was 34.7.

The greatest ranges were 29°.8 at Cambridge, 29°.3 at Nottingham, 25°.5 at Preston; the smallest ranges were 14.1 at Liverpool, 15°.6 at Bradford, and 16° at Leeds. The general mean was 21°.8.

The mean of the seven high day temperature Combinance of the control of

highest at Brighton, 57°.5, at Truro 57°.4, at Cambridge 56°.9; and lowest at Bradlord, 49°.6, and at Bolton and Sunderland 50°.2. The general mean was 53°.2.

was 53.22.

The mean of the seven low night temperatures was highest at Truro, 42°3, at Plymouth 41°.6, at Liverpool 41°.1; and was lowest at Hull, 37°1, at Cambridge 37°.3, and at Bolton 37°.5. The general

mean was 39°,5.

The mean daily range was greatest at Cambridge, 19°,6, at Brighton 17°,1, at Nottingham 16°,7; and was least at Bradford, 10°,1, and at Liverpool and

was least at Draidott, 167, and at Liverpool and Sunderland 10°,5. The general mean was 13°,7.

The nean temperature was highest at Truro, 48°,2, at Brighton 47°,4, at Blackheath 46°,6; and was lowest at Bolton, 42°,3, at Bradford 42°,9, and at Wolverhampton 43°,3. The general mean was 48° 8°

Rain .- The largest fall was 1.18 inch at Bolton, 1.05 inch at Sheffield, 0.98 inch at Nottingham; the smallest fall was 0.26 inch at Truro, 0.37 inch at Brighton, and 0.39 inch at Blackheath. The general mean fall was 0.72 inch.

SCOTLAND: Temperature,-During the week ending May 3, the highest temperature was 55°.9, at Aberdeen; at Edinburgh and Paisley the highest was 51°.3. The general mean was 52°.8.

The lowest temperature in the week was 29°, at Perth; at Paisley the lowest temperature was 36°.2.

Perth; at Passley the lowest temperature was 36°.2. The general mean was 32°.1.

The mean temperature was highest at Aberdeen and Greenock, 44°; and lowest at Perth, 42°.5. The general mean was 43°.3.

Kain. — The largest fall was 2.08 incbes, and the smallest fall was 0.21 inch at Aberdeen. The general mean fall was 0.79 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

BOTTLE-BRUSH: G. Schaschke. Several New Holland plants are popularly called Bottle-brushes. The one you have is probably a Metrosideros. They all require temperate-house treatment.

CUCUMBERS: Amateur. In the absence of full par-ticulars (and you give us almost none), we cannot say with certainty what causes the peculiar spotted appear-ance of the leaves. Perhaps there was turpentine, or paraffin, in your lamp-black. — Tyro. Certainly the Cucumber disease, and in an aggravated form.

DENDROBIUM WARDIANUM: J. R. M. Many thanks, but unsuitable for illustration.

ERRATUM.—In the report upon the Auricula show, p. 588 of your last issue, the new seedling green-edged variety shown, through a clerical error, is credited to Wm. Brockback. Esq., whereas it was exhibited by Mr. R. Lord, of Todnorden.

IMANTOPHYLLUM: A. S. Imatophyllum is wrong, and Clivia is best of all.

INSECTS: C. E. F. A smashed fragment of an insect we cannot identify.—A Subscriber. The larvæ of the common Cranefly, or David Longleys (Tipula oler-acea). They feed on the surface of the soil, after dark, and should be hand-picked thes.

dark, and should be hard-picked thee.

NAMES OF PLANTS: W. Craik. 1, Ornithogalum pyrenaicum. Send the others when in flower.—Thos. Yours. Omithogalum pyrenaicum. Your other question next week.—Constitut Rander. In the absence of the constitut Rander. In the absence of the constitut Rander. In the absence of the constitut Rander. In the absence of the constitution
ODONTOGLOSSUM PESCATOREI: F. Mill. A very prettily spotted variety, that will no doubt improve as the plant becomes stronger.

PANSY: Revoland May. Your seedling Pansy has every-thing to recommend it for pot-culture. It is large in size, of good shape and substance, clear canary-yellow in colour, with maroon blotch. With such a habit and constitution as you describe it ought to be worth send-ing out. We think you would do well to put it before the Eleval Committy. the Floral Committee

ROSE MARÉCHAL NIEL: John C. Tallack. Your plant must be in robust health to produce so many flowers in pairs. As a rule they are only produced single.

SEEDS.

SEEDS.

LONDON: May 7.—The seed market to-day was very thirdy attended, with scarcely any business doing, in first the season must now be considered as about over. Values all round show no material change. Spring Tares have become exceedingly scarce, no Konigsbergs are now obtainable, and only a few Brunswick Gores remain unsold. Canary and Hemp seed are both somewhat cheaper. For blue Peas there is an improved euquity. The trade for feeding Linseed continues very languid. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

CORN.

At Mark Lane on Mooday the Wheat trade was weak, Saxonka, Australian, and some of the Indian Wheats were quite 6d, lower than on Monday sernight. Other descriptions of foreign were not quotably altered, and the limited sales of English Wheat were at about the rates of the previous Monday. No quotable change occurred in flour, which met an exceedingly slow demand. Parley of all kinds realised firm rates, and there was a fair demand. Beans and Peas were stardy in value. Maize remained the same as on Friday. Oats were held for steady value, but purchases were mona a there was a fair demand. Deaths and the same as on Friday. Oats were held for steady value, but purchases were upon a small scale.—On Wednesday transactions in Wheat and flour were weaker, although they were too restricted to test quotations. Barley was fairly firm. Beans and Peas showed steady value, and Maize was quiet.—Average prices of corn for the week ending May 3:—Wheat, 37t. 4d.; Barley, 30t. 6d.; Oats, 20t. 5d. For the corresponding period last year:—Wheat, 42t. 10d.; Barley, 2st. 4d.; Oats, 2st. 4d.; Barley, 3st. 4d.; Cats, 2st. 4d.; Cats, 2s Barley, 32s. 4d.; Oats, 23s. 2d.

CATTLE.

At Copenhagen Fields on Monday, with rather a smaller supply, the beast market was a little better than on the Monday previous that the beast market was a little better than on the Monday previous that the better than the beat supplies that the better prices in some instances. Calves brought about late values, and pigs were dull of sale. Quotations:—Beasts, 4t. to 5t. and 5t. 4d. to 5t. 8d.; calves, 4t. 8d. to 6t. 6d.; sheep. 4t. 8d. to 5t. and 5t. 4d. to 5t. and 5t. 4d. to 5t. and 5t. 4d. Thursday's trade was much about the same as Monday. Beasts and sheep sold quietly, at that day's prices. Lambs were steadier, and there was no change in calves or pies. or pigs.

POTATOS.

The following are the average prices at market:—
Magnum Bonums, 6os. to 90s. per ton; Champions, 40s.
to 6os.; Regents, 5os. to 6os.; Schoolmasters, 70s.;
Victorias, 70s.; Roses, 40s. to 50s.; Snowlakes, 40s.;
Flourball, 45s.; new Pottatos, 11s. per cwt. The
imports into London last week consisted of 84 baskets m St. Nazaire, and 5001 packages 61 boxes from

COALS.

The following are the prices current at market during the week:—East Wylam, 155; Walls End—Hetton 155. 6d.; Hettons Lyons, 145; Lambon, 155.; Wear, 145.; East Hartlepool, 145. 9d.; South Hartlepool, 155. 3d.; Tyne (unscreened), 111.; Tees, 155. 9d.

SILVER MEDAL THE

BENJAMIN EDGINGTON,

2, Duke Street, London Bridge, S.E.,

For the excellent Tents, Garden Nettings, and Greenhouse Shadings exhibited at the Royal Horticultural Show.

Also a SPECIAL CERTIFICATE. Royal Horticultural Society's Great Flower Show May 23, 24, and 25, 1882 and 1883.

"Among the pretty Garden Teuts exhibited by Mr. Benjamia Réglaipton, of London Bridge, S.E., there is a green one made from a new kind of canvas which has been metallised. The process of metallising the canvas makes it waterproof and retproof—two very important considerations in this variable climate of nurs. So highly does Mr. Benjamia Edgington think of this canvas that he has taken up the sole London agency for th."

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced uowards of thirty years ago by the Advertisers, and its genuine good quality, notwinstanding a host of unprincipled mitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thioning, and is used cold. It is used to the grounds at Windoor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

At the Manufactory, or as, dat, per galloo carriage paid to any Station in the Kingdom.

"Piercefield Passing the State of the State

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kugdom for ppwards of thirty years; and their constantly increasing tradie in it, and the numerous Testimonials they receive, stamp it as a truly geouine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuined. JOHN BLAKE'S ACTING HYDRAULIC RAMS.

FOR RAISING WATER FOR THE SUPPLY OF

TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, and FARMS.

No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams. NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet. SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Gallons passing through them.

BLAKE'S PATENT HYDRAULIC RAM, worked by water, rising from a 2-inch bore-hole, 90 feet deep, and forcing 3600 gallons per day through 400 yards of delivery pipe to a cistern at the house, at an elevation of 150 feet, from which cistern the water is gravitated to several drinking troughs in the farmyard and fields, the last trough being at the lowest level.

RECENT AND OTHER TESTIMONIALS.

RECENT AND OTH

From Mr. A. J. RUTHERFORD, Agent to C. F. H. Bolckow, Ssq., Estate Office, Ma. ten
Hall, Middlesboreugh, September 26, 188,—"Dear Sir,—I am glad to say that the Rams you
put down on the Hambledon Estate, for Mr. C. F. H. Bolckow, are working very well. You
undertook, with 6 gallons per mionet, to send up 1500 gallons aday, and with enough water to
work the Rams at full power, 200 gallons ad day. With a supply of 11½ gallons per minute they
entility ago 200 gallons, and whoe working full power 1000 gallons per day are sent up to a height
of nearly 400 feet.

From Mr. HENRY ROBINSON, Esquiere to the Stockport District Waterworks Co.,
September 8, 1883.—"Dear Sir,—I can now report well of the two Hydraulic Rams we have
fixed to your instructions for the supply of Disely Village, 4,000 gallons per day as when you
have some since the fine the supply of Disely Village, 4,000 gallons per day was the quantity
you promised they would force to a height of 68 feet, but on testing them I am convinced that
to the belief that a more sample and efficient pump cannot be found."

From Captain TOWNSHEND, Wincham, February 10, 1877.—"In answer to your inquiry
am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly
well, and gives no trouble. It will work when quite immersed, as it has been several times

well, and gives no trouble. It will work when quite immersed, as it has been several times
From I. SPENDER CLAAL Sea, Ford Manor, Lingfield, Surrey, Angent 9, 180.—" In

gations per day, actiough you only promised solicon.

From J. SPENDER CLAY, Esq., Ford Manor, Lingfield, Surrey, August 9, 1880.—"In reply to your letter of inquiry I am glad to be able to say that the two Hydranile Rams which you fixed here are working, satisfactorily, and that cut of 13 gallons 3 quaria per minute, the maximum yield of the spring, they deliver to the top of my house, outstant a full mile from the spring, 4 gals. 13. For minute, or 3 roy galions per 2 shous, being 1 so gallons above the quantity you guaranteely.

From Mr. JOHN ARCHBOLD, Engineer to Messys, Barber, Walker & Co., Eartwood, Notts, October 21, 1889.—"I am glad to inform you that the Hydraulic Ram you fixed for Thomas Barber, Eaq, whilst working with a fall of 30 feet, and forcing to a height of 90 feet, through 200 yards of delivery pipe, is working exceedingly well, throwing up 9 pms out or every 35 pints passing through it, thus giving 77 per cent. of useful effect."

passing inrough it, inus giving 77 per cent. of useful ellect.

From Mr. T. BARHAM FOSTER, C.E., 23, John Dallon Street, Manchester, October 12, 1833.— Dear Sir, -1 have tessed the Ram you contracted to fix on the Husts Estate, Stafford-shire, for James Chadwick, Esq., to force 1,000 og allons per day of spring water through 800 yards of delivery pipe, to an elevation of sol feet, whist worked by liver water falling 5 feet 9 inches, and am pleased to hind that when at full power the Ram sends up 13,000 gallons per day to the height and distance named, and though the Ram is now adjusted to work at only three-fourths its power, the work done represents over 57 per cent, of useful effect.

From HORATIO R. B. PELLE, E.g., Commissioner to Sir Michael Shaw Stewart, Bart.,

Montain Manufacture, A. Agusti 13, 1852.— I am glad to say the Ram you fixed at Castle
Farrish Control of the Control o

proportion to an elevation of 75 feet.

From FRED. J. TURNER, Esq., Agent to His Grace the Duke of Portland, Mansfield Woodhouse, Agent 50, 1883.—"Dear Sir,—I have much pleasure in stating that the Hydraulic Rams which you erected has year for His Grace the Duke of Portland, a Lyadhurst, near Mansfield, and at Stedburs, Ayribate, are wooding ery well, and they are most satisfactory in every way. and at Stedburs, Ayribate, are wooding they well, and they are most satisfactory in every way. Carbotic Park, Sisser, October 1, 1883.—"Dear Sir,—When you surveyed the site at Sackville Park, Sisser, October 1, 1883.—"Dear Sir,—When you surveyed the site at Sackville Park, Sisser, October 1, 1883.—"Dear Sir,—In resources available. My bailify repeared the ground to your instructions, and in twelve days from the arrival of your men, the Ram was in operation, sending up so per cent. more water than you promised to a height of 101 feet, and distributing a supply to a farm and several cottage on the way. I have pleasure in recording my entire approval of the work."

From Sir A. WOODIWISS, The Pastures Derby, January 15, 1883.—"Dear Sir,—In reply to your enquiry, I have much pleasure in informing you that the Hydraulic Ram you supplied and fixed for me in July last is working as satisfactorily as could be wished, and has fully realised my expectations, and I have no hesiation in saying it is a decided success."

From Sir ROBERT MRNZIES, Batt, of Meniese, Rannech Lodee, Rannech, August

realised my expectations, and I have no hesiation in saying it is a decided success."

From Sir ROBERT INFX/IES, Bart, of Menizer, Rennach Lodge, Rennach, August
20, 1850.—"The Hydraulic Ram which you haed to me to supply water to Ranaoch Lodge
and Camesurich, two houses thee-quarres of a mile apart, is a complete success. The
elevation of the two houses are different there is a regular supply of 7

elevation of the two houses are different there is a regular supply of 7

Rem took the place of one previously tried on the same spot, and which did not succeed, and was
in fact a complete failure."

to fact a complete failure.

From Mr. WILLIAM LAIT, Architect and County Surveyor, Compton Venney, Warwick,
January 16, 1882.—"I have much pleasure in stating that the Fatent Hydraulic Rain I had from
you for the Rev. J. Cardwell Gardener, of the Vicarage, Bullers Marstan, and which you fixed
there, is, I consider, remarkably successful, as indicated below:—4120 gallons of water per day
are passing through the Rain with a descent of 13 feet 8 inches. Out of this small quantity
robo gallons are sent up to a height of 41 feet, showing 79 per cent. of useful effect, and the mase
of its working is so slight as to be almost insudible."

SHANKS'S PATENT LAWN MOWERS FOR 1884.

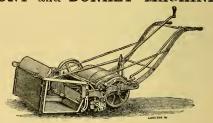

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines. These Machines are in use in the Royal Gardens at Kew, Hampton Court, Osborne and Balmoral, in most of the Public Parks and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the notes studied for English Lawns. They have now been before the Public for many years, and stand unrivalled. These Machines are early worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

BEDDING PLANTS

FLORISTS' FLOWERS.

We are now prepared to execute orders from our fine Collections of the following, of which we respectfully invite an inspection

nspection:—
Chrysanthemums,
Phloxes,
Delphiniums,
Fuchsias,
Pansies,
Violas,
Roses in Pots,

Dahlias, Pentstemons, Coleuses, Colenses,
Pelargoniums,
Mimuluses,
Clematises,
Carnations and Picotees.

Also a large assortment of all kinds of choice BEDDING PLANTS, which can be supplied at moderate prices. Our CATALOGUE of the above is now ready, and may be had free on application.

THE

Gardeners' Chronicle.

SATURDAY, MAY 17, 1884.

HERSCHELL HOUSE AND UPTON PARK.

A ROUND the busy station of Slough a new neighbourhood has sprung up. This does not now appear a suitable spot for the observations of a Herschell, or of a genial lover of rural retreats like Edward Jesse, although the latter dated his Favourite Haunts and Rural Studies from Upton Park close by, and the former raised his telescope in a garden in the same parish of Upton-cum-Chalvey. Ten minutes' walk on the high road towards Windsor brings you to a residence of substantial red brick, which is still called Herschell House. George III, had been prompted by the scientific world to increase the astronomer's small resources by a salary, and here he completed the largest telescope in the world in 1789, and saw Saturn from the lawn in the rear with the help of his own 5-foot reflector, made by himself with his own hands. Here he discovered a new planetary system and several satellites before unknown; and here his sister Mary, who now lies beside him, devotedly assisted Herschell for many years; and here, on one occasion, her abstracted brother found her in the night suspended by a hook in the machinery, and a good deal hurt. The good, faithful sister had been calling out "I'm hooked!" some time.

Herschell House, which Sir William bequeathed to his son, has been enlarged by the addition of a third storey, the grounds have been reduced for the sake of a site for adjoining houses, land here having become valuable for building upon. Many good houses have been built in the immediate neighbourhood, and the large church of Slough, recently enlarged, stands hard by. From this spot a bye-road leads to the village of Upton, where Mr. Jesse resided, and where Herschell was buried, as was Mr. Ingram, late of the Royal Gardens, Frogmore, who spent some years of his honourable retirement at Slough.

Among the appropriate ornaments of this old church of Upton are a Yew tree of unknown date, and an "Ivy-mantled tower" which has been claimed as that of Gray's Elegy, though the tower of Stoke Pogis has been also named in competition. Since the death of Herschell, in 1822, this perfect specimen of a village church had been disused for a time and had fallen into bad repair. An increasing population led happily to its restoration and enlargement.

We may be thankful for the augmented wealth which has brought with it so many blessings and improvements of every kind. All be happy, alive or dead! Among the latter there is one who rests in this retired spot under a sumptuous monument, while his kindred— for he had returned to Upton as his birthplace -sleep in a row near at hand, and rest as well perhaps under the green turf as he does under marble.

Everywhere, in any tolerably attractive neighbourhood within easy reach of London, signs of increasing wealth meet the eye. The Thames Valley particularly, almost as far as Reading, is fast becoming a paradise where new grounds

and gardens are formed every year. The level surface of the river valley, the only drawback of the district, can be very greatly relieved by planting, so the settlers here reverse the rule of exterminating woods which prevails among settlers in some other regions, and make it their first task to enliven the monotony of the surface, and to break up its straight lines by skilled landscape gardening and the planting of groups of shrubs and trees of various heights.

The pleasing appearance of the little old church and churchyard at Upton are mainly due to the grouping of the shrubs and timber on and around the spot. There is a tablet to the memory of Herschell in the chancel, and another to his sister; and if we seek here for examples of success in life we find them within as well as outside the church, for Herschell as well as outside the church, for reference was the soon of humble parents, his father having been a German bandsman. The tablet, like his son's gravestone, near Darwin's and Sir Isaac Newton's, on the floor of Westminster Abbey, is a modest memorial of greatness, and the costlier monuments we have mentioned are perhaps just as appropriate to wealth. H. E.

MASDEVALLIA FLAVEOLA, n. sp.*

AT first sight this might be regarded as Masdevallia attenuata, but it is not. The leaves are cuneate, obovate, or spatulate, and the slender peduncles, surpassing the leaves, have usually two, or even three They are described as light yellow, yet I have a distinct impression that there are on each side two orange zones on the outer perigone. It has the side sepals very rounded at the top, and covered for some distance with the odd sepal. The tails, very narrow at the base, are dilated above, and exceed the cupular part of the perigone. It is no great thing, but one of those little curios which the collector of the Masdevallias will grow with pleasure. It was discovered by Herr Hübsch, in Costa Rica, for Mr. F. Sander, who has just imported a stock of it. H. G. Rchb. f.

ODONTOGLOSSUM PESCATOREI LOWIANUM, n. var.

This grand thing was discovered by one of Mr. Low's travellers. I had a dried specimen from my excellent oldest English correspondent. The plant arrived, and had the good luck to come into Sir Trevor Lawrence's hands, who kindly forwarded me now a fresh raceme. It is very long in the sepals and petals, which have numerous mauve spots and dots on a ground, the greater part of which is a fine light mauve, just as in the best Odontoglossum crispum sastuosum. H. G. Rchb. f.

DENDROBIUM DACTYLIFERUM, n. sp.+

This would appear to be a near neighbour of Dendrobium macrostachyum of Dr. Lindley. Its flowers are nearly the same, just as broad, and light ochre-white. The lobes of the lip are bordered by a fine ahrupt brown margin and calli, as well as the anther, which is of the darkest sepia. The shape of the lip is curious enough. Its long and narrow side lacinize go out into angles, and are quite approximate to the anterior square emarginate thick blade. There are three thick parallel keels on the disc, ending before the base of the anterior blade. The colours are derived from a sketch prepared by M. Förstermann, who sent living plants to Mr. F. Sander. It is expected to flower soon. The stems are great curi-

osities. Their upper parts are covered with old short thickish peducales, which show the scars of two or three flowers. The lower part of these stems are comparable to those of Dendrobium macrostachyum, and are full of roots, coming out, not in tufts and from the base, but singly from numerous joints, thus reminding one of such Epidendra as E. radicans. I have a tuft of stems at hand, where vigorous stems without any base adhere to other stems by their agglutinate roots in a remarkable manner. H. G. Recht, f.

TUBER-BEARING SPECIES OF SOLANUM.

Systematic Summary,-So far as I can judge from the material and information which we possess in England, out of twenty species which have been named, six-viz., S. tuherosum, S. Maglia, S. Commersoni, S. cardiophyllum, S. Jamesii, and S. oxycarpum-possess a fair claim to be considered as distinct species in a broad sense; and of the others eleven — viz., S. etuberosum, S. Fernandezianum, S. immite, S. colombianum, S. Otites, S. Valenzuelæ, S. verrucosum, S. debile, S. stoloniferum, S. utile, S. squamulosum, and S. Fendleri-are certainly, or probably, mere forms or varieties of S. tuberosum, and S. Ohrondii and S. collinum of S. Commersoni.

ECONOMIC SUGGESTIONS. - What Lord Cathcart asked for were any suggestions that a botanist might be able to give, founded upon his knowledge of the Potato plant and its geographical distribution, that were likely to be of practical value to cultivators. In reviewing the subject the considerations of this character that occur to me are these :-

In the first place, it always seems to me that cultivators work upon the tacit assumption, if I may so express it, that the one object in life of the Potato plant is to grow Potatos, and that this assumption has no sound foundation in fact or reality. Solanum is one of the largest genera in the vegetable kingdom. About 900 names stand in the botanical books as species, and Bentham and Hooker estimate that probably 700 of these are really distinct. Of these 700 it is only six that grow Potatos at all, and the remainder all maintain their hold in the world as most plants do, by means of their flowers, fruits, and seeds. I do not think that the Chilian S. etuberosum and Mexican S. suaveolens are more than mere forms of S, tuberosum, and they are said to be quite desti-tute of tubers; and there is the fact noted by Sir J. D. Hooker, that when S. Maglia was first grown at Kew for two years it did not yield any tubers. A great many of the cultivated varieties rarely produce flower and fruit. Any plant brought to the tuberbearing state is in a disorganised unhealthy condition, a fitting subject for the attacks of fungi and aphides, The great difficulty with which we have to contend in fighting disease is that in the Potato, as in other cultivated species, we grow in great masses plants which in a state of Nature are scattered amongst others.

The relationship of tuber to fruit is so clearly shown by one of the experiments of Mr. T. A. Knight that I will cite it in this connection. "Every gardener knows," he writes, in Philosophical Transactions, 1806, p. 297, "that early varieties of the Potato never afford either blossoms or seeds; and I attributed this peculiarity to privation of nutriment, owing to the tubers being formed preternaturally early, and thence drawing off that portion of the true sap which, in the ordinary course of Nature, is employed in the formation and nutrition of blossoms and seeds. I therefore in the last spring planted some cuttings of a very early variety of the Potato, which had never been known to bloom in garden-pots, having heaped the mould as high as I could above the level of the the mound as ingine as I could above the level of the pot, and planted the portion of the root nearly at the top of it. When the plants had grown a few inches high they were secured to strong sticks, which had been fixed erect in the pot for that purpose, and the mould was then washed away from their stems by a strong current of water. Each plant was now suspended in air, and had no communication with the still is the part exerct but it. Shows receive and as soil in the pots except by its fibrous roots; and as these are perfectly distinct organs from the runners that generate and feed the tubers, I could readily pre-vent the formation of them. Ellotts were soon made by every plant to generate runners and tubers, but by every mant to generate tuniers and thers, but these were destroyed as soon as they became per-ceptible. An increased luxuriance of growth now became visible in every plant, numerous blossoms were emitted, and every blossom afforded fruit." Secondly, a suggestion as to what might be done towards widening the power of climatic adaptation of

the cultivated Potato. There are certainly six distinct species of tuber-yielding Solanum, each with its own distinctive climatic peculiarities. I went to Mr. Sutton's trial-grounds specially to investigate this point, and came away fully satisfied that all the rumerous varieties in cultivation had originated from tubersering the horse defined. As for socialization in rumerous varieties in cultivation had originated from S. tuberosum,* as here defined. As far as climate is concerned, it cannot be doubted that Solanum Maglia (or the Darwin Potato as we might suitably christen it in English) would be better fitted to succeed in England and Ireland than S. tuberosum, a plant of a comparatively dry climate. We have indisputable testimony that S. Maglia and S. Commersoni yield readily an abundant supply of eatable Potatos. What I should suggest is, that these should be brought into the economic arena, and throughly tested as regards their economic value, both as distinct types and when bybridised with the innumerable tuberosum forms. hybridised with the innumerable tuberosum forms

The above remarks are taken from Mr. Baker's recent monograph in the Journal of the Linnean Society, wherein, however, we find no mention of Solanum (Witheringia) montana (Bot. Mag., t. 2768), the San Lorenzo Potato of Peru. ED.]

OLD FASHIONED GREENHOUSE PLANTS.

ERYTHRINA CRISTA-GALLI.—We have a specimen of this fine old plant which has flowered strongly and well in the greenhouse annually for the last twenty years; it requires but little attention, and it is always admired when in flower. The plant is cut down to the old stump annually like a pollard Willow. In the spring the young shoots grow out strongly in the greenhouse, and when they are 4 to 6 inches long, a few of them may be gouged out from the old stump with a heel attached, when they will strike in a hot-In about three or four weeks the young plants will have become sufficiently rooted to require repotting into larger pots. The first year 6-inch pots will be large enough. The plants require little or no water in winter, and should be cut down to within a few inches of the ground in December. The plants should be shaken out of the pots in January and be repotted in 6-inch pots; transferring them to 8-inch ones when the pots are quite filled with roots, and in that sized pot it will flower strongly. A writer in the first number of the Floricultural Cabinet, published in 1833, says that "he potted a two-year-old cutting in January. In April it was 6 feet high, and profusely in flower. Afterblooming it was cut down close to the original stem in May. In July it had again grown six feet high, and well in flower as before. It was cut down a second time in August, and flowered splendidly for the third time in October." The writer in question exhibited the same plant three times at the Horticultural Show at Chichester. Doubtless the plant had been grown in a stove, and being a native of Brazil, this treatment would suit it very well. likes a rich composition to grow in, of good turfy loam, and a little peat added. In dry warm positions it is quite a hardy plant, and succeeds well out-ofdoors. An example of it, against a wall of one of the plant-houses in Messrs. Veitch's nursery at Chelsea, has been growing and flowering in the same position for more than a quarter of a century, and there is a fine plant in a frame at Kew. The leaves are attacked by red-spider in dry hot weather, but it can easily be kept in check or destroyed by syringing.

CANTUA DEPENDENS is another old-fashioned green house plant, that well repays any care that may bebestowed upon it to bring it to perfection. It is a plant that will succeed in any greenhouse where it has plant that will succeed in any greenhouse where it mas plenty of light and air. Its greatest enemy is red-spider, which causes the leaves to drop off, if it is not observed in good time. It is very readily propagated from cuttings, and the young plaots should be grown on freely by repotting them as they require it. The long straggling growths must be trained to sticks put in close to the rim of the pots. A plant about 4 feet or more in height, trained in the form of a cylinder, and rather wider at the top, would now be a novel and attractive feature in any greenhouse. About two parts of turfy loam to one of peat, with a little dry and decayed stable manure mixed with it, and some sand, if necessary, is the best potting soil. Its long tube-shaped pendulous flowers, of a bright rosy-red colour, are produced in April and May. They are also produced in great profusion when the plant is encouraged to

^{**}Masterallia flaveola, n. 59.—Folio a basi petiolari cuneato spatulata nhuuse emarginate; pedunculu gracili apice 2—3-floro; menta nhuusangud : sepalis laterallius apice rotundatis omnibus alte cobserentibus, caudis longioribus supra basin angulatis superbus isupra basin angulatis superbus isupra basin angulatis superbus interaintis; labello pandurata acuto apiculo crasso intramarginali, aurantiaci ante apicem; carnis geminis in disco. Flores flaveoli. H. G. Robb, f. + Dendrobium datyliferum, n. 5p.—Affine Dendrobium acretachyo, Lindli: cauihus elongatis demum sulcatis; basi x multis articulas rhosphoris; s superne tacentos 2—3-floros x multis articulas rhosphoris; s superne tacentos 2—3-floros varium pedicellatum non zequante; sepalis lanceis; tepalis previoribus; labelli angusti lacinis lateralbus angustis apice triangulo abruptis; lacinia mediana crassa subquadrati menginata; carinis terais in disco carnosis ante basin lacinia mediana abruptis; columna apice trioentata, H. G. Robb, F.

^{*} Four old cultivated specimens in the Sloane herbarium at the British Museum, and one from Philip Miller, all belong to typical S. tuberosum.

grow freely the previous season, and treated to a decided season of rest by being kept comparatively dry in winter. An excellent figure of the plant was given in these columns in vol. xiii., p. 785.

HOVEA CELSII is a great favourite with us, and is now profusely in flower; its small purplish-blue flowers are really pretty. It does not brook the tying and training essential to the formation of a round-headed specimen plant. All plants were not intended by Nature to grow in one form, any more than the flowers were to be of one colour or one shape. Those who would cultivate this New Holland plant must be prepared to see it grow rather leggy, and with bare woody stems. By pinching and tying out in the early stages of its growth it can be kept in order for a few years; but a twenty-year-old specimen forms 5 feet stems, rather bare at the base. If it is placed amongst other plants the stems are not observed, and the clusters of Pea-like flowers have an elegant appearance hanging over the fair white masses of Deutzia gracilis or Staphylea colchica. It likes a good compost of turfy peat to which a little decayed turfy loam has heen added. We mix some broken charcoal with it, which will keep it sweet for a long time if the drainage is good. This is purely a cool greenhouse plant, and may remain there all the year round in a light and airy position.

AZALEA SINENSIS .- This may almost be said to be an old-fashioned plant. It used to be popular a quarter of a century ago for exhibition. It is a distinct and pleasing novelty in a collection of Azaleas, and is valuable in an exhibition collection of stove and greenhouse plants; there is no other plant produces flowers of the same pleasing bright orange colour. The variety we have grown for many years was sold under the name of Fraser's variety. The flowers being larger and brighter in colour than the usual type, the habit is rather straggling; but with a little care a compact bush can be obtained. This is a far superior plant to any of the forms of A. mollis now becoming so popular, and the flowers last much longer in good condition. The young wood is very brittle, and when the plants are large many of them snap off in moving them about at the time of rearranging the plants. It is not very difficult to force this species into flower, but it blooms early in May if left in a cool greenhouse all the year round. It is a deciduous plant, the leaves taking a reddish tint before they drop off in autumn.

PIMELEA SPECTABILIS. - The plants treated upon above are not difficult to grow, and as a rule Pimeleas also can be grown into good specimens without any extra care; but this species has a tendency to become leggy, unless it receives careful cultivation. It is seldom seen now as an exhibition plant, but it should be an important specimen, if well grown, in the most select collections. Its heads of creamy-white or rose coloured flowers are very attractive. What the plant requires, to grow it well, is a position near the glass in an airy greenhouse. Carefully train out the shoots, and stop them in the spring and early summer months by pinching out the tips of the growing stems. The young plants require repotting every year, using good turfy peat with a little loam and sharp sand. The best time to repot them is sharp sand. in spring, the plants have then the whole season before them to fill their pots with roots. Watering requires to be done with great care, especially after repotting. This, and indeed all such hard-wooded plants, should be moderately moist at the roots before they are potted, and in that case they require no water for nearly a week. Indeed if the weather is wet and cold they may be better without it for ten days, by that time the roots will have made an attempt to enter the new compost, and the water applied at the right time will cause them to push more rapidly. It is an error in practice to water a plant immediately it has been potted, and one which often destroys the small rootlets that go to support it. In contrast to this species may be named P. Hendersoni, which makes a large hardsome plant for exhibition, requiring much the same treatment as the other, and is easier to grow into a specimen. Syringe treely underneath the leaves whenever a trace of red-spider is seen. J. Douglas, Great Gearies, Hford.

ANTHURIUM VERVAENEANUM.—A variety of A. Scherzerianum, raised by M. Vervaene, of Ghent, and characterisd by oblong acute white spathes, of which only the tip is red. The plant is figured in the last number of the Revue Horticole.

APPLES AND PEARS IN THE CARSE OF GOWRIE.

WE take the following extracts from a paper read by Dr. Rohertson, of Erral, an enthusiastic pomologist, at a recent meeting of the Perthshire Society of Natural Science:—

The cultivation of fruit in this country, especially in Scotland, has been sadly neglected of late. Carse of Gowrie, as well as elsewhere, many good There has orchards were allowed to run to waste. been a great outery as to bad seasons, and not withnut good cause, but bad culture had, I fear, as much to do with it as bad seasons, or, I should rather say, no culture. Many of the Carse orchards had no digging, no pruning, and no manuring, and yet under such treatment fruit was expected. In many of the largest orchards in the Carse all the trees were com-"fogged," covered with moss, and the soil completely exhausted by wild grass and that stoloniferous plant known in the country by the name of Crawtaes. [Is this Ranunculus repens?] In October last I had good opportunities of seeing many of the Carse orchards, as I was asked by the Secretary of the Dundee Horticultural Society to gather up all the specimens of Apples I could find for the Apple Congress at Chiswick. I also visited many gardens as well, and most of the good specimens I got were from gardens, clearly proving what I have always advocated, that good culture is the great secret of successful fruit growing. The duty of collecting so many different specimens in so many gardens and orchards entailed on me a good deal of extra labour, but I sometimes managed to "kill two birds with one stone," by visiting a patient or two, while I gathered up a few Apples as well. It was, however, very interesting and very pleasant work, as it gave me a good opportunity of seeing many orchards and gardens at the most interesting season of the year; and I must say that all with whom I came in contact-even those who had rented orchards-gave me freely all the specimens I wanted, and all the information in their power, when I told them the purpose I wanted them for.

I think I sent to the Congress the largest collection that was forwarded from Perthshire. I had over sixty varieties, some of them really beautiful, and large in size. Some of them were from my own garden, but by far the greater number was collected as already stated. One or two of the finest specimens which were particularly noticed, especially for their beauty, were from A. Lacaille, Esq., Gourdiehill. The Lass o' Gowrie was particularly fine. One thing I particularly noticed in going through many of the orchards, was the enormous number of Apples of a small size, quite unfit for market, with no names, or merely local names; many of them just Crabs or wild Apples, not even having colour, as many of the American Crabs have, to recommend them for cultivation anywhere. The only Crab Apple I saw with any pretensions to beauty or symmetry of form, was in the U.P. Manse garden, Pitrodie-a beautiful little round one, of a fine golden colour, tiuted with red. I was truly sorry to see so many large orchards in the Carse with so very few of the large growing kinds, Apples that are really worth being sent to market, and likely to be able to compete with those brought from the Continent, and also from America. The Apples from Germany, as a rule, are of a larger kind, and higher in colour than what we grow in Scotland, or even Great Britain, hence the price they command in our markets. To remedy this as far as possible, and having the writing of this paper in view, I sent out a schedule of four questions to almost all the head gardeners in the Carse, and some of the most experienced market gardeners and orchard keepers, asking what Apples and Pears grown at present in the Carse orchards are unworthy of being cultivated on account of smallness, had quality, or had bearing. Also, what kinds they would substitute in the place of the had ones, as more suitable for market and home consumption-at the same time asking them to make what remarks they thought proper on the subject. I did this with the view of laying before the members of this Society, and the general public, a synopsis of the pomological lore of the Carse in the shape of a good list of Apples and Pears that are really worth cultivating, and fit either for market or home consumption, and able to cope with foreign importations,

From the returns sent me I learn that a great many Apples and Pears in the Carse that are not worth cul-

tivating have only local names, and many of them no names at all; and the kinds that are really worth cultivating are not so very numerous, notwithstanding the vast number of varieties that are grown throughout the length and breadth of the land.

In the Apple-voting there were nineteen in allfourteen head gardeners and five market gardeners
and orchard-keepers—all men of great experience in
fruit-growing as well as fruit-packing and selling. A
few of the gardeners have had from forty to fitty years'
experience, and some of the orchard-keepers have had
from five to twenty of the principal Carse orchards
under their care. Well, I will now give the result, which I trust will be useful, not only to growers
of fruit in the Carse, but also clsewhere, in making a
good selection either for garden or orchard i—

-Lord Suffield, 18; Keswick Codlin, 15; Tower of Glamis, 16; Stirling Castle, 15; King Pippin, 12; Hill's Seedling, 12; New Hawthornden, 12; Dumelow's Seedling, 11; Warner's King, 11; Irish Peach, 10; Yorkshire Greening, 9; Lord Duumore, 9; Phillips' Seedling (Cellini), 9; Lass o' Gowrie, 8; Kentish Codlin, 7; Nonesuch, 7; Early Red Margaret, 7; Manks Codlin, 6; Arbroath Oslin, 6; Ribston Pippin, 5; Kerry Pippin, 5; Irish Green, 6; Grey Leadington, 3; Golden Pippin, 4; Echliuville Seedling, 6; Cambusne-than Pippin, 5; Blenheim Pippin, 4; Revelstone Pippin, 6; Ringer, 4; Strawberry Late, 4; French Red Streak, b; Kinger, 4; Strawberry Late, 4; Frenen Red Streak, 4; Baldwin, 3; Cox's Orange Pippin, 9; Eve Apple, 3; Fullwood, 3; Fair Maid of France, 3; Lord Derby, 3; Northern Spy, 3; Paradise Pipin, 3; Strawberry Early, 3; Wallace Cluster, 3; White Captain, 3; Standard, 3; Rock, 3; Mifriston, 2; Adams' Pearmain, 2; Astrachan Paradis, 2; Pedigrachime Engalding. Astrachan White, 2; Bedfordshire Foundling, 2; Baxter's Pearmain, 2; Beauty of Kent, 2; Blenheim Orange, 2; Dutch Codlin, 2; Irish Codlin, 2; Cornish Gilliflower, 2; Claygate Pearmain, 2; Devonshire Quarrecden, 2; Early Julien, 2; Emperor Alexander, 2; Fillbasket, 2; Green Sweet, or Colville, 2; Grenadier, Reinette du Canada, 2; Maiden, 2; Norfolk Bearer, 2; Orauge Pippiu, 2; Pott's Seedling, 2; Wadhurst Pippin, 2; Woodstock, 2; Betty Geeson, Calville Malingre, Cockle Pippiu, Carlisle Codlin, Dutch Mignonne, Fearn's Pippin, Jolly Beggar, Jenny Lind, Little John, Leyden Pippin, Margil, Nelson's Glory, Norfolk Beefing, Northern Greening, Pearson's Plate, Rymer, Beefing, Northern Greening, Pearson's Plate, Rymer, Royal Russet, Yellow Ingestre, Sam Young, Small's Incomparable, Striped Beefing, Summer Thorle, Waltham Abbey, Winter Greening, Williams' Favourite, Yorkshire Beauty, Green Stoup, Painted Lady, Ashmead's Kernel Improved, Annie Elizabeth, Lady Henniker, and Winter Pearmain-all one vote each.

Now, by these nineteen voters, about one hundred kinds have been voted in as good, and all deserving to be cultivated. The majority of the kinds I had the pleasure of seeing last autumn, and can bear testimony to the care with which they have been selected. Some of them are not so well known as they should be, or they would have got more votes. I might instance the Lass o' Gowrie, which, although pretty high up in numbers, should have been further up, as it is one of the best early Apples we have. Then there are Annie Elizabeth, Lord Derby, Emperor Alexander, Lady Henniker, and Waltham Abbey, all really first-class Apples, which would be more culti-vated were they better known. Lord Suffield, which is highest in the list, well deserves the place it occupies, is a free grower, a free bearer, having a hardy and beautiful bloom. The trees are not liable to canker, can be grown almost to any size wanted, and thrive as well on the Crab as the Paradise stock. know an amateur, about half a mile from Errol, who had them the other year 171 oz, on a tree grafted by a working man, and on a Crab stock from the woods. I must not omit to mention another new Apple, raised by a great botanical friend of my own, the late John Brown, of Murie Gardens. It was exhibited for the first time at the Dundee show last autumn by his son, the present gardener of Tayhank, Errol, and was 1st-prized for table Apples in the gardener class.

For Pears only seventeen voted—fourteen gardeners and three orchard-keepers—and the result is as under:—

Hazel or Hessle, 14; Crawford, 11; Swan's Egg, 9; Galston or Moorfowl's Egg, 8; Williams' Bon Chretien, 7; Craig's Favourite, 7; Beurrië d'Amanils, 0, Jargonelle, 6; Marie Louise, 5; Beuvie, 5; Beurre Diel, 5; Easter Beurré, 4; Beurre de Capiaumont, 3; Autumn Berganotte, 3; Flemish Beauty, 3; Grey Honey, 3; Josephine de Malines, 3; Citron des Carmes, 2; Croft Castle, 2; Black Auchan, 2; Beurré Rance, 2; Broom Park, 2; Green Chisel, 3'

Hacon's Incomparable, 2; Louise Bonne of Jersey, 2; Longville, 2; Souvenir du Congrès, 2; Passe Colmar, 2; Napoleon, 2; Nondescript, 2; Beurré Bachelier, Bergamot d'Esperen, Bishop's Thumb, Beurré White, Black Pear, Catillac, Colmar d'Eté, Cripple Fiddler, Beurré d'Aremberg, Beurré de l'Assomption, Clapp's Favourite, Duchesse d'Angoulème, Drummond, Duncan, Summer Doyenné, Glon Morceau, General Todtleben, Green Yair, Jersey Gratioli, Huntingdon Early, Madanie Treyve, Maréchal de la Cour, Pitmaston Duchess, Suffolk Thorn, Thomson's Pear, Winter Nelis, Vat, Aston Town, and Uvedale's St. Germain—all one each.

The last-named has been known to grow 3 lb. in weight. While still speaking about Pears, let me give a list of some I had the pleasure of seeing growing in pots this season, and their weight when taken off:—Doyenné du Comice, 17 oz.; Beurré Bachelier, 14 oz.; Beurré Diel, 15 oz.; Foodante d'Automne, I lb.; General Todtlehen, 13 oz.; Glou Morceau, 12 oz.; and Nouvelle Fulvie, 14 oz. All the above were in one little glasshouse, but with no artificial heat. Here is a list from another garden, and noder glass also:—Lieutenant Poideven, 16½ oz.; Duchesse d'Angoulême, 121 oz.; Pitmaston Duchess, 13 oz.; Madame Treyve, 10½ oz.; General Todtlehen, 14 oz.; Maréchal de la Cour, 15½ oz.; and Soldat d'Esperen, 121 oz. This will give you some little d'Esperen, 123 oz. Anis will give you some initie dea of the size Pears can be raised to in pots, under favourable circumstances, and well attended to otherwise. Now, you must not go away with the idea that because these fruits were grown under the shelter of a glasshouse, they cannot be a support of the carrows. he grown almost as well outside. If grown pots, and liberally treated and placed in a sheltered situation, they will grow to an immense size. You will perhaps be surprised when I tell you that I saw some of the same Pears I have already named grown in another garden under glass, but with no artificial heat, some of them in 9-inch pots-pots not larger than you grow an ordinarily sized Pelargonium in-with from six to eighteen large Pears, from 12 oz. to I lh. in weight. The finest coloured and largest King Pippin Apples I met with last season were grown in a pot at the edge of the front door of Mr. Wilson's garden, Cuha Terrace, in the village of Errol. I had the pleasure of exhibiting them at a lecture I delivered in Kinnaird in February last on cottage gardening, and they were so highly coloured that some of the audience took them for Oranges,

WET OR DRY.

THE long - continued dry weather, not perhaps dry everywhere, but dry generally, because the rainfall almost all over the kingdom for the past several months has been singularly small, is naturally exciting much attention, and almost alarm. Pleasureseeking people see only in fine weather the fullest opportunity for them to obtain ample enjoyment, and no saying in relation to the weather is more common than the remark, "It is a pity fine weather should do any harm 1" Perhaps so far no considerable amount of harm has been done, still the soil is at the time of writing (for in our changeable clime we must always make a reservation) very dry; yet vegetation is for the year only in its infancy, and no great strain has been made upon the soil to sustain life. The pinch is now coming rapidly, and if no rain fall during the present month we shall enter upon June with sad forehodings. We have had it pleasantly impressed upon us that a drier winter or spring than the seasons just past have rarely been known, and to special mildness has been linked special dryness. In the almost ordinary course of things, in the realisation of those average compensations which Nature is so fond of producing, we ought to have a wet, cold summer, but certainly there is no present evidence that such a catastrophe is imminent; on the other hand, should the summer continue as the winter and spring have heen-markedly dry-then we shall have heautiful weather to set against thirsty soil and starved crops. No one can say that at present the garden or farm outlook is cheering; but were we now to have a week or two of abundant genial, warm rains, a revolution in vegetable aspects would be worked quickly. The fruit growers have had a heavy blow, and either a Irut growers have had a heavy blow, and either a wet, cold summer, or a hot, parched one, would add to their burthens, therefore the season is heing watched with exceeding interest and anxiety. Practical readers fully understand the importance of rain just now, for once the summer is fairly in there is little hope for the desired moisture until autumn is with us, and then it comes too late.

Prchid Notes and Hleanings.

ODONTOGLOSSUM WILCKEANUM.-The offspring of the union between the variable O. luteo-purpureum and the beautiful but fickle O. Alexandræ, this plant, by the endless variety exhibited by the different specimens, offers as great a puzzle to botanists as all the other Orchids which are the result of natural crossfertilisation do. To the cultivator and lover of heautiful flowers it gives a great number of handsome varieties, the poorest of which are good enough to grow, and so strikingly lovely as to warrant their being placed among our most cherished nurslings. It has long been known to all Orchid growers that in the case of each of the variable natural hybrid varieties the name is rather given to the section of plants supposed to be the result of intercrossing a given pair than to any individual plant the result of such cross, as no other course is open where scarcely two plants can be obtained alike in every particular in the marking, colour, or shape of the flowers. Hence it is that out of a dozen plants all entitled to the same name, some will be worth ten times as much as others, Odontoglossum Wilckeanum was first flowered by Mr.

of Mr. Bull's establishment. The long show-house is arranged much in the same way as last year, but with several judicious improvements suggested by previous experience. The edging of the stages has been plaoted with Panicum sulcatum variegatum (now called Oplismenus imbecillis variegatus), a form raised in the nursery, not so brightly coloured as the variety usually grown, but more suitable for use where a foil is wanted for brilliantly coloured flowers. Next to this is a line of deep green Maidenhair Fern, over which hang the graceful spikes of many Odontoglossums whose loveliness is heightened by the greenery beneath them. The side stages are occupied, as it were, with Adiantum cuneatum, dotted with elegant little Palms, such as Cocos Weddelliana, but only thinly, to provide contrasts with the flowering Orchids, which to some extent are arranged in groups of varieties of particular species. This arrangement not only enables the exhibitor to invest his show with artistic merit, but has advantages also of an educational character. Thus, who can pass a group of varieties of Cattleya Mendelii without heing at once struck by the remarkable range of variation which this species exhibits? Here are forms with the colours of the labellum ranging from a light tint of violet to the richest purple, while the sepals and petals vary from pure white to lovely shades of mauve and rosy-purple. The yellow blotch on the lip peculiar to the species is present in

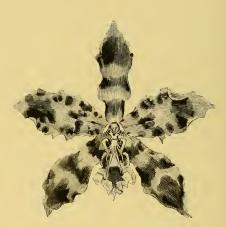

FIG. 122.—ODONTOGLOSSUM WILCKEANUM.

Wilcke in 1880 in the collection of M. Massange, of Baillonville, Marche, Belgium, and in honour of him it was named. Our illustration (fig. 122) gives a flower of the true original type, but each succeeding year furnishes s with other and widely differing varieties, varying from the bright yellow, reddish-brown blotched original form, to the extraordinary O. W. pallens of Mr. Lee's collection, which has a transparent greyish-white ground blotched and spotted with shiny light chestnut colour, and having a hright yellow centre. This variety would he pronounced a "crispum," but in this, as in all other cases in which the true names of hybrid Odontoglots are concerned, the column and its appendages, and the labellum and its shape, and the arrangement of its centre come to the rescue, and positively prove that O. luteo-purpureum has had something to do with it. O. Wilckeanum is now a great favourite, and every good collection has its pet varieties of it: it is all the more liked that it is a good "doer," and seems to improve in heauty every year if grown in a cold house, such as the O. Alexandræs thrive in.

MR. BULL'S EXHIBITION.—We have no hesitation in saying that the exhibition which Mr. Bull opened on Tuesday eclipses all his previous efforts in the same direction. His show-house is a scene of the greatest orchidic beauty, haffling description, and we had almost said defying exaggeration. In truth, it is a marvellous display for any nurseryman to create single-handed, and it speaks volumes for the resources

all hut one, in which the yellow is replaced by white —a rare and valuable variety. On Tuesday 112 flowers of C. Mendelii varieties were open. Other variable species are treated in the same way, and Odonolglossum Alexandræ alone affords many combinations of widely differing forms. The Alexandræs are truly a splendid lot, every variety being a gem in its way, and their number adds largely to the total number of 1160 spikes of hloom, which the genus Odontoglossum contributes to the feast. Included in these are several unnamed species or hybrids, O. Roezlii, O. cordatum, a nice specimen with ten spikes; O. Halli, the white-lipped form named leucoglossum; a prettily spotted form of O. Rnckerianum; the fine O. mulus, which has lately been fetching good prices; the rare O. Victor, supposed to be one of two only in the country; O. triumphans, one plant hearing two noble arching spikes of thirty-one flowers; O. Wilckeanum, and its white-ground variety named pailens. Amongst the Cattleyas, besides the Mendeliis already noted, are C. labiata brilliantissima, a new variety, with the well-knowo markings of Backhousiaoa on the petals, and the labellum of the richest crimson-maroon, with yellow blotches on the side lobes; C. Skinneri, lovely violet-purple placed in cootrast with the variety alba. Lælias include L. purpurata alba, two or three forms, and the new L. Schilleriana Mastersii, white with purple labellum, and the side lobes fringed with the same colour. Down the top of the central stage are handsome

Palms, Zamias, Ferns, and Anthuriums, most noticeable of all at the entrance being a noble example of Anthurium Veitchii, with fifteen handsome leaves standing out in bold relief above a charming group of varieties of Odontoglossum vexillarium, mixed with richly coloured Masdevallias. Arching in various directioos are a number of grand spikes of Cymbidium Lowii, and among them the rare C. Lowii flavum, with the pale-coloured lip. Other rare and good things which claim attention are a fine new Brassia, unnamed, with cionamon-brown coloured sepals and petals tipped with yellow, the labellum white, and

them all would require more space than can be spared, but we hope we have said enough to induce all who have the opportunity to pay the exhibition a visit,

THE ORCHID MARKET.—Nearly 5800 was the amount realised at the sale of Orchids in flower at Stevens' Rooms on the 8th inst. We append the prices obtained for a few of the lots:—Odontoglossum mulus, 18 gs.; Lycaste Skinneri alba, £13 2.f. 6d.; Masdevallia Harryana, Bull's blood var., a plant with twenty-eight leaves and twelve spikes, 11 gs.; Odonto-

hundreds of bulbs," of Cattleya Mossies, fell to a bid of $\angle 26$ 5. The Anguloas mainly consisted of A. Ruckeriana varieties, which met with a ready sale, the best prices obtained being' $\angle 31$ 10x., $\angle 21$, $\angle 13$ 2.5 $\angle 4$, $\angle 10$ 10x., and $\angle 9$ 10x; A. uniflora specimen with twenty-four bulbs, fetched 6 gs.; and another species, said to be white flowered, $\angle 7$ 10x. and $\angle 7$, &c.

CATTLEYA MOSSIÆ RETICULATA,—Messrs. F. Sander & Co. have flowered out of their large importation of C. speciosissima a grand variety with immense sweet-scented flowers and gigas-like veined crimson labellum. It is a most beautiful Cattleya, in habit exactly intermediate between the nearly round-bulbed C. speciosissima and the true compressed bulbed C. Mossiæ. It has the Honeysuckle scent of C. Eldorado.

THE LARGE POPLAR AT DIJON.

A VISIT to the interesting and well ordered Botanic Garden at Dijon last autumn furnished us with an opportunity of noting how with scanty means M. Weber contrived to make the garden entrusted to his charge subserve the purposes of horticulture and agriculture as well as of scientific botany. As we mentioned at the time, one of the curinsities of the garden is a gigantic Poplar, Populus nigra, of which, owing to the courtesy of M. Weber, we are now in a position to give an illustration (fig. 123). This noble tree is believed to be more than 400 years old; documentary evidence alludes to it in 1660. At the ground level the girth of the trunk is about 50 feet, and at 1 foot above this it measures nearly 40 feet. As will be seen, appropriate measures are now taken to secure the well-doing of the tree.

THE HEALTH EXHIBITION.

As might naturally be expected, floral and arboreal adjuncts to the above show form no slight item of its attractions, and are, indeed, well nigh indispensable, especially in those parts that are unoccupied by buildings. Although we are in the middle of May, vegetation shows considerable backwardness, the result of the cold winds of April, which retarded, and in many instances very much injured that that pushed so untimely, and it will therefore be some time yet before we have the accustomed fulness of summer to replace our present barrenness. The newly laid turf, which has taken the place of the acres of mud, the result of the ceaseless trampling by visitors last season, together with freshly laid gravel, forms the best of settings for the various objects scattered over the garden. Some new walks have been laid out, that will afford additional space for promenaders, and likewise for a greater number of chairs, and provisions are made to keep the promenaders off the turf. This is an especially good feature in the minor alterations seen this season, for if the turf can be preserved in a luxuriant condition the effect of the whole—lighting, waterfalls, fountains, &c .- will be much heightened.

Several of the leading nurserymen have supplied plants, at their own cost, for the embellishment of various portions of the gardens-an item that would too heavily have taxed the resources of Chiswick had it been undertaken by the Royal Horticultural Society. In front of the clock, and opposite to the water-basin, Messrs. Lane & Son, Great Berkhamsted, have placed a massive bank, composed mostly of Rhododendrous. This is situated close to the buildings, which range thereabouts from east to west, and in front has a soft serpentine outline. The same firm has also another border, made up mainly of Rhododendrons, Conifers. and evergreens, of sizes between I foot and 5 feet in height, which skirts the Eastern Arcade for the greater part of its length, and being rather closely planted with symmetrical, handsome plants, it forms an admirable screen in that part. In the neighbourhood of Messrs. Doulton's pottery exhibition Messrs. Paul & Son, Old Nurseries, Cheshunt, make a brave show with some fine pyramidal Hollies, Araucaria excelsa, and with a capital assortment of the choicer Conifers arranged in a narrow border skirting one of the sheds.

We noticed several handsome specimens of Abies numidica, A. Williamsii, A. Dunnettii, and A. perthensis; and also a strikingly symmetrical Picea brachyphylla; a low piece of rockwork planted with flowering clumps, together with a group of standard

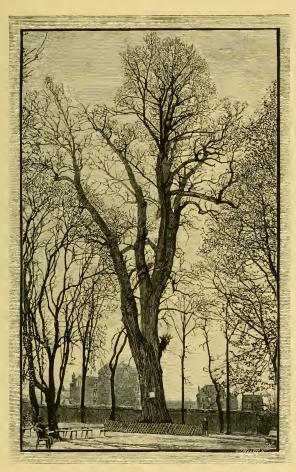

FIG. 123.-THE GREAT BLACK POPLAR AT DIJON.

the flower scented as of Violets; the new hybrid Calanthe Dominyi, with a dozen spikes or more of bluish-violet flowers; Masdevallia Harryana magnifica, purple, and M. Harryana Meteor, a fine shade of crimson; Oucidium superbiens, a much deeper coloured form than the ordinary one; the seldom seen Oncidium pumilum, a low-growing plant with short, dense spikes of small yellow blossoms; the rare Oncidium verrucosum pictum; the Humming Bird Masdevallia, M. trochilus, the handsome scarlet and orange-coloured Epidendrum rhizophorum, and Dendrobium chrysotoxum, both the Burmese and East Indian forms, the former of which has much the advantage in size. These are, of course, not a tithe of the good things now in bloom; to mention

glossum Alexandre, 7 gs.; Ledia purpurata, fine specimens, 18 gs. and £15 4z. 6d.; Cattleya Mossiæ, a fine variety, £21 10z. 6d.; Masdevallia Shuttleworthii, £7; Odontoglossum vexillarium, dark variety, £7 10z.; Cattleya Mendelii, £8 18z. 6d.; Oncidium sp., £8; Masdevallia regalis, £8; M. conchiflora, with sixty leaves, £5 10z.; M. maxima, with thirty leaves, £6 10z.; M. Harryana sanguinea, £9; Odontoglossum vexillarium, a fine plant in a 15 nich pot, 1z gs.; and Odontoglossum sp., gs. On the following day, May 9, Messrs. Protheroe & Morris also had a good sale, at which the specialities were Odontoglossums, Cattleya Mossiæ, varieties, and Anguloas. A very fine hybrid Odontoglossum realised 10 gs.; and "a wonderful mass, having

Roses in bloom, which latter will be renewed from time to time as the plants go out of bloom, comprise Messrs. Paul's donation in this way. pavilion finds place about the middle of a congeries of sheds, stalls, and offices; and here, in an open space, Messrs. C. Lee & Son have arranged four beds, at the angles of a square, that is embellished by a water basin. These have been filled with small and large plants of Rhododendrons, white Broom, golden Weigelas, Berberis Darwinii, and a variety of flowering plants of a herbaceous character, as a carpet under those. Here and there are small standard Euonymus japonicus, with gold and silver variegation, and many examples of Vucca gloriosa are planted, or stand about; some of them, doubtless, are intended to be used in the remainder of the design, which was in a somewhat incomplete state. The little quadrangle here should form, when fountain and water-basin and its encircling parterre are finished the prettiest, coolest, nook about the place. Messrs. C. Lee & Son have also formed a narrow flower border on either hand as the visitor approaches the embattled gateway of old Londondecoration just a little out of keeping with adjacent objects, but one which probably will not be retained. The middle walk in the show is in the hands of Messrs. Waterer & Co., of Bagshot, who have made good use of the more ample space with which they were favoured. Borders having a width of from 6 feet to 12 feet, run along the base of the buildings on either hand, and these are planted, in a pleasing irregular style, with standard and bush Rhododendrons, Thuias, Retinosporas, and others of that class; the serpentine margin next the turf being prettily defined with dwarfer evergreens and Conifers.

This portion, with its ample turf margins, will be a pretty bit of decorative gardening, when the budloaded Rhododendrons are in flower. In a shady cool retired spot in front of the Prince of pavilion Mr. Maurice Young, Milford, Godalming, has placed a goodly assortment of Rhododendrons, in the form of a continuous border running round the major portion of the available space, the basin-shaped middle area being of the greenest of turf. The floral decorations in the pavilion are in the hands of Messrs. Dick Radclyffe & Co., 129, High Holborn, W.C., who have a rockery with dripping water, and electrically lighted; many Ferns, Lycopodiums, Dracænas, Pandanus, and small Palms, forming the bulk of the subjects made use of on the rockery. Inside the saloon here a few flowers, Ferns, and other plants of an ordinary character are to be seen. They have likewise placed some rockwork in the large water basin in the grounds, in which artificiality and contrast with the smooth stone walls to which it has been attached are too apparent.

Messrs. Fulham, of Broxbourne, the well-known constructors of rockeries, &c., are building up one of their structures, which will shortly be completed. They have samples built up as quoins in a building of their terra-cotta—a material of a warm buff colour, and of a lively brick-coloured, smooth-surfaced concrete. The show made by the rustic furniture and arbor nakers includes some very well furnished examples by Mr. J. W. Parrett, of Forest Hill, S.E. — several of the heather-thatched arbors being very tasteful in design, and not too small, a fault often seen in such structures. Mr. Lovegrove, of Slough, contributes some artistically made chairs, stools, and summer-houses.

On other objects of interest we shall have occasion to speak later on.

Foreign Correspondence.

SIERRA DE MANCHIQUE: Afril 19,—I have been making a very pleasant tour in Algarve, Southern Portugal, and, amongst other places, paid a visit to Monchique. We started about 100 o'clock to see the sulphur baths, about an hour's walk from our inn, and to which we were told about 500 people come every year, the bathing season usually beginning by the middle of April; but this year no one had as yet come, owing to the cold weather. On the way we found Cistus ladaniferus growing in quantities, the flowers being very large, and the spot at the base of the petals in different plants varying in depth of colour till it was entirely lost, making the white variety very handsome. Cistus salvifolius, a compact low-growing bush, was covered with flower;

and growing side by side with it, Cistus populifolius, a tall striking looking plant growing from 3 to 4 feet high, with a hard woody stem and tree-like habit, with very large leaves and flowers, the latter almost identical with those of C. salvifolius, white with pale yellow at the base of each petal. In some plants the leaves were turned a bright crimson-a fact which we did not know how to explain. A little further on we found another species of Cistus, unknown by name, but covered with bright yellow flowers, and looking very pretty growing among the blocks of granite which were scattered over the ground. On the hillside above the baths we found Gladiolus serotinus, and near it a few plants of Asphodelus ramosus, which seems to be very common in Portugal, and which makes some of the low-lying plaios of the Alentajo quite pink as far as one can see. Our next find was a parasite on the roots of the Cork tree, a handsome plant of a bright purple colour; then Myrtus communis, and near it Viburnum tinus. On our way back we found Scilla pumila, and several other plants. In the Chestnut woods near our inn-which were very backward, not being yet in leaf—we found Rannoculus Ficaria, Primula acaulis, and Viola canina, Scilla pumila, making it look much like an English wood in spring; Pæonia officinalis, in full flower and coming up from seed as I dug up several young seedlings; Sarsaparilla (Smilax) climbing over a Bramble bush with its graceful clusters of reddish-brown berries; Saxifraga granulata growing on the top of every wall and dyke, making them a mass of white; while underneath in the crevices between the stones were numbers

of Ferns—Ceterach, Asplenium, &c.—making the tough granite wall look very pretty.

April 20.—A very showery day. We started for the highest peak of the Manchique at 11 o'clock; on the way up we found Erica arborea covered with flower, E. umbellata also in flower, Calluna vulgaris growing near but over. All the way up we found a pretty little purple Trichonema growing even at the very long among the stunted Furze and Bracken. At 1.30 we reached the top, which was marked by a pilar made of granite, and the ratin having fortunately stopped and the mist cleared off, we could see a little of the splendid view, looking towards the sea, of Portomão, Lagos, Faro, and Cape St. Vincent, and northwards of numberless hills with mule paths winding over them, and here and there a sierra, one of which our guide told us was the Sierra de Estrella. On our way down we found Rhododendron ponticum growing along the sides of the mountain streams, but only a few flowers out; also Lavandula stæchas. Scatt Wilson.

The Benbageous Bonden.

SINGLE DAFFODILS BECOMING DOUBLE, -A very few lines more and I have done with this subject until next spring. It is not a question of theory, or of probability, but of the evidence of facts. I ask those interested about it, not only to make experiments themselves, but to make enquiries amongst their gardening friends, and to get them to try. That genuine typical single wild Daffodils turn to the double of a larger garden variety is a statement naturally received with some incredulity, and I was quite prepared for a repetition of all the plausible arguments which have frequently before been adduced against it. In fact, the editorial answer we have so often seen made to those who have sent large double Daffodils as the garden produce of single wild Daffodils-" Your double flower belongs to quite a different variety, and cannot have been produced by the single wild Daffodil "-this answer, I say, appears reasonable and conclusive enough. But I have now received more than fifty letters on the subject, many of them recording observations which seem to have been carefully made; I may, therefore, fairly ask the readers of the Gardeners' Chronicle not to be too hasty in rejecting such evidence, and not to conclude that because a similar change does not take place in their garden the result must be the same in all soils. I have made an abstract of the evidence in the letters I have received, and a list of the gardens-more than twenty in number-to which I have sent for experiment typical wild Daffodils, collected far from any cultivated ground. That this labour may not be wasted, I have entrusted a copy of my abstract to Rev. Mr. G. Engleheart, of Appleshaw, near Andover, a gentleman whom I feel sure will soon be a high authority on Daffodils. We must probably be contented to wait two years until the question is definitely settled. C. Wolley Dod, Edge Hall, Malpas, Cheshire, May 10.

NARCISSUS ABSCISSUS AND N. BICOLOR. - During the last fortnight, and since writing the notes which appeared on p. 617, I have examined many flowers of N. abscissus, both sent from other gardens and flowering in my own. I find that in size and form they vary considerably, and I believe that further experience will show that the two forms figured as abscissus and bicolor meet. I shall be glad to be told that there is another and a more satisfactory bicolor wild somewhere; but, however this may be, I feel convinced that N. abscissus belongs to the bicolor group, and not to Pseudo-Narcissus, to which it is referred by the "new name" committee. It has the broad thick leaves, the nearly cylindrical and unreflexed trumpet, and the late-flowering habit of the bicolor section, and in colour corresponds exactly with lorifolius and rugilobus, two varieties sold by Mr. Barr, between which I have never succeeded in finding a difference. On the other hand, amongst a large collection of wild N. Pseudo-Narcissus collected from all parts of the kingdom, and from the South of France, I have only found in one instance an approach to the bicolor type in the form of the trumpet, though the white perianth is common frumpet, though the write personne to comment of enough. Mr. Peter Bart, however, is quite right in saying that we must grow these flowers in masses, and in the same soil, before we can fairly compare them. C. Wolley Dod, Edge Hall, Malpas, May 10.

DAFFODILS CHANGING FROM DOUBLE TO SINGLE, AND BACK AGAIN. — It is suggested on p. 616 that double Daffodils may become single through poverty of soil, and still continue to be potentially double. This is a point on which I have made experiments. I find that soil, though apparently poor, may have the doubling property; and, on the other hand, that double flowers may become single in rich soil. The soil of my flower-borders at Edge is very fertile in leaf-producing qualities, but nearly all double flowers have a tendency to become single in it. About five years ago Mr. Archer Hind sent me from Devonshire some double wild Daffodils in flower. They were nearly all of the form which typical N. Pseudo-Narcissus most commonly assumes when it doubles in its native fields. The trumpet, or crown, was quite full, but retained its cylindrical shape. In three years several of these were producing perlect single flowers, a stigma and pollen-bearing anthers being present. Last autumn I sept two or three of these to Mr. Archer Hind, believing that in the soil which had produced them they would recover their double form; and so they did, for at the end of last March he sent me the flower of one of them as double as ever. The Peerless Daffodil is liable to the same changes from double to single, and back again. This year I found a perfectly single flower of Orange Phoenix, from which I am trying to raise a stock of singles. I have before found it so nearly single that the filaments were represented only by rudimentary petals quite at the base of the cup. Mr. Peter Barr has more than once offered to double these again for I never doubted his power of doing so, but I would far rather keep them single. C. Wolley Dod, Edge Hall, May 12.

DOUBLING OF DAFFODILS .- Like many who are interested in the Daffodil, I am an unbeliever in the wonderful transformation, under certain conditions of culture, that takes place in the English Pseudo-Narcissus, passing from a comparatively dwarf plant, and one that will not thrive everywhere, into abscissus, remarkable for its tall growth, large flowers, robust habit, and which will grow anywhere, and withal of a deeper yellow colour. Still, such earnest workers as the Rev. Wolley Dod, and the Rev. E. H. Engleheart, must have good reasons for their firm belief in this extraordinary change. I hope, therefore, that Dr. Foster, and other members of the Council of the Royal Horticultural Society, who are not insensible to the importance of the statements put forth, will see their way to arrange a little conference of those interested in the subject at one of the spring meetings of 1885. Mr. Brockbank could then show us the ripe seed in the capsule of the N. Telamonius plants, and afford further information of changes in Daffodils which he has been noting. P. B.

DR. BROWN'S DOUBLE NARCISSUS NANUS. — Mr. Brockbank (p. 617) refers to flowers from Cork of double N. nanus, I also had flowers sent to me from the same source, and I consider them double Lent Lilies, and perfectly distinct from the flower sent by Dr. Brown to the Daffodil Conference. P. B.

NARCISSUS INCOMPARABILIS SEMI-PARTITUS. At p. 489 reference is made to the above showing symptoms of doubling. I also have a plant with the cup partially filled with florets, and have marked it for observation next year. I may mention that N. incomparabilis semi-partitus is, in my opinion, the single of Codlings and Cream Narcissus. P. B.

THE time has now arrived when the effect of the still beautiful spring bedding plants must be destroyed, to give place to those intended for the summer and autumn display. It seems rash and unjustifiable to adopt such extreme measures while the plants are still so lovely, but where the same garden is made to do double duty there is no alternative, for if the operation of removal is long delayed, the summer plants cannot establish themselves sufficiently early to produce that grand display in summer and autumn, which is expected from them, and of which they are capable when timely planting and due attention is afterwards paid them. These difficulties point most clearly to the desirability of making, where it is possible, the spring and summer gardens distinct and separate from each other; in short, it is only when they are so separated that the full beauties of each can be thoroughly appreciated, not only so, but the positions most suitable, and the surroundings best calculated to heighten and increase the effect of the respective plants used for the two purposes are so distinct, that one garden can never be used for the two purposes without the occurrence of frequent anomalies and occasional disappointment. Assuming that spring plants do occupy the beds now required for the summer plants, no time should be lost in effecting their removal, and in doing this it is highly important that the work should be done in a careful and methodical manner, otherwise not only will the numerous varieties of plants and bulbs become hopelessly mixed together, and be a source of considerable annoyance next year, but if due and timely attention be not paid to their special requirements many of them will die, and thus heavy expenses will he entailed in making good the deficiencies.

In the removal of such bulbs as Narcissus, Crocus, Hyacinths, and Tulips, should the foliage be already yellow or decayed, it will be sufficient to take them up carefully, name them, and then place them on mats or boards in a dry position to ripen; should the foliage, however, he still green and healthy, they should, on being taken out of the beds, be potted in very sandy loam, and then placed in a very warm sunny spot and moderately watered till the foliage dies down, when they may, with the others before mentioned, be placed on the shelves in the root-store until again required. Pansies, Violas, Daisies, Aubrietias, Arabis, Violets, and all similar plants should immediately on removal be cut back, divided where necessary, and transplanted into the reserve beds. They should be watered, shaded from bright sun for a few days until root-action recommences, after which they will give but little trouble, except to be kept clean till they are again required. Primroses, Polyanthuses, and all similar shade-loving plants, will require somewhat different treatment, as the hot summer's sun is more than they can endure without suffering greatly. They should be planted in such borders as receive but a small amount of sunshine; they also should have their bloom-spikes removed; they may also be divided to a small extent, but not very minutely at this season, otherwise they become so weakened as to be of little service for a considerable time afterwards.

As this class of plants is exceedingly useful, because they are so early and so floriferous, great care should be taken to mark, when in bloom, all the best varieties, and also to classify them, so as to keep the special colours distinct. In planting them after division, a good sandy loam should be chosen, with a liberal admixture of well-decayed leaf-mould, a substance which seems especially suited to them. A good packet of seed should be sown every year so as to keep up the

required stock of plants, and from which may be weeded the indifferent varieties as soon as they bloom. The present is an excellent time to do this, and at the same time a full sowing should also be made of the different varieties of Wallflowers, which are perhaps of equal value and importance, for the decoration of the spring garden, as the Primroses and Polyanthus. A warm sunny border should be selected, and as soon as the plants can be handled they should be transplanted into other beds, so as to keep them dwarf and induce them to make abundance of fibrous roots. Harbinger, Veitch's Dwarf Dark, Belvoir Castle Dwarf Yellow, and Goldem Gem, are the most useful varieties for this

As the spring plants are transferred to their summer quarters the beds should be immediately prepared to receive the summer plants, and as this double cropping necessarily impoverishes the soil very rapidly, it is advisable to rectify this, not only by the addition of such manures as will be most suitable to the plants, but also by the addition of new loam; also by these means the soil is kept fertile, without producing that exuberant growth which would result if manures only were applied. T. S. C.

The Pitchen Garden.

ERE this the Seakale season will have terminated, therefore the pots and boxes with which the plants were covered, together with the material which has been used as a covering, should be removed without further delay, if not already done. The flower-stalks on Rhubarb plants, which in some cases will be showing somewhat freely, should be removed as soon as they appear. Young plants of Broccoli, &c., should be pricked out in nursery beds as soon as they are large enough to handle-at all events, before the plants become crowded in the seed-beds—preparatory to being finally planted out. The plants should be allowed sufficient room to develope themselves during the time they are intended to occupy the nursery beds. This is a procedure that deserves more practical attention and adoption than it always receives, for it not unfrequently happens that seedling Broccoli, Cauliflower, &c., are allowed to grow closely together in seed-beds until they are required for finally planting out; and under these circumstances the plants, instead of making a stocky and consolidated growth, become lanky and weak. Early Peas, which are now podding, will be benefited by having an occasional soaking of weak liquid-manure. table Marrow plants should now be planted on the mounds or beds previously prepared for them, and under the protection of hand-glasses. If not already done, plant a sufficient number of Beetroot at the foot of a south wall for seed; and for the same purpose put sticks, one to each of the best formed heads of Cabbage, as a means of indicating their intended use. Where Parsnips are much sought after, a sowing made now will come in well for late use, Asparagus beds should be looked over daily, and have all the "grass" cut as soon as it is fit, washed, sized, and tied up in bundles, and stood on the ends in saucers containing a little water, in a cool room, until required for use.

Continue to make small sowings and plantings of Cos and Cabbage Lettuces at short intervals, so as to maintain a succession. Plant out Cauliflower and Cabbage plants, including the Red Dutch Cabbage, in quantity according to the demand. If transplanted during showery weather they will experience very Make another sowing of Carter's little check. Heartwell Marrow and Wheeler's Imperial Cabbages, to come in for autumn and winter use. Another sowing of Early Horn Carrots for drawing from, and of Early Ulm and Dwarf Curled Savoys for late plantings should be made, as also another sowing of Turnips. Thin out successional crops to 6 or 9 inches in the rows. Sow some more Round Spinach in rows from 12 to 15 inches apart, and clear the ground of the winter crop as soon as the springsown produce is fit for use, and get the ground manured and dug for other crops.

Where former directions in the way of seed-sowing and planting have not been attended to no time be lost in carrying out those cultural should now details in accordance with existing circumstances. Late plantings of both Cauliflowers and Potatos, Brussels Sprouts, &c., will require attention in the

way of earthing-up. Use the Dutch hoe freely among young crops, and let cleanliness and neatness, in addition to judicious cropping, be the order of the day. Look over the crop of autumn-sown Onions, pinch the tops out of those showing a disposition to run, and bend the stems of the others, not only with a view to reducing the chances of their running to seed, but to hasten the development of the bulbs, H. W. Ward.

The Bardy Fruit Barden.

NOTWITHSTANDING the sad accounts of the fruit crops from many low-lying localities, we still hope that many places have escaped the biting frosts which occurred during the latter part of April. Here bush fruits of all kinds will be plentiful, Apricots will be scarce, while Peaches have escaped, and are well set; Pears will be an average, and Apples will again be abundant, as the blossom of many sorts did not open till this month, for-

> " If Apples bloom in May, You may eat them night and day."

The wave of cold has given place to a sudden rise of temperature (86° in the shade), and although this may not last, still we shall be quite justified in removing all coverings from wall trees, carefully labelling and putting them away for another year where mice will not get at them. Where glass copings exist, we would on no account remove them at this time of the year, as they will help to retain the warmth during the night; and although the objection may be made, that the dews are kept off by covering them up, this can easily be made up by syringing with the garden engine between 5 and 6 P.M., in mild weather; this will refresh vegetation, and help to keep down insects, which now abound.

Many wall trees will now push out strong breastwood, especially where root-pruning has been neglected, therefore go over them and pinch the shoots with the finger and thumb. This will save the necessity of using the knife so freely by-and-bye, and make them more fruitful, and the same applies to pyramids and espaliers. The Strawberries promise well for a crop. Our Black Prince on a south border are a perfect sheet of bloom; but as the rainfall in many localities is considerably below the average, it will be well to give the beds a good watering. Weak liquid manure will be beneficial directly the fruit is set, as the juicy fruit cannot be produced in the best condition unless an abundant supply of moisture is afforded. This assistance is most wanted on shallow soils overlying gravelly subsoils.

Where mulching is not finished not a day should be lost in getting it done, thereby retaining moisture in the soil. The black aphis—an insect most difficult to kill-will soon begin to appear on the wall Cherries. Various plans are recommended, but we have found a decoction of home-made tobacco-water to be the best, which can be economically used by dipping the young shoots in the liquid. This plan answers well, more especially if taken in time.

Fig trees may now have all coverings removed from them, and although the tree loves warmth and a rather light soil, yet it is possible for it to "cast its untimely fruit " from want of moisture, especially if the trees are old, and the border in which the roots are is heavily cropped with other things. The crop, which is most promising this year, should be looked after in this respect, more especially it the season should continue dry. 7. Rust, Eridge Castle, Sussex.

SCHIZOCAPSA PLANTAGINEA. - Botanically this plant is of great importance as being the only genus besides Tacca presenting characters of the florat organs so paradoxically like those of the Amaryllis family as to be readily mistaken for it. The deeplylobed or pinnatisect leaves of some species of Tacca, however, and the mode of inflorescence in both, furnish a distinguishing feature at once to class them in a separate order. The greenish flowers are pro-duced in dense involucrate umbels, with long threadlike secondary bracts, which are altogether unique in their way. Several species of Tacca are worth cultitheir way. Several species of Tacca are worth cultivating for their ornamental Aroid-like foliage. Some have entire leaves, but may be distinguished from Schizocapsa by having a berried fruit, while the latter has a dry one.

APPOINTMENTS FOR THE ENSUING WEEK,

TUESDAY, May 20

Sale of Sir William Mariotr's collection of Orchids, and imported Orchids, from Mr. Sander, at Stevens' Rooms.

THURSDAY, May 21

THURSDAY, May 22

FRIDAY. May 23

FRIDAY. May 23

SATURDAY, May 24

SATURDAY, May 24

SATURDAY, May 24

SATURDAY, May 24

Linnan-Society: Anniversary Meeting, at 3 F.M.

W. E frequently hear the expression "the picture of health," and it would seem as if the HEALTH EXHIBITION must be something of the same character, the qualifying epithet, "International," being added, to indicate that artists of various nationalities are concerned in the work. We need not, however, quibble about the name, but as many of our readers may be arranging their plans, and making up their minds what they will and what they will not see in the forthcoming visit to London, we may at once suggest to them, that they are pretty sure to find a great deal to instruct and gratify them in the new Exhibition. Looked at merely as a sight, the wonderful reproduction of a street in Old London is a marvellous piece of realism, whose picturesque effect is all the more delightful from the singular contrast it affords to the essentially nineteenth century surroundings, and, may we add, from the absence of the mediæval cobbles and archaic drainage arrangements. The electric lighting, which is on a scale of unexampled magnitude, the costumes, the dairies in full operation, all these and numerous other matters are sure to attract sightseers, and can hardly fail to add to their stock of information. But it is not of these we would here speak, but rather of those matters more especially within our own department.

The programme of the exhibition is so wide that it might include without violence almost everything that pertains to gardening. Food products from the vegetable kingdom are, indeed, shown in a dried state from a few exhibitors, and doubtless, when the foreign courts get filled up we shall find a better representation of these products than we have hitherto seen in the necessarily incomplete examination we have yet been enabled to make. Decorative gardening is illustrated, so far as space permits, by certain of our leading nurserymen whose exhibits are alluded to in another column, and those who remember the state in which the garden was left at the close of the Fisheries Exhibition — a state in which it remained till a few weeks ago-will be surprised at the eminently satisfactory transformation which Mr. BARRON has effected in a short time. Other phases of decorative and utilitarian gardening will be represented by the numerous floral meetings, and exhibitions of truit and vegetables, which it is intended to hold throughout the season. Horticulture, therefore, is, to some extent, represented among the many elements which contribute to the health of the people—their food, their dwellings, their clothes, their instruction. Subject, however, to what may become apparent later on, when the exhibition is more complete, we venture to express the opinion that horticulture, as a whole, is rather inadequately represented. Considering the enormous importance of open spaces in thickly populated towns, we are surprised to find the subject of town squares, recreation-grounds, and parks, apparently not represented in a "health" exhibition. Detailed examination may, in the future, cause us to modify this opinion and reveal a fuller and better representation of the myriad vegetable substances used for food, clothing, medicine, and economic uses generally, and which are the subjects of cultivation in various countries. China and Venezuela are reported as likely to show well in these departments; but India and the Colonies seem to be inadequately represented.

Messrs. SUTTON and WEBB have done somewhat in this direction, principally from the point of view of agriculture, by exhibiting the stands and class of subjects familiar to visitors at agricultural shows, including samples of ensilage at present not so familiar. Messrs. CARTER & Co. have gone beyond this, and surprised us by an exhibition of samples-small indeed-of numerous vegetable products which we do not usually meet with on the stands of agricultural seedsmen. Messrs, Christy & Co. have a small case well filled with interesting objects of this character, many of them comparatively novel, and, what is more, they invite the visit (by previous appointment) of those interested to Malvern House, Sydenham, where many of the plants yielding the products in question may be seen in cultivation.

Now that so much interest attaches to germs and Bacteria, it may be well to call the attention of those who would like to know what they are like, to some admirable models in, we presume, the German (Prussian) Court-we say presume, for the geography and topography of the Exhibition in its present state are rather obscure. The models in question represent the Bacteria and their allies magnified some 25,000 times, but even with this enlargement they are not thicker than the finger, and do not look the direful things they really are.

We have frequently had occasion to call attention to the utter want of any thorough systematic instruction in the principles and practice of gardening in this country, and to contrast it with the different state of things in Belgium, France, Germany, and the United States. It was with additional pleasure, therefore, that, on passing into the Belgian Court, we lighted upon a large model in relief of the School of Horticulture at Vilvorde, with its lecture-rooms, museum, kitchen garden, orchard, fruit garden, flower garden, and plantations. The model is, as we have said, of very large size, and may serve to give an idea of the kind of establishment our neighbours think requisite for the training of the gardeners of the future. From a tabular statement attached we find that in this garden, presided over by Mr. GILLEKENS, there are 1662 varieties of Pears under cultivation, 597 sorts of Apples, Peaches muster 154 sorts, Plums, 145; Cherries, 151; and so on in proportion with other fruit trees. Of vegetables 804 sorts are grown for comparison and trial, 648 ornamental trees, and

Of the numerous exhibits connected with construction, heating, ventilation, and drainage, we may now and then find occasion to speak; suffice it now to repeat that not only the general visitor but the gardener in particular will find plenty to engage his attention in this new Exhibition, apart from the ordinary shows of the Royal Horticultural Society, which will be held in the great conservatory.

- PÆONIES.-Now that garish Sunflowers have enjoyed the sun of popular favour, and the modest Daffodil has been suddenly lifted, to its own regret we imagine, to notorious prominence, we may expect the gorgeous Pæonies to have their turn. For boldness of form and superb coloration there are no plants to equal them, and, moreover, they are absolutely hardy, and though repaying the outlay of a little manure, and a little labour expended on the soil, require as little in the way of cultivation as any border flower we know. They may be grown in heds or borders in well-trenched, rich soil, or they may occupy the front of shrubberies. Occasionally they are planted in woodland walks, in the grass by the side of carriage-drives and similar situations, but, to our thinking, nowhere is their extraordinary brilliancy of coloration so. effective as when grown in the full sunshine. Their great fleshy roots resemble Dahlia tubers, but need no such protection as we are wout to give to the latter. P. officinalis, a native of Central and Southern Europe, has furnished our gardens with numerous variations in the colour of the flower and also in the The hairy seed-pods, lined amount of doubling. with red, and with scarlet axils to the dark blue seeds, are almost as attractive as the flowers themselves. tenuifolia, a species native of Hungary and Southern Russia, has somewhat smaller flowers than the preceding, equally rich, but less varied in colouring; the foliage is cut up into numerous very narrow segments, like those of the leaf of Fennel. P. corallina is a native of Southern Europe, with less deeply divided leaves than P. officinalis, and bright red flowers. This species, shown in the upper part of our illustration (fig. 124), has been naturalised on an islet in the Severa, but is not considered to have any claim to be rated as a native plant. P. Wittmanniana is remarkable for its pale yellow flowers. In all the preceding species the stalks bear solitary flowers, but in P. albiflora the stem branches at the upper part into a number of stalks, each surmounted by a large whitish or rose-coloured fragrant flower. Numerous varieties of this species (a native of China) exist in gardens, ranging in colour from pure white and pale yellow to deep purple. The flowers, which are produced later in the season than the foregoing, have considerable resemblance to those of the Moutan, or Tree Pæonies, which, though slightly more tender than the perennial species, are so strikingly beautiful that it is a marvel that their cultivation should have so much declined of late years. What are called hybrid Pæonies are, we believe, for the most part selected seedling variations from P. officinalis or P. albiflora. No hybrids of this genus are mentioned in Dr. FOCKE's enumeration of known hybrids, though many such are enumerated in nursery catalogues.

- AWARDS OF THE FLORAL COMMITTEE,-We are glad to be able to announce that the Royal Horticultural Society has at last published what has long been badly wanted—a complete list of the awards made by the Fruit and Floral Committees from 1872 to February 12, 1884. It is published at the Society's office, at the price of 1s.

- Mr. J. VAN DER SWAELMEN, of Ghent, has, we hear, been appointed by the French Government a Chevalier of the order for "Mérite Agricole."

--- FRUIT PROSPECTS IN THE LOTHIANS. - A Midlothian correspondent writes :- "I am glad to say that we have, to a great extent, escaped the great damage done to the fruit crop by the late frosts in England. Although we had 9° of frost on April 25, the fruit-blossom suffered less than usual, owing to the dry state of everything at the time. Generally around here there appears to be a full crop of hardy fruit in most gardens and orchards, and surely we are safe now from frost. For the past week the weather has been uncommonly genial, and vegetation is rushing ahead.'

- Anthurium Scherzerianum giganteum, PINCE'S VAR.—A fine spathe, measuring 6 ioches in length and 3 in width, of a dark blood-red colour, comes from Messrs. Lucombe, PINCE & Co., of Exeter Nursery. It is a very fine variety, and the immense spathe sent is said to be of the ordinary quality horne by this form. The West of England is rich in fine varieties of this plant, the one of which Messrs. Lucombe, Pince & Co. send the spathe and the famed variety of CYPHER of Cheltenham being two of the very best.

- DAMAGE TO TREES .- One of those now too common cases in which owners of trees are made to suffer loss through the act of some manufacturer or other person engaged in an offensive business came before the Queen's Bench Court of Justice a few days since. The plaintiffs are owners of market orchards at North Hyde, Middlesex, let to Mr. WILD, a market gardener, and the defendant is a brick-burner. The plaintiffs alleged that through the contiguity of the brick-kilns the adjoining fruit trees were seared or burned, the leaves blackened, and the fruit prematurely dropped. The claim was for £100 damages, and the injury done to the trees seemed to be clearly proved. Curiously enough, in what might be well regarded as a simple matter of fact and nothing more, there was no lack of evidence to show that no injury whatever had been done. As the damage referred to last year's produce, it must be admitted that the pre-sent was not the most desirable time for adjudicating on

Fig. 124,—single pæonies. (see p. 644.)

the matter, as now the kilns are not being employed. Had the case been tried a few months hence, when the kilns are in full operation, ocular demonstration might have been obtained by both judge and jury, were they willing to ascertain the facts as to which body of witnesses were in the right. Really, cases of this sort seem simple and straightforward enough, and yet lead to as much hard swearing as some running-down action. If trees suffer specially, the inference naturally is that special causes have operated to produce the injury, and here that inference was strongly supported by the nearness of the brick-kilns. That these emit gases or fumes of the most deleterious kind we know from practical experience, and their immediate contiguity to vegetation or human habitations must always be a source of danger.

— THE REMOVAL OF A GREENHOUSE,—At High Ashurst, Dorking, the residence of the Hon. H. D. Ryder, an ornamentally constructed span-roofed conservatory, 32 feet by 18 feet, consisting entirely of iron and glass, and having a fixed roof and side sashes, has recently been lifted from off its brick bed, and transported to a new site. The work, which, owing to the rapid ascent of the ground, presented considerable difficulties, was concluded successfully, with the trifling damage of two broken panes, by Messris, J. Gray & Sons, of Danvers Street, Chelsea, S.W.

— JUNIPERUS SINENSIS AUREA, — This smallgrowing coniferous shrub is of a rich golden hue which has the desirable quality of constancy, making the plant presentable at all seasons alike, thus differing from Thuia aurea sinensis, which is only truly golden when growing. It will find its place either in groups or masses in the winter garden arrangements, for which it is well adapted, and when of due dimensions as an isolated plant for the house, garden, or small partere.

--- MEAT FOR TREES .- The belief in the carnivorous requirements of trees has not quite become an exploded matter in some parts of the Continent, if it has fortunately been banished from amongst ourselves. Many of the older members of the craft could tell some singular doings as to root feeding that occurred in the earlier years of this century, which would fairly pair off with the following :- A gardener in Prussia pair on with the ionowing: —A gardener is repossessed an old Apple tree of the there well known Red Stettiner kind, which, in spite of all his care and endeavours, refused to bear fruit, but yet made very strong wood. In this difficulty he tried the effects of ringing the bark, but with but little resultthe tree bore a few fruits, of which some fell off during the summer; but this was not the effect of too great a flow of sap, the ringing having possibly prevented that. It occurred to him at last that the roots were not obtaining the necessary food, and just then a horse died; this was cut up into pieces and buried in the soil round the tree, about as distant from the bole as the branches reached. The results that followed this operation were astounding, for the hitherto unfruitful tree has borne splendid crops of fruits ever since-of course, thanks to the buried horse-beef in its larder.

— ROYAL METEOROLOGICAL SOCIETY,—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 21st inst., at 7 P.M., the following papers will be read:—"Note on the Proceedings of the International Polar Conference, held at Vienna, April, 1884," by ROBERT H. SCOTT, M.A., F.R.S., President; "Meteorological Observations on the Maloja Plateau, Upper Engadine, 6000 feet above the Sea," by A. Tucker Wise, M.D., F.R. Met. Soc.; "On some Results of an Examination of the Barometric Variations in Western India," by A. NAYLOR PEARSON, F.R. Met. Soc.; "Illustrations of the Mode of taking Meteorological Averages by the Method of Weighing Paper Diagrams," by RICHARD INWARDS, F.R. Met. Soc., F.R.A.S.; "Ten Years' Weather in the Midlands," by RUPERT T. SMITH, F.R. Met. Soc.

—— HEREACEOUS CALCEOLARIAS.—In Mr. H. B. SMITH'S new nursery at Hanwell there may be seen some 2500 plants of Calceolarias, the most forward of which are quite ready for market, with others coming on to succeed them. They illustrate in a remarkable manner what a market grower can produce in a 48-sized put. One long span-roofed house, with a flat stage on either side, is full of many

hundreds of these plants, and the strain is remarkable because of the half-shrubby character of the plants, their uniform growth, the fine trusses of bloom, the size and shape of the individual flowers, and the marvellous variety of colours. The height of the plants averages 9 inches, a very few rise to 12 and 15 inches, but these will be rejected for seed purposes. The prevalence of dark, and especially of purple colours, is striking. In collections of her-baceous Calceolarias one frequently notes the undue predominance of yellow flowers, which serves to give a character of sameness to a group, but no such disposition strikes one at the Hanwell nurseries. A number-say 200 or 300-had been shifted into 32-sized pots, and have grown charming specimens, without any sacrifice of the dwarf habit of growth, but as this size of pot is too large for market purposes the great bulk will remain in puts of smaller size. The seeds were sown about the first week in September; as soon as the little plants were large enough they were pricked off into store boxes, then placed singly in thumb pots, and finally shifted into 48's. Thus in the short space of eight months charming plants can be had, and if they had been shifted a little more frequently they would have been some way towards reaching good specimens.

—— AMARVLLIS BELLADONNA.—The mild winter was favourable to a wonderful development of growth in these plants: they may be said to have put forth in early spring an unusual harvest of strong foliage. On the fine border of this plant at Gunnersbury Park this can be witnessed, and next autumn there should be a harvest of flowers of unusual quantity. It has now been planted something like six years, and the surface is literally covered with vigorous leaves. The border was thoroughly planted in the first instance, and Mr. ROBERTS expects it to last another half-dozen years before it will be necessary to lift, divide, and replant.

—— HULL BOTANIC GARDEN.—Schedules have been issued for a flower show to be held in these gardens on July 2, 3, and 4.

- APPLES IN NORTHERN FRANCE. - The Apple crop in this country last year was an exceptionally good one, and the same seems to have been the case in Northern France. In the Department of La Manche it was unprecedented, and was gathered in excellent condition. As in the South a good Grape year brings wealth and happiness in its train, so certain parts of Normandy and Brittany a favourable Apple season is an earnest of contentment and comfort for almost all classes in these parts. Cider is the only drink of the country, and its price is an important factor in household expenses; besides, most farmers have orchards, and it is observed that when the crop is large the quantity more than compensates for the fall in price which accompanies a favourable season. In 1883 Apples were readily sold at 1 f. 50 c. for 100 litres, and up to 2 f. for good samples. As a result, the cost of cider has been reduced, and this wholesome beverage is now within the reach of even the poorest of the people.

— Anemone Favonia.—This, which is known also as the Peacock Anemone, is a singular variety, though doubtless closely allied to the common garden type. Mr. H. B. SMITH has a large piece of it in his nursery at Hanwell, and finds the flowers to sell well in Covent Garden. It is double in character, having a margin of rich red segments, with a very close and compact centre of bright green petals, of such a hue of green as one would like to see on a green-edged Auricula. In good ground it grows to a height of from 8 to 10 inches, and it is very free of bloom. It makes charming patches in the open border, and apparently the best way to manage it is to plant it in good soil, and permit it to remain undisturbed. Gardeners will find it very useful to grow in quantity to cut from.

— CYCLAMEN PERSICUM SEEDING.—Those who have experience of this plant when it is forming its seed-pods know that it is of frequent occurrence that the stems of the seed-pods turn soft, and a kind of rot sets in which causes the loss of the pods. Now, if the rotting stalks come into contact with other stalks the element of decay is imparted to them, as if there was a kind of infection through the contact. At this season of the year growers of Cyclamens—who, by the way, are careful not to overburden their plants with too many seed-pods, six or eight being

ample—go carefully over their plants, taking care that no seed-stem is in contact with an affected one, and laying them regularly round the plant away from each other, so that this cannot possibly happen. By this means valuable seed is saved which might otherwise he last.

— CHOISYA TERNATA.—The more one sees of this plant the more one is struck with its great usefulness as a decorative subject, and for cutting from at this season of the year. Mr. J. ROBERTS has some charming specimens in one of his plant-houses at Gunnersbury Park, plants of a bushy character, and flowering very freely. The plants are kept in small pots, and planged in the open air in summer; this induces a short stocky growth and the production of flower-buds, and the trusses are as plentiful as any one would well desire to see them.

— ADIANTUM MUNDULUM.—What a beautiful Maidenhair this is, and were it appreciated as it should be it would displace the valuable old A. cuneatum to a great extent. It has smaller pinne than this: they are of a triangular form, and apparently intermediate in size between those of A. cuneatum and A. gracillimum, and there is something more to be said for it—it stands well in a cut state, and is charming for backing up buttonholes.

- FREESIAS, - These are such beautiful subjects that it is no wonder they stand so high in the estimation of lovers of Cape bulbs. Mr. ROBERTS grows these and other Cape bulbs with great success at Gunnersbury Park. F. Leichtlini is very beautiful, the flowers being white or pale creamy-yellow, with a rich yellow marking or blotch on the lower segments. F. reracta alba is longer in the flower, and is very pleasing With these are associated two very pretty Sparaxis, viz., Josephine, white, with yellow centre; and Leopard, primrose, with deep golden centre. Another very showy form is S. tricolor, with its red, white, and golden flowers. Ixias are rapidly coming on to succeed these. Really there is no difficulty in growing them treated as they are at Gunnersbury. A few bulbs are placed in a 48-sized pot, a nice light free soil being used, and batches are pitted successionally through the autumn; the pots are placed in a cold frame, where they are wintered, and as they advance in growth they are taken into a warm house to flower. It can scarely be said they are forced; but they expand their flowers a little earlier through being in a comfortable temperature.

— CATALPA TREES IN NEW SOUTH WALES,—
Recent advices from New South Wales state that the
Catalpa trees (C. speciosa) which have been introduced
from America—in the forests of which they form some
of the most valuable trees—are in a very flourishing
state, beiog remarkably healthy and vigorous in
their growth. The tree is described as being remarkable for its durability and size, and for its imperviousness to damp. It is considered especially
suitable for the construction of bridges, railway
sleepers, and all other purposes where a hard and
durable wood is required. The tree has succeeded so
well in the plantation where it has been introduced
that it is intended to extend it to other parts of New
South Wales.

- KALANCHOE GRANDIFLORA, -If allowed to cumber the house on the make-shift sort of system, as plants of this character often are, nothing is more damaging to their reputation, while, on the other hand, a little attention to their requirements produces surprising results. The present plant is no exception, and the shrubby stems, together with the glancous metallic hoe of the leaves, furnish a distinctive feature well worthy of attention for mixing even with conservatory plants of more slender and graceful habit, if a separate structure cannot be devoted to succulent plants. The terminal cymes of large yellow flowers are conspicuous enough to attract attention, while a sweet and agreeable odour pervades the atmosphere in which they are grown. In the succulent-house at Kew two forms have been flowering for some time, the one having short broad petals, while those of the other are much parrower and longer, and evidently less odoriferous.

—— PLANTING BURNHAM COMMON.—Messrs, LITTLE & BALLANTYNE, of Carlisle, have just completed on the common adjoining Burnham Beeches a scheme of planting which will be very interesting to Londoners especially. The scheme, says the Times, consists in the covering of the common with some fifty groups of Beech trees, planted in irregular outline, and in the planting, in addition, of 5000 young Beech and Oak trees. The latter are placed promiscuously over the common, and are from 12 inches to 18 inches in height. The trees in the groups are larger, about 4 feet high, and each group contains from fifteen to twenty-five trees. Landscape effect in the future has been an important object in the arrangement.

—— A New Brownea.—Mr. Bull. has a new Brownea in flower—a hybrid between B. grandiceps and B. Arhiza, and which in habit is quite intermediate between its parents, with a dense terminal head of bright carmine flowers. Browneas flower so seldom and especially in a young state, that the instance is worth recording.

—— FIG NEGRO LARGO.—This excellent variety is fruiting with marvellous freedom in the Fig-house at Gunnersbury Park. The plants are in pots, and Mr. ROBERTS states that though he has tried various means of fruiting it when planted out, he cannot succeed in doing so, while in pots it is all he could desire. Overhead, from the large planted-out trees of White Marseilles and Brown Turkey, he is taking heavy crops; and these trees, always burdened with fruit, appear to be even more prolific in bearing this year.

ACANTHOMINTA ILICIFOLIA,—"A singular little plant, with much the habit of a small Lamium, and a faintly aromatic smell." The whorled flowers are purplish, like those of the common purple Dead Nettle. Native of southern California. "The chief interest of the plant is botanical as being a monotypic genus, the affinities of which are with a genus of far distant tropical Brazil. Betanical Magazine, t, 6570.

—— LABICHEA LANCEOLATA.—A West Australian leguminous plant, closely allied to Cassia, but having only two stamens. The glossy leaves are three-foliolate, the central one five or six times longer than the side ones. The flowers, about \(^3\) inch in diameter, are of a yellowish colour, and produced in abundance. A very desirable greenhouse plant, Botanical Mogazine, t. 6751.

— COFFEA TRAVANCORENSIS is a small South Indian species, with leaves of variable form, generally more or less elliptic, and with numerous white salvershaped flowers. Botanical Magazine, t. 6749.

—— SKIMMIA OBLATA.—An excellent under-shrub for winter gardening, for the furnishing of small beds, or for forming a border to large ones. The foliage is neat, therefore not likely to be injured by wind. It is perfectly hardy, and flowers profusely, but sets no berries, as its congener, S. japonica, does; for that we must await the arrival of its mate, as we were compelled to do in the case of the Aucuba.

— TORENIA FOURNIERL.—"The most beautiful species of the genus often confounded with T. asiatica, from which it differs wholly in the terminal and more or less racemnse inflorescence," and with "no tooth at the base of the longer filaments." The plant was introduced from Cochia China by M. GODEFROY, and sent out by M. LINDEN. The upper lip of the flower is pale lilac, the lower bright violet, the central lobe having an orange blotch at the base. Botanical Magazine, t. 6747.

— CINERARIAS IN THE OPEN AIR.—A Chepstow correspondent writes:—"A Cineraria is now in bloom, that has been out the whole winter in a sheltered place in a garden in Gloucestershire."

LINNEAN SOCIETY.—The anniversary meeting of the Linnean Society will be held on Saturday, May 24, at 3 P.M.

--- THE SALE BOTANICAL SOCIETY will hold its second horticultural exhibition in the Botanical Gardens on June 19, 20, and 21.

— RANSOMES, SIMS & JEFFERIES, LIMITED.— We are informed that, on account of the continuous extension of their business, and the desirability of fixing the capital employed in it, Messrs, RANSOMES, HEAD & JEFFERIES have converted their partnership into a private limited company, constituted under the Companies' Acts, 1862 to 1883, which has been registered, and will be henceforward carried on under the name of "RANSOMES, SINS & JEFFERIES, Limited." The new company has acquired all the assets, and will discharge all the liabilities of the partnership. The management of the business of the company will be continued by the partners of the late firm, viz.:—ROBERT CHARLES RANSOME, JAMES EDWARD RANSOME, JOHN ROBERT JEFFERIES, who, together with Mr. WILLIAM DILLWYN SIMS, and members of their respective families, are the shareholders in the new company.

- MAXILLARIA LUTEO-ALBA.-A large number of the species belonging to the genus Maxillaria are by no means looked upon with affection by most Orchid growers. The species, however, named at the com-mencement of this note is handsome enough to deserve a place in any collection of showy Orchids, and is wonderfully different from the small-flowered dull-coloured epiphytes which are generally associated with the genus Maxillaria. It is, moreover, a free grower, and a profuse bloomer. The large flowers are borne on scapes 6 inches or more in length, and last a considerable time when cut. The sepals and petals are yellowish-brown; the lip is yellow, margined with white, and the throat is striped with purple. Some short time ago Mr. WILLIAMS was awarded a First-class Certificate at the Royal Horticultural Society for a plant of this species. A good figure is given in WARNER'S and WILLIAMS' Orchid Album, tab. 106.

THE WEATHER, -General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 12, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: -The weather varied greatly in different localities and on different days. During the first part of the time it was generally cool, cloudy and showery; but subsequently it became very fine and warm at all except our extreme north and south-west stations. By the close of the period, however, it had again become unsettled, and over the greater part of England sharp thunderstorms were experienced. The temperature has been 1° below the mean in "Scotland, N.," and about equal to it in "Scotland, W.," and "England, S.W."; but from r to 3° below it elsewhere. The maxima, which were generally registered on the 11th, were unusually high, especially over the north-west, central, and south-east parts of England. At Bawtry the thermometer rose to 83°, at Newton Regny to 80°, at several of our south-east stations to 78° The minima were recorded either on the 6th or 7th, and varied from 29° in "Scotland, E.," to 31° in "Scotland, N.," and "Ireland, S.," to 43° in the Channel Islands. The rainfall has been .rather more than the mean in Scotland and the North of Ireland, and about equal to its normal value in "England, N.W.," and "Ireland, S.," but less in all other districts. Bright sunshine has been much more prevalent than during last week over Central, Southern, and Eastern England, and in the Channel Islands, but shows no material change elsewhere. The percentage of possible duration varied from between 21 and 27 in the northern and northwestern parts of the kingdom, and 55 in "England, E.," and 62 in the Channel Islands. Depressions observed :- At the opening of this period a disturbance was passing away from our neighbourhood in a north-easterly direction, and the barometer in our islands and France was rising, with moderate northwest breezes. By the morning of the 7th, however, pressure had given way briskly on our western coasts, and during the remainder of the week a series of depressions, travelled north-easterly over or to the westward of our extreme north-west and west coasts, while over France and the south of England the mercury was comparatively high and steady, south to south-west winds, fresh or strong at times in the west and north-west, consequently became general over the United Kingdom, but the formation of some thunderstorm depressions over the south-east of England and north of France on the 12th caused the direction of the wind over England to vary considerably.

— GARDENING APPOINTMENT. — Mr. T. Do-HERTY, late Foreman to Mr. LETTS, Aske Hall, Richmond, Yorkshire, has been engaged as Gardener to Lord NORTH, Wroxton Abbey, Banbury, in succession to Mr. FINLAY, who is seeking another engagement.

∯loqists' ∯lowers.

ALPINE AURICULAS.—In the group of these shown by Mr. C. Turner, of Slough, at the Royal Horticultural Society's meeting on Tuesday last, were a few pretty varieties deserving a passing note. The following were all shaded flowers with golden centres:—Mrs. Ball, very pretty indeed; W. H. Grenfell, Titian, Unique, very fine, a beautiful exhibition flower; Nemesis, King of the Belgians, extra fine; Model, the centre creamy-yellow; and Homer, very rich in colour. Of shaded flowers with creamy-white centres the following are very good:—Jewel, Corsair, Queen Victoria, and Mrs. Dodwell. To those contemplating making a collection of alpine Auriculas it may be said that the shaded flowers take highest rank for exhibition purposes. Most of the foregoing are new varieties not yet distributed, but when announced they may be added to collections with advantage.

NEW TREE CARNATIONS .- It was but a few blooms of these Mr. Turner had on Tuesday last, but they served to indicate the qualities of size, form and varieties. Mrs. Maclaren, to which a First-class Certificate of Merit was awarded, is a crimson bizarre, flaked with rosy-pink and purplish-crimson on a white ground, large full flowers, stout and finely rounded petals. One bloom of this variety had a blush ground very delicately tinted with purple, and with stripes and flakes of rich deep purple; in this character it was very attractive indeed. Mrs. Llewellyn is a fine variety, a self of a purplish-rose hue. Ruby is a bright purple self, full and striking; Negro is a deep crimson self, the petals nicely fimbriated; in this character it is highly attractive. Rufus is very rich in colour, brilliant scarlet, with a slightly fimbriated edge, charming to look upon, and deserving a place in every collection. Mrs. Dix is heavily suffused with orange-red, a fine full flower. Le Perle is smaller in size, pure white ground, with a kind of edging or lacing of small flakes of deep pink-a very good lot

THE NEW DAHLIAS OF ISSA. - These, if not very numerous, yet include some varieties of which raisers and distributors may reasonably be proud. The fact that new varieties are few may be taken as illustrating the fact that it is now difficult to produce varieties that mark distinct advances upon existing varieties, and therefore those who send out new Dahlias are cautious in selectiog what they shall distribute. Sometimes a flower showing great promise when exhibited for the first time becomes, perhaps by reason of excessive propagation, or from some other cause that Nature prefers to keep as a secret of her own, deteriorated, and is found quite disappointing upon trial; another, thought to be scarcely above the average, yet under careful cultivation flashes out into a variety of such unexpected quality as to be a veritable floral surprise, and these contrarieties are confined not alone to the Dahlia.

Foremost among the new varieties now being distributed by Mr. Turner must be placed Mr. W. E. Gladstone. This was shown and certificated at the Dahlia show at the Crystal Palace last September under the name of Mrs. Hurst, the wife of the raiser, but was subsequently changed to Mr. Gladstone, under which name it was certificated by the Royal Horticultural Society. It is a charming delicate flower of an exceedingly pleasing character, and perfect in form; the ground colour delicate soft fleshypink, which when shaded becomes even more delicate It is a jewel among show flowers, and it is regarded as very constant, good habit, 4 feet in height. Muriel Fellowes is a full-sized, well formed yellow self, that must prove as useful in the flower garden as in the exhibition stand; it comes of a good size, is very constant, and grows to a height of 3 to 4 feet. Ruby Gem (Harris), will be remembered by some as a rubycrimson ground flower, with a small yellow tip to the petals, reminding us of Stafford's Gem; distinct, good outline petal, and centre. These three form Mr.
Turner's trio of new show varieties for the present

Messrs. Keynes & Co. have eight varieties, seven of which are of their own raising, viz.:—Dewdrop, dark primrose, a pleasing self of good properties, likely to prove very useful; Lucy Berry, lilac, suffused with white at the base of the petals, fine form, perfect outline and high centre. a flower likely to give general satisfaction; Mrs. F. Foreman, a large bright lilac self, rich in colonr, good form, and a useful show variety; Mrs. G. R. Jefford, a deep yellow self, of excellent properties; Mrs. W. Haskins, a very pretty fawn coloured flower, distinct, good in every respect, first-class in petal and outline; Mrs. Staples, yellow ground, edged with crimson, a neat, well-formed flower of pleasing character; and Statesman, a large purplish-crimson self, constant and useful. The last of the floral octave is Grand National (Eckford), a large yellow self of good form and quality, of good habit and dwarf growth.

Of new fancy Dahlias, Mr. C. Turner has one, viz., Duchess of Albany, one of the sports from Gaiety, but in this case the flowers are striped with rich crimson on a pale orange ground, there being an absence of the white tip: a pleasing and distinct flower. Messrs. Keynes & Co. have four, viz.:—Arabella, buff, with scarlet and crimson stripes, good form; Alderman, lilac, heavily striped and splashed with purple, pretty and distinct; Goldfinch, yellow, striped with purple and tipped with white, a pretty and somewhat curiously marked variety; and Lotty Eckford, white, beautifully striped with purple, good form and very attractive. All the new facey varieties are of quite dwarf growth, and among the new Dahlias of the past few years can be detected a marked disposition to throw their flowers fully erect, which feature adds greatly to their value as decorative plants. K. D.

Notices of Books.

The River Congo, from its Mouth to Bolobo, &c. By H. H. Johnston, F.Z.S. (Sampson Low & Co., 1884.)

It is unfortunately notorious that a book of travel is usually unsatisfactory. Either the traveller is a bad observer, unable to see, incompetent to appreciate what he does see, without sense of proportion, and ignorant of what is likely to interest the reader; or, if he be possessed of the requisite knowledge and powers of observation he may lack the faculty of laying before the reader in an interesting form the results of his investigations. Mr. Johnston belongs evidently to a different type. He is full of intelligence and zeal; he knows what to look for, and how to look at it; he admires, or at least appreciates all he sees, and his pages happily reflect the buoyant zeal of his temperament. The consequence is that we have a book of travel that is not only full of valuable in-formation, but which is as readable as a novel—a great deal more so, indeed, than most. In most books of this character—especially those written by sportsmen-the reader lays down the book with a feeling of regret that such opportunities should fall to the lot of those who can turn them to so little account for the benefit of others. In other cases we are tantalised by glowing descriptions of bird or plant, so drawn up that no mortal can form an idea what the creature or the plant really was. We do not grudge these gentlemen their travel nor their sport, but they need not write books. On the other hand, we bave reason to be thankful to Mr. Johnston for his accurate word painting no less than for the delightful freshness and vigour of his style. "I have merely tried," the author says, "to produce with pen and brush an ordinary guide-book to the Congo which may convey to intending travellers or stay-at-home folks a fairly just impression of the great river. All that is written or drawn within has been directly done from Nature, and the faultiness in it arises more from incompleteness of detail than from incorrect outline." Such is the author's too modest account of his book, the perusal of which leads us to say that the so-styled incompleteness of detail is in this case an advantage rather than otherwise to the general reader, for whom the book is written, while the firm, evidently truthful outline serves admirably to give the reader a distinct impression of the nature of the country traversed, and of its main features, physical and vital. Starting from Angola, Mr. Johnston made his way northwards to the month of the Congo, and then passed along the course of the river eastward as far as Bolobo, some course of the river eastward as are as botton, some 300 miles from the coast. From Sierra Leone down to some 4° or 5° south of the equator the dense tropical forest—the abode of the gorilla—skirts the coast, extending inland as far as the Victoria Nyanza

and Lake Tanganyika. To the south of this is a 'savannah" country, less densely wooded and more "park-like" than the former region-a designation, says the author, "which its open grassy spaces and formal groups of shady trees amply justify." Through this district, abounding, as we shall see, in interesting plants, many of which have been made known to us by Welwitsch, Mr. Johnston passed on his way to visit Mr. Stanley and the various mission stations of the African Association, established under the auspices of the King of the Belgians. South of this a tract of sparse vegetation and scanty rainfall occupies the coast live, and this in its turn shades off into sandy wastes, with little or no rainfall, and consequent paucity of vegetation. Here is the home of the Welwitschia. But the interest of the present volume lies entirely in the park-like district through which the lower Congo flows. What it is like we had better let Mr. Johnston tell for himself. He has scarcely got heyond the mouth of the river at Kissangé when he writes thus :-

ing flower-stalks, grow in groups of forty or fifty together, often reflected in the shallow pools of stagnant water round their bases and filling up the foreground of the high purple-green forest with a blaze of tender Peach-like colour. Higher up the Congo, near Stanley Pool, this is what the author says:—

"On this point, rising nearly perpendicularly from the water, the forest climbs the hill-sides, higher than the eye can reach, without a single break in its Inxuriance, The variety of colours, too, at this season, when most of the trees are in blossom, is particularly striking. One tree will be covered with scarlet flowers scattered with a liberal hand, another has pendulous flowers cat prinkywhite hanging gracefully by their long stalks amid the sombre mass of foliage, while errant creepers in exuberant growth trail their yellow and purple blossoms over the victims they entwine. There is every note struck in the gamut of green, and the trees that form this mass of foliage may vary in tone from blue-green to greenish-yellow, and from greenish-white to russet-red, and they will differ equally in form and aspect. While some are compactly massed in their leafage, others grow errati-

FIG. 125.—CRINUM ZEYLANICUM.

"Our adjectives are too puny to describe fully the vegetation of such places as Kissangé. We want to express ourselves in the tongues of Central Africa, which have sometimes seven different terms to express different kinds of forest. . . There is a splendour of vegetable growth that defies an adequate rendenng either with the brush or the pen. The hot sun and the ozy mud call into existence a plant-life which must parallel in rank luxuriance and monstrous growth the forests of the coal measures, and reproduce for our eyes in these degenerate days somewhat of the majesty of the vegetable kingdom in bygone epochs,"

Again, as to the floral display, which some writers have rather disparaged, Mr. Johoston tells us that "in Tropical Africa, at least, is iovalidated the theory of some naturalists, that the equatorial region cannot offer flower shows like those of the temperate zone." Among these flowers the terrestrial Orchid, Lissochilas giganteus, which shoots up to a height of 6 feet from the ground, greatly struck Mr. Johnston, bearing as it does "such a head of red-mauve golden-centred blossoms as scarcely any flower in the world can equal for heauty and delicacy of form. These Orchids with their light green spear-like leaves and their tall sway-

cally and in disordered tufts. Beautiful Mimosas dominate their fellows clothed in foliage of dark green velvet; Draceenas raise their spikey heads here and there from out of the soft, verdant mass. The large flat leaves of a Fig alternate with the feathery Palm fronds, while many stems are completely disguised by the network of graceful creepers which masks them like a vegetable cobweb. The Calamus Palm makes a sort of latticework fence, rising straight up from the water's edge, and seems effectually to forbid trespassing in these fairy forests, while along the river's brim lines of white Lilies (Crinums) stand like sentinels to see the barrier is not passed." (Fig. 125.)

For absolute gorgeousness, however, nothing can compare with the fruits of the Cucurbitaceæ, with their rich colours to attract the attention of birds,

How good an observer the author is may be illustrated by what he says about the Dracemas and the succulent Euphorbias, which he never saw in a wild state, but always in the immediate vicinity of villages or habitations, the explanation being that the uninhabited portion of the country is periodically set on fire by the natives, so that only in those places which the bush fires do not reach can rich vegetation and

649

forest trees exist. How far these bush fires account for the growth of the terrible grasses we do not know; at any rate, the author speaks in no measured terms of the annoyance caused by them in the endeavour to force a passage through their densely tangled stems, their sharp cutting leaves, and irritating barbs.

"Moreover, the grass effectually shuts out all prospect of one's surroundings, and harbours and conceals snakes, buffalos, and hostile natives. I do not know a more despairing outlook than on arriving at the top of a hill in Africa, to look down on a tract of waving grass. If be a lake you can cross it in cances, or go round it; or if you look forth on a sterile desert, you feel you may hurry over its sterility and at least see your way before you. But grass! How are you to know what danger it does not veil? Quagmires, pitfalls, human enemies, or noxious beasts.... When it is dry it cuts you like

most magnificent member of the Congo flora," a circumstance which the illustrations would not of themselves lead us to infer. Numerous Palms are mentioned, in particular a Hyphene, supposed to he H. ventricosa, and of which, by the courtesy of the publishers, we reproduce the illustration (fig. 126). This is a most beautiful and majestic Palm, 30 to 60 feet in height, with bluish-green fan-shaped fronds, and clusters of yellow fruit about the shape and size of a large Apple, with a thin sweet pulp surrounding a hard ivory-like stone. Of this fruit the elephants are immoderately fond. Just below the crown of leaves there is a curious swelling or bulging of the stem, which adds strangely to the grace of the pillarlike stem.

Although we have naturally dwelt in particular on the botanical aspect of Mr. Johnston's book, it must

FIG. 126.—HYPHÆNE VENTRICOSA.

a razor. It slashes you across the face and over the backs of your hands! The blades intercross and bar your way like hostile sabres; they insultingly whip off your helmet, they fetter your legs and interlace themselves round your ankles, but, like most African difficulties, they lose much of their resisting power it boldly encountered. Squeeze your hat on tightly, lower your head, put your hands in your pockets, and charge through them and they will yield before you."

Not only are there numerous scattered allusions to plants and other objects of natural history throughout the volume, but special chapters are devoted to them. From that relating to plants we learn that giant leguminous trees are especially prominent, among which is the lovely Camoensia, described and figured by Welwitsch; Mussaendas, Baobabs, Hibiscus, and a score of other ornamental genera come in for special mention; while the Orchid before referred to, Lissochius giganteus, is again described "as the

not be supposed that other branches of natural history are passed over. On the contrary, the book teems with valuable notes of observation, not only on birds, beasts, and fishes, but on the physical aspects of the country, and the peculiarities, structural and mental, of its inhabitants, with whom it is clear the traveller was in full sympathy.

From the mouth of the Great Mohindu and the

There is a distance of over 700 miles secured to civilisation, and offering no greater risks to the traveller than those attributable to the elements, or to the ordinary contrariety of tropical rivers. The elimate, away from the coast, is by no means unhealthy if proper precautions be taken, and the chief drawbacks seem to be the grass and the insects. The opening up of the country has been accomplished in seven or eight years by the determination and insight of Mr. Stanley, through whose influence and energy stations are founded, pro-

perty rendered secure, and the passage of travellers and merchants rendered safe for several hundred miles beyond Stanley Pool, without the need of escort or fire-arms. This opening up of a road across Africa for the benefit of the world, and from a pure love of knowledge and civilisation, is in a very large measure due to the munificence and far-sightedness of one well known to British horticulturists—being none other than the King of the Belgians.

Home Correspondence.

What is an Amateur?—With all possible respect for the dictum of the National Rose Society in this matter, I yet fail to see that it cuts any Gordian knot or lays a disagreeable ghost. It is very difficult indeed to separate the amateur grower of plants who sells his surplus stock through the medium of a printed list from one who disposes of his more privately and through a written medium. Where such is the case the distinction is absurd, or how would this decision affect the status of the man who, whilst pronouncing himself an amateur, yet in sending to a firm an order for plants mentions that other houses always allow him trade privileges? An odd sort of amateur that, yet he is known to exist. Then, although in Roses we know that England furnishes very few amateur raisers, and that as a consequence they can hardly in regard to those flowers have seedlings to offer to the trade, yet some perchance whose status as amateurs is unchallenged, do raise other plants, and make profit by selling their best seedlings to trade houses—out, of course, through the medium of a printed list, but privately. Would these, for instance, he amateur rosarians, but traders in relation to the other flowers? The National Rose Society certainly does not cut that Gordian knot. The abolition of all such distinctions in competitions seems to be the most satisfactory method of settling the question. Z.

— It is now set forth in your columns, that an amateur ceases to be such if he sends out lists of his plants for sale. Now, as a grower of florist's flowers, I ask what am I, an amateur, to do, in or der to dis-

— It is now set forth in your columns, that an amateur cases to be such if he sends out lists of his plants for sale. Now, as a grower of florist's flowers, lask what am I, an amateur, to do, in or der to dispose of my surplus stocks of Auticulas, Carnations, and the like anoually? What am I to do with my surplusage—some 300 plants annually? Last year I wrote to five dealers, asking, them to buy what I had to spare. Each replied No. A frieod of mine sent his Auriculas to a leading dealer, without bargaining, and all he was allowed was a shilling for each plant, and the amount was placed to his credit against his next bulb account. I think, therefore, it will be quite evident that there is no course open for an amateur but that of the usual circular with his surplus list, annually, and that it should now be settled that he is none the less an amateur if he sells his own surplus plants in this manner. The course I followed last year was to advertise in another oame in the gardening papers. A good many applications came, and as I had a good many Auriculas to sell, I offered lots of roo, carefully selected and assorted, at a low price to new beginners. It is his way several collections were commenced, and I have been pleased to note that two of my clients showed this year, and won substantial prizes. I shall be only too glad if some one will point out how the surplus stock of florists' flowers can be disposed of, as the dealers will certainly ont help us. Amateur. The question is, not what the "amateur" florist its to do with his surplus stock, but what the committees of the several societies who draw up schedules mean to include noder the terms "amateur" or "dealer" respectively. If we were appealed to, we should have no hesitation in including our correspondent, on his own showing, as a trader. Ed.]

The Potato Disease.—In his generally very able article upon this subject, Mr., Jensen arges that the greatest obstacle to the stamping out of the disease is found in the fields that have grown Potatos the preceding year. He says, some diseased Potatos may remain there from which the disease may take its start. I am very glad he uses the word "may," and not the imperative "will." That some tubers will remain is certain, even with the most careful lifting, but still always very few. Then, of these, will one be found alive and germinative in the spring that is at all diseased? I take exception to Mr. Jensen's conclusions, as I do not believe any diseased tuber could exist in the soil throughout the six months of the winter, for if the moisture of the soil (firespective of possible frost) did not utterly rot or decay the tubers, certainly they would not escape grubs, slugs, and other vermin, which will attack all partially decaying tubers with avidity. Again, do we not as a rule see early planted Potato plants unusually robust and strong, thus showing that through the winter only the fittest had survived? I feel we may put aside the assumption that the disease is at all propagated by tubers left in the soil all the winter, as groundless. As to the plan of disinfecting, no doubt a temperature of 104°, if a dry temperature, will do no harm to the

tubers, but a few hours' such treatment would not suffice to sprout them healthily, and thus produce all that wondrous improvement in the ctop which Mr. Jensen indicates. There I fear he protests too much. Sprouting tubers may be performed easily enough with small quantities, but not so readily when tons have to be manipulated. A, D.

Sowing Turnips.—I finished the sowing of our farm crop of Turnips to-day, the two principal varieties being the Frize Winner and Champion Purple-top Swede, with Skirving's and two other less known kinds for comparison by-and-bye in more limited extect. Few people in Ireland sow so early indeed, a very experienced agriculturist took me to task in a local journal last year for advocating early sowing, for the supposed reasons that they would "start" to seed or keep badly. The result, with me, for several years disposed of either supposition. Now the main reason why I try and have all my Swede seed in the ground by May 10 is to avoid the ravages of the Turnip flor black Turnip beetle. Let me enter into some details. How many farmers have to sow their Turnip crops twice or thrice? This entails labour, expense, partial failure, and at best, as I have frequently noted, a late crop, that can never compete with the early one. The gardener has the same enemy to contend against, and a host of expedients as remedies have been devised. In one category we have soot, then lime, then sulphur, and once I saw one intelligent man in desperation—he had put down seed three times—use a mixture of all three together. But one of the peculiarities of the Turnip beetle is that the female lays her eggs generally on the under-side of the soft young leaf, so that dusting with any of the substances named overhead is necessarily ineflective. Another class of expedients is tar, oil, birdlime, kee, placed on canvas and drawn over the seedlings as a trap to eatch the depredators. The subject is too serious, so I need not say how amusing the occupation (or occupators if the word were permissible) would look in a too 720 acre field I Prevention is better than cure, and my remedy costs nothing, while it makes success retaio. From several pools by this year, owing to the relatively low temperature so far, it may be later. Sy having the Turnip rop sown before the present date, say May 10 or thereabouts, it will be in "the rough leaf," and can then

Effects of Frost.—I do not know whether the illustration of the effects of the recent frosts seen here is peculiar or not, but I think it is worth referring to. A large Oak tree here, which stands alone, and has a spreading diameter of from 50 to 60 feet, has been so cut by the frosts all round its outer side, that every bud is seared or burnt, and destroyed. On the other hand, right in the crown of the tree and in its middle, the buds are untouched, and now I see a green centre and crown with not a green leaf, or the least prospect of one, on the outer surface from the base to three-fourths its height. I do not know that the frost was more intense here than elsewhere; but the result so far seems curious, and would indicate that at a certain elevation it was much less severe. I notice further, in the case of early Horse-Chestnuts, that the bloom-buds are all falling, If that feature be general we shall have but a poor show of that striking bloom this year. Probably in many localities the full effects of the frosts have not yet been made apparent. A. D.

Lonicera sempervirens.—This beautiful scarlet Ilonespackle is now coming into abundant bloom with me, the plant being in the open and in a corth-west corner, where it gets no sunshine till late in the day. Though the position be thus cold and shady the plant has thriven well, retained leafage ocarly all the winter, broke into growth very early, and will soon be a rich prolusion of scarlet flowers. Though I deprecate the cutting of beautiful garden flowers, yet if they must be had, then is this Honeysuckle one of the most charming climbers that can be grown for the purpose. Ordinarily planted as a greenhouse climber it really is more beautiful against a wall where it is sheltered from ficree winds. Quercus.

Violas for Cutting in Spring: Souvenir.— During the months of February, March, and April, and I might include May, the number of hardy outdoor flowers from which you can cut-and-come-again are not numerous. The enclosed Viola came to me some few years since from Mr. Cannell, of Swanley, under the name, if I remember aright, of Souvenir, and after a trial since (in comparison with at least a score of other varieties) I think you will agree with me in saying no flower garden should be without it.

Countess of Kintore, Champion, Unique, Pilrig Park, Mrs. Langtry, Violet King (Emperor William), the old Magpie Pansy (?), and so on, have all their special merits and peculiar colour tinting, but in floriferousness, size, substance, and persistent blooming commend me to this. A friend told me this was not the correct name. I had the first blooms the last days of February, and have no doubt, as in former years, with a mild December, I may have some to send you at Christmas. You will then at once see the great merit of such flowers, that hardly tax an idle bour, as compared with the tender nurslings that flicker for a brief few days—or, as in the case of the Tigridias, a brief few hours—and are gone. W. J. Murphy, Clonmel.

Stephanotis floribunda,—The shoot of Stephanotis which I send herewith is from a plant bearing upwards of a score, all equally as good as the piece sent. It is planted out in a good hed of loam and peat, with a good sprinkling of half-inch bones, and is trained close to the roof of a plant stove here. It. Carter, Decanhill Castle Gardens, Coleraine, Ireland, [An admirable illustration of the extrem floriferousness of this plant, under favourable cultural conditions. Ed.]

Maréchal Niel Rose,—Noticing your reply to Martin Tallack respecting this Rose, I would mention that here, from growth of last season's bads, I have cut scores of blooms receutly, with which were one or two buds also. The buds were worked on Madame Berard plants, and the resulting growth unusually fine. Probably that accounts for the floriferousness: as a rule I am content to get one flower on a shoot or lateral, if that be a fine one. A. D.

Hybrid Tea Rose, Reine Marie Henriette,— There is a nice plant of this growing at Kelton IIall, planted out in a span-roofed house, and, judging from its appearance there, It promises to succeed well, as a crimson companion for Maréchal Niel. It is a vigorous grower, and flowers from each bud along the whole length of the strong shoots, in the same way as the Maréchal does. The flowers are of good substance, and of a pleasing purplish-crimson colour. W. H. Divert, Burghley.

Theophrasta Jussiæi. — In your last week's issue you gave a brief notice of a plant, Theophrasta Jussiæi, growing in the Palm-house at Kew. It may interest your readers to know that I believe it to be the only plant of it grown in this country. It is recorded to have been introduced from San Domiago in 1818, and from conversations with the late A. E. Lambert, Esq., about it, I have every reason to believe that it was introduced by him. It was either presented to or placed under the care of Mr. Colville, of the then famous nursery, King's Koad, Chelsea, which, in 1834, was broken up, and the stock of rare plants sold by auction. I was anxious to obtain the Theophrasta and several other rare plants for Kew, and Mr. Aiton, then Director, allowed me a sum of money to endeavour to purchase them at the sale, and after a smart competition with Mr. Joseph Knight, of the also famed nursery, King's Road, it was knocked down to me for £4; it was then about 2½ feet high. It has now been fifty years at Kew, and in 1870 I learned it was 7 feet high. What is its height at the present time? In addition to your description of the flowers, I may add that they have a very mawkish odour, 7. Smith, ex-Curator, Keyal Gardents, Kew.

Potato Analysis.—A correspondent, "A.," at p. 618, asks whether the result of an analysis of Magnum Bouum and Champion Potatos would show one waxy and the other mealy? Surely it is hardly worth while to call in the aid of the chemist to tell us what may be ascertained by the most unscientific enquirer by merely carefully cooking the kinds. Is, not "A." rather begging the question in assuming, as he certainly does, that the flesh of Magnum Bonum is waxy, and that of the Champion mealy? I have found on our soil here that Magnum Bonum cooks very mealy, If a German analysis is to be accepted as correct, Champion certainly exhibits the largest quantity of starch; but what we want to know, with prespect to Potatos of various kinds, is, which gives us the greatest proportion of real flesh and bone forming matter, and also of heat-producing principle. To fairly test kinds some should be cooked first and others analysed. A. D.

Early Cabbages.—I have read with much interest the various experiences that have found a place in your columns during the past few weeks relative to the superiority of one variety of early Cabbages over another, and am induced to add mine for the benefit of all concerned. Some few years ago I was for several easons thoroughly dissatisfied with results from this crop; it seemed impossible to get a reliable strain from the source whence I obtained my seed. I therefore resolved on a trial of several of the popular

and advertised kinds; these consisted, as far as my memory serves me, of Dwarf York, Sugarloaf, Imperial, Nonpareil, Defance, and Heartwell Early, each obtained from different parts of the country, in order, if possible, to ensure a thorough change of seed. A sowing was made in the second week in August, and the plants were all put into a piece of ground direct from the seed-bed, as I am no advocate for a second planting. The brake had been one year turned up from productive meadow land composed of 10 inches of strong loam lying on a hungry clay, and facing directly north. It had just carried an enormous crop of Myatt's Kidney Potatos, of such a quality as I have never before or since seen. We happened to gct some severe weather during the early part of the year, which played sad havoc with the Yorks and Sugarloafs, more than half getting destroyed. As soon as the season allowed of a growth I took special note of the progress. Some of the Sugarloafs and Noopareils began to bolt, but it was not noticeable amongst the others. I was by this time enabled to distinguish the difference in the lots; the Heartwells, Defiance, Imperials, came out conspicuous from the fact of their forming such close compact heads: I therefore noted these sorts as superior to the others, and had further to test the best of these, which I confess, I had a difficulty in doing in the growth, but in making the first cutting I found the greatest number of perfect heads amongst the Heartwells; yet as the trial so far had brought these varieties so close together, I thought I would try a cooking test, so sent three heads of each to the the perfect of the perfect heads amongst the average and proven. Since this I have grown no other kind for early work, and have at the present time as fine a piece as any in the country, iodeed, my early Cabbages have quite a local reputation. I ought, perhaps, to state for the benefit of others that I procure the seed from Messrs. Carter & Co., Holborn, London, who, I believe, introduced the variety. Tetratige.

Suddenness of Disease in Potatos.—It would appear from the following quotation from the article on the "Potato Rot," by Prof. W. G. Farlow, of Harvard University, that the suddenness of the attack of the Peronospora is sometimes as well marked in fields of "apparently" sound (see p. 588) Potatos in America as it is in Great Britain. Professor Farlow writes, Bulletin of Bussey Institution, Part. IV., p. 319:—"At times its advent (the Peronospora) is soudden that, within a few hours, the Potato fields change from green to brown and black, and the plants which, in the morning, gave promise of an abundant orop, before night present a mass of decaying vegetation, in which are involved not only the leaves and stems, but also the tubers." W. G. S.

Gardenia intermedia.—Herewith I beg to enclose a few flowers of the above-named Gardenia. My main object in sending them is to show that good Gardenias can be grown in an ordinary heated pit, and also the beneficial effect of Standen's manure in improving the size of the flowers, which I think you will agree with me in saying are above the average size. Some of them are close on 5 inches across. In making these remarks I do not by any means wish to infer that fine Gardenias have not before been grown in pits: I know full well they have. Still, there may be some amongst your writers who may not know this, and who may at the same time be desirous of growing a few of this, to say the least, beautiful and chaste flower. The leasts from which the enclosed flowers were cut were propagated two years ago, the cuttings were inserted round the sides of 4-inch pots and placed in a pit with a brisk bottom-heat, and kept shaded for a time till rooted. They were then potted into 3-inch pots in a mixture of half peat and fibry loam with a dash of clean river sand in it, and put back into the same pit. When these pots were full of roots they were potted into 6-inch pots, using the same soil as before, and replaced in the same pit, the pots being plunged in sawdust over a slight bottom-heat. Last spring they produced a few flowers. After blooming the plants were again overbauled, some of them being simply top-dressed with a mixture of peat and some Standen's manure, say, about a table-spoonful to each plant; the rest were shook out and repotted into the same sized pots as before. After being replunged in the same pit they were treated to a comparatively high temperature shows our surface of peat and some Standen's manure, and and surface of peat and some Standen's manure, say, about a table-spoonful to each plant; the rest were shook out and repotted into the same sized pots as before. After being replunged in the same pit they were treated to a comparatively high temperature was kept about 55°, the day temperature being about

being more long-jointed, it is possible to cut a portion of the shoot with the flowers without injuring the plaats. Many of our plants have had, and have yet to come, from two to three dozen flowers on each, and out of the batch of about two dozen only some three or four are in pots more than 6 inches in diameter. We have some G. florida amongst them. They do well with the same treatment, but do not give such fine individual blooms, though, as I mentioned in your columns some time ago, they are more continuous bloomers than G. intermedia, which latter variety only blooms once a year with us. H. J. C., Grimston.

FORESTRY.

THE FORESTRY EXHIBITION .- The first list of exhibitors in connection with this Exhibition has been published, and we note that, besides private exhibitors, the following Governments and departments are represented :- Home Government -The departments of Woods and Forests, the War Office, and the Epping Forest Commission. Colonial Governments—British Guiana, St. Vincent, Sierra Leone, Tobago, Cyprus, the Cape, Mauritius, New Brunswick, Dominica, Gambia, South Australia, and Tasmania. Indian Empire-Calcutta, Pegu, Punjab, North-West Provinces, Andaman Islands, the Sanderbands, Madras, Malabar, Tingevelly, Coimbatore, Nelambur, Johor, Travancore, the Straits Settlements, Protected States, and Ceylon. Foreign Governments-Norway and Sweden, Denmark, Chili, Persia, Siam, Honduras, Mississippi, Florida, Venezuela, Borneo, San Salvador, Japan, and Persia. Private exhibitors number about 500, and contribute articles under nearly all the classes and sections which have been already detailed — wood pulp and materials for paper and wood-working machinery being specially re-presented. Since this list was published, the committee have received applications for space from the Government of Japan (lor 5000 square feet) and others, which has made it necessary to erect additional galleries furnishing about 10,000 square feet of space for exhibits, and which, it is expected, will be sufficient to accommodate everything without over-crowding. Amongst the exhibits expected from the Canadian side are:—A collection of native woods, in rough and finished state, shown by the Provincial Government and the New Brunswick Land and Lumber Company; an office, with complete internal fittings, including full panellings, by J. C. Risteen & Co., Fredericton; a wooden screen or "trophy," showing all varieties of native woods in combination, also several articles of furniture, by J. & J. D. Howe, St. John; a miniature log cabin, an Indian and several other similar articles, by Mr. Wright, an employe of the last-named firm; a collection of Indian goods, including tobogans, snow shoes, baskets, Birch-bark work, Lacrosse clubs, and the like, by Mr. J. R. Smith, of Union (Street, and Mr. W. S. Thompson, of the Indian Bazaar, St. John; a collection of bobbins, blocks, and other small wooden ware by the Quaco Wood Manufacturing Company; a case of spools, by the Piccadilly Spool Works, St. John; a collection of doors, sashes, wash-tubs, washboards, butter hrkins, churns, and turned work, by the Woodstock Wood Working Company, Woodstock; Venetian blinds, mouldings, &c., by A. Christie & Co., St. John; hardwood doors and sashes and outside blinds, by Scott & Lawton, St. John; a bedstead and turned work, by Wm. Jaffray, St. Mary's, York; shingles, by the Van Buren Manufacturing Company; Excelsior, by Hutchings & Co., St. John; a collection of Birch-bark pictures, by Mrs. Marvin, St. John. The New Brunswick Railway Company have kindly offered to bring to St. John, free of cost, any articles sent over their line to be forwarded to the Exhibition.

Diseases of Trees.—It may safely be assumed that every tree is liable to some malady, disease, or accident—some, perhaps, more so than others, some openly exposed and easily seen, while others are hid, and concealed. The whole catalogue of diseases and accidents may safely be divided into two classes, namely, preventable and unpreventable, or those susceptible of cure and those that cannot be cured. The learned ancients, we are informed, laboured hard to make, or find out the talisman by which every evil to which flesh is heir was to be warded off. We

may take up the work where they left it, and although we work as long and hard as they, when we abandon the fruitless task, just as they did, we shall be as near, but certainly no nearer than they were in finding out the secret. In this brief paragraph it is not intended to explain what disease is, whence it comes nor whither it goes, but very briefly to direct attention to some of the more conspicuous and inveterate maladies incident to some forest trees. The subject, taken even in its most limited compass, is a wide and expansive one, and must, for convenience sake, be taken in two sections, which will be sufficiently well defined by the unmistakable distinctive lines of evergreen and deciduous trees, of which for the present the latter will constitute the subject.

We hear and know comparatively little about historical trees beyond the circumstance that they are said to be very old (not unfrequently twice the age they really are), and that they are also of immense size. The marvel is that people are not far more wonderstruck with the appearance of our forest giants than they are. With trees, as with men, few there are which escape the hundred and one casualties incidental to tree life, hence the comparatively small number of trees, however favoured, that attain to old age and great size.

THE OAK, justly designated king of the forest, suffers severely in its boughs and branches, being shattered with antumn gales which occur before the leaves are shed. The Oak is also very liable to various forms of "shakes," the result no doubt of being grown on soil not suitable for it. If grown under conditions, however, in harmony with its nature the Oak of all other trees (except the Spanish Chestnut) should attain the greatest age and size.

ASH.—The Ash tree, though amongst our best and hardiest denizens, is yet in many cases under certain conditions very liable to an inveterate and injurious affection of ulcerated bark. This disease takes place in the tree before the bark assumes that beautiful corticated, carved network-like appearance, which commands such unusual admiration, after which the bark, and therefore the whole tree are as safe and well protected as can be. The unsightly ulcerous wounds referred to never heal up as they do in many other species, but deepen and spread all over the tree, rendering it in most cases quite useless except as fuel.

ELM.—The Elm tree is known by the two distinctive names of English and Wych. The former is a comparatively soft and brittle wooded tree, and very liable to having large limbs broken and riven off by gales in autumn; retaining, as it does, its leaves to the very last, makes it doubly liable to injury from that cause. The Wych Elm, generally speaking, is a strong and hardy tree, but unless grown on good dry loam, in which it can grow free and fast, it seldom grows sound, being affected with shakes of various forms, which renders it unfit for industrial work. It has to be noticed, however, that there are several very worthless varieties of Wych Elm, growing side by side with the good sorts, from which they cannot be distinguished till cut down.

BEECH. - Seedling Beech are tender, and often suffer by frosts in the month of May; but beyond that the tree is as hardy as any in the forest, except on one point, the only vulnerable one of importance I koow of, namely, the bark. The Beech is essentially a thin and tender barked tree, and the bark never, even in extreme old age, assumes that rough corky condition common in most other trees, but, on the contrary, always remains smooth, glossy, and very tender. The bark is very liable to contract a certain disease, which begins at first in minute dark spots, presenting sometimes the appearance of having received the contents of a fowling-piece. The spots multiply and spread all over the surface, at times very slowly, and at others rapidly. The bark becomes dis coloured, but seldom, till greatly aggravated, does it Excesses of cold wet weather rupture the bark. during the season of growth appear to be most productive of the disease.

ALDER.—The Alder tree is often complained of on account of its dead tops, but there is nothing either alarming or remarkable about this feature. It is by oo means a long-lived tree, although large specimens, and of considerable age, are here and there to be met with throughout the kingdom. The heartwood of the tree is by no means durable, and from the circumstance that it is but too frequently planted in cold, wet, boggy ground, where nothing else will grow, it would amount to something like a

miracle if it could remain healthy and sound in all its members for any considerable number of years.

LABURNUM.—It is, perhaps, as rare a thing to see a tree of any considerable size and age of the Laburnum standing erect and well balanced upon its own stem as to see a four-leaved Clover. The heartwood of the Laburnum is withal hard and durable as furniture, &c., but the main roots do not retain their vitality for many years, and, as a matter of course, when they decay the tree heels over, and there remains in a reclining position, it may be, for a century or more, for as the old roots decay young ones are constantly forming, which take their place and fulfil their office.

HORSE CHESTNUT.—The Horse Chestnut is very listed to have its limbs broken off, not only with gales, but by lodgment of snows, and even heavy dees, when in full summer foliage. It is a tree on that account that should never be planted in close proximity to human dwellings. A peculiarity, and also a great defect of the tree, is its disposition to grow with a spiral or twisted stem, in some trees very slight, but in others very conspicuous and injurious.

POPLAR.—Most of the Poplars grow tall, and their branches suffer severely by breakage from wind, which, combined with the unfavourable circumstance that, as they grow straggling and thio-topped at best, they can ill afford the loss of top boughs, which renders the tree in many cases quite unsightly and useless as a landscape object.

WALNUT,—The Walnut tree, like the Laburnum, is very liable to lose the vitality of the main anchor roots, and, like it, fall into a reclining position, as described of the Laburnum. It also bleeds profusely when a limb or large branch is cut off.

LIME TREE.—The Lime tree has, perhaps, fewer defects than any other forest tree, and yet in point of profit not much can be said in its favour. Small dead branches are frequent occurrences, and they become conspicuously white amongst the dark spray of the branches. It is from the inner bark of the Lime tree of Russia, of which country the tree is native, that the well known bast or mats of commerce are made; and where a branch remains upon the tree after it has lost its vitality, the inner rind referred to becomes detached and hangs down or waves in the wind like so many ribbons or brown rags, which require pruning off. C. Y. Mehic, Culter Houre, Banfishire.

COLONIAL NOTES.

BRITISH HONDURAS .- Mr. D. Morris, the Director of Public Gardens and Plantations in Jamaica, has given the result of his visit to the colony of British Honduras at the close of 1882, in the form of a small volume of 152 pages, under the title of The Colony of British Honduras, its Resources and Prospects; with Particular Reference to its Indigenous Plants and Economic Productions. Mr. Morris says in his pre-face that "In England little is known of British Honduras, and that little not of a very flattering character." Referring to the forests the destruction Referring to the forests, the destruction of which is common in most tropical countries, Mr. Morris utters a word of warning against any extensive or reckless wood-cutting, but at the same time points out that it would be well for the Government to afford every reasonable help for the establishment of permanent plantations, and for attracting to the colony an intelligent race of planters possessing the necessary capital and energy. "At present," stated, "several hundred thousand acres of some of the finest lands to be found in any British dependency produce an annual export value (in Mahogany) of only £50,000. This sum is attained in Jamaica in the export value of such a 'minor product' as Oranges." It is pointed out as a new and somewhat startling fact that the export value of Oranges from Jamaica is equal to that of Mahogapy, the great staple industry of British Honduras. It shows, however, the gradual change that is taking place in the development of the West India Islands by means of the American fruit trade. Mr. Morris looks forward to an extension of this fruit trade to British Honduras as one means of bringing prosperity to the colony, but he says at the same time he does not wish it to be inferred that the larger industries are not likely to succeed there; on the contrary, with available capital and a supply of labour no country could do better; thus extensive areas of land are suitable for the culti-

vation of the Sugar-cane, and further inland Cocoa plantations might cover hundreds of acres, and Coffee of the finest quality ought to flourish on the slopes

and higher lands.

The chief industry of British Honduras is woodcutting. Mahogany is exported to the extent of about 3,000,000 feet per annum, the cost of which, ready for shipment, is from £8 to £10 per 1000 feet. The annual export of Logwood is about 15,000 tons, realising from £2 to £3 per ton. "Wood-cutting operations have now been carried on for more than 200 years, and as a result much of the finest timber has been cut down. There is, however, much fine timber still to be found in the interior, but probably beyond the reach of rivers; hence it is believed that the construction of a railway will not only advance other industries, but at the same time stimulate the production and export of the old staples of the

The chief Pine of the colony is known as the Yellow Pine (Pinus cubensis). The timber of this is used only to a small extent for building purposes, owing, it is said, to the difficulty of sawing it. wood is heavy, and would probably be very durable if properly seasoned; as it is, however, it is used chiefly for firewood and making torches, which are largely used in the Mahogany works. Mr. Morris says that an impression prevails in the colony that two species of Pine exist on the Pine ridges, distinguished as the white and yellow Pine, but that he was unable to distinguish between them. He suggests that if properly tapped they might yield good resin, and by distillation good turpentine.

Some interesting notes are given on the Cocca that, cultivated in the South, is described as being probably forms of Theobroma Cacao, "but in other instances the characters approached more nearly to T. angustifolia, which is supposed to be a distinct species, and under cultivation in Guatemala. This last is no doubt the Tabasco Cacao of the Atlantic slopes of Central America, which is probably identical with the celebrated Socurusco Cacao of the Pacific

We cannot follow Mr. Morris through his numerous notes on other equally valuable plants. It will suffice to say that he pays considerable attention to indiarubber plants, the Sugar-cane, dyes, Rice, Maize, Cinchooa, and other medicioal plants, tropical fruits and food-plants. At the end of the book a list of works and serials is given suitable for the use of tropical planters. Mr. Morris has fallen into some errors regarding the issue of some of the serials. Thus he refer to the *Pharmaceutical Journal* and the Journal of the Society of Arts as a "monthly record and a "monthly magazine" respectively, when in fact both are issued weekly. The *Technologist* also is quoted as a "monthly record," but this periodical has ceased to appear for some years past.

For the information of those who wish to obtain Mr. Morris' little book, it may be well to state that it is published by Mr. E. Stanford, of Charing Cross.

Keports of Hocieties.

Royal Horticultural: May 13.

SCIENTIFIC COMMITTEE.—Dr. Maxwell T. Masters, F.R.S., in the chair. Present:—Messrs. Murray, Houston, McLachlan, Boulger, Grote, Loder, W. G. Smith, Ridley, Prof. Church.

Stem of Aloc ferox.—Mr. McLachlan exhibited portions of the dead stem of this plant perforated by the Anobium striatum, or Death-Watch beetle. As a

preventative of such attacks in timber, furniture, &c., the application of kerosene, or of hot solution of carbolic acid, was recommended.

Cases of Lepidopterons Insects.—Mr. McLachlan showed from Eastern Tropical Africa some very remarkable insect cases, the work of some of the Psychidæ, and so wonderfully like shells of Cyclostoma, or Paludioa, as readily to be mistaken for them or their casts; and in the same way that the coils are occasionally reversed in these shells so was it with these cases.

with these cases.

Canker,—Mr. Frere, Roydon, Diss, sent a branch of the true Service tree affected with canker, but there was no evidence to show from what cause.

Caoma lariets, &c.,—Mr. Plowright sent Larch leaves affected with this fungus, which is rare in this country; also specimens of Æcidium Pini, supposed to be the accidial form of Collosporium seneciones.

Puccinia suaveolens.—Mr. Plowright sent speci-

mens of this fungus, with the following note:—"The remarkably powerful odour emitted by these bodies was noticed by Persoon when he named the fungus 'snaveolens.' The odour of the spermogonia is observable for a long time after the plant has been gathered. It clearly is an instance of mimicry, in which the fungus mimics the odour of some flower. Léveillé thought it resembled the perfume of Orange blossoms; De Bary likened it to that of Enothera biennis. The object of this odour is, as Rathay has recently shown, to attract the visits of insects, who in recently shown, to attract the visits of insects, who in their turn disseminate the so-called spermatia. The following insects have been found to visit the spermogonia of this particular Uredine:—Coleoptera: Apion onopordi (Kirb.), Crepidodera aurata (Marsh), Podaonopordi (Kirb.), Crepidodera anrata (Marsh), Poda-grica placida (Kutsch), Loggiarsus anchuse (Puyk), Diptera: Scatophaga merdaria (Fabr.), S. ster-coraria (Linn.), Micropeza corrigiolata (Linn.), Nyctia halterata (Pauz), Anthomyia (Op.), He-miptera: Stenocephalus agilis (Scop.), Car-pocoris nigricornis (F.). This Uredine is one of those which have a perennial mycelium. Rostrup in Stackbard that these individues effected with the those when have a perennial mycenum. Assitup in 1873 showed that those individuals affected with the spermogonia in spring soon afterwards produced the well known Uredo spores (Uredo suavolens), but upon these plants no other spore forms were produced. When the Uredo spores were placed upon other and healthy specimens of the same host-plant they gave rise first to the Uredo spores, which were in due course succeeded by the teleutospores. I hope before long to give somewhere a more extended notice of Rathay's important researches upon the spermo-

gonia del Bright Schibited.—From Mr. Loder, flowers of Fritillaria Thomsoniana, Primula dolomitis, Andromeda fastigiata, &c. From Mr. Farraut, Isle of Man, Rhododeadro lanatum, a rare plant in cultiva-

tion; R. Fortunei, and R. niveum.

FLORAL COMMITTEE .- Present in Section A. FLORAL COMMITTEE.—Present in Section A.:— John Fraser, Esq., in the chair; Messs. E. Hill, J. O'Brien, J. Dominy, J. Hudson, J. Woodbridge, H. Herbst, J. Laing, H. Ebbage, T. Moore, Rev. G. Henslow, and Dr. Masters. Section E.:—Shirley Hibberd, Esq., in the chair; Messrs. H. Bennett, W. Bealby, G. Duffield, D. C. Lathbury, H. Cannell, W. B. Kellock, and H. Turner. The leading leatures of this meeting were pot Roses, herbaccons Calceo-larias, Daffodils, and new plants. Several well known orchidists exhibited new and interesting objects in the new plant section, and as showing the progress which new plant section, and, as showing the progress which is being made with the hybrids, it may be mentioned that no less than three of Mr. Seden's seedlings obtained that no less than three of Mr. Seden's seedlings obtained First-class Certificates—viz. Cypripeolium grande x. Masdevallia Chelsoni x, and Cattleya Mardeli x. The two former came from Sir Trevor Lawrence's collection, and the latter from Mr. Lee's. Cypripedium grande is a strong, robust growing plant, with two strong spikes of dull lemon coloured flowers, with the dorsal sepal of a paler tint. Masdevallia Chelsoni has scarlet and orange coloured flowers. From Burford Lodge also came Phalænopsis sumatrana purpurea, a form in which the purplish-violet in the labellum is of a very rich hue. A splendid spathe of the new Authurium ferrierense x also came from Sir Trevor's garden. Cattleya Mardeli is a spathe of the new Aothurum terrerense x also came from Sir Trevor's garden. Cattleya Mardeli is a dwarf-growing form of the Skinneri type, with the flowers of a rich deep rose-pink, and a fine broad purple labellum. Mr. Lee also showed in Cattleya Mendelli var, selbornensis, a highly coloured variety, with a handsome lip tipped with purple. From Baron Schröder's garden came two very fine varieties of Odootoglossum crispum named respectively Delliense and Ballantinei. The former is a medium-sized, neat-shaped flower, white suffused with rose and prettily spotted with blood-red; while the latter is of neat-shaped flower, white suffused with rose and prettily spotted with blood-red; while the latter is of larger proportions, with the broad sepals and petals nicely fringed, and heavily blotched with crimson. Mr. B. S. Williams sent a miscellancous collection, including Cattleya Mossire magnifica, a good variety; Psychotria jasminifiora, very freely flowered; Rhodo-dendron Kaiser von Russland, deep rose, spotted with crimson, of decided R, arboreum type; Asplenium borridum, a strong-growing species, whose fronds have a black hairy midrib of great substance; Odontoglossum Alexandræ splendens, a form having very large suffused illac blooms; and Brassia antheroites, a most striking plant with a spike of ten flowers, the long sepals and petals being of a yellow ground colour, spotted with brown. A vote of thanks was awarded to Mr. Kemp, gr. to D. C. Graham, Esq., Dunlop House, Ayr, for several glasses of cut blooms of Vanda suavis and V. teres, handsome sprays of bloom that were cut from most floriferous plants. A pretty baskethul of small plants of Boronia elata; a useful looking dwarf Fern, Osmunda javanica, having almost erect-growing fronds of pale green; a fine Gloxinia, appropriately named Purity; and a collection of Japanese Maples, came from Messrs, J. Veitch & Sons, Chelsea. The latter included two new forms, which received Certificates, viz., Acer japonicum var. aurea, with yellow palmed leaves; and A. polymorphum septemiobum elegans purpurea [Phocbus, what a name!], a handsome cutleaved coppery-red. A group of Azalea rosæflora

and Cornus brachypoda variegata, a plant with handsome creamy variegation, came from the same frm. A much more varied assortment of Japanese Maples came from the New Plant Company, Colchester, among which were some wonderfully distinct and pretty forms, which, owing to the absence of names, we cannot further distinguish. For these a Bronze Banksian Medal was awarded. From W. Vanner, Esq., Camden Wood, Chislehurst, came Odontoglossum citrosmum roseum, Vanner's variety, which was awarded a vote of thanks. The Calceolarias shown were well grown examples of the dwarf market strains. Mr. H. B. Smith, St. George's Nursery, Ealing Dean, received a Bronze Banksian Medal for a collection, in which the prevailing tints were rich brown, pink, and crimson. Silver Banksian Medal was awarded to Mr. H. B. May, Dyson's Lane Nursery, Edmonton, for a group, in which the golds and yellows predominated, and which were admirably set off by a profuse intermix ture of Adiantums. From the Society's garden there were also herbaceous Calecolarias, Gloxinias, Ferns, and a collection of dwarf hardy plants. Messrs, W. Paul & Son, Waltham Cross, received a Gold Medal for large and fine collection of Roses in pots and many (twenty) boxes of cut Rose blooms. The plants were of moderate dimensions and very well bloomed. Messrs. Barr & Son, Covent Garden, were awarded a Silver Banksian Medal for a collection of Nortas Silver Banksian Medal for a collection of Nortas Silver Banksian Medal for a collection of Nortas and the received and the plants were good for the season. Mr. T. S. Wate, Ilale Farm Nursery, Tottenham, showed a beautiful and varied collection of cut blooms of late Tulips, Narcissi, and hardy plants. Fot plants of Moutan Peonies of the varieties Madonan, Grand Duchesse some creamy variegation, came from the same firm. A much more varied assortment of Japanese Maples and varied collection of cut blooms of late Tulips, Narcissi, and hardy plants. Pot plants of Moutan Peconies of the varieties Madona, Grand Duchesse de Bade, Adriana, Maxima plena, Piner, Moris, and Wohnerii were also shown by him, and the big showy flowers attracted much attention. Calochortus Eenthami and Phlox setacea Vivid, a rich purple coloured rock plant, also came from Mr. Ware, who was awarded a Silver Banksian Medal. A vote of thanks was bestowed on Mr. C. Noble, Sunningdale Nursery, Bagshot, for a collection of cut blooms ol Clematises. Messrs, J. Laing & Co., Forest Hill, had a good new zonal Pelargonium in Belle Nancienne, a semi-double flesh-pink, with salmoon-coloured centre; Coleus Brooksii, and some enormous blooms centre; Coleus Brooksii, and some enormous blooms centre; Coleus Brooksii, and some enormous blooms of single-flowered Begonism mostly brilliant in colour. Some seedling Gloxinias of some merit came from Mr. R. Phillips, gr. to Dr. Baber, Meopham, Kent. Mr. Dean, Ealing, staged a large finely flowered specimen of Iberis gibraltarica hybrida; Mimulian smoschatus rubra. Mr. Turner, of Slough, showed two stands of Carnation blooms, of much beauty and in most instances of great merit, the flowers being large, full, and the colours good and distinct; the same exhibitor. and the colours good and distinct: the same exhibitor staged a pretty collection of alpine Auriculas in pots, staged a pretty collection of alpine Auriculas in pots, which were greatly admired by the many visitors to the conservatory. Messrs. Lucombe, Pince & Co. of Exeter, exhibited spathes of Anthurium Scherzerianum giganteum, of enormous proportions, and received a vote of thanks.

The awards made were :-

FIRST-CLASS CERTIFICATES.

Section A.
To Sir Trevor Lawrence, Bart., M.P., for Cypripedium

To Sir Trevor Lawrence, Bart., M.P., for Masdevallia Chelsoni ×

To Sir Trevor Lawrence, Bart., M.P., for Phalænopsis

sumatrana purpurea.

To W. Lee, Esq., for Cattleya Mendelii ×.

To W. Lee, Esq., for Cattleya Mendelii var. selbornensis.

To Baron Schröder, for Odontoglossum crispum To Baron Schröder, for Odontoglossum crispum

To Baron Schroder, for Orbito setacea var. Vivid.
Ballantinei.
To Mr. T. S. Ware, for Phlox setacea var. Vivid.
To Mr. B. S. Williams, for Brassia antheroites.
To Mr. B. S. Williams, for Asplenium horridum.
To Messrs. Veitch & Sons, for Osmunda javanica.
To Messrs. Veitch & Sons, for Acer polymorphum septemlobum elegans purpureum.
To Messrs. Veitch & Sons, for Acer japonicum

SECOND CLASS CERTIFICATE To Mr. T. S. Ware, for Calochortus Benthami,

FIRST-CLASS CERTIFICATES. Section B.

To Messrs. John Laing & Co., for zonal Pelargonium elle Nancienne. To Mr. C. Turner, for Tree Carnation Mrs. McLaren.

SECOND-CLASS CERTIFICATE.

To Mr. R. Dean, for Mimulus moschatus Cloth of Gold.

FRUIT COMMITTEE.—Present: John E. Lane, Esq., in the chair; Messrs. J. Ellam, P. Crowley, G. T. Miles, S. Lyon, J. Burnett, G. Bunyard, C. Silverlock, A. W. Sutton, W. Paul, G. Breese, F. Rutland, J. Lee, G. Goldsmith, H. J. Veitch, and J. C. Mundell. Mr. B. S. Williams exhibited examples of his new Basing Park Hybrid Melon, an early, medium-sized, scarlet-fleshed variety; and Mr. Coysh,

gr. to E. H. Wood, Esq., Newbold Revel, Rugby, sent half-a-dozen fine fruits of his hybrid between Conqueror of Europe and Scarlet Gem, a large scarlet-fleshed variety, of very good quality for the time and season, and a Cultural Commendation was awarded. Messrs. Lane & Son showed some good fruits of their Prince Albert Apple; Mr. Turner had an admirably preserved sample of Winter Pearmain; Mr. Divers, of Weirton, sent several varieties of Rhuharb; and some excellent samples of Broccoli came from Mr. Ham, Hildenborough.

Obituary.

THE ranks of horticulture have rarely contained -alas! that we should have to say, lost-a more estimable and remarkable man than Mr. ALEXANDER JAMES MAULE, who recently died at his residence in Bristol, where he succeeded to the old-established business carried on by his father. The nursery was one of those old-fashioned, all-round establishments where everything might be procured at first-hand, but in addition to this Mr. Maule had his specialities. Orchids were one of them, and it is needless to say the collection was no mean one. Another speciality was garden pots. In addition to his nursery, Mr. Maule had a pottery, and was enabled to fashion to his own fancy and knowledge the description of pots best suited for his purpose, among them an Orchid pot figured in our columns. But these are minor specialities-greatest of all was his own strong individuality. Apparently he owed little to early education or training, save perhaps in purely business matters, but for all that he possessed an originality and independence of thought which betokened careful observation and much natural intelligence, uncontrolled, it may be, hy the regulating power which early judicious education gives. His experiments in Potato culture, reported in our columns (April 22, 1876) afforded an illustration of this. They evided a keenness of apprehension and a cleverness of reasoning which would have probably led to excel-lent results, if they had been sufficiently based in early life on exact knowledge. As it is, they were looked on as mere fads—and fads, it may be, they were; but they were the fads of a remarkably original and intelligent man. Mr. Maule looked on the formation of tubers as a diseased condition analogous to that of certain tumors in animals; and he had the idea, that by grafting our wild species of Solanum on the haulms of the Potato-which he did successfully-that he should obtain Potatos less susceptible to disease than those grown in the ordinary way. Another notion— he had numbers—was that the culture of Yuccas might be turned to good account here, not only for fibre, but for the liquor to be had from their fermented juice. As to the former point there is no sort of doubt, it is only a question of finance, whether it would not be cheaper to import the fibre than to grow Yuccas here. The other matter is a question of taste, and those who had the opportunity of judging do not seem to have appreciated Yucca ale. Mr. Maule was an importer of new plants, and a few years ago it fell to our lot to pick out in his nurseries as worthy, not only a name, but of special commendation, from a decorative point of view, the plant known as Pyrus Maulei. Mr. Maule was loud in the praises of the jam made from the fruit of this plant, and we have nothing to say against it, but to our taste it finds a better use in the addition of a small portion of one of the fruits to an Apple tart, as Quinces are used. A small portion only is needed, for the flavour is powerful. Mr. Maule was full of quaint reflections; some of these are mentioned in the Bristol Times, from the pen of one who evidently knew him well. Some of these recollections we are tempted to quote. Speaking of Maule's love for his plants and the contentment he got therefrom, the narrator proceeds :-

" 'Yet,' I said, 'Mr. Maule, gardeners have not the reputation, as a class, of being always the most equable and happy-minded of men; but if they were all constituted as you are, it ought to be one continuous treat to them.

" 'I am afraid it is so, my good sir,' he answered. They are, I fear, rather given to take a complaining view of life. When I am on my business journeys, and call at a gentleman's place in the country, I usually see the gardener first, to know what things may be wanted, "Well," I say, "gardener, how do you get on?" "Oh, pretty, well," he sometimes answers, but not in the most contented of tones. "Master is reasonable enough, but missus wants flowers and fruits all the year round; and then, as for help, though I cannot say I quite require

another man, I should be glad to have a woman, as the weeding gets ahead of us." I then say, "Stop there my friend: this is the rock upon which all our craft split. The head of our profession, that "grand old gardener," Adam, was as happy as the day was long until he took Adam, was as happy as the day was long until the took if into his head, like you, to ask for a woman to help him in the garden. His request was granted, and then began all our troubles. We might now, but for that egregious mistake, have had the whole globe for one hooning Garden of Eden, 'Inr. Maule died a bachelor!'

"The tropical plants and Palms had each a special

moral for his eye. Where some large leaves were naturally perforated, so that the light came through the holes to animate the lesser vegetable growth beneath, he referred to this condition as conveying a lesson to men with a greedy and monopolising turn, not to keep out the light from lesser creatures struggling for existence in the same sphere.

"I wanted some Asparagus plants, and was perhaps unnecessarily particular as to the kind I ordered. dear sir,' said he, 'it is not the plant but the bed you have to look to; almost any Asparagus plant will flourish if you make a fitting place for it.'

'And how do you recommend the bed to be made, Mr. Maule?' I inquired.

"'Look here, sir,' he answered; 'wherever there is a great man, though he should be in a different walk, calling, or profession to your own, mark his distinguishing characteristic, and follow it as far as you can by To what did the great Arthur, Duke of Welanalogy. lington, owe his triumphs? To trenching, sir. The lines of Torres Vedras were a perfect and elaborate system of trenching, and I say, follow him in your Asparagus bed—trench it thoroughly, and you are sure to triumph, by draining off the wet, which is the death of

He told me of a workman of his who was ". He told me of a workman of his who was a great adept at grafting Roses, and thus contrived to get a good many thorus in his fingers during the week; but then, sir, he did not worrit himsell, taking then out hourly or daily; he bore them patiently in the flesh until Sunday, when, as soon as the parson gave out the text, he took his penknife from his pocket, and, under the genial influence of a soothing discourse, he quietly and deliberately drew the prickly intruders from his fingers, and returned home with clean hands to begin another week of budding and grafting next morning in a dutiful frame of mind."

We much regret to learn that Mr. CRANSTON, of the Cranston Nursery and Seed Company, Here-ford, while driving from Pembridge Fair to his home on Wednesday night, was thrown out of his carriage

We are sorry to hear of the death, on April We are sorry to near of the death, on Appin 29, of Mr. JAMES B. GRAY (aged 52, years), for nine years gardener to W. L. Barclay, Esq., The Briers, Reigate, and previously for seventeen years gardener to G. W. Alexander, Esq., of Wood Hatch. Mr. Gray, who was a devoted lover of Orchids, leaves a widow and thirteen children, several of whom are doing credit to the profession of their father.

—— We regret to record the death, at Kirby Line, Liverpool, on May 4, after a long and painful illness, of Mr. John Busserr, aged 79 years. Mr. Bissert, was for many years gardenerat Sefton Park, near Liverpool, whence he retired about seven years ago on a handsome pension from the Earl of Sefton.

London: Atmospheric Pressure.—During the week ending May 10, the reading of the barometer at the level of the sea increased from 20,36 inches at the beginning of the week to 20,40 inches by 9 A.M. on the 4th, decreased to 20,38 inches by 3 P.M. on the same day, increased to 30 o7 inches by 9 A.M., and decreased to 30 inches by midnight on the 7th, increased to 30,22 inches by 9 A.M. on the 9th, and decreased to 30.27 inches by 9 A.M. on the 10th, and decreased to 30.27 inches by 9 A.M. on the 10th, and decreased to 30.27 inches by 9 A.M. on the 10th, and was 30.18 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 20,92 inches, being 0,22

at the level of the sea was 29.92 inches, being 0.22 inch higher than last week, and 0.02 inch lower than

the average of the week.

Temperature. — The highest temperature in the shade in the week was 74°.2, on the 10th; the highest on the 7th was 55°. The mean of the seven high on the 7th was 55°. The mean of the seven high day temperatures was 60°.7. The lowest temperature was 36°.1, on the 5th; on the 9th the lowest temperature was 46°.5. The

mean of the seven low night temperatures was 41°.5.

The greatest range of temperature in one day was 28°.7, on May 10; the smallest was 13°.7, on the 6th.

28°,7, on May 10; the smallest was 13°,7, on the 6th. The mean of the seven daily ranges was 19°,2.

The mean temperatures were—on the 4th, 48°,3; on the 5th, 44°,5; on the 6th, 48°,6; on the 7th, 47°,3; on the 8th, 50°,0; on the 9th, 54°,0; and on the 10th, 52°,5; of these the first five were below their averages by 2°,5,6°,7,3°,4°,4, and 0°,7 respectively; and the last two were above by 3°,4 and 5°.2.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 132°, on the 10th. The mean of the seven readines was 100°,6.

readings was 100°.6.

The lowest reading of a minimum thermometer with its bulb placed on grass was 29°, on the 7th. The mean of the seven readings was 34°.4.

Rain.—Rain fell on four days to the amount of

0.38 inch, of which 0.22 inch fell on the 5th.

ENGLAND: Temperature .- During the week ending May 10 the highest temperatures were 75° at Cambridge, 74°.2 at Blackheath, 70° at Leicester and Hull; the highest star at Plymouth was 60°.3, at Wolverhampton 60°.4, and at Bradford 61°.4. The general mean was 66°.2.

The lowest temperatures in the week were 33°, at Cambridge and Hull, 33°.4 at Wolverhampton and Nottingham; the lowest at Truro 41°, at Plymouth 40° and at Preston 39°.5. The general mean was 36°.4.

The greatest ranges were 42°.2 at Cambridge, 36°.1 at Elackheath, 37° at Hull; the smallest ranges were 10° 5 at Perston 20°.3 at Plymouth 32°.

were 19°.5 at Preston, Bradford, The genera at Preston, 20°.3 at Plymouth, 23°.4 at The general mean was 29°.8.

The mean of the seven high day temperatures was highest at Cambridge, 62°, 9, at Nottingham 61°, 1, at Blackheath 66°, 7; and was lowest at Freston, 54°, 6, at Bradford 54°, 9, at Bolton 55°, 1. The general mean was 58°.

mean was 50°.

The mean of the seven low night temperatures was highest at Liverpool, 46°.7, at Truto 46°, at Preston 44°.5; and was lowest at Wolvenhampton, 39°.3, at Cambridge 40°.2, at 11ull 40°.7. The general mean

was 42°.7.

The mean daily range was greatest at Cambridge, 22°.7, at Hull 19°.9, at Nottingham 19°.8; and was least at Liverpool, 9°.2, at Preston 10°.3, at Bradford 11°.6. The general mean was 15°.3.

The mean temperature was highest at Truro, 51°.3, at Blackheath 50°.6, at Cambridge 49°.9; and was lowest at Wolverhampton, 45°.8, at Bolton 46°.6, at Sunderland 46°.9. The general mean was 48°.7.

Rain.—The largest fall was 0.82 inch at Bradford, 0.56 inch at Leeds, 0.54 inch at Sunderland; the smallest fall was 0.08 inch at Brigbton, 0.07 inch at Leicester, and 0.08 inch at Liverpool. The general mean fall was 0.34 inch.

Scotland: Temperature. - During the week ending May 10, the highest temperature was 62 Glasgow; at Greenock the highest was 57°. general mean was 59°.8.

general mean was 59°.8.

The lowest temperature in the week was 30°.1, at
Aberdeen; at Leith the lowest temperature was
35°.5. The general mean was 33°.2.

The mean temperature was highest at Leith, 48°;
and lowest at Pertb, 44°.6. The general mean was

Adin. — The largest fall was 1.46 inch, at Edinburgh and Paisley; and the smallest fall was 0.66 inch at Aberdeen. The general mean fall was 1.17 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

Ammonia from Gasworks: T. H. K. The best advice we can give you is to let it alone, as it can only be used safely in very small quantities.

UCHARIS: 7. Searle. The variety seems to be all right, but the cause of the plants not doing satisfactorily is not apparent. There must be something in the treatment which they do not like, what that may be you should be the best able to form an opinion.

you should be the best able to form an opinion.

INSECTS: 7. J. P. The beetle sent is the common cockchafer (Melolontha vulgaris). I. O. W. — S. J. The insects which have gnawed off the tops of your grafts of Plums, Briers, and Roses, are the common Curculio oblongus. Shake the plants over a white cloth, after dark, when the insects fall down, and may be destroyed with hot water. I. O. IV.

MIMULUS: James Wood. We do not see where the newness comes in. Hose-in-hose Mimuluses are no novelty now.

novely now.

NAMES OF PLANTS: Miss Haig. Thomasia solan-acea.—C. W., Weybridge. Erodium cicutarium.—T. Imrie & Sons. Ixia crateroides var.—IV. B. An Abies, which we do not recognise from such a small spectmen.—C. C. D. 1, 2, 3, Cardamine hrsuta; 4, Capsella bursa-pastors; 5, Equisetum palvere; 6, Equisetum arvense. Cardamine amara is as large, or larger than C. pratensis; the flowers are about the same size, but white, and the leaves larger.

RAFFIA: R. S. The Raffia or Roffia so much used for tying purposes, is the cuticle of the leaves of the Palm, Raphia Ruffia, a native of Madagascar and Mauritius.

TREE TOMATO.—If the gentleman who wrote us a few weeks ago, asking for information as to obtaining the seeds of this plant, will again send his name and address, we shall be happy to send him a few, received districtions. direct from Jamaica.

WALLFLOWER: IV. B. H. Your double black velvety Wallflower, a counterpart of the double yellow, is a very old plant, not cultivated now so much as it used to be.—Haveck. No darker than the common bloodered grown for the London market.

Markets.

COVENT GARDEN, May 15.

[The subjoined reports are furnished to us regularly every Thursday, by the kindoess of several of the principal sales-men, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. ED.]

LARGE quantities of Channel Islands Grapes have reached us during the past week, and prices have considerably fallen. Strawberries are in good supply, with no alteration. Trade rather more lively. James Webber, Wholesale Apple Market.

ATOS.—Kent Magnums, 80s. to 100s. per ton; do., Regents, 80s. to 100s.; Champions, 50s. to 65s.—New: Jersey Kidneys, 16s. per cwt.; Lisbon, 1cs.; Malta, 10s. to 12s.

LONDON: May 14—Messrs. John Shaw & Sons, of 37, Mark Lane, report that no feature either of interest or importance is just now showing itself in connection with the trade for farm seeds, the season being in nection with the trade for nam seeds, the season being in lact over. Stocks remaining on hand are generally in moderate compass. For white Mustard and Rape seed there is rather more inquiry. Spring Tares are almost exhausted. Sowing orders still come to hand. The demand for Canary and Henp seed is meagre. Feeding Linseed is firm. Other articles continue without quotable change.

CORN.

At Mark Lane on Monday, in English Wheat, held for late value, very little business was done. Foreign ruled 1s. lower on the week for white and 6d. to 1s. lower for ed. Stout Barley was 1s. over Monday staninght, and grinding descriptions the turn dearer. Oats were not appreciably altered in value, but were more saleable. Beans and Peas were quiet and unchanged, and Maize scarce and firm at 6d. to 1s. over the rates of the previous Monday.—On Wednesday the tendency of Wheat was perceptibly weaker. Stout Barley off stands was firm, grinding sorts quiet. Maize, from scarcity, brought in some cases 3d. advance. Beans and Peas were quiet, and the market 1or Oats barely so good.—Average prices of corn for the week ending May 10:—Wheat, 38s. 2d.; Barley, 30s. 4d.; Oats, 20s. 5d. For the corresponding period last year:—Wheat, 43s.; Barley, 37s. 4d.; Oats, 20s.

HAY,

HAY.

Tuesday's Whitechapel Market report states that supplies of Clover, hay, and straw were very large, with a decidedly downward tendency in prices. Quotations:

—Prime old Clover, 95z. to 106z. j. inferior, 60z. 10 75z.; prime second cut, 90z. to 105z. est meadow hay, 80z. to 38z.; inferior, 40z. to 65z.; and straw, 28z. to 36z. per load.—On Thursday there was a large supply on skie. Trade was dull, especially for hay, prices for which were easier. — Cumberland Market quotations: — Superior meadow hay, 84z. to 90z.; inferior, 60z. to 72z.; superior old Clover, 108z. to 115z.; inferior, 70z. to 85z.; prime second cut, 95z. to 105z.; and straw, 29z. to 36z. per load.

POTATOS.

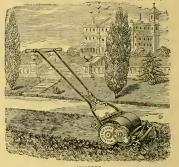

POTATOS.

The following are the average prices current during the week:—Magnum Bonums, 6os. to 100s.; Champions, 4os. to 65s.; Regents, 4os. to 50s.; Snowflakes, 5os. to 55s.; and Roses, 4os. per ton; new Potatos, 3d. per Ib.; foreign, do., 9s. to 14s. per cwt. The imports into London last week were:—14to bags from Harlingen, 8o tons Pontrieux, 5218 packages Malta, 654 baskets St. Nazaire, 176 cases Port Said, 315 sacks Rouen, and 2 sacks from Brussels.

Government Stock.—Consols closed on Monday at 101½ to 101½ for the delivery, and 101½ to 101½ for the account. Tuesday's prices were as on the previous day for delivery, and 101½ to 101½ for the account; the same figures were recorded on Wednesday. The final quotations of Thursday were 101½ to 101½ for delivery, and 101½ to 101½ for the account.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced uowards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled mitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and its used cold. It is used in the grounds at Wiedsor Castle, Kew Gardens, and at the seats of may hondreds of the Nobility and Gestry, from whom the most flattering testimonials have been received.

At the Mannfactory, or 12. 6d. per gallon carriage paid to any Station in the Kingdom.

Station in the Kingdom.

"Piercefield Park, June 21, 1876.—Sits,—I bave this day forwarded from Chepstow to your address a black varnish cash, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had, address, a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address, pectfully, WM. COX."

CAUTION.—Hitt. & SMITH would particularly warm their Customers against the various cheap Varnishes now so much advertised.

H. & S. S. Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their Constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increasing trade in it, and the numerous and their constantly increases the second of the constant increase and their constantly increases the constant in the constant increase and their constant increase and the constant increase and their constant increase and the constant in the constant increase and their constant increase and the constant increase and their constant increase and t

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1884.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, 2012.—"Movince Machines.—After a critical scanniant on the Silver Medal was granted to the old firm of world-wide fame, Messrs, T. Green & Son, of Leeds and London. As the Machines are known in all Jands where good law cherished, it is quite unnecessary to give any description of them."

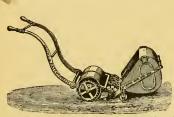

Upwards of 115,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received testifying to their superiority over all others. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

ad. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order.

4th. They make little or no noise in working. 3th. They will cut either short or long Grass, set or 6t3.

The Magnificent Collection of STOVE and GREENHOUSE

FLOWERING and FOLIAGE PLANTS, TREE and OTHER FERNS, PALMS, CYCADS, CAMELLIAS and AZALEAS,

AMARYLLIS, GREENHOUSE

RHODODENDRONS, &c.,

is, perhaps, the largest in Europe; Amateurs and others requiring Plants of this description would do well to pay these Nurseries a visit.

THE COLLECTION OF ORCHIDS IS ALSO VERY EXTENSIVE,

Several Houses being filled with these Plants.

Specimens are grown in large numbers, as well as a very large Stock of Established, Imported, and Semi-established Plants. The Orchid Houses are worthy of a visit at this time of the year, there being a good display of Plants in Flower of all sizes.

Victoria and Paradise Nurseries, UPPER HOLLOWAY, LONDON, N.

BEDDING PLANTS

FLORISTS' FLOWERS.

We are now prepared to execute orders from our fine Collections of the following, of which we respectfully invite an inspection:—

nspection:—
Chrysanthemums,
Phloxes,
Delphiniums,
Fuchsias,
Pansies,
Violas,
Roses io Pots,

Dablias, Peatstemons, Coleuses. Pelargoniums, Mimuluses, Clematies, Carnations and Picotees.

Also a large assortment of all kinds of choice BEDDING PLANTS, which can be supplied at moderate prices. Our CATALOGUE of the above is now ready, and may be had tree on application.

DANIELS BROS.,

The Royal Norfolk Seed Establishment, NORWICH.

Gardeners' Chronicle.

'SATURDAY, MAY 24, 1884.

IMPROVEMENT OF FARM AND FOOD PLANTS.

THE returns of agriculture may be increased and the yield of the crops improved either by means of higher farming, or by enlarging the productive powers of the plants of the farm. Horticulturists are familiar with the subject of plant "improvement." They are accustomed to the modifications produced by cross-breeding and selection. They are aware that our "excellent vegetables and luscious fruits," as Mr. Darwin describes them, had but a lowly origin in sour Crabs, or Sloes and Bullaces, or in such stringy roots as those of the wild Carrot or Parsnip, and those primeval forms of Beet or of the Cabbage tribe which grow on the cliffs of our European coasts, or on the sea shore. The task of improving the plants of the garden has been abundantly rewarded at all periods down to the present bour; in fact it may be said that the horticulturist has never tried his hand upon them without producing marked results. He may not always achieve what he regards as improve-ments, but at all events he finds his plants plastic. There is nothing sterotyped in vegetable life, colours may be altered, forms modified, size diminished, or the contrary, while beauty in flowers, and flavour and quality in fruits and vegetables can be readily developed. All this the horticulturist is familiar with, and whether he has read De Candolle's recent work on the Origin of Cultivated Plants, or not, he is aware that although the amelioration of some. of the most useful garden plants was pre-historic, the same art that unknown improvers employed is still practised with success.

Under these circumstances the Royal Agricultural Society of England has published a paper on the "Improvement of the Plants of the Farm," in the latest number of its Journal, and no horticulturist will question M. Vilmorin's conclusion, when he remarks in a letter to the author of the paper :- "I have no doubt but the process of improvement, which has given such excellent results as applied to vegetables and ornamental plants, might also be used successfully in the case of the plants of the farm." The earliest grown cereals now in preservation were taken from the rubbish heaps of the Lake dwellings in Switzerland. They are better no doubt than those first produced by that mythic personage—we may call her "Ceres"—who succeeded in en-nobling the wild grasses; but they are very inferior to the Wheat and Barley of the present day. The same remark applies to the Peas and Beans of the Bronze period (Animals and Plants under Domestication, by Charles Darwin, M.A., F.R.S., &c.); so that these agriculturists, especially in America, who are now attempting the further improvement of the cereals, possess for their encouragement the same evidence as horticulturists-that of accom-

plished facts. How many "subjects" in horticulture may have undergone these enforced improvements which are referred to here, it would not be easy to estimate; but the plants of agriculture are

not a dozen, all told, if the varieties of pasture grasses be excluded, and the main crops of the farm are composed of a few cereals, "roots," pulses, and forage plants. It can hardly be doubted that these few plants may be improved, if the attention of breeders and selecters be concentrated upon them. Thomas Andrew Knight always claimed to have increased the stamina of Wheat by crossing varieties, so that his new sorts withstood the blights of 1795 and 1796, when ordinary varieties were badly damaged. In 1819, Mr. Patrick Shirreff commenced a very successful career as an improver of Wheat and Oats, proceeding for years on the principle of selecting the best plants in the fields. Late in life he commenced the crossing of varieties, and his crosses won their way, though unfortunately he was still a young breeder, though an old man, when he died. At present there are no English breeders of cereals known to fame, though we learn from their own essays, and from their addresses to a Convention of Agriculturists at Washington, and from other sources, that in the United States and Canada there are several. In this country, however, the selection of cereals was never more actively pursued, and several new and approved sorts, both of Wheat, Barley, and Oats, are on the market. We may here observe, that mere thin seeding, or high feeding, is not "selection," and a monster ear is not a guarantee that the principles of selection have been judiciously applied, or, indeed, applied at all. Farmers need, at present, a good deal of instruction in this department. As a rule they appear somewhat inert on this, as on other matters, and, on the contrary, some of them are too easily led astray by pretended improvements. Moreover, some farmers have yet to learn that improvements are often relative to soil and climate. A superfine white Wheat has a limited habitat, and, in like manner, most of the varieties have their own districts and special soils-strong coarse sorts may be excellent on poor soils, but not elsewhere.

Probably the greatest improvements in the plants of the farm are those effected by the breeders of Turnips, whose favourite varieties have been greatly increased, and their habit altered by long-continued selection for the purpose of adapting them to a greater variety of soils and circumstances. There are sorts of Turnips, for example, that bury themselves to their crowns, and which are for that reason secure from frost and well adapted for the production of Turnip-tops, much to the convenience of flock-masters in spring. There are sorts that come quickly, and others that are slow, and they obey the same rule of greater or less speed in regard to their decay. Some are best for folding, some for storing, some for the South, others for the North. In Cabbages the same diversities have been induced, and the cultivation of this crop has been greatly extended owing to its newly-acquired endowments and increased adaptability. Mangel Wurzels, too, have been greatly improved, and wonderfully trimmed up in neck and root by the art of the breeders, besides being rendered far more nutritions. Of Potatos and their infinite varieties nothing need be said, the subject being familiar. Beans have been influenced by selection, not by crossing of varieties. Little has been done in field Peas, though, judging from what has been done in the garden, much probably might be done to increase their yield and improve their quality. The forage plants also have been neglected, and the common red or broad-leaved Clover remains still a weakly subject, the victim of that mysterious infirmity, the Clover sickness, and no one yet has tried to invigorate it by crossbreeding. If the Alsike Clover be regarded as an accidental hybrid between Trifolium repens and T. pratense, as Linnæus thought-and it certainly looks like a cross-then Nature

effected a capital mingling, and produced a plant which all farmers approve of, the Alsike Clover being robust, and yielding a heavy crop. As forage crops are more than ever in demand, some sanguine improver perhaps will take the hint. We know what happens in horticulture when a demand springs up; it need hardly be added that the improvement which the Royal Agricultural Society suggests would result in an increase of the national income just in proportion to this extent.

NEW LACHENALIAS.

THE three following new species of Lachenalia have all come from Mr. T. S. Ware, of Tottenham. I do not know from what part of Cape Colony they have been procured. Of the four subgenera, as defined in my Monograph in the eleventh volume of the Paurnal of the Linnean Society, these all belong to Chloriza, which contains seventeen species out of the twenty-nine there described.

LACHENALIA (CHLORIZA) FISTULOSA, n. sp.— Foliis 2 lanceolatis levibus scapo equilongis; floribus 12—15 laxe spicatis, odoris, pallide versicoloribus; bracteis minutis delitoideis; calycis campanulati sepalis ovato-oblongisalbido-cœruleis apice brunneolis; petalis obovato-unguiculatis albis purpureo marginatis calyce paulo longioribus; staminibus calyce æquilongis.

Bulb depresso-globose, ½ inch in diameter; outer tunics white. Leaves 2, lanceolate, green, fleshy, unguiculate, 4 inches long, ½ inch broad. Seape green, terete, as long as the leaves. Spike lax, 2 inches long, ¾ inch in diameter; bracts minute, deltoid. Flowers fragrant, ½ inch long; calyx ampullæform, ½ inch long, white tinged with sky-blue; sepals ovate-oblong, brown at the tip. Petals obevate-unguiculate, spreading at the top, white, edged with purple. Stamens as long as the calyx. Several upper flowers sterile, with larger bracts.

LACHENALIA (CHLORIZA) LILACINA, n. sp.—Bulbo globoso; foliis 2 lanceolatis brevibus falcatis carnosis nigro maculatti; scapo rubro-brunneo maculato; floribus subdense spicatis lilacino-cœruleis odoris; bracteis minutis deltoideis; calyce oblongo sepisis oblongis, petalis oblongo-unguiculatis calyce sesquilongioribus late patulis; genitalibus calyce æquilongis.

Bulh as in the last. Leaves 2, lanceolate, falcate, fleshy, smooth, 4 inches long, $\frac{1}{2}-\frac{3}{4}$ inch broad, glossy green, with copious, immersed, round, blackish spots. Scape slender, terete, 4—5 inches long, greenish-red, mottled with red-brown. Flowers ahout 20, arranged in an oblong spike 2—3 inches long, an inch io diameter, all strictly sessile; bracts minute, deltoid. Calyx oblong, bright lilac with a little blue at the base, $\frac{1}{4}$ inch long; sepals ovate-oblong. Petals the same colour, half as long again as the sepals, spreading widely, obovate-unguiculate. Stamens as long as the calyx. Many upper flowers of the spike sterile, with larger lanceolate bracts.

LACHENALIA (CHLORIZA) ODORATISSIMA, n. 5p.

— Bulbo globoso; foliis 2 lanceolatis pustulatis scapo longioribus; scapo viridi; floribus circiter 20 albidis odoratissimis racemosis; bracteis minutis deltoideis, pedicellis flore brevioribus; calyec eampanulato, sepalis ovato-oblongis apice viridulis; petalis obovatis patulis calyce sesquilongioribus; staminibus petalis requilongis.

petalis equilongis.

Bulh globose, $\frac{1}{3}$ inch in diameter. Leaves 2, lanceolate, falcate, fleshy, green, much blistered over the face, $\frac{1}{3}$ foot long, $\frac{1}{3}$ — $\frac{3}{3}$ inch broad. Scape green, terete, shorter than the leaves. Raceme moderately dense, $\frac{1}{3}$ — $\frac{1}{2}$ inches long, nearly t inch in diameter; lower pedicels $\frac{1}{3}$ — $\frac{1}{3}$ inch long; bracts minute. Calyx $\frac{1}{3}$ inch long; sepals oblong, white, with green tip. Petals obovate-unguiculate, $\frac{1}{3}$ iach long, the tips very spreading. Stamens as long as the petals.

The two first are nearest to L. pustulata, and the last to L. Cooperi. J. G. Baker.

AOTUS GRACILLIMA.—This is a West Australian shrub, with elongated branches and linear leaves. The flowers are a bright yellow marked with red, and are produced in such profusion along the branches as to hide the foliage, and to give the slender twigs the appearance of golden cylinders. The Aotus requires abouts the same treatment and soil as the Epacris, and will thoroughly repay any little care in cultivation,

WEST AMERICAN FOREST TREES.

In going westward from Lake Superior the arborescent vegetation ceases near Brainerd, the last trees being White Pine, Banks' Pine, the Larch, White Birch, White Maple, and Aspen. Thence to the Rocky Mountains a continuous sheet of herbaceous vegetation covers the surface, and no trees are seen except Cottonwoods (Populus monilifera) along the Missouri. The first ranges of the Rocky Mountains on this route along the Yellowstone River and in the Park are covered sparsely or densely with trees, the higher summits and ridges with Pinus flexilis, James, Abies grandis, and Pseudo-Tsuga Douglasii, Carr.; the foot-hills, and in some cases the levels, are thickly set with Pinus contorta, Dougl., var. Murrayana, Watson. This latter is regarded by some as a distinct species (P. Murrayana, Murr.), but is only an upland form, which is larger and more spreading. Both varieties, however, grow in proximity in many parts of Oregon and Northern California. In the lowlands of the Park are dense thickets of dwarf Willow, and here and there a tree of Populus angustifolia, James, and Pinus ponderosa, Dougl.

The divide west of Helena is covered with scattered trees of Douglas' Spruce, which here reaches a height of 100 feet. In the gorges which head-in the mountains there are a few trees, often of good size, of Pious ponderosa, Dougl, but they are here out of place, and belong properly to the arid country between the Rocky Mountains and the Cascade Range.

In the valley of Clark's Fork, and about Pend'Oreille Lake, the forest growth is quite strong; the rocky cliffs and ridges are set with Douglas' and Menzies Spruces, while the lowlands sustain a crowded growth of slender trees belonging to three species which are characteristic of the Western flora, probably not crossing the divide. These are Pinus monticola, Dougl.; Larix occidentalis, Nutt.; and Thuia gigantea, Of these the first has altogether the babit of our White Pine in trunk, foliage, and branches, but is at once distinguished by its longer and more slender cones. In the Cascade Mountains this species occurs sparingly over a large area, but I have never seen it elsewhere in such abundance as on Clark's Fork. The same is true of the Larix : larger trees than any found here are scattered over the eastern slope of the mountains of Oregon, but they are comparatively rare. The Thuia extends from the sources to the mouth of the Columbia, constantly increasing in size; in the Rocky Mountains never attaining more than one-half the dimensions it reaches on the lower river. As we descend the valley of Clark's Fork the western Hemlock (Tsuga Mertensiana, Carr.) begins to make its appearance; at first as shrubs or low trees simulating exactly the Hemlock of the Eastern States, from which this has only a varietal difference. On the Lower Columbia it grows, like many other Conifers, to be a majestic tree.

Between the last ranges of the Rocky Mountains, near Pend'Oreille Lake and the Cascades, the prevailing and almost the only tree is Pinus ponderosa, Dougl. It scarcely forms forests here, but is scattered over the country in considerable abundance, and

attains a large size. Passing the gorge of the Columbia we come into the dense forests of the Pacific coast proper, where the number and magnitude of the trees is greater than I have seen in any eastern or even tropical region. The trees of several kinds here reach an altitude of 300 feet, and often stand so near together that all undergrowth is absent, and the horseman makes his way through them with difficulty. On the lowlands the Douglas Spruce and the western Arbor-vitæ are the most abundant. Locally the Hemlock is common, and along the rivers the North-western Cottonwood (Populus trichocarpa, T. and G.) stands thick and attains a large size. Along the smaller streams, and in swampy places, the Oregon Ash (Fraxinus Oregana, Nutt.) and the arborescent Alder (Alous rhombifolia, Nutt.) occur in considerable numbers, and attain about equal size-i.e., a diameter of 1 foot, and a height of 50 or 60 feet. Scattered through this lowland forest are the two common Maples of the West (Acer macrophyllum, Pursh, and A. circinnatum, Pursh). Of these the first grows sometimes to the height of 80 feet, with a diameter of trunk of 12 to 15 inches, and on young plants the leaves sometimes attain a breadth of a foot or more. Maple is a peculiar feature in the forests of the Lower Columbia, Puget Sound, and Vancouver's Island. It

never becomes more than 6 inches in diameter, and several trunks usually spring from the same root. These are very slender, droop, and, frequently reaching the ground, take root at the summit. Where these interlacing trees are numerous they form a thicket which is almost impenetrable.

On the higher and more rocky portions of the country the Western Balsam Fir (Abies grandis, Lindl.) and its congeners A. nobilis, Lindl., and A. amabilis, Dougl., are locally numerous, and attain great size-i.e., reach a height of from 150 to 200 feet, and a trunk diameter of 5 to 7 feet. With these, which form a distinct sub-genus, are the omnipresent Douglas Spruce, and Menzies Spruce, formerly known as Abies Menziesii, Dougl., but now generally called A. sitcheosis, Carr. Still higher, and reaching to the line of perpetual snow, are Pinus flexilis, James, var. albicaulis, and Tsuga Pattoniana, Englm., the latter the most beautiful of all Conifers. Less common than the preceding Conifers, but locally abundant in the country bordering the Lower Columbia and Puget Sound, are two Cypresses (Chamæcyparis Lawsoniana, Parlat., and C. nutkaensis, Spach.). Of these the first, sometimes called the Ginger Pine, from the fragrance of its wood, is much admired and cultivated for its beauty, and esteemed for the excellence of the lumber it furnishes. Scarcely less interesting to the botanist is the western Yew (Taxus brevifolia, Nutt.), a tree often 40 to 60 feet in height, growing spariogly in the lower portions of Oregon and Washington. Three species of Juniper are scattered over the drier and more rocky parts of the country bordering the Columbia, viz., Juniperus occidentalis, Hook., in the foot-hills of the Cascades, often an erect tree 40-50 feet in height; J. utah ensis, Englm., low and spreading in the interior; and J. communis, L., generally distributed, and closely resembling in foliage, fruit, and mode of growth, the eastern and European plant.

Among the great Conifers of the Pacific coast two of the most gigantic and valuable, the Sugar Pine (Pious Lambertiana, Dougl.), and the Redwood (Sequoia sempervirens, Endl.), approach, and the first reaches the line of the N. P. Railroad, though their habitat is more southern, and both are important elements in the resources of the country from which it will derive much of its business. Of these the Sugar Pine-nearly related to the eastern White Pine by habit, foliage, cones, and wood-is the monarch of the geous, frequently reaching a height of 300 feet, with a diameter of from 10 to 15 feet. This grows chiefly in the Sierra Nevada and Cascade Mountains throughout Oregon and California. The Redwood is even larger. It is found only along the coast and about Port Orford forms forests, which surpass in the average dimensions of the trees any others I have The lumber furnished by both these great trees is excellent; and, like the White Pine of the East, they are suffering such wholesale destruction as promises soon to exhaust the supply they furnish. next in intrinsic value as timber trees, and, from their abundance, having even greater economic importance, are the Douglas and Menzies Spruces, the White Fir (Abies grandis, Lindl.), and the western White Cedar (Thuia gigantea, Nutt.). These form the basis of the lumber industry of the Puget Sound region, and supply all the great saw-mills, some of which cut 250,000 feet per day. The timber furnished by these trees is good, but the lumber is interior.

With the array of magnificent conifers which flourish in the moist and equable climate of the North Pacific coast the poverty of the angiospermous flora is in striking contrast. Two Maples, two Poplars—one on the high and other on low grounds—one Ash, and one Alder, have heen enumerated. To these should be added two arborescent Willows (Salix lasiandra, Benth., and S. longifolia, Muhl.), one of of little value, and two other hard-wood trees, and he list is complete. On the last mentioned trees I have made the following notes:—

In the open grounds of the Willamette Valley, Puget Sound, and Vancouver's Island, Garry's Oak (Quercus Garryana, Dough.) is not uncommon. It is usually of moderate size, and of a peculiar straggling and misshapen growth; occasionally trees of 3 or 4 feet in diameter are met with, but the shape is so irregular, and the wood so brittle, that it has little value as a timber tree. In the forests of hoth Oregon and Washington Territory two trees are sometimes seen that are sure to attract the attention of the Eastern botanist. One of these, which grows on the

higher grounds, is the Oregon Chinquapin (Castan-

opsis chrysophylla, A. DC.), generally a shrub, but sometimes reaching an altitude of 50 or 60 feet, and conspicuous from the golden pubescence of the underside of the leaf. The other tree to which I refer is the Madrona (Arbutus Menziesii, Pursh.). This is a small tree, but one much admired; the foliage is persistent and rich, the leaves oblong or lanceolate, with serrated edges, and the fruit, which grows in clusters, is red, and somewhat resembles that of the Mountain Ash, but is less abundant, and grows in more open panicles. Thus, Mechan.

MEMORIAL TO ARTHUR VEITCH.

THE accompanying illustration (fig. 127) is that of a handsome drinking fountain erected in Fulham, at the junction of the Moor Park Road with the high road, and nearly opposite the London Athletic Club's ground, by Mr. Harry J. Veitch, io affectionate remembrance of his late brother, Arthur, whose name will loog remain in the memory of gardeners as that of a man who laboured earnestly to improve their status and well-being. The fountain, which is of grey granite, partly polished, and in part rough-

FIG. 127.—ARTHUR VEITCH MEMORIAL FOUNTAIN.

hewo, forms a handsome terminal to the triangular space existing at the point indicated.

AN ISLE OF WIGHT GARDEN.

"MAY I come and see your garden?" I ventured to write, and had a prompt and favourable reply, soon followed by a visit, and a pleasant morning was spent amongst the flowers. Every garden has its speciality, and the skilful cultivator soon finds out the plants that are perfectly at home in the particular soil and climate of his domain.

"I don't know any plant that won't grow here" (near Ryde), said Mr. Ewbank; and it was quite true that plants of the most diverse character and from the most distinct habitats were thriving side by side. The alpine Primulas and the Cape Ixias, Sparaxis, &c., were side by side; still the Ixias seemed the most at home. It is a square garden, such as is attached to most modern fair-sized suburban houses, not quite close to London, but every inch is made use of, and there is an overflow into the church garden adjoining, beautifying this also.

Well, the glory of the garden was the black Iris one fine plant, which had been baked all last summer in a box of sand on a greenhouse shelf until planted out in September, had two fine flowers probably 8 to 9 inches across standing out in the midst of a slightly raised bed of bulbs. Then a lovely flower of 1ris Pavonia, with its spot of many rays, struck me much, though from its commonness the owner almost passed

it unnoticed. Great clumps of Habranthus pratensis, with their Amaryllis-like flowers of metallic crimson; Nemostylis grandiflora is a gem amongst bulbous plants; its flower has the loveliest blue colour imaginable; Dietes Huttoni, has spikes 3 feet high of yellow Iris-like flowers. The last of the Narcissus to bloom was N. gracilis, still in flower, but everywhere bulbs abound on the warm, sunny, southern borders at the foot of the house walls, on beds raised slightly on the lawn in crowded companionship one with the other; the best of the Oxalis, Piottæ, enneaphylla, brasilieosis purpurea, lobata, and many others. chortus of sorts, such as lilacinum, Maweanus, pulchellus, venustus, and others too numerous to name; Scillas of the S. campanulata type; S. bifolia alba var. grandiflora, a little gem; Muscaris, with the finest of the Grape Hyacinths-M. armeniacum -long spikes of rich dark blue. Ixia, Sparaxis in flower and coming on-bulbs everywhere showed in rich abundance, and are evidently to be the flowers of the garden.

Other plants besides bulbs abound, however, and specially may be noticed the weed of the garden—Anemone palmata alba; Lathyus Sibthorpii, with its rich purple flowers; Senecio spatulifolius, a handsome British plant; Romnea Coulterii—is this hardy near London?—Myosotis rupicola, in full sun on sand—a very pretty Belgian form of Anemone coronaria alba. On the rockwork were Gentiana verna, Lithospermum purpureo-cecruleum; Convolvulus encorum, with its silvery leaves and white flowers—alas I only half-hardy here; Ligularia Hodgsoni, a bold-leaved plant; and in full sun the beautiful Italian Campanula Allioni.

In shady peat beds with the Trilliums and peatloving Lilies, Houstonia cerulea was seeding finely, and the beautiful Claytonia virginiana was in full bloom, forming masses of white flowers.

There only remains to mention the covering of the walls, and here one is tempted to covet, but vainly, one's neighbour's climate. Mutisia decurrens is just about to open its flowers on raised sand with the roots closely clinging to the wall. Edwardsia grandiflora is laden with yellow flowers, in shape like those of the Glory Pea; Trachelospermum (Rhyncospermum) jasminoides and others, that are with us greenhouse climbers, cover every inch of house and church. The soil of the garden is brick earth on gravel, the heife addition is sand (fine Lower Greensand from Newport), in which everything grows; it has a soft earthy feel, and seems mixed with some blackish flakes. With what small trouble the materials and ordinary soil, and an adjacent sand-pit, may not a garden of surpassing interest, full of flowers from January to December, be had, and every flower in it hardy, or at least possible to cultivate with a minimum of trouble.

All thanks are due to those who, like the owner of this garden are "trying all things," and adding to our lists of possible outdoor plants. George Paul.

HARDY FLOWERING SHRUBS.

THE season at which plants flower is the best to note their merits, whilst the impressions they give are fresh in memory. As each succeeding spring comes round we cannot help noticing the comparatively little use that is made in many gardens of some of the most attractive flowering shrubs now in cultivation, and which are often either wholly absent from the shrubbery, or so meagrely represented as to have comparatively little effect. The first we may mention Forsythia suspensa, the bright yellow starry flowers of which are not uplike in appearance those of the naked flowering Jasmine-Jasminum nudiflorum, and, like it, they are produced in the greatest profusion. During the past March, wherever we met with it there was quite a glow of colour. It thrives, freely in any soil of fair quality in a fairly open situation. Of Cydonia japonica even the well known common red variety is oftenest seen in the shape of a solitary plant or two confined to a wall, whereas it is one of the most beautiful of all plants grown as a bush; the past mild winter just suited it, enabling the flowers to keep on opening for three or four months unusually fine and bright in With it should be associated the white and the flesh-coloured varieties. Then there is C. sinensis and the red-flowered P. Maulei, beautiful plants, which are not nearly so much grown as their merits entitle them to. The different kinds of Pyrus are a feature in any garden, when judiciously placed where they have fair play, and not crowded too much by stronger growing things that impoverish the soil, as well as overhapg them too much.

Pyrus malus floribunda stands unsurpassed for the beauty and profusion of its flowers, as effective in the bud state before they open as they are when fully expanded with the whip-thong-like shoots laden with delicate colour. P. sinensis and P. salicifolia are both beautiful. Of Thorns, Paul's double scarlet (Cratægus Oxyacantha coccinea plena) has been a long time in getting much known, yet every one, even where space is limited, should grow it; its colour is so vivid that it lights up everything near it, and its erect habit of growth gives it a distinct appearance from the other more drooping sorts. Deutzia gracilis is so much confined to pot culture that one might almost suppose people forget that it is equally at home in the shape of a dense, good-sized bush in the shrubbery as it is in the forcing-house in a pot. The biggest and best managed examples that are met with in pots are much interior to those out-of-doors when it has had time to get fully established. Not the least of its merits is its flowering after most shrubs are over. The length of time that it takes to get a really sterling hardy shrub to become generally known and appreciated is evidenced by one of the Viburnums, V. plicatum, which is unquestionably one of the most beautiful hardy flowering plants in existence; it has been in the country nearly forty years, yet the shrubberies wherein it is absent far outnumber those in which it is present.

The Lilacs (Syringa) are such general favourites that every one plants them, nevertheless they keep to the old kinds, most of which are inferior to the best of the newer varieties, such as the white Charles X. and the fine purple Dr. Lindley. Amongst Laburnums L. Alschingeri stands out equally conspicuously by its absence in many shrubberies, as it does for the extreme length and beauty of its yellow reaching and the common sorts are over. Of Hydrangeas H. paniculata grandiflora alike bas a claim on planters for its hardiness, profuse babit of blooming, and distinct appearance, to which may be added the not less desirable property of flowering later than most things. Where properly placed in the front of masses of dark leaved shrubs its densely packed long tapering heads of flower are seen to the best advantage.

of flower are seen to the best advantage.

Those desirous of having shrubs that flower late in the season, when almost everything in the way is over, will do well to plant the different sorts of Hibiscus syriacus (Althea frutex), amongst the single and the double varieties of which, in their various colours, are some of the most telling of bardy shrubs, flowering as they do from top to bottom when fairly treated. In Cistus the best known is C. ladaniferus, that it is not by any means so generally met with as its effective character deserves; others of the family worth a place are C. corbariensis, C. cymosus, C. laurifolius, C. salvisefolius. Amongst either large or small-growing shrubs there are few, if any, of greater merit, especially if the unsurpassed fragrance of its flowers are taken into account, than the little, dwarfgrowing Daphne encorum. Its perfume is by many preferred to that of its Chinese relative, D. iodica. The little room that it takes up is in its favour. Wherever it can be induced to thrive it deserves all the attention that can be given it, but although it grows in some places with little or no attention, be yound seeing that it is not overrun by larger and quicker-growing things, in others it does indifferently. Alany other beautiful flowering shrubs here are those that are held in comparatively little favour with many who plant shrubberies, but the above are a few that should find a place in even the most select company. T. B. [We cordially endorse our correspondent's suggestions. We have figured several of the best from turns till these plants receive the attention they merit. Ed.]

GOLD-LACED POLYANTHUSES.

THE London and Manchester shows of the National Auricula Society were remarkable this year for the excellence of the new varieties of Polyanthuses which were exhibited, and which won, in most cases, against the old stagers. It is a most encouraging fact, and shows that those who are now cultivating Polyanthuses are not content with the very few varieties which have for years been almost exclusively shown, but are raising their own, with marked success. It is a curious fact that Lord Lincoln, one of the oldest, and best of the black grounds—and now, alas! one of the scarcest—failed altogether to attract the attention of the judges in

London. This was its only appearance this year, and it is so nearly extinct that it may probably have been its last. Beauty of England, another fine variety, is now exceedingly rare, and is seldom seen. It always a nice point to distinguish between it and Pearson's Alexander, and when it was staged in the 1st prize lot at the Manchester show it attracted deserved attention. But was it Beauty, or was it Pearson's Alexander? Mr. Ben Simonite, who acted as one of the judges, argued the matter warmly. He well remembered both the old "Alexander" and the "Beauty," and he had no doubt whatever that this was Pearson's Alexander. The name was thereupon amended. During the afternoon it was interesting to note the groups which huog about this flower, showing the deep interest its reappearance excited. Your readers will recollect that I stated in your columns a few months ago, that Pearson's Alexander still existed amongst us (p. 25, Jan. 5).

Of the new varieties there have been two exhibited this year which were raised by Mr. Paul T. Barlow, of Congleton, the raiser of the fine variety, Congleton Queen. Lord Beaconsfield was shown by the Rev. F. D. Horner in London, where it won the 3d in the singles, and it was in Mr. Beswick's 2d prize lot of three at Manchester. Blackbird was also in Mr. Beswick's lot, and was exhibited by me as a seedling, and won 4th in the singles. Lord Beaconsfield and Blackbird are both of Mr. Paul Barlow's raising, and are characterised by clear delicate lacing, good colour, and fine circular eyes. The fault, if any, is that the lacing is sometimes paler than the centre. They furnish a very strong contingent to reinforce the old black-ground Folyanthuses. Of my own seedlings it is not for me to speak, but the reporters of the London and Manchester shows have spoken well of them. They have in every case held their own against the older

I think the prizes for Polyanthuses should be enlarged both in amount and in number. There are many new growers, and, as will be seen from the above, there are many new plants. The barbarous Northern custom of obliging the exhibitor to divest the plant of all trusses, save one, ought to be put a stop to. It is not insisted upon in London, and I hope it will be also omitted in the future schedules of the Northern Section. Polyanthuses should be shown naturally. They need no dressing, and a plant which can carry five trusses should count accordingly. The judges may be trusted to single out the best trusses, or the competing truss might be indicated in some way, and the judgment might be thereupon. If Polyanthus growers were encouraged, we should soon have better varieties. Win. Brockbank.

FLOWERS IN SEASON.

FROM Messrs. Rodger, McClelland & Co., of Newry, we have received specimens of the following interesting plants:—

BERBERIS HYBRIDA AUTUMNALIS.—A fine shrub, growing to a height of 4 feet, with arching shoots and broadly linear or somewhat 3-lobed leaves, and dense clusters of orange flowers. It is like B, stenophylla x, but even more free-flowering, the individual flowers being rather smaller. A valuable feature is, that it flowers freely a second time in the autumn.

GREVILLEA ACANTHIFOLIA.—A greenhouse shrub with oblong, leathery, pinnately-cut, dark green leaves; the side lobes are divided into three subdivisions, each of which is ovate and spine-pointed. The inflorescence is a dense one-sided spike, the pale rosy-lilac flowers being all turned to one side. The long projecting styles produce a singular effect.

HAKEA EPIGLOTTIS is a greenhouse shrub, with long spreading cylindrical spine-pointed leaves, like those of Picea Morinda, and with small rosy-lilac flowers in their axils.

POMADERRIS VACCINIFOLIA.—A balf-hardy small shrub, allied to the Spiraeas, with small-stalked ovate entire leaves, whitish on the under-surface, and clusters of numerous small yellowish-white flowers at the ends of the branches.

clusters of numerous small yellowish while lowers the ends of the branches,
PLAGIANTHUS DAMPIERI AND P. PULCHELLUS,
—Of these we shall bave occasion to speak at another time. The former, in particular, is desirable as a

hardy free-flowering shrub.

SENECILLIS CARPATICA.—A Composite, with large, broadly ovate glaucous leaves, and stalked clusters of yellow flower-heads. Of this we hope to give a figure

on another occasion.

THE PROPAGATOR.

THE PROPAGATION AND CULTURE OF DROSERAS. -These interesting plants are continually dying out of collections for want of a knowledge of the proper means of keeping up a succession of young plants, and yet nothing is easier than to multiply them by means of root cuttings. When potting the old plants, it is well to obtain as many of their roots as can be spared without injuring them. These roots, when they have been cut up into pieces an inch in length, should be dibbled into a store-pan, leaving an inch between each piece all over the pan. The holes thus made should be filled up with a little dry sand. After watering them they must be placed upon a platform or moist shelf, and great care exercised to prevent them becoming dry. As soon as the shoots of the root-cuttings are an eighth or a quarter of an inch in height they should be cut off, with a sharp knife, together with a small portion of the old root. These cuttings should be potted into small thumbs, and placed in little pans on a moist shelf or platform. They must not however, be allowed to become dry. The pans containing the old roots should be replaced in their old position, for they will continue to produce young plants for about two years. The soil best adapted to the nature of the Drosera is composed of one half spongy peat, broken up into pieces about the size of walnuts, one fourth of finely chopped sphagnum moss, and one fourth of To every bushel of this soil should be river sand. added a 48-potful of charcoal, broken up ioto pieces of hazel-nut size, and a 48-potful of yellow loam, and the whole well mixed together.

DROSERAS FROM CUTTINGS.—Some of the plants intended for cutting purposes require some previous preparation, such as those the stems of which have grown long. These should be covered up to the crown with a little chopped moss and some sand, in order to encourage them to root. When they have rooted the tops of the plants can be taken off for cuttings, the ends of which should be placed in some dry sand; indeed, it is well to sprinkle a little sand on the cut on the old plant. Each leaf of the tall varieties should be supported by a small stick, but the crowns of all the cuttings should be firmly secured by means of pegs. They should now be placed in small pans of water upon a shelf or platform. The old plants will for years form stock plants, and as fast as they break into growth the growth should be taken off as cuttings, and treated in the manner stated above.

DROSERAS FROM SEED .- It is a good plan to fertilise the Drosera flowers day by day to obtain a supply of good seed. Store pans should be filled with the soil mentioned above, which should be raised in the centre so as to slope down towards the edge of the pan, and well watered to settle the soil. ripe seed should be gently sprinkled upon the surface, and great care must be taken when watering the pans to see that the seed is not floated or washed away. The seed-pans should now be placed on a damp shelf or platform, and be kept damp. When the seeds germinate the seedlings that are visible should be pricked off and potted into small thumbs. In order to prevent the seedlings becoming dry, and to make it more easy to move them from place to place, it is advisable to place six or eight of the pots into a 48-sized pan, the interstices to be filled with sand and a little chopped moss. The seedlings can he potted into larger pots as they grow in size and strength.

CULTURE.—There are many features in the culture of the Drosera to which special attention should be directed. They are best cultivated on a raised platform near to the glass in an intermediate-house of sunny aspect. They thrive best when grown apart from other plants, and we have more than once called attention to the necessity of keeping them in a damp state. To effect this end they should be placed in small pans filled with water, at least during the growing season. They must not on any account be watered overhead, and this may be prevented by keeping a large pan filled with water, and large enough to dip them in. It is advisable to dip the plants in the water, because, owing to the peculiar nature of the soil, it does not soak through when watered in the ordinary way, and we should mention that rain-

water should always be used. Droseras are often spoifed by being confined to a close case, and placed in the shade. They thrive best in the warm rays of the sun, therefore they should be placed as near the glass as possible. It should be understood that the Droseras require keeping moist all the year round, even although the foliage dies down for some weeks.

The flowers of these interesting plants are generally large, and mostly of a pink or white colour, and the prettiness of the latter is combined with a fragrant odour. The following are the most easily grown species:—Prosera dichotoma, D. rubra, D. capensis, D. spathulata, and D. rotundifolia. T. O. [A page illustration of various species was given at p. 104, vol. iv., 1875, ED.]

THE GROSVENOR GALLERY.

THERE are fewer pictures of botanical and borticultural interest in the Grosvenor Gallery this year than usual. The same dearth holds good with the exhibition at the Royal Academy. We need hardly say however that there are some remarkable and admirable pictures in both collections.

Amongst the first pictures in the Grosvenor will be noticed three excellent portraits by L. Alma Tadema, and a large boldly treated landscape by R. Barrett Browning; these we pass, and notice in No. 21 a bold and dashing picture of " Scarlet Garden Poppies," by M. J. Muckley, painted with all the vigour and skill peculiar to this accomplished flower painter; No. 25, "May," a picture of red and white Hawthorn blossom, by the same artist, we think is somewhat less successful. The pictures of "The Bath," 28, J. R. Weguelin, and 38, "Aphrodite," by Philip 11. Calderon, R.A., are meritorious studies of the figure, but we do not like the unpatural blue colour and decorative treatment of the sea in the last. No. 40, "Leaves have their time to fall," David Murray, A.R.S.A., is a good representation of Birch trees, and probably painted direct from Nature, as the fungi amongst the dead leaves, Agaricus muscarius, are more common amongst Birch leaves than elsewhere in our woodlands. 45, Ten Virgins," J. M. Strudwick, is a figure subject that we do not like; it is obviously based on the mannerisms, without the knowledge and power, of E. Burne Jones. 60, "Meadows by the Avon," Alfred Parsons, is one of the best landscapes we have seen from the brush of this skilled, dashing, and facile landscape artist; this picture is especially true to Nature, and the perspective (well marked in the position of the advanciog figures) perfectly correct. 63 and 75 (the numbers were transposed on the pictures on the Press day), "Peaches and Blackberries" and "Haws," W. Hughes, are two carefully painted decorative pictures that we think are open to improvement in drawing: when a picture is de-corative in character it is not necessary to make any part contrary to Nature.

The picture of "King Cophetua and the Beggar Maid," by E. Burne Jones (60), is a large attraction by E. Burne Jones (69), is a large attractive containing life-size figures. This is perhaps work, containing life-size figures. This is perhaps the most important picture Mr. E. Burne Jones has ; it represents a king in armour on the lower steps of a throne, upon the upper part of which is sttting "the Beggar Maid." The picture is carefully and skilfully drawn, and is full of curious and well painted details. Opinions will vary as to the value of the work, but there can be no doubt of its general excellence. Like all works from the brush of E. Burne Jones, the subject is treated in a somewhat conventional and decorative manner. 104, "A Wood Nymph," E. Burne Jones, is even more decorative in its treatment than the last; no one can deny the beauty of the drawing and painting, but one can hardly imagine a Dryad to be so solid and melancholy-fooking - the face would answer for that of Atropos. Near this picture is a magnificent work by J. E. Millais, R.A., portrait of the Maquis of Lorne.

There are several most beautiful landscapes, as 187, "The Thames below Runnymede," and 201, "A Bed of Water Lilies," by Keeley Halswelle, A.R.S.A. In 222 Mrs. John Coffier has painted a skilfully drawn study of nude figures, comparable with 28 and 38. At 206 and 211 are two of the curious pictures for which the Grosvenor Gallery is famous; the first is termed "The Bridge of Life," by Watter Crane; the other, "Patience on a Monument Smiling at Grief," by R. Spenser Stanhope. Both display considerable

skill in composition and drawing, but both are marred by curious conventionalities.

In 265 W. Holman Hunt contributes an indifferent pottrait of Dante Gabriel Rossetti; the picture is of interest as showing the features of Rossetti and the style of portraiture belonging to Mr. W. H. Hunt. There are but few flower pictures worthy of special note in this year's "Grosvenor"; some are astounding for their badness. In 290 Mr. M. D. Mitchell exhibits a picture named "Dahlias," dull and lustreless; in 292 J. M. Jophing sends "York and Lancaster Rosses," with petals solid and thick, and, as we think, unnatural. 298, "Sweet Peas," as well as 376 and 377, "Clifton Lin," appear to be the juvenile productions of a very raw begioner. 305, "June Rosses," Mrs. R. E. Welby, is a good picture; and 322, "Rosses," Miss Maude Naffel, is an admirable work, in strong contrast with several very feeble attempts in the same room; the drawing is very accurate, and the painting of the leaves—in one place with the light shining through them—is very redictable, 372, "Chrysanthemums," Miss E. F. Jackson, is a well executed picture, as is 374, "Almond Blossoms," by Mrs. Cecil Lawson; the blossoms are considerably larger than Nature, and the attempt at the colour of Almond Blossom is a failure.

LAMBTON CASTLE.

A CONSIDERABLE addition has been made in the fruit department under glass at Lambton, in the shape of a lean-to orchard-house against the long wall supporting the terrace flower garden that fronts the range of large vineries, &c., and separating it from the fruit garden. This orchard-house, which has been built two years, is unheated, and is 325 feet long and 16 feet wide. It is in two equal divisions, separated by a small span-roofed structure in the centre, standing at right angles to the range and projecting somewhat, and which is kept gay with flowering and other plants, and contains a considerable number of Roses. The western division is principally occupied by Pears, some in pots and some planted out along the front and trained to wires stretched lengthways of the house, at a sufficient distance from the glass, alternate tree is confined to three shoots, the intervening ones having two each. A shoot is taken up immediately under each of the roof bars, which are 14 inches apart. These trees are ultimately intended to partially cover the roof; the selection, both of permanent trees, as well as those in pots, comprises all the well proved kinds. All have made good progress, and have set such quantities of fruit in most cases as to require much thinning. The size the fruit reaches under this system of cultivation may be judged from the weight which many of the leading sorts reached fast year, though the trees had only been one year in the house:—Pitmaston Duchess, 20 oz.; Souvenir du Congrès, 20 oz.; General Todtleben, 19 oz.; Williams' Bon Chrétien, 16 oz.; Brockworth Park, 18 oz.

A row of trees in 14 and 16-inch pots, consisting of Apples, Plums, and Cherries, runs the entire length on the side of the walk furthest from the back wall; these also have set a profusion of fruit. The back wall is planted with Plums, which are making satisfactory headway. Some of the Pears are on Quince stocks, others on the Pear. The corresponding half of the range is similarly filled with Apples, Pears, and Plums, with Peaches on the back walf. They are all in good condition, and many of the trees have set ten times the quantity of fruit they will he able to carry. The permanent trees planted in front will only be allowed to cover about three-fifths of the lower part of the roof, so as to give the Peaches and Plums on the back wall a chance. A shelf runs over the path the whole length, that holds about 500 Strawberries in pots. There is a narrow border running between the path and the back wall, planted with Carnations and other flowering plants that will have a chance of thriving until the trees get larger.

The construction of this long range deserves a word of notice. It is plain, but well and substantially built; the glass is wide, the bars, as already intimated, being some 14 inches apart, admitting a maximum of light; to every three ordinary bars a rafter is introduced, each of which is trussed, thus giving strength to the roof. The path is composed of cast iron grating in pieces not too large to be easily moved, and has the merit of being clean, all but imperishable, and has a nice appearance. The roof ventilation in each of the divisions, 162½ feet long, consists of a 2 feet wide continuous light, hinged at the top; it is in two pieces,

divided in the middle where the opening gear is placed. The opening and closing is effected by a flat iron sliding bar running the whole length under each light; to this are fixed at intervals stout iron rods attached to the bottom of the hinged lights. sliding movement of the bar is effected by a chain and wheeled screw, worked right or left, according as the light is to be opened or shut; the movement is quick, and so easy that a child could do it. The advantage this sliding arrangement has over the old revolving bar worked by leverage is, that the whole of the strain present with the various applications of the old method is got rid of, admitting of almost any possible length of light being raised at once. The front lights in the range are 21 feet deep, and are furnished with sliding bars similar to the top. In these houses Mr. Hunter has secured the same provision that has been the sheet-anchor of his success in fruit culture, Grapes especially-an unlimited supply of water, so laid on that it can be used with a minimum amount of labour. An inch pipe, with taps at short intervals, to which can be attached a hose-pipe, runs the whole length of

VINES .- The Vines in the principal range, which have produced such quantities of large bunches within the fast ten or a dozen years, have this winter had their inside roots lifted, and new borders made for them; they have been planted fourteen years, and as those who have followed the details that have appeared in the Gardeners' Chronicle of the treatment to which they have been subject are doubtless aware, for several years after they came into bearing a considerable portion of the extremities of their roots in the inside borders were annually shaken out and put in new soil -treatment which the size of the bunches and the collective weight of the crops they bore gave evidence of having agreed with them. But as they went on and filled the borders, 12 feet in width, this annual part renewal had to be given up. Conscious of the benefits of fresh soil Mr. Hunter has now renewed these borders. It may here be well to state that part of the outside border to these houses is the same size as the inside, the remainder a little narrower. The Vines are planted near the front wall, which was built so as to give the roots free egress to the outside border, and there is about balf the quantity in it that there is inside, where, when lifted, they were found as close as they could run in every direction. They have not been shortened, as is sometimes done when borders are renewed, but left entire.

In the first house at the eastern end of the range there is a mixed lot, consisting principally of Gros Colmar, Alicante, Lady Downe's, Barbarossa, and Raisin de Calabre; when I saw them at the latter end of April they were showing a grand crop, many of the bunches with enough in them to reach from 6 to 10 pounds. In the Muscat-house adjoining only half the border bas been made, the other part is to be done next winter; the show of fruit in this house is equally promising in every way. In the corresponding house to this, in the opposite half of the range, wherein is the Black Hamburgh Vine that bore the monster bunches, all the inside border has been remade, and, as in the others, without any sign of the Vine having suffered any check, the wood, foliage, and bunches being unexceptionable. The Vines in the other ranges are bearing heavy and promising crops. All are now grown on the long-shoot system, more or less according as the distance the rods are apart will permit of. In the houses in the upper ranges, where they are nearer together, as a matter of course, there is not room to run them so long as in the lower, where they are further apart.

PINES.—Of these Mr. Hunter has still a number of seedlings in the course of being proved; they are a fine lot of strong, stout-leaved plants, likely to carry big fruit. They are mostly the result of crosses, in which the Queen has been one of the parents, smooth Cayennes, and one or two of Mr. Hunter's seedlings being the others.

THE CONSERVATORY at Lambton is always unique in appearance from what one is accustomed to see. There are comparatively few climbers used, the space overhead being occupied by the immense examples of basket plants, and others still larger, mounted overhead on the strong iron arches that span the paths in many places. On these many thiogs are used that one would never expect to see in such positions, but which are nevertheless very effective; for instance, on the top of one of the four arches standing at the four

points of the compass over the path surrounding the nearly circular centre bed, in the cool division, was a Pimelea spectabilis, some 7 feet across, its branches hanging down so as to all but cover the pot. On the opposite side to this is a large and handsomely flowered specimen of Darwinia tulipifera, with a couple of dense bushy Azaleas occupying the corresponding two arches. The pots of these and other plants similarly used are plunged in wire baskets made to fit, and clothed with Selaginellas, Ivy-leaved Pelargoniums, smooth-leaved Begonias, Ferns, Ficus repens, and other things of a like description. The four plants above-named stand on the crown of the arches, with a smaller example of something of a drooping habit right and left of each on the spring of the arches.

In the central bed the plants are stood low and close, so as to cover the surface in a way that scarcely a pot is seen; they are relieved by taller examples standing well out of the carpet of verdure. On the opposite side of the path a similar arrangement exists, plenty of colour being secured by the presence of Azaleas, Roses, Deutzias, Cinerarias, Hoteias, Hyacinths, zonal Pelargoniums, Hydrangea Thomas Hogg, and the common variety; the former sort was very effective in the shape of tall, loose pyramids covered with flowers. The roof is thinly draped with the shoots of one or two climbers, that do not perceptibly lessen the light to the plants beneath. house is glazed low down all round, and is away from the influence of anything to interfere with the light. In the central division of the house the plants are disposed somewhat similarly, the arrangement being varied from time to time. The centre is occupied by a fine spreading Palm, with smaller plants round. All round next the outer wall runs a wide stone stage, which is now planted closely with Eucharis amazonica, the large deep green leaves of the plants showing that they like their situation; amongst these are placed a few tall coloured-leaved Dracænas, with their pots hidden by the leaves of the Eucharis. Fronting this is a mixed assortment of plants effectively placed. Spreading Ferns, such as Davallia Mooreana, and immense examples of the best Adiantums, are here arranged overhead; along with them were a couple of plants of Cypripedium insigne, nearly a yard in diameter; in this light position they thrive well, many of the scapes bearing two flowers each. A remarkable example of Platycerium alcicorne, in beautiful condition, not less than 6 feet across, is here suspended, and is one of the most telling plants in the place.

In the third division, on a much lower level than those noted, are two fine plants of Dicksonia antarctica with trunks 10 to 12 feet in height, and a Cyathea medullaris. They were originally planted out, but as usual with such plants when they have unlimited root-room, they threatened to outgrow the space at command. They have been taken up and put in tubs only some 25 inches in diameter, in which they are doing well, showing how little the plants resent all but disrooting. A few very large specimens are here mounted up overhead, including Latania borbonica, 14 feet across; and a pair of Kentias somewhat smaller, also a pair of Imantophyllums in 18-inch pots. The bright, healthy condition of the foliage in this, as in the other divisions of the house, shows how the plants enjoy the hose-pipe being freely used on them. T. B.

Foreign Correspondence.

GARDENING NOTES FROM A LIME SOIL ON THE GENOSSE RIVIERA.—On the Genoese Riviera winter and spring have passed away, and summer has arrived (May 5), as evidenced by the general blooming of Roses, as in England early in July. A retrospective glance on our horticultural history—or, at least, on some features of it—during the winter months may present interest as bearing on climate and soil.

The former is characterised in winter by long nights, with a rather low temperature, averaging from 40° to 45°, and by short days with a shade temperature averaging between 50° and 55°. The sky, however, five days out of six is clear, and the sun brilliant, consequently there is mostly during the day intense light and ardent sun-heat. The soil in the Mentone district is generally a limestone soil, formed by the break-up of secondary oolitic limestone, with very little vegetable humus. As a necessary result, unless

a soil is artificially made or provided, it is only the plants that grow naturally in a lime soil that do well; all others merely vegetate or die. On the other hand, the fact that a plant thrives and flourishes here is a proof that it is a lime-plant, and that it would probably thrive best elsewhere in a lime soil, natural or artificial.

Ivy .- There are several varieties of Ivy in the district, growing freely in the ravines and gullies, but none equal a large-leaved one which I brought from Algiers ten years ago. There I found it absolutely courting sunshine, growing in a blaze of light and sunshine with exuberant vitality. It nearly chokes the valley of the Chiffu, or Monkey Valley. The plant I brought home has propagated as freely as the common sorts, and one has nearly covered the side of a tower, 65 feet high, within ten years, upon the mortar and lime of which it no doubt partly exists. On a wall against which a number of nursery plants were growing there is a shoot, healthy and vigorous, which has been living in the full blaze of the southern sun for five years without roots. It remained attached to the wall when the parent plant was cut away, fully exposed to the south. I remember on one occasion, in Surrey, planting sixty Ivies against a wire fence, in a sandy soil devoid of lime. died but one, and on examining that one I found that some of its lower branchlets had attached themselves to an adjoining brick wall. Thus does the Ivy justify its claim to being a lime plant.

Cypripedium insigne .- Three winters ago I read somewhere that the Cypripedium insigne liked a lime soil; so I brought with me a patch as large as my hand, which was planted in a rockery without any particular care. It did very well, flowered freely all winter, and increased much in size; indeed, in two years, by division, we have got seventeen good plants, which have all done well this winter in the open air, in rockeries, in the lime soil of the country, without any particular care. They have been mostly in the shade, but some were planted in full sunshine. all remained in the ground last summer, taking their chance throughout the heat and drought, and we did not lose one. It is a great acquisition to my garden; and thus is verified the statement that this Orchid likes a lime soil. I presume it is a terrestrial Orchid in Nepaul, its Asiatic home.

Bougainvilleas. - I also brought from Algiers, ten years ago, a light crimson Bougainvillea, which they called Warscewiczii, saying that it came from Brazil. It has done very well with me. It has, indeed, become common all over this coast, as also in many localities, such as Malta, on the shores of the Mediter-It is infinitely more beautiful than the B. spectabilis which is grown and exhibited in England. Mr. Harry Veitch, who was here three years ago, told me that it was rare in the trade, but as I gave him a number of cuttings I should think that by this time he must be ready to supply it. I find no great difficulty in propagating it here from cuttings. It grows with extreme luxuriance provided it is well watered, and covers my walls and sheds with masses of its crimson-bract-flowered branches from Christmas to May. The date of flowering depends on the amount of sunshine it receives. I remember reading that in the Brazils they cover the roofs of the houses with this plant, and that it flowers gloriously, even when the roofs are of zinc. Following out this idea, I trained it over a tile-roof shed with complete success. To succeed so thoroughly in this district the Bougainvillea must be a lime-loving plant. The new wood is matured during the hot dry summer, but it flowers in cool sunny weather.

Linum trigynum. - This plant is one of my greatest triumphs. It grows luxuriantly in large bushes, many teet in diameter, and produces myriads of handsome yellow flowers nearly all the winter, from December to May. It requires little or no care, no watering in summer, and very little, if any, attention to soil or manure. I have bushes growing in heaps of stone and calcareous earth, in a deserted quarry, and flowering as freely as in the garden beds. It is quite a sight to behold; the large shrub is all but concealed by the handsome blossoms ever succeeding one another. I often wish I could show one at Kensington; I am sure I should get a prize. Singularly enough, my neighbour, Mr. Hanbury, cannot grow them at La Mortola as I do, although our vegetation is mostly the same. His soil, however, is not so decidedly calcareous as mine. This Linum must be a lime plant, as is the red Valerian which grows out of the crevices of our rocks, just as it does along the line

of railway in the chalk cuttings in Kept. Johnson gives its habitat as the East Indies; here it is supposed to come from Japan.

Aubrietia. - The Aubrietia's natural habitat is Greece and the Levant; so, as might be supposed, it does splendidly with me, although but little, if at all, cultivated on the coast. I brought a patch over, a few years ago, from my English garden, and have been surprised to see how vigorously it grows and flowers. It forms large trailing masses, and early in January is covered with a sheet of blue flowers which excite general admiration. It seeds freely, and the seeds sow themselves all round the spot where it grows. In summer it fades away and withers, like grass, to spring into vigorous life with the first rain. It is clearly accustomed to the climate and treatment it meets with in my garden-to be roasted and dried up in summer-and does not suffer therefrom, probably the reverse. I get different shades of blue on different plants from the same seed and under the same treatment, so that these different shades can scarcely be considered garden varieties, and depend probably on different degrees of sunshine.

Teucrium orientale.—This Germander is perhaps the most remarkable plant I have. It grows to be a large bush 6 or 8 feet high, many feet across, a mass of branches and blue flowers, anywhere, amongst stones, on the rocks, without being watered or manured, and attracts attention more by its vigour and health than by its beauty, for its leaves are small, of a whitish green, and its blue flowers insignificant, although numerous. It is most useful for filling up sunburnt corrers, and getting masses of foliage where scarcely anything else but Agaves and Cactures in general, or Aleppo Pines, would grow. I must make an exception, however, in favour of the—

Eriocephalus africanus, which shares with the Teucrium the power of growing and flourishing among the rocks, in the driest, most sunburnt, and most sterile regions. It flowers very freely in midwinter, producing sheets of small white flowers, the seeds of which are coveloped in wool, which justifies its name. It comes from the Cape of Good Hope, and the Teucrium from the Levant, both climates assimilating to that of the Genoese Riviera, mild in winter, dry and hot in summer—thence, no doubt, its great vigour and luxuriance with us. No doubt also it grows in a purely lime soil on calcareous rocks, or it never would thrive as it does here on our limestone rocks, and amongst the debris of a deserted quarry.

Bulbs .- The Narcissus does perfectly well in the lime soil, growing with great profusion, and reproducing itself in some of the Olive groves. Those that I import from Holland, if left in the ground, do not die, but form new bulbs, and after two or three years throw up spikes as fine as the first. I may say the same of Hyacinths if left in the ground undisturbed. This is explained by the fact that they are natives of the south of Europe, although it is rather remarkable, as in Holland they are grown in very different conditions. They are planted in very highly manured sandy soil, only a foot or two above water, that is, above the water level beneath the soil, as I was told at Haarlem last summer. There the bulbs are always taken up in spring and stowed away during the summer, so they really get the absolute rest which heat gives them in their native climate. Tulips, Crocuses, and Snowdrops flower once and then seem to die off. Evidently the limestone soil does not suit them; some Snowdrops planted in chestnut earth and sand went on flowering for several years in February, as at home, but they have gradually died out.

Amaryllizes do not flower with me in winter out-of-doors, not until advanced spring. They come from the Cape of Good Hope, but probably they flower there some time after the summer beat has commenced. With a little artificial beat, however, from some experiments I have made, I believe I shall easily get them to flower io mid-winter. The Maschevallis awaveolens, the Trachelospermum jasmiooides, the Gardenia, the Begonia jasmiooides, all do admirably out-of-doors, flourishing throughout the winter, but they do not flower until the end of May, when we are all gone. They clearly want a little heat to expedite their movements, which I am seriously thinking of giving them. They are all so lovely it is a pity to see the buds every year, and not the flowers. The Gardenia requires a light soil, the other three can do with the lime soil of the district, well manured. With this exception, all the plants I have named are a complete success here in the lime

soil. They are clearly suited to such a soil, require heat and rest in summer, and will flower with a cool temperature in winter. The charm of a winter garden in the South is, that when winter is over, and we get back to England, we begin again, as it were, and go over the same charming horticultural scenes, but under different auspices, agaio. Henry Bennet, M.D., Torre di Grimaldi, Mentone.

(To be continued.)

LATE TULIPS.

THERE are some localities where these very heautiful flowers are largely grown in cottage gardens, and delightful is it to drive through lanes skirted with pretty cottages in the gardens of which many thowers bloom richly and abundantly. The other day Mr. Ware, of Tottenham, exhibited blooms of many choice kinds in large numbers, thus showing that though as a florist's flower the Tulip has here in the South fallen into decadence, yet that as a decorative flower it is highly prized. What can be more beautiful than a mass of the superbly coloured Tulipa Gesneriana?-or what more interesting to the lover of pure refinement in flowers than a choice named sorts in which may be found all these peculiar attributes of form and markings, of which modern gardeners know so little? It may be true that the Tulip is becoming a fashionable decorative flower, but flowers that are contingent upon fashion for popularity may have but a fleeting existence. It is far better to learn that myriads of late Tulips are being grown in our country gardens for the delectation of those owning them, than it is to hear that myriads of flowers are being sent into the London market to flicker and then die. Not least valuable in these Tulips is the feature that the bulbs are so hardy, and in some old gardens they remain in the soil for years. That may not be the best form of cultivation, but it is undoubted evidence of robustness. For general uses we are not sure whether the rich coloured self forms are not better than are the most beautiful of flakes and bizarres. Still a few of these are acceptable, but variety in colour as well as in names is desirable. Happily, these good hardy Tulips may be purchased cheaply, and thus become everybody's flower.

NEW INVENTIONS.

A NEW METHOD OF GLAZING,-At the recent Building Trades Exhibition were to be seen examples of a new method of fixing the glass in the roofs of horticultural buildings intended for plant-growing purposes. Many ways of doing this have been tried but this may be accepted as the latest outcome of this almost universal desire to have an easily repaired, watertight roof, with the least use made of putty; and it seems to fulfil all reasonable conditions in this respect. The roofing bars (fig. 128) are made without any rabbet, but have a cap of wood, or zinc, covering the bar, and projected on each side about half an inch. The putty is placed under this cap, and the sheet of glass being then pushed up quite close, is kept in position with four cork cams-ordinary winebottle corks cut into discs of quarter inch in thickness will answer the purpose (see fig. 129), taking care, when nailing them to the bar with a small wire nail, that they are not pierced through their centre, but at some point a slight distance from it. By turning these round the necessary pressure is obtained to keep the glass close up to the putty strips. When the putty hardens the glass will adhere to it, and these pieces of cork can then be removed; but as they are not conspicuous, it would be quite as well to leave them. Perhaps some portion of the putty would ooze out under the pressure, and which it would be necessary to cut off, but this in glazing a house could be done from the inside as the work went on. The whole of the work of glazing can be, and is better done from the inside, and it does not seem essential to good work to perform it only in dry weather, as no water can affect the putty under the sheltering cap; it would only be necessary to keep the glass in a dry state. With the zinc capping both putty and wooden bar are sheltered from the weather, and in that way they must materially help to keep the house from decay for a longer period than is the case with merely painted woodwork. The sash or roof bars may be of iron, and may be fitted with a cap of copper or of zinc, and putty may be used as before or dispensed with, and the glass be kept in position by metallic cams instead of cork. Under the glass, metal guttering (zinc or copper) is fixed to the bars, in short overlapping lengths, for the purpose of catching any drip that may occur from rain being driven under the capping by the wind. For plant-houses that are not orchard-houses putty would be found the hetter means

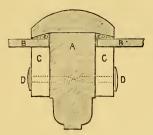

FIG. 128.-THE "DENNIS" SYSTEM OF GLAZING.

of fixing the glass, and then the narrow guttering would not be required. These methods, with various adaptations, were shown, fitting them for a great variety of uses besides garden structures. We do not think the system could be applied without some modifications to sliding sashes or movable ventilating lights, nor indeed to any part of a glass-house where the glass would be affected by slamming or jarring in the act of opening or shutting, as the panes must become loosened thereby. Mr. T. H. P. Dennis,

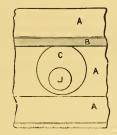

FIG. 129.-THE "DENNIS" SYSTEM OF GLAZING.

horticultural builder, of Chelmsford and Mansion House Buildings, is the pateotee and manufacturer.

THE "DENNIS" PATENT HOLDFAST LOCK FUR-NITURE.—The defects of the ordinary method of attaching door-handles by means of set screws dropped into holes drilled in the sides of the spindles which turn the latches, are too well known to every householder to need mention here as an excuse for directing the attention of our readers to another of Mr.

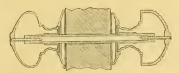

Fig. 130.—THE "DENNIS" PATENT HOLDFAST LOCK FURNITURE.

T. H. P. Dennis' inventions, which is one, we think, that will be welcomed by many more than can afford to indulge in his patent system of glazing. As will be seen by our illustration (fig. 130), instead of the side screw arrangement, Mr. Dennis adopts a longitudinal screw which passes through the middle of the knob into the spindle, which is tapped with a screw thread at each end. The knobs are also tapped in the centre of their outer end with the same screw thread as the spindle. The spindle is inserted in the

lock, and when the handle with the screw loose in it is adjusted the screw is turned down until the head is exactly on a level with it, and all is quite secure. It is a clever and valuable invention, which we shall certainly adopt ourselves, and the sooner the article comes into the market the better we shall be pleased.

The Henbageous Bonden.

WHAT IS THE DOUBLE NARCISSUS POETICUS? -Mr. Peter Barr lately asked me, Of what is the double N. poeticus the double? I replied that it is the double of the single N. poeticus, now in flower in nearly every garden, which he calls in his catalogue N. p. var. recurvus. Mr. Barr says, that whatever it is, it certainly is not this. Now N. poeticus changes from single to double, in gardens at least, as often as N. Pseudo-Narcissus and N. incomparabilis, so there are many who can tell us, if they will, whether it is the common form or not which undergoes this change. All I can say is, that both single and double N. poeticus abound in my garden; whether they pass from one to the other I am not certain, but I have carefully compared the growth of both, and assert that there are no significant or characteristic differences between the two. The leaves of the single form are a little weaker, and have a greater tendency to bend over from the middle, but leaves are a very fallacious criterion of variety in Daffodils. The most obvious difference to the inexperienced is in the length of the tube, which on the single form is cylindrical, and 14 inch long, exclusive of the capsule or seed-pod; but in the double is funnel-shaped, and often not more than half an inch long, but Mr. Barr must know very well, though all growers of Daffodils may not have observed it, that as a Daffodil begins to double the seed-pod begins to disappear, and the tube to shorten; and the more complete the doubling, the more complete is the suppression of the seed-pod, and the shorter the tube, compared with that of the normal form. In the varieties of N Pseudo-Narcissus in which the tube is always short, this difference is less conspicuous, but in many of the double forms of N. in-comparabilis there seems to be often no tube at all, the pedicel tapering up from the hase of the spathe to the base of the petals. In the double of the small Jonquil (N. jonquilla), the entire suppression of the normally long tube is very remarkable. I send one or two of these, also specimens of single, semi-double and double N. poeticus (var. recurvus) in illustration of what I have written. C. Wolley Dod, Edge Hall, Malpas, May 19.

[With this communication our correspondent obligingly sends illustrative specimens. To make the condition of things clearer we may remind the reader that the flower-tube, or "thalamus," is that portion between the perianth segment and the ovary. It bears the stamens at various heights within, according to the species, and from its upper edge proceed the flower-segments, the inner ones with their "corona" or outgrowth. Its lower portion encloses the ovary, which, indeed, is confluent with it. The thalamus, or flower-tube, is, in reality, nothing but the end of the flower-stalk, altered in character as above described. In the completely double flowers sent by our correspondent the thalamus is solid, not tubular -in other words, it retains its stalk-like character; the ovary is wanting, the perianth segments are increased in number, and the stamens are more or less petaloid in character. Hence, increased development of the outermost parts of the flower, and perverted development of the stamens, are counterbalanced by an arrest of development of the ovary-an illustration of what morphologists call organic compensation. Of course, we are now referring solely to Mr. Dod's specimens. In the big double flowers of the Telamonius section the ovary and ovules are not arrested in their development, and further, according to Mr. Brockbank, they ripen into seed-pod and seeds, as might be expected to happen, but which, so far, has been rarely observed, and never by ourselves, though it should be said we have never specially looked for them, ED.1

HERBACEOUS PLANTS AND OTHER PERENNIALS.

These, like all other trees and plants, were kept back by the weather, but have since come on with a rush, and many are now flowering, although sadly needing rain, or a more genial almosphere, which

with hot sun and the wind chiefly in the east, has been very arid for some time past, and even by night we get little dew. The subjects that seem to feel this state of things most are the double Pyrethrums, which look very distressed, if not kept watered, flagging down in their foliage and flower-stems as if they were dying, but with a good soaking they quickly revive, and right well do they pay for the labour, as with liquid manure applied the blooms come remarkably fine and make a grand display in the border. In cases where they are wanted for cutting for exhibition, or other special purposes, the best way is to grow the plants in rows or beds, so that they can be mulched, which is a great help in keeping them uniformly moist at the roots and maintaining them in a strong healthy condition. The same remarks apply to the lovely Spiræa palmata, which cannot endure drought, and should therefore be planted low, or have a ridge of soil drawn up round each, and manure spread within the enclosed space, as then what water is given the plants get and receive full benefit from it long after. The finest specimens I have seen are growing on wet half shady places, where they come on late and last a long time in perfection.

Hemerocallis flava is one of the most valuable of all herbaccous plants, as even thus early some of its beautiful rich yellow Lily-like blooms are open, and others will follow on for weeks yet to come. We have been using it for forcing, and a splendid thing it is for the purpose, as it responds readily to heat, and affords a colour that is scarce at all seasons. The way we manage is simply to dig clumps up, and, if too large, divide them to suit the pots, which check seems to do them no harm, as they flower almost as strong and well as others left undisturbed.

Another gem, though not strictly a berbaceous subject, is Daphne encorum, which does well in our light sandy soil, as we have several clumps ranging from a feet to a yard across, and a mass of blossom, which is so sweet as to scent the air for some way around. For banks, rockwork, or other clevated positions this Daphne is quite unsurpassed, and should be in every garden, where, in planting, it deserves a conspicuous place. Those who have failed with it will find the turfy parings of walks and road grit suit it, and by landing up among the branches layers root freely, and in that way stock may be increased to any extent. Lithospermum prostratum forms a splendid companion plant to the one last named, and requires the same kind of soil and situations, or sharp sandy peat, when it spreads and roots in a similar manner, and rivals the Gentian in the greath depth of blue of its flowers, which, though small, are exceedingly numerous.

Even more conspicuous are the Gentiana acaulis and Iberis gibraltarica, which form the finest of all spring beds, and though so strong in contrast, associate well and are very pleasing together. Anemone coronaria are all past shedding their petals and going to seed, but as they are so frost-proof and so early, they deserve a long rest, which they will soon take for themselves, and make their appearance again ere winter sets in. The most useful things now for cutting are the double white Narcissus, pure and sweet as a Gardeoia and quite as nice looking. Fity the plants will not force better, as in winter or spring such blooms would be of double value to what they are now. It is florentian rand germanica will soon be all aglow, and grand masses of them are when the collection is large, as they are gogeously beautiful, being nearly equal to Orchids in form, and of all shades of colour. Eich soil and a moist suny situation are the conditions for them, and when so favoured they are sure to do well. Paconies, both herbaccous and tree, have felt the effects of the sun; and are fast expanding their big flowers, which will be ablaze shortly and command admiration.

and are last expanding their log libers, which win be ablaze shortly and command admiration. Aquilegias, too, are popping open, and fine border plants they are, especially A. chrysaniha and A. cerculea, the best and most distinct of them all. Anchusa italica and A. capensis are also charming just now, the latter being one of the most desirable plants any one can have in a border, as the numerous blossoms are of the richest of blues. Sweet Scabious that have stood out all the winter are now blooming, and are big bushes that will soon make a fine show. Solomon's Seal, and its congener, Lity of the Valley, are likewise displaying their bells and delicate greenery together. J. S.

TILLANDSIA STREPTOPHYLLA. — A remarkable Bromeliad, native of Mexico and Honduras, with united strap-shaped leaves, twisted like a cork-screw, and beset with silvery scales. Bracts elongate, pink; flowers violet, in dense spikes. Figured in the Botanical Magazine, t. 6757 (May, 1884).

Orchid Notes and Cleanings.

NOTES FROM SUMMERVILLE, LIMERICK .- Aërides crispum var., the plant of which I send you a photograph, was grown at the coolest end of the East Indian-house, which, I believe, is the most suitable place for it, although it will do in the Cattleya-house in a manner no one need be ashamed of. The foliage and general appearance of the plants, however, show that they prefer the warmest house, being stronger and deeper in colour; in either case I have kept them near the glass, and moderately shaded, watering freely while growing, and less so during their season of rest, or rather, period of inactive growth, for it never seems to be thoroughly at rest. It must be occasionally sponged to remove dirt and scale, it being rather subject to a small white form of this pest, which clings most tenaciously to the leaves. The plant referred to is carrying seven spikes, one of them having 116 flowers on it, and two others, each with but a few flowers sbort of that number, the remaining four spikes varying from fifty to twenty flowers each. From the top of the pot to the top of the plant is 4 feet 9 inches, and it has three principal growths; each, however, is from the one stem.

Of Acrides Fieldingi we have a good variety,

carrying a spike of 135 flowers and buds; this variety may also be grown in the Cattleya-house, but the East Indian-house suits it best. Give it plenty of water while growing, and by no means allow it to become dry in winter. The flowers of Chysis bractescens at once remind one of a statue, so solid are they in appearance and colour of sepals and petals, being as near like a marble image as it is possible to describe; the lip has a yellow blotch, streaked with rich brown. I have one of these now with two spikes from one growth; the flowers, however, are not quite so large-31 inches-as where only one spike is produced from each growth. I think this species deserves to be more extensively grown than at present. Each plant here has or will flower in spikes varying from two to five flowers from each growth. They are imported pieces obtained in February of last year, and after starting were placed in baskets with peat and moss, and grown in the East Indian-house, and liberally supplied with water until growth was completed, when they were removed to the Mexican-house, and received only a minimum quantity of water; on commencing growth again they were placed in summer

Epidendrum bicornutum, a lovely species, is doing better here than it generally does. Last summer I received a plant of it which had made very small growth from its imported bulbs. Being in a basket, I hung it up over the water-tank at the warme:t end of the East Indian-house, and close to the roof ventilators, so that when air is admitted it passes freely over the plant, the current being, how-ever, broken by the blinds-Williams' patent Orchid shading-an admirable article for the purpose. I give the plant an abundance of water, and for root material sphagnum, peat, and charcoal. It is just opening a fair spike of its snowy-white flowers, excepting a few purple spots on the lip. Vanda Parishii, Marriottiana, a by no means common Orchid, is here represented by a plant carrying a spike of six flowers, the end bud not opening as yet, but still looking healthy. This seems to enjoy all the heat one can give it, and does best in a basket with sphagnum and crocks mixed through it. Dendrobium thyrsiflorum, with its large racemes of white and orange flowers, deserves a place in every collection, more particularly as, by having a few plants, they can be made to form a succession. I grow it in the warmest house, and rest it with others of the family in the Mexican-house, removing it to the hothouse as soon as the flower-nodes have pushed a little. It will last a fortnight in full beauty if removed to a cooler and drier atmosphere as soon as its flowers are fully developed. Cattleya citrina has been much admired by every one who has seen it. 1 grow it in the Odontoglossum-house, where it does remarkably well suspended from the roof on a piece of virgin cork, to which it is clinging most tenaciously, its roots creeping in all direction. We treat it liberally with water while growing, but give less afterwards. On the flower-spike becoming prominent I remove the plant to the Mexican-house, which causes the flowers to come larger, and brings the white edging on the lip out more clearly than when

allowed to open its flowers in the Odontoglossumhouse. The perfume of this Orchid is most delicious. The other day I saw a plant growing in a house with Pelargoniums, &c., a far more suitable place for it than a stove, in which it is yet occasionally to be found, so that any one with a glasshouse need not despair of growing this gem, and it takes up little room. E. Dumpter, Gr. to J. Fitzgerald Bannatyne, Esy., Summerville, Limerick.

REQUISITES IN ORCHID CULTURE.—M. Lucien Linden appropriately calls attention to three cardinal points in Orchid culture :—I, The use of rain-water; 2, The employment of shading only when the sun burns, and then the light should be allowed to filter through open canvas netting; 3, Abundance of air even in frosty weather, when M. Linden counsels the ventilators to be opened and heat to be raised in proportion.

ODONTOGLOSSUM HALLI,—A splendid variety with a large white lip, of this showy Odontoglot, is now in flower in Baron Ferdinand de Rothschild's collection at Waddesdon. The plant has seven spikes bearing 103 flowers, and is composed of eighteen leaf-bearing bulbs—a very fine specimen.

Cypelfedium Pubescens. — Last year, at one of the highly successful conversaziones which the Royal Horticultural Society held at Burlington House, in the rooms of the Linnean Society, Mr. Goldring exhibited blooms of this fine hardy species. In our columns (vol. xix., p. 785) a life-size engraving igiven, and a reference to this will show what a fine plant it is. Although not possessing the brighter colours of one of its allies, C. spectabile, the combination of yellow and brown is decidedly pleasing. The species forces well, too. In a wild state C. pubescens is frequent in the United States, where it affects bogs and low woods.

CYPRIFEDIUM CAUDATUM.—Although this is the generally recognised name in gardens it would be more correct, botanically, to include it in the genus Scleinjedium on account of the three-celled ovary. It is figured in Paxton's Flower Carden, i., 9, and has been in cultivation for over thirty years, yet it is sessed on seen in healthy vigorous growth than is desirable. This is probably owing to a less pliable constitution and less accommodating to circumstances than some of its congeners, which flower almost continually. Like the rest it is terrestrial in habit, and, being a native of the dripping climate of Ecuador, delights in librar supplies of water. If potted solely in living sphagnum moss it will give more satisfactory results than in the usual mixture of ingredients, the moss being very retentive of moisture. The extraordinary length of the petals giving rise to the specific name constitutes this species an extremely interesting and highly attractive subject.

ONCIDIUM TIGRINUM.—A free-growing and free-blooming species, of compact growth, with a moderate-sized branching raceme, and flowers of long duration, produced in autumn. The flowers are 2½ inches in their longest diameter, flat, oblong; sepals and petals narrow, oblong acute, yellowish, with cinnamon-brown bars; the lip 3-lobed, side lobes small, rounded; central lobe stalked, very large, cordate, transversely oblong. Native of Mexico. Orchid Album, 1, 137.

LÆLIA ALBIDA. — An autumn-flowering species, with terminal spikes of six to eight flowers, each about 2 inches across, flat, stellate; sepals and petals oblong or lanceolate, white; iip 3-lobed, side lobes erect, unfolded; central lobe tongue-shaped, rose-coloured. Native of Mexico. It requires bright light and abundance of water in the growing season. Orchid Album, t. 138.

ARUNDINA BAMBUSIFOLIA.—An Orchid with long reed-like slender stems, and long sessile lancedate leaves. Flowers in racemes or spikes at the end of the stem expanding successionally, each about 24 inches across, flat, with a projecting lip, broadly oblong; sepals lanceolate, petals ovate lanceolate, rosy, lip as long as the segments, convolute at the base, the distal portion flattish, with two rounded lobes, magenta, with orange or whitish stripes in the throat. Native of North-east India. Orchid Album, 1, 139.

CYMBIDIUM AFFINE.—An Assamese Orchid, with racemes of large white flowers, each about 23 inches across, segments oblong acute, lip arched, rather shorter than the segments, 3-lobed, side lobes concave, central lobe flattish, cordiform, white with purple spots. Orchid Album, t. 140. Mr. Williams recommends these plants to be as fully exposed to the light as possible, but shaded from the direct rays of the sun.

FRUITS UNDER GLASS.

PEACHES AND NECTARINES .- A buoyant condition of the atmosphere should be continually maintained in early houses in which the fruit is closely approaching maturity, and the fruit should be exposed to the full power of the sun, so that the highest degree of finish and flavour may be obtained. daily syringings with clean rain-water must be persevered with until the most forward fruits are fit to gather, and the borders at that time should have a sufficient watering to take the trees safely through the gathering period, and to prolong this and advance flavour the ventilators should be kept well opened both day and night, and a drier atmosphere be pre-Let the trees be looked over each day, and the ripe fruits removed and placed in a flat basket, well padded with wadding and tissue-paper. trees in the second house, which have now finished stoning their fruits, should have every encouragement afforded them to bring their crops to perfection. The cleanliness of their foliage should be insured by thorough daily syringings at six o'clock in the morning, and again at closing time; young laterals and terminal growths should be removed, while the permanent ones are carefully tied in, and the fruits exposed to the sun. The lack of substantial mulchings of short manure and adequate drenchings of tepid diluted liquid must not be permitted, neither must injurious insects be allowed to survive. Should brown-scale appear upon the young wood dislodge it at once with a small stiff brush saturated with a solu-tion of Gishurst Compound. Later houses should receive such treatment as will bring their fruits in at the required date; the ventilation should be attended to early before the sun runs up the temperature, and care taken in disbudding to secure a regular spread of young wood without crowding.

MELONS .- As early crops are gathered the plants should be removed, the woodwork of the pits cleansed, and the walls whitewashed to destroy any red-spider or other insects that may have taken up a lodgment there. The soil should also be removed and the upper portion of the beds, if composed of leaves or similar material, be turned and added to as required. A ridge of fresh compost should then be introduced to be in due time furnished with a set of young plants. Although it is far preserable to use maiden soil for each crop, the same soil may be made to do for two or more crops by turning over the ridges as soon as they are relieved of the old plants, well breaking up the compost, and removing the roots, moistening the mass through, and making all firm again in readiness for replanting. If the compost is much exhausted some decomposed manure mixed with it will be found beneficial, and top-dressings of horse-droppings as well as waterings with liquid manure will be of great assistance to the plants after the fruit is set. Some cultivators follow the system of taking two crops from the plants, and there is no difficulty in so doing, indeed it is advantageous where glass is limited, as two crops can be thus obtained from a given space a shorter time than could be otherwise accomplished, but the finest fruits are derived from young plants possessed of clean healthy foliage. Successional plants should have their secondary lateral growths well thinned-out before they lengthen and crowd the trellis, a moderately dry atmosphere with a warm circulation of air should be upheld during the time they are in blossom, and a high temperature especially when to be commanded from sun-heat, with liberal employ-ment of the syringe at closing time, should be provided whilst the fruits are swelling. The present is a suitable time for planting in frames which are unprovided with hot-water pipes, and these are usually available now after supplying crops of Potatos; plants raised under the influence of fire-heat for this purposes should be placed in their new quarters and inured to the change previous to being turned out of their pots, and night coverings with mats will be requisite for

VINES.—In situations that have not been for some time favoured with rain the condition of external borders with regard to moisture should be ascertained. It does not usually happen that these require to be artificially soaked with water so early in the season as the present time; nevertheless, with us this has been indispensable, owing to the lengthened dry state of the weather. When the berries in successional houses of Black Hamburghs show signs of colouring, the change of treatment essential to perfect this transition should be immediately brought into practice. Hastening the process by keeping a high moist temperature must not be attempted, as the deep bloom so much coveted is only procurable by the allowance of plenty of time. A balmy current of air constantly passing through the structure is of primary importance; the necessary atmospheric moisture should be created by early morning dampings, the Vines be still supported by timely waterings at their roots, and the production of young foliage should not be now checked. Any seedless berries of Muscats that may have been overlooked at the time of thinning should be removed carefully, for they will not swell to the full size, and the unevenness of berries detracts materially from the appearance of the bunches. Paramount amongst other duties now requiring attention is the thinning to be done in the succession houses, and to keep this work under requires both diligence and painstaking care. In dealing with Alicantes, Lady Downe's, Mrs. Pince's Black Muscat, and other varieties that have to haog after they are ripe through a lengthy period of variable weather, the importance of thinning, so that air can pass through the clusters and prevent moisture from condensing in their centres, should be borne in mind. As soon as the operation is completed see that the borders are remulched with good short manure. Early houses in which the top-dressings have become washed out and impoverished should also be replenished with like material. Thomas Coomber, The Hendre Gardens, Monmouth.

Plants and their Sulture.

FORCED PLANTS .- Among these useful aids to an early spring supply (both for affording an abundance of cut blooms and for use in the show-house or conservatory) there is hardly any plant more useful than the Deutzia gracilis when well managed. They can be retained in vigorous health for several years without even being repotted, provided they receive an average amount of attention in other ways that will be found conducive to their well-being. We have several large specimens which have not been repotted for the last eight years, and they have this season made a better growth even than usual, all of them having flowered most profusely previously during the early spring, with the exception of a few that we did not treat in the usual way last summer. For the sake of appearance we placed some in front of our large Camellias in pots, which being under the shade of some large Elms did not flower so well as usual, owing undoubtedly to the wood not being so well ripened.

When our plants have finished flowering we pick off all the flower-spikes and then encourage them to complete a good growth in the genial atmosphere of a vinery in its earlier stages of treatment. This we consider is an important item in their culture, as frequently after flowering they are discarded, as not being considered worthy of any special attention, even getting turned out into the keen cutting air and frosts of the spring months, there to take their chance. Under this treatment no flowers can be reasonably expected the following year. It may be urged that for want of room the plants cannot be accommodated to complete this after growth as we have just advised, but surely if they can be made to flower every season, instead of missing every other one, this could be managed, for it will be obvious that not nearly so many in number are required when they can be made to do duty every year.

When a liberal growth has been made, we gradually harden them off till they receive full exposure to sun and air. Ours have just passed from the vineries into a temporary erection that has to do duty as a greenhouse, and thence been removed to their summer quarters. Should any stock of this useful plant have been neglected thus far in the season, we advise them to be taken in hand at once, and as good a growth as possible be obtained whilst there is time to secure it. Any that are in a bad state of health will want attention at the root; by reducing the ball somewhat these would again go into the same sized pot, using a good fibrous loam with a little decomposed manure or leaf soil to encourage fresh root-action. All through

their active stages of growth the Deutzias will be benefited by occasional doses of liquid manure, even whilst the flower-spikes are heing developed. On no account allow them to suffer in the least when in flower, or this period of their beauty will be shortened thereby. They enjoy an almost complete immunity from insect pests, at least such is our experience-we never remember our stock to have been in the least affected with any. Some cultivators we are aware cut their plants hard back after flowering and thus endeavour to secure a good break of young shoots from the base; by this means, however, the plants do not increase in size so quickly, and we think it doubtful if there is any real advantage to be gained by following this mode of culture. Later on, in order to lessen the labour of watering during very hot weather, it will be found a good plan to plunge the pots from half to three-quarters of their depth in a bed of coal

The double blossomed Plum (Prunus sinensis alba flore-pleno) will succeed well under the same treatment as that accorded to the Deutzia, whilst we have every reason to believe (although we have not proved it from experience) that the comparatively new subject for forcing, the Staphylea colchica, would be amenable to the same course of culture. Of such subjects as Andromeda floribunda, Kalmia latifolia, and the hardy Rhododendrons, one season's rest will be found essential; we would therefore advise that they be turned out of pots into a bed of well prepared and suitable soil as soon as possible. That useful Lilac, Charles X., should also be turned out of pots, receiving at the same time a moderately good pruning, which would keep the plants compact, and be conducive to a good growth another season. Under the same treatment the Gueldres Rose (Viburnum Opulus) would also succeed, and be made to do good service again after a season's rest from flowering. Clumps of imported Lilies of the Valley that have been forced should be broken up, and each crown dibbled in separately on a bed of well prepared soil; after another year's growth the same could be turned to a good account for early forcing if desired. Clumps of Hoteia (Spiræa) japonica would be all the better if planted in the open soil for a similar rest; division of the largest should be resorted to, or they will be of unwieldy size another year. Both Dielytra spectabilis and Helleborus niger should be similarly treated if they have done duty this year io pots; a somewhat more open position would, however, suit them best. By disposing of the majority of hardy forced plants in this manner a considerable amount of labour will be saved, as well as being beneficial to the plants in the long run.

Solanum capsicastrum of the improved types should also be planted out at once to secure an early growth that will perfect a good crop of berries before the advent of the autumn frosts. The stock of Bouvardias when well hardened off may also with advantage be planted out for the summer, unless every attention can be insured for their well-being under pot culture. All the plants of Richardia æthiopica would decidedly be better off in the open ground than in pots, breaking up the larger ones unless extra sized plants are

When large plants of Salvias are wanted for the conservatory the same culture will insure the desired end with a minimum of labour, but for neat, compact plants pot culture will be the better plan to follow. Schicostylis coccinea should be turned out into rich soil, if not already done, previously increasing the stock by division if the same is deficient in quantity. It must not, of course, be assumed that no attention at all will be required for any or all of these several genera of plants (that we have advised to be thus treated) with respect to watering. A certain amount of water will be necessary during hot weather, but the unrestricted root-action will materially aid in sustaining the plants. Tames Hudton, The Gardens, Gunners/ury House, Adon.

PASSIFLORA RACEMOSA.—Amongst the brightest coloured stove creepers for the walls or rafters must be reckoned the above named Passiflora, often called P. princeps; the length of the inflorescence varies according to age and vigour, the difference being especially marked in young plants, and those possessing an extra amount of vigour. Like all the genus, it should be planted out in a not too limited border, if its true characteristics are to be seen.

M R. WILLIAM THOMSON, of the Tweed Vineyard, returns to the charge, when he asks, in a pamphlet before us, "Is OUR CLIMATE DETERIORATING?" Our readers will remember that this subject occupied much attention a few years ago, and that the late Mr. MACNAB, Mr. D. T. FISH, and others, discussed the subject at considerable length in our columns. Among the gardeners the balance was in favour of an affirmative reply to the above question. The meteorologists concluded that they had no sufficient evidence, and so the matter stood, and we venture to think still stands. We heartily agree with Mr. THOM-SON, that for the practical purposes of the gardener, the effects of climate on vegetation are much more to the point than the records of the thermometer. The thermometer is an inanimate column of spirit or mercury, affected indeed by changes of temperature -expanding by heat, contracting in its absence, but itself substantially unchanged. The plant is a living organism, composite in its structure, varied in its composition, never at rest (except under special conditions, which we need not refer to here), always at work, doing one sort of work at one place, fulfilling some other function elsewhere. It is helped, or it is hindered in its work by the same agencies as those which influence the thermometer, but in addition it is influenced by many circumstances, such as stage of growth, competition, situation, insect-agency, and injuries which have no effect on the thermometer. But while this is so, we demur to the statement that "the evidence afforded by the effects of climate on vegetation is more reliable than observations dependent on human instrumentality, however accurate," It would be so could we disentangle the complicated web of plant life, and say for certain what influences this particular thread of the web, what affects that one, and precisely what results are to be attributed to the combined action of the

The very simplicity of the thermometer and the abstract character of its indications show that the evidence it affords, so far as it goes, is and must be more reliable than that which is the outcome of the tangled complex we call life, But then it does not go far, and it takes note of one set of conditions only, and in so far Mr. THOMSON is right. For Mr. THOMSON "the produce itself is the only sure test, all other things being equal." Yes, but there is the difficulty: how can we equalise all other things? The thermometer does do it for us to a certain extent, but as we have shown only partially; and as for the other things we see no equality about them-they seem so extremely unstable that it is exceedingly difficult to come to any reliable conclusion. The physiologist in the laboratory may indeed contrive to isolate a plant and place it under comparatively uniform conditions, while it is made to tell its tale as to the effect of heat or cold, or what not, but in the garden or in the field such uniformity of conditions is unattainable. Mr. THOMSON brings forward evidence from various gardeners of repute, which tends to show-what is indeed sufficiently evident-that of late years crops of most kind have been bad, but, so far as we see, there is nothing to justify the large inference of any permanent deterioration, but merely of fluctuation. the winter we have just passed through, where about London, for instance, snow has scarcely once been seen, with those of 1879-1880, 1880-1881. Shall we, therefore, draw the inference that we passed through a neo-glacial epoch a year or two ago, and are now enjoying a climate like that of the Miocene period, or like that of the South of France at the present day? Obviously the answer would be in the negative; and so, without disputing the facts set forth by Mr. THOMSON-and which, indeed, may be taken as in the main beyond dispute-we may well hesitate before we infer from them that our climate has undergone, or is undergoing, deterioration, as distinct from fluctuation. Before we could accept such a view we should have to eliminate all other possible causes for the deficiency or inferiority of our crops.

Take fruit culture on walls, for instance. We think it can hardly be said, take the country through, that anything like so much attention and care is paid to wall trees as in the days of our forefathers. Doubtless those who hold that the climate is deteriorating will seize upon this in support of their case, but while allowing due weight to this point we would suggest that other causes might be found in the great extension of culture under glass, where the gardener is to a large extent independent of climate; to the multiplicity of duties now cast on the gardener, the constant demand for cut flowers and table decorations; all these matters take up time and labour, which used to be expended outdoors. Now-a-days it pays better to import products from more favoured climes, or cultivate under glass, and outdoor fruit crops suffer proportionately. But that this need not be the case is shown in cases where, as at Ditton Park, an amount of care is bestowed on the wall trees equal to what was applied in olden times. We mention these matters, not by any means as absolutely controverting Mr. THOMSON'S statements and opinions, but merely as elements in the problem, which must be duly considered before we can arrive at any con-clusion worth having. The recollections of individual gardeners as to the amount, and specially as to the character of the produce, unsupported by any more definite evidence, are, indeed, entitled to respect; but they will not contribute to the settlement of the question, unless backed up by trustworthy statistics and controlled by the elimination of other than climatal causes.

We cannot put pen to paper on this subject without expressing our regret that the information collected under the auspices of the Royal Horticultural Society as to the effects of the two severe winters we lately passed through remains still unpublished. If nothing else can be done, at least a mere list of plants injured at various stations would be useful. As it is, one of the greatest opportunities of the kind has been lost, and the advocates of the deterioration of our climate have lost what would have been for them a well filled armoury of facts.

We may conclude these remarks by appending some valuable information, derived from the Marquis of SALISBURY, as to the "vineyard" at Hatfield, of which we gave illustrations some years ago :—

"The Vines at the vineyard at Hatfield were planted in 160-11. As the vineyard was 5 acres in extent, and 30,000 Vines were planted, it may be concluded that they were standards. The Vines were a present from the wife of the French Ambassador to Sir Robest CECIL.

"It is probable that this was one of the latest vineyards planted in England. There is no record of the time when it was abandoned. Vineyards in England are mentioned as early as A.D. 280, and there are thirty-eight nettries of vineries in the Doomsday Book (compiled 850 years ago). CAMDEN says, in his Britannies 'It may seem to be the slothfulness of the people more than the indisposition of the air, that this nation yieldeth not wine at this day. The vineyards

probably declined gradually with the growth of comnerce, which enabled better wine to be got from France than could be produced at home. (The overthrow of the monasteries gave the finishing blow to home production of wine.)

"PARKINSON, writing of vineyards in 1627, says: 'The former vineyards in England have long since been destroyed, and the knowledge how to order a vineyard has entirely perished with them.'

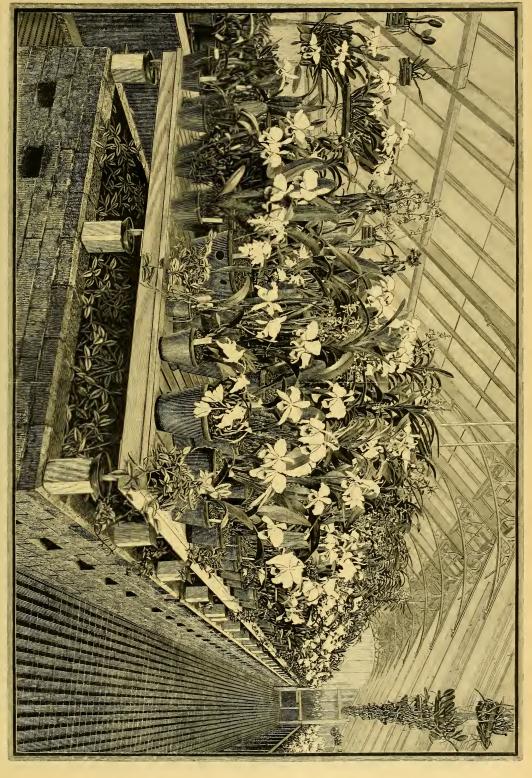

"AUSTIN, writing in 1663, gives as a reason why it is fruitless labour to strive in these days to make a good vineyard in England—"That the years are not so hot in Englund as formerly."

- Mr. LEE'S CATTLEVA HOUSE -- Our illustration (fig. 131), from a photograph taken for us by Messrs. Bedford, Lemere & Co. just before the end of the C. Trianæ season, gives a view of Mr. WILLIAM LEE's famous Cattleya-house, and will serve to give an idea of the excellent quality and fine condition of its occupants. Allowance must, however, he made for the limited field which the camera covers compared with that which the eye takes in, and the consequent difficulty of introducing anything but a glimpse of the beauties displayed along the whole length of this vast and well-appointed structure. With respect to the excellence of the plants, and the extraordinary varieties to be found here, little need be said, as their reputation is well known; and the fact that ever since its completion last year, in addition to receiving the already existing fine collection, the Downside Cattleya-house has been open to admit every other worthy variety, should pronounce it to be of the first merit. Among the many rare things in flower at the time our picture was taken were fine plants of C. Trianæ alba, C. T. Dodgsoni, C. T. Osmani, C. T. Normani, C. T. Backhonsiana. Osmani, C. T. Normani, C. T. Backhonsiana, C. T. Russelliana, and the famed 250 guineas C. T. Leeana. Among the Cattleyas will be seen the earliest of the Vandas. The collection of these is very complete at Downside, where every obtainable good variety is grown. The Vandas are grown with the Cattleyas all the year round, and nothing could he better than their healthy condition and the freeness with which they produce their flowers, which begin before the C. Trianæs are over, and continue to accompany the C. Mendelii and C. Mossiæ throughout this season and late into the summer; indeed, the different species of Cattleya, Lælia, and Vanda contained in this house and its two lobbies seem so to work in with each other that a constant and varied display of bloom is kept up all the year round without the aid of plants grown in other houses being called in. At the present time the C. Mendelii, C. Mossice varieties, the Vandas, &c., are producing as fine a display as that given by the C. Trianæs. Seeing that Mr. LEE has so admirably planned his Cattleya-house, we again give its dimensions, which are 100 feet long, 21 feet 6 inches wide, and 12 feet 6 inches high to ridge. Top ventilation from end to end; bottom ventilators 3 feet long and 9 inches wide, placed 6 feet 6 inches apart; and there is also at each eave of the roof, where the glass comes on the wall-plate, a quarter of an inch of air on day and night, summer and winter-the edge of the first sheet of glass being fixed with this aperture between it and the wall-plate, an arrangement which always ensures a pure air in the house. The walks are 3 feet 9 inches wide, and paved with Staffordshire blue brick, the grooves in which keep the walks comfortable even when abundance of water is used. Indeed, in this and all the other houses at Downside, the object seems to be to make them comfortable and healthy, both for the plants and their admirers.

—— WOBURN ABBEV.—The Duke of BEDFORD has given permission for the Abbey Gardens and Sculpture Gallery at Woburn, and the Park Farm, to be open to members of the Royal Agricultural Society and their friends who may wish to see the various objects of interest there, after inspecting the Woburn experiments on the occasion of the annual excursion organised by the Society, which will take place on Thursday, June 5.

— THE HON. AND REV. J. T. BOSCAWEN asks us to state that he will be at the Show-ground, Maidstone, all next week, and that he will be obliged by his correspondents addressing him there.

— ROYAL HORTICULTURAL SOCIETY.—At the last meeting of the Floral Committee Mr. CHARLES KERSHAW, Sleadsyke Nurscries, Brighouse, was

awarded a First-class Certificate for a coloured form of the common Sycamore, mention of which was inadvertently omitted in our report.

PICKLED PEACHES,—The Revue Horticole recommends the young Peaches removed at thinning time to be put into vinegar and pickled like Gherkins. Our contemporary is usually sober in his praises, but he emphasises the pickle as excellent.

— Instruction in Market Gardening.—
The Préfet of the Seine has appointed M. Duvillard,
market gardener, of Arcueil, to give public instruction in the principles and art of market gardening,
for which it appears M. Duvillard has special
qualifications, not the least of which is an excellent
establishment where the various branches of the art
are carried on. A little information of this character
in our country districts would be very desirable,

THE JARDIN DES PLANTES, — The Revue
Horticole announces the appointment of M. LOURY as
superintendent of the glass-houses, in the place of M.
HOULLET, resigned,

— MOUNTING DRIED PLANTS. — Dr. J. H. OVSTER, in the Botanical Casette, recommends the following cement, in place of gum or glue, for mounting plants:—Bisulphuret of carbon, 4 oz.; crude indiarubber sufficient to make of the proper thickness, It is always ready for use. We imagine the difficulty for many people would be to get the materials.

- TOBACCO JUICE OR TOBACCO WATER is now very generally recommended for mixing with other articles for washing fruit trees, Roses, &c., for the destruction of insects and blight. Inquiries are often made as to bow and where this juice can be procured under the name of the London Tobacco juice, very few knowing that a grant from the Honourable Board of Customs was allowed to Messrs. Corry & Soper, of Shad Thames, London. S.E., in the year 1866 for the purpose of extracting the juice from leaf Tobacco for horticultural purposes eotirely free of duty, thereby enabling the public to get a strong article containing about 40 oz. of lea Tobacco to every gallon for the sum of 2s, 6d., being a great saving on the ordinary Tobacco-water obtained from the Tobacco manufacturers, as it may be diluted with eight to ten parts of water with the best results, thereby effecting a great saving not only in cost but in carriage. We believe Messrs. CORRY & SOPER are the only makers of this article in London, and it may be obtained through the seed trade generally.

— LABELS.—Among the numerons substances recommended for labels, we do not remember to have heard before of meerscham. M. HEDIARD, however, at a recent meeting of the Central Horticultural Society of France, spoke favourably of it. M. DUCHARTER, at the same meeting, advocated the use of scraps of ivory on which the name of the plant is to be written with a quill pen dipped in a solution of nitrate of silver. The inscription can be removed if necessary by scraping with glass.

— THE BLUE GUM TREE IN IRELAND,—A question having arisen as to the hardiness of Eucalyptus globulus in Ireland, enquiries have been made on the subject, and we learn that on Lord MAURICE FITZCERALD's estate at Johostown Castle, Co. Wexford, the recent hard winters have killed them off, although they had attained 60 feet in height, and had been planted thirteen years. Lord MAURICE FITZCERALD has a good many young plants from last year's seed, but is doubtful if they will survive any hard winters that may be experienced in the future.

COTTAGERS' AND ARTIZANS' EXHIBITION AT SOUTH KENSINGTON—We find that the exhibition of collections of cottagers' produce by societies, in order to illustrate the culture of a district, is in danger of being considerably restricted, by reason of the fact that collections of fruit must be shown with vegetables. Apart from the fact, that in many cases there will be in all probability a scarcity of fruit, there are not a few districts in which allotment gardens are necessarily limited in extent—not exceeding 20 rods—and it is against the regulations in some instances to plant fruit trees. In cases where there is no such regulation, those who cultivate prefer to grow ground crops, and eschew planting of trees, confining themselves to a few bush fruits. There are acres of allotment gardens about the country on which it would be difficult to

find a standard or bush tree of Apple, Pear, Plum, or Cherry. One locality near London, where vegetables are finely grown on the allotment gardens, will be excluded from competition in consequence of fruit being required. It is too late to make any authoritative announcement, but it is to be feared that, fruit being indispensable according to the conditions of the schedule, the competition will be restricted in con-It would be well if Mr. BARRON were sequence. authorised to make some definite declaration as to what is implied in the term "kinds." Is it to be understood in the sense of variety or not? Because the term is differently understood in some localities from what it is in others, there is much need that an authoritative declaration be made. It is a nice point to leave to the decision of judges, though there is no doubt but that the men who will be called upon to make the awards will put a liberal interpretation on the schedule. But in such a peculiar competition as this, the fewer ambiguities there are to exercise the minds of exhibitors the better.

OX-EYED DAISIES,-In the neighbourhood of Maidenhead the steep embankments on the Great Western Railway are white with the manifold blossoms of the white ox-eyed Daisy (C, lencanthemum). It has spread itself along the sides of the embankment for miles, and the wonder is that in such an open sunny spot the plants are not roasted up during summer. In the fields, and especially in some parts of Kent, the yellow Corn Marigold (G. segetum) is throwing up large numbers of bright golden-yellow flowers, where they contrast with scarlet Poppies and the blue Centaurea Cyanus. It is worthy a place in our gardens, for it is invaluable for cutting from. It is recorded that at one time this became so troublesome a weed in Denmark that a law was passed inflicting a penalty on any farmer who neglected to eradicate it from his cornfields. It does not appear to be plentiful enough in this country to become a nuisance to the agriculturist, and in all probability the fact that it is being made a garden plant sets persons to work to collect seeds, and this must tend to circumscribe the growth of the plant. The single form of Chrysanthemum coronarium is an excellent companion to this,

- TRADE CATALOGUES. - It is against our rule, for obvious reasons, to notice trade catalogues in any other way than by a simple acknowledgment of their receipt, but now and again we feel obliged to break the rule in question in favour of a catalogue which appears to us to be that and something more, and such an one is now before -a catalogue of Ferns cultivated for sale by Messrs. W. & J. BIRKENHEAD, of Sale, near Manchester. It is a small quarto of 100 pages, profusely and admirably illustrated, and much to be commended both for its orthography and typography, which are excellent. The Ferns are arranged alphabetically in three groups-stove, greenhouse, and hardy, with the native country and average height of each, and at the end several pages are occupied by valuable advice on the culture and management of these interesting plants. It is indeed something more than a mere trade list, and deserves hearty commendation.

- NOMENCLATURE OF VARIETIES - Some time since we had occasion to call attention to the diversities and incongruities of practice, arising from the admixture of adjectives of different genders in composite names (p. 373). M. ALPHONSE DE CAN-DOLLE was good enough also to give an expression of opinion on the subject. M. DE CANDOLLE pointed out that, in general, authors of repute have made the varietal name conform to the gender of the generic name, thus-Thymus Serpyllum, B. montanus. Where the abbreviation "var." or the word "varietas" are employed, there, says M. DE CANDOLLE, it seems most correct to make the adjective feminine. Having the convenience of gardeners (not that of philologists) in mind, we suggested that in all cases the varietal name should be feminine, whether the word "varietas" be expressed or merely understood. In some comments on this article in the American Journal of Science, Dr. ASA GRAY points out that LINNÆUS, as a rule, made the gender of the varietal name follow that of the generic, neuter if neuter, feminioe if feminine, and so on, thus :- Viburnum opulus. 8. roseum, or, to take an example used in our former note, Narcissus Bulbocodium monophyllus. Dr. GRAY, from an oversight, makes us attribute to M. DE CANDOLLE words that he did not use-a passage which he quotes in inverted commas is made to read

as if it were the opinion of M. DE CANDOLLE, which it really is not, as the reader may see on referring to the page where M. DE CANDOLLE's opinion is given quite separately, but it will be seen that it, in so far, coincides withour own view—that the feminine termination should be used when the word "var." is employed. Dr. GRAY proceeds to say that if our proposal of making the varietal name feminine in all cases [where there was no objection to the practice] were to be adopted, specific names and subspecific names would have to be made feminine also. Why not? We would have plant names, of whatever grade, feminine, provided there were no grammatical or other reason to the contrary. Where a neuter or masculine form is an indication of a bit of history, as it so frequently is, there, of course, we would religiously preserve it in its original form; but in the case of newly-formed names, and more especially of those which fill our horticultural catalogues, we believe that our proposition would tend to simplification, and obviate doubts.

THE HEALTH EXHIBITION .- As exhibitors of models in wax and other materials of our most esteemed varieties of vegetables, salad plants, Pulse, roots, and Curcurbits, the palm should certainly be awarded to Messrs. SUTTON & SONS, of Reading. Their display is not only the most varied and extensive, but is remarkable for the generally faithful reproduction of the objects dealt with, and therefore must form a trustworthy guide to amateurs and gardeners desirous of making selections of these products of the garden and the field. We see here, at a glance, the different sorts of Peas, Beans, Lettuces, Beet, Radish, &c., modelled when the respective items are just at that stage of growth that best adapts them to be gathered for use; roots, such as Potatos, Beet, Parsnips, Turnips, as fully developed, but not overmature; whilst roots and other purely farm productions are represented in their fullest development, Collections of seeds, and seed-bearing grasses and cereals properly so-called, occupy the upright sides of the stand, whilst the wax models are arranged in convenient horizontally placed glass cases round the sides and ends; and the position of the exhibit is directly facing the visitor on entering from the Exhibition Road. To the left of this stand Messrs. WEBB & Sons, Wordsley, have a large collection of vegetable seeds, heads of grasses, Rye, Wheat, Barley, and Oats, in considerable variety; Clovers, Peas, and other kinds of farm and garden seeds; fine samples of the Peas Kinver Marrow, Electric Light, New Triumph, and Wordsley Wonder. Not far removed from this case is that of Messrs. WHEELER & Son, of Gloucester. This is one of the more interesting collections, as the exhibitors have classified the grasses according to their adaptability to various soil formations. Thus, for chalk, we bave Anthoxanthum odoratum, Poa pratensis, Lolium perenne, Cynosurus cristatus, Avena flavescens, Festuca ovina. London Clay or Eocene: Lolium perenne, L. Devonianum, Dactylis glomerata. and so on through carboniferous or limestone soils and Oxford clays. Garden vegetable seeds, farm seeds, and samples of appetising-looking ensilage Berkeley, &c., complete the items shown. Messrs. JAMES CARTER & Co., of High Holborn, are also well represented. In their cases we find seeds arranged according to their uses, but without regard to soil or climate; pasturage and culioary vegetable seeds, those of plants suitable as bee feeders, and of textile plants in great variety, medicinal and fruit We noticed seeds of Cinchona, seeds and stones, Manioca, Betel, Diospyros embryopteris, Cardamons, Colocynth, Nux Vomica, Kola and Brazil nuts—the latter being entire, and not as we are accustomed to see them exposed for sale, in size near that of a cricket ball. Many sorts of cattle feeding cake, samples of ensilage from Clover and Rye, and likewise from Spergula arvensis, some plants of the last named being shown in growth; flour made from various seeds, such as Wheat, Millet, Buckwheat, Peas, Lentils, &c.; and from widely separated landsas New Zealand, Russia, Hungary, and the United States-nuts, berries, Hops, and seeds of many coniferous trees also find a place in this instructive and well arranged collection.

— THE HEALTH ENHIBITION. — We inadvertently stated in our last number that the planting in the middle walk in the show was is in the hands of Messrs. WATERER & CO., of Bagshot, instead of Mr. ANTHONY WATERER, of Knap Hill, Woking.

- IXIA CRATEROIDES. - This undoubtedly is one of the most beautiful of the larger group of varieties, and it is a conspicuous feature at Gunnersbury Park just now. Grewn in pots, a few bulbs in each, and subjected to cool treatment, the specimens are covered with strong bearing fine bunches of rich bright rosycrimson flowers, making it a decorative plant of great beauty. Mr. ROBERTS must be commended for the prominence he has this season given to Cape and other bulbs. On the south front of one of his houses in the kitchen garden he has a raised bed 30 inches or so in width, with a brick fronting 3 feet in height. On the top of this is a bed of good soil, a foot in depth, and in it Mr. ROBERTS planted early in February lines of Gladiolus Colvillei albus, Sparaxis, Ixias, and Freesias. All have made a strong growth, and this should presently be a very charming bed indeed. Dry as the weather is, the development of the plants is good, and helped by occasional waterings they stand the drought without injury. One interesting feature always present at Gunnersbury is, that Mr. ROBERTS always has some novelties in flower that one does not meet with in ordinary gardens,

— VEGETABLE PRODUCTS IN SWITZERLAND,—
From a report of the Horticultural Department of the
receot Zurich Exhibition, by M. E. MERTENS, we
learn that the approximate annual value of the horticultural products in Switzerland is as follows:—

| France, | France, | France, | France, | Tables |

- OPENING AND CLOSING OF FLOWERS. -M. DUCHARTRE, in a number of the Bulletin of the Botanical Society of France (1883), p. 66, which has only recently reached us, sums up the results of some observations on Crocus flowers by saying that the expansion of these flowers, whether cut or still remaining attached to the plant, is promoted by increase of temperature, and their closing by diminution of temperature, independently of any action of light. The change may be produced by a variation of 4-5 C. in from thirty to sixty minutes, and the phenomena may in general be repeated several times in the same flower by alternate exposure to relatively high or low temperature. M. DUCHARTRE suggests that the placing the closed flowers in a higher temperature induces evaporation from the outer epidermal cells of the perianth segments and consequent shrinkage, in consequence of which the segments curve outwardly and the flower opens. When the expanded flowers are removed into a cooler temperature evaporation diminishes, the turgidity of the outer cells is restored, and the segments close up.

- Loss of "Leaders" in the Spruce .-M. MER, in a communication to the Botanical Society of France, Feb. 9, 1883, explains the tendency of the Spruce, grown in the edge of plantations, to lose their leaders on the following grounds :- The leaves on the leader shoots, whether primary or secondary, receive the light tangentially to their surface, and hence at a disadvantage, as it has been shown that the starch-producing power is exercised most fully when the leaves are exposed to direct light. Hence, if the leading shoot be overshadowed by neighbouring branches, starch is formed in small quantities, and the leader is in consequence enfeebled, the diminished activity of the leaves prevents the supply of sufficient water, and the leaves consequently dry up, and ultimately the shoot itself perishes.

—— HYBRID NARCISSUS.—M. L'ABBÉ MAGNAN cites, in the Bulletin of the French Botanical Society (June 9, 1883), a wild hybrid between N. juncifolius and N. Tazetta, the latter being the seed parent. The foliage is intermediate in character between that of the two reputed parents. The flowers have the colour of those of N. juncifolius and the size of those of N. Tazetta. M. MAGNAN goes into particulars in support of the correctness of his views.

— WEEDS AND WORK. — Those pestilent enemies of garden proprietors, weeds, are the best friends of the garden labourer. Just now we find the

latter earnestly anxious that weeds should grow, and, pests as they are to the former, even he thinks growing weeds less an evil than no growth whatever, Throughout our market garden districts the absence of weeds, consequent upon the long-continued lack of rain, is causing a dearth of labour, and in all directions men and women have been released from daily toil-a fate that may seem pleasant enough but for the fact that they, too, are released from receiving their weekly pay. We have heard employers say that they do not mind weeds growing, because other things grow too. That is looking at the matter in an excellent and philosophical spirit. Such a growing time is rather favourable to the labourer, because often then his employer's necessity is his opportunity. Just now the employer has it all his own way, and if the labourer does not pray for rain, that the weeds may grow, it is doubtless because he thinks rain and weeds past praying for. Many employers, we fear, in regarding the absence of weeds, are apt to think that the hoe, one of the most useful labour implements in gardens, has no further purpose to serve, and that it may as well hang and rust. That is a grave error, not only from a cultural point of view, but also from The hoe is a first-rate cultivator, and the labourer's. its free use amongst crops, even if there be no weeds to kill, will be productive of great good in freeing and aërating the surface of the soil, and thus promoting growth in the crops. The soil which in the severest drought has its surface kept loose and frequently stirred, will always have a most moist base. Both in the interests of good cultivation and of the wageless labourer, we commend that fact to the attention of

--- CABBAGES,-Spring Cabbages have always been esteemed as favoured and acceptable vegetables. It is true they follow upon that flower of the Brassica family-good late Broccolis; but on the other hand the Cabbage has its spring season pretty much to itself, and in green stuffs our choice is that of Hobson's -Cabbage or nothing. We find just now a good breadth of spring Cabbage of the highest value. White and purple Broccolis are gone; so, too, are all other of the winter greens, and even the winter Spinach has been dug or ploughed in to make room for late Potatos, so that Cabbages and winter Onions -the latter by no means a substitute for Broccolisare the chief garden and field products. Cauliflowers are not in, though blessed indeed is the gardener, private or otherwise, who has a goodly and an early planted breadth of these almost ready for cutting, Seakale and Asparagus are vegetables for the select, but not for the million, and but for spring Cabbages the million would just now be greenless. Even these Cabbages, however, are not just now all that could be desired, for they have been too long wanting rain, and wear a bluish aspect. Cabbages have had their integrity severely tested this year also, and any tendency to bolt has been helped rather than retarded. We fear that this tendency thus hastily to make the running is due more to bad selection than to weather, because [there are myriads of plants that have withstood the temptation bravely. Bad would it be for us if they had not. In spite of assumed new kinds it is open to doubt whether we have made with Cabbages any great stride during recent years. There were plenty of beautiful spring Cabbages a generation since, and we have no more now. Still it is some-thing if we think we have advanced, as our self-love is satisfied.

— THE LUDLOW ROSE SHOW is announced to be held on Tuesday, July 8.

— DATURA SANGUINEA. — Formerly botanists were wont to divide the genus Datura into several, and this species was included amongst the Brugmansias on account of its shrubby or tree-like habit and pendulous flowers, with the ealyx splitting on one side, and resembling a spathe. A magnificent specimen, now in lull flowering order in the conservatory at Kew (No. 4), is a sight in itself well worth a visit to see. It is permanently planted out in a border, and receives no particular treatment, except a hard cutting back towards the end of the season, when flowering is over, in order to keep it within reasonable bounds, and induce it to form strong young wood, on which alone the handsome scalet flowers are produced. Cultivated in pots the flowering season can be regulated in a great measure by the time of pruning back, and introducing to a stove temperature in order to

start it; but flowers will not be so freely and abundantly produced as when planted out. There is a painting of this species, No. 161, in the "North" Gallery at Kew.

- THE PARCELS POST .- The postal authorities again direct attention to the necessity of everything sent through their hands being securely packed. Fruit, especially, should be packed securely in tin boxes with tight-fitting lids, and in such a manner that the juice may not exude to the damage of other things sent by the mails. In the case of eggs, the authorities recommend the following method of packing :- To use a tin box with well-fitting lid; to wrap each egg separately with a sufficiency of old news-paper, or other soft material; to place the eggs on end, one close to the other, and to fill up the interstices and the box with newspaper, cotton waste, sawdust, bran, or chaff, so as to prevent the eggs from striking together, or against the sides or top of the box in which they are contained; finally, to write prominently on the address portion of the outer wrapper or label the words, "Eggs-with care."

— THE ORCHID MARKET.—At the sale of Sir WILLIAM MARKET's collection of Orchids, held this week at STEVENS' Rooms, the highest prices realised were for Cattleya exoniensis, 34 gs. and 38 gs.; Dendrobium nobile nobilissinum, 7½ gs.; Vanda teres aurora, £10; Cypripedium Stonei, 19 gs.; Cattleya gigas, 14 gs.; Odontoglossum crispum Dennianum, 14½ gs.; Cattleya labiata, 9 gs.; C. Dowiana, £6 to and 7 gs.; and Lælia purpurata, £9.

— CLEMATIS JACKMANNI ALBA,—A form asserted to be a cross between C. Jackmannix and C. Fortunei, with pinnate (not ternate) foliage and large white flowers, flushed with a bluish shade and produced on the young wood. It was raised by Mr. NOBLE, of Bagshot, and is figured in the March number of the Florist and Pomologist.

- THE WEATHER.-General remarks on the temperature, raiofall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 19, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: The weather has been rather dull in Ireland, Scotland, and the north-west of England, with frequent showers, but elsewhere the sky has been clearer and the weather generally dry. The temperature has been a little below the mean in the western and extreme northern parts of the kingdom, as well as in the Channel Islands, but from 1° to 3° above it in the east of Scotland and over eastern, central, and southern England. The maxima, which were registered on the 16th in most districts, but on the following day in the south east of England, varied from 59° in "Scotland, N.," and 60° in "Scotland, W.," to 74° in "England, S.," and 75° in the "Midland Counties." The micima, with few exceptions, were recorded on the 19th, and ranged from 32° in "England, N.W.," and "Ireland, N.," and 33° in the "Midland Counties" and "England, S.W.," to 40° in "England, S.," and 46° in the "Channel Islands. The rainfall has been more than the mean in Scotland, the greater part of Ireland, and the north-west of England, but less elsewhere. Bright sunshine has been less prevalent than during last week in most places, the percentages of possible duration varying from 22 in "Ireland, N.," to 42 in "Eggland, N.E.," and "England, S.W." Depressions observed:

—Barometric pressure has continued highest and —Barometric pressure has continued highest and comparatively steady over France, while over our islands the barometer has again been influenced by depressions moving in a north-easterly direction outside of, or over, our extreme north-west and northern coasts. Southerly to westerly winds have consequently prevailed over the United Kingdom, and, though moderate in the east and south-east, have blown freshly or strongly in the west and north, at times reaching the force of a slight gale. At the close of the period the barometer had become highest on our western and south-western coasts, and the wind over our islands light in force and variable in direc-

— GARDENING APPOINTMENTS, — Mr. LEWIS JORDAN, formerly Gardener at Coleby Hall, Lincoln, as Gardener to J. TEMPLETON MORGAN, Esq., Erampton Park, Huntingdon.—Mr. H. Balley, for the last two years Orchid Foreman at The Poles, Ware, as Gardener to W. L. BARCLAY, Esq., The Briers, Reigate.—Mr. WILLIAM HALL, lately Gardener at Deighton Grove, York, as Gardener to C. PERKINS, Esq., Kirkley Hall, Northumberland.

THE INTERNATIONAL EXHIBITION AT ST. PETERSBURG.

THE International Exhibition of the Imperial Society of Horticulture, open from May 17 to 28, is being held in the Manège Michel, a large building formerly used for the parade of Guards, and situated a short distance off the Nevsky Prospect. The interior of the building is oblong, about 300 paces long, and about 66 in breadth, and upon this unpromising dead level and rigidly restricted space has been formed a scene which for effectiveness and splendour must surpass all expectation. From the Botanic Garden and from the Imperial Gardens at Gatschina have been brought a number of fine specimens, including many magnificent Palms and Cycads, which form in themselves an exhibition. The building in proportion is not lofty, and by skilful disposition of the plants a happy appearance of breadth has been secured, while it is at the same time completely furnished. The one misfortune is a slight insufficiency of light, which is admitted only by side windows. The arrangement has been planned and carried out by Dr. Regel, the general Director, and he has succeeded well in his evident aim to produce a natural effect, and to avoid all staginess. We can but say that the result entirely repays the pains and trouble that has been taken.

The principal entrance, at the end of the building, opens upon an elevated platform, a kind of transverse promenade, prettily screened from the grand display by an ornamental colonnade, covered with Ivy, and from this position we get an idea of the general The walls are entirely screened from view by flanks of fine-foliaged and flowering plants; between the windows Spruce Firs and other tall plants reach to the ceiling, and a walk gracefully curved in conformity with the shape of the central groups gives free circulation around the building, while between the groups there is free communication from side to side. The fine specimens and principal groups are shown to advantage by undulations of the floor, in imitation ol a naturally favoured garden. Descending from the entrance platform we reach the first large group on the lowest level, the next is on higher ground and includes a pond, of irregular outline in rugged rock, with a fountain. Further on the principal walk on the left is carried by a bridge over a rocky ravine which leads to the relreshment department. This bridge is formed of Birch timber with its natural bark, and the effect is good. Rocks are cleverly imitated on a basis of wood by means of Russian mats; they are laid in the form desired, and then covered with plaster, which is coloured in imitation of Nature.

Passing the bridge we come into view of an English garden at the further end, which slopes to a rocky background at considerable elevation. Through the centre of it and under a bridge we pass to a department for implements, pottery, and artificial flowers with many other miscellaneous exhibits. The English garden is tastefully laid out, though its use is purposely to display the plants exhibited. A rivulet bordered with Arum Lilies, and crossed by a bridge, is introduced with very good effect. From the bridge which crosses the ravine leading to the implement and miscellaneous department we have a fine view of the entire scene, and it has a charmingly tropical aspect, enlivened by the passing and repassing of the groups of visitors. The exhibits repose, it were, in groves of fine Palms and Cycads, formed for their reception by the liberality of the great establishments we have already mentioned. Everywhere beneath the plants the ground is surfaced with moss, and tubs necessarily exposed are decorated with sheets of Birch bark. The great groups are outlined with strips of thin wood, painted green, and within are the subordinate groups of the collections

exhibited.
Judging the exhibits practically occupied the whole of the 16th. The members of the jury to the number of nearly 200 assembled under the presidency of II. E. General Greig, and the business of the day was commenced by a religious service, followed by a benediction upon the entire exhibition. General Greig then expressed thanks to the jurymen and exhibitors for their attendance and exhibits, and proceeded to explain the order of the day. The jurymen were divided into sixteen sections, each of which lected a president and secretary. On Saturday, the 17th, in the afternoon, the Exhibition was opened in full ceremonial by the Emperor and Empress, who were attended by a throng of Ambassadors, Ministers, Generals, and Court digoitaries, all in full notiform, and bearing their decorations. There were

present the Grand Duke Vladimir, the Grand Duke Nicolas, a patron of the Society, and a number of distinguished ladies.

Our report of the exhibits must be deferred, but we may instance in particular a remarkable collection of hardy Orchids, exhibited from the Botanic Garden, to the number of about thirty species, in flower—the finest we have seen since the time of the fine collection of the Comte de Paris at Twickenham. Then there is a splendid collection of new plants, from the Compagnie Continentale d'Horticulture of Ghent, which we will have occasion to note in detail. There is complete absence of Foglish exhibitors.

In the evening the first meeting of the Congress took place, in the Hôtel de Ville, and after an address by H. E. General Greig, the Vice-Presidents and Secretaries were elected, and arrangements were made for the future sectional and general meetings. (From our Special Correspondent.)

Home Correspondence.

British Ferns and their Varieties. — Would Mr. Stansfield kindly give us, as time permits, a description of the various varieties of British Ferns? I am well aware that this would be a laborious task, but to Mr. Stansfield, who is at home with the subject, it would be less difficult than to any other of your correspondents. To many others, as well as myself, I have reason to believe that the above would be a subject of special interest. What is most wanted is a description of the better and more distinct varieties, so that their identification may become simple to the amateur. A. D. W.

The Fruit Crops.—After getting towards the end of April without any frost of consequence, we had reason to think the fruit crop was sale, but unfortunately such has not turned out to be the case, as the thermometer went down to 22° during the last week of the month, and the cold has been fatal to nearly all blossoms, away from the protection of walls, then open, and to fruit that was set. The effect, though feared, could not be seen then, but it can now, and is only too visible, as Pears on pyramids are falling in bunches without leaving one behind, although all sorts are not hit alike, as some have a sprinkling, and Louise Bonne has weathered through, and retains a considerable quantity. It is doubtful, however, if they will swell, as, though they look fresh at present, they show frost-bite by their irregular shape, and when so injured they generally crack, and have hard woody knots under the skin. Cherries and Plums on standards are all killed, and greatly damaged on walls, as these, like the Pears, are deformed, and it is a great chance if they get through the stoning, as no doubt the kernels are injured. Morellos do not appear to have taken any harm, and as they opened during the few hot days we had, they had set thickly, and are now looking fresh, healthy, and well. Gooseberries, though in nearly full leaf, felt the frost much, and the bushes in consequence are severely thinned, the ground being covered with fallen fruit, and a good deal of that left on is blistered, and eats hard after cooking. Currants of the red and white kinds are also hurt, and are dropping from the bunches, but, so far as can be judged at they have escaped that will be something, as, though the crop was plentiful last year, they have lead to the red and white kinds are also hurt, and are dropping from the bunches, but, so far as can be judged that will be something, as, though the crop was plentiful last year, they have leaven by during and bold. Teaches have shelter the flowers look strong and bold. Teaches have shelter the flowers

The Double-flowered Gorse (Ulex europæus fore-pleno).—This is at present one of the most ornamental and conspicuous plants in our nursety borders. For planting on aid portions of extensive rockwork it has few equals, the flowers, which completely hide the foliage, being in full sunshine beautiful beyond description. A. D. Webter.

Doubling of Daffodils.—The note of "P. B.," on p. 642, is hard to interpret. Assuming that the word "abscissus" is meant for "Telamonius" [It should have been, as our correspondent surmises, Telamonius plenus. Ep.], I fail to see how a little conference, at which Mr. Brockbank could show us the ripe seeds in the capsule of the N. Telamonius plenus, would advance our knowledge of the way in which single Daffodils become double. But if "P. B." really means to suggest that those who have found single Daffodils turn double shall be summoned to London to give evidence before a sort of Council of

Five because he, "P. B.," chooses to disbelieve their word, he greatly mistakes the English character, unless he intends to get an Act of Parliament passed giving inquisitorial powers against all who dare to assert so unorthodox a doctrine as that single Daffodils can be doubled. There is notbing on which an Englishman is more sensitive than about having his word doubted when he makes a statement of a simple fact which he knows to be true. It is very kind of some who care little about the matter to have come forward to say what they have done, and it is ungracious either to meet their statements with a "cross-examination before a conference—not the kind of lent tormentum which seems to me likely to elicit further formation. I am artaid it would effectually deter much voluntary evidence which more caulious advances might render available. C. Wolley Dod, Edge Hall, May 18. [It is requisite to point out, for clearness sake, that the single Daffodil, N. Pseudo-Narcissus, is said under cultivation to become the large Florence Daffodil or N. Telamonius plenus, and this latter is asserted to produce ripe seed. Ed.]

British Orchids.—I send for your inspection a flower-spike of the early purple Orchis (O. mascula) just to give you some idea of what this plant is like when well grown in good, damp, calcareous loam. Clumps containing, say, from a dozen to twenty of these plants, and all bearing spikes similar to that sent, are a grand sight, and for rockwork embellishment can favourably compare with any plant, native or exotic. If some of the ten-guinea Orchids sold at Stevens' had flowers equal to the enclosed their value would, I have no doubt, be doubled. The Brown Man Orchis (O. fusca), another handsome and rare native plant, is now in full blow, and, as you will see from the enclosed flowers, it is a species well worthy of the little trouble requiring to be expended on its cultivation. It succeeds best in strong chalky loam, and in a partially sheltered situation. A. D. Webster.

Effect of Frost.—The instance quoted by "A.D.," p. 650, is a striking illustration of the fact, that radiation is always greatest the nearer we approach to the surface of the ground; this is also easily proved by taking observations from a thermometer laid flat on the ground, and one suspended in the air a few feet above it. It is also well known that frost is generally more severe in valleys than on the tops of hills, &c., and this accounts for the young fruit on Gooseberry bushes being killed by the late frost at Stamford, while here, about 2 miles away and 80 to 100 feet greater elevation, we have a good crop. A curious instance of the uncertainty of frost in its effects was pointed out to me a few days since by Mr. Seth, at Grimsthorpe Castle; a batch of Hoteia japonica, growing behind a north wall out of reach of the sun was unhurt, while another batch growing on a west border was very badly affected. W. H. Divers, Burgaley.

Hale's Early Peach,—On Saturday, the 17th inst., we picked two fruits of the above-named Peach, one of which weighed $6\frac{1}{2}$ oz. They were the produce of a shoot or two of Hale's Early that arose from a few buds of that variety which we budded on a tree of A'Bee Peach in our early-house two years since. The fruit of A'Bee will not be ripe for another three weeks at least, as you will see from the one sent herewith Is not this rather a curious circumstance? I could understand a large branch—say one-third of a tree of another variety to maintain its natural earliness, but for a shoot not more than 2 feet long to do so, to me seems worth mentioning. The other Peaches in the same house as Hale's Early are, besides A'Bee, Early Rivers, Gorses Mignonne, and Violette Hātive Nectarine. None of them will be ripe for another three weeks at least. C. [A marked instance of the well known fact that buds of one tree worked on another, almost invariably, but not absolutely, retain their own individual characteristics. Eb.]

Long-Potted Lily Bulbs.—If there are any of your readers who may have potted their Lilies, say last October or November, or their imported stock, which generally arrives from Japan about the first week in December, and if either sorts, or a portion of them, have not formed stems, they may like to know there may still be hopes of success. To-day, going over a cold frame of some of the more tender kinds, I was rather surprised to find one imported L. auratum and one L. eximium, potted at the time mentioned, quite sound, and with a potful of roots, but no stem, they will be useful for succession. IV. J. Murphy,

The Doubling of Primroses.—I send herewith three flowers taken from one plant of common yellow Primrose which is from seed and grown for two years in our borders in nichly manured soil. They illustrate the doubling of flowers in a very remarkable manner. No. t has a flattened stalk, as if two were joined together, ten distinct ribs to the calyx, ten petals, two pistils and probably double the proper number of stamens—an exact double, or twin flower in one, and beauty. In No. 2 there is a more complete doubling, the thickened stalk being round and the two pistils united into one, the petals in two rows approaching the centre. No. 3 is triple, baving a three-ribbed stalk, a three-sized calyx all joined at the ovary, three distinct tubes and rows of petals, each corolla with its pistil and stamens complete, but all arising from one ovary. A stage or two further would bring us to the double yellow Frimrose. It will be observed there is no conversion of stamens and pistils into petals, but a doubling and tripling of each, from a single ovary. The process of doubling appears to me the same as in the Daffolis. Wm. Brockbank.

Peculiar Growth of a Portugal Laurel.—The anoexed illustration (fig. 132) represents a curious and uncommon growth of the Portugal Laurel, in which one of the lower branches entered the ground at a distance of 6 feet from the main stem and formed a tree which is now nearly equal in size with the original. The junction-branch is of equal diameter throughout—about 2 inches—and springs from the main stem at a distance of 4 feet from the ground. Both trees are over 20 feet in height, and grow close to one of the drives in the park here. A. D. Wehster, Penrhyn Castle, North Wales.

Tuberous Solanums.—Will Mr. Baker, whose very interesting remarks on Potatos all must have

It is a fact that in many features the American Potatos have shown in foliage and character of tuber marked divergences from our own older kinds, but there has always been found in them a lack of that mealiness and flavour found in our English sorts. Still farther, they have not shown themselves capable of resisting disease. Their chief good qualities are quickness in maturing and heavy cropping. It would thus seem that the species Fendler, which Mr. Baker mentions, is a form of S. tuberosum, and possessed no disease-resisting properties. Now that we have in some degree by cross-breeding blended the English and American varieties of garden Fotatos into one breed, we have found more disease-resisting power than formerly prevailed, and the best features of each are united. It thus happens that we have now the very finest and best strains of garden Potatos ever seen. I have grave doubts whether with our present means we can well improve upon what we have. Those who have made use of the American blood at the first found a new and most valuable parentage, but those who, coming later, will employ as parents only the products of these international crosses will but interbreed without creating any novel forms or producing any exceptionally robust strains. If, however, we could intercross our present descendants of S. tuberosum with the species Maglia or Commersoni, assuming such crosses to be practicable, there is no telling what results may produce. The experiment quoted by Mr. Baker as having been carried out early in the century by Mr. T. A. Knight, is interesting in so far as it shows that early Potatos are now, viz., fruitless. Still it is preferable, having

FIG. 132.—PECULIAR GROWTH OF A PORTUGAL LAUREL.

read with pleasure, kindly say where the species be names as specially suitable for cultivation in this climate, S. Maglia and S. Commersoni, cao be obtained? It would be useful to learo, also, something as to their habits of growth and probable most suitable forms or methods of culture. These species are doubtless interesting denizens of a botanic garden, but in the hands of practical cultivators they may become something more, and with careful culture and intererossing may give us a totally new family of Potatos. Certainly we have little reason to find fault with our existing garden family of this splendid esculent, except for the fact that it is so liable to disease. That, perhaps, is bad enough to nearly outweigh many virtues. Our present race of Potatos came early and late; they will keep good till Potatos come in again; they are wondrously prolific, and generally of first-class quality indeed, here, in Old England, we can boast of having the best Potatos in the world. If the Peronospora would let us alone we should have nothing to complain of, and certainly it has been very lenient in its effects during the past two years, so that we have had immense crops, and if the coming summer should go on as it bas begun, we shall have a big crop of Potatos again this year, and little disease. Still, these crops are the abundant products of exceptionally favourable seasons, and any year may see the return of a cold, wet, sunless summer, and with that a terrible outbreak of the disease. Then would come a big cry out for disease-resisting kinds, the which, if found in the products of new species, would be hailed with acclamation. Some years since a noted American asier of Potatos wrote to Mr. R. Feon that he believed the indigenous S. Fendleri to be one of the parents of the once popular American strain of garden Potatos.

regard to the large increase of kinds since Mr. Knight's time, that not a few early ones may be found that are bloomers and fruiters. If his experiment applied to the Ashleaf Kidney, it shows that it is very ancient, and farther, that its habit is now as it was then. Still it is very obvious that almost similar results might be obtained in any kiod that refused to produce bloom by gently removing the soil from the base of the plant, and picking off all tubers as they formed. None the less Mr. Knight's theory, pleasing one as it may seem, is rather upset by the fact that not any early kinds, but many late ones also, are bloomless and fruitless, even though robust. Thus, though International, a very robust kind, will produce bloom-buds, it never sets flowers or produces fruit. On the other hand, its own brother, Woodstock Kidney, which is not less robust and a good cropper, blooms and berries most abundantly. Schoolmaster and Magnum Bonum rarely set their blooms, whilst many weaker growers and good croppers will do so freely. Growers regard free berried kinds as nuisances rather than as blessings; still there is no actual proof that berries, or apples as they are called, are produced at the expense of the root crop. It is a received assumption, but remains yet to be proved. I would add that foliage gives little clue as to parentage, for one seed-hall, the product of a cross, will give in its progeny the most diversified leafage.

Who is an Amateur?—What is Trading?—The first question you deal with on p. 580 of your issue for May 3, and few reasonable men, or men gifted with the power to reason, will differ from you in your assumption, "that a cultivator who neither grows

plants nor trades in them for gain—one, in fact, who, as a rule, loses by their culture—is undoubtedly an amateur," but as you go on to detail you get amongst thorns; and close with the suggestion, that the terms might be ahandoned were "classes made for the smaller growers from which the larger ones were excluded." No one again, I assume, can disagree with smaller growers from which the larger ones were ex-cluded." No one again, I assume, can disagree with your proposition, that "the clearest notion of an amateur is of one who, having some other vocation for means of livelihood, takes to the cultivation of flowers as a recreation and means of enjoyment." Your expression of respect for the "noble army of horticultural amateurs," and your assurance "that the trader also holds the body in high esteem, as the very back-bone of true horticulture in this country," will trader also holds the body in high esteem, as the very back-bone of true horticulture in this country," will also meet with general assent. But there are times, as the recent controversy has served to demonstrate, when irritating contentions may be set up, on plausible if insufficient grounds. Then in vexation of spirit we incline to seek refuge in some other path—but it will be well before we abandon a well beaten track, carefully to survey the proposed new course, Assuming, then, classes shall be made for the growers of larger and smaller stocks respectively. will that Assuming, then, classes shall be made for the growers of larger and smaller stocks respectively, will that method be free of difficulty? What shall be the limit of the smaller class? and how shall we determine the extent and condition of the stock grown on the date of exhibition? Let me try to illustrate this difficulty. An exhibition is fixed for the average date of a given area, within that area are growers of stocks varying in extent from 1000 plants to 300. But the sites whereon the plants are grown, and the conveniences and skill of the several cultivators affect not only the character, but the period of the bloom in a the character but the period of the bloom in a high degree. A, with a smaller stock, occupies a site, and has conveniences which enable him to mass his whole force on a given point (the date of exhibition); whilst B, with a larger number of plants, from cir-cumstances he cannot control has not more then cannot whole force on a given point (the date of exhibition); whist B, with a larger number of plants, from circumstances he cannot control, has not more than one-third of his stock in bloom at that time. How long in such circumstances would such an arrangement stand? And yet another question. How long, with competition tied and bound with such restrictions, would the specimens produced be illustrative of the higbest attainable merit? For we have ever to remember, whatever Little Pedliogton may suggest or desire, exhibitions are not designed for the exaltation of individuals or classes, but for the development, and determination by comparison, of horticultural skill, and the advantage of the many. The more I have thought over the subject, and the more my experience has been enlarged, the more I have been impressed with the wisdom of the maxim, when applied to specific exhibitions, of "Few classes and many prizes in each class," Let this be fairly realised in practice, oa as to give prizes to six-sevenths of the metriorious exhibits, and though there will be complaint of the weedy incapable, every generous competitor will be satisfied. We have not, however, as yet arrived at a solution of the questions, Who is an amateur? and What is trading? In the remarks I addressed to the special meeting of the National Auricula Society (Southern section), on the 22d ult., in the defence of my status as an amateur, I stated as my opinion that the line of demarcation between the amateur and dealer was to be found in the fact that the deeler, as his profession suggested, legitimately opinion that the line of demarcation between the amateur and dealer was to be found in the fact that the dealer, as his profession suggested, legitimately sought profit, whilst the amateur did not; the one not only reared plants but bought and sold them as a means of profit, whilst the amateur obtained no return, save as it might be his productions attained marked public favour. And on this ground I shall be prepared to take my stand. Then, what is trading? Practically as technically, we know this is buying and selling. Do these growers of certain specialities in the wide field of horrowleve hus in the reading and selling. Do these growers of certain specialities in the wide field of horticulture buy, in the trading sense of the term, the subjects due to their cultural skill? Is the seed I obtain from my Carnations and Picotees to be described as the result of purchase? And, going another step, it when a novel and desirable result has been attained from that seed I may not distribute the progeny to my brother lovers of the tribe other than progeny to my brother lovers of the tribe other than by the hands of a professional dealers, how long will there remain amateurs or professional dealers in the land? "Oh, but," rejoins one of that class of critics whose knowledge of affairs and views of life are about as limited as the boundaries of their parish, "you publish a catalogue, and that makes you a dealer." Verily I do publish a list as I have fortunate occasion. publish a catalogue, and that makes you a deart-verily I do publish a list as I have fortunate occasion. So also, if I may dare to cite so august an example, does Her Most Gracious Majesty, when her man of business notifies a periodical sale of yearling stock on her home farm. Will that suffice, or shall I go farther? Only that I fear to trespass unduly upon your space I could write much more, and if the why and because of my distributing my seedlings person-ally were published, I should have no cause to fear the verdict of the public. In conclusion, permit me to say, Little Pedlington notwithstanding, I will suffer no restraint to be imposed upon my right to dispose of my productions in the form I may find most convenient—nor any interference with my right to interchange with my brother growers, whether of advice or counsel, or the objects of our care; and in this determination I know I shall have the support of

every amateur interested. E. S. Dodwell, Oxford, May 19.

The Use and Abuse of the Incognito.—

Apropos of the paragraph by "K.," in your issue of the 10th inst., p. 618—a virtual repetition of a paragraph by "Old Exhibitor" in the Journal of Morticulture for May 1—affecting to recite a resolution of the National Rose Society on the subject of what an amateur may do—or not do—and asserting, "The decision of the above aamed Society, as many of your readers will remember, was that any person who printed or published a list of plants and circulated such list, or advertised it in any way, with the view of disposing of such plants was, de fact, a dealer or trader in them, and could not be regarded as an amateur." I beg you will allow me to say I have been in communication with Mr. Mawley, one of the Hon. Secretaries of the Rose Society, and with gentlemen of the committee, and have warrant for stating that, in the terms quoted, no such resolution has been before the committee, and that the character of the resolution and the division of the committee on the resolution and the division of the committee on the resolution and the division of the committee on the resolution and the division of plants, or of any specific condition. E. S. Dedweell, Oxford.

Pricking-out,—We often see this commendable operation of successful gardening done in a very shipshod way, especially by young men, and when we think how delicate are the roots of all young seedling plants, it is but small wonder that so many plants have crumpled-up roots and stunted growth at planting time. Most of the old fathers of the craft were believers in "pricking-out," but they did it carefully, keeping for the purpose certain portions of south, north, or west borders for the special purpose. Strong manures were all eschewed, as favouring unequal growth in the bed, and also as being positively dangerous for very young plants, the best materials for reviving a spent bed being sifted leaf-mould, or good sifted loam from a pasture. The beds having been bastard trenched in the late autumn, received this dressing when pricking-out had to be attended to, and not previously, the soil being levelled roughly, the additional leaf-mould or loam given, and then dug over with a spade to not more than 4 inches in depth. The soil was then lightly trodden over and evenly raked, finally slightly patted with the spade, and it was ready for anything. Seedling plants of Cauliflowers, Lettuces, Cabbages, Broccolis, Celery, are all of them the better for being pricked off. Supposing these to have been raised in warmth or under handglasses under the protecting south wail, the plaots must have stood too thickly, and must soon become drawn, so they must be pricked off, as being far too small to take care of themselves in the quarters or the borders. When plaots are from 1½ inch to 2½ inches high they are big enough to be taken in hand. The beds are best 4 feet wide, or even less, then all the work can be done from the alleys, and there is no more treading on the bed, which has a spoiling effect on the soil, that hinders the free growth of thes high they are big enough to be taken in hand. The beds are best 4 feet wide, or even less, then all the work can be done from the alleys, and there is no more treading on the bed, which

THE AMARYLLIS.—The flowering season is now practically over, although in a large collection a few plants, principally seedlings, will continue to produce flowers all through the season, or at least up to the end of August, when the plants ought to be at rest. At present the whole collection of flowering bulbs, whether of seedlings or named varieties, is about starting to make their second growth, and it is needless to say that, unless they make a clean, healthy, and strong growth now, they will not flower successfully ext spring. A small species of thrips seems to attack them in hot weather; it establishes itself in the centre of the plants just as it does in Orchids. It is easy enough to destroy the pest by fumigating with tobacco smoke. This should be done on three nights at

intervals of about four days; but we find it necessary to study the weather a little, and select if possible a calm night. It is a good plan to plunge the pots overhead in the bark bed, if there is convenience for doing so; if not, the plants will make their growth in any stove temperature, or on the shelves in a vinery. In either case they require shading at this season, as they are injured by exposure to the sun. The seeds will soon be ready for sowing; probably they are ripe in some cases. We sow them as soon as they are gathered, either in a hotbed or, what is better, in a heated bed in the forcing-house. As soon as the plants are well up they may be pricked out into 5 or 6-ioch pots, a dozen plants in a pot. It is not a good practice to be continually syringing Amaryllids; but they are benefited by an occasional syringing overhead, on the evenings or afternoons of fine hot days. If a house can be set apart for their culture, the temperature should be about 65° at night.

CHRYSANTHEMUMS .- It is easy enough to neglect the plants at this season of the year, when the bedding-out is in full swing, with plenty of work in every direction claiming daily attention, but getting the specimen plants into their flowering-pots is too important to be overlooked. This ought now to be should be potted early in June. We had not sufficient room under glass for our plants, and found it necessary to turn them out-of-doors; the cold frosty winds set in almost immediately, and checked their growth very considerably. The right thing to do is to mix up the potting soil about mid-winter and to place it in some corner of an outhouse or shed. If this is not possible, some shutters should be placed over it, to throw off the rains. Perhaps the majority of cultivators mix up their soil as they want it. In that case we would advise four barrowloads of good loam, one of decayed stable manure, one of leafmould, to be added to half a peck of crushed bones, and as much pounded oyster-shells; this will make a good compost for them, and will produce a vigorous growth and satisfactory bloom. When the hot, dry weather sets in aphis will probably appear on the young growths. Tobacco-powder is the best thing to destroy them, and by far the best way to apply it is to take the shoots in one hand, draw the leaves together a little, and with the other hand shake the powder over it with a pepper-box. Apply water rather sparingly to the roots after repotting; when the roots have run well into the new soil water may be applied more freely.

PRIMULAS .- P. Sieboldii .- The numerous varieties of this fine species must be treated as greenhouse "florists' flowers." They are not only interesting plants in the greenhouse during the month of April, but they are extremely beautiful. When the plants are placed in the greenhouse or conservatory at a considerable distance from the glass the leaf-stalks get very much drawn up, which tends to weaken the plants and also makes them more liable to be attacked by red-spider, which is sure to establish itself on the under-sides of the leaves. It can be kept down by syringing; we have placed the plants together in the Auricula-house, where they are freely watered and partially shaded from the sun; our endeavour being to keep the leaves in a healthy green condition as long as we can. The plants would also do well if placed in a cold frame behind a north wall. Primula sinensis in the form of named varieties should now be propagated. The double varieties are such useful and lasting winter-flowering plants that they ought to hold an honoured place in every garden. They are easily propagated if the plants are allowed to get rather dry at the roots and are freely supplied with light and air before taking the cuttings off. Each cutting should be taken off with as long a stem as possible, and be put in separately in fine sandy soil. I have propagated a good stock quickly by plunging the pots containing the cuttings in a bed in a hothouse, enclosing them in a handglass as well; but there is no doubt that the more slow process of a very gentle bottom-heat in an ordinary hotbed produces the most satisfactory plants. Here also the cuttings should be covered over with handglasses. Our seeds of the best single varieties were sown early in May, and they are now coming up. The difficulty of obtaining seeds from the best varieties seems to be greater every year. The packets are dearer, and contain fewer seeds; this is the inevitable result of high breeding, and no blame can be laid upon the

dealer, who has to supply the wants of the public at a fair profit to himself. The few plants we do get up are very precious, and require great care to bring them up to the flowering stage. They should be pricked out in light soil as soon as they are ready.

FUCHSIAS,-These useful plants are easy enough to grow if people will but give them ordinary attention, but this they do not seem to get in the majority of cases. The Cinerarias are nearly over, and as the hot weather sets in the Calceolarias soon begin to hang out signals of distress, we must therefore have Fuchsias and Pelargoniums to take their place; both are now showing for bloom. The Fuchsias were started in one of the vineries, and have now been removed to the greenhouse. Cuttings put in six weeks ago have now formed rooted plants, and will be grown on in pits to succeed those plants that were started early. We flower them in 5 and 6-iach pots during the months of July, August, and September. The plants are, of course, carefully potted and trained to form neat specimens thickly covered with coral drops. The plants are liable to be attacked both with red-spider and greenfly, but fumigating and syringing must be resorted to in good They also require rich turfy loam, with some crushed bones added to it to grow in. Besides the numerous fine varieties of the florist's type, the distinct and free flowering variety, Lord Beaconsfield, distributed by Messrs. Laing & Co., of Forest Hill, and Mrs. Rundle, sent out by Messrs. Cannell, of Swanley, are most useful decorative plants.

THE ABUTILONS.—These are now, thanks to Mr. George, of Putner, well within the charmed circle of what we designate florists' flowers; they are a class of plants that are not held in universal esteem, and truth compels me to say that until the last year or two I did not care to grow them. Tall, lanky plants with few flowers were the rule; now we have compact plants I foot or 18 inches high, clothed with foliage to the pots, the branches thickly draped with their large brightly coloured, well-formed flowers, They are the easiest grown of greenhouse plants. Cuttings put in during the month of August are now such flowering plants as I have described, while spring propagated plants are growing on freely to keep up a succession of bloom through the summer. J. Douglas.

DOUBLE PRIMROSES, &c .- From Messrs. James Cocker & Sons, Aberdeen, there has come to us lately a truly beautiful lot of double Primroses and other charming spring flowers, the fine fresh blooms showing how admirably the climate of Aberdeen suits them, and, still farther, how beautiful they may be in the North when here, in the not too sunny South, ours are long past blooming. Of the Primroses, No. 1 shows the Double White, as commonly grown, in fine form; and No. 2, labelled "Double Peach," seems identical with what we have hitherto known as the Double Blush-it is a white, prettily tioted with lilac. No. 3, called the Old Double White, is a smallish flower, densely petalled, evidently lacking vigour. No. 4 is the true Old Double Yellow, and not Sulphur, which Messrs. Cocker have named it. This early sulphur is not in the collection, and is very distinct, having smooth, glossy foliage and pale creamy flowers. This double yellow before us has large dented leaves, and the flowers are very fine. No. 5 is a moderate sample of the recently named Cloth of Gold. It has, perhaps, a little more colour than No. 4, but hardly seems a more durable variety. No. 6, Double Red, is to us a new and distinctive kind, flowers large, and double, in colour reddish-lilac. It looks like a red sport from the white, is 'pretty, though not striking, and not to be confounded with another kind we have here in the South, the old Scotch Red, which is of a much deeper hue of colour. No. 7 gives us the true form, as recognised here, of the old Double Purple, a beautiful kind, the flowers really maroon-violet, and having white specks on the petals. No. 9 is our beautiful favourite the old Double Crimson, so rich its clothing of velvety maroon-crimson; and No. 8 the pretty rosy-purple semi-double Arthur Dumollin or platypetala plena. No. 10, a new variety, not named, is of a sulphury-buff, fine, and not of good quality.
We should hardly find space for such an inferior kiod. No. 11 is our favourite Double Lilac, so universally grown. No. 12, Croussi flore-plena, is a large loose kind, rather coarse, and of a reddish-mauve hue; and No. 13 is the beautiful kind we

know as crimson-purple, but which here is called "purple" only. It is of a reddish-purple hue, won-derfully free, and often blooms in trusses like a Polyanthus. No. 14 is a truss of the ancient double crimson Polyanthus, called sometimes King Theodore; and No. 15 is another double Polyanthus, the flowers of the purple of the polyanthus and the polyanthus are the polyanthus. No. 15 is another double Polyanthus, the flowers of which open badly, and are of a reddish ground, much flaked and edged with yellow; we should prefer to allow this kind to remain as oow, uonamed. No. 16 is not, as marked, Jackanapes, but the true old Jack-in-the-Green, of which now there are many better forms from seed. No. 17 is a remarkably striking and good shaped Polyanthus, of an intense maroon-black colour, but wanting a lemon eye to make it perfect, otherwise it is a beautiful variety, the name of which is not known—perhaps it never has been named. No. 20 is the double black Auricula Othello; and No. 21 the sweet-sented double yellow Auricula, called in the South Yellow Prioce. Figally, No. 18 is a fine flowered Primula, apparently pubsesens; and 19 is a finely flowered form of P, elliata purpurea.

Reports of Şocieties.

Edinburgh Botanical: May 8.—The Society met in the class-room, Royal Betanic Gardens, Mr. W. Be boyd, President, in the chair. The Treasurer read the annual report, which stated that the income for the past year had been [185] 111, 112, and the expenditure [121, 124, 54], thus leaving a balance of [60] 171, 64, to the credit of the Society. Professor blockson then read

Mr. Symington Grieve, in a paper on "Some Statistics regarding the Topographical Botany of Scotland," said he had gone over some 20,000 or 30,000 plants in Scotland, given by Mr. H. C. Watson in his latest edition of Topographical Botany. He then gave statistics as to each of the forty Watsonian "vice counties" in Scotland, and described a number of plants in each district to show the present state of botanical knowledge with regard to field botany. In making several suggestions as to perfecting the knowledge of the distribution of plants in Scotland, he said that a camp might be formed, supplied with tents and other apparatus, and members of the Society sent out to those parts of Scotland out hitherto worked by botanists.

Mr. R. Bullen cave in his report on the temperature.

one hieror worked by botanists.

Mr. R. Bullen gave in his report on the temperature, regetation, &c., as recorded in the garden of the Royal Botanic Institution of Giasgow, April, 1884. The highest day temperature registered was 58°, on the 3d and 4th, the lowest 42°, on the 23d. The highest meant remains a strength of the month. A dry seed-sowing time is always accepted as a good omen, alke for the gardener and farmer; this was especially desirable this season, owing to the water-soaked condition of the soil. We have had a longer succession of dry weather, accompanied by the proverbial east wind, than usually talls to be recorded, and which has had the effect of not only retarding the germination of many seeds, but of materially checking the development of early leafing trees and shrubs, and giving the buds of Juter kinds a dormant look. Recently transplanted her baceous plants look pitiable, and the artificial watering of such looks much like love's labour loss. A short but heavy halistorm passed over here to-day, the 30h.

Mr. R. Lindsay gave in his report on "Vegetation at

Mr. R. Lindsay gave in his report on "Vegetation at the Royal Botanic Garden for April, 1884," Through-out the month of April there were generally low night temperatures, with bright sunshine during the day. The

The following were amongst the plants in flower ex-bibited from the garden:—

The President exhibited cut flowers of Primula Sie-boldi, varieties of several fine species of Narcissus. I, Milne, Esq., Kevock Tower, Lasswade, sent sprays of Lanrustions in fine fruit. From Mr. Campbelli, Ledaig, Argyleshire, came cut flowers of various plants from the

Reading Horticultural: May 15,—While some borticultural societies have deteriorated during the past few years the Society of Reading has entered upon a prosperons career, which is shown from the fact that it has a good subscription list, and a handsome reserve fund, and that this year it has not only been able to augment many of its leading prizes, but has also added 3d prizes to many classes. In addition, with unusual promptitude, the prize-money is paid on the afteroon of the show day, so that it is no wonder that not only do local exhibitors give their best assistance to the committee, but some of metropolitan reputation are attracted

ANNUAL AVERAGES OF THE TIME OF FLOWERING OF FORTY PLANTS,

a note by Professor John Clehnd, Glasgow, on the death of Professor Allen Thomson, formerly a member of the Society; after which the President read a communication on a variation of Asplenium germanicum. He noticed several stations where this and A. septentrionale were found together, but never A. ruta nutraria. He also exhibited a fine specimen of Pinguicula alpina in flower.

Mr. Wr. C. Crawford read a paper on "Phytophenological Observation, the Budding and Flowering of Plants, the Ripening of Fruits and the like, in Relation to Climate and Weather," The number of such observations regularly made is immense, and an attempt is being made in Germany to co-ordinate them and give them a scientific value. With this aim phenological maps have been recently issued, showing by contour lines places where vegetation is equally advanced, similar to isothermal lines. These phenological maps have been recently issued, showing by contour lines places where vegetation is equally advanced, the former do not seem to show much that may not be inferred from the latter. Attention was then directed to some very careful researches of Professor Hoffmann, of Giessen, on the flowering of plants, in which he noallyses the phenomenon into its separate factors, such as the mean temperature of the sir, sunshine, rainfall, temperature of the soil, &c., and shows that the most important of these is underground temperature, the other factors going largely to make it up. Graphic curves of averages of the times of flowering of forty plants regularly observed at the Royal Botanic Gardens during the years were exhibited, and alongside these was shown a curve of the average temperature of the soil during the same period; the two curves were seen to run exactly parallel. These considerations lead to the conclusion that as long as no more careful methods are followed than a present, such as methods of taking large averages from selected plants, observations and records of the annual progress of vegetable and the professor of the conclusion and pr

cold easterly or north-easterly drying winds which prevailed almost cootinuously throughout the month, and the absence of anything like drenching rain, together with a succession of frosty nights at the end of the month, seriously retarded vegetation. The transfer of the seriously recorded vegetation. The transfer of the seriously reading occurred on the 1st, 28°; 2 rsrs, 27°; 293, 27°; 25th, 27°; 28th, 28°; called vegetation where the most severe month of the season. The following are the aggregate amounts of frost registered during each month:—October, 3°; November, 2°; December, 3°; January, 20°; February, 24°; March, 29°; April, 37°. Total amount for season, 153°. Owing to the advanced condition of vegetation the low temperatures of April have done great injury to fruit trees and bushes in many parts of the country; much more damage, however, appears to have been sustained in the South than in the North. Almost the only plants damaged in the garden are Astilbe and Dielytra; young leaves of Horse Chestnut and Roses are also slightly damaged. cold easterly or north-easterly drying winds which pre-

and Koses are also signify damaged.

During the month the rock garden was very attractive, owing to the numerous alpine and herbaceous plants in flower; 103 species and varieties came into bloom for the month, as against 108 for the same month last year, making a total of 225 since January 1, as compared with 210 for the same period last year. The most conspicuous plants which flowered were:—

Andromeda tetragona Anemone Robinsoniana Menziesia empetriformis Narcissus rupicola Primula rosea , cortusoides Rhodora canadensis Podophyllum Emodi Leucojum æstivum Erythronium giganteum

Aubrietia Headersoai Bryanthus erectus Hutchinsia alpina Rhododendron chamæristus Tussilago alpina Pyrus Maulei Trillium grandiflorum Primula Sieboldi Tulipa pulchella Arenaria balearica Arenaria balearica Trollius americaous Phlox aristata Rhododeodron glaucum Helonias bullata Iberis Tenoreana Alyssum saxatile Corbularia Graelsii Arnebia echioides

to the Reading shows. This was conclusively shown on the occasion of the spring show within the Abbey ruins on the 15th inst.; the permanent site within the Abbey ruins, with its grassy shoes and winding gravelled walks, perhaps unequalled in the provinces as the place for a show, was full to repletion, and with contributions generally of a very satisfactory character. There was an abundance of flowering plants, as there should be at a spring show, but with imposing touches of foliage to diversify the arrangement, which was as usual in the hands of Mr. W. Phippen, and remarkably well done. As is generally the case, the band was stationed in the Forbury Gardens, through which the many visitors passed to the Abbey ruins, and these were charmingly gay with the hues of spring flowers.

these were charmingly gay with the hues of spring flowers.

Taking flowering plants as the leading features, while some were very good, the Gloxinias were superlatively fine; the six specinens shown by Mr. Baskett, gr. to W. J. Palmer, Esq., Reading, were extra large in size, splendidly grown, and abundantly flowered—and such flowers too! They descreted a money prize far beyond what was allotted to them in the schedule. Mr. Farey, gr. to C. Stephens, Esq., Reading, was a good 2d. Calcolarias were, as they usually are here, numerous and very good; rice specimens of good size, clean, and grandly flowered. Here also Messrs. Baskett and Farey took 1st and 2d places. Roses in pots were a good feature, Mr. J. F. Mould, nurseryman, Pewsey, being 1st with a very good lot; Mr. Tranter, Upper Assenden, being 2d. Mr. Lockie, The Gardens, Oakley Court, Windsor, had the best four; Mr. Easkett being 2d. Fuchsias were better than we generally see them here; and it may perhaps be stated in extensation of their moderate character, that it is early in the season for them. Mr. Summer, gr. to J. H. Millard, Esq., Reading, was 1st, with a style of plant that showed off the specimens to the best advantage, Azaleas—small in size but carefully grown and flowered—lit up the show with bright colours: the best six came from Mr. Lockie, being in 8-inch pots and very uniform. The leading varieties were Warrior, Lady Scott, Model, Eclatante

and Mdlle. Verschaffelt; I. Armitage, gr. to W. Clarke, Esq., Reading, came in a good 2d; and Mr. Baskett 3d. Messrs. Lockie and Mortiuner, gr. to Major Storer, Purley Park, were severally 1st and 2d with four specimens, and they were deserving of high praise. In Mr. Lockie's group Roi d'Hollande, grandily coloured; Keine des Pays Bas and Duchesse Adelaide de Nassau were the best. Pelargoniums were, as usaul, ever effective, especially the nine in 8 inch pots shown by Mr. Ashby, who is the champion grower of the district. The plants were even, foliage perfect, clean, and admirably flowered, the varieties old but well adapted for the purpose—Crimson King very bright and striking. No fancy varieties were forthcoming: unfortunately the cultivation of these appears to be abandoned in this district where they were formerly so well swas staged every fine group of hardy Rhododendrons was staged every fine group of hardy Rhododendrons was staged every fine group of hardy Rhododendrons was staged in the show.

The class for twelve stove and greenhouse plants in flower brought two renowned competitors, viz., Mr. Janes, nurseryman, Lower Norwood, and Mr. E. Tudgey, Waltham Cross, but the former was well ahead, having good examples of Anthurium Andreanum, with fourteen large spathes, and this specimen appeared to be an object of great interest to the visitors; a huge Erica cavendishiana, E. Lindleyana, very good; Clerodendron Balfourianum, &c., Mr. Tudgey had a very fine Erica Cavendishiana, a good E. ventricosa, Clerodendron Balfourianum, and two others. Mr. Mortimer was a good 2d, having a very fine example of Tabernemontana coronaria, but scarcely class, of the proper store of the store of the proper store

All. James coming 2d with a capital example of Erica depressa.

At the south end of the tent was a very fine group of foliaged and flowering plants arranged for effect, filing a large space, and shown by Mr. W. Less, gr. to Mrs. Marsland, The Wilderness, Reading. This, though Marsland, The Wilderness, Reading. This, though the most attractive feater of the propulsion of the most attractive feater of the most award of the highest value was made to it.

Orchids made a charming feature, and here Mr. James was 1st with three plants, having a fine Odontoglossum excillarium with more than three dozen flowers [Lefia purpurata, finely bloomed; and a good piece of Dendrobium nobile. Mr. Mortimer came in 2d with Dendrobium the most propulsion of
flowers each; Mr. James was 2d, with a fine piece of Cattleya Mendelli.

Some fine specimens of foliage plants were staged, though they were generally in company with small and weak specimens. Thus it was that Mr. Mortimer came in 1st with six capital specimens, staging in fine condition Pandanus Veitchii, Croton majesticus, and C. Weismanni, both in fine condition; alocasia Thibautian, with some splendid leaves; a fine piece of A. metallica, and Yucca alolfolia variegata. Mr. Tudgey was placed 2d, having two huge Cycads, a Pritchardia pacifica, and some small stuff. Mr. James came in 2d.

Ferns were admirably shown; indeed, it may be said that good examples of these are a standing feature of the Reading exhibitions. The best group of fifteen exotic Ferns and Mosses, which is a class new to the schedule, came from Mr. Mortimer, all being temarkably good, Adiantums being a strong point. Mr. Mapo, gr. to Miss Moore, Reading, came in next, with a smaller lot. The groups of six were finely shown, and here flow. The groups of six were finely shown, and here flow. Mr. Baskett was 1st with four Ferns, and four fine-foliage plants also. Some good Palms were shown by Messrs. James and Tudgey in the class for three plants.

Cut flowers comprised Roses, stove and greenhouse.

shown by Messrs. James and raugey in the class to three plants.

Cut flowers comprised Roses, stove and greenhouse, and hardy cut flowers, Pausies, &c. All were very pretty, but they contained uothing requiring special mention. A Certificate of Merit was awarded to Mr. Read, gr. to T. Wilder, Esq., Purley Hall, for a very fine strain of double German Wallflower.

Table Accordations, though put quite so numerous as

fine strain of double terman Wallflower.

Table decorations, though not quite so numerous as usual, were yet very good. Miss Phippen was the only exhibitor of three vases, done, as usual, in her best style; and in the class for two vases of wild flowers Miss Cole was 1st, Miss Phillips 2d, and Miss Stransom 3d. These were very pretty indeed. Mr. Phippen had the best bridal bouquet, and also the best three button-balos.

holes.

In the class for the large group of plants Mr. Phippen was 1st, and Mr. James 2d, but they were not up to the usual Reading form. In the class for the smaller group there was a very brisk competition, Messrs. Woolford, Hatch, and Summer taking the leading prizes in the order of their uames. A disposition to overcrowd was observed in most of them.

Some good black Grapes were shown by Mr. Howe, gr. to Sir R. Sutton, Benham Park; Messrs, Ashby, and Baskett. In the class for white Grapes, Foster's Seedling was shown, Mr. Ashby being 1st, and Mr. Baskett

2d. Mr. Mortimer had the best dish of Strawberries, showing Sir I. Paxton in fine condition; and Mr. Howe had an excellent dish of White Marseilles Figs.

Of vegetables there was an excellent display for the season. In this department the chief interest centred on some special prizes given by Messrs. Sutton & Sons for Potatos and Cucumbers. Among the latter Purley Park Hero was finely shown by Mr. Mortimer, as perfect a Cucumber as one could well desire to see; Challenger and Royal Wonder came in 2d and 3d. In the class for new kidney Potatos, Sutton's Ashleaf and Sutton's Ringuleader were severally 1st and 2d; in that for round Potatos, Early Market and First and Best were in good form.

form.

Mr. C. Turner sent from Slough a valuable collection of Pelargoniums, Carnations, cut Roses, and alpine Auriculas, to which a special award was made. First-class Certificates of Merits were awarded to Tree Carnations Mrs. Maclaren, Hector, Rults, Ruby, and Mr. Llewelyn; and to alpine Auriculas Mrs. Ball, Homer, and Eclipse. The same award was made to the Excelsior Lawn Mower, shown by the Chadborn and Caldwell Company, Upper Thames Street, E.C.

Royal Botanic Society: May 21.—This, the first large exhibition held this season, brought together an unusually large number of well-grown, and, in some instances, magnificent plants. Worthy of especial commendation were the Clematises of Messrs, G. Jackman & Son, of Woking, the Orchids by well known cultivators of these favourite plants, Messrs, W. Paul & Son's Roses, and the fine Indian Azaleas of Mr. C. Turner, Mr. Cypher, and others. These were the centres of attraction, but the show, as a whole, was admitted by the habitars of these gatherings to be the best that has been witnessed for some years past.

STOVE AND GREENHOUSE PLANTS.—The nurserymen's competition for the best twelve stove and greenhouse plants was a well-contested one, rst, Mr. J. Cypher, of Cheltenham, with Ixora Williamsii, a well-proportioned plant; Anthurium Scherzeriaaum and the variety Cypheri, Darwinia ulipifera, Erica Cavendishiana, Clerodendron Balfourianum, Pimelea Hendersoni, Drncophyllum gracile, well flowered; and some Azalea indica in fine bloom. 2d, Mr. H. James, Castle Nursery, Lower Norwood, who had good plants of Erica Liudleyana, Anthurium Scherzeriaaum, and Azalea Ingrami, beautifully bloomed; 3d, Messrs, T. Jackson & Son, of Kingston. In this collection were to be noticed a well flowered Rhododendron Dalbousianum, and several Ericas.

flowered Rhododendrou Dalbousiauum, and several Ericas.
For ten stove and greenhouse plants, competed for by amateurs.—rst, Mr. W. Chapman, gr. to J. Spode, Esq., Hawkesyard Park, Rugely, in whose collection were excellent Ixoras, Aphelexis macrantha grandiflora, Tremandra verticillata, and Darwinia tulipifera, a grand example, and which was adjudged the winner of the Veitch Memorial Prize and \(\frac{1}{2} \); ed, Mr. C. Rann, gr. to \(\frac{1}{2} \) W. Verten, Esq., Handcross Park, Crawley, who staged a beautiful Anthurium Scherzerianum; a fine specimen of Tetrathea cricoides, and a most noticeable well-flowered example of Cytissus Everestianus; 3d, Mr. J. Child, gr. to G. Bull, Esq., Garbrand Hall, Ewell. For six stove and greenhouse plants (anateurs).—rst, Mr. W. Chapman, with plants, conspicuous amongst which were Erica Cavendishiana, Aphelexis macrantha, and Aerophyllus venosum. In the class for nurserymen, complements.—rst, Mr. J. Cypher, in whose lot were excellent examples of Bougainvilles glabra, Francisces eximin, and Erica depressa; 2d, Mr. I. F. Mould, Pewsey, Wilts, who had good plants generally: especially to be noticed were Ixora Regina, Pirnelea Hendersoni, and Boronia pinnata; 3d, Mr. Tudgey, nurseryman, Waltham Cross.

Original Schape of the Schape

pinnata; 3d. Mr. Tudgey, nurseryman, Waltham Cross-ORCHIDS,—The premier prize for twelve Ortchids was worthily awarded to Mr. J. Powell, gr. to W. E. Brymer, Esq., M.P., Ilsington House, Dorchester, whose beautifully bloomed lot of generally large-sized plants attracted great attention from the visitors. A Cattleya Skinneri of a brightness of colour rarely seen, and whose diameter was quiteg feet, literally smothered with large perfect flowers. Dendrobium tobile was even larger, Calauthe verattfolia had eleven tall spikes, Dendrobium putchellum full of its semi-translucent rosy flowers, and, which is so rarely seen, doing well; Odonieglossum citrosnum, Thuma Marshalli, Dendrobium Falconeri, a Lycaste Skinneri with a dozen blooms, and a Dendrobium Jenkensi composed the cit. Catt., gr. to W. Cobb, Esq. Silverdale Lodge, Sydenham, who had fine plants of Oncidium Marshalliananum, Dendrobium thyrsiflorum, a plant of Cypripedium caudatum with twenty bloomed Cattleya Mossie, and C. Mendelli; an enormous Cymbidium Lowii, with six very large spikes; a particularly large and brightly coloured Odonioglossum vexillarium. In this competition a Silver Medal was taken by Mr. C. I. Salter, gr. to J. Souubgate, Esq., Selborne, Streatham This was a much admired collection, containing as it did, some capitally grown and flowered specimens, namely, a Vauda Denisonii, with a dozen blooms; a This was a much admired collection, contraining, as it did, some capitally grown and flowered specimens, namely, a Vanda Denisoui, with a dozen blooms; a Dendrobium thrysiforum, with four massive spikes; a Dendrobium thrysiforum, eirosmum, carrying seven large and strong spikes; Dendrobium lamesianum, very full of flower; an O. vexillarium, brightly coloured and of unusual dimensions; and several Cattleyas and Masdevallias. A Silver Medal was awarfaed to Mr. James Douglas, gr. to F. Whitbourne, Esq., Great Gearies, Ilford, for a dozen containing well bloomed examples of Odontoglossum Roezlii album, Cypripedium villosunt, Dendrobium Farmeri, the bright Epidendrum vitellinum majus, Cattleya Mossize (from La Guayra), beautifully

flowered, carrying eighteen large blooms. A Large Bronze Medal was awarded to Mr. J. Child for a good dozen plants, which included a fine Brassia maculata, Dendrobium Farmeri, Leela purpurata pallida, Vanda suavis, a fine-leaved, large plant; ind a Dendrobium uobile, covered with bloom, and which measured a yard in diameter. 3d, Mr. H. Heims, gr. to F. A. Philbrick, Esq., Q.C., Öldfield, Bickley, who had an immense example of Sobralia macrantha splendida, which, luckly, had opened its evanescent blooms in the nick of time; also a pretty piece of Ondidum concolor.

had opened its evanescent blooms in the nick of time; also a pretty piece of Oncidium concolor.

In the nurserymen's competition with twelve exotic Orchids—Mr. H. James was 1st; his exhibit contained good examples of Cattleya Mendelli, Cypripedium barbatum grande, Odontoglossom vexillarium, Dendroblium obbile, Aerickes Fieldingi grandis; 2d, Mr. Jas. Cypher, who had excellently flowered plants ot Dendroblium thrysiflorum, D. noble, and D. Wardianum; 3d, Messrs. T. Jackson & Son, Kingston.

ROSES.—In the nurseymen's competition for the best nine Roses in pots, Messrs. Paul & Son, The Old Nurseries, Cheshunt, were 1st, with big well-bloomed plants, the best of which were Chas, Lawson, Céline Forestier, Madame Victor Verdier, Madame & St. Joseph, and Cheshunt Hybrid. In the competition for the best twenty Roses in pots, rst.—Mr. C. Turner, Slough, whose Camille Bernardin, Innocenta Pirola, Céline Forestier, were very nice plants. ad, Messrs. Paul & Sou, The Old Nurseries, Cheshunt.

AZALEAS,—In the class for six greenhouse Azaleas, amateurs—1st, Mr. J. Child, with pretty plants of Magnet (a cherry-red) Keine des Pays bas, Model, Concinnum, a good rosy-purple, Duc de Brabant, and Barclayana. 3d, Mr. G. Wheeler gr. to Lady Louisa Goldsmith, St. John's Lodge, Regent's Park. In the nurserymen's class for the best six Azaleas—1st, Mr. C. Turner, who bad magnificent plants of Duc de Nassau, Chelsoni, Comtesse de Flandres, Reine des Fleurs, Madame Cananart d'Hamale; 2d, Mr. J. Cypher, with fine Cedo Nulli and Hercules. In the open competition for the best twelve greenhouse Azaleas in not less than six varieties—1st, Mr. C. Turner, with Apollo, Jean Vervaner, Mrs. Turner, Roi d'Hollande, Roi Leopold, Cordon Eleu, Mons, Thibaut, and others; d., Mr. H. Eason, gr. to B. Noaks, Esq., Hope Cottage, Highgate; 3d, Mr. H. James. For the best six Azaleas shown by amateurs, 1st, Mr. J. Child, Garbrand Hall; 2d, Mr. Wheeler; 3d, Mr. H. Eason.

CAPE HEATHS were in all cases well shown—none over-large or unwieldy, and all beautifully bloomed. In the open class for the best six Ericas, 1st, Mr. E. Tudgey, Exote Nursery, Waltham Cross, who staged E. Cavendishiana, E. cocinea minor, E. eximia superba, E. affinis, E. tricolor, &c.; 2d, Messrs, Jackson & Son; 3d. Mr. Cypher.

In the PELARGONIUM competion, although the fashion of the day has relegated them to a low position, there were some excellent plants exhibited by well-known growers. The amateur competition for the best six show sorts, placed 1st, Mr. F. J. Hill, gr. to H. Little, Esq.; 2d, Mr. J. Wiggins, gr. to W. Clay, Esq.; 3d, Mr. Griffin, gr., Gothic Lodge, Sydenham.

The nurseryneo's competition for the best six show Pelargoniums resulted in Mr. Turner being placed 1st, Mr. Cypber 2d, and Mr. J. Odell 3d; and in the open class for six fancy Pelargoniums Mr. Turuer 1st, Mr. J. Hill 2d, Mr. Wiggins 3d.

Hill 2d, Mr. Wiggins 3d.

Botanical Certificates.—To the New Plant and Bulb Company, for Acer palmatum roscum and A. palmatum aureum. To Messrs. R. Ker & Son, Liverpool, for Ficus elastica albo-variegata, a plant of a yard high, the mature foliage showing the ereamy variegation, and a boxful of recently struck plants, showing the fainter markings on young leaves. To Messrs, sander & Co., St. Alban's, for Odontoglossum elegans superbissima, a very fine form with beautiful markings and extra large. To Mr. C. J. Salter, gr. to J. Southgate, Esq., Selborne House, Streatham, for Cattleya Mendelli marginata, having the lip, which is highly coloured, margined with rosy-criason. To Mr. H. James, Caste Nursery, Lower Norwood, for Odontoglossum mulus and O. polyxanthum. To Mr. Jas. Cypher, purseryman, Chelenham, for a fine variety of Anthurium Scherzeriasum, named Cypherij, a flower larger than that of the type; and Cypripedium Rôbelenii. To Mr. B. S. Williams, of Upper Holloway, for Cypripedium ciliolare.

larger than that of the type; and Cypripedium Robelenii. To Mr. B. S. Williams, of Upper Holloway, for Cypripedium ciliolare.

Floral Certificates were granted for the following plants:—To Mr. J. Hill, gr. to H. Little, Esq. Hillingwish and the control of the third that the control of the c

—plants that were in most instances fully 5 feet high and proportionately broad. They were full of large symmetrical bloom, and were greatly admired for their beauty. The sorts were Madame van Houtte, Princess of Wales, Wm. Kennet, Impératrice Eugénie, Duchess of Edinburgh, Fairy Queeo, Purpurea elegans, Duke of Norfolk, Patens floribunda, Blue Gem, Mrs. Hope, and a few others rather less distinct.

The EXOTIC FERNS shown by amateurs were particularly happy examples of useful proportioned plants that any one possessing an ordinary sixed house cangrow. 1st, I. Douglas, in whose lot were admirable examples of Adiantum concinnum latum, Dicksonia antarctica, D, fitorosa, and D. squarrosa; 2d, Mr. G. Wheeler, with smaller plants; 3d, Mr. R. Butler, gr. to H. H. Gibbs, Esq., St. Dunstan's, Regent's Park, who had a very nice piece of that handsome Fern, Microlepis hirta cristata.

very nice piece of that handsome Fern, Microlepis harta cristata.

Fine-foliage plants were rather abundantly shown—a good feature where, as in the case of shows in a tent, relief is desirable, on account of the amount of bright colour prevailing amongst the flowering portion. For the best six.—1st, Mr. C. Rann, with fine Areca sapida, Cycads, Isatania borbonica, Croton undulatus, &c.; 2d, Mr. G. Wheeler; 3d, Mr. R. Butler, In the nurserymen's competition with an equal number.—1st, Mr. Cypher, with fine plants, chiefly of Kentias, Cycads, and a Dasylirion actorichum. For the best twenty-four Gloxinias in pots.—1st, Mr. H. Eason, whose plants were above the ordinary size, of erect habit, and having good foliage; 2d, Mr. C. Rann, for rather smaller plants, also creet in habit.

Mr. Douglas took the prize for alpine plants, which

were above the ordinary size, of erect most, and naving good foliage; ed, Mr. C. Rann, for rather smaller plants, also erect in habit.

Mr. Douglas took the prize for alpine plants, which having been placed by the management in a hot sunny corner, were nearly roasted by the afternoon. Messrs. Cross & Steer, nurserymen, Salisbury, showed their new perpetual flowering Fink, Louisa Ashburton Mr. Hooper, Vine Nurseries, Widcombie and their new perpetual flowering Fink, Louisa Ashburton Mr. a collection of the welkeded; leasts, and the steer of the welkeded; leasts, and the steer of the welkeded; leasts, and the steer of the welkeded and the steer of the welkeded; leasts, and the strain of Mimulus, named Queent's Prize, and also Pansy blooms; and Mr. Wiggins a seedling Pelagonium of a new type. A large Bronze Medal was awarded of Mr. D. White, gr. to Mrs. Farnel Watson, Redded of Mr. D. White, gr. to Mrs. Farnel Watson, Redded of Mr. D. White, gr. to Mrs. Farnel Watson, Redded and of a bright hue generally. A collection of plants, consisting of both stove and greenhouse varieties of the most varied description, were shown by Capt. Halford Thompson, Claremont, Exeter, as having been grown in moss, with possibly extra help from manure in some form. The plants were fairly healthy in appearance, but were sadly deficient in bloom, and we think it will be found difficult to give them the necessary rest, as moss so not easily kept in a medium wet or dry condition—it is either too wet or too dry. If this difficulty can be got over, the system would be useful for window gardeners in towns, who do not find it either cheap or easy to get proper mould. The exhibitor was awarded a Bronze Medal.

Miscellaneous Plants were largely shown, Mr. B. S. Williams, Victoria Nurseries, Upper Holloway, contributing a large collection of Ortchids that were nicely show off by a free intermixture of Adiantums, small Palms, Cyperus, and Mosses. The plants were not of a large size, but there were many rarties, and others difficult of culture or seldom seen, such as Cyprighting of the Cyperus, and Mosses. The plants were mot of a large size, but there were many rarties, and others difficult of culture or seldom seen, such as Cyprighting of the Cyperus, C. Swannaum, and C. selligerum, C. ciliolare, Masdevallia Chelsoni, M. Harryana Iliacina, and M. Veitchii grandifiori Arierise and Continguation of the Cyperus ocellata, a great number of Odontoglossum-house; Calanthe Dominiana, Cattleya Walkeriana, Ceologya ocellata, a great number of Odontoglossums and Ocidiums, including O. nigratum, a rare species; I Trichopilia crispa, and the Dalkeith variety of Vanda tricolor. The exhibitor was awarded a Small Silver plit Medal. Messrs. I Sander & Co., St. Albans, sent a varied and interest importation. These had been grown culties a hardily as greenhouse plants, were beautifully bloomed, the spikes being pumerous and strong, and the markings and perfect form of most of them were remarkable in no small degree. A Small Silver Medal was awarded them. Messrs. Carter & Co. received a Bronze Medal for herbaceous Calceolarias, and Messrs. Ker & Son a Silver Medal for a wonderfully good assortment of Crotons. Mr. Stevens, nurseryman, Putney, exhibited some pretty Abutilons. A collection of plants, mostly of the greenhouse section, was shown by Messrs. Culturk & Son, which was effectively arranged with Ferns, Selaginellas, Palms, and Dracensa. A Small Silver Medal was awarded. Messrs. Laing & Co., Forest Hill, obtained a Silver Medal for a wonderfully good assortment of Crotons. Mr. Stevens, on the strength of the decision of plants in the group. A small silver Medal was awarded. Senal Silver Medal for a swarder of the substance of the fir MISCELLANEOUS PLANTS were largely shown, Mr. theless are rarely met with in the competing groups at

thetess are rately me.

Rose compelitions.

The Veitch Memorial Prize of a Medal and £5 for the best Orchid went to Mr. J. Powell, gr. to W. E. Brymer, Esq., M.P., Ilsington House, Dorchester, for his splendidly flowered Cattleya Skinneri.

Notices of Books.

The Student's Guide to Systematic Botany, &c. By Robert Bentley, F.L.S. (London: Churchill,)

This is designed as a "convenient and handy little volume for use abroad and at home by medical, pharmaceutical and other students, who are desirous of obtaining a good practical knowledge of some of the more important British natural orders and medicinal plants, and also as a foundation for further study." It comprises chapters on classification, nomenclature, and the method of describing plants, together with a brief account of certain selected natural orders, but without any note of any medicinal or economic properties that the plants may have. The book is avowedly drawn up with a view to the examination room; but it is only suited for the more elementary examinations.

Köhlers' Medizinal Pflanzen .- The fifth part of this publication is before us. It consists of a series of well executed, fully coloured plates, with botanical analyses of the plants used in medicine. The text is in German. Fortunately the plates appeal to people of all nationalities. We can recommend them strongly as excellent, and so inexpensive that four well executed and well coloured plates can be had for is., to say nothing of the text.

PUBLICATIONS RECEIVED .- Contributions to the Flora of Queensland; by P. O. Shanessy. SAND-BINDING PLANTS IN INDIA.

In a report on the sand-binding plants found near Madras which Dr. Bidie has furnished to the Government Revenue Department some interesting facts are stated. "The utilisation of indigenous plants to bind the sands of this coast," Dr. Bidie says, "was apparently first attempted in 1849 on the suggestion of Colonel Worster, R.A., to protect the beach road from sand. Subsequently Dr. Cleghorn devoted attention to the subject, the immediate object then in view being to consolidate the shifting sands thrown up by the sea near Sir A. Cotton's groynes, which still exist along the beach opposite the city of Madras. The chief plants employed on both these occasions were the Goat's font Creeper (Ipomæa pes-capræ), and the spiny pink-like grass Spinifex squarrosus,"

In referring to the measures that have been adopted in Europe and America for the reclamation of coast lands Dr. Bidie points out that the planting of such plants was enforced by law on the beaches of Long Island as early as 1758, and in France, where successful and extensive operations have been carried on since 1780. In the South of France the first step towards arresting the progress of the sand is to erect a barrier to the drift, the usual form being composed of palings or hoards about 4 feet high, and the sharpened ends driven into the sand. Each board is from 5 to 6 inches wide and 11 inch thick. An inch space is left between the boards, so that as the sand drifts it is piled up in front of the boards, and passing also through the spaces is deposited behind. The boards soon become buried in the heap of sand which is collected around them, when they are raised without disturbing the heap. When the paling is first erected a space on the windward side eight times wider than its height is planted with sand-binding plants, those used in France being chiefly Arundo arenaria, a Triticum, Cakile maritima, and a Salsola. The dune thus secured rises higher and higher, and the plants as they are huried struggle upwards and bind the drifted heap with a network of roots. The dunes in France increase in height at the rate of about a foot a year, and the top is sometimes covered with

Dr. Bidie says :- "The chief local plants instrumental in thus arresting and consolidating sand are those mentioned by Dr. Cleghorn-viz., squarrosus, Ipomæa pes-capræ, Launæa pinnatifida (formerly Microrhypeus sarmentosus); and to these may be added Cyperus arenaria and other Cyperaceæ, and Tridax procumbens. The locality which these plants frequent is that of the loose shifting sands, The most common species found in these localities are Canavalia obtusifolia, Hydrophyllax maritima, Sesamma prostratum, Pupalia orbiculata and Crinum sp.

Immediately behind the dunes the flora is somewhat more extensive, the chief plants found in that zone being Polycarpa corymbosa, "Alissicarpus vaginalis, Phaseolus trilobus, Desmodium gangeticum, *D. triflorum, *Indigofera enneaphylla, Mollugo stricta, *Spermacoce articularis, *Iledyotis Heynei, Ipomæa pes-tigridis, I. tridentata, Lippia nodiflora, Asystasia coromandeliana, Pedalium rumex, *Leucas diffusa (?), *Chamissoa aspera, *Ærua Monsonia, Chenopodium indicum, Salicornia indica, *Cyperus Chenopoduthi micuum, Sancerina indica, Sperus castaneus, *C. bulbosus, *C. distans, *Filmbristylis ferruguinea, *Kylliogia triceps, Isolepis gracilis, Trachyosus muricatus, Aristida setacea, Eleusioe ægyptiaca, Chloris barbata, Perotis latifolia, Imperata arundinacea. Shrubs and trees also begin to appear at this zone, amongst which may be noted Carissa carandas, Ehretia arenaria, Pandanus odoratissimus, Phoenx farinifera, Borassus flabelliformis, Anacardium occidentale, Solanum Jacquinii, Psidium pytiferum, Jasminum angustitolium, Memecylon tinctorum, Calotropis gigantea, Hoya viridiflora, Tylophora asthmatica, and Hemi-desmus indicus. Pandanus odoratissimus is particularly useful when it is desirable to raise the saod-drift in large heaps, and at the same time to afford shelter from the sea breezes. The Caiophyllum inophyl-lum also thrives well when planted in such situations, and so does Pheoix sylvestris. If there is a backwater or canal, Aviannia tomen-tosa will be found most useful for consolidating the bank and catching the drift, as a dense miniature thicket of shoots springs up wherever the roots extend and catches débris of all kinds as well as sand If the water is fresh the tall grass, Saccharum spontaneum, also becomes a most valuable protecting agent from the moving sand. Other trees which thrive well near the coast, and which might be used for planting up reclaimed tracts of sand, are Eugenia jambolana, Albizzia Lebbek, Sapindus emarginatus, Thespesia populnea, Paritium tiliaceum, Cordia myxa, Pongamia glabra, Odina Wodier, Mangifera indica, Feronia elephantum, Mimusops hex-andra, Dalbergia paniculata, Acacia planifrons, Acacia latrosum, Pithecolobium dulce, Ficus indica, F. tsila, and Casuarina muricata. "Extensive plantations of this last-named tree exist for many miles along the coast north and south of Madras, and these have greatly improved the appearance of what was before a sun-beaten, sandy waste. There can be no doubt also that the plantations have rendered the fields behind them more valuable for affording shelter, and in some cases have permitted land to be brought under cultivation which would otherwise have remained in a waste state. The Casuarina is a very hardy plant near the sea, and will grow down to high-water mark even amongst loose sand. The secret of its flourishing in such situations is due to the fact that the subsoil water is always near the surface, and that the sand, although apparently barren, is generally largely mixed with decayed organic matter. When the trees in a Casuarina plantation are left unpruned they throw out decumbent horizontal branches, which develope roots and thus fix the sand. If the trees are cut these rooting branches, when left intact, throw up shoots, and thus the forest is naturally renewed. In the shade of an established Casuarina plantation the ground is littered with the minute twigs shed by the trees, and this top-dressing, if left undisturbed, shortly decays and fructifies the soil. The plants which grow in the shade of Casuarioas when not too dense are marked thus * in the foregoing list."

Dr. Bidie says that the importance of the Casuarina in the reclamation of waste sandy tracts on the coast can hardly be over-estimated.

ÆTHIONEMA CORDIFOLIUM .- A woody perennial, with the habit of Iberis, with linear spatulate leaves and close oblong heads of rosy-lilac flowers. Native of Lebanon. Gartenflora, t. 1150,

LONDON: Atmospheric Pressure.—During the week ending May 17, the reading of the barometer at the level of the sea decreased from 30.18 inches at the beginning of the week to 29.93 inches by 3 P.M. on beginning of the week to 29.93 inches by 3 P.M. on the 12th, increased to 30.03 inches by 9 A.M. on the 13th, decreased to 29.85 inches by 9 A.M. on the 13th, decreased to 30.47 inches by 9 A.M. on the 15th, decreased to 30.07 inches by 3 P.M., increased to 30.09 inches by midoight on the same day, and was 29.75 inches by the end of the week. The mean reading of the barometer for the week at the level of the sea was 29.98 inches, being 0.06 inch higher than last week, and 0.06 inch above the

at the level of the sea was 29 98 inches, being 0.06 inch higher than last week, and 0.06 inch above the average of the week.

Temperature. — The highest temperature in the shade in the week was 80°,5, on the 11th; the highest on the 15th was 60°,5. The mean of the seven high day temperatures was 70°,0.

The lowest temperature was 40°, on the 14th; to the 15th the lowest temperature was 52°. The mean of the seven low night temperature was 49°,3.

The greatest range of temperature in one day was 32°,5, on the 11th; the smallest was 13°,5, on the 15th. The mean of the seven daily ranges was 21°.6.

The mean of the seven daily ranges was 21°.6.

The mean of the seven daily ranges was 21°.6.

The mean temperatures were—on the 11th 64°.4.:

The mean temperatures were—on the 11th, 64°.4; on the 12th, 63°; on the 13th, 57°.3; on the 13th, 63°; on the 13th, 59°.1; and on the 17th, 61°.4; and these were all above their averages by 13°.2; 11°.9, 6°.2, 2°.3, 1°.1, 6°.8, and 8°.6 perspectively.

8°.6 respectively.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 142°.5, on the 12th. The mean of the seven readings was 117°.8.

The lowest reading of a thermometer with its bulb placed on grass was 36°,5, on the 11th. The mean of the seven readings was 4t°.2.

Rain.—Rain fell on two days to the amount of 0.32 inch, of which 0.30 inch fell on the 12th.

ENGLAND: Temperature.—During the week ending May 17 the highest temperatures were \$3^\circ, of at Backheath, 80° at Cambridge; the highest at Plymouth was 66° , of at Truro 68° , and at Brighton 70° . The general mean was 76° .3.

The lowest temperatures in the week were 40° at Truro and Bolton, 41° at Cambridge; the lowest at Brighton, Blackheath, and Preston, 46° . The general mean was 43° .5.

The greatest ranges were 39° at Cambridge, 38° .9 at Bradford, 37° at Hull; the smallest ranges were 22° .6 at Plymouth, 24° at Brighton, and 28° at Truro. The general mean was 32° .8.

The mean of the seven high day temperatures was highest at Cambridge, 72° .1, at Blackheath 70° .9, at Nottingham 69° .5; and was lowest at Truro and Sunderland, 61° , at Plymouth 61° .1. The general mean was 65° .4. ENGLAND: Temperature .- During the week ending

The mean of the seven low night temperatures was highest at Brighton, 49°.6, at Blackheath 49°.3, at Preston 49°.1; and was lowest at Bolton, 45°.4, at Wolverhampton 45°.5, and at Bristol 46°.6. The general mean was 47°.7.

The mean daily range was greatest at Cambridge, 25°.3, at Nottingham 22°.4, at Blackheath 21°.6; and was least at Plymouth, 12°.2, at Trura and Sunderland 13°. The general mean was 17°.7.

derland 13°. The general mean was 17°.7.

The niean temperature was highest at Blackheath, 58°.8, at Cambridge 57°.8, at Nottingham 56°.6; and was lowest at Bolton, 52°.3, at Bristol 52°.6, at Truro 52°.7. The general mean was 54°.0.

Kain.—The largest fall was 1.15 inch, at Bolton, 0.79 inch at Preston, 0.60 inch at Liverpool; the smallest fall was 0.04 inch, at Cambridge, 0.09 inch at Brighton, 0.12 inch at Plymouth. The general mean fall was 0.34 inch. mean fall was 0.34 inch.

SCOTLAND: Temperature.—During the week ending May 17, the highest temperature was 71°, at Glasgow; at Dundee the highest was 63°.4. The general mean was 67°.7.

The lowest temperature in the week was 36°, Perth; at Leith the lowest temperature was 30, at The general mean was 33°.9.

The mean temperature was highest at Leith, 54°.1;

and lowest at Greenock, 51°.7. The general mean was 52°.8. was 5.2.0.

Rain. — The largest fall was 2.22 inches, at Greenock; and the smallest fall was 0.18 inch at Edinburgh. The general mean fall was 0.74 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

. MR. CRANSTON,—An incorrect announcement in our last issue has, we are sorry to find, occasioned much unnecessary pain and inconvenience. It appears that the fatal accident alluded to befel a brother of the famous Rose grover, who was not connected with the nursery establishment, although it was accused it he information which reached us. it was so stated in the information which reached us.

CATTLEYA MOSSIÆ: J. IV. A very good variety of Cattleya Mossiæ, but certainly not the var. reticulata.

Cattleya Mossace, off tertainly not the var, retuclinata, Flusious on Dracenas, &c.: T. G. "The little black scale" is a harmless fungus named Filobolus crystallinus. The fungus is very minute, and grows on dung and similar material, often in great abundance. At a certain period of growth, each fungus elastically shoots one of these growths into the air; they are sporangia, or spore-cases, and being sticky, they fix on glass, rafters, pots, &c., alike—sometimes on gardeners' faces as they are looking over plants.

INDIAN CORN: H. S., Belfast. Sow the seeds at once in light rich soil, and in strong heat. When the NOIAN CORN: H. S., Bellast. Sow the seeds at once in light rich soil, and in strong heat. When the young plants are large enough, plant them in rows; or, better still, in groups of three or five, in hills about 4 feet apart. The soil must be rich, deep, well tilled, and well drained. If you only want to cut the plant green, for fodder, you may sow at once in the open ground. ground.

MEDICINAL HERBS: L. M. Yes, undoubtedly many of our wild plants have medicinal properties, but in practice it is cheaper and more convenient to make use of the drugs imported wholesale from climates with more heat and sun than we are blessed with, and where in consequence the medicinal ingredients are more perfectly and abundantly formed than they would be here. We advise you, if you are neither a botanist nor a doctor, not to meddle with herbs, for many are poisonous

NAME OF FRUIT: H. 7. C. Apple: Northern Greening.

NAME OF FRUIT: H. 7. C. Apple: Northern Greening.

Maxvedl. 1t, probably Cotonenised; 3, Libocedma decurrens, often, but erroneously, called Thuia gigantea. called Thuia gigantea.

NOTICE TO LEAVE: Dublin. If you are paid weekly, one week's notice to leave is all that is given or required.

PEACHES DROPPING OFF: G. H. The fruits will drop off during the stoning period, but only to a small extent, if properly managed. Unsuspected dryness at the roots was probably the cause in your case, but we have no means of judging exactly.

ROSES: An Old Subscriber. The bark has been eaten by a weevil (Otiorhynchus or Curculio). They feed at night, and must be searched for then.

by a weevil (Ottorhynchus or Curculio). They feed at night, and must be searched for then.

NRES: A. C. R. The warty excrescences on the underside of your Vine leaves will not do much barm if you give the Vines more air. The temperature of the house has been kept too high, and the atmosphere too moist.—R. S. B. The leaves look as if the plants were subjected to a high night temperature, and deficient ventilation at all times. They are thin and flabby, although of great size, and, as a consequence of the treatment, have fallen a prey to thrips, redspider, and other insect pests. Give more air night and day; and if you could bring fermenting stablemanure into the house, sprinkle the house floor with guano-water, you would then obtain bardier foliage and fruitful wood for another year. There is no Phyllosera present.—R. R. W. I am well acquainted with leaves in the state of the Vine leaves sent, but I have never been able to see either fungus or insect. It is assails that one or other may start the allment, but it is sailed that one or other may start the allment, but it is sailed that one or other may start the allment, but it is sailed that one or other may start the allment, but first, which is the state of the Vine leaves, who can be produce the injury; they are hyenes, who can be produced the injury; they are hyenes, who can be treated to the state of the vine leaves the content of the produce the injury; they are hyenes, who can be treated and puttid, without the cause being apparent. W. G. S. INES—AERIAL ROOTS: Amaleur. It is not easy to

putnd, without the cause being apparent. W. G. S. VINES—ABRAIA ROOTS: Amatur. It is not easy to say why the Lady Downe's should produce aerial roots, and not any other Vines in the same house, unless it be that its natural roots are not in such a thriving condition as they might be. They are unsightly, but will do no harm to the cane, and may be cut off when the Vines are pruned in the winter.—T. Griffin. In your case the production of the acrial roots is easily accounted for by the lowness of the house, which is conducive to a close moist atmosphere. Your plan of encouraging the roots to grow in bundles of moss, kept moist, must be of some advantage to the pot Vines, but in the case of Vines planted out we should regard the practice with dislavour, and for more reasons than one. more reasons than one.

SEEDS,

SEEDS,

LONDON: May 21.—The season being over, the trade or farm seeds has assumed the extreme quietude which is usual during the sunmer months. Quotations in consequence show no variation. There is some small inquiry for Mustard and Rape seed. The sale for Canary, Millet, and Hemp seeds is at present restricted. Feeding Linseed continues very quiet. Blue boiling Peas and Haricot Beans are steady in value. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday English red Wheat was 1s. under the previous Monday, white Wheat showing no quotable change. Australian Wheat sold at a similar decline, and foreign Wheats were easier. Barley ruled steady, and good stout qualities tended rather against the buyer. Old Beans were unchanged, as also were Peas and Leutlis, Maize was 3d. to 6d. dearer than on Peas and Lentils. Maize was gd. to 6d. dearer than on Monday se'nnight, and on Oats a similar advance was quoted.—On Wednesday the enquiry for Wheat or flour was extremely dull, and business was too small to test quistations, which were nominal, but the tendency was against holders. Barley ruled very firm. Maize since Monday advanced 6d., and Oats have sustained a similar advance.—Average prices of corn for the week ending May 17:—Wheat, 375. rod.; Barley, 395. od.; Oats, 215. For the corresponding period lastyear:—Wheat, 437. 4d.; Barley, 305. 8d.; Oats, 225. 9d.

CATTLE.

CATTLE.

At the Metropolitan Market on Monday, with lighter supplies than on the previous Monday, the beast market was firmer, the large number known to be at Deptford tended to check the rise. Of sheep and lambs there were 1000 less than on Monday se'nnight, and for both better prices were obtained by 2d, to 3d, per lb. Quotations:—Beasts, 4s, to 5s, and 5s, 2d, to 5s, 6d, calves, 5s, to 6s, 8d, i sheep, 5s, to 5s, 6d, and 5s, 8d, to 6s, i calves, 5s, to 6s, 8d, is beep, 5s, to 5s, 6d, and 5s, 8d, to 6s, i and 5s, 8d, to 6s, i and 5s, 8d, to 6s, i calves, 5s, 5s, 8d, to 8s, 2d, Tbursday's trade was quiet. Both beasts and sheep moved off slowly at about Monday's prices. Other stock dull.

HAY.

HAY.

At Tuesday's Whitechapel Market supplies were large, and trade dull. Quotations:—Frime old Clover, 55. to 165.; inferior, 65. to 175.; prime second cut, 25. to 165.; inferior, 65. to 175.; prime second cut, 26. to 165.; and straw, 28. to 195.; per load.—On Thursday there was a fair supply, and trade was quiet.—Cumberland Market quotations:—Superior meadow hay, 84. to 94s.; inferior, 65s. to 74s.; superior Clover, 105s. to 11s.; inferior, 65s. to 90s.; and straw, 32s. to 37s. per load.

POTATOS.

POTATOS.

The average prices during the week were as follows:
—Magnum Bonums, 70s. to 1055.; Victorias, 60s. to
80s.; Champions, 55s. to 70s.; reds, 40s. per 10n; new,
14s. to 15s. per ewt.—The imports into London lawek were:—13s6 baskets 74 packages from St. Nazaire,
7179 packages 135 boxes 59 cases Malta, 43 cases Bordeaux, 1220 bags Hamburg, 348 cases Cadiz, and 741 cases Lisbon.

Government Stock .- Consols closed on Monday at roris to notify for delivery, and notify to roll for delivery, and as on honour the second. The shadow is figure were rorist to roll for delivery, and as on Monday for the account. The closing prices of Wednesday and Trorist for receiving to rorist to rorist for delivery, and rorist to rorist to rorist for delivery, and rorist to rorist for the account.

OLLOWAYS PILLS.—The chief Wonder of Moden Times.—This incomparable medicine increases the appetities strengthens the stomach, deaness the liver, corrects bilinusness, prevents flatulency, purifies the system, invigorates the nerves, and reinstates sound beath. The enormous demand for these Pillis throughout the globe astonishes everybody, and a single trail convinces the mest sceptical that nu medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race. They are a blessing to the incidental to the human race. They are a blessing to the disease. The purification of the blood, removal of all restraint from the secretive organs, and gentle aperitive action are the prolific sources of the extensive curative range of Holloway's Pills,

HEALTH EXHIBITION. - NOTICE. - J. WEEKS & CO.'S EXHIBITS.

Class 35, Group 4, East Central Court.

"INCOMPARABLE" OPEN FIRE-GRATE

Specially adapted for Warming Studies, Libraries, Dining and Drawing Rooms, Nurseries, Offices, &c. This Boiler possesses the appearance of an ordinary fireplace, but the bars are hollow and constitute a tubular boiler. It is for use in connection with hot-water pipes, and for distributing theat in large rooms more effectually than can be done by an ordinary fireplace. By its means also the adjoining room or rooms on the same level or above may be effectually warmed from the same fireplace.

WEEKS'S PATENT DUPLEX UPRIGHT TUBULAR BOILER

for Warming every description of Domestic and Horticultural Structure.

WEEKS'S HYDRO-CALORIC COIL,

For Warming and Ventilating in one operation. By its means a constant current of Fresh Warm Air (humid or otherwise at pleasure) is introduced into the building.

WEEKS'S HYDRO-CALORIC PEDESTAL COIL.

Full particulars and Estimates to be obtained from J. WEEKS & CO, Warming, Ventilating, and Horticultural Engineers, King's Road, Chelsea, London.

SHANKS'S PATENT LAWN MOWERS FOR 1884.

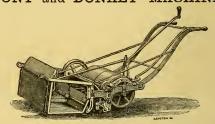

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines. These Machines are in use in the Royal Gardens at Kew, Hampton Court, Osborne and Balmoral, in most of the Public Parke and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawns. They have now been before the Public for many years, and stand unrivalled. These Machines are early worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

BEDDING PLANTS AND

FLORISTS' FLOWERS.

We are now prepared to execute orders from our fine ollections of the following, of which we respectfully invite

ollections of the follow inspection:— Chrysanthemums, Phloxes, Delphiniums, Fucbsias, Pansies, Violas, Roses in Pots,

Dahlias, Pentstemons, Colenses, Pelargoniums, Mimuluses, Clematises, Carnations and Picotees.

Also a large assortment of all kinds of choice BEDDING PLANTS, which can be supplied at moderate prices. PLANTS, which can be supplied at moderate prices.

Our CATALOGUE of the above is now ready, and may be had free on application.

DANIELS BROS... The Royal Norfolk Seed Establishment, NORWICH.

THE

Gardeners' Chronicle.

SATURDAY, MAY 31, 1884.

MY FLOWER GARDEN IN THE DECCAN.

URING the whole of my life I have been an amateur floriculturist, and in whatever tropical climate my lines have been cast there I have managed, under more or less disadvantages, to raise a few flowers, differing from or superior to those growing around. But, strange as it may appear, the place where I obtained the greatest success and had the most charming and perfect varieties of blooms was at Secunderabad, in the Nizam's territory in the Deccan of India, and where I had to contend against difficulties unknown before. True that for four months of the year the temperature of the station was cool and moist, but for the remaining eight either the periodical rains swamped, or the scorching hot winds and sun dried up every atom of delicate vegetation. Then again the soil was the poorest of the poor -sand, or rather pulverised granitic rock, being its chief component, and the labour available was the least expert I had hitherto had the misfortune to deal with. Your Indian mahleesuch being the name of the native gardeneris, as a rule, an ignorant coolie, knowing little of the practice and less of the principles of his occupation, which he only follows, as it is his caste-caste, the bogie despot of the East. Moreover, he is a gentleman who scorns to be taught, strive you ever so much to teach him.

But before I enter into any details as to how, drawbacks notwithstanding - I produced flowers which would have held their own with those of many a European grower, let me give the reader an idea of the spot where this cultivation was carried on-my house and grounds to wit. Of the former I shall merely say, that it was large and substantial, and stood within an inclosure-compound is the generic term-of a coarse grass, indigenous to this portion of the Deccan. A thin belt of shrubs and trees skirted the frontage of the bungalow; among the former some Crotons, Hibiscuses, Mimosas, Lantanas, and Oleanders; among the latter, flowering but fruitless, Pomegranates, a widespreading Neem (Melia Azadirachta), a ditto Tamarind, and a Moringa pterygosperma, that tree whereof the root is the substitute for Horse Radish, the seed pods the "stick curry" of gourmets, and the seeds themselves the "Ben Nut," yielding the oil used in perfumery. An undergrowth of a sort of yellow flowering dwarf Leguminous plant, relieved by several bright-leaved Poinsettias and variegated Laurel, and by many a bush of the ubiquitous Marvel of Peru, or Four o'Clock Flower, and Plumbago, filled up the ground space between the trees and shrubs, which, however, could not be said to flourish well, Mother Earth being, as before mentioned, so sadly wanting in elements of nutrition.

How, then, did I manage to grow flowers sufficiently worthy in points of speciality to be chatted about in this journal? Wholely and solely by cultivating them in pots from their alpha to their omega—from seedling to maturity. I shall take but one instance, and that the rare and choice Convolvuli and Ipomœas I pos-

sessed, and which, indeed, were the raree show of my garden. Sowed in pots, and fit for removal, I carried them to and arranged them around the pillars which supported the portico of the house, there to trail up a latticework of cane. Growing as they did in rich mould, their upspring was amazingly rapid even for Convolvuli in a hot climate, and presently they literally dazzled the eye with the variety, the colouring, and the numbers of their bloom, which embarass de richesse had indeed to be toned down with Jasmine, Honeysuckle, and a climbing Rose or two, all having been previously raised in pots and brought into their present position. So, to be poetical, I could fairly say-

"O'er the porch the wild Rose and the Woodbine entwined,

And the sweet-scented Jessamine waved in the wind,"

—bar always that the sun's heat causes very much of the fragrance to evaporate from the oil-cells, not only of Jasmine, but from every scented flower in the East.

A gardener from temperate zones, visiting my "compound"-the word is convenient-would have been struck by the abnormal system he saw in operation; nothing hedded out, everything "bedded" in-if I may be allowed the term-either a pot, a half tub, a keg, a cartridge barrel, or receptacle capable of holding it. I and others too who gardened in the Deccan held to the wine-bibber's view-that the liquor, being good, no matter what sort of vessel held it. And this same expert would have stared a bit as well at the arrangement of the various plant receptacles aforesaid, though he must have confessed that it was pleasing and effective. I disposed the receptacles in semicircles, where they would show to the greatest advantage, and particularly in front of the To each of these semicircles there was a background of tall plants-Cannas, Salvias, Poinsettias, Coleus, Tobacco-nay, even of feathery branched Asparagus. One has no idea until one tests it, what an elegant mass of light foliage the "sprays" of Asparagus make. In front of this "backing" stood a large tub painted green, or an equally large flower-pot daubed red, in which grew a Rose, or a Gardenia, or a choice Hoya, or a Stephanotis, or indeed any flowering plant that would stand out well, and not "hide its diminished head." Then around the base of the tub or pot, but at a foot or two from it, came a closely-set-together arc of small flower-pots, in each of which was either an Aster, a Balsam, a Phlox Drummondi, a double Portulaca, a dwarf Tropæolum, an Antirrhinum, a Marigold, a Verbena, a tuft of Golden Feather; and last, but not least, a Geranium or Pelargonium, care being always taken not to mix flowers higgledypiggledy, but to keep each kind together, and to study colours and sizes somewhat. I may assure the reader there was very considerable beauty and a little realisation of the "bedding out" in this order of plants of mine.

The Roses I cultivated were many, those that did best being the old-fashioned sorts, such as Maréchai Niel, Gloire de Dijon, Géant des Batailles, Cloth of Gold, Devoniensis, Coquette des Alpes, and so on; and it was wonderful how quickly they grew, and how profusely some of them flowered. The soil I used was a haphazard rule-of-thumb mixture of leaf-mould, stable manure, alluvial gatherings from the large fresh-water tanks, red earth—its colouring principle no doubt iron, sand, and a dash of sal ammoniac, which, in infinitesimal quantity, is a grand fertiliser, but, when too liberally given, a certain atropos to a Rose bush. The trees were wintered by Jaying bare the roots, and depriving them of water to a great extent during the hot season, when all vegetation is at standstill. The mahlee afore told of objected greatly to this "not gib tree pance (water) to drink, dis plenty too hot sun," and was for drenching them, but I forbade his doing so under penalty of

It was striking how quickly and splendidly, yet not without trouble, Balsams grew. I had them with huge sized flowers, of all colours and varieties, raised from seed obtained from Carter and from Sutton. I would have matched my dwarf Camellia Balsams with any, even with renowned growers of the flower in England. Portulacas did gloriously, the double ones

always recalling to my mind those rosettes one sees buttonholes of officers of French and other Continental orders of knighthood. Asters, too, were an especial pride of mine, and I got much kudos for the dwarf Pæony Perlection, the dwarf Victoria, and the dwarf Chrysanthemum kinds I raised. It was difficult to get good Verbenas, but, per contra, Pelargoniums, both double and single, were really firstrate. So also Phloxes, and Snap-dragons, and other annuals, which at this moment have faded from my niemory. But I remember that Sweet Peas flowered scantily and were next akin to scentless, but Tuberoses made up for that, and were almost too powerful in perfume. Dahlias and Zinnias did fairly well; Tulips would never flower with me, nor would the Gladiolus, though I have seen it thriving in the gardens of the Nizam, near the city of Hyderabad.

Three spoliators infested my garden: one was the white ant, which got into the tubs and boxes, ate the wood, and worked its way through the soil into the roots and stems of Roses and such-like; another spoliator was the bandicoot, or pig-rat, who revelled upon the larger seeds and the juicy parts of succulent plants; and the third and last, and worst, was my gardener, who, for the trifling consideration of a few of the Nizam's "duls" (copper coins), would cut and sell to any lady or geutleman of the station a bouquet of my choicest blooms, at the same time taking oath to me that he knew not how my "Johns of Battles," "Cockeys of Yalpes," "Glories of the Dungeon," as he miscalled my Roses, or how my "Gasters," "Ploxes," "Snapping-up-Dragons," and other flowers had been conjured from my pots into the vases of other individuals. H. L. C.

New Handen Plants.

PASSIFLORA "CONSTANCE ELLIOTT."

MESSRS. LUCOMBE, PINCE & Co., of the Exeter Nurseries, obligingly forward us blooms of a new seedling variety of Passiflora corulea, which is noteworthy on many grounds. First it is as hardy as the type, and has the same beautiful foliage. The flowers, however, are ivory-white, almost without a trace of that blueish tint which gave the species its name-the styles alone show evidences of the purplish hue characteristic of the species. Structurally the flowers present no difference whatever from the ordinary form, even in the disposition of the threads of the corona, but in colour, as we have said, the difference is considerable, and the agreeable fragrance is-speaking from memory-much more marked in the new variety. The sepals are greenish on the outer surface, white within, the petals white, the outer threads of the corona ivory-white, faintly tinged with yellow towards the tips, the remaining coronal threads have the same tint, and are quite destitute of the purplish bars and tips which characterise the species. Whether the fruit differs from the ordinary long ovoid orange-coloured berry we do not know. In any case it is a very beautiful variety, whose elegance and singularity of form and delicacy of tint will commend itself to all plant We give at p. 701 an illustration of this new variety, which received a First-class Certificate at the last meeting of the Royal Horticultural Society. Passiflora ccerulea affords an illustration of the truth of the common statement, that we never know the qualifications of a thing till we try them. botanist would have been bold enough to say that a plant, native of South Brazil, in the environs of Rio Janeiro, and a little southward, would be hardy enough to flower and fruit profusely on walls in the climate of Dublin and even of Middlesex? And yet this is the case, as every rambler through a London suburb knows. It is true that in many cases where no protection was afforded the plant died down to the ground in the severe winters of 1879 80 and 1880-81, but that the destruction was only partial is suf-ficiently shown by the rich sestoons of flower, fruit, and foliage, which may still be seen in their due season. M. T. M.

NEW FORMS OF EUCHARIS.

I am indebted to the kindness of Mr. Bull for a sight of three interesting plants from the United States of Columbia which he has just flowered.

The first is Plagiolition Horsmanni, in excellent condition, with fully developed leaves, just like those of a Eucharis, cotemporary with the flower. The second is a form of Eucharis Sanderi, differing from the type as figured in the Botanical Magazine by having the six stripes that run down the adnate corona green instead of primrose-yellow. The third is a form of E. amazonica (grandiflora) with the free portion of the corona not more than half as long as in the Botanical Magazine type, thus running off from it in the direction of E. Sanderi. This might be called E. grandiflora var. brachystephana. T. G. Baker.

HYMENOCALLIS EUCHARIDIFOLIA, n. sp. *

This is a new Hymenocallis belonging to the group with a long tube and Eucharis-like leaf, allied to speciosa and guianensis. It is distinguished from its neighbours by its few-flowered umbels, sessile leaves, and large corona. It has flowered for the first time at Kew this summer. It was received in 1882 from an unknown correspondent without any information as to its native country. All the species of the genus come from Tropical or Subtropical America, whilst Pancratium, which differs from Hymenocallis in seed only, belongs almost exclusively to the Old World.

Bulb ovoid, with thin brown outer tunics. Leaves four, thin, bright green, cotemporary with the flowers, oblong, 1 foot long, 3-3½ inches broad at the middle, with about fifteen distinct veins between the margin and midrib, branching off from the latter as in a Eucharis; blade nearly sessile, with a midrid ½ inch broad at the base. Scape ancipitous, I foot long. Umbel of 4—5 sessile flowers. Spathe-valves withered by the time the flowers are fully expanded. Ovary obloog-trigonous, under ½ inch long. Perianth with a sleeder green tube 4 inches long; segmeots linear, deeply channelled down the face, 3-3½ inches long. Corona white, regularly funnel-shaped, 1½ inch long, I inch across at the throat, with two distinct cusps on the edge between each filament; free portion of each filament I—1½ inch long; anthers linear, ½ inch long. Style green, exserted beyond the anthers. No distinct scent. § C. G. Baker.

PAPER-MAKING MATERIALS.

THE attention that has been given of late years to the very important question of the paper supply has resulted in the more general utilisation of many products that were but a few years ago scarcely known. The threatened exhaustion of the Esparto supply went a considerable way to turn the attention of paper-makers to other sources of material, and fresh substances are now frequently brought to notice, the young shoots of the Bamboo being amongst the most recent. The essential for a good paper is a substance that will pulp well, and at the same time possess a fibre sufficiently tenacious to strengthen the paper when finished; thus, the well-known Iodian papers made from the tough, fibrous barks of Daphne papyracea and D, cannabina are celebrated for their great strength; and again the Japanese papers made from the inner barks of Broussonetia papyrifera and B. Kæmpferi are sometimes made as thin as gauze, and yet on account of the interlacing fibres they possess considerable strength. Everybody knows how multitudinous and varied are the uses to which the Japanese apply paper. It is then to some of these well-known foreign sources of paper material, the suitability of which is abundantly proved, that we ought to look for some of our future supplies. It is not impossible perhaps to export the material in the form of paper stock or half-stuff, and we might perchance get this either from the Indian Daphne or the Fijian or Japanese Broussonetias; besides which, the plants themselves might be introduced into some of our colonial possessions, and grown for the sake of their fibrous bark; indeed, this would seem to have been already begun by Dr. King in the Botanic Garden, Calcutta; for in his last report on these gardens he says, "The Paper Mulberry (Broussonetia papyrifera) grows wonderfully well, and I am trying to obtain the seed in

^{*} Hymenocallis eucharidifolia, n. sp. — Bulbo ovoideo folisi 4-synanthis oblongis pedaitus subsessilibus; scapo ancipii fulis: aguiolongo; umbelis 4-s-fons sessilibus; spatthe valvis decidius; tubo cylindrico 4-pollicari, segments linearius tubo brevirobus, coros fundudubular lutra unciali deutibus iuteratamicis: perespicuis; lilaarendema parte libero corosa æquidongo; stylo longe exserto. f. G. Baker.

large quantity from Europe so as to be able to spread its cultivation in India." This, then, would seem to be a new branch of culture well worth consideration and experiment by planters in various parts of the world, for the trees might even be planted on the boundaries of plantations or as shade trees.

The Paper Mulberry grows everywhere in Japan, and is a valuable tree, as furnishing the bast from which a large portion of the Japanese paper is made. The plants are reproduced in quantity by subdividing the roots, and in two or three years are ready to be cut. This work is done in November, and the branches, 7 to 10 feet long, are made up into bundles 3 or 4 feet in length, and steamed, so that the bark is loosened, and can he more readily stripped off. This is washed, dried, and then again soaked in water

pulp evenly, after which the cover is first removed, then the Bamboo couch with the sheet of paper, and in returning the operative lays the sheet upon the others. When a number of sheets have thus been prepared they are pressed, to exclude the water, and afterwards spread out with a brush upon boards and allowed to dry. The sheets are only about 2 feet in length, but sometimes sheets 10 feet long are produced.

On all sides the question of finding substitutes for rags for paper making is acknowledged to be one of the most important. In Bavaria, according to a recently issued Government report, the paper-makers are directing earnest attention to the discovery of some substitute for rags, "and largely adopting wood, which has not tended to improve the

the average price at the close of 1882 only amounted to f_3 10s.; and in the summer the best wood-pulp was sold at even f_3 5s, per ton. Manufacturers found it difficult to dispose of their large stocks, and as wet wood-pulp could not be well preserved for a longer time, coosiderable quantities were damaged, and sold as inferior goods at prices varying from f_3 to f_2 15s, per ton. In consequence of this many mills stopped working until their stock of pulp had sufficiently diminished. In November, 1882, a meeting of manufacturers was held in Christiania, when several subjects connected with the wood-pulp industry were discussed. Thus it was proposed to restrict the produce, but no practical result in that direction was arrived at, except that a committee was elected for a further consideration of the matter. It

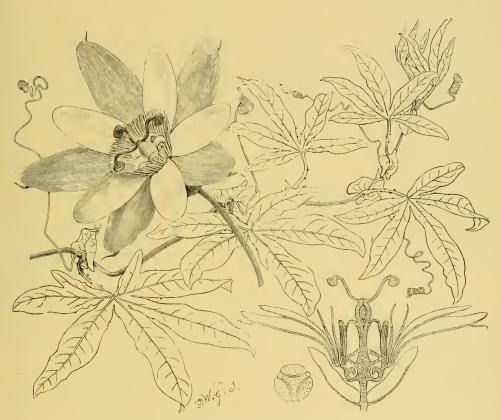

FIG. 133.—PASSIFLORA (CŒRULEA) CONSTANCE ELLIOTT: FLOWERS IVORY-WHITE. (SEE P. 700.)

and scraped with a knife to remove the outer skin, which is used for inferior kinds of paper. The bast, when cleaned, is washed, repeatedly kneaded in clean water, and mixed. It is then bleached in the sun until sufficiently white, after which it is boiled in a lye, chiefly of Buckwheat ashes, to remove all gummy matters. The fibres are now readily separated, and are transformed into pulp by beating with wooden mallets. The pulp is mixed in vats, with the necessary quantity of water, to which is added a milky substance prepared from Rice-flour, and a gummy infusion of the bark of Hydrangea paniculata, or of the root of Hibiscus Manihot.

The "Gouches" on which the paper sheets are pro-

The "couches" on which the paper sheets are produced are made of Bamboo, split into very fine sticks, and united in parallel lines by silk or hemp threads, so as to form a kind of mat. This is laid upon a wooden frame, and the apparatus dipped into the vat, raised, and shaken, so as to spread the

paper, and they still desire to see the export duty reestablished, as though the duties on paper under the new tariff may give them the home market, they are desirous of improving their paper and exporting to foreign countries."

Again, in a report from the Consul at Christiania, we read that the produce of wood-pulp increased immensely during 1882, causing prices to fall considerably. Many mills were extended, and several new ones were exected during the year. Some of the mills established in 1881 only commenced working in the beginning of 1882, at a time when the sale of wood-pulp is, as a rule, very limited. The manufacturers tried to force the sale of their produce, and thus large quantities were rather suddenly thrown upon the market, causing a considerable fall in prices. While the consumers in 1881 had to pay from £5 to £5 75.6% per ton for wood-pulp containing 50 per cent. of water, delivered free on rail at Christiania,

seems that while in 1875, 8,540,000 tons of woodpulp were exported, the quantity had risen in 1882 to 59,033,000 tons.

From Drammen the Vice-Consul also reported that the exportation of wood-paper pulp showed a considerable increase. As only a very few mills, however, gave a reasonable profit, the owners were compelled to avoid all possible expense, and therefore a large proportion of the pulp was exported from Drammen direct, instead of vid Christiania, in order to save the cost of railway carriage between those two places. Since all the paper-pulp mills are situated along the railway line from Drammen up to Konigsberg and Randsfjord, the only reason for exporting the pulp by way of Christiania, and paying heavy railway charges, is the convenience which the regular lines of steamers from Christiania to the great places of import afford to shippers. A regular line of steamers from Drammen to a convenient port of

the east coast of England ought to pay, especially if a reasonable return freight could be relied on.

In a report from Rome dated at the close of the past year, under the head of paper, it is stated that 'this industry, for which considerable hydraulic force is necessary, meets, in the province of Rome, with the most favourable auspices, yet there are surprisingly few manufactories; indeed, there are only eighteen moved by a 510 hydraulic horse power, and employing 347 men, 157 women, and 103 children. The production of paper is a little over 16,000 quintals (31,520 cwt.), though it might be at least 25,000 quintals (49,000 cwt.). The materials used for making it are rags of vegetable texture, and straw. A manufactory in Tivoli makes use of asbestos for the production of cardboard. At present the manufacture of paper in Italy exceeds the demand as to quantity, but not as to quality. The newspapers of Rome are printed on paper obtained from manufactories on the river Livi, distance about seventyfive English miles from Rome."

Amongst the most recent materials applied to paper making is the fibrous stems of the sugar cane after they have been passed through the mill, and the saccharine juice expressed; this, which is known as bagasse, has hitherto, in most cases, been used as fuel. In America, however, fuel of all kinds is cheap, so that in Louisiana, for instance, bagasse is seldom or never used for burning, and it is a worthless product, some planters indeed not knowing what to do with it. Recent experiments have shown that the hitherto useless bagasse contains a fibre that may be utilised for paper making. A ton of the material will yield about 650 lb, of fibre, while every ton of the latter can be converted into 1500 lb. of pulp. It has been estimated that each planter who makes 400 hogsheads of sugar might realise no small portion of his yearly expenses by working his bagasse and extracting its fibre. A company was formed in New Orleans about a year ago to make paper out of cane fibre. Their numerous experiments have satisfactorily ascertained that paper of an excellent quality can be made from this substance, and that the material is so inexpensive that it can be profitably worked. Certain planters have offered the company all the bagasse on their places for from five to ten years gratis. They hope to see this new industry started, so that they will be able to sell their bagasse to the factories. Others propose to extract the fibre themselves, for, if once paper factories are established, it will become a marketable product. John R. Jackson, Museum,

PLANTS IN FLOWER.

CYCLOPIA GENISTOIDES,—Messrs, Rodger, Mc-Clelland & Co. send flowers of Cyclopia genistoides, a greenhouse shrub, rarely seen in gardens, but one whose merits should more frequently secure it a place. The branches are slender, somewhat wirr, angular, the sessile leaves of three linear segments with recurved margins. The flowers are in close terminal racemes, and resemble those of the common Broom. The plant is a native of the Cape of Good Hope, and is both distinct and showy.

ROSA ACICULARIS.—A shrub with purplish-brown branches, studded with slender straight prickles of unequal lengths. Leaves with four sessile pairs, and one terminal stalked, oblong obtuse, dentate leaflet, Tipules, broad, leafy; flower-stalk, solitary, shorter than the leaf-stalk. Sepals twice or thrice longer than the ovoid lip, narrow, lanceolate, dilated at the tip. Petals carmine. A very beautiful single Rose. Native of Siberia.

PSYCHOTRIA JASMINIFLORA. — Notwithstanding the enormous number of species of this genus, and the consequent variety of form to be met with, they are almost unknown to the gardening world, simply from the fact of their possessing little or no distinctive ornamental feature to ensure their introduction and cultivation. The blue-herried P. cyanococa, however, is an exception, and the present one another, from the large pure white Bouvardialike flowers which are produced at the ends of the branches in great abundance. It is also known as Glonera jasminifora, but the generic characters having been proved to be those of an insufficiently described Psychotria are now merged in the latter genus. This species is flowering in the Palm-house at Kew.

NOTE ON COMPTONIA ASPLE-NIFOLIA AND MYRICA CERIFERA.

NEXT to the pleasure of working up the botany of plants in their native country, is that of seeing or hearing what is being done with them in other lands. English gardeners do treat some of our Canadian and American plants unmercifully, stewing in stove houses, between 60° and 80°, Pontederias, Sarracenias, Water Lilies, and Brasenias, whose whole winters are spent at home in a temperature ranging between the freezing temperatures of water and mercury. But, then, we are grateful that they succeed so well in rendering attractive, as ornamental plants, so many species that, in their native haunts, are rather plain and monotonous. I am often tempted by your notices, happily not infrequent of late, to hunt up the past history and early introduction to Europe of our plants, and have thus been led to collect some interesting facts. One of the latest American plants you referred to is Comptonia asplenifolia. It is one of our common dwarf shrubs, often hid by the taller growth of other shrubs, but becomes conspicuous on Blueberry barrens (where the vegetation consists mostly of dwarf Vaccinia), and in cleared spaces in the woods where the soil is dry enough, and not too rich for taller plants. In old clearings it may be seen monopolising spaces of several acres in extent, forming a crop that might be grown for its tannic acid. Its distinctive form and mimicry always ensure attention from the botanists, and the city wanderer picks it and enjoys its fragrance; but the rural residents' interest in it is too often limited in range to its use for the bedding of cattle. That notice in the Gardeners' Chronicle (n. s., xxi., p. 182), from Hortus Collinsonianus, of the with Spleenwort leaves," which "makes a fine tea and gives a good flavour to beer," introduces the plant to us here in a new rôle. You properly object to Loudon's "English" name (as it has become customary to call translations of botanical names); as cumbrous, and, while approving of the one given in Gray's Manual, viz., "Sweet Fern," you add, with a delicately mingled touch of dubiety and reservation, "only the plant is by no means a Fern." The benevolent object of my writing now is to ease the editorial conscience on this matter. (I feel also that a note ought to be here interpolated to the effect that if there are some of Loudon's English names that we do not care to use now, it is not because we have forgotten the great services which he rendered to natural science in the way of promoting its study at a time when its students were comparatively few and far between, by the attention which he gave to English names and the accentuation of Latin ones in the Magazines, of Natural History, and of Gardening, as well as in his stereotyped works.) It is no doubt unknown in England that Comptonia is familiarly recognised wherever it grows in America as "Sweet Fern." This is the true Anglo-American name of the shrub, long established and in common use in the country, not a "popular" name given by a writer on plants, but one that has originated with the people themselves. In Webster's American Dictionary of the English Language (ed. 1865), we fiod: "Sweet Fern, n. (Bot.) A small North American shrub, having sweet-scented or aromatic leaves resembling Fern leaves." Whether the Dictionary took the name from Gray, or Gray from the Dictionary, I cannot tell, not having the first edition at hand, but both are correct. I ought to add, however, that "Sweet Fern" sounded oddly enough to me when I first heard it in this country, just as Christmas Rose sounds oddly to an American or Canadian as the name of an unfamiliar Ranunculaceous plant. Such names are cherished when they are suggestive of pleasant ideas; when we first hear them we are apt to interpret them in a too exact and literal sense; as we become familiar with the plants intended the names cease to convey false notions. The use of the word "rose" as applied to the "Christmas" Hellebore we condone and rather like to use as a recognition of the plant's beauty, and as a pleasing reminder of the summer Roses that have come and gone; so the name "Sweet Fern" imposes upon no one who is familiar with the plant, but simply suggests a fragrant shrub, whose closely and regularly set leaves resemble the pinnæ of Ferns. The only inconvenience is that a botanical professor has often, in the course of one excursion, to explain half a dozen times that Comptonia is not a vascular Cryptogam, but an angiospermous PhœnoReferring to Hortus Kewensis, ed. 2, vol. v., p. 254, I find that Comptonia was cultivated in 1714 by II-er Grace the Duchess of Deaufort, Br. Mus. H. S., 141, fol. 37, which (according to preface) "signifies the Sloanean Hortus Siccus kept in the British Museum, from whence much information, principally concerning the plants cultivated by the Duchess of Beaufort, has been obtained." I am not aware whether anything more has been published regarding Her Grace's botanical labours than the scattered notices in Hort. Kew.; neither can I quite make out whether the name Comptonia was first used in Hortus Kewensis. Airon, Banks, Solander, are severally given as authorities for it in different works.

A nearly allied plant, and a frequent associate of the Sweet Fern along our Atlantic shores, is the fragrant Myrica cerifera, which has the corresponding names "Sweet Laurel" and "Sweet Bay." These names have no doubt been given originally by English people, who were reminded by its long, broad, shining leaves of the Laurels and Bays of English gardens. Dr. Gray, however, gives the names "Bay-berry" and "Wax Myrtle," which, together with "Candleberry-tree," are given in Webster. It has no resemblance in foliage to Myrtus communis. In Quebec Province (formerly known as Lower Canada) the names are "Arbre à la cire" and "Cirier de la Caroline." In English books the plant is often called "Candleberry Myrtle," in allusion probably to the tradition of the wax having been used by the early missionaries for candles. (Small candles of this wax were sent from Nova Scotia to the London Exhibition of, I think, 1862.) I gave some account of this plant in the Edinburgh Botanical Society's Transactions, in 1864. Myrica cerifera was also cultivated in England by Her Grace of Beaufort so long ago as 1699 (Br. Mus. Sloane MSS., 525 and 3349; Ait. Kew, v.). It would be interesting to ascertain in what way these plants reached England at that early period, and from what part of the American coast. George Lawson, Dalhousie College, Nova Scotia, Halifax, March 20.

NOTES FROM HUTTON HALL.

It goes without saying that the fruit forthcoming from this garden for some years past has held so conspicuous a place at the leading exhibitions that it has gained a representative position. At a time when there are outcries as to the produce of Dritish gardens in this department being swamped at all events in quantity by that of foreign growth it is gratifying to see that in a representative place like Flutton there is evidence of the present season's crops being fully equal to those of the past.

equal to those of the past.

Of Grapes when I visited the place in the latter part of April in the early house there was a good crop that would soon be ripe. Early Summer I tignan (Muscat de Saumur) was carrying a beautiful lot of nice bunches. This is a favourite with Mr. McIndoe; its quality, earliness, and free-bearing habit make it deserving of more general cultivation than it receives. The successional crops in the big roomy houses occupied by Vines are collectively very promis-In the late Hamburgh-house, which, in addition to the Hamburghs, contains Duke of Buccleuch, Golden Champioo, Foster's Seedling, &c., these, as also the Hamburghs, are all showing splendidly; the unusual quantity of big bunches showing give unmistakable evidence of the continued vigour of the Vines, and the extent of the ripening process to which they are subjected in autumn. house in which there is also a mixed lot, noticeable amongst them for their exceptional condition are Muscat of Alexandria, Bowood Muscat, Gros Colmar, Duchess of Buccleuch, and Muscat Hamburgh, the bunches set as full and regularly as possible. In the house wherein are located the principal late sorts, amongst them Gros Guillaume, Lady Downe's Seedling, Mrs. Pioce's Black Muscat, and Gros Colmar, are in condition such as it would be difficult to

Most of the Vines here are grown on the longshoot system, the effects of which are apparent in the size of the bunches. This method has now been sufficiently proved to show that, when combined with skilful treatment in other matters, it is the way beyond all others to continue getting big bunches out of Vines after they are past the ordinary age for producing them. The other chief essentials are manifestly liberal feeding, abundance of water to the roots, and no lack of means to ripen the extra strong wood which the treatment employed produces. Under the cold, chilly system of Grape-growing advised by some, the outcome would be a crop of big tendrils in place of big hunches. Mr. McIndoe is evidently one of those who realise the necessity for the large quantities of water which Vines require to keep them up to the mark, and without the ample provision he has at command it would be a difficult task to maintain the occupants of the extensive ranges here devoted to them, with the big inside borders, in the condition they are. When water has to be given by canfuls the roots are too often on short commons at the time they want it most. There is here a tank in the side of the hill, 200 feet above the garden: it is 100 feet by 30, and 6 feet deep; the supply, I believe, is inexliaustible. With the pressure that a head like this gives, and full means for its distribution in the houses a vast amount of labour is saved, and things that require it get enough.

PEACHES, like Grapes, are grown on an extensive scale, and are forced to come in earlier than Grapes. The first house is filled with fine trees : the earliest to come in, Early Beatrice, was all but cleared of the crop; the first were gathered on April 9: the remaining trees in this house were carrying a beautiful lot of fruit-amongst them Lord Napier Nectarine was noteworthy. In a large span-roofed successional house, filled with very big trees in fine order, there Is promise of an abundant crop.

MELONS are grown so as to have them in as long as can be, some of the first crop had been cut, more were ripe, and others were fast coming in. The two principal sorts grown are Best of All and Scarlet Premier, both seedlings of Mr. McIndoe's.

PINES .- In these times, when so many are giving up Pine growing, it is refreshing to meet with a well managed lot of plants, such as occupy the pits here devoted to them. The stock, in their various stages, from successions to those nearly ripe, are in fine order, those especially that are intended to come in in autumn are the right stamp of plants to produce fine

STRAWBERRIES .- The great extent of glass devoted to fruit culture, in roomy light houses, affords ample means for Strawberry forcing, which is well done.

Figs also are grown in abundance; in the spanroofed corridor that connects the principal lot of houses; they are trained on the roof, yielding abun-

ORCHARD-HOUSE,-In a district like this part of Cleveland, where few of the good kinds of Pears, Plums, or even Apples, can be depended on to bear satisfactorily, an orchard-house is both useful and interesting, especially when account is taken of the size and beautiful condition the fruit can be grown to in a structure of this description. Consequent on this, a house of this kind has been built; it is span-roofed, 165 feet long by 16 feet wide, and well stocked with Apples, Pears, and Plums, part planted out, the rest in pots. Some of the Apples are on Paradise stocks, others on the Crab; the Pears are part on Pear stocks, others on Quinces. Most of the trees were in full bloom, presenting a sheet of delicate colour. All the leading sorts of the fruits named are represented. Under the ridge was a shelf filled with Strawberries. Interspersed about the floor, where a bit of room was available, were Peas in pots; in fact, a house of this description can be turned to account in many ways.

Amongst decorative plants, Spiræa Aruncus is here forced in quantity; it is very effective either as a conservatory or room plant; both foliage and flowers are handsome. Lilium candidum, as a forced plant, is better done than I have before seen it; Dutch grown bulbs are used; they are potted as soon as they can be had (early in September), and are then plunged out-ofdoors in sea-sand, and as soon as they have made plenty of roots and begun to grow away they are moved to a pit, where they are brought on slowly with a little forcing; in this way the earliest come in about the beginning of April. In one of the houses others were coming on to follow, many of them with eight or nine flowers to a stem. Perpetual flowering Carnations are also well managed; the plants occupy the end of a light house, and have plenty of vigour in them, which is a reliable evidence of their ability to flower. A yellow sort named Stanstead Beauty, with a much freer habit of growth than is usually found in varieties of this now much prized colour, deserves

mention; it is a good bold flower and a free bloomer twenty flowers were cut from a single plant in a 7-inch pot in one week at the beginning of April.

Narcissus are great favourites at Hutton, especially the Daffodil section; the best of the bicolors, such as Horsfieldi and others of the group are grown in quantities in pots, and forced so as to keep up a succession; they are treated to about as much warmth as Crocuses and Snowdrops will bear.

Amongst the nice selection of Orchids the most noticeable were a fine plant of Phalænopsis Luddemanniana, with eight or nine crowns; Vanda suavis, and V. tricolor, both of which are large and strong Odontoglossum vexillarium, of which there are several examples remarkably strong; as also O. citrosmum, O. Phalænopsis, and O. Roezlii; Lælias, Cattleyas, Cypripediums, Dendrobiums, and Cymbidium eburneum, the last a fine specimen which grows and flowers well kept warmer than many growers find it to succeed well. T. B.

EFFECTS OF DIFFERENT MANURIAL APPLICATIONS UPON THE GROWTH OF FRUIT TREES.

IT is hardly possible, says Prof. Penhallow, * to gain a thorough insight into the cause of growth or of the diseases of plants unless we have first collected accurate data concerning the laws of nutrition and the effect of special food elements in different chemical combinations upon the growth of particular species and varieties; and it is thus certain that we cannot hope to discover the means of correcting or preventing an abnormal condition until such data are obtained.

Plants belonging to the same family necessarily present well defined physiological peculiarities which are common to all, and to this extent they would require similarity of treatment, but in individual cases we discern a more or less strongly marked departure from these general laws, which requires a different course of treatment for each member of the family. While this is stated to be true in the highest sense between the various genera it is also true, though perhaps in a less degree, with regard to different species or even varieties.

Considerations of this nature led Professor Penhallow to see the importance of a systematic course of treatment, by means of which the special action of different plant-foods might be noted as affecting different species and varieties of fruits when applied under the ordinary conditions of field cultivation. this purpose it was decided to establish an orchard, into which should be introduced varieties of fruit trees and Vines for experimental treatment, and it was further designed that the subjects should be selected (1) so as to include at least one of all the larger fruits; (2) on account of the special value of the fruit; (3) from its liability to disease; and (4) on general considerations.

With these guiding ideas in mind, the following trees were selected :- Quinces, Grapes, Peaches, Apples, Pears, Plums, and Cherries.

The manurial applications were arranged as

No. 1. Without manure.

No. 2. Farmyard dung.
No. 3. Chloride of potassium, dissolved bone and kieserite (sulphate of magnesia, 55.6 per cent.).

No. 4. Nitrate of potash, dissolved bone, and kie-

No. 5. Nitrate of soda, dissolved bone, and kieserite. No. 6. Sulphate of potash, dissolved bone, and kie-

Professor Penhallow says, although the experiments are of such short duration, yet the trees developed some striking differences under the various treatments, which he considered largely due to the direct results of the applications made.

It is first noted, that between the manured and the unmanured trees there was a marked distinction of luxuriance of growth, which was in excess in the former in almost every case; and unquestionably the result of proper food being present in considerable quantity, and available to the plant. Again, as between the trees treated with nitrogenous and purely inorganic manures, the former showed a markedly greater luxuriance of foliage and richer colour. In the case of the trees treated with stable dung, the

whole growth in several cases was more luxuriant than in those treated with mineral fertilisers.

With regard to the general effects of manures on regetation Messrs. Lawes and Gilbert aptly remark that "The general tendency of nitrogenous manures is to favour luxuriant and continuous growth, as distinguished from arrest and consolidation of that already formed; whilst that of mineral manures is to favour consolidation rather than luxuriance. Or, to put it in another way, a characteristic effect of nitrogenous manures is to favour the extension of foliage, and give it a depth of colour, whereas that of mineral manures is to aid stem formation and the production In fact, a relative excess of nitrogenous supply favours the extended growth of the organs of vegetation, prolongs their development, it may be, until the resources of the plant are exhausted, or the season past. On the other hand, a relative excess of mineral manures may bring on premature ripening. It is the proper adaptation of the two descriptions of supply to the current requirements of the plant, and of the season, that gives both full, properly proportioned, and well-matured growth.

Again, the excessively dark green colour of vegetation is indicative of a high percentage of nitrogen, an abundant formation of chlorophyll, but deficient carbon-assimilation, due to a deficiency of certain mineral constituents relatively to the amount of nitrogen taken up. In fact, there is, so far as the nitrogen available and the chlorophyll formed are concerned, so to speak, potential, but not actual growth.

Foreign Correspondence.

FLORICULTURE AT THE TURIN EXHIBITION .-A special department having been allotted to floriculture by the authorities, we may presume that an effort has been made to present a respectable front; if so, it has miserably failed-so much so that the floral exhibition would not be worth noticing at all were it not for the bearing which it has on floriculture in this part of the South of Europe.

A considerable space has been allotted to the exhibitors, forming a parallelogram, open on its northern extremity, and closed by a roofed gallery on the other three sides. The exhibitors are exclusively nursery-

men from Turin and its vicinity.

The principal effort appears to have been made with Roses, evidently appreciated at Turin as elsewhere. A large bed of standards in pots attracts the eye on entering, grouped so as to form an inclined plane, those in front being about 3 feet high, those in the last row behind about 5 feet. I never saw a more miserable lot of standard Roses; long sticks, with a small bunch of leaves and twigs at the end, and from two to half-a-dozen small half-grown Roses. Many bore names that we never see at our exhibitions in England, and I presume know but little of. Some of our exhibition Roses, however, were represented, but by such specimens as to be all but unrecognisable. There were also several groups of dwarf pots, but all beneath mediocrity, small and ill-grown. It makes me sigh to see little buds and flowers of Marechal Niel and Chromatelle (Cloth of Gold), placed in the post of honour, with apparent pride, when I thought of the masses of these beauti'ul Roses, as large as plates, which I had left a few days before in my garden at Mentone.

The Azaleas were numerous and in good health, but there were few equal to our first-rate kinds; they would have been considered a very second-rate collection in England. They were grown just as Nature bid them—in straggling bushes, without form or shape. We are so accustomed in exhibitions and plant-houses to see Azaleas trained so as to present a mass of bloom, that we feel disappointed with straggling, partly-flowered bushes, although such plants may in reality be more natural and most worthy of praise.

A great attempt appears to have been made with Pelargoniums of all sorts-zooal, double, and fancy. Their inferiority, however, to those we grow in England was still more marked than with the Roses. They were mostly poor stunted plants, with poor flowers, plants that would be all but unsaleable in Covent Garden at 6d. apiece. The failure to grow them respectably was the more marked as they were all pretentiously marked with a name, as having great floricultural value. Frequently these names quite unknown to me, but I recognised by the name some of our best exhibition kinds, although I ccr-

^{*} Abridged from Professor D. P. Penhallow's report of the experimental farm at Houghton, Ne v York.

tainly should never have recognised them by the flower, indeed many seemed to be reverting to the primitive African forms, which we see in the Pelargonium-house at Kew, so meagre, poor, small, and characterless were the flowers.

There were some good double Petunias and other ordinary spring flowers, such as Nasturtium, Cineraria, Silene, Mimulus, but none in any way remarkable, quite the reverse. Then there was a bed as a central decoration, consisting of ordinary Palms, Aralias, Dracœnas, Crotons, Marantas, Phormium tenax (in the place of honour), one small Pandanus javanensis, and a few Ferns; altogether they constituted a lot such as would be sent out in London to decorate the staircase in a second-class rout.

As these flowers had probably been ten days in the ground they must have been partly grown under glass, but that is no explanation of their defective development and character. They were exhibited by the leading nurserymen of the locality and, such as they are, will no doubt be rewarded by gold and silver medals, as having attained as great perfection as is attainable ! The only conclusion that we can come to is that floriculture is at a low ebb in this part of North Italy, and that its inhabitants are not acquainted with the perfection it has attained in England. I do not think that the climate is in fault, if I may judge by the results that I attain at Mentone on the Genoese Riviera, where Roses and Pelargoniums, indeed most flowers, assume splendid proportions if proper care is taken of them winter and summer, as at home. They must not be left to themselves, as I believe is pretty much the case in most Italian gardens. There was a good collection of Oranges from the South of Italy, Otranto, Sicily, &c. All were thick-skinned, and must be very interior to the thin-skinned one from the Azores, such as the St. Michael's Oranges, which we principally consume in London, and which I am introducing to the Riviera, as recently described in this journal.

I did see one novelty to me, viz., Asparagus forced in pots. Many pots, not large ones, contained some twenty sprouts, indeed they were crowded with them, each pot producing a dish.

I must not conclude without stating that the Turin Exhibition generally is a great success. This success is the more meritorious as the Exhibition is entirely Italian. Singularly enough, no other nation has contributed to it, and yet the want is not lelt, so fully have the Italians themselves responded to the call in every branch of manufacture and art. It proves that the Italian nation is advancing very rapidly in every branch of human civilisation and knowledge. There is also the evidence of great national wealth. Most truly have the Italians been striving of late years to justify their proud motto, "L'Italia fara da se." By abstaining to come to this Exhibition the other nations of Europe have enabled them to show that they now possess within themselves all the elements of a great and prosperous nation. The Exhibition more especially shines in the fine art department; there are 2000 pictures and 500 sculptures, many of which are very good indeed-worthy of Italy's former days. She is evidently retracing her steps. J. Henry Bennet, M.D., Turin, May 20.

LINARIA STRICTA.

A CHARMING Linum, or Flax, seeds of which I collected in the neighbourhood of Catania at the foot of Mount Etna, and have brought into cultivation. This annual species of a very numerous family is the nolly fresh yellow representative that is worth cultivation, and which is a pretty addition to our tender annuals. Planted with Linaria maroccana, or with L. carminea, or with L. reticulata, it has a pretty and lively effect, and lights up a group uncommonly. The plant, which grows to the height of about a foot, has numerous branches of a loose habit, with plenty of foliage, forms a perfectly charming bush of a very floriterous character. The shoots are upright, and terminate in a spike of bloom. The leaves are linear or strap-like, smooth, or nearly so, light green or emerald, opposite, or verticellate, the flower-spike close, large and full, the petals much larger than the callyx, brilliant sulphur, with golden-yellow mouth, brownish-striped ground, and long blunt spur. It flowers from May till late in the autumn, and sometimes bears a full second crop of flowers in July and August if the shoots that carried the earliest flowers are pruned off. It is best sown where it is intended

to stand in March, or it can be sown in autumn and wintered in a place free from much frost. The plant has equal value with the above-mentioned allied varieties, and is conspicuous from its lovely colouring. Garten Zeitung.

EALING PARK.

THIS estate, once renowned for its superb horticultural produce when it was tenanted by the late Mrs. Lawrence, is now to a very great ex tent in the hands of the builder; the place has been cut in twain by means of a fence running from east to west, starting from Elmsham, opposite the cemetery in Ealing Lane, on the road to Brentford, and extending to Windmill Lane, a main thoroughfare from Little Ealing to Brentford. Roads are also cut in the same direction and crosswise, and already at the southern extremity a line of small villas has been erected, and some are already inhabited. The dividing line of fence saves so far nearly the whole of the pleasure-grounds; it passes along close by the side of a noble Cedar of nearly 250 years' growth—now, alas 1 in extremis, shorn of many of its leading branches, and gradually progressing towards death—and passes close to the southern extremity of the fine avenue of Cedrus Deodara, a representation of which is given on p. 705. The mansion and a portion only of the pleasure-grounds now constitute the Convent of the Dames de Nazareth, the dividing line from the park being a little way east of the mansion.

On that side-on the south side-the boundary of the Convent grounds passes right across the Deodar avenue in a straight line eastwards, leaving outside of it the pond, and many of the fine specimen trees. Thus, between that portion already laid out for building purposes and the southern boundary of the Convent grounds there is a broad strip filled in great part with trees and sbrubs, though happily not open to the public, though marauders find their way within. Many of the fine specimen trees of a rare character, planted by Mrs. Lawrence, still remain : some of them were gifts from Lord Auckland when Governor-General of India; but it may be soon when some of these, and the Willows raised from slips brought from the tomb of Napoleon at St. Helena, will go down before the onward march of the builder. The grounds attached to the Convent are in a sadly neglected state, which is to be regretted for the sake of old associations with the place, and the vineries and plant house used when the place was occupied by Mr. Budgett are let off to a neighbouring garden. The small Italian flower garden has disappeared altogether.

Sir Trevor Lawrence kindly informs us that the Cedrus Deodara avenue was planted by his mother, Mrs. Lawrence, in the year 1842 or 1843, or thereabouts-Sir Trevor writes from the best of his recollection, not having any note of the date. The Cedars grew and flourished without check until January, 1867. At that time Ealing Park was occupied by J. 1807. At that time Eating rate was occupied by J. S. Budgett, Esq. "It was a season of intense frost, especially in the Thames Valley, and the Deodars were a great deal injured. It seemed as though a cold blast had struck along the avenue, cutting the trees here and there at varying distances from the ground, but not killiog any. It is of course well known that Deodars grow at a great altitude in the Himalayas. They are seldom found growing vigorously under 6000 feet above the sea, and they thrive up to 10,000 or 11,000 feet, if not higher, when the winter temperature is very low, but the trees are protected by snow. In the valley of the Chenab River I have seen magnificent trees at 8000 or 9000 feet, among them many 30 feet in circumference, some 36 feet. The Deodar timber is probably the finest deal, if so I may call it, in the world; and being full of a resinous oil, it possesses extraordinary durability. The Deodar forests are now carefully preserved and looked after-twenty-five or thirty years ago they were ruthlessly cut and hacked about. 'Deodar' is the native name, and means 'God's gifts.'"

Mr. William Cole, of the Vineyard, Feltham, who was gardener to J. S. Budgett, Eq., in 1867, states that the frost which did so much damage to the Deodar avenue happened in the early part of January of that year, when the thermometer in the gardens showed 45° of frost. The previous summer was wet and sunless—trees of all kinds ripened their wood badly. Up to this time the Deodars were perfect

specimens: but after that frost some of them lost nearly all their leaves, and did not show any signs of breaking until June, and then one quarter of the branches did not break at all. The Araucarias in the grounds lost all their bottom branches; all the fine Bays were killed with the exception of one; evergreen Oaks of marvellous size were killed to the ground-in fact, every bit of Laurel, Arbutus, &c., suffered in the same way; and as showing the extent of the damage done at Ealing Park, Mr. Cole further states :- "I put a man on piecework to faggot up the prunings, and there were 1800 faggots: the slaughter was fearful all over the place." The trees forming the avenue have now become pretty well furnished again, but it is to be feared that their destruction is imminent.

The view on p. 709 is taken at the north end of the Deodar avenue, near to the point where the visitor formerly emerged from that portion of the ground occupied by the vineries, &c., on to the pleasure grounds. Standing on the spot represented in the foreground of the picture, and turning to the right, the visitor looks southwards along the length of the Deodar avenue; and to the left, northwards, to the temple seen at the extreme end of the representation of the avenue. Round it to a considerable extent are huge bushes of Golden Hollies, that take on a superb colouring. Looking through the stone archway covered with Ivy, a portion of the west front of the mansion is seen, together with a portion of the conservatory. When occupied by Mr. Budgett, this portion of the grounds was beautifully kept, as the importance of the place required. It is yet charming in decay and neglect. In the dense growths of shrubbery, and in the umbrageous growth of the tress, hundreds of singing birds find a congenial home, and they warble forth their songs as if happy beyond expression, and careless of the rapid approach of the town that bids fair within the next few years to circle this place with a cordon of dwellings, and obliterate the rural aspect which has hitherto characterised this well known demesne. R. D. [Our illustrations are from photographs by Mr. Vernon Heath. Ed.]

The Posery.

Roses in Pots at Shirecliffe Hall, Shef-FIELD. - Rose culture always possesses an amount of interest, and in the neighbourhood of large towns probably increased in consequence of the difficulties of growing good examples; therefore a few notes on the Roses grown at Shirecliffe Hall, Sheffield, may be acceptable to the readers of the Gardeners' Chronicle. Those who only know the smoky metropolis of cutlery by the glimpses obtained in passing through the town by the Manchester, Sheffield, and Lincolnshire Railway, will never expect floriculture to flourish in the district; nevertheless, many triumphs are achieved in its various branches by the skill and perseverance of its gardeners. The above collection of Roses (which is only a small one) is remarkable for beauty and vigorous health; each plant is clothed with fine soliage, without the least blemish. They occupy the back portion of a lean-to house, and although only small plants that were potted last year, are everything that can be desired for the short time they have been in training. Both bushes and standards are represented. The largest specimen, Magna Charta, is 4 feet in diameter, and bears about forty fine flowers, of good colour and shape; Edouard Morren is a very good plant, but not quite so large as the above variety, it carries a number of excellent blooms; Madame Rivers is also grown as a bush, about 3 feet in diameter, and when I saw it a few days ago, each shoot bore a fine well-developed bud just expanding, and would shortly produce fine blooms; Jules Margottin is laden with about forty large flowers of a bright rich piok, good in colour and substance, and rich in the old-fashioned perfume that too many newer varieties lack; Céline Forestier is another good example, with beautiful, well-formed, pale yellow flowers. Amongst the standards (which I have previously stated are only small) is Dr. André, with eighteen fine blooms, of a rich bright red; Madame Victor Verdier has thirteen fine blooms, 4 to 41 inches diameter, of a rich deep crimson or cerise hue; La France, a small plant with seven fine shoots and eleven flowers, and expanding buds, of a beautiful rich blush tint, very delicate and handsome. Madame Lacharme has a

good head of fourteen strong shoots, bearing sixteen open and expanding very pale and elegant flowers. Marquise de Castellane has twelve shoots, each bearing a fine bright rose-coloured bloom; the foliage of this plant is exceedingly thick and leathery, in fact, the whole of the plants are clothed with fine healthy foliage, speaking unmistakably of their strength and vignour. Several plants of the old Persian yellow Rose are very effectively distributed amongst the other specimens, that give a very pleasing contrast with their small foliage and numerous yellow flowers, to their large-foliaged and more fashionable sisters. Many other varieties are grown, and produce large numbers of flowers, the most notable being Maréchal Niel, Gloire de Dijon, and Niphetos, established plants of the two former varieties producing yearly

cottage with a hundred or more expanded blooms; but the weather is too hot, and it droops and cuts but a sorry figure beside the vigorous hybrid Bourbon. At Maresfield, on a gabled cottage in the nursery grounds, there is a splendid climbing Devoniensis with magnificent blooms. The front of the cottage, however, was the most interesting on account of the two grand old Banksias with their hundreds of trusses of yellow and fragrant white blooms, resembling in form the double-blossomed Cherry. The foliage of both these old and somewhat neglected favourities is evergreen, and just now quite charming in its glossy, bright green freshness. The plants are thirty years old on their own roots, and have gnarled stems as thick as a man's arm. The old monthly China is still a favourite, and very charming it

Elairii No. 2 is occasionally used, but the most popular favourite for its fragrance and continuous blooming is our old friend Gloire de Dijon. Maresfield is famous for its Rose nurseries; in early July these must be a treat to rosarians. T. W., Harrow.

The Benbageous Bonden.

PAPAVER ORIENTALE AND P. BRACTEATUM.— Those who cultivated hardy plants more than thirty years ago can remember two distinct forms of giant perennial Poppy, known respectively as P. orientale

FIG. 134.—THE DEODAR AVENUE AT EALING PARK. (SEE P. 704.)

large crops of fine flowers. In several of the cases mentioned the flowers were not all opened at once. Taking into consideration the disadvantages of growing Roses in such a smoke-laden atmosphere that is obtainly charged with injurious gases, the whole is highly creditable to the skill and perseverance of the head gardener, Mr. J. Udale. A determination to succeed under difficulties often leads (as in this case) to good results, and should encourage those placed under similar conditions, to persevere until the object sought is obtained. Y. H. S.

ROSES ON COTTAGE WALLS.—The prettiest displays I have seen this spring are at Uckfield and Maresfield in Sussex. One cottage in the High Street has a magnificent Charles Lawson with huge rosy blooms, and an abundance of healthy bright green foliage. There is a Maréchal Niel on the same looks as it peeps in modestly at the latticed casement. The crimson is pretty, but not so free. Gloire de Dijon looks washed out and unhappy in the continued hot, dry weather; it will probably have its revenge later on. Its primest time is in September, when the second crop comes on, and the gossamers wreath it in the early morniog with diamond necklaces. The grandest yellow Rose I have seen on cottage walls, and by some days the earliest, is the gorgeons Solfaterre. The early shoots are of a coppery-green, affording a delicious contrast to the fragrant gold and sulphur cloud of blooms. It was budded on a Brier, and made shoots of from to to 12 feet in length year after year; pruning was confined to thinning out the branches, themselves left untouched. The old Maiden's Blush is still trained on some cottage fronts, and very pretty and fresh It looks with its light green foliage. Its season is very short.

and P. bracteatum. The former was then the more common in old-fashioned gardens. It grew in large patches, producing an abundance of light orange-coloured flowers on rather weak stalks about a yard ligh. The flowers were generally not quite straight on the stalk, which was more or less bent in some part, and the whole plant looked rather untidy. This P. orientale is figured in Curtis' Bot. Mag., vol. ii., tab. 57.

The other, P. bracteatum, was a far finer plant for garden decoration, throwing up large stiff stalks, on which the flower was supported quite upright. The flower was larger, and the petals stiffer, than in P. orientale, and the colour bright military red. The height of the stalk was from 4 to 5 feet. It derived its name from large leaf-like bracts generally present just beneath the flower, which were usually absent from the typical P. orientale. Both kinds

had large black spots at the base of the petals, inside; these were, however, not always present.

I have described these plants as they used to be thirty years ago, using the past tense; for there are no longer two varieties only, but many, and the old types are connected by a number of intermediate forms, either hybrid or natural, so that two names are no longer sufficient if the distinction is to be main-Botanists probably make all belong to one species; and I observe that whilst in Don's Botany, published in 1831, there are twenty-seven species of Papaver described, Bentham and Hooker have reduced the number to fourteen. Several complaints have been made to me within three years, that the old bright red P. bracteatum has become scarce, and that the seed which is now sold under the name produces only orange-coloured flowers. I still have the same plants of it which I grew thirty years ago; but I must own that the finest Poppies I have, and the finest I see in other gardens, both in size of flower and in brightness of colour, are orange-coloured. These have stalks as stiff, and bracts below the flower as large, as any with more scarlet flowers; and they expand their petals more fully, making when open a better cup. These Poppies have great merit as backrow garden flowers, being very showy from the middle of May to the middle of June. They like a deep light soil, and when once planted will grow for twenty years or more in the same spot, without further attention, though they like top-dressing. Side shoots may be taken from them at the end of winter to make fresh plants, but they are most easily raised from seed, which may be sown under glass in autumn, so as to give the young plants time to grow to a good size before the heat of summer causes them to lose their leaves. They seldom flower till two years old. C. IV. Dod, Edge Hall.

FORESTRY.

PRUNING.—The present month is perhaps preferable to any other for pruning, foreshortening, or disbudding coniferous trees. Great diversity of opinion, however, exists as to the proper season at which the operation should be performed, as well as to the oecessity for pruning, but most arboriculturists are in lavour of spring or early summer, as the wounds caused by amputation heal over more quickly, and are consequently less liable to bleeding then than at any other time. Hardwood trees may also be pruned with safety during this mouth, care being taken not to perform the work too severely. The removal of contending leaders, shortening lower and straggling branches, and, where necessary, removing others that have been previously shortened, will be all that is required at present.

BARKING .- The barking season commenced rather unfavourably, with a continuance of cold easterly winds, but since the last week of April the weather has been almost all that could be desired, and the work in most districts, if not already finished, must now be in a very advanced state. As soon as convenient after peeling, the clearance of timber, firewood, and branches from the falls should at once be set about, more especially where the stalls are intended for coppice. Advantage should also be taken of dry weather this month to have all the Oak trees carted to the saw-mill, timber-yard, or wherever their destination may be, as they have frequently to be dragged a considerable distance before being laid on the cart or timber carriage. If this be done in wet, slushy weather it is not only unpleasant for the workmen but highly injurious to the saw when the timber is being planked, from the gritty mud which adheres so firmly to the bark. Repair woodland roads that have been cut up by the cartage of timber, and scour all drains in their immediate vicinity.

WOODLAND.—Voung plantations on ground given to the growth of rank vegetation should be well looked to, and all rough herbage, such as Brambles, Bracken, Gorse, and grasses, should be cut from around the plants. In the woodland little can now be done, beyond clearing and removing brushwood, binding faggots and cordwood, and felling dead or unhealthy trees, which at this season are easily recognised.

REMOVING IVY.—This is the proper time to go over plantations and cut off Ivy, and as in some districts this work is attended with considerable cost, the following method, which has been extensively practised on this estate, may be suggested :- Half-adozen boys with a man in charge are employed at the work. One of the boys goes before with a hand-bill, or small hatchet, and carefully cuts the Ivy around the bole of each tree, at a distance of 3 or 4 feet from the ground, the others following with light mattocks grub up the roots for a couple of feet in circuit round the base of each tree, also removing it from the trunk up to where the first boy cut it through. It is a work requiring great patience and perseverance, and may be thought by many as an expensive mode; but in plantations such as ours, where the ground is literally carpeted with Ivy, it is of little use removing it from the trees without to some extent clearing the ground around each. That Ivy luxuriates so here can only be accounted for by the humid atmosphere being congenial to its growth, this estate being both mountainous and maritime.

NURSERY WORK.—Owing to the fine growing weather weeds are unusually plentiful and vigorous, and will require great attention to keep within bounds. To prevent the weeds seeding it will be necessary to keep the hoes going during dry and hot weather. Hand-weeding of seed-heds is best performed during damp weather, as their removal at that time is not nearly so injurious to the young plants as when the weather is dry and sunny. Collect and sow Elm seeds, and where necessary store up others for early spring planting. If the weather is dry, an occasional watering will greatly assist early germination of the seeds. Those seeds intended for spring sowing should be carefully dried previous to storing, as any default in this way is attended with injurious results as regards the germinative properties of the seed.

Composts intended for use during the summer and autumn will now require turning, their value as manures being much enhanced by the addition of a liberal supply of lime. Vacant plots in the nursery should be heavily manured and roughly dug over preparatory to autumn filling. Evergreen trees and shrubs may still be successfully removed by lifting with good balls of earth, and attending to a regular course of watering until they become thoroughly established in their new positions; unless in cases of extreme necessity it is, however, better to defer such work until the autumn.

FENCING.—Continue the erection and repairing of fences as recommended last month, and tar or paint all iron and wire fencing, tree-guards, gates, and wooden erections of various kinds. Rustic work, including arbours, bridges, and seats, should also receive their annual overhauling, and he made clean and fresh by a coating of paint and varnish. See that woodland fences are in a good state of repair, as cattle are usually turned into their summer quarters during the present month.

IIEDGING.—A slight pruning or switching vill be beneficial to such bedges as are apt to become bare and open at the bottom. Ornamental hedges that receive two trimmings annually should receive the first during the early part of the precent month, which will enable them to push forward and ripen a second growth before winter sets in. The necessity of keeping down weeds along the line of fences cannot be too strongly or often enforced on those having the care and management of such. The evil results arising from neglect of this are too well known to require comment, and should be carefully noted by those in charge of the work.

ROADS AND WALKS.—Beyond hoeing, edging, and clearing carriage drives and policy walks, little else will be required at present, more especially where previous instructions regarding their management have been attended to. Previous to using the edging-iron it is a good plan to cut a strip of grass, say 3 feet in width, along each side of the roads, which will not only impart a more finished appearance but prevent, to a great extent, the grasses from shedding their seeds along the margins. In using sall for the destruction of weeds it should never be placed within a short distance of the verge or edging, as much camage is frequently occasioned thereby. The results of salt as a weed-killer are most marked during warm, dry weather.

GENERAL WORK.—As soon as workmen can be spared the preparation of ground—draining, fencing, and pitting—for planting next season may be proceeded with. Clear out drains and watercourses in plantations, repair roads, and keep grass rides clear of Nettles and other rank vegetation. Nothing tends

to enhance the value of timber like good roads, and they ought never to be neglected. Those who burn charcoal for home consumption should now set about the work, as the men employed are all the better of long daylight while watching the charring of the kilns, Mowing and cleaning in pleasure grounds, as well as the pinching and pruning of trimmed Laurel beds and choice plants in the shrubbery, should now receive attention, A. D. Webster, Penrhyn Castle, North Wales.

Prchid Notes and Hleanings.

ORCHIDS AT ROSEFIELD, SEVENOAKS .- Mr. De B. Crawshay's neat little collection gives a good example of the perfection to which Orchids may be brought even where but little space is devoted to them. Whether in or out of bloom, the sleek, contented look of his plants, makes them pleasant things to contemplate, for, after all, it is only unhealthy or badly-grown plants which are not handsome when not in bloom, and all who have witnessed the affectionate touch the Orchid-grower gives a thriving favourite must know that to him and his confreres at least there is pleasure in them, either in or out of flower. Probably the two best examples of cultural skill on the place are two magnificent specimens of Disa grandiflora, the one bearing eight and the other six strong flower-spikes, some of them three-quarters of an inch through at the base. The plants are perfect and unblemished by thrips or any other insects, and soon they will be radiant with their scarlet flowers. While so many of this beautiful Disa have been smothered and drawn into weak flowerless growth in close houses, Mr. Crawshay has been getting his into their present state of perfection by growing them in a shady but light corner of the greenhouse, along with Pelargoniums, &c. are copiously watered all the year round, and carefully watched that aphis do not get hold on them; and beyond this they occupy their quiet corner without giving any trouble notil the buds are well advanced, when they are removed to a cold pit outside and still watered freely. This removal gives better size and colour to the flowers, and gives the plants a change until the end of the summer, when they are returned to their old quarters. Cattleyas and Odontoglossums are the specialities at Rosefield, but the Phalenopsis, in their tiny house, are sound and strong, and are yet giving a few flowers, which look very pretty arching over those of Aërides War-Cypripedium niveum, and other warm-house Orchids. The Cattleyas are contained in an ornamental conservatory-built structure, with curved roof. It is rather loltier than is generally considered good for plants, but we have lately seen Orchids thriving well in several houses with the same supposed defect, and here the condition of the Cattleyas and the progress they make year after year seems to say that so long as the plants get the required amount of light the height of the roof is not of so much consequence. For the display of bloom the Mossies have the greatest part of the show, and their quality is beyond compare, the size of their flowers and the diversity of their colours making them of the first order of merit, and at the same time very difficult to describe. In bloom with them are a few good C. Mendelii and C. Warneri, and not in bloom are some very fine examples of C. Dowiana, C. aurea, C. gigas, and others of that section, all in grand health, and many of them furnished with very stout flowering growths. Mr. Craw-shay grows this section of Cattleya well, chiefly in baskets suspended from the roof and near to the glass. baskets suspended from the roof and near to the glass. The Odontoglossum-house has a very fine specime of O. Marshallianum, some good O. Alexandræ, O. Pescatorei, Masdevallias, Ada aurantiaca, &c., in bloom, and quantities in bud, and all, like the rest of Mr. Crawshay's Orchids, looking perfectly happy.

ODONTOGLOSSUM CRISPUM STEVENSI.—A form in which the flower-segments are beavily spotted with chocolate-brown spots. Orchid Album, t. 127.

MASDEVALIA SCHLIMII. — A figure of this is given in the Botanical Magazine, 1884, t. 6740. It was figured and described in Gardeners' Chronicle, 1883, i., p. 532, f. 80.

SACCOLABIUM GIGANTEUM VAR. ILLUSTRE.—A variety with the flower-spike much longer than in the type. The flowers also are larger and less closely arranged, while the lip is more deeply coloured. Illustration Horticole, t. 517.

The Flower Handen.

EVERY effort should now be made to forward the work of bedding-out with all possible speed, so as not only to enable the plants to establish themselves early in their summer quarters, but the sooner this work can be completed so much the sooner can other equally pressing and important work be attended to. To those who have but small flower gardens to furnish, and who do not adopt spring bedding, the work of summer planting is not a very formidable task; but where the garden is large, and a continuous display is required in spring, summer, and autumn, the tax and strain on the gardener and his forces at this season of the year is often very great, so much that, even with the utmost care, quick despatch of work, and the most methodical arrangements, some of the other departments in the garden which also require special care at this season, suffer con-siderably for waot of timely attention. This pressure does undoubtedly sometimes cause the work of preparing the beds and transplanting to be hastily and improperly performed, and the result is failure and disappointment. Every detail in the flower garden, especially at this season, should be duly and carefully carried out, not only in providing the most suitable soil or manure for the special requirements of the different plants, but also in having the soil in the most suitable condition in respect to moisture, and in taking care to compress the soil firmly round their roots in planting. In preparing the beds, care should be exercised not to introduce too much manure, or exuberant growth with little bloom will be the result. It is better to substitute fresh loam, and give the required stimulant by administering liquid manure, so as to produce the desired growth, and to sustain the plants during the flowering period. As the spring plants are removed they should receive proper care, instead of being thrown carelessly aside or heeled in roughly without water or shade till half of them are dead. should have the blooms removed, and then he carefully divided, transplanted, watered, and shaded till growth recommences, and though these details will occupy somewhat longer time than if roughly and hastily performed the results will be so much more successful and satisfactory.

AS SUB-TROPICAL AND FINE-FOLIAGED PLANTS occupy a very important part in the summer decoration it is well that special attention should be paid to their requirements, if anything like a good effect is to be obtained from their use. In the first place they will not succeed in elevated or exposed positions without an efficient screen from cutting winds. It is also necessary that they should have an abundant supply of moisture as well as perfect drainage. The soil in which they are planted should also be rich and light, and although sheltered from wind they should with few exceptions be exposed to the full influence of the sun. As they are much more effective in bold masses or well defined lines than when planted in insignificant patches, plenty of space should be allowed for their full growth, and where the garden is limited it is better to plant the more moderate growing varieties than the larger kinds, and as their chief beauty lies in the full development of each leaf proportionate space should be given when transplanting according to their size. In combination with the ordinary bedding plants, especially when the more graceful kinds are used, they are sometimes most pleasing, as they not only tend by their varied outlines to break the usual flat surfaces, but they also relieve by their cool tints those brilliant masses of colour which, although they may startle and surprise, seldom perfectly please and satisfy the onlooker.
Their most natural and most effective position, however, is perhaps in sheltered yet sunny dells, planted in isolated and by no means formal groups or masses at sufficient distance so as to allow of some low creeping plants being planted at their base, which will not only cover the bare soil underneath them, but which will at the same time act as complementary companions to their more imposing neighbours.

HERBACEOUS BORDERS.—Attention should now be paid to these, not only in keeping them clear of weeds, but also in timely thinning, staking, and tying; the surface of the ground should he frequently loosened, and occasional top-dressing of well decomposed manure should be given, as well as repeated waterings with liquid manure. As the foliage of bulbs dies away, these blanks may be filled in by sowing or placting over them choice and suitable annuals. Roses should receive abundant supplies of liquid manure during dry weather; the surface of the beds should be kept loose, and an occasional mulching with well decomposed manure will also assist their growth and the full development of their flowers. They should he kept free from insects, and the flower-buds should be freely thinned, if large blooms are desired. T. S. C.

Che Pitchen Çarden.

THE refreshing rains of Sunday morning last enabled us the following day to make good plantings of Brussels Sprouts, Cauliflowers, Cabbages, Snow's Superb Winter White Broccolis and Lettuces, and to prick out into nursery beds young plants from later sowings 4 to 5 inches apart every way to grow on for transplating later in the season. If Winter Greens are not already pulled up, and removed to the refuseheap, no time should now be lost in doing so, and in getting the ground manured and dug, so as to be in readiness for other crops, as, for instance, Peas (of which a good sowing of Ne Plus Ultra and British Queen should be made forthwith for use in September and October), Broad Beans, Spinach, &c.

TRANSPLANTING ROOTS,—Advantage should be taken of showery weather to proceed with the thinning-out and transplanting of Onions, Beetroot, and l'arsley—which is an operation that should always be done if possible during damp weather, because then the young plants not only draw and transplant better and with more expedition, but they are obviously less subject to check than if the work has to be performed when the ground and atmosphere are both in a dry state the ground and atmosphere are both in a dry state the thinning and transplanting of the above roots is a simple one; but nevertheless is not well known, and consequently not so frequently practised as should be. It is as follows:—

ONIONS.—As soon as the young plants are large enough to handle, and the nature of the weather permits of its being done, they are thinned to 2 or 3 inches apart in the row, and the blanks, if any, are filled up as the thinning is proceeded with, taking care in planting that the holes are made deep enough, so that the fibrous roots, which should be shortened back a little, may not get bent when transplaoted, and that the bulbs are not buried deeper in the soil than they had been before. I am aware that most growers allow greater space between the individual Onions than we do, with the obvious intention of obtaioing larger bulbs, but for all ordinary purposes 2 or 3 inches between each bulb in the row will be found sufficient, it being perfectly astonishing to what size the Onions will grow, pushing each other out of the way as they grow into the 12-inch space between the rows. Moreover, I find, as most gardeners do, that medium-sized Onions keep better and are more economical in the using than large ones. In thinning the crop we leave a few of the outside rows to be thinned, as required for immediate use.

BEFROOT, —Half our crop is in some seasons obtained from transplanted plants, which, in every particular, are as good and well grown as those not so treated. The one essential point, assuming that the ground is of the right description, and has been properly prepared for the young roots, as in the case of seed, is to make the holes deep eoough for the young roots to be transplanted in their entirety, and about the same depth in the soil as they were before, without being curved in the process of transplanting, as in that case deformed roots will be the result. The advantage above referred to consists in this—that the treatment of the roots is accommodated to existing circumstances, which will admit, say, of ten cows being sown at the proper time; the whole space which it was intended to ernp with Beet being then, and for a month or six weeks afterwards, occupied with other crops: this ground to be subsequently related from the same sowing.

With other tops: This gains to be be exceeded, planted from the same sowing.

We transplant fifty row without any loss from having small or deformed roots. The same course can be adopted if necessary with the Onions, provided the transplanting is carried out carefully and at the proper time, that is, when the bulbs and roots are quite young and the ground moist, and that the roots until they have become established. Tarsley, too, through some cause or other, is not so generally transplanted as it deserves to be; not but that it will, like the Onion and Beet, do equally well if the necessary

number of rows is sown at one time; but as a matter of economy a small patch of seed could be sown about the first week in March, and two months later the requisite number of rows transplanted therform, which plants will grow freely, and exhibit as little tendency to run to seed as those sown and afterwards thinned out.

Lees.—This in some places is an important crop, and in many gardens it might be reodered so by giving it more attention than it generally receives, and which its merits as a culinary plant unquestionably entitle it to. The plant delights in a rich, stiff, loamy soil, and we practise the following method as to transplanting, which we have found answer very well indeed, fyiz.—In an open situation and well-manured and deeplydug piece of ground, drills are drawn similar to those made for Peas, about 18 inches apart, and in these holes 2 or 3 inches in diameter are made 9 or 10 inches apart in the rows, and in these the plants are placed upright, allowing sufficient earth to cover the roots to fall into the holes in the process of planting; and subsequently the soil is gradually washed into the holes by the rain and by the use of the hoe between the rows, care being taken not to bury the hearts of the plants. When the Leeks are planted water should be given them, and occasionally afterwards until the least have taken to the soil, after which they might have an occasional watering with liquid manure. Grown in this way Leeks with large and well blanched stems are obtained. We have also grown the Leek satisfactorily in trenches prepared as for Celery, and the soil drawn to the plants as they increased in growth, and until the trenches are made level with the rest of the ground.

Make now a sowing of Colewort for winter use, and as soon as the Celery plants from the second sowing become fit for planting out, let them be transferred to the trenches which have been prepared as recommended in a former Calendar. II. W. Ward, Longford Castle Gardens, Wilts.

The Bardy Fruit Garden.

THE unusually dry weather and high temperature most favourable to the propagation of all kinds of insects, and every means must be adopted to keep their numbers in check. In making up mixtures for their destruction, it should be borne in mind that soft water is by far the best for diluting insecticides, and, failing that, soap-suds can be utilised for the purpose, or an ounce of soft-soap added for every gallon of water, and to this add the killing mixture recommended in a previous Calendar. A thorough wetting is the principal thing to aim at, so that the trees are best syringed when the sun is low, and a thorough washing given next day with clear water to wash off the feeble and dead insects. We have found the tobacco-juice manufactured by Messrs, Corry & Soper, and recommended in last week's number, p. 678, to be of excellent quality, and invaluable as an insecticide.

in last week's number, p. 075, to be of exceining quality, and invaluable as an insecticide.

The leaves affected with curl on Peach trees had better be picked off. Gradually thin the shoots of this year's growth, but not so as to expose the fruit just yet to the full blaze of the sun. Apricots will require looking over—stopping brenstwood and keeping a sharp look-out for the grubs that lie rolled up in the leaves. Pears trained on walls, as well as those grown as pyramids, will need constant pinching to keep them in bounds and save the knife later on. See that newly planted trees do not suffer from want of water at the roots; a thorough soaking, followed by a mulching directly afterwards, to help in retaining effect. Strawberries, in the absence of rain, will require watering, using a pot without a rose, and an effectual soaking is wanted, more especially on south borders and in light soils: the north borders will take care of themselves for the present. The Kaspberry will also require attention: in many cases watering and mulching will be required, this being a a surface-rooting plant that soon suffers in dry weather.

weather.

See that the Strawberries which have been forced do not stand about roasting in the sun, but quickly plant them in well manured ground at once, and be sure to put them in deep enough, as oftentines the soil settles, and the plant is left high and dry at the mercy of the weather. The Vines on walls are now shooting away strong from each spur; only let one shoot grow, and rub off the others, giving preference to those showing fruit. Green Goseberries are now being picked both for tarts and bottling; in gathering them first go over those bushes which are heavily enopped with fruit and gather one-half. This will enable those left to swell off more freely, and keep a close watch on the first appearance of the caterpillar, and have the Hellebore pull at hand ready in case of need. Y. Rutt, Eridge Cattle, Sursex.

A FEAST of Strawberries—not a feast for the palate—certainly not; even the proud beings who are permitted to instruct their fellows in theoretical or practical gardening may not at this season of the year aspire to such delights. They are for the noble, the wealthy, the patrician, but not for the needy. No; our feast of Strawberries is but an optical one-a feast of richness and beauty to the eyes, but not for the taste; for are not Strawberries obtaining in the market the price of from 5s. to 9s. per pound, according to quality, or somewhere thereabouts? And to eat Strawberries is to eat money literally-a species of luxurious living not to be dreamt of by the needy. But what the palate may not taste, the eyes can enjoy-nay, even revel in; and perhaps in the really beautiful sight before us we find far more of real enjoyment than will Dives when he shall partake of some of these luscious fruit, which, ere they grace his table, shall have cost him almost double the amount we have named.

This feast is found at a market growing establishment, where not a thousand or two, but many thousands of plants are annually forced, and done well-perhaps as well as pot-Strawberries can be done: for where the forcing of these is a speciality of trade, and one that has been carried on in the same place for more than thirty years, it is but natural that the highest culture should be looked for, and the best results found. We not long since referred to the beautiful show of Cyclamens seen in the houses of Mr. RICHARD CLARKE, at Twickenham, and looking in again a few months later find that a great transformation scene has been enacted in the interim, and the huge areas of flowers have given place to luscious richly coloured fruit. It was a sight not soon to be forgotten. On entering one long leanto range of houses 150 feet in length, one sees nothing but Strawberries from end to end. There were three throws on the front shelf, five rows on the rising stage, and one on the back shelfnine rows in all, in various stages of fruiting, but nearly all carrying ripe fruit. Of course the best fruits are gathered every day, and are run into market, therefore there cannot be seen that show that private growers may sometimes make when with a few scores of plants from which they gather perhaps but twice a week, they now and then have reasonable cause to be proud. But here Mr. CLARKE grows a thousand perhaps where many private gardeners only grow a score; and indeed he grows in his houses and frames only Cyclamens and pot Strawberries, both being done very largely and very well.

Yet we are not quite exact in saying only pot Strawberries are grown, for in some long ranges of low frames there may be seen hundreds of large plants literally laden with fruit that were last year forced in pots, then planted out, and early in the spring were lifted with balls of soil and roots, carried in and planted in rows 18 inches apart in these frames, and then littered over both to protect the roots and the fruits. All these are "Napiers" (market growers seldom trouble themselves about prefixes), the which, Mr. CLARKE mentions, do so well under glass but do

not compare with "Paxtons" in market value outdoors. To securesize and quality the fruithere, as with the pot plants, will be liberally thinned. The pot plants are all in large 32's, a good useful size; and it is worthy of notice that every plant, though there are so many thousands, stands in a saucer filled with soil. That this method of culture has much to do with the splendid crop of fruit we see there can be no doubt. Plants stood on such beds of soil have in a fortnight sent down roots into them so freely that lifting the pots brings up the whole of the soil and saucer bodily. Mr. CLARKE holds that these saucers of soil render great service in helping to swell and finish the fruit.

In addition to the long range we have mentioned there is another, some 110 feet long, filled as the other, and a glorious show of fruit; whilst low houses and frames are full also. Outdoors the whole of the ground is full of Strawberry plants also, and the produce in good seasons is marvellous; yet, strange to say, Mr. CLARKEHAS grown Strawberries, and these alone, in the same soil for thirty-two years right off. Of course plenty of manure is given, and the rows being already 30 inches apart, the succession plants, always from pits, are turned out in rows between the old ones, and those are cleared off or dug in as is convenient. If the forced plants do not give enough (and Presidents and Paxtons are preferred for outdoor culture), then a big lot of runners is dibbled up thickly in the autumn, and these are potted in the spring for planting out as soon as the fruit is gathered. Of course, in so many years the mere addition of the good loam in which the pot plants have been grown greatly helps to replenish the soil. A vast deal more might be written about this feast of Strawberries, but it is a case in which good wine needs no bush.

ABNORMAL GROWTH OF VINES. - The following letter was sent to us from the Washington Department of Agriculture by Dr. TAYLOR: --"1 send to your address by this mail (April 14) a specimen of Grape Vine stock sent to this Department from Mexico. No one here, entomologist or fungologist, is able to explain the cause of the abnormal growth. The disease is not confined to Mexico, specimens from Florida, New Jersey, and other States, have been received." The disease is clearly identical with what is figured by ESPRIT FARER,* whose name is well known for his experiments on the connection of the genus Ægilops with the origin of Wheat. It is not common in this country, and as far as we have seen, the knots are not accompanied by adventitious roots, as in the specimens before us, and as figured by FABRE, so that we can scarcely attribute it to their presence. There is, indeed, a form of canker in Apple trees which is caused by the development from the bark of bundles of roots, the tips of which decay and thus cause canker; and we have seen exactly the same cause of disease in Lilies, where the roots are numerous, and disease is carried upwards into the bulb from the decay of their spongelets. all the specimens we have seen there is a white mould, so that at first we were inclined to think that the disease might be caused by an Ascomyces, like the hag-plums, but examination did not confirm the notion, and the white mould on the American specimens consists of Sporotrichum minutum, GREV., which is the same thing with Verticillium nanum, B. and BR. The mass, which is developed from the centre of the shoots, consists entirely of amorphous cells, quite distinct from the structure of the Vine branch. The specimens are in too old a condition to enable a satisfactory sketch being taken, but we hope at some future time to get specimens in an early stage of growth, with which we shall be more successful. M. 7. B.

— THEORETICAL HORTICULTURE.—It will be remembered by those brought into contact with the members of the Cercle d'Arboriculture de Belgique who visited this country a couple of years since, that they were charmed with our bautiful private gardens and parks, and with our market and trade plant

establishments, but were disappointed with our general culture of market vegetables and fruits. The announcement we made last week respecting the appointment in Paris of a public instructor in the art and practice of market gardening shows how much, in this respect at least, the French excel us. find our trade growers complaining, and with ample cause, that the Continental growers are beating them in the production of vegetables, fruits, and flowers; and perhaps too hastily we, or rather they, have jumped to the conclusion that all the foreigners' success arises from a preferential climate, whilst it may he that keener application to the theory and practice of gardening, and higher appreciation of the art of good culture, have really been the operating Our systems of culture are doubtless good so far as they go, but they are not scientific, and too often proceed upon a rule-of-thumb basis. Why have we here no school of horticulture, no professor of the theory and practice of gardening, no really earnest effort hy higher methods of culture and closer study of our formidable competitors' elements of success, to counteract their distressing effects upon home market gardening? The absolute necessity of something practical heing done becomes more and more apparent every year.

— LINNEAN SOCIETY.—The anniversary meeting was held in the Society's rooms on Saturday last, Dr. Duncan, one of the Vice-Presidents, in the chair. The financial condition of the Society is very satisfactory, and good progress is making in all departments. Dr. Duncan's address was a very compact and appropriate one, on the special work in science of LINNEUS and of LAMARCK respectively. The leading points were skilfully set forth without unnecessary digression, and the contrast between the hent of mind and between the career of the two men instructively drawn. Sir John Lubbock was beelected President, Mr. Frank Crisf Treasurer, Messrs. B. D. Jackson and G. J. Romanes Secretaries; as new members of Council, to replace others retiring in rotation, Messrs. Bayley Balfour, Carretters, Under W. P. Sladden, and Colonel Godding Mustern were elected.

—— ANOPLOPHYTUN AMŒNUM.—A Bromeliad with curving stem, densely crowded with long linear subulate leaves. The blue flowers are in spikes, surrounded by orange bracts. A native of Brazil. Figured and described by M. ED. MORREN, in the Belgique Horticole, 1833, t. xviii.

— EALING, ACTON, AND HANWELL HORTI-CULTURAL SOCIETY.—On the 27th inst. a large body of the members of the above Society entertained at a complimentary dinner their President, the Rt. Hon. S. H. WALPOLE, M.P., in commemoration of the fact that the present year is the twentieth anniversary of Mr. WALPOLE filling that position. E. M. NRISON, ESQ., J.P., of Hanger Hill House, occupied the chair, and among the company present were Lord GEORGE HAMILTON, M.P., the Rev. Professor HENSLOW, and many of the leading inhabitants of Ealing. The toast of "Success to the Ealing, Acton, and Hamwell Horticultural Society" was responded to by Mr. R. DEAN, the Hon. Secretary, and that of "Success to the Eotanical and Horticultural Societies of the United Kingdom" by the Rev. Professor HENSLOW. The hall was decorated in the most charming manner by Mrs. H. B. SMITH, and the proceedings throughout were of the most interesting and satisfactory character. It was announced that the summer exhibition of the Society would take place in the grounds of the Manor House, Ealing, on Wednesday, July Q.

— TULIPA KESSELRINGII, REGEL.—A new Central Asiatic Tulip, with the bulb-coats hairy, four to five crowded leaves at the hase of a solitary flower-stalk bearing a small flower, the segments lanceolate, yellow, the outer ones striped with green on the outer surface, and with a reddish margin. Bot. Mag. t. 6754.

— DIPLARRHENA MORAEA. — The babit and foliage of this pretty Irid hears a striking resemblance, when out of flower, to some of our narrow-leaved Flags, such as Iris stylosa and I. graminea; but this illusion is dispelled on the expansion of the flowers. These are white, with the exception of two of the inner segments of the perianth, which are for the greater part yellow, and comparatively very small.

^{* &}quot;Observatioos sur les maladies regnantes de la Vigne, dans les Bulletins de la Société d'Agriculture de l'Herault Jan.—Mars, 1853.

This disparity is the more noticeable in the slightly nodding flowers, and the arrangement of the perianth leaves so as to facilitate, or even to encourage, the entrance of insects for the purpose of fertilisation. Several flowers are produced in succession from the terminal spathe, and are faintly but sweetly fragrant. Two species only are known, natives of Australia and Tasmania, and the present one is flowering freely in the Cape-house at Kew.

DRYMONIA PUNCTATA.—The species of this genus are natives of Tropical America, where they are shrubby, prostrate, and rooting, or epiphytical upon trees, to which they cling for the support of their ordinary or stoloniferous stems. This species has pen-

pots, and owing to the mild winter, and with the extreme care which is always bestowed upon the plants here, they grew into very fine specimens, characterised by healthy vigorous foliage, and that compact half-shrubby habit which is always characteristic of the Reading strain. The great object of Messrs, SUTTON & SONS in fertilising these flowers is not only the increasing of the size and the build of the flowers, but also in developing new shades and combinations of colour. One of the chief charms of a collection of Calceolarias is the variety of tints they present to view, and in this respect the Reading collection is most noteworthy. It is perhaps not to be wondered at that fine and striking specimens of herbaccous Calceolarias are always one of the

is somelimes taken to them when massed alone in a bed on account of the sameness they present for the rest of the year when out of flower; but there is no reason there should be cause for complaint on this head, if only a little forethought is brought to bear in associating a few other things with them in sufficient numbers that will follow with their flowers, such as the common white Lily (L. candidum), Tritoma Uvaria, Spirzea palmata, and Anemone japonica, pink and white. These will thrive satisfactorily with the Azaleas without encroaching or being encroached upon so as to do or to receive injury. The following is a selection of the best and most distinct now in flower at Coombe Wood:—Altaclarensis, goldenyellow; occcinea, dark scarlet; cruenta, orange-

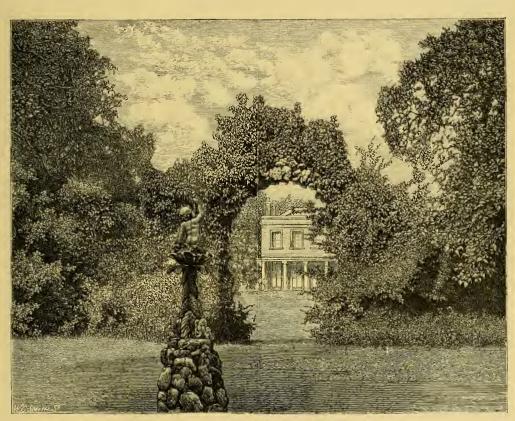

FIG. 135,-VIEW IN THE GARDENS AT EALING PARK. (SEE P. 704.)

dent shoots of the latter sort, which are very graceful when the plant is cultivated in a hanging-basket, as it ought to be. The flowers are white, with a yellow throat, and beautifully spotted with purple on the limb, while the margin is fringed. Although extremely pretty, they are notwithstanding of secondary importance from a decorative point of view in presence of the elegant and attractive habit of the plant. It may be seen in fine condition in the stove at Kew, and there is a figure of the plant in the Botanical Magazine, t. 4089.

— HERBACEOUS CALCEOLARIAS AT READING.—
The annual display of these at the Portland Nurseries of
Messrs. SUTTON & SONS have this year been very fine;
but the hot drying weather of late, and the process of
fertilisation, had, when we saw them, somewhat impaired the beauty of their flowers. The collection
consists of about 200 plants, principally in Io-inch

features of the May show of the Reading Horticultural Society.

Seen, as these plants often are, dotted about singly in the mixed shrubbery, where they are overcrowded with larger things, little idea can be formed of the beautiful effect they have when massed in sufficient numbers to admit of all their varied colours being seen together, ranging as they do from white through all the shades of soft and deep yellow, pale and deep pink, pure or suffused with red, to scarlet and the deepest crimson. Their profuse habit of flowering, even when the plants are small, is not the least of their merits. These Azaleas are made a speciality in this nursery; all the best of the newer varieties raised in recent years are present in quantity, giving a mass of soft and brilliant shades of colour such as obtainable from no other class of hardy shrubs. Exception

scarlet; Daviesii, white; Decorata, pink; Elector, orange-scarlet; Florentine, rosy-pink and sulphur colour; Géant des Batailles, crimson; General Chasse, scarlet-red; Graf von Melan, hlush; Grand Duc de Luxembourg, scarlet; Invictissima, sulphur colour, striped salmon; Leopold I., sulphur, orange, and salmon; Marie Verschaffelt, pink and yellow; Nancy Waterer, yellow and salmon; Narcissiflora, primrose-yellow; Ne Plus Ultra, orange-scarlet; Oscar I., creamy-sulphur, piok shaded; prioegg graadiflora, deep piok; Rosy Queen; Sully, orangesalmon; Van Dyck, deep red; Van Houtte, red and yellow; Viscoccephala, sulphur-white.

—— SAGGITTARIA MONTEVIDENSIS.—"One of the most beautiful water plants, other than the Water Lilies, that has been introduced into the tropic aquarium of Kew since its establishment, and a very full grower and flowerer. Nothing can exceed the

snowy whiteness of the flowers, which are produced in succession, relieved as they are by the rich maroon blotches, bordered with pale gold at the base of each petal." As in our Arrow-head, the leaves are hastate, the flowers in loose terminal verticils each 2 inches across, with three large rounded petals as described by Sir Joseph Hooker. Native of Tropical and Subtropical South America. A figure is given in the Botanical Magazine for May, 1, 6755.

INTERNATIONAL HEALTH EXHIBITION .-Model laboratories of public health are to be established for the display and demonstration of methods of examining food, air, water, soil, and constructive materials of dwellings, disinfectants, &c. These laboratories will afford an instructive model for municipalities and sanitary authorities. 1. Physiological or biological, under the charge of Mr. WATSON CHEYNE and an assistant. 2. Chemical and Physical, including the methods of chemical and microscopical examination of water, soil, air, foods, clothing materials, constructive materials, &c., under the charge of Professor CORFIELD and an assistant. The following sub-committee to be appointed to superintend the arrangements :- Sir James Paget, Bart.; Professor Burdon Sanderson; Sir Joseph Lister, Bart.; Professor Michael Foster; Dr. Angus Smith; Dr. Buchanan; Mr. Ernest Hart; Mr. W. Watson Cheyne, and Professor Corfield. Laboratory for biological research .- The laboratory will be divided into a large room—the laboratory proper—and three small ones, two for incubators, &c., and one for cleansing purposes. The exhibit will include all the instruments, materials, and methods (short of the actual inoculation of animals) employed in the investigation of the bacteria and fungi associated with the zymotic diseases of man, animals, and plants. The methods of testing the power of disinfectants will, within the same limits, be also shown. In more detail there will be exhibited the materials and processes employed in preparing sterilised cultivating media-cultivations of various micro-organisms, especially those associated with disease-modes of demonstrating bacteria by staining, &c .- modes of investigating bacteria in air, water, and soil, and of isolating and studying the organisms found-methods for testing the power of chemical agents in destroying bacteria, with illustrations - photographs of the various micro-organisms-micro-photographic apparatus-microtomes, microscopes, incubators, purifying chambers, &c. Demonstrations will be given from time to time, at which several of the matters mentioned above will be illustrated, such as the forms of various micro-organisms—cultivations of some organisms to show their modes of growth—methods of preparing sterilised cultivating materials, and of carrying out a series of pure cultivations-methods of examining air, earth, and water for bacteria. Hygienic laboratory. - In this will be exhibited all the apparatus necessary for the physical, chemical, and microscopical examination of water, air, soils, foods, disinfectants, &c., and also for the examination of sanitary appliances. Illustrations of the following will be given: - Microscopical examination of water sediments; chemical examination of mineral and of organic matters in suspension and solution in water; growth of organisms in gelatine and sugar solutions; testing the value of filters. Methods for estimation of the carbonic acid in air, including the "household test;" detection of other gaseous impurities; chemical and microscopical examination of the organic matter in air. Mechanical, chemical, and microscopical examination of soils. Chemical and microscopical examinations of various articles of food and drink; detection of adulteration. Examination of "disin-fectants," wall papers, articles of clothing, &c. Apparatus for experiments illustrating the movements of air in pipes, &c., and its passage through various materials; methods for testing the soundness of drain-pipes and soil-pipes; the efficiency of traps and other apparatus; and any other experiments con-nected with hygiene. Physical, chemical, and micro-scopical demonstrations will be given from time to time.

—— SOLANUM MAGLIA.—This is the plant of which tubers were sent from Chili in 1822 to the Royal Horticultural Society as those of the true wild Potato, and which was figured as S. tuberosum by SABINE in Trans. Hort. Soc. Lond., vol. v., p. 240. It was found again by DARWIN in the Chonos Archipelago and mentioned in the Voyage of the

Beagle. Nevertheless, according to Mr. BAKER, this is not the veritable origin of the Potato, which is the species known as S. tuberosum, a native of the Andes of Chili and Peru. The present plant is nearly glabrous, with small, oblong, insipid tubers and white flowers. It is figured in the Botanical Magazine, t. 6756.

- CANDYTUFTS .- Between perennial, biennial, and annual Candytufts, we get a variety of fairly hardy flowers of much beauty and decorative excellence, and in the variety get also a long blooming season. One of the earliest and most striking is the fine white-flowered Iberis superba; indeed, the spikes of this kind on strong plants bear a close resemblance to the fine spikes seen on the new Rocket-flowered annual kind, Empress. This perennial kind produces flowers admirably adapted for cutting, as well as for massing in beds or borders; and though its habit is perhaps a little loose, yet strong old plants produce a splendid head of bloom. For smaller beds, or edgings, or on rockwork, none can excel the singularly beautiful and pure white Iheris corifolia, so dwarf and compact, and yet so very floriferous. Both these kinds will increase so easily by means of cuttings that any one may obtain a good stock in a season. Iberis gibraltarica, though a perennial, yet is not always found able to resist our winters; and, therefore, though its blooms are so fine, the variety is not so acceptable as are thoroughly hardy kinds. The new and very beautiful hybrid from gibraltarica, though an assumed perennial, is really best treated as a biennial. It is curious that, though there is so much of variety in the habit of growth of this hybridsome plants being large and robust, and others very dwarf and compact, foliage also varying considerablyyet the flowers throughout are almost identical in form and colour. In time, by careful selection of seed from the best forms, this variation may be got rid of. Sown in May, the plants will bloom in April and May of the following year. The new annual kind, White Empress, produces grand spikes from plants sown in August and dibbled out in a frame for transplanting out early in the spring. Of other annual kinds the new carmine and the crimson are beautiful, and produce singularly striking and effectual masses of colour in the flower garden.

— IMPATIENS FLACCIDA VAR. ALBIFLORA, Illustration Horticole, t. 619, April, 1884.—A white Impatiens, so like I. Sultani that it is generally, though, as it turns out erroneously, referred to that species in gardens.

-- DRACÆNA LINDENI. - A garden plant grown under this name having flowered in the stove at Kew, proves, as many suspected when it was sent out, to be a mere variety of the old Dracæna fragrans, of which a figure is given in the Botanical Magazine, 1081. The lanceolate elliptic gracefully arching leaves render the plant valuable for decorative purposes, but chiefly so when in a comparatively small state, and well furnished with foliage. Old plants are apt to branch, and, losing their lower leaves, become ungainly, although the plant in that condition is, notwithstanding, worth its room in a large warm conservatory for the delicious fragrance of its flowers. The whole inflorescence, with its shortened branches and densely capitate clusters of flowers, are the same as in the type, from which this variety differs by the broad creamy yellow bands of variegation on the leaves-a very important matter horticulturally.

—— STENOMESSON INCARNATUM. — A bulbous plant, with a scape terminated by two or three flowers with very long scarlet tube, divided into six shallow oblong ovate lobes, streaked with green on the outer surface. Gartenflora, t. 1147 (1884).

—— SEEDLING CARNATIONS.—It would be interesting to learn whether the elevation of the Carnation—and of course we include also its edged congener, the Picotee, in the reference — to the position
of a florist's flower has helped to render it popular as
a common garden flower or otherwise. Whilst some
tell us that the hard and fast rules of the florist have
but served to confine the cultivation to restricted and
select limits, the florists will doubtless as broadly
assert that in their efforts to promote the development of the highest form and excellence in marking
in the Carnation, they have, too, largely helped its
popularity as a garden flower. The matter is hardly

worth discussing, and certainly not in a cynical spirit; but, whether due to the florists or not, it is certain that there is a strong taste for Carnations as common garden flowers growing up, and that it is a taste that the trade is catering for. Thus in the production of wondrously blooming kinds we have to thank Continental seed-growers for the beautiful strains they send us-and those, too, so cheap that we marvel not to find plenty of these charming flowers in all gardens. When from packets of seed of any good strain we get robust plants that bloom with marvellous profuseness, and produce 80 per cent, of good double flowers, and these in wondrous variety of colour and markings, we may well wonder that the cultivation of such beautiful border flowers is not universal. It is true that, because of their marvellous blooming propensities, these seed-obtained Carnations can hardly be termed perennial, simply because they make nearly all blooming stems, and little or no That is, however, a matter of little moment, as seed is cheap and abundant, and it is but to sow in the spring of each year-and in the open ground, too—to ensure an abundant supply of robust plants. If we want to secure the fine self Cloves, and those richly-marked bizarres, flakes, and flames, which the florist so much prizes, we may sometimes get them from seed also, but it is more costly. Still there is this recompense, that the plants are true perennials, and may be easily perpetuated.

— TROP.EOLUM DIGITATUM, Gartenflora (1884), t. 1146. — Leaves peltate, five-lobed; flowers on long stalks, with scarlet spur and yellow fringed petals. A beautiful species, native of New Grenada, and, as it seems, cultivated in Messrs. IIAAGE & SCHMIDT'S establishment as T. Gättnerianum.

— TULIFA CUSFIDATA, REGEL.—Flowers white, with oblong acuminate segments. The bulb also is prolonged into a long neck. Received in the St. Petersburg Botanic Garden from Mr. ELWES, and figured in the Gartenfora, t. 1147.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 26, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:

—The weather has been characterised by very fine warm days and clear cold nights. Towards the end of the period, however, the conditions over our southern counties became less settled, rain falling and lightning occurring in many places. Temperature has varied greatly, and on the whole has been little higher than the mean. The maxima were very high; it hose recorded on the 33d or 24th were as high as 85° in "England, N.W.," 83° in "England, S.N. 88° in "England, S. 38° in "England, S. 38° in "England, S. 39° in "England, E.," and from 33° to 36° in nearly all other districts. The rainge of temperature was, therefore, very large everywhere, and at Newton Reigny on Friday the sheltered themcometer, after falling to 38° in the early morning, rose rapidly, and reached 35° by 3.20 F.M., giving a range of 47° in about twelve hours. At 3 40 F.M. (the dry bulb being \$5°) the wet bulb reading was \$5°, showing a difference of 27°. The rainfall has been less than the mean in all districts. Over the greater part of the kingdom there has been hardly any fall at all. Bright sunshine shows a very considerable increase in Viscotland, E., "10 69 in "England, N.W.," 70 in "England, E.," to 69 in "England, N.W.," 70 in "England, N.W., "70 i

— GARDENING APPOINTMENT.—Mr. THOMAS HOVELL has been appointed Manager of the horticultural department of the Preston Pleasure Gardens and Nursery Company (Limited).

MANUFACTURE OF RAISINS.

IT is said that there are but few localities in the world where this industry is carried out successfully. All our present foreign supplies come from Southern Spain and Italy, which sources have no rival in the The choice varieties of Grapes from world's market. which raisins are made require a very peculiar soil for their proper maturity, and also the conditions of climate where they can be perfectly cured are rare and limited. They must, for perfect results, be cured in the open air, in contact with a dry and heated soil, in an atmosphere void of all dampness, secure from rain and dew, and under the hottest sunshine. Artificial heat gives at best only a very inferior article. From these requirements it is easy to see why raisin production has taken a limited range, and why the vast Grape regions of the country have never attempted it. In Fresno County, California, vineyards are being established on a large scale, and it is believed that in this district will be found all the desiderata needed for the production of raisins. fruit needs only to be cut from the Vine with the utmost care, and deposited in a shallow tray set at its root, and left there to dry for a couple of weeks. It is then turned by placing an empty tray on top and upsetting the whole body, and then is left to dry a week or more longer. The heat of the tortid sun thus dries it completely. The dried bunches are then put by layers into a hox termed a "sweat-hox," holding about 100 lb., and covered up. Here the drying becomes perfectly equalised. Then the fruit is carefully and tightly packed in 10 lb. or 20 lb. boxes, interlaid and covered with fine paper, the covers are nailed tightly on, and they are ready for market. This is the plan adopted in California, and the experiment, so far, has proved both successful and satisfac-Already many thousands of acres have been planted with the peculiar raisin Grape. It is only recently that this industry has been attempted in California, and the workers have as yet had but little time to mature their processes. The Vines are young, and it is held that the raisin Grape gives its best products upon Vines of considerable age.

THE INTERNATIONAL EXHI-BITION AT ST, PETERSBURG.

(Continued from p. 680.)

OUR notes commence in an annexe to which we have not yet referred-a hothouse for the more tender plants, and a garden for the exhibits of trees, shrubs, and certain other hardy plants. In the entrance to it we find an excellent collection of models of farm and garden roots, by Mr. Ernst Benary, with various fruits, pictures of the preceding, and of flowers, There are, also, various pictures from the *Illustration* Horticole, basket-ware from the Institution for the Blind on the Quai du Canal Catherine-all for garden use; Japanese and other potting-ware; tiles for greenhouse floors, exhibited by a Russian firm; Mushroom-spawn, we believe from Dr. Werner, of Breslau, loose in texture, sandy, and quite different from what we see in England.

PLANTS,-The first collection of plants is a group of Araliads from the gardens of the Grand Duke Constantine Nicolaievitch, including A. nobilis, a fine species with oblong sinuated leaves, and others with which we are familiar. In a fine group of small Cycads from the same gardens we notice Zamia linifolia at once striking from the filiform segments of the leaves, and Zamia Fischeri, so well furnished as to be good for table decoration. A fine collection of succulents, a feature of the Exhibition, is exhibited by Messrs. Haage & Schmidt, of Erfurt, who show the extremely rare Anhalonium prismaticum, Leuchtenbergia, and Pelycophora. Another fine collection is exhibited by Mr. F. A. Haage, jun., of Erfurt, who has a fine plant of Pilocereus Haagei. There is also an interesting collection from the Botanic Garden, in which we find the curious and pretty Mamillaria micromeris, with small, closely applied spines. Orchids are poorly represented, but we find a set from the Botanic Garden, one of them in it being the curious Bifrenaria inodora, with olivaceous segments and a purple lip. Some others are exhibited by Mr. O. Bock from the gardens of Mr. Pastoukhoff. is the splendid collection of new plants of the Compagnie Continentale d'Horticulture, of Ghent, which, we believe, has obtained the greatest success of the Exhibition: and Mr. Linden's representative, M. J. Von Mol, was complimented by the Emperor, who purchased a set of new plants; and their Imperial Highnesses 1st prize, which consisted of two vases of rare marble, worth £100, or 1000 roubles, has fallen to this collection.

NEW PLANTS.—Among the new plants of 1884 are some very fine Aroids. Alocasia imperialis is a splendid species, in habit not unlike Alocasia macrorbia, but in substance like thick leather, and blue-bronze in colour above, purple beneath. A. regina is similar and of the same species, but darker in colour. These will be known among the best of new plants for this year. Homalonema Seissmayerianum is amply lurnished with broadly cordate dark green leaves. Philodendron Regelianum is not unlike P. crinipes; Pothos Enderiana is striking, because of its black-green foliage, and it seems excellent for clothing a wall. Schismatoglottis decora and variegata are beautiful plants, with white variegation. One of the most striking Aroids, from a botanical point of view, is Cyrtosperma matrieffiana, from Sumatra, with prickly stems and Tacca-like division of the leaves. With this exception the preceding Aroids are all from Borneo. We have omitted Curmeria metallica, a fine reddish-brown leaved kind. Other plants of this year not Aroids are Curculigo seychellensis, with prickly stems and divided leaves, which appears to us to be rather a Carludovica, though we remember none with spines; Pandanus leucospinus, good in its present small state; Livistonia Wageriana, with long, yellow, depressed spines; Croton Oosterziei, Pandanophyllum Wendlandi, like P, humile, but darker in colour; and Calamus kentiæformis. Among previous introductions most particularly are

Zamia maypurensis, from Venezuela, apparently distinct; and Gynnogramma schizophylla gloriosa, finer and more plumose than the species; Tillandsia Pastirchoffiana, and plumose than the species; Tillandsia Pastichoffiana, and Aglaonema Rœbellini, from the Philippines, one of the best of this group, fine in foliage and in its white coloration. A fine Anthurium Andreanum from the Compagnie deserves notice. It is in habit almost like a Philodendron, 5 feet high, with internodes 4 or 5 inches long, and bearing many fine spathes. By MM. Chantrier Frères, of Mortefontaine, France, are exhibited two hybrid Anthuriums distinct, and described lately by M. E. André; of these Anthurium carneum x is a hybrid hetween A. Andreanum A. And

hybrid Anthuriums distinct, and described lately by M. E. André; of these Anthurium carneum x: is a hybrid between A. Andreanum and A. ornatum; the other, A. Chantrierii x: is between A. subsignatum and A. ornatum; both are fine plants in foliage, and the former possesses prettily coloured broad spathes with white spadix, effective and durable. A Chantrierii x: resembles in its spathe a narrow form of A. ornatum, but its foliage is even better and the petioles are shorter. Splendid Crotons of moderate size and magnificent: Colour, are exhibited also by Chantrier Frères, and of them the best are Empereur Alexandre III., of fiery red colour; Marquisie de l'Aigle, yellow spotted with green; and C. Carrieri, somewhat similar. These are broad-leaved kinds; of the Disraelt type is Mortefontainesi, much finer than its earlier precedent; and of narrow-leaved varieties, C. Bronetii, which is pendulous, and coloured red and yellow; C. interruptus elegans is also beautiful. also beautiful.

also beautiful.

Fine new and other Aroids are from the Botanic Garden, including an unnamed and distinct Philodencon, and some of Dr. Regel's own species, in particular Anthurium Gustavi, with large roundish leaves. M. Jacob Makoy, of Liege, exhibits Aphelandra Margaritæ, with bronzy leaves marked with white lines, and particularly some Bromeliacees, the chief among them being Tillandsia variegatat, like T. pubbosa, but beautifully variegated. He has also Cryptanthus Regeli, Tillandsia Greigi, Vriesia Barilleti, bearing bold inflorescences; and Tillandsia Quintusi.

Roses.-Returning now to the chief entrance to inspect the Roses of Russian growth, exhibited chiefly by C. T. Freandlich, nurseryman at Tsarskoïe Seloe, the Roses of Riskall glowth, channed chen'y by M.

C. T. Freandlich, nurseryman at Tsarskofe Seloe, who has received several medals, we noticed that the majority were budded last year, but these small plants for decorative use are floriferons, and the flowers large for the size of the plants. Specimens of large size are not entivated in Russia. Large gold medals were awarded to the exhibitor for his collection of Tea and hybrid perpetual Roses. A group of R. polyantia vars, by this exhibitor, to which was awarded a small gold medal, we think extremely charming, and it includes the white Paquerette, Ernestine de Barente, dark pink; Mignonette, flesh-coloured; and several others. The group is bordered by dark and pale varieties of R. Laurenciana. This exhibitor is the chief among but few others, and we believe that all are nurserymen.

Cincrarias are dwarf, and the varieties evidently good, but the cultivation of them appears difficult on account

Cincrarias are dwaf, and the varieties evidently good, but the cultivation of them appears difficult on account of the absence of sufficient light in winter, though from the Botanic Garden were some tolerably good. Mr. Ernst Benary contributes a number of single flowers, fine in colour and size.

Azaleas, like the Roses, are exhibited in small plants only, but these are well-flowered and perfect in colour. A large gold medal was awarded to Mr. Fr. Seissmayer, of the Tauried Imperial Garden, for a beautiful collection, well flowered and richly coloured. The same exhibitor showed a collection of Rhododendron ponticum in variety, very successfully flowered, and bright in colour. Ericas are few—two kinds in one collection colour. Ericas are few—two kinds in one collection only—E, persoluta alba and E. cylindrica, are said to be from Leipsig, and are of first-rate culture.

One of the features of the Exhibition undoubtedly is

the collection of plants contributed from the Botanic

Garden, and particularly the fine collection of hardy Orchids, of which there are about thirty-six species: as before remarked, it is the finest array of these interesting plants we have seen since they were cultivated by the Conte de Faris at Twickenham. But the content of t age: under the circumstances of this admitted under glass. There are many plants of particular interest from the Botanic Garden. A magnificent allium, A. Alexie-anum, is like a Haemanthus in its great broad leaves, and not dissimilar at a glance in its deuse heads of whitish flowers, which, however, are not show, but fine whitish flowers, which, however, are not show; but fine in their own way. Heterotropa asaroides, now were rare, is flowering amidst an arrangement of hardy plants. In this set is Iris Bladowi, Fritillaria imperialis are, incotora, like the species, but apparently with much smaller flowers. Wullenia carinthiaca is unusually fine in flower, Viola attacta lutea is a pretty and distinct plant; a variety of Senecio campestris called procera has orange flowers, and Kanunculus Bertoloni with pretty white flowers and round leaves in a choice kind. Trollius americanus pallidus flavus is one of the palest of this genus. Arnebia echioides, Corydalis Sewerzowi with flowers almost like those of Tropcolum polyphyllum, a well flowered plant of Rubas arcticus with some Primulas, will serve to show by their mention the nature of this collection.

The English garden to which we have before referred is

Thindax, with serve to show by their incidence we have before referred is practically furnished with plants from the Botanic Garden. A collection of Bamboos includes Bambusa argentea strata, the leaves with white stripes above and beneath, they are of a remarkably blue glancous colour. Arunifaria glancosecens, with small leaves and twiggy habit, is also characteristic in this collection. Succulents in good assortment and choice kinds are tastefully arranged by setting the pots amidst rough stone and bits of moss, which leaves nothing to he desired for good effect. The arrangement of the whole of this part is extremely satisfactory and well carried out. Plants from the Botanic Garden are distributed through the building and a plant of Heracleum pubescens variegatum.

from the Botanic Garden are distributed through the building and a plant of Heracleum pubescens variegatum. At annowr of fine specimens of Pulms are contributed from the Imperial Cardens of Tauride, St. Petersburg, Mr. Fr. Seismayer, and the imposing effect of the Exhibition is greatly due to their presence. Among them is one of the finest plants we know of Livistonia Hoogendorpi, splendid specimens of Latania borbonica, Corypta australis, Chamacrops chinensis, and Euterpe edulis, all perfect, the latter exceptionally graceful. Mr. Ed. Pynaert of Ghent sends a fine collection of twenty-five Palms, including a good Calyptronoma Swartzi, and a Cocos Mikaniana, large in size for its leaves, yet unbroken into segments. Mr. A. Van Geert exhibits a pair of fine Cycas Van Geerti; and a fine Cycas media elegantissima, one of the finest Cycads in the Exhibition, is perhaps the same as this. It has a stem about 4 feet high, and with its long graceful leaves it forms almost a perfect ball, the its long gracein leaves it forms annota a percet man, the leaves reaching below the very small tub in which it is growing. This is exhibited by Mr. Otto Abela, gardener to Mr. Polovistoff, of Taraskole Seloe. The same ex-hibitor has a splendid specimen of Ceratozamia longifolia, and equally fine and perfect is his Encephalartos Alten-

stein:

Of the commoner kinds, such as Encephalartos caffra and of the commoner kinds, such as Encephalartos caffra and revoluta, there are fine examples distributed through the building. Of the latter we saw fine examples in the nursery of M. Potesta, one of the principal ones of the city. Of the rare Cycas callicoma there are two or three specimens exhibited. The choicest collection of all, though the plants are small, is that from the garden of the Grand Duke Nicolaievitch, which contains Zamia angustifolia, somewhat remarkable for its narrow leaves, like Z. Inifolia, before referred to; Cycas Seemanni, Dioon spinulosus, Macrozamia corrilipses gyrata, with the pinnee arranged or twisted into a spiral; and several other choice, but less distinct, and more common kinds. In the open garden the following appear the most

other choice, but less distinct, and more common kinds.

In the open garden the following appear the most interesting. First, a very good collection of fruit trees under various forms of training, extremely well done, from the Academy of Forestry at Petrovskoie, near Moscow, and affording a good demonstration of the art. A collection of dwarf Coniters is noteworthy, from Mr. Stolborn, of Kappela. There is here a very interesting collection of alpines, exhibited by Dr. Regel and M. Kesselring; it includes the best specimens we have seno of Gentiana verna and Anemone vernalis; Colchicum Interum and C. crociffortum are flowering freely in pots, and Korolkowia Sewerzowi is finer than we remember having seen it before. There is a charming and perhet and Korolkowia Sewerzowi is finer than we remember having seen it before. There is a charming and perfect specimen of Androsace ciliata in a 32-sized pot, which is completely covered with its lovely rosy flowers. There are still other excellent plants which we must pass over with the mention of a Campanula alpina, which differs entirely from any of the plants so called in Eritain, by having a stiff erect spike, which rises from a rosette of leaves. In this garden are numbers of deciduous trees and shrubs from Dr. Regel and M. Kesselring, intended to form an exhibit of them, but they are not yet in leaf. From our Special Correspondent, (To be continued.)

INTERNATIONAL FORESTRY EXHIBITION.

We are now enabled to place before our readers a plan (fig. 136) of the buildings for the forthcoming Exhibition in Edinburgh, which, as we have said, promises to be one of great importance. The site of the Exhibition is in the grounds of Donaldson's Hospital, part of which is shown at A on the plan. The Exhibition building, B, consists of a nave between 600 and 700 feet in length, with three transepts and various annexes. The offices and committee rooms are shown at C. The main entrance is at D, other entrances at E, F; G is a tramway line leading from the city, separated from the terrace, on which the Exhibition building stands, by a shrubbery and fence. Part of the Exhibition will be located in the grounds around the building, as at H.

Home Correspondence.

Successional Flower Gardening.—We do not find the frequent anomalies mentioned by a recent correspondent in combining spring and summer gardening in the same garden. From early spring to late autumn I think it may be safely said there is never an entire absence of flowers out-of-doors. May is one of the least gay months in the long flower season as regards bulbs and herbaceous plants, but the bright tints of spring foliage and some early flowering shrubs make their lessened number but little missed. Snowdrops, Crocuses, masses of Scilla sibirica, winter Aconites, borders of Narcissus nanus, Chionodoxas, increasing as they do in beauty year by little missed. Snowdrops, Crocuses, masses of Scilla sibirica, winter Aconites, borders of Narcissus nanus, Chionodoxas, increasing as they do in beauty year by year, and the numerous other early spring flowers, leave no garden without excuse if it he not gay in early spring. These are succeeded without a break by the later spring flowers. Anemone fulgens, Queen Anne's Jonquils, Forget-me-Nots, Daistes, &c., in separate beds, by giving a few masses of different colours, add to the good effect of mixed beds and borders, which are by far the most interesting and satisfactory as the chief feature of a "perpetual" flower garden. June brings its wealth of early summer flowers, Pansies, Foppies, Lilies, Delphiniums, Pinks, &c., and Roses, though the latter, from late prunling, to avoid the harm of east winds, belong rather to July than June, and help to bridge over the slight dimination of blossom between early and late summer plants. Spring bedding plants are effectively replaced by half-hardy summer ones, though the latter hardly equal them in beauty, and the endless varieties of "mixed" flowers have no lack of brightness till frost and autumn rain dim their beauty. Even then, though brilliancy may be quite over, some of the autumn hardy plants are son as possible after the autumn flower garden has lost its beauty, which, with the fine varieties of Michaelmas Daisies, a few perenoial Sunflowers. longer. The needfal autumn work should be begun has soon as possible after the autumn flower garden has lost its beauty, which, with the fine varieties of Michaelmas Daistes, a few perennial Sunflowers, scarlet Lobelias, Gladioli, and other beautiful late flowers, need be by no means of a dingy kind. It requires thought and planning, and perhaps some extra trouble, to keep up a perpetual supply of flowers in a small garden for nine or ten months in the year; but, at all events, in favourable climates it can be done, and any extra trouble is well rewarded. With regard to half-hardy bedding plants, we plant Pelargoniums, &c., amongst such spring bedding plants as die down, without disturbing the latter except when the beds require to be remade, and even then the roots and butbs may be replanted at once. Summer flowers do none the less well, and if care be taken in planting the latter and in taking them up in autumn no harm is done to the bulbs. With Dasies, Forget-me-Nots, &c., which have to be removed to reserve ground for summer, it is easy to take up such as are in the way in time for planting out summer bedding plants; or, in the case of Begonias, to plant the tubers amongst them, even when spring flowers are in full blossom in April. 1 am inclined, though, to think that (if they are required to make much show before autumn) it is better to push them on a little before planting them out-of-doors late in May. Where the plan of leaving spring flowers in the ground is carried out, care must be taken to fit in the requirements of each to its summer successor in the different beds. Spring flowers requiring high culture, such as Amenone fulgeous, are well succeeded by variedifferent beds. Spring flowers requiring high culture, such as Anemone fulgens, are well succeeded by variegated Pelargoniums, &c., while such spring flowers as Queen Anne's Jonquils lose none of their brilliancy in beds not too rich for green-leaved Pelargoniums. We cannot manage a succession in Pansy beds, except by bordering them with early spring bulbs—a plan which brightens up any bed where plants do not either die down or bear yearly removal to the reserve ground. C. M. Owen.

Early Cabbages: Heartwell. — Every one requires at all seasons these wholesome vegetables, and all must have been interested in the correspondence anent them in your columns for some weeks. I thoroughly agree with your correspondent (p. 550) in his selection of the above; but for an early Cabbage he left unnoticed one of the most valuable and special characteristics of this variety. I allude to its immunity from "starting" or "bolting" to seed in the early spring months. Here and elsewhere whole squares with the market gardeners, and worse in private gardens, are rendered worthless by this means, and immense loss entailed. When the seed-bed is on a hard poorish soil, this variety will hold any length without starting for seed, and what this means those interested can appreciate. W. Y. Murphy, Clonmel.

Hybridising.—In making several thousands of crosses between varieties of the same species, one cocasionally perceives results that are difficult to explain. Why, for instance, should different varieties of zonal Pelargoniums refuse utterly to intercross? A little experiment made last season may throw some light on the subject, though it does not clear it up. Some time ago, the late Dr. Denny in one of his pleasant after-dinner speches at Chiswick, gave us an account of the origin of the white zonal sent out by him, viz., Prima Donna. It was, he said, a bud-sport from an older variety, one of the shoots of which, taking on a stronger habit, and producing flowers double the usual size, was propagated and named as above. Among other remarks, the Doctor said he had found it to be quite sterile, either with its own pollen, or as male or female parent with other varieties. On procuring a plant I tried the effect of crossing it with La Dame Blanche, a variety of French origin, having the same character as to sterility as Prima Donna. I only made one or two attempts and nearly all were successful, and I now have five seedlings intermediate between the two parents. I shall be much interested if any one can throw further light on the matter, as to whether La Dame Blanche also originated as a sport, or if there are other known cases of otherwise sterile sports being mutually fertile; and lastly, the reason why. C. E. Pearson, Chikwell Nurrerick, Notts.

Abies nobilis.—There are some charming specimens at Maresfield, and just now they are nost unique objects. The topmost whorl of branches bears the upright comes from 3 to 4 inches in length, and five-eighths of an inch in diameter. The general disposition of the pollen-bearing organs in flowers is above the stigma, so that fertilisation frequently takes place without the aid of insects. In the Abies under notice the tier below the cones carries the pollen-bearing catkins in clusters of three or four each, pale greenishs traw colour within, and tinted with crimson on the surface. A tap on the catkin-bearing branch disergaged the polleo, which rose in the still atmosphere in a beautiful golden cloud. The whole tree, some 7 or 8 feet high, with its pale green terminal shoots drooping, crimsoned catkins and chandelier-like cone-bearing branches, is extremely interesting and elegant. T. W., Harrow.

Double Narcissi.—I have been watching with much concern for some time past the gradual return to singleness of some of our large clumps of double white Narcissus. We attribute this deterioration to the clumps having increased so much during the twelve years that they have remained in the same border, the roots having probably become entangled and bound together, and the soil round them impoverished. We shall try if a change of place will bring back to the flowers next season their former beauty of doubleness. Though the only specimens remaining are dead, or nearly so, I send them in order to show the "undoubling" phase in which the Narcissus now is. E. V. B., May 27. [Can our correspondent oblige us with a bulb or two, the flowers of which are, or have been, in the intermediate stage? Ed.]

The Phylloxera.—I shall be much obliged if any of your correspondents can inform me if there are any Vines in this country inlested with the Phylloxera, and, if so, where ? as I am anxious to try a remedy on a Vine which may have the disease. For some time past I have been experimenting on a healthy Vine, in order to prove there is nothing injurious to the plant itself, with complete success, as after five applications of the remedy the Vine looks better and more healthy than it ever did before. I enclose my name and address. Hex. [The last specimen received was from the neighbourhood of Dorking. Ed.]

Araucarias.—Some of the finest specimens of the so-called Monkey-tree are to be seen at the extensive and picturesque nurseries of Wood & Son, Maresfield, Sussex; one, which seems to be the only female specimen (perhaps 35 feet high, is bearing a dozen huge green cones. The seeds, however, do not always ripen. There is a peculiar charm about a well furnished Araucaria when "standing at ease" on a nicely

kept lawn. It consists perhaps in the regularity of its whorls of branches, each denoting a year's growth, the long cylindrical imbricated branches of a dark, velvety green, bending in snake-like curves, the lowest tier resting gracefully on the sward with the terminal shoots reflexed. The soil of these nurseries must be lavourable to the growth of the Chilli Pine, as it is also called; when it has become necessary to remove portions of branches that encroach on the path, as if requently the case, the wound exudes a tough and viscid gum, but a vigorous young growth succeeds at the point where the branch is cut, T. W., Harrsow.

Vesuvius Pelargoniums Wintering Outdoors, -Referring to my note (in your issue for December 29, 1883) of these flowering in my window boxes outside at Christmas I have now to say that the plants have passed the whole of the winter outside and are now very vigorous and showy with flowers and buds. The Marigolds in a cottage garden near, mentioned as being in bloom at the same time have been in bloom ever since although they did not seem to like the few sharp frosts we had. *Yames O'Brien, Harrow-on-the-Hill.*

A Welsh Scarecrow.—The sexton of a certain church in North Wales has invented rather a novel and certainly very amusing method of preventing, or, rather, trying to prevent, the attacks of birds on his fruit trees, and which consists in displaying amongst the branches the full-sized likeness of a cat cut from the pages of some book or almanac. Regarding the efficacy of the experiment I am not able to speak. W. [We have seen this plan tried, but—familiarity breeds contempt. Ed.]

The Eucalyptus in Cornwall.—The enclosed letter relative to the cultivation of several varieties of Eucalyptus, may interest some of the readers of your paper. I distributed the seed of nineteen varieties to about 500 persons some four or five years ago, for the purpose of ascertaining whether other kinds than the E. globulus was fitted to our climate. The subject is interesting as bearing on the question of the reforesting of Ireland. Several correspondents have assured me that the Eucalyptus globulus grows well and survives the winters in that part of the kingdom. C. Roberts, F.R.C.S., Ebotton Row, Marjair, May 23. [See letter in our last issue, p. 678. ED.]

"Dear Sir.—Some time ago (four years, I think) you were kind enough to send me some Encadyptus seed. I think I was not successful in raising all the varieties, but found the citriodora, cinerea and sideroxylon grew readily. The former is, I think, acknowledged to be a delicate kind, and I have only allowed plants to remain out in the summer. There is little likelihood that they would stand a cold winter. The cinerea I am inclined to think from my observation is hardier than the more common globolus, and I am pleased to say I have a little tree from your seed which has been out two winters, and is now in bloom. I have hopes that with all the summer before it some of the seed may ripen. The sideroxylon appears also to be tolerably hardy. It has not grown very fast. One plant was out last winter quite unhurt, but it must be said we had very little frost. I have also the amygdalina and globulus—the former out-of-doors two years and the latter three. In a gurden near Falmouth, 7 miles from here, and nearer the sea, the globulus has attained a large size, and there are young trees grown from seed ripened there. Geo. Hart Taylor."

British Ferns,—It is to be hoped that the enquiry of "A. D. W.," in last week's number, will elicit an occasional paragraph, not merely with reference to the description of interesting varieties of our native Ferns, but also in relation to their history and the circumstances under which they have been found wild or raised from spores. There could not be a better model to follow than the descriptions in the Nature-frinted British Ferns, and a supplemental volume of this work, describing and illustrating the hest forms that have been found or raised since its publication would be welcomed by many. W. O'B.

Potato Types.—I have read with great interest "A. D.'s "communication on the cultivated Potato at p. 681. If the will give me bis address I will gladly send him a copy of my paper, in which all the six species are fully described and figured. Of the types other than tuberosum, Maglia, Commersoni, Fendleri, and Jamesli, are all four in cultivation in London gardens, but in all cases I am afraid the supply of tubers at present on hand is very small. They all appear to increase readily, and by another season I hope there will be no difficulty in any intending experimenter being able to get tubers of all four kinds. Y. G. Baker.

Flower Shows.—Some years since, when on the Council of the Royal Horticultural Society, I proposed a plan in order to induce more people to visit the shows, and thus increase the income. This plan was simply to well advertise the show some seven or ten days beforehand, stating the names of the exhibitors, with the sorts of plants they would show, and I promised that if they would do this I would send

extensive banks of Phalænopsis, Cattleyas, Odontoglossums and Vandas to different shows free of expense to the Council. My then colleagues feared the expense of advertising would be more than the extra number of paying visitors would contribute to their funds, and thus the idea was never carried out. Some twenty-five years since I first proved to the Orchid growers of those days the fine effect produced by flowering large numbers of the same species together. The object for which I write is to suggest to the managers of flower shows to carry out my idea before stated, and if not to the full extent at least let them print on a sheet of paper a list of the exhibitors and their exhibits, and let them be sold in the tent at 1d, or a sheet of paper a list of the exhibitors and their exhibits, and let them be sold in the tent at 1d, or yfd, each. I believe sufficient would be sold to pay for the cost, and it would be a great boon to visitors. I, for instance, at the last Botanic should have much liked to have inspected the alpine plants of Mr. Douglas had I known such to be in the show, but being, as I have been told, in a corner I did not see them. Robert Warner, Brownfeld, Chelmiford.

Rhododendrons at Messrs. Veitch's Coombe Wood Nursery.—The Rhododendrons are a grand feature in these grounds at the present time, and will be followed by other varieties a little later on equally promising, especially if we are favoured with the dripping weather now so much needed in this part of

the following, which are now in fine condition at Coombe Wood:—Blandyanum, deep crimson; Bylsianum, white and crimson; congestum roseum, light rose; Duchess of Edinburgh, crimson; Elfrida, rosy-crimson; erectum, rose colour; formosum elegans, pink, spotted; Frederick Waterer, glowing crimson; Guido, crimson; Kate Waterer, rosy-crimson, marked with yellow; Lady Lopes, light rose, dark markings; Lady Rolle, white and yellow; Leviathan, pinkish-white; Lord John Russell, pale rose; Marion, shaded pink; Mirabile, deep rose; Marion, shaded pink; Mirabile, deep rose; Mrs. Cameron, pink, orange spots on upper petals; Mrs. John Walter, white centre, bright crimson edge; Mrs. comeron, pink, orange spots on upper petals; Mrs. John Walter, white centre, bright crimson edge; Mrs. cameron, pink, orange spots on upper petals; Mrs. John Walter, white centre, bright crimson edge prose; Larose, which was a constant of the control of the best of which are Alarm, white centre, scarlet edge; Attrosanguineum, deep red; Barclayanum, rose; Caractacus, purplish-crimson; Celebrandum, dark purple-crimson; Charles Bagley, red; concessum, rosy-pink, centre paler; Currieanum rosy-lifac, fastuosum flore-pleoo, mauve; Francis Dickson, deep scarlet; Hector, crimson; John Spencer, rous white, crimson; H. W. Sargeant, crimson; John Spencer, rose colour, piok margio; John Waterer, crimson; Joseph Whitworth, deep purple-lake, dark spots; Lady

roots of plants are soon left without any moisture to feed on. Some think they remedy this by giving water, and so perhaps they do in a measure, but few give enough, and driblets are worse than useless, as the thirsty feeders come quickly upwards for the little they can get, and while in search of that it is snatched from them, as it were, by the parched air licking it up in its course, and instead of their cravings being satisfied they perish miserably almost within reach of what they most want. If one does water, and gives a thorough soaking, the ground, as we all know, cracks, and these minute fissures let it all in again, besides which they strain, and often break or rupture the roots. By giving a mulching all these evils are avoided, as, by shading the surface after or before the wash caused by watering, there is none of that panoing or hardening of the crust which always takes place without it, and instead of the rapid change from wet to dry, the soil remains uniform both as regards warmth and moisture, as the mulching, being of a non-conducting nature, not only prevents evaporation, but to a great extent stops radiation, and thus keeps the earth under in an equable condition, and so favours the roots of plants that are in it. Trees in the ordinary course get mulched by Nature, as there are the fallen leaves, and all kinds of dibris under and it must be a dry time indeed if some moisture is not to be

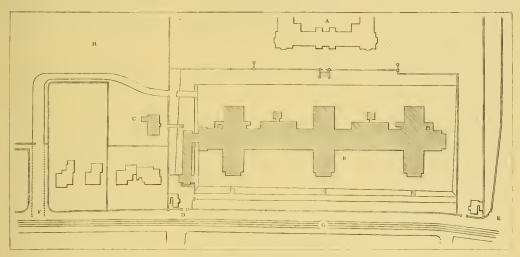

Fig. 136.--Plan of the edinburgh international forestry exhibition. (SEE P. 712.)

the kingdom, and which plays no inconsiderable part in the character as it does in the endurance of the flowers of these favourite shrubs. The collection here is large and comprehensive, including quantities of all the best varieties in cultivation, new and old, standards and dwarfs. The nature of the soil, combined with the attention bestowed, results in the annual production of an even profuse head of bloom, which, coupled with the natural formation of the grounds, that admits of the whole sea of gorgeous colour being taken in at once, presents a sight not easily forgotten. Such mild winters as the last and preceding of 1882-3, were exceptionally favourable to the very early flowering section of Rhododendrons, which deserve to be more extensively used than they are, but instead of planting them in beds or clumps amongst the late blooming sorts, they should be introduced to well sheltered nocks where they will receive protection from the surroundings, or their flowers are always liable to get cut off by the frosty nights that when sheltered a little they often escape. These early varieties were this spring extremely beautiful. Amongst the bulk of the later section that do not bloom until the season for frost is over there is still a difference of at least two or three weeks in the time of their flowers opening—a note of which requires to be taken by those who like to have the occupants of a bed all in bloom simultaneously. In the best varieties that bloom first after what may be termed the safe season is reached, that is, when the time that danger from frosty nights is passed, may be named

Claremont, scarlet, black blotches; Lady Eleanor Cathcart, rose, spotted with chocolate; Lady Frances Crossley, pink; Madame Miolan Carvalho, pure white; Michael Waterer, rosy-scarlet; Mr. Holford, salmon; Mrs. John Clutton, white; Mrs. Shuttleworth, scarlet, spotted j Mrs. Mendel, piok, centre yellow; Sherwoodianum, rose-lilac, spotted with chocolate; Sigismund Rucker, magenta, spotted; Sir Thomas Sebright, purple, blotched with bronze; Sydney Herbert, crimson, spotted black. The samessin appearance present in a bed filled wholly with Rhododendrons, objection to which is sometimes taken, can easily be corrected by the introduction of a few Irish Yews and pyramidal Tree Box, with here and there a plant of the Ispanese Acers, A. polymorphum sauguineum and A. p. atropurpureum; oothing can be more effective than the rich colour of their leaves in association with the flowers of the Rhododendrons. A singular instance of the effects of the severe frost in April is to be seen in this aursery, where some of the main stems of the Rhododendrons had their bark split right up for 2 or 3 inches, leaving it now in a curled-back state, as if it had been stripped from the wood by force. T. B.

Mulching.—If those who have gardens were only aware of the great benefits to be derived from mulching they would have little bare ground for the sun to play on among their crops and fruit trees, taking the moisture out of the earth, as it does by the great heat on its surface causing the most rapid evaporation, which goes on at such a rate during the day that the

found when the deposited rubbish is moved or disturbed. Planted on a sloping border, and attached to a wall, how altered are the conditions, as then, instead of the branches shading the ground over the roots, it is exposed to the full glare of the sun, and becomes almost baked by the heat. No wonder then that Peaches and Nectarines get red-spider, and look distressed when they have a crop of fruit to carry, as to feed that, and pump up sap to supply the place of that lost through the leaves, is a greater task than the roots can perform. With a mulching and one or two waterings the work is easy enough, and the sun on the foliage does good, as instead of causing flagging, and breeding or favouring insects, it hardens the tissues, and consolidates and makes firm the wood. Before putting the manure on to act as a mulching, it is a good plan just to prick up or break the surface of the ground, as then the rain or water, when given, goes in freely, and in some cases where trees stand out singly or are grown as pyramids, it is as well to form a basin, by drawing away a portion of soil and leaving a ridge round which will hold the water or liquid manure till it soaks down to the roots. Not only are all kinds of fruit trees assisted greatly by a muching, but Peas and Scarlet Runners are quite as much so, and in hot dry seasons it really is the ooly way to keep them in bearing. To be of full service it should be put along by the sides of the rows early, and the closer, in reason, it is put, and the more ground it covers, the better it will be for the plants.

as good as anything, and where it can be gol seaweed is valuable, especially for Cauliflower and Celery, which like the little salt that is in it. To put on flower-beds where Calceolarias and such-like are planted, I have found nothing equal to old Mushroom dung, which breaks up fine, and is not objectionable looking. Sifted leaf-mould is also good, and is neat, and lets the water through readily; and where the leaf-mould cannot be obtained, grass from the mowing machine may be substituted, as it soon dries and shrivels and forms a good mulching. For gardens near towns occaa-nut libre is the most comea-table commodity, and an excellent material it is if gardens near towns cocoa-nut nore is the most come-at-able commodity, and an excellent material it is if care be taken not to let it mix with the soil, amongst which it is very injurious; its decomposition is very slow, and during that process it breeds fungus, which is poison to the roots of all plants. 7. Sheppard.

Keports of Şocieties.

Royal Horticultural: May 27,

SCIENTIFIC COMMITTEE.—Present: Sir J. D. Hooker, in the chair; Messrs. Boscawen, W. G. Smith, Ridley, Murray, McLachlan, Smee, Houston, Professor M. Foster, Dr. Masters, and Rev. G. Hens-

Dietes iridifolia.—Mr. Ridley reported that the plant referred to him at the last meeting was Dietes

ridifolia.

Rhododendrons.—A letter was read from Mr. Far-Rhododendrons,—A letter was read from Mr. Par-rant (Isle of Man) relating to the specimen of R, lanatum shown by him at the last meeting. Nearly seventy trusses were in bloom at the same time. As to Rhododendron Falconeri Mr. Farrant stated that he believed his plant to be the finest in the kingdom— a huge bush, 10 or 12 feet high, and as much through, growing in the open air, was covered with splendid foliage. Mr. Farrant has also large specimens of R.

toliage. Mr. Farrant has also large specimens of K. barbatum, Roylei, Thompsoni, Fortunei, Aucklandiee, niveum, arboreum, and others.

Araucaria inbricala.—Mr. Farrant also reported that he had a monoecious plant of this species. Three male catkins had sufficed to fertilise about 200 female

male catkins had sufficed to fertilise ahout zoo female cones, which gave the tree a singular appearance, Wallfarwer on Black Currant, — Dr. Masters showed, on behalf of Mr. C. S. Broome, a specimen showing a Wallflower growing on a bush of black Currant. The specimen was found in a market garden belonging to Mr. Cole, of Ilford. The appearance suggested that a seed had been accidentally sown on a branch of the Currant, and that the roots had penetrated through the pith. Mr. Murray undertook to examine the specimen more fully, and to report on the result.

to examine the specimen more fully, and to report on the result.

The Descending Sap,—Dr. Masters showed specimens of Aucuba, on which he had experimented in various ways. In the first specimen the branch had been simply "ringed," he whole of the bank being removed, with the usual result of the formation of a swelling at the upper end of the wound. In a second specimeo two strips of bank had been removed, leaving the intervening portions untouched: a ligature in the intervening portions untouched: a ligature ing the intervening portions untouched; a ligature was applied around the centre of the wound. The result was the healing of the wound in the ordinary manner without any swelling above the ligature; thus showing that the lateral strips of bark permitted the currents of nutritive fluid and the formation of healing showing that the lateral strips of bark permitted the currents of nutritive fluid and the formation of healing tissues to be carried on in spite of the ligature. In a third specimen the bark had been only partially removed on two sides, the intervening portion being left intact. A ligature was applied as before. The result was a slight swelling on one side above the ligature, while on the other no swelling was apparent, the bark having apparently been removed on this side to a greater depth, as a portion of dead wood was observable, and which was becoming covered over with new growth in the ordinary manner. The fourth specimen was a branch which had been completely ringed, and the wound covered for a time with damp moss, afterwards allowed to become dry. The result was a swelling above the ligature and a formation of adventitions roots into the moss. Afterwards, when the moss was allowed to become dry, the whole branch, both above and below the ring, died. In all the other cases the injury done was partial, and confined to the portions above the wound, but in this last case the whole branch was completely browned and shrivelled. The experiments were all made on May 13, 1833.

Disease of Cress.—Mr. W. G. Smith referred to the

shrivelled. The experiments were all made on may 13, 1853, Disease of Cress.—Mr. W. G. Smith referred to the disease of Cress (Lepidium satisum) as caused by a putrefactive fungus named Pythium DeBaryanum. The disease is especially common in seedlings, so common that it is almost impossible to grow Cress in any position, or material, without the disease showing itself. Mr. Smith said the idea generally accepted amongst botanists was that the spores and mycelium of the fungus are so generally diffused throughout all sails that it is impossible to plant Cress seeds without

their coming in contact with the fungus. Mr. Smith considered this idea to be wrong, and stated that inferior seeds were much more subject to disease than the selected ones, as supplied by first-rate seed merchants. The following experiments were tried:—Collections of seeds were sown in ordinary soil in common flower-pots. Other seeds were planted in soil that had been well boiled, placed in pots that had also been boiled; after cooling, under bell-glasses. An equal number of seedlings came up diseased in both series, showing that the disease was not in the soil, but possibly on or in the seeds. A batch of seeds was then washed in water containing one per cent. of carbolic acid and planted in soil that had been boiled, placed in pots that had also been boiled, and allowed to cool as before. About one-fourth or one-fifth of to cool as before. About one-fourth or one-fifth of the seeds were killed, and the Pythium could only be the seeds were killed, and the Pythium could only be detected after long searching; showing that the fungus was probably present in some condition outside the seeds. Mr. George Murray suggested that the last experiment should be repeated, and the seedlings watered with distilled water only, to avoid the possibility of the Pythium existing in the water supplied. Proliferous Cones of Larch.—Mr. Houston showed specimens of Larch comes in which the axis of the cone was prolonged into a leaf-bearing shoot.

Insect Petits in Orchitis.—Mr. Boscawen showed roots of a Cattleya on which gallike formations were formed. Mr. McLachlan stated that the growths in question were connected with the presence of a hymenopterous insect, Isosoma orchidearum. An allied form was accused of destroying cereals in the United States, but inasmuch as it was contrary to the

United States, but inasmuch as it was contrary to the rule in this genus to be parasitic it was supposed by some that some other insect was the real gall-maker, and that it preyed upon the Isosoma. This, however, was at present merely conjectural, and other entomologists thought the insect named was really the producer of the gall.

Hybrid Sarracenias.—Rev. George Henslow stated that he had examined the microscopic structure of the pitchers of the hybrid Sarracenias shown at a recent meeting by Mr. Williams, as well as that of the parent plants, and found that the hybrids prescoted in their anatomy, as in their outward appearance, intermediate

appearances.

Desmids in Swimming Bath.—Rev. J. Henslow Demids in Samming Balh.—Rev. J. Henslow alluded to a brown and green discoloration on the tiles of a swimming bath, the water of which was heated to 80°, and in constant movement. On examination the deposit was found to consist of large numbers of Diatomacæ and Desmidieæ.

Daubling of Mercing* Assembling was accounted by the property of the pro

Doubling of Narcissus.—A committee was ap-pointed to examine into the alleged conversion of single to double Daffodils, and the circumstances con-nected therewith. It was suggested that selected bulbs should be grown at Chiswick for this purpose.

FLORAL COMMITTEE.—Present in Section A.: John Fraser in the chair; Messrs, E. Hill, J. O'Brien, H. Ebbage, H. Williams, H. Herbst, and J. Hudson. In Section B.: Shirley Hibberd, Esq., in the chair; Messrs. H. Bennett, H. Cannell, W. Bealby, J. James, J. Child, H. Turner, and W. B. Kellock. A somewhat smaller number of new plants came under the notice of the committee at this meeting, but more than one of unusual interest attracted the notice of the committee at this meeting. notice of novelty seekers. Perhaps the most interest-ing plant shown was a small one, with three leaves and a small two-flowered spike of crimson-scarlet flowers, of the rare Masdevallia racemosa Crossi, a plant we never saw in bloom before, and which is one plant we never saw in 6100m netore, and wairen is one of the most difficult Orchids to import alive, if not the worst that a collector could have to deal with. The honour of flowering the plant is due to its exhibitor, J. Fellowes, Esq., Churchfield, West Bromwich, and we regret that the committee did not make an award to the complete of the committee did not make an award to the complete of some interest, shown in J. Fellowes, 154, Committee did not make an award to it. Another Orchid of some interest, shown in flower by Baron Schröder and Mr. Salter, gr. to J. Southgate, Esq., Selborne, Streatham, was Cattleya Schröderiana, a plant which in habit and the appearance of the flowers seems to be intermediate between C, bicolor and C, Walkeriana. The colour of the sepals and petals is most peculiarabrone by the committee of the period of the period balellum is rich rosy-violet. Another pretty Orchid, shown by Baron Schröder, was Phaius burdus, with cionamorcoloured sepals and petals, and purple-brown labellum, yellow at the base. Cattleya Mossie var. alba came from Mr. Lee's collection, and also three forms of the fine Odontoglossum mulus, one of which bore a three-branched spike of thirty-four flowers, which was voted a Cultural Commendation. Mr. Lee also sent some little gems in flowering plants of the rats was voted a Cultural Commendation. Mr. Lee also sent some little gems in flowering plants of the rare and diminutive Masdevallia tridactylites, M. calura, M. Arminii, and M. cuculata. Mr. White, gr. to C. Dorman, Esq., showed a fine example of the showy Masdevallia rosea, with about three dozen expanded flowers, which also received a Cultural Commendation. From Baron Ferdinand de Rothschild, Waddesdon Manor, Aylesbury, came the very fine specimen of Odontoglossum Hallii leucoglossum, noted in our last number, and which, besides being Culturally Commended, was recommended to the Council for the award of a Medal. From W. Vanner, Esq., Camden

Wood, Chislehurst, came a specimen with three spikes of the curious Cymbidium rhodocaris, and Cattleya Mendelii marginata alba, a very good form. Mr. Cummings, gr. to A. H. Smee, Esq., also sent a small group of Orchids which included Cattleya labiata Roezlii, with its pretty purple-stained lip; a fine variety of the chest-nut-red Oncidium crispum; Brassia Keileana, with brown sepals and petals, and creamy-white labellum. Mr. R. Dean again showed his new Mimulus moschatus Cloth of Gold, and received a higher award than was made to it at the previous meeting. Mr. Bealby, The Laurels, Roehampton Park, showed a fine new Ivy-leaved Pelargooium, named Isidore Feral, a lovely peach-coloured double-lowered variety, with very large pips, and a good-sized truss. Mr. S. Ford, gr., Leonardslee, exhibited a couple of stems of Bambusa Metake, about 10 feet long, showing the line growth it makes in that part of the country. Messrs, Veitch & Sons showed a couple of new Tree Carnations, and received a Frist-class Certificate for one named W. P. Milner, the finest pure white that has yet been introduced, the petals being broad, the flower of excellent shape, and very pure. Messrs. Hooper & Co., of Twickenham, showed Carnation Madame Pynaert, which could not be distinguished from the pink variety of Souvenir de Malmaison. Messrs. Cannell and Mr. Eckford both contributed cut blooms of Pansies; and Mr. R. May, Leyburn, York, sent some plants in pots of his new yellow Paasy Golden Circle, a bold, free-flowering, bright coloured variety for pot cultivation. The New Plant and Bulb Company, Colchester, cent a neat collection of new Japanese Acers, principally forms of A. septemlobum and A. palmatum, together with several plants of Cypripedium spectabile.

The awards made were:—

The awards made were :-

FIRST-CLASS CERTIFICATES. Section A.

To Baron Schröder, for Phalus Iuridus.
To Baron Schröder, for Cattleya Schröderiana.
To Mr. C. J. Salter, for Cattleya Schröderiana.
To Messrs, Lucombe, Pince, & Co. for Passiflora
"Constance Elliott."

Section B.
To Messrs, Veitch & Sons, for Carnation W. P. Milner.
To Mr. W. Bealby, for Ivy-leaved Pelargonium Isidore Feral. To Mr. R. Dean, for Mimulus moschatus Cloth ot Gold.

CULTURAL COMMENDATIONS.

To Baron F. de Rothschild, for Odontoglossum Halll leucog Iossum.
To W. Lee, Esq., for Odontoglossum mulus grandi

florum. To C. Dorman, Esq., for Masdevallia rosea.

To C. Dorman, Esq., for Masdevallia rosea.

FRUIT COMMITTEE.—Present: Henry Webb, Esq., in the chair; Messrs. J. Burnett, S. Ford, G. Goldsmith, J. C. Mundell, C. Ross, G. T. Miles, C. Silverlock, G. Bunyard, A. Howeroft, R. D. Blackmore, and John Lee. The first of the series of fruit and vegetable shows held in connection with the Health Exhibition brought a good attendance of members, and a larger number of subjects for them to adjudicate upon, than is usual at this season. Mr. J. F. Barter, Lancefield Street, W., a very successful cultivator of Mushrooms for market, sent a very fine sample of his produce, together with some bricks of spawn of his own make, and was awarded a Cultural Commendation. Mr. Miles brought up an excellent dish of Chelsea Gem Peas, a good early variety for growing in cold frames, which the exhibitor thinks very highly of. It grows only to the height of about 15 inches, and is a free bearer. Mr. Gilbert, Burghley, sent some fine Broccolis, Gilbert's Late Queen, very closely resembling Cattell's Eclipse, and which the committee requested should be grown at Chiswick cortrial. Mr. Eckford, gr., Boreatton Park, Baschurch, sent another verying celled Mr. Orgens, and help. committee requested should be grown at Chiswick for trial, Mr. Eckford, gr., Boreatton Park, Baschurch, sent another variety called May Queen; and Mr. S. Ford, gr., Leonardslee, Horsham, sent Ford's Latest of All, but neither stood the test of comparison with the one shown by Mr. Gilbert of the very fine new sort called Model. Seedling Mclons were exhibited by Mr. Taylor, gr. to J. McIntosh, Esq., Dunevalled, Mr. Bresse, Petworth; and Mr. Howe, Benham Park, but none passed the committee's standard.

THE FRUIT AND VEGETABLE SHOW.—At this meeting, which was held in connection with the Health Exhibition, culinary vegetables and fruit were the productions of the greatest interest, flowers occupying a subordinate position, and after the surfeit of hornical content of the surfeit of hornical content of the surfeit of hornical condensate position, and after the surfeit of hornical condensate position, and the previous week, it was a relief to find the edible section brought into notice. The vegetables shown were generally very creditable to the growers, but some classes were but poorly represented, notably Strawberries in pots, Peaches, Nectarines, Cherries, and Pines; whilst Grapes, both black and white, were shown in considerable quantities. For the collection of vegetables of this srason's growth Mr. A. Waterman, gr. to A. Brassey, Eaq., Preston Hall, Aylesford, was awarded the rst prize, In

nis collection were finely grown French Forcing Carrots, Brown Globe Artichokes, Canadian Wonder Kidney Beans, of great size, and quite tender; Larly Milan Turnips. Connov-r's Asparagus, Vicks' Criterion Tomatos, White Italian Onion, particularly large and clean in growth; and the Pea Culverwell's Marrow. The 2d prize was taken by Mr. Miles, gr. to Lord Carrington, Wycombe Abbey, with a collection, but very little behind the former; in this were very large and ripe Stannfordian Tomatos, Little Gem Peas, Veitch's Early Forcing Cauliflower, the shapely Potato, Lady Paget, and Cucumber Tender and True, well finished off. Mr. T. Lockie, gr., O. Økley Court, Vindsor, was 3d. This rock contained well-filled pods of Abamas, Cucumber Purley Park Hybrid. Negro Long very big Green Globe Artichison and the other competing collections were to be sone good samples of the following: — Woodstock Kidney and Veitch's Ashleaf Potatos, Trophy and Hathaway's Excelsior Tomatos, Telegraph Pea, Early Munich Turnip, some very large and firm Leannington Broccoli, and nice Early London Cauliflowers. In the amateurs' competition for the best fifty heads of Asparagus, Messrs. Cheshire Bros., 24, St. Botoloph Street, Colchester, were 1st for a large, evenly-sized succulent lot; 2d, Mr. F. A. Colc, Colchester, with as large, but less nicely selected samples of market—that is, with much uneatable such bush as a warded to Mr. Gr. R. Growth and the such as a warded to Mr. Gr. R. Growth and the such as a shale of others; 2d, Mr. A. J. Houpard, Brick Farm, Kew. From the above it will be seen that the lion's share of the awards were taken by the Colchester growers—market and others. For French Asparagus, 100 heads, Messrs. Webber & Co., Covent Garden, were awarded the test prize. For the best fully heads grown in a natural way—that is, with more grown by Messrs. Stewart, Goldsmith, Speed, and Herrin. Cauliflowers and Broccoli Late Queen, and Veitch's Early Foreing Caulifilower. The competition in the class for collections of Cabbages brought a la

Goldsmith, Hollander.

Salad materials were in abundance, but there was nothing out of the usual run of kinds used—no blanched Dandelion, Chicory, Corns-slad, Chervil, Garlic, Celery or Celeriac. The 1st prize was awarded to Mr. R. Gilbert, gr., Burghley House, Stamford, whose collection consisted of Cos and Cabbage Lettuces, Tomato Vick's Criterion, Tarragon, French Sorrel, Cress, Mustard, Onions, and the Olive-shaped Radish; 2d, Mr. C. Waite. For six bunches of Radishes,

rst, Mr. G. Richards, gr. to the Earl of Normanton, Somerley House, Hants; 2d, Mr. C. Waite; 3d, Mr. S. Haines. Mr. W. Allan, gr., Gunton Fark, Mr. R. Gilbert, and Mr. Goldsmith were awarded respectively 1st, 2d, and 2d for two beads of Lettuces.

S. Haines. Mr. W. Allan, gr., Gunton Fark, Mr. R. Gilbert, and Mr. Goldsmith were awarded respectively stst, 2d, and 3d for two heads of Lettuces.

FRUTTS.—The show of black and white Grapes was not large, nor did we notice any that would require a superlative in describing them; the white varieties, Foster's Seedling and Buckland Sweetwater, were nice sized bunches, but Black Hamburgh Grapes, although in most instances as finely coloured as autumn produce, were not remarkable for weight of bunch. The 1st prize for Black Hamburgh Grapes was awarded to Mr. W. Robins, gr. to E. Dyke Lee, Esq., Hartwell House, Aylesbury; 2d, Mr. Woodbridge, gr. to the Duke of Northumberland, Ston House; 3d, Mr. W. Fyle, gr. to W. F. Dbek, Esq., The Lee, Esq., Hartwell House, Aylesbury; 2d, Mr. Woodbridge, gr. to the Duke of Northumberland, Ston House; 3d, Mr. W. Fyle, gr. to W. F. Dbek, Esq., The Mr. Stone of the Stone of a yellow-fleshed kind raised from Benham Beauty and Hero of Lockinge. In the miscellaneous class, Mr. C. Ross, Welford Park, obtained a 1st prize for fourteen dishes of Apples, five of Pears, and three fruits of Smooth Cayenne Pine-apples. Ac equal 1st to Mr. J. Woodbridge, Sion House, Isleworth, for several ripe pods and foliage of Vanilla planifolia, the penetrating perfume of which could be detected some yards distant; 2d, Mr. J. Austen, Ashton Court, for a large dish of Brunswick Eigs, in first-rate condition; and 3d to Mr. C. Howe, Benham Park, for a good dish of Brown Turkey Figs, The only Pine-apple shown for competition wasa Queen, from Mr. Miles, to which a 1st prize was awarded.

Incomy rine-applies snown for competituous was Queen, from Mr. Miles, to which a 1st prize was awarded.

FLOWERS, &C.—Hardy flowers in great variety were shown by Mr. T. S. Ware, Tottenbam, among them being abundance of Preonies, Pyrethrum roseum, handsome Aquilegia glandulosa, Delphinium nudicaule, and German Irises. Messrs. Barr & Son, and Messrs. Hooper & Co., Covent Garden, contributed largely from their abundant collections of hardy flowers; the collection of the latter exhibitor contained a pretty plant in Marica gracilis with flowers white and light blue. Messrs. G. Jackman & Son, Woking, again exhibited their splendid collection of Clematises, for which a Gold Medal was awarded. From Messrs. Kelway & Son, Langport, Somerset, came several boxes of cut blooms of single and double Pyrethrums, and of hybrid Amaryllis, together with a gorgeous collection of herbaccous Pizony Blooms, some of which possessed a mass of central petuls, thread-like, as in Japanese Chrysanthenums, Hossins, J. Veltich & Son, Chelsea, showed some floroupton Stock in a greatment of the same approve by them a few seasons back; they contributed several bunches of Aquilegia glandulosa, A. Corrulea hybrida, and A. ealifernica hybrida, of according hybrida, of according hybrida, of according hybrida, and A. ealifernica hybrida, of according hybrida,

Crystal Palace: May 23 and 24.—This great gathring will be put down as one of the most successful that the Crystal Palace directors have been the means of bringing together in recent years, and should mark the Leginaing of a cycle of horticultural exhibitions worthy of the splendid building and site in which they are held. Mr. Head, the able manager, deserves much praise for his share in the preliminary work of schedule arranging, as well as for his idea of holding the show in tents, instead of in the inadequate space at the disposal of the managers in the centre aisle. The tents afforded more room for promenading—they were pleasantly warm only—and grass and gravel always seem to be a more fitting setting for horticultural productions that any others.

seem to be a more tuning seeming to northeritaria pro-ductions than any others.

The tents, which were conditions to each other, were pitched on the area once covered by that portion of the building which was burnt down, the largest of them

being set apart for the largest plants, and the smaller ones for Orchids, florists' flowers, and small plants generally. In the open classes Mr. W. Chapman, gr. to J. Spode, Esq., Rugeley, was 1st, as he had been two days before at the Botanic Society's show; 2d, Mr. H. James, Lower Norwood; 3d, Mr. E. Tudgey, Waltham Cross, for nine stove and greenhouse plants, distinct, in loom. For nine Azalea indica, Mr. C. Turner's splendid plants were an easy 1st; Mr. Jas. Child, gr. to W. J. Bell, Esq., Garbrand Hall, Ewell, mas 2d; and the 3d was withheld. The Cape Heaths were few in numbers, and the only pitz awarded was a 1st to Mr. E. Tudgey, to a collection of nine varieties, of which Briac Towenships, and the control of the state of the control of the state of the s

happier effect than when they are seen placed in olique positions on a table, as is the case clsewhere.

For the best stove and greenhouse Ferns, consisting of nine distinct kinds, Mr. Penfold was again placed 1st, with Adiantum peruvianum, A, cardiochkena, Davallia Mooreana, D, polyantina, Polystichum Eillardieri, &c., well grown, healthy specimens; Mr. J. Wakchana, gr. than the state of the

In the class for nine distinct Dracænas, Mr. H. James was 1st with plants of D. Shepherdi, D. Baptisti, D. amabilis, D. Mooreana, and some other and older varie-

was 3d, with much smaller plants.

In the class for nine distinct Dracemas, Mr. H. James was the with planta and and some other and older varieties. This was a well grown collection, the foliage and colouring being all that could be desired. Mr. J. R. Bird was 2d, with plants considerably younger, including such as D. ignea, D. voluta, D. Fillengti, and the conspicuous D. terminalis alba. Mr. C. Rann was 3d. Caladiums were very well shown by Messrs. J. Laing & Co., Forest Hill, whose nine distinct varieties found much favourable comment, some of the best being C. Sanconiathon, C. Comtesse de Condeixa, C. Madame Fritz Koechin, C. Anna de Condeixa. This collection took ist prize, no others being awarded. The Pelargonium coatest again resulted in Mr. C. Turner being placed the rist for show varieties, with plants grown in his uoapproachable style. No other competitorentered. In the class for nine fancy Pelargoniums, Mr. C. Turner was awarded the rst prize; 2d, Mr. J. Wiggins, gr. to W. Clay, Esq., Grove Road, Kingston.

Messrs, G. Jackman & Son, Woking Nurseries, brought their grand collection of Clematises for which they eccived he desired the collection of Clematises for which they eccived he desired the collection of Clematises for which they eccived he desired the collection of Clematises for which they eccived he desired the collection of Clematises for which they eccived he desired the collection of Clematises for which they eccived he desired the collection of Clematises for which they entire the foliage and the prize. For the best eighteen Roses, not less than twelve varieties of not less than twelve, distinct, and in g-inch pots; Mr. H. James being awarded the ad prize. For the best eighteen Roses, not less than twelve varieties, in pots not exceeding o inches, Mr. C. Turner was ts, his plants being stocky, well foliaged, and capitally flowered; Messrs, Ford, gr. to C. J. Leaf, Esq., Pains Moodeside, Farmalla Rosn, the Old Nurseries, Cheshunt, were awarded the 2d prize. For the best eighteen Roses, not le

dimensions, but which was made up of widely different materials to the winning one, and in which good sized plants of Impatients Sultani told with great effect. For the best single specimen stove plant in bloom the winners were respectively Mr. Jas. Wakeham, with Clerodendron Ballourianum; Mr. H. James, with Anthurium Andreansum, as equal 1st; and Mr. E. Tudgey as ad, with Clerodendron Ballourianum. For the best single specimen greenhouse plunt in bloom, 1st was Mr. C. Rann, with a Darwinia; Mr. E. Tadgey 2d with Erica ventricosa; and Mr. W. Chapman 3d, with an Erica ventricosa; and Mr. W. Chapman 3d, with an Erica ventricosa; and Mr. W. Chapman 3d, with an Erica ventricosa; and Mr. G. Rann took 1st prize for the best specimen of a fine-foliage plant; Mr. H. James was 2d, and Mr. E. Tudgey 3d. Some exceedingly pretty bouquets, white and otherwise, floral devices, such as anchors, breast-knots, sprays, and the like, were shown, Mr. J. R. Chard, The Floral Depôt, Chase Corner, Clapham Common, being 1st for six buttonhole bouquets. Messrs, J. Laing & Co. 1st for bouquet; and Mr. C. Hepburn, decorative florist, Crystal Palace, was 1st for a bridal bouquet. Miss Gross, 6, Oxford Terrace, Lower Addiscombe Road, Croydon, took the highest prize for three vases for the table.

a bridal bonquet. Miss Cross, 6, Oxford Terrace, Lower Addiscombe Raod, Cross, 6, Oxford Irerace, prize for three vases for the table.

AMATEUR CLASSES,—For six stove and greenhouse plants is twas Mr. Chapman, 2d Mr. C. Rann, Mr. J. Child took the 1st and only prize for six Azaleas, The well known growers, Mr. T. N. Penfold, Mr. C. Rann, and Mr. W. King, gr. to P. Crowley, Esq., Waddon House, Cryodno, took respectively 1st, 2d, and 3d prizes for six fine-foliage plants of no particular novelty. Mr. T. N. Penfold took the premier prize for six stove or greenhouse Ferns, his group containing Davallia fijensis, Microlpia hirta, and Todea superbain good order. For the best six Orchids of distinct species Mr. C. J. Salter was 1st, with handsome pieces of Dendrobium Wardianum, Cymbidium Lowianum, Cattleya Mendelli; the 2d prize fell to Mr. J. Child; 3d, Mr. W. King, For six distinct Crotons the prize winners were respectively—1st, Mr. Penfold, with Queen Victoria, Lady Zedland, Johannis, Elegantissimus, and others; 2d, Mr. J. R. Bird; 3d, Mr. J. Wakeham, The sort named C. Hawkerl in the 2d prize fel was a remarkably bold marked variety. Neat plants of Draceenas with the sort named C. Hawkerl in the 2d prize for was a remarkably bold marked variety. Neat plants of Draceenas Mr. J. R. Start, Mr. G. Mr. W. King, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove Fall, Mr. J. Sharp, gr. to F. Hatchell, Esq., Grove

Devon and Exeter Horticultural: May 22 and 23.—This two days' exhibition was held in grounds adjoining those occupied at the same time by the Duon County Agricultural Association. The committee selected this occasion, expecting to make it a financial success; but outside that body it was generally considered a mistake, and so it proved to be. This Society is fortunate in having a large and influential list of subscribers, and so will be able to tide over the losses occasioned by this exhibition; but it would have been more satisfactory had the committee been able to have balanced their accounts. As an exhibition of horticultural produce it was a complete success, and quite equal to any of its predecessors. One of the largest collections of plants formerly exhibited at these exhibitions has been dispersed, but it is gratifying to note that several new exhibitors, and some very ode exhibitors, have again come to the front with very settining its extends, so that the Society can still boast of exhibition graterymen of Exetens.

The leading nurserymen of Exetens.

The leading nurserymen of Exetensist the Society to a very great extent by the loan of their grand collections of plants. Messrs, Lucombe, Pince & Co, unconsected the society of the exhibition specimens, as usual put up a splendid collection, which included many fine Palms and Tree Ferns. Two very handsome examples of Cyeas revoluta, one at each end of their collection, had a fine effect. A very fine specimen of Anthurium Scherzer-

ianum majus occupied a central position. It had sixty enormous spathes of a very deep shade of colour. Large and small specimens of Azalea indica in colour. Large and small specimens of Azalea indica in colour carriety, densely flowered, were interspersed through the collection, with fine plants of Allamandas, Stephanotis, Clerodendrons, and many other subjects. A nice lot of Orchids were also staged by this firm, as well as a few stands of very good seedling Pansies.

Messrs. R. T. Veitch & Son staged a very fine lot of plants, principally flowering subjects, with an admixture of choice hardy subjects, specimens of Areca lutescens and A. aurea, Cocos Weddelliana, Ipanses Maples, and Asparagus plumosus nanus, which were used to make the display effective. As por lpants for arrangement with flowering kinds the Maples are exceedingly pretty, their flaely cut foliage and variety of colour arc charming. A very interesting group of Orchids, a specimen of the beautiful Adiantum rhodophyllum (new), several specimens of the greenhouse Rhododendrons Princess Royal and Alexandra, Anthuriums, Dinonea muscipula, a fine specimen of Saracenia flava, a great variety of choice hybrid Rhododendrons and Ghent Azaleas; several well-flowerd specimens of Azalea indica, including the lovely white Lady Pollumore, Stella, Alice, Souvenir de Prince Albert, &c., were included in this group. In competitive classes the Silver Cup given for the most effective arrangement of miscellaneous plants on a stage, 20 feet by 5 feet, was won by Mr. Rowland, gr. to William Brock, Esq., Parker's Hill House, Exeter. The group consisted of a very fine and graceful Coos Weddelliana in the centre with several smaller specimens, same fine densely flowered specimes of Dendrobium mobile, Odonoglossum Alexof misceianeous plants on a stage, 20 teet by 5 feet, was won by Mr. Rowland, gr. to William Brock, Esq., Parker's Hill House, Exeter. The group consisted of a very fine and graceful Coos Weddelliana in the centre with several smaller specimens, some fine densely flowered specimens of Dendrobium nobile, Odonoglossum Alexandre, pot Roses, Amaryllis, Gloxinias, small Grotons, Dracemas, and Isolepis gracilis. Mr. Seward, gr. to Sir R. H. F. Davie, Creedy Park, Crediton, followed every classly on the heels of the former, but his large specimens of Phenix dactylifera did not compare favourably with the beautiful Cocos in Mr. Rowland's collection; small specimens of Cocos, Gennoma gracilis and Lead and Section of the Section of Mr. Rowland's collection; small specimens of Cocos, Gennoma gracilis and Lead and Gloxinas were good pots of Amaryllis and Gloxinas were store and greenhouse plants, half in bloom and all fine-foliaged; and Mr. Rowland was placed od, though his flowering plants, which included a fine specimen, well flowering plants, half in holome and all fine-foliaged; and Mr. Rowland was placed od, though his flowering plants is receive great weight in the estimation of judges. For six stove and greenhouse plants Mr. Teed, gr. to Mrs. Ensor, The Bungalow, Topsham, took the 1st prize with a splendid Istora Williamsi, Aphelexis macrantha purpurea, and Clerodendron Balfourianum, Cocos Weddelliana, and Crotons Johannis and Warrein. Mr. Craiggs store to Susua Dixon, Esq., Winslade, was placed 2d, with a noble specimen of Anhurium crystallinum, Thrinax elegans, Croton intermedius, a well-flowered Azalea, Beauty of Surrey, a splendid old white variety; and a very fine Boronia elatior. Mr. Craiggs was 1st fors k Ferns, with good specimens of Gleichenia semivestita, Adiantum cardochlena, Nephrolepis davallidides firenas, Mr. Grea and and Serns, Horion and Cattleya Mena and Mr. Craiggs took the 1s

Cattleya intermedia, all very fair specimens. For six Ericas Mr. Teed and Mr. Craiggs took the 1st and 2d prizes respectively.

For nine Indian Azaleas, distinct, Mr. Weeks, gr. to E. Sanders, Esq., was awarded 1st bononrs, his specimens being all densely flowered and fresh. His principal varieties were Rosa multiflora, Duke of Devonshire, Standard of Flanders, Souvenir de Prince Albert, and Duke de Nassau. Mr. Seward was 2d, with a very nice tot of specimens, his Model, Stella, Hermine, and Duke de Nassau being the best. For six Azaleas Mr. Teed was 1st, and for six ditto in post not to exceed 8 inches Mr. Weeks was 1st and Mr. Teed 2d. The Azaleas Mr. Weeks was 1st and Mr. Teed 2d. The Azaleas Inches Mr. Weeks was 1st and Mr. Teed 2d. The Azaleas Coccipied a tent by themselves, and proved a source of great attraction to the visitors.

Begonias, 1st Devolution of the Control of the Gront, Mr. Greson, gr. to Lord Habeton, to cause to the front, Mr. Greson, gr. to Lord Habeton, and Mr. Rowld, 2d. In the class for six pot Roses Mr. Teed staged Madame Rothschild, Madame Lacharme, Countess of Oxford, Victor Verdier, Beauty of Waltham, and La France, in very fair condition, and was awarded 1st prize. For nine Calceolarias Mr. Rowland carried off the 1st prize, with a very die condition, and was awarded 1st prize. For nine Calceolarias Mr. Rowland carried off the 1st prize, with a very handsome lot; Mr. Counter, gr. to Mark Farrant, Esq. being 2d, also with a very creditable collection. For nine Pelargoniums the same competitors were placed in the same order.

CUT FLOWERS.—For twelve Roses (one variety), Mr. Barnes, gr. to T. C. Daniels, Esq., Stoodleigh Court, Tiverton, was 1st, with a grand box of Marcehal Niel; Mr. Leach, gr. to John Drew, Esq., Park Villa, Kenton, being 2d, with the same variety. For twelve Roses, distinct, Mr. Barnes again won the 1st prize; and also

staged a box of twenty-four trebles, distinct, not for competition, in first-class style. Mr. Ayson, gr. to E. F. Studd, Esq., Oxton House, was 1st for eighteen Pansies,

FRUIT.—Mr. Geeson was 1st for black Grapes, with Black Hamburghs, nice shaped bunches, and well coloured; Mr. Lang, gr. no Lord Poltimore, was ad, For white Grapes, Mr. Isaac, gr. to B. C. Gidley, Esq., was placed sts, and Mr. Geeson ad—the first with Muscats, and the latter with Foster's Seedling. Mr. Isaac was 1st with six Peaches, Early York, and W. Cuttbertson, Esq., ad, with Hale's Early—both very good dishes. Mr. Cutthertson was 1st for a Melon; and Mr. Powell, gr. to the Earl of Devon, 1st for Strawberries, with Sir Joseph Paxton; 2d, Mr. Seward. Mr. Barnes was awarded an extra prize for a very fine dish of Citrons,

VEGETABLES.—A great number of competitors staged collections of six kinds, exclusive of salading, the rst prire failing f Mr. James, gr. to Sir John Walrand, Bradfield, 18 Mr. James, gr. to Sir John Walrand, Bradfield, 18 Mr. James, gr. to Sir John Walrand, Bradfield, 18 Mr. James, gr. to Sir John Walrand, Bradfield, 18 Mr. James, J. Mr. Battnes was related was ad, and Mr. Branes, 3d. Mr. Battnes was was rst for ledge of salad and twelve Tomatos; and Mr. Sollmad, John W. H. Dunsford, Esq., Tiverton, was rst for ledge Caulifiowers; the Rev. L. F. Potter 1st for red kidney Potatos and three Cabbages; Mr. Leach 1st for six Cos. Lettuce and twelve Omions. On the whole the vegetables were very good, considering the long period of dry weather which has prevailed. (From a Correspondent).

vegetables were very good, considering the long period of dry weather which has prevailed. (From a Correspondent).

Paris Horticultural: May 20 to 26.—The spring show of this Society was well attended by the public especially on the 22d, when 12,000 persons a public especially on the 22d, when 12,000 persons a public especially in the 22d, when 12,000 persons a public especially if foreign exhibitors send plants. The French people, and the Parisians above all, are beginning to take an interest in these shows, the number of visitors increasing every year. The place where the shows are held is a very suitable one, being in the Pavillon de la Ville de Paris, in the Champs Elysées, the most fashionable quarter of Paris. There is plenty of ground around it, well shaded with Chestnut trees.

Orchids were shown in quantities, good small plants as a rule, but of Indian Azaleas there were only a few, and nothing striking among them. The Grand Prix d'Honneur went this year to M. Charles Verdier, who staged a large collection of standard Rose trees and dwarfs. We notted the following:—Tugenie Verdier, Euglea Appert, Jean Louis and the paris of the collection of standard Rose trees and dwarfs. We notted the following:—Tugenie Verdier, Euglea Appert, Jean Charles Lelebure, Paul Néron, Abel Carrière, La France, Camille earnedin, &c. This lot was placed in a large tent adjoining the Pavillon. In the Pavillon M. Léon Duval, of Versailles, had a group of well grown Dracenas and Orchids, among the latter being Odontoglossum vexillarium, Pescatoric, cordatum, Alexandre, and Schlieriana; Cypripedium lavigatum, Argus, niveum, and Hookeri; Maschevallias of sorts, Ada aurantiaca, and Dendrobium thyristiorum. The Dracenas were Gladstonei, Liervali, Wilsoni, amabilis (always one of the best), regis, Mooreana, Fraseri, salmonea, iguea, creeta alha, Chelsoni, ancrepensis, excels, Robinsoniana, Lindeni, Massangeana, and Goldieana. Mr. Landry, of paris, contributed a group of various plants, paris, contributed a group of various plants, pa

fruits.

M. Godefroy-Lebenf, of Argenteuii, the Editor of the Orchidophile, staged, not for competition, two fine groups of Orchids, containing good varieties of Odontoglossum vexillarium, Alexandra, Pescatorei, cordatum, and luteo-purpureum; Phalenopsis amabilis, and Schileriana; Onedidum Marshalli, Acklandie, Skinneri, and Mossice; Vanda tricolor and suavis, Cypripedium Lawrenceanum, candatum, Dauthieri, calurum, villosum, Dominii, and Lowii; Lycaste Skinneri, Trichopilia crispa marginata, suavis, Leela purpurata, Arpophyllum giganteum, Masdevallias Lindeni, Houtteana, Wallisi;

Chysis bractescens, &c., also a very good plant, well flowered and marked, of Authurium Scherzerianum Rothachidau Dessel, & Roy of Ibrifs, and M. Louis Rothachidau Dessel, & Roy of Ibrifs, and M. Louis Lender Dessel, & Roy of Ibrifs, and M. Louis Lender Dessel, & Roy of Ibrifs, and M. Louis Lender Dessel, & Roy of Ibrifs, and M. Louis Lender Dessel, & Roy of Ibrifs, and M. Louis Lender Dessel, & Roy of Ibrifs, and M. Louis Lender, & Roy of Ibrifs, and M. Louis Lender, & Roy of Ibrifs, and Lender, & Roy of Ibrifs, and R. Louis Lender, & Roy of Lo

Massachusetts Horticultural,—At the exhibition on April 12 gratuities were awarded to the Hon. Francis B, Hayes, for greenhouse Rhododendrons; W. H. Baldwin, for Primula vulgaris (English Primroses), and W. C. Strange, for Général Jacqueminot Roses. April 19,—W. S. Simpkins exhibited twelve specimens of the Cornelia Cook Roses, the finest ever seen here, and was awarded a Silver Medal for them. F. S. Ames exhibited a large collection of rare and beautiful Orchids, and was awarded a Silver Medal for Cypripedium ciliare. A gratuity was awarded to Sewall Fisher, for some fine seedling Pinks; and to Francis P, Hayes, for an Indian Azalea; W. C. Strong, for Général Jacqueminot Roses; and to Mrs. E. M. Gill and Mrs. A. D. Wood, for displays of flowers. April 26.—At this exhibition there was a remarkably fine display of Pansies. C. W. Norton exhibited flowers that measured 3½ inches in diameter. David Allen, gr. to R. M. Pratt, exhibited flowers of two Bomareas, beautiful greenbouse climbers. May 3.—In to-day's exhibition sone fine plants were shown. David Allen, gr. to R. M. Pratt, exhibited a Silver Medal. Edward L. Beard exhibited en Gowers of Amenone and other flowers. John Mitchell had a very extensive display of Primulas, Gratuities were awarded to Messrs, Beard and Mitchell, and also to Mrs. E. M. Gill and Miss S. N. Strong, for displays of cut flowers. May 10.—The exhibition of to-day was very attractive one. Messac Petagroniums, Azalesa, and pretty was a proper successive plants, including Heaths, Eriostemons, and W. K. Wood, a new fragrant Crimm from the Cape of Goot Hope. John Gardener exhibited a stand of greenhouse plants, including Heaths, Eriostemons, and W. K. Wood, a new fragrant Crimm from the Cape of Goot Hope. John Cardener exhibited a stand of greenhouse plants, including Heaths, Eriostemons, and W. K. Wood, a new fragrant Crimm from the Cape of Goot Hope. John Cardener exhibited a stand of greenhouse plants, and from Mrs. P. D. Richards came a fine collection of wild flowers. Prizes and gratuitie Massachusetts Horticultural,-At the exhibi-

to John L. Gardner. Basket of flowers: the 2d prize to Miss S. W. Story. Fifty Pansies: E. S. Beard; 2d, Mrs. B. M. Gill. Herbaccons plants: J. W. Manning. Gratuities were awarded to John L. Gardner, for plants; B. R. Freeman, for native Violets; Mrs. E. M. Gill, for Pansies; B. G. Smith, for Andromeda floribunda; Geo. Seaverns, for Hydrangea; E. L. Beard, for Anenone and Primuta Sieboldi; W. H. Wood, E. Sheppard, Mrss. S. W. Strong, and Hovey & Co., for cut flowers. A Bronze Medal was awarded to David Allen, gr. to R. M. Pratt, for a plant of Odontoglossam Edwardit. (From a Correspondent.)

Variorum.

VEGETATION ON THE CONGO.—Clumps of a dwarf Palm, Phœnix spinosa, which bears a just eatable starveling Date, hedge in these beautiful Orchids from the wash of the river, and seem a sort of water-mark that the tides rarely pass, but the water often leaks through the mud and vegetable barrier, and forms inside the ring of dwarf Palms many little quiet lagoons, not necessarily unhealthy, for the water is changed and stirred by each recurring tide; and in the lagoons hordered by Orchids and tall bushes, with large spatulate leaves and shining white bracts about their flower-stalks [Mussænda], by Paudanus, by waving Oil-Palms, and by Mangrove trees, poised on their many feet, and telling out against the shining sky with their lace-like tracery of leaves-in these quiet stretches of still water are the homes and feeding grounds of myriad forms of life : of blue land-crabs, whose burrows riddle the black soil; of always alert and agitated "mud-fish," flapping and flopping through the ooze; of tiny amethystine red-beaked kingfishers, of kingfishers that are black and white, or large and grey and speckled; of white egrets, of the brown and storklike Scopus umbretta; of spurwinged geese, and of all-devouring vultures. rustling in the vegetation, and a large voracious lizard slips into the water, or on some trampled bank a crocodile lies asleep in the warm sun with a fixed smirk hanging about his grim muzzle. These lagoons are places seething with life—life that is ever stirring, striving, and active—and when you suddenly arrive, slipping and splashing in the watery footholds, the sudden silence that greets you is rather the frightened hush of a thousand apprehensive creatures. " The River Congo," by H. H. Johnstone,

DESERT PLANTS .- Several enterprising cultivators are now, at our suggestion, trying to multiply the thornless Opuntia and the Spek-boom in Namaqualand, Angra Pequina, and elsewhere. I think these excellent food plants have not received the attention they deserve. Of course they are special food plants, suited to special localities, and do not come into competition with the ordinary veldt-hosjes and grass wherever the climatic conditions permit the usual pasturage. But I am sure that, should the Spek-boom be incapable of acclimatisation on the sun-smitten randts of Namaqualand, the Opuntia may be grown in vast thickets at the junction of rock and sand veldt, and its use would save much of the present expenditure in importing compressed hay for trek-cattle. Such culture throughout all carroid districts of the colony subject to frequent failure of seasonal rains is far more important than the introduction of any more of the fancy staples which are from time to time proposed, praised, and forgotten, and which have given point to the proverbial sneer that "the Cape is a country of samples." M'Owan, in " Report of the Cape Town Botanic Gardens."

THE FORESTS OF EUROPE are estimated to cover 500 millions of acres, or nearly 20 per cent. of the surface of the Continent. In British North America there are said to be 900 millions of acres of forest, in the United States 560 millions, in South America 700 millions. The total thus estimated for Europe and America alone is equal to 3,600,000 geographical miles, each containing 736 English acres. It is interesting to compare this area, so far as the possible supply of fuel is concerned, with that of the coalfields of the world, which is estimated at 134,000 geographical miles. Of this area one-twenty-fifth part is in the United Kingdom, or 5360 geographical miles of forest, against 5000 geographical miles of coalfields in full work. Four-fifths of the known coalmeasures lie within British and American territory, the forests of Europe and America covering twenty seven times the area of the known coal-measures of the world. In Baden, where the forest statistics are

carefully prepared, the annual production of wood is less than the weight of hay that can be grown on an equal area. At that rate—which is low for an average—each geographical mile of forest will yield, one with another, 1500 loads of timber per annum. But a square mile of coal-measure yields something like 20,000 tons in the year. The latter produce, however, is limited and exhaustible. Extract the coal, and not only is there an end of the fuel, but the soil itself is generally reduced to utter waste. Arrange the forest according to the best theories of forestry, and its yield is perpetual. Builder.

TIMBER IN TEXAS. - As an illustration of the extent of the timber trade in North America the following extract from a recent report from Texas will be of interest :- Notwithstanding the fact that the greater proportion of the State consists of immense prairie Texas possesses the largest area of woodlands of any State in the Union. The timbered country is situated in Eastern Texas; and, according to the Forestry Report, in 1880 there were 63,000,000,000 feet of standing Pine, worth, on the average at the mills if sawn up into planks, 12 dols. per 1000 feet. Besides Pine there are large quantities of Cypress timber, both red and white, from which roofing shingles are made. At Beaumout these mills turn out 250,000 daily, and at Orange six shingle mills made during the year 1881 66,000,000. Of Cypress shingles Bois d'Arc is very abundant in some counties, and for posts is unsurpassed, as it will last for years in the ground without rotting. It is also used for carriage and waggon spokes, and is also coming into use for paving streets. It does not appear what the botanical name of the Bois d'Arc is. The report from which the foregoing is taken concludes by saying that the vast territory of Texas, covering an area one-third larger than either France or Germany, with its divers interests and resources, offers an unlimited field of enterprise for the capitalist, and equal advantages in other ways to persons of small means, to practical farmers with capital enough to make a start, and to the mechanic.

LONDON : Atmospheric Pressure .- During the week LONDON: Atmospheric Pressure.—During the week ending May 24, the reading of the barometer at the level of the sea increased from 29.75 inches at the beginning of the week to 30.17 inches by 9 A.M. on the 20th, decreased to 30.14 inches by 9 A.M. on the same day, increased to 30.45 inches by 9 A.M., addereased to 30.41 inches by 3 P.M., and increased to 30.41 inches by 3 P.M., and increased to 30.01 inches by midnight on the 21st, decreased to 30.01 inches by 3 P.M. on the 24th, and was 30.05 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.15 inches, being 0.17

at the level of the sea was 30.15 inches, being 0.17 inch higher than last week, and 0 23 inch above the average of the week.

Temperature. — The highest temperature in the shade in the week was 81°, on the 24th; the highest on the 18th was 50°. The mean of the seven high day temperatures was 60°.4.

The lowest temperature was 41°.1, on the 21st; on the 18th and 24th the lowest temperature was 50°. The mean of the seven low night temperatures was 46°.2.

The mean of the seven rowing transported 46°.2.

The greatest range of temperature in one day was 31°, on the 24th; the smallest was 9°, on the 18th. The mean of the seven daily ranges was 23°.2.

The mean temperatures were—on the 18th, 52°.9; on the 19th, 53°; on the 20th, 53°.2; on the 21st, 55°.4; on the 22d, 57°.8; on the 23d, 62°.3; and on the 24th, 63°.3; of these the first three were below their averages by 0°.3; 0°.6, and 0°.5 respectively, and the last four were above by 1°.5, 3°.7, 8°, and 5°.7 respectively.

and the last lour were above by 1.5, 5.7, 1.8, 5.7, respectively.

The highest reading of a minimum thermometer with blackened bulb in vacuo placed in the full rays of the sun was 142°,5, on the 24th. The mean of the seven

sun was 142.5, on the 2410. The mean of the seven readings was 119.2.

The lowest reading of a minimum thermometer with its bulb placed on grass was 34. on the 21st. The mean of the seven readings was 38.1.

Rain.—Rain fell on the 18th, to the amount of

0.06 inch.

ENGLAND: Temperature.—During the week ending May 24 the highest temperatures were St.2 at Cambridge, 81° at Blackheath, 50°,1 at Nottingham; the highest at Suoderland was 60°, at Plymouth 70°.8, at Brighton and Sheffield 73°. The general mean was 25°.4.

at Brighton and Sheffield 73°. The general mean was 75°.4.

The lowest temperatures in the week were 41°.1 at Blackheath, 41° at Brighton, 39°.4 at Liverpool; the lowest at Truro was 32°, at Cambridge, 33°, at Nottingham 33°.2. The general mean was 36°.0.

The greatest ranges were 48°.2 at Cambridge, 46°.9 at Nottingham, 44° at Truro; the smallest ranges were co° at Sunderland, 32° at Brighton, 33°.3 at Plymouth. The general mean was 38°.5.

The mean of the seven high day temperatures was highest at Nottingham, 72°.6, at Cambridge 71°.8, at Blackheath 69°.4; and was lowest at Sunderland, 62°.1, and at Liverpool and Bolton 63°.7. The general mean was 66°.5.

The mean of the seven low night temperatures was highest at Brighton, 47°.3, at Blackheath 46°.2, at Allackheath 46°.2, at Line 10°.20°.3°.

The mean of the seven low night temperatures was highest at Blighton, 47°.3, at Blackheath 46°.2, at Suoderland 45°.9; and was lowest at Truro, 30°.3, Wolverhampton 30°.5, and at Cambridge 39°.9. The general mean was 42°.7.

The mean daily range was greatest at Cambridge, 31°.9, at Nottingham 30°.5, at Truro 28°.1; and was least at Sunderland, 16°.8, at Liverpool 18°.3, at Brighton 18°.5. The general mean was 23°.8.

The mean temperature was highest at Blackheath, 56°.8, at Nottingham 55°.6, at Brighton 54°.9; and was lowest at Wolverhampton, 50°.6, at Bolton 50°.8, and at Sheffield 51°.4. The general mean was 52°.9.

heath, 50.0, at Rottingnam 55.0, at Engition 55.4.9; and was lowest at Wolverhampton, 50.6, at Bolton 50.8, and at Sheffield 51.4. The general mean was 52.9.

Rain.—The largest fall was 0.13 inch, at Leeds, 0.10 inch at Wolverhampton, 0.06 inch at Blackheath; the smallest fall was 0.01 inch, at Sheffield and Bradford. No rain fell at Truro, Plymouth, Bristol, Leicester, Cambridge, Nottingham, Liverpool, Bolton, or Sunderland. The general mean fall was 0.03 inch. was 0.03 inch.

SCOTLAND: Temperature.—During the week ending May 24, the highest temperature was 75°, at Perth; at Greenock and Leith the highest was 70°. The general mean was 72°.

The lowest temperature in the week was 32°,

The lowest temperature in the week was 32°, at Perth; at Leith the lowest temperature was 38°,4. The general mean was 36°,1.

The mean temperature was highest at Dundee, 52°,9; and lowest at Glasgow and Perth, 49°.8. The general mean was 50°,9,

Rain.—The largest fall was 0.51 inch, at Leith; and the smallest fall was 0.07 inch at Paisley. The general mean fall was 0.24 inch. No rain fell at Perth.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

BERNE CONVENTION: J. T. R. All the European States except Russia, Norway, Sweden and Denmark. States except Russia, Norway, Sweden and Demmark, CYTISUS ADAMI: R. G. The specimen you send is a good example of the very curious graft-hybrid said to have been produced by grafting or budding C. purpureus on the very different C. Laburumm. In the specimen sent some branches are like those of the two parents, others intermediate in character. Though not very uncommon, this tree always excites astonishment, as well it may. A ton, or perhaps a ton-and-a-half, of literature exists concerning it.

DEFORMED ONION: E. S. Apparently the outer coats of the bulb have been eaten away by sings or grubs, and through the aperture so formed the base of one of the inner leaves has protruded.

HYDRANGEA: H. Michel. Your supposed new double-flowered Hydrangea seems to us to be only the H.

stellata prolifera, illustrated in the Flore des Serres,

INSECTS: H. E. The spider you send is certainly not likely to injure your Vines.

LARICIO AND SCOTCH FIR: 7. S. Very different. Get the forester to show you the two. It would take too long to describe the differences here. The cone of Laricio was figured a short time since: see p. 15 of our issue for January 5 last.

our issue for January 5 last.

NAMES OF PLANTS: C. IV. Spirca prunifolia, single-flowered form — J. Mell. Oxalis corniculata. No one knows what the true Shamrock is.— J. D. Sisymbrium Sophia.— The Islands, Allium ursinum.— D. Dovodcavell. 1, Geranium Robertianum; 2, Potentilla Tormentilla; 3, Melampyrum pratense; 4, Lotus corniculatus; 5, Veronica officinalis; 6, Gly-ceria aquatica.— IV. Mayo. Lamium purpureum aureum, a variegated form of the common Dead Nettle.— H. H. D. O. Illicium ainstum; Cytisus Adami. — Ash. 1, Saxifraga granulata; 2, Allium ursinum; 3, Berheirs atropurpurea; 4, Weigela rosea; 5, Ribes aureum.— S. Lord. Lolium perenne; 2, Holeus molis.— W. A. C. The Bird Cherry (Prumis Fadus), and Anthoxauthum odoratum.— William, Epidedicum variegatum Epidendrum variegatum

Epidendrum variegatum.

POLYANTHUSES: "J'as. Cocker & Co. No doubt your double Polyanthus (No. 15) is a very fine and irce-blooming kind, and growing in the open is doubtless seen to much greater advantage than when gathered. The blooms are very double, and of a bright golden hue much nixed with red. Had it been a good self of either colour we should have thought it preferable, but that may be but a matter of taste. The yellow hose-in-hose Cowslip is much below the best kinds we see here in the South, both in size and colour. We can imagine that both it and the deep red hose-in-hose kind sent are very free and effective in masses, but both come considerably below the size and quality seen in such forms as Cioth of Gold, Scarlet Gem, or Lord Wolseley. Your Primula species is P. Murroii, a very charming thing, and one of the most distinctive of a beautiful family.

VINES AND MELONS: An Old Subscriber. Scalding is the cause of the mischief in both cases. You either give air too late in the day, or close too early in the case of the Vines; and make the Melons weak by shading. Gradually inure them to the sun-light and heat, and so encourage, a stronger root action. encourage a stronger root-action.

SEEDS.

LONDON: May 28.—The seed market to-day was thinly attended, and the business doing as nearly nil ns possible. The prolonged drought is having a prejudicial effect upon the young Clovers, Trefoils, and grasses. Sowing Rape seed, being in imp rowed request and short supply, has advanced 21, per or. Canary seed, Hemp, and all bird seeds, continue dull of sale. Yohn Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

CORN.

At Mark Lane on Monday the demand for both Wheat and flour was extremely small, and previous rates hardly obtainable. Burley met a moderate demand, and on the week must be quoted 6d. dearer. Beans remained at the rates of Monday week. Peas were scarce, and steady in value. Lenuis were lower. Oats were fully it, dearer on the week, and Maize stood 1s. above the previous Monday's vellue.—On Wednesday quotations for both Wheat and flour were nominally unaltered. Barley, Beans, and Peas were quiet, but with a steady tone. In Maize business was quiet. Oats were very firm, and rather dearer.—Average prices of corn for the week ending May 24:—Wheat, 38s.; Barley, 29s. 4d.; Oats, 20s. 7d. For the corresponding period lasty, ear. "Wheat, 43s. 7d.; Barley, 31s. 8d.; Oats, 22s. 2d.

CATTLE.

At Copenhagen Fields on Monday there was a very good assortment of cattle, but the trade ruled slow, especially at the finish, and 5s. 6d, was the most general top rate, but 2d, more was realised in some cases. Except for quite the prime neat weights and choice qualities sheep and lambs sold lower than last week. Calves were in demand, and prime qualities dearer, whilst there was little or no inquiry for pigs. Quotations:—Beasts, 4s. 10-5s., and 5s. 2d. to 5s. 8d.; calves, 5s. 8d. to 6s. rod.; sheep, 4s. 8d. to 5s. 4d., and 9s. 8d. to 6s.; lambs, 7s. 6d. to 8s.—On Thursday the trade was steadier. Peasts were quiet but firm. Sheep met with more attention, and were steady in value; lambs moved off more freely, and calves and pigs were quiet.

HAY.

Tuesday's Whitechapel Market report states that supplies were not quite so large as last reported, but trade was very dull. Quotations:—Prime old Clover, 95, to 1065, inferior, 60c, to 755, iprime second cut, 90s, to 1065, i best meadow hay, 80s, to 86s, i inferior, 40s, to 65s, i and straw, 28s, to 35s, per load.—On Thursday a moderate supply was offered. The trade was very quiet, at late rates.—Cumberland Market quotations:—Superior meadow hay, 86s, to 95s, inferior, 70s, to 80s, i superior Clover, 10ss, to 11s, inferior, 70s, to 80s, i; and straw, 34s, to 38s, per load.

POTATOS.

POTATOS.

There have been large supplies at market, and trade quiet at the annexed quotations:—Magnum Bonums and Victorias, 80s. 10 90s.; Regents, 70s. 10 90s.; Champions, 69s. 10 80s. per ton. New Potatos:—Jersey, 15s. to 16s.; Lisbon, 7s. 10 8s.; and Malta, 6s. 10 7sr. per cwt.—The imports into London last week consisted of 459 packages from Malta, 117 boxes Cadiz, 2708 Lisbon, 200 bags Hamburg, 500 Stettin, 201 boxes Valencia, 5930 packages Malaga, 1649 baskets St. Nazaire, and 55 cases from Alexandria.

Oil Paint No Longer Necessary.

ILL AND SMITH'S BLACK VARNISH,

or Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thrids cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled mitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

At the Manufactory, or 12, 8d, per gallon carriage paid to any Station in the Kingdom.

"Piercefield Park, June 21, 1876.—Six,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Recefield Fark, Chepstow.—I am, Six, yours reCAUTION.—Hitt. & Shirtm would particularly warm their Customers against the various cheap Varnishes now so much advertised.

Customers against the various cheap variances now as madvertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; of the large estates in the kingdom for upwards of thirty years; of the large estates in the kingdom for upwards of thirty years; of the large light marked with their name and Registered Trade Mark as above, without which none is genuine. Large illustrated CATALCOUEs of Pencing Hurdles, Field Large illustrated CATALCOUEs of Senting Hurdles, Field HILL AND SMITH, Briefley Hill Ironworks, Staffordshire: 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 7, 1884.

A LITTLE HOUSE WITH TREES A-ROW.

A VISIT to the home of Alexander Pope, one of several leading writers who originated the graceful as opposed to the formal style of landscape gardening, reminded us of a great philosopher of some years since who constantly lamented his defective education. He tells us in his Autobiography that at the age of three he was already learning Greek, and that he first studied Nature, at the age of thirty, in the pages of Wordsworth. He could not have had a better master, but he should have gone to school earlier, to the school which Kingsley refers to-that excellent naturalist and still better clergyman-when he describes the youth whom Nature invites to wander with

> " And he wandered away and away, With Nature—the dear old nurse— Who sang to him night and day The rhymes of the Universe.

" And whenever the way seemed long, Or his heart began to fail, She would sing a more wonderful song Or tell a more wonderful tale.

All men to be well balanced must feed on Nature young; most of our great men have done so. Alexander Pope "lisped in numbers" in Windsor Forest, and sang of his father's house at Binfield, "a little house with trees a-row," almost as a child. Born in Lombard Street, May 21, 1688, he was happily removed early to a house his father had purchased at Binfield—"my paternal cell," he called it in his boyish verses, "with trees a-row, and like its master very low."

He lived at Binfield from the age of twelve till he was twenty-eight, and here, in one of the best parts of Berkshire for soil and scenery, in the borders of Windsor Forest, he was healthfully reared, as Shakespeare had been in another country district, and Milton-though he, too, was London-born-in another. "First in these fields," he says, "I tried the sylvan One of the Beeches in the groves of strain." Binfield Park bore this inscription till its fall, "Here Pope sung." He wrote when very young, and he must have begun to think at an unusually early age. To a great extent he educated himself, showing the strength of his genius by becoming his own professor, instead of requiring, as most readers do, several teachers and "coaches" to assist him. Four schoolmasters, including one at Twyford, had done their best to confuse his brains, until, at the age of twelve, he came to live at Binfield, where Windsor Forest became his academy, the accomplished Sir William Trumbull his companion, and the poets his guides and masters.

All country people and those who are interested in gardens must naturally like to hear of improvements in rural districts, of the increase of wealth and comfort, the extension of education and refinement, the rise of families, the building of houses, the formation of gardens, and the planting of groves and shrubberies. In all these respects Binfield has advanced very considerably since the time of its illustrious poet. Two railway stations — Bracknell and Wokingham—each within 3 miles of Binfield and about 36 miles from London—have opened its communications, and an additional church has been erected for its increased population on the high ground, which those who come to reside here for the sake of air and scenery naturally prefer.

The old church, where Catherine Macaulay, the historian, was buried in 1791, lies low, as does Albay Park, a mile beyond it, with its old family Oaks and bits of scenery resembling old Windsor Forest. Two other large houses are of the older type, Binfield Park and Billingbear Park, each belonging to noble families-the latter to Lord Braybrooke, of Audley End, Essex. The village consists of a number of red houses, nests near one another, like those of rooks or swallows, and not always of the model kind. And now we reach the high ground where Pope's father's cottage stood, and still stands in part, incorporated with a good brick house occupied by a baronet, and crowning the hill 200 feet above the old church. Some very noble Scotch Firs in the grounds have given the mansion its name of "The Firs." Pleasing outlooks over distant parts of this county and of Bucks cheer it, winding lanes environ it, coverts surround it, and singing birds make music for it.

Most of the better houses in the parish have clustered around the new church on the high ground, and several of them have borrowed the poet's name, such as Pope's Nest, Pope's Wood Lodge, and Pope's Wood House, which the gallant General Sir Trevor Shute, who fought and won the battle of Egmont in India, and led the final charge, has greatly enlarged, and has named Egmont House. A reading and club-room, too, is about to be erected by subscription on this higher ground, certain benevolent subscribers having found the source of true happiness in helping their less fortunate neighbours.

Returning to the time of George I., when country villages were far less happy in their outlook than they now are, it would seem that excess was more natural to ardent youth then as now, for Pope, sickly boy as he was, brought himself to death's door at the age of twelve through excessive application as a student. At fifteen he was learning Greek, Latin, French, and Italian, and it is not surprising that about this time he was ordered by the doctors to work less, walk more, and, if possible, to ride on horseback. Mrs. Rackett, his sister, spoke of him as having "a maddish way with him," and a sweet temper. He recovered his health in Windsor Forest, rambling about and gathering flowers; and no doubt the healthfulness and beauty of many of the parishes, which were once included within the bounds of Windsor Forest, will render them more and more desirable to those who seek for pure air and an attractive country within an hour of London.

In visiting the early home of Pope, we do not particularly care to recall his sentimental stolid poem of "Windsor Forest." He did not excel in description, and his "Windsor Forest" is not equal to the real one; but apart from his poems, we owe him our gratitude as one of the most influential improvers of gardening. The design of old English gardens consisted in a formal and intolerable arrangement of straight lines, and Oueen Caroline's winding piece of water in Hyde Park, formed by the union of several detached ponds, and called from its shape the Serpentine, was regarded as a bold innovation. The custom of the eighteenth century occasioned a comical remark by Lord Strafford. Lord Bathurst had widened a brook at Ryskins, near Colnbrooke, and, with excellent taste, had followed the natural lines of the valley, instead of forming a straight canal; and

Lord Strafford, thinking he had acted from economy, asked him to own how much more it would have cost him to have made the stream straight!

Only the influence of great writers can break through superstitions on the subject of taste, and we owe the reform of landscape gardening to some of our greatest men-to Bacon, our foremost philosopher, to our greatest poet, as some have esteemed Milton, to one of the most accomplished essayists, Addison, and to Pope. The poet Mason, one of the other leaders of the better school of gardening, says, in a note to his "English Garden," that "Bacon was the prophet, Milton the herald, of modern gardening; and Addison, Pope, and Kent, the champions of true taste." Those who would test this opinion will know where to look for Bacon's essay, where we read that the Almighty planted the first garden, and for Milton's noble verses in praise of Nature; they will find Addison's view in his paper on "Imagination," 1712, and Pope's in his satirical essay on "Verdant Sculpture" in the Guardian of 1713, and in the "Epistle to Lord Burlington," where he lays down the true rules of art, recommends "good sense," the study of Nature and of the genius of the place. It was by writings such as these that the formal Dutch school of gardening was disparaged, the pathway prepared for landscape gardeners like Kent and his successors, and the taste of the public reformed.

The turn of the tide in regard to the fashion in gardening may be observed among the writers of two generations ago. Miss Edgeworth, for example, makes one of her characters say she "hated everything straight," and that "uniformity and conformity had had their day." Horace Walpole, who described so many gardens, and suffered from rheumatism after a fête champetre at Stow, aptly described the change from that reign of monotony when, quoting Pope again, grove nodded to grove, and each alley had its brother. It was Bridgman, the inventor of the "Ha, ha!" who discovered first, among landscape gardeners, that all Nature was a garden, in fact on this subject he leaped his own sunk fence. H. E.

PÆONIES.

As Pæonies, after a generation of neglect, are once again coming forward as garden favourites, I should like to say a few words about them. There is a capital monograph of them in the twelfth volume of the Transactions of the Linnean Society, by Mr. George Anderson, who immediately after writing it was killed by a fall from a carriage. It was founded upon the finest collection of garden forms that probably ever was brought together—seventy plants, that of Mr. Sabine, of the Horticultural Society, at North Mimms. In this monograph thirteen Pæonies are described under specific names, and their characters and syconyms are very carefully worked out. I should strongly recommend those of your readers who are working at Pæonies to 'get hold of this monograph and study it carefully. It was drawn up in the year 1817, and since that time a great many new forms have been discovered.

To-day we know about two dozen that may be considered as botanical species or subspecies. Under each of these, if brought into cultivation, there is scope for a large number of varieties, distinct from a horticultural point of view. Probably each would vary widely in the colouring of the flower. In Moutan, albiflora and officinalis, which are the best known, there is red in every shade, from crimson graduating down to pink, and also pure white.

Doubling may take place in any species to a greater or lesser extent by petalody of the very numerous stamens. In flowers so large as Pæonies these changes are very conspicuous.

The following is the best classification and enumeration of the forms which I am able to give, but Pæonia, like its neighbours Aquilegia, Aconitum, and

Delphinium, is what botanists call a critical genus, and the leading specific types are linked together by many intermediate connecting stages:—

Sub-genus r.—Shrubby. Disc enveloping the base of the carpels.—P. Moutan.

Sub-genus 2.—Herbaceous. Disc not produced to envelope the base of the carpels.

Follicles glabrous.

P. Wittmanniana, obovata, albiflora, Brownii, humilis, microcarpa, leiocarpa, coriacea, Cambessedesii.

Group 2.

Follicles tomentose, erect or slightly spreading.
P. tenuifolia, anomala, Emodi, officinalis, peregrina, paradoxa, lobata, mollis.

Group 3.

Follicles tomentose, spreading stellately when mature. P. corallina, Russi, Broteri, triternata (daurica), arietina, decora, cretica.

J. G. Baker.

(To be continued.)

SHELL-LIKE LARVA CASES.

AT the meeting of the Entomological Society of London, held on February 7, 1877, I exhibited "an extraordinary case of a Lepidopterous larva from Zanzibar, sent by Dr. (now Sir John) Kirk, who had found it on Mimosa. It was probably allied to Psyche and Oiketikus, and was in the form of a flattened Helix, half an inch in diameter, formed apparently of a kind of papier-maché, with a smooth whitish outside coating."

Very recently my friend Mr. Bates gave me nine cases of a somewhat similar character, found by Dr. Baxter at Mpwaipwa, East Africa, about 100 miles inland from Zanzibar. Dr. Baxter's attention had been drawn to them by seeing them carried about by the larvæ that formed them. But these, instead of being flattened, are high, and resemble shells of the genus Cyclostoma or Paludina in a wonderful degree (fig. 137, A). They vary from 9-13 mm. in diameter at the lowest whorl, by from 9-15 mm. in height. Each forms about 31 whorls, the sutures indicating which are not very sharp, owing to a coating to be presently alluded to. In six of them the spiral turns from left to right, in three from right to left. The apex is blunt and depressed; the mouth nearly circular, and there is a deep open umbilicus; all have the mouth perfectly open. Upon making a vertical section it is seen that the whorls are perfectly sepa-They are of extreme lightness, yet the walls are nearly 11 mm. thick. This lightness is owing to the texture, which, although perfectly hard and firm, is somewhat fibrous. The material is undoubtedly vegetable matter, but whether masticated specially for the purpose, or excrementitious, is uncertain to me. I rather incline to the latter idea, because there is no opening through which the excrement could be ejected, other than the mouth of the case. The exterior has a thin coating of (apparently) silk of a pale drab colour, which reoders the cases very smooth, but not glossy; but the older cases are blackened by a coating of what is probably adventitious matter. I am unable to say on what plant they were found, but one of them is attached to a fragment of a plant, which may possibly be Mimosa.

It is well known that exotic species of Psychidæ are given to fabricating cases of extraordinary forms, but, of all that I have seen, these are the most extraordinary, on account of their perfect similarity to shells.

The cases of the South European Psyche (Cochloplanes) belix, are tolerably familiar to most entomologists, but their resemblance to/shells is less marked, on account of the debrix with which their exterior is covered; moreover, the texture is slight and yielding, and at, or near, the apex there is an opening through which the excrement can be ejected. They bear more external resemblance to the now well-known cases of the Trichopterous genus Helicopsyche. For the sake of comparison I give here figures of the cases of Psyche helix (fig. 137, p). The figures are enlarged to two diameters, but the smallest figures (indicated by ") show the natural size.

With the above described cases, collected by Dr. Baxter, are others formed of twigs, arranged longitudinally or transversely (not uncommon), and one, 47 mm. long, mimicking a shell of the genus Denta-

lium, but such, I think, have already been noticed and described. R. MacLachlan, in "Entomologists' Monthly Magazine," June, 1884, and Royal Horticultural Society, Scientific Committee, May 13.

COLUMBINES.

THE botanical characters and the relationship of the different species of Columbine are of little importance to gardeners, who think more of the ornamental qualities of the flowers. We may say, however, that Mr. Baker, in his "Synopsis of the Genus Aquilegia," which appeared in the Gardeners' Chronicle of 1878, enumerates the names of seventy species described by different writers on botany; of these he retains twenty-five as sufficiently distinct, though in the Genera Plantarum of Bentham and Hooker we find the number of species of Columbine reduced to five or six. Perhaps even of these his would be difficult to define the limits, and perhaps from a gardener's point of view greater variations may be found within a single species than are to be found between one species and another. Without inquiring what are to be the few lavoured names which are to be retained with specific honours, it may be said that for all gardening purposes five are sufficient to form the base of a collection of the fioset Columbines, and adopting Baker's names I will call these A. vulgaris, formosa, chrysantha, ccerulea, and glandulosa. There are other distinct kinds which may be desirable additions

dry and sandy border. Of A. glandulosa the name is commoner than the plant. Its headquarters in the kingdom is the nursery of Messrs. Grigor, of Forres, from whom it can always be obtained true, as they grow no other kind. I believe that the best dealers in seeds are supplied with seed of this kind from them. In the Forres nurseries it grows 2 feet high, with twenty or thirty flowers on a plant, some of the flowers measuring 3 inches across, but in England its growth is less robust.

Mr. Baker describes two varieties of A. glandulosa—one which has the flower all blue; the other, which he calls var. jucunda, has the corolla white, but differs in no other way from the type. It is the latter form which Mr. Grigor has; the other, with the less ornamental self-coloured flower, does not seem to be in cultivation. The five kinds I have enumerated may all be raised from seed, which should be sown under glass early in the year, and the seedlings should be grown oo, so as to become as large as possible before their first winter. They should always be transplanted once or twice before they are moved to their flowering place, which should be done before winter; no Aquilegia moves well after it is a year old, or flowers well after being moved in spring.

A few words must be said about hybrids. Some of the best hybrids will come accidentally, others made by design will turn out disappointing. I do not find it difficult to effect crosses provided I apply the pollen with a camel-hair brush before the flower is quite

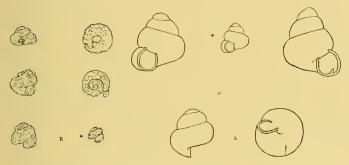

FIG. 137.-SHELL-LIKE LARVA CASES OF LEPIDOPTEROUS INSECT.

where large collections are grown, and some of these will be mentioned presently, but all the most beautiful Columbine flowers may be referred either to one of these five, or to hybrids of them.

A, vulgaris I consider the best seed parent for the tall showy kinds with large flowers and branching flower-stalks, and those with the largest single flowers, and the best and clearest self-colours, or the most distinct bicolor forms should be selected to keep. A, vulgaris includes many varietal names, as well as the kind described by Mr. Baker as A, sibirica, to which many of the handsomest of the common Columbines, especially those with a whole corolla, are probably to be referred.

A. formosa is the handsomest and brightest of those with red and yellow flowers. A. californica and A. truncata come very near it, and ought probably to be included in the name. It is, however, very important to a garden to get the best red Columbine which can be found; as the red flowers produce by far the largest quantity of pollen, and fertilise many other varieties near them. The poorest of all the reds is the common North American kind, called A. canadeosis. Unfortunately the seed of this is so easily obtained, and the plants so easily raised, that it abounds in gardens, though nothing tends more to deteriorate a good collection of Columbines than its presence. A. chrysautha is well known and easily raised and kept, though not so easy to keep true. Those with the largest flowers and of the clearest canary-yellow should be preferred. A. ccerulea is perhaps the most beautiful species of all, and the most important for forming hybrids. It is too well known to require describing. It prefers a

open, otherwise the bees are before me, and I never can depend upon the cross being made. The largeflowered forms of vulgaris are, as I have said, the seed-parents of the tallest and most showy hybrids, made with the pollen of glandulosa, or corrulea, or for The last-named kind produces the most effective crosses for size and abundance of flowers; it also has the habit of reflexing its sepals, and of protruding its anthers in a conspicuous bunch before the mouth of the corolla-two very ornamental features. I have been trying to obtain a variety of this cross with scarlet sepals, reflexed, and a white corolla, and have nearly succeeded. Red is often entirely absent from hybrids of formosa, the form being given without the colour. Second and third crosses may be successfully made, and after a little experience it will be found what combinations produce the most successful results. The best seed I have yet had has been some given to me by Mr. A. Rawson and Mr. Douglas, in which A. cœrulea has a conspicuous place.

I may say a few words in conclusion about several distinct kinds of Columbine not yet mentioned by me. The early and dwarf A. viridifiora is more curious than ornamental. A. fragans is a name common in seed lists, but I believe the plant does not now exist in cultivation. I have sown the seed of the best dealers for several years without ever producing anything like it, although I own that I have in one or two cases raised some very beautiful hybrids which have repaid me for my trouble. I have never seen in flower either A. alpina or A. pyrenaica; plants dug up in their native mountains can never be re-established, and though I believe Mr. Thompson, of I ps-wich, supplies true seed of both, it never comes up.

Plants sent from Continental nurseries have been altogether wrong. The last to be mentioned is A. Skioneri; this is curious, handsome, and distinct, but rare. The late Mr. Nelson, of Aldborough, kept it true, and from his garden I had seed, through Mr. W. Thompson, ten years ago, and have contrived to keep it ever since that time. Plants seldom live for more than two years; being a native of Central America it finds our winters too cold and our summers not warm enough, and it is hardly hardy here. It never flowers till July, and I carefully save the two or three pods of seed which it ripens. Plants I have now show as yet no signs of flower-stalk. I do not question the existence of the true plant in gardens in the South of England, but merely say that what is generally called A. Skinneri is a long-flowered form of A. canadeosis or californica. C. Wolley Dod, Edge Hall, June 1.

HUME TOWERS, BOURNE-MOUTH.

BOSOMED high in tufted trees, about I mile north of Bournemouth Pier, is Hume Towers, the commodious seaside residence of John Sellow, Esq. It is in the modern style of architecture, and is approached from the Branksome Road. From the tower, which is surmounted by a flagstaff, an extensive and pleasing view is obtained. South, east, and westward is the picturesque and salubrious town of Bournemouth, above which and the Pine trees among which the houses forming the town are built, and to the exhalation of which the salubriousness of the place is not a little attributed, tower the lofty spires of St. Peter's and other sacred edifices; and in the background is seen the undulating surface of the deep blue sea, dotted with ships of various sizes, and belonging to various nations, as far as the eye can reach; whilst away in the distance to the right and left can be distinctly seen the "Old Harry Rocks" and the "Needles." Immediately north of the Immediately north of the mansion and contiguous to the pleasure grounds in that direction is an unbroken expanse (apparently 1000 acres) of Pine wood, which forms a striking though sombre contrast to the other side of the picture.

The pleasure grounds, which, fourteen years ago, were, like the whole of this charmingly situated estate, part of the adjacent woods, are opposite the south and west fronts of the house, whence they slope sharply in the direction of the Branksome Road, and between which and the grounds a high, flourishing, and well-kept Holly hedge makes a capital boundary and screen. These well-kept grounds have been laid out with taste and skill, and judiciously planted with an assortment of choice Conifers and ornamental and flowering shrubs, and which, for the time they have been planted, have made rapid and luxuriant growth. Two beds of choice Rhododendrons in fine flower and variety were especially worthy of notice, as also are nice specimens of Araucaria imbricata, Wellingtonias (both clothed to the ground with healthy branches), Abies Nordmanniana, Pinus Lambertiana, Thuiopsis borealis, and the Strawberry tree (Arbutus Unedo), of which there are about forty fine bushes covered with large clusters of fruit, which, when ripe, contrast effectively with the oblong-lanceolate serrulated green leaves underneath. The double flowering Gorse is a capital sea-side plant. The general character of the soil in which the above-named trees and shrubs are luxuriating is peaty, resting upon a hard gravelly subsoil which is impregoated with iron, and was trenched between 3 and 4 feet deep before the trees and shrubs were planted in it.

The kitchen garden, which is south of and contiguous to the pleasure grounds, but effectively shut off from the latter by trees and shrubs, covers an area of about 2 acres (including the space occupied by the glass-houses and fruit trees), and is well cropped and, like the place in general, well managed. A noteworthy feature in connection with this department is a capital illustration of the useful and ornamental combined in the way of a fruit arbour 286 yards long, over the two side and bottom walks (the glasshouses being at the top) of this garden, which slopes gradually to the south, from which direction the arbour is entered from the ornaniental grounds. It is a substantial and ornamental framework of iron and wire, and is well covered with Apple, Pear, Plum, and Cherry trees in variety, and which in ordinary seasons yield fairly good crops, but this year Mr.

William Harp, Mr. Sellow's able gardener, and to whom the credit of making these interesting and well-kept gardens is due—will have to be satisfied chiefly with the ornamental character of this delightfully shady summer promenade.

GLASS-HOUSES .- These consist of three vineries, three Peach-houses (span-roofed), one plant-stove, In the vineries are nice even and one greenhouse. crops of average-sized bunches, those in the early house approaching maturity. The following Peach and Nectarine trees are healthy and carrying good crops of fruit in the Peach-houses, which run east and west-viz., Royal George, Grosse Mignonne, Stirling Castle, Bellegarde, George IV., and Walburton Admirable Peaches; and Elruge, Victoria, and Violette Hâtive Nectarines. The plant-stove con-tains a nice clean well-grown lot of fine-foliaged and flowering plants, chiefly of a decorative character, the most noticeable being fine plants of the Golden Fern (Gymnogramma chrysophylla), Adiantum cultratum (A. trapeziforme), Davallia divaricata, Adiantum Sanctæ Catharinæ; and ol ornamental-foliage plants Alocasia metallica, Cissus discolor, Dracænas, &c. Two grandly flowered plants of Hoya carnosaone on a pyramid oval trellis, and the other trained to wires underneath the roof-also find room in this

The greenhouse is gay with a variety of flowering including Pelargoniums, Calceolarias, Petunias, Cinerarias, amongst which were a few good doubles, bright magenta; Azaleas, in variety; Epiphyllum splendens and salmoneum, the latter a delicately-scented variety); Salvia rosea, a dwarf, compact-growing variety, and said to be a good bedder; Caroation Souvenir de la Malmaison, Tropæolum tricolorum (neatly-trained), Centaurea ragusina compacta, a very effective decorative plant, and easily increased by offsets inserted singly in 3-inch pots filled with sandy soil, and placed in a close frame, and shaded from bright sunshine until they have emitted roots, when it should be discontinued, and the plants gradually inured to light and air. Flowering shoots of Tacsonias Van Volumii and exonicusis, depending gracefully from the roof, give variety and finish to this house; and for the benefit of those of your readers who have hitherto failed to flower satisfactorily these very free-flowering climbers, I may be allowed to state that all that is necessary to Insure success with healthy free-growing plants is to train the shoots thinly and loosely to a series of wires fixed underneath the roof of a light greenhouse or conservatory, cut clear away all superfluous shoots, and keep the roots, which should be confined to either large boxes or narrow well-drained horders, consisting of three-parts sandy loam and one of peat, well supplied with water. With a passing reference to the good Mushroom-house, fruit-rooms, young men's apartments, &c., in the rear of the vinery range, and the fine banks of Rhododendrons and Holly in the background, we will conclude our brief notice of Hume Gardens, over which Mr. Harp has presided for the last fourteen years with credit to himself and satisfaction to his employers. H. IV.

RHODODENDRONS AT HARROW WEALD PARK.

THE beautiful grounds of Harrow Weald Park, in which stands the stately Gothic residence of A. Sims, Esq., have for the last three weeks been enlivened with an astonishing display of glorious colours. For the last few years the gardens and pleasure-grounds, which comprise an area of 15 acres, have been enriched by the addition of the best new varieties of Rhododendrons, Kalmias, and hardy Azaleas. plants are arranged for the most part in picturesquely disposed clumps. The subsoil, which lies only 4 inches below the surface, is the tenacious London clay. A portion of this is removed, and a bushel or more of fibrous loam is mixed with a shovelful of peatthat is the compost used. There are several instances, however, in neighbouring gardens, where Rhododendrons are thriving in fibrous loam alone, without any peat whatever. Clumps of Lilium auratum are interspersed with the American plants, which form later on an effective background to this grand Lily. I will mention a few of the most effective :-Eclipse, very large, chocolate-crimson; Generalissimo, rosy-crimson; atrosanguineum, fiery crimson with black spots; Illuminator, rosy-pink, bright and effective; Mrs. John Penn, salmon, edged with lake; Queen of the West, rose with chocolate spots; Scipio, one of the most striking of the rose-coloured section; Curator is a beautiful shaded lilac, with light throat and deep yellow spots, Among the whites I was most struck with Purity, Snowflake, Crown Prince (edges tinged with blusb), and Empress Eugénie. I should be glad of an opportunity later on to give some account of the gardens, houses, and grounds—they are well deserving of note. There is a fine collection of coniferous plants, a large bardy fernery, well planned and capitally furnished, Rosehouse, and good crops of Grapes and Peaches, just finishing off.

The most striking feature of the place, however, is the extremely elegant hexagon-shaped conservatory, with bays east and west, and a corridor with recesses for flowers. There are some fine specimen Falms, Seaforthia elegans and bortonica; several Tree Ferns, and a fernery with fountain and statuary. The little Ficus repens is used considerably as a drapery for the walls, which consist of a red sandstone. On the dome-shaped roof are Tacsonia exoniensis and Lapageria rosea. Trained on the outer wall, and on a pretty rustic arbour, I noticed the somewhat rare but beautiful old scarlet Trumpet Honeysuckle. The view from the terrace comprises a richly wooded landscape, stretching miles beyond Royal Windsor, T. W., Harrow.

THE "CHICK" HOUSE, OR INDIAN CONSERVATORY.

IN 1871 I went to the Royal Botanic Garden near Calcutta, I saw there that the then Curator, Mr. Scott, had been successful in growing Orchids and Ferns under a grass roof, such as is used by natives for growing the "Fan-vine"—a species of Piper (see Gardeners' Chronicle, p. 281, vol. xix.).

On returning to Lucknow I conceived the idea of trying a modification of what I saw in Calcutta, suited to a climate where a hot dry wind usually raged between March 15 and June 15, sometimes even later. In the Horticultural Garden I erected a house covered on all sides and top with "chicks" of reeds, called "Sentha," that is, the dry stems of the Saccharum moonja. A "chick" is a blind made either of these reeds or of strips of Bamboo, more or less thin, and fitted to doors and windows of Indian bungalows.

During the process of erecting this house I made some interesting experiments. I supported one of these blinds horizontally across some Bamboos in sunlight; then I took a sheet of paper and held it close to and parallel to the reeds. I found that the direct sunlight passed through and alternated with the shadows of the reeds. By moving the paper from the reeds I found that their shadows broadened. and eventually crossed each other, producing a light totally different from direct sunlight, and resembling at a certain distance a sort of moonlight. Thinking over the matter I came to the following conclusion: As the sun's disc at its distance from the earth is broader than the reeds, it follows that close to the reeds there will be alternate sunlight and dark shadows, but that at a certain distance the shadows and lights would mingle, and produce a subdued light, such as, for instance, would be produced under a tree by the mingling of the shadows of the leaves and the sun's rays that pass between them, same thing may be illustrated by making a pin-hole in a door and allowing the direct rays of the sun coming through it to be received on a sheet of paper behind the pin-hole. By moving the paper from the door it will be seen that the picture of the pin-hole enlarges in diameter as it recedes from the hole. The reason, of course, is that the disc of the sun being larger than the hole the rays proceeding from the edges of the disc cross each other at the hole, and diverge again ad infinitum. The difference of size between the sun's disc and the diameter of the reeds is, I take it, the reason of the beautiful subdued light which fills the interior of the "chick" house-sn suited to all plants which, in a state of Nature, are found in forests, and lighted only by the mingled lights and shadows produced by the leaves and branches of the forest trees and bushes. Before setting up my first "chick" house in the Lucknow Horticultural Garden many plants, including Ferns, could not be grown at all. By irrigating the soil under this house from a well, a moist ground and atmosphere were kept up in the driest season. The screen of "chicks" protected the plants, not only from the scorching hot wind outside in summer, but to a great extent from the frost in winter. In my annual report to Government of 1874 I find the following:—

"The most successful experiment of the past year has been the 'chick' house, or conservatory. It has answered for many things beyond my most sanguine expectations. Pteris longifolia and cretica, Asplenum esculentum and dentatum, Nephrolepis exaltata und tuberosa, Nephrodium molle and truncatum, Polypodium proliferum, lineatum, and irioides; Cheilanthes formosa, Adiantum Capillus-Veneris and caudatum—all Ferns—thrive with a luxuriance which cannot be sur-passed in their native habitats. The Acalypha tricolor, which delights in the moist, hot climate of Bombay, lit up the conservatory with its painted leaves. The superb Heliconia (now, I believe, called Musa coccinea), re-sembling a dwarf Plantain, flowered under this cover for the first time, and produced a head of brilliant scarlet The wiry Passiflora kermesina climbed up the posts with great luxuriance, and festooned itself between them, dropping here and there its graceful branches, studded with crimson starlike flowers. Selaginella lævigata, with its creeping stems and lacefronds; the Eucharis amazonica, with its waxy milk-white flowers; the large-leaved Scindapsus, exotic Palms, and Araucarias, with their varied and charming foliage-all these and many other delicate plants have tound a home in this conservatory, and promise to become a great acquisition to Lucknow. This house is 64 feet long, 40 feet wide, and 8 feet high."

A judge in the Indian Civil Service, who came out with me on my return from furlough in 1881, told me one day:—"Your 'chick' house made quite an era. We had a very nice one put up in our compound, and used to have chota hazri (early breakfast) in it every morning, surrounded by Ferns and other pretty things."

Of course such houses can be made more expensive and permanent with iron posts and framework. Later on, indeed, a very fine conservatory of this kind was erected in the Royal Botanic Garden at Calcutta. There, however, it was covered over with wire netting, and over this were tied leaves of a long kind of grass. Many other "chick "houses were erected in different places. I made a tour in South India last year. At Bangalore and Madras I saw them—although there, instead of "chicks," they use open mat-work, made of thin laths of Bamboo, with meshes about an inch or so wide.

These "chick" houses are invaluable for hot

Climates, where the frost in winter is insignificant. They temper the heat and dryness of the atmosphere to a remarkable extent. In the rains, the atmosphere inside is apt to become too damp, from want of ventilation. To counteract this, I made windows all round, closed with "chick" blinds during the hot and winter months, and opened up during the rains.

It is interesting to find that the "lath shadings" in use in France, and now being introduced into England, answer the same purpose, in mitigating the force of the direct sun-rays, and the subdued light produced under them is explainable by the same causes as stated before. The screen, of whatever material made, must be a certain distance from the plants, so that the sun-light may reach them after the shadows of the laths have crossed, in order to exclude direct rays. If the plants are placed immediately below the screen, they will, I have no douht, still be scorched where the direct rays touch them.

It would be interesting to know at what date the French began to use these lath shadings, in order to ascertain whether they took the hint from our "chick" houses. In Florence, in 1850, in one of the nursery gardens, I saw a structure something similar to our "chick" house, for summer use.

These houses can be modified in various ways. One I roofed with dried leaves of the common Phoenix Palm; another I roofed with "chicks," leaving the sides all round quite open. Being screened on the wind side by trees, the latter made an admirable place for germinating seeds of all asorts in pots and for raising young plants.

I believe that houses covered in this way might be used in England during the summer for screening plants from the sun and wind. In a country where everything is made by machinery something might be devised of a permanent nature—such as wire screens—like "chicks" and painted; or screens made of strips of zinc. Both these might, however, radiate too much heat towards the plants. The "chicks" or blinds that are now made in

England for windows, of thin strips of wood, would I think hardly answer, as they are too close, and would not stand wear and tear. In Florence I saw blinds of this kind made of a strong wiry reed, called "Giunco." Those would promise to be more durable, if the string which binds them were tanned or tarred. E. Bonavia, M.D., Etawah. [Such houses are, we believe, common in Italy—we have seen them in the Pisa Botanic Garden. Ed.]

THE PROPAGATOR.

DIONEA MUSCIPULA (VENUS' FLY-TRAP).—At first sight it would appear to be a difficult matter to multiply this plant to any extent with success, but such a view will be dispelled by the detailed methods of multiplication given below. The simplicity and comparative ease of propagation should lead the gardener to enlarge his stock of this singular and interesting plant. The three different methods of increasing the Diouxea are:—I, by division; 2, by leaf-cuttings; 3, from seeds.

I. By Division .- This operation is a simple one, and consists in dividing the plant through the centre of the stem. This should be done with a sharp knife and when the plants have been shaken out of the soil. Owing to its peculiar growth it requires some care in dividing the plant, which as a rule cannot be divided into more than two pieces. Each piece should be potted into a thumb-pot. It is well when pottingup to run a little dry sand around each piece. Each pot must be placed in a saucer, full of water, and on a shelf or platform. The soil best adapted to the nature of the plant is composed of one-half sphagnum moss, finely chopped up; one-fourth spongy peat, broken into pieces of hazel-nut size; and one-fourth river sand. To every bushel of this mixture must be added one 48-potful of charcoal, another of yellow loam, and another of ballast or broken potscharcoal and the ballast to be broken into small pieces, and the whole to be well mixed together.

2. From Leaves .- In making cuttings of the leaves of the Dionæa, none other than mature leaves should be selected. The leaves must be taken off close to the stem of the plant and afterwards dibbled an inch deep into well drained pans previously prepared. The pans should be filled with the soil mentioned above when it has been passed through a 1-inch sieve, they should also be watered before receiving the cuttings. After they have been placed upon the shelf or platform they require constant attention, and the gardener must be careful to see they are shaded from the rays of the sun, and to prevent them ever suffering from want of moisture, As soon as the leaves form plants they must be potted each into a thumb-pot, and can be placed with the other stock.

3. From Sceds .- The flowers of the plants intended for seed should be fertilised day by day. drained pans should be prepared to receive the seed; they should be filled with the soil previously mentioned, which should be sifted through a }-inch The soil should be firmly pressed into sieve. the pan, raising it an inch higher in the centre, and making it slope gradually towards the edge or rim. It is necessary to well water the soil before sowing the seeds, which need only to be sprinkled on the surface. The pans must now be placed on a shelf or platform, and special care must be taken to see that they do not become dry. When the seedlings become visible they must be potted separately into small thimble-pots. It is a good plan to place six, eight, or more of these pots into a 32-sized pan, filling up the interstices with chopped moss. These must be replaced upon the shelf, watered, and protected from the rays of the sun.

Culture.—Dionæa muscipula, or, as it is more commonly known, Venus' Fly-trap, has many characteristic peculiarities to which the cultivator has to pay special attention. It will be found to grow best under the following conditions. When potting them is should be into 60-pots, and a little dry sand should be placed around the plant itself. The pots should be placed in pans filled with water, and if both the pans and the pots are washed once a week it will not only prevent the water becoming stagnant, but will also make the plants more healthy. It is only necessary to do this in the growing season. The plants grow best upon a little raised platform, although a shelf will do, and when placed in a south-east aspect.

They like plenty of air, and if it is possible to have the ventilator raised about I inch night and day it will conduce to the health and vigour of the plant. The Dionæa can be exposed to the full sun, indeed it flourishes under its iofluence. With regard to watering the plants ought never be allowed to become dry, neither must they be watered overhead. As the winter approaches, and the plants begin to die down, the saucers in which they were placed should be taken away, as the plants then need only to be kept moist enough to sustain life in them. And, lastly, we would urge the gardener to be constantly on the watch to prevent the inroads and ravages of the wood-louse. This insect will eat its way into the centre of the plant, remain there unperceived until it has devoured the whole plant, and will if not checked destroy the whole stock. In order to pre-vent this disaster it is advisable to examine every plant, and where a leaf has died off to run in a little dry sand; also into the crown and hollow places at the bottom of each plant, at the same time pressing the soil firmly and closely round the plant so as to fill up any cavities.

CEPHALOTUS FOLLICULARIS: ITS PROPAGATION AND CULTURE: (1). Propagation. - The proper means of propagatiog this plant is by the root. the plant has been shaken out the thick roots should be cut off, and each of them again cut up into pieces an inch long. In potting them, which should be in small pots, each piece should be embedded so deeply that the top of the root is level with the surface of the soil, and a little sand should be placed around each piece of root. It is now only necessary to place them on a shelf or platform, and to see that they are never allowed to become dry. Soil composed as follows is best suited to the nature of the plant :- One part finely chopped sphagnum moss, two parts spongy peat, and one part river sand. To every bushel of this compound should be added a 48-sized potful each of yellow loam, ballast, and charcoal, the two latter to be broken up into pieces of hazel-nut size, and the whole to be thoroughly mixed together. With regard to

(2). Culture—the Cephalotus follicularis may be treated in a similar manner as Dionæa muscipula, respecting which we bave written above; but Messrs. Jas. Veitch & Son, of Chelsea, who have the most wonderful stock of this curious plant, plunge their plants in pans of white spar, and cover them with bell-glasses, keeping them always in a cold light house. The glasses are kept slightly tilted, and the plants show off their singular beauty well in their setting of white marble spar. T, O.

STRAWBERRIES FOR MARKET.

THE class for a single dish of Strawberries of the British Queen or any of its type, for which prizes will be offered at the next fruit show at South Kensington, will perhaps have interest for the few growers of old kinds, but it is certain that neither the Queen nor any of its class is held in high esteem by market growers, howsoever valuable it may be in the market. We learnt the other day from a grower that he grew a few Queens only, and was very well paid if he obtained a good crop once in four or five years, simply because the price is so much in excess of that obtained for average kinds. It would be idle to deny what is so well known in the Strawberry, and that is, that really high flavour and freebearing are seldom found in unison. The British Queen and its best allies will make good growth and seem to thrive admirably, yet rarely give a decent crop of good ripened fruit. The very fact that Nature seems seldom able to colour the points of the fruits as others are finished shows that some elements of robustness or productiveness are lacking, hence the majority of growers, though sadly, have been obliged to allow these high-flavoured kinds to fall into desuetude. To market growers any appeal to them to grow Queens is invariably met by the remark that they want to live and pay their rent, and that this sort will not help them to do it. For that reason the favoured Strawberries of the market are the richcoloured Paxtons and Presidents, and the proverbial acid but firm Napiers, though a few will grow the old Keens' Seedling, and for preserving the once famous Elton Pine. Even rarer, except in some old

gardens round London, is the Grove End Scarlet, so much favoured in still-rooms for preserving whole, as all Strawberries should be.

It is further interesting to note that in the corresponding South Kensington fruit show in July prizes are offered for the once famous old Hauthois. Naturally the introduction of these classes leads to the inference that the promoters of these prizes wish to resuscitate old high-flavoured kinds, but the result is exceedingly doubtful, for the simple reason that very few indeed care to cultivate them. After all, there are not a few who hold to the belief that really high-flavoured fruit of almost any kind sooner cloys the palate than do good juicy but less aromatic fruit, and that, therefore, the partaking of the latter is in the end more enjoyable. Probably many persons will demur to that proposition, but something is to be said on both sides. Where those who favour less flavour in their Strawberries have the advantage is in the immense productiveness of the kinds producing them-a fact that it is impossible to ignore in market culture, let amateur growers and connoisseurs say what they may. Still, seem odd that no cross-breeder of Strawberries has yet succeeded in raising for us a President, Paxton, Napier, and Héricart de Thury, that has the flavour to some extent of the Queen or of the Hantbois. Perhaps there has been too much anxiety to secure size and colour with productiveness only, hence the higher flavoured forms have been neglected. Recently very few new Strawberries have been put into commerce, and myriads of those introduced during the last thirty years have passed into oblivion. When we remember how many kinds have been raised, and yet how few of them are now popularly grown, it would seem as if there had either been too much treading in a beaten track by raisers or else that their novelties lacked merit.

If the recent paucity of new kinds implies that raisers have nearly tired of a self imposed task, perhaps they may find success in starting on a new tack and seeking how far it may be possible to engraft upon a Paxton the rich flavour of a Queen or upon a Napier that of the once famous Hautbois. Still it is certain that success will only be measured by constancy in productiveness, let flavour be ever so good. How little do we hear now of the famous old Pines with their peculiar flavour, and too often lack of stamina. Very few of the Pines are grown now, excepting in select gardens, and the Hauthois has nearly gone the way of the dodo. once fondly thought that in Dr. Hogg, W. F. Radcliffe, and some others, the Queen was reproduced in more robust and productive forms, but even these seem to exist only in nursery gardens, where happily some of the old kinds are still cared for and where they may be obtained. Still with these a time comes when no more are asked for, and then they pass away

A few years since and Sir Harry startled the world of Strawberry growers, but where is it now, and who would grow even the monstrous James Veitch except for its size? Empress Eugénie, Oscar, Eleanor, Carolina superha, Trollope's Victoria, Myatt's Alice, said to have been inferior in flavour to the Queen, where are these and many others, and how soon will the favourites of to-day follow them? X.

FLOWERS IN SEASON.

FROM Mr. Gumbleton we have received the following, some of which we hope to figure and deal with at greater length hereafter:—

HABROTHAMNUS FASCICULATUS, from the open wall. A shrub with dense purple pubescence, oblong acute stalked leaves, and terminal heads of orange-crimson flowers, each about 1 inch in length, with long vase-shaped obovate-oblong tubes with fine, short, erect, pointed lobes—a remarkably handsome shrub.

HABROTHAMNUS CORYMBIFLORUS. — A hardy free-flowering shrub, needing no protection (in South Ireland). The leaves are lanceolate, downy; the flowers in dense terminal heads, surrounded by ovate acute leaves, each about 1½ inch long, rosy-lilac, with long funnel-shaped tubes and a five-parted limb, the lobes of which are lanceolate, spreading, and alternately reflexed.

SPIRÆA ROTUNDIFOLIA ALBA.—A hardy shrub with stalked glabrous roundish leaves, with racemes

of flowers at the end of the shoots—each flower about ¼ inch across, with rounded white petals.

EURYBIA STELLULATA.—A perfectly hardy shrub, which at a first glance appears identical with Olearia Gunniana figured by us at p. 733, vol. xvii.

EURYBIA ILICIFOLIA.—A Composite Aster-like shrub with minute subsessile ovate toothed leaves, shining on the upper surface, clothed with cream-coloured down on the under surface. Flower-heads numerous, on long stalks, corymbose, each cylindrical with numerous appressed oblong scales, surrounding long narrow strap-shaped white ray-florets, flat or recurved at the tips. According to the Arboretum Segretanum this is the Eurybia erubescens of De Candolle.

GENISTA AMSANCTICA. — A hardy Broom-like shrub, the lower branches of which are tripinnately divided, all the divisions linear, spine pointed. The leaves formed on the young growths are subsessile oblong, entire, and like the young shoots covered with white silky hairs. The yellow leguminous flowers, like those of a Cytisus, are in terminal heads.

EMBOTHRUM COCCINEUM is well known for its handsome, oblong, entire, leathery, shiniog leaves, and terminal heads of very long slender brilliant crimson flowers. In Mr. Gumbleson's collection the tree attains a height of 35 feet, and is one of the most brilliant shrubs it is possible to conceive.

CEANOTHUS VELUTINUS.—A remarkably vigorous hardy shrub, suitable for walls, with bold ovate glabrous leaves, resembling those of a Melastomad, but with large terminal panieles of white flowers, like those of a Privet, but characteristically those of a Ceanothus.

LIBERTIA GRANDIFLORA is a herbaceous plant of the Iris family, with tufts of white flowers in whorls along the ends of the stem. Each flower is about 1 inch across, with small linear sepals and broad ovate white petals.

CRATÆGUS OXYACANTHA.—Under the varietal name of Gumperi bicolor (Flore des Serres, xvi., tab. 79), Mr. Gumbleton sends a very brilliant crimson single-flowered variety. The white stamens contrast well with the crimson petals, and have doubtless suggested the name.

GREVILLEA BUXIFOLIA.—We have received this from Mr. Smith, of Newry. It is a greenhouse shrub with sessile many-ranked small oblog acute leathery pilose leaves and terminal heads of stalked flowers, of a cream colour, but covered with white dowo, and with long projecting curved styles, ending in broad trowel-like stigmas. The perfume of the flowers is like that of hav.

MILDEW ON ROSES .- Every Rose grower, gentle or simple, whether he or she have cultivated their favourite flower in houses or in the open air, has been troubled with mildew. Sometimes more virulent in its attacks than at others, sometimes appearing early in the season and sometimes late, but whenever it does come sadly interfering with the appearance, and to a certain extent also with the well-being of the plants; and every one has asked the question, What is the cause of it and what the remedy? Some have said, What can you expect from such highly manured Roses? You do everything in your power to encourage it : you heap on manure, you water with liquid manure, you bring your plants into a highly excitable state, and you prepare them by their rich feeding for those ills just as the turtle and venison-fed alderman prepares for himself the vile "podagra." Others again say, Look at your situation; you are surrounded with trees-you have no free circulation of air; and in such a position what can you expect but mildew? Many-in fact the larger number of growers-attribute it to that most fruitful parent of ills human, bestial and vegetable-our cold and searching east winds, which chill the sap and encourage the growth of the fungus. We are aware that this is a stock reason for all such subjects, and as there is no reply, it often has to stand the brunt of what it is not quite certain is due to it; however, whatever causes may affect the Rose so as to produce mildew, that the cold easterly wind does so I have had convincing evidence.

In writing about Maréchal Niel the other day, I mentioned that I had two plants in large pots in my greenhouse; they are both of the same age, were planted in the same way, treated exactly alike, with

this exception, one is in a cold vinery (with no heat whatever) facing the south, the other in a glass house in which I bloom Pansies, facing the east. They have both forced their roots through the pots, and have rooted in the soil; both started well into growth. When the cold east wind set in, in April, the difference soon showed itself—the Rose in the house facing the east soon became affected with mildew, while that in the cool vinery facing south was in no way affected by it. I send you foliage of both, that you may see the difference. I dusted the most mildewed plant with sulphur; it to a certain exteot checked its progress, but it gave to all the flowers a greenish tinge, which detracted greatly from their beauty. The healthy plant has given me from sixty to seventy blooms, all of great beauty and of good size.

of great beauty and of good size.

The condition, then, which, in the case of Roses under glass, so manifestly affects them, is, I doubt not, the cause of mildew in a vast number of cases out-of-doors. The very sudden change of temperature to which they are exposed is as injurious to them as to ourselves, but we cannot provide against it out-of-doors—and, therefore, I suppose we must be content to try and check its progress when it does attack them. There is one comfort, that it rarely attacks the open-ground plants until later in the season, and it does not permanently injure these plants: a small crumb of comfort, but still better than none. Wild

THE MASDEVALLIAS.

THIS genus, the species of which are chiefly natives of the high ranges of the Cordilleras of South America,

Fig. 138.-MASDEVALLIA COCCINBA

was but poorly represented in our Orchid collections until about fifteen years ago, when Messrs, James Veitch & Son, of Chelsea, were lucky enough to obtain living specimens of their still favourite and distinct M. Veitchiana from Peru. It flowered in 1868, and, strange to say, from that one importation the whole of the plants of it now in the country were obtained. Since that time, however, new species have steadily continued to be imported, in spite of the many difficulties offered to the successful carriage of these small-growing bulbless plants from their cool and moist homes in the highlands, through the warm valleys, and across the seas to this country. M. Tovarensis (candida), with its snow-white flowers, was named in 1848, and is an early and very valuable addition, which retained its high price until the day that both Low and Sander got an importation over, when it fell from pounds to shillings. M. Harryana came - a host in itself, varying in its lovely shades from lilac to magenta, blood-red and maroon, no two plants in an impor-tation being exactly alike. With respect to adhering to the one specific name, "Harryana," to all these varieties, it gives a very marked proof of the consistence and clearsightedness of Professor Reichenbach, who steadily maintained the name in spite of the comments of many who considered their newly flowered specimens quite new and not varieties of that plant.

Then came from that indefatigable Orchid-hunter, Roezl, an account of the wooderful true M. chimzera, which he discovered in 1872, and which flowered, under cultivation, in 1875. Many a joke was passed at the time about the length of the tails, but we now know that we can beat the description. After M. nycterinia had been freely sold for it the true plant arrived, and, together with its congeners, formed what is called the "Chimzeroid section," and gave a new feature to our cold Orchidhouse. M. Lindeni, a light blue-mauve with white tube, and one of the earliest arrivals, is very distinct

from the M. Harryana which is so named; it is the earliest in spring to flower, and there is but one variety of the true plant.

This is the true species sent over by G. Wallis, in 1869. That figured from Glassevin in the Botanizad Magazine, t. 5990, having the yellow tube, tall habit, and other characteristics which seem to pronounce it a variety of M. Harryana. M. Davisii was a great acquisition, obtained from near Cuzco, in Peru, and flowered with its importers, Messrs. Veitch, in 1875. It gave the much needed bright golden-yellow flowers. M. Shuttleworthii (botanizal Magazine, t. 6372) with its compact habit and large rose and yellow blooms, is a favourite with all; and the numerous varieties of M. ignea, varying in tint from yellow to cherry-red, are most florilerous and showy. This species first flowered in 1871.

M. rosea is now established with us, and proves itself to be worthy to rank with the best, and so does Veitch's hybrid M. Chelsoni after years of probation, and all who saw the tiny plant at South Ken-sington, on Tuesday week, are delighted with the flowers of the last new arrival, M. racemosa Crossi (fig. 139) the dried flowers of which, horne from six to twelve on a spike, are of orange-scarlet to blood-red in colour, and quite distinct in shape. above mentioned comprise most of the very showy kinds, and when they are seen with half a hundred flowers on each, as we often now see them, they are indeed lovely. The Masdevallias, however, need not have gaudy colours to make them attractive, for the little M. Estradæ, the fly-bearing M. polystictum, the pretty M. amabilis, the innocent-looking M. ionocharis, the curious M. tridactylitis, with its flowers like beetles, the varieties of M. Houtteana, the waxlike M. Carderi (the bell-sbaped flower in our illustration (fig. 140, p. 741), and numerous others, by the profusion with which they produce their flowers, quite compensate for lack of size or brilliance of colour. The M. macrura, M. Schlimii, M. trochilus, M. radiosa, and many others give us large strange-looking flowers, striking and effective. In fact, so large has the genus now become, so beautiful are its members, and so easily are they managed that a separate house is devoted to them in most of our large collections, and well do they pay for the space given them,

We cannot close our note on these plants without asking, what has become of the true Masdevallia coccinea, which came originally from Pamplona (alt. 9500) and which flowered with Messrs. James Veitch & Son in 1868? Dr. Lindley described it:— "This most charming thing, with flowers as red as a soldier's coat," and our illustration (fig. 138), reproduced from the Gardeners' Chronicle, 1868, p. 75, represents it as having a kind of enlarged tube, something like that of M. Veitchiana. We often see a plant so named in collections, but it is always a variety of M. ignea. Perhaps the original species has been lost, and if so there is in it another prize to be obtained by our keen Orchid importers.

CULTURE.—Cool shade, moisture, and pure air are the chief essentials for these plants. While liking light they resent the bright sunshine being let in on them, and whereas heat stimulates some plants into growth, on these it has quite the opposite effect and only tends to stunt them and produce on them the unsightly black blotches one sometimes sees on the leaves. For the general collection in winter a lowest inght temperature of \$5° April., with a day temperature of \$5°, will be found to answer best; and in summer the lowest possible temperature that can be secured without artificial heat should be aimed at. This can best be secured by putting pleaty of water about on and under the stages, and by keeping up an evenly balanced top and bottom ventilation; indeed, althoughthe ventilators should be regulated according to the weather they should never be quite closed, summer or winter, day or night. The Chimeroid Masdevallias do best in baskets in sphagnum moss and fibry peat, and these and M. Tovarensis are known to do better in a shady part of the Cattleya-house in winter and that they flower better when so managed, but, nevertheless, if necessary, all may be grown together in a house of the temperature given.

With respect to the proper aspect for a Masdevallia-bouse, preference is given to a north or northeast frontage, but it appears that the matter is of minor importance, for many of the healthiest and best flowered plants in the country are to be seen in houses of quite the reverse aspect; as a rule, however, most Orchids last longer in bloom in summer when placed in a north or north-east house. Attending to watering is a very important matter with Masdevallias, and as a good rough rule it may be said that they should not be allowed to get dry once in the year, rain-water alone being used to keep them moist. An open woodwork stage placed over a water-tight

FIG. 139.—MASDEVALLIA RACEMOSA, VAR. CROSSI: FLOWERS ORANGE-SCARLET. FROM AN ORIGINAL DRAWING BY MR. LEHMANN. (SEE P. 736.)

one is best for the Masdevallias, as for all other Orchids.

POTTING.—Some begin to pot their Masdevallias early in December, but the greater part of the growers wait until the new year comes in, and begin the work early in January; certain it is that the plants root in winter, and the beginning of the new year is a good time to give them fresh stuff. The compost used

should be one-half living sphagnum moss and one-half fibry peat, broken in lumps, to which should be added a good sprinkling of charcoal, also in lumps. The pots being crocked more than one-half the way up the plants should be potted with the above-mentioned compost, so that no matter how much water may be given it would drain away freely, and not allow the plants to become sodden. Masdevallias, if merely potted on, have a babit of forming a close

tuft, and when allowed to do so the flowers often decrease in size, and the plants sometimes die off without warning; it is well, therefore, in growing on a specimen to keep it divided up, the pieces being potted in the same pot, as the size of the plant increases much more rapidly when so treated, and the blooms are larger and of a better colour.

APHIS ATTACK THE MASDEVALLIAS more particularly in spring and summer, but if they are continually looked after and sponged off with a little weak tobacco-water they may easily be kept under. Thrips, too, sometimes beset them, but very rarely when the plants are grown properly cool; these must be sponged off, and the plants dipped several days in succession in weak tobacco-water, and if that fails to check them, fumigating should be resorted to, but only as a last resource, for it is seldom that it can be accomplished without injury to the plants. For sugs, the better way is to make a pleasure of hunting them, and killing them late in the evening and early in the morning.

in the morning.

In the illustration at p. 741, commencing at the upper left hand corner, the first is Masdevallia Davisi, next to which, with the leaf at the back, is M. ignea; in the right hand corner. In the second row from the top, beginning at the left, is M. Harryana, below which is M. Shuttleworthii, with a front and side view of M. chimzera (spotted), to the right of which is M.† Tovatensis (white); at the lower left hand corner is M. Trochilus, and in the centre the bell-shaped M. Carderi.

∯loqists' ∯lowers.

CARNATIONS.—In Messrs. Veitch's nursery the Carnations are now coming into flower in one of the greenhouses-indeed a batch of the fine white variety, W. P. Milner, is in full flower, and very charming they look arranged in the greenhouse; quite independently of their great value as cut flowers this is the most robust in growth, and, all points considered, it is the finest of all the white border varieties. There were also a few plants in flower of The Queen. If this kind would grow as freely in the borders as the other, it would surpass it in point of quality; as it is grown under glass, the quality and refinement of the flowers are coosiderably in advance of any hitherto raised. Those who do not yet possess The Queen (Abercrombie) should at once add it to their stock; it will not fail to please. I have grown the two named above with The Bride (Hodges.) There are more Brides than one, so it is best to ask for Hodges', and see that you get it! The yellow varieties do not seem to grow so freely anywhere as we would like them to grow; and Mrs. George Hawtry, in flower here, is no exception to the rule; but it has clear yellow flowers, and as it may be safely classed with the perpetual flowering varieties, it is indispensable. There are so few yellow varieties. What has become of Ascot Yellow? It is a true perpetual, but, like the rest of the group, rather delicate; we grew it for years, but it was lost ultimately. I well remember Mr. John Standish bringing it up one gloomy day in November or December, rather more than ten years ago. It was an edged flower, but a better yellow than most of them. The Prince of Orange and seedlings from it cannot be classed as perpetuals, and they flower ten days or more later than the ordinary show Carnations and Picotees. Mrs. McLaren I was greatly pleased with; it was in much finer bloom than I had yet seen it. As it is the first perpetual floweriog crimson bizarre, it might have passed if it had not quite been up to the mark, but it is as good as many of the summer flowering type; it is of vigorous constitution, and ought to be the parent of many fine varieties that would supply us with show Carnations two months before the ordinary forms come in.

Flowering, as they do, at the very hottest period of the year, the florist's type of Caraations do not last very loog in flower, and it is undoubtedly a great advantage to get them in earlier in the year, when the weather is cooler. A Carnation in cold weather will remain on the plants for nearly a month; in July it is difficult to keep them in good condition for more than ten days. I also noticed a new variety named Thomas Wallis. It has very large, full flowers, of a reddish-scarlet colour, with a darker flake; flowering as it does with great freedom it is excellent for decorative purposes, or to use as cut flowers. Mrs. Keen is one of the darkest coloured varieties yet

raised. It was sent out by Messrs, Veitch last year, and is of the perpetual-flowering type, and a great acquisition to this section. A few pots of forcing Pinks arranged amongst the Carnations are very pretty, and in their way quite as beautifal. The old Anne Boleyn was amongst them, but it has had its day. It is now surpassed by such beautiful varieties as Lord Lyons, which is much brighter in colour, and has more refinement in flower. The white variety, Lady Blanche, is getting rather scarce in the trade, but it is yet the best white, while Mrs. Moore is the best laced variety. J. Douglas.

FORESTRY.

THE FORESTRY ENHIBITION.—During the last fortnight the Index Collection from India, consisting of 666 different specimens of timber trees, valuable either for the 'wood or other economic products, has arrived in Edinburgh. Numerous exhibits have also been received from Durma and other of the more distant countries. Messrs. Cranston & Elliott's handsome offer has been accepted, to fit up and furnish, at their own expense, the rooms at the entrance of the main gallery, which are to be used respectively as reception and reading rooms.

In addition to the foreign countries which have already intimated their intention of being represented, the Government of France have courteously allowed Sir Alex. Muir Mackenzie, Barti, and Col. Playlair, to make a selection of the native woods of Algeria, as displayed in the official collection at Algiers, for the purpose of being exhibited at Edinburgh. Professor Archer has also granted the loan of some of the beautiful Indian wood carvings, and other rare wood specimens from the Edinburgh Museum of Science and Art.

Some splendid fishing-rods, in the shape of bamboos, of great length, have arrived from Rangoon. The State of Guatemala has just intimated its intention to be represented. The newspapers from the Canadian colonies report the activity and interest which the Exhibition has awakened there, and the collections of Canadian forest products promise to be a prominent and interesting feature in the Exhibition.

The executive committee has determined to make the price of season tickets \(\frac{f_1}{i}, \text{ and to issue fornightly} \) tickets at varying rates, to suit temporary visitors. The evening illumination of the grounds and other popular attractions are receiving due attention, and with these and the electric light, which will be displayed in the grounds as well as in the galleries, the Exhibition is sure to be a favourite resort for visitors from other countries, to whom the evening promenade is a necessity of summer existence.

The Benbaceous Borden.

THE DOUBLE NARCISSUS POETICUS .- Mr. Peter Barr tells me that he has discovered the single form of the double N. poeticus, and that is N. p. var. patellaris, and he sends me specimen flowers of that variety. replied that on comparing them with my single 'recurvus," which he says is true to name, I could discover no difference. Ilis answer is, that when my eye has been educated like his by long training to distinguish Daffodils, I shall he able to see it. Well, perhaps I shall; but is it worth while to retain as distinct io our catalogues varieties which it takes thirty years' training to learn to distinguish? The moral I draw is, that bulb catalogues are very much overdone already with varieties of Daffodil, and that two-thirds of the names (I could not enumerate them in the season) might be cancelled without any loss to horticulture, and with great advantage to those who are deterred from attempting to make a selection by the bewildering length of the list of "yellow crowns" "primrose perianths." As for the particular variety, N. p. patellaris, it is not mentioned in Burbidge's monograph, or in Mr. Barr's or any other bulb catalogue I possess. C. IV. Dod, Edge Hall, June 2.

THE DOUBLING OF DAFFODILS.—I have followed with some interest the various letters on the conversion in some soils of single into double Daffodils, but as yet I am afraid I am one of the sceptics. I have here an orchard with any quantity of single Daffodils,

and they have certainly been there over twenty years, and amongst them one clump of N. biflorus. Divided by a public road there is a small garden, and next to it another orchard. In it there are from twenty to thirty clumps of double Daffodils, which I take to be the double Telamonius. Both the double and single are growing in the grass. I have never seen anything approaching a double among the single, or a single among the double Daffodils. I have also been on the look-out for possible seed among the double, and the other day found that one clump had from ten to twelve seed-pods, but on going carefully through the rest of the clumps could only find one other seed-pod. The pods appear to be full of good seed, which I shall certainly sow, and await the result. I notice that the pods of the double, although a stronger grower, are only half the size of the single. W. Rolles Fryer, Lytchett Minster, Poole.

Prchid Notes and Hleanings.

CHOICE ORCHIDS AT MESSRS. VEITCH'S. - At this season the numerous varieties of Odontoglossum crispum and O. Pescatorei make a fine display in most large collections; and these are supplemented by the yellow ground Odontoglossums. One very seldom sees such a spike of O. Pescatorei as there is here at present; it is a good variety, and on the curving branched spike I counted 100 flowers. Oncidium pulchellum is a small plant, with pinkywhite flowers, and a yellow lip prettily spotted. variety of Masdevallia Harryana named regalis is one of the finest varieties of this handsome species. Oncidium concolor, suspended here and there in the cool-house, has an excellent effect amongst the others; its clear yellow flowers are not matched by any other species of small growth. O. cucullatum is always welcome amongst the small-growing kinds, and at present is very pretty in the cool-house. Cattleya-house the gorgeous blooms of C. Mendelii, whether they are of the white or rosy sepalled varieties, attract most attention in May and June; while the visitor cannot but linger over many exquisite varieties of Lælia elegans-one I noticed with a lip of deepest crimson with rosy sepals and petals. Here is also a novelty, probably unique, named Cattleya It has rather narrow sepals and petals, iricolor. creamy-white; the lip has crimson markings, with a transverse yellow bar. The new Cypripedium ciliolare is also proving itself to be a remarkably fine species; a plant here was much finer than usual, although the ordinary forms are greatly admired. It is one of the finest of all the barbatum group. 3. D.

ODONTOGLOSSUM VENILLARIUM,—A fine specimen, bearing fifteen spikes and 150 good-sized flowers, is now in bloom at Ferrières. Mr. Bergman was the first to flower this grand Orchid in France in 1875.

CATTLEYA SANDERIANA is also now in bloom, for the first time in France, in the Ferrières collection.

LISSOCHILUS GIGANTEUS.—In the marshy spots down near the river shore are masses of that splendid Orchid, Lissochilus giganteus, a terrestrial species that shoots up often to the height of 6 feet from the ground, bearing such a head of red-mauve, goldencentred blossoms as scarcely any flower in the world can equal for beauty and delicacy of form. These Orchids, with their light green spear-like leaves, and their tall swaying flower-stalks, grow in groups of forty and fifty together, often reflected in the shallow pools of stagnant water round their bases, and filling up the foreground of the high purple-green forest with a blaze of tender peach-like colour. "The River Congo," by H. H. Johnston, F. Z. S.

VANILLA AROMATICA. — This climbing Orchid is met with in its wild state at Sante Comapan; it is occasionally met with on the Cocca trees, but it rarely fruits; first, it must raise itself beyond the shade which prevents the access of air and light—that is to say, that its flexible stems must climb to the top of the tree, from whence they fall in graceful garlands swaying to and fico, provided that the Indian, stimulated by the hope of gain, does not come, pruning-knife in hand, to clear away the dense foliage of the forest. The Vanilla also thrives on the dry and bare

rocks, which it covers in the fashion of our Ivy, and in which position it always bears numerous excellent fruits, the presence of which is revealed about the time they attain maturity, owing to the subtle per-fume which they give off. The fruit is a long pod, about 12-20 centimetres long; they must be gathered before they are quite ripe, otherwise the valves separate, so that their contents become soaked and spoilt by the rain. The sawdust-like seeds, now considered as the seat of the Vanilline, are scattered, and the aromatic perfume of the plant thus disappears. Mexican Vanilla is highly esteemed, and is cultivated in certain villages of the State of Vera Cruz. In the interest of the thrifty Indian it is to be wished that Vanilline may no longer be extracted from Fir tree sawdust, otherwise the Vapilla will lose in value daily. B. Rocal, in "Belgique Horticole."

Mr. SANDER'S ORCHID-HOUSES: VANDA TERES. -We say in French, "Il faut rendre à César ce qui appartient à César." I have read in the Gardeners' appartient à César." Chronicle and other horticultural papers of the new arrangement in Mr. Sander's houses for watering the paths, &c., and which is considered as a new idea; so it is, but it originated here, as may be seen by referring to the Orchidophile for January, 1884, which contains a plan and description of our cool Orchid-house. This house was occupied by the plants from March, 1882, and was then in full working order. In the beginning of the year 1883 I had the pleasure of a visit from Mr. Sander, who admired the system much, and said he would carry it out at St. Albans. Mr. Sander may have had the idea at the same time as we did, but still we were the first to put it into execution. I mention this merely to show that we poor French gardeners sometimes have ideas of our own. In your issue of May 10, p. 609, mention is made of "Vanda teres in excelsis" at Tring Park. I have heard of the good growth and fine flowers of these plants, but the treatment adopted by Mr. Hill was first practised at Ferrières. This our friend, Mr. Harry Veitch, can testify. We have grown Vanda teres in perfection for some fifteen years, and people have come from long distances to see it, including Mr. Veitch, Sir Nathaniel Rothschild, Mr. Hill, and many others. At that time this gem was seldom seen in flower in England or in France, while we gathered as many as 700 flowers [in a small corner of a house which contained some plants of it. Ernest Bergman, Ferrières-en-Brie, Seine-et-Marne.

FRUITS UNDER GLASS.

VINES,-During the past month the extremes of temperature and of drought, accompanied by other conditions in the weather of a variable character, have enforced unremitted watchfulness and anxiety. worst condition of all has been occasioned by the parched north-east air having to be admitted into the structures, where it readily displaced the genial moist atmosphere, and gave to the tender occupants a shock prejudicial to their satisfactory advancement. It is at times like these that ventilators with their apertures covered with perforated zinc are found to be of great When the early house is cleared of its fruit Vines should be subjected without delay to thorough syringings to eradicate red-spider and other depredators from the foliage, and the operation should be followed up until the leaves mature. The wood invariably ripens in early houses without recourse to special treatment; hot water can consequently be shut off, and the ventilators be left open. Some advocate a late development of lateral growth in order to sustain root-action, but our practice is to prevent it by disbudding, being persuaded that Vines break more satisfactorily the following season if not subjected to that excitement, at the same time we endeavour to preserve the old foliage from suffering in any way by keeping it clean and the borders well moistened. Very early forced Vines do not usually retain vigour for a lengthened time, and where renewal is contemplated it should be set about as soon as the crop is gathered. The present is an opportune time for permanently planting those that have been raised from eyes this season. We prefer inside borders for early work, and those formed of moderately coarse compost, firmly trodden, and well drained for all purposes. Before planting ascertain that the balls of soil are moist, plant them firmly, mulch with short manure, water with tepid water, and shade for a few days until the

foliage can withstand the sun. Muscat of Alexandria, Golden Hamburgh, and other kinds that are liable to have their berries scalded should when passing that stage, which lasts from two to three weeks during the stoning time, be submitted to a warm buoyant night temperature to prevent condensation of moisture on the berries. The back ventilators should be left a little open through the night, more air be admitted early, and the ventilation be conducted so as to obviate a rapid rise in the temperature.

PINES .- Judicious management of the shading is an important item in Pine culture, and where thin tiffany is made use of, and the houses are of the modern light type it should now, if the sky is clear, be brought into employment by 8 A.M., and not be removed until the sun's strength has waned : young foliage developes more healthfully and the fruits swell and colour more regularly when scorching sunshine is subdued instead of being allowed to reach them. The early Queens started at the beginning of the year will have comshould therefore be kept drier, and a circula-tion of air be promoted through the day and upheld in a limited degree during the night. Where Cayennes and other late varieties are fruited in compartments with Queens, they should have been plunged at one end, where they can be kept closer and damped between without materially putting to inconvenience the carrying out of the essential treatment necessary to perfect the Queens. If a greater number of fruits are ripening together than is required at one date, a portion may be retarded by being transferred to cooler positions where they can mature slowly. A batch of late fruiters, which should consist of Black Jamaica, Charlotte Rothschild, and Smooth Cayenne, should be induced, by keeping them rather dry at the roots, to show their fruits at the beginning dry at the roots, to show their fruits at the beginning of next month. These will prove of invaluable service in early winter, Young plants of the last two varieties should be shifted into their fruiting pots when in proper condition, and be incited, as should be all sections of successional plants, by early closing with brisk temperatures, and plenty of atmospheric moisture charged with ammonia, to make rapid, vigorous progress. Drawing need not be apprehended at this season if the plan of giving air early is adopted. Available suckers of the Smooth Cayenne and Chartes Rotherhild should at all times be utilized. They Available suckers of the Smooth Caspene and Challedte Rothschild should at all times be utilised. They associate well together, are invaluable for autumn and winter use, and, indeed, can be made to ripen fruits satisfactorily at almost any time of the year.

STRANBERRIES.—All except the latest varieties will have been consumed, and success with these depends in a great measure upon the structure in which they are grown; those having a southern aspect are not well adapted for ripening fruit in at this season, when the sun has long-continued force. The kind of house we use, with good results, is hip-roofed and faces the east, having stages some 2 feet 9 inches from the glass; the plants are consequently only indirectly exposed to the sun during the hottest part of the day, and the fruits do not scald, as there is a sufficient space between them and the glass for a clear passage of air. Preparations will now have to be made to raise the stock of plants for next season. Unhappily the present state of the weather is unfavourable to the growth of runners, and where ther has been no special treatment adopted to produce them there will probably be some difficulty found in securing strong early plants. For the purpose of yielding runners young plants should be plauced out in well prepared open quarters in August, in rows 3 feet apart. By mulching with short manure, denuding them of flower-spikes, and watering when necessary, a quantity of vigorous offsets will be more readily commanded than can be obtained by any other mode of culture. In layering 3-inch pots should be employed, which, baving been filled with sound loam, lightened with manure from spent Mushroom-beds, should be plunged in the mulching material and severally furnished with a young plant, which can be best kept in its place by a small peg. The method of layering at once in fruiting pots has been extolled, and it cannot be denied but that it is done with feasible reasons, yet after comparing the individual advantages we still cling to the old practice. Respecting varieties, it may be said that it is a mistake to have many, even where very large numbers of plants are forced. Of the many kinds we have tested the following have been selected as suiting our purpose well and they should be started in the order name

Plants and their Culture.

STOVE FLOWERING PLANTS FOR AUTUMN AND WINTER DECORATION, - Now that considerable relief is experienced from the usual overcrawded state of the houses during the spring months by the removal of the bedding and other tolerably hardy plants to the open air no delay should be allowed in looking after the old stools and securing an early hatch of cuttings of the most useful plants for the above purposes. Very early starting of such material is not to be recommended, even if more room than usual is at disposal, but when pressed for space, as is the case with most gardeners, it is far better delayed till there is sufficient room to give each and all of such plants every opportunity of making a sturdy growth. A good stock of short-jointed cuttings will in a brief space of time be available for insertion. If a brisk bottom-heat is at command to facilitate rapid root action so much the better, but as soon as each kind is well rooted see that they are inured to the ordinary atmosphere of the house. If struck in cutting pots, shake out and pot singly without delay. The mistake is oftentimes made of allowing young stock to remain crowded together in the pots in which they were inserted as cuttings. Rather than allow this it would be better to defer propagation for a short space of time. Voung stock that has been starved and stunted in this way rarely make a vigorous clean growth afterwards. We prefer, in many instances, to insert the cuttings singly in thumb-pots when there is room at disposal in the propagating pit. This is by far the better mode of procedure. A dwarfer plant is thus obtained, and is also more quickly worked off to make room for another lot. A properly constructed propagating pit is an essential aid in the increase of all the necessary stock of tender exotics. There is scarcely any time of the year when it is not capable of being turned to a good account in the production of the requisite material to meet the demands of the present day. It is also a far better plan to be at all times working up a successional stock of young plants to take the place of those that have become stunted and unhealthy. If this system were adopted, instead of retaining plants from year to year when they have gone far past their most useful days, our houses would oftentimes look far more effective. The days of large overgrown plants, except for special exhibition purposes, are fast going by. One plant is oftentimes seen occupying the space of three or four that would give a better return. To keep a plant for the sake of keeping it when it is really past its best should not be tolerated by any means. The labour, too, that is frequently expended on the cleansing of stove plants from mealy-bug and other filth might be considerably lessened by throwing away those that are the worst affected, and thus endeavour, by closer attention to the remaining stock, to completely exterminate the pest we have more specially named. Then by propagation when free from this pest of our hothouses the refurnishing can he speedily effected.

To revert, however, to the propagating pit, we might just state that we find ours simply invaluable for rapid reproduction. At one end of a lean-to stove an extra wall, one brick thick, has been carried to the necessary height. This space has within it two 4-inch hot-water pipes that furnish plenty of hottom-heat. Bearers over the pipes carry some slates on which is laid some cocoa-fibre refuse as a plunging medium. Some plants we strike in this material and then pot them up when well rooted, but we generally prefer to insert the cuttings in pots and We have already worked off then plunge them. some young stock of Eranthemum pulchellum and E. Andersoni, that were struck in thumbs and are just shifted into 4-inch pots, in which they will stand for some little time. Later on both of these species will be kept somewhat cool and airy, in order to develope as compact a growth as possible. Poinsettias that are now started into growth, although not pruned back, are furnishing nice young shoots for propagation. As each succeeding one is taken off another will push forth below the former, and continue to give us several shoots in succession. Euphorbia Jacquiniæflora affords us cuttings in a similar way, the earliest of these are struck, but later hatches can still be inserted. Centropogon Lucianus should not be over-looked; plants of this useful winter flowering subject when of one year's growth will, however, make the

more robust shoots, but some young ones should always be allowed for. Flumbago rosea and P. coccinea should receive similar treatment and vigorous growths freely encouraged. Some cuttings of the Scutellarias should be got in soon by those who grow them; they are fine showy objects when in flower, but not always the most floriserous, at least such has been our experience. Justicia carnea and J. speciosa will also be found very useful for large collections, old plants will generally furnish several flower-heads during the season, but if cut hard back at this period of the year, and repotted when starting into growth, a hetter return may be anticipated in the autumn. Do not overlook the useful and floriferous Thyrsacauthus rutilans, of which some few cuttings should be secured and grown on without pinching. Plants that were struck last year will this season make useful stuff either for intermixing with the taller plants, or for training up the roof of the stove; in this latter manner the pendent racemes of brilliant coloured flowers would be displayed to excellent advantage. flowers would be displayed to excellent advantage. Where seedlings of Begonia insignis and B. Knowsleyana were raised early in the year, such will now be making nice young plants, that with attention will become well furnished by the autumn. Cuttings of either species should be got in as soon as possible in the event of no seedlings having been raised. B. Moonlight is another good winter-flowering variety, with blossoms of a yellowish-white, which are very freely produced. Seedlings of Aphelandra auranwith blossoms of a yellowish-white, which are very freely produced. Seedlings of Aphelandra auran-tiaca Roczlii, which are always preferable to cut-tings, should be kept in a light position in order to preserve as dwarfa plant as possible. If raised early, they will now be fit to shift into 4-inch pots, which will flower them very well. Of bulbous plants, the uncommon yet heautiful Urccolina aurea (pendula) should be encouraged to perfect a good growth. The Gesneras should now be looked after also. If they have been kept dry up to the present time, a good watering should now be given them with an increased temperature. This will soon ioduce them to show the property of the signs of activity, then they can be shaken out, and rearranged in smaller pots with care. The same operation can also be done before growth commences. They thrive well in a light soil with a preponderance of leaf-mould, and when well started into growth a pit or frame with a slight bottom-heat will suit them to the letter. James Hudson, Gunnersbury House Gardens, Acton, W.

The Orchard House.

We are now applying a surface dressing to the whole of the pol trees; it is placed on thinly the first time. It was some trouble to get the malt or kilndust we have usually had, we have therefore used some stable manure from a yard where the horses are littered with peat; this, in the proportion of half loam and half manure, makes a good dressing for many fruit trees. It is also being used for Vines and Fig trees in pots; these have been done about ten days, and the dressing is already quite permeated with roots. When this is the case, another thin layer of the dressing should be applied. We do it at intervals of about two weeks, and the continued supplies of should two weeks, and the continued supplies of should two weeks, and the continued supplies of stimulating food to the trees give vigour almost beyond belief. I never use any liquid manure, hut trust entirely to these dressings to give the trees all they require. Success is not problematical, but assured, if the trees are kept quite clean and well supplied with water. It is the inattention to watering that causes the fruit to drop during the period of stoning, and prevents what remains from swelling to anything like a fair size. Figs swifer from attacks of red-spider, as well as the Peaches and Nectaries; thorough syrtingings are therefore necessary night and morning to destroy it. As soon as the fruit begins to swell after stoning it is much benefited by a moist atmosphere and plenty of heat, shutting up the ventilators in the afternoon, so that the temperature rises to 85° or 90° by sun-heat. During this critical period the atmosphere ought to be at the saturation point, and in hot weather the trees may be watered twice daily at the roots—I allude, of course, to pot trees. If they are planted out I would give a thorough soaking of water to the roots, sufficient to soak the border to the bottom, at the first swelling of the fruit. It swells very rapidly after the stoning, and for this reason daily attention is necessary to hinsh it off well. The inexperi

APPOINTMENTS FOR THE ENSUING WEEK

TUESDAY, June 10

ROYAL Horicultural Society: Meeting of Fruit and Floral Committee, at 1: AM.; Scalerific Committee, at 1: AM.; Scalerific Committee, at 1: AM.; Scalerific Committee, at 1: AM.; Scaler of Imported and Established Orchids, THURSDAY, June 17, Sale of Imported Orchids, at Stevens' Rooms. June 17, Sale of Imported Orchids, at Protheroe & Morris' Rooms. Sale of Imported Orchids, at Protheroe & Morris' Rooms.

N view of the failure in many places of the LARCH, the necessity of looking for a substitute becomes imperative. Nor can we doubt that such a substitute may be found. Among the most promising are the Corsican Pine, Pinus Laricio, and its many varieties; the Nordmann Fir, Abies Nordmanniana: Cupressus nutkaensis, Sequoia sempervirens, the Douglas Fir, Abies Douglasii; Abies grandis, &c. No doubt also some of the Japanese species, such as Abies brachyphylla, Veitchii, sachalinensis, may ultimately be found available, but at present they are either too expensive or too little is known as to their rate of growth or the quality of their timber, and the same may be said of many of the Californian and Oregon trees, like Abies grandis or Cupressus Lawsoniana. For the present we must be content to grow them and many others purely as ornamental trees. We cannot be too thankful to such men as Mr. PARKER HAMOND and others who, by their enlightened experiments, are doing much to solve the problem, and prove by demonstration the suitability to our climate or otherwise of the numerous species that have been introduced of late years. From this point of view the establishment of arboreta, wherein the trees are accurately determined and named, becomes of much importance. The arboretum at Kew becomes yearly of more importance, and we can but hope that one result of the forthcoming Forestry Exhibition in Edinburgh may be the establishment on a proper footing of the arboretum attached to the Botanic Garden of that city. Not only should the nomenclature be verified and carefully kept by means of suitable labels, revised by competent authority at regular intervals, but observations on the preference of particular trees for particular kinds of soil, the rate of growth, the degree of hardiness, the quality, strength, and specific gravity of the wood noted as opportunity offers.

Much attention should also be given to the discrimination of particular varieties. It is well known, for instance, that some varieties of Scotch Pine (Pinus sylvestris) are much preferable to others. The botanical distinctions may not be easy to define, but no one can doubt their intrinsic importance, either from the point of view of pure science, or from that of practical industry. The variations in question have doubtless more or less direct connection with diversities of soil, altitude, and climate generally. The numerons varieties of the Corsican Pine illustrate this. Though they run one into the other in most perplexing fashion, yet it is not difficult to sort them out into geographical varieties, according to the countries in which they grow, and the altitude at which they are met with. We have already described and figured many of these, such as the Black Austrian, so hardy in seaside districts, the true Laricio, and the true Karaman Pine, which, we believe, is that grown at Kew under the name of Pinus neglecta. What is often called Pinus caramanica is nothing but ordinary Laricio from which the true Karamanian Pine differs. We have so lately described and figured this, that we should not again advert to it were it not for an obliging letter we have received from M. HENRY VILMORIN, accompanied by specimens, which we are pleased to see confirm the view we took. M. VILMORIN tells us that his grandfather had the tree in cultivation at Verrieres more than fifty years ago, but that it was removed. Cones of it will be seen in the collection to be exhibited by Messrs. VILMORIN at the Forestry Exhibition, and seedlings have been raised from it, some of which have produced cones, and from one of them (probably) specimens have been sent to us which agree with what we consider the true Karaman Pine as figured at p. 481. We quote from the Pinetum Britannicum the following remarks as to the varieties of P. Laricio, adding that the leaf-structure (a point not attended to when that account was written) is the same in all the varieties, and that there are differences in the colour of the young shoots and of the buds which we may refer at length on another occasion.

"The differences by which characteristic specimens of these forms may be distinguished from each other, are the following. Taking the normal P. Laricio as the type of the whole of the Laricio forms, then P., pyrenaica may be said to be an offshoot in one direction, having the leaves longer and more slender, and somewhat falling back, while P. austriaca (including Pallasiana) is an offshoot in another, having the leaves shorter and more rigid, more numerous, and of a darker green, and standing bristling straight out. The cone of Laricio is generally smaller and less tumid than that of austriaca, while that of Pallasiana is larger, longer, straighter, and more like the Plinaster than is that of austriaca. The prickle on the scales of the cone is stronger and more persistent in Pallasiana and austriaca than in the Corsican Laricio and pyrenaica.

FIG. 140.-PINUS (LARICIO) HELDREICHIL.

"The habit and form of the trees is another character by which to distinguish them. The branches as well as the leaves of P. austriaca are much more numerous and upright-growing, so that it makes a narrower and closer tree than Laricio proper. Pallasiana, again, is a still broader growing tree, the branches springing from near the ground, and spreading out so as to give it the appearance of a broad, compact pyramid. Pyrenaica, on the other hand, when growing alone is more like Laricio, although in its native mountains it is bare until near the top, leaving only a tufted summit somewhat in the fashion of P. pinca—a character probably due to their having been crowded in their youth.

their having been crowded in their youth.

'The variety which grows in Calabria, Pinus calabrica, is more cylindrically conic, its branches more upright and, as it were, adpressed to the stem, forming a narrower and more compact head, looking in general more like a Cembra. In plantations of this variety there are usually a great number of trees with two or more leaders. This may be due to the more upright direction of the branches above alluded to. This variety was named calabrica by TENORE, and stricts by CARRIERE and other horticulturists. M. CARRIERE and other horticulturists. M. CAB be a distinct species. 'This form, perhaps, indeed, this species,' says he, 'is very constant in its reproduction, and among the individuals of which I have spoken none has wandered from the characters above mentioned.' But we find Professor Scholuw observing no such difference; he says, 'The variety called calabrica by TENORE, of which I obtained specimens from the BOHAMEL'S figure, and with the great tree of this species (Larico) in the Garden of Plants at Paris.' Pinus Heldreichii and Pinus Fenole, ANTONE and KOTSCHW, are synonyms of a variety of calabrica. It is said that it will, in a given time, become one-third thicker than the ordinary variety, and as high. Pinus Laricio.'

We take this opportunity of figuring a cone of P. Laricio var. Heldreichii, received from

Dr. CHRIST, of Basle, through the mediation of Mr. NICHOLSON (fig. 140). It will be seen that the cone hardly differs from that of Laricio proper, though Dr. CHRIST, in his original description, says that the umbo or point of the scale in Laricio is shining, while in Heldreichii it is dull—"opacus."

In a letter before us Dr. CHRIST speaks of this as a very remarkable mountainons and alpine variety of Laricio, of dwarf proportions, like Pinus Pumilio, and native of the high mountains of Greece, Olympus, and Thessaly. There is a tree so named in the Kew arboretum, but as we are not quite sure whether it really represents the variety in question, we defer making any further comment upon it.

— PERSONAL ADORNMENT.—On the occasion of the evening jake of the Royal Botanic Society, on July 2, an exhibition of floral decorations will be held as usual; an interesting class for the ladies should be that in which special prizes are offered for arrangements of flowers, leaves, &c., for personal adornment, such as wreaths, chaplets, and the like, and also for use in dress trimming and ornament. The conditions provide that these may be prepared ready for attachment to the dress, or the dress may be exhibited as ornamented.

— THE LATE MR. ATKINS' COLLECTION of herbaceous and alpine plants has been secured by Messrs. PAUL & Son, the Old Nurseries, Cheshunt, to prevent its dispersion. It is a most interesting collection, particularly rich in the forms of hardy Cyclamens, Saxifrages, &c.

— ROVAL HORTICULTURAL SOCIETY. — We understand that at the meeting on Tuesday next Messrs, Kelway & Son, of Langport, propose to make a large display of double and single Pyrethnums and Pæonies—an exhibition which they intend to keep on view for a fortnight.

— OUR NATIVE SHRUBS AND TREES forms the subject of a series of ten weekly lectures which were commenced on Wednesday, May 28, at the Crystal Palace, the lecturer being Mr. DAVID HOUSTON, F.L.S., of the Birkbeck Institution.

— A Manual of the British DiscomyCETES, with descriptions of all the species of fingil
hitherto found in Britain, iocluded in the family, and
illustrations of the genera, is in preparation by Mr.
WILLIAM PHILLIPS, F.L.S., of Shrewsbury, and
will shortly be published. Mr. PHILLIPS has, we
understand, had the advantage during the publication
of his Evicultaci Britannici of examining British
species collected in a fresh stage, of consulting the
splendid herharium of the Rev. M. J. Berkeley,
and also those of the late Mr. F. CURREY and other
collectors, and of studying all recently published
excitectif published by Continental mycologists. In
the execution of his task he has been promised the
valuable assistance of Dr. M. C. COOKE, who has
kindly placed at his disposal the notes relating to this
family collected for a revised edition of the "Handbook," and he confidently anticipates the co operation
of all English mycologists.

— KEW GARDENS AND THE HEALTH EXHIBITION.—On Whit-Monday, the Royal Gardens at Kew were visited by \$4,000 persons, or 22,600 more than the corresponding Bank Holiday last year. The number of visitors to the International Health Exhibition was \$4,679.

— NEW HARDY RHODODENDRONS AT MAN-CHESTER.—A box of trusses of new hardy Rhododendrons, raised by Mr. ISAAC DAVIES, nurseryman, of Ormskirk, attracted much attention at the Whitsun show at Manchester, and they served as an intimation that the raising of new varieties is not confined wholly to the South of England. The following varieties are fine in shape, handsome, and in some cases novel in appearance, and produced in fine trusses:—General Graham, Mons. Thiers, Respleodent, Oliver Cromwell, and Flower of May. One thing appears to be wanting at this particular show—namely, a competent tribunal to act in the

Fig. 141.—GROUP OF MASDEVALLIAS. (SEE P. 736.)

capacity of a floral committee, and award certificates to plants of descriving merit. There were present many subjects, new and novel—as, for instance, Mr. TURNER'S new perpetual Carnations—that such a body might have appropriately recognised in the way suggested. Manchester is such a plant growing district, and it is said one of the best markets for novelties, that there would be something appropriate in making the Whitsun show the occasion of an exhibition of what is distinctively new; and there are subjects raised in the midland districts that cannot be sent to London in good condition, but might be shown at Manchester.

- MULCHING HERBACEOUS PLANTS. - The advantages of mulching the surface of the ground occupied by many kinds of vegetable crops is generally admitted, and in dry summers in such parts of the kingdom as are subject to a light rainfall the good results of the practice become doubly apparent, especially where water is given, which when combined with mulching has not only a much greater effect on growth, but there is a great saving of labour, as the water applied under such conditions lasts much longer through the check which the mulching materials offer to evaporation. But it is not alone in the kitchen garden that the advantages of mulching are seen, but equally so with herbaceous plants, although in the case of the latter the operation is not by any means so common as it deserves to be. An inclination to have the surface trim and smoothly raked often prevails, to the detriment of the plants, an objection being raised to the presence of anything in the shape of loose material on the surface, which is supposed to be inseparable from an untidy appearance; but such is not the case if only a mulching of the right sort is used. On beds and borders filled with herbaceous plants manure in any form does not look well; but if leaf-mould sufficiently decomposed - say such as results from leaves which have lain together for a year and a half, so as to have become sufficiently reduced -is applied, it not only answers the purpose greatly reducing the amount of evaporation from the soil, and keeping the roots of the plants near the surface in active condition, but looks nice, and keeps down weeds as well. Where spent Hops can be had, and which before use are allowed to lie together for a few months, so as to get dark-coloured, they make excellent mulching material for berbaceous borders.

THE BOTANICAL GARDENS, MANCHESTER. -Gradually, under the intelligent supervision of Mr. BRUCE FINDLAY, these gardens show signs of very satisfactory improvement. Alterations are being made, new houses erected, and a large extent of garden added, while some rockwork which appears to have been a very successful venture adds another feature of interest to these charming gardens. Though the Whitsun season this year fell between the time for the appearing of the spring and summer flowers-just when one had declined and the other had not commenced to unfold their charms-there is yet much about the grounds of a very interesting character, and that despite the drought. The Thorns are in the full glow of their beauty, and the dry weather has been favourable to the prolongation of their bloom. Various species of Cratægus are in flower; so are Chestnuts, Laburnums, Lilacs, &c. The houses are very gay, and in excellent order. In one of the new plant structures are some very fine specimens in pots of Schizanthus pinnatus, such examples as one rarely sees, large in size, and finely bloomed. Despite the drought, the turf was fresh and green, and in such a condition to delight the eyes of the visitors to the great Whitsun show.

— A New Recreation Ground for East London.—Owing to the exertions of the Metropolitan Public Garden, Boulevard, and Playground Association, who have provided seats and an extra caretaker, the extensive churchyard surrounding St. Dunstan's, Stepney, about 5 or 6 acres in extent, bas been thrown open to the public for their use and enjoyment. This quiet resting-place is likely to be highly appreciated during the heat of the summer and autumn months—a pleasant change indeed for many from the hot and dusty thoroughfare, and, looking at the conduct of those who have already availed themselves of the privilege, one not at all likely to be abused.

-- THE FLOWER SERMON. On Tuesday evening the church of St. Katherine Cree, Leadenball

Street, was crowded to hear the Rector, the Rev. W. M. WHITTEMORE, D.D., preach his thirty-second flower sermon. He took for his text the 3d verse, 2d chapter, of the Song of Solomon—"The Apple tree amongst the trees of the wood." He said that the Apple tree, beautiful as it was, and rich and fragrant as was its blossom, was after all only a common tree. Yet it belonged to that grand order of which the Rose was the type and the queen. He drew from this fact the lesson that the position of his hearers might be a low one, and yet they might belong to the highest order. The Apple blossom did not fall off, but the different parts were used to form the Apple; and so a child's present life was moulding The Apple blossom was an its future character. arrested branch which was sacrificed, so that there might be fruit; and he drew the lesson that the blossom was a striking illustration of the great law of self-sacrifice which ran through all creation. Earthly luxury was unfavourable to spiritual blossom. If a gardener wanted a fruit tree to be barren, he plant it in very rich soil. A gardener preferred Apple trees which bore their fruit early, for whatever the trees might suffer from the colds of winter, they would still suffer further from the ravages of insects. It was better to be religious while young than for children to wait until they were older. There were probably three thousand varieties of the Apple, and yet they all had the same essential character. In these days of controversy they might learn the lesson from that fact that the Church of Christ had its variations and differences, but with all those differences there might be one law, one faith, one baptism. -Each person present brought a bouquet, and the Rector announced that all the bouquets which were lest would be sent to the Seaman's Orphanage or to the dark homes in the vicinity of the London docks.

- PRIMULA SIKKIMENSIS. - In a cool moist position at the base of the old rockery at Kew is a clump of this beautiful Himalayan Cowslip. While it reminds one very forcibly of our native Cowslip, the primrose-yellow flowers are much larger and more decidedly pendulous. The clump under notice is in full flowering order and very graceful, and were it not for the naturally elongated flower-scapes giving it a rather straggling appearance, this species would be more highly prized than it is. The plants were raised from seeds last year collected in the Sikkim Himalayas at an elevation of 11,000 feet, and sent to Kew through the medium of the Calcutta Botanic Gardens. It is of great advantage to rear young plants from seed frequently, because, although the plant is hardy in this country under favourable conditions it is apt to deteriorate or even dies during our mild and damp winters. When the leaves die down in autumn the crown is more or less entirely covered by the soil, so that due care is necessary to guard against digging them down, or pulling them out by

- GOOSEBERRIES,-Whilst some market growers are lamenting the general destruction of their Gooseberry crop others, more fortunate, are hoping to reap from their crops a little recompense for the loss of other fruit crops. Naturally it is asked, Why have some such good crops of Gooseberries and others such poor ones? Too many would perhaps reply that the frost has struck with more force in some gardens than in others, but such a reason would be neither satisfactory nor correct. The chief, if not only, cause of the difference in crops is found in the different modes of pruning, for whilst those who have hardor prining, for whist mose who have hard-pruded find their produce almost nil, those who have been sparing of the knile have an abundance. Really hard thinning of the bushes exposes the embryo fruits to the full severity of the frost, whilst dense bushes give ample leafage and plenty of shelter. Something may be due to sorts, but not much, as there is no great difference in the best market kinds, but the famous Lancashire Lad, without doubt, is not only one of the hardiest of kinds, but it is also one of the most productive, and possesses that admirable habit whereby the fruit is least exposed to the weather. Sparsely pruned bushes, no doubt, do not give such fine fruit as do those more hardly pruned, but then these latter far more than compensate in bulk, and as the larger portion of Gooseberries are gathered for market in a green state, mere size is not a very desirable feature. Again, the hard thinning which heavily laden bushes receive thus early, not only relieves them of their burthen early, but enables the fruit left to ripen to attain to a good size. Clearly the advantages of light pruning of Gooseberry bushes are many.

- Plagioliston Horsmanni.—This new bulb, of which a figure is given in the Gardeners' Chronicle, vol. xx., o.s., fig. 16, may now be seen flowering in the Begonia-house at Kew. Since having a little more time to establish itself in this country, its true character becomes more evident, The present specimen is altogether stronger than that figured, and producing more than three times as many flowers. From its nearest ally, the Eucrosia, it differs botanically in the much longer tube of the perianth and the fan-shaped arrangement of the segments, while from a horticultural point of view the difference is more evident, if less valuable. Its pure white flowers would furnish a beautiful contrast, and at the same time constitute it a fitting companion to the Eucrosia, with bright scarlet flowers marked on the exterior of the segments with a green It is rather remarkable and much to be regretted, that the latter should be so much neglected in gardens as it is.

- ROYAL NATIONAL TULIP SOCIETY. - The annual exhibition of this Society took place at the Botanical Gardens, Maochester, on Saturday, May 31, a report of which appears elsewhere. Great regret was expressed by the growers and exhibitors of the Tulip at the enforced absence, through illness, of the President of the Society, Mr. SAMUEL BARLOW, J.P.; and at the dinner which always follows after the prizes are awarded the following resolution, on the motion of Mr. J. THURSTON, of Wolverhampton, seconded by Mr. B. SIMONITE, was unanimously passed:—"That the members of the Royal National Tulip Society desire to express their deepest regret that the impaired health of their esteemed friend, SAMUEL BARLOW, Esq., compels him to retire from the position of Hon. Treasurer and Secretary of the Society, which offices he has, for such a lengthened period, filled with so much satisfaction: and they sincerely hone that he will soon be restored to his usual health, and be enabled to officiate in his old capacity of President for many years to come. The members of the Society specially and unanimously desire to offer, with their best wishes, their most cordial thanks to him for his services as Hon, Treasurer and Secretary, which he has so freely given to the Royal National Tulip Society." It was further resolved that this resolution be sent to Mr. BARLOW.

- MEDINILLA AMABILIS .- In point of attractiveness and general horticultural interest this plant, which was introduced about ten years ago (see Gardeners' Chronicle, vol. i., p. 371,) may looked upon as of secondary importance to the older and better known M. magnifica. It is, nevertheless, of the same bold and robust habit of growth, with ample foliage (the venation of which is rather abnormal amongst Melastomads) and compound terminal, conspicuous cymes of flowers. The chief point of distinction lies in the small caducous floral bracts of this species, compared with those showy organs that play so important a part in M. magnifica. The individual flowers, however, are larger and paler, rosypink, enlivened with the stamens, half the number of which have three colours-namely, violet, crimson, and yellow. There are flowering specimens of both species in the Victoria-house at Kew.

- VARIETIES OF ANTHURIUM ANDREANUM. -From the first appearance of the flowers of this fine Aroid it was evident that, as in the case of A. Scherzerianum, there would prove to be many forms of the plant differing, not alone in the size of the individual flowers, but also to some extent in their form and intensity of colour. In some the spathe, in place of lying flat so as to show the surface fully, has an ngly twist at the extremity; in size there is great difference in the flowers of individual plants, some being double or treble as large as others, and, as a matter of course, so much the more prized. But beyond this there is as much difference in the form of growth in the plants, some preserving a close, compact habit, the crowns as they are formed keeping close to the surface of the soil, whilst others assume a somewhat scandent character, the additional crowns as they appear mounting up considerably above the pot in which they are grown, with an apparent disposition to keep on further in this direc-tion as they increase in size. As some guidance to

those who may happen to be purchasers of this Anthurium, we may state that in a number of the climbing habited forms of the plant we have seen they were all comparatively worthless, the flowers in each case being poor from the first, and getting smaller as the succeeding crowns got higher above the soil. As will be easily understood, the comparatively few exceptionally large-flowered forms of the plant that have appeared are highly prized by cultivators of stove plants.

WEATHER ASPECTS. - The weather-wise comfort us with the assurance that we shall have no rain till the turn of the days, by which they mean midsummer, some few weeks hence. Perhaps we ought to be thankful for so much cold comfort, as some others, equally weather-wise, declare that we shall get no rain till the autumn. Really, having regard to the fact that the five months of the year now gone have been probably the driest five months with which a year has opened for a generation or more, there seems no reason why that five months might not be lengthened to ten months, or even for the entire year. History is said to repeat itself, and so does Nature, but such excessive repetition becomes monotonous, and a really dry year may be a hit of a novelty, if not a very desirable one; indeed we shall too soon hear of suffering from want of water, and abundant scoldings for our want of forethought in not storing that stern necessity when it can be had. Still it must be pleaded that for several years we have had little cause to complain of drought, and a big outlay that can be made profitable but one year in seven or so will hardly pay. None the less, greatly blessed are those who have an abundance of water to hand. We hear, for instance, on every hand, Strawherries never looked better than now, and perhaps they may, but how much longer can the best breadths in the kingdom hope to endure and produce a corresponding crop of fruit without speedy rain or an abundant artificial supply of water? Grass makes poor growth, and over extensive areas the hay crop will be almost nil without rain. The same remarks apply in a score of ways, and it is but natural that long-continued drought should create exceeding anxiety; indeed, the misfortunes which frost has wrought for the fruit growers drought may he repeated for the vegetable growers. If it be not a Hihernianism, we should say that the very finest day of the present year will be that one which gives us a pouring and continuous rainfall-and that, as these sheets are passing through the press, is in course of realisation.

THE FAIRCHILD LECTURE. - On Tuesday night the Fairchild Lecture was delivered at the Shoreditch parish church. This is one of the oldest foundations in London. By the will of a pious gardener of Hoxton, THOMAS FAIRCHILD, 1728, a sum of £25 was vested in the churchwardens for the delivery of a lecture every Whitsun Tuesday on one of the following subjects: -"The Wonderful Works of GOD in the Creation," or "The Certainty of the Resurrection of the Dead, proved by the certain Changes of the Animal and Vegetable Parts of the Creation." The first sermon was preached by Dr. JOHN DENNE, on Whit-Tuesday, May 19, 1730, from St. Matthew, vi., 28-30 (the Providence of GOD as seen in the Lily and the sparrow). From that time until now-a period of 154 years-the lecture has been regularly delivered at Shoreditch Church. On this last occasion the lecturer was the Rev. JAMES BENNETT, of Park Church, Chelsea.

— Geranium fileum. — This Crane's-bill is generally considered to he not a true native, although long ago naturalised, and presenting all the appearances now of a genuine British plant. In most botanical works it is recorded as growing wild in England, as well as Scotland sometimes. It is one of those species possessing a characteristic individuality from the deep purplish-black flowers, which are orbicular in outline and spread out flat. Besides, it is a good old inhabitant of the herbaceous border, from which it has been hanished to the more obscure cottage garden or botanical collection. When seen in a wild state, however, it seems to acquire fresh interest, and ought to be more frequently seen in gardens. In hedge hanks towards the middle of Surrey some fine patches appear happy and quite at home.

—— NEW FLOWER VASES, &C.—These were an object of considerable interest at the Manchester Botanical Gardens, and they served to illustrate the

axiom that everything in this world can be utilised. Here were charming flower vases, tumblers, jugs, cups and saucers, and many other things, looking as if they were made of a richly-veined dark horn or black marble, but really manufactured out of blast furnace slag, millions of tons of which abound in the neighbourhood of great ironworks. It is really the refuse of earth, iron, and glass, after the liquid metal has heen drawn from it; it has been used for brick-making, repairing of roads, and other purposes, and failed, but is now happily utilised as above stated; and there is this peculiarity about it, that the manufacturer has no control over the pattern; that is formed in the mould as the heated slag is poured into it; and though no two articles are really alike, they yet match exceedingly well. The slag is re-melted at a great heat, then poured into prepared moulds, and subjected to hydraulic pressure. There is danger of the articles cracking in the act of cooling, as the darker part cools before that which is so handsomely shaded and feathered with white; but this is of hut comparatively small moment, as the cost of the slag is but trifling. The articles exhibited on this occasion were the property of Mr. J. BEESLEY, Fern House, Rolland Road, Lozells, Birmingham; and we understand that the idea of utilising the slag in this way was first carried into practical effect in Germany. Generally the ware, if it may be so termed, is of the most elegant and ornamental character, and perfectly free from porosity.

— ANNIVERSARY DINNER OF THE AGRICUI-TURAL SEED TRADE ASSOCIATION.—This meeting was held last Friday evening in the Holborn Restaurant, the leading firms belonging to the Association heing represented. Mr. David Syme occupied the chair, and Mr. Wm. Neustetel the vice-chair, Amongst those present were Messrs. N. Sherwood, N. David, Jas. Glenn (Belfast), D. Allester, W. Bates, — Marsh, — McAtee (Baltimore), John Donaldson, Alf. Newton, &c. After the usual loyal and other patriotic toasts the Chairman proposed "Prosperily to the London Agricultural Seed Trade Association," which was responded to by Mr. Allester, Secretary. Several other toasts followed, and a most enjoyable evening was spent.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 2, 1834, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:
—The weather during this period has been on the whole cold, and often very cloudy; the air has been dry and searching, and at times frost has occurred on the ground. The winds have been mainly north-easterly or easterly, but towards the end of the week they shifted somewhat suddenly to the south-west-ward, and occasionally blew strongly on some parts of our northern and north-western coasts. The temperature has not varied much. It has been below the average by 3° or 4° over England, by 1° or 2° in Scotland, and about 2° in Ireland. The highest readings occurred over England on the 27th, and in the West of Ireland the maximum (70° to 72°) values were registered on the 27th or 28th, when the sky was clear, and a moderate breeze from the eastward carried the warm air from the inland to the western coast stations. The lowest of the daily maxima (33° to 35°) were registered in England early on June 1. The lange has been somewhat large. The rainfall has been deficient over Great Britain and Ireland. In England there has been none, but in the Channel Islands a considerable quantity fell during the earlier and later days of the week, at which time local disturbances were observed about the mouth of the Channel Islands and earlier and hater than the control of the procession observed:

—These have been very slight, so far as depth is concerned; but, as before noticed, the shallow one which appeared over the Bay of Biscay between the 27th and 29th, caused a large fall of rain in the Channel Islands and west of France, and those which came over our western coast at the end of the period gave a moderate fall at the western stations and a large fall in the Channel Islands, bound the control of the period gave a moderate fall at the western stations and a large fall in the Channel Isla

— GARDENING APPOINTMENTS.—Mr. CHARLES WARWICK, lately Foreman at St. Ann's, Co. Dublin, as Gardener to Lord O'NEILL, Shane's Castle, Co. Antrim.—Mr. WILLIAM DIVERS, Fruit Foreman to Mr. GILBERT, Eurghley, as Gardener to J. T. HOPWOOD, Esq., Ketton Hall, near Stamford.

TOBACCO IN PORTUGAL.

THE British Consul at Oporto recently furnished a report on Tobacco growing in this port-wine district, a branch of culture brought about by the failure of the Vine crops owing to the disease. The best qualities of Tobacco-Turkish, Havana, and Manilla-are grown in more southerly latitudes than that of the Upper Douro, which is about 41°; but the cold of this mountain region in winter is great, and its heat in summer i far greater than its latitude might seem to promise. A very good French authority, M. Jules Guyon, says, "Wherever the Vine will thrive no crop is more profitable than Tobacco, and a district where wine can be grown with qualities of flavour, body, and essential vinosity, superior to any in the world, may be expected to grow Tobacco of superior excellence; but many other requirements go to the making of good Tobacco besides climate. The first operation is to sow the seed on a prepared seed-bed in early spring. Great care is necessary in weeding, watering the seedlings, and in protecting them from wind, sun, excessive rain, and the attacks of insects. In two or three months, according to climate, the seedling is ready to be planted out, io ground manured as we in England manure for Potatos. A garden line is employed in planting, and a little more than a yard is allowed in France by the regie from plant to plant, but Spanish and American authorities consider this space to be far too great.

The young Tobacco is sheltered in case of excessive sun, and the field watered before planting ing takes place if the soil be dry. In from fifteen to twenty days the ground is cleaned with the hoe, and the plants are slightly earthed up. When the flower-bads hegin to show the lower leaves are removed, leaving only about twelve, more or less, according to the kind of Tobacco, and according to whether quantity or quality of Tobacco is looked to whether quantity or quality of Tobacco is fooked for. About a fortinght after this operation the Tobacco is ready to be gathered. It is then that the real difficulties begin, and the treatment it now receives determines whether the product is to be classed as very bad, fair, or good. A process akin to the making or stacking of hay takes place, but a process which requires infinitely more care, more watchfulness, and more attention to detail. hay, the Tobacco has to be partly dried and then fermented, and it has then to be dried again. The plants are harvested by being cut down and left for a few hours on the ground, preferably in the shade, where, by partially losing its sap, the plant becomes limp and flexible enough to be carried without injury being done to the leaves. The Tobacco is then taken to the drying-house, and hung up in bundles on rods crossing the rafters; and so it remains three or four days. The bundles are then separated into smaller ones, which allow of fuller exposure to the air. In about a month the Tohacco has gained some colour, and its aroma. It is then gathered into heaps, the heaps resting on a framework of wood raised from the floor and covered with mats, weights being placed above the mats. All these operations are critical, and vary in duration with the temperature and humidity of the air. A slight fermentation takes place at first in the heaps, followed by a drying up of the juices of the plant, after which the colour deepens and the aroma is heightened.

When, in from twenty to thirty days, this last operation is concluded, the Tobacco is ready for classification, according to size, colour, and appearance of the leaf, the highest class being the dark brown kinds with large smooth leaves, through the lighter shades of brown and yellow, to the greenish, black or yellow leaves, spotted, toro, rough and discoloured, which form the last class. These are the processes which every grower of Tobacco has himself to perform. It will be seen that they are almost of the nature of a manufacture, and require patience, skill, knowledge, great attention, and a good deal of actual labour. In France, accordingly, good deal or actual labour. In France, accordingly, the cultivation of Tobacco is almost entirely one of the petite culture. It would be too much to expect such qualities of skill and attention from a farmer of the ordinary type, accustomed to the routine of four or five crops only, and the charge of two or three kinds of domestic animals. The yeoman farmer of Portugal is necessarily much more than this, he is accustomed to the difficult culture of Maize, as well as to that of the ordinary cereals; to growing many varieties of pulse, of Gourds, and of Water Melons;

he is a wine farmer and a wine maker; he grows Olives and presses the oil; he is skilled in mining for water, and in the process of irrigation. The farmer of the Douro undertakes still more, and is more skilful and enterprising than the men of other parts of the country. His wine making is a very delicate operation; he is a shrewd, patient, and cautious as the Norman, and is as versatile a cultivator of the fruits of the earth, as the farmer of Provence. There is no doubt, therefore, that so far as good and careful cultivation is concerned, the Douro farmer is quite capable of undertaking to grow Tobacco. On the other hand, the reporter says in his opinion it is open to doubt whether the soil of the Upper Douro, stony as it is, and poor as it is, except in the bottoms of the narrow valleys and ravines, is rich enough to support so exbausting a crop as Tobacco, without frequent, copious, and expensive additions of manure. It is a soil so poor and so dry, that even the Olive trees on its hillsides are conspicuously stunted in growth. If such manurings are necessary, then its carriage through the steep and wetched roads of the mountains would add greatly to the first cost of production. The great want of water is, perhaps, another drawback to successful cultivation.

CHINESE VEGETABLE PRODUCTS.

In a report of a journey through the provinces of Tsu-ch'uan, Yünnan, and Kwi-chou, from Feb. 11 to June 14, 1883, some interesting notes occur on the vegetable products of the country traversed. At one part of the journey brick tea is described as being made up into packets of 18 catties in weight. The tea in first enclosed in what looks like dried Banana leaf, and theo cased with coarse matting. The packets are long and flat, and are piled one above another on a wooden framework extending above the carrier's head. At the bottom are usually a couple of half packets, which afford a good rest for the pole which the carrier places under his load when he wants a rest. The maximum load I have hitherto noticed was ten whole packets and two half packets, weighing 198 catties-a good load to have on one's back for fifteen days-the time usually taken by these carriers between Ya-chou and Ta-chien-lu. The ordinary load was eight and nine packets. The freight between these two places is 300 cash a packet, so that if the journey is performed in fifteen days the wages of a carrier of ten packets amount to 200 cash a day. Among carriers of such heavy weights one would expect to find men of remarkable physique, but they seemed to be distinguished for "want of leg." The same applies to the salt-carriers. They travel slowly, resting every few yards and giving vent to their feelings, which on such a day must have been anything but amiable, in a low whistle, or rather half-whistle and sigh. The brick tea manufactured at Ya-chou for the Tibetan market is altogether different from the brick tea manufactured by foreign merchants at Hankow. The former is entire leaf and twig loosely pressed, while the latter is tea dust firmly compressed into actual brick-shape." "Beyond Tung-ching Hsien the valley contracts, and the hills on either side become more precipitous, rocky, and uncultivated; frequently the bed of the stream occupies the whole valley, while the road runs along the hillside. Some distance south of the city the hills are thickly dotted with the Tea shrub growing on very rocky ground, and we met a number of carriers with bundles of brown leaves and twigs, which we took for dead leaves collected for firewood, but which turned out to be 'tach'a,' great or coarse Tea. It was bound for Ya-chou, and will doubtless find its way back along the same road to Tibet." At another point of the journey the Mulberry, Orange, red Date, and Pear trees were frequently met with; the Orange is described as a tall tree with a small fruit with a thick and wrinkled skin, so thick in-deed that the edible portion of the Orange is reduced to a minimum. A very remarkable fibre, about which something more will, it is hoped, be soon found out, is described in the following para-graph:—"At Hai-t'ang I procured a specimen of a coarse cloth, manufactured from the fibrous root of a grass which grows in the gullies of the mountains in the neighbourhood. It is called the 'fire cleansing cloth,' and is used for dusting and other purposes. The peculiarity of the cloth is that when it is dirty it is put in the fire, the dirt is consumed, and the cloth is taken out clean and uninjured, and ready for use. I can vouch for the truth of this, having made the experiment myself." The white wax insect is said to be the chief produce of Chien-chang. Little white wax, however, is produced as compared with other producing districts, such as Chia-ting Fu, which depend entirely on the Chien-chang valley for their supply of insects, and it has hitherto been matter of surprise that the valley of Chien-chang should produce the insects and not the wax, and Chia-ting the wax and not the insects. The reason is perfectly simple, however. In the Prefecture of Chia-ting the Wax tree is extensively grown; in the valley of Chienchang it is not. The white wax insect does not grow on the Wax tree, but on the Tung-ching tree which is widely grown in the Chien-chang valley. A small twig of this tree, the scientific name of which does not occur, is described as containing about half-adozen round excrescences about the size of a Pea, and innumerable smaller excrescences like minute shell-fish clinging to the bark. On opening one of the brown glazed Pea-shaped excrescences thousands of minute whity-brown creatures, whose movements are all but imperceptible to the naked eye, are seen. In less than a month's time the excrescences would be collected, transported, and suspended on the branches of the Wax tree. At first they spread themselves on the upper side of the leaves during the night, but hide during the day from the sun under the leaves. After a time they spread over the branches, and secrete the wax.

The narrative from which the foregoing information is gathered is worth the time occupied in its perusal. It is printed by Harrison & Sons.

WEEPING TREES.

AMONG the variety of subjects chosen for planting we do not find that those with a pendulous habit of growth meet with that amount of recognition their general effectiveness entitles them to. If we take the trees as usually seen, they are planted with a niggardly hand, as if their presence would spoil the landscape, and on the principle of having one here and another widely distant. yet too much inclined to follow the dictum of the older landscape planters, who, we know, were possessed of crotchets, but whom we too religiously follow in their instructions, instead of breaking loose from them. We are aware there are some who would no more tolerate a weeping tree than they would decorate their board in the old Roman fashion with a skull, because of the funereal bias of association of ideas. To our trees it is now often conceded by men of taste that, given a tree that shall look well and really be effective as such, a group of the same will be still more so; therefore a large group, composed mainly of trees of a pendulous habit-say of Beech, Ash, or Willow-must form a desirable addition in a garden large enough to admit of it. On the same principle a large piece of water of several acres in extent has a distinct and appropriate margin, if this consists chiefly of such trees-the charm consisting in their shoots and branches touching or tending downwards in perpendicular lines towards the great horizontal line of the water, at the same time that they hide entirely or else partially obscure the outline of the bank, and so add to the charm of mystery belonging to all that we cannot fully see. These are the summer aspects only of deciduous trees. In winter all is bare, although even then there is a beauty in such trees.

Of weeping evergreen subjects we possess nothing worthy of the name fit for such positions as those in which we would place the Willow, Ash, and Beech, or the Sophora pendula. Some few Conifera have a the pendulous Wellingtonia; and there is a drooping, tangled variety of the common Spruce named viminalis that would fit that description. There is a drooping Holly, but as it is usually seen it is a stiff, ungraceful subject; in fact, a weeping Holly seems almost a misnomer and an impossibility, so rigid is the habit of the species generally. It is a matter for regret that no examples of avenue planting are to be found composed of such trees as Fagus sylvatica pen-This is a beautiful object in soils suited to the Beech, and on these it will be found to grow quickly. The free and fantastic habit of its growth would, in part at least, tone down the artificiality that is associated with the avenue. Nothing can look more formal and ungraceful than an avenue of any species of Coniferous trees, but pendulous trees of this variety, planted alternately with, and slightly in advance of, say, Copper Beech, Tulip trees, or Gymnocladus cana-densis, or even the common form of Beech, would have a very pretty effect when in leaf; and even in winter the variety of habit in the two or more different kinds of trees would not be without its charm, M.

WINTER IN THE TROPICS.

IT seems to be hardly realised how wintry is the aspect of the dry season in the Tropics. Many more of the trees in Africa are deciduous than we often imagine in our conjured-up mental visions of a fair tropic land, where perpetual verdure reigns, and the vegetation is a vague, indefinite mixture of limp Palms, with fronds like ostrich feathers, and rampant Bananas raising their florid greenery above the masses of formless creepers; but, nevertheless, when about a month has elapsed after the last rains are over, the aspect of an African hillside has much of the cheerless desolation of winter about it. The once imposing Baobabs, whose masses of verdure were fair to see, are reduced to mazes of leafless twigs; the ground is covered with a brown carpet of fallen leaves; many trees, though retaining their foliage, put forth no fresh shoots, and are yellow and seared with the hot sun; here and there an evergreen stands out, like an English Yew or Holly, in almost heartless contrast of dark cold green, amid its faded withered fellows, and next to it, perhaps, is a white skeleton of what was a short time since a tulted tree. The tall herbs, erewhile gay with gorgeous flowers, show now nothing but yellow stalks and shrivelled seed-vessels, in which perhaps there still lurks a point of colour in the red or orange seeds that gleam from under the brown husk. The many tiny flowerets, the mosses and fungi, are scarce to find; only certain repulsive plants-things with fleshy, mutilated limbs, weirdly swollen, distorted, and covered malicious prickles stand forth in disagreeable prominence, screened from view no longer by the fair and delicate creeping Ferns and clambering Lycopodiums, and seeming to stand unchanged and prosperous when all else fades and dies. In the great meadows through which the path meanders, the waving grasses are laid low, and in their place are dismal tracts of black ashes where the bush fires have just swept by. But the dry season is hardly death so much as recuperation. It is a short pause-a sleep in which the expended forces of Nature are once more gathered in. Just as the earth in its summer solstice spins out from the sun's control like a restless child, and then, wearied with its wilfulness, lets itself be slowly drawn in again to run its sober winter journey, so its tiny children, who have rioted in all the exuberant excesses of spring and summer, need the repose of the slack months to restore their energies. " The River Congo," by H. H. Johnston, F.Z.S.

CLIMBING PLANTS IN TREES.

THESE give an appearance of robust luxuriance and unrestrained vigour, reminding the spectator ol those tropical and half-tropical climes where Nature, under the influence of perpetual heat and moisture, runs riot, producing oftentimes vege-table giants. Some of the most astonishing of these are the climbiog plants, that ascend the tallest trees of the forest in search of light and space where they can develope their foliage and flowers, travelling from tree to tree, and some throwing out roots in the air, that reach to earth, there taking fresh roothold, and extending still further in their stem growth. Our plants, checked in their growth by frost and cold through half the year, cannot vie with these tropical inhabitants of the jungle and the forest, and our nearest approach to them is to be found in the larger forms of Ivy, in Ampelopsis bederacea, in Wistaria sinensis, the Vine, Clematises, and Periploca græca. But the largest and strongest of our climbers, the one that approaches the nearest to these, is Aristolochia Sipho. Smaller creepers we have io abundance, but our purpose is with the most rampant ones, good for ascending our biggest trees. When once this becomes established, it will grow fast enough. It is no use to merely dig a hole at the treeroot and stick the plant in expecting it will do well; but a good sized hole must be got out near the stem. There are no fibrous roots in that part to draw the goodness out of the soil you give, unless the tree is young, and in that case you had better plant no creeper; or better, a hole may be made some distance off, training the main shoot underground when it has

got as thick as the thumb, in the meantime allowing it to grow attached to a stake for support. If merely assisted in its upward climb with a tie here and there, this plant will quickly reach the summit of a tree 50 feet high; it will not then strangle a tree like Ivy with its clustering thick growth, but will creep outwards, if the tree is a solitary one, to the extremities of the limbs, letting fall slender shoots and festoons of handsome, broad, heart-shaped foliage, and in warm summers an abundance of its curious pitcher-like hrown flowers. Ampelopsis hederacea sorts makes a good creeper, the growth being rapid, and its autumn tints most gorgeous. This is not a self-clinging plant, and must, therefore, have assistance at first, although later the interlacing stems clasp the stem and branches of a tree, and will merely require that its leading shoots be led upwards and outwards. A. tricuspidata or Veitchii is a very handsome kind, but is less suited to climb a tree than to drape a low fence, the pediment of a statue or a vase, or to be allowed to cover a low stump or pillar, and having, contrary to the other kinds of Ampelopsis, a clinging habit, it gets on without much assistance. Periploca græca is a most hardy, quick growing, deciduous creeper, growing to great lengths in one season; the foliage is deep green in colour and lanceolate in form. This is fit for any place where a creeper is desirable; the flowers are inconspicuous, and purplish in colour. The Clematis, Vine, Ivies, Honeysuckles and Wistarias are too well known to need description, although it may not be amiss to note that Clematis flammula is one of the very fastest growers, and has deliciously scented white flowers, which appear in immense bunches on old plants. C. vitalba should also not be omitted-indigenous to our country, and found in our southern hedgerows, smothering other plants out of existence. The Trumpet Honeysuckles, Bignonia radicans, and some such Roses as Boursault, Prairie Rambler, Avrshire. and Jasmine are all good in positions where there is much light, as the beauty of all these few last consists more in their flowers than in the foliage, so that as simple climbers rampant and full of leaf those mentioned at the beginning of this article being the best for the purpose. F. M.

DEUTZIAS.

THESE profusely blooming miniature shruhs, which are so easily grown in the open air or in pots, should be in every garden. Useful as forced plants for early winter and spring flowering as are D. gracilis and D. crenata, they are but rarely seen growing in clumps or masses by themselves-a mode of treating them that displays them to the greatest advantage. If the lighter habited and earlier blooming D, gracilis be intermixed with D, crenata. D. scabra, or the pink-flowered D. sanguinea florepleno, a long succession of bloom can be secured, the sorts flowering at different times in the order they are named. Any of them look well as small groups on the turl, and the larger growing as single specimens, make excellent effects with their long unrestrained garland-like flowering branches drooping all round the plant in May and June. The Weigelas, massed together and bordered with Deutzias, make a very chaste combination, that may be improved by the addition of flowering bulbs and hardy herbaceous plants or summer flowers. The pruning of the Deutzias of all kinds is best done just after the flush The pruning of the of the bloom is past; they may then be cut back more or less, according as the variety is a weak or a strong grower. All of them flower on the previous year's wood and on spurs made on still older wood. D. scabra and D. crenata should have the main shoots left at the length of 3 or more feet, and if the plants occupy a sunny position in the garden, where well-ripened shoots may reasonably be looked for, the plants soon attain a good size, and bloom abundantly. They are not fastidious as to soil, but do better in an eariched light soil than in one that is heavy and cold, Soils of the latter character are the better for an addition of sand, peat, and even ashes, the latter being placed at some depth under the plant. The plants can be propagated in the same way, and at the same time of the year, as Roses, Currants, &c., or from cuttings in a mild bottom-heat in spring, taken from plants that have been brought on in heat. The cuttings must be potted off when rooted, and grown on in pots for a time in a close frame, giving air as the season advances, till full exposure can be used without checking growth. During the winter plunging

in tan or leaves to protect the roots from frost will carry the plants over that period of the year, and the next spring such examples as are required for out-ofdoors use can be planted in lines in the reserve garden, where they must stay till they attain a size proper for planting out in their permanent stations. Young plants in pots are liable to attacks from thrips and green-fly, and, under a warm dry treatment, to red-spider, but under more natural conditions they are seldom molested by iosects.

DUPPLIN CASTLE.

MR. HUNTER's Woods, Forests, and Estates of Perthshire, is chiefly valuable for its numerous notes on trees, but he adds to the title "with Sketches of the Principal Families of the County," and that part of his narrative will prove of the greatest interest to the general public. At some future date, perhaps when the seedling Oaks of Perthshire have become decrepit dotards, when the Battle of Dupplin, fought five centuries ago, has receded 500 years further into the past, and near it the epoch of oblivion which overtakes all such events, even the romantic history of heroic Scotland may be read with much less interest than it is own. But at present the story of Scotland's struggles and the history of the origin of her leading families, possesses all the interest of a most exciting novel, to which the dignity of truth is added.

Dupplin has been a battle-field—thanks to a prevailing taste in the country it has now become the scene of some of the most successful arboriculture in Perthshire. Sir John de Hay, of the twelfth century, was the ancestor both of the Marquis of Tweedale, and the present Earl of Kinnoull, of Dupplin Castle, The titles of Earl of Kinnoull, Viscount of Dupplin. and Lord Hay were won by Sir George Hay in the years 1627 and 1633, as High Chancellor of Scotland. The ninth Earl paid the great family of Drummond the compliment of assuming their name and arms as heir of entail of his great-grandfather, William Drummond, Viscount Strathallan. And now we may pass from the family tree to the trees on the estate. The double Oak avenue, the double avenue of Beech trees, and the Lime avenue are all remarkable; some of the Beeches are among the finest in Scotland, measuring 151 feet at 5 feet, with boles of 30 feet, and total height of 120 feet. It is pleasing to meet with "Oswald's strip" of Abies Douglasii, named from the late respected head gardener, and growing rapidly on the light and friable well-drained soil which the roots delight to fasten upon and penetrate with ease, and where they find abundant constituents of their growth. A Silver Fir in the policies girths 16 feet at 5 feet, and has a straight stem of 30 feet; but an older tree of the same sort measures 17 feet at 5 feet, with a bole of 40 feet to the part where it branches, and a height of 120 feet. This is one of the earliest planted Silver Firs in Scotland, but throughout the Land o' Cakes there are no Silver Firs that equal those of Inverary, where scores of trees, among thousands of noble specimens, 14 feet, 15 feet, and 16 feet 4 inches at 5 feet from the ground, taper gradually so as to present an uninterrupted trunk, measure timber to a great height, and lift their topmost leader 130 feet or 140 feet from the ground. And, since Inverary recurs to mind, let us mention the avenue of Beech near the town, measuring in girth 15 leet 7 inches, 17 feet, and 18 feet 6 inches at 5 feet from the ground, height and breadth being in just proportion.

Still the avenue of Silver Firs on the north side of the burn at Dupplin is worthy of the notice it obtained during the visit of the Queen and Prince Albert in the days of lang syne, when the Royal and accomplished couple visited many great houses in Scotland, and crossed the Grampians to Blair Athole, travelling in simplest fashion, and stopping the night at an ion near the pass, where the maids were too frightened to wait at table. In Leaves from the Journal of Our Life in the Highlands these excursions are well described, and the beautiful situation of Dupplio Castle is mentioned, with its wide views; the Lower Strathearn below the hill, with the river winding its crooked way towards the Tay, the railroad passing presently under the Hill of Moncreiffe, the Ochils westwards, and the village of Bridge of Earn nestling under the shadow of Moredun top in the opposite direction. Many noble seats, too, are seen, such as "lordly Duncrub," Freeland, Condie, and Ardargie, and far in the west the woods and mansions of Ardoch. Among the numerous trees measured by Mr. Hunter is a fine Spanish Chestnut, girthing, as he notes with his usual precision, "20 feet at 5 feet, with a very good bole, but rather kootty." A Duplin Araucaria imbricata is also described and figured, as it deserves, being a tree full of pricky foliage from the top to the ground. A height of \$\frac{1}{2}\$ feet, a stem of 5 feet 7 inches at 1 foot above the ground, and a circumference of the branches of 65 feet, are measurements most satisfactory in a tree of this kind thirty years planted. The pinetum—not yet noticed—contains many notable Conifers, and those who read of the dimensions of these rarer specimens, as well as of the trees generally, and whose own trees are less favourably placed, will envy perhaps the soils and sites of Dupplin. Mr. Hunter adds an account of that other property belonging to the lord of Dupplin, Kinaoull 11ill, near Perth.

VEGETABLE PRODUCTS OF BORNEO.

SOME interesting notes on the products of Boroco are contained in a recently issued report. The chief of these products are gutta-percha, india-rubber, and rattans. Of the first of these the writer says :--"Various kinds and qualities of gutta-percha are afforded by various Sapotaceous trees, but the pure red Bornean gutta is yielded by Dichopsis Gutta. species of the genus Dichopsis, however, yield guttas which, being of inferior value, are frequently mixed by the native collectors with the more valuable red variety. The red variety is obtained from red and rough-stemmed trees, which are generally found growing among old jungle on the hill-sides to a height of from 100 to 150 feet, with a diameter to 3 feet. The natives, who roam the jungle collecting this raw product, proceed as follows:—On coming across a tree old enough to cut-one having a diameter of, say, 12 inches-they fell it, cut off the top, and ring the bark at distances of about a foot. The sap for two or three days gradually drains away, and as it does so is collected in any convenient vessels, such as leaves, cocoa-nut shells, &c., from which receptacles it is transferred to a pot and boiled with a little water for half an hour or so. The milk is boiled to prevent it from hardening on exposure to the air, as if allowed to do so it becomes comparatively valueless. It is very difficult to estimate the comparative yield of each tree, as the quantity varies so much, according to the size of the tree and time of the year-the flow of the sap being greatest when the tree is producing most leaves; but a small tree will generally yield a quarter of a picul (33 lb.), while the largest ones may yield even as much as three-quarters of a picul (100 lb.) each. The value of this red gutta varies according to its purity, from 40 dollars to 80 dollars per picul. Another species of Dichopsis (D. macrophylla) yields an inferior gutta of white colour. This species is of smaller growth (50 to 60 feet high), and differs also slightly in the foliage. It yields proportionately less gutta, often only 20 catties (261 lb.) per ton.

INDIA-RUBBER, OR CAOUTCHOUC,-This is ohtained from three varieties or species of roughstemmed woody climbers, known as Manungans (Willughbeia sp.), which attains a length of over 100 feet, and a thickness of about 8 inches. The juice is obtained in much the same way as gutta, and is prepared either by boiling like gutta, or by steeping in a solution of salt. This wasteful method of collecting guttas and rubbers has naturally caused an exhaustion of the supply from the more accessible districts; the rubber trees, bowever, are probably not so thoroughly exterminated as the gutta tree, owing to the greater tendency of the former to be reproduced from suckers (especially when young plants are cut down), from cuttings of the stem rooting accidentally, and from the fruit, which being edible, is much sought after by monkeys, birds, wild pigs, &c.

RATTANS, OR CANES.—These are the stems of various species of Calamus, as C. Rotang, C. rudenum, C. verus, &c., which are found distributed all over the district. Two different kinds are known to the collectors by various names according to any special quality they possess. These canes are termed rattans to distinguish them from the Malacca cane (C. scipionum), the stems of which are much thicker and used, after heing bronzed by heat, as walking sticks,

Under the head of "Agriculture" it is stated that the only plants cultivated in Western Borneo for exportation are the Gambier (Uncaria gambir), Pepper (Piper nigrum), and the Sago Palm (Metroxylon Sagu). Gambier and Pepper are cultivated only in the immediate neighbourhrod of Sarawak, while the Sago Palm is grown on almost every river in the Sarawak and Brunei territories, but curiously is not found in North Borneo, to the north of the Papar River, which enters the sea some 50 miles north of the island of Labuan. Its absence in North Borneo is remarkable, as it is again found in abundance still further north in the Philippine Islands. The cultivation of Pepper and Gambier is carried on together in the same plantations, and has, in the hands of skilled Chinese cultivators, proved successful; but the cultivation of the Sago Palm and the preparation of raw Sago is the only cultivation (if planting the shoots and protecting them from wild pigs can be called cultivation) congenial From numerous enquiries made during to Malays. the past few months, not only among natives who grow Sago, but of Europeans who have lived many years in Sago-growing districts in Western Borneo, the writer of the report says he feels assured that the growing of Sago by Europeans would prove remnunera-tive. "Although," he proceeds to say, "the growth of the Palm is rapid, the tree must reach maturity before being cut, and thus ten years must elapse before any return is obtained for the capital expended; but even allowing for compound interest on the capital, the profit, by the lowest estimate, is from 20 to 25 per cent. The estimates I have met with for planting Sago are, as a rule, misleading, being evidently founded on statistics obtained in exceptionally favourable localities. The most important factors of success in growing Sago are locality and soil. I aminformed that in some localities Sago trees flourish on hillsides, if so such localities must have exceptional soils, or another indigenous variety of Sago tree may exist; but practically Sago trees flourish in the level plains periodically manured with fine mud from the neighbouring hills by the overflow of the river. The presence of a whitish clay as a component part of the soil seems essential for the fullest development of the tree, one of its uses evidently being the mechanical one of retaining moisture. I have found Sago trees growing in certain localities to be between six or seven times more productive of starch than the same variety of Sago growing on soil which to the inexperienced eye seemed to differ very little indeed, if at all, from that in the more productive localities. A Sago plantation demands no skilled labour, entails very little expense for up-keep, and is one of the safest investments. The necessity of waiting ten years for returns is, however, enough to deter many Europeans from cultivating this product, which is so peculiarly suited to the climate and soil of Borneo, and the preparation of which is so readily and cheaply effected by the

natives of the country."

The exports of Sago in 1882 from Singapore fell much below that of the previous year, mainly due, it is said, to the low market value of Sago-flour during 1882. The quality of Sago-flour exported from Sarawak is said to be better than the average imported to Singapore.

TIMBER.—Under this head it is said that the chief wood exported is iron-wood, the botanical source of which is not known. It is of excellent quality and high value, and is said to surpass every other wood in durability. It is already becoming scarce in the vicinity of the capital, from whence its export has been prohibited, but large supplies are still obtainable,

UNSEASONABLE SEASONS.

WE English are not unfrequently taunted with being always talking about the weather, and there is a grain of truth in the accusation. Vet it is only natural that people should often be found speaking of that which circumstances compel them to thick much of, and those who thus give a thrust at our peculiar idiosyncrasies forget that in the matter of climate our experiences are very different to theirs. The inhabit ants of Continental Europe know what kind of weather to expect at each turn of the season and generally get what they look for; their summers may occasionally turn out somewhat drier than usual, or their winters a little more severe, but they are not subject to having their calculations respecting their work and pleasures turned topsy-tury in the way we

so often find ours, and through which we get a habit of frequent allusion to this, the ruling factor in so much of what we do, or leave undone, and about which we are ever under an uncertainty unknown in most countries.

Proverbially changeable as our climate is from day to day, it follows that we are seldom subject to extremes of long duration. A summer with a three months drought and a cloudless sky, even in the driest of the southern counties is a rare occurrence, and snow without thaw seldom stays more than as many weeks. Once or twice in a quarter of a century we may have a few roasting days with a temperature approaching that of the Tropics, setting us thinking of the miseries those compelled to reside there suffer; now and then we get just a taste of a northern European or North American winter, with, for a night or two, the mercury all hid in the ball of the thermometer, which sets us shivering, and gives room for long lamentations about the wide-spread destruction in our gardens. If in winter we get a few weeks with the wind in the Gulf Stream, and thereby noseasonably warmed, we usually have a correcting influence from the opposite quarter, which arrests the otherwise premature movement that would occur in plant life.

From time to time, generally at long intervals, there comes an unseasonable season, like the last winter, wherein the customary changeableness in temperature was all but absent, when, except for the short days and clouded sky, we might imagine that the two last months of the old year and the two first of the new had dropped out of their course-an occurrence the more noticeable, from the fact of its following that of 1882-3, wherein the mildness was only a little less marked than in the last winter, but which did not exert near such an influence in exciting growth in most plants as in the past season, when a good many things scarcely ceased to grow at all. Not the least noticeable thing connected with this untimely movement in vegetation was that it was prematurely excited almost as much on northern aspects as in warmer positions facing south; this no doubt was owing to the all but absence of sun over a good part of the kingdom for the first six or seven weeks of the year, and which was providential in its effects on trees, by keeping back the bloom which otherwise would doubtless have been much earlier, and more in danger than it was.

In the past extraordinary winter the movement was not confined to the flower-buds and flowers of such plants as first show their activity in the bloom. or in such as push their leaves and flowers simultaneously, like the Gooseberry, but extended to many others. Amongst evergreens that usually remaio dormant until the spring has fairly entered Euonymus of various kinds in February had young shoots 6 inches long with leaves threefourths their full size. Some Aucubas, and several kinds of Ivy on north walls, such as the large-leaved Hedera Regneriana, II. canariense, H. digitata, and others, were never quite at rest all the winter, some Ivies having in such sunless positions young growth a foot long with the new leaves of the soft green colour peculiar to them. Cydonia japonica, in common with many plants from the same country, was much influenced by the season. Berberis nepalensis, at the middle of February in exposed places north of London, had its flowers fully open; B. Aquifolia, a little later. Kerria japonica, on a north east exposure, had its flowers showing colour during the last week of the month, with plenty of young leaves. The flowers of the red Ribes had attained half their size, showing their bright red colour at the middle of February. In warm sheltered places the first blooms of Almonds were open at the close of the month.

Individual plants of the common Whitethorn in the hedges in many places had their leaves unfolded nearly as large as a shilling. Tea Roses were never during the winter fairly at rest; some of the varieties with a strong constitution, like Gloire de Dijon, haviog kept on opening their autumn-formed buds in succession all the winter, whilst some of the earlier varieties, like the blush and the crimson Chioas, showed their spriog buds very early. Maréchal Niel on a south wall had young flower-buds on it nearly as large as horse Beans at the beginning of February. Of early spring flowers Primoses and Walliflowers were open at Christmas, whilst Snowdrops, Crocuses, Scilla sibirica, and Violets were open early in February. The flowers of various Daffoldis were showing colour

by the middle of the month, and several varieties of Pansy were blooming as they usually do a month or six weeks later; the flowers of Crape Hyacinth (Muscari) were showing through the crowns of leaves ten days later, and scores of other early spring flowers were proportionately before their time. In the last week in February a young wasp was caught and killed, a queen having been seen buzzing about a fortnight earlier. The rooks began to build in the middle of the month, but after a day or two stopped, seeming undecided what to do; but began again before the close. One remarkable thing was the absence last winter of the foreign feathered visitors that usually come to us at that season, and which, when once here, do not make any mistakes in leaving before the hard weather is done with T. B.

Home Correspondence.

Health Exhibition: the Vegetarian Dinner. -On principle every horticulturist should partake of the vegetarian dinner in the chief gallery of the Health Exhibition-for is not every scientific plantgrower and botanist a sort of vegetarian? dinner consists of three courses, and the charge is so moderate-6d.-that the expenditure of cash need not be too seriously felt even by the most humble fungologists. The dinners are produced, as stated on longologists. The conners are produced, as stated on a large placard in the dining-room, under the auspices of the "Order of Danielites." It is not every one who "dares to be a Daniel," but let us pass into the symposium of "Akreophagy"—a word used on the bills outside—and lounge with the lotus-eaters of the Homeric tales. The handsome room is hung with pictures in oil and adorned with printed moral maxims. The room is stated to be "ventilated by maxims. The room is stated to be "ventilated by Abolus waterspray." The diners are waited upon by sweet vegetarian virgins, and all the profits we are told are given to the poor of London and other large towns. The god of the winds is not wanted in the hall of the Akreophagi to dispel the enticing odours of the savoury vegetable viands—the beans, the peas, the inviting onion, and the odorous cabbage. In the first course we have a choice between the first course we have a choice between lentil soup, not spoiled by the addition of beef, and tapioca and not spoiled by the addition of beet, and tapioca and milk soup. We tried the latter, it was truly a treat for an epicure. If we had partaken of both it would have been 2d, extra; this extravagance we could not venture upon. The second course on Tuesday week included curried haricots, maccarantheses and Pen fittings, we tried the mecanonic roni cheese, and Pea fritters; we tried the maccaroni. and have no hesitation in saying that we felt quite a different person after its consumption. The last course included Fig pudding, Rice pudding, Health pudding, blancmange, and stewed Gooseherries. We longed for "Health Pudding," but it was unhappily "oit;" and although the pretty maid told us we "off;" and although the pretty maid told us we could buy the recipe at the door in the Penny Vegecould buy the recipe at the door in the Fenny Pregaterian Cookery, we have failed to see it in the eighth cidion. This work may resemble Sachs' Handbook in some of the good new things being in the last edition. We therefore fell back with good nature on Fig pudding, a gastronomic esculent of great potency. The drinks are choice and various—nectars for the gods. The smiling maid advised us, after the Fig ambrosia, to try a brimming goblet of Sparkling Kalopine. This transcendently exhilarating delicacy is costly—3d. a bottle; but what is 3d. for a bottle of celestial Nepenthe qualied where E-bolus sings in the airy halls of the Akreophagi! If all the visitors to the next meeting of the Royal Horticultural Society will pay a visit to the Vegetarian Hall and try a sixpenny next meeting of the Royal Horticultural Society will pay a visit to the Vegetarian Hall and try a sixpenny banquet—ninepence with sparkling Kalopine—we promise them that they will soon feel like different men. A book is sold in the Hall termed How to Marry and Live Well on a Shilling a Day—we are anxiously studying this valuable little treatise. W. G. S.

— There ought to be some considerable sym-

There ought to be some considerable sympathy between gardeners and the socio-economical movement known as vegetarianism. Of course those who live by the culture and sale of fruits and vegetables have no unnatural jealousy of the prosperity which seems to wait upon those who supply the world with animal food, but it may none the less seem natural that if much less of animal food be partaken of much more of fruits and vegetables would be consumed. Vegetarians hardly trouble themselves about such considerations in pushing their ideas. They hold rather that vegetarianism is a humanitarian movement in the sense that it renders needless any form of crucity to the lower animals, whilst they farther contend that physically man is not a carnivorous creature, nor is he like the hog, omnivorous; but is a combination of the frugivorous herbivorous, and graminivorous animals, and that consequently he should be wholly vegetarian. It may interest all those gardeners who would like to test in a short way the value of a vegetarian diet, and who will visit the

National Health Exhibition during the summer to learn that there is on the east side of the lower or great arcade a place specially set apart for the serving of vegetarian diamers which are furnished under the auspices of a society, and consist of three courses of vegetable matter, all admirably cooked and served for the small charge of 6.6. Extras ruo at the same simple rate. The waiting is all done by well-dressed attendants. There are no tips, and bread and water are supplied all this gratis. I partook of one of these dinners the other day, having, as a first course, capital Lentil soup; for second, Haricots and Potatos; and third, Fig pudding—a very delicious and enjoyable mid-day meal. Other courses on that bill of fare were tapioca and milk soup, Pea fritters and Potatos, rice pudding, blancmange and stewed Prunes. Not the least interesting fact was that this vegetarian department is immeasely patronised, and bids fair to become one of the most popular items of the great show. A. D. Does any one go a second time? We shall not. E.]

Fruit Trees in California.—Vour allusion to Californian vineyards in your article on "The Mannfacture of Raisins" leads me to thak that a few notes on Californian fruit culture in general, and the time of year when the different trees flower and ripen their fruit, may be acceptable. I will preface my remarks by saying that the source from whence I have derived my information is a reliable one—a genteman who has spent nearly thirty years in the State, and devoted considerable time to agriculture and fruit growing. All fruit trees grow with great rapidity in this State, but the richest alluvial soils are net with on the banks of the Sacramento River, and down in the valley of the Sacramento the best Pear trees flourish. They constantly set as many as three crops in one season. The trees bloom at the usual time in March, with the Apples, Plums, and Cherries, and then, at the expiration of some weeks, fresh flowers will start again, and set another crop, and so on during the flowering time; but it is rarely that more than two crops ripen. "I have eaten," says my authority, "from my own trees in the same season Duchessed 'Angouleme and Bartlett's Pears, fully ripead and of the usual size, of the second crop, the same trees having produced and ripened afine fruit crop that year." This gentleman always raised his Pears oo standards, but a great many growers have them dwarfed on the Quince. He, however, considered that they grew too fast to bear fruit well when so cultivated, although some trees bore must abundant crops when thus managed; for instance, a Glou Morceau Pear, dwarf tree, planed in the year 1855, when it had grown only one year from the bud, was in three years' time to feet high, 4 feet through the top, and measured round the stem at the ground just 10 inches, braoching about 1 foot from the surface. Strawberries begin to ripen in California as early as the month of March, and continue to do so until December. They are the only fruit that require irrigation in the State, for the westerly and southern breez

Lathyrus Drummondi, &c.,—This really heautiful perennial Pea is now coming into bloom in wondrous fashion, indeed till this year I had never realised how grand a climbing Pea it is, but a well established clump of roots in a suitable spot has made splendid growth that is covered with bloom-buds, and many flowers are open, showing that lovely rich reddish-carmine hue which marks this Pea. Blooming thus early it will have a long season, and seems to be quite, as early as the twin flowered Lathyrus grandiforus, that superb variety which, if early, is sooner over. How very beautiful this latter kind is when grown in quantity may be seen at Windsor, where in the forecourts of some of the houses which look on to the Great Park it is largely grown. Perhaps the least noteworthy of all the Everlasting Peas, the red form of Lathyrus latifolius, is the most common one, but it is only because the beauties of the white, pink, striped, and blush tinted forms are little known that they are so little cultivated. Very beautiful effects might be obtained by planting these various Everlasting Peas in clumps here and there, and when well established—and that must be the work of a few pers—and that must be the work of a few pears—then training them up to stout stakes every summer. Some half dozen tens to each clump would keep them well in place, and very beautiful they would look. Not least, they would furnish a large supply of very varied and charming flowers for cutting. When seed of any of the kinds can be obtained—and all do not seed freely—it is a good plan to sow half a dozen in a 6-inch pot, and when the plants are up to plant out where they are to remain. Some kinds, perchance, can only

be obtained by root-pieces, and thus constancy to character is ensured. Certainly as hardy decorative plants Everlasting Peas seem to have been largely overlooked. A. D.

Climatic Changes.—In discussing the question as to whether or not the climate has undergone change in a cooler direction the point for consideration is, not so much whether certain trees will or will not grow, or refuse to fruit, but rather whether the average temperature is below that of fifty or a hundred years ago. That keen observer of Nature, Gilbert White, in describing the winter of 1784-1785, tells us that the cold was intense, the thermometer often going below zero. On the other hand, some summers just at that time were not only excessively bot, but so abnormally hot as to call for his special notice. Had these been ordinary seasons they would have called for no special comment, but the very fact that they receive such shows that they were abnormal, and not common. White mentions that which may interest Northern gardeners to learn, "that in the northerly climate of England the summers are often so defective in warmth and sunshine as not to ripen the fruits of the earth so well as might be wisbed." Thus it is evident that average seasons were pretty much a hundred years since as now—some hot, some cold, and some temperate. The chief point for discussion, however, is as to the distribution of temperature through the year. Of old we certainly seemed to have more clearly dividing lines between winter and summer than now exists. If the winters were colder the summers were hotter, whilst now, if the winters are mild the summers are seldom hot. We had this year really more pleasant spring-like weather in February and March than we had in April and May, and if we take that fact as a guide in our discussion we shall doubtless come to an exact conclusion. If we could have the low temperature of the two latter months during the two former ones all would be well, but the diversion of much of the once customary winter cold to the spring seems to be the distressing cause of our garden missortunes; otherwise the average temperature of the year remains, perhaps, about the same. Southron.

Utilising Weeds: Gas Lime, and other Expedients.—Some twenty years ago, then a pupil at the Government Farming Institute at Glasnevin, I remember reading in the Gardeners' Chronicle of that time — when that journal took a special in-terest in farming as well as in gardening—a strong article against the common practice of getting rid of article against the common practice of getting rid of weeds by burning. I cannot remember the alternative then recommended; but with your permission I will refer to the method I have taken of utilising such villainous root weeds as "Squitch," Crowsloot, Creeping Fiorin-grass, Docks, Thistles, Plantains, &c., and a host of others that no ordinary treatment will rid the larm or garden of. About three years since, having several acres of very neglected land to cultivate that had been let in "con-acre," and that it was no one's interest to clear for several wears one. was no one's interest to clear for several years pre-viously, I collected at considerable trouble and expense some 500 loads, principally of Squitch or Couchgrass; some of the stems (creeping) of this looked grass; some of the stems (creeping) of this looked thick, black, and venerable from age, while a yard long for pieces was about the average. I was strongly recommended to "try fire;" but when one remem-bers how little is left after that species of "cremabers how little is left after that species of "cremation," I did not think I should lose the material for such a valuable compost. All I should have left would be about I per cent. of ash—say ten loads or so out of the 500—that is, ninety per cent. of the organic, or most vabluable part, would have been lost, at least to me. I tried death by smothering as well as burning, and used "rock lime," that is, unslaked from the kiln. I first calculated that the lime in slaking, spread on the heap, would produce so much heat as would kill all the weeds in contact therewith: secondly, that the all the weeds in contact therewith; secondly, that the resulting air-impervious cement formed by the slaked lime on the top and sides would kill all vegetable and weed life; and thirdly, that the following year, sliced down, turned, and mixed, I should have a very nselul compost. All three calculations were fully and amply realised. I mentioned the plan, though nothing compost. All three calculations were fully and amply realised. I mentioned the plan, though nothing new, in the local journals, and am aware many have adopted it as an excellent means, without any expense, of procuring a valuable and always athand compost. Where lime cannot easily or inexpensively be procured I would recommend the following expedient:—If stable manure can be had for the purpose, use it with the weeds in alternate layers, when such a heat is produced as is alternate layers, when such a heat is produced as is alternate layers, when such a heat is produced as is continuous to all vegetable life, and the resulting compost is better than before, in fact admirable potting stuff, for top-dressing lawns, or any other similar time stuff, for top-dressing lawns, or any other similar ting stuff, for top-dressing lawns, or any other similar purpose. If the stable manure is not fresh then you purpose. If the stable manure is not Iresh then you merely manure the weeds. If coal-ash is sifted and beaten so close around and on top as to exclude air it will have the same effect. This year the local gas company have kindly placed at my disposal as much gas-lime as suits my purpose; this is instant death to all vegetable life, while the resulting compost after a year is even more valuable. W. J. Murphy, Clonmel.

Hardy Succulents at Floore.-This extraordinary collection is now at its best as regards flowers, we have never seen it so floriferous before. At the present time the different varieties of Echinocereus ocanthus are a mass of bloom, some of the plants aving from seventy to seventy-seven flowers expanded at once, and the various shades of orange, crimson, and purple exhibited by the flowers have a dazzling effect. Beside the above, Echinocereus paucissimus, E. Fendleri, E. pheeniceus, and E. viridiflorus, with its curious green flowers, are very full of flower. Mammillaria Hyderi var. applanata are particularly good this year. Few are aware of the beauty of these plants, or they would be more generally cultivated; all they require is a good pit or frame with good watertight lights. No covering of any kind is used winter or summer except the lights; sometimes they are frozen as bard as bricks in winter, but if perfectly dry frozen as hard as bricks in winter, but if periectly dry no harm ensues; and in summer they are syringed and the lights closed about 3 o'clock, when the temperature rises to 100 or 110, which they enjoy, as no daoger is apprehended as long as the temperature is kept under 115. Those content of the alphane graden made a receive ledge planted in the alpine garden under a rocky ledge to protect them from wet have much increased in size, but owing to their situation they do not receive In size, but owing to their situation they do not receive the same amount of sun as those in the pit, consequently they do not flower so freely, but grow more uluxuriantly. In this collection the following species are doing well:—Echioacereus viridiflorus, E. Simpsoni, E. pheniceus, E. procumbens, E. Krausii, E. candicans, E. pecinatus; Opunia comaochie, O. Whipplei, O. Engelmanni, O. arborescens; Agave utahensis, A. Parryi, A. deserta, and several others. I may observe that the minimum thermometer on grass registered on April 20, 16°; 23, 13°; 24, 16°.

Garden Insects .- The cold north and north-east winds with which we have been visited of late have winds with which we have been visited in the have been anything but favourable to plants, the growth of which has been slow, and, what is worse, there is much leaf-cucling, showing plainly that there is "worm i' the bud," or that losects are rife, as is generally the case after such weather, for, to use a generally the case after such weather, for, to use a gardeniog phrase, the shoots cannot get away from them, or in other words their progress is slow, and maggot or aphis have every chance of effecting a footing. The rate of increase of the latter is some-thing marvellous, for no sooner is a cluster seen than it spreads, and in a few hours is all over a tree. This shows the great importance of waging war at first sight if the enemy is to be vanquished and exterminated before he does mischief. To make the battle short, sharp, and decisive the attack must be attack must be made in earnest and no quarter given, or, Phoenix-like, the fly springs up again, and though life may have been well nigh spent, in a day or two they are round, and again as active as ever. If we can only get them in a circumscribed space, and fenced round with glass, as we do in houses, we have them at our mercy, as let them initiate themselves into whatever mercy, as let them initiate themselves into whatever vegetable folds they may, smoke is searching enough to find them out and despatch them. This, however, depends on the kind of tobacco-paper used, as the material differs greatly, some being very good, safe, and strong, and other worthless rubbish, and almost dear at a gift, as the consuming of it often does much harm to the foliage. After trying many makes I have arrived at the conclusion that the best is the cheapest, and in some cases where tender leaved plants have to be fumigated, I am of tender leaved plants have to be furnigated, I am of opinion that only genuine ishag Tobacco ought to be burned. Unless care is taken there is much waste in doing this, as to get the most out of it the combustion should be slow, and another great point is, when the smoke is given off, and in the house, to keep it there as long as possible that it may effect its work, and destroy all the unwelcome marauders. With this end ia view a still night should be chosen, and if wet, so long as the foliage is dry inside, all the better, and if not, the shading or blinds, if any, should be let down and heavily syringed, as then the water fills up the material and the laps in the glass, thus sealing, as it were, the openings, and making air-tight the case. This done, the smoke tells, and in order that no aphis escape the funigation it should be repeated early the following morning, and the house kept closed as the following morning, and the house kept closed a long after as is safe to the occupants. To wash of the dead parasites and refreshen the plants it is necessory to give a good syringing, or to make use of the garden-engine, charged with clear water, which will at once cleanse the foliage and make it look bright. To contend with green or black-fly outdoors different tactics have to be pursued, and there is nothing for it but a resort to one or other of the insecticides, of which there are many, that known as Nicotine Soap being, perhaps, as good as most of them, as it contains being perturbed the active properties of Tobacco, and is potent, without being dangerous to young shoots or tender leaves on which it may be used. A cheap and good insecticide may also be made by boiling 2 lb of Quassia chips with \(\frac{1}{2} \) lb. of soft soap in

5 gallons of soft water. By steeping a pound of Tobacco in the liquid it will be strong enough to be diluted to three limes the quantity, and by using it at a temperature of about 90° it is very effectual. For Roses, Peaches, and Nectarines, Plums, Cherries, or, indeed, on anything, it may be applied with safety, but whatever be chosen in the way of insecticide, it should only be left on a few hours, and then thoroughly washed off by the aid of an engine, which, if used occasionally after, and the stream well directed will keep the plants clean. Tobacco dust is exceedingly useful, and if gardeners and rosarians were armed with it in a distributor carried about in a pocket, they need not be quite so much plaqued, as they could discharge a volley at sight and pass on, leaving the aphis falling off to the ground. The maggot is a more troublesome foe, as be is so insidious as to hide himself by colling the leaf around him in a most dexterous way, and to think of bunting him out is quite out of the question, as to do that is a work of time and requires great patience. To settle matters quickly there is nothing like a squeeze between the finger and thumb, which makes the maggot collapse at once, as may be felt, and much satisfaction derived therefrom. The Gooseberry caterpillar is not quite so bad, though in many gardens it is very troublesome, but by handpicking it may be got rid of, as also by dusting with Hellebore powder, or syringing with water in which leaves of Foxglove have been boiled or steeped when hot. For red-spider there is no remedy so efficacious as sulphur, which may be mixed in soap, but water and syringed on to the foliage and wall, but where trees are mulched and have the garden engine played on them this insect ought not to appear, or, should it do so, it should not gain sufficient footing to played on them this insect ought not to appear, or, should it do so, it should not gain sufficient footing to do any barm. J. S.

Gladiolus Colvillii, The Bride,—This plant deserves extensive cultivation for conservatory decoration, judging from a few pots of it I saw at Stibbington Hall, Wansford, a few days since. It had a very chaste and pleasing appearance intermixed amongst the usual occupants of a conservatory, and being only about 1 foot in height, its white flowers slightly marked with pale yellow, rivalled in beauty the Orchids, of which there were many very choice varieties in the adjacent houses. The appearance of these gardens in every respect—the gravel walks were the best I ever saw—reflected the greatest credit on Gladiolus Colvillii, The Bride,-This plant the best I ever saw-reflected the greatest credit on Mr. Milne who has charge of the garden department. W. H. Divers, Burghley.

The Ginger Beer Plant,-There stands before me in an ordinary white glass bottle that fungoid phenomenon, the so-called Ginger Beer plant. I had heard much of this very curious thing of late, but till now had not seen it. An old neighbour, who is very enthusiastic about it, has brought me, however, the bottle that is before me, and its contents ever, the bottle that is before me, and its contents are water sweetened with sugar, some pieces of whole ginger, and the "plant"—which in bulk is perhaps enough to fill an ordinary teacup resembles most closely Tapicca as purchased from the grocers. It is white, in many pieces and form; and when handled is found to be fairly firm, somewhat slippery, and very light. Still its normal position seems to be at the bottom of the bottle, until, in the process of change which goes on within, the pieces ascend to the surface, and there remain for a time, and presently return to the bottom, so that whilst the contents are said to beworking these Tapicca-like pieces of fungus are constantly ascending and descending. It is evident said to he working these Tapioca-like pieces of fungus are constantly ascending and descending. It is evident that carbonic acid gas is also being fast formed from the sugar, and this, too, is constantly ascending to the surface in small globules. Even portions of the ginger at times are affected with the motions going on, and ascend and descend as do the lighter and more buoyant fungus. This so-called plant certainly cannot be credited with the production of ginger beer. It simply produces an actated liquid in this way, that the lungus seems to convert the sugar or saccharine into [alcohol and water, accompanied by the emission off carbonic acid gas; and evidently as the pieces of carbonic acid gas; and evidently as the pieces become charged with the gas they become buoyant and ascend, lalling again when the buoyancy is lost. In twenty-four hours the sugar and water are converted into a pleasant sub-acid beverage, and either the converted into a pleasant sub-acid beverage, and either the converted into a pleasant sub-acid beverage, and either the converted into a pleasant sub-acid beverage, and either the converted of the converted to ginger or essence of lemon creates a non-effervescent drink far more pleasant than is ordinarily manufactured. Fresh water and sugar should be added about every twenty-four hours, A. D.

Gardening in 1597.—I send you the following extracts from an old black-letter book on gardening which lately came into my possession:—

"At what time trees ought to be planted and set,—All kinde of trees may bee planted, transported and cut in March, but it is better they be turned in October, for the frost hurteth them not so much as at other times: for learned men say that in dry townes and warm countries they plant in October or November, and that in moist townes and cold vallies they plant in February or March:

in none other time may yon plant or graffe. When you will plant or set againe wild stumps, if there be anything broke at the root, cut it off. Every plant must be set two foot one from another, or at least one foot, especially when they should bear strong fruits: likewise when thou wilt set strong seedes, as Nuts, Almonds, and Peaches. When a man will plant two stumpes, so must they be of two yeare old, except the Vine. These things you must understand of those plants or stumps which are planted with roots." with roots.

with roots."

"How the Stumpes and Plants must be Prepared and Dressed, which you will Plant.—The plant or spront you must cut round about, so that you leave the very end of it, and put it then into a hole; but if the stumpes great cut it cleane off, and then put onely the undermost part into a hole, long or short, as you will; but if you find two stumpes growen together, you must take heede that the spront growe upright, and if it will not you must constraine, and tie it to a sticke."

Here follow certain instructions how must be kept, and how you must labour them :

"How to keepe plants, stumpes, or trees, from the wild beaster, that they havt them not.— When the path of the beast is free and remediess, there must be put poles, and with thornes the same young trees must be enclosed."
"That the Hurrs doe not hurt them.—Spit on thy hand, and annoine the sprouts therewith, and no Hare will hurt them."

"I'rt them."

"I'rt the Deares spoill them not.—Take the pisse of a Dear and Apples or other fruites maybe made redde.—If you will graft upon a winds stumpe, put the sprouts in ble will graft upon a winds them, and the fruit will be

red."
"Otherwise.—Take an Apple branch and graft it upon an Alder stumpe, and the Apples will be redde. Likewise if you graft them upon Cherry trees."
"How Sower Fruites be made Sweet,—Which tree beareth sower fruites, in ye same pearee a hole a foote or somewhat lesse above the roote and fill that with hony, and stop the hole with a haw-thorae branch, and the fruit will be sweet."

W. Swanston, Belfast.

will hurt them

The Common Hart's tongue Fern. - This Fern belongs to a very handsome genus, and although it is probably one of the most common of our British wild plants, it is likewise one of the most beautiful of them. We possess a great many varieties of this Fern, most of them produced by cultivation; but I believe I am correct in stating that the I lart's-tongue is the only representative we have in England of the is the only representative we have in England of the genus Scolopendrium, and that the generic name was given it because the long lines of spore-cases on the underside of the fronds were supposed to resemble a centipede's (Scolopendra) feet. There js but littledanger of Fern collectors making a mistake with respect to this plant and confusing it with any other species, still it may be well to mention a few of its distinguishing marks. The fronds are long, sword-like, and a shining bright green. The stem is scaly, and the root-stock is slightly creeping. It can be easily increased by division. The seed cases stand upwards. The seed cases stand upwards increased by division. The seed cases stand upwards, and are placed between the veins at some distance from the midtibs. The seed-vessel cover is special, some-times linear, in other cases hollow. The finest Hart's-tongues Fern 1 have ever seen in an uncultivated state were in North Wales, but I am told that the climate of Ireland is still more favourable to their growth, and that fronds a yard long have been found near Dublin, Wiltshire, too, has been mentioned as a good locality, and I have met with some splendid exceinment in the I (armethic woods but the Fern is specimens in the Hampshire woods, but the Fern is not particular as regards its babitat. It will take root not particular as regards its habitat. It will take root in the walls of ancient ruins, grow between the bricks in the walls of anciënt ruins, grow between the bricks in the side of old wells, flourish under the shade of overhanging Oaks, and clothe the sloping, sunny wayside banks with beauty. A small specimen I dug up ten years ago in an adjoining lane, and planted in a cold greenhouse, produced magnificent crisped fronds last year. They looked like green satin frills. Another planted in the same way produced forked fronds. It really made a most striking-looking and attractive object. The plants were in the first place broad and strap-shaped for nearly a foot long; they then became branched, or forked, making two small fronds of about 4 inches long, and in these instances these smaller fronds again became cleft, so that the these smaller fronds again became cleft, so that the original frond was twice subdivided, having six lobes in all. Every one who saw it noticed its singulobes in all. Every one who saw it noticed its singu-lar appearance, but I am sorry to say that the froods it has put forth this spring in the open—for changing my house at Lady Day, I had to remove it—do not show any intention of branching. It has reverted to its original form of hedgerow growth. Any open fibrous soil mixed with leat-mould, or sand suits this Fern, and it likes moisture. Every grower of our native Ferns should try to procure all the varieties of Hart's-tongue, since they are hardy, evergreen, and exceep. retus submut ty to procure an the varieties of Harristongue, since they are hardy, evergreen, and exceedingly handsome. The best known are the P. vulgare polyschides, a narrow-leaved kind, found near Bristol; the S. vulgare undulatum, which I think my "green frill" must have been, and the S. vulgare multifidum, of which my lobated steeping was no doubt an average from the processing the proces of which my lobated specimen was no doubt an example. Dr. M. C. Cooke in his Fern Book for Everybody, states that there are eighty-five varieties of the

Scolopendrium vulgare, all of them named, but as I bave never seen a list of them, I cannot mention any particular specimen save the broad-branched form alled ramosum majus, which I at first had hoped forked Fern would turn out to be, but it unfor-tunately did not show the curious curved points which in the early variety turn towards each other like a lobster's claws, and the Endive-leaved variety called laceratum. Helen Watney, Heatherview.

THE INTERNATIONAL EXHI-BITION AT ST. PETERSBURG.

(Concluded from p. 711.)

GROUPS of decorative flowering plants in com-petition for the best and choicest arrangement are very creditable, but they are very similar to those of our own exhibitions, and include the same kinds. Mr, F. Noieff, of Moscow, for a group of ornamental plants in flower, obtained the prize of the President of the society. It consisted of a central mass of Lilium candidum, bordered with Lilium longiflorum, then a band of splendid double white and coloured Stocks in small pots, and a final edging of Astilbe japonica and Violas. Another group by the same exhibitor consisted of a central mass of Azaleas bordered with some splendid pots of Mignonette, and tiny but well-flowered plants of Deutzia. For a collection of fifty ornamental stove and greenhouse plants the prize of the Horticultural Society of Hamburgh and neighbourhood was awarded to the Botanic Garden, Mr. E. Ender gardener, and among other choice plants he had Theophrasta Jussiæi in flower. For a mixed collection of ornamental plants in flower the prize of the Vice-President of the Imperial Society was given to an arrangement from the gardens of the Grand Duke Constantine Nicolaïevitch. It stood on a plateau before the English garden and surrounding a daïs, on which stood a fine Chamærops bumilis arborea, and on each side the busts of their Imperial Highnesses the Emperor and Empress. Most un-common, in pots for this purpose, were double Dahlias and Foxgloves, which appear not at all unworthy of pot culture from a decorative point of view. Hyacinths were exhibited in several effective groups, and they were considered good for Russian growth though they were somewhat drawn. Mr. Eilers, one of the chief local nurserymen, exhibited Lily of the Valley in quantity and in good state except that, like the Hyacinths, they were somewhat drawn. A fine specimen of Viburnum macrocephalum was exhibited, which shows how fine it is for the green-

house.

Conferr were well represented, and the principal collection was that of Mr. F. de Sitter, of Apeldooro, Holland, to whom was awarded the 1st prize—an Intermediate Gold Medal. These specimens waried from about 4 to 6 feet in height, and, like some other collections, were scattered for effect over the entire building. Most of these specimens were faultless, and, among others, Retinospora obtusa fillera, R. plumosa aurea, Thuiopsis nutkaensis pendula, and Thuiopsis to make a selection. The finest collection of the genus Araucaria were noteworthy, but it is difficula to make a selection. The finest collection of the genus Araucaria we have ever seen exhibited was from the Tauride Imperial Gardens, St. Petersburg—Mr. Fr. Scissmayer, It included twenty-eight reputedly distinct kinds, and the great majority were quite distinct for garden purposes. A. brazilensis pendula, 20 feet high, was very good, the branches beneath the leader pointing straight to the earth. A. excelsa pendula is also gracefully pendulous. One of the most effective is A. Regeli, which is very bright green in colour, and densely furnished with branchlets, which curve downwards. A. Van Geert is one of the most distinct, with Lycopodium-like branchlets. President Greig, Napoleon Baumann, Waranzowi, and Niepraschki, are also noble kinds.

Miscellanea.—We have now to pick up various mis-

Waranzowi, and Niepraschid, are also noble kinds.

Miscellanea.—We have now to pick up various miscellaneous exhibits, hitherto passed by, but from the great number of the plants alone (nearly 600) it will be impossible to notice all. A fine group of eleven Theophrastas, all distinct, and the so-called Theophrasta imperialis, cannot be missed, as every plant was individually perfect, not a leaf tarnished, and jit well illustrated the ornamental effect of the members of the genus. For a single specimen of Theophrasta macrophylla a Large Silver Medal was awarded, and it is really very fine, about 5 feet high and about 5 feet through. All these are from the gardens of the Grand Duke Constantine Nicolatevitch. Moutan Paconies were exhibited by Mr. P. Fertsch, of St. Petersburg, a small group, but showing how fine they are for pot culture. A Large Silver Medal was awarded to a little group from the Fotantic Garden consisting of Statics Suworovi, with rosy flowers, special conditions of the Carden Constitute of the Carden C

flowers from Mr. L. Spath, of Berlin. It gave the idea flowers from Mr. L. Spath, of Berlin. It gave the idea that for early spring decoration there are lots of such plants with pretty foliage which might be forced with advantage. Amoog dark foliaged plants principally were Betula alba purpurea, Annygdalus persica folias purpureis, Prunus cerasifera folias purpureis, Quercus sessiiflora purpurea, and several others. Yellow-foliaged plants, apparently good and effective, were Coryus Avellana aurea and Alnus glutinosa aurea. White varies-

forms.

Fruit and vegetables were not numerous. For Strawberries in pots a Large Silver Medal was awarded to Mr. Sohrt, of the Imperial Gardens, Tsarskoie Seloe. Grapes were small and so also were the Apricots, with one exception to which a Small Gold Medal was awarded. A collection of vegetables from Mr. W. E. Gratscheff was a notable feature in the exhibition, and to it was awarded the prize of the Municipal Council of St. Petersburg. Potatos were in great variety, and in proportion equily so were the Radisbes, which in Russia appear to be in demand in all colours and shapes.

Cut flowers in stands and in wreaths were made up/with good material, but were generally too heavy and massenders.

Out flowers in stands and inverted to be been accomplished to the stands and inverted to be been and material, but were generally full Roses and material, but were generally full Roses and material, but would perhaps be difficult to get any other result. Mr. Eilers contributed the best arrangement, and was awarded a Gold Medal. In this arrangement the combination of Forget-me-Nots and Lilies of the Valley was its most pleasing feature. This exhibitor showed an excellent window decoration, in which Phrynim sagnueum was effective. Everlasting flowers and grasses in all colours and dyes were in grand display, and were very fine as these things go. Apparently real fronds of Cycas revoluta, silvered, are not to be despised in their proper position as ornaments. One exhibitor deals largely in Edelweiss, and showed a large horse-collar like arrangement composed of it, and a swan of the same material, priced at \(\frac{1}{2} \) \frac{1}{2} \)—an exhibit in thoroughly bad taste. Artificial flowers were exhibited made of various seeds and husks, and though ingeniously constructed were far from beautiful.

taste. Artificial flowers were exhibited made of various seeds and husks, and though ingeniously constructed were far from beautiful.

Among artificial flowers the least objectionable were Roses made with feathers, and very cleverly put together. Miss Rowers, of Melbourne, contributed most beautiful water-colour pictures of Australian plants. One of these was composed of four species of Anigozanthus, and was very characteristic. Another fine picture was composed of Encalyptus ficifolia and E. diversicolor. This series, indeed, was worthy of much praise, and a Gold Medal was awarded to it. Models of hothouse construction were exhibited as adapted to the exigencies of this northern climate, but they do not seem to be important, and are precisely as we see them in use everywhere. There were nomerous Wardian cases for window culture, and aquaria with the various gold his (some with double tails, as illustrated some time ago, we believe, in the Lecture Hour). In one aquarium the notice of a sparant of apparently very consense in the longer stem by which the air can be sucked away. Implements were exhibited, but there appeared to be nothing in principle different from hose we are familiar with. The majority of them were for

watering and syringing purposes. From the Botanic Garden at Nikita were exhibited extremely fertile branches of Coniferce, and photographs of the principal

Reports of Societies.

Manchester Botanical and Horticultural: May 30 to June 6.—On this occasion the Council and their indefatigable Secretary scored a distinguished success. It was the seventeenth exhibition held by the Society, and Dr. Watts, the Chairman of the Council, stated at the judges' luncheon, that it was one of the largest exhibition held by the Society had beld, and if not the best certainly one of the best. Last year the enlarged exhibition hone and the annexe sufficed to take the whole of the exhibits, but on this occasion, owing to the increased number of exhibitors and entries, it was necessary to call into requisition the tent which formerly was rected by the side of the old show-house, and this, in addition to the other parts of the show, was full to repletion. The peculiar conformation of the show-house admits of but little in the way of effective grouping, while in the tent all the exhibits were arranged on tables, but in the annexe Mr. Findlay had judiciously and artistically arranged his material, and the effect was very fine, especially when looked at from the raised mound near to the Trafford Road. The weather was fine, and the attendance of visitors on the opening day exceeded that of any previous exhibition. On Saurday also the attendance was favorable, and a fine Whit-Monday no doubt attracted a large number of visitors.

Original Trafform of the Schember of the Sitters. Manchester Botanical and Horticultural: May

of any previous exhibition. On Saturday also the attendance was favorable, and a fine Whit-Monday no doubt attracted a large number of visitors.

ORCHIDS.—These were not only very largely but very finely shown, and Mr. B. S. Williams, who has attended every exhibition for the past seventeen years, said he had seen nothing like it before. R. P. Percival, Esq., South place of the seventeen years, said he had been controlled to the seventeen years, said he had been controlled to the seventeen years, said he had been controlled to the seventeen years, said he had sonly a few being what is termed made-up specimiers, and years with the class for fifteen Orchids in flower Mr. Percival was easily sts, with a magnificent specimen of Ledia purporata, quite 4 feet through, and having twenty-one flower-stems, carrying on the aggregate eighty flowers, and such flowers too; Cattleya Mendelli, perhaps one of the finest examples ever seen, with over fitty flowers; Thunia Bensoniæ, with over twenty-two spikes; Denderboium Iparesisanum, with some twenty flower-stems; D. fimbriatum oculatum, Cattleya Mossie, with about forty flowers, a superb specimen; Oncidium concolor, Anguloa Clowesii, a very fine piece indeed; Cyptipedium barbatum, Vanda saavis, V. tircolor, Odontoglossum veillarium, very activation of the cattleya Mossie, with about forty flowers, a superb specimen of bigb-class cultivation. This collection formed a very conspicuous object at the rend of the exhibition house, and made a very attractive foreground to Mr. S. Schloss' splendid exotic Ferns. ad, O. Schneider, Esq., Fallowfield (Mr. U. Holmes, gr.), with some well grown plants. Mr. Percival was also rst with nine Orchids, staging another very fine to lended; including two superb specimens of Cattleya Mossie, Odontoglossum cellarium, occulatum, Cheth, S. Schloss' plendid dextic Ferns. and O. Schneider, Sq., Lendelii and C. Mossie, Dendrobiam formosum giganetum, D. chrystoxum, D. thyrsiflorum, Odotoglossum erresurents. C. Alendelii and C. Mossie, Dendrobiam premors

Broome, Esq., Didsbury. In the class for ten Orchids made-up specimens are not permitted to be shown, and here the rst prize was again taken by Mr. Percival, with a very fine lot, superbly grown and flowered, besides being large in size, the subjects being Lælia purpurata, Odontoglossum vexiliarium, O. citrosmum, O. Alexandree, Cattleya Mossiæ, C. Sanderiana, very fine; Vanda snavis, Cypripedinm caudatum, C. Domicianum, and Anguloa Ruckeri, carrying some very fine flowers, ad, Joseph Broome, Esq., with some very good specimes indeed, including such a piece of Vanda teres as one seldom sees, D. Wardianum, D. Farmeri, D. Falconeri, and D. nobile, Cattleya Mossiæ, Aérides Fieldingii, &c., 3d, Mr. O. Schneider. In the class for staging the following in fine condition —C. Mendelli, C. amethystina, C. Skinneri, C. intermedia, and C. gigas. In that for three Vandasthe Earl of Wilton, Prestwich (Mr. W. M. Baillie, gr.), was 1st, with two specimens of V. sauvis and one of bicolor; ad, S. S. Malley, Esq., Fallowfield (Mr. George Jackson, gr.), with three plants of V. stavis.

In the nurserymen's division, there was a goodly dissipant but by bespense.

Esq., Fallowfield (Mr. George Jackson, gr.), with three plants of V. stawis.

In the nurserymen's division, there was a goodly display, but the absence of Mr. B. S. Williams from the competition lessened the number of plants. The best sixteen specimens came from Mr. J. Cypher, Cheltenham, who had well-grown and bloomed specimens of the following:—Cattleya Mossice, C. Mendelii, C. Warneri, C. Mossize esuperba, C. superba splendens, very fine in colour; and C. Gaskelliana, Cypripedium Laurencianum, and C. nivenun, Dendrobium thyrsiforum, very fine; D. Jamesianum, &c.; 2d, Mr. H. James, nurseryman, Lower Norwood, whose leading examples were Cattleya Mendelii, C. Mossize deiteata, Leelia purpurata, Epidendrum vitellinum, Masdevallia Veitchii, &c.; 3d, Messrs, Heath & Son, nurserymen, Cheltenham. Mr. H. James was placed 1st with teo Orchids, staging Oncidiom Marshallianum, very fine; Odontoglossum excillarium, O. Pescatorei, with a very fine branched spike; Cattleya Mossize, Cypripedium barbatum grandilforum, Leelia purpurea, and Vanda correlescens Jamesianum, with flowers much smaller than those of the species; sepals and petals pure white, with a rich blue-purple lip, and protted plag in of hee taskes it a wariety of V. corrulescens; ad, Mr. J. Cypher, whose leading plants were Dendrobium thyrsiforum, D. nobile, D. Bensone, D. Wardianum, Cattleya Mossize, C. marginata, &c.; 3d, Messrs, Ann Gress-Mossise, C. marginata, &c.; 3d

Messrs. Heath & Son.

STOVE AND GREENHOUSE PLANTS,—In the amateurs' class the best eight plants came from S. Schloss, Esq., Bowden (Mr. C. Paul, gr.), who had two large specimen Azaleas, one red the other white; a very fine specimen Stephanotis floribunda, not sufficiently in flower; the finest Anthrium Scherzerianum in the show; Bongain-villea glabra, Clerodendron Balfourianum, and Erica ventricosa; ad, the Earl of Wilton, Mr. Baillie's leading plants being Allamanda grandiflora, Darwinia tulipifera, D. Hookert, Bongainvillea glabra, Azalea Roi Leopold, and Erica perspicua nana, &c.; 3d, Mr. E. Cliffe-Glover, Leck (Mr. C. Roberts, gr.). In the nurserymen's class for ten plants Mr. Cypher, who of late years has had it pretty much bis own way at Manchester, had some very hine fresh specimens of high-class quality, including a fine white Azalea magnifera, a splendid example of Erica depressa, E. Cavendishiana, Azalea Extranei, Franciscae actimia, Dracophyllum grande, Authrium Scherzerianum, Darwinia tulipifera, very fine; and Aphelexis macrantha purprene. 2d, Mr. H. James, whose leading plants were Azalea tyeryana, Erica coccinea minor, Erica ventricosa magnifica, E. Cavendishiana, E. ventricosa bicolor, Clerodendron Ballourianum, Pimelea decussata, and Darwinia tulipifera. 3d, Mr. F. Turdgey, Waltham Cross. Waltham Cross.

Waltham Cross.

AZALEAS.—These were fairly numerous, and on the whole pretty good, and were of excellent service in the annexe, where they formed striking patches of colour. In the annexers division Mr. John Rylands, Stretford (Mr. Geo. Roberts, gr.) was 1st, his best plants being Glory of Sunninghill, Duc de Nassau, Roi d'Hollande and triumphans. 2d. Mr. J. Broome, who had Perryana, Charmer, Roi d'Hollande, and Comte de Flandre, as the best in his group. 3d. Mr. S. Schloss. In the nurserymen's class for eight specimens, Mr. C. Turner, Royal Nursery, Slough, had a very good to indeed, rather above medium size and finely bloomed, viz.:—Charmer, Duc de Nassan, Duchesse A. de Nassas, Souvenir de Prince Albert, Mons. Cuvellier, Reine des Fleurs, &c. There was no other competitor in this class.

ERICAS.—These were better shown by nurserymen than by amateurs. Mr. Cypher had the best six, nice fresh plants, consisting of E. Caveodishaoa, E. affinis, E. tricelor rosea, E. ventricosa coccinea minor, E. ventricosa magnifica, and E. ventricosa rosea. Mr. Tudgey was placed ad, having some good specimens, ventricosa magnifica, and grandiflora, adpressa, and eximia superba being the best.

ROSES.—As both Mr. Turner and Mesars. Paul & Son, of Cheshunt, were exhibiting on this occasion, a good show of these resulted. With twenty plants in pots not more than 9 inches across, Mr. Turner was well ahead with excellent specimens of Camille Bernardin, Madame Eugène Verdier, Céline Forestier, Viconate Vigier, Charles Darwin, Juno, Edouard Morren, Marie Bammann, La France, Marquis de Castellane, J. S. Mill, Duchesse de Vallombrosa, Comtesse de Sereneyi, &c. 2d, Messrs, G. & W. Yates, nurserymen, Marchester; 3d, E. Tudgey. In the class for a group of thirty Roses in any sized pots, Messrs, Faul & Son, Old Nurseries, Cheshunt, were placed 1st with an excellent

lot of plants that formed a most valuable contribution to the show. The leading varieties were J. S. Mill, Madame Victor Verdier, Charles Lawson, very fine; Madame Clemence Joigneaux, Beauty of Waltham, Madame Lacharme, Edouard Morren, Villeret de Joyeuse, Catherine Soupert, Ulrich Brunner, Souvenir de Madame Berthier, a dark Victor Verdier, Marie Van Houtte, François Michelon, &c.; 2d, Messrs. G. & W. Yates; 3d, Mr. E. Tudgey. In the amateurs' class for six Roses in pots Mr. John Heywood, Streffurd, was 1st; Roses in pots Mr. John Heywood, Streffurd, was 1st; Marie Browner, Heaton Mersey, 2d. As might be expected these fell much behind the nurserymen's plants.

CLEMATIS.—Messrs. R. Smith & Co., St. Johu's Nursery, Worcester, were the ouly exhibitors of these, and they must be congratulated on the excellent specimens produced. The leading varieties were Princess of Wales, Madame Van Houtte, Sensation, Lord Neville, Fairy Queen, Madame Van Houtte, Sensation, Lord Neville, Fairy Queen, Lady Caroline Neville, Grande Duchesse, of Miles and Markette and Markette of the Amateurs' class for six Clematis Mr. J. Dickins was rst, and Mr. J. Blewwood 26. Heywood 2d,

SONERILAS.—This interesting class brought some very fine and well grown plants, but only partially in flower. Mr. J. Broome had some well grown specimens in the class for six, staging margaritacea, Hendersoni, argentea, Rowley, Marmorata, and Nelly; 2d, Mr. S. Bairlein, who had a very fine pan of S. margaritacea.

argentea, Rowley, Marmorata, and Nelly; 2d, Mr. S. Bairlein, who had a very fine pan of S. margaritacea.

MISCELLANEOUS FLOWERING PLANTS. — Of these Calecolarias were an interesting show, and the leading plants were very good, being clean and well grown. Mr. A. Schill had the best ten plants among anateurs, Mr. Tootal was 2d, and Mr. J. M. Hetherington 3d, in the nurserymen's class for twelve plants Messrs. R. P. Ker & Son, nurserymen, Liverpool, were a long way rst with well grown plants of a good strain. Mr. Turner took down to Manchester eight specimen show, and the same number of fancy Pelargoniums, and consequently had it his own way, though Mr. C. Rylance had some excellent plants also. Mr. Turner's eight show comerised Amethyst, Illuminator, Prince of Prussia, Prince Leopold, Kingston Beauty, Duchess of Bedford, and two others; 2d, Mr. C. Rylance. Leopold, Kingston Eeatty, Duchess of Bedford, and two others; 2d, Mr. Rylance. Mr. Turner's eight fancies consisted of Mrs. Pottle, Fanny Gair, East Lynne, Lady Carington, Electric Light, Mr. Hart, Prince Teck, and Lady Harvey; 2d, Mr. C. Rylance. In the amateurs' division for six show Pelargoniums, Mr. Bridge, Roly, Liverpool, was 1st, with good plants of Volonté Nationale, Trnomphe de St. Mande, Albina, Duchess of Edinburgh, Mrs. Ashby, and Royalty; 2d, Mr. T. Dickens. No fancy Pelargoniums were shown in this division, but D. Adamson, Esq. Didshury, had the best six zonais; Mr. J. Silkenstalt being 2d. In the nurserymen's class Mr. C. Rylance had eight excellent specimen zonais, well grown and bloomed; Messrs. R. Fleming & Sons, Liverpool, being 2d. Mr. C. Flylance was the only exhibitor of eight zonal Pelargonium, start shown in this division, but D. Adamson, Esq. Didshury, had the best six zonais; Mr. J. Silkenstalt being 2d. In the nurserymen's class Mr. C. Rylance had eight excellent specimen zonais, well considering the lateues of the season. Glovinas were a charming feature; the leading collection of ten plants comprised large and finely grown specimens

HARDY PLANTS.—As usual, these were numerous and good; but we missed Mr. W. Brockbank's choice collection, as he has such a wealth of these interesting plauts. The best thirty hardy herbaceous and alpine plants came from Mr. T. Dickeus, Higher Broughton (Mr. W. Cr. Bennett, gr.), who had well grown and alpine plants came from Mr. T. Dickeus, Higher Broughton (Mr. W. Cr. Bennett, gr.), who had well grown and state of the plants of the plants came from Mr. T. Dickeus, Higher Broughton (Mr. W. Cr. Bennett, gr.), who had well grown and state of the plants came from the plant

FOLIAGED PLANTS.—Some truly magnificent examples of these were shown, and they greatly helped the striking appearance the exhibition-house presented. The best ten came from Mr. John Rylands, and consisted of stratug appearance the exhibition-house presented. He best ten came from Mr. John Rylands, and consisted of Prichardia pacifica, Areca lutescens, Latania borbonica, Adocasia Lowii, Cycas revescens, Latania borbonica, Adocasia Lowii, Cycas revescens, Latania borbonica, Crotra de Meismanni, and C. Williamsii, ampestirio, Crotra de Meismanni, and C. Williamsii, S. Schloss, sie and finely developed; ad, Mr. S. Schloss, sie and finely ervoluta, Gleichenia Mendelli, very fine; Anthurium Veitchii, A crystalliaum, Cocos Weddeliana, &c. ; 3d, Mr. E. C. Glover. In the nurserymen's class for cight plants Mr. J. Cypher staged a fine lot, Consisting of Cycas orientalls, C. circinalis, C. revoluta, Tbrinax elegans, Dracena hybrida, Latania borbonica, Kentia canterburyana, and Croton Williamsii; 2d, Mr. E. Tudgey, with fine examples of Cycas revoluta, C. circinalis, Kentia canterburyana, and Croton Williamsii; 2d, Mr. E. Tudgey, with fine examples of Cycas revoluta, C. circinalis, Kentia canterburyana, and Croton Williamsii; 2d, Mr. H. Janes,

FERNS.—In the class or eight exotic Ferns, Mr. S. Schloss was 1st with a grand lot, all of great size and fanely grown; they consisted of Gleichenia flabellata, G. rugestris glauescens, G. spelmece, G. rugestris, glauescens, G. spelmece, G. rugestris, etc. and a discovered per special spelment of the state of the spelment G. Mr. E. C. Glover. Alt. J. Rylands had the best six Adianum, decorum, primatum, uteam, cuncatum, gracillinium, decorum, primatum, and Farleynes; Mr. J. G. Silkenstadt was 2d; and Mr. Hodgkinson 3d—both with good specimens. FERNS.-In the class or eight exotic Ferns, Mr. S.

DRACENAS.—Mr. J. Broome was placed 1st with six showy, well-defined plants of Youngl, Shepperdi, Baptisti, anerleyensis, Goldicaua, and Weismanni; 2d. Mr. S. Baerlein, Didsbury (Mr. W. Williams, gr.), who had Lindeni (very fine), indivisa, anabliis, Rossi, and Salmoneana; 3d. Mr. Sykes, Stockport. In the unreserymen's class for twelve varieties, Messrs. R. P. Ker & Son, Liverpool, staged a very fine lot, prominent being Macleayi, Rebeccee, Robinsoniana, Mooreana, albo-marginata, Gladstonei, Goldienas, Salmoneac, recurva, Mrs. Frenke, Baptisti, and Lindeni; 2d. Mr., I. James, with fine plants of Shepperdi, Lindeni, Fraseri, nycterinia, terminalis alba, amabilis, and Gladstonei.

CROTONS. — In the nurserymen's class for twelve varieties, Messrs. R. P. Ker & Son were placed 1st with superb examples of equal size, finely grown and coloured, comprising Weismanni, interruptus aurens, Princess, Queen Victoria, Conntess, Baroness Rothschild, Hawkeri, Evansianus, Warreni, and Williamsi, No other exhibitor competed. In the annateurs' class for six plants, Mr. J. Broome was 1st, with good specimens of Andreanus, Williamsii, Prince of Wales, Queen Victoria, Evansianus, and Burtonii, all finely grown and coloured; 2d, Mr. E. C. Glover, with Queen Victoria, Baroness Rothschild, pictus, and Johannis as his best.

PITCHER PLANTS.—These were a very fine feature, and Mr. J. Broome was awarded the 1st prize for a very fine collection of ten, consisting of Nepenthers Rafflesiana, Henryana, and Mastersiana (specially fine), Wilhiamsii, Kennedyana; Sarracenia Mitchelliaua, Maddisoniana, Unrupurea, flavopicta, and Drosera capensis; 2d, Mr. O. Schneider, with fine examples of Nepenthes Hookeriana, N. Dominiana, Sarracenias Mitchelliana, Chelsoni, illustris, purpurea, and Swaniana; 3d, Mr. James Fildes, Charlton.

NEW PLANTS.—The best twelve in the nurserymen's division came from Messrs. R. P. Ker & Son, and consisted of Areca Verschaffelti, Lienala grandis, Ficus elastica albo var., Pitchardia Vuylstekeana, Schismatoglottis Roebelinii, Anthurium ferrierense. Davallia Tyermanni, Croton Countess, and Croton Flambeau, as the best marked among them; ed., Mr. II. James, who had Lealia purpurata var. virginalis, Nepenthes Mastersiana, Odontoglossum polyanthum, Anthurium ferrierense, &c. In the amateurs' class for six new and rare plants, Mr. J. Broome was 1st, with Nepenthes bicalcarata, with twelve very fine pitchers; N. robusta, Sarracenia Atkinsoniana, S. Swanaana, Anthurium Andreanaum, and Draczena Lindeni.

TREE AND OTHER FERNS.—Tree Ferns were shown in pairs and their great size helped to swell the effect in the annexe. Here also were the collections of hardy Ferns, all, as is usual at Manchester, well cultivated. There was but one collection of six filmy Ferns, that from Mr. John Rylands; it consisted of very fine examples of the following:—Todea superba, T. pellucida, Hymenophyllum demissum, H. flexuosum, and Trichomanes radicans.

PALMS AND YUCCAS.—The best four Palms came from Mr. S. Baerlein, who had large examples of Livistonia altissima, Cocos Weddelliana, Geonoma Schottiana, and Kentia australis; 2d, the Earl of Wilton. Mr. John Rylands had the best four Yuccas, staging three plants of aloifolia variegata and one of quadricolor; Mr. Jeroome was 2d, with two of the former and two of

TABLE PLANTS.—These were represented by the young, light, and graceful plants one usually sees, and they were both numerous and good.

GROUPS ARRANGED FOR EFFECT.—These were objects of considerable interest and decorative value in the annexe. That arranged by Messrs. R. P. Ker & Co.,

covering 450 superficial feet, was of a very high order of merit; scarcely any flowering plants were used, but the rich colours of many of the elegant Crotons employed gave great life to the arrangement. It was one of the most deservedly admired of the objects in the show. Messrs. W. & J. Birkenbead, of Sale, stood next in order with a group formed wholly of Ferns. In the annateurs' class the groups occupyied goo feet, and here Mr. Smith stup for Mr. Rylands a charming piece of decorative art, which was some way ahead of the others. Mr. S. C. Glover was 2d, and Mr. S. Schloss 3d.

art, which was some way anead of the others. Mr. S. C. Glover was ad, and Mr. S. Schloss 3d.

FRUIT.—Some very good fruit was staged on this occasion. The best collection of eight dishes came from gr. In the stage of the stage

ASPARAGUS.—Special prizes were offered for hitty heads in a bundle, the best coming from Mr. G. T. Miles, Mr. Thomas Pitt, Berry Hill, being 2d, and Mr. G. Pollock 3d.

BOUQUETS.—In the nurserymen's class for three bouquets Mr. J. Cypher was 1st, Mr. J. R. Chard, Clapham Common, 2d, and equal 3d prizes were awarded to Messrs, Sherratt & Pointon, of Congleton, and Mr. T. Walkden, S.Je. In the amateur class Mr. R. P. Gill, Ashton-on-Mersey (Mr. W. Flant, gr.), was 1st, with two bouquets, Mr. J. Heywood being 2d.

two bouquets, Mr. J. Heywood being 2d.

MISCELLANEOUS PLANTS.—Several fine and interesting groups of plants were staged not for competition. In the exhibition-house was a very extensive collection from Mr. B. S. Williams, Victoria Nursery, Holloway, containing a great deal of novelty of a very extensive chiectory of the control of the MISCELLANEOUS PLANTS .- Several fine and inter-

The Royal National Tulip: May 3t.—The annual exhibition of this Society took place at the Botanical Gardens, Manchester, in connection with the great Whitsun Show, Mr. Findlay providing accommondation of the state of the season, indeed south of the Treut the Tulips were all over, while at Stakehill Mr. Barlow's fine collection was not at its best. As far north as the North Riding, Mr. Horner's flowers were nearly over, though he was able to bring a twelve of such fine quality as to win for him the premier prize. At Wolverhampton Mr. Thurstan was about at his best. It is not, therefore, to be wondered at that the exhibition was thinner than usual. Further, the flowers were seen to disadvantage, for in order to provide staging space some of the plants had to be temporarily removed, so they became scattered, and it is a little difficult to gather up all the details of the competition. competition.

In the leading class for twelve Tulips, two feathered and two flamed in each class, the Rev. F. D. Horner

was placed 1st, with feathered bizurres, Royal Sovereign and Garland; flamed do., Omar Pacha and Dr. Hardy; feathered roses, Industry and Heroine; flamed do., Rose Celestial and Annie MacGregor; feathered byblœmens, May Queen and Mrs. Cooper; flamed byblœmens, Talisman and Duchess of Sutherland. 2d, Mr. James Thurstan, Wolverhampton, with feathered bizarres, Sulphur and seedling; flamed bizarres, Sir J. Paxton and Dr. Hardy; feathered byblœmens, Adonis and seedling; flamed byblœmens, Talisman and Duchess of Sutherland; feathered rose, Mrs. Thurstan, a seedling raised by Mr. Thurstan—a perfect masterpiece among feathered roses, with a rich scarlet-rose and finely pencilled feather on a white ground: this was awarded a First-class Certificate of Merit, which it thoroughly well deserved: and Heroine. 3d, Mr. James Knowles, Ashton; j.th, Mr. John Moore.

certificate of sterrit, which it introducingly wed reserved; and Heroine. 3d, Mr. James Knowles, Ashton; 4th, Mr. John Moore.

In the class of the stress of

week. Mabel; and byblemen, Lord Denman. 2d, Mr. Lanner. Thurstan, with bizarre, Sir J. Paxton; rose, Mabel; and byblemen, Talisman. 3d, Mr. J. Kitchen, with bizarre, Dr. Hardy; rose, Aglaia; and byblemen, Talisman.

Class 6 was for one feathered and one flamed flower, and here Mr. Prescott was 1st with feathered bizarre, Lord Lilford; and flamed bizarre, Sir J. Paxton. 2d, H. Fearnley, with flamed bizarre, Dr. Hardy; and a feathered rose, unknown. This class was for maiden growers only, and two prizes only were awarded.

Class 7 was for one feathered and one flamed Tulip in each class, and here the competition was very brisk, Mr. H. Housley being placed 1st, with bizarres, Sir. J. Paxton flamed, and Masterpiece feathered. 2d, Mr. J. Moore, with flamed bizarre, Dr. Hardy, and feathered rose, Heroine. 3d, Mr. W. Dymick, with flamed bizarre Dr. Hardy, and feathered rose, seedling.

Then came class 8 for the cut blooms io each of the six classes, and a great number of flowers were staged. We take the feathered flowers first, and here the properties of the six classes, and a great number of flowers were staged. We take the feathered flowers first, and here the properties of the six flowers first, and here the flowers, the flowers first, and here the flowers first, with flowers, the flowers first, and here the flowers, the flowers first, and here the flowers first, and here the flowers first, with flowers, the flowers first, with flowers, thands, and here the flowers first, with flowers, the flowers first

Great Flower Show at St, James' Hall, Manchester: May 30 to Yune 4.—This was an exhibition of considerable extent, completely filling the immense Concert Hall in Oxford Street. It differed from the show at the Botanical Gardens in that it was made up to a large extent of hardy Rhododendrons and Anerican Azaleas. These were used in immense quantities, particularly the former, and they were arranged with skill and taste by Mr. J. Forsyth Johnson, who had entire charge of the show. A series of sloping stages was placed all round the immense ball, varying in size and height, and on these the plants—all in Bower—were staged, backed by coniferous plants. There was an immense bank in front of the spacious crelestra, one of the best things the fluid adherent converted and with a fill of about 2 feet to the floor, which was covered with turl. This bank was surmouted with hurge specimen Rhododendrons and Ghent Azaleas, full of bloom. About this spacious hall were large plants of Unpressus Lawsoniana and Rhododendrons of enormous size, also covered with flower; and there were also huge pyramids of Rhododendrons and Azaleas, with here and there a flat stage, on which was placed a number of Tea Roses in pots in bloom. So judiciously were the various groups distributed that from every point there was an almost uninterrupted view across the hall. The plaots were supplied by Messrs. Fisher, Son & Sibray, Sheffield; John Hooley, Cheadle; Isaae Buck, Bowdon; C. Noyes, Stockport; John Taylor, Ireland; Clibran & Son, Altincham; and the Liverpool Horticultural Company. It was understood that they were all purchased popularis, including 150 Roses, 80 Rhododendrons, 69 Azaleas, and acoo Panaies. Mir Johnson deserves high praise for his effective arrangement.

pleyed peoc plants, including 1500 Roses, 800 knowledendrons, 650 Azaleas, and eaco Paneise. Mr. Johnson deserves high praise for his effective arrangement.

Bath and West of England Agricultural (Maidstone): **Yinte 2—6.**—The horticultural attractions of such an important agricultural gathering as that which has just been held in the control of the garden, although wanting in variety and abundance, was nevertheless the centre of an admiring crowd of visitors, who were lavish in their praise of the Orchids that had been kindly sent by a few noted growers. These flowering plants possessed the charm of being more than novelites to most of the yeomen and their wives and daughters, and enthusiastic indeed were their terms of admiration in wittessing them for the first time. Next to these the capital display of garden vegetables found a very appreciative crowd of beholders among the same people, and with country folk generally, possessing, as most of them do, a practical acquaintance with the different points that go to make good specimens in this class. The indefatigable promoter of the horticultural section was the paint to secure the co-operation of gentlemen and their gardeners resident in the country of Kent, although it must be stated, that the finest group of Orchids came from Dorset, and a few other attractive plants from London and Worcester. In addition to the display of plants, a special feature was a mound covered with rockwock, arranged in horizontal layers, which contained many interesting fossils embedded in the limestone locally known as Kentish Rag, supplied by Messrs. W. H. Bensted & Son, from the famous Iguanodon Quarry, near Maidstone. The mound was only partially planted with Ferns, and with a few Japanese Maplesthat the New Bulb Company, Colchester, placed at Mr. Boscawen's disposal. The Orchids, formi

by the extreme narrowness of the show table—space in the right place being the chief want of the arrangements, the sides of the tent having but few productions, whilst the centre table was an assemblage of closely packed plants, out of which nothing could be well seen, with the exception of the tall Palms. Nr. Geo. Bunyard, The Nurseries, Maidstone, contributed a mixed group, consisting of Dracena australis, Chameropes excelsa, small flowering plants of show, fancy, and decorative Pelargoniums, Ferns, Prunns Pissardi, and a large triangular-shaped mass of flowering plants, such as Rhododendroos, Azaleas, and other shrubs, which served to separate the entrance from the exit doors. From the same there came Ferns in considerable numbers, for planting on the rockwork. A prize (a cup) for the best flowered Orchid was awarded for a Vanda snavis, with five spikes, shown by Mr. Haycock, gr. to Roger Leigh, Esq., Barham Court, the plant was very beautifully in flower, although not being remarkable for large size. Pollage plants were contributed by Mrs. Spottiswood, H. A. Brassey, Esq., Ashley Dodd, Esq., and by Mr. G. Eunyard. These having been placed on the accuracy of the middle able. The same contributes sent a few plants are retributed by drag ones. There were good-sized Palmain vaniety, Cycads, Anthuriums, Allocasias, Sanseviera sebrina. The same contributors sent a few plants of a large size of Statice Holfordi, Clerodendron fallax, Erica Caventishaum, and a few other varieties of Heaths. Some large specimens of white Marguerites, full of bloom, and measuring a feet or more in diameter, were sent by Mr. Waterman; several Clematises and three small hampers of hardy plants in bloom came from Messrs. R. Smith & Co., nurserymen, Worcester. For some handsome plants of Adiantum farleyense in big pots, Mr. Mackensie, gr. to the trustees, Linton Park, was awarded a 1st prize.

For a Kent show—a county boasting of its capabilities for advanced fruit culture—the meagre display observed was the more to be remarked, Mr. Hayco

to the first-named.

President Strawberries and a moderately sized Smooth Cayenne Pine-apple, a number of Iruits of Nelons-Scarlet Premier and Best of All—came from Mr. McKenzie, Linton.

The horticultural building and heating firms were present in considerable numbers—their motels of planthouses, frames, wall-cases, Tomato-frames, handlights, with various devices more or less simple for opening with various devices more or less simple for opening front or top lights, and for propping up frame-lights, made an imposing addition to the show. The larger exhibitors were Mesrs. Wright & Holmes, Mesrs. Edgcumbe Rendle with samples of patent glazing. Mesrs. Richardson, Darlington, bad a house in the Queen Anne fashion of glazing—at least over the front over them and at the ends of house in the spandril is filled with small panes inserted in rather heavy sash-work.

Variorum.

CLIMBING PALMS .- The banks here begin to be most markedly festooned and trellised with a curious Calamus, or climbing Palm, the fronds of which are prolonged into a bare creeping stalk, furnished with curiously reversed hooks, so that once the frond falls against a branch it attaches itself securely by means of these recurved thorns, and thus climbs higher and higher, often fringing the top of the forest with graceful beads of swaying fronds, which with their waviog whip-like terminations point straight skywards, as if seeking for greater heights to climb. The motto of this Pulm should certainly be "Excelsior," and it might also be taken as a vegetable type of ambition, Beginning in the lowliest form, the young Palm looks like a broad-leaved Bamboo with divided leaves suggesting strongly its poorer and simpler relations; it soon begins to aspire, and from being first a groundgrowing shrub, it throws out a long flexible stem, rising far ahove the first humble set of fronds, and by means of its sharp hooks making use of every support in its way to climb higher and higher. Soon the leaves or fronds become more elegant. They split up from their previous bifid condition into many fla-

ments, and at length the once lowly, feeble thing, by making use of everything that comes in its way and can give it a lift, looks proudly forth from the top of some giant tree, and for a while content with the attainment of its ambition, has time to pause and throw out its flowers, which turn to bunches of scarlet Dates. Its fruit has a thin, sweetish pulp around it, which seems harmless, at any rate to man, but I have never noticed any bird or beast devouring it. The colour of the leaves is a yellow-green, and it forms a decidedly bright addition to the river landscapes. "The River Congo," by H. H. Johnston, F.Z.S.

ANTS IN HOUSES .- Two parts of the house in which I am now living were suddenly discovered to be infested with these little animals, but great pests. I amused myself two or three hours for several nights by catching them with a small brush, dipping the same in water in a pudding-basin with a spirit-lamp under to keep the water as hot as possible. Hundreds and hundreds I caught and scalded in this way, but still the enemy did not decrease. When, one night, my knees having had long enough acquaintance with the floor, a sudden thought came over me, or, as some would say, a spirit whispered to me, "Why not try Keating's powder?" The powder was obtained from headquarters. The enemy's camp was reached as near as possible, and was well peppered, as also were their meeting-places and promenades. After a couple of days' enjoyment-or otherwise-of the powder, the enemy was discovered as little black specks distributed over the field of battle as thickly as the Arabs we were lately told of. My enemies I swept up and cremated, but did not urn the remains. earned the pleasure of getting rid of them, for now none are to be seen. Y., in the "Builder,"

The Meather.

22. The day; cocasional gleams of sunshine. Fine clear night.

23.—Dull day and night; strong wind.

4.—Fog all the morning. Dull day. Wet night.

LONDON: Atmospheric Pressure .- During the week ending May 31, the reading of the barometer at the level of the sea increased from 30.09 inches at the beginning of the week to 30.43 inches by midought on the 26th, decreased to 30.24 inches by 3 P.M. on the 27th, increased to 30.26 inches by 9 A.M., on the 27th, increased to 30.26 inches by 9 A.M., decreased to 30.22 inches by 3 P.M., and increased to 30.26 inches by midnight on the 28th, decreased to 29.99 inches by 3 P.M. on the 30th, increased to 30.07 inches by 9 A.M. on the 3tst, decreased to 30.04 inches by 3 P.M. on the same day, and was 30.11 inches by the end of the week.

The mean reading of the barometer for the week was 30.17 inches, being 0.02 inch higher than last week, and 0.22 inch above the average of the week.

Temberature.— The highest temperature in the

week, and 0.22 inch above the average of the week. Temperature. — The highest temperature in the shade in the week was 71°, 3, on the 27th; the highest on the 29th was 53°.5. The mean of the seven high day temperatures was 61°.7.

The lowest temperature was 42°.5, on the 27th and 3tst; on the 25th the lowest temperature was 49°.5.

The mean of the seven low night temperatures was

The mean of the seven low night temperatures was 44-9.

The greatest range of temperature in one day was 28°.8, on the 27th; the smallest was 7°.1, on the 25th. The mean of the seven daily ranges was 16°.8.

The mean temperatures were—on the 25th, 52°.2; on the 25th, 56°.6; on the 25th, 56°.5; on the 27th, 56°; on the 25th, 48°.7; on the 29th, 48°.5; on the 30th, 45°.1; and on the 31st, 50°.2; and these were all below their averages (excepting the 26th and 27th, which were 1°.4 and 0°.6 above) by 2°.8, 6°.9, 7°.3, 0°.9, and 6°.1 respectively.

6°.1 respectively.

The highest reading of a thermometer with blackended bulb in vacuo placed in the full rays of the sun was 129.5, on the 26th. The mean of the seven readings was 98.1.

The lowest reading of a minimum thermometer

with its bulb placed on grass was 34°,5, on the 27th and 31st. The mean of the seven readings was 37°.1.

Rain.—No rain fell during the week.

ENGLAND: Temperature,—During the week ending May 3t the highest temperatures were 80° at Nottingham, 78°.5 at Bradford, 75°.1 at Wolverhampton; the highest at Sunderland was 60°, at Hull 61, and Sheffield 64°. The general mean was 60°.2. The lowest temperatures in the week were 34°.8 at Cambridge, 37° at Hull, 37°.2 at Nottingham; the lowest at Plymouth was 46°.3, at Truc 43°, and at Blackheath 42°.5. The general mean was 40°.4. The greatest ranges were 42°.8 at Nottingham, 37°.1 at Wolverhampton, 36°.7 at Bradford; the smallest ranges were 18° at Sunderland, 23° at Sheffeld, and 24° at Leicester and Hull. The general mean was 28°.8.

The mean of the seven high day temperatures was

The mean of the seven high day temperatures was highest at Nottingham, 67°, at Truro 64°.9, at Plymouth 64°.5; and was lowest at Sunderland, 53°.4, at Sheffield 57°.4, at Hull 58°.7. The general mean

was 61°.3.

The mean of the seven low night temperatures was highest at Plymouth, 50°.5, at Truro 40°.3, Brighton 40°.6; and was lowest at Cambridge 40°.3; at Wolverhampton 41°.6, at Hull 42°. The general

Wolverhampton 41.6, at 11un 42. The general mean was 44°.6.

The mean daily range was greatest at Nottingham, 23°, at Cambridge 22°.7, at Wolverhampton 20°.5; and was least at Sunderland, 8°, at Sheffield 12°.8, at Plymouth 14°. The general mean was 16°.7.

The mean temperature was highest at Plymouth, 55°.8, at Truro 55°.4, at Nottingham 53°.8; and was towest at Sunderland, 47°.5, at Hull 48°.6, and at Sheffield and Bolton 49°.3. The general mean was c1°.2.

51 3. — The largest fall was 0.24 inch, at Plymouth, 0.16 inch at Bristol. No rain fell at Truro, Brighton, Blackheath, Leicester, Cambridge, Wolverhampton, Nottingham, Sheffield, Liverpool, Bolton, Hull, Bradford, or Sunderland.

SCOTLAND: Temperature.—During the week ending May 31, the highest temperature was 70°, at Paisley; at Aberdeen the highest was 58°.1. The

general mean was 63°.2.

The lowest temperature in the week was 31°

at Perth; at Leith the lowest temperature was 41°,5.
The general mean was 38°,1.
The mean temperature was highest at Paisley,
54°,1; and lowest at Leith, 48°,5. The general 54.1; and lowest at Lettin, 40.5. Incan was 50°.4.

No rain fell during the week at any station.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

DOUBLE-FLOWERED APPLE: J. F. The production of such flowers on the midsummer shoots is not unusual, Generally—as in your case—the fruit is not formed. We have figured illustrations on previous occasions.

DOUBLING OF NARCISSUS .- Mr. Brockbank sends specimens of N. poeticus quite similar to those forwarded last week by Rev. C. W. Dod, whose opinion he

ERRATUM: ISOSOMA.—In the account of Mr. McLach-lan's communication to the last meeting of the Scientific Committee an error occurs which reverses the sense of what was really said. Instead of the words, "it preved upon the Isosoma," read that "it was preyed on by the Isosoma."

FIRE CLEANSING CLOTH: Charles Palmer. It must surely have been made of Asbestos for travellers' yarn?], and not of the fibrous roots of a grass, which would not stand the process. The account is given at length in another column, but we decline to guarantee the correctuess of the statement.

GLOXINIAS: B. Ashlon. Very fair in quality, but no better than should now be obtained from an ordinary packet of seeds.

LEEKS: Strebor. We do not remember to have seen any such instance before, and shall be glad of further information. Was the seed grown by yourself, or bought in?

Mushrooms: W. G. You had better read Mr. Wright's Mushrooms for the Million (171, Fleet Street, E.C.),

and then decide for yourself as to whether you are likely to succeed. Information on all the points you enquire about is given in this book.

likely to succeed. Information on all the points you enquire about is given in this book.

SEEDS.

SEEDS.

LONDON: June 4.—The market to-day for farm seeds was characterised by quite a holiday spirit, and the business actually doing was as nearly n'i as possible. For spring Tares a few occasional orders still come to hand. In Clover seeds there is now nothing doing. Mustard and Rape seed find buyers at last weeks currencies. For Canary and Hemp seed the tendency of values is in buyers favour. Other articles at this quiet period of the year offer no subject for remark. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

CORN.

Monday being a Bank Holiday there was no busicess transacted at Mark Laue. On Wednesday trade was very quiet for both Wheat and flour, prices remaining nominally unchanged. The general rainfall tended rather to quiet the trade in feeding stuffs, and but little was done in any description to affect quotations. Common Russian Oats had a slightly easier tendency.—Average prices of corn for the week ending May 31:—Wheat, 37s. 7d.; Barley, 28s. 9d.; Oats, 21s. 2d. For the corresponding period last year:—Wheat, 43s. 5d.; Barley, 29s. 9d.; Oats, 22s. 5d.

CATTLE.

At Copenhagen Fields on Monday trade in beasts was slow, with prices occasionally rather easier. There was a good supply of sheep and lambs; very little change in prices, but tendency rather against sellers. Foreign calves were depressed, and hardly any English offering. Quotations:—Beasts, 4s, to 5s, and 5s, 2d, to 5s, 6d; ad, 5s, 6d, to 6s, prices, price

HAY.

At Tuesday's Whitechapel Market trade was very quiet, but top price of hay advanced 2s. Quotations:—
Prime old Clover, 05s. to 105s.; ioferior, 6ss. to 75s.; prime second cut, 9os. to 105s.; best meadow hay, 8os. 108s.; inferior, 4os. to 65s.; and straw, 28s. to 35s. per load.—On Thursday there was a sbort supply, and trade was steady at improving prices.—Cumberland Market quotations:—Superior meadow hay, 9os. to 98s.; inferior, 7os. to 78s.; superior Clover, 108s. to 115s.; inferior, 8os. to 90s.; and straw, 34s. to 38s. per load.

POTATOS.

At the Borough and Spitalifields markets supplies of new are increasing moderately, but really good qualities are shorter, and trade slow. Elsewhere the average prices were:—Magnum Bonums 75:. to root: Champions, 35: to 60:. Roses, 55: to 60:. Victoria, 70:. to 80:. Flakes, 70:. to 80:. per ton. New:—Jersey, 16:. to 16:. 64:, 71:. per evu.

COALS.

The following are the prices current at market during the week:—Ravensworth West/Hartley, 74s, 2d.; Walls End—Hetton, 155, 6d.; Hetton Lyons, 14s; 5t. Lambton, 155.; West, 14s.; Caradoc, 15s. 6d.; East Hartlepool, 14s, 2d.; Tees, 15s. 6d.

WRIGHT & HOLMES,

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.
(Kegistered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all muddoor work, while it is fully two-thurds cheaper. It was structured upwards of thirty years ago by the Advertisers, and its geonine good quality, notwinhstanding a host of unprincipled mitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and its used cold. It is used on the grounds at Windoor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering existing the cold of the property of the control of the cold of

W. RICHARDS, GARDENERS' CHRONICLE OFFICE, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

SHANKS'S PATENT LAWN MOWERS FOR 1884.

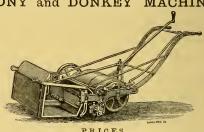

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines. These Machines are in use in the Royal Gardens at Kew, Hampton Court, dosborned and Balmoral, in most of the Public Parks and Gardens in the Kingdom, and in almost all the Royal Gardens in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawns. They have now been before the Public for many years, and stand unrivalled. These Machines are easily worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

SATURDAY, JUNE 14, 1884.

LEEKS.

THE origin of the common Leek has not, we believe, been absolutely proven, but there is a general agreement among botanists that it is a peculiar form of Allium Ampeloprasum, a species wild in Southern Europe and the Mediterranean region, and naturalised in various parts of Britain. This was the view held by Linnæus, Philip Miller, Sims (Bot. Mag., I. 1385), A. P. De Candolle, Gay, Alphonse De Candolle (Plantes Cultivies), and Regel (Alliorum adhuc cognitorum, Monographia). The Leek, as we grow it in gardens, has nowhere been found wild, and though there seems to have been a tradition that it originated in Switzerland, we find no warranty for the statement, which, moreover, was discountenanced both by Haller and Alphonse De Candolle, both very eminent Swiss botanists. Gerard, in the first edition of the *Herbal* (1597), p. 138, says "It is very common everywhere," but he gives no clue as to when or whence it was introduced.

Nyman, in his Conspectus (1878-1882), 735, speaks of the Leek (A. Porrum) as cultivated for culinary purposes, and as having originated from A. Ampeloprasum. In Southern Europe, however, he says it occurs here and there subspontaneously (naturalised), and is recorded in the alps of Bucovina.

Vilmorin (Plantes Potagères, p. 416) adopts the general view, and considers it probable that the Leek and the Allium Ampeloprasum are one and the same species, differing only in the circumstance that in the one case the cultivator's efforts have been directed to the formation of bulbs, while in the other the object has been to secure the development of long sheathing leaves.

The Leek differs from the Onion not only in the small size of the bulb, or rather in its elongate form, but also in its flat leaves, with long sheaths, and which are arranged in two rows instead of several. Moreover, while the Onion bulbs produce numerous axil-lary bulblets, in the Leek these are few or It would thus seem as if growth in length were compensated for by diminished productiveness of bulbils. Indeed, a diminished production of bulbils is a necessary consequence of the leaves being arranged in two rows only, for in a given space there are, of course, fewer leaves. We are reminded by this of what at first sight might seem widely different—we mean the "monstrosa" varieties different—we mean the "monstrosa" varieties of the common Spruce Fir, with its elongated, snake-like branches, destitute, or nearly so, of lateral divisions. Inordinate growth in length, here, as in the Leek, is accompanied by a partial suppression of the side-shoots. We are induced to refer to the matter by the

We are induced to refer to the final by the receipt from a correspondent of specimens of Leeks, some with globular bulbs, such, as Sir Joseph Hooker tells us, charaterise Allium Ampeloprasum, and others with long bulbs of the usual form, which we are informed are all growing together in rows from seed sown in April, 1883. We do not remember to have previously seen a similar instance of reversion.

COMPOSITION OF ANIMALS.

764

ABOUT twenty-five years ago Sir J. B. Lawes and Dr. J. H. Gilbert gave a lengthened report (*Phil. Trans.*, Part II., 1859) on the analytical results which had then been obtained, illustrating the actual and comparative composition of some of the animals of the farm, fed and slaughtered as human food.

The weights of the carcases, and of the several internal organs and separated parts, had been determined in the case of two calves, two heifers, and fourteen oxen; 249 sheep, in five classes, as to age, maturity, fatness, and mode of feeding; and fifty-nine pigs, in seven classes, arranged chiefly according to the food consumed. In all 326 animals were experimented upon.

From the data thus obtained it appeared, that whilst the internal organs—or, so to speak, the machinery employed in the production of the meat—increased considerably in actual weight during the "feeding" or "fattening" period, yet they diminished in proportional amount to the whole body, or to the carcass. That is to say, it was the carcass—the most important edible portion of the animal—that increased the most rapidly.

The following is a very condensed summary of some of the results quoted in this part of the inquiry. There is a remarkable difference in the construction and economy of the receptacles and organs of elaboration of the food of our farm animals, as may be gathered from the following table:—

Percentages (in fasted live-weight) of the Digestize Organs.

			Oxea	Sheep.	Pigs.
Stomach and contents			11.61	7 43	1.28
Intestines and contents	• • •	••	2 74	3.53	6.24
Total		••	14.35	10 96	7-52

Thus, whilst 100 lb. fasted live-weight of the ox comprised about $14\frac{1}{2}$ lb. of stomach and intestines (and their respective contents), that of the sheep contains only 11 lb., and that of the pig $7\frac{1}{2}$ per cent.

These facts are of considerable importance, as indicating the great difference in the food-requirements of the various animals of the farm; the ruminants consuming such a large proportion of fibre, much of which is indigestible; and the well fed pig but little indigestible matter, and a relatively large proportion of starch

To ascertain more exactly the composition of our slaughtered animals, and of their increase whilst fattening, ten animals of different descriptions, and in different conditions of maturity, had been devoted. In these the amount of water, mineral matter, nitrogenous substance, and fat were determined. The following table contains a summary of the percentage composition of oxen, sheep, and pigs, both in a store and in the fat condition:—

	Oxen.		She	ep.	Pigs.		
	Store.	Fat,	Store.	Fat.	Store.	Fat.	
Nitrogenous sub-}	17.8	150	14 5	11.5	140	10.5	
Fat	22.6	34 8	23.8	45-4	28 1	49-5	
Minera matter (Ash) }	5.6	4 6	4 4	3-4	26	1.4	
Total day sub-	46.0	54 4	42.7	бо.з	44-7	61 4	
Water	54 0	456	57-3	39-7	55 3	38.6	
Total	100.0	100.0	10),0	100.0	100.0	1000	

From these results it appears that while water forms the largest proportion of the animal body, it considerably diminishes as the animal progresses from the lean to the fat condition. The nitrogenous matter and the ash

is seen to be in less abundance in the fat than in the store animal. It will be observed further, that the largest item in the dry or selid substance of the animal body is fat, and that there is nearly twice as much in the carcass of the animal fit for the butcher as in the same weight of the store or lean animal. The fat also forms by far the highest percentage in the pig, and the least in the ox.

The general conclusions were, that but a small proportion of the increase of a fattening animal was nitrogenous substance; that less than 10 per cent., and even as little as 5 per cent. of the nitrogenous substance of good fattening food, would probably be finally stored up in the increase; that the proportion of fat stored up was very much greater than that of the nitrogenous substance; and lastly, that the stored-up fat would frequently involve in its production an amount of the non-nitrogenous constituents of the food much greater than the weight of the stored-up fat itself.

Our distinguished authors have now published (Phil. Trans., Part. III., 1883) an account of the quantity and composition of the mineral matter (ash) in certain separated parts, and in the entire bodies of the ten animals previously referred to, of which the following is a summary.

In the first place, 1000 lb. live-weight of calves or oxen is found to carry off from the farm much more mineral matter than the same weight of lambs or sheep, and 1000 lb. liveweight of pigs much less than sheep.

Thus whilst 1000 lb. live-weight of oxen may contain from 40 lb. to 50 lb. of mineral matter, an equal weight of sheep will carry off only about 30 lb or less, and the same live-weight of pigs less still. In all cases by far the largest proportion of the total mineral matter is in the collective carcass parts.

Referring to the amount of the most important mineral constituents, whilst 10001b. liveweight of calves or oxen may carry off from 30 lb. to 40 lb. of phosphate of lime, the same weight of sheep would carry off only about 26 lb. or less, and and an equal weight of pigs considerably less still. With each description of animal the quantity of phosphate is still in a given liveweight of the fatter than of the leaner individuals; and this is especially so in the case of

In round numbers it is said that 1000 lb. live-weight of oxen will carry off only 2 lb. or less of potash, sheep from $1\frac{3}{4}$ lb. to $1\frac{1}{2}$ lb.; and 1000 lb. of pigs about the same; in each case the less the fatter the animal. Of the potash as of the phosphoric acid by far the larger proportion of the whole is in the carcass parts. The constituent coming next in amount is soda; but with oxen the quantity in 1000 lb. live-weight does not reach $1\frac{1}{2}$ lb., with sheep it is only about 1 lb., and with pigs about the same.

It is stated, with regard to each description of animal, that a given live-weight will contain less of every constituent the more the animal is matured or fattened; and that the loss to the land, or to the manure from purchased food, will be considerably more with growing than with only fattening animals.

As conveying a somewhat more definite idea of the amount of some of the most important mineral constituents that would be removed from an acre of fair average pasture or arable land in animal increase, and in some other products, it is approximately estimated that of phosphoric acid an acre would lose more in milk, and four or five times as much in Wheat or Barley grain, or in hay, as in the fattening increase of oxen or sheep. Of lime the land would lose about twice as much in the animal increase as in milk, or as in Wheat or Barley grain, but probably not more than one-tenth as much as in hay. Lastly, of potash an acre would yield only a fraction of a pound in animal increase, six or eight times as much in

milk, probably twenty or thirty times as much in Wheat or Barley grain, and more than one hundred times as much in hay.

FIUNE 14, 1884.

The loss to the land in the animal increase is, in fact, chiefly in phosphate of lime, in amount varying from 5 lb. to 10 lb. per acre. In milk the loss is higher in phosphoric acid, less in lime, and more in potash. In Wheat or Barley grain the loss of phosphoric acid is several times as great, and it is chiefly as phosphate of potash; whilst in hay the loss in phosphoric acid is much the same as in Wheat or Barley grain, but that of lime and potash is very much greater than in any of the other products.

RHODODENDRON ROYLEI.

In the latest revision of Himalayan Rhododendrons in Hooker's Flora of British India, vol. iii. (1882), 9, 474, Mr. C. B. Clarke refers this to R. cinnabarinum, together with R. Blandfordiiflorum. We shall not venture to dispute such an arrangement, but for garden purposes it is expedient to keep them distinct. R. Roylei has broader and smoother leaves, and larger flowers of a brighter colour than in R. cinnabarinum. For the specimen figured (6g. 142) we are indebted to Mr. Mangles, who informs us that the truss of eight flowers was cut from a plant 9 feet high in bis garden, where it is hardy except in the most severe winters.

BARON SCHRŒDER'S GARDEN.

FROM Egham station a two-miles drive along a pleasant road brings us to The Dell, and entering and passing along the broad smooth carriage-drive, which is edged with well trimmed grass, planted with large specimens of rare Conifers, and backed by shrubs, we come to the mansion, which is situated on high ground. A glimpse of a view to the left causes us instinctively to turn on that side, and then a grand scene of sylvan beauty presents itself. Sloping suddenly down on this side, the ground forms a natural dell enclosed on each side by huge Beeches, ages old, among which the different green of an occasional Oak may he seen contrasting finely with the tints of the other trees and the Bracken-covered foreground. Stretching far away the dell seems to form an avenue to Windsor Castle and its immediate surroundings, which appear as clearly defined at the three mil distance as though they were but a quarter of a mile off, and give a most lovely natural picture, and one over which we were fain to linger. On this side nothing but wild natural beauty is found, the only sign of modern gardening being the bright flowers of two or three scarlet Thorns on the slope of the dell. But we pass round to the front of the house, and a bewildering sight of quite a different nature meets our view. Belting the raised margin of a space of about to acres, and artistically planted in masses at pro-minent points over the smooth green lawn, are thousands of Rhododendrons of the best kinds in full bloom, giving the most glowing and varied expanse of colour we ever remember sceing. Not alone are the quantities of plants there, and giving their grand display, but the clever manner in which they have heen arranged by massing the colours and grouping the beds, so that wherever the eye catches the colour it is effective, and is seen in every part with a sufficiency of green either of the lawn or the background of trees to prevent it being wearisome to the eye, indeed, so much art has been displayed in the arrangement that he would be clever, indeed, who could suggest an improvement. Magnificent! no one could fail to exclaim when his eye lights on that gorgeous

Every fine variety that can be obtained is here in quantity, and we thought it a very good opportunity to make a selection of the best, but a critical examination proved the difficulty of that undertaking, so lovely are they all that the preference of any is much a matter of opinion. We noted, however, that our old friend The Queen was the most telling white, though Mrs. Russel Sturgis, a grand white with dark brown blotch, was very effective, and that Baron Schroeder was the brightest of the dark crimsons. At The Dell, too, many new unnamed sorts are grown, and several very fine things we picked out were of this class. Away, too, round the banks and along the shady walks the common ponticum was so lovely as to cause us to ask, Why is it not more

planted as a common shrub? It grows anywhere and is hardier than a common Laurel, as effective a shrub as any, and giving an abundance of flowers.

But to take the general outline of the garden we must go back to the mansion, which on this side has the conservatory running half-way, with the corresponding statuary and picture gallery on the other half, while the other side or end is enclosed the whole length by an ornamental structure which Is planted as a Fernrockery, some very fine old Tree Ferns being there, as well as an interesting geoeral collection.

From the conservatory we see that the carpet of the large and beautiful expanse before us is a well defined lawn; in the foreground is a small but sufficiently large geometrical flower garden broadly edged with permanent plants and planted with the usual brilliantly coloured bedding plants; beyond are some fine clumps of the snowy Kalmia, the yellow and coppery-

Leaving this lovely garden, which is quite removed from the more material plant, fruit and kitchen garden, by the road under which we pass through a subterranean way, we come to the glasshouses and offices. These occupy a large area, and are well and conveniently arranged according to a plan, every point being studied to make all things efficient and neat. The houses are thirty-four in number, and are arranged in a square, the large Orchid and other plant-houses being in the middle, the smaller ones next, and the vinceies, orchard-houses, Cucumber and Melon-houses outside. Cleanliness and order prevail throughout the whole place, not a stray tool, idle barrow, or other unnecessary obstruction, being met with anywhere. Everything bears that thriving look which is so indicative of good attention on the part of all concerned.

Passing to the large span-roofed Orchid-houses,

The Cattleya-houses have large specimens in bloom of C. Mossia, C. gigas, C. g. Sanderiana, the new and pretty C. Schrcederi, C. Mendelli, Leelia purpurata, L. grandis, L. elegans, large masses of C. Skinneri alba, C. Mossica alba, C. Warneri, Anguloa macrantha, A. Ruckeri sanguinea, Cypripedium Schreederi, Ceelogyne Massangeana, some good Utricularias, &c., and a fine tuft of the rare Cypripedium Fairrieanum not in bloom. The Phalæoopsis-house is a pretty oval structure, with an oval tank in the centre, with Nepenthes sanguinea, N. Mastersianus ×, N. Northiana, N. Rajah, N. Veitchii, and others hanging over it, the stages being occupied by a fine lot of Phalænopsids in bloom being P. Schrederi, P. Sanderiana, P. grandillora, and P. Luddemanniana.

The long cold-house we found gay with a large batch of Odontoglossum vexillarium, and another of the finest forms of Masdevallia Harryana which were

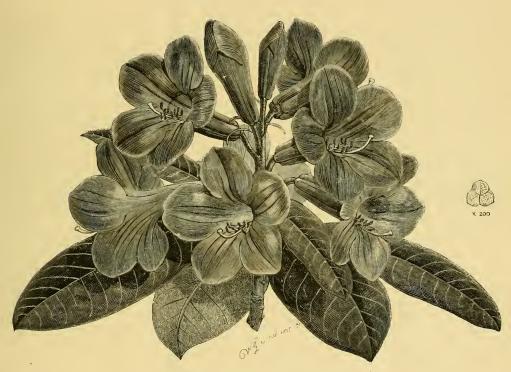

Fig. 142.—RHODODENDRON ROYLEI: FLOWERS BRICK-RED. (SEE P. 764.)

tinted Azaleas, and the before mentioned gorgeous Rhododendrons to which the eye is continually attracted and which bound the view on all sides.

Near the mansion are a few giant Cedars and patriarchal Oaks, and placed here and there are fine speci-mens of rare Conifers, many of which must have made good use of their time to attain such a size in the few years they have been in the country. Among them are noble specimens of Araucaria imbricata, bearing plenty of cones; Libocedrus decurrens, Cedrus atlantica, C. Deodara, many of the varieties of Cupressus Lawsoniana, &c., ranging from 20 feet to 30 feet in height, and lovely specimens of many of the Retinosporas, including the fine R. filifera, from 5 feet to 10 feet each. In the distance is a Copper Beech, which materially assists the picture; and near by is the famed specimen of old double white Camellia, which thrives so well here in the open air. It is a marvellous shrub, spreading some 25 feet across and some 18 feet in height; a bloom or two lingers yet on it, but that some time since we were told it bore thousands of flowers, and was a sheet of white blooms.

first we find them occupied by a magnificent lot of specimens of the rarest and most costly, the fame of many of which has penetrated all over the world wherever "orchidie" is spoken; for examples, those fine plants of Cypripedium Stooei platyteoium, C. Godefroye, C. Morganie, and Aérides Schreederi.

The East Indian-houses contain some grand Vandas and Aérides, including V. Insigois Schreederi, a bush of V. Sanderiana, as well as several smaller, and a fine piece of the new Acrides Lawrencie. Pitcherplants are hanging overhead, and in bloom are many Vandas of the tricolor section, V. Denisoniana, a grand plant, with many large white flowers; V. ccerulescens, several varieties; the quaint V. limbata, several fine varieties of Aérides Lobbii, with branched spikes over 3 fect in length; plants of A. crassifolium 2 feet 6 inches across, and bearing large dark rose flowers on spikes of about 3 feet in length, grandly flowered; A. affine; many Dendrobes, among them being a lot of D. Dearei, with from six to twelve of its snow-white flowers on a spike; and fine pans of C. niveum, C. Lawrenceanum, &c.

arranged to contrast well with the many O. Alexaodræ, good O. Pescatorei, and numbers of other rare and lovely things, such as Oncidium pulchellum with its branched spike of about twenty-five blooms resembling little flowers of Odoatoglossum vexillarium. It is an old Jamaica plant, but now very tare. Passing through the stove-houses we encounter some wonderful specimens; selecting a few we must name Anthurium Varocqueanum, with scores of leaves 7 feet to 8 feet in length; A. Veitchii to match; A. Scherzerianum with over one hundred spathes, Cycas revoluta with circular head 9 feet through, Ixoras with over one hundred trusses each and no meally-bug; grand Bougainvilleas and a finely bloomed specimen of the climbing Lily (Gloriosa superba) overhead.

The Azalea and Camellia houses are well furnished: with the former we note two good globular specimens of our old friend Mitraria coccinea, with its bright scarlet drooping flowers, and with the Camellias, which are mostly planted out, are a fine collection of filmy Ferns. Cut flowers in great quantity are an imperative necessary here, and many bouses are

devoted to Gardenia^e, Tuberoses, Stephanotis, Ferns, Tea Roses, Carnations, Pelargoniums, Calceolarias, Achimenes, Gloxinias, &c., all of which are wellgrown and gay with bloom.

Fruit of the best quality is equally in demand and equally well supplied, as witness the heavy laden Vines in the long range of vineries, commencing with the one in cutting and following through the next just turning in, and so on, in all stages, to the latest with berries just forming; the 300 feet long range of heated wall cases, with its trees laden with Peaches, Nectarines and Flums; the orchard-houses with Peach and Nectarine trees, many of them bearing 100 to 150 ripe and ripening fruits; the scented Pines and luscions Melons, and the shelves and pits of Strawberries in all stages of fruit. These last are splendidly done at the The Dell, where they commence the forcing with Vicomtesse Héricart de Thury, followed by La Grosse Sucrée, then by Alice Maude and Sir Charles Napier, finishing with President;

and by this system the best results are obtained. Pits are arranged round many of the houses, and are filled with Chrysanthemums, Carnations and other young stock, and in one of the sunniest is the fine collection of Nerioes, getting the necessary baking in the sun. Excellent provision is made for raio-water, one of the tanks alone holding 17,000 gallons; the gardener's house is a handsome and commodious structure; and the young men's bothies, with bath-room attached, are models of what young men's lodgings should be. The kitchen garden, it is needless to say, is as good and well kept as all the rest of this fine garden establishment. Saturday, June 7, the day of our visit, was the twentieth anniversary of Mr. Ballactine's (the gardener's) appointment as its director-general, and no more telling testimonial of his abilities could be found than the condition in which The Dell gardens now are. During Mr. Ballantine's tenure of office a great part of that beauty which we now laud has been evolved from rough garden or homely pasture, and every change or improvement which has been made has been well done. The Baron, too, always happy, but happiest in his garden, must have his share of the honours, for both master and man must have been of accord to bring about such a good

WILTSHIRE WOODS AND DOWNS.

A BOTANICAL EXCURSION.

WE are a party of three, Mr. and Mrs. M., and the writer, all botanically inclined, and for the time being sorely affected with the British Orchid fever, to cure which, we purpose-but not by medical advice-taking a ramble over the charmingly picturesque downs of Wilts, and through one or two pieces of woods, which are dotted about here and there, feeling well assured beforehand that, a harvest sufficiently rich to quench the thirst of even the most feverish of orchidologists is in store for us. To say that enthusiasm will sometimes take its possessors long distances, few people, it may be presumed, will be found to deny. In our case there must have been no lack of it, seeing that Mr. and Mrs. M. have journeyed a distance of something like 400 miles mainly to pay a two days' visit to the home and stronghold of many of the species of our English orchidaceous plants. It seems almost superfluous to say, to any one imbued with a love for wild flowers, that the study of our native Orchids is an extremely interesting one, and the advantages and knowledge to be obtained respecting them from a visit to their natural habitats are such as cannot be acquired from a collection under cultivation, no matter how close our observations may be. In their wild state we meet with them in colonies as it were: one species may be found in hundreds in one particular spot, and may not be met with again perhaps for miles, whilst others again may be found split up into many colonies or clusters, as if a few members of a large family had rebelled against their elders, and sought pastures new. Again, we may find that a certain species will be comparatively plentiful this year in one particular place, and then almost vanish for a year or two, only however to reappear as strong and numerous as before.

"To-morrow morning at a quarter to ten we will start, taking a piece of woodland skirting the downs before our mid-day meal," is the course decided on the night preceding our first day's pleasure. The time soon arrives. No. 1 of the party has the Orchid fever in an acute form, is restless, imagines he has

discovered a plant which is quite new to the locality, the name of which may prove to be "Listeriaorchisophrysarinifera puzzeles," but he is in great doubts on the point, and ere he wakes it vanishes into oblivion. Entering the wood after ascending a short steep hill, we soon come in contact with flowering plants of Cephalanthera grandiflora; Mr. M., who has not seen it before, is highly delighted, and well he might be, for it is really a grand and majestic looking plant when in bloom, with spikes from 11 to 2 feet high, each clothed with yellowish-white flowers, from six to ten in number. Listera ovata, the common Two-blade, is next seen, and is very vigorous, a few of the flowerstems attaining a height of nearly 2 feet. Orchis maculata is just coming into flower and calls for no Orchis special comment. Habenaria bifolia (Butterfly Orchis), is the next treat in store for us; it appears to be plenti-ful and is just expanding its first flowers as we see, requiring only a few more days to be at its best. This is certainly one of the prettiest of our native Orchids, as well as one of the most frequent, and when seen with spikes some 2 feet high, with from twenty to thirty of its greenish-white flowers resembling small butterflies, one cannot refrain from greatly admiring it. Nearing the end of this part of the wood and gradually getting to higher and drier ground we are rewarded by finding that singularly interesting and leafless Orchid, Neottia Nidus-avis (Bird's-nest Orchis), so called, it is said, from its roots being like a bird's-nest, although we ourselves have always failed to see much resemblance between the two. The plant is evidently at home under Beech trees, and on a chalky soil, spikes 12 inches long being met with here and there; the flowers, which are of a dull brown colour, are far from being attractive, and at most can only be said to be more curious than pretty.

Emerging from the wood at its highest point and turning sharp to the right we take a piece of down land on our way back, finding we have a good threequarters of an hour to spare. Descending down a very steep hillside which demands our proceeding slowly and cautiously to prevent us from performing some acrobatic feat by going headlong first, we are not long in finding Orchis ustulata: of this, however, a word or two later on. The formation of the ground where we now are is of a decidedly interesting and curious character, especially to any one making their first acquaintance with our South Downs and is what is locally called a cleave. We shall probably convey but a very inadequate idea to the reader of what a cleave is, by saying that it is a formation of the land which presents the appearance of having had millions of tons of soil removed therefrom, and in shape frequently, though not always, something like a horseshoe. A few plants of that sweetly-scented Orchis Gymnadenia conopsea are here to be met with, and are just coming into flower. Our primary object, however, is to find some strong plants of an Ophrys, which the writer had seen a few days previously, and which he thought might prove to be O. aranifera, a very rare species in-We are doomed, however, to meet with a sad disappointment, by finding that they had been eaten off by a flock of sheep, which had been feeding in this particular cleave for the previous two days. "Well, really, I am sorry; I would have gone a long way to see aranifera in flower," is the exclamation, uttered with mournful emphasis, as we in vain try to forget our disappointment. Ah, well! there is no help for it, and so saying, we return to our starting point, passing on the way, and close to the roadside, a beautiful bank which is one mass of wild flowers, consisting principally of the following, viz.:—Hieracium pilosella, Leontodon hispidum, Lotus corniculatus, Lamium album, Veronica chamædrys, Trifolium pratense, T. procumbens, Plantago media, and P. lanceolata.

An honr's rest and we are again on the move, this time with an addition of two to our party, which consists of "Merchant," the driver, and his sprightly chestnut nag; a truly harmless looking pair indeed, but just the right sort for our purpose, the former courteous and obliging, whilst the latter is quiet in harness, free from vice, and is probably good both to ride and drive. "Now, Merchant, take the Salisbury Road and drive to the hill beyond Knook," is the order given. "Yes, sir," and off he goes at a pace considerably less than 10 miles an hour, landing us there safe and sound. Taking the white chalky downs on the left, half-an-hour is spent in collecting specimens; G. conopsea is one of the first plants met, and in a short time it will be a grand sight, with its tall pyramidal spikes of fragrant flowers, varying in colour from purple to pink and to almost white.

Ophrys apifera is very plentiful, this year seemingly being a very good one for it on this portion of the downs. It is fast throwing up its flower-stems and in a fortnight or three weeks hence will doubtless be at its best. Polygala vulgaris (Milkwort) we see in all directions — in many places the ground being literally carpeted with its bright blue flowers, which, with their white stamens, are exceedingly pretty and very attractive. A little further on and we come to quite a little rustic pageantry in the form of a number of village children, gambolling and romping away right heartily and merrily, whilst a few others again have been busy, like ourselves, collecting wild flowers, and are now engaged in making them up into miniature bouquets. One of them appears to be quite a genius, and has made a neat little basket with handle and everything complete of Juneus communis, and which is half filled with flowers, amongst which we note Helianthemum vulgare, Ranuoculus bulbosus, Lotus corniculatus, Polygala vulgaris, and Potentilla anserina.

"Now, Merchant, drive round the road towards hitters." "All right!" and taking the box-seat Chitters." and the reins, the driver and his horse are soon going along at a fairly good pace, the fatter, doubtless, with some idea that he is going home, as his head is now in that direction. Another half-mile and we turn sharp round to the right, at the same time with a perceptibly slackened speed. Some two or three hundred yards have only to be traversed when a very pretty picture presents itself, viz., a few acres growing on the hill-side, of Onobrychis sativa, whose pale pink flowers, borne on stout stems 2 feet high, may be seen from a considerable distance. Although it is cultivated in this locality for feeding purposes, the plant is nevertheless indigenous to the soil and may be frequently met with by the roadside and on railway embankments. Nearing a belt of Fir trees, our objective point, a search is made for the green Musk Orchis, Herminium monorchis; we have grave doubts, however, and they are soon confirmed, about finding it thus early in the year. Poterums, Sanguisorba, Anthyllis vulneraria, Ranunculus bulbosus, and Polygala vulgaris are the most noticeable plants we see here. We are not long in arriving at the most prolific piece of downland for wild flowers in the district.

Our time would not permit of staying very long; sufficient, however, to become acquainted with most of the things in bloom, and for the purpose of avoiding a repetition of name, it may be stated that most of the foregoing were found in abundance: Orchis Morio we came across in plenty, but it is fully a fortnight past its best-there are acres of it, not, we would say, with a plant growing here and there, but in great abundance—as many as a hundred spikes may sometimes be counted in a few square yards. O. ustulata is more scattered, but is evidently at home. for here it is that we find our strongest spikes, some of which are fully 8 inches long-the average length by some authorities is stated to be 2 to 3 inches. The flowers, which have a reddish sunburnt appearance, and have gained for it the appropriate name of Scorched Orchis, are long-lived, more so I think than most other British species. Saxifraga granulata, Carduus nutans, Gentiana campestris, Carex glauca, Cerastium arvense, and Briza minor are also to be met with, as well as that very rare British plant; Senecio campestris. Cineraria integrifolia—the last-named is said to be extremely limited in Britain, being confined chiefly to a few chalky downs, and to the maritime rocks near Holyhead.

We now make the best of our way to Boulsbarrow Knoll—a name well known to Wiltshire archeeologists, and which, if my information is correct, was the last resting-place of many ancient Britons long anterior to the Roman invasion, and of the latter we may say they have left many traces in this part of the country of their pre-existence in England. It is now a case of the blind leading the blind, for Merchant hardly knows which down tract to take. We decided, however, to take the second on the right, and which eventually proves to be the correct one. Leaving the Chitters and Amesbury road we have soon a charming view of the downs. We are now well on to Salisbury Plain. Yes, and what a vast expanse of country we have in view. To right and to left the downs stretch away as far as the eye can see, and we may go for miles and find the country of the same character, giving one certainly the idea that England is far from being over-populated. The only life one

meets with beyond vegetation, is an occasional flock of sheep with their shepherd, his dog leading the way; and to any one wishing to live a life of solitude, we' would say-obtain a situation as shepherd on Salishury Plain. Nothing in the way of plants are met with on our way to the Kooll, indeed we did not expect to find many, but once arrived there it was thought a few more Orchids might be seen, hut such did not turn out to be the case, for beyond a few plants of Reseda lutea, Asperula cynanchica, Potentilla aoserioa, and Ranunculus aquatilis, nothing worth noting was seen.

A move is at last made for home, Merchant and his chestnut nag, doubtless, being glad to hear the sound of such a word; and it must be confessed his customers had almost become tired enough for one day. So ended an interesting and agreeable amongst the woods and downs of Wilts. J. Horse-

WHEAT MILDEW AND

THE honour of being the first to demonstrate the connection between the Barberry Æcidium and the Wheat mildew belongs to a Dane, a schoolmaster, who lived in the village of Hammel, near Aarhus, in Jutland, at the beginning of the present century. 1818 the Royal Agricultural Society of Denmark published a paper by Schœler, "On the Pernicious Induence which the Earberry bush exercises on Cereals." This paper has been hitherto overlooked, until Mr. Nielsen brought it under notice in 1874, + in his capacity as Consulting Botanist to the Royal Agricultural Society of Denmark, Schoeler began the study of the subject in 1807, when, by closely observing the yellow spots on the underside of Barberry leaves he came to the conclusion that they were due to a microscopical fungus. In 1810 he noticed that the Barberry bushes were nearly free from this fungus, and that the Rye was that year also almost free from rust.; "I then thought," he says, "that there might possibly be a close relationship between the rust on the Rye and that upon the Barberry; and when, in the following year (1811), I noticed that the rust upon the Barberry appeared much earlier in the spring than the rust did upon the other plants-grasses and cereals-I thought I had found out the true origin of the rust in Rye. Still, however, this question again and again presented itself to my mind, 'Where does the rust on Rye come from in those places in which no Barberries are to be found?' In the summer of 1812 I convinced myself that the Barberry bushes are indeed able to communicate the rust to the Rye by means of the wind, even to a considerable distance."

For several years prior to 1813 he experimented in his garden by planting different kinds of corn around Barberry bushes, and found that Rye and Oats were especially liable to be destroyed almost every year by the rust, which always appeared first nearest the Bar-

From 1813 to 1817 he planted large and small Barberry bushes in his Rye field; he found that the larger bushes did not give rise to the rust in the Rye, when they lost their foliage in the process of transplanting; but, on the contrary, the smaller bushes, which did not lose their leaves so readily, did give rise to the rust in the Rye to a very marked degree.

One of his experiments he thus describes :-" I planted in May, 1816, in a Rye field; three small Barberries; one of them did not thrive, but the other two developed nineteen leaves before the end of May, nearly all of which had the yellow spots of Æcidium herberidis upon them. When in the middle of the following June the Rye immediately surrounding these two bushes became rusty, I invited by a notice in the newspapers every one interested in the question to come and convince themselves of the pernicious influence which the Barberry exerts. On account of this invitation many people came to visit me, and all of them, the learned as well as the unlearned, declared that they could accept no other cause for the rust on the Rye than the small Barberry plants. They were astonished that so small a cause

should have produced so great an effect. On June 22 most of the Rye plants for 30 to 40 feet (square feet) around these small Barberries were more or less rusty, mostly so to the north and north-west, but for a long time afterwards not even a single rust spot could be found elsewhere in the field."

In the same year (1816) Schoeler performed the following experiment: -Some fresh branches of the Barberry bush having rusty leaves upon them were cut off, put in a box, and carried to a Rye field, where The rusty Barthe Rye was still moist with dew. berry leaves were applied to some of the Rye plantsto the straw as well as to the leaves-by rubbing them with the underside of the affected Barberry leaves until he could see some of the yellow dust (spores) of the fungus adhered to the Rye plants. The infected Rye plants were then marked by tying them to sticks driven into the ground. In five days time these plants were badly affected with rust, "while at the same time," says Schoeler, "not one rusty plant could be found anywhere else in the whole Rve field,'

For the above extract I am indebted to Mr. Jensen, who kindly drew my attention in the first instance to Scheeler's investigations.

Of course the village schoolmaster's researches found little favour with the learned men of his day. He was met by such unanswerable arguments as, "Can cows produce horses?" and the like. Still, the fact remains that Schoeler was the first actually to demonstrate the identity of the Barberry Ecidium with the Wheat mildew. In De Bary's subsequent investigations, which were conducted perfectly independently, as Schoeler's experiments were unknown to him, at that time he was led up to this point in the life history of the Barberry Æcidium by his previous investigations with the non-heteroccismal Uredioes, by finding from actual experiment that their acidia are only mere conditions of the other spore forms.

One point about which Scheeler is clear-namely, that the Wheat mildew does occur independently of the Barherry-is worth notice, as indicating that the man was an accurate observer of Nature, and not a mere theorist, carried away by a preconceived notioo. This point is often overlooked, even in the present day, that Puccinia graminis has another way of reproducing itself without passing through the aecidial stage. In the Gardeners' Chronicle I have already given my own views upon this subject. Since then I have obtained specimens of mildewed Wheat from Australia, from three gentlemen, namely, from Professor Custance, South Australia; Mr. James Sewell, Queensland; and Mr. A. H. Sampson, New South Wales. Now all these specimens show this marked difference from those which occur in England, namely, that the uredospores are far more profuse. It is a fact in connection with probably all other heteracismal Uredines that when they are developed from the æcidiospore the teleutospores are far more abundant, and produced earlier in the life of the fungus than when the Uredine arises from the teleutospore itself, in which case the uredospores are the most abundant. I have elsewhere + shown that this is the case with Puccinia rubigo-vera as it occurs in this district.

Ifere we find the Uredo as early in the year as March in extreme profusion, but I have never gathered the Acidium (.E. asperifolii). Again, the Luzula pucciuia (P. obscura), which has its Acidium on the common Daisy +, also occurs in America, specimens of which Professor Farlow has sent me from Massachusetts, where the Daisy is an unknown plant except in cultivation. In all the American specimens I see the same fact obtains-namely, an excess of uredospores compared to what we find in British specimens.

I am pleased to find that the same observation has heen made by Mr. Rostrup \$, who finds plants of Groundsel (Senecio) when growing in districts from which the Pine is absent when affected with the Coleosporium seoecionis produce uredospores almost entirely. Further Rostrup found the uredospores of Chrysomyxa Ledi upon a specimen of Ledum palustræ which he had received from Greenland, although the Ecidium of this species, as shown by De Bary, occurs upon Picea excelsa, a tree which does not occur in Greenland. Charles B. Plowright, 7, King Street, King's Lynn, June 8.

ON TUBER-BEARING ROOTLESS CUTTINGS OF SOLANUM COM-MERSONI.*

WHEN Mr. J. G. Baker read his paper "On Tuber-bearing Solanums," before the Linnean Society of Loodon on January 17, last, I was very much interested, or rather the interest I had previously felt in the introduction of a new species of Potato (Solanum Ohrondii, Revue Horticole, = S. Commersoni, Dunal), from the River Plate to the Naval Garden at Brest, was revived. M. Blaochard had kindly sent me a few tubers of this last-named species, which I planted in a pot of earth and placed in a warm planthouse in February of the present year. The temperature of the house varied from a maximum of 70° on warm sunny days to a minimum of 50° on cold, wet, or frosty nights. This temperature I had been led to believe was near that naturally enjoyed by the plant in its native habitat. Late io March growths appeared, and in April it occurred to me that, as my stock of tubers had been necessarily limited, it would be possible for me to increase it by means of cuttings made from the succulent young stems, which were abundantly produced; accordingly I took off twelve cuttings and inserted each cutting separately in a small (thumh-sized) flower-pot in light sandy soil. The pots were partly plunged in a bed of sand in a heated propagating case having a bottom-heat of 70° to 75°, and a top-heat of about 10° lower. For a week or ten days the cuttings remained fresh and stationary, but after that time such as had been terminal growths commenced to elongate, while those which had formed merely a leafy section of the young growing Potato stems threw out young axillary leafy growths, or shoots, from the axil or eye immediately above the level of the earth in which the cuttings had been inserted. Seeing these new axillary growths, and the elongation of terminal growths already made, I naturally assumed that the cuttings had put forth roots from their lower ends, as other allied plants, such as Tomatos, readily do. But a careful examination showed that they had not done so. After a careful examination of all the cuttings I find that only one has rooted, and that one not from the original cutting, but from the base of an axillary out-growth made after the cutting had been inserted some time. But I ought to have said that before this thorough examination was made I was surprised to observe that the leaves of some of the cuttings, especially those which I had thought most healthy and strongly rooted, began to assume a yellow colour, and that finally the cuttings appeared to he dying away without any evident cause. An examination showed that in no single instance had roots been produced by the original cuttings, but that each and all, without exception, had produced a small tuber from the lowermost leaf-axil of the cutting itself. I beg to lay examples of these cuttings in all their stages before the Scientific Committee for their

observation and opinion. This instance of direct tuber-hearing from a stem inserted as a cutting, is mainly interesting as having taken place without any roots baving been developed, It is a well known fact that old Potato tubers may give rise to new tubers without either roots or leaves being present, or developed in any way; and I remember Mr. Gilbert, of Burghley, showing me, some years ago, old tubers bearing young ones in the direct way here indicated. That Gloxidia leaves inserted as cuttings produce tubers at their leaf bases is also a well known fact; but in that case, as also in the case of Dahlias, true roots are also developed directly from the cuttings. In the case of the "Bulb Vine" (Vitis gongylodes) as its annual stems approach dissolution one or two of the internodes nearest to the apices of the shoots thicken and so form growing tuhers, but in the case of Solanum Commersoni we have an axillary subterranean growth developed directly from rootless section of a stem inserted in moist earth, and in a heated atmosphere. The production of axillary stem tubers from the haulm of growing Potatos is, of course, quite a common occurrence, but I remember no case of tubers having been observed as produced from rootless stem cuttings, as in the present

As I have observed, the only roots I saw on the whole batch of cuttings were produced from an axillary outgrowth of the cutting made after its insertion, and not from the original cutting itself. This is quite a

common feature when Asparagus consanguineus and A, tenuissimus are increased by stem cuttings. The portion actually inserted never produces roots, but from the axils of these cuttings new shoots arise which produce roots from their bases. F. IV. Burbridge.

NEW CATTLEYA HOUSE AT MESSRS, VEITCH'S.

THIS grand new structure, which has been added to the already immense Orchid department at the Royal Exotic Nursery, is designed to prevent overcrowding in the other thirty odd Orchid houses, of various sizes, and to give a spacious home for the large masses of Cattleyas and Lælias which have for many years been collected and nursed by this old firm. It is now filled with a most wonderful collection, and presents already a display of bloom which may truly be said to baffle all attempts to describe. is plainly and substantially built with all the latest improvements in ventilation, &c., which experience can suggest, and it seems to be perfect in all respects, and likely to produce an improvement even in the previous good culture of the plants for which the house was built. Its length is 132 feet, width 22 feet, and height 14 feet, and it is heated by an 8 feet Trentham boiler and sixteen rows of 4 inch hot-water pipes, all of which are kept well under control by means of valves. On entering the house flowers appear everywhere, the whole of the staging from end to end being arranged alike with plants in bloom, the side mainly devoted to the varieties of Cattleya Mossiæ, being so densely set with flowers that from the doorway but few leaves are to be seen, and yet the plants are well furnished with them.

It is interesting to note the varying beauties of these most favourite Cattleya Mossiæs. In some instances the flowers are of a soft blush tint with dark crimson and orange labellums; in others the petals are light rose, and the labellums beautifully marbled with crimson and orange. Some plants have almost self-rose blooms, and others are nearly white, and all emitting that grateful Honeysuckle odour which goes so far in keeping this old servant high in the estiso at in keeping this out servant ingin in the esti-mation of all who love good flowers be they of Orchids or not. Mingled here and there about the house are some very fine varieties of C. labiata Warneri, which seen in a good form is one of our best Cattleyas, although an indifferent variety, scarcely tolerable. Considering the years the plant has been in the country, it is not yet nearly common enough. In rough terms, it may be said, that in Messrs. Veitch's new house will be found in bloom hundreds of plants of C. Mossiæ, C. Mendelii, and C. gigas, varying in size of specimen and form and colour of bloom, and presenting a grand display which all who are interested in such things should There are also many huge well flowered specimens, any one of which, apart from the general display, would reward the visitor. Perhaps the most beautiful plant in the house is a very large mass of a very fine form of the true C. gigas bearing thirty-six flowers of the most perfect form, the large flat violet-crimson labellum being well shown up by the pure white and yellow disc in the throat. It is indeed wonderful. Near it and giving a good opportunity for comparison, is a plant of the true C. g. Sanderiana bearing an immense four-flowered spike of bloom. The whole of the flower has an intensely lurid glow to its bright rose and dark crimson colours, and the whole of the plant itself has a dark-red tint. Some masses of Lælia purpurata with twenty to thirty flowers each, the welcome and agreeable scarlet and yellow tints of L. harpophylla, and L. cinnabarina; the large moth-like blooms of the L. majalis; the clear rosy beauty of a splendid bank of Odontoglossum vexillarium, and the flowers of numerous tall-growing Vandas and Sobralias,

present a most lovely spectacle.

But the grand display in this large building has not robbed the older portion of the Orchid department of any of its accustomed show or interest, for the whole of the houses are well-furnished with bloom. The new specimen Cypripedium-house, giving many fine things, both species and hybrids, such as C. Petrei, C. selligerum majus, the grand C. cardinale, C. Schroederi, many examples of C. Lawrencianum, C. ciliolare, many fine specimens of C. niveum, and of the best forms of C. barbatum grandiflorum, which quite put the old kind out of the field. The Phalenopsis house is as gay as ever, the recent

display of P. amabilis and P. Schillerlana being taken up by the P. graudiflora, assisted by some fine forms of the lovely pink-tinted P. Sanderiana, the rosy P. Schroederi and P. Luddemanniana rosea, the ivorywhite P. tetraspes, &c., and some fine tufts of Odontoglosum Roczlii, and the handsome leaved Anæctóchili, which seem to do so well here. The Dendrobes give fine examples of D. Bensoniæ, D. chrysotoxum superbum, D. suavissimum, the rare D. Falconeri giganteum, D. Dalhousianum, D. Derac, quantities of the various forms of D. infundibulum, D. draconis, the pretty little D. pulchellum, grand masses of D. thyrsiflorum, &c.

The East Indian range has a good example of Coclogyne Massangeana in bloom, and beside it a new Coclogyne of the same section, which may be said to be a fit companion for it. The plant is about 2 feet in height, with long slender pseudobulbs, and bandsome leaves. It bears a long drooping spike of some thirty attractive flowers, with tawny petals, and pure white and brown labellums, the colour being placed in the throat as with a grainer's comb, which gives it a very quaint and unique appearance. It is a very valuable introduction. In the same range are Aërides affine, with a dozen spikes; A. Schræderi, A. cris-

Fig. 143.—SHAM GRAFTING. (SEE P. 772.)

pum, and its variety Lindleyanum; A. Fieldlingii, and many other Aërides and Vandas, among which are exceptionally fine forms of V. cristata, V. lamellata, V. cœrulescens Boxalli, and a small plant of the best V. teres, bearing over a dozen of its large rose coloured blooms.

The old Cattleya-houses-not a bit impoverished by the new one—are gay with bloom, and contain as well as the C. Mossiæ, C. Mendelii, &c., some wellwen as the C. Mossae, C. Mendelli, acc., some wenflowered plants of C. Acklandiæ, and the beautiful yellow and crimson C. Dowiana. The Odontoglossum and other cold Orchid-houses for blomming plants now form a T range, but already preparations are being made for enlarging it, and throwing it into one large span, which will be a great improvement, as it will afford a better means of displaying the fine specimens which it always contains. At present it is in flower throughout, even the roof being called into request to bear numerous suspended pans and baskets containing the smaller species in bloom, the many Utricularia montana and U. Endresii being particularly attractive when so displayed. On the stages are quantities of fine plants of O. Alexandræ and O. Pescatorei in bloom. No Orchid collector ever seems to get enough of these, and giving colour and variety are fine specimens of the orange-scarlet Epidendrum vitellinum majus, the golden-yellow E. xanthinum, the ever-flowering E. Wallisii, the rosy E. arachnoglossum,

the pretty new white, black, and yellow Oncidium nigratum, O. Wentworthianum, Anguloa Clowesii, Miltonia Warsewiezii, Disa grandifora, many variously
tinted Masdevallia Harryana, the true M. Lindeni,
and uther interesting Masdevallias, Odontoglossum
sceptrum, O. Ruckerianum, O. Hallii, O. Andersonianum, O. Geerstedii, O. vexillarium, O. cirrosum,
O. Roezlii; Calanthes of the Veratrum-leaved section
and other rare things, together with the golden-laden
spikes of the O. macranthum, which are turning overhead, making a display which the expert who has
visited this great establishment will not be slow to
form some definite conception of. In this, too, as in
most of our other large collections, it is pleasant to
see that the plants are free from insects, and no trace
of the former troublesome "spot" is to be found;
indeed, Messrs. Veitch's plants were always free
from it.

MESSRS. BUNYARD & CO.'S NURSERIES AT MAIDSTONE.

THESE old-established nurseries appear to have taken on renewed youthfulness since they came under the enlightened management of the present head of the firm, and if the work done and the subjects dealt with are not so noticeable or so showy, and do not make much noise in the gardening world, there is yet apparently a considerable trade done in a class of plants the demand for which is constant and tolerably regular in the immediate neighbourhood, and also in the adjoining counties, wherever fruit growing has become a staple industry. Owing to the increased population of the town, much of the land on its outskirts has passed into the hands of the builder, and that of Mr. Bunyard being on high ground—the favourite position for the modern builder—was among the first to pass into other hands.

The exigencies of their trade, and the natural desire to be removed from even a remote chance of again having to clear out, have induced the firm to take up land on lease, about a mile and a-half from the town. This was formerly in greater part an enormous ragstone quarry, and the prodigious hollows, and heaps of dibris to be found all over the lower portion of it, attest to the great amount of costly planning work that was undertaken to fit it for a nursery garden. The precipitous heights were tumbled into the quarry holes, much rock lying near the surface was blasted, and turned into account as road material; heaps of stone rubbish were smoothed into the form of gentle swellings, and then faced over with a depth of soil sufficient for growing nursery stock well. All this work cost much money; and the grubbing of the remainder of the woodland added much to the expense. I was informed that this had been met throughout the carrying out of the work by catchcrops of various kinds, and which also acted in an ameliorating way on the rough crude soil. The condition of much of the stock now growing on this land speaks highly as to its fitness to grow excellent general nursery stock. Fruit trees are grown in great numbers, prominence being given to those common commercial varieties that suit the soil and climate of the county.

As, for instance, the prolific Farleigh Damson, the market fruit par excellence, and one that finds almost universal acceptance with the Kent fruit farmers, was observed in great breaks in different sites, and numbered, all told, ahout 30,000. The more generally grown Denyer's Victoria Plum, which finds so much appreciation round London and in most private places, number 15,000. The old purple Orleans is less grown than it once was, probably owing to its uncertain quality of cropping-one year yielding an abundance, and then missing several years. The tree has also an ugly propensity for dying off suddenly, in part or wholly, after the unaccountable manner of the Apricot. Other Plums grown in quantity are the Early Czar, a seedling from Prince Englebert, which it equals in size; the colour is dark red changing to purple, and it has the advantage of not cracking after rain. Another fine Plum is Rivers' Prolific, one of the late Mr. T. Rivers' seedlings from Précoce de Tours, and one that has become famous as the best flavoured early sort extant, just as the raiser ventured to predict it would be. The Pershore Plum, a prolific yellow market fruit, is another kind we find in the nursery in large numbers, there being of the three last named kinds about 5000 of each. Of the other kinds, mostly those in demand amongst gardeners in private places, there are forty, in all the different styles of standard, bush-trained,

and cordoo. The frosts of this spring have made but little havoc among any of the stock of either Plums or other fruit, and its usual accompaniment, the black or blue aphis, was remarked to be visible but in very small numbers.

Of Pears that are present in great numbers, are Williams' Bon Chrétien, Hessel, or Hazel as the growers name it; and the Chalk, a Pear much grown in the county. Of Apples there are very large breaks, consisting mainly of standards in various stages of development up to finished trees. Cox's Orange Pippin would appear to be held in much estimation, as there were to be found about 5000 trees in various forms. Worcester Pearmain, another Apple which takes on a high colour on Kentish soil, becoming thereby a favourite market fruit; and Keswick

of cold easterly winds which had much retarded the growth, there was a remarkable absence of the usually abundant black-fly, and the little that was visible was being diligently treated to a bath of quassia-water. Among white sorts of Cherries are great quantities of Amber Heart or Bigarreau Napoleon, Frogmore, and Governor Wood; and Black Heart, Black Cluster, and Rivers' Early among black kinds. We found bush fruit, which is much in demand, in large quantities, and especially Whitesmith and Lancashire Lad amongst Gooseberries, Baldwin Black Currants, and Kentish Cob-nuts. Of these last few other varieties are grown, and these in small numbers, for the supplying of private gardens.

This fruit ground looks quite picturesque when viewed from the high road that skirts it at the lower

FIG. 144. - MOCK-GRAFTING AS PRACTISED BY THE CHINESE (PHOTINIA AND JUNIPERUS). (SEE P. 772.)

Codlio, a culinary Apple well known in the London market, were to be found, each numbering 5000 plants. About 150 varieties of Apples are grown, either on free or dwarfing stocks, that appear to make excellent progress on this deeply stirred old woodland.

Manure is but spariogly employed, the manurial agencies found in the soil sufficing for the present, and moreover, the land is full of the smaller roots of trees and weeds that once covered it, and which in the course of their gradual decay will afford outriment for many successional crops of trees. Mr. Bunyard evidently sees in a few Apples of recent origin, such as Lord Grosvenor, Lord Derby, and Grenadier, worthy supplanters of the ancient Codlin and Hawthornden race—and is multiplying them accordingly.

The Cherry is, of course, very extensively cultivated, and wonderfully clean examples of the most popular kinds were observed. In view of the long prevalence

part-a border planted with Conifers, Hollies, and a variety of evergreen and variegated plants of moderate size adding to the finished look of the grounds thereabouts. The long grassy drives which lead into the heart of the nursery are likewise furnished with the same varieties of plants, having, in fact, the general aspect of the mixed shrubbery, thereby helping, in a very practical manner, a non-cognisant purchaser when making his selection. Prunus laurocerasus rotundifolia, whose extreme hardiness has now been absolutely assured in this country, is much grown, in preference to the common form of Laurel, its hardiness being not its only recommendation, as its habit is more compact and dwarfer, the bush spreading sidewards at a quicker rate than does the vertical growth. An orchard-house, measuring 60 feet by 30 feet, stands on high ground about the middle of the nursery. It is strongly but simply constructed, and is exceedingly light. Here we found a large number of fruit trees of the usual kinds—Pears, Apples, Peaches, Plums, Nectarines, Gooseherries—many of them literally crowded with fruits, especially Plums—Transparent Gage, Pond's Seedling, Jefferson's, Rivers' Prolific, and Rivers' Sultan. The trees were neat, small pyramids, which had evidently been one and a half year in pots, and were full of productive wood. They would remain there till July and then be put outdoors to perfect their fruit and growth, the exceptions being only the Peaches and Nectarines that are carrying fruits.

The holes found everywhere in the old quarry gave cheap facilities for making tanks, of which advantage was taken in the land adjoining the orchard-house. The rain water collected in these is found sufficient for all purposes connected with the growing of fruit trees in pots, and for that of Roses, and will, no doubt, tend to keep the plants healthier than well-water would do. These tanks have been built at various levels—the overflow from the higher placed ones is conducted to those at a lower level—and all waste of what is a valuable agent on this hilly dry land is obviated.

The Rose-bouse, adjoining the fruit-house, consists of two divisions, each 50 feet long by 16 feet, with brick side walls—a span-roof with a few ventilators in it. It is well adapted for the purpose, and was, as well as the other, built from Mr. Bunyard's own design. Here was a complete assortment of Tea Roses, planted out and carefully labelled, so that in taking buds, &c., there would be no liability to commit errors in substituting one sort for another. The same care was also displayed in keeping fruiting permanent cane: of all the sorts of Grapes grown for sale. M.

the Arboretum.

MEXICAN CONIFERS, - PINUS POPOCATEPETLI. Lindl.—It was at a height of nearly 3500 metres above the sea on the volcano Popocatepetl that I met this fine tree. It grows abundantly on the borders of deep ravines made by volcanic eruptions, and rendered more abrupt every year by the waters which are precipitated into them in consequence of the melting snows. What is curious here, is the strangely local character of this Pine, which never descends into the depths of these gorges, nor ascends much above them. I do not think there is a chance of the plant adapting itself to the climate of Central Europe, although the temperature in winter often sinks below - 10° to - 12½° C. (= 10° -14° F.); the long Mexican summers enable the wood to attain complete maturity, and in fact the low temperatures are accompanied by great dryness of the air. This species belongs to the group Strobus, and is nearly related to the Californian species, Pinus Lambertiana; the needles, 15-18 cm. (6-8 inches) long, and of a greyish-green colour, are in groups of five; when completely developed the scales fall—a special characteristic of the group Strobus. The cones are large, 50-60cm. (19-22 inches) long by 15 cm. thick; they exude abundantly a sweet resin; the seeds are as large as small hazel-nuts, and taste deliciously, especially when slightly roasted before they are eaten. In the Principality of Oaxaca-a rich and important town, situated in a valley on productive soil in a delightful country, with a delicious climate-given to F. Cortez as a reward for his services-is found another Strobus described under the name of Pinus ayacahuite, differing from the pre-ceding species in the smaller size of its leaves and cones, and near to Lord Weymouth's Pine (P. Strobus) of Northern America.

Pines abound in Mexico, almost every group is represented. Amongst the Binæ (leaves grouped in pairs) Pinus edulis; among the Ternæ (leaves grouped in threes) Pinus patula—one of the most elegant of Couifers, the needles of which, of a shaded greenish-yellow colour, are very sleader, about 20 cm, in length, soft and pendent. The effect produced is so strikingly picturesque that were it not for the impossibility of importing it into this country I should greatly desire to bring it under the notice of painters and landscape gardeners. I saw once an isolated specimen, covered from base to summit with crowded branches, when its beauty so impressed me that tears started to my eyes, and I returned more than once for a last look. We must not forget the species of the group quinæ (leaves in fives), belonging to the section

Pseudo-Strobus, so great in their diversity that on certain mountains each tree might pass for a distinct variety. Among the Silver Firs, Ahies religiosa, must be mentioned, with violet and green cones. the region of Réal del Monte, a mining country in the district of Tulancingo, in the province of Mexico, I also saw Pseudo-Tsuga Douglasii var. Lindleyi (Roezl), which is different from the famous Pseudo-Tsuga or Abies Douglasii of California, in its shorter, thicker needles, dark green on both sides. I discovered this in 1862; unhappily there only remained one good seed, therefore this pretty variety has not yet been introduced into European gardens. And now we are speaking of the disputed Pseudo-Tsuga Douglasii the reader may perhaps wish for my opinion on the value of this Conifer for German forests, and wish to know why I do not use in describing it the more general name of Abies. I will reserve my opinion on the first point, contenting myself with reciting two lines dedicated to it by a botanist of my acquaiotance :-

> " Abies Douglasii, Abies Douglasii, Is not the tree for German forests,"

As to the name of the plant, it is not a true Abies (Silver Fir). The Silver Firs bear erect cones, which fall on reaching maturity, leaving the wind to disperse both scales and seeds in all directions. It is quite different with the Pseudo-Tsuga: whose cones are pendent, and when ripe the scales persist and only the seeds fall; finally the needles differ completely in shape and position from those of Abies.

I have also seen in Mexico two Cupressus and three new Juniperus, independently of a new Taxus and a Podocarpus. In this Podocarpus as in Podocarpus neriufolia, R. Br. and P., and in P. andina (Prumnopytis elegans, Phil.), the fleshy seminiferous axis has no bracts and forms a succulent receptacle for the seed ; its colour is a beautiful reddish-purple, the seed itself blue, and their relative situations strange and peculiar. Imagine a purplish-red Cherry, the blue-coloured stone of which instead of occupying the inside of the fruit is at the top, and you can imagine my Podocarpus; the fructiferous red receptacle is suspended by a short stalk between the yellowish-green succulent needles. Before leaving the Conifers let me mention Taxodium mexicaoum, Carr., a forest of which with trunks 15 m. in girth, is situated at the foot of the Castle of Chapultepec, near the village of Taccibaya, near Mexico, the same which was formerly the house of the unfortunate Emperor Maximillian, and of his not less unhappy spouse. B. Roeel, in "La Belgique Horticole."

The Herbageous Honden.

COLUMBINES.—In my notes on Columbines on 7, 733 is a misprint, due, no doubt, to my bad writing; but the muscles of my wrists were so strained last week by carrying about two 6-gallon watering-pots full of water that I have an excuse. For "Columbines with a whole corolla" read "white corolla." As regards A. glandulosa one at least of my friends claims to have "the true typical plant," but Mr. Regel, of St. Petersburg, told me last year he had not the true plant, and had failed to get it from Turkestan. He sent me, however, seed of what he said was the nearest to it he had. I have sent flowers of the plants raised from this seed to Mr. Baker, and he says—"just what I understand as A. sibirica (Lam.); for A. glandulosa see Sweet's Flower Garden, vol. i, (2d series), tab. 55." This represents Gregor's A. glandulosa var. jucunda of Baker. C. Wolley Dod, Edge Hall.

NARCISSUS POETICUS PATELLARIS,—In Loudon this given as an English plant, and described as "spreading flowered, leaves erect." Haworth calls it "the large broad May flowering," and refers to English Botany, t. 275, and to Parkinson's Paradisus, p. 75, fig. 2, "Narcissus purpureus maximus, the great white purple-winged Daffodil." Narcissus Perfections recurvus Haworth calls "the drooping-leaved Saffron Sun," and a good figure of it will be found in Herbert's Amaryllidacee, plate 40, fig. r. I am thus particular, as I hope it will enable those interested in the varieties of Narcissus the more readily to distinguish between the two varieties, and if patellaris is really an Figlish plant, it may be met with in old English plant, it may be met with in old English plaradism. As regards Wolley Dod, I sent him one

flower each of the above-named, and the relative difference between the two flowers, if estimated by comparison, was about the same as there is between a shovel and a spade, and that I take to be sufficient to justify us in exonerating from blame Salisbury for naming patellaris, and Haworth for naming recurvus. Amongst the many cut flowers of double Poeticus Narcissus sent to me this season I have been much struck with a small and a large-flowered, and felt sure they must come from two varieties. On referring to Haworth I find he assigns the small double form to Poeticus of Linnæus, a small May-flowered variety, and the large double flower to patellaris. In the soils where the Narcissus Poeticus changes from single to double a good test would be found were ornatus tried, confusion would be avoided, as at present I do not think a double form of this early flowering variety exists. When Mr. Rolles Fryer has harvested the double Narcissus pods, will he kindly make known the result as to the number of black seeds in a pod? P.

NARCISSUS POETICUS PATELLARIS (see Gardeners' Chronicle, p. 738) is one of the varieties of Herbert. I presume that if it is found in different places the bulbs perhaps came from my nursery, as it figured formerly in the catalogues of my firm; lately it has not been quoted, as the stock was too limited for this : it will, however, now be offered again. It is a variety which seems to multiply not nearly so easily as the other varieties of Poeticus. I bought this form with a very complete collection of different Narcissus, more than thirty years ago, at Messrs. Osborn & Son's nursery at Fulham. This collection, consisting of about fifty sorts, all unknown in Holland then, was cultivated carefully, and years afterwards offered to the trade, and sold regularly in England, where a great number of these sorts meanwhile had been lost or could, at least, not easily be found. 7. H. Krelage, Haarlem, June 8.

Orchid Notes and Hleanings.

EXTREMES IN ORCHID SHADING. - When any particular practice connected with the cultivation of some kind of plant or plants has been carried too far, and the mistake has become generally admitted, it often happens that a rush is made in the opposite direction. This has evidently been the case with Orchids, which in some cases are now subjected by inexperienced growers to more sun than the condition of the plants or the character of the house in which they are grown will warrant. As one who has persistently pointed out the mistaken ideas prevalent as to the requirements of these plants in the matter of shade and the mischievous effects of the excessive shading at one time frequently looked on as necessary, it may not be out of place to offer a word of warning about the injury that may occur by indiscriminately allowing them to be too much exposed to the direct action of the sun. In this matter, as in everything of a kindred nature, circumstances have an important influence over individual cases; the exposure to the sun which it is advisable to submit a given set of Orchids to that happen to be in a condition to bear a maximum of its rays coming on them, may be injurious to others that by their previous treatment are wholly unfitted to stand its unrestricted force; for instance, a collection that consists of plants that from the time they were first imported have been grown in light houses with little shade, and where other conditions connected with their cultivation have been equally conducive to stout growth and tough leathery leaves, will bear with impunity an amount of sun that would result in yellow shrivelled leaves and bulbs with plants that had been subjected to heavy shading, combined with little air and a murky close atmosphere, the whole texture of such plants being comparatively soft and wanting in substance. Beyond this the description of house in which these plants are grown has much to do with the extent of shading that is necessary, a hip-roofed, or a lean-to structure facing east or west, or a span-roofed house with ends north and south, are each calculated by the position of the woodwork composing the roof to ward off much of the sun's rays in the middle of the day when it is in its fullest force, whereas the bars and rafters in a hip-roofed or lean-to house facing south, or

a span standing ends east and west, offer the least obstruction to the sun in the middle of the day when its rays are most powerful, and come with full force on the plants. The distance from the glass the plants are placed is another matter that requires to be taken into consideration in determining the amount of shade which it is necessary to give. Knowledge based on practical experience is needful to determine the amount of shading requisite in each individual case. In this as in many other matters connected with gardening there can be no hard and fast line drawn; but, this much may safely be said, that although it is a mistake to expose plants to more direct sun than the condition they are in will enable them to bear, still no more shading either in the length of hours the blinds are allowed to remain down over them or in the thickness of the material used should be allowed than the state of the plants and the character of the houses in which they are grown requires. T. Baines.

SAECOCHILUS UNGUICULATUS. — This is one of those species of which comparatively little is known, and which in itself has very little to recommend its general cultivation; but the species having recently been imported into the country in considerable quantities under the erroneous name of Phalænopsis equestris, it has become more common amongst us. Its characteristics are like those of Phalænopsis Luddemanniana, and unless the plant were in flower it would be difficult to distinguish the two. S. unguiculatus produces a greater profusion of flowers; they are borne in two distinct sets of about eight or ten, one set opening with the morning sun and remaining in perfection for about four hours, closing at midday, and at eventide finally falling from the spike. They are as large as an ordinary Phalænopsis rosea, transparent, white, with a few deep red spots on the labellum, and a yellow column, and while they remain open they emit a sweet odour. After the lapse of a few days the other set expand and follow precisely their predecessors. This curious species was originally introduced from Manilla, from whence also comes Phalænopsis rosea, and P. equestris is but a syn. of P. rosea. During the past week several plants have flowered in Mr. J. T. Peacock's collection at Hammersmith, and cannot but be regarded as simply a botanical novelty. W. Gestling.

CATTLEYA LABIATA PERCIVALIANA. — Of this Orchid, concerning which there was much controversy, a good coloured figure is given in the Orchid Album, t. 144. As explanatory of the variety of opinion that at one time prevailed, Mr, Williams says that "imported plants vary greatly in merit—more so in this than in any other Cattleya that has come under our notice . . . and many [varieties of this type] prove to be worthless, and unfortunately no one can tell whether individual plants will be good or bad till the flowers expand. The good ones are really valuable, for there is no other Cattleya in which the lip and throat are so richly coloured."

ARPOPHYLLUM GIGANTEUN, Lindl.—I met with this beautiful Orchid at Sante Comapan in the form of gigantic specimens densely covering the branches of the trees to the very tops of the mountains. Think of thin pseudobulbs, 40 centimetres long (12 inches), giving origin to leaves more than 60 centimetres in length, and to panicles of small, dull rose flowers, so crowded that there were more than 500 in a cluster. The prettiest specimens that I gathered bore about twenty-five of these flower-spikes—a splendid spectacle, to which no description can do justice. It is a singular thing that this Orchid is only met with in this particular region, although hills and mountains abound by hundreds, one behind another. Finally, let us mention the following fact as proto of the amount of resistance with which certain plants are endowed. Between the months of October and March these Orchids in their aerial condition are exposed to violent squalls, which blow from the north with such strength that it is difficult for a man to stand against them, It might well be thought that the plants would be uprotoed and scattered, but it is not the case; even the leaves are left iotact. Recal in "La Belgique Horticole."

ODONTOGLOSSUM ALEXANDR.E. -- Mr. Vanner has sent us from Camden Wood, Chislehurst, a couple of flowers of a superb variety of this favourite Odontoglot. They measure over 4½ inches across, are of beautiful form, and of the purest white, with a faint tinge of violet on a few of the sepals, and the fine fringed lip handsomely spotted with trinsson.

ONCIDIUM LIMMINGHH.—This species, described by Professor E. Morren in the Ediffuju Horticole, vit, p. 353, cic., when received at the Liège Botanic Garden from Caraccas, has been lately found in Brazil, by M. Binot, who has succeeded in introducing a number of plants to the Botanic Garden, Brussels, where M. Binot is for the present to be found. The plant is "a gem."

THE work of bedding-out should now be completed, but where such is not the case every exertion should be made to finish it as quickly as possible. The late much needed rains will assist the plants greatly in making rapid growth, and enable them to become quickly established and cover the beds. Constant attention will be required in tying, pegging, and stopping the young shoots till they have filled their allotted spaces, and until this is accomplished all the blossoms should be picked off, so as to encourage free and vigorous growth. After planting, the surface soil should be frequently loosened with the hoe, so as to eradicate weeds and at the same time admit the rain freely to the roots of the plants. When established, Pelargoniums, Calceolarias, Verbenas, and all similar plants will be greatly benefited by occasional applica-tions of weak liquid-manure or light top-dressing of such artificial manure as will stimulate them a moderate degree; this practice is much less troublesome and more advantageous and convenient than the practice of applying so much solid manure to the beds, because it can be used at the proper moment and withheld when thought desirable. The more tender subjects, such as Coleus, Iresine, and Alternanthera, which invariably suffer severely when exposed early, may now be planted, as the ground is sufficiently warmed to cause them to grow away freely, nor are we now likely to get frosts or cold storms to check their progress.

Advantage should be taken of this showery weather

transplant annuals, biennials, and perennials which have been recently sown and prepared in frames or in seed-beds in the open garden, and as most of them are during such weather very liable to be eaten by slugs and snails, they should be carefully protected from these pests by frequent light dustings with lime or soot; water should be given, and slight shade to protect them from scorching sun by using evergreen branches so as to prevent flagging till they

take root.

THE HERBACEOUS BORDERS are now particularly gay, and to keep them in perfect order no labour nor pains should be spared in staking, tying, and cleaning. The hoe should be kept freely at work amongst them, and as most of them are gross feeders, frequent deluges with liquid manure will prove very beneficial, not only in producing exuberant growth and abundance of bloom, but also in tending to increase the brilliancy of their colours and prolong the period of flowering. No class of plants are more beautiful at this season than the Iris and Pæony, and none appear to be more grateful for generous and liberal treat-

BULBOUS PLANTS which have matured their growth may now be taken up, dried, and stored till autumo. As the Persian Ranunculus are now showing bloom they should be freely watered in dry weather, and a partial shade from intense sunshine will be very advantageous. When well grown they make charming and most effective beds in the flower garden, and are particularly valuable, as they are gay during the interval between the early spring bulbs and summer flowering plants.

THE LAWN will now require special attention in mowing, sweeping, and rolling. A few days' neglect at this period will be plainly visible throughout the whole summer, and as with the rapid growth of the Plantain, Aconite, Daisies, and other objectionable weeds also appear, immediate measures should be taken to destroy them. For the broad-leaved weeds there is no better remedy than the application of sulphuric acid with a pointed stick, simply touching the crown of the plant with a drop of the liquid, and for the destruction of the smaller-growing weeds, frequent surface-dressings with finely sifted wood-ashes or good artificial manure are perhaps the best, as they stimu-late the fine grasses which will then outgrow and choke the low-growing objectionable weeds. The verges should be frequently edged, and the walks kept clear from weeds, and be frequently swept and rolled.

THE SHRUBBERIES .- All recently planted subjects should be freely watered and mulched during dry weather, and care should be taken that they cannot be swayed about by wind till they have become thoroughly established.

PRUNING cannot now be performed to any great extent; still, where the plants are crowded together, careful and moderate thinning and topping may be practised. All weeds should be eradicated by frequently forking or hoeing the ground, and where found necessary the surface should be top-dressed either with new soil or well decayed manure, as may be deemed requisite. T. S. C.

Che Gitchen Garden.

BROCCOLI, &c .- This will be a good time to get good breadths of Borecole and autumn and early winter Broccoli planted. Of the Borecole, the dwarf curled Scotch and Cottagers' are undoubtedly the best and the most bardy varieties, and in order to secure sturdy plants the seedlings, as recommended in a previous Calendar, must be transplanted into nursery beds before they become crowded in the seed-beds, and then, as soon as the plants have thoroughly established themselves, and before they get crowded, be finally planted out, and in the absence of rain carefully watered until they have taken root. Ground on which old Strawberry plants and early Peas have been grown is the best for receiving winter and spring Broccoli, the plants not making therein an over-luxuriant growth. In the act of planting the stem should be inserted in the soil as deep as the lower leaves, in order to keep them dwarf, so that in the event of a hard winter the plants may have the protection of both the soil and soow, if any; moreover, it is a fact that cannot be too well known, that it is the stems of Broccoli, Borecole, and kindred plants that suffer most, and that where these, through babit or cultivation, are dwarf, the losses through frost are inconsiderable, hence Borecole will succeed moderately well in almost any garden soil and position, but where a good strong open piece of ground can be given to it, the quantity and quality of the crop will be correspondingly enhanced. The green curled Kale should not be planted closer than 20 inches between the plants in the rows, and 2 feet between the latter; and Cottagers' Kale should be allowed from 9 to 12 inches more each way. The following varieties, together with Walcheren and Autumn Giant Cauliflowers, make a good succession, and a good planting should be made forthwith, in ground prepared as for Cabbage and Cauliflower plants, in drills 3 inches deep, 2 feet apart, and the same distance in the rows, viz. : -- Veitch's Self-protecting, Grange's Early White Cape, Early Purple Cape, Dancer's Late Pink Cape, Snow's Winter White, and Early Penzance. The later and stronger growing varieties of Broccoli should be allowed from 6 to 9 inches more room between the plants each way, using an iron dibber or a crowbar if the ground is very bard, as undug ground will often be, after Strawberries, &c. In planting Broccoli plants some kind of classification of the respective varieties, and the time at which they come in for use, should be observed, so that the crops may be cleared in convenient rotation, and the ground made available for other cultivation. Make another planting of Early London and Veitch's Autumn Giant Cauliflowers, and cover the heads of those now coming into use with the leaves, so as to keep them white and firm. Also plant out a sufficient number of dwarf Savoys and Brussels Sprouts in rows 15 inches by 12 inches apart. It is a good plan before planting to dip the roots in a puddle made of ordinary garden soil, with sufficient clay added to render it adhesive, and with which a few handfuls of new soot has been mixed. This will have the effect of making the roots distasteful to worms, which are sometimes very troublesome in gardens. Since we had recourse to dipping the roots in this mixture, we have had no further trouble in this Capsicums, where much in demand, may direction. now be planted out under a south wall in a bit of rich soil, which should then he watered to settle it about

SEED SOWING .-- Sowings of Broad Beans and Canadian Wonder French Beans, also Endive of the broad-leaved and green curled type, and Walcheren and Veitch's Aulumn Giant Cauliflower should now

be made, as also Mustard and Cress and Radishes, which, as previously recommended, should be sown every fortnight or three weeks during the summer. Early next week make another sowing of Scarlet Runners on the south side of the row sown proviously, assuming that it runs east and west, and in the event of the row running north and south the next sowing should be made on the west side; but the former position (respecting which full particulars were given in the number for April 19, at p. 515) is unquestionably the best, inasmuch as the first row protects the second. Make another good sowing of late and second early varieties of Peas (principally the latter) for yielding supplies late in autume, and about a week or ten days later Laxtoo's Earliest of Alt. Day's Early Sunrise, and William I, should be sown on a warm border to supplement the gathering from the preceding sowing. Successional sowings of Turniss (Early Soowball and Carter's Jersey Lily), Carrots (Nantes Horn), for autumn and early winter use, and Lettuces of the Cos and Cabbage varieties should also be made, and subsequently attended to when necessary in the way of watering, &c. be made, as also Mustard and Cress and Radishes,

GENERAL WORK .- This will consist of the earthingup of Brussels Sprouts, Cabbages, Cauliflowers, Broad Beans, French Beans, and Peas, together with the sticking and mulching between the rows of the latter sucking and mutching between the rows of the latter with rotten dung, the watering of seed-beds, seedlings, and freshly set plants, and rows of Peas and Beans, and Celery, when necessary, which, thanks to the bountiful rains, has not been the case lately. Vegetable Marrows and Ridge Coumbers, which should now bave the hand-glasses raised by tilting each corner, and the shoots taken out underneath in different directions. may have the hand-glasses of the shoots taken out underneath in different directions, may have the handglasses or tops removed in showery weather, &c. Recently transplanted herbs should not be allowed to suffer for want of water at the root. Tomatos out-of-doors will also require attention as to watering and the training of their shoots. H. W. Ward, Longford Castle Gardens, Salisbury.

The Bandy Squit Garden.

THE 2 inches of rain which fell here during the and fruit growers will naturally participate in the timely showers. There is every prospect of an abundant crop of Strawberries, it is therefore well to go over the plantation and pull out any gross weeds, which give an untidy appearance unless removed. Be careful not to tread on the first, which is now fast hastening to maturity; when once it is fairly ripe gathering should be done, selecting the early hours in the morning for gathering the day's supply, which should be put in a cool place till required. In country districts, and more especially where woods surround the garden, and especially after a mild winter like this, birds will be found very destructive to fruit, especially Strawberries and Cherries; old fish-nets are generally recommended for their protection, but after years of experience we have found the square-mesh nets made by Eddy, of Porthleven, Cornwall, far superior in every respect, and if carelast fortoight have much improved our prospects; the square-mesn nest made by Eddy, of Portifleven, Cornwall, far superior in every respect, and if carefully labelled and put away when not in use they will last for many years. The Fig crop promises to be an abundant one. Oftentimes, and more especially in the case of young trees, there will be a sudden rush into wood, and the fruit will drop; timely attention to stopping of the subsidiary shoots will prevent this, cause the fruit to ripen some ten days earlier.

and cause the fruit to ripen some ten days earlier.

Look over the Raspberry plantations, and remove any superfluous suckers, only leaving those which will be required for next year's crop. The autumnhearing sorts will form an exception to this, inasmuch that it is this year's shoots which carry the crop; therefore leave them alone, simply keeping the weeds down, except that the canes will be greatly hencited by being mulched with manure.

In gathering the green Gooseherries for imme-

by being mulched with manure.

In gathering the green Gooseberries for immediate use or preserving, have an eye to any overloaded bush, and gather from those, more especially in the case of young plants, which, thus relieved of their crop, will soon grow into sturdy busbes. The black Currant loves a somewhat moist situation, and nothing tends more to small, insipid fruit as drought the property of the property at the root. Mulching with any material, even lawn grass, will do; as to keep the roots moist is of great advantage to the erop. Where it is desirable to hurry on a few bushes of red Curants, this may be accomplished by stopping the shoots or removing half of

plished by stopping the shoots or removing half of them altogether.

Look over the Apricots for the last time, and remove any ill-placed fruit or any which may have previously escaped notice. Peaches are a splendid set, and will require atteotion in thinning the fruit, removing superfluous shoots and leaves with the cut, keeping all insect pests under. As the temperature has fallen again, put off the atternoon syringing till it gets warmer. J. Rust, Eridge Cautle.

APPOINTMENTS FOR THE ENSUING WEEK.

Linguist Group State
YEAR after year we receive from astonished correspondents specimens of the certainly very astonishing CYTISUS ADAMI-a tree bearing flowers and leaves of the common Laburnum, intermixed with those of the very different Cytisus purpurens, and, what is more significant still, with branches showing every intermediate gradation in form and colour of stem, leaves, and flower. So much has been written about this extraordinary graft hybrid-for such it was asserted to be by its raiser-that in default of any information additional to that already recorded in these pages and elsewhere, we should not now venture to bring the subject under notice, were it not for two reasons. The first is to impress on those who have the opportunity of so doing, the desirability of carrying out further experiments by budding C. purpureus on to C. Laburnum and other allied plants. So far as we know, Cytisus Adami is solely propagated by budding on the common Laburnum, and no successful attempt has been made to produce the variety de novo, either by repeating ADAM'S original experiment, or by floral hybridisation in the ordinary way; and yet in no other manner can it be decidedly settled whether ADAM's original statement, that it was the result of budding C. purpureus on C. Laburnum, is the correct one, or whether it is merely a hybrid production in the ordinary sense. The plant was described by Mr. DILLWYN in our columns, 1841, pp. 325, 336 (see also p. 265), and 1842, p. 397, having previously been noted in the Gardeners' Magazine by Dean HERBERT. The fullest account of the plant, with numerous references to the literature, is to be found in BRAUN'S Rejuvenescence, 1851, English translation, by HENFREY, Ray Society, 1853; in Professor MORREN's paper in the Belgique Horticole, with coloured figures, in 1871; and a summary of the whole subject is to be found in DARWIN'S Variation of Animals and Plants.

vol. i., ed. 2 (1875), p. 413. With the exception of ADAM'S original statement (1825), the accuracy of which is questioned, we have little in the literature of the subject but negative results or bare assertion and statement of opinion, that is, so far as the actual origin of the plant is concerned. As to the negative results, neither CASPARY, nor REISSECK, nor DARWIN, who all made the attempt, succeeded in fertilising C. Laburnum with the pollen of C. purpureus. A record given in these pages, 1857, pp. 382, 400, in which it is alleged that grafts of C. purpureus were implanted on C. Laburnum, and which gradually assumed the characters of C. Adami, has been objected to as open to doubt, but a statement of a somewhat different, though cognate, character at p. 454 of the same volume is less open to doubt. In that communication Mr. F. E. MADDEN, of Ballinasloe, states "that in 1848 or 1849 I inoculated a lot of Laburnums with the purple variety (Adami); three specimens now remain widely apart in the nursery grounds. On one there are now thirteen tufts of Cytisus purpureus on the purple branches, one of them terminating the limb, and on two others six and nine similar tufts. Although yellow shoots have proceeded from the purple original (Adami), the Cytisus proceeds only from the purple Laburnum (Adami) in two instances; the purple and yellow-bloom proceed from the same bud, and in several instances single bunches of yellow bloom appear on purple branches, which are heaped with rich blossoms. One such bunch comprised thirteen racemes, but where an entire bunch of yellow Laburnum appears, neither C. purpureus nor the purple variety is seen in any instance, but the bloom is more luxuriant, longer in the racemes, and of a pale canary colour." This case is interesting as a statement of facts to which parallels are seen every year, but it proves nothing as to the origin of C. Adami, which is the really important point to be cleared up.

Another reason that has induced us to mention the Cytisus Adami is furnished by the receipt from Mr. COLE, of Ilford, of a specimen of BLACK CURRANT on which a WALLFLOWER was growing vigorously. It was impossible to believe in any actual graft between two such dissimilar plants, and on cutting down the stem it has been ascertained that the stem of the Wallflower has made its way up through the centre of the stem, pushing aside the pith-cells which were dead. In this manner we were enabled to trace the Wallflower stem up from the root of the Currant, but owing to the place where the section was made we were not able to see how and where the Wallflower made its entrance, as we have no doubt it did, from the soil to the Currant. There was no organic connection between the Currant and the Wallflower, the latter had simply bored its way up through the pith of the former. At first we supposed that a seed had germinated on the Currant and sent down its root, but we are assured by Mr. MURRAY, who has examined the specimen microscopically, that it is a stem, and so must have entered from below.

The case, then, furnishes a natural parallel to the artificially produced "greffe des charlatans" as practised by the Chinese and others. The illustration, fig, 144, p. 769, taken from a Chinese drawing sent home by Mr. FORTUNE, shows how a Photinia was made by those ingenious folk to grow togther with a Juniper. ANDRÉ THOUIN showed how the Charlatan's Graft might be imitated by planting within the hollow trunks of an Ash and a Lime a variety of other plants, the branches of which ultimately interlaced. (See fig. 143, p. 768.) Latterly, as we learn from the Revue de l'Horticulture Belge, the Dutch and Belgian public have been informed by the Press (we need not say we do not mean the horticul-tural Press), that black Roses may be obtained by grafting Roses on to Oaks; the Rose obtains thus tannin from the Oak, and the tannin acting on the iron in the Rose produces the black dye customary in such cases. All this is, no doubt, believed in by readers who take what the papers tell them for truth, and we must admit that, false as it is, it would not be more extraordinary than the case of Cytisus Adami. M. VAN HULLE-who is assuredly no charlatan-lets us into the secret of the Rose-Oak or Oak-Rose. He tells us that such a phenomenon exists in the Ghent Botanic Garden, having been constructed-we can use no better word-by the late M. DONKE-LAAR. And this is how it was done. A seedling Oak with a stem about 8 centimetres in girth was taken, a red-hot iron was passed up through the pith, through the channel thus formed a small Rose stem was passed. The formed a small Rose stem was passed. The two plants were placed in the same pot, and grew together. The original plant exists in the Ghent Botanic Garden, but M. VAN HULLE had to renew the Rose, for the original plant was in course of time strangled by the Oak.

— Fritillaria Macrophylla, — We are glad to be able to give a figure of this pretty Liliaceous plant (fig. 145), whose rosy-lilac flowers are very pleasing. It is a native of Nepal, and

one of those very numerous plants whose aim in life it seems to be to perplex botanists and upset all their nicely concerted plans, which work so well on paper, but so often fail in the garden. In fact, our present plant is not quite a Lily, and not quite a Fritillary, but something between the two. Mr. Baker, in his latest revision of the Lilla-ceæ, includes it in Fritillaria, and, moreover, shows that by right of priority it should be called F. macrophylla, but it is best known in gardens as Lilium Thomsonianum, having been so named by Dr. ROYLE in honour of Dr. ANTHONY TODD THOMSON, a man who deserved the compliment. To show the confusion that exists, it may be mentloned that while ROYLE, in his text—ROYLE, Illust. Plant. Him. (1839), p. 388, t. 92—calls it a Fritillary, his plate is marked Lilium. Mr. ELWES does not include it in bis Monograph of Lilium, and we imagine but few people grow the plant. For our specimen we are indebted to Mr. LODER. The bulb is one of the definite class, that is to say, the old bulb dies after flowering, but not before provision is made for next year's growth. soil suitable for the plant is a rich loam mixed with leaf-mould and fragments of limestone, with good drainage. It is figured in the Bot. Mag., t. 4725, under the name of L. roseum.

- NATURE REFRESHED .- The rain which fell so abundantly at the moment of our going to press last week, although in its coming signally falsifying the prognostications of the weather prophets, has yet given the most unbounded satisfaction. We have rarely wanted rain more badly - we have rarely had our need more thoroughly satisfied. Summer rains are too often of an eccentric slap-dash kind. They have a fashion of tumbling down like cataracts, washing everything either out of the soil, or deeply into it. In the present instance the earlier drops came like gentle dew, slowly, softly, and with singularly refreshing sweetness. Then gradually they thickened, and became dense, yet never rushing, and Then gradually they did not cease till the soil, if not saturated, had well drunken. A few more such gentle falls of moisture before the month closes will make us enter upon the beats of summer, should they come, with light hearts. As a result of the rain we see already a marvellous change in Nature, and there is a bursting and revival that illustrates forcibly the dormant powers of vegetation, which favourable weather enables it to put forth. Specially will pastures and the corn crops, Peas, Potatos, and Strawberries feel the benefit, and a load of intense care and anxiety has been taken from off many minds. The value of such a timely rain to the country must be incalculable; nay, if we did but take the low estimate of an increased yield arising from it to the extent of 20s. per acre of cultivated land, what a large sum that would represent! Agaio, we see an enormous impetus at once given to labour, for in all directions the land is now teeming with workers. week or two since and there seemed to be literally nothing to do, yet in a brief space it is hey, presto! change! and gardens and fields are the scenes of toil and activity. Even in the puttlog out of winter greens we see thousands of men actively employed at once, with the almost certain result that next winter will see an abundance of welcome vegetable products,

- MARKET POTATOS .- A metropolitan market gardener, who has recently paid a visit to Jersey, and has returned enchanted with the delightful equable climate of the favoured Channel Islands, states that Potatos rank amongst the favoured market crops of the one island he visited, and that as much as £10 per acre is paid as rental for land in which they are grown. The rows are very close together, the soil being rich, and the climate so delightful, promoting rapid growth, and the long process of earthing and other arts of cultivation are not practised. Our home growers of early Potatos find thus that they have severe competitors in their particular trade; but if the crops are good they seldom complain of prices, perhaps for the reason that home-raised Potatos, grown more naturally, and baving longer time in which to perfect the tubers, are not only much better flavoured, but are much more fitted to be articles of food. Here, as in Jersey, the growers mostly favour kidneys, these being not only earliest and most productive, but always obtain the best price in the market. It is worthy of remark, too, that homegrown Beauty of Hebron will always prove as acceptable as foreign Ashleafs. In spite of the very dry weather so long prevalent, home Potatos in good soil are looking extremely well, and now are making

FIG. 145.—FRITILLARIA MACROPHYLLA: FLOWERS ROSY-LILAC. A, LEAF; E, SECTION OF FLOWER; C, POLLEN, MAGN. (SEE P. 772.)

such rapid growth that the cultivator finds it hard work to keep pace with his crops. Immense breadths have been planted, recent good Potato years having given growers much encouragement. As a rule the Potato proves to be a safe crop, early ones especially, as they are run into market ere the disease can do much harm. As large quantities were planted so early, the plants have more root-force than usual,

- OLD ENGLISH VINEYARDS. - Sir JOSEPH HOOKER writes:-"As the subject of vineyards in England in old times is always interesting, I enclose copy of a passage from SWITZER'S Iconographia Rustica, vol. ii., p. 266 (London, 1718), and should be glad to hear through the pages of the Gardeners' Chronicle, whether the site of the vineyard in question is known :- 'That vineyards may be so cultured in England as to produce large quantities of Grapes, and these so well ripened as to afford a good substantial vinous juice, needs no demonstration, when in several parts of Somersetshire there are at this time flourishing vineyards; and the vineyard of the late Sir WILLIAM BASSET, in that county, has annually furnished some hogsheads of good bodied and palatable wines, which I have been credibly informed by gentlemen who have drank considerable quantities of it with the greatest satisfaction. It is not so much owing to the inclemency of the air here in England, that our Grapes are generally so much inferior to those of France and other hotter climates, as to the want of an exact culture; though I confess at the same time, that the best management will not answer our expectations without a tolerable season to ripen the fruit : and sometimes the variousness of the weather in the summer will unavoidably render the fruit sour and immature, and this does not always or generally happen, and therefore we are not to be discouraged.'

— HUDDERSFIELD CHRYSANTHEMUM SOCIETY.—A committee of forty members, organised to promote the formation of a Chrysanthemum society in Huddersfield, have met with so much local support, financial and otherwise, that they have decided to hold an exhibition on Nov. 14 and 15 next.

- BOTANICAL NAMES. - Mr. RANDAL H. ALCOCK has published what appears to be merely a re-issue (with a page of corrections) of a useful book brought out by him some years ago under the title of Botanical Names for English Readers (DEANSFIELD & Co., Manchester). It is notorious that those who really care for plants find no insuperable difficulty in acquiring the terminology of botany, and that those who raise an outcry against the ordinary nomenclature are, for the most part, those who have so little interest in the matter that they will not take the little trouble required to master it. The operatives of Lancashire interested in plants, even though destitute of a classical education, easily acquire botanical names. The present work will be found a useful aid in overcoming the difficulties we have named, so far as the names of British plants are concerned, but it seems a pity that occasion was not taken to render the book more complete, and more particularly to have incorporated so much as was needful of the modern canons of botanical nomenclature as drawn up by M. A. DE CANDOLLE, adopted at the International Botanical Congress of 1867, and fully discussed in that very useful and, strange as it may seem, attractive volume, La Phytographie. Had this been done the incompleteness of the preliminary historical sketch might have been passed over, as, however interesting, relatively of secondary importance.

— THE BATTLE AMONG PLANTS.—It has generally been assumed that Rhododendron hirsulum prefers a limestone soil, and R. ferrugineum one that contains no lime, but according to Dr. CHRIST, of Bale, when either of these species grows by itself it can accommodate itself to the most varied soils; but when they grow together, R. hirsutum, finding a limestone soil most propitious to its development, overcomes its companion, which thrives best on a soil into the composition of which lime does not enter.

— THE PHGENIX HOEING AND RAKING MACHINE is a new appliance for cleaning garden walks, invented by Mr. Ennis, gardener, Emo Park, Portarlington, and which as a labour-saving implement seems to be meeting with much favour in the Emerald Isle. The patent rights have been acquired by Mr. THOMAS MOORE, Ormond Quay, Dublin, the

proprietor of the Farm, Forest, and Garden, who, on the 5th inst., put the machine to a severe practical test in The People's Garden and the Phoenix Park, Dublin, in the presence of Mr. Dick, superintendent of the park; Mr. F. W. Moore, Glasnevin; Mr. F. W. Burbidge, Trinity College Botanic Garden; Mr. Ambrose Balle, Mr. Knowlden, gardener to the Duke of Leinster, Carton; Mr. Blackburn, Abbotstown; Mr. Garnier, late of Kylemore; Mr. Sheppard, landscape gardener, Dundrum; Mr. Douglas, gardener to Lord Monck; Mr. McCulloch, gardener to Lord Powerscourt; Mr. McKenna, gardener to the Chief Secretary; Mr. McKenna, gardener to the Cher Secretary; Mr. David Pressley, late gardener at Knockmaroon; and Mr. John Cairns, who at the completion of the trials signed the following testimonial :- "The Phoenix Hoeing and Raking Machine for garden walks and carriage drives was tried to-day (June 5) in the Phoenix Park, Dublin, under our personal inspection; and it is our unanimous opinion that the machine is a thoroughly practical and efficient labour-saving horticultural implement." In an early issue we shall give a description and illustration of the machine, which appears to us to be worthy of the attention of gardeners having large areas of walks and drives to keep in order.

— WARAS,—Under this name a substance used in Arabia as a dye, a cosmetic, and a specific against cold, has been lately attracting attention. Mr. W. T. THISELTON DYER in the *Pharmaceutical Journal describes it as consisting of the glandular hairs and exudation therefrom from the surface of the pod of a leguminous tree, Flemingia rhodocarpa, native of Eastern Tropical Africa. A closely allied or identical species occurs in Southern India,

— BECONIA LYNCHEANA, — "A very noble species of a genus, the ornamental species of which, numerous as they are, both Indian and American, are far from being exhausted for garden purposes." It is a Mexican species, introduced by ROEZT, and has been called B. Roezlii, but that name is preoccupied. It is a handsome species, with tall erect branching stems, glabrous cordate-acute, denticulate, and large terminal many-flowered panicles, each flower about 1½ inch across. The plant is figured and described by Sir Joseph Hooker in the Botanical Magazine for June, 1884, 1, 6758.

— Mr. J. T. PEACOCK, Sudbury House, Hammersmith, has sanctioned the opening of his collections of Orchids and succulent plants for public inspection for a short time in aid of the funds of the West London Hospital.

- HARDY HERBACEOUS PLANTS AT MAN-CHESTER .- To many the groups of these at the recent show were objects of great interest, at the same time they were to some extent disappointing. They had they were to some extent disappointing. They had too much of the character of plants forced into bloom, and some of them were made-up plants. The fact that some—perhaps the majority—had been pushed on into bloom under glass imparted to them a drawn and weedy appearance, and affected both the colour and size of the flowers. It is a state of things that is perhaps inevitable. The Whitsun show falls between the time for the spring and early summer flowering subjects, when there is some difficulty in getting a sufficient number into flower, and to make up a collection of sixty or more plants some shifts must be resorted to. It happened at the recent show, owing to the crowded state of the exhibition, that the space allotted to the collections was insufficient to enable the plants to be staged to advantage, and they were unduly crowded, especially as some of them, such as Lilium longiflorum and others, were quite large specimens. Perhaps it would be well if classes were made for forced and unforced plants, though it might be difficult to say which were forced and which unforced, or if such a distinction should be found impracticable the number of plants might be reduced in order to get a more select representation. A wide latitude was given by exhibitors to both terms "herbaceous" and "alpine," and disqualifications on these accounts are to be deprecated without some previous intimation in the schedule of prizes, for these irregularities have been sanctioned at previous exhibitions by the awarding of prizes.

— VERONICA LYALLI. — Of all the shrubby New Zealand species of recent introduction, this one, added to our collections about four year ago, and again exhibited by Messrs, VEITCH, on Tuesday,

may indeed rank as one of the best. Quite a number of species of the New Zealand type are flowering on the new rockery at Kew, and some of them quite profusely, and while it is impossible to deny the neat attractive habit, together with the floriferousness of many, V. Lyalli is indeed a floral gem of modest beauty. It is a low compact bush, from 8 to 12 inches high, and literally covered with white flowers with a radiating violet-purple eye. The individual corollas are several times the size of those of the other species, and are produced in axillary racemes towards the apex of the short branches. Like V. Traversi and V. pinguifolia it is all but hardy in our climate, except in exceptionally severe winters, and is well worth while keeping in stock in the reserve pits amongst other choice, rare, or half-hardy subjects.

—— SHOW PELARGONIUMS.—We learn that Mr. TURNER, of Slough, will send a large collection of new show Pelargoniums to the exhibition of the Royal Botanic Society on Wednesday next, June 18, including some seedlings of very rich colours.

—— TRICHOCAULON PILIFERUM.—A remarkable Stapelia-like plant, with thick erect cylindrical bluot stems, covered with tubercles, tipped with single prickles, something like a Cucumber. The flowers are star-shaped, pupilish, and like those of a small Stapelia. Botanical Magazine, June, 1884, t. 6759.

— PAPAVER ERACTEATUM.—Last year an enthusiastic gardener residing in a favourable spot near the sea-coast on the South of England, having a bed of Yucca aloifolia, wanted someting to mingle with them during summer. He tried several subjects, and at last hit upon Papaver bracteatum. The result was all that could be desired. He raised plants from seed, and was delighted with the rich colours he so obtained. There were shades of pale scarlet, and some of the deepest crimson, with fine touches of intermediate tints. He saved seed from two or three of dwarfish growth and finest in colour, and proposes to raise a batch of seedlings every year. This fine, bold, and showy plant should be in flower borders, in order to succeed the Pæonies, for they are very gay during the summer months. The rich shining black blotches on the bases of the petals are in marked contrast to their brilliant colours.

RANUNCULUS GLACIALIS.—This species has been found on the Swiss Alps at a height of 4270 metres, so that not only mosses and lichens, but flowering plants exist above the snow-line—a fact paralleled by the occurrence of flowering plants in high latitudes in Greenland, as noted by us some time since. In Switzerland, according to Dr. Christ, there are 249 species not found beyond the high alpine region; sixty-four of these species are spread throughout the polar regions.

—— FRENCH RANUNCULUSES.—A large number of varieties of these pretty flowers were received by us lately from Messrs. ANT. ROOZEM & SONS, Haarlem, the many different shades of colour, and the perfect form of the greater portion of them making a most charming collection. It is a plty their beauty is not more generally recognised by our gardeners, their easy cultivation, rich and varied colours, and their capability of making, when sufficiently close planted, telling masses of colour in beds or horders, ere the summer bedders display their flowers, should again make them favourites in the garden. Their red and scarlet colours do not glow like those of the Anemone, and they bloom somewhat later, although this last depends in a measure on late or early planting; and no flowers last longer when cut and put into water.

— LILY OF THE VALLEY ROOTS,—In a communication to the Medical Tribune, as quoted in the Pharmaceutical Yournal, Dr. KUNZE states that while passing through a large New York drug store in the third week of January he was surprised to notice two open barrels filled with fresh roots of Convallaria majalis. Upon closer examination and inquiry be found that these roots were from forced hothouse plaots, from which the flowering stem and leaves had been cut off for the flower market, and that this practice of turning the exhausted roots to account was not uncommon. Under these circumstances Dr, KUNZE thinks it is not surprising that physicians fail to obtain the results expected from the use of preparations of Convallaria, and he suggests that the old

astrologers, in requiring that a plant intended for medicinal use should be gathered under certain planetary influences, had the advantage in practice, since the gathering of the plant in the best possible condition was probably thus secured,

—— SOCOTRINE ALOES.—The plant yielding the true Socotrine Aloes, the produce of A. Ferryi, has been introduced into Natal, and the drug will probably become in course of time an article of commerce in that colony.

- CARNIVOROUS PLANTS .- Although physiologists have universally accepted the facts originally proposed by DARWIN as correct, yet there has been a disposition in some quarters, if not to question the fact, at least to doubt its utility. Mr. FRANCIS DAR-WIN undertook some experiments to satisfy the latter point, and now we have to record the results of some experiments made by M. BUSGEN. This gentleman commenced his experiments with seedling Droseras, and ascertained that the digestion of nitrogenous matter begins with the appearance of the first leaf, The experiments were continued for two years, with the result that those plants "fed" with nitrogenous diet in the shape of aphides and small insects were the more vigorous. Fourteen plants so treated produced seventeen flower-stalks and ninety seed-pods, while sixteen plants not so treated produced only nine flower-stalks and twenty seed-pods. More conclusive still were the results of analysis, which-we cite from the Annales Agronomiques, 1884, p. 238-showed for the first set a total weight of dry matter (remaining after the expulsion of water by heat) of 0.352, while the unfed plants yielded only 0.119 parts of a gramme (= 15 grains).

- PINKOS TUBERS. - "Under the name Pinkos-knollen," says the Pharmaceutical Journal, "a very hard red woody substance has lately been introduced into the Vienna market, probably from Australia, which is found to be almost as valuable for turning purposes as ivory. Dr. Franz von Höhnel has subjected this substance to careful examination, and has determined, from the following characters, that it is the product of a coniferous tree belonging to the family Araucarieæ:-1. The absence of true vessels. 2. The absence of resin passages. 3. The extremely thin-walled medullary rays, consisting of a single row of cells, compara-tively large, and placed in hulgings of the tracheids. 4. The remarkable pits which indicate the tracheids on the borders of the medullary rays. 5. The large bordered pits of the tracheids, which meet from opposite sides, usually placed in two rows, and then nearly polygonal. 6. The sclerenchymatous pith, from 4 to 5 millimetres wide. The so-called 'tubers are turnip-shaped, 15-40 centimetres long and 7-16 broad: and apparently broken off at one end, running out into a point at the other end. The tranverse section shows a sclerenchymatous pith, 4-5 millimetres wide, surrounded by a number of very narrow annual rings, the older of which are concentric, the outer ones strongly excentric. They are usually sovered by rotten wood and soil, and are probably gigantic knots which have fallen out of decaying and mouldering trunks in the primeval forest. the genera of Araucarieæ they must be derived from either Araucaria or Dammara, and very probably from Araucaria Bidwillii, the 'Bunya-bunya Pine,' a native of New South Wales."

— RANUNCULUS BRUTIUS. — On the new rockery at Kew there is a fine clump of this pretty Buttercup. It is not unlike some forms of R. acris in the cutting of the clustered dark green leaves, and the creamy-vellow flowers are borne in great profusion on simple or slightly-branched stems about a foot or less in height. R. brutius is a native of Southern staly.

— ROYAL METEOROLOGIAL SOCIETY.—At the ordinary meeting of this Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 18th inst., at 7 F.M., the following papers will be read:—"The Equinoctial Gales—do they occur in the British Isles?" by ROBERT H. SCOTT, M.A., F.R.S., President; "On the Physical Significance of Concave and Convex Barographic and Thermographic Traces," by the Hon. RALFH ARRGEMENT, F.R.Met.S.; "Maritime Losses and Casualties for 183, considered in Connection with the Weather," by Charles Harding, F.R.Met.S.; "The Helm

Wind," by the Rev. Josh. Brunskill, F.R.Met.S.; "Climate of the Delta of Egypt in 1798—1802, during the French and British Campaigns," by W. T. BLACK, F.R.Met.S., Surgeon-Major. The commemoration dinner will take place in the Holborn Restaurant, High Holborn, on Tuesday, June 17, at 6.30 P.M.

RHODODENDRONS AT THE HEALTH EXHIBI-TION.-These plants have been in splendid bloom during the last week, the rich glowing colours of the flowers lighting up the paths and courts, and the avenues about the buildings in a way that no other plants can do at this season of the year. The question may have presented itself to some persons as to what condition of bareness we should be reduced in the flower garden during the months of May and June without our showy genus, the Rhododendron. There is simply no shrub grown in Britain that can usurp or ever fill its place; in fact, in garden adornment and when out of bloom, its massive dark green leafage will form no mean screen for the unsightly upright iron and wooden walls, and other things and places not of beauty, to be found about the congeries of buildings. Much praise is due to those public-spirited enterprising firms of nurserymen who, at great expense, have brought and arrayed their shrubs, Conifers and Rhododendrons, so artistically. Foremost amongst them, as regards the numbers planted, are Messrs. LANE & Son, of Great Berkhamstead, whose fine bank of the latter shrubs runs in an irregular border right and left of the electric mast. These occupy a shaded, albeit an open position, and act as a blind to a long flat range of buildings. In the main centre path of the garden, and quite encompassed by high walls, Mr. ANTHONY WATERER, of Knap Hill, has a beautifully flowered number of both very large plants, and many of various heights and dimensions which form one of the finest leatures in the place. Mr. WATERER had placed canvas shelters over the border, so that the flowers will remain much longer in bloom than others not so protected. Under this light-hued and brilliant flowers show up wonderfully well, but the effect on the dark ones is very much to lessen their effect; yet the balance of advantage is in retaining the protection, so as to have a feast of flowers for as long as possible. One of the prettiest nooks is that which is found at the Bishopsgate, and by the side of the Prince of Wales' Pavilion. Here Mr. MAURICE YOUNG, of Milford Nurseries, Godalming, has planted three sides of a square plot with the Rhododendron, the fourth side being only partially occupied with an oval bed containing also dendrons. The shade thrown by the buildings, and the grateful coolness of the site generally, have promoted the gradual openiog of the flowers, and their retention in freshness. The plants were in most instances quite loaded with bloom, and the emerald turf in front of the borders making the best of setting for them. He has also a border of half-standards and dwarf bushes on either side of the highway to Old London. Mr. C. NOBLE, of Sunningdale, has a fine lot of Rhododendrons arranged with much taste, amongst them being several grand specimens. These plants enter into the pretty miniature garden of Messrs. C. LEE & Son, of Hammersmith; this occupies a retired position near the London Waterworks Companies' pavilion. Among the sorts we noticed such old kinds that seem almost indispensable -- elegans roseum, elegans purpureum, elegans album, some of the oldest Catawbiense hybrids of Mr. JOHN WATERER's raising. These are robust, hardy, and good bloomers. Then Everestianum, good under glass but still better outside, the lilac and white contrasting capitally with vivid reds and crimsons; perspicuum, a pretty blush, that alters with age to white; Minnie, another blush variety with chocolate spots; the free and hardy Nero, of dark rosy-purple; H. H. Hunnewell, a sort large in truss, of a rich crimson. Lady Eleanor Cathcart was seen in several collections, lighting up splendidly, with its pale-rose blooms. There were splendid plants of Barclayanum, an old crimson kind, that is of great value for its lateness in blooming. This and John Waterer, another crimson flower, that is a free-flowerer, were employed with good effect in Mr. Young's groups. Onslowianum, a blush flower, having a pale-lemon eye, and Princess of Wales, a rose shaded with purple, were conspicuous by their good condition. Lady Armstrong, a palishpink flower, was very fine: this was one of the choicest kinds seen. Mrs. John Penn, a pale salmon; Salvini, a free-blooming purple; the old well-known purplish-crimson Caractaeus, Lady Winifred Herhert, a handsome fringed deep rose-coloured bloom—the habit of the plant is good, and it is a very desirable variety. Princess Mary of Cambridge, light blush, with carmine edge to the petals, was another indispensable kind that was observed in many places, as was Sir J. Whitworth, a fine big purple-rose, that onght to be recommended for its quality of late blooming. Concessum, old, but beautiful, the colour a pure rose. Those named constitute some of the better known varieties that were met with in large sized examples in the different groups.

- STOCKS FOR BUNCHING. - This is saying something, but not nearly enough, in praise of some Stocks now to be seen growing in Messrs, SUTTON & Sons' seed grounds at Reading. There are to be seen Bromptons, Capes, autumnals, &c., but the particular strain to which attention is being called is a very dwarf, bushy, hardy, and wonderfully free branching, and therefore free flowering type of the Intermediate; dwarfer and more compact in growth than the Queen type. It is a strain that does not throw up a hold central spike like the Brompton, but they branch freely from the very base of the stem, and every branch is covered with flowers, and these vary in colour from deep purple to manve, scarlet to rose, brick-red and pure white. It seems to be a tough and hardy race, likely to stand frost and wet alike. The winter having been so mild has been highly favourable to the well-being of biennial Stocks; there was no frost to harm them, and they have been and are flowering gloriously. It does not appear that any particular designation is given to this strain, but gardeners and market growers alike will find it extremely useful for cutting from, and also for planting out for decoration in early

— PRESENTATION.—On the occasion of Mr. SMITH leaving the nurseries of Messrs. RODGER, MCCLELLAND & Co., of Newry, the workmen of that establishment presented him with a tea-service and an address.

- THE WEATHER .- General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 9, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:

—The weather during this period has been cold, cloudy, and very unseasonable, especially over the southern, midland, and eastern parts of England. The winds have been north-easterly and northerly, but not strong, and the general conditions of a complex cyclonic character. Thunderstorms occurred in many parts of England between the 6th and 8th. Thunderstorms occurred in The temperature has been below the average everywhere, the deficit ranging from 4° or 5° over Ireland and the greater part of England to only 2° in Scot-The highest readings were those recorded over our Midland Counties on the 4th, where the thermoroeter rose to 71° or 72°, while the lowest registered over England occurred toward the latter portion of the period, and varied from 44° to 46°. land, at Nairn, the sheltered thermometer fell to 39° or 40° on several occasions. The range during the week The rainfall was largely in excess over our southern, midland, and eastern counties; in "England, S." the amount registered was nearly five times the average. In Scotland and Ireland, however, there was a decided deficit. Bright sunshine.-This was very deficient at the English stations, only 7 per cent. of the possible duration being recorded in "England, S.," 11 per cent. over the "Midland Counties," and 19 per cent. in "England, N.E." In the north of Scotland, however, the percentage recorded was 45, in "Scotland, E." 33, and in the Channel Islands, 34. Depressions observed.—These were very shallow, and their movements extremely irregular; in many cases they appear to have been formed, and to have dispersed over our area. The behaviour of one, however, deserves special notice. Advancing in a west-north-westerly direction from the Baltic, it lay at 8 A.M. (5th) over the Skager Rack. Thence it continued its westerly motion, and arrived near the Shetlands at 8 A.M. on the 6th, and passed out to sea through the Pentland Firth during the morning.

—— GARDENING APPOINTMENTS.—Mr. R. R. WHITFIELD, late Foreman at Marton Hall, Middlesborough, as Gardener to JAMES MONTAGUE, ESC., Melton Park, Doncaster.—Mr. EDWARD BAXTER, formerly Gardener at White Lodge, East Barnet, as Gardener to R. C. L. BEVAN, Esq., Trent Park, New Barnet,

THE PLANTING OF THE TOWN MOOR, LEEDS.

WOODHOUSE MOOR is a large expanse of ground, commanding extensive views. It lies west of Leeds, about twenty minutes walk from the Town Hall of that borough. It was formerly overgrown with Whins, and in wet times was boggy. The Corporation purchased the moor some years ago, and an attempt was made to improve it. This was sturdily resisted by the older folks, who were under the impression that the Corporation intended "to steal it." ever, the corporate body persevered. The moor, which has a strong clay subsoil, was land-drained, but the mistake was made of covering up the tiles with the subsoil, and the result followed that the water could not get away. While the surface was wet the drains were perfectly dry. One portion of the moor was planted, some fourteen or fifteen years ago, by Mr. Rider, of Moortown, but the soil was poor, the plantation bad no attention, the trees were allowed to grow higgledy-piggledy, there was no pruning or thinning, manuring or improving the soil was never thought of, and stunted growth was inevitable. How the trees lived or throve at all was a marvel. No one in the Corporation seemed to have an idea that an intelligent forester was required to superintend the plantations. Men were appointed to take charge of the moor, well enough in their way, but not sufficiently versed in forestry. The forest trees are mere bushes; scores of them are ruined as to form and shape, and the old nursing Poplars, whose time is long past, are left standing, to the great injury of the Limes, Sycamores, Chestnuts, Alders, Beeches, and other forest trees that require light, air, and "elbowroom" to expand into nobler growth. Concreted walks were laid across the moor, and Councillor J. Hardwick paid for forest trees to form avenues. These trees all died, and no wonder. Holes were dug in the clay, forming natural reservoirs for water; soil was put in, and this receptacle received the handsome and healthy young trees. When this first attempt failed bigger holes were dug in the clay said to be drained, more soil was added, and large un-wieldy trees were planted. The moor is exposed to the full force of the westerly, south-west, and northerly winds. Staking the trees was a necessity, but no staking can keep these big trees steady on such a

bleak and exposed moor. Next an enclosed plantation was formed, and so successful was this attempt that it was evident all that was needed to ensure success in growth was shade and shelter. Acting on this idea, Mr. John Lee, who is connected with the Leeds Times, and who has had some experience in connection with the Bradford and other parks, conceived the notion that he could make the moor "blossom like the Rose." With the permission of the Corporation he selected one of the bleakest and most upfavourable portions of the expanse, and there constructed a rockery. Everybody laughed at the idea, and none more so than the professional gardeners and nurserymen. The modus operandi was simply in this wise :- Taking off the soil and subsoil down to the clay, the site was thoroughly drained; then a layer, some 18 inches deep, of what are known as "dry midden ashes, containing no small amount of ammonia, were placed on the clay. A deposit of "gully muck," which had been lying rotting for several years, was "discovered" on the moor, and this material was laid on the top of The old soil of the moor was put on the the ashes. "gully muck," and layer on layer this pile was raised to a height of 6 feet in the centre, and sloping at the sides. At the Aireside Hematite Iron Works, near Leeds, is produced a grey slag, prettily honey-combed, impervious to moisture, which resists the blackening effects of the Leeds smoke, and is admirably suited for rockwork. Mr. Leonard Cooper, manager of the works, kindly gave some 60 tons of this material, and with it the rockery was built.

Four enclosed circles were formed, each one facing a different point of the compass, with narrow open mouths. The circles of stones rise from some 3 feet in front to 4 or 5 feet at the back, and in the centre of the entire design is the great mass of piled-up earth, sloping inwards at the top, to catch all the moisture that falls. The rockery was planted with Sycamore, Elm, Alder, black Poplar, Mountain

Ash, Copper Beech, Silver Poplar, Hawthorns, Weigela, Viburnum, Ghent Azaleas, Rhododendrons, Hollies, Aucubas, Golden and common Elders, Southernwood, Honeysuckle, Ivy, Heaths, Alpines, double Whin, and various creepers. Ferns, Primroses, Polyanthus, Seduns, Saxifrages, and herbaceous things generally, were placed in the interstices between the stones, and a few annuals were sown. The work was commenced in February, 1883, and from that time forward up to now—thanks to the mild winter—the "Lion" Rockery, as it is called, has never been without bloom. Primroses on Christmas Day on Woodhouse Moor were a sight that the Leeds people never expected to see. Whichever way the wind may blow three of the circles are sheltered, and while each is warmed by the sun, on none of them does it shine all the day. Gardeners will understand the advantages of this "shade and shelter" on a breezy moorland height.

During the summer and autumn of 1883 the rockery was brilliant with bloom; hundreds of bees hummed about it, and the perfume was delicious. Those who had said that "nothing would grow on Woodhouse Moor" were confounded, and the professional gardeners were astonished. Trees, shrubs, plants and annuals all throve, the bloom was unusually fine, and many were the queries as to where the wonderful plants and seeds came from that showed such surprising results.

It was all very simple. The Corporation produce at their sewage works a black mould that has extraordinary properties, and at their destructor works is a residuum, made from the refuse vegetables of the markets, equally good. The gardeners would not look at these valuable materials. By judicious mixture with the common soil of the moor luxuriant growth was secured. Objection was raised that this material was unnaturally forcing growth, and that the things in the rockery would go back as fast as they had progressed. The answer to this is now seen on the moor, where the "Lion" Rockery is covered with most luxuriant growth. Thinning out extensively is a necessity, and many barrowfuls of stuff have had to be removed to prevent over-crowding. The storms that blow over the moor are terrific. was said that the wind would tear everything up, and scatter the plants far and wide. This has not happened yet. The growlers asserted that the trouble was not worth the candle, as there would only be greenery five months in the year. The terrible storms of the last winter did not disturb or destroy anything, and the various varieties of Sedums, Saxifrages, as well as the evergreens, have kept up the brightness and greenery of the rockery ever since it was erected.

It was planted by Messrs. Rider, of Moortown, near Leeds, but contributions were kindly sent from Bradford and other places to adorn this recreation ground of Leeds. The work was purely voluntary on the part of Mr. Lee, who was determined to show that his critics and deriders were all in the wrong. His chief assistant in the work is Tom Spinks, a laoouring man employed by the Corporation, but who, like Opie, the celebrated painter, mixes brains with everything he does. No professional gardener has had hand in this undertaking, though Mr. Lee is indebted to Mr. F. Richmond, of Lister Park, Bradford, and to Mr. M. Lannder, of Horton Park, Bradford, and to other friends in the gardening line, for many practical hints. The Corporation found the soil and labour. but all the planting was done by voluntary effort, the chief contributor in money being the Mayor of Leeds (Alderman Woodhouse), who, with his amiable wife, planted the first trees in the rockery, which are doing well.

Encouraged by the success of his first effort, Mr. Lee has, with the sanction of the Corporation, continued his honorary labours, and has entirely re-modelled one of the entrances to Woodhouse Moor. and has built a second and larger rockery as a mask for new conveniences. The work has been conducted on the same principle as the first, and, with Tom Spinks as his foreman, Mr. Lee has had the pleasure of planting about a dozen beds. The soil is taken out to the clay, midden ashes laid on this, and soil some or 4 feet deep piled on the top. The beds are designed in form to combat the westerly winds, and "shade and shelter" are studied to secure growth. The voluntary response, though not so liberal as might be expected from such a rich community as Leeds, has not been despicable. Upwards of £250 has been given in money, and in the value of plants and other things, but of course the cost of the Corporation is much greater, though they have bad nothing to pay for designing and management, which would mean a considerable sum. The new plantations are doing well-thanks, in a great measure, to the excellent means of watering provided by the Corporation, The percentage of deaths amongst the trees and shrubs is very small. The heds were planted by Messrs. Rider, Moortown; Messrs. Hartley, Head ingley; and Mr. Dixon, Alton Nursery. As no commission was asked, these gentlemen have generously planted several enclosed circles free of cost, and have given other plants worth in the aggregate some £20. Good soil and sods have been tipped on the moor at 1s. a load, though 1s. 3d. has been paid for some of it, but even at the latter rate the soil is cheap. Mr. Lee believes that by mounding up the beds the moor may be rendered a really charming The Corporation propose to form new grounds for the cricketers, the moor having time out of mind been the great playground of Leeds for this healthful

There is one very remarkable feature about this work. It was said that the people would not appreciate and respect the task in which Mr. Lee is engaged. It is very pleasant to know that they do respect it, that nothing is stolen or damaged, and that the people are delighted with what they never expected to see—the adornment of Woodhouse Moor.

Notices of Books.

Traité de Botanique Médicale Phanerogamique, Par II, Baillon, Seconde fascicule, Paris : Hachette,

In this second part of a treatise on medical botany, of which we have already mentioned the publication of the first, M. Baillon proceeds with an account of the several orders which produce medicinal plants. Full descriptions of the principal drug-yielding species, as of the Opium Poppy, for instance, are given, accompanied by excellent illustrations. It will be new to many of our readers that the Opium Poppy grown in various parts of France yields opium containing as much as 10 and even 20 per cept. of morphia; the latter yield has been obtained, even in the North of France. It would seem, therefore, as if the culture might be profitable, but this is not the case, owing to the cost of labour. M. Baillon does not confine himself to the plants specified in the Pharmacopaia and which are in general use, but gives relatively an equal amount of space to extra officinal plants. For a student's text-book we venture to think this is a mistake. To occupy space with Duckweeds, Water Lilies, and Sarracenias is needlessly to increase the size of the book and add to the burden of the unhappy student. Even in a book of reference such as this will be, it would be better, in the interest of the unlearned reader, to put plants of comparatively little medicinal importance in an appendix by themselves, or, at least, in smaller type. The woodcuts are excellent, and the text such as may be recommended with the greatest confidence. A few oversights, how-ever, have escaped even M. Baillon's keenness; the cone at p. 1349 is certainly not that of the Silver Fir, Pinus Abies; and the abnormal growth at p. 1351 is not necessarily a deformed male catkin, and is in any case the work of an insect (Chermes).

Flore de Paris, &c. Par J. L. Lanessan. Paris: Doin.

Our hotanical readers interested in the plants of Northern and North Central France, and in the comparison between it and our own flora, will welcome the appearance of this handy little volume. The plants are arranged according to their natural orders with a series of analytical tables by means of which with a little care the orders, genera, and species, may be ascertained in the same way as in Beotham's Handbook. Not only are all the wild plants introduced, both of flowering and of flowerless plants, but also all the poisonous species, and most of the commoner cultivated plants. Numerous woodcuts are given, together with elaborate indices and tables containing much information necessary for students and collectors. The value of the book can only be tested by frequent use, but the method in which the book is put together and the reputation of the author lead us to commend it as one of singular usefulness, the like of which we cannot point to in this country.

Home Correspondence.

Cremating Weeds .- I have read Mr. Murphy's communication on the destruction of root weeds by lime or fresh horse-dung, and have no doubt that the method he describes is quite effectual. But even although I hold that belief I have for some years back been constrained to have recourse to the wasteful system of "cremation." My object in this is to make sure of the destruction of the seeds of such annual weeds as Chickweed, Poa annua, and Groundsel, which in seed-beds and among small newly planted out forest trees are by far the most troublesome weeds I have to deal with. It is impossible at all times to have these pulled before they seed, as I find them ripening their seed all through a mild winter. If any of your correspondents can recom-mend a plan for effectually destroying the vitality of these seeds in the compost heap it will confer a great boon, as well as effect a great saving to a Northern Nurservman.

Royal National Tulip Show .- Having subscribed to this for many years, and having sent my subscription as usual for the year 1884, and having had no notice whatever of the date of this year's exhibition, I wish to know if my experience of the management at headquarters is according to rule, or an exception? If I find I am an except person, I will be the proper person of the property of the will ask Mr. Bentley the reason why. But before I take so rash a step, I should like to know how many other subscribers are in the "same hoat." Subscribers to the Royal National Tulip Show, please reply. Shirley Hibberd.

The Indian Conservatory .- There is a want of scientific accuracy in the excellent description of the Indian conservatory in your last number. As a matter of fact, the angular size of the sun's disc cannot be compared with the linear space between two laths. The problem to be solved is, at what distance from the screen would the rays from the sun's circumference converge to a point and all the light be a peoumbra. The answer is, 107 times the width of aperture, or say 9 feet to an inch; and the greater the distance in excess of this the more would the light be diffused. II. K. scientific accuracy in the excellent description of the

The Cabbage Caterpillar, — The American fashion of spreading a net over the crop of Cabbages or Cauliflowers is the most effective mode of preventor Cauliflowers is the most effective mode of preventing the butterfly alighting on the plants, and is the only one that cultivators living in warmer climates than ours can adopt that will prevent a crop being eaten up by the caterpillars. Here, in our colder clime, the insects are never seen in such immense numbers, and therefore the difficulty of dealing with them is much less. I would say use the net by all means, if you have one; but in lieu of that, it is a good plan to carefully go over the plants and hunt out the patches of eggs that are found on the leaves, both on the upper and under-side, but more on the latter, and then to crush them between the finger and thumb. This does not take a long time, and need only be done during the time the Cabbage butterfly is about. When once the caterpillar has hatched out ahout. When once the caterpillar has hatched out and is able to crawl the labour is all in vain, as each and is able to crawl the labour is all in vain, as each must be caught separately, whereas in the finger-and-thumb method scores of eggs are smashed in the space covered with a florin. By not taking the remedy in time the writer has had a crop of full-grown Cabbages reduced to a plantation of skeldton leaves in a few days—all attempts at catching the caterpillars or drowning them with water from a hose leading to nothing, as the voracious insects never leave off feeding for a moment till their transformation into chrysalids is accomplished. M.

Early Peas,—These, like everything else, seem to have heen greatly retarded and to have suffered from the absence of rain and exceeding aridity of the air, but since the change they are filling fast, and will now turn in in rapid succession. The first with us to he fit for use is Eastes' Kenthis Invicta, which, sown at the same time, and on the same border, having therefore equal advantages with William I., is quite a week before this well-known variety, the pods of which are as yet quite fast while the others are full. Although William I. is not ready to pick quite so soon there can be no question but that it is the better Pea of the two, as, besides having more depth of colour it is superior in flavour when cooked. Not only is this so, but the pods are longer and contain more Peas of a larger size than the Invicta, and it should, therefore, be grown to come in to succeed it. should, therefore, be grown to come in to succeed it. To follow closely on after William I. I like to have a row or two of Day's Sunrise, which seems to have origi-

growing side by side. I can see no difference whatever in the colour of their flowers, habit or growth. Where they differ at this point is in their degrees of forwardness, as Suorise, sown at the same date—January 19—is well "slated," while the other is only just setting, o One great disadvantage Sunrise has which the other is free of is that it fills badly, as generally the pods are very gappy, thus showing some defect in the setting. Being a marrow the flavour is good and equal to Advancer, which is most valuable as a second early and one of the most useful of the many good ones Dr. Macleau sent out. As most gardeners will now be picking early Peas it is a favourable time to compare notes and make memoranda of the sorts to grow for succession in the year next to come. 7. S.

— As there seems to he a desire among gardeners to find out which is the earliest Pea I send you our experience. We sowed on December 12, 1883, on a south border in the kitchen garden Sangster's No. 1, and picked the first dish on May 30. G. Lambert, Oakwood.

G. Lambert, Oakwood.

Malformed Fuchsia.—The accompanying figure (fig. 146) shows a deviation of a very extraordinary character. The flower is normal except in mortant exception—that from the sides of the ovary, or rather, of the flower-stalk enclosing the ovary, proceed two leaves, from the axil of one of which proceeds a single stamen, while from the other come two united at the

FIG. 146,-MALFORMED FUCHSIA

base, but separate above. The specimen came from Messrs. Keynes & Co., of Salisbury.

The Pink Wood Sorrel .- This rare plant I saw The Pink Wood Sorrel.—Inis rare plant I saw in considerable quantity some time since growing on the shady side of a raised ditch. The colour was, however, not so deep as a plant sent from Edge Hall, although perfectly distinct from the normal form. I collected some flowers to send you, but they were quite withered before reaching home. A. D. Webster.

Agaricus (Volvaria) gloiocephalus, Fr.—We have received some magnificent examples of this large, rare, and very handsome Agaric. Our largest specimen was 9 inches high, and 4½ inches across the cap. The habitat was remarkable, for the Agarics were found growing on an old wool waste or shoddy heap near Huddersfield; the base or volva of each fungus was firmly embedded in the black shoddy and the same material was sticking on the top, when the fungi were received by us. Mr. A. Clarke, one of the members of the Huddersfield Natural History Society, forwarded the examples for naming. W. G. S.

Quick Revival of Flowers and Plants,—One cannot fail to be pleased and struck with the quick revival there has just been in flowers and plants, all of which have changed as if by magic during the last twenty-four hours, as before the rain it was pitiable to see the distress they were in ; but instead of wearing anything like that wee-hegone look now, they are all smiles, and appear gorged to repletion. This is more apparent with the Rhododendrons than anything else, as they were struggling to burst their huds and get their blossoms open; and though many of the earlier kinds did succeed, the later failed, and seemed to give Quick Revival of Flowers and Plants.-One

up in despair. Although well known to be moisture-loving plants, it was not so much the dryness of the earth that affected them as the exceeding aridity of the air, which for a long time past has lacked humidity both day and night, as there has been no dew or dampness in the atmosphere to refreshen and revive famishing vegetation. For some things this has, perhaps, heen well, or the cold might have told more severely, but as the tissues are firm and hardened, the low temperature and winds have not done the harm they otherwise would. Roses, like Rhododendrons, seem quite to rejoice in the rain, which, besides acting so beneficially on the buds in helping to swell and latten them up to burst out in the big flowers to come, has, in a great measure, cleansed the shoots of aphis, and made the foliage look lovely with its bright tints of green. Bedding plants have had a sorry time of it, and show it in the leaf, which looks brown and weather-beater; but where watered they must have been moving below, as with the sum we have had, the ground has been warmed, and roots are not slow in taking advantage of this, as may be seen when a plant or two has to be lifted and shifted. The change in the herbaceous border has been as remarkable as in the Rose garden, for there the plants seem to quite driok in the rain, and the Irises especially show how well it suits them, as they are magnificent and full of beauty in the various colours and forms of their blossoms. Writters sometimes compare them with Orchids, but really these latter might be compared with the Iris, as, excepting some of the Cattleps's and Leslias, there are few that rival them and forms of their biossonis. Writers solutions compare them with Orchids, but really these latter might be compared with the Iris, as, excepting some of the Cattleyas and Lælias, there are few that rival them in the delicate shades of their petals and markings. Lovely as the flag-leaved section are, the hulbous-rooted excel them, and these are now fast pushing up heir flowers, which, when open, will be the most attractive things in the garden. Aquilegias are also moisture-loving plants, at least at this season, and are now a feature in borders, as since the wet they look fresh and are full of gay blooms. Spireas of all kinds seem to revel in the change, and soon the big S. Aruncus, and the charmingly rose and violet tinted S. palmata, will have their fine spikes and panicles open. The change in Pyrethrums has been great, as they not only require moisture below, but the same in the air, or they cannot get their big double blooms to expand. J. S.

My Fernery.—There was a dull, untidy corner in my greenhouse which gradually became the receptacle

My Fernery.—There was dull, untidy corner in my greenhouse which gradually became the receptacle of garden tools, pots, or whatever a lazy amateur thought it too much trouble to put away decently. I had looked at this unsavoury spot many times with a feeling of shame when a friend had heen asked in to accept a Maréchal Niel, or a bunch of Grapes. The house was L-shaped, the stem of the L having alean-tood, the foot of it a span. The aspect was south, and the back wall (north) contained the entrance. The roof of the span part was covered with a grand Maréchal Niel and Clematis rubella, so that the spot was entirely shaded. Now it happened some time before that a few huge old Portugal Laurels were cut down to the intended fernery. First, however, I collected from obscure recesses an indiscriminate aggregation of dibrit of domestic/civilisation in the shape of broken crockery, bottles, preserved meat and fruit tins, old iron, &c. If Macaulay's New Zealander should happen to exavate here he will discover, probably, some fragments of ancient pottery. These I placed in an irregular heap, and among them, in a sloping position, resting on either wall, the aforesaid naked stumps, which seemed to stretch out their hopy arms for Ferny covering. The next step was to turn to the pages of the Gardeners' Civenniet for the addresses of the enterprising gentlemen who are contioually asking us if we want 'beautiful flowers.' They could not have contrived Gardeners' Chronicle for the addresses of the enterprising gentlemen who are continually asking us if we want beautiful flowers." They could not have contrived a more cunning and insidious question. Of course I did and always have done, they are the only luxury to me indispensable; for a few shillings to he able to surround oneself and enjoy their companionship, mute it may be, but fragrant and chaste and beautiful, is a privilege, and one of my greatest delights. An envelope containing half-a-crown's worth of stamps was forthwith despatched, and in a couple of days a goods-waggon delivered at my door two thumping bagfuls of fibre dust. Mixing these with a like quantity of loam, the top spit of a meadow, and a bushel of silver-sand, my compost was complete. With some burrs I formed the intended pockets; then thrusting the loam into the intense. inrusting the foam into the interstices, and covering the dibris with 10 or 12 inches of the same, it was left a few days to settle before planting. Care had been taken to provide drainage. It is always a desideratum with me to bring home from my rambles a few Fern trophies, and I had only to look in odd corners and shady spots round my carden to find sufficient. and shady spots round my garden to find sufficient roots for stocking the fernery without having recourse roots for stocking the temery without naving recourse to the nurseries for hardy foreigners. For the larger species which occupied the lower stations I had plenty of Filix-mas and feemina (the Lady Fern), Lastrea dilatata—a grand Fern for the purposes; Hart's tongue, deliciously cool and glossy, and affording a charming contrast with the finely divided kinds;

Polystichum angulare and aculeatum, a strong tuft of Holy (Lonchitis) from Glen Tilt; Thelypteris, a delicate and charming green; the old Polypody, the Orcopteris, and the graceful hay-scented Feru, Lastrea recurva. The most difficult and refractory Feru to manage was our old friend the Bracken. Blechnum spicant required a little peat; and Cystopteris fragilis was assisted with some bits of limestone, as was also Calcareum; the limestone Polypody, Dryopteris and Phegopteris, the Oak and Beech Ferns, had a little leaf-mould, and found comfortable stations between the tufts of larger kinds. Osmunda did not do well, but was happy out-of-doors in a shady border. Asplenium viride, the green Spleenwort, and the blackstemmed variety did splendidly; and a bit of Trichomanes radicans grew fairly well in a damp shadycorner. Ceterach, the Scale Fern, was happy too in a light spot, wedged between two bits of limestone, and Adiantum nigrum öid well in the recesses of the upper region. Last of all, Capillus-Veneris, the British Maidenhair, flourished well. I had discovered some thousands of little plants in the cliff just under ______, in Cornwall. My extempore fernery was a reality, the account of it is matter of fact—no fiction: I say "was," we have left the old house since. With some trouble in constructing the fernery, and care in attending to it—though it required but little of the latter—I was rewarded with abundance of Fern fronds to help with cut flowers; and, what was formerly an eyesore and disgrace to my greenhouse, became, after the yellow Roses and Grapes, its principal feature of interest. I am thinking of constructing another, but shall confine the framework material to burrs and some lumps of limestone; I shall also contrive to have a little tank, either of cement or wood—water is an almost indispensable accessory to a picturesque fernery, both for use and ornament. T. W., Harryaw.

Acrial Roots on Vines.—I observe in Mr. Thompson's Practical Treatise on the Vine that acrial roots indicate a state of things that is not desirable, and is caused by one or two things, either the house is kept too moist, or the border too cold and wet. I also notice in your answers to correspondents (p. 686) that it is probably caused by the natural roots not being in such a thriving condition as they might be. For some time I have been very much rinterested in this subject, and have made many observations, but I am not yet satisfied as to the real cause. But I can say it is not entirely and absolutely from either of the causes above-stated; for I have two vineries here that are not in any way in the condition above-mentioned. The earliest Vines have made several acrial roots; but the border is entirely inside with a concreted bottom, plenty of drainage, and not in any way too wet or too cold. As regards the atmosphere, it has been kept with a nice growing, moist atmosphere, with plenty of air and fire-heat, so as to keep the temperature about 60° at night and 70° in the day with a rise of 10° by sun-heat. The roots in the border are in first-class condition, and are all close to the surface, feeding on a good top-dressing, which was put on in the autumn, and is now full of healthy, thriving young roots. This is the house of Grapes I wrote about in the Cardener's Chronicle with respect to the quantity I had cut after being planted three years, and they are now carrying as good a crop as any one would wish to see. I shall be very pleased to show them to any one desirous of seeing them. I might say that these same Vines measure 6 inches in circumference 2 feet from the border. The other Vines that have made acrial roots are young ones planted late last year. They were cut back to within 18 inches of the surface, and this old wood has made this season a splendid cane of 14 or 15 feet and 2 inches in circumference and the others carrying such a heavy conditions, and has been damped down as the others. I therefore

Greenhouse Plants in the Open Air.—I send you a fasciated growth of Habrothamnus Newallii and H. roscus, with growth, to show how well they are doing in a sbeltered place out-of-doors. They have been planted out two years. Last summer one shoot was close on 8 feet long, which shows how well they grow outside; but I would not recommend them to be planted out, except in very sheltered situations. Mitraria coccinea, Adenandra fragrans, Crowea saligna, Solanum jasminoides, and Hibbertia volubilis have all stood the winter unblemished; Cantua dependens, planted in strong clay loam, wis killed to the ground line in November, with 9° of frost, but I believe it will break again from the bottom; this made nearly 3 feet of growth last

summer. Choisya ternata does well here, and I have reason to think it will prove hardy in most parts of England, and will be much sought after when it is well known. F. Clark, Gr. to Mrs. Yoad, Patching, Worthing.

Chrysanthemums Prematurely Flowering.—Lange numbers of my Chrysanthemums, which should flower in November, are now throwing up flowerbuds in abundance, and I find that the same is the case in my neighbours' gardens all about these parts. They all seem affected alike—stock plants that have been left in the old pots, young plants for the coming season, pompous, and large Japances, incurved varieties, &c.—very many of all kinds display this strange and most unfortunate precocity. It affects not only the plants taken here, but very many others that I have obtained by exchange or purchase from all parts of the kingdom. A nurseryman came this morning to consult my gardener about this trouble, and told him that he had buds as large as a sixpence on plants of Grandiflorum, a late Japanese variety, that does not bloom here generally till the middle of December. What is to be done? Are we to let them grow on and flower, and have Chrysanthemum shows in August? Or are we to pinch off the buds and take our chance for a fresh crop in September for the November displays? Is this premature blooming general throughout the country? What are the great growers going to do? I should be much obliged for information. The meaning of this physiological explosion is that we have been over-feeding and over-forcing our plants; we have all been doing it, and now they have aff of the gout I James Salter, Basingfield, Basingsloke, June 11. [Cut them down half way; they will then bloom quite as well, if a trifiel aler, than under ordinary circumstances. Ed.].

The German Iris.—I seed you a specimen of the above Iris, with five falls, five standards, and all other parts of the flower equal; in my collection the freak is quite common, mostly, bowever, with four standards and four falls. I have grown a large collection of this Iris for many years, but never noticed this freak before; it may, however, be common, and I shall be glad to learn the experience of others. In Iris Kæmpferi we have this increase of petals as a fixed character, but I take it this is a passing freak in the barbata group, as the remainder of the flowers on the stalk have the normal three standards and falls. P. Barr. [A cut across the flower-stalk and ovary shows that the abnormality is due to the union of two flowers, and to the consequent suppression of one fall, one standard, one stamen, and one style. There are six cells to the ovary (twice three), showing that the suppression did not affect that organ. Ed.]

foreign Correspondence.

BOGOTÁ, AND HOW TO GET THERE. — I have been a collector of Orchids in England for the last twelve years, and on being attacked in November, 1883, by a desire to roam, the United States of Colombia and Bogotá naturally came across my mind. A Royal Mail steamboat left Southampton on December 3, and I accordingly took a cabin in her for Savanilla. Now, to find out as much about the country as I could in the short time that was left to me, and to make my preparations for the start, was a work of necessity. I called upon three of the leading London nurserymen with whom I had dealt in Orchids, but I got no really valuable information from any one of them. One told me that I should find Bogota full of Orchid bunters, and that every taproom in the place was crowded with them and Indians bringing down Odontoglossum Alexandræ and O. Lindleyanum mixed for sale, and that if I entrusted Orchids to his care, after I had paid all expenses of carriage, he would realise all that he could get for them and hand me over half the pro-Another told me that I should find O. Alexandræ in any quantity, but only to pick out the best varieties, and send them home separately labelled. The third told me that the admission to the O. Alexandræ grounds was carefully closed to all strangers, and that I should have to pay a royalty on all the plants collected.

I left Southampton in the R.M.S. Maselle, and found on board a professional Orchid hunter, a native of Bohemia, who was going out to Ecuador on a mission for his firm. We stopped two days at St. Thomas and a few hours at Port-au-Prince, in Haiti. The island of San Domingo is a magnificent island from the sea, and has never been explored by European botanists; it is governed by a Negro Republic, and it is not over sale for white people, owing to the

perpetual revolutions going on there. We arrived at amaica on Friday, December 21, and having a clear day to stay there I took my Bohemian friend for a drive to Gordonstown, and through what are called the old Botanical Gardens. We found Oucidium luridum growing in quantity, but no very large plants of it. After this we want, but no very age plants of it. After this we want through Hope Plantation, one of the Government nurseries, and under the superintendence of Mr. Morris. Both here and at the Cinchona plantations, where Mr. Morris resides, every kind of experiment in the naturalisation of useful plants, trees, and shrubs is being conducted. We left Jamaica on Sunday morning, and arrived at Colon on Tuesday (Christmas Day); on Wednesday I went for a walk round the island on which Colon is situated, but found only a Catasetum with seed-pods. On Thursday I walked with an engineering friend to Monkey Hill, where the cemetery of Colon is situated; here the trees were covered with parasites; there was Epidendrum bicornutum in any quantity, but the hollow pseudobulbs were so full of an obnoxious little black ant as to render handling them disagreeable work. Catasetums and Mormodes and an Oncidium were very plentiful, but the only plants in flower were a worthless Epidendrum sp. (I should imagine not named and not worth exporting), with a delicious

At Colon I said good-bye to my Bohemian companion, and went on to Savanilla. From thence I took the train to Barranquilla, the port and startingplace of the Magdalena steamboats. Here I had to wait four days before a steamboat was starting for Caracoli or the Bodegas de Bogota, where the mule journey to the capital commences. And now a word as to expenses. The lowest first-class fare from Southampton to Savanilla is £30, good table, wine included, at breakfast and dinner; from Savanilla to Barranquilla is &t, and from Barranquilla to Caracoli is £10, food, but no drinks, included. At the custom-house at Barranquilla 100 kilos of luggage are allowed free, but after that you must pay at the rate of 15, per pound, and as guns and cartridges weigh heavy I had a considerable amount to pay. You may take as much Tobacco and as many cigars as you please-the only duty consists in the weight of your luggage. The charge at the Victoria Hotel at Barranquilla is 6s. 8d. a-day, including a bed, early coffee at 6, breakfast at 11, and dinner at 5 P.M., and a very good bath. On board the Magdalena steamboats they provide you with food and a trussel bedstead, and you have to obtain beforehand mosquito curtains, pillows, and mats for your bed, and beer or light claret for driok at dinner. If you have a private cabin—which, by-the-bye, is of no use—you have to pay £2 extra. As the duration of the voyage is very uncertain, varying, in fact, from eight days to three months, according to the state of the river and the time of the year, I do not think the above fares excessive.

I wandered about the woods that separate Earran-quilla from Savanilla, but could find no trace of an Orchid, nor of a rattensake, which I was told I should find in quantities. I went out shooting, but could find nothing to shoot. The heat was not intolerable, as there was always during the day a nice sea breeze blowing, but the sun was very powerful, and a Panama straw hat was the best head covering. The medicines that I took with me were Cockle's pills, chlorodyne, quinine in powder, some 1-grain opium pills, and some undiluted carbolic acid. These are all necessities, and I should recommend any Orchid hunter to take these and oothing else. The less spirits one drioks in the tropics the better, but on the Magdalena River I was recommended by a very steady old stager to have a small glass of rum the first thing in the morning.

Having transferred all my bedding and traps on Lager beer and a demijohn of rum, so as to be prepared against all emergencies, I started from Barranquilla on the stern-wheel steamboat Anita on Friday morning, January 4, 1884. On Sunday we arrived at Puerto National, the port for Ocaña, three days' distance, on mules. Ocaña is the headquarters for Odontoglossum Pescatorei, and lower down, nearer the river, fis O. Roezlii and Cattleya Trianze. On Wednesday we arrived at Naré, the starting-point for Medellin—seven days' journey by mule—and the next largest town to Bogotá. Near here is the head-quarters of Odontoglossum vexillarium. At Naré I found a small yellow Oncidium, the only Orchid I found in the Magdalena valley, though I was on shore three

or four times every day for an hour each time when the vessel was taking in wood. On Friday we arrived at Caracoli, and I made a bargain with a man for three mules to take me up to Facatativá for £4, everything included, that is to say with a poon, saddle, pack saddles, and keep. This is about the usual price. The scenery up the Magdalena River is very fine, but rather monotonous, as the banks are always low. The shades of green in the foliage are very various, and relieved now and again by masses of scarlet and yellow flowers. The jungle is very dense, and can only be traversed by a frequent use of the machete, or sheaf-knife, that the Indians always carry. Monkeys are not very plentiful through the woods. Caymans, or alligators, swarm on every mud

bank all the way up the Magdalena. I started from the Bodegas de Bogota at 9.30 the next morning, having ordered my mules to be ready at 6 A.M., but this want of punctuality is most trying with the "peons." "Manara—to-morrow," is the only answer you get when you remonstrate with them. stayed the first night at El Consuelo - Consolation, having mounted 4000 feet above the Magdalena level: no Orchids about here, and the mule-path very bad all the way. I left El Consuelo at 7 the next morning, and descended 1000 feet to Guaduas, so called from the Bamboos which grow there in quantities, and of which all the houses are built. After a rest and breakfast I left Guaduas at II A.M. The road was a steady ascent for some time, then a steep descent, then a series of very stiff zigzags up to the Alto del Trigo, or Elevation of Wheat, 6500 feet above the sea. Here all tropical vegetation had died out, and nothing but barren scrub was visible; thence a descent of rather over 4000 feet was necessary to the village of Viletta, the centre of the mule trade. Coffee is largely cultivated about here. I passed my second night at Viletta at a comfortable posada, and had a good swim in the river the next morning. I left here at 7 A.M., and soon came to enormous masses of Sobralia macrantha on both sides of the path. As the road ascended various Odontoglossums were in flower of the hystrix type, and at last I came to my first Alexandræ, but it was over, and in this part of the country I never saw one in flower. A month earlier, and I should have been in time. In fact, any one coming to Colombia after Orchids should leave England in the beginning of October. Alexandræ continued almost to El Roble, or the Oak tree, at an elevation of 9000 feet above the sea level, or 600 feet above the level of the plain of Bogotá. At El Roble Oaks come upon the scene, and Bracken and Dog Oaks come upon the scene, and Bracken and Dog Roses—all mixed with Tacsonia Van Volxeni and Passiflora edulis (?). A short descent brings one upon the plain, 30 miles long, in the direction of Bogotii, and 20 miles broad—a basin of an old lake, with two silands jutting out of it, until the waters forced their way through the hull side and formed a drainage to the whole district. The passage made by the water caused the Falls of Tequludama—of which more anon. An hour from El Roble and one comes to "Los Manzanos"—the Apple trees, and about two hours from this are the Cinchona plantations of Alejandria, the property of Messrs. Heckel & Freese, of Bogotá and Milan in Italy, where the bark is sent to be transformed into Italy, where the bark is sent to be transformed into quinine. Near this plantation are to be found some of the best varieties of Alexandræ, the large, unspotted, broad sepalled and petalled varieties, with the beautiful rose-coloured blush; and it was from this neighbourhood that Messrs. Stevens received all their best varieties for sale. The inn, "Los Manzanos," forms a good headquarters for this district. From here to Bogotá there is a fair carriage road, but as I had engaged my mules to Facatativá (a name that I thought I never should have remembered)—pronounced just as it is spelt, with the accent on the last syllable—10 miles further. From here to Bogotá is 20 miles. I put upat the Fonda de Cordova, and gave my "peon" 6s. 8d., with which he was most extremely delighted—tips not being general in this part of the world.

bs. 8d., with which he was most extremely delighted—tips not being general in this part of the world. My personal expenses from Caracoli to this point, in addition to the mule hire, were under 10s.

I have transformed all the heights and distances and money into English measures, as being more suitable to my readers, but let no one come out here without a certain amount of knowledge of Spanish, or the method of the contract of without a certain amount of knowledge of Spanish, or they will be taken in tremendously. And now a word as to the honesty and civility of the people, who are nearly entirely Indian, with a little Spanish blood in them. Their honesty surpasses all belief; they never touched or attempted to touch anything of mine, even when left in saddle-hags for the night. A rum bottle was sacred to them, and there is no necessity for carrying arms, though I always did so—a loaded revolver and a large dagger being ready to my hand. E. W. Walker, E. W. Walker.

(To be continued.)

FRUIT NOTES.

LORD NAPIER NECTARINE .- Messis. Rivers & Son have sent us from Sawbridgeworth a remarkably fine forced fruit of this Nectarine. It weighed 61 oz., measured 91 inches in circumference, and was beautifully coloured and exquisitely flavoured. This variety, it will be remembered, is one of the late Mr. Rivers' seedlings, and had he raised nothing else, would have been a good monument to his memory.

THE WYEDALE PLUM.—A late bearing variety,

of good quality for cooking purposes. The fruit is about 13 inch across, oblong, rounded at both extremities, reddish-violet; flesh yellowish, sepa-rating freely from the stone. Figured in the March

number of the Florist.

PEAR, STRIPED BEURRE D'AMANLIS .- The peculiarity of this variety consists in the presence of a variable number of broad reddish streaks extending lengthwise round the Pear, and giving it a striking appearance. The good qualities of the variety are in no wise less in it than in the type. A good figure is given in the April number of the Bulletin d' Arboriculture.

PLUM, REINE CLAUDE DE BRAHY .- Fruit large, tounded; stalk short, deeply set, suture well marked; flesh golden-yellow, very juicy, sugary, with a delicious flavour, adherent to the stone. It is a sure though moderate cropper, and the fruit comes into use late in the season. Bulletin d'Arboriculture; March, 1884.

PEAR BEURRÉ ROYAL DE TURIN.—A fruit like Doyenné d'Hiver, raised in the nurseries of MM. Simon-Louis at Metz. M. Pynaert speaks of it as a superb Pear, and of great merit as to quality and pro-Its season is October and November. ductiveness. It is a large Pear-shaped fruit, a little oblique at the hase, with a thick, short stalk, and slightly depressed The skin is yellow, speckled with russetty spots, the flesh melting, sugary, pleasantly acidulous.

NOTES ON PÆONIES.—II.

Subgenus Moutan,—Shrubby. Disc produced inlo a cup enveloping the base of the carpels,

1. P. Moutan, Sims, in Bot. Mag., t. 1154; DC Prodr., i., 65; Anders., Mon., No. 1.—Stems shrubby, copiously branched. Leaflets entire at the base, often cut in the upper part into oblong acute segments, glabrous on both surfaces, moderately firm in texture, not at all decurrent on the rachis. Flowers very large, very various in colour, Carpels small, numerous, densely

Widely cultivated in China and Japan from an early date. There are numerous garden varieties, of which the principal are papaveracea, figured Andr., Bot. Rep., t. 463; Lodd., Bot. Cab., t. 547; Sims, Bot. Mag., t. 2175; Banksii, Andr., Bot. Rep., t. 448; Ker, Bot. Reg., t. 379; Sims, Bot. Mag., t. 1154; Humei, Ker, in Bot. Reg., t. 379; rosea, Andr., Bot. Rep., t. 373; Lodd., Bot. Cab., t. 1035; Rawesii, Hort. Trans., vi., 479; and Anneslei, Hort. Trans., vi., 482, 1. 7.

Subgenus II. PÆONIA PROPER.-Stems herbaceous. Roots a cluster of fusiform fibres. Disc not produced into a cup.

Section 1.-Follicles glabrous.

2. P. Wittmanniana, Stev., in Ann. Sc. Nat., 374; Boiss., Fl. Orient., i., 97; Bot. Mag., t. 6645.— Stems r-headed; lower leaves biternate, with usually not more than three segments in each division; leaflets thin in texture, often 11-2 inches broad, ovate, acute, dark green and glabrous above, hairy below. Peduncle short. Sepals unequal, orbicular, the longest more than an inch long. Petals orbicular, yellowish-white, 2 inches long. Filaments longer than the small authers. Carpels in the type glabrous, with a small ligulate spirally-curved

A native of the Caucasus and the mountains of the North of Persia. A well-marked species, still rare in cultivation. We have a specimen from Asterabad, from Professor Bunge, of a variety with hairy carpels.

3. P. obovata, Maxim., Prim. Fl. Amur, p. 29; P. oreogeton, S. Moore, in Journ. Linn. Soc., xvi., 376.— Stems glabrous, about 2 feet long. Lower leaves not more than biternate, three thin leaflets, glabrous on both sides, oblong, acute, reaching 3 inches long, 12-2 inches broad, all deltoid at the base, the leaflets not more than nine to a fully-developed leaf. Peduncle short. Re-flexing unequal, sepals an inch or more long. Corolla red-purple, as large as in P. officinalis. Follicles 2arcuate, glabrous, 1 inch long, 1 inch in diam.; stigmas small.

A native of Sachalin, Amurland, and the northern provinces of China. Not known in cultivation, so far as I am aware.

4. P. albiflora, Pallas, Fl. Ross., ii., t. 84; Anders., Monog., No. 2; DC., Prod., i., 66; P. edulis, Salisb., in Parad. Lond., t. 78.—Stems 2—3 feet long, entirely glabrous, often branched, and bearing from 2—5 flowers. Leaflets often confluent at the base, oblong, acute, reaching a length of 3—4 inches and a breadth of 1—1½ inch, quite glabrous, a deeper brighter green than the other kinds, often coloured at the edge, and the veins also red; lower leaves with about five segments in each of the three divisions. Peduncle more produced than in officinalis, with often a large simple leaf a little below the flower, and 1-2 large foliaceous acute outer sepals. Petals as large as in officinalis, very various in colour, usually white or pink. Follicles often 3-4, ovoid, arcuate, glabrous, under 1 inch long, with small spiral stigmas.

A native of Siberia, introduced long ago into cultivation. There are a crowd of garden varieties, but it does not shade off into any of the other species. It does not flower about London till June, and may easily be recognised at a glance from a distance by the dark bright colour of leaves, and the way in which its flowers, which are often more than one to a stem, nis nowers, which are often more than one to a stem, with the large simple leaves near them, stand out above the tutts of leaves. The principal named varieties are vestalis, Andr., Bot. Rep., t. 64; tatarica, Bot. Reg., t. 42; uniflora, Bot. Mag., t. 1756; Whitleyi, Ker, in Bot. Reg., t. 630; Andr., Bot. Rep., t. 612; Humei = sinensis, Sims, Bot. Mag., t. 1768; and fragrans, Bot. Reg., t. 485. It was called edulis because the roots are sometimes eaten by the Mongolian Tartars.

5. P. Brownei, Dougl., in Hook. Fl. Bor. Amer., I., 27; Brewer and S. Wats, Fl. Calif., i., 13; P. californica, Nutt.; Torrey and Gray, Fl. N. Amer., i., 41.—Quite glabrous. Stems 1-headed, not more than 1—1½ foot long, bending over till the follicles touch the ground. eaves 5-6, decompound, with very numerous small, Deaves 3—0, decompound, win very inumerous sman, oblong, obusse, or sub-acute, copiously confluent, segments 1—1 inch broad. Peduncle short, and the outer sepals often leaf-like and compound. Corolla globose, not more than 1 inch in diameter; orbicular petals not much larger than the sepals, dull red, brighter red towards the edges, Follicles 4—5, nearly straight, oblong, very leathery, glabrous, 1 inch long.

A most distinct species, hy its small globose flowers and Columbine-like leaves; the only one known in America. Its geographical range is very wide, as it extends from nearly sea level in California up nearly to the snow line on the Rocky Mountains. I am not aware that we have it now in English gardens, but it is figured in the *Botanical Register*, vol. xxv., tab, 30.

6. P. humilis, Retz., Obs., 35; Anders., Monogr., No. 8; Bot. Mag., t. 1422; DC., Prod., i., 66.—Stems 1½—2 feet long, 1-headed, hairy towards the top. Leaves five or six to a stem, the lower with twenty to thirty oblong acute copiously confluent segments 4-1 inch broad, dark green and glabrous above, pale and pubescent beneath. Peduncle short, and calyx with often r—3 very compound leaves from its base. Petals orbicular, bright red, 2 inches long. Carpels 2—3, glabrous, arcuate, 1 inch long, ½ inch in diameter; stigmas small, reflexed,

This is an old well-known inhabitant of our gardens, and is fully described in Anderson's monograph. It is not distinct from officinalis and peregrina in any broad sense. The only wild specimens I have seen are from the South of France, gathered by Petit near Perpignan. It is the P. peregrina var. leiocarpa of the French, but not of the Spanish Floras.

7. P. microcarpa, Boiss. and Reut., Pugillus, p. 3; P. 7. F. mitricarpa, Dosso, Th. Crit, p. 93; Willk. pregrina v. leiocarpa, Cosson, Pl. Crit, p. 93; Willk. et Lange, Fl. Hisp, iii., 975.—Stems 1—12 foot long, l-headed. Lower leaves with about thirty oblong, acute confluent segments \(\frac{1}{2} - \frac{3}{4} \) inch broad, very pubescent beneath. Flower solitary, the outer sepals not so compound as in humilis. Petals bright crimson. Follicles 2, glabrous, very spreading, smaller than in humilis.

A native of the mountains of Spain. A very near ally of P. humilis. I am not aware that we have it in English gardens.

8. P. coriacea, Boiss., Voy. Esp., xiv., t. 3; Willk. et Lange, Fl. Hisp., iii., 976. — Stems glabrous, r-headed, r\frac{1}{2}-2 feet long. Lowest leaves with not more than 9—13 leaflets, which are broad, oblong, acute, sometimes 2 or even 3 inches broad, firm in texture when mature, more or less glabrous on both surfaces. Calyx, with often 1—2 large compound leaves from its base. Corolla large, bright crimson. Follicles 2—3, glabrous, very spreading, above an inch long when mature. Stigmas purple, falcate.

A native of the alps of Granada, at an altitude of 5000-6000 feet above sea level; and also of the mountains of Morocco and Algeria.

9. P. cornica, Sieber Exsic. — Stems glabrous, 1-headed. Lower leaves with not more than nine thin, oblong acute leaflets, which are 1½—2 inches broad, green and glabrous on both surfaces. Calyx with 2—3 large, foliaceous, simple outer sepals. Petals large, orbicular, bright crimson. Follicles glabrous.

A native of Corsica, known to me only from a single dried specimen. There is a closely allied plant in Algeria, regarded by Munby as a variety of P. Russi. P. Cambestedessi, Willk. and Lange, F?, Hisp., iii., 976, from the Balearic Isles, is also, judging from the description, a closely allied form, but I have not seen a specimen. P. G. Baker.

(To be continued.)

FORESTRY.

NOTES ON FORESTRY.—Unlike the laws of the Medes and Persians, "which alter not," the standard laid down and strictly adhered to by all true arboriculturists regarding the exact measurements of growing trees is unfortunately too often lost sight of by the general public, and a haphazard system invented instead, the result of which is that the measurements are utterly fallacious and not of the slightest use for any practical or scientific purpose, Maoy cases of this kind have occurred lately, and not a little controversy in writing has been occasioned thereby. We would, therefore, strongly impress upon all who take an interest in the size and growth of trees, the need of a definite and uniform method of measurement.

In giving the girth of a tree give it correctly to the inch, and always state distinctly the perpendicular height at which the measurement or measurements have been taken, as unless this is done they are of no value whatever, and only lead the unwary to errone-ous and exaggerated deductions. The standard height now generally adopted by arboriculturists for measuring the girth of growing trees is 5 feet, that is when but one measurement is taken; if two, at 3 feet and 5 feet from the ground level.

Poisonous Plants .- Notwithstanding the numerous warnings to stockowners regarding the poisonous properties of Yew and other prunings, the number of deaths that can he clearly traced to this source seem annually on the increase. As certain as the spring-time comes round, when shrubbery pruning is usually in hand, we read of cases in which cattle, horses, or sheep have been poisoned by cating the prunings of Yew, Laurel, or Rhododendron, carelessly left within their reach, or, as is not unfrequently the case, deposited in the yards and fields in which they run. There can be no doubt, in fact it has been proved by experience, that half-withered prunings of Yew are far more deadly in their effect than when partaken of in a fresh state, which should be a timely warning to those who are at present engaged in "shrubbery trimming" to carefully collect all prunings, and either have them conveyed to some safe out-of-the-way place beyond the reach of farm stock, or, better still, reduced to ashes on the ground. Several cases have lately come under my notice in which horses and sheep have been poisoned by nibbling the shoots of Rhododendron and Yew; and one thing has certainly surprised me-how slow the veterinary surgeon is to detect the cause of illness or death.

FLOWERING TREES AND SHRUES.—Considering the soft and unripened state of the growth made last season by trees and shrubs, the profusion of flowers this spring is something remarkable. This is due in a great measure, no doubt, to the mild winter and spring through which we have passed. Rhododendrons and Azaleas were a perfect glow of beauty, and with such a variety of colour and shade as almost to

defy description. A bed of the former, all the best kinds, at Penrhyn Gardens, was truly a sight which few could fail but to admire. The border, or rather plot in which they have been planted was carefully prepared by Mr. Speed, and certainly the results obtained are far in excess of the labour expended. The Rhododendrons are interlined with the Cape Hyacinth (H. candicans)-and such Hyacinths ! Why last season most of them attained a height of 6 feet, which clearly shows that the peat bed and partial shelter of the Rhododendrons is just what is wanted for the successful cultivation of this stately flower, Very ornamental at present is the pure white ballshaped flowers of the Gueldres Rose (Viburnum Opulus), while the Broom and Gorse are a perfect sheet of gold. The various species of Lilac seem almost overloaded with their rich and fragrant blossoms, while the Mock Orange, Deutzias, and Laburnums, and a hundred others, for the list is far from exhausted, only show how sweet and attractive they can be when dressed in Nature's floral attire.

THE BARENESS IN BEAUTIFUL SHRUBS and trees of many gardens and pleasure-grounds along the sea coast is, I believe, far more owing to not knowing what to plant than from any disinclination on the part of the owners. The following list of trees and shrubs, which succeed well along our Welsh coast, may therefore be useful to those who have the will, but want the knowledge of such plants as will thrive in the saline air of the sea-coast garden. Amongst shrubs, the various species of Euonymus deserve the first rank, as they not only brave the cutting sea winds with impunity, but are highly ornamental as well. Others well worthy of note are :- Escallonia macrantha and E. rubra, Garrya elliptica, Tamarisk (this is perhaps the best of all), Aucuba japonica, Holly, Privet, Arbutus Uaedo, Hydrangea hortensis, Fuchsia Riccartoni, Levcesteria formosa, and Deutzias of sorts. Of forest trees we find the following to be the best :- Pinus austriaca, P. Laricio, P. pinaster, P. insignis, P. maritima, P. Cembra, and the High land Pine, P. sylvestris. Amongst hardwoods the Sycamore, Alder, Poplar, and Turkish Oak, deserve

EUCALYPTUS GLOBULUS .- Considerable attention is again being directed to this plant, as to whether or not it is sufficiently hardy to survive our winters. That it is not, was, I thought, clearly enough proved some halfa-dozen years ago, when nearly every specimen in the country was killed to the ground. In the Gardeners' Chronicle of May 31 the Eucalyptus is again brought under notice, and spoken of as being hardy, and passing unscathed through a Coroish winter. This may be true, still its half-hardy nature and non-suitability for our climate generally is well known, and the fact established beyond a doubt. In some warm, well-sheltered, maritime situations in the south of England it may and does succeed, but further north it is in most cases quite a failure, and has long since been expelled from the Arboretum. There a number of these trees were planted out experimentally over the park, but although they did well for several years, and in many cases had attained a height of from 12 to 15 feet, yet during a severe winter, some five years ago they were killed to the ground-not even one tree being left. If I remember rightly the Eucalyptus met a similar fate in Ireland at the same time. [Ves. See p. 678.]

THE CORNISH ELM (Ulmus cornubiensis) is a tree that far too seldom receives the attention its merits deserve. When viewed from a distance this tree closely resembles the Lombardy Poplar; it is, however, more branched, and the habit rarely so fastigiate. Here it attains a large size, many trees being from 70 to 80 feet in height, and girting at 3 feet up to 7 to 8 feet. In the formation of a young plantation here some years since this tree was extensively used, especially along the outskirts, where its decided character can best be seen. The difficulty of procuring the true variety, as well as its requiring to be grafted, have in most cases made young plants of the Cornish Elm very scarce and expensive. It produces seed very sparingly, and several unsuccessful attempts to raise it in this way have convinced us that at least this method of perpetuation is impracticable. wood is hard, beautifully grained, and susceptible of a fine polish. During severe gales lately several trees of this kind were blown over in the park here, and the timber used instead of the Eoglish Elm in boat building. A plank sawn from the centre of one of these trees was polished and preserved in the nursery along with a collection of woods, and the timber seems but little inferior to the species.

HISTORY OF OLD AND PICTURESQUE TREES, or of trees remarkable for their great size, rarity, or beauty is always a most interesting subject, and of value to science as well as practical forestry. the subject has received a fair share of public attention, and the dimensions of many fine old trees have been recorded in the pages of the Gardeners' Chronicle, as well as various other horticultural papers, thus affording a lasting record for comparison of the growth and longevity of our forest trees. There can be no doubt that many old and remarkable trees, growing in out-of-the-way places or in private grounds where but few frequent, have never been recorded, so that it is rather a difficult matter to state where the largest specimen of any particular tree is growing. those interested at all in the subject, the exact measuring and recording of any remarkable tree they may come across would occasion but little trouble or may come across would occasion but little trouble or inconvenience, and would be of immense benefit to science and forestry. The Scottish Arboricultural Society has done good work in this way by offering prizes for reports on "The old and remarkable trees on any estate." A. D. Webster, Penrhyn Castle, North Wales.

∯loqists' ∯lowers.

A FEAST OF PYRETHRUMS .- No better or more appropriate designation could be applied to the wonderful and unprecedented display of double and single Pyrethrums staged by Messrs. Kelway & Son, nurserymen, Langport, at the meeting of the Royal Horticultural Society on Tuesday last. It must be said, in reference to this firm, that if they take a flower in hand they make their mark with it, as witness the Gladiolus; and they are proving equally successful with the Pyrethrum, and especially with the single forms, as they are this season distributing the large number of sixty-three new varieties, some of them distinguished by great richness of colour, size, and symmetry. Some of the finest of the newer varieties of double Pyrethrums were raised at Langport. It was computed that Messrs. Kelway & Son staged about 1000 flowers in something like 200 varieties, in this way furnishing a really representative collection. To the horticulturist they possessed an absorbing interest; the ordinary visitor to the Health Exhibition stood before the flowers and hazarded all sorts of opinions as to what these flowers were, and their guesses were amusingly wide of the

The following new varieties of the present year were exhibited in fine form :- Peach, delicate blush, very fine; Shotover, lovely pink, very pretty; and Virgo, sulphur, large and fine. The two following were new of 1883, and were seen to excellent advantage on this occasion :- Marquis of Salisbury, cherry-rose, very fine and distinct; and Niobe, flesh-coloured, and full. These are all flowers raised by Messrs. Kelway & Son. The following varieties may be cited as the very finest among the double flowers :- Captain Boyton (Kelway), bright crimson, very fine; Captain Nares (Kelway), really brilliant in colour, of a very rich bright crimson; Chamois, pale chamois colour, very distinct; Duchess of Edinburgh (Kelway), mauve, extra fine; Emile Lemoine, rosy-lilac, large and full; Floribunda plena, rose; Galopin (Kelway), crimson, edged with white, very fine; Gloire d'Italie, rosy-red, very fine; Hobart Pasha (Kelway), very rich in colour, brilliant maroon, extra fine; Imbricatum plenum, crimson, very fine; Im-pératrice Charlotte, flesh, very fine; Iturbide, pur-plish-crimson, very large, bright, and of the finest form; Iveryana, bright rose; J. N. Tweedy, maroon, very fine, one of the very best ; Lady Derby (Kelway), silvery flesh, very fine; Madame Billiard, white, tinged with rose, very fine; Minerva, rose, very fine; Mons. Barrel, purplish-crimson, very large and fine; Nemesis, red, shaded with orange, very fine; Peau Rouge, rosy-red, very fine indeed; Penelope, French-white, yellow centre; Placida (Kelway), peach colour, very fine; Princesse de Metternish, pure white, very fine; Progress, crimson, bronze centre, very fine; Rembrandt (Kelway), rosy-purple, very fine; Rose Perfection, Illac, very fine; and Versailles Defiance, carmine, very fine.

Of single flowered varieties the following are all of Messrs, Kelway & Son's own raising (Where did they raise the names? Neither Editornor Reader can accept any responsibility in this case. En.]:—Abbracca, lilac, very fine; Amptilis, rose, very fine; Abantiades, rich crimson, very fine; Abdalonymus, pale purplish-crimson; Abarbarea, pale magenta, very fine; Abdatotillas, bright magenta, very strikling; Abrodcatus, magenta-crimson, very fine; Nagnania, delicate fesh, very pretty; Cerinthus, purplish-red, very fine; Devona, pink with white ring, very pretty; Endora, rich crimson, fine and striking; Gargara, carmine, very fine; Genesus, brilliant crimson, extra fine; Hippona, crimson-scarlet, very rich in colour; Labyrinthus, rosp-purple; Abæcenium, rich rose, very fine; Abodiacum, piok, pretty and attractive; Menander, purple-crimson; Nero, crimson, very fine; Opheas, brilliant crimson, very fine; Padusa, white, slightly tinted with blush—very pretty; Pasos, carmine-rose—very fine; Raphana, amaranth; Rubington of the colour; Theodotus, maroon—very fine; Colour; Theodotus, maroon—brilliant; Urion, rosy-lilac—very fine; Vestatis, bright pink; Rhodus, dark maroon; Abrocamus, magenta—very fine; Epicerdis, rosy-purple; and Cerretani blush.

It is comparatively easy to fertilise the single flowers; indeed, they seed pretty freely of themselves, but in the case of the double flowers the florets have to be cut away in order that the fertiliser may reach the necessary organs. It is from seed of double flowers that double varieties are raised; but they throw single forms also. Occasionally a double form is found in seedlings raised from seed of single varieties, but it is a very rare occurrence. The seed is sown the following spring, but it is two years before the plants flower and show their characters. Langport soil is a heavy loam resting on a bed of gravel, and this appears to suit the plants exactly. Need we say that the Pyrethrum is perfectly hardy, but it suffers more from excessive wet than from hard frost, hence the advantage of a gravel sub-soil like that at Langport. The Pyrethrum has one most determined enemy-the slug. In autumn it will secrete itself among the decaying leaves, lie there until spring, and as soon as the plants begin to put forth their young growths prey upon them, eating out the hearts of the Kelway states that after searching for slugs, and dislodging such as can be discovered, it is a good plan to place a layer of sharp sand about the plants after clearing away the dead foliage in autumn, and renewing it when necessary. R. D.

THE AURICULA.—On May 3, p. 583, I wrote on crossing the different varieties with each other to obtain certain results. It is too late in the season now to say anything more on this subject; but it is very singular that this season the raisers of seedling Auriculas, or rather those who attempt to raise them, are more numerous than I ever knew. I have had many pips and trusses sent, but not a good one-none that would beat even the ordinary named varieties. I would like to say, once for all, that really good seedlings are not likely to be had, unless the best named varieties are crossed with each other. Prince of Greens, for instance, with its pale tube, ought not to be crossed with Beeston's Apollo, also with a pale tube, but with Colonel Taylor, or even Admiral Napier, with its angular paste, would be better than a pale tubed variety. In the white-edged class Acme, John Simonite, and Conservative would make the best seed parents; while in grey-edges George Lighthody, Dr. Horner, and Silvia would do well to cross for good quality in this class. In selfs, Pizarro, Ellen Lan-caster, and Eliza will make the best crosses. The seed-pods show signs of approaching the ripening stage, and as soon as the seeds are ripe save them sow in pots or small pans, placing them in a frame or hand-light in a shady place. soil must be kept moist, when the seedling plants will appear in two or three weeks, but the largest proportion of them will not vegetate until the following spring. It is now time to see that all the repot-ting is done, if it has not already been attended to. The small offsets taken off in the spring will make good flowering plants for next year with careful culti-

THE CARNATION AND PICOTEE. — Allusion was also made at p. 583 to seedlings of these. If they were sown at the right time in April they are now

good-sized plants, and might be planted out on the irst favourable opportunity where they are to flower. After they are planted out but little more attention will be required, except to keep the ground free from weeds by occasional hocing. The named varieties grown in pots are making exceedingly good growth this year; considering the excessively quently cold weather this is rather surprising, for the Carnation, as a rule, does not like exposure to cold, drying east winds. The flower-stems should be tied to the sticks as they advance in growth, and disbudding must he attended to as soon as the buds are large enough. Leave about three flowers to bloom on each This is done to increase the size of the flowers, but if they are not intended to be cut for exhibition it is best to allow the whole of the buds to remain. Greenfly is still troublesome, and, as the buds increase in size and hot weather sets in, an invasion of thrips may be looked for. In hot dry weather it is a good plan to give them a dewiog overhead with the garden engine or a syringe.

Potting, tying, and generally looking after the wants of the perpetual flowering varieties will give occupation to the grower during this and the two following months. Some people grow them under glass all the year round; I have done so, but it is much better to put them out-of-doors in a rather sheltered place; but they must be well exposed to light and air, else they get drawn up, which is an evil to be avoided: such plants will not produce the best flowers—they are obtained from sturdy clean plants that have had the full benefit of light and air without being checked by heing exposed to draughts.

THE PINK .- June is the month for the Pink to bloom; the buds are, therefore, well advanced, at least such as we have, for quite three-fourths of them have been destroyed by wire-worm. Growers should take note of this when planting on recently brokenup meadow-land, as even with all the care and attention to trapping this pest they still destroy the plants. Many of the worms are destroyed by placing Carrots and Potatos under the surface of the ground, into which they insert themselves, and are drawn out with The blooms are much increased in size, and them. the lacing is more perfectly developed when the surface of the bed is dressed with decayed manure, and the plants well watered in dry weather. About the end of this month the pipings should be put in. They will do in the open air if dibbled into fine soil under the shady side of a wall or fence. They do better of course if a hand-light or frame can be afforded for

THE FORCING PINKS should now be in the form of good-sized plants. They do best planted in an open space of ground with about 9 inches allowed between each plant. We first put in the cuttings closely together in pots, then plant out a few inches apart in boxes, to be ultimately planted out in the open ground. They are potted into the pots they are to flower in during the month of October.

THE PANSY.—Our plants of these have been rather late in blooming, and the flowers are not very large, owing to the late cold spring and succeeding dry weather. When there is time to mulch the surface of the beds and to water freely, there is then oot much difficulty in getting good blooms. The weather is very seldom too cold for this plant. I found the wire-worm quite as destructive to the Pansies as it was to the Pinks. The plants that were in pots are now over, and if there are plenty out-of-doors the pot plants may be thrown away. Old Pansy plants give quantities of bloom, but all of it out of character. Cuttings may be put in now to flower in the autumn. For giving a mass of bloom the whole season through, seedlings are the best. They must be planted in rich deep soil a foot apart; and also be surface-dressed three times during their time of flowering, and in dry weather be well watered.

THE PHLOX AND PENTSTEMON.—These hardy plants are amongst the most useful things we have in the flower garden for the late sunmer and autumn months. The young plants of Phloxes propagated from cuttings in March should be grown on vigorously whether they are in pots or planted-out. They are both gross feeders, and require good surface dressings and plenty of water. The old plants of Pentstemons usually suffer from severe frosts in winter, so that it is necessary to propagate plants in the autumn from cuttings. This year we scarcely lost a single plant out-of-doors; but the young ones are certainly the best to produce good flower-spikes. They ough now to be planted-out. J. Donglas, Great Gearies, Hjord.

COLONIAL NOTES.

CEYLON.—We extract the following notes from the Report of the Director of the Royal Botanic Gardens, Ceylon, for the year 1883:—

COFFEE,—The transition period of the planting revolution which has been in progress here for the last few years may be now considered nearly over, and the new conditions to be in a fair way to full establishment. Coffee, which was estimated only three years ago to cover 252,000 acres, now occupies little over 178,000 acres;* and, what is more striking as evideoce of the change, very much more than half of this is being grown along with Cinchona, Tea or Cacao, a condition general preliminary only to a complete substitution of the old by the newer and more promising crop.

The export for the past commercial year (ending with September, 1883), 260,000 cwt., is the lowest for forty years, and is considerably less than half that of the previous one.

This tremendous falling off in crops is, with a due allowance for a series of had seasons, the result of leaf-disease. On estates, no doubt, this has operated indirectly as well as directly, by rendering it impossible to afford a liberal cultivation, but the terrible direct effects of continued attacks of the pest are strikingly seen in the condition of so-called "native" Coffee, the export of which has dwindled to 14,422 cwt., little over one-third of that of last year.

The complete extinction of "native" Arabian Coffee would, under present conditions, be no great loss, and as regards Hemileia, even a direct benefit; and the same may be said of that on many old and ill-tended There is indeed reason to hope, that when Coffee hecomes one crop out of several, and its cultivation, instead of occupying vast sheets of country to the exclusion of all other vegetation, becomes restricted to localities and estates where it is known to respond to good treatment, attacks of leaf-disease will be less severe and less frequent. We may hope that the fungus will then take its place with the many other more or less similar pests which afflict cultivated plants, and which, though always present, vary in mildness or severity in accordance with climatic conditions (weather) from season to season. It is to be earnestly desired that every encouragement be given to keeping up a liberal cultivation of Coffee where possible

The area, 4651 acres, given as under Liberian Coffee, shows that the cultivation of this species is slowly increasing. It appears to be allowed that its yield is, as a rule, better than that of Arabian Coffee, in spite of severe attacks of leaf-disease. A large distribution has been made to native cultivators, principally through the Government agents. From Henaratgoda garden over 40,000 seedling plants have been given out, and a smaller quantity from Pérádeniya.

TEA.—Though the progress in this cultivation was astonishingly rapid in 1882, the past year has seen a for greater extension. Ceylon exported in the commercial year (1882-3) over a million and a-hall pounds (1,522,852), and in the three closing months of 1883 probably not lesss than 150,000 lb. more. The acreage under Tea is estimated at 32,000, but on 20,000 acres of this the plants are not yet three years old. A very large proportion is, however, old Coffee land, and about 5000 estimated acres of Tea are mixed with Coffee or Cunchona.

The prospects of Tea-growing are, on the whole, very favourable, and present experience is most encouraging. From the first, when the consumption was almost entirely local, an excellent character distinguished Ceylon Tea; and its special qualities appear to be generally maintained and to be winning approbation in the home market. The fine series of samples (over eighty in number) which competed at the Colombo Agri-Horticultural Show in August, has been sent on by the Planters' Association to the Calcutta Exhibition, where they will be able to be compared with the picked Teas of India.

CINCHONA.—The export of bark from Ceyloa for the last commercial year attained the extraordinary total of nearly seven million pounds (6,925,953 jb.), and it is supposed that fully one a half million more have been exported in the three concluding months of 1883. This is a greater quantity than could have

A I take the estimates and other figures throughout this part of my report from the series carefully prepared for Ferguson's Directory for 1883-4.

been expected, but it is to be feared that a large proportion has been very poor stuff, which, at the low prices prevailing, it can scarcely have been worth while to send home. To make it profitable to sell "twigs" at 2d.—6d. a pound, needs the existence of a local manufactory in operation. This, too, would be independent of all "rings" and combinations in Europe, such as that which during the past year has succeeded in lowering the price of bark and raising the cost of quinine. A local factory for extracting alkaloids on the spot, when it is established, will indeed be an equal benefit to the growers of Cinchona and the consumers of the febrifuge alkaloids in the East; but at present it seems more likely to be set up in South India than in Ceylon.

It is estimated that there are probably 128,000,000 Cinchona trees in the Colony, of which not over 22,000,000 are more than two years old. What proportion of the remaining 106,000,000 is likely to grow up to maturity can only be guessed at, but it will pro-bably not be a large one. Much less Cinchona has been raised during this year, and it is very doubtful if the large export of the past one will be maintained.

An extensive contribution to the botany of cultivated Cinchonas is contained in a report* upon the Government plantations in the Nilgiris, which I had the honour of offering to the Government of Madras, after a visit made in May at the invitation of that Government, and with the kind sanction of His Excellency the Governor of this Colony. The most interesting question here dealt with, is the nature of the Cin-chonas known in the Nilgiris as magnifolia and pubescens. In my report for 1881, p. 5, I have referred to these kinds of Cinchona, and there proposed the name robusta for them, expressing the opinion that their local hybrid origin, as maintained by McIvor, and generally accepted in Ceylon, was more probable than the correctness of Mr. Cross statements as to their identity with the Pata de Gallinazo, of Chimborazo-i.e., C. erythrantha. Against this view it had been urged that the trees existed in the oldest plots at Naduvatam, planted in 1862, before any Cinchona had flowered in India. careful examination of these, and of the reports of the plantations, has confirmed the original opinion, and I have shown that these trees were almost certainly planted by McIvor as supplies in 1866 7, and as hybrid seedlings. I was also able to name the puzzling corky-barked species called crispa by Cross (who collected it in the Samora Mountains, east of Loxa, in 1861), lucumæsolia by Markham, and decurrentisolia by Howard. It proves to be C. Humboldtiana, Lamb., a species botanically allied to C. carabavensis (C. Pahudiana), and not likely to prove of value, Attention was also called to another corky-barked Cinchona, a form of C. officinalis, to C. lancifolia, of which a few trees still remain, and to the valuable C. pitayensis. A good deal of synonymy has been cleared up, and it is to be hoped that the nomenclature now given, the result of much trouble and research, may be generally accepted in S. India and Ceylon, where at all events uniformity ought to prevail. The practical suggestions made in the report as to the principles which should regulate the future management of the plantations-including the appointment of a quinologist, to work with the Superintendent in a system of experimental cultivation based on selection by analysis-are under the consideration of the Secretary of State.

CACAO. - The position of this product in very satiscacao.—The position of units product in the last commercial year (3588 cwt.) have actually trebled that of the year before. Of the estimated acreage (9896 acres) over a half is growing along with Coffee (mainly Liberian), and much is not in full bearing. The efforts of the last two or three years to induce a native cultivation have lately been more vigorously pushed; and encouraged by the Government officials, the natives seem at last to be more ment officials, the natives seem at last to be more favourably disposed towards it. The garden at Henaratgoda has played the important part in this attempt to supplant in suitable districts the nearly valueless native Coffee by a profitable substitute. No useful plant is more suited for the village garden than this, if only the cultivators will take the trouble to protect and look after the young plants for the first year or two; when once established little further attention is required.

INDIA-RUBBER: † CEARA .- A planted area of 977

acres is credited to this, but rubber has not yet appeared among our exports. Since it has been ascertained that the quality is excellent,* cultivators have been endeavouring to discover a means by which the milk can be obtained at a cost sufficiently low to give a return, but without, as yet, encouraging

The yield of the gutta percha trees seems to be very small-less even than the rubber trees. Thus, from a tree of Dichopsis Gutta, thought to be over 100 years old, and over 100 feet high, Mr. Wray succeeded in son, and over to feet fight, 3rt. Wray succeeded in extracting, by the ordinary native method of felling and ringing the trunk and branches, only 2 lb. 5 oz. of clean gutta. Of "Gutta Taban puth," a tree to inches in diameter gave 2 lb. 11 oz., and one of Payena Leerii, 2 fect 8 inches in circumference, only oz. Mr. Wray has satisfied himself that only about 3th part of the gutta percha actually in the bark is extracted by this method, and he believes that by pounding and boiling the bark the whole could be obtained. As the question of the supply of gutta percha is becoming a pressing one, it is to be hoped opinion. To quote Sir J. Hooker (Kew Report, 1881, p. 38), "the time cannot be far distant when the natural sources of gutta percha will be definitely used up." In view of this contingency it behoves the Governments of those few British Colonies— Ceylon being one-in which the trees will grow to lose no time in establishing plantations, which must in the future become a valuable source of revenue. But in this Colony neither in this case nor in the case of indiarubber can anything be done until a proper forest conservancy is established.

Peports of Şocieties.

Royal Horticultural : June 10.

SCIENTIFIC COMMITTEE. - Sir J. D. Hooker, SCIENTIFIC COMMITTEE.—SIT J. D. HOOKET, K.C.S.I., in the chair. Present: Messrs. Grote, Bennett, Boulger, Loder, Wilson, Pascoe, McLach-lan, Houston, Murray, Ridley, Hon, and Rev. J. T. Boscawen, Dr. Masters, Rev. G. Henslow, Secre-

tary.

Diatoms in Swimming Bath. - Rev. G. Henslow, adverting to a communication made by him to the last meeting, stated that since he had painted the glass roof of a green colour, the growths in question bad ceased.

Wallflower on Currant Bush .- Mr. G. Murray Wallfower on Currant Bush.—Mr. G. Murray reported that he had examined the specimen refered to him at the last meeting, and found that the body traversing the stem of the Black Currant was a stem, and not a root. The Wallflower seed must therefore probably have germinated in the ground, and sent up jits stem through the centre of the Currant stem, the pith of which was destroyed or partly converted into cork. There was no true epidermis on the stem, which was of two years' growth.

Inseet Pests. — Mr. Houston showed leaves of Plums devoured by larvee of Hypnomenta, which egatack also Hawthorns, Pyracanthas, &c.

attack also Hawthorns, Pyracanthas, &c.

attack also Hawthorns, Pyracanthas, &c.

**Rubus Ideats var. Leesti.—Dr. Masters showed flowering specimens of this singular variety of the Raspberry, sometimes called R. obtusifolius, sent by Mr. Culverwell, who retains his conviction that this form was raised by himself as a direct result of the fertilisation of the Raspberry by the pollen of a Strawberry—a view not endorsed by the committee. That the plant is really of hybrid origin, however, seems probable, from the fact that the carpels are almost all deformed, although the pollen in the specifict. Dr. Focke records a hybrid between R. Idæus and R. cæsius, but which does not appear to be the same as the present plant. same as the present plant.

Leeks with well-formed Bulls, Dr. Masters showed on the part of an anonymous correspondent, specimens of Leeks, some of which had globular bulls like those of an Onion. The Leek is supposed to be a gardeo variety of Allium Ampeloprasum, and these specimeos were in some part a reversion to the wild

Deformed Strawberry .- Mr. McLachlan showed a Strawberry with a deformed and contracted inflores-cence and virescent flowers. It was considered probable that it might be due to the puncture of an Acarus.

Lilies .- Mr. G. F. Wilson exhibited specimens to show how Lilies recovered after injury from frost.

Gall on Root of Bean.—Mr. G. Murray mentioned the receipt of specimens of roots of Beans affected

with Galls, the work of a weevil, associated with which were numerous Anguillulidæ, which were con-sidered as more injurious than the weevil.

sidered as more injurious than the weevil.

Monstrous Begenias.—Sir J. D. Hooker showed
small flowers of Begonia destitute of ovary, but with
stamens proceeding from the base of the styles.

Heterocism of Fungi.—Mr. Plowright sent specimens of Rostelia lacerata, artificially produced on
Hawthorn, by means of Podisoma Juniperi, also a
paper on Wheat mildew and the fungi associated with
it. (See p. 267.) (See p. 767.)
Rustelia cancellata on the Pear.—Mr. W. G. Smith

Resteria cancentata on the Fear,—Mr. W. G. Smill said that, without going so far as to say that a connection between the Roestelia and Podisoma was impossible, he might point out that Professor Farlow had shown that R. cancellata was very common in Massachusetts, whilst its supposed Rœstelia was not known to occur at all. Professor Farlow, in America, known to occur at all. Professor Farlow, in America, had never been able to artificially produce the Restelia on the Pear (the plant specially named by Oersted), but, on the contrary, the spores of Podisoma Juniperi-Sabinas, when placed on a variety of leaves, including the Pear, were followed by Spermagonia on Hawthorn only. Oersted said the Spermagonia of Hawthorn were produced by another and different species of Podisoma. Professor Farlow obtained a like result upon Hawthorn leaves after the application of the sources of Gwingsperapring biseature in biseature. like result upon Hawthorn leaves after the applica-tion of the spores of Gymnosporangium biseptum and G. macropus, both fungi being peculiar to America, and, therefore, unknown in Europe. Mr. Smith said that whilst the results of spore application were so contradictory he thought it would be well to place the heterocism of the Uredines—at any rate for the present—in a suspense account.

Formation of Tubers on Rootless Cuttings .- Mr. Burbidge sent a paper detailing how, after making outlings of Solanum Commersoni, a production of tubers on the subterranean portion was observed prior to any formation of roots, the new tuber was therefore in this case formed wholly independently of root action. (See p. 757.)

action. (See p. 757.)

FLORAL COMMITTEE, —Present in Section A: Thomas Moore, Esq, in the chair; Messrs. J. Fraser, J. Laing, F. R. Kinghorn, G. Henslow, II. Williams, J. Dominy, J. Woodbridge, E. Hill, J. O'Drien, H. Ballantine, and Dr. Masters. In Section B: Shirley Hibberd, Esq., in the chair; Messrs. J. James. W. Bealby, G. F. Wilson, G. Duffield, W. B. Kellock, H. Bennett, H. Cannell, and J. Donglas. The principal interest in the exhibition to-day centered in the great collections of hardy finwers, brought by a few well-known metropolitan growers of these now much appreciated plants; and the show of these should at least strengthen the hold they have taken of the majority of people who possess a garden, it matters not of what dimensions. Some of the subjects may not ndapt themselves to all soils and positions, and among these are mainly found such half-hardy bulbs as Babianas, Ixias, Sparaxis, and Tritonias. The best collection as regards variety and general completeness was that staged by Mr. T. S. Ware, Tottenham, which contained such a number of good things that we are constrained to name only a very few of the more striking of them. There were collections of double and single flowered Pyrethrums, of Aquilegia glandulosa, of single Poppies and Violas. Amongst the last-camed were—Blue King, deep blue with purple center; Miss Felton, which, also with purple center; Gem of Roses, deep blue; and Countess of Kintore, porcelain-blue and white—all good bedding kinds. Campanula glomerata dahurica made a fine mass of purple colour, so did Lathyrus grandiflorus of red. There was a good quantity of Cypripedium calceolus, beautifully fresh, making one wonder why so few gardeners grow it. Thermopsis fabacea was a telling group of pure yellow, much superior to Lupinus. Arrows. FLORAL COMMITTEE. - Present in Section A: group of pure yellow, much superior to Lupinus arboreus. Ixias formed perhaps the showiest and most admired genus in this and other collections. In Mr. Ware's were almost all the cultivated hybrids of these Name's were almost all the cultivated hybrids of these lovely early summer flowers. I. rosea plena is a very pretty thing, as is I. Vulcan, a white suffused with rose, and having purplish-rose stripes on the petals; I. Lady of the Lake, a rosy-purple, was likewise of great attractiveness. Good bunches of Dielytra formosa, and collections of Anemones and Iris germanica, and the highly scented white Pink, Alice Lee, were to be seen amongst this lot. A silvergilt Flora Medal or a smaller collection of hardy flowers. Foremost for beauty were some Brompton Stocks in pots, with grand spikes of bloom of nearly 1 foot in length, vigorous and sturdy, with the individual flowers thickly set, and measuring in the fullygrown flowers at the bottom of the spike quite 1\(\frac{1}{2}\) inch in diameter. The Aquilegia californica hybrida shown in this group were also of great beauty, as were the in diameter. The Aquilegia californica hybrida shown in this group were also of great beauty, as were the Ixias and Tritonias. Ixia maculosa and Babiana General Slade, of a deep purplish rose colour, were pre-emineally fine, as was Antholyza coccinea, with brilliant rosy - scarlet bloom. Pretty collections of German Irises and Pyrethrums were also included in this exhibit. A Bronze Flora Medal was awarded

Printed with G. O. No. 1189, September 26, 1883.
 † The import of caoutcho into Great Britain during 1882 amounted to nearly twenty million pounds.

^{*} I am informed that as much as 4s. a pound has been obtained for Ceylon Ceara rubber.

to Messrs. Barr & Son, Covent Garden, for an extensive group, containing collections of Pyrethrums of single and double forms; of Iris versicolor, I. neglecta, herbaceous Pæonies, a showy lot of Gladiolus byzantinus, a handsome lot of bloom of Spanish Iris of a most interesting character, Iris squalens in considerable variety as regards names, and many varieties of Iris pallida. Mixed with the more conspicuous plants were quantities of Camassia esculenta and French Ranunculuses. Allium acuminata, a neat purplish-lilae corymb of bloom; Cyclobothra pulchella, Broditea gracilis, yellow, striped with green; and Scilla ciliaris, with rosy-likae petals and lilae anthers, gold tipped, were in Messrs. Barr's collection. A Bronze Flova Medal was also nawafed to Messrs. Hooper & Co., Covent Garden, for a small group, consisting of herbaceous Pavonies, white, crimson, rose fringed, and whole petalled. P. Couronne d'Or, a double flower, the centre petals being tipped with rose—a distinct and pleasing variety; a collection of German Irises. A Bronze Flora Medal was awarded to Messrs. Kelway & Son, Langport, Somerset, for a very extensive collection of the best new and old Pyrethrums, Poppies, and herbaceous Pæonies. Seedling Amaryllis were shown by them, and if not up to the high standard we are accustomed to see from Messrs. Veitch, Williams, and others, there were undoubtedly great advances on old varieties seen Messrs. Veitch, Williams, and others, there were undoubtedly great advances on old varieties seen amongst them. We noticed Maximentius, a crimson antings them. We hother backments, a crimage starlet; stripe on a white ground; Abontes, an orange-scarlet; Bellona, a finely shaped deep crimson bloom of much apparent substance; Tricoris, a crimson, with a broad regular formed band running down each petal; Bellona, a finely shaped deep crimson bloom of much apparent substance; Tricoris, a crimson, with a broad regular formed band runoing down each petal; Volana, a cinnabar-red; Herald, white, striped with crimson; and Neptune, also a crimson of good form. From Messrs. Cannell & Sons, Swanley, there came a bright little boxful of cut blooms of Begonia hybrida, among which were some of stellate form that were very handsome. The three varieties of this form are Clovis, a cinnabar-red, the petals irregularly serrated, and a centre of greyish-green similarly formed petals; Berenice, a bright scarlet flower. Other cut blooms of Begonias were Duchesse de Gallière; Rosamonde, large and fall, with, as it were, several centres; Fulgurante, a deep crimson-scarlet, of pleasing proportions; Mons. Bauer, and Karl XII., a tazza-like bloom, showy and distinct. A collection of Pansy blooms came from the same exhibitor, and received a Vote of Thanks. Mr. J. Rapley, gr. to J. Brand, Esq., Bedford Hill House, Balham, staged a group of Calceolarias, consisting of dwarf plants of yellow and parti-coloured blooms, and the pure yellow Cloth of Gold, for which he obtained a Bronz-Banksian Medal. Mr. J. James, The Nursery, Woodside, Farnham Royal, received a Vote of Thanks for cut blooms of Calceolarias of high quality, the strain of which was Highly Commended. Mr. Stacey, nuryscryman, Dumow, showed a good stand of Verbenas, for one of which, Lord Brooke—a very bright scarlet with a bold white eye—he obtained a First-class Certificate. Mr. Stevens, St. John's Nursery, Putney, showed a new Abultion of full size and colour named Lustrous, and received for the same a Vote of Thanks. Messrs. Paul & Son, Cheshutt, showed the new Tea Rose, Souvenir de Thérése Levet, bright rose shaded with crimson; and Mr. Ware, Papaver nudicanle album and P. miniatum, an orange-tinted bloom. Messrs, J. Veitch & Sons thisted Weigela hortensis nivea, a pure white; Dr. II. Baillon, a dark red; Kalmia latiolia major splendens, a distinct deeper coloured variety of boughast galeate, a desirte wat handsome John of this very useful Fir and the pretty Veronica Lyalli, the correctness of the name being questioned. Mr. S. Williams brought a neat compact example of Metrosideros floribunda alba, a white flowered Bottlerush, for which a Vote of Thanks was given. From Syon House, Mr. Woodbridgebroughtan Ornithogalum called caudatum, an introduction from the Cape, with large dense heads of fine paper-white flowers, which the plant produces with great freedom. A very large form of Oncidium Marshallianum, named giganteum, came from G. N. Wyatt, Esq., Lake House, Cheltenham; and Messrs. Sander & Cockhibited and received First-class Certificates for two grand forms of Odontoglossum crispum. The variety Souvenir du Prince Leopold is a fine white shaded with manve, and the lip blotched with brown; oc. c. roseum guttatum is of fine size and shape, heavily spotted with pale brown. Messrs. Cannell & Sons received First-class Certificates for two fine Begonias—Madame Castiguez, large full double, and bright rosy-cerise in colour; and Lucie Lemoine, a very double white, quite a miniature Hollyhock in shape. Messrs John Laing & Co. bad a very prett double primrose-coloured Begonia, named Canary Bird, which also obtained the coveted award. Statice Swarowii, a miniature growing plant with branched spikes of small rose-pink flowers, came from Messrs. James

Carter & Co. Mr. Hill, gr. to Sir N. de Rothschild, Tring Park, brought a very fine Cattleya gigas with eleven lovely flowers, for which he received a Cultural Commendation.

The awards made were :-

Section A.

FIRST-CLASS CERTIFICATES.

To Messrs, Sander & Co., for Odontoglossum crispum

To Messrs, Sander & Co., for Odontoglossum crispum roseum guitatum.

To Messrs, Sander & Co., for Odontoglossum crispum Sonvenir du Prince Leopold.

To Messrs, Veitch & Sons, for Kalmia latifolia major

splendens.
SECOND-CLASS CERTIFICATE.

To Messrs. James Carter & Co., for Statice Suwarowii.

FIRST-CLASS CERTIFICATES.

To Messrs, John Laing & Co., for Begonia, Canary

To Messrs, H. Cannell & Sons, for Begonia, Madame Castaiguez.
To Messrs, H. Cannell & Sons, for Begonia, Lucie

Lemoine.
To Mr. W. Stacey, for Verbena, Lord Brooke.

HIGHLY COMMENDED.

Mr. J. James' strain of herbaceous Calceolarias,

FRUIT COMMITTEE,—Present: II. Webb, Esq., in the chair; Messrs. H. J. Veitch, R. Hogg, W. Paul, J. Roberts, J. Burnett. G. Bunyard, J. Smith, G. T. Miles, S. Lyon, G. Paul, P. Crowley, R. D. Blackmore, and J. Lee. The labours of this committee were very light, and but few objects brought before them call for special comment. A number of Melons were exhibited, the best being the Chalfont Favourite, a green-fleshed seedling between Victory Meloos were exhibited, the best being the Chairon Favourite, a green-fleshed seedling between Victory of Bath and a scarlet-fleshed seedling, exhibited by Mr. Herrin, gr. to T. N. Hibbert, Esq., Chalfont Park, Slough. It came out 1st in several good competitions last year, and is handsomely netted, besides being high-flavoured. Mr. Butler, gr. to G. Arlett, Esq., Manor Wood, Hatfield, sent a fine dish of Esq., Manor Wood, Royal George Peaches.

SCOTLAND: Temperature.—During the week ending June 7, the highest temperature was 67°, 3, at Paisley; at Aberdeen the highest was 60°. The general mean was 64°, 6.

The lowest temperature in the week was 37°, at Perth; at Leith the lowest temperature was 44°.9.

The general mean was 42°.

The mean temperature was highest at Paisley, 52°.9; and lowest at Aberdeen, 51°. The general

nean was 5f. 9. general mean was 5f. 10 general mean was 5f. 9. Rain.—The largest fall was 1.04 inch, at Paisley; the smallest fall was 0.10 inch, at Dundee. The general mean fall was 0.43 inch.

JAMES GLAISHER, F.R.S.

Variorum.

GARDENING .- The amateur gardener may profitably bear in mind that success in gardening is like success in life, inasmuch as the secret of success depends, in great measure, on attention to little things. We obtain our plants from all sorts of places-from rocky heights, from humid valleys, from snowy plains, and from warm water-courses-and yet we expect them all to thrive under nearly the same conditions within the boundaries of one garden. And the wonder is that many of them do thrive under conditions that appear so very different to those they were adapted for by Nature. But their adaptiveness is a limited quantity, and it is an important part of the business of the cultivator to discover the limits, so that he may not kill his pets by subjecting them to conditions at variance with their requirements. Two amateurs of hardy Ferns agreed to make an attempt to grow the true Maidenhair Fern in a London garden, and they both bought plants of the same trades-man for experiment. One planted his delicate pet in a nice snug corner of the rockery, and, having followed the teaching of a book as to the mode of planting, he waited and hoped for the best. The other followed the teaching of the book as regards the suitable soil

and so forth, but, having reflected on the frail constitution of the plant, he proceeded to evolve out of his consciousness conditions of which the other had not thought. He made a miniature cave with slabs of stone on edge, thus enclosing the delicate Fern in a kind of open stone box. As winter approached, he laid another slab over the box, thus making a close cave of it, the plant still obtaining sufficient light and air through the rough apertures where the fittings were imperfect. The plant so easily disposed of by No. 1 disappeared during the first winter, and was seen no more. The plant of No. 2 lived and grew, and became a grand specimen, and was displayed to visitors, living all alone, like a jolly hermit, in its substantial cave, through the large chinks of which it laughed at the frost and defied the winds; and when it spoke -as of course it often did-the subject of its discourse was the importance to the gardener of things that thoughtless people call "trifles." "Familiar Garden Flowers," by Shirley Hibberd.

MYRTUS PIMENTA, LIN. - This fine Spice tree grows at some leagues from the lagoon of Sante Comapan, on the detritus of volcanic eruptions in this district, which has its rainy and dry seasons.

The leaves resemble those of a Camellia, except that they are elongated; they give off a heavy aromatic persume when crushed in the hand. The tree is bertome when trushed in the hand. The free is 8—10 m, in height; as it grows isolated it forms a majestic pyramid; its bark peels of annually, like that of the Plane. The young bark is quite smooth, and of a greyish-white colour, so that the tree can be distinguished afar off in the forest. The flowers are white, like those of the Myrtle; the fruits constitute brown Pea-like bodies, which are sold in the shops under the name of "Jamaica Pimento." I can only recommend my readers not to he led by the size of the fruit when huying, as there exists in commerce Pimento of a larger size but much less value. Those rimento of a larger size but much less value. Those of our trees are smaller; they are gathered before complete maturity, after which they are carefully dried in the sun. Their scent is strong and powerful, but aromatic and agreeable, more noticeable in the valves (?) than in the seeds, Roesl, in "La Belgique Hotticole."

Enquiries.

"He that questioneth much shall learn much."-BACON.

WALNUTS.—I shall feel obliged if any reader can inform me of the best means of obtaining a large quantuy of seed Walnuts for planning on an estate of mine in Florida. I should want them specially selected from healthy trees this season, and of the fine paper-shell variety. Wm. Newton.

Answers to Correspondents.

APPLE TREES INJURED: IV. Gallop. We think the damage must have been done by frost. The fact of the fruit-spurs being more full of sap than the woodshoots accounts for their being the most injured.

ASPARACUS AND PEACH LEAVES: T. B. No Asparagus should be cut when the produce is of the size sent. Either the bed is exhausted by excessive cutting to too late a date, or the plants are too young, or the cultivation has not been understood. In respect to the Peach leaves, it is a very bad case of "cul," due to the presence of a fungus often described in these columns, for which there is no knowo cure. Cut the affected leaves clean away, carefully place them in a box or bag, and then as carefully burn them.

BIFRENARIA AURANTIACA: A. J. T. Grow it on a raft, with some peat and moss about its roots, and in a Cattleya-house temperature.

a Catterya-tionse temperature.

Brighton Flower Show: Exhibitor. The authorities have no doubt consulted their own—or, rather, the interests of the Society—as they are fully entitled to do; and if their regulations do not suit the convenience of exhibitors the latter can defend themselves by staying away. A society in debt cannot always consider the exhibitors only, though of course, as a matter of policy, they should do so as far as they can.

GUMMING IN CUCUMBERS: Market Gardener and Enquirer. This is a disease that has given much trouble for some years, and for which a practical remedy has not yet been found.

has not yet been found.

INSECTS: F. B. The insect which has eaten your Gardenia buds "in the same way that the Rose magnet destroys. Rose buds" (which is a state of things which I should hardly have expected from the insect sent), is a Brazilian species of grasshopper which has lately been imported into our greenhouses and hothouses, and done much mischief. A description and figure will appear shortly in our pages. I. O. W.—T. Worth. One of the species of Ottorhynchus. If you found it eating the top of a Dendrobium Wardianum you may take it for granted "it will do harm to the plants." That must be obvious,

LILY OF THE VALLEY: B. B. We cannot see that the flowers sent are different in any way from the ordinary type, of which they are by no means good examples, although it may be possible to see some slight variations in growing plants, as may also be observed in any other genera. Under good cultivation the same variety may be grown to treble the size of the specimen sent.

ANCHESTER BOTANICAL AND HORTICULTURAL SHOW.—In the report at p. 749 the 2d prize for eight stove and greenhouse plants in flower is stated to have been awarded to Lord Wilton, gr. Mr. Baillie, while it was really won by Ino. Rylands, Esc., whose gardener is Mr. George Smith, and not Mr. George Roberts, as inadvertently given in another paragraph. MANCHESTER

in was feath with the development of the design of the design of the design and t

Nepenthes Rafflesiana: H. H. G. It is the usual rule for this species to form two kinds of pitchers on the same plant.

ORCHIDS: Ireland & Thomson. A fine form of Cattleya Mossice, with good broad petals, the colour rich and pure, and the lip bright and showy.

PANSY: A. We do not see anything out of the common in your seedling.

Roses AT ShireCliffe Hall: Erratum, At p. 704, for "40" blooms on Magna Charta, read "80." THE LONDON PLANE: A. Decidedly not Platanus occidentalis, but the acerifolia variety of P. orientalis.

THUIA AUREA: An Old Subscriber. Our advice is to leave the plant alone till the end of July, and then to cut the shoots back as far as is desirable with a knife. On no account clip the bush with shears, unless you wish to utterly spoil it sa papearance.

THUIA LOBBIT: X. What is grown as this is generally either the true Thuia gigantea, or a variety—one of the many—of T. occidentalis. It would be best to do away with the name altogether, for, like Mrs. 'Arris, it is a myth.

WEEPING WILLOW: C. The species is of Chinese origin. The Babylonian Willow, so called, is probably Populus cuphratica.

SEEDS.

LONDON: June 11.—There was but a poor attendance on the seed market to-day, and very little business was done. For the time being there is no consunptive sowing demand, and as yet no speculative enquiry of importance has sprung up. New French Trifolium has now begun to offer. There is a moderate trade passing in Mustard and Rape seed. The sale for spring Tares continues. Bird seeds show no material alteration, John Saku & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN,

At Mark Lane, on Monday, there was only a moderate inquiry for Wheat. Good qualities of English were tarily steady in value, but secondary sorts met no attention. Imported Wheats mostly sustained the previous Monday's value, and Australian showed rather firmer prices. Flour met but a limited inquiry, and remained without quotable change in value. In Barley no change was made in quotations. Maize on the week was rather lower. Peas were written tr. lower. In Oats, common Russian were rather easier, but fine stont qualities rather dearer.—Wednesday's trade was very slow in every department. Wheat and Flour met very little inquiry, and prices remained nominally unchanged, but the tendency was against holders. Barley met less inquiry than recently, and Maize was rather in favour of buyers. Beans and Peas were quiet and unchanged. For common Cast the market continues flat, but for good qualities him.—Average prices of corn for the week ending June 7:—Wheat, 37s. Barley, 27s. 1st. (2018, 21s. 4st. 4st.; Barley, 28s. 2st.) cod.

The following prices have been obtained at market during the week:—Magnum Bonums, 70s. to 100s.; Regents, 6co. to 70s.; Champions, 20s. to 70s. per 10s. Maltas, 7s. to 7s. 6d, per owt.; new—Jerseys, 7s. to 13s. per ewt.; Lisbons, 7s. per ewt.—The imports into London last week consisted of 568 packages 294 baskets from St. Nazaire, 30 cases 10s to boxes Malta, 2 cases Gothenburg, 2164 packages Jersey, 285 cases Bordeaux, 54 packages Lisbon, 349 packages Valencia, and 27 bags from Eoulogne.

COALS.

The following are the prices current at market during the week:—East Wylam, 150; Broomhill West Hartley, 145; Walls End—Hetton, 165; 6d.; Hetton Lyons, 155; Lambon, 165; Pear, 155; Tees, 165, 6d.; East Hartlepool, 156, 9d.; South Hartlepool, 155, 3d.

Government Stock.—Consols closed on Monday at 99% to cos for delivery, and 994% to 100% for the account. Tuesday's prices were as on the previous day for delivery, and 69% to 100 for the account. The linal quotations of Wcdnesday were, 99% to 99% to 90% for delivery, and 99% to 99% for the account. The last quotations on Thursday were 99% to 99% for delivery, and as on the previous day for the account. These quotations are ex div.

Oil Paint No Longer Necessary,

HILL AND SMITH'S BLACK VARNISH,

for Preserving Ironwork, Wood, or Stone.

(Registred Trans Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is folly two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled initiators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is nosed cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many boundered of the Nobility and Gentry, from whom the most Sold in Casks of about 90 gallons each, at 1s 6th per gallon, at the Manufactory, or 1s. 8tf, per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTINONIAL.

SHANKS'S PATENT LAWN MOWERS FOR 1884.

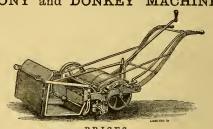

The only Lawn Mower fitted with Double-Edged Sole Plate, which enables the cutting parts to last twice as long as in other Machines. These Machines are in use in the Royal Gardene at Kew, Hampton Court, Osborne and Balmoral, in most of the Public Parks and Gardene in the Kingdom, and in almost all the Royal Gardene in Europe.

SHANKS'S PATENT LAWN MOWERS are the most suitable for English Lawn. They have now been before the Public for many years, and stand unrivalled. These Machines are early worked, not liable to get out of order, and will make the Lawn as smooth as velvet.

Gardeners' Chronicle.

SATURDAY, JUNE 21, 1884.

PETWORTH AND THE PERCIES.

THE compilation of an extended history of I the family of Percy would prove an elaborate work. Only a short account can be given here, having special reference to a few of the most prominent of the family, and to their visits to their southern residence at Petworth. The acquisition of this fine Sussex property dates from the Conquest, when "Alsgernon Percy, so called from being heavily whiskered, obtained a grant of 10,000 acres of land here, after Hastings, and resided in the park, as his heirs did after him, for about 300 years. The northern name of Northumberland was first bestowed on the Percies in 1377, when the father of Hotspur was created earl of that county. Till then they had been, so far as their title was concerned, a Sussex family-Barons of Petworth.

In this somewhat gossipping chronicle we have now to relate that the Baron of Petworth of his day fought at Lewes on the king's side, and was taken prisoner by De Montfort. His successor, the fifth lord, won distinction both as a statesman and a soldier, and his seal, with the lion rampant and his motto "Esperance," was attached in the year 1300 to the letter to Pope Boniface VIII. which declared the independence of the Crown of England. The same lion rampant was conspicuous in most of the battles of that period, including Bannockburn. A distinguished crusader, William Percy, must be mentioned as having first adopted the family badge of the crescent, conspicuous at Alnwick, and still the sign of the "Halfmoon Inn," the principal inn of Petworth. His banner, says a

"Swept the shores of Judah's seas, And waved in gales of Galilee.

Henry Percy's lion rampant, also prominent in tented fields, gave its name to the "Blue Lion" of Petworth, and a rampant lion carved in store lords it on a parapet of Sion House, and on the top of the "Tenantry Column" at Alnwick. The Percies probably always had a residence at Petworth, the original dwelling being a stronghold of the usual type; but castle building, without royal licence, was prohibited in the reign of Henry II., and the fifth lord was constrained to seek the necessary licence "to fortify and krenallate with a wall of stone and lime his manors of Spofford and Lekynfield, in the county of York, and Petworth, in the county of Sussex." The fortified residence at the latter place stood on the hill in the park, and some old Chestnut trees in front of the cricket ground mark its site. Henry, the fifth lord, died in 1315.

The great achievement of the sixth lord was the victory at Nevill's Cross, where he commanded the first division of the English Army, ronted the Scots, and captured their king. In 1324 Edward II., who gave permission to "krenallate" the dwelling-house, arrived at Petworth from Horsham on September 6, taking Newbridge, in the parish of Pulborough,

in his way. The retinue of a king at that time has been compared to the tail of a comet for length, and the household charges at Petworth on the following day reached the sum of £11 2s. 3d. The king was fond of fruit, and accordingly the rector of Petworth presented him with seven score Pears. William de la Zouche, ancestor of Lord de la Zouche, of Parham Park-famous for its heronry-sent him four score and sixteen nuts of St. Philibert, twenty-eight flagons of wine grown at Chiltington, some beer, two carcases of oxen, four swans, and six herons. On Friday there was a fish dinner, and the tenant and neighbours sent in eels, trout-not then in season, and one only sent -pike, bream, and mullets-the grey mullets of the Arun. The king gave Nicholas, the harper, 20s. that day, Nicholas being a musician who came in the suite of the Lady Camoys. On the Saturday the king departed for Hamp-

We have now to relate that in 1330 a proctor of the Pope came to Petworth from Slindon, after endeavouring to serve a papal writ on the Archbishop of Canterbury, who had a manor there. Six gallons of cold water had been poured upon him on his producing the writ, and he had ridden over the hills with his party, hunted by the Archbishop's retainers with whips and halloos and vexatious blowing of horns. At Petworth his reception was not a gracious one, and he was imprisoned for three days.

The sixth lord died in 1352. Henry, the seventh lord, fought at Crecy, and was the custodian of David Bruce, and a statesman of

mark. He died in 1368.

With the eighth Lord of Petworth, father of Hotspur, a long era of misfortune commenced, dating partly from the trial of Wycliffe, when, the Londoners siding on that occasion with their Bishop, Northumberland House attacked and entered by the mob. The Duke of Lancaster, the Earl, and John de Ypres, were dining at the time at Ypres Inn, when a messenger brought the news that the Londoners were upon them, the Duke "being then at his oysters." They ran for their lives, reached the river, and arrived by boat at Kingston, the Duke with broken shins, having tumbled over a form, as history relates, and "broken both his shins for haste." Northumberland soon after resigned the office of Earl Marshall. The part he played at Bosworth, and his share in deposing Richard II., are notorious in history, and in Shakespeare's Richard II.; and we shall only say further of this very turbulent gentleman, that he rebelled for the third and last time after the Battle of Shrewsbury, and shortly afterwards lost his head.

One of the most interesting memorials at Petworth is the sword of Hotspur, which Shakespeare makes the reckless hero draw at Shrewsbury, exclaiming:—

"Here draw I A sword whose temper I intend to stain With the best blood that I can meet withal, In the adventure of this perilous day. Now Biperance! Percy, and set on: Sound all the lofty instruments of war; And by that music let us all embrace: For (Heav'n to earth) some of us never shall A second time do such a contresic."

After Hotspur's death, in his forty-first year, his wife, the gentle Kate, came to Petworth, married Lord Camoys, and was buried in the neighbourhood at Trotten Church, with her second husband. Hotspur's son, the second Earl, restored to his honours by Henry V., became the very popular hero of Chevy Chase, and was twice killed, once in poetry and once in prose. On the first occasion, Sir Hugh Montgomery, a Scottish knight:—

"Well mounted on a gallant steed, Ran fiercely through the fight; And through Earl Percy's body Thrust his hateful spear. With such a vehement force and might He did his body gore, The staff ran through the other side A large cloth yard and more."

In point of fact the second earl fell fighting on the Lancastrian side at the battle of St. Albans, 1455. Thomas, a son of his, born at Leconfield, was created first Lord Egremont and fell at Northampton in 1460. The eldest son Henry, who was born at Leconfield, was Queen Margaret's Captain-General in the North, commanded at Towton, and there fell during a slaughter unequalled in the annals of our civil wars, in 1461.

The five last-mentioned Percies having fallen in battle, or on the scaffold, the next earl was murdered in a popular uprising; the next was the most conspicuous of the nobles at the splendid court of Henry VIII., and the author of *The Northumberland Household Book*, entitled "The Regulations and Establishment of the Household of Henry Algernon Percy, the Fifth Earl of Northumberland, at his Castles of Wresil and Lekinfield (Leconfield) in Yorkshire: begun A.D. 1512."

He died in 1527. There is nothing to say of the sixth earl, except that he died of a broken heart on the execution of his brother for treason. In 1552, King Edward VI. came to Petworth: its owner had not conformed to the new faith, and his Sussex manor was in the hands of the crown. The king entered the county on July 21, coming from Guildford and passing from Petworth to Cowdray and Halmaker. were 4000 persons in his train, "enough," says a spectator of the pageant, "to eat up the country, especially as there was little meadow nor hay," the district being densely wooded. The king entered Petworth with his guards amid a stirring blast of trumpets; his yeomen grooms and pages wore the well-known scarlet livery, and carried their halberts, bows, and iavelins.

Edward remained at Petworth fournights, and, writing to his favourite companion—his whipping boy, Barnaby Fitzpatrick, then in France—he says:—"Whereas you have been occupied in killing your enemies, in long marchings, in pained journeys, in extreme heat, in sore skirmishings, and divers assaults, we have been killing of wild bestes, in pleasant journeys, in good fare, in viewing of fair countries, and rather have sought how to fortify our own (Portsmouth) than to spoil another man's." The sympathetic youth who wrote this letter died within a year of his tour in Sussex, having kept up his correspondence with Fitzpatrick to the last.

On the accession of Queen Mary, the seventh lord of Petworth, being a Catholic like his pre-decessors, was created Baron Percy of Cockermouth and Petworth, and seventh earl of Northumberland by re-creation. In the Protestant reign of Queen Elizabeth the tables turned upon the seventh lord, and once more the Percy of the period was beheaded, leaving behind his brother the eighth lord. Another royal visit to Petworth was contemplated in 1583, when the Queen reached Cowdray in the immediate neighbourhood, and would have come on to Petworth but for a letter from its owner, conveying to Walsingham various excuses, such as want of time for the preparations, my lady's health, and the shocking state of the roads. Some time after this he fell under suspicion as a Catholic, and was commanded by the Council "to keep his house." Having half-a-dozen houses he selected one at Blackfriars, where he remained unmolested, riding frequently down to Petworth. At that time the ancient castle in the park was still standing, but the site of the family residence was the same as at present. The wide space in front was laid out with straight gravel-walks, low walls, terraces, and parterres, planted with clipped shrubs.

site of the stables, which, according to Fuller, were the "best of any subjects in Christendom," is now covered by the lake.

The Earl was one of the greatest of the Elizabethan builders, and such a man should have died at home in the midst of his improvements, but unfortunately he brought on himself a sadder fate by tampering in futile Catholic plots. He was not a very dangerous conspirator, but a certain Charles Paget was his companion, and unfortunately for the Earl this man-crossing the Channel, and landing on the coast of Sussex -was conducted to Petworth by Shelley of Michelgrove. Treasonable conversations followed, and were duly reported to Burleigh by a spy, a pretented priest, who joined the gentlemen over their wine. One night Percy and his friends were all arrested, and the unfortunate Earl found himself caged in the Tower, with his friend Shelley in a neighbouring dungeon. There are two stories as to the prisoner's death. According to the official account, he shot himself with a dag, or pistol; the other statement, which was more generally believed, was that he died of the plunge of a knife. He was found in bed undressed, with his clothes in perfect order, and the bed quilt decently drawn about him.

We must here pause to mention, with due praise, Henry, ninth earl and twenty-first baron of his line, who, to catalogue his merits briefly, was a gallant soldier, whom Raleigh himself respected, a man of letters, and the patron and warm friend of all true scholars. Spenser admired him, and sent him a sonnet and a copy of his Fairy Queen. Bacon praised him in a letter still extant. Sion House, which had been previously rented off the Crown, was settled on him for his distinguished public services, and here and at Petworth the accomplished peer, clever, popular, and wealthy, trained his plants and sported with his children. There were four children, all destined to be famous-Algernon, afterwards tenth earl, and one of the heroes of the Civil War; Henry, Lord Percy of Alnwick, the favourite cavalier of Queen Maria Henriette; Lucy, Countess of Carlisle, the friend of Stratford and of Pyne, and the subject of a thousand rapturous songs; and Dorothy, the mother of Algernon Sydney.

Like his predecessors, the earl was a Papist, and on the occasion of the Gunpowder Plot he fell under suspicion. Guy Fawkes had ridden down to Sion House, it was said, to report the official searching of the cellars beneath the Houses of Parliament. When accused, the earl pleaded his secluded habits, his Sussex life, love of children, gardening, and books; but in spite of those pleas he was committed to the Tower, where several of his predecessors had been "done to death" privately, or had passed to the block through its Byeward Gate. The Beauchamp and Bloody Towers in the fortress were dark with traditions of the family, which in this short narrative have not been noticed.

The earl's sentence was a harsh one-imprisonment for life. He resided in the Martin Tower, on the north-east angle of the Ballium Wall, where his friend, the astronomer Heriot, shared his lodgings, while Robert Haes and Walter Warner, and a host of scholars and men of science, were his constant visitors. Happily the restraint of the Martin Tower improved the Earl's character by enlarging his knowledge, diminishing his pride, and softening his heart. His wife had not been able to reside with him at Petworth through "incompatibility of temper;" she came to him in prison, and found him a very good husband, far better in the shadow of adversity than he had been in the sunshine of prosperity. They became, with their offspring, a united and a happy family, their two pretty children were the spoilt favourites of all the inmates of the Tower who had access to them, and as they grew up the Earl hired the adjoining Brick Tower of

the Master of the Ordnance, as a residence for Algernon. In due time they fell in love—Algernon with a Cecil, and Lucy with a Hay, the future Earl of Carlisle, and the prisoner, though softened by his situation, objected to both marriages. "The blood of Percy," he said, "would not mix with the blood of Cecil if you poured them into a ditch," and he sent word to Hay that his daughter should never get a penny from his purse if she married without her father's leave. The young people, however, married immediately. The King honoured their nuptials with his presence, and his bridal present was a promise that the Earl should be liberated.

After fifteen years imprisonment he was "fetched away" in a coach and six, when he immediately retired to Petworth, and lived once more the old Sussex life with his friend Heriot, corresponding with Kepler on the laws of vision, on the sun spots and the satellites of Jupiter. He died and was buried at Petworth in 1632. An appropriate epitaph for his monment would be—"Student, sorcerer, swordsman, scholar; given alike to play and pleasure; prompt and saucy with blade and tongue; prompt and saucy with growing to the still haunts the Martin Tower. Heriot's sundial is still on the wall, and the terrace connecting the Earl's lodging with the Brick Tower and Constable's Tower is still called the Earl of Northumberland's Walk. H. E.

(To be continued.)

A NEW FRITILLARY AND IRIS FROM TROY.

Amongst the discoveries which have been made in connection with the expedition to Troy of Dr. Schliemann is a new species of Fritillary, of which specimens have just been distributed by the collector Sintenis, under the name of Fritillaria Schliemanni, Ascherson and Sintenis. It belongs to the small group with an undivided style, and of the species in cultivation most resembles F. tullpifolia and dasyphylla. It has six to eight alternate leaves, the lower oblong-lanceolate and obtuse, the upper lanceolate and acute, a one-headed stem under a foot long, with a single drooping flower, a yellowish-green perianth, without any distinct tessellation; stameas not more than half as long as the perianth, and a clavate ovary with six acutely-angled ribs. A fine new Iris has also been found. It is closely allied to I, spuria and Guldenstaeditana, and has been named Iris Kerneriana. T. G. E.

MULE PINKS.

THE numerous groups of these useful plants do not receive the attention they deserve, for they are rarely grown. They are wonderfully free of bloom, very showy in the open border, and most useful for cutting from. How and when the mule Pinks first originated is perhaps not exactly known, possibly the perpetual Carnation and Sweet William have lent their influence in the origination of this strain. The new varieties which occasionally appear are of Continental origin; one of the best though not the newest, for it first put an appearance some twentyyears ago, is Dianthus hybridus multiflorus. still grown, and it produces its medium-sized, well formed rosy-pink flowers with great profusion, doing well in the open border, and being also very use-When planted out it forms a dense ful in pots. compact tuft of dark green herbage, attaining a height of 6 inches or so. From amongst this rise up numerous flower-stems, sturdy and freely branched, bearing a profusion of sweet-scented flowers, varying somewhat in shade according to their age, and the act of cutting appears to induce the plant to throw up successional flower-stems. There is this decided gain in this variety, that it is decidedly more perennial in habit than any which preceded it. From this, there is every reason to believe, have proceeded other varieties, among them one named Napoleon III. This is a late introduction of exceptional merit, and it well deserves a place in every garden suited to it, for it is invaluable both for border use and for cultivation in pots, having a dwarf, bushy habit, being very freeflowering, and producing large quantities of dazzling double crimson flowers. Mr. Roberts is growing it somewhat largely at Gunnersbury Park for cutting purposes, and praises it very highly. It was shown in two or three of the collections of hardy herbaceous plants at Manchester, but not in the best condition, having, apparently, been forced into bloom. Another hybrid mule Pink is Dianthus Atkinsoni, said to be one of the oldest, but has remained unnoticed, and therefore scarce for a long time; in colour it is a vivid carmine-crimson, and very striking, with larger flowers than is usually seen in this There are several varieties of these mule Pinks : the two named, with a very good white, are among the best; and our object in calling attention to them is to indicate a class of plants well deserving of a more extended cultivation.

MR, B. S. WILLIAMS' NURSERY.

CALL when we will at the Victoria Nursery, we are certain to find some good plants in bloom to reward us for our trouble, and should our genial friend, the proprietor, be at home, so much the more does a draw on his inexhaustible stock of Orchid lore enhance the pleasure of a visit, The Orchid trade with Mr. Williams has always been a large one, but even his great resources have to be continually increased, to keep pace with the demand for these lovely and interesting plants. The latest addition to the "Orchid area" is the long span-roofed structure formerly devoted to hard-wooded greenhouse plants, which has been converted ioto a Cattleyahouse, and well the plants seem to have taken to their new domicile. This, like all Mr. Williams' Orchid-honses, has the shading fixed well above the glass, which, even in the hottest weather, keeps the houses "nice and cool." The shading material used, too, also demands another word of recommendation, so well does it answer the duty required of it, to break the glare of the sun's rays while admitting plenty of light. Being made of cotton, too, it has the further merit of lasting longer than other shadings of a textile character to recommend it.

In the Cattleya-houses at the end of last week there were some fine types of C. Mossiæ in flower, and enough of them to make any house gay. Varieties of C. Mendelii were also plentiful, and, as usual, well varied in colour, the darkest of all being of a particularly rich deep shade. C. Warnerii and grand C. gigas also claim notice, and specially so does a plant of the true Lælia Brysiana, a showy Brazilian species often confounded with L. purpurata, from which it is distinct both in the shape and colour of its flowers. Cattleya Mossiæ kermesina, a distinct and pretty variety, is noticeable from the presence of so little of the yellow colouring in the throat, and the rich mauve colour of the sepals and petals. One of the forms of C. gigas—not an over-free-flowering species, by the way—has a very rich, broad, open lip, reminding one much of that of Sobralia macrantha. Near by the latter was C. Mossiæ Hardyana, the curiously dappled petals of which render it distinct and attractive amongst others.

In the Vanda-house, the inmates of which seldom look better than at this season, are still some fine fresh flowering plants of the useful Calanthe veratrifolia, some of which have been in bloom since February last. The rare Anguloa Ruckeri sanguinea is also noted in flower, and attracts attention by reason of its peculiar colour—a shade of red not common among Orchids—and strong seent. A good specimen of Cypripedium Stonei, several examples of Vanda teres, and the scarce Aérides Larpentæ are all in flower; and on a strong plant of Vanda Batemanni a grand spike is approaching the flowering stage.

In the cool houses the Masdevallias provide the richest display of bright colours, such species as amabilis, Harryana, ignea, and Veitchii, in numbers, contributing most to the show at this season. The Odontoglossums, as usual, make a strong claim upon our "bump of admiration" as fine spikes here and there of O. crispum, O. cordatum, O. citrosmum, O. Pescatorei, in good varieties, come under review.

The New Holland plants having been ousted from their former abode by the Orchids, Mr. Williams is building a new house for them—a long, wide, span-roofed structure, in two divisions, with every modern improvement that experience warrants the adoption of, and which when completed will be one of the features of the cursery. We noted also that the old Camellia-house at the bottom of the nursery has been adapted for the cultivation of greenhouse Rhododendrons, a class of handsome free-flowering evergreen shrubs which are rapidly becoming popular, thanks to the beautiful acvelties that hybridists have lately put into commerce. The house is filled with a thritty lot of plants, with not a few good "specimens" among

All the houses now are in their summer dress, and the clean, thrifty character of the occupants claims a passing word of praise. In the Palm-house Mr. Williams directed our attention to the merits of Phoenix rupicola, a handsome Palm, which grows more slowly than P. reclinata, and is therefore better adapted for ordinary sized houses than a plant that soon grows "too big for the place." Asplenium candatum, sometimes called A. longissimum, which resembles a Goniophlebium in habit, with fronds 4 feet long, and proliferous at the tips, was pointed out as "a grand basket Fern." The scarce old Brainea insignis, the young fronds of which are of a reddishbronze colour; a fine specimen of Adiantum Williamsii, showing its value as an exhibition plant; the neat little Adiantum mundulum, and the miniature growing Lygodium microphyllum, differing so much in its size from the scandens section, are also pointed out in the fernery as plants worth notice. We have several times called attention to Amaryllis Mrs. Garfield, a very pretty and free flowering variety, introduced by Mr. Williams, and have now to mention another acquisition in the same way. This is Amaryllis Mrs. William Lee, which like the first - named belongs to the reticulata type, and is a genuine "gardeners' plant," insomuch that it seems never to have done flowering or to be out of season. It is evergreen, remarkably freeflowering, will stand almost any amount of heat, and in colour is pink with deep rose-coloured venation.

HERBACEOUS PÆONIES.

Mr. T. S. WARE's remarkable groups of hardy flowers and the marvellous display of Pyrethrums set up by Messrs. Kelway & Son, possessed such an absorbing interest for visitors at the meeting of the Royal Horticultural Society on the 10th inst., that it is not to be wondered at that the blossoms of herbaceous Pæonias that were shown by Messrs. Kelway, Messrs. Hooper & Co., and others, received less attention than they deserved. It is wonderful with what rapidity new varieties are on the increase. Those who think that the crimson flowered forms we are accustomed to see in borders are the sole representatives of a group, will be surprised to learn that Messrs, Kelway & Son this season catalogue 250 varieties, and of these sixty-three are new single and forty-one new double varieties of their own raising, which are being sent out for the first time this year. This rate of production is somewhat astounding, and is calculated to give something like a scare to oldfashioned gardeners, who can remember that fifty years or so ago the number of species and varieties did not much exceed twenty. The shades of colour seen in the new varieties show much variety. Some are blood-red, some purple, some rose, and then down to white there are many soft tints, such as pink, flesh, satiny-white, salmon, &c. — all very pleasing indeed, and forming an admirable contrast to the varieties with rich coloured flowers.

Among the new double varieties shown by Messrs. Kelway & Son were Adelaide, pure white—very fine; Bacelus, rosy-purple; Frigidus, rose and white; Hadraoum, satiny-rose; Macella, pink, with yellow centre; and Papinus, crimson-purple. In Messrs. Hooper & Co.'s stand were some very fine forms, but it was difficult to obtain the names, which was a matter for regret. How extensively Messrs. Kelway & Son grow seedlings may be imagined from the fact that they have this season planted out some 2000 to 3000, which are in bloom, or will flower this year. This firm appear to go systematically to work, as they carefully fertilise the finest varieties. But a considerable amount of patience is needed, for the seed does not germinate under twelve months, and then some three or four years pass before the seedlings

flower and their characters can be ascertained. The patience shown by the Langport firm, and the amount of labour they have expended on the improvement of this fine old-fashioned flower, have been rewarded by the production of varieties worthy of extended cultivation. But in how few gardens are they seen.

Now that hardy plants are receiving a greater share of attention than they did a few years ago, there is a chance of these herbaceous Pæonies rising to a higher level of popularity than they have yet reached. And it is scarcely necessary to add that all that is required to grow them well is a rich deep loam, some shade, and plenty of space in which to develope themselves, and then the plants become objects of conspicuous beauty. A stiff soil suits them better than a light one, and if the clumps are covered over with some mulching in October or November, when the foliage has died down, they will be greatly benefited. May frosts are apt to injure the buds of the Pæonies, and it is a good plan to slightly syringe the plants when frost is deposited on them, taking care to do so before the morning sun shines directly upon the foliage, R. D.

NOTES BY THE WAY.

SOME LEIGESTRESHIRE GARDENS. — There are three of these that appear to me to deserve recognition in the pages of the Gardeners' Chronicle. They are not especially noteworthy perhaps as examples of horticultural skill, yet interesting and instructive nevertheless, as the means of education for the young, quiet contemplation for those who weary of the turmoil of busy life, and a solace and delightful recreation for the aged. Being in the neighbourhood lately, I visited each of these gardens. The first is attached to the Desford Industrial School; the second surrounds the monastery of St. Bernard; the last consists of the allotments adjoining Wyggeston's Hospital at Leicester.

DESFORD INDUSTRIAL SCHOOL. - About five years ago the Leicester School Board determined to provide an asylum for the waifs and straysi.e., the truants—of their busy and prosperous town. The school buildings consist of an extensive and picturesque group of rooms, workshops, farm-stead, &c., standing on a breezy hill half a mile from Desford station. These are surrounded by 60 acres of pasture, arable, and garden ground, the whole of which is cultivated by the boy inmates (nearly 221), under the control and guidance of well qualified labour masters. Every one of these, with the exception of a few employed in the engine-room, must dig, or beg and be ashamed. But little or no compulsion is needed, pure, fresh air, healthy exercise, and a sense of freedom in the open-air workshop, engenders a feeling of self respect and trustworthiness which breeds contentment and promises well for the future. The boys work in relays of twenty. The gardens consists of 26 acres planted with the usual crops, interspersed with rows of standard Apples and Plums, and large breadths of bush fruits and Strawberries. Not the least advantage to the great midland town, beyond an ultimate saving of rates, must be the largely increased supply of freshly gathered vegetables and fruit. It is the intention, moreover, to grow flowers also of the commoner kinds, for sale. On asking the intelligent labour-master why such prominence was given to gardening in the industrial programme of the school, he replied, "A man with some knowledge of gardening never need be idle : there is always something for him to do, especially if he happened to have an allotment or garden of his In Leicester and Nottingham the greater number of workmen have gardens, and then if he emigrated, as many of the inmates do after leaving, there was a trade in their hands at once. A good many people have gardens, and don't know how to till them." Of course in so large an establishment there must be the strictest regard for order and discipline. Every clothing, his towels, brushes, &c., and especially of whatever tools or implements he may use in the course of the day. course of the day. "A place for everything and everything in its place," is a motto not only hung upon the walls of the school-room, but enforced upon the farm and garden. I observed some small plots for flowers which were managed entirely by the boys themselves, small prizes being

given for the best planted and most tidily kept plots. It would be well, however, to put at the disposal of the boys portions of 6 poles or more each, allowing the boys the entire control of them, and letting them take the whole of the profits. The tenancy of such plots should be given to the most industrious and intelligent of the boys, as a kind of reward or prize. The land consists of a heavy loam with clay subsoil, but it appears to be under thorough cultivation; and altogether, with school, workships, farm, and gardens, this noble institution reflects the highest credit upon all concerned, both the School Board which initiated it, and those more immediately associated with its control and management.

THE MONASTERY GARDENS, St. BERNARD .-Charnwood Forest reminds one in its ancient desolation, its granite tors, its bleak moorland and subalpine vegetation, of Dartmoor. It lacks the Heather, however, which clothes the moorland in late summer with purple robes. One can imagine, when glancing round here and there on the apparently unreclaimable soil, what sort of a land it was ere those sturdy selfdenying toilers, the monks of St. Bernard, snatched acre by acre from the desolation, struggled, unmurmuring, stone-laden, up the rugged slopes, and piled their burdens in long straight lines of partition walls. Two hundred acres have thus been saved. The grave and venerable men who did this useful work have long since gone to their rest, within the Vew-enclosed graveyard, but some, at least, of their works remain. A portion of the desert "blossoms as a Rose." As we approach the monastery five monks proceed in single file to their afternoon labours in yonder Wheat field. I see them now bending at the hoe in dignified silencenot a voice seems to break the solemnity of a fine summer afternoon, not a gesture nor a glance escapes the toilers as the lark flutters along the springing corn and mounts in the blue lift above them, filling the air with music. Round one of the lichen-stained tors the brothers have planted a series of small gardens enclosed by Yew, Cypress, and Laurel hedges, and on the rugged central tor. with its green-grey mosses-Nature piled in picturesque confusion-stands the emblem of the Christian faith. The rocky ledges and crevices around the main mass are tastefully, because naturally, planted with Cupressus, Irish Yew, and Bay trees. A roughly hewa stone path leads to the plateau on which the Cross stands.

This part of the garden is in the highest degree impressive. It is known as Mount Calvary. Beyond the Cross, and here and there under a dome of leaves a statue of the Virgin, there is nothing to remind one of the presence of a monastery—no gaudy colour or gilding or tinsel: the garden is a series of quaint and sombre yet graceful vignettes. Here is a brother pulling some ecormous Leeks for the mid-day potage; then another clipping a Vew hedge. Old-fashioned flowers border the stone paved paths, for the most part sombre hued. Only in one soot was there a patch of brilliant colour, Tulips, Hyacinths, and Natcissus. But as I endeavoured to initiate a conversation upon the plants in his little greechouse—the only one, by the way, that was to be seen—he gravely shook his head. Speech to the visitor is forbidden except through the authorised conductor.

The neighbourhood of Whitnick and Coalville is the scene of thriving collieries. It was pleasant to see what capital gardens some of the colliers had, and several of them well furnished greenhouses. Eleven acres of rough forest land had been let out in allottments at the modest reot of £2 per acre after the first three years. During the reclamation no rent was charged.

THE HOSPITAL GARDEN.—About 300 years ago a rich brewer, one William Wyggeston, bequeathed part of his large fortune—for even then brewers made fortunes—for the endowment of a hospital for decayed tradesmen or their widows. The funds, however, got into wrong hands, as was usual with endowments for charitable purposes, educational or otherwise. Radical Leicester, however, insisted on its rights, and sufficient has been saved from the week to build and endow a most successful school, of which the town may well be proud. Another portion of the salvage has been applied in accordance with the benevulent donor's wishes in founding a harbour of refuge for the aged townsfolk aforesaid. It was a happy thought to provide a garden for each inmate. There are twelve men and twelve women in all, and each is

allowed a plot of land 8 poles in extent. They are all, with the exception of a blind inmate and a very old person, cultivated by the tenants themselves, and every one has a small plot for flowers and Strawberries. One old man, whom I remember as a market gardener at Leicester forty years ago, is still as enthusiastic a florist as ever. There are few occupations of which it can be said that one never tires; music is one, and anglers say their recreation is another; but surely gardening may claim pre-eminence in this respect. This eighty-four-year-old gardener watches his opening seedlings, principally Paosies, Polyan-thuses, and Auriculas—though he is proud of his seed ling Potatos also-with as much keen interest and delight as ever, and he adds to his modest luxuries by the sale of them. The gardens, therefore, are a source of profit as well as of quiet, healthy recreation. When one considers that the average age of these fourand-twenty gardeners is something over seventy-five. there is a strong testimony to the longevity of the frateroity. T. W., Harrow.

STREPTOSOLEN JAMESONI.

THIS is a showy greenhouse plant, native of New Grenada, and introduced as long ago as 1846. of shrubby habit, with rugose ovate leaves and terminal heads of showy orange-coloured tubular flowers, whose general appearance may be gleaned from our illustration (fig. 147). It was formerly called Browallia Jamesoni, and under that name was figured and described in the Botanical Magazine, t. 4605, but it differs from Browallia in the inflorescence and the position of the tube of the corolla. The plant had very much gone out of cultivation, if, indeed, it had not been lost altogether, and we are indebted for its reintroduction to M. Aodré. Mr. Cannell exhibited it in flower at a recent meeting of the Floral Committee, where its free blooming habit and bright pleasing colour attracted much notice from plant growers generally.

VEGETABLE PRODUCTS OF LOANDA.

CONSUL COHEN, reporting on the products of Loanda, states that the cultivation-or, more correctly, the collection-of ground-nuts (Arachis hypogea), which had for a few years back dwindled down to a fraction, has again revived, and might, if properly attended to, form one of the most valuable staples of the colony, notwithstanding its very inferior quality when compared to the produce of other countries. The reason is obvious. It can hardly be said that this valuable plant is cultivated in this colony, except in some very rare and few localities. It is merely collected from the wild plant by women and children. The plant, never improved by careful cultivation, has never yielded good nuts, which would certainly be the case in the singularly rich soil of this country if it were carefully planted from selected forms. The natives of the interior, from their habits of iodolence and indifference, only cultivate the Mandioca plant and the Sugar-cane, but generally to supply their immediate wants. Many important and extensive plantations have been made of the Sugarcane, but almost exclusively for the manufacture and distillation of rum, which is preferred by the natives, and commands a higher price than the spirit usually imported from Hamburgh under the name of white rum.

The manufacture of sugar in this colony has never been thought of, notwithstanding the facilities for cultivation of the cane, and the immense interest that would certainly be derived from an outlay of capital for that purpose.

The palm oil, which has now become one of the most important staples of the colony, is collected from the fruit or kernel of the Palm (Eleis guinecasis), which grows wild throughout this province. Notwithstanding the many applications, and the utility of its production, it is never cultivated by the natives; they simply collect what the wild plant yields, and never for a moment think of henefiting the plant or tree. The yield in itself is enormous; each bunch, or spadix, will yield from 500 to 1000 kernels [fruits], or "dendems," as the natives call them. Theo, instead of improving this plant, the natives destroy it by extracting from the tree the juice or sap, of which they manufacture one of their favourite drinks.

The Caoutchouc, or Indiarubber, grows wild and

FIG. 147.—STREPTOSOLEN JAMESONI: FLOWERS BRIGHT ORANGE. (SEE P. 796.)

in abundance throughout the interior. If it were properly or prudently attended to, the produce of rubber would in a very few years be immense; but the natives have in many places reacted the fable of the goose with the golden egg, by destroying the tree in their greed of obtaining a larger supply of liquid, which has almost exterminated the tree in many places.

Cotton has not attained the cultivation or attention that it was anticipated and hoped it would receive; but it has been cultivated almost exclusively by Europeans who introduced it, which accounts for its having already supplanted the ground-outs in value exported, and would become still more important and valuable if the pickers were taught to collect with more care and attention to cleanliness, which would greatly enhance its value in the European market.

Coffee continues to be the grand staple of the colony, and would certainly increase in value if the Coffee of certain districts were fairly and impartially compared with the best Coffee in the European markets; but, unfortunately for the interests of the colony, the commercial body—or, rather, the metropolitan or home Government—has not taken any real interest in the matter, and never even thought of having it presented or compared at the great Coffee fair held last year. While Coffee from every part of the world was examined, compared, and tasted, not even a sample was shown, or a word said about the Coffee of Angola. Some districts of this province produce a very superior quality, which commands preference in a general market.

Another article that has but very recently been brought to the market with a promising future is the Tobacco of this colony. It has been known for many

years growing wild in the interior, and used only as snuff by the natives; but in 1877 an active and enterprising merchant of this place, attracted by the superior quality of the leaf, established a manufactory of cigars and smoking tobacco in this city, and, owing alone to his untiring activity, wading through all impediments and endless obstructions, has succeeded in improving the natural article, and produced a smoking Tobacco which has become very popular throughout the province, selling at about 2:. 4d. Per Ib., besides cigars and cigarettes. There are four distinct qualities of Tobacco in the province. The first quality in every respect is the Ambacca, being equal, If not superior, to the Havanah, especially for cigars, the leaf being very large and very fine. It is highly aromatic and mild, never causing salivation. When collected with more care, and better known in the manufacturing world, it will be much sought after.

The Dande, the second quality, much resembles the Virginia, and in many samples is more aromatic. The Quanza, or third quality, closely resembles the Turkish tobacco, lightly aromatic, and at the same time very mild, and therefore well adapted for cigar-Then the Congo, or fourth quality, is a mixture of two qualities; one very similar to good Kentucky, and the other the Dutch tobacco; but as it comes mostly from the interior, and is conducted with very little care or attention, it is not improved by the handling it now gets.

The natives smoke the leaves of a plant they call Liamba (Cannabis sativa). It is highly narcotic and stupefying, the inveterate smoker becoming idiotic and useless in a very few years. Its action is much more violent than that of Opium. Many Europeans have been addicted to its use, attracted by its stimulating or inebriating qualities.

THE STRAWBERRY CROP.

ITS COMPOSITION AND REQUIREMENTS.

THE Strawberry ranks as an exhausting crop, because it ordinarily requires considerable mulching and high-manuring to make it successful. This highmanuring is necessary partly because the plants, in order to make their culture remunerative, must grow rapidly at the fruiting season, and must therefore be plentifully fed with those substances which agricultural chemistry has of late years made so prominent in the minds of intelligent farmers-namely, nitrogen, potash, phosphoric acid, and lime.

In an analysis of the Strawberry Pierre found that 100 lb. of ripe fruit would yield 4.38 lb. of ash, and on submitting this ash to further chemical analysis he obtained the following data :-

Comfosition of the Ash of Strawberry Fruit.

							P	er ceot.
Potash								40.3
Soda								1.8
Lime					٠			16.7
Magnes	ia							1.5
Oxide o								7.8
Phosphi	oric a	cid						11.1
Silica								3.1
Sulphui	ic ac	id, car	bonic .	acid,	and chi	orine		17.7
							_	

This investigation by Isidore Pierre was made in 1862 at Caen, in France, with the variety known as Comte de Paris, and is described in his Agronomie, t. 2, p. 156.

Professor Pierre also gives a stalement of the composition, exclusive of water, of the total yield per hectare of fruit taken up to June 30, and of leaves, stems, and runners, taken up to the middle of August of the same year. These results, calculated to pounds per acre, may be stated as follows:—The quantity of fresh fruit (which Pierre considered to be rather below the actual produce of his land) amounted in round numbers to 11,000 lb. per acre. The entire plants were reckoned to contain 62.3 per cent. of water, and the Vines 30 per ceot.

Composition of a Strawberry Crop (Roots Excepted)

Before entering upon a consideration of these figures let us see what constituents would be removed from the soil by the growth of ordinary farm crops. Potash, phosphoric acid, lime, and nitrogen are by far the most important elements of plant-food, so we will confine our attention to these.

Weight and Average Composition of Selected Farm Crops, in Pounds, per Acre.

Description of crop.		Weight of crop dry.	Potash.	Phosphoric acid.	Lime.	Nitrogeo.
		Lb.	Lb.	Lb.	Lb	Lb.

These figures show that if the whole crop of Strawberries-plants and fruit combined-were removed, it would take from the land more dry matter [dry matter is that which remains after the watery and gaseous portions have been driven off by heat] than an average crop of either Wheat, Beans, white Turnips, or Potatos; four times more potash than Wheat, and very much more than either by Beans or Potatos, but less than with white Turnips. Of phosphoric acid the Strawberry would abstract from the soil nearly twice as much as Wheat, and more than either Beans, white Turnips, or Potatos. Of lime, Strawberries remove ten times more than an average crop of Wheat, three times more than a full crop of Beans, four times more than Potatos, and half as much again as white Turnips. Of nitrogen, the Strawberry would im-poverish the land twice as much as Wheat, rather more than Beans, half as much more as Potatos, but 15 lb. per acre less than white Turnips.

If we regard the fruit only, and compare the com-position with that of Wheat grain, Bean corn, Turnip bulbs, and Potato tubers, which is the part usually removed and sold from the farm, the case is quite different, but in a practical point of view the foregoing figures are extremely useful and instructive, and will repay careful study.

Comparison between the Composition of 1 Ton of Farmyard

Dung and 1 Ton of Strawberry Fruit.

	Potash.	Phosphoric acid.	Lime.	Nitrogen,	
1	Lb.	Lb.	Lb.	Lb.	
Farmyard dung	11	8	16	12	
Strawberry fruit	39	**	16	32	
Fruit more than manure	28	3	0	20	

The three substances-potash, phosphoric acid, and lime-are perfectly soluble in water. When added to the soil they enter into combination with it, which, though insoluble in water, can be taken up readily by the roots of plants. If, therefore, these ingredients are applied to the land, and for any reason the plants do not take them up, they remain there until they are wanted.

Certainly there should be no difficulty in restoring to the soil the substances removed by an average crop of Strawberries.

Such a restoration as we have intimated in the above table is all that is needful, if the fruit only be exported. As it should be the aim of every gardener both to enrich his soil and to preserve it from impoverishment, the old Strawberry vines, runners, and roots should be put into a suitable compost and returned to the land. In this case, except in first establishing the planting, or in raising plants for market, the farm or garden suffers no loss but that of the fruit, and from a consideration of the com-

parison between one lon of farmyard dung and one ton of Strawberries, it can be seen that from 3000 to 3500 lb. of good stable manure is sufficient to make good what the fruit removes.

A light dressing of Peruvian guano dug in be-tween the rows, or watering the plants with a weak solution of sulphate of ammonia, will much improve

solution of sulphate of ammonia, will much improve the crop on poor soil.

A Strawberry field too highly manured may give a good crop when the weather is, by its coolness and dryness, just favourable to vegetation, but may fail of its crop when the heat and moisture at the flowering and further than a cross-size.

its crop when the heat and moisture at the flowering and fruiting time are excessive.

The New Jersey State Agricultural Report publishes the following particulars of the successful growth of Strawberies by Mr. P. T. Quinn, of Newark: —

"After a crop of Early Rose Potatos, heavily manured, dug and marketed in the end of July and beginning of August, lurrows half-a-yard apart, and 4 to 5 inches deep, are opened with a plough. Between August 15 and 22, Strawberry plants of the Charles Downing and Green Prolific sorts are set in these furrows 15 to 18 inches apart; weeds are kept down by two turns of the cultivator between the rows, and twice boeing. In December the plants are covered with a light well-decomposed compost, made of sweepings of the vegetable and fish markets, and some stable dung. Towards the middle of April the coarse sweepings of the vegetable and hish markets, and some stable dung. Towards the middle of April the coarse portions of the manure are raked from the plaots, and left between the rows; salted hay is laid under the then luxuriant leaves to prevent undue evaporation from the soil, and to keep the fruit clean. The average yield of Strawberries by this method is stated to be 5487 quarts per imperial acre."

EDINBURGH PARKS AND GARDENS.

EDINBURGH, with its quarter of a million of inhabitants, and soon to be reinforced by visitors to the Forestry Exhibition and crowds of tourists, does not seem to need the same extent of park and pleasure-ground space as other cities of similar population. Its admirable site, where hill and dale are blended together in pleasing proportions, together with the braciog influence from the waters of the Firth of Forth, immediately in proximity, offers more than average security for the prolongation of life, even where crowded tenements prevail. And then, unlike most cities, there are no crowds of chimney-stacks belching forth their hostile volumes of smoke to begrime the face or affect the lungs; everything, even to a stranger, points to it, not as a manufacturing city, but as the chief centre of law, light, and learning of Scotland. In the midst however of wealth there is also squalid poverty, and even the well-to-do working classes who inhabit the roomier and better of these seven to eight storeyed tenements, which make the old town of Edinburgh very conspicuous, are physically better, and consequently better tempered, if they have parks and pleasure-grounds within easy distance of their homes to promenade in. And the same may be said of the respectable middle class. They soon get tired of looking at the Regalia or Mons Meg, or John Knox's house, or St. Giles', or even Holyrood Palace and Chapel with all its grim associations open fields, well-kept drives and walks, trees, shrubs, and plants, and the delightful greensward are more in their way; and hence the municipal authorities of the city, faithful to the behests of their constituents, have done much, and seem to be doing much more, to extend pleasure ground space for the health and recreation of the inhabitants.

Meaotime there is in keeping, under the care of the Corporation, Prince's Street Gardens, divided by the National Gallery into an area of about 35 acres in the centre of the city-that is, dividiog the old from the new town—Calton Hill, extending to over 20 acres, in the East, and Regent Road paddock immediately adjoining covering over 3 acres. On the south there are The Meadows, with an area of 73 acres, and Brunts-field Links immediately adjoining with an area of over 32 acres; and then Stockbridge in the northwest, with an area of over 20 acres. In addition to this there are several squares and open spaces amounting in the aggregate to about 10 acres, all well-kept and suitably decorated, each of considerable importance to the families residing about and around Blackford Ifill, which has been recently acquired, extends to about 107 acres, and lies due south from the centre of the city, commanding a splendid bird's-eye view from its eminences. If to this we add the Queen's Park, which is purely Government property, extending to about 640 acres, there is a strong case made out for the citizens of

^{*} Warrington's Chemistry of the Farm.

Edinburgh enjoying exceptional advantages in this way, and yet we were told that the keeping up of all does not cost 1td. in the pound; and what seems anomalous about it is, the money spent, unlike some of our larger towns, is taken from a common-good fund, instead of being charged directly under a special Parks' trust.

When the stranger is ushered into the city from either of the two termini, the first open space to command attention is the Prince's Street Gardens. These separate in the most successfully undulating way possible the old from the new town-springing from the drive, substantially railed off, running along the street of the city-Prince's Street-and dipping deep down into the gulley, through which the North British Railway glides, rising up somewhat precipitously to the famous rocky eminence-Edinburgh Castle, and the Mound. These gardens have been transformed in conformity with the wants of the age in recent years, a spacious promenade forming one of the most distinguishing features having for its central object at the one end the famous Sir Walter Scott Monument by the self-taught genius Kemp, and St. John's Church on the other, where the celebrated Dean Ramsay so long officiated. The trees in the glade, that are going on grandly, are firstly and chiefly Corstorphine Plane (Golden Sycamore), than which there is not a more ornamental subject among trees, and when in young foliation is ofquite a rich golden colour-as rich in colour and far more handsome in lealage than the Balsam Poplar. Huntingdon and Canadiao, Willows, and the Sycamore are the more conspicuous trees. They all stand out in relief, not being crowded, which is advantageous for park trees, either in gardens of this kind or about the more pretentious demesne. A good scope of grass well kept is a desideratum, and together with the heds of flowering and ornamental plaots give a character to any formal piece of ground. The great slopes receding from the Prince's Street side have been planted with the Irish Ivy relieved at

Passing out of the railed enclosure, the next thing to command observation is the Waverley Gardens, which are merely the roof covering of the Waverley Market, where all the floral, fishery, and other exhibitions of importance are held—the finest thing in the way for this sort of exhibition in the kingdom. This space covers 2 acres, and is a unique piece of elaborate decoration—from the outer railing to the raised flower heds encased in stone nicely decorated both winter and summer.

intervals with the green and gold blotched Aucubas,

and although some of the townsfolk with irrational

ideas about them would rather have it torn out and

mixed with some such thiog, set down in a higgledy-

piggledy way, as Whin and Furze, we in turn would

rather have such things relegated to the fine stony

ridges of the Calton Hill or Arthur's Seat. We quite

agree with the designer, that the place for natural

plantations is not alongside piles of Grecian and

Gothic architecture.

Moving out and along the Portobello Road we come upon the Calton Ifill. From this elevation there is a magnificent prospect of both the city and the Forth. Some little additional expense might be advantageously incurred here, in the way of improving its somewhat hare appearance. Possibly the city authorities are content to keep it in an unfinished state, like the National Monument on its crown; pity that it should be so, for it is one of the first places that a stranger would elect to go to, and it is surely better to have a few parks well clothed and well kept than a lot in an unfurnished unkempt state. The monuments of Nelson, Dugald Stewart, the tutor of Brougham, Palmerston, and others, might have a little more of tree life about them, and the rocky slopes, which have been recently engaging attention, would be vastly more attractive with a few more trees and shyus shout they

Although, as we have indicated, the Queen's Park is not under the charge of the Corporation, but Her Majesty's Board of Works, the stranger will find this the next most convenient and by far the most important open space or park en route. In the time of James V. this extensive park was enclosed with a stone wall, which has not been kept up, although considerable portions of it still exist. This park is more remarkable for its commanding view from Arthur's Seat and Salisbury Crags than for any feature of the planter's art about it; indeed, but for batches of Whins and a few plants indigenous to its soil, the resources of Nature have not heen called in to give it the character it might possess.

The Queen's Drive, set on foot by the late Prince Consort, makes it easy of access for those not inclined to scramble up to its summit, but in all other respects it is as hare of prominent vegetation as the Bass Rock or the tops of the Lammermuirs, both of which can be seen from the summit on a clear day. Assuming that the visitor follows the Queen's Drive from Ilolyrood, passing St. Margaret's Well, St. Margaret's Loch, Whinny Hill, Dunsapie Loch, Sampson's Ribs, and the rifle range, and wending their way by Parkside Street, a few minutes' drive will bring them to the Meadows.

The Meadows connect the important suburbs of the Grange, Newington, and Merchiston with the city proper, and as a park constitutes undoubtedly one of the finest features in the suburban district. It is laid out with spacious drives and walks, and is suitably ornamented with all sorts of deciduous and evergreen trees and shrubs. There is more improvement in this direction in this way than in any quarter of the city. Mr. McLeod, the superintendent, says more people avail themselves both on weekdays and on Sundays of this than of any of the other parks, and just now the fresh green of the deciduous tree foliation, to country folks even, is an exceedingly pleasant sight.

And the same may be said of Bruntsfield Lioks, although not half the area. It adjoins the residential estate of Sir George Warrender, and some very large trees fringe the outline, chiefly Sycamores. Edinergh, even with its comparatively pure air, cannot grow Limes or Chestouts satisfactorily, and consequently they are disappeating, their places being filled with other material, chief among which are the Golden Elder, the Ash, the Laburoum, the English Elm, the Iluntingdon Willow, and the Mountain Ash (Pyrus aucuparia). All sorts of games are permitted in certain portions of these parks. Goli is a great game among the Dunediners, and there is an archery ground kept up and railed off in the Meadows.

Stockbridge Park is chiefly used for the games of cricket and football, and is consequently more a resort for the followers of those who engage in these national games than for more general outing. The great show of the Highland and Agricultural Society takes place there this season.

Upon the whole the parks and gardens of the town have been greatly improved during this last decade, and not a little of the credit in pushing these things forward has been due to the respected superintendent, Mr. Angus McLeod. A.

DISEASE OF PALMS.

In the course of last summer we received from different persons diseased plants of Corypha and Pheenix, the leaves of which were covered with brown patches. Herr Professor De Bary, of Strasbourg, had the kindness to examine them, and the following is the result, which we now publish:—

"The diseased plants of Corypha australis which you sent to me at the end of October were a long time under examination by us before we could say anything about That is the reason the answer has been so long delayed, The browned dead portions contained all sorts of fungi (moulds), but quite preponderating, as further examination taught, was the species Pestalozzia, related to, and similar but not identical with P. macrospora, If the brown spots were made moist the spore forming organs of the mould appeared on the surface in the form of black patches, as the enclosed sample in-dicates. When the moulds were distributed on healthy leaves that were cut from the plants and kept in a moist state the fungus pierced them and caused their death. According to the degree of dampness so spread the destruction over a greater or a lesser area. Whether the fungus is capable of killing perfectly healthy seedlings that are not kept too moist was not determined. From those plants which were sent, and which were grown all died except one. This has a leaf, on which the Pestalozzia has appeared, and which is now partially dried up. The dying symptoms made no further progress in winter, and the plant is pushing out sturdy new foliage. Healthy seedlings of Phœnix dactylifera and of Chamærops were not attacked by the fungus even under quite moist culture under bell-glasses. On saccharine mixture and similar inorganic substances the Pestalozzia grows extraordinarily luxuriant. What most concerns us is the destruction of the fungus. The attacks are most probably invited by the not quite normal forma tion of the Corypba seedlings, or at least assisted hereby,"

A. De Bary, in " Deutsche Gärtner Zeitung."

∯loqists' ∯lowers.

NEW VERBENAS .- The stand of these set up by Mr. W. II. Stacey, of Dunmow, Essex, at the recent meeting of the Royal Horticultural Society, points to the fact that the Verbena is not yet to be permitted to sink into the position of a neglected flower, and it would be a pity if it were so. The names of Sankey, Smith, Weatherill, Edmonds, Perry, Eckford, Keynes, and others have been associated with this flower in times past; its free, prostrate growth, and great plenteousness of bloom, will always make it a favourite. On this occasion Mr. Stacey was awarded a First-class Certificate of Merit for Lord Brooke, a rich shaded scarlet variety with a white eye, pip stout, and of good form. A variety named Orion was remarkable for the great size of the pips-so large, indeed, as to incline to coarseness; the colour bright shaded carmine, with a bold lemon eye. Other good varieties were Harlequin, the pale ground flowers heavily striped with crimson and lilac; Cantab, pale manve, white centre; Marginata, which opens carmine and changes to pale pink, and having a bold white eye; and the Clown, flaked and striped with purple on a white ground. Mr. Stacey has no reason to despair of the future of the Verbena. It may be his lot so to improve it as to make it as popular as it was fifteen or twenty years ago.

WINTER BLOOMING PELARGONIUMS .- It is probably but a well-worn platitude to say of gardening that there is no vocation which requires greater forecasting, or more preparation for the future. gardener, as a rule, has less to concern himself about to-day than about a period several weeks or months hence. By this preparation for the future to-day is provided for, but the to-day has to provide for some to-day yet in the distant future. Just now, for instance, gardens may be literally revelling, both under glass and in the open, in the glories of Pelargonium bloom; the forethought of last autumn has made the present abundance easy. The forethought of to-day may make as beautiful a show of Pelargonium bloom almost as easy at Christmas-certainly it can he had as easily under glass. Some of those who have been privileged to see the marvellous show of beautiful bloom from those favourite plants which Mr. Cannell always has at Swanley in the winter months may have thought, perchance, that only some magical powers could produce what seemed to be at the season of the year so impossible; and yet what has been produced at Swapley has always been obtained by simple means; in fact, the secret of Mr. Cannell's displays has chiefly been found in the early preparation of the plaots, and in growing them in suitable houses. It is true that the simple principle of topheating in vogue in the Pelargonium-houses at Swanley has something to do with Mr. Cannell's beautiful shows of bloom, but certainly not all; hecause, though few others have ever done these plants better, some have perhaps done them as well in a more limited way, and without top heating have produced great results.

All the section of zonal Pelargoniums propagate so readily, that cuttings put in now will be good rooted Now is the time to put in the plants in a month. tops; and to have them once rooted, making solid growth, it is wisest to put the cuttings singly into small pots. Once well rooted in these, they need shifting on into 48's, and again into 32's, and established in them the shifting is done, as heyond that size pot, for plants simply intended to produce an abundance of good bloom, it is not desirable to go. Plants intended for exhibition at the November Chrysanthemum shows should now be well established in 48's, being selected from autumn-struck cuttings, Presently these must be shifted into 24's, and the plants being well pinched, and then plunged in a bed of ashes or cocoa-fibre in the open, will, if kept till the end of September devoid of bloom, with the help of some manure-water, produce at that time in a gentle heat splendid heads of bloom for the Chrysanthemum exhibitions. The rich warmth of colour and glowing hues found in these plants render them truly acceptable aids to the late shows. Seeing that it is just as easy, under proper culture, to have them as good in November as in July, it is to be deplored that for autumn and winter exhibition and decoration they are not far more grown. Even for such particular purposes it is not too late to make a start now, using rooted stocky plants. Where it is not purposed to grow show plants the gardener may have the advantage that he can grow very many more kinds in the same space, and thus secure greater variety and beauty. Mr. Cannell has shown us year after year that doubles will bloom as beautifully as the singles, though as a rule they are less free-flowering; yet it is noteworthy that within the past few years doubles have undergone a great change in form, and are rapidly running the singles hard in the excellence of habit and freedom of blooming.

The original coarse growth, huge leafage, and

sparse flowers, have given place to better qualities in every respect, so that it is not difficult to have many doubles carrying splendid heads of bloom. As to sorts of both kinds most suitable for winter blooming some difference of opinion may prevail, arising, doubtless, from experience of particular kinds only. It is most improbable, however, that there are any kinds which, if properly grown, are not amenable to the grower's requirements, and will furnish him with an ample reward. As a rule, sturdy, compact, free growing kinds are preferable, but where some particular hue of colour can only be obtained from loose growers, it is better to have the indifferent habit than to sacrifice a beautiful variety. Dr. Denny Is a sample in point, for it is of very indifferent habit, but the rosy-lake colour of its flowers renders it in the winter singularly beautiful. It is one of not the least charming features of winter blooming Pelargonlums, that the hues seen in the flowers are always much more refined-and, indeed, it may truly be said exquisite-in the dull months of that period of the year than in summer; then the brilliant sunshine gives to the rich tints almost a gaudy air, that is not always pleasing, though necessarily they are in a degree effective. In the winter colour seems almost to give warmth, and warmth then is so very grateful. houseful of Chrysanthemum blooms is in the month of November a charming sight; a houseful of double and single Pelargoniums in bloom then is a glorious spectacle, and, as evidenced at Swanley, once seen never likely to be forgotten. All gardeners who have not yet grown Pelargoniums for winter blooming will do well immediately to set about it.

ANTIRRHINUMS .- The genial winter has permitted these biennials to live over and bloom now with a degree of strength that is unwonted here, for on stiff clay land wet mild winters seem almost as destructive to these plants as do severe frosts. As a result, a big bed of Antirrhinums over the greater portion of its area is now producing grand spikes of bloom some 4 feet in height, carrying flowers of great size and of exceeding beauty. Whether some form of fungus, or other disease, affects the Antirrhinum I cannot say, but in one portion of the bed plants early in the winter began to assume a browned appearance, and gradually to die off. The soil was the same, the strain the same, and there were no special reasons for this decay. Still it existed, although with no visible evidences of fungus such as we see so plainly on many other plants. Without doubt Antirrhinums thrive hest on dry gravelly soil, and the deaths amongst the plants may have been but an accident of soil, and nothing more. Very beautiful indeed now are all those which came through the winter untouched, and the noble spikes of great length are such as can only be seen on plants that have been well wintered, Though the majority are producing striped or flaked flowers, I do not think them open to the charge of sameness sometimes brought against them, for not two can be found absolutely alike, the markings being so varied in form and colour. One feature of any good striped strain is that it always produces many rich coloured self flowers; indeed, it is very common to find self coloured flowers of the first year breaking into stripes and flakes the following summer. Seed should be sown at once under glass to ensure late autumn bloom, and, the winter permitting, a grand show of bloom next year. Where it is absolutely needful the plants should be treated as annuals; seed should be sown in a gentle heat in March; and, put out early, the plants will bloom from midsummer till the end of the autumn. A. D.

ALPINE AURICULAS, — In looking over Mr. Turner's fine collection of these plants opportunity was afforded for grouping some of the leading varieties into their several sections, so as to enable growers,

and especially such as are desirous of becoming exhibitors, to make a selection of suitable flowers. At the Manchester and Rochdale Auricula Show all alpine Auriculas staged for competition must be shaded flowers—that is to say, there must be two colours on the margin, one darker than the other, the palest on the edge. Flowers that are true self alpines, i.e., having one shade only on the margin, are not admitted to competition. At the London show no distinction is made, but shaded flowers are decidedly the prettiest and most striking, and the new varieties raised at Slough show a very large preponderance of shaded flowers.

Of shaded flowers with gold centres the following are very good : - Mrs. Phipps, pale lemon centre, maroon shading into violet-this is a charming variety, of great merit; Mrs. Ball, rich golden ceutre, black ground, shaded bright purplish-rose extra fine; King of the Belgians, deep golden centre, maroon and bright crimson shading—one of the finest varieties for exhibition purposes; Picotee, pale gold, dark purple, and shading of bright salmon-pink; Philip Frost, creamy-sulphur centre, dark ground shaded with bright rose—a very handsome variety, but weak in the centre; Mr. Thompson, rich golden centre, maroon ground, with bright crimson edge, nearly a self, but when the shaded margin is clear it is very handsome; President, golden centre, maground, with pale salmon-purple shading, very large pip, and a strong grower; Spangle, bright golden centre, rich crimson ground, with slight bright crimson shading—golden centre; Sleight, dark ground, with broad shading of salmon-buff, large, very fine form; Titian, golden centre, dark ground, with vivid crimson edge -extra fine; John Brown, pale gold, dark ground, with broad shading of salmon-rose-very fine : I. T. D. Llewelyn, pale lemon centre, black ground, bright magenta-purple shading-extra fine; Sultan, bright golden centre, slight dark ground, with broad shading of crimson-very fine; Mariner, bright pale golden centre, dark ground, with shading of purplishcrimson—very fine pip; and Ethel, pale yellow centre, broad velvety margin, with the slighlest wire shading of plum. This by no means exhausts the varieties in this section, but they serve to show something well worthy of attention.

Of what may be termed cream or white-centred flowers the following are good representatives:—George Lightbody, white centre, dark velvety ground, with pale violet shading—very pretty and attractive; Tenniel, creamy centre, dark ground, with bright lilac edge—very pretty; Duchess of Coonaught, cream centre, dark ground, shaded with purplish rose—large and very fine; Queen Victoria, pale sulphur ground paling to green, dark ground, shaded with bright lilac—good form, and very attractive; Susie Matthews, white centre, dark ground, shaded with bright mauve-lilac; and Conspicua, creamy centre, black ground, with bright pale mauve shading—a good old variety. Diadem should properly come into the section: it opens with a pale gold centre, but soon changes to creamy white. This is a lovely shaded variety, having a bright crimson edging to a dark ground, and when in good form is highly

The following represent the self flowers, not a few of which are of great beauty, and well deserving of cultivation:—Phoenix, rich golden centre, with bright crimson-maroon margin, very fine form—sometimes this comes slightly shaded with brilliant crimson, and then it is most attractive; Spangle, golden centre, rich bright maroon margin; Mercury, golden centre, rich crimson-maroon margin—very fine; William Bragg, golden centre, glowing maroon margin—very fine; Colonel Scott, bright yellow centre, very dark maroon margin—large and very fine; John Ball, bright gold centre, rich dark crimson margin—extra fine; and Fred. Copeland, pale golden centre, dark crimson margin—vextra fine; and Fred. Copeland, pale golden centre, dark crimson margin—vextra fine; and Fred. Copeland, pale golden centre dark crimson margin—vextra fine; and Fred. Copeland, pale golden centre dark crimson margin—vextra fine.

William Bragg, golden centre, glowing maroon margin—very fine; Colonel Scott, bright yellow centre, very dark maroon margin—large and very fine; John Ball, bright gold centre, rich dark crimson margin—extra fine; and Fred. Copeland, pale golden centre, dark crimson margin—very fine.

The foregoing list does not Include the many fine varieties of shaded flowers Mr. Turner has produced during the last two or three years. They are not yet offered in commerce, but probably will be, to some extent at least, during the next year. Many of these are singularly beautiful, and mark advances in this flower of a surprisingly satisfactory character. R. D.

TULIPA ALBERTI.—A Central Asiatic Tulip with hright-red flowers, the segments of each of which is marked at the base with an obcordate yellow blotch, margined with brown. Hort. Elwes. Figured in the Botanical Magazine, t. 6761.

THE NEW PARK AT BARODA, INDIA.

IN a former number (p. 318) we published a descriptive account of the new public park, laid-out and planted under the direction of the present Gaekwar of Baroda, India, which we now supplement with two illustrations, kiedly sent to us by an Indian correspondent. The Kamnath Temple and Ghat, illustrated on p. 801, is situated on the north bank of the Viswamitra River, and is the great bathing place of the Hindoos at new and full moon, and after all The small tree near the centre in the family deaths. foreground is Ficus glomerata, and the larger trees inside the court of the temple are specimens of Ficus religiosa, which the Hindoo women venerate, from the belief that their deity, Vishnoo, was born among its branches, and that the performance under it certain rites and ceremonies will cause the barren to be fruitful. The other trees in the background consist mainly of Tamarindus indica.

The handsome stone bridge, illustrated on p. 805, spans a tributary of the Viswamitra, and bears the name of its builder-Charles Waddington. It was built in 1826, in one span of 100 feet, and is situated near to the entrance of the Park. Arundo Donax is seen growing on both sides of the stream. On the right-hand side the trees are nearly all Tamarindus indica, but the large leaves observable on this side are those of Ficus asperima, and the branch hanging immediately over the arch is of Zizyphus jujuba. On the left side the trees are Acacia arabica, amongst which are many plants of Ipomoca carnea, a South American plant which has found an agreeable home in Western India, where it ascends to the tops of the highest trees. The tree immediately behind the horseman ls Pongamia glabra, and to the right, behind the Hindoo and Parsee, is Acacia arabica in fruit. In the ornamental tub is Agave americana variegata, with an Enothera growing over it and in flower,

THE PROPAGATOR.

THE CULTURE AND PROPAGATION OF ARA-LIAS. - Although no restriction is placed upon the propagator as to what season of the year he should commence to propagate the Aralia, yet there are certain times and circumstances in which the cuttings and grafts should be made to ensure a satisfactory result. Strict attention must be paid to the fact that, in the first place, only well-matured wood-or, as it is termed, "hard wood" - is suited for making cuttings and grafts: if soft wood is selected the experiment will result in failure, loss of time, and waste of labour; and, in the second place, that in grafting particular care must be taken to so arrange it that both the bark of the graft and the stock meet as nearly as possible. In instances where a large batch of cuttings and grafts is required, one or two reasons present themselves to us in favour of the months of August or September as a good time to commence In the first place, during these months propagating. the cases will not be required for soft-wooded cuttings, and in the second it will greatly benefit the cuttings and grafts if they are allowed to grow quietly in the cases during the winter months.

It will be found a good plan to select suitable plants of such varieties as Aralia Veitchii, A. gracilima, A. elegantissima, and A. leptophylla, and to propagate them in the following manner: — I, By grafting the tops of the plants on their own roots; 3, by grafting the tops on the plants on their own roots; 3, by grafting the tops on the roots of other varieties; and, 4, by cuttings.

1. Grafting the Tops of the Plants on the Bottoms.—Taking the plants one by one, cut them down, leaving, however, 2 or 3 inches of the main stem—or, as it is called, stock—above the surface of the soil. Now it is necessary to make a graft from the top of that portion of the plant which has already been cut off. As we have previously mentioned, it should be a strong piece, having at least six or eight leaves attached. This is to be grafted on to the stock, or bottom, which is done as follows:—After levelling the top of the stock, or stem, cut a piece out of the side an inch in length and one-eighth of an inch deep, and in shape like the letter V. The graft must be made to fit this cut, taking special care to see

TUNE 21, 1884.1

that the bark of the graft is fixed so as to meet the bark of the stock. It is oow only necessary to hind them together with a strong piece of Russian matting. The old stump, or stock, frequently breaks out into growth, and will soon make a strong and bushy plant. If bushy plants are not required the young shoots should be rubbed off as soon as they appear.

2. Grasting the Tops of the Plants on their Own Roots,—This method can only be employed in such cases where the roots are of sufficient size and strength to nourish the graft. The course followed in grafting on the stem, or stock, can be followed in this case. The following is, however, a very good method:— After having cut the plant down, and cut it up icto pieces each having at least two leaves attached to it, the roots also should be cut into pieces of 1½ inch or frame by themselves on a gentle bottom-heat. After seven or eight days have elapsed they may be watered, but this must be carefully done, in order to prevent the water reaching and injuring the graft.

3. Grafting the Tops on the Roots of Other Varieties.—This may be done in precisely the same manner as detailed in the last preceding paragraph. The roots of the common hardy Aralia spinosa will supply an excellent stock upon which other varieties may be grafted. The sap flows freely from such soft stocks, which will rapidly make robust plants. The soil for potting the grafts in should be composed of half good peat, one-third loam, and one-fourth riversand, which should be well mixed together and rubbed through a 4-inch sieve. To every bushel of this mixture add a 48-potful of finely broken potsherds.

would if it was unsupported. Also in tying the leaves to the main stem it not only takes up less space in the cutting-frame, but also tends to prevent the leaves from decaying.

After watering the cuttings they can be placed in a frame upon a gentle bottom-heat. The lights of the frame should be raised for an hour each morning for purposes of ventilation, and newspapers should be spread over them during the day to protect the cuttings from the scorching rays of the sun. The cuttings will require careful watering, and should never be allowed to become dry.

Culture.—As soon as the grafts have united the plants can be taken out of the case and placed on a gentle bottom-heat, but not in a frame. When they have rooted through they can be potted into pots of

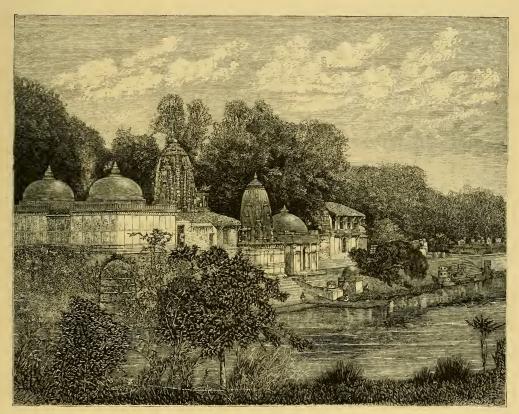

FIG. 148.—THE KAMNATH TEMPLE AND GHAT ON THE VISWAMITRA RIVER, BARODA. (SEE P. 800.)

2 inches in length. On each piece of root a longitudinal cut an inch in length should be so made as to leave a cleft for the end of the graft to fit into. The operation is best described as follows:—Insert the knife at the top of the root, and press it gently downwards for the length of an icch, and instead of cutting the piece off, withdraw the knife and cut it off from the outside in a downward slanting manner, so as to leave a piece projecting like the barb of a fish-hook. The graft must be made to fit this cut, and he firmly bound to it with a piece of matting. The grafts must not be watered until about seven days after they have heen potted; it is therefore necessary that the soil be well moistened before potting. If this is not done it will probably prove to be fatal to the grafts. They should be potted into thumb-pots, with the top of the root level with the surface of the soil, and placed in a case or

4. From Cuttings.—The remaining portion of the plants (the tops of which were taken for grafts), or plants specially set aside for cuttiogs, may be cut up into pieces about 1½ inch long, and having three or four leaves appended to each piece. A sharp knile should be drawn across the bottom of the stem of each cutting in such a manner as to form a cross. By this means three or four roots will often be produced instead of only one. The cuttings should be potted into long thumbs, in soil composed of hall turfy loam, one-third peat, and one-fourth river-saad, after having been well mixed together and rubbed through a 'inch sieve. The soil should be sunk an inch deep in it. The leaves should be raised towards, and tied to, the main stem, which should be securely supported by a small stick. This will keep the cutting firmly in the pot, and cause it to root sooner than it

suitable size, and then be replaced upon the bottomheat for four or five days. At the end of this time they should be removed to a warm house, and placed upon a cool bottom, and in this position they will grow best.

Aralias must never be syrioged when the plants are making new growth. If this is done it will invariably curl the young leaves, which when they have arrived at maturity, being themselves misshapen, will disfigure the plant. The house should be well veotilated, and the cuttings protected from the rays of the sun.

Before concluding it will be well to make a few remarks upon the fungus which commonly attacks, and often destroys, the graft. It is a small blue and white fungus, and appears upon the matting, or other tie, with which the graft is bound. The best way of destroying the fungus is by brushing it off with a small brush, or wiping it off with a plece of cloth; but, in order to prevent its ravages, the grafts should be passed through the gardener's hand, and carefully examined once a week. T. O.

The Erboretum.

SUBSTITUTES FOR THE LARCH .- In your number for the 7th inst, you call attention to the failure of the Larch in many places. Of the varieties you suggest as substitutes no doubt the most promising is Abies Douglasii. One has only to see the fine trees at Murthly (Perthshire), and also those planted by Mr. McCorquodale on the Earl of Mansfield's estates lu the same county, to become convinced of this. There are also some fine young healthy and vigorous trees in the policies of Moncrieffe House, Bridge of Earn, planted by Mr. Bissett, and these are fully exposed to the southwest winds, which are here felt with great severity, the Tay Bridge succumbing to a gale from this quarter. A. Douglasii grows also remarkably well in the stiff clay of the Weald of Sussex. The late Mr. Perkins, who collected so many fine trees at Chipstead Place, near Riverhead, planted two specimens of A. Douglasii close to his residence, in a bank of sand, and after growing to a large size they suddenly died away, after some twenty years' growth; no doubt the sandy subsoil had something to do with the trees giving way.

Pinus Laricio is so difficult to transplant that it is a question whether it will ever be planted in quantity. Mr. Rose, who until lately was gardener at St. George's Hill, Weybridge, some years since showed me a very fine specimen. Sequoia sempervirens will not stand the wind, the young shoots being so brittle that the top is constantly being broken off by gales. The largest bole I have seen of this is at Tandaragee Castle, the seat of the Duke of Manchester in Ireland. The best specimen I remember to have seen was at Wilton House, near Salisbury, the seat of the Earl of Pembroke; it was growing freely not far from the splendid Cedars of Lebanon for which Wilton is noted. If I remember rightly, Mr. Challis told me it (S. sempervirens) was the only Conifer that seemed to thrive, excepting the Cedars of Lebanon, as in the gravelly subsoil, about 2 feet below the surface, water is always standing or percolating. The young tree was as straight as a gun-barrel. There is a Deodar also at Tandaragee growing on the margin of a pond, the roots being consequently in a swamp in a similar state as found growing in the Himalayas; no doubt want of attention to this has been the cause of so many failures. The two trees I would strongly recommend to be planted in quantity in the usual way as grown for timber, so that they could be nursed like other timber trees, are Thuiopsis dolabrata variegata and Retinospora pisifera. The Thuiopsis stood in the Perth nurseries the terrible winters of 1878-79, 1879-80, and 1880-81 without the slightest injury, or even of the foliage being browned, the Retinosporas suffered slightly, as also Cupressus nutkaensis; a few more degrees of frost would have killed many of the Californian and Japanese Couifers of recent introduction. Cupressus Lawsoniana and C. L. erecta viridis, 8 and 9 feet high, exposed to the west, were killed root and branch; and in the nursery quarters nearly a fourth of the Douglas Firs were also destroyed; those, however, that remained after the winter was over seemed none the worse, with the exception of a few of the ends of the leaves being browned. The Thuiopsis dolabrata variegata grows freely, and is so readily propagated that it could soon be obtained in any quantity. Ladies and gentlemen who have resided in Japan have told me that this was the best timber, and that it is highly valued in its native country, Retinospora pisifera and R. plumosa being next in request. Much valuable information may be gleaned from Mr. Hunter's Woods and Forests of Perthshire as to the hardiness of some of the newer introductions, as the winters I have named will never be forgotten. At Kinnoull, across the River Tay from Perth, after the break-up of the long frost of 1880-81, I saw a plumber engaged for two days before he could get at the water-pipe to repair a breakage, and he found the soil frozen to the depth of about 3 feet, show-ing the terrible ordeal recently introduced trees and shrubs had to undergo. Abies grandis will, no doubt, be much planted when more plentiful, also Abies Lowii

(Parsonsi or lasiocarpa). A, Nordmanniana would also be worth trying as a timber tree, being so hardy and growing freely almost everywhere; it is, however, usually seen as single specimens and not planted in clumps or plantations for timber. North of the Tweed the foresters seem to have given more attention to the requirements of timber than those in the south; as there is, however, a prospect of timber before many years being in brisk demand, especially if our foreign supplies fail, landed proprietors would do well to pay more attention to this crop; so much land at present lying waste or almost so, could with modetate outlay be made profitable. William Heale, Lincoln.

Notices of Books.

The Sagacity and Morality of Plants, &c. By J. E. Taylor, Ph.D. Chatto & Windus.

This is one of a class of books which we venture to think is becoming too numerous. In so saying we are not thinking of the interest of authors and publishers, but of the probable effect on the progress of sound botanical knowledge. Of late years, stimulated by the epoch-making works of Darwin, we have had a host of such books, the earlier ones of which we venture to think were the best, because more fully imbued with the inductive spirit and caution of the great master. Such, however, washis influence in revealing and calling attention to points of fascinating interest to those who have a liking for natural history, that many devoid of his judicial spirit have allowed themselves to be carried away into the land of romance, to substitute parable for fact, imagination for reality, all the while believing themselves to be faithful disciples of the great teacher. We fear Mr. Grant Allen has a great deal to answer for in this respect on his own account, and by reason of the example he has set to others endowed with a fluent literary style.

Dr. Taylor, whose previous works we have had occasion to commend, and whose object is so laudable, has, we regret to find, on this occasion allowed himself to stray, as he is not wont to do, from the safe path of induction and accurate statement. That there may be no "misunderstanding" we quote from the chapter on that subject :- " Every flower is in reality composed of aborted and degraded leaves." And again, "Leaf-buds can be changed at will into flower-buds, as every gardener knows." fear gardeners do not know this, but certainly they would be very glad to do so if they could act upon the knowledge. So we are told that the horti-culturist "rings" or otherwise cripples his Azaleas or Camellias, so as to force them to produce flower-buds instead of leaf-buds, and that "he cuts down Lilies year after year just before they give signs of flowering . . . so that when such a plant is allowed to flower there is an unusually magnificent display," We may also ask what proof there is "that the uprising sap or fluid food must be thinnest and poorest at the ends of the branches [where the flowers are borne] seeing that it has been tapped all the way up by the leaves." We should have expected that the growing points would be the best provided with nutriment, and that the requirements of pollen-formation and seed-development would demand, as, indeed, we know they do, a relatively larger supply of nutriment than in the case of the leaves. A few pages further on we are told that "the upflowing fluid is called sap. and that it is to plants what the arterial blood is to animals." This occurs in a chapter headed "Stating the Case," but we must say that it is stating the case as it might have been done a century ago perhapsthough even then the comparison would have been made with venous not arterial blood-but certainly not as it would be expounded by any physiologist of the present day, and certainly not as it would be put before any examiner nowadays by any candidate who had well-founded hopes of passing the ordeal. The metaphorical style of teaching is very useful when the student is made to understand that it is metaphor, not fact, that is laid before him; but if this be not done, the task of unlearning becomes more serious than that of learning. When the opportunity occurs for publishing a second edition, it may be suggested to the author that of the two accuracy is to be preferred to fluency, and if a model be required, none better can be found than in the little works laid down on much the same lines as Dr. Taylor's—we allude to Dr. Asa Gray's How Plants Grow and How Plants Behave.

Prchid Notes and Hleanings.

ZYGOPETALUM BURKEI.—This species, described in our columns, vol. xx., p. 684, is a native of Demerara. The racemes spring from the base of the oblong sulcated pseudobults. The flowers are 2½ inches across, flat, star-like; the sepals and petals ovate, lanceolate, green, with purplish-brown blotches. The lip is shorter than the sepals and petals, rounded at the free end, white with raised orange ridges at the base.

CŒLOGYNE BARBATA.—A winter-flowering evergreen Orchid, with egg-shaped pseudobulbs and racemes of large white flowers, each 3 inches across; the sepals and petals lanceolate; the lip three-lobed, as long as the sepals; the lateral lobes erect, curved over the column, the central lobe oblong, notched; sepia-brown, with darker stripes, and with fringes of brown hairs. It grows in a cool-house, with the Odontoglossums,

ODONTOGLOSSUM PESCATOREI.—A very fine variety of this is in flower with Messrs, John Laing & Co., Stanstead Park Nurseries, Forest ITill, who have just commenced cool Orchid culture. The flowers are pure white and very large, and the labellum is broad, beantifully crenulate, and heavily blotched with violet, and stained in the centre with orange. If Messrs. Laing are as successful with Orchids as they have been with tuberous Begonias, we may expect to see any of the good things which fall into their hands grown to perfection.

DENDROBIUM LINAWIANUM—a Chinese Orchid better known under the improper name of D. moniliforme, with jointed stems, long pedicels, supporting rosy-liac flowerseach about 3 inches across, with narrow sepals, broad petals, and relativelysmall lip with a white base, with two violet spots and an anterior rosy-purple blotch. It is figured in the last number of the Orchid Album, t. 141. Mr. Williams gives a caution as to over-potting and over-watering this species, and recommends that good drainage be given and that the plant be well elevated above the rim of the pot. The plant should be grown at the cool end of the East India-house, with plenty of light.

VANDA SUAVIS.—Mr. De Bary Crawshay has favoured us with a cut spike of fifteen flowers of a good variety of Vanda suavis, from a plant which produced five spikes, and sixty-five flowers in all, a rather unusual number from one "break" of which the specimen only consists. This is 4 feet 6 inches high and has leaves, of which there are forty, down to the pot.

FRUITS UNDER GLASS.

VINES,-We are now enjoying favourable weather for Grape colouring, as air can be freely admitted without causing a chill, and a suitable atmospheric temperature can be maintained without the aid of much fire-heat. Under these agreeable conditions the ventilators of houses in which the fruit is at this stage may be kept well opened until 6 P.M., when they should be left so that a steady circulation of air may continue during the night. The night tem-perature for Muscats while they are changing colour should not be permitted to fall below 70°, and that for the day may range about 10° higher with the usual rise from sun-heat. These like other varieties require a constant current of air to perfect them, but they are particularly impatient of cold draughts, and should therefore be cautiously ventilated in cold weather. The bunches in late houses, which have been all thinned, should now be gone over a second time, and have all defective herries removed. Sublaterals must also be removed as they form, except where wanted to extend over thin spaces; in such cases they should be stopped when they have reached the desired length, and be tied down to the trellis. Afford enough fire-heat to keep up the night temperature to 65°, and be guided by the weather in damping the mulching material for the purpose of creating atmospheric moisture. The floors of houses having only external borders should be thinly coated

over with manure from Mushroom beds which will retain moisture and canse an agreeable humidity which is not to be derived from a hard solid surface. All successional Vines which have fall crops advancing will now require an abundance of tepid liquid manure to keep them well nourished and their foliage in a healthy robust condition. This is often far too stintedly administered, and disappointment frequently results from this cause. Our borders are formed more firmly, and the internal ones are deeper than is generally considered advisable to have them, yet, although they are well mulched with horse droppings, or other short manure, and do not dry so readily as those more porous and shallow, we water them at least once a fortnight until a stream flows freely from the drains from the time the trelliess are covered with foliage until the Grapes have finished colouring, and that such treatment suits them is manifest.

MELONS.-Although at this season Melons are usually grown without fire-heat, we still find a little at night helpful. Our situation is in a valley which is traversed by a stream, and the predominating soil in the neighbourhood is tenacious clay, from which a minimum of heat only radiates; the average night temperature is consequently a low one, and we frequently find ourselves driven to the aid of artificial heat, when those who are more favourably placed can succeed better without it. Continue to sow a few seeds once a fortnight, to yield a supply of fruit in the autumn. When the space can be spared, the young plants may be planted out from their seed-pots as soon as the first rough leaf has fully developed, instead of shifting them into 32's, as is the usual practice. There is a considerable advantage to be gained by planting-out at this stage, inasmuch as the plants do not receive so much check, are not so liable to be spoiled by red-spider, and at once produce a remarkably robust growth not usually obtained by those treated in the customary way. Water both at the roots and in the atmosphere must be carefully given to successional plants trained on soil over beds of fermenting material in unheated pits in dull damp weather, for if indiscreetly made use of the stems will lack fibre, and the plant will, in all probability, succumb to canker. For this reason we never mulch plants subjected to this treatment as we do those trained on a trellis or are grown under the influence of fire-heat. In dull seasons we have found it advantageous to raise the main stems a little above the surface of the soil on small flower-pots reversed to enable the air to pass under and consolidate them. The laterals carrying the young fruits should also be raised well over the foliage upon small wooden props, so that the blossoms may keep dry and proper fertilisation be thus facilitated. Some kind of support must also be provided for the fruit; flower-pots are frequently used. but these cause disfigurement by the fruits resting on their hard surface. We employ two props for each fruit, which support a short rod, to which the lateral is trained. The props are of sufficient length to prevent the fruits coming in contact with the soil. When this plan is adopted a space clear of foliage should be preserved immediately around the fruits, otherwise moisture will rest upon them and cause coarse netting.

PEACHES AND NECTARINES .- The condition of the weather during May was such as to bring up the colour of early Peaches in a very satisfactory manner. As the trees in the early house are severally cleared of their fruits they should be at once sufficiently washed with rain-water, by the syringe being so directed that both surfaces of the leaves are reached with sufficient force to dash off red-spider, which, if previously kept down, usually makes headway and multiplies, while syringing is discontinued during the fruit-gathering period. Much of the wood which has carried the crop will be of no further service, and should be cleanly cut out; in fact, such use should now he made of the knife as will leave but little to be done after the foliage falls. This is an important point in Peach culture, which should not be delayed, for it has a beneficial effect upon the trees when dope in time, by giving the sun and air more freedom to perfectly mature the young wood and foliage, and to thus invigorate the buds upon which the ensuing crop Unnatural or premature maturation of the wood would, however, be fatal, and its growth and development of healthy foliage must be encouraged, and a check from any cause avoided. Inside borders

which have become more or less dry during the gathering season should be thoroughly watered with cool water, and the temperature should be kept as low as possible. The ventilators both back and front must be left wide open continually, or the top sashes may be removed if they are not fixtures, so that the benefit of rain and thorough coolness may be fully reaped. Liberal ventilation should be afforded to houses in which the fruits are ripening, and the use of fire-heat may be discontinued when the state of the weather will admit of its being done without causing a check to the trees. Late houses should be kept freely ventilated; let the young shoots he carefully tied-in and kept clear of insects, and keep external as well as internal borders well supplied with tepid liquid manure. It is an easy matter to be deceived by showers of rain after spells of dry weather when the top-dressings of short manure have become dry; these absorb the rain, and the roots are little benefited. Thomas Coomber, The Hendre Gardens, Monmouth,

Plants and thein Cultune.

THE CONSERVATORY, - With the prospect of some warm, genial weather soon, with some brief periods of which we have been favoured of late, with intervals of somewhat cold and sunless days, we now purpose easing our stoves of several of the hardier among the class of fine-foliaged plants for the decora-tion of the conservatory till the end of September. Reference to a previous Calendar (p. 483, April 12) will be found to give selections of appropriate subjects for the decoration of the conservatory during the summer months, and if they have been treated as then advised no material harm will accrue to any of them. It will be found necessary to lessen the amount of air and to avoid any sharp currents for at least a week or two, till the plants become fairly well acclimatised to their new quarters, then matters may go on pretty much as before during warm congenial weather. It a spell of colder weather should set in, it will he an easy matter to keep the structure more nearly closed to the exterior atmosphere, at the same time avoiding any superfluous moisture as much as possible. Greater caution will be necessary, perhaps, in some instances to avert any damage from scalding, these kinds of plants being more susceptible to injury in that respect than the ordinary run of conservatory

We have previously written against the bad policy of besmearing the ronfs with heavy permanent shading in the form of whiting or lime; in an ornamental building, such as a conservatory, this should on no account be allowed. When a permanent material for this purpose is requisite by the formation of the roof and its inaccessibility to the fixture of roller-blinds, we advise Hexagon Netting to be used. It is of sufficient texture to diffuse the direct action of the sun's rays upon the plants beneath it, and in dull cloudy weather admits a considerable amount of light by reason of its loose make. For upright use to screen the plants along the sides or ends of the building, there is nothing to surpass spring-roller blinds when well fixed. These are far hetter than those with cords to work on the old system, which we have found to he constantly getting out of order by the stretching or contraction of the cords according to the weather. For these we have now substituted the spring-blinds, which give, comparatively speaking, no trouble at all, and if well protected against wet will last many seasons.

When the plants are first taken from the stovehouse to the conservatory be careful not to apply water to their roots in quite such a liberal manner (Palms and Tree Ferns excepted), and that which is used should be chilled previously to being applied, either by exposure to the warmth of the sun or by drawing the supply from another source and of a higher temperature, and reducing the same rather helow that which has been previously used. See that the foliage of plants with bold and massive growth is kept as clean as possible; although this is necessary in every instance, it is of more importance among the most striking and effective plants when under close observation. In the arrangement and grouping of the plants endeavour as far as possible to vary the same as a contrast to the method that has been pursued during other periods of the year. The fine-foliaged element should be allowed to predominate, using flowering plants more sparsely. As each of these latter require renewal they can be taken out without disarranging the entire group when they are only used as dot plants. Our plants are arranged on a flat surface and on the ground line, whilst for the summer months we endeavour to keep the arrangement as low as possible, in order that a good view of the pleasure grounds may be obtained over and above the majority of the plants. Specimen Dracenas and Palms are interspersed to break up the monotony of the group, and thus they produce a very good effect, each plant being allowed an abundance of room.

This kind of arrangement suits our convenience admirably during the summer, and I doubt not many others might adopt it with advantage. Being short of accommodation for bringing on flowering plants at this season of the year, and of the usual description used in conservatories, induced us to take this course. Of these latter we only grow small stuff for the filling of ornamental wire baskets that are arranged under a verandah during this season of the year. When the conservatory is thus arranged an opportunity will be immediately afforded of rearranging the other houses from which the supplies have been drawn, which in our case, and I doubt not in many others also, will become considerably overcrowded of Whilst this work is being proceeded with a watchful eye should he kept on all insect pests, and the remedies so repeatedly recommended in these columns be put in practice without delay. Seize the opportunity, too, of giving the house itself a good cleansing when it is possible to spare the time for that purpose. If a temperate stove, as well as a moist warm one, is at disposal the plants could be arranged in each to suit their respective requirements for the time being.

CAMELLIAS.—Any of these that are grown in pots can be transferred from the conservatory to the open air for the summer season by this time, the growths being now fairly well hardened. A fumigation should, however, be previously given if any thrips or aphides are getting together a colony. When taken out-of-doors some caution at first will be advisable to screen the plants from the direct rays of the san during the heat of the day. We prefer ours to be so placed that the sun's rays do not reach them till late in the afternoon, and they are thus arranged now with precautionary measures employed to secure them against being blown over by a sufficiently strong wind. These plants, when of dense bushy babit, are readily toppled over if they are of extra size, and we find it a saving of labour and an insurance against injury to secure them with stakes in the first instance. Any potting operations had better be deferred another month or two, when the wood is thoroughly well bardened; in the meantine give close attention to the watering of any that are pot-bound, and after a hot sultry day a good all-round syringing will be very beneficial to them.

INDIAN AZALEAS.—The latest of these will now be past their best, and will at once require attention in the removal of the seed-pods, which on late flowering varieties often set very freely, after which the young growth should be pushed forward in a moist growing temperature, and in the course of a few weeks they will be fit to remove to the open air. It is a mistake to keep them too loop in a growing atmosphere, often resulting in a bad set for another season bloom. As the growths are completed any requisite potting operations should be seen to in order to allow these hine rooting plants as long a period as possible to lay hold of the new soil before the advent of another winter. James Hudson, Gunnersbury House Gardens, Acton.

PALISOTA BARTERI.—In the ordinary form of this plant the inflorescence consists of a dense ovoid cluster of flowers not exceeding 2 or 3 inches in length; but a specimen planted out in the Palm-house at Kew has produced a cyliodrical raceme of 6 or 8 inches in length. The outer and inner whorks of the perianth segments are similar in colour and texture—a very abnormal character for the order. They are of a papery or transparent white, and hotticulturally of little decorative value, but they are followed by berries, which are at first white, then spotted with pale violet, and ultimately of a bright scarlet colour. In the germination of seeds of this plant it may be interesting to note that as in so many other monocotyledons, the blade of the cotyledonary leaf does not leave the testa, while the first true leaf appears like a cotyledon that has enlarged, as in the Cyclamen, to perform the duties of an ordinary leaf, although in this case the

THE notes which we have from time to time published concerning the provision of OPEN SPACES IN OUR LARGE TOWNS for recreative purposes, and especially for the supply of fresh, and for the dilution and removal of foul air, have already sufficed to show that although many of our large towns are fairly well provided with such outlets on their outskirts, there is too often a lamentable deficiency of open space within the town itself. Where the piety of our ancestors had not made sufficient provision, municipal wisdom and private generosity have in many cases supplied the void, with the result that few of our large towns have not now, at greater or less distance from their centre, adequate provision of the kind indicated, and public attention is so much directed to the importance of the matter that there is little fear now-a-days of wilful neglect in procuring and maintaining such open spaces. general requirements are for the most part well studied; first and foremost there is the space, as free and unobstructed as circumstances will

allow. No buildings beyond such as are absolutely necessary should be allowed within the precincts of the town parks, but open, breezy lawns for recreation, avenues of trees for shade and shelter, seats in abundance, shrubbery borders and clumps, with a due admix-ture of evergreen and deciduous shrubs, flower-beds in moderation, and, above all, in good taste; well-arranged walks and rides not more numerous than the necessities of the case demand, and devoid of purposeless meanderings. These strike us as the essentials for which the ratepayer may fairly be called on to pay, and they may be summed up in the sentence—Plenty of space and plenty of plants to freshen, purify, and adorn it. Ornamental details furnished by the landscape gardener and the florist, and educational appliances, are by no means unimportant, but for them we might look rather to private generosity than to public

As for the means and appliances for recreation the population itself might not untairly be expected to supply, under proper regulation, what is required. When the essentials are provided, then, and then only, is it desirable to spend money—especially public money—on matters of relatively secondary importance.

But while the facts are as we have stated in the case of the larger areas, in the vicinity of our large towns, the state of things is by no means so favourable within the towns themselves. House abuts upon house, long lines of streets without a break-yards filled up with factories, often noisome-what should be, as they once were, gardens, now filled with warehouses, store rooms, stables, and other even more objectionable obstructions to the free passage of GoD's gracious gifts of light and air: this is what we find in most towns, and it is bad enough without entering into the noisome details of foul slums, festering alleys, and noxious manufactures. On purely sanitary grounds, numerous small open areas thickly dotted in the midst of our large towns, are, we venture to think, even more important than the larger areas in the suburbs, where they are of less intrinsic importance from a sanitary point of view, and where their distance from the densely populated portions of the town of itself constitutes an obstacle to their full enjoyment by the persons to whom they are of greatest importance—the children, the aged, and the infirm.

It is from this point of view that we sympathise so heartily with the efforts made in London and elsewhere to secure open spaces for health and recreation in the very heart of the towns. It is difficult to exaggerate the value of the open spaces on the Thames Embankment, not easy to say too much in praise of the barristers, who with a degree of thoughtful consideration with which they are not often credited, throw open the Temple Gardens at stated intervals for the enjoyment of the dwellers in the neighbouring closelycrowded streets. Few spaces are so limited that a little grass, a tree or two, and a seat cannot be provided, and trifling as this may seem it is not really done, as any one may judge for himself in the courts of busy London. What a relief to the eye and spirit is even a single tree in such a situation, while the amount of oxygen given off by its surface contributes in no small degree to the purification of the vitiated atmosphere.

Those who are too busy-too absorbed in other matters-to note the benefit even of a single tree in a London court, may form some idea of the matter by paying a visit to the Health Exhibition. Consciously or unconsciously, we know not which, the managers of that Exhibition have supplied us with an excellent illustration of the benefits to be derived from small open spaces. Gallery, arcade and corridor, are here packed close to gether, each filled with a crowd of human beings, blocked up with machinery, fouled with dust, redolent of many and divers odours. Here we have in a small compass an epitome of what we may see in London, Manchester, Sheffieldin any large town. Step out from one of these crowded galleries into one or other of the numerous open spaces which separate one block of building from another, and how welcome the change. Just at this season they are rendered exceptionally beautiful by the brilliant colouring of the Rhododendrons and other flowering shrubs supplied by the nurserymen, and by the well-kept grass; but all through the season, even when the brilliancy of the flowers is past, these open spaces, constricted though they are, will be found a delight and refreshment to the wearied visitor.

The exigencies of the Exhibition have prevented any large amount of open space being reserved in any one place, but this makes the smaller areas dotted about all over the Exhibition all the more grateful, and, as we have said, they furnish models for imitation wherever people are densely crowded together in closely restricted areas. Broad thoroughfares, lined with trees if possible; roomy squares, encircling boulevards, small recreation-grounds thickly dotted in the hearts of our towns, these are what are required to promote the health and comfort of the inhabitants, and by consequence the welfare of the State. In the formation, maintenance and management of such spaces, the gardener is the man best suited, and were his advice and his knowledge what to plant more frequently sought, much unnecessary expense and imperiect management would be obviated.

— DISEASE IN TULIFS,—Mr. ELWES sent me some specimens of Tulips in the spring which seemed suffering from cold. He thought at first that the sun acting on the wet leaves was the cause, but the diseased state was extending to the stem. The plants were growing in a frame, which, though exposed to

rain, had been protected from frosts, and it was feared that the disease might affect all the more delicate wild species. Precisely the same affection has taken place at Sibbertoft in wild plants of the true T. Oculus solis, and others growing in the open air. I attributed it at first, like Mr. ELWES, to cold, or some other atmospheric cause. I was unable at the time to examine either, but I have had an opportunity since, and I thought, on making a section, that I had discovered a large-spored Protomyces, which would be quite enough to damage the plants; but fortunately I had preserved Mr. ELWES, specimens, which were yet in the box in which they were received, and I found that on the patches minute plants of Polyactis cana had been developed, which bore myriads of spores, which were undoubtedly what I saw in the section. matter is worth recording, because it shows how easily mistakes may be made. I have this morning examined the bulbs of some of the plants affected in my garden, and I find that they are not seriously diseased, and I still find no fungus in the decayed leaves. I hope, though, that neither Mr. ELWES nor myself will have to regret the loss of some interesting wild imports. M. 7. B.

- Foxgloves,-A lady was seen wandering about in the conservatory at South Kensington during the last meeting of the Royal Horticultural Society, carrying in one hand a portion of a Foxglove spike upon the top of which was one of those not uncommon abjects, a large cup-shaped flower. Probably thinking her flower to be a genuine novelty, she hoped it would have proved a surprise to the Scientific Committee if she could light upon that body. It is rather an odd circumstance in relation to these large Foxglove flowers that they seem for a time to manifest themselves not unfrequently in a strain, and then totally disappear. duction is of course due to some malformation of growth by which two or three ordinary blooms become conjoined into one, but seed carefully saved from the pods resulting, fails to reproduce the exaggeration. Fortunately Foxgloves are so beautiful that they need no meretricious aids such as distorted flowers to render them popular. The Digitalis pur-purea of the woods and waysides is pretty, especially when grown in a mass, but the fine spotted garden forms whilst retaining all that is charming about the wild kind, yet add such fine form, size, variety of colouring, and beautiful markings, that it is fair to say few really British flowers have been more thoroughly improved, yet remain unspoiled. It is a fair subject for surprise that after all Foxgloves of the beautiful spotted strain are not more universally grown, for they seed most freely and are most easily raised. It would be hardly fair, perhaps, to treat them as wild flowers, for without some decent cultivation they may soon lose all their added beauties. It is not too late to sow seed now, but it should be where it may be induced rapidly to germinate, so that the young plants put out with ample room may have time to develope their growth fully.

FUNGUS ON PEAR LEAVES,—In a neighbour's garden I was surprised a few days since to see many of the leaves of very vigorous young Pear trees marked with very dark brown dead patches. I was at first somewhat puzzled, as they were clearly not the ordinary spots due to early cold, but after some search I found that they arose from the attack of a minute fungus, Ascomyces bullatus, which I had not seen for some years. Some of the Condinental botanists have refused to adopt the genus, substituting for it the name of Exoascus. The word was intended to indicate that the whole plant was composed of naked asci, the new name really meaning the same thing. As others may have similar spotted Pear leaves, it may be well to point out the cause. TULASNE refers the plant to the genus Taphrina, but it is doubtful whether he is right in so doing. M. J. B.

——PRESENTATION TO MR. B. S. WILLIAMS,
—For some years past Mr. B. S. WILLIAMS has sent a collection of plants to the annual exhibitions of the South Essex Horticultural Society, the last of which was held on the 12th inst. at Knott's Green, Leyton, on which occasion the committee presented him with a handsome pair of candlesticks and inkstand in silver, "in recognition of his valuable services to the Society." We are glad to note that the managers of one society, at least, have a soul above medals.

EARLY STRAWBERRIES. — Of these we received from Mr. LAXTON, of Bedford, on Tuesday, two varieties perfectly ripe, gathered from plants in the open ground. King of the Earlies, a hybrid between Vicomtesse Héricart de Thury and Black Prince, from which the first ripe fruit was gathered this season on May 31, has fruits of medium size, conical in form, with somewhat prominent seeds, and of a dark crimson colour on the side most exposed to the light. This must he valuable for its earliness, combined with size, in which latter point it excels Black Prince, but the flavour of the sample sent was not equal to that of the old variety, although this might be owing to the want of sun-heat during the three or four days preceding the ripening. The Captain, a cross between Crown

part are unpleasantly prominent. An important feature is an index containing the vernacular names, Arabic, Greek, Persian, and Turkish, prepared by Prof. ASCHERSON. The intimation given on the cover that the author is engaged in the preparation of a supplement will be received with great satisfaction, but, with or without a supplement, the work will remain an enduring monument of the keen sagacity and unwearied labour of the author, and will secure to him the gratitude of many generations of botanists.

— MR. CULVERWELL'S HYDRID RASPERRY. —Mr. CULVERWELL having been good enough to forward us flowers of his supposed hybrid Raspberry, we sent them to Dr. FOCKE, of Bremen, at once a great authority on Rubi and on hybridisation. Dr. the opportunity will repeat the experiment, and in due time record the result.

—— ACTION OF LIGHT ON GERMINATING SEEDS.—The general results of some experiments performed by M. CIESLAR, as recorded in a recent number of the Annales Agronomiques, are:—1. That the influence of light on germination varies according to the species; those of the Mistleto do not germinate without light; other seeds, such as Barley, Maize, &c., germinate indifferently in light or darkness, it growth of others, again, is promoted by light. It may be said, as a general rule, the small seeds with but little reserve-matter germinate better in light than in darkness, while the larger seeds, rich in reserve-matter, either grow better in light than in darkness, unlied the second section of the second s

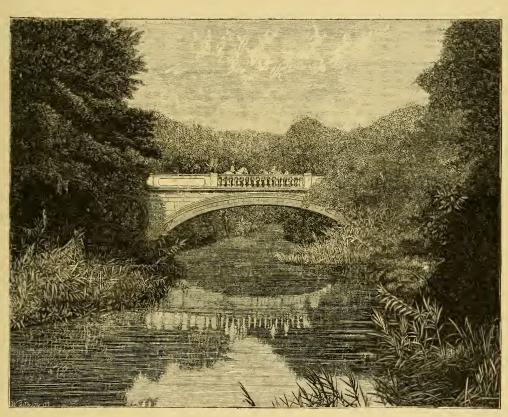

Fig. 149.—Charles Waddington's bridge in the New Public Park at Baroda. (See P. 800.)

Prince and Forman's Excelsior, is a finer fruit than the King of the Earlies, being much broader at the base, and of a closer, heavier texture, and is therefore likely to make a good sort to pack for transit to long distances. The flavour was not equal to that of some other kinds, but it is early, as it was ripe on June 10 in the open ground, and therefore of value in market or private gardens. If these early varieties are amenable to forcing for early fruit, they will be valuable additions to those we already have.

"FLORA ORIENTALIS."—We are pleased to be able to announce the issue of the concluding portion of M. Bolssier's Flora Orientalits, containing the Grasses, the Conifers, Ferns and allied orders. The value of this publication to horticulturists who are interested in the botanical history of the plants they cultivate is very great. The misprints in the present

FOCKE adheres to the opinion expressed by him last year from an inspection of the leaves only—viz., that the plant is a peculiar variety of the Raspherry, R. Ideus, which has been observed in various countries, and which has been koown under the varietal names of R. obtusifolius (WILLD.), R. anomalus (ARRHEN), and R. Leesii (BABINGTON). It agrees even in trilling peculiarities with a plant from Bromberg (E. Germany) which Dr. FOCKE has cultivated for many years. Dr. FOCKE altogether doubts its hybrid origin. On the other hand, Mr. CULVERWELL adheres to his statement that he has produced this plant by impregnating the flowers of the Raspherry with the pollen of the Strawberry, and states that in making the experiment he used due caution—as, indeed, so expert a hybridist might be expected to do. Further experiments are required, and we sincerely hope that Mr. CULVERWELL and others who have

or are indifferent; and in no case has a seed been found to grow better in the dark than in the light. 2. The action of the light is very complicated, as has been shown by experiments with light of various degrees of refrangibility. The yellow rays are favourable to germination, while the violet rays retard it, and even prevent it altogether at certain low temperatures. 3. The favourable influence of white light upon the growth of certain seeds is manifested chiefly by the higher vigour of the seeds so grown—Poa nemoralis, Agrostis stolonifera, Nicotiana macrophylla. Without doubt, further experiments would enlarge the list of these plants. 4. Very even germination under white light affords evidence in favour of the propitions influence of light to germination. 5. The germinative energy of small seeds seems to be augmented by the light. 6. In seeking the causes of the influence of light, it may be said—(a), that the light acts favour-

ably by its conversion into heat; (b), that the favourable effect of yellow light being granted, the acceleration of growth by light is a consequence of accelerated assimilation; (c), that light favours the germination and prosperity of young plants, by producing better root-growth, even in the case of small seeds.

—— STATICE ROSEA.—About forty years ago this very handsome and distinct Sea Lavender was figured in the Botanical Magazine under the name of S. rytidiphylla. It is a native of South Africa. The large calyx and corolla is a rich deep rose colour, and the small shortly stalked leaves clothe the upper parts of stems about a couple of feet in height. The species is now bloming at Kew in the Temperate-house.

THIGHNIUM LEUCOBOTRYS,—Like not a few of its allies in Sikkim, Nepal, &c., this pretty plant is epiphytal in a wild state, although in English gardens it submits readily enough to ordinary cultivation. It is an evergreen shrub, with rigid erect whorled branches and racemes of white flowers, followed by snowy-white berries. The species was first found by BOOTH growing upon Oaks among the Duppla Itilis in North-eastern Bengal, and was figured in the Botanical Magazine, t. 5103. The swollen base of the trunk, which forms so striking a feature in the wild plant, is not particularly developed in the plant now fruiting in the winter garden at Kew.

—— THE GOLDEN MEADOW SWEET.—Of the common Spirca Ulmaria there is a variegated form which is not uncommon in gardens, and which, when grown in somewhat poor soil, in order to prevent as far as possible its tendency to revert to the green-leaved type, is a decidedly handsome plant. The form, however, with self-coloured golden-yellow leaves is much more desirable, as it seems constant enough, and grows vigorously; the brightly coloured foliage being, during the earlier part of summer at any rate, very conspicuous amongst green-leaved herbaceous plants.

—— MECONOPSIS WALLICHII VAR. FUSCO-PURPUREA. — A form with dull brownish petals instead of the blue ones characteristic of the species. Botanical Magazine, t. 6760.

Aroid, with thick erect stems, long-stalked, with peltate, cordate, ovate, acute leaves. The peduocles are terete, slender, and bear a short, cylindrical spadix, invested by a large, oblong, recurved spathe, purple on the inner surface, yellow without. Botanical Magazine, t. 6762, June, 1884.

- THE HEALTH EXHIBITION: TEA .- This is so numerously represented by the growers themselves, in the case of Indian Teas, and by their agents, and also by importers and dealers in the article, that a few notes of the more original and more varied col-lections of the planters and their agents are all that we shall be enabled to notice at any length. In the Indian court on the west side of the buildings the District Association of the Kangra Valley has a very complete assortment of the herb, grown in the country in which the undertaking in question is established. It appears that there are between 300 and 400 different varieties, or perhaps more correctly speaking flavours, as flavour will vary more from soil, shelter, and altitude, and are more appreciable than any differences caused by variety, time of picking, or subsequent manipulation. Here are found about twelve distinct varieties of manufactured Tea from Kangra, placed in glass-covered boxes where it is possible to note such differences as form, size, and colour, the intelligent Hindu in charge being most obliging to answer any questions the visitor may put to him respecting them. There are also on view a portion of the trunk of a Tea shrub of about 4 inches in diameter, equalling therefore that of an old Gooseberry bush, say of twenty years; Tea seeds, photographs representing views in the district of Kangra, operations in the cultivation and manufacture, very English-looking square-towered churches, and dwellings in Sylhet, Cachar, and Assam. Taking out the mountains in the distant views, and substituting short-petticoated Irish garden-women for the semi-nude Kangraites, we might take some of the photographs to represent the regularly planted small fruit farms of Kent, so much, too, do the bushes resemble them. On this same stand are to be found a few samples

of Mysore, Tellicherry, and Nilgherry Coffees; and a case containing samples of Indigo from places far distant from each other, as Java, Oudh, Madras, Bombay, and Benares, and several with quite local appellations. Specimens of Tea growing in nots are also on view; these consist of the wild species of T. sinensis and T. viridis, T. assamica, as well as some hybrid forms possessing mostly creamy variegation on the leaf. Another Indian bazaar near this was tenanted by Hindu attendants, and an Englishman, Mr. BOWDEN. The construction and fittings are as completely Indian in appearance as materials, and a knowledge acquired by long residence in the country, can make them, the native women in their costume adding much to the idea desired to be conveyed. In this bazaar are samples of Teas of a more varied description than is seen at the Kangra stall, while the proprietor is an agent for those Teas generally that are produced on Indian soil. These are packed in airtight metal-like paper, but which is a true metal that can be soldered by merely passing a hot iron over the edges. As this is a bazaar proper it is only to be expected that we should find a varied and curious assortment of native wares, such as curries and what they are made of, pickles of the warmest, a preserve made from Physalis Alkekengi, the Cape berry, said to be superior to that of Guava, in its flavour and aroma are less evanescent and more delicious; Trinchinopoly eigars made from a Tobacco called Lank; Peppers to stimulate the flagging appetite; and Indian toys for bahies brown and white, whose colours are as fast as their own, for they cannot be licked off-an advantage not to be overlooked by owners of infants. Coloured models of Indian fruits of many species form an interesting portion of the items seen at this stall, and we must not forget the toddy gatherer and his wife. As this intoxicating liquid is made from the juice of the fruit-stalk of Borassus flabelliformis, a species of Palm that attains a beight of 70-100 feet, it is necessary, to get the "basis," to climb the tree to the top, where the long bunches of fruit hang. These fruits are of the size of medium Oranges, and it is from their foot-stalk that the liquid slowly drips. A fruit is cut off and a jug hung on to catch the juice, so that there may be several hanging on one bunch. These have to be placed in position in the early morning and removed in the evening, so that our toddytapper bas quite enough on his hands when he bas ten or a dozen Borassuses on draught. His wife, of course, carries the jars and he does the climbing business, which is done by means of a strap round his waist and by fastening his feet near the ankles with another, so that by leaning back against the waiststrap, his feet being placed against the stem, he can ascend by a series of jerks,

ECHIUM ARBOREUM. — Imagine our native Viper's Bugloss (Echium vulgare) with a stem as thick as the wrist and a much branched head 6 or 8 feet high and as much through it, and a fair idea of this singular plant will be obtained. Just now there is a good specimen in bloom in the Winter Garden at Kew. We believe the exact history of the Kew plant is not known with certainty; it appears, however, to be very near the Echium simplex from Tenerifie, as shown in picture No. 23 in the "North" Gallery at Kew.

—— MELALEUCA WILSONI,—Amongst the showiest members of a brilliant flora some of the Melaleucas certainly can claim a place. Above a hundred
species are knowe, by far the larger number of which,
however, are not in cultivation. A group of Melaleucas from New South Wales will be found represented in picture No. 97 in the "North" Gallery,
M. Wilsoni was raised at Kew from seeds sent home
by Baron von MUELLER, and a figure of the species
appeared in the Botanical Magazine, t. 6131. It is a
dry country species, and is very conspicuous with its
dense clusters of flowers with their bright rose-red
stamens. A nice plant is now in bloom in the Winter
Gruden at Kew.

— A BOTANIC GARDEN FOR JERSEY,— The "Gradener temarks that much of the experimental work in connection with economic and medicinal plants, carried on at Kew, must be done under great difficulties, on account of the climate, and asks the pertinent question—" Could they not establish a supplementary garden in Jersey wherein to grow many of the things that will not stand out at Kew?

The Cinchonas, the Guns, the Teas, and many tropical fruits would grow here in favourably selected spots without artificial covering winter or summer, and much of the work in connection with the raising and studying of useful plants and their introduction from one of our colonies to another, now carried on at Kew, might be much facilitated by the establishment of a botanic garden in Jersey worked in connection with and under the same authority as Kew."

--- TURNING PLANTS OUT-OF-DOORS,-Now is the time when many gardeners will be thinking of turning out pot-plants into the open air, with a view to the growth they make possessing more substance and strength than if the plants were kept indoors altogether. The practice is an old one, and correct in principle as regards many things which are being benefited thereby, but it is often carried out without sufficient discrimination as to the plants so exposed, and equally so in the time chosen for putting them out; for instance, how often may be seen Azaleas that have not been forced early, but that have been subjected to warmer treatment to bring them into flower about March, or the early part of April, turned out-of-doors by the end of May, when all their young growth is not half developed, with the shoots and leaves as soft and tender as they can be, the result of which is that they receive so severe n check by the sudden change, that although under such treatment they will set flower-buds freely enough generally, but the flowers forthcoming the following spring are small and often ill-formed compared with what they would have been had the plants been kept indoors until the wood was matured and the buds visible. In the case of plants that bave been forced early, and consequently bave had more time after blooming to make growth, they do not suffer in the same way, but even with them it is better to have the buds formed before standing them out, With Azaleas that have been kept back so as to bloom late, and consequently make their growth correspondingly late, they are better kept under glass altogether. Epacrises are benefited by exposure to the open air; the effect it has on them is to cause the production of more flowers than would he possible if the plants were kept altogether under glass, but the time they are required to come into bloom should be taken into account in deciding when they are stood out, as they generally set their flowers at once, however early in the summer they are exposed, consequently where a succession of bloom is wanted over as long a period of the winter and spring as obtainable, a portion of the stock should be put out at two or three different times, from midsummer to the beginning of August. santhes, which are so useful for greenhouse decoration, especially the high-coloured varieties, can never be depended on to flower as they should do without a long season of exposure in the full sun; when strong shoots of these plants fail to flower it may all but invariably be set down to being stood out too late. They should always be fully exposed from midsummer until there is danger of frost, old yellow Erica, E. depressa, will rarely bloom satisfactorily unless it is out in the full sun from the middle of June, or earlier, until the end of September. Acacias flower freer, especially when the plants are young and comparatively small, in which condition they are the most useful for forcing, if they have a good roasting with the sun out-of-doors, particularly the old A. armata, still one of the bestit should be out by the beginning of July. Genistas require to be out about the same time, and both may remain until in danger from frost. Neriums, which are amongst the most desirable stock that can be grown, should be in the full sun out-of-doors from midsummer till autumn, or there is no dependence on their flowering. The elegant habited Aotus gracillima, all the Boronias, the different varieties of Chorozema, Clianthus puniceus, Mitraria coccinea, and Myrtles should all be outside during July and up to the middle or end of September. All the above are most desirable for ordinary decorative use, even where there is no attempt at growing much in the way of hard-wooded plants.

— ESCALLONIA PHILIPPIANA.—On the outside wall of the Economic-bouse at New is a healthy young specimen of this species in flower. A description and a short history of it is given in the Gardeners' Chronicle for 1873, p. 947. It has also been described under the name of E. angustifolia, or as a variety of

E. virgata; but for horticultural purposes this is a matter of secondary importance. The small white flowers resemble those of the Hawthorn both in size, colour, and smell; while at the same time the spreading petals are altogether misleading to those who are familiar only with such species as E. macrantha and E. illinita, the petals of which stand erect and form a pseudo-tubular corolla. Its introduction from Valdivia, in Chili, somewhat north of the latitude from whence we had E. macrantha; as guarantee of its hardiness and suitability for our climate. The flowers are produced singly from the axils of the leaves along the small lateral shoots, and would be very useful as cut flowers, to mix with others, on account of their Hawthorn fragrance.

— Rose, TRIOMPHE DE L'ENTOSITION.—A robust Rose, with stout straight prickles, dark foliage and large full crimson flowers. Raised by M. MAR-GOTTIN in 1855, and figured in the May number of the Journal des Roses.

— CLIVIA LINDENI.—A small but healthy specimen of this having flowered in the Palm-house at Kew, gives an opportunity of determining its value botanically or horticulturally. It seems to be intermediate between C. miniata and C. nobilis. With respect (to the leaves, they are very robust and suddenly narrowed to a short point, whereas in C. nobilis they are truncate, and in C. miniata drawn out into a long tapering point. The flowers are large, of a deep orange-scarlet colour, with a white tube slightly splashed with orange, and are conspicuous by the great breadth of the inner segments of the perianth. They are decidedly of the C. miniata type, and present a totally different appearance from those of C. cytanthiflora, a hybrid conforming to C. nobilis in the flowers.

—— CHRYSANTHEMUM SEGETUM. — Gardeners will find this an excellent plant to cut from during the summer. It is common in the fields is some districts, and if a few plants be lifted, placed in a good loamy soil, and attended to until they are established, they will be found to produce a great number of flowers. The act of cutting induces the plants to throw out more flowers, and thus a very acceptable succession is provided. It is, unfortunately, a plant of rather straggling and uncouth growth, and needs to be associated with something else to give a little support to the branches.

—— ISMENE ANDREANA.—A greenhouse bulbous plant, introduced by M. ANDRÉ from Columbia. The white flowers are like those of Hymenocallis, with very narrow white segments and very large staminal tube or cup.

—— LYSIMACHIA NUMMULARIA AUREA.—If the common green-leaved type of this plant were rare or difficult to grow, it would in all probability attract more attention. Few plants require less care, and would better repay the cultivator for a small space in some damp spot in the herbaceous border. Perhaps the species is seen best in windows, where its long shoots, laden with large golden-yellow flowers, are allowed to fall over the sides of the pots or boxes in which it is planted. The variety named at the common Creeping Jenny in its golden-coloured leaves; as a companion to the other it is thoroughly worthy of a place in any collection of hardy herbaceous plants.

LINARIA HEFATICÆFOLIA.—In spite of its small size — it makes a dense mat of tiny leaves studded with purple flowers, and hardly attains more than an inch or two in height—this is rather a showy and desirable plant. It makes an admirable plant to cover ground occupied by spring flowering bulbs, and in places where it is not killed by too much moisture it is quite able to take care of itself. This and the charming little Arenaria balearica, with its star-like pure white flowers, are well worth a place in every reckery.

—— RHODODENDRON FORTUNEI.—In the Rhodon-dendron Dell at Kew there has lately been in fine flower a large specimen of this handsome species. It was found by FORTUNE on mountains, at 3000 feet elevation, in the Chinese province of Chekiang, and from seeds sent home by him were raised the plants from which LINDLEY first described the species. Both in foliage and foral characters it comes somewhat pear

the Himalayan R. Ancklandii, so frequently noted in these columns, but differs markedly in colour. The corolla is seven-cleft, shortly campanulate in form, and of a fine pale rose colour. The fragrance, too, is different from that of most other Rhododendrons, reminding one strongly of cinnamon. A good figure is given in the Botanical Magacine, t. 5596.

- THE SCHOOL OF HORTICULTURE OF VIL-VORDE.-A short time since we had occasion to notice the large model in relief of this establishment now to be seen at the Health Exhibition. Our Brussels correspondent tells us that the Count and Countess of FLANDERS lately paid a visit to the school and spent two hours in examining the orchard, the kitchen garden, the stoves, the fruit garden, &c. The collection of fruit trees is the richest in Belgium, containing powards of 1600 varieties of Pears, 600 sorts of Apples, 200 of Peaches, &c. Eight hundred varieties of kitchen and market garden plants are grown for examination and comparison, the director, M. GILLEKENS, attaching much importance to the development of market gardening as a partial remedy for the depressed state of agriculture, which seems to be as much felt in Belgium as here. A training school is attached to the garden.

- WILLESDEN PAPER .- This material, obtained by treating paper in a solution of cupro-ammonium (copper salts with ammonia), is now coming into use for a variety of purposes, and may be recommended for the roofing of sheds, Mushroom-houses, summerhouses, and garden structures generally. alters the character of the cellulose of the paper, converting it into a kind of cement, which is impermeable to water, and binds the fibres of the paper together, thus preserving them. Insects and mildew find no favourable resting-place in paper so treated, so that the material is remarkably durable. Willesden, "4-ply" is the best adapted for roofing material, and we believe is cheaper than galvanised iron, and has the non-conducting power of felt. It requires no painting nor application of pitch. various descriptions of the paper, which may be used for a great variety of purposes. We confine purselves to what we have purselves observed.

- THE WEATHER. -General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 16, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: -The weather has continued unsettled and rainy in the extreme north of Scotland, but in all other parts of the kingdom it has been fine and dry. perature has been slightly above the mean in "Scotland, E.," and about equal to its normal value in "England, N.E.," but in all other districts it has varied from 1° to 2° below. The maxima, which were recorded on the 13th, were as high as 83° in the "Midland Counties," 80° in "England, N.E.," and "England, E.," and 79° in "England, S." In the "Channel Islands," however, the highest reading was 67°, while in "Scotland, N.," the thermometer only rose to 56°. The minima were generally registered on the 10th, and were rather low. In the "Midland Counties" the temperature fell to 35° in "England, S.W.," to 37° in the north and west of Scotland, and in the south of Ireland to 38°, and in most other districts to between 40° and 43°. The rainfall has been a little more than the mean in "Scotland, N.," but considerably less elsewhere. Bright sunshine shows a decrease in duration over the extreme north of Scotland, but in all other districts there has been a decided increase. The percentage of the possible duration varied from 60 in the "Channel Islands" and 55 in "England, S.W.," to 24 in "Ireland, N.," and 16 in "Scotland, N." Depressions observed.-Pressure was generally high and rather uniform in the west and south of our islands and the north and west of France, and comparatively low in the northern and easterly parts of our area, where some extensive but not deep depressions were observed. Moderate S.W. to W. winds prevailed during the earlier part of the period, but alterwards N.W., N., and N.N.E. breezes became general, with cooler weather,

—— GARDENING APPOINTMENTS.—Mr. THOMAS RICHARDS, late Foreman at Davenham Bank, Malvern, as Gardener to Lord TEMPLEMORE, Preston Condover, Basingstoke, Hanls.

The Herbageous Horden.

VARIETIES OF NARCISSUS POETICUS.-Now that the flowering season of this plant is over, it may be of some use to gardeners to mention those varieties which have merit as well as distinctive characters. Of a large number which have been sent to me under many names, and as natives of many countries, I select six of the best. The earliest—and its earliness is its chief merit-is the variety angustifolius, a thin flower, but at least a month earlier than the common typical The second in time is ornatus, with a broad flat flower, and is very good and ornamental, filling the space of time between angustifolius and Contemporary with it, and like it in form but much larger in size, is the variety grandiflorus, the finest of all the section, but rare and slow of increase. The fourth in order is what most people call typical N. poeticus, but in some bulb catalogues it is called recurvus, from its habit of reflexing its petals. It is by far the commonest single form in gardens, and wherever in England the Poet's Narcissus is naturalised this is the form. The fifth, and smallest, is that described by Herbert by the name verban-ensis. It is a neat, diminutive flower, quite distinct, and a native of Italy. The sixth, and last, is the double form. I have been asked by many correspondents, whether there is any difference in kind between those which in doubling entirely lose the orange-tipped segments of the crown, and those which retain them. I believe this difference is accidental, and I find the two forms often mixed together. As for the var. patellaris, I am quite willing to leave it alone, to make its way on its own merits; and though I am said to be incapable of distinguishing a spade from a shovel, I shall always call a spade a spade, even at the risk of offending those whose flowers I criticise. C. Wolley Dod, Edge Hall, June 14.

AQUILEGIA GLANDULOSA,—Messrs. Morrison, of the Elgin Nurseries, bave sent me a box of flowers of A. glandulosa as fine as any I ever saw from Forres, The stalks are branched, each bearing several flowers, and many of them, as sent, are 18 inches high. Elgin and Forres we know are in the same county, and it would be interesting to enquire what conditions the plant finds there especially suited to it. On looking at the rain map it will be seen that the rainfall of the north of Morayshire is exceptionally small, and this Columbine is certainly very impatient of wet in winter. C. Wolley Dod, Edge Hall, Malfas. [The Messrs. Morrison have also favoured us with a fine sample of this beautiful plant. Ed.]

NARCISSUS POETICUS PATELLARIS (see Gardeners' Chronicle, p. 770): N. P., recurvus, the drooping leaved Saffron Riun, not Saffron Sun.—I am about to look into the N. poeticus var. with the view of adjusting the section, and distinguishing the May flowering sorts. I have cleared up the early flowering except spatulatus, and albus, "Haworth." Herbert, who knew Narcissus indifferently, says he did not know ornatus, albus or spatulatus. The first I cleared up some years hack, and may clear up the other two; so when stray roots come in the way of your readest let them not forget me, as I this year set aside a bed or poeticus only. This season I had a poeticus in my grounds: for weeks belore the flower opened there was a little bladder-like spathe on each plant, and when the flower broke through its cell I was reminded of bygone days when a sweep's head emerged from the chimney cowl as proof he had traversed the devious paths of flue-life. P. Barr, Covent Garden.

KNIPHOFIA ROOPERI.—Amongst the occupants of the herbaceous border few are more stately or attractive from a distance than the members of this genus, and certainly none can compete with them in the dull autumo days, when brightly coloured and showy flowers are few or almost absent. This species resembles to some extent the old and well know o K. aloides, otherwise known as Tritoma uvaria, and almost universal in British gardens. K. Rooperi, however, has shorter heads of paler coloured flowers, which differ somewhat in shape from those of the other. Its time of flowering also differs from most of the others in cultivation in being either very late or very early. In mild winters it often persists in throwing up flower-stems, which, however, never become very showy owing to the deficiency of sunshine. It has been flowering for some time on the new rockery at Kew, and there is a figure of it in the Botanical Magazine, t. 6116.

FRUIT NOTES.

PEAR CULTURE IN JERSEY. - The Royal Jersey Horticultural Society has published a list of sorts found, from experience, suitable for culture in Jersey, with their time of ripening. These are as follows :-

Chaumontel, November and December.
 Glou Morceau (west wall), December and January.
 Doyende du Comice, November and December.
 Marie Louise ffree stock, south-west wall), September and

3. Doyeané du Comice, November and December,
4. Marie Louise ffree stock, south-west wall), September and
Gelober.
5. Locale de Manile, September and October.
6. Beurré d'Amanlis, September,
7. Josephine de Malines (wall), January and February.
7. Doyeané d'Hiver, or Bergamotte de la Pentecôte, February and Marchi.
6. Van Mons. Leon le Clerc (free stock, wall), October and November.
7. Van Mons. Leon le Clerc (free stock, wall), October and November.
7. Maréchal de la Cour, October and February.
7. Souvenir du Congrès, September.
7. Bergamotte d'Esperen, March.
7. Bergamotte d'Esperen, March.
7. Bergamotte d'Esperen, March.
7. De Tongres, October.
7. Crasanne fsouth wall), November,
7. Leon de South wall), November,
7. Doyenné Boussoch, September.
7. Anapoléon (free stock), September.
7. Gansell's Bergamotte, October.
7. Juses Colmar (wall), December and January.
7. Jules d'Autielles wall), January,
7. Jules d'Autielles wall), Janua

Passe Colmar (wall), December a
 Jargonelle, August.
 Jules d'Auriolles (wall), January.

The first six are considered the best, and these are probably the most suitable for market work : Nos. 1 and 3, when well grown as stated above, meet with a ready sale, at from £2 10s. to £5 a hundred; No. 3 is rapidly rising in public estimation, and last season fetched a much higher price than the Chaumontel; Marie Louise, under good cultivation here, will reach 13 or 14 oz. in weight, and then meet with a ready sale, as it is never coarse whatever its size; Louise Bonne of Jersey is not a large fruit, but the tree is a good bearer; Beurré Diel is also good oo the same account, and its fruit is one of the finest, often reaching 14 to 16 oz. Again, Duchesse d'Angoulême is a fine large fruit, though it is not in the above list, from which it has been excluded on account of its being a rather uncertain setter: when it does set it carries good fruit, as a bush in the open ground, but, like most of the other popular sorts, the largest are from walls. Gersey Gardener

THE APPLE TRADE IN NOVA SCOTIA .- Two years ago last fall the first ocean steamer came to the port of Annapolis for a cargo of Apples, and some 50,000 barrels were sent to the English market. What has been the effect of this? We have now buyers from Glasgow and Liverpool who pay us 4 dol. a barrel for our Apples at our own doors. There is another most important requisite in this trade, and that is, to have proper warehouses in which to store the fruit, as well as proper steamers in which to carry it. Some grades of our Apples have sold in the London market at from 35s. to 38s. sterling a barrel. That was the effect of their being first carefully stored and then properly carried across the ocean. It was at first supposed that any steamers would answer to carry We, therefore, employed transient boats at a low freight; the result was that the fruit was landed in a poor condition, and brought ruinous prices. ten days' storage in a heated and unventilated hold had seriously injured the fruit. It had become wilted from the high temperature in the hold of the vessel. Heat injures fruit more than frost. Even frozen Apples can be brought back to their original condition by carefully removing the frost, but if they have been wilted by heat they can never be restored. Apples cannot be taken out of a cold, damp temperature and deposited in a ship's hold or anywhere else where the thermometer stands at 55°, without being spoiled. We found then that ordinary steamers are not suitable for the Apple trade, but that we must confine our Apple export business to special freighters. We also ascertained that the fruit must be stored in a dark damp place, with a temperature of not over 30°, and not less than 28°. Apples will not freeze even at a temperature of 25°, but with a temperature below that there is a little danger of frost. That has been the result of our experience. Apples are an article of commerce that vary in price. There is sometimes a difference of from 2 dol. to 3 dol. a barrel, caused solely from the fruit not being properly carried across the sea. In Annapolis a company has been started which is only in its infancy. We have a prospect of exporting not merely 50,000, but 300,000 or 400,000

barrels a year, and we have the market within ten days of us. In some parts of Annapolis County you can almost shake the Apples from the trees into the steamer. England imports annually from 4,000,000 to 5,000,000 barrels of Apples, London alone importing 1,500,000. The exports from America to England in 1880-1 were 1,250,000 barrels in each year. Until last year Nova Scotia was not known in England in the Apple trade. Until within a short period all Apples from this side of the Atlantic were called American Apples. After a little while two classes were recognised, American and Canadian; at last Nova Scotian Apples became recognised as a distinct class. The classes stood-American first, Canadian second, and Nova Scotian third. Now this order is reversed-the Nova Scotian Apples are recognised as the first-class, Canadian second, and American third. All this has been done within the last two years. From the "Transactions of the Fruit Growers' Association of Nova Scotia."

MELONS.

OWING to the facility with which Melon blooms can be cross-fertilised, we find this fruit to be, like Cucumbers, exceedingly fertile in the production of new varieties; but, like Cucumbers also, Melons in all the diverse kinds produced are unable to exhibit any material divergence in the form and character of foliage or flower, and only very little in the character or appearance of fruit, hence the exceeding difficulty which exists in determining how far one assumed new kind may or may not differ from another. Perhaps it is to this incapacity to exhibit variation in ordinary features that we find in Melons so little divergence in colour, flavour, or character of the fruit. It would be of exceeding interest to be enabled now to compare with the best acknowledged Melons of the day the best of twenty or more years since, for gardeners then prided themselves that they produced first-rate fruits. It seems to be the misfortune, even of the best of kinds, that it can never be relied upon to produce fruits equal to its assumed merits at any time, and it is more than likely that out of a dozen of any one sort not more than two or three will be high-class. Have we not bred our Melons up to their very highest pitch of excellence ?-indeed, if we have made so little progress during the past several years in the production of quality, it would seem obvious that, with our present garden race, a point has been reached beyond which it is not easy to pass. What will our Melon breeders say to a proposal to hark back, as it were, to some new and distinct breeds?—new so far, of course, that they have not been utilised in this country, and through the instrumentality of which it is just possible some genuine and desirable novelties may be produced. We have now all that can be desired in form, size, and beauty, and there is little fault to find on the score of productiveness. Our chief want is richer flavour, something more than mawkish sweetness, or mere sugar and water. Who will strike out a new path in Melon productiveness?

ALPINE PINKS.

It is a thankless office to tell either nurserymen or amateurs that the names on their plant-labels are wrong; and yet a recent study of the plates in the European Flora of Reichenbach, who is, I believe, the best authority on the alpine Pinks, has convinced me that very few of those we see in gardens would have the names under which they pass sanctioned by good botanists. The geous Dianthus presents a formidable array of more than 200 names, and as many as seventy species are recognised in the Genera Plantarum; but perhaps not more than one-fourth of these could fairly be called alpine Pinks, however difficult it may be to fix the limits of this title. will be well to take D. alpinus of Linnæus, figured in vol. xxx. of the Botanical Magazine, t. 1205, as the type of alpine Pinks, and to say that the more nearly they approach to this standard the better their right to be included in the class. Nursery catalogues of alpine plants enumerate generally from twenty to thirty species of Dianthus, but these include many with aggregate or bunched flowers, more resembling little Sweet Williams, and not possessing anything like the merit, as rockery ornaments, of the class of which I am speaking. Single dwarf hybrids of the common garden Pink, D. plumarius, are also very frequent, and though many of them are pretty and neat, they make the distinction of the true species all the more difficult. But I am speaking as a gardener; and to gardeners it is less important that flowers should be true to their botanical name than that they should be good.

The best three mountain Pinks commonly to be found in alpine catalogues are named respectively D. alpinus, D. glacialis, and D. neglectus. Nothing bad is likely to be sold under any of these three names, even if they are not botanically true to species. The earliest to flower and the best I have, I first bought in the nursery of Mr. R. Parker, of Tooting, by the name of D. neglectus. Finding that Messrs, Backhouse sent out the same under the name of D. glacialis I have grown it for five years by the latter name, but it is certainly not the D. glacialis of Reichenbach, but a much better plant. It grows in a compact tuft, with dark green, obtuse leaves half an inch long, and bears a profusion of flowers on single stalks, about 2 inches high when flowering, growing to 3 inches afterwards. Sometimes there are two, rarely three flowers on a stalk: the colour is rosy-pink, and the diameter of the flower exactly an inch. It is generally in flower by the middle of April, and on Juoe 14 there are still several flowers left. On a plant the size of the palm of my hand I have had sixty flowers open at a time, overlapping one another, and at its best it is always the gem of the rockery. The capsules swell and harden and open in due course, but I have never found a seed in them. I am disposed to think it is a natural hybrid between D. glacialis and D. alpinus. I am now sending it to Kew for the second time to try to get a name for it. D. glacialis of Reichenbach has smaller flowers, sparingly produced, and always more or less covered by the long stalk-leaves. Mr. E. G. Loder has sent it me several times from the Alps in a letter, wrapped only in wax paper-the best way I find of sending small plants. These have lived unbappily for a year, but never got over their transplanting. Last year, however, I found six seeds on one of them when it came, from which I have grown six healthy plants which I hope to establish. The true typical D. alpinus—I have grown it from seeds collected in the Alps—has dark green shining leaves spread horizontally, half an inch long, broader than those of kindred kinds, and large flowers 11 inch across, with broad overlapping petals. The colour is purple-pink, with darker marks at the base of the petals. The flower-stalk, in the best type, is so short that the flowers seem to rest on the leaves, but in some varieties the stalk is longer. The first flowers appear about the end of May, six weeks later than those of the Pink I first described. This plant rarely ripens a seed in my garden. What I believe to be true D. neglectus in my garden. What I believe to be true D. neglectus according to Reichenbach's figure, has flowers as large as those of D. alpinus, but lighter in colour, and having narrower petals, which leave a space between when spread. The flower-stalks, which often bear two flowers, are not more than an inch high; the leaves are more acute, less shining, and more upright than those of D. alpinus. It flowers at the same time as that species, and often ripens seed,

Another very good variety came to me as D. neglectus. The flower-stalks are quite as long as in the type, the flowers smaller, more plentiful and more uniform in colour, which is deep bright pink. This variety ripens seed plentifully. It seems to me to answer to D. nitidus of Reichenbach, which is quite different from the bunch-flowered Pink called D. nitidus by older botanists. Omittiog two or three similar varieties or natural hybrids of this class, I must notice the two only native perennial species of Pink. The one, D. deltoides, the Maiden Pink, does not belong exclusively to rocks or mountains: but the abundance of its bright pink flowers, and the ease with which it is cultivated, make it a desirable plant for rock gardens; there is also a pretty white flowered variety with a pink eye nearly as common.

The other, D. cæsius, the Cheddar Pink, is an alpine of alpines, being found only on bare and dry exposed rocks. From the figures in Reichenbach the species seems variable both in size and shape of flower, but I have never possessed the true native plant from Somersetshire, of which seeds or cuttings would be gladly welcomed here. It is useless to give a list of species, many of which could not be obtained true, or might be found inferior to hybrids, which have perhaps usurped their names. My advice to those who wish to cultivate alpine Pinks is to buy what they see that is good, and not to be too curious about the name of it, which is a matter that can be

investigated afterwards at leisure. But two more species, which seem to be common in cultivation, may be mentioned-D. fragrans and D. petræus. probable that both of these have had a share in producing some of the garden varieties of Pink generally referred to D. plumarius. They are neat, free-flower ing plants, from white to pale pink, and the two are liable to be confused. The smallest double Pink I have seen is generally referred to D. petræus. Imagine a pure white Jasmine flower with jagged edges, and doubled to a ball, without losing any of its fragrance, and that is the plant. I have distributed it freely for two or three years, as it is too good not to be in general cultivation, but the only single Pink I have seen with the true Jasmine scent was a white one bearing the name "fragrans," so I am disposed to call the double one by the same name. All these kinds seem very ready to form hybrids, and many have been made both naturally and artificially, yet much remains to be done. A plant with the habit of D. alpinus and the colour of D. cruentus would be a great acquisition. Something should be said of cultivation.

selected. C. Wolley Dod. Edge Hall, Malbar. [We supplement our correspondent's remarks with an illustration (fig. 150) of Dianthus glacialis, prepared from a specimen kindly sent to us by Messrs. Backhouse, ED.]

Çhe Kosery.

ROSE PROSPECTS.—The "Time of Roses" is now fast approaching, indeed all say is already upon us; "this warm sunny weather" is fast developing their beauties, already do Belle Lyonnaise, Gloire de Dijon, Bouquet d'Or, Rève d'Or, Climbing Devoniensis, &c., lavish their beauties on our walls, and day after day an unlooked for beauty shows us a lovely Tea, or an early bloom of a H. Williams, and schedules of Rose shows pour in upon us, and on all sides preparations are being made for the coming struggles, and as usual comes the question, What are our prospects for the season? I may claim some little right to pronounce an opinion, although I have visited, perhaps,

FIG. 150 .- DIANTHUS GLACIALIS, HORT. BACKHOUSE: FLOWERS ROSE-COLOURED.

We are often told that alpine Pinks are easily cultivated, and there may be favoured soils where they may be left alone for a long time, and do well. But a raised rockery greatly helps the conditions under which they like to grow; and in such ground as mine it would be hopeless to attempt them without artificial soil. Something which the roots can easily penetrate, and which allows wet to pass readily downwards, but prevents its passage upwards, is good for them. I find cocoa-nut fibre, broken limestone the size of wheat (granite might be equally good if a little powdered mortar were added), coarse sea-sand, fine loam and peat soil, in equal parts, a good mixture. A foot deep of this will grown any alpine Pink well; but soil which becomes hard and cakes does not suit them. They root deeply, and like rough stones to root amongst. Wireworms under ground, and slugs, and short-tailed field-mice above are their worse enemies. I generally put a perforated zinc collar round them till established. Seed, when it can be obtained, is the best mode of increasing them; but cuttings are not difficult to strike in silver-sand under a hand-light, care being taken to avoid keeping them too wet. Some of the kinds root readily if pegged down into sand and peat. In the cultivation of all of them overgrowth and shade must be avoided, and the most exposed situations

not so many gardens as usual, but they have been in various parts of the country, and my conviction is that unless something very untoward happen, we are likely to have one of the very best Rose seasons that we have had for many years. Of course one hears complaints, but they are fewer than I ever recollect. The mild winter at one time seemed as if it would militate against success; the plants grew and kept green'; they were in February and March so forward that blooming buds were formed at the end of the shoots, and two-thirds of the eyes had started ; and it seemed almost too much to have to cut all this away, but it had to be done, and soon instead of the flowing canvas our Roses were "running under bare poles. It was marvellous what they did in a short time and in good Rose soil the growth has been very rapid and strong. The best examples of growth that I have seen have been in Cheshire in the gardens of Mr. Tinsley, Grappenhall Lodge, and Mr. T. B. Hall, of Larchwood, Rockferry; nothing could possibly surpass the vigour and beauty of the plants, but then besides the care and attention bestowed on them, especially by Mr. Hall, what soil it is 1-that rich deep unctuous loam in which the Rose especially delights and which goes down any depth you like. In Mr. Tinsley's garden I saw plants of Charles Lefebvre on its own roots, which had shoots that would, I venture to say, before the season was out, be 8 or 10 leet high. In such soils dry weather is not a serious matter. The roots have gone far and wide in search of food, have got it, and flourish accordingly. It is on light soils such as mine that the trial comes in such seasons. We have sighed for rain, but it comes not, and hence watering must be largely resorted to, and this not, as I have said, for exhibition purposes—for I do not exhibit—but for the wellbeing of the Rose itself. In such a season mulching is very valuable, but it is very untidy, especially as I am here surrounded with blackbirds, thrushes, &c., for whom it is a free hunting ground, and, therefore, I do not use it until the autumn. I once did it when a relative was coming to see me whose nose was very sensitive to. smells, and as there was a good deal from the pigstye in it, it nearly drove her out of the garden.

I have already seen some Roses of interest. Souvenir de Thérèse Levet promises to be the best of the late Teas. It is very free-flowering, and likely to be very useful. Etoile de Lyon, which some have regarded as not equalling, far less surpassing, Perle des Jardins, is likely to be a good beat on that variety. I have already seen it very fine, and the weather we are now getting is very favourable for all such Roses.

As far as the success, then, of exhibitions is concerned everything looks well up to the present time, but all will depend on the character of the weather for the next three weeks. "Hope springs eternal," &c., and although hopes may have been disappointed in years past it may be this season they will be fully realised. Wild Rose.

P.S.—Since the above was written I have seen and heard of a terrible visitation of honeydew, mildew, and aphides, consequent on the cold east winds, which will in many cases quite alter our prospects. Wild Rose,

THE FLOWER-STALKS OF ROSES .- Every rosarian is familiar with the fact that the Maréchal Niel Rose has a specially slender and brittle flower-stem; so much is this the case, that the Rose is often broken off short by the merest twist or change of position: not a few have also marvelled much that the slender branchlet could convey sufficient food to the enormous golden masses of petals that crown or ter-minate them, for the Maréchal Niel is pre-eminently distinguished by substance as well as size and number of petals. With the single exception of Paul Néron, it is probably the largest Rose, though rumours are rife of rivals to both in this respect. Still, for substance, size, and number of flowers, it is difficult to match, perhaps impossible to beat, the Maréchal Niel; and were the flowers weighed no Rose could be found to match it in the gross weight of its rich harvest of bloom. The weight of the individual flowers of the Maréchal Niel Rose would seem incredible were we not so familiar with it. And all this substance, odour, colour, is conveyed along a passage so narrow and so weak that a block or break-down seems inevitable at any moment.

More wonderful still, those buds that have the weakest stems and which bend their necks to the burden the most, seem invariably to produce the finest flowers. I cut several to-day, and in every case the flowers that drooped the most, so as to depend like a bell to such an extent that the blooms bent back and formed a right angle with the growing stems, were the finest, alike in size, form, substance, and colour—the weight of the flowers being seemingly a factor of considerable potency in their development to such abnormal dimensions.

In some correspondence I had the honour of holding with the late Charles Darwin in regard to the attractive power of Grapes and other fruit, that great naturalist appeared to endorse this view-that the mere weight of the produce was one means of ensuring a plentiful supply of food. There can be little doubt but that this is so in the case of Grapes and most other fruits, notably Melons, Cucumbers, &c. And now it is assuredly a case in strong support of similar views that our weakest-necked Rose is also our most massive one, and characterised by a maximum of substance in the petals; and more than this, that the finest flowers are, as a rule, those that droop the most. The drooping may of course be explained on other grounds, and may be held to take place after the special development has taken place. In a word, the Roses may be said to droop because they are fine, and not to become fine by reason of their drooping. Experience and observation, however, by no means confirm this view. Were this so the blooms on the strongest, thickest branchlets that never droop would be the finest. It might also be affirmed that the flowers enlarge by their partial or complete inversion, not by virtue of their weight, but through their change of position. It is a fact, that not a few Roses, especially of those difficult to open, such as Miss Ingram, Madame Lacharme, and several others, may be improved in form, and apparently enlarged in size by being partially or tied down. The petals unfold more determinedly, as it were, the form is somewhat modified, and the bloom may be enlarged. But this special effort of Nature seems different alike in its cause and its results to that seen so frequently-almost invariablyin the drooping buds of the Marcchal Niel Rose. Niphetos grown under glass, trained some distance from the roof, at times developes a similar tendency, though nothing to the extent of the Maréchal Niel; and I trust rosarian observers and vegetable physiologists will give us their opinion, and while about it will also say whether they can throw any new light on the huge warts on the stems that cut short the career of so many Maréchal Niel Roses alike on their own roots and on stocks of all sorts and sizes. Can it be that there is any correlation between the brittleness and weakness of the Rose necks of the Marechal, and those cankerous swellings that prove so fatal to this magnificent Rose? This is hardly likely, and these gropings after, rather than guesses at truth, are offered for what they are worth. D. T.

MILDEW ON ROSES: THE REMEDY .- I have been reading the interesting notes of "Wild Rose on this subject, and am tempted to add a few observations. Some Roses are undoubtedly more subject to it than others. Miss Hassard does not succeed with me, nor, so far as I am aware, in any of the Rose gardens around, though grown under diverse circumstances of soil, situation, and treatment. My limited stock in the open has a southern slope and full exposure, and I never notice mildew, with one exception. The soil sometimes carted from the farm is firm tenacious clay, and very liable to get as firm as iron. When this happens—and excessive rain or watering, followed by a spell of dry weather such as we have been lately experiencing, induces such-death, with mildew as an accessory, frequently results before the real cause can be determined, or before a busy man can notice it. If any one cause superinduce mildew, I should say it is the fierce "north-easter; but too frequently there are concomitant assistants A fortnight since I had most promising specimens of Triomphe de Rennes, Marie Ducher, Beauty of Staplesord, Niphetos, Céline Forestier, &c., in pots. The pots were not large, so I was giving them an occasional dose of artificial manure. The growth was thus forced and tender, though grown fully exposed, and almost wholly in the open air. A few days of the villainous blast referred to, and the leaves were curled at the edges, and mildew set in, especially on the first-named specimens. I am not much of a believer in sulphur as a positive and permanent remedy, especially if there are more causes than one. What can sulphur on the leaves do for the roots, if they are injured from excessive moisture and undue evaporation, or, like the excellent illustration of the London alderman, over-fed? Besides, it is very unseemly, and, as noticed by "Wild Rose," gives yellow Roses an unnatural green tinge. I am no believer in expedients because they were known to our ancestors. What I did was to syringe the worst, back and front of the leaves, with a strong solution of carbolic soap, and with satisfactory results. A new soap, called "Sanitas," used for disinfecting purposes, I consider even better. A few which I considered too moist at the roots, I repotted, without disturbing the ball much, and withheld water until fresh growth commenced. I have recommended the same plan to a neighbouring gardener, and with equally satisfactory results. Preparations from Tobacco I cannot help looking on as an "edged tool" that none but the very experienced in its use should have recourse to, especially in connection with very tender Rose foliage. W. J. Murphy, Clonnel.

SUMMER PROPAGATION OF NOISETTE AND HYBRID CHINA ROSES.—These capital summer and autumn flowering plants, which ought to find more

recognition in the garden than they have obtained of late years, are best increased in the end of June, or in July, by cuttings of firm but not ripe wood. should be made with a slight heel, and should retain all their leaves, even to the base, shortening them back only if too heavy, by cutting the upper portion of the leaf away. A spent hotbed, slightly freshened up by the addition of a few barrowloads of Oak or Beech leaves, will be an excellent place in which to strike them-one with two or three lights being large enough for a big garden. Level the surface when the heat has declined to 80°, then put on about 2 inches of loam, and over that 2 inches of finely sifted sandy soil, and finish off with a slight surfacing of sand, and the bed is ready. On making the cuttings take care they do not flag more than can be avoided, therefore do not keep them lying about, but as soon as a few score are ready insert them to about 14 inch in depth in the bed, water with a fine rose and warm water, close up, and shade effectually with something thicker than scrim. The frame must he kept close during the day, but may have air given early in the morning for twenty minutes to dry up excessive moisture. Watering may become occessary excessive moisture. Watering may become occessary again before rooting takes place, if the underlying stratum of loam is of a porous nature, not otherwise, and a slight dewing over will be found beneficia after hot days. Shading must be constant, only during sunshine, and must be taken off immediately the sun leaves the frame. I found the fewest losses when the frame stood in the sunniest place in the frame ground, and usually 90 per cent. will grow. If potted off as soon as the majority of the cuttings are rooted (which will be in about eighteen days) into 60's, and kept close in a frame for a week, they will make good plants to put out the following spring. In a good strike the plants should not lose their leaves, in that way differing from autumn-struck Rose cut-tings, in which the loss of the foliage, at an early date, affords a sign that success will attend the work. M.

Home Correspondence.

Cytisus Adami.-We have received a fine branch of this interesting tree, bearing tufts of the flowers and leaves of C. purpureus, C. Laburnum, and the inter-mediate form, C. Adami. It appears that in the ordinary course of events the tree bears the intermediate flowers only, but where any injury, such as the destruction of the terminal bud of a branch takes place, one or other of the supposed parent forms is produced. An example in the garden of Mr. C. E. Stuart, of Reading, for many years bore nothing but the flowers of C. Adami; last year, however, a tuft of C. purpureus was produced at the lower part of This was accidentally destroyed, but this year branches of both C. purpureus and C. Laburnum have been produced in various parts of the tree, the former chiefly in the upper parts. The mixture of the erect tufted branches of C. purpureus with the pendulous racemes of C. Laburnum and the curiously intermediate C. Adami, gives the tree a very striking appearance. At every point where one of the parent forms was produced there were marks of some previous injury-a small branch torn off or the extremity of a bough destroyed. A coloured figure of the pendulous variety, C. Adami var. pendula, is given in the Revue Horticole for 1871, p. 370. This shows flowers with the pink and yellow colouring definitely separated. In the Reading tree none of these flowers were to be seen, all were a dull yellowish-pink, with the brown marks characteristic of C. Laburnum at the base of the petals, while the calyx was exactly that of C. pur-pureus. H. N. R., British Museum.

Worms,—The common complaint against cats for scratching up young or small plants in suburban gardens is open to some doubt. In my experience this spring I have found the worms to be answerable for all such that have occurred in my own garden. Early in April a number of Lettuces, planted out, were found for several mornings after to have had their roots removed quite out of the ground, as though lifted up by the leaves and left, some simply laid over on their sides, and others 2, 4, or more, and one nearly 9 inches away. When the plants had properly taken root the attacks ceased, and during the dry weather the young plants since put in escaped, but upon the return of rain the attacks have again been

made, not upon the cultivated vegetables, which are all firmly rooted, but upon the younger growth of various weeds. This is a power of denudation, I believe, not quoted by Darwin. IV.

Sowing Vegetables where they are to Stand. -The long spell of dry weather has been so very trying for all freshly transplanted vegetable crops that it has been next to impossible to keep the plants alive, and many like myself no doubt wish they had practised that best of all systems, the sowing and rearing of the plants where it is intended they should grow and turn in. Those who do so with Brussels Sprouts, Cauliflower, and Lettuce generally have the finest, as there is no check except the slight one at thinning, and the plants being left with tap-roots intact are always much stronger and better able to bear drought, as they can get down and find moisture when there is none near the surface. Transplanted Lettuce at and after this season generally bolt, but those sown, thinned out, and allowed to stand, seldom or never run, and not only that, but they heart-in much harder and closer, and are crisper, more juicy, and better in flavour. The way to manage is to choose a piece of partially shaded ground, such as a border near a building or wall, and having heavily manured and dug it shallow drills 15 inches apart should be drawn, and in these two or three seeds pressed, and just covered in passion and about a foot between, as then the Lettuce, when they come up, will stand in the right positions, and all that is necessary then is the singling out, and leaving the eternnest among them to grow. The hoeing seeds pressed, and just covered in patches, leaving that is necessary then is the singling out, and leaving the strongest among them to grow. The hoeing after, which will be requisite to keep down weeds, gradually fills in the shallow drills, and thus slightly earths up and steadies the plants. For Cauliflower the drills should be at least 2 feet apart, and the patches of seed 18 or 20 inches from each other in the rows, which will afford sufficient room for their the rows, which will afford sufficient room for their full extension, and enable them to turn in with fine heads. Endive, too, are much better sown where they are to stand, and may be treated precisely the same as Lettuce, except that the Endive, having to stand late in the autumn, needs a more open and sunny position. A good situation for it is a sloping border, or a place on one of the quarters, where it can easily be covered or protected for blanching. J. S.

The Jensen System of Protective Moulding,—Probably owing to the vast importance of the Potato crop in these countries you have repeatedly devoted a large portion of your space to the consideration of the above. I am much interested in everything pertaining thereto, both for farm and garden purposes, and I want space for only a few lines to ask a question in reference to this matter, as the time will shortly come to decide whether this system of prevention is to be resorted to or not. Let me for argument sake admit the system of protective moulding is feasible and practicable, I want to ask has any reader of the Gardeners' Chronicle put it into practice to any considerable extent, so as to employ paid hands to do the work, and if he has would be kindly say if he found the experiment a paying one comparatively? W. J. Marphy, Clonmel. [Some experiments are being carried out at Chiswick, under the ausplees of the Scientific Committee, which will be reported on in due season. Ed.]

Royal National Tulip Show.—Mr. Bentley writes that he sent me notice of date of show ten days in advance, and it is proper, therefore, to conclude that the Post-office failed in its duty, which is certainly unusual. As a matter of course, I am sorry I sopke. One of my friends who takes a special interest in Tulips found himself all in the dark, like myself, about the date of the show, although he sent his subscription in good time. I owe Mr. Eentley an apology, which I readily offer, hoping to be pardoned for my loudness, on the ground that I have had painful experience of the prevalence of humbug on this terrestrial sphere. Shirley Hibberd.

Old English Vineyards (p. 774).—Sir Joseph Hooker's letter on the Bassett vineyards is very interesting. In my Plant Lore of Shakespeare I quoted Pbillips' account of them published in the Pomerium Britannicum in 1820, and I have now no doubt that Phillips quoted from Switzer without acknowledgment. I was then unable to identify the vineyards named, but have since discovered them. They were at Claverton, near Bath, and part of the property was sold by Mr. Richard Holden to the Bassetts for Still called The Vineyards. In 1701 the property was sold by Mr. Richard Holden to the Bassetts for vine of the vineyards of Claverton." In 1801 was published a map of 5 miles round Bath, in which the vineyards are marked, and the Vines plainly shown. By the Bassetts the property was sold to the Kegans, and by them in 1868 to the present owner, Mr. Skrive.

Last year I was taken by Mr. Skrive to the site, and if a vineyard could succeed anywhere in England I should think it would succeed there. The soil is a brashy oolite, warm and dry, and the vineyard faces full south, ou a steep slope, fully protected from the north and east, and the ground forming natural terraces. What is the present result of the Castle Coch experiment in vineyards? [Unsatisfactory. Ed.] Henry N. Ellacombe, Bitton Vicarage.

The Fruit Crop.—It is very remarkable that the hardy fruit crop has suffered more than the tender, yet so it is; for while in most places where a little The Pruit Crop.—It is very remarkable that the hardy fruit crop has suffered more than the tender, yet so it is; for while in most places where a little protection has been given, or there is natural shelter more than walls afford, pleoty of Apricots, Peaches, and Nectarines, are to be seen, while in the very same gardens, Cherries, Plums, and Pears, as well as Cooseberries and Currants, are mostly cut off, or badly thioned and injured, as may now be seen by the quantity lying on the ground, and the crippled, unshapen fruit on the trees. This immunity from harm on the part of Peaches, Nectarines, and Apricots, can only be accounted for by their having been in flower so much earlier, and getting set and well on in swelling before the sharp frosts came during the third week in April, which caught Plums, Cherries, Pears, and the bush fruits just at a critical tume, and the result has been wholesale destruction, which will be a serious thing for market growers, who have suffered so much of late. Fortunately, Apples have escaped, and though the trees in most parts of England bore heavily last year they formed plenty of blossom-buds, and have a fair crop this, which the late rain bas helped considerably by washing the foliage and well soaking the ground, thus freeing the Apple clusters of maggots, and causing the fruit to swell at a great rate, so that within a few days it doubled its size. If we get warm weather just now its progress will be rapid, but I do not think there will be any fine Pears, as the frost seems to have played sad tricks with them, and left them gouly and full of knotty excrescences. They are bad on walls, but they are much worse on pyramids, where the greater part have fallen, and most of those left are full of deformity. The hardiest kind, or the one that seems to have escaped best, is Louise Bonne, a tree of which, standing among the others, with no more shelter or advantages, has nevertheless a full crop of clean-looking fruits. The only other variety that has anything like a crop is Easter B only just a few, and the greater point holic, although most of them had plenty of bloom. Cherries on a south-east wall have plenty of fruit, but those on a westerly aspect are very much thinned. The effect of the frost on these has been most singular is at it seems to have destroyed the flesh, the stones being only covered with a thick, tough skin, and those that do swell are all sorts of shapes. Morelos will be plentiful, as they generally are, on account of blooming so much later, and as they are such good keepers, and so valuable in so many ways for cooking and preserving, the wonder is that they are not much more extensively grown. While on the subject of Cherries, I would just like to say a word in favour of Frogmore Bigarreau, which has all the good qualities of the old kind, and is considerably earlier, fruit with us on a tree growing on a south-east wall being now (June 14) ripe, thus being quite a fortnight in advance of the original sort. The Frogmore Bigarreau was strongly recommended by the late Mr. Robert Osborn, who was a good judge, and who, I think, sent it out. Where Gooseberries and Currants seemed to have suffered most is after close pruning or severe thinning, which is more practised in gardees than among market growers, and this difference in treatment, though it is the means of bringing about finer fruit, often ends in a partial and sometimes total loss of the crop. The system of having Gooseberries and Currants in rows between other trees favours the market man; but independent of that shelter, when bushes are thick with branches and full of foliage, they do much to protect and shelter themselves, as there is no draught of cold air through them, and a degree or two gained may, and frequently does, save the Gooseberries and Currants from the sting of the frost. 7, S.

Cytisus Adami. — Your leading article at p. 772 seems to cast some doubt on Adam's statement, that by inarching or grafting Cytisus Laburnum purparascens (not Cytisus purpureus) Coar statement is the one cited by Darwin and Morren; we have not been able to consult the original. The case is important, inasmuch as C. purpurascens is = C. Adami, and is a bybrid production, which materially alters our correspondent's case. ED.] on the common Cytisus Laburnum, the result would be that from this graft shoots exactly similar in every respect to Cytisus purpureus, both in blossom and foliage, would emanate (in reality it would be Cytisus purpureus), and in addition to this shoots would also be produced with both the leaves and flowers of the stock used, viz., Cytisus Laburoum. This has been verified out, and over again in the large nurseries where ornamental trees are grown, and any one who may still be

sceptical has only to purchase or graft C. L. purpurascens on the common yellow Laburnum, and in two or three years the result would be as stated above, reliance should not be placed on a single plant, but half-a-dozen should be tried. A fine specimen of Cytisus Adami used to be in the Royal Horticultural Gardens at Chiswick, and is probably still growing in the portion taken from the old garden. Abother similar specimen used to be in the Upton Nurseries, Chester, growing near the brook that divides the Upton and Newton Nurseries, and the late Mr. Francis Dickson told me it originated in the way I have named, and since then I have seen many similar trees. I have never tried to cross C. L. purpurascens either with the common Laburnum or C. purpures, I have often woodered how C. L. purpurascens originated, as it seems so unlike the C. Laburnum in many respects. I found on one occasion a bundle of scions intended for grafting that had not been required had all rooted freely, showing it could be produced on its own roots. C. L. purpurascens is the best stock on which to bud or graft Cytisus purpureus and C. purpureus albus. On the C. Laburnum they frequently die away and become unsightly; this is not the case when growing on C. L. purpurascens. One of the most beautiful of the yellow Laburnums is C. L. Parksii, William Heale, Lincoln.

A Flower Basket.—The accompanyiog illustration (fig. 151) was sent us by our special correspondent at the late International Horticultural Exhi-

FIG. 151.-A RUSSIAN PLOWER BASKET.

bition at St. Petersburg. It represents what many ladies will consider a handy thing when gathering flowers, inasmuch as it obviates the necessity of carrying a basket while collecting flowers, or of stooping to place them in a basket on the ground. The contrivance figured can be stuck into the ground in any convenient place, and moved about as required.

Early Peas.—The present is a good time to compare notes on Peas with regard to the important points of earliness and quality—the first earliest being now at their best. My method of growing early Peas is to sow in boxes, pots, or on turves (I do not care which, provided they are carefully attended to through all their stages of growth), early in the year, and plant out on a sheltered border when the weather will permit. I have grown several varieties for trial, but will only mention a few of the earliest and best in quality, viz., William I., sown in boxes, January 12, plated out March 10, io bloom May I, gathered first dish June 7—quality excellent; First Crop, sown at the same time as the above, was in bloom on May I, and we gathered the first dish on June 6—

quality and quantity inferior to William I.; American Wonder, sowo and planted out at the same time, bloomed on May 5, and we gathered on June Squality and quantity excellent; Paragon, sown and planted with the others, was in bloom on May 24—will not be fit to gather till the last week in June. Taking all in all—quality, quantity, and earliness—I do not think we have a more useful Pea in cultivation than William I. David Lumsden, The Gardens, Blexham Hall, Steaford.

Fenaria sanguinea, Pim.—In the Gardeners' Chronicle for December 22, 1883, I described and figured a remarkable mould which occurred in some aoundance. Jone of the sound of the plant seemed so doubtful that for the time I refrained from giving it a name, hoping that investigation might give some clue to its nature. In this, however, I was disappointed, as repeated and varied attempts have entirely failed to induce germination beyond the extension of very short hyphæ. I therefore venture to propose the above name as a new genus and species till some more fitting one be found for it. Its place is apparently near Pythium Fernaria (fenum = Hay) saoguinea, nov. gen. et spec. Hyphsama dense, felted, sparingly septate, producing abundantly caducous, somewhat pyriform, conidia, thick walled, also spherical conceptacles containing numerous ovate sporidia, exterior of conceptacles somewhat byssoid. The whole giving a decided blood-coloured tint to the stem of grass on which it occurs. Hab, silo at Albert Farm, Glasnevin, Co. Dublin, October, 1883. Greenwood Vim, M.A., F.L.S.

Acrial Roots on Vines.—Apropos to the remarks on this subject at p. 778, I am tempted to ask whether the so-called acrial roots on Vines are roots at all. This may seem a very sceptical sort of question to put, because the theory as to these pendent leeders from Vine stems being roots is universally accepted. Really are they other than species of tendrils, such as are seen plentifully on many wall climbers, but that in the case of Vines are only created or developed by the peculiar atmospheric conditions under which the Vines are grown? Some would perhaps call these stem-roots or tendrils, spongioles—a fine name that may mean anything. Is it not the case with some climbers that when in close coatact with a wall they produce exactly similar protuberances, yet if detached from a wall have none? Yet in no case can these be called roots. [Why not, if their structure and mode for growth is that of roots? Ed.] A. D.

Chrysanthemums Flowering Prematurely.—
It gave me great satisfaction to see Mr. Salter (at p. 778) calliog attention to this unfortunate precocity. I am growing about 300 plants this year for exhibition purposes, and, to my astonishment, when giving them their last shift into 12-inch pots I found most of the plants intended for cut blooms with flower-buds on them as large as Peas. I concluded that this was caused either by the cuttings being taken too early, or from the plants having been kept under glass too long, on account of the coldness of the nights and sharp piercing winds in the day-time. My cuttings for this year's plants were taken early in November, which to my mind is far too early, for I have never taken them until this year before the middle of March is quite soon enough, as experience has shown. I was the most successful exhibitor of Chrysanthemum plants at Safron Walden for three years, and all my plants were struck from cuttings taken in March, whilst those of my opponents were either old plants or cuttings struck in the autumn. Coming again to the point of early flowering I will give my experience, having adopted three dilierent methods. First I cut some quite down; those I am afraid will not be forward enough for their wood to become well matured. Secondly, I cut some down half way, and those have made such a weak growth that I am disposed to think the quality of the flower will be destroyed; and, thirdly, I simply pinched out the buds, and those I am happy to say are giving more satisfaction, as they are growing again very stroog. Those that are growing on for specimen plants, I am happy to state, have not shown any signs of flowering, as they have been frequently pinched, the only exception being Mrs. G. Rundle. Mrs. Dixon and Cassandra, the Japanese varieties that have been throwing up flower-buds and those that have been throwing up flower-buds

Bronze Jardin des Plantes, Cherub, General Slade, Hereward, Hero of Stoke Newington, Lord Derby, Mabel Ward, Mr. Gladstone, Mr. Jay, Blonde Beauty, Beethoven, Mrs. Cunningham, Mr. Bunn, and I might mention many others. Among those that would have been in bloom now had they not been stopped I may mention—Incurved: Mrs. G. Rundle, Mr. Dixon, Cassandra, Novelty, Pink Perfection, George Glenny, Mons. Elie, Gloria Mundi, Empress of India, Emily Dale, Her Majesty, Lady Hardinge. Japanese sorts that were very forward with flower-buds are:—Album plenum, Apollo, Elegance, Magnum Bonum, Striatum, Perfectum, The Cossack, Victoria, Rosa Bonheur, M. Castel, Red India, Illustration, Jane Salter, and Hero of Magdala. Alfred Bishop, The Gardens, Wannock House, Polegate, June 16.

The Double White Rocket.—Just at this time of the year we hear about that rara avis in flores, the true old double white Rocket, and it seems that occasionally it finds its way inte editorial sanctums, but does not come before the eyes of the public. Will some one who is a favoured possessor of this rarity send it to one of the London shows so that it may be seen, and those who have it not, or it would seem cannot get it, may become acquainted with it.? Our old but, alas! not true double Rocket seems to be but an impostro—a very hard appellation to apply to one of our swetest of hardy border flowers. It is true that this latter kind is not of a pure white colour; it has the demerit of being tinted with rose, but it is very hardy, is a robust free grower, blooming finely, and the flowers are as richly perfumed as the best of Stocks. Beyond being of a purer hue, what more can the true old being of a purer hue, what more can the true old double white Rocket be? A. D.

Wiltshire Woods and Downs,—When reading over the interesting article (p. 766) on a botanical excursion to the Wiltshire Downs by Mr. Horsefield I could not help wishing that I had been the fourth member of the party. It is seldom, indeed, as was, however, the case here, that even three friends having a mutual interest in our native Orchids as was, however, the class nets, that even three friends having a mutual interest in our native Orchids meet for a botanical roam. The members of this securison seem, from the list of Orchids found, to have been amply rewarded for their search, for there are certainly few districts in this country where an equal number of species, some very rare, could have been collected in a day's outing. The large white Cephalanthera (C. grandiifora) is, I am glad to know, still flourishing in at least a few secluded spots, where long may it remain, for, as it is much sought after, I had feared it was now becoming a rare native plant. I was also pleased to know that the Bee and Scorched Orchids (Ophrys apifera and Orchis usultata) are still found pretty plentiful in Wiltshire, as the former especially is in great demand, and must be torn up in quantities each year either here or on the Continent. Habenaria bifolia, or as it is popularly known as the latterfly Orchis, certainly deserves all that Mr. Horsefield has said in its favour. I have a beautiful variety of this plant with variegated leaves, which Horscheld has said In its favour. I have a beautiful variety of this plant with variegated leaves, which offers a rich contrast to the ordinary form. Regarding the Bird's-nest Orchis (Neotita nidus-avis) we have yet a good deal to learn, but I believe that I can now satisfactorily account for the peculiar appearing and disappearing of this interesting plant, and which I may have occasion to refer to at another time. A. D. Webster.

Foreign Correspondence.

GHENT: SYNDICAL CHAMBER OF BELGIAN NURSERYMEN .- The second monthly meeting of the joint committee of the Syndical Chamber and the Royal Agricultural and Botanical Society of Ghent was held recently at the Casino, and was as great a success as the first. Seventy-five new and rare plants were entered for the criticism of the jury. Certificates of Merit were awarded to Masdevallia Harryana var. D'Haenei, shown by M. D'Haene; to Diessenbachia Jenmani, exhibited by M. Auguste Van Geert; to Cattleya Mossiæ Margarita, submitted by the Compagnie Continentale; to Odontoglossum by the Compagnet Commentate, to Contingiossim luteo-purpureum, from M. C. Vuylsteke; to Croton sp. nov., sent by Messrs. Wartel Frères; and to Begonia Countess Louise Erdody, of Messrs François Debois et Cie.

Cultural Certificates were awarded for Masdevallia amabilis, shown by MM. Vervaert, et Cie; to Vriesia fenestralis, which came from M. A. Peters, of Brussels; to Licuala grandis, from the Compagnie Continentale; to Davallia fijiensis plumosa, from M. Auguste Van Geert; and to Phœnix rupicola, from M. Jules Heye-Leysen. Numerous ''Honourable Mentions" were also adjudged. The success of these meetings is now assured, and we have no doubt of their value to the horticultural interests of Ghent.

FORESTRY.

INTERNATIONAL FORESTRY EXHIBITION.—Already the shell of the building in which the grand exhibition of forestry, arboricultural products, and appliances is to be held, is complete. Although the erection is of wood, and therefore paltry (necessarily) as regards its material, some attention has been paid to form and outline, so that the usual shed-like effect produced by wooden buildings is altogether avoided. By means of transepts, central dome, and what may be called conical domelets at the two ends of the main building, an effect is produced very much like that of the International Exhibition buildings at South Kensington in miniature. The whole length of the lawn in front of Donaldson's Hospital has been taken up, so that the stately front of that great building is entirely hidden, only its turrets peeping out in the background. The entrance will not be by the gate next the city, but by the western gate, from with in a few yards of which a wide covered way, 54 yards in length by 10 in width, extends up to the western end of the main building. The gabled portico is of a very handsome rustic design, the entrance being by three arches, immediately behind which will be the paygates, arranged in the most convenient manner, after study of the mode found so successful in London and Paris Exhibitions. At the north end of the covered way another flight of steps to the east gives access to the main building, which affords an uninterrupted view from end to end. The walls of the covered way are to be lined with calico of various colours, but the chief features of the main building are to be brought out into relief by means of paint. The beams or principals supporting the roof are semicircular in lorm, and already some dozen of them finished in blue and white give an indication of the cheerful effect which will be produced. For a temporary structure this style of decoration is admirably adapted, as it is neither too substantial nor too trivial, but pleases the eye and suggests no waste of means. The domes and transepts will, of course, be treated in similar The nave is 233 yards in length by 20 yards in width, and the transcpts, of which there are three, are each 100 yards long, and about as wide as the

Every one is pushing on the work of receiving and arranging in order to be thoroughly ready for the opening on July 1. Mr. W. E. Dixon has entered on his duty of superintending the reception and arrangement of the specimens, but a large staff will he required to be at his command to get everything in thorough order in the short time now left before the opening.

The building will be lit at night by the electric light, fitted up by the Anglo-American Brush Electric Light Corporation. The wires are being led along the roof on either side, and the number of arc lamps will be between sixty and seventy, those depending from the three domes being of course much larger and more brilliant than the others. The building Is run on two circuits, so that, should anything go wrong with one, the other will remain in operation. There will therefore be no fear of the building being left in darkness by any accident to the batteries or wires. In the refreshment-rooms, annexes, and other portions of the building apart from the nave, there will be about 150 incandescent lamps. It is also proposed to construct an electric railway along the front of the building, which will be engineered by the same company, and will doubtless form no small item in the attractions of, and revenues to be derived from,

the Exhibition.

Among the exhibits already forwarded are the whole of the specimens sent by the Indian Government; the collections of Messrs. Vilmorin, Andrieux ment; the collections of Messrs. Vilmorin, Anufficial & Co., Paris; Messrs. Sutton & Sons, Reading; and of Sir James Campbell, Bart., of the Dean Forest.

The committee met a few days since to make

arrangements for the opening ceremony, and appoint

AMERICAN FORESTS .- Dr. J. T. Rothrock, of the University of Pennsylvania, recently delivered one of the course of University lectures in Association Hall, Philadelphia, taking for his subject "The Relation of American Forestry to American Industry." Some of its salient features are brought out in the following synopsis from The American :- "His University lecture was a summary of the latest development of the necessity of forestry laws to protect the tuture timber trade of the country. He showed the percentages of timber land to other productive territories, from the 3 per cent, of Great Britain to the 45 per cent, of Sweden, and that the lowest ratio that can be called self-sustaining is 15 per cent., while in America there is only a margin of 1½ per cent, between dearth and supply. At the rate at which the forests are being destroyed this small advantage will soon disappear, and then there will be a timber famine throughout the land. Great Britain, between 1872 and 1876, imported 77,000,000 dollars' worth of timber—about 2.60 dol. for each individual—while the supply was only about 1.30 dols, from native sources. In the United States, besides using about 19.90 dol, per head, 600,000,000 dols, worth were exported. How long this can last is a question of time, and very little time, too. There ought to be as large a proportion of woodland to clear land for atmospheric purification as for timber supply. The rainfall is not necessarily affected by clearing off the timber; but failing springs and falling rivers do result from it, for forests diminish evaporation over 80 per cent. is the practical remedy within reach? Professor Rothrock points to Germany, with its nine forest schools, their high standard, and their able teachers and growing classes of pupils. One man in America, Professor Sargent, of Massachusetts, is the only person employed and paid by a State to look after the vast empire of timber. He has worked hard to secure active measures to protect the interest entrusted to him. An exemption of preserved forests from taxes would soon return the loss of revenue in the enhanced value of the timber. The reckless destruction of trees is the first thing to be cured. Even if Congress withdraws national timber land from sale it will be only a palliative, and there are no trained men to which this enormous source of future trained men to which this controls source of tulure wealth can be safely entrusted. Within five years the hest white Pine will all be gone; within thirty-five or forty years all the rest of the good timber will have been exhausted. Can there be any question about the necessity of such legislation, State and National, as shall protect the country from a timber famine?" Botanical Gazette.

Reports of Societies.

Edinburgh Botanical: June 12.—The Society met at the class-room, Royal Botanic Garden, W. B. Boyd, Esq., President, in the chair. The following communications were read:—

f. "Obituary Notice of the Rev. John Macvicar, D.D., LL,D., of Moffat." By the Rev. John M'Murtrie,

M.A. II. "Beapt, or Journal M.A. II. "Beapt of the Scottish Alpine Botanical Club at Braemar." By Charles Stuart, M.D., Chimside; communicated by the President. The following plants were exhibited as amongst the most interesting of the finds:—Saxifraga rivularis, S. nivalis, Luzula arcuata, Betula nana, Salix Scalleri.

Sadleri.

III. "On the Progress of Open-air Vegetation at the Royal Botanic Garden." By Robert Lindsay, Curator.

III. "On the Progress of Open-air Vegetation at the Royal Botanic Garden." By Robert Lindsay, Curator.

Vegetation at the Royal Botanic Garden for May, 1884.—During the month of May vegetation made fairly good progress. No frost was registered, and once only did the glass fall to the freeing point, while last May the thermometer was at or below freezing point on four occasions, indicating 9° of frost. From the 181 Miller which a succession of dry, parching, easterly winds with bright sunshine throughout the day prevailed until the end of the month. Most deciduous trees have developed fine healthy foliage, and a few, owing to the absence of frost, have flowered better than usual, such as Horse-Chestnut, Hollies, and few, owing to the absence of frost, have flowered better than usual, such as Horse-Chestnut, Hollies, and a few, owing to the absence of frost, have flowered better than usual, such as Horse-Chestnut, Hollies, and Favia flava. Laburnum and Thorns, both single and double, also promised well; but others, particularly Lilacs, double and single Cherries and mondarity as usual. Although no actual frost was an advantaged to the same emperature was not high. The lowest readings of the thermometer occurred on the 2d, 3½, 4th, 3½, 5th, 3½, 7th, 33′, 10th, 3½. The highest morning readings were—on the 12th, 57′, 22d, 59′, 23d, 652′, 23th, 652′, 31st, 58°, 10th parts of the same month last year, making a total of 455 since January 1st, as compared with 446 for the same period last year. A large proportion of those which began to flower in May were—Corydalis nobilis, Tulipa pulchella, Lychnis demonstrates and sulphurea, Erims alpinus and bispanicus, Dode-catheon integrifolium, Phlox amcma, Daphne encorum. Preonia tenuifolia fi.-pl., Olcaria Gunniana, Enkianthus

himalaicus, Dryas octopetala, Clintonia Andrewsiana, Aquilegia glandulosa, Lupinus nootkaensis, Anthyllis montana, Anthyllis erinacea, Pentstemon Menziesi, Erigeron Roylii, Linaria alpina, Chamæbatia foliolosa, Aciphylla squarrosa, Meconopsis nepalensis, Linaria origanifolia, Onosma stellulata, &c.

acipylla squarrosa, Meconopsis nepalensis, Linaria origanifolia, Onosma stellulata, &c.

IV. Miscellaneous communications:—
(a). Mr. Liodsay exhibited a spray of Elæocarpus cyaneus, from a plant now 30 feet high in one of the hothouses, covered with flowers.
(b). Mr. Muirhead, Factor, Raxton, Berwickshire, exhibited a collection of fifty cut blooms of alpine and herbaceous plants, which were greatly admired.
(c). Mr. Thomas Walker, Carluke, sent fine specimens of Paris quadrifolia and Eortychium Lunaria.
(d). From cold frames in the garden unmer of interesting plants in dower—Androsace cotundifolia var. meteorallys, Aquilegia glandulosa, Erigeron aurantiacus, Cyclobohra cerulea.
(e). Isaac Anderson-Henry, Esq., of Hay Lodge, Trinity, sent pots containing the following Indian and New Zealand plants in bloom:—Morina nova species; Myosoiis adotarctica from New Zealand, new; Catheartia villosa, Pimelea from 4000 feet, in New Zealand, quite hardy; Pratia sp., New Zealand.
Among nuany beautiful plants in flower in pots from the Royal Botanic Garden were Myosoiis alopsetris, Veronica Lyallii, Primula longiflora, P. capitata, Saxifraga mutata, S. longifolia, seedling; Calecolaria Kelyana, Petrocoptis Lagascee, Lewisia rediviva, Erinus hispanicus, alla and alpinus, Gyspophila cerasticise, Linaria origanifolia, Cyclobothra cœrulea, Globularia cordifolia, Lysimachia nemorum, Erigeron aurantiacus, Androsace rotundifolia or macrocalyx, Aquilegia glandulosa.

Royal Botanic; June 18.—This show was held as usual at this season in the large tent in the garden, and proved a worthy conclusion to the successful hortical-intral displays of the present year in the Society's garden. The flowering section, although lacking the gorgeousness always added to any show in early summer, in which the Indian Azaleas are largely seen, was fairly bright with colouring that would have looked admirable had the sun deigned to peep forth. Stove and greenbouse plants were in considerable numbers, the awards in the open class being, 1st, Mr. J. Cypher, nurseryman, Cheltenham, in whose dozen plants were handsome specimens of Allamaoda Hendersoni, profusely bloomed; Ixora Williamsi, equally fine; I Hedaroma (Darwinia) tulljuffera, Azalea Souvenir de Prince Albert, Stephanotis florihamsi, equally fine; I Hedaroma (Darwinia) tulljuffera, Azalea Souvenir de Prince Albert, Stephanotis florihams, et al. (1998) and the stephanotis florihams, et al. (1998) and et al.

Thames, in whose lot were fine Pinnelea mirabils, an extraordinary floriferous example; Clerodendron Balfourianum, Erica mutabilis, and Franciscae calycina major, with an abundance of bloom; 3d, Mr. H. James, nurseryman, Lower Norwood.

The amateurs' class for six stove and greenhouse plants brought some capital specimens of moderate userlistic, the desired field. Ewell, who had excellent examples of Clerodendron Balfourianum, Erica depressa, Statice profinsa, Appleckis macrantha, Dracophyllma gracile, and Azalea Reine des Belges; ad, Mr. A. Gibson, gr. to T. F. Burnaby, Atkins, Esq., Halstead Place, Sevenoaks, in whose collection were Tabernæmontana coronaria, beautifully bloomed, showing what a capital plant it is when well done, and a good plant of Dipladenia antibilis; 3d, Mr. C. Rann.

In the nurserymen's competition for the best six stove and greenhouse plants; st, Mr. J. Cypher, with neat, well-flowered specimens, including Dipladenia anabilis; and the state of the state

specimens, especially an Odontoglossum vexillarium roseum, Cypripedium barbatum superbunn, and Ledia Brysiana, a fine thing, with four blooms; 2d, Mr. H. James, who had some good things, such as Cattleya Mendelit, Cypripedium Stonei, and a large Angulea Clowesii, with a considerable quantity of bloom, II. James had the field quite to himself, and was warded a 1st prize for twelve plants of warious steas—from small plant the other competition for the best six Fuchsias, st. Mr. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, who had Sedan, Marie Cornellisen, Lady Dorothy Neville, Rose of Castille, Carminata, and Earl of Deaconsfield, all of which were welb-bloomed pyramids, d. Mr. G. Wheeler, gr. to Lady Louisa Goldsmith, St. John's Lodge, Regent's Park. For the best six Pelargoniums, 1st, Mr. C. Turner, unseryman, Slough; 2d, Mr. J. Cypher. In the amateur's class for the same number, 1st, Mr. J. Wiggins; 2d, Mr. Z. J. Hill. In the nurserymen's class for the best six fancy Pelargoniums; st, Mr. T. Turner. The amateur's competition for six plants of the fancy section resulted in Mr. F. J. Hill. Being placed 1st, Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston, 2d. In the open class Mr. H. Eason was awarded 1st, for the best six for Dr. Martineau, Clapham Park.

Exotic Ferns were not an important feature, still those shown were good examples of their kind: for the best

Clapham Park.

Exotic Ferns were not an important feature, still those shown were good examples of their kind; for the best six specimens, 1st, Mr. C. Rann; 2d, Mr. G. Archer, Highbury. In the amateurs' class for six fine-foliage plants Mr. C. Rann was 1st, withtwo Crotons, three Palnats and Dasylirion acrotrichum; 2d, Mr. J. Child, with neat useful specimens; 3d, Mr. G. Wheeler. The nurserymen's competition for the best six fine-foliage plants placed Mr. H. James 1st, Mr. J. F. Mould 2d; and in the open class for six Palms, distinct, 1st, 2d, and 3d prizes were awarded respectively to Mr. C. Rann, Mr. H. James, and Mr. R. Buller.

Tuberous-rooted Beegonias were not in very large num-

Mr. H. James, and Mr. R. Buler.

Tuberous-rooted Begonias were not in very large numbers, nor were they conspicuous for large size; but the new varieties with double blossoms were frequently seen. For the best twelve plants, nurserymen, 1st, Messrs. J. Laing & Co., Stanstead Park Nursery, Forest Hill, with had Lord Crewe, a fine scarlet; B. Novelty, B. Bridesmaid, B. Robt, Laing, & Lochair, B. Golden Gen, B. Dr. Masters, and the Hon. Mrs. Goschen; 2d, Mr. C. Coppin, Shirley Nursery. In the amateurs' class for twelve specimens, 1st, Mr. J. Child, for more old-fashioned pendulous kinds; 2d, Mr. J. Tong, gr. to J. S. Law, Esq., South Lodge, Southgate, with nice plants.

CUT FLOWERS formed a good display, and much interest centered in the groups of stove and greenhouse cut blooms, which were in all cases shown in the finest condition, and in quantity sufficient to judge of their merits. Hardy cut blooms were in unwonted abundance, and comprised all those sections of seasonable varieties and species which are now become so popular for outdoor gardening and for indoor decoration. In the amateurs' class for the best twelve varieties of Roses, to be shown in three trusses of each—1st, Mr. J. Hollingsworth, Turkey Court, Maidstone, whose flowers of the following kinds were fine thus early in June:—Etienne Levet, Niphetos, Marquis Castellane, Miss Hassard, La France, Edouard Morren, Madame Willermoz, Madame Bravy, Madame Gabriel Luizet, and Paul Néron.

Madame Bravy, Madame Gabriel Luizet, and Paul Néron the nurserymen's class for the best twenty-four varieties, to be shown in three trusses of each—rst, Messrs. I all & Son, The "Old" Nursery, Cheshunt. In this collection we noticed pretty blooms of Ulrich Baumann, Duke of Edinburgh, Alba rosea, Glory of Cheshunt, Souvenir d'Elies Vardon, Elie Morel, and Cheshunt Hybrid. For the best twelve yellow Roses of one variety, open—rst, Mr. W. Robbins, gr. to E. D. Lee, Esq., Hartwell Grange, Aylesbury, with splendid blooms of Marchal Niel; 2d, Mr. J. Hollingsworth, for Madame Berard. For the best twelve Roses, any colour, one variety—rst, Mr. J. Hollingsworth, with beautiful Cheshunt Hybrid; 2d, Mr. W. Robbins, with beautiful Cheshunt Hybrid; 3d, Mr. W. Robbins, with beautiful Cheshunt Hybrid; ad, Mr. W. Robbins, with Early and Blooms of Adam; 3d, Messrs, Paul & Son, Cheshunt, with La France.

A basket of Roses 3 feet in diameter, tastefully arranged, with a foliaged covered cross handle, was shown by Messrs. Paul & Son, The "Old" Nursery, Cheshunt, who were awarded the 1st prize. Another was shown by Mr. A. Gibson, gr. to T. F. B. Akkins, Esq., to which a 2d prize was awarded.

Hardy cut blooms were shown by Messrs. J. Veitch & Sons, Chelsea, and being put up in large-sized bunches made a fine effect, the species and varieties being arranged artistically, with a view to effect. There were collections of Pyrethrums in single and double forms, Eaglish and German Irises, Antirrhinums, Gladious byzantuns, G. Colvillei abba, G. Lord Grey, G. Prince Alfred, G. Prince of Wales, and G. Crown Princess, fine showy striped varieties; Canterbury Bells, Brompton Stocks, Allium moly, Hemerocallis flava, and Hussrs. Barr & Son, Covent Garden, showed immense

Messrs. Barr & Son, Covent Garden, showed immense Messrs, Barr & Son, Covent Garden, showed immense collections of Pyrethrums, Iris in great variety, very comprehensive collections of Tritonias, Ixias, Peonies, and many other species of hardy flowers, for which they were awarded a Large Bronze Medal, Messrs, Hooper & Co, had also a very large group of similar flowers, and were awarded a Small Silver Medal; and Messrs, Kelway & Son, Langport, an extensive collection of Pæonies, Pyrethruns, &c., that met with undoubted appreciation, containing as it did flowers of great brilliancy of colour and perfection of form.

Store and greenhouse cut blooms were shown in quantum of the property of the proper

Stove and greenhouse cut blooms were shown in quan-

tity. 1st, Mr. Balchin, Brighton, whose blooms were much admired; 2d, Mr. A. Gibson; 3d, Mr. J. Weston. Mr. H. James took the 1st prize for Orchid blooms, shown in twelve trusses; 2d, Mr. Saller. For the best stand of twenty-four trusses of show Pelargoniums, 1st, Mr. C. Turner; 2d, Mr. F. J. Hill; 3d, Mr. Jigglins. For twenty-four trusses of cut blooms of zonal Pelargoniums, 1st, Mr. F. J. Hill; 2d, Mr. J. Weston. Wild flowers were seen in three collections only, but these included the bulk of the indigenous plants in bloom in the districts where the exhibitor resides, 1st, Mr. Dixon, gr. to Sir T. M. Wilson, Bart, Uckfield; equal 1st, Miss E. Smith, Benhall Mill, Frant; 2d, Mr. Dixon, Mr. H. James exhibited some small plants suitable for use in the dwelling, and was awarded the 2d prize. The same exhibitor was likewise Commended for a group of small floweriog plants suitable for a small greenhouse.

To Mr. C. Turner, for Fancy Pelargonium Phyllis.

Saffron Walden Horticultural,—This Society held a very successful two days' show in the magnificent park of Lady Braybrook, in close contact with the county exhibition of the Essex Agricultural Society. Both shows were very successful. The Saffron Walden Horticultural Society is one of the oldest in the country, having been established in 1819. Those most familiar with the history of the Society affirm, that the one just held (on June 12 and 13) was the best that has yet been held. It was certainly an admirable exhibition. The open classes of stove and greenhouse, and fine-foliage and variegated plants, Puchsias, Pelargoniums, grouping of plants arranged for effect, &c., being exceedingly good, as was also a capital collection of fruit trees are successful. The second of the second with finit of the finest quality and highest colours, with fruit of the finest quality and highest colour. Saffron Walden itself was et 262, gay with bunting and crowded with eager visitors. The very name has a horticultural flavour. Here, long long ago, saffron was grown for profit, and fields now laden with golden grain were full of flowers, and the busy bands of men, women, and children in pursuit of a profitable industry, that seems to have vanished out of the land. In nore modern times Saffron Walden became the centre of another great floral industry—that of the rational of honour and importance in connection with these noble flowers, and distributed went on increasing, and there seemed every prospect of Hollyhock culture being well-nigh universal. Suddenly, however, the disease appeared, and snote down our plants, and finally it became more than a match for our Chater, and Hollyhocks have almost disappeared, even from Saffron Walden. Mr. Chater still tress to hold on to his own old favourites, bast crist of the property of the work of the work of the work of the saffron Walden. Mr. Chater still tress to hold on to his own old favourites, bast centre for the saffron Walden. Mr. Chater still tress to hold on to his own old favour Saffron Walden Horticultural,-This Society Chater still tries to flord on to his own our labourities, but it seems almost hopeless, as no skill or care can guard Hollyhocks from this fell destroyer. The writer has tried starving out the pest, Hollyhocks have been all destroyed and not one left for three or four years.

Hardly have they been reintroduced, when once more the pest is down upon them, and they are gone. But this by the way. In the great tents devoted to the show that in which most of the open classes were staged was this by the way. In the great tents devoted to the show that in which most of the open classes were staged was the best. Here many of the specimens would have done credit to the great metropolitan shows. The fine plants of Ericas, Azaleas, Stephanotis, Eonganvilleas, and other hard-wooded plants, were simply magnificent. There were three lots of twolve each, and Mrs. Gibson, the Mayor's wile—so we understood — beat Messrs. Warren and Tudgey. In the next class, for twelve ornamental foliage plants, the order of the three chief prize-takers was slightly altered, standing thus:—rst, G. Warren; 2d, Mrs. Gibson; 3d, E. Tudgey. Mr. Joshua Clarke showed fourteen him Orchids, but there was no competition in this class.

Azaleas were past their best, but there were nice collections of six each shown, the prize-being awarded thus;—rst, G. Warren; 2d, E. Tudgey; 3d, Mrs. Gibson;
In the exotic Ferus, Mrs. Gibson area.

In the exotic Ferns, Mrs. Gibson was 1st, and C. Emson 2d. These were neat lots, but not specially

Giuson.

In the exotic Ferns, Mrs. Gibson was 1st, and J. C. Emson 2d. These were neat lots, but not specially striking.

Fuchsias were about the finest feature in the show, the three lots of six for the special prize being good, though the 1st prize lot of T. A. Greenwell were by far the best, and as near perfection as could well be; Mrs. Gibson is 2 to 1 for the second of the 1st prize lot of T. A. Greenwell were by far the best, and as near perfection as could well be; Mrs. Gibson is 2 to 1 for the second of the 1st prize lot
these. In the amateurs' classes the same persons were mostly successful, though to those of Mrs. Gibson, T. D. Green, and Joshua Clarke, Messs. Emson, Tuke, Ackland, &c., were added. These classes were generally well filled, zonal Pelargoniums, alike in the plant and cut flower classes, being particularly so, the three lots of six each exhibited by Mrs. Gibson, W. M. Tuke, and Joshua Clarke being as near perfection as may be. The doubles were not equal to the singles. A very pretty group of six lvy-leaved Pelargoniums were shown by Mr. Chester, who was 1st in this class. in this class.

The group of pot plants arranged for effect brought forward a brisk competition. There were four lots forward a brisk competition. There were four lots arranged, at the four corresponding corners of the large tent. Most of them were too flat, and the one with decidedly the most artistic centre had the most common. decidedly the most artistic centre had the most common-place edge. After keen scrutiny and much walking to and fro, the judges—Mr. Fraser, of London; and Mr., D. T. Fish, of Bury St. Edmunds; assisted by Mr. George Paul, of Cheshunt—made the awards, as fol-lows:—rst, T. D. Green; 2d, Joshun Clarke; 3d, Her-bort Taylor; and 4th, J. G. Emson. Neither hand bouquets nor table devices possessed quite average merit, and it would be wise to offer a few liberal prizes for these in the open classes, so as to fire a few professionals into the field and induce a new and higher departure in matters of floral design and decora-tive taste.

higher departure in matters of floral design and decorative taste.

Fruit, unless in the matter of Strawberries and those already named, was rather scarce, and scarcely up to average merit. Vegetables were plentiful and good, and some of the collections remarkably so. The 1st prize was taken by J. C. T. Smith; 2d, J. Wilkes; and the globy B. L. Ackland. Basket of salad,—1st, J. Wilkes; 2d, J. C. T. Smith. It was pleasing to find so many of the prizes in the open classes remaining at home, and Mr. Archer Mrs. Gibson's talented gardener, and other creative for the contractive for the contractive for the prizes in the open classes remaining at home, and Mr. Archer Mrs. Gibson's talented gardener, and other results of their skill. The cottagers' produce was plentiful and good, and the awards liberal. We had almost forgotten to name, among special exhibits bighly commended by the judges, the fine collection of hardy herbaccous plants exhibited by Mr. George Saul. Mr. Chater was also an exhibitor in this class; but the most marvellous special exhibit was the magnificent boxes ot Verbenas shown by Mr. Stacey, of Dunmore. These were the very finest ever seen by the writer. The show was admirably managed and arranged by the committee and the joint Hon. Sees, Messrs. Arthur Midgley and B. L. Ackland; and the weather, being all tlat could be desired, over riceo visitors were admirted, and foo taken at the gates the first day. [From a Correspondent.]

Variorum.

EXHALATION OF OZONE BY FLOWERING PLANTS. -The question, "Are plants in bedrooms unhealthy or not?" has been frequently put, and as frequently answered in directly contradictory terms. The question, so far as the production of carbonic acid is concerned, is of little moment, for the quantity of that gas given off during a night by any conceivable number of plants likely to be placed in a bedroom is so small as to be practically harmless. It is the organic matter which accompanies the expired breath of the sleepers that really renders the air of a bedroom foul,

and it would seem from some researches made by Dr. J. M. Anders that flowering plants at least help to purify the atmosphere wherever they may be placed. Schreiber and other investigators have, for instance, asserted that the emanations from Pine forests actually convert the oxygen of the zir into ozone, and Naquet goes further with the dictum that "ozone exists in woods and fields, and wherever there is active vegeta-tion." However ozone may be produced, there seems no difference of opinion as to its value in our atmosphere, for the majority of chemists are agreed that it is the "great purifier," and no one can attribute any deleterious influence to it. Ozone is rarely found in dwelling-rooms, as it is decomposed in the process of oxidising the organic matter present, and it is only when a number of flowering plants are introduced that ozone in any appreciable quantity can be detected. Dr. Anders has, during the last three or four years, devoted much of his le sure time to an investigation of the question whether flowering plants exhale ozone, and in 1882 he commenced a series of experiments ln the Horticultural Hall of Fairmount Park, Philadelphia, which have enabled him to answer definitely and decidedly in the affirmative. In an interesting review of the subject, which he has contributed to some recent numbers of the American Naturalist, he leaves to the expert chemist the determination of the real nature and properties of ozone, and proceeds to explain how he has discovered that it is exhaled from flowering plants. It was thought at one time that the green parts of plants evolved ozone under the influence of the sun; but lately it has been accepted, principally on the evidence of Cloez and Bellucci, that the change in the iodised test-paper, supposed to be due to ozon, is really caused by the action of moisture, oxygen, and light. The first experiments of Dr. Anders were made in the main hall of the buildings at Fairmount Park, which is 220 feet long, 100 feet wide, with curvilinear 100fs, 65 feet high in the centre. This house corresponds to what is known as the Palm-house at Kew, and is filled with similar plants, the average temperature being 70° Fahr. Alongside is the Fern-house, the forcing-house, the temperate-house, the propagating-house, and the economic-house, each about 100 feet by 30 feet by 20 feet. Many of the first tests were negative, amongst other reasons because the houses were daily visited by considerable numbers, and the ozone, assuming any to have been present, would be used up in oxidising the organic matter given off from the lungs of the visitors. The next series of experiments were com-menced in February, during which month only an The next series of experiments were comoccasional visitor was nemitted, and the chief result was that in the propagating-house the action was found to be greater than in the external air, though even then the colouration was marked as "very slight." He obtained positive evidence that flowering plants at any rate exhale ozone, and it became necessary to repeat the experiments out-of-doors, and to ascertain whether the reactions indicated by the test-papers were really caused by ozone. Accordingly a plant case was removed to the "back yard," where the plants received the sunshine for at least eight hours daily during clear weather, and gave still stronger evidence of their power in colouring the test-papers, probably because the situation was better calculated to enable them to exert their influence, and also because the experiments were of longer duration. A piece of red litmus suspended in the case gave no indication of the presence of ammonia, and peroxide of hydrogen could have nothing to do with the effects observed on the test-papers, because the temperature of the air within the case, which was carefully noted, was never found less than 90°, or 20° higher than the point at which peroxide of bydrogen is decomposed. Dr. Anders satisfied himself by several repeated tests that the reactions were not due to nitrous oxides, and that being the case, the conclusion is inevitable that flowering plants exhale ozone. A trial with foliage plants having soft thin leaves gave negative results. Seven plants of what Dr. Anders calls asperdisteus (probably Aspidistra), one Fern, and three Dracænas were placed in the case for a week, the weather being extremely warm, the temperature of the air in the case ranging from 85° to 100° Fahr. The Schönbein papers gave negative results throughout, and those prepared with guaiacum gave one "very slight reaction." As the first experiment with what Dr. Anders calls inodorous plants did not yield any very definite results, a further trial with seventeen healthy Pelargoniums was made for six days, the observations being taken during ten hours on each day. The

Schönbeins gave one negative, and two "slight," three "marked" blue shades, the negative result occurring on a rainy day when there was no sunshine whatever. Further observations were made on these plants with similar results, and the conclusion again is inevitable, that flowering plants, even when inodorous, exhale ozone. The experiments also prove that sunshine, or at least strong diffused sunlight, is as essential to the generation of ozone by plants as it is to the work of assimilation and transpiration carried on by them. English Mechanic.

SURVIVALS.—The tich and rank vegetalion that surrounds the neatly-built houses is most amazing, compared with the barrenness outside. I saw some remarkably fine clumps of Euphorbias as I entered the village of Vellálá, and further on, some handsome Dracænas or Dragon trees in full hlossom, with graceful sprays of small cream-coloured flowers depending from among the spiky leaves; the general aspect of the plant recalling the Yuccas, to which it is not distantly allied. It is the first and only time that I remember to have seen this Dracæna on the Congo, and it seems curious to find it preserved thus in a village. Indeed, it is an interesting fact that so many plants should be found growing in the villages in this part of Africa, which are never seen in the open. The Euphorbias, for instance, I have never seen in a wild state, so to speak, but they exist in all the villages on or near the Congo from Yellala to Bolobo. Their native name in Congo is "Ndiza," but although they are known and named, I never could ascertain that any superstitious value or importance was attached to them, which would serve to explain was attached to them, which would serve to explain their constant presence in native towns; perhaps the real solution of this fact, as also of the presence of large trees and luxurlous vegetation round the villages, is that all the uninhabited country is periodically set on fire by the natives, and that only periodically set on the by the natives, and that only in those places which the bush-fires do not reach can rich vegetation and forest trees exist. It is evident, and, indeed, the fact has struck Stauley, Schweinfurth, and most observant African travellers, that the grass fires must largely affect the "phytography" of Africa. "The River Congo," by H. H. Johnston, F.Z.S.

LONDON: Atmospheric Pressure.—During the week ending June 14, the reading of the barometer at the level of the sea increased from 29,71 inches at the beginning of the week to 30.19 inches by midnight on the 10th, decreased to 30.18 inches by 9 A.M. on the 11th, increased to 30.31 inches by 9 A.M. on the 12th, decreased to 30.30 inches by 3 P.M., and increased to 30.34 inches by midnight on the same day, decreased to 30.19 inches by midnight on the 13th, and was 30.33 inches by the end of the week.

The mean reading of the barameter for the week at the level of the sea was 30.13 inches, being 0.41 inch higher than last week, and 0.16 inch above the average of the week.

Temperature.— The highest temperature in the shade in the week was 75°, on the 12th and 13th; the highest on the 9th was 55°. The mean of the seven high day temperatures was 66°.1.

The lowest temperature was 44°.5, on the 9th; on the 13th the lowest temperature was 49°.7.

The greatest range of temperatures was 49°.7.

The greatest range of temperatures was 49°.7.

The sea of the seven low night temperatures was 49°.7.

The mean of the seven down just temperatures was 25°.5, on the 13th; the smallest was 9°.7., on the 8th. The mean of the seven daily ranges was 16°.4.

The mean temperatures were—on the 8th, 51°.5; on the 9th, 48°.9; on the 10th, 53°.3; on the 11th, 51°.3; of these the first four were below their averages by 6°.2, 9°, 4°.5, and 1° respectively, and the last three were above by 4°.8, 4°.5, and 2°, 7 respectively.

The highest reading of a thermometer with black-ened bubl in vacuo placed in the full rays of the sun was 135°, on the 14th. The mean of the seven readings was 100°.7.

The lowest reading of a minimum thermometer with its bubl placed on grass was 30°.5, on the

ings was 100°.7.

The lowest reading of a minimum thermometer with its bulb placed on grass was 39°.5, on the 11th. The mean of the seven readings was 42°.5.

Rain fell on two days to the amount of 0.15 ioch.

ENGLAND: Temperature.—During the week ending June 14 the highest temperatures were 83° at Hull, 82°, 1 at Nottingham, 81° at Leeds; the highest at Brighton 69°, 3, and at Truro and Bristol 72°. The general mean was 76°.

The lowest temperatures in the week were 40° at Truro, at Wolverhampton 40°.4, at Plymouth 42°s, the lowest at Preston was 47°, at Liverpool 45°.9, and at Leicester, Hull, and Leeds 45°. The general mean

was 43.7.

The greatest ranges were 39° at Nottingham, 38° at Hull, 37°.6 at Wolverhampton; the smallest ranges were 24°.8 at Brighton, 26° at Preston, 28°.7 at Liverpool. The general mean was 32°.9.

The mean of the seven high day temperatures was highest at Nottingham, 70°.6, at Cambridge 69°.3, at Leicester 67°.2; and was lowest at Bolton, 62°.6, at Liverpool 63°.5, at Bradford 63°7. The general mean was 65°.6.

The mean of the seven low night temperatures was

mean was 65°.6.

The mean of the seven low night temperatures was highest at Plymouth, 51°, at Liverpool 49°.8, at Truro and Blackheath 49°.7; and was lowest at Wolverhampton, 45°.4, at Bolton 45°.9; at Nottingham, 46°.8. The general mean was 48°.3.

The mean daily range was greatest at Nottingham, 23°.8, at Cambridge 21°.6, at Hull 19°.2; and was least at Plymouth, 13°.5, at Liverpool 13°.7, at Preston 14°.6. The general mean was 17°.3.

The nean temperature was greatest at Blackheath.

Preston 14%.6. The general mean was 17°.3.

The mean temperature was greatest at Blackheath, 57°, at Nottingham 56°.9, at Cambridge 56°.7; and was lowest at Bolton, 52°.4, at Wolverhampton 53°, at Bradford 54°.2. The general mean was 55°.2.

Kain.—The largest fall was 0.83 inch, at Preston, 0.79 inch at Bristol, 0.73 inch at Bradford; the smallest fall was 0.03 inch at Plymouth, 0.06 inch at Hull, and 0.08 inch at Liverpool. The general mean fall was 0.35 inch. No rain fell at Truro.

SCOTLAND: Temperature.—During the week ending June 14, the highest temperature was 73°.1, at Edinburgh; at Glasgow the highest was 62°. The general mean was 68°.

The lowest temperature in the week was 37°, at Glasgow; at Leith the lowest temperature was 44°.S. The general mean was 41.°2.

The mean temperature was highest at Edinburgh 55°.2; and lowest at Aberdeen, 52°.9. The general

mean was 53°.9.

Rain.—The largest fall was 0.48 inch, at Edinburgh; and the smallest fall was 0.05 inch, at Dun-dee. The general mean fall was 0.21 inch. No rain fell at Glasgow.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

AQUILEGIA: S. & M. The deformity in question is due to the absence of the petals, and constitutes the variation sometimes called the "stellate," or star-like Columbine. It is not uncommon.

ARAUCARIA: T. Leslie. Please send the photograph on paper for approval.

AUBRIETIA: S. & M. We have compared your Aubrie-NURBERTIA: S. & M. We have compared your Aubric-tia with almost spent flowers of violacea and Hender-soni, and find both these named kinds very much fuer and deeper in colour, though less highly coloured now than they were several weeks since. Your kind ex-actly resembles what either of these kinds will often give from seed, and whilst doubless exceedingly pleasing in a mass, will not compare with the cerufi-cated kinds.

CROSSING POTATOS: B. You should take care to cut away the stamens with a fine-pointed pair of scissors, and this you can the more readily effect as the stigma is (in the flowers we have seen) ripe before the

anthers, and projects beyond them before the authers open. Having isolated the stigma in this way, and covered it with a bag of muslin, to prevent access of insects, you can apply the pollen with a camels'-hair brush from some other variety as soon as you see the stigma is ready—that is, when it becomes moist on the surface. It is of no use doing so before.

The Surface. It is it to use only so better.

The Hydrangea was certainly seen by the committee, or Mr. Barron would not have sent the letter of thanks which you enclose to us. As for ourselves, we do not undertake to notice everything sent to the committee meetings, and which are not considered worthy of an award.

FOXGLOVE VAGARIES: To Numerous Correspondents, The state of affairs is by no means uncommon, and is the consequence-of the running together of several of the upper flowers. No two specimens are quite alike, and no one as yet has given a satisfactory reason why,

FUNGUS ON LILY OF THE VALLEY LEAVES: T. Heb-den. The fungus Puccinia betonice has always been very common, but that on the leaves sent, Ecidium convallariae, has occurred in Britain this year for the first time. We hope to illustrate it in an early number.

Inst time. We hope to illustrate it in an early number.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—

We have received the following donations from gardeners for the benefit of this Institution, and shall be glad to receive others:—J. H., 51.; H. W., Liss, 51.;

C. F. P. (annual), £1.15. Small contributions (where larger cannot be spared) will be thankfully received.

MOTH: D. M. L. We were unable to identily it.

LONDON: Tune 18.—The market to-day was most thirdy attended with but little business doing. There is still a good sale for spring Tares, and the already limited stocks are of course further reduced. New French Trifolium is now offering, but no attention is yet being paid to same. Mustard and Rape seed continue to move off in small lots. There is a better inquiry for blue boiling Peas and Haricot Beans. Feeding Linsced is firm. Tohn Shaw & Sons, Seed Merchants, 37, Mark Lane, London, B.C.

CORN.

At Mark Lane on Monday there was nothing in Wheat pressing for sale at quotably reduced rates, although the tendency was in buyers' favour. Flour was dull of sale, and barely steady on the week. Maize showed 6d. decline. Beans and Pens were quoted the same as on Monday week, but Lentils were a decline of 1s. There was no improvement in the market for common Oats, which were 6d. to 9d. lower than on Monday seringht; fine Oats, on the contrary, were firm and dearer.—On Wednesday the prices of Wheat and flour were unaltered, the properties of the contrary of the contrary were firm and flour were maltered, when the tentile in the price of the contrary were firm and the price of the contrary were firm and the price of the contrary were firm and the contrary were contrary to the contrary were firm and the contrary were contrary to the contrary to but the tendency was rather adverse to holders. Barley met but little inquiry, and was the turn cheaper to sell. Beans and Peas renained unaltered. For common Oats the market was weak, but firm for fine. Round Maize was held rather more firmly, but flat corn was dead.—Average prices of corn for the week ending June 14;—Wheat, 37.4.4.; Barley, 28; 3d.; Oats, 21s. 5d. For the corresponding period last year:—Wheat, 42s. 9d.; Barley, 25s. 6d.; Oats, 22s. tod.

CATTLE.

At the Metropolian Market on Monday there was a very good assortment of English cattle, no Scotch, and from abroad Canadians of good useful quality, which averaged gs. to 55. 2d. A few Danish and Swedish soid at 4s. 6d. to 5s. 2d., and 4s. 6d. to 4s. 8d. respectively. Sheep and lambs met a slow sale, with a tendency in favour of buyers. Calves met a very slow sale, and Swedish, which comprised the bulk of the supply, were depressed in value. Quotations:—Beasts, 4s. to 5s., and 5s. 2d. to 5s. 2d.; calves, 4s. 8d. to 6s. 4d.; sheep, 4s. 1od. to 5s. 4d., and 5s. 6d. to 6s.; lambs, 7s. to 7s. 6d.; plag, 4s. to 4s. 6d.—Thursday's trade showed more firmness. Beasts sold at full prices, with a fair demand. Sheep and lambs were steady in value, business being moderately active; and calves and pigs were quieter.

HAY,

HAY.

Tuesday's Whitechapel Market report states that supplies were large and the trade firm. Top rates of best Clover and hay advanced 1s. per load. Quotations:—Prime old Clover, 955. to 1165.; Inferior, 6ss. to 755.; prime second cut, 905. to 1122.; best mendow hay, 805. of 95s.; joint stawa, 28s. to 37s. per load. — On Thursday there was a good supply. Trade was steady, and prices were firm. — Cumberland Market quotations:—Superior Clover, 108s. to 1165.; inferior, 65s. to 76s.; superior Clover, 108s. to 1165.; inferior, 84s. to 95s.; and straw, 34s. to 38s. per load.

POTATOS.

New Potatos are plentiful, and trade is now rather limited for old descriptions. The quotations to hand for the week are as follows:—Magnim Bonums, 80.. to 100.; Champions, 30.. to 60.. per ton; new—Jerseys, 61. 109.; (Cherbourgs, 7s.; St. Malo, 65. do. to, 51. isbbons, 55.; Maltas, 55. per cwt.—The imports into London hast week were:—934 cases from Bordeaux, 1600 boxes 3166 packages lashon, 638 packages 2842 baskets St. Knazire, 2300 packages Jersey, 1188 cases Cherbourg, 35 tons St. Malo, and 3 bags from Orotava.

Oil Paint No Longer Necessary,
AND SMITH'S BLACK VARNISH,
for Preserving Iroawork, Wood, or Stone.
(Registeral Frade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thrids cheaper. It was introduced unwards additively withstanding a host of unprincipled intators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and its used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, Erom whom the most Sold in Casks of about 30 gallons each, at 1s. 6d, per gallon can the Manufactory, or 1s. 8d, per gallon carriage paid to any Station in the Kingdom.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwerk, Wood, or Stone.

(Regustered Trade Mark.)

This VARNISH is an excellent substitute for cil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and tis genuine good qualty, notwishtanding a hast of uprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires on mixing Windsor Cautie, Kew Gardens, and at the seats of many Windsor Cautie, Kew Gardens, and at the seats of many bundreds of the Nobility and Gentry, from whom the most fluttering testimonials have been received.

Sold in Gasks of about 30 gallons each, at 12. 6d, per gallon, Sold in Gasks of about 30 gallons each, at 12. 6d, per gallon, Station in the Kingdom.

PETWORTH AND THE PERCIES.

(Concluded from p. 795.)

WE now approach another catastrophe in the succession of this ancient house, when the direct line failed. Having introduced in our last rapid narrative by far the most in-teresting of all the Percies, except Hotspur, who owes his fame to chivalry and Shakespeare, we must now descend to a very good sort of man, "Knight of the Garter, and Lord High Admiral of England," son of the scientific and long-time incarcerated ninth earl. Living during the Civil War, and siding with the Parliament he found his chief delight, when the war was over, in his gardens and plantations at Petworth. At Northumberland House the plan of restoring Charles II., was concerted between him and General Monk.

The catastrophe occurred on the death of his son Josceline, eleventh earl. The name of the first Baron Petworth, be it observed, was Algernon, and the same name has been borne by many of his successors, including the present duke. Against the name of Josceline, the eleventh earl, the word finis may be written, for he was the last Earl of Northumberland of the house of Josceline de Louvaine. All that need be said of him further is that he died.

The tomb of his heiress, the Lady Elizabeth, is in the Percy Chapel of Westminster Abbey, where she slumbers in peace, of which she could have had but little, one would think, in her youth, for at her father's death an immediate scramble ensued for her hand and land. She was married for the second time at the age of fifteen, her first husband, Henry Cavendish, Earl of Ogle, having been buried at Petworth within a year of the marriage. She was then betrothed to Thomas Thynne, of Longleat, who missed the prize, being murdered by a foreign rival, Count Konigsmark. At the age of fifteen the Lady Elizabeth was safely married to proudest man who ever ruled at Petworth, Charles Seymour, Duke of Somerset. The duke lived in royal state at Petworth, and the strictest rules were observed relating to his diginity. No person in his household allowed to turn his back upon his Grace. His children-there were thirteen-never presumed to seat themselves before their father. The servant who blew the fire in his presence-fires were of wood then, and bellows were much used -did so standing with his back to the fire, bellows reversed. A daughter stood on each side of this very great man's chair during his afternoon nap, and the Lady Charlotte being tired or ill, and having dared to sit down, had her legacy reduced to £20,000 in her father's will. The great heiress who had married him never forgot his pride of birth, and he on his part loved her better for being a Percy; and when her successor, Lady Charlotte Finch, tapped the duke on the shoulder with her fan (and a lady's fan is the sceptre of the world), he turned upon her with a sharp reproof and eulogised his first duchess,

who would never have taken such a liberty.

During the erection of the Somerset Hospital at Petworth the duke came on visits of inspection, which are still traditionally remembered. He used to arrive from the adjacent park in a sedan chair, all carved and gilded, and carried by majestic serving men. A running footman cleared the way with a silver-topped staff, and two others marched, with silver-headed sticks, one on each side of the chair. The duke's foibles, however, were but little blemishes, and his virtues were considerable; his duchess, the heiress, loved him, and so did Queen Anne. He was a staunch Protestant. When James II. bade him attend the Pope's Nuncio to his audience, he refused. Such attendance, he 1688 he offered his services to the Prince of Orange, and at the critical moment of Anne's decease he was in Council at Kensington, whither he had hastened to aid in securing the Protestant succession.

In 1703 the King of Spain paid a visit to Petworth, and ate and drank very heartily, sitting at the middle of an oval table. He brought his wine with him-"strong red and white Tyrol"-and drank off a glass tumblerful at a time. He had an odd way of disposing his bread in small bits laid upon a plate, and covered with a napkin, and he helped himself bit by bit, keeping the plate always covered on his left hand. His wine was brought to him in a small bottle, carefully concealed or covered up. He exhibited a strange aversion against dogs, and on one of the duke's dogs entering the dining-room the animal was instantly but very quietly removed by the king's attendants, who used every possible precaution to prevent him seeing it. King Charles of Spain, afterwards the Emperor Charles VI., came to Petworth on December 28, and again on his return from Portsmouth on December 31. The roads were extremely muddy, and in passing from Godalming to Petworth his Majesty's coach had to be propped, and the attendants in the first coach were three times overburied. In 1782 Dr. Johnson came to Petworth (see Boswell's Johnson, vol. v., p. 38).

The Duke of Somerset lived during the reign

The Duke of Somerset lived during the reign of Charles II., James II., William and Mary, George I., and George II., and attended the funerals of most of these monarchs. He died in 1748, a very old man, and was buried at Petworth, having built the present palatial mansion.

After the "proud duke" came his son, the seventh Duke of Somerset, and owner of Petworth, which passed to him under his mother's settlement. He had previously succeeded at her death to the barony of Percy, a title she held in her own right, and had been created Baron Warkworth and Earl of Northumberland in his father's lifetime. The title had been extinct seventy years, since the death of Josceline, eleventh earl; it was now revived in favour of a family who were Percies in blood though not in name, and in default of heirs male it was to devolve on Sir Hugh Smythson, Bart., who had married the new earl's and prospective duke's only daughter. In the first year of his dukedom this son of the last daughter of the Percies was also created Baron Cockermouth and Earl of Egremont with remainder, in default of male issue, to his nephew Sir Charles Wyndham, eldest son of his sister Lady Catherine Seymour, who had married Sir William Wyndham, the greatest statesman of the reign of Anne.

Within two years the duke was dead. Sir Hugh Smythson was Earl of Northumberland, and Sir Charles Wyndham, Earl of Egremont, and owner of the manor of Petworth. The first-named nobleman assumed the name of Percy, and was raised to the dukedom in 1766—the last-named died in 1763, when George O'Brien Wyndham, third Earl of Egremont, succeeded him at the age of twelve years. The heritage

of the Percies was now finally divided between the restored house of Percy and the house of Wyndham, each sharing alike the blood of Hotspur through female succession.

Petworth is still held by the descendants of the Earl of Egremont, and Lord Leconfield, his grandson, is a wealthy and worthy agriculturist, country gentleman, and master of foxhounds. The twelve-years-old Earl of Egremont of 1763 became one of the great agricultural improvers of his time, as well as a patron of the fine arts. Several of the rising artists of his day were sheltered in his house and aided in their early struggles by his excellent advice and liberal purse. During sixty years he spent f,20,000 a year in the improvement of his property, Arthur Young and similar adepts in farming being among his frequent guests and advisers. He was one of the first of the great land proprietors of the early part of this century who, in default of agricultural societies and the existing methods of assembling country folk, held great meetings, sheep shearings, and ploughing matches at their houses, and thus brought agriculturists and men of science The Petworth meetings vied with together. those of Woburn and Holkham, but these were not the only means by which "the great Lord Egremont," as he was called in his county, endeavoured to benefit his neighbours. A well known author and visitor at Petworth gives the following account of one of Lord Egremont's feasts to the poor in 1835* :-

"He had arranged it in the open air, and a fine sight it was-fifty-four tables, each 50 feet long, were placed in a vast semicircle on the lawn before the house. Nothing could be more amusing than to look at the preparations. The tables were all spread with cloths and plates and dishes; two great tents were erected in the middle to receive the provisions, which were conveyed in carts, like ammunition; plum puddings and loaves were piled like cannonballs, and innumerable joints of boiled and roast beef were spread out, while hot joints were prepared in the kitchen and sent forth as soon as the firing of guns announced the hour of the feast. Tickets were given to the inhabitants of a certain district, and the number was about 4000; but as many more came, and the old peer could not endure that there should be anybody hungering outside his gates, and he went out himself and ordered the barriers to be taken down, and admittance given to all. think 6000 were fed. Gentlemen from the neighbourhood carved for them, and waiters were provided from among the peasantry. food was distributed from the tents, and carried off on hurdles to all parts of the semicircle. A band of music paraded round, playing gay airs. The day was glorious—an unclouded sky, and soft southern breeze. Nothing could exceed the pleasure of that fine old fellow; he was in and out of the windows of his rooms twenty times, enjoying the sight of these poor wretches, all attired in their best, cramming themselves and their brats with as much as they could and their brats with as much as they coind devour, and snatching a day of relaxation and happiness. After a certain time the women departed, but the park gates were thrown open, all who chose came in and walked about the shrubbery and up to the windows of the house. At night there was a great display of fireworks, and I should think at the time they began not less than 10,000 were assembled. It was alto-gether one of the gayest, most beautiful spec-tacles I ever saw; and there was something affecting in the contemplation of that old man, on the verge of the grave, from which he had only lately been reprieved, with his mind as only lately been reprieved, with his mind as strong and his heart as warm as ever, rejoicing in the diffusion of happiness, and finding a keen gratification in relieving the distress and con-tributing to the pleasures of the poor."

This last Earl of Egremont, heir of the O'Briens and Wyndhams, and part heir of the Percies, lived to complete his eighty-fifth year, and left his estates to his son. H. E. [For some account of the gardens at Petworth, see pp. 491, 523, of vol. x. E.]

CŒLOGYNE DAYANA, n. sp.*

WE have had recently before us two noble Ceelogynes, with leaves like those of Plantago major, and long flaccid pendulous racemes of brown flowers with tomentose ovaries, the old Ceelogyne tomentosa of Dr. Lindley, and the new C. Massangeana. The first one, for a long time only known by a dried specimen presented by Messrs. Veitch, and a discovery of the gallant T. Lobb, has at last flowered with Mr. A. D. Berrington, M.P., Abergavenny; the second one is a new species, which flowered first in the Cattleya paradise of Mons. Massange de Louvere, of Faillowille, but which has been found since elsewhere, and is perhaps an original introduction of Messrs, Jacob Makoy & Co., of Lièce.

Now Messrs. Veitch bring out a third species, quite a worthy rival of the other two, but much nearer to Coelogyne tomentosa, on account of its acute sepals and petals. It was imported from Borneo. The long parrow fusiform bulbs have stalked oblong acuminate leaves. The long lax inflorescence had twenty-three flowers, equalling those of Coelogyne tomentosa. The deciduous bracts are rhomboid, blunt. The sepals and petals do not need a long description: they are ligulate acute, as stated above. The lip is broad, three-lobed, the side lobes blunt, undulate, central-lobe reniform, apiculate, crenulate, transverse. The whole appears to be of the lightest ochre colour, with numerous dark brown collateral longitudinal broad stripes on the lateral lobes, and on the same light ochre ground, a crescent shaped half ring of dark brown opening towards the base on the middle lobe. Two plaited keels run from the base of the lip to the base of the mid-lobe, where they are divided into six similar keels, covered with the most lovely partly denticulate undulations. On each side the upper part of the base runs out into a short retrorse carinate line. The slender column has an emarginate border to the androclinium on the back of the anther.

The species is dedicated with the greatest satisfaction to Mr. J. Day, this time at the suggestion of Mr. Harry Veitch. I had another Corlogyne of somewhat inferior beauty, destined to bear Mr. J. Day's name, so that this excellent gentleman, whose name is so thoroughly connected with Orchids, could no longer escape commemoration by a Corlogyne. H. G. Rehb, f.

FLOWERS IN SEASON.

MR. BUREIDGE sends us a copious supply of specimens to show what is in bloom in Dublin. Fine bunches of Spanish Iris, yellow, blue, bronze, and gold; Delphinlum Barlowi, magnificent in its metallic purple sheen; Cheiranthus mutabilis, with flowers of yellow and lilac; Phacelia sp., fine spikes of Gladiolus Colvillei, and of the white variety The Bride, the donble-flowered Rocket, so useful for cutting purposes, and many others, among which we may specify the following:—

FUNCIA MACULATA, a form with the disc of a pale yellowish white colour, surrounded by a narrow belt of green. Occasionally a natrow green stripe runs down the disc along the course of the nerves. This is a very effective plant. Mr. Burbidge also sends us leaves of the same species, but with only a relatively narrow white band in the centre prolonged down the leaf-stalk. May we suppose that slugs and snails were generously included among reptiles, when St. Patrick drove those creatures out of Ireland? The question suggests another, Did the slugs then all migrate to the London clay? Be this as it may, it is within our experience, that nothing but the most determined vigilance, and that not always, will preserve Funckias

^{*} The Greville Memoirs, 1874, vol. i., p. 84.

^{**} Calagyne Dayana, n. sp.—Aff Cel'gyni tomeatose et Massaogeaum; ps-ud bu bo pyratormi graciit; folis breve periodats obiuspis acuminatus raceno laxifico pendulo; bracteis rhombodes obtuse acuto decidus; ovarnis tomeatoss; sepalis chombodes obtuse acuto decidus; ovarnis tomeatoss; sepalis chombodes obtuse acuto decidus; ovarnis tomeatoss; sepalis chombodes obtuse acuto decidus; mediano transverse renformi apiculato; carrois elegantis-sime pitcats a basi, labeli in basan lobi auterioris, carinis belissime phicigeris ibi senis, lateralibus paulo rerorsum ascendentibus crure altero; columne androclusio p stuce emanginato. Flores pallide ochracet publiche im bunneto-pitcit. Ex Borneo insula imp. el mete Lond, Veitch. H. & Redo, F.

from falling a prey to these marauders. In another garden, with a gravelly subsoil, the Funckias are allowed to grow in peace, although slugs are by no means absent.

LUZULA NIVEA.—A wiry grass-like plant with slender erect stem, narrow leaves, and small white flowers in terminal heads, each about I inch across. The flower-segments of grasses and rushes, to which latter group our plant belongs, are usually green, or quite translucent; but in this case the perianth segments are opaque white. Their dry consistence would permit of their use for the same purposes as "everlasting" plants.

BAPTISIA LUPINOIDES.—A handsome herbaceous perennial, 2—3 feet, with erect striated stem and ascending branches. The leaves are like those of the Laburoum, but with two large leafy stipules at the base. The numerous yellow Broom-like flowers are arranged in long racemes, and are succeeded by long pods ascending pearly parallel with the stem. The Baptisias are natives of the Eastern States of North America. We are not able to verify the plant, but there is sone of that name in Gray's Manual. Some of the Baptisias yield a bluish dye, and this circumstance is said to have suggested the name, from βαπηζω-τή dye.

MUSCARI COMOSUM.—An old plant, dear to every lover of old-fashioned plants, and dearer still to the comnoisseur in botanical curiosities, for there are here no flowers but a thicket of flower-stalks with rudiments only of flowers. In fact, though at first sight dissimilar, the real state of the case is identical with that presented to us in the Cauliflower. With the dainty monster comes a specimen of the normal inflorescence, long, sleeder, unbranched, with a tendency at the tip for the flower-stalks to become violet and for the flowers to disappear, or rather not to appear at all. Here then we have a pretty illustration of the law of compensation in virtue of which if one part is degenerate (in this case the flowers) another part is more highly developed (in this case the flowers) another part is more highly developed (in this case the flowers) another part is more highly developed (in this case the flowers) another part datract insects to the true flowers below, and thus ensure fertilisation; but in the monstrous plant there are no flowers at all, and we can only suppose that in this case the curiosity of mankind has served to perpetuate what in all probability would otherwise soon become extinct.

BRODIEA CONCESTA. — A bulhous plant, with tall slender scapes bearing at the top crowded head's of blueish-violet Hyacinth-like flowers, each about \$\frac{3}{2}\$ inch long, tubular funnel-sbaped. Those who like to look into things will be interested in the scales inside the flower, recalling the crown of Narcissus or Pancratium, but different from either. In this case the scales are very clearly undeveloped anthers opposite the petals or inner segments of the perianth. The plant is a native of British Colombia.

CLEMATIS ALPINA.—In the splendour of the modern garden forms we are rather apt to overlook the elegance and distinct appearance of the older forms of this genus. The present species, with its very twining stems and tufts of broadly cut 3-parted leaves and pale blue stat-like or bell-like flowers, should by no means be lost sight of.

SPIRÆA HUMBOLDTII? — A fine berbaceous perennial, with large spreading triangular bipinnate leaves, the segments of which are lanceolate acuminate, saw-toothed; the minute white flowers are exceedingly numerous, and borne on the sides of long slender white flower-stalks arranged in a paniculate form.

PULMONARIA SIBIRICA. — A peculiar looking glaucous perennial of the Borage family, differing from most of its relatives in its smooth leaves, which are broadly lanceclate. The flowers are tubular, each about half an inch long, blue, fading off into violet and pale red, and disposed in coiled clusters, according to the wont of the order to which it belongs.

SYMPHYTUM PICTUM.—"A fine border perennial," and so indeed it is. Like the preceding it is a Borage-wort, but its rough leaves, inseparate at the base from the stem, are different enough. The arrangement and form of the flowers is the same, but in this case the flowers are rich velvetty magenta in colour, and very handsome. Five sharply pointed scales alternate with the stamens, which open before he stigma is ripe.

SOLANUM CRISPUM.—A handsome but not nicesmelling, half-climbing shrub, with bold foliage, stalked, cordate, ovate, acute leaves and loose, open, terminal cymes of flat, star-sbaped, violet flowers, from the centre of which protrudes the tuft of yellow anthers.

DISEASE OF YEW.

SPHÆRELLA TAXI (COOKE).

In the Gardeners' Chronicle for December 20, 1879, p. 800, there is a brief reference to the above fungus as the cause of disease in Yews. The disease was first detected by the Hon, and Rev. J. T. Boscawen, in Corowall, and the examples were examined and reported on by Dr. M. C. Cooke. This gentleman at first thought the fungus was a mere consequence of disease, but he afterwards altered his views, and expressed his belief in the Spherella being the cause of the new disease in Yew.

Dr. M. C. Cooke described the species as a new one in Grevillea, vol. vi., June, 1878, p. 129, in the following words:—"Spharella Taxi. Epiphyllous; perithecia gregarious, occupying the whole surface of the leaves, black, slightly prominent; asci cylindrical; sporidia elliptical, apparently uniseptate when mature."

During the last six years the disease has been gradually spreading from Cornwall through Devonshire, Somersetshire, and Dorsetshire, and, as far as our information goes, it has not yet got nearer to London than the counties we have mentioned. The fungus is extremely small and very destructive, and all the accounts we have received confirm Dr.

FIG. 152. - FUNGUS PRODUCING DISEASE IN YEW: SPRAY OF NATURAL SIZE, DETAILS MAGNIFIED.

Cooke's later views, that the ungus attacks the healthy Yews, and sets up disease. In the upper part of fig. 152 we have illustrated a small spray of ew suffering from the disease. The ailment attracts attention, as it causes large numbers of the leaves to become brownish-white in colour, instead of dark green; these dead leaves speedily fall to the ground, and so the tree assumes a naked appearance. The white leaves are shown at the bottom of the spray, and the bealthy green leaves above. When the diseased leaves are examined with a leos they are found to be covered chiefly on the upper side with vast numbers of black dots, so small as to be almost invisible to the unaided eye. Each of these dots is a Sphærella, or "little Sphæria or sphere." A fragment of Yew leaf, with the sphærellæ in situ, is

It is obvious from Dr. Cooke's description, that he had imperfect materials from which his description was drawn up, and as I have recently received for naming excellent and mature specimens of the fungus from Prolessor Buckman, of Sherboroe, I have prepared the following description and accompanying

figure to illustrate the plant :-

The sphwrellæ, as immersed in the flesh of the leaf, are shown in the left-hand bottom figure, enlarged ten diameters. As maturity is reached, the epidermis of the leaf is torn either longitudinally or transversely as shown: each of the black dots in Nature is not larger than a pio's point.

To see the nature of one of these very minute black dots a single example must be selected and cut in two with a sharp lancet. This is a delicate operation. From one of the exposed surfaces of the two hemispheres a thin transparent slice must then be cut off. This is a still more delicate operation. When the slice is cut off, enlarged 100 diameters, and examined with the microscope, it will be seen, as in the middle central figure of fig. 152. The dark shading shows the black cellular investing membrane or "perithecium" of the sphærella; the outer unshaded bladders represent the epidermal cells of the leaf. Within the black membrane a number of sausageshaped bladders may be seen; these are termed asci by botanists, and they each enclose a definite number of spores. Some of the latter are seen emerging from the mouth of the sphærella. To save confusion the spores are not shown in the asci in the central illustration; but a single ascus or bladder is shown on the right packed with eight beautiful sep-tate spores or sporidia. These are the reproductive bodies of the fungus, and at maturity the ascus or bladder bursts at the top, and the spores sail out. If we now place a few of the sporidia under the higher powers of the microscope, and magnify them 1000 diameters, we shall see them as in the three bodies on the bottom right of the illustration, each furnished with three, four, or five partitions or septa, and each piece furnished with a minute lustrous nucleus. Each nucleated piece is capable of germinating and producing a new sphærella. Each sphærella produces from 200 to 250 spores, and a single infested Yew leaf will produce from 50,000 to 100,000.

The Yew is a very hardy subject, and Yew leaves are very firm. The germ threads from the spores can only get inside the leaves by forcing an entrance through the little microscopic mouths or organs of transpiration underneath the leaves. This process, no doubt, presents difficulties, so that the fungus of Yew is progressing but slowly towards the Midlands and the North. As the diseased leaves fall to the ground the fungus with its spores is there preserved in a suitably moist and sheltered position. Wherever the disease is seen the invaded branches or branchlets should be cut off and burnt. W. G. Smith.

ROCK PLANTS AT EDGE IN JUNE.

LAST year several of the most successful cultivators of alpine plants recommended the use of open sandy soil in rockeries; I believe they were right. It encourages the plants to root deeply amongst the stones which retain moisture. Besides coarse sand I find that limestone refuse, obtained at a cheap rate from the lime works, and passed through a sieve of 4-inch mesh, is an excellent material to mix in the soil, and to cover the surface, as it stops evaporation. With this treatment several plants are doing well with which I have hitherto failed.

The Cistineæ rejoice in this dry and sunny season, Cistus seldom survives one winter here, but many have now survived two, and are now bushes more than a yard through. None surpasses C. crispus, with a hundred of its brilliant rose-coloured flowers opening every day on each of half-a-dozen plants. A sandy rockery under a south wall, built for hardy Cacti, which proved a failure, is now filled with Cistus and Helianthemum, which at present are a great success. Helianthemum Tuberaria, a herbaceous rock Rose, is never very successful as an ornament, but is curiously The most showy of this class are the varieties of H, vulgare, single and double. The best is a bright copper-coloured flower, which continues week after week a heap of blazing flowers; I think its name is Fireball. Besides these varieties of the native rock Rose there are several other British kinds of merit. H. polifolium, from Torquay, a free-flowering pure white, is good. But the best yellow which flowers in May and is now over, is H. canum. This plant car-pets the barest parts of the Great Orme's Head, and is thought difficult to establish in cultivation; but by beginning with young plants from seed, or cuttings, and planting in broken stone on the summit of a rockery with hardly any soil, pressing the roots very tight, I find it an easy plant. I was amused to see a miserable scrap with two flowers exhibited in a pot amongst the prize alpines at a recent exhibition and to have my attention called to it as a cultural success, haviog just left at home several plants 4 feet round, with probably more than a thousand open flowers on each; when grown so it is well worth its room. The annual H. guttatum sows itself in the same spot each year, and is neat and rare.

Many leguminous plants are now very good; Astragalus hypoglottis is neat, but few of this genus can be trusted, unless known; they are endless in number, and a large proportion are coarse and untidy. An omospessulanus has a good pendulous habit for perpendicular sides, but the colour is poor. I once had one called A. vagioatus, which was a rich imperial purple in colour; but it died in time, and I never could find the plant again, though the name is common. Then there is the native Hippocrepis comosa, and the Swiss H. helvetica, both very good, the former more elegant and light, whilst the latter quite hides its mass of bright green leaves with its yellow flowers. Perhaps neither of them is better than the common wild Lotus corniculatus. The best of all the class is Coronilla iberica; the large size of its flower bunches, and the even way in which they are distributed, make it one of the most desirable of rock plants. Oxytropis pyrenaica is also good, but hard to establish, wanting the most exposed and driest store.

The Toad-flax tribe has many good representatives. One I seldom see-Linaria origanifolia - though apparently only biennial, flowers every year through June and July, sowing itself about like the commoner L. alpina, from which it differs in being more upright in growth and light purple in colour. A large mass of Linaria pallida is now very showy, though I will not take the responsibility of recommending so erratic a plant, especially for a small rockery. The gem of the tribe is L. anticaria, a dwarf perennial, easily grown, either from seed or cuttings. The flowers are pearly-white, with cross bars of purple on the mouth, and it flowers profusely. Lychnis Lagascæ is a dwarf shrub, in the same sense in which a Wallflower or an Antirrhinum is a shrub, but of far more tender growth than these. It is not more than 4 inches high, and produces a great abundance of bright pink flowers from April to July. It is most conveniently treated as a biennial, and is very easily raised in spring from seed, to be planted out in November. tender shoots are not suited to resist the alternate snows and thaws of a rough English winter, they should therefore have the protection of a projecting stone above them; with this they are amongst the best of rock plants. My finest specimens are more than 3 feet round, and still have each more than 500 open flowers. Those wintered in pots in a cold frame and planted out in spring are not so fine. The Geranium tribe rejoice in this dry sunny weather, and are unusually good; none prettier than G. argenteum, which sows itself in the narrow cracks of the limestone, where it is surprising how it subsists. G. subcaulescens is also very dwarf and neat. For a large rockery one named platypetalum, with large broad blue flowers, is very showy; indeed, all the tribe are fond of rocks, and do best on them where room can be found. Erodium macradenum, E. petræum, and the tiny E. Reichardi all like dry beds, and the two former ripen their seeds in weather like this, and are best and easiest grown from seed. On the other hand, Cyananthus lobatus, like most Himalayan plants, abhors drought and must be kept regularly watered. It is just beginning to flower in a dozen places. That curious monstrosity, Phyteuma comoplaces. Inat curious monstrosity, rayteuma comosum, would look quite at home under sea-water in an aquatium, resembling, as it does, some of the sea Anemone tribe. It grows here in the crevice between two projecting stones, having been tied up between two flat bits of limestone, with a mere dredging of soil, and hammered into the aperture. It has now six fine flowers upon it. Viola montana is a June-Gaussiting allegt, producing from a background study and appears to reducing from a background study and the constitution. two flat bits of limestone, with a mere diedging of soil, and hammered into the aperture. It has now six fine flowers upon it. Viola montana is a June-flowering plant, producing from a herbaceous stock an upright bush a foot high, with pale blue flowers—a very distinct species. A little Erythræa 2 inches high is now covered with flowers, like those of the common wild type. It is perennial, and may be pulled to pieces in spring; its habit is excellent. It has several names, but I have not been able to find out which is right, so I forbear to give any. Veroni-cas—the name is as plural as legion—are many of them past. The two best shrubs for the rockery are V. carosula, which is smothered with flowers early in June, though I cannot see that it differs much from pinguifolia and Lyalli, the latter, perhaps, liable to be killed by severe winters. A pink variety of the common wild V. officinalis is so flowery as to give a pretty colour to dry bases of the stones over which it creeps. V. rupestris is well known and good, but the more compact and neat V. saxatilis, with its red and its purple varieties, V. Grievi and V. Balfouriana, hardly get the attention they deserve. There is no room now lett to speak of Campanulas, which will last a long time, and may be mentioned at another opportunity. C. Wolley Dod, Edge Hall, Malpar, Cheshire, June 21.

∯loqists' ∯lowers.

THE AMARYLLIS .- At p. 682 it was stated that the plants were starting into growth for the second time, and I may say at once that it depends on the treatment they receive whether they will push into growth early or late, or perhaps not at all. Too often the Amaryllis is treated as if it were a Tulip or a Crocus, and is dried off almost as soon as the flowering period is over. Under such conditions the plants will not make a second growth, and they will make a very poor attempt at flowering the following season. When the flowers fade remove them, but allow the stems to remain until they decay naturally, and keep the plants growing for about sixteen weeks after the time of flowering is past. By that time they will have completed their second growth, and should be gradually inured to a drier atmosphere, with more air and a free exposure to the sun. The autumn flowering varieties have been produced by crossing the evergreen A. reticulata with the spring flowering type almost at the same time by Messrs. James Veitch & Sons, of Chelsea, and Mr. B. S. Williams, of Holloway. The first-named firm introduced Autumn Beauty, and the latter Mrs. Garfield and Mrs. William These varieties have the evergreen character of A. reticulata, and cannot be treated to such a decided season of rest as the offspring of A. aulica, A. pardina, A. Leopoldii, and A. graviana. sowed the seeds about two weeks ago, and they are now pushing through the ground; in two weeks more they will be pricked out, a dozen plants in a 6-inch pot. It is a sad waste of time and money to raise seedlings from inferior varieties, as they cannot be flowered very well under two or three years from the time of sowing the seeds; the space they occupy may just as well be taken up with really good sorts as with inferior sorts which are scarcely worth house-room.

AZALEAS.-It is now a good time to repot such plants as are not yet placed in heat. If it was thought to be unnecessary to repot any of the plants they are much improved by a surface dressing of some fertiliser. Guano mixed with equal parts of pounded charcoal and sandy peat answers well; the guano itself is rather strong, but a tablespoonful of it spread over the surface of a r5-inch pot would not injure the plants to which it is applied. Three times as much of the mixture I recommend might be given. It will soon be filled with active white hair-like roots, and the plants will show by the dark green of the foliage and the vigour of the young growths how much they enjoy it. If a hothouse can be set apart for the plants the temperature may be kept up to 65° or 70° at night, 85° or more by day, with shade from the direct rays of the sun. If there are any thrips on the plants they, as well as red-spider, can be destroyed by syringing vigorously two or even three times daily, Any vigorous growths that are taking a too prominent lead should be pinched back; the plants ought to be trained in the form of a bush. They will take a goodly supply of water at the roots. Shut the house up where they are growing early in the afternoon, to utilise the sun-heat. If the nights were a little warmer we might do without artificial heat altogether.

CALCEOLARIAS. — Where large specimen plants have to be produced from seeds it is necessary to sow early—say about the first week in May. Successional sowings may be made in June and July, and the July sown seeds will sometimes produce the best, or at least the most useful plants. The culture of these plants is simple enough, and may be summed up in a few words. Keep them clean, and let them be grown on without any check to their growth; the young plants to be protected from scorching sunshine. A frame facing towards the north is the best position in which to grow them.

CINERARIAS.—The treatment of these is much the same as that of Calceolarias at this time of the year. They may be grown in the frames, and be potted, watered, &c., just as the others are. In one respect there is a difference, and that is the treatment of named varieties. The offsets, or suckers, from the base of the old stems are readily propagated by separating them from the old plant with a knife, and potting them in fine soil, using small pots for the purpose. They will soon form vigorous little plants,

if they are placed under the shade of a wall or fence. Dry hot weather brings thrips and green-fly, both very troublesome pests to deal with in the summer.

PELARGONIUMS. - It is the custom with many people to put in any cuttings that may be required when the plants are cut down later in the season. It is much better to take them off before the plants have had time to become too much dried at the roots. The best plants are always obtained from young growths taken off in May and June. Plants produced from such cuttings may be grown on freely during the autumn months, and will form good flowering plants for the following season in 6-inch pots, whereas cuttings taken from the hard well-rlpened wood make but little progress, even after they are rooted. The proper treatment for the old plants that have done flowering is to keep them comparatively dry at the roots for two or three weeks, allowing them to get to the driest point, when they may be cut over. No water should be given for a few days, which will allow the cut portion to heal over. water is applied soon after they are cut, or if the plants should be moist at the roots while they are being pruned, the wounds will bleed, and take long to heal over. The plants should be placed in a cool airy house, near the glass, after they are pruned, or they may stand out-of-doors until the eyes start well.

ZONAL PELARGONIUMS.—The plants intended to flower next winter are now in 60-sized pots; they will presently be repotted in 4½-inch and 5-inch pots, to be repotted again in 6-inch and 7-inch. The plants should either be kept in a cool airy house or they should be placed out-of-doors; they like to be well exposed to the sun all through the summer and autumn months. The flowers have also to be removed as fast as they appear. J. Douglas, Great Gearies, Ilford.

NOTES ON PÆONIES,—III.

SUBGENUS II. PÆONIA PROPER.—Stems herbaceous.

Root a cluster of fusiform fibres. Disc not produced into a cup.

Section 2.—Follicles tomentose, erect-arcuste when mature.

10. P. tenuifolia, Linn.; DC. Frodr., i., 66; Anders., Mon., No. 4; Bot. Mag., t. 926; Rehb., Icon., fig. 4740; Boiss., Fl. Orient., i., 98.—Roottubers fascicled, with creeping stolons. Stems 1-headed, glabrous, 1-1 foot long, densely leafy up to the flower. Leaves 10-12; cut up into very numerous linear 1-nerved confluent segments under a line broad. Flower solitary, creet, surrounded by the crowded reduced upper leaves. Sepals orbicular, ½—2 inch long. Petals dark crimson, elliptic-cuneate, 1½ inch long. Anthers small, linear-oblong, shorter than the filaments. Follicles 2--g, erect-arcuate, villose, not more than ½ inch long; stigma ½ inch long, red, spirally recurved.

Extends as a wild plant from Transylvania to the Crimea, Caucasus, and Armenia. It was introduced into English gardens in 1765, and is a well known and very distinct type, clearly marked at a glance in all stages of growth by its very numerous narrow leaf-segments. It flowers with officinalis at the middle of June. P. laciniata and P. hybrida of Pallas are two varieties with broader leaf-segments than in the type.

11. P. anomala, Lina, Mant., 247; Anders, Mon. No. 3; Bot. Mag., t. 1754; Andr., Bot. Rep., t. 514; Ledeb., Fl. Ross., i., 74. P. intermedia, C. A. Meyer, in Led., Fl. Alt., ii., 277; Led., Fl. Ross., i., 74. P. Fischeri, Hort.—Root-tubers large and fusiform; stolons none. Stem as tall as in officinalis, glabrous, always r-headed. Leaves to—12, cut into numerous confluent lanceolate acute segments ½—j inch broad, 1½—2 inches long, 30—40 to the lower leaves, dark green above, pale green below, glabrous on both surfaces. Flower solitary, with the outer sepals produced into long, office compound leafy points. Corolla bright crimson, 4 inches in diameter, with about eight obovate or oblong petals 1—13 inch broad. Stamens ½—j inch long. Folitices and three, ovoid, 1 inch long, ½ ioch in diameter, arcuate, tomentose or glabrous.

Occurs as a wild plant in Europe, sparingly in Lapland, and in Asia it is spread all through the western half of Siberia, especially in the Ural and Altai ranges of mountains, and round Lake Baikal. It is a well marked type, midway between P. tenuifolia and P. officinalis, and is common in Eoglish collections, but there are two varieties—one with hairy and one with

naked follicles, so that it has just as good a right to be classified in the former section as here.

12. P. Emodi, Wall., Cat. Ind., No. 4727; Hook. fil. and Thoms., Flora Brit. Ind., i., 30; Hook. fil., in Bot. Mag., t. 5719. P. officinalis, Hook. fil. and Thoms., Fl. Ind., 60, non Linn.—Stems 2—3 feet long, quite glabrous, bearing 2—3 flowers when at all Invariant. Leaves thin in texture, glabrous on both surfaces, darkgreen above, pale green beneath; the lower with about 20—30 lanceolate or oblong-lanceolate very confluent acuminate segments, 1—1½ inch broad. Flower white, 3—4 inches in diameter, several of the outer sepals produced into long leafy, sometimes compound points; the petals unequal obovate, the outer 1½—1½ inch broad. Follicles 1—2, ovoid, tomentose, ½ inch in diameter; stigma very small, orbicular, straight, with the two sides folded together.

A native of the west temperate Himalayas, at an

as a wild plant throughout the southern half of Europe. It hegins to flower in our London gardens about the middle of May, P. lobata, Desf., DC. Prod., i., 66, is apparently a variety of officinalis, of dwarfer habit than the type, with narrower more numerous leaf-seerments.

14, P. peregrina, Miller; Anders., Mon., No. II; Bot. Mag., tab. 1650; D.C., Prod., i., 66.—Stem r.½—z feet long, r-headed, pubescent towards the top. Leaves 5—6 to a stem, dull green and glabrous above, pale green and plose beneath, the lower with 15—20 oblong acute segments, 1—1\(\frac{1}{2}\) inch broad, the longes; 3—4 inches long, outer with leafy points. Petals 5—10, bright crimson, 2 inches long, 1\(\frac{1}{2}\)—2 inches broad. Follicles 2—3, tomentose, erect-arcuate, I inch long, inch in diameter; stigmas crimson, folded together, and hooked, \(\frac{1}{2}\) inch

"This is the latest in coming into flower of all Pæonics, excepting albiflora; its flowers seldom expand hefore the latter end of May. It forms a dense tuft of leaves and flowers more dwarf than bumilis, and is the lowest in stature of all the species excepting mollis. From pergrina it differs in the leaves being small, ovate, and more glaucous; the leaflets more divided, crowded, and imbricated; the ultimate fissures shallow and obtuse; in the germens being close pressed together and very little separated even in the ripe follicles." Our most typical wild specimens are from Montpellier and Trieste. A full account of it will be found in Sweet's Flower Garden under the figure cited. It is not recognised as a species by any of the recent Continental Flora writers.

16. P. mollis, Anders., Mon., No. 13; DC. Prod., i., 66; Lodd., Bot. Cab., t. 1263; Sabine, in Bot. Reg.,

FIG. 153.—PÆONIA CORALLINA: FLOWERS CRIMSON.

altitude of 5000 to 10,000 feet. A fine well-marked plant, still rare in English gardens, most like P. albiflora of the common cultivated kinds.

13. P. officinalis, Retz., Obs., 35; Anders., Mon., No. 5; Bot. Mag., t. 1784; D.C., Prod., i., 55; Reich., Ic. Germ, t. 127, fig. 4743.—Stem stout, one-flowered, glabrous, 2—3 feet long. Leaves 5—6 to a stem, glabrous, dark green above, pale green beneath, the lowest with 15—20 lanceolate or oblong lanceolate acute confluent leaflets, 1—2 inches broad. Sepals very unequal, the inner orbicular and obtuse, the outer leaf-like and acute. Petals dark crimson, nuch imbricated, obovate, or nearly orbicular, t.½—2 inches broad. Stamens ½ inch long; anthers rather shorter than the filaments. Carples 2—3, ovoid, densely tomentose, erect-arcuate, when fully mature 1 inch long. ½ inch in diameter; stigmas ovate, complicate, crimson, recurred.

The commonest species in gardens (see fig. 153), especially in the double-flowered form, and spread

Widely spread through the South of Europe, and common in cultivation. It is not distinct from P. officinalis as a species in any broad sense. I do not know how to distinguish it from P. pubens, Sims, in Eot. Mag., t. 2264; or P. banatica, Rochel, Reich., Lo. Germ., tab. 125, fig. 4741 c.

15. P. paradoxa, Anders., Monogr., No. 12; DC., Prodr., i., 66; Sweet., Brit. Flow. Gard., t. 19.—Stem 1-4½ foot long, hairy in the upper part, with never more than a single flower. Leaves 5—6 to a stem, green, and glabrous above, glaucous and plose beneath, the lower cut up into 9—40 acute confluent segments, ½—½ inch broad, the largest not more than 1½—2 inches long. Peduncle so short that the flower is amongst the upper leaves. Calyx and corolla just like those of officinalis and peregrina. Follicles 2—3, ovoid, tomentose, erectarcuate.

This is not in any broad sense more than a variety of peregrina. Anderson identifies it with the Pæonia promiscua of Lobel, Gerard, and Ray, and says:—

t. 474.—Stem about I foot long, I-headed, densely pilose. Leaves 5—6, crowded, dull green above, glaucous and densely pubescent beneath, cut into 30—40 oblong lancoclate segments [§]—I inch broad. Flower like those of officinalis and peregrina, but smaller and duller in hue. Follicles 2—3, densely pilose, erectarcoate.

Not distinct from the last in any broad sense. Anderson, who first separated it, writes:—"This plant is at first sight distiloguishable from its congeners by its short, rigid, upright stalks, the dark bluishgreen colour of its leaves, which are flat, compact, very much divided, the lacinic crowded, overlapping each other, very woolly on the under-side, nowise bordered with red, as in most of the others, and, the lateral leaflets being almost sessile, the exterior side of each disposed to be decurrent. It is the most dwarf of all our species, seldom reaching 18 inches in height, even in our gardens. The flower is small, of a dark dull purplish-red, by no means handsome." It

has not been claimed as a wild plant by any of the authors of recent Floras of the southern countries of Europe. J. G. Baker.

(To be consinued.)

Foreign Correspondence.

BOGOTÁ AND HOW TO GET THERE (continued from p. 779).-When you are at Facatativá you are 10 miles in the plain and 20 miles from Bogotá, and you are at the foot of one of the two islands that in former times projected out of what was then the lake. The drive thence into Bogotá is an easy one-a public coach runs daily backwards and forwards, and the charge is 6s. 8d, or one can take a coach to oneself for £3 10s., or, if there is a return empty coach a bargain can be made with the driver. The alluvial nature of the soil can be easily seen as you drive along -in fact it is rather like a long drive through an Irish bog-on both sides of the road run deep ditches full of water, which prevent access to the neighbouring The land is very fertile, and produces two crops of wheat a year without any manure, and with very little cultivation. The first harvest takes place in January of the crops sown in September, and the second in July, of the crops put in the ground in February, which, curious to state, is the hottest and finest month in the year, with a mean temperature of 61° F. The mean temperature of the Plain of the Sabana, as it is called, is 59°, so that there is very little variation. Besides Wheat, Barley, Maize, Vetches, Beans, and Potatos, garden stuffs are cultivated, and the flocks of sheep and the herds of beasts give the scene quite an English aspect. The farm houses dotted on the plain, and generally surrounded with a clump of trees, assist in the delusion, which is only dispelled by the curious but picturesque costumes of the Colombian cavaliero, and the muffled-up aspect of his señoras, as they ride ambling by on their The use of the lasso still predominates, and the cavaliero, as well as his herdsman, is very clever with it. The mules also are very clever in avoiding it, and will gallop about with their heads closely pressed into their neighbours flanks to dodge the noose as it comes down. There is not a vestige of an Orchid in the Plain of the Sabana, and all search is useless there.

On arriving at Bogotá I went to the boardinghouse of Mrs. Bowden, an Englishwoman, in the street Calle No. 1 al Norte, Her charges are from £8 to £10 a month for a good bedroom, four meals a day and attendance, but, of course, no wine or beer. This is the usual charge at Bogota for living, though the Grand Hotel-a sad misnomer-charges more. Drinks, such as Lager heer, cost 15. 6d. a pint; claret costing nothing under 6s. a bottle, and brandy costing 30s. a bottle, are very dear and very bad. The beer of Bogotá is not nice, and costs 44. a pint. My first afternoon gave me an idea of a tropical thunderstorm in the Andes; the rain descended in torrents for an hour and a half, balls of fire, which seemed to burst with a greenish hue about them, descended every two or three minutes, and these, mixed with the most vivid lightning, gave me the idea that chaos had come back once more. The reverberation of the thunder amongst the mountains at the back of the town was very fine, and the street was The next morning I went to La simply a torrent. Flora to call on Mr. Kalbreyer, the German nurseryman, to whom I had a note of introduction from Messrs. Veitch. Kalbreyer had been an Orchid collector for that firm, but fever had undermined his health, and he set up in business on his own account at Bogota as a general nurseryman and introducer of new plants. The Colombians have money to spend on flowers, and to give bouquets is a favourite method of ingratiating themselves with the ladies. As a sample of prices, a flower of Lycaste Skinneri brings in 6s. 8d., a simple Camellia costs 3s. 4d., and a good spike of Odontoglossum Alexandræ or O. triumpbans is worth from 10s. to 12s. Roses are very abundant all the year round, and very cheap; but the particular favourite flower of the Colombians is the Pansy -El Pensamiento-and good large flowers of this will cost 6.4, apiece, especially if they are a new

Kalbreyer showed me over his garden, which is kept in a thoroughly Colombian, that is to say untidy, manner. Of Orchids he had a good many Odonloglossums Alexandræ, triumphans, and gloriosum in flower, and Masdevallias Harryana and

Shuttleworthii; Cattleyas will not grow up here unless in glass-houses, and that is a very expensive anuscement. Ao old piano case roofed in with glass costs close upon £20. In the garden were Gloire de Dijon and Maréchal Niel Roses on their own roots, doing very well indeed, and most of the regular H.P., aod Tea Roses. Peas were coming up—in flower and fruiting, excellent Cabbages and Cauliflowers. There were some Peach trees with fruit on them, but they do not come to perfection here; Asparagus will not grow at all, but for fruit and vegetables the Bogotá market on Friday mornings is the most wonderful sight I have ever seen in any part of the globe. All the fruits of the hottest tropical regions mixed with the products of the coldest mountain districts, such as frozen hail, are to be found there.

I will enumerate a few, to give an idea of the fruits. Strawherries, both wild and cultivated; Bananas, common Plantains, Cherries, Apples, Pineapples, Mangoes, Cocoa-nuts, Melons of three or four kinds, Peaches, Pomegranates, Passionflower fruit (Passiflora edulis and quadrangularis), Mulberries, Blackberries, Curubas, Figs, Plums, Guavas, Nisperos, Grapes, Nuts, Altmonds, Chirimoyas, Oranges sweet and sour, Limes, Dates, Gourds, Alligator Pears, Tomatos and Tamarinds—to say nothing of about fifteen sorts of fruit in addition whose Spanish names I could only find out. Of vegetables there is a great profusion likewise, and all the country productions, such asstraw hats, sandals, baskets, carved wood and home-spun cloth, are to be found. It is needless to add that they always ask more than they expect to receive for their goods. Meat is very good but dear, almost as dear as in London.

Two days after my arrival I was attached by the usual Magdalena sever, that always seems to attack fresh European arrivals at Bogotá; for this I took four grains of opium and five grains of quinine, and then sent for the most celebrated poisoner of the district. He came and told me that I had treated myself quite right, and to go on taking quinine if I I escaped. The next day found me very weak and wretched, but I was able to go out and stand about in the sun. The rooms at Bogotá are wretchedly cold and cheerless, so to counteract this every Colombian lolls about in the sun. I went for a walk up the Boccaron, the valley which lies between Mount Serrate and Guadaloupe, and through which runs the River Bogotá. Sentries are placed with rifles for some distance from the town to prevent There were numberpeople bathing in the stream. less Orchids to be found here, but they were nearly all of the Masdevallia, Pleurothallis, or Restrepia kinds, and were, as I afterwards discovered, all known to Herr Lehmann-nothing at all brilliant. The Government had built some stone walls across the path to prevent the Indians coming down with their supplies to market, but they might as well have built them to prevent the swallows or humming-birds flying about.

The ascent of Guadaloupe, which is some 2000 feet above the town, does not repay any one except for the view, and, when the sun is shining, the rays through the sprays caused by the Falls of Tequendama are very fine. The district of Patcho, about one and a-half day's journey from Bogotá, abounds with Odontoglossum Alexandree. Some of these are the large, well-spotted varieties, others are worthless, and it is from here that the Indians bring in their plants to the town. This district has all been bought by an Englishman. Mr. George Bunsch, a brother of a former Minister in Colombia, who has brother of a former Minister in Colombia, who has started large ironworks in the district, and he has a great helief in the future of Colombia. Godnotglossum Lindleyanum is always more or less mixed up with plants fromhere. The spotted variety of Alexandre, the broad-sepalled and petalled variety, and the new variety with the branching spikes, always grow about three days' journey from each other, and this latter—Odontoglossum Alexandrae Lehmanoi – grows in quite an unsuspected place, and as I am bound to secrecy in the matter I cannot more exactly disclose the place, but doubtless there will be large importations of it soon. E. W. Walker,

(To be continued.)

THE HEALTH EXHIBITION. — The total number of visitors to this great show during the week ending June 14 was 143,121; and during the week ending on June 21, 143,122, or one more. It would be interesting to know what are the chances of the numbers of any two consecutive weeks being so close again.

Orchid Notes and Cleanings.

MAJOR LENDY'S ORCHIDS, - The commodious houses at Sunbury House, Sunbury-on-Thames, may truly be said to contain a collection of Orchids, for while the showy large-flowered kinds are grown in quantity, every other variety which is pretty finds a home there, and all the insignificant flowered species are represented for botanical purposes. Here we may often see plants of Stelis, Pleurothallis, Octomeria, Restrepia, or small flowered Masdevallia, which by good culture have been grown into masses and enabled to produce numerous flower-spikes, which by their numbers not only make up for the smallness of the individual flowers, but seem to impart a fairy-like grace to the plants by the very features which in small or ill-grown specimens are regarded as defects. The cold houses contain a very fine lot of Odontoglossums, including many superb forms of O. Andersonianum, O. Ruckerianum, O. Edithæ, and O. Wilckeanum, and a most complete collection of Masdevallias, comprising almost the whole of the known species in cultivation. In these houses the Oncidium macranthum thrive well, and are now and for a great part of the year giving a profusion of their large golden blooms from the long flower-spikes which twine overhead. Arranged in a similar manager is a first spike of O similar manner is an immense flower-spike of O. zebrinum about 12 feet in length, and several of the yellow and brown flowered O. serratum, which yellow and brown flowered O. serratum, which mingle well with the brighter flowers of the other species. In the coldest house, growing over the water-tank, is a grand specimen of Odontoglossum coronarium with five strong leads, and all looking very healthy. It is grown in a large pan with sphagnum moss, over which it seems to delight to spinaguan moss, over most and shady. This plant troubles many growers, but those who once find out how to grow it, find it very easy to do. A cool, still, moist corner over a water-tank has been found by several to be the best suited to it. One of the houses is devoted chiefly to the varieties of O. Alexandræ, O. Pescatorei, and the Masdevallias; and they are giving a good show of bloom assisted by a quantity of the snowy-flowered Dendrobium infundibulum, some masses of the delicate little Palumbina caodida, Odontoglossum cordatum, O. Reichenheimii, O. Hallii, O. sceptrum, Oncidium concolor curtum, O. prætextum, the pretty violet coloured Odontoglossum Edwardii, and the scarlet Sophronitis grandiflora, and good masses of Epidendrum vitellinum majus. In another cool house the Odontoglossum vexillarium have the best of the display, and grand some of the varieties are, one of the very dark flowered kinds measuring nearly 5 inches in length, and some of the white flowered forms are very lovely and seldom to be found of such size and substance. With them are some good varieties of Masdevallia Harryana, M, bella, M. chimæra, and many other curious Masdevallias, as well as the pretty Barkeria spectabile, the quaintlooking, large-flowered Epidendrum Parkinsonianum, and some well-flowered plants of the old Miltonia flavescens, which are as pretty as many of the newer arrivals. The Deodrobiums are giving a good supply of bloom from healthy plants of D. Parishii in several varieties, D. Bensoniæ, D. thyrsiflorum, and a good specimen of the true D. Griffithianum, with its long, loose racemes of light yellow flowers, not a bit resembling the D. densiflorum, which is generally The East Iodian house is more than half filled with Phalænopsis, which are especial favourites They are in good condition, and are well furnished with flowers either present or in prospect. The P. speciosa, with its quaintly painted flowers, seems more likely to be a favourite than it was at first supposed to be, for there it is very pretty. Good varieposed to be, for there it is very pretty, Good varie-ties of P. Luddemanniana, P. tretraspis, P. Schree-deri, and the pretty little P. Parishii, are also blooming, and with them many good pans of Cypri-pedium niveum, C. Lawrenceanum, C. Stonei, C. vexillarium, C. Argus, and many Angræcums and Acrides, certaply not the least handsome of them being the old Aërides odoratum. The Cattleya-house re-cently erected is arranged for effect, the Cattleyas, being mingled with Caladiums, and the long slender flower-spikes of the many species of Oncidium being utilised to train over the iron arches of the middle walk. Altogether it looks very

effective with the many large blooms of C. Mossiæ, C. gigas, C. Meadeli, C. Warneri, C. lohata, C. Walkeriana, C. Forbesii, C. guttata, C. labiata, Lycaste aromatica, Ladia elegans, L. purpurata, Sobralia macrantha, and numbers of other odd, pretty, or showy things. Particularly noteworthy is a grand mass of a lovely variety of Lælia purpurata, with thirty-five flowers; a handsome Cattleya gigas Sanderiana, which is such a gorgeous thing when obtained true; a lovely white C. Mossia, with yellow and rose lip, which was sold by Messrs. Sander as C. Mossice Arnoldiana; a well-flowered mass of the old dark rose-lipped Epidendrum macrochilum, a fourflowered plant of the strange-looking Brassavola Digbyana, and some healthy plants of Odontoglossum Phalænopsis, O. Roezlii, Epidendrum prismatocarpum, Utricularia montana, U. Endresii, Vanda Batemanii, and the curious scarlet-lipped Epiden-drum Pseudepidendrum, well furnished with bloom, Major Lendy has also some Burmese Orchids and botanical curiosities imported direct, but, as with most amateur Orchid importers, too great a quantity of the small-flowered species are received, the last consignment from Guatemala, consisting of Stanhopeas, Epidendrums, &c., being particularly unfortunate, as more than one or two plants of each of them are not worthy of the room they occupy. It is pleasant, however, to see one so enthusiastic as Major Lendy caring for the small as well as the large-flowered

The Flowen Sanden.

THE late fine weather has proved very beneficial to the newly planted subjects in the flower garden, even the tenderest kinds have already made satisfactory progress and will speedily fill their allotted spaces, Having made such rapid growth extra attention will be requisite in pegging, tying, and training them in the proper direction, and in pinching and stopping exuberant growths and such shoots as have already filled the spaces they are intended to occupy. Although the weather has been very favourable to the growth of most plants, there are a few subjects to which it has not appeared to be altogether suitable. Freshly planted Calceolarias, for instance, have not made satisfactory growth except where special means have been taken to keep their roots cool and moist. Frequent watering alone is not sufficient to ensure this, but if a good mulching of rotten manure is also given over the surface of the beds immediately after planting they will succeed thoroughly, nor should this beneficial and economical method of mulching in dry, hot weather be confined to Calceolarias and similar plants, as there are few kinds that will not be im-proved immensely by its application, and much labour in watering will thereby be averted. Where the beds are surrounded or intersected by Box edgings, these should now be trimmed as neatly as possible, and the shoots carefully cleared away; the gravel walks should also receive a sprinkling of new gravel over the surface, and then be well rolled. Cleanliness, neatness, and order should be maintained throughout, so as to make everything as bright and pleasing as possible.

ANNUALS AND PERENNIALS may still be planted, so as to fill up all blank spaces left by the early flowering bulbs in the herbaceous and spring borders, and extra sowings of the quicker growing kinds may still be made to succeed those plants which are not yet ripe for removal; by so doing an ever changing and ever beautiful display may be obtained at comparatively little labour and cost. Two of the most beautiful subjects in bloom at the present time are the Delphiniums and the Aquilegias. When well grown there are few plants in the herbaceous border so gorgeous. Amongst the newer varieties of the latter nearly every imaginable colour is obtainable from seed, they are also exceedingly useful for house decoration.

Roses now require special attention, not only in removing defective buds injured by the late spring frosts, but also in the destruction of the Rose weevil, which appears to be unusually prevalent this season: the best remedy is to inspect them daily and remove the grubs from the leaves; where gross shoots are

being formed they should be topped so as to equalise the flow of sap. Frequently loosen the surface soil with the hoe and then mulch it with totten manure. Should mildew appear sulphur should be immediately applied to the affected plants, nor should one dressing be deemed sufficient where it has taken firm hold; sulphur is so easily dispersed by wind and rain that ofterepeated dressings are required to destroy it. T. S. C.

The Bandy Anuit Garden.

SRAWBERRIES will now be in full bearing, and as our raiofall is considerably below the average, this fact must not be lost sight of, for it is out of the question to expect large crops of fruit unless an abundance of moisture is first supplied, therefore water in the evening, preferably from river or pond if it can be obtained. See also that the nets are put on every night after gathering, because it is at daybreak, before any one is about, that birds are most destructive, and, as we said before, let all fruit for the day's supply, be gathered early. Cherries will now be ripening, and nets will also require to be placed over them; where the Cherries are all planted together (and they always should be), the labour and expense of covering them is not so great. As the fruit will now be approaching maturity, syringing with any insecticide must for the present be abandoned. Pears on walls will require the breastwood to be stopped and permanent shoots laid in. Peaches must be gone over again; insects are terribly numerous this year and must be kept under. At this thinning of the fruit one may be left on a shoot, and later on, if they are still too thick, this operation can be repeated. It is quite a mistake to remove every leaf from off the fruit just yet, when this is done thus early oftentimes the fruit gets scalded, so little and often is the best maxim here. Trees which have been grafted will now need to have the ties binding the graft taken off, and in the case of strong growths re-tie them, to prevent them from being blown off. This month the fruit-room will be less in demand than in any other during the whole year, therefore see that the necessary cleansing is attended to; open the ventilators wide, and whitewash the walls and scrub or paint the shelves—not that we recommend the latter, except where the woodwork has got black and unsightly. Where a suitable building does not exist, it should now be erected, remembering that is the storehouse of the garden, and in doing so avoid lofts or places near stokeholes. The building should have a north aspect, be a foot or two under-ground, be built with hollow walls, and have some non-conducting material between the ceiling and the and have ventilators at the point, and shutters to the windows, as it should ever be borne in mind that a dark room and a low temperature is most favourable to the keeping of fruit. On no account introduce hot-water pipes or any heating apparatus where the place is extensive; this may be done in the ripening-room or Grape-room adjoining. J. Rust, Eridge Castle, Sussex.

The Fitchen Garden.

PLANTING, &c .- This will be a good time to make another planting of the stronger plants of the respective varieties of Savoys, the distance between the plants each way being, as with kindred subjects, determined by the size which the different varieties attain, as well as by the nature of the soil, in poor land less space being required than in rich ground. Small varieties, like Tom Thumb and Early Ulm, may be planted as stated in my last Calendar, in rows 15 ioches apart and 12 ioches in the row; while Drum. head should have a space of 2 feet between the plants each way. In taking up the plants care should be exercised in examining the roots, in order to ascertain whether they are clubbed or not, and all that show signs of that disease should be destroyed. Continue to make successional plantings of Celery in trenches, as previously advised, and see that the plants do not suffer from want of water at any time. Do not trouble about earthing them up until they have attained to 12 or 15 inches in height, and thereby not only economise labour in the operation, but also lessen the chances of the soil getting into the hearts, which is frequently the case when the plants are earthed-up when only 6 or 8 inches high, and the object blanching the head—is secured as completely as by carrying out the operation at more frequent intervals.

TOMATOS OUT-OF-DOORS —The chief points to be observed in Tomato culture, whether indoors or out, are to keep the shoots and leaves well stopped and thinned. If the plants are trained up the wall with one or more stems, these should not be closer to each other than 10 or 12 inches, all side shoots being pinched at the first joint, and kept persistently stopped afterwards, and the leading and secondary branches stopped above the fruit. As soon as the latter have set, their development will be hastened by the plants having liberal supplies of liquid manure at the roots. Thus treated, and with ordinary summer weather, the plants should yield an abundant supply of ripe fruits. In tacking the shoots to the wall, sufficient shredroom should be allowed for their expansion.

GENERAL WORK .-- Get ground well manured and dug in which to plant Coleworts and Cabbage plants; 15 inches each way will be sufficient space between the plants of the former, and 20 inches between those of the latter. As young plants of Cauliflowers, &c., become large enough to handle in the seed-beds, prick them out in nursery beds, as previously advised, before they become crowded. Advancing crops of Canadian Wonder French Beans will now be the better for having some short sticks put to them to keep the stems erect and the pods clean. Peas will now be plentiful enough to take the place of Asparagus, therefore the cutting of the latter should be discontinued. This is necessary, to enable the plants to make foliage, and consequently fresh roots, and thus acquire more vigour for the ensuing year. attention which the beds will require for the next few months will be freeing the ground from weeds and seedling plants, which are found in abundance. H. IV. Ward, Longford Castle.

Natural History.

THE WILD CAT.—Can any of your readers inform me whether or not the wild cat (Felis catus) is extinct in Britain? I am led to ask this question by the frequency with which one hears of its capture and destruction by trappers. The domestic cat being naturally a poacher, not unfrequently emancipates itself, and leads in the woods an independent life, and is there called by gamekeepers and others the wild cat. Nothing can be more erroneous, as the true wild cat. Nothing can be more erroneous, as the true wild cat is rarely, if ever, seen, and then only in one or two of the northern Scottish counties, being now extinct in one of its last English shelters—Delamere Forest. In Britain it was formerly plentiful, as we leara from Richard II.'s charter to the Abbot of Peterborough, giving him permission to hunt the hare, fox, and wild cat. In 1571 the Duke of Sutherland exhibited in London a wild cat, the following account of which was published by the late Mr. Frank Buckland in Land and Water. He states that "He was first sent to my house in Albany Street, but the beast was so fierce that there would have been a "mutiny at the Nors' both of bipeds and quadrupeds if I had taken him as a guest. So I was unwillingly obliged to pass him on, in a cab, to my friend, Bartlett, at the Loological Gardens, who put him in excellent condition for the show. This wild Scotch cat won a prize of £1 tos. I think the poor thing should have a silver collar made of this value, only who will 'bell' (or rather collar) the cat? At the show he looked very bitter and snartly. He kept his ears flat down, and every now and then smiled a ghastly gin and showed his white teeth, with a hissing 'kuss, kuss,' as much as to say, 'Let me out of this cage but for a minute, you wretched Londoners, and I'll make the lot of you skedaddle. I'm a prisoner now, but I have got good old Scotch blood in my veins, and I would hake the bundle of you clear out like frightened sheep, like my ancestors did the Picts hundreds of

It is frequently asserted that the true wild cat is identical with our tame animal, but only by those who have never seen a wild cat, as this latier is not only ferocious in appearance, but untameable as well. I have seen several killed in the North of Ireland which we had never any trouble in distinguishing from the tame animal by their lank, lean, though powerful appearance, as well as by the tail ending in a small brush, instead of tapering gradually to a point, as in the domestic cat. Other points of difference are the rather long, pointed ears, grey head, marked with two black stirpes passing from the eyes over and behind the ears, and grey body, with a blackish lorgitudinal stripe along the middle of the back. A. D, thebter,

Rooms. Crystal Palace Rose Show.
Sale of Orchids and other Plants, at Stevens' Rooms. SATURDAY,

A RECENT auction sale of the season's growing CROPS on a large number of FRUIT ORCHARDS situate on the western side of London, revealed very plainly the scanty amount of produce to be disposed of in that part of the county. The first thirteen lots did not even bring out a bid, so sparse was the fruit; and out of the score or more submitted to competition but two obtained fair prices. Such a fact as this speaks volumes for the present ordinary state of the market fruit crops, in the neighbourhood of London at least, although it may be accepted in mitigation of this example that the orchards were not those of good market growers, who are first-class cultivators, but belonged rather to private persons who, not being market growers, prefer to dispose of their fruit crops through dealers, who would purchase and gather the crops, rather than send them to market themselves.

But the other day a strong plea was put forth in favour of the cultivation of more fruit. It is strange that with all the information that is given from year to year as to the condition and prospects of the fruit crops through the Press, that persons who occupy positions of eminence in various circles, and whose opinions are regarded with special respect, should remain in ignorance of the fact that our crops are abundant or deficient, not because of the will of man, but from circumstances beyond his control. Over and over again has it been shown that, so great are the breadths of land now under fruit culture that a heavy cropcertainly a rare event-does but mean a glut that is replete with loss to the grower. It is a fact that did we have really heavy crops every year repletion to the public would but lead to starvation to the grower. The best paying crop is half a one, and that a good sample. A very poor crop is ruinous, and a very heavy one is nearly as bad. We learn that a comparative deficiency of some preserving fruits this year will bring no inconvenience to the jam manufacturers, because they are well supplied, and will be glad of a short season to enable them to clear out.

Having regard to the immense number of our population few would perhaps expect to learn that jam makers ever became glutted with material, but such, we learn, is the case. Had the great crop of fruit at one time anticipated been realised we might have seen that singular but still occasional incident-growers unable to sell, and almost unable to give away, their fruit. It may be, indeed most likely is, the case, that whenever we get a large fruit crop it is not distributed so effectually as may be desired amongst consumers. The means for distribution are abundant, but they are also costly; hence before the luscious fruit for which the grower receives at the first such a very moderate price reaches the actual consumer its original price has doubled, perhaps trebled, and the final sale is heavily handicapped. So common is the love for fruit that it seems as if the consumption in the proper season would be illimitable and the sale profitable. Thus it comes that those who preach a crusade in favour of more fruit culture usually base their notions of the profits of fruit culture on the prices paid to the dealers, and hastily jump to the conclusion that the only remedy for these prices, which of course are unduly high, is to be found in wider and extended culture.

Our market growers are men of marked enterprise, and are only too ready to seize upon any opportunity that may offer to realise profits. If fruit culture were so very profitable a vocation we should find the growers expanding their orchards most rapidly. Around the metropolis and, indeed, throughout the country, that is constantly being done now, but not much more rapidly than is needful to replace exhausted orchards or to make good others that have been built over or otherwise destroyed. There is no great profit realised even by men whose lives have been spent in their vocation, and who are more familiar with market and public requirements than are any enthusiasts or philanthropists; and were fruit culture such an Eldorado as is represented, they would need no lectures or pamphlets to stir them to farther extension of their fruit gardens. Whilst this extension of their filling gardens. Whilst this season we have seen the top fruit crop so terribly attenuated by the frost, we are now seeing both drought and blights acting disastrously upon bush and ground fruit crops; so that the difficulties of fruit culture are many, and in embarking in that vocation all must be reckoned with. We were once made familiar with a demand for the ntilisation of railway embankments for controllers. fruit culture. Most likely those who contended for such utilisation of these wastes gave the subject but little consideration, and that we hear little of it now shows that wiser counsels have prevailed. When we have ensured good and safe crops for our cultivated orchards, we may then turn our attention to even railway embankments.

- RHODODENDRON CAMPVLOCARPUM,-When loaded with inflorescence of surpassing delicacy and grace this species claims precedence over its more gaudy congeners, and it has always been regarded by me as the most charming of the Sikkim Rhododen-drons. In such terms as these did Sir Joseph (then Dr.) HOOKER, speak of this species when he first made it known in his sumptuous Illustrations of Sikkim Rhododendrons, t. 30. The species has been retained in Mr. C. B. CLARKE'S most recent revision in the Flora of British India, vol. iii., p. 467 (1882), so that to the illustration now given (fig. 154) nothing need be added in the way of description save to say that the flowers are of a pale primrose-yellow colour and fragrant. The name campylocarpum applies to the curved sickle-like capsules, not shown in our illustration. For the specimen figured we are indebted to the Hon, and Rev. J. T. BOSCAWEN, in whose famous garden at Lamoran this species is found to be hardy.

- GARDENERS' ROYAL BENEVOLENT INSTI-TUTION. - On Tuesday next the forty-first anniversary festival of this Institution is to be held "Albion," Aldersgate Street, when Mr. GEORGE LAMBERT, F.S.A., will preside. We have often had occasion to bring this deserving Institution under the notice of our readers, and we do so with the greater pleasure as we believe that it is founded on sound principles of self-help, and is characterised by judicious management. The steady racterised by judicious management. progress of the Institution, in spite of adverse criticism, not always well founded, is a proof of the correctness of our statement. The complaints which have reached us from time to time have been based on a misunderstanding of the objects of the Institution, and an unreasonable expecta-tion of what can and what cannot be done. It is obvious that an institution which is intended to confer such substantial benefits upon deserving candidates must be carried on upon the soundest financial basis, and be so managed as to be as secure as possible against risk, and this we believe to be the case in the present instance. The growth of the Institution from small beginnings to its present respect-

able position alone substantiates our view. We should. indeed, be glad to see the Institution less dependent upon outside assistance than it is, but we can but recognise the fact that, if there is any shortcoming in this particular, it is due to the class more particularly interested in the matter. The gardeners of the nation have it in their power, if they would only exert it, to have a larger voice in the management of the Institution, but they must remember that in order to maintain and extend its usefulness, they must not only support it vigourously by their contributions, but recognise the fact that matters of successful finance demand as much forethought and knowledge of business management as does the control of a large garden establishment. If the gardeners of the country feel any deficiency on this head, as from the nature of their occupations they may well do, they may at least be expected to recognise the qualifications of others more favourably situated than themselves to deal with such subjects. One very satisfactory feature connected with the Institution is manifested by the steady growth of the Augmentation Fund devised to increase the amount of the pensions paid. The amount now given is, it must be admitted, small. It was small when the Institution began its benevolent labours, and in view of the altered circumstances of the present time it is smaller still. Hence the necessity for further effort to make the pensions more adequate. This, and the increase in the number of pensioners are really matters almost entirely in the hands of the gardeners themselves, and we hope to see them appreciate this truth and exert themselves to increase the annual income of the Society and the consequent extent of its usefulness. As to the employers of gardeners and the charitably disposed, their contributions already bear a large, a very large proportion to the receipts from bond fide gardeners, and we do not for a moment doubt that in spite of the depression to which all who derive incomes from land are subjected those contributions might be largely increased were the claims of the Institution more forcibly brought under their notice by the gardener. Begging is, happily, a distasteful matter to most of us, but there are occasions, and this is one, where begging, judicious, if importunate, is in the highest degree laudable. In addition to various small sums and notices of annual subscription received by purselves, we are informed by the Secretary that the Augmentation Fund up to the present date, June 25, is 6376 16s., as against £28 9s. this day last year, although the usual collecting cards have not yet been sent out. They will be issued on or about July 18. The principal subscribers to the Augmentation Fund this year are :- The Baron Schreeder, £50; Alfred de Rothschild, Esq., £10 10s.; the Duke of Devonshire, £10 10s.; Messrs. Veitch & Sons, £26 5s.; John Waterer, Esq., £10 10s.; Richard Chrimes, Esq., £10 10s.; T. C. Daniells, Esq., £10 10s.; A. Sim, Esq., £10 10s.; H. C. Hardy, Esq., £10; E. C. Baring, Esq., £10 10s.; Mr. J. Smith, £10 10s.; S. Morley, Esq., M.P., £10 tos.; T. S. Childs, Esq., £10; Baroness Von Roemer, £5 5s.; Messrs. Wigans & Cosier, £5 5s.; Mr. W. Fletcher, £5 5s.; F. Tiack, Esq., £5.-with others, let us hope, too numerous to be mentioned, except in the public audit of the Institution, and of that other audit, wherein are recorded the names of those whose deeds, accomplished by their right hands, are not known to their left.

- DISEASES OF FIELD AND GARDEN CROPS. -Under the above name Messis. MACMILLAN & Co. have a small work in the Press from the pen of one of our contributors, Mr. WORTHINGTON G. SMITH. It describes the diseases of Clover, Onions, grass, straw, club-root and the other diseases of Turnips, Mangels, Cabbages, &c.; the diseases of corn, as rust, mildew, ear-cockle, smut, and bunt; the diseases of Peas, Lettuces, and Parsnips; Ergot, Dodder, the Potato disease, and other subjects. Upwards of 140 new illustrations from living examples have been drawn and engraved for this book by Mr. SMITH. Most of the original camera-lucida drawings on paper, the herbarium examples, the microscopic slides, and a set of proofs from the blocks before printing have been placed in the Department of Botany, British Museum (Nat. Hist.), South Ken-

- TRUFFLES IN CALIFORNIA,-A somewhat sensational article appeared in one of the Californian journals, announcing, as if it were a matter of econo-

FIG. 154.-RHODODENDRON CAMPYLOCARPUM: FLOWERS PRIMROSE-YELLOW: POLLEN GRAIN MAGN. 200. (SEE P. 832.)

mical importance, that Truffles had been found in California. Four specimens, which occurred in the University grounds at Berkeley, Allameda Co., California, which are probably all that have been found, were sent by Mr. J. J. RIVERS, Curator of Organic Natural History in the University, and these consist of one species apparently identical with the red Truffle of Bath, Melanogaster variegata, two belonging to the group of real Truffles, and one very anomalous production which I cannot refer at present to either division—one a real tuber, with hispid elliptic spores, which if new is closely allied to the British T. ruffum; the other, of a beautiful cherry-red when fresh, belongs to the genus Pachyphlæus. All too small to be of any culinary value. Though the red Truffle is used at Bath, its merit is rather to make the sauce of a dark brown colour than from any pleasant flavour. The four will be characterised in a forthcoming number of Grevillea, where the fungi, collected by Dr. HARKNESS himself, have already been published. M. 7, B.

FLOWERS FOR CUTTING AT ASCOTT .- So great is the need of finding out everything that is useful for cutting that many of our large garden establishments devote fine ranges of glass to the trial of new and the culture of well known plants useful for these purposes. In Mr. LEOPOLD DE ROTHS-CHILD's fine garden great provision is made, both indoors and out, for plants of this nature, and at the present time they are giving a great display of blooms, and the healthy succession plants giving liberal promise for the rest of the year. Neat, clean, wellbuilt houses are filled with Pelargoniums in full bloom, as sturdy and compact as those grown for the London market, and which market growers only are supposed to be able to grow. Others are devoted to perpetual-blooming Carnations (among which the fine rose variety, Mary Morris, is very telling), Eucharis, Gardenias, Tabernæmontanas, Stephanotis, Bouvardias, &c.; and to supply suitable foliage a fine houseful of Adiantum cuneatum. In another range the Dracænas, Crotons, Caladiums, and other finefoliage plants are well grown. The lofty Rose-house is covered with Maréchal Niel, Gloire de Dijno, and Duchess of Edinburgh Roses, as well as others, among which a great favourite is alba rosea. The conservatory, too, with its marble pavement, coallooking rockery and climber-covered roof and pillars, is as neat and well kept as all other things under Mr. JENNIOS' care. Outdoors the Pinks are found invaluable for cutting, and large borders of them are densely packed with their pretty fragrant flowers, the kinds most in favour being Dame Blanche, a pure white, with plain edge; Mrs. Sinkins, a fringed white; Mrs. Moore, white, with crimson eye; Harry Hooper, white, with purple eye and edge; Lord Lyon, rose, with crimson centre; and the old Anne Boleyn. The mule Pinks, too, are well grown. Every salient point is planted with Roses and other fine flowering shrubs, and all the walls and pillars with Honeysuckles and other climbers, the remaining Apple trees in what was an orchard many years ago being utilised to support the

heavy masses of old white rambling Roses. The lovely rocky dell, with its cool looking piece of water and natural sunk garden, is well kept, and a most cripyable spot at this season.

- MARKET STOCKS. - It is rather an odd fancy on the part of market growers of these flowers for bunching that they should prefer single to double ones. Almost invariably the double-flowered Stock has the preference everywhere; even the most intense devotees of single flowers, persons who will almost lash themselves into fury at the sight of a double Dahlia, yet positively go into ecstacies over a fine double Brompton. It is not any fancy for single fads that renders market growers the more fond of single Stocks. Their tastes are governed by pecuniary instincts; indeed, it is to them matter of the most absolute indifference whether flowers are double, single, or what, so long as they are abundantly produced, will bunch well, and, not least, will sell. The favoured colours in market Stocks are scarlet and white, and the most favoured kinds to produce these colours are the Scarlet Brompton and the White Queen. The Purple Queen is not only one of the hardiest and freest to bloom of all branching Stocks, but it always produces a very large percentage of doubles. Still the colour is not so acceptable as are white and bright red. The Scarlet Queen is free and hardy, but as a rule the colour of its flowers lacks richness. It is too pale; hence growers prefer the Brompton, and to produce a branching habit early pinch out the main stem. There are strains both of these and of the White Queen that never produce double flowers, and, as a consequence, plants are very robust. So great is the quantity of these Stocks grown in some of the fruit orchards during the year that in such seasons as the present they are more profitable than the overhead fruit trees are. Where Violets, Wallflowers, Stocks, Narcissi, and other favourite market flowers are so largely grown, the perfume is often singularly delightful when the atmosphere is humid.

- FROST EFFECTS ON THE FRUIT CROP .- If we only note well that which occurs each succeeding season, if it does not teach something that has not been frequently observed before, it goes to confirm that which was already known. The destructive April frosts that this season destroyed much we had hoped for after we had begun to think that our fruit crops would escape, has taught lessons that it is well not to lose sight of. Despite the unusual absence of sun during the winter months the extraordinarily mild weather brought much of the bloom of the early flowering fruits out earlier than usual; the bloom of Apricots in most parts of the kingdom was over and an unusual crop of fruit set when the frost occurred, of which in many places enough has escaped, but, in all of a number of gardens that we have had opportunity of seeing in widely different parts of the kingdom, the fruit on Apricots that has not been killed is on wood that is either touching the walls, or so near as all but to touch them; on spurs that stand at all out from the branches scarcely a fruit remains. The same holds good with Plums on walls; both these fruits have a tendency to get long in the spurs, Plums often bearing better when in this condition than when kept more trim in appearance. But this spring's frosts have acted as a reminder that the further the bloom-buds are from the wall the more danger they are in if a low temperature occurs either whilst the trees are in bloom, or after the young fruit is set. On Pears the effects of the cold April nights in many places are similarly apparent; the bloom on the long spurs where these exist has, as it usually does, suffered most. Moral. - Don't encourage the growth of long spurs.

—— SEEDLING FLORISTS' FLOWERS.—Mr. JAMES Lyrs, of Clyffe Hall, Market Lavington, has sent us flowers of a new Fuchsia and a new zonal Pelargonium, both of his own raising. The Pelargonium is of the brightest shade of rose with a light centre, and quite remarkable for the size of its truss. One of them consisted of no less than 143 pips and buds in various stages of development—quite a mass of bright colour. The seedling Fuchsia is—to us, at least—a novelty in shape, having long crimson sepals (and tube) of leathery texture, and a large corolla of broad, somewhat contorted petals, red at the base, shading off to purplish-maroon. If the babit is good this should be worth growing.

- Close Mowing.-Mowing machines have done something to enable such of the garden staff as had the work of mowing to do with the scythe to get more rest than when it had to be done before the dew was off the grass, and so far the change has been an Vet amongst those who are old enough advantage. to remember the condition lawns were in from thirty to forty years ago, when mowing-machines were little known, there will be few who have not noticed that they are the reverse of having been improved, especially on dry soils, and where the lawn is an old one, and been long subject to the impoverishing ordeal of having the grass continually kept short. be little doubt that the burnt-up, weedy condition, now often apparent on lawns, is to a considerable extent owing to the machines used being set too low, necessarily cutting the grass nearer to the roots than it can bear, the object of which may be traced to a desire to have the grass as short as it can be got, and also to escape the mowing having to be repeated oftener than can be avoided. In many cases, if the machine was set half or three-quarters of an inch higher than it is, the grass would be much benefited thereby.

- MULCHING. - The beneficial effects of mulching all plants that have their roots near the surface-especially kitchen garden crops-are more generally known than acted upon. A winter which left the soil drier than ordinary, has been succeeded by a spring with an unusually light rainfall, the result of which, despite the steady rain we had a few weeks back is, that in many places many of the autumn kitchen garden crops are likely to suffer severely unless means are taken to assist them by watering. Now watering is a heavy job, entailing much labour, and it is well where such work is done to take means to make the most of it. All experience points in one direction in the matter, which is that watering and mulching should go together as one good soaking will benefit a crop more, if the ground to which it is applied is mulched immediately after, than two or three waterings without the mulching.

- CANTERBURY BELLS, - These may well be classed as amongst the showiest of biennials. Perhaps that is faint praise, because many less beautiful flowers have been described as grand, splendid, and so on, and have much less deserved these glowing epithets. The Canterbury Bell is now something very different from its ancient progenitor. Probably when so designated the Campanula media really produced pendent or hanging flowers, and resembled bells. If that were so, now the course of Nature, or the persistent selection of the florist, has inverted the order of things, and the bells have become nearly erect—indeed, are cnps. Further, too, we see in them a wonderful departure from their original character, for now the blooms are very large, are of exceedingly handsome form, and bursting away from the once restricted hues of white and blue, include a score, not the least beautiful of which are the lavender, mauve, and rose colours. But with this development of variety in colour there has gone on much very marked development of doubling. Not only is one cup, as it were, lined by another, so that at the first the duplication of cups is not noticeable, but there may often be seen three cups also, and then there comes a fourth, and perchance a fifth, then the outer cup is filled to overflowing. All these double flowers are of fine form and very enduring; indeed, if grown only to furnish bloom for cutting, they would be singularly valuable. Curiously enough, the flowers expand in order of duplication—the singles first, the dense doubles last. The Calycanthema section produce curious and very pleasing flowers, but there is no reason why strains should be kept distinct; indeed, coupling them will but lead to increased It is not yet too late to sow seed for securing good blooming plants next year.

— CHLENOSTOMA POLVANTHUM.—About twentysix species of this genus are known to science, inhabiting the southern part of Africa. They are all of a
low herbaceous or sub-sbrubby character, and, judging
from those occasionally seen in cultivation, they
deserve to be more freely introduced for the adorament of the conservatory and greenhouse, or such
structure in which a low airy temperature is kept up.
C. polyanthum is figured in the Bolanical Register,
1847, t. 32, and may be seen in flower in the Capehouse at Kew. It is of low branching habit, with

leaves very similar to that of Lobelia erinus, and the flowers, of the most delicate lilac, with an orange eye, are several times as large as those of C. hispidum, which latter, however, is more floriferous. It is very appropriate for mixing and enlivening the front stages of a house with other low-growing subjects.

— Mr. John Wills.—The daily papers will have made our readers aware of the misfortunes which have fallen on Mr. Wills from causes to which we need not advert, suffice it to state, as the result of recent legal proceedings, the prosecution instituted against Mr. Wills has in the words of his advocate, "been most rightly abandoned," while the Recorder said he entirely agreed in that course. Several noblemen had come forward and said that they believed the company was a going concern and that they had put their money into it and advised their friends to do so. That was really the whole question in the case. The jury then, by the direction of the Recorder, returned a formal verdict of "Not Guilty," and Mr. Wills left the court.

— MR. JOHN COX.—We regret to hear that our old and valued contributor, Mr. JOHN COX, has been compelled to retire from the management of the gardens at Redleaf, Penshurst, Kent, which he has held since 1847. His former foreman, Mr. WILLIAM HOLAH, has been engaged as his successor.

— M. GROENEWEGEN.—The Dutch papers record the death of M. J. C. GROENEWEGEN, the Curator of the Botanic Garden at Amsterdam, at the age of seventy-three. The Amsterdam garden did for Java what Kew has done for our own Colonies, in the matter of the introduction of the Cincbona.

— Mr. JOHN BARRY.—Past and present members of the Fruit and Floral Committees who were not at South Kensington on Tuesday, will be sorry to bear that Mr. JOHN BARRY, who, for a number of years has been Mr. BARRON'S clerk-in-charge of the committee books, was on the previous Thursday taken ill, his malady being of such a nature as to in-capacitate him for work for some time to come. The members of the committee present, we are glad to say, showed their appreciation of Mr. BARRY'S unfailing attention to his duties, and their sympathy for him and his family, by a substantial subscription, which we desire to say has not been closed. Mr. SHIRLEY HIBBERD kindly undertook the duties of treasurer, and to receive any sums that may be sent to him on Mr. BARRY'S behalf.

MARSHALL WILDER.—It is with great concern that we learn that the veteran horticulturist has had to sustain the bitter loss of bis eldest son, on the 7th iost.

- THE WEATHER .- General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 23, 1884, issued by the Meteorological Office, 116, Victoria Street, London, S.W.: -The weather has been very fine and warm over our south-western districts, but more or less cloudy and cooler in all other parts of the kingdom. The temperature has been a little above the mean in "England, S.W.," and the "Channel Islands," and about equal to it in "Ireland, S.," but elsewhere it has ranged from 1° to 4° below its normal value. The maxima, which were registered on different days in inaxima, which were registered on dimentiously and the various districts, ranged from 75° in "England, S.W.," and 74° in the "Midland Counties" and "England, S.," to 68° in "Scotland, E.," and "England, N.W.," and to 60° in "Scotland, N.W. The minima were generally recorded on the 17th, and varied from 40° in "England, N.E.," "England, E.," and 50° in "Ireland, N.," to 46° in "Scotland, E.," and 50° in the "Channel Islands." The rainfall has been considerably less than the mean in all districts. siderably less than the mean in all districts. The percentages of possible duration ranged from 63 in the "Channel Islands" and 59 in England, S.W.," to 18 in "Ireland, N.," 9 in "England, N.E.," and 8 in "Scotland, N." Depressions observed. — Pressure has been high and uniform over nearly the whole of our area, the only depressions observed being situated over the Baltic. The winds in our islands have conour area, the only ways over the Baltic. The winds in our islands have consequently been light in force and variable in direction; but generally they blew from the northward or northwestward. By the close of the period the barometer porthwestern and northern coasts, was falling on our north-western and northern coasts, and the wind in Ireland and Scotland has shifted to the south-westward.

Home Correspondence.

The Potato Disease.—This unwelcome visitor has already put in an appearance in this district. It was first observed in a cottage garden, which is narrow, and surrounded with high hedges, and I now hear that it has spread to other gardens in the neighbourhood. Its early appearance this season is somewhat unexpected, as this district is suffering from an excessive drought. The country is parched up. Large tracts of land may be seen without a green blade of grass. I have a lot of early Potatos which have had their tops quite burnt away. The weather has also been very hot; the thermometer has on several days registered 80° and 82° in the shade, and once \$4°. The high temperature may account for the early appearance of the disease in such dry weather, coupled with the fact of the garden it first appeared in being confined. It is seldom that it puts in an appearance thus early, in weather so apparently unfavourable for its development. George Griffin, Slebeck Park. Pembrokschire.

Chrysanthemum segetum,—On p. 807 it is truly remarked that gardeners will find this an excellent plant to cut from during the summer. What is still more important might have been added—that it is an excellent plant to cut from during the winter. The plant is not annual, as is usually supposed, but at least biennial, and by a judicious selection of time for sowing and cutting back a single plant at two years old may have grown to a size of 40 r5 feet through. Large plants cut down to half their height before flowering in summer will produce a crop of flowers at the end of autumn, which, by the use of handlights, will continue to open through the winter in dry sunny corners. C. Wolley Dod, Edge Hall, June 21.

Double Daffodil Seed.—In reply to Mr. Bari's questions as the number of seeds in the podsof the double Daffodils, I may say that I found from fifteen to twenty seeds in a pod, and the greater part look bright, good seeds. I cannot, however, speak quite accurately, as before leaving home a week since, I looked at the plants, and finding one of the pods turning brown, picked them all, as the mice are very troublesome this year, and on my return found that all the pods had opened and some of the seeds had fallen out. W. Rolles Fryer, Lytchett Minister, Poole. [Mr. Brockhank writes that he has to day [June 25] gathered ripe seed from a marked bulb of Narcissus Telamonius plenus. It will be interesting to note in due season if the double flower is perpetuated in the seedling. ED]

Pentstemons.—It is not often one sees these in bloom so early as June in the open border, but last winter having been so mild, the shoots were uninjured, and the plants continued to grow uninterruptedly, forming, as they have, quite bushes, which are sending out strong spikes, that will soon make a grand show. Seedlings are so good now, that it is hardly worth troubling about named varieties, as plants may be raised annually from fine strains, that afford magnificent flowers; or cuttings may be taken, and any of special merit saved, and increased in that way if considered desirable. Ther way to propagate Pentstemons is to take off the half ripe shoots that are not showing flower, and put them in on a shady horder under a handlight, in sandy soil, where they should be kept close and moist, when they will quickly root; or they may be placed in pots and treated in the same manner, and when struck, potted off, and wintered in any cold frame. § 7. S.

Narcissus montanus Ripening Seed,—Mr. Balter in his "Review of the Genus Narcissus" mentions a prevalent opinion that N. montanus never ripens seed, Mr. Archer Hind has just sent me some ripe seed of it from his garden in Devonshire. C. Wolfey Dod.

Mr. Culverwell's Hybrid Raspberry.—I beg to thank you for exhibiting my hybrid Raspberry before the committee of the Royal Horticultural Society, but at p. 782 you say the committee does not endorse my opinion that the Raspberry is a hybrid, but no reason is given for their condemnation of what I say is a fact. I have plenty of facts to convince me that it is a hybrid, which I have stated in your columns before. I will now state another fact, bad to get over —my hybrid is sterile, and nothing can induce it to fruit, whereas R. Idaeus is a fruit-bearing plant. I crossed the Raspberry with the pollen of the Strawberry on two different occasions, and on each trial I raised several plants, perhaps forty in all, more or less like the Strawberry in the leaf—but all sterile. Some were quite dwart, being less than a foot high, while others grew to the ordinary height of the Raspberry; some had the calyx quite an inch long, some had green flowers, and all very curious. They all flowered—some had pollen, others had none, and as

they showed no signs of fruiting they were all destroyed but three, which had the greatest resemblance to the Strawberry both in leaf and flower. I might ask, Were all these plants, of various sizes and forms, Ideus? or, was it not curious that the three plants I did save should be pronounced Ideus, although the flowers are imperfect and not fruit-bearing. Another fact—Rubus Ideus cannot be found in any part of this district. I have been able to examine some thousands of seedling Raspberry plants sown by birds in a covert, but not one of the form of R. Ideus could be found. I had no idea of provoking a discussion on this subject, but sent it to you as a curiosity, with my hybrid Currant, which I think no one has yet ventured to say is not a hybrid. William Cutverreal, Thorpe Perrow.

The Rocket Candytust Empress.—I am rather disappointed with this new Candytust, not because, it well selected, it is not a fine thing, but rather that it has been put into commerce so hadly selected. In order to have it in its hest form I sowed seed in a cool house late in the autumn, and dibbled the plants out into good soil during the spring. They are now in bloom, but only about 20 per cent. have the true character—that is, single stems, robust foliage, and heads breaking up into four or five fine spikes. That form is a really sine one, but seems to need several form is a really sine one, but seems to need several form, that it may be had true. The major portion of the plants are very uneven in growth, are branching, and differ little from the old white Candytust, beyond being rather more robust. It is a pity so sine an annual has been so hurriedly put into commerce, as if in a really set form it would be a grand acquisition to our flower gardens. A. D.

The Phœnix Hoeing and Raking Machine,
—At p. 774 we noticed a satisfactory trial of this new
machine, which has reently been made in the Phœnix
Park, Dublio, in the presence of several well-known
practical gardeners. We are now coabled to give an

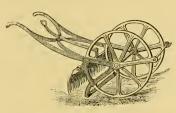

FIG 155.-HOEING AND RAKING MACHINE,

illustration (fig. 155), which shows the character of the machine better than it can be described, and need only now add that where the soil is of a loose, sandy character, its use must effect a great saving in labour.

Dianthus glacialis.—The figure hearing this name on p. 809 is a good representation of the best early alpine Pink in cultivation, but I think it is not D. glacialis. I need not repeat what I have said about it on p. 528, but may say that I have twice sent it to Kew for an opinion, and that the same judgment was passed upon it both times, that it is an early and very floriferous variety of D. alpinus. According to Pritzel's Index Iconum the true D. glacialis has never been figured in any English work. My friend Mr. E. Loder has many dried specimens in his herbarium, but neither he nor I have succeeded in making it flower in England. C. Wolley Dod.

Striking Cuttings in Moss.—I send you some rooted cuttings of Coleus, showing the method of propagation I have adopted this season. Instead of pricking them out in cutting pots or pans, I tie a small ball of moss at the base of each cutting, and put them singly in thumb-pots without any soil, to keep them in a vertical position. Those now sent were put in the moss ten days ago. I venture to think this system will be of much use to many of your readers, as the cuttings rooted in this way can so easily and so cheaply be sent by post, and will receive no check to their growth. No cuttings that I have tried refuse to strike in this way, and I should add that I do not remove the moss when potting them on. Yames Lye, Market Lavington, June 18.

A Hybrid Foxglove.—A few years since I succeeded in obtaining a cross between Digitalis purpurea and D. lutea, but the plants did not long endure. I have now blooming some half-dozen plants of an undubted byhrid of natural production between D. lutea and D. purpurea of the fine garden forms. D. lutea was the seed parent, and the hybrids resemble that form in habit, but the foliage is larger and darker,

the stems taller, the blooms finer, and though most of them are of the same creamy hue, they have unmistakeable evidence of the spotted marking in the throats that so richly mark our garden Foxgloves. Curiously enough, in time of blooming the plants assume an intermediate place, comiog between the garden kinds some time in full bloom, and D. lutea, which is not yet in flower. A. D.

The Double White Rocket. — This charming form of this fine old hardy plant was seen in rate condition at the exhibition of the Royal Elotanic Society on the 18th inst. There were two huge bunches of spikes of flowers shown among a collection of miscellaneous plates by Mr. E. S. Williams, of the Victian Nurseries, Holloway. It is the variety that is met with in Lancashire, Cheshire, Derbyshire, and other midland counties, and as different from the double white Rocket found in the South of England as can well be. To begin with, the flowers are of the purest white, small, full, well formed, and produced on long symmetrical spikes, reminding one of those of the Candelabra Larkspur. It is a plant of smaller growth in all its parts than the old French White, and does not grow so readily in the South as the variety we are accustomed to see. It seems to require a cool, moist climate, and this is why it is that it dourishes so well in different parts of Lancashire. We have tried it round London, both in pots and in the open ground, but it always died during the hot weather of summer. It would perhaps do better when it became thoroughly established in the hardy border. It is while establishing itself that it comes to grief. Z.

— This is one of the very good things I had a note taken of to bring before you for commendation when I saw the observations of "A. D.," at p. St2. He is quite right in saying that the rose or the purple-timed variety is generally sold as the real "Simon Pure." One of the reasons, I believe, is that the real double pure white is slow and difficult of propagation, which does not 'commend it to nurserymen. Some years since I got a plant from the Hon. Mrs. Bagwell,

establishing itself that it comes to greet.

— This is one of the very good things I had a note taken of to bring before you for commendation when I saw the observations of "A. D.," at p. 812. He is quite right in saying that the rose or the purple-tinted variety is generally soid as the real "Simon Pure." One of the reasons, I believe, is that the real double pure white is slow and difficult of propagation, which does not commend it to nurserymen. Some years since I got a plant from the Hon. Mrs. Bagwell, Marlifield, and have but two large ones at present, but these I have been cutting spikes from for visitors and decoration for weeks, and from all I learn it must be as "A. D." intimates, rather scarce. As a sweet-scented showy border flower in May and June there is certainly no other white to come near it, especially for cutting. The true variety I know was at Swanley, but I cannot say if Mr, Cannell has it now. W. J. Murphy, Clounel.

— Like many other of the fine old border plants

Like many other of the fine old border plants this Hesperus seems to have almost died out, or to have been discarded and lost, as it is seldom met with now, and yet it is one of the most desirable early blooming subjects any one can grow, sending up, as it does, giant spikes of pure white blooms as large and full as those of the Stock. I was much struck with one I saw the other day, which was a perfect bush a yard through, and nearly as much in height, and crowded with flowers. I wonder if this Rocket would force, as, if so, what a valuable thing it would be for the greenhouse or conservatory, or for cutting from early in spring. Anyhow it is so good that it should be in every garden border, and all it wants near is a Delphinium or I wo to back up and make a fine contrast. Y. S.

Fonaria sanguinea, Pim.—It is generally unsafe to found a new genus from imperfect materials, Mr. Pim does not mention autheridia in his description of this fungus, but I saw them. The fuogus he adverts to differs but little from Pythium except in the torulose septate mycelium. The blood colour was not a character of Mr. Pim's fungus, it was merely derived from the blood-coloured fungus, named Isaria, on which it grew. As I have seen a similar fungus with Mr. Pim's producing globular oospores as well as the little zoospores in the sporangia, I think there can be no doubt that the Glasnevin plant is a Saprolegnia, and under the mame of S. philomukes (philos, I love; mukes, a fungus) I have illustrated it from living examples, the sheets belog now in the press. W. C. S.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.— The annual general meeting of this Society was held at Willis' Rooms on the 18th inst., Lord Carrington in the chair. From the twenty-fourth anoual report we learn that, although the increase in subscriptions and dooations for the year ending December, 1883, was not especially marked as compared with 1882, the standard of that year has been more than maintained. In the latter year the total amount received under the head of subscriptions and donations was £(1,3,12 188, 84, being £2300 in excess of any previous twelve months, and in the balance-sheet dealing with accounts for 1883 it is seen that the income from those sources reached in that year £(13,465 195, 94), being a further increase of £250. There are now on the books of the Institution 97 males, costing £2522; 337 females, costing £7407; 75 married couples (or 150 person), costing £3000; and 8 children, costing £165 per annum; and on the same day 64 fresh pensioners, exclusive of octogenarians, were added to the list.

Reports of Hocieties.

Royal Horticultural: June 24,

Royal Horticultural: June 24.

SCIENTIFIC COMMITTEE. — Professor Michael Foster, F.R.S., in the chair. Present: Messrs. Grote, Houston, Masters, Ridley, Murray, Loder, Lowe, W. G. Smith, A. W. Eennett, Boulger, and the Rev. G. Henslow, Secretary.

Potato Disease, & — Mr. W. G. Smith stated that he had been informed of the outbreak of the Potato disease in the neighbourhood of Bedford, and also alluded to the existence of a Fusisporium, probably parasitic, upon Agaricus gloiocephalus, to a Saprogenia, parasitic, upon the common Mushroom, and to Æcidium convallarire, which will be figured in a subsequent number.

to Acadum convallarire, which will be figured in a subsequent number.

Disease of Yew.—Mr. Smith shower perceimens of Yew fatally attacked by Spherella Taxi: see p. 827.

Disease of Pertugal Laurel.—Mr. Murray reported that he had examined specimens of the "sliver leaf" but had not found traces either of fungus or of insect, but only evidences of defective nutrition, the causes of which were not obvious.

Highrid Visits —Professor, M. Fectors whilitied on

Hybrid Irises.—Professor M. Foster exhibited an interesting series of hybrid Irises raised by himself, and made some comments upon them, which it is to be hoped will ultimately be embodied in some com-

Plants Exhibited.—Mr. Loder showed specimens of the true double white Rocket, and of a hybrid Fink raised between D. alpinus as the seed-parent, and D. barbatus as the pollen-parent. The flowers opened of a pure white, but ultimately became deep rose. Professor Foster showed a hybrid between D. alpinus 97, and D. superbiens 5°. From Messrs, Veitch came a plant of Drosera auriculata. From Mr. Noble came a Clematis with double flower the Mr. Noble came a Clematis with double flowers, the plant bearing which was said to produce single flowers later on. Other specimens were exhibited, but which were not of general interest.

but which were not of general interest.

FLORAL COMMITTEE.—Present in Section A.:—
John Fraser, Esq., in the chair; Messis, H. BallanJohn Fraser, Esq., in the chair; Messis, H. BallanJohn Martin, J. Laing, H. Williams, T. Moore, E. Hill, J. O'Brien, J. Woodbridge, Dr. Masters, and Rev. G. Henslow. Section
B.:—Shirley Hibberd, Esq., in the chair; Messis,
Il. Cannell, H. Bennett, W. Bealby, G. Duffield,
and H. Turner. Mr. T. S. Ware, who is making a
continuous display in the conservatory, had again on
view a most remarkable collection of hardy berbaceous and alpine plants, which were awarded a Silvarceous and alpine plants, which were awarded a Silvargilt Flora Medal. Ilardy flowers were also contributed in large groups by Messis. Barr & Son,
Messis Kelway & Son, Messis. Hooper & Co., and
Messis, James Veitch & Sons, and Mr. Noble contributed a small group of well flowered Rhododendrons. The new plants exhibited included a choice
set of new tuberous Begonias from Messis. John
Laing & Co., two of which were certificated—Her
Majesty, a very pretty white flower shading to rosepink on the margin; and Torey Laing, a large flat
flower of great substance, and bright yellow in
colour. Mr. B. S. Williams had Leelia purpurat
atropurpurea, specially rich in the deep colour of the
labellum; Odontoglossum Williamsianum, a natural
hybrid between O. grande and O. Schlieperianum,
with a hold showy spike of flowers of the O. grande
type, yellow with brown markings; Croton Flambeau,
a very richly coloured form of the angustifolius type;
Amaryllis Ferdinand de Rothschild, intense crimson,
and A. marginata grandiflora, crimson, banded and
harred with white. Sir Trevor Lawrence had a very a Very nichly coloured form of the angustifolius type; a Amaryllis Ferdinand de Rothschild, intense crimson, and A. marginata grandiflora, crimson, banded and barred with white. Sir Trevor Lawrence had a very distinct Odontoglossum in O. excellens, primroseyellow, with a white centre, and purple-brown spots. Baron Shroeder exhibited Odontoglossum crispum Veitchianum (the plant shown last week at Regent's Park, as O. crispum mirabile), a superb variety, white partially suffused with violet, overlaid with numerous brown blotches; and Ledia Dominiana rosea, a fine variety with a richly coloured labellum. Mr. W. Soper, 307, Clapham Road, sent a plant with two fine spikes of a pure white form of Odontoglossum citrosmum; and Mr. De B. Crawshay had the highly coloured Anguloa Ruckerii sanguinea. Messrs, lames Veitch & Sons showed another of their graod strain of hybrid Rhododendrons, R. President, bearing a fine truss of reddish-orange coloured flowers; Drocera auriculata, a slender growing species; Phyllanthus subemarginatum, an eigant little plant with insignificant white flowers; and Philodendron grandidens, a robust growing New Grenadan species with long heant white flowers; and Philodemfron grandidens, a robust growing New Grenadan species with long broad leaves, deep green, with white veins. Mr. H. M. Follett showed Odontoglossum Pollettianum and O. Pescatorea punctatum. Messrs. William Paul & Son exhibited the new Tea Rose, Sunset, raised by Mr. Peter Henderson, of New York, and which is of the Petie des Jardins type, but of a darker shade in colour. Mr. Turner had a stand of four sorts of heavy-edged Picotees raised by Mr. Fellowes—Min-

erva, purple; Hebe, dark purple; Picturata, rose-pink; and Ensign, heavy red. Mr. W. Stacey, Dunmow, again sent a fine stand of Verbenas, one of which, named striata, rich pink with a white stripe, was singled out for an award. Mr. Bennett, of Shepperton, sent a pretty box of hybrid Tea Roses, including the rich-coloured Countess of Pembroke and Cleopatra, flesh-pink, with the backs of the petals shaded rose, and the petals broad and well rounded.

The awards made were :-

Section A.

FIRST-CLASS CERTIFICATES.

To Baron Schreeder, for Odoutoglossum crispum

To Baron Weitchianum.
To Baron Schreeder, for Lælia Dominiana rosea.
To Mr. B. S. Williams, for Lælia purpurata atropur-

purea. To Mr. B. S. Williams, for Odontoglossum Williamsianum.

To Mr. B. S. Williams, for Croton Flambeau.

To Sir Trevor Lawrence, Bart., M.P., for Odontoglos-

m excellens. To Messrs. James Veitch & Sons, for Drosera auricu-

To Messrs, James Veitch & Sons, for Rhododeudron

President,

Section B. To Messrs. John Laing & Co., for Begonia Her Majesty.
To Messrs. John Laing & Co., for Begonia Torey

Laing,
To Messrs, W. Paul & Son, for Tea Rose Sunset,
To Mr. W. Stacey, for Verbena striata,
To Mr. Turner, for Picotee Picturata.

FRUIT COMMITTEE. — Present: Henry Webb, Esq., in the chair; Messrs. J. Lee, F. Rutland, G. M. Breese, G. Bunyard, C. Ross, J. E. Lane, W. Faul, R. D. Blackmore, J. Ellam, G. T. Milles, H. J. Veitch, J. Roberts, and J. C. Mundell. Mr. Roberts exhibited three highly finished bunches of Duke of Buccleuch Grapes, quite ripe and free from spot. Mr. Bolton, gr., Combe Bank, Sevenoaks, sent a bush heavily ladeen with fruits of Bolton's Prollife Gooseberry, an oval-shaped, slightly hairy fruit, certainly borne in great profusion. Mr. Parr, gr., Givon's Grove, Leatherhead, sent a fruit of the Good-owod Melon weighing 14 lb. 2 oz. Seedling Melons were exhibited by Mr. C. Ross, Welford Park, Mr. E. S. Wills, The Gardens, Edgote Park, Banbury, and Mr. C. Ilowe, gr., Benham Park, Newbury, but no awards were made.

FRUIT AND VEGETABLE SHOW.—The display made to-day was not so large as on the last occasion, but was thoroughly representative of the comestible products in season; and as regards Grapes especially it may be said that finer have not often been seen in June. There were only three collections of fruit, and the prizes fell to Mr. Coleman, gr. to Lady Henry Somerset, Eastnor Castle; Mr. Miles, gr. to Lord Carrington; and Mr. Waterman, gr. to H. A. Brassey, Esq., M.P., Preston Hall, Kent, in the order named. Mr. Coleman, who was closely run by Mr. Miles, had a couple of fine Queen Pines, good examples of Black Hamburgh and Foster's Seedling Grapes, Blenheim Orange Melon, Royal George Peaches, finely coloured; Lord Napier Nectarines, Bigarreau Napolcon Cherries, and Brown Turksy Figs. The best pairs of Pines came from Mr. Colmen, The Hendre Gardens, Monmouth; Mr. Miles, and Mr. Fry, The Gardens, Haydon Hall, Eastoot; and the best basket of 12 lb. weight of Grapes, a splendidly finished lot of Black Hamburghs, came from Mr. Tavener, Woolmer Gardens, Liphook; Mr. Turton, gr., Maiden Erleigh, being a very good 2d, and Mr. Coleman 3d. For two bunches of black Grapes, Mr. Tavener was again 1st, with handsome shaped, well swelled, and superbly coloured bunches of Black Hamburghs; Mr. C. Herrin, gr., Chalfont Park, Gerrard's Cross, coming in 2d; and Mr. Wildsmith, gr., Heckheld, 3d. Mr. Herrin took premier bonours in the white Grape class, with Foster's Seedling. The best three dishes of Strawberries, thirty fruits of each, and very fine samples of Marguerite, Empress Eugénie, and Sir Joseph Paxton, came from Mr. T. Sharpe, Knowle Iliil, Chertsey; Mr. C. Haycock, gr. To Neare, Hounslow, was 1st, with Sir Charles Napier. With capital samples of Elton and Black Tartarian Cherries, Mr. Roberts again secured a 1st prize; and to Mr. Waterman a similar award went for fifty fruits of any other variety," Mr. Thompson, gr., Croxby Honse, Hounslow, was 1st, with Sir Charles Napier. With capital samples of Elton and Elack Tartarian Che AND VEGETABLE SHOW .- The display

from Heckfield, Barham Court, and Eastnor, in the order named. The Peach and Nectarine classes were order named. The Peach and Nectarine classes were especially good ones, remarkably fine fruit being shown in both. The 1st prize dish of Peaches, from Mr. Johnstone, gr., Eapham Abbey, Sussex, was the admired of all beholders, the individual fruits being of wondrous proportions. The variety was Rivers' Early York, which we certainly never saw of such a size before. A handsome sample of Grosse Mignonne, from Mr. Farrance, of Chadwell Heath, was 2d, and Mr. Wildsmith 3d, with some highly coloured Crimson Galande. Mr. Turton took the lead in the Nectarine class with splendidly coloured fruits of Violette Hátive, Mr. Haycock being a good 2d, with Elruge; and Mr. Mowbray, gr., Fulmer, Slough, 3d, with Pitmaston Orange, of fine size and quality. The Melon prizes were awarded to Mr. Mowbray, Mr. Coomber, and Mr. Wildsmith; but as the fruits were not cut we should not like to confirm the correctness of the judges' decision in so but as the fruits were not cut we should not like to confirm the correctness of the judges' decision in so placing them. They may have been correct, and we do not say that they were not; but if the prizes are to be awarded in the same way next month it would be as well to know it, because a fruit that is sound in the rind and something more than ripe within will be the one to stage, though not one that would please the palate. Flavour and aroma do not always run torether in Melons.

the rind and something more than ripe within will he he one to stage, though not one that would please the palate. Flavour and aroma do not always run together in Melons.

The class for a collection of vegetables brought out five excellent lots, and Mr. Miles again headed the list of winners with a first-class lot, which included Green Globe Artichokes, White Naples Onions, Nantes Horn Carrots, Lady Paget kidney Potatos, Canadian Wonder Beans, Stamfordian Tomatos, Canadian Wonder Beans, Stamfordian Tomatos, Pride of the Market Peas, Erfurt Cauliflowers, and Moore's Cream Marrow, all of the finest quality. Mr. Waterman was a close 2d, and Mr. S. Haises, gr., Coleshill House, Highworth, a very good 3d, a fewpoints behiod being Mr. Ward, gr., Longford Park, Salisbury, and Mr. Meads, gr., Beckett Park, Shrivenham. Mr. Meads was 1st or Potatos, with Woodstock Kidney; Mr. Hart, gr., Glenhurst, Esher, 1st for Tomatos, with Trophy; Mr. S. Haines 1st for Tomatos, with Trophy; Mr. S. Haines 1st for Tomatos, with Trophy; Mr. S. Haines 1st for Tomatos, with Stratagem, Telephone, and Telegraph; Mr. Mulir, gr., Margam Park, 1st for noe dish of Peas, with Duke of Albany; Mr. Mulir 1st again for a collection of Peas; Mr. Ward 1st with Carter's Leviathan Longpod Beans; Mr. Waterman 1st with Canadian Wooder Kidney Beans and with French Forcing Carrots; Mr. C. Osman, South Metropolitan District Schools, Sutton, 1st, with Sutton's Improved Telegraph Cucumbers; Mr. Mulir 1st with a collection of Lettuces, and Mr. G. H. Richards, gr., Somerley Park, Ringwood, 1st for Salads.

Messrs. Webber & Co.'s special prizes for the best packed three boxes of fucit.—Grapes, Feaches, and Strawberries—were won by Mr. Turton and Mr. Coleman and Mr. Eldridge, gr., Chesterfield Park, af Salfron Walden, in the order named. Mr. Turton and Mr. Coleman and the additional section of the seas reverse won by Mr. Turton and Peaches in soft moss; both sent fruit of high quality, but Mr. Turton's Grapes showed the least rubbing, and were of unexceptionable qu

of unexceptionable quality in other respects.

Messrs. Wheeler & Son's prize for Kingsholm Cos
and Tom Thumb Lettuces was taken by Mr. Muir,

the only exhibitor.

York Gala: June 18, 19, and 20.—This, the twenty-sixth show held by this Society was a success in every way. The numerous classes in the several departments for plants, fruits, and flowers were well filled with the exception of our Roses, which, as a matter of course, were in a great measure confined to flowers grown under glass, through the fact of the outdoor bunsual number of chulbitors in the state of the new control of the country of their productions, was such as to make up for the classes for cut flowers, combined with the quality of their productions, was such as to make up for the deficiency of Roses. Fruit was present in large quantities and good condition, there being comparatively little shown in the insufficiently ripe state that often mars the appearance of the displays at the early summer shows. The class for sixteen stove and greenhouse plants, ten flowering and six fine-leaved, is always the chief attraction here. On the present occasion there were four competitors—Mr. Letts, gr. to the Earl of Zeldand, Aske Hall, Richmond, Vorkshire, being well in front with a fine group, containing some extraordinary examples, amongst which was the finest Ixora occcinea we have seen for some time bearing about a cordinary size; Phoenocoma prolifera, an immense bush 3½ feet through, profusely covered with flowers of the deepest colour; Anthurium Andreanum, bearing invery large bright coloured spathes; Anthurium Scherzeinaum, a large flowered variety, carrying about sixty blooms; Allamanda grandiflora, Erica depressa, and Azalea Due de Nassau, all in excellent condition; the fine-leaved plants, which were staged so as to form a background to the flowering examples, included a grand specimen of Encephalartos Vroomii, Croton Queen Victoria, nearly y feet in diameter; and a well grown specimen of Kentla Fosteriana. Mr. Cypber, Queen's Road Nurseries, Cheltenham, who was 2d, had, amongst others, a

splendidly flowered Stephanotis, a few days short of being at its best; Darwinia tulipifera, Pimelea diosmæfolia, and Clerodendron Balfouranum. 3d, Mr. Berrys gr. to W. Dove, Esq., Crown Cottage, York, gr. to T. Green and the state of the

FINE-FOLIAGED PLANTS.—In the class for six 1st honours went to Mr. Cypher, who had nicely grown plants; 2d, Messrs. Bailey & Sons, St. Oswald's Nursery, Fullord, whose group was composed of larger specimens but deficient in colour; 3d, Mr. Noble. Three foliage plants.—Mr. Letts, who was 1st, staged a pretty lot, containing a good plant of Cordyline indivisa. Mr. J. McIntyre, gr. to Mrs. Gurney Pease, Woodside, Darlington, was a good 2d, showing; in a well grown group a fine specimen of Cycas circinalis. Four Crotons.—Here again Mr. Letts was 1st with medium-sized highly coloured examples of C. Warreni, C. Johanis, C. majesticus, and C. Mortii; 2d, Mr. McIntyre.

nis, C. majesticus, and C. Mortii; ad, Mr. McInityre.

FERNS were shown in quantity, a tent being devoted to them. They were in very nice condition, and although the competing groups were in a great measure and although the competing groups were in a great measure of the state
ORCHIDS were shown in good condition, the flowers collectively being fresh and at their best. There were fewer made-up specimens exhibited than is often seen nowadays. With six Mr. James Sunley came in 1st, Mr. Rollisson 2d, and Mr. Cypner 3d. Three Orchids.—1st, Mr. Cattwright, gr. to A. Wilson, Esq., Hull; 2d, Mr. James Sunley; 3d, Mr. Eastwond, gr. to Mrs. Tettey, gr. to B. Hemsworth, Esq., Milford Junction, with Trichopilia crispa, very well bloomed; 2d, Mr. James Sunley; 3d, Mr. Rollisson.

Trichoplila crispa, very well bloomed; 2d, Mr. James Sunley; 3d, Mr. Rollisson.

PELARGONIUMS, as usual, were a feature, such as is not now to be seen elsewhere, one of the large tents being completely filed with midst of the centre stage. The plants collectively in the various classes were models of high cultivation, sufficiently large, and profusely flowered, the flowers backed up with good healthy foliage. With the flowers backed up with good healthy foliage. With a faultless dozen, splendidly bloomed, and nicely trained; Mr. Rylance was a good 2d; and Mr. Macintosh, gr. to J. T. Hingston, Esq., York, 3d. Six show Pelargoniums: 1st, Mr. Eastwood, with plants similar to those in the large class; 2d, Mr. Macintosh. Three show varieties.—With these Mr. Eastwood took the lead, having grandly flowered plants; 2d, Mr. Macintosh. Zonals were in no way inferior to the large flowered kinds, their general condition, including a profusion of flower just brought out to the day, was such as is rarely seen. Here again Mr. Eastwood had 1st honours; 2d, Messers. Tybas & Son, Rypon, 3d. St. Solepas, 3d. Mr. Eastwood, with plants of a like description to those he had in the preceding class; 2d, Mr. John Sunley. Double zonds were also splendidly shown. Fancy Pelargoniums, now so seldom met with in really good condition, were beautifully done, Mr. Eastwood here again heading the list with a large, profusely flowered group; 2d, Mr. Rylance. With three fancies Mr. Eastwood scored another win, thus taking 1st in the whole of the nine classes for flowing Pelargoniums—a feat that, it may be safely said, has never been equalled in such company as he had here to compete with one server the unmerously represented.

POT ROSES at midsummer are not to be had in the rearm enoughton as sective that they were prevertheless.

POT ROSES at midsummer are not to be had in the same condition as earlier, but they were, nevertheless, present in considerable quantities and in creditable order. In the open class for six Messts, Pybus & Son were 1st, with nicely flowered plants about 3 feet through; 2d, Messrs, Jackson & Co., Bedale; 3d, Mr. II. May was Bedale, Nine Roses in 8-inch pots.—Here Mr. May was

zst, putting up a nicely flowered lot; Messrs. Pybus & Son and Messrs, Jackson & Co, were placed equal 2d. First honours for twelve in 8-inch pots went to Messrs. Jackson & Co., for a pretty group; 2d, Messrs. Pybus, who also had a nice group;

ALPINE AND HERBACEOUS PLANTS were we'll shown, ALFINE AND HERR ACEOUS PLANTS were well shown, MESSTS. Billey & Son taking the 1st prize in the class for twenty, with a nicely varied collection; Masters W. H. and J. A. Rodwell, acj. Mr. Simpson, 3d. Six tuberous-rooted Begonias.—These were nicely shown by Messrs. Bailey & Son, and Mr. Nicholson, Thirsk, who were 1st and 2d in the order named. Gloxinias were very well done, in the class for twicks, first, who were very well done, the class for twicks, first, which is colour; 2d. Mr. Berry. Six Gloxinias.—1st, Mr. Russell; 2d. Mr. Berry. With six Coleus, Mr. Lezenby, who had well grow plants, with the colour fully brought out, took the 1st prize. prize.

prize.

The liberal prizes offered for groups of plants arranged for effect brought out a keen competion, filing one of the large tents; in the larger team of the large tents; in the larger team of the l small examples in nice condition.

small examples in nice condition.

FRUIT.—For eight dishes Mr. McIndoe was 1st with a good even collection, consisting of Black Hamburgh and Muscat of Alexandria Grapes, a Queen Pine, Bellegarde and Alexandra Noblesse Peaches, Pitmaston Orange Nectarine, Best of All Melon, and Brown Turkey Figs; 2d, Mr. Westcott, gr. to the Duske of Cleveland, Raby Castle, Darlington, who also showed a good collection; 3d. Mr. Elack, gr. to the Misses Pease, Darlington. With six dishes Mr. McIndoe was also rst, staging a good lot, most of the varieties of which were similar to those he exhibited in the preceding class. Mr. Wallis, gr. to Sir H. M. Thetap, Son, Yark, who was 2d, had, if we went of Grapes, Grosse Mignonia Meland Vloette Haitive Nectarion, St. Mr. Clayton, gr. to Mr. Clayton, gr. to Mr. Clayton, Edg. Graps Mr. Clayton, gr. to Mr. Clayton, Edg. Grinston Park, Tadeaster, was 1st, vith. Black Hamburgh Grapes, A Bec Peaches, Violett Haitive Nectarines, and a Melon—all in excellent order; 2d, Mr. Cartwright, who had, along with others, a good dish of Peaches. With a single Fine, any variety, Mr. Hare, gr. to R. H. C. Neville, Esq., Grantham, was 1st, showing a nice Queen; 2d, Mr. Black, Black Grapes were well shown. For three bunches Mr. Johnson, gr. to H. Gill, Esq., Boston Spa, took the 1st prize with compact, nicely finished examples; 2d, Lord Hotham, South Dalton Hall; 3d, Mr. Dawes, gr. to the Hon. Mrs. Meynell Ingram, Temple Newsam. Three bunches of Muscats.—sts, Mr. Jefferson, gr. to T. Earnshaw, Esq., Sheffield, who had Muscat of Alexandria, unusually well coloured for so early in the season; 2d, Mr. McIndoe; 3d, Mr. Clayton, with good bunches and ange even berries, that wanted more time. Three bunches of any other white Grape.—rst, Mr. Dawes; 2d, Mr. Cartwright. Dish of Peaches.—rst, Mr. Juzey, gr. to W. St. Quinton, Esq., Scampston Hall, with beautifully coloured Crimson Galande; 2d, Mr. Mitchell, gr. to M FRUIT.-For eight dishes Mr. McIndoe was 1st with to W. St. Quinton, Esq., Scampston Hall, with Geaultully coloured Crimson Galande; 2d, Mr. Mitchell, gr. to Lord Wenlock. Dish of Nectarines.—Tst, Mr. John Sunley; 2d, Mr. McIndoe. Scarlet-fleshed Melon.—1st, Mr. McIndoe, with Best of All; 2d, Mr. J. Edmonds, Bestwood. Green-fleshed Melon.—1st, Mr. Dawes; 2d, Mr. Mitchell. Dish of Figs.—1st, Mr. McIndoe, with nice Brown Turkey. Some fine Strawberries were shown, Mr. Cartwright being 1st, and Mr. Wallis ad

Wallis ad.

Vegetables were present in quantity and good condition; for eight dishes, Mr. Hemming was 1st, and Mr. McIndoe ad.

A good collection of misrellaneous plants was shown by Mr. B. S. Williams, Victoria Nursery, Upper Holloway, consisting of Orchids, Nepenthes, Sarracenias, Heaths, Amaryllis, and other stove and greenhouse flowering and fine-leaved plants. Messrs, Richard Smith etc., of Worcester, had a fine group of Clematis in pots, very nicely arranged. A First-class Certificate was awarded to this firm for a new Clematis, Beauty of Worcester, af free-blooming, medium-sized, six-petalled flower, with broad petals; in colour it is a very deep blue-purple: a distinct-looking variety.

Leeds Horticultural: June 25, 26, and 27.—This important gathering of West Riding horticulturists was opened on Wednesday in the gardens of the Horticultural Society of the town, and remained open for three days. The site is an excellent one, being at some distance across the breezy Town Moor, and therefore somewhat removed from its ever-abundant smoke. We would say that it is the home of the Horticultural Society in prospective, for beyond securing the site, not much has as yet been taken in hand in essectially horticultural matters to render it worthy of this wealthy horticultural matters to render it worthy of this wealthy horticultural matters to render it worthy of this wealthy horticultural matters to render it worthy of this wealthy horticultural mattering centre. This is the mare regretable, seeing that with the exercise of Judgment in making a selection of the plants, shrubs, and tree found to do well in the particular locality, a garden would be accessible to the gradeners of the ownstand to the public in general, in which many useful lessons

might be imbibed in the art and science of a profession that is daily found to be growing more in importance, and that finds almost everywhere the highest appreciation.

The exhibition was held in three tents, pitched so as to form a long nave of about 100 yards, with two annexes one on either side, of about half the length of the first-

one on either side, of about half the length of the firstnamed tent. There was ample space for cultivators to
arrange their exhibits, and likewise for the visitors to
promenade in all directions without an approach to overcrowding. The largest tent was set apart for groups of
stove and greenhouse plants, for fine-foliage plants, and
for groups of small decorative subjects, put together on
the level turf en echelon—some of these occupying 216
square feet, and others 96 square feet, and notwithstand
ing the fact of these groups being strictly rectangular in
shape, their arrangement in themselves, and land the
regard to each other, prevented any under the
regard to each other, prevented any under arrangetion of large Ferns, and the leafage of the Palms
assisting admirably as foils to the whole.

The visitor on entering was confronted by a raised
circular stage filled with Roses in post, those immediately facing the entrance being small examples
sent by Mr. H. May, Hope Nursery, Bedale, not for
competition. There were some very superior blooms
amongst them, and in the mass were exceedingly effective;
behind these were the Roses of the competitors. For the
best twelve in pots, open, Messrs, Pybus & Son, Ripon,
were 1st, their stand consisting of nicely grown plants,
several of them measuring 3 feet in height, 2§ feet in
diameter. Among them we observed Centifolia rosea,
La Esmeralds, Juno, Jules Margottin, Clottide Roland,
Magna Charta, La Reine, Marquis de Castellane, Glore
de Dijon, Emily Laxton, and Madame Jeanne Go. Mr. H.
May, with a cliff proportions is in this group were Centifolia
rosea, Princess Beatrice, Madame Lacharme, Comtesse
de Serenye, and Monsieur Noman; 3rd, Mrs. Tetley,
Westwood (gr., Mr. J. Eastwood), small plants, requiring
age to make them worthy of winning the higher prizes.

In the anateurs' class for the best six stove and
greenhouse plants, and certificial rosea;
and the bird proportions is not bird proup were Centifolia
rosea, Princess Beatrice, Madame Lacharme, Comitess
for the be

group of decorative plants, covering 96 feet, the 1st prize went to Mr. H. Wright, in whose very telling group were many plants of Adiantum gracillimum, Caladiums, Spirzeas, a good variety of blue Lobelia, used as an edging to it; Fuchsias, and the like class of materials; 2d, Mr. Liftum auratum; 3d. Mr. J. Noble, gr. to Mrs. Fry. In the open class for the best six stove or greenhouse Ferra she 1st prize was awarded to Mr. J. Noble, whose Goniophebium subsurvienlatum, Gleichenia Mendelli, Microlepia hirta cristata, and others were of considerable metit; the 4d prize being awarded to Mr. W. Frankland for fair specimens, among them being Blechnum corco-vadense, Cyathea medullaris, and Dicksonia fibrosa; 3d, Mr. H. Wright. In the amateurs' class for the best six three Ferras—1st, Mr. J. Eastwood; 2d, Mr. W. Tuke; 3d, Mr. John Sunley. Selaginellas were not observed in any great numbers, and in the open class for the same Mr. J. C. Padman was the only prize-winner, a 3d prize-being awarded for pans of Selaginella densa—S. Mertensi, S. denticulata, S. Kraussiana aurea being the best of the material states of the same Mr. J. C. Padman was the only prize-winner, a 3d prize-being awarded for pans of Selaginella densa—S. Mertensi, S. denticulata, S. Kraussiana aurea being the best of the material states of the same Mr. J. C. Rylance, Ormskirk, having beautiful specimens of Polystichum proliferun, Lasters Fliik-mas, L. cristata, and Osmunda regalis cristata; the 2d prize was nawrded to Mr. W. Goodchild, gr. to Mrs. C. Nylor, Potter Newton, the Osmunda regalis cristata; the 2d prize was awarded to Mr. W. Goodchild, gr. to Mrs. C. Nylor, Potter Newton, the Osmunda regalis cristata; the 2d prize was awarded to Mr. W. Goodchild, The pelangoniums, both zonal and others, were to be found in great force, and, Mrs. Sh. Wasser, Pybus & Son. For three hardy Ferns the 1st and 2d prizes were tuken for the proper states of the same proper states of the same proper states and Lastree Flik-mas cristata being also very fine plants; 3d, M

J. Statisty and Mr. J. Dixon was 2d.

Orchids were from several gardens in the neighbourhood, a few choice varieties being found amongst them. The 1st prize was awarded to Mr. W. Frankland, who had Cypripedium barbutum, Leelia purpurata, Aérides Fieldingi; 2d, Mr. G. Rollisson in whose lot were plants of the control of

Burley. Mr. H. Wright, Mr. R. Featherstone, and Mr. W. Frankland took 1st, 2d, and 3d prizes in the order named for hand bouquets of mixed coloured flowers, which were not wanting in elegance, but were mostly put together far too solidly, every flower touching its neighbour, and there were no interstices between them. For the best bridal bouquet, 1st, Mr. J. A. Mann, gr. to D. B. Kendell, Esq., Wakefield; 2d, Mr. W. Frankland; 3d, Mr. C. Rylance.
Cut blooms of Roses, forty-eight distinct sorts,—1st,

D. B. Kendell, Esq., Wakefield; 2d, Mr. W. Frankland; 3d, Mr. C. Rylance.

Cut blooms of Roses, forty-eight distints orts.—rst, The Cranston Nursery Company, Hereford; these were in their usual good style, and consisted of kinds ordinarily seen, as Ed. Morren, Marie Baumann, Violette Bruyer, Hardy Frères, La France, Duchesse de Vallomorsa, Baronne de Rothschild, Chas. Lefebver, Hippolyte Jamain, Souvenir de la Malmaison, Mons. E. Y. Creas, White Baroness, Maréchal Niel, Le Havre, and Bennet's Novelty, Lady Mary Fitzwilliam, with others of merit. 2d, Mr. H. May, his Violette Bruyer, Marie Contet, Countess of Rosebery, Madame Ducher, Antoine Ducher, and Lord Beaconsfield being the finest; 3d, Mr. W. M. Robinson, Bramham. For the best twenty-four cut blooms, the Cranston Nursery Company was 1st, with a lot including many of the kinds seen in their larger exhibit; 2d, Mr. H. May; 3d, Mr. W. M. Robinson, whose blooms were small, and not quite forward for showing. The Content was the season of the Cranston Nursery Company was 1st, with a lot including many of the kinds seen in their larger exhibit; and the Cranston Nursery Company was 1st, with a lot including many of the kinds seen in their larger exhibit; and the company of the story and with the analysis of the story of the story of the story and the place of 1st and 2d, Mr. J. Eastwood showed some good blooms in the manteurs' class for twelve, and were placed 1st and 2d, Mr. J. Sunley taking 3d prize.

Cut flowers of the story of and reenhouse sections were Mr. J. Sunley taking 3d prize.

Cut flowers of the stove and greenhouse sections we

Cut flowers of the stove and greenhouse sections were rather abundant, and were very good in quality, as well as being in fair variety; perhaps the bunches would have been still more effective had the growers been more liberal and made them larger. The 1st prize was awarded to Mr. W. Hodgson; 2d, Mr. W. Letts; 2d, Mr. W. Tuke. In the amateurs' class for the best six bunches—1st, Mr. J. Sunley; 2d, Mr. W. Hodgson; 2d, Mr. W. Walker. Nosegay and zonal Pelargoniums, 13d, Mr. W. Walker. Nosegay and zonal Pelargoniums, Pansies, and bunches of hardy flowers made a display that had many admirers. In the class for show Pansies, and amateurs, the 1st prize was awarded to Mr. R. Cross, the 2d to Mr. Robert Mann, and the 3d to Mr. Richard Mann.

amateurs, the 1st prize was awarded to Mr. R. Cross, the 2d to Mr. Robert Mann, and the 3d to Mr. Richard Mann.

FRUIT.—The fruit that was shown was mostly of excellent quality, if in some cases there was a little deficiency of colour in the Peaches and Nectarines, and Muscat of Alexandria was not of that rich amber colour, showing perfect ripeness in the fruit. For the best collection in six varieties, 1st, Mr. J. Edmonds, in whose lot were Bretzgae Melon, an imposing looking fruit; Black Hamburgh and Poater's Seedling Grapes, Chancellor Peach, Sawarded to Mr. R. Dawes, gr. to the Hon, Mrs. Meynel Ingram, Temple Newsam, who rate he 1st very closely; 3d, Mr. W. Wallis, gr. to Sir Henry Meysey Thompson, Kirby Hall, York. In collections consisting of four varieties, 1st, Mr. R. Sleightholme, gr. to T. W. Dymond, Eag., Burntwood Hall, Barnsley, whose Lord Napier Nectarine, Alexandra Peach, and Muscat of Alexandria Grapes were nice examples of early fruit; 2d, Mr. R. Dawes; 3d, Mr. J. Edmonds, gr. to the Duke of St. Albans, Bestwood Lodge, Nottingham. For the best two dishes of Grapes, two black and two white, 1st, Mr. R. Grindrod, Whitfield, Hereford, whose exhibits consisted of Mnscat of Alexandria and Black Hamburgh; 2d, Mr. R. Dawes. For Johnson, gro to H. Gill, Esq.; 3d, Mr. J. Edmonds—Mr. Grindrod taking the 1st prize for white Grapes, Mr. Johnson, gro to H. Gill, Esq.; 3d, Mr. J. Edmonds—Mr. Grindrod taking the 1st prize for white Grapes, Mr. Johnson, gro to H. Gill, Esq.; 3d, Mr. J. Edmonds—Mr. Grindrod taking the 1st prize for white Grapes, Mr. Sleightholme the 2d, and Mr. J. Sunley the 3d. The competition in other fruit classes was not in any way severe, and calls for but little comment, Mr. Jefferson, gr. to J. Garside, Esq., Carlton House, Worksop, being 1st of a Pine, and Mr. T. Hare, gr. to R. H. C. Neville, Esq., Wellingore, Grantham, 2d. Mr. W. Wallis took the 1st prize for white Grapes, Mr. J. Edmonds the 2d, and Mr. J. Sunlow the 2st prize for house and garden in the usual way, with evergreen twig

Jersey Royal Horticultural.-The midsummer Jersey Koyai Horticulural.—The midsummer flower show of this Society is always its event par excel-lence, and this year, as was indeed expected, it has been one of the very best on record. It was held on the 18th nst. by kind permission of Mrs. Robin upon the picturesque grounds of her residence, Steephill, St. Saviour's. The beauty of a cloudless June afternoon, the very many and well known attractions of Steephill, the band of the Worcestershire regiment, and the "mind" to see and to be seen drew together a very large assemblage of ladies and gentlemen, either residents in or visitors to the island. In one tent, of which there were three, pitched upon a wooded slope, and where, by the way, the heat was tropical, were staged the usual exhibits of Roses, Pelargoniums, and other summer flowers—all good; some in size and brillancy of bloom almost unmatchable anywhere. In another tent were cut flowers, and in a third were fruits that many a parched lip watered for their refreshing juices. The show of vegetables was excellent in size, in variety, and quantity, and may be fairly said to have been the best for many a year. Some Brobdinagian Rhubarb, Cucumbers, Peas, Beans, Artichokes, Lettues, et hoe genus owne, were of these escuulents the nost noticeable and pmiseworthy. Altogether the Society scores one for this, its fifty-first display. Correspondent.

ECONOMIC PRODUCTS OF INDIA.

UNDER the title of "Economic Products of India, exhibited in the Economic Court, Calcutta Interna-tional Exhibition, t883-84," Dr. George Watt has compiled an elaborate list of economic plants. The first volume or part treats, under separate heads, of-1, gums and resins; 2, dyes, tans, and mordants; fibres and fibre yielding plants; 4, oils, and oil seeds; and 5, medicinal products. Each part is arranged alphabetically, the generic names being placed at the head of each paragraph. This arrangement is, to a certain extent, useful for ready reference to those not accustomed to a scientific arrangement, but it has its disadvantages inasmuch that plant has more than one use it is necessary to refer to it under each head. The whole of the parts show a great deal of research, for Dr. Watt seems to have made himself acquainted with the best and most recent works both in this country and in India, as is evidenced by the references made to Dr. Dymock's Materia Medica of Western India, Fluckiger and Hanbury's Pharmacographia, Bentley and Trimen's Medicinal Plants, &c. Scattered through the books are some interesting notes; thus in part v., Medicinal Products, under the head Astragalus sp., we find the Gum known as Sarcocolla referred to as follows: — "For some time Sarcocolla was sup-posed to be obtained from Penea (Sarcocolla) mucionota, a native of the Cape of Good Hope. It is known, however, to come from Persia, and it cannot therefore be obtained from species of Penæa or Sarcocolla, the species of which are found in the South of Africa. Mr. Baden Powell mentions Penæa in his Punjab Products, but, as pointed out by Dr. Dymock, Sarcocolla is entirely imported into India, coming from the Persian Gulf. Its medicinal virtues have been much admired by the natives of India, either made into an ointment and plaster, or into a medicated oil. It is one of the chiel ingredients of the Parsee bone-setter's plaster (Lep). It is described as aperient, and a resolvent of corrupt and phlegmatic humours, acting best when combined Myrobalano or Sagapennm. It is also supposed to be fattening, and is therefore eaten by Egyptian women. This exceedingly useful substance, which is widely consumed in the East, does not seem to have attracted attention in Europe to the extent which it deserves. Dr. Dymock's opinion, that this is identical with the true Sarcocolla of the Ancients, is supported by Dr. Watt, who thinks there is much to favour the idea. Meer Muhammad IIusein, in his Makhzau-ul-Adwiya, describes the plant which yields this gum as a small thorny shrub, known as Sbayakah, a native of Persia and Turkestan. The Persian and Arabian name of the gum is Auzeroot.

The book contains curiosities in the medicinal uses of plants; thus we read that the root of Delphinium mundatum is chewed by a certain tribe for the cure of toothache, but that it affects a cure only on Sundays. Again, under Diamond (for the book is not confined to vegetable products) we are told that this valuable article is much used in native medicine, and that N. C. Dutt says, in his Hindu Materia Medica, that it is purified by being enclosed within a Lemon and boiled in the juice of Sesbania grandiflora. It is described as being reduced to a powder by heating a piece of the root of the Cotton plant into a paste with the juice of the Betel-nut, both being not less than three years old. Within this paste the diamond is placed, and roasted seven times. The diamond is then stated to be easily powdered. This powder is stated to act as a powerful alterative tonic. It is more familiarly known as a powerful mechanical

A curious use for the seeds of Datura fastuosa is given; they are described as being a favourite poison for criminal purposes, both the seeds and their pre parations being generally employed by the Indian road poisoners, not for the purpose of destroying life, but for stupefying their victims with the view of committing theft. Death, however, may follow as a consequence of an over-dose. They are also used to render liquor more intoxicating, being burnt upon charcoal with vessels inverted to catch the smoke. The seeds are also used in the form of a powder for the same purpose, being more powerful in this When full of smoke the liquor is thrown into a vessel, and the mouth covered over for a night. It seems remarkable that, when thus burned, the smoke should retain the same poisonous and intoxicating properties.

Variorum.

OLIVE OIL IN TUSCANY .- It is stated that the Olive crop in Tuscany for 1883 did not exceed 25,000 barrels, or 5 per cent. of a full crop. In some of the Olive districts the crop failed completely, in others the fruit suffered much from the long drought, and in general the yield was far below the average, not only in Tuscany, but in Puglia and Liguria. A large quantity of Tuscan oil is annually sent to Nice, where it is used to improve the local produce, which is then exported to France and Russia, under the name of Nice or Provence oil. The bulk of the Tuscan oil is bought up by Leghorn merchants, and after undergoing a purifying and refining process by filtering, which makes it brilliant and clear, it is exported to England, France, Germany, Russia, &c., the largest shipments being made to England. The best qualities of genuine Olive oil are sent abroad in pipes, half-pipes, and in casks of various dimensions. On the other hand, the oils which are made up in half chests and square boxes and sent to England only, containing thirty flasks, are usually very inferior, being mixed with cotton oil. This may be accounted for by the enormous competition prevailing in the London, Liverpool, Bristol, and other markets, and the great demand for a cheap article; the consequence is a deterioration in quality corresponding with increased production, so that the price of these descriptions has now gone down considerably. In connection with this subject the following particulars, from a detailed account of the growth of Olives and the production of oil in Tuscany, recently furnished to the British Consul at Leghorn by one of the principal exporters of that place, will be read with interest. He says that the best quality of oil can only be made from fruits that are perfectly and uniformly sound, well ripened, gathered as soon as they are dropped from the trees, and crushed immediately. highest quality of olive oil for eating purposes should not only be free from the least taint in taste or smell, but possessed of a delicate appetising flavour. When so many favourable conditions are needed as to gowth, maturity, and soundness of the fruit coupled with great attention during the process of oil-making, it is not to be wondered at that by no means all or it is not to be wondered at trait by no means an or even the greater part of the oil produced in the most favoured districts of Tuscany is of the highest quality. On the contrary, the bulk is inferior and defective. These defective oils are largely dealt defective. These defective oils are largely dealt in both for home consumption and for export, when price and not quality is the object. foreign countries there is always a market for inferior defective olive oil for cooking purposes, &c., provided the price be low. Price and not quality is the object, so much so that when olive oil is dear, cotton-seed, ground-nut, and other oils are substituted, which bear the same relation to good olive oil that butterine and similar preparations do to real butter. The very choicest qualities of pure olive oil are largely shipped from Leghorn to England, along with the very lowest qualities, often also adulterated The oil put into Florence flasks is of the latter kind. Many years back this was not the case, but now it is a recognised fact that nothing but the lowest quality of pil is put into these flasks-oil atterly unfit for food, and so bad that it is a mystery to what use it is applied in England. Importers in England of oil in these flasks care nothing, however, about quality, cheapness is the only desideratum. The best quality of Tuscan olive oil is imported in London in casks, bottled there, and bears the name of the importers alone on the label. There is no difficulty in procuring in England the best Tuscan oil, which nothing produced elsewhere can surpass, but consumers who wish to get, and are willing to pay for the best article, must look to the name and reputation of the importers and the general excellence of all the articles they sell, which is the best guarantee they can have of quality.

BRIER-ROOT PIPES, -In a report on the trade and commerce of Leghorn, the following note on the so-called Brier-root pipes which have become so large an industry of late years, will be read with interest :- "An interesting industry has been started here within the last three years by a Frenchman from Carcasonne, for the export of material for the manufacture of wooden pipes. Similar works are also to be found at Sienna and Grosseto. Selected roots of the Heath (Erica arborea)-preference being given to the male variety-are collected on the hills of the Maremma, where the plant grows luxuriantly and attains a great size. When brought to the factory the roots are cleared of earth, and any decayed parts are cut away. They are then shaped into blocks of various dimensions with a circular saw set in motion by a small steam-engine. Great dexterity is necessary at this stage in cutting the wood to the best advantage, and it is only after a long apprenticeship that a workman is thoroughly efficient. The blocks that a workman is thoroughly efficient. are then placed in a vat and subjected to a gentle simmering for a space of twelve bours. During this process they acquire the rich yellowish-brown hue for which the best pipes are noted, and are then in a condition to receive the final turning and boring, but this is not done here. The rough blocks are packed in sacks containing forty to 100 dozen each, and sent abroad, principally to France (St. Cloud), where they are finished into the famous G. B. D., or Pipes de Bruyère," known to smokers in England under the name of "Brier-wood pipes." duction of this article is considerable, four hands turning out about sixty sacks per month. Consignments are also made to England and Germany, but at present the demand is said to be rather slack.

TROPICAL SCENERY. - In the forest through which the little track or foot-wide path meanders, the universality of beauty fills me with quiet delight. Delicious, penetrating scents from the many flowers embalm the air; the chirping of insects, and the pleasant low cries of birds gently vibrate on the ear, and the eye is continually feasted with the displays of colour, or the endless deploying of graceful forms. Looking up towards the sky, you see the cerulean blue checquered with a fantastic lacework of leaves, and little specks and dapplings of sunlight are scattered lightly over the outer groups of foliage, but hesitate timidly before the great depths of solemn gloom in the heart of the forest. Much animal life is evident here. At almost every turning the path introduces you brusquely to a happy family of monkeys, who have descended from the tree-tops to feed on the small ground-growing berries, or to plunge their greedy wasteful fingers into the crimson pulp of the They bound up into the trees on straying gourds. your approach, taking refuge well within gunshot on large platforms and nests of twigs, which they seem to have constructed on the upper branches. It would be absolutely brutality to take advantage of their confidence and bring them down with a bullet from your Winchester, when you have plenty of provisions in your cases, and stand io no immediate need of roast monkey. Besides, if you are but discreet and behave as becomes Nature's guest, your great hostess will show you many of her quaint and beautiful children. The green fruit pigeons startle you in the trees with their strange cry, commencing with a whirring noise, two or three clucks, and ending up with a sweet and prolonged The bee-caters are swooping in eccentric circles on the many flying insects, and little hornbills sit in staid immobility on bare and exposed branches, watching the bee-eaters as if they would like to imitate them, but felt that such great exertions were unbecoming. These bornbills, large or small, come to the ground to feed almost invariably—no doubt, because it is there that most of their food, such as grasshoppers and the exuviæ of animals usually lies. Still they are a curious instance of an arboreal type

of bird gradually becoming terrestrial again. " The River Congo," by H. H. Johnston, F.Z.S.

ENTOMOLOGY .- We have before us the third report of the United States Entomological Commission, a bulky volume relating to the Rocky Mountain locust, the canker-worm, the Hessian fly, and other insects, with numerous maps and illustrations. In addition to a vast mass of practical information, there is much record of original scientific research. Mr. SWINTON, of Guildford (England), contributes a remarkable paper on the periodicity of insect migrations and their relations to solar phenomena and earthquakes. The author concludes that the great European migrations of insects take their rise in the years of minimum sun-spots, and continue until the expiration of the succeeding maximum, when a sudden diminution in numbers takes place. Speaking of locusts, the author says, "Can any one say when the locusts will again leave their breeding-grounds and ravage the cultivated land?" To which question he supplies the following answer :- "To this question I think a ready answer may be giventowards the next period of fewest sun-spots and earthquake prevalence, which will occur, it may be four, it may be ten years hence." Finally, he says, "The weather is the cause of insect multiplication; the weather in consecutive years differs alone (virtually) on account of changes in the sun's photosphere. Isolated observations on temperature, magnetic deviation, auroras, wind-disturbances, rainfall, water in rivers, famines, diseases or epidemics, earthquakes, and other sun phenomena, give erroneous results. Properly generalised observations show almost invariably an exact concordance between the sun's changes and these effects. The conception, as the proof, is one of numbers." We are now, it appears, in Europe passing through a period of few auroras, and at a minimum point in the great sun-spot cycles, when, judging from the past, great extremes of summer and winter temperature may be anticipated. The report is full of valuable information, access to which is facilitated by full tables of contents and indices,

Juce 9,—Fine, duit day and night.

20.—Fine and bright at times, overcast generally.

20.—Fine and bright occasionally, generally cloudy.

21.—Fine and bright till 2 PM, duit afterwards.

23.—Fine bright day and night.

24.—Clear and overcast alternately, slight rain falling

at 10 F.M.

25.—Slight rain at 9 A.M., partially cloudy throughout.

LONDON : Atmospheric Pressure .- During the week ending June 21, the reading of the barometer at the level of the sea decreased from 30.33 inches at the beginning of the week to 30.16 inches by 3 P.M., on the 16th, increased to 30.18 inches by 9 A.M. decreased to 30.16 inches by 3 P.M. on the 17th, increased to 30.21 inches by 9 A.M. on the 18th; decreased to 30.20 inches by midnight on the same day, increased to 30 26 inches by 9 A.M., decreased to 30.23 inches by 3 P.M. on the 19th, increased to 30.26 inches by 9 A.M. on the 20th, decreased to 30.21 inches by midnight on the same day, increased to

to 30.24 inches by 9 A.M. on the 21st, and was 30.18 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.21 inches, being 0.03 inch higher than last week, and 0.25 inch above the

average of the week.

The highest temperature in the shade in the week was 69°,5, on the 20th; the highest on the 18th was 59°,9. The mean of the seven high day temperatures was 65°,2.2.

day temperatures was 65°.2.

The lowest temperature was 47°.5, on the 17th; on the 19th the lowest temperature was 53°. The mean of the seven low night temperatures was 50°.5.

The greatest range of temperature in one day was 17°.5, on the 21st; the smallest was 11°.9, on the 18th. The mean of the seven daily ranges was 14°.7.

The mean temperatures were—on the 15th, 56°.4; on the 16th, 55°.2; on the 17th, 54°.7; on the 18th, 53°.6; and these were all below their averages by 2°.6, 3°.9, 4°.6, 5°.9, 0.8, 1°.4, and 1°.5 respectively.

by 2°.6, 3°.9, 4°.0, 5°.9, 80...

The highest reading of a minimum thermometer with blackened bulb in vacuo placed in the full rays of the sun was 121°, on the 21st. The mean of the seven readings was 103°.2.

The lowest reading of a minimum thermometer with its bulb placed on grass was 39°.2, on the 17th. The mean of the seven readings was 42°.9.

Rain.—No rain fell during the week.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending June 21 the highest temperatures were 75°.2 at Plymouth, 75° at Truro, 73°.6 at Nottingham; the highest at Sunderland was 62°, at Liverpool 66°.7, and at Sheffield 67°. The general mean was 69°.8.

The lowest temperatures in the week were 41°.5 at Cambridge and 42°.5 at Bristol and Wolverhampton; the lowest at Liverpool was 49°.6, at Leiceter 48°.8, at Preston 48°.5. The general mean was 45°.7.

The greatest ranges were 31° at Truro, 29° at Cambridge, 28°,5 at Bristol; the smallest ranges were 17°.1 at Liverpool, 19° at Sunderland, and 19°.5 at Preston. The general mean was 24°.1.

The mean of the seven high day temperatures was highest at Turo, 70°.6, at Plymouth 69°.8, at Bristol 67°; and was lowest at Sunderland, 38°, at Sheffield 61°.6, at Liverpool 62°.2. The general mean was 44°.3.

The mean of the seven low night temperatures was highest at Liverpool, 52°.1, at Preston 51°.6, at highest at Liverpool, 52°.1, at Preston 51°.6, at

The mean of the seven low night temperatures was highest at Liverpool, 52¹.1, at Preston 51.6, at Leicester 51.1; and was lowest at Wolverhampton, 46⁵.6, at Bristol 47.4; and at Bolton 47.8. The general mean was 49.4.

The mean daily range was greatest at Truro, 22.3, at Cambridge 21.2, at Bristol 19.6; and was least at Cambridge 21.2, at Bristol 19.6; and was least at Sunderland, 9.4, at Liverpool 10.1, at Sheffield 12. The general mean was 15.4.

The niean temperature was highest at Plymouth, 58.7, at Truro 57.6, at Blackheath 56.6; and was lowest at Sunderland, 51.5, at Wolverhampton 52.1, and at Sheffield 53.8. The general mean was 55.4, and at Sheffield 53.8. The general mean was 55.4, and at Sheffield 53.8. The general mean was 55.4 he smallest falls were 0.02 inch at Brighton and Bradford. No rain fell at Truro, Plymouth, Bristol, Blackheath, Cambridge, Wolverhampton, Liverpool, Bolton, or Sunderland. The general mean fall was 0.03 inch. Cambridge, Wolverhampton, Liverpool, Bolton, or Sunderland. The general mean fall was 0.03 inch.

Scotland: Temperature.—During the week ending June 21, the highest temperature was 78°, at Perth; at Leith the highest was 61°.3. The general mean was 78°.

The lowest temperature in the week was 41°,

The lowest temperature in the week was 41% at Glasgow; at Leith the lowest temperature was 47%.6. The general mean was 44%.2.

The mean temperature was highest at Paisley and Perth, 56%.1, and lowest at Aberdeco, 53.%.9 The general mean was 54%.9.

Kain.—The largest fall was 0.0.15 inch, at Glasgow; and the smallest fall was 0.0.2 inch, at Paisley, The general mean fall was 0.0.2 inch, at Paisley, The general mean fall was 0.0.3 inch. No rain fell at Edinburgh, Greenock, or Leith.

CORN.

CORN.

At Mark Lane on Monday English Wheat was in moderate supply and dull of sale; foreign, though a very slack sale, upbeld the previous Monday's value. Grinding Barley on the spot was very quiet, without change in value. Beans and Peas were quoted as on Monday week. Maize showed a decline of 3d, to 6d., and was quiet. The large receipts of Oats last week depressed values 6d. on the common qualities, from which there was a recovery of 3d. on lighter arrivals and smaller shipments from Kussia. Fine stout qualities were very fine, and ranged up to 23. for Russian and Swedish, which were scarce.—On Wednesday transactions were merely of retail extent in both Wheat and flour. Quotations were nominally unlatered, but the tendency was weak. Barley met only a limited enquiry, but remained steady in value, Peasa and Peas moved off in retail quantity at unaltered value. Maize rather gave way; Oats were firm and against bupers.—Average prices of corn for the week ending June 21:—Wheat, 371: Barley, 275. 174.; Oats, 224. 4d. For the corresponding period last year:—Wheat, 427. 5d.; Barley, 317. 6d.; Oats, 225. 6d.

CATTLE.

At Copenhagen Fields on Mondy a very good collection of both English-fed and imported cattle were on offer; among the former grass-fed beasts were more numerous and extremely prime, the latter consisted principally of Camadian of good useful character. Of much consisted principally of Camadian of good useful character. Of the control
HAY.

Tuesday's Whitechapel Market report states that sup-Tuesday's Whitechapel Market report states that supplies were large and trade dull, prices tending downwards, Quotations:—Prime old Clover, 95. to 175.; inferior, 60s. to 75s.; prime second cut, 90s. to 175.; inferior, 28s. to 37s. pre load.—On Thursday there was a large supply on sale. The trade was dull, except for straw, prices for which were dearer. Cumberland Market quotations:—Superior meadow hay, 88s. to 96s.; inferior, 65s. to 76s.; superior Clover, 110s. to 175s.; inferior, 90s. to 100s.; and straw, 34s. to 38s. per load.

POTATOS.

The following are the latest quotations to hand for the week:—Magnum Bonums, 80z. to 50z.; Champions, 50z. per ton; new—Jerseys, 8z. to 5z. 6d. per cwt.; Cherbourgs, 7z. to 8z.; Flukes, 8z. 6d. to 9z.; Lisbons, 3z.; and Maltas, 5z. 6d. per cwt.—The imports into Loodon last week consisted of 40 tons from St. Malo, 1982 packages 2210 bags Jersey, 128 baskets St. Nazaire, 23 packages Lisbon, 2458 Cherbourg, and 23 cases from Malta.

Government Stock.—Cossols closed on Monday at 99½ to roo½ for the account. The figures of Tuesday and Wednesday were 99½ to 100 for delivery, and 99½ to 100 for delivery, and 99½ to 100 for both decount. Thursday's quotations were 99½ to 100 for both delivery and account. These quotations are explicitly approximately the second of the s

HOSE-HOSE-HOSE.

PATENT RED-RUBBER GARDEN HOSE.

Stands severe tests of Government Departments, thus proving superiority of quality. Lasts four times as long as ordinary tolarianber Hose, Lighter in Weight, Greater in Strength, and Cheaper in the long run than any other Hose for Gardee Use. A correspondent write:—"I have had a length of your Red Rubber Hose in such mice years, and it is now as good as ever." Private Customers Supplied at Trade Prices.
