7147. *Use.* The timber may be used generally in rural economy, and the poles form a light and convenient hurdle. Pontey says, the timber is "considerably durable; a property which, it appears, may be much augmented by steeping some months in water, as is frequently done with oak-saplings." The bark of all the sorts mentioned is found to be sufficiently astringent to be now generally used by tanners.

7148. *The best willows for osier-grounds are the following:—*

7149. *The common osier, Salix Viminalis.* (Eng. Bot. 1898.) (fig. 680.) The leaves are long, waved at the edges, but not serrated; shining green above, and silvery underneath. The shoots grow long, straight, and tough, and are well adapted for the larger sorts of baskets, hampers, crates, and hoops.

7150. *The auricled osier, S. stipularis.* (Eng. Bot. 1214.) "The two-year-old shoots make excellent rods for baskets, cradles, bird-cages, and such articles; and the one-year shoots are used as fillings. The shoots are long, nearly equal in thickness throughout their extent, and somewhat downy, or hoary, particularly at the tops or extremities. The leaves are alternate, with footstalks, long and narrow, somewhat

notched on the edges, green and smooth above, woolly below. The stipulæ or leaf-scales are conspicuous and remarkable, resembling a pair of ears."

7151. *The green osier (S. rubra)* (Eng. Bot. 1145.) is an excellent basket willow. "The shoots are very long, tough, smooth, and of a grey color, occasionally inclining to purplish. The leaves are narrow and very long, from three to four inches, bright green on both sides, and serrated."

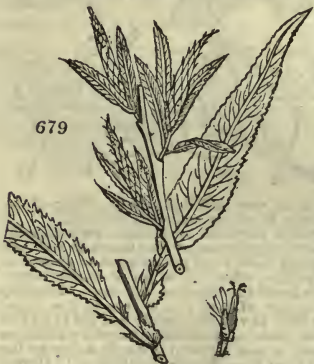

7152. *The basket-osier, S. Forbyana.* (Eng. Bot. 1344.) "The best willow for the finer sorts of basket-work. The shoots are of a yellowish ash-color, sometimes purplish; smooth, very flexible and tough. The leaves are alternate, on foot-stalks, from two to three inches long, somewhat serrated, chiefly towards the top; dark-green above, and glaucous or pale-bluish beneath."

7153. *The long-leaved triandrous willow (S. triandra)* (Eng. Bot. 1454.) "is common in osier-beds, and its stools afford most excellent shoots for basket-work, long, slender, pliable and tough; they are smooth, of a brownish color, and towards the top they are fluted or grooved. The leaves are long, and closely and strongly serrated."

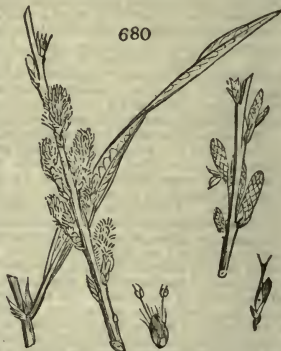

7154. *The velvet osier, S. mollissima.* (Eng. Bot. 1509.) "Its leaves are very smooth and green above, and very silky and soft beneath. Shoots long and very numerous, but not tough; when allowed, however, to remain for two years, they make most capital rods."

7155. *The yellow willow, or golden osier (S. vitellina),* (Eng. Bot. 1329.) produces "handsome shoots, of a yellow color and shining, and well adapted for basket-work."

BOOK IV.

LANDSCAPE-GARDENING.

7156. In *landscape-gardening*, the art of the gardener is directed to different objects, and some of them of a higher kind than any belonging to gardening as an art of culture. In the three branches hitherto considered, art is chiefly employed in the cultivation of plants, with a view of obtaining their products; but in the branch now under consideration, art is exercised in disposing of ground, buildings, and water, as well as the vegetating materials which enter into the composition of verdant landscape. This is, in a strict sense, what is called landscape-gardening, or the art of creating or improving landscapes; but as landscapes are seldom required to be created for their own sakes, landscape-gardening, as actually practised, may be defined, "the art of arranging the different parts which compose the external scenery of a country-residence, so as to produce the different beauties and conveniences of which that scene of domestic life is susceptible."

7157. What these *beauties and conveniences* are, must, in different ages and countries, depend on the state of society and climate; and, in the same age and country, on the

wealth and taste of individuals. This art would be a very simple one in rude ages and mild climates, when man had few wants, and scarcely any desires; but, like other arts, would become more intricate as mankind betook to more variable climates, and became more refined in habits and manners. Taking a view, as far as history permits (see Part I.), of the past and present state of landscape-gardening in all countries, the objects desired in the country-residence of a wealthy man, wishing to display his riches, are fundamentally the same. These were and are, *adaptation* to the habits of genteel life for the time being, as to matters of use and convenience; and *distinction* from the common scenery of the country, as to matters of taste or beauty in landscape. The first object would principally affect the mansion and accompanying erections for men or cattle; and these would, at first, be merely of greater dimension than those of the common mass of rustics; but, as society improved, they would be distinguished by more perfect execution, and appendages indicative of the habits of genteel life. The second object, distinction in the surrounding scenery, was and is effected by such dispositions of the common materials of landscape, as ground, water, trees, &c. as indicate the employment of art and expense. In early times, this would produce regularly level or sloping surfaces of ground, and water and trees bounded by straight or geometrical lines, which would distinguish the country-residence from the natural or open unenclosed scenery around. In late or modern times, when the general face of the country was disposed in artificial forms, a contrary practice would be pursued, and natural-like scenery would be created for precisely the same object as in the other case; the display of wealth and taste, and the attainment of distinction.

7158. Hence the origin of what are called *the geometric and natural styles* in landscape-gardening, both evidently founded on the same principle, the love of applause and distinction. The first has been generally condemned as unnatural and absurd; and so it is, if we look upon it as an imitation of nature; but as it never pretended to this, but, on the contrary, was avowedly a display of the power of art over nature, it ought to be judged, like every other work of man, by the end in view; and if, as we have already observed (526.), it be considered as designed to distinguish the garden-scenery of the man of wealth from the common fortuitous scenery of the country in rude or less cultivated times and places, it will be found admirably calculated for that purpose, and just as natural to man as any other part of his habits or manners. But we will even go farther, and maintain that the geometrical disposition of landscape-scenery has powerful beauties, both of the inherent kind, as that of a long broad avenue, or of general or particular associations, as its suitableness to Gothic architecture, very ancient residences, &c. Disapproving, therefore, of that absolute preference of the modern or natural style, which totally excludes the other, we have, in treating of planting (Book III. Chap. IV.), not lost sight of the geometrical dispositions of trees; and we shall, in considering the present branch of our subject, notice also the dispositions of ground, water, roads, &c. peculiar to the geometric style. A knowledge of both will be desired by the liberal-minded practical designer; and the occasional adoption, in part, at least, of the ancient style, will be dictated by general good taste, as well as by the particular tastes of individuals, and the circumstances of peculiar situations. We shall consider, in succession, the principles of composing landscape; the treatment of the materials of verdant scenery; the union of these materials in forming landscapes; and the union of landscapes in connection with scenes of use and convenience in forming country-residences.

CHAP. I.

Of the Principles of Landscape-Gardening.

7159. *The principles of landscape-gardening*, like those of every other art, are founded on the end in view. "Gardens and buildings," Lord Kames observes, "may be destined for use solely, for beauty solely, or for both. Such variety of destination bestows upon these arts a great command of beauties, complex not less than various. Hence the difficulty of forming an accurate taste in gardening, and architecture; and hence, that difference or wavering of taste in these arts, greater than in any art that has but a single destination." (*Elements of Criticism*, 4th edit. vol. ii. 431.) Not to consider landscape-gardening with a view to these different beauties, but to treat it merely as "the art of creating landscapes," would thus embrace only a small part of the art of laying out grounds, and leave incomplete a subject which contributes to the immediate comfort and happiness of a great body of the enlightened and opulent in this and in every country; — an art, as the poet Mason observes,

— "Which teaches wealth and pride,
"How to obtain their wish — the world's applause."

7160. *The ancient authors on architecture and gardening* have rarely attempted to lay down any general principle of composition. Vitruvius hints obscurely, that the different parts of buildings, should bear some proportion among themselves, like that which subsists between the different members of the human body; that the quantities constituting the magnitudes of temples, should have certain ratios to one another, and he lays down canons for the individual proportions, and collective arrangement of the columns of the different orders. These, however, are not principles, but mechanical rules, formed on very limited associations. The same remarks will apply to the directions respecting the walks, walls, hedges, and borders of the ancient style, laid down by D'Argenville, Clarici, Le Blond, and Switzer. It is in the writings of modern authors, therefore, and chiefly from the enlightened investigations of the Rev. A. Alison, that we are to draw our information as to the principles by which the artists of the ancient style were instinctively guided in their productions.

7161. With respect to *the modern style*, considered as including what belongs to the conveniences of a country-residence, as well as the art of creating landscapes, Pope has included the principles under, 1st, The study and display of natural beauties; 2d, The concealment of defects; and 3d, Never to lose sight of common sense. Wheatley concurs in these principles, stating the business of a gardener to be "to select and to apply whatever is great, elegant, or characteristic" in the scenery of nature or art; "to discover and to show all the advantages of the place upon which he is employed; to supply its defects, to correct its faults, and to improve its beauties." Repton, whose observations on landscape-gardening bear on the title-page, to be "written with a view to establish fixed principles in these arts," enumerates congruity, utility, order, symmetry, scale, proportion, and appropriation, as principles, "if," as he observes, in one place, "there are any principles." Mason places the secret of the art in the "nice distinction between contrast and incongruity;" Mason, the poet, invokes "simplicity," probably intending that this beauty should distinguish the English from the Chinese style; simplicity is also the ruling principle of Lord Kames; Girardin includes every beauty under "truth and nature," and every rule "under the unity of the whole, and the connection of the parts;" and Shenstone states, "landscape or picturesque gardening" to "consist in pleasing the imagination," by scenes of grandeur, beauty, and variety. Convenience merely has no share there, any farther than as it pleases the imagination. Congruity and the principles of painting are those of Price and Knight; and nature, utility, and taste, those of Marshall. From these different theories, as well as from the general objects or end of gardening, there appear to be two principles which enter into its composition; those which regard it as a mixed art, or an art of design, and which are called the principles of relative beauty; and those which regard it as an imitative art, and are called the principles of natural or universal beauty. The ancient or geometric gardening is guided wholly by the former principles; landscape-gardening, as an imitative art, wholly by the latter; but as the art of forming a country-residence, its arrangements are influenced by both principles. In conformity with these ideas, and with our plan of treating of both styles, we shall first consider its principles as an inventive or mixed, and secondly as an imitative art.

SECT. I. *Of the Beauties of Landscape-Gardening, as an inventive and mixed Art, and of the Principles of their Production.*

7162. *Works of art*, Alison observes, may be considered, either in relation to their design or intention — to the nature of their construction for the intended purpose — or to the nature of the end they are destined to serve; and their beauty accordingly will depend, either upon the excellence or wisdom of the design, the fitness or propriety of the construction, or the utility of the end. The considerations of design, of fitness, and of utility, therefore, may be considered as the three great sources of the beauties of works of inventive art. They have been called relative beauties, in opposition to those of nature and imitative art, which are hence denominated natural or independent beauties. There is a third source of beauty common both to arts of invention and imitation, which is that of accidental beauty, or such as is produced by local, arbitrary, or temporary associations. The beauties of objects, whether natural, relative, or accidental, are conveyed to the senses by the different qualities of matter, forms, sounds, colors, smells, and motion; but form is the grand characteristic of matter, and constitutes in a great degree its essence to our senses. In our remarks, therefore, on the beauties of inventive art, we shall chiefly consider design, fitness, and utility, in regard to form.

7163. *The expression of design* is displayed by such forms and dispositions, as shall at once point out that they are works of art. Thus regularity and uniformity are recognised in the rudest works of man, and point out his employment of art and expense in their construction. Hence the lines, surfaces, and forms of geometric gardening should be different, and in some degree opposed to those of general nature. Irregular surfaces, lines, or forms, may be equally useful, alike works of art, and, considered with reference to other beauties, may be more agreeable than such as are regular; but, if too prevalent,

they might be mistaken for the production of nature, in which case they would lose the beauty of design ; but forms perfectly regular, and divisions completely uniform, immediately excite the belief of design, and with this belief, all the admiration which follows the employment of skill and expense. Ground in level or regular slopes, or in hills or hollows of symmetrical shapes ; woods of right-lined boundaries ; trees, and especially such as are foreign to the soil, planted equidistantly in masses, in quincunx, or in straight rows ; water in architectural basins, regular canals, or fountains ; walks and woods, of uniform width and perfectly straight ; straight walls and hedges are easily distinguished from nature's management of these materials, and are highly expressive of the hand of man.

7164. *Regular forms are satisfactory*, Stewart observes (*Philosophical Essays*, 238.), "from the principle of a sufficient reason, adopted by Leibnitz. What is it, that in any thing which is merely ornamental, and which at the same time does not profess to be an imitation of nature, renders irregular forms displeasing ? Is it not, at least, in part, that irregularities are infinite ; and that no circumstance can be imagined which should have decided the choice of the artist in favor of that particular figure which he has selected ? The variety of regular figures, it must be acknowledged, is infinite also ; but supposing the choice to be once fixed about the number of sides, no apparent caprice of the artist in adjusting their relative proportions, presents a disagreeable and inexplicable puzzle to the spectator."

7165. Wherever *symmetry* "is useful to the soul, and may assist her functions, it is agreeable to her ; but wherever it is useless, it becomes distasteful, because it takes away variety : therefore, things that we see in succession ought to have variety, for our soul has no difficulty in seeing them : those, on the contrary, that we see at one glance, ought to have symmetry ; thus at one glance we see the front of a building, a parterre, a temple ; in such things there is always a symmetry which pleases the soul, by the facility it gives her of taking the whole object at once." (*Montesquieu*.)

7166. *The expression of design*, in the progress of the arts, though at first difficult, becomes afterwards easy, and renders regularity and uniformity only expressive of common design. Hence, to confer a character of superiority in works of design, variety would be introduced ; and as uniformity was the sign of design, so uniformity and variety would become the sign of improved or embellished design. "Considering, therefore, forms in this light as beautiful, merely from their expression of design, the observation of Dr. Hutcheson may perhaps be considered as an axiom with regard to their beauty, viz. that where the uniformity is equal, the beauty of forms is in proportion to their variety ; and when their variety is equal, their beauty is in proportion to their uniformity." (*Alison's Essays*, p. 106.) To this stage, in the progress of design, may be referred the architectural ornaments introduced in garden-scenery, such as seats, buildings, statues, urns ; and in the later stages of the art, serpentine walks, labyrinths, verdant sculpture, and many other improvements. The variety and embellishment thus conferred on gardens produced in time many absurdities, that we would not wish to see resorted to with a revival of the ancient style, unless in examples considered solely with a view to imitation. The sculpture of trees, however, might, when first introduced, be greatly admired, even by men of sense, for its novelty, and the discovery of a certain degree of skill in the artist ; but as, in our times, they would neither be new nor meritorious, they could scarcely be consistently introduced with a view to embellish design.

7167. *To prevent variety from degenerating into confusion*, and as Professor Stewart characteristically expresses it, "puzzling the spectator," unity of intention must never be lost sight of. This, indeed, is necessarily implied in every work of art, since, without it, the slightest attempt at design would only end in a chaos of materials.

7168. *Fitness*, or the proper adaptation of means to an end, is the second source of the relative beauty of forms. Considered in relation to the parts of a building, it is generally denominated proportion, and refers to the adequate strength of certain parts to bear certain weights, &c. In the detail of the ancient, and in scenes of relative beauty in the modern style of gardening, it relates to the magnitude and situations of buildings, and other artificial objects, relative to natural ones, — to the extent of the different scenes or constituent parts of a residence, compared to the whole, — to the propriety and congruity of certain objects as ornaments, — and, in general, to the adequacy of means to an end, whatever these means or that end may be.

7169. *Utility* is the third source of the relative beauty of forms. None of the other beauties will compensate for the entire want of utility in any scene of architecture or gardening. Objects at first thought beautiful, soon lose this expression when they are found to be of no use ; and others, with first impressions the most disagreeable, are felt to become beautiful as they are known to be useful. "This species of beauty," Alison observes, "is in itself productive of a much weaker emotion than that which arises from the different sources of ornamental beauty ; but it is of a more constant and permanent kind, and much more uniformly fitted to excite the admiration of mankind." (*Essays on*

Taste, vol. ii. p. 201.) "To unite these different kinds of beauty; to dignify ornamental forms by use; and to raise merely useful forms into beauty, is the great object of ambition among every class of artists. Wherever both these objects can be obtained, the greatest possible beauty that form can receive will be produced. But as this can very seldom be the case, the following rules seem immediately to present themselves for the direction of the artist:—1. That where the utility of forms is equal, that will be the most beautiful to which the most pleasing expression of form is given. 2. That where those expressions are at variance; when the beauty of the form cannot be produced without sacrificing its utility; that form will be most universally and most permanently beautiful, in which the expression of utility is most fully preserved." (*Essays*, vol. ii. p. 202.) Some of the various modifications of utility, as applied to country-residences, may be here enumerated.

7170. *For the purpose of habitation*, for example, good air and water, a genial climate, fertile soil, cheerful prospect, and suitable neighborhood, &c. are known requisites. Convenience must be joined to use, comforts to conveniences, and luxuries to comforts. Exercise, whether in the shape of walking, riding, or driving, requires to be provided for; and recreation, whether in the common field sports, athletic games, or in botanical, agricultural, and other useful, elegant, or scientific pursuits, must be kept in view: rural fêtes and amusements might also be enumerated.

7171. *Accidental associations* form the last class of relative beauties, and are "such associations as, instead of being common to all mankind, are peculiar to the individual. They take their rise from education, from peculiar habits of thought, from situation, from profession; and the beauty they produce is felt only by those whom similar causes have led to the formation of similar associations." (*Stewart's Essays*.) Among these may be reckoned,—

7172. *Classical and historical associations*. The influence of the former in architecture is well known; the latter often adds charms to a spot, in no respect remarkable to those who are unacquainted with its history. "Classical associations," Stewart observes, "have added immensely to our natural resources, but at the same time, warped our taste in various instances;" acquiring, as Alison adds, "a superiority over the more permanent principles of beauty, and determining for a time the taste of nations."

7173. *National associations* are also frequently at variance with such as are universal, and have, perhaps, greater influence than any other associations whatever. (*Stewart's Essays*.)

7174. *Personal associations*, or such as arise from the accidental style of natural beauties, to which we have been accustomed in our youth. Many particulars come under this head, which it would be tedious to enumerate; but one mode of vanity and selfish feeling deserves particular notice, as intimately connected with the business of the landscape-gardener. It is that interest which the attachment to property creates in men's minds, "rendering them alive to every trifling recommendation belonging to what is their own, while it blinds them to the most prominent beauties in the property of their neighbors." (*Stewart's Essays*, p. 468.)

7175. *Appropriation*, or such an arrangement as shall, either in reality or appearance, render all, or the greater part of what we see from a country-seat our own, is a consequence of personal associations. The simplest way of effecting this, is by shutting out all objects which do not correspond with the idea, by means of walls or plantations. A more refined mode is, by harmonising the scenery; by adopting some of the forms, colors, and arrangements in our own territory (6769), which appear in those of our neighbors, as seen from the house, or some particular points of view. According to Wheatley, "one property of a riding is to extend the idea of a seat, and appropriate a whole country to the mansion." For this purpose, he requires the road of the riding to be different from common roads in form and preservation, and distinguished by accompaniments borrowed from a park or garden, &c. Knight strongly objects to appropriation, and ridicules certain attempts of this sort, made by placing the family arms on the inns and public-houses of the neighborhood, and on "stones with distances," as, he says, was recommended by one improver. Girardin also objects to the principle; but Repton, and we believe, almost every other professional man, finds it a very principal object of attention. Repton defines appropriation to be, "that command over the landscape visible from the windows, which denotes it to be private property belonging to the place." "A view from a London house into a square or into the parks may be cheerful and beautiful, but it wants appropriation; it wants that charm which only belongs to ownership—the exclusive right of enjoyment, with the power of refusing that others should share our pleasure. The most romantic spot, the most picturesque situations, and the most delightful assemblage of nature's choicest materials, will not long engage our interest without some appropriation; something we can call our own; and, if not our own property, at least that may be endeared to us by calling it our own home." (*Fragments of Landscape-Gardening*, p. 206.) This *envie de s'arrondir* seems to have existed, and the proximity and intermixture of property to have been felt as an evil among landed proprietors from the earliest ages. Ahab desired the field of Naboth, that he might convert it to a garden of herbs (or flower-garden), because it was near to his house; and Marvel, the attorney, says to his patron,—

— "What course take you
(With your good patience,) to hedge in the manor
Of your neighbor, Master Frugal? As 'tis said,
He will not sell, nor borrow, nor exchange;
And his land lying in the midst of yours,
Is a foul blemish."

MASSINGER. *New Way to pay Old Debts*, Act 2. Scene 1.

"I stick still in the inn of a hired house," writes the amiable Cowley to Evelyn, "without that pleasanter work of human industry, the improvement of something which we can call our own."

SECT. II. *Of the Beauties of Landscape-Gardening, considered as an imitative Art, and of the Principles of their Production.*

7176. *The chief object of all the imitative arts is the production of natural or universal beauty.* Music, poetry, and painting, are the principal imitative arts; to these has been lately added landscape-gardening, an art which has for its object the production of landscapes by combinations of the actual materials of nature, as landscape-painting has for its object their imitation by combinations of colors. Landscape-gardening has been said "to realise whatever the fancy of the painter has imagined" (*Girardin*); and, "to create a scenery more pure, more harmonious, and more expressive, than any that is to be found in nature herself." (*Alison*.) Such are Alison's ideas of the powers of this art; and such appear, in some degree, to have been those of Wheatley and Girardin. A more correct idea of its capacities, in our opinion, is suggested by the remark of Lord Wal-

pole, when he represents it as "proud of no other art than that of softening nature's harshness, and copying her graceful touch." It has also been said, that it is "to poetry and painting, what the reality is to the representation." (*Girardin*.) But experience proves, that the former (the reality) is always exceeded by the latter, both in respect to natural and picturesque beauty. Suppose, for example, any given variety of ground, rocks, and distance, as the basis to be furnished with wood, water, and buildings; the rocks shown, or concealed, as the gardener may wish, or as the genius of the place may require, and every other purpose effected, which is in the power of gardening to perform. When all this is done, it will be a scene greatly inferior in beauty to the imitative creation of a painter from the same groundwork and materials; or, let there be a natural landscape, either of mediocrity or of any given beauty, with every circumstance so arranged, as to be alike suitable for both arts; and let a painter and a gardener, each attempt to copy it according to their art, with or without permission, to improve its beauties. Which of the two imitations would be most beautiful, considered in the abstract, and without reference to any selfish or arbitrary association? Decidedly, in our opinion, the production of the painter. In short, no comparison between the powers of landscape-painting and those of landscape-gardening can be instituted, that will not evince the superior powers of the former art. The great source of the beauty of every verdant landscape is wood; and so much of the beauty of all woods depends on accidental circumstances, in their progress from the time of planting, till they attain a considerable age, and which circumstances cannot be said practically to be under the control of the gardener, that however high our aim, however we may study the natural effects of time, and however correctly we may imitate them, at the end of all our labors, any wood of art will always be far inferior to a wood of nature under the same circumstances. For further illustrations, we have only to appeal to such painters as have made landscape their particular study, and who certainly must be considered in this case as the best judges with regard to scenic truth or picturesque beauty.

7177. *To what kind or degree, of beauty then, can landscape-gardening aspire?* To this we answer, that, abstracted from all relations of utility and design, it can seldom succeed in producing any thing higher than picturesque beauty, or such a harmonious mixture of forms, colors, lights, and shades, as will be grateful to the sight of men in general; and to such, more particularly, as have made this beauty in some degree their study. This harmonious assemblage of objects may be grateful and agreeable, without being accompanied by any, or at all events, by much general expression; for example, of gaiety, melancholy, grandeur, simplicity, or elegance; but it may also combine one or more of these poetic or general beauties in a high degree, and this, too, with or without being picturesque. It may recall many other pleasurable emotions, if we admit the considerations of fitness, novelty, or its contrast to surrounding scenery, and utility or its adaptation to man. Such is our opinion of the capacities of landscape-gardening. If it is lower than that of some authors and artists, we can only say, that it has been formed from the observation and experience of what actually takes place. The artist may and ought to aim at the highest degree of beauty, which his own imagination, the genius of the place, and the views of the owner, will admit of; but let him not proceed with, or hold out to the world, mistaken views of what his art can and cannot perform.

7178. *The principles of imitative landscape-gardening*, in that view of this term which limits it to "the art of creating landscapes of picturesque beauty;" we consider with *Girardin*, *Price*, *Knight*, and other authors, to be those of painting; and in viewing it as adding to picturesque beauty some other natural expression, as of grandeur, decay, melancholy, &c. we consider it, with *Pope*, *Warton*, *Gray*, and *Eustace*, as requiring, both in the designer and observer, the aid of poetic mind; that is, of a mind conversant in all these different emotions, or pleasures of imagination, which are called up by certain signs of affecting or interesting qualities, furnished by sounds, motion, buildings, and other objects.

7179. If taking a third view of *imitative landscape-gardening*, as "the art of laying out the grounds of a country-residence," then, with popular opinion, we comprehend under the term all the above beauties, with those of relative beauty, the principles of which have been the subject of the preceding section. The principles of landscape-gardening then, as an imitative art, we conclude to be derived from nature, as developed by the principles of landscape-painting; and, as recognised by poetic mind, or a mind alive to those general beauties or associations universally felt in civilised society. We consider this, perhaps to many a tedious developement of the principles of landscape-gardening, called for by the vague and indefinite manner in which they are spoken of by authors, no less than by artists; and, as a proof of this, we refer our readers to the volumes of the late — *Repton*, who, whatever may be the merits of his practical taste, has certainly, whenever he has touched on the subject of principles, written in a very unsatisfactory manner. To those who are conversant with the literature of landscape-gardening, it must appear a very gratuitous task to write a book "with a view of establishing fixed principles" in the

art, and to find in such a book, after the publication of the works of Wheatley, the two Masons, De Lille, Price, and Knight, such a passage as the following: "If any general principles could be established in this art, I think they might be deduced from the joint considerations of relative fitness or utility, and comparative proportion or scale; the former may be referred to the mind, the latter to the eye." (*Obs. on L. Gardening by H. Repton, Esq.* Introduction, p. 2.) While we disapprove of this disingenuous mode of writing, the frequency of which we must regret in this artist's works, we willingly pay tribute to his practical good taste, and more especially in architecture.

7180. *As an illustration of the theory of landscape-gardening*, which we have adopted, we subjoin a slight analysis of the principles of a composition, expressive of picturesque and natural beauty. For this purpose, it is a matter of indifference, as far as respects picturesque beauty, whether we choose a real or painted landscape; but, as we mean also to investigate its poetic or general beauty, we shall prefer a reality. We choose then a perfect flat, varied by wood, say elms, with a piece of water, and a high wall, forming the angle of a ruined building; it is animated by cows and sheep; its expression is that of melancholy grandeur; and, independently of this beauty, it is picturesque in expression; that is, if painted it would form a tolerable picture.

7181. *Unity is the first obvious principle* which pervades this picture. No ideas of gaiety or prettiness are excited by such a scene. All the parts unite in forming a whole, which the eye can comprehend at once, and examine without distraction. "La vue," says Girardin, "le plus vagabond de tous les sens, a besoin d'être fixée pour jouir avec plaisir et sans lassitude." Were this principle not prevalent, the groups of trees, the lake, and the building, would only please when considered separately, and the result would be as poor a production as a machine, the wheels of which are accurately finished and nicely polished, but which do not act in concert so as to effect the intended movement.

7182. *It is true to nature*; that is, the objects or materials are what they appear to be. The trees, which are neither very old nor very young, though in the distance diminished by their remote situation, we discover by their trunks and contour, to be still trees. They are not shrubs placed near the eye, with a view to produce a false perspective; nor is the fragment of building merely a disguised wall, because it has openings which have once been windows, and is crowned in one part by battlements. The water is natural, its surface being below the level of the adjoining ground, not raised above it, as is often the case in artificial waters. This completes the truth or reality of the scene. The necessity of adhering to truth is still greater in painting, in which all objects must appear to be natural, not only in forms and color, but also relatively to the forms and colors around them. Objects, especially those whose forms and dimensions are familiar to us, as men or horses, painted of different heights in the same plane; as, for example, in the distance, of the same magnitude as that in which they appear in the foreground, would, from the acquired habit of measuring unknown by known objects, give a falsehood to the scene, and appear as animals of a different species, or as monsters. It seems to be from the same principles of being true to nature, that a gradation of scene, or what is called distance, is required, or at least is so satisfactory in landscape. The mind, after being impressed with the effect of a whole, delights in examining its parts in succession; the more simple and obvious the arrangement of these parts, therefore, the more readily does the mind acquiesce in their effect. The eye of the artist, seizing on the nearest and most remote parts of a scene, readily marks an intermediate or middle distance; no given extent seems necessary for this purpose:

"To make the landscape grateful to the sight,
Three points of distance always should unite;
And howsoever the view may be confined,
Three marked divisions we shall always find."

The Landscape, by KNIGHT.

7183. *The disposition of the parts* is the next object of analysis, and the enquiry is how in this respect they concur in forming a whole. 1. As to forms, we find that their disposition is in groups or masses. The largest group, for example, is placed towards one side of the picture in the foreground, another towards the opposite side of the middle distance, including the building and adjoining lake; and the remote, or third distance, consists of a low line of wood, with projecting groups or masses. 2. As to colors, we find only different shades of yellow and green on the trees and ground. 3. As to the light, we find one large and principal light near the middle of the view, diverging into shade as it approaches the sides; the clearest part is the water, and the next clearest the building, and the third light spreads over a broad space of ground, near the water. The groups in the foreground are all in a deep shadow. One of these, near the water, partakes of the principal light, and those in the third distance are distinguished by a sort of neutralisation of light, color, and shade. Such is the disposition of the groups or parts, in order, in a complex view of the whole, to fix the eye, and prevent it from being distracted by scattered lights, confusion of forms, and inharmonious color.

7184. *The connection which subsists between these different parts* is a subordinate but important consideration. 1. They are connected in each distance by a real nearness of situation; and, 2. In the view as a whole, from the one group coming in part before the other, so as to produce connection by apparent proximity. Suppose the reverse to be the case, and that the groups were unconnected either by real or apparent distance of situation, the consequence would be, that each group being surrounded by light, would become a distinct object. The eye would have no resting place, and the assemblage would not compose a whole.

7185. *The relation which subsists between the parts*, composing each individual group, is next to be examined. 1. In regard to the form of the parts of each group, as they are all groups of the same sort of tree, we find one elementary form prevalent, but differing in magnitude, and in combination, by their contrasted disposition, to such a degree, that each group differs in form from the others, without at the same time being of opposite forms.

7186. *In regard to color*, the same kind of color prevails in each and in all of the groups, but is varied in degree by the same contrasted disposition. In some parts a yellowish-green prevails, in others a greenish-yellow, in others a russet or red-green, and occasionally a bright-green, as on that part of the turf where the light strikes with the greatest force.

7187. *In regard to light and shade*, those parts of the groups which rise above the horizon, and are backed by the sky, are dark, and generally darker than such as are backed by the ground, or by other adjoining groups. The prominent parts of each group are lighter than the retiring parts or recesses among the spray and leaves. These prominent and retiring parts, in the near groups, are very numerous; in the distance they are lost in the general aerial shade of the group. It may be observed, as a general principle, that trees, from their rough surface, and consequent imperfect reflection of light, are always comparatively darker than water, buildings, or ground. In creating real landscape, they serve in some measure as shades, as the other materials mentioned serve as lights.

7188. *The sky, the cows, and the sheep*, must be noticed in order to complete the sketch. Suppose, then, that the sky is merely grey and cloudy, and the cattle and sheep grouped in the middle distance,

what will be the expression of the view? We think it would express very little to general observers; but there being nothing glaringly offensive in the arrangement, it would be expressive of some beauty to him who had bestowed some attention to the subject of landscapes; for though it exhibits but little harmony of forms and colors, light or shade, it still possesses enough of these ingredients to render it worth looking at as a picturesque view.

7189. *The general or natural expression of melancholy and grandeur remains to be accounted for.* For this purpose, let the building be the ruins of an ancient castle, whose lofty quadrangular form may be readily imagined from the walls we mentioned, as composing a part of the scenery. The character of grandeur, then, is not in this instance communicated to the picture, by the picturesque effect of the walls, which have no variety of form, light, or shade, in themselves, but by the mental associations to which they give rise in a cultivated mind.

7190. *As another example of picturesque, and poetic, or sentimental expression, imagine the cattle and sheep removed, the surface of the ground covered by smoothly mown turf, and the luxuriant branches of some of the foreground trees nearly reclining on the ground.* The first expression would be that of beautiful, or *elegant picturesque*; the next that of stillness, and consecration to man, — stillness, as being without animals or moving objects; and consecration to man, from the mown surface, greatly heightened by the circumstance of the branches of trees reclining on the ground, which never can happen where sheep or cattle are admitted, and which forms the leading visible distinction between a group of trees in a park, and a group on a mown lawn. It is not from the smoothness of the turf, or any particular mixture of light and shade in the reclining branches, that this expression is produced, but from reflecting on the cause of this appearance.

7191. *As a third example, imagine, instead of the smooth turf, uncouth rough ground, covered in some places with furze, briars, brambles, and tangled thickets; the water fringed with rushes, and partially concealed by aquatic shrubs; and wild horses and deer forming the animated part of the scene.* The expression would be eminently picturesque; but there would also be an expression of wildness, not resulting from the picturesque qualities as such, but from mental reflection on the difference between this scene and one of cultivation.

7192. *As a fourth example, imagine the view deprived of the lake and the building, and consisting only of the wood and ground, with the heads of a straggling row of willow-trees appearing in the middle distance, and the sound of a distant waterfall heard through the trees.* Here, to picturesque beauty we have an idea of water — of an immense body of it in the lake or river which supplies the waterfall — and of the rocks, which oppose their powerful obstruction to a body of water. The reader will here remark, how much of the sublime beauty of this scene depends on sound, which can never be included under picturesque beauty. The leading expression is that of sublimity, accompanied by various associations of dignity produced by the rocks, and of grandeur suggested by the stream, after the waters have renewed their tranquil course, and rolling, as we may imagine, majestically along under the shade of the line of willow-trees.

7193. *Other examples, of a more striking nature, might be adduced; but these instances we consider as better adapted to show the difference between a composition merely picturesque, and one expressive of general or natural beauty, and to prove our position, that both poetry and painting enter into the principles of imitative landscape-gardening.* They will also show, how very little the production of natural beauty is within the power of the landscape-gardener. He may display it to more advantage. In the first example of expression, for instance, the building, or such parts of it as more obviously show its real character, might be displayed by the removal of some over-obtruding branches; and in the second, a garden-seat, and some garden-trees, as the lime, cedar, &c. might add to the idea of consecration to man. In the third, a corn-field or a barn in the distance, would aid the effect by contrast; and in the last, a bridge would determine the situation and reality of the river. But to attempt effecting these expressions by building a ruin, placing a garden-seat in a paddock, or erecting a bridge where there was no water, would, however common in the infancy of the art, be now justly considered ridiculous. Much more, it is true, might be done in improving the picturesque beauty of each of these scenes, provided the trees were already grown to maturity, and too numerous rather than too few; but if the trees are yet to plant, it is evident that only the ground-plans of the masses and groups of trees, and of the breadth of the lawn, could be formed by the artist.

7194. *A very common error, since the introduction of the modern style, has been to suppose that picturesque beauty is the only beauty to be aimed at in laying out grounds; but so far from this being the case, it will often happen that the alterations required for*

the purposes of convenience and character, will lessen that beauty, whilst it increases that of dignity, refinement, and appropriation to man. As an example, we may refer to Rivenhall Place, in its state before being improved by Repton (*fig. 681.*), and the

682

same residence subsequently to improvement, or as intended to be improved. (*fig. 682.*) Every one will allow that its unimproved state (*fig. 681.*) presents the most picturesque landscape; while its dressed state is the more dignified and desirable as the landscape of a considerable country-residence.

CHAP. II.

Of the Materials of Landscape-Gardening.

7195. *The materials of landscape-gardening with which we work in order to obtain the desired effect, are the same whatever style we adopt. Those of nature, are ground, wood, water, and rocks; to these, art has added buildings, roads, walks, fences; and animated or moving objects, sounds, &c. may be considered as accompaniments only partially under our control.*

SECT. I. *Of operating on Ground.*

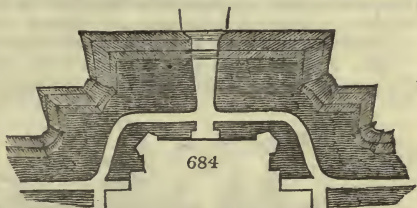

7196. *The operations of art on this ponderous material are necessarily of a very limited description. The most extensive and costly operations, to restore or create natural surfaces, even when attended with the desired effect, afford less permanent gratification to personal feeling than most other improvements. If a deformed space has been restored to natural beauty, we are delighted with the effect, whilst we recollect the difference between the present and the former surface; but when this is forgotten, though the beauty remains, the credit for having produced it is lost. In this respect, the operations on ground under the ancient style, have a great and striking advantage; for an absolute perfection is to be attained in the formation of geometrical forms, and the beauty created is so entirely artificial (*fig. 683.*) as never to admit a doubt of its origin. Long, therefore, after the improvement is finished, the credit and the beauty remain to gratify and charm the owner. Improvements on surfaces, whatever be their object, ought to be made in scenes which are near the eye, or intended to be frequently seen; at a distance they are lost if the effect be on a small scale, and often better effected by wood, if on one of considerable magnitude. Attempts to remove distant inequalities, by lowering heights and*

683

filling up hollows, very seldom are attended by results sufficient to justify the expense incurred ; but when art is employed to heighten distant eminences the success is greater : in the last case art may be said to act positively, in the former negatively — to produce or increase a beauty, instead of only removing or lessening a deformity. All operations on ground may be included under, 1. Those which have for their object the beauty of art or design ; and, 2. Those where natural beauty is intended to be produced.

7197. *Operations with a view to relative or artificial beauty.* The forms in use for this purpose are few and simple. They originate in, and are influenced by, those of the house ; and are, for the greater part, bounded by right lines ; and the surfaces are levels or slopes of different degrees of abruptness. The magnitude as well as form of each of the figures in the ground immediately adjoining a house, or in a detached walled enclosure, should be regulated chiefly by the magnitude of the mansion, or extent and grandeur of the whole place, though they are often obliged to conform, in some degree, to the natural surface. When the ground slopes from the house in all directions, narrow parallelograms will be the prevailing forms both of the levels and slopes. The broadest level, and greatest perpendicular depth of slope, will generally be placed next the house, and the next broadest level, &c. in succession, till, after three or four levels, and as many slopes are obtained, the artificial surface shall finally blend with the natural ; unless, as is frequently the case in the geometric style, a kitchen-garden wall, or some similar work of art, forms the termination. In this case, separation by some architectural or other accompaniment, will, by forming a break in the order of forms, admit of adopting, in continuation of the artificial surface, such levels and slopes as the character of the scene may require, or a due regard to economy dictate. When the mansion, or scene of operations, is on a surface naturally flat, the levels will be of greater dimensions, the slopes smaller, and both fewer in number. But though parallelograms are the common figures employed, sections of polygons, trapeziums, circles, and curvilinear figures, are frequently admitted. They are used in architectural elevations, and in fortifications, which are the prototypes of this part of ancient gardening ; and, therefore, when apparent in the mansion, should be reflected, as it were, by the grounds. (*fig. 684.*) The forms to be used, however, is a matter easy to determine. The principal difficulty is to arrange them together, so that they may concur in producing a whole, or a good effect. In disposing, connecting, relating, and contrasting them for this purpose, the artist will preserve regularity and uniformity in the complex view of the whole, varying and harmonising the detail according to the degree of beauty and variety he intends to produce. If he has duly prepared his mind by theoretical studies, and practised architectural and landscape drawing, his own feeling of their impression will suggest when he has attained the desired effect ; for the models of artificial surfaces which remain of ancient gardens are poor productions compared to what might be created in this way, through the judicious application of the principles of relative beauty. A good deal depends on adjusting the extent of geometrical or architectural surface to the size of the house and surrounding grounds ; and in this matter much depends on the regularity or irregularity of the ground plan of the former, and on the evenness or variation of the surface of the latter. A square house on a level, or on a gentle swell, will require least extent of architectural platform around it, and a straggling gothic castle on an irregular declivity the greatest extent of terraces, angles, ramps, and slopes.

7198. *Natural beauty of ground.* As the right lines and geometrical forms of the architect, take the lead in grounds of artificial beauty, so the flowing and broken lines, and undefined forms of the landscape-painter, take the lead in those of natural beauty. To create them in ground, is generally impracticable and unadvisable ; but where they exist concealed by accidental deformities, or incomplete in expression, through dulness in their leading features, art may relieve from the impediments to beauty, even though the situation is at some distance from the eye. In reclusive scenes immediately under view, art may aspire to create beauty even from a tame flat, but especially from its opposite, a flat abounding with deformities. In effecting all those purposes, the same principles apply. The first thing to fix in the mind is the desired surface, or that style of natural ground which is best to be imitated. The next thing is to examine on what parts, forms, and lines, the natural beauty of this ground chiefly depends ; if undulating, whether the concave or the convex prevails ; if broken ground, whether horizontal and perpendicular, or curved and inclined lines prevail. These are then to be imitated in the improvement, ever keeping in view the important principle of a whole as the end of the connection, and harmony of the parts of which it is composed.

7199. *The removal of accidental deformities* forms one of the commonest operations on ground. Old quarries and other pits, useless cattle-ponds, open drains, mounds of earth, marks of ridges, are to be considered of this description. As they have been raised by art, so in dispersing them, the best general rule is to restore the natural surface; but sometimes the remains of fences are so numerous, that advantage may be taken of the earth to be removed, and some variety given to a surface otherwise dull and featureless. If the fence consists of a great number of turns of different lengths, by removing both the mound and part of the surface on each side of the drain, a small winding hollow or vale may be formed: the effect of which may be heightened, by placing the earth removed on adjoining indications of natural eminences; not so as to form knolls, but so as to connect and harmonise with the prevailing idea of expression. The most simple and obvious improvement of exhausted quarries and dry pits, is to plant them (*fig. 685.*); this, though it will form a series of pleasing scenes, is not always consistent with the

general expression to be created, and such groups as would arise from these spots, might destroy breadth of light and connection, independently of excluding distant objects. In this case, they must be filled up by under-growths, or by lowering the adjoining surface in such a way as not to interfere with general effect, or a sufficient descent for the surface-water. Where broken ground enters into the idea of the composition to be effected, open drains, or hollow pits, afford fine sources of picturesque beauty, especially if the ground is dry, or can be readily under-drained. This character, however, can seldom be introduced as an original feature; but in ground naturally leading to abrupt and broken lines, it may be more desirable to improve this expression, than attempt creating a more polished surface. In cases of this sort, almost every thing depends on the introduction of wood, copse, and verdant roughnesses, to harmonise the broken surface; for mere broken ground, without a character of luxuriance and wildness communicated by wood, is seldom better on a smaller scale than a surface deformed by scars.

7200. *Natural bumps or excrescences* (*fig. 686. a*), as well as pits (*b*), are not uncommon in many grounds which have not been subjected to agricultural improvement.

When these are not large, the process of fallowing with the plough will remove them; when they are of some magnitude, they may often become sources both of polished and picturesque beauty. If they are numerous and favorably distributed, by the removal of some, and the enlargement through that means of others, they may give an impression of undulation, especially if situated on a naturally irregular surface. If on a declivity, and covering rocks or huge stones, a mixture of flowing lines with abruptnesses may be happily introduced.

7201. *A varied but yet dull surface* may often be improved by a skilful artist. By studying the character indicated by nature, it will generally be found, that the deficiency of expression is owing to the hollows being in part clogged up, either naturally or by long continuation under the plough; and the swells lowered in a corresponding degree by the same process. In this case, the obvious improvement is to remove earth from the hollows, and place it on the eminences, ever keeping in view the natural expression, and avoiding to end the improvement, by leaving the hollows gutters, and the eminences pointed ridges. This sort of improvement is not a very obvious one, though often attended with surprising effects, for every foot of depth taken from a hollow, and laid on an adjoining hill, adds two feet to the height of the latter. All these observations will be understood as referring to grounds near the house.

7202. *Distant scenes* of a park, as hills, or mountains (*fig. 687.*), are only to be improved by wood; and these remarks, in so far as they extend, will suggest not what is to be removed, but what must be concealed. Many excellent hints on this part of the subject are to be found in the picturesque tours of Gilpin, referring to ranges of

hilly scenery in different parts of the country, of much of which he has given views. With respect to ground, as respects garden-scenery, almost the only writer who has treated of it at length is Wheatley, whose excellent book, so frequently referred to by all succeeding writers on gardening, ought to be in the hands of every man of taste. In the chapter on ground in that work, the author concludes with a salutary caution, which ought ever be taken in connection with the wisest rules; "a caution which has more than once been alluded to, must always be had in remembrance; never to suffer general considerations to interfere in extraordinary great effects, which rise superior to all regulations, and perhaps owe part of their force to their deviation from them. Singularity causes at least surprise, and surprise is allied to astonishment. These effects are not, however, attached merely to objects of enormous size; they frequently are produced by a greatness of style and character, within such an extent as ordinary labor may modify, and the compass of a garden include. The caution, therefore, may not be useless within these narrow bounds; but nature proceeds still farther, beyond the utmost verge to which art can follow, and, in scenes licentiously wild, not content with contrast, forces even contradictions to unite. The grotesque, discordant shapes which are often there confusedly tumbled together, might sufficiently justify the remark. But the caprice does not stop here; to mix with such shapes a form perfectly regular, is still more extravagant; and yet the effect is sometimes so wonderful, that we cannot wish the extravagance corrected." (*Obs. on Mod. Gard.* p. 23.)

SECT. II. *Of operating with Wood.*

7203. *Wood produces almost all the grand effects in both styles of improvement; for trees, whether in scattered forests, thickets, or groups, or in compact geometric squares, avenues, or rows, constitute the greatest charm of every country. Trees improve the most varied outlines of buildings (fig. 688.), and without them the grounds*

of a residence (fig. 689.) would often be nothing more than an unmeaning profusion of winding roads or walks. A tree in itself is, indeed, the noblest object of inanimate nature; combines every species of beauty, from its sublime effect as a whole, to the individual beauty of its leaves; exhibits that majestic uniformity and infinite variety which constitute the essence of relative beauty; and the natural expressions of individual species are as various as are their forms and magnitude, their utility to man, and the situations, soils, climates, and other general and accidental circumstances of which they are indications.

7204. *The effect or expression of trees, individually and in masses, has been entered on at length in the preceding book; we shall here, therefore, confine ourselves to a few general observations on the effect of planting in the geometric and modern manners.*

7205. *In planting in the geometric style, the first consideration is the nature of the whole or general design; and here, as in the ground, geometric forms will still prevail, and while the masses reflect forms from the house, or represent squares,*

triangles, or trapeziums, the more minute parts, characterised by lines rather than forms, such as avenues, rows, clumps, and stars, &c. are contained in parallelograms, squares, or circles. In regard to the parts, masses and avenues should extend from the house in all directions, so far as to diffuse around the character of design; and as much farther in particular directions as the nature of the surface admits of, the distant beauties suggest, and the character of the mansion requires. In disposing these masses, whether on a flat or irregular surface, regard will be had to leave uncovered such a quantity of lawn or turf as shall, at all events, admit a free circulation of air, give breadth of light, and display the form of the large masses of wood. Uniformity and variety as a whole, and use as well as beauty in the parts, must be kept constantly in view. Avenues, alleys, and vistas, should serve as much as possible as roads, walks, lines of fences, or screens of shelter or shade; but where this is not the case, they should point to some distant beauties, or near artificial objects, to be seen at or beyond their termination. The outer extremities of artificial plantations may either join natural woods, other artificial scenes, cultivated lands, or barren heaths or commons.

7206. *When artificial plantations join natural woods*, the avenues, alleys, and circular glades of the former may be continued a certain length in the latter, so that the point where the natural wood begins, and the artificial plantation ends, may not be discoverable. In aid of this effect, the sort of tree which prevails in the natural scenes, should also prevail in the adjoining parts of the artificial wood. When artificial scenes join other artificial scenes, nothing can be easier than by the reciprocal continuation of avenues, strips, or masses, so far to unite the two seats, as to conceal the boundaries of each, while the two mansions will thus each borrow a splendor from the other. There are still existing proofs of the attention paid to this subject in former times, an instance of which occurs in the apparent connection by avenues between Blenheim, Ditchley, and Heythrop, though the last mansion is nearly ten miles distant from the first.

7207. *When artificial scenes join cultivated lands*, if those lands are enclosed, broad strips, hedge-rows, square or round clumps in the angles of the fields, with such reciprocal disposition of lines or forms as the case may suggest, will continue the character of artificial plantation; and where roads are necessary, if utility does not forbid, they should be formed in part as avenues, in continuation of those within the artificial scene.

7208. *When artificial plantations are bounded by barren heaths or commons*, all that can be done is to advance beyond the boundary of the place portions of avenues, and rows of trees of different lengths. Sometimes an inequality, crowned by a clump or thicket,

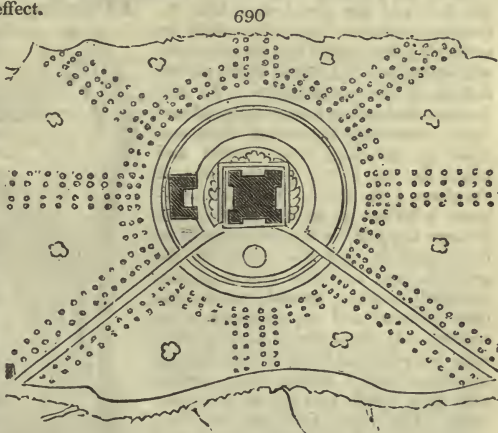

may promote the idea. On other occasions, where the heath or waste may be so bleak as to convey no agreeable expression, and therefore is, of course, struck out entirely from the improved scene, a sort of connection may be given, by advancing strips or rows from the boundary plantation into the heath. Even single or scattered trees, if they can be protected in that situation, will have a tendency to produce that sort of connection required; and, while it gratifies the proprietor's love of appropriation, will please the eye of the traveller, who views the country as a whole, and delights to observe the harmony and beauty of its principal features. Having disposed of the whole, and of the parts, as far as respects their general effect and connection, what remains to be considered is, the sort of tree, manner of disposing the plants, fences, and future management.

7209. *When the object in view is the expression of art and design*, the propriety of employing species of trees different from those which are natural to, or most abundant in the surrounding country, is obvious. In a country of common pine, the spruce and silver firs and cedar afford a choice. In a country of oaks or elms, chestnuts, limes, and planes, form suitable contrasts. Where the plantations are extensive, the value of the timber must always be a principal object; and, therefore, the contrasted trees should be chosen accordingly. Some species, however, are so happily adapted for this style, and as ornamental trees in both styles, that they ought seldom to be omitted excepting near the house: such for example, as the horse-chestnut, lime, Spanish-chestnut, plane, lucombe oak, cedar, stone pine, &c. As the four last species mentioned are, in exposed situations, liable to injury from extraordinary severe winters, a few hardier sorts, resembling them in general appearance, should be intermingled in the plantation, to preserve the larger masses in case of accident, but to conform with the general effect in color and style of foliage, as well as in form. Different species ought not in general to be mixed together in the masses; one, or at most two, conforming varieties are sufficient; more would destroy the breadth of color of the mass, and the character of its surface. Different masses, avenues, and more minute parts, may, however, be planted with different species of trees; rare sorts may be also introduced in lines, along the front of many of the masses, ranged along stars, crosses, &c. The snowdrop-tree, from its beautiful blossoms, and the birch and hazel, for the display of their catkins during winter, are well calculated for walks adapted to that season of the year, and should be planted in front of pines, or other evergreens. Such also is the principal situation for flowering shrubs, and no plants can be more showy than the horse-chestnut, common lilac, acacia, guelder-rose, Portugal laurel, holly, bird-cherry, pyrus, mespilus, and laburnum, in similar situations, and for general purposes. In distributing the species of tree in extensive masses, the same general principles of composition must be attended to, which we have pointed out, as far as respects form. The colors and character of the heads of the trees must be connected, and, at the same time, to a certain degree contrasted, in order to produce an artificial and yet harmonious effect.

7210. *Whether the new varieties of American and other trees*, obtained since the introduction of landscape-gardening, are to be admitted under this style of improvement may be questioned by some. We answer, certainly, unless where the object is the imitation of an ancient residence (*fig. 690.*); and there can be no doubt that where such is the object, exotic trees will destroy part of the illusion; but we do not contend for the revival of the ancient style solely as producing imitations and allusive characters, or on account of its antiquity, but as a distinct mode of gardening. We would therefore not copy its faults or study its defects, but add to its beauties from all the resources furnished by the present improved state of the arts of design, as well as by the continued accession to our stock of trees and shrubs. If however a positive imitation of an ancient residence is intended, then the species of tree should be limited to those used in ancient times, as well as the forms and lines of their disposition.

7211. *The manner of disposing the plants* is influenced by the same principle of avowed

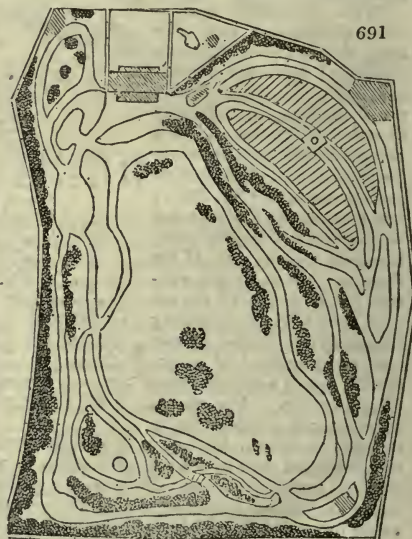

art; in rows, equidistant masses, in squares, or in quincunx, and in every case so as never to be mistaken for trees or shrubs sprung up accidentally.

7212. *Fences.* Here the ancient style has a grand advantage over the modern, in which, as far as respects the imitation of nature, all fences are to be considered as temporary, and, therefore, to a certain degree, looked on as nuisances to be afterwards removed. Besides, their irregular and circuitous line is displeasing to many who do not understand ground-plans, with a view to picturesque beauty, when the trees are grown up. But in geometric gardening, fences are to be considered in many cases as objects, and when not regarded in this light, their directions and limits are so minutely pointed out by the determined outline of the plantations, that the eye acquiesces in their situation and use. Fences of any common and economical description are employed to protect the trees of open avenues, open groves, and single open rows. But the more common kind are walls, which in the prominent parts ought to be well built of shaped stone, and substantially finished by raised or flat copings, bearing some relation to the copings of the simpler parapets of the house. The gates necessary in these walls, as well as in some sorts of permanent verdant fences, supply occasion for such architectural forms and lines, as are advantageous in reflecting those of the mansion, and strengthening the prevailing idea of dignity, art, and design. Every sort of fence belonging to the modern style, may be occasionally employed in the ancient; and besides walls, half-sunk walls, and raised mounds with a walk at top, we may enumerate hedges of holly, yew, laurel, and other shrubs, either simple or chequered, by alternate deciduous or evergreen species, varied by arcades and standards, shorn into shapes, or in their natural growth. Hedges of flowering shrubs may also be introduced; of creepers on open palisades; and various others of great beauty may be invented, or are to be found in books on this style of gardening.

7213. *Management.* In this respect also, the advantage is greatly in favor of the ancient style; for as all operations of pruning and thinning in the other should be done under the eye of the landscape-gardener, so all these operations here may be performed by any laborer; the object being simply to produce a straight, upright, smooth stem, to a certain height according to circumstances, and allow each particular tree to attain its full size. Shearing or clipping is always a mere mechanical operation; plain hedges and close alleys require only a line for a guide; and in the case of arcades or verdant sculpture, there is, or always should be, a frame of trellis-work of correct design to guide the operator. From the comparative brevity of this view which we have taken of planting under the ancient style, the reader will perceive, that we are far from supposing it to take the lead of the natural method to which we now proceed, referring for more particular information to Le Blond, and other French authors; and to Switzer's *Ichnographia Rustica*.

7214. *In planting with a view to natural beauty,* the effect of the whole is here also the first and the grand consideration. All planting, as respects the formation of a country-residence, must necessarily be materially influenced by the character and situation of the house, as the capital feature in the composition. To this feature, the leading masses of wood and lawn, answering the end of light and shade in painting, must invite and direct the eye in the general view of the place. (*fig. 691.*) Each must embrace it on one or on more sides, and diverge from it in masses suitable to its magnitude and the extent of the grounds, and in forms and characters of woody surface, suitable to the natural situation and the expression to be created. If the mansion is on a declivity, the principal light should embrace the front which looks down, rather than those which look up, or on either side. The views from the windows suggest this arrangement, and will point out in every other situation, whether a flat, a hill, or an irregular surface, on which side or sides the leading masses are to have their origin. To determine their magnitude, form, and number, would be impossible, without

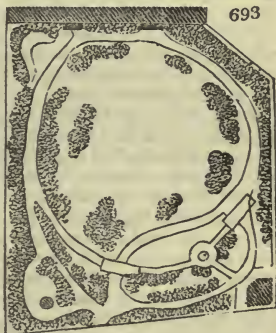

a particular case to refer to. To point out their style is sufficient, which must always be irregular like nature; generally stretch along such rising ground as the situation affords; and, like her, always combine a certain degree of uniformity or recognisable shape, even amidst the greatest seeming deviations from this quality of figures. As the house indicates the commencement of the masses, the character of country surrounding the scene of improvement must determine the limits and style of their termination. If the lands are laid out in regular enclosures, bounded by hedges and hedge-rows, fragments of these (fig. 692.) must prevail in the margin of the park; at least in as many

692

places, and to such a degree, as will produce connection; and, if possible, as much farther as will harmonise the scene within, with the country without. If it is entirely or in part surrounded by forest scenery, the termination is easily and completely effected, by attending to the style of wood and species of tree prevailing without, for a moderate distance within the boundary. If bounded by the sea, or a large lake, an abrupt termination will be as natural as it would be formal on the margin of a cultivated surface. Abrupt terminations, however, are often unavoidable, as in examples of villas, where the owner having no demesne, has no control beyond his boundary fence. All that can be done, therefore, in such cases, is, to create as much beauty and interest as possible within the given limits. Where one villa joins another, this sort of isolated abruptness is avoided or lessened; and, in the case of suburban villas (fig. 693.), it is seldom felt as any deformity, though, even here, connection and general harmony with what is exterior, will add beauty to what is within.

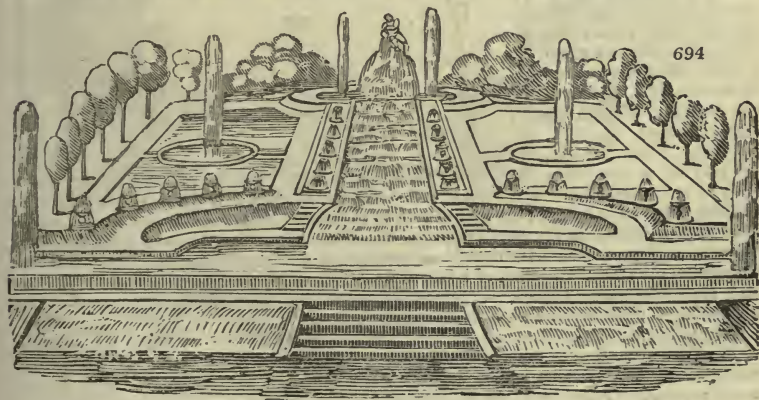

7215. The details of planting in this style have already been given at length in the preceding book.

SECT. III. Of operating with Water.

7216. Water is a material of so captivating and interesting a description in the different characters in which it occurs in nature, that no view can be reckoned complete in which it does not compose a feature. It forms a part of every garden in the ancient style, in the various artificial characters which it there assumes of oblong canals, ponds, basins, cascades, and *jeux-d'eau* (fig. 694.); and in modern improvement, such is the

694

value attached to its effect, that no place is deemed perfect without a river or lake ; and such the indiscriminate desire of obtaining them, that nature has been too frequently disregarded in their form and situation. Of the characters which water assumed under the geometric style, we can only observe, that their names convey, in a great degree, an idea of the forms. Their situations were near the mansion ; and their marginal accompaniments of masonry, turf walks, and hedges, were determined by the architectural forms and lines of the capital feature in the scene. The choice, from the most intricate and curious fountains to the plain oblong canal, depended on the splendor of the general design ; very little on natural situation. The supply was generally obtained from some concealed reservoir.

7217. *To imitate lakes, rivers, or rills, and their accompaniments, is the object of landscape-gardening ; and of each of these natural characters we shall remark the leading circumstances in the originals and the imitations.* All water is either running or stagnant. Lakes, ponds, and pools, are of the latter class ; rivers, rivulets, and rills, of the former description. In certain situations, lakes may be created where their supply is moderate ; rivers and rills only when it is abundant. Both characters, when they exist in nature, may be improved by studying the natural characteristics of each species.

7218. *Situation, relatively to the character of the ground's surface, is the first consideration respecting water, in whatever form it may appear.* No situation in which this material may be supposed to exist and expand itself into a body, can be truly natural, that is not a vale, plain, or hollow. Mountain streams are out of the question ; and small lakes or pools, in hollows or elevated grounds, are more to be considered as accidental than as general nature. Even artificial lakes or rivers on a considerable scale, to be natural must either be, or seem to be, situated in the lowest part of the landscape then under the eye. If otherwise, if placed on the side of a declivity over which the eye can range at the same time, it may be attractive to a stranger at first view ; but the want of truth or fidelity to the thing to be imitated, will soon bring on an increasing aversion in the mind of genuine taste.

7219. *Ponds in different levels, seen in the same view, are very objectionable on this principle.* The little beauty they display as spots, ill compensates for the want of propriety ; and the leading idea which they suggest, is a question between their present situation and their non-existence. The choice, therefore, as to the situation of water, must ever depend more on natural circumstances than proximity to the mansion. Is then all water to be excluded that is not in the lower grounds ? We have no hesitation in answering this question in the affirmative, so far as respects the principal views, and when a lower level than that in which the water is proposed to be placed is seen in the same view. But in respect to recluse scenes, which Addison compares to episodes to the general design, we would admit, and even copy the ponds on the sides or even tops of hills, which may be designated accidental beauties of nature. In confined spots they are often a very great ornament (*fig. 695.*) ; as a proof of which, we have only to observe some of the suburban villas round the metropolis, where a small piece of water often comes in between the house and the public road with the happiest effect.

7220. *A beautiful lake, or part of a circuitous body of water, considered as a whole, will be found to exhibit a form, characterised by breadth rather than length ; by that degree of regularity in its outline as a whole, which confers that, which, in common language, is called shape ; and by that irregularity in the parts of this outline, which produces variety and intricacy.* Supposing the situation to be fixed on for the imitation of a lake (*fig. 696.*), the artist is to consider the broadest and most circuitous hollow as his principal mass or breadth of water, and which he will extend or diminish according to the extent of aquatic views the place may require. From this he

may continue a chain of connected masses of water, or lakes of different magnitudes and shapes, in part suggested by the character of the ground, in part by the facilities of planting near them, and in part by his own views of propriety and beauty. The outline of the plan of the lake is to be varied by the contrasted position of bays, inlets, and smaller indentations, on the same principles which we suggested for varying a mass of wood. To the irregularity of outlines so produced, islands and *aits* (fig. 697.) may be added on the same principle, and for the same objects as thickets and groups. This will complete the character and beauty of the plan of the water.

7221. *But the grand effect of water in landscape, depends on wood as its accompaniment.* The variety and intricacy of outline, the reflection of forms and colors, the shady recesses and flickering lines of light, all depend on trees. These are not to be sparingly or indiscriminately scattered around the margin, but liberally in some places, for the sake of a contrasted mass of grateful color or shade, to relieve the brilliancy of the water; and with discrimination everywhere to mark the beauties, and heighten the variety of the outline, without destroying breadth of effect, or a whole, either as respects the water alone, or the entire residence.

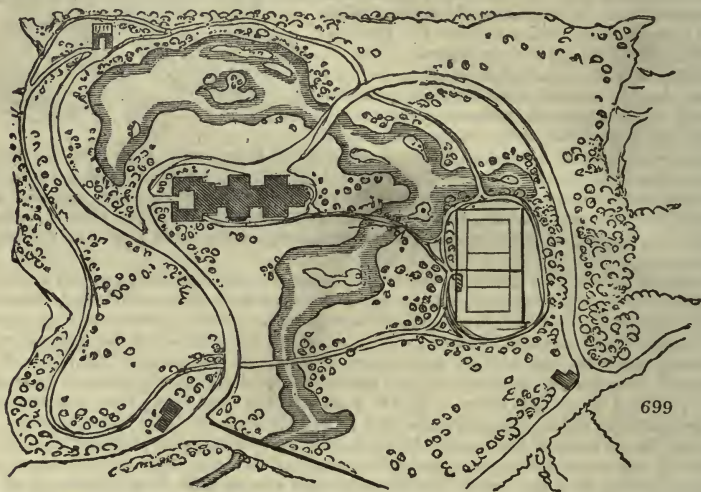

7222. *The marginal banks of water in nature, are tame or bold, gravelly or sedgy, stony or rocky, according to the character of the surrounding ground.* Art, therefore, must imitate each in its proper place, not always by a studious picturesque arrangement of the marginal accompaniments in each case, but by excavating the ground-work, planting the trees and shrubs, and leaving the rest to the motion of the waves of the water. After the effects of one winter, stones or gravel may be deposited in spots suitable for stony or gravelly shores. But to enter into this, and many other circumstances in the imitation of lakes, would exceed the proper limits. We add two cautions: the first is, in all cases of the beautiful picturesque, so to arrange by puddling and under-draining, that a marshy appearance may not surround the lake; and that rushes, and such aquatic plants, may not extend farther than a few feet or yards from the margin of the water. The other respects islands, which are the greatest ornaments to lakes. But that island which is placed in the centre, or in any situation where it does not connect with other islands, or with the shore, so as to form part of a prominence or recess, is injurious to the effect of the whole inversely as its beauty, when properly placed.

7223. *Rivers and rills, we have said, are rather to be improved than created; for we cannot sympathise with that taste which directs the mimicry of so noble a character as a river, or is satisfied with a nearly stagnated rill.* We do not consider the river at Blenheim as an exception, because that piece of water was formed by widening a considerable brook. We allude to those wavy serpentine canals, which are never mistaken for natural scenes, and, in almost every case, might be advantageously exchanged for a lake. A rill, however, may have its course rendered more varied, may be expanded at proper places into regular shapes, and all the alterations accounted for and harmonised by planting. (fig. 698.)

7224. *Progress and impetuosity* are the two leading ideas which belong to running waters. The first expression may be heightened by counteracting any tendency to expansion; by removing some of the circuitous and oblong projections of earth or stone in the banks; and sometimes by deepening its bed, or by substituting a more direct line for a circuitous course. The idea of impetuosity is indicated by its effects, in reverberating against high banks, or common banks, on which trees are situated, and may be increased, by augmenting the cause or the effect, and thus either digging and undermining the trees, cutting down the high banks on which the water acts, or placing very slight piers as jetties on the opposite shore. Picturesque additions to the marginal accompaniments both of

riders and rills will readily suggest themselves. Cascades and waterfalls may sometimes be created; and the occasional expansion of natural brooks into pools, affords a fine hint for imitation, when this form of water comes within a scene of improvement. One of the greatest improvements that can be made in many places laid out in Brown's time, and subsequently, consists in widening in some places, and varying the margin in others, of those tame serpentine canals, then so much in fashion. By this means, and by adding islands and trees, they may often, without deranging the place as to other details, be rendered highly beautiful at a moderate expense. (*fig. 699.*)

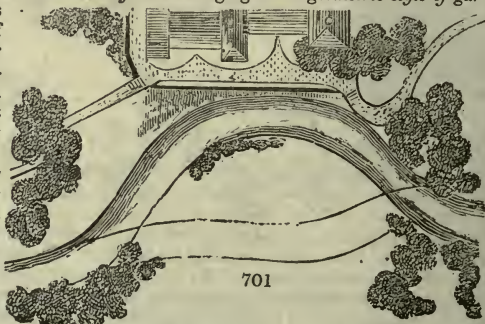

7225. A waterfall, or cascade, is an obvious improvement where a running stream passes through a demesne (*fig. 700.*), and is to be formed by first constructing a bank of masonry, presenting an inclined plane (*a*) to the current, and rendering it impervious to water by puddling (1720.) or the use of proper cements, and next varying the ridge (*b*) and under side (*c*), with fragments of rock, so chosen and placed, as not to present a character foreign to what nature may be supposed to have produced there. The adjoining ground generally requires to be raised at such scenes, but may generally be harmonised by plantation.

700

7226. Where running water is conducted in forms belonging to the geometric style of gardening, waterfalls and cascades are constructed in the form of crescents, flights of steps, or wavy slopes; all which have excellent effects of their kind when appropriately introduced, as at Chatsworth, Hatton, and many other places.

7227. A natural stream may sometimes be improved by altering its direction, and bringing it through a more interesting part of the grounds; and we have known an admirable effect produced by bringing a distant river close to the house, even so much so as to wash the base of its terrace-wall. (*fig. 701.*)

SECT. IV. *Rocks.*

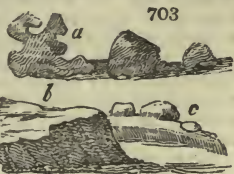

7228. *The imitation of rocks forms no part of the geometric style of gardening, and are a material of the natural style, equally unsuitable to be created. But though rocks cannot readily be imitated, their expression may sometimes be heightened when desirable, and concealed when disagreeable.*

7229. *The character of rocks may be savage, terrific, sublime, picturesque, or fantastic. By attending to the forms of the milder characters, and their connection with ground and trees, we shall discover whether, and to what extent, they may be improved. Savage rocks are too inhospitable to be permanently admitted, in any extent, near the eye. All rocks convey something of this idea that are not accompanied by vegetation; and, therefore, planting among or near them is, in every case, an improvement where trees do not exist. All rocks are expressive of dignity; those eminently so, are not greatly varied by projections from their surface: their beauty is to be augmented, either by increasing their surface in height or depth, or by connecting it if too scattered. The removal of a few feet of earth, or part of the bushes or trees from the bottom of a precipice or ridge, and the emplacement of a line of wood along its summit, will increase its real and apparent height; a similar process, with respect to the sides, will add to the idea of stability and continuation. If the parts are too much scattered, a few trees placed before, or bushes or creepers planted in the intervals between the parts, will connect them, and give the idea of a whole, partly concealed. But in this case, a considerable breadth of surface is necessary, at least in one place, otherwise dignity must give way to picturesque beauty. But the least indications of rocks that are not very fantastic in their form, even including such whose chief expression is picturesque beauty, are, to a certain degree, expressive of dignity. The slightest indication of a stratum or ledge appearing above the surface, conveys something of this idea, and ought not to be neglected. When they are discovered by alterations in the ground with a view to the formation of roads, fences, and water, or to the erection of buildings, occasional advantage may be taken of their appearance. A road across a declivity may be accompanied by a ledge of rocks instead of a bank of earth. Grounds which are broken and picturesque, will display a more sufficient reason for the appearance. The walls of a terrace evidently in part founded on a rock, will give an idea of dryness, dignity, and security to the house; and the margin of a stream displaying even large stones, increases the idea of impetuosity; or, in lakes, of the action of water in washing away the earth. Among imitations of wild scenery, detached stones heighten the illusion, and carry back the mind to the aboriginal state of the country. Loose or detached fragments of rocks may often aid the effect of real or supposed masses. The appearance of a large rude stone near a wooded steep, unless of one evidently rounded by water or art, always leads the mind to the larger mass up the acclivity from which it has been broken and rolled down; if partly sunk in the ground, and concealed by vegetation, the fertility of the imagination considers them as parts of magnitudes which lie buried under the surface. All this, however, can only be successfully accomplished in a country which, by the character of its general surface, does not preclude the idea of rocks. On a flat or a champaign country, the want of truth, or seeming truth, would render them disagreeable; and, indeed, did rocks exist in such a landscape, they should be hidden rather than displayed, unless of such extraordinary magnitude and effect, as to form an exception to general principles.*

7230. *The judicious distribution of stones, in situations where they are not evidently foreign to the character of soil and surface, may greatly heighten wildness and picturesque beauty. (fig. 702.) Every thing, however, will depend on the manner in which this is done; they must not be merely laid down at random on the surface (a), or formally joined together (b), or merely connected, which, however, is better (c); but grouped with taste (d), and partially concealed by vegetation and sunk in the soil. (f, g).*

7231. *Fantastic stones (fig. 703. a) should be avoided in all cases, unless in some peculiar scene; and where there are already indications of stratified or regular masses of rock (b), it can never appear natural to place near them round, water-worn stones (c). Where angular and laminated stones are near; or where*

such as can be quarried in forms suitable for building may be procured, grand effects may be produced; either by using them in forming imitations of nature, or by combining them in a mixed style of artificial form and natural conglomeration. (fig. 704.)

SECT. V. Buildings.

7232. *Buildings*, as materials of scenery, are entirely under the power of man; and, from that circumstance, were carried to an unwarrantable excess in the decline of the ancient, and the infancy of the modern style. Improvements on ground are forgotten by their effect; that of planting may be accounted too distant or too slow by ordinary minds; but a building is complete the moment it is finished. It affords immediate satisfaction to the owner; and being known as a costly object, full credit is given to him for the expense incurred. Thus wealth, confiding in its powers, multiplied garden-buildings to an excess, which ended in creating a disgust, still existing, in some degree, at their appearance in improved scenery. Before proceeding further, it may be proper to offer some remarks on the style or architecture of buildings.

7233. *It is a common error to consider nothing as architecture but what is Grecian*; to fancy that all architecture must have what are called orders; and to consider the Gothic, Chinese, or Hindoo modes of building, as mere barbarous compositions. But nothing can be more unphilosophical than this mode of viewing the subject; and it may just as well be said that there is no true language in the world but the Greek; that every language ought to correspond with it in the tenses and moods of the verbs; and that every other mode of speech is mere jargon. A style of building, and mode of oral communication, must have a sufficient claim to be considered as complete, when they answer the purposes for which they are intended; and, applying this principle to the architecture and language of different countries, we shall find that each is complete relatively to those countries. That any style of building, or any language can be universally suitable, is to suppose that the same climate and the same degree of civilisation prevails over the whole globe. Thus, as there are different languages, and different manners and customs, so there are different styles of architecture; and though we may prefer the Grecian, as having been used by the most refined nations of antiquity, let us not hastily reject every other style as devoid of congruity, or unsuitable for being applied to constructions of use or beauty.

7234. *The origin of the different styles of architecture* are usually traced to imitations of temporary structures formed of timber or of rough trees; and thus the Grecian column, with its capital ornamented with foliage, has been called an imitation of the trunk of a palm, with the petioles of its recently dropped leaves still adhering; the Gothic arches and tracery have been likened to wicker-work, or the intersecting branches of an avenue; and the Chinese style to the imitation of a tent supported by bamboo. But the imitation of nature is the last thing that occurs in the progress of improvement; and though the above opinions may not be without their use as a sort of hypothesis for composition; yet it appears much more probable that styles of building have taken their origin, jointly from the materials the country afforded, and the wants of the people. According to this hypothesis, the Grecian may be considered as founded on the use of planks of stone, in the same way as beams of timber (fig. 705. a); the Gothic, by the use of small stones, held together by their position (b); and the Hindoo, by the use of small stones, held together by superincumbent weight (c). The Doric temple (fig. 706.) is easily traced in this way to its prototype of wood; but though the idea be supported by the authority of Vitruvius, it should never be considered as any thing more than mere conjecture.

7235. *The progress which architecture has made in Britain*, in modern times, is matter of greater certainty; and Repton, with his usual taste, has furnished an ingenious

vignette (fig. 707.), which indicates that the most remote style of domestic architecture, was that of the castellated Gothic; to which succeeded the ecclesiastic Gothic; next the style prevalent in the seventeenth century, being a mixture of Gothic and Grecian, commonly called the Elizabethan style; after that the Grecian; and last of all, the Hindoo, just coming into notice, and which he considers (*Designs for the Pavilion at Brighton, &c.* 1810) as likely to become fashionable.

The most suitable style for domestic purposes in Britain, he considers to be the Gothic, as admitting every description of interior form and arrangement, an unbounded variety in the external forms and lines, and as being favorable to future additions, without deranging the effect or ordonnance of the original composition.

706

707

7236. With respect to *the effects of buildings, as component parts of verdant scenery*, Shenstone observes, that a landscape; to him, is never complete without a building or rocks; and certainly, considering it merely in the light of a picturesque view, a building, in addition to merely verdant scenery, forms a better picture, by giving a desirable feature or resting-place for the eye. Considered, however, in the light of natural expression, the meanness of root-houses and grottos, the absurdity of hermits' cells, heathen temples, triumphal arches, mock chapels, &c.; and the inutility of all of them, render them positive deformities in scenes of natural or picturesque beauty. They break in upon repose, simplicity, and all allusion to natural scenery by their frequency, and suggest ideas of ostentatious vanity in the owner, rather than of propriety and elegance of taste. But though their excess is so general and so obnoxious, the occasional introduction of some sorts may be made with propriety. Garden-seats are necessary for shade or shelter; bridges, for communication between the banks of rivers or rills; cottages, gate or entrance lodges (fig. 708.), as abodes for laborers; and open sheds as places of resort for cattle. Even a prospect-tower is a desirable object in a flat country, affording no other means of obtaining a bird's-eye view. A temple, after all, is in many cases but a garden-seat; and if beautiful in itself, and judiciously placed, we can see no objection to its introduction in the garden-scene of a princely mansion; certainly none to more than one of them, under the geometric style of planting. To raise a monument in memory of a great public character, or consecrate an urn to private friendship, or parental memory, can hardly be offensive to any mind. A sundial is both a useful and an agreeable object; and statues and busts, in highly polished scenery, by the contrast in the kind of beauty displayed, recall the mind for a moment, from contemplating the wide range of nature, to admire the hand of art concentrated in a single point. In this view there are various objects of this description admissible in the more polished scenes of gardens, &c., as marble fountains, fragments of antiquity, &c. But when simplicity and natural-like beauty are the prevailing idea, all works of art must interfere more or less with the idea; and unless they can raise up and maintain a more interesting expression, they must be regarded as injurious rather than beautiful.

708

7237. *But simplicity and nature, continually repeated, become tiresome in their turn, and man is then pleased to recognise the hand of art, if judiciously exercised, even*

on an artificial ruin (*fig. 709.*); but then the execution must be such as to silence every idea as to its history; it must be so like truth as to interest by the likeness, not by deception, which is disgusting. Artificial ruins, however, need seldom be resorted to while there are so many other architectural and sculptural decorations to which we can have recourse. Nothing gives more general satisfaction than a neat and comfortable picturesque cottage (*fig. 710.*), with a good garden in neat order and cultivation; and such buildings may always be applied to some useful purpose, even in the grounds of small villas or *fermes ornées*. In more extensive scenes, cottages of

different styles may be introduced from that of the Greenlander or Norwegian to the Hindoo; and there can be no reason why a proprietor, if he chooses to go to the expense, should not ornament the dwelling of an upper servant in any style he pleases, even that of a Chinese mandarin. (*fig. 711.*)

SECT. VI. *Of the Accidental Accompaniments to the Materials of Landscape.*

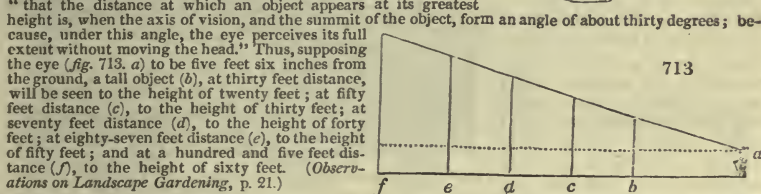

7238. *Of accidental accompaniments* the first are *roads*; and of roads, the principal is the *approach*. The approach, or road to the house, ought to display to advantage the beauties of that part of the place it passes through, and as many other beauties as may be displayed without showing the principal, which are generally those of the garden-front. In both styles, it ought to ascend to the house rather than descend, and pass along a flat or hollow rather than over inequalities of surface.

7239. *The approach in the geometric style* was generally a wooded avenue, in one or in several lines. In the modern, it is generally a bold, free, gently waving line; every turn of which is, or seems to be, produced either by some gentle variation in the surface, or by the position of a group of trees. It may pass through wood only, or through forest-like scenery. The first view obtained of the house ought to be as favorable as possible, and not of any particular front, but rather an angular view, bosomed in trees. The second, or if there are two or more, the last view, on a nearer approach, should be distinct, and show the entrance-front, and porch, or portico; the road approaching it at such a distance, obliquely, as that the eye may now readily comprehend the whole, and to the greatest advantage.

7240. *In conducting the spectator to view objects*, whether by approaches, roads, or walks, it is a matter of some nicety to determine *à priori*, the exact distance at which he should be permitted to obtain a full view. There is a certain point of distance from whence every object appears at its greatest magnitude. The apparent *height* of any object will

vary according to its distance, the inclination it makes with the horizon, and our relative elevation or depression. A correspondent of Repton states, that "any two of the above three things continuing the same, the apparent magnitude will decrease with the third, though not in exact proportion to it. Thus, the object being perpendicular to the horizon, and our elevation remaining the same, its apparent height will decrease with the distance. Our elevation and the distance remaining the same, the apparent height of the object will decrease with its inclination to the horizon. The inclination and distance being the same, the angle, or apparent height, will decrease with our elevation or depression, supposing our height was at first the middle point of the object. This last being liable to some exceptions, the general rule is, that the distance from the object, measured by a perpendicular to it, the point at which its apparent height will be greatest is, where the perpendicular, from the eye falls upon the centre."

7241. *The difficulty in this subject is to know what the conception is that we shall form of the height and magnitude of an object according to different circumstances; its apparent height, as well as its real height, remaining the same. This cannot be reduced to rules, but depends chiefly on a careful comparison of particular instances. One cause, Repton considers, may proceed from the position of the eye itself, which is so placed in most foreheads as to view a certain portion of the hemisphere without any motion of the head. This portion has been variously stated at from sixty to ninety degrees. The eye surveys more in breadth than in height, and more below the axis of vision (fig. 712. a) than above it. Much depends on the projection of the forehead and eyebrows, prominence of the eye, &c. in different individuals; yet the upper angle (a b) will seldom be greater than one half of the lower angle (a c); and Repton ascertained that he could not distinguish objects more than twenty eight degrees above his axis of vision, though he could distinctly see them fifty-one degrees below it. From hence, he concludes, "that the distance at which an object appears at its greatest height is, when the axis of vision, and the summit of the object, form an angle of about thirty degrees; because, under this angle, the eye perceives its full extent without moving the head."* Thus, supposing the eye (fig. 713. a) to be five feet six inches from the ground, a tall object (b), at thirty feet distance, will be seen to the height of twenty feet; at fifty feet distance (c), to the height of thirty feet; at seventy feet distance (d), to the height of forty feet; at eighty-seven feet distance (e), to the height of fifty feet; and at a hundred and five feet distance (f), to the height of sixty feet. (*Observations on Landscape Gardening, p. 21.*)

7242. *The approach in the modern style was well understood by Repton, and the following excellent observations by this artist seem to sum up every thing that can be said on the subject: — The road by which a stranger is supposed to pass through the park or lawn to the house is called an approach; and there seems the same relation betwixt the approach and the house externally, 'hat there is internally betwixt the hall or entrance and the several apartments to which it leads. If the hall be too large or too small, too mean or too much ornamented for the style of the house, there is a manifest incongruity in the architecture, by which good taste will be offended; but if the hall be so situated as not to connect well with the several apartments to which it ought to lead, it will then be defective in point of convenience: so it is with respect to an approach; it ought to be convenient, interesting, and in strict harmony with the character and situation of the mansion to which it belongs.*

First. It ought to be a road to the house, and to that principally.

Secondly. If it is not naturally the nearest road possible, it ought artificially to be made impossible to go a nearer.

Thirdly. The artificial obstacles which make this road the nearest ought to appear natural.

Fourthly. Where an approach quits the high road, it ought not to break from it at right angles, or in such a manner as robs the entrance of importance, but rather at some bend of the public road, from whence a lodge or gate may be more conspicuous; and where the high road may appear to branch from the approach rather than the approach from the high road.

Fifthly. After the approach enters the park, it should avoid skirting along its boundary, which betrays the want of extent or unity of property.

Sixthly. The house, unless very large and magnificent, should not be seen at so great a distance as to make it appear much less than it really is.

Seventhly. The first view of the house should be from the most pleasing point of sight.

Eighthly. As soon as the house is visible from the approach, there should be no temptation to quit it (which will ever be the case if the road be at all circuitous), unless sufficient obstacles, such as water or inaccessible ground, appear to justify its course. (*Enquiry into the Changes of Taste in Lands. Gard. p. 109.*)

7243. *Walks are the next accompaniment to home scenes, without which they cannot be viewed but in particular states of the weather and the surface. They were straight, angular, or in regular curves, in the geometric style, and are in easy natural-like lines in the modern manner. Though avowed objects of art, they ought always to bear a certain analogy to the scenes they pass through; with formal-kept hedges in highly finished scenery, and edges blending with the gravel in the picturesque manner, recommended by Price in more wild scenes. Taste must determine their general course, from the range of beauties to be displayed; and their particular turns, from local beauties and ac-*

cidental circumstances. The principle of a *sufficient reason* ought never to be lost sight of in laying out walks and roads; that is, no deviation from a straight line should ever appear, for which a reason is not given in the position of the ground, trees, or other accompanying objects.

7244. *The finest description of hill or mountain walk* is where the path is carried along the declivity on a perfect level, or where it winds round the hill by a gradual and regular ascent, here crossing a smooth slope and there forcing its way through rugged rocks, always preserving the same easy ascent or descent. When the views from such walks are grand and extensive, and especially if they include part of a river, a lake, or the sea seen through a proper foreground of trees, nothing of the kind can be more noble.

7245. *Of valley walks*, one on the wooded banks of a winding river, with cascades, or running over a rocky bed, the path sometimes accompanying the stream, at other times both retiring or separating from each other, till the sound of the water is scarcely heard through the wood, and then meeting again, accompanied by open glade or meadow, with the other variations of which such scenery is susceptible, may be reckoned among the finest of the kind.

7246. *Fences* are accompaniments common to both styles of landscape; they are either permanent or temporary, and, in both cases, have been treated of in considering the subject of planting (6820.) and wood. (7203.)

7247. *Animated nature*. Deer, wild and tame hares, cattle, sheep, game, singing birds, all belong to a residence, and are necessary to complete its beauty. Pheasants and other game, ranging undismayed by man, in garden-scenes, give a high idea of seclusion and removal from common nature; the finer sorts may be retained in appropriate structures (fig. 714.), and the common left to themselves, but liberally supplied with food. The cawing of rooks, the shrieking of the owl, the screams of peacocks, the notes of birds, are all desirable circumstances in certain situations, and ought to be attended to, by introducing such trees or plants as are favorable to their increase. The smoke of a cottage or a farm-house, the view of a distant village, the spire of a church, a water-mill, or a ruin, all become interesting in certain cases; and with a thousand other instances of natural expression, in a great measure beyond the reach of art, will be sought for, and turned to account by the judicious artist.

CHAP. III.

Of the Union of the Materials of Landscape-Gardening, in forming the constituent Parts of a Country-Residence.

7248. Having applied the principles of natural and relative beauty to the materials of gardening separately, we shall next apply the same principles to the formation of those scenes of use, convenience, or elegance, which form the constituent parts of a country-residence.

7249. *The mansion and offices* first demand attention, as the central feature of art and refinement. What relates to the design of these groups of buildings belongs to architecture; but the situation, aspect, style, and accompaniments are within our province. In determining the situation, a great variety of circumstances, some of a general, and others of a local or peculiar nature, require to be taken into consideration. Natural shelter, dry sub-soil, the view of the house from a distance, and the distant prospect seen from the house, belong to the former; and removal from the boundary of a public road, suitableness of the adjoining grounds for the garden-scenes which accompany mansions, trees already there, or so situated as to aid the effect, &c. belong to the latter. According to Repton, the choice of a situation ought to be founded on, "First, The natural character of the surrounding country: Secondly, The style, character, and size of the house: Thirdly, The aspects or exposure, both with regard to the sun and the prevalent winds of the country: Fourthly, The shape of the ground near the house: Fifthly, The views from the several apartments: and, Sixthly, the numerous objects of comfort; such as a dry soil, a supply of good water, proper space for offices, with various other conveniences essential to a mansion in the country; and which in a town may sometimes be dispensed with, or at least very differently disposed."

7250. *To arrange these considerations according to their respective weight or influence is hardly possible; "this must depend on a comparison of one with the other, under a variety of circumstances; and even on*

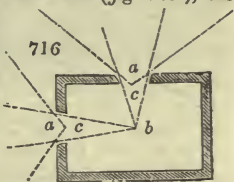

the partiality of individuals, in affixing different degrees of importance to each consideration. Hence it is obvious, that there can be no danger of sameness in any two designs conducted on principles thus established; since in every different situation some one or more of these considerations must preponderate; and the most rational decision will result from a combined view of all the separate advantages or disadvantages to be foreseen from each. It was the custom of former times, in the choice of domestic situations, to let comfort and convenience prevail over every other consideration. Thus the ancient baronial castles were built on the summits of hills, in times when defence and security suggested the necessity of placing them there; and difficulty of access was a recommendation: but when this necessity no longer existed, (as mankind are always apt to fly from one extreme to the other,) houses were universally erected in the lowest situations, with a probable design to avoid those inconveniences to which lofty positions had been subject; hence the frequent sites of many large mansions, and particularly abbeys and monasteries, the residence of persons who were willing to sacrifice the beauty of prospect for the more solid and permanent advantages of habitable convenience; amongst which, shelter from wind, and a supply of water for store fishponds, were predominant considerations." (*Enquiry*, &c. p. 83.)

7251. In hilly countries, or in any country where the surface is varied, the choice is neither made in the bottoms (*fig. 715. a*), nor on the summits of the eminences (*c*), but

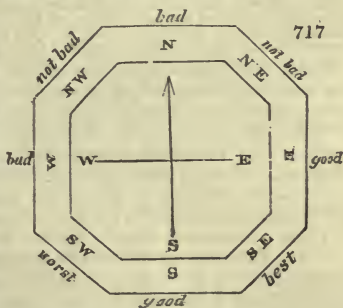

generally on the south-east side of the latter (*b*), on a raised platform, the rising grounds behind being planted both for effect and shelter.

7252. The field of vision, or portion of landscape which the eye will comprehend, is a circumstance frequently mistaken in fixing a situation for a house; since a view seen from the windows of an apartment will materially differ from the same view seen in the open air. Much evidently depends on the thickness of the walls (*fig. 716.*), the width of the windows (*a*), and the distance of the spectator from the aperture. Near the centre of the room (*b*), the spectator will not enjoy above 20 or 30 degrees of vision; but close to the window (*c*) his eye will take in from 70 to 100 degrees. Hence, to obtain as much of the view from a room as possible, there should not only be windows on two sides of a room, but one in the angle, or an oblique or bow-window on each side, instead of the common form. (*Obs. on Landscape Gardening*, p. 24.)

7253. The aspect of the principal rooms deserves particular attention in every case, and most so in bleak or exposed situations. The south-east is most commonly the best for Britain (*fig. 717.*); and the south, and due east, the next best. The south-west, Repton considers the worst, because from that quarter it rains oftener than from any other; and the windows are dimmed, and the views obstructed, by the slightest shower, which will not be perceptible in the windows facing the south or east. A north aspect is gloomy, because deprived of sunshine; but it deserves to be remarked, that woods and other verdant objects look best when viewed from rooms so placed, because all plants are most luxuriant on the side next the sun. "The aspect due east," he considers, "nearly as bad as the north, because there the sun only shines while we are in bed; and the aspect due west is intolerable, from the excess of sun dazzling the eye through the greatest part of the day. From hence we may conclude, that a square house, placed with its fronts duly opposite to the cardinal points, will have one good and three bad aspects." (*Fragments on Landscape Gardening*, &c. p. 108.)

7254. A mansion for the country, if a mere square or oblong, will thus be deficient in point of aspect, and certainly in picturesque beauty, or variety of external forms, lights, and shades. An irregular plan, composed with a combined view to the situation, distant views, best aspects to the principal rooms, effect from different distant points, and as forming a whole with the groups of domestic offices and other architectural appendages or erections, will therefore be the best; and as the genius of the Gothic style of architecture is better adapted for this irregularity than the simplicity of the Grecian, or the regularity of the Roman styles, it has been justly considered the best for country-residences. Another advantage of an irregular style is, that it readily admits of additions in almost any direction.

7255. *Convenience, as well as effect*, require that every house ought to have an entrance-front, and a garden-front; and, in general cases, neither the latter, nor the views from the principal rooms, should be seen fully and completely, but from the windows and garden-scenery. Not to attend to this, is to destroy their contrasted effect, and cloy the appetite by disclosing all, or the greatest part of the beauties at once. The landscape which forms the back ground to a mansion, the trees which group with it, and the architectural terrace which forms its base, are to be considered as its accompaniments, and influenced more or less by its style. The classic pine and cedar should accompany the Greek and Roman architecture; and the hardy fir, the oak, or the lofty ash, the baronial castle.

7256. *Terrace and conservatory.* We observed, when treating of ground, and under the ancient style, that the design of the terrace must be jointly influenced by the magnitude and style of the house, the views from its windows, (that is, from the eye of a person seated in the middle of the principal rooms,) and the views of the house from a distance. In almost every case, more or less of architectural form will enter into these compositions. The level or levels will be supported partly by grassy slopes, but chiefly by stone walls, harmonising with the lines and forms of the house. These, in the Gothic style, may be furnished by battlements, gateways, oriels, pinnacles, &c.; or, on a very great scale, watch-towers may form very picturesque, characteristic, and useful additions. The Grecian style may, in like manner, be finished by parapets, balustrades, and other Roman appendages.

7257. *The breadth of terraces*, and their height relatively to the level of the floor of the living-rooms, must depend jointly on the height of the floor of the living-rooms and the surface of the grounds or country to be seen over them. Too broad or too high a terrace will both have the effect of foreshortening a lawn with a declining surface, or concealing a near valley. The safest mode in doubtful cases is, not to form this appendage till after the principal floor is laid, and then to determine the details of the terrace by trial and correction.

7258. *Narrow terraces* are entirely occupied as promenades, and may be either gravelled or paved: and different levels, when they exist, connected by inclined planes or flights of steps. Where the breadth is more than is requisite for walks, the borders may be kept in turf with groups or marginal strips of flowers and low shrubs. In some cases, the terrace-walls may be so extended as to enclose ground sufficient for a level plot to be used as a bowling-green or a flower-garden. These are generally connected with one of the living-rooms or the conservatory, and to the latter is frequently joined an aviary and the entire range of botanic stoves. Or, the aviary may be made an elegant detached building, so placed as to group with the house and other surrounding objects. An elegant structure of this sort (fig. 718.) was designed by Repton for the grounds of the Pavilion at Brighton.

718

7259. *The flower-garden* should join both the conservatory and terrace; and, where the botanic stoves do not join the conservatory and the house, they, and also the aviary and other appropriate buildings and decorations, should be placed here. (See 6076. and 6161.)

7260. *The kitchen-garden* should be placed near to, and connected with the flower-garden, with concealed entrances and roads leading to the domestic offices for culinary purposes, and to the stables and farm-buildings for manure. (See 2382.)

7261. *The situation of the orchard* should, all other circumstances being suitable, be near to the kitchen-garden; and between them may be very properly placed the gardener's house, connected with the furnace, sheds, fruit-rooms, &c. (See 2527.)

7262. *The lawn*, or that breadth of mown turf formed in front of, or extending in different directions from, the garden-front of the house, is, in the geometric style, varied by architectural forms, levels, and slopes; and in the modern by a picturesque or painter-like disposition of groups, placed so as to connect with the leading masses, and throw the lawn into an agreeable shape or shapes. In very small villas the lawn may embrace the garden or principal front of the house, without the intervention of terrace-scenery, and may be separated from the park, or park-like field, by a light wire fence; but in more extensive scenes it should embrace a terrace, or some avowedly artificial architectural basis to the mansion, and a sunk wall, as a distant separation, will be more dignified and permanent than any iron fence. The park may come close up to the terrace-garden, especially in a flat situation, or where the breadth of the terrace is considerable.

7263. *The shrubbery* generally connects the house and flower-gardens, and forms, strictly speaking, a part of the pleasure-ground scenery. It is a scene in which the object is to arrange a collection of foreign trees and shrubs in a dry border, generally on the north side of a walk, or in dug groups and patches. One very principal consideration is, to connect, partly in appearance only, the dug patches. The distinct unconnected obtrusion of such scenes is justly reprobated by Price, who gives excellent in-

structions for creating the beautiful picturesque among dug groups, and preserving all the polish and appearance of high keeping with the most delicate culture of the plants. (See 6187.)

7264. *The pleasure-ground* is a term applied generally to the kept ground and walks of a residence. Sometimes the walk merely passes, in a winding direction, through glades and groups of common scenery, kept polished by the scythe, and from whence cattle, &c. are excluded. At other times it includes a part of, or all the scenes above mentioned; and may include several others, as verdant amphitheatres, labyrinths, (fig. 719.) a Linnæan, Jussieuan, American, French, or Dutch flower-garden, a garden of native, rock, mountain, or aquatic plants, picturesque flower-garden, or a Chinese garden, exhibiting only plants in flower, inserted in the ground, and removed to make room for others when the blossom begins to fade, &c.

7265. *The park* is a space devoted to the growth of timber, pasturage for deer, cattle, and sheep, and for adding grandeur and dignity to the mansion. On its extent and beauty, and on the magnitude and architectural design of the house, chiefly depend the reputation and character of the residence. In the geometric style, the more distant or concealed parts were subdivided into fields, surrounded by broad stripes or double rows, enclosed in walls or hedges, and the nearer parts were chiefly covered with wood, enclosing regular surfaces of pasturage. In the modern style, the scenery of a park is intended to resemble that of a scattered forest, the more polished glades and regular shapes of lawn being near the house, and the rougher parts towards the extremities. The paddocks or small enclosures are generally placed between the family stables and the farm, and form a sort of intermediate character.

7266. *The farm*, or that portion of agricultural surface, retained in the hands of the owner for private cultivation, was, in both styles, placed without, but adjoining the park; and when circumstances admitted, near to the paddocks. In some cases, on a moderate scale, part of the park constitutes the whole, or a part of the farm, and is kept in aration. The trees in this cultivated space are arranged in natural-like masses, so as to give the idea of part of a forest-scene subjected to the plough. When the park is extensive and truly forest-like, the effect of the whole is much improved by the contrast, and recalls to mind those charming scenes in the woody districts of Germany, where cultivation smiles in the glades and recesses of eternal forests.

7267. *The riding*, or drive, is a road indicated rather than formed, which passes through the most interesting and distant parts of a residence not seen in detail from the walks, and as far into the adjoining lands of wildness or cultivation, as the property of the owner extends. It is also frequently conducted as much farther as the disposition of adjoining proprietors permits, or the general face of the country renders desirable.

7268. *Original arrangement.* Though the above arrangement of the component parts of a residence will be found, in general, the most convenient on a flat surface, or one gently varied, we are far from recommending its universal adoption. Situations are always fertile in suggesting new ideas, which

“Start even from difficulties, strike from chance;”

and a mind already stored with a knowledge of every part of the subject, works from principles, and fortuitous suggestions, rather than models. We would rather see an original idea attempted than the most beautiful arrangement imitated.

CHAP. IV.

Of the Union of the constituent Scenes in forming Gardens or Residences of particular Characters; and of laying out Public Gardens.

7269. *To complete a country-residence* is the end of all landscape-gardening, whether imitative or geometric. In the preceding chapter we have given a general idea of the parts or scenes, and their connection, which enter into a complete residence of the first order. We have now to notice their arrangements in different gradations of residences

and these, we must previously acknowledge, are so intimately blended, that we hardly know how to separate them, and give a distinctive character to each; every country-gentleman, from the occupier of the palace to the cottage, adopting such luxuriant scenes as suit his particular taste, without reference to any thing but his own desires; and this happy circumstance contributes, perhaps, as much as the difference of situations, to the variety in the beauty and style of British country-residences. Mansions, villas, temporary residences, cottages, and public gardens, may be said to include the leading distinctions. Public gardens are much less various than private ones, because there are fewer publics than individuals.

SECT. I. *On laying out Private Gardens, or Residences.*

7270. *The specific distinctions of private residences* may be considered as the mansion and demesne, the villa, the farm, the temporary residence, and the cottage; but each of these branches out into a number of subspecies and varieties.

7271. *The mansion and demesne.* The characteristic of the mansion and demesne, is the demesne or surrounding lands in tenancy. Any residence of which the dwelling-house is of a higher character than that of the mansion and demesne, as the castle, abbey, and palace, has the same general arrangement in the grounds, and differs chiefly in extent, and in the arrangements of the courts and other exterior appendages of the house.

7272. *As a specimen of this style*, we shall give the arrangement at Michel Grove in Sussex, the residence of R. Walker, Esq. from the works of Repton:—

7273. In *determining the situation* for a large house in the country, there are other circumstances to be considered besides the fences and appendages immediately contiguous. These have so often occurred, that I have established in imagination certain positions for each, which I have never found so capable of being realised as at Michel Grove.

7274. I would place *the house*, with the principal front, towards the south-east.

7275. I would place *the offices* behind the house; but as they occupy much more space, they will of course spread wider than the front. I would place the stables near the offices. I would place the kitchen-garden near the stables. I would put the home-farm buildings at rather a greater distance from the house; but these several objects should be so connected by back roads as to be easily accessible.

7276. I would bring *the park* to the very front of the house.

7277. I would keep *the farm* or land in tillage, whether for use or for experiment, behind the house; I would make the dressed pleasure-grounds to the right and left of the house, in places which would screen the unsightly appendages, and form a natural division between the park and the farm, with walks communicating to the garden and the farm.

7278. *The villa* may be nothing more than a park with a house of smaller size than that of the *mansion* and *demesne*, surrounded by a pleasure-ground, and with the usual gardens. Moderate extent and proximity to other villas, constitute the characteristic of this class of residences; but though adjoining lands are not necessary to the character, they do not, where they exist, change it, unless their extent be considerable. Two villas joined together often mutually aid each other in effect, especially as to water and trees. (*fig. 720.*)

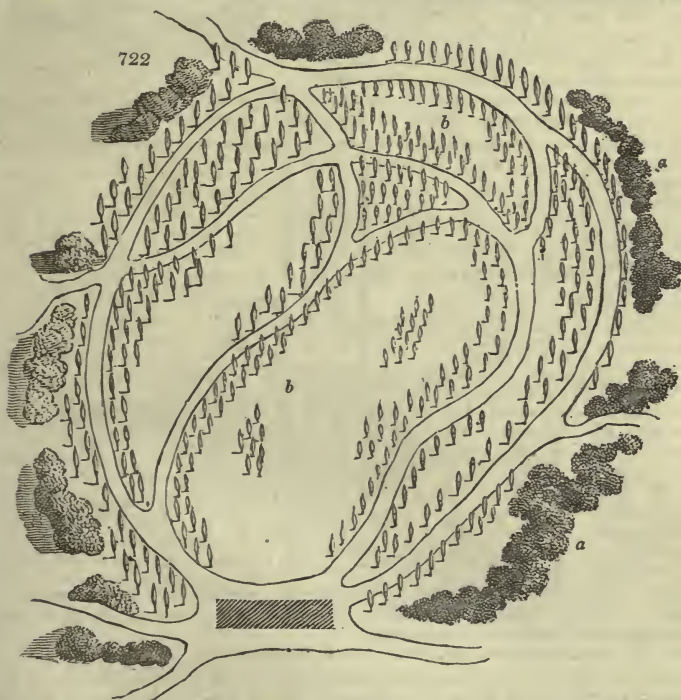

7279. *The villa farm.* A villa being originally a farm-house, we think that the Roman arrangement, in which the farm-offices were joined to, or at least so near, as to form with it and the domestic offices one group of buildings, might be adopted as the characteristic distinction of this class of residences. The farm-buildings should, in that case, be dignified with more architectural design than when placed at a distance; but

still in due subordination to the mansion. Instead of deer, sheep may graze the park on the garden-front, separated from the house by an architectural barrier, or in some situations, with a platform of gravel, and walks and knots of flowers. A glacis of turf, with a light fence below the slope, will be sufficient protection from sheep or cattle, and not impede the view of the lawn from the windows. The entrance-front may be approached through grass fields, not separated with common hedges, but with picturesque fences (*fig. 721.*) in the modern, and double hedges and slips of planting in the geometric style. All or any part of the other constituent parts of a *mansion and demesne* residence, such as hot-houses, gardens, orchards, pleasure-grounds, &c. may or may not be added, according to its extent, and the particular taste of the proprietor.

7280. The *ferme ornée* differs from a common farm in having a better dwelling-house, neater approach, and one partly or entirely distinct from that which leads to the offices. It also differs as to the hedges, which are allowed to grow wild and irregular (*fig. 722.*), and are bordered on each side by a broad green drive, and sometimes by a gravel-walk and shrubs. It differs from a villa farm in having no park. A dry hilly soil is best

suitable for this description of residence, of which there are some fine examples in Surrey, Kent, and the Isle of Wight.

7281. *Temporary residences*, as marine villas, sporting or shooting boxes, seldom con

tain much land attached. No hot-houses, and but little pleasure-ground is here required. What land there may be, should be applied to use rather than to beauty. Speaking of hunting-boxes, Marshall observes "a suit of paddocks should be seen from the house; and if a view of distant covers can be caught, the back ground will be complete. The stable, the kennel, the leaping-bar, are the appendages, in the construction of which simplicity, substantialness, and conveniency should prevail."

7282. *A cottage ornée*, we think, might be characterised by the 'garden-front opening into a picturesque orchard; or a lawn, varied by groups of fruit-trees, instead of a lawn or park planted with forest trees. It may contain any part of the scenes of the villa, at the will of the owner. If the situation of the house is elevated, so as to give a view from the principal rooms of a great part of the farm, it will be the more desirable. A desirable foundation for this improvement is an old English farmhouse; by adding to which one or two principal rooms, a very interesting group may be formed at little expense.

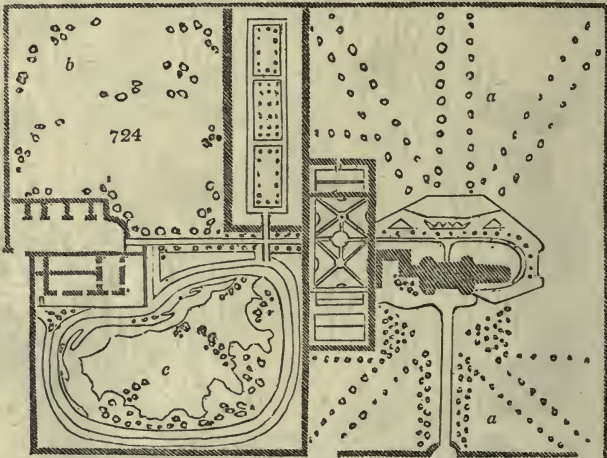

7283. *Cottage en verger*. An agreeable variety of this species sometimes adopted in France, consists in surrounding an enclosed space of one or two acres, with an irregular strip of walnut, cherry, chestnut, and other tall-growing trees (fig. 722. *a*) which produce both fruit and timber; and then planting the interior space (*b*) with the finer sorts of fruit-trees, especially pears and plums, as standards, on turf. Winding walks are led through the whole, and groups of flowers and kitchen-vegetables introduced.

7284. *The citizen's villa* (fig. 723.) is a spot of one or more acres laid out in lawn and shrubbery, but without a kitchen-garden. As the space contained is very limited, and often under an acre, only the most select trees, shrubs, and flowers should be employed; and great part of the trees and shrubs should be evergreens. Seats and other decorations may

of the most select designs, and best workmanship; and what is of the last consequence, none but a good gardener should be employed in order to preserve the whole in the highest order and keeping, at every season of the year. Gardens or residences of this sort are almost peculiar to the neighborhood of London; and the occupant procures his culinary productions and fruits cheaper and better than he can grow them, from that first of all gardens, *Covent-garden*.

7285. *The suburban villa* (fig. 724.) is of limited extent, but contains a small kitchen-garden and stables, with a field planted either in the ancient style (*a*), or modern style (*b*); with a neat lawn, and groups of flowers (*c*). Such villas are occupied more by professional men and artists, than by the lesser merchants and rich tradesmen, who (those of the metropolis at least) prefer the citizen's villa. When two or more of such villas can be formed adjoining each other, the happiest effects may be produced if

their owners act in concert at their first planting; and a sort of community of scenery may be enjoyed, without lessening individual privacy and comfort. On the contrary, a gain might result to each proprietor rather than otherwise; for if two villas, adjoining each other, are laid out in the modern style, then by placing the masses of wood of the one, against the masses of the other, less ground would require to be occupied in plantation by each. Office-buildings might be placed against, or near office-buildings, so as to be shut out, or partially concealed with less than the usual quantity of trees, and so on. In the ancient style, avenues and vistas might be contrived to pass through each other's grounds, and the ornamental objects which formed their termination, serving both parties, only half the usual number would require to be erected by each.

7286. *The suburban house* (fig. 725.) is a large commodious dwelling, in a village-like collection of houses, or streets, on the outskirts of the metropolis, or of large towns; and occupied as the constant residence of wealthy professional men or merchants. It has a carriage-entrance to the house and stables in front, and a small kitchen-garden behind.

7287. *The house with carriage-entrance* (fig. 726.) occurs very commonly in the suburban streets of large cities; it contains a small garden behind, not however sufficient to employ a gardener; and it is without stable or coach-house; the fore-court is varied by shrubs and a few trees, and the central circle of turf, ornamented with baskets of flowers or roses; and in the middle a statue, sundial, fountain, pond, or a cedar, or other evergreen tree.

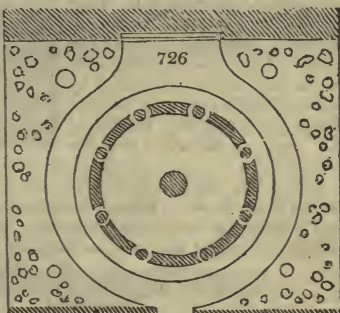

7288. *The house with covered entrance* (fig. 727.) is similarly situated to the other, but generally further from town, to and from which the occupant passes by the local public conveyances. It contains a garden-court before, and a garden behind the house, like the other; but the former is entered by a porch (a), connected with the house by means of a glass or opaque roofed passage (b); and along the front of the house is an open veranda (c, c) communicating with a vestibule (d). This sort of suburban house is well suited for invalids, who may take exercise, and enjoy the plants under the glass roofs in rainy weather.

7289. *The house and conservatory* (fig. 728.) is similarly situated to the last, with one or two wings (a and b), as conservatories; or, the one a conservatory, and the other a botanic stove, or a vinery. These communicate with the two principal living-rooms, and also with the fore-court (c); the latter entrance is that made use of by the gardener. Heat is supplied from the under-ground offices of the house; and if the latter is heated by hot air, in Sylvester's excellent manner, or by the more simple operation of steam, it will be accomplished so much the more readily

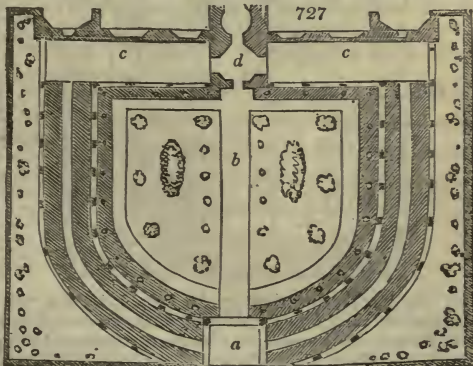

725

726

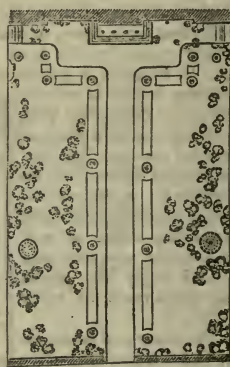

727

and effectually. They may be also lighted up by gas, if there is a public gasometer in the neighborhood.

7290. *The house and flower-garden entrance* (fig. 729.) requires a more airy situation than either of the three last varieties; and is generally situated in some road or street, a mile or two from town, or in some suburban hamlet. The flowers may be variously arranged, and may be either florists' flowers or herbaceous perennials, with a mixture of dwarf ornamental shrubs. A very complete mode is to grow the flowers in the garden behind the house, and bring them to the front as they come in flower. This sort of residence is well suited for retired tradesmen, who act as their own gardeners; and some fine examples are to be found at Hammersmith, Hampstead, and round Manchester. The French and Dutch, and also the Germans, excel in this kind of garden, and produce the most pleasing effects by a judicious combination of very few species of flowers. They take care to select such as are showy, of brilliant and distinct simple colors, as white and scarlet lilies, red and white roses, nasturtium, candytuft, daisy, larkspur, &c. They admit few yellows, or small scattered flowering plants; but study to have masses of the same colors and forms, contrasted by different colors also in masses. There are many fine gardens of this sort in Picardy and the Netherlands, and some in Hanover.

7291. *The house and French parterre* (fig. 730.) can hardly be considered a distinct variety from the last; though it differs in this, that the front garden of the latter contains turf around the flower-compartments, whereas the former is composed entirely of earth, and gravel, edged with box, or some other plant.

7292. *The common front garden* (fig. 731.) is a variety so well known as to require no description; but, like the six preceding varieties, it is introduced here chiefly to suggest, that these humble scenes may be greatly improved in design, and also in cultivation and keeping. There is little danger of the gardens of the wealthy being neglected; but it is of great importance to the advancement of gardening, that the art should be displayed to as great perfection as possible in those gardens which are most universal; which are continually under the eye of a large city population; seen by the whole country-inhabitants, when they visit the towns; and which chiefly come under the eye of foreigners.

7293. *The farmer's garden* should not be placed adjoining the rick-yard, on account of the straw liable to be blown into it: and should be well enclosed to exclude poultry, pigs, and other domestic animals. Supposing the farm-buildings to occupy three sides of a square, and the farm-house to be placed in the middle of the south side, and the rick-yard to be placed beyond the north side; then the kitchen-garden may be placed adjoining the east or west side of the square; the grass-orchard, which may also be the drying-ground, and area for rearing young poultry, on the opposite and corresponding side; and a small flower-garden may serve as an entrance-court to the farm-house. But in the case of farmhouses on a larger scale, where the house is detached from the court of offices, the three gardens should be united with a small portion of lawn, and a pond, so as to form about an acre (more or less, according to circumstances), of garden and pleasure-ground round the house. (fig. 662.) The part destined for the growth of culinary vegetables should be laid out in right-lined plots and borders; the orchard-trees planted in rows or quincunx; and the flowers and flowering shrubs arranged in groups or beds on turf. The most useful and prolific fruit-trees should be chosen; including some plants of hops, and one or two walnut or chestnut trees in the exposed side of the orchard, if the climate is such as will ripen their fruits. No class of men have it in their power to form and cultivate a garden at less expense than that of the farmer; but unfortunately few farmers have a taste for the subject; perhaps, because gardening is not sufficiently contrasted to agriculture, to afford the farmer that sort of relief sought for in recreative and pleasurable pursuits.

7294. *The laborers' cottage and garden.* This may be reckoned too humble a country-residence for the consideration of the landscape-gardener; but we conceive it to be of very great importance to the general good, that these should be improved, and their inhabitants ameliorated. What we shall advance is founded on the principle, that whatever renders the cottager more comfortable and happy at home, will render him a better servant and subject, and in every respect a more valuable member of society. Besides, one of the most constantly occurring objects in the country is the laborer's cottage, whether detached by the road-side, or grouped in hamlets and villages; and therefore to render such buildings and their scenery more ornamental must, independently of every other consideration, be a very laudable object.

7295. *The accommodation contained in the cottage,* and the size of the garden, should, no doubt, be regulated by the family of the cottager, and the facilities afforded him by his line of employment to live well, or bring up a large family, &c. But we shall take the lowest case that can occur, and state what we consider to be the minimum of accommodation, which a humane employer in England would wish to be enjoyed by his serving laborer, even if he had no other family than his wife.

7296. *The whole space to be enclosed,* including the garden and the site of the house, cannot be less than one eighth part of a statute acre. The cottage should, if possible, be placed in the centre, fronting the south-east, by which means, if it be a square or a parallelogram, the sun will shine on each of the four sides a part of every day in the year. Its floor should be raised two steps above the level of the garden; its principal windows to the south-east. A gutter should be placed under the eaves, to prevent the ground, at the base of the walls, from receiving extreme moisture, and thus rendering the interior damp and unwholesome. The cottage should consist of the following parts:—

7297. *A porch* to throw off the rain from the steps of the door, and prevent it from being blown in by the wind. On the smallest scale, two broad boards, or two slates or flag-stones, placed pediment-wise over the door will suffice.

7298. *A lobby, broad passage,* or other space inside the door, to contain lumber, fuel, garden-tools, and to serve as a place for washing, or working at coarse work, &c.

7299. *A cooking and living-room* entered by the lobby or outer room; the fire-place, with an oven and small boiler, both included in a cast-iron grate.

7300. *A sleeping-room* over the living-room, and entered by a stair from the lobby or outer room.

7301. *A garret,* or children or lodger's sleeping-room, or small room for any purpose, over the lobby or outer room.

7302. *A pantry,* taken off the lobby, with a small window to the north-west.

7303. *A closet,* for utensils and articles used in the living-room, taken off that room, with a window to the north-west or south-east.

7304. *A hen-roost,* forming part of the garret over the lobby, and entered by a poultry-ladder, placed against a small opening near the bottom of the outer wall.

7305. *In the garden should be a well,* with a pump, if deep; unless some other source of good water is near.

7306. *A water-closet* placed in a hidden part of the garden, behind the house, so contrived that the visitor may neither be seen from the windows of the cottage nor the public road, with a going and returning, or an incidental approach, instead of the direct *cul de sac* paths which commonly lead to such places.

7307. *A pigsty* attached to the north-east or south-west front.

7308. *A dunghill,* or a small spot adjoining the pigsty, surrounded by a dwarf wall.

7309. *A niche in the wall* of the south-east front of the house, to hold two or more beehives, with two iron bars, joined and hinged at one end, and with a staple at the other to lock them up to prevent stealing.

7310. *The surrounding fence* may be a wall, close pales, a holly, thorn, sloe-thorn, or damson-plum hedge, according to circumstances; if a hedge of any kind, then standard plum, pear, apple, or cherry trees, may be planted in it; if a wall, the same sorts may be trained against it. Next to the fence, a border should be carried round the whole; a similar border may be formed round the house; and the area for culture will then be thrown into two compartments, one behind the house, and one in front of it. The compartments may be surrounded with a line of gooseberries and currants, and a few standard apples or plums (as being the two most useful cottage fruits) scattered over the whole. Against the house may be planted currants, pears, or a vine, according to the situation and climate. Honeysuckles and monthly roses may be planted next the porch; ivy against the water-closet; and the scented clematis against the pigsty. The border round the house should be devoted to savory pot-herbs, as parsley, thyme, mint, chives, &c. and to flowers and low flowering shrubs. The surrounding border, under the wall or hedge, should be devoted to early and late culinary crops, as early potatoes, pease, turnips, kidneybeans, &c. No forest trees, especially the ash

and elm, should be planted in, or if possible, even near the cottager's garden; as these are ruinous to crops; the first both by its shade and roots, and the latter by its roots, which spread rapidly to a great extent, close under the surface. The oak is the tree the least injurious to gardens.

7311. *Variation* may be made in this extent of accommodation, by adopting a different form for the ground-plan of the plot; by different inclinations of surfaces, kinds of fence, sort of materials used for the roof and walls of the house, coloring of the walls, and above all, by adopting different styles of architecture. But whatever is done in this respect, no attempt at ornament or picturesque effect should be made which is at variance with comfort;—lattice windows are cold and comfortless; chimney-flues tortured in their direction, with a view to fixing the stack of chimney-tops in some particular point, occasion smoky apartments. A variety of other deviations from common practice made to gratify the eye of the beholder, without any reference to the inhabitant, might be mentioned; but we shall only add, that whatever is most comfortable and durable will please the best in the long run.

SECT. II. Public Gardens.

7312. *Public gardens* are either designed for recreation, instruction, or commercial purposes. The first include equestrian and pedestrian promenades; the second, botanic and experimental gardens; and the third, public nurseries, market-gardens, florists' gardens, orchards, seed-gardens, and herb-gardens.

SUBJECT. 1. Public Gardens for Recreation.

7313. *Public parks, or equestrian promenades*, are valuable appendages to large cities. Extent and a free air are the principal requisites, and the roads should be arranged so as to produce few intersections; but at the same time so as carriages may make either the tour of the whole scene, or adopt a shorter tour at pleasure. In the course of long roads, there ought to be occasional bays or side expansions to admit of carriages separating from the course, halting or turning. Where such promenades are very extensive, they are furnished with places of accommodation and refreshment, both for men and horses; this is a valued part of their arrangement for occasional visitors from a distance, or in hired vehicles. Our continental neighbors have hitherto greatly excelled us in this department of gardening; almost every town of consequence having its promenades for the citizens *à cheval* and also *au pied*. Till lately, Hyde Park, at London, and a spot called the Meadows, near Edinburgh, were the only equestrian gardens in Britain; and neither were well arranged. But in 1810, the Regent's Park was commenced from a suggestion of W. Fordyce, Esq., the late surveyor of woods and forests, and it promises to be a scene worthy of the metropolis. It is only to be regretted, that the space available to the public is so much curtailed by interspersed villas, and surrounding rows of houses and gardens: for though from the number of trees, the wealthy citizen who can view the scenery from his horse or coach may recognise the park character; yet by rendering so great an extent of the surface private property, the wanderings of the pedestrian are limited, and his views of the scenery confined.

732

7314. *The public garden of Carlsruhe* (fig. 732.), and the town, founded by the Margrave Charles William in 1715, are formed to correspond with each other. The palace (*a*) is noticed by Sulzer (*Théorie des beaux Arts*, &c.) and by Hirschfeld (*Théorie des Jardins*, &c. vol. iv. p. 416.), as one of the finest in Germany, and remarkable for having the wings at an oblique angle to the main building. Behind, exactly in the centre of the circular carriage-promenade (*b*), is a tower (*c*), which commands a bird's-eye view of the whole park, pleasure and kitchen gardens (*d*), and the town and church (*e*). The whole is on level ground, and joined to a natural forest. In the town many English and other foreign artisans were settled. Among the trees near the palace, are some of the finest old tulip-trees, planes, bignonias, sumachs, acacias, cedars, and other exotic trees in Germany.

7315. *Boulevards* (*Boulevard*, Fr., or round work; a bulwark, or great bastion, or ram-

part, generally round). Many of the continental cities have a species of equestrian promenade within their boundaries, which is deserving of imitation. These are broad roads, accompanied by rows of trees, near the margin of the city, originally formed on the ramparts, or surrounding fortifications, and completely encircling it. They are highly interesting promenades, especially to a stranger, to whom they give an idea of the topography and most remarkable points of the scene in the most agreeable manner. The boulevards at Paris, Vienna, and Moscow, are particularly to be admired in these respects.

7316. *A promenade might be formed in the margin of London*, of a very interesting kind, by continuing the street called the New Road through Hyde Park, entering close to where Kensington Gardens leave off, proceeding thence across the Serpentine River, and coming out exactly opposite Sloane-street: then along this street and part of the King's Road, to the road leading to Vauxhall Bridge; from this bridge along roads already formed, and as may be seen by the map, well suited to lead to Blackheath; then turn towards London through Greenwich Park, so as to display the best views of the metropolis over Greenwich Hospital; form a viaduct or road, on a cast-iron colonnade, across the river, sufficiently high to admit ships in full sail to pass under: descend this, and join the City Road, which joins the New Road, and completes the circle. This course which, with the exception of the bridge, might be formed at no great expense or derangement of property, would give a grand view of the metropolis, and by now and then deviating from the direct road and returning to it, Kensington Gardens, Hammer-smith Nursery, the King's Road Gardens, Chelsea Garden, the garden of Loddiges' at Hackney, the Regent's Park, Highgate, Hampstead, and all the most interesting gardens, scenery, and objects close to London, might be rapidly glanced at in one day.

7317. *Mountain promenade.* One of the finest equestrian promenades that can be imagined might be formed on the hill of Arthur's Seat at Edinburgh. From the base at Holyrood Park, let a road ascend winding round the hill, including the appendage of Salisbury Craigs, and the knoll to the east, if desirable, to the summit, at a rise not greater than two inches in six feet. Having arrived at the summit, let it wind down again at a similar slope, intersecting the other road, and arriving also at Holyrood Park. Then let or sell the ground to individuals to build on or plant, each according to his taste. The slope of the road would be found so gradual that a two-wheeled chaise might be driven up or down at a trot, which can be done on the Simplon road, where the slope is $2\frac{1}{2}$ inches in six feet. Taking the height of the hill from the park at 700 feet, this would give less than five miles of ascending promenade, and the same number descending. By the formation of these two roads, hundreds of the finest situations in the world, for summer villas and cottages would be formed, and probably in time let or sold, so as to cover much more than the expense, both of purchasing the hill as it now is, and forming the roads in the very best manner.

7318. *Public gardens, or pedestrian promenades.* These, with very few exceptions, have been in all ages and countries laid out in the geometric style. The Academus at Athens is an ancient example. The summer garden at Petersburg, a modern one. Even in China, where irregularity in gardening is so much desired in general, Ellis (*Journal of the Embassy of 1816*) informs us, that "the Fatee gardens at Canton, the resort of the fashionables, consist of straight walks." And however much our gardening has been praised and copied by private persons on the continent of Europe, yet, with the exception of Count Rumford's walk at Munich, and the late Earl of Findlater's at Carlsbad, almost all the others are very properly in straight lines. The object of public gardens is less to display beautiful scenery than to afford a free wholesome air, and an ample uninterrupted promenade, cool and shaded in summer, and warm and sheltered in spring and winter. In a limited extent, these must be attempted in one principal walk, which, for that purpose, should as much as possible be laid out in a north and south direction. In more extensive scenes, certain covered walks may be devoted to summer, and certain east and west open walks, to spring and winter. The broad open, and narrow covered avenues of the ancient style, are valuable resources on a large scale; these conjoined and laid out in a south and north direction, give in the centre an open, sheltered, sunshine walk in mid-winter; and a close or covered avenue being lined out along each side of the open central one, will afford shady walks for summer, and occasional places of retreat from casual showers in spring. Oxford and Cambridge afford some fine open and covered avenues, though far inferior to many on the continent.

7319. *Public squares*, of such magnitude as to admit of being laid out in ample walks, open and shady, are almost peculiar to Britain. The grand object is to get as extended a line of uninterrupted promenade as is possible within the given limits. A walk parallel to the boundary fence, and at a short distance within it, evidently includes the maximum of extent; but if the enclosure is small, the rapid succession of angles and turns becomes extremely disagreeable, and continually breaks in upon the pas

des promeneurs, the conversation of a party, or individual contemplation. The angles, therefore, must be avoided, by *rounding them off* in a large square; in a small one, by forming the walk into a circle; and in a small parallelogram, by adopting an oval form. In laying out a large square (fig. 733.), four objects ought to be kept in view.

1. Sufficient open space (*a*), both of lawn and walk, so as the parents, looking from the windows of the houses which surround the square, may not long at a time lose sight of their children: 2. An open walk, exposed to the sun, for winter and spring (*b*): 3. A walk shaded by trees, but airy for summer (*c*): 4. Resting-places (*d*); and a central covered seat and retreat (*e*), which, being nearly equidistant from every point may be readily gained in case of a sudden shower, &c. The statues of eminent public men are obvious and appropriate decorations for squares.

The statues of eminent public men

7320. *Russel Square*, laid out from a design of Repton in 1810, is one of the most complete in these respects in London. It has been objected to as over-planted; but this is only a piece of vulgar injustice, applied indiscriminately to every rural artist, all of whom, as a matter of course, conclude, that when magnitude effects the purposes of number, the superfluous plants will be rooted out.

7321. *Sloane Square* is very ingeniously laid out as a botanic garden, by which means the surrounding inhabitants have an easy opportunity of blending recreation with instruction. This plot being a parallelogram or long square, and the ground being low, Repton proposed to form it into a winding valley, containing a piece of water; the walks to be winding, the trees grouped, and the whole contrived so as to produce an appearance of nature in the midst of art: but his advice was not complied with. The late poet-laureate, Pye (*Essays*), purposed to lay out a square, in imitation of a wild overgrown quarry or gravel-pit, and plant it with thorns, hollies, furze, brambles, ferns, &c. This mode he would adopt on account of its originality.

7322. *Edward's Square*, Kensington, was laid out, in 1819, in groups and winding walks, in a manner different from most other squares, by Aglio, an eminent landscape-painter. A small city square might be laid out in terraces, like the *Isola Bella*, or the gardens of Babylon, and the space beneath usefully disposed of as vaults for goods, or a cattle-market.

SUBJECT. 2. Public Gardens of Instruction.

7323. *Botanic gardens.* The primary object of botanic gardens is to exhibit a collection of plants for the improvement of botanical science; a secondary object to exhibit living specimens of such plants as are useful in medicine, agriculture, and other arts; and a third is, or ought to be, the acclimating of foreign plants, and their dissemination over the country. In choosing a situation for a botanic garden, the leading object must be proximity to the town, city, or university to which it is to belong; and the next, if attainable, a variety of surface and soil, to aid the necessary formation of composts and aspects for different plants. In general, however, there is little choice in these respects, it being sufficiently difficult to procure an adequate extent of surface of any kind near large towns. As the leading object or feature in the view of a botanic garden is the range of hot-houses; and as these must always face the south, it is generally desirable that ground on the north side of the principal public street or road by which it is to be approached, should be preferred to ground on the south side. In the latter case, the hot-houses must be approached from behind, and then the spectator must turn round to look at them, by which their grand effect is lost. The Liverpool and Oxford gardens are in this respect unfortunate; that of Edinburgh fortunate.

7324. *The extent* requisite for a botanic garden depends upon that of the collection intended to be formed; as well as on the magnitude to which the tree-plants are intended to be grown. A good deal will depend also on whether tender exotics are to be principal or secondary objects of collection, and also on the manner of growing the hardy herbaceous plants. An immense collection of herbaceous plants may be included in a small space, if the soil is loamy, rather inclined to moisture, and if the plants are separated from each other in the rows by bricks or thin tiles, which at once completely divides them and stints their growth, so as to admit a great number being planted on the same space. The extent of the Chelsea garden is little more than three acres; that of the Liverpool garden is five acres; and in both are extensive collections. Messrs. Loddiges have above a thousand species of herbaceous plants, which they keep constantly in small pots, set on beds of scoria. These occupy very little space, and the plants thrive well. Of course the larger-growing kinds are excluded.

7325. *The form* of a botanic garden is a matter of very little consequence: where the extent is small, a square or parallelogram may undoubtedly be made to contain most plants; but where it exceeds four or five acres, any form will answer; and, indeed, if there is a sufficient quantity of ground, the more irregular the form, so much the more variety will there be in the circumferential walks of the garden. The Chelsea, Cambridge, Oxford, and Edinburgh gardens, are square, or nearly so; those at Liverpool, Glasgow, Hull, and the Dublin Society's garden, are irregular. The two latter both in outline and surface. The most irregular botanic gardens, both as to form and surface, with which we are acquainted, are those of Königsberg and Warsaw. A small rill runs through the former, with the most irregular wavy banks on each side; and the latter is on the steep, broken, and almost inaccessible banks of the Vistula.

7326. *In laying out the area* of a botanic garden, the objects already mentioned, and various others, must be kept in view. If it be merely desired to have a general collection, then a surrounding border for the trees and shrubs; internal compartments for the

beds of herbaceous plants; and a space at one end or side for the hot-houses, frames, compost-yard, &c. will be sufficient; surrounding the whole with a walk, which may also cross the garden in one or more places. Such a walk to display in succession every remarkable feature, is essential to all gardens, whatever may be their extent or kind.

7327. *In a complete botanic garden, the following seem to be requisites:—*

1. *A curator's house*, with seed-room, office for business, library of reference, herbarium, room for lectures or demonstrations. This is most generally situated at or near the entrance of the garden. Some consider it preferable to place a lodge at the entrance for the under-gardeners, and to place the curator's house with its accompaniments as above, in connection with the range of hot-houses; and this the more especially as botanic gardeners are rarely family men, at least in Britain.

2. *A range of hot-houses*, either in one line, or in a semi-circle, circle, square, half square, &c. according to taste and other circumstances; with back sheds for all the usual purposes of such, including rooms for the journeymen, where there is no lodge; and lodgings for one man, even if there is a lodge, in order to attend to the fires.

3. *An adjoining arrangement of pits and frames*, but not in front of the range of hot-houses, as in a nursery.

4. *A compartment-ground* for all the usual purposes.

5. *An aquarium*, including a bog, pond, spring, and salt-water cistern, for marine algae.

6. *A rock-work* and underneath pendient walls, tunnels, vaults, and caves, open in different degrees and directions for the growth of mosses, ferns, fungi, &c.

7. *Borders*, shaded and kept moist in different degrees for ferns and other appropriate plants.

8. *A fungi-ground*, shaded by trees or vaults, and containing stumps and roots of trees of different kinds, and other means for the preservation, as far as art will go, of a collection of native or hardy fungi, edible, and poisonous.

9. *An American, or bog-earth ground*, either a border, or connected groups, or a composite figure surrounded by walks.

10. *An eliciation*, or paved area, for setting out the greenhouse plants in summer for air and exercise by wind. In the pavement ought to be holes, in which to insert iron rods to be connected with wires, to which to tie the taller and more flexible plants.

11. *A grass-ground or gramineum*, for bringing all the grasses together.

12. *A compartment for the plants used in medicine*, according to the Pharmacopœias of the different universities, &c.

13. *A compartment for the hardy poisonous plants*.

14. *Compartments for the plants and trees used in agriculture, horticulture, dyeing, and other branches of general economy*.

15. *A compartment for florists' and border flowers*.

16. *A compartment, or, what is generally preferable, surrounding border or belt, for trees and shrubs*.

7328. *Various other sub-arrangements* or compartments of this nature may be contrived, as for creeping plants, climbing natives of particular countries, succulents, bulbs, &c.; and the association of plants in this way by strong natural and artificial (alluding to their use) affinities, is well calculated to facilitate both their culture and study. The most complete arrangements of this kind are to be found in the Paris, Dublin Society's, and Glasgow gardens. The size and shape of these sub-arrangements will, of course, be various, which will add greatly to the interest of the walks. They will, in general, be most advantageously placed round the outskirts of the garden, within the marginal plantation, and should be separated by different sorts of rustic walls, or mounds of rock-work, hedges, thickets of evergreens, and other means. They should all be connected by a walk in such a way as that a general spectator may see each scene without being obliged to enter minutely into it; and that whilst none can escape the botanist, he may have an easy opportunity of entering minutely into each or any of them.

7329. *The central, or principal part of the ground*, should be devoted to one general arrangement of all the phanerogamous plants, including hardy exotic trees and natives. The trees may be kept dwarfed, by being propagated from cuttings, or layers, and by planting in pots, and pruning; and the stove, and other exotics, will of course only be plunged in their appropriate places for a few weeks in the warmest part of each summer, as in the Paris garden. Every plant ought to have its name painted on strong cast-iron tallies, on a bevelled face, in letters so large as to be legible without stooping. If to the name, systematic and English, could be added the Linnæan and Jussieuan class, native country, and time of flowering, it would obviously greatly facilitate the peripatetic study of plants. The tallies once placed there, should never be removed, excepting when the arrangement is to be enlarged, because the name will show that the plant exists, or ought to exist, somewhere in the garden; and will or ought to be placed there in the proper season. Such a collection should, in short, be a transcript of the catalogue of the garden; some of the filices, and most of the fungi, algæ, and musci excepted.

7330. *Whether the arrangement in the compartments or main area* of such a general collection ought to be Jussieuan or Linnæan, must depend on the opinion of those concerned. In the present state of botanical science, that of Linnæus is the best for the study of nomenclature and technology; it is that generally adopted in Britain and the north of Europe; whilst that of Jussieu is almost universally adopted in France and Italy.

7331. *The botanical arrangement in the hot-houses*, and as far as that kind of arrangement is applicable, in the different subsidiary or *habitat* arrangements, should, in our opinion, decidedly be Jussieuan, as presenting the strongest natural affinities, and calculated to promote variety in general appearance, facility in recollecting names, and often answering as to kind of culture. The Paris garden is the most complete in Europe as to comprehensive arrangement; though the collection of plants is inferior to that at Kew or Liverpool. It is remarkable also for its menagerie, containing a collection of living animals of many kinds, lodged in appropriate buildings with surrounding enclosures of different degrees of extent. It also contains specimens of all the different soils, composts, and operations of horticulture and agriculture. A plan of this garden, which contains about seventy acres, and was arranged in its present form by the chevalier Molinos, has been given by Professor Thouin, in the *Annales du Musée*; and another published more recently by the professor's brother, G. Thouin (*Artiste Jardinier*), in *Plans Raisonnées des Jardins*, &c. This plan (fig. 734.) not only contains the ichnography of the garden (1 to 21), but in the margin are placed elevations (22 to 42) of the houses in which the living animals are kept, of the immense buildings in which the

museum of natural history is contained (24), and of the hot-houses (23), and entrance-gates (32).

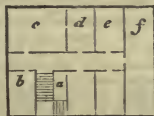

7332. The entrance to the garden is through a handsome iron railing between lodges (1, and the elevation 32), opposite the bridge of Austerlitz (42). On the left is the menagerie, commencing with the ferocious animals, in a long building, with wings and a fore court; and next in order is a number of small irregular-shaped enclosures of pasture, covered by trees, each devoted to one genus of animals, and containing a building in the centre for their repose or shelter (2 and 3). Passing these we arrive at the dwelling-houses of the professors of natural history; and the large amphitheatre (4, and elevation 26) in which the lectures are given. Here is also the hot-house department (7, and elevation 23), with a sunk area in front for pots and frames; a space called the seed-garden for raising seeds, and for nursing them till they flower. Adjoining is an artificial mount, crowned with a kiosk (5), which overlooks, not only the whole garden, but great part of Paris; it contains a sundial, which, by means of a lens, is contrived to discharge a cannon every day at noon. The museum of natural history is a large building at the upper end of the garden, exactly opposite the entrance (6, and elevation 24); it is separated by a handsome low wall and iron rails from the open garden, which consists of 36 plots, enclosed by lattice-work from the walks, which are at all times open to the public. These plots contain specimens of the mode of propagating all herbaceous vegetables, all trees and shrubs (8)—a department which is particularly rich in specimens of grafting and inarching (9); a large basin for aquatics, and aquatic birds and reptiles, situated at the bottom of an excavation, more than ten

feet below the level of the general surface of the garden (10); the sides of this excavation are planted with marsh trees and shrubs. The next divisions consist of florists' flowers arranged according to their colors and times of flowering (11); medicinal plants (12); illustrations of the operations of agriculture on plants, as the different kinds of hedges, live fences, rows, &c. (13); all the sorts of fruit-trees, vines, and fruit-shrubs, which grow in the open air in France, with different modes of pruning and training them (14); all the sorts of vegetables used in rural economy throughout Europe, the more tender sorts, as the convolvulus battatas, being protected early in the season by glass (15). The general arrangement of all the plants grown in France, tender and hardy, occupies ten plots (16); the classification adopted is that of Jussieu. The tender species are brought from the hot-houses in June, and plunged in their places in the beds, where they remain till September; the hardy tree and shrub kinds are kept dwarf by pruning, and brought into flower by ringing. The different sorts of annual plants, and the mode of raising seeds of every kind, is displayed in a large plot (18). There is a general arboretum (17); one of winter or evergreen trees (19); of trees in perfection in autumn (20); of summer trees (21); and of spring trees.

7333. The principal buildings are the menagerie for ferocious animals (22); the conservatory (23); museum (24); lodge for East India deer (25); lecture-theatre (26); near which is situated the office of administration for the garden; retreat for buffaloes (27); stable for the equus tribe, with pigeon-house over (28); Merino and other sheep-cots (29); cot for goats (30), for camels (31), for elephants (35), for foreign oxen (37), for red deer (39), for the dromedary (40), for packing plants (41), and for a public coffee and milk house, situated at the base of the mount (38). There is a restaurateur in the spring arboretum (21), also a number of other buildings of less note; and so complete is this establishment, that in some of the areas destined to show certain branches of culture, there are lodges containing specimens of all the implements in use in that branch. (*Annales du Musée; Rayer's Descriptive History of the Paris Garden.*)

7334. In the office of administration, which is remarkably complete, is the botanical cabinet (fig. 735.), thus described in the *Horticultural Tour*: "In the staircase (a) is preserved a tall palm-stem from South America, which had been naturally clasped in a very extraordinary way by some liane or twining shrub, and evidently strangled by the deeply indented grasp of its invader. Professor Desfontaines' working-room (b) adjoins, and next, the working-room for the professor's assistants (c). Here a respectable-looking female was now employed in fixing dried specimens of plants to sheets of white paper, after they had been arranged for that purpose by Professor Desfontaines. There is a room (d) appropriated to the keeping of the specimens of dried plants. They are contained in close presses, and so accurately and conveniently arranged, that the specimens composing any particular genus can be produced for examination the moment they are called for. Another (e) contains specimens of wood of very many species of trees, we believe of almost all that are figured in the quarto volume published by Sepp of Amsterdam, and edited by Dr. Houttuyn, and of many unknown to these laborious Dutchmen. The samples are in general smoothed with the plane, the better to display the grain, and the extreme beauty of some kinds. A vase, nicely formed out of the stem of a date-palm, is a curious object: it is about a foot and a half in diameter, and somewhat more in height. A large apartment (f), extending the whole breadth of the building, contains the seeds and seed-vessels of plants, with specimens of vegetable products in general. In the same room several commodious presses and drawers are appropriated to the reception of the seeds saved in the garden from the more rare or tender plants, particularly those of only annual duration. We may add, that the great attention paid to this part of the business of the garden, the saving of seeds, and keeping them in the nicest order, received our unqualified approbation. A glazed frame containing numerous skeletons of leaves and flowers, had a very pretty and unusual effect. Fronds of the great umbrella-palm of Ceylon (*Corypha umbraculifera*) decorate the ceilings of two of the rooms." (*Hort. Tour*, 353.)

SUBJECT. 3. Commercial Gardens.

7335. Public nursery-gardens come first in order. In choosing a situation in which to establish a nursery, two points are to be considered, fitness as to the disposal of the produce, and fitness as to shelter, aspect, and soil. Where it is intended to attempt a general nursery business, regard must be had to the leading roads of the district, the means of carriage by land or water, the kind of objects that will be most in demand, whether seedlings, fruit-trees, or tender exotics, or all of these. Where a local business is to be commenced, it is evident much will depend on the choice of a conspicuous situation in some line of road of general resort, and as near as possible to some town or city. As far as respects shelter, aspect, and soil, the remarks already submitted in reference to private nurseries (6974.) may suffice. The best general soil is evidently a free tender loam; and the best general aspect or exposure, one inclining to the north; as precocity is no advantage in a nursery, but the contrary, and all seedlings and tender plants will be the safer till they come up, and come up more vigorously, when brought on not so much by the direct rays of the sun as by his indirect influence on the atmosphere. Another great advantage of a northern exposure is, that plants and trees may be taken up, as well as planted, later in the season, than in one of a contrary nature. Grafting also, and making good deficiencies and other nursery-operations, which are generally deferred to the last moment, may be done with less injury to the trees and plants.

7336. The extent of a nursery must depend on the means of the occupier, and the probable extent of market. It will also depend, in some degree, on the kind of articles to be chiefly cultivated, and the mode of cultivation to be pursued. Where manure is scarce, such a system of alternate nursery and market-garden crops must be adopted as shall preserve the ground in heart; but where manure is more abundant the severe crops may succeed one another more closely. Where thorns and seedling forest-trees are to be the chief articles grown, it is evident less ground will be required than when transplanted forest-trees are to be the chief article produced.

7337. In laying out a nursery, the objects to be cultivated, and the kind of business to be expected, must be leading guides in the design, and the duration of the tenure will naturally have a material influence on the execution. The following seem objects desirable for a complete nursery:

7338. *The dwellinghouse* of the master; this in a nursery for local demand, and in which public attraction is an object, ought to be placed near the road; and at the same time as centrally as possible in other respects. In general, the living-rooms ought to be elevated so that their windows may command, as far as practicable, the whole nursery; but, at all events, the following objects, more or less:—

7339. *A seed-shop* and counting-house or office, which should be connected with the house for the master's convenience; but, at the same time, have each distinct entrances. The counting-house should have a good clock, and a rope or chain communicating to a bell placed over, or in some conspicuous situation for regulating the hours of labor; also a speaking-pipe to the packing-court and centre of the hot-houses.

7340. *A journeyman's living-room*, and a number of sleeping-rooms for the whole or a part of the journeymen employed by the year, or otherwise, communicating with the packing-court, or in some cases, on a small scale, occupying part of the ground-floor of the house. From this appendage should be a speaking-pipe and bell to communicate with the counting-house and the master's sleeping-room.

7341. *A tool-house*, sufficiently commodious and properly arranged, communicating with the seed-shop. The tools should be at least weekly examined by the foreman before paying the men. The larger number-sticks or tallies, not in use, should also be kept here.

7342. *A museum and herbarium-room*, in which models (in plaster, Roman cement, or *papier mâché*) of all the fruits, and dried specimens of all or most of the plants grown in the nursery, should be kept, in order to show to purchasers, in seasons when the plants to be purchased are not in fruit or in flower.

7343. *Packing-sheds*, surrounding a part or three sides of a packing-court, one of these being open to, or commanded by, the windows of the office and common living-room of the house. Over these should be a range of seed and store lofts.

7344. *A stable, cart-shed, cowhouse, and pigsty*, if such conveniences are desired, communicating on one side with the packing-court, and on the other with the wall: a coal-shed, a horsedung-heap, and other similar objects in the back area of the dwellinghouse.

7345. *A store-ground, or laying-in-ground*, three or more times the size of the packing-court, in which to inhume the roots of plants taken up, to be ready for sale or packing.

7346. *A plot for the hot-houses*, square, octagonal, or polygonal in the circumference or boundary, and the central part for the pits, and all the framing, hand-glasses, &c. with space sufficient for setting out the green-house plants during summer. If the whole boundary cannot be at once, or perhaps not at all, covered with glass, the naked part may be a wall for training fruit-trees, and the north border for auricular frames or stages, striking cuttings, &c. But in a general nursery, the whole of the boundary of a square may be very properly covered with glass, facing the centre; that of northern aspect being well adapted for striking plants, and preserving, or retarding such as are in flower. The exterior of this boundary line should be arranged for pots, potting, tan-furnace, and general working sheds; or, if this be not wanted on the south side, that part of the wall may be devoted to the training of fruit-trees.

7347. *A compost-ground* for different sorts of earths, gravel, manure, and the rubbish-heap.

7348. *A rotting-ground* for depositing tree-seeds, in layers of sand or ashes, in order to rot off their external coats, and promote the decay of nuts or other hard covers of seeds. (6079.)

7349. *A parterre* for the culture and display of such of the border and florists' flowers as are grown in the nursery, and for a specimen of rock-work, a flower-stage, aquarium, apiary, and covered seat for visitors.

7350. *The main area of the nursery* should be laid out, as nearly as the circumstances will admit, in parallelograms, of any convenient dimensions, but not wider than the ordinary length of a garden-line, say under 150 feet, which allows of a row sufficiently long for any purpose. The chief reason for the parallelogram form is, that all rectangular figures are most easily cultivated and measured, and the reason for their being all of the same size is, in order that the master may readily, after a little experience, form a tolerably accurate idea of the quantity of every kind of nursery labor requisite for a plot of this shape and size. Thus, supposing each division to contain half an acre; then one man will dig it in one day, trench it in two days, hoe it, if in wide rows, in a fourth of a day, if in narrow rows, in half a day. A woman, if in beds, will weed it, if very thick of weeds, in two days; if thin of weeds, in one day, and so on. The compartments should, as much as possible, be cropped with one general class or kind, and by rotation. As, for example, for seven years: 1st, Break up from grass with turnips after trenching; 2d, Transplanted forest trees, two years; 3d, Green crop, one year; 4th, Annual flowers, for seed, one year; 5th, Seedlings, one year; 6th, Transplanted fruit-trees, four years; 7th, Bedded thorns, two years; and so on. Some compartments must be set apart for common stools; and if the circumferential borders are not sufficient or proper for stools of rare or peculiar sorts, others must be contrived by means of hedges, pales, or walls, to produce shelter and shade for cuttings, fit situations for bog-earth borders, American stools, bog plants in general, and similar purposes. If the borders are all of the same width, say ten or twelve feet, it will simplify all future calculations as in the compartments.

7351. *A grand central, and a circumferential walk*, with some cross walks, should be contrived to display the whole nursery to the best advantage. A narrow or common sized border should accompany these walks, excepting where the broad circumferential border comes in; and in the narrow borders should be displayed single specimens of all the more rare trees and shrubs grown either from seed, or by other means, for sale, and of all the perennial, biennial, and annual border-flowers sold to the public in the form of plants, roots, or seeds. Those may be excepted which are grown in the flower-garden, rock-work, and aquarium.

7352. *A nursery-orchard* should be formed of some compartments near the house; and in these, one or better two plants of each of all the hardy standard fruit-trees should be planted, in order to come into bearing, and admit of proving the kinds; and from which alone the grafts and buds should be taken, (unless on the introduction of new and valuable sorts, in which case such grafts as can be got must be taken till some of the progeny moved to the nursery-orchard come into a bearing state,) which are to be used in the nursery. This

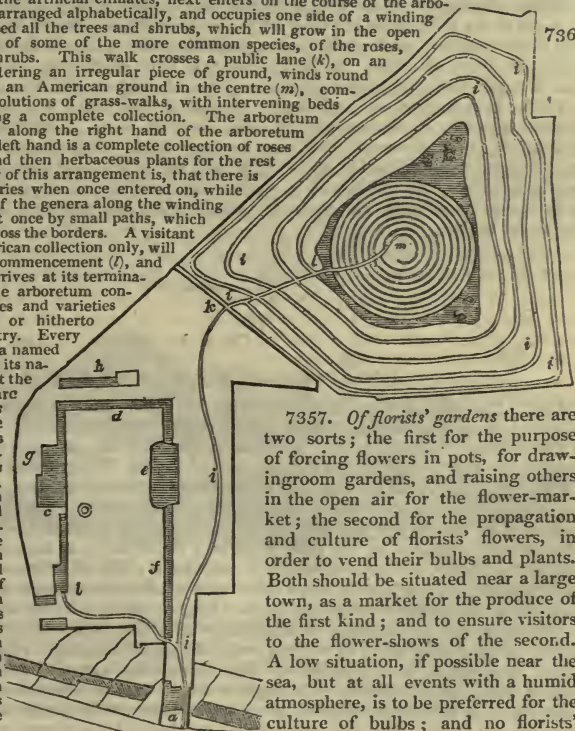

orchard should be surrounded by a wall, on which to grow specimens of such sorts of plums, cherries, and pears, as do not ripen well as standards; the hardier sorts of grapes, and peaches, nectarines, and apricots. The tenderer sorts of vines, and some few peaches, which are tender in the northern counties, may be grown, one of a sort, under each rafter in the range of hot-houses.

7353. *The compartments for stools of every description, and the borders for cuttings, should be as near the house as possible, as on these, men are employed a greater number of days in the year than on any other of the compartments, and therefore it is desirable such compartments should be more immediately under the eye of the master.*

7354. *Fruit-tree and seed-bed compartments should come next; then transplanted shrubs; next young forest trees transplanted; and, in the most distant parts, the larger forest trees, as requiring least culture of all. But a proper attention to rotation will not admit of this arrangement being completely attended to; and to keep the ground in good heart is as essential to success as keeping the men at work.*

7355. *In some of the principal nurseries which have risen to their present degree of eminence by degrees; and where consequently one building or additional object has been added to another as wanted, without having any general plan in view, the greatest confusion in appearance, and a considerable loss of labor, is the final result. The best way in such a case is to pull down great part of the hot-houses and outbuildings, and re-arrange the whole on some plan which will admit of a regular tour of inspection, either by the master or stranger-visitants. A fine example of this has recently been given by Messrs. Lodiges; whose arrangement, and mode of displaying the whole to strangers, is so perfect, that the time saved in conducting visitors through the premises will be no small gain.*

7356. *The Hackney nursery (fig. 736), or commercial botanic garden, affords an example of a small irregular spot, laid out both with due consideration as to effect, botanical science, and economy as to culture. The entrance (a) leads to the range of hot-houses, and commences with the stoves (b), proceeds to the grand palm-house (c), thence to the dry-stove bulbs, and other articles (d), to the double camellia-house (e), and the green-house plants (f). The area enclosed by these buildings is devoted to the culture of plants in pits and frames, to beds of rare American and herbaceous plants, and to collections in pots ready for sale. The outside space on the north side (g) is used as a depository for soils, pots, and other agents of culture; and for propagating-pits (h), and nursery-plantations of delicate articles. The visitant having arrived at the end of the artificial climates, next enters on the course of the arboretum (i, i, i), which is arranged alphabetically, and occupies one side of a winding walk, till it has exhausted all the trees and shrubs, which will grow in the open air, with the exception of some of the more common species, of the roses, and American select shrubs. This walk crosses a public lane (k), on an elevated bridge, and entering an irregular piece of ground, winds round it till it terminates in an American ground in the centre (m), composed of a series of revolutions of grass-walks, with intervening beds of bog-earth, displaying a complete collection. The arboretum alphabet is only carried along the right hand of the arboretum walk (i, i, i), and on the left hand is a complete collection of roses for a certain length, and then herbaceous plants for the rest of the space. The beauty of this arrangement is, that there is no interruption to the series when once entered on, while at the same time any of the genera along the winding paths may be gone to at once by small paths, which occur here and there across the borders. A visitant wishing to see the American collection only, will proceed at once to its commencement (n), and wind along it till he arrives at its termination (m), and so on. The arboretum contains a number of species and varieties not before introduced, or hitherto neglected in this country. Every species commences with a named specimen, left to attain its natural size and shape next the walk; behind, in a line, are stools for laying or stocks for grafting, and the next two or three lines are devoted to the reception of the young plants till sold or disposed of. This mode saves much trouble in culture, and at once shows the purchaser the sort of tree he is to get, and assures him that he is getting its real progeny. The names of the trees and American shrubs, and the numbers of the herbaceous plants and roses, are painted on the ends of bricks, which are let half their length into the ground, in an oblique manner, so as their ends may meet the eye at a favorable angle.*

7357. *Of florists' gardens there are two sorts; the first for the purpose of forcing flowers in pots, for drawing-room gardens, and raising others in the open air for the flower-market; the second for the propagation and culture of florists' flowers, in order to vend their bulbs and plants. Both should be situated near a large town, as a market for the produce of the first kind; and to ensure visitors to the flower-shows of the second. A low situation, if possible near the sea, but at all events with a humid atmosphere, is to be preferred for the culture of bulbs; and no florists'*

flower will thrive in an atmosphere impregnated with coal-smoke. Very little skill is requisite for laying out either of these gardens to those who understand the culture they require. The hot-house, pit, and frame departments should be kept together; close to them the compost, dung, and tan grounds or sheds; next the ground where pots of roses, &c. are plunged; and the least near parts remain to be devoted to the culture of flowers or flowering shrubs in the open ground. For the convenience both of culture, without treading on the plants, and of gathering the flowers, the whole is generally laid out in beds, sometimes with box-edgings, but more commonly without any, which for bulbs and plants to be annually removed, admits of more effectual culture.

7358. *Market-gardens* are of two kinds; those cultivated by manual labor, and those wholly or in part by the plough. In choosing a fit situation for a market-garden, regard must not only be had to the requisites for a good kitchen-garden, as to shelter, soil, water, &c. (2382. to 2430.), but to the probable market-kind of produce to be grown, &c. The extent must depend jointly on these circumstances and the capital to be employed. The smallest extent of surface and capital is that in which a man performs the whole of the labor himself, and this so entirely depends on the articles cultivated, the nature of the soil, and mode of culture, that it may vary from one to two acres, and where grain and seed crops are introduced, to a greater number. As to the quantity of ground which a man of capital may manage by this way, no limits can well be assigned to an active and vigilant master. Some London gardens of this description, entirely cultivated by manual labor, exceed 100 acres. In laying out a market-garden there cannot be said to be any thing peculiar: the general points of order, distinctness of compartments, and keeping the plots as much as possible in squares and parallelograms, are of obvious importance.

7359. *Public orchards* are of various kinds; garden-orchards, where the ground is cultivated and cropped with culinary vegetables or small fruits; arable orchards, where the trees are in rows, and the spaces between in aration; and pasture-orchards, where the trees are scattered over pasture-lands. In fixing on a situation for either kind, the three chief points are soil, sub-soil, and shelter, which have been already considered in treating on private orchards, as well as the planting and kinds of fruit-trees.

7360. *Physic or herb-gardens*, if for growing aquatic herbs, as mint, should be situated in a low moist soil; if for aromatic herbs, as lavender, rosemary, &c. on a dry poor soil; and if for roses and similar plants, for producing flower-leaves, for the distiller, the soil should be loamy and rich. In laying out this kind of garden, the only point in which skill is requisite, is the contrivance of a system of irrigation for the mints.

7361. *Seed-gardens*, or seed-farms, require a dry soil; and two should never be situated together, if destined for the same sorts of seeds. All the art in them consists in cropping, so as to ensure seeds true to their kind. Indeed, the culture is by far the most important consideration, not only in this, but in the four preceding descriptions of public gardens; and this is still more the case with respect to *gardens for peculiar crops*, as for the bulbs of white lily, rhubarb-roots, licorice, &c. which, as to laying out, require no further notice.

CHAP. V.

Of the Practitioners of Landscape-Gardening.

7362. *The practice of landscape-gardening* has been thought such a simple business, that every proprietor might perform it for himself. The same thing, indeed, may be said of the practice of medicine, law, or cookery, for every one can prescribe a cure, decide a quarrel, or boil an egg. "Had the art of laying out grounds," Repton observes, "still continued under the direction of working-gardeners or nurserymen, the proprietor might supersede the necessity of such landscape-gardeners, provided he had previously made this art his study; but not (as it is frequently asserted,) because the gentleman who constantly resides at his place must be a better judge of the means of improving it, than the professor, whose visits are only occasional; for if this reason for a preference were granted, we might with equal truth assert, that the constant companion of a sick man has an advantage over his physician. Improvements may be suggested by any one; but the professor only acquires a knowledge of effects before they are produced, and a facility in producing them by various methods, expedients, and resources, the result of study, observation, and experience. He knows what can and what cannot be accomplished within certain limits. He ought to know what to adopt, and what to reject; he must endeavor to accommodate his plans to the wishes of the person who consults him, although in some cases they may not strictly accord with his own taste." (*Observ. on Landsc.*

Gard. p. 10.) A more wise plan than that of doubting on the subject would be to have the separate opinions of different landscape-gardeners and architects; for no opinion need be followed if disapproved of; while the probability is, that there would be something valuable in each, and the proprietor might finally, aided by the artist he preferred, decide for himself, never, however, forgetting the idea of a consistent and beautiful whole. As to the expense of opinions, Girardin observes on this subject, "N'allez pas le regarder — il vous en coûtera bien davantage pour des variations, et des retouches continuelles."

7363. *The intimate connection between landscape-gardening and architecture*; the propriety and advantage of the joint consultations of the landscape-gardener and the architect, as to the situation, aspect, and style of the house; together with the almost unavoidable encroachments of the former on the latter, by designing and executing garden-buildings, has given rise to an opinion, that the landscape-gardener ought to combine the functions of the architect. Repton justifies the idea, by referring to the many excellent houses built by Brown, with no other knowledge than that acquired by observation of all the best houses; and of Kent, who was at once landscape-gardener, architect, and historical painter. We are of opinion, that in the case of garden-buildings and small villas, or ornamented cottages, the knowledge both of the theory and practice of architecture, which it is necessary every landscape-gardener should possess, may sometimes enable him to combine the duties of both professions; but such are the advantages of a division of labor in the fine, as well as in the useful arts, that in all more extensive buildings, and indeed even in those we have mentioned, we would recommend the employment of a regular architect, jointly with a landscape-gardener, as a surgeon consults with a physician in important cases. — The duties of the landscape-gardener resolve themselves into the formation of a plan or design, and the carrying of it into execution.

SECT. I. *Of the Study of the given Situation and Circumstances, and the Formation of a Plan of Improvement.*

7364. Whatever may be the *situation and circumstances* where the opinion of a landscape-gardener is desired, he should be furnished with a written or verbal instruction as to the points to which he should chiefly direct his attention; with a complete map of the estate, and an accurate detailed history and description of its localities and peculiarities. From these, from topographical and county surveys, and a residence of a few days or weeks, according to the extent of the subject and season of the year, (spring, before the leaves expand, being the most favorable time,) he will be able to procure every requisite information, and to establish in his memory every thing relating to the situation and vicinity. He is then, and not before, to embody and mature his ideas of improvement; directing his attention first to the situation and aspect of the house and offices, the extent of the park, and the emplacement of the kitchen-garden; next to the general masses of wood; and then, successively, to the breadth of lawn, the situation and character of water, the pleasure-ground, farm, and other details. Before making up his mind on any part of the subject, he will often find it of importance to have sections taken of the grounds in different directions, levels of springs, and rills, &c.; and most frequently he will have occasion for stakes, for marking out lines on the ground; of flagstaffs or poles, from six to fifty feet high, to represent the effect of trees (*fig.* 737.) and other objects; of strips

of white sheeting, to show the effect of water, by forming a white outline on a perfect level; of frames partially covered with boards, to show the effect of buildings; and he may even require boring-irons, or pits dug, in order to enquire into the nature of the subsoil. Being furnished with a plan of the present state of the grounds, (such as *fig.* 351.) he will, as he makes up his mind on particular improvements, mark them down on this map in pencil, and when the whole is finally adjusted, he will put them in red, or in any distinguishing color. And on one or more general or panoramic views (*fig.* 355.), as well as on the particular views which he may have taken on different spots, he will also mark

in red the outlines that will be made by the improvements adapted to the different situations. In addition to these, he will show the effect, by geometrical sections taken in different directions across the grounds (*fig. 349.*), to show the ground's surface. His next operation is to make a vertical profile (*figs. 353, 354.*), showing the effect of the whole, supposing the alterations to be fifteen or twenty years completed, with corresponding, panoramic, or general views (*fig. 355.*), and with particular landscapes.

7365. It remains for him to give *reasons in writing* for all that he proposes; a practice which no employer or artist should ever omit to have done, as such opinions remain as data, to be referred to concerning the management and future effects; as well as in point of present or future justification of the taste, both of the artist and proprietor. This may be done in the following order: 1. Recapitulating the given instructions; 2. The characteristic features, and other details, of the given situation and vicinage; 3. A description of, with the reasons for, the general outline of improvement; 4. The description of, with the reasons for the detail; 5. An outline of the future management; 6. Directions for the execution; and, 7. An estimate of the expense.

7366. *In all these discussions* proper references will be made to the maps and sketches. Simple language will of course be employed in describing future effects; but, above all, simple sketches, which shall owe little of their effect to shading, and none to coloring, or finishing, are essentially necessary.

7367. *Girardin* seems to have been the first who suggested this mode of obtaining an opinion systematically; and his remarks on the fallacious effect of beautiful drawings instead of outlines, are well deserving of attention. "Vous tâchez même que cette esquisse ne soit qu'un simple trait, et ne présente d'abord que les formes principales des objets, et la disposition générale des grandes masses de votre ensemble. Un dessin bien fini ne manquera pas de vous séduire par l'agrément de la touche d'un habile artiste; vous vous déterminerez d'après un dessin dont vous ne réussiriez peut-être pas à obtenir l'effet dans la nature, et il faut bien mieux avoir à gagner qu'à perdre dans l'exécution."

7368. *Repton* has the merit of first employing this system elegantly and extensively in England, and of adopting, instead of one entire landscape to show the previous taste, and another to show the effect of the alterations, a slip of paper of the size and shape of those parts of the landscape which require alteration. This is fixed at one edge of the entire landscape, and lies flat over part of it, so that when lifted up it shows the full effect. It must be confessed, however, that, though an elegant mode, it is not perfectly fair, since the view in which the cut paper forms a part can never look so well as the other, even from the mere circumstance of the bounding line of the paper. For some cases, however, it may be used, though in general it will be found, that two entire landscapes afford the most impartial means of judging of the effects of an improvement. The discussion and sketches of the place, and improvements being finished, and bound in a book, the ground or working plan is to be put on canvass, or copied on parchment, for the common use of the gardener, or whoever sets out the work; and the profile put on rollers, to be preserved along with the book of *notitia*. These being delivered to the proprietor, he will determine, after mature deliberation, whether or not he will adopt the whole, or any part of the improvements, previously consulting those friends whose taste or judgment he considers adequate to forming a judicious opinion on the whole, or any one part of the subject. "Lorsque l'esquisse de votre ensemble sera faite, alors vous réflécherez, vous concerterez, vous discuterez avec des gens de goût, l'ordonnance générale de la disposition qu'elle vous présente." In this example of forming a plan, we have had in view a dull and nearly flat site, where nothing has been done; but it is evident that the same general principles are applicable to such places as are to be altered, diminished, or enlarged.

7369. *By a general plan, accompanied by others more detailed, of the kitchen-garden, pleasure-grounds, terrace, &c.* and by the explanatory details of the book of *notitia*, any gardener of ordinary intelligence may execute the most intricate design, and if this design has been carefully formed from inspecting the premises, and proper general views have been minutely taken from different points, the landscape-gardener may show the effect of future improvements with confidence, and leave behind him the *Notitia*, or *Book of Improvements*, or, in other words, such plans, sections, views, and written instructions, as may enable the gardener gradually to produce them, with nearly as much certainty as an architect directs a builder to raise an elevation of masonry. Distantly situated proprietors, ambitious of displaying some refinement of ideas on rural matters, might in this way first procure, and then work to a general plan; instead, as is often the case at present, of working according to their own crude notions; and producing scenes which afford no pleasure to any one but their owner, and only to him whilst he remains in *statu quo* as to taste.

SECT. II. *Of carrying a Plan into Execution.*

7370. *Whether a plan be carried into execution* by contractors, or by the proprietor at his own risk, must depend on circumstances, both respecting the knowledge, taste, and leisure of the proprietor, and the nature and extent of the improvements. Where an entire new house and grounds are to be created, an eminent substantial contractor for the buildings, and another for the ground operations, will be found the most speedy and certain as to expense; the work, in both cases, being liable to be regularly examined at stated periods by a neutral surveyor, accompanied by the original designers of the improvements. If this mode is not adopted, the whole or greater part may be done under the eye of the owner and his steward; various, and as many parts as possible, being let by the job. We shall take a cursory view of the chief objects of alteration or addition; and indicate some things in each, which may in most cases be more profitably done by the job, premising, that whenever the cost or intricacy of any piece of work is consider-

able, unless a contractor of some respectability is employed, the work is much better done by the laborers of the proprietor.

7371. *Buildings.* All alterations or new erections may be readily estimated and executed by contract, and, almost in every case, at less expense to the proprietor. The mere difference between the trade price and the gentleman's price of the materials and labor, and between the hours kept, and quantity of work done in a given time by a journeyman to a master-tradesman and to a gentleman, will (if the former should, by error in estimating, find no other gain), afford a certain profit to the tradesman; and thus, suppose a contractor to estimate a piece of work at 1000*l.*, and which the proprietor, changing his mind, instead of letting to the contractor, executes himself, and finds the amount 1100*l.*, the contractor, had he got the job, would have actually had a profit, and the owner been a gainer of 100*l.* The mansion, domestic and farming offices, garden-walls, and hot-houses, may all be separately contracted for.

7372. *Ground.* The removal of ground, fences, or digging, may in every case be let by the job, and with decided advantage to both parties. The extent of particular contracts should, of course, be in proportion to the responsibility of the contracting parties.

7373. *Planting.* The enclosures and the preparation of the soil may, in all extensive cases, be executed by contract; but the planting or insertion of the plants, on which so much depends, should uniformly be done by day-work; excepting, however, those cases in which a respectable nurseryman will engage to put in a certain number of plants of a certain kind, size, and age, and maintain them there for at least three years. In some extensive cases, the land may be prepared by fallowing, which the adjoining farmers will generally undertake at a very moderate price per acre. In most cases, the contractor for fences, of whatever description, should undertake to uphold them for a given number of years; and in cases of thorn-hedges, or other live fences, until they become sufficient barriers.

7374. *Road and walk making* may frequently be contracted for; but in this case, as in every other, much will depend on the skill, activity, and experience of the gardener or general overseer. This subject will be found illustrated at greater length, and in a manner incompatible with the nature of this work, in the second edition of our *Treatise on Country-Residences*, 4to.

PART IV.

STATISTICS OF BRITISH GARDENING.

7375. AFTER having considered gardening as to its history, as to the scientific principles on which it is founded, and the application of these principles to the different branches of practice; it remains only to take a *statistical survey and estimate* of its present state and future progress in the British isles.

BOOK I.

OF THE PRESENT STATE OF GARDENING IN THE BRITISH ISLES.

7376. *The present state of British gardening*, as to knowledge, has been the subject of the former parts of this work; but its importance, in the general economy of society, can only be learned by a statement of the manner in which it is actually carried on; the modifications to which it has given rise in the pursuits of those who have embraced the art as a source of livelihood; of the kinds of gardens employed by men of different orders in the state; of the principal gardens as distributed in the different counties of Britain and Ireland; of the British authors who have written on gardening, and of the private or professional police, and public laws relative to gardeners and gardens.

CHAP. I.

Of the different Conditions of Men engaged in the Practice or Pursuit of Gardening.

7377. *Gardeners* may be arranged as operators or serving gardeners; dealers in gardening or garden-tradesmen; counsellors, professors, or artists; and patrons.

SECT. I. *Of Operators, or Serving Gardeners.*

7378. *The garden-laborer* is the lowest grade in the scale of serving gardeners. He is occasionally employed to perform the common labors of gardening, as trenching, digging, hoeing, weeding, &c. Men for the more heavy, and women for the lighter employments. Garden-laborers are not supposed to have received any professional instruction, farther than what they may have obtained by voluntary or casual observation. In all gardens where three or four professional hands are constantly employed, some laborers are required at extraordinary seasons.

7379. *Apprentice.* Youths intended for serving, or tradesmen-gardeners, are generally articulated or placed under master or tradesmen gardeners, for a given period, on terms of mutual benefit: the master contracting to supply instruction, and generally food and lodging, or a weekly sum as an equivalent; and the parents of the apprentice granting the services of the latter during his apprenticeship as their part of the contract. The term agreed on is generally three years; or more if the youth is under sixteen years of age but whatever may be the period, by the laws as to apprentices it must not extend beyond that at which the youth attains the age of manhood. No one can ever expect to attain to the rank either of master-gardener or tradesman, who has not served an apprenticeship to the one or the other. In general it is preferable to apprentice youths to master-gardeners, as there the labor is less than in tradesmen's gardens, and the opportunities of instruction generally much greater.

7380. *Journeyman.* The period of apprenticeship being finished, that of journeyman commences, and continues, or ought to continue till the man is at least twenty-five years of age. During this period, he ought not to remain above one year in any one situation; thus, supposing he has completed his apprenticeship in a private garden at the age of twenty-one, and that his ultimate object is to become a head-gardener, he ought first to engage himself a year in a public botanic garden; the next year in a public nursery; that following, he should again enter a private garden, and continue making yearly changes in the most eminent of this class of gardens, till he meets with a situation as head-gardener. The course to be followed by an apprentice intended for a tradesman-gardener is obvious; having finished his period in a private garden, let him pass through a botanic and nursery-garden, and then continue in the most eminent of the class of public or tradesmen's gardens, to which he is destined.

7381. *Foreman* (before-man, or first man). In extensive gardens where a number of hands are employed, they are commonly grouped or arranged in divisions, and one of the journeymen of longest standing employed as foreman or sub-master to the rest. Whenever three or more journeymen are employed, there is commonly a foreman, who has a certain extent of authority at all times, but especially in the absence of the master. This confers a certain degree of rank for the time being, but none afterwards.

7382. *Master-gardener.* A journeyman has attained the *situation* of master-gardener, when he is appointed to the management of a garden, even if he has no laborer, apprentice, or journeyman under him; but he has not attained to the *rank* of master-gardener till having been a year in such situation. Afterwards should he be obliged to work as journeyman, he still retains the rank and title of master-gardener but not of head-gardener.

7383. *A head gardener, or upper gardener,* is a master who has apprentices or journeymen employed under him. Out of place and working as a journeyman, he retains the rank and title of master-gardener, but not of head-gardener.

7384. *Nursery foreman.* This is an important situation, the foreman being entrusted with the numbered and priced catalogues of the articles dealt in; authorised to make sales; entrusted to keep an account of men's time, &c. (see *Time-Book*, 2338.); and in consequence it entitles the holder to the rank of head-gardener while so engaged, and to that of master-gardener ever afterwards; the same may be said of foremen to public botanic gardens, and royal or national gardens.

7385. *A travelling gardener* is one sent out as gardener, or collector of plants, along with scientific expeditions; he is generally chosen from a botanic garden; and his business is to collect gardening productions of every kind, and to mark the soil, aspect, climate, &c. to which they have been habituated.

7386. *Botanic curator.* This is the highest situation to which a serving gardener can attain next to that of being the royal or government gardener. He superintends the culture and management of a public botanic garden; maintains an extensive correspondence

with other botanic curators; exchanges plants, seeds, and dried specimens, so as to keep up or increase his own collection of living plants, and *herbarium siccum*. Abroad, for want of sufficiently intelligent practical gardeners, they have what are called *directors* and inspectors of botanic or other government gardens; but no such office is requisite in this country.

7387. *Royal gardener, court-gardener, or government-gardener; Jardinier de la Cour, Fr.; Hoffgartner, Ger.; and Giardiniere della Corte, Ital.* This is the highest step, the *summum bonum* of garden-servitude. In foreign countries, the court-gardener wears an appropriate livery, as did formerly the head gardeners of the principal nobility, as well as the court-gardeners of this country. At present this remnant of feudal slavery is laid aside in every grade of British garden-servitude.

SECT. II. Tradesmen-Gardeners.

7388. *Of tradesmen-gardeners*, the first grade is the *jobbing gardener*, who makes and mends gardens, and keeps them in repair by the month or year. Generally he uses his own tools, in which he is distinguished from the serving gardener; and sometimes he supplies plants from a small sale-garden of his own.

7389. *Contracting gardeners, or new-ground workmen*, are jobbers on a larger scale. They undertake extensive works, as forming plantations, pieces of water, roads, kitchen-gardens, and even hot-houses, and other garden structures and buildings. Formerly, and especially in Brown's time, this branch of trade was combined with that of the artist-gardener, but now since the principle of the division of labor has been so much refined on, they are generally separated.

7390. *Seed-growers* are as frequently farmers as gardeners; their gardens or fields are situated in warm districts, and they contract with seed-merchants to supply certain seeds at certain rates, or to raise or grow seeds furnished to them by the seedsmen on stipulated terms. The great test of excellence here is never to grow at the same time such seeds as may hybridise the progeny by impregnation.

7391. *Seed-merchants, or seedsmen*, deal in garden-seeds and other garden-productions; in general they combine the business of nurserymen or florists, but sometimes confine themselves entirely to dealing in seeds wholesale, or to a sort of agency between the seed-growers and the nursery-seedsmen.

7392. *Herb-gardeners* grow herbs, either the entire herb, as mint, or particular parts, as the bulb of liliun, and the flower of the rose for medical purposes, or for distillation or perfumery.

7393. *Physic-gardeners, herbalists, or simplicists*, not only grow herbs for the purposes of medicine, or perfumery, but collect wild plants for these purposes. Formerly, when it was the fashion among medical men to use indigenous plants as drugs, this was a more common and important branch of trade. They have commonly shops appended to their gardens, or in towns, in which the herbs are preserved, and sold in a dried state.

7394. *Collectors for gardens*. The first variety of this species is the gipsy-gardeners, who collect haws, acorns, and other berries and nuts, and sell them to the seedsmen; the next are those who collect pine and fir cones, alder-catkins, and other tree-seeds, which require some time, and a process to separate the seeds from their covers, and clean them before they can be sold; and the highest variety are those gardeners who establish themselves in foreign countries, and there collect seeds and roots, and prepare dried specimens of rare plants for sale.

7395. *Orchardists* of the simplest kind are such as occupy grass-orchards, where the produce is chiefly apples, pears, and plums, for cider or kitchen-use; the next variety occupy cultivated orchard-grounds where fruit-shrubs, as the gooseberry, currant, strawberry, &c. are grown between the fruit-trees; and the highest variety occupy orchards with walls and hot-houses, and produce the finer stove-fruits and forced articles.

7396. *Market-gardeners* grow culinary vegetables and also fruits; the simplest kind are those who grow only the more common hardy articles for the kitchen, as cabbage, pease, turnips, &c.; a higher variety grow plants for propagation, as cauliflowers, celeri, and artichoke-plants, and pot-herbs, as mint, thyme, &c.; and the highest variety possess hot-beds and hot-houses, and produce mushrooms, melons, pines, and other forced articles and exotic fruits. They have often shops at their gardens, or in towns, for the disposal of their produce; and these, when fruit is chiefly dealt in, are called fruit-shops; where culinary vegetables are joined, green-grocery shops. Most commonly, however, the culinary vegetables are carried to market, and there disposed of to such as retail them in shops or on stalls. Occasionally they are deposited for sale in the hands of agents or brokers, and sometimes shops are supplied regularly on certain conditions.

7397. *Florists* are either *market-florists* who grow and force flowers for the market, and of this subspecies are two varieties, those who grow only hardy flowers to be cut as nose-

gays, and those who deal chiefly in exotics or green-house plants to be sold in pots. The other subspecies is the *select florist*, who confines himself to the culture of bulbous-rooted and other select or florists' flowers, who has annual flower-shows, and who disposes of the plants, bulbs, tubers, or seeds.

7398. *Botanic gardeners* are such as devote themselves exclusively to the culture of an extensive collection of species for sale; these may be either limited to indigenous kinds, as was the botanic garden of the late Don of Forfar, embracing all hardy plants, or extending to tender exotics. Botanic gardeners also collect and dry specimens of plants, and also of mosses, fungi, algæ, &c. for sale: to this they often join the collecting of insects, birds, and other animals.

7399. *Nursery-gardeners, or nurserymen.* This is the highest species of tradesman-gardener. Their business is to originate from seed, or by other modes of propagation, every species of vegetable, hardy or exotic, grown in gardens, to rear and train them for sale, and to pack or encase them, so as they may be sent with safety to distant places. The nurseryman is commonly also to a certain extent a seed-grower, and is generally a seed-merchant, supplying his customers annually with what seeds they require for cropping their gardens as well as with the trees they use in stocking them. The simplest variety of nursery-gardener is he who confines himself to the rearing of hedge plants and forest trees; the highest, he who in addition to all the hardy trees and plants maintains at the same time a collection of tender exotics.

SECT. III. *Garden Counsellors, Artists, or Professors.*

7400. The first species of this genus of gardeners, is the *garden surveyor, or valuator*. His business is to estimate the value of garden labor and produce, and of garden structures, edifices, and gardens themselves. When a proprietor lets his house and garden to a tenant for a certain number of years, the stock of the garden is valued, and either entirely paid for by the tenant, or it is again valued when the latter quits the premises, and the difference in value paid either by the tenant to the landlord, or by the latter to the former, as the case may be. It is the business of the garden-surveyor to estimate the value of the stock, crop, and business of nurserymen, and other tradesmen-gardeners, quitting or entering on premises, or purchasing or disposing of their establishments. The garden-surveyor is sometimes also a garden-auctioneer; but generally his business is confined to valuing, and practised by nurserymen or other tradesmen-gardeners.

7401. *The tree-surveyor, or timber-surveyor*, limits his occupation to arboriculture: he measures and values standing timber or copsewood; estimates the value of young plantations, the expense of forming them, of managing them during a certain number of years; of enclosing with live hedges of every kind, and their management till fence high: he determines what trees shall be felled, thinned, or pruned, and directs the manner of performing these operations.

7402. *The horticultural architect (Planner, Scotch)* gives designs for kitchen-gardens and flower-gardens, with their structures and buildings: he sometimes also lays out shrubberies and pleasure-grounds, when on a small scale. In this case he takes the title of ornamental gardener (*Planner of policies, Scotch*), or ground-architect.

7403. *The horticultural artist* is employed in designing and painting fruits, flowers, plants, implements, and horticultural structures and gardens, but chiefly in drawing fruits and flowers, the gardens and structures being more commonly drawn by the horticultural architect, or landscape-gardener.

7404. *The landscape-gardener, or layer out of grounds; Artiste jardinier, Ingénieur des jardins pittoresques, or Anglais, and Jardinier paysagiste, Fr.; Garten künstler, Ger.; and Artiste giardiniere, Ital.* This species of counsellor gives designs for disposing of the plantations, water, buildings, and other scenery, in parks or landscape-gardens, and generally for every thing relating to the arrangement of a country-seat, excepting the architecture of the mansion, offices, and other buildings; but in what respects the site of these, and the exposure of the principal fronts and apartments of the house, his counsel is required jointly with that of the architect.

7405. *The gardening author* may be considered the most universal kind of garden-counsellor, since his province extends to every branch of the art. The simplest variety of this species is the author of remarks, or an essay, or treatise on one particular plant or subject; the most comprehensive, he who embraces the whole of the science and art of gardening; but the most valuable, he who communicates original information.

SECT. IV. *Patrons of Gardening.*

7406. *Every man* who does not limit the vegetable parts of his dinner to bread and potatoes, is a patron of gardening, by creating a demand for its productions. He is a *consumer*, which is the first species of patron, and the more valuable varieties are such as regularly produce a dessert after dinner, and maintain throughout the year beautiful nosegays and pots of flowers in their lobbies and drawingrooms.

7407. *Amateurs* (lovers of gardening). These promote the art by the applause they bestow on its productions, of which, to a certain extent, they become purchasers.

7408. *Connoisseurs* (critical or skilful lovers of gardening). These promote the art in the same way as the amateur; but much more powerfully, in proportion as approbation, founded on knowledge, is valued before that which arises chiefly from spontaneous affection. By the purchase of books, engravings, and drawings, from which, in great part, this species of patrons acquire their knowledge, they may be said to be eminent encouragers of counsellor-gardeners.

7409. *Employers* of gardeners, whether of the serving, tradesman, or counsellor classes, are obvious and undoubted patrons of the art.

7410. *Occupiers* of gardens of necessity employ both serving and tradesmen gardeners, and when they are amateurs or connoisseurs, are often great encouragers of the art; for every one is not so fortunate as to rank among the

7411. *Proprietors* of gardens, who are the most eminent of all patrons, promoting every department of the art, and employing serving, tradesmen, and artist gardeners. A man whose garden is his own for ever, or for a considerable length of time, whether that garden be surrounded by a fence of a few hundred feet, or a park-wall of ten or twelve miles, will always be effecting some change in arrangement, or in culture, favorable to trade and to artists. "I pity that man," says Pope, "who has completed every thing in his garden." "Après mes enfans et deux ou trois femmes que j'aime, ou crois aimer à la folie, mes jardins sont ce qui me fait le plus de plaisir au monde; il y en a peu d'aussi beaux." (*Mémoires et Lettres du Prince de Ligne*, tom. i. 117.)

CHAP. II.

Of the different Kinds of Gardens in Britain, relatively to the different Classes of Society, and the different Species of Gardeners.

7412. IN order to form an estimate of the importance of gardening to a people, and of the duties of gardeners in filling different situations, it is not only necessary to notice the different species of gardeners to which it has given rise, but also *the different kinds of gardens; the classes of society which enjoy them; and the species of operators and patrons who cultivate and encourage them.* In this view, gardeners may be arranged as private, commercial, or public establishments.

SECT. I. *Private British Gardens.*

7413. *Of private British gardens*, the most numerous class of gardens, and those the most regularly distributed over the British isles, are those of the country laborer, or what are usually denominated *cottage-gardens*. Next to his cottage, the laborer finds his garden the most useful and agreeable object, by supplying a part of his food, affording an agreeable source of recreation, and presenting an opportunity of displaying his taste in its cultivation. To the laborer who has no cottage or garden, human life presents no hopes; his future extends only to a few days; he has no consolation but in the contemplation of fixed wages, which the most fatiguing exertions can in no degree increase, and of which, in the case of illness, he has only the amount of a week to interpose between the absolute want of lodging and food. But the laborer who rents a cottage and garden is secure at all events of a roof to cover him; he can multiply his pleasures and pains by the addition of a wife and children; and he knows that he can live for a certain time on the produce of his garden. By these hopes he is consoled. Besides, he has that most desirable object, something that he can call his own; and is thus enabled to participate in the feelings which belong to the love of property and progeny—feelings often, indeed, mixed with pain, but which nevertheless, have been an object of ambition from the earliest ages of the world.

7414. *Cottage-gardens*, in a moral and political point of view, are of obvious importance; attaching the cottager to his home and to his country, by inducing sober, industrious, and domestic habits; and by creating that feeling of independence which is the best security against pauperism.

7415. *The extent* of the garden of a laborer ought never to be such as to interfere with his employment as a laborer; unless it is sufficiently so to enable him to dispose of part of the produce in the manner of a market-gardener; or to keep a cow and dispose of her produce. But as it will rarely happen that in either case he can compete in the market with the regular market-gardener or farmer, the most useful extent of garden is that which shall occupy his own leisure hours in the operations of digging and planting, and those of his wife and children in hoeing, weeding, and watering. This will generally, as already stated (7296.), be something between one eighth, and three sixteenths of an acre, including the space on which the cottage stands.

7416. *The vegetables* which may be most profitably cultivated by the occupants of this description are, cabbages of the early heading sorts, hardy borecoles, as the German greens, early potatoes, parsneps, tur-

nips, carrots, onions, leeks, peas, beans, and kidneybeans; a plant or two of celery (not to be blanched), thyme, mint, and chives for seasoning; and a few plants of rhubarb for tarts.

7417. *The fruit-shrubs*, which ought never to be omitted, are the gooseberry, and black and red currant, as standards, in the margins of the plots, or against the walls or pales, if the garden is surrounded by these: the kinds of gooseberry should be those which grow with straight upright shoots, as the Manchester and Warrington reds, the amber, yellow globe, rough green, and crystal. The fruit-trees should be of the best bearers among the baking apples and plums; as the hawthorndean, and any of the codling apples for early use, the grey russet and winter pearmain for winter and spring; and the damson, bullace, and winesour plums; the may-duke cherries, or yair, and a winter bergamot pear may be added. If the climate and aspect is favorable, the most southerly sides of the house may be covered with a white muscadine, or black July grape, or otherwise with pears in the best aspects, currants in the worst, and a rose and honeysuckle on the porch. (See 7310.)

7418. *In the management of cottage-gardens*, no opportunity should be neglected by the cottager of collecting manure from the highways, from the grass, weeds, and mud of ditches and lanes; leaves of trees, soot-ashes, and all household refuse, should be collected, and the whole mixed together in the dunghill (1977.), and turned frequently over before using. In the culture of these gardens, the principle of a change of surface (2549.), and of a rotation of crops (2556.), should be attended to; and also that of continually stirring the soil among growing plants as deep as possible; of watering in dry weather, regularly every evening, and of gathering by hand all worms, snails, slugs, grubs, and other insects, as soon as they appear. Of potatoes only the early sorts should be cultivated in the cottage-garden, because that plant is now so generally a subject of field-culture, that for a main supply the cottager will find it cheaper to purchase from the farmer; or to rent a few square yards of a field devoted to drilled green crops, and cultivate himself as many as may serve his family and his pigs and poultry. Besides, in either of these ways, he is more certain of obtaining potatoes of good quality, as even though the sorts be changed, still the quality is much deteriorated by repeated culture on the same spot.

7419. *Improvement of cottage-gardens*. It would be a most desirable circumstance, if proprietors who keep head gardeners would desire them to attend to the gardens of the cottagers on their estates; to supply them with proper seeds and plants; to propagate for them a few fruit-trees, and distribute them in the proper places in their plots; to teach them modes of culture suitable for their circumstances; and to enforce them by adequate motives of hope or fear, of reward or removal, as the case might require. In this way, at no additional expense whatever to the proprietor, much happiness might be diffused; and constantly recurring objects too often indicating wretchedness, or at least slovenliness, rendered useful, neat, and even ornamental.

7420. *Domestic improvement of cottagers*. It would also be a very desirable circumstance if some of the female servants, or even some of the charitably disposed female members of the family, would instruct the cottagers' wives on their estates in improved modes of cookery, washing, making, and mending. It is astonishing how ignorant and how extravagant the humblest classes are in these respects; it is rare to find in operation any principle of action, or much regard to economy in domestic management. It appears to be all work at random, from the making of soup to the baking of pastry. Much might be done by taking any one cottager's dish, and cooking it in different ways before her. For example, soup from vegetables, water, and a little butter only. How different that made by merely boiling the ingredients *au naturel*, and that by burning a part of the butter; adding toasted crumbs of bread, a few leaves of chives, and half a leafet of green celery! How few cottagers know how to make the most of their bees, which, besides honey, afford a most refreshing and enlivening drink, little inferior, when properly made, to champagne. Man, in the condition of a day-laborer, is generally so much engaged in procuring the raw materials of subsistence, that he is without leisure to invent the machinery, or resort to the manipulations necessary for manufacturing them into the best fabrics. But let him once be properly instructed in this matter; let him once feel the enjoyments of which, even *his condition of life* is susceptible, and he will not easily afterwards relinquish them. In a state of labor and servitude, man is generally so dull and stupid, that almost every degree of refinement, or sensation beyond that of mere animal feeling, is lost on him. The rich man is happily willing to put his hand in his pocket to help him; but that merely affords a temporary relief from evil. To supply instruction in plain practicable economy, and patiently to follow it up till it becomes a habit in the instructed, is to effect a radical improvement in this condition of life; which will be felt by the subjects of it during their lives; and being transferred to their posterity like other habits and customs, must ultimately ameliorate this most numerous and efficient order of society.

7421. *Supplying economical knowledge to cottagers*. Something in furtherance of the above ideas might be effected by distributing tracts on cottage-gardening and house-economy; but man, grown up in ignorance without the habit of reading, does not readily receive instruction from books. His want of experience in book-knowledge prevents him from discerning what is practicable from what is speculative, and consequently he cannot, like the man who is conversant both with books and practice, seize on what is valuable and appropriate it to his use. The mind requires a certain preparation before it will receive new ideas; and its faculties must have been exercised on ordinary matters, before reason can be properly employed, on any subject not common. Tracts, therefore, among the laboring classes are chiefly useful to their children; and if children were taught the common labors and operations of husbandry and domestic economy at school, which they might easily be by the Lancasterian method of instruction, it would fit them for entering on a life of labor with superior advantages, both in point of performing their labor, and in making the most of its reward.

7422. *The cottage-gardens of artificers*, that is, of operative mechanics and manufacturers, small tradesmen, and other country artisans, differ from those of the common laborer in being somewhat larger, and in having a larger portion of the space devoted to the culture of fruit-trees and flowers. They are cultivated by the occupier and his family, and very frequently sufficient ground is connected with these gardens to enable the occupier to keep a cow or horse. These indeed are often half-starved animals, producing little benefit to their owners beyond the feelings of satisfaction which the idea of possessing them confers. In several parts, and especially the north of England, and generally in Scotland, the gardens of artisans differ from those of the cottager, in being held on a

long building-lease, and in being situated in or around large towns. The most remarkable gardens of this description for riches, order, and beauty, are at Norwich, where they first originated (373.); at Spitalfields, near London, among the residences of the silk weavers; at Manchester, and other Lancashire and Cheshire towns; and at Paisley and Glasgow. The occupiers are generally their own masters, having their looms or other implements of trade within their dwellings, and being employed by merchant-manufacturers, or taking their goods to a common market. They are generally an intelligent, industrious class of men, who take great delight in their gardens, and the point of practice in which they excel is in the production of florists' flowers. Norwich is, or used to be, noted for carnations. Spitalfields is still noted for all the competition flowers, but especially for auriculas and tulips. Manchester for auriculas and polyanthus, and also for the production of new varieties, and large specimens of gooseberries; and Paisley and Glasgow for pinks. The florists in Lancashire, indeed, excel in every branch of their profession, and are also famous for their success in cultivating the potatoe, which was in general use in this county long before it was known in many others. The artisans of Paisley are, perhaps, the most intelligent of their order in the world; even the speeches of what were called the radical reformers of this town, astonished by their argument and style; and the success of the florists, and the laws of their association, are not less surprising. (See *Lancashire and Renfrewshire*, in the succeeding chapter.)

7423. *The farmer's garden* (7293.) varies in extent from an eighth part to a whole acre or upwards, according to the kind of farm. Lord Kames (*Gent. Farm.* 297.) considers a fruitful kitchen-garden as the chief accommodation of a farm; yet farmers in general pay very little attention to their gardens, even where the best systems of agriculture are preserved. They are managed in the smallest farms by the farmer himself, with the occasional assistance of his men, and of the female part of his family; in those of a higher kind, where the farmer is not personally an operator, they are managed by a laborer, who is generally kept on the farm for cleaning hedges, clearing out furrows, and doing such extra field-work as cannot be performed by the regular hands of the farm.

7424. *In tradesmen's farms*, large, or what are called gentlemen's farms, villa farms, and *fermes ornées* the gardens are commonly managed by a gardener, who is expected to assist in the field during the hay and corn harvests; and, therefore, he seldom ranks high in his profession.

7425. *The products of common farmers' gardens* are of the most useful and hardy kinds; but those of villa and ornamental farms contain hot-houses, and often produce many of the luxuries of regular villa or mansion gardens. Indeed, were farmers disposed to excel in gardening, no class of country residents, excepting landed proprietors, have an opportunity of indulging their taste so variously and extensively, and at so little expense. In the first place, supposing a farmer to have a lease for twenty-one years, at a fair rent; whatever state he finds the farm in; if it be enclosed and subdivided, he may render it a *ferme ornée*, by leaving strips of pasture round all the arable fields, and connecting these by gates in such a way as that he may form a *drive* or *riding* (7280.) round and through the whole. Secondly, he may form, or enlarge and arrange, the kitchen-garden, flower-garden, orchard, and the portion of lawn and pleasure-ground round or beside the farm-house, at pleasure. Thirdly, he may heat hot-houses, pits, and hot-beds, at the expense of labor only, by fermenting his farmyard-dung in such pits as West's (*fig.* 230.), in such vineries as Anderson's (*fig.* 461.), or in other vaults for pines (*fig.* 462.), or behind walls or pales, to force fruit-trees. Perhaps one of the simplest modes for a farmer to take the benefit of his fermenting dung would be to have a line of pales to serve as a wall for training on, hinged at the surface of the ground. On these, when placed in a position forming an angle with the ground of 45°, the trees should be trained. Then, when the dung is to be placed behind, the pales should be elevated to the perpendicular, and the dung dropped down in cart-loads, and laid up in a regular ridge, sloping towards the pales, but perpendicular on the north side. This being formed, the pales should be folded back on the slope, and the advantage of this plan over that of fixed upright pales would be, that as the dung sunk the pales would sink with it, and by being always in close contact, would receive more heat than by the usual mode, in which, when the dung sinks, it separates from the pales, and then the whole surface of the dung being exposed, the heat ascends, and is lost. But an exceeding good plan for every description of forcing or exotic culture, would be to construct houses on the plan of West's pit, with all that part of the north wall under the level of the earth or floor for the pots substituted by cast-iron or stone pillars, and wooden gates between. These would facilitate the putting in and taking out of the dung, and, being shut close, no part of the heat would escape. These plans are only for amateur, or proprietor farmers, for the common commercial or market farmer could not devote either sufficient capital or attention to the subject. He, in general, leaves the care of his garden to his wife, whose taste and ambition does not often carry her ideas farther than a cucumber-frame; though a small green-house, and even a vinery, as it requires so very little attention (see 3041.), might often be added, in order to enhance the enjoyments of this class of society.

7426. *Street-gardens, and the smaller suburban gardens* (7287. to 7292.), are the next classes in point of number. They differ from the former in being almost always gardens of pleasure, consisting of a grass-plot (*complot*, Fr. a design or device,) with a border, or a few patches of flowers in front of the house, and a gravel-plot or grass-plot behind, sometimes substituted by a plot for culinary vegetables and small fruits. Their extent may be from an eighth to half an acre, and they are managed by jobbing-gardeners by the day or year. As the plants and turf are soon injured by the smoky and confined atmosphere incident to their situations, the finer plants and trees do not thrive in them, and the sorts which do succeed, and even the turf, require frequent renewal. Evergreens and early spring flowers, both of the tree and herbaceous kinds, are most to be desired as permanent plants for these gardens; and in summer a display of annuals is made from transplanted plants furnished by the jobber, whose great object ought to be to keep up a succession of flowers, and to keep the grass and gravel in order, and the whole perfectly neat.

7427. *Tradesmen's villas* (7284.), of the smaller kind, may contain from a fourth part to a whole acre, and are commonly managed by a sort of hybrid gardener, who acts also in the capacity of groom, or of house-servant. On a larger scale they are managed by master gardeners of the lowest kind, as from such situations they can seldom rise to be head gardeners. Besides attending to the duties of the jobber, as to suburban gardens, the citizen's gardener ought to study to procure early and late crops of the vegetables most in use; as peas, kidneybeans, potatoes, turnips, &c., because at these seasons they are dear to purchase. Main summer crops are of less consequence, as they may be procured cheap at market. For similar reasons, he ought never to be deficient of salads, pot and sweet herbs, tart plants, &c., as these are dearer to purchase in proportion to other vegetables, because less in demand. If there are frames, hot-beds, and hot-houses, the same general principles are to be observed, viz. when the whole of what is necessary for the consumption of the family cannot be raised, to raise such crops as, whether from their kind, or the seasons at which they are grown, are most dear to purchase.

7428. *Where amateurs of gardening have gardens*, they are generally cabinets of rural beauty, however small. We may offer as examples that of R. A. Salisbury, Esq. which consists entirely of plants in pots, which fill a court of a few yards square in Queen-street, Edgeware Road, London; and that of Topham, of Elkins's-row, Bayswater, which is not much larger than that of Salisbury, but in which the choicest flowers are sunk in pots, and changed whenever they begin to fade. This garden is a speck of perfect beauty in its kind. There are a few plots round London similarly treated, and but a few. On a larger scale are numerous amateur gardens; that of the Comte de Vandes, at Bayswater, contains two acres, and is remarkable for its botanical collection, its standard roses, and the neatness with which it is kept: but the plan of the garden, its *cul de sac* walks, ill proportioned borders, and paltry boundary fence of pales, spoils every thing.

7429. *The gardens of connoisseurs* vary in extent; perhaps the largest and best furnished is that of Knight, the first of all horticultural connoisseurs, at Downton Castle, which, with the experimental ground, contains several acres, and various hot-houses, pits, and frames. In general these gardens are to be considered as horticultural workshops, and beauty and order is not to be looked for. Regular gardeners are very seldom employed. Knight says (*Hort. Trans.* iv. 17.), "My gardener is an extremely simple laborer, he does not know a letter or a figure." One horticulturist with whom we are acquainted, employs only women; another, only boys; and several do all the work themselves.

7430. *Suburban or citizens' villas* (7285.) may be considered as occupied by a more wealthy class of citizens; or if not more wealthy, possessing more of the taste and ton of good society. These gardens or residences contain always a portion of lawn or field, as well as a kitchen-garden and shrubbery, and may extend from one to ten acres. They generally contain hot-houses of some kind, and are managed by a regularly bred master-gardener. Besides attending to the duties of a tradesman's gardener, he must bear in mind two things; first, as the families who occupy such places are generally constant residents, he must provide enjoyment both of the agreeable kind from the flower-garden and plant hot-houses, and of the useful kind from the culinary and fruit-garden, for every month in the year; and secondly, he must attend to the habits of the family as to the kinds of productions and enjoyments preferred. The great art of deriving enjoyment from a country-residence of this description, is to provide an interest, a hope, and a fear, for every season, or even for every month in the year. By observing the chapter of monthly productions of horticulture (6038.), and the table of monthly floricultural productions (6741.), the resources which these branches afford are readily discovered. There are also other resources in the nature of culture; such, for example, as raising flowers or fruits from seed. In this view it is good to have some seedlings of early and late flowers, as of the polyanthus and dahlia; of early and late fruits, as of the currant or strawberry, and apple, to come into flower and bearing every season. Other devices for exciting and keeping alive interest will readily occur to the reflecting gardener.

7431. *With respect to the habits of a family*, it is not only the duty of a gardener to grow those vegetables, fruits, and flowers, of which the members consume the most, or of which they are fondest; but he must also look for other habits of enjoyment; as whether they are fond of walking in the garden, and at what times and places, so as to have every thing in the condition and order best adapted for those purposes. Some delight in smells, and for such, the most odoriferous plants should be distributed along the walks; others in sounds, and for these, the trees and plants which produce the fruits preferred by singing birds should be planted; or birds, in portable aviaries, distributed through the grounds. Some, in walking, may prefer not being seen by workmen, or at least not meeting them in the paths on which they enjoy this mode of recreation; others may take delight in seeing work going forward, and even in asking questions of the operators.

7432. *In all families there are invalids* at some time or other, and a great object is to render the garden an alleviation to their sufferings. Some afflicted in the lower extremities can only walk on grass-walks; others, from asthma, may not be able to stoop to smell to or gather a rose or a gooseberry; others may require to be carried round the hot-houses in a chair, or wheeled along the walks reclining on a couch, and covered with a glass case. Grass-walks, standard roses, and gooseberries, elevated pots of plants, hot-house paths uninterrupted by pots, and gravel-walks smoothly rolled, are obvious luxuries for such persons. A sick horticulturist, confined to his chamber, may derive some enjoyment from having pots of plants brought before him for a few minutes, to show him their progress; and also by relations of what work is going on, and what articles are vegetating in the garden. When life is under the pressure of disease, any object or measure which can divert the attention for a moment affords relief; for though night cannot be turned into day without the presence of the sun, its darkness may be lessened by a speck of the dimmest day-cloud. It does not often happen that residences are laid out purposely for invalids; but where this is the case, the designer ought to contrive gently inclined planes instead of steps or stairs, and to avoid all corners in walks and paths. Easy turnings in walks are also a great luxury to studious persons, who think as they walk. For this reason, an author, if he can afford any other garden than a pot of mint, should surround his plot with an oval path, that he may walk on without end, and without any sensible change in the position of his body.

7433. *Whether a family is of retired or public habits* ought to be noticed by the gardener. A retired family will derive most satisfaction from the useful products, and the personal recreation they can take in their garden. A public or fashionable family, on the contrary, from its beauty, high order, and keeping. Beautiful objects are formed to be admired, that is their use, and what renders them so desirable, and their possessors so much envied; therefore those who possess beautiful objects in order to derive the enjoyment they are calculated to confer, must court applause by inviting such friends as are likely to become admirers. Let no man shut himself up in the midst of beautiful rural nature and think he will be perfectly happy, lest he should be forced with the satirist to ask —

—“What is nature? ring her changes round,
Her three flat notes are water, plants, and ground.”

7434. To be condemned to *pass an eternity in a pleasure-ground*, would be perhaps as dull as to pass it in a conventicle. Man is a social being, and never can reject the habits to which this part of his nature gives rise with impunity. To be happy he must see and be seen: it is the operation of this principle that has rendered the most beautiful seats of the country *show-places*, or places which all the world are invited to come and admire, as Blenheim, Mount Edgcombe, Hackfall, &c.; which induces others to publish accounts of their seats, as Dr. Letsom of Grove Hill, the late T. Johnes, Esq. of Hafod, &c.; which leads the citizen to place his box or lodge, and the artisan or laborer his cottage or cabin by the roadside; and which, in short, impels the humblest individual to court applause by making his powers, either of purse or mind, known to those around him. A gardener, therefore, must attend to these general principles of our nature, and apply them in his department as well as he can; for much, it is evident, depends on his studying the effect of the scenes under his charge, and keeping them in the most perfect order and neatness for inspection.

7435. *Villas.* (7278.) The grounds and gardens of this class of residences may occupy from ten to a hundred acres, or upwards; they are generally managed by a head gardener, with one or more journeymen, and probably an apprentice, and with the occasional assistance of men and women laborers. The kitchen and flower gardens of places of this sort are generally good, and well furnished with hot-houses; the shrubbery also is carefully laid out, and planted with choice shrubs and trees; and as the proprietor is generally an opulent commercial man, he is liberal in his annual expenditure. The gardeners at such places are generally well paid, no limits put to the dung, implements, structures, or assistance they may want, and left more entirely to their own discretion than those in the service of country-gentlemen. Their responsibility is, therefore, so much the greater, and they are quite unpardonable if they do not excel in their art, and, above all things, in keeping the whole scene under their charge in the utmost order and neatness. It frequently happens, however, that soon after a gardener has got into such a situation, and become familiarised with his garden, and the habits of his family, he begins to consider his place as a sinecure (*sine*, adv. and *cura*; i. e. without care), and instead of arduously endeavoring that the productions of the current year shall surpass those of the year past; instead of adding more and more to the enjoyments of his employers, he begins to try with how little they may be put off; and the object of his ambition, which ought to be to delight and astonish his family, is ultimately lowered to that of contenting them. This sort of lethargic indifference, brought on by plenty and ease, is not peculiar to gardeners; it is a condition of our nature, which also furnishes checks to its increase after a certain

period ; but it is the business of cultivated man to apply these checks at an early stage, and thus to lessen the evils to all parties.

7436. *The simplest check to indolent gardeners* is the demands of their masters, who seeing at other tables, and in other gardens, productions superior to their own, and knowing that they spare no expense, &c. naturally enquire into the cause of the default. This sort of observation when abroad, and comparison with home, ought never to be neglected by those who wish to keep servants of any description to their duty. The deficiencies and bad points of other gardens and gardeners may be let alone ; but their excellencies should always be particularised, and dwelt on to our own ; and where a failure happens in the one case, the reasons required for the other's superiority in that particular, and our inferiority. If the master ultimately becomes dissatisfied with the condition and produce of his garden, let him first call in the nurseryman who recommended the gardener, as counsel for both sides ; and let him consign him to this nurseryman, with such a character as he may be considered to merit.

7437. *On the order and neatness with which a garden is kept*, so much of its beauty and effect depends, that often as we have mentioned the subject in the course of this work, we must again advert to it. Many excellent gardeners are deficient in these particulars, from causes which, at first sight, would seem calculated to have a contrary effect ; such as staying constantly at home in their own gardens, and daily inspecting every part of them. The consequence of this is, that the changes which take place in the growth, decay, or deterioration of objects is so gradual as not to be observed, and that an object seen twice every day for ten days, seems the same thing the twentieth time which it did the first, when, in fact, and to the person who has only seen it two or three times, it is something different. To illustrate this, let us suppose a collection of green-house plants, newly shifted, surfaced, pruned, trimmed, tied, washed, and replaced on the stage, and that one man attends to the watering of them regularly every day for a month. They are newly shifted plants the first day, and consequently require nothing done to them ; so they are the second, third, fourth, and so on, even after a week or ten days they are so considered, and this notion now becomes habitual to the attendant. Every day as he enters the green-house to water, he sees, without even opening his eyes, (that is, the idea recurs,) a stage of newly shifted plants, all fresh, and free from weeds and decayed leaves, and wanting nothing ; therefore weeds and decayed leaves he never thinks of looking for, but waters on ; whilst a stranger, or one who has not seen them for a few days, is struck with the slovenliness displayed, and though perhaps the same thing may take place in his own garden, or his own department in the same residence ; he goes away not willing to benefit the other by corrective advice, but "thanking God he is not like this man."

7438. *This cause of slovenliness* we think there are few gardeners who will deny to be correctly stated ; and we think, the cause being discovered, the remedy very easily presents itself. Let master gardeners not inspect every part of what is under their care *every day at the same time*, and in the *same order*, but let them omit some parts on some days, occasionally omit the whole, and often vary the time and order of their visits. Let them also, instead of going round to look if such and such scenes are in order, go impressed with the idea of finding them in bad order, in search of particular sorts of weeds, of decayed, damaged, or straggling parts of plants, insects, &c. It may seem ludicrous to add, let him go round sometimes in the night instead of during day ; but we are persuaded that viewing particular scenes by the light of a lantern or the moon, would present them in such a new aspect, as would probably show deformities or deficiencies. It is a common observation of servants, that after their master has been a day or two confined with illness, or on the morning after an evening of dissipation, he is generally very apt to find fault and be cross, and difficult to please. This is actually the case, and is satisfactorily accounted for without reference to humor or temper : the master sees faults which before escaped him, because the machinery of his faculties has been deranged, and he sees differently. But why does he see faults rather than beauties ? Because it is his business to seek for them, and this impression being habitual on his mind, the strongest images reflected by the eye are of that nature.

7439. *Visiting neighboring gardens* is another important part of a head gardener's duty. This should be done with a view not only to order and neatness, but also to good culture, intelligence as to the state of gardening, &c. ; he should not limit his visits to those near him, but include all the principal gardens for forty or fifty miles round ; and he should, at least, once a-year, visit the capital or the metropolis, to inform himself, by means of the nurserymen, and among the numerous first-rate gardens that are always found round capital cities, the horticultural societies, and agricultural libraries, of what is going on in the gardening world.

7440. *The mansion and demesne* (7270.) is less common than the villa near large towns, but more so in the country. The proprietors are sometimes commercial men, but more generally country-gentlemen. Their extent varies from a hundred to a thousand acres,

or upwards, and, in addition to the park and gardens, they contain a home or family farm managed by a bailiff. The garden-scenery, as in the case of a villa, is managed by a head gardener, sometimes more circumscribed in his operations, but always respectably provided for, both as to his person and garden. The worst point attending residences of this description is, that the business of gardener and bailiff is, sometimes in England, and often in the other districts of the empire, united; and the consequence almost universally is, that the business of both situations is very imperfectly performed. The master's object in attempting this union is obviously the saving of a bailiff's wages, which, it is allowed, is an apparent saving, though certainly not always so ultimately. The gardener and bailiff cannot be present at one time, both in the garden and on the farm; he must pass alternately from the one to the other, and it may be questioned whether the time lost in his absence from both, while going between them or at market, and from the one while on the other, does not more than counterbalance the wages of a bailiff, independently of any other consideration. But the loss both to the farm and garden, in cases of this sort, though not very obvious at first sight, is very considerable when details are entered on. No man brought up as a gardener can at once become a good bailiff; and admitting that he may become one in time, yet he acquires his experience at his master's expense. It is generally imagined that a gardener makes a good arable farmer; but this he does not become without experience; for though he may know what good culture is, and may bring the fields of corn or green crops under his charge into a state of good cultivation, yet he may do this at much too great an expense to afford any profit. But the management of arable land is but a small part of a bailiff's duty; the grand object is the breeding, rearing, fattening, buying, and selling of live stock; and a knowledge of these parts of farming cannot be acquired under several years' experience. In the mean time, the losses to the master by bad marketing must be most considerable. Suppose the gardener and bailiff goes to purchase a few scores of sheep, and a dozen of oxen for feeding, every grazier knows that on the nature of the *feel* alone, which no man can communicate to another by description, much of the value of the animal depends. But a gardener knows nothing of this *feel*, and the tact of discovering it is not to be acquired but after such a course of experience as no prudent master, who knows any thing of the subject, would wish a bailiff to acquire in his service. As much might be said on the correctness of judgment required in selecting animals to breed together, and in the shrewdness required for marketing; the latter, a duty totally inconsistent with the retired habits of a gardener.

7441. *That some gardeners may become good bailiffs* we readily allow, because a man of moderately good natural faculties and persevering application, will acquire any thing; but from the nature of the duties which a bailiff has to perform, and the time he must occupy on the farm and at market, it is impossible he can attend sufficiently to the garden. We have never yet known an instance where the duties of both the offices were well performed by the same person, but almost universally found both the garden and farm deficient in the products expected from them. That the master is content is no proof to the contrary, for knowing no better, he naturally considers what he has as the best.

7442. *From the country-gentleman's gardener, who does not unite the duties of bailiff*, a good deal is expected; he must know his profession well; he cannot probably from limited extent and means produce all he could wish, or that a garden should afford, but what he undertakes to raise he must raise in perfection, according to the kind and season, and the main crops in sufficient quantity, because he cannot, like the citizen's gardener, have recourse to Covent-garden, nor like the villa-gardener, surrounded by neighbors, borrow from them melons, mushrooms, or asparagus, in cases of emergency. He has one duty also which does not belong to either of these classes of gardeners, that of packing and sending fruits and other garden products to town when the family reside there.

7443. *The mansion-residence* may be considered as including all those between the villa and the royal palace. The dwellinghouses are called houses, halls, courts, or palaces, according to the custom of the country, where they are situated; or castles, abbeys, or Grecian buildings, according to their style of architecture; and mansions or palaces, according to their extent and magnificence. The mansion-residence consists of the same parts as in the mansion and demesne (7270.); it may contain from five hundred to ten thousand acres, or upwards, and the whole is managed in the first-rate establishments by the following officers: — *A secretary*, who receives the commands of the master, and conveys them to the *house-steward*, who manages the expenditure of the house and offices, and gamekeeper; to the *land-steward*, who manages the tenanted lands, receiving rents, and seeing to the fulfilments of covenants in leases, repairs, &c.; to the *bailiff*, who manages the family farm; and to the *gardener*, who manages the garden-scenery, including the park, as far as respects the trees and grass, and the internal plantations or forests.

7444. *The gardener who occupies a first-rate situation* has under him a forester, for the demesne-woods and park-trees; a pleasure-ground foreman for the lawns and shrubbery; a flower-garden foreman, a forcing-department foreman, and a kitchen-garden foreman. A horse and two-wheeled chaise is kept for his use, by a boy, who also acts as his messenger and house-servant. He lives in a respectable house, near the kitchen-garden, with a stable and cowhouse not far distant. His wages are from 150*l.* to 300*l.* a-year, independently of a free house, fuel, and other advantages. He should be at the head of

his profession when he enters on it; and keep himself at the head of it, by taking care to be informed of every improvement and invention in his line, as they are discovered and made public. He must not only know all that is in books, but must be in advance in knowledge; not only ready to apply all the best practices, but fertile in expedients on extraordinary occasions, and in cases of novelty, difficulty, or emergency. Necessities and difficulties, as they occur, excite the inventive faculty far beyond reflection or study; therefore we can afford little assistance here, except recommending the gardener who is ambitious to excel in his profession, first to store his mind with all the resources of gardening, and next to lay up in his memory as many ideas as he can on all other subjects, but especially on art and science. Next to books on gardening and agriculture, and the topographical surveys of every kind, he should have frequent recourse to the best encyclopædias of general knowledge, and observe the operations, and converse much on professional subjects with mechanics and artificers of every description. Much useful information is to be obtained from carpenters, millwrights, and smiths, and all kinds of information may occasionally be applied to use in so varied and extensive an art as gardening.

7445. *Some idea of the extent of the duties of a head gardener who fills a first-rate situation*, may be had from the chapter of monthly horticultural productions, the table of floricultural productions, and arboriculture and landscape-gardening, as treated of in this work; and therefore all that we shall attempt here, in addition to what has just been offered on the subject of the duties of gardeners holding inferior situations (7426. to 7442.), is to enumerate a few of the expedients, some of them common and others uncommon, which every description of gardener will have occasion to practise more or less; but which more particularly demand the attention of gardeners of the highest class, who, not being limited in expense, are expected not to be deficient in producing all the comforts and luxuries that a garden can afford. We shall arrange these hints under the four departments of practical gardening.

7446. *Expedients and anomalous practices in the horticultural department.*

To have early crops of herbaceous vegetables in the open air. Sow in pots early in spring, one seed in a pot of the smallest size, place them in a gentle hot-bed, shift into larger pots as they grow, and when all danger from frost is over, transplant with the balls entire in the finely pulverised rich soil of a warm border. Peas, beans, turnips, potatoes, carrots, saladings of all sorts, and spinage may be had very early in this way.

Stable-dung is very scarce, and a great quantity is wanted for hot-beds and pits. Collect the spray of trees, copsewood, and hedges; cut it into lengths of three or four inches, with a straw-cutter, and mix it with the dung. Add carpenters' shavings, flax-dressers' refuse, leaves, reeds, rushes, peat, moss, heath, or any substance capable of undergoing the putrescent fermentation.

Tanners' bark is scarce. Add spray, furze, or heath, chopped with the straw-cutter to the length of the chips of bark, also chopped shavings of wood, parings of leather, &c.

Autumn-planted cabbages and cauliflowers, and also spinage and onions have failed. Sow early in spring single seeds in small pots on heat, shift often, and transplant in the warmest situation when all danger from frost is over.

To forward early seedling crops. Sow in the usual way under cold-frames, and remove them when all danger from frost is over. Peas, spinage, and turnips, may be had three weeks earlier than usual by this practice.

All your ground is cropped, and some crops not lik'd to be removed in time to let those which are immediately to succeed them, be got in in season. Forward the succeeding crop in pots, and as soon as the preceding crop is removed, transplant with the balls entire.

The garden is too small for the culinary productions. Forward the brassica tribe in pots, and only head or flower them in the compartments. Instead of hot-beds, which occupy much horizontal space, have cucumbers and melons on hot-walls covered with glass: train other creepers, as love-apples, New Zealand spinage, gourds, &c. on upright trellis-work or pales, the potato-haulm to stakes; stick all peas; train gooseberries, currants, and all dwarf trees as espaliers.

Sorts of fruit not approved of. Engraft or inoculate other sorts. You have some excellent sorts of peaches or other soft tree fruits,

which you wish some person to taste at a distance, too great or too inconvenient to send the fruits themselves. Send some blossom-buds either in spring to be scollop-budded, when they will produce their fruit the same year, or in the usual budding season.

Trees old and not productive. Head down and renew the soil, and see that the roots are not too deeply buried.

To have late crops of hardy legumes and leaves. Plant the latest crops in large pots or boxes; keep them plunged in the open air, and remove them when there is danger of frost to any of the forcing-houses not in operation. In damp weather, light gentle fires in the daytime, but not at night; in frosty weather, light gentle fires at night. In this way peas, beans, kidneybeans, cauliflower, spinage, &c. may be had in a good state till January or later.

The furnaces or flues of a house in action are suddenly deranged during a severe frost. Distribute pots of burning charcoal or peat over the floor or paths of the house, and cover the glass with mats.

To lessen the danger of the sun scorching plants in hot-houses or hot-beds. Fill them with clouds of steam, by pouring water on the ground or otherwise.

You have lately renewed your tan-bed, and the heat is too great for the pines which are plunged in it. Begin at one end of the pit, and take out a row across the pit; then whelm hot saucers at the bottom of each hole left by the pots; lift the second row, and set the pots on the saucers: they will thus be surrounded by air instead of earth. When the tan cools replace them as before.

Grafts of fine fruits are received, for which you have no stocks, and you do not wish to put them on old trees. Dig up some roots of trees of the proper kind, and make stocks of them; grafting, and afterwards planting in Knight's manner. (2037.)

Never forget that grafting and budding may be performed at any season of the year, (though best in certain seasons,) and on herbaceous as well as woody plants, on roots and tubers as well as on stems, stalks, and ligninea shoots.

Consider the sap of plants as a stream that you may direct and modify almost at pleasure; that a great many plants may be propagated from leaves alone, &c.

7447. *Expedients and anomalous practices in floriculture.*

The gravel-walks earthy and ill colored; a large party is expected, and you wish to give the walks a fresh and good appearance. Water them with water impregnated with lime and yellow or red ochre, according as the natural color of the gravel may be yellow or brown.

The pleasure-ground is deficient in singing birds. Distribute cages of Canary and other birds in song, hanging them on the trees in unseen situations.

The flower-garden and shrubbery deficient in odoriferous plants, to produce an immediate remedy. Distribute pots of mignonette (or Persian iris early in the season), and also bottles of water, containing the ends of sprigs of sweetbrier, birch, balsampoplar, balm of gilead, and other firms, place these so as not to be conspicuous, and renew them as they decay.

To diffuse odors in the atmosphere on particular occasions and during dry weather. Sprinkle the odoriferous plants with the water-engine.

A large party is expected at a particular time; to give freshness and odor to the whole flower-garden. Sprinkle every part with water, excepting the walks; if with rose-water, which may be made at little expense where there is extensive shrubbery, and kept for sprinkling the hot-houses; so much the better.

You expect a large party to visit the plant hot-houses, and they have been fumigated with tobacco the night before. In one distribute sprigs of terebinthinate trees, as the spruce and silver firs; in another, sprigs of briar; in another, birch, verbenatriphylla, mignonette, bruised leaves of acorus calamus, and so on: then sprinkle with pure water. Or do not use plants, but merely water the whole with rose-water; or use a little musk, orange-water, or other artificial odors.

Some of your houses are very uncleanly from accidents to plants, insects, or other causes; but company is expected to go through them at a particular hour. Contrive to have them filled with sweet smells at that time. Distribute a few choice things in pots near the eye; which, by attracting the attention of the spectator, will help to divert his eye from defect or disease, and to estimate what is concealed by what is seen.

After a dry summer your lawn is covered with brown blotches, on account of the shallowness of the soil, it is desired to give a temporary green appearance. Water these places with lime and water, mixed with green color, the lime serving as a body.

A quantity of large green-house plants suddenly arrive, and no house is ready to put them into. Place poles against a south

wall, and place the sashes of your spare hot-beds over them in the manner of slates.

To form temporary jets of water. Procure one or any number of cast-iron, or other strong vessels, which may hold from six to thirty, or fifty gallons or upwards; let each vessel have a tube reaching from what is to be its top within an inch of its internal bottom; this tube must have a nozzle to unscrew, and also a stopcock. The vessel being half filled with water, an air-condenser is to be screwed to the pipe, and the air powerfully condensed, then turn the stopcock to prevent the escape of the water; unscrew the condenser, and screw on the nozzle for the jet. All is now ready for operation, and the vessel may be placed in the situation where the jet is desired: here it may be either set in an excavation made to fit; or concealed by plants; or the vessel may be a vase, or made in any ornamental form. Being placed where it is to operate, it may remain for any length of time before using: to set it at work, it is only necessary to turn the stopcock, and according to the diameter of the orifice of the nozzle, it will throw the water from ten to fifty feet or more in height, gradually diminishing in height, as the water is expended, and lasting in joint proportion to the quantity of water contained in the vessel, the orifice of the jet, and the compression given to the air. This principle admits of great variety, extension, and modification, and might be made to produce very splendid effects; and though these effects would be but temporary, they would not be objectionable on that account, as in this climate, already cold and moist, the constant play of jets of water is by no means desirable.

To produce harmonious sounds in the flower-garden, in the hot-house, or near arbors, seats, &c. Place Eolian harps in proper situations, as in Germany.

To disperse an agreeable odor suddenly and powerfully. Charge one of the jet-vessels with air, having previously introduced some of the odor in the form of oil or essence, &c., then produce the discharge at the proper time and place, or charge with rose-water.

To direct a stream of deleterious air against insects in hot-houses at a distance from the path. Direct the stream through a long tin tube, or charge a jet-vessel with the smoke or air.

To syringe plants without a syringe or engine. Use a brush or birch-broom dipped in water.

To recover plants in hot-houses injured by frost. Shade two or three days from the sun, and keep the temperature very little above the freezing point.

7448. *Expedients and anomalous practices in landscape-gardening.*

To render a dull part of the park more interesting. Build a hay-stack there; or erect a shelter for cattle; or on temporary occasions pitch a tent; or place a portable hay-rack with food to attract deer or cattle; or send some men to work on the spot.

To vary on an extraordinary occasion a dull, uninteresting part of the horizon. Cause a fire to be lighted of green wood, or such materials as by the ascending smoke will break the line in the proper place.

To vary for a few seasons the front of a mass of wood. Disbark one or two trees at proper places at the surface of the ground, and when dead they will produce a break. For a few weeks: cut a tree while in leaf, so as its leaves may wither and remain on, or water with the engine and lime-water.

To give an idea of the effect which a piece of water in a particular place, and of a particular shape, will have. Mark out the shape, and water the surface with lime-water; when dry the effect will be obvious.

To give a foreknowledge of the effect of a gravel-walk in any particular place. Mark it out, and water with lime and yellow ochre.

To show the effect of trees. Use poles with crosses at top, or better, use entire trees, the thinnings of plantations.

7449. *Expedients and anomalous practices in arboriculture.*

A quantity of valuable trees arrive from a distance, very much injured and dried up, and too late for planting in the usual way. Immerse in water, or bury entirely in earth; then puddle and plant; or plant for one season in a shady part of the nursery; or plant in pots, and place these on heat, when rare kinds, till they begin to grow.

A violent wind has blown down a number of trees. Lop their tops, and prune and arrange their roots, replacing them upright; they will produce effect much sooner than young trees.

To show the effect of buildings. Erect poles, and stretch canvass, or nail boards on them, so as to form the sky outline of the proposed edifice.

To show the effect of raising ground. Stud it over with stakes of the height intended to elevate the earth, and stretch here and there strips of green canvass, bunting, bass mats, or green straw or hay-ropes, over these. Hay-ropes, from well-got hay, are cheapest, and, if of sufficient number, answer perfectly.

To give a poetical and pastoral air to a scene for the moment. Employ a person with a flute to play at particular times; drive cattle to drink at a stream; pass a flock of sheep that way, &c.

To give a forest character to particular parts of the park or woody scenery. Broaden the shagged hedges, and axes; show the remains of a fire; leave some branches or felled trees, &c.

To direct the eye to a particular point, either to observe its beauties, or to prevent it from observing some deformities in the same scene. Place a white object there, as a hay-rick, man at work with his coat off, white cow, or horse, &c. if the background be ground or wood; and a dark object, if sky or water. If the scene be a lake, then place a boat at the point to which you would attract the eye.

A handsome tree has lost some branches on one side, or is disfigured by the removal of another tree. Try and arrange the branches by cords or strong wires, as is done in green-house plants with threads.

To cover a tree rapidly with creepers. Place leathern bags of earth, containing plants of the sort of creeper desired, here and there on the trunk and principal branches; tie them flat to the tree, so as they may not appear conspicuous.

7450. *To some of these expedients* it may be objected, that they are deceits or temporary tricks; but if they are so, they are in the spirit of the scenery to which they belong, and they are calculated only to produce pleasure, not pain to any one; none of them are falsehoods, or calculated to make a thing of one nature appear to be of another. We have not directed the display of artificial fruits on wall-trees, or the fruiting of orange-plants from the shops, of milliners' flowers in green houses, or living figures placed on pedestals as statues, of fountains in mourning by making them run out ink, of altars and temples, with persons in proper costume sacrificing on them, of mock buildings or animals, scoops or painted perspectives; all which and other deceptions are recommended and practised by the French and Dutch.

7451. *Gardens of royal palaces.* The government-gardens of this country are those of Windsor, Hampton Court, and Kensington; that of Kew being a private royal garden. None of them are in any respect worthy of their rank: the garden at Windsor is without hot-houses; that at Hampton Court consists chiefly of some pine-pits and a vinery; at Kensington, great part of the kitchen-garden is cultivated by the plough, and the only two things which render it worth notice are its pine-stoves, and the public gardens or pleasure-ground. The garden-structures at Kew are in a state of decay, and the gardens are never in first-rate order, often slovenly, and always confined as to arrangements. It is said these things arise from want of funds; and from the low rate at which the operators are paid in these gardens. This seems to be the case, and it is much to be regretted, as it prevents the royal gardeners from displaying their skill and taste. Judging from the pine-apples grown in the forcing-departments at Kensington and Hampton Court, there is reason to believe this would be highly creditable to themselves, and exemplary to the nation.

7452. *The royal gardeners* were formerly much consulted by private gentlemen on the subject of their profession: this is still the case, though in a much less degree, and more now as to garden structures or culture, than as to matters of design and taste. With reference to this circumstance, the professional skill of royal gardeners ought to be of the first order, as their opinion will always be law to a certain number of the court; but for the culture and produce of the gardens (situated as these now are), less professional skill is wanting in a royal gardener than in a private head gardener, as deficiencies in products can always be made up from the commercial gardeners, or from Covent-garden,

SECT. II. *Commercial Gardens.*

7453. *Of commercial gardens*, the lowest species are what are called *ploughed or farmers' gardens*. One or two are to be found near all large towns, and a number round London. They extend from fifty to a hundred and fifty acres or upwards, and are almost entirely cultivated by the plough and other agricultural implements. Their possessors are small farmers, and the chief difference between this *farm-gardening*, and common farming is, that the green crops that intervene between the corn crops are more highly cultivated, and instead of being consumed on the farm, are sent to market as culinary vegetables, or food for stall-fed cows. The crops of every kind, but especially the green crops, are cultivated in drills, two close together, with a wide interval, by which means abundance of room is left to plough and horse-hoe the broad interval, and to sow a succeeding crop there before the other is removed. In this way two crops are obtained most years, as a specimen of which we shall mention one of the common rotations, viz. 1. Peas, with dung, two rows near each other, and a wide interval; 2. Turnips in the intervals; 3. Drilled wheat between the turnips; 4. Turnips, with dung, in drills after the wheat. These four crops are put in, and removed within two years, the ground being in good heart.

7454. *The seed-garden* is the next species, and forms one of the points of union between horticulture and agriculture. These gardens or small farms are not numerous, and confined chiefly to two or three counties near the metropolis. They consist of from five to twenty acres or upwards, in part cultivated by the plough; the occupier is not generally a bred gardener, but sometimes is so, and unites with the business of seed-grower that of market or nursery gardener. The seeds he cultivates are generally limited to a few kinds; thus chervil, radish, and cress seeds are grown chiefly in the neighborhood of Saffron-Walden in Essex; cabbage-seeds at Battersea; onions at Deptford; peas in Kent, turnips in Norfolk; rape in Lincolnshire; mustard in the county of Durham, &c. The great art is to grow the seeds true to their kind, for which purpose one grower must not attempt too many varieties of the same species, but he may grow a number of different species, and of varieties of the same species, provided they do not come into flower at the same time. Such seeds as are raised in large quantities, as turnip, mustard, cress, maw or poppy-seed, peas, &c. are either sold privately by samples, to the London or other seedsmen, or exposed publicly in the seed-market in Mark-lane, London, or in local country markets. But for the greater number of seeds, the practice is for the nurserymen about London to grow a sample of it in their own grounds as pure and perfect as possible, and then to send it to the seed-farmer to be sown and cultivated by him, and the seed ripened, cleaned, and sent to the nurserymen, at a fixed rate, by the cwt. or bushel. Flower-seeds are generally grown by nurserymen themselves; many of the other sorts by market-gardeners, and many kinds are received from the head gardeners of private gentlemen.

7455. *Grass-orchards* (*Vergers agrestes*, Fr.) form the next point of union between farming and gardening. There are a number of them in the cider counties, and in the Vale of Clyde, and Carse of Gowrie. A suitable soil and site are chosen, the surface, if not in pasture, is sown with grass-seed, and standard fruit-trees, chiefly apples and pears, and sometimes, as in Shropshire, plums and walnuts are planted in rows, and properly fenced. They receive little pruning, and generally receive no other care but that of gathering the fruit, which is either made into cider; stored in cellars; or sent immediately to market. As the trees get old and covered with moss or mistletoe, or infected with canker, shakes, or rottenness, they are scarified, headed down, and sometimes regrafted or rooted out and renewed, according to circumstances. (See *The Orchardist*, by Bucknall, and *Hints to Proprietors of Orchards*, by W. Salisbury.)

7456. *Ploughed orchards* differ in nothing from the grass-orchards but in being constantly or occasionally under aration. The trees stand in quincunx, and every year the direction of the furrows is changed; thus, the first year it may be ploughed east and west; the second, south-east and north-west; the third, south and north; and the fourth, south-west and north-east. The stem of each tree is thus left in the centre of a square or rhomboid of turf of four feet on the side. The ground is cropped as in common farming, or farm-gardening.

7457. *Market-gardens*. (7358.) The number of these is considerable; their situation is near large towns or seaports, and their extent from one to fifty acres or upwards; some near London extend to upwards of a hundred acres. The object of all is to produce culinary vegetables and fruit for public sale, either as called for at the garden or garden-shop; as wanted by the green-grocer; or exposed in the public market. Some of these gardens are general, producing every description of culinary fruit and vegetable, hardy, exotic, and forced, in demand; of which, as examples, may be mentioned the Earls Court garden, of upwards of sixty acres, and with extensive hot-houses, by Gunter; the Hoxton garden, nearly equally extensive, by Grange; and the Isleworth gardens, by Wilmot and Keens. Other gardens near the metropolis are devoted chiefly to particular

crops; as that of Biggs, at Mortlake, to asparagus; some at Battersea, to cabbage and cauliflower; at the Neats-houses, to celery; at Deptford, to asparagus and onions; Charlton and Plumstead, to peas, &c. In some gardens attention is chiefly paid to forcing early, and growing late crops; in others, as at Lambeth, by Andrews, exotic fruits, as pines and grapes, are chiefly grown. At a greater distance from town, articles of easy carriage, as gooseberries, strawberries, asparagus, tart-rhubarb, sea-kale, &c. are leading articles; and in small gardens in the immediate vicinity of the metropolis, nothing is sent to market; but salads, as water-cress, radishes, lettuce, parsley, herbs, and flowers are the chief articles grown, and they are sold in small quantities on the spot. The market-gardeners near seaports direct their attention chiefly to the produce of cabbage, onions, turnips, and such vegetables as are in demand as ships' stores. In most parts of the country it happens, that from bankruptcies, absence of families, and such like causes, the produce of a number of private gardens is sent to market. This is a good deal the case near London; but so much so round Liverpool and Manchester, that scarcely a market-gardener is to be found near these towns. Indeed, many of the citizens there who possess villas and gardens, cultivate them as much for the sake of the disposal of the produce as for their own enjoyment.

7458. *Market-gardeners on a small scale* have generally been master or head gardeners, who have acquired a capital from a number of years' servitude; those occupying more extensive concerns are generally the sons or successors of other market-gardeners, and possess considerable capital. An important point in the culture of these gardens is to supply abundance of manure and water in dry weather; these always produce luxuriant and succulent crops of leaves, though obviously injurious in respect to flavor. A proper rotation and change of surface are also important; and in smaller crops it is a material point to have the rudiments of one crop always ready to succeed another. Thus radishes, lettuces, and onions are sown on asparagus-beds; the radishes are soon drawn, and succeeded by the lettuces and onions, which are left only in places where they will not injure the asparagus; the lettuces come into use soon after the asparagus is cut, part of the onions are drawn young, and the rest left to bulb. In the alleys between the beds, cauliflowers are planted early in the season, and between these, at a later period, cucumbers, which, with their runners, cover the vacant parts both of the alleys and beds. Thus six crops are obtained in succession, and the ground is clear by October for landing up the beds. Early cauliflowers are generally a profitable crop. The seeds are sown in August, pricked out, and planted under hand-glasses, six under each, in October. The glasses are placed in rows, ten feet apart, and at four feet distance from centre to centre in the row: thus an acre contains 1092 glasses. After the cauliflowers are planted, the ground is sown with lettuces and spinage; if the lettuce stands the winter, it is valuable, and grows fast when the soil is stirred round it in March. About this time, four of the six plants under each glass are removed, and planted in a warm situation, or in the sheltered alleys of the asparagus-beds. About the beginning of May the cauliflowers are too large for the glasses, and are just coming into flower. As they are gathered and their roots removed, they are replaced by cucumber-plants, previously raised in hot-beds, and now containing two or more proper leaves. In July the middle of the intervals between the rows of glasses is planted with endive, and between each glass two cauliflower-plants are planted to come in late. Thus five crops are raised, all valuable ones, if the ground was previously in good heart, and was kept frequently well stirred, and quite free from weeds. The following are common rotation: 1. Radishes, carrots, savoy or cabbages, or coleworts; 2. Early turnips, autumn cabbage; 3. Spring turnips, French beans, savoy, or peas and spinage, and leeks or broccoli.

7459. *In sowing broad-cast crops* it is found of advantage to sow several sorts of seeds together, because some of them may fail or be destroyed by insects after they come up: if all come up and thrive, then such sorts as are least valuable may be treated as weeds. Thus onions, radishes, lettuce, and carrots, are often sown together; sometimes the carrots are weeded out, and the best crop is the onions; at other times the onions partially fail, and are drawn for salading or transplanting, and the lettuce is the main crop; Radishes are often sown with turnips, as a sacrifice to the fly, while the turnips escape.

7460. *In general all transplanted crops*, and as many sown ones as possible, are drilled; and for bulky crops, as cabbages, peas, beans, &c. it is an approved practice to sow or plant two rows near to each other, and then leave a wide interval, in which a dwarf early crop, or crops of short duration, as spinage, lettuce, &c. is sown. By the time the main crop is at its full size, the inter-crop is removed; the ground is then dry, and another crop, as cabbages or turnips, introduced, which is ready in its turn to succeed as the main crop. In this way, no part of a market-garden is ever left naked or cropless, at least during summer, and though these intervening crops are often injured when young by the shade of the main crops, yet, if the ground be in high order, they soon recover when freely exposed to the air, and the ground is stirred. If the land, however, is not in good heart, it is a better system to adopt a rotation, and stir the whole ground well between each crop, because here, the soil being poorer, a greater volume is required to supply the same nourishment: quantity is substituted for quality.

7461. *With respect to the comparative market value of crops*, they must, on the general average, be nearly on a par; if one crop is at any time dearer than another, it is in consequence of being more precarious or expensive to raise; if one article is very dear at one time, it is immediately overgrown, and becomes proportionally cheap. To grow something of every thing is safe for those who have extensive concerns; select things for those who devote their whole attention to small spots; and things long of coming to perfection, as tart-rhubarb, sea-kale, asparagus, &c. to those who have capital. It is never advisable to propagate a dear article very extensively, as every body is likely to be doing the same thing; it is better even to adopt a contrary practice.

7462. *A good deal of the profit of market-gardening* depends on studying the state of the market ; in gathering crops sparingly when things are low, and in sending liberal supplies at times, where, from weather or other causes, they are, or are likely to be high. This requires both judgment and capital, for the needy grower must sell at any price.

7463. *Orchard-gardens.* These are distinguished from the parterre or field orchards, in being cultivated with the spade, and cropped like a market-garden ; indeed, they are so much allied to market-gardens, as hardly to require any separate discussion. In general, several kinds of fruit-trees are cultivated together, as tree-fruits, shrub-fruits, and herbaceous fruits ; but some spots, from the soil, and probably superior culture, are noted for particular kinds of fruit, as Twickenham and Roslin, for strawberries ; Maidstone, for filberts and cherries ; Pershore for currants, &c. An account of the Isleworth mode of growing strawberries has been given in the *Horticultural Transactions* by Keens, an eminent grower of fruits and culinary vegetables. The filberts are planted in rows alternately with rows of cherry-trees ; and, as temporary crops, a row of gooseberries, currants, or raspberries, are planted in each interval. Currants are grown extensively round Pershore, and the fruit sold to the manufacturers of British wines. They are also grown in Kent and Essex in rows eight feet asunder, and four feet from tree to tree. Early in spring the ground is dug, and sown with spinage ; to that succeed potatoes, and to those cabbages, which last are gathered as coleworts before winter : four crops, including the fruit, are obtained in one season.

7464. *Herb and physic gardens.* These are of limited number and extent, and generally occupied along with market or seed gardens. There are one or two for peppermint and a few other herbs, near Edinburgh, and the rest are in the vicinity of the metropolis, and chiefly at Mitcham in Surrey. Peppermint is a principal crop, which requires a moist soft soil, and to be taken up and replanted every three or four years. Lavender is grown to a considerable extent on lean soil, as is chamomile, wormwood, rosemary, thyme, &c. Licorice and rhubarb require a deep free soil ; roses, which are grown in large quantities for their flowers, require a rich soil ; white lilies and colchicum, grown for their bulbs, require a new soil. In one or two gardens near the metropolis, many species of herbs are grown to gratify the demand of certain classes of medical men, of self-doctors, and of quacks and irregular practitioners. Formerly there were many gardens of this sort ; apothecaries generally grew a great part of their own herbs, and collected the rest in the fields ; and hence the reason why so many of them formerly were eminent as botanists ; but at present the only remarkable herb-garden is that of Messrs. Dicksons and Anderson at Croydon. These herbalists and seedsmen have constantly on sale, at their long established and respectable shop in Covent-garden, upwards of 500 species, including all the varieties mentioned by Culpepper and other herbalists of the 17th century. There are still one or two herb-shops which collect their simples in a wild state ; but land is now so generally cultivated, that even if there were a demand for native herbs, this mode would not be very successful. It may be mentioned as a curious fact, that in Weston's time, (say about 1750,) winter savory, chamomile, pennyroyal, peppermint, &c. were grown in the common fields near London, where cattle were turned out all the winter ; the scent of these herbs being so disagreeable to these animals as to cause them to avoid them. (*Weston's Tracts*, &c. 71.) All herbs should be gathered dry, and in sunshine after dry weather ; they should be dried in the shade, and when perfectly dried, pressed close by a press or weights, and enclosed in paper. The packets should then be deposited in a dry place, and when opened for use always carefully shut afterwards. The practice of hanging up herbs in loose bundles, tends to dry them too much and dissipate their flavor.

7465. *Market flower-gardens.* These are devoted to the culture of flowers for sale when in blossom ; either cut as nosegays, or in pots. They are chiefly to be found in the neighborhood of the metropolis, where a sort of division of objects exists among them. Some gardens are noted for their roses ; others, as that of D. Carter at Fulham, for growing the narcissus tribe ; Colville in the King's Road, for geraniums ; Henderson at Paddington, for cheap heaths ; the Bedford nursery for mignonette ; and Smith, at Dalston, for forced flowers of all sorts. These gardens are not large ; generally from one to a dozen of acres, and they are occupied by gardeners who have been brought up to this department of their profession. The standard articles of cultivation are roses, especially the moss-rose for nosegays ; the monthly rose is also much grown in pots for spring and autumn sale. The sweetbriar is in demand for its odor ; honeysuckles, lilacs, mezeurons, rhododendrons, azaleas, spiræas, double and scarlet-blossomed jasmynes, laburnums, rose-acacias, are in great repute, especially when forced. All sorts of evergreens, as pines, firs, laurels, cypresses, arbor-vitæs, hollies, yews, and above all, laurustinus and box, are much in demand for decorating balconies, flat roofs, areas, courts, lobbies, &c. Potted fruit-trees in bearing have generally a ready sale, and especially the grape and peach.

The common flowers for nosegays are snowdrops, anemones, narcissi, hyacinths, ranunculuses, tulips, lilliums, auriculas, polyanthuses, carnations, pinks, sweetwilliams, sweetpeas, wallflowers, many other border-flowers, and most of the biennial and annual kinds.

The flowers prolonged in duration by being placed under glass before frost approaches, being in pots, are mignonette, stocks of all the sorts, nasturtiums, veronics, violets, geraniums, monthly roses, laurustinus, clematis, dahlia, and chrysanthemum.

The forced flowers are chiefly the pink tribe, violets, wallflowers, ten-week stocks, common stocks, hyacinths, crocuses,

narcissal, tulips, tuberoses, lilies, rose-campions, sweetpeas, lupines, roses, lilacs, sweetbriars, mezerions, &c.

The exotics in most common demand are myrtles, geraniums, hydrangeas, heaths, camellias, Chinese roses, heliotropes, fuchsias, &c.

The flowering plants generally kept in pots are auriculas, polyanthuses, pinks, carnations, violets, foxgloves, veronics, dahlias, chrysanthemums, phloxes, and saxifragas of sorts, most of the bulbs and many of the annuals and biennials.

The flowers blown in water-glasses are the hyacinth and narcissus chiefly, and also the crocus, tulip, amaryllis, colchicum, iris, &c.

7466. *Of mignonette*, perhaps more pots are sold in and near the metropolis than of any other potted plant whatever; fifty years ago it was hardly known. Next to mignonette may be named stocks, pinks, sweetpeas and wallflowers, among the hardy plants; hyacinths, among the bulbs; and geraniums and myrtles, among the exotics. Some years ago heaths and camellias were chiefly in repute; these being found difficult to keep in living-rooms, the public taste has changed, and the flower-grower varies his products accordingly. All these, and other sorts of plants in pots, are also lent out by the market-florist, to decorate private or public rooms on extraordinary occasions, but especially for those midnight assemblages called routs. This is the most lucrative part of the grower's business, who generally receives half the value of the plants lent out, as many of them, and generally those of most value, are so injured by the heat as never to recover.

7467. *Florists' gardens* are devoted to the culture of florists' or select flowers for the sale of the plants and roots. There are not many exclusively devoted to this branch, excepting near Manchester and the metropolis. Those near Manchester, Paisley, and most other provincial towns are generally on a small scale, and cultivated by men who have auxiliary resources of livelihood; but near London are some extensive concerns of this sort, particularly those of Milliken and Curtis of Walworth; Davy of the King's Road; Mackie of Clapton, &c.; the first is celebrated for tulips and most bulbs; the second for pinks and carnation; the last for auriculas. This is one of the most delicate and difficult branches of gardening, and is only successfully pursued by such as devote their exclusive attention to it. The great difficulty is to preserve fine varieties, and keep them from degenerating or sporting; many gardeners, excellent propagators and cultivators of hot-house and green-house plants, find it a very difficult task to grow a fine auricula or carnation; and their flowers would cut but a poor figure at the florists' shows, either near London or in the country. Much depends on the soil, which requires to be rich and well mellowed by time. It is also the most precarious branch of commercial gardening as a means of subsistence, since the purchasers are not so much the wealthy mercantile class who possess villas, or the independent country gentlemen, in whose gardens fine florists' flowers are seldom seen, as the tradesman and middling class. The income of these being temporary, that is, depending in a great measure on personal exertion, and the current demand for their produce is, of course, easily affected by political changes, which make little difference to the man whose income arises from a fixed capital.

7468. *Nursery-gardens.* (7335.) In these are propagated and reared all sorts of trees and shrubs, and all other herbaceous plants in general demand: the culture of florists' flowers is often combined to a certain extent, and the dealing in seeds imported, bulbous roots, and garden-implements and machines, is generally considered a part of the business. Hence the designation of nurseryman, seedsman, and florist, formerly, and still, to a certain degree, common on their sign-boards. Of this class of commercial gardens, there is one or more in most counties of Britain, and a few in Ireland; but the greater number, and by far the most important, are in the vicinity of the metropolis. Their extent near town is limited; some contain only an acre or two, but others occupy forty or fifty acres; in the country where land is cheap, some are of double or treble that extent. In general they have been commenced by head gardeners, who had acquired a little capital, and continued by their sons or successors. In country nurseries, the commoner hardy fruit-trees, and tree and hedge plants, are the chief products: near Edinburgh and the metropolis some embrace every article of nursery produce, as the Hammersmith nursery, unrivalled in the world; others deal chiefly in fruit-trees, green-house plants, or American plants; and some almost limit themselves to particular species, as the camellia, erica, geranium, &c. The Scotch nurseries, and especially those of the northern districts, as that of Gibbs at Inverness, are famous for the raising of forest tree seedlings, which they send in large quantities to all parts of the three kingdoms.

7469. *The subject of nursery-culture* embraces almost every part of gardening; since no department requires a more general knowledge, or so much attention and practical adroitness. The essential part of the business is the art of propagation; which, in some cases, as in multiplying heaths, and other Cape and Botany-bay plants, by cuttings, and in raising even the pine and fir tribes from seed, requires very delicate and accurate manipulation, and constant subsequent care and attention. Even grafting, budding, and layering, require to be carefully, skillfully, and expeditiously performed, and the future progress of the scion, bud, or shoot, carefully watched. Next to propagating, rearing requires attention, and especially transplanting and pruning; on the former depends the state of the roots, and of course the

fitness of the plant for removal; and on the latter, very often, the future figure of the tree. The Dutch and French nurserymen are in some respects superior tradesmen to those of Britain: they generally remove all plants for sale, especially the ligneous sorts, every second or third year, and continue doing this with fruit-trees for seven or ten years, training their heads at the same time in particular forms. The purchaser finds their heads already formed and bearing fruit, and with such tufts of fibrous roots that they suffer very little from removal. Even thorn, privet, yew, and other hedge plants are trained in this way, and ready-made hedges may be purchased by the foot or yard. (*Hort. Trans.* 201.)

7470. *The most skilful and vigilant nurseryman can seldom make his practice conform to his knowledge.* Thus, many customers, from ignorance, indolence, or unforeseen circumstances, defer ordering what they want from their nurserymen till the last moment, which consequently prevents him from applying the requisite details of culture to his stock of plants and trees in the proper season. Thus the heading down of fruit-trees is often delayed, in deference to late purchasers, till the buds begin to push; and to cut them at that time, particularly vines, apricots, and cherries, would endanger their existence, and, at all events, enfeeble their shoots. In this case it is necessary to wait till they have made shoots of a few inches, when they may be headed down not with much regard to shoots which have appeared, but more as they would have been cut in the proper season when nothing appeared but buds. The plant in a healthy, vigorous state, when so headed down to apparently dead or dormant eyes, will soon push, and regain in a great degree, the lost time; and, indeed, it may always be considered safe to rub off all shoots, not in desirable situations, from healthy trees, provided it be done early in the season. Trees which are not in full health, whether recently transplanted or not, should, in general, be left with their tops on; the leaves on which will prepare nourishment to strengthen their roots, and they can be headed down the following season. Some persons, after the drawing season, fill up the blanks in the lines of fruit-trees, with stocks to be budded the same season. This may do in new and excellent soils, and where there is little demand for fruit-trees; but, in general, the best way is to fill up all blanks that cannot be filled up with the tree kind in the proper season, with culinary vegetables, either for the kitchen or for seed, or with flowers to produce seed.

7471. *The following are leading objects of nursery-management:—*

7472. *Correctness in the names given to plants and seeds of every description, and particularly to fruit-trees.* To facilitate this, as to *seeds and roots*, their names should be painted on the various boxes, sacks, and chests in which they are kept; and as to fruit-trees, they should be designated by numbers painted on wooden, or better on cast-iron, tallies. Stools and stock-plants of every description, not very generally known, and, if possible, the whole of those planted along the borders, whether known or not, should have their systematic and English names painted on similar tallies; and smaller herbaceous plants in pots, and all exotics in pots, excepting such as come under the head of fruit-trees or plants, as vines, pines, &c. should be named on small wooden tallies, written with a black-lead pencil on white-lead newly rubbed on. Seton's number-stick (*fig.* 161.) is by far the best for temporary numbers to fruit-trees, or for numbering sown seeds or small plants. Some employ leaden, iron, or copper tallies, painted, but these are too conspicuous, and require too much labor in the preparation for a nursery. It appears to us, that, to prevent the chance of substituting one sort of fruit-tree for another, either by accident or design, the following mode might be adopted: let a catalogue of fruit-trees be printed by the nurseryman, and let it contain against each name the number placed against the plant in the nursery; then every autumn before the drawing season commences, let a person with steel types of the numerals, and a marking-iron with the initials of the nurseryman, go through the rows of fruit-trees and beginning at No. 1., say of apples, put type 1. in a proper socket prepared in the marking-iron, and mark each tree fit to move, a few inches above the graft; let him next do the same with No. 2., having changed the type; and so on with the apples and all other fruit-trees, not excepting the peach. This would not supersede the use of parchment labels to plants sold, but it would afford both to the nurseryman and the public who purchased his catalogue and his trees, a certain means of detecting error; as, should the label drop off in the hurry of carrying the trees to the packing-court, or in unpacking when arrived at their final destination, the number on the bark and the published catalogue could readily be referred to. If performed with a small sharp instrument, this practice could do no harm to the tree.

7473. *Punctuality, accuracy, and despatch, in executing all orders.*

7474. *Rather procuring or omitting an article than sending off a bad one, unless under peculiar circumstances, to be explained to the party.*

7475. *Careful packing, and such as suits the sort of articles, the season, the distance, or the climate to which they are to be sent, mode of carriage, &c.*

7476. *Keeping an exact account of men's time, and being particular in mustering them every morning before the hours of commencing work, and again at the hours of rest and refreshment.* This may be greatly facilitated by causing them all to enter and go out at the same gate, which ought to be that at the counting-house; and a bell or horn should call them to or from work.

7477. *Keeping a vigilant eye to the men while at work, especially with strangers, till you have proved to them that you know what they can do by day or hour, by fair labor.*

7478. *Having one principal foreman or partner for the whole, and sub-foreman for the exotic, American, herbaceous, general nursery, and seed departments.*

7479. *Having a proper person employed as a traveller; or yourself or partner taking that department.*

7480. *Acting on all occasions with the utmost impartiality between gentlemen and their gardeners, leaning rather to the latter, in all doubtful cases, as the weaker party, according to the common consent and practice of all mankind.*

7481. *Paying all workmen, and, at all events your foremen, such wages for their labor as may not tempt them either to idleness or pilfering themselves, or to countenance these practices in others.*

7482. *Publishing a printed catalogue on a scientific principle, of every article you have, or intend to have, for sale, with the names, synonyms, some description of the fruits, and reference to a figure of the plant or fruit in some generally known work; and placing, as above observed (7472.), the same number opposite the names of your fruit-trees in the catalogue, as is actually placed against them on cast-iron tallies in the nursery, and annually in autumn, before the drawing season, impressed on all of them fit for sale, with a marking-iron and types.*

7483. *Attending at all times and seasons; and in every part of the nursery to frugality (avoiding meanness) and neatness, keeping every where a vigilant eye, and always being beforehand rather than behind, with the different operations of cultivation. Much of neatness depends on the master's insisting that every workman shall clean up and finish as completely as practicable, every operation as he goes along. Having taken up a tree or a plant, he ought never to forget to level up the hole; having pruned one, he ought at the same time to pick up the shoots, or if in a course of pruning, he should have a boy or woman going after him to do so, or, at all events, they ought to be picked up the same day. A corresponding attention to order and neatness is requisite in every other operation; and this attention once become a habit, will be found a saving of labor, and a source of profit as well as of pleasure.*

7484. *The management of the seed department is comparatively simple. The chief difficulty for seedsmen who are beginners, and at a distance from the metropolis, is the ordering the proper quantities of each seed from the growers or wholesale dealers. The guides to this are the proportions of the different crops usually grown in private gardens, and the wants of the class who are likely to become purchasers. The same diffi-*

culty occurs in beginning almost every business, and is only to be overcome by experience. The different periods to which different seeds retain their vegetative powers require to be known by seedsmen, as well that they may not furnish lifeless seeds to their customers, as that they may not throw away as useless such as are possessed of the vital principle. Though few seeds are kept by respectable seedsmen above a year, yet in cases where a partial failure has taken place in the seed crop, most sorts will grow the second year after that in which they have ripened. Some, however, will keep from two to five or ten or more years; and others for an unknown length of time.

7485. *The latest periods at which the seeds most generally in demand may be expected to grow freely are the following:—*

Cabbage tribe. Four years.
Leguminous culinary vegetables. One year.
Esculent roots. Beet, ten years. Turnip, four years. Carrot, one year. Parsnep, one year. Radish, two years. Salsify, two years. Skirret, four years. Scorzonera, two years.
Spinaceous plants. Spinage, four years. White beet, ten years. Orache, one year. Purslane, two years. Herb-patience, one year.
Allicaceous plants. Two years.
Asparaginous plants. Asparagus, four years. Sea-kale, three years. Artichoke, three years. Cardoon, two years. Ram-pion, two years. Alisanders, and the thistles, two years.
Aconitaceous plants, in general two years. Lettuce, three years. Endive, four years. Burnet, six years. Mustard, four years. Tarragon, four years. Sorrel, seven years. Celery, ten years.
Pot-herbs and garnishing plants, in general two years; but

Parsley will grow at six years. Dill and Fennel, five years. Chervil, six years. Marigold, three years. Borage, four years.

Sweet herbs, generally two years; but Rue and Rosemary, three years; and Hyssop, six years.

Plants used in tart, &c. generally two years; but the Rhubarb only one year; and Gourd, Pom-pion, &c. ten years.

Herbaceous fruits. The Cucumber and Melon, ten or more years. Love-apple, Capsicum tribe, and Egg-plant, two years.

Annual and biennial flower-seeds, generally two years; but some grow with difficulty the second year: they are seldom kept by seedsmen longer than one year.

Perennial flower-seeds, the same.

Tree-seeds. Stones, two years; and some, as the Haw, three; but they are in general of very doubtful success the second year. Acorns will scarcely grow the second year; Elm, Poplar, and Willow seeds, not at all.

7486. *All seeds ought to be kept dry, and the air as much as possible excluded; but those liable to be attacked by insects, as the pea, bean, turnip, radish, &c. should be occasionally exposed to air and friction, by being passed through a winnowing machine. (fig. 283.)* The more rare seeds should be kept in their pods till the season for using. Seeds received from foreign countries should, in general, be sown as soon as possible after their arrival. In packing seeds for the home demand, no particular process is requisite; but in sending seeds to America or the East Indies, the sorts which soon lose their vitality should be enveloped in clay, tallow, or wax, or put up in bottles rendered air and water tight. (2311.)

7487. *Bulbous roots,* with the exception of the anemone and ranunculus, can only be kept out of ground a few months with propriety, though some are often found in the seed-shops as late as May. When thoroughly dry they may be kept in bags or boxes, and the more delicate sorts wrapt up in papers separately. Ranunculus and anemone roots retain their vegetative powers two, and sometimes three years.

7488. *The English seed-growers and seed-collectors* furnish the greater part of culinary, flower, and indigenous tree-seeds sold in the shops, but a part also are obtained from other countries; as of onion-seed from Genoa; anise, basil, &c. from the south of France; carrot, onion, and a variety of seeds, when the English crop fails, from Holland. The hardier bulbs, as crocus, daffodil, &c. are for the most part grown in England: the other hardy sorts are obtained from Guernsey, as the Guernsey lily; the Cape of Good Hope, as ixia, gladiolus, &c.; from South America, as the tuberose; or China, as the Japan lily, &c. The seeds of tender exotic trees and shrubs are obtained from the seed-collectors at the Cape, New Holland, and other foreign settlements; and of others from North America.

7489. *The recommendation of head gardeners* forms an important part of a nurseryman's duty and care, and one in which he may render essential services to horticulture. He ought to select such as are well qualified for what they undertake, and consider himself as in some degree responsible for the conduct of the person recommended. In addition to this, the nurseryman, in the yearly tour he generally makes among his country customers to receive payments and take orders, should observe whether the person recommended has acted according to his expectations, and should exhort, reprove, or approve, accordingly. The nurseryman, while on this tour, by seeing a number of gardens and gardeners, must, by comparison, be well able to judge of their merits; and by judiciously dealing out approbation or blame, might do much good. The good gardener, who had become slovenly, from not seeing other gardens, or from the indifference of his employer, might thus be recalled to his duty, and the art not suffered to be disgraced by his practice. This is also the time for gentlemen to state to nurserymen the faults they have to find with their gardeners, so that they, by their advice, may endeavor to correct them. The nurseryman who has recommended a gardener, is the only person who can act as a mediator between this gardener and his employer; and we repeat, that by the judicious interference of well informed and experienced nurserymen, much good might be done; gardens kept in better order, and gardeners improved and retained, instead of being removed from their situations without being properly informed of their errors, and a proper opportunity afforded them of amendment.

SECT. III. Public Gardens.

7490. There are very few *public gardens* in Britain; and we can only refer to the enclosed areas of the public squares and parks of the metropolis and principal cities, to

the botanic gardens of the universities and other public bodies, and to the gardens of the two horticultural societies.

7491. *The public squares* are generally kept in order by jobbing gardeners at a certain rate by the year. The principal part of their business consists in keeping the grass short, by mowing once a fortnight in summer, and rather seldomer in spring and autumn; in keeping the gravel clean, and keeping up a display of flowers in the dug groups.

7492. *The public parks* and other equestrian promenades are mostly managed by officers appointed by government; being once formed, and the trees grown up, they require little annual expense. The Mary-le-bonne or Regent's Park is in part let as a nursery-ground, and, instead of a rent, the occupier is bound to plant a certain number of trees the first year of his lease, to nurse up these, and leave a certain number of them on each acre at the end of his lease. A considerable part of this park is also, as already mentioned, let to private persons for the purpose of erecting villas, which, though it will control the rambles of the pedestrian, will give and maintain a woody appearance, without any expense to the public.

7493. *The botanic gardens* of the universities are under the general direction of the professor of botany, and managed by a head gardener or curator: those, founded by subscribers, or a society, as the gardens of Liverpool, Hull, Glasgow, and Dublin, are under the direction of a committee, and similarly managed. The duties common to curators are the keeping up and increasing the collection of plants; those who manage university-gardens, have, in addition, to furnish specimens of certain plants in sufficient numbers for the use of the professor and students. In some cases, the curator is required to instruct students; and in others, he is permitted to do this, and to take pupils or apprentices for his own emolument. Most gardens exchange, and some, as that of Liverpool, sell plants and seeds.

7494. *On the cultivation of botanic gardens* we shall offer only a few general hints. Instead of the principle of *rotation*, is here substituted that of a *renewal*, partial or wholly, of the soil. On shallow soils it is to be effected by removal of the whole, or a proportion of the old soil, and the introduction, and thorough mixture of a proportionate quantity of good virgin loam, or of virgin peat, bog, or sand, according to the plot or border to be renewed. In rock-works, and bogs, American grounds, and in most of what may be called *particular habitats*, there is no other way; but in the plots which contain the general arrangements, deep trenching may partially or wholly supply its place.

7495. *Manure* cannot altogether be dispensed with in botanic gardens, particularly for some or most of the vegetables which will be included under the culinary, agricultural, and flower-garden departments; but, in general, decayed leaves is the best manure for all other plants and trees, not in a state of monstrosity or otherwise changed by cultivation.

7496. *Sheltering and shading* are parts of culture which demand very considerable attention in botanic gardens, especially in warm climates. Delicate plants which require a moist atmosphere, as some alpine and Americans, require to be closely covered with a hand-glass, and this again partially with a wicker case during the whole summer, even if under the shade of a wall or hedge.

7497. *In sowing, and causing to vegetate, seeds which have been brought from a distance*, a good deal of skill is often requisite. Sowing in very fine earth in pots, covering them with a bell, and placing them in the shade and in moist heat, is the most likely mode to succeed, whatever climate the seeds may have been sent from. To this, some add previous steeping of the seed in pure water, and in water impregnated with oxygenated muriatic acid. Others water with water impregnated with this acid or with its gas; some charge the earth of the pot with the gas, and others invert a bell-glass over it, containing an atmosphere partly or wholly composed of the gas. (See *Hill, in Hort. Trans.* vol. i. 233.) All these modes, and others suggested by vegetable chemistry, may be tried; but where the vital principle is not extinct, the first mode will generally be found sufficient. Numerous annual and biennial seeds require to be sown every year, independently of seeds of new sorts from foreign countries. For collections of these in beds or in a general arrangement, the mode of sowing in rows across the bed, is obviously the best; and several rows radiating from a polygonal tally in the centre, is the most economical, as admitting of the greatest number of sorts in the least space.

7498. With respect to *management*, there are various duties belonging to the office of curator of a public botanic garden which are peculiar to the situation; some of which we shall briefly enumerate.

7499. *Gathering and drying specimens* to maintain the herbarium, and to exchange or give away; frequently inspecting the herbarium to guard against damp and moths; collecting and *preserving seeds* of every kind for the purposes of exchange.

7500. *Collecting wild plants*, and seeking for new species in proper situations; in unfrequented haunts for herbaceous plants; in haunts much frequented by birds, for trees; in bays, and sheltered creeks, and shores, for aquatics; in rocky shores for marine plants; among the tops of snow-clad mountains in winter, for mosses; in old forests in winter for lichens, and in spring for fungi, and so on.

7501. *Acclimating plants*, by raising them from seeds, one generation after another, till the final progeny will endure the open air throughout the year. Dr. Walker (*Essays*) states how the *passiflora carulea* was acclimated in Scotland, merely by time, without propagation from seed. Sir Joseph Banks (*Hort. Trans.* vol. i. 21.), by sowing the seeds of succeeding generations of the *zizania aquatica* from 1791 to 1804, "proved that an annual plant scarce able to endure the ungenial summers of England, became, in fourteen generations, as strong and as vigorous as our indigenous plants are, and as perfect in all its parts as in our native climate." Next to the ordinary duties of a botanic curator, this appears to us much the most important of the services he can render the horticulture and agriculture of his country.

7502. *Distributing seeds, cuttings, and plants of all sorts*, among all who are likely to keep them, and set a due value on them, but to none else. The illiberality of the administrators of some gardens, in this respect, has been much and deservedly blamed. The surest mode of preserving a plant in the country is, to render it as common as possible; and the easiest mode of effecting this is, to distribute a few specimens among the nurserymen. From an opposite conduct, many of the plants introduced at Kew, and described in the *Hortus Kewensis*, are not to be found in the Kew garden; and, thus, never having been distributed, are lost to the country. The policy of this garden, for a number of years past, is considered as highly reprehensible; being supported by the public, it ought to have been devoted to its service.

7503. *Giving the name and history of plants* to all eager enquirers, in order to encourage a desire of botanical knowledge: to induce a taste for botany and the vegetable kingdom, by pointing out striking peculiarities of plants to superficial observers, in order to attract their attention; trying to point out things which may assimilate with the taste or foible of the person addressed; recollecting that sexual matters and matters bordering on the marvellous, are the most generally attractive to volatile or vacant minds: in this way "becoming all things to all men, in order, by all means, to gain some."

7504. *Disseminating and dispersing seeds and plants* of scarce natives, or of foreign sorts not yet naturalised, by placing them in their proper soils and habitats. Thus, when the aquatic plants are reduced, throw the parts taken from rare ones, into an adjoining ditch, lake, canal or river; scatter the seeds, and plant the roots of wood-plants in plantations; arenarious plants on sandy soils or shores, and so on. Curator Anderson of the Chelsea garden scatters all his spare seeds on Battersea, Clapham, and Wandsworth commons, and throws his spare aquatics into the Thames. The consequence is, that though only a few years practised, some rather scarce plants seem already naturalised in these places. Dickson, an enthusiastic botanist, naturalised that beautiful plant, the fresh-water soldier, in the ponds about Croydon; as we have done the same plant, and several others, in the Serpentine canal in Hyde Park. Salisbury, one of the first botanists of the age, and equally eminent as a horticulturist, thinking he could naturalise on our sandy shores the *pancratium maritimum*, planted a bulb in the Isle of Wight, among *chelidonium corniculatum*, and *eryngium maritimum*, with which he saw it growing wild below Montpellier (*Hort. Trans.* vol. i. 341.); "and when at school, in the neighborhood of Halifax, in 1769, he was flogged in the Whitsuntide holidays, for helping to propagate the *narcissus triandrus*, and for running out of bounds to know the name of it at North Bierly."

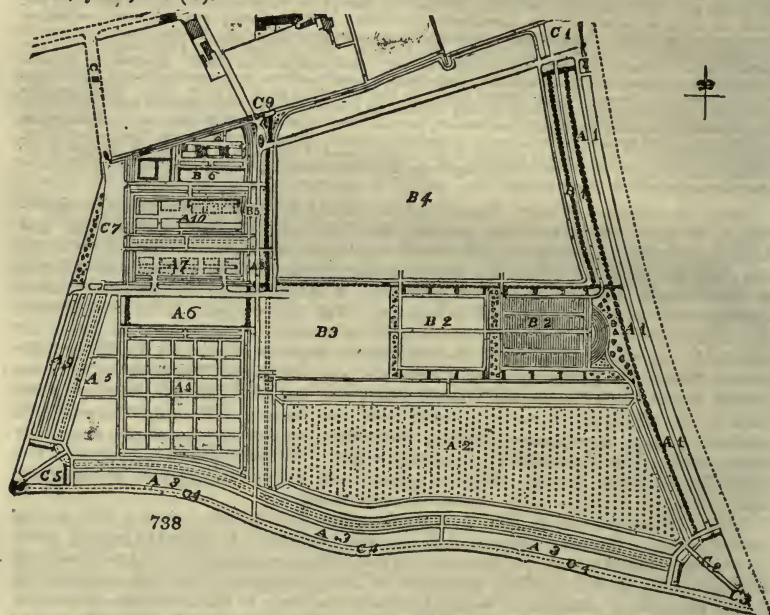

7505. *A catalogue* of every botanic garden should be printed for exchange, distribution, or sale. Very complete gardens, such as those of Kew, Cambridge, and Liverpool, find it answer to publish printed catalogues, with a view to remuneration by sale; but the legitimate object of a botanic-garden catalogue is, to exchange it with that of other botanic gardens, foreign and domestic; in order, that by comparison of riches, exchange may be made for mutual advantage. For this purpose, it seems desirable, that every thriving establishment should print or prepare a catalogue once a-year, or once every two or three years. To facilitate this, it might be printed by the lithographic process, from a list written in a small hand on prepared paper. By printing only the botanic names, each sheet would contain nearly four thousand names, and consequently three sheets, all the plants, native or introduced into Britain. This might be produced stitched together, all expenses included, for a trifle; and as the present law respecting letters stands, might be franked in separate sheets. Thus a cheap communication between British botanic gardens might be formed, and through our foreign ambassadors, these catalogues might be distributed all over the world.

7506. *A catalogue may be formed of figures*, where it is not convenient to form one of printed names. Thus the possessed or desired plants might be indicated by putting down the numbers placed against the names of the plants in some generally circulated botanical catalogue. If, in the excellent catalogue of Sweet, the genera had been numbered as in the synopsis of Persoon, it would have been the best; in the mean time, Persoon's work, as it is in the hands of most botanists, foreign and domestic, may be referred to; and as an example of the brevity of this kind of catalogue or reference, let us suppose one curator wishes to write to another for *Varronia crenata*, *lineata*, *bullata*, and *globosa*; all he has to do is to write for *Per.* (Persoon), 371. (the number of the genus), and 1. to 4. (the numbers of the species desired), and similarly as to all the plants described in Persoon's *Synopsis*. Ten thousand plants would in this way be represented by about 11,500 figures, which might occupy one sheet of letter-paper. But our *Encyclopædia of Plants*, and catalogue entitled *Hortus Britannicus*, are numbered in such a way as to render communication more facile than any mode of using Persoon, or any other species plantarum or catalogue whatever.

7507. *The gardens of the horticultural societies*, being at present in a state of embryo, do not admit of description. The published plan of that of the London Society (*Report on the Formation of a Garden*, &c. 1823), appears to us most defective in general arrangement. It is in part executed; and if completed according to that plan, there will be, as we think, a want of grandeur and unity of effect as a whole, and of connection and convenience in the parts. One obvious error that must strike every one that has had no part in making it, is, the forming the arboretum in a large rectilinear clump; and another is scattering the hot-houses and other buildings here and there over the garden. There should, in our opinion, have been three grand parts: a centre for all the buildings of every description, with the exception of entrance-lodges and resting-seats, or shelters, &c.; a circumference, displaying the arboretum, fruticetum, and ornamental flowers; and the intermediate space laid out as culinary, dessert, floricultural, experimental, naturalisation, and nursery gardens. The hot-houses requisite for these different departments might easily have been arranged so as to be included in each of them, and yet forming with the other buildings a whole or connected chain round the central area, and these might have been all heated from the same steam apparatus, and the sheds and other parts and buildings lighted, if desired, by gas. The grand entrance should have presented three carriage-roads: one to the centre, to which visitors could drive and inspect the hot-houses of all the departments, and just take a *coup d'œil* of the open gardens belonging to them; the two others proceeding to the right and left, and forming a circumferential one, along which visitors might drive round the whole arboretum or shrubbery, and enter if they chose by six or eight communications, at different distances, the six or

eight different open gardens. This is but a first rough sketch of what might have been, but such as it is we leave it as our protest against the present plan, from the details of which the reader will judge for himself.

7508. *The London Horticultural Society's garden* contains 33 acres, of which $17\frac{1}{4}$ are devoted to horticulture (A), $13\frac{3}{4}$ to floriculture and arboriculture (B), and $1\frac{3}{4}$ to lodges, roads, yards, &c. (C).

The fruit and kitchen department (A) contains —

Eastern slip for herbs, perennial esculents, and strawberries, and border of east wall, A 1
Orchard, A 2
Southern slip for strawberries, gooseberries, currants, and raspberries, and borders of south wall, A 3
Kitchen-garden, A 4
Miscellaneous standard fruit compartment, A 5
Site for fruit glass, A 6
Pits and forcing ground, A 7
Garden for small fruits, A 8
Western slips for stocks, and fruit-wall border, A 9
Experimental garden, A 10.

The ornamental department (B) contains —

Entrance to flower-garden, B 1
Flower-garden, B 2

Site for ornamental glass, B 3
Arboretum, B 4
Rose-garden, B 5
Experimental garden, B 6

The lodges, roads, and yards (C) are —

Entrance from London, and ornamental gardener's proposed lodge, C 1
Assistant secretary's proposed lodge, C 2
Space unoccupied at S.E. angle, C 3
Private road outside of the fence on the south, C 4
Kitchen-garden proposed lodge, C 5
Space unoccupied at S.W. angle, C 6
Yards for stables, sheds, composts, &c., C 7
Private road to Turnham-green, C 8
Entrance by the National School from Turnham-green, C 9.

7509. *The garden of the Caledonian Horticultural Society* is not yet in a state to be discussed.

CHAP. III.

Topographical Survey of the British Isles, in respect to Gardening.

7510. *The British isles are naturally and politically more favorable to the practice of horticulture in all its branches than any other country; in no country is so great a proportion of the surface covered with gardens, including, under this term, the parks or landscape-gardens, which surround gentlemen's seats. The beauty and magnificence of these parks, and the villas, mansions, castles, and palaces, of which they are the appendages, far surpass what is to be met with in any other part of the world. The palaces and scenery of Italy are more interesting to artists and classical antiquaries, from the particular associations necessarily connected with their pursuits; but the views of an accomplished and well regulated mind will extend to other kinds of excellence, as well as those of picturesque or classic beauty; and a man that knows to what extent civilisation and refinement are carried in different parts of the world, will look into the interior of these casinos and palaces, their gardens and farms, and enquire to what extent they would contribute, in their propriety, salubrity, furniture, produce, and management, to the gratification of the wants of an Englishman in his present state of refinement. In these particulars he will find them so very deficient, as to admit of no sort of comparison with those of Britain.*

7511. *Of the state of gardening in each of the different counties of the United Kingdom*, the following notices are necessarily imperfect to a certain extent; from defective information some things are omitted, and erroneous statements may exist as to others. In the selection of the names of the principal country-residences, some are undoubtedly admitted which may not have that claim, in comparison to others which are excluded; and others, though they once had that claim, may now have it no longer, from neglect, change of ownership, or even destruction as a country-seat. Most of the descriptive hints, added after the names of country-residences, refer to the state they were in some years ago, some as far back as 1805; and the changes in the names of the possessors that may have taken place since that time must no doubt be the cause of various errors, though we have spared no pains to avoid them. The descriptive epithets, added to the names of places in the southern kingdom, are taken generally from the *Beauties of England and Wales* (London, 26 vols. 8vo. published from 1801 to 1815); those of Scotland from the beauties of that country (5 vols. 8vo. Edin. published from 1802 to 1809); and those of Ireland from *The Traveller's Guide* (1 vol. 8vo. Dublin, 1819), and from the information of a correspondent there, well acquainted with every part of that country. We have visited all the counties of Britain ourselves in 1804, 5, and 6, and since been professionally engaged in several of them; and we have also made a general tour of Ireland in 1811. When any remarks occur which are not found in the books referred to, they may, for the most part, be considered as the result of our own observation at these periods or since. From the limited space that we can devote to this part of the work, these remarks are necessarily very few; we have omitted stating any thing as to the indigenous plants; and said very little as to the natural woods or artificial plantations of each county. All the seats which are of established celebrity, and are, or were, what are called show-places, are distinguished by a cross (x): of most of these places accounts have been published in the local guides, sold in country-towns.

SECT. I. *Gardens and Country-Residences of England.*

7512. *The surface of England* is estimated at 32,150,000 acres, almost everywhere cultivated, and nowhere incapable of cultivation; in most places varied — gently and beautifully in some districts, and abruptly and on a grander scale in others. The most hilly and mountainous districts are those of the north, and the most level those of the east. The most humid climates are those of the western and northern counties, as Lancashire and Cheshire; and the most dry those of the east and south, as Norfolk and Sussex. The richest soils, and those in which gardening, as an art of culture, and as a trade, has been carried to the greatest perfection, are those round the metropolis; there, within the circuit of ten miles, it is estimated (*Lyson's Environs of London*, published 1792 to 1796), 500 acres are employed in raising culinary vegetables; 800 acres covered with fruit-trees and shrubs; 300 acres in medicinal herbs; 500 as nursery and florists' gardens; besides not fewer than 1200 acres employed by farming gardeners in growing potatoes for the market; and 1200 occupied with turnips, cabbages, parsneps, and white beet for milch-cows. Gardening, as an art of design and taste, may be considered as nearly equally advanced in almost all the counties. Some of the most highly kept gardens and country-residences are in Middlesex and Surrey; of the most extensive and magnificent in Oxfordshire, Yorkshire, Nottinghamshire, and Devonshire. The best examples of cottagers' and farmers' gardens are in Essex, Kent, Norfolk, and Lancashire; the seed-gardens are chiefly in Essex and Kent; orchards in Herefordshire, Warwickshire, and Devonshire; and market-gardens and nurseries are distributed according to the extent and population of the different counties. These counties are forty in number, and we shall take them in the order of the circuits made by the judges, being that in which their names are most generally associated in our memories, and that also in which they are not unaptly classed in regard to beauty and character.

7513. MIDDLESEX, occupies the north side of a vale watered by the Thames, and containing 179,200 acres, of which one part is clayey and another marshy, but the greater part productive. As containing the metropolis, it may be considered the richest county in the United Kingdom as to culinary and flower gardening. The depot or market, where chiefly these productions are exposed for sale, is Covent-garden, an open square, laid out with fixed temporary wooden shops and stalls. The vegetables and commoner fruits and flowers are brought in by carts and waggons three days in the week, Tuesday, Thursday, and Saturday, so as to arrive in the market between three and five o'clock; they are then sold by regular salesmen to the retailers of the market, or to green grocers, fruiterers, and stall-keepers from different parts of the town. In general the terms are adjusted, and the market cleared of the vehicles and horses by ten o'clock or earlier in the summer, no more remaining in the market than what is found by the different tenants to be sufficient for the local consumption. The more valuable fruits and flowers, such as forced strawberries, peaches, grapes, and pines, and forced roses, hyacinths, and nosegays, during winter, are generally sold by private contract to the fruit-shops in the market, or to others distributed in different parts of the town. The principal fruit-shop is that of Grange, in Piccadilly, who is the king's fruiterer; the principal flower-shop that of Smith, in Covent-garden market. Besides the central market of Covent-garden, there are others in different parts of the town, as the Fleet, Newgate, Borough, &c. which receive very considerable supplies of the leading kinds of vegetables direct from the country; but the forced productions, and the more expensive fruits, are generally brought to Covent-garden, when not disposed of to the shops by private contract.

7514. The following TABLE exhibits a comparative View of the *Average Prices of Vegetable Productions*, of the best quality, by Retail, in Covent-garden Market, throughout the Year.

7515. *The seed-market* is held twice a-week, on Mondays and Fridays, in a large roofed space in Mark-lane. Here the growers or holders of garden-seeds, and of such agricultural seeds, as are commonly sold by nurserymen, as clover, rye-grass, &c. attend and transact business by sample. The purchasers are the London retailers, or the wholesale dealers for their country customers; nothing is there sold by retail.

7516. *The produce of the nursery-gardens* is sold on the spot; as is also that of the florists' gardens; the herb-growers sell their productions to the wholesale druggists and manufacturing chemists by sample.

7517. *The public gardens of Middlesex* are as under:

Public Promenades.—The principal public promenades of the metropolis are the verdant areas of the squares, especially Finsbury, Russell, Grosvenor, and Berkeley Squares; and the public squares, and also walking promenades in this county, are the parks of St. James, the Hyde, and Mary-le-bonne.

Botanic Gardens.—The only public botanic garden is that of Chelsea, containing between three and four acres. The origin of the Chelsea garden is involved in obscurity; the first notice of it in the books of the Apothecaries' Society is in 1674, when it was proposed to wall it round; and two years afterwards, in 1676, they agreed to purchase the plants growing in Mrs. Gape's garden at Westminster, which garden, it is thought, may have been the one mentioned in Evelyn's *Diary* for 1656, as "the medical garden at Westminster, well stored with plants, under Morgan, a skilful botanist." Piggott is the name of the first curator, noticed in 1676. Watts, mentioned both by Ray and Evelyn, was an apothecary by profession, but undertook the care of the garden in 1680, at 50*l.* per annum. Miller was appointed in 1722, at the time Sir Hans Sloane, when applied to for a renewal of the lease of the garden, granted it to the Society in perpetuity at a rental of 5*l.* per annum, and on condition that specimens of fifty new plants should annually be furnished to the Royal Society till the number amounted to two thousand. Miller resigned his situation as curator two years before his death in 1770, and was succeeded by Forsyth, who went to be royal gardener in Kensington in 1784, and was succeeded by Fairbairn, who died in the garden in 1814. His situation is now filled by Wm. Anderson, who has greatly enriched the garden, and contributed materially to restore its high character. It may be noticed as a warning to gardeners, and indeed to all of us, that the two first curators, Watts and Miller, are said to have relaxed from their activity and got careless; and that Fairbairn neglected the garden for a number of years together. No proper catalogue of this garden has ever been published; with the exception of one, of the medical plants, by Miller and Rand, in 1730, and another of the same kind in 1739.

Farmers' Gardens.—The principal of these are in the parishes of Chelsea, Hammersmith, and Fulham; to the west; and at Hoxton, Kingsland, Hackney, &c. to the east of the Metropolis. George Matyeat of Fulham, Samuel Hutchins of Earl's Court, Kensington, Cock and Dancer of Chiswick, and Brown and Reid of Hoxton and Kingsland, have the most extensive ploughed gardens; the smallest exceeding a hundred acres. Southfield Farm, near Parson's Green, in Fulham, has been occupied jointly as a market-garden and a nursery for upwards of two centuries, and the whole of that time till the beginning of the present century, in the family of Rench. In this garden, were produced the first pine-strawberry, and the first auricula, by the father of the late Mr. Rench, who also instituted the first annual exhibition of flowers. He died at the age of ninety-nine years, having had thirty-three children. The late Mr. Rench, mentioned by P. Collinson, as famous for forest trees, introduced the moss-rose; planted the elm-trees now growing in the Bird-cage Walk, St. James's Park, from trees reared in his own nursery; married two wives, and had thirty-five children, and died in 1783, in the same room in which he was born, at the age of a hundred and one year. The grounds are now occupied as a market-garden by Mr. Fitch, who married one of the daughters.

Vegetable Gardens and Garden Orchards—abound in the same parishes. The principal are those of Grange of Hoxton, and Gunter of Earl's Court, each of which contains between sixty and seventy acres, extensive forcing-houses and pineries, and walls for fruit-trees. The open garden is regularly planted with standard fruit-trees, and is more devoted to the production of fruit than of culinary vegetables. The garden of Wilnot at Isleworth is of the same character, and nearly equally extensive; and next is that of Michael Keens of the same place. The gardens of Brentford and Twickenham are famous for strawberries; in those of the last parish there are about four hundred acres covered with this fruit. Almost the whole of the parish of Fulham is occupied in fruit-trees and vegetables. The gardens of the Neat's Houses in Chelsea have long been famous for celery and cauliflower: water-cresses are grown in irrigated trenches at Baywater and in the parish of Isleworth.

Market Flower-Gardens.—For forced flowers and shrubs, the principal garden is that of Smith of Dalston; for geraniums and green-house plants in general, Colville in the King's Road; and for hardy flowers, D. Carter's of Fulham. Some of the nurserymen deal extensively in forced flowers, as Jenkins of Mary-le-bonne, Henderson of the Edgeware Road, &c.

Florists' Gardens.—Of these the principal in Middlesex is that of the Davy in the King's Road, near Bailer at Claydon, and also of the King's Road; Moore in the King's Road, and some at Brentford and Hounslow.

7518. *Nurseries.* The principal British nurseries are in this county; and as almost all the country nurseries are supplied with their more rare articles from the west, we shall particularise the names of a few:—

The Vineyard.—at Hammersmith, is unquestionably the first nursery in Britain, or rather in the world. At the beginning of the last century it was a vineyard, and produced annually a considerable quantity of Burgundy wine. A thatched house was built in the grounds; the upper part occupied as a dwelling house, and for selling the wine; and underneath were the wine-cellar. The ground was taken by Messrs. Lee and Kennedy, the fathers of the present, or late occupiers of that name, and continued by their sons, who dissolved partnership in 1816, and the concern now the sole property of Lee.

This nursery owes its celebrity, in a great measure, to the late James Lee's knowledge in botany, and to his publishing the Introduction to that science at a time when its principles

were not generally diffused. Lee was patronised by a great many of the nobility and gentry, for his general knowledge in natural history, and for his sound sense and strong understanding. The nursery is now carried on by his son to greater extent in every department than any other nursery in Europe. J. Lee has just four sons, whom he intends to bring up to the business in four separate departments: the seed business, the counting-house, exotics in houses and fruit-trees, forest trees and hardy plants.

Besides an extensive correspondence, and a vigilant attention to procure every new plant as soon as introduced by others, a great many plants have been introduced to the country directly by this establishment. Among the collectors they sent out for this purpose, may be mentioned a person collecting oak at Cape of Good Hope, in partnership with the Empress Josephine, collecting ericas, bulbs, and other plants; and a man in South America.

The whole concern, from its first establishment to the present moment, has been conducted with singular spirit and skill; no expense spared to procure new plants from abroad, and preserve and propagate them when received. The green-houses are extensive, and a house two hundred feet long has lately been erected for fruiting the different sorts of grapes, and another for figs. The proprietor has grounds for the commoner descriptions of stock in different parts of the country: as at Bedford for stocks for fruit-trees, and for cherries; at Hounslow and Bagshot for stocks, and also for seedling fruit-trees, and other commoner articles, &c.

The Fulham Nursery—was established by Christopher Gray, about the beginning of the last century. Catesby, Collinson, Miller, Dr. Garden, and other eminent botanists, and travellers contributed many rare plants and great quantities of Bishes. Compton's collection was purchased by them from the bishop's successor. Some fine old exotics are still existing in this nursery, as the quercus suber, celis occidentalis, alianthus glandulosa, diospyros virginiana, &c. The first magnolia grandiflora was planted here; the original tree, the parent of most of the older trees of this kind in the country, died some years ago; the dead trunk, which is still preserved, measured four feet ten inches in circumference; its branches extended twenty feet; it was as many feet high, and its fragrance perfumed the whole neighborhood. This nursery passed successively from Gray to Burchall, and from him to Messrs. Whitley, Brames, and Milne, the present occupiers.

The Brompton Park Nursery—was founded by Messrs. Cooke, Lucre, London, and Field, in 1681. In 1694, all the partners having died or sold out but London, he took in Henry Wise, who had been an apprentice to Rose, the royal gardener, as London had also been. At that time the grounds exceeded 100 acres in extent. This nursery passed successively from London and Wise to Swinboe, Smith, and Co.—in 1756 to Jeffries and Co.—in 1788 to Gray, Wear, and Co.—in 1810 to Gray and Sons, in whose occupation it is at present. The grounds are now reduced to thirty acres, and the establishment has unavoidably fallen off in reputation. In the time of London and Wise it was spoken of in terms of the highest approbation by Evelyn. In his preface to the translation of Quintine's *Complete Gardener* (published 1701) he says, "the proprietors, Mr. George London, chief gardener to the majesties, and his associate, Mr. Henry Wise, are recommended for their assiduity and industry; they have not made gain the only mark of their pains, but with extraordinary and rare industry, endeavored to improve themselves in the mysteries of their profession; from the great advantages and now long experience they have had, in being employed in most of the celebrated gardens and plantations which this nation abounds in, besides what they have learned abroad, where horticulture is as much respected as it is here." He also says, "the gardens of its noblemen and persons of quality, which they have planted, and which are still under their care and attention, justify what I have said in their behalf."

Bowack, who wrote an account of the parish of Kensington in 1705, says, that some affirm that if the stock of these nurseries were valued at one penny per plant the amount would exceed 40,000*l.*

The Kensington Nursery—was established by Robert Furber, in the beginning of the last century, and was of note for fruit-trees in Miller's time; it has passed successively from this family to Grimwoods, and to Messrs. Malcolms, the present spirited and judicious possessors.

The Brentford Nursery,—Messrs. Ronalds and Son, has been established upwards of a century. It is chiefly devoted to the culture of fruit-trees.

The Brompton Agricultural Nursery,—Messrs. Gibbs and Co., was originally part of the Brompton Park nursery; but was established chief for a display of the grasses and plants used in agriculture, during the present century.

The Hackney Botanic Nursery—was established by Conrad Loddiges, a German gardener, about the middle of the last century. It is particularly devoted to the propagation of rare plants, and contains the best general collection of green-house and hot-house exotics of any commercial garden. In palms, tree-ferns, and scitaminee, it particularly excels, and of the first tribe, possesses upwards of eighty species. For the better display of these plants, Messrs. Loddiges have lately erected the largest hot-house in the world; it being 80 feet long, 60 feet wide, and 40 feet high. It is heated by steam, as are all the others, extending to upwards of a thousand feet, forming three uninterrupted sides of a parallelogram. In the area are the pits and frames. Two houses are devoted to the camellia: one is roofed with copper sashes, by Timmins of Birmingham; the other is a curvilinear-roofed house, formed of our bar (fig. 739.) It is 120 feet long, 23 feet wide, and 18 feet high. (See the details, see 735*o.* and fig. 736.)

The Kingdland Nursery—was in part in the occupation of Fairchild, and also of Cowel, in the beginning of the last century. The present possessors are Messrs. Bassingtons.

The Balfs-pond Nursery.—Messrs. Brooks and Co., has been established upwards of half a century, and is carried on with much spirit, collectors being sent out to distant countries, and many new plants imported. Among these are several chrysanthemums, psidium, &c.

The Mile-end Nursery.—was established by James Gordon, gardener to Dr. Sherrard, at Eltham, and passed successively to Gordon, Derrner, Thompson and Co.; Gordon, Forsyth, and Co.; and Thompson and Co., by whom it is at present kept up in a very respectable style.

The Mary-is-bonne Nursery.—Thomas Jenkins, has been established within the present century; it is of considerable extent; contains extensive hot-houses for forcing flowers, for green-house plants, and pits for pine-apples. It also contains a subscription botanic garden.

Other Nurseries.—Of these there are, perhaps, a hundred

in this county that might be deservedly mentioned. That of Fraser and Co., in the King's Road, noted for American herbaceous plants; of Harrison and Co., Old Brompton, for its antiquity; Schaler and Co., King's Road, as famous for roses; Joseph Knight for a general collection of exotics and hardy flowers, and for excellent management; that of Kirk and Son for its antiquity, the grounds being in part surrounded by the walls of Cromwell's garden; Henderson's, in the Edgeware Road, for pine-apples; Forsyth (one of the principal London seedsmen), at Mile-end; Ross, at Kingsland, &c.

7519. *Private gardens* come next in order.

Street-Gardens (fig. 740.)—are necessarily numerous in the outskirts of the metropolis; many of them in the New Road, Hammersmith Road, and in the parishes of Chelsea, Fulham, and Kensington, are very neatly kept.

The Cottage-gardens of Laborers.—near town, are not remarkable for management, but in the western and eastern extremities of the county they are better.

The Cottage-gardens of Artificers.—are often very neatly kept; particularly those of the Spitalfields weavers, and other operatives who have a taste for flowers.

Farmers' Gardens.—As many of the farmers near the metropolis are retired or speculative London tradesmen, they have often very neat gardens. Those to the west of London may be referred to as examples.

Suburban and Citizens' Villas.—are in considerable number, of various degrees of extent; but generally neatly kept.

7520. *Villas* are numerous in every part of the country; a few may be enumerated:—

Arno's Vale.—near Southgate; J. Walker, Esq. A noble mansion, chiefly by Sir R. Taylor: the grounds comprise woods watered by the New River; the flower-garden is rich, and there is an extensive range of hot-houses containing an abundant collection of exotics.

Culland's Grove.—near Southgate; Sir W. Curtis. A substantial villa, and good kitchen-gardens, with hot-houses, on which no expense is spared.

Canons.—near Edgeware; Sir Thomas Plumer. A dull flat of rich pasture, intersected by rows of elms, and surrounded by a brick wall.

This place is remarkable as having been the site of the improvements of the celebrated Duke of Chandos, who rose from the rank of a private gentleman. James Bridges, Esq. married into the family of Lake, then proprietors of Canons. Having made his fortune as a paymaster in the German war, and acquired his title, he built the magnificent mansion of Canons about 1712. It stood nearly in the centre of the park, at the end of a spacious avenue, being placed diagonally so as to show two sides of the building, which, at a distance, gave the appearance of a front of a prodigious extent. Vertue describes it as a "noble square pile, all of stone; the four sides almost alike, with statues on the front; within was a small square of brick, not handsome, the out-offices of brick and stone, very convenient and well disposed." &c. The architect was James, of Greenwich, and the whole expense of the building and furniture is said to have amounted to 200,000l. Dr. Alexander Blackwell, author of a treatise on agriculture, who after wards went to Sweden, where he died, and whose widow published figures of plants, was employed to superintend the works out of doors. Lyons thinks it is probable he laid out the pleasure-grounds; but it is not unlikely that the architect, James, who translated Le Blond's *Gardiennage*, disposed of the grounds as well as of the house. The duke's manner of living corresponded with the magnificence of his mansion, and fell little short of the state of a sovereign prince. Canons and the

duke were satirised by Pope under the character of Timon and his villa, in 1731. Pope at first denied it, and afterwards wrote an exculpatory letter to the duke, who answered it with great magnanimity, as by a man who accepted his excuse without believing his professions. There is a print of Hogarth's, in which he represents Pope whitewashing the Earl of Burlington's house, and bespattering the Duke of Chandos's carriage as it passes by.

When the duke died, the mansion being thought to require an establishment too expensive for the income of his successor, after fruitless attempts to dispose of it entire, was pulled down, and the materials sold by auction in 1747. The grand staircase, of which each step was a single block of marble above twenty five feet in length, is in Lord Chesterfield's house in May Fair; the equestrian statue of Geo. I. in the centre of Leicester Square; the park was purchased by an upholsterer (Hallett), who built the house now existing, and successively occupied by himself, by O'Kelly, and the present proprietor. Two poems were written on Canons; one by S. Humphreys, in 1728, the other by Gildon.

Cranford Lodge.—near Norwood; Countess of Berkeley. Remarkable for its pheasants, which, in the late earl's time, were everywhere as abundant, and seeking their food on the green sward with all the confident serenity of domestic fowls.

Edelford Park.—near Uxbridge; C. Clowes, Esq. A handsome mansion; and grounds finely undulated, well wooded, and watered by the river Colne.

Durham Park.—near South Mimms; J. Trotter, Esq. A good house, well wooded grounds, and a productive kitchen-garden.

Ealing Grove.—near Ealing; C. Wyatt, Esq. A substantial and commodious house, and forty acres of ground arranged with much judgment.

Earl's Court Villa.—at Earl's Court; John Baynes, Esq. Was the villa for the late celebrated surgeon, John Hunter. Here he had a curious menagerie.

Flambards.—near Harrow; Lord Northwick. The house being in the village, from its elevation commands astonishingly fine views; the grounds are disposed in good taste.

Fordhook.—near Ealing; Charles Duval, Esq. A good house, once the residence of Fielding; the grounds economically and tastefully disposed.

Forty Hall.—near Enfield; J. Meyers, Esq. The house originally by Jones, but altered; the grounds extensive, undulating, abounding in lofty elm and ash-trees, and adorned with some fine pieces of water.

The Grove.—near Stanmore; C. Poole, Esq. The grounds are remarkable for containing an island and tomb, in imitation of the *Ile des Peupliers*, at Ermenonville, and of Rousseau's tomb, formerly there, but now in the pantheon of Paris.

× *Gunnerbury*.—near Ealing; A. Copland, Esq. A desirable villa, with seventy acres of ground, adorned by two

fine sheets of water, and numerous cedars, supposed to have been planted by Kent, who laid out the grounds shortly after 1740. There are extensive forcing-houses and plant-stoves.

Hendon Place,—near Hendon; W. Carbone, Esq. A handsome stately mansion, the grounds rendered attractive by various picturesque undulations, watered by the river Brent. Among the trees are some fine cedars, and one of remarkably large growth.

Kempton Park,—near Sudbury; Mrs. Fish. Great improvements were made here a few years ago by the late Mr. Fish, both in building, excavating for pieces of water, and in planting. At his death, however, the hot-houses and other articles were sold by public auction, and what remains is neglected.

Marble Hill,—near Twickenham; C. A. Falk, Esq. The grounds were laid out by Pope, at the time the house was the property of the Countess of Suffolk. They contain much venerable wood, and a dilapidated grotto.

Marble Hill Cottage,—near Twickenham; T. Brent, Esq. An embellished dwelling; fitted up with great delicacy of taste by the late Lady Diana Beauclerk, and standing on a spot of peculiar beauty, close to the Thames.

Rushlyn House,—Hamstead; General Sir M. Disney. A good house, commanding extensive views of London and Surrey, over the Regent's Park; the extent of the grounds considerable for the situation.

South Lodge,—near Enfield Chase; N. Gundry, Esq. Celebrated as having been the residence of the great Earl of Chatham, who expended a considerable sum in laying out the grounds; which, according to G. Mason, he did much in the manner recommended by U. Price. The place is now much neglected. The temple of Pan, which stands in the pleasure-grounds, is described by Wheatley, in *Observations*. It was afterwards the residence of Mr. Sharp (the friend of Collinson), in 1764, who had a good collection; and whose gardener, Watts, (who worked under Miller, and is now an old man and nursery-gardener at Acton,) propagated the mistletoe on most sorts of trees, resinous as well as non-resinous.

Southgate Grove,—near Southgate; W. Gray, Esq. A beautiful Ionic building, by Nash, to which an elegant conservatory is attached. The lawn declines from the house, and then rises in an opposite flank, fine clothed with oaks; the walks were laid out by H. Repton. On the whole, this is one of the most romantic and beautiful villas in Middlesex: it bears a striking resemblance to that of Blaize Castle, near Bristol.

Spring Grove,—near Hounslow; Lady Banks. Chiefly remarkable as having been the residence of the late eminent President of the Royal Society, and patron of all natural science. There is an excellent kitchen-garden; and pines and mushrooms grown to great perfection by J. Olden.

Strawberry Hill,—near Twickenham; Countess of Waldegrave. The house, a composition of the late Lord Orford's in the Gothic style, built from time to time, and great part being wood covered with plaster, it is going fast to decay: the grounds are of very limited extent, and much less interesting than has generally been imagined; without the Thames they would be dull.

Twickenham Villas,—These are numerous; that of Baroness Howe is in the garden of Pope, and not far from the site of his house. Pope purchased his villa, and removed there in the year 1715, and continued improving it till his death, in 1744. It was then sold to Sir William Stanhope, who added wings, and enlarged the gardens. It then passed to Wellbore Ellis, Esq. afterwards Lord Mendip, who married his daughter; next to Viscount Clifden, who sold it to Sir John Briscoe, Bart. and after his death it was purchased by Baroness Howe, in 1807, who levelled the villa to the ground, and built a new house on the site. The weeping-willow, planted by Pope, perished in 1801.

The villa of George Pococke, Esq. was the residence of Secretary Johnstone from 1720. Mackey, in 1724, says he had the best collection of any gentleman in England; that he had slopes for his vines, from which he made some hogsheds of wine a year, and that Dr. Bradley reckoned him among the first gardeners in the kingdom.

Twickenham Park was once the property of Lord Chancellor Bacon, who estimated it "a fit residence for persons to study in." About 1740 this seat was the property of M. Vernon, a merchant of Aleppo, who brought the weeping-willow from the Euphrates, and planted it here. Peter Collinson says he saw it growing there in 1743, and that from that tree originated all the weeping-willows in Britain. (Lambert, in *Linn. Trans.*) Lysons observes, that Twickenham has so long been the favorite retreat of the scholar, the poet, and the statesman, that almost every house has its tale to be told.

Tyford House, near Widsen;—Willan, Esq. A commodious Gothic residence, the effect of which is much admired, by Atkinson; the attached lands agreeably ornamented with wood; a small portion dedicated exclusively to pleasure-grounds, and the rest managed as a hay-farm.

Whilton Place,—near Hounslow; lately the residence of Sir William Chambers, was built by Archibald, Duke of Argyle, celebrated in the early part of the last century for the introduction of exotic trees. Many of the plants and trees were moved to Kew in 1762; but a number of the cedars sown here in 1725 still remain, and constitute the finest assemblage of that tree in the country. The house, after the death of the duke, became, by purchase, the residence of Sir William Chambers, the architect. The grounds were divided, and an elegant villa built on a part of them by the father of the present proprietor, George Gosling, Esq. A lofty tower; the old green-house, now formed into a dwelling-house; and fine pieces of water and venerable pines, firs, and cedars, still remain.

Wimbly Manor House,—near Kilburn; J. Gray, Esq. A neat house, most agreeably situated in a grass-farm, ornamented from the designs of H. Repton.

Wyke House,—near Brentford; E. Ellis, Esq. Remarkable for its good and well-managed kitchen-garden.

7521. *Villas with demesne-lands and mansion-residences* are not very numerous.

Bentley Priory,—near Stanmore; Marquis of Abercorn. An irregular brick edifice, of no architectural pretensions, but

occupying an elevated site, and commanding extensive prospects.

Boston House,—near Brentford; Colonel Clitherow. The grounds umbrageous and ornamental, and noted for large cedars.

Cresswell,—near Hampton; Earl of Mansfield. A remarkable building, by Adams and George Sanders, and some additions by Atkinson; with fifty acres of pleasure-grounds, beautifully disposed, containing some fine old wood, and undergrowth of rhododendrons, and other American plants; there is a fine terrace-walk, flower-garden, and excellent kitchen-garden, home-farm, and dairy.

Chiswick House,—near Chiswick; Duke of Devonshire. An elegant Corinthian edifice, by the Earl of Burlington and Kent, with two wings by Wyatt. The gardens were originally laid out by Lord Burlington, in the Italian style, with a redundancy of sculptural embellishments, but have since been modernised. They now contain a large flower-garden, a range of hot-houses 300 feet in length, and a group of aviaries for hardy birds: there is also a large kitchen-garden.

Stammore House,—near Stanmore; G. H. Drummond, Esq. The house and grounds originally by Holland; the grounds, since improved by Repton, contain some fine views.

St. John's Hill,—near Brentford; Duke of Marlborough. The grounds disposed with great taste; but, with the house, of limited extent.

Trent Place,—near Enfield; J. Cumming, Esq. A spacious brick structure on a fine swell in the midst of a park of 500 acres, more varied by irregularities, and of a bolder character than is usual in Middlesex.

Wrotham Place,—near South Mims; G. Byng, Esq. A spacious architectural pile, by Ware, on a commanding eminence: the park is rather deficient in wood.

7522. *The first-rate residences of this county are chiefly in London*, but there are a few in the country.

Holland House,—near Kensington; Lord Holland. A magnificent Elizabethan mansion, with a demesne of 300 acres, of which 63 are in pleasure-grounds, and the rest a flower-garden, beautifully laid out and managed. Here the ruins of a stable become a fine object; for the stalls having been arched with masonry, remain and resemble a ruined aqueduct. In this garden the dahlia was first successfully cultivated in England.

Sion House,—near Brentford; Duke of Northumberland. Once the property of the Duke of Somerset, whose physician, Dr. Richard, author of *The Herbal*, mentions a botanic garden formed here. The house is a magnificent quadrangular structure of stone, improved by Adams, and more recently by Hardwick. The grounds are flat; but abound in fine trees, and the pleasure-grounds with many venerable cedars, and other exotics. They were laid out by Brown; lately under the care of Hoy, F.L.S., and now of Stroud, author of an *Introduction to Botany*.

7523. *Royal Gardens*. Of these there are four, Carlton Gardens, Hampton Court, Kensington, and Picnic.

Carlton Palace Gardens—were originally laid out by Kent, for Lord Carlton; and afterwards by Brown and Holland, for the present king when Prince of Wales. They are secluded, but not much enriched with flowers and shrubs, or in high keeping. Attached to the palace is a conservatory; a copy of the skeleton of Henry VII.'s chapel in Westminster Abbey; but though handsome as a piece of architecture, it is of little use as a plantation, being in fact intended more as a lounge and resource for an extra room on great occasions.

Hampton Court,—the most capacious, and perhaps the most magnificent, of all the royal palaces: principally built by Cardinal Wolsey; but enlarged by Henry VIII., and in part rebuilt by William and Mary. It consisted originally of five, but the style impure (Grecian). Its situation is upon the north bank of the Thames: it is embraced by forty-four acres laid out in the Dutch taste in the time of William and Mary, by London and Wise. The ground belonging to it as park, is of considerable extent, and is distinguished by the different divisions of Bushy Old Park, New Park, Middle or Hare Warren, and Hampton Court. The gardens contain a labyrinth, one of the most perfect, as to preservation, in England: the privy garden is ornamented with terrace-walks, and near it is a grasper, seventy feet by fourteen, occupied by a Hamburg vine planted in 1769, which has been known to produce in one year 200,000 lbs. of grapes. Its roots are said to have found their way to a drain leading from the offices to the river, from which it is supposed to derive moisture and nourishment. There is a kitchen-garden of twelve acres, with nine pits, and various hot-houses heated by steam, and managed by Padley, the royal gardener.

Kensington.—The palace a large brick building, badly placed in relation to the surrounding gardens, being lower than the greater part of the surface. The gardens are three miles and a half in circumference, and contain grass and gravel, open and shaded walks, with a circular basin and river. The finest point of view is on entering from the Uxbridge road. The kitchen-garden was formerly famous as exhibiting the effects of the late W. Forsyth's mode of managing fruit-trees; at present the forcing-department is remarkable for its hot-houses, in which the pine is better cultivated than in any of the royal gardens. The original extent of the gardens was only thirty-six acres. Queen Anne added thirty acres, which were laid out by her gardener, Wise. Queen Caroline added nearly 300 acres from Hyde Park, which were laid out by Bridgeman. Being royal gardens, several poems have been published to celebrate them; one by Tickell, in his works; another in 1722; and a third in the pastoral calendar in 1763.

Picnic, or Buckingham-House Gardens—were enlarged and laid out soon after the middle of the last century, by Robinson, brother to Ramsay Robinson, the king's farmer. They occupy a triangular spot of a few acres, and have scarcely any other beauties to recommend them than those of seclusion and verdure.

7524. *SURREY*. A surface of 519,040 acres, generally beautifully varied in surface; the soil in a great part gravelly or sandy; poor in many places; but from the salubrity of the air this county is particularly

adapted for villas and other residences. That part of the metropolis which is within the county, contains a garden-market for the commoner fruits and vegetables, but it is not extensive. There are several respectable seed-shops, and the greatest seed-factors reside here; in the suburbs and suburban villages, are some good market-gardens, the principal herb-gardens in the kingdom, and some seed-gardens: juniper-berries and cranberries used to be gathered on the commons on Box Hill and Leith Hill, and sold in the metropolis. There are a few nurseries: the county abounds in villas, and contains some mansion-residences. There are no public gardens in the county; but the promenade of Greenwich Park, in Kent, adjoins the metropolis. In Stevenson's survey of the county, it is stated, that 3500 acres are employed as farmers' market-gardens. The greatest gardening author this county has produced is Evelyn, of Wootton House, and the most celebrated gardens which have existed in this county those of the Carews, at Beddington.

7525. There are various commercial gardens.

Farmers' gardens.—Of these there are a considerable number in the low part of the county, adjoining the Thames. Turnips are grown in abundance and in great perfection, for the cow-keepers.

Market-Gardens.—There are some highly cultivated and of very considerable extent on the banks of the Thames, especially at Barnes, Mortlake, and Camberwell. The two former places are famous for asparagus, and Battersea for cabbages. There are generally about eighty acres under asparagus in the parish of Mortlake: the greatest grower is Biggs, who has had forty acres under this crop at one time. There are some good gardens near Chertsey, and here the Chertsey or great Surrey carrot is better grown than anywhere else, and the London seedsmen are supplied from the growers with its seeds. The hardy fruits are less generally grown for the markets in Surrey than in Middlesex and Kent; but there is one celebrated grower of exotic and forced fruits, Isaac Andrews at Lambeth, famous for his pine-apples, and being annually among the first who send early grapes and cherries to market. His hot-houses, like those of Gunter and Grange in Middlesex, are all heated by steam.

Herb and Physic Gardens.—These are chiefly in the parish of Mitcham, where the soil is poor and gravelly. The oldest establishment of this description is that of Potter and Moore, who formerly grew most of the articles in the vegetable materia medica then in vogue. They now grow chiefly roses, lavender, chamomile, the mints, opium-poppy (*Papaver somniferum*), halm, blessed-thistle, borage, clary, hyssop, sage, scurvy-grass, angelica, thyme, fennel, pot-marigold, &c. Messrs. Dickson and Anderson, of Covent-garden, seedsmen and herbalists, have a garden at Croydon for a general collection of such herbs as are only in demand in small quantities.

Market Flower-Gardens.—There are several of them near the metropolis, but none eminently deserving description.

Florists' Gardens.—The principal of these is that of Messrs. Milliken and Curtis, at Walworth, who have the first collection of hardy bulbs grown in this country. It was founded by the late — Maddock, author of the *Florists' Directory*, about the middle of the last century. There are also one or two other very respectable gardens of this description.

Nursery-Gardens.—Before London was so much extended on this side, there were some old and extensive nurseries, such as those of the Drivers, Malcolms, North, &c.; but the grounds which occupied these gardens, are now generally built on, and the existing nurseries are of less note though highly respectable. Of these may be mentioned that of Ronaldson at Tooting, noted for the best collection of erice in the vicinity of the metropolis; Chandler at Vauxhall, noted for camellias; Griffins of South Lambeth, for bulbs; Phillips at Lambeth, for fruit-trees; and Buchanan at Camberwell, for a general collection. Near Bagshot are a number of nurseries, devoted chiefly to the growth of stocks for fruit-trees, with which they supply the trade in London, and elsewhere. Among these may be mentioned Donald at Woking, Cobbett at Horsehill, Ham-mord, and others, at Ripley and Trimley; Lee, of the Vine-yard, has also extensive nurseries in this quarter, for raising the commoner articles.

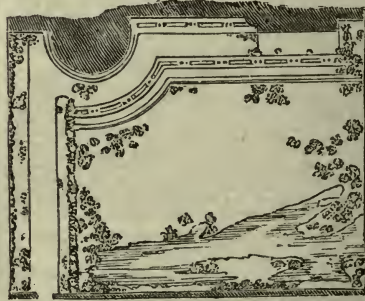

Botanic Gardens.—That of Tradescant at Lambeth, and a medical garden by Morgan, mentioned by Evelyn, the lease of which was bought by the Apothecaries' Company in 1676, may be noticed as belonging to the garden-antiquities of the county. Curtis, the botanist, had formerly a subscription botanical garden at Lambeth Marsh; which was afterwards removed to Queen's Elm, Brompton. Benjamin Robertson formed a valuable botanic garden, at a great expense, at Stockwell; he died in 1800, and bequeathed the whole of his estates for the purpose of establishing it as a public botanic garden; but his will was set aside.

7526. **Private gardens**, as already observed, are very numerous, and generally well managed, compared with those of most other counties. Cottage-gardens are neat, and often ornamental, and the farmers' gardens are generally well attended to, this class of cultivators being here, as round most large towns, in great part retired tradesmen.

Suburban Villas (fig. 741.)—are certainly more numerous, and better laid out than anywhere else. They border the different great roads for some miles from town, and render them delightful to the passing traveller.

741

7527. **Villas.** We have selected a few; but the number that merit attention is more than double those here named.

Addington Place,—near Croydon; Archbishop of Canterbury. A good house in the centre of a park, much varied and well planted: the house lately enlarged and improved.

Albury Place,—near Blackheath; S. Thornton, Esq. An elegant Ionic mansion, greatly altered and improved by the present proprietor. The park, a beautiful piece of ground, of 250 acres, finely wooded, especially with old Spanish chestnuts. There are some small pieces of water in the park, and a basin and fountain in the garden. This place was noted in Evelyn's time (327.) for the subterraneous passage of 160 yards in length,

made nearly through a hill, but a rock at the south end prevented the design from being completed.

Bolly, near Chertsey; Sir J. Mawbey. An elegant stone mansion, in a park well stocked with timber, and adorned with a fine piece of artificial water, with a bath at one end of it.

Burwood Park, near Walton; Sir J. Frederick. An elegant house, in a park of 300 acres, valued here because not intersected by a single footpath.

Bysshe Court, near Godstone; J. M. Ewart, Esq. Worthy of notice on account of the kitchen garden, which is surrounded by a moat, the area enclosed being that on which the former mansion stood.

× *Deeplene*, near Dorking; T. Hope, Esq. A man of great taste in all the fine arts, and eminently so in architecture and gardening. His essay on gardening, and on household furniture, are highly esteemed. This Italian villa was built by the Duke of Norfolk, but improved and decorated with sculptures and a Tuscan tower, by the present proprietor. The grounds are not extensive, but are highly romantic, and intersected with walks in various directions, which, with admirable liberality, are at all times open to the public.

Egham Park, near Egham; — Parry, Esq. A neat house, in a well wooded park of sixty acres, lying on the south-west side of Cooper's Hill; a conservatory and colonnade added to the house, and the kitchen-garden much improved by the present proprietor.

Ember Court, near Thames Ditton; Colonel Taylor. A stuccoed house, and a park of late years greatly enlarged and improved.

Grove Hill, near Camberwell; the late J. C. Lettson, M.D. A plain mansion; the gardens laid out with great taste and beauty, and rich in exotics. There are also various ornamental buildings, and the whole is in the highest state of preservation.

Kingswood Lodge, near Egham; — Flounder, Esq. A substantial stuccoed house; the grounds modernised by us in 1805, for Gideon Bickerdye, Esq. the proprietor at that time. They are chiefly remarkable for their commanding prospects, and as forming a part of Cooper's Hill, celebrated by Denham.

Monk's Grove, near Chertsey; Lord Montford. Remarkable only for its kitchen-garden, sunk in the side of St. Anne's Hill, at a great expense.

Morden Park, near Morden; G. Ridge, Esq. A handsome quadrangular house, on a rising ground, agreeably diversified with extensive plantations of shrubs and flowers, and embellished by two sheets of water.

× *Norbury Park*, near Mickleham; W. Locke, Esq. A simple but grand mansion, in an elevated commanding situation, "well fitted to reign over the domain in which it is placed." The park is extensive, and the wood in judicious masses branching away from the house in opposite directions. It contains many walnut-trees, the nuts of which in some years are said to fetch 600*l.*, and in other seasons scarcely a bushel is produced.

× *Pain's Hill*, near Cobham; Lord Carhampton. One of the most beautiful and meritorious places in England. The extent is 213 acres, great part taken from a barren heath; but the surface being naturally varied, and the river Mole bordering the estate, laid a foundation for every improvement. By a simple contrivance the water was raised so as to supply a large and beautifully varied lake, and the buildings and woods were judiciously adapted to the grounds. A vineyard was planted on the south side of a gravelly hill, from which wines were made for several years. The woods were planted so as of themselves to produce variety, by adopting the manner of grouping the natural orders; thus, in one part the pine and fir tribes prevailed, in another aquatics, and so on. The place was celebrated by Whetstail, Walpole, and other writers, and much admired by the public to whom it was open, till it fell into the possession of the present proprietor.

Peterham Lodge, near Kew; Sir W. Manners. The house a design of the Earl of Burlington; the grounds spacious and beautiful, and adjoining Richmond Park.

Poleston, near Leatherhead; — The grounds remarkable for a fine terrace-walk 900 feet in length.

The Priory, near Ryegate; Lord Somers. A modern house, with 76 acres of pleasure-grounds, very well laid out.

Purley, near Godalming; — Admiral Cornick. A neat Corinthian house in a judiciously arranged area of fifty-four acres.

× *Richmond Hill*, — Richmond. Among the many fine villas here, we may notice that of the Marquis of Queensberry, as affording an example of grounds on both sides of a public road judiciously connected by a subterranean communication.

Roehampton Grange, — Roehampton; W. Gosling, Esq. An elegant modern structure, by Wyatt, with a highly polished lawn and shrubberies, and a fine piece of water, supplied by pipes from a conduit on Putney Common. There are above a dozen other structures equally deserving attention at Roehampton.

That of Lord Viscount Fitzwilliam was the house of Sir Matthew Decker, maternal grandfather of his Lordship, a wealthy Dutch merchant, who first brought pine-apples to perfection at this place. Mackay, in his tour through England, before the year 1724, says, that there was in the garden the longest, the largest, and the highest hedge of holly that he ever saw. In the house was the picture of a pine-apple gathered there in 1720, on account of a visit of George I. for whose reception Sir Matthew built a room on purpose. He died in 1749. The hedge no longer exists. Lord Fitzwilliam died —, and the picture is now in the Fitzwilliam museum at Cambridge.

Roek's Nest, — near Ryegate; H. Turner, Esq. An old mansion, recently enlarged and beautified, standing in a delightful park, with fine old woods; a large lake, and good kitchen gardens and hot-houses.

The Roekery, — near Dorking; — Fuller, Esq. Purchased in 1759, by Daniel Malthus, Esq. author of the translation of Girardin *Sur les Paysages*, &c. from Abraham Tucker, Esq. of Bechworth Castle, the celebrated author of *The Light of Nature pursued*. Mr. Malthus took advantage of its beauties of hill, dale, wood, and water, converted it into an elegant seat, and sold it in 1768.

Sherwood Lodge, — near Battersea; J. Wolfe, Esq. The house has received an elegant addition in the Gothic style; the grounds of limited extent, but in high keeping.

Shrub Hill, — near Dorking; Lord Leslie. A commodious and pleasant villa.

Streatham Park, near Streatham; A. Atkins, Esq. The grounds contain 100 acres, surrounded by a shrubbery and gravel-walk, forming a circuit of two miles; the kitchen-gardens remarkably extensive, and enclosed by a wall four feet high.

St. Anne's Hill, — near Chertsey; Mrs. Fox. The gardens and pleasure-grounds of moderate extent, but laid out with much taste by the late eminent statesman, whose widow now resides here.

Tilburth Hill, — near Godstone; Alexander Mac Leay, Esq. F.R.S. L.S. &c. The house on the south side of a green hill finely bosomed with trees, and looking across a rich vale, to finely wooded hills beyond. The gardens and pleasure grounds small, but rich in American plants.

West Bechworth, — near Dorking; H. Peers, Esq. An old mansion, the grounds greatly enlarged and improved by the present owner; the old park remarkable for its noble timber; especially chestnuts, elms, and limes.

Woburn Farm, — near Chertsey; Sir J. St. Aubin. A brick house; the grounds flat, but agreeably varied by a piece of water, which is remarkable for having been first planted and laid out by the late P. Southcote, Esq., the inventor of the *ferme ornée*. To such a character they have now scarcely any pretensions.

7528. *The mansions with demesnes*, in Surrey, are few compared with the number of villas.

Ashled Park, — near Ryegate; Hon. F. G. Howard. An elegant mansion, with magnificent stables, in a park of 140 acres, enclosed with a brick wall.

Beddington, — near Croydon; W. Gee, Esq. Celebrated in the sixteenth century for its gardens, and for the first orange-trees grown in England. The attention paid by Sir Francis Carew to other plants as well as orange-trees, is proved by his showing to Queen Elizabeth, who used frequently to visit him, a cherry-tree with ripe fruit, kept back a month beyond the usual time. One of the white trees he strained a canvass, which was occasionally wetted; by this means the cherries grew large, and continued pale; when assured of the queen's coming he removed the canvass, and a few sunny days brought them to their color. (*Platt's Garden of Eden*, 165.) The present mansion was erected about 1709; the park contains some fine elms, is not varied nor very extensive.

J. Gibson, in an account of the gardens near London, written in 1691, says the orangery at Beddington was above 200 feet in length; that most of the trees were thirteen feet high, and that the gardener had the year before gathered at least 10,000 oranges. The heir of the Carew family was then in his minority, and the estate was let to the Duke of Norfolk. At present, Richard Carew, Esq. is in possession of the estate, and the manor-house is in the occupation of William Gee, Esq. his younger brother.

× *Claremont*, — near Esher; Prince Leopold of Saxe Coburg. The park was chiefly planted by Kent, for Pelham Earl of Clare, and afterwards Duke of Newcastle, who built the prospect tower and called it Clare (clear) mount. After the Duke's death, it was purchased by Lord Clive, who, when setting out on his last voyage, gave directions to Brown to build a house, without limiting him to expense. He performed the task to the satisfaction of his employer, at a charge somewhat above 100,000*l.* It is a beautiful Corinthian building of freestone, an oblong square open on all sides, the offices under ground, and connected with the stables by a subterranean communication. The situation is well chosen, the execution good, and the internal arrangement unexceptionable. Brown had often altered houses, but this house, and that of Cromer, are the only instances of his having erected new ones. The grounds want water, and are rather deficient in distant prospect; but in other respects they are singularly and beautifully varied, and planted with the greatest taste. In the late Princess Charlotte's time, government built a green-house on an eminence in a very bad style; it is composed of large painted windows and fan lights like an assemblage of shop fronts. A good collection of plants is scattered among the hot-houses of the kitchen-garden, which is in the use of renovation and restoration.

Clendon Place, — near Guildford; Earl of Onslow. A noble mansion, by Leoni, built in 1731, the stables more recently by Brown, who also laid out the grounds, and transformed a chalet into a rich scene of picturesque beauty.

Cobham Park, — Cobham; H. C. Combe, Esq. A substantial mansion, and ground of considerable beauty; the kitchen-garden well seen to, and the hot-houses in good condition.

Esherick House, — near Leatherhead; J. Laurel, Esq. A brick house, improved in design, and stuccoed by the present proprietor, standing in a park of 400 acres.

× *Erwood*, — near Merstham; Duke of Norfolk. A house built by the late duke for an occasional residence. It stands in a park of 600 acres, on the brow of an eminence, commanding extensive views of the home grounds, which contain a piece of water of sixty acres, and over the beautiful wooded heights of Dorking, and the adjacent country.

Gatton Park, — near Ryegate; Sir M. Wood. A handsome house, of considerable extent, much varied in surface, and containing several detached pieces of water.

Maraton Park, — near Godstone; J. Hetsel, Esq. A good house, delightfully situated in a valley, and mentioned by Evelyn as being a noted improvement.

Moor Park, — near Farnham; — Simpson, Esq. A large white house of simple architecture, in a park not very extensive, but abounding in scenes beautifully romantic. This was formerly the residence of Sir William Temple, who died here, and was so attached to this retirement, that by his own directions his heart was buried in a silver box under the sundial in his garden, opposite to a window from which he used to contemplate the landscape.

Nonsuch Park, — near Cheam; S. Farmer, Esq. A part of what was the park of the royal palace of Nonsuch, on which a handsome Gothic mansion, by Wyatt, has been erected by the present proprietor.

The Oaks, — near Mitcham; Earl of Derby. Originally an alehouse, but greatly enlarged and improved by the present pro-

prior as a hunting-seat; the park surrounded by a hill of two miles, and spotted with numerous clumps.

× *Oxlands*,—near Walton; Duke of York. A demesne of 3000 acres, almost entirely park, with a house by Holland; a fine terrace-walk; a serpentine lake, by Wright, which has often been mistaken for a part of the Thames; and a much admired grotto.

× *Okeham Park*,—near Guildford; Lord King. The grounds have been lately much improved, the piece of water enlarged, and the whole adapted to the modern taste.

× *Pepper Harrow*,—near Haslemere; Lord Middleton. A good mansion, on the banks of the Wey, sheltered on the north and east by rising grounds, covered with plantations; with an elegant conservatory at the west end of the house, and a kitchen-garden of three acres, containing a good range of hot-houses.

× *Wimbledon House*,—Wimbledon; Earl Spencer. A mansion by W. Holland, in a park of 1200 acres, agreeably diversified in surface, containing fine distant views, and tastefully laid out by Brown, who formed a sheet of water, which covers a surface of 50 acres. The manor-house of Wimbledon was formerly one of the first in the kingdom. A survey of it was taken in 1649, and a copy of it is inserted in the 10th volume of *Archæologia*. The house was painted in fresco externally, like the palace of Nonsuch: in the gardens was an orangery, containing forty-two trees, in boxes, valued at 10*l*. each, lemons, citrons, pomegranates, figs: in the mazes, wilderness, knots, alleys, were a great variety of trees and shrubs, a bay-tree, and an *Irish arbutus*. There was a *musk millon* ground "at the end of the kitchen-garden, trenched, manured, and very well ordered for the growth of *musk millons*." The house was pulled down, rebuilt, burnt down, and rebuilt again in 1786.

× *Wootton House*,—near Dorking; Hon. and Rev. J. Evelyn Boscawen. A seat of the Evelyns since the time of Elizabeth. It is a low spreading building of no pretensions, surrounded by hills, clothed with copse-woods; but open to the south, and containing some good pasture-ground round the house.

7529. Royal residences.

Ken.,—near Brentford; the private property of the king, was established by the Princess Dowager of Wales, in 1761, and has become universally celebrated, chiefly from the number of

seeds or plants sent there from foreign countries, and the excellent description of them published in the *Hortus Kewensis*. A catalogue of the plants was first published by Dr. Hill in 1768, in one volume; that by the late W. Aiton in 1789, in three volumes, 8vo. The present catalogue, completed in 1812, extends to three volumes. Sir W. Chambers published a description of the house and gardens in 1763, with upwards of forty plates, and they have also been the subject of two poems, one by J. Ritso in 1763, and the other by Henry Jones, author of the tragedy of the *Earl of Essex*, in 1767.

From the first establishment of the garden, a number of collectors have been sent abroad, and maintained there for the purpose of sending home plants and seeds. This has added a great many names to the catalogue, because every plant is introduced there which has once been in the garden; but unfortunately, from want of that liberality in giving away or exchanging plants, which ought to, and does characterise almost every institution of this description, many of the plants which have been introduced are lost, and no where to be found but in the catalogue. We have only to instance the natural order of proteaceæ.

A palace in the Gothic style was built by Geo. III. on the banks of the Thames, the design is by Wyatt, and rather crowded; the situation more beautiful than wholesome. It has never been completed.

× *Richmond Park*,—near Richmond. The palace long since taken down; the park 2253 acres, surrounded by eight miles of brick wall. It is well wooded, and contains some large pieces of water. A part of what is called the Old Park is occupied by his present majesty as a dairy; the remainder constitutes the royal gardens, which were first laid out by Bridgeman in avenues, and afterwards opened and improved by Brown. They have the advantage of being situated on the banks of the Thames, and exhibit some beautiful views. Queen Caroline, who was very partial to this spot, had here a dairy and menagerie. Several ornamental and grotesque buildings were dispersed about the gardens; one of which, called Merlin's Cave, contained several figures in wax; another, called the Hermitage, was adorned with busts of Sir Isaac Newton, Locke, and other literary characters. A description of these gardens was published in 1755.

7530. SUSSEX. A surface of 935,040 acres, gently varied, the soil generally rich, great part bordering on the sea, consists of low undulating hills, or what may be called hilly plains, known by the name of Downs (from *Duno*, Sax. a hill). The northern parts, towards Essex and Kent, abound in natural woods, or remains of woods called wealds. This county is not remarkable for its gardening; on the coast, however, and especially about Worthing, the fig thrives better in the open air than it does any where else in England. It is grown to great perfection in the gardens of the Duke of Norfolk, at Arundel, and in some commercial gardens near Worthing. These trees, and also the fig-orchard, of nearly an acre, at Tarring, near Worthing, occupied by Loud, and containing 100 standard trees, have already been referred to. (4853.) Market-gardens, in the neighborhood of Lewes and Worthing, are rather on the increase, for the purpose of supplying the latter village and Brighton, both rapidly increasing, with culinary vegetables. The garden-market at Brighton is at present supplied with all its more valuable articles from London, excepting peaches, grapes, and figs, which in autumn, are imported from France. The severity of the sea-breeze renders this part of the coast peculiarly unfavorable to gardening. The principal nursery in Sussex is that of Chichester, by Silverlock, distinguished as the inventor of a hollow wall (fig. 238.) which promises to be of real utility both in gardening and cottage-building. There are also nurseries at Horsham, Lewes, and other places, but they are of no great note. At Brighton there is a florist, who grows chiefly auriculas and geraniums. Furze-seeds are collected for the seedsmen from the wealds, and some tree-seeds from the woods of the Duke of Richmond and Lord Sheffield. The cottage-gardens near the coast are neatly managed, and productive; as are some of the farmers' gardens. There are a few villas near the marine towns; but the principal country-seats are mansions with demesnes.

7531. *Of villas and mansions*, the following are but a few of those deserving note:—

× *Ashburnham Abbey*,—near Beachy Head; Earl Ashburnham. A spacious modern edifice, in the midst of an extensive park, containing much fine timber, and a large sheet of water.

× *Bayham Abbey*,—near Tunbridge Wells; Marquis of Camden. A small habitation in the Gothic style, badly placed; but the demesne extensive, and affording a situation for building, for which a magnificent design has been given by H. Repton. (*Observations on Landscape Gardening*.) Near the present building the interior of an old church and cloisters have been laid out as a flower-garden, which is much admired.

× *Buckhurst Park*,—near Lewes; Lord Whitworth. Both house and grounds have been greatly improved by this nobleman and his lady, the Duchess of Dorset.

× *Cannon House*,—near Westdean; Lord Selsey. A small place, too near a churchyard, and a small brook, which is dry in summer: the effect of both, however, much diminished by judicious planting.

× *Bridge Castle*,—near Tunbridge Wells; Earl Abergavenny. An irregular castellated edifice, embattled and flanked with round towers, but without any imitation of ancient architecture in the doors, windows, or other details. It stands on a bold eminence, in a park of 2000 acres, well wooded and watered.

× *Glynde*,—near Tunbridge Wells; Lord Hampden. A noble pile, of Elizabethan architecture, with a terrace commanding a fine view of the surrounding country. The grounds much improved by the late Dr. Trevor, but at present rather neglected.

× *Heathfield Park*,—near Wynchelsea; F. Newberry, Esq. The park environed with holly, able to keep in any game in Evelyn's time; some of these hollies still exist, and many have been cut down for their timber.

× *Michel Grove*,—near Clapham; Sir J. Snelly. A spacious Gothic mansion (fig. 742.), of cream-colored brick, and in the most florid taste of that style of architecture: the arrangement, both internal and external, harmonious and scientific. The grounds, by Repton, display some fine marine views.

× *Parham*,—near Arundel; Sir C. Bishop. A singular old Elizabethan house, not much altered either exteriorly or within; the park abounding in stately groups of oaks.

× *Sheffield Place*,—near Lewes; Lord Sheffield. The mansion stands low, in a park of between 5 and 600 acres, long famous for its large oak-trees, and more recently so for other plantations, and for the care and judgment with which these are managed in every part of the demesne. There is 100 acres of pleasure-ground, and above 1400 acres managed as a home farm, and with experiments in culture, and breeding, for which Lord Sheffield has been long celebrated.

× *Stanner*,—near Lewes; Earl of Chichester. A plain stone edifice, forming three sides of a square, in a park much diversified by nature and planted with judgment.

× *Stansted-house*,—near Chichester; L. Way, Esq. One of the most delightful situations in the kingdom; the house, an elegant Ionic pile, with an observatory, wings, an observatory, and cupolas; the park 650 acres, finely varied and wooded.

× *West Grinstead Park*,—near West Grinstead; William Burrell, Esq. A handsome stone mansion; the grounds lately much improved, and some hot-houses added to the kitchen-garden.

Up Park,—near Eastbourn; Sir H. Featherstone. A magnificent house, and well wooded park; the timber-trees, in 1733, valued at 19,000*l*.

7532. The following are first-rate residences :—

× *Arundel Castle*,—at Arundel; Duke of Norfolk. A magnificent castellated structure, partly very old, and partly reconstructed on a more sumptuous style. It is founded on a circular knoll, effected partly by nature and partly by art; the adjoining grounds flat towards the sea, but the rest of the park varied and well wooded. The kitchen-gardens are good, and noted for their old and prolific standard fig-trees.

× *Goodwood*,—near East Lavant; Duke of Richmond. A magnificent house in the Grecian style, chiefly by Wyatt; the stables built of small flints collected on the South Downs. The stables and offices form a handsome quadrangular building near the house, and are inferior to few if any in the kingdom, and the dog-kennel exceeds in magnificence and convenience; even to luxury, every structure of the kind ever raised for such tenants. The park includes 2000 acres; behind the house is a fine grove of cedars, mentioned by Collinson; of the true service, mentioned by Miller; and everywhere abundance of old timber; and it contains a beautiful summer-house; on the pleasure-grounds is a tennis-court; and on a hill beyond the park, a race-course.

× *Hamstead House*,—at Egremont; Earl of Egremont. A magnificent mansion, fronted with freestone, and surrounded

7534. KENT. A surface of 935,600 acres, considerably diversified by ridges of chalky eminences in some places; low marshy grounds on the Thames and Medway; open downs near Dover; and an inland, flat, and woody part, towards Sussex, called the Weald; a Saxon word signifying wood, or the woody part of a country. It is one of the oldest cultivated counties in England; and, from some laws peculiar to it, landed property is much divided, and there are a great many small proprietors who reside on, and cultivate their own estates. Hence the garden-like appearance which prevails in great part of this tract; and particularly about Maidstone, and on the road from London to Canterbury. The cottage and tradesmen's gardens on this tract are remarkably neat, perhaps more so than any where in the world, unless in some parts of Holland. It is also very productive in vegetables and fruits for the market, and in seeds of different kinds for seedsmen: it contains some beautiful villas, and one or two fine old mansion-residences, and one public, formerly a royal park. Philip Miller appears to have been born in this county, near the metropolis, but where is uncertain. The most celebrated gardens in former times were those of Knowle, and of Dr. Sherrard at Eltham.

7535. Public garden.

Greenwich Park,—near Greenwich, originally belonging to Greenwich Palace, but that being formed into an Hospital in the reign of William III., it is now disjoined. It contains 188 acres, walled round by James I., and planted with elms and Spanish chestnuts in intersecting rows by Le Notre, in Charles II's time. The coup d'œil of the Metropolis, from this park, is as interesting a thing of the kind as exists.

7536. Commercial gardens.

Farmers' and Market Gardens,—abound along the Thames, for the supply of the shipping. Immense quantities of green peas are grown round Dartford, both in farm market-gardens and in common farmed lands for the London market. At Sittingbourne, and in the Isle of Sheppey, peas and beans are grown; and at Greenwich and Deptford great quantities of asparagus, sea-kale, onions, cauliflowers, &c. Edmonds at Deptford is the greatest grower of asparagus, and sometimes has 70 or 80 acres under this crop.

Orchards,—These are chiefly about Lewisham, Maidstone, and along the banks of the Medway; the principal fruits of the county are the cherry and the filbert, but most of the others are also grown, from the walnut to the strawberry. The latter fruit is brought to great perfection at Fordwich, a village near Canterbury, belonging to Earl Cowper.

Seed-Gardens,—Great quantities of seeds are grown for the seedsmen; canary, radish, kidneybeans, and formerly turnip in the Isle of Thanet; toker or Sandwich beans at Sandwich, and also kidneybeans. Various seeds are also grown round Maidstone, and much canary-seed in the hundred of Herne. The Kentish perennial ryegrass is collected through the county, and shipped for the seedsmen at Faversham. About twenty acres in the parish of Deptford are generally devoted to the growth of onions for seed, the Deptford variety being in great repute.

Of Florists' Market-Gardens—there are two at Greenwich; and there are also some Florists' Gardens there.

Nurseries,—are not unfrequent, though the county is already fully planted, and most of the orchardists raise their own trees. The principal is that of John Willmott and Co. of Lewisham. It was founded by Mr. John Russel, about the middle of the 18th century, who raised himself by his skill and industry to a state of affluence rare among nurserymen; and, after keeping his carriage, and living many years like a gentleman, died in 1794, aged 63, leaving property to his son-in-law with increased spirit; the grounds contain 150 acres; 70 hands are employed, and about 3000*l*. a-year paid for labor.

The New Cross Nursery,—near Deptford, W. Cormack and Sons, is extensive, and has long enjoyed a respectable reputation.

7537. Cottage and villa gardens.

Cottage-Gardens,—Besides being neater, as already mentioned, these gardens are stocked with finer kinds of vegetables, as kidneybeans, early potatoes, lettuces, &c. than in most counties; and they abound more in flowers.

Private Gardens of Farmers,—are also superior to those in most counties; fruit is here a necessary of life, everywhere cultivated; and all that is not consumed at home finds a ready market at Maidstone or London, or is purchased by the fruit-hawkers and the agents who travel through the county.

Suburban Villas,—A few of these line the roads near the Thames, and especially about Deptford and Greenwich, and there are a number round Blackheath, among villas of a larger description. A few also exist round every town in the county, and all are highly kept.

Terrace-Garden at Dover Castle,—The governor, *pro temp*. Four gradations or terraces cut in the shelving chalk and flint rock. On the barren walls vines and figs are trained; the

by statues; in the front an artificial lake formed at an expense of not less than 30,000*l*., the water collected from numerous small springs in surrounding hills and conducted thither in pipes. The park is 12 miles round. It was formerly little better than a moss and waste, but has lately been drained and well stocked with every variety of British oxen, and also those of the Calmucks and of Astracan; there is also a breed from the East Indies; the Scottish bison, and the shawl goat of Thibet. His lordship farms extensively, and has used every exertion to encourage the breeding of oxen as beasts of labor rather than horses. The gardens and hot-houses are on a scale of design and management suitable to every other part of this truly noble demesne.

7533. Royal residence.

× *The Pavilion, or Palace*,—at Brighton, is in a mixed style of Chinese, Gothic, and Moresque architecture, in which the former greatly prevails. Exteriously it forms a singular and beautiful whole; but is badly arranged within, and, excepting the dining-room, the others are low or of disagreeable forms and proportions; or, like the music-room, over-labored in attempting to keep up the Chinese character. The grounds contain only a few acres, in which are a magnificent pile of stables, formed round a circular court, covered by a dome partly glazed. The garden-scenery is tasteless, stored with the meanest flowers, and shows no exertions for approbation.

latter ripen in October, while in the low part of the town they seldom ripen at all. The whole in a state of neglect.

Belvidere,—near Plumsted; Lord Eardley. A spacious brick edifice on an elevation, rapidly declining towards the north, with fine views over the Thames into Essex; the grounds, though small, agreeably diversified, and well wooded.

× *Blendon Hall*,—near Bexley; J. Smith, Esq. A good house, and the grounds agreeable, with some natural oak-woods and a piece of artificial water. The present owner has greatly improved them, from the designs of H. Repton.

Charlton House,—near Charlton; Lady Wilson. A good specimen of the style of James I.; the grounds occupy 70 acres, include some beautiful scenery, and fine old trees, especially cypresses.

Danson Hill,—near Bexley; J. Johnstone, Esq. A handsome mansion, by Sir Robert Taylor; and grounds containing fine woods, and a spacious sheet of water, laid out by Brown.

Eden Farm,—near Beckenham; Lord Auckland. An elevated healthy situation, surrounded by fine beech-trees.

Devon Cliff Lodge,—near Ramsgate; Lord Keith. The house a good specimen of modern Gothic; the grounds, which contain thirteen acres, remarkable for a curious subterranean passage 500 yards in length.

Godmersham Place,—near Canterbury; — Knight, Esq. A handsome mansion, backed by extensive woods.

Hayes Place,—near Beckingham; P. Dehaney, Esq. The mansion erected by the late Earl of Chatham; who, as G. Mason informs us, took much delight in improving the grounds.

Eastfield,—near Ashford; Earl Thanet. A square edifice of Portland stone; the grounds skirted by the Stour, and much improved by the present Earl, who dedicates great part of his time to agricultural pursuits.

Hill Park,—near Westerham; J. H. Barrow, Esq. The grounds beautifully varied by nature, tastefully planted, and containing a curious artificial cascade in front of the house.

Holwood House,—near Beckenham; the favorite retreat of the late prime minister Pitt. A small house, but the grounds extensive and beautifully laid out by H. Repton.

Lee,—near Ickham; T. B. Bridges, Esq. A Gothic mansion by James Wyatt, Esq.; praised by Lord Walpole; the park displaying some fine thriving trees over undulating grounds.

Quarry Hill,—near Tunbridge; J. Burton, Esq. an eminent London builder. A castellated mansion by the roadside, built of the stone and flints of the country, with an extensive park, abounding in undulations and woods.

Wooden Court,—near Dover; Rev. E. T. Brydges. A white house on a bold hill, nobly crowned with woods; the grounds much varied with hill and valley.

Woodlands,—near Blackheath; J. J. Angerstein, Esq. An elegant mansion of Portland stone, in a commanding situation; the grounds agreeably varied, and the gardens remarkable for the quantity of glass they contain. There is a very large conservatory and numerous vineries, the invention and execution of Mr. D. Stewart, when this gentleman's gardener; also an excellent collection of exotics.

7538. Demesne and first-rate residences.

× *Chevening*,—near Seven Oaks; Earl Stanhope. A good mansion by Inigo Jones, with grounds flat and rich, but not much varied by plantation. The present earl is much attached both to horticulture and agriculture.

Cobham Hall,—near Cobham; Earl Darnley. A house in the form of a Roman H, the centre partly by Inigo Jones; the park of 1800 acres, nearly seven miles in circumference, beautifully diversified, abundantly wooded; with remarkably fine oaks, and a noble avenue of lime-trees. On an elevated site is a large magnificent mausoleum, which cost 9000*l*.

Footscray Place,—near Footscray; — Harris, Esq. The mansion of freestone, copied from a design by Palladio,

erected near Venice; the park well planted, and embellished with a canal, formed from the Cray river, which flows through the grounds.

Knole Park,—near Seven Oaks; Duchess of Dorset. A magnificent Elizabethan palace, the most modern part of which is dated 1605; it covers five acres. The park is between five and six miles in circumference, varied in surface, and clothed with venerable oaks, beeches, ashes, and elms. The pleasure-grounds, for the greater part, remain in their original taste, and contain some fine old limes, cedars, and other trees. Extensive conservatories, modern rosaries, and flower-gardens, with other improvements, have been added by the present proprietor, who is much attached to gardening.

Mot,—near Maidstone; Earl Romney. Formerly a castellated mansion, surrounded with a moat; now a splendid structure on a knoll, commanding fine views, "but having too

much the air of a citizen's villa." The park is extensive, timbered with large trees; with a broad sheet of water, and a handsome bridge.

Mount Morris,—near Monks Horton; the late Lord Rokeby. A large square brick house by Gibbs, and a well wooded park of 1000 acres, greatly improved in its pasture by the owner, who took great delight in farming.

X Penhurst,—near Tunbridge; J. S. Sydney, Esq. An extensive castellated pile of the 13th and 14th centuries; the park now reduced to 400 acres, but containing many fine old lime, oak, chestnut, and beech trees.

Summer Hill,—near Tunbridge; W. Woodgate, Esq. A celebrated and beautiful seat, granted by Queen Elizabeth to the Earl of Leicester. The mansion erected in James I.'s time; the grounds richly wooded and highly picturesque.

7539. ESSEX. A surface of 1,240,000 acres, of which one part, bordering on the Thames, is marshy, and chiefly under pasture; another part southwards is occupied with the remains of Hainault and Epping Forests; and the remainder in the middle of the county, and towards Cambridge is a mixed tract of arable lands, on which, besides corn, the coriander, caraway, and hazel, are grown. The rest abounds in pasture and gentlemen's seats. There is a good market at Colchester for vegetables, and in the corn-markets there, and other places, samples of the commoner garden-seeds are generally exposed for sale.

7540. Commercial, cottage, and farmers' gardens.

Farmers' Market-Gardens.—These are extensive in most parts of the county. About Ilford, Barking, and Plaistow, immense quantities of early potatoes are grown for the London market.

Market-Gardens.—The principal of these are near the metropolis, and at Chelmsford and Colchester; the latter town and Evely, and Purfleet, supply the first early peas from the east side of the metropolis. Few of the market-gardens in this county, in Kent, or indeed any where, excepting those of Middlesex and Surrey, have much glass.

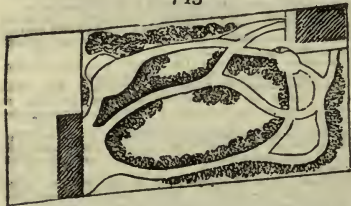

Seed-Gardens.—The London seedsmen receive more of their stock from this county than from any other. In the low district on the Thames, great quantities of rape-seed are grown; brown and white mustard are grown in most places; small garden-seeds of almost all sorts round Coggeshall, Colchester, and in the Isle of Mersey; carrot-seeds at Wethersfield; coriander, caraway, and mawe seed (*Papaver somniferum*, var. with blue seeds), round Coggeshall; from the Marquis of Buckingham's woods at Gosfield Hall, near Braintree, most sorts of fir-seeds which are sown in England are procured, and hornbeam-seeds from Epping Forest.

Physic-Gardens.—There are none of these worth mentioning, unless one or two near Saffron Walden, in which the saffron is still cultivated for the apothecaries; but this article being procured so much cheaper from abroad, its culture in England is nearly given up.

Florists' and Nursery Gardens.—There are few of any consequence.

Cottage-Gardens, Farmers' Private Gardens, and Suburban Villas. (see 743.)—about and are in general very neatly kept; formerly the tradesmen of Chelmsford and Colchester were much attached to the culture of florists' flowers, and they still continue to be so in a considerable degree.

743

7541. Of Villas there are a considerable number, from which we select only a few.

Coopersale,—near Thoydon Gernon;—Archer, Esq. A spacious edifice, surrounded by lawns and pleasure-grounds.

Deben Hall,—near Thaxted; Mrs. Chiswell. A handsome stone mansion, designed by—Holland, surrounded by thriving pleasure-grounds.

Eastbury House,—near Barking;—Sterry, Esq. A spacious brick edifice, with octagonal towers and chimneys; the grounds rather confined.

Fitz-Walters,—near Brentwood; T. Wright, Esq. An octagonal house, with chimneys in the centre; the grounds of limited extent.

Greentead Hall,—near Greentead; C. Ord, Esq. A neat house and good garden.

Halingbury Place,—near Stansted; J. Houboun, Esq. A desirable and pleasant residence, lately much improved.

Hare-street Cottage,—in Hare-street; the late H. Repton, Esq. Remarkable as having been the residence of this justly celebrated artist.

Langley,—near Great Waltham; J. J. Tuffnell, Esq. A handsome house, on a pleasant eminence, and the park and grounds well laid out.

Linton Hall,—near Boxley;—Campbell, Esq. A handsome modern building, with piazzas, encompassed by a small park and garden.

Marden Park,—near Miseden;—Sandys, Esq. The house is ancient; the park seven miles in circumference, and rarely equalled for birch woods, picturesque, sequestered, and romantic scenes.

Twinstead Hall,—near Twinstead; J. Marriot, Esq. A spacious handsome building, surrounded by pleasant gardens, over which is a bridge to the adjoining meadows.

7542. Mansion and demesne residences.

Audley End,—near Saffron Walden; Lord Baybrooke. A magnificent Elizabethan structure, of which, according to Lord Walpole, John Thorpe and Bernard Janson were the architects. The model was procured from Italy, and cost 500*l.*, and the expense of erection was 190,000*l.* The park is finely wooded, and some improvements, it is believed, were made from the designs of H. Repton.

X Claybury Hall,—near Woodford; J. Hatch, Esq. A neat house, and greatly improved scenery; the park contains some fine timber.

Colne Park,—near Little Colne; P. Hills, Esq. A handsome mansion of white brick, surrounded with woods and plantations, among which is an Ionic column, erected by J. Soane, Esq. architect, in 1791.

Copford Hall,—near Colchester; J. H. Harrison, Esq. A handsome house and pleasant grounds, containing several pieces of water.

Copped Hall,—near Epping; J. Convers, Esq. One of the greatest ornaments of the county. The house, of white brick, has been much improved by Wyatt: the park is extensive, irregular and well wooded, and the distant prospects grand.

Easton Lodge,—near Dunmow; Lord Maynard. An Elizabethan mansion in an elevated situation, surrounded by a spacious park, with water and shrubberies.

Foulkham Hall,—near Witham; J. Bullock, Esq. A stately old mansion; and, in the grounds, one of the largest cedar-trees in the kingdom.

Felix Hall,—near Kelvedon; C. C. Weston, Esq. A neat modern building, and the grounds laid out with much judgment.

X Gosfield Hall,—near Gosfield; Marquis of Buckingham. A mansion of the domestic architecture prevalent in Henry VII's reign. The grounds are of limited extent.

Hare Hall,—near Romford; J. A. Wallenger, Esq. An elegant mansion of Portland stone, with wings joined by colonnades; the pleasure-grounds are well laid out by Wood, a local landscape-gardener.

Higham Hills,—near Woodford; J. Harman, Esq. The house is on a high ridge, to the west of which is a fine park, bordering on Epping Forest, and containing a fine piece of water and many exotic trees.

Hill Hall,—near Theydon Mount; Sir W. Smith. A handsome quadrangular building on an eminence, with fine prospects over a well wooded park.

Ingatstone Hall,—near Ingatstone; Lord Petre. An irregular pile in a low situation, noted for its fishponds.

Langford Hall,—near Langford; N. Westcome, Esq. A modern white house, in a finely wooded park.

Mitney Hall,—near Manningtree; F. H. Rigby, Esq. The house has lately been much improved, and some plantations and pleasure-grounds laid out with taste.

Navestock Hall,—near Navestock; Earl Waldegrave. A plain brick building, pleasantly situated among gardens and pleasure-grounds.

Shortgrove,—near Audley;—Smith, Esq. A handsome mansion on an eminence, with the river Granta at the foot of a lawn in front, from which the house is supplied by water from a machine designed by the celebrated mechanician, Dr. Desaguliers. The plantations and pleasure-ground are thriving and beautiful.

Thorndon Hall,—near Brentwood; Lord Petre. The mansion, founded by a descendant of Faine, in the Corinthian style. The park and grounds well stocked with wood, and many of the trees of great rarity and value, having been planted by a former Lord Petre, mentioned by Ellis, in a letter to Linnaeus, as one of the greatest encouragers of botany of his time, and in short the Meceas of the age.

Valentine,—near Wanstead; C. Cameron, Esq. A venerable mansion and grounds; the hot-house remarkable for a vine of the black Hamburg kind, planted in 1758, and nearly as large and prolific as that at Hampton Court.

Wanstead House,—near Wanstead; Wellesley Long Pole, Esq. (1820.) A large and magnificent structure, the principal front 260 feet. The park is very extensive, and abounds in old avenues, water, &c., laid out by London and Wise. The present proprietor has made great improvements; erected extensive hot-houses in the kitchen-garden, and formed one of the largest American gardens in the kingdom, from designs by Lewis Kennedy, Esq. The whole lately sold in lots.

Wald Hall,—near Brook Street; C. Towers, Esq. A handsome building in a large park with rich gardens and plantations, and distinguished by an embattled prospect-tower.

Whitley,—near Badbrook; T. Walford, Esq. An elegant residence with fine plantations, extensive pleasure-grounds, rich in exotic trees, and containing some well constructed ornamental buildings and a fine collection of English plants.

7543. HERTFORDSHIRE. A surface of 302,080 acres, the north part forming part of a chalky ridge which extends across the kingdom in this direction, the rest agreeably varied. The soil is generally loamy or clayey, on a chalky sub-soil: there are many private gardens in the county of almost all descriptions; a number of small nurseries and market-gardens, and some florists' market-gardens. The gardens at Moor Park and Cashiobury were formerly the most celebrated in the county.

7544. The villas are less numerous than the demesne-residences.

Beechwood Park,—near Market Street; Sir J. Sebright. A handsome mansion in a delightful well-wooded park, abounding in stately beech-trees. There is a farm of 700 acres, cultivated in the first style by the proprietor, who is distinguished both as a grower of corn, and a breeder of domestic animals.

Brecklet Hall,—near Welwyn; Lord Melbourne. A handsome dwelling, from the designs of Paine; the park and grounds beautiful, and much enriched by the river Lea, which is here formed into a handsome sheet of water. The park farm is scientifically cultivated, chiefly by the direction of Lady Melbourne.

Brickenden Bury,—near Hertford; — Morgan, Esq. The park is large, and well furnished with wood and water.

Broxbourn Bury,—near Broxbourn; J. Hosanquet, Esq. The house is spacious, and with the park has lately been much improved.

Cockenbury,—near Royston; Lady Wills. A singular, but not unhandsome mansion, in a pleasant park.

Colney House,—near London Colney; G. Anderson, Esq. A handsome and regular mansion, with wings; the offices connected by an underground passage, and completely enveloped in evergreens. The park contains some fine oak and elm trees; the pleasure-grounds are extensive; the kitchen-garden well stocked with the best sorts of fruit-trees; and there is a large green-house full of choice plants.

Gabins,—near North Mims; J. Hunter, Esq. In Henry VII.'s time the seat of Sir John More, father to the illustrious Sir Thomas More. The gardens were then, and in the succeeding reign, celebrated for their splendor in the ancient taste.

Gorbunbury House,—near St. Albans; Earl Verulam. A Corinthian house of brick stuccoed, by Sir Robert Taylor; and a park of 600 acres, well stocked with fine timber, particularly beech.

The Grove,—near Watford; Earl of Clarendon. An irregular brick structure in a park three miles in circumference, through which the river Gade flows in a divided stream. There is a farm of 600 acres assiduously cultivated by his lordship, who pays the greatest attention to every branch of farming.

Hamels,—near Sacombe; G. Melish, Esq. The grounds laid out with much taste.

Hemsted Bury,—near Hemel Hempstead; — Hilton, Esq. A neat house and planted grounds in a mixed style between the geometric and the modern manner.

Panhangar,—near Hertford; Earl Cowper. A fine situation, the house lately improved, and the grounds pleasant. The park contains a remarkably large oak.

Theobald's Park,—near Cheshunt; Sir G. B. Prescott. A residence of 300 acres, with a handsome mansion erected on what was formerly a palace and park of James I., who, having got possession of the park, by exchange, from the Earl of Salisbury, enlarged and surrounded it with a wall

7546. BUCKINGHAMSHIRE. A surface of 318,400 acres, hilly, and abounding in some places in natural beech-woods, the soil rich, and on chalk. It does not abound in gardens or residences, but contains one long celebrated—Stow. The seedsmen procure many of their tree-seeds from the natural woods of the county; as beech-mast, from Amersham and High Wycombe, and also hornbeam, holly, haws, and juniper. Some of the nurserymen procure their stocks for standard roses from the same woods, and from copse-woods at their periodical fellings, or when they are to be rooted out.

7547. Villas and demesne-residences.

Bulstrode,—near Beaconsfield; the Duke of Somerset. The house is in no respect remarkable; the park contains 5600 acres, abounding in old oak and beeches. The gardens were formerly kept in good order, and also the farm.

Chalfont House,—near Chalfont St. Giles; in 1800, Thomas Hibbert, Esq. The grounds were laid out by the former possessor with much taste and judgment; and are finely ornamented with wood, and adorned with a pleasant piece of water. The gardens, in Mr. Hibbert's time, were richly stocked with tender exotics, especially heaths, and other Cape plants.

Cleffden,—near Woburn (Bedf.); a seat founded by George Villiers, second duke of Buckingham, in the reign of Charles II. Burnt down in 1795. The grounds are finely varied by woods, which descend on the side of a steep hill to the Thames, and are celebrated by Pope in his *Moral Essays*.

Fawley Court,—near Finest; Strickland Freeman, Esq. The mansion is handsome and spacious, with four fronts: it was built in 1684, from a design of Sir Christopher Wren. The grounds round the house are rather flat; but the distant scenery is hilly, well wooded, and the windings of the Thames are seen along a beautiful vale.

Hall Barn,—near Beaconsfield; Edmund Waller, Esq. descendant of the poet, by whom the grounds were laid out in the ancient style, verging into a sort of wildness at the extremities of the walks. The ground near the banqueting-house has been moved and remodelled by the poet at very considerable cost, and the place, on the whole, must have deserved the encomiums that were made on it when in its perfection, and in high keeping; at present it is rather neglected.

Hedon Lodge,—near Woburn; Lord Frederick Boston. The house is modern and elegant; the grounds are distinguished for their high sloping hills, deep valleys, and the wild luxuriance of the woods, which, combining with the bold swells or abrupt depressions of the surface, produce some very beautiful and picturesque scenery. The view from the brow of the hill, with the village church: the winding Thames, and the distant hills clothed with beech-wood, is very fine. (1800.)

Latimers,—near Chesham; Lord George Cavendish. A

ten miles in circumference. When Cromwell's survey was taken in 1650, it contained 2508 acres, diversified with avenues and other masses of trees. The gardens were large, and ornamented with labyrinths, canals, and fountains. The great garden contained several acres, and there was besides a pheasant, privy, and laundry garden. In the former were nine knots, artificially and exquisitely made, one of them in imitation of the king's arms.

Tring Park,—near Tring; Sir D. Smith. The house is large, spacious, and convenient, and the park consists of between 300 and 400 acres, beautifully varied both with undulations of surface and fine trees.

Watton Woodhall,—near Watton; S. Smith, Esq. A spacious and elegant mansion, occupying one of the finest situations in the county, built by Sir Thomas Rumbold, and the kitchen-garden formed by Malcolm. The park is large, diversified by hill and dale, and watered by several small streams, which flow into the river Beane, in its course through the grounds; it contains fine oaks, many of which are of great magnitude. The kitchen-garden is excellent and well managed.

Wormleybury,—near Wormley; Sir A. Hume. A good house and pleasant grounds, but chiefly remarkable for its horticultural productions, Sir Abraham having introduced various new plants from China and India.

7548. The following may be considered as first-rate residences.

X Cashiobury,—near Watford; Earl of Essex. A spacious Elizabethan mansion; and a park between three and four miles in circumference, abounding in rich scenery and noble timber, originally planted by Le Notre. The pleasure-grounds are extensive, and contain a beautiful flower-garden in the Chinese style. The kitchen-garden is well cultivated, and also the home farm. The Earl of Essex, in Evelyn's time, was a great encourager of gardening, as is the present earl.

X Hatfield House,—near Hatfield; Marquis Salisbury. A magnificent Elizabethan mansion, in a finely diversified park watered by the river Lea, and containing some of the finest oak, ash, elm, and other trees in the county. There were originally two parks, one for red and the other for fallow deer; and in one of them was a vineyard which was in existence at the time Charles I. was a prisoner at Hatfield. In 1795, a piece of ground of 17 acres in extent, was set apart for agricultural experiments, which are conducted with great science and assiduity by the marchioness.

X Moor-Park House,—near Rickmansworth; — William. A magnificent Corinthian mansion, by Giacomo Leoni, and the grounds laid out under the direction of the celebrated Lucy Countess of Bedford, and afterwards modernised by Brown, when the estate was in the possession of Lord Anson. The park is finely diversified with oak, ash, elm, and lime trees, so old as to be much decayed at their tops. This celebrated seat has been praised by Bacon and Sir W. Temple; and one of its possessors B. H. Styles, Esq. was unfairly satirised by Pope, for removing a hill from the north front at an expense of 5000*l*.

small place of no great note, but here introduced, because referred to by G. Mason as having been laid out by Brown.

Shardloe,—near Amersham; T. D. T. Drake, Esq. The house is a respectable modern edifice, from a design, by M. Adam; it is situated on the brow of a hill, overlooking a broad sheet of water, planned by Bridgeman. The park is much varied in surface, and richly clothed with beech-woods.

Stoke Park,—near Stoke Pogies; John Penn, Esq. The house was built in 1789, from the designs of James Wyatt, Esq.; and the grounds laid out by H. Repton, are beautiful, though of limited extent.

Woburn Farm,—near Woburn; Earl Wharton (1770). This place was laid out as a *ferme ornée*, and was celebrated in the time of Wheatley, who gives a full description of it. It is now entirely obliterated, and the grounds let as a common farm.

X Wycombe Abbey,—near Wycombe; Lord Carrington. The house situated in a bottom, has lately been much improved in the Gothic style by Wyatt. The grounds contain a curious artificial cascade, executed by J. Lane, a stonemason, who executed the cascade at Bowood, in Wiltshire, and is celebrated for his talent in this way. The park contains 500 acres, well wooded and watered, and bounded on the south by high hills.

Wycombe Park,—near Wycombe; Sir J. D. King, Bart. The house is small, by W. Ware, in the Grecian style and elegant. The grounds form part of a vale, bordered by a stream, and are deservedly much admired for their wood and water. They were laid out by Brown, and received some improvements from H. Repton.

7548. The following are first-rate residences: —

X Ashridge Park,—near Hemsted; Earl of Bridgewater. The ancient abbey, lately pulled down, and a magnificent Gothic mansion, erected from the designs of J. Wyatt in 1815. The park is five miles in circumference, pleasantly varied with hill and dale, and furnished with some very fine oak and beech trees. The gardens are extensive; the culinary department is under the care of T. Torboun from Kew, an excellent gardener; and the flower-garden contains several acres, full of variety, and laid out from the designs of H. Repton, Esq. in 1814. The farm is managed by a Northumbrian bailiff.

X Stowe,—near Buckingham; Marquis of Buckingham.

The chief ornament of the county, and celebrated for nearly a century for its gardens. When beheld at a distance, this place appears like a vast grove, interspersed with columns, obelisks, and towers, which apparently emerge from a luxuriant mass of foliage. The gardens obtained their celebrity from the alterations effected by Lord Cobham, in the early part of the last century. The first artist employed was Bridgeman, whose drawings are still in possession of the marquis. Stowe was the most eminent place in the ancient style, and set the fashion of employing numerous statues and architectural ornaments. Kent was called in probably about 1755 or 1760; he abolished

7549. BEDFORDSHIRE. A surface of 260,000 acres, not much varied; the soil sandy in many places, and a strong clay in others. It contains Duke of Bedford; and the village of Sandy, on the growing pickling cucumbers, which are sent to the London market, and sold by the bushel.

Amphill Park,—Amphill; Earl of Upper Ossory. The mansion, a superb edifice, built in the Grecian style; the park contains 2000 acres, extensive and flat, but furnishes some pleasant prospects; it has a fine water view, and many ancient oaks.

Luton Hoo,—near Luton; Marquis of Bute. The house is large, and contains one good front by Adams; the library is 146 feet in length, and inferior only to that of Blenheim. The park is extensive, well wooded, and watered by the river Lea, which expands into a lake, varied by islands at the base of the eminence on which the house is situated. The gardens of the farm were formerly kept in high order, but are now (1821) much neglected.

Vrent,—near Selsey; Baroness Lucas (1800). An ancient seat, the grounds of which were submitted to Brown, who

several formalities; and among other improvements substituted the sunk fence for the high wall. A stranger, in passing through the grounds, is astonished at the number, the beauty, and the magnificence of the buildings; and the house, with its extended front, elevated site, and extensive prospects, is a truly grand object. The gardens of every kind are kept in high order, especially the flower-gardens, lawns, and shrubberies, near the house. The buildings and other objects are too numerous to be even enumerated here; a copious account of them, accompanied by plates, will be found in *Seely's Description of Stow*.

formed here a noble serpentine river, their principal ornament, and has occasioned this place being called the Stow of Bedfordshire. They abound with architectural ornaments, and contain many fine large trees.

× *Woburn Abbey*,—near Woburn; Duke of Bedford. A first-rate residence. The abbey, or palace, is in the Ionic style, very extensive, and was much improved in the end of the last century, from the designs of Holland. From the duke's apartments a covered way leads to a green-house, 140 feet in length; and from the end of the green-house a piazza of nearly a quarter of a mile leads along the margin of a flower-garden to the dairy, a handsome Chinese building, ornamented with stained glass. The park is very extensive, varied in surface, and abundantly clothed with trees; but it wants one feature of essential importance, water. This might be given, but it would be at considerable expense. At present there are several small pieces or lakes; but they have no effect in a general point of view, though some of them are pleasingly picturesque as recluses scenes. One of them, contrived to fall in the way of the approach, is crossed by a viaduct (*fig. 744*) designed by Repton. There are many fine old cedars, silver firs, and pines, in one part of the park, which were planted under the direction of Miller; and there is a very tall beech with an erect stem, which has been noticed by Ponsie. The gardens are extensive, and abundant in every thing; and the farm has long been celebrated for the annual meeting of agriculturists, called sheep-shearings, to which it gave rise, and at which all the eminent agriculturists of the country, and many foreigners, are annually present. The late duke, Francis, it has been truly observed, did as an individual what is generally done by society; he rewarded invention, fostered ingenuity, and gave a fair trial to every new agricultural scheme. The present duke has not the same taste as his late brother, but still keeps up the annual meetings, and cultivates the park farm.

744

7550. HUNTINGDONSHIRE. A dull, flat, humid, unhealthy surface, of 240,000 acres.

Hinchinbrooke House,—near Huntingdon; Earl of Sandwich. A large irregular building, built of stone and brick by the

Cromwells, in the time of Elizabeth; the park flat, and not extensive.

7551. CAMBRIDGESHIRE. A surface of 500,000 acres; little varied, but fertile and healthy. It is not remarkable as a gardening county; but it contains a good botanic garden at Cambridge, and one or two extensive seats. The parent tree of the weeping-ash still exists in this county, at Gamlingay, in a field, close by a farm-house. It is a tall tree, with a naked stem and weeping top. The first graft taken from it was presented to the father of Miss Plumtree, who had the living of Wimpole, and the second to Lord Hardwick's steward, about 1760, or later. (*Plumtree's Residence in Ireland*, p. 93.) The seedsmen receive a good deal of clover-seed from Royston, and of white and yellow mustard from the Isle of Ely. Clark is the principal nurseryman at Cambridge.

Public Promenades.—There are a few shady walks belonging to some of the colleges open to the public in general, and some private gardens; but none of them of any note.

The Cambridge Botanic Garden.—was established in 1763, by Dr. Walker, vice-master of Trinity College, who purchased nearly five acres about 1761 for that purpose, and gave it in trust to the Chancellor, Masters, and Scholars of the University, for the purpose of a public botanic garden. Thomas Martyn, the titular Professor of Botany, was appointed reader on plants, and Charles Miller, son to Philip Miller, (who had assisted Dr. Walker in choosing the ground,) was made first curator. To him succeeded Donn, who died in 1817, and was succeeded by Mr. A. Biggs, the present curator. This garden has obtained considerable celebrity entirely through the exertions of Donn, who, in a short time, formed a very extensive collection, and published the *Hortus Cambridgiensis*.

Madingley,—near Long Stanton; Admiral Sir Charles Hinde Cotton, Bart. The house is in the Elizabethan Gothic,

and resembles that much-admired example of this style, Holland House. The grounds are unbragous and picturesque.

Chippenharn Park,—near Newmarket; John Thorp, Esq. A magnificent mansion; it was erected from a design of Inigo Jones, about the end of the seventeenth century, and the grounds laid out in the geometric style. The present proprietor has increased the property, and made very great improvements on the grounds. There is a beautiful sheet of water near three quarters of a mile in length, the joint work of the late Mr. Eames and Mr. Lapidge. The hot-houses form a range of nearly 500 feet. In the plantations upwards of a million of trees have been planted.

× *Wimpole*,—near Gamlingay; Earl Hardwicke. The most splendid private residence in Cambridgeshire. The mansion is a large brick structure; the park is extensive, but rather flat; the river Cam flows through it, and there are three lakes. The whole has been greatly improved, and the farming establishment is eminently distinguished, and ranks with those of Woburn and Holkham.

7552. SUFFOLK. A surface of 800,000 acres, generally level, the soil sandy towards the sea, but clayey inwards. It is an old county, and contains some venerable seats and woods. Great quantities of peas are grown for the London market at Woodbridge, and especially the pearl pea; Lowestoft is famous for carrots; a good deal of clover, with some turnip-seed, is furnished from the different parts of the county; and there are good nurseries at Bury, Ipswich, and Barton Mills.

Bury Botanic Garden.—was established in 1819, by W. Hudson, of Chapel House, formerly of the War-office, a great lover of plants. Its extent is between two and three acres, and the collection of hardy plants is already considerable. The expenses are defrayed by annual subscribers at two guineas each. It is in contemplation also to establish a botanic garden at Ipswich.

Ampton Hall,—near Bury; Lord Calthorpe; and *Livermere*, N. L. Acton, Esq. adjoining. The owners have made a noble river through both parks at their joint expense, by which means they have ornamented their estates to a degree otherwise impossible. In Mr. Acton's grounds the river terminates in a scoop, or painted perspective, in the Dutch style; a thing rarely to be met in England. The Rev. M. Young, author of the *Agricultural Survey of the County*, has given a description of the river, and says, "the scoop has an excellent effect."

Elvedon Hall,—near Elvedon; Earl Albemarle. A demesne of 4000 acres: a few years ago, of barren sand, but now planted and improved; the agriculture conducted with great

skill and assiduity by the proprietor, who ranks high as a farmer and breeder.

× *Euston Hall*,—near Thetford; Duke of Grafton. A commodious red-brick mansion, with little decoration, surrounded by immense trees, and watered by the Ouse. The park contains 1450 acres, and an elegant temple designed for a banqueting-house, by Kent, and erected in 1746. The late duke was an able and successful agriculturist, and kept upwards of 3200 acres in his own hands.

Flixton Hall,—near Bungay; A. Adair, Esq. A noble structure, near the river Waveney, in Inigo Jones's Gothic, built in 1615, but in excellent preservation. The grounds contained originally some fine old woods, and have lately been enlarged and embellished with extensive plantations.

Finborough Hall.—near Stow-market; R. Pettward, Esq. An elegant house of red brick, with a fine garden, by F. Sandys. The park, of 200 acres, gently slopes from the mansion, into a circular valley, through which runs a stream; there is a fine winding walk to the church, and beautiful groups of straggling thickets of trees.

Henham,—near Henham; Earl of Stradbroke. An elegant modern mansion, and an extensive park and pleasure-grounds, kept in excellent order.

Helmingham Hall,—near Helmingham; Earl Dysart. A house built in the time of Henry VIII., surrounded by a moat, which, as well as the basin in the park, is frequented by great numbers of wild fowl. The park comprehends 400 acres, and contains some of the finest old oaks in this part of the kingdom. The church is close to the park, and near it a picturesque cottage, inhabited by a person, whose business it is to take care of the vaults and splendid monuments of the Tolennache family, who possessed the estate in the reign of Edward I.

Heveringham Hall,—near Huntingfield; Lord Huntingfield. One of the finest seats in the county; the house a modern erection from the designs of Sir Robert Taylor, and finished by Wyatt; the front 200 feet long, and adorned with Corinthian columns. It is situated on an eminence in an extensive park, which abounds in fine plantations, and is diversified by a noble piece of water near the house. The whole of this extensive property has been improved by plantations, which, in a few years, will give a new character to this part of the country.

Icknworth Park,—near Bury; Earl Bristol. An unfinished mansion, on a grand scale, from a design sent from Italy; the park eleven miles in circumference, and containing 1800 acres.

753. NORFOLK. A surface of 1,240,000 acres; every where flat, fenny towards Lincolnshire; sandy in most places; and the rest a strong clay. It contains some good residences. At Norwich florists' flowers were first introduced into England by the refugee manufacturers from Flanders, about the middle of the sixteenth century. The principal nurseryman in the county is Mackie, of Norwich. The London seedsmen receive mustard-seed from Wisbeach, and some turnip and clover-seed from other quarters.

7554. Villas and demesne-residences.

Blickling Hall,—near Aylsham; Right Hon. W. A. Harbord. An interesting ancient mansion, surrounded with a moat, completed in 1628: the gardens, at that time, containing an elegant wilderness and lake. The park consists of 1000 acres, abounds in old trees, and the lake extends, in a crescent shape, for a mile, and its greatest breadth is 400 yards.

Felbrigg,—near Cromer;—Windham, Esq. A house partly of the time of Henry VIII. but subsequently enlarged; the park abounding in old woods, and greatly improved by the late possessor, whose taste in such matters is evinced in his letter to Repton. *Gillingham Hall*,—near Yarmouth; Lord Beresford. A venerable Gothic house (fig. 745.), with some fine old trees, a handsome piece of water, and ivied ruins of an old church.

Guntton Hall,—near Cromer; Lord Suffield. The park remarkable for its very extensive plantations.

Hanworth,—near Cromer; R. L. Doughty, Esq. An excellent modern house, situated in a small but very pleasant park, well wooded, and laid out with great taste.

Hillington Park,—near Sechey; Sir M. B. Folkes. A residence lately much improved, and the gardens, hot-walls, and hot-houses, rendered very complete.

Kimberley Hall,—near Downham; Lord Wolehouse. A convenient house, in an extensive and beautiful park, richly ornamented with wood and water.

Rainham,—near Wells; Marquis Townshend. A comfortable house, built in 1630, by Inigo Jones; the grounds extensive, naturally suited for improvement, but not much improved.

Walsingham House,—near Walsingham; H. L. Warner, Esq.

Livermere,—near Fakenham; N. I. Acton. An elegant seat of white brick; the grounds flat, but adorned with a fine piece of water, and well wooded.

Redgrave Hall,—near Botesdale; Admiral Wilson. A spacious mansion of Woolpit brick, with Ionic columns; the park charmingly wooded, and adorned with a fine piece of water in front of the house.

Rendlesham House,—near Rendlesham; Lord Rendlesham. A princely residence: the mansion of great extent, modern, but in the Elizabethan style. The park and pleasure-grounds extensive, and highly kept. The former abounds in old wood, though rather deficient in undulations of surface.

Rushbrook Hall,—near Pakenham; R. Roshbrook, Esq. A noble spacious mansion with wings, forming three sides of a square; the park very extensive and well wooded, both with timber-trees, and undergrowths, furze, hollies, &c. for game.

Sudborne Hall,—near Orford; Marquis of Hertford. A sporting residence of the marquis; the hall a plain quadrangular building, covered with composition; the park abounding in copse and other covers for game, with cultivated patches sown with corn and buck-wheat for the same purpose.

Wodvorton Hall,—near Woolvorton; C. Berners, Esq. A house of the cream-colored brick of Woolpit, with an Ionic portico, placed on the banks of the Orwell; the stables detached and rendered ornamental. The park is neatly laid out, and contains a handsome monumental obelisk of freestone.

745

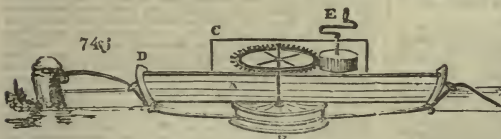

A commodious house, and grounds which have been under a course of improvement for several years, and are now highly beautiful. A rivulet is swelled to a lake, and a judicious use made of the ruins of a priory which formerly existed here.

Wollerton Hall,—near Aylsham; Lady Waldegrave. An elegant modern mansion, built by Ripley the architect, under the direction of Horace Walpole, in 1730. The park is large and well ornamented with wood and water.

7555. The following are first-rate residences:—

Holkham Hall,—near Wells; T. W. Coke, Esq. One of the best mansions in England, in point of comfort and arrangement. The park extensive, flat, and sandy; but varied by trees and farming processes continually going on, and containing a piece of water for which Repton contrived a boat (fig. 746.) so constructed, that by means of a cylinder and rope (B), and machinery enclosed in a box (C), and connected with the rope (D), the boat may be moved from one side of the water to the other, according as the handle (E) is turned to the right or left.

Houghton Hall,—near Rougham; Earl Cholmondeley. A noble freestone structure, with two fronts, wings with cupolas, and one of the best dining-rooms for proportions and conveniences in England. The park is extensive, but dull and flat: it contains some fine old beech-trees.

746

7556. OXFORDSHIRE. A surface of 450,000 acres, considerably varied by ridges, approaching, in some places, to the character of hills; the climate cold, and the soil in most parts thin, on a stony sub-soil. It contains the magnificent residence of Blenheim; some others of great extent, and a botanic garden at Oxford. There are no commercial gardens in the county worth mentioning.

7557. Public gardens.

Public Promenades and College Gardens.—The promenades of Magdalen College are umbrageous and varied, considering that they are merely walks round meadows on raised mounds, bordered by hedges and hedge-row trees. The public avenues are magnificent, and as well adapted for display as the others are for retired exercise or conversation. There are private gardens to most of the colleges; their form is generally square or oblong, surrounded by a broad walk and intersected by others; that of Christchurch is famous for its fig-trees, planted in 1648; that of Trinity for its verdant sculptures; and that of St. John's College, for being laid out by Brown, in the modern style, in 1775.

The Botanic Garden of Oxford—was founded by Henry Earl of Danby, in 1632; it contains five acres, a green-house and stove, and a gardeners' house. The first curator was Eobart

from Brunswick, in whose time, and in that of his son, who succeeded him in 1679, it was more worthy of notice than it has been since. Its present curator is William Baxter, A. L. S. and F. H. S.

7558. Villas and demesne-residences.

Badminton,—near Henley; J. Grote, Esq. Forty acres of pleasure-ground and a house; in the former a summer-house, from which fine views are obtained through vistas formed by shrubs, the holly and other dark greens being placed in the fore-ground.

Coombe Lodge,—near Henley; S. Gardiner, Esq. A flat place, rendered interesting by every thing that art could effect by planting.

Grove Cottage,—near Stokenchurch; R. Davis, Esq. Truly an elegant cottage-dwelling; neat, commodious, simple, and harmonised with the rural scenery around.

× *Middletown Stonery*,—near Bleicester; Earl Jersey. An extensive unvaried residence; but greatly improved both as to the house and grounds by the present possessor.

× *Mongewell*,—at Mongewell; Bishop of Durham. The mansion unfavorably placed, but the attached grounds extensive, and arranged with much taste.

× *Nuneham Courtenay*,—near Oxford; Earl Harcourt. A Grecian house, in part by Brown; the grounds laid out by this artist, and the flower-garden, which has been much admired, in part by him, and in part by Mason the poet. The park contains 1500 acres, and a beautifully varied drive is conducted through it.

× *Sherbourne Castle*,—near Watlington; Earl Macclesfield. Surrounded by a broad and deep moat, and approached by three drawbridges, the chief entrance guarded by a portcullis. The park contains sixty acres, but is flat and uninteresting; the pleasure-grounds have been lately improved; a flower-garden laid out in a chaste taste; an extensive conservatory of stone and cast-iron erected; and also a pavilion for the reception of flowers in the more genial summer months.

× *Thame Park*, near Thame; Miss Wykham. Two hundred acres of very rich pasture-land, skirted with wood, but rather flat, originally laid out by Brown, and the pleasure-grounds, now improving, contain a good conservatory.

× *Wormsley*,—near Stoken Church; John Fane, Esq. The house on a very elevated site, the grounds of little merit or beauty, but the proprietor an excellent farmer and breeder.

× *Wroxton*,—near Banbury; Earl Guildford. A building in the abbey style, of considerable antiquity; and what renders the place particularly interesting, the geometric style of gardening is kept up in every improvement introduced in the pleasure-grounds.

7560. BERKSHIRE. A surface of 476,160 acres, finely varied by low hills and vales, the air healthy, and the soil good, and well cultivated. It contains numerous villas and mansions. The neighborhood of Reading is noted for the white-skinned, or Reading onion, the bulbs of which are grown in quantities for the London market, and the seeds for the seedsmen. Cabbage-seeds are also grown in quantities there, and asparagus grown both for the Bath and London markets: and there is a good nursery occupied by Swallow.

7561. Villars and demesne-residences.

× *Beaumont Lodge*,—near Windsor; Henry Griffiths, Esq. The house is in the Gothic style, by Mr. Elym, architect, of Windsor: the park contains one hundred acres, sloping to the Thames, and finely varied by wood.

× *Benham House*,—near Speen; Earl Craven. The house is in the Ionic style, with an elegant portico; the grounds agreeably varied and richly wooded, and contain a handsome sheet of water, supplied by the river Kennet.

× *Caversham*,—near Reading; C. Marsac, Esq., is in Oxfordshire, though so near the capital of Berkshire. It is an old place, celebrated in *Observations on Modern Gardening*, for the beauty of the approach, which is between two hills, with the scattered trees descending their steep sides, and approaching and retiring from the road in beautiful variation. The house is plain, elegant, large, situated on an eminence, and forming a conspicuous object from the surrounding country. The park is not extensive, but is much varied, so as to appear more considerable than the amount of its contents would indicate. The garden-scenery is agreeable; but the horticulture not remarkable. The whole was laid out by Lord Cadogan, with the assistance of Brown.

× *Chisley Farm*,—near Wallingford; in 1800 the property of Lord Kensington, and formerly reputed to be the largest and most compact farm in England. Rent 1000*l.* per annum. Before the desolation of monasteries, it belonged to the Abbot of Reading, who had a seat here. The great barn in which his tithes were deposited is yet standing, and measures 101 yards in length, and eighteen in breadth. The side walls are only eight feet high, but the roof rises to a great height, and is supported by seventeen stone pillars, each four yards in circumference.

× *Coleshill House*,—near Coleshill; Viscount Folkestone. The house is a perfect and unaltered specimen of the taste of Inigo Jones, from whose design it was erected in 1650. The park is not large, but is very agreeable.

× *Donnington Grove*,—near Speen; William Brammel, Esq. The house is a handsome modern building. The park is wooded, and enriched by view to Donnington Castle. It contains a piece of water judiciously managed.

× *Park Place*,—near Henley; Earl of Malmesbury, son of the celebrated author of *Hermes*. Originally formed at great expense by Field Marshal Conway, and mentioned by the Prince de Ligne, in his *Coup d'œil sur les plus beaux Jardins de l'Europe*, as one of the finest seats in England. The present proprietor purchased the estate from the widow of the marshal in 1796, and greatly improved the mansion, with the assistance of the architect, Holland. It is situated below the brow of a lofty range of hills, which accompanies the winding of the Thames for several miles. "The many interesting objects concentrated in this demesne, are calculated to excite even the most latent energies of poetic description. The grounds combine beauty, grandeur, and variety. The composition of the home scenery is bold, and the distant prospects varied and extensive. The steep sides of the hills, with their chalky precipices, are overhung with grand masses of stately beech, interspersed with evergreens, which extend to the margin of the stream, and from various points of the landscape, appear like an immense verdant amphitheatre. The projecting lawns correspond with the sublimity of the contiguous scenery, and unite in forming a diversity of rich and beautiful prospects."

× *Selwood Park*,—near Sunning Hill; James Sibbald, Esq. The house is a handsome modern building from the designs of Robert Mitchell; the grounds consist of 300 acres, the principal part of which is laid out as a *ferme ornée*. A fine ride, of about four miles in extent, embraces the principal part of the scenery, which is richly diversified with stately trees and a large piece of water.

× *White Knights*,—near Reading; Duke of Marlborough (1820). The house is a plain building, situated in the centre

7559. The following are first-rate residences:—

× *Blenheim*,—at Woodstock; Duke of Marlborough. The most princely private residence in Britain, or in Europe, too universally celebrated to require any eulogium. The palace and bridge by Vanbrugh; the grounds by London and Wise, and subsequently by Brown. The finest view is on entering from the Woodstock gate; but the scenery is everywhere grand and magnificent. The pleasure-ground walks are extensive and varied; and there is a drive of eleven miles round the park. Part of the latter is cultivated as a farm. The lake is the largest piece of artificial water in England: the diameter of the centre arch of the bridge is 101 feet. There is little of culture either in the kitchen or flower-garden; the latter was an oval, with a basin of water in a centre; and radiating walks, after the plan of that of Madame de Pompadour at Versailles. Unhappily (as we think) it has lately been destroyed, and an aviary erected on its site.

× *Ditchley*,—near Woodstock; Lord Dillon. A good house, by Gibbs; the grounds very extensive, and intersected by an avenue of five miles, in the centre of which the house is placed, and at the opposite extremities are seen in a clear day, the palace of Blenheim and Heythorpe House. The natural courses on the estate are intersected by narrow alleys in all directions, clipped on the sides to facilitate the shooting of game.

× *Heythorpe*,—near Easton; Earl of Shrewsbury. A superb mansion in the Italian style, approached by a magnificent avenue, formed by square platoons of elm-trees. The grounds chiefly in the ancient taste, with curious artificial cascades. There are also extensive hot-houses.

of the grounds, rather low, and close to an irregular sheet of water. This place is mentioned by Wheatley as one of the earliest examples of a *ferme ornée*. The present proprietor has rendered it celebrated for its botanic riches, in which, if it does not surpass, it may vie with any residence in the empire. There is a large walled garden studded with hot-houses of every kind, and another surrounded by a hedge and sunk fence, laid out in the ancient style, and abounding with seats and curious rustic huts. The whole has been lately described and illustrated by highly finished plates, from the pen of Mrs. and the pencil of Mr. Hoffland. (See *Description of White Knights*, fol. 181*y*.)

× *Woodley Lodge*,—near Reading; James Wheble, Esq. The mansion is a neat modern edifice, built by the present proprietor's father, in the time of George II. The grounds were tastefully laid out by Keyton, who mentions them as such in his work. The park having, in 1817, been greatly enlarged by an extensive enclosure; the author of the present work was employed to give designs, which have since been executing under the eye of the proprietor, who has great taste and considerable skill in rural improvements; and is a well informed truly amiable man.

7562. Royal residences.

× *Frogmore* (Frog-moor),—near Windsor; the favorite residence of the Queen of George III. The house is not large, but neat; the grounds occupy a valley, thirteen acres of which is laid out in pleasure-ground, highly enriched by flowers and artificial objects. The whole is diversified with a piece of water, of irregular shape, and winding in different directions, in one place approaching the house, and in another retiring beneath the thick woods. "In this sweet, sequestered spot, every thing is serene and pleasant. The devious path, the umbrageous thicket, the dilapidated ruin, and secluded temple, all conspire to render it peculiarly interesting. Exclusive of the variety of indigenous and exotic trees and shrubs, which are scattered through the grounds, there are fine ornamental buildings tastefully denominated the Gothic temple, the Ruin, the Hermitage, the Temple of Solitude, the Chinese Temple, &c. The Ruin was erected from a design by W. Wyatt; and being seated on the water's edge, partly embowered in woods, and diversified with fractures in the walls, and ivy, it constitutes a truly picturesque ornament when seen from various points of view. The Hermitage is a small, circular, thatched building, situated in the south west corner of the garden, and completely embowered with lofty trees. It was constructed from a drawing of the Princess of Hesse Homburg, when Princess Elizabeth, whose taste and skill in drawing are allowed to be considerable. The surrounding scenery is justly contrived to assimilate with the character of the place, the view of every distant object being excluded by trees and underwood. These improvements were superintended by Major Price, brother to Uvedale Price, Esq., the celebrated author of the *Essays on the Picturesque*." (*Beauties of Eng. and Wales* (1801*h*), 1: 268*h*.)

Since the death of the queen, in 1818, the grounds have been respectively kept up by the female part of the royal family who reside there.

× *Windsor Castle*.—The principal residence of the British sovereigns. It was originally a hunting seat of William the Conqueror; improved by Henry I., and the park surrounded with a wall; greatly improved by Edward III., under the celebrated architect, William de Wyckham, who, in 1357, superintended the works at a shilling per day, and ultimately made a fortune by the king's employment. Queen Elizabeth raised the terrace on the north side; Charles II. repaired and embellished the whole structure, and much was done by George III., under the direction of W. Wyatt. The avenues in the park were planted by Charles II., who also formed a bowling-green; but this, with a flower-garden formed by Queen Anne, were destroyed during the late and preceding reigns.

7563. GLOUCESTERSHIRE. A surface of 800,000 acres; elevated, hilly in many parts, and the climate cold; low, fertile, and humid, however, on the banks of the rivers, as in the Vale of Gloucester. On the borders of Monmouthshire are some woods of lime-tree, from the bark of which ropes are made for fishery and agricultural purposes. There are a number of nurserymen in this county, of which the principal are

Sweet and Miller of Bristol, who are the most extensive garden-tradesmen in the west of England. Miss Wheeler has a nursery at Gloucester, which was founded by her father, the author of a *Gardener's Dictionary*.

7564. The following are *villa-residences* : —

Blaise Castle, — near Bristol; J. Harford, Esq. The house is an elegant Grecian design by Nash; the grounds are reclusive, well-wooded and highly beautiful. Not far distant is a picturesque village of thatched cottages, also from the designs of Nash, the habitations of pensioners of the prior.

Blenheim Ayres, — near Painwick; B. Hyett, Esq. The house is a handsome modern edifice, judiciously joined to woods, and embellished by new plantations.

Cheltenham, — Tomlins, Esq. The gardener (Evans) has formed a brick drain along the front of his vine-border. This drain is furnished with hopper funnels at each end, through which liquid manure is supplied to the roots unaccompanied by the unpleasant smells which are dispersed around when this manure is poured on the surface.

Prinknash, — near Tewkesbury; T. B. Howel, Esq. A low Elizabethan house, on an elevated site, commanding extensive prospects. Considerable improvements were made by the present proprietor in 1806.

7565. *Mansion and demesne residences*.

Badmington House, — Sudbury; Duke of Beaufort. The house is an extensive building, on a French model, erected in 1682; the park is nine miles in circumference, intersected by noble avenues. The gardens were celebrated in the first duke's time; but are at present rather neglected.

Barnesley Park, — near Bibury; James Musgrave, Esq. The mansion is a sumptuous edifice, in the Italian style. The park is three miles in circumference, and contains some extensive plantations.

Burton Hall, — near Great Barrington; Lord Dymor. The house is an elegant Doric structure; in the grounds is a good specimen of a *ferme ornée*; the park is well wooded, and three miles in circumference.

Clear Well, — near Newlands; T. Windham, Esq. A handsome mansion and plantations around it well disposed.

Dyrham, — near Sudbury; W. Brathwaite, Esq. A handsome mansion, with a front of 150 feet, and a park of 500 acres. *Dunstons Abbey*, — near North Cerney; Sir M. S. Pleydell. A villa on a singular plan, situated on an eminence distinguished for the beauty of its scenery.

Guiting Park, — near Withington; — Snell, Esq. The house is elegant and compact, and the grounds beautifully varied and well wooded.

Highmeadow, — near Newnham; Lord Gage. A noble man-

sion, in a bold situation, containing a fine bird's-eye view of the village.

Highnam Court, — near Gloucester; Sir B. W. Guise. A mansion by Inigo Jones; an extensive park, and pleasure grounds, judiciously disposed.

King's Weston, — near Clifton; Lady de Clifford. The house, one of Vanburgh's best designs, in a situation rarely equalled for beauty and grandeur. The park abounds in fine oaks and elms; the pleasure-grounds with American plants; and there are good kitchen and flower gardens. The views, towards the Severn and the Avon, ravish the senses with their grandeur and beauty, and render this place one of the finest in the county.

Lydney Park, — near Lydney; Rt. Hon. C. B. Bathurst. An old mansion, and near it some fine woods.

Oakley Grove, — near Cirencester; Earl Bathurst. A mansion in the old French style, amidst pines and other evergreen trees.

Rendcombe, — near Chedworth; S. Barrington, Bishop of Durham. The mansion is elegant and the park extensive, abounding in wood, and furnishing fine prospects.

Sherborne House, — near Sherborne; Lord Sherborne. A monastic-like mansion of two quadrangles; with two parks, each between three and four miles in circumference.

Southam House, — near Cheltenham; T. B. de la Bere, Esq. a venerable and far-famed mansion of Henry VIII. It is of two stories, and more entire than almost any building of that era in England. The situation commands some fine prospects in front, and is backed by old and picturesque woods.

Stoke House, — near Clifton; Dowager Duchess of Beaufort. A spacious castellated house in an extensive park, commanding fine views of the Vale of Evesham.

Stout's Hill, — near Uley; L. Baker, Esq. A handsome modern edifice with octagonal projections, turreted and ornamented in the pointed style, and surrounded by fine beech-woods.

Stowell, — near Northleach; Lord Stowell. The house is on an eminence, in a pleasant park of 100 acres, embellished by well arranged plantations.

Toddington House, — near Toddington; C. H. Tracy, Esq. A spacious Elizabethan building, with gardens and pleasure-grounds in the modern style, and a park of 150 acres.

Whitcombe Park, — near Malvern; Sir W. Hicks. Situated at the base of some commanding eminences, finely clothed with beech-trees.

Williamstrip, — near Colne. An elevated site, but the house well sheltered by plantations.

7566. **WORCESTERSHIRE.** A surface of 500,000 acres; hilly in many places, as at Malvern and Broomsgrove, but in general low and very fertile, as in the Vale of Evesham. There are some good residences. The white onion is extensively grown near Evesham; asparagus and cucumbers for the Birmingham market; carrot-seed at Woolverley; crab-stocks, and currants for their fruit, at Pershore; from which place crab-pips are received by the London seedsmen.

Blackmore Park, — near Malvern; T. Hornold, Esq. An elegant modern building; the park well wooded, but rather in too formal a manner.

Broomsgrove Court, — near Upton; Earl of Coventry. Naturally a dull flat place, but made what it is by Brown, who both designed the house, and laid out the grounds. This place has always been remarkable for the degree of neatness and order in which it is kept.

Dailford, — at Dailford; — late the residence of Warren Hastings, Esq. A handsome house, in a commanding situation; the grounds tastefully laid out, and a piece of water formed; but the design of the whole evidently incomplete.

Gutcomb Park, — near Minchinhampton; David Ricardo, Esq. A small place with a handsome house, beautifully disposed grounds, and a good kitchen-garden.

Hasley, — near Broomsgrove; Lord Lyttelton. A square house, with raised pavilions at the angles, in a park long celebrated for the beautiful undulations of its surface, and the fine scattered groves and thickets of beech and other trees. As *Hasley*, however, it is deficient in having no pleasure-ground or flower-garden scenery near the house. This must materially lessen the comforts of its possessors in the winter months, who must cross the open park before they can get to gravel-paths of any kind. The original dell of shrubbery and waterfalls, formed by the first Lord Lyttelton and Shenstone, was denuded some years ago, and only the timber-trees left.

Ham Court, — near Upton; J. Martin, Esq. An elegant mansion, lately built, situated on a rising lawn, studded with plantations in an elegant style of improvement.

Hanbury Hall, — near Droitwich; J. Phillips, Esq. A fine old mansion, dated 1710, full of large windows (the window-tax being then unknown), with every thing comfortable within, and surrounded by a well-wooded park of 150 acres.

Henell Grange, — near Broomsgrove; Earl Plymouth. A very extensive house, dated 1712, in the midst of a pleasant park, with hills gently swelling, and a lake of about 30 acres. The plantations are extensive, and abound with oaks, in various stages of growth.

Kyre Wyre, — near Tenbury; — Pytts, Esq. An elegant mansion, in a highly picturesque park, through which runs a rapid stream; the distant views, like all those in this part of the country, very picturesque, from its broken and undulating

outlines, tufted with lofty trees, or smiling with cultivation and enlivened by the meandering course of the Wye.

Lee Castle, — near Kidderminster; J. Knight, Esq. Remarkable for its kitchen-gardens and lofty hot-houses for fruiting rare exotics, and in which the lee-chee ripened its fruit in 1819, for the first time in England.

Madresfield (Mothersfield), — near Malvern; Lord Beauchamp. A baronial castle modernised, surrounded by a fine extent of lawn and plantations.

Northwick, — near Broadway; Lord Northwick. An ancient house, modernised, with an extensive and well planted park.

Orderley Court, — near Worcester; Marchioness of Downshire. A mansion recently much improved, in the midst of a park, flat but extensive, and bordered by the Severn.

Stamford Court, — near Slodon; Sir T. Winnington. A commodious and substantial house, situated in an ample park, containing two large pieces of water; the whole rather deficient in plantations.

Thorn Grove, — near Worcester; — Lamotte, Esq. A plain mansion on an eminence, with an extensive lawn and serpentine lake, bordered with thriving plantations.

Tickenhill, — at Bewdley; — Ingram, Esq. A delightfully situated house, in a well wooded park, commanding fine wild views over a dell to Wyre forest. Through the indulgence of the possessor, it is used by the inhabitants of Bewdley as a public promenade.

Whitby Court, — near Stockton; Lord Foley. A newly improved and improving seat, which, when the plantations are grown up, will be truly magnificent.

Westwood House, — near Droitwich; Sir J. Packington. A fine old Elizabethan mansion, surrounded by garden-courts, flanked by towers and other architectural appendages. It stands on an eminence in a very extensive park, much varied in surface, and with extensive oak-groves, commencing at a certain distance from the house, and extending outwards like the gores of a circle, leaving large avenues between. There is a piece of water of sixty acres, and situations where other pieces might be formed.

Weston Villa, — near Bardley; — Mossley, Esq. A most elegant villa on a hill, embowered in deep tufted shades, covered in some places with ivy, and surrounded with ornamented walks interspersed with Gothic seats, towers, and hermitages, and displaying fine views of the Severn and its banks.

7567. **MONMOUTHSHIRE.** A surface of 340,000 acres; hilly, romantic, rich in pasture and woodlands; abounding in ruined castles, and containing some picturesque seats. The Vale of Usk in this county, like that of Clwyd in North Wales, and Montgomery, presents the finest scenery in Wales.

Llanerth House, — near Llanerth; T. Jones, Esq. A good house, by Nash, and agreeable grounds, with a piece of water, laid out by Lappie.

Llanmarnoch House, — near Newport; late Sir Robert Salisbury, Bart. A handsome brick house, on an eminence, surrounded by plantations, chiefly by Sir R. Salisbury, the late proprietor.

Stierfeld, — near Chepstow; N. Wells, Esq. An elegant house of freestone; the grounds extensive, celebrated by tourists for their romantic walks and views along a precipice

washed by the Wye, and described by Wheatley in *Observations*. The place owes its celebrity to Valentine Morris, Esq. who began to improve it about 1740.

Pontypool Park, — near Pontypool; C. H. Leigh, Esq. A substantial mansion, with most romantic grounds, well furnished with wood, water, rocks, some ornamental buildings and excellent views.

Tredgar Park, — near Abergavenny; Sir C. G. Morgan. A substantial brick mansion of the time of Charles II.; the park

extensive, and finely diversified with variegated features, soft and abrupt, champaign, and acclivous, covered with noble plantations of oak, beech, and Spanish chestnut.

Troy House,—near Monmouth; Marquis of Worcester. A house by Inigo Jones, on the banks of the Trothy. This seat was famed for its gardens in Charles I.'s time, and especially for its delicious fruits. In the apophthegms of the Marquis of Worcester, it is stated that "Sir Thomas Somerset, a very

7568. **HEREFORDSHIRE.** A surface of 600,000 acres; much varied by hills, some of which approach the character of mountains; it abounds in natural chards; and the soil is everywhere deep and rich. There are some fine seats, and the county will hereafter be celebrated in gardening history as being the birth-place or residence of Uvedale Price and R. P. and T. A. Knight.

Belmont,—near Lower Eaton; — Matthews, Esq. A romantic situation on the Wye.

Berrington,—near Leominster; Rt. Hon. T. Harley. A square modern edifice of whiteness, in a pleasant park.

× **Donlton Castle**,—near Ludlow; T. A. Knight, Esq. Pres. of the Hort. Soc., built by his brother R. P. Knight, Esq. the celebrated author of *The Landscape*, a poem; of the *Analytical Inquiry into the Principles of Taste*, and other elegant and classic works. The house is of stone, with towers, and embattled walls, but internally finished in the Grecian style. The park abounds in inequalities of surface and natural woods, which stretch along the banks of the Tame; a stream which flows through the grounds, to the extent of about three miles, over a rugged bed. There is also a considerable hill in front of the house, clothed with verdure and natural woods to its summit. On the whole it is one of the most picturesque residences in England, and having within these few years become the residence of T. A. Knight, Esq. promises to be equally celebrated in respect to horticulture.

Eywood,—near Lyon's Hall; Earl of Oxford. The grounds display a great diversity of scenery, and are ornamented with some fine plantations.

Foxley,—near Hereford; Uvedale Price, Esq., the celebrated author of *Essays on the Picturesque*. A plain brick mansion, beautifully varied by creepers, and surrounded by a magnificent amphitheatre of woods, chiefly oak, beech, and elm, planted by the father of the present proprietor; but partly of cedars introduced by the present occupier. There are fine views judiciously opened in many places, and small pieces of water introduced as lights to fix the eye, with other improvements which display the elegant and correct practical taste of the great reformer of landscape-gardening.

Garnons,—near Bridge Solaers; Sir J. G. Cotterell, Bart. Extensive and flourishing plantations, and fine prospects.

× **Hampton Court**,—near Hope; Earl of Essex. A magnificent Elizabethan mansion, on a lawn of nearly 100 acres, surrounded by a park between seven and eight miles in circumference.

7569. **SHROPSHIRE.** A surface of 849,940 acres; mostly flat, with some hills; the soil generally good. It contains a number of good nurseries; and sends to London baking-plums and walnuts in large quantities.

Aston Park,—near Oswestry; W. Lloyd, Esq. A most elegant mansion, and the natural beauties of the place much improved by the correct taste of the owner.

× **Hankensley Park**,—near Whitchurch; Lord Hill. A good mansion, on a beautiful slope on the north side of a romantic hill; the grounds extensive, and combining beauty and singularity. There are bold cliffs, grotesque rocks, most romantic walks, a hermitage, and many other buildings and seats; a long artificial river formed along a slope, and everywhere the finest trees. On the whole, it is, and has

7570. **STAFFORDSHIRE.** A surface of 780,800 acres; hilly and moory towards the north, but plain and fertile in the other parts. It contains a number of villas and mansion-residences, and nurseries are established at most of the principal towns.

Botley,—near Newcastle; J. Wedgewood, Esq. A superb villa-mansion, surrounded by highly polished pleasure-grounds, with an excellent kitchen-garden.

Beaudearth (fine desert),—near Stafford; Marquis of Anglesea. A magnificent residence, improved from a comparatively

complete gentleman, delighted much in fine gardens and orchards." The same gardens were famous in Henry VIII.'s time, when in possession of William Herbert, who, we are informed by Evans (*Letters on Wales*, 184.), sent two men, by the names of Richards and Williams, to France and Flanders, for the express purpose of studying horticulture, and importing esculent vegetables and choice fruit-trees.

Harewood,—near Llanfrother; Sir H. Hoskyns. The mansion lately improved; the park well wooded.

× **Holm Lacey**,—near Hereford; formerly the Duke of Norfolk. The mansion Elizabethan, and kept in perfect preservation as a national curiosity; the grounds pleasant; the old garden on the model of that at Hampton Court, Middlesex, with a spacious terrace: it abounds in yews, formerly clipped in shapes, and not far distant is a pear-tree which covers nearly a quarter of an acre, and yields annually from twelve to sixteen hogheads of perry.

Hope End,—near Ledbury; J. M. Barrett, Esq. The house and grounds recently improved from our designs; the latter highly romantic by nature, and well wooded.

× **Kentchurch**,—near Llanfrother; J. Scudamore, Esq. (*Escudamore*, *Ecuyer d'Amours*, squire or assistant in love matters.) A pleasant situation, with a park of three or four miles in circumference.

Longworth,—near Bromyard; J. Walwyn, Esq. A good mansion, recently erected, and the grounds well timbered.

Meend Park,—near Llanfrother; Sir R. Symonds. A plain brick mansion; but the grounds richly wooded.

Moccas Court,—near Longtown; Sir G. A. Cornwall. A good house, delightfully situated on the southern bank of the Wye, with a large park, finely clothed with oak, and remarkable for a variety of that tree with weeping spray. The only other specimen we know of is in the botanic garden at Amsterdam. The growth of the oak in this part of the country is supposed to be more rapid than anywhere else.

Rotheras,—near Hereford; C. Bodenham, Esq. A spacious brick mansion, and grounds containing one good timber.

Shobden Court,—near Mortimer's Cross; Lady Bateman. An elegant seat; the park between three and four miles in extent; contains rich and picturesque scenery.

Stoke,—near Bromyard; Lord Foley. A spacious brick house with a terrace in front; the park and grounds well wooded, and considerably improved under the direction of H. Repton.

Suften Court,—near Bromyard; — Hereford, Esq. A handsome mansion of Bath stone; the grounds improved by H. Repton.

long been, a place to excite wonder, and also agreeable emotions.

The Leasowes,—near Hales Owen; — A pasture-farm, chiefly celebrated as having been the residence and the creation of Shenstone. Some of the root-houses and grottoes in the paths which lead along the hedges, and in the strips of copse and dingles, still remain.

Oakley Park,—near Ludlow; Lady Clive. The mansion on the banks of the Thame; the grounds naturally romantic, and laid out with much taste and judgment.

rude state (fig. 747.), by the late Earl of Uxbridge, who, with the aid of H. Repton, formed a large piece of water, planted variously, and rendered the house more conspicuous. (fig. 748.)

747

Belmont,—near Ipstone; J. Sneld, Esq. The house, pleasantly situated on a gently rising hill, fronting the south-east; nearly surrounded by deep woods, furnished with underwood of ash, hazel, birch, willow, &c., cut every six years for hoops and a crate-ware for the potteries. The walks through these woods are rude natural paths; and on the bordering spaces, not covered with copse, are planted many hardy plants, and there left to grow without farther culture. On the whole, this is a place combining the justest taste, great knowledge of culture, agricultural as well as horticultural, and a strict regard in all things to economy in the first expense and future management.

× **Blithfield Park**,—near Abbots Bromley; Lord Bagot. An Elizabethan building, placed at one side of the park, which

748

is rich in large oaks and picturesque views. Lord Bagot pays considerable attention to horticulture, and cultivates successfully the loquat-apple, of which he has given some account in the *Horticultural Society's Transactions*.

Broughton-hall,—near Stafford; Sir T. Broughton. An ancient mansion, surrounded by stately plantations of indigenous trees, especially sycamores. The park is divided by the road; but no art has been used to mark the appropriation of the opposite part to that in which the house stands.

× **Enville**,—near Enville; Earl Stamford. The house, a large brick structure of an impure Gothic character; the grounds formerly celebrated, but now chiefly remarkable for a fine lawn, some old trees, and a cascade formed by Shenstone.

Hagley Hall, — near Rugstone; Lord Curzon. A finely situated house, and the artificial scenery around it very judiciously disposed.

× *Ingestre Hall*, — near Stafford; Earl Talbot. A respectable Elizabethan edifice, surrounded by grounds in the ancient style, but in a great degree modernised by the present proprietor.

Little Aston, — near Tarnworth; —. A splendid mansion, surrounded by an extensive lawn, finely varied by trees, and embellished with a noble lake. Over the latter is thrown a very handsome stone bridge, and opposite to it stands an elegant stone conservatory.

Prestwood, — near Dudley; Sir Thomas Littleton. A fine modern house, the surrounding pleasure-grounds exhibiting a most delightful variety of hill and dale, wood and water, effected chiefly by the hand of nature.

Sandon, — near Newcastle; Lord Harrowby. An elegant mansion, finely situated on the declivity of a considerable eminence, commanding noble and luxurious prospects.

Sandwell Park, — near West Bromwich; Earl Dartmouth.

7571. WARWICKSHIRE. A surface of 639,760 acres; elevated, not much varied, well wooded to minerals. There are many neat cottage-gardens in the county, especially near Coventry. The principal market-gardens for the commoner culinary crops near that place.

Anstley Hall, — near Oldbury; I. N. Ludford, Esq. An irregular mansion, with an extensive park, in which, on an insulated spot, is a Chinese temple, by Sir W. Chambers; and in another appropriate spot is a hermitage.

Aubrey Hall, — near Astley; F. P. Newdigate, Esq. An elegant specimen of the florid Gothic, divested of the exuberant and grotesque; the park fine and extensive, well wooded, and adorned with artificial expanses of wood and water.

Bilston House, — near Bilston; Hon. J. Simpson. A spacious but irregular mansion, entered by iron folding gates, which conduct to a venerable porch. The gardens are extensive, and preserved in all the formality of the old taste. One walk is still termed Addison's, whose seat this was, and where he generally resided after his marriage with the Countess of Warwick. The grounds being let, are going fast to decay.

Guy's Cliff, — near Warwick; B. Greethead, Esq. A singularly picturesque combination of rock, wood, meadow, and the windings of the Avon, with a mansion respectable both in size and character.

Merevale, — near Atherstone; D. S. Dugdale, Esq. A handsome residence; the grounds particularly rich in fine and venerable oaks.

Whitby Hall, — near Coventry; Lord Hood. A capacious

7573. LEICESTERSHIRE. A surface of 522,240 acres; grazing counties in England. It does not abound in rich, has seldom good gardens.

Beaumanor, — near Ashby de la Zouch; W. Herrick, Esq. The park extolled for picturesque beauty, combined with serenity and sublimity of character, it abounds in venerable oaks, ash, elm, and willow.

× *Donnington Park*, — near Donnington; Marquis of Hastings. A magnificent pile of ecclesiastical Gothic, by W. Wilkins, sen. surrounded by a park containing very old trees. The building is in a bottom, half earthed up, and the approach descending to it has a very bad effect. The pleasure-grounds contain a small piece of water, and were laid out by H. Repton.

Gopall Hall, — near Bosworth; Lady Howe. An elegant mansion, which, with the improvements on the grounds, is said to have cost 100,000*l*. In the park are some fine temples and carved seats.

7574. DERBYSHIRE. A surface of 720,640 acres; hilly, irregular, and in some parts mountainous; the valleys rich and beautiful. There is a good nursery and florists' garden at Derby, by Joseph Mason, and some neat cottage-gardens in the county.

Bretby Park, — near Bretby; Earl of Chesterfield. A fine old structure was taken down some years ago, which is said to have been surrounded with gardens disposed after the plan of Versailles, with terraces, statues, and fountains. (See a bird's-eye view by Kip, in *Nouveau Theatre de la Grande Bretagne*, and *The Topographer*, vol. ii.)

Chaddesdon, — near Derby; Sir R. M. Wilmot. A neat villa, with a good kitchen-garden.

Foremark, — near Repton; Sir Francis Burdett, Bart. The house is an elegant and substantial modern building; and the park and gardens respectable.

Locke Park, — near Locke; William Drury Lowe, Esq. The grounds are naturally much varied, and contain a handsome artificial lake; but the plantations having been made when the geometric taste was in fashion, do not accord well with the variations of surface.

Osbaston, — near Derby; Sir Robert Wilmot. The house is a large handsome edifice; the grounds were laid out by Eames; the pleasure grounds occupy five acres, and are very agreeably disposed.

Overton Hall, — near Derby; Lady Banks. In the garden a

A quadrangular brick building, stuccoed, situated in a romantic valley, and surrounded with a charming lawn, laid out with the highest degree of taste and judgment.

× *Shugborough House*, — near Rugeley; Lord Anson. An elegant Grecian mansion, in a low situation, *over-watered* by the Trent. The grounds were laid out at great expense by the late Thomas Anson, Esq. and contain numerous and well-executed ornamental buildings, in different styles of architecture. The present proprietor cultivates a farm in a very scientific manner.

× *Trentham*, — near Newcastle-under-line; Marquis of Stafford. A low situation, with abundance of water, and some rising grounds. Great expense has lately been incurred on the house, and a fine mausoleum built opposite the entrance-gates, from the designs of Tatham; but nothing will ever render this place truly grand. The kitchen-garden is good, and no nobleman encourages every kind of improvement more than the present marquis. (See *Loch's Account of Improvements*, &c. 8vo. 1819.)

Elizabethan mansion of stone, commanding agreeable views. The park and gardens agreeable, but rather neglected.

7572. The following are first-rate residences: —

Coombe Abbey (Cwm, or Cumbe, a low or hollow place), — near Coventry; Earl Craven. A noble mansion, in part by Inigo Jones, in a park of 500 acres, well varied by wood and water.

× *Ragley Hall*, — near Alcester; Marquis of Hertford. A spacious mansion, improved by Wyatt, on the summit of a round knoll, in an extensive park abounding in majestic oak-trees, and also in young plantations, with a fine lake and every feature worthy of this noble seat. The kitchen-gardens are noted for the extent of their hot-houses, and for the cultivation lake of the pine-apple, especially of the Providence kinds.

× *Warwick Castle*, — Warwick; Earl of Warwick. An ancient Gothic structure, on a steep rock rising from the Avon, with a large garden-court, flanked by towers, and with a gate and porticulis, &c. in a truly baronial style, and in excellent preservation. The park is very extensive and finely adorned by wood, and watered by the Avon, as well as some artificial lakes. The pleasure-grounds contain a fine course of broad gravel-walks, and some luxuriant and bulky cedar-trees.

acres; low, generally flat, and one of the richest gentlemen's seats; and the farmers, though often

Lockington Hall, — near Keyworth; Rev. P. Stony. The grounds much improved by the present possessor.

Prestwold Hall, — near Prestwold; C. J. Packe, Esq. A large modern mansion and finely wooded park.

Queenby Hall, — near Frisby; Mrs. Latham. A large building on a finely wooded avenue, with a terrace-walk commanding very fine prospects of hanging hills with scattered woods and neatly cultivated enclosures.

Stanton Harold, — near Bredon; Earl Ferrars. A large pile of brick and stone, in a park of 150 acres, containing a lake of thirty acres, and a handsome stone bridge.

Wanlip Hall, — near Leicester; Sir G. C. Hudson. The pleasure-grounds laid out with much taste.

gooseberry-tree which covers a wall fifty-one feet long, and six feet high. It is of the small rough red sort, and bears well. A grove of 100 birch-trees on this estate have been tapped for upwards of sixty or seventy years for their sap: thirty or more trees are tapped in a season, and the sap sold to the makers of British wine in the neighborhood. (See *Farey's excellent Survey of this County*, 3 vols. 8vo.)

Shipley, — near Belper; E. M. Munday, Esq. The house is modern and elegant, the grounds very well disposed and wooded, and the gardens celebrated of late for their orange-trees.

Wiltley Castle, — near Matlock; R. Arkwright, Esq. The castellated mansion is romantically situated in Matlock Dale, and surrounded by lawns, rocks, and natural woods, and washed on one side by the Dove. The kitchen-garden and hot-houses are good and well attended to.

Wingerworth, — near Chesterfield; Sir William Hunlocke. A noble seat, improved from a comparative bald state (*fig. 749*.) by Repton, who enlarged the water, and planted some trees, and gave breadth to the lawn in front of the house. (*fig. 750*.)

7575. The following are *first-rate residences* :—

× *Chatsworth*,—near Bakewell; Duke of Devonshire. The most celebrated seat in Derbyshire. The palace is an immense quadrangle in the Grecian style; the park lies sloping to the river Derwent, and is nine miles in circumference. It is much diversified with hill and dale, and plantations. The pleasure-grounds are in the ancient taste, and contain the best artificial water-works in England.

× *Haddon Hall*,—near Bakewell; Duke of Rutland. One of the most complete baronial residences now remaining, and though not inhabited, kept in good repair. The extent of the building, and the number of apartments and offices, are calculated for the display of a very extended hospitality; the hall, or great public dining-room, is particularly admired. The park was ploughed up many years ago; the terrace-gardens

remain, and consist of terraces ranged one above another, each having a stone balustrade.

× *Hardwick Hall*,—near Normanton; Duke of Devonshire. The house is of stone, and built by Elizabeth Countess of Shrewsbury, whose passion for building is well known; it is also celebrated as having been the place of confinement of Mary Queen of Scots. The park abounds in fine old oaks, and contains the ruin of a former castle, in which is a room noted for the justness of its proportions, and said by Kennet, to have been thought a fit pattern of measure and contrivance of a room at Blenheim.

× *Kedleston Hall*,—near Derby; Lord Scarsdale. The house is a Grecian pile of 14 rooms, and one of the handsomest in England. The park is five miles in circumference; it contains a fine sheet of water, with cascades and islands, and a venerable grove of oaks.

7576. NOTTINGHAMSHIRE. A surface of 495,360 acres; gently varied, fertile, dry, and healthy, containing the remains of the extensive forest of Sherwood. There are good nurseries, and also some market-gardens and orchards at Retford and Nottingham, and tree-seeds are collected about Worksop and other places.

× *Alston Grove*,—near Nottingham; Sir G. Clifton, Bart. The approach to the house, through an avenue a mile in length, covered with turf, and broad enough for a dozen carriages to drive abreast, is the finest specimen of a hill originally in the ancient taste, but lately remodelled.

× *Clifton Hall*,—near Nottingham; Sir G. Clifton. Pleasantly situated on the Trent, and deeply embosomed in groves of oak and elm.

× *Colwick Hall*,—near Nottingham; ——— Musters, Esq. A house by Carr, in a bottom, but backed by rising hills, well wooded, and surrounded by neat pleasure-grounds.

× *Cumber Park*,—near Worksop; Duke of Newcastle. A large house: the park containing 4000 acres, and eleven miles in circumference, abounds in plantations, picturesque irregularities, a large piece of water, and a highly enriched bridge. Near the house, however, it is dull and flat.

× *Kirklington Hall*,—near Southwell; Mrs. Whetham. A large edifice, with an undulating lawn, descending to an unbragging piece of water, surrounded by easy slopes.

× *Nellmorth*,—near Mansfield; embosomed in wooded hills, among which two brooks have been expanded by art into irregular lakes.

× *Newstead Abbey*,—near Mansfield; ——— Toildman. The building, and such of the grounds as have been purchased by this gentleman, are undergoing improvements: but the place is chiefly remarkable as having been the scene of improvements of Lord Byron, grandfather to the present lord. When in its splendor, the house was situated in a vale, in the midst of an extensive park finely planted, with a winding lake flowing almost up to the house, with two cannons on the banks, a Gothic prospect house, a fine arch, &c. The gardens contained an ancient Gothic green-house, leading to a flower-garden, formed on what was once the burying-ground of the church, in which is a large circular vault, with a pedestal of white marble, and inscription in memory of the Newfoundland dog buried below.

7577. LINCOLNSHIRE. A surface of 1,783,680 acres; great part on the sea-shore, flat and fenny; the wolds, which occupy the north-east, as the word (Saxon) imports, are hilly and void of wood. The London seedsmen receive hemp, turnip, rape, and mustard seed, from this county; and sell there large quantities of parsley-seed, which the farmers sow with their clovers, as a preventive to the rot in sheep. Some garden-seeds for the supply of the Yorkshire seedsmen are grown in the Isle.

× *Burwell Park*,—near Burwell; B. Lester, Esq. A handsome mansion, in a commanding situation, surrounded by a park, abounding in timber. Dr. Matthew Lester, great grandfather of the present owner, was physician to Charles I., and is mentioned by Parkinson as one of his patrons in botany.

× *Coleby Hall*,—near Lincoln; General Bertie. A fine old house, with modern additions, and surrounded by thriving plantations.

× *Grimsthorpe Castle*,—near Edinham; Duke of Ancaster. An irregular pile, chiefly by Vanburgh, on a beautifully undulated lawn, descending to two lakes, comprising about 100 acres, beyond which is a rising ground covered with trees. The park is one of the most extensive in the kingdom; there are three ridings in it, each four miles, in a straight line and in different directions. There are some rough forest scenery and great extent of rich pasture, and if the vale below had been floated as was intended, there would have existed here one of the most magnificent pieces of artificial water next to Blenheim.

7579. RUTLANDSHIRE. A surface of 123,000 acres; varied, but composed chiefly of fertile valleys.

× *Burley-on-the-hill*,—near Oakham; Earl Winchelsea. The house, a magnificent structure, ranking with Burleigh, Belvoir, Castle Howard, and similar edifices. It was built after the Reformation, by the Earl of Nottingham, in the Doric style. The park contains 1085 acres, abounding in large oaks, and all kinds of forest-trees; the lawn is extensive, and contains a curious grotto, and other decorations. The entrance-front of the house has a court-yard, separated from the road by a superb iron-railing; and on the garden-front is a terrace-walk, 500 yards in length, and 12 broad.

7580. NORTHAMPTONSHIRE. A surface of 617,000 acres; fenny towards the north-east; but, in general, elevated, varied, and abounding in country-seats. There are some nurseries; and Cornfield, a florist at Northampton, is considered one of the first growers of the carnation; and in the market-gardens onions are grown to great perfection.

× *Althorpe*,—near Brington; Earl Spencer. A large pile, dated 1685, is a park distinguished by large masses of wood, and considerable inequality of surface.

× *Castle Ashby*,—near Ashby; Earl Northampton. A large pile, by Inigo Jones, on a gentle eminence, in a park containing a large lake, by Brown.

× *Cranford Bridge*,—near Cranford; Sir G. Robinson. A modern house, surrounded by an extensive lawn and pleasure-grounds.

× *Deene Thorpe Park*,—near Deene; Earl of Cardigan. A low embattled structure, with a turret terminating each wing;

× *Ossington Hall*,—near Laseton; J. Dennison, Esq. The house unites elegance and comfort; the pleasure-grounds agreeably laid out, and the park extensive.

× *Polkington Hall*,—near Retford; Foljambe, Esq. An elegant modern seat, surrounded by thriving woods and verdant glades, and watered by a rivulet, which expands to a lake.

× *Stanton*,—near Newark; ——— Stanton, Esq. A noble mansion and gardens and pleasure-grounds, beautiful and extensive.

× *Trumpington Hall*,—near Barton; J. W. Emmerton, Esq. A mansion in the style of James I.; the gardens seat and agreeable, and the surrounding scenery picturesque.

× *Thornby Park*,—near Worksop; Earl Manvers. A comfortable house, in a low situation, well backed with rising ground, thickly planted, and forming part of the park, which is thirteen miles round, and contains some fine pieces of water. The gardens were in part constructed in the French style, by the late Duchess of Kingston.

× *Wilsbeck Abbey*,—near Worksop; Duke of Portland. A handsome lake by H. Repton: the kitchen-garden celebrated in the time of Speechey, but for many years neglected. The park, being part of the forest of Sherwood, abounds in old oaks, and contains numerous young plantations of oak, sheltered by birch, sown or planted by Speechey.

× *Woodaton Hall*,—near Nottingham; Lord Middleton. A square structure, with towers at the angles, and an elevated prospect-room in the centre, executed by John Thorpe, in Queen Elizabeth's time. It is approached by a winding avenue of lime-trees, nearly a mile in length. The park is extensive; the kitchen-garden well managed; the gooseberries grown in pots, and sent to table in that state.

× *Winthorpe Hall*,—near Muskham; R. Pocklington, Esq. An elegant building with plantations, and grounds very extensive.

× *Pandon House*,—near Wrayley; E. Turner, Esq. A house by Hawksmoor, a pupil of Sir John Vanburgh, afterwards enlarged by Carr of York: the park much improved by plantations.

7578. The following are *first-rate residences* :—

× *Belvoir Castle*,—near Belvoir; Duke of Rutland. A magnificent castellated structure, on the summit of a conical hill, rebuilt from the design of H. Wyatt; commanding views over several counties. The park, of great extent, containing a very complete dog-kennel, and the gardens good.

× *Burleigh*,—near Stamford; Marquis of Exeter. One of the most splendid old houses and spacious parks in the kingdom; the house in the Elizabethan style; the park modernised by Brown, who formed a handsome expanse of water, and removed many terraces at the house to form a lawn. A copious account of this place, with views, has been published by Mr. Drakard, of Stamford.

× *Erlon Hall*,—near Stratton; ——— Noel, Esq. A grand Elizabethan edifice, with a park of 1510 acres, planted in the ancient style, by London and Wise: the gardens have long been famous, and the water and cascades much admired.

× *Normanton House*,—near Normanton; Sir G. Heathcote. An irregular modern mansion; a well planted park of 400 acres; and gardens neatly laid out.

the grounds beautifully varied, well wooded, with a fine piece of water, an island, and various ornamental buildings.

× *Fawley House*,—near Fawley; ——— Knight, Esq. A motley building of different ages; the park, a fine improved demesne, abounding with forest scenery and water.

× *Kelmarsh*,—near Kelmarsh; W. Hanbury, Esq. A large mansion, with pleasure-grounds pleasingly diversified with the contrasted positions of wood and water.

× *Rothwell Hall*,—near Rothwell; ———. A very tastefully disposed seat, by the late possessor the Hon. W. Cockayne.

Upton Hall,—near Northampton; T. S. W. Samwell, Esq. A large irregular building, on a gravelly soil, displaying fine views of the distant scenery.

7581. YORKSHIRE. A central, and, in part, marine county, of 3,698,380 acres; the surface varied, containing several mountains, extensive moors, and some royal forests; the subsoil most generally rocky or stony; no public garden or park; a subscription botanic garden at Hull, and nurseries and market-gardens at all the large towns. It abounds in residences, especially in the West Riding, where nearly 400 are mentioned in *The Beauties of England and Wales*, as worthy of notice. The farmers' gardens are kept in a good state in the better parts of the county; and at Leeds there are some neat cottage-gardens. At Sherborne, in the West Riding, the wine-sour plum, one of the best baking sorts, abounds and thrives on limestone soils, and the fruit is sent to Hull, York, London, and other markets. There is a horticultural society held at Leeds, the chief promoter of which is J. Carr, of St. Anne's; and the same gentleman is active in his endeavors to set on foot a botanic garden. Chapel Allerton, near this town, noted when in the possession of R. A. Salisbury, is now a public nursery.

The Hull Botanic Garden—was established in 1812, by subscription. It occupies five acres, and is arranged on the same general plan as that of Liverpool, having been laid out chiefly by Shepherd, the curator of that garden. The principal walks which surround and intersect the garden are eight or nine feet broad, and form a total length of nearly three quarters of a mile; particular compartments are set apart for bog, alpine, and green-house plants; a pond thirty yards in length, for the growth of aquatics, and at the south-west corner of the garden a mount twelve feet high, admitting, though itself surrounded by trees, an extensive view of the Humber, the Lincolnshire coast, and the Wolds. The country round Hull being almost without trees, the shady walks of this garden form an agreeable resource as a promenade for the families of the subscribers. The curator is Mr. William Donn, nephew to the late curator of the Cambridge Garden.

Nurseries.—There are a number in this county, and some are of great extent. The oldest establishments are at York and Pomfret; the first carried on by J. Backhouse. Others has a considerable nursery at Huddersfield, and there are others of greater extent at Cottingham, near Hull, and at Doncaster. The seed of the York cabbage is supplied by Rigg and Son of York.

7582. Mansion and domestic residences.

Albarn Hall,—near Ribblesham; Geo. Folljame, Esq. Charmingly situated on an eminence rising from the Don, and skirted with wood down to the river.

Alerton Manoeverer,—near Knaresborough; Lord Stourton. An elegant mansion, in a park of 400 acres of very rich land, and charmingly picturesque. It contains a fine octagonal tower, from which are obtained extensive views.

Birdsall,—near Malton; Lord Middleton. A spacious and commodious mansion and pleasure-grounds, well planted and arranged.

Bradford,—at Bradford;—Hustler, Esq. An ingenious horticultural amateur, who has a good garden and collection of hardy herbaceous plants.

Bramham Park,—near Tadcaster; Geo. Fox, Esq. A stately mansion; the grounds laid out in the last century, in the ancient style, afford a good specimen of geometrical gardening.

Brocklesley Hall, Lincolnshire,—near Barton; Lord Yarborough. The park extensive, and diversified with plantations and rising grounds, containing a fine Gothic chapel and mausoleum, by Wyatt. Considerable improvements taking place in the kitchen-garden by substituting espaliers for standard fruit-trees, which had rendered the garden like a closely planted orchard.

Bilham House,—near Doncaster; W. Hewitt, Esq. The grounds contain a Belvedere (*Bel*, Italian, fine, beautiful; and *vedere*, to see), which commands the most extensive and richest prospect in Yorkshire.

Constable,—near Hedon; Sir Clifford Constable, Bart. A park spacious though flat, abounding in trees, with extensive walks, a large piece of water, and elegant bridge.

Cave Castle,—near Southcave; H. G. Barnard, Esq. A small but extremely pleasant park, with very large gardens and pleasure-grounds.

Copgrove,—near Knaresborough; Thos. Duncombe, Esq. An elegant mansion on a rising ground, with a pleasing prospect of the lawn, and a fine sheet of water, bounded with wood, winding out of sight beyond a distant hill.

Cusworth Hall,—near Doncaster; W. Wrightson, Esq. An elegant mansion, in one of the finest situations in the kingdom. The grounds are every thing that could be desired in a moderate space; the prospects extensive in all directions over a delightful country embellished with gentlemen's seats, churches, and other enlivening objects.

Denton Park,—near Otley; Sir H. C. Ibbetson. A noble structure, commanding fine views of the Vale of Wharfe.

Eeringham,—near Market Wrighton; M. Constable, Esq. A large and lofty brick mansion in a flat country; the park with a successful imitation of a river.

Eshton Hall,—near Gargrave; M. Wilson, Esq. A cottage with a conical mountain in front wooded to the top, and gardens liberally provided for, and conducted by J. Douglas, a skilful gardener. There is a good collection of bog plants for which the cold, moist climate of this place is well adapted.

Finingley Park Cottage,—near Bawtry;—Harvey, Esq. A curious and elegant shooting cottage, surrounded with every sporting convenience.

Farnley Hall,—near Otley; W. Fawkes, Esq. An elegant mansion, high on the side of an immense bank, commanding extensive views of the bank opposite, across the Vale of Wharfe. The kitchen-garden and farm well attended to.

Grimstone Grange (Grimstone Hill),—near Heydon; Charles Grimston, Esq. A superb baronial mansion, on an elevated site in a hilly park.

Hookfall (Hag-fall, i. e. Witch's fall or valley),—near Ripon; Miss Laurence. A singularly romantic scene, composed of a steep rocky declivity, descending to a woody glen; the walks along the declivity, showing finely varied views, a cascade, and, at an elevated point, Mowbray, a prospect which, Gilpin says, nature has worked with her broadest pencil.

Hackness,—near Scarborough; Sir J. V. B. Johnstone, Bart. Remarkable for the gardens and pleasure-grounds, executed in a superior style of elegance, in a vale, with a terrace-walk commanding extensive views, and a green-house richly stocked with exotic plants.

Wakfield Lodge,—near Towcester; Duke of Grafton. Delightfully situated on a gentle eminence, which slopes to a large lake, formed by Brown.

Horsesham Hall,—near Kirkham; Geo. Cholmley, Esq. A large and elegant mansion, on a swell rising from a beautiful valley; the pleasure-grounds finely embellished with plantations, but the views rather confined.

Holme,—near Howden; Hon. W. Stourton. A seat on a moor, susceptible of great improvement, and of possessing, at no great expense, a range of pleasure-grounds, which, in magnificence and picturesque beauty, not many places in England could excel.

Kirkstatham Hall,—near Guisborough; H. Vansittart, Esq. An excellent mansion by Carr; the gardens extensive, and laid out with much taste; they contain an octagonal temple, and with the house, the whole has an air of princely grandeur.

Leddon Lodge,—near Aberford; Chr. Wilson, Esq. A handsome mansion, in a fine open country, with agreeable pleasure-grounds.

Melburn,—near Pocklington; Sir H. Vavasour. A handsome brick mansion, in a flat country, finely ornamented with plantations.

Nelson-on-the-hill,—near Doncaster; R. F. Wilson, Esq. A good house and fine grounds, with those extensive prospects so general in this part of the country.

Mulgrave Castle,—near Whitby; Earl Mulgrave. A Gothic house in a commanding situation on the sea-coast; the approach roads much admired, and the verdant and marine views both very extensive.

Newby Hall,—near Ripon; Lord Grantham. A brick mansion, supposed by Sir C. Wren, in 1705: the pleasure-grounds laid out with most correct taste.

Owston,—near Doncaster; Phil. Cooke, Esq. An elegant structure on a rising ground in the centre of a rich and fertile country; the estate enlarged and a good *arondissement* formed by the exertions and purchases of the present proprietor.

Phlampton,—near Knaresborough; Lord Harewood. Remarkable for its pleasure-grounds, which are studded with detached rocks resembling large coal-cinders; it contains also a lake abounding in sinuosities. The whole scene of twenty acres is supposed to have been formed out of an old quarry; like the beautiful garden, mentioned by Brydone (*Travels in Sicily*), near Syracuse.

Rilstone Hall,—near Knaresborough; Sir H. Goodrick. A house on an eminence, the grounds remarkable for containing the original tree of the Rilstone pipin.

Ripley,—near Knaresborough; Sir W. Ingilby, Bart. The house, built in 1550, is a capacious castellated mansion with a park of old oaks, and a kitchen-garden, remarkable for its complete arrangement of hot-houses, and its collections of culinary and floricultural exotics.

Sandbeck (Beck, i. e. stream),—near Tickhill; Earl of Scarborough. A magnificent Grecian mansion in a valley, surrounded by high grounds and plantations, containing a fine piece of water and twelve miles of gravel-walks.

Sleay,—near Bridlington; Sir Tatton Sykes, Bart. A mansion from the proprietor's own designs, executed in a superior degree of elegance; the pavilions, hot-houses, green-houses, and other ornamental appendages, all in the most elegant and appropriate style.

Streethorpe,—near Doncaster; G. C. Yarborough, Esq. A handsome modern mansion, and the plantations and pleasure-grounds laid out with great judgment and taste.

Streaton Castle,—near Gainsborough; J. Wharton, Esq. An extensive fronted mansion, on the banks of a stream which has been expanded into a lake, and appropriate planting and other alterations made in the grounds.

Spifforth,—near Wetherby; Hon. and Rev. W. Herbert, an eminent botanist and horticultural amateur. The gardens are rich in curious bulbs and other rare plants.

Sprotborough Hall,—near Doncaster; Sir Joseph Copley. A mansion of Charles the Second's time, commanding delightful views of verdant scenery.

Stockall Park,—near Wetherby; W. Middleton, Esq. In the grounds is a lake, and on its margin near the house, a rock of a very singular shape, sixty-five feet in circumference and thirty feet high. It is supposed to have given rise to the name of the seat, as Stockheld, in Germany, signifies the base or pedestal of an image or statue.

Studley Royal,—near Ripon; Miss Lawrence. The pleasure-grounds used to be reckoned the finest in England. They occupy a valley furnished with a brook swelled into ponds, and forming various cascades, terminating in the fine ruin of Fountains Abbey. They abound in seats and buildings, and contain 500 acres, and the park 700 acres.

Thirkley Park,—near Thirkley; Sir T. Frankland. A good house, by Wyatt, and the grounds and gardens remodelled, partly from the proprietor's own ideas, and partly from those of the late Mr. Melbie. They contain some fine old cornel, pines, and *P. pyralis*, and a good kitchen-garden.

Wendworth Castle,—near Barmley; H. Vernon, Esq. An extensive fabric, on a considerable eminence, surrounded by an extensive park, containing a piece of water, half-way down the slope, forming, from the house and grounds above, a zone of light which to a stranger has a strange and unnatural effect. Near the house the grounds indicate the remains of the geometric style, and contain some fine cedars and other exotics, and a water-garden of embroidery.

Wheatley Hall,—near Doncaster; Sir Will. Cooke, Bart. On the banks of the Don, in a low but beautiful situation, and decorated with some of the finest oaks in the country.

17583. *First-rate residences.*

Castle Howard,—near Malton; Earl of Carlisle. A magnificent palace by Vanbrugh, with a front of great extent than that of Blenheim; the grounds not favored by nature, but containing a large piece of water and some old woods, considerably enlarged and improved by the present earl. There are several ornamental buildings in the grounds, and especially a superb mausoleum.

× *Duncombe Park*,—near Helmsley; C. S. Duncombe, Esq. A superb house by Vanbrugh, with a terrace adjoining, which affords delightful prospects over a fertile valley to wooded hills. The grounds contain an Ionic temple, and other buildings, and abound in fine trees.

17584. **DURHAM.** A surface of 610,000 acres, rich in pastures and woodlands towards the east this county.

Basingbourne Hall,—near Stanstead; Sir P. Parker. A small place, but the mansion elegant.

Bradwell Lodge,—near Hockley; ———. The house is an elegant building designed by J. Johnson, Esq. with an observatory on its summit. The grounds may be noted as containing decoys for game.

Buthorne House,—near Birdbrook; G. Pyke, Esq. The house was modernised in 1801, and stands in a large park, finely disposed into pleasure-grounds.

Belchamp Hall,—near Belchamptwaller; Rev. Sam. Raymond. A spacious mansion, fine terrace, and beautiful lawn.

× *Broxlet Lodge*,—near Kildredon; P. Du Cane, Esq. A handsome mansion, pleasantly situated on an eminence, near the centre of a small park, commanding fine views.

Burnhall,—near Merrington; B. Salvin, Esq. A low, re-
cluse, and much improved spot.

Castle Edin (Dun, Sax. a hill; or *Edin*, Gaelic, the steep face of a rock),—near Watergate; R. Burdon, Esq. A handsome castellated house, on the top of a woody precipice, which descends to a romantic delf.

Croxdale Hall,—near Butterby; W. Salvin, Esq. The house occupies a lofty situation on the Ware, and the grounds are beautifully wooded.

Eggleston House,—near Eggleston; ——— Hutchinson, Esq. Occupies a lofty situation on the banks of the Tees, surrounded by plantations, enclosing a garden noted for its botanical collection.

Grange Hall,—near Darlington; G. Allans, Esq. A modern mansion, pleasantly situated, containing an extensive museum of natural history.

Greenroaf,—near Lancaster; Sir T. Clavering. A plain but large mansion; and pleasant grounds, ornamented with walks and plantations.

Newton Hall,—near Durham; Sir T. Liddell. A plain mansion, surrounded by plantations, and containing fine views.

Ravenworth Castle,—near Gateshead; Sir T. H. Liddell, Bart. A modern mansion, sheltered by a fine forest of oaks.

Shincliffe Hall,—near Durham; R. Scott, Esq. A good house, sheltered by a beautiful amphitheatre of hanging woods.

Slub House,—near Winston; ——— Harrison, Esq. A respectable modern building, with pleasant grounds and thriving plantations.

Wingard,—near Greatham; Sir H. V. Tempest. An elegant residence, combining hospitable comforts, and an attractive mixture of varied ground, woods, and waters.

Woodlands,—near Lancaster; T. White, Esq. son and

7586. **NORTHUMBERLAND.** A surface of 1,157,760 acres, much varied by hills and mountains; fertile and well cultivated in the valleys, and abounding in ruined castles. Hexham is noted for the growth of onions, and there are extensive nurseries at Gateshead, near Newcastle, but on the Durham side of the Tyne, carried on by Falla and Son, and at Morpeth. Brown, the celebrated landscape-gardener, was born at Cambol, or Camphill, near Hartburn, in this county.

Babworth,—near Retford; the Hon. J. B. Simpson. A comfortable residence; the pleasure-grounds laid out in good style by H. Repton.

× *Chipschate Castle*,—near Wark; J. Reed, Esq. A delightful residence, with woods, rocks, and waters, and scenery in all respects enchanting.

× *Gosforth House*,—near Newcastle; C. J. Brandling, Esq. A mansion by Pain, and the grounds surrounded by a broad belt of wood, and varied internally by clumps, and a piece of water by White.

Heaton Hall,—near Newcastle; M. W. Ridley. An elegant house by Newton, the translator of Vitruvius, erected in 1713, on the steep and woody banks of Ouseburn.

Whitfield Hall,—near Newbrough; W. Ord, Esq. The house surrounded by high and bold rocks, and hanging woods thick with hollies, with which the lawn, being in high keeping, forms the finest contrast.

17587. *First-rate residences.*

Alnwick Castle,—Alnwick; Duke of Northumberland. A

7588. **LANCASHIRE.** A surface of 1,155,840 acres; mountainous and rugged towards the north and east, the other parts nearly plain, rich, but the climate moist. Near the large towns, and assemblages of operative manufacturers, it abounds in neat cottage-gardens, remarkable for their excellence in the culture of the gooseberry, and of florists' flowers. This county has long been noted for its florists' societies, and also a botanical society held at Warrington; and it is now distinguished by the Liverpool botanic garden, one of the first in England. Onions are grown extensively near Warrington, and asparagus to great perfection in several farm market-gardens near Liverpool. The Isle of Man, which lies off this county, contains nothing remarkable in the way of gardens; but it is the birthplace of Kewley, the inventor of the *Regulating Thermometer*.

Liverpool Botanic Garden—was established by subscription, chiefly through the influence of the celebrated W. Roscoe in 1800, and opened in 1803. It contains upwards of five acres, in a triangular form. (fig. 751.) It is entered between lodges (1, 1), which contain the curator's house, committee-rooms, &c.; and to this a library of natural history is to be added as soon as circumstances will permit. A walk surrounds the garden, and leads successively to the stove (2), rock plants (3), bog plants (4), green-house ground (5), conservatory (6), aquarium (7), herbaceous plants (8), and graminæum (9). The garden was laid out by Mr. John Shepherd, the curator, who published a catalogue of the plants in 1808; and to whose indus-

try, and extensive correspondence, the garden owes, in a great part, its present flourishing condition.

Florists' Gardens.—The principal of these exclusively devoted to the culture of flowers for sale are Nicholson's and Horrock's, both of Bolton. Taylor and Smith are extensive florists at Manchester, and combine also the nursery business. Thomas, at Middleton, near Manchester, has a good assortment; and there are above half a dozen good commercial florists at Oldham.

Allington Hall,—near Chorley; Sir R. Clayton. A modern house, on a gentle elevation, finely embosomed in wood.

× *Brownshelm*,—near Whalley; T. L. Parker, Esq. A

successor to the eminent landscape-gardener of that name. A neat mansion, and extensive plantations on a dreary and bleak moor, now rendered beautiful, comfortable, and valuable.

17585. The following are *first-rate residences*; —

Gibside,—near Thytton; Earl Strathmore. The mansion is situated on the east side of the Derwent; the park is four miles in circumference, much varied in surface, and well clothed with fine old oak-woods. The winding approach to the house along the brink of a wooded glen; the banqueting-house; the Ionic column of 120 feet, crowned with a statue of liberty, the terrace, and chapel, are much admired.

Hardmicks,—near Sadgiefeld; M. Russel, Esq. Created from bog by the former proprietor, J. Bindon, Esq. and now celebrated for the beauty of its pleasure-grounds and the elegance of its ornamental buildings. The improvements were commenced in 1750. The terrace, the bathing-house, the lake, the winding river, the cascade, the temple, the rivers, and the banqueting-house, are much admired.

Lambton Hall,—J. G. Lambton, Esq. A modern building by Bononi; the grounds lately much improved, and the kitchen-gardens containing a great extent of hot-houses.

Lumley Castle,—near Chester-le-street; Earl Scarborough. The mansion is a quadrangle of the æra of Edward I. placed on the brow of a well wooded valley. At each exterior angle is an octagon turret, machiolated for the purpose of annoying assailants, and in different parts are other arrangements of a former age, rarely now to be seen in the oldest edifices.

Raby Castle,—near Standrop; Earl Darlington. A noble Gothic pile, on an elevated rocky foundation. It affords a fine example of magnificence and comfort in the large entrance-hall, into which carriages drive before the visitors are set down. The park, pleasure-grounds, and plantations accord with the dignity of the castle. There is a terrace, commanding extensive prospects, 750 yards in length. The farm is extensive, and highly cultivated; the farmyard is close to the castle, and excluded from the view by an embattled screen. The dog-kennels and stables are rendered interesting architectural piles, and on the whole, few places in the empire are so magnificent, so complete, and so well kept up.

Sellaby Hall,—near Sellaby; Earl of Darlington. A free-stone and blue slate villa; the grounds disposed with great taste and judgment; the stables are arranged so as to form an ornamental group subordinate to the mansion; and the effect of the whole highly beautiful.

most extensive castellated pile, with curious ornaments: the grounds of great extent, watered by the river Aln, and well wooded. The kitchen-garden lately much improved by a range of hot-houses erected from the designs of J. Hay, Edinburgh.

Belasy Castle,—near Stamfordham; Sir C. M. L. Monck. A grey house, with a venerable tower, on rising ground, finely interspersed with single trees, and thick groves of wood.

Chillingham Castle,—near Chillingham; Earl Tankerville. A square heavy structure; in a very extensive park, containing a large herd of deer, and another of the white Scottish bison, shy, wild, and savage.

Hovick,—near Alnwick; Earl Grey. A noble structure by Newton, of Newcastle, in a park near the sea, which has been lately much improved.

Seddon Delaval,—near North Shields; Lord Delaval. A mansion by Vanbrugh, and a fine Gothic chapel: the grounds extensive, and containing an obelisk and mausoleum.

large Elizabethan mansion, in a conspicuous situation; the park, the remains of an ancient forest, but rather denuded.

Luckenfield Lodge,—near Ashton; lately F. D. Astley, Esq., author of *Hints to Planters*. An irregular pile, on a steep hill, with a broad terrace, and grounds particularly grand and romantic.

Huddow Hall,—near Little Milton; T. Weddel, Esq. A most romantic and picturesque situation.

Haigh Hall,—near Wigan; Earl of Balcarres. A venerable mansion, and grounds, remarkable for a summer-house built of Cannel coal.

Heaton Lodge,—near Manchester; Earl Wilton. A handsome stone edifice, by the late Samuel Wyatt, Esq. on a commanding situation, in the midst of a fine park, five miles in circumference, and enclosed with a stone wall. The entrance lodges in Doric, and mansion in the Ionic style.

Croft Hall,—near Warrington; Mrs. Hornby. The garden here was formerly rich in botany; and a catalogue of the plants was published by the gardener, Neale, in 1779.

Townley Hall,—near Burnley; J. Townley, Esq. A large venerable structure, forming three sides of a quadrangle; the park, enclosed in Henry VII.'s time, contains some very old oaks, which, with the contiguous mountains and distant country, present various combinations of grand and picturesque scenery.

Croston Rectory,—near Ormskirk. About twenty years ago the garden here was remarkable for its melons, which were trained on a hot-wall, and by using the seed of successive generations, the plants were found to be in some degree acclimated. The plants were rooted under bell-glasses on a moderate hot-bed at the base of the wall, and trained up it like the love-apple.

Woodfield. H. Sudell, Esq. near Blackburn. A handsome house and an extensive park, well stocked with deer. A kitchen-garden, prolific in forced and exotic productions, and a flower-garden under a separate gardener.

Conistone Priory,—near Ambleside; — Braddyl, Esq. Chiefly remarkable for its abundant horticultural products, hardy, forced, and exotic.

7589. First-rate residences.

Ashton Hall,—near Lancaster; Duke of Hamilton. An old baronial castle, in a park abounding with noble woods and fine marine views.

Knutsford Park,—near Prescott; Earl of Derby. An ancient mansion and very extensive park, greatly improved by the present owner. The kitchen-gardens are extensive and well managed; and near them is one of the largest aviaries in England. The gardener here excels in growing cucumbers, which he produces at table every day in the year, from a small

7590. CHESHIRE. A surface of 676,000 acres; generally level, with a moist climate, and deep rich soil. There are a number of market-gardens in this county, for the supply of Liverpool and the shipping; Altringham is famous for the carrot, which bears its name. There are good nurseries at Nantwich and Knutsford; and neat cottage and fine flower-gardens in several places.

Alderley Park,—near Alderley; — Stanley, Esq. Chiefly remarkable for its beech-grove, the trees of which are among the largest in the kingdom.

Bramwell Hall,—near Stockport; W. Davenport, Esq. The mansion is in the Gothic style, and very ancient. The site is elevated, and the prospects are pleasing, over a winding brook in a wooded bottom.

Bolesworth Castle,—near Barn Hill; Sir O. Mosely. The house is spacious, and in the Gothic style; and the grounds, though possessing little natural beauty, have been judiciously laid out.

Bromborough House,—near Bromborough; James Manwaring, Esq. The mansion is a handsome building, of the red stone of the country, and the grounds are pleasant and judiciously laid out.

× *Booth's Hall*,—near Knutsford; P. Legh, Esq. The mansion is plain, the park extensive, and varied by some fine pieces of water.

Carden,—near Farm; John Leech, Esq. The mansion is a venerable building, and the park and grounds are spacious and beautiful.

× *Durham Marsey*,—near Altringham; Earl Stamford. The mansion is a spacious brick quadrangle; and the park which surrounds it is extensive, and full of fine timber. Some of the oaks are of extraordinary magnitude; and in their tops is a heronry, where many herons associate, and build in society like rooks. The pleasure grounds are extensive, and well arranged.

Hyde Hall,—near Hyde-Chapel; George Hyde Clark, Esq. The house ancient, and the grounds picturesque and elegant.

7592. WESTMORELAND. A surface of 462,080 acres, and moors, that call aloud for planting and draining.

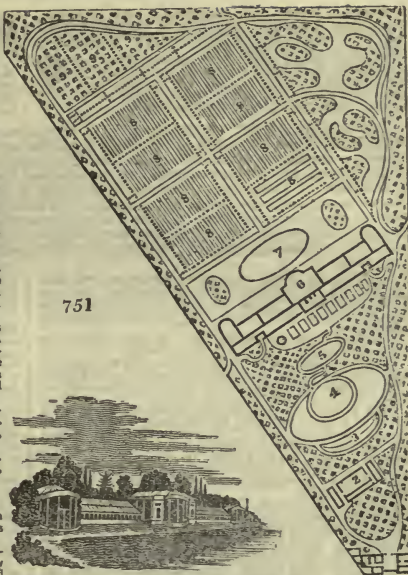

Colgarth,—near Ambleside; —. The residence of the late Bishop of Llandaff; chiefly deserving notice for its extensive and judiciously managed plantations.

Curwen's Island,—in Wyandermere lake, near Ambleside; J. C. Curwen, Esq. A Roman villa, with a dome, in the centre of a small island, well wooded, and the walks and gardens arranged from the designs of the late T. White, Esq. the landscape-gardener of the north.

× *Lomther Castle*,—near Lomther; Lord Lonsdale. A first-rate residence, the mansion castellated by Smirke, of rose-tinted white stone, with an outer and inner court, and a terrace as a basement 500 feet long and 100 feet wide: the whole building rather low for the style of architecture, but in other respects excellent. The parks and pleasure grounds are of great extent, and command a variety of prospects and scenery, not surpassed perhaps in any other part of the British dominions. There is a terrace of closely mown turf: the grasses of the

7593. CUMBERLAND. A surface of 970,000 acres, entirely mountainous, and abounding in lakes, the most numerous and celebrated of any county in the empire: as in the other north-western counties, the climate is severe, and winter long and dreary.

Corby Castle,—near Carlisle; Henry Howard, Esq. The mansion has lately been improved from the designs of Nicholson; it is boldly situated on the banks of the Eden, which are well wooded by nature, and singularly grand and picturesque. The grandfather of the present owner began

hot-house or pit, with a vault underneath, the first which was heated by steam in England.

Lyme Hall,—near Stockport; John Legh, Esq. The house is a quadrangle, in the style prevalent in James II.'s reign. The park is not well wooded, but remarkable for its trees. At present both house and grounds are undergoing great alterations.

Pennyton,—near Stockport; Sir George Warren. The mansion is an elegant Ionic building; the park extensive, and the pleasure grounds beautifully disposed.

Peel Hall,—near Halton; the property of the Earl of Plymouth. It is one of the most magnificent old mansions in the county, though now only occupied as a farmhouse.

7591. The following are first-rate residences: —

Cholmondeley Hall,—near Malpas; Earl Cholmondeley. A spacious mansion has lately been erected; and the grounds laid out by Webb.

Crewe Hall,—near Wyrthunbury; John Crewe, Esq. The mansion is a fine structure, by Inigo Jones; and the grounds are judiciously laid out.

× *Eaton Hall*,—near Eaton; Earl Grosvenor (gross and reneur, Fr. or grand huntsman; an ancestor of this family having been in this capacity to the king). The house was originally built by Sir John Vanburgh, but has lately been remodelled, in the Gothic style, by Hardwick. The park is extensive, and with the gardens, has been much improved from the designs of Repton.

× *Talton Park*,—near Knutsford; W. Egerton, Esq. The house is from an elegant design of Wyatt; the park contains 2500 acres, including a mere, or lake, of some extent; the kitchen-garden is large, and contains a spacious well constructed pinery, and shady border for mosses.

acres; much varied by lofty mountains, naked hills,

finest mountain kind. It is nearly a mile in length, and runs along the brink of a limestone cliff, which overlooks a great part of the park, irregularly scattered with forest trees of immense growth, and well stocked with deer. It was this park that Lord Macartney compared to the garden of the Emperor of China at Gehol.

× *Rayrigg Hall*,—near Kendal; Rev. T. Fleming. On the banks of Wyandermere; and said to resemble Ferney, the celebrated seat of Voltaire, near Geneva.

Rydal Hall (Rye-dale),—near Kendal; Sir F. Le Fleming. A romantic seat on a mountain side, clothed with natural oak-woods, and celebrated for its waterfall.

Warton,—near Carlisle; J. Jackson, Esq. The gardens resemble those of Kensington; and are said to have been laid out by Mollet, James II.'s gardener, for the Scalfie family, successors from Edward II.'s time till within the eighteenth century.

to lead walks through these grounds in 1706, and is said to have been one of the first persons who broke through the frames of the ancient style of laying out grounds. The late Mr. Meikle, who was a good deal employed to lay out grounds in the north of England, was originally gardener here.

Muncaster House,—near Ravensglass; Lord Muncaster. Great improvements have been made by planting the bleak hills on this estate: his lordship has also irrigated extensively, and is a very spirited agriculturist.

Nunnery,—near Penrith; Rich. Bamby, Esq. The house is in a low confined situation, but the grounds are extremely beautiful, and laid out with great taste and judgment. They lie along the banks of the Eden, whose rugged bed produces several cascades and one waterfall of nearly twelve feet.

7594. HAMPSHIRE. A surface of 1,112,000 acres, considerably varied in character of surface, yet without high hills. The Isle of Wight is a detached portion, remarkable for its beauty and fertility; the Downs, a chalky ridge, are bare of timber. The New Forest and Bere Forest occupy large tracts near Southampton, and are the principal *tree-bearing* royal forests in the management of the government: on the borders of Dorsetshire there are large tracts of heath, and on the sea-shore extensive marshes. There are several nurseries at Southampton, of which the oldest established is that of Rogers, and the next in repute that of Page. There is a horticultural society held at Winchester by some gentlemen and gardeners of the county. In the Isle of Wight, at St. Laurence cottage, there was a vineyard managed by a regular *vigneron*. At Fratton, near Portsmouth, is grown the Portsmouth broccoli, so much esteemed.

Appuldurcombe,—near Godshill, Isle of Wight; The Hon. —Pelham. A Corinthian mansion of freestone, with four fronts, in a spacious park in the midst of an amphitheatre of hills, ornamented with trees of large size, and commanding fine prospects.

Avington,—near Winchester; Duke of Buckingham. A brick mansion, in a second and wooded valley, with a fine park, in a spacious park in the midst of an amphitheatre of hills, ornamented with trees of large size, and commanding fine prospects.

Belle Vue,—near Southampton; Admiral Sir R. Blyth. A superb modern house, commanding a most exquisite prospect over the Southampton water, with extensive gardens and hot-houses, and an excellent botanical collection.

Bavis Mount,—near Southampton; Henry Hulton, Esq. A mount in a bay of the river, and laid out as a wilderness, by Charles Mordaunt, Earl of Peterborough, in Pope's time. His lordship is said to have refused to let strangers see the ground, unless during high water.

Bonchurch Cottage,—near Bonchurch, Isle of Wight; —Hatfield, Esq. A comfortable and picturesque house in a most romantic situation.

Bradwell Lodge,—near Hockley; — The house is an elegant building, designed by J. Johnson, Esq., with an observatory on its summit.

Bramshill,—near Hartley Wintney; Rev. R. Cope. An Elizabethan edifice on an eminence, in a spacious park, and one of the most commanding features of the county.

Broadlands,—near Rumsey; Lord Palmerston. A neat edifice of white brick, in a well wooded park.

Cadland,—near Southampton; R. Drummond, Esq. The house is plain, but commodious; the park was laid out by Brown, and is five miles in circumference. The whole is in high keeping.

Castle Malwood Cottage,—near Lyndhurst; General Wynyard. A high situation, with extensive views; the garden kept in high order.

Cane Hill,—near Portsmouth; J. Delmé, Esq. An elegant modern building, in a pleasant park, on the east side of the lake of Portsmouth Harbour.

Cranbury House,—near Winchester; Sir N. Nolland. An extensive mansion; good kitchen-garden and fine prospects.

Cruickston,—near Lichfield; — Once the seat of Edward Lisle, Esq. author of *Oberon, or the Traveller in Agriculture*; he died in 1722, having had twenty children, seventeen of whom survived him. Of these nine, sisters, constructed a grotto which has been celebrated by Pope in his *Rural Essays*,

"This radiant pile nine rural sisters raise," and of which only the skeleton now remains.

Cuffhills,—near Lyndhurst; — Rose, Esq. A handsome residence, greatly improved by the late owner, the Right Hon. G. Rose; the grounds and part of the forest are every thing that can be desired. The late Mr. Eames, when called in to give his professional assistance, found nothing to do but to arrange the pleasure-ground scenery and the kitchen-garden. The whole is now kept in respectable order.

Dogmersfield Park,—near Odiham; P. St. John Midmay, Esq. The mansion is extensive; the park contains 700 acres, much diversified in surface, and by old woods, new plantations, and a lake of forty-four acres. The pleasure-grounds were laid out by Eames. In the plantations the ash is much and successfully cultivated for hop-poles.

Evelham,—near Hatford Bridge; Lieut. Gen. Gwynne. An eligible residence; the park and grounds two miles in circumference, laid out by Eames, who had a lease of this estate for twenty-one years.

Exbury House,—near Exbury; Col. Mitford, author of the *History of Greece*, by whom the grounds have been greatly improved. The demesne is about eight miles in circumference.

Fairy Hill,—near Ryde; Rev. H. Oglander. A neat house, and the grounds disposed as a *ferme ornée*.

Fern Hill,—near Wooten Bridge, Isle of Wight; S. Saunders, Esq. The house bears some resemblance to a church; the prospects are remarkably fine, and the kitchen-garden good.

Froghill,—near Calbourne; F. Harrington, Esq. A small, but elegant house, and grounds disposed with much taste.

Gatecombe House,—near Carrisbrooke, Isle of Wight; A. Campbell, Esq. Beautifully situated on the declivity of a hill, and the park ornamented with natural oaks and copice-woods.

Grange Park,—near Almsford; Alexr. der Baring, Esq. The house by Inigo Jones, and said by Walpole to be one of his

Ponsomby Hall,—near Egremont; G. E. Stanley, Esq. The house is modern and surrounded by numerous plantations and agricultural improvements made by the present spirited owner.

Workington Hall,—near Whitehaven; J. C. Curwen, Esq. The house is a spacious quadrangular building; the park and pleasure-grounds are extensive, and the home farm celebrated, for it ranks Workington and Curwen with Holkham and Coke, Woburn and Bedford.

best works: the grounds varied and beautiful. In the gardens an extensive range of iron hot-houses by Jones and Co. of Birmingham.

Hackwood Park (Hawking Wood),—near Oldleasing; Lord Bolton. The house lately improved; the park very extensive, bold, and irregular, and finely clothed with noble beech-trees, many of which, near the house, are mantled with ivy. The pleasure-grounds contain 100 acres, and afford examples of an aquatic menagerie, a verdant theatre, French garden, and music temple.

High Clere,—near Lichfield; Earl of Carnarvon. The mansion an elegant modern structure of brick, stuccoed; the park thirteen miles in circumference, and few in the kingdom display a surface more varied, or scenery more interesting. Almost every thing has been done by the present owner, who is also a great encourager of horticulture.

Huralbourne Park,—near Whitechurch; Earl of Portsmouth. The mansion by W. Wyatt: the grounds delightfully wooded, and furnishing fine prospects.

Maitland House,—near Romsey; Sir C. Mill. A spacious and venerable edifice, with commodious gardens and pleasure-grounds, noted for their plane-trees.

Moyles Court,—near Ringwood; — Lisle, Esq. A good building, in a park, small, but agreeable.

Newtown,—near Boldre; H. C. Plowden, Esq. A spacious and elegant mansion, with a circular room at the top, from which extensive views are obtained. The gardens are small, but neatly kept.

Norris,—near East Coves, Isle of Wight; Lord Seymour. A Gothic edifice, with an extensive front, by J. Wyatt, Esq. The park small, but affording fine marine views.

Northcourt House,—near Shorewell; R. Bull, Esq. A building of the time of James I., with the grounds nearly in the same state as originally disposed, in ranges of small terraces, with seats, and walls for fruit.

Paultons,—near Romsey; S. Stanley, Esq. The whole demesne is about five miles in circumference: it was submitted to Brown, who thinned the natural woods, and opened ample lawns.

Pienell House,—near Boldre. A beautifully situated house, with lawns and pleasure-grounds, extending to the sea-side.

Portsmouth House,—near Southampton; A. M'Kinnon, Esq. A handsome building by Crunden, situated close to Southampton Water, with extensive pleasure-grounds, beautifully diversified.

Priory,—near St. Helen's Green, Isle of Wight; Sir Nash Grose. This demesne consists of a narrow strip of ground, about a mile in length, extending along the shore: both house and grounds have been much improved by their present owner.

Red Rise,—near Stockbridge; H. Errington, Esq. Pleasantly embosomed in woods, and surrounded by open downs.

Stoneham Park,—near Winchester; J. Fleming, Esq. An old mansion, recently much improved: the park extensive, and laid out by Brown.

St. Lawrence Cottage,—near Undercliff; Sir R. Worsley. Here a vineyard has been formed, and is now directed by a French *vigneron* (vine-gardener). It was begun in 1792; occupies three acres of rocky ground, sheltered from the north. Muscadines are chiefly planted in beds, twelve feet wide, and the plants a foot and a half apart each way. The stools are kept at about eight inches high, and two shoots are annually grown from each, to succeed the two of the former year then in fruit. These shoots are not allowed to extend more than three feet and a half. A pleasant light wine is made from the grapes.

St. Simon Park,—near Winchester; Sir F. Baring. The house and grounds, recently much improved: the gardens and hot-houses extensive, and well managed.

Vine,—near King's Clere; W. Chute, Esq. The situation rather low; the grounds well wooded.

7595. First-rate residence.

Strathfieldsay,—near King's Clere; Duke of Wellington. The house, now undergoing great alterations, is rather low; the park is extensive and well wooded. The alterations are by Wyatt, the architect of Drury-lane theatre.

Clarendon Lodge,—near Salisbury; F. H. Bathurst, Esq. A commodious modern edifice, surrounded by extensive grounds, abundantly wooded, and containing a natural lake, from which issues a stream.

Conesfield House,—near Downton; Sir A. Paget. A true *ferme ornée*; the fields regularly encompassed with ornamental hedges and trees, with generally a turf drive, or a gravel-walk: the views from these hedge-paths are extensive.

7596. WILTSHIRE. A surface of 821,120 acres; elevated, varied, but not much wooded: the climate dry and cold. Gary and Moody, nurserymen, near Salisbury, grow the best crocuses in England, of which they send large quantities annually to London, and other parts: there is a famous grower of ranunculuses and anemones at Marlborough, and a good nursery at Devizes, besides various market-gardens. Savernake Forest, in Tottenham Park, is the only one in the kingdom belonging to a subject.

Ashecombe,—near Cranbourne; P. Methuen, Esq. The house is singularly situated on an isolated knoll, which has been, not unaptly compared to an inverted basin, placed in the middle of a large China bowl.

Broomers,—near Downton; R. Brewster, Esq. An Italian villa, by Falkham, of which the stables are of a very superior kind. The grounds and exterior scenery highly picturesque and beautiful.

Earl's Stoke.—Connected with this spot is a rustic village by design. It consists of several cottages placed on the sides of the road, each detached from the others, and every one accompanied by its garden-creepers, trees, honey-suckles, &c.

Lake House,—near Ambresbury; Rev. Edw. Duke. A respectable, and truly picturesque edifice, with bay windows, gables, yew-hedges, terraces, &c. in the genuine style of the last age.

Liddiard Park,—near Wootton Bassett; Lord Bolingbroke. Extensive grounds abounding in fine old trees, and containing a pond of water.

Longford Castle,—near Salisbury; Earl of Radnor. A house remarkable for its ground-plan, which was intended to resemble the catholic monogram of the Trinity, erected about 1591, from the designs of John Thorpe. An entirely new structure, in the castellated style, is in contemplation. The park is rich in woods and picturesque views, and is watered by the Avon.

Littleton Park,—near Ramsbury; E. L. Popham, Esq. Four miles in circumference, well wooded, and containing a hill, and the river Kennet passing through the pleasure-grounds.

Melchett Park,—near Downton; J. Osborne, Esq. The grounds remarkable for a beautiful Hindu temple, erected by the late owner as a tribute to the merits of Warren Hastings, Esq.

Pyt House, near Wardour; J. Bennett, Esq. A modern Grecian edifice, with an elegant chapel attached, and pleasure grounds extensive, and laid out with considerable taste.

Roche Great Court,—near Salisbury; F. T. Egerton, Esq. An Italian house, by C. H. Falkham, Esq., and 2000 acres of ground, laid out as park, garden, and farm scenery.

Rosed Ashton,—near Trowbridge; R. G. Long, Esq. A mansion lately improved, and a park of considerable extent, abounding in woods.

Tottenham Park,—near Marlborough; Earl of Aylesbury. This seat, including Savernake Forest, is sixteen miles in circumference; the whole intersected by numerous walks and avenues, eight of which diverge from a common centre. The house is a square brick building with wings; opposite to it is a lofty column, erected by a late earl as a testimony of gratitude to its former possessor.

Wilcot House,—near Uphaven; Admiral Montague. A modern mansion, adorned with a finely wooded park, bounded by a branch of the Avon.

Wilbury House,—near Amesbury; Sir C. W. Malet. A comfortable stone house, with a park recently planted, and likely to become eminently deserving notice.

7597. First-rate residences.

× *Borwood,*—near Calne; Marquis of Lansdown. An extensive mansion, chiefly by Adams, on an eminence, in a park and pleasure-grounds, extensive, greatly diversified in natural features, and richly adorned with plantations. Within the boundary of the park are contained numerous valleys, each of which is characterised by its own peculiar form, feature, and scenery, and one is covered by a broad and irregular lake, the waste waters of which flow over a much-admired artificial cascade.

× *Corsefield House,*—near Corsham; P. C. Methuen, Esq. An Elizabethan house, altered and enlarged by Brown, and subsequently, in a very superior style, by Nash. The grounds, laid out by H. Repton, are extensive, but little varied. A hot-house and conservatory have been erected by Stewart.

Charlton Park,—near Malmesbury; Earl of Suffolk. A noble pile, by Inigo Jones, but unfinished: the park extensive, but at present cultivated as a farm.

× *Fonthill Abbey,*—near Hindon; late W. Beckford, Esq. A magnificent and unique mansion, in imitation of a Gothic abbey, in style, situation, and surrounding scenery very peculiar, and considered the most remarkable seat in the west of England. The natural and scenic features of this place are bold, grand, and highly diversified. Nearly the whole of an eminence, which gradually ascends from the open country on the north, and from a fine enclosed country to the south, is covered with woods, some of which are of ancient growth, but the greater part planted by the father of the late possessor.

7598. DORSETSHIRE. A surface of 775,000 acres, divided into two parts by a range of chalk hills, which run east and west: the climate dry and healthy, and the soil rich. Near this county is the Isle of Jersey, which, with Guernsey, supply roots of the amaryllis sarniensis to the seedsmen, and some grapes to the fruiterers. Parsneps are grown to a great size, and there is a general taste for flowers, and neatness in the gardens, to which their mild winters are particularly favorable. In these islands many of our green-house plants thrive in the open air; as several of the amarillidæ, verberna triphylla, camellia, celtis, nerium, corea, melaleuca, pittosporum, and even canna indica, which is a weed in some gardens. It is suggested by Dr. McCulloch (*Appendix to Quayle's Agr. View of the Norman Islands*), that Guernsey would form an excellent coast station in acclimating the plants of hot countries. The arum maculatum is so abundant in the Isle of Portland, that the common people gather its roots, prepare them as sago, and send the produce to London, where it is sold as Portland sago.

Frynton House,—E. B. Portman, Esq.; near Poole. A splendid modern mansion, and extensive and beautifully varied grounds. The gardens in a high state of cultivation and keeping, and the whole one of the first residences in the county.

Encombe,—near Kimmeridge; William Morton Pitt, Esq. The situation is extremely fine, and the grounds are disposed with much taste. On this estate, in 1753, was found a mushroom that weighed eight pounds, was fifteen inches long, ten round, eight deep, and the section almost in the form of the figure 8.

Kingston Hall,—near Poole; Henry Banks, Esq. The house was erected in 1665, and is large and substantial. The kitchen-garden is well attended, and the park-scenery good.

Lullworth Castle,—near Lullworth; T. Wild, Esq. The house is a noble pile; the park occupies a circuit of nearly four miles, and has lately been much improved.

× *Milton Abbas,*—near Milton Abbas; Earl of Dorchester. The house, by Sir W. Chambers, is one of the most magnifi-

7599. SOMERSETSHIRE. A surface of 991,360 acres, hilly and stony towards the N.E., with ferns, marshes, and moors, towards the centre; the remainder high and hilly. There was a curious market-gardener at Bath, about 20 years ago, who proposed ripening grapes under hand-glasses; and in Switzer's time, there was a seat there abounding in curious water-works. Salter is the principal florist and nurseryman, and has published a tract on florists' flowers. There are also good nurseries at Taunton, Frome, and Bridgewater.

From the apex of a hill, amidst a grove of ancient pines, rises the lofty tower, turrets, pediments, and pinnacles of a mansion, which assumes externally the character of an ancient monastic edifice. It consists of a central tower about 270 feet in height, a lofty entrance-hall, a vestibule, a wing, or transept, extending from the tower to the east, and two other wings, branching off from the centre to the north and south. The exterior elevations of each of these portions is dissimilar to the others, and each is appropriated to the different accommodations and purposes of an elegant and commodious mansion. State-rooms, gallery, libraries, eating-rooms, parlours, drawing-rooms, &c. are fitted up in a truly splendid style; and adorned with the choicest works in literature and the fine arts. The architect of the whole was James Wyatt, Esq., and many of the most eminent artists of the country were employed in finishing the interior.

The abbey is approached by a broad avenue of turf, upwards of a mile in length, on the summit of a ridge, the sides of which are thickly wooded. A public road formerly intersected the park, but that road is now in great part arched over, and lighted by openings at intervals. There are numerous green drives (the sub-soil being chalk, these are always dry), and gravel-walks, which conduct through the grounds, and especially the woods, the under-growths of which, in many places, are formed of the most choice sorts of roses and American plants, purchased and placed in their appropriate soils at great expense, and afterwards left to run wild. There are whole acres of azaleas, rhododendrons, magnolias, &c. which have a most delightful effect. Herbaceous plants are equally profusely scattered; and there are a few seats and buildings, but these are chiefly confined to the lower grounds, where there are several large pieces of water, cascades, grottoes, &c. near to the site of the former Grecian mansion. This we were fortunate enough to see before its removal in 1806. The kitchen-garden is good, and no expense spared to render it productive in exotic as well as hardy esculents and fruits.

× *Longleat,*—near Warminster; Marquis of Bath. A magnificent mansion, and the proudest architectural ornament of this part of Wiltshire, built in the latter part of the 16th century from the designs of an Italian architect. The grounds were laid out in Charles II.'s time by London and Wise, and subsequently remodelled by Brown, whose plans were followed by the late marquis to his death in 1795, and have been continued by the present proprietor. A broad and luxuriant valley contains the house and a large sheet of water: the park stretches up the sides of the surrounding hills, covered by the finest old timber, and fifteen miles in circumference; the approach from the south is a straight avenue nearly a mile; the others are different, and that from the Warminster road displays nearly the whole of the domain.

Stoke Park,—near Devizes; J. Smith, Esq. A house and offices, with a front of 556 feet, on the summit of an eminence, surrounded by a well wooded and watered park, in which the pleasure-ground occupies a narrow winding valley, containing a rivulet, the waters of which form several cascades. On the whole, few spots in England present such a combination of lawn, hill, vale, waters, and diversified plantations.

× *Stourhead,*—near Mere; Sir R. C. Hoare. The mansion from the designs of Colin Campbell, author of the *Vitruvian Britannicus*: the grounds long noted for their sylvan beauties and picturesque features. The scenery consists of ridges of hills, forming long extended terraces, and deep narrow valleys with rivulets. The sides and summits of some of these eminences are thickly, and others partially, clothed with wood. One of the valleys is covered with water by means of a dam, and various cascades are formed on the brooks: throughout the whole place, temples, obelisks, bridges, covered seats, and other buildings are introduced.

Wardour Castle,—near Salisbury; Earl Arundel. A large magnificent mansion, by Paine in 1776, the grounds are much diversified in surface and by planting, and they contain the ivied ruins of the old castle.

× *Wilton,*—near Wilton; Earl Pembroke. An extensive pile, of rather incongruous architecture, by Hans Holbein, Solomon de Caus, Inigo Jones or his successor Webb, and James Wyatt, Esq. The park contains some ornamental buildings, old trees, and pieces of water.

cent piles in the county; the grounds beautifully varied and richly wooded, were in part laid out by H. Repton. A village was formed from the vicinity of the house, and erected in a regular style in a distant situation.

More Critchell,—Near Winborne; Charles Stewart, Esq. This is a romantic seat, with an excellent mansion, commanding extensive views.

Waterbourne Harrington,—near Dorchester; Edward Williams, Esq. The house is a large quadrangular building, and the grounds contain some fine oaks, and chestnuts of the growth of two centuries and upwards.

Stourhead Castle,—near Milton; Earl of Digby. The mansion is a singular structure, in the form of a Roman H; the centre part was built by Sir W. Raleigh, and is dated 1514. In the park is a grove, said to have been planted by Sir Walter. The grounds were much improved from the designs of Brown.

Enmore Castle,—near Enmore; Earl Egmont. A quadrangular embattled structure, the stables and offices all under ground; the shrubbery neat and elegant, and the views over a finely cultivated and enclosed country.

7600. DEVONSHIRE. A surface of 1,600,000 acres, abounding in mountains, hills, and valleys; the former barren and moory, the latter mild in climate, beautiful and fertile; orchards abound in the southern part, and the centre contains that barren, bleak tract, called the Forest of Dartmoor, now happily under a spirited course of improvement. Ford at Exeter, and Luccombe of the same place, (who raised the variety of the common oak which bears his name,) are the principal nurserymen. The father of Galpine, author of the *Compend of British Plants*, had a nursery at Brenton. The Duchess of Bedford has a picturesque cottage retreat on the banks of the Tamar (*fig. 752*), one of the last places at which the late H. Repton was consulted.

Bicton,—near Bicton; Lord Rolle. The mansion is spacious; the park pleasantly situated, and well wooded.

Boringdon,—near Plymouth; Lord Boringdon. The house was built at the end of the fourteenth century, though now occupied as a farmhouse; the park contains 500 acres richly wooded, to which continual additions are making on the side of Dartmoor.

Castle Hill,—near South Molton; Lord Fortescue. The mansion is situated on the acclivity of a finely wooded eminence; the grounds are well diversified, and contain a fine sheet of water.

Collingriest House,—near Tiverton; Thomas Winsloe, Esq. The mansion has lately been enlarged, and the grounds improved.

Escot House,—near Honiton; Sir John Kennaway. The house has been improved by H. Wyatt; the plantations are among the most luxuriant in Devonshire.

Farringdon House,—near Ottery St. Mary; J. P. Chelwick, Esq. The grounds are pleasant, and the plantations particularly flourishing.

Great Fulford, near Exeter; B. Fulford, Esq. The mansion is one of the most ancient in the county, and still retains much of its original character: the park is much diversified internally by undulations, and the judicious disposition of trees and the distant river are interesting.

Haldon House,—near Exeter; Sir L. Palk. The house is a model of Buckingham House in St. James's Park. The ornamental grounds are extensive, and the plantations cover many acres.

Landrige,—near Chudleigh; Rev. J. Templar. The mansion is large; the grounds are picturesque and finely wooded, and contain some of the largest trees in Devonshire.

Luscombe House,—near Dawlish; C. Hoare, Esq. The house is an elegant design of Nash, who has endeavored to unite the picturesque, the beautiful, and the ornamental. The grounds are beautifully varied by nature, and well planted.

Manchead,—near Kenton; Lord Lisburne. The mansion is of considerable antiquity: the park abounds in fine plantations of firs and other forest trees; and the lawn in the garden-front of the house is beautifully varied by groups of trees.

7601. CORNWALL. A surface of 758,000 acres, and the valleys rich.

Carclven,—near Falmouth; Sir W. Lemon, Bart. The house is of granite, in the Ionic style; the grounds are beautiful, and much improved by plantation.

Clowance,—near Hale; Sir John St. Aubyn, Bart. The house is enveloped in wood, the park is large, and the pleasure-grounds delightful.

Cotchele or Cuttaye House, near Calstock; Earl of Mount Edgecumbe. The house is an irregular quadrangle, situated on a bold knoll, on the banks of the Tamar. The woods which descend from the house abound in some of the most magnificent oaks and chestnuts in England.

Menabilly,—near Menabilly; Philip Rashleigh Esq. The house is of granite, and commands an extensive prospect over the British Channel: it contains one of the finest collections of native minerals in the kingdom. The kitchen-garden is well managed; and the grounds are distinguished for their very beautiful grottoes.

Pendurves,—near Clowance; John Stackhouse, Esq. The house is a large handsome granite edifice; and the grounds contain a large lake.

Port Elliot,—near St. Germain's; Lord Elliot. The mansion is irregular, and the grounds very much so, and greatly improved and embellished, in part from the designs of Repton.

Godhurst,—near Enmore; Sir C. Tynte. A noble building, with a park, and home pasture-farm, of great extent, exhibiting as fine scenery of the verdant and cultivated kind as any in England.

752

Mount Edgecumbe,—near Plymouth; Earl Mount Edgecumbe. The house is a very ancient building; the grounds are among the most remarkable in England for boldness, fine trees, and marine views. The grounds have been considerably improved by the present earl, and an account of them lately published, entitled *A Walk round Mount Edgecumbe*, with eight views, 1821.

Nutwell,—near Topsham; Lord Heathfield. The mansion is large, and the park scenery highly interesting.

Orton House,—near Kenton; Rev. J. Swete. A new house has been built, and the grounds, which had been laid out at great expense in the old style, are modernised, and a fine lake formed from a natural brook.

Powdersham Castle,—near Kenton; Lord Courtenay. A very ancient seat, with a venerable Elizabethan mansion, and extensive grounds finely planted. The circumference of the park is nearly ten miles; and the pleasure-grounds and kitchen-gardens are replete with appropriate productions.

The Retreat,—near Kenton; Sir Alexander Hamilton. An elegant seat, kept in good style.

Sultram,—near Plympton St. Mary; Lady C. Parker. The situation is eminently beautiful: the mansion is the largest in the county; the new approach is particularly admired.

Tamlock,—near Barnstaple; Sir B. Wray, Bart. An imposing mansion and woods, remarked by authors as taking in at once the best manor, best mansion, finest church, and richest rectory in the county: the house is in the Gothic style, and the grounds have recently been much improved.

X Upgrove,—near Chudleigh; Lord Clifford. One of the most enchanting spots in Devon: the grounds contain every variety of objects which constitute beautiful scenery—wood, water, rock, and unevenness of surface; and the exterior scenery is highly interesting.

Wulford Lodge,—near Honiton; General Simcoe. The house is large, and decorated with fine old woods and many plantations, which clothe a declivity, and form a semicircle around it.

Yeo Vale,—near Bideford; Rev. F. H. Morrison. An ancient seat, recently much improved.

mountainous and hilly, but temperate in climate,

Pontilly Castle,—near Cotchele; Mrs. Tilly (1820). The house, which is modern but embattled, is finely situated on the banks of the Tamar. The declivities towards the river are most luxuriously wooded with elms and limes, and the background scenery is distinguished by a tower in which the late Mr. Tilly was inhumed sitting in his elbow-chair with bottles, pipes, &c. before him.

Tetedy Park,—near Redruth; Lord de Dunstanville. The house is of granite, from a design by Edwards; the park contains 700 acres, of which 150 are appropriated to a lawn and sheep-walk; on the rest extensive plantations have been made. The situation is bleak, and it is said the pineaster is planted as a nurse to other species, and that the larch will only grow in sheltered situations.

Trelartha Hall,—near Launceston; Colonel Radd. A torrent dashing over immense rocks, amid mountainous and woody scenery, renders this a singularly grand and picturesque place.

Trelawny House,—near West Cove;—Trelawny, Esq. The mansion is in the Elizabethan style, and the views are over the valley of the Love river, which contains some of the finest scenes in England.

SECT. II. Wales.

7602. A hilly mountainous surface of 5,206,900 acres, with a climate colder than that of England, and more moist in the proportion of 34, the average number of inches of rain which falls in Wales, to 22, the number for England. The soil is generally of an inferior description, and the great proportion of mountainous surface is fit only for planting, which is the principal branch of gardening followed in Wales: horticulture and floriculture are chiefly confined to the low grounds near the sea and internal valleys. There are no public gardens; but few commercial ones; and the number of gentlemen's seats is very limited: cottage and farmers' gardens indifferent, though generally well stocked with commoner varieties of cabbage or borecoles and leeks.

7603. ANGLESEA, or MONA. A hilly bleak island of 200,000 acres; ill adapted for any branch of gardening, but containing a few seats worthy of notice.

Baron Hill,—near Beaumaris; Lord Bulkeley. A house improved by Sam. Wyatt, but supposed to be too high for its elevated situation. The ground is much varied by nature, and improved by lawns, groves, bridges, and other ornamental buildings; and from a tower on Baron Hill the finest prospects in the island are obtained.

Bodorgan,—near Aberfraw; O. P. Meyrick, Esq. A house by Dufford, on an eminence, in a small park well clothed with wood.

7604. CAERNARVONSHIRE. A mountainous surface of 310,000 acres, with few gardens of any sort whatever.

Vaenol House,—near Caernarvon; T. A. Smith, Esq. A handsome modern structure, deeply embosomed with trees, with an extensive lawn sloping to the Menai.

× *Penrhyn Castle*, near Bangor; Lady Penrhyn. A castellated mansion of considerable antiquity, improved by Wyatt, surrounded by plantations, for the extent of which and

× *Plas Newydd*,—near the banks of the Menai; Marquis of Anglesea. An elegant castellated mansion, with an extended front by Potter, of Litchfield; built of native marble. The home grounds extend along the Menai, contain a fine lawn, marine terraces, baths, green-houses, and gardens, and are abundantly wooded; the park is not very extensive, but contains some antiquated oaks, many new plantations, fine drives and walks, and very picturesque views.

for the various uses to which the Penrhyn slab is applied, this residence is chiefly remarkable. Park-pales, gates, doors, window-shutters, troughs, mangers, stall-partitions, hot-bed frames, and a variety of other articles are formed from it, and found to be very durable.

7605. DENBIGHSHIRE. A hilly tract of 410,000 acres, the soil various, but not rich or favourable for cultivation, excepting in the valleys. The seats are chiefly on the Chester side of the country.

Llewini Hall,—near Denbigh; M. Hughes, Esq. Situated on a flat lawn, with a bleachersy too near, and not properly placed out.

Powdriffth Farm,—near Denbigh; Mrs. Lloyd. A *ferme ornée*, handsomely laid out and kept in good order.

Pool Park,—near Rathin; Lord Bagot. Delightfully situated, and finely wooded with old chestnut-trees.

× *Plas Newydd*,—near Llangollen; Lady Eleanor Butler, and Miss Ponsonby. An elegant residence fitted up in the cottage style, and the grounds beautifully laid out by the elegant and accomplished proprietors.

Llandyitho Hall,—near Llangollen; T. Jones, Esq. A handsome structure of brick, in a flat situation, with a park composed of this bottom, and part of the surrounding hills finely wooded.

Erdig,—near Wrexham; S. Yorke, Esq. Chiefly remarkable for the beauty of the approach through a dense wood; there are also other unbragous walks, a rivulet, lawn, and banquetting-house, much admired.

Bern Hall,—near Wrexham; T. Lloyd, Esq. A handsome modern mansion, embosomed in fine rich plantations; the situation flat, but the surrounding scenery hilly and grand.

Acton Hall,—near Wrexham; Sir F. Cunliffe. A good mansion, on an elevated lawn; the grounds extended, and greatly improved by the present proprietor.

Upper Gwerill Hall,—near Gresford; Mrs. Atherston. The grounds most tastefully laid out, with highly romantic walks, alternately umbrageous, and open on the banks of the Alun.

Llanarcho House,—near Denbigh; D. Leo, Esq. A beautiful park, with a fine piece of water, commanding extensive views. The gardens were formerly laid out by M. Davies, Esq. on his return from Italy, with formal walks, clipped trees and hydraulic statues. Among the images and water-tricks was a sundial, which, on the spectator's approach, spouted in his face, and apologised for the rudeness by an indecorous inscription. The whole place is now modernised, and the fine old house too much so.

× *Wynnolwy*,—at Ruabon; Sir W. W. Wynn. The house, an extensive pile, erected at different times, approached through a straight avenue a mile in length; the trees, old and large, elms, oaks, beeches, and planes. The park is eight miles in circumference, surrounded by a high stone wall; the surface is not much diversified, but it contains a fine sheet of water and numerous plantations, with an admirable artificial cascade, similar to that in Bowood Park, near Calne. The horticultural and floricultural establishments are very complete; and here the banana was fruited, and its fruit used at the dessert, for the first time in England. There is a large farm under the care of an excellent Berwickshire bailiff.

7606. FLINTSHIRE. A surface of 160,000 acres, less mountainous or varied than any of the Welsh counties, and not unfavorable to gardening.

Downing,—near Whitford; D. Pennant, Esq. A mansion H-shaped, with Gothic wings, in a low sequestered situation, surrounded by finely wooded grounds, which owe their tasteful disposition to the late eminent naturalist, father of the present possessor.

Hammer Hall,—near St. Asaph; Sir T. Hamner. A handsome brick structure, situated in grounds naturally fine from their consisting of eminences and slopes. These are embellished with woods and plantations, and a lake of 50 acres.

Heartsheth Hall,—near Mold; G. L. Wardel, Esq. Beautifully situated on a gentle slope, showing three fronts, with an

excellent range of stables and offices peeping through fine plantations in the back ground.

Leeswood,—near Mold; Sir G. Wynne. The grounds occupy a fine slope, and were laid out by Switzer above a century ago, whose magnificent iron gateway, through which the forecourt of the house is entered, still remains.

Pengern,—near Whiteford; Sir E. P. Lloyd. A modern structure, surrounded by grounds extensively planted, and otherwise greatly improved by draining in some places, and irrigation and levelling, and removing of detached stones, in others.

7607. CARDIGANSHIRE. A surface of 500,400 acres, more mountainous than any in South Wales; the mountains generally bleak and bare of wood.

× *Hafod*,—near Aberystwith; ——— late the seat of T. Jones, Esq. By far the most grand and picturesque residence in either North or South Wales. The house, in a peculiar style of Gothic or Moresque architecture, in the side of a secluded basin, among high mountains: the approaches to it full of beauty and contrast, the numerous walks displaying waterfalls, precipices, views, prospects, cultivated scenes, rude spots, seats, buildings, &c. singularly romantic and sublime.

The kitchen-gardens and farm were extensive, and successfully cultivated. This place has been described by many tourists; but in the most elegant manner, by Sir J. E. Smith, P. L. S. in a *Tour to Hafod*, with many views.

Stradmore Vale,—near Llandysil; R. Taylor, Esq. An elegant mansion, desirably situated in a rich bottom, on the banks of the Teivi, and backed by a luxuriant forest of oak.

7608. GLAMORGANSHIRE. A surface of 422,000 acres, mountainous towards the north, but more level and suited to culture in the southern parts.

Gnoll Castle,—near Neath; ——— Grant, Esq. The house rises with baronial pomp and grandeur, on the point of a hill, overlooking the town and adjacent country. The grounds most judiciously laid out by the late Sir H. Mackworth.

Llantriddu,—near Cowbridge; Sir J. Aubrey. An Elizabethan mansion, in a park richly wooded, of considerable extent, and surrounded by a stone wall.

Margram,—at Margram; ——— Talbot, Esq. The house fallen to decay; but the park, which is extensive, and well wooded, still preserved in its original state, and considerable attention paid to the pleasure-grounds, which are remarkable for the orange. There is a Doric edifice, built in 1757, 327 feet in length, and 81 in breadth, with a square room, parted off at each end. There are 110 orange-trees, several of which are 18 feet in height, and remarkably handsome. In summer they are

removed to the lawn, and arranged as a grove. Various traditions exist as to the bringing of the trees to Margram; but that generally credited is, that they were originally designed as a present from the King of Spain or Portugal to Elizabeth; but that the vessel stranding on the Margram estates, they became the property of the lord of the manor.

Rheola,—near Swansea; John Edwards, Esq. The gardener, Walter Hogg, an excellent cultivator of pines: one of the new Providence kind weighing 9lbs. 4oz. was presented to the king in 1821. (See 2831. and *Hort. Trans.* iv. 555.)

Penrice Castle,—near Swansea; R. M. Talbot, Esq. A commodious and elegant mansion: the grounds laid out with great taste, and ornamented with some artificial pieces of water.

Stout Hall,—near Swansea; J. Lucas, Esq. Great taste displayed in the disposition of the pleasure-grounds and gardens.

7609. PEMBROKESHIRE. A peninsular surface of 335,600 acres; generally plain and fertile. Grapes attain greater perfection in the hot-houses of this county, than in those of any other of Wales.

Castle Maelgren,—near St. Dogmaels; ——— Hammet, Esq. The grounds embrace the Teivi, and are laid out with great taste; the mansion also materially improved by the late proprietor.

Llanvanny Hall,—near Milford; H. Barlow, Esq. A pleasantly situated house, the grounds bordered by a creek on one side, and Milford-haven on the other.

Piston Castle,—near Milford; Lord Milford. A mansion of considerable antiquity, castellated, with a fine terrace in front, and enlarged and improved to suit the modern style of magnificence in domestic economy. The grounds on an extensive scale, richly wooded, and watered by the confluence of two mountain streams.

× *Stackpoth Court*,—near Pembroke; Lord Cadwor. A grand and imposing building, situated on the precipitous margin of a narrow valley, which has been converted into a lake. Along the front next the water, a broad terrace has been formed; and the other, which contains the entrance, looks into some elegant pleasure-grounds. The kitchen-garden is most successfully cultivated by Buchan, who, in 1821, cut 120 to 200 pines, and upwards of 13 cwt. of grapes.

Penry,—near St. Dogmaels; ——— Saunders, Esq. The house in a pleasant rural spot embosomed in trees; the gardens in the old style carefully kept up; the whole greatly admired.

7610. RADNORSHIRE. A surface of 326,400 acres; partly level and partly mountainous.

Bouldibrooke—near Presteigne; Sir H. Jones. Mentioned as worthy of notice.

Walton,—near Old Radnor; R. Urwic, Esq. A handsome modern house.

Wellfield House, — near Builth; D. Thomas, Esq. A neat modern house; the grounds containing some flourishing young plantations.

7611. **MONTGOMERYSHIRE.** A surface of 500,000 acres; fertile, and wooded. Some of the vales are beautiful; and there are many fit situations for residences.

N-ntown Hall, — near Newtown; Sir John Pryse. A finely wooded park of considerable extent.

Borlich, — near Llanfyllin; B. Lloyd, Esq. A good mansion, and the grounds greatly improved by the late owner, who was the greatest planter in the county, having planted 60 acres with 904,000 trees.

Powys Castle, — near Welch Pool; Earl Powis. A castellated mansion of red sandstone, situated on the ridge of a rock, the entrance by an ancient gateway, between two masonry circular towers. The ascent by two immense terraces rising one above another, connected by steps, and ornamented by

Maeslough, — near Paine's Castle; W. Wilkins, Esq. A respectable structure; the grounds watered by the Wye, and their position extremely beautiful.

vases, statues, and other antique remains. There were hanging gardens, in imitation of those of St. Germain, composed of a series of terraces, connected by flights of steps cut out of the solid rock, with water-works, &c.; but these are now altered, or, like every thing else here, going rapidly to decay. The park is much varied by nature, and combines turf as smooth, close, and green, as the finest lawn, blended with broken ground, rocks, and rough thickets of thorns and oaks. It contained much old timber, but great part of this has been lately felled.

7612. **MERIONETHSHIRE.** A much admired and romantic surface of 500,000 acres; abounding in streams, rocks, and ruined castles; but with few little display of gardening.

Nannarn, — near Dolgelly; Sir R. W. Vaughan. A substantial and elegant structure in a well wooded park, with fine prospects, and remarkable for a small herd of deer, which make venison of a superior flavor. There is a good kitchen-garden, but the present proprietor is chiefly attached to agriculture, and is considered a good corn-farmer, and tolerable breeder.

Tan-y-Bwlch Hall, — near Dolgelly; — Oakley, Esq. An elegant villa in a lawn, at the bottom of a hill, surrounded by pleasure grounds tastefully disposed, and containing a good kitchen-garden.

7613. **BRECONSHIRE.** A surface of 512,000 acres, entirely mountainous, with the exception of some of the narrow valleys; in general it is *terra damnata* as to every branch of gardening, excepting planting.

Cyfartha, — near Merthyr Tydvil; William Crawshaw, Esq. The hot-house department of the kitchen-garden extensive, and the pine-apple extensively and successfully cultivated.

Dan-y-Park, — near Crickhowel; E. Kendel, Esq. A good house, with a meadow and some rising grounds formed into an agreeable park, bordered by the Usk. The kitchen-garden contains some substantial cast-iron hot-houses.

Llangard Castle, — near Builth; J. Macnamara, Esq. A

7614. **CAERMARTHENSHIRE.** A surface of 228,000 acres; fruitful in corn and grass, and the least hilly of any county in South Wales.

Hendlys, — near Llandovery; Col. Williams. The grounds occupy both sides of the river Tywi, and are connected by a foot-bridge, raised upon two projecting rocks, and of a construction that harmonises with the wild and romantic character of the scene.

Abermarlais, — near Llandovery; Admiral Foley. A modern house in a small park, but which contains some good trees and picturesque views.

Edwinstford, — near Llandoilo; Sir J. H. Williams. The mansion and grounds exhibit an appearance of magnificence, and contain a lofty avenue, which serves as an approach.

Taliaris, — near Llandoilo; Lord R. Seymour. Low, flat ground, but well wooded.

Newton House, — near Llandoilo; Lord Dynevor. A plain square building, with a small turret surmounting each

new mansion commenced, and other improvements in progress. According to Malkin (*Scenery of South Wales*, &c. 251.), this place may, and probably will, be one of the first in Wales.

Fenpost House, — near Brecknock; P. Williams, Esq. A respectable mansion, with a finely wooded park, watered by the Usk.

angle, in a park comprising a considerable extent of ground, and exhibiting, perhaps, a richer display of picturesque beauty than any spot of equal size in the kingdom. The scene is finely described by Dyer in his poem of *Grongar Hill* : —

“Gaudy as the opening dawn
Lies a long and level lawn,” &c.

Golden Grove, — near Llandoilo; Lord Cawdor. An indifferent house on low grounds, lately begun to be planted and improved. The kitchen-garden and hot-houses are extensive, and well attended to.

Middleton Hall, — near Llandoilo; Sir W. Paxton. One of the most splendid mansions in South Wales, by Cockrell; the grounds finely planted, and containing an elegant prospect-tower, and a good kitchen-garden.

SECT. III. Scotland.

7615. *The surface of Scotland* is estimated at 18,944,000 acres, in three natural divisions. The first lies north of the chain of Highland lakes, which stretch from Murray to Mull, and consists of little else than dreary mountains and some moors; the second, or middle division, extends from this chain of lakes to the rivers Forth and Clyde; it is mountainous, but cultivated in the valleys and on the eastern shore to a considerable extent; the remaining division is covered by hills with some mountains, but everywhere cultivated or improvable, and highly favorable for most branches of gardening. The country-residences of Scotland are almost entirely confined to the two last divisions; in general they excel those of England in the prominence of their natural features, being generally backed by hills or mountains; encompassed by a river or stream; or situated on a lake, or the sea-shore. But they are inferior to those of the south in magnificence, and even in taste, both as to architecture and landscape-gardening. The gardeners of Scotland have long been in esteem for skill and assiduity in their profession; they excel in the culture and general management of the kitchen-garden, those of a certain rank, as Neill has observed, being generally kept in much better order; and at less expense than gardens of the same kind and rank in England.

7616. *The garden-productions in which Scotland excels* are, turnips, potatoes, strawberries, raspberries, and gooseberries. In fruits, Scotland does not excel, nor can this be the case till the practice of producing a dessert be more common among the ordinary gentry of the country than it is, or was ten years ago. A dessert is rare among the middling classes; and fruit pies or cider are quite unknown to the operative inhabitants. The most extraordinary gardening exertions which have been made in Scotland are in the planting department, and chiefly in the middle division of the country, which already begins to assume a new and sylvan character. The cottage-gardens are generally carefully cropped with the more common vegetables, and form a useful appendage to the laborer's dwelling. The farmers' gardens are rather neglected.

7617. *The principal commercial gardens* lie around the capital; taken altogether they occupy about 530 acres, of which 130 are employed as nursery grounds by seven or eight individuals, who hold from fifty to four acres each. The four hundred acres of market garden-ground are cultivated by nearly eighty gardeners, in holdings of from half an acre to about twenty acres each. There are market-gardens in almost every county, and the total extent of ground occupied as nurseries in the kingdom is estimated at 700 acres. Some of these nurseries raise and dispose annually of ten or twelve millions of seedling and transplanted forest trees. Previous to 1760, when the taste for planting and rural embellishment in Scotland began to increase, there were not above six nurseries in Scotland; and these, taken together, did not occupy above sixty or seventy acres. In 1812, one house in Edinburgh shipped upwards of two million of seedlings, chiefly larch and spruce fir, Scotch pine, birch, elm, ash, alder, and hawthorns.

7618. **MIDLOTHIAN.** A surface of 230,400 acres, varied by inequalities, and in some places by hills. Round Edinburgh are some neat suburban cottage and villa gardens, some good market-gardens, three extensive nurseries, and a botanic garden. The Caledonian Horticultural Society, and also the Caledonian Gardener's Lodge, is held in the capital. There is a market for culinary productions and the common fruits; and it is in contemplation to establish one for ornamental plants in pots and flowers.

Public Promenade.—Holyrood Park is a piece of ground of moderate extent, adjoining the palace of Holyrood. The hill of Arthur's Seat, and adjoining inequalities and valleys, contain upwards of 400 species of plants, and a great variety of mineral productions, with varied and extensive views and prospects. (See 7317.)

The Edinburgh Botanic Garden,—as it existed till lately, contained five statute acres, of a varied surface, and properly situated to the north of the road which leads past it. It was founded by Sir A. Balfour about 1680; removed from its original to its late site under the auspices of Dr. Hope in 1767, and is now (1821) removing to a more extensive area, under the superintendence of the present professor, Graham, and his able garden-curator, M^r. Nab. This site contains 16 acres; and will display extensive hot-houses, and both a Linnean and Jussieuian arrangement.

Market Gardens.—Few of these, of any extent, are known to have existed previously to 1746. At that time Henry Wallace cultivated peas, potatoes, turnips, and other culinary articles, on an extensive scale: before his time, the supply was limited to what could be carried in baskets. Next to Prentice, Thomas Peacock may be mentioned as an extensive grower about 1750; and his successor, who now occupies about twenty acres, produces at this time the best asparagus, cauliflower, and celery, sent to market. Ross's garden is about the same extent; the rest are considerably smaller. Besides culinary herbs, most of these grounds are stocked with standard fruit-trees; and since the custom of making British wines became so fashionable as it now is in Scotland, great part is occupied with currants, gooseberries, and raspberries. Strawberries are grown to greater perfection than probably anywhere else in Britain, at Roslin, on the banks of the Esk.

Orchards.—There are but few of these in this county, and those are chiefly near Laswade and Dalkeith. Edinburgh market is supplied with fruit from the standard trees in the market-gardens, and from such private gardens as are let to commercial gardeners by their occupiers, on account of absence or otherwise. This is also the chief source of forced and exotic fruits, as very few of the market-gardeners venture to build hot-houses. Fletcher, however, built a vinery, and produces the best early grapes.

Seed-Gardens—are unknown in Scotland. Some cabbage, borecole, and leek seeds, are raised in the country; but most garden-seeds are procured from London, and some from Holland.

Herb-Gardens.—There are one or two on a very small scale, in which peppermint is chiefly cultivated.

The Leith Walk Nursery.—Messrs. Dickson and Shankley; a respectable establishment of nearly fifty years' standing, in which every description of nursery article is propagated according to the demand, and the whole kept in excellent order and neatness.

The Broughton or Adelphi Nursery (from *Adelphi*, a brother).—Messrs. Dickson, brothers; an extensive establishment of nearly twenty years' standing, kept in good order.

The Jock's Lodge Nursery.—Herderson and Co.; an extensive establishment, judiciously managed.

The Comely Bank Nursery.—Cunningham. This establishment is conducted more on the plan of the London nurseries than any of the others. Flowers and tender exotics are cultivated with success; and mushrooms also in flat beds, in the open garden, not covered either with mats or litter. They are originated without planting spawn, on beds like what are called lazy beds of potatoes; but the details of the method the inventor is said to decline making public.

There are some other nurseries, — but not of sufficient note to require being particularised in our very limited space.

Calder House.—near Mid-Calder; Lord Torphichen. A stately fabric, surrounded with very extensive plantations.

Hutton House.—near Calder; — Davidson, Esq. A venerable, ancient house, the grounds, containing 800 acres, till lately exhibited one of the most perfect specimens of the old style in the county, or perhaps in Scotland; with artificial

cascares, fountains, alcoves, terraces, and an excellent kitchen-garden. They are supposed to have been laid out by London and Wise, or some of their pupils, about the beginning of the last century.

Dalmahoy.—near Edinburgh; Lord Morton. A good house, in a park of between 400 and 500 acres, enclosed by a well-built wall, and subdivided into lesser commodious enclosures by strips of plantation.

Colinton House.—near Edinburgh; Sir J. Foulis. A substantial house, in a commanding situation, embosomed in wood.

Drighorn Castle.—near Edinburgh; — Trotter, Esq. A magnificent castle, in the Gothic style, commenced, and the grounds much improved and planted; the mountainous parts from designs by the celebrated landscape-painter, Nasmyth.

Braid House.—near Edinburgh; — Gordon, Esq. A neat square house, placed in the bottom of a ravine, or narrow glen, well wooded, and watered by a stream.

Pennycook House.—near Pennycook; Sir G. Clerk. A handsome Grecian house, finely situated on a level lawn, on the Esk; the situation rendered interesting by a turn of the river; the ruins of a castle on its banks; and the Pentland hills in the distance. The kitchen-garden contains an extensive range of hot-houses.

Melville Castle.—near Laswade; Lord Melville. An extensive mansion, in the pseudo-Gothic style, in a romantic situation on the Esk, and surrounded by high banks covered with wood.

Dalhousie Castle.—near Laswade; Earl of Dalhousie. An old castellated mansion, lately modernised; surrounded by extensive and romantic pleasure-grounds. The river Esk washes the base of the castle; and its lofty wooded banks afford delightful summer walks.

Newbattle Abbey.—near Laswade; Marquis of Lothian. A large modern building, with a lawn of thirty acres, and a park beautifully varied, and well clothed with trees; the kitchen-garden good, and well managed.

✓ Dalkeith House.—near Dalkeith; Duke of Buccleugh. A building without pretensions to style, nobly founded on a naked rock; which, however, was earched up about the beginning of the last century. The park contains upwards of 800 acres, surrounded by a stone wall nine feet high; it is magnificently wooded, and watered by two streams, the North and South Esk, which pass near the house. The kitchen-garden contains twelve acres, and is reckoned one of the first in Scotland; the hot-houses and flower-garden are proportionately extensive.

Morton Hall.—near Liberton; — Trotter, Esq. A massy stone fabric, on the south bank of a hill, surrounded by a beautiful park.

Duddingston House.—near Edinburgh; Marquis of Abercorn. A handsome Grecian house, by Sir W. Chalmers, and the grounds by Robinson, nephew to the royal gardener of that name at Kensington. They are thus described in the *Beauty of Scotland*. "This villa, with the pleasure-grounds or park which have been annexed to it, exhibits an example of all that money or art can do to adorn a nearly flat surface, through which a small stream of water naturally runs; clumps, groves, canals, lakes, isles, cascades, temples, shrubbery, serpentine walks, and spreading lawns. In every corner, art and expense have been ostentatiously displayed, and nature is evidently employed merely as her handmaid. Such a place as this, however, has considerable beauty, and excites much interest in a country like Scotland, where bold natural scenery so much abounds, by the striking contrast which it exhibits to the general aspect of the surrounding territory." (Vol. i. 354.)

Woodhouselee.—near Roslin; — Tytler, Esq. A venerable and romantic house and grounds; the latter remarkable for containing the largest silver fir-tree in the county; for a fine terrace-walk, and superb holly-hedge. Some curious ornaments, in the geometric style of gardening, which existed here, were obliterated when the grounds were remodelled in 1787.

7619. **EAST LOTHIAN.** A surface of 190,368 acres, little varied on the east side, but hilly and mountainous towards the southern extremity. It is remarkable for the excellence of its agriculture; and it contains some good kitchen-gardens. There is a small nursery at Haddington; and a number of market-gardens in the county, of from half an acre to two and a half acres in extent, for local supply, and for the supply of Edinburgh, and the shipping of Leith, and other sea-ports along the coast. There are small orchards at Ormiston and Prestonkirk.

North Berwick House.—near North Berwick; Sir H. D. Hamilton. A good house, surrounded by an extensive suite of enclosures, subdivided by straight lines and strips, or double rows

of trees in the ancient style; the object being to combine the general effect of a park as to wood and pasture, with the utility and convenience of enclosures.

Wemyss House,—near Aberlady; Earl of Wemyss. A magnificent mansion, by Adams, in which the smoke of all the chimneys is conducted to three stone domes, and issues by their summits. The three principal rooms are of gigantic proportions, with only one window to each. It is situated close to the sea-shore, on level ground, laid out and planted by Ramsay; but the house is not yet finished.

Ainsfield,—near Haddington; Earl of Wemyss. A noble building with wings, the central front 109 feet long. The park is flat, and not extensive; but there is a large and excellent kitchen-garden.

Yester House,—near Yester; Marquis of Tweedale. An elegant and magnificent structure of stone, with a park containing some fine old trees, and a good kitchen-garden.

Salton Hall,—near Salton; — Fletcher, Esq. An ancient house, lately much improved, as well as the grounds, which were among the first in which exotic trees were introduced.

7620. BERWICKSHIRE. A surface of 326,400 acres. The northern part mountainous, with few country-seats: but the south and east districts gently varied in surface; rich in soil in some places; and everywhere under a system of farming which has been long celebrated. In this part of the county are a few gentlemen's seats, but none of any note. There are only two or three market-gardens near Berwick, and near Dunse.

Dryburgh Orchard,—Planted by the Earl of Buchan in 1788, and now very productive in pears and apples.

Retreat,—near Abbey; Earl of Wemyss. A singular house, of a circular form, in a retired situation on the banks of the Whitadder, in the heart of the Lammermuir mountains, sur-

rounded by natural woods, romantic dells, and extensive artificial plantations.

Dunse Castle,—near Dunse; — Hay, Esq. A respectable old place.

Roundby,—near Dunbar; Earl of Haddington. Remarkable for its fine old woods, planted in the beginning of the last century, by a former earl, who wrote a treatise on Planting. There is also a remarkably fine holly-hedge of the same standing, and a good kitchen-garden. In 1805, pine-apples were grown here in a pit, with a brick vault below, into which steam was introduced. Some of the plants were in pots, and the rest planted in the soil.

Ormistoun,—near Haddington; — Cockburn, Esq. A good kitchen-garden, and well planted pleasure-grounds.

7621. ROXBURGHSHIRE. A surface of 472,320 acres, chiefly hilly and mountainous, and in great part under pasture. There are a few acres of market-garden ground near Kelso and Jedburgh; and some orchards at these places, at Melrose, and at Gattin. At Jedburgh are pear-trees supposed to be from five to six centuries old. Some account of these orchards will be found in the Caledonian Horticultural Society's Memoirs. (Vol. iii. p. 286.)

Hamick and Hass nam Nursery,—Messrs. Dickson's extensive establishments, at the villages bearing these names, begun 1729; they supply the north of England and south of Scotland; and from them originated the Leith Walk nursery, in Midlothian, and the Perth nursery, in Perthshire.

Orchards of Melrose and Jedburgh,—Apple and pear trees, planted by the priests of the abbeys of these towns, in the 16th century, which are still very prolific, especially the pears: the two principal kinds are called the *duke's* and *monk's* pears.

Crailing House,—near Crailing; — Paton, Esq. A neat villa, most romantically situated on the high banks of the Jed.

7622. SELKIRKSHIRE. A surface of 160,600 acres, of hills and mountains, almost entirely under pasture.

7623. TWEEDALE. A surface of 929,778 acres, hilly and mountainous, generally in pasture; but with some barren moors and fertile vales.

7624. DUMFRIESHIRE. A surface of 644,385 acres, consisting, in great part, of hills and mountains; but with some low fertile lands towards the south. There is a nursery at Dumfries, and about twelve market-gardens, averaging three acres each.

Orchards,—There are a number of private orchards in this county, some of them a century old, and very productive. The greater part of the produce is sent to market.

7625. KIRCUDBRIGHTSHIRE. A surface of 561,641 acres, hilly, rocky, and with some mountains, the greater part in pasture. There are some market and fruit gardens along the coast, which send their produce to Dumfries and Ireland. An extensive orchard was formed by Lord Selkirk about 1790; and small collections of fruit-trees have been planted at most of the farmhouses on his lordship's estates.

St. Mary's Isle,—near Kirkcubright; Earl of Selkirk. A substantial house, lately much improved, in an island, lately rendered a peninsula by an embankment. The grounds much diversified by woods, interspersed with thorns, briars, and brambles, in imitation of a natural forest, by a former possessor. There is a handsome gravel-walk, by which a stranger makes a tour of the whole.

7626. WIGTONSHIRE. A surface three miles broad, varied and fertile, with few hills and no mountains.

Galloway House,—near Galloway; Earl of Galloway. A large house surrounded by extensive plantations, enclosed by substantial stone walls. Here figs ripen against a common garden-wall.

Barnbarrow,—near Wigton; John Vans Agnew, Esq. A

fine old place, greatly improved by the late and present proprietor.

Castlerigg,—near Whithorn; — Hawthorn, Esq. A good house, situated on an elevated surface, and backed by old woods and young plantations.

7627. AYRSHIRE. A surface of 1600 square miles; partly hilly, and very generally under pasture. There some good gardens of almost every class: that of Ballochmyle was formerly reckoned one of the first private gardens in Scotland. There are in plantation 25,000 acres.

Monkwood Botanic Garden and Nursery,—is situated near Ayr, and was founded by the present proprietor, Mr. James Smith. It contains about two acres; and the collection includes above 2000 hardy exotics, besides a very full collection of British, and above 500 sorts of green-house plants.

Kilmarnock Nurseries,—Messrs. Sampson have an extensive and highly respectable establishment; and there is another equally respectable, but of more recent origin.

Market-Gardens,—there are several, from one to six acres in extent, in the neighborhood of Kilmarnock and Ayr. Their main crops are onions and carrots, of which they export large quantities to Ireland. There are also market-gardens at Irvine, Stewarton, and Saltoats. There are few or no orchards.

Culzean Castle,—near Culzean; Earl Cassilis. A noble mansion, in the hybrid Gothic style of Adams, placed on a bold precipice on the Carrick shore; the offices adjoining forming a fine subordinate group. The park contains 700 acres, richly wooded, and abounding in marine views. In the pleasure-grounds is an extensive collection, both of hardy and tender

exotics; and there is a productive kitchen-garden: the whole in high keeping.

Eglinton Castle,—near Kilwinning; Earl of Eglinton. A noble castellated mansion, which, with the grounds, were greatly improved by the late earl. The trees of the park are large, of picturesque forms, and much admired. The kitchen-garden one of the best in the county.

Loudon Castle,—near Kilmarnock; Marquis of Hastings. An extensive Gothic building by Elliot, enclosing part of the old castle; the grounds lately planted from suggestions by Nasmyth.

Ballochmyle,—near Mauchlin; — Alexander, Esq. Remarkable for its excellent kitchen-garden, about 1790 reckoned one of the first in Scotland. The gardener's name, John Livingston, formerly gardener to General Scott, of Bellvue, near Edinburgh.

Bargannay Park,—near Ayr; Sir H. D. Hamilton. A residence greatly improved, and most extensively planted by the present proprietor.

7628. RENFREWSHIRE. A surface of 153,307 acres; abounding in hills, and moors, and with a cold moist climate in the elevated district. The most remarkable gardening feature in this county is the florists' gardens of Paisley.

Market-Gardens and Orchards,—There are several market-gardens round the sea-ports of Greenock and Port Glasgow; and some orchards at the latter place. There is also a very old

orchard at Paisley, which, owing to the extension of the town, is now situated near its centre: it contains two Scotch acres and some pear-trees of a large size and venerable aspect.

Gardens of the Operative Manufacturers of Paisley.—The operatives of Paisley, taking them at large, exhibit a condition of improvement very rarely indeed, if at all to be paralleled among persons in the same rank of life; and they are particularly remarkable in their taste for objects which please the eye by their beauty, for such occupations for amusement as require nice attention, and for various intellectual gratifications. In their dress, in the furnishing of their houses, and in matters of a similar kind, they study a great degree of neatness. Even their pigeons, which they keep in considerable numbers, are known in the vicinity to be distinguished for their beauty and variety. Several operatives greatly excel in the management of bees; and communicate to each other their experiments and success. It will perhaps be difficult to find elsewhere, in the same classes of the community, an equal proportion of persons who occasionally entertain themselves with *making verree*. And it is probable, that for miscellaneous information, they are not to be equalled by the operatives in any place. The only operatives in this nation, or perhaps in any other, who can be compared with them for information, are the mibners at Lead-hills, who work but six hours a-day, and have with success devoted much of their leisure to the improvement of the mind. But the intellectual attainments of the Paisley operatives must be more various than theirs, and are probably in no department inferior.

By a statement of the private reading societies in Great Britain, which was some years ago exhibited to the newspapers, it appeared that a very considerable proportion of the whole (it is believed not less at that time than one third) existed in Paisley. How far any of these attachments and habits may have been promoted by the inspirations of Flora, it may not be easy to determine, but all of them in some measure preceded the epoch of her homage and influence at Paisley.

It has been remarked by a gentleman of learning and philosophical observation in Paisley, the Rev. William Ferrier, that the attention to flowers which is so conspicuous there, is in a considerable degree an effect of the peculiar manufacturing habits of the people. It is well known, that not only for the execution of the most delicate ornamental muslins, but for the invention of patterns, the operative manufacturers of Paisley stand unrivalled. Their ingenuity is continually in exertion for new and pleasing elegancies, to diversify their fabrics. Now, where such habits obtain, the rearing of beautiful flowers, which object every congenial to them, will easily be adopted, and pursued as a favorite amusement. On the other hand, it seems highly probable, that the rearing of flowers, by a reaction, must tend to improve the genius for invention in elegant fancy muslins.

The florists of Paisley (it is observed by the same gentleman) have long been remarked for the peacefulness of their dispositions, and the sobriety of their manners. The Florist Club not only represses all irregularities at its weekly meetings, which dismiss at ten in the evening; but would erase from its lists any disreputable name. It is pleasing to think, that not only the attachment of individuals to the culture of beautiful flowers, but the association of persons possessing this taste, seems to be favorable to social order.

Origin of the Florists' Society.—The culture of pinks became an object of attention in Paisley and its vicinity, between the years 1785 and 1790. Till then, none but those of the most ordinary kind were known there. But at that period, some seeds, reputed of good quality, were procured from London: the great bulk of these produced plain pinks. In a few instances, however, *laced* sorts appeared; which, being new, were greatly admired. The seeds of these were carefully preserved and cultivated; and many good sorts were procured from them. The florists persevered in cultivating these; and, at the same time, did not neglect other kinds brought year after year from London, where they were greatly excelled in varieties. And, by pursuing continually on the simple principle of saving and using the seeds of the finest pinks, the original qualities were not only preserved but improved. For some years past, all importation has ceased. On the contrary, plants reared in Paisley have been sent by order to London, and have been pronounced equal or superior to any in England.

The spirit for improving pinks, and many other kinds of flowers, is cherished in Paisley by an appropriate institution,

established in the last year of the past century, and which encourages and methodises a constant amicable competition. Those which are called Competition Flowers, are eight in number: viz. Auricular, Polyanthus, Hyacinth, Tulip, Anemone, Ranunculus, Pink, and Carnation. There is usually an annual competition of the best specimens of one or other of those eight kinds.

Some idea of the zeal of the Paisley cultivators may be formed, when it is stated that several of them can show 70 or 80 of the most choice varieties of pinks; others 200 varieties of the choicest tulips; others 60 or 70 varieties of the best carnations all named; besides many excellent inferior varieties of each kind.

Rules of the Florists' Society.—The society have weekly meetings every Thursday evening, from the flowering of the Polyanthus, till the disappearance of the Carnation, and they have also annual meetings for determining remembrance. At the weekly meetings, every member may produce specimens of as many kinds of the eight competition flowers as are in season; and the best specimen of each kind entitles the possessor to one enrolment of his name in the society's minute-book for prizes. The successful competitor in the kind which the judges declare to be the most frequent among them presented for the night is enrolled in a department of the minutes appropriate to the competition for the predominant flower. The successful competitors for the secondary flowers of the night are each enrolled in a list, called the Competition of All Flowers. Should only one specimen of a kind be presented, the enrolment still takes place; because none would cut down their finest plants, were the accidental want of a rival specimen to render this sacrifice vain. But when each of the competition flowers is in the prime of its season, a competition for the best collection of specimens of six varieties of it is announced at one meeting, and decided at the next; and the name of the gainer is twice inserted. The weekly competition is determined, in ordinary cases, by two judges. If these do not agree, a thirdman is chosen by the club to decide; and should he demur, another judge is added. When the six best flowers of a kind are required, three judges are appointed. At the end of the year, those records are investigated; and there is exhibited to the society a statement of the different winners, of the number of the appearances of each in the books, of the particular flowers in which he excels, and even of the merits of those flowers. Honorary rewards are then distributed. The most successful florist receives perhaps a spade; the next a rake; and the third a trowel or knife.

In the books there is likewise a department for Border-Flowers: and here the names of such members as from time to time produce the best of each sort are entered. And there is another department for the name of every member who presents the best blown flower of its kind. When the books are annually reviewed, the comparative merits of the competitors in each of these last departments are estimated; but no prizes are assigned. When the earliest specimen, however, is a competition flower, the name of the florist stands not only in the department for the earliest flowers, but also in the prize minute-book.

At the annual meetings five judges are appointed; of whom, for the most part, two are strangers, who are known to the florists. Two guardians receive the articles for competition, and affix to each a private number, so that the judges cannot know to whom any of them belong till after the decision. The first prize, which is a silver medal, of about the value of a guinea, with a suitable inscription, is awarded to the person who presents, of his own rearing, the twelve specimens of the competing flower, which, taken collectively, are the best. The twelve next in general entitle the cultivator to an inscribed silver medal, worth about 15s. After the decision, the flower for next annual competition is announced. Pinks are brought into competition twice as often as any other species of flowers.

On these occasions from forty to a hundred manufacturers and tradesmen of the place dine together; and every one who has formerly gained a medal is then expected to wear it. (*Gen. Rep. of Scoll. App. vol. I. ch. ix.*)

7629. LANARKSHIRE. A surface of 556,800 acres, hilly and bleak, but with some fertile valleys. There is a botanic garden, and some good nurseries and market-gardens round the capital; Clydesdale is noted for its orchards, and the total number of acres in the county occupied in this way is estimated at 340. There are some gardeners' lodges, florists' meetings, and a horticultural society, held at Glasgow.

Glasgow Botanic Garden.—This garden owes its origin in a great measure to the exertions of T. Hopkirk, Esq. jun. of Dalbeth, a gentleman attached to botany, advantageously known as the author of *Anomalies of Plants*, and who has long cultivated a collection amounting to 3000 species. It contains eight acres, and is the joint property of the College, and a number of subscribers, who are incorporated under the title of the Royal Botanic Institution of Glasgow.

The plan of the garden (*fig. 753*) combines variation of landscape and scientific arrangement in a very eminent degree. It was devised by a committee of subscribers, and chiefly T. Hopkirk and R. Austin, the latter a well known nurseryman. It consists of the following details:—

1. A general collection of herbaceous plants.
2. A collection of grasses.
3. A Linnean arrangement.
4. Arrangement according to the natural method of Jussieu, &c.
5. British plants, with edgings of common heath (*Calluna vulgaris*), which bears clipping like common box.
6. Medical plants.
7. Plants used in agriculture or commerce.
8. Forest trees.
9. Willows.
10. Borders for annuals.
11. Collection of biennials.
12. Esculent vegetables, fruits, &c.
13. Grass lawn.
14. American borders.
15. Aquarium.
16. Rock-work.
17. Collection of roses.
18. Borders for florist's flowers, as pinks, carnations, &c.

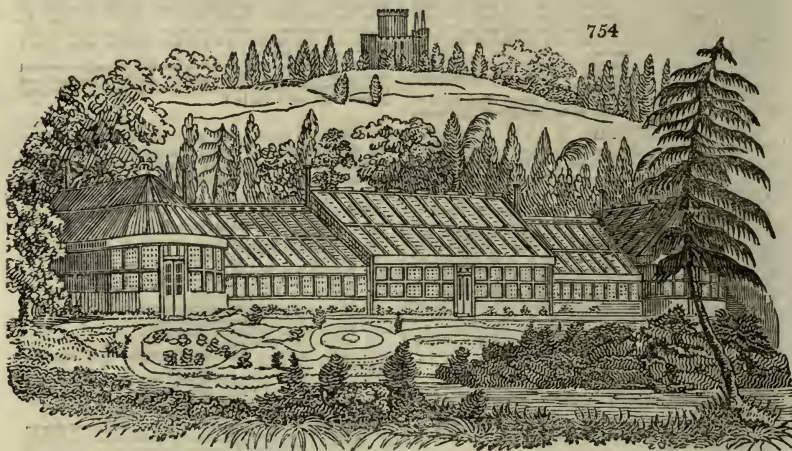

19. Border for bulbs.
 20. Collection of variegated plants.
 21. Alpine plants.
 22. Green-house ground.
 23. Shrubs.
 24. Forcing-beds, frames, &c.
 25. Green-house.
 26. Stoves.
 27. Stove; a conservatory, on the west end.
 28. Medical plants in quantity, for sale.
 29. Enclosure for cultivating rare plants.
 30. and 31. Duplicate borders.
 32. North entrance from the Sandyford road, with the lodge and lecture-room.
 33. Queen Mary's yew, propagated from the famous tree at Culcuth Castle twenty years ago.
 34. South entrance from Dunbarton road.
 35. Under-gardeners' rooms and potting-beds.
- On the enclosing wall, which is ten feet high, and also in the esculent department (12), the most approved sorts of hardy fruit-trees are cultivated; so that this garden, like that of Paris, will combine horticultural as well as botanical information.

The plan was executed under the direction of Stewart Murray, the present very intelligent and satisfactory curator of the garden. It was begun in May 1817, and completed in two years. The total sum subscribed by the members of this institution, amounts to nearly 11,000*l.* T. Hopkirk has presented to it the whole of his collection; and through his exertions, and those of the other proprietors, and especially of that distinguished botanist, Dr. W. J. Hooker, the college professor of botany, the garden, in 1821, contained upwards of 9000 species.

The surface of the area is happily considerably varied, which adds greatly to the effect of the irregular groups and compartments; and it is fortunate also in having agreeable

exterior scenery (fig. 754.), which, to the spectator walking in the gardens, forms a fine back-ground to the hot houses, and at the same time shelters them from the north winds.

Glasgow Nurseries—occupy about 60 acres; the principal are carried on by Austin and Co. and Brown.

The *Market-Gardens of Glasgow*—are estimated to occupy 260 or 270 acres, which are cropped chiefly with the commoner articles; sea-kale, artichokes, beet, endive, French beans, and shallots, are not in demand; and other rarer sorts are unknown. Thirty acres, however, are occupied in raising strawberries for the Glasgow market, and an acre in a good season is estimated to produce from 800 to 900 Scotch pints, or about four times that number of pottles.

Clydesdale Orchards.—These are 60 in number, and occupy from 210 to 220 acres between Glasgow and Lanark. The

largest contains about 30 acres. The fruits produced are apples, pears, plums, gooseberries, and currants. Many of them occupy steep banks, and are never cultivated. The others are chiefly ploughed, unless where the small fruits are grown in the intervals of the trees. The produce finds a ready sale in Glasgow and the sea-ports; and the demand seems increasing.

× *Hamilton Palace*,—at Hamilton; Duke of Hamilton. A gloomy old fabric, situated on one side of an extensive park watered by the Clyde; well wooded with old oaks, and distinguished by an extensive frontage, or false palace, on an eminence, called Chatelherault (Herald's Castle), said to be

in imitation of the duke's residence of that name in the circle of Vienne, in France. The acorns grown in Hamilton Park are reckoned the best produced in Scotland.

Bothwell House,—near Bothwell; Lord Douglas. A ro-

7630. DUMBARTONSHIRE. A surface of 159,356 acres, chiefly mountainous, abounding in mosses and moors, with some natural woods, in which the holly and yew are more common than anywhere else in Scotland.

Orchards.—These are rare, though fruit-trees thrive well in the county. Excellent apples are produced in the tradesmen's gardens of Dumbarton; and there is an orchard at Lochlomond, belonging to Macdonald Buchanan of Ross, which contains two of the largest and most healthy golden pippin-trees in Scotland, generally very productive.

7631. STIRLINGSHIRE. A surface of 450,560 acres of hills and fertile valleys; the latter generally under aration. There is a nursery at Stirling, and some market-gardens of the commonest kind between that town and St. Ninians, and at Falkirk.

Orchards.—There are upwards of 20 of these in this county, generally very prolific in pears, apples, and plums; cherries are little grown in Scotland. The green-gage plum ripens in these orchards as a standard, and there are some large and prolific pear-trees nearly two centuries old. The alluvial soil of the Carleland is from 30 to upwards of 100 feet in depth, of rich mud, and in this the tap-roots of the pear-tree find an ample range.

7632. LINLITHGOWSHIRE. A surface of 71,580 acres, agreeably varied, generally under mixed culture, and beautifully watered on one side by the Forth. There are a few market-gardens about Borrowstounness and Linlithgow.

Barnbougle Park,—near Queensferry; Earl of Roseberry. A castellated mansion on a rock within high-water mark, lately much improved by Wilkins; the park extensive and finely wooded, and subdivided in the manner peculiar to the country, so as to be rendered available as a grazing-farm.

Hopetoun House,—near Queensferry; Earl of Hopetoun. One of the most stately and imposing mansions in Scotland, in the Grecian style, by Sir W. Bruce, and finished by Adams. It stands on a lawn of a mile in length, washed by the Forth, and is surrounded by extensive woods and plantations, a pleasure and kitchen garden in high cultivation.

Newliston,—near Ratho;—Hogg, Esq. A good house with extensive grounds planted by the Earl of Stair, in the ancient style; the trees in plantations, arranged, as it is vulgarly said, in the order of two engaging armies. The grounds in some places were formerly cut into curious flights of steps and terraces (fig. 755.); but much of this taste was obliterated about the beginning of the present century. The trees are for the greater part horn-beams, that species being at once of rapid growth and patient of pruning and clipping. The timber, however, is of little value, excepting for fuel.

7633. CLACKMANNANSHIRE. A surface of 50,720 acres, beautifully varied, with few hills, and generally well cultivated. There is a market-garden at Alloa, of about five acres, and some small nurseries.

Orchards.—There are some near Culross: one called Castle-hill is at least two centuries old. The apple-trees are nearly exhausted with age, but the pear-trees remain in full bearing; the Crawford and sugar are the principal early, and the Achans the late sorts.

Shaw Park,—near Kincardine; Earl of Mansfield. The

7634. KINROSSSHIRE. A surface of 39,702 acres, considerably varied by hills, valleys, streams, and a large lake.

Blair Adam,—near Kinross; W. Adam, Esq. Remarkable for the extent of the plantations on a barren-like peat soil,

7635. FIFESHIRE. A peninsular surface of 322,500 acres, finely varied by hills, valleys, a mountain, some lakes, and bounded on one side by the Forth, the other by the Tay, and the third by the open sea. It is an old county, well cultivated, and containing some fine country-seats of moderate extent. Though the climate is unfavorable for the larger fruits, yet in no county of Scotland are gardens so general from the cottage to the mansion, or so well managed: as a proof, there is scarcely such a thing as a market-garden in the county.

Kircaldy Nursery,—at Kircaldy; Sang, editor of *The Planter's Calendar*, and an extensive contractor for planting and managing plantations. There is also a nursery at Cupar, and at some other towns.

Market-Gardens.—There is one of six acres, surrounded by a high fruit-wall at Kircaldy; one of nearly equal extent at Pathhead, and one or two more at different parts of the county.

Orchards.—There are none of recent formation, excepting one laid out by Sang in 1811; but the remains of fruit-trees are still to be seen at the ancient abbey of Lindores.

× *Wemyss Castle*,—near Kircaldy; Gen. Wemyss. Long

7636. PERTHSHIRE. A surface of 4,068,640 acres, much varied by hills and mountains, but containing some fertile valleys called straths and carses. It contains some excellent country-residences. The cream-colored cherry of Ardvorlich, and the black bean of Castle Menzies, are mentioned by Dr. Robertson (*Agr. Surv. of Perthshire*) as being much esteemed. There is a respectable nursery at Perth, one at Dundee, and some lesser ones at Dunkeld, and other places; there is also a Horticultural Society held at Perth.

Perth Nurseries.—contain between 50 and 60 acres; the principal is by Dickson and Brown; in whose extensive and highly respectable establishment some fine varieties of the Scotch rose have been originated from seed.

Market-Gardens.—Dundee is said to be better supplied with vegetables than any other town in Scotland. The quantity of ground on which they are grown is estimated at 100 acres; and James Reid, in 1750, was the first who excelled in this mode of culture. The shipping ensures a brisk demand for common articles.

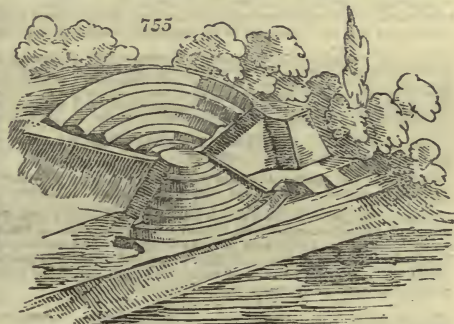

manic and truly noble residence on the banks of the Clyde, with excellent gardens, an extensive collection of plants, and most romantic walks and rustic structures. The whole kept in the highest order.

Rosedoe,—near Luss; Sir J. Colquhoun. The house delightfully situated on a peninsula projecting into Lochlomond: the grounds well wooded by nature, and a good kitchen-garden lately formed at considerable expense.

Ross,—on Lochlomond; H. M. Buchanan, Esq. Remarkable for its beautiful beech-trees.

Callander,—near Falkirk;—Forbes, Esq. The grounds remarkable for large and venerable oak, ash, and beech-trees, which were among the earliest artificial plantations reared in Scotland.

Mynadoe Castle,—near Buchanan; James, Duke of Montrose. A noble place, surrounded by extensive plantations, the present duke having been one of the greatest planters in Scotland.

grounds contain extensive plantations of oak-trees, and are capable of being rendered a beautiful and extensive park.

Tillibodie,—near Alloa; Sir Ralph Abercrombie. The house and grounds backed by the Ochil hills, one of which is finely planted from the designs of Nasmyth, the landscape-painter.

but now covered with finely sheltered grass fields, and the general climate improved by the drainage and warmth.

famous for its kitchen-garden, laid out by Nicol, and its pleasure-grounds by White of Durham. The house is surrounded by extensive plantations, and the whole place is kept in the highest degree of order and neatness.

× *Rath*,—near Kircaldy;—Ferguson, Esq. Most excellent kitchen-gardens also by Nicol, and finely-planted grounds in high keeping.

Balgowny Castle,—near Marhinch; Earl of Levin. A quadrangular structure on the banks of the Leven, of great antiquity; surrounded by finely wooded grounds, containing a good kitchen-garden.

Orchards.—There are upwards of twenty in the Carse of Gowrie, situated on the flat northern shore of the Tay, chiefly from Kinfauns to the town of Dundee. The oldest are about 100 years: the soil is a deep mud or clay. They occupy in all nearly 130 acres. There are also a few old orchards along the south base of the Ochil hills.

Scots Palace,—near Perth; Earl of Mansfield. A noble castellated mansion by Atkinson, in one of the finest situations in Scotland, with a lawn in front of great extent, washed by the Tay, and backed by rising grounds covered with wood.

The gardens and pleasure-grounds extensive, complete, and well managed.

Duplin Castle,—near Perth; Earl of Kinnoull. A good house, and well planted grounds.

Dunkeld House,—at Dunkeld; Duke of Athol. A large plain house in a bottom, surrounded by hills and mountains, celebrated for their extensive plantations, especially of the larch, and for their romantic walks, waterfalls, streams, and rocks. Obvious defects of this place are, that there is no proper walk or wood to make a tour of the whole, and that the walks on the hill side, do not ascend in regular gradation, but are desultory and deficient in grandeur.

Blair House,—near Blair; Duke of Athol. A genuine Highland residence, chiefly remarkable for the extent of the surrounding plantations which clothe many hundreds of acres of lofty mountains and craggy steepes and hills.

X Blair Drummond,—near Stirling;—Drummond, Esq. Celebrated as being the residence where Lord Kames displayed his taste in planting and improving in the latter half of the last century. The evergreens planted at that time are now singular ornaments to the grounds.

X Taymouth,—near Kenmore; Earl of Breckinridge. The most magnificent residence in the county. The house a spacious Gothic mansion, erected at different times, placed on a lawn about a mile in breadth, between two mountains, which open to Loch Tay on one side, and the Tay river passes within two furlongs of the house. The mountains, lawn, and

the banks of the waters, are richly clothed with wood, through which are led magnificent walks. Of the trees, the limes and larches have attained to a great size, and there is an avenue of the former 450 yards in length, scarcely equalled any where.

X Drummond Castle,—near Crieff; Lord Gwydir. The castle enlarged, and the grounds extended and highly improved by the present owner, assisted by his ingenious steward, Lewis Kennedy.

Ochtertyre,—near Crieff; Sir P. Murray. A finely wooded place, greatly improved by the present owner; the kitchen-garden and hot-houses laid out by Nicol.

Lundie House,—near Dundee; Lord Duncan. An excellent kitchen-garden, by Hay of Edinburgh.

Valleyfield,—near Culross; Sir R. Preston. A romantic residence, laid out from designs by Repton, whose son visited this place about 1804. The principal feature deserving a stranger's notice is the approach through a wooded glen.

Gartmore,—near Crieff;—Graham Esq. A fine old place, noted for its fine forests, old cedars from seeds brought from Syria, and a good kitchen-garden by Nicol.

Glenaeagle,—near Stirling; Sir R. Abercrombie. A house in the mixed style of Gothic and Grecian, of Adams, standing in finely varied grounds, well planted, and containing a fine piece of water, by White.

Castle Grey,—near Perth; Earl Grey. A good house, by Atkinson, in a delightful and well wooded situation.

7637. **ANGUS, or FORFARSHIRE.** A surface of 593,320 acres, consisting of mountains with extensive and fertile valleys; the former generally bearing good pasture, and the latter under aration. Montrose and Arbroath have a few small market-gardens; Brechin and Forfar have no market-garden; but many of the tradespeople cultivate spots of ground for their recreation; and besides supplying their own families, produce a sufficiency of culinary vegetables and small fruits to meet the demands of their townsmen. It is estimated that upwards of 33,000 acres are covered with plantations. In aftertimes this county will be celebrated as having given birth to the Dons, a family of botanists of superior order.

The Forfar Botanic Garden,—was founded by George Don, a well known botanist, who added more plants to the British Flora than any botanist of his time. The garden contains little more than an acre; but embraces almost all kinds of soil and situation, and in it were crowded together nearly all the hardy herbaceous plants and shrubs known in Britain.

7638. **KINCARDINESHIRE.** A surface of 243,444 acres, mountainous towards the north, but more level and fertile on the south-east.

Brodie House,—at Brodie; Alexander Brodie, Esq. F. L. S. A fine old place, much improved, and planted, by the present

There is also a small green-house, containing above 1000 different species. Don died in 1814; but the botanic garden is still kept up.

Castle Glamis,—near Glamis; Earl of Strathmore. A very ancient building, renovated by Inigo Jones; the grounds in the ancient style, and containing some fine old trees.

proprietor; and containing a good botanic garden, and some noble avenues.

7639. **ABERDEENSHIRE.** A surface of 718,806 acres, generally flat, but varied by knolls, wavy ridges, and gentle inequalities, formerly moory and bleak, but now extensively planted. It is said, that there is scarcely a gentleman in the county who has an estate of 100*l.* a year who has not planted some hundred thousands of trees, and that there is above 50,000 acres in the county covered with artificial plantations. There are a number of nurseries round Aberdeen noted for raising seedlings, many of which are sent to the south of Scotland and to England.

The Aberdeen Nursery,—Messrs. Reid. An old and respectable establishment chiefly devoted to the culture of forest trees, and especially to seedlings of Scotch pine, larch, fir, and thorns. The father of the present occupier, who is also proprietor of the soil (twelve acres), was gardener to Sir Archibald Grant of Monymusk, the greatest planter in Scotland.

Ross's Nursery,—a newly established concern, carried on with great spirit. There are various other nurseries.

Market-Gardens,—These are numerous, both for the supply of the town and shipping. Almost the entire parish of Old Machar is laid out in this way, and occupied by several hundred industrious men. At Peterhead there are also gardens for growing vegetables for the shipping of that place.

Orchards,—There is an extensive one at Pitfuir, containing ten acres, including the ruins of the ancient abbey of Deer and its gardens; one of five acres at Auchterie, and some in a neglected state between Kene and Monymusk.

Crathes,—near Aberdeen. Sir R. Burnet, Bart. An excellent kitchen-garden in the old style, with magnificent holly

hedges, abundance of prolific fruit-trees, and venerable exotic shrubs.

Monymusk,—at Monymusk; Sir A. Grant. Remarkable for its extensive plantations, the late proprietor having planted about fifty millions of trees; some of which, at the time of his death, were near one hundred feet high, and above six feet in circumference. The gardens and pleasure-grounds are beautiful and extensive.

Invercauld House,—near Invercauld;—Farquharson, Esq. Famous for its pine-forests, the timber of which equals that of Norway.

Slaines Castle,—near Slaines; Earl of Errol. Situated on the margin of the sea, with few trees around, but with a good kitchen-garden.

Den of Rubislaw,—near Aberdeen; Professor Davison. A romantic villa, the gardens forming terraces cut out of granite rock, watered by a stream, near which grow naturally many rare plants, and among others, *Linnaea borealis*. The whole kept in the highest order and neatness.

7640. **BANFSHIRE.** A surface of 649,600 acres; hilly and mountainous, with fertile valleys well cultivated. There are some good market-gardens at Banf.

X Duff House,—near Duff; Earl of Fife. A magnificent quadrangular building, by Adams, in a park 15 miles in circumference, chiefly laid out by the late Mr. White. On the other parts of the estate more trees have been planted than on any property in the county.

Gordon Castle,—near Gordon; Duke of Gordon. A large

house; the grounds celebrated for their fine woods, extensive gardens, and romantic walks.

Cullen House,—near Cullen; Earl of Findlater. Remarkable for its fine old woods: the late earl being one of the earliest and most extensive planters in the county.

7641. **MORAYSHIRE.** A surface 42 miles long, by 20 miles broad; great part hilly or mountainous, with extensive pine-forests; but with a considerable tract only gently varied and well cultivated. There is a market-garden at Elgin, in which onions are chiefly grown for the parishioners, and two small orchards: one at Logie, formed in 1786, and the other at Pitgavenny, formed in 1798.

7642. **NAIRNSHIRE.** A surface 17 miles long, by 10 miles broad; the greater part level and fertile.

7643. **CROMARTYSHIRE.** A peninsular surface of 68,480 acres; chiefly an elevated tract of heath, but undergoing rapid improvement by the agriculturist.

7644. **CAITHNESS.** A surface of 395,680 acres; generally flat; described by Pennant as an immense morass, with some fertile spots. From the materials which compose this morass, it appears to have been formerly full of wood; but recent attempts to raise plantations have not been very successful. There is a market-garden at Thurso of seven acres; a remarkable circumstance, as there are none in the counties of Cromarty, Ross, or Sutherland.

Thurso Castle,—near Thurso; Sir J. Sinclair. Chiefly remarkable for agricultural improvements, but displaying also

some plantations, and a kitchen-garden, and many ingenious but abortive attempts at amelioration.

7645. **THE ORKNEY and SHETLAND ISLES** contain nothing that we have heard of worthy of notice in the way of gardening. Such a thing as an orchard is unknown in these islands. In Orkney, Neill observes (*Gen. Rep.* sect. ii. p. 180.), a few apples are produced on wall-trees; in Shetland still fewer, and that only in particularly good seasons.

7646. **SUTHERLANDSHIRE.** A mountainous uncultivated surface of 1,478,400 acres; about half of which is the property of the Marquis of Stafford, who has enlarged the farms, built new farmhouses,

and planted extensively. (See *An Account of the Improvements on the Marquis of Stafford's Estates, &c. by James Loch, Esq.* 8vo. 1820.)

Dunrobin Castle, — at Dunrobin; Marquis of Stafford. There is no mansion employed as a residence, but it is said a magnificent one is in contemplation, and there is a park devoted to the breeding and feeding of 1000 mountain deer. In the garden, apples, pears, and cherries thrive perfectly

7647. ROSS-SHIRE. A surface of 1,776,000 acres; the eastern part fertile, and containing some country-seats; but the rest rude, mountainous, and fit only for plantations and pasture. In no part of Scotland have the proprietors been more assiduous in forming public roads, and in planting extensive moory tracts.

Market-Gardens and Orchards. — There are none of the former; but there is an old orchard at Redcastle, in which the nonpareil ripens as an espalier. At Castle Braham, Novar, and Braclangwell, are also orchards of recent formations.

Invergordon Castle, — near Invergordon; — M'Leod, Esq. A handsome house, by Gillespie, of Edinburgh, surrounded by thriving plantations, on grounds where eighty years ago not a tree was to be seen.

Novar, — near Cromarty; Sir H. Monro. A great and finished place, and one of the most complete in the north; the situation of the house is elevated, and it commands a fine view of the bay of Cromarty.

Rorburgh House, — near Avoch; — — — A modern edifice, substantially built and commodious. It is situated on a beautiful bank near the sea, and surrounded by a Scottish

7648. INVERNESS-SHIRE. A surface of 2,000,000 of acres, being the largest county in Scotland. It consists of two ranges of mountains, separated by a chain of lakes now united by the Caledonian canal. The valleys are fertile; many of the mountains are covered with natural forests inhabited by the red and roe deer, the alpine and common hare, and other exquisite sorts of game.

Inverness Nursery, — at Inverness; Messrs. Gibbs. A very extensive establishment for forest trees and hardy fruit-trees; with branch nurseries at other towns. Here is a very complete nursery orchard of all the hardy fruit-trees which ripen their fruits as standards, and from which the scions and cuttings for propagation are taken.

Orchards. — There are but few public or commercial orchards, but some private ones, of which a great part of the produce is sent to market. One of the largest is at Auchnagairn, near Inverness. It was planted in 1788, chiefly with the Herefordshire cider apples. The trees are now in a full bearing state. They are placed thirty feet apart: till lately the intermediate spaces were regularly cropped, according to the rotation of the farm, along with which the orchard is let; now, however, the branches nearly meet, and grass is found to be the preferable under-crop. The old garden at Castle Stewart, belonging to the Earl of Moray, and situated seven miles north-east of Inverness, may also perhaps be ranked as an orchard. The trees are chiefly morella and Kentish cherries, and the large black gean. They are generally of great size, and many of them shattered with age, having seen several centuries; yet they often produce most plentiful crops. At Milltown, of Ketwell, there are some remarkably large lammas and achua pear-trees, about a century old. They are very productive. An apple-tree here in the orchard of Easter Lovat, on the river

7649. ARGYLSHIRE. An extensive surface of 3800 square miles, consisting of hills and mountains, with several islands considered as belonging to it. It abounds in lakes and inlets of the sea, and contains some natural woods; but the climate is moist, and excepting in the department of arboriculture, does not excel in gardening. There are some small market-gardens at Cambleton; and a branch nursery from that of Gibbs at Inverness, at Inverary.

Inverary Castle, — near Inverary; Duke of Argyll. A square castellated mansion, with a tower at each corner, and a high glazed pavilion, shooting up above the towers from the centre of the roof. It is built of a grey stone (*lapis alatus*, or pot-stone) which becomes black with a shower of rain, and is immediately restored by a gleam of sunshine, which is a fertile source of singular effects in this moist weeping climate. It stands on a lawn, which extends to Loch Fyne, an inlet of the sea fifteen miles in circumference, surrounded by rising groves of plantations on the sides, and reaching towards the summits of the highest mountains and rocky steeps, sprinkled with rising trees. (fig. 756.) One of these mountains is Dunicol, covered with wood, excepting where the rugged rocks project through the trees, and add greatly to its grandeur. On its top stands a lonely watch-tower, which, like everything useful or characteristic, has a good effect. Had this hill been crowned with an ornamental building, the effect would have been absurd. A plan was prepared for substituting ramparts and bastions, which would have been equally fatal to its present simplicity and grandeur.

The bold, and in some places savage, features of this part of the country, require only a judicious disposition of wood to render them more hospitable to the eye, and to improve the pasture and the climate. The larch-tree has already effected wonders in Argyleshire; and what its effects may be over the whole of the Highlands by the time half a century more has elapsed, it is difficult to imagine. Savage will then be changed to, or at least combined with, sylvan grandeur.

7650. BUTESHIRE comprehends the islands of Bute and Arran, and some smaller isles; hilly, but with a moderate climate, and in general favorable to the growth of trees and hedges. There are two or three small orchards and market-gardens near Rothsay and Mount Stewart.

Mount Stewart, — Marquis of Bute. An elegant house, commanding a fine view of the Firth of Clyde, surrounded by extensive plantations, formed by the late marquis, abounding with various sorts of game, and in which the turkey is natu-

well, and every thing might be obtained by the use of glass.

Skibo, — at Skibo; — — — Dempster, Esq. Extensive plantations have been formed, and in the gardens apricots and walnuts have sometimes ripened.

park, that is, an assemblage of grass-fields, surrounded by strips and varied by masses and groups.

Balnagowan, — near Kilmuir; Sir J. C. Ross. A most desirable seat, surrounded by an immense extent of thriving plantation.

New Tarbat, — near Kilmuir; Earl of Cromarty. A superb modern house, inferior to few seats in Scotland, surrounded by extensive grounds and plantations, which join those of Balnagowan.

Braham Castle, — near Urray; Lord Seaforth. A fine building, pleasantly situated on the river Conan, and surrounded by extensive and well planted grounds, containing a good kitchen-garden and an extensive collection of exotic and hardy plants.

Red Castle, — near Loch Beaully; Colonel Grant. An ancient and respectable residence considerably improved.

Beaully, covers a space of forty-seven feet in diameter. A Beaully pear-tree is spoken of, which used to produce sixteen sacks of fruit in a season.

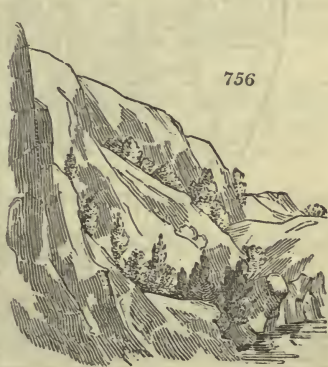

Castle Braham, — at Braham; Lord Seaforth. The garden and demense greatly improved under the direction of Gibbs, now a nurseryman at Inverness. The Canadian rice (*Sizania aquatica*) is naturalised on the lakes and ponds; and extensive and thriving plantations abound over the whole estate.

Kilravock, — near Croy; — — — Gardens laid out with taste; fruitful orchards and extensive woods, embracing an elegant modern house, situated on a rock hanging over and washed by the Navin.

Cantray, — near Croy; — — — Davidson, Esq. A commodious house, and the grounds planted and greatly improved.

Glengairny House, — at Glengairny; — — — M'Donald, Esq. The house on the shore of Loch Orich, surrounded by wood, and approached from the lake by a fine old avenue.

Castle Grant, — at Grant; Sir J. Grant. The house consists of three sides of a quadrangle, improved by R. Adam, beautifully situated on the north side of the Spey. It commands an extensive and noble landscape, including the park in which it stands of 4000 acres, and the natural forest of Abernethy of 40,000 acres, at the base of the lofty mountains of Cairngorm. Eastward lies the wide-bending cultivated vale of Cromdale watered by the Spey.

756

ralised. The gardens contained a good collection of plants; but, excepting the kitchen-garden, they are now in a state of comparative neglect.

SECT. IV. Ireland.

7651. The surface of *Ireland*, which is estimated at 11,067,712 Irish acres, is much less varied than Scotland and Wales, but rather more so than England, though great part of it consists of bog and wastes, yet these are everywhere improvable by draining and culture, or planting. The climate is more temperate than that of Britain, but also more moist; it is, on the whole, highly favorable to the culture of leaves and roots;

and favorable for all the other branches of gardening. The political situation of the country, and the general absence of proprietors, have prevented much from being done; but, from the cheapness of land and labor, and the natural advantages every where presented, the most extensive parks, pleasure-grounds, and kitchen-gardens, might be created at a comparatively moderate expense.

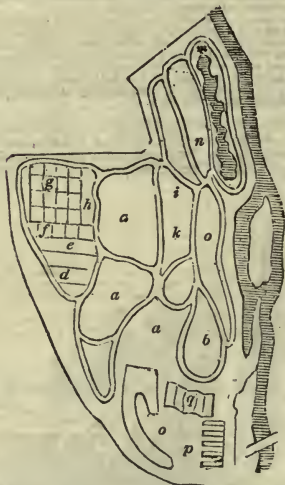

7652. *The names of residences* here given are selected from the *Traveller's Guide*, published in Dublin in 1819: the characteristic epithets added are from that work, and the English reader will of course make due allowance for Irish phraseology. We have made the general tour of Ireland, and been engaged professionally in three or four counties, and we know that many places, styled delightful and enchanting in the "Guide," would cut but a poor figure if placed beside hundreds of seats in England whose names we have omitted. There is very little old timber in Ireland, and very few of the "demesnes" that have any other park than a grass field, without trees, in which the house stands. Deer parks are rare, and also kitchen-gardens with hot-houses. Mackay of the Trinity College botanic garden, and M^cLeish of Harold's Cross, are well calculated for furnishing designs for both these improvements, and happily there is at present a spirit for employing these gentlemen. If to this the proprietors would join a more constant residence on their estates, much would be effected.

PROVINCE OF LEINSTER.

7653. DUBLIN. A fertile surface of 147,840 Irish acres, little varied, but well adapted for horticulture and floriculture. At Dublin is a royal park; two excellent botanic gardens; two good nurseries by Simpson, Toole, and Mackay, and Grimwolds and Keefe, with some culinary commercial gardens. In Dublin is St. Stephen's Green, a very large naked square, a design for ornamenting which by A. M^cLeish is about to be published.

The Phoenix Park, — near Dublin; a public promenade and a royal park, seven miles in circumference, beautifully diversified with woodland, champaign and rising grounds, tastefully adorned with extensive sheets of water, and plentifully stocked with deer. The civic regal residence here is respectable and commodious. The kitchen-garden of the Chief Secretary's lodge is reckoned one of the best managed in the county of Dublin.

The Botanic Garden, — at Glasnevin (fig. 757.); Dublin So-

cety. Established with the commencement of the 19th century, chiefly through the exertions of Dr. Wade, author of several works on Irish botany. It is situated at Glasnevin, within two miles of Dublin Castle, and contains 30 statute acres. "Nothing," the authors of the *History of Dublin* observe, "can exceed the command of aspect which the irregular beauty of the surface presents, and of which the planners (chiefly Dr. Wade) of the garden have been careful to avail themselves. Having ample room for every botanical purpose, they have not sacrificed taste to convenience, or disturbed such objects as contributed to the beauty of the old demesne, originally that of Ticken the poet. The summit, having considerable elevation, gradually or abruptly slopes to the river Folka, which forms a sweeping boundary to one side of the garden. Here large clumps of venerable elms, or other forest trees, shade the sloping steeps, or, running along the ridges, separate the ground into irregular divisions. Through these the ivy-crowned ruin of some venerable arch presents a passage, so that many of the compartments are approached by some picturesque or striking entrance. Nor is the systematic arrangement less judiciously managed. Nothing can be conceived more ungraceful than the formal regularity necessary in such an arrangement; every plant following in its order, and labelled with its name, presents to the eye an irksome sameness.

To avoid this appearance, each class is subdivided into smaller compartments, insulated in green sward, and communicating by pathways, and the intervals filled up with scattered shrubs, so that, while the most exact regularity is observed in the classification, and the series of plants follow each other in such succession that the most minute can be immediately found, the whole presents the aspect of unstudied confusion."

This garden contains the following arrangements, or subdivisions:—

A Hortus Linnaeusii (a), subdivided into a herbaceous division, and one for shrubby, fruit-bearing, and forest trees. Six acres are assigned to this division. To each plant is prefixed a metal label, inscribed with its number in the Glasnevin catalogue.

A Hortus Jussieuensis (b), rather limited, yet sufficiently extensive to comprise all the orders of which there are hardy specimens introduced in Britain.

A Hortus Hibernicus (c), or garden of native Irish plants, containing upwards of 1345 species, including Cryptogameae.

A Hortus exulentus (d), containing not only the usual culinary vegetables, but all others in which wholesome and nutritious qualities reside, in such a degree that they can be converted into human aliment.

A Hortus medicus (e), or garden of plants used in medicine, arranged on the plan of Woodville's *Medical Botany*; and containing every hardy plant in which any medical virtue is known to reside.

A Hortus pecudarius (f), or cattle garden, in which are arranged all plants which the animal to whom the plant is appropriated is fond of eating, and which are wholesome food for it; also such as he is not fond of eating, though not unwholesome. On the opposite side are arranged such plants as the same animal will eat, but which are injurious to it, and likewise such as it refuses to eat whether injurious or not. Each of these particulars is noted on the label, pointing out the plant, and likewise whether the plant be indigenous or foreign.

A Hortus rusticus (g), or garden of plants used in rural economy, including the grasses, clover, &c.

A Hortus tinctorius (h), containing all the plants used in dyeing, particularly those which are indigenous to Ireland.

A Hortus plantarum volubilium, repentium, et scandentium, (i, k), or garden of twining, creeping, and climbing plants, shrubby and herbaceous.

A Hortus plantarum saxatiliu, or garden of rock plants on rock-work. This is formed on an artificial mound, constructed on the most elevated part of the garden. "The fragments of rock for this purpose were transported from the Hill of Howth, and such was selected as were already clothed with various species of mosses and lichens. These were piled together without any apparent order, so as to give the appearance of a natural rocky mound. But it so constructed that spiral walks winding round the sides, but not visible at a distance, conducts the visitor to the summit. Here, as he ascends, he sees every grey stone clothed with its appropriate vegetation, and in every fissure of the rocks some alpine plants. When arrived at the summit of this mound, the eye is gratified with a view of the whole garden, lying beneath displayed as in a map." (*History of Dublin*, p. 1298.)

A Hortus lacustris et palustris (n), or garden of aquatic and marsh plants. On the banks of the Folka lies an extensive flat, lower than the bed of the river, in which an irregular lake is formed, two hundred yards in length, for the aquatic; and on the shores, and in an island formed on purpose at one extremity, the marsh plants are grown. At convenient intervals green promontories project into the water; which, while they give a picturesque variety to the banks, afford an opportunity of approaching such plants as the botanist may wish to examine. The grounds surrounding the lake are varied with American pines and other transatlantic woods that love a swampy soil, and beyond these the rising grounds are entirely devoted to ornament.

A Hortus cryptogamorum (o), or garden of cryptogamous plants. This is a steep bank, shaded by lofty trees.

A Hortus Flores (p), or flower-garden, in which the florists' flowers are cultivated in parterres.

A *Hortus exoticus* (p), or garden for tender exotics, comprising a conservatory, two green-houses, and a hot-house parallel, close together, and commencing by a common passage at the north end.

A *Professor's house and Lecture-room* (q), with a library *hortus siccus*, &c. The house of the former proprietor, Tickle, is preserved, and arranged for this purpose.

This garden is managed by a professor and lecturer, with a salary of 300*l.*, a superintendent at 100*l.*, two assistants at 60*l.* each, twelve gardeners at 12*l.* per week, and six apprentices at 9*l.* The total annual expense, including 75*l.* as rent for the land, is about 1500*l.* a-year. Besides the usual number of apprentices, six who having passed the usual period under private gardeners, are received here to complete their knowledge and experience, especially in the hortus esculentus. After passing two years here they are received as gardeners into private houses, and are much sought after. A premium of five guineas is given by the society to those who are recommended by the superintendent for assiduity and good conduct; and the superintendent receives 5*l.* as a gratuity for his trouble in instructing them.

The *Botanic Garden at Trinity College*.—This garden was begun in 1807. It is situated in low grounds, and contains three and a half acres, of an irregular shape, surrounded by a wall twelve feet high. There are separate arrangements for trees, shrubs, and herbaceous plants, according to the Linnæan system, and a very full collection of medicinal plants, arranged according to the natural method of Jussieu. To each plant is prefixed a label containing the systematic and English names, and class and order, both of Linnæus and Jussieu. Separate arrangements are formed for the perennial, the biennial, and annual herbaceous plants, and for the grasses. Only one wing of the intended range of glass has yet been built, which comprises a stove thirty-five by sixteen, and a green-house forty feet by sixteen. In front is a small aquarium. This garden is rapidly increasing in riches under the excellent management of its present curator, G. Mackay, who is also botanical demonstrator, and lectures on botany and horticulture.

7654. WICKLOW. A finely varied surface of 305,404 Irish acres; with fine dells and brooks, and bordering on the sea.

Bellevue,—near Bray; D. Latouche, Esq. A romantic residence, with extensive gardens and hot-houses, on which no expense is spared to preserve their reputation of being the first in Ireland.

Glenmore Castle,—F. Synge, Esq. Extensive mountain plantations going forward; varied scenery in the home views, and prospects reaching even to Wales; hot-houses and flower-gardens.

Clonmanning,—Rev. Dr. Trevel. Extensive kitchen-gardens, and the first cast-iron hot-houses erected in Ireland, from the designs of A. M'Leish. Myrtles grow here in the open air to the height of sixteen or eighteen feet.

Kilrudeary,—near Bray; Earl of Meath. A romantic country-residence, in a deep valley, overshadowed by lofty mountains.

Newtown Mount Kennedy,—near the village of that name;

7655. WEXFORD. A peninsular surface of 315,396 Irish acres, of good soil, but little varied in aspect.

Camolen Park,—near Enniscorthy; Earl Mountmorris. A beautiful demesne.

7656. KILKENNY. A surface, somewhat varied by hills, of 318,249 Irish acres. There is a good nursery here, by John Robertson, who has distinguished himself by some excellent papers published in the *Transactions of the London Horticultural Society*.

Ballyragget House,—near Ballyragget; Lady Ormond. A charming demesne; the mansion burned down during the rebellion of 1798, but restored by her ladyship.

7657. KILDARE. A flat surface of 242,245 Irish acres of fine arable soil.

Bishop-court,—near Kill; Lord Ponsonby. A magnificent mansion and highly cultivated demesne.

Belan,—near Tinolin; Lord Aldborough. A beautiful seat with extensive plantations.

Castleton,—near Celbridge; ———. A mansion on the banks of the Liffey as superb an edifice as any in Ireland, and the plantations correspond in magnificence.

Kiladonon,—near Celbridge; Lord Leitrim.

Carlton,—near Maynooth; Duke of Leinster. A superb

7658. KING'S COUNTY. A surface of 282,900 acres, little varied, and of which nearly one half is bog or waste.

Charleville Forest,—near Tullamore; Earl of Charleville. A demesne of 1500 acres, partly the remains of a natural forest, on which the present earl has built a magnificent and commodious mansion in the castellated style, and laid out the grounds with great taste.

7659. QUEEN'S COUNTY. A surface, consisting chiefly of bogs, mountains, swamps, and wastes of 235,300 acres.

Stradbally Hall,—near Stradbally; ———. Cosbie, Esq. A beautiful seat.

Brookley Park,—near Stradbally; Earl Roden.

7660. CARLOW. A surface of 137,000 acres of grand and picturesque surface and good soil.

7661. EASTMEATH. A fertile surface of 227,900 acres, generally flat, but with only a moderate portion of bog and waste.

Gormanstown House,—near White Cross; Lord Gormanstown.

Stane Castle,—near Stane; Earl Conyngham. A splendid mansion, now decaying, and the grounds, through which flows the Boyne, planting and being otherwise improved.

7662. WESTMEATH. A surface of 249,943 acres of bogs, hills, a number of lakes, and some fertile ground.

Gaulstown Park,—near Gaulstown; Lord Kilmaine. A superb residence.

Headfort,—Earl of Bective. A princely residence, with ex-

Of Villa Gardens.—There are a very considerable number that might be enumerated, such as St. Catherine's, belonging to the bankers Latouche; St. Woolstans, ———. Kane, Esq., Mount Sackville, ———. M'Kennis, Esq.; Edmondberry, ———. Needham, Esq.; Donnybrook, Dr. Percival; those of Miss Colville, Miss Smyth, Mrs. M'Ganna, besides a number near Bray, Lucan, Leixlip, Clontarf, &c.

Clare Hall,—near Donnybrook; ———. Stupendous rocky scenery, with old trees in the park.

Marino,—near Dublin; Earl of Charlemont. A delightful edifice, in a demesne of 200 acres, judiciously and tastefully planted, with a fine ornamental temple. The grounds are thrown open to the Dublin citizens two days a-week.

Merrille (sea villa),—near Donnybrook; Lord Downes. A beautiful mansion and grounds. An extensive collection of ornamental plants; a green-house, stove, flower forcing-house, by A. M'Leish, and culinary forcing-houses.

Leopard's Town,—Lord Castlecoote, situate at the bottom of the Dublin mountains, and abounding in picturesque views from the house and walks in the pleasure-ground.

Terenure,—F. Bourne, Esq. Extensive hot-houses and gardens; and a varied collection of plants, judiciously arranged by J. Fraser, an excellent botanist and gardener, and a man of general information.

Mound Merriem,—near Donnybrook; Lord Fitz William. A magnificent mansion, with gardens and trees.

Newtown Park,—near Donnybrook; ———. A magnificent mansion, and some trees in the park.

Kylister,—Lord Newcomen. A fine situation; the kitchen-garden remarkable for its grapes and pines.

Kingstown,—The Right Hon. W. Saurin. A small garden, but rich in exotic productions, fruits, and flowers, and especially of bulbous exotics.

Rathfarnham Castle,—near Rathfarnham; ———. A magnificent castellated structure, with agreeable pleasure-grounds.

Tollagh Palace,—at Tollagh; Archbishop of Dublin. An ancient venerable structure, with extensive gardens, kept in fine order.

Lord Rossmore. Extensive plantations, and a waterfall of 100 feet, in what is called the Devil's Glen.

Powerscourt,—near Enniskerry; Lord Powerscourt. An extensive-fronted edifice, in a demesne of 600 acres tastefully planted, and ornamented with water and buildings.

Charleville,—near Enniskerry; Lord Monck. Situated on the river Dargle, with a luxuriance of rural beauties.

Blessington Park,—near Blessington; Marquis of Downshire. A fine park; the house consumed in the rebellion of 1798, and not yet rebuilt. This place was formerly famous for the first kitchen-gardens in Ireland.

Rushborough,—near Naas; Earl Miltown. The front of the house and offices form an extensive facade of hewn stone, nearly 700 feet long. The grounds finely varied and well planted.

Desart,—near Bennet's-bridge; Lord Desart. A magnificent mansion and extensive demesne.

Ashbrooke,—near Durrow; Lord Ashbrooke. A magnificent mansion, with an extensive demesne.

mansion, the demesne extensive, a vast lawn waves over gentle hills, interspersed with plantations to a great extent, affording a variety of beautiful prospects. A stream winding through the whole has been widened to a river, over which an elegant bridge is constructed, and a lofty square prospect tower has been erected on one of the most elevated knolls.

Nemberry,—near Castle Carberry; Lord Harberton. A beautiful seat.

Frankford,—near Frankford; ———. An antique mansion, with a fosse and drawbridge, in an extensive flat demesne.

Daronscourt Hall,—near Stradbally; Lord Portarlington. A magnificent seat.

Ballyroan,—near Ballyroan; Lord De Vescey. A magnificent residence.

Dunasy Castle,—near Dunshauglin; Lord Dunasy.

Ardracran Palace,—near Trim; Bishop of Meath. A chaste and simple building.

Headfort,—near Kells; Marquis Bective. A magnificent mansion, and extensive and beautifully planted demesne.

tensive views, commanding hills, rocks, ruined towers, and rich farms. From a prospect tower on the hill of J.loyd, upwards of twelve counties are seen. There is much old

timber, and the finest larches in Ireland. The house, gardens, and grounds had been much neglected, but are renovating and improving under the guidance of M^r Leish.

Crugan, — near Moat-a-Greugine; ———. A fine mansion and beautiful demesne.

Trasteraugh, — near Morinstown; Sir P. Piers.

Lacken, — near Mullingar; ———. A beautiful mansion and demesne.

Ballinagh, — near Mullingar; H. O'Reilly, Esq. A charming residence.

Castledown Deleah, — near Mullingar; Earl of Westmeath. A charming residence.

Puckinham Hall, — near Castle Pollard; Earl Longford. A splendid seat.

Lisnabin Castle, — Captain Purdon. A house, offices, and conservatory, in the Gothic style, by M^r Leish; extensive prospects, some old trees, and numerous young ones.

Knuck Drin, — Sir R. Levinge, Bart. A large castle, by Shiel of Dublin; upwards of 100 acres of oak and holly

woods, and nearly 400 acres of artificial plantations judiciously managed. There is an approach of two miles, and a drive of six miles, both abounding in picturesque views. There is a conservatory, terrace-garden, English and Dutch parterre, rosary, botanic ground, and kitchen-garden, all connected, and in a suitable scale to the castle, by M^r Leish.

Ballynegall, — J. Gibbons, Esq. An excellent house in the Grecian style, by Johnston of Dublin; abundance of old timber, and dressed grounds and gardens laid out by M^r Leish.

St. Lucys, — Sir T. Chapman, Bart. A good castellated house, and well managed grounds and gardens, laid out by M^r Leish.

Ranalla, — R. M. Reynella, Esq. A pretty English-looking seat, by M^r Leish.

Lough Cren, — J. L. Napier, Esq. A house by Cockerell of London, in the Grecian style, and much natural and artificial wood, and every promise of magnificence. The proprietor is one of the best landlords in Ireland.

7663. LONGFORD. A surface of 134,700 acres of rich and beautiful spots, interspersed with bogs, mountains, morasses, and fens.

Castle Forbes, — near Newtown Forbes; Earl Granard. A splendid residence.

7664. LOWTH. A surface of 126,960 Irish acres, fertile, undulating, and thickly interspersed with lofty hills.

Barmath, — near Clogherhead; Sir E. Pellew. A charming mansion, encircled with an extensive and well planted demesne.

Clermont, — near Lurgan Green; Earl Clermont. An elegant seat.

Colom, — near Slaine; Hon. John Foster. A demesne tastefully ornamented with extensive plantations.

PROVINCE OF MUNSTER.

7665. WATERFORD. A surface of 262,800 Irish acres, rough, rocky, and mountainous, with a soil varying through all the gradations of loam and peat.

Ballinacrom, — near Tramore; ———. A well planted demesne.

Curraghmore, — near Waterford; Marquis of Waterford. An extensive demesne, which for beauty and variety cannot be surpassed in any part of the united kingdom.

Lismore, — near Lismore; Duke of Devonshire. A magnificent pile, now repairing, and the grounds being improved.

7666. CORK. The largest county in Ireland, comprising a surface of 1,048,709 Irish acres, of which 231,959 are bogs, mountains, and waste. There is a nursery by Thomas Sheehan.

Cork Botanic Garden — was founded in 1809, by the Royal Cork Institution (a society of gentlemen incorporated after the manner of the Dublin Society, and like that society supported by annual grants from Parliament); six acres are enclosed by a hedge, and one acre near the centre by a wall; includes a hot-house and green-house. The plants in the garden are arranged in the Linnean manner; it is managed by a committee, and the curator is Mr. James Drummond, A. L. S., a good practical botanist and intelligent gardener.

Of late years the funds of the Cork Institution have been so low that it has been found necessary to turn the greater part of the garden into a nursery, and dispose of the produce.

Castle Martyn, — near Youghal; Earl of Shannon. A magnificent mansion and demesne.

Ratcliffe, — near Middleton; Earl Inchiquin. A noble seat. The tide gently flows to the garden-walls.

Moorfield, — near Kilworth; Lord Mount-Cashel. A superb residence.

7667. TIPPERARY. A surface of 554,950 Irish acres, rugged, coarse, and mountainous in the west, but level and fertile in the east, where the lands are considered amongst the most productive in Ireland.

Kilmore, — near Clonmel; ——— Bagnal, Esq. A beautiful seat.

Newtown, — near Clonmel; Sir T. Osborne. A neat mansion.

Knocklofty, — near Clonmel; Lord Donoughmore. An enchanting residence on the banks of the Suir, finely planted.

Shanbally, — near Clogheen; Lord Lismore. A splendid residence.

Kilconely, — near Ballyporeen; Sir W. Barker. A delightful residence.

Cashel Palace, — near Cashel; Bishop of Cashel. The gardens beautiful and tastefully arranged.

Cashier, — near Cashier; Lord Butters. A delightful residence.

Ballygriffin, — near Goldeer; Earl Clanwilliam. An enchanting residence.

Suir Castle, — near Golden; Lord Massay. A beautiful situation on the banks of the river Suir.

Dancers Court, — near Tipperary; Lord Milton. A fine residence.

Castledown, — near Templemore; Marquis of Lansdown. A fine romantic seat.

Templemore, — near Templemore; Sir J. C. Carden. An elegant seat.

7668. LIMERICK. A surface of 386,750 Irish acres, generally flat and very rich, especially the tract of low lands on the Shannon, which are deemed the richest and most prolific in Ireland. There is a nursery at the county town, by Thomas Lees.

Ballymort, — near Askeaton; ——— Massey, Esq. A beautiful seat.

7669. CLARE. A surface of 476,200 Irish acres, of which more than half is bog, mountainous, and waste; the mountains numerous, and the soil and surface of the lower grounds very various.

Innistynon, — in the village; the castle of the elder branch of the O'Brien family.

7670. KERRY. A surface of 647,650 Irish acres, much varied in surface and soil, and to a tourist the most interesting county in Ireland, as containing the lakes of Killarney.

Mount Meredith, — near Castle Island; O'Donohue, Esq. A charming residence.

Kenmare Lodge, — near Kenmare; Marquis of Lansdown.

Kenmare House, — near Killarney; Lord Kenmare. A delightful demesne along the banks of the river Deneagh, at the mouth of which the aquatic excursion of the lakes is

commenced. Round the lakes of Killarney is Bellview, and various other houses of little or no interest, otherwise than from their situation. The banks and islands of the lakes are rich in botany; and display truly interesting copses and single specimens of arbutus unedo, as well as grand and picturesque views.

PROVINCE OF CONNAUGHT.

7671. ROSCOMMON. A surface of 346,650 Irish acres, with some lofty hills, but no lakes of any magnitude: it is generally in pasture.

Clover Hill, — near Mount Talbot; ——— Latouche, Esq. A beautiful residence.

French Park, — near Belanagar; ———. A delightful mansion and demesne.

Stokestown, — at Stokestown; R. Mahon, Esq. A magnificent mansion.

7672. GALWAY. A surface of 989,959 Irish acres; varied and rich, but without hills or mountains: generally in pasture.

Portumna Castle, — near Portumna; Marquis of Clanrickard. A venerable mansion.

Flower Hill, — near Portumna; Lord Riverton. A delightful residence.

Spring Garden, — near Eyrecourt; ——— Pearce, Esq. A beautiful residence.

Dalystown, — near Woodford; Right Hon. D. B. Daly. A fine mansion and well planted demesne.

Queensborough, — near Eyrecourt; Earl Louth. A fine seat.

Gort House, — near Gort; B. Smyth, Esq. A fine seat.

Garbally, — near Ballinasloe; Lord Clancarty. A splendid residence.

Ballydonnellan, — near Aghrim; ———. A beautiful demesne.

Oramore Castle, — near Oramore; ——— Blake, Esq. A venerable mansion.

Dunastyle, — near Kilconnel; J. Daly, Esq. A splendid and magnificent mansion.

Clonbrook, — near Asheragh; Lord Clonbrook. A beautiful mansion, and highly improved demesne.

Bellew, — near Newtown Bellew; Sir E. Bellew. A beautiful seat.

7673. MAYO. A surface of 790,600 Irish acres; a great portion mountainous and waste, and the rest chiefly in pasture.

Castlebar House,—near Castlebar; Lord Lucan. A venerable structure, solidly situated on the brow of a steep eminence overhanging the river.

Moat,—near Ball; Sir R. B. Lynch. A delightful residence.

Neal,—near Ballinrobe; Lord Kilmaine. A magnificent mansion and extensive demesne.

7674. LEITRIM. A surface of 255,950 Irish acres; hilly, with fertile valleys, and numerous streams and lakes; the whole well adapted for every branch of gardening.

Lurgan,—near Lurgan Bay; Right Hon. S. Winne. A beautiful residence.

7675. SLIGO. A surface of 247,150 acres, nearly the third quite waste, the rest fertile in corn and potatoes.

Haslewood,—near Sligo, on Lough Gill; ———. The house and demesne aptly composed in elegant magnificence.

PROVINCE OF ULSTER.

7676. CAVAN. A surface of 301,000 Irish acres, abounding in fenny pastures and coarse grounds.

Florence Court,—near Swadlinben; Earl Enniskillen. A lake, hedgerows, and meadows; an extensive demesne-farm, under the care of a Northumbrian agriculturist. All the upper servants English.

Farnham House,—near Kilmore; Lord Farnham. A splendid residence, in an extensive demesne, abounding in

7677. FERMANAGH. A surface of 283,400 Irish acres, chiefly boggy and mountainous; interesting to tourists as containing Loch Erne.

Bellisle,—on an island in Loch Erne; Earl Ross. The island contains 200 acres, charmingly diversified by hills, dales, and gentle declivities, which are richly clothed with old timber, through which gravel-walks are conducted, and a temple

erected, from which a panoramic view is obtained, not only of this, but of all the other wooded islands of the loch. One of them is exclusively used as a deer park.*

7678. MONAGHAN. A surface of 179,600 Irish acres, much encumbered with bogs and mountains, but in part rich and cultivated.

Castle Blaney,—near the village of that name; Lord Blaney. A delightful residence, commanding a fine view of

a lake, thickly interspersed with islands richly planted with trees.

7679. TYRONE. A surface of 467,700 Irish acres, a great portion rough and mountainous.

Baron Court,—near Newton Stewart; Marquis of Abercorn. A magnificent mansion, but no park-scenery or gardens deserving notice. Extensive plantations, however, have been made in various parts of the demesne.

Aghinias,—near Caledon; Lord Belmore. An elegant mansion and extensive demesne.

Caledon Hill,—near Caledon; Lord Caledon. A delightful residence.

Farna Hill,—near Dungannon; Lord Northland. A magnificent residence.

Stewart Hall,—near Stewartstown; Lord Castlestewart. A magnificent residence.

7680. DONEGAL. A surface of 679,550 Irish acres; the greatest portion reclaimable and irreclaimable mountains.

7681. DERRY. A surface of 318,500 acres; its surface varied but without mountains, and the soil generally fertile.

7682. ARMAGH. A surface of 181,450 acres, with an irregular surface that has not unaptly been compared to eggs placed on end in a basin of salt.

Castle Gosford,—near Markethill; Lord Gosford. An extensive demesne fringed with trees.

Castle Dillon,—near Richill; Sir C. Molyneux. An extensive demesne, containing a handsome sheet of water, skirting the base of a hill covered with a very thriving plantation.

Lurgan House,—near Lurgan; Right Hon. W. Brownlow. A delightful residence. Near this seat is Lough Neagh, a lake of 60,361 acres.

7683. DOWN. A surface of 348,500 Irish acres, considerably varied, with but few mountains and moors.

Moira Castle,—near Moira; Marquis of Hastings. Contains some old trees, and also some young plantations; gardening in all its branches having been here attended to by the present owner's father, when neglected in almost every other part of Ireland.

Lissige,—near Newry; Earl Clanwilliam. A splendid residence.

Hillsborough Castle,—near Hillsborough; Marquis of Downshire. A magnificent residence.

Ballymoney,—near Rathfriland; Marquis of Downshire. A fine country-residence.

Belvoir,—near Newtown Breda; Lord Dungannon. A magnificent residence.

Bryansford,—near Narrow Water; Lord Clanbrassil. A delightful and sequestered residence, well planted, with a river, and a succession of picturesque cascades.

7684. ANTRIM. A surface of 420,999 Irish acres, considerably varied with mountains and hills, fertile valleys, bogs, and dry wastes. It is noted by tourists as containing the Giant's Causeway. There are two nurseries at Belfast.

Shane's Castle,—near Antrim, on the borders of Lough Neagh; Lord O'Neil. An enchanting residence.

Castle Uxton,—near Templepatrick; Lord Templeton. A beautiful seat.

Glenarn Castle,—near Glenarn; Earl Antrim. A venerable and magnificent mansion.

CHAP. IV.

Of the Literature of Gardening.

7685. *The first books on agriculture and gardening* were written by the Greeks some centuries before the Christian æra, and by the Romans about the commencement of that period. Among the ancient Greek writers, Hesiod, Homer, Theophrastus, Xenophon, and Ælian, may be mentioned as having touched more or less on gardening. The works of the modern Greeks, or those who wrote after the seat of the Roman government was transferred to Constantinople, are collected under the title of *Geoponica*; and have been translated by T. Owen, who also translated Varro and Palladius. Among the Latins, the works of Varro are the first in the order of time; next Cato, and Pliny, and Columella, and, lastly, R. T. E. Palladius, supposed to have lived in the fourth century. Passages relative to the subject may be found in most of the Roman poets, especially in Martial, Virgil, and Horace; but Pliny's natural history, and Columella's 11th book on gardens, are those from which the most correct ideas may be obtained of Roman gardens. In the ages which succeeded the fall of the Roman empire, few books were written, excepting on religion: the first which appeared on rural matters was by

Crescenzo, in Italy, early in the fifteenth century; and soon after one or two in France, Germany, and Britain. We shall enumerate the whole of the British works on gardening, as far as we have been able to collect their titles; and next, the leading works of France, Germany, Italy, Spain, Sweden, Russia, and America.

SECT. I. *Of the Literature of British Gardening.*

7686. *The first British work on husbandry* is that of Judge Fitzherbert, published about the middle of the 16th century. Before the end of the same century appeared Tusser, Mountain, Mascal, and Hyll, who wrote expressly on gardening, partly from their own experience and observation, and partly by translating from the Latin and Greek authors. In the seventeenth century appeared as gardening authors, Plat, Lawson, Gardiner, Standish, Parkinson, Plattes, Austin, Tradescant, Evelyn, Cowley, Blake, Rea, Worlidge, Meager, Temple, and some others. Those of the succeeding century are numerous, and consist in great part of practical or professional gardeners, who wrote from their own experience; of these are London and Wise, Collins, Switzer, Fairchild, Miller, Cowell, Hitt, Hill, Wheeler, Boucher, Swinden, Abercrombie, Speechly, Forsyth, Maddock, M'Phail, Repton, and Nicol.

7687. *Of amateur gardeners and botanists*, who wrote on gardening during the eighteenth century, there are Laurence, Bradley, Evelyn, Justice, Hanbury, Weston, Wheatley, Chambers, G. Mason, Mason the poet, Anderson, R. P. Knight, T. A. Knight, U. Price, M. Marshall, and C. Marshall. The nineteenth century has produced one or two practical authors, as Pontey, Hayward, Emmerton, and Hogg; one gentleman writer on the subject, Hope; besides a number of authors of both classes, who have contributed papers to the Horticultural Societies.

7688. *The old gardening books previous to the Restoration*, Professor Martyn observes (*Pref. to Mill. Dict.* xxxv.), "are of very inferior value, with scarcely any pretence to originality, if we except Scot, Lawson, Parkinson, and Austen. Evelyn made a new æra in planting and gardening. His first work was from the French, and published before the Restoration; but his great work, *The Silva*, was original, delivered before the Royal Society in 1662, and first printed in 1664. The same year his *Gardener's Almanac* was also published, and maintained its ground until Miller's *Kalendar* appeared. Cook assisted him in the article of planting; Sharrock and Rea in that of gardening, which Cowley and Rapin ornamented with the flowers of poetry. Quintiney, with his followers, London and Wise, figured in gardening at the end of the same century: Liger, Laurence, and Bradley, at the beginning of the next; these were followed by Switzer and Fairchild, who lead us to the time of Miller, in 1724. Contemporaries with Miller were Batty Langley and Cowell. Miller, during his long career, had no considerable competitor, until he approached the end of it, when several writers took the advantage of his unwearied labors of near half a century, and fixed themselves upon him, as various marine insects do upon a decaying shellfish. I except Hitt and Justice, who are both originals; as is also Hill, after his fashion; but his gardening is not much founded in experience."

7689. *The first considerable treatise on ornamental gardening* is "Wheatley's, entitled *Observations on Modern Gardening*, and published without his name. Shenstone published his *Unconnected Thoughts* in 1764. There is an anonymous pamphlet on the *Rise and Progress of the present Taste of Planting Parks and Gardens*, in 1767; and an *Essay on Design in Gardening* in 1768, by George Mason. *The English Garden*, a poem by Mason, appeared in 1772. Knight published *The Landscape*, a didactic poem, in 1794. Repton, the same year, *Sketches and Hints on Landscape Gardening*. Marshall, a *Review of the Landscape*; and in 1796 he treated on ornamental gardening, in the second edition of his work on planting. *Essays on the Picturesque*, by Uvedale Price, Esq. in 1798. In 1803, a second magnificent work by Repton, entitled *Observations on the Theory and Practice of Landscape Gardening*, appeared; and another, *Fragments on Landscape Gardening and Architecture*, in 1716. Loudon's *Observations on Planting and Landscape Gardening* appeared in 1804; and his *Treatise on Country Residences* in 1806."

7690. *The most useful works on gardening at the present time* are, in horticulture, those of Forsyth, Nicol, and Abercrombie; in floriculture, that of Maddock; in arboriculture, those of Pontey and Sang; and in landscape-gardening, those of Wheatley and Repton. In the transactions of the horticultural societies are some valuable and original communications on the first branches, and especially on horticulture. In enumerating the principal British works on gardening, including some few of those on husbandry and botany, naturally connected with our subject, we shall adopt the order of the appearance of their authors, as writers on gardening; and when we can, we shall give short biographical notices. Those authors who have merely written articles published in the transactions of societies, or in public journals or magazines, are not here included, unless they have also written separate works.

SUBJECT. 1. *British Works on Gardening.*

1502. *Arnold, Richard*, an ancient English chronicler, and haberdasher, in St. Magnus's parish, London; flourished in the end of the fifteenth and beginning of the sixteenth century; died about 1521.

The Customs of London, from the time of Richard I. &c. commonly entitled *Arnold's Chronicle*, and first printed at Antwerp in 1502, fol.; reprinted along with a series of English chronicles. London, 4to. 1811. It is divided into chapters, and contains the following articles:—

The act for trees above 20 years growing to pay no tithes. The craft of gaffynge and plantynge and alterynge of fruyts, as well in colours as in taste. A treatise of the four elements and four seasons, &c. and of the canyculare dayes. The fourme and mesur to mete land by. Percely (probably cress) to grow in an hour space, &c.

1557. *Anon.*
The Grete Herbal, which gyveth parfyt knowledge and understanding of the boke lately printed by me Peter Treveris.

Peter Treveris was the first printer in Southwark; the book to which he alludes was "the Grete Herbal, 1516," and the first or second production which issued from his press.

1557. *Tusser, Thomas*, gent., born near Witham, in Essex, 1515, received a liberal education at Eton school, and at Trinity-hall, Cambridge; lived many years as a farmer in Suffolk, and afterwards removed to London, where he published his first work in 1557, and died in 1580.

1. Five Hundred Points of Good Husbandry, as well for the Champagne and Open Country as for the Woodland. Lond. 1557. 4to.

2. Another edition, entitled, *Flue Hundred Points of Good Husbandry*, vnted to many of Good Huswifery; first devised and now lately augmented, with diuers approved Lessons concerning Hopps and Gardening, &c. Lond. 1573. 4to.

1571. *Mountain, Didymus*.

1. The Gardener's Labyrinth; containing a Discourse of the Gardener's Life, in the yearly travels to be bestowed on his plot of earth, for the vnting of a Garden; with Instructions for the choise of Seedes, apt times for Sowing, Setting, and Planting, and Watering; and the Vessels and Instrumentes serving to that use and purpose; wherein are set forth, diuers Herbes, Knottes, and Mazes, cunningly handled for the beautifying of Gardens; also the Physike of eche Herbe, &c. (gathered out of the best approved Writers of Gardening, Husbandrie, and Physicke, &c. Lond. 1571. 4to.)

2. The Second Part of the Gardener's Labyrinth; vnting such skilful experiences and worthy Secretes, about the particular sowing and remouing of the moste Kitchen Herbes; with the wittie ordering of other daintie Hearbes, delectable Flooures, pleasant Fruites, and fine Rootes, as the like hath not heretofore bin vttered of any; beside the Physicke benefites of eache Herbe annexed, with the commoditie of Waters distilled out of them, right necessarie to be knownen. Lond. 1577. 4to.

1574. *Hill, Hyll, or Hyle, Thomas*, a London author of various works on Dreams, Physiognomy, Mysteries, an Almanac, Astronomy, Arithmetic, &c.; died in the beginning of the seventeenth century.

The Profitable Arte of Gardening; to which is added much necessarie matter, and a number of secrets, with the Physicke helps belonging to eache hearbe, and that easily prepared. To this is annexed two proper Treatises, the one entituled the Marvailous Government, Propertie, and Benefite of Bees, with the rare Secretes of the Honnie and Waxe. And the other, the Verely Coniecture meete for Husbandmen. To these is likewise added a Treatise of the Arte of Graffing and Planting of Trees. Gathered by Thomas Hyll, citizen of London. Lond. 1574. 4to.

1594. *Platt, Sir Hugh*, author of various philosophical works, and apparently a lawyer. "Sir Hugh Platt (says Weston) spent part of his time at Copt-hall in Essex, and at Bishop's-hall in Middlesex, at each of which places he had a country-seat; but his town-residence was Lincoln's Inn." In the *Jewel House of Art and Nature*, he is named Hugh Platte or Platt, (for it is spelt both ways,) of Lincolnes Inne, gentleman. By the same book it appears that he then (1594) lived at Bishop's-hall, and that he had an estate near St. Alban's.

He does not inform us what profession he was of, only that it was alien from the studies of husbandry and gardening. He must have had a numerous family, for six of his children died of the worms.

It appears from his *Garden of Eden* (p. 96.), that he was living in the year 1606; and that he had a garden in St. Martin's-lane.

1. The Jewel House of Art and Nature, contending diuers rare and profitable Inventions, together with sundry new Experiments in the Art of Husbandry, Distillation, and moulding. Faithfully and familiarly set downe, according to the Author's own experience, by Hugh Platte, of Lincolnes Inne, gentleman. Lond. 1594. 4to.

2. The Garden of Eden, or an accurate Description of all Flowers and Fruits now growing in England, with particular Rules how to advance their Nature and Growth, as well in Seeds and Hearbes, as the secret ordering of Trees and Plants. By that learned and great observer, Sir Hugh Platt, knight. The fifth edition. Lond. 1660. small 8vo.

3. The Second Part of the Garden of Eden, &c. Never before printed. Lond. 1660.

1597. *Gerarde, John*, a surgeon and famous herbalist, was born in Cheshire, 1545; died about 1607. He lived in Holborn, where he had a large botanic garden, one of the first attempts of the kind in England.

The Herbal, or General History of Plants, gathered by John Gerarde, Master in Chirurgerie; with cuts. Lond. 1597. fol.

1597. *Lawson, William*, a practical author, who wrote, besides his *Orchard, Tractatus de Agricultura* 1656. 4to. He professes to write wholly from experience, and not to delight in curious conceits as planting and grafting with the roots upward, inoculating roses on thorns, and such like.

A New Orchard and Garden; or the best way for Planting, Graffing, and to make any Ground good for a rich Orchard: particularly in the North, and generally for the whole Commonwealth; with the Country Housewife's Garden for Herbs of common Use; their Virtues, Seasons, Profits, Ornaments; variety of Knots, Models for Trees, and Plots, for the best ordering of Grounds and Walks. As also the Husbandry of Bees, with their several Uses and Annoyances: all being the experience of forty and eight years' labor, and now the third time corrected, and much enlarged. Whereunto is newly added, the Art of Propagating Plants, with the true ordering of all manner of Fruits, in their Gathering, carrying Home, and Preservation. London. 4to. Followed by most profitable new Treatise, from approved experience, of the Art of Propagating Plants. By Simon Harward.

1604. *Anon.*

The Fruiterer's Secrets, 4to. black letter. It contains some curious directions for preserving fruits and other garden-productions.

1612. *C— R—*.

An Old Thrift newly revived, by R. C. of Planting and Preserving of Timber and Fewel, by R. C. 1612. 4to. in four parts.

1613. *Standish, Arthur*.

New Directions of Experience, authorised by the King's most excellent Majesty, as may appear, for the Planting of Timber, and Fire-wood, &c., and how as great store of fire-wood may be raised from hedges as may plentifully maintaine the kingdom for all purposes, without losse of ground; so as within thirty yeares all spring woods may be converted to tillage and pasture. Lond. 1613. 4to.

1620. *Bacon, Francis*, Viscount of St. Albans, a most distinguished philosopher, and high-chancellor of England in the reign of James I., was born in London 1560, and died 1626.

Essay on Gardens, &c. in *Instaurata Magna, sive Novum Organum*, &c., of which there are numerous editions both in Latin and English: one by Shaw, with notes. Lond. 3 vols. 4to. 1725.

1622. *Bonfeil, John*.

Instructions how to plant and dress vines, and to make wine, and how to dry raisins, figs, and other fruits, and also olives, oranges, lemons, pomegranates, almonds, and many other fruits. Printed with his Treatise on the Art of making Silk, page 36—88. Lond. 4to.

1623. *Markham, Gervase, Jarvis, or Gervas*, an English author who wrote on a great variety of subjects during the reigns of James I. and Charles I., and died about 1685. He appears, says Harte (*Essays*, ii. 32.), to be the first Englishman who deserves to be called a hackney writer. All subjects seem to have been alike easy to him. His thefts were innumerable, but he has now and then stolen some very good things, and preserved their memory from perishing.

The Country Housewife's Garden, by Gervase Markham.

1629. *Johnston, Thomas, M.D.*, a learned botanist, a native of Yorkshire, bred an apothecary, and established in that profession in London; he made various botanical tours, and published the first local Flora, which appeared in England; died 1643.

The Herbal; or General History of Plants, gathered by John Gerarde, enlarged and amended. Lond. 1629. fol.

1629. *Parkinson, John*, a celebrated herbalist and botanist; born in 1567, bred an apothecary, and acted in that capacity and as herbalist and botanist to James I. and Charles I.; died about 1640. Professor Martyn says his *Paradisus* is the first gardening book worth mentioning, and that considering what had been done before it, it has the greatest merit.

1. *Paradisus in Sole Paradisus Terrestri*; or, a Garden of all sort of pleasant flowers which our English ayre will admit to be nourished up: with a Kitchen Garden of all manner of herbes, rootes, and fruites, for meate or sause used with us; and an Orchard of all sorte of fruit-bearing trees and shrubbes fit for our Land, together with the right ordering, planting, and preserving of them, and their uses, and vertues. Collected by John Parkinson, apothecary of London, 1629. fol. There is an engraved titlepage by Switzer, representing the Garden of Eden; with 109 wooden cuts of flowers and fruits, and a portrait of the Author. Dedicated to the Queen.

2. *Theatrum Botanicum*; or, an Herbal of great extent. Lond. 1640. 2 vols. fol. 1746 pages, with many wood cuts.

1631. *Austen, Francis*.

Observations on Sir Francis Bacon's Natural History, so far as it concerns fruit-trees. 4to.

1633. *Plattes, Gabriel*, a poor man, but a useful writer. Harte says, he had a bold adventurous cast of mind, and preferred the faulty sublime to faulty mediocrity. As great a genius as he was, he was allowed to drop down dead in London streets with hunger; nor had he a shirt upon his back when he died. He bequeathed his papers to Hartlib, who seems to have published but few of them.

1. Treatise of Husbandry. Lond. 1633. 4to.
2. Discourse of Infinite Treasure, hidden since the World's beginning, in the way of Husbandry. Lond. 1639. 1653. 1656. 4to.

1640. *Aaon*.
1. The Countryman's Recreation; or, the art of Planting, Grafting, and Gardening, in three books. Lond. 1640. 4to. With a perfect Platforme of a Hop-Garden.

2. The expert Gardener, collected out of Dutch and French Authors. 1640. An edition with cuts in 1654.

1645. *Weston, Sir Richard*, of Sutton, in Surrey. He was ambassador from England to Frederick V. Elector Palatine and King of Bohemia, in 1619. He was present at the famous battle of Prague, and his curious relation of it in a letter is still preserved in MS. It is remarked in the *Philosophical Transactions*, that England has profited in agriculture to the amount of many millions in consequence of the Flanders husbandry having been made known by Sir R. Weston's book.

A Discours of Husbandrie used in Brabant and Flanders; shewing the wonderful improvement of land there; and serving as a pattern for our practice in this Commonwealth. Lond. 1645. 4to. 24 pages.

1645. *Hall, Joseph*. This author lived at Shedley, in Yorkshire; an extract from his work may be seen in the *Museum Rusticum*.

An Essay on Timber Trees.

1649. *Blith or Blythe, Walter*, an officer in Cromwell's army, who, with other English gentlemen, holding commissions at that time, was eminently useful in introducing improvements into Ireland and Scotland.

The English Improver Improved; or, the Survey of Husbandry Surveyed, discovering the Improbability of all Lands; by Wa. Blith, a lover of Ingenuity. Lond. 4to.

This is an original and incomparable work for the time.

1651. *Hartlib, Samuel*, an ingenious writer on agriculture, and author of several theological tracts, was the son of a Polish merchant, and came to England about 1640. He was a great promoter of husbandry during the times of the commonwealth, and was much esteemed by all ingenious men in those days. Milton addressed to him his treatise on education, and Sir William Petty inscribed two letters to him on the same subject. Cromwell allowed him a pension of a hundred pounds a year.

A Designe for Plentie, by an universall Planting of Fruit-trees; tendered by some Wel-wishers to the Public. London, without date, but probably 1652. 4to. Published by Hartlib, who had the MS. from the Hon. Colonel John Barkstead, lieutenant of the Tower. The author was an aged minister of the Gospel, at Loving-land near Yarmouth.

1653. *Austen, Ralph*, author of several works on theology, all printed at Oxford, where he seems to have lived, and died probably about 1680.

1. A Treatise of Fruit-Trees. Showing the manner of Grafting, Setting, Pruning, and Ordering of them in all respects; according to divers new and easy Rules of experience; gathered in the space of twenty years. Whereby the value of Lands may be much improved, in a short time, by small cost, and little labour. Also discovering some dangerous Errors, both in the Theory and Practice of the Art of Planting Fruit-trees. With the Alimentall and Physicall use of fruits. Together with the Spirituall use of an Orchard. Held forth in divers Similitudes betwene Naturall and Spirituall Fruit-trees; according to Scripture and Experience. By Ra. Austen. Practiser in the Art of Planting. Oxford, 1653. 4to.

1656. *Tradescant, John*, a Dutchman, but the period of his coming to England is unknown. He is said to have been some time in the service of Lord Treasurer Salisbury, and Lord Wootton. He travelled as far eastward as Russia; was in the fleet that was sent against the Algerines in 1620, on which occasion he collected plants in Barbary and the Isles of the Mediterranean. About 1629 he obtained the title of gardener to Charles I. When he founded his garden at Lambeth is not exactly known; but there he collected the first considerable collection of natural history ever formed in this country. His museum was called Tradescant's Ark, and was much frequented by the great. He had a son of the same name, who took a voyage to Virginia, and brought home many new plants. Tradescant's spiderwort and aster are among the number of plants introduced by them. In what year the elder Tradescant died is uncertain, but he was an old man when his book was published. The son inherited the museum, and bequeathed it by a deed of gift to Elias Ashmole, Esq., who lodged in Tradescant's house. It afterwards became part of the Ashmolean museum, and the name of Tradescant was unjustly sunk

in that of Ashmole. John, the son, died in 1662: his widow contested the will, and upon losing her cause, it is said she drowned herself. A curious account of the remains of the Lambeth garden, drawn up in the year 1749 by Sir W. Watson, is printed in the 46th vol. of the *Philosophical Transactions*; and of the family monument erected by Mrs. Ashmole, in the 63d vol. of that work.

Catalogue of the plants in his garden.

1657. *Deale, John*, a Herefordshire gentleman.

1. A Treatise on Fruit Trees, shewing their Manner of Grafting, Pruning, and Ordering: Of Cider and Perry: Of Vineyards in England, &c. Oxf. 1653, 1657, 4to. 1665, 12mo.

2. The Hereford Orchards; a pattern for the whole of England. Lond. 1657, 12mo. 1724, 8vo.

3. Observations on some parts of Bacon's Natural History, as it concerns Fruit Trees, Fruits, and Flowers. Oxf. 1658. 4to. Printed along with the work entitled, A Treatise on Fruit Trees, 1665, 12mo.

4. General Advertisement concerning Cider.—Letters about Improvement of Nurseries, Orchards, &c. Lond. 1677. 4to.

1658. *Browne, Sir Thomas*, M.D., an eminent physician and antiquary, was born in London, 1605, died 1682.

1. Hydriotaphia; or, a Discourse of Sepulchral Urns lately found in Norfolk, together with the Grounds, Cypresses, or the Quincuncial Lozenge, or Net-work Plantation of the Ancients, artificially, naturally, and mystically considered. Lond. 1658. 8vo.

2. Certain Miscellany Tracts in Scripture, of Gardens. Lond. 1684. 8vo.

1658. *Evelyn, John*, F.R.S., an eminent natural philosopher and patriot, was born at Wotton, in Surrey, the seat of his father, Richard Evelyn, Esq.; the 31st of October, 1620: after he had finished his education at Oxford, his philosophic turn of mind induced him to quit his native country, rather than engage in the civil war then breaking out, and in 1644, he set out to make the tour of Europe. He wrote on a variety of subjects, philosophical, political, and literary, and died on the 27th of February 1705-6, in the 86th year of his age, and was interred at Wotton.

In 1819, Memoirs of J. Evelyn, Esq., including his Diary, were published by William Bray (in 2 vols. 4to.), a very interesting book, as affording a faithful picture of the times in which he lived, and a good idea of the gardens on the continent at the time he travelled, and those of England at the end of the 17th century.

1. The French Gardener, instructing how to cultivate all sorts of Fruit-Trees and Herbs for the Garden; together with directions to dry and conserve them in their natural state. Lond. 1658. 8vo.

2. Fumifugium; or, the Inconvenience of the Air and Smoke of London dissipated; together with some Remedies humbly proposed. Lond. 1661. 12mo. This work was addressed to His Majesty King Charles II., and published by his express command. The author proposes the removal of such trades as require great fires, five or six miles out of London, towards Greenwich; also of slaughter-houses and chandlers; and to plant fragrant nurseries and gardens in the low grounds near the city. The lime-trees in St. James's Park were planted in consequence of this suggestion.

3. Sylva; or, a Discourse of Forest-Trees, and the Propagation of Timber in His Majesty's Dominions. To which is annexed, Pomona; or, an Appendix concerning Fruit Trees in relation to Cider, the making and several ways of ordering it. Lond. 1664. fol. Dr. Hunter, of New York, published an elegant edition, with copious Notes and Engravings, in 1776, 2 vols. 4to.

4. Kalendarium Hortense; or, the Gardener's Almanac, directing what he is to do monthly throughout the year, and what Fruits and Flowers are in their prime. Lond. 1664. 8vo.

5. Terra; a Philosophical Discourse of Earth, relating to the Culture and Improvement of it for vegetation and the propagation of Plants, as it was presented to the Royal Society, April 29. 1675. Lond. 1675. fol.

6. Pomona; a Discourse concerning Cider. Lond. 1679. fol.

7. Monsieur de la Quintinye's Treatise of Orange-Trees, with the raising of Melons, omitted in the French editions, made English by J. E. Lond. 1698.

8. Actæaria; or, a Discourse of Sallets. Lond. 1699. 8vo.

1660. *Sharrock, Robert*, LL.D., prebendary of Winchester, born in Buckinghamshire in the 17th century, author of various judicial and theological works; died 1634.

1. The History of the Propagation and Improvement of Vegetables by the concurrence of Art and Nature. Written according to Observations made from Experience and Practice. Oxford, 1660. 8vo.

2. Improvements to the Art of Gardening; or, an exact Treatise of Plants. Lond. 1694. fol.

1662. *Cowley, Abraham*, an eminent English poet, was born in London 1618; began to write poems at the age of fifteen; lived in terms of intimacy with Evelyn and other eminent men of his time; went to court; but at last, Spence informs us, he grew sick of going there, "took a house first at Battersea and then at Chertsey, always farther and farther from town, where he died in 1667. His death, Pope observes, was owing to a mere accident. He went with Dean Sprat, who afterwards published his life and writings, to dine at a neighbor's house, who according to the fashion of the times, made them too welcome. They did not set out for their walk home till it was late, and had drank so deep that they lay

out in the fields all night. This gave Cowley the fever, which carried him off." He disliked women, and was fond of retirement in idea, and pants after it in his poems; but, according to Dr. Johnson, was unhappy when he had attained his wishes.

Plantarum, Herbarum, Florum, et Sylvarum, Lond. 1662. 8vo.

1664. *Blake, Stephen.*

The complete Gardener's Practice, 4to. Lond.

1665. *Hughes, William.*

1. The Complete Vineyard; or, an excellent way for the planting of Vines, and ordering of Wines and Wine-presses, according to the German and French manner. Lond. 1670. 8vo.

2. The American Physician, or a Treatise of the Roots, Plants, Trees, &c., growing in the English Plantations; with a Discourse on the Cocoa Tree, and the ways of making Chocolate. Lond. 1672. 12mo.

3. The Flower Gardener, how most Flowers are ordered, increased, &c. Lond. 1672. 12mo.

1665. *Rea, John, gent.* He seems to have been a professional gardener, and to have given plans for laying out grounds.

Flora, or a complete Florilege, furnished with all requisites belonging to a Florist. Lond. 1665. fol. with cuts.

1666. *Beale, Dr. John,* an ingenious English divine and philosopher, was born in Herefordshire, 1603, died 1683.

1. Experiments and Observations on Vegetation and the Running of the Sap, &c. (*Phil. Trans.* 1669. Abr. i. p. 301.)

2. The Connection of certain Parts of the Tree with those of the Fruit. (*Ibid.* 1669. p. 334.)

3. Remarks on the Vine and Britannicum.

4. Agrestick Observations and Advertisements.

1666. *Rose, John,* gardener to Charles II. at St. James's.

The English Vineyard vindicated, and the way of making wine in France. Lond. 12mo. 1690. 8vo. First printed with Evelyn's French Gardener, in 1690.

1668. *Worlidge, John, gent.*

1. Systema Agriculture; the Mystery of Husbandry discovered. By J. W. (John Worlidge) gent. Lond. 1668. fol.

2. The Art of Gardening. Lond. 1700. 8vo.

1672. *Drope, Francis, B.D.,* a native of Cumner in Berkshire, where his father was vicar, and his brother a physician. Francis died at Oxford, and this work was published after his death by his brother, and dedicated to Lord Windham, who is stated to have a fine orchard at Brackley.

A short and sure Guide to the Practice of Raising and Ordering of Fruit Trees. Oxford, 12mo.

1675. *Cotton, Charles, Esq.,* an English poet, born in Staffordshire in 1630; author of a number of political works, memoirs, poems, &c., and editor of Walton's *Angler*; died 1687.

The Planter's Manual of Raising, Planting, and Cultivating all Sorts of Fruit Trees. Lond. 8vo.

1676. *Cooke, Moses,* gardener to the Earl of Essex at Cashibury. Evelyn in his *Diary* mentions him as a skilful artist in the mechanical part of gardening, not ignorant in mathematics, and with some pretensions to astrology. He afterwards became a partner with Lucre, Field, and London, in the Brompton Park Nursery.

1. The Manner of Raising, Ordering, and Improving Forest Trees. By Moses Cooke, Lond. 4to.

2. The Art of making Cider, published in Evelyn's works.

1677. *Lawrence, Anthony.*

Nurseries, Orchards, Profitable Gardens, and Vineyards encouraged. Lond. 4to.

1681. *Langford, T.*

1. Plain and full instructions to raise all Sorts of Fruit Trees that prosper in England; with Directions for making Liquors of several Sorts of Fruit. Lond. 1681. 8vo.

2. The Practical Planter of Fruit Trees. Lond. 1681. 8vo.

3. Systema Agriculture; being the Mystery of Husbandry discovered. Lond. 1681. fol.

1682. *Meager, Leonard.*

1. English Gardener; or, a Sure Guide to Young Planters and Gardeners. Lond. 1683. 8vo.

2. New Art of Gardening; with the Gardener's Almanack. Lond. 1697. 8vo.

3. The Mystery of Husbandry. Lond. 1699. 12mo.

1683. *Gilbert, Samuel,* author of *Fons Sanitatis*; or, the Healing Spring at Willowbridge in Staffordshire.

1. The Florist's Vade Mecum. Lond. 12mo.

2. The Gardener's Almanack. By Sam. Gilbert, Philereus. In this small book is a particular description of the Roses cultivated in the English gardens at that period, and very accurately described.

1683. *Read, John,* gardener to Sir George Mackenzie of Rosehaugh in Aberdeenshire, one of the earliest Scotch gardening authors.

The Scots Gardener; whereunto is annexed, the Gardener's Kalendar. Edin. 1683. 4to.

1684. *Bobart, Jacob,* curator of the botanic garden at Oxford.

Effects of the Great Frost on Trees and other Plants. (*Phil. Trans.* 1684. Abr. iii. page 89.)

1685. *Temple, Sir William,* a statesman of deserved eminence, and a miscellaneous writer, was born in London in 1628. He was ambassador for many years at the court of Holland, and there ac-

quired his knowledge and taste in gardening. He introduced some good sorts of grapes and other fruits, and one variety of nectarine still bears his name; he had an excellent walled garden at Sheen in Surrey, in which his contemporary Evelyn says his trees were most exactly trained. He had another seat at Moor Park near Farnham in Surrey, where he died in 1688, and his heart, by his desire, was buried in a silver urn under a sundial in the garden. He was warmly attached to gardening and retired leisure, and declares one of the greatest pleasures in life to be "such a degree of liberty, as to be able to walk at one's own pace, and one's own way."

Upon the Gardens of Epicurus; or, of Gardening in the year 1685. (In his works, vol. i. Miscellanea.)

1685. *Anon.*

The Complete Planter and Ciderist. 8vo.

1691. *Gibson, J.*

A short Account of several Gardens near London, as viewed in 1691. (*Archæologia Britannica*, vol. xii. p. 181.)

1699. *Facio, Nicholas,* of Duilherd, F.R.S., a mathematician, was born in Switzerland in 1664. He studied at Geneva, after which he settled at Utrecht as a tutor, but was there suspected of Spinozism. In 1687 he came to England, where he taught mathematics, was tutor to the Marquis of Tavistock, and had a patent for jewel-watches; but when the French prophets made their appearance, he joined them in all their extravagancies, for which he stood in the pillory in 1707. He died at Worcester in 1753. Some of his papers are in the British Museum.

Fruit Walls improved by inclining them to the Horizon; or a Way to build Walls for Fruit Trees, whereby they may receive more Sunshine and Heat than ordinary. By a Member of the Royal Society. Lond. 4to. With Plates by Gribelin.

This is a very ingenious and scientific work, in which the advantages of receiving the sun's rays at right angles are mathematically and optically demonstrated.

1699. *London and Wise,* nurserymen and garden-architects, and the most eminent in their line at the end of the seventeenth and beginning of the eighteenth century. George London was apprentice to Rose, the royal gardener, and sent by him to France to study the beauties of Versailles. On his return he was made head gardener to Dr. Compton, Bishop of London, and at the beginning of the revolution, superintendent of the royal gardens, at a salary of 200*l.* a-year, and page of the back-stairs to Queen Mary. Of Wise little is known, excepting that he laid out grounds; and in particular Blenheim. Switzer says, London was a man of singular activity; and when on a tour of the places at which he had concern, used to ride, at an average, sixty miles a-day, which at last brought on a fever, that occasioned his decease after a fortnight's illness, in 1717.

The Complete Gardener: or Directions for Cultivating and right Ordering of Fruit Gardens and Kitchen Gardens. With the Gardener's Kalender, directing what is to be done every Month in the Year. By Monsieur de la Quintinie. Now compendiously abridged, and made of more use; with very considerable Improvements. By George London, and Henry Wise. To which is prefixed, an Address to the Nobility and Gentry. By J. Evelyn, Esq. Lond. 1717. 8vo.

1704. *Anon.*

Dictionary Rusticum; or, a Dictionary of Husbandry, Gardening, Trade, and Commerce. 2 vols. 8vo. with Cuts.

1706. *Gentil.*

Solitary or Carthusian Gardener; being Dialogues between a Gentleman and Gardener. Lond. 8vo. Most probably a translation from the French.

1707. *Fleetwood, William,* successively Bishop of St. Asaph and Ely, and much admired as a popular preacher, was born in London in 1656, published a great number of sermons, and other works, and died in 1723.

Curtiosities of Nature and Art in Husbandry and Gardening. Lond. 8vo.

1707. *Mortimer, John,* author of some tracts on religious education. His works on husbandry were translated into Swedish, and published in Stockholm in 1727.

The whole Art of Husbandry, in the way of managing and improving of Land.

1712. *Addison, Joseph,* was born at Milston in Wiltshire, 1672, educated at Salisbury, Litchfield, and Oxford; he addressed some verses to Dryden at the age of twenty-two; obtained a pension of 300*l.* a-year in 1699; travelled on the continent for three years; returned and assisted Steele in the *Taller and Spectator*; married the Countess-Dowager of Warwick in 1716; became secretary of state; resigned on a pension of 1500*l.* a-year, and died in 1719 at Holland House, Kensington, leaving only one daughter, who died unmarried in 1797.

1. On the Causes of the Pleasures of the Imagination, arising from the Works of Nature, and their Superiority over those of Art. (Published in the *Spectator*, No. 144.)

2. Description of a Garden in the Natural Style. (*Ibid.* No. 477.)

1714. *Lawrence, or Laurence, John, M.A.*, an eminent naturalist, admitted of Clare-hall, Cambridge, B. A., 1688; presented to the rectory of Yelvertoft in Northamptonshire, in 1703; where in three years he improved a garden of thirty-two yards square, the soil a wet white clay, so that it produced some of the choicest fruits. In 1721 he was presented to the rectory of Bishops Wearmouth, county of Durham, where he died in 1732. He is described as of a hospitable and benevolent disposition, and taking great pleasure in presenting a rich dessert of fruit to his friends. He was fond of gardening, and considered it as a recreation particularly suitable for a clergyman. "The most wholesome kind of exercise, being *ad ruborem, non ad sudorem*; such an exercise as studious men require; less violent than the sports of the field, and more so than fishing; in fine, the happy medium."

The Clergyman's Recreation: shewing the Pleasure and Profit of the Art of Gardening. Lond. fol.

1715. *Snow, T—*, author of *Apoproscopy*.

Arts, Improvements: or Experiments in Building, Agriculture, Gardening, &c. Lond. 8vo.

1715. *Switzer, Stephen*, a seedsman and artist-gardener. To be addressed "At the Flower-plot over against the Court of Common Pleas in Westminster Hall; or at his garden in Millbank, Westminster." He is said to have been brought up under London and Wise. He appears to have been well educated for the time in which he lived, and it is remarkable that so little is known of his history. He died in 1745.

1. *Ichographia; or the Nobleman, Gentleman, and Gardener's Recreation: Directions for the General Distribution of a Country seat into rural and extensive Gardens, Parks, Paddocks, &c. with a general System of Agriculture, illustrated with a great variety of Copperplates, from the Author's Drawings.* Lond. 1718. 3 vols. 8vo.

2. *The Practical Fruit Gardener.* Lond. 1724. 8vo.

3. *Compendious Method of raising Kitchen Vegetables.* Lond. 1729. 8vo.

4. *An Introduction to a General System of Hydrostatics and Hydraulics.* Lond. 1729. 2 vols. 4to.

5. *Dissertation on the true Cytus of the Ancients.* Lond. 1731. 8vo.

6. *Universal System of Water and Water-works, Philosophical and Practical; with Cuts.* 1730. 2 vols. 4to. The Third Edition, made very perfect and complete, especially that part which relates to the burning of clay.

1716. *Bradley, Richard, F.R.S.*, a popular writer of very considerable talent and indefatigable industry, author of various treatises in natural history, husbandry, &c. and Professor of Botany at Cambridge. According to Professor Martyn, "he was chosen into that office November the 10th, 1724, by means of a pretended verbal recommendation from Dr. Sherard to Dr. Bentley, and pompous assurances that he would procure the university a public botanic garden by his own private purse and personal interest. The vanity of his promises was soon seen, and his total ignorance of the learned languages known. In 1731 it was in agitation to turn him out of his professorship; and he died in the latter end of 1732. It may seem strange to assert, that the translator of Xenophon's *Œconomicks* did not understand Greek; it is, however, true. Mr. Bradley's being then a popular name, he was paid by the booksellers for permitting them to insert it in the title." He first made himself known to the public in 1713, by two papers, printed in the twenty-ninth volume of the *Philosophical Transactions*; one On the Motion of the Sap in Vegetables; the other, Microscopical Observations on Vegetation, and on the quick Growth of Mouldiness on Melons. From this time to his death he published two volumes in folio, four in quarto, and nearly twenty in octavo, on gardening, botany, and agriculture, besides other publications on natural history and the arts. Though Bradley's writings do not abound in new discoveries, yet they are not destitute of interesting knowledge, collected from contemporary gardeners and from books. He was an advocate for the circulation of the sap, and made several new observations on the sexes of plants, in consequence of the production of hybrid species, by which he added strength to that doctrine. He wrote instructively on the germs of trees, on bulbs, on grafting, and particularly on the methods of producing variegated and double flowers; and, on the whole, his writings, coinciding with the growing taste for gardening, the introduction of exotics, and improvements in husbandry, contributed to excite a more philosophical view of these arts, and diffuse a general and popular knowledge of them throughout the kingdom.

1. *The History of Succulent Plants, with their Descriptions and Manner of Culture, in five Decads.* 1716.

2. *New Improvement of Planting and Gardening, both Philosophical and Practical.* 1717. 8vo.

3. *A new Improvement of Planting and Gardening, both Philosophical and Practical, explaining the Method of the Sap, and Generation of Plants; with other Discoveries never before made Public; for the Improvement of Forest-Trees, Flower-Gardens, or Parterres; with a New Invention, whereby more Designs of Garden Plats may be made in one Hour, than can be found in all the books now extant. Likewise several rare Secrets for the Improvement of Fruit Trees, Kitchen Gardens, and Green-house Plants. To which is now added, the Gentleman's and Gardener's Calendar. The whole illustrated with Copper Plates.* 1720.

4. *A Philosophical Account of the Works of Nature; endeavouring to set forth the several Gradations remarkable in the Mineral, Vegetable, and Animal Parts of the Creation, tending to the Composition of a Scale of Life. To which is added, an Account of the State of Gardening, as it is now in Great Britain and other Parts of Europe, together with several New Experiments relating to the Improvement of Barren Ground, and the propagating of Timber-trees, Fruit-trees, &c. With many curious Cuts.* 1721. 4to.

5. *A Treatise on Husbandry and Gardening.* 1721. 8vo.

6. *The Monthly Register of New Experiments and Observations in Husbandry and Gardening; made for the months of April and May 1722; wherein is explained: 1. The Method of bringing Herbs, Flowers, and Fruits, to Perfection in the Vineyard; with an account of a new invented wall, to forward the ripening of Fruit, &c. 2. An Account of transplanting Forest-Trees and Fruit-Trees, of any bigness, in the Summer season; so that gentlemen may make complete Plantations in a few days, as effectually as if they had been growing for many years. Also a New Method for the Improvement of Tulips. The second edition; to which is added, 3. An Answer to some Objections lately made against the Circulation of the Sap, mentioned in the Chapter of the Improvement of Tulips.* 1723. 8vo.

7. *A General Treatise of Husbandry and Gardening, containing such Observations and Experiments as are new and useful for the Improvement of Land; with an Account of such extraordinary Inventions and Natural Productions as may help the Ingenious in their Studies, and promote universal learning. With variety of curious Cuts.* 8vo. 1723. Dedicated to Sir Nicholas Carew, of Beddington, Surrey, Bart., "whose delightful gardens would alone be enough to draw upon him the admiration of that part of mankind who study the pleasures and tranquility of life," and whose "wonderful orange-trees, first made familiar to an English climate by his noble ancestors, and the agreeable structure raised for their preservation," are honorably noticed. The third and last part (for August, September, and the remaining part of the second year,) is inscribed to the Earl of Burlington, "whose palaces and gardens give an example of his distinguishing genius," and has in it, among many other interesting articles, "Observations concerning Vineyards and their Produce, with some Account of the Vineyard near Bath." This celebrated vineyard, it is stated, contains six acres of ground; and in 1718 produced 66 hogsheads of wine, which was then worth 660*l*. We are told, also, that in 1724, there were still superior vines at Mr. Fairchild's at Hoxton, and at Mr. Warner's at Rotherhithe.

8. *A Philosophical Treatise of Agriculture; or, a New Method of cultivating and increasing all sorts of Trees, Shrubs, and Flowers; being a very curious work, enriched with useful Secrets in Nature, for helping the Vegetation of all Sorts of Trees and Plants; and for fertilising the most stubborn Soils.* By G. A. Agricola, M.D. and Doctor of Philosophy at Ratisbonne. Translated from the German, with Remarks. Adorned with Cuts. The whole revised and compared with the Original; together with a Preface confirming this new Method. 1723.

9. *Practical Discourses, containing the most approved Methods for improving Estates and Gardens.* 1726. 2 vols. fol.

10. *Practical Discourses concerning the Four Elements, as they relate to the Growth of Plants.* 1727. 4to.

11. *Botanical Dictionary, for the Use of the Curious in Husbandry and Gardening.* 1728. 2 vols. This was, it is believed, the first attempt of the kind in England.

12. *The Vineyard; being a Treatise showing, 1. The Nature and Method of Planting, Manuring, Cultivating, and Distilling Vines; 2. A Proper Direction for the Weaving, Pruning, Making, Keeping, Fining, and Curing all Defects in the Wine.* 3. *An Easy and Familiar Method of Planting and Raising Vines to the greatest Perfection; illustrated with several useful Examples.* 1728. 8vo.

13. *The Gentleman and Gardener's Calendar, directing what is necessary to be done in every Month in the Year, in the Kitchen Garden, Fruit Garden, and Nursery; Management of Forest Trees, Green Houses, and Flower Gardens, with Directions for the making and ordering Hop Grounds.*

14. *A General Treatise of Husbandry and Gardening; containing a new System of Vegetation; illustrated with many Observations and Experiments, formerly published Monthly, and now methodized and digested under proper Heads, with Additions, and Alterations; in Four Parts.* 2 vols. 8vo.

1716. *Stevenson, the Rev. Henry*, of East Retford, Nottinghamshire.

1. *The Young Gardener's Director.* Lond. 12mo.

2. *The Gentleman Gardener Instructed.* 8th edition. Lond. 1769. 12mo.

1717. *Collins, Samuel, Esq.*, of Archerton in Northamptonshire.

Paradise Retrieved; demonstrating the most beneficial Method of managing Fruit-Trees, with a Treatise on Melons and Cucumbers. Lond. 1717. 8vo.

1717. *Evelyn, Charles, Esq.*, son of John Evelyn. *The Lady's Recreation; or the Third and Last Part of the Art of Gardening improved.* Lond. 1717. 8vo.

1722. *Fairchild, Thomas*, commercial gardener at Hoxton, where he had an excellent vineyard, and was one of the principal nurserymen and florists of his time. He first made himself known by a paper in the *Royal Society's Transactions* (vol. xxxiii. p. 127.), on the "different and sometimes contrary motion of the sap in plants," and assisted in expe-

riments on vegetable sexuality. He died in 1729, and left funds for a botanical sermon, which is delivered annually on Whitsun Tuesday, at St. Leonard's Shoreditch; it was preached for many years by Dr. Colin Milne, by whom it was published in 1779, and has since been continued by the Rev. Mr. Ellis, of Merchant Taylors' school, who receives three guineas out of the funds left by Fairchild for each sermon.

The City Gardener; containing the Method of Cultivating such Plants as will be Ornamental, and thrive best in the London Gardens. 1722. 8vo.

1724. *Miller, Philip*, F.R.S., a celebrated botanist and gardener, author of the *Gardener's Dictionary*, and of several other works, was born 1692. His father, according to Professor Martyn, "was gardener to the Company of Apothecaries, and he succeeded his father in that office in 1722." We have been informed, however, by Watts, a nurseryman at Acton, one of the few surviving gardeners who worked under him, that Miller's father was a market-gardener, somewhere about Deptford or Greenwich, and that Miller himself was a commercial florist, and had a small garden near the situation of the present King's Bench Prison in Surrey. He was considered an ingenious florist, and was selected by the apothecaries as their gardener, on the perpetual grant of the garden-ground by Sir Hans Sloane in 1722. It appears also from Field's *History of the Chelsea Garden* (pub. 1821) that there is no evidence that Miller succeeded his father. Miller "raised himself, by his merit, from a state of obscurity, to a degree of eminence, rarely, if ever before equalled, in the character of a gardener. He added to his knowledge of the theory and practice of gardening, that of the structure and characters of plants, and was practically versed in the methods of Ray, Tournefort, and Linnæus. He adopted the system of the latter in the seventh edition of his work with great reluctance; but was convinced at length by the arguments of Sir W. Watson and W. Hudson. He maintained a correspondence with the most eminent botanists on the continent; among others, with Linnæus, who said his Dictionary was not merely one of gardening, but of botany. *Non erat Lexicon Hortulanorum, sed Botanicorum*. By other foreigners he was emphatically styled *Hortulanorum Princeps*, the 'Prince of Gardeners.' To his superior skill the curious owe the culture and preservation of many fine plants, which would otherwise have been lost." His infirmity, Professor Martyn continues, "induced him to resign his office a little time before his decease, which took place in 1771, in his eightieth year." He was consulted by gentlemen on the subject of planting and laying out grounds, and particularly by the Dukes of Bedford, Northumberland, and Richmond. He had many pupils, among whom were the late Mr. Forsyth and W. Aiton. John Ellis, who seems to have had some pique at Miller, says, he was turned out of the garden for his obstinacy and impertinence to the apothecaries, but his salary continued. His vanity, he says, was so raised by his voluminous publications, that he considered no man to know anything but himself; "though Gordon, Aiton, and Lee, have been long infinitely superior to him in the nicer and more delicate parts of gardening." According to Field's tract, he gave in his resignation in consequence of some altercation or misunderstanding with his employers. This happened in 1769, when he removed to a house close by that part of the Chelsea churchyard where he was buried, and near which an obelisk was erected to his memory by the Horticultural Society in 1810. He was succeeded by the late W. Forsyth, F.A.S.

1. The Gardener's and Florist's Dictionary, or a complete System of Horticulture. 2 vols. 8vo. Lond.

This work was recommended by the most famous gardeners and nurserymen of that time; by Thomas Fairchild at Hoxton, Robert Furber at Kensington, Robert Smith at Vauxhall, Samuel Driver at Lambeth, Moses James at Standgate, Obadiah Low at Battersea, Christopher Gray at Fulham, Benjamin Whitmill at Hoxton, Francis Hunt at Putney, and William Gray junior at Fulham. Weston says, these persons were united in a society for the improvement of gardening; that Miller acted as their secretary; and that this work was in some degree the produce of their joint efforts.

2. Seven years after this Miller published his Gardener's Dictionary in folio. This is commonly regarded as the first edition, and is entitled "The Gardener's Dictionary; containing the Methods of cultivating and improving the Kitchen, Fruit, and Flower Garden. As also, the Physic Garden, Wilderness, Conservatory, and Vineyard, according to the Practice of the most experienced Gardeners of the present age. Interpersed with the History of the Plants, the Characters of each Genus, and the Names of all the particular Species, in Latin and English; and an Explanation of all the Terms used in Botany and Gardening. Together with

Accounts of the Nature and Use of Barometers, Thermometers, and Hygrometers proper for Gardeners; and of the Origin, Causes, and Nature of the Meteors, and the particular Influences of Air, Earth, Fire, and Water upon Vegetation, according to the best natural Philosophers. Adorned with Copper Plates. By Philip Miller, Gardener to the Botanic Garden at Chelsea, and F.R.S.

The seventh edition is entitled, "The Gardener's Dictionary: containing the best and newest Methods of cultivating and improving the Kitchen, Fruit, Flower Garden, and Nursery. As also for performing the practical Parts of Agriculture, including the Management of Vineyards, with the Methods of Making and Preserving the Wine, according to the present Practice of the most skillful Vignerons in the several Wine Countries in Europe. Together with Directions for Propagating and Improving, from real Practice and Experience, all Sorts of Timber Trees.

The ninth or Professor Martyn's edition, is distinguished by the arrangement of the matter, and the completeness of the enumeration of species; all being included which are to be found in the fourteenth edition of Linnæus's *Systema Vegetabilium*, with the exception of the minute tribes of mosses, algae, or seaweeds, and fungi or mushrooms; of which the generic characters are commonly given, together with such species as are used in food, or in any of the arts. In all the former editions of the dictionary, the culture was generally mixed with the descriptions of the species, and was frequently repeated several times under the same genus, but here the scientific, popular and practical parts being kept separate they may each be consulted with facility; and what was before confused, now becomes distinct and obvious.

This laborious work, Professor Martyn observes, is the result of the unwearied application of what talents he possesses, and time he could spare from the duties of his profession during twenty years; no attention or industry has been wanting on his part; and he has strained every nerve to render it as complete in its kind as the nature of so extensive an undertaking will allow.

3. On a Method of Raising some Exotic Seeds. (*Phil. Trans.* Abr. vii. 250. 1785.)

4. On the early Flowering of Tulips, and other Bulbous Plants, when placed in Bottles filled with Water. (Ib. 467.)

1726. *Whitmill, Benedict*.

The Gardener's Universal Calendar. Lond. 8vo.

1727. *I—, S—*.

The Vineyard; being a Treatise, showing the Manner of Planting and cultivating Vines, in Foreign Parts; Directions for making Wines: Method of Planting Vines in England. New Experiments in Grafting and Inoculating all Sorts of Fruits; the best Method of raising several Sorts of compounded Fruits. 8vo.

1728. *Castel, Robert*, a London architect and antiquary.

The villas of the ancients, illustrated with cuts. Lond. fol.

1728. *Langley, Batty*, an architect of houses and gardens; born 1696, at Twickenham, where he resided; author of several architectural works.

1. Practical Geometry, applied to the Arts of Building, Surveying, Gardening, and Mensuration. Lond. 1726.

2. The Sure Method of Improving an Estate by Plantations of Oak, Elm, Ash, Birch, and other Timber Trees. Lond. 1728. 8vo.

3. Pomona, or the Fruit Garden Illustrated: being the sure Method of Preserving the best Kinds of Fruit; with Directions for Pruning, Nailing, Thinning, &c. With Cuts. Lond. 1729. fol.

4. New Principles of Gardening; or, the Laying out Pastures, Groves, Wildernesses, Labyrinths, Avenues, Parks, &c.

1729. *Cowel, John*, gardener at Hoxton.

1. Account of the Olive in Blossom, Torch Thistle, and Glastonbury Thorn. Lond. 8vo.

2. Curious and Profitable Gardener, containing the newest Method for improving Land by Grain or Seed, also a Description of the Great Alehouse, and other excursions, with his Manner of preserving them in Winter. 8vo.

1729. *Triewald, Martin*, Director of Mechanics, Sweden, author of some papers in the transactions of the Royal Society. An account of tulips and such bulbous plants, blowing much sooner when their bulbs are placed upon bottles filled with water, than when planted in the ground. (*Phil. Trans.* vol. xxxvii. 80, 81.)

1730. *A Society of Gardeners*. This society consisted of the most eminent florists and nurserymen of the time, who state in their preface, that finding great inconvenience from the unsettled and vague nomenclature of plants which then existed, they resolved to undertake this work for the public benefit. They published only one part, dedicated to Thomas Earl of Pembroke and Montgomery, and a preface enumerating the most eminent encouragers of gardening of the time. Weston and Martin conjecture that this work gave rise to the folio edition of *Millers' Dictionary*, which appeared in 1731 (the 8vo. in 1724.), Miller being secretary to the society.

1730. The Gardener's Catalogue. — Catalogus Arborum Fruticumque tum Exoticarum tum Domesticarum, &c. or, The Gardener's Catalogue of Trees and Shrubs, both Exotic and Domestic, which are hardly enough to endure the Cold of our Climate in the open Air, ranged in an Alphabetical Order, according to their most approved Latin Names; with an Index of the English Names referring to the Latin. To which is added the Characters of each Genus in English, and a short Account of the different Growths of each Tree or Shrub, illustrated with 21 Copper Plates, in which there are above 50 beautiful Plants which were designed by the famous Myneer Van Huysum, and are represented in their proper Colours. Done by a Society of Gardeners, price 1*l.* 1*1s.* 6*d.* stitched, in fol.

1732. *Anon.*

1. Essay concerning the best methods of Pruning Fruit-trees, also the Method of Pruning Timber Trees, and also a Discourse concerning the improvement of the Potatoe. London. 8vo.

2. The Flower Garden displayed, in above 400 representations of the most beautiful Flowers, with the description and history of each plant, and the method of their culture.

1732. *Furber, Robert*, of Kensington, nurseryman, who published a number of separate prints of all the different kinds of fruits grown in this country. His nursery is now in the possession of Messrs. Malcolm and Co.

1. Fruits for every month in the year, in fol. 12 Plates.

2. An Introduction to Gardening, or Guide to Gentlemen and Ladies in furnishing their Gardens, being several useful Catalogues of fruits and flowers. Lond. 8vo. 1733.

1732. *More, Sir Thomas.*

A Flower Garden for Gentlemen and Ladies, or the Art of raising Flowers to blow in the depth of winter, also the method of raising Salletting, Cucumbers, &c. at any time of the year.

1732. *Murray, Sir Alexander*, of Stanhope, author of some political works relative to Scotland.

The nature and method of Planting, Manuring, and Dieting a Vineyard.

1735. *A Lady.*

Merlin: a Poem; humbly inscribed to her Majesty. To which is added, The Royal Hermitage, a Poem. Both by a Lady, with several curious representations both of the Cave and Hermitage. 1735. 8vo.

1735. *Anon.*

The Rarities of Richmond: being exact Descriptions of the Hermitage, and Merlin's Cave, in the Gardens there. 1735. 8vo. with his Life and Prophecies. 1736.

1738. *Ellis, William*, a farmer at Little Gaddesdon, near Hemstead in Hertfordshire, author of *Complete Husbandry*, and other farming works.

The Timber Tree improved; or the best practical methods of improving different lands with proper timber. Lond. 8vo.

1738. *Anon.*

The Complete Seedsman's Monthly Calendar, shewing the best and most easy Method for raising and cultivating every sort of Seed belonging to a Kitchen and Flower Garden: with necessary Instructions for sowing of Berries, Mast, and Seeds, of Evergreens, Forest Trees, and such as are proper for the improving of Land. Written at the command of a Person of Honour. Lond. 8vo.

1739. *Anon.*

An Essay upon Harmony; as it relates chiefly to Situation and Building. 8vo. 1739.

1739. *Frowel, Samuel.*

A new Treatise of Husbandry and Gardening.

1740. *Gray, Christopher*, a nurseryman at Fulham; a correspondent with many of the eminent botanists of his time, and the first who received the magnolia grandiflora from America, and propagated it extensively.

A Catalogue of Trees and Shrubs which are prepared for sale by Christopher Gray, Nurseryman at Fulham.

1744. *Anon.*

Adam's Luxury and Eve's Cookery, or the Kitchen Garden displayed. 8vo.

2. Curious Experiments in Gardening: modes of Propagation, &c. illustrated by wood cuts. 12mo. 1730.

1744. *Watson, William*, M.D. F.R.S. was born in London, in 1715, educated at Merchants-tailors' school, and served his time to an apothecary. He made discoveries in electricity, for which he obtained the Copley medal, and was honored with the degree of doctor in physic by two German universities. He died May 10. 1787. Besides papers in the *Philosophical Transactions* and the *London Medical Observations*, he wrote *An Account of Experiments on inoculating for the Small-pox*.

1. On the Culture of Mushrooms.

2. Account of the Remains of John Tradescant's Botanic Garden at Lambeth.

3. Account of the Bishop of London's Garden at Fulham.

1746. *Stephenson, David*, M.A. author of *A New Mechanical Practice of Physic*.

Gentleman's Gardener's Director of Plants, Flowers, and Trees; with a Garden Kalendar. Lond. 1746. 8vo.

1747. *Anon.*

The Compleat Florist, 8vo. It consists of 100 copper-plates and flowers, colored and plain.

1748. *Anon.*

A Dialogue upon the Gardens of Lord Viscount Cobham, at Stowe in Berks. 8vo.

1749. *Dickson, James* and Co., nurserymen and seedsmen, Edinburgh.

Catalogue of Hot-house, Green-house, Hardy, and Herbaceous Plants, Flowering and Evergreen Shrubs, Fruit and Fruit Trees. Edinb. 8vo. An enlarged edition in 1796, enumerating in alphabetical order all the plants described in the *Hortus Kewensis*.

1750. *Bickham, George.*

The Beauties of Stowe, with cuts, 8vo.

1752. *Anon.*

An Account of the Emperor of China's Gardens at Pekin. 8vo.

1753. *Anon.*

The Kitchen and Flower Garden complete, in four sheets.

1753. *Coventry, Francis*, was born in Cambridge-shire, and educated at the Magdalen-college, Cambridge, where he took his master's degree in 1752, and entered into orders. He died in 1759, having

just before been presented to the donative of Edgeware. He wrote *Penshurst*, a poem in Dodsley's collection, and a poetical epistle to the honorable Wilmot Vaughan.

Strictures on the Absurd Novelties introduced in Gardening, and a humorous Description of Squire Mushroom's villa. (Published in the *World*, a periodical work, No. XV April 12. 1753.)

1753. *Rocque, Bartholomew*, a florist of Walham Green; author of some agricultural works: a great advertiser of grasses; sowed mixtures in his grounds, and sold the turf at so much per square foot to propagate from; extolled the burnet and lucern, particularly the former: patronised by the Duke of Cumberland. Switzer speaks of a similarly named person, probably the father, who had a vineyard planted in a common field-garden, from which he made wine for thirty years; and although the ground was flat, the wine was as good as that of Orleans and Auxerre.

A Treatise on the Hyacinth: containing the manner of cultivating that Flower, on the experience lately made by the most eminent Florists in Holland; translated from the Dutch. Lond. 1755. 8vo.

1754. *Justice, James*, Esq., F. R. S., one of the principal clerks of session, or civil court of law, in Scotland. His father was a merchant, and dealing with the Dutch, imported flower-roots, which it has been said first gave the subject of this memoir a taste for gardening. He had a villa and large garden at Crichton, near Dalkeith, where he finally spent his fortune, in gardening pursuits, and was obliged to dispose of the property. Here, he practised gardening for thirty years: went twice to Holland to study the culture of bulbs, and also visited Italy; and "satisfied the most learned societies in Britain of his practice and knowledge of the culture of the nicest flowers, and of plants, both exotic and indigenous, which adorn our British gardens. The Ananas," he says (1754), "though now in many gardens, were first brought to fruit in Scotland by me; I can with truth affirm, that no person in this country bestowed more liberality upon improvements in gardening than I did, for the truth of which I can appeal to many of my countrymen." He died about 1762 or 3.

1. The Scots Gardener's Director. By James Justice. Edinb. 8vo.

2. A new edition, entitled, The British Gardener's Director, chiefly adapted to the Climate of the Northern Counties: directing the necessary works in the Kitchen, Fruit, and Pleasure Gardens, and in the Nursery, Green-house, and Stove. By James Justice, F.R.S., one of the principal Clerks of Session. Edinburgh, 1764. 8vo.—The Advertisement, dated September 1763, sets forth, that the first impression being sold off, the author set about correcting mistakes, and making additions; but that his death deprived the world of his after-labors, which the memorandums and notes left behind him gave room to think he intended to have laid before the public. — This is an original and truly valuable work, founded upon reflection and experience.

3. An edition in 1764, arranged as a Monthly Kalendar, and very different from any of the others.

1754. *R — S —*, gentleman.

The Gardener's Pocket Book, or Country Gentleman's Recreation; being the Kitchen, Fruit, and Flower-Garden, displayed in Alphabetical Order.

1755. *Hill, John*, M.D., a miscellaneous writer, was the son of a clergyman, and born about 1716. He served his time to an apothecary in Westminster, and in that situation studied botany, which procured him the patronage of the Duke of Richmond and Lord Petre, who employed him in their gardens. In 1746 he translated the tract of Theophrastus *On Gems*; which was followed by *A General Natural History*, in 3 vols. folio. He next engaged in compiling a supplement to Chamber's *Cyclopaedia*; and at the same time published a periodical paper called *The Inspector*. Having obtained a doctor's degree from St. Andrew's, he endeavored to get elected into the Royal Society; but being disappointed, he attacked that learned body, first in a pamphlet, and next in a quarto volume, written with asperity and acuteness. His facility in writing was very great, and there was hardly a popular subject on which he did not exercise his pen, so that in some years he is said to have realised fifteen hundred pounds. He also gained considerably by quack medicines, and was much encouraged by the Earl of Bute, under whose auspices he published *A System of Botany*, in 26 vols. folio; for which he received the order of Vasa from the King of Sweden. He died Nov. 22. 1775. Besides the works already mentioned he wrote some novels and farces. Hill had a dispute with Garrick, and another with Woodward the comedian; the former answered him in an epigram, and the latter in a pamphlet, with this motto from Shakespeare: "I do remember an apothecary culling of simples." This alluded to a story that

Hill was excluded from some nobleman's gardens for having carried off several valuable plants.

A short account of his life, writings, and character was published at Edinburgh in 1779, and his widow, Lady Jane Hill, published *An Address to the Public, setting forth the Consequences of his Acquaintance with the Earl of Bute*. 1788. 4to.

1. A Method of raising Trees from the Leaves. By John Hill, M.D. 8vo. 1758, under the name of Thomas Barnes.

2. Eden; or a complete Body of Gardening. London. fol. Coloured plates. 60.

3. Complete Body of Husbandry, with plates. fol.

4. The Gardener's New Calendar. By John Hill, M.D. Lond. with plates.

5. An Idea of a botanical Garden in England, 1758.

6. An Account of a Stone, which on being watered produces Mushrooms. London, 1758. 8vo. Plates 2.

7. A Method of producing Double Flowers from Single, by a regular Course of Culture, illustrated with Figures. Lond. 1758. Plates 7.

8. The Origin and Production of Proliferous Flowers, with the Culture at large for raising Double from Single, and Proliferous from the Double. Lond. 1759. 8vo. Plates 7.

9. The Practice of Gardening by T. Perfect, a pupil of Dr. Hill. London. 1759. 8vo.

10. Botanical Tracts. Lond. 1762. 8vo. — A title prefixed to pamphlets published at different times.

11. The Construction of Timber explained by the Microscope. 1770. 8vo.

1755. *Hitt, Thomas*, gardener to Lord Robert Manners, at Bloxholme in Lincolnshire, afterwards a nurseryman in Kent and a designer of gardens. He wrote on husbandry, and the improvement of barren lands in Aberdeenshire, of which county he seems to have been a native. He died about 1770, and his papers came into the possession of — Meader, gardener to the Duke of Northumberland, who published from them the *Universal Gardener*.

A Treatise on Fruit Trees, Lond. 8vo. An original work, valuable for its mode of training trees.

1756. *Anon.*
On the Heat and Cold of Hot-houses.

1757. *Chambers, Sir William*; an eminent architect, was born in Sweden 1726, but his ancestors were of Scottish origin. He was brought to England at the age of two years, and placed in a school at Rippon. His first entrance into public life was in the capacity of supercargo to a Swedish East India ship, in which he made one voyage to China. On his return he quitted the sea, and applied to architecture, under the patronage of Lord Bute, by whose interest he was appointed drawing-master to the late king, then Prince of Wales. His first employment as an architect was in building a villa for Lord Besborough, at Roehampton, after which, he was engaged to lay out the royal gardens at Kew, where he introduced the Chinese ornaments. In 1771 he was honored with the Swedish order of the Polar Star, and in 1775 appointed to conduct the building of Somerset House. He was at this time a fellow of the royal society, and a member of that of antiquaries; besides which he held the places of architect to the king, surveyor-general to the board of works, and treasurer of the royal academy. He died in 1796, aged 69.

1. Designs for Chinese Buildings, Furniture, Dresses, Machines, and Utensils, engraved from the originals drawn in China; to which is annexed, A Description of their Temples, Houses, Gardens, &c. Lond. 1757. max. fol.

2. Plans, Elevations, Sections, and Perspective Views of the Gardens and Buildings at Kew in Surrey, the seat of her Royal Highness the Princess of Wales. Lond. 1763. fol. 42s. A very splendid work.

3. Dissertations on Oriental Gardening. London, 1774. 4to. 5s.

1757. *Spence, Joseph, D.D.*, Professor of poetry in the university of Oxford, author of an essay on Pope's works, *Crito*, and other well known and esteemed works. He was the friend of Lord Walpole; is styled by the latter a man of judgment and taste in gardening. He was born in 1698, and died in 1768.

Some Account of the Emperor of China's Gardens, &c. By Sir Harry Beaumont. Lond. 8vo.

1757. *Anon.*, erroneously attributed by Nichols (*Lit. Anecdotes*) to John Baynes, who died before the poems below were published; by some to Mason, the author of the *English Garden*.

1. An Heroic Epistle to Sir Wm. Chambers. 4to.

2. An Heroic Postscript. 4to. 1758.

These poems are ranked among the most spirited satires of the age.

1757. *Thompson, John*, a commercial gardener at Newcastle upon Tyne.

1. The distinguishing Properties of a fine Auricula. Newcastle. 8vo.

2. The Dutch Florist. Newcastle. 12mo. 1758.

1758. *Hanbury*, the Rev. *William*, rector of Church Langton, Lancashire, died 1778.

An Essay on Planting, and a Scheme to make it conducive to the glory of God, and the advantage of Society. 8vo.

2. A complete Body of Planting and Gardening, containing the Natural History, Culture, and Management of Deci-

duous and Evergreen Forest-trees, &c.; the whole forming a complete History of Timber-trees, whether raised in Forests, Plantations, or Nurseries; as well as a general System of the present Practice of the Flower, Fruit, and Kitchen-Gardens. To be completed in about 140 sixpenny weekly numbers, from December 1769, in two volumes, folio.

1758. *Marshall, Robert*, Esq. F.R.S., of Stratton, in Norfolk.

1. Observations on the Growth of Trees. (*Phil. Trans.* Abr. xi. 320. 1758.)

2. On the Usefulness of Washing and Rubbing the Stems of Trees to promote their Annual Increase. (*ib.* xiv. 124. 1776.) The same. (*ib.* xv. 138. 1781.)

3. Indications of Spring. (*ib.* xvi. 561. 1789.)

4. On the Measures of Trees. (*ib.* xviii. 100. 1797.)

1759. *Barnes, Thomas*, a fictitious name adopted by Sir John Hill for his first gardening publication, (*See Hill, John*, 1755.)

1759. *North*, —, a nurseryman at Lambeth, on the grounds now occupied as a nursery by John Hay.

1. Treatise on Grasses, and the Norfolk Willow.

2. Gardener's Catalogue of Hardy Trees, Shrubs, Flowers, Seeds, &c. 8vo.

1759. *Perfect, Thomas*, inventor of the new Chinese *parterres*, a name adopted by Sir John Hill, and supposed to be that of a famous nurseryman at Pomet in Yorkshire. *See Hill, John*, 1755.)

1759. *Stillingfleet, Benjamin*, an ingenious naturalist and miscellaneous writer, born about 1702; died 1771.

His Literary Life and select Works, by William Cox. Lond. 1811. 3 vols. 8vo. They contain a Calendar of Flora, and some curious essays towards a history of husbandry.

1760. *Anon.*
The London Gardener. 8vo.

1760. *Haddington*, Earl of, a Scotch nobleman, whose residence was at Tynningham, near Dunbar, where he made considerable plantations for the time and country; he was a general encourager of improvements; died about 1787.

A Treatise on Forest Trees. Edin. 8vo.

1760. *Lee, James*, of the firm of Messrs. Kennedy and Lee, nurserymen at the Vineyard, Hammer-smith, a native of Scotland; some time under Miller at Chelsea, afterwards gardener to the Duke of Argyll at Whitton, and next he commenced the nursery with Kennedy, then gardener to Lord Bolton at Chiswick. Lee was a correspondent of Linnæus, and most of the American botanists of the time, and is mentioned by John Ellis as one of the first gardeners. His elements of botany have contributed, perhaps more than any other work, to spread a knowledge of the Linnæan system among gardeners. He died in 1795, and was succeeded by his son of the same name, an ardent lover and liberal promoter of gardening improvements. (*See* 7518.)

1. Introduction to Botany; containing an Explanation of the Theory of that Science, and an Interpretation of its Technical Terms, extracted from the Works of Linnæus, &c.; with 12 plates. Lond. 8vo.

2. Catalogue of Plants and Seeds, sold by Kennedy and Lee, Nurserymen at the Vineyard, Hammer-smith.

1760. *Pullein, Samuel*, M.A., author of different publications on the silkworm, mulberry, and cotton-plant.

Observations towards a Method of Preserving the Seeds Plants in a state of Vegetation, during long Voyages. Lond. 8vo.

1760 to 1780. *Various authors*. The following works contain some pleasing and valuable observations on modern gardening, and are generally considered as having contributed to spread a taste for that style: —

1. Warton's Essay on the Writings and Genius of Pope. Vol. ii. from p. 236. to p. 248. and p. 262. 1762.

2. The first article in the 2d volume of the *Antiquarian Repository* is a pleasing description of "White Knights, the seat of Sir Henry Englefield, Bart. one of the first examples of the *ferme ornée*." 1761.

3. Letters concerning the present state of England. 8vo. 1772. Letter 26.

4. A Tour to London, by Grosley; translated by Nugent. 8vo. 1772. Vol. ii. p. 115.

5. Knox's Essays. Vol. ii. 4th edit. No. 91. and No. 117.

6. *Lælius and Hortensia*. By Dr. Stedman. 8vo. 1782. Letters 5 and 6.

To these may be added from the poets: The Description of the Grotto of Calypso, and of the Garden of Alcinoüs, in Pope's *Odyssey*; of the old Corycian's Garden, in Dryden's *Virgil*; of the Garden of Arminia, in Hoole's *Tasso*; various passages in Milton's *Paradise Lost*, Thomson's *Seasons*, and other poems.

Among prose writers may be referred to: The Description of the Vale of Tempe, in *Ellan's Various History*; of Vaulch and Petrarch's Garden, from Mrs. Dobson's Life of Petrarch; Petrarch's Description of *Silva Piana*; Smollett's *Travels through France and Italy*, vol. ii. Letter 31. dated 1763; Gough's *British Topography*, p. 158. Oxfordshire; Critical Review for October, 1771. p. 312. and August, 1785; and the preface to Girardin's *Landscape*. To these might be added, various papers in the *Gentleman's Universal*, and other magazines, published about this time, and also to the tours and topographical works of the same date.

1760. *Anon.*

Adam armed, or an Essay endeavouring to prove the Advantages and Improvements the Kingdom may receive, and the Inconveniences and Impediments it may avoid and remedy, by the Means of a well-ordered and duly rectified Charter for Incorporating and Regulating the Professors of the Art of Gardening; humbly offered and presented by the Master and Company of the same. Fol. no date; supposed about 1760.

1762. *Home, Henry*, commonly called Lord Kaimes, from his official legal situation; an eminent Scotch lawyer, philosopher, and critic, was born at Kaimes in Berwickshire, 1696; died 1782. He was originally bred a writer or attorney, but by assiduous application raised himself to be a judge. He farmed his own estate at Kaimes for several years; and afterwards resided at Blairdrummond in Stirlingshire, his wife's estate, where he displayed his taste in laying out grounds. His life has been written by Lord Woodhouselee.

Essay on Gardening; in the Elements of Criticism. Lond. 3 vols. 8vo. In this work he recommends a judicious use of both the ancient and modern styles.

1763. *Wheeler, James*, a nurseryman at Gloucester. After his death the nursery was carried on by his two daughters, who separated some years ago, and it is now carried on by one of them.

The Botanist's and Gardener's New Dictionary; containing the Names, Classes, Orders, Generic Characters, and Specific Distinctions of the several Plants cultivated in England, according to the System of Linnaeus: to which is prefixed, an Introduction to the Linnaean System of Botany. Lond. 1763. 8vo.

1764. *Doddsley, Robert*, an ingenious English poet, miscellaneous writer, and bookseller; was born in Nottinghamshire, 1703.

A Description of the Leasowes, the Seat of William Shenstone, Esq., accompanied by a Plan. Lond. 12mo.

1764. *Museum Rusticum*, a periodical work, containing various papers on planting and horticulture.

Museum Rusticum et Commerciale; or select Papers on Agriculture, Commerce, Arts, and Manufactures. Drawn from experience, and communicated by Gentlemen engaged in these Pursuits. Revised and digested by several Members of the Society for the Encouragement of Arts, Manufactures, and Commerce: in 6 vols. 8vo.

The Museum Rusticum was succeeded by a similar work in 1768, entitled *De re rustica*, completed in 2 vols. 8vo. in 1770.

1764. *Shenstone, William*, Esq., a poet and country gentleman, celebrated for his taste in landscape-gardening; born in Shropshire 1714, died 1763.

Unconnected Thoughts on Landscape Gardening. In his works collected after his death, in 3 vols. 8vo. Lond.

1766. *Abercrombie, John*, son of John Abercrombie, who had a nursery and garden in the neighborhood of Edinburgh; and was in the habit of supplying the markets of that city with vegetables.

John Abercrombie, our author, was born in 1726; and was educated at a grammar school, till he attained an age to be of service in his father's business, for which he had always a predilection. After he had arrived at manhood, on some trifling family differences occurring, he left his father, and came to London; in the vicinity of which he worked for some years as a journeyman gardener. To note the particulars of most interest, he was long employed in the Royal Gardens at Kew, and at Leicester House, now Leicester Fields; and in these situations he occasionally contributed to the boyish diversions of his present majesty. He lived as principal gardener with several noblemen and persons of high rank and respectability, and particularly with that eminent botanist, Doctor Munro (father of the present celebrated physician), at Sunning Hill, near Windsor: here he continued several years, and was married while in the doctor's service, to a young woman in the family of Sir James Douglas, where he had before lived. He afterwards had a garden and nursery at Hackney, whence he sent his goods to Spitalfields Market; and the profits of his business enabled him to support his increasing family with comfort and decency. At this crisis, some time about 1770, Mr. L. Davis, an eminent bookseller of London, accompanied by Dr. Oliver Goldsmith, having previously ordered a handsome entertainment at an inn in Hackney, surprised Abercrombie with an invitation to dine with them with a view to induce him, by encouraging overtures, to compose an original work on Practical Gardening. Abercrombie consented, with reluctance, fearful it might call off his attention too much from his garden and nursery; and at last, only on the condition of his materials being revised, and the style improved by Dr. Goldsmith. This celebrated writer, however, did not perform his part of the undertaking: after the papers had been handed to him by the humble gardener, then an inexperienced writer, and anxious to have his luxuriances pruned, the doctor said, as an apology to the bookseller for returning the MS. unrevised, that "Abercrombie's style was best

suited to the subjects of which it treated." Abercrombie, however, frequently lamented, and the public possibly may do the same, that this very perspicuous and elegant writer did not fulfil his engagement.

Abercrombie's first work was entitled *Every Man his own Gardener*, which had a rapid sale; and, from the temporary profits being considerable, he was induced to neglect, and soon after to give up, his nursery; and to enter upon a course of authorship on horticultural subjects.

On first publishing *Every Man his own Gardener*, the diffidence of Abercrombie induced him to affix to the title-page the name of Mawe, who was gardener to the Duke of Leeds. After the publication of a second edition, he accepted of an invitation from the nominal author of his book, who had been much flattered by the compliment, to visit him in Yorkshire. When introduced to Mawe, whom he had never before seen, poor Abercrombie (as he used facetiously to narrate) encountered a gentleman so bedpowdered, and so bedaubed with gold lace, that he thought he could be in the presence of no less a personage than the duke himself. However, they soon came to a right understanding; for he continued his visit for more than a fortnight, and "fared sumptuously every day." He likewise received much information from Mawe, as the groundwork of improvements which he afterwards made in his book, *Every Man his own Gardener*, and in other publications. They subsequently maintained a friendly correspondence for years.

About the year 1774, Abercrombie took a tea-garden at Hoxton, near the Shepherd and Shepherdess; and exhibited in the grounds his practical skill in raising exotics and choice fruits: his arbors there are, to this day, spoken of as rural curiosities. In different parts of the garden he was accustomed to fix pieces of his own humble poetry.

At length he left it, on the expiration of the lease, which he was unable to get renewed. Unfortunately, just before the lease had expired, the original proprietor of the grounds under whom Abercrombie held, and who was disposed to do him the most friendly offices, died. This gentleman was an eminent goldsmith, and an alderman of the city of London: during his illness, his relations prevented Abercrombie from visiting him, or from access to the house. On his death, Abercrombie experienced another severe disappointment, in not being noticed in the alderman's will; although he had been led, by professions of friendship and promises of assistance, to form the highest expectations from this quarter.

Previous to the year 1790, Abercrombie's family had grown up and had settled away from home. From this period to the time of his death, he chiefly depended for support on the occasional improvements which his several works required. From 1796 to the time of his decease, he resided at Charlton Street, Somers' Town, except when he was visiting a friend at Cambridge, or was engaged in any professional pursuit at a considerable distance from town. When out of business, he was a constant visitor, being a great walker, of the nursery-grounds and botanic gardens around the metropolis, with the object of collecting horticultural and botanical information. He was also occasionally employed in planning new gardens and ornamental grounds, as a horticultural surveyor and improver; for which he was sometimes handsomely remunerated.

In the spring of 1806, being in his eightieth year, Abercrombie met with a severe fall, by which he broke the upper part of his thigh-bone. This accident, which happened to him on the 15th of April, terminated in his death. After lying during the interval, in a very weak exhausted state, without much pain, he expired in the night between April and May as St. Paul's clock struck twelve. He was lamented by all who knew him, as cheerful, harmless, and upright.

1. *Every Man his own Gardener*, being a New Gardener's Calendar, with complete Lists of Forest-trees, Flowering Shrubs, Fruit-trees, Evergreens, annual, biennial, and perennial Flowers: Hot-house, Green-house, and Kitchen-garden Plants, with the Varieties of each Sort cultivated in the English Gardens. Lond. 12mo.

Of this very useful and popular work the editions have been numerous. From the diffidence in the writer, it was first published as the production of Thomas Mawe, gardener to His Grace the Duke of Leeds, and other gardeners; but it was entirely written by Abercrombie, whose claim has since been, in some measure, asserted, by subjoining in the titlepage the name of John Abercrombie, to the more popular one of Mr. Mawe. It is to be lamented, Professor Martyn observes, that

so respectable a performance should be accompanied by this deceit and book-trading.

2. The Universal Gardener and Botanist, or a General Dictionary of Gardening and Botany, exhibiting, in Botanical Arrangement, according to the Linnaean System, every Tree, Shrub, and Herbaceous Plant that merits Culture, &c. Lond. 1778. 4to.

3. The Garden Mushroom, its Nature and Cultivation, exhibiting full and plain Directions for producing this desirable Plant in Perfection and Plenty. Lond. 1773. 8vo.

4. The British Fruit Garden, and Art of Pruning; containing the most approved Methods of planting and raising every useful Fruit Tree and Fruit-bearing Shrub. Lond. 1779. 8vo.

5. The Complete Forcing Gardener, for the thorough Practical Management of the Kitchen Garden, raising all early Crops in Hot-beds, and forcing early fruit, &c. Lond. 1781. 12mo.

6. The complete Wall-tree Pruner, &c. Lond. 1783. 12mo.

7. The Propagation and Botanical Arrangement of Plants and Trees, useful and ornamental. Lond. 1785. 2 vols. 12mo.

8. The Gardener's Pocket Dictionary, or a Systematical Arrangement of Trees, Herbs, Flowers, and Fruits, agreeable to the Linnaean Method, with their Latin and English Names, their Uses, Propagation, Culture, &c. Lond. 1786. 3 vols. 12mo.

9. Daily Assistant in the Modern Practice of English Gardening for every Month in the Year, on an entire new plan. Lond. 1789. 12mo.

10. The universal Gardener's Kalender and System of Practical Gardening. Lond. 1789. 12mo.

11. The Complete Kitchen Gardener and Hot-bed Forcer, with the thorough Practical Management of Hot-houses, Fire-walls, &c. Lond. 1789. 12mo.

12. The Gardener's Vade-mecum, or Companion of General Gardening; a Descriptive Display of the Plants, Flowers, Shrubs, Trees, Fruits, and general Culture. Lond. 1789. 8vo.

13. The Hot-house Gardener, or the General Culture of the Pine Apple, and the Methods of forcing early Grapes, Peaches, Nectarines, and other choice Fruits in Hot-houses, Vineries, Fruit-houses, Hot-walls, with Directions for raising Melons and early Strawberries, &c. Plates. Lond. 1789. 8vo.

14. The Gardener's Pocket Journal and Annual Register, in a Concise Monthly Display of all Practical Works of General Gardening throughout the year. Lond. 1791. 12mo.

15. A new edition of the Practical Gardener revised, with considerable additions, by Mr. James Mean, Head-gardener to Sir Abraham Hume, Bart. 12mo. 1816.

16. The Practical Gardener's Companion, or Horticultural Calendar, containing the latest Improvements in Horticultural Practice. To which is annexed, on a plan never before exhibited, the Garden Seed and Plant Estimate; edited from an original Manuscript of J. Abercrombie, the whole revised by J. Mean. Lond. 18mo. 1816.

1766. Jones, Henry, a poetical and dramatic writer, a native of Drogheda in Ireland; died 1770.

Kew Garden, a Poem in two cantos. Lond. 4to.

1766. Lightoler, J—, a London architect.

The Gentleman and Farmer's Architecture, being Plans for Parsonage and Farm-houses, with Vineries, Green-houses, &c. on 25 plates, in fol.

1766. Locke, John, one of the greatest and most distinguished philosophers this country has produced; born in Somersetshire 1632; author of numerous works; had a fine seat at Norbury Park in Surrey; died 1704.

Observations upon the Growth and Culture of Vines and Olives, the Production of Silk and the Preservation of Fruits. Written at the request of the Earl of Shaftesbury, to whom it is inscribed: now first printed from the original manuscript, in the possession of the present Earl of Shaftesbury. Lond. 8vo.

1767. Anon.

The Rise and Progress of the present Taste in planting Parks, Pleasure Grounds, Gardens, &c. from Henry the Eighth to King George the Third. In a poetic Epistle to the Right Honourable Charles Lord Viscount Irvin, 4to.

Very scarce, only observed by us in Mr. Forsyth's library.

1767. Giles, John, gardener to Lady Boyd at Lewisham in Kent, and from 1777 foreman in the nursery of Messrs. Russell there. He died in 1797, in his seventy-second year.

Ananas; or a Treatise on the Pine Apple, in which the whole Culture, Management, and perfecting this most excellent Fruit is laid down in a clear and explicit Manner. To which is added, the True Method of raising the finest Melons with the greatest success, &c. Lond. 8vo. 1 plate.

1767. Mawe, Thomas, gardener to the Duke of Leeds, the nominal author of the first publication of John Abercrombie, entitled *Every man his own Gardener*. Abercrombie wrote this work in prison, and being desirous of sending it into the world under a great name, applied to Mawe, then unknown to him. Mawe went to see Abercrombie, and feeling for his situation, permitted him to use his name. This Abercrombie told to Watts of Acton, who is our authority for inserting it.

1767. Rutter, James, gardener at Wandsworth, and Daniel Carter, gardener at Battersea; respectable market-florists, the latter is the father of Thomas and Daniel Carter, esteemed flower-cultivators at the present day.

Modern Eden; or, the Gardener's Universal Guide; containing plain instructions for performing every branch of Gardening, whether relating to ornament or utility; in which are laid down the best methods for raising all the products of the kitchen and flower-garden, and the training, pruning, and entire management of Fruit-trees, &c. Lond. 1767. 8vo.

1768. Gibson, John, M. D., a native of Scotland, surgeon in the royal navy, and author of some medical works.

The Fruit-Gardener, containing the method of raising

Stocks for multiplying Fruit-trees, with directions for laying out and managing Fruit-gardens. 8vo.

1768. Gilpin, the Rev. William, M. A., an ingenious divine, born in Carlisle 1724, educated at Oxford; kept for many years a school at Cheam in Surrey, and afterwards became vicar of Boldre, in Hampshire, and prebendary of Salisbury, where he died in 1804. The whole of his tours and other works on the picturesque, well merit the study of the landscape-gardener.

1. Observations on the River Wye, and several Parts of South Wales, &c. relative chiefly to Picturesque Beauty, made in the Summer of 1770. Lond. 1783. 8vo.

2. Observations relative chiefly to Picturesque Beauty, made in the year 1772, on several Parts of England; particularly the Mountains and Lakes of Cumberland and Westmorland. Lond. 1787. 2 vols. 8vo.

3. Observations chiefly relative to Picturesque Beauty, made in the year 1776, in several parts of Great Britain; particularly the Highlands of Scotland. Lond. 1788. 2 vols. 8vo.

4. Remarks on Forest Scenery, and other Woodland views, relative chiefly to Picturesque Beauty. Illustrated by Scenes of New Forest, in Hampshire; in 3 books. Lond. 1791. 2 vols. 8vo.

5. Three Essays: on Picturesque Beauty; on Picturesque Travel; on Sketching Landscapes. To which is added; a Poem on Landscape Painting. Lond. 1792. 8vo.

6. Observations on the Western Parts of England, relative chiefly to Picturesque Beauty. To which are added, a few remarks on the Picturesque Beauties of the Isle of Wight; 18 Plates. Lond. 1798. 8vo.

7. Observations on the coasts of Hampshire, Sussex, and Kent, relative chiefly to Picturesque Beauty, made in the Summer of 1774. Lond. 1804. 8vo.

8. Observations on several parts of the Counties of Cambridge, Norfolk, Suffolk, and Essex; also several parts of North Wales, relative chiefly to Picturesque Beauty; in two Tours, the former made in the year 1769, and the latter in 1773. Lond. 1809. 8vo.

1768. Mason, George, Esq., a classical scholar and critic; author of an Appendix to Dr. Johnson's Dictionary, and of some other translations and philological works. He lived chiefly in London, and was connected with the Sun Fire Insurance Office.

1. Essay on Design in Gardening. 8vo.

2. An Essay on Design in Gardening; first published in 1768, now greatly augmented. Also a Catalogue of several Publications on the same Subject. Lond. 1795. 8vo. Two Appendices. 1798. 8vo.

1768. Wildman.

Treatise on the Culture of Pear-trees, to which is added a Treatise on the Management of Bees. 12mo. Dublin.

1769. Dicks, John, gardener to His Grace the Duke of Kingston at Knightsbridge.

A New Gardener's Dictionary, or the whole Art of Gardening fully and accurately displayed; containing the most approved Methods of cultivating all kinds of Trees, Plants, and Flowers. In 60 numbers, small folio, completed in 1771.

1769. Dincombe, John, author of some works on antiquities, but chiefly known as the inventor of the dendrometer.

A Treatise upon the Dendrometer, a new invented Instrument for the more certain and ready Measurement of Standing Timber by Inspection only; for facilitating the practical operation of Engineering, Land-surveying, &c. Lond. 1769. 8vo.

1769. Garton, James.

The Practical Gardener, and Gentleman's Directory for every Month in the Year; with proper Directions for raising Mushrooms. To which is prefixed, an Essay upon Vegetation, Soil, Manure, and the nature and form of Stoves, Hot-beds, &c. With a Copperplate, exhibiting at one view the several Aspects for planting a Fruit-Garden. Lond. 1769. 12mo.

1769. Powell, Anthony, Esq., gardener to George II.

The Royal Gardener; or, complete Calendar of Gardening for every Month in the Year, digested in regular order, and so contrived as to exhibit, in a clear and comprehensive manner, the business to be done in the Flower, Fruit, and Kitchen Garden at all Seasons. Likewise Directions, founded on experience, for Sowing, Planting, Pruning, Transplanting, Engrafting, and every other particular necessary to be known by such as desire to aim at a perfect knowledge of this most ancient, healthy, and agreeable of all sciences. Lond. 12mo.

1769. Taylor, Adam, gardener to J. Sutton, Esq., at New Park, near Devizes, in Wiltshire.

Treatise on the Ananas, or Pine-Apple, containing plain and easy Directions for raising this most excellent fruit without fire, and in much higher perfection than from the stove. To which are added, full Directions for raising Melons. Devizes. 8vo. One Plate.

1769. Anon.

Stowe: a Description of the magnificent House and Gardens, &c. 8vo. Cuts.

1770. Ellis, John, Esq., a distinguished naturalist; a native of Ireland, celebrated for his discovery of the animal origin of corals. He wrote a variety of tracts, and numerous papers in the *Transactions of the Royal Society*; and died 1771.

1. Directions to Voyagers for bringing over Plants, &c. from the East Indies, and other distant Countries, in a state of Vegetation. Lond. 1770. 4to.

2. Some additional Observations on the Method of preserving Seeds from foreign parts, for the benefit of the American Colonies. Lond. 1775. 4to.

3. Historical Account of Coffee; with an Engraving, and Botanical Description of the Tree. To which are added, many Papers relative to its culture and use as an article of diet and of convenience. Lond. 1774. 4to.

4. Description of the Mongostan and the Bread Fruit, the first esteemed the most delicious, and the other the most useful of all the Fruits in the East Indies. To which are added

Directions to Voyagers for bringing over them and other vegetable productions. Plates. Lond. 1775. 4to.

1770. *Hunter, Alexander*, M. D. F. R. S. was born at Edinburgh 1733; settled as a physician at Gainborough, at Beverly, and finally at York; author of various agricultural and medical works, and of a cookery-book: died at York 1809.

New Edition of Evelyn's *Sylva* and *Terra*.

1770. *Ockenden*, —, Esq.

Letters describing the Lake of Killarney and Ruessan Gardens. Dublin. 8vo.

1770. *Weston, Richard*, Esq. an amateur gardener, who derived his information chiefly from inspecting the commercial gardens near London.

1. Tracts on Practical Agriculture and Gardening, in which the advantage of imitating the Garden Culture in the Field is fully proved by a seven years' Course of Experiments. To which is added, a Complete Chronological Catalogue of English Authors on Agriculture, Gardening, &c. Lond. 1769. 8vo.

2. The Universal Botanist and Nurseryman, containing Descriptions of the Species and Varieties of all the Trees, Shrubs, Herbs, Flowers, and Fruits, Natives and Exotics, at present cultivated in the European Nurseries, Greenhouses, and Stoves, as described by modern Botanists; arranged according to the Linnaean System, and their Names in English. To which are added, A copious Botanical Glossary, several useful Catalogues and Indexes. Plates. Lond. 1770-1774. 4 vols. 8vo.

3. The Gardener and Planter's Calendar; containing the Method of raising Timber Trees, Fruit Trees, and Quicks for Hedges; with Directions for forming and managing a Garden every Month in the Year; also, many new Improvements in the Art of Gardening. Lond. 1773. 8vo.

1770. *Wheatley or Whateley, Thomas*, Esq. of Non-such Park, Surrey, secretary to the Earl of Suffolk. He had a brother who fought a duel with John Temple, Esq. in 1773 (*Güchris's Trials by Ordeal*, p. 107.), and another, a clergyman. He died about 1780; and some remarks on Shakspeare were published after his death, in a thin 12mo. tract. It is remarkable, that so little is known of a writer, the beauty of whose style and the justness of whose taste are universally acknowledged. After enquiring at his publishers and other sources, we have not been able to ascertain to a certainty the mode of spelling his name.

Observations on Modern Gardening, illustrated by Descriptions. Lond. 1771. Pp. 257. An edition, in quarto, in 1798, with Walpole's History, inserted as notes, and an appendix, consisting of an Essay on the natural Situation of Gardens, originally published by Dodsley.

1771. *Meador, James*, gardener to the Duke of Northumberland at Sion House, and afterwards to the Empress Catherine at Peterhoff, near Petersburg. He was a very satirical person, and wrote verses both on his friends and enemies.

1. The Modern Gardener, or Universal Kalender; containing Monthly Directions for all the Operations of Gardening, to be done either in the Kitchen, Fruit, Flower, and Pleasure Gardens, as likewise in the Green-house and Stove; with the Method of performing the different works, according to the best practice of the most eminent Gardeners. Also an Appendix, giving full and ample Instructions for forcing Grapes, Vines, Peach, Nectarine Trees, &c. in a new manner; never before published; selected from the Diary Manuscripts of the late Mr. Hitt. Revised, corrected, and improved by J. M. Lond. 1771. 12mo.

2. The Planter's Guide, or Pleasure Gardener's Companion; giving plain Directions, with Observations for the proper Disposition and Management of the various Trees and Shrubs for a Pleasure Garden Plantation. To which is added, a list of Hardy Trees and Shrubs for ornamenting such Gardens. Embellished with Copper-plates. Lond. 1779. oblong 4to.

1772. *Butcher, William*, a nurseryman at Comely Garden, near Edinburgh.

Treatise on Forest Trees; containing not only the best Methods of their Culture hitherto practised, but a variety of new and useful Discoveries, the result of many repeated Experiments. To which are added, Directions for the Disposition, Planting, and Culture of Hedges. Lond. 1772. 4to.

1772. *Mason, William*, a divine and celebrated lyric and descriptive poet; born in Yorkshire 1725; died 1797, precentor, and canon of York.

The English Garden; a Poem in four books. Lond. 1772-82. 4to. A new edit. corrected. To which are added, a Commentary and Notes, by W. Burgh, Esq. Lond. 1785. 8vo.

1772. *Pierre, Louis de St.*, a native of South Carolina, and proprietor of lands there.

The Art of Planting and Cultivating the Vine, &c. according to the most approved Methods in France. Lond. 12mo.

1774. *Anon.*

An Essay on the different Natural Situations of Gardens. 4to. 1s. 6d. 1774.

1775. *Pye, Mrs. Hampden*.

A Peep into the principal Seats and Gardens in and about Twickenham (the residence of the Muses) descriptive of their Beauties, internal and external, with a suitable Companion for those who wish to visit Windsor or Hampton-court. To which is added, a History of a little Kingdom on the Banks of the Thames, and its present Sovereign, &c. 8vo.

1776. *Ellis, Thomas*, gardener to the Lord Bishop of Lincoln.

The Gardener's Pocket Kalender. Lond. 12mo.

1777. *Anderson, James*, LL.D., an agricultural writer of great versatility of genius, was born at Herdmanston, in the county of Edinburgh, 1730, on a farm which his parents had possessed for some

generations, and which he was destined to inherit and to cultivate. He lost his parents at an early age, but his education was not neglected; he studied chemistry under Dr. Cullen, and soon leaving his farm near Edinburgh, took one in Aberdeenshire of 1300 acres, which, after improving and cultivating for twenty years, he let, and enjoyed an annuity from it during his life. He settled after leaving Aberdeenshire in the neighborhood of Edinburgh, where he published the *Bee*, in weekly sixpenny numbers, till it extended to eighteen volumes. In 1797 he removed to Isleworth, near London, where he published *Recreations in Agriculture*, in six volumes, and his *Description of a Patent Hot-house*. Here he enjoyed his garden, and died of a decline in 1808, aged 69. Besides the works which bear his name, he wrote the reviews of books on rural matters for the *Monthly Review* for many years.

1. Miscellaneous Thoughts on planting and training Timber-trees, by Agriculture. Edin. 1777. 8vo.

2. Recreations in Agriculture, Natural History, Arts, and miscellaneous Literature. Lond. 1799. 1802. 6 vols. 8vo.

3. A Description of a Patent Hot-house, which operates chiefly by the heat of the Sun, and other subjects; without the aid of Flues, or Tan-bark, or Steam, for the purpose of heating it, &c. Lond. 1801. 12mo.

1777. *Bastard, William*, Esq. of Kitley in Devonshire.

On the Culture of Pine-Apples. An extract of a letter from William Bastard, Esq. of Kitley in Devonshire, to Samuel Musgrave, Esq. M.D. F.R.S. dated Kitley, March 15. 1779, communicated to the Society by Dr. Musgrave.

The writer states that he fruits his pines in pots set in pans of water, on a shelf close under the roof against the back wall; prefers a cistern over the flue in that situation; found a plant without roots grow well, and produce a fruit which weighed two pounds.

1777. *Heeley, Joseph*, Esq.

1. Letters on the Beauties of Hagley, Envil, and the Leasowes; with Critical Remarks and Observations on the Modern Taste in Gardening. Lond. 1777. 2 vols. 12mo.

2. Description of Hagley Park. 1777. 8vo.

1777. *Loddiges, Conrad, and Sons*, eminent botanical nurserymen at Hackney, where their grounds are remarkable for orderly arrangement, and for the magnitude and extent of the hot-houses.

1. A Catalogue of Plants and Seeds, in English and German. 8vo.

2. The Botanical Cabinet, containing figures of new or rare Plants, with Directions for their Culture. 1817. 4to. In monthly parts.

3. A Catalogue of Plants for Sale. 12mo. 1820.

1777. *Maurice*, the Rev. Thomas, M.A., chaplain to the 97th regiment, author of various poems and tracts on Indian history and antiquities.

1. Hagley; a Poem.

2. Grove Hill, the seat of Dr. Lettson, a descriptive Poem; with an Ode to Mithra, and many plates. Lond. 1799. 4to.

1777. *Wilson, William*, a native of Scotland; worked some time under Miller, and was sent by him to Sir James Cockburn, Bart. at Petersham; afterwards gardener to the Earl of Glasgow, near Paisley.

A Treatise on the Forcing of Early Fruits, and the Management of Hot-walls. Lond. 12mo.

This is a useful little treatise; he uses the heat of fermenting dung in his peach and vine houses, as well as the heat of flues; and directs not to prune peach-trees to be early forced till the fires have been made for a fortnight, because "the sap, when it begins to ascend, will spring more regular after the knife than after a dry wound." (p. 13.)

1778. *Anon.*

The Practical Gardener, directing, in the most plain and easy manner, what is necessary to be done in the Kitchen, Fruit, and Flower Garden, the Green-house, and Wilderness. Lond. 8vo.

1778. *Swinden, N* ———, an ingenious gardener and seedsman at Brentford-End, Middlesex.

The Beauties of Flora displayed, or Gentleman and Lady's Pocket Companion to the Flower and Kitchen Garden. Lond. 8vo. 1778.

1779. *Neale, Adam*, gardener to John Blackburne, Esq. near Warrington, Lancashire.

A Catalogue of the Plants in the Garden of John Blackburne, Esq. alphabetically arranged according to the Linnaean System. Lond. 8vo.

1779. *Speechey, William*, gardener for many years to the Duke of Portland, at Welbeck in Nottinghamshire; afterwards a farmer; died at an advanced age in 1820.

1. A Treatise on the Culture of the Pine-Apple, and the Management of the Hot-house; together with a Description of every species of Insect that infests Hot-houses, with effectual Methods of destroying them. York, 1779. 8vo.

2. A Treatise on the Culture of the Vine, exhibiting new and advantageous methods of propagating, cultivating, and training that Plant, so as to render it abundantly fruitful. With new Hints on the Formation of Vineyards in England. York. 4to.

3. Practical Hints on Domestic and Rural Economy, relating partly to the utility, formation, and management of Fruit, Kitchen, and Cottage Gardens, and Orchards, &c. Lond. 8vo. 1820.

1780. *Walpole, Horace*, afterwards Earl of Orford, youngest son of Sir Robert Walpole born in 1718;

a man of taste and genius, author of the *Castle of Otranto*, several papers in the *World*, &c.; he sat in parliament from 1741 to 1768, when he retired, and devoted his time to the improvement of his villa, Strawberry-hill, near Twickenham. In 1791 he succeeded his nephew as Earl of Orford, but never took his seat in the House of Lords. He died in 1797.

1. On Modern Gardening, published in the *Anecdotes of Painting*; in a later edition of 1782 are some additional notes.

Various Remarks on Gardening occur in his correspondence with Mr. Montague, published in 1818, in 4to.

1781. *Darwin, Erasmus*, M.D. F.R.S., an eminent physician and poet, born at Elton near Newark, in Nottinghamshire, in 1731. Completed his medical studies at Edinburgh, settled at Litchfield, where he resided the greater part of his life: but went to Derby in 1781, and died there in 1802. As a poet he is esteemed rather gaudy and fanciful; as a philosopher, he is apt to indulge in hypothesis; but he possesses the great quality of being totally exempt from every kind of prejudice.

Phytologia, or the Philosophy of Agriculture and Gardening, with the Theory of Draining Morasses, and with an improved construction of the Drill Plough. Lond. 1800. 4to.

1781. *Fulmer, Samuel*.

The Young Gardener's best Companion for the Kitchen and Fruit Garden. Lond. 12mo.

1781. *Lettison, John Coakley*, M.D. F.R.S., an eminent physician in London, was born on a small isle called little Van Dyke, near Tortola, in 1744; died 1815.

1. *Hortus Uptonensis*; or a Catalogue of Stove and Green-house Plants in Dr. Fothergill's Garden, at his death. Lond. 1781. 8vo.

2. *Grovehill*; a Rural and Horticultural Sketch. Lond. 1804. 4to.

3. On the Beta Cicla, or Root of Scarcity. (*Caled. Hort. Mem.* i. 420.)

1783. *Anon.*

Some thoughts on Building and Planting, addressed to Sir James Lowther, Bart. published in Dodsley's collection of poems for this year.

1783. *Bryant, Charles*, of Norwich.

1. *Flora Dietetica*, or the History of Esculent Plants, both Domestic and Foreign, in which they are accurately described and reduced to their Linnean, generic, and specific names, with the English names annexed. Lond. 1783. 8vo.

2. A Dictionary of the Ornamental Trees, Shrubs, and Plants, most commonly cultivated in the Plantations, Gardens, and Stoves of Great Britain; arranged according to the Linnean generic names, and containing full and accurate Descriptions of the Genera and Species, with the names properly accented. Norwich, 1790. 8vo.

1783. *Falconer, William*, M.D. F.R.S., physician to the general hospital, Bath; author of a number of medical works, and of Remarks on the influence of climate, situation, nature of country, population, nature of food, and way of life; on the disposition and temper, manner and behaviour, intellects, laws and customs, forms of government, and religion of mankind. A most interesting work.

1. An Historical View of the Taste for Gardening and Laying out Grounds among the Nations of Antiquity. 8vo. The principal parts of this tract were originally printed in the Literary and Philosophical Memoirs of the Manchester Society. 8vo.

2. An Essay on the Preservation of the Health of Persons employed in Agriculture; and on the Cure of Diseases incident to that way of life. Lond. 1789. 8vo.

3. Miscellaneous Tracts and Collections relating to Natural History; selected from the principal writers of antiquity on that subject. Lond. 1793. 4to.

1784. *Curtis, William*, a botanical writer, was born at Alton in Hampshire in 1746. He served his apprenticeship as an apothecary to his grandfather, and while in that situation cultivated botany with eagerness. At the age of twenty he came to London, and entered into the service of Mr. Talwin of Gracechurch-street, to whose business he succeeded. His love of botany, however, induced him to give up the shop, and he became a lecturer and demonstrator in his favorite science. His first garden was at Bermondsey, and afterwards he occupied a more extensive one at Lambeth, which he exchanged for another at Brompton. In 1771, he published *Instructions for Collecting and Preserving Insects*; and in the following year a translation of the *Fundamenta Entomologiæ* of Linnaeus, with the title of an Introduction to the Knowledge of Insects. In 1777, appeared the first number of his *Flora Londonensis*, which was completed in six fasciculi of seventy-two plates each. This work was followed by the *Botanical Magazine*, in monthly numbers. In 1782 he published a *History of the Brown-tailed Moth*; besides which he wrote *Practical Observations on the British Grasses*, and some papers in the transactions of the Linnean Society, of which he was a member. He died in 1799, and

was buried at Battersea; after his death his lectures were published with colored plates.

1. A Catalogue of British Medical, Culinary, and Agricultural Plants, cultivated in the London Botanical Garden. Lond. 1784. 12mo.

Mr. C. commenced the *Botanical Magazine* in 1787. A work which has met with great encouragement, and has done much to diffuse a general taste for botany. It is still continued by Dr. Sims.

2. Observations on Aphides, chiefly intended to show that they are the principal cause of Blights in Plants, and the sole cause of the Honey Dew. (*Trans. Linn. Soc.* xi. 75. 1802, posth.)

1784. *Rodenhurst, T.*

A Description of Hawkstone in Shropshire, the seat of Sir Richard Hill, Bart. in 1799. 12mo.

1785. *Anon.*

Miscellanies on Ancient and Modern Gardening, and on the Scenery of Nature. Lond. 8vo.

1785. *Kyle, Thomas*, gardener to the Hon. Baron Stewart of Moredun, near Edinburgh. One of the first gardeners in Scotland of his time.

Treatise on the Management of the Peach and Nectarine Trees, either in Forcing-houses or on hot and common Walls. Edin. 8vo.

1785. *Marshall, William*, Esq., a native of Yorkshire, brought up to trade; was some years in the West Indies, as a planter; returned about 1775, and took a farm in Surrey; went down into Norfolk as agent to Sir Harbord Harbord's estates in 1780; left this situation in 1784, and went and resided at Statfold, near the junction of the four counties of Leicester, Warwick, Stafford, and Derby, where he remained till 1786, occupied in collecting materials for his economical survey, and in printing some of his works. From this time, till about 1803, he resided chiefly in Clement's Inn, London, in winter, and visited different parts of the country during summer. He spent one summer in Perthshire, chiefly on the Earl of Bredalbane's estates at Taymouth; and partly also on the Earl of Mansfield's at Scone. He proposed arrangements for the tenantable lands, and also the park and woody scenery on various estates; and finally retired to a considerable property he purchased in his native county, in the Vale of Cleveland, in 1808, where he died at an advanced age, in 1819. He was a man of little education, but of a strong and steady mind; and pursued, in the most consistent manner, from the year 1780 to his death, the plan he originally laid down; that of collecting and condensing the agricultural practices of the different counties of England, with a view to a general work on *Landed Property*, which he published; another on *Agriculture*, which he did not live to complete; and a *Rural Institute*, in which he was supplanted by the Board of Agriculture.

1. *Planting and Rural Ornament*, 1 vol. 8vo. A second edition in 2 vols. in 1796.

2. A Review of the Landscape, a didactic poem; also an Essay on the Picturesque; together with Practical Remarks on Rural Ornament. Lond. 1796.

1786. *Brocg, Philip Le*, M.A., chaplain to the Duke of Gloucester. About the time he published his work on the Vine, he took out a patent for "training all sorts of fruit-trees or vines near the ground," as suggested by Lord Bacon, and practised at the time the patent was taken out by F. X. Vispre, at Wimbledon, and subsequently at Chelsea. (See *Speechley, Treatise on the Vine*, 8vo. edition, p. 205.)

1. A Description of certain Methods of Planting, Training, and Managing all kinds of Fruit Trees, Vines, &c. Lond. 1786. 8vo.

2. Sketch of a Plan for making the Tract of Land called the New Forest, a real Forest, and for various other purposes of the first national importance. Stockdale, 1795. 8vo.

1786. *Broune, Robert*, gardener to Sir Harbord Harbord, Bart. at Gunton, in Norfolk.

A method to preserve Peach and Nectarine Trees from the Effects of the Mildew; and for the destroying the red spider in melon frames, and other insects which infest plants in stoves, and trees, shrubs, &c. in the open garden. Lond. 12mo.

1786. *Vispre, Francis Xavier*.

A Dissertation on the Growth of Wine in England. Bath, 8vo.

1789. *Emmerich*, Lieutenant-colonel A., a German gentleman, author of a tract on his own profession, and deputy-surveyor of the woods and forests under Mr. Robinson.

The Culture of Forests; with an Appendix, in which the state of the Royal Forests is considered, and a system proposed for their improvement. Lond. 1789. 8vo.

1789. *Graffer, John*, a native of Germany, who came to England about the middle of the eighteenth century, and after being some time under Miller, was gardener to James Vere, Esq., of Kensington-Gore. Afterwards he joined Thompson, a gardener, and Gordon, a seedsman, in establishing a nursery at Mile-end. When Gordon died, the nursery became the sole property of Thompson, the present pro-

prietor; and Græffer, soon afterwards, received from Sir Joseph Banks the appointment of gardener to the King of Naples, at Caserta. Here he laid out an English garden, and richly stocked it with exotics from the Hammersmith nursery. He was employed by Admiral Lord Nelson to look after his estate of Bronte, and by various native noblemen to lay out their grounds; he remained in his situation as gardener at Caserta during Murat's reign, and died there, or was in part murdered when he fell from his gig, within a mile of his own house in 1816.

A Descriptive Catalogue of upwards of 1100 species and varieties of Herbaceous or Perennial Plants: divided into six columns, exhibiting, at one view, the names, magnitude, height and situation, time of flowering, color of the flowers, and native country of each species. With a List of Hardy Ferns, for the decoration of Northern Borders, and the most ornamental Annuals. Lond. 1789. 8vo.

1789. *Sowerby, James*, F.L.S. A botanical draftsman and engraver to whom science is much indebted. He formed a rich museum of botany and mineralogy, and published different valuable works on the latter subject; he died in 1822.

1. The Florist's Delight, containing six Coloured Figures, with the Botanical Descriptions. Lond. 1791. fol.

2. Figures of English Fungi, or Mushrooms. Lond. 1797—1803. 3 vols. fol.

3. Notice on the Effect of Watering Fruit Trees early in the Spring. (*Hort. Trans.* ii. 271.)

1790. *Brulles*, —.

Hints for the Management of Hot-beds, and Directions for the Culture of early Cucumbers and Melons. To which are added, brief Instructions for Pruning Wall and Espalier Trees. Bath, 1790. 8vo.

1791. *Forsyth, William*, Esq. F.A.S., a native of Scotland, born at Old Meldrum in Aberdeenshire in 1737; came to England in 1763, and was some time employed under Miller at Chelsea. He was afterwards gardener at Sion House, till Miller's removal in 1769, when he succeeded him as curator of the Chelsea garden; and at the death of the late Thomas Robinson, Esq. royal gardener at Kensington, in 1784, he was appointed to that situation. Here, finding the fruit-trees in an old worn-out state, he began a system of renovation by heading down, and renewing the soil, in which he was highly successful; and for discovering the ingredients of a composition with which he covered over the wounds, received a parliamentary reward. His works procured him the published animadversions of Knight, M^rPhail, Pontey, and others. He died in 1804, and left a son an eminent London seedsman, and author of a botanical catalogue, &c.

1. Observations on the Diseases, Defects, and Injuries in all kinds of Fruit Trees; with an Account of a particular method of Cure, invented and practised by the Author. Lond. 1791. 8vo.

2. Treatise on the Culture and Management of Fruit Trees; in which a new method of pruning and training is fully described. With plates. Lond. 1802. 4to.

1791. *Linnean Society*.

Transactions of the Linnean Society, vol. i. 4to.: vol. xii. completed in 1820. These volumes contain some papers connected with gardening; such for example as: 1. Biographical Memoirs of several Norwich Botanists, vol. vii. 2. Notes relating to Botany, and collected from the manuscripts of the late Peter Collinson, Esq. F.R.S. and —, vol. x. 270. 8. On the supposed Effect of Ivy upon Trees, vol. xi. 27.

1791. *Salisbury, Richard Anthony*, Esq. F.R.S., a learned botanist, enthusiastically attached to that study, and to gardening. Salisbury was educated at North Bierly and the university of Edinburgh. He had a fine garden (now a public nursery) at Chapel Allerton, near Leeds, and afterwards possessed that of the late Peter Collinson, Esq., at Mill-hill, near London. He now resides in the metropolis, and is an active member of and contributor to the Linnean and Horticultural Societies.

1. On the Cultivation of the Polianthes Tuberosa, or Tuberosa; with its Botanical Description and Figure. (*Trans. Hort. Soc.* i. 41. 1812.)

2. Observations on the different Species of Dahlla, and the best Method of cultivating them in Great Britain. (Ib. 84.)

3. A short Account of Nectarines and Peaches naturally produced on the same Branch. (Ib. 103.)

4. Some Account of the Red Doyenné Pear, with a Figure. (Ib. 250.)

5. Some Account of two New Varieties of Grape. (Ib. 253.)

6. On the Cultivation of Rare Plants. (Ib. 261.)

7. On the Cultivation of the Jamrosade (Eugenia Jambos. L.) in the National Garden at Paris. (Ib. Appendix. 11.)

8. On the Vegetation of High Mountains; translated from a Paper of M. Raymond's. (Ib. 15.)

9. Description of a Bank for Alpine Plants, by Mons. Thouin, abridged. (Ib. 24.)

10. On the Cultivation of the Mohopsis Conspicua. (Ib. ii. 37. 1815.)

11. Some Account of the Chioenes Seryjillifolia, or Snow-berry, a fruit nearly allied to the Cranberry. (Ib. 94.)

12. Some account of the Melidiora Pellucida, a beautiful Evergreen Shrub from China. (Ib. 156.)

12. Description of Ord's Apple. (Ib. 285. 1817.)

1792. *Maddock, James*, originally from Warrington in Lancashire, a quaker, and commercial florist at Walworth, died about 1806.

Florist's Directory, and complete Treatise on the Culture and Management of Flowers, with a Supplementary Essay on Soils, Manure, &c.; with plates. Lond. 1792. 8vo. 10s.

1792. *Martyn, Thomas*, B.D. F.R.S. son of Dr. John Martyn, who read botanical lectures at Cambridge, before he was elected professor, on Bradley's neglecting to perform his office. He succeeded his father as Professor of Botany in 1761; is author of a *Sermon, a Tour in Italy*, some translations and commentaries, and various botanical works.

1. The Gardener's and Botanist's Dictionary, of the late Philip Miller, corrected and newly arranged, with additions. Lond. 1805-1807. 4 vols. fol.

1792. *Smith, Sir James Edward*, M.D. F.R.S. P.L.S., a distinguished naturalist, founder and president of the Linnean Society; author and editor of many botanical works, the principal of which are the *Flora Britannica* and *Flora Græca*.

1. Sketch of a Tour on the Continent, in the years 1786 and 1787. (Containing some account of the gardens of France and Italy.) Lond. 1793. 5 vols. 8vo.

2. Tour to Hafod, in Cardiganshire, the Seat of Thomas Jones, Esq. Lond. 1810. super fol.

3. Directions for raising Ferns from Seed, as practised by Mr. Henry Shepherd of Liverpool. (*Hort. Trans.* iii. p. 358.)

1793. *Steele, Richard*, gardener at Thirsk in Yorkshire.

An Essay upon Gardening; containing a Catalogue of Exotic Plants for Stoves and Greenhouses of British Gardens; the best Method of planting the Hot-house Vine, &c.: with the History of Gardening, and a Contrast of the ancient with the modern taste. York, 1793. 4to.

This work is fide more than a catalogue of trees and plants, but contains an elevation of the stove erected by R.A. Salisbury, Esq. at Chapel Allerton.

1793. *Trusler, Rev. John*, LL.D. a singular literary character and low popular compiler, was born in London in 1735. He was brought up to physic in a very humble line; but contrived to get into orders, and for some time officiated as a curate. At length, in 1771, he began to publish abridgments of popular sermons, printed in imitation of manuscript; and next he established a bookselling business upon an extensive scale. Having thus acquired a fortune, he purchased an estate at Englefield-green, where he died in 1820.

1. The Art of Gardening. Lond. 8vo.

2. The Lady's Gardener's Companion. Lond. 18mo. 1816.

1794. *Haworth, Adrian Hardy*, Esq., F.L. and H.S., of Cottenham near Beverley, Yorkshire, a botanist and horticultural amateur, author of a work on insects.

1. Observations on the Genus of Mesembryanthemum, in two parts; containing Scientific Descriptions of above 130 species, about 50 of which are new; Directions for their management; new arrangements of the Species, References to Authors, and a great variety of critical, philosophical, and explanatory Remarks. Lond. 1794. 8vo.

2. Synopsis Plantarum Succulentarum, cum Descriptionibus Synonymis, Locis, Observationibus Anglicanis Culturarum. Lond. 1812. 8vo.

3. A new Arrangement of the Genus Narcissus. (*Trans. Linn. Soc.* 1799. vol. v.)

4. A new Arrangement of the Genus Aloe. (Ib. 1801. vol. vii. p. 1.)

5. On the Cultivation of Crocuses, with a short account of the different Species known at present. (*Trans. Hort.* vol. ii. p. 122. 1815.)

1794. *Hayes, Samuel*, Esq. M.R.I.A., an Irish author.

A Practical Treatise on Planting. Dublin. 8vo.

1794. *Knight, Richard Payne*, Esq., a gentleman of great classical attainments, and of refined taste; proprietor of a fine demesne and park near Ludlow, on which he built an elegant mansion from his own designs. After residing there many years, he gave up the possession to his brother, the celebrated horticulturist, and now lives chiefly in London.

The Landscape, a didactic poem. 4to. two plates. This produced a Sketch from the Landscape, a poem in 4to. generally attributed to the poet Mason; and a Review, by W. Marshall; the latter a very virulent production.

1794. *M^rPhail, James*, a native of Aberdeenshire; gardener for twenty years to Lord Hawkesbury (now the Earl of Liverpool), at Addiscombe Place, near Croydon. An excellent grower of pines and melons; author of some tracts on Agriculture and the Poor Laws.

1. Treatise on the Culture of the Cucumber; shewing a new and advantageous method of Cultivating that Plant, with full Directions for the Management thereof, and the degree of Heat it requires on every Day of the Year, &c. To which are added, Hints and Observations on the Improvement of Agriculture. Lond. 1794. 8vo.

2. The Gardener's Remembrancer throughout the Year, exhibiting the surest and most improved Methods of Manuring, Digging, Sowing, &c.; the Nature of Earth, Water, Heat, Air, and Climate, best adapted for the Culture of Plants, and Production of Fruits, Flowers, and esculent Vegetables, in the forcing way; the Causes and Symptoms of Disease and Barrenness in Trees of every kind, with means of Prevention and Cure. To which is prefixed a View of Mr. Forsyth's Treatise on Trees. Lond. 8vo.

1794. *Price, Uvedale*, Esq., of Foxley, near Hereford. A gentleman and scholar of great taste;

enthusiastically fond of pictures, statues, and picturesque beauty in all objects and mental impressions; and who has greatly improved and beautified his own estate.

1. An Essay on the Picturesque, as compared with the Sublime and the Beautiful, and on the Use of Studying Pictures for the Purpose of improving Real Landscape. Lond. 1794. 8vo.

2. A Dialogue on the Distinct Characters of the Picturesque and the Beautiful, in Answer to the Objections of Mr. Knight. Lond. 1801. 8vo.

3. Letter to H. Repton, Esq. on the Application of the Practice, as well as the Principles, of Landscape Painting, to Landscape Gardening, intended as a Supplement to the Essay on the Picturesque; to which is prefixed Mr. Repton's letter to Mr. Price. Lond. 1795. 8vo.

1794. Shaw, James, author of a Tour in the Netherlands.

Plans, Elevations, Sections, Observations, and Explanations of Forcing-houses in Gardening. Whitch. Fol.

1795. Knight, Thomas Andrew, Esq. F.R.S.L.S. &c. president of the Horticultural Society. A distinguished vegetable physiologist and horticulturist; brother to R. P. Knight, Esq. (See 1794.)

1. A Treatise on the Culture of the Apple and Pear, and on the Manufacture of Cyder and Perry. Lond. 1797. 12mo.

2. Some Doubts relative to the Efficacy of Mr. Forsyth's Plan, in renovating Trees. Lond. 1802. 4to.

3. Report of a Committee of the Horticultural Society of London. Lond. 1805. 4to.

4. Pomona Herefordiensis; or, a Descriptive Account of the old Cyder and Perry Fruits of Herefordshire. Lond. 1809. 4to.

5. Observations on the Grafting of Trees. (Phil. Trans. Abr. xvii. 569. 1795.)

6. Experiments on the Fecundation of Vegetables. (Ib. xviii. 504. 1799.)

7. Account of some Experiments on the Ascent of Sap in Trees. (Ib. 333. 1801.)

8. Account of some late Experiments on the Descent of the Sap in Trees. (Ib. 277. 1803.)

9. Experiments and Observations on the Motion of the Sap in Trees. (Ib. 183. 1804.)

10. Concerning the State in which the true Sap of Trees is deposited during Winter. (Ib. 88. 1805.)

11. On the Reproduction of Buds. (Ib. 257.)

12. On the Direction of the Radicle and Germen during the Vegetation of Seeds. (Ib. 99. 1806.)

13. On the inverted Action of the Albuminous Vessels of Trees. (Ib. 292.)

14. On the Formation of the Bark of Trees. (Ib. 103. 107.)

15. On the Economy of Bees. (Ib. 234.)

16. On the Inconvertibility of Bark into Albumum. (Ib. 103. 1808.)

17. On the Origin and Office of the Albumum of Trees. (Ib. 313.)

18. On the Origin and Formation of Roots. (Ib. 169. 1809.)

19. On the comparative Influence of Male and Female Parents on their Offspring. (Ib. 392.)

20. On the Parts of Trees primarily Impaired by Age. (Ib. 178. 1810.)

21. On the Causes which Influence the Direction of the Growth of Roots. (Ib. 209. 1811.)

22. On the Motions of the Tendrils of Plants. (Ib. 314. 1812.)

23. On Ice found in the Bottoms of Rivers. (Ib. 286. 1816.)

24. On the Action of detached Leaves of Plants. (Ib. 289.)

25. Upon the Extent of the Expansion and Contraction of Timber in different Directions, relative to the Position of the Medulla of the Tree. (Ib. 269. 1817.)

26. Introductory Remarks relative to the Objects which the Horticultural Society have in view. (Hort. Trans. i. 1. 1806.)

27. Observations on a Method of producing new and early Fruits. (Ib. 67.)

28. On raising New and Early Varieties of the Potatoe. (Ib. 57.)

29. On the Advantages of Grafting Walnut, Mulberry, and Chestnut Trees. (Ib. 60.)

30. On a new Method of Training Fruit Trees. (Ib. 70.)

31. A Description of a Forcing-house for Grapes. (Ib. 99.)

32. On the proper Construction of Hot-bed Frames. (Ib. 142.)

33. A short Account of a new Apple called the Downton Pippin. (Ib. 145.)

34. On the Management of the Onion. (Ib. 157.)

35. An improved Method of cultivating the Alpine Strawberry. (Ib. 159.)

36. On some Varieties of the Peach. (Ib. 165.)

37. On a new Variety of Pear. (Ib. 178.)

38. On Potatoes. (Ib. 187.)

39. A new and expeditious Mode of Budding. (Ib. 194.)

40. On the best Method of Constructing a Peach-house. (Ib. 199.)

41. On the Culture of the Potatoe in Hot-beds. (Ib. 211.)

42. View of the Theory of Vegetation. (Ib. 217.)

43. A short Account of some Apples and Pears, of which Grafts were presented to the Members of the Horticultural Society. (Ib. 226.)

44. A new Method of Grafting, with a figure of it. (Ib. 239.)

45. On the Advantages of employing Vegetable Matter as Manure in a fresh state. (Ib. 248.)

46. On some Early Varieties of the Potatoe. (Ib. 244.)

47. On facilitating the Emission of Roots from Layers. (Ib. 255.)

48. Some Account of Two new Varieties of Grape. (Ib. 258.)

49. Some Account of the Elton Pear, with a figure. (Ib. 1.)

50. On the Transplantation of Blossom-Buds. (Ib. 7.)

51. On an early Variety of Grape from America. (Ib. 10.)

52. On the proper Stock for the Moor Park Apricot. (Ib. 19.)

53. On inarching leafless Branches of Peach Trees. (Ib. 35.)

54. On the Prevention of the Disease called the Curl in the Potatoe. (Ib. 64.)

55. On the Culture of the Mulberry. (Ib. 68.)

56. On the early Puberty of the Peach Tree. (Hort. Trans. ii. 70.)

57. On the Culture of the Pear Tree. (Ib. 78.)

58. On the Prevention of Mildew in particular Cases. (Ib. 82.)

59. On the Culture of the Shallot, and some other bulbous-rooted Plants. (Ib. 97.)

60. On the Propagation of the Mulberry Tree by Cuttings. (Ib. 114.)

61. On the beneficial Results of planting Potatoes, which have grown late in the preceding year. (Ib. 125.)

62. On the Application of Manure in a liquid form to Plants in Pots. (Ib. 147.)

63. On the ill Effects of excessive Heat in Forcing Houses during the Night. (Ib. 130.)

64. An Account of two Varieties of Cherry, raised at Downton. (Ib. 137.)

65. An Account of a new Variety of the Peach. (Ib. 140.)

66. On the Want of Permanence of Character in Varieties of Fruit, when Propagated by Grafts and Buds. (Ib. 160.)

67. On the Mode of Propagation of the Lycopodium cancellatum, a species of Fungus, which destroys the Leaves and Branches of the Pear Tree. (Ib. 178.)

68. On the Preservation of Fruits during Winter and Spring. (Ib. 193.)

69. On the Effects of different kinds of Stocks in grafting. (Ib. 199.)

70. Some Account of three new Cherries, the Elton, Black Eagle, and Waterloo. (Ib. ii. 208.)

71. An Account of three new Peaches, in a letter to Joseph Sabine, Esq. (Ib. 214.)

72. On the Culture of the Peach and Apricot, as Espalier Trees. (Ib. 219.)

73. On the Ventilation of Forcing-houses. (Ib. 224.)

74. Upon the Advantages of Propagating from the Roots of old ungrafted Fruit Trees. (Ib. 252.)

75. On the Means of preserving Broccoli in Winter. (Ib. 304.)

76. Observations on Mr. Brown's Account of his Steaming Apparatus, with some Suggestions for the Improvement thereof. (Ib. 324.)

77. Observations on the Verdello Grape. (Ib. 327.)

78. Suggestions for the Improvement of Sir George Stuart Mackenzie's Plan for Forcing-houses. (Ib. 350.)

79. Upon the proper Mode of Pruning the Peach Tree in cold and late Situations. (Ib. 364.)

80. Observations on the proper Management of Fruit Trees, which are intended to be forced very early in the ensuing season. (Ib. 368.)

81. An Account of a Peach Tree, produced from the Seed of the Almond Tree, with some Observations on the Origin of the Peach Tree. (Ib. iii. 1.)

82. On the best Mode of Pruning and Training the Mulberry Tree, when trained to a wall in a cold climate. (Ib. 63.)

83. Upon the Variations of the Red Currant (Ribes rubrum) when propagated by Seed. (Ib. 86.)

84. Upon the Propagation of Varieties of the Walnut Tree, by budding. (Ib. 153.)

85. On a Method of Forcing Rhubarb in Pots. (Ib. 154.)

86. Upon the Pruning and Management of Transplanted Standard Trees. (Ib. 157.)

87. Upon the Variations of the Scarlet Strawberry (Fragaria Virginiana) when propagated by Seeds. (Ib. 207.)

88. Description and Account of a new early Black Cherry. (Ib. 211.)

89. Description of a new Seedling Plum. (Ib. 214.)

90. Upon the Preservation of Fruits from Wasps. (Ib. 259.)

91. On Training the Fig Tree. (Ib. 307.)

92. On the superior Healthfulness of Scions taken from the Trunks of Apple Trees, to those cut from the Extremities of the Branches. (Ib. 387.)

93. Observations upon the most advantageous Forms of Garden Pots. (Ib. 389.)

94. Upon the Culture of the Guernsey Lily. (Ib. 399.)

95. Upon the different Qualities of the Albumum of Spring and Winter-felled Trees. (Phil. Trans. 1820.)

96. Upon the Means of giving Strength to the Stems of Plants growing under Glass. (Hort. Trans. iv. 1.)

97. Upon the Culture of the Pine Apple without Bark, or other Hot-bed. (Ib. 72.)

98. On the most economical Method of employing Fuel in heating the Flues of Forcing-houses. (Ib. 156.)

99. Physiological Observations upon the Effects of partial Decortication, or Ringing the Stems or Branches of Fruit Trees. (Ib. 159.)

100. Further Particulars of the Downton Strawberry. (Ib. 197.)

101. Upon the Culture of the Fig-Tree in the Stove. (Ib. 200.)

102. On the Cultivation of the Cockscumb. (Ib. 321.)

103. Observations on Hybrids. (Ib. 367.)

104. Directions for preserving Buds of Fruit Trees in a vegetative state, when sent to considerable distances. (Ib. 403.)

105. On the Management of Fruit Trees in Pots. (Ib. 439.)

106. An Account of an improved Method of raising early Potatoes. (Ib. 447.)

107. On Grafting the Vine. (Ib. 495.)

108. Further Observations on the Culture of the Pine Apple. (Ib. v. 142.)

109. Notice of a new Variety of Ulmus Suberosa, and on grafting tender Scions. (Ib. 146.)

110. Description of a Melon and Pine-pit. (Ib. 225.)

111. On the advantages and disadvantages of curvilinear heath-houses. (Ib. 227.)

112. A new and improved Method of cultivating the Melon (Ib. 238.)

113. On the flat Peach of China. (Ib. 271.)

114. On the injurious influence of the plum-stock on the Moor Park Apricot. (Ib. 287.)

115. An Account of some Mule Plants. (Ib. 292.)

116. On obtaining early Crops of Peas. (Ib. 321.)

1795. Repton, Humphrey, Esq., a distinguished landscape-gardener, was born at Bury St. Edmund's, in Suffolk, in 1752. He accompanied Mr. Wyndham to Ireland in 1783, and for a short time held a lucrative situation in the castle of Dublin; but when his friend quitted that kingdom, Repton also re-

turned to England. He now directed his attention to drawing, architecture, and particularly landscape-gardening; in which last line he obtained considerable employment. He died in 1818, leaving several sons, one of whom married the daughter of Lord Eldon. Repton published some books on miscellaneous subjects; but his principal works are on landscape-gardening.

1. Letter to Uvedale Price, Esq. on Landscape-Gardening. 1794. 4to.

2. Sketches and Hints on Landscape-Gardening; collected from designs and observations now in the possession of the different noblemen and gentlemen for whose use they were originally made; the whole tending to establish fixed principles in the art of laying out grounds: 16 colored plates. Lond. 1795. folio.

3. Observations on the Theory and Practice of Landscape-Gardening, including some Remarks on Grecian and Gothic Architecture, collected from various MSS. in the possession of different noblemen and gentlemen; the whole tending to establish fixed principles in the respective arts: with many plates. Lond. 1803. 4to.

4. Observations on the Changes in Landscape-Gardening. 1806. 8vo.

5. On the Introduction of Indian Architecture and Gardening. 1808. folio.

6. On the supposed Effect of Ivy upon Trees. (Linn. Trans. 1810, vol. xi. p. 27.)

1796. Anon. Generally attributed to Mason the poet, author of the *English Garden*. (See 1772.)

A Sketch from "The Landscape," a Poem, by R. P. Knight, Esq. Lond. 4to.

1766. Donn, James, F.L.S. H.S. curator of the botanic garden at Cambridge; died in 1817.

Hortus Cantabrigiensis; or, a Catalogue of Plants, indigenous and foreign, cultivated in the Walkerian botanic garden, Cambridge. Camb. 8vo.

The ninth edition, edited and accented by Frederick Pursb, in 1819, and one subsequently by Lindley.

1766. Lindley, George, nurseryman at Catton, near Norwich.

1. The Plan of an Orchard; exhibiting at one View a select quantity of Trees, sufficient for Planting an acre and a half of Land, properly arranged according to their usual size of growth, and hardness of bearing, &c. Lond. 1796, a folio sheet.

2. An Account of some of the best Varieties of Apples peculiar to, or cultivated in, the county of Norfolk. (Hort. Trans. iv. 65.)

1796. Marshall, the Rev. Charles, vicar of Brixton, Northamptonshire.

Introduction to the Knowledge and Practice of Gardening; with Hints on Fish Ponds. Lond. 1796. 12mo.

1797. Astley, Francis Duckenfield, Esq. of Duckenfield Hall, near Aston, in Lancashire, member of the Manchester Agricultural Society; now resident on the continent.

1. A few Minutes' Advice to Gentlemen of Landed Property, and the Admirers of Forest Scenery; with Directions for Sowing, Raising, Planting, and the Management of Forest Trees: To which is added a Catalogue of Forest Trees, Fruit Trees, and Flowering Shrubs, with their usual prices, as sold by the nurserymen and seed-men. Chester. 12mo.

2. Hints to Planters, collected from various authors of esteemed authority. Manchester. 1807. 8vo.

1797. Busch, Peter, father to Joseph Busch, gardener to the Emperor of Russia.

Method to destroy or drive away Earth Worms, and various other Insects hurtful to Fields or Gardens. (Phil. Mag. i. 169.)

1797. Bucknall, Thomas Skip Dyot, Esq.

The Orchardist, or a System of close Pruning and Medication for establishing the Science of Orcharding, &c. Extracted from the xi. xii. xiii. and xiv. vols. of the Society's Transactions for the Encouragement of Arts, &c. with additions. Lond. 1797. 8vo.

1797. Salisbury, William, nurseryman and botanist, botanic garden, Brompton; formerly of Sloane Square.

1. Hortus Paddingtonensis; or, a Catalogue of Plants cultivated in the garden of J. Symmons, Esq. Paddington House. Lond. 1797. 8vo.

2. Method of packing Plants and Trees intended for Exportation, so as to preserve the Vegetative Powers for many months. (Nicholson's Journal, xxx. 339, 1811.)

3. The Botanist's Companion, or an Introduction to the Knowledge of Practical Botany, and the Uses of Plants, either growing wild in Great Britain, or cultivated for the Purposes of Agriculture, Medicine, Rural Economy, or the Arts. Lond. 2 vols. 12mo. 1816.

4. Hints to the Proprietors of Orchards. 1817. 12mo.

5. The Cottager's Companion, or a Complete System of Cottage Gardening; intended to instruct the Industrious Poor of the United Kingdom of Great Britain. To which is added a descriptive List of Plants growing wild, which are useful for Culinary Purposes. Lond. 12mo. 1818.

1798. Andrews, Henry, botanical painter and engraver in London.

1. Engravings of Ericas, or Heaths, with Botanical Descriptions. Lond. 1796. folio.

2. The Botanist's Repository, with colored figures of such Plants as have not appeared in any similar publication. Lond. 1797-99. 2 vols. 4to.

3. A Review of Plants hitherto figured in the Botanist's Repository. Lond. 1801. 4to.

4. The Heathery, or Monograph of the Genus Erica. (Published in monthly numbers.) vols. i. to vi. 1804 to 1812.

1798. Archer, Clement, Esq. M.R.I.A.

Miscellaneous Observations on the Effect of Oxygen on the Animal and Vegetable Systems; and an Attempt to prove

why some Plants are Evergreen and others Deciduous. Part I. 8vo. Bath.

1798. Nicol, Walter, a Scotch horticultural architect, and author of merit; son of the gardener who planned and executed the gardens and pleasure-grounds of Raith in Fifeshire. After receiving the rudiments of his horticultural education at Raith, he went to England, and soon afterwards became head gardener to the Marquis of Townshend, at Rainham Hall, in Suffolk. He afterwards returned to Scotland, and became head gardener to General Wemyss, at Wemyss Castle, in Fifeshire. About 1797 he left his situation, settled in Edinburgh, and commenced his career as horticultural architect. In the year 1810 he undertook an extensive journey through England, for the purpose of visiting the principal seats and plantations, with a view, on his return, to compose the *Planter's Calendar*. This work had scarcely commenced, when he was seized with an illness which carried him off suddenly in March 1811.

1. The Scotch Forcing Gardener; together with Instructions on the Management of the Green-house, Hot-walls, &c. Illustrated with Plates. Edin. 1798. 8vo.

2. The Practical Planter; or, a Treatise on Forest Planting; comprehending the Culture and Management of Planted and Natural Timber; also the Management of Hedges, Fences, and the Construction of Stone Walls, &c. Edin. 1799. 8vo.

3. The Villa Garden Directory; or Monthly Index of Work to be done in the Town and Villa Gardens, Shrubberies, Parterres, &c. Edin. 1809. 8vo.

4. The Gardener's Calendar; or Monthly Directory of Operations in every Branch of Horticulture. Edin. 1810.

5. The Planter's Calendar; or, the Nurseryman and Forester's Guide to the operations of the Nursery, the Forest, and the Groves. Completed by Sang. Edin. 1812. 8vo.

1798. Robinson, a London architect, nephew to Thomas Robinson, Esq. gardener to Geo. III. at Kensington.

Forms of Stoves used for Forcing-houses. Lond. oblong 4to.

1800. Hill, Daniel, M.D. F.H.S.

1. Practical Observations on the Use of Oxygen, or Vital Air, in the Cure of Diseases; to which are added a few Experiments on Plants. Part I. Lond. 1800. 4to.

2. On the Use of Oxygen Air, in promoting Vegetation. (Hort. Trans. i. 233. 1815.)

1800. Pontey, William, planter and forest pruner to the Duke of Bedford, and ornamental gardener; resident at Huddersfield, where his brother is a respectable nurseryman.

1. The Profitable Planter; a Treatise on the Cultivation of the Larch and Scotch Fir Timber, shewing that their excellent quality, especially that of the former, will render them so essentially useful, as greatly to promote the interests of the country. Huddersfield, 1800. 8vo.

2. The Forest Pruner, or Timber Owner's Assistant; being a Treatise on the Training or Management of British Timber Trees, whether intended for use, ornament, or shelter; including an explanation of the nature of their general diseases and defects, with means of prevention and remedies, where practicable; also, an examination of the properties of English Fir Timber, with remarks on the defects of the old, and the outlines of a new system for the management of Oak Woods. With eight explanatory plates. Lond. 1805. 8vo.

3. The rural improver, &c. Huddersfield, 1823. 4to.

1802. Society of Practical Gardeners; evidently, however, a compilation by a hackney writer who knew little of the subject.

Rural Recreations, or the Gardener's Instructor; exhibiting in a clear and perspicuous manner all the Operations necessary in the Kitchen, Flower, and Fruit Gardens, &c. for every Month in the Year; with a Treatise on the Management of Bees, &c. and Catalogues of Plants. Lond. 8vo.

1803. Loudon, John Claudius, landscape-gardener, and author of some works on agriculture; born in Lanarkshire in 1782, began to practise in 1803; to farm extensively in Oxfordshire in 1809, and in Middlesex in 1810; travelling on the continent in 1813-14-15, again in 1819, now residing at Bayswater.

1. Observations on laying out the public Squares of London. (Literary Journal, 1803.)

2. Observations on the Formation and Management of Useful and Ornamental Plantations; on the Theory and Practice of Landscape Gardening, and on gaining and embanking Land from Rivers, or the Sea. Edin. 1804. 8vo.

3. A short Treatise on some Improvements lately made in Hot-houses. Edin. 1805. 8vo.

4. A Treatise on forming, improving, and managing Country Residences, and on the choice of Situations appropriate to every class of Purchasers. With an Appendix, containing an Enquiry into the utility and merits of Mr. Repton's Mode of showing Effects by Slides and Sketches, and Strictures on his Opinions and Practice in Landscape Gardening. Illustrated by Descriptions of Scenery and Buildings, by references to Country Seats, and passages of Country in most parts of Great Britain, and by 32 engravings. Lond. 1806. 2 vols. 4to.

5. Hints on the Formation of Gardens and Pleasure-Grounds, &c. 4to. plates. 1812.

6. Remarks on the Construction of Hot-houses; pointing out the most advantageous Forms, Materials, and Contrivances to be used in their Construction; with a Review of the various Methods of building them in foreign countries, as well as in England; with 10 plates, from etchings on stone. 1817. 4to.

7. Sketches of Curvilinear Hot-houses; with a Description

of the various purposes in Horticultural and General Architecture, to which a solid iron Sash-bar, lately invented, is applicable. 1818.

8. A comparative View of the common and curvilinear Mode of roofing Hot-houses. Lond. folio. 1815.

9. Encyclopedia of Gardening. Lond. 8vo. 1822.

10. The different modes of cultivating the Pine Apple from its first introduction to Europe to the improvements of T. A. Knight, Esq. in 1825. Lond. 8vo. 1822.

1803. *Moriarty, Mrs. Henrietta Maria*, author of several novels.

Viridarium; or, Greenhouse Plants; containing fifty plates, drawn and colored from Nature. 1803. 8vo.

1804. *Amos, William*, formerly a gardener and bailiff to a nobleman, and afterwards a farmer at Brothertoft, Lincolnshire, author of some works on the drill husbandry.

Minutes of Agriculture and Planting, &c. Lond. 1804. 4to.

1805. *Banks, Sir Joseph*, Bart., president of the Royal Society, was the son of William Banks, Esq. of Revesby Abbey in Lincolnshire, and born there in 1743. He received his education first at Eton, and next at Oxford, but left the university on the death of his father in 1761; and two years afterwards made a voyage to Labrador and Newfoundland. In 1763, he and Dr. Solander went with Lieutenant Cook to Otaheite; in which voyage Mr. Banks narrowly escaped perishing by the frost, on the island of Terra del Fuego. After his return he received the degree of doctor of laws at Oxford; and in 1772 undertook a voyage to Iceland and the Western Isles of Scotland. In 1778 he received the Order of the Bath, and was elected president of the Royal Society. In 1781 he was created a baronet; but about two years afterwards his conduct in the Royal Society gave such offence to the scientific members as had nearly produced a schism: this tempest, however, was dispersed, and the president retained his seat without any farther opposition to the end of his life. Sir Joseph, though afflicted for many years with the gout, continued his exertions for the improvement of agriculture and the extension of natural history to the very last of his long and useful life. He died May 9. 1820. He has some papers in the *Philosophical Transactions*, and published besides a tract on the Rust on Wheat.

1. An Attempt to ascertain the Time when the Potatoe (*Solanum Tuberosum*), was first introduced into the United Kingdom, with some Account of the Hill Wheat of India. (*Hort. Trans.* i. 8.)

2. Some Hints respecting the inuring Tender Plants to our Climate. (Ib. 21.)

3. On the Revival of an obsolete Mode of managing Strawberries. (Ib. 54.)

4. An Account of the Method of Cultivating the American Cranberry at Spring Grove. (Ib. 75.)

5. On the Horticultural Management of the Sweet or Spanish Chestnut Tree. (Ib. 140.)

6. On the Forcing-Houses of the Romans, with a list of Fruits cultivated by them now in our Gardens. (Ib. 147.)

7. On some Exotics which endure the open Air in Devonshire, in a Letter to him, by A. Hawkin. (Ib. 175.)

8. A short Account of a Colored Figure of a new Apple, called the Spring-Grove Codling. (Ib. 197.)

9. On Ripening the Second Crop of Figs that grow on the new Shoots. (Ib. 252.)

10. Some Horticultural Observations, selected from French Authors. (Ib. 4. Appendix.)

11. Notice from a work of Monsieur Lelieur, on the Hereditary Diseases of Fruit-Trees. (Ib. 27. Appendix.)

12. Notes relative to the first appearance of the Aphis Lanigera, or the Apple-Tree Insects in this Country. (Ib. vol. ii. 162.)

13. On the Advantages of turning the Branches of Fruit-Trees over the Walls against which they are planted.

1805. *Dickson, Mr. James*, F.L.S. V.P.H.S., of the respectable and long established firm of Messrs. Dickson and Anderson, seedsmen and herbalists in Covent-garden, London. James Dickson was born at Kirke House in Peebleshire, in 1738, and acquired his first knowledge of gardening in the garden of the Earl of Traquair. He afterwards improved himself in the Brompton nursery, then the property of Jefferey; he was head gardener in several places till 1722, when he established the well known seed and herb shop in Covent-garden. Dickson's attention was first drawn to botany when a boy, by hearing one of his playmates enquire of another the name of a plant (Star of the Earth, *Plantago Coronopus*) which grew near them. Finding the boy able to answer the question he felt an impulse to obtain that kind of knowledge and superiority, and ever afterwards pursued his object with unremitting ardor. By directing his attention to a then neglected branch of botany, the mosses, he established for himself, says Sabine, "an imperishable reputation." He was one of the earliest members both of the Linnean and Horticultural Societies. (See *A Biographical Memoir*, in *Hort. Trans.* v. App. 1.)

1. On a Variety of the Brassica Napus, or Rape, which has long been cultivated upon the Continent. (*Hort. Trans.* i. 26.)

2. Observations on, and an Account of, the Tubers of the

Lathyrus tuberosus, with Instructions for the Cultivation of the Plant in a Garden. (*Hort. Trans.* ii. 359. 1817.)

3. On the Cultivation of the Hampon. (Ib. iii. 19. 1818.)

1805. *Macdonald, Alexander*, a fictitious name adopted by R. W. Dickson, M.D. formerly of Hendon, Middlesex, author of *Practical Agriculture*, and other works on farming.

A complete Dictionary of Practical Gardening. 2 vols. 4to. plates. The plates of flowers from paintings by the late Sydenham Edwards.

1805. *Parkyn, G. J.*, author of *Monastic Remains*; and generally reputed the author of the *Six Designs* for laying out Grounds, 1793, published with Soane's *Designs for Villas*.

Architectural Sketches, folio, No. 1. These contain plans for laying out grounds, according to the different natural situations, with descriptions: among others, a plan of Gen. Washington's grounds at Vermont.

1806. *Anon.* A lady, author of *Conversations on Botany* and some other works.

The Florist's Manual. Lond. 12mo.

1807. *Ellis, Daniel*, Esq. of Edinburgh.

1. An Inquiry into the Changes induced on Atmospheric Air by the Germination of Seeds, the Vegetation of Plants, and the Respiration of Animals. Edin. 1807. 8vo.

2. Further Inquiries into the Changes induced on Atmospheric Air by the Germination of Seeds, the Vegetation of Plants, and the Respiration of Animals. Edin. 1811. 8vo.

1807. *Shaw, William*.

The Practical Gardener. Lond. 8vo.

1808. *Griffin, William*, formerly gardener to John Manners Sutton, Esq., at Kelham Hall near Nottingham, and now to Samuel Smith, Esq., at Wood Hall, in Hertfordshire.

1. A Treatise on the Culture of the Pine Apple. Newark. 8vo.

2. On the Management of Grapes in Vineries. (*Hort. Trans.* i. 98.)

1809. *Knight, Joseph*, F.H.S., nurseryman in the King's Road, Chelsea; formerly gardener to ——— Hibbert, Esq., at Clapton, whose collection of plants he now possesses.

1. An Essay on the Cultivation of the Plants belonging to the Order of the Proteæ. Generally attributed to R. R. Salisbury. Lond. 1809. 4to.

2. On the Cultivation of Horse-Radish. (*Hort. Trans.* i. 207. 1810.)

1810. *Aiton, William Townsend*, Esq., gardener to the king at Kew and Kensington. To the first situation he succeeded on the death of his father, William Aiton, in 1793, and to the other on the death of William Forsyth, Esq., in 1804.

1. *Hortus Kewensis*, or a Catalogue of Plants cultivated in the Royal Gardens at Kew; by the late Mr. W. Aiton; a new edition enlarged. Lond. 1810-13. 5 vols. 8vo.

2. An Epitome of the 2d edit. of *Hortus Kewensis*, for the Use of Practical Gardeners; to which is added, a Selection of Esculent Vegetables and Fruits cultivated in the Royal Garden at Kew. Lond. 1814. 8vo.

3. Brief Practical Observations on the Cultivation of the Cucumber in the Royal Gardens at Kew, during the Autumn and Winter Months. (*Hort. Trans.* vol. ii.)

1810. *Dean, J. and W.*, printers, Manchester.

1. An Account of the different Gooseberry Shews used in Lancashire, Cheshire, &c. in the year 1810. To which is added, a Statement exhibiting at one view the number of Prizes won, by each sort of berry at the several Meetings. Manchester. 12mo. continued annually.

2. An Account of the Flower Shews in Lancashire, Cheshire &c. for 1817, continued annually. Manchester. 12mo.

1810. *The Caledonian Horticultural Society*.

Founded in 1809, chiefly through the exertions of Dr. Andrew Duncan, Senior Professor of the Institutes of Medicine in the University of Edinburgh. It is a prosperous, well conducted, and most useful society.

Memoirs of the Caledonian Horticultural Society. Edin. 3 vols. 8vo. to 1824.

1811. *Lindegard, Peter*, gardener to the King of Denmark, at the royal gardens of Rosenburgh near Copenhagen.

1. On the mode of forcing the vine in Denmark. Lond. 8vo.

2. An account of the methods of forcing peaches in Denmark and Holland. (*Hort. Trans.* v. 520.)

1811. *Haynes, Thomas*, nurseryman, at Oundle, Northamptonshire.

1. Improved System of Nursery Gardening. Lond. 1811. roy. 8vo.

2. Interesting Discoveries in Horticulture; being an easy, rational, and efficacious System of propagating all hardy American and Bog Soil Plants, with Ornamental Trees and Shrubs of general Description, Green-house Plants, including Botany Bay and Cape Plants; Herbaceous Plants, affording favorable Shoots and Fruit-trees in every variety, by planting Cuttings, chiefly in the warm months, without artificial heat. Lond. 1811. roy. 8vo.

3. Treatise on the Improved Culture of the Strawberry, Raspberry, and Gooseberry. Lond. 1812. 8vo.

4. On collecting Soils and Composts and preparing them for use, &c. Lond. 12mo. 1821.

1811. *Hooker, William*, Esq. F.L.S. H.S., horticultural draughtsman and engraver.

Pomona Londinensis; containing representations of the best Fruits cultivated in British Gardens; with Descriptions. 1813. 4to. To be completed in about 18 numbers.

1811. *Wade, Walter, M.D.*, Professor of Botany to the Dublin Institution.

1. *Salices*, or an Essay towards a General History of Sal-
lows, Willows, and Osiers. Dublin. 8vo.

2. *Prospectus of the Arrangement in the Dublin Society's*
Botanical and Agricultural Garden at Glasnevin. Dublin,
1818. 12mo.

1812. *Cushing*, —, a native of Ireland, late fore-
man of the hot-house department to Messrs. Lee
and Kennedy, at the Hammersmith nursery.

The Exotic Gardener, &c. London. 8vo.

1812. *Hogg, Thomas*, master of an academy at
Paddington, Middlesex, and a very successful grower
of the carnation.

1. A concise and practical Treatise on the Growth and
Culture of the Carnation, Pink, Auricula, Polyanthus, Ra-
nunculus, Tulip, &c. London. 12mo. 1 plate.

2. On the Cultivation of Pinks. (*Hort. Trans.* iv.)

1812. *Todd, George*, surveyor and hot-house
builder, employed by W. T. Aiton, Esq., the late Sir
Joseph Banks, and other eminent horticulturists.

Plans, Elevations, and Sections of Hot-houses and Green-
houses, an Aquarium, Conservatories, &c. recently built in
different parts of England for various Noblemen and Gen-
tlemen, &c. London. fol.

1813. *Lyon, Peter*, an apothecary and phisic gar-
dener at Comely-garden, Edinburgh.

1. Observations on the Barrenness of Fruit Trees; the Means
of Prevention and Cure. Edin. 1813. 8vo.

2. A Treatise on the Physiology and Pathology of Trees;
with Observations on the Barrenness and Canker of Fruit
Trees; the means of Prevention and Cure. 1816. 8vo. Edin.

1813. *Sinclair, Sir John, Bart.* of Ulbster, in Caith-
ness, a distinguished patriot and voluminous agricul-
tural writer; founder of the Board of Agricul-
ture.

Account of some Experiments to promote the Improvement
of Fruit Trees, by peeling the Bark. London. 1815. 8vo. These
experiments were made by P. Lyon, of Edinburgh. (See *Lyon*,
1813.)

1814. *Phillips, Leonard, jun.*, an extensive grower
of hardy fruit-trees for sale, at Lambeth.

1. Catalogue of Fruit Trees for Sale. London. fol.

2. Transactions in the Fruit-tree Nursery at Vauxhall.
London. 1815. 8vo.

1814. *Weeks, Mr. Edward*, late gardener to Vis-
count Kirkwall, in Wales, patentee of a forcing-
frame (1835.); and now hot-house builder at the Hor-
ticultural Repository, King's Road, London.

The Forcer's Assistant; a Treatise with useful Hints on
Forcing, by a new device for the application of Frames to the
Culture of Melons, Pines, and other choice Fruit from Dwarf
Plants; and of the Early Esculents usually in demand for the
first tables; including a few plain Directions for Forcing the
Grape, Cherry, and Peach in Houses; with an Appendix de-
scribing the Patent Forcing Frame, and exhibiting some of its
advantages; to which is prefixed an introduction, connecting
the principal parts of the theory of Vegetation, with the prac-
tice of Horticulture. Chipping Norton. 8vo. 84 pages.

1815. *The London Horticultural Society*, com-
menced by a few individuals in 1804, and established by
charter in 1809. It is perhaps one of the most
flourishing and best conducted societies of the kind
in existence.

Transactions of the London Horticultural Society. London.
4 vols. 4to. many plates, 1815 to 1824.

The papers of the first writers are dated 1805.

1816. *Emmerton, Isaac*, formerly a nurseryman
and florist at Barnet, and an enthusiastic cultivator
of the auricula.

A Plain and Practical Treatise on the Culture and Manage-
ment of the Auricula, &c. London. 12mo.

1816. *Salter, J. —*, nurseryman, seedsman, and
florist, Wells Road Nursery, Bath.

2. Treatise upon Bulbous Roots, Green-house Plants, Flower
Gardens, Fruit Trees, the Culture of the Sea Kale, Destruction
of Insects, &c. 12mo. Bath, 1816.

The author, in an advertisement, "humbly requests that
those who purchase his book will not give the rules therein
laid down to others, as it will materially injure the sale
thereof."

1817. *Brookshaw, George*, a teacher of flower-
painting.

1. *Pomona Britannica*, or a Collection of the most established
Fruits at present cultivated in Great Britain; selected from
the royal gardens at Hampton Court, and from the most cele-
brated gardens round London, accurately drawn, and colored
from nature.

2. The Horticultural Repository, containing Delineations of
the best Varieties of the different Species of English Fruits; to
which are added the blossoms and leaves, in those instances in
which they are considered necessary, accompanied with full de-
scriptions of their various properties, time of ripening, and di-
rections for planting them, so as to insure a longer succession of
fruit; such being pointed out as are particularly calculated for
forcing. Part 1. 8vo. 1821.

1818. *Baldwin, Thomas*, gardener to the Marquis
of Hertford, at Ragley, in Warwickshire.

Short Practical Directions for the Culture of the Ananas, or
Pine Apple. 8vo. Warwick.

1818. *Blakie, Francis*, steward to T. W. Coke,
Esq., of Holkham, in Norfolk, author of some tracts
on agricultural subjects, and of various papers in
the *Farmer's Journal*.

A Treatise on Hedges and Hedgerow Timber. 12mo.

1818. *Hayward, Mr. Joseph*, gent., an amateur

gardener, formerly a Yorkshire clothier, now resid-
ing at Plumstead in Kent.

The Science of Horticulture. London. 1818. 8vo.

1818. *Macwilliam, Robert*, a native of Aberdeen,
and surveyor in London.

An Essay on the Origin and Operation of the Dry Rot; to
which are annexed, Suggestions for the Cultivation of Forest-
trees, and an Abstract of the Forest Laws. 1818. 4to.

1818. *Page, Mr. William Bridgewater, C.M.H.S.*,
nurseryman, at Southampton, and son-in-law of
Kennedy, late of the Hammersmith nursery, who
is the reputed author of Page's Catalogue.

Page's Prodromus; as a general nomenclature of all the
plants, indigenous and exotic, cultivated in the Southampton
botanic gardens; arranged alphabetically, as they are con-
sidered hardy or tender to the climate of Britain, under their
different characters of trees and shrubs, herbaceous, &c. The
generic and specific names after the Linnaean system; with the
English names, propagation, soil, height, time of flowering, na-
tive country, &c.; also occasional hints for their cultivation.
An Appendix, containing selected lists of annuals; all the
choicest kinds of fruits now in circulation, with their characters,
&c., and a short tract on the sexual system, from the Philoso-
phica Botanica of Linnaeus. London. 8vo.

This, when the errors with which it abounds in every page,
are corrected in a new edition, will be the best Gardener's Ca-
talogue that has hitherto been published; that of Sweet is
much more correct and extensive as a botanical work, but this
is more instructive in what relates to culture. No gardener
ought to be without both works.

1818. *Sweet, Robert, F.L.S.*, an excellent practical
botanist, and experienced cultivator.

1. *Hortus suburbanus Londinensis*; or, a Catalogue of Plants
cultivated in the neighbourhood of London, arranged accord-
ing to the Linnaean system; with the addition of the natural
orders to which they belong, reference to books where they
are described, their native places of growth, when introduced,
time of flowering, and reference to figures. London. 8vo.

2. *Geraniaceae*; or, Natural Order of Geraniums. 8vo. London,
1820. in numbers.

3. The Botanical Cultivator. London. 8vo. 1820.

1819. *Monteth, Mr. —*, timber valuer at
Stirling, inventor of a composition, which he sells
for destroying all manner of insects.

The Forester's Guide, &c. Stirling. 12mo. plates.

1819. *Winch, Nathaniel John, F.L.S.*, an able prac-
tical botanist.

Essay on the Geographical Distribution of Plants through the
Counties of Northumberland, Cumberland, and Durham.
Newcastle. 8vo.

1820. *Field, Henry*, member of the Society of
Apothecaries.

Memoirs Historical and Illustrative, of the Botanic Garden
at Chelsea; belonging to the Society of Apothecaries of Lon-
don. London. 8vo.

1820. *Hogland, Mrs.*, formerly Mrs. Hoole, now
the wife of an eminent landscape-painter, author of
various novels and some poetry.

An Historical Description of White Knights, a seat of the
Duke of Marlborough, near Reading. Lond. Imp. fol.

The literary part is by Mrs. H., and the engravings by her
husband.

1820. *Hope, Thomas, Esq.*, of Deepdene, near God-
stone, in Surrey, a gentleman of highly cultivated
taste, author of a splendid work on household fur-
niture, and of *Anastasis*, a novel displaying much
genius.

An Essay on Gardening, published in the Description of
White Knights, by Mrs. Holland.

1820. *Phillips, Mr. Henry*, formerly master of an
academy at Bayswater.

1. *Pomarium Britannicum*, an Historical and Botanical Ac-
count of Fruits known in Great Britain. 8vo.

2. The History of cultivated Vegetables. London. 1822. 2 vols.
8vo.

3. *Sylva Florifera*; or, the Shrubby. London. 2 vols. 8vo.
1823.

4. *Flora Domestica*. 1 vol. 8vo.

1820. *Pigott, Richard*, florist, Dutch Villa, Sher-
dington, near Cheltenham.

A short, plain Treatise on Carnations and Pinks. 8vo.

1821. *Cobbett, William*, a well known political
writer, son of a farmer, born at or near Farnham,
in Surrey, 1776; in 1783 he went to London, and was
employed in an attorney's office; in 1784, he en-
tered into a regiment sent to America, went to
France in 1792, returned the same year to America,
and was engaged in literary pursuits till his return
to England in 1801, went to America again in 1816
(?), and returned in 1820, and now resides in Ken-
sington, where he has a large garden.

The American Gardener; or, a Treatise on the Situation,
Soil, Fencing, and Laying out of Gardens, on the Making
and Managing of Hot-beds and Green-houses, and on the Propaga-
tion and Cultivation of the several Sorts of Vegetables, Herbs,
Fruits, and Flowers. London. 12mo.

Though the author shows great ignorance of botany and phy-
siology, he has contrived by his style, by many shrewd remarks,
and by curious and bold assertions, sometimes at variance with
facts, to make an interesting book, from which it may be
gathered, that horticulture in America is but in its infancy,
and from the climate must ever have great obstacles to contend
with.

1821. *Neill, Patrick, Esq.* A.M. F.L.S. secretary to
the Natural History Society of Edinburgh, and to
the Caledonian Horticultural Society, author of a

tour through the Orkney and Shetland islands, published in 1806; and of various essays and papers on natural history in the Scotch encyclopædias: a most benevolent and intelligent man, and a skilful horticultural connoisseur.

1. Notice of Mr. Knight's Doctrines regarding Fruit Trees. (Cal. Mem. lib. 218.)

2. The articles Horticulture in the Edinburgh Encyclopædia, and in the Appendix to the Encyclopædia Britannica.

3. On the Gardens and Orchards of Scotland. (Printed in Sir John Sinclair's General Report of Scotland, 1814, vol. ii. p. 45.)

4. Report to the Highland Society concerning early Potatoes. (Gen. Rep. of Scotland. App. vol. i. p. 419.)

5. Journal of a Horticultural Tour throughout some parts of Flanders, Holland, and the north of France, in the autumn of 1817, by a Deputation of the Caledonian Horticultural Society. Drawn up by P. Neill, one of the Deputation. Edinburgh. 8vo. 1823.

1823. Harrison, Mr. Charles, F.H.S., gardener to J. S. Wortley, Esq., Wortley Hall, near Sheffield, Yorkshire.

A Treatise on the Culture and Management of Fruit Trees. Sheffield. 8vo.

SECT. II. Of the Literature of Gardening in Foreign Countries.

7691. Italy having been the country in which the revival of arts and literature took place, was the first to produce books on agriculture and gardening: that of Crescenzo is well known. The adjoining countries of France and Germany produced the next books; and those of Belon, Etienne, and Heresbachius, may be cited as among the best of the 16th century. Commelin is among the earliest Dutch authors on gardening; Rudbeck, his contemporary, one of the first who wrote in Sweden: both published after the middle of the 17th century. Herrera, one of the few Spanish writers on agricultural subjects, wrote about the end of the 16th century. The other countries of Continental Europe have produced little worthy of notice; and but few gardening books have hitherto appeared in America. Of such as are most generally known in this country, or apparently most interesting as illustrating the state of gardening at the time of their production, we give the titles in the following subsections.

SUBSECT. 1. Works on Gardening published in France, exclusive of Translations.

7692. Of French works on gardening we have given a more copious list than of those of Germany, because the French language is more generally known, and the books not difficult to obtain. Many of them are in the libraries of the British Museum, the Horticultural Society, or in the Banksian collection. One of the best books on the state of culture in France is, the *Nouveau Cours d'Agriculture*, 13 vols. 8vo. 1810.

1533. *Champion, Symphorien*, a physician, a native of Lyons, who distinguished himself in the battle of Aignadel in 1509, and was made chevalier of the two gilt spurs; he wrote several works, and died in 1539 or 1540.

Campus Elysium Gallie amœnitatem refertus, in quo quidquid apud Indos, Arabes et Pœnos reperitur, apud Gallos demonstratur posse reperiri. Lugduni. 8vo.

1535. *Etienne, Charles*, a physician of Paris, who wrote several tracts on gardening and agriculture, and first united them in one work in 1529, under the title of *Prædium Rusticum*. Having married his daughter to Jean Leibault, also a physician, he produced, with his son-in-law, the *Maison Rustique* in 1570.

1. De Re Hortensi. Par. 1535. 8vo.

2. Seminarium et Plantarium, Fructiferarium, &c. Par. 1536. 8vo.

3. Vinetum, in quo varia Vitium, Uvarum, &c. Par. 1537. 8vo.

4. Arbustum, Fonticulus Spinetum, &c. Par. 1538. 8vo.

5. Sylva Fruticum Collis. Par. 1538. 8vo.

6. Pratium, Lacus Arundinacum. Par. 1543. 8vo.

All these were united in *Prædium Rusticum*. Par. 1554.

7. L'Agriculture et Maison Rustique, &c. Par. 1570. 4to. This work has gone through upwards of 50 editions, the last entitled, *La Maison Rustique, ou Cours complet d'Agriculture, d'économie rurale et domestique*, édition entièrement refondue. Paris, chez Lecrivain. 2 vols. 8vo.

8. Columella de Hortis. 8vo. 1542.

1546. *Cognatus*, the name adopted by *Gilbert Cousin*, a canon of Nozerai, who died in 1567 in the prison of Besançon, where he was shut up on account of his religious opinions.

De Hortorum laudibus. Basil, 1546.

1552. *Brossard, Davy or David*, a Benedictine monk at Mons, belonging to a family which still exists in the Maine.

L'Art et Manière de semer Pepins, faire Pépinières et Sauvages: enter en toutes sortes d'arbres, et faire vergers; avec un autre Traité de la manière de semer Oignons en Jardins, le tant, et la saison de planter, replanter, recueillir graines, et cultiver toutes sortes d'herbes, &c. Mons. 8vo.

1553. *Belon, Peter*, a French physician, was born in the province of Maine about the year 1518. He travelled into Palestine, Greece, and Arabia, and published an account of those countries in 1553, 4to. He was assassinated at Paris in 1564.

1. De Arboribus coniferis, resiniferis, aliisque semper virentibus: de Cedrina, Cedrio, Agarico, Resinis, &c. Paris. 4to. fig. 2. Les Remonstrances sur le Defaut du Labour et Culture des Plantes, et de la cognoissance d'icelles, contenant la manière d'affranchir et apprivoiser les Arbres sauvages. Paris, 1558. 8vo.

1540. *Cornus, Georges*, or *Gorgole de Corne*, according to some writers a native of Florence.

1. Manière d'Enter, Planter, et Nourir les Arbres et Jardins, avec quelques autres traités d'Agriculture. Paris. 8vo.

2. De la Manière de Planter, Arracher, Labourer, Semer et

Emouder les Arbres Sauvages, Bois Haut et Bois Taillis Paris. 8vo.

1560. *Davy, P* —, that is, *Pere David*, or *David Brossard*. (See *Brossard*, 1552.)

1563. *Palissy, Bernard*, born at Agen in 1524, was a potter, according to some, and a China-ware manufacturer, according to others. He cultivated chemistry and the arts, and went beyond his age; he wrote various pieces, which have been collected and published in several volumes. Those which relate to agriculture and rural economy, are entitled, *Moyen de devenir riche*. He died between 1602 and 1604.

Recepte veritable par laquelle tous les hommes de la France pourrout apprendre à augmenter leurs Trésors, avec le Dessin d'un Jardin délectable et utile. Rochelle. 4to. 1563.

1564. *Mizauld*, —, born at Montluçon, in 1575; died at Paris at an advanced age. He studied mathematics and medicine with reputation; but his love of novelty, singularity, and astrology, made him lose in succession the little glory which he had acquired, his fortune, and his life. He published many works, chiefly in Latin, the first of which, on gardening, appeared in 1564; and all those which relate to the subject have been collected and published by Caille, a physician, under the following title: —

Le Jardinage de Mizauld. Paris, 1578.

1570. *Leibault, Jean*, a physician, born at Dijon, died at Paris in 1596; author of various works on medicine, and jointly with his father-in-law, Etienne, of the *Maison Rustique*. (See *Etienne*, 1535.)

1580. *Lundrie*, —.

Avertissement et manière d'enter assurément les Arbres en toutes saisons, &c. Bourdeaux, in 8vo.

1585. J. P. D.M., that is, *Jacques Pous*, Doctor of Medicine.

Sommaire traité des Melons. Lyon de Tournes. 8vo.

1631. *Garnier, Claude*.

La manière d'enter, planter, et semer, avec les remèdes contre les moucheron, limaçons, et autres bêtes qui gâtent les herbes et jardins. Troyes. 16mo.

1638. *Boycaud, Jacques*, cuyer; sieur de la Barauderie, intendant of the gardens of Louis XIII.

1. Traité du Jardinage selon les Raisons de la Nature et de l'Art, ensemble divers desseins de parterres, pelouses, bosquets, et autres ornemens servant à l'embellissement des Jardins. Paris. folio. 1638. Several times reprinted.

2. Traité du Jardinage qui enseigne les Ouvrages qu'il faut faire pour avoir un Jardin dans sa perfection, et la manière de faire des pépinières, de greffer, enter, &c. 12mo. 1639.

1651. *Mollet, André*, a relation and contemporary of Claude Mollet, who was gardener to Henry IV., and Louis XIII. of France, as the other is said to have been to James I. of England.

1. Le Jardin de Plaisir, contenant plusieurs Dessins de Jar-

dinage, tant Parterres en Broderie, Compartimens de Gazon, que Bosquets et autres, avec un Abrégé de l'Agriculture touchant ce qui peut être le plus utile et nécessaire à la construction et accompagnement du dit Jardin de Plaisir, par André Mollet, intendant des Jardins du roi d'Angleterre. Stockholm. folio.

2. Manière pour élever les Melons. Paris. 12mo. 1659.

1652. *Le Gendre*, an assumed name; that of the real author being, according to Quintinie, Robert Arnauld d'Andilly, a clergyman, born at Paris in 1589, author of various theological works and memoirs of his own life, who died in 1674. But the compilers of the *Bibliographie Agronomique*, consider that the Abbé de Pont-château, a monk of Portugal, was the real author. Baillet, a noted French bibliographer, ascribes it to M. M. Guillaume de la Moignon, et Olivier Lefèvre d'Ormesson: Rapin ascribes it to La Moignon; and Grégoire is of the same opinion as Quintinie. All agree in the excellence of the work.

De la Manière de cultiver les Arbres Fruitières, par le Sieur Le Gendre, curé de Henonville. Paris. 1652.

An English translation appeared in 1660, entitled *The right Manner of ordering Fruit-trees*, &c. translated from the French of Le Gendre. London. 8vo.

1652. *Mollet, Claude*, head gardener to Henry IV., and of Louis XIII.; he created in France, in 1582, the *parterres à compartimens*; in 1595, he planted the garden of Saint Germain-en-Laye, of Monceau, and of Fontainebleau; in 1607, he had planted at Fontainebleau 7000 fruit-trees; he had, in 1608, made fine plantations of cypresses in the gardens of the Thuilleries, which were killed by the rigorous winter of 1608. On the whole, he effected a great deal for the time in which he lived, and his name and memory has been too much forgotten. His relation, Andrew Mollet, was gardener to James I. in England. (See *Mollet, André*, 1651.)

Théâtre des Plans et Jardins, contenant des Secrets et Inventions inconnus à tous ceux qui jusqu'à présent se sont mêlés d'écrire sur cette matière; avec un Traité d'Astrologie, propres pour toutes sortes de Personnes, et particulièrement pour ceux qui s'occupent à la Culture des Jardins. Paris. 4to. 22 plates. The designs invented by André, Jacques, and Noël, sons of the author.

Several editions of this work have been printed at Paris, but none lately.

1651. *Bonnefons*, —, author of a letter on the agriculture of Italy.

Jardinier Français et Délices de la Campagne. Paris. 2 vols. 12mo.

1653. *Triquel, R.* —, prior of St. Mark.

Instruction pour les Arbres Fruitières.

A third edition, with a Treatise on the Management of Oranges, Pomegranates, Olives, and Spanish Jessamine, in 1658.

1654. *Chesnée, Montereull, Charles de la*.

Le Fleuriste Français, traitant de l'Origine des Tulipes; avec un Catalogue des noms des Tulipes. Caen.

This appears to be the first treatise written on Tulips; the second was by d'Ardenne in 1660. A plagiarism from Chesnée's work appeared in 1678, entitled *Traité des Tulipes*.

1658. *Morin, Pierre*, a florist at Paris, mentioned by Evelyn; he devoted 40 years of his life to the culture of flowers, and was, the French authors say, the Vilmorin of his time.

1. Remarques nécessaires pour la Culture des Fleurs.

2. Instruction facile pour connoître toutes sortes d'Orangers, et de Citronniers; qui enseigne aussi la manière de les cultiver, semer, &c. Paris. 12mo. 1680.

1658. *Stephanus, Morinus*, a protestant divine, born at Caen in 1625, where he was settled as a clergyman, and afterwards as a professor of the Oriental languages at Amsterdam; he published various theological works, and died in 1700.

Observations circa Culturan Plantarum.

1660. *Saint Etienne, Claude de*, a Bernardin monk.

1. Instruction pour connoître les bons Fruits et les Arbres Fruitières, selon le mois de l'année et la façon de les cultiver. Paris. 12mo.

Several editions, with the title somewhat varied, as Nouvelle Instruction pour connoître, &c. 1667.

2. Traité de la Connaissance des bons Fruits, par M. M. Merlet et Saint Etienne, 4th edit. 1782.

1665. *Rapin, Rene*, or *Renatus*, a Jesuit, was born at Tours in 1621. He taught polite literature with great reputation in the colleges of his order; and died at Paris in 1687.

1. Renati Rapini de Hortorum, lib. 14. 1665. Item Ultrap. 1672. 8. præter ejus libellum de Cultura Hortensi, et Mearsi arboretum sacrum.

2. Nemus; translated into English verse by Evelyn junior, printed with the Sylva. Rapin's 4 books translated by him were published separately, 1673. 8vo. Lond.

1675. *Laurent, Jean*.

Abrégé pour les Arbres nains, et autres, &c. Paris. 4to. This author believes in the influence of the moon, and enjoins many curious superstitious practices to secure successful culture.

1675. *Merlet, Jean*, of St. Stephen.

Abrégé des Bons Fruits avec la manière de les connoître, &c. Paris. 12mo.

1677. *Aristote*, jardinier de Puteaux, considered by the French bibliographers as an assumed name, and designation

1. Observations sur le Livre du Curé d'Henonville, ou de l'Abbé de Pont-château de Cambout de Coislin, Jardinier de Port Royal. 12mo. 1677.

2. Traité de cultiver toutes sortes de Fleurs; avec Instructions pour cultiver et greffer les Arbres Fruitières. Paris. 12mo.

3. Instructions pour le Jardin Potager, avec l'Art de cultiver les Fleurs et les Arbres Fruitières. Paris. 12mo. 1678.

1683. *R. D. C. D. W. D.*

Le Jardinier Français, qui enseigne à cultiver les Arbres et les Herbes Potagères, avec la Manière de conserver les Fruits, dédié aux Dames. Rouen. 12mo.

This work has come through a great many editions in France, and was translated by Evelyn in 1638, under the title of the French Gardener.

1692. *Chataigneraie*, le Sieur de.

La parfaite Connaissance des Arbres Fruitières, &c. Paris. 12mo.

1696. *Dahuron, René*, gardener to the Duke of Brunswick, at Luneburg.

Nouveau Traité de la Taille des Arbres Fruitières, contenant plusieurs figures, qui marquent les manières de les bien tailler. Paris. 12mo.

1690. *Quintinie, Jean de la*, born in 1626, at Chabanais, near Angoulême, died in 1700. He was destined for the bar, but a passion for gardening determined him to that pursuit. He became tutor to a young gentleman, M. Tambonneau, and made the tour of Italy with him, where his passion for his favorite study increased. At his return, the father of his pupil submitted his gardens to his direction. Here he acquired experience and reputation. The great Condé used to take pleasure in conversing with him, and Charles II. of England invited him to superintend his gardens, with a considerable pension. Louis XIV. created for him the office of director of the royal fruit and kitchen gardens. It is uncertain whether any other work by him appeared during his life than the first of those enumerated below.

1. Traité des Jardins Fruitières et Potagers. Amsterdam. 4to. fig.

2. Instructions sur les Jardins Fruitières et Potagers, avec un Traité des Orangers, et des Réflexions sur l'Agriculture. 4to.

Both works have come through numerous editions in the French language, and were translated into English by Evelyn, and by London and Wise.

17. *Chomel, Noël*, a curate in Lyons, who died in 1712. His nephew, a physician, published in 1761, *Histoire des Plantes usuelles*.

Abrégé de l'Histoire des Plantes usuelles, &c. An Edition in 1803, with the Linnæan names by Mailland.

17. *Lemarié, Fr.*

Supplément à l'Art de l'Ami des Jardins d'Utilité et d'Ornement; contenant des notions sur la culture de diverses plantes; entre autres le rutabaga au chou-navet de Laponie, qui ne gèle jamais en terre, et qui remplace le colza; sur de nouveaux arbres et arbrisseaux, tels qu'un nouveau Rosier, le Mangoustain, et autres; avec deux listes des panachés, dont l'une des plants vivaces en pleine terre, et l'autre des arbres et arbrisseaux. Paris. 12mo.

17. *Pelée, M. de St. Maurice*, member of the Paris Agricultural Society.

L'Art de Cultiver les Peupliers d'Italie, &c. Paris. 12mo.

17. *Renault*, —, a civil officer in the district of Rouen.

Mémoire sur la Culture des Pommiers dans toute l'étendue de la France. Rouen. 8vo.

1701. *Marchant*, —, of the Academy of Sciences.

Dissertation sur la Préférence que nous devons donner aux Plantes de notre Pays, par-dessus les Plantes étrangères.

1703. *Liger, Louis*, born in 1658, died in 1717; author of various works on rural and domestic economy, and of a *Théâtre d'Agriculture*, in several volumes, and a new edition of the *Maison Rustique*.

1. Traité facile pour apprendre à élever des Figuières. 12mo.

2. Le Jardinier, Fleuriste, et Historiographe, 2 vols. in 12mo. 1703. An edition with the title somewhat varied in 1704.

3. La Culture parfaite des Jardins, Fruitières, et Potagers. 12mo. 1714.

1705. *Besnier*, —, a physician in Paris, father-in-law to the celebrated physician Dionis.

Le Jardinier Botaniste, ou la Manière de cultiver toutes sortes de Plantes, Fleurs, Arbres, et Arbrisseaux, avec leur usage en médecine et pour l'embellissement des jardins. Paris. 8vo.

1705. *François*, —, one of the brothers of the Chartreuse in Paris.

Le Jardinier solitaire, ou Dialogues, contenant la méthode de cultiver un jardin fruitier et potager, 8vo. An edition in 1770, with the title somewhat varied.

1705. *Valléfont*, l'Abbé de, a naturalist and antiquarian, author of several works.

Curiosités de la Nature et de l'Art sur la Végétation, ou l'Agriculture et le Jardinage dans leur perfection, &c. Paris. 12mo.

The same work in English. 8vo. 1784.

1707. *Andry*, —.

Le Thé de l'Europe, ou les Propriétés de la Veronique. Paris. 16mo.

1707. *Tournesfort, Joseph Pitton de*, a physician and botanist, was born at Aix, in Provence, June 5. 1656. He was intended for the church, but on the death of his father he relinquished the study of

theology, to indulge his inclination for natural history. To gratify this passion, he made numerous journeys in Europe and Asia; after which he became professor of physic in the royal college, and of botany in the king's garden at Paris, where he died Dec. 23. 1708. His botanical publications are numerous; the most important is his *Institutiones rei Herbariæ*, which method of arrangement was followed in this country as well as in France, till supplanted by the systems of Linneus and Jussieu.

Observations sur la Naissance et la Culture des Champignons. Mém. de l'Acad. de Paris, 1707.

1712. *Angran de Rueneuve*, a lawyer.

Observations sur l'Agriculture et le Jardinage, pour servir d'Instruction à ceux qui désirent de s'y rendre habiles. Paris. 2 vols. 12mo.

1712. *Boullay*, —, canon of Orleans.

Manière de bien cultiver la Vigne, de faire la vendange et le Vin dans le Vignoble d'Orleans, utile à tous les autres Vignobles du Royaume. 2d edit. in 12mo.

1713. *D'Argenville, Dezallier Ant. Joseph*, born in Paris, where he died in 1765. He held a public situation, and his principal study was natural history. The articles Hydrographie et Jardinage in the *Dictionnaire Encyclopédique* were furnished by him.

1. La Théorie et la Pratique du Jardinage, ou l'on traite à fond des beaux Jardins de Plaisance et de Propriété, contenant plusieurs Plans et Dispositions générales des Jardins, nouveaux dessins de Parterres, de Bosquets, de Boulingrins, Salles, Cabinets, &c. Paris. 4to. 1713.

Only the first edition of this work appeared with the name of the author, who afterwards adopted that of Le Blond, by whose name the work is best known. It was translated into English by John James of Greenwich, architect, and entitled

The Theory and Practice of Gardening, containing all that relates to fine gardens, &c. &c.

2. Dictionnaire du Jardinage. Liege, 1783.

Besides the above, he remodelled and published the works of Roger Schabot, after his death. (See Schabot, 1767.)

1716. *Ressons, Jean-Baptiste Deschiens de*, born at Chalons; died in 1736. He was lieutenant-general of artillery, and member of the Academy of Sciences; united a taste for arms with that for study, and excelled in both.

Manière de greffer les Arbres des Fruits à Noyaux, sans perdre aucun tems, en sorte qu'un arbre qui aura fait de tres-mauvais fruits l'année précédente en pourra porter de tres-bons l'année suivante. Paris. 8vo.

1719. *Lemaistre, M*, —, curate of Joinville.

Fruiter de la France, ou Description des Fruits, à Noyaux et à Pépins, qui se cultivent dans le royaume; avec une dissertation historique sur l'origine et les progrès des Jardins. 4to.

1722. *Saussai, le Sieur de*, gardener to the Princess of Condé, at Anet, afterwards inspector of the gardens of the Duke of Bourbon.

Traité des Jardins. Paris. 12mo.

1730. *Hamel du Monceau, Henry Lewis du*, a distinguished naturalist, was born at Paris in 1700.

He became a member of the Academy of Sciences, to whom he communicated a number of papers on vegetable physiology. He died at Paris, where he was dean of the academy, in 1782.

1. De l'importance de l'Analogie, et des Rapports que les Arbres doivent avoir entre eux pour la réussite et la durée des greffes. (Mém. Acad. Par. 1730. 31.)

2. Sur les Plantes qu'on peut élever dans l'Eau. (Mém. Acad. Par.)

3. Traité des Arbres et Arbustes, qui se cultivent en France en pleine terre. Par. 1755. 2 vols. 4to.

4. Physique des Arbres, ou il est traité de l'Anatomie des Plantes, et de l'Economie Végétale; avec une Dissertation sur l'Utilité des Methodes de Botanique, et une Explication des Termes propres à cette science. Par. 1758. 2 vols. 4to.

With numerous copperplates. This is his most important work, and on it his merit as a Physiologist chiefly rests.

5. Traité complet des Bois et des Forêts. Par. 1758-67. 6 tom. 4to.

6. Des Semis et Plantations des Arbres, et de leur Culture. Par. 1760. 4to.

7. Art du Charbonnier. Par. 1761. fol.

8. De l'Exploitation des Bois, ou moyen de tirer parti des taillis demi futaies et hautes futaies. Par. 1764. 2 vols. 4to.

9. Du Transport, de la Conservation, et de la Force du Bois. 1767. 4to.

10. Traité des Arbres Fruitières. Paris, 1768. 2 vols. 4to. With fine coloured plates of fruit-trees, &c. This is his most splendid work.

1732. *Guerin, M* —.

Traité de la culture parfaite de l'Oreille d'Ours. 12mo.

1735. *Jussieu, Bernard de*, born at Lyons in 1699; practised physic, and became curator of the plants in the royal garden of Paris, and superintendent of that at Trianon. In this last garden he first displayed the celebrated system which bears the family name, and has been so much perfected by his nephew, Antoine de Jussieu. All the members of this family have devoted themselves to science.

Catalogue des Arbres et Arbusteux, qui se peuvent élever aux environs de Paris, &c. Paris. 12mo.

1757. *Thouin, André*, le Chevalier &c, Professor of Culture in the University of Paris; author of various memoirs on gardening and agriculture, inserted in the French encyclopedias, dictionaries, and periodical works, and in the transactions of

their learned bodies: an excellent man, and esteemed one of the first gardeners in Europe.

1. Mémoire sur l'Usage du Terreau de Bruyère dans la Culture des Arbusteux et Arbustes étrangers, regardés jusqu'à présent comme délicats dans nos jardins. (Mém. de l'Acad. des Sc. de Paris, 1781. p. 481-495.)

2. Sur les Avantages de la Culture des Arbres, étrangers pour l'emploi de plusieurs Terrains de différente nature abandonnés comme stériles. (Mém. de la Soc. R. d'Agricult. de Paris, 1786. p. 43-49.)

3. Description du Jardin des semis du Musée d'Histoire Naturelle, de sa culture et de ses usages. (Annales du Mus. d'Hist. Nat. tom. 4.)

4. Description de l'Ecole d'Agriculture pratique du Musée d'Histoire Naturelle. (An. du Mus. tom. 10, 11, & 12.)

5. Mémoires sur des nouvelles Modes des greffes. (Ibid. tom. 12, 13, 14, &c.)

6. Notes sur la Culture des Patates et des Pommes de terre. Sur la Culture des Plantes Alpines. (Ibid. tom. 3. p. 183.)

7. Mémoire sur la Culture des Bruyères. (Ibid. tom. 2. and 3.)

8. Mémoire sur la Culture des Dahlias, &c. (Ibid. tom. 3.)

9. Monographie de greffes, ou Description technique de diverses sortes de Greffes, employées pour la multiplication des Végétaux. Paris, 1821, in 4to. avec 13 pl. in lithog.

10. Instruction sur l'Etablissement des Pépinières. Paris. 8vo.

11. Notes sur les Semis du Pin de Riga. Paris, 8vo.

12. Note sur la Culture et les Usages du Pin Laricio de Corse. Paris. 8vo.

1739. *Buffon, George Louis le Clerc*, Count de, was the son of a counsellor of the parliament of Dijon, and born at Montbard, in Burgundy, in 1707. He studied at Dijon, and was intended for the law, but his inclination lay to the sciences, particularly astronomy and geometry; and it is said he was never without Euclid's *Elements* in his pocket.

At the age of twenty he made the tour of Italy, after which he visited England. On his return he divided his time between Montbard and Paris, and in 1735 published a translation of Hale's *Vegetable Statics*, which was followed by one of Newton's *Fluxions*. In 1739 he was appointed superintendant of the royal garden and cabinet, which by his care were considerably enriched. He was a member of the French Academy, treasurer of that of Sciences, and in 1771 he was created a count.

His private character was that of a libertine, and he was extremely vain of his person and talents.

"The works of eminent geniuses," he would say, "are few; they are those of Newton, Bacon, Leibnitz, Montesquieu, and my own!" He died of the stone in 1788. His only son was guillotined in 1793.

1. Mémoire sur la Conservation et le Retablissement des Forêts. (Mém. Acad. Par.)

2. Mémoire sur la Culture des Forêts. (Id. ib. 1742.)

1737. *Riviere, de la*, and *du Moulin*.

Méthode pour bien cultiver les arbres à fruit, et pour élever les treilles. Utrecht. 8vo.

1741. *Bazin, Gilles-Augustin*, a physician of Strasbourg; author of some tracts on insects, trees, &c.; died in 1754.

1. Observations sur les Plantes, et leur analogie avec les Insectes.

2. Traité de l'Accroissement des Plantes. 8vo.

1745. *De Combles*, a native of Lyons, began to write on agriculture in 1745; and after having led a life of agitation, he retired to a country-house near Paris, where he gave himself up to gardening.

1. Traité de la Culture des Pêchers. 12mo.

2. L'Ecole du Jardin Potager. 2 vols. 12mo.

In 1802, these two works were published together in 2 vols. 12mo. which made the fifth edition of L'Ecole du Jardin Potager.

1746. *Ardenne, Jean Paul de*, born at Marseilles in 1689, where he became a priest and superior of the congregation of the oratory. He had a country-house at Fortcalquier, where he devoted great part of his time to the culture of flowers and to deeds of charity. He was reckoned among the most famous florists of his time. He died in 1769.

1. Traité des Renoncules. Paris, 1746. 8vo.

2. Traité des Tulipes. Plates, Aug. 1760. 12mo.

3. Traité des Oeillets Plates. Avignon, 1763. 12mo.

4. Traité des Jacinthes. Illustrated with plates. Avignon, 1763. 8vo.

5. Traité de l'Oreille d'Ours, 8vo. Avignon, 1759. 2 vols. 12mo.

6. Année Champêtre. Lyons, 1769. 3 vols. 12mo.

1750. *Roux, Augustin*, born in 1726; died in 1776; Member of the Royal Society of Agriculture.

1. Traité Physique de la Culture et de la Plantation des Arbres, avec la manière de les exploiter, de les débiter, &c. Paris. 12mo.

2. Traité de la Culture des Arbres à ouvrier. 12mo.

1751. *Desbois, Francis Alexander Aubert de la Chesnaye*, born at Ernay on the Maine in 1699, died in an hospital in Paris in 1784. One of the most indefatigable compilers of the 18th century.

Dictionnaire Universel d'Agriculture et de Jardinage. Paris. 2 vols. 4to.

1753. *Franchville, Joseph Dufresne de*, of the academy of Berlin, born at Dourlens in Picardy

in 1704; better known by the first edition of Voltaire's *Siècle de Louis XIV.*, which appeared under his name, than by any of his other works.

Catalogue nouveau de bons Fruits. 12mo.

1754. *Moer, M.* —

Traité de la Culture des Renoncules, Œillets, Auricules, et Tulipes. 12mo.

1757. *Bertrand, Francis*, a citizen of Paris, enthusiastically attached to the country, but not being able to retire to it, he amused himself by collecting passages from the poets on the pleasures of a country life.

Ruris deliciae. Collectæ ex melioris notæ Latinis Gallicisque Pœtis. Paris. 12mo.

1757. *Morel, N.* —, of Lyons, born 172-. An ancient architect, who introduced the modern style of gardening in France. He assisted Girardin in laying out Ermenonville, and afterwards was employed at the extensive concerns of the park of Moreville.

1. L'Art de Distribuer les Jardins suivant l'usage des Chinois. Londres. 8vo. 1757.

2. Théorie des Jardins, ou l'Art des Jardins de la Nature. 8vo. 1776.

A new edition, enriched with a list of trees, their heights and colors, by C. Morel, in 1805.

3. Tableau Dendrologique, contenant la Liste des Plantes Ligneuses, Indigènes et Exotiques acclimatées; la manière dont elles se propagent, le terrain et l'exposition qui leur conviennent. Lyons. 12mo. 1800.

1758. *Gauges de Cessières*, advocate at Laon.

Les Jardins d'Ornement, poème. 8vo.

1759. *Bidet, M.* —, of the agricultural academy of Tuscany, and officer of the royal household; a native of Champagne.

Traité de la Culture des Vignes. 2 vols. 12mo. 1759.

An improved edition by Duhamel du Monceau, in 1752.

1760. *Buchoz, Pierre Joseph*, a physician and member of several societies; born at Metz in 1731, died in great distress at Paris in 1807. He wrote above three hundred volumes relative to medicine, agriculture, the veterinary art, and natural history. A plant (*Buchoziana*) was named after him by L'Heritier.

1. Catalogue Latin et François des Plantes, Vivaces, &c. pour la Decoration des Jardins, 1786, 18mo.

2. Dissertation sur la Cèdre du Libon, le Platane et le Cytise. Par. 8vo. 1804.

He printed numerous other dissertations of this description separately, which are all collected in the following work.

3. Nouveau Traité Physique et Economique per forme de Dissertations de toutes les Plantes qui croissent sur la Surface du Globe. In fol. 1786. 2 vols.

4. Lettre sur la Méthode de s'enrichir promptement, et de conserver sa santé par la Culture des Végétaux. 8vo. 1760.

5. Mémoire sur l'Hortensia, le Cestrau, &c. augmentée de deux mémoires sur le Lagerstrom et le Fothergill. 8vo. 1804.

6. Monographie de la Rose, et de la Violette. 8vo. 1805.

7. Observations sur Quatre Genres d'Arbustes; l'Azalia, le Cèdre, le Kalmia et le Rhododendron, que méritent d'être cultivés dans les Jardins. 8vo. 1782.

8. Prospectus d'Histoire Naturelle des Végétaux, de la France, &c.; ou la Botanique, la Médecine, l'Agriculture, le Jardinage et les Arts réunis dans le règne végétal de la France. Metz, in 8vo. 1765.

Buchoz was at this time botanical demonstrator to the Royal College of Physicians, at Naney.

9. Réflexions sur le Genre du Robinier. 8vo.

10. Traité de la Culture des Arbres et Arbustes qu'on peut élever dans le royaume. 12mo. 1785.

1760. *Duchesne, Ant. Nicolas*, professor of natural history, in the central school of Versailles, author of some geological works.

1. Traité des Fraisiers. 12mo. 1760.

2. Sur la Formation des Jardins. Par l'auteur des Considérations sur le Jardinage. Paris. 8vo. 1775.

1760. *Thierat*, —, a lawyer, and an officer in the woods and waters; author of various tracts on agriculture.

Observations sur la Culture des Arbres à haute Tige, particulièrement des Pommiers.

1763. *Bonnelle, Charles*, born at Artois.

Le Jardinier d'Artois, ou Éléments de la Culture des Jardins Potagers et Fruitières. 8vo.

1763. *Maupin*, —, valet-de-chambre to the queen; author of a number of works on rural subjects.

1. L'Art de la Vigne, &c. 8vo. 1779.

2. Almanach, ou Manuel de Vignerons de tous les pays. Paris. 8vo. 1789.

3. Avis sur la Vigne, &c. Paris. 8vo. 1786.

4. Lettre de l'Auteur de la nouvelle Méthode de cultiver la Vigne, &c. Paris. 12mo. 1761.

5. Nouvelle Méthode de cultiver la Vigne, &c. 12mo. Paris. 1763.

A new edition, with additions, by Buchoz in 1799.

1763. *Mandrola*, —.

Manuel du Jardinier. 8vo.

1765. *Chambray, Louis*, Marquis de, born in 1703, occupied himself much in cultivating the apple, and in making cider.

Art de cultiver les Pommiers, les Poiriers, et de faire les Cidres, selon l'usage de Normandie. Paris. 12mo.

1765. *Delille, Jacques*, an eminent French poet,

member of the French Academy, born at Clermont, in 1738, died at Paris in 1811.

1. Les Jardins.

There is an English translation by Mrs. Montolieu, in 1797.

2. Le Jardin d'Eden; suivi d'une Épître à deux Enfants Voyageurs. Paris. 18mo. 1817.

1765. *Dupuy*, —.

Observations sur la Culture de la Vigne.

1765. *Saint-Péray, Guerneau de*, born in Beauce, author of some tracts on political economy and agriculture.

Traité de la Culture de différentes Fleurs, des Narcisses, Girofliers, Tubéreuses, Anémones, Jacinthes, Jonquilles, Iris, Lis, et Amarantés. 12mo.

1766. *Lataille-des-Essarts*, —.

Mémoire sur le Safran. Orleans. 8vo.

1766. *Masse, Jean* —, advocate.

1. Dictionnaire portatif des Eaux et Forêts. 2 vols. 8vo.

2. Traité des Bois et des différentes Manières de les semer, cultiver, planter, exploiter, &c. Paris. 2 vols. 8vo. 1769.

1767. *Chartréuse, les révérend Pères de*, de Paris.

The nursery of these reverend fathers was for a long time the only one on the continent.

Catalogue des Arbres à Fruits, les plus excellents, les plus rares, et les plus estimés, qui se cultivent dans les Pépinières des Pères Chartréuse, avec la Description tant des arbres que des fruits, &c. 8vo.

1767. *Schabol, Jean-Roger*, a deacon, the son of a sculptor, who occupied himself much in gardening, and wrote several works, not elegant as to style, but original, and entirely from his own experience. He died in 1768, aged 77 years.

1. Théorie et Pratique du Jardinage, avec fig en taille douce. Paris. 3 vols. 12mo.

This work was prepared from the author's papers, and published after his death, by Dezallier d'Argenville, who collected all Schabol's works, and published them under the title "Manuel du Jardinier, ou Journal de son Travail distribué par Mois. Paris. 12mo. 1772.

2. Dictionnaire du Jardinage. 1 vol. 12mo. 1767.

3. Observations sur les villages de Montreuil, Bagnolet, Vincennes, Charonne, et villages adjacents, à deux lieues ou environ de Paris, au sujet de la Culture des Végétaux, avec une idée de la Méthode qu'on y emploie pour traiter les Arbres, surtout les pechers. 1755. (Inserted in the *Journal Economique* for that year.)

4. Éléments du Jardinage utile, ou Méthode de cultiver avec succès le Potager, et le Verger, d'après les Experiences de Roger Schabol, &c. Metz, in 12mo. plates. 1786.

1767. *Wenckeler, Jean George*, commonly called *Egner*.

Instructions sur le Jardinage, que renferment en abrégé ce qui a rapport à la Culture des Fleurs, des Fruits, et des Légumes, &c. Paris. 8vo.

1768. *Saint Simon*, Marquis de, aide-de-camp to Prince de Conti; died in 1794. He wrote also on bees.

Des Jacinthes, de leur Anatomie, Reproduction et Culture. Paris. 12mo.

1768. *Tschoudi, Jean-Baptiste-Louis-Theodore*, Baron de, author of some articles in the *Encyclopædia*, and translator of Miller's *Dictionary*; died at Paris, in 1784.

1. De la Transplantation, de la Naturalization, et du perfectionnement des Végétaux. 8vo. 1778.

2. Traité des Arbres résineux conifères, extrait et traduits de l'Anglais de Miller, avec des notes. 8vo. 1768.

Essais sur le greffe de l'herbe, &c. Strasbourg. 8vo. 1819.

1769. *Bearde, de l'Abbaye*, died young at Paris in 1771, author of a dissertation on a subject in political economy, which obtained the prize of the academy of St. Petersburg in 1769.

Essais d'Agriculture, ou Tentatives Physiques, &c. Par. 8vo.

1769. *Larivière de, et M. — Dumoulin*.

Méthode pour cultiver les Arbres à Fruits et pour les élever en treilles, par le Sieurs de Larivière et Dumoulin. Paris. 12mo.

1769. *Toustain-de-Limesy, Charles Francois*, an officer in a regiment of Champagne, under the old regime, member of several agricultural societies.

Mémoires sur les Plantations.

1770. *Anon*.

Le Jardinier prévoyant, Almanach suivi des Considérations sur le Jardinage. Paris. 16mo.

This work has been improved, and continued to the present time, and now appears annually under the title of

Le Bon Jardinier, Almanach, avec Supplément, contenant des préceptes généraux de culture, &c. par M. M. Loiseleur des Longchamps, Vilmorin, et Noisset. Paris. 12mo. plates.

1771. *Hérissant, Louis Antoine Prosper*, born in Paris in 1745. His father was a celebrated printer, and the son was educated as a physician, but died in 1770, at the early age of twenty-five.

Jardin des Curieux, ou Catalogue raisonné des plantes les plus belles et les plus rares, soit indigènes, soit étrangères, avec les noms Français et Latins, leur culture et les vertus particulières de chaque espèce; le tout précédé de quelques notions sur la culture en général. Paris. 8vo.

This work is the description "raisonnée" of a fine garden which Mr. Cochon, an ancient magistrate of Paris, had formed at Chatillon near Bagneux, within two miles of Paris. Hérissant died before his work was completed, and it was finished by M. Coquerneau.

1771. *Latapie*, —, the translator of Wheatley's *Observations on Modern Gardening*; to which he added, a Discourse on the Origin of the Art, notes

to the text, and a description of Stow, where he is said to have resided some time with Lord Temple. L'Art de former les Jardins Modernes, ou l'Art des Jardins Anglais, traduit de l'Anglais, &c. Paris. 8vo.

1772. *Brousse, M* — de la.

Traité de la Culture du Figuier, suivi d'Observations et d'Experiences sur la meilleure maniere de la cultiver. 12mo.

1773. *A Society of Amateurs.*

Essai sur la taille des arbres fruitiers. Paris. 12mo. fig.

1773. *Pelletier, de Frepillon*, —.

Essai sur la taille des Arbres Fruitiers. 12mo.

1773. *Trother*, —.

L'Art de fertiliser les Terres, et de preserver de la gelée commodément et à peu de frais, les Arbres, et Arbrisseaux, les Vignes, &c. Paris. 3 vols. in 8vo.

1774. *Felan, l'Abbe* de.

Traité de la Culture de Melon. 8vo.

1774. *Watelet, Claude Henri*, receiver-general of finances, member of the Academy of Sciences, and other learned bodies, was born at Paris in 1715. He was celebrated for his love of arts and letters, and enjoyed himself at his country-house, called *le Moulin joli*, near Paris, where he created an English garden, and wrote on the subject. He died in 1755. Essai sur les Jardins. Paris. 8vo.

1775. *Mallet, Robert Xavier*, author of several works on agriculture.

1. Culture des Asperges, et des petits Pois. 12mo.

2. Beauté de la Nature, Fleurimanie Raisonnée, &c. 12mo.

3. Dissertation sur la Maniere de cultiver des Plantes choisies dans les Chassis Physiques du Sieur Mallet leur Inventeur, avec la Description de ces Chassis. Paris. 4to. p. 33. pl. 1.

1775. *Roubo*, —, joiner and architect, author of several works on joinery, died about the end of the 18th century.

L'Art de Treillager, ou Menuiserie des Jardins. Par. fol. Du Hamel is said to have praised this work, in which the author has exhausted his subject.

1775. *Vallet, A* — N —, a lieutenant-general under the old regime, and procurator fiscal of the barony of Romainville, near Paris.

Manuel Oeconomique pour les Bâtimens et Jardins, trestitules aux Propriétaires et Entrepreneurs, &c. Paris. 8vo.

1777. *Durival, Clement*, brother of N. L. Durival, an agricultural writer, was born at St. Aubin, in 1728; he wrote on the finances and rural economy, and his memoir on the vine was crowned with the prize at Metz, in 1777.

La Vigne, Mémoire Couronné, à l'Académie de Metz, par M. Durival le Jeune. 8vo.

1777. *Girardin, L. R. Vicomte* d'Ermenonville, a military officer of high rank, who travelled in England about the time when the new style of laying out grounds was coming into fashion; and when he returned to France, laid out his seat at Ermenonville in this style.

La composition des Paysages sur le terrain, ou des moyens d'embellir la Nature autour des habitations, en y joignant l'utile à l'agréable. 8vo.

This work has been translated into English, with an historical introduction by Daniel Malthus, Esq.; and also into German and Italian.

Another edition, with notes, was published a few years ago, by René Girardin, the son of the author, and present proprietor of Ermenonville.

1778. *Prudent, P* —, a capuchin friar.

Reflexion d'un Vigneron de Besançon, l'Abbé Bovarel, en 1777, sur les Causes d'une Maladie qui attaque plusieurs Vignobles de Franche-comté. Vesoul. 8vo.

1779. *Calonne*, —, advocate.

Essai d'Agriculture en forme d'entretien, sur les Pépinières des arbres, étrangères, et fruitiers, &c. Paris. 12mo.

1780. *Lamoignon-Malherbes, Chrétien-Guillaume*, born in Paris in 1721, and guillotined there by the revolutionary faction in 1793. He was an excellent man, attached to the arts, and introduced on his estates many exotic trees.

Observations sur le Vins, les Orchis, le Méléze, &c.

1780. *Maréchal, Pierre Sylvain*, born at Paris, in 1750, died in 1803; author of a great many works, the principal of which is a *Dictionary of Atheists*. Décades du Cultivateur. Paris. 3 vols. 8vo.

1781. *Henriquez, Jean*, a lawyer, author of different works on forests and the chase.

1. Mémoire sur les moyens de multiplier les plantations de bois sans nuire à la production des subsistances. Rheims. 12mo. 1789.

2. Observations sur le menagement des bois. Verdun. 8vo. 1781.

3. Code pénal des Eaux et Forêts. 2 vols. 12mo. 1782.

1781. *Parmentier, Antoine-Augustin*, born 1737, at Montdidier, in the department of La Somme, one of the most distinguished chemists, and active and careful philosophers which has appeared in France. Author of a great number of works, and co-operator in many others, as the *Annales de Chimie*, *Nouveau Cours d'Agriculture*, &c.

1. Recherches sur les Végétaux nourissans qui, dans les tems de disette, peuvent remplacer les alimens ordinaires; avec des nouvelles Observations sur la Culture des Fommes de Terre. Paris. 8vo.

2. Mémoire sur la Culture, et les usages de la Patate (Convolvulus Batatas). (Mém. de l'Acad. de Toulouse, tom. 3. p. 183 — 196.)

1782. *Barruel-Beauvert*, captain of dragoons under the old regime.

1. Plainte du Chou et du Navet contre les Jardins de l'Abbe de Laille. 8vo.

In verse, and considered a "plaisanterie agréable, piquante et fondée."

2. Lettres Critiques sur le Poème des Jardins suivies du "Chou et du Navet." Amsterdam and Paris. 8vo.

1782. *Porcelin de la Roche-Tillac*, doctor of laws, canon of Montreuil-Bellai, in Anjou; born in 1746 at Dissais.

Le parfait Vigneron, ou l'Art de Travailler les Vignes, de faire le Vin et de le conserver. 12mo.

1783. *Brétonnicre, M* — de la.

1. Correspondence Rurale, sur la Culture des Terres, et des Jardins, &c. Paris. 12mo.

2. Ecole du Jardinier Fruitier. 2 vols. 12mo.

3. Ecole du Jardinier Potager. 2 vols. 12mo.

1783. *Durados*, —.

Mémoire touchant les Pépinières. 8vo.

1783. *Filassier, N* —, director of a nursery near Meudon; member of several academies, born at Warwick in Flanders.

1. Culture de la Grosse Asperge, dite de Hollande, &c. Paris. 12mo.

2. Dictionnaire du Jardinier Français. Paris. 2 vols. 8vo. 1791.

1784. *Durand*, —, a physician of Dijon, where he died in 1799, author of several works on botany.

Nouveau moyen de multiplier les Arbres étrangers. Nouv. Mém. de l'Acad. de Dijon. 2 sem. p. 7-6.

1784. *Musiel*, —.

Traité Théorique et Pratique de la Végétation, contenant plusieurs expériences nouvelles et démonstratives sur l'économie végétale, et sur la culture des arbres. Paris. 4 vols. 8vo.

1785. *Secondat de Montesquieu*, son of the celebrated author of *l'Esprit des Loix*, died in 1795, aged 79 years. He never would assume the name which his father had rendered illustrious; and had so great a respect for his memory, that he preserved in the Chateau of Brède the furniture and the library, exactly in the order in which his father had left them. He occupied himself chiefly in the study of natural history, and in agriculture.

Mémoires sur l'Histoire Naturelle du Chêne, sur la resistance des Bois à être rompus par les poids dont ils sont chargés sur la culture de la vigne, &c. Paris. fol. 15 plates.

1786. *Cabanis de Salagnac*, born at Issoudun in 1729; died in 1786; advocate of parliament, member of the Agricultural Society of Limoges.

Essai sur les Principes de la Greffe.

A new edition in 1802. Paris, in 12mo. By Chambray.

1787. *Le Rouge*, geographical engineer to the king.

Recueil des plans et des vues des plus beaux Jardins de l'Europe, &c. Paris, oblong folio, 14 parts, 1787 to 1790.

An interesting and valuable work, now become scarce.

1787. *Lézy-de-Marnesia*, —, born at Besançon, and died at Paris in 1800, aged 66 years; a member of the assembly, &c.

De la nature Champêtre: Poème. Paris. 8vo.

A very pleasing poem, which has passed through several editions.

1788. *Baummann, F. G.*

Catalogue des Arbres Fruitiers les plus recherchés et les plus estimés qui peuvent se cultiver dans notre Climat. Paris. 8vo.

1788. *Bousmard*, —, a Frenchman, a captain in the Prussian service, supposed to have been slain at the siege of Dantzic.

Mémoire sur cette Question: quelle seraient les moyens de multiplier les Plantations des Bois, sans trop nuire à la Production des Subsistances? 8vo.

1788. *Fontaines, Louis de*, Grand Master of the University of Paris, and President of the legislative body, &c.

Le Verger, poème. 8vo.

1788. *Saint Martin, M* — de.

Traité de la Culture du Chêne. 8vo.

This is esteemed a good work on sowing and planting wood, and disposing of their produce.

1789. *M. L. L.*, Mr. *Le Berriays*.

Traité des Jardins, ou le nouveau la Quintinie, contenant la Culture: 1o. des arbres fruitiers; 2o. des plantes potagères: 3o. des arbres, arbrisseaux, fleurs et plantes d'ornemens; 4to. des arbres, arbrisseaux, et plantes d'orangerie et serre chaude. Paris. 4 vols. 8vo. figures.

1790. *Chassel*, —, formerly president of the parliament of Metz.

Supplément au Dictionnaire des Jardiniers, qui comprend tous les genres et toutes les espèces non détaillées dans le Dictionnaire de Miller. Metz. 4to.

1790. *Magsson-de-Blamont, Charles-François Philibert*, born at Blamont in Montbelliard in 1762; became major in the Russian army; exiled from that country in 1797; in 1802 became secretary of the prefecture of Coblenz, and associate of the institute. He translated Mason's *English Garden*, and Wheatley's *Observations*, into French.

Les Jardins de Sambouky, poète Russe, traduit du Russe en Français. 8vo.

† 1790. *Hervé, M. Villé*, director of the Royal Garden of the Luxembourg. Mr. Hervé's father was gardener to the Charleux monastery, where fruit trees had been collected and propagated for upwards of half a century before the revolution. In the early part of this revolution, the elder Hervé, foreseeing that the establishment would be put down, applied for and obtained permission from the existing government to establish a national garden of fruit-trees, and the garden of the Luxembourg was made the receptacle of this collection.

Taille raisonnée des Arbres fruitiers. Paris. 8vo.
A new edition, with a supplement, sur la Greffe, in 1802. 8vo.

Catalogue Méthodique et Classique, de tous les arbres, arbrustes fruitiers et des vignes, formant la collection de l'école impériale établie près le Luxembourg. Paris. 4to. 1809.

1790. *Rosier, François*, born in Lyons, in 1734, and killed there on the 29th September, 1793, during the siege of that city, by a bomb-shell, which buried his shattered remains in the ruins of the apartment which he occupied. He began his career as an author, by writing in the *Journal de Physique et d'Histoire Naturelle*, of which Gauthier Dagoty was editor. He next occupied himself with his *Agricultural or Rural Dictionary*, which is the work by which he is chiefly known. He cultivated a farm near Beziers, which Arthur Young went to see when on his tour in France in 1787; but the abbé had left it, on account of the Bishop of Beziers, who kept a mistress somewhere near, and, for his more commodiously visiting her, got a road made across the farm at the expense of the province. This occasioned a quarrel between the abbé and the bishop, which ended in the former being obliged to quit his farm. The abbé, like all other men who depart from common practices, was looked on as a fanciful and wild cultivator, and because he paved his stables and cow-houses, it was reported by his neighbors that he paved his vineyard. He wrote a great many works, chiefly on agriculture.

1. Manuel du Jardinier, mis en pratique pour chaque Mois de l'Année. 2 vols. 18mo.

2. Cours complet d'Agriculture théorique, pratique, économique, &c. 15 vols. 4to.

3. Cours complet d'Agriculture pratique, d'économie, rurale, et domestique, &c. 6 vols. 8vo.

4. Nouveau Cours complet d'Agriculture théorique, et pratique, contenant la grande et la petite Culture, l'Economie rurale et domestique, la Médecine Vétérinaire, &c.; ou Dictionnaire raisonné et universel d'Agriculture. Ouvrage rédigé sur le Plan de celui de feu l'Abbé Rozier, duquel on a conservé tous les Articles dont la Bonté a été prouvée par l'expérience; par les Membres de la Section d'Agriculture de l'Institut de France, viz: par MM. Thouin, Parmentier, Tessier, Huzard, Silvestre, Boc, Chassiron, Chapital, Lacroix, De Perthis, Yvart, Decandolle, Du Tour. 13 vols. 8vo. 1810.

This is by far the best general work on the agriculture and gardening of France, and supersedes the use of a great many others.

1791. *Nectoux*, —.

Observations sur la Préparation des envois des Plantes, et Arbres des Indes Orientales pour l'Amérique, et leur traitement pendant la traversée. (Mém. de la Soc. R. d'Agricult. de Paris, Trimestre d'Hiver, p. 110.)

1791 *Tessier, Henri-Alexandre*, Professor of Agriculture and Commerce to the Central Schools, Member of the Institute, and Doctor of Medicine, &c.; author of a great number of works, and, jointly with Professor Thouin, of the article Agriculture, in the *Encyclopédie Méthodique*.

Mémoires sur les Plantations des Terrains vagues, sur-tout sur celles des grandes routes, et sur les causes du dépérissement des Bois, et les moyens d'y remédier. 8vo.

1792. *Ceruti, Joseph Ant. Joachim*, born at Turin in 1738, became a member of the society of Jesuits, and rendered himself famous at the suppression of that order by his *Apologie de l'Institut*. He was the friend of Mirabeau, and the principal editor of the *Feuille Villageoise*.

Les Jardins de Betz, Poème accompagné de Notes instructives sur les Travaux Champêtres; sur les Arts, les Lois, &c. 8vo.

This work was written in 1785, but did not appear till 1792.

1793. *Paulet*, —.

Traité des Champignons, Ouvrage dans le quel on trouve la Description détaillée, les Qualités, les Effets, les différents Usages des Champignons, &c. Paris. 2 vols. 4to. plates.

1794. *Préau deau-Chemilly, Eugene*, cultivator at Bourneville, in the department of Oise.

Des Haies considérées comme Clôtures; de leurs avantages, et des moyens de les obtenir. Paris. 8vo.

1795. *Butret*, —, gardener.

Taille raisonnée des Arbres fruitiers, et Opérations relatives à leur Culture, démontrées clairement par des raisons physiques tirées de leur différente nature. Paris. 8vo. A tenth edition in 1804.

Catalogue de Roses. Rouen. 8vo.

1821. *Lebreit, M—*, *Isidore*, pharmacien et propriétaire rural.

Mémoires sur la Trappa Natans, ou la Châtaigne d'eau. Rouen. 8vo.

1823. *De Candolle, A. P.*, professor of botany in the academy of Geneva, author of *Regni Vegetabilis Systema Naturale*, now publishing; of various other botanical works, and of several articles connected with culture, in *Nouveau Cours*, &c.

1. *Mémoire on the different species of the genus brassica, and of the genera allied to it.* (*Hort. Trans.* v. 7.)

2. *Catalogue des arbres fruitiers du Jardin Botanique de Genève*. Geneva. 8vo.

3. *Mémoire sur la famille de crucifères*. Geneva. 4to.

Hortulus.

An elegant poem on the culture of plants and flowers.

1578. *Heresbachius, Conradus*, counsellor to the

SUBJECT. 2. Works on Gardening published in Germany, including Denmark and Switzerland, exclusive of Translations.

7693. *The Germans have an immense number of books on every subject, and in the gardening department are more especially prolific on the subject of planting and forests. We have made a selection, with a view to giving an idea of the progress of gardening in Germany, and also to include the books contained in the Banksian and other public libraries of this country. Every English work of merit is translated into German as soon as it appears, and the same may be said of the best works of France, and of every other country. Two of the most desirable books for giving an idea of the state of culture in Germany, are Dietrich's Wörterbuch, with the Supplement to 1820, 10 vols. 8vo.; and Sickler's Deutsche Handwirthschaft, many vols. 8vo.*

849. *Anon.*, ascribed to the learned Benedictine, Walafrid Strabon, of the diocese of Constance, who died in 849.

1578. *Heresbachius, Conradus*, counsellor to the

Duke of Cleve; was born in 1508, died in 1576. He wrote various theological works; besides his *Rei Rusticæ libri IV.*, which was published in 1570, and his *Legum rusticarum, et operarum per singulos Menses digesta*, in 1595. The former was translated by Barnaby Gooch, of Lincolnshire, with the following title:

Four Books of Husbandrie, containing the whole art and trade of Husbandrie, Gardening, Graffing, and Planting, with the antiquitie and commendation thereof. Newly Englished, and increased by Barnabe Gooche, Esquire. At London, 4to. 1578. Leaves 194, besides the Dedication, Epistle and Table at the beginning; and Olde English rules in verse, for purchasing Lande, at the end.

His authorities extend from the Bible and Doctors of the Church, through the Greek and Roman writers, Homer, Cato, &c. to the moderns as low as Ruellius, Fuchsius, Mathiæus, Cardanus, and Tragus. He subjoins a list of his friends and others, who assisted him. S. Nich. Maibee, M. Cap. Byng-ham, M. John Somer, M. Nicæas, Yetzwerf, M. Fitzherbert, M. Willi. Lambert, M. Tusser, M. Tho. Whetenhall, M. R. Deering, M. Hen. Brockhuil, M. Franklin, H. King, Richard Andrewes, Hen. Denys, William Pratte, John Hatche, Philip Partridge, Kenworth Dafforth.

The work is in dialogue. The persons are, Como, a gentleman retired into the country; Rigo, a courtier; Metella, wife of Como; and Hermes, a servant.

1597. *Peschelus*.

Garten Ordnung. Eisleben, 1597. folio. with wood cuts.

1629. *Caus, Salomon*, author of some works on perspective, hydraulics, and dialling.

1. Hortus Palatinus à Frid. Rege Boemæ, Heidelbergæ extractus. Francf. fol.

2. Les Raisons des Forces mouvantes, avec divers Desseins de Fontaines. Paris, fol. 1624.

1630. *Clusius, Carolus* (not the celebrated botanist of the preceding century).

Catalogi seminum, cum regulis circa eorum stationem. Printed with Herbario Hortiano, 335-414. Marburg. 8vo.

1631. *Laurenberg, Peter*, of Rostock, who died in 1639.

1. Horticultura et apparatus plantarum. Frankfort. 4to.

2. De Horticultura libri duo, regulis observationibus, experimentis et figuris novis instructa, &c. Frankfort. 4to.

164-. *Royer, Johann*.

Unterricht wie ein feiner lust-obst-und Küchen-garten anzulegen, allerley schöne Gewächse darein zu zeugen, zu verpflegen, zu warten. Printed with this author's Beschreibung des Gartens zu Hessem. 45-96.

1647. *Vredmannus, Johannes Frisius*, a German architect, who published some works on his art.

De Hortorum, Viridariorumque forme elegantes. Col. 1647. fol.

1647. *Anon.*; attributed to Stengeline.

Hortorum, florum et arborum historia. Munich. 2 vols. 12mo.

1662. *Jonston, Johann*, born at Sambter, in Poland, in 1603, died on his estate at Zieboldorf, in Silesia, in 1675; a learned naturalist, author of several works, which have been collected in six folio volumes.

Dendrographia, sive historia naturalis de arboribus et fructibus, tam nostri quam peregrini orbis, libri x. Frankfort, fol. et figuris æneis, 1662.

1663. *Eltzholz, John Sigismund*, an eminent Prussian botanist, was born at Frankfort on the Oder 1623, practised with great reputation as court physician at Berlin, and died in 1688.

1671. *Hiebert, John Christian*.

Horticultura.

1695. *Packbusch, Stephanus Ludovicus*, author of some medical works.

Dissertatio de varia plantarum propagatione. Leipsic. 4to.

1696. *Anon.*; attributed to Tschiffeli.

École des Jardiniers, où l'on apprend à semer des arbres fruitiers, à les mettre en Pépinière, &c. Berne. 12mo.

1697. *Stisser, John Andrew*.

Botanica Curiosæ, oder Annenckungen, wie einige fremde Kräuter in seinem garten bisher cultiviret. Helmstadt. 8vo. p. 241. 12 plates.

1700. *Plukamer, Johann Christoph*, a physician in Nuremberg, and the director of the botanic garden there.

2. Nurnbergische Heresperides. Nurnb. fol.

3. Hesperidum Norimburgensium sive de Malorum Citreorum Limonum, Aurantiorumque cultura et usu, libri 4. Norimbergæ. fol.

1702. *Siegelsteiner, George*.

Wohlfundirte Zwerghaum Schule, oder Unterricht wie die Zwerghäume beschnitten werden-Frankfort-on-the-Maine. 8vo p. 124. plates.

1702. *Anon.*, thought to be F. C. Weber, who translated Quintine's works.

Gründliche Anweisung zu einer wohlgeinrichtete Baumchule. Hamburg. 8vo. p. 120. 12 plates.

170-. *Schmersall, Elias Frederick*.

Abhandlung von dem Baumschneitte. Hamb. Mag. 10 band, 4266.

1712. *Waldtschmidt, Wilhelmus Huldéricus*.

Programma de industria cœvi hodierni, qua propagatio plan-

tarum, veterum circa res hortenses occupationes post se re-

linquit. Kiel, 1712.

1713. *Hesse, Henry*.

Neue Garten-Lust. Leipsic. 4to. p. 389, plates.

1715. *Anon.*

Historischer und verständiger Blumen-gärtner, und von Anlegung, Wartung und Pflege eines Baum und Küchen-gartens. Leipsic. 4to. p. 783, 21 plates.

170-. *Agricola, George Andrew, M. D.*, author of several agricultural works, which have been translated into French and English.

1. The Artificial Gardener, translated from the German. London, 1717. 12mo.

2. Philosophical Treatise of Husbandry and Gardening, &c. translated from the German, by Bradley. London. 4to. cuts, 1721.

There is a volume on planting "by Agricola," of which Dr. Anderson (see Sect. 1.) is the author.

1735. *Deuso, Johann Daniel*, author of a naturalist's kalender, and some other works.

Von Anlegung und Vermehrung wilder Obstbäume. Printed in his Beiträge zur Naturkunde. Berlin, 7 stuk. p. 620-627. 1732 to 1765.

1738. *Krause, L. Ph.*, born in Berlin, where he was a nurseryman.

Klinger und sorgfältiger Gärtner. Leipsic. 8vo.

1741. *Ungehuier, John Andrew*.

Dissertatio de cultura plantarum. Leipsic. 4to.

1750. *Lehmann, John Christian*, an amateur, who lives in Leipsic.

Vollkommer Blumen-garten in Winter. Leipsic. 4to. p. 71, 1 plate.

1750. *Grotjan, John August*.

1. Physikalische Winter-belustigung mit Hyacinthen, Jonquillen, Tazetten, Tulipanen, Nelken und Leucojen. Nordhausen. 8vo. p. 120.

2. Ergötzliche Sommerbelustigung, &c. mit Garten Kalender. Nordhausen. 2 vols. 8vo. 1759.

1750. *Seligmann, J. Mich.*

1. Abbildung des lieblichsten Blumen mit Beschreibung. Nuremberg, fol.

2. Hortus Nidissimus. (By Seligmann and Cp. Jac. Trew.) Also in German. Leipsic, folio, many plates.

1751. *Riedel, J. Cp.*

Vermehrtes Garten-Lexicon benebet nützlichen Garten Kalender. Nordhausen. 8vo.

1753. *Gesner, John*, a canon of Zurich, and professor of mathematics and natural philosophy in that university, was born in 1709. He studied at Leyden and Basle, where he contracted an intimacy with Haller; and their epistles have been printed. He died in 1790. Gesner published two dissertations on plants, in 1741, in which he announced the new system of Linnæus, of whom he says, that he was a man destined to reform all natural history. Besides these he was the author of eleven dissertations, published under the title of *Phytographia Sacra*. He also wrote on extraneous fossils; and compiled an index to Weinmann's *Phytographia*. But he was grossly imposed on, as well as Haller, by the present of a meadow crowfoot, on the branches of which the flowers of the daisy had been so neatly fastened as to escape detection till after Gesner's death. Of this rarity he published a description, in a learned discourse on vegetable monsters, entitled, *De Ranunculo Bellidiflora*. The cheat was discovered by Sir Joseph Banks, who procured the specimen, and separated the parts by the application of steam.

1. De Ranunculo Bellidiflora, et de Plantarum generibus. Zurich. 4to.

2. Theses Physicæ Miscellanæ speciatim de Thermoscopia Botanica. Zurich, 1755. 4to.

3. Vom Gebrauche des Thermoscopi Thermometer bey Wartung der Pflanzen. (Hamburg Mag. 16 band. p. 288.)

1753. *Reichard, Ch.*, a celebrated writer of Guides, and other compilations, who lived at Erfurt, and died some years ago.

Land- und Gartenschatz. Erfurt. 8vo.

A new edition in 1802, by J. Volkmer Sickler.

1761. *Boehmer, George Ralph*, professor of botany and anatomy at Wittenberg, was born in 1723; studied under the celebrated Ludwig; wrote various botanical works, and died in 1803.

1. Programmata. De serenidis vegetabilium seminibus monita. Wittenberg. 4to.

2. Bibliotheca scriptorum historie naturalis, œconomiz, aliarumque artium et scientiarum ad illum pertinentium realis systematica. Leipsic, 1765-89. 9 vols. 8vo.

This is considered a very valuable work.

1761. *Schaffer, Jac. Ch.*

Die wunderbare Eulenzitten nebst der Baumraupe, aus welcher derselbe entstanden, &c. Regensburg. 4to. plates.

1764. *Plaz, Anthony William*, author of a tract on vegetable physiology, published in 1745.

Programma de plantarum sub-diverso cœlo nascentium cultura. Leipsic. 4to. p. 13.

1765. *Gleditsch, John Gottlieb*, a naturalist, was born at Leipsic in 1714. He took his doctor's degree in physic at Frankfurt on the Oder, where he was appointed professor of botany, physiology, and medicine. He was also a member of the Academy of Sciences at Berlin, and died in 1786.

1. Vermischte Physikalisch Botanisch-œconomische Abhandlungen. Halle, 1765-67. 3 theil, 8vo.

2. Pflanzenverzeichnis zum Nutzen und Vergnügen der Lust- und Baumgärtner, nebst Anmerkungen, die deren Pflege, Vermehrung, Pflanz und Blütezeit betreffen. Berl. 1773, 8vo.

1. Neue Erfindung wie man im Winter Ananas, Spargel Melonen, &c. und andere Vegetabilien in gleichen Rosen Veilchen, Hyacinthen, &c. ohne Mistbeet und sogar in Zimmern erziehen und zur Reife bringen kan. Nuremberg. 8vo.
This piece of horticultural quackery is sold in a sealed envelope. The pamphlet contains a few pages, illustrated by a plate. The mode is to introduce boiling water into a leaden cistern, enclosed in a case or frame, containing the plants; to renew as it cools, and give very little air.
2. Neue Gartenbau Kunst, oder Sammlung zur Verzierung des Parks und Garten. Leipsic. folio, 8 plates.
1821. *Bertuch, M., author of an Essay on Hieroglyphics.*
Garten-Magazin. Weimar. One or more numbers annually. 5 vols. and 6 numbers, published up to June 1821.

SUBJECT. 3. Works on Gardening published in Italy, exclusive of Translations.

7694. *A considerable number of books on rural affairs have been published in Italy; but there, where garden and field culture are so nearly allied, gardening and agriculture have been so blended by the writers, that it is difficult to know under which department to include the books. The best work for giving a general idea of the state of culture in Italy is, the Annali dell'Agricoltura, 22 vols. 8vo. by F. Re. 1809 to 1814.*

1546. *Alamanni, Louis*, a Florentine gentleman, an eminent poet, born in 1495. Having conspired against Julius de Medicis (Pope Clement VII.), he took refuge in France, where he was well received by Francis I., and sent in embassies to several courts. He wrote several poems, beside the following, and died in 1556.

Della Coltivazione.
It is translated into French with the title of *Georgiques Italiennes*.

1596. *Bacoli, A.—*
De Naturali Vinorum Historiâ, de Vinis Italiæ, et de conviviis antiquorum, libri viii. folio. Rome.

1622. *Soderini, Giovanvettorio, e Bernardo Davanzoli.*

Des différentes especes de Meuriers qui se cultivent dans le territoire Florentin. (*Mém. Acad. Scien. Paris*, 572.)

1777. *Brochieri, Francesco*, gardener to the King of Sardinia, at Turin.

Nuovo Metodo, adattato al Clima del Piemonte, per coltivare gli Ananasi senza Fuoco. Turin. 12mo. 1 plate.

He recommends pits and dung, or tan: this, he says, is the English and Dutch method, both which countries he had visited.

1780. *Freylinio, di Buttigliera, Conte.*

Sulla maniera di riscaldate economicamente le serre degli Ananassi. In the Opusculi, scelti. Florence. 8vo. tom. xi. p. 15, 17.

His improvement consists in mixing sawdust with tan or dung, to lessen expense, and prolong the heat.

1780. *Borch, Michael Jean*, Comte de, a Piedmontese gentleman, author of various works on lithology.

Lettres sur les Truffes du Piémont. Milan. 8vo. 3 plates.

1783. *Picciuoli, Giuseppe*, curator of the garden of the illustrious Marchese Niccolò Panciatichi, at the Villa Loggia, near Florence.

Memoria sulla coltivazione degli Ananassi. Printed at the end of Horto Panciatichi, p. 24—32. Florence, 8vo.

His method is nearly the same as that of La Court, and Brochieri. See sec. ii. and A.D. 1777 above; he notices Bastard's mode of ripening the fruit in water, translated and published in Opusculi scelti, tom. ii. and Count Freylinio's, of mixing sawdust with the dung. Brochieri, he says, is one of the first gardeners in Italy.

1783. *Gardini, M.—*, a physician at St. Damians, near Asti, in Piedmont.

De influxu electricitatis atmospherice in vegetantia, disser-

tatio ab academia Lugdunensi premio donata anno 1782. Turin, octavo, 1783.

1787. *Affaitata, Casimiro.*

L'ortolano in Villa, e l'accurato giardiniere in Città. Bassano, in 12mo.

1794. *Bussato, Marco.*

Giardino di Agricoltura nel quale s'insegna tutto quello che appartiene ad un perfetto giardiniere. Bassano, in 8vo. fig.

1798. *Comparetti, Andrea*, a physician at Turin, author of some anatomical dissertations.

1. Saggio sulla cultura e governo de' Boschi. Padova, in 8vo.

2. Dinamica degli insetti. 1b. 1800, 2 vols. in 8vo.

180—. *Finocchi, Anton. Maria.*
Memoria sopra le fecondazioni dei fiori doppie. Mem. dell' Acad. di Sienna. tom. 8.

181—. *Fernaini, D.—* *Louis*, abbé of Vallombrosa.

Dissertations sur la culture des sapins. Paris. 8vo. plates. Translated by M. Desacres Fleurance.

1803. *Silva, Sigismondo*, a physician at Milan, who has a handsome villa in the suburbs.

Arte de' giardini Inglese. Milano, 1803, 2 vols. in 8vo. fig. An edition afterwards in quarto, in great part translated from Hirschfeld.

1804. *Bruley, C.—*, a proprietor of lands at St. Domingo.

Rapport sur les essais de culture des plantes, exotiques, dirigés à la vènerie, (at Turin) du departement du Pô. Turin. 8vo.

1807. *Carradori.*

Degli organi assorbenti delle radici delle piante. Milano, 1807, in 8vo.

1808. *Barelle, Giuseppe.*

Descrizione esatta dei Funghi nocivi o sospetti, con figure colorate. Milano, 1807, in 4to.

1809. *Re, Filippo*, librarian to the Patriotic Society at Milan, afterwards in the employ of government, at Turin, where he died in 1820 or 21. He wrote a great number of works on rural and economical subjects.

1. Lettera su alcune particolarità osservate nella coltivazione dei giardini del Milanese. Milano, 1811, in 8vo.

2. Lettera sopra alcune di quelle produzioni che volgarmente dicono rose di quercia, e sulla microrrhizomania. Verona, 1814, in 4to. fig.

3. Elementi di giardinaggio. Milano, 1806, in 8vo.

4. Della poesia didascalica Georgica degli Italiani dopo il ristauramento delle scienze sino al presente. Saggio. Bologna, 1809, in 8vo.

5. Annali dell' agricoltura del regno d'Italia cominciati in Gennajo 1806, e terminati in Giugno 1814, 66 parts, forming 22 vols. in 8vo. with about 30 plates.

 Saggio sopra l' indole dei giardini moderni. Verona, 1817. 8vo.
 181-. *Anon.*
 Dell' Arte dei Giardini Inglesi. 2 vols. 8vo.

1817. *Pindemonte, Ippolito di*, an Italian poet, who has spent some time in England, and Luigi Mabil, a gentleman of Lombardy.

Su i Giardini Inglesi, e sul merito in cio' dell' Italia, Dissertazione di I. P. — c sopra l' indole dei giardini moderni saggio di L. M. Con altre opere sulle stesso argomento. Verona. 8vo. 1 plate.

1817. *Anon.*

1. Accurato agricoltore per Campi, Orti e Giardini, con tutte le regole della Coltivazione sulla fondata esperienza di uomini periti. Milano, 1817. 12mo.

2. La Cultura dei fiori a seconda del clima Lombardo. Ib. 1817. 12mo.

SUBJECT. 4. *Works on Gardening originated and published in Holland, exclusive of Translations.*

7695. *The Dutch excel more in the practice than in the literature of gardening.* The works of La Court, and Van Osten, the former little known, are among the best that have been produced. There are none of recent date of any consequence. The *Journal of a Horticultural Tour in Holland, Flanders, &c.* by a deputation of the Caledonian Horticultural Society, gives the best idea of the state of gardening in that part of the Continent in 1817.

1560. *Curtius, Benedictus*.

Hororum libri xxx., in quibus continetur arborum historia, partim ex probatissimis quibusque auctoribus, partim ex auctoribus observatione collecta. Leyden. fol.

1613. *Meursius, Jean*, died at Leyden, in 1613, in the flower of his age.

De arborum fructuum et herbaceum proprietate usu et qualitatibus, lib. iiii. Leyden. 8vo.

1631. *Chuyt, Outger Augerius*, author of some works on minerals and insects.

Memoire der vromden blom-bollen, wortelen, kruiden, planten, struycken, zaden ende vruchten, hoe men die sal wel gheconditioneert bewaren ende over seynen, that is,

Memoir on the mode of preserving and sending over in good condition foreign bulbs, roots, herbs, plants, shrubs, seeds, and fruits. Amsterdam. 8vo.

1699. *Vander, Groen, I*——, gardener to the Prince of Orange.

Le Jardinier Hollandais, avec environ deux centes modèles de parterres à fleurs et autres; labyrinthes, pavillons, ouvrages, treillis et mailles de lattes, et de quadrans et horloges solaires. Amsterdam. 4to.

1672. *Mundtguis, Atrahouc*, physician, and professor of botany at Groningen; born in 1626, died in 1682.

De cura et cultura plantarum. Amstel. 4to. fig.

1576. *Cause, D. H.*

De Koninglycke hovenier (the Royal Gardener.) Amsterdam. fol. p. 224, plates.

1676. *Commelin, John*, a botanist, was born at Amsterdam in 1629. He succeeded his father as one of the magistrates of his native city, where he formed a new botanical garden, and died in 1692. His nephew, Gasper Commelin, a physician, was appointed professor in botany, and director of the garden at Amsterdam.

Nederlantzse Hesperides. Amst. fol. with many plates. Englished by G. V. N. London, 1685. 8vo.

1682. *Van Sterbeek Francis*.

Criticulura, of regeringhe der ythenische boomen. (Of the culture of the orange tribe, and the management of exotic trees.) Antwerp. 4to. p. 296, 14 plates.

1703. *Osten, or Oosten, Henry Van*, curator of the botanic garden at Leyden.

1. Der Neldersländische Garten. Leyden. 8vo. 5 plates.

Translated into German and French; and into English, as

2. The Dutch Gardener, &c. Lond. 1710. 8vo.

1713. *Anon.*

De nieuwe naauwkeurige Nederlandse hovenier. (The New Improved Dutch Court Gardener.) Leyden. 4to. p. 286, plates.

1721. *Du Vivier, Jean*, supposed to be a French Protestant refugee.

Le Jardin de Hollande planté et garni de fleurs, de fruits, et d'orangeries, &c. Le tout après une longue expérience, mis au jour pour l'intérêt public. Amsterdam. 12mo.

1737. *Anon.*; the author Mr. La Court, a Dutch merchant, who had a country-house and fine garden at Drieboek, (triangle,) near Leyden, where he was the first to introduce and cultivate, with success, the pine-apple and the tuberose. He died between 1757 and 1740.

Aenmerkingen over het aenleggen van landhuizen, luthoven, plantagion, enz. enz. (Remarks on the laying out of country-houses, pleasure-gardens, plantations, &c. &c.) Leyden 4to. p. 414, with 15 plates.

These plates contain plans of pits for growing the pine and the vine; a general plan of Drieboek, and figures of the pine-apple, tuberose, and some varieties of oranges and lemons. The book is very scarce; only a few having been printed. The only copy we have seen is in the Banksian library.

1750. *Cuno, John Christian*, of Amsterdam. Description of his own garden, in Dutch verse.

1752. *Voorhelm, George*, commercial florist at Haerlem, of the firm of Voorhelm and Van Zompel. Traite sur la Jacinthe.

1760. *Van Kampen, or Campen, et fils*, florists, at Haerlem.

Traité des Fleurs a oignons. 8vo. with plates; translated with this title.

The Dutch Florist; or, true method of managing all sorts of Flowers with bulbous roots. 4to.

1771. *Knoop, Jean Herman*, a gardener at Leuwarden, in Friesland, died about the end of the 18th century.

1. Pomologie, ou description les meilleures sortes de pommes et de poires que l'on estime et cultive le plus, soit aux Pays-bas, soit en Allemagne, soit et Angletterre. Amsterdam. fol. fig.

2. Fructologie, ou description des arbres fruitiers, ainsi que des fruits que l'on plante et qu'on cultive communément dans les jardins. Amsterdam. folio.

1772. *Poederle, — l'ainé*.

Manuel de l'arboriste da forestier Belgique, ouvrage extrait des meilleurs auteurs anciens et modernes, et soutenu d'observations faites dans differens pays ou l'auteur a voyagé. Brussels and Paris. 2 vols. 8vo.

An anonymous work, with nearly the same title, appeared in 1774.

1784. *Burtin, Francis Xavier*, a physician in Lorraine, author of some works on mineralogy.

Mémoire sur la question: quels sont les végétaux indigènes que l'on pourrait substituer dans les Pays-bas, aux végétaux exotiques. Brussels. 4to.

1805. *Serrurier*.

Fruit Kundig Wordenboek. 2 vols. Amsterdam.

1817. *Musche*, curator of the botanic garden at Ghent.

Horius Gandensis. 12mo. Ghent.

1817. *Huthem*.

Discours sur l'état ancien et moderne de l'agriculture et de la botanique dans les Pays-bas. Ghent. 8vo. p. 70.

SUBJECT. 5. *Works on Gardening, published in Sweden, Norway, and Iceland, exclusive of Translations.*

7696. *Scandinavian books on gardening are few, and chiefly by Linnæus or his pupils.* A knowledge of the present state of culture in Sweden is best obtained by reference to the transactions of the Stockholm and Upsal Academies.

1643. *Anon.*

Een ny trädgårdens Book. (A new garden book.) Printed with Arr. Mansons Ortbok. Stockholm. 8vo.

1664. *Rudbeck, Olaus*, a Swedish physician, was the son of the Bishop of Vestera, and born in 1630. While a student at Upsal, he discovered the lymphatics in the liver, and other parts of the body; though his claim of priority was contested by Bartholine. He also cultivated botany, and founded a garden for the university of Upsal, where he held

the chair of medicine till his death in 1702, having resigned the professorships of botany and anatomy, some years before, to his son, of the same name.

1. Preside, Dissertatio: Horticultura nova Upsaliensis. Resp. Gust. Lohrman. Upsal. 4to.

2. Catalogus Plantarum Horti Upsaliensis.

5. Campi Elysi, liber primus. Upsal, 1702. Liber secundus. Upsal, 1701. 2 vols. fol.

This was to be a vast work, in which all the known plants in the world were to be represented by wooden cuts, in twelve volumes, folio. The two first volumes however, were so unfor-

fortunate, as to put an end to this stupendous project. A dreadful fire having broken out in Upsal in 1702, among its ravages reduced to ashes the printing-office, when only a few copies of the work had been removed. These are, of course, extremely valuable.

1686. *Rudbeck, Olaus, filius*, the son and successor of the professor of the same name, was born at Upsal in 1660. He took his doctor's degree at Utrecht, and in 1720 joined Berzelius in founding the Swedish Academy of Sciences, the memoirs of which learned body contain a number of his dissertations on subjects of natural history. He also published some works on the plants and animals mentioned in Scripture. He died in 1740.

Propagatio Plantarum Botanico-physica. Upsal. 8vo. p. 142. with wood cuts and copper-plates.

17—, *Fragræus, Jonas Theodor.*
Konsten at skära frukt träd. (The art of nursing fruit-trees.) Vetensk. Acad. hand. 2. 45.

1728. *Dahlman, G. T.*
Den förfärdige trädgårdsmästaren. (The successful Gardener.) Stockholm. 8vo. p. 230.

1738. *I. P. B.*
En trädgårdsbok. (A Garden-book.) Stockholm. 8vo. p. 212.

1739. *Linnaeus, or Von Linne, Charles*, was the son of a clergyman at Rashult, in Sweden, and born there May 13. 1707. He was educated at Lund, from whence he removed to Upsal, where he was appointed to read lectures on botany, in 1730; and the year following he received a commission from the Academy of Sciences, to travel in Lapland and Norway. In this journey he paid attention to the art of assaying metals, on which he afterwards delivered a course of lectures. In 1735 he went to Harderwyck, in Holland, where he took his doctor's degree, and while in that country he became, through the introduction of Boerhaave, superintendent of Mr. Clifford's garden, at Hartecamp, of which he drew up a catalogue. While in this situation he published also his *Flora Lapponica*; after which he visited England. On his return to Holland, he continued his *Genera Plantarum*, and was chosen a member of the Imperial Academy. In 1737 he printed the *Hortus Cliffortianus*, in fol.; and his *Critica Botanica*. He returned to Sweden in 1738, and was chosen a member of the academy at Upsal; and soon afterwards he laid the foundation of that at Stockholm. In 1740 he was chosen professor of medicine at the former place, where he undertook the reform of the botanical garden, to which he gave many valuable exotics. In 1745 he published his *Flora Suecica*; which was followed by the *Fauna Suecica*. At this time his merits were so well appreciated, that a medal was struck to his honor, and he was appointed archibuteo to the king. In 1749 appeared his *Materia Medica*; and in 1751 he published the *Philosophia Botanica*. His most splendid publication came out in 1754, with this title, *Musæum Regis Adolphi Frederici*, comprising a description of the natural curiosities in the royal museum. While conducting this work through the press, Linnaeus was honored with the order of the Polar Star; and in 1756 he was ennobled. In the mean time he prepared for publication his *Species Plantarum*, which was followed by the *Systema Naturæ*. This illustrious naturalist died at Upsal, Jan. 10. 1778, and his remains were interred with great solemnity, in the cathedral of that city, where his pupils erected a monument to his memory. His son, Charles Linnaeus, born in 1741, became demonstrator in the botanic garden, and published some valuable works. He was ill-used by his mother, which is supposed to have hastened his death, in 1783. His sister, Elizabeth Christina, discovered a luminous property in the flowers of the nasturtium.

SUBJECT. 6. *Works on Gardening, published in Poland and Russia.*

7697. Of original *Polish or Russian books on gardening* there are very few; but a number of translations were made in Poland during the early part of the 18th century. There are agricultural transactions published occasionally by a society at Warsaw, which, with the transactions of the Economical Society of St. Petersburg, may be considered as the best books for obtaining some idea of the state of culture in these countries.

1788. *Samboursky*, a Russian poet, author of a number of works chiefly in verse, and of a poem on gardens, which has been translated into French, with the title

Le jardins de Samboursky. 8vo.
1793. *Georgi*, a physician, and member of several learned societies.

Description de la Ville de St. Petersburg et de ses Environs. Petersburg. 8vo.

18—. *Lomonosow*, a Russian poet and miscellaneous writer, author of a poem on glass, and the advantages resulting from its use in a northern cli-

mate. The subject of hot-houses forms a considerable part of the poem.

1808. *Czartoryska*, Princess *Isabella*, a lady of one of the most ancient families in Poland in the royal line. She spent a considerable time in England, where she acquired a taste for the modern art of laying out grounds, introduced it on her estate at Lublin, and wrote the following work on the subject.

Mysli Rozne o Sposobie Zakladania Ogrodow, &c. (Thoughts on the manner of Planting Gardens.) Warsaw. 4to. plates.

SUBJECT. 7. *Works on Gardening, published in Portugal and Spain.*

7698. *The transactions of the royal agricultural society at Madrid*, are almost the only recorded source of obtaining any knowledge of the state of culture in Spain.

1557. *Herrera, Gabriello Alphonso*.
Libro di Agricultura. One book treats "De las Huertas," or of Gardens.

178—. *Cavanilles, Antonio Joseph*, an eminent botanist, author of various works, and among others, of *Figures and Descriptions of the Plants of Spain*.

De la Juncia avellanada, o chufas de Valencia. (*Annales de Ciencias Naturales*, tom. iii. 234.)

1807. *Clemento y Rubio, Don Simon de Roxas*.

Ensayo sobre las variedades de la Vid comun que vegetan en Andalusia. Madrid. 4to.

Translated into French by de Caumels of Toulouse.

1817. *Anon.*

Notices sur un Arbre à Sucre, (*Arbutus Unedo?*) découverte en Espagne. Traduit de l'Espagnole par D.A. Armesto. Paris. 8vo.

SUBJECT. 8. *Works on Gardening, published in North America.*

7699. *A number of American essays connected with gardening* will be found in the agricultural transactions of the Philadelphia and New York societies, in the transactions of the Society of Arts of New York, and in Dr. Dean's *New England Farmer's Dictionary*. *Cobbett's American Gardener* may be considered as affording a tolerable picture of the state of gardening in the United States, where it appears the long and severe winters are material drawbacks to every branch of the art.

1755. *Belgrove, William*.

A Treatise upon Husbandry and Planting. Boston, New England. 4to. pp. 86.

1785. *Marshall, Humphrey*.

CHAP. V.

Of the Professional Police, and Public Laws relative to Gardeners and Gardening.

7700. *By professional police*, we mean those associations which gardeners have formed, at different times, for mutual benefit or instruction, or the improvement of their art; by public laws, those of the legislature.

7701. *A fraternity of gardeners*, we have already remarked, has long existed in Germany as regularly organised as that of masonry. A fraternity also exists in France, but less extensive and systematic. Their principal lodge is at Versailles; the *confrères de St. Fiacre*, being there, as Neill observes, to France, what "Adam's lodge of Aberdeen is to Scotland." There are also a few similar fraternities in this country, who hold meetings, and have secret signs and other rites nearly similar to those of masonry; but these societies have no systematic connection like those of Germany. From masonry they have undoubtedly taken their origin; but how, when, and where, and for what object, in the first instance, though we have corresponded with competent persons in all parts of the kingdom, we have been unable to ascertain.

7702. *The oldest gardeners' lodges* seem to be those in Aberdeenshire, and *Adam's lodge*, held in the city of Aberdeen, is considered the oldest in Britain: there is another of nearly equal antiquity, called *Solomon's lodge*, held in Banf. These lodges profess to be for the mutual instruction of the members in their art; for the assistance of brethren in distress; and for the benefit of travelling members. The first object is attained both by secret instructions, and also by competency exhibitions of garden productions, as flowers and fruits; the second, by annual subscriptions, from which a fund is formed, managed by a committee of the society; and the third, by signs and pass-words, as in masonry. They have a general meeting, formal procession with symbols and flowers, and afterwards a feast, once a-year. There were formerly a number of gardeners' lodges in Scotland, and there are still a few besides those of Aberdeen and Banf, but chiefly confined to the counties of Aberdeen, Forfar, and part of those adjoining.

7703. *The principal Scotch gardeners' lodge*, though it has no connection or control over the others like the metropolitan masons' lodge, is the Caledonian lodge of Edinburgh, founded about the end of the last century: its object is the same as that of the Aberdeen lodge; but it has no shows of flowers, or other garden productions. Their meetings are respectable, their processions pompous, and their funds considerable.

7704. *There are very few gardeners' lodges in England*; the only one of which we have been able to obtain any distinct account is "Adam's Lodge, of London," founded June 4, 1781, of which the rules and orders have been published. This lodge is described in the *Rules*, &c. as a "Fraternity or community for improving the art of Gardening; to establish a fund for the mutual support and relief of each other in the time of sickness, lameness, or distress; and also to ascertain the characters and abilities of such gardeners who shall belong to, or may be recommended by this society, to obviate the difficulty so commonly complained of by the nobility, gentry, and others, of obtaining skilful and experienced persons to undertake the employment." At present it consists of about one hundred and fifty members, and is on the decline. The allowance to the sick or disabled has been gradually diminished from insufficiency of funds; and from having been originally fixed by a random guess, instead of estimations of the value of lives, &c. as ought to be done in all benefit societies.

7705. *Gardeners' charter*. About the middle of the last century, Lee, Gordon, Russel, and Malcolm, all Scotch gardeners, commenced their nurseries at Hammersmith, Mile-end, Lewisham, and Kennington. Their success excited the jealousy of the established commercial gardeners, who, between 1760 and 1770, held several meetings, and entered into resolutions not to employ young men from the north. These resolutions were not long adhered to; but a tract, entitled *Adam armed* (see p. 1106. A.D. 1760.), published by this association at the time, shows the extent of what they intended. From this tract it appears, that James I. had granted a charter to certain persons inhabiting within London, and six miles of it, who were capable to educate and instruct young men in the art of gardening. This charter was granted in the third year of this king's reign, and renewed in the fourteenth; but in the tract alluded to it is stated never to have been put in force, and not to be sufficiently extensive; and therefore it is proposed, that a charter be granted to extend over the whole kingdom, to prevent mere laborers and other unqualified persons from assuming the profession of gardeners, and thereby doing "great injury to the nobility's and gentry's gardens and plantations," as well as to proprietors who let ground to such as "undertake to furnish the market with eatables." Only a certain number of gardeners were to be licensed to take apprentices, and of these the number was to be limited, &c. This attempt at monopoly of skill does not appear to have met with serious attention, and all that resulted from the association, as far as we have been able to learn (from a gardener, Duncan, upwards of 90 years of age), was the partial exclusion, for a year or two, of young Scotchmen from a few of the nurseries and gentlemen's gardens near town, which were managed by Englishmen.

7706. *The origin of florists' societies* we have not been able to discover. It is more than probable that meetings for the display of fine flowers and the estimation of their merits, were first held at Norwich, where, as Sir J. E. Smith informs us (*Suppl. Encyc. Brit.* art. Bot. 336.), a love of flowers, and a great degree of skill in their culture, had been introduced into that city with its worsted manufactures, about the middle of the sixteenth century. At all events, there were florists' feasts held there so early as 1637; a play called *Rhodon and Iris*, being extant, which was acted before the company in that year. (*Linn. Trans.* vol. ii. p. 226.) The next florists' meetings, it is probable, sprang up about London; and Nathaniel Rench, of Fulham, is said (*Faulconer's Historical Account of Fulham*) to have been the first who established them, probably about the end of the seventeenth century. According to Davey, florist, King's Road, whose father was also an eminent florist, and lived to be upwards of ninety years of age, the florists' feasts and meetings were at their greatest height about London, between 1740 and 1770. They were then attended by many noblemen and gentlemen, as the horticultural societies are at present. They declined towards the end of the last century, but have since revived, and are

at present rather on the increase. The florists' meetings, and those of gooseberry-growers in Lancashire and the adjoining counties, are very numerous, and rather on the increase. When they were first adopted in that part of England is not exactly known. From the best accounts we have been able to collect, they were in vogue there in 1760, and are re-collected so far back as 1740. Some florists' societies existed in Edinburgh during the latter end of the last century; and on one of these the Caledonian Horticultural Society was founded. The principal florists' societies in Scotland are at Paisley.

7707. *The principal modern societies for the encouragement of gardening* are, the London and Caledonian Horticultural Societies, whose transactions are so frequently referred to in this work.

7708. There are few *public laws* specially formed for the two first branches of gardening, horticulture and floriculture; the general laws being quite sufficient for their protection. Robbing of orchards or gardens, of fruit growing therein, is punishable criminally by whipping, small fines, imprisonment, and satisfaction to the parties wronged, according to the nature of the offence. (43 Eliz. c. 7.)

7709. There are a number of *acts relative to arboriculture*, and especially against the cutting down of young trees. (See *Tomlins's Law Dict.* vol. ii. art. *Timber.*)

BOOK II.

OF THE FUTURE PROGRESS OF GARDENING IN BRITAIN.

7710. *The improvement of gardening*, like that of every art or commodity, necessarily depends on demand and production. These causes operate reciprocally on each other: a nicety of taste in the purchase of vegetables and fruits exposed in public markets, will occasion articles of better quality being brought there; and articles of a superior quality, by improving and rendering more fastidious the taste of the purchaser, will ensure the continuance of their production. In like manner, if those who have private gardens were a little more difficult to please in selecting a gardener, and in the quality of the produce sent to table, the consequence would be, an improvement in that produce, and more scientific gardeners. More scientific gardeners would surprise and delight, by their superior fruits and flowers, and the greater order, beauty, and high keeping of their gardens; and the habits of both parties accommodating themselves to this improved state of things, would be the ground on which to rely for its continuance. In this view of the subject, the future progress of gardening depends on two causes; the improvement of the taste of the patrons of gardening; and the improvement of the science and art of practical gardeners.

CHAP. I.

Of the Improvement of the Taste of the Patrons of Gardening.

7711. *Improvement* is the characteristic of civilised man, and implies progressive advances. Men rest satisfied with what they have, when they know of nothing better; and therefore, one of the first sources of improvement in the taste of the patrons of gardening, whether of the tradesman who has recourse to the public market, or the private gentleman who is in possession of a garden, is the increase of knowledge. The wealthy tradesmen of Dublin and Edinburgh should look into Covent Garden market in London; and, not to mention fruits, and forced or exotic productions, let them compare the cauliflowers and salading of the three markets. Those who have once acquired a taste for such salads of endive as are afforded in the London market throughout the winter, would not very readily reconcile themselves to the acetarious productions of Dublin and Glasgow during that season.

7712. *The ignorance of the proper mode of cooking vegetables*, and especially of dressing salads, which exists among the middling classes, is another retarding cause. A French laborer, out of a few leaves of dandelion and wild sorrel, which may be gathered by the hedge-sides anywhere, and almost at any time, will produce, merely by the aid of the common condiments, what the wives of the greater number of respectable British tradesmen have no idea of. There can be no great demand for a thing, of which the use is not thoroughly understood; and, therefore, an improvement in the knowledge and practice of cooking must take place among a certain class before much can be expected in the quantity, kind, or quality of the gardening articles which they commonly consume.

7713. *The more general use of dessert fruit among the middling classes*, is another requisite wanting for the improvement of horticulture in Scotland and Ireland. If fruit, physiologically considered, is less wholesome after dinner than before it (which is questionable), it is at least more so than where drinking is substituted in its place. To prolong the period of eating, and the conversation of female society, are not only objects which afford immediate satisfaction; but, by moderating the use of stimulating liquors, tend to ensure future health. But, even in England, where a dessert is universal among the independent class, there is a great want of nicety of taste: fruit is valued by many only as a symptom of the presence of wine: others contentedly use pears and plums that would be rejected at the most common French *déjeuné*; and many rest satisfied with melons and grapes, who, at almost no additional expense, might have pine-apples. Wherever the litter of four horses is at command, pine-apples may be grown in Baldwin's manner (2649. and 2698. &c.) with very little trouble to the gardener, and, indeed, at much less trouble than trying to have very early cucumbers or melons. But why speak of pines, when not one family in a hundred is properly supplied with mushrooms, which ought to be on the table in some form, every day in the year. On a small-scale, the grand secret is, to employ a gardener who knows his business; and to direct his attention less to raising ordinary productions at extraordinary seasons, than to raising first-rate crops of everything in due season. On a larger scale, all ordinary and extraordinary things should be attempted that art and wealth can accomplish.

7714. *A taste for fine flowers and rare exotics* must be preceded by some knowledge of plants, or a taste for scientific botany, and the history, geography, and uses of plants. These branches of knowledge may be considered as gaining ground. A good deal also depends on the fashion of using flowers as chamber ornaments, and on having green-houses attached to dwellings; both are most agreeable and rational luxuries; and it is much to be desired that a taste for them was more general, especially in provincial towns, and in the cities of Scotland and Ireland.

7715. *The taste for planting* has attained a greater height, during the last twenty years, than any other department of gardening; the beneficial consequences of which are already powerfully felt in Scotland, and the exposed parts of England. An essential requisite in this department is attention to the future management, thinning, and pruning of plantations.

7716. *The taste for landscape-gardening* has been nearly dormant in England, during the last thirty years; in Scotland it has been more active, but not of the purest kind; little has been done in Ireland generally, though there are some patriots there, who have been active in improvement. A taste for deer-parks is not common in Scotland; and rare in Ireland. A park in Scotland is a grass field; and what in that country corresponds with the park of a mansion in England is a number of green enclosures lying contiguous to each other, and surrounded by strips or rows of trees. In Ireland a mansion and park is a naked house, in a naked grass field, surrounded by a stone wall. There are exceptions in both countries; and many lawns or sheep-parks in Scotland of considerable beauty. Besides, a union of pasturable wooded enclosures, as a park, may be very well defended on the principle of utility; but there can be no defence of the naked parks of Ireland.

7717. *The taste for public gardens*, as promenades and botanic gardens, seems on the increase; but unfortunately these are seldom founded on a sufficiently secure basis. The funds of the recently established botanic gardens have been generally raised by the subscriptions of a certain number of individuals, to whom, and to certain annual subscribers, the garden is alone accessible. Perhaps it would be better, if, as in the case of public promenades, the funds were raised by the whole town or community, and the garden thrown open to all, like that of Paris. Public umbrageous promenades, either equestrian or pedestrian, are very desirable additions to all aggregations of houses.

7718. *Choice of a gardener.* Very much of the comforts and pleasures which a private gentleman derives from his garden, and garden-scenery, depends on the qualifications of the gardener which he employs to manage them. It was formerly the practice, in books of gardening, to give directions to gentlemen how to choose a gardener. These might have been of use when the qualities desired differed little from those sought for in a common laborer; such as sufficient strength and health, and good morals, disposition, temper, &c. But every master can judge of these and other similar points; and for any gentleman who has not a knowledge of gardening to go further, would be more dangerous than useful. We are clearly of opinion, that in almost every case the best mode is to apply to a respectable nurseryman; to describe to him the sort of garden and garden-scenery to be managed, and the sort of productions desired, and to rely on his recommending a fit person for accomplishing the intended objects. If this person should not turn out so well as was expected, the nurseryman will be in some degree responsible for his conduct, and will feel doubly anxious to replace him by a more competent person.

CHAP. II.

Of the Education of Gardeners.

7719. *By education* is generally understood that portion of knowledge which is obtained at schools; but we shall here use the term in a somewhat more extended sense, and consider it as the means which may be employed to render man competent for performing the part which he undertakes to perform in life with increased satisfaction to himself and others. Education may thus be considered as extending to everything which operates on the body or mind, from the earliest period of our existence to the final extinction of life. With this object in view, we shall consider in succession the professional, intellectual, moral, religious, physical, and economical education of gardeners, previously submitting some general remarks.

SECT. I. *On the degree of Knowledge which may be attained by Practical Men, and on the General Powers of the human Mind, as to Attainments.*

7720. *The knowledge* of languages, history, geography, arts, sciences, and literature, which a gardener daily occupied with his profession may acquire, provided he begins at the commencement of his apprenticeship, and continues to employ his leisure hours in reading till he is twenty or twenty-five years of age, is by no means inconsiderable: not that he can, or need become learned; but, if desirous, he may become generally intelligent; render himself fit, as far as conversation is concerned, for good society; prove instructive and entertaining to others by his conversation; and provide a reserve fund of enjoyment for himself, by laying up a store of ideas for reflection in misfortune, disease, or old age.

7721. *The terms knowledge and ignorance are entirely relative:* the knowledge of a modern chemist's porter would have subjected him to be hanged and burned in the days of the first popes; and any bricklayer's laborer who reads the London newspapers, has more correct ideas on the principles of political economy than nine tenths of the nobility in Russia and Spain. It is impossible to set limits to the knowledge which may be obtained by those who are destined even to the most severe and constant labor. The intelligence of the miners in Scotland and Sweden may be referred to as proofs. The miners at Leadhills have a regular library and reading society; and the works they make choice of are not only histories, voyages, travels, &c. but even works of taste, such as the British classics, and best novels and romances. The degree to which knowledge will prevail among any class of laboring men, will depend jointly on their own ambition; on the demand for, or reputation in which, knowledge is held; and on the opportunities of acquiring it. A dull, stupid person, with little native activity, will never desire to know more than what enables him to supply the ordinary wants of life. Where the workmen of any art are required to have technical knowledge of any particular kind, they will be found invariably to possess it. Thus carpenters and masons require some knowledge of the mechanical principles of architecture, and working engineers of the strength of materials; and these kinds of knowledge are acquired by them without an hour's interruption of their daily labor: on the contrary, the habit of evening study renders them more steady, sober, and industrious than other workmen; than bricklayers and paper-hangers, for example, whose employments require much less intellectual skill. If every cook-maid, before she could obtain a first-rate place, were required to be able to read *Apicius Redivivus* in the original tongue, there would be no want of learned cooks; and if no gardener could obtain a first-rate situation who had not written a thesis in Greek, or who had not made the tour of Europe, there would soon be found abundance of gardeners so qualified. A Caledonian, when he comes to the low country, soon acquires the English tongue, and if he has been taught Latin, thus knows three languages. The servants at the inns on some parts of the Continent, frequented by different nations, often acquire a moderate knowledge of three or four languages. A late custom-house officer on the island of Cronstadt spoke and wrote ten languages; and the bar-maid, at the hotel (de Londres) at which we lodged in Moskwa, in 1814, could make herself intelligible in Swedish, Russian, Polish, German, French, Italian, and English.

7722. *The certain way of obtaining anything is to be impressed with the necessity of possessing it;* either to avoid the evil of being without it; to satisfy the desires of others as to ourselves; or, our own desires. There is scarcely anything that a rational man can desire that he may not obtain, by maintaining on his mind a powerful impression of the necessity of obtaining it; pursuing the means of attainment with unceasing perseverance, and keeping alive that enthusiasm and ardor which always accompany powerful desires. Even the most extravagant desires, when sufficiently powerful, are often gratified. To attain eminence, as a literary character, natural or experimental philosopher, mathematician, divine, lawyer, or physician, it is only necessary to have a powerful desire for that kind of eminence, and to apply unceasingly to the subject, and to that alone. All may not acquire, by the same degree of labor, the same degree of eminence; but any man by labor may attain a knowledge of all that is already known on any subject, and that degree of knowledge is respectable; what many never attain to, and what few go beyond.

7723. *The grand drawback to every kind of improvement is the vulgar and degrading idea that certain things are beyond our reach;* whereas, everything is attainable by the employment of means; and nothing, not even the knowledge of a common laborer, without it. There are many things which it is not desirable to wish for, and which are only desired by men of extraordinary minds; but let no man fancy *anything* is impossible to him, for this is the bane of all improvement. Let no young gardener, therefore, who reads this, even if he can but barely read, imagine that he may not become eminent in any of the pursuits of life or departments of knowledge, much less in that of his profession: let him never lose sight of this principle, — that to desire and apply is to attain, and that the attainment will be in proportion to the application.

SECT. II. *Of the Professional Education of Gardeners.*

7724. *In order that a professional man should excel as such, every other acquirement must be kept subservient to that of his profession. No branch of knowledge should be pursued to any extent, that either of itself, or by the habits of thinking to which it gives rise, tends to divert the mind from the main object of pursuit. Something, it is true, due to relaxation in every species of acquirement; but judicious relaxation only serves to whet the appetite for the vigorous pursuit of the main object. By the professional education of gardeners, we mean that direction of their faculties by which they will best acquire the science and manual operations of gardening: and we shall suppose the young man to be instructed, to have no other scholastic education than some knowledge of arithmetic, and the first problems of geometry and land-surveying. The sort of garden which ought to be the scene of the days of apprenticeship should, if it can be so foreseen and arranged, be that which the learner is ultimately intended to possess or manage. As the great majority of young men who learn this art, are intended for serving-gardeners to private families; a private garden, where every department is respectably conducted, is the best to begin with. Here, or in any other garden in which he may be placed, he will have to learn the names of things, their uses in gardening, how to use them in the best manner singly, and how to combine their use in performing the different operations of gardening.*

7725. *The grand foundation for every kind of acquirement, is the cultivation of the faculties of attention and memory. Unless we pay attention to what is addressed to us, whether by the eye or the ear, it is impossible we can remember, because the sight or sound has made no impression on the memory, and without memory, there can be no knowledge.*

7726. *Many pass through life without seeing or hearing anything but what immediately concerns their avocations. It is a common thing for a person to walk out and return without being able to describe, or even mention, any one thing he has seen; or to read a newspaper without being able to tell what he has read farther than to give some vague idea of the subject. All this is the result of neglecting to rouse and exercise the faculty of attention; or of limiting our attention to one single object or class of objects. One of the first things, therefore, that a young man should do, is to cultivate the faculty of attention, which he may do every hour of the day, by first looking at an object, and then shutting his eyes and trying whether he recollects its magnitude, form, color, &c.; whether he would know it when he saw it again, and by what mark or marks he would know it or describe it. When he goes from one part of the garden to another, or is on a walk or journey, let him pay that degree of attention to everything he sees and hears, which will enable him to give some account of them when returned from his walk or journey; and let him try next day, or some days afterwards, if he can recollect what he had seen then, or at any particular time and place.*

7727. *The attention must be exercised systematically, in order not only to impress the memory, and enable the observer or hearer to recollect objects, but to describe them. A thing or a discourse must be attended to, not only as a whole, but as a composition of parts; and these parts must be considered not only as to their qualities of dimension, color, consistency, &c., but as to their relative situation and position.*

7728. *To be able to give an account of a town or village, for example, the first thing is to get a general idea of the outline of its ground-plan, which may be done by looking from a church-tower or adjoining hill next, its relative situation to surrounding objects; as what hills, or woods, or waters join it, and in what quarters; next, the direction of the leading street or streets must be noticed; then the intersecting or secondary streets; the principal public buildings; the principal private ones; where the lowest houses and narrowest streets are situated; and what is the character of the greater number of houses composing the whole assemblage.*

7729. *To be able to recal to mind or to describe the figure of any person before us for the first time, it is necessary to attend to height, either absolute, by estimation in feet and inches; or comparatively with our own, or that of any other person or object present at the time; to figure or shape generally, as whether tending to excellence or defect; then to hands and feet, gait, manner, &c.; and, above all, to the form or outline of the countenance, the complexion, and other details of the face. One untutored person looking at another with a view to recollect or describe him, would only stare; but an attentive and systematic observer would survey both the party generally and in detail, and in such an order as would readily occur to the mind on reflection. He would not, for example, after estimating the height, proceed next to the color of the eyebrows, but would take the breadth and shape, as more congenial to the accustomed train of ideas. The young gardener will apply these hints to recollection of parks, pleasure-grounds, walled gardens, hot-houses, and also to the study and recollection of individual plants.*

7730. *To be able to recollect and relate written or oral discourses, the same general principles will apply; the first thing is to attend to the object in view, and next to the order or form in which the whole is proposed to be treated of or delivered; lastly, to the manner in which the details are filled up.*

7731. *The study of natural history and drawing are well adapted for improving the faculties of attention and memory. The former by its systematic arrangement, and the precision of its details, tends to habits of order, accuracy, and distinctness, and to the ready discrimination and recollection of single or natural objects: the latter contributes to the same end, and also to the recollection of objects in groups or combinations. Hence, the importance of a gardener's attending to botany, zoology, and drawing, even with a view to general improvement, independently of their special utility in his profession.*

7732. *The recollection of names and numbers is a more mechanical process than the recollection of objects. Names are either descriptive, that is, when they consist of a word, or are composed of words which describe something of the object to which they are applied, as Longtown or Hillhouse; or they are arbitrary, meaning nothing, or nothing now known or definable, as William, Thomas, &c. The first are of easy recollection, because, even though the object may never have been seen, its image may be presented to the imagination by the name, as a town of great length, and a house on a hill top; the second are only to be recollected by seeing the objects to which they are applied, and then associating in the mind the name with the thing; or by seeing the description or portraiture of the objects, and associating the name with these; or by finding a resem-*

blance between the new name and a known name, as William, wild yam; Thomas, to mass, &c.

7733. *The principal names which a gardener has to recollect* are those of plants; to assist him in this knowledge, the etymologies of all the generic names, and of the specific names, which are substantives, is of great advantage; the ordinary specific names being adjectives, are easily understood and recollected. The generic names of plants and animals are of three kinds; those composed of words indicating something of the nature, or appearance, or uses, of the plant, as *Gypsophila*, *Helianthus*, *Linum*, &c.; those composed of the name of some eminent individual, as *Hellenia*, *Gordonia*, or after some town, as *Colchicum*; and those composed of native or local names, as *Elettaria*, *Acacia*: the first are of easy recollection, because the natural soil, the sight of the flower, or the recollection of its image or its uses, will recall to mind the name; the second may be recollected by considering who the name-father was, and by associating his figure and some action of his life, real or imaginary, with a specimen of the plant. Thus Gordon was a nurseryman at Mile-end, a short, lame, sailor-looking man, who dressed in blue trowsers, chewed tobacco, and was without offspring; it is easy to imagine his wife reproaching him with the last circumstance, while he points to *Gordonia Lasianthus*. All those names, whether of science, or those which occur in the common intercourse of life, as of persons and places, are to be recollected on the same principle; that is, either by the name itself calling up an image, by its resemblance to some other name already known, or by forming an association between it and some known or familiar visible object; and the more ludicrous the association, the better will it be recollected. In forming these associations, it is essential that the object employed to aid the memory be one capable of being seen; to associate any particular object with a sound, smell, touch, or taste, would give little aid to the memory; and to associate it with abstract nouns or ideas, none at all. "If I am told that the Dutch merchant Schimmelpenninck was a very wealthy or religious man, that will not assist me in recollecting his long name; but if I say to myself there is some resemblance between Schimmelpenninck and *skim-milk-pen-and-ink*, the resemblance may enable me to do so; or if I have recourse to a Dutch dictionary, and discover that *schimmel* is grey, and *penninck* a penny, I have greypenny, as a synonym, which, with the operations the mind has undergone in getting at it, will most probably impress the original name on the memory. If a Highlander tells me his name is Macpherson, I immediately interpret it *mac-pearson* — *mac parson*, — son of a parson — son of a Catholic priest and a Highland maid."

7734. *Figures may be recollected by gardeners with readiness and certainty.* For all numbers not exceeding 24 they have only to associate the figure with the name of the corresponding Linnæan class, or with one of the plants of it. Thus, if a lad in a nursery is sent to the fruit-tree ground for plants of number 19 and 21 of pears, he has only to think of *Syngenesia* and *Monœcia*. For all numbers exceeding 24, and under 250, he may make use of the terms of the first ten orders, in addition to the 24 classes; and thus, No. 241 will be *Cryptogamia monogynia*, 249 *Cryptog. enneagynia*, 208 *Gynandria octogynia*, and so on. To any one but a gardener or botanist, this mode of recollecting numbers has no advantages over any ordinary system of artificial memory; but as there can be no gardener to whom these classes and orders are not perfectly familiar during the whole period of his life, or at least of his practice as a gardener, to him it is superior to all the artificial systems. It is easy to add to the certainty of remembrance by associating the figure of any known plant or plants belonging to the class or order; thus, for 24 he may think of *Osmunda regalis*, for 245 *Osmunda regalis* and *Daucus carota*, or a fern-frond and a carrot-leaf, for 16,213 he may think of a nosegay composed of a *Canna glauca*, *Narcissus triandrus*, *Olea fragrans*, and *Rosa provincialis*, or he may fancy himself planting these plants in a row or in a pot. If a gardener rides through twenty turnpike-gates in a day, he may recollect the pass-number of them all. He has only, in passing through them, to place a pot of the indicating plants on each of their gate-posts.

7735. *Numbers may also be recollected by gardeners by their going through the operation in imagination, of cutting them on a number-stick, either by the common (fig. 160.), or by Seton's method. (fig. 161.)* Names may be recollected in like manner, by their going through the operation mentally, of writing or printing them, or writing them in some particular hand, or imagining how some particular friend, with whose handwriting they are acquainted, would write them. They may be supposed to be written on any scrap of paper, or against the day of the month in a common pocket-book, or what is preferable, after the last entry made in the pocket memorandum-book (7741.), to be afterwards described.

7736. *The memory, both as to figures and words, may also be materially assisted by studying the postures of the human figure, corresponding to the first ten Italic numerals, and the letters of the Roman alphabet.* Plates of these are to be had in the juvenile libraries. Some useful hints on the subject of memory will be found in Feinagle's work on the subject, and especially in a tract by Jackson, in which Feinagle's system is greatly improved; but the machinery of both systems, though they enable a student to recollect an astonishing deal in a short time, yet, like other complicated machinery, it soon goes out of order when not in constant use. It is, therefore, unfit for practical men.

7737. *The uses of things and their history, is the next thing which a gardener has to acquire.* The uses of the implements, tools, utensils, and machines of gardening, he will acquire by manually exercising them in performing the labors and operations of gardening under the direction of his master. He should not only know how to use them, but how to use them in the best manner; and also the history of each implement or machine, derivation of its name, why one form is preferable to another; in short, he should know the rationale of the formation and operation of all of them. The essential part of this he may acquire by reading Part II. of this work, and the rest from the study of the principles of mechanics, and by conversing with intelligent carpenters, millwrights, and engineers.

7738. *The uses of the commoner garden plants* he will find in the third part of this work, Books I., II., and III., something more he will find in Book IV., and for the rest he must have recourse to books on cookery, medicine; chemistry, and farming, which go more into detail. Much information on all the arts con-

nected with the vegetable world will be found in our *Encyclopædia of Plants*, and in the *Encyclopædia Agriculture*.

7739. *The study of systematic and physiological botany* must go hand in hand with practical acquirements; for which, and also for forming an herbarium, he will find general information in Part II. Book I., and for more minute details, he may consult the authorities there referred to. Some idea of vegetable chemistry and geology he will obtain from Books I., II., and IV. of Part II.; and also of the different insects and vermin which are enemies to gardens and garden-productions. The study of landscape-gardening, being the highest part of the profession, should not be attempted till the apprentice has made himself master of the three departments which precede it.

7740. *A knowledge of the weather and the seasons*, so as, in some degree, to be able to predict them from signs, is an important part of a gardener's acquirements. Our observations in Part II. Book II. will aid him in this study, and he should also keep a weather-book, or naturalist's journal, such as we have already suggested. (2349.)

7741. *A pocket memorandum-book*, for taking notes of everything interesting, whether professional or general, is a useful help to the young gardener. He should begin this sort of memorandum-book while leaving school; and he will probably find it useful to continue it all his life after. Its size should be small, to suit the pocket; it requires no ruling, but a line across the page half an inch from the top. On writing on one page, the opposite one should always be left blank for corrections and additions, for sketching or for taking down temporary memorandums in pencil. The following may be considered as a specimen in which it is to be particularly observed, that a margin is left on the written page, on which margin each article is begun with a word written or printed in large letters. These words, thus conspicuously placed, serve as an index to each article, and in future reference will be found of material use, as they can be glanced over like the words in a dictionary. Any thing to be inserted, should always be done instantly, never later than the same day. If it is done out of doors, it may be written on the blank page in pencil and afterwards copied on the opposite page in ink.

Pocket Memorandum-Book of J. Gott, Apprentice, at Aubrey Hall.—January 27th and 28th, 1821.

27th.
PEAS. — Last night's frost and this day's sun have killed the peas in the south border: but those sown in the north side of the wattled hurdles escaped, being shaded from the sun.

LIZARD. — Caught a new species, and took it to Twigg. It had no tail, which convinced him it must be a distinct species.

28th.
ROSES. — Idea of a conic iron tree, covered with any of the climbing roses, all over inoculated with monthly roses.

PARSNEPS. — Gurkin O'Doolittle caught distilling parsnep whiskey in the tan-shed: discharged without a character. His still two watering pots placed top to top, and closed with a wet cloth: the top kept cool by pouring water on it.

NEW IDEAS. — Torriell Joss, the parson, called; says there are two ways of getting new ideas; by shuffling what ideas we have together, like a pack of cards, (which is to be done by a free glass of wine, opium, or tobacco,) when new combinations may occur to the mind accidentally: or by a studied selection of ideas suitable to the subject on which it is desired to invent, which can only be done by scientific persons, as Sir H. Davy in his invention of the safety-lamp.

These were covered with drill hand-glasses, and the crop is now, June 2d, fit to gather.

N. B. — It turned out to be only the common lizard (*Lacerta vulgaris*, Linn.) which had lost its tail by some accident, and the wound had healed over.

Mem. — Cobbler's name White, lives two doors from the Cat and Fiddle.

7742. *Apprentices are often required to keep a written journal of work* done in the garden for their own use, and this may be advisable in cases where no regular books are kept by the master; but where such books and tables are kept as we have recommended (2338. to 2350.), the apprentice performing his part making entries in, and daily seeing them, need keep no other books for his own improvement than a naturalist's calendar (2349.) and the journal or memorandum-book just described. In the last he can enter such facts belonging to gardening as are commonly entered in gardeners' journals.

7743. *Progress when a journeyman.* An apprentice, besides studying his art in the garden of his master, should, as often as may be, visit those of his neighbors, and observe what is going on there. His apprenticeship completed, he should move to a different part of the country, performing the journey leisurely on foot; botanising and collecting insects and minerals, and visiting every distinguished garden on his way. When he settles, he should be in a different kind of garden to that in which he was before, and there he should continue a year, and then remove and travel to another part of the country, and settle there a year, and so on as already suggested (7380.), till he attains his twenty-fifth year, when he may undertake the situation of master. During the whole period in which he is journeyman, he should be steadily and unceasingly employed in improving himself, first in his own art, and the branches of knowledge, as botany, natural history, chemistry, weather, &c. on which it more immediately depends; and next, if his ambition permits, on general subjects of literature, arts, and sciences.

SECT. III. *Of the Intellectual Education which a Gardener may give himself, independent of acquiring his Profession.*

7744. *Self-education* may be carried to a greater extent by a gardener than by almost any other artisan. No gardener, in our opinion, ought to be employed as a master under the age of twenty-five years. Suppose him, therefore, to be put an apprentice

fifteen, he has ten years in which to acquire his profession, and generally to improve himself. In that period he may not only acquire his profession, but, according to the extent of his ambition and application, a considerable degree of knowledge on almost every subject. Everything, as we have more than once observed, depends on his ambition; without this he will not even acquire his profession, and at all events will find no leisure time for any other kind of improvement. When we consider, however, that the labor of a gardener is not severe, and that it is only during the hours of daylight, the time he has for self-improvement is very considerable. It may surprise some when we state, that this time equals (taking the whole year), that employed in study by professional students at colleges. A gardener, in the shortest day, begins work at eight o'clock and leaves off at four o'clock; which, allowing two hours for breakfast and dinner, gives six hours of labor; in the longest day he works only ten hours, and therefore it will not be far from the truth to consider eight hours per day as the average duration of his labor throughout the year. Dividing the twenty-four hours which compose the day in three equal parts, we have eight hours for rest, dressing, and undressing; eight hours for labor, and acquiring the practice of gardening; and eight hours for refreshment and study. On comparing this time for study with that which is usually devoted to it by young men at college; not the generality of young men, but those even who attain to eminence; we will find the difference very inconsiderable. The student requires the same time for rest, and at least two hours more for dressing and undressing (say ten hours); for breakfast he requires an hour; dinner and tea, at least three hours; and for exercise (which if he neglects he will soon be unable to study at all), at least two hours; in all, for exercise and refreshment, six hours; which added to ten of rest and dressing, gives eighteen hours, leaving exactly the same number of hours for study which every gardener has, taking the average of the year. It is true the eight hours of the gardener are subject to the time employed in eating; but that may well be considered as compensated by the knowledge of botany he acquires in the garden during his hours of labor. Add also, that the gardener may (unless his health forbid) draw still more time than we have mentioned from the hours of sleep; we think it will not be denied, that, taking all circumstances into consideration, he has as much time as studious men, taking the average of the year, usually devote to study.

* 7745. *The branches of education best deserving a gardener's attention* are next to be considered. As one branch of knowledge is as much as any person ever does or can excel in, and as that branch, in the case of every professional man, ought to be his profession, it seems to us that a gardener ought not to attempt to excel in any one branch of science besides that of gardening; but rather to make himself acquainted, to the degree that circumstances may permit, with the whole cycle of human knowledge. If he attempts any thing else, it is impossible, isolated as he must be, in comparison with others who study the same subject among abundance of books and fellow-laborers, that he can attain to the highest degree of eminence. It is impossible, for example, that he can arrive at great perfection, even in the study of botany, from not having an opportunity of consulting the herbariums and books which are only to be found in the metropolis. He may, however, and ought to, attain a respectable degree of knowledge, not only in botany, but also in the other branches of natural history: such for example as will enable him to refer any natural production to its place in the Linnaean system, and describe scientifically any new production. But that he should be expert at chemical analysis, dissection of animals, solving problems in any of the higher branches of mathematics, or excel in painting, music, or poetry, is what we by no means propose, or think practicable; though we are convinced he may know something of all those subjects, and of all others on which there are published books.

7746. *The source from which he is to derive his general knowledge*, it may easily be conceived, is chiefly from books; with such aid as opportunity offers from professional men, public lectures, men of talents and learning wherever he has an opportunity of conversing with them; artists, artisans, and manufacturers of every description; and also manufactories, engines, mines, dock-yards, and all other works displaying human skill. But the grand source is books, and the question is how a journeyman gardener, whose wages are often less than those of a common laborer, is to procure them? Our answer is, borrow them; and make it a fixed rule to purchase no books excepting grammars, dictionaries, and other elementary works; and of these used or cheap copies. The head gardener will always be able and willing to lend his apprentices and journeymen a certain number of books; and the patron under whom they serve, will generally be found equally liberal.

7747. *The sorts of books* desirable to borrow, independently of those connected with the professional acquirements, such as treatises on Chemistry, Zoology, Mineralogy, &c. will depend on the degree of advancement of the student. But that which we are of opinion cannot be dispensed with, is a good encyclopædia. One systematically instead of alphabetically arranged would be the best; but as most country libraries are now stocked with the *Encyclopædia Brit.* or *Rees's Cyclopædia*, these must be taken till a well executed one on the plan of the *Encyclopædia Metropolitana*, now publishing (but badly executed), finds its way into general use.

7748. *The studies to be commenced with* is next to be determined. It is necessary to premise here, that the mind, before it can derive much improvement from reading, must undergo a certain degree of culture. To improve by reading it is not sufficient to be able to read; we must be able to analyse language and discourse; to recognise the real or apparent object of the writer; and to trace the order of his ideas from the commencement to the conclusion. The foundation of this is the exercise of the faculty of attention, already dwelt on; and essential aids to it is the study of grammar, and of languages. Another excellent help is the study of systematic natural history; a circumstance highly in favor of gardeners who are desirous of improving themselves in general literature; since, if they know their profession at all, they must have a tolerable knowledge of systematic botany, which gives the mind an orderly and systematic mode of thinking. It is not uncommon, for example, to hear gardeners who have no pretensions to general literature, applying the terms, genera, species, subspecies, and varieties, to manners of thinking, or acting, to religion, weather, forms of governments, &c. For want of this preparation of the mind, there are many persons who read a great deal, and derive very little benefit from it. Their minds are not competent or not habituated to view the subject which they read as a whole, and to take a view of its general scope and tendency. All they see of it is the parts as they pass before their eyes, their relation and connection they think nothing of, and the whole passes as it were through the mind, instead of remaining on it. Reading to such men, in comparison with those whose minds have been prepared by elementary studies,

may be said to resemble pouring water on ground with a hardened surface, in comparison to pouring it on soil which has been loosened with the spade.

7749. *English grammar and a foreign language* are suitable studies to commence with. Another excellent aid to forming the mind to precision and accuracy is the knowledge of quantities; for which reason we would join to the study of languages, those of arithmetic and geometry. These, with a portion of general reading, some species of personal accomplishments, and the requisite professional studies, are all that we would have an apprentice commence with, and this only in a certain order to be afterwards described.

7750. *With respect to personal accomplishments*, we would have dancing, fencing, boxing, wrestling, the infantry manual exercise, whist, backgammon, chess, the flute, and violin, attended to as far as opportunity offered; considering dancing, boxing, and the violin as the most essential objects. In most country-places these and all the other acquirements may be learned from retired valets, old soldiers, or from some of the servants in a great family, at an easy rate. Swimming and horsemanship should not be neglected if opportunity offers. The acquirement of some knowledge of some or all of these accomplishments will occupy very little time; once attained, they are resources for self-defence, for social entertainment, or of relief from ennui when alone. Dancing and the manual exercises are particularly useful as improving the gait, and habituating to good postures both in standing and sitting. To a man who has no other resources for advancement in life than such as are personal, every exterior acquirement is of the utmost importance. — These remarks will to many appear sufficiently extravagant; but we would ask, whether there is any young man who does not, to a certain extent, possess most of these acquirements as it were accidentally? Why then may he not improve them by art, if opportunity offers; or, if they are of use, why should he not seek occasion both to improve and extend his knowledge in this department.

7751. *In study, as in everything else, much depends on the economy of time*; the march of time is regular and constant, and as there is only a certain portion of the twenty-four hours which a gardener can devote to study, everything depends on his employing every moment of that portion. To be convinced of what is lost by delay, let two persons commence walking along a road in company; then let one of them stand still for half a minute while the other walks on; at the end of the half minute the distance at which the former will find himself from the latter will be found astonishing. Again, supposing them walking together, and that one, instead of walking along the road with the other, deviates and diverges from it — the distance at the end of half a minute, at which the deviator is found from the one who walked straight on, will be still more astonishing, and is greatly more ruinous, because not only is the time required to return to the direct road equal to that taken to diverge from it, but when returned, the deviator will be a whole minute's walking behind the other. These two simple experiments it would be well for two young gardeners to try, in order that the results may make a strong impression on their minds; and let them ever afterwards think of them when they feel inclined to be lazy or dilatory, or to depart from the line of duty.

7752. *To aid in the economy of time*, it is desirable to form some plan of study; where there is no regular plan much time is lost in hesitating what to begin with; and both lost and misapplied by fatiguing the mind with too long intense application to one thing; by which means a proportional relaxation is required, and the memory, being irregularly charged, will be less faithful. By a well ordered pre-disposition of studies, the time which would be lost in considering what would be done next is gained, and the one study becomes a relaxation as it were from the other. We shall here suggest a general plan for a young gardener's employment of time during the few years he has to pass previously to becoming master, and leave him to fill up the details in his own way. We by no means offer this plan as the best; others may be equally good; but the grand point is to fix on some plan, and to adhere to it strictly.

7753. *Plan of study for languages*. We shall suppose the apprentice, and indeed every gardener under thirty, to rise at five o'clock throughout the year; a necessary habit in the gardener, both for the hot-house fires and for study. He will thus have nearly an hour in summer, and from one to three hours in winter before he goes to work. These we would devote to languages throughout the ten years; on no account would we study anything else at that time, and on no account would we study any language during the rest of the day. Latin and English grammar may be taken on alternate mornings till the latter is acquired; and afterwards Latin may be taken two mornings, and Greek the third morning. In two or three years the fourth day may be devoted to French; and in the seventh year, or earlier, according to circumstances, Latin, Greek, French, German, Dutch, and Italian may be taken in succession, one morning to each. The object being such a knowledge of English as to be able to write it correctly; of Latin and French to translate them with ease; and of the other languages to be able to make out their meaning by the occasional help of a dictionary. There is nothing to hinder any person of even inferior organisation, to attain this knowledge in ten years, at the average rate of one and half hour's study every morning. The great thing is not to omit a single morning, unless from illness; for even in the case of absence from home, or during a journey, a grammar or any polyglot book, such as a Testament or a Commenius, may be carried in the pocket.

7754. *Rigid pursuit of the object in view*. If at any time, through business or over-sleeping, but a few minutes can be got in the morning, still these few ought to be applied in the usual channel; even half a minute is worth something, for in that time a noun may be looked over, or a rule read and reflected on during the walk to the place of working. If no time is left, even while dressing, a dictionary may be opened and a word looked at, and recollected, and even a word per day gained is worth something.

7755. *Progress is gradual*. It is impossible to gain any end either in self-improvement or any thing else at once: all art is gained by labor, and nothing is lasting but that which advances by degrees. The independence which even a very moderate knowledge of languages confers on the possessor, whether in general reading, or in reading foreign books, is invaluable, and amply compensates the trouble requisite to acquire them. To any person going abroad for profit or improvement, they are essential. It is a common thing to suppose, that a certain long number of years are requisite to acquire Latin, which may be the case with children who learn it by compulsion, and is more or less the case as to everything they are taught; but with a grown-up and voluntary learner the case is widely different. We have known men in this country acquire one or two languages, after having attained their fortieth year; and the thing is quite common among migrating tradesmen on the Continent.

7756. *Books on grammar*. In purchasing the grammars, that of Cobbett or Lindley Murray may be selected for the English; and for the other languages, any that can be got cheapest; the last remark will apply also to the dictionaries. To impress rules and words on the memory, read them aloud, sing, or chant them, or write them down. Books in most languages may be had at book-stalls for a trifle; or by applying to a subscriber to the Bible Society, he will procure a New Testament in any living language, and also in Latin, Greek, and Hebrew, for two shillings or half a crown. Used copies of the *Janua Linguarum* of Commenius, containing Greek, Latin, French, &c. are to be had even cheaper.

7757. *Plan of study for general subjects*. The spare time after breakfast and dinner we would devote to botany for the first three years, and the seven years afterwards to botany and other branches of natural history, gardening, and farming books. Thus the early part of the day is disposed of for the whole ten years: the next thing is to arrange for the evening. For this the arrangements must vary according to circumstances, as it does not all depend on the will of the student; thus lectures can only be attended, when and where given; and those who may have undertaken to give instructions in fencing or fiddling, must be received at such evening hours as suits their convenience, &c. We would, however, never break in on the day-studies with these acquirements; and as far as possible devote two hours at some period of every working-day evening, during the first three years, as follows: of the first evening to drawing plans and architectural subjects; the second to arithmetic, mensuration, and land-surveying; the third, to

drawing landscape and figures; the fourth, to Euclid's *Elements*; the fifth, to drawing plants, flowers, insects, and minerals; and the sixth to mechanics and experimental philosophy. The remainder of each evening to be disposed of in writing essays and letters, both with a view to improvement in the style, and in penmanship; to miscellaneous reading, if possible, from an encyclopædia, assigning a due proportion to each kind of study or acquirements.

7758. *A holiday*, when it occurs, we should recommend to be commenced with a language, as usual, and to be included in the general rotation for that branch; but the remaining part of the day we would dispose of in portions of one, two, or three hours, in bringing forward those evening studies which we had been least successful in during the week, or found ourselves most in want of for actual use. Holidays are also particularly adapted for drawing, which, though it ought not to be neglected with artificial light, yet goes on best with that of the sun. Nothing can be more mechanical than copying drawings, or drawing from nature, and there is nothing (but want of will) that can hinder every gardener from being a good draughtsman in all the three departments. To paint in oil, or make highly finished drawings, valued as such, is quite a different thing, and not to be attempted but by such as have much leisure, or adopt that pursuit as a profession.

7759. *The books necessary for general studies* are, any authors on arithmetic, mensuration, and land-surveying, who are pretty full; any used copy of *Euclid*, and of *Young's Lectures on Natural Philosophy*; or study the articles on the last subject in a good encyclopædia. There is no very good drawing-book for self-instructors, but some one may be borrowed, and those parts of any encyclopædia consulted which treat on the subject. For the miscellaneous reading, all the books required are to be borrowed, and chiefly, if possible, an encyclopædia, which ought to be read through volume by volume, and notes taken in the pocket memorandum-book (7741.) of such parts as are considered best worth remembering.

7760. *Conclusion.* A great deal more might be said on this subject, did our limits permit; suffice it to add, that if a student only wills and exerts himself, everything will be found possible; difficulties may occur, and may retard for a time, but they will finally be overcome. The great thing is to be convinced of the importance of incessant application, by which any man may attain to eminence, and without which eminence was never yet attained. The profession of a gardener is, more than any other, favorable for mental acquirements; his labor is easy; his patron has a library: he has frequent opportunities in improving his language and manner, by being asked questions by his patron and his family, and other superiors who are educated and polished. He may also render himself useful to clergymen, medical men, and school-masters, by collecting and preparing objects of natural history for them, for which in return he will receive useful hints, and the loan of books. A great object is, to accomplish all this, and yet have some spare money for travel and accidents, which is to be done by great simplicity (avoiding what is meagre) in food and dress; by neglecting the use of such luxuries as tea, sugar, spirits, and such other articles as are much taxed; by purchasing used clothes, and never new ones before having arrived at the degree of head gardener, for the best dress; and by having, for daily use, dresses of coarse grey stuff, not enhanced in price by much ornamental manipulation, or by taxes. — Though, in making these remarks, we have had in view chiefly young men, yet there is no period of life at which improvement may not be commenced, and attempted with a degree of success that will amply repay. At any period under thirty, every thing we have proposed may be attained: a great deal, even at forty, and enough to meliorate and humanise life, beginning even at the latest period. Let the gardener never forget that though something will depend on his organisation, yet, that much the greater part depends on education — on his desire of raising himself, and on incessant application. To desire anything ardently, is, in truth, to be inspired with the power of attainment.

SECT. IV. *Moral, Religious, and Physical Education of Gardeners.*

7761. The subject of *morals* (*morales*, Lat. manners) regards the conduct of man towards others; that of *religion* (*religio*, Lat. devotion, devoted to), his opinions as to God or the nature of things; and that of *physical education* (*physica*, Lat. the knowledge of nature) instructs him in the art of preserving health.

7762. *Morality and religion* are usually treated as depending on each other; the latter is considered as the principal foundation of the former, and man is taught to be sober and honest, not only to avoid the punishment awarded by the laws of his country, but to avoid still greater punishment in futurity. But morality may and does exist apart from religion; for truth and justice, honesty and humanity, are essential to the existence of regular society. Debauchery of every kind is attended with the loss of reputation, and more or less of bodily health; those who despise, and affect to treat with contempt or ridicule, the opinions of the respectable part of society, are themselves despised and excluded from society in return. In the intercourse of society, a man always receives according as he gives; and as he treats others so is he treated himself. If he wishes to be dealt with honestly, he must be honest; and if he wishes to be respected by respectable men, he must respect them, and their conduct and principles. In short, independently of religious motives, it is necessary to be moral, in order not to be disreputable; and worth while to be highly so, in order to ensure confidence and respect. Whatever theory therefore the young gardener may adopt, there is only one practice which he will find to answer his expectations; and that is, the strictest regard to truth, honesty, sobriety, decency, and purity in himself; and respect for others, in proportion as these virtues appear in their conduct and conversation.

7763. *The moral law of all countries is essentially the same*; because, in the rudest forms of society, it is found necessary to enforce justice and honesty; but among rude nations, and even among those in a comparatively advanced state, the more refined laws of morality are neglected. Thus in Russia, where the people, from the boor to the czar, are the most religious in Europe, it is no discredit to a gentleman to lead a debauched life, or to pilfer trifling articles from another, or to steal from shops (*Lyall's Moscow*, xxxix.); but in a refined and luxurious state of society, such as that in Britain, the enjoyment of every individual depends not only on a strict, but a refined morality; and men must not only be civil, but polite.

7764. *Politeness* may be considered the ornament or finish of morals or manners; and though it is commonly thought to belong chiefly to the higher classes, yet it will be found both attainable and useful in a high degree, by every class, and by none more than the gardener. Polite and amiable conduct, like a good figure and address, recommend themselves at sight, and make at once an impression in favor of the man who possesses them. "Civility," Lady M. W. Montague observes, "is a sort of current coin which costs nothing and buys everything." The greatest genius and abilities will never procure a

man advancement, without a good address. We recommend the perusal of what Lord Chesterfield has written on the subject, guarding against those slips of the pen where he seems to recommend impurity and deception. If these suit the character of a modern ambassador, they are practices which a poor man cannot afford to deal in.

7765. *The foundation of all true politeness is a desire to please others*; though some mistake it for a display of their own acquirements; and others, a cringing acquiescence to the opinions of others. The two last errors are to be avoided, the first as immediately, and the second in a short time, incurring contempt. To be polite with permanent advantage it is necessary to be sincere; and any degree of vanity, pride, or arrogance, is certain of proving offensive. To please others, one of the first things requisite, is to be, or appear to be, pleased ourselves. A man may show his pleasure or displeasure, by his action, by his speech, and by his features. An easy, graceful, and yet manly action, is to be attained by the practice of dancing and the manual exercise; a gracious and polite manner of speaking by much reading, and by attending to the language of ladies and gentlemen, frequenters of polished society; and the features of the face may be set to satisfaction, discontent, anger, or ill temper, according as either of these states of mind are adopted. If the muscles of his face are put in training by a gardener at the commencement of his apprenticeship, almost anything may be done with them, as may be proved by the case of comedians. A gardener's object should be less the power of varying them, than of giving them a set expressive of animation joined to a degree of satisfaction: this medium or central disposition he can occasionally alter to that of pleasure on the one hand, or disapprobation on the other, as circumstances may require.

7766. *An essential part of politeness is agreeable conversation*, and taking part in the current amusements of the time and place. The art of conversation, like all other arts, is only to be acquired by reflection and experience. The first thing is to store the mind with ideas on every subject by reading, and especially with anecdote, history and biography; the next thing is to adapt our conversation to the society in which we happen to be; and the last requisite is to endeavor to discover the precise part and quantum of conversation which we ought to supply.

7767. *The art of conversation* is as little understood by the great bulk of mankind as the art of chemistry: and the consequence is, that in ordinary society it consists in tiresome relations, as to the party or their affairs; attempts to obtain victory in argument, to display knowledge or acquirements; or something which may give superiority over the others present; or of criticisms on the absent; the source of all which is unrefined selfishness. Polite conversation is a totally different thing from disquisition; or mere talking about any one thing, whether relating to ourselves or others. In disquisition, the object is to ascertain truth; in conversation, to pass the time in an interesting and agreeable manner. The object of every one who takes part in a polite conversation ought to be to please; whatever cannot be said on any subject entered on, without giving offence to some one present, or to truth or decency, ought to be avoided. By common consent, the party will pay due respect to the master of the house, as to the president of the assembly; and though all will contribute their share, those rich in talent and experience will naturally contribute the most.

7768. *Every master of a family ought to instruct the members of it in the art of conversation*, and to advise them more especially to avoid all subjects that lead to argument and discussion. These are of little service to truth or instruction; because men are seldom convinced by arguments carried on in society. No man is willing to be publicly convinced of anything, and especially if he who has the better side of the argument happens to be younger or of an inferior rank. Men may be willing to be instructed, who would not submit to be convinced; and some will consent to receive information, who would feel hurt at the idea of instruction. Elderly persons, however, and such as are of acknowledged experience and acquirements, may both instruct and inform: but even these must be cautious as to the manner in which they correct, or contradict, or criticise; lest, as is often the case, they appear more eager to display their own superiority, than to improve and oblige the party addressed. The love of self is liable at every moment to break in upon and spoil everything; and therefore the grand object is to keep that feeling continually under restraint by keeping alive the idea, that the object of all conversation is to please. Three or four young gardeners, all eager for improvement, might practise conversation on this principle, by assembling occasionally, and either conversing as equals, or for the sake of variety and improvement, assuming characters. Two, for example, may take the part of the parents of a family; one or two as strangers on a visit to them, and the rest as children, and so on. The party might first produce that sort of family wrangling and snarling, which commonly occurs at fire-sides, as the conversation to be avoided; and next, a conversation as it ought to be, or as each gardener would desire to have it in his own family.

7769. *Whist, chess, &c.* For the purpose of being able to join in the amusements of society, we have already recommended the study of whist, chess, &c. These are essential personal accomplishments of every man who would find his way in society in England, where conversation is not nearly so well understood as on the continent, and therefore less relied on for passing the time agreeably.

7770. *Elevation of manners.* There are two things in conduct which the gardener ought most particularly to avoid, *familiarity* and *cupidity*. When these qualities discover themselves either in manner or conversation, they are a certain mark of low birth and breeding. A low, ignorant man, if he receives the slightest civilities from a superior, immediately conceives the latter has a particular friendship for him; and soon endeavors to turn this friendship to advantage, by asking to borrow money to forward himself in business, or requesting a place under government, or a pension. If a gentleman, or indeed any man, notices a low familiar woman, the latter immediately concludes he is in love with her; if she has daughters, he has come to marry one of them; and at all events, he is a particular friend to be boasted of and relied on in time of need, who will certainly advance the family in some way or other. Such is the self-love and ignorance of mankind betrayed by the vulgar; for familiarity proceeds from that sort of gross selfishness that puts no restraint on wishes that it does not consider grossly criminal; and indulges in the most absurd hopes, merely because, if realised, they would tend to their profit.

7771. *A well informed and polite man is not familiar with any one*, because he knows that if he were to lay bare everything respecting himself he would lessen respect; and he does not show an impertinent curiosity after the circumstances of others, because it might hurt their feelings to expose them. Cupidity is out of the question with him, because he knows mankind too well, to suppose they will give him a valuable thing merely because he asks it; but even if there was a chance of getting it in this way, still he would not ask, because he might be asked for something still more valuable in return. In this way politeness becomes highly useful as a check upon gross selfishness; and by serving to keep up a mutual respect between man and man, it restrains the offensive passions, ameliorates the temper, and promotes social enjoyment. A man of sense and experience will not be very familiar with his most intimate friend. Respect is always lessened in proportion as familiarity takes place; and without respect there is nothing to hinder individuals, even the most intimately connected by ties of blood, affection, or interest, from proving very offensive to each other. Where a weaker and stronger party, as man and wife, parents and children, masters and servants, cease to act in such a way as to maintain a mutual respect, the stronger party is obliged to have recourse to the principle of fear, — becomes of necessity a domestic tyrant, and is obeyed and hated, instead of being obeyed and respected. What is it that makes a man hate his wife's faults more than those of any other woman? first, he knows them better: secondly, he knows he must put up with them: thirdly, he knows that she knows his faults, and hates them more than she does the faults of any other man. All this arises from familiarity.

7772. *The want of mutual respect* is the cause of many evils among the lower classes; it is the origin of almost all family quarrels, and of most of those between individuals; the cause, familiarity, ought therefore to be avoided, by all who would be respected; and a salutary restraint placed on all their feelings,

both of love and hatred, curiosity and communicativeness. Judicious restraint is everything as to over-coming bad or vulgar qualities; a man properly under its influence may be compared to a well trained tree; and as this figure is familiar to the young gardener, it may be well for him frequently to ask himself, whether, supposing he were a cherry-tree, he would be reckoned one finely spread against a wall or an unpruned standard.

7773. *Religion* is a subject which we leave every gardener to arrange with his own conscience; only observing, that as it concerns only the man himself, and unless joined to enthusiasm and proselytism, can never injure others; every one should be left at liberty to think in this respect as he chooses. Let no one, however, consider that differing from others as to religion implies a difference in morality, or a neglect of moral principles; and let every gardener consider well what we have before said on this subject. (7762.)

7774. *Physical education.* It may be supposed superfluous to say anything to gardeners in respect to *health*. But the truth is, that since the general introduction of hot-houses, the profession of a gardener has become in some degree different from what it was; and he is now subject to heats and colds, which are liable to bring on inflammatory and rheumatic complaints. Being heated excessively in a hot-house, and cooled to a very low degree in the open air during winter, or in an ice-house (which is now in almost daily use in good gardens, for preserving fruits and vegetables) during summer, do not of themselves injure the constitution; but the evil arises from the partial operation of either extreme by which one part of the frame is cooled or heated sooner than another. By this the circulation and perspiration are unnaturally accelerated or diminished in these parts, and of course the action of the whole system deranged. When this takes place, the consequences are fever, costiveness, and often St. Anthony's fire, ague, rheumatism, &c. If taken in time, opening the bowels and the hot-air bath of the hot-house, taking care either to go at once from it to bed, or to the dry-stove and greenhouse, so as to cool gradually, will restore the system to order; if neglected, time, opening and sudatory medicines, and probably the doctor, will be required. The principal danger is to be dreaded from the excessive heat and perspiration produced by working in the bark-stove or in pits, such as during shifting, syringing, &c. To guard against these, the operator should limit his dress at the time to a loose flannel shirt and wooden shoes, and when finished, should wipe himself perfectly dry before putting on his ordinary clothing.

7775. *The foundation of all health is regularity in the time and quantity of food taken, and in the common evacuations.* If these are strictly attended to, everything will go on well; if suffered to become irregular, every thing will go wrong. The stomach is the *primum mobile*, as it were, of the constitution; the cause, when disordered, of the most afflicting diseases, and the first thing to be restored in order to their cure.

7776. *A strict attention to personal propriety and sober habits* need hardly be mentioned, with reference to young gardeners who mean to advance themselves; to suppose, indeed, that they would indulge in inebriety, or in alehouse society, is so entirely out of the question, that we shall not enter on the subject.

SECT. V. *Of Economical Education, or the general Conduct and Economy of a Gardener's Life.*

7777. A gardener, who has attained his twenty-fifth year, and has carefully employed the leisure time of the preceding ten years in improving himself, will now have formed his judgment on most subjects; and be able to determine a *general plan for the future economy or management of his life*. A man may be learned, or have a genius and taste in his profession, without having that taste or judgment as to the economy of life which leads to fitness and propriety of conduct, and will induce him to fix on an object to be acquired, and devise and pursue rational means of obtaining it. Bad taste in the common business of life may lead to bad plans, to a desire to acquire property too rapidly, to gambling, to match-making, to quackery, and, probably, even to crime and disgrace. The principal cause of this bad taste is, that what is called education is much too limited in its objects; or that part which is commonly left to parents or masters is but very imperfectly supplied. A youth ought not only to be instructed in the different laws by which the conduct both of individuals and society is regulated, but also in the art of forming a plan for the management of his talents, so as they may best contribute to his happiness. Nothing is more conducive to happiness, than fixing on an end to be gained, and then steadily pursuing its attainment.

7778. *Forming a plan of conduct.* Though some things in every man's life, and often the most important things, are the result of accident; yet here, as in every other case where a multitude of actions are to be performed with a view to an ultimate object, a plan must be of importance for their arrangement. No man is born in possession of the art of living, any more than of the art of gardening. The one requires to be studied as well as the other; and a man can no more expect permanent satisfaction from actions performed at random, than he can expect a good crop from seeds sown without due regard to soil and season. The greater part of mankind enter on life without any fixed

object in view ; or, if they form some general notion of acquiring wealth or distinction, they form no plan by which it is to be accomplished ; the consequence is, that such persons, after blundering on through their best years, arrive at the end without having gained anything but experience, now of no use to them. When we look round and observe the quantity of misery in the world ; the greater proportion is, or seems to be, the result of a want of plan, or of a bad plan of life. How many parents are unsuccessful in their struggles to maintain a large family ; the result of too early marriage, and a thoughtless and unmeasured procreation ! How many find themselves arrived at old age, with no other resource for support but charity ; the consequence of want of foresight in expenditure ! How many are suffering under poverty brought on by their own want of frugality, or positive extravagance ; or under disease from excesses and irregularities committed in the hey-day of life ! And how many, among those not born to inherit property, who, at no period of their life, have any other alternative between hard labor and deficient food, than disease and want !

7779. *Want of plan* may not, in every case, be the cause of all this misery ; because accident enters into life for something, both in the unfavorable as well as the favorable side of the question ; but we have no hesitation in asserting, that want of plan, as a cause of misery, is as ninety-nine to a hundred. Any plan at all, even a bad plan, is better than none ; because those who set out on any plan will, in all probability, sooner discover its errors, if a bad one, and correct them, than those who set out on no plan, will discover the want of one, and form a good plan. — Plan, in short, is predestination, as conduct is fate. The young gardener, who is just setting out in life, may well tremble at the consequences of proceeding on the journey without the guide of a judicious plan. This plan he must form himself : because he alone knows the nature of his talents and resources ; — all that we can do is to offer a few hints.

7780. *In order to be able to form a plan*, it is previously necessary to determine the object to be obtained by it. Happiness is the object of every action of human life, and consists in the gratification of certain wants and desires ; some of these desiderata are peculiar to youth, and others to old age ; but many, as clothing, food, rest, relaxation, entertainment, &c. begin with the earliest, and continue to the latest period of life. All these gratifications are procured by labor ; in savage life, by hunting, fishing, and gathering fruits, till the man, no longer able for these labors, is obliged to lie down and die of want : in civilised society they are also obtained by labor ; but here, what is called property exists ; and man, in the vigor of his days, when the supplies of his labor are greater than the demands of his wants and desires, or when he chooses not to gratify the latter to the full extent admitted by the former, can, as it were, embody a part of his labor to be made use of when he is no longer able to perform it with ease. A man, in this case, is said to arrive at independence ; instead of want, as in the case of the savage ; or of beggary, as in the case of the improvident.

7781. *Independence is the grand object* which not only a gardener, but every man destined to live by the exercise of his labor or talents, ought to have in view. At certain periods of life, when the imagination is vivid, and health and spirits in their utmost vigor, some may prefer glory, high literary or professional reputation, or even present pleasure ; and it is a noble attribute of our nature to prefer these to mere accumulation of money : but a great warrior, poet, or painter, arrived at old age and want, if the latter be brought on by common improvidence, will not find himself surrounded by many marks of distinction ; and, though it may possibly be some consolation to him, that the three or four letters composing his name will be sometimes pronounced together after he is dead, yet it will not be much.

7782. *The exercise of his profession is the most rational mode in which a gardener, or any person properly educated to one, can pursue independence.* Only extraordinary circumstances can justify a change of profession ; in common cases it indicates a want of steadiness of character, or a want of success ; and the latter is commonly attributed to want of skill. It is better, therefore, to pursue unremittingly the profession to which we have been educated, even though we should not be very successful in it, than to risk an infringement on character by adopting another. The practice of gardening, as we have already seen (7377.), is carried on by three different classes, serving, tradesmen, and artist gardeners. The greater number of young men cannot do better than commence in the first branch. To begin in the second, unless an established business is purchased, a partnership in a respectable firm procured, or some situation discovered where there is an effectual demand for produce, would, to a young man without connection, be attended with at least a loss of time, if not with greater losses. As to the third branch, the demand is so very limited, that it can never be recommended in a general way. It remains, therefore, for the young gardener to look to the serving branch, as that by which he will the more certainly attain to independence.

7783. *Of serving gardeners*, there are two species, with their varieties ; the public gardener and private gardener. The latter is the only species to be recommended in a general way ; but whichever a young gardener adopts, it would be well if he could previously procure himself to be sent abroad for a year or longer, as gardener or collector to some expedition ; or even if he could, at his own expense, visit Amsterdam, Antwerp, Leyden, and Paris. All this he may do at present, proceeding by sea to Rotterdam, either from London or Edinburgh, for less than twenty-five pounds ; and a judicious young man, even though so much devoted to improvement as we suppose our young gardener to have been, ought to have saved that sum by his twenty-fifth year. In times of war it may be more expensive, or impossible.

7784. *Situations.* Though it be seldom that a gardener can choose a situation for him-

self, it may be proper to mention, that by far the best in the world are in England; there are some good situations in Scotland, and a few in Ireland; and there are occasionally good offers to go abroad as gardeners to the governors of British colonies, or to eminent merchants there. The principal foreign openings for British gardeners, however, are in Russia, where the emperor employs nearly a dozen head gardeners, generally British; and where the same, or a greater number, are in the service of the first-rate nobility. The salaries given are not very great; but the accommodations and necessary advantages are sufficient to admit a frugal man's saving the greater part of the salary. Great care is requisite, however, to have a written arrangement before leaving this country, including a permission to return at pleasure, as no confidence can be placed in the verbal agreements of most of even the highest Russian nobility. We know of no other foreign situations worth notice. If a gardener thinks of going to America, or any of the colonies, on his own account, he will, of course, require a certain capital, and must also reckon on spending his days there. Supposing a young gardener to have obtained a tolerably good situation at home, and to have proved it for a year or two, he should, in our opinion, set about two things; the first is saving money, and the second is entering into the married state. The first is absolutely essential to the scheme of being independent in old age; the second nearly equally so to passing through life comfortably.

7785. With respect to *saving money*, we shall not attempt to state the proportion of neat wages that may be yearly saved; nor how the money may be best laid out; as these depend on circumstances. All we need suggest, is the necessity of keeping the ultimate object, and its great advantages, continually in view, and to prefer security of principal to high interest. As some data to enable the reader to estimate the accumulation of money saved, and put in a savings' bank, or in the funds, we shall suppose a gardener to begin saving at the age of 27, and to continue saving till he attains his 50th year; laying out every year's savings at only 4 per cent., adding half-yearly the interest to the principal; and at the end of that period purchasing an annuity for his own life, or the joint lives of himself and wife, with the accumulated sum: then —

£		£	s.		£	s.
10	If he saves {	366	3	which will purchase an annuity for a person aged 50 years, or for two lives of that value, of	29	0
15		549	5		43	10
20		732	7		57	17
25		915	9		72	5
30		1098	10		86	15
40		1465	1		115	15
50		1850	18		144	11
60		2197	1		173	11
70		2563	5		202	9
80		2929	8		234	7
90		3295	12		260	6
100		3661	16		289	4

7786. *By commencing master-gardener, and beginning to save at twenty years of age*, a gardener, or even a common laborer, may attain the same advantages as to independence; but with inferior domestic comforts, as he cannot afford to spend so much annually; and with less enjoyment from literary and intellectual sources, because his time for previous improvement is reduced one half; and in the after part of his life, as he will only be able to obtain inferior situations, he must calculate on laboring personally. If he begins at twenty, however, and saves till he is fifty, the additional time will bring his smaller sums to very nearly the same totals as those of the more accomplished gardener: thus —

£		£	s.		£	s.
5	If he saves {	280	8	which will purchase an annuity for a person aged 50 years, or for two lives of that value, of	22	2
8		448	12		35	6
10		560	16		44	5
15		841	4		56	9
20		1121	12		88	11
25		1402	0		110	15
30		1682	8		132	17
35		1962	16		155	0
40		2243	4		177	2
50		2804	0		221	10
60		3364	16		255	15
65		3645	4		288	0

7787. *These calculations being made at the rate of 4 per cent. interest, and the Northampton valuation of life*, (by which a man at 50 is estimated to live 18 years longer, while in London only 16 years,) must be considered as low rather than otherwise.

7788. *The vulgar reason why a young man ought to save money is*, that he may get together as much as may enable him to collect some furniture and get married. This, however, may be called saving to produce want and misery. A young loving couple, anxious to consummate their first wishes, will not be very nice in the quantity or quality of their furniture. All they consider necessary is accordingly often acquired before either are twenty. Housekeeping and propagation are commenced; and thus the foundation laid of a life of hard labor, scanty food, and their attendants, bad temper, and often disease. After twenty-five years of bustle and distraction, half a score of children have been produced, and are most probably growing up in rags and ignorance; and all that this couple can say is that they have struggled hard to create nine times as much misery as that by

which they are themselves oppressed. If the man had limited himself for twenty-five years to making the heads of pins, he might have accumulated as much as would have made him independent and comfortable, and still had sufficient time before him to marry, and enjoy the comfort and solace of a wife and children. But the use of a wife to a gardener, and to every man who is not independent, ought to be chiefly as the operative partner in his domestic establishment; to prepare his food, and keep in order his lodging and clothes. If, in addition to these duties, she has cultivated, or will cultivate her mind so as to become interesting as a companion, so much the better; and if the parties further think that they can attain their object of independence, and rear one or two children, let them do so. Universal sources of happiness should never be rejected, when they can be retained.

KALENDARIAL INDEX.

THE almanac time in this kalendar is calculated for the meridian of London; but as a kalendar of nature is given for the metropolitan district, the almanac time may, in every part of the empire, be varied to suit the local climate and vegetation.

In general, other circumstances being alike, four days may be allowed for every degree, or every 70 miles north or south of London: in spring, operations may be commenced earlier in that proportion southwards, and later northwards; but in autumn the reverse, and operations deferred as we advance southwards, and accelerated as we proceed to the north. In every case allowing a due weight to local circumstances.

JANUARY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	35 9	6	29 56	1.957 inch.	A cold January is reckoned seasonable. The gardener, during this month, does not labor in the garden more than five hours a-day; allowing one hour more for early and late attendance on hot-house fires, and seven hours for sleep, there remains eleven hours for personal improvement. Let the young gardener, who is ambitious of distinguishing himself from the common clay of his profession, not let one of these hours run to waste, 7751.
Edinburgh	34 5		29 194	2.994	
Dublin -	29 92		29 721	2.697	

1. Kalendar of animated nature round London.

In the first week: shellless snails (*Helix*) and earth-worms (*Lumbricus terrestris*) appear.

Second week: redbreast (*Motacilla rubicola*) whistles, nuthatch (*Sitta europæa*) chatters, misel-toe-thrush (*Turdus viscivorus*) sings, and wagtails (*Motacilla alba et flava*) appear.

Third week: the common lark (*Alauda arvensis*) congregates.

Fourth week: snails (*Helix hortensis*) and slugs (*Limax aler et hyalinus*) abound in sheltered parts of gardens; the hedge-sparrow (*Motacilla modularis*) whistles, the large titmouse (*Parus major*) sings, and flies appear on windows.

2. Kalendar of vegetable nature round London.

In the first week: some plants accidentally in flower; and others, as the laurustinus, continued from December.

Second week: winter aconite (*Eranthis hyemalis*), Christmas-rose (*Heleborus fatidus*) in flower, and hazel (*Corylus avellana*) catkins beginning to appear; common honeysuckle (*Lonicra periclymenum*) buds begin to appear.

Third week: primrose (*Primula vulgaris*) flowers in sheltered places; daisy (*Bellis perennis*) and chickweed (*Alsine media*) begin to flower.

Fourth week: mezezon (*Daphne mezereon*) begins to flower; and sometimes spurry (*Spergula arvensis*), pansy (*Viola tricolor*), white scented violet (*Viola odorata*), archangel (*Lamium rubrum*), and colts-foot (*Tussilago purpurea et odorata*) show blossoms.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) early frame and Charlton peas about the beginning, and some dwarf marrowfats about the end of the month. (3601.) Early mazagan and long-pod beans in the first week (3616), and the last. (3617.) In the last fortnight, on a sheltered border, sloping to the south, the hardy green Egyptian, early and brown Dutch lettuces. (3970.) On a similar border, in the first and second week, early dwarf short-top radish; in the last fortnight, the salmon-colored. (3760.)

Protect (2206.) by temporary coverings, newly sown seeds, as lettuce, endive, celery, &c.

Transplant (2079.) strong plants of the brassica tribe carrots, parsneps, &c., to run for seed.

Dig (1864.) and trench (1870.) vacant ground in dry weather.

Prepare (1970.) composts and manures. Attend to neatness (2359.), by picking up all dead leaves, and removing all plants killed by the frost, &c. (2355. to 2373.)

Insects, &c. (2276.) Destroy slugs, set traps for mice, and remove all larvæ, webs, eggs, &c.

4. Hardy fruit department.

Plant (2077.) fruit-trees in general, in open weather.

Protect (2206.) newly-planted trees from frost and drought by mulching (2098.); fig-trees by fronds or mats, if you have neglected this business in October. (4861.)

Prune (2110.) apples, pears, plums, cherries, gooseberries, currants, and raspberries, preferring mild weather, or only moderate frosts. Prune first such trees as stand in compartments or borders that you wish to dig or dress (2579.); apricots in the last fortnight, if very mild. (4535.) Loosen the extremities of the shoots of such trees as it is not proper to prune at present, and wash them with soap-suds and sulphur, or scalding water if insects are suspected. (2276.)

Dig (1864.) and stir the earth round trees which have been pruned; trench ground intended for trees.

Stake newly planted trees. (2098.)

Clean trees from moss, mistletoe, &c. (2624.) Guard against hares, by tarring or lime-whiting their stems, or tying thorns round them. (2292.)

Destroy (2280.) insects by washes, or hot water, applied both to walls and trellises, and to the trees.

Fruit-room and cellar. (2298.) Look over the fruit in open boxes or shelves, and pick out decayed or tainted ones; but do not touch the casks of fruit in the cellar. (2299.)

5. Culinary hot-house department.

Glass case without heat. (2686.) Sow radishes, lettuce, carrots, small-salads (3399.); and peas and beans for transplanting. (3616.)

Hot-beds and pits. (2678.) Prepare for making up hot-beds for early cucumbers (3178.) and melons (3281.), if you have not begun in November. Sow early radishes, and small-salading on slight hot-beds. (4078.) Sow carrot on a slight hot-bed, to produce a crop for drawing in April and May. (3400.) Kidneybeans, peas, potatoes (3367. 3681. 3683.), &c. may be sown and planted on slight hot-beds in small pots, to fit them for transplanting. (7446.) Force asparagus (3349.), sea-kale (3366.) and tart-rhubarb (3366.), on hot-beds, or in pits, or in the open garden. (3398. and 4263.)

Pinery. (2697.) Give air and water sparingly to pines; sow kidneybeans; take in strawberries.

Forcing-houses. (2940. and 3063.) Give air and water, and, according to the progress your trees have made, increase your stimuli of every description. Attend to kidneybeans and strawberries, wherever you have any stove-room. (3367. and 3358.)

6. Flower-garden. — Open ground department.

Plant (2077.) dried roots of border-flowers, if not

done before; but defer planting bulbs of the finer florists' flowers till February, unless the weather is very mild. (6302.)

Transplant (2079.) daisies, and other edgings, if the weather is fine, and it was not done before. (6528.)

Protect (2206.) choice plants by matting, litter, cases of wicker-work, old bark, and all other proper means, observing to do it with due attention to neatness in this department of gardening. (2359.) Attend to the finer sorts of tulips, which will emerge from the ground by the end of the month; hoop them over, and apply mats. (6252.) Ranunculuses and anemones, which have been planted in November, will require a similar attention. (6270.)

7. Flower-garden. — Hot-house department.

Glass case without heat. (2686.) Attend to the alpine (6537.): they should have air every dry day, and must, in very severe weather, be protected by mats, and even litter, to imitate their native snow covering at this season. Mignonette and other prolonged annuals, as stocks, sweetpeas, &c. will require similar attention. (6486.) Look to choice auriculas (6375.) and polyanthuses (6398.); keep them plunged in frames in old tan, or, what is better, saw dust, or ashes. In general, never attempt to keep a potted plant through the winter in a cold frame, unless it be plunged, or the pots be standing very close together.

Hot-beds and pits. (2678.) Begin to force roses (6218.) and other shrubs, and hardy flowers, as well as bulbs, if you have not begun in November: put bulbs in blowing-glasses. (6503.)

Green-house. (6211.) Minim. temp. for this month, 40 deg., max. at fire-heat, 44 deg. See that the most delicate plants be in the warmest part of the house, in so far as is consistent with other arrangements: give air freely in fine weather, and water at all times sparingly. (6212.)

Dry-stove. (6176.) Min. temp. for this month 45 deg. with fire-heat; water very sparingly, but give air every fine day. (6212.)

Bark, or moist stove. (6214.) The minimum temperature for this department, with fire-heat, may be 58 deg. and maximum 70 deg.: water and give air with discretion.

8. Pleasure-ground and shrubbery.

Plant (2077.) most sorts of deciduous trees in fine weather, and deciduous hedges. (6838. and 6816.)

Prune (2110.) native and naturalised deciduous shrubs and trees (6884.); cut deciduous hedges (6899); attend to the weather: only the very hardiest natives are to be cut during frosts and snows. (6889.)

Digging. (1864.) Continue this operation in the interior of masses and groups, as well as in the shrubberies and other screen plantations. Where the exterior abounds with flowering shrubs and plants, it should have been dug in autumn, and must not be deferred till next month.

Dress turf (6191.) and gravel (1957.): the former may be done in moist, but the latter only in dry weather.

Form and repair lawns and turf verges, in mild weather. (2100. and 2101.)

9. Trees. — Nursery department.

Lay out (6973.) ground for a nursery, if not done in autumn; gather all manner of tree-seeds. (6982.)

Dig (1864.) and *trench* (1870.) vacant ground between the rows of plants, which are to stand a year longer: fill up any vacancies as you go along. (7470.)

Lift (2081.) plants fit for planting out.

Prune (2110.) nursery plants before planting: do this in sheds, and keep the roots covered with matting or moss.

Gather (2292.) cones of the larch and other firs, and of the pine tribe. (6984.)

Protect (2306.) beds of germinating seeds with straw or litter; put other tender seedlings in pots under frames, or mats and hoops, from birds, mice, snails, and other vermin. (2220.)

Rotting-ground (6979.): turn over the different layers frequently, and see that none of them are soaked with water.

Seed-loft and cellar (6980.): look to all the sorts of seeds in these departments; whether buried in sand, or in heaps, layers, baskets, drawers, or bags.

Destroy (2280.) vermin, and, in bad weather, cut and paint tallies and prepare parchment labels, number-sticks, hooks for laying, &c. (1517.)

10. Trees. — Permanent plantations and park-scenery.

Prepare (6817.) ground for grove or screen plantations; for useful strips; for detached, and for hedge-row trees; and planting in general. (6878.)

Plant (2077.), in dry weather, deciduous trees, Scotch pine, and larch fir. (6997.)

Prune (2110.) deciduous trees, and also larch fir and Scotch pine groves (6892.), hedge-row trees, and indeed deciduous forest-trees in every form (6884.); cut and plash, repair and renovate, and complete hedges of deciduous plants or trees. (6917.)

Enclose and fence (6820.) ground intended to be planted (6822.) by posts and rails in all weathers (6820.); but by mortar walls, in mild weather only. (6823.)

Fell (6954.) timber-trees, where the bark is no object.

Thin (6905.) crowded plantations, distinguishing between such as consist of sorts fit for barking, or transplanting, and sorts for consumption in any of the usual forms of young trees, or coppices (6906. and 6915.), and otherwise prepare for planting the more extensive (6817.) sites. (6820. to 6851.)

Excavate and remove ground for forming pieces of water, &c. (1945. and 7217.)

FEBRUARY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London	42 3	5	29 94	0.873 inch.	This month (the <i>spring or sprout kale month</i> of the Saxons) is usually subject to much rain, or snow; ei her is accounted seasonable: the old proverb being, "February fill like with either black or white." Early forced articles, and especially cucumbers and peaches, require great care during this month; when the sun does not appear for several days, danger is to be apprehended from damps, and at other times from chills.
Edinburgh	36 6		29 55½	1.269	
Dublin	43 78		30 091	2.24	

1. Kalendar of animated nature round London.

In the first week: bees (*Apis mellifera*) come out of their hives, gnats (*Culex*) play about, insects (*Insectæ*) swarm under sunny hedges, and the earth-worm (*Lumbricus terrestris*) lies out; hen-chaffinches (*Fringilla*) flock, and the song-thrush, or throistle (*Turdus musicus*), and common lark (*Alauda arvensis*) sing.

Second week: the buntings (*Emberiza alba*) and linnets (*Fringilla linota*) appear in flocks; sheep (*Ovis aries*) drop their lambs; geese (*Anas anser*) begin to lay.

Third week: rooks (*Corvus frugilegus*) begin to pair, and resort to their nest-trees; house-sparrows (*Fringilla domestica*) chirp, and begin to build; the chaffinch (*Fringilla œlebs*) sings.

Fourth week: the partridge (*Tetrao perdix*) begins to pair, the blackbird (*Turdus merula*) whistles, and the field and wood larks (*Alauda arvensis et arborea*) sing; the hen (*Phasianus gallus*) sits.

2. Kalendar of vegetable nature round London.

In the first week: the snowdrop (*Galanthus nivalis*), whin (*Ulex europæus*), white deadnettle (*Lamium album*), polyanthus (*Primula veris*) flowers; and the elder (*Sambucus nigra*), and some roses and honeysuckles, begin to expand their leaves.

Second week: common crowfoot (*Ranunculus repens*), dandelion (*Leontodon taraxacum*), and the female flowers of hazel (*Corylus avellana*) appear.

Third week: veronica agrestis in flower; many of the poplar and willow tribe show their catkins; and

also the yew (*Taxus baccata*), alder (*Alnus communis*), the tulip (*Tulipa*), crown-imperial (*Fritillaria imperialis*), and various other bulbs, boldly emerging from the ground.

Fourth week : the erica carnea, wood strawberry (*Fragaria vesca*), some speedwells (*Veronica*), the groundsels, and sometimes the stock and wall-flower (*Cheiranthus*), in flower. Some sorts of gooseberries, apricots, and peaches, beginning to open their buds.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) radishes at twice or thrice (3760.); round-leaved spinach twice (3771.), lettuce for succession (3970.), peas and beans in the beginning and end of the month (3601. and 3616.); some early cabbages to replace any plants of the last August sowing; at the end of the month, red cabbage. (3492. and 3518.) In the last week savorys (3519.); in the last fortnight dill, chervil, and fennel (4097. to 4109), early Horn carrot near the end of the month (3718.), early Dutch turnip in the last fortnight (3698.), small salads every fortnight (4078.), onions for a full crop in the last week, and a few leeks at the same time. (3816. and 3835.)

Temporary coverings. (2306.) Cover with litter, fronds of spruce and silver fir, mats, and other means, as circumstances may require.

Plant (2077.) Jerusalem artichokes (3692.), chives, garlic, shallots (3838. to 3847.), horse-radish (4113.), licorice (4245.), and potatoes. (3676.)

Propagate, by rooted offsets (1983.), mint, balm, sorrel, penny-royal, tansy, tarragon, fennel, and burnet. (4081. to 4131.)

Transplant (2079.) for seed, if it was not done in autumn, the *Lrassica* tribe, onions, carrots, turnips, beet, celery, endive, parsneps, and leeks.

Dig (1864) and *trench* (1870.) vacant ground in moderate weather, and perform all other operations of this kind only in dry weather.

Destroy insects by the usual means. (2280.)

Store-room. Look over onions, and other dried roots. (1704. and 1705.)

Tool room. See that tools are always cleaned before being laid by at this season. (1706.)

4. Hardy fruit department.

Plant (2071.) all sorts of fruit-trees, when the weather is fine (4361.) : strawberries towards the end of the month. (4717.)

Protect roots of new-planted trees by mulching (2693.); tops of apricot, plum, peach, and nectarine trees coming into blossom. (2266.)

Prune (2110.) apricots, peaches, and nectarines, before the blossom-buds are much swelled (4480. to 4550.); apples and pears before the end of the month (4369. and 4433.) : finish vines (2965.), and nail them, and also gooseberries, currants, and raspberries. (4634. 4670. 4680. and 4696.)

Prepare ground for planting (2077.) : spring-dress strawberry-plants; dig and dress ground where the trees are pruned; support newly planted trees with stakes (2098.); clear the bark of trees of moss, &c.; fence orchard trees where sheep, cattle, or hares may be expected. (2624.)

Destroy insects. (2280.)

Fruit-room. (2238.) Keep continually examining the loose fruit, whether in the open shelves, or close drawers : remove all tainted specimens.

Fruit-cellar. (2299.) Such fruit as is put up in close casks, and sealed or plastered up to exclude the air, will require no farther attention than keeping out extreme frosts, so as the temperature may stand between 32 and 40 degrees.

5. Culinary hot-house department.

Glass case without heat. (2686.) Sow lettuces, small salads, &c. as in last month (3399.), plant potatoes. (3381.)

Hot-beds and pits. (2678.) In the first week begin to force cucumbers and melons : in general, the beds now set to work produce finer fruit than those put in action sooner. (3164. and 3271.) Continue sowings of salads (3399.), and kidneybeans (3367.); begin or continue to force asparagus, potatoes, sea-kale, tart-rhubarb, &c. (4203.); sow a few seeds of early cabbage and cauliflower plants for early planting.

Mushroom-beds. Protect established beds, and spawn new ones (3430.) : keep up the heat of all hot-beds by linings. (1976.)

Pinery. (2697.) Attend to the proper temperature (2847. and 2872.) : pines want little air or water at this season. See that suckers on dung-heat are not too moist.

Forcing department. (2940.) If you have not begun before, this is a very good time to commence with most sorts of fruits, peaches, cherries, vines, &c. Set in strawberries and other plants in pots, also fruit-trees and shrubs, and plant kidneybeans; apply stimuli by degrees, but, having once begun to excite, do not decline, otherwise you produce an injurious check to vegetation. See to the stems of vines which are outside the forcing-houses and stoves which are at work. (3012. and 3031.)

6. Flower-garden. — Open ground department.

Sow (2071.) a few hardy annuals in the last fortnight, if the weather be fine : most of the sorts are better deferred till the end of March. (6307.) Mignonette and ten-weeks' stocks, in a warm border, to be protected in severe weather. (2206. and 6486.)

Propagate hardy plants from the root and herb; but September or March are better seasons. (6490.)

Plant dried roots, when the weather is open and dry. (6301.)

Transplant (2079.), if the last fortnight be fit weather, the hardier biennial and perennial border-flowers. (6490. and 6505.)

Shelter and protect (2066.) by all the usual means; but take care not to exclude air and light a moment longer than is absolutely necessary.

Prepare vacant ground for plants and trees, also composts for plants in pots. (1981.)

Bees. Feed such hives as are weak. (1748.)

7. Flower-garden. — Hot-house department.

Glass case without heat. (2686.) Dress select auriculas, and cover them at night to promote their growth (6376.); sow ten-weeks' stocks, and mignonette, for successional supply. (6218. and 6486.)

Hot-beds and pits. (2678.) In the last week, prepare for tender annuals, continue to force bulbs, and the usual sorts of border-flowers and Dutch roots in dung-beds and pits heated by fermentable substances, steam, or by smoke-flues. (6503.)

Green-house. (6211.) Minimum heat for this month, 40 deg. maximum, with fire-heat, 44 deg. Give air freely in fine weather, but water sparingly; the alternate drying by fire-heat, and then macerating by watering, is a sure way of killing tender plants in small pots.

Bark, or moist stove. (6214.) Give air whenever the thermometer rises to 70 deg. or under it, if the sun shines, keeping up your fire and bottom heat. Begin to propagate by the usual modes; attend to neatness and routine culture.

Dry-stove. (6176.) Min. 45 deg., max. with fire-heat, 50 deg. Give water and air as in January.

8. Pleasure-ground and shrubbery.

Plant (2077.) deciduous trees and hedges, as in January; deciduous shrubs after the middle of the month. (6138. 6160. and 6189.)

Prune (2110.) as before, finishing most sorts by the middle of the month, if possible. (6190.)

Dig (1864.) as before, and include the flower and shrubbery borders towards the end of the month. Sweep and roll gravel-walks and lawns (6191.); trim the edges of verges with a weeding-iron; remove mosses and weeds everywhere. (6201.)

Form and prepare lawns and gravel-walks, as directed for last month. (2100. and 2101.)

9. Trees. — Nursery department.

Fruit-trees. Sow kernels and fruit-stones (7011. and 7016.); lay quince, walnut, and mulberry trees; plant cuttings of the gooseberry, currant, and elder. Lay or graft the berberry, hazel-nut, and filbert. 7031.) Preserve cuttings of the vine and fig in dry earth (4809.); plant suckers of the raspberry; prepare for grafting. (2043.)

Ornamental shrubs. Sow hardy deciduous sorts; lay and plant cuttings, and take off suckers for propagation; plant out in nursery rows, and prune deciduous kinds. (7031.)

Forest trees. (6982. to 7031.) Sow mountain ash, hornbeam, wild cherry, hawthorn, ash-keys, hazel-nut, acorns, walnuts, Spanish and horse chestnuts, &c.

Sett March & April but more thin

holly and yew in the last fortnight. Plant cuttings of poplar, elder, and willow; lay in seedling larches; gather pine and larch cones. (6982.)

Fork up (1872), *dig* (1864), or *trench* (1870.), between nursery rows, not intended for removal this season (7037.); weed and remove decayed leaves, attending as much as possible to order and neatness. (2359.)

10. Trees. — Permanent plantations, and park-scenery.

Plant (2077.) fences of deciduous trees (6820.); forest trees of all the deciduous sorts, in mild

weather; ornamental deciduous sorts, not very tender, in fine weather.

Prune (2110.) deciduous sorts, excepting such sorts as are apt to bleed, as the wild cherry, birch, and sycamore, or the resinous and evergreen tribes, which are best pruned in summer, autumn, or late in spring.

Thin and fell timber and young trees, as for last month: remember not to touch bark-woods this month. (6905. and 6954.)

Operate (1862.) on ground, with a view to forming roads, pieces of water, and other effects of landscape-gardening. (7195.)

MARCH.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	46 4	4	30 20	0.716 inch.	The beginning of March usually concludes the winter; and the end of the month is generally indicative of the succeeding spring; according to the proverb, "March comes in like a lion, and goes out like a lamb." The Saxons called this month the <i>lengthening month</i> , in allusion to the increasing of the days. The most laborious period of the gardener's year is the last half of this month; and the first fortnight of April.
Edinburgh	41 7		28 886	1.455	
Dublin -	44 09		29 707	2.364	

1. Kalendar of animated nature round London.

In the first week: the ring-dove (*Columba palumbus*) coos, the white wagtail (*Motacilla alba*) sings, and the yellow wagtail (*Motacilla flava*) appears; the earthworm (*Lumbricus terrestris*), and the snail (*Helix*), and slug (*Limax*), engender.

Second week: the jackdaw (*Corvus monedula*) begins to come to churches; the tomtit (*Parus caeruleus*) makes its spring note; brown wood-owls (*Strix ulula*) hoot; and the small tortoise-shell butterfly (*Papilio urticae*, L.) appears.

Third week: the marsh titmouse (*Parus palustris*) begins his notes; various flies (*Muscae*) appear; the fox (*Canis vulpis*) smells rank; the turkey-cock (*Meleagris gallo-pavo*) struts and gobbles.

Fourth week: the yellowhammer (*Emberiza citrinella*) and green woodpecker (*Picus viridis*) sing; rooks, ravens (*Corvi*), and house-pigeons (*Columba*) build; the goldfinch (*Fringilla carduelis*) sings; field-cricket (*Scrabæus*) open their holes; and the common flea (*Pulex irritans*) appears.

2. Kalendar of vegetable nature round London.

In the first week: various species of the pine, larch, and fir tribes in full flower; the rosemary (*Rosmarinus officinalis*), the willow (*Salix*), and bay (*Laurus nobilis*), in blossom; various trees and shrubs beginning to open their buds.

Second week: the common honeysuckle (*Lonicera periclymenum*) and some roses in leaf; crocus vernus, and other subspecies, and some scilla; in flower; pilewort (*Ficaria*) and creeping crowfoot (*Ranunculus repens*), hepatica and elder (*Sambucus nigra*), sometimes in leaf.

Third week: saxifraga oppositifolia, draba verna, daphne pontica and collina, and lonicera nigra, in flower.

Fourth week: the peach and nectarine, apricot, corchyrus japonicus, pyrus japonica, crown-imperial, saxifraga crassifolia, buxus sempervirens, and other plants in warm situations in flower, or just advancing to that state.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) the main crops of most esculents. Drum-headed and Scotch cabbages for field-culture. (3492.) Peas (3601.), beans (3616.), lettuce (3970.), spinach (3771.), and small salads every fortnight. (4079.) Indian cress (4119.), a few savoys (3519.) for an early crop; and towards the end for a full crop. Onions (3816.) for a full crop; and leeks (3835.), some red and white cabbage (3492. and 3512.), full crops of carrots (3718.) and parsneps. (3727.) Asparagus in the third week. (3862.) Cauliflower in the last fortnight, for a full crop (5848.); bore-coles (3529.), and Brussels sprouts for autumn and winter crops. (3524.) In the last fortnight, sea-kale (3902.), cardoons (3933.), turnips (3698.) celery (4003.), alisanders (3950.), and most culinary aromatics, as parsley, dill, fennel, &c. (4081.) In the last week, summer savoys (3519.), and mustard for seed. (4027.)

Plant (2077.), in the first fortnight, horse-radish (4114.), licorice (4245.), chives, shallots, and garlic (3810.), old store onions, as scallions or small bulbs for a full crop of large bulbs. Jerusalem artichokes and sea-kale, and in the last fortnight, potatoes for a full crop. (3676.)

Temporary coverings (2206.): continue these as in last month.

Propagate edible perennials by slips and offsets (1988. and 1989.)

Transplant the brassica tribe, lettuce, and asparagus. Fill up vacancies. (2496.)

Dig, &c. as in last month (1864.) from composts and earths in heaps or hills. (1977. and 1981.)

Destroy insects. (2280.)

Store-room. Remove decaying articles, and admit plenty of air, &c. (1704. and 1705.)

4. Hardy fruit department.

Plant (2077.) fruit-trees in general. The fig (4851.) and mulberry may now be planted. (4607.) Finish planting gooseberry-trees before the middle of the month, and currants and raspberries by the end. (4642. 4670. and 4696.) Alpine and wood strawberries may be planted, though autumn is preferable. (4717.)

Protect roots by mulching (2098.), and trees coming into blossom by the usual means.

Prune (2110.) till the middle of the month; but finish then if possible. If not, apricots may be pruned till the 5th (4532.), peaches and nectarines till the 15th (4498.), gooseberries to the 7th, red and white currants to the 10th or 12th, and the black currant to the 20th. (4646. and 4675.)

Dig and dress between rows of currant-trees, and other fruit-trees where this operation has not been done before. Dress any strawberry beds you have not been able to do before. (4719.)

Destroy insects. (2280.)

Fruit-room. (2298.) Examine the fruit in the room; take care not to leave open the door of the cellar so as to raise its temperature above 40 degrees.

5. Culinary hot-house department.

Glass case without heat: Sow kidneybeans to receive a few weeks' protection. Remove frames from cauliflower-plants. (3545.)

Hot-beds and pits. (2678.) Go on with hot-beds for cucumbers and melons. (3164.) Sow a few turnips on a gentle hot-bed to come in early. (3399.) Sow all sorts of culinary annuals. Give air and apply linings to maintain the proper temperatures. (1976.) Attend to pine suckers and crowns; shift any that may require larger pots, and examine the roots of such as are sickly. (2718.)

Pinery. (2697.) Keep sowing kidneybeans, and filling spare corners with strawberry-pots for succession. See that your bark-pit be in proper heat, and attend to the temperature for this month, and the other points of culture. Pines are now generally shifted. (2918.)

Forcing department. (2940.) Attend to the culture of each particular kind; and generally to keep down insects by watering; promote setting of fruit by air, and encourage growth by steaming or filling the house with vapors by powerful fires and waterings over the leaves and every part of the house.

6. Flower-garden. — Open ground department.

Sow (2071.) hardy annuals (6507.) in the second, third, and last week; and some of the more robust half-hardy annuals about the end of the month. (6513.) Such biennials as flower the same year, as honesty, scabious, bastard rocket, sweet allyson, clary, Chinese hollyhock, and Indian pink. (6505.) Biennials in general, and also perennials towards the end of the month. (6493.)

Propagate by rooted slips and offsets; but next month is preferable for rootless slips and cuttings. (2063.)

Plant dried roots: finish with the anemone and ranunculus in the first fortnight. (6256. and 6875.)

Transplant annuals from the patches in the borders, and biennials and perennials from the flower-garden nursery, into their final sites. (6110.)

Shelter choice border and all florists' flowers in severe weather. (2206.)

Dig, dress, hoe, rake, &c. only in dry weather. Clean up all borders, and prepare vacant ground. (1864. to 1881.)

Bees. Feed weak hives as in last month. (1748.)

7. Flower garden. — Hot-house department.

Glass case without heat. (2686.) Take care of alpine and prolonged annuals, remove all weeds, and be discreet in your waterings. (2078.) Cover auricula-frames in very severe nights (6375.); by keeping them rather warm at this season they will come up with fine tall stalks to support their magnificent trusses. Sow half-hardy annuals for transplanting, they will come into flower as soon as those sown in the open air last month. (6513.) Take care of the hardy succulents. (6592.)

Hot-beds and pits. (2678.) In the first fortnight sow half-hardy annuals on a slight hot-bed for transplanting to come in first. (6513.) Sow tender annuals at any period of the month. (6725.) Plant tuberoses in pots for forcing. (6323.) Force roses and other flowering or odoriferous shrubs and all desirable hardy flowers in pots. Sow seeds of greenhouse and hot-house plants to be propagated in this way. Plant cuttings for the same end. (2063.)

Green-house. (6211.) Make no fires unless the thermometer, in the open air, falls to 35 deg.; 45 deg. with fire-heat will be a good medium heat in this month. Begin to propagate by cuttings. (6627.)

Dry-stove. (6176.) A good medium heat for this month will be 55 deg. which may be kept up with very little fire-heat. Give water moderately, but see that what you do give wets the earth, and does not escape between the ball and the edge of the pot. Give air freely in fine weather.

Bark, or moist-stove. (6214.) Give air in general, as in last month. If you wish to promote a vigorous growth, shift your plants into a rich compost, water over the top about three o'clock, and then shut the house close up for the night. Do this only when the temperature has been up to 80 deg. (2205.)

8. Pleasure-ground and shrubbery.

Plant (2077.) deciduous trees and shrubs, also deciduous hedges; finish as early as possible, unless

the season be unusually backward. Evergreens of the hardier sorts towards the end of the month. (6541. and 6572.)

Prune (2110.) deciduous trees and cut hedges, and finish this work as early as possible. In pruning plants, where the chief object is their flowers, attend to their mode of bearing these. In short, never begin to cut a tree before having a clear and distinct idea of what you wish to attain—is it health, shape, size, leaves, shoots, flowers, or roots?

Dress winter and autumn dug shrubberies. Mulch, stake, water, and attend to neatness. (2359.) Dress and roll turf and gravel; attend to the margins with the turf-raser. (1317.)

Form and repair gravel-walks. In some situations imitation gravel-walks require to be turned every two or three years and partially renewed. (1960.)

9. Trees. — Nursery department.

Fruit-trees. Sow kernels for stocks; lay the vine and the fig (4808. and 4848.); plant cuttings and eyes of the vine in the open air, or in pots, to be placed in a moist heat. Graft towards the middle of the month, or sooner or later, according to the season. Plant out seedling stocks in nursery rows. (7031.) Head down newly budded and grafted trees not intended to be removed. (2039.)

Ornamental trees and shrubs. Sow seeds of the hardier sorts. Evergreens may be sown in the last week. Finish laying deciduous kinds, plant cuttings and suckers, and graft some rare sorts towards the end of the month. Plant out layers, cuttings, and suckers in nursery rows. (7031.)

Forest trees. (6982.) Sow nuts, keys, and berries, and also birch and alder seed. In the last fortnight begin to sow evergreens. Plant cuttings, suckers, &c. as in February. Plant out from the seed-bed or cutting-border in nursery lines. Dig between the rows of trees and shrubs not intended to be removed this season.

Weed, hoe, rake, and stir the surface in fine weather. Dig between nursery lines, where the plants are not to be removed. (6982. to 7031.)

Shelter and protect from cold, birds, and vermin. (2206. and 2289.)

10. Trees. — Permanent plantations and park-scenery.

Plant all sorts of deciduous trees and shrubs, the Scotch pine and larch fir. (6983.) Towards the end plant most sorts of evergreens. (6572.) Hedges of evergreens. Fill up blanks in plantations of two or more years' standing.

Head down trees intended to stole for underwood, or to produce single leaders for timber-trees or poles. (6829 and 6894.)

Fell and thin trees and copse; but the barking sorts not till the end of the month, when they will part with the bark. (6941.)

Sow forests and woods; about the middle of the month is a good time, as the crows, rooks, and other vermin will be less likely to annoy the seeds, having the farmer's progeny to attack. (6828.)

Operations on ground, and masonry, may now go on with the utmost vigor; the days having attained a sufficient length, and the weather being generally dry: external brick walls for gardens, however, are better deferred till May, when all danger from frost will be over.

APRIL.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	49 9	3	29 77	1.460 inch.	The weather of this month is distinguished by the rapidity of its changes. It is generally stormy, interspersed with gleams of sunshine, hail, snow, some frost, and occasionally violent storms of wind. Fruit-tree blossoms and half-hardy plants require protection and particular attention during this month. The young gardener, while at work, may study the germination and foliation of trees, and the gaiety and delicacy of newly expanded foliage.
Edinburgh	46 3		29 873	2.414	
Dublin -	51 125		29 909	2.561	

1. Kalendar of animated nature round London.

In the first week: the viper (*Coluber berus*) and woodlouse (*Oniscus asellus*) appear; the mistletoe-thrush (*Turdus viscivorus*) pairs; frogs (*Rana*) croak and spawn; and moths (*Phalænæ*) appear.

Second week: the stone curlew (*Charadrius aedicularis*) clamors; young frogs (*Rana temporaria*) appear; the pheasant (*Phasianus*) crows; the trout (*Salmo trutta*) rises; and spiders (*Aranæ*) abound.

Third week: the crested wren (*Motacilla regulus*) sings; the blackbird (*Turdus merula*), raven (*Corvus corax*), pigeon (*Columba domestica*), hen (*Phasianus gallus*), and duck (*Anas boscha*) sit; various insects appear; and the feldfare (*Turdus pilaris*) is still here.

Fourth week: the swallow (*Hirundo rustica*) returns; the nightingale (*Motacilla lucinia*) sings; the bittern (*Ardea rotellaria*) makes a noise; the house-martin (*Hirundo urtica*) appears; the black-cap (*Motacilla atricapilla*) whistles; and the common snake (*Coluber natrix*) appears.

2. Kalendar of vegetable nature round London.

In the first week: the daffodil (*Narcissus pseudo-narcissus*), the garden-hyacinth (*Hyacinthus orientalis*), the wallflower (*Cheiranthus cheiri*), the cowslip (*Primula officinalis*), the periwinkle (*Vinca*), sloe (*Prunus spinosa*), and various other herbs and trees in flower.

Second week: the ground-ivy (*Glechoma hederacea*), gentianella (*Gentiana acaulis*), pulmonaria virginica, the auricula, iberis sempervirens, cynoglossum omphalodes and most of the common fruit-trees, and fruit-shrubs in flower.

Third week: some robinia, andromeda, kalmia, and other American shrubs; daphne laureola, ulmus campestris, chrysosplenium oppositifolium, mercularia perennis, and other plants, in flower.

Fourth week: the beech (*Fagus*) and elm (*Ulmus*) in flower; ivy-berries drop from the racemes; the larch in leaf, and the tulip and some white narcissi and fritillaries in flower.

3. Kitchen-garden.—Culinary vegetables.

Sow seakale for a full breadth; lettuce, small salads, and radishes, twice or thrice in the month. Peas and beans (3501. and 3617.), broccoli thrice (3555.), borecoles in the first week (3529.), cabbages and savoy twice (3492. and 3519.), spinage for succession (3771.), turnips twice (3698.), silver-skinned onions every three weeks during summer for drawing; onions, leeks, and cardoons, in the first week, for a general crop (3929.); celery, in the first fortnight, for a general crop (4003.), mustard for seed (4027.), carrots, in the second or third week, for a main crop (3717.), kidneybeans, in the second week, for an early, and in the last week for a late crop (3634.); asparagus and parsneps, in the first or second week, but not later (3727.); red beet, in the third week, for a full crop, and also nasturtiums, salsify, scorzonera and skirret (3740.) Sow culinary aromatics and herbs, if not done in March. (4131.)

Propagate by bulbs and dried roots. (1987.) Finish planting the main crops of potatoes. (3576.)

Propagate perennial culinary plants by slips and offsets, as all the pot-herbs, aromatics, &c. (1988.)

Transplant lettuce, cabbages, seakale, celery, and cauliflowers. (2079.)

Dress artichoke and asparagus beds, or compartments. (3925. and 3884.) Hoe and thin spinage, onions, turnips; earth up cauliflowers and cabbages, seakale for blanching, peas, beans, and potatoes. Stick peas, tie up lettuces, destroy weeds, and stir the ground in fine weather. (2591.)

Attend to insects, and to the store-room. (2280. and 6980.)

4. Hardy fruit department.

Plant cherries, plums, apples, and pears, till the 10th; apricots and gooseberries till the 5th; peaches and nectarines till the 15th; but defer till autumn what you cannot accomplish by this period, unless the season is unusually backward. (2077.)

Protect as in last month. (2206.)

Prune, if you have delayed it; but expect vines to bleed, and stone-fruits in general to be much injured by the operation, if not performed very early in the month, and even that is too late. In the last days of the month, rub off the buds of vines which appear where you do not wish shoots. (4326.)

Routine culture. Water, mulch, stake, and fence. Weed strawberry-beds, and pinch off runners, where you do not wish to have young plants.

Destroy insects, and especially the thrips, which will begin to appear on forward peach-trees; pick off caterpillars. (2280.)

Fruit-room. Turn, pick, wipe, and air the more choice dessert fruits; and look also to the baking apples and pears. (2298.)

Fruit-cellar. Attend to the temperature, and never break open a cask till you are in want of its contents. (2299.)

5. Culinary hot-house department.

Glass-case without artificial heat. If the season is backward, sow in the first week kidneybeans, to be protected till the weather is mild. (386.)

Hot-beds. Continue preparing a succession of beds for ridging and hilling out cucumbers and melons. Sow, transplant, shift, &c. all esculents, or pot-herbs, which are tender annuities, as gourd, basil, love-apple, capsicum. Maintain the proper degrees of

heat by linings. See to pine-suckers. Plant crowns and suckers taken off in the winter. (2712. to 2717.)

Pinery. Attend to routine culture: shift the plants, reinforce the bottom heat, water and give air as judgment founded on experience, reflection, and vigilant attention shall direct. The pine is a very difficult plant to kill, but it requires constant and powerful heat, and rich loamy soil, and also water more abundantly than is often given to it, to produce large, well flavored fruit; attend to minor articles grown or forced in the pinery, as vines, fruit-trees in pots, cucumbers, kidneybeans, and strawberries. (3338.)

Forcing department. All that it is proper, in our opinion, to say here, is "guard against supineness: there is much less danger from your ignorance than from your indifference or want of vigilance." (2360.)

6. Flower-garden.—Open ground department.

Sow annuials; all the sorts for a main crop, or for a succession, if you have sown them in March (6507.); half-hardy annuials in warm borders there to remain. (6513.) Biennials and perennials should be sown as early in the month as possible.

Propagate by rooted and unrooted slips and offsets. (1988.)

Transplant all sorts from the nursery to the borders (2079.); tender and half-hardy annuials from the hot-beds to the borders. (6503.)

Routine culture. Weed, hoe, rake, stir the surface, remove all decayed leaves and stalks as soon as the plants have done flowering, unless you select a stalk or two occasionally for seed. Never leave all the flower-stems for this purpose, and seldom all the pods or seed-vessels which are on a stem, as that would weaken the plants.

Protect your auriculas from the extremes of every description of weather: if placed on a stage facing the north, or set on a shaded paved platform about three feet high, they will be better than if continued in the frames. (6383. and 6384.)

Destroy insects, and especially pick the grubs from the leaves of rose-trees: if you do not attend to this, you will have no blow worth looking at. (2280.)

7. Flower-garden.—Hot-house department.

Glass case without artificial heat. Alpines may now be entirely uncovered, and also prolonged annuials and most half-hardy sorts; a few half-hardy annuials may still be sown, if not done in proper season. (6513.)

Hot-beds and pits. Shift frequently such tender annuials as you mean to come to a handsome size, more especially balsams. (6481.) Sow more seed, if you have not enough of plants; plant out some in the borders to grow strong broad plants, especially balsams and combs in very warm situations. Plant tuberose roots, and shift those which are coming forward, if they appear to be stinted in their growth. (6323.) Attend to pots of cuttings, and seedlings from either of the following departments (6683.):—

Green-house. Fire-heat may generally be dispensed with in this month. Go on propagating by all the methods in use; this is the fittest season of the year: a good deal depends on taking off, making, and putting in the cuttings, but nothing will answer, if constant attention is not paid to keep them in a medium state as to air, heat, and moisture afterwards. (6634.)

Dry-stove. No fire will here be necessary, excepting when the thermometer in the open air is under 40 deg. or 42 deg. Propagate by the usual means, which in general for succulents is cuttings; attend to bulbs now coming into flower. (6654. and 6658.)

Bark or moist stove. Go on, as in last month, shifting, propagating, and stimulating as the nature of the different hot-house plants requires, and as your views or duties inculcate: never forget neatness, and removal of dust, insects, &c. (6685. to 6716.)

8. Pleasure-ground and shrubbery.

Plant (2077.) such sorts of deciduous shrubs as you deemed too tender to plant last month; but finish this work in the first week. Plant a few roses as late as you can, in order to retard their coming into bloom: or, if you can afford the time and room, place potted roses in the ice-cold cellar in autumn, and do not take them out till the August following, by this means you will have a fine show in October

and November (6554.) Evergreens, the hardiest sorts at the beginning, and the less so at the end of the month. (6572.)

Prune such deciduous shrubs as you have neglected last month; evergreens from the middle to the end of the month. (6884.)

Form and repair lawns, by procuring and laying turf, and by sowing grass-seeds. Where it is desired to destroy moss on extensive lawns, fold sheep till it be trod down and killed by pressure and manure; on small lawns, roll. In shady, damp situations, however, moss makes a better lawn than grass, and it should be encouraged by forming the surface of lawns of bog earth in all situations where grasses do not thrive, as in towns, under close trees, &c. Mow established lawns twice a-month; attend to gravel and margins. (6191.)

9. Trees. — Nursery department.

Fruit-trees. (4361.) Finish sowing kernels for stocks, or new varieties. Plant cuttings of the vine, fig, gooseberry, and currant, if it has been unavoidably delayed till this unfavorable season. Graft the pear, plum, and apple. (2013.) Attend to newly grafted trees, and repair cracks in the clay, or renew such balls as may have dropped off; eradicate all suckers, and pinch off shoots that protrude below the grafts.

Ornamental trees and shrubs. Finish sowing deciduous sorts, as early as possible. Sow cedars, cypresses, and other ornamental evergreens about the end of the month. Sow in pots or boxes, or in shady borders of soft peat earth. Transplant evergreens. (6982. to 7037.)

Forest trees. Finish sowing common tree-seeds,

and commence with the resinous tribe, the larches, firs, and pines; the cypresses, arbor-vitas, &c. Finish planting deciduous trees in nursery rows, as early as possible. (7007.) Evergreens may be transplanted during the month. Kiln-dry the cones of the cedar and fir tribe, but not of the pine tribe: and get the seeds out in time for sowing the end of this month or beginning of next. (6984.)

10. Trees. — Permanent plantations and park-scenery.

Sow for forests and woods, and all sorts of profitable plantations in masses. Observe it is rather late for nuts, berries, and keys, but this is the proper season for small seeds. (7016.)

Plant evergreen trees, as pine, fir, cedar of Lebanon, holly, and yew during the month; but finish planting deciduous sorts as early as possible. (7007.) Wherever the plants are to be, or have been long out of ground, take good care to dry up their roots, by exposing them as much as you can to the sun and air; do not be nice in planting.

Routine culture. Begin to hoe and clean the ground in plantations, which have been made on prepared ground. Crop the ground in newly made plantations, where cropping is intended.

Operations on ground or rocks may now be prosecuted with vigor. This is also one of the best months for building. Road-making, draining, fencing, &c. are advantageously performed during this and the two preceding months. But improvements can neither be well designed nor executed after the trees are covered with leaves, and the ground's surface and qualities disguised by luxuriant herbageous vegetation.

MAY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	56 61	2 5	30 02	0.794 inch.	Vegetation now goes on with great vigor, though there are often very cold and even frosty nights, which materially injure exotics, natives of the warmer climates, such as the potatoe, dahlia, kidneybean, &c. The human animal, in common with most others indigenous to our climate, is generally in high spirits and vigor during this month. Woe to the young gardener who exhausts his spirits in any other way than in self-improvement.
Edinburgh	50 4		29 585	1.945	
Dublin -	52 193		30 061	1.812	

1. Kalendar of animated nature round London.

In the first week: the titlark (*Alauda pratensis*) sings; the cuckoo (*Cuculus canorus*) is heard; the gudgeon (*Cyprinus gobio*) spawns; the redstart (*Motacilla phænicurus*), swift (*Hirundo apus*), white-throat (*Motacilla sylvia*), and stinging-fly (*Conops calcitrans*) appear.

Second week: the turtle-dove (*Columba turtur*) coos; the red ant (*Formica rubra*), the laughing wren (*Motacilla curruca*), the common flesh-fly (*Musca vomitoria*), the lady-cow (*Coccinella bipunctata*), grasshopper-lark (*Alauda locustæ vocæ*), and willow-wren (*Motacilla salicaria*) appear.

Third week: the blue flesh-fly (*Musca vomitoria*, var.) appears; black snails (*Helix nigra*) abound; and the large bat appears.

Fourth week: the great white cabbage-butterfly (*Papilio brassicæ*) and dragon-fly (*Libellula 4-maculata*) appear; the glow-worm shines; and the fern-owl, or goat-sucker (*Caprimulgus europæus*), returns.

2. Kalendar of vegetable nature round London.

In the first week: geum urbanum, artemisia campestris, lily of the valley (*Convallaria majalis*), water-violet (*Hottonia palustris*), tulip-tree (*Liriodendron tulipifera*), and numerous other plants, in flower.

Second week: the oak, ash, sweet chestnut (*Fagus castanea*), hawthorn (*Mespilus oxyacantha*), the common maple (*Acer campestre*), horse-chestnut (*Æsculus hippocastanum*), barberry (*Berberis vulgaris*), and the ajuga reptans in flower.

Third week: the water scorpion-grass, or forget-me-not (*Myosotis scorpioides*), lime-tree (*Tilia*), milk-wort (*Polygala vulgaris*), nightshade (*Atropa belladonna*), and various American shrubs, in flower; and rye (*Secale hybernium*) in ear.

Fourth week: oaks, ashes, and beeches now generally in leaf, and the mulberry (*Morus nigra*) beginning to open its buds; the cinnamon-rose and

some other hardy roses in flower; and also the bramble (*Rubus fruticosus*), moneywort (*Lysimachia nummularia*), columbine (*Aquilegia vulgaris*), and various other trees and shrubs, in blossom.

Kitchen-Garden. — Culinary vegetables.

Sow hardy aromatic herbs, if not done last month. Small salads four times in the month for a complete succession. Radishes and lettuce thrice. (3760. and 3970.) Peas and beans once a-week. (3601.) Spinage once a-fortnight. (3771.) Carrots, for late drawing, twice in the month. (3718.) Borecole, in the first week, for a second main crop. (3529.) Dwarf kidney-beans, in the first week, for a full crop in July; in the last fortnight, for crops in August and September. (3633.) Borecole and Brussels sprouts for the last crop, and German greens to come in for spring. Savoys for the last crop. (3519.) Onions for drawing, young leeks to be late transplanted, cauliflowers in the second and third weeks for a Michaelmas crop. (3542.) The less hardy aromatic herbs, and pumpkins, the last fortnight. (4207.) Cucumbers for picklers on a dry warm border, in the last week. (4876.)

Protection. Continue this, nightly, for kidney-beans and tender plants transplanted from hot-beds. (2906.)

Propagate by bulbs and dried roots. If abundance of potatoes have not been planted, effect this as early as possible; in late situations they may be planted till the middle of June. (3676.)

Plant slips and offsets.

Transplant the brassica tribe, lettuce, celery, radishes, and other plants for seed. (3079.)

Routine culture. Stick peas, top early crops of beans, and also of peas; earth up cabbages, beans, peas, potatoes, &c. Thin, weed, hoe, and stir the surface among seedling crops. Water in dry weather, support stems, pinch off all decayed leaves, &c.

Destroy insects and vermin. (2280.)

4. Hardy fruit department.

Plant strawberries, if it has not been done last month. (4717.)

Prune what trees you have neglected, and run the risk of losing, or leave them unpruned till autumn as a proof of vigilance and skill. (2360.) Summer prune vines, peaches, and other early shooting trees against walls, and such gooseberries as are planted there to produce upon early fruit. (2522.) Remove all suckers, excepting selected ones of raspberries, and pinch off strawberry runners as directed for last month. (4717.)

Routine culture. Mulch, protect, and water where necessary. Water strawberries over the herbage, and especially after the fruit is set. (4717.)

Destroy insects, especially snails and caterpillars. On the first symptoms of the leaves rolling up, unroll them and pick out the grub before it does further mischief. Take special care it does not get at the petals of apple and pear blossoms. (2280.)

Fruit-room. Look over the fruit of every description which the increase of temperature will now cause to taint rapidly. (2298.)

Fruit-cellar. Open a few casks of such dessert apples and pears as are now wanted for the table. Close them as soon as you have taken out the proper quantity, and let them still remain in the cellar. (2298, and 2299.)

5. Culinary hot-house department.

Glass case without artificial heat. Remove glasses from cauliflowers and kidneybeans, according to the weather. Sow capsicum under frames or hand-glasses in a warm border. (4271.)

Hot-beds. Go on with hot-beds for frames for melons, and build dung-ridges for growing cucumbers under hand-glasses. (3262.) Sow cucumbers and melons for late crops, and attend to the various particulars in their culture. Attend to air, water, shade, insects, &c.

Pinery. Attend particularly to your fruiting plants, give abundance of heat and water, and keep down all manner of dirt, insects, &c. (2906.) Attend to minor articles cultivated in the pinery, and to routine culture of every kind. Think and act for yourself; kalendars too often mislead the ignorant who rely on them implicitly, not considering that no two cases are ever to be found alike. (2607.)

Forcing department. Produce the required temperatures, and attend to all the parts of good culture and neat management. (2611. and 2940.)

6. Flower-garden. — Open ground department.

Sow annuals of all sorts for succession. Biennials in the nursery compartment for a stock for next year. (6507. and 6513.)

Propagate, especially by cuttings from the stalks, as of wallflower, rocket, &c. (6505.)

Take up bulbs and tuber roots, as crocus, hyacinth, lily, &c. (6501.)

Transplant, as directed for the last month, stocks and other sorts in pots for winter. (2079.)

Protect tulip-beds and all rare florists' flowers from the midday sun, the rain, and the winds. (2206.)

Routine culture. Hoe, rake, &c., weed, and clear away dead leaves. Do not neglect whenever rain has battered the ground, to stir it up and refresh it as soon as it is nearly dry. Stir the surface round close patches of annuals, and refresh and top-dress all pots of prolonged annuals, now in full flower or in seed. Keep all the primula tribe rather dry at this season, and in the shade of a north wall. Plunge the pots in ashes or sawdust.

Destroy insects, and pick the grubs off roses. Detach seed-pods from all plants you do not wish to ripen seeds. Water, thin, and shade with judgment, and keep a vigilant eye to order and neatness. Shut yourself up in your room for two entire days, or go from home a similar time, and when you return and look over the garden you will see many things that would have escaped you, had you gone on plodding day after day. Remember that such things are seen by others, and that though all may appear to you in good order, to another there may be much slovenliness and confusion. (7437. to 7439.)

Store-room. Lay up crocus and other bulbs and roots till wanted in the autumn.

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. These will now be chiefly employed with annuals in pots, for prolongation and in striking from cuttings, &c. (2063.)

Hot-beds. (2678.) Go on as directed last month with your tender annuals. Plant a few tuberoses for succession. (6323.) Attend to cuttings and seedlings from the hot-house and green-house departments. Shift and transplant as occasion requires. (2079.)

Green-house. Give abundance of air every day, and in mild nights leave some all night: water over the top, and shut the house in the afternoon when you water. This invigorates growth wonderfully.

Propagate as before. Shift most of the plants, examine their roots.

Dry-stove. (6176.) Give abundance of air. Fires will not now be wanted. Look to bulbs, as soon as they have done flowering. Shift all such as require it, putting them into larger or smaller pots, according to their state, and your object.

Bark, or moist stove. (6214.) Give abundance of heat, air, and water, if you wish the plants to grow and flower vigorously. (6638. to 6716.)

8. Pleasure-ground and shrubbery.

Plant deciduous trees and shrubs, but only to fill up a vacancy, or to cause a check for the purpose of late flowering. Immediately after performing the operation, mulch, shade, and water. (2098.) Evergreens, especially the more tender sorts, but finish by the middle of the month. (6997.)

Prune (2110.) evergreens, finishing by the middle of the month. (6997.)

Routine culture. Hoe, rake, weed, water, stake, shade, shelter, &c. as circumstances require. Roll and mow once a-week, if showers are frequent, but once a-fortnight will do in dry weather.

Lay down turf, if not completed before, water well and roll immediately afterwards. (2101.)

Gravel-walks may still be formed and repaired, but the work should have been completed last month. Roll well with a heavy roller. (1356. to 1968.)

9. Trees. — Nursery department.

Fruit-trees. (4361.) Look over grafted trees.

Ornamental trees and shrubs. Sow the seeds of evergreens and American sorts, in the first and second weeks of the month. Lay and graft the tenderer sorts of evergreens and Americans. Plant out tender evergreens and Americans in nursery rows, or in pots, for more convenient removal. (6562.)

Forest trees. Finish planting out evergreens, seedlings, and nurslings as early as possible. Sow poplar and willow seeds as soon as gathered. These seeds will not come up if kept a very few days out of the ground. (7024.)

Protect from all sorts of garden enemies, and attend to order and neatness. (2206. and 2256.)

10. Trees. — Permanent plantations and park-scenery.

Planting evergreens may still go on, if the weather is dull and moist, but the sooner it is finished the better. (6977.)

Pruning. Sang recommends this as a good season for pruning old oaks, because the wound heals quicker while the sap is flowing.

Fell oak woods and coppices, and other barking trees, but complete the operation about the middle of the month, or before. (6941.)

Routine culture. Attend to planted ground under, or to be put under, light culinary crops. (7037.)

Prepare ground for autumnal planting or forming of plantations by sowing, as the tree-seeds ripen. (6817.)

Operate on ground for water, or other territorial improvements. Continue to build and execute plans determined on at an earlier season.

JUNE.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London	63 22	2	29 93	0.332 inch.	The weather is sometimes cold at the beginning, but is generally agreeable and steady towards the middle of the month. By observing the column indicating the greatest variation of the thermometer in each month, it will be seen that it varies, in London, only two degrees in June, which is less than in any of the preceding months. In July and August the variation is the same; but in March and October it is twice as much.
Edinburgh	57 2		29 666	1.935	
Dublin	58 76		30 06	0.860	

1. Kalendar of animated nature round London.

In the first week : the sedge-sparrow (*Passer arundinacea*), the fly-catcher (*Muscicapa atricapilla*), the wasp (*Vespa vulgaris*), and several species of bee and butterfly appear.

Second week : the burnet-moth (*Sphinx filipendulae*) and forest fly (*Hippobosca equina*) appear; bees swarm.

Third week : several flies, butterflies, moths, beetles, and other insects appear.

Fourth week : insects abound; and singing-birds begin to retire to the woods, and leave off singing.

2. Kalendar of vegetable nature round London.

In the first week : water-lilies (*Nymphaea et Nuphar*) flower; also iris pseud-acorus, anthemis cotula, polygonum persicaria, malva rotundifolia, and numerous other plants.

Second week : the vine, raspberry, and elder in full flower; also various Scotch roses (*Rosa spinosissima*), broom (*Spartium*), nettle (*Urtica*), and wheat in the ear.

Third week : the orchis, epilobium, iris xiphium and xiphoides, the hardy ixie and gladioli, and a great variety of garden and field plants in flower; also the wheat and many of the pasture grasses.

Fourth week : some black and red currants ripe, strawberries in abundance; young shoots of trees and shrubs have nearly attained their length; oats and barley in flower; blue-bottle, scabious (*Centaurea cyanus*), and numerous others, in bloom.

3. Kitchen-garden. — Culinary vegetables.

Sow peas and beans once a-week or ten days. (3601.) Cucumbers for picklers. (4876.) Gourds in the first week. (4211.) Small salads and lettuce every week or ten days. (4078. and 3964.) Radishes and spinage in the first week. (3771.) Kidneybeans every fortnight, for succession. (3633.) Endive about the 10th or 24th, for the main autumn and winter crops. (3981.) Chervil twice in the month for summer use, also purslane. (4088.) Cabbages, of quick-growing sorts, for summer and autumn consumption, about the beginning and middle of the month. (3492.) Turnips in the first week, for succession; and in the second and third week for a full autumn crop. (3698.) Carrots (3717.) twice, for drawing young. Broccoli and borecole, in small portions, for succession, late in spring. (3553. and 3557.) Onions to be drawn young.

To save seed. Mark out cauliflowers, lettuces, &c. and let them send up their flower-stems. (3553.)

Protect when and where necessary. (2206.)

Propagate by bulbs, roots, offsets, slips in showery weather. (1987.)

Transplant (2079.) the brassica tribe, cardoons, endive, lettuce, and other plants and herbs, also plants reared in hot-beds.

Routine culture. Tie up garlic and rocambole leaves in knots to check the progress of the flower-stalk. Stick and top peas; top beans; earth up finocchio to blanch; also white beet. Thin, hoe, weed, and stir the ground as before. Support with stakes, and water as far as practicable; in dry weather.

Taking crops. (2290.) Cut and dry herbs for winter use. Gather ripe seed. Discontinue cutting asparagus at the end of the month.

4. Hardy fruit department.

Prune and train the summer shoots of all descriptions of wall and trellis trees. (2110.)

Thin out the summer shoots of fruit-shrubs, and of all fruit-trees, excepting high standards, which do not require this nicety. (2576.)

Routine culture. Mulch, water, fasten by stakes, weed, hoe, and rake where wanted. Throw nets over cherry-trees and protect the fruit from the birds. Water strawberry plots every day in dry weather, desisting a little as the fruit begins to ripen.

Destroy insects. Strew sulphur over the mildew, water for the acarus; direct a stream of tobacco smoke against the aphids and thrips, but depend on your fingers for the thorough eradication of grubs, which, at this season, are by far the most mischievous of garden enemies. (2280.)

Fruit-room and cellar. As in last month. (2298.)

5. Culinary hot-house department.

Glass case without artificial heat. Raise hand-glasses over cucumbers on props, and train out the runners, in the second or third week. Ridge out melons in good earth, in the last fortnight; cover with mats till the end of the third week. (3328. and 3329.)

Hot-beds. Keep up adequate temperatures for ripening the fruits by linings. Reinforce melon ridges with linings. Train, prune, and impregnate as circumstances require. Attend to air, water, shade, and even nightly coverings after cold days. Keep up proper linings to your beds of pine-suckers.

Pinery. Attend to what was stated last month. If you want extraordinary large fruit, and do not mind losing the suckers, apply the usual means, viz. heat, water, and removal of all stem and root suckers. (2829.)

Forcing department. See last month. Keep up successive supplies of kidneybeans, strawberry, and fruit-trees in pots. (3338.)

6. Flower-garden — Open ground department.

Sow a few hardy and half-hardy annuals for succession, as before. (6507. and 6513.)

Propagate, by cuttings, such plants as are proper for this purpose, as they go out of flower. Pipe and lay pinks and carnations towards the end of the month. (6406. and 6440.)

Take up bulbs and other tuberous roots, dry them in the shade and remove them to boxes or drawers in the store-room, wrap the finer sorts in papers. (6501.)

Transplant (2079.) annuals in the borders and in pots for autumn and winter flowering. Biennials and perennials may also be transplanted into nursery rows at this season, or even where they are finally to remain.

Routine culture. Mow, weed, hoe, rake, thin, stir, and dress; and keep up as complete an appearance of polish and high keeping as your strength of men and other means will permit. (6191. to 6201.) Shade, shelter, water, and attend to carnations coming into flower. Destroy earwigs and all manner of insects. (2280.) Go round the garden frequently and examine everything minutely, and reflect on what might be done to promote its growth and beauty. To aid you, imagine it to be a garden which you were sent to criticise, and to be paid according to the number of faults you found. Or imagine it your neighbor's garden, or the garden of some one you hate. (7438. and 7439.)

7. Flower-garden — Hot-house department.

Glass case without artificial heat. Propagate the dianthus tribe by pipings under hand-glasses and frames. (6406.)

Hot-beds and pits. Put pots of carnations and pink pipings in gentle heat, it will facilitate their striking. (6406. and 6440.) Do not forget to give head-room to your balsams and other tender annuals, which should now be noble-looking plants. Attend to pots of cuttings and seedlings; also to young stove plants put into this department for more rapid advancement.

Green-house. As soon as the mulberry comes into leaf remove the plants to a fit situation in the open air. Some plunge them in ashes; but the major part set them on scoria, gravel, or pavement, in a partially shaded situation, a cold bottom and a certain degree of shade are essential to their well-doing. (6635.)

Dry-stove. (6176.) Give abundance of air night and day, but be moderate as to water. Cease to water bulbs soon after they have done flowering; let them go slowly into a state of hybernation, and then take them out of the pots and dry them.

Bark, or moist stove. Increase your heat with the lengthening day, and prolonged sun, and by consequence increase the concurring agents of vegetation. Propagate by the usual means; save seeds where you can; destroy insects, and attend to neatness. (6688. to 6705.)

8. Pleasure-ground and shrubbery.

Prune and regulate summer shoots, and take off suckers where not wanted to extend the bush or propagate the species. (6190.)

Routine culture. Weed, hoe, rake, stir the surface, support climbers, regulate the shoots of creepers, &c. Water and roll any new-laid gravel to combine it properly with the rest. Dress, roll, and mow lawns and turf in every form. Keep your eyes open to every part of the grounds at this season; for now perfect neatness and the utmost polish and high keeping is expected. Do not trust to what you are told to do in calendars, but think for yourself: calendars frequently make mere machines of gardeners; for though man is a thinking animal, yet he is also a lazy imitative animal, and will not exert himself in any way, and not even think, unless urged on by some strong motive. All your faults will be discovered, sooner or later, and rely on it you will receive a proportionate disgrace from your neighbors or visitors; if you are attentive to your duty your merits will be discovered in like manner, and you will receive appropriate credit and reputation, which is your capital stock in trade, on which you depend for your livelihood. (2372.)

9. Trees. — Nursery department.

Fruit-trees. Begin budding during the last fortnight. Look over all your newly grafted and all other trees; rub off superfluous, irregular, or ill placed shoots and suckers, and tie weak grafts and dangling shoots from budded stocks to neat stakes. (2039.)

Ornamental trees and shrubs. Lay the summer shoots of roses, hard-wooded evergreens, and other

sorts which are proper to be propagated in this manner. Put in cuttings of young wood properly ripened at the lower end. Bud rare sorts. (2056.)

Forest trees. Collect and sow elm-seed in the third or fourth week; or if you do not wish to sow it, lay it in the store-loft. (7023.) Seedlings of the more choice pines may be thinned where too thick, and the thinnings planted and shaded about the end of the month. (6997.) Gather Scotch elm-seed from the middle to the end of the month. (7203.) Attend to kitchen crops among transplanted trees, and in vacant places in general. (7037.)

10. Trees. — Permanent plantations and park-scenery.

Fell oak-coppices, if it has not been done before. The middle of this month will prove a better time, as to the trees, than the middle of May, as they will not bleed so much: but the bark will not peel so well. (6941. to 6957.)

Prune and thin the side shoots of the present season, from established trees. (6884.)

Routine culture. Stake newly planted tall hedge-row trees, where not done before. Attend to weeds everywhere, and to ground under-crop. Prepare ground for autumn sowing or planting.

Operations on ground and buildings are carried on at this season with less advantage than in the three preceding months. The ground is hard and difficult to penetrate; and the moisture in new built masonry dries too rapidly.

JULY.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	66 3	2	29 89	2.194 inch.	This was called <i>hay month</i> by the Saxons, and in it are more plants in flower than during any other. The young gardener should now devote a considerable portion of his time to collecting and drying specimens, duplicates, and triplicates, in order to acquire a stock to exchange with brother-gardeners or naturalists; or with booksellers, apothecaries, students, schoolmasters, and clergymen, for the loan of books, and for aid and instruction in study.
Edinburgh	60 6		29 445	2.546	
Dublin -	61 13		29 929	2.614	

1. Kalendar of animated nature round London.

In the first week: the cuckoo (*Cuculus canorus*) leaves off singing; the stone-curlew (*Charadrius ædinenus*) whistles occasionally late at night; and the golden-crested wren (*Motacilla regulus*) now and then chirps.

Second week: the quail (*Tetrao ferrugineus*) calls; the cuckoo-spit, or frog-hopper (*Cicada spumaria*), abounds.

Third week: young frogs migrate; hens moult.

Fourth week: the great horse-fly (*Tabanus bovinus*) appears; and partridges fly.

2. Kalendar of vegetable nature round London.

In the first week: enchanter's nightshade (*Circæa lutetiana*) and lavender (*Lavandula spica*) in flower, and pinks and carnations in full bloom.

Second week: the fallen star (*Tremella nostoc*) appears, also puff-balls (*Lycoperdon bovista*), and sometimes the common mushroom (*Agaricus campestris*).

Third week: raspberries and gooseberries ripe, potatoes in flower, asparagus in berry, the lilliums in perfection.

Fourth week: the truffle (*Tuber cibarium*) now hunted or dug up in commons and forests; nightshade (*Solanum nigrum*), devil's bit (*Scabiosa succisa*), burnet-saxifrage (*Pimpinella saxifraga*), and a great number of plants in flower.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) salads and lettuce in shady situations, for successional crops. Turnip-radish for an autumn crop. (3760.) Kidneybeans, in the first week, for a late full crop. (3633.) Peas and beans, in the first week, and a fortnight afterwards try a small sowing for a late crop. (3601.) Endive, in the first week, to come in at the close of autumn; in the third week, for a winter crop. (3981.) Broccoli, before the 10th, for a late spring crop. (3557.) Fenchio, for succession, in the first fortnight. (4099.) Round-leaved spinach, in the first week, in a shady border for a succession. (3771.) Triangular-leaved, or prickly spinach, in the last week, in poor ground to stand the winter. (3775) York and sugar-loaf cab-

bages, in the first week, for autumn use, and in the last week, for winter and spring. (3499.) Carrots, in the first week, in a shady border. (3718.) Turnips twice or thrice, in showery weather. (3698.) Welch onions; for autumn onions, sow the bulbing sorts in the last week to stand the winter. (3816.) Coriander and borage for young crops. (4222. and 4127.)

To save seed. Mark out the brassica tribe, and other esculents in perfection, and let them shoot up flower-stems.

Propagate by slips, offsets, &c. where not done before, and where plants have completed their inflorescence, and are to be cut down as tarragon and other pot-herbs. (4093.)

Transplant (2079.) as before, and include celery and celeriac, endive, &c.

Routine culture. Stick and top peas and kidney-beans, top common beans, train cucumbers and gourds, earth up the leguminous crops and potatoes; hoe, thin, and stir the surface wherever necessary, among all descriptions of crops; water, as far as your time will permit, and particular crops require.

Taking crops. (2290.) Take up shallots, and dry them for winter use; also romachole and garlic when ready. Gather ripe seeds and onions, and cut herbs in blossom, drying and storing both. Gather the fruit of young gourds for pies, stews, and pickling.

Destroy insects, and ward off vermin. (2276.)

4. Hardy fruit department.

Plant strawberries in the open garden; and in pots for next winter's forcing. (4717.)

Prune, train, thin, and regulate all the summer shoots of wall and espalier trees, and dwarf and tall standards. (2573.)

Routine culture. Hoe and weed fruit-tree borders. Hang up nets, water and mulch where necessary. Water alpine strawberries, which will now be in full bearing, every third or fourth day, unless in a shady situation.

Destroy (2276.) insects: keep earwigs, ants, boys, and idle women from fruits, as cherries, &c. approaching to a state of ripeness.

Fruit-room. (2298.) This will now be empty; clean and wash every part of it, and air it well for occasional summer and next winter's use.

Fruit-cellar. (2299.) If you have attended properly to casking up keeping-apples and pears, you will still have a supply, and even of grapes in some cases. If the cellar gets too warm, the casks should be removed to the ice-house.

5. Culinary hot-house department.

Glass case without artificial heat. Plant out melons and cucumbers shading and watering, &c. (3164. and 3271.)

Hot-beds and pits. Prune melons and cucumbers; give air and water, and attend to shading and weeding; collect mushroom-spawn; attend to young pines. (2718.)

Pinery. You will now begin to cut fruit in abundance. See to the stools: earth them up, so as to cause the suckers to strike root: put them into a brisk bottom-heat, and give proper supplies of water. You will thus gain much time, and profit from the expiring strength of the parent plant as long as possible. This is the true way to fruit a pine-plant in eighteen months or even less time. Suckers thus treated will, next spring, be equal to two-year-old plants. (2936.)

Forcing-houses. Expose those houses, where crops are taken, to the natural climate, by removing, as far as possible, the roof, and even the ends and front, if they are moveable. (3110.)

6. Flower-garden. — Open ground department.

Sow a few annuals, for succession, and prolongation in pots through winter. (6507.)

Propagate (6490.) from cuttings of plants going out of flower; from rooted slips of such as are ripening their seed, as auriculars and the primula tribe; go on piping and laying the dianthus tribe. (6412.)

Take up bulbs as they go out of flower: this work should generally be completed by the end of the first week, unless for the lily tribe, the colchicum, and a few others.

Transplant late sowings of annuals, and also biennials and perennials, into nursery rows. (2079.)

Routine culture. Eradicate all weeds the moment they appear: keep the surface always fresh, and rather rough, never smooth and battered. It is better to have little clods and knots of earth, than to have a naked or dug surface as smooth as a table. The clods and knots make variety of light and shade, and are besides more favorable for the admission of air, heat, and water to the roots. Shade, shelter, and water. Gather seeds as they ripen, and dry them in the seed-room or lofts, the windows being open. Destroy insects; cut out broken stalks, and diseased parts of plants. Cut down stalks which have done flowering, and remove all decayed leaves.

Gather flowers neatly with a knife, and so as not to disfigure the plant. (6196.) Gather in general from the reserve-garden, so as not to disfigure the borders.

Store-room. (1704.) Look over your bulbs now and then, to see that none get mouldy. See also to your newly put-up seeds. (1705.)

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. (2636.) Most of

these, at this season, are given up to the kitchen-garden, or used to protect at nights the tender annuals, some of which, as the humble and sensitive plant, cannot so well be put out in the borders. (6724. and 6725.)

Hot-beds and pits. (2678.) Little use is now made of them by the florist, unless for propagation of stove plants. Attend to cuttings from whatever department. If you are endeavoring to flower the more delicate aquatics, see to the keeping up a regular heat.

Green-house. (6211.) This will now be filled with pots of tender annuals, which only require shifting now and then till of a certain growth; and then only common routine culture.

Dry-stove. (6176.) Some set out a part of the succulent tribe at this season. If you do, let it be in a very warm situation: heavy and continued rains prove very injurious to succulents in the open air.

Bark, or moist-stove. (6214.) Increase the temperature with the increase of light, and add air and water accordingly. Attend to all the minor points of culture. See that the floors or paths of your stoves are swept every day, and wash your plants well with the engine, otherwise they will soon get unsightly. Be sure to dash this water on all plants in blossom, in order to curtail their beauty, and lest they should set fruit.

8. Pleasure-ground and shrubbery.

Prune (2110.) as in last month: box-edgings and evergreen hedges in the last week of this month, if the season is a forward one. (6190.)

Routine culture as in June.

Lawns. (6191. and 6097.) Attend to these, according as the weather may be showery or otherwise. In dry weather, set your men to mowing at three o'clock, and let them rest from eleven till three o'clock: in moist weather the time of the day is of less consequence. In France and Italy, the working gardeners, during summer, may be said to do the principal part of their work early in the morning, and late in the evening.

Gravel-walks. Weed and roll these in moist weather. When dry, and the gravel becomes loose, water and roll. (1957.)

9. Trees. — Nursery department.

Fruit-trees. Attend to budding, and look over your grafted trees; pinch off all obtruding shoots and suckers. (2039.)

Ornamental trees and shrubs. Continue laying summer shoots, and plant cuttings and bud as in last month. (2050.)

Forest trees. Sow elm-seed; attend to weeding and cleaning all beds and rows of seedlings, or other nurslings, and of transplanted trees. (7023.)

10. Trees. — Permanent plantations and park-scenery.

Prune (2110.) evergreens in the last week, if the summer has been so favorable as nearly to ripen the wood.

Routine culture. Attend to kitchen, or field crops, among young plantations; and to large weeds everywhere. Do not forget hedges and other fences: keep all sorts of fences at all times in repair. (6820.) Few operations in landscape-gardening can now be commenced; but some, as excavating for water, &c. may go on.

AUGUST.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	65 85	2	30 06	0·824 inch.	This is the <i>barn, or harvest month</i> of the Saxons; many seeds of herbaceous vegetables ripen in this month, and most sorts of culinary crops, raised in the open garden, are now in perfection. Insects, especially the winged tribes, now abound; and the young gardener should be assiduous in collecting them for the same object as he collects specimens of plants. By carrying a small box in his pocket, he may pick them up while at work.
Edinburgh -	60 6		29 823	1·996	
Dublin -	62 82		30 172	5·558	

1. Kalendar of animated nature round London.

In the first week: flying ants (*Formica*) appear; bees kill their drones; and the swallow-tailed butterfly (*Papilio machaon*) appears.

Second week: young martins (*Hirundo urbica*) and swallows (*Hirundo rustica*) begin to congregate, and swifts (*Hirundo apus*) to depart; the whame, or burrel-fly (*Estrus bovis*), lays eggs on horses.

Third week: the black-eyed marble-butterfly (*Papilio semele*) appears; various birds reassume their spring notes.

Fourth week: the nuthatch (*Sitta europæa*) chatters; the stone-curlew (*Charadrius edicnemus*) whistles at night; the goatsucker (*Caprimulgus europæus*) and young owls (*Strix ulula*) make a noise in the evening; robin-redbreast (*Motacilla rubecola*) sings; and rooks roost on their nest-trees.

2. Kalendar of vegetable nature round London.

In the first week: melilot (*Trifolium officinale*), rue (*Ruta graveolens*), yellow succory (*Picris hieracioides*), and burdock (*Arctium lappa*), in flower; the bread-corns ripe.

Second week: wild clary (*Salvia verbenaca*), meadow-rue (*Thalictrum flavum*), ploughman's spike-nard (*Conyza squarrosa*), and various other natives, in flower.

Third week: the mallow (*Malva*), lavatera, holly-hock (*Alcea rosea*), and lobelias, among the garden-flowers, and the polygonums and potamogetons among the wild plants, now in blossom.

Fourth week: the autumnal crocus (*Colchicum autumnale*), aster, solidago, senecio paludosus, teasel (*Dipsacus fullonum*), and various other plants, in flower; the earlier varieties of all the hardy kernel-fruits ripe.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) turnip for a main crop, in the first week; but sowings made after the 15th seldom fully succeed (3698.); make frequent sowings of small salading, radishes, and lettuce (3760.): the latter for autumn and winter crops. Parsley may now be sown for winter and spring use, this being the most natural season for sowing biennials. (4282.) Some of the large sorts of cabbage, in the first week, to come in in the autumn of the following year and subsequent winter; and early sorts in the first week, for colworts next winter and spring. Spinage, in the first or second weeks, for a main winter crop. (3775.) Carrots in the first and third weeks for drawing young in spring. (3718.) Endive and corn-salad for winter and spring; chervil for a late crop; onions for a full winter crop; angelica, fennel, scurvy-grass, and blessed-thistle for next year. Cauliflowers twice, in the third and fourth week, for crops, to stand over the winter, in sheltered borders, or under frames. American cress, in the last fortnight, for a spring crop.

Propagate (1987.) by slips and cuttings, where necessary.

Transplant (2079.) as in last month, and include leeks, perennial herbs, &c.

Routine culture. Displace the suckers from such artichoke heads as you would grow to the greatest magnitude; stick peas and runner kidneybeans; earth up the brassica and leguminous tribe, and potatoes in so far as requisite. Land up celery, endive, white beet, finocchio, &c. for blanching. Hoe, thin, weed, stir the surface, water, shade, and attend to neatness and order; and clear off all crops the moment they are done with. (2367.)

Taking crops. (2290.) Take up the alliaceous tribes as before; gather pickling cucumbers; cut herbs; gather ripe seeds.

Destroy insects. (2276.)

4. Hardy fruit department.

Plant (2077.) strawberries, as directed for last month.

Prune (2573.), regulate, train, and otherwise arrange the summer shoots of all fruit-trees as directed for last month.

Routine culture. Hoe, rake, weed, and stir the surface under gooseberry compartments, and in general under and around all fruit-trees. Where fruit is beginning to ripen, be very moderate in thinning the leaves. Mat up small fruits on north walls, intended to be preserved till late in autumn; water spring-planted trees in dry weather, also strawberry-plants in blossom and fruit. Dress strawberry-beds that have done bearing. (4726. and 4727.)

Take (2290.) gooseberries and currants, with the fruit-scissors or tongs. Apricots and such wall-fruit as is ripe with the fruit-gatherer. (See figs. 141. to 152.)

Destroy (2276.) insects; the acarus will now be your greatest enemy.

5. Culinary hot-house department.

Glass case without artificial heat. Sow long prickly cucumbers for a late crop, to receive the aid of artificial heat in October and November. Sow in pots, or make layers or cuttings for the same purpose. (3185.)

Hot-beds and pits. (2678.) Recruit the linings of melon-beds, and prune, train, weed, water, and impregnate all the cucumbers.

Mushrooms. Search for spawn, in cow-pastures more especially, and take care of it when hot. (3410.)

Pinery. See last month.

Forcing-houses. (2696.) Most of the forced peaches will now be gathered; fully expose the trees, unless you have so great a proportion of grapes under the rafters, or running along the top of your trellis, as to render it worth while to keep the sashes on to ripen them. It is however better never to have them together in such contending proportions. Cherry-trees and others in pots, and of which the shoots are ripe, should be put in a state of hybernation, by removal to a cold cellar, or shaded border. This will fit them better for a succeeding early artificial spring.

6. Flower-garden. — Open ground department.

Sow (6346.) auricula and other primula seeds in pots and boxes, so as to admit of winter protection. These seeds come up stronger now than if kept till the following spring; and, though they will not flower sooner than the second spring after sowing, yet they will then flower much stronger than plants just a year old. (6347. to 6349.) Mignonette, stocks, and other annuals in pots, for prolongation through the winter. (6486.)

Propagate (1987.) by all the usual means. This is now the best time for taking off rooted slips of the auricula: the Lancashire florists will never touch these till the third day of this month, when their florists' sales commence. (6369.)

Take up bulbs and tuber roots of the few plants which had not ripened their stalks before, as of the martagon and red and white lily.

Plant dried offsets of bulbs, as these from their small size and tenderness, rather suffer from being long out of the ground. Plant autumn-flowering bulbs and Guernsey lily. (6315.)

Transplant (2079.) most sorts of biennials and perennials, and your latest sowings of annuals and half-hardy annuals intended for the borders.

Routine culture. Prepare composts. Hoe, dig, rake, stir, weed, thin, shade, shelter, prop, stick sweetpeas, and other climbers. Water, and gather seeds; mow verges and glades where they exist in the flower-garden, according as you find they require it.

Store-room. (1704.) Look once a-month at your roots and seeds; and gather, dry, clean, and store up seeds as they ripen, attending to name and date each packet or bag accurately.

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. See last month.

Hot-beds. (2678.) Attend to such cuttings as are forwarding in these, and to late crops of tender annuals. Prepare successions of tender annuals for the green-house.

Green-house. (6211.) Attend to your tender annuals; and do not forget creepers, and vines, and such plants as being planted in the ground cannot be turned out. (6647. to 6651.)

Dry-stove. (6176.) About the end of the month, it will be safe to replace such plants as you had ventured in the open air. Any you put in cold-pits, may remain a month longer. (6663. to 6668.)

Bark, or moist stove. (6214.) See last month. Attend to creepers, climbers, and vines, also aquatics, which, if you have a proper aquarium, will now be in great perfection, and highly beautiful. (6180.)

8. Pleasure-ground and shrubbery.

Plant (2077.) evergreens towards the end of the month; water, mulch, and shade, for some days, if very delicate sorts. (2098.)

Prune evergreens (2110.); roses for forcing. (6559. and 6560.)

Routine culture. Hoe, rake, weed, &c. as before. Prepare ground for planting; dress gravel and grass as in June and July.

Form and repair lawns, by turfing or sowing. It is now an excellent season for sowing lawns. See that you make use of the proper grasses, according to the soil and situation. Attend to gravel walks. (1957.)

9. Trees. — Nursery department.

Fruit-trees. (3039.) Finish budding of the late va-

rieties of the stove fruits, before the middle of the month. (2056.) Look over the grafted trees, and slacken the bandages of your earlier and most advanced grafts and buds.

Ornamental trees and shrubs. Plant cuttings of hardy evergreens, as laurel-bay, privet, box, &c. in the last fortnight. (7032.) Provide heath and bog-earth for American and other sorts. (1981.) Go on with budding rare species.

Forest trees. Sow elm-seed, if you have not done it before; or do not choose to defer it till spring. (7025.)

Routine culture. Hoe, weed, &c. and keep every part in perfect order; look to your kitchen-crops and ripening-seeds. Prepare ground from which kitchen-crops have been removed for planting.

10. Trees. — Permanent plantations and park-scenery.

Plant (2077.) evergreens in the last week, if the weather is moist. Water to settle the roots, and mulch and stake according to circumstances. (2098.)

Prune the birch, wild cherry, and maple tribe, at the end of the month, when the leaves are beginning to fall, as they are apt to bud later or earlier. (2110.) Evergreens at the end of the month. (6572.)

Prepare ground for planting next month, either by ploughing, digging, trenching, or pitting, as the case may be. (6816 and 6817.)

Destroy ferns, nettles, and other bulky weeds in park-scenery, by bruising their stems with the weeding-pincers (*fig. 146.*), close by the surface: as cutting them over is found a less permanent check to their flowering again.

SEPTEMBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	59 63	3 5	30 09	0.482 inch.	The temperature begins now to decline and to vary; the nights begin to lengthen, and heavy dews and diminished transpiration and evaporation render artificial watering in the open air less necessary, unless against trees on walls, to keep down insects. Many varieties of fruits ripen during this and the former month, which the young gardener ought to study, and, when he can afford time from other studies, he should make drawings of a few.
Edinburgh	54 5		29 739	3.470	
Dublin -	59 35		30 239	3.021	

1. Kalendar of animated nature round London.

In the first week: young broods of goldfinches (*Fringilla carduelis*) appear; the linnet (*Fringilla linota*) congregates; the bull (*Bos taurus*) makes his shrill autumnal noise; and swallows (*Hirundo rustica*) sing.

Second week: common owls (*Strix flammea*) hoot; the saffron-butterfly (*Papilio hyale*) and willow red under-wing moth (*Phalena picta*) appear; herrings (*Clupea harengus*) are now cheap.

Third week: the ring-ouzel (*Turdus torquatus*) appears; the flycatcher (*Muscicapa atricapilla*) withdraws.

Fourth week: the stare (*Sturnus vulgaris*) congregates; the wood-lark (*Alda arborea*) sings; the woodcock (*Scolopax rusticola*) and fieldfare (*Turdus pilaris*) appear; and the swallow (*Hirundo rustica*) departs.

2. Kalendar of vegetable nature round London.

In the first week: the fungus balotus albus appears; traveller's joy (*Clematis alba*) and parnassia palustris in flower.

Second week: catkins of the hazel and birch formed; blossoms, and green, red, and black berries found on the bramble at the same time; leaves of the sycamore, birch, lime, mountain-ash, and elm begin to change.

Third week: the ivy (*Hedera helix*), laurel (*Prunus laurocerasus*), and furze (*Ulex europaeus*) in flower.

Fourth week: hips, haws, and nuts ripe; leaves of plane-tree (*Platanus*) tawny; of the hazel, yellow; of the oak, yellowish green; of the sycamore, dirty brown; of the maple, pale yellow; of the ash, fine lemon; of the elm, orange; of the hawthorn, tawny yellow; of the cherry, red; of the hornbeam, bright yellow; of the willow, hoary.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) small salads twice or thrice on a south border, chervil, corn-salad, cress of sorts may still be sown to stand over winter. (4032. to 4072.) Radish in the first week for a late autumn crop. (3760.) Lettuce in the first week for standing the winter under a south wall, and under cold-frames. (3970.) Spinage in the first fortnight for use late in spring. (3773.)

Protect cucumbers and melons, at night, by matting or otherwise as the case may be. (3164.)

Propagate (1985.) as in April, culinary herbs and under-shrubs.

Transplant (2079.) all articles intended for use the current autumn, during the first week. The brassica tribe, leeks, celery, endive, &c. for winter and spring use. Seedling cauliflowers, where you think you can ensure their standing through the winter. Try a bed of sandy loam or lime rubbish under a

tree or south wall. (3546.) Make plantations of herbs.

Routine culture. Earth up and stir only in dry weather. Stick, stop, support, cut down, blanch, and thin where you see it necessary; no time is to be lost at this season.

Taking crops. (2290.) Take up potatoes, and do it effectually. Gather pickling cucumbers, onions, nasturtium-seeds, and other pickling articles. Gather herbs and take ripe seed. Remove all decayed leaves, haulm, stems, &c. and the remains of all crops, which have been taken, so as to preserve order and neatness, and make way for other crops or winter fallows. (2600.)

Destroy insects and vermin. (2276.)

Store-room and cellar. Dress, sort, and put up seeds which have been well dried. Finish housing edible bulbs of the alliaceous tribe and potatoes (2298. and 2299.)

4. Hardy fruit department.

Plant (2077.) strawberries for a main plantation, this being the best month in the year for that purpose. (4717.) Pot strawberries for forcing. (3336.)

Prepare ground for planting, and towards the end of the month, if the wood of young peach and apricot trees be ripe you may remove them.

Prune (2110.) and regulate summer shoots, but cut little after the middle of the month. Thin leaves sparingly.

Routine culture. Provide composts for recruiting old borders and forming new ones. Protect choice fruit, especially grapes, from birds and flies. After the crops of wall-trees or compartment borders are gathered, dig and dress the borders. Dress and fork up strawberry-beds.

Take (2290.) peaches, grapes, early apples, pears, plums, &c. the dessert sorts, with fruit-gatherer, and sorts for the kitchen, with the hand gloved. Choose, if possible, dry weather for gathering all sorts of fruit.

Destroy insects, especially acarus, and guard against wasps and large blue flies (2276.)

Fruit-room. (2298.) Lay up apples and pears for keeping a few months; in general, the long keeping sorts ripen late in the season.

5. Culinary hot-house department.

Glass case without artificial heat. Sow small salads under hand-glasses or frames in the last week. (4078.) Take off the glasses from cauliflower-plants in all mild days.

Hot-beds and pits. Attend to late crops of melons and cucumbers; keep up the temperature, and be discreet in the use of water. (3164. and 3271.) Begin to build mushroom-beds, either in or out of doors. This month and March are the two best seasons. Plant suckers and crowns of pines on rotten tan placed on dung, or other fermenting beds or pits.

Pinery. (2697.) You will still have abundance of fruit; attend to what was said in July. Renovate your bark or leaf beds when necessary, and keep up the full heat till your fruit is chiefly ripened off, or

removed (pot and all) to the fruit-room to ripen leisurely. Your young plants will grow faster in this month than in any month of the year.

Forcing-houses. (2696.) Late crops of grapes will be coming in, but most of the forcing-houses will now be in a state of rest. Keep off all the sashes, unless you mean to force very early, in which case cover the house with mats from the sun, and admit air from the north, in order to promote a cool, dry atmosphere as best for hybernation.

6. Flower-garden. — Open ground department.

Sow the primula tribe, if not done last month. (6339. and 6388.) The seeds of most biennials and perennials may be sown this month with advantage, provided you can afford protection to them in winter. On the whole, however, it appears better to defer the business till spring, unless with a few sorts which sometimes lie a whole year before they come up, when sown at that season. Among them may be enumerated columbine, agrimony, chelone, &c. If sown now their seeds will come up the following spring, and they will flower the same season. (6493.)

Propagate (1985.) by all the modes, but more especially from slips, rooted or unrooted, the stalky part of herbaceous plants being now of a proper texture and maturity for this purpose.

Plant crocus and other bulbs, and such autumn-flowering bulbs as you have neglected to plant early in spring. (6501.)

Transplant as in last month. (2079.)

Shelter. (2206.) If the end of the month be wet, hoop and mat such plants as will be injured by over much wet. Among these are the primula tribe and tender annuals planted in groups over the borders; also bulbs, as the tuberose and Guernsey lily, planted or plunged in the borders.

Routine culture. Prepare ground for florists' flowers. Trench and sift the earth where tulips and hyacinths are to be planted, at least three feet deep.

Store-room. See to roots and seeds. (1704.)

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. (2686.) Replace the more tender auriculars in the frames, but keep off the glasses, excepting when it rains.

Hot-beds. See last month. (2678.) Most of the green-house and hot-house plants will now be advanced; remove them to cold-frames, or to the green-house or dry-stove, according to their natures, to harden them gradually. Some may go directly to the stove.

Green-house. The beginning of this month is a fit time to repair, paint, glaze, and clean the flues, &c. of every description of house not in crop. Replace some of the more tender plants from the open air at the beginning, and the whole in the course of the last week of the month. Dress them properly and set them in natural groups, not in the usual method. (See particularly 6536.)

Dry-stove. Replace all the succulents and other plants, which you had put in the open air, and arrange every part of your stage for the winter. If you cannot form natural groups, at least put every genus by itself. (6205.)

Barb, or moist stove. Begin to lessen the stimuli towards the end of the month, in order to harden for the approaching winter. Plant bulbs which have been taken up and dried. Attend to routine culture. (6688.)

8. Pleasure-ground and shrubbery.

Plant (2077.) evergreens generally; deciduous species in the last week.

Prune (2110.) evergreens all the month: deciduous species when the leaves are dropped.

Routine culture as in last month. Remove all decaying flowers that do not bear ornamental seeds or berries. Dress and mow turf, and roll and clean gravel.

Form and repair lawns, or verges, or grassy glades. (3100. and 2101.)

9. Trees. — Nursery department.

Fruit-trees. (2039.) Sow cherry and plum stones for stocks, also peach and almond stones for the same purpose, or for new varieties. Gooseberry and currant cuttings may be planted in the last week of the month, in sheltered dry situations, where they will not be much damaged by alternate frosts and thaws in winter.

Transplant (2079.) stocks from the seed-bed to the lines, where they are to remain to be grafted. Look to the budded and grafted trees. The matting may generally be removed early in the month.

Ornamental trees and shrubs. (6570.) Sow brier and other rose seeds. Plant cuttings of hardy evergreens. Take off layers of the sorts which have been laid two years, or which root well within one season. Plant cuttings of a few of the deciduous shrubs which are most hardy, or of tree-currant, ivy, honeysuckle, yellow-berried elder, &c. Take off suckers, and plant them in nursery rows.

Forest-trees. Gather and sow all sorts of deciduous tree-seeds. If you do not sow them, take them to the seed-loft, or rot-heap for preservation. Plant and prune evergreens, as also the wild cherry, birch, and sycamore. Gather seeds of all sorts now ripe. (6982.)

10. Trees. — Permanent plantations and park-scenery.

Thin woods and coppices; and where the trees are wanted, take them carefully up; if they are large, they should have been previously prepared a year ago. (6955.)

Plant (2077.) deciduous trees, generally, and even the larch, spruce fir, and Scotch pine.

Prepare for planting by fencing and all the subsequent processes. (6820.)

Operate on ground, and recommence building walls or other works belonging to the department of landscape-gardening.

OCTOBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London	52 81	4	29 69	2.027 inch.	Grapes and other late fruits ripen during this month, and some main culinary crops are gathered and housed. A few specimens of plants may still be collected, and many species of the animal kingdom. Not one animated being should be neglected from the worm upwards. Collections of spiders are best made during this month, and the young gardener may continue to dissect and study the pulpy fruits.
Edinburgh	49 7		29 339	3.234	
Dublin	51		29 76	2.708	

1. Kalendar of animated nature round London.

In the first week: the red-wing (*Turdus iliacus*) arrives; snakes and vipers bury themselves.

Second week: hooded crows (*Corvus cornix*) and wood-pigeons (*Columba palumbus*) arrive; henchaffinches (*Fringilla coelebs*) congregate, and prepare for migration, leaving their males in this country.

Third week: the snipe (*Scolopax gallinago*) appears in the meadows; wildgeese (*Anas sylvestris*) leave the fens, and go to the rye-lands.

Fourth week: the tortoise (*Testudo græca*) begins to bury himself in the ground, and rooks visit their nest-trees; some larks (*Alaudæ*) sing, and

the woodcock (*Scolopax rusticola*) returns; spiders' webs abound.

2. Kalendar of vegetable nature round London.

In the first week: strawberry-tree (*Arbutus unedo*), holly (*Ilex aquifolium*), China hollyhock (*Alcea chinensis*), and China aster (*Aster chinensis*), in bloom.

Second week: catkins of some species of salix formed; leaves of the asp almost all off; of the Spanish chestnut, yellow; of the sugar-maple (*Acer saccharinum*), scarlet; of the common birch, yellow and gold; and of the weeping-birch, gold and bright-red colored.

Third week: clematis calycina in flower; some horse-chestnuts and acacias quite denuded of leaves.

Fourth week: various plants, especially annuals, continue in flower; leaves of marsh-elder (*Sambucus ebulus*), of a fine pink; of stag's-horn sumach, of a purplish red; of the American oaks, of fine shades of yellow, orange, red, and purple.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) small salads, lettuces, and radishes in the first week. If mild weather continues they will come in about Christmas. Mazagan beans, and hotspur or frame-peas (3601.), in the third or last week, to see if they will stand the winter. (3616.)

To save seed. Transplant cabbage, savoy, beet, parsnep, carrot, turnip, bulbous and Welsh onion. Mark what is said (3508. and 3537.) as to the danger of bastardy among the cruciferæ family. (3592.)

Protect all newly risen annuals, and newly deposited seeds, as also parsley on the approach of frost. (2206.)

Propagate (1985.) the alliaceous tribe and culinary perennials.

Transplant (2079.) endive and lettuce on warm borders, and cabbages in close rows or in beds, to remain in that state till wanted as plants in spring. Cauliflowers in the last week, to receive the protection of frames. (3545.)

Routine culture. Earth up and stir the surface only in fine dry weather. Hoe, rake, thin, weed, and dress off all beds of winter crops. Protect cauliflowers from heavy rains by breaking a large leaf and folding it over the flower. As crops are cleared, dig and trench the vacant ground.

Take up (2290.) potatoes, Jerusalem artichokes, beet, parsnep, salsify, scorzonera, skirret, tap-rooted parsley, and horse-radish of two summers' growth. Preserve them in dry sand.

Destroy insects. (2280.)

Root-cellar. See that this is perfectly dry, and that abundance of sand is laid over the roots.

Store-room. Finish cleaning and putting up seeds, and see that all you have are in a good state, and not attacked by vermin. (1704.)

4. Hardy fruit department.

Plant (2077.) all sorts of hardy fruit-trees as soon as the leaves have dropped off, but not before, as some practise; for in this state neither their shoots nor roots are ripe. Give ample waterings after planting.

Protect (2206.) fig-trees as soon as their leaves have fallen. Shield late grapes from frost by matting. Immerse pots containing plants intended to be forced, into dry old tan or ashes to save their roots from frost.

Prune (2110.) all sorts of fruit-trees excepting the raspberry, elder, and fig, which being trees of much pith, or medulla, are apt to die back from the point of section-cut place, when pruned at this season, and are therefore better left till spring.

Routine culture. Prepare ground for new plantations. Dig and ridge up where the trees are already pruned. Winter-dress strawberry-beds.

Take (2290.) grapes, apples, pears, and other fruits.

Fruit-room. (2298.) Lay all fruits first here till thoroughly dried, and then barrel up the longest keepers, and remove them to the fruit-cellar.

5. Culinary hot-house department.

Glass case without artificial heat. (2686.) Plant lettuces and cauliflowers under frames, to stand the winter. Sow small salads in the second week, and last fortnight under frames or hand-glasses.

Hot-beds and pits. (2678.) Keep up the declining heat of such beds as have not yet ripened off their crops. Dress those which have done bearing, and prick in lettuce or cauliflower plants. Prepare mint and other herbs for forcing, by putting them in pots or boxes. Get up mushroom-beds if not done in September. Plants pine-suckers in the open bed or pit, as they are taken off. Cover well at nights. (2206.)

Pinery. This is a general time for shifting and renewing the bark-bed. Do not put the plants into very large pots, as they will not grow much in winter. Till the last week of the month your plants will grow rapidly. (2697.)

Forcing-houses. (2940.) Prune and in general cleanse and repair the houses and flues, mend

broken glass, and paint the whole when necessary. (2695.)

6. Flower-garden. — Open ground department.

Sow (2071.) annuals in pots, for prolongation, in cold frames and pits, and some of the hardier sorts in warm borders, to come in early next spring, if the winter should prove mild. The sorts fit for this are larkspur, adonis, belvedere, pansy, persicaria, annual stock, and strawberry blite.

Propagate (1985.), but chiefly at this season by dividing the root, as of daisies and of other edging plants, irises, &c.

Plant most of the border-bulbs about the end of this month; and you may even plant florists' anemones in properly prepared beds. (2077.)

Transplant (2079.) biennials and perennials, in the flower-nursery, to stand till the spring. Strong plants may be moved where they are finally to remain. (6490. and 6505.)

Protect (2206.) auriculas, carnations, and other florists' flowers from heavy rains by mats and hoops, or glass frames. Begin at the end of the month to remove dahlia roots to be dried in an open shed, and then carried to the store-room.

Routine culture as in last month. Prepare composts. Stir the ground only in dry weather. If the season has been very dry, flower-borders may be dug over about the end of the month. Attend, above all things, to neatness. Do not trust to any kalendar for directions in this, or any point, but endeavor to bring your own brain into work, and try and look at your works with the eye of a critic and an enemy, or even of a stranger. (7438.)

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. (2686.) Begin about the middle of the month to fill frames and pits with pots of mignonette, stocks, &c. for prolongation through the winter.

Hot-beds and pits. (2678.) Roses which have been some time in a state of hybernation and in the shade, may now be put in bottom heat, as may hyacinths and some other bulbs. Water-glasses may now be brought into use. Observe, in the first place, to plant the bulbs in earth for a week or fortnight, which will make them strike roots more freely, and then take them up and put them in the water-glasses. Force them forward a week or two in frames, before you remove them to the drawing-room. Continue to plant some every fortnight for succession. (6502.)

Green-house. (6211.) Replace all your plants, if you have not already done so. All your winter's credit depends on the style in which you do this: give air right and day, unless the thermometer drop to 35 degrees. Water sparingly. (6211. to 6213.)

Dry-stove. (6176.) Apply fires towards the end of the night, so as to keep a medium temperature with fire-heat of 46 or 48 degrees. Arrange the plants for the winter. Pot and set in bulbs of most sorts.

Bark, or moist stove. Lessen your temperature by degrees; and also your air and water. A good medium heat for this month will be 70 degrees, which will require fire-heat, even if the bark-bed is in full force. (6214. to 6216.)

8. Pleasure-ground and shrubbery.

Plant (2077.) all the hardier trees and shrubs where the ground is not apt to be rendered very wet during winter: very delicate sorts leave till spring. This is the best season for planting.

Prune (2110.) evergreens; but finish, if possible, in the beginning of the month. Deciduous sorts as soon as the leaves fall.

Routine culture. Clear away all refuse, weeds, and decayed twigs. Roll, mow, sweep, hoe, weed, and remove moss and worm-casts.

Form and repair lawns as before. (2100. and 2101.)

9. Trees. — Nursery department.

Fruit-trees. Sow for stocks as directed for last month. The plum, cherry, almond, medlar, apple, pear, quince, barberry, service-tree, walnut, filbert, and common hazel-nut, may now be sown to greater advantage than in spring, provided you can keep the vermin from them during winter. Lay the

But sow for that & American birds

mulberry, or any other sort generally propagated in that way. Plant cuttings of elder; but it is rather too late for the ribes tribe. Remove raspberry suckers. Remove fruit-trees to their final situations, as soon as they have lost their leaves. This month, in all dry situations, is the best month in the year for transplanting fruit-trees.

Ornamental trees and shrubs. Sow the seeds of deciduous sorts. Lay deciduous sorts as their wood ripens. Plant out in nursery rows; shelter where requisite. (2206.)

Forest trees. Sow most sorts, as directed for last month; but take care to guard against vermin. Gather haws, sea and holly berries, hips, &c. and take them to the rot-heap. Lay and propagate by cuttings some of the timber-growing willows and poplars. Plant and prune in the nursery lines as required. (6583. to 7037.)

10. Trees. — Permanent plantations and park-scenery.

Plant (2077.) generally as long as the weather is mild; but prefer the spring for very wet, late, bleak situations. (6838. to 6840.)

Thin, prune, and fell generally, but do not fell barking-trees, or remove thinnings of the oak, larch, &c. so large as to be worth barking.

Prepare for planting, as directed for last month. This is a very fit season for draining, which may be continued in all weathers, when men can work out of doors, till the planting season returns. In this way the men may be kept on without loss either to themselves or you. (6817.)

Operations on ground should now be carried on vigorously; but buildings should be completed, if possible, by the middle of the month.

NOVEMBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	44 44	4	29 68	2.527 inch.	This is the windy month of the Saxons; it is generally also cold and moist, and one of the most disagreeable for the laboring gardener, but he may console himself with the shortness of the day, and hail the approach of evening, when he may lay aside his wet dress and fortify his mind by converse with books. Roots, fruits, seeds, dried herbs, and insects require looking over and protecting from damps.
Edinburgh -	41 1		29 638	4.514	
Dublin -	43		29 74	0.394	

1. Kalendar of animated nature round London.

In the first week: the buck (*Cervus caprilus*) grunts.

Second week: the golden plover (*Charadrius pinnatus*) appears.

Third week: snails (*Helix*) and slugs (*Limax*) bury themselves.

Fourth week: greenfinches (*Fringilla montifringilla*) flock; the winter moth (*Geometra brumaria*, Sam.) and the common flat-body moth (*Geometra applanata*, Sam.) appear in gardens about the end of the month.

2. Kalendar of vegetable nature round London.

In the first week: a few plants in flower, by accident, chiefly annuals, according to the season.

Second week: the fungus *helvella mitra* appears; *laurostus* in flower.

Third week: *calicanthus præcox* in flower.

Fourth week: some primroses show flowers at this season; and some plants, unnaturally in flower, still continue if the weather is temperate.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) short-topt radishes on a warm border for the chance of obtaining an early spring crop. (3760.) Peas and beans as directed for last month. (3601. and 3616.)

Protect (2206.) celery, endive, artichoke, seakale, potatoes left in the ground to be taken up as wanted, and any other outstanding edibles roots by litter or leaves. Radishes, and parley with fronds of fern. Cauliflowers by hoops and mats.

Propagate (1985.) perennial herbs, if not done last month.

Transplant (2079.) any thing you have omitted in October.

Routine culture. All operations on the earth, excepting digging and trenching, must be performed only in fine dry weather. Dress artichoke and asparagus beds. Take up endive, brocoli, and cauliflower, and lay them flat in dry ground, or in some of the ways described. (2293. &c.) Guard against the damping off of cauliflower plants, and weed all seedling crops. Dig, trench, and manure.

Take up all edible roots, which you intend to preserve, and remove them to the root-cellar.

Destroy (2276.) insects, and particularly snails, at this season.

Root-cellar. (2299.) Keep out the frost, if it sets in severe; and equally so water, from above or below.

Store or seed-room. (1704.) Turn over edible roots kept in the dry, as the alliaceous tribe, and pick out decaying bulbs. See to your seeds.

Ice-house. (1730.) Fill the ice-house if the frost is sufficiently strong.

4. Hardy fruit department.

Plant (2077.) all sorts of fruit-trees, as directed for last month. Choose dry weather. Water to settle the earth. Stake where required, and mulch (2098.) both root and stem, where you wish the trees to do well. Mulching the stem is particularly useful for very tall standards, and especially for the pithy-wooded sorts.

Prune (2110.) the vine, and other very hardy fruit-trees; the apricot, peach, and nectarine had better be deferred till spring.

Routine culture. Dig and dress wherever pruning admits; or where you have not been able to overtake the work last month.

Take (2290.) such apples and pears as still remain on the trees during the first week; dry them well in the fruit-room, and then barrel or jar up the long-keeping sorts for the cellar.

Fruit-room. (2298.) Examine such bunches of grapes, and branches of plums and currants, as you have hung up to preserve the fruit; and pick off all decaying berries. Look over all the other fruits, and attend to medlars, quinces, and services.

5. Culinary hot-house department.

Glass case without artificial heat. (2686.) Sow small salads and peas and beans, either to transplant or to remain after moving the frames. Transplant lettuces and cauliflowers from frames to be covered with hand-glasses. Attend to air and removing decayed leaves.

Hot-beds and pits. (2678.) Sow small salads, force mint, and other herbs. Try sowing of radishes on a moderate hot-bed. Transplant lettuces from the cold-frames to force them forward. Begin to force asparagus six weeks before the expected demand. Build mushroom-beds; if under cover, it will be better.

Pinery. (2697.) Moderate every stimulus to vegetation: because, for the proper well-being of plants, it is requisite they should all go on in harmony. Heat, air, and water, air can supply; but light, in any thing like adequate quantities for vegetation, is beyond the power of man: therefore let your heat, air, and water, be in a proportion to your light.

Forcing-houses. Some begin this month; it so, begin the usual course. Dig and dress the borders; prune, train, paint, and cleanse the house, &c. if not done last month, which is much the best time. (2695.) Set in strawberries. (3338.)

6. Flower-garden. — Open ground department.

Plant (2077.) dried roots of border-flowers. (6502.)

Transplant (2979.) biennials at the beginning of the month, if the weather is very fine: but this work is better deferred till spring. (6504. and 6505.)

Protect (2206.) tender roots by litter, leaves, tan, ashes, or landing up trees by mats, or straw covered with mats or nets. Take care of seedlings.

Routine culture. Collect earths, composts, and manures; and, in general, finish digging among herbaceous flowers by the middle of the month. Asters and such-like plants are often only checked in their growth and flowering by the frosts and rains; attend to them, as they are apt to be blown about, and be disfigured at this season. In cutting them over after the ground is dug, choose a dry day, and obliterate the prints of your feet with a fork. Mow as occasion requires.

Store-room. (1704.) Look at such bulbs as you are keeping for spring planting.

Bees. (1745.) See that these are properly protected by straw covers, or by being placed in the beehouse.

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. (2686.) Take care of alpine and the primula tribe. Also of the annuals and perennials intended for forcing. Guard against damps by admitting air; and to do this effectually, always remove the sashes in the daytime; or, if the frames being in front of stoves, do not admit of this, tilt or elevate them in front, as high at least as the plane of the sun's rays at noon.

Hot-beds and pits. (2678.) Go on forcing all manner of flowering shrubs, bulbs, and perennial plants, and take in now and then a few pots of mignonette, to keep up a constant supply in full flower for the drawingroom. Blow Dutch roots in water-glasses as before.

Green house. (6211.) Medium temperature, with fire-heat, 42 degrees, maximum 44 degrees. Water sparingly; give air as the weather will permit; and see to neatness. Encourage mouldiness on the surface of the pots, also weeds and decayed leaves; these being great ornaments at this season, and highly useful for the plants.

Dry-stove. (6176.) Minimum temperature, with fire-heat, 45 degrees, maximum 50 degrees. Succulents require very little water at any time, but especially at this season.

Bark, or moist stove. (6214.) Your medium temperature may now be 65 degrees, or less, but never exceeding a minimum of 55 degrees, and a maximum of 75 degrees. Lessen water and air, as light and heat are lessened. See that bulbs receive proper treatment, as these will produce your finest spring-flowers, especially the crinums and amaryllideæ.

8. Pleasure-ground and shrubbery.

Plant (2077.) deciduous trees, and shrubs of the hardier kind so long as the weather continues dry.

Prune and cut hedges. (2110.)

Protect delicate American trees, as magnolia, and shrubs not yet fully acclimated, as the Chinese rose. Roll, mow, and sweep turf. Attend to fallen leaves. (6195. and 6201.)

Turf may still be laid, but it is now too late to form or repair lawns by sowing grass-seeds. (2101.)

Prepare for planting, by levelling, digging, trenching, &c. (1863. to 1871.)

9. Trees. — Nursery department.

Frui-trees. (4361.) Plant only in mild and rather dry weather; mulch, water to settle the earth about the roots, and stake as circumstances require. Forward delayed work as to fruit-trees, for after the middle of the month it is better not to touch them till February.

Ornamental trees and shrubs. Complete what should have been done last month, as to planting, laying, taking off layers, &c. (7031.) Prune the more hardy sorts in the lines, and protect such as are tender by the usual means.

Forest trees. Finish sowing the larger seeds before severe weather sets in. Complete all other nursery operations for the season, if possible. Pruning the plants in lines may be the last operation. Gather cones, acorn, masts, nuts, keys, and berries for immediate sowings, or the loft or rot-heap, according to their natures, and your skill and circumstances. (6983. to 7037.)

10. Trees. — Permanent plantations and park-scenery.

Plant in all temperate weather, and moderately dry situations. (2079.)

Thin, fell, and prune deciduous trees, as in last month. Cut, plash, and repair hedges; and more especially the hawthorn kind. (6917.)

Dead-fences of every description, excepting mortar-walls, may now be attended to; but avoid building in December and January, even the simplest wall. Frost is certain at this season, and its effects equally so.

Operate on ground, water, rocks, woods, and timber erections; but by no means on buildings where mortar is used.

DECEMBER.

Weather at	Average of the Thermometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS.
London -	41 4	3	29 64	1.124 inch.	<i>Winter month.</i> Sax. Cold, but dry. The gardener's operations are chiefly of the laborious kind; but the days are short and the nights long. In the last week the young gardener should examine himself as to his professional and intellectual progress during the bye-past year. If he contents himself with merely excelling his fellows, he is lost; let him aspire at professional perfection, and high reputation among good and scientific men.
Edinburgh -	38 9		29 66	2.598	
Dublin -	36 34		29 723	2.916	

1. Kalendar of animated nature round London.

The mole (*Talpa europæa*) throws up hillocks; the December moth (*Eriogaster populi*, Sam.) appears about the beginning, and the yellow-line quaker (*Noctua flavilinea*, Sam.) about the end, of the month.

2. Kalendar of vegetable nature round London.

Some of the last month's plants continue in flower, according to the weather.

3. Kitchen-garden. — Culinary vegetables.

Sow (2071.) peas and beans, and a few radishes (3760. and 3601.), as for last month. Choose the very mildest weather, and consider the final result as extremely uncertain.

Protect (2206.) beans sown thick for transplanting, and parsley intended for daily use, with fern; celery, with litter; any plants with litter which you have not been able to land up, as artichokes, asparagus.

To save seed. Transplant cabbages, if you have neglected it until so unfit a season.

Routine culture. Attend to this only in the best weather, and chiefly in the middle of the day. Earth up peas and beans, or cover their stems with ashes, sawdust, or old tan. Earth up celery when dry. Tie up any endive, cardoons, and white beet which has been neglected. Weed, but do not depend on the hoe, and only attempt to stir dry grounds; as stirring clayey lands at this season will do much more harm than good.

Take up edible roots and full-grown vegetables with esculent leaves, as the borecoles, and plant the latter in sand in an open shed for daily use.

Destroy (2276.) slugs, snails, mice, and other vermin.

Root-cellar, seed, and store-room. (1702. to 1705.) See that these, and what they contain, be kept in perfect order.

Ice-house. (1730.) Fill this, if not done last month.

4. Hardy fruit-department.

Plant (2077.) the hardier trees, as the apple, pear, gooseberry, currant, &c. in mild weather. (4361.)

Prune as directed for last month; but remit the operation in severe weather. (2110.) Partially unnailed or untie trained trees, and wash their boughs and shoots, as well as the walls and trellises, with any glutinous bitter fluid.

Routine culture. Trench, dig, and ridge up the

soil, but only in dry weather. Turn over composts, dung, and earth heaps. Prepare borders and orchards, &c. for planting in spring. Recruit exhausted soils by the application or partial substitution of such as is fresh and rich.

Destroy the larvæ of moths and every description of garden enemies, by usual or unusual means.

Fruit-room. Look over the loose fruit every ten or twelve days.

Fruit-cellar. Keep this close to retain an even low temperature, never under 32 nor over 40 deg. till May, the earliest period when it should be opened. (2299.)

5. Culinary hot-house department.

Glass case without artificial heat. (2686.) Sow small salads, radishes, and lettuce; if the weather proves mild they may do some good. Weed, take off decayed leaves, and give abundance of air in dry weather. Protect, in severe frosts, by mats or litter.

Hot-beds and pits. (2678.) Begin to force asparagus, sow small salads, and transplant lettuce to be forced forward. Use the transplant, in order that no check may be given, or any occasion for watering produced. Prepare cucumber-beds; or if you have begun see to them. Light is the grand thing to be attended to, for heat, air, water, and earth you can command at pleasure. Force mint, attend to mushroom-beds, and compost-making; procuring earth, manures &c. Cover up at nights with all care; but avoid damps, by always giving a little air on fine days, and all night, when there is danger of steam of dung.

Pinery. (2697.) Keep a steady heat; but little air or water will be wanting, excepting to the kidneybeans and strawberries which you set in last month.

Forcing-houses. (2940.) Go on with the routine culture, for houses which you have begun to force; and dig and prepare the borders of the others, but it is too late for pruning or repairs.

6. Flower-garden. — Open ground department.

Protect as directed for last month, and be liberal in the use of ashes, rotten tan, litter, &c. to the roots of the more tender plants; as to beds of florists' bulbs, tender and half-hardy shrubs, as China roses, hydrangeas, &c. where such plants can be ventured in the borders.

Routine culture. Prepare composts, manures, and simple soils, and turn them over frequently. Much of the value of all composts and soils, at least for the florist, depends on their being sweet and mellow, which is only to be attained by time and frequent turnings. Attend to neatness in the application of litter, ashes, and other protecting materials.

Store-room. See that the frost is completely excluded. (1704, 1705.)

7. Flower-garden. — Hot-house department.

Glass case without artificial heat. (2686.) Attend to alpine, and florists' flowers in frames; also to annuals, as directed for last month.

Hot-beds and pits. (2678.) Go on forcing shrubs and flowers, and blowing bulbs in water; renovate by linings, where necessary. If you have begun in October to force roses, you will have them as well as bulbs in blow by the middle of the month. See

to bulbs in water-glasses, and take care to keep up a succession of roses, bulbs, and most popular forcing-flowers and shrubs. (6217. to 6219.)

Green-house. (6211.) Minimum temperature 42 degrees, maximum 44 degrees, with fire-heat. Water sparingly; give air freely in good weather, and remove decayed leaves as they appear.

Dry-stove. (6176.) Minimum temperature for this month 45 degrees, maximum, with fire-heat, 50 degrees. The more severe the weather out of doors, give less water within; but give air freely in fine weather.

Bark, or moist stove. (6214.) Keep a medium heat of 55 degrees, or 58 degrees, and lessen water and air. Attend to routine culture; but the grand thing at this season is, to keep the fire-heat as regular as possible; for the ratio of increase of heat from flues, after they are heated to a certain extent, is such as often to overheat the house, and scorch or desiccate the plants: hence, in our opinion, one of the many advantages of adopting steam, by which the pipes can never be heated much above 200 degrees.

8. Pleasure-ground and shrubbery.

Plant as in last month. (2077.)

Prune (2110.) in fine weather.

Protect as before. (2206.)

Routine culture. Rake up leaves, and sweep them from the lawns and gravel. Repair walks, and roll them; see that water stand on no part of their surface.

Lay down turf, if you cannot help it; but this is not a good season; September and March are the best. (2101.)

Prepare for planting by trenching, digging, &c. (1870.) Rods and poles for tying up plants and for twiners, spray or sticks for sticking climbers, as the sweet-pea, &c. (1516.)

9. Trees. — Nursery department.

Fruit-trees. (4361.) Complete neglected work as far as weather will permit; but if the season is severe, defer it till February. Prepare tallies, &c.

Ornamental trees and shrubs. (6539. and 6542.) Finish delayed work, and attend to protecting tender sorts. See to the seeds in store, and prune only in very fine weather. Prepare tallies, labels, sticks, stakes, poles, rods, spray, fronds, and other materials of culture and management. Collect composts, earths, and manures, and turn over those you have got, so as the frost may thoroughly penetrate them.

Forest trees. (6983.) Attend to the rot-heap, seed-loft, and compost-ground; and plant, or take up, or prune only in fine weather: much depends on the season, and other circumstances. (6384.)

10. Trees. — Permanent plantations and park-scenery.

Plant (2077.) only in fine weather, unless thorn-hedges; or large trees of common sorts, with balls of earth.

Fell and prune (6941. and 6884.) where the trees are not for transplanting, nor of the barking sorts.

Thin out coppice-wood for poles, stakes, &c. (6912.)

Prepare for planting by the usual processes, and by fencing and draining. (6817. and 6820.)

Operate on ground and rocks, but not on buildings.

GENERAL INDEX.

N. B. *The Numbers refer to the Paragraphs, not to the Pages, excepting in the case of the List of Authors, where they refer to the page and the year in which the Author published: in such cases the word page, and letters A. D. are prefixed.*

ABBREVIATIONS: H. Hardy, F. Frame, G. Green-house, D. S. Dry-stove, S. Stove, i. e. Bark-stove, Peren. Perennial, Bien. Biennial, An. Annual. C. B. S. Native of the Cape of Good Hope, Austral. Native of Australasia, N. S. W. New South Wales, N. Holl. New Holland, V. Diem. Van Diemen's Island, W. Ind. West Indies, E. Ind. East Indies, S. Eur. South of Europe, N. Eur. North of Europe, S. Amer. South America, N. Amer. North America, Mex. Mexico, &c. (See as an example of the mode of applying these Abbreviations, article Abroma.)

ABELE-TREE, *populus alba*, 7135.

Abercrombie, John, a British writer on gardening, page 1106. A. D. 1766.

Aberdeen nursery, 7639.

Aberdeenshire, gardens of, 7639.

Abermarlais, a seat in Caermarthenshire, 7614.

Ablactation (*ablactatio*, to wean), grafting in such a way as to wean the scion by degrees from the stock; that is, inarching, 2007.

Ablaqueation (*ablaqueo*, as, to lay bare), the laying bare the bottom of the stem, and the principal roots of fruit-trees, in order to render them more fruitful, 2162.

Abroma, polyadel. decan. and malvaceæ, S. tr. E. Ind. and N. S. W., (that is, Bark-stove trees natives of the East Indies and New South Wales,) which grow freely in common garden-soil, and are propagated readily by seeds and cuttings.—For the general culture of bark-stove plants, see Bark-stove.

Abrus, wild licorice, diadel. decand. and leguminosæ, a S. tr. Jamaica, which grows in loam and peat, and is raised by cuttings, planted in sand, and plunged in the tan-bed, under a hand-glass.

Acacia, polyg. monœc. and leguminosæ, S. tr. and G. tr. Austral. E. Ind. and C. B. S., which grow in loam peat and sand, and are propagated by cuttings taken off in the young wood, and planted in sand under a bell-glass, and in bottom heat. Most kinds may also be propagated by large cuttings of the roots similarly treated. The H. tr. grow in similar soil, and propagate in the same manner, or by seeds.

Acæna, dian. monog. and rosacæ, G. peren. C. B. S. and Austral., which grow well in loam and peat, and cuttings taken off at a joint, root freely under a hand-glass. The H. peren. will grow in common garden-soil, and are continued by cuttings.

Acalypha, monœc. monad. and euphorbiacæ, S. and H. an. E. Ind. and N. Amer., the S. an. should be sown in pots in a hot-bed, and the H. an. in the open garden. The soil for both, loam and rotten dung, or leaf-mould.

Acanthus, bear's breech, didyn. angios. and acanthaceæ, a S. tr. E. Ind. and H. peren. Eur. Both grow in common soil, and divide readily at the root.

Acarna, syngen. polyg. æqual. and cynarocephalæ, a H. peren. and H. an. S. Eur. Both thrive well in common soil, and propagate by the usual means.

Acarus tellarius, or red spider, described, 2271: to destroy in the different departments of gardening,—see those departments.

Accelerating vegetation, operations for, 2181.

Acer, maple, polygam. monœc. and acereæ, H. tr. Eur. and N. Amer., which grow in any soil, and propagate by layers or seeds, and some species by cuttings.

Acer pseudo-platanus and *platanoides*, the common and other maples, 7097. and 7099.

Aceras, gynan. monan. and orchideæ, a H. peren. Eng. which thrives best in light loam and chalk, and is only to be raised by seeds.

Acterarious plants, 3963.

Achania, monad. polyan. and malvaceæ, S. tr. Jamaica, which grow in common soil, or in loam and peat, and cuttings root in sand under a hand-glass.

Achard, Professor Francis, page 1126; his works on gardening, A. D. 1798.

Achillea, milfoil, syngen. polyg. equal. and compositæ, hardy, peren. Eur., which grow in common soil, and are readily increased by dividing at the root.

Achras sapota, pentan. monog. and sapotæ, S. tr. Amer. requiring a rich, loamy soil, and cuttings root in sand under a hand-glass.

Achyranthes, pentan. monog. and amaranthaceæ. The S. and G. tr. India, thrive in any rich soil, and cuttings root freely. The ah. species should be sown in a hot-bed.

Acidoton, monœc. polyan. and euphorbiacæ, a S. tr. Jamaica, which will grow in loam and peat, and may be increased by cuttings in sand under a bell-glass.

Acisanthera, decan. monog. and salicacæ, a S. tr. Jamaica, which may be treated like acidoton.

Acmella, syngen. polyg. frustran. and compositæ, the S. and S. Amer. an. should be sown on a hot-bed, and the H. an. in the open garden.

Acnida, Virginian hemp, diœc. pentan. and chenopodæ, a H. an. N. Amer., to be treated as such.

Aconitum, wolf's bane, polyan. trig. and ranunculacæ, H. peren. S. Eur. of common culture.

Acorus, hexan. monog. and aroidæ, H. peren. Brit. and China, marsh plants of easy culture.

Acosta, a Spanish naturalist, 32.

Acrostichum, cryptog. filices, and filicæ, ferns; S. and G. peren. E. and W. Ind. which grow in loam and peat, and are increased by seed or dividing the root.

Acrostichum calomelanos, 6739.

Actæa, polyan. monog. and ranunculacæ, H. peren. Brit. and N. Amer. of common culture.

Actinocarpus, hexan. polyg. and alismacæ, G. and H. peren. N. S. W. and Eng. aquatics, which will only thrive in water, and propagate by seeds.

Acyos, didyn. gymnos. and labiatæ, H. bien. and an. Eur. of easy culture.

Adam's Lodge, of London, a fraternity of gardeners, some account of, 7704.

Adam's Lodge, of Aberdeen, 7702.

Adam's needle,—see Yucca.

Adanson, Michael, a celebrated French botanist, author of *Familles des Plantes*, and other works, who died in the beginning of the present century, 722.

Adansonia, sour-gourd, monadel. polyan. and malvaceæ, a S. tr. Senegal, which grows best in rich

- loam, and cuttings strike in sand, plunged in heat under a hand-glass.
- Addington Place, Surrey, 7527.
- Adelia, diœc. monad. and euphorbiacæ, a S. tr. Jamaica, which may be treated like adansonia.
- Adenandra, pentan. monog. and diosmæ, G. tr. C. B. S. which grow in sandy peat, and the young tender tops made into cuttings, and planted in sand, will root under a bell-glass without bottom heat.
- Adenanthra, decan. monog. and leguminosæ, S. tr. E. Ind. which grow in loam and peat, and large cuttings with the leaves not shortened, will root in a pot of sand plunged in heat under a hand-glass.
- Adiantum, maidenhair, cryptog. filices, and filicæ, G. and H. peren. Madeira and Brit. ferns, which grow well in loam and peat, and propagate by dividing the root or by seed.
- Adina, tetran. monog. and rubiacæ, a S. tr. China, of easy culture in loam and peat.
- Adonis, polyan. polyg. and ranunculacæ, a H. peren. and H. an. Eur. of easy culture in common soil.
- Adoxa, octan. tetrag. and saxifragæ, a H. peren. Brit. a diminutive plant, which does well in pots in common soil.
- Adrianople, gardens of, 307.
- Ægiops, hard-grass, polygam. monœc. and graminæ, H. peren. and an. Eur. of common culture.
- Ægiphila, tetran. monog. and verbenacæ, S. tr. W. Ind. which thrive well in light loam, and cuttings root freely under a hand-glass in heat.
- Ægle, Bengal quince, polyan. monog. and aurantiæ, a S. tr. E. Ind. which requires a rich loam, and is propagated by ripened cuttings planted in sand, without shortening the leaves, and plunged under a hand-glass in heat.
- Ægopodium, goutweed. pentan. dig. and umbellifereæ, H. peren. Brit. of the easiest culture.
- Acridæ, air-plant, gynan. monan. and orchideæ, S. peren. China, parasites, which may be hung up in a basket of moss or pieces of bark, or fixed by moss and bandages to the trunk or bark of a tree, — see the Hon. Mr. Herbert's treatment detailed, 6736.
- Ærua, pentan. monog. and amaranthacæ, a S. tr. and S. bien. W. Ind. which grow well in rich, light earth, and cuttings strike freely.
- Æschynomene, diadel. decan. and leguminosæ, a S. tr. W. Ind. which requires rich loam, a good deal of heat, and is propagated by cuttings under a bell-glass in bottom heat. The S. an. and H. an. India and Amer. may be treated as tender annuals.
- Æsculus, horse-chestnut, heptan. monog. and acercæ, H. tr. Asia and N. Amer. which prefer light, deep soil, and sheltered situations, and are propagated by seeds or layers.
- Æsculus hipposcastanum, the common horse-chestnut, 7126.
- Æthionema, tetrad. silic. and crucifereæ, a H. bien. and H. an. S. Eur. of common culture.
- Æthusa, fool's parsley, pentan. dig. and umbellifereæ, a H. peren. and H. an. Brit.; poisonous weeds.
- Affaiti, Casimiro, his works on gardening, page 1158. A. D. 1787.
- African almond, brabejum stellulifolium.
- African flea-bane, tarchonanthus camphoratus.
- African fruits deserving cultivation, 6018.
- African lily, — see Agapanthus.
- African marigold, tagetes erecta.
- Agapanthus, African lily, hexan. monog. and hemerocallidæ, G. peren. C. B. S. which thrive in loam, and a little rotten dung, and are propagated by dividing the root, or by seed.
- Agaricus campestris, garden-mushroom. See this and various other species of agaricus described, 4339. Culture of the garden-mushroom, 3404; what spawn is, 3406; where indigenous spawn may be collected, 3410; preserving spawn, 3412; procuring spawn artificially, 3413; propagating, 3415; methods of raising mushrooms, 3423; ridges in the open air, 3424; preparing the dung, 3425; forming the bed, 3426; moulding, planting, covering the bed, 3427; culture on shelves, in the German manner, as introduced by Oldacre, 3434; compost, 3435; making, spawning, earthing, subsequent treatment, 3436; renovating old beds, 3440; growing mushrooms in pots, boxes, &c. with dung, 3442; without dung, 3443; culture in melon-beds, 3445; in old hot-beds, 3447; in pits, 3448; in dark frames, 3449; in a cellar 3450; general details, 3452.
- Agathosma, pentan. monog. and diosmæ, G. tr. C. B. S. soil, a sandy peat: propagated by cuttings in sand under a bell-glass, but not plunged in heat.
- Agave, hexan. monog. and bromelæ, D. S. and G. tr. and peren. S. and N. Amer. soil, a rich loam; propagated by suckers.
- Agen, General Lomet's villa at, 176.
- Ageratum, syngen. polyg. æqual. and compositæ, G. tr. requiring a light, rich soil; propagated by cuttings under a hand-glass. The H. an. is of common culture.
- Aghinuas, a seat in Tyrone, 7679.
- Agr. Chem., Davy's Agricultural Chemistry.
- Agricola, Dr. George Andrew, his works on gardening, page 1123. A. D. 170-.
- Agrimonia, agrimony, dodecan. dig. and rosacæ, H. peren. Eur. and N. Amer. of easy culture.
- Agrimony, — see Agrimonia.
- Agrostemma, rose-carnation, decan. pentag. and caryophyllæ, H. peren. and an. of common culture.
- Agrostis, bent-grass, trian. dig. and graminæ, a S. peren. E. Ind. and H. peren. and an. Eur. of the easiest culture.
- Agumi, the Italian term for bitter fruits, especially the orange tribe.
- Ailanthus, polyg. monœc. and terebintacæ, a S. tr. and H. tr. E. Ind. which grow in common soil, and are propagated by cuttings of the roots.
- Aimsfield, a seat in East Lothian, 7619.
- Air, its nature and properties, 1216.
- Air-plant, — see Aërides.
- Aira, hair-grass, trian. dig. and graminæ, H. peren. and an. Eur. of the easiest culture.
- Airthrie Castle, near Stirling, 364.
- Aitonia, monad. octan. and meliacæ, G. tr. an. C. B. S. soil, sandy loam and peat; propagated by cuttings of young wood, in sand, under a bell-glass, and plunged in heat. Avoid planting too close, and wipe the glass frequently, as they are apt to damp off.
- Aizoon, icos. di-pentag. and ficoidæ, a G. tr. an. and bien. C. B. S. and S. Eur. succulents, which grow in lime-rubbish, and propagate readily.
- Ajuga, bugle, didyn. gymnos. and labiatæ, H. peren. Eur. of common culture.
- Akee-tree, blighia sapida.
- Alamanni, Luigi, his works on gardening, page 1128. A. D. 1546.
- Alangium, polyan. monog. and myrtiacæ, a S. tr. E. Ind. soil, loam, and peat; propagated by cuttings, in sand, under a hand-glass in heat.
- Alaternus, rhamnus alaternus.
- Albionco, J. H. his works on gardening, page 1125. A. D. 1795.
- Albua, hexan. monog. and asphodeleæ, G. peren. C. B. S. bulbs; soil, light, sandy loam, and vegetable mould; propagation by offsets; or by leaves taken off with a scale of the bulb, and carefully planted.
- Alcazar, a palace and gardens in Spain, 291.
- Alchemilla, ladies' mantle, tetran. monog. and rosacæ, H. peren. and an. Eur. of common culture.
- Alcina, syngen. polyg. necess. and compositæ, a G. an. Mexico, of easy culture.
- Alcoves, 1810.
- Aldbury Place, Surrey, 7527.
- Aldea, pentan. monog. and hydrophyllæ, a H. peren. Magellan, of common culture.
- Alder — see Alnus.
- Alderley Park, Cheshire, 7590.
- Aldworth Hall, Yorkshire, 7582.
- Aletris, hexan. monog. and hemerocallidæ, H. peren. N. Amer. requiring a peat soil and shady situation, and propagated by offsets from the roots.
- Aleuritis, monœc. monad. and euphorbiacæ, a S. tr. Society Isles; soil, a rich loam; ripe cuttings, with their leaves on, strike in sand, under a hand glass.
- Alexanders — see Smyrnum.
- Alexandrian laurel, ruscus racemosus.
- Alisma, water-plantain, hexan. polyg. and alismacæ, H. peren. marsh plants, and aquatics of easy culture.
- Alison, the Rev. A., his Analysis of the Principles of Design, 7160 — 7162.
- Allamanda, pentan. monog. and apocynæ, a S. tr. Guiana; soil, a rich loam; cuttings strike freely in moist peat.

- Allantodia, cryptogam. filices, and filicæ, a G. peren. Madeira; a fern; soil, loam and peat; and propagation by dividing the root or seed.
- Allerton Manleverer, a seat in Yorkshire, 7582.
- Alliaceæ plants, 3810.
- Alligator-pear, laurus persea, 5977.
- Allionia, tetran. monog. and nyctagineæ, H. peren. N. Amer. which grow in common soil; and cuttings root readily under a hand-glass.
- Allium, garlic. hexan. monog. and asphodeleæ, H. peren. and bien. Eur. bulbs of easy culture.
- Allium ascalonicum, the shallot, 3845.
- Allium cepa, the common onion, 3830.
- Allium porrum, the leek, 3811.
- Allium sativum, the garlic, 3841.
- Allium scænoprasum, the chive, 3838.
- Allium scorodoprasmum, the rocambole, 3852.
- Allspice — see Calycanthus.
- Allspice-tree, myrtus pimenta.
- Almond, — see Amygdalus.
- Alnus, alder, monœc. tetran. and amentaceæ, H. tr. Eur. and N. Amer. of common culture, propagated by seeds.
- Alnus glutinosa, the common alder, 7132.
- Aloe, hexan. monog. and hemerocallideæ, D. S. and G. tr. and peren. C. B. S. which grow best in sandy loam, with lime-rubbish or gravel, and are propagated by suckers, or leaves stripped off, and planted shallow in, or laid on the surface of a pot of mould.
- Alonsoa, didyn. angios. and scrophularineæ, G. tr. S. Amer. which grow in rich, light soil, and are increased by seeds or cuttings.
- Alopecurus, foxtail-grass, trian. dig. and gramineæ, H. peren. and an. Jamaica and Eur. grasses of the easiest culture.
- Aloysia, didyn. angios. and verbenaceæ, a G. tr. Chili, which grows in light, rich soil, and increases by cuttings.
- Alpinia, monan. monog. and scitamineæ, S. per. W. and E. Ind. reedy or marsh hot-house plants of common culture.
- Alstrœmeria, hexan. monog. and asphodeleæ, S. and G. peren. S. Amer. which thrive in sandy loam, and peat or vegetable earth, and increase by seeds or dividing the root. A. ligtu is difficult to flower, unless the roots are put into a state of rest, by withholding water till the shoots are quite dried up; then give a good watering, and put it in a moist heat, and it will flower abundantly. (Sweet.)
- Alstrœmeria salsilla, the edible alstrœmeria, 6030.
- Alston Grove, Nottinghamshire, 7576.
- Altenburg, Pomological Society of, their annals, page 1127. A. D. 1810.
- Alternanthera, pentan. monog. and amaranthaceæ, a S. peren. S. bien. and G. peren. E. Ind. and S. Amer. soil, light and rich, and cuttings root freely in the shade.
- Althæa, marsh-mallow, monad. polyan. and malvaceæ, S. peren. and bien. and H. peren. tr. and an. all of common culture.
- Althæa frutex, hibiscus syriacus.
- Althorpe, a seat in Northamptonshire, 7580.
- Alyssum, mad-wort, tetrad. silic. and crucifereæ, a F. tr. and H. tr. peren. and an. Eur. of easy culture in common soil, and readily increased by cuttings.
- Amaranthus, amaranth, monœc. pentan. and amaranthaceæ, a S. an. and H. an. As. Amer. Eur. of common culture.
- Amaryllis, hexan. monog. and amaryllideæ, S. G. and H. peren. Eur. Amer. and Afr. bulbs of common culture: some may be treated as aquatics, — see 6317.
- Amateurs of gardening, 7407; their gardens and management, 7423.
- Amber-tree, anthospermum æthiopicum.
- Ambrosia, monœc. pentan. and corymbifereæ, H. an. of common culture.
- Amellus, syngen. polyg. super. and corymbifereæ, a G. tr. C. B. S. soil, loam and peat, and cuttings root freely under a glass; and H. peren. Amer. which grow in common soil, and cuttings root freely under a hand-glass.
- American books on gardening, 7699.

- American garden, how to compose the soil, 6568; to arrange, 6122.
- American shrubs, 6562; culture, 6568; final situation, 6569.
- Amerimnum, diadel. decan. and leguminosæ, S. tr. W. Ind. requiring a light loam; and cuttings, not deprived of their leaves, root freely under a hand-glass in a warm situation.
- Amethystea, dian. monog. and labiateæ, a H. an. Siberia, of common culture.
- Ammannia tetran. monog. and salicææ, a S. an. and H. an. W. and E. Ind. of easy culture.
- Ammi, bishop's weed, pentan. dig. and umbellifereæ, H. peren. and an. Eur. foetid. weeds.
- Amomum, monan. monog. and scitamineæ, S. peren. Sierre Leone, reedy marsh plants.
- Amorpha, bastard indigo, diadel. decan. and leguminosæ, F. and H. tr. Amer. which grow in common soil, and increase by cuttings planted in autumn, in a sheltered situation.
- Amphill Park, Bedfordshire, 7549.
- Ampton Hall, Suffolk, 7552.
- Amsonia, pentan. monog. and apocynæ, H. peren. N. Amer. which grow in common soil, and are increased by cuttings or dividing at the root.
- Amygdalus, almond, icos. monog. and rosaceæ, a G. tr. and H. tr. Persia and Eur. requiring rich loam, and which may be propagated by seeds, layers, grafting, &c.
- Amygdalus communis and amara, the sweet and bitter almond, 4542.
- Amygdalus persica, the peach-tree, 4481; flat peach of China, 4485.
- Amygdalus, var. nectarina, the nectarine-tree, 4517; to force the peach and nectarine, 3063.
- Amysis, octan. monog. and terebintaceæ, S. tr. S. Amer. soil, loam and peat, and cuttings root freely in sand under a hand-glass.
- Anabasis, pentan. digy. and chenopodeæ, a G. tr. Spain, which grows well in loam and peat, and cuttings root in sand under a hand-glass without bottom heat.
- Anacampteros, dodecan. monog. and portulacææ, G. tr. and peren. C. B. S. succulents which grow in sandy-loam and lime-rubbish, and cuttings root readily in similar soil.
- Anacardium, cashew-nut, ennean. monog. and terebintaceæ, a S. tr. India, soil a light loam, and cuttings from ripened wood, not deprived of their leaves, will root in sand under a hand-glass.
- Anacyclus, syngen. poly. super. and corymbifereæ, H. an. S. Eur. of common culture.
- Anagallis, pimpernell, pentan. monog. and primulacææ, a G. an. and bien. and H. peren. and an. Eur. all of easy culture, increased either by seeds or cuttings.
- Anagryis, bean-trefoil, decan. monog. and leguminosæ, a G. and F. tr. Spain and Tenerife, soil loam and peat, and cuttings will root in sand under a hand-glass.
- Anarrhinum, didyn. angios. and scrophularineæ, a H. bien. of common culture.
- Anastatica, rose of Jericho, tetrad. silicu. and crucifereæ, a H. peren. Levant, which will grow in common soil, and cuttings under a hand-glass root freely.
- Anchovy-pear, grias cauliflora, 5979.
- Anchusa, bugloss, pentan. monog. and boragineæ, G. and H. bien. and peren. Eur. and C. B. S. which grow freely in common soil, and are increased by cuttings or seeds.
- Anderson, James, LL. D. 130, 140. a British writer on gardening, page 1108. A. D. 1777.
- Andersonia, pentag. monog. and epacrideæ, a G. tr. N. Holl. which grows freely in peat soil with the pots well drained, and not overwatered; young tops made into cuttings root in sand under a bell-glass.
- Andrachne, bastard orpine, monœc. gyan. and euphorbiacæ, a H. an. Italy, of common culture.
- Andreas, Mr. Isaac, an eminent grower of the pineapple at Lambeth, 2712.
- Andreas, Henry, a British writer on gardening, page 1112. A. D. 1798.
- Andromeda, decan. monog. and ericææ, S. G. and H. tr. N. Amer. E. Ind. and Eur. which prefer peat soil, and cuttings strike in sand under bells or hand-glasses; but the hardy sorts make plants more rapidly by layers, 6562.
- Andropogon, polygam. monœc. and gramineæ, S. G. and H. peren. E. Ind. and Eur. grasses of easy culture.
- Androsace, pentag. monog. and primulacææ, H. peren. bien. and an. Eur. which thrive best in small pots in turfy loam and peat, the pots being well drained; they are increased by seeds, or dividing at the root.
- Andry, a French author on gardening, page 1116. A. D. 1707.

- Andryala, *syngen. polyg. æqual. and cichoraceæ*, G. peren. and bien. and H. peren. and an. As. Afr. and Eur.; the green-house sorts grow well in light loam, and cuttings root freely under a hand-glass; the hardy sorts are of common culture.
- Anemia, *cryptog. schismatopterides, and filices*, S. peren. W. Ind. ferns of the usual culture.
- Anemone, *polyan. polyg. and ranunculaceæ*, H. peren. Eur. and N. Amer. which grow in loam rather light and rich than heavy, and increase by dividing the root or by seeds.
- Anemone coronaria, and hortensis, the common garden anemone, 6275.
- Anethum, dill, pentan. dig. and umbellifereæ, a H. peren. and an. Eur. of common culture, and propagated by seed.
- Anethum fœniculum, the common fennel, 4097.
- Anethum graveolens, the common dill, 4103.
- Angelica, pentan. dig. and umbellifereæ, H. peren. and bien. Eur. and Amer. which grow in loamy deep soil, and are increased by seeds.
- Angelica archangelica, the garden angelica, 4216.
- Angelica-tree, aralia spinosa.
- Anglesea, gardens and residences of, 7603.
- Angran de Rucneuve, a French writer on gardening, page 1117. A. D. 1712.
- Anguria, monœc. dian. and cucurbitaceæ a S. peren. Carthagenæ, soil light and rich; propagation by cuttings or seeds.
- Angus, or Forfarshire, gardens and residences of, 7637.
- Anigozanthos, hexan. monog. and hemodoraceæ, a G. tr. N. Holl. which grows in loam and peat, requires a good deal of water, and is increased by dividing at the root.
- Anise, pimpinella anisum.
- Aniseed-tree, — see Illycium.
- Anisomeles, didyn. gymnos. and labiateæ, a S. an. E. Ind. of the usual culture.
- Ann. Bot. Annals of Botany, by C. Kœning and J. Sims.
- Annona, custard-apple, polyan. polyg. and annonaceæ, S. tr. W. Ind. and S. Amer. requiring a rich loam; and ripened cuttings with the leaves unshortened, will root in sand, under a glass in a moist heat.
- Annual plants, such as are of one year's duration, and are therefore raised annually from seeds ripened the preceding year. There are some exceptions in the cases of rare plants which do not seed freely; or where particular varieties are to be preserved. In these cases propagating by cuttings or layers is adopted.
- Annals, bark-stove or hot-house, their culture, 6724, 6725.
- Annals, dry-stove, 6663.
- Annals, frame, their culture, 6596.
- Annals, green-house, their culture, 6660.
- Annals, half hardy, their enumeration, 6512; culture, 6513.
- Annals, hardy, adapted for border-flowers, 6506; their culture, 6507.
- Anomatheca, trian. monog. and irideæ, a G. peren. C. B. S. a bulb of the irideæ family.
- Ansley Hall, Warwickshire, 7571.
- Ant, — see Formica.
- Anthemis, chamomile, *syngen. polyg. super. and corymbifereæ*, a G. peren. and H. peren. and an. Eur. and China, of easy culture, and propagated by seeds, cuttings, or dividing at the root.
- Anthemis artemisiæfolia, the Chinese chrysanthemum, 6470.
- Anthemis nobilis, the common chamomile, 4235.
- Anthericum, hexan. monog. and asphodeleæ, G. tr. peren. bien. and an. C. B. S. which grow in light sandy loam, with the pots well drained; the bulbous kinds should have no water when not in a growing state; the shrubby sorts root from cuttings, and most of the species produce seeds.
- Anthocercis, didyn. angios. and solanææ, a G. tr. N. Holl. which grows in loam and peat, and cuttings root readily under a bell-glass in sand.
- Antholyza, triand. monog. and irideæ, G. and H. peren. C. B. S. bulbs of the irideæ family.
- Anthospermum, amber-tree, diœc. tetran. and rubiaceæ, a G. tr. C. B. S. which grows well in loam and peat, and strikes readily from cuttings.
- Anthoxanthum, spring grass, dian. dig. and gramineæ, H. peren. Brit. and Morocco, of the easiest culture.
- Anthoxanthum odoratum, scented vernal grass, 4318.
- Anthriscus, rough chervil, pentan. dig. and umbellifereæ, a H. peren. and an. common weeds.
- Anthyllis, kidney-vetch, diadel. decan. and leguminosæ, G. and F. tr. and bien. Eur. which grow in loam and peat, and are propagated by seeds or cuttings under bell glasses in sand. The glasses must be kept wiped, otherwise the cuttings are apt to damp off.
- Antidesma, diœc. pentan. and terebintaceæ, S. tr. E. Ind. which require a rich loam, and cuttings will root in sand under a hand-glass in moist heat.
- Antiquities, uses of, in gardening, 1840.

- Beauty, that property in objects by which they are

- recommended to the power or faculty of taste; the reverse of ugliness; the primary, or most general object of love or admiration. (*Jeffrey, in Supp. Encyc. Brit.*) That which gives pleasure to the mind in objects of sense. (*M.A. Schimmelpenninck, chap. i.*)
- Though, in the common colloquial acceptation of the term beauty, it is applied only to such objects as delight the senses of vision and hearing; yet, in the strict and literal sense of the word, a fine view, a harmonious concert, the perfume of a rose, or the taste of an anana, are each possessed of beauty.
- The authors quoted, and also Alison, Stewart, and Knight, have discussed the subject of beauty in a clear and satisfactory manner, by which it appears that the great error of preceding writers on the subject, consisted in supposing that there was only one kind of beauty; whereas, there are many kinds, though some are much more general and universal than others. Nothing but mind can either please or disgust mind; and therefore the beauty that we see in objects depends, as D'Alembert has observed, on what is within ourselves. Man is possessed of the origin of every taste and refined enjoyment naturally; but every one of these, from the lowest sense to the highest, requires cultivation before it become capable of conferring much intellectual gratification. Though in the nature of things, therefore, there may be an absolute or universal beauty; yet, practically, all beauty may be said to be relative to the state of man in different countries and ages, and in different degrees of civilisation and refinement. Fashion, therefore, or the prevailing modes of the day, will by the great number of persons, always be esteemed the true criterion of beauty.
- Beauty of kitchen-garden scenery, 2355; of the flower-garden, 6201; of landscape scenery, 7157.

- under a hand-glass. The *H. peren. Virginia*, grows in peat soil, and is propagated by dividing the root.
- Boerhaavia*, hog-weed, dian. monog. and nyctagineæ, S. tr. and peren. Indies, which thrive well in rich loam, and cuttings root readily.
- Bœttiger*, C. A., his works, page 1127. A. D. 1817.
- Bog-rush*, — see *Schenus*.
- Boissier*, a beautiful villa near Geneva, 240.
- Bolesworth Castle*, Cheshire, 7590.
- Boltonia*, syngen. polyg. super. and corymbifereæ, *H. peren. N. Amer.* of common culture, 7594.
- Bombax*, silk-cotton tree, monad. polyan. and malvaceæ, S. tr. E. Ind. and S. Amer. which grow freely in loamy soil, and cuttings, not too ripe, taken off at a joint, will root freely under a hand-glass in heat.
- Bonchurch Cottage*, Isle of Wight, 7594.
- Bonfœil*, John, a British author on gardening, page 1099. A. D. 1622.
- Bonnelle*, Charles, his work on gardening, page 1118. A. D. 1763.
- Bontia*, didyn. angios. and myoporineæ, a S. tr. W. Ind. which thrives in peat and loam, and cuttings root readily in heat, under a hand-glass.
- Books on gardening*, 7685.
- Books of accounts and others required to be kept by gardeners*, 2337.
- Booth's Hall*, Cheshire, 7590.
- Borage*, — see *Borago*.
- Borago*, borage, pentan. monog. and boragineæ, *H. peren. bien. and an. Eur.* of the easiest culture.
- Borago officinalis*, the common borage, 4127.
- Borassus*, diœc. hexan. and palmeæ, a S. tr. E. Ind. which thrives well in sandy loam, and is propagated by seed.
- Borbonia*, diadel. decan. and leguminosæ, G. tr. C. B. S. which grow in loam and peat, and young cuttings strike readily under a bell-glass in sand.
- Borch*, Michael Jean, Comte de, his works on gardening, page 1128. A. D. 1780.
- Border* (*bordure*, Fr.), the edge, fringe, or margin of any thing, especially when distinguished by a line of demarcation, by ornament, or otherwise, from the main piece or plot.
- Border-flowers*, herbaceous plants of hardy constitution and easy culture, well adapted for ornamenting borders. In floriculture they are classed under distinct heads, viz. as perennials, 6489; bulbs, 6500; biennials, 6504; hardy annuals, 6506; half-hardy annuals, 6512; for particular purposes, 6515; for concealing upright deformities, 6516; horizontal deformities, 6517; which will grow under the shade and drip of trees, 6518; for ornamenting pieces of water, 6519; rocks, 6524; with evergreen leaves for winter display, 6527; for edgings to beds or borders, 6528; highly odoriferous, 6529; dial plants, 6532; ferns and mosses, 6534; alpinæ, 6537; common showy sorts for a small garden, 6538.
- Borders for fruit-trees*, 2484.
- Borders for gardening* are of general use in horticulture and floriculture, as accompaniments to walks, and walls or other fences. The former are chiefly as ornamental compartments; and the latter partly ornamental, but chiefly for the culture of fruit-trees, and the more delicate herbaceous esculents. The width of borders that accompany walks, is generally guided by that of the walk; but they are esteemed handsomer when broader rather than narrower; wall or fence borders should, according to the most approved ideas, never be less than the height of the wall or fence; since the roots of a tree require as much room to extend themselves as the shoots. For the formation of fruit-tree borders in kitchen-gardens, see 2484; and in flower-gardens, 6111. to 6118.
- Borecole* (*boreal cole*, northern cole or cale), — see *Brassica*.
- Borghese*, villa of, at Rome, 84.
- Bornefond*, —, a French writer on gardening, page 1116. A. D. 1653.
- Bornet*, Charles Henry, his works on gardening, page 1120. A. D. 1800.
- Borning-piece*, 1367.
- Boronia*, octan. monog. and diosmeæ, G. tr. N. S. W. which thrive well in loam and peat, and young cuttings strike readily under a bell-glass in sand.
- Borrington*, a seat in Devonshire, 7600.
- Borya*, diœc. dian. and euphorbiacæ, *H. tr. N. Amer.* which thrive in any common soil, and are increased by layers. Ripened cuttings planted in autumn will also take root.
- Bosc*, Monsieur Louis Auguste Guillaume, F.L.S. H.S., inspector of the government garden of the Luxembourg, Paris; his works on gardening, page 1122. A. D. 1819.
- Boscage* (*boscagium*, Lat. or *bocage*, Fr.), a grove or thicket of trees.
- Bosus* (*old Lat.*), all manner of wood.
- Bose*, Gaspard, proprietor of a fine garden near Leipsic, at the end of the 17th century, 217.
- Bosea*, golden rod, pentan. dig. and chenopodeæ, a G. tr. Canar. which grows freely in loam and peat, and cuttings root in sand, under a hand-glass, without heat.
- Bossiaea*, diadel. decan. and leguminosæ, G. tr. Austral. which grow in loam and peat, with a little sand, the pots being well drained; and cuttings, not too ripe, will root in sand, under a bell-glass, guarding against damp.
- Boston House*, Middlesex, 7521.
- Bot. Cult.*, Sweet's Botanical Cultivator, 8vo. 1820.
- Bot. Mag.*, Curtis' Botanical Magazine.
- Bot. Reg.*, Kerr's Botanical Register.
- Bot. Rep.*, the Botanist's Repository for new and rare plants, by H. Andrews.
- Botanic garden*, a garden for the culture of plants with a view to botanical science, 7323.
- Botanic gardener or curator*, 7386; his duties, 7498.
- Botanic gardens for the sale of plants*, at Monkwood, 7627; at Forfar, 7637.
- Botanic gardens of Chelsea*, 7517; Kew, 7529; Oxford, 7557; Cambridge, 7551; Hull, 7581; Liverpool, 7588; Bury, 7552; Edinburgh, 7618; Glasgow, 7629; Dublin, 7653; Cork, 7666.
- Botanic gardens*, public, their formation, 7323; management, 7497.
- Bothwell House*, Lanarkshire, 7629.
- Botley*, a seat in Staffordshire, 7570.
- Botley*, a seat in Surrey, 7527.
- Botrychium*, moonwort, cryptog. stachyopterides, and filices, *H. peren. N. Amer. and Brit. ferns*, which grow in peat earth in shady situations, and are propagated by dividing the root or by seeds.
- Bouché*, Pierre, his works on gardening, page 1127. A. D. 1809.
- Boulevard*, a promenade, 7315.
- Boulay*, —, a French writer on gardening, page 1117. A. D. 1712.
- Boultonbrook*, a seat in Radnorshire, 7610.
- Bourbon palm*, *latania rubra*.
- Bourreria*, pentan. monog. and boragineæ, S. tr. E. and W. Ind. of easy culture in loam and peat, and cuttings root freely under a hand-glass.
- Boursault*, Monsieur, possessor of a fine garden in Paris, 173.
- Bousmard*, —, his writings on gardening, page 1119. A. D. 1788.
- Boucher*, William, a British author on gardening, page 1108. A. D. 1772.
- Bouvardia*, tetran. monog. and rubiaceæ, G. tr. N. and S. Amer. which grow in loam and peat, and are increased by cuttings of the roots, or young cuttings under a hand-glass in heat.
- Bowden*, a seat in Wiltshire, 330.
- Bower* (*bur*, or *bure*, Sax. a parlor), an arbor formed with trees, — see *Arbor*.
- Bowood*, a seat in Wiltshire, 7597.
- Boxthorn*, — see *Lycium*.
- Box-tree*, — see *Buxus*.
- Br.*, Brown, Robert, Esq. F.R.S., possessor of the Banksian Library, one of the first botanists of Europe, distinguished for his knowledge, and improvement of the Jussieuan system.
- Brabejum*, African almond, polyg. monœc. and proteacæ, a G. tr. C. B. S. which grows in sand and peat, and ripened cuttings root in sand under a hand-glass.
- Brachysema*, decan. monog. and leguminosæ, a G. tr. N. Holl. a climber which thrives well in sandy loam and peat, and is increased by layers or cuttings under a bell-glass in sand.
- Bradford*, a town in Yorkshire, gardens of, 7582.
- Bradley*, Richard, F.R.S., a British author on gardening, page 1102. A. D. 1716.
- Bradwell Lodge*, Durham, 7584.
- Bradwell Lodge*, Hampshire, 7594.
- Braham Castle*, Ross-shire, 7647.
- Braid House*, Midlothian, 7618.
- Brake*, the fern pteris.
- Bramble*, — see *Rubus*.

- Bramborough House, Cheshire, 7590.
 Bramham Park, Yorkshire, 7582.
Bramieri, Don Giulio, his works on gardening, page 1128. A. D. 167.
 Bramwell Hall, a seat in Cheshire, 7590.
 Bramshill, a seat in Hampshire, 7594.
 Brasileto, — see *Cæsalpinia*.
Brassavola, gynan. monan. and orchideæ, a S. peren. W. Ind. a parasite, or air-plant, which may be hung up in baskets of moss or tan, or tied in a belt of moss to the trunk of a palm or other tree.
Brassia, gynan. monan. and orchideæ, a S. peren. Jam. an air-plant, requiring the same treatment as the *brassavola*.
Brassica, tetrad. siliq. and crucifereæ, H. peren. bien. and an. Eur. of the easiest culture, 3483.
Brassica oleracea var. α . *capitata*, the white cabbage, 3487.
Brassica oleracea var. β . *rubra*, the red cabbage, 3509.
Brassica oleracea var. γ . *sabauda*, the Savoy cabbage, 3513.
Brassica oleracea var. γ . *sabauda* subvar. γ ., the Brussels sprouts, 3522.
Brassica oleracea var. δ . *sabellica*, the borecole, 3527.
Brassica oleracea var. ϵ . *botrytis*, the cauliflower, 3538.
Brassica oleracea var. ζ . *botrytis* subvar. ϵ ., the broccoli, 3555.
Brassica oleracea var. η . *napobrassica*, turnip-rooted cabbage, 3529.
Brassica napa, rape, used as a salad plant in gardens, and grown in agriculture for food for sheep, and for the seed to be pressed for its oil, 4028.
Brassica rapa, turnip, 3693.
Brassica eruca, a salad plant, 4063.
 Bread-nut, — see *Brosimum*.
 Bread-fruit, — see *Artocarpus*.
 Brechin Castle, a seat in Forfarshire.
 Brecket Hall, Hertfordshire, 7544.
 Breconshire, gardens of, 7613.
Breitenbach, Ph. Fr. his works on gardening, page 1126. A. D. 1805.
Breitschneider, K. B. his work on gardening, page 1126. A. D. 1798.
 Brentford nursery, Middlesex, 7518.
 Bretby Park, a seat in Derbyshire, 7574.
Brettoniere, M. — de la, his works on gardening, page 1119. A. D. 1783.
 Brickenden Bury, a seat in Hertfordshire, 7544.
Bridel, his works on gardening, page 1120. A. D. 1798.
Bridgeman, a landscape-gardener of eminence in the early part of the 18th century, 342.
 Bridges, different kinds of, used in gardening, 1782.
 British authors on gardening, 7636.
 Briza, quaking-grass, trian. dig. and gramineæ, a H. peren. and an. Brit. grasses of the easiest culture.
 Bro. Jam., the Civil and Natural History of Jamaica, by Patr. Browne.
 Broadlands, a seat in Hampshire, 7594.
Brochieri, Francesco, his work on gardening, page 1123. A. D. 1777.
 Brookesley Hall, Yorkshire, 7582.
 Brockley Park, in Queen's County, 7659.
Brocq, Philip, le, M. A. a British writer on gardening, page 1109. A. D. 1786.
Brodiaea, hexan. monog. and hemerocallideæ, G. peren. Georgia, which grow well in sand and peat, kept moist, and are propagated by dividing the root like *agapanthus*.
 Brodie House, in Kincardineshire, 7638.
 Brompton House, 7590.
 Brome-grass, — see *Bromus*.
Bromelia, hexan. monog. and bromeliaceæ, S. tr. natives of South America and the West Indies, all of which grow well in two thirds good fresh loam, one third leaf mould or rotten dung, and as much sand as will prevent the mixture from getting hard and compact, with watering. A warm, and rather moist atmosphere is required to grow the fruiting sorts to any size; but they are otherwise very hardy. Most of the species bear that peculiar production called a crown on the summit of their fruit, by which, or by suckers, they are usually propagated.
Bromelia ananas, the common pine-apple; its history and varieties, 4784; its general culture, 2697; preferable varieties, 2698; soil, 2700; artificial heat, 2706; propagation, 2712; nursing department, 2718; succession department, 2753; fruiting department, 2792; general directions common to the three departments, 2842; insects, 2906; compendium of a course of culture, 2917; recent improvements by Knight, Marsland, &c. 2924.
 Brompton agricultural nursery, Middlesex, 7518.
 Brompton Park nursery, Middlesex, 7518.
Bromus, brome-grass, trian. dig. and gramineæ, H. peren. tr. and an. Eur. of the easiest culture.
Brooklime, *veronica beccabunga*.
Brookshaw, George, a British gardening author, page 1114. A. D. 1817.
 Brook-weed, — see *Samolus*.
 Broom, — see *Spartium*.
 Broom-rape, — see *Orobanche*.
Brosimum, bread-nut, polygam. diœc. and S. tr. Jam. soil, a light loam; propagation by large old cuttings not divested of their leaves, in a pot of sand under a hand-glass in a moist heat.
Brossard, Davy, or David, a French writer on gardening, page 1115. A. D. 1552.
Brossae, pentag. monog. and ericeæ, a S. tr. S. Amer. which grows in peat and sand, and young cuttings will root in the same mixture under a bell-glass on gentle heat.
Brotera, syngen. poly. segr. and cynarocephaleæ, a H. peren. S. Amer. which will grow in common loam, and is propagated by dividing the root.
 Broughton Hall, Staffordshire, 7570.
 Broughton House, Kircudbrightshire, 7625.
 Broughton, or Adelphi nursery, Edinburgh, 7618.
 Broughtonia, gynan. monan. and orchideæ, a S. peren. Jam. an air-plant, requiring the same treatment as *brassavola*.
Brousse, M. — de la, his works on gardening, page 1119. A. D. 1772.
Broussonetia, paper-mulberry, diœc. tetran. and urticæ, a H. tr. Japan, which grows in common garden-soil, and is readily increased by layers.
Browallia, didyn. angios. and scrophularineæ, G. an. S. Amer. of the usual treatment.
Brown, Launcelot, Esq. a celebrated landscape-gardener, born at Cambol, or Camphill, a few houses near the village of Hartburn, in Northumberland. He died in 1782, without issue, holding at the time the situation of head-gardener at Hampton-court, and possessed of considerable wealth, which he left to a nephew, 342.
 Browne, Robert, a British writer on gardening, page 1109. A. D. 1786.
 Browne, Sir Thomas, M. D., a British author on gardening, page 1110. A. D. 1658.
 Brownea, monad. decan. and leguminoæ, a S. tr. W. Ind. which grows best in loamy soil, and cuttings of ripened wood will root in sand under a hand-glass in moist heat.
 Brownsholme, a seat in Lancashire, 7588.
 Broxburn Bury, a seat in Hertfordshire, 7544.
 Broxmore, a seat in Wiltshire, 7596.
 Broxton Lodge, Durham, 7584.
Brucea, diœc. tetran. and terebinthaceæ, a S. tr. Abyssinia, which thrives in loamy soil, and cuttings root in sand under a hand-glass in heat.
Bruchus pisi, 3642.
Brugmansia, pentan. monog. and solanæ, a S. tr. Peru, which thrives in rich loam, and strikes from cuttings in moist heat.
Bruley, C. —, his works on gardening, page 1123. A. D. 1804.
Brulles, —, a British writer on gardening, page 1110. A. D. 1790.
Brunia, pentan. monog. and rhamneæ, G. tr. C. B. S. with heath-like leaves, which grow in sandy peat with a moderate supply of water; and young cuttings in sand, under a bell-glass, will strike root freely.
 Bryansford, a seat in Down, 7683.
Bryant, Charles, a British author on gardening, page 1109. A. D. 1784.
 Bryony, — see *Bryonia*.
Bubon, pentag. dig. and umbellifereæ, G. tr. and G. bien. Eur. and C. B. S. grow freely well in loam and peat, and ripened cuttings taken off at a joint, and planted under a hand-glass in sand, will root readily; the H. bien. species is of easy culture.
Bubroma, bastard cedar, polyadel. dodec. and malvaceæ, a S. tr. Jamaica, which thrives well in loam and peat, and cuttings root freely in sand under a hand-glass.
Buch. ic., *Buch's icones plantarum*.
Buchnera, didyn. angios. and scrophularineæ, a H. peren. N. Amer. which grows best in pots in loam and peat, and is increased chiefly by seeds.

- Buchoz*, Pierre Joseph, his works on gardening, page 1118. A. D. 1760.
- Bucida*, olive-bark tree, decan. monog. and santalaceæ, a S. tr. Jamaica, which grows best in loam and peat, and well ripened cuttings root in sand under a hand-glass plunged in heat.
- Buckbean*, *menyanthes trifoliata*.
- Buckhurst Park*, Sussex, 7531.
- Buckinghamshire*, gardens and residences of, 7546.

- Bur-parsley*, — see *Caulis*.
- Bur-reed*, — see *Sparganium*.
- Bursaria*, pentan. monog. and pittosporææ, a G. tr. Ind. and Amer. a showy plant which grows best in sandy loam and peat, and cuttings root readily in sand under a bell-glass.
- Bursera*, polyg. diœc. and terebintaceæ, a S. tr. W. Ind. which grows in loamy soil, and large cuttings root in sand under a hand-glass in moist heat.
- Burtin*, Francis Xavier, his works on gardening, page 1129. A. D. 1784.
- Burton Constable*, a seat in Yorkshire, 7582.
- Burtonia*, decan. monog. and leguminosææ, a G. tr. N. Holl. requiring attentive treatment; it grows in sandy loam and peat, with the pots well drained, and young cuttings will root in sand under a bell-glass.
- Burwell Park*, a seat in Lincolnshire, 7578.
- Burwood Park*, Surrey, 7527.
- Bury St. Edmunds*, botanic garden at, 7552.
- Bushey Park*, at Hampton Court, 7523.
- Bushnell's Wells*, Oxfordshire, 1662.
- Bussato*, Marco, his work on gardening, page 1128. A. D. 1794.
- Butcher's broom*, — see *Ruscus*.
- Butea*, diadel. decan. and leguminosææ, S. tr. E. Ind. splendid plants which grow in loam and peat, and cuttings taken off at a joint, and planted in sand, and not deprived of their leaves, will root in moist heat, covered with a hand-glass.
- Buteshire*, gardens of, 7650.
- Butler*, gardener to the Earl of Derby, at Knowlesley, and afterwards a nurseryman at Prescot, 1589.
- Butonum*, flowering-rush, ennean. hexag. and hydrocharideæ, a H. peren. Brit. an aquatic.
- Butter-bur*, *tussilago petasites*.
- Butter-wort*, — see *Sanícula*.
- Buttneria*, pentan. monog. and malvaceæ, S. tr. Amer. which grow in loam and peat or rich loam, and ripened cuttings root under a hand-glass in sand.
- Button-flower*, — see *Gomphia*.
- Button-tree*, — see *Conocarpus*.
- Button-weed*, — see *Spermacoce*.
- Button-wood*, *cephalanthus occidentalis*.
- Buttrct*, —, his works on gardening, page 1120. A. D. 1795.
- Buxus*, monœc. tetran. and euphorbiaceæ, H. tr. of easy culture, and propagated by cuttings or layers.
- Buxus sempervirens*, the common box-tree, the best of all edging shrubs, 6582; as a timber-tree, 7118.
- Bysshe Court*, a seat in Surrey, 7527.
- Bystropogon*, didyn. gymnos. and labiateæ, G. tr. Canaries, which thrive in loam and peat, and cuttings root readily in the same soil under a hand-glass.
- Byzantium*, gardens of, 306.

C.

- Cabanis de Salagnac*, his works on gardening, page 1119. A. D. 1786.

- Cacalia*, syngen. polyg. æqual. and corymbifereæ, a S. tr. and S. an. C.B.S. and Amer. succulents, which grow in sandy loam and brick-rubbish, and are propagated by cuttings; the H. peren. are of the easiest culture.
- Cachyris*, pentan. dig. and umbellifereæ, H. peren. Eur. of common culture, and propagated by seeds.
- Cactus*, icosan. monog. and cactææ, S. D. S. Indics and Amer. and G. tr. succulents of easy culture.
- Cactus opuntia*, the Indian fig, 5966.
- Cacucia*, decan. monog. and onagrarææ, a S. tr. Guiana, which grows well in loam and peat, and cuttings root freely in sand under a hand-glass.
- Cadet*, Charles Louis, his works on gardening, page 1120. A. D. 1801.
- Cadet-de-Vaux*, Antoine Alexis, his works on gardening, page 1121. A. D. 1807.
- Cadia*, decan. monog. and leguminosææ, a S. tr. Arabia, which prefers a light soil, and cuttings root in sand under a hand-glass and plunged in heat.
- Cadland*, a seat in Hampshire, 7594.
- Caenwood*, a seat in Middlesex, 7521.
- Caernarvonshire*, gardens and residences of, 7604.
- Cæsalpinia*, decan. monog. and leguminosææ, S. tr. E. and W. Ind. prickly branched, which thrive well in loam and peat, and cuttings sometimes succeed, taken off in a growing state, but not too young, and plunged in a pot of sand under a hand-glass in moist heat.
- Cæsia*, hexan. monog. and asphodelææ, a G. peren. N. S. W. which grows in loam and peat, and is increased by dividing at the root or by seeds.
- Cæsulia*, syngen. polyg. æqual. and corymbifereæ, a S. peren. E. Ind. requiring a rich, loamy soil, and cuttings root freely.
- Caithness*, gardens of, 7644.
- Cakile*, tetrad. silic. and crucifereæ, a H. peren. and

- an, Eur.; the first best grown in pots, and the other of common culture, and both increased by seeds.
- Calabash-tree, — see *Crescentia*.
- Caladenia*, gynan. monan. and orchideæ, a G. peren. N. S. W. which may be grown in loam and peat, and increased by division at the root.
- Calamagrostis*, trian. dig. and gramineæ, H. peren. Eur. grasses of the easiest culture.
- Calaminth*, — see *Calamintha*.
- Calamintha*, calaminth, didyn. gymnos. and labiateæ, F. tr. and H. peren. Eur. and Amer. of common culture, and increased by seeds or dividing at the roots.
- Calamus*, hexan. monog. and palmeæ, S. tr. E. Ind. palms, which thrive best in sandy loam, and a warm, moist atmosphere, and are propagated by seed.
- Calanchoe*, octan. tetrag. and sempervivæ, D. S. tr. As. and Afr. succulents which thrive well in sandy loam, but require bottom heat to make them flower. "The leaves placed on a pot of mould, or on the tan, will shoot out young plants from the notches of the margin." (*Sweet*.)
- Calathian violet*, *gentiana pneumonanthe*.
- Calceolaria*, slipper-wort, dian. monog. and scrophularineæ, G. peren. and an. Peru and Falkland islands, of easy culture, and propagated by seeds.
- Calcutta*, gardening of, 500.
- Caldasias*, pentan. monog. and scrophularineæ, a S. an. New Spain, of common culture.
- Calder House*, Midlothian, 7618.
- Calea*, syngen. polyg. æqual. and corymbifereæ, S. tr. and a S. bien. W. Ind. which grow in rich soil, and cuttings strike readily either in sand or mould.
- Caled. Depic.*, *Chalmer's Caledonia Depicta*, an antiquarian work.
- Caled. Hort. Soc.*, Caledonian Horticultural Society, some account of, 410, and page 1113. A. D. 1810.
- Caled. Mem.*, *Memoirs of the Caledonian Horticultural Society*, page 1113. A. D. 1810.
- Caledon Hill*, a seat in Tyrone, 7679.
- Calendula*, marigold, syngen. polyg. neccess. corymbifereæ, G. tr. and a G. peren. Eur. and C. B. S. which thrive in loam and peat, and cuttings root freely in the same soil under a hand-glass; and H. an. of the easiest culture.
- Calendula officinalis*, the common pot-marigold, 4122.
- Calla*, heptan. monog. and aroidæ, a G. and H. peren. Eur. and C. B. S. the first an aquatic, and the other a marsh plant of easy culture. *C. æthiopia* will also grow well on the green-house stage.
- Callander*, a seat in Stirlingshire, 7631.
- Callicarpa*, tetran. monog. and verbenaceæ, S. and G. tr. E. Ind. and Amer. which grow best in loam and peat, and ripened cuttings strike root in sand under a hand-glass in heat.
- Callicoma*, dodec. dig. and cunoniaceæ, a G. tr. N. S. W. which thrives in loam and peat, and cuttings of ripe wood root readily in sand under a hand-glass.
- Calligonum*, dodec. tetrag. and polygonæ, a H. tr. Caspian Sea, which may be grown in loam and peat, and propagated by layers.
- Callisa*, trian. monog. and commelineæ, a S. peren. W. Ind. a creeper of easy culture.
- Callistachys*, decan. monog. and leguminosæ, G. tr. N. Holl. which grow fast and flower freely in loam and peat, and cuttings planted in sand under a bell-glass.
- Callitriche*, water-starwort, monandr. digyn. and naideæ, a H. an. Brit. which grows on the surface of shallow water, and sends down delicate fibres to the soil below.
- Calluna*, octan. monag. and ericeæ, a H. tr. Brit. (formerly *erica*) the common heath; it requires to be grown in peat soil, and may be increased by seeds, layers, or cuttings of the young shoots planted in sand under a hand-glass.
- Calodendrum*, pentan. monog. and pittosporæ, a G. tr. C. B. S. which, as the name imports, is of great beauty. It grows in loam and peat, and cuttings of ripe wood root readily in sand under a hand-glass.
- Calodium*, monœc. polyan. and aroidæ, S. tr. and peren. Ind. and Amer. most of which grow freely in water, or in rich soil in a moist heat; they are propagated by tubers of the root.
- Calonne*, —, his works on gardening, page 1119. A. D. 1779.
- Calophyllum*, polyan. monog. and guttifereæ, S. tr. Ind. which grow well in light loam, and cuttings of ripened wood strike freely in sand, under a hand-glass in moist heat.
- Calopogon*, gynan. monan. and orchideæ, a F. peren. N. Amer. which grows in peat, and is increased by dividing at the root.
- Calothamnus polyadelph.* icosan. and myrteaceæ, G. tr. N. Holl. which thrive in loam and peat, and cuttings root in sand under a bell-glass.
- Calotropis*, pentan. dig. and asclepiadæ, S. tr. N. Amer. which grow in light loam, young cuttings root freely under a hand-glass in a pot of sand, care being taken that they do not get mouldy.
- Caltha*, polyan. polyg. and ranunculaceæ, H. peren. Brit. marsh plants of the easiest culture.
- Caltrop*, — see *Tribulus*.
- Calvel*, Etienne, his works on gardening, page 1121. A. D. 1802.
- Calvert and Co.*, their work on gardening, page 1122. A. D. 1821.
- Calycanthus*, icosan. polyg. and rosaceæ, H. tr. N. Amer. which thrive in loam and peat, and root by layers in the same soil.
- Calypso*, gynan. monan. and orchideæ, a H. peren. N. Amer. a bulb, which grows best in peat, or in sandy loam and peat, and is increased by offsets from the bulbs or by seeds.
- Calyptantes*, icosan. monog. and myrteaceæ, S. peren. W. and E. Ind. which thrive in sandy loam, and peat; and though cuttings do not strike freely, ripened once sometimes root under a hand-glass. Layers answer best.
- Calystegia*, bearbind, pentan. monog. and convolvulaceæ, H. peren. Eur. and Amer. of common culture.
- Camb. Brit.*, *Cambden's Britannia*, an antiquarian work.
- Cambridge botanic garden*, 7551.
- Camden Park*, in Wexford, 7655.
- Camelina*, tetrad. silic. and crucifereæ, H. an. Eur. of common culture.
- Camellia*, monadel. polyan. and auranteæ, G. tr. China, of great beauty, — see 6612.
- Cameraria*, bastard mangeneel, pentan. monog. and apocynæ, Ind. which grows well in loam and peat, and cuttings root in a pot of sand under a hand-glass.
- Campanula*, bell-flower, pentan. monog. and campanulæ, G. tr. peren. bien. and an. and H. peren. and an. Eur. As. Afr. and Am. of common culture, and increased by seeds, dividing at the root, or by cuttings.
- Campanula rapunculus*, the rampion, 3941; *campanula pyramidalis*, 946.
- Camphire-tree*, *laurus camphora*.
- Camphorosma*, tetran. monog. and chenopodæ, a G. under-shrub, S. Eur. of easy culture in light soil, not over-watered.
- Campion*, cucubalus baccifer.
- Cams Hill*, a seat in Hampshire, 7594.
- Canada rice*, *zizania aquatica*.
- Canarina*, hexan. monog. and campanulaceæ, a G. peren. Canaries, requires a light soil, no water where the leaves have died down, and to be put in the stove to flower well. It is propagated from cuttings of the roots or shoots.
- Canary-grass*, — see *Phalaris*.
- Candleberry-myrtle*, *myrica gale*.
- Candy-carrot*, *athamanta cretensis*.
- Candytuft*, — see *Iberis*.
- Canella*, dodec. monog. and meliaceæ, a S. tr. W. Ind. soil loamy; and cuttings of large old wood, with all the leaves taken off at a joint, in sand, in a moist heat, strike, though with difficulty.
- Canna*, Indian shot, monan. monog. and canneæ, S. peren. Ind. and S. Amer. reedy or marsh plants of easy culture, and propagated by seeds or dividing the root.
- Cannabis*, hemp, diœc. pentan. and urticæ, a H. an. India, of easy culture.
- Canon House*, Sussex, 7531.
- Canons*, a seat in Middlesex, 7520.
- Cantaleupe melon*, — see *Cucumis*.
- Canterbury bell*, *campanula medium*.
- Canton*, *Fatee gardens* at, 7318.
- Cantray*, a seat in Inverness-shire, 7648.
- Cape of Good Hope*, gardening of, 502.
- Cape jasmine*, *gardenia florida*.
- Caper-bush*, — see *Capparis*.
- Capparis*, caper-tree, polyan. monog. and capparidæ, S. and G. tr. Eur. and W. Ind. chiefly

- climbers and trailers, which grow freely in light loam, and strike readily by cuttings.
- Capparis spinosa*, the caper-bush, 6038.
- Capsicum*, pentan. monog. and solanææ, S. tr. G. tr. and H. an. Indies, of easy culture, and propagated by cuttings or seeds.
- Capsicum annuum*, cerasiforme, and grossum, 4272. to 4277.
- Caralluma*, pentan. dig. and asclepiadææ, D. S. tr. E. Ind. succulents which grow in brick rubbish and loam, and increase by cuttings left till their wounds dry up before planting.
- Caraway, — see *Carum*.
- Carclere, a seat in Cornwall, 7601.
- Cardamine, lady's smock, tetrad. siliq. and cruciferae, a G. peren. and H. peren. bien. and an. Eur. of the easiest culture.
- Cardamine pratensis*, common lady's smock, 4311.
- Cardamom, elettari cardamomum.
- Carden, a seat in Cheshire, 7590.
- Cardiganshire, gardens and residences of, 7607.
- Cardinal-flower, *lobelia cardinalis*, 6460.
- Cardiospermum*, heart-seed, octan. trig. and sapindææ, S. an. India and Brasil, of common culture.
- Cardoon, *cynara cardunculus*, 3929.
- Carduus, thistle, syngen. poly. æqual. and cynaroccephalææ, H. peren. bien. and an. Eur. of common culture.
- Carduus marianus*, 3956.
- Carex*, monœc. trian. and cyperaceæ, a G. peren. and H. peren. Eur. and Amer. grasses of common culture.
- Careya*, monad. polyan. and a S. peren. E. Ind. which grows in light soil.
- Carica*, papaw-tree, diœc. decand. and cucurbitaceæ, S. tr. India which grow vigorously in a loamy soil, and large cuttings, not deprived of their leaves, root in sand under a hand-glass in heat.
- Carissa*, pentan. monog. and apocynææ, S. tr. E. Ind. which grow in loam and peat, well drained, and without being much watered; cuttings root in sand under a bell-glass in heat.
- Carlina*, carline-thistle, syngen. polyg. æqual. and cynaroccephalææ, H. peren. bien. and an. Eur. of common culture, and raised from seeds.
- Carline-thistle, — see *Carlina*.
- Carlow, the county of, as to gardening, 7660.
- Carlsruhe (Charles's peace or retreat), public gardens of, 7314.
- Carlton Palace gardens, London, 7523.
- Carnation, — see *Dianthus*.
- Carob-tree, *ceratonia siliqua*.
- Carolineæ, monad. polyan. and malvaceæ, S. tr. W. Ind. splendid plants which thrive well in loamy soil, and cuttings taken off at a joint, and not deprived of their leaves, root in sand under a hand-glass in heat.
- Caronelli*, Conte Pietro de, his works on gardening, page 1128. A. D. 167.
- Carpesium*, syngen. polyg. super. and corymbiferae, H. peren. Eur. and China, which grow in light soil, and are increased by seeds.
- Carpinus*, hornbeam, monœc. polyan. and armentaceæ, H. tr. Eur. and Amer. of common culture.
- Carpinus betulus*, the common hornbeam, 7091.
- Carpopogon*, diadelph. decan. and leguminosææ, S. tr. E. Ind. climbers which grow in loam and peat, and cuttings root freely under a bell-glass in sand.
- Carradori*, his works on gardening, page 1128. A. D. 1807.
- Carrot, 3712. — see *Daucus*.
- Carthamus*, syngen. polyg. æqual. and cynaroccephalææ, G. tr. Eur. and Afr. which grow well in a loamy soil, and cuttings root freely in sand under a hand-glass. The H. peren. and an. are of common culture.
- Carton, a seat in Kildare, 7657.
- Carum*, caraway, pentan. dig. and umbelliferae, H. bien. Eur. of common culture.
- Carum carvi*, the common caraway, 4225.
- Caryophyllus*, clove-tree, icos. monog. and myrtaceæ, a H. tr. Moluccas, which grows in loam and peat, and cuttings, not deprived of their leaves, root in sand under a hand-glass in a moist heat.
- Caryota*, monœc. polyan. and palmææ, a S. tr. E. Ind. a palm which grows in sandy loam, and is propagated by seeds.
- Cascades, 1827.
- Caserta, a royal Neapolitan palace and gardens, 87.
- Cashel Palace, in Tipperary, 7667.
- Cashew-nut, *anacardium orientale*.
- Cashier, a seat in Tipperary, 7667.
- Cashiobury, a seat in Hertfordshire, described, 7545.
- Cassava, *jatropha manihot*.
- Cassia, decan. monog. and leguminosææ, S. and G. tr. bien. and an. E. and W. Ind. which thrive in loam and peat, and cuttings will root in sand under a hand-glass in moist heat: many kinds ripen seeds.
- Cassine, pentan. trig. and rhamnææ, a S. tr. and G. tr. C. B. S. which grow freely in loam and peat, and cuttings root readily in sand under a hand-glass.
- Cassinia, syngen. polyg. segr. and corymbiferae, G. peren. N. Holl. of common culture, 1769.
- Cassino (*Ital.*), a little house, a villa, or cottage ornée.
- Castanea, chestnut, monœc. polyan. and amentaceæ, H. tr. Eng. and Amer. of common culture.
- Castanea vesca*, the sweet chestnut; as a fruit-tree, 475; as a forest tree, 7094.
- Castel, René Richard, his works on gardening, page 1121. A. D. 1802.
- Castel, Robert, a British writer on gardening, page 1103. A. D. 1728.
- Castelleja, didy. angios. and scrophularinææ, a H. peren. Louisiana. of common culture.
- Castle Ashby, Northamptonshire, 7580.
- Castle Blaney, a seat in Monaghan, 7678.
- Castle Dillon, in Armagh, 7682.
- Castle Eden, Durham, 7584.
- Castle Glamis, in Angus-shire, 7637.
- Castle Gosford, in Armagh, 7682.
- Castle Grant, in Inverness-shire, 7648.
- Castle Gray, in Perthshire, 7636.
- Castle Hill, a seat in Devonshire, 7600.
- Castle Howard, Yorkshire, 7583.
- Castle Malwood Cottage, Hampshire, 7594.
- Castle Upton, a seat in Antrim, 7684.
- Castle Wry, a seat in Wigtonshire, 7626.
- Castle Martyn, a seat in the county of Cork, 7666.
- Castlebar House, a seat in the county of Mayo, 7673.
- Castletown Delvin, a seat in Westmeath, 7662.
- Castletown, a seat in Kildare, 7657.
- Castletown, a seat in Tipperary, 7667.
- Castor-oil plant, *ricinus palma christi*.
- Casuarina, monœc. monan. and coniferae, G. tr. Austral. which grow freely in loam and peat, and cuttings root in sand under a hand-glass.
- Cat-mint, — see *Nepeta*.
- Cat's ear, — see *Hypochaeris*.
- Cat's tail, — see *Typha*.
- Catstail-grass, — see *Phleum*.
- Cat-thyme, *teucrium marum*.
- Catalpa, dian. monog. and bignoniaceæ, a S. tr. W. Ind. which grow well in light loam, and cuttings root in sand under a hand-glass in heat; the H. species thrives in common soil, and is increased from seeds or cuttings of the roots.
- Catananche, syngen. polyg. æqual. and cichoraceæ, a H. peren. and an. Eur. and Afr. of common culture.
- Catchfly, *lychnis vespica*.
- Caterpillar, the second or larva stage in the progress of insects generated from eggs, after which they become pupæ, or chrysalidæ, and lastly, imagoæ or perfect insects, 2227; general principles of palliating their effects and destroying, 2277; mode of destroying caterpillars on the cabbage tribe, 3593; gooseberries, 4656; roses and other flowers, 6194.
- Catesbæa, lily-thorn, tetran. monog. and rubiaceæ, S. tr. W. Ind. which grow in loam and peat, and cuttings root in sand plunged in heat, and covered with a bell-glass.
- Cathartocarpus, decan. monog. and leguminosææ, S. tr. E. Ind. which may be treated as cassia.
- Cattaneo*, Giacomo, his works on gardening, page 1128. A. D. 1767.
- Caucalis, bur-parsley, pentan. dig. and umbelliferae, H. bien. and an. Eur. of common culture.
- Cauliflower, 3038. — See *Brassica*.

- Cayenne, gardening of, 505.
- Caylus, N — de, his works on gardening, page 1121. A. D. 1806.
- Ceanothus, pentan. monog. and rhamnæa, S. tr. and G. tr. Amer. and W. Ind. which grow in loam and peat, and cuttings root freely in sand under a hand-glass. The H. tr. grow in common soil, and are readily raised from seeds or layers.
- Cecropia, snake-wood, diœc. dian. and urticæa, a S. tr. Jam. which prefers a loamy soil, and large cuttings planted in sand under a hand-glass will strike root.
- Cedar of Goa, cupressus lusitanica.
- Cedar of Lebanon, — see Pinus.
- Cederhelm, Baron Carl Wilhelm, his works on gardening, page 1130. A. D. 1740.
- Cedrela, pentan. monog. and meliæa, a S. tr. W. Ind. which grows well in loam and peat, and cuttings root under a hand-glass in sand.
- Celandine, — see Chelidonium.
- Celastrus, staff-tree, pentan. monog. and rhamnæa, G and H. tr. C. B. S. and Amer. requiring similar treatment to ceanothus.
- Celery, 3997. — see Apium.
- Celosia, cock's comb, pentan. monog. and amarantaceæ, a S. bien. and an. E. Ind. and China; of common culture.
- Celosia cristata, the common cock's comb, 6483.
- Cels, M. François, C. M. H. S. an eminent nurseryman at Mont-Rouge, Paris, 194.
- Celsia, didyn. angios. and solanæa, S. an. F. bien. and H. an. Eur. and E. Ind. of common culture.
- Celtis, nettle-tree, polyg. monœc. and amentaceæ, S. tr. and H. tr. Eur. and Amer. which require only common soil and culture, and are increased by seeds or layers, or by cuttings.
- Cenchrus, trian. monog. and gramineæ, a S. tr. and H. an. India; grasses of the easiest culture.
- Cenia, syngen. polyg. super. and corymbifereæ, H. an. C. B. S. of common culture.
- Centaurea, centaury, syngen. polyg. frustan. and cynarocephalæa, G. F. and H. peren. bien. and an. Eur. of common culture.
- Centaurea benedicta, the blessed thistle, 4250.
- Centaur — see Centaurea.
- Centunculus, bastard pimpernel, tetran. monog. and primulaceæ, a H. an. Brit. of common culture.
- Cephaelis, pentan. monog. and rubiaceæ, S. tr. Jam. and Afric. which thrive in loam and peat, and cuttings roots freely under a hand-glass in sand.
- Cephalanthus, button-wood, tetran. monog. and rubiaceæ, a H. tr. N. Amer. which grows best in loam and peat, and is propagated by layers or ripened cuttings.
- Cephalophora, syngen. polyg. æqual. and corymbifereæ, a F. peren. Chili, which grows in sand and peat, and young cuttings root readily under a hand-glass.
- Cerastium, mouse-ear, chick-weed, decan. pentag. and caryophyllæa, H. peren. and an. Eur. of the easiest culture.
- Ceratocarpus, monœc. monan. and chenopodeæ, a H. an. Tartary, of common culture.
- Ceratonla, carb-tree, polyg. diœc. and leguminosæa, a G. tr. Levant, which thrives well in loam and peat, and ripened cuttings root in sand under a hand-glass.
- Ceratophyllum, horn-wort, monœc. polyan. and naiadæa, H. peren. Brit. aquatics, of easy culture, and increased by seeds.
- Cerbera, pentan. monog. and apocynæa, S. tr. S. Amer. and India, which grow in loam and peat, ripened cuttings root readily in sand under a hand-glass in moist heat.
- Cercis, Judas-tree, decan. monog. and leguminosæa, H. tr. Eur. and America, which grow in common soil, and are raised from seeds or layers.
- Cerinth, honey-wort, pentan. monog. and boraginæa, a H. tr. and an. Eur. of common culture.
- Ceruti, Joseph Ant. Joach. his works on gardening, page 1120. A. D. 1792.

- Chimaphila, decan. monog. and ericæ; H. tr. N. Amer. rather difficult to preserve; they grow best in a bed of peat, and seldom transplanted.
- Chinampas, or floating gardens of Mexico, 491.
- Chiococca, snow-berry, pentan. monog. and rubiaceæ, a S. tr. Jam. which thrives well in loam and peat, and cuttings root freely in sand under a hand-glass.
- Chionanthus, fringe-tree, dian. monog. and oleineæ, H. tr. N. Amer. of great beauty, which grow in good loamy soil, and are increased by seeds or grafting on the common ash.
- Chiphase Castle, Northumberland, 7586.
- Chippenharn Park, Cambridgeshire, 7551.
- Chironia, pentan. monog. and gentianeæ, G. tr. C. B. S. which grow in peat with a little loam, and young cuttings root under hand-glasses in the same soil.
- Chiswick House, Middlesex, 7521.
- Chlora, yellow wort, octan. monog. and gentianeæ, a H. an. of common culture.
- Chloranthus, chulan, tetran. monog. and chloanthæ, G. tr. China, which may be treated as chenolea.
- Chlorophytum, hexan. monog. and asphodeleæ, a S. and G. peren. Afr. grow in loam and peat, and are increased by dividing at the root, or by seeds.
- Chocolate-nut,—see *Theobroma*.
- Cholmondeley Hall, Cheshire, 7590.
- Chomet, Noel, a French author on gardening, page 1116. A. D. 17—.
- Chomelia, tetran. monog. and rubiaceæ, a S. tr. W. Ind. which grows in loam and peat, and cuttings root readily in sand under a hand-glass in heat.
- Chondrilla, syngen. polyg. æqual. and cichoraceæ, a H. peren. France, which grows best in peat soil, and is increased by seeds or dividing at the root.
- Chorizema, decan. monog. and leguminosæ, G. tr. N. Hol. which grows in sandy loam and peat, and produces seed in abundance.
- Chorispermum, tetrad. siliq. and crucifereæ, a H. an. of common culture.
- Christ, I. L., his works on gardening, page 1127. A. D. 1809.
- Christ's thorn, *zizyphus paliurus*.
- Christmas rose,—see *Helleborus*.
- Chron. Scot., Chronicles of Scotland, by Pittscottie.
- Chrysanthellum, syngen. polyg. frustan. and corymbifereæ, a S. an. W. Ind. of common culture.
- Chrysanthemum, syngen. polyg. super. and corymbifereæ, a G. tr. and H. an. and peren. which grow in common garden-soil, and are increased by dividing the root, or by cuttings, or seeds.
- Chrysanthemum leucanthemum, 4316.
- Chrysanthemum indicum,—see *Antemis*.
- Chrysobalanus, cocoa-plum, icos. monog. and rosaceæ, a S. and G. tr. W. Ind. and Georgia, which grow in sandy loam, and large cuttings taken off at a joint, with their leaves uninjured, and planted thinly in a pot of sand, under a hand-glass, will strike root.
- Chrysocoma, goldy-locks, syngen. polyg. æqual. and corymbifereæ, G. tr. C. B. S. and Eur. which thrive in loam and peat, and cuttings root readily under a hand-glass.
- Chrysophyllum, star-apple, pentan. monog. and sapoteæ, S. tr. W. Ind. which thrive in sandy loam, and cuttings of ripened shoots root in sand under a hand-glass, with a strong moist heat.
- Chrysoplenium, golden saxifrage, decan. dig. and saxifrageæ, H. peren. Eur. and Amer. which grow in shady moist places, and may be treated as marsh plants.
- Chrysurus, trian. dig. and gramineæ, a H. an. of common culture.
- Chulan,—see *Chloranthus*.
- Cicely,—see *Scandix*.
- Cicer, chick-pea, diadel. decan. and leguminosæ, a H. an. of the easiest culture.
- Cichorium, succory, syngen. polyg. æqual. and cichoraceæ, a F. bien. H. peren. and H. an. Eur. Afr. and India, of the easiest culture. C. endivia, the garden endive, 3976. C. intybus, succory, 3988.
- Cicuta, cow-bane, pentag. dig. and umbellifereæ, H. peren. Eur. and Amer. which grow best in marshy places, and are increased by seeds.
- Cimicifuga, bugwort, poyan. pentag. and ranunculaceæ, H. peren. Eur. and Amer. of common culture.
- Cinchona, pentan. monog. and rubiaceæ, S. tr. which grow in loam and peat, but not very freely, and ripe cuttings in sand under a hand-glass, in moist heat, will strike root.
- Cineraria, syngen. polyg. super. and corymbifereæ, S. G. and H. tr. and peren. Eur. and C. B. S. plants of easy culture, and propagated by cuttings, division, or seeds.
- Cion,—see *Cyon*.
- Circeæ, enchanter's nightshade, dian. monog. and onagrarig, H. peren. Brit. creepers, which prefer moist shady situations, and grow in any soil.
- Cissampelos, dioc. monad. and menispermæ, a G. tr. and S. peren. S. Amer. climbers which grow freely in loam and peat, and cuttings root under a hand-glass.
- Cissus, tetran. monog. and vitiaceæ, S. G. and H. tr. Amer. and Ind. of easy culture in peat and loam, or in garden-earth, and readily propagated by cuttings; the S. and G. sorts in a moist heat, and the others in the shade under a hand-glass.
- Cistus, rock-rose, polyan. monog. and cistineæ, G. F. and H. tr. Eur. and Amer. under-shrubs, which grow in common soil, or loam and peat, and may be increased by layers, or young cuttings taken off at a joint, and planted under a hand-glass; seeds are frequently produced.
- Citharexylum, fiddle-wood, didyn. angios. and verbenaceæ, S. tr. W. Ind. which grow freely in loam and peat, and cuttings root in sand under a hand-glass.
- Citizens' villas, 7285; management of, 7430.
- Citrus, orange-tree, polyad. polyan. and aurantia, G. tr. India and China,—see 4879.
- Citrus acida, the lime, 4899.
- Citrus aurantium, the orange, 4884.
- Citrus decumana, the shaddock, 5902.
- Citrus medica, the lemon and citron, 4896, 4897.
- Citrus tribe, their propagation and culture, 5905. to 5954.
- Clackmannanshire, gardens of, 7633.
- Cladium, trian. monog. and cyperaceæ, a H. peren. Engl. a grass of the easiest culture.
- Clares voyées (Fr.), open railings or barriers, 335.
- Clarici, Paolo Bartolomeo, his work on gardening, page 1128. A. D. 1726.

- Clare Hall, a seat in the county of Dublin, 7653.
- Claremont, a seat in Surrey, 7528.
- Clary,—see *Salvia*.
- Clayberry Hall, Essex, 7542.
- Claytonia, pentan. monog. and portulacæ, H. peren. and an. N. Amer. and Silesia, of the easiest culture.
- Claytonia perfoliata, as a spinage plant, 4327.
- Clear Well, a seat in Gloucestershire, 7565.
- Clearing-nut, *strychnos potatorum*.
- Cleavers, *galium aparine*.
- Clematis, virgin's bower, polyan. polyg. and ranunculaceæ, S. and G. tr. climbers, which grow in light, rich soil, and young cuttings strike readily under a hand-glass in heat. The H. species grow in any soil, and are increased by layers, dividing at the root or seeds.
- Clemento y Rubio, Don Simon de Roxas, his work on gardening, page 1131. A. D. 1807.
- Clermont, a seat in Lowth, 7664.
- Clerodendrum, didyn. angios. and verbenaceæ, S. and G. tr. Ind. and China, soil half loam, a quarter rotten dung, and a quarter peat; they require a large pot to flower freely, and young cuttings root readily under a hand-glass.

- Cleome**, tetrad. siliq. and capparidæ, S. tr. bien. and an. Ind. and Amer. which grow in rich, light soil, and are readily increased by cuttings or seeds.
- Clethra**, decan. monog. and ericæ, a G. tr. and H. tr. N. Amer. the first thrives well in peat, with a little loam, and is propagated by cuttings or seeds; the hardy sorts grow in peat and sandy loam, and are generally increased by layers.
- Cleifden**, Buckinghamshire, 7547.
- Cliffortia**, diœc. polyan. and rosaceæ, G. tr. C. B. S. which thrive well in loam and peat, and young cuttings root freely in sand under a bell-glass.
- Clifton Hall**, Nottinghamshire, 7576.
- Climate**, as it affects gardening, 518.
- Climate of Great Britain**, study of, 1290.
- Climbers**, vegetables which attach themselves to trees or other upright objects by their tendrils, or hooks, as the creepers do by their roots, and twiners by the convolving of their stems.
- Climbing herbaceous plants**, 6516; shrubs, 6573; green-house plants, 665; dry-stove plants, 6665; stove plants, &c. 6717.
- Clinopodium**, wild basil, didyn. gymnos. and labiatæ, H. peren. Brit. and Egypt, which grow in any soil, and are increased by seeds or by dividing the roots.
- Clipping**, or shearing plants, 1888.
- Clitoria**, diadel. decan. and leguminosæ, S. tr. and an. Ind. and Amer. which thrive well in loam and peat, and ripened cuttings will root under a bell-glass in heat.
- Clonbrook**, a seat in Galway, 7672.
- Clothing**, the stems of trees, 2540.
- Cloud-berry**, *rubus chamaemorus*.
- Clouds**, their terminology, &c. 1235.
- Clove-tree**, *caryophyllus aromaticus*.
- Clover**, — see *Trifolium*.
- Clover Hill**, a seat in Roscommon, 7671.
- Clowance**, a seat in Cornwall, 7601.
- Clown's all-heal**, *stachys palustris*.
- Club-moss**, — see *Lycopodium*.
- Club-rush**, — see *Scirpus*.
- Clugny**, a seat near Paris, 162.
- Clumber Park**, Nottinghamshire, 7576.
- Clusia**, balsam-tree, polyg. monœc. and guttifereæ, S. tr. which require a light sandy loam, and cuttings root freely in sand under a glass; in their natural state they grow on decaying or rotten barked trees.
- Clusius**, Carolus, his works on gardening, page 1123. A. D. 1630.
- Cluyt**, Outger Augerius, (or Dirck, Dut.) his works on gardening, page 1129. A. D. 1631.
- Cluytia**, diœc. gynan. and euphorbiacæ, a S. tr. and G. tr. C. B. S. which grow in loam and peat, and young cuttings root readily in sand under a bell-glass.
- Clydesdale orchards**, Lanarkshire, 7629.
- Clypeola**, treacle-mustard, tetrad. silic. and crucifereæ, a H. an. S. Eur. of the easiest culture.
- Cneorum**, widow-wall, trian. monog. and terebintacæ, a G. tr. S. Eur. which grows in light soil, and may be increased by cuttings or seeds.
- Cnicus**, horse-thistle, syngen. polyg. æqual. and cynarocéphalæ, H. peren. bien. and an. Eur. of common culture.
- Cobbett**, William, as a writer on gardening, page 1114. A. D. 1821.
- Cobham Park**, a seat in Surrey, 7528.
- Cobham Hall**, Kent, 7538.
- Cobæa**, pentan. monog. and bignoniacæ, a G. tr. Mex. a climber of easy culture, and propagated by seeds, or struck from cuttings under a hand-glass in a little moist heat.
- Coccinella**, lady-cow, or lady-bird, an insect of the coleopterous order, 6561.
- Coccoloba**, seaside grape, octan. trig. and polygonæ, S. tr. Ind. which grow freely in light loamy soil, and cuttings taken off at a joint will root in sand under a hand-glass; the leaves must not be shortened.
- Cocosopsisium**, tetran. monog. and rubiacæ, a S. peren. W. Ind. a creeper which grows freely in loam and peat, and cuttings root in sand under a hand-glass.
- Cocculus**, diœc. dodec. and menispermæ, S. tr. E. Ind. climbers which require plenty of room to flower, and grow in loam and peat; cuttings root easily under a hand-glass.
- Coccus**, or cochineal insect, described, 2245; how to subdue, &c. 2278.
- Cochlearia**, scurvy-grass, tetrad. silic. and crucifereæ, H. peren. tr. an. and Eur. of common culture.
- Cochlearia officinalis**, the common scurvy-grass, 4067; armoracia, the horse-radish, 4111.
- Cochlearium**, or snailery, 1767.
- Cockenhatch**, a seat in Hertfordshire, 7544.
- Cock's comb**, — see *Celosia*.
- Cocksfoot-grass**, — see *Dactylis*.
- Cocoa-nut**, — see *Coccus*.
- Cocoa-plum**, — see *Chrysobalanus*.
- Cocos**, cocoa-nut tree, monœc. hexan. and palmæ, S. tr. E. and W. Ind. palms of the usual culture.
- Cocos nucifera**, the cocoa-nut, 6009.
- Codarium**, dian. monog. and scrophularinæ, a S. tr. Guinea, which grows in loam and peat, and ripened cuttings will root in sand under a hand-glass in heat.
- Codon**, decan. monog. and solanæ, a G. bien. C. B. S. of easy culture.
- Coffea**, coffee-tree, pentan. monog. and rubiacæ, a S. tr. Arabia and W. Ind. which thrives well in loam and peat, and ripened cuttings root easily in sand under a hand-glass in heat.
- Coffee-tree**, — see *Coffea*.
- Cognatus**, a name assumed by Gilbert Cousin, a French author on gardening, page 1115. A. D. 1546.
- Cogwood-tree**, *laurus chloroxylon*.
- Cointcreaux**, François, his works on gardening, page 1120. A. D. 1800.
- Coix**, Job's tears, monœc. triand. and graminæ, S. peren. E. Ind. grasses which grow readily in light rich soil, and seed plentifully.
- Colbertia**, polyan. pentag. and dilleniaceæ, a S. tr. E. Ind. which thrives in loam and peat, and ripened cuttings, not deprived of their leaves, root freely in sand under a hand-glass.
- Colchicum**, meadow saffron, hexan. trig. and melanthacæ, H. peren. Eur. bulbs flowering in autumn, — see 6501.
- Cold-houses**, for plants, 1696. and 6185.
- Coldenia**, tetran. tetrag. and boraginæ, a S. and E. Ind. of common culture.
- Cole**, coleworts, cale, kale, (*keale*, Sax. or *caulis*, a stem, Lat.) cabbage-plants of the brassica tribe, whose leaves are used before they form a head, — see *Brassica oleracea*.
- Coleby Hall**, Lincolnshire, 7577.
- Coleshill House**, Berkshire, 7561.
- Colewort**, — see *Brassica* and *Crambe*.
- Colgarth**, a seat in Westmoreland, 7592.
- Colla**, Luigi, his works on gardening, page 1128. A. D. 1813.
- Collectors for gardens**, 7394.
- Collington House**, Midlothian, 7618.
- Collins**, Samuel, Esq. a British writer on gardening, page 1102. A. D. 1717.
- Collinsonia**, dian. monog. and labiatæ, a G. peren. and H. peren. N. Amer. of common culture; they prefer rather a moist situation.
- Collpriest House**, Devonshire, 7600.
- Colne Park**, Essex, 7542.
- Colney House**, Hertfordshire, 7544.
- Colon**, a seat in Louth, 7664.
- Colpoon-tree**, cassine colpoon.
- Coltsfoot**, — see *Tussilago*.
- Columbarium**, or pigeonry, 1767.
- Columbine**, — see *Aquilegia*.
- Columnæa**, didyn. angios. and scrophularinæ, S. tr. W. Ind. of easy culture, and easily lost; it grows well in loam and peat, and strikes readily from cuttings, but will soon rot or damp off if it have too much water, or stand in a damp part of the house.
- Colutea**, bladder-senna, diadel. decan. and leguminosæ, H. tr. Eur. of easy culture, increased by seeds.
- Colwick Hall**, Nottinghamshire, 7576.
- Com. Got.**, *Commentarii societatis regie scientiarum Göttingensis*.
- Comarum**, icos. polyg. and rosaceæ, H. peren. Brit. marsh plants.
- Comely Bank nursery**, Midlothian, 7618.
- Comfrey**, — see *Symphytum*.
- Commelin**, John, his works on gardening, page 1129. A. D. 1676.
- Commelinea**, trian. monog. and commelineæ, S. and G. peren. and an. and H. peren. and an. Amer. all of which grow freely in sandy loam and peat, and are increased by dividing the root or by seed.
- Commersonia** pentan. pantag. and butneriacæ, a S. and G. tr. N. Hol. which grow well in loam and peat, and cuttings root readily under a hand-glass in sand.

- Common acacia, — see Robinia.
 Common dragon, arum dracuncul.
 Comocladia, maiden-plum, trian. monog. and terebinthaceæ, S. tr. W. Ind. which grow in loam and peat, and ripened cuttings in sand under a bell-glass in moist heat will strike root.
Compavetti, Andrea, his works on gardening, page 1128. A. D. 1798.
 Compost, composed soil, or composed dung; a mixture of earths, or of earths and manures, or of manures alone, and hence the terms compost-soil, and compost-manure; to collect and form, 1977.
 Compost-ground, a place for laying and preparing composts, 1984.
 Comptonia, monœc. trian. and amentaceæ, a H. tr. N. Amer. which thrives best in peat soil, and is increased by layers.
 Coniferous trees, their culture and management, 6983.
 Conium, hemlock, pentan. dig. and umbelliferæ, a G. tr. and H. bien. and an. Eur. C. B. S. and Barbary, which grow in any soil, and are increased by seeds.
 Connoisseurs of gardening, 7408; their garden arrangements, 7429.
 Conocarpus, button-tree, pentan. monog. and combrétacæ, S. tr. W. Ind. which thrive well in loam and peat, and cuttings root in sand under a hand-glass in heat.
 Conservatory, a habitation for ornamental plants of moderate temperature, in which the greater part are planted in beds or borders of soil, and allowed to attain a considerable size, 6174.
 Constantinople, gardens of, 308.
 Consumption in plants, 900.
 Contortion in plants, 898.
 Contracting gardeners, or new-ground workmen, 7389.
 Contrajerva root, dorstenia contrajerva.
 Convallaria, lily of the valley, hexan. monog. and smilacæ, a H. peren. Brit. of easy culture.
 Convolvulus, hind-weed, pentan. monog. and convolvulacæ, tr. peren. and an. Eur. and Amer. of all the departments of culture, mostly twiners, which grow readily in any soil, and are increased by the roots or seeds, and some by cuttings in sand.
 Convolvulus batatas, the Spanish or sweet potatoe, 6026.
 Convolvulus reptans, a spinage plant in China, 6037.
 Convolvulus soldanella, 4313.
 Conyza, fleabane, syngen. polyg. super. and corymbifereæ, tr. peren. and an. Eur. As. Amer. of all the departments which grow freely in loam and peat, and are increased by cuttings or seeds.
Cook, Moses, a gardening author, page 1101. A. D. 1676.
 Cookia, wampee-tree, decan. monog. and aurantia, a S. tr. China, which thrives well in sandy loam, and ripened cuttings not deprived of any of their leaves, root in sand under a hand-glass in moist heat.
 Coombe Abbey, Warwickshire, 7572.
 Coombe Lodge, a seat in Oxfordshire, 7558.
 Coopersale, a seat in Essex, 7541.
 Copaifera, balsam of capevi, decan. monog. and leguminosæ, a S. tr. S. Amer. which prefers a sandy loam, and ripened cuttings root in sand under a hand-glass.
 Copford Hall, Essex, 7542.
 Copgrove, a seat in Yorkshire, 7582.
 Copped Hall, Essex, 7542.
 Coppice-wood, or copse-wood (from *couper*, to cut, Fr.); woods which may be cut periodically, 6897.
 Copse, — see Coppice.
 Coptis, polyan. polyg. and ranunculacæ, a H. peren. N. Amer. which grows best in pots and in peat soil, and is increased by dividing at the root.
 Coral-tree, — see Erythrina.
 Corallorhiza, gynan. monan. and orchideæ, a H. peren. Scot. which grows best in peat soil, and is increased by seeds.
 Corby Castle, Cumberland, 7593.
 Corchorus, polyan. monog. and tiliacæ, S. tr. and an. Ind. Amer. which thrive in rich soil, and root readily from young cuttings; and a H. tr. of easy culture, and which roots from cuttings as readily as the common willow.
 Cordia, pentan. monog. and boraginæ, S. tr. and a peren. E. and W. Ind. which grows in loam and peat, and cuttings root freely in sand under a hand-glass in heat.
 Coreopsis, syngen. polyg. frustr. and corymbifereæ, S. peren. bien. and an. W. Ind. and Amer. which grow freely in rich light earth, and cuttings root under a hand-glass; and F. and H. peren. of easy culture.
 Coriander, — see Coriandrum.
 Coriandrum, coriander, pentan. dig. and umbellifereæ, H. an. Eur. of easy culture.
 Coriandrum sativum, the common coriander, 4222.
 Coriaria, diœc. decan. and , a H. tr. S. Eur. of easy culture, increased by layers or suckers.
 Coris, pentan. monog. and primulacæ, a G. bien. S. Eur. of common culture.
 Corispermum, tickseed, monan. dig. and chenopodæ, H. an. of common culture.
 Cork botanic garden, 7666.
 Cork-tree, quercus suber.
 Corn-flag, — see Gladiolus.
 Cornelian-cherry, cornus mascula.
 Cornucopie, trian. monog. and gramineæ, a H. an. Levant, a grass of easy culture.
 Cornus, Georges, a French author on gardening, page 1115. A. D. 1560.
 Coruus, dog-wood, tetran. monog. and caprifolæ, H. tr. and peren. Eur. and N. Amer. of easy culture, excepting the two perennial species, which grow best in pots, or in a bed of peat.
 Cornutia, didyn. angios. and verbenacæ, a S. tr. W. Ind. which thrives in loam and peat, and cuttings root in sand under a hand-glass.
 Cornwall, gardens and residences of, 7601.
 Coronilla, diadel. decan. and leguminosæ, G. tr. Eur. which thrive well in loam and peat, and increase by cuttings or seeds; and H. tr. and peren. of common culture.
 Coronopus, wart-cress, tetrad. silic. and crucifereæ, H. an. Brit. of easy culture.
 Correa, octan. monog. and diosmaceæ, G. tr. which thrive well in sandy loam and peat; and ripened cuttings root freely in sand under a bell or hand-glass.
 Corrigiola, strap-wort, pentan. trig. and portulacæ, a H. an. Eng. of common culture.
 Corsfield House, Wiltshire, 7597.
Corthum, I. E. her works on gardening, page 1127. A. D. 1814.
 Cortusa, bear's ear, sanicle, pentan. monog. and primulacæ, a H. peren. Austria, which grows best in pots in loam and peat, and is increased by seeds or dividing at the root.
 Corydalis, diadel. hexan. and papaveracæ, H. peren. Eur. and Amer. which thrive in light, rich soil, and are increased by dividing the roots, or by seeds.
 Corylus, nut-tree, monœc. polyan. and amentaceæ, H. tr. Eur. and N. Amer.
 Corylus avellana, the common nut-tree, and garden-filbert, 4752.
 Corypha, fan-palm, hexan. monog. and palmæ, a S. tr. which grows in light soil and strong moist heat.
 Cosmea, syngen. polyg. frustran. and corymbifereæ, a G. peren. and an. Mexico, of common culture.
 Costmary, — see Balsamita.
 Costula, syngen. polyg. super. and corymbifereæ, S. G. and H. an. C. B. S. of easy culture.
 Costus, monan. monog. and scitamineæ, S. peren. India and S. Amer. reedy or marsh plants, increased by dividing at the root.
 Cottell House, Cornwall, 7601.
Cotta, —, his works on gardening, page 1127. A. D. 1817.
 Cottage, different kinds of, 749.
 Cottage en verger, 7283; cottage and garden of laborers, 7294; of artificers, 7422.
 Cottage gardens, their management, 7418.
 Cottage ornée, 7282.
 Cotton, Charles, Esq., a British writer on gardening, page 1101. A. D. 1675.
 Cotton-grass, — see Eriophorum.
 Cotton-rose, filago pigmaria.
 Cotton-thistle, — see Onopordum.
 Cotton-tree, — see Gossypium.
 Cottlewood, navel-wort, decan. pentag. and sem-pervivæ, G. tr. and a peren. C. B. S. succulents of easy culture; and H. peren. rock-work plants, propagated by seeds or dividing the root.
 Couch-grass, Cricum repens.
 Counsellors, or garden-artists, 7400.

- Crichton, formerly a distinguished seat near Edinburgh, 385.
- Crinum, hexan. monog. and amaryllidæ, S. G. peren. Amer. and Ind. which grow in rich loam with dung, in large pots, and are increased by suckers, or by seeds.
- Cristaria, monad. polyan. and malvaceæ, a H. peren. Missouri, which grows only in peat in a shaded border, and increases slowly by seeds, or dividing at the root.
- Crithmum, samphire, pentan. dig. and umbelliferae, a G. bien. and H. peren. which grow in light, sandy soil, and are increased by seeds, or dividing at the roots.
- Crithmum maritimum, the common samphire, 4278.
- Crocus, trian. monog. and iridæ, H. peren. Asia and Eur. bulbs of the easiest culture, 6285.
- Cromartysire, in respect to gardening, 7643.
- Crome, G. his work on gardening, page 1127. A. D. 1811.
- Crome Court, Worcestershire, 7566.
- Crossandra, didyn. angios. and acanthaceæ, a S. tr. E. Ind. which thrives well in rich, light soil, and cuttings root in sand under a hand-glass.
- Cross-wort, — see *Crucianella*.
- Crotalaria, diadel. decan. and leguminosæ, S. and G. tr. bien. and an. E. Ind. and Afr. which grow in loam and peat, and are increased by young cuttings in sand under a bell-glass; some species ripen seeds.
- Croton, monæc. monad. and euphorbiaceæ, S. tr. and an. Ind. Amer. and Eur. which grow in loam and peat, and cuttings with their leaves on root in sand under a hand-glass.
- Crowberry, — see *Empetrum*.
- Crowea, decan. monog. a G. tr. N. S. W. which grows in sandy loam and peat, in an airy situation, and not over-watered, and cuttings root freely in sand under a bell-glass.
- Crowfoot, — see *Ranunculus*.
- Croxdale Hall, Durham, 7584.
- Crucianella, cross-wort, tetran. monog. and rubiæ, G. and H. tr. and an. Eur. of common culture.
- Crux Easton, a seat in Hampshire, 7594.
- Crypsis, trian. dig. and gramineæ, a H. an. Eur. a grass of easy culture.
- Cryptarrhena, gynan. monan. and orchidæ, a S. parasite, which may be treated as ærides.
- Cryptospermum, tetran. monog. and nyctagineæ, a G. peren. N. S. W. which grows in loam and peat, and cuttings root freely under a hand-glass in sand.
- Cryptostemma, syngen. polyg. frustran. and corymbiferae, H. an. C. B. S. of common culture.
- Cubieres, —, Ainé, his works on gardening, page 1121. A. D. 1803.
- Cuckoo-flower, lychnis flosculi.
- Cucubalus, campion, decan. trig. and carophyllæ, a H. peren. Eng. of common culture.
- Cucumber, 4873. — see *Cucumis*.
- Cucumis, cucumber, monæc. monad. and cucurbitaceæ, F. and H. an. India and C. B. S. of common culture in rich soil.
- Cucumis melo, the melon, under hand-glasses, 3262; culture of, 3271; soil, 3272; time of beginning to force, 3279; forming the seed-bed, choice of seed, sowing, 3281; treatment till removed to the fruiting-bed, 3287; forming the fruiting-bed, moulding, planting, 3288; temperature, 3291; air, 3295; water, 3298; earthing, 3302; training, 3303; setting, 3307; cutting the fruit, and saving seed, 3312; second crop from the same plants, 3315; late crops on old hot-beds, 3318; culture of melons in a dung-pit, 3319; in a fluid-pit, 3320; in M'Phail's pit, 3321; under hand-glasses, 3322; on a sloping bank, 3329; insects and diseases, 3330.
- Cucumis sativus, the common cucumber, sorts of described, 4873; culture of in hot-beds, 3164; treatment till removed to the fruiting-bed, 3192; forming the fruiting-bed, 3199; air, 3217; water, 3221; training, 3257; culture in a fluid-pit, 3236; in M'Phail's pit, 3238; in stoves, 3251; in Weeks's patent frame, 3261; sorts described, 4869.
- Cucurbita, gourd, monæc. monad. and cucurbitaceæ, F. and H. an. Ind. and S. Eur. of common culture in rich soil.
- Cucurbita pepo, the pompon; C. citrullus, the water-melon; C. melo pepo, the squash-gourd; C. verrucosa, the warted gourd; C. lagenaria, the bottle-gourd; C. aurantia, the orange-fruited gourd; and C. succada, the vegetable-marrow gourd.
- Cuffhells, Hampshire, 7594.
- Culex, the gnat, a dipterous insect, 2267.
- Culland's Grove, Middlesex, 7520.
- Cullen House, in Banshire, 7640.
- Cullumia, syngen. polyg. frustr. and corymbiferae, G. tr. C. B. S. which thrive in loam and peat, and cuttings root in the same soil under a hand-glass.
- Culzean Castle, in Ayrshire, 7627.
- Cumberland, gardens and residences of, 7593.
- Cumin, cuminum cuminum.
- Cuminum, cumin, pentan. dig. and umbelliferae, a H. an. of common culture.
- Cunila, dian. monog. and labiateæ, H. peren. N. Amer. and Eur. of common culture.
- Cunonia, decan. dig. and cunoniaceæ, a G. tr. C. B. S. which grows in loam and peat, ripened cuttings will root in sand under a hand-glass.
- Cuphea, dodec. monog. and salicariæ, a S. tr. and bien. and G. bien. and an. Amer. of common culture.
- Cupressus, cypress, monæc. monad. and coniferae, G. tr. Amer. and C. B. S. which grow well in loam, and peat, and cuttings root in sand under a bell-glass; and H. tr. which grow in common soil, and are raised from seeds.
- Curatella, polyan. dig. and magnoliæ, a S. tr. S. Amer. which thrives in sandy loam, and cuttings root in a pot of sand under a hand-glass.
- Curculigo, hexan. monog. and asphodeleæ, S. and G. peren. E. Ind. bulbs of the usual culture.
- Curculio, the weevil, a coleopterous insect which inhabits grain, nuts, and other seeds, 2235.
- Curculio nuceum, the filbert-weevil, 4761.
- Curcuma, turmeric, dian. monog. and scitamineæ, S. peren. E. Ind. reedy marsh plants, increased by division at the root.
- Curraghmore, a seat in Waterford, 7665.
- Currant, — see *Ribes*.
- Curt Spreng., Curtii Sprengel Historia Rei Herbariæ.
- Curtains for shelter, — see *Structures*.

- Curten*, —, his writings on gardening, page 1120. A. D. 1798.
- Curtis*, William, F. L. S. a British author on gardening, page 1109. A. D. 1783.
- Curtisia*, hassagay-tree, tetran. monog. and a G. tr. C. B. S. which thrives in loam and peat, and ripened cuttings root under a hand-glass in sand.
- Curtius*, Benedictus, his works on gardening, page 1129. A. D. 1560.
- Curvilinear* hot-houses, list of, erected by Messrs. Bailey, 1587.
- Cuscuta*, dodder, pentan. dig. and convolvulaceæ, a G. an. and H. peren. and an. Eng. and China; parasites which may be sown at the root of any branchy plant, and they will spring up, and attach themselves to it, — see 942.
- Cushing*, a British writer on gardening, page 1114. A. D. 1812.
- Cussonia*, pentan. dig. and araliæ, G. tr. C. B. S. which thrive in sandy loam, and cuttings root in sand under a hand-glass.
- Custard-apple*, — see *Annona*.
- Cusworth Hall*, Yorkshire, 7582.
- Cutting*, as an operation on plants, 1884.
- Cuttings*, to propagate by, 2063.
- Cyanella*, hexan. monog. and asphodeleæ, G. peren. C. B. S. bulbs of common culture.
- Cyathæa*, cryptog. filices, and filicæ, a S. peren. W. Ind. a fern of the usual culture.
- Cycas*, diœc. polyan. and palmææ, S. tr. E. Ind. which grow in light soil and moist heat, and are increased by seeds.
- Cyclamen*, pentan. monog. and primulaceæ, a G. peren. and H. peren. Eur. which grow in loam and peat, and are increased by seeds; when not in a growing state, the tubers should have no water.
- Cyclopia*, decan. monog. and leguminosææ, a G. tr. C. B. S. which grows in sandy loam and peat, and very young cuttings will root readily in sand under a bell-glass, care being taken to wipe the glass frequently, to prevent their damping off.
- Cydonia*, quince, icos. di-pentag. and rosaceæ, F. and H. tr. Eur. and Amer. of easy culture, and increased by cuttings, layers, or grafting on thorn stocks.
- Cydonia vulgaris*, the common quince, *pyrus cydonia*, L. 4459.
- Cyfartha*, a seat in Brecknockshire, 7613.
- Cylista*, diadelph. decan. and leguminosææ, S. tr. Ind. climbers which succeed well in loam and peat, and cuttings will root in sand under a hand-glass.
- Cymbaria*, didyn. angios. and scrophularinææ, a H. peren. Dauria, a rock-work plant, which prefers light, sandy soil, and may be increased by seeds.
- Cymbidium*, gynan. dian. and orchideæ, S. peren. E. Ind. which thrives in sandy loam mixed with potsherds and bits of woods, and well drained; the species are increased by dividing at the root.
- Cynanchum*, pentan. dig. and asclepiadææ, S. and G. tr. Eur. and C. B. S. climbers which thrive in loam and peat, and cuttings root freely in sand under a hand-glass; the H. peren. thrive in light soil, and increase freely by seeds or the root.
- Cynara*, artichoke, synen. polyg. æqual. cynarcephalææ, G. and H. peren. Eur. and C. B. S. of common culture.
- Cynara scolymus*, the garden artichoke, 3917.
- Cynara cardunculus*, the cardoon, 3929.
- Cynips*, the gall-fly, a hymenopterous insect, 2259.
- Cynips quercus folii*, the oak gall-fly, 7075.
- Cynodon*, trian. dig. and gramineæ, a S. peren. and H. peren. Eng. and E. Ind. grasses of the easiest culture.
- Cynoglossum*, hound's tongue, pentan. monog. and boraginææ, a G. bien. an. H. peren. and an. Eur. and Amer. of easy culture.
- Cynometra*, decan. monog. and leguminosææ, a S. tr. E. Ind. which grows in sandy loam, and large cuttings root in sand under a hand-glass in heat.
- Cynosurus*, dogstail-grass, trian. dig. and gramineæ, a H. peren. and an. Eur. grasses of easy culture.
- Cyon* (cion, sion, or scion, a twig of a tree), in grafting, that part which is attached to the stock, in order to become the future tree; the shoot engrafted on a stock, — see *Grafting*, 7075.
- Cyperus*, trian. monog. and cyperaceæ, S. G. and H. peren. and an. Eur. Ind. Amer. grasses of easy culture.
- Cyperus esculentus*, the rush-nut, 6034.
- Cyphia*, pentan. monog. and campanulaceæ, G. peren. C. B. S. which thrive in loam and peat, and cuttings root readily under a bell-glass in sand.
- Cypress*, — see *Cupressus*.
- Cyprinus auratus*, the gold carp fish, 6086.
- Cypripedium*, lady's slipper, gynan. dian. and orchideæ, H. peren. Eng. and N. Amer. which will thrive only in peat soil and in the shade, and are the better of protection during winter; they are difficult to increase, but sometimes they perfect seeds.
- Cyrenaica*, gardens of, 6.
- Cyrilla*, pentag. monog. and ericeæ, a G. tr. Carolina, which grows in sandy loam, and young cuttings root in sand under a bell-glass, but not freely.
- Cyrtanthus*, hexan. monog. and amaryllideæ, G. peren. C. B. S. bulbs which grow in sandy loam and peat, require plenty of water when in a growing state, but scarcely any when dormant.
- Cyrtopodium*, gynan. monan. and orchideæ, S. peren. Amer. requiring the same treatment as cymbidium.
- Cysticnaps*, diadel. hexan. and papaveraceæ, a H. an. C. B. S. of common culture.
- Cytisus*, diadel. decan. and leguminosææ, G. F. and H. tr. Eur. As. and Amer. chiefly shrubs which prefer a light soil, and are propagated readily by seeds or layers.
- Cytisus alpinus*, the tree or Scotch laburnum, 7113.
- Cytisus laburnum*, the shrubby laburnum, 7020.
- Czartoryska*, Princess Isabella, her work on gardening, page 1131. A. D. 1808.

D.

- Dactylis*, cocksfoot-grass, trian. dig. and gramineæ, H. peren. Eur. of the easiest culture.
- Damia*, pentan. dig. and asclepiadææ, a S. tr. E. Ind. which grows in loam and peat, and cuttings root in sand under a hand-glass.
- Daffodil*, — see *Narcissus*.
- Dahlman*, G. T., his works on gardening, page 1130. A. D. 1728.
- Dahuron*, René, a French author on gardening, page 1116. A. D. 1696.
- Dailsford*, a seat in Worcestershire, 7566.
- Dais*, decan. monog. and thymelææ, a G. tr. C. B. S. which grows freely in loam and peat, and may be increased by cuttings of the roots placed in a warm situation.
- Daisy*, — see *Bellis*.
- Dalbergia*, diadel. decan. and leguminosææ, S. tr. E. Ind. which do well in sandy loam, and ripened cuttings root under a hand-glass in sand.
- Dalea*, diadel. decan. and leguminosææ, S. and G. an. and H. peren. Ind. and Amer. of common culture.
- Dalechampia*, monœc. monad. and euphorbiaceæ, a S. tr. W. Ind. a climber, which grows in sandy loam, and roots freely in sand under a hand-glass.
- Dalhousie Castle*, Midlothian, 7618.
- Dalibarda*, icos. polyg. and rosaceæ, a H. peren. N. Amer. a creeper, which prefers peat soil, and a shaded situation.
- Dalkeith Park*, Midlothian, 7618.
- Dallinger*, Prosper, his works on gardening, page 1126. A. D. 1798.
- Dalmahoy*, a seat in Midlothian, 7618.
- Dalmar*, Basse N —, his works on gardening, page 1120. A. D. 1800.
- Dalmeny Park*, kitchen-garden at, 2455; hot-houses there, 2861.
- Dalystown*, a seat in Galway, 7672.
- Damascena*, the damson, or Damascus plum, — see *Prunus*.
- Damasonium*, hexan. polyg. and alismaceæ, a S. peren. E. Ind. an aquatic.
- Dampiera*, pentan. monog. and goodenoviææ, a G. peren. N. S. W. which grows well in loam and peat, and young cuttings root freely under a hand-glass.
- Dan y Park*, a seat in Brecknockshire, 7613.
- Dancer's Court*, a seat in Tipperary, 7667.
- Dandelion*, — see *Leontodon*.
- Danson Hill*, a seat in Kent, 7537.
- Daphne*, octan. dig. and thymelææ, a S. tr. which thrives in loam and peat, and roots by cuttings under a hand-glass; and H. tr. beautiful under-shrubs, which prefer peat soil, and are increased by seeds or grafting on the *D. laureola*, 6562.
- D'Argenville*, Dezallier Ant Joseph, a French author on gardening, page 1117. A. D. 1713.

- Darnel, — see *Lolium*.
 Darton Park, Yorkshire, 7582.
Darwin, Erasmus, M.D. F.R.S., a British writer on gardening, page 1109. A. D. 1781.
 Date-palm, — see *Phoenix*.
 Date-plum, — see *Diospyros*.
Datisca, diœc. docœc. and resediaceæ, a H. peren. Candia, of common culture.
Datura, thorn-apple, pentan. monog. and solanææ, H. an. Asia, Afr. of the easiest culture.
Daucus, carrot, pentan. dig. and umbellifereæ, H. bien. and an. Eur. of the easiest culture.
Daucus carota, the garden-carrot, 3712.
Davallia, cryptog. filices and filicææ, a G. tr. and peren. N. S. W. and Canaries, ferns of common culture as such.
Daviesia, decan. monog. and leguminosææ, G. tr. N. S. W. which grow in sandy loam and peat, and cuttings, not too ripe, will root readily in pots of sand under a hand-glass, without bottom heat.
Davy, Pêre, a French author on gardening, page 1115. A. D. 1560.
Dawsonscourt Hall, a seat in Queen's County, 7659.
 Day-lily, — see *Hemerocallis*.
De Caumels, his works on gardening, page 1122. A. D. 1816.
De Combles, his works on gardening, page 1117. A. D. 1745.
De Distrib. plant., Humboldt de distributione plantarum.
 Deadly carrot, *atropa belladonna*.
 Deadly nightshade, — see *Thapsia*.
Decandolle, L. A. one of the most eminent French botanists, distinguished like Brown in this country, by his knowledge and improvement of the Jussieuan system of classification, page 1122. A. D. 1823.
 Deciduous trees with showy flowers, table of, 6540.
 Decorative buildings used in gardening, 1768.
 Decortication, 2165.
 Decorum in garden operations, 2358.
Decumaria, docœc. monog. and myrtiææ, a H. tr. Carolina, which grows in common soil, and cuttings root freely in sand under a hand-glass.
Deene Thorpe Park, Northamptonshire, 7580.
 Deepden, a seat in Surrey, 7527.
Deeringia, pentan. monog. and amaranthææ, a S. bien. E. Ind. of common culture.
Delaford Park, Middlesex, 7520.
Delaunay, Mordaunt, his works on gardening, page 1122. A. D. 1811.
Deleuze, J. P. F., his works on gardening, page 1120. A. D. 1809.
 Delhi, gardens of, 462.
Delille, Jacques, the poet, his works on gardening, page 1118. A. D. 1765.
Delphinium, larkspur, polyan. trig. and ranunculææ, H. peren. bien. and an. Europe and Amer. of common culture.
 Delve (*Sax.*), to dig, — see *Dig*.
 Delville, a seat near Dublin, 368.
 Demesnes, gardens of, 7271; management, 7443.
 Den of Rubislaw, a seat in Aberdeenshire, 7639.
 Denbighshire, gardens and residences of, 7605.
Dendrobium, gyan. monan. and orchidææ, S. peren. N. S. W. parasite, which may be treated as aërides; and G. peren. which thrive in sandy loam and peat, and are increased by dividing at the root.
Dentella, pentag. monog. and rubiææ, a H. an. N. Holl. of common culture, 1662.
 Derbyshire, gardens and residences of, 7574.
 Dermestes, leather-beetle, or chaffer, a coleopterous insect, 2332.
 Derry, county of, as to gardening, 7631.
Desbois, F. A. A. de la Chesnaye, his works on gardening, page 1117. A. D. 1751.
 Design, principles of, in landscape-gardening, 7163.
Desmanthus, polyg. monœc. and leguminosææ, S. tr. bien. and an. E. and Ind. which grow in loam and peat, and some of them, as *D. natans*, may be treated as aquatic; they are increased by seeds, or young cuttings planted in sand under a bell-glass.
Deuso, Johann Daniel, his works on gardening, page 1123. A. D. 1735.
 Devil's bit, *scabiosa succisa*.
 Devonshire, gardens and residences of, 7600.
 Dew, theory of, 1243.
Dianella, hexan. monog. and asphodelææ, a S. peren. and G. peren. which grow in sandy loam and peat, and are increased by division at the root.
Dianthus, pink, decan. dig. and caryophyllææ, a G. tr. and peren. and H. peren. bien. and an. Eur. and As. which thrive in light rich soil, and thrive by cuttings or pipings and layers, in sandy loam under a hand-glass.
Dianthus caryophyllus, the carnation, 6406.
Dianthus hortensis, the pink, 6440.
Diapensia, pentan. monog. and ericææ, a H. peren. Lapland, an alpine, which must be grown in small pots in peat soil, and protected during winter.
Diapysros kaki, the kaki-tree, 6016.
Dichondra, pentan. dig. and convolvulææ, a S. peren. and G. peren. N. S. W. and Jam. which thrive well in loam and peat, and cuttings root freely.
Dicks, John, of Knightsbridge, a British author on gardening, page 1107. A. D. 1769.
Dicksonia, cryptog. filices and filicææ, a S. tr. and peren. G. peren. and H. peren. ferns of common culture as such.
Dictamnus, fraxinella, decan. monog. and rutææ, a H. peren. Germ. of easy culture, and may be propagated by seeds, cuttings, or divisions at the root.
Didelta, syngen. poly. frustran. and corymbifereæ, G. tr. C. B. S. which thrive well in any rich light soil, and cuttings root freely under a hand-glass.
Diel, Aug. Fred. Adrian, M. D., his works, page 1126. A. D. 1799.
Diervilla, pentan. monog. and caprifolia, a H. tr. N. Amer. a low shrub of easy culture, and increased by suckers.
Dietrich, Fr. Gli., his works on gardening, page 1126. A. D. 1802.
Dig (*dician*, Sax. to make a trench about), to break or open up the ground with a spade; in gardening, to raise, reverse, and pulverise the surface-soil for eight or ten inches deep, — see Digging.
 Digging, 1864.
Digitalis, foxglove, didyn. angios. and scrophulariææ, G. tr. and H. peren. and an. Eur. of easy culture.
Digitaria, finger-grass, trian. dig. and graminææ, H. an. of common culture, 1662.
Digitaria sanguinalis, Polish millet, 4335.
Dilatris, trian. monog. and hemodorææ, G. peren. grasses of common culture.
Dill, elt., Joh. Jac. Dillenii Hortus Elthamensis.
Dill, — see *Anethum*.
Dillenia, polyan. polyg. and dilleniææ, S. tr. E. Ind. which grow in light loam, and ripened cuttings, not deprived of their leaves, root freely in sand under a hand-glass in heat.
Dillwynia, decan. monog. and leguminosææ, G. tr. N. S. W. which grow in sandy loam and peat, with pots well drained, and young cuttings root freely in sand under a bell-glass.
Dimocarpus, octan. monog. and sapindeæ, S. tr. the litchi and longan of the Chinese, China, which grow in rich loam, and have been cultivated for their fruit, 5991.
Dionææ, Venus's flytrap, decan. monog. and droserææ, a G. peren. Carolina, which thrives best when planted in a pot of sphagnum, or common moss, with a little peat mould at the bottom of the pot, and the pot placed in a pan of water.
Dioscorea, diœc. hexan. and dioscœrææ, S. peren. E. and W. Ind. climbers of easy culture.
Dioscorea sativa and *alata*, the yam, 6023. and 6024.
Diosma, pentan. monog. and diosmææ, G. tr. C. B. S. which thrive best in peat soil, and young cuttings root freely in sand under a bell-glass.
Diospyros, date-plum, polyg. diœc. and ebenææ, S. an. G. tr. Italy, Amer. and India, which thrive well in light loamy soil, and ripened cuttings succeed best in sand under a hand-glass in heat. *D. kaki*, the Japan date-plum is increased by inarching or budding on the common kinds.
Diospyros lotus (*Ziziphus lotus*, W.), the Eur. date-plum, 6016.
Diotis, monœc. tetran. and chenopodææ, a H. tr. Siberia, which grows in any light soil, and is readily propagated by layers, and cuttings may be rooted under a hand-glass.
Diphyllia, hexan. monog. and berberidææ, a H. peren. N. Amer. which grows freely in a light rich soil, and is increased by dividing at the root.

- Diplazium**, cryptog. filices, a *S. peren.* Jamaica, a fern which grows in loam and peat in the shade, and is increased by seed or dividing at the root.
- Dipsacus**, teasel, tetran. monog. and dipsacæ, *H. bien.* Eur. of common culture.
- Dipterix**, tonquin-bean, diadel. decan. and leguminosæ, a *S. tr.* Guiana, which grows in light loam, and ripened cuttings root in sand under a hand-glass in a moist heat.
- Dirca**, leather-wood, octan. dig. and thymelæ, a *H. tr.* Virginia, which grows best in peat earth, and is increased by layers: snails are particularly fond of this plant.
- Disa**, gynan. monan. and orchideæ, *G. peren.* C. B. S. which thrive in sand and peat, and require very little water when not in a growing state.
- Disandra**, heptan. monog. and scrophularinæ, a *G. peren.* Madeira, a trailing plant of common culture.
- Disperis**, gynan. monan. and orchideæ, a *G. peren.* C. B. S. which may be treated as *disa*.
- Diss. orient. gard.**, Chambers's Dissertation on Oriental Gardening.
- Ditchley**, a seat in Oxfordshire, 7559.
- Dittany**, *origanum dictamnus*.
- Diuris**, gynan. monan. and orchideæ, a *G. peren.* N. S. W. requiring the same culture as *disa*.
- Dock**, — see *Rumex*.
- Dodartia**, didyn. angios. and scrophularinæ, a *H. peren.* Levant, which thrives in rich light soil, and is increased by seeds or dividing at the root.
- Dodder**, — see *Cuscuta*.
- Dodecatheon**, the African cowslip, pentan. monog. and primulacæ, a *H. peren.* Virginia, which thrives in light loam, and is increased by dividing at the root.
- Dodonæa**, octan. monog. and terebintacæ, *S. and G. tr.* Austral. Amer. and Africa, which thrive well in loam and peat, and are increased by cuttings under a bell-glass in sand.
- Dodsley**, Robert, as a British author on gardening, page 1106. A. D. 1764.
- Dogmersfield Park**, Hampshire, 7594.
- Dogsbane**, — see *Apocynum*.
- Dog's cabbage**, *thelygonum cynocrambe*.
- Dogtail-grass**, — see *Cynosurus*.
- Dogtooth-violet**, — see *Erythronum*.
- Dog-wood**, — see *Cornus*.
- Dolichos**, diadel. decan. and leguminosæ, *S. and G. tr.* bien. and an. which grow freely in light rich soil, and are increased by cuttings under a hand-glass or by seeds, which many produce freely.
- Dolichos soja**, or soy plant, 6037.
- Dol-y-Myllynlyn**, a seat in Merionethshire, 7612.
- Dombeya**, monad. deced. and malvacæ, a *S. tr.* Mauritius, which grows in sandy loam, and ripened cuttings root in a pot of sand in moist heat under a hand-glass.
- Don**, David, Esq. F.L.S., librarian to the Linnæan Society, 7045.
- Don**, George, of Forfar, a celebrated British botanist, 386.
- Donegal**, county of, as to gardening, 2278.
- Donn**, James, F.L.S., curator of the Cambridge botanic garden, page 1112. A. D. 1796.
- Donnington Grove**, Berkshire, 7561.
- Donnington Park**, Leicestershire, 7573.
- Doodia**, cryptog. filices and filicæ, a *G. peren.* N. S. W. a fern of the usual culture.
- Dornbach**, a seat, and also a mountain near Vienna, 204.
- Doronium**, leopard's bane, syngen. polyg. super. and corymbifereæ, *H. peren.* Eur. of common culture.
- Dorsetshire**, gardens and residences of, 7598.
- Dorstenia**, tetran. monog. and urticæ, *Eur. and S. Amer.* which grow freely in light rich soil, and increase at the roots or by seed.
- Doryanthes**, hexan. monog. and amaryllideæ, a *G. tr.* N. S. W. which grows in loam and peat, and is increased by suckers.
- Dorycnium**, diadel. decan. and leguminosæ, *G. tr.* and *peren.* S. Eur. which thrive in loam and peat, and young cuttings planted under a bell-glass in sand, root freely, or they may be raised from seeds.
- Doucain-stocks**, 4387.
- Douette-Richardot**, his works on gardening, page 1121. A. D. 1803.
- Down**, county of, its gardens and residences, 7683.
- Downing**, a seat in Flintshire, 7606.
- Draba**, whitlow-grass, tetrad. silic. and crucifereæ, *H. peren. bien. and an.* Eur. of easy culture.
- Dracæna**, dragon-tree, hexan. monog. and asphodeleæ, *S. tr.* E. Ind. which thrive well in light loam, and large cuttings stuck in the bark-beds when in a brisk heat root freely.
- Dracocephalum**, dragon's head, didyn. gymnos. and labiateæ, a *G. tr.* and *H. peren. and an.* Eur. and Amer. of common culture.
- Dracontium**, dragon, heptan. monog. and aroidæ, *S. peren.* India, which grow in light rich soil, and are increased by dividing at the roots.
- Dragon**, — see *Dracontium*.
- Dragon's head**, — see *Dracocephalum*.
- Dragon-tree**, — see *Dracæna*.
- Drainging**, 1095.
- Dreghorn Castle**, near Edinburgh, 7618.
- Dreyssig**, his works on gardening, page 1127. A. D. 1809.
- Drill** (*drillen*, Dutc. to bore holes with a drill), lengthened excavation formed in gardening by the hoe, for the purpose of inserting seeds. Sometimes drills are formed across beds by a large wide-toothed rake, and the same rake serves when the plants are sprung up, to stir the soil between the rows, 1873.
- Drill-rake**, 1315.
- Drimia**, hexan. monog. and asphodeleæ, *G. peren.* C. B. S. bulbs which grow in sandy loam and decayed leaves.
- Dronninggaard**, a seat in Denmark, 61.
- Drope**, Francis, B. D., a British author on gardening, page 1101. A. D. 1672.
- Dropsy** in plants, 883.
- Dropwort**, *spirea filipendula*.
- Drosera**, sundew, pentan. pentag. and droseracæ, *H. peren.* Brit. which grow in watery bogs in peat earth, but which will thrive and flower well when kept in small pots in the green-house. "The pots should be filled three parts full of peat earth, and some moss placed on it, the droseræ then planted in the moss, and the pots placed in pans of water." (*Sweet.*)
- Drottningholm**, a royal garden near Stockholm, 246.
- Drummond Castle**, in Perthshire, 7636.
- Dry rot**, — see *Merulius destruens*.
- Dry-stove**, its construction, 6176.
- Dry-stove plants**, 6663; woody sorts, 6664; climbing, 6665; succulent, 6666; bulbous, 6667; herbaceous, 6668.
- Dryander**, Jonas, M. D., an eminent botanist and bibliographer, who compiled the *Bibliotheca Banksiana*, and the greater part of the *Hortus Kewensis*.
- Dryandra**, tetran. monog. and proteacæ, *G. tr.* N. Holl. which require the same treatment as *banksia*.
- Dryas**, icos. polyg. and rosacæ, a *H. peren.* Brit. which thrives best in a border of peat, and may be increased by cuttings dividing at the roots or by seeds, which it produces in abundance.
- Dryburgh Orchard**, in Berwickshire, 2220.
- Drypis**, pentan. tetrag. and caryophyllæ, a *H. bien.* Italy, of common culture.
- Du Halde**, a missionary who wrote on China and its gardening, 479.
- Du Ham**, *Du Hamel's Treatise on Fruit Trees*.
- Du Petit Thouars**, *Le Chevalier Aubert Aubert*, his works on gardening, page 1122. A. D. 1816.
- Dublin**, county of, its gardens and residences, 7653.
- Dublin botanic garden**, 7653.
- Dublin society**, 7653.
- Dubois**, Louis, his works on gardening, page 1121. A. D. 1804.
- Duchêne**, Ant. Nicholas, his works on gardening, page 1118. A. D. 1760.
- Duck's foot**, — see *Podophyllum*.
- Duck-weed**, — see *Lemma*.
- Duckingfield Lodge**, Lancashire, 7588.
- Duddington House**, in Midlothian, 7618.
- Duff House**, Banffshire, 7640.
- Dufresnoy**, a celebrated French landscape-gardener, 165.
- Duhamel**, — see *Du Ham*.
- Dumb cane**, — see *Arum*.
- Dumbartonshire**, gardens of, 7630.
- Dumfriesshire**, as to gardening, 7624.

Dumont-Courset, his works on gardening, page 1121. A. D. 1802.
Duncan, Andrew, M. D., page 1112. A. D. 1181.

E. B. — see Eng. Bot.
Ealing Grove, Middlesex, 7520.
Eames, Mr., a landscape-gardener, who died the beginning of the present century, 342.
Earl's Court Villa, Middlesex, 7523.
Earl's Stoke, Wiltshire, 7596.
Earth-nut, — see *Bunium*.
Earth-pea, *lathyrus amphicarpos*.
East Hornden, a seat in Essex, 3038.
East Indies, gardens of, 461.
East Lothian, gardens of, 7619.
Eastbury House, Essex, 7540.
Eastcliff Lodge, Kent, 7537.
Eastmeath, county of, its gardens and residences, 7661.
Easton Lodge, Essex, 7542.
Eastwick House, Surrey, 7528.
Ebourgonnement or disbudging, — see *Pruning*, and *Operations of Gardening*.
Echinaria, trian. dig. and gramineæ, a H. an. S. Eur. of common culture.
Echinophora, sea parsnep, pentan. dig. and umbellifereæ, H. peren. Eur. which grow in light soil, and are increased by seeds.
Echinops, globe-thistle, syngen. polyg. segreg. and corymbifereæ, H. peren. and an. Eur. of easy culture.
Echites, pentan. monog. and apocynæ, S. and G. tr. W. Ind. which grow freely in loam and peat, and cuttings root readily under a hand-glass in sand.
Echium, viper's bugloss. pentan. monog. and boragineæ, G. tr. C. B. S. which grow in loam and peat, and may be raised from cuttings or seeds; and H. bien. and an. Eur. of common culture.
Eclipta, syngen. polyg. super. and corymbifereæ, a S. and H. an. of common culture.
Ed. Encyc., the *Edinburgh Encyclopædia*, conducted by Dr. Brewster.
Eden Farm, Kent, 7537.
Edible fuci, 4349.
Edible fungi, 4336.
Edible wild and other neglected plants, 4283; greens and pot-herbs, 4235; roots, 4300; legumes, 4309; salads, 4311; teas, 4317; variously applicable, 4320.
Edifices, anomalous; ice-house, 1723; bee-house, 1734; Polish hives, 1738; common hive, 1739;

glass hive, 1740; hive of Palteau, 1742; Huish's hive, 1743; Howison's hive, 1744; management of bees, 1745; position of the aviary, 1735; choice of bees, 1746; materials and size of hives, 1747; feeding of bees, 1748; covering the hives, 1750; swarming, 1752; taking the honey, 1755; by total deprivation, 1757; by suffocation, 1758.
Edifices, decorative, characteristic class; rocks, 1837; ruins, 1839; antiquities, 1840; rarities and curiosities, 1841; monumental objects, 1842; sculptures, 1843; vegetable sculptures, 1844; inscriptions, 1845; eye-traps; 1846. — see *Structures used in Gardening*.
Edifices, decorative, convenient class; prospect-tower, 1806; kiosque, 1807; temples, 1808; porches and porticoes, 1809; alcoves, 1810; Italian arbor, 1812; French arbor, 1813; caves and caverns, 1814; grottoes, 1815; roofed-seats, boat-houses, moss-houses, flint-houses, bark-huts, 1816; elegant structures, 1819; exposed seats, 1820; swings, 1821; constructions for displaying water, 1822; waterfalls, 1826; cascades, 1827; jets and other hydraulic devices, 1829; drooping fountains, 1832; sundials, 1834; vases, 1835.
Edifices, decorative, useful class, 1769; cottages, Gothic, Grecian, Chinese, Bengal, English, Scotch, Italian, Polish, Russian, Swedish, Danish, 1770; primitive huts, 1781; bridges, 1782; fallen tree, foot-plank, Swiss bridge, 1785; bent plank, 1786; of common carpentry, 1788; of masonry, 1789; of cast-iron, 1790; boat-bridge, 1791; sepulchral structures, 1792; the gate, 1794; maintenance of a gate's position, 1795; gates as decorations, 1800; gate with falling bars, 1799; rails, 1803.
Edifices of gardening, their farther improvement, 1847.
Edifices used in gardening, 1698; economical buildings, 1699; head gardener's dwelling-house, 1700; gardener's office, 1701; seed-room, 1702; fruit-room, 1703; journeyman's lodge, 1707; sheds, 1709; entrance lodges and gates, 1712; buildings for raising water, 1713; wells and pumps, 1716; conduits, 1717; reservoirs, 1718; tanks, 1719.
Edinburgh botanic garden, 7618.
Education of gardeners, importance of, 7719; professional education, 7724; intellectual, 7744; moral, religious, and physical, 7761; economical, 7777.
Edward's Square, London, mode in which it is laid out, 7322.
Edwardia, decan. monog. and leguminosæ, F. tr. N. Zeal. which grow in common soil, and are generally raised by seeds, but cuttings will root in sand under a bell-glass.
Edwinstow, a seat in Caermarthenshire, 7614.
Egger-moth, — see *Phalæna*.
Eggleston House, Durham, 7584.
Egg-plant, — see *Solanum*.
Egham Park, Surrey, 7527.
Eglinton Castle, a seat in Ayrshire, 7627.
Ehreta, pentag. monog. and boragineæ, S. tr. E. and W. Ind. which grow in loam and peat, and cuttings root readily under a hand-glass.
Ehrhart, Frederick, his works on gardening, page 1124. A. D. 1782.
Ehrhartia hexan. monog. and gramineæ, a G. peren. C. B. S. a grass of common culture.
Eisenstadt (Iron Town), a seat in Hungary, 206.
Ekebergia, decan. monog. and meliaceæ, a G. tr. C. B. S. which grow in loam and peat, and cuttings without their leaves shortened, root readily in sand under a hand-glass.
Elæagnus, oleaster, tetran. monog. and elæagneæ, S. and G. tr. Amer. and Ind. which grow in loam and peat, and ripened cuttings root freely in a pot of sand under a hand-glass.
Elæocarpus, polyan. monog. and guttifereæ, a S. and G. tr. E. Ind. and N. Holl. which may be treated like elæagnus.
Elæocharis, spike-rush, trian. monog. and cypereæ, H. bien. Eur. Afr. and Austral. marsh grasses, is of easy culture.
Elæodendrum, olive-wood, pentan. monog. and rhamneæ, Afr. and Austral. which grow in loam and peat, and ripened cuttings root in sand under a hand-glass.
Elais, oily-palm, dioc. hexan. and palmææ, a S. tr. a palm of the usual culture.
Elate, monoc. hexan. and palmææ, a S. tr. E. Ind. a palm of easy culture.

- Elatine, water-wort, octan. tetrag. and caryophyllææ, a H. an. of common culture.
- Elder, — see Sambucus.
- Elecampane — see Inula.
- Electricity, 1210.
- Elegia, diœcia, trian. and restiaceæ, G. peren. C. B. S. rush-like plants of easy culture.
- Elephant-apple, *feronia* elephantum.
- Elephantopus, elephant's foot, syngen. polyg. segr. and corymbifereæ, S. and G. peren. E. and W. Ind. which grow freely in loam and peat, and cuttings root in the same soil under a hand-glass.
- Elephant's foot, *tamus* elephantopus.
- Elettaria, monan. monog. and scitamineæ, S. peren. E. Ind. reedy marsh plants of easy culture.
- Eleusine, trian. dig. and gramineæ, a S. peren. and H. an. Ind. and America, of easy culture.
- Elichrysum, syngen. polyg. super. and corymbifereæ, G. tr. and peren. which grow in sandy peat well-drained, and cuttings root freely in sand in a frame on a hot-bed; but not covered with a bell-glass, otherwise they are apt to damp off.

- Englebert, Jortin, his works on gardening, page 1130. A. D. 1784.
- Enkianthus, decan. monog. and ericeæ, a G. tr. China, which grows in sandy loam and peat, and ripened cuttings root readily in pots of sand under a hand-glass without bottom-heat.
- Enmore Castle, Somersetshire, 7599.
- Enontekis, garden of the minister there, 250.
- En quenouille (*Fr.*), a mode of training trees, 2120.
- Entrance lodges and gates, 1712.
- Enville, a seat in Staffordshire, 7570.
- Epacris, pentan. monog. and epacrideæ, G. tr. N. S. W. which thrive in sandy peat, rough and turf, and they require frequent shifting. "Young cuttings planted in pots in sand, under bell-glasses in autumn or winter, or early in spring, will root freely; but not so in summer." (*Sweet.*)
- Ephedra, diœc. monad. and confereæ, H. tr. Eur. under-shrubs which grow in peat earth, and prefer a moist situation; they are readily propagated by division at the root.
- Epheliis, octan. monog. and sapindeæ, a S. tr. Guiana, which grows in light loam, and large cuttings root best under a hand-glass in sand.
- Epicurus, gardens of, 23.
- Epidendrum, gynan. monan. and orchideæ, S. peren. W. Ind. parasites which may be treated as ærides.
- Epigæa, decan. monog. and rhodoraceæ, a H. tr. N. Amer. which thrives in peat soil, and is increased by layers; it requires to be protected during winter.
- Epilobium, willow-herb, octan. monog. and onagraceia, G. and H. peren. and an. Eur. and Amer. of the easiest culture.
- Epilobium angustifolium, 4298.
- Epinedium, barrenwort, tetran. monog. and berberideæ, a H. peren. Eng. which prefers peat and loam, and is readily increased by dividing the roots.
- Epipactis, gynan. monan. and orchideæ, H. peren. Brit. which do best in pots in loam and peat, and increase by dividing the roots; they require little water when in a dormant state.
- Equestrian promenades, 7313.
- Equisetum, horse-tail, cryptog. gonopterides, and equisetaceæ, a H. tr. and H. peren. Brit. which may be treated like ephedra.
- Eranthemum, dian. monog. and acanthaceæ, tr. E. and W. Ind. which grow in rich light soil, and root readily under a hand-glass.
- Erauthis, winter aconite, polyan. polyg. and ranunculaceæ, a H. peren. Italy, the winter aconite, of the easiest culture.
- Erbstein, K. F. W., his works on gardening, page 1126. A. D. 1799.
- Erddig, a seat in Denbighshire, 7605.
- Erica, heath, octan. monog. and ericeæ, G. tr. C. B. S. mostly under-shrubs of great beauty; table of species and varieties, 6607; propagation and culture, 6608. The H. species grow in peat soil, and are increased by layers, cuttings, or seeds.
- Eridge Castle, Sussex, 7531.
- Erigeron, syngen. polyg. super. and corymbifereæ, H. peren. bien. and an. Eur. and Amer. of common culture.
- Erinus, didyn. angios. scrophularineæ, a G. tr. and T. peren. Eur. and C. B. S. which thrive best in peat, and increase by cuttings or dividing at the root.
- Eriocaulon, pipe-wort, trian. trig. and restiaceæ, a H. peren. Scot. which grows in bogs, and is increased by suckers from the roots.
- Eriocephalus, syngen. polyg. necess. and corymbifereæ, G. tr. C. B. S. which grow in light rich soil, and cuttings root readily in the same soil, under a hand-glass.
- Eriogonum, emnean. monog. and polygoneæ, H. peren. N. Amer. which thrive best in pots, and are increased by seeds.
- Eriophorum, cotton-grass, trian. monog. and cypereæ, H. peren. Eur. and Amer. bog grasses of easy culture.
- Eriosoma mali, — see Aphis lanigera.
- Eriosperrum, hexan. monog. and asphodeleæ, G. peren. C. B. S. with tuberous roots, of easy culture in sandy loam and peat.
- Eri thrals, pentan. monog. and rubiaceæ, a S. tr. Jamaica, which grows best in loam and peat, and cuttings root in sand under a hand glass in moist heat.
- Ermenonville, one of the most distinguished country-seats in France, about ten leagues from Paris, on the road to Flanders by Morfontaine, 167.
- Erodium, heron's bill, monad. pentan. and geraniaceæ, G. peren. and H. an. Eur. and Asia, of easy culture, — see Geraniæ.
- Erucaria, tetrad. siliq. and crucifereæ, a H. an. of easy culture.
- Ervum, tare, diadel. decan. and leguminoseæ, H. an. Brit. and Ind. of easy culture, — see 4310.
- Eryngium, eryngo, pentan. dig. and umbellifereæ, a S. peren. and H. peren. Eur. and Amer. which grow in any soil, and are increased by seeds or dividing the root.
- Eryngo, — see Eryngium.
- Erysimum, hedge-mustard, tetrad. siliq. and crucifereæ, H. peren. bien. and an. Eur. of the easiest culture, — see Barbarea.
- Erythraea, pentan. monog. and gentianeæ, a G. peren. and H. an. Eur. of common culture.
- Erythrina, coral-tree, diadel. decan. and leguminoseæ, S. and G. tr. which grow readily in sand and peat, and cuttings, not too ripe, root in sand under a hand-glass.
- Erythronium, dogstooth-violet, hexan. monog. Ilia, H. peren. Eur. and Amer. with tuberous roots, of easy culture.
- Escot House, Devonshire, 7600.
- Esculent roots, 3643.

- Escorial, palace of, in Spain, 294.
 Fisher Place, formerly a seat in Surrey, 341.
 Espalier trees, such as are suitable for, or are planted against, espalier rails, 2508.
 Espaliers, or espalier-rails, railings of timber or iron for the culture of fruit-trees, used as a substitute for walls, 1576.
 Essex, gardens and residences of, 7539.
 Esterhazy, a seat in Hungary, belonging to Prince Esterhazy, 206.
 Ethulia, syngen. polyg. æqual. and corymbiferae, S. an. India, of common culture.
 Etienne, Charles, a French author on gardening, page 1115. A. D. 1535.
 Etiolation, a disease of plants, 892.
 Eller, J. Ch., his works on gardening, page 1125. A. D. 1789.
 Eucalyptus, icos. monog. and myrteaceae, G. tr. Austral. which grow in loam or peat, and cuttings root in sand under a bell-glass, but not very freely.
 Euchilus, decan. monog. and leguminosae, a G. tr. N. Holl. which thrives in sandy loam and peat, and cuttings root freely under a bell-glass in sand.
 Euclea, diœc. dodec. and terebintaceae, G. tr. C. B. S. which grow freely in loam and peat, and ripened cuttings root readily in sand under a bell-glass.
 Euclidium, tetrad. silic. and cruciferae, a H. an. Levant, of common culture.
 Eucomis, hexan. monog. and asphodeleae, G. peren. C. B. S. bulbs which grow in light rich soil, and may be propagated by offsets; or, if leaves be stripped off close to the bulb, and planted in pots of mould, they will produce bulbs at their base.
 Eucrosia, hexan. monog. and amaryllideae, a S. peren. Cape Horn, a bulb which may be treated as amaryllis.
 Eugenia, icos. monog. and myrteaceae, S. and G. tr. Ind. and America, which thrive in two thirds loam and one third peat, and ripened cuttings root freely in sand under a hand-glass.
 Eugenia jambos, the Malay apple, 5933.
 Euonymus, spindle-tree, pentan. monog. and rhamneae, a G. tr. and H. tr. Eur. and Amer. of easy culture in common soil, and propagated by layers, ripened cuttings planted in autumn, or seeds.
 Eupatorium, syngen. polyg. æqual. and corymbiferae, S. tr. and H. peren. Amer. of easy culture.
 Euphorbia, spurge, dodec. trig. and euphorbiaceae, S. D. S. and G. tr. and peren. Eur. As. Afr. and Amer. mostly succulents, which prefer loam and lime rubbish. Sweet says, "the way I have succeeded best in striking the cuttings, is to stick them in the tan amongst the pots in a good heat, and not cover them with any glass." (*Bot. Cult.* 55.)
 Euphrasia, eyebright, didyn. angios. and scrophularineae, H. an. of easy culture.
 Euryale, polyan. monog. and nymphæaceae, a S. an. India, an aquatic which often produces seeds, 6728.
 Eustace, the Rev. John Chetwode, a Roman Catholic clergyman, author of an eloquent classical tour in Italy, 2 vols. 4to. 1813. He died of a fever at Naples in 1815.
 Eustoma, pentan. monog. and gentianeae, a H. an. W. Ind. of easy culture.
 Euston Hall, Suffolk, 7552.
 Eustrephus, hexan. monog. and asphodeleae, a G. peren. N. S. W. a climber which grows in sandy loam and peat, and is increased by dividing the root, or by cuttings under a hand-glass.
 Eutaxia, decan. monog. and leguminosae, a G. tr. N. Holl. which thrives best in sandy loam and peat, and young cuttings root freely in sand under a bell-glass.
 Euthales, pentan. monog. and goodenoviæ, a G. peren. N. Holl. which grows in sandy loam and peat, with little water, and may be increased, though slowly, by dividing the root or by seed.
 Evelyn, Charles, Esq., a British author on gardening, page 1102. A. D. 1717.
 Evelyn, John, F.R.S., his writings on gardening, page 1100. A. D. 1658.
 Evening flower, — see *Hesperantha*.
 Evergreen trees, suitable for floricultural purposes, 6541.
 Everingham, a seat in Yorkshire, 7582.
 Everlasting, — see *Gnaphalium*.
 Everlasting penta, *lathyrus latifolius*.
 Evolvulus, pentan. dig. and convolvulaceae, S. an both Indies, of easy culture.
 Ewood, a seat in Surrey, 7528.
 Ex. Gard., Cushing's Exotic Gardener.
 Exacum, tetran. monog. and gentianeae, a G. bien. and H. an. Eur. of common culture.
 Exbury House, Hampshire, 7594.
 Excavation of ground, 1867.
 Excœcaria, diœc. monad. and euphorbiaceae, a G. tr. Chili, which will grow readily in light rich soil, and cuttings root in sand under a hand-glass.
 Exotic culinary vegetables little cultivated in Britain, 6022.
 Exotic culture, leading operations of, 2201.
 Exotic esculents, not hitherto cultivated as such, 6022.
 Exotic fruits, 4778.
 Exotic fruits, little known, but deserving cultivation, 5974.
 Exotic fruits, neglected as such, 4878.
 Expedients in the management of gardens, 7446.
 Exton Hall, Rutlandshire, 7579.
 Eyebright, — see *Euphrasia*.
 Eyetraps, in gardening, 1846.
 Eywood, Herefordshire, 7563.

F.

- Fabricia, icos. monog. and myrteaceae, G. tr. Austral. which thrive well in loam and peat, and young cuttings root readily under a bell-glass in sand.
 Facio, Nicholas, F.R.S., a British author on gardening, page 1101. A. D. 1639.
 Fagara, tetran. monog. and terebintaceae, S. tr. and a G. tr. W. Ind. and Japan, which grow in light loam, and cuttings root in sand under a hand-glass.
 Fagonia, decan. monog. and rutaceae, a G. bien. and an. Candia and America, of common culture.
 Fagus, monœc. polyan. and amentaceae, H. Brit. and Amer. of easy culture, and increased by seeds; and some curious varieties by grafting or budding on the others.
 Fagus sylvatica, the beech-tree, 7088.

- Girdling trees, 863.
- Gisekia*, pentan. pentag. and portulacæ, a S. an. W. Ind. of common culture.

- Glades in planting, regular or irregular, 6813.
 Gladiolus, corn-flag, trian. monog. and irideæ, G. and H. peren. C. B. S. bulbs of easy culture, 6319.
 Glamorganshire, gardens and residences of, 7608.
 Glaser, J. F., his works on gardening, page 1124. A. D. 1774.
 Glasgow botanic garden, 7629.
 Glasgow nurseries, 7629.
 Glasswort, — see *Salicornia*.
 Glass case, 1531. — see *Structures*.
 Glaucium, horn-poppy, polyan. monog. and papaveraceæ, a H. Bien. and an. Eur. of common culture.
 Glaux, black saltwort, pentan. monog. and salicariæ, a H. peren. Brit. which grows best in pots in sand and peat, and is increased by dividing at the roots.
 Glechoma, ground-ivy, didyn. gymnos. and labiatæ, H. peren. Eur. of common culture.
 Gleditsch, John Gottlieb (John Love-God), his works on gardening, page 1123. A. D. 1765.
 Gleditschia, polyg. diceæ. and leguminosæ, a F. and H. tr. Amer. and China, of easy culture, and increased by layers or seeds.
 Glengary House, in Inverness-shire, 7643.
 Glinus, dodec. pentag. and ficoideæ, a G. an. S. Eur. of common culture.
 Globba, dian. monog. and scitamineæ, S. peren. E. Ind. reedy plants of easy culture, and increased by dividing at the roots.
 Globe-amaranth, — see *Gomphrena*.
 Globe-flower, — see *Trollius*.
 Globe-thistle, — see *Echinops*.
 Globularia, tetran. monog. and globulariæ, G. tr. Eur. which grow well in loam and peat, and cuttings root freely in the same soil under a hand-glass.
 Gloriosa, hexan. monog. and liliæ, S. peren. E. Ind. with tuberous roots, 6723.
 Glossodia, gynan. monan. and orchideæ, a G. peren. N. S. W. which grows in sandy loam and peat, and requires but little water when not in a growing state; it is increased by offsets and seeds.
 Glossology of plants, 555.
 Gloucestershire, gardens and residences of, 7563.
 Gloxinia, didyn. angios. and gesneriæ, S. peren. S. Amer. which thrive in light rich soil, and leaves taken off close to the stem and planted will root and make plants.
 Glyceria, trian. dig. and gramineæ, a H. peren. Brit. a grass of the easiest culture.
 Glycine, diadel. decan. and leguminosæ, G. tr. Ind. and Amer. mostly climbers, which thrive in loam and peat, and root readily from cuttings; and H. peren. of easy culture in similar soil.
 Glycyrrhiza, licorice, diadel. decan. and leguminosæ, H. peren. of easy culture.
 Glycyrrhiza glabra, the common licorice, 2243.
 Glynde, a seat in Sussex, 7531.
 Gmelin, John Frederick, his works on gardening, page 1125. A. D. 1787.
 Gmelina, didyn. angios. and verbenaceæ, S. tr. E. Ind. which grow best in sandy loam and peat, and cuttings root in sand under a hand-glass in heat.
 Gnaphalium, everlasting, syngen. polyg. super. and corymbifereæ, S. and G. tr. C. B. S. and Eur. which thrive in peat or in sandy loam, and cuttings taken off at a joint and planted in the same soil, the pots placed in a steady situation, but not under glasses, root freely; the H. species are of common culture.
 Gnidia, octan. dig. and thymelæ, G. tr. C. B. S. which thrive well in peat soil, with the pots well drained, and care being taken neither to over water them, nor let them droop for want of water, as they are easily killed; very young cuttings root in sand under bell-glasses.
 Gnull Castle, Glamorganshire, 7608.
 Goathurst, a seat in Somersetshire, 7599.
 Goat's beard, — see *Tragopogon*.
 Goat's rue, — see *Galega*.
 Goat's thorn, astragalus tragacantha.
 Godmersham Place, a seat in Kent, 7537.
 Golden Grove, a seat in Caermarthenshire, 7614.
 Golden rod, — see *Solidago*.
 Golden rod tree, boscæ yervamora.
 Golden saxifrage, — see *Chrysosplenium*.
 Golden thistle, — see *Scolymus*.
 Goldyllocks, — see *Chrysocoma*.
 Gomesa, gynan. monan. and orchideæ, a S. peren. Brasil; a parasite, which may be treated as aërides, epidendrum, &c.
 Gomphia, button-flower, decan. monog. and och. naceæ, S. tr. Jamaica, which thrive in sandy loam, and cuttings root in sand under a hand-glass in a moist heat.
 Gomphocarpus, pentan. dig. and asclepiadeæ, G. tr. C. B. S. which grow freely in loam and peat, and cuttings in sand under a hand-glass in a little bottom-heat, root freely.
 Gompholobium, decan. monog. and leguminosæ, G. tr. Austral. which thrive in sandy loam and peat, not over watered, young cuttings root without difficulty under a bell-glass in sand.
 Gomphrena, globe-amaranth, pentan. monog. and amarantaceæ, a S. tr. peren. bien. and an. Ind. and Amer. of easy culture.
 Goniocarpus, tetran. monog. and onagrariæ, a G. an. China, of common culture.
 Gonolobus, pentan. dig. and asclepiadeæ, S. tr. Amer. climbers, which grow freely in loam and peat, and cuttings root readily under a hand-glass: the other species are of easy culture.
 Goodenia, pentan. monog. and goodenoviæ, G. tr. N. Spain, which grow freely in loam and peat, and cuttings root under a hand-glass.
 Goodia, diadel. decan. and leguminosæ, G. tr. Austral. which thrive well in sandy loam and peat, and young cuttings root freely under a bell-glass in sand.
 Goodwood, a seat in Sussex, 7532.
 Goodyera, gynan. monan. and orchideæ, a S. peren. Eur. and Amer. which grows in loam and peat, and is increased by suckers from the root, and H. peren. which thrive in sandy peat, and may be increased like the others.
 Gooseberry, — see *Ribes*.
 Goosefoot, — see *Chenopodium*.
 Gopsal Hall, Leicestershire, 7573.
 Gordonia, monad. polyan. and malvaceæ, a G. and F. tr. which grow in peat soil with a little loam, and are increased by layers or ripened cuttings under a hand-glass.
 Gorhambury House, Hertfordshire, 7544.
 Goring, E. H. J., Bm. Trommsdorf, and F. K. L. Sickler, their joint work on gardening, page 1126. A. D. 1802.
 Gorinka, a seat near Moscow, 260.
 Gormanstown House, in Eastmeath, 7661.
 Gort House, a seat in Galway, 7672.
 Gorteria, syngen. polyg. frustr. and corymbifereæ, a G. an. C. B. S. of easy culture.
 Gosfield Hall, Essex, 7542.
 Gossford House, East Lothian, commonly called Wemyss House, 7586.
 Gossford House, Northumberland, 7619.
 Gossypium, cotton, monad. polyan. and malvaceæ, S. tr. bien. and an. Ind. and Amer. which thrive in rich light soil, and generally ripen of seeds; or cuttings will root under a hand-glass in sand.
 Gotthardt, J. Ch. and R. Eyserbock, their work on gardening, page 1127. A. D. 1806.
 Gotz, J. F., his work on gardening, page 1124. A. D. 1780.
 Gouania, polyg. monœ. and rhamnæ, S. tr. W. and E. Ind. which grow freely in loam and peat, and ripened cuttings root in sand under a hand-glass in heat.
 Gouges de Cessieres, his work on gardening, page 1118. A. D. 1758.
 Gould, Mr., an Englishman, in the service of Prince Potemkin, considered in his day as the first gardener in Russia, 277.
 Gourd, — see *Cucurbita*.
 Goutweed, — see *Ægopodium*.
 Graffer, Mr. John, his works on gardening, page 1109. A. D. 1789.
 Grafting, 2013.
 Grafting, origin of, 33.
 Grammitis, cryptog. filices and filiceæ, a H. peren. Brit. a fern of the usual culture.
 Grange Hall, Durham, 7584.
 Grange Park, Hampshire, 7594.
 Grangea, syngen. polyg. super. and corymbifereæ, S. and H. an. E. Ind. of common culture.
 Grape, — see *Vitis*.
 Grape-gatherer, 1353.
 Grape-hyacinth, muscari botryoides.
 Grass of Parnassus, — see *Parnassia*.
 Gratiola, hedge-hyssop, dian. monog. and scrophularinæ, a S. bien. and H. an. Eur. Ind. and Amer. of common culture.
 Gravel, 1957.
 Gray, Mr. Christopher, his work on gardening, page 1104. A. D. 1740.
 Great burnet, — see *Poterium*.

Great Fulford, a seat in Devonshire, 7600.
 Greek valerian, — see *Polemonium*.
 Green dragon, arum dracontium.
 Green-house, its construction, 6164; general culture, 6202.
 Green-house plants, 6597; select sorts, 6598, to 6618; woody sorts, 6621; climbers, 6652; succulents, 6654; bulbs, 6658; herbaceous, 1729; selections for particular purposes, 660.
 Greencroft, a seat in Durham, 7584.
 Greenstead Hall, Essex, 7541.
 Greenwich Park, Kent, 7535.
 Grenada, gardens of, 292.
 Grevillea, tetran. monog. and proteaceæ, G. tr. N. S. W. which grow freely in sandy loam and peat, and ripened cuttings root under a hand-glass in sand.
 Grewia, polyan. monog. and tilliaceæ, S. and G. tr. Ind. and C. B. S. which thrive in loam and peat, and cuttings do best in sand under a hand-glass in heat.
 Grias cauliflora, the anchovy-pear, polyan. monog. and guttifereæ, a S. tr. Jamaica, 5979.
 Grielum, decan. pentag. and rosaceæ, a G. peren. C. B. S. which thrives best in sandy gravel, with the pots well drained, and cuttings root in the same soil without glasses.
 Griffin, Mr. William, his writings on gardening, page 1113. A. D. 1808.
 Grimsthorpe Hall, Lincolnshire, 7577.
 Grimstone Garth, Yorkshire, 7582.
 Grindelia, syngen. polyg. super. and corymbifereæ, G. tr. and a peren. Mexico; which thrive well in light, rich soil, and young cuttings root freely in the same soil under hand-glasses.
 Grindstone used in gardening, 1467.
 Grisenthwaite, Mr., an apothecary at Wells, Norfolk, and agricultural writer, 1050.
 Grislea, octan. monog. and salicariæ, a S. tr. E. Ind. which thrives in loam and peat, and young cuttings root freely in sand under a bell-glass in heat.
 Grohman, —, his works on gardening, page 1126. A. D. 1798.
 Gromwell, — see *Lithospermum*.
 Groningen, botanic garden of, 133.
 Gronovia, pentan. monog. and cucurbitaceæ, a S. peren. Jamaica; a climber, which thrives well in rich soil, and cuttings root readily under a hand-glass in heat.
 Grottoes, as decorations in gardening, 1815.
 Ground, how to operate on, in landscape-gardening, 7196.
 Ground compasses, 1366.
 Ground-ivy, — see *Glechoma*.
 Ground measure, 1363.
 Ground-pine, ajuga chamæpitys.
 Grounds, the art of laying out, — see Landscape-gardening.
 Groundsel, — see *Senecio*.
 Groundsel-tree, baccharis halmifolia.
 Grove, a seat in Hertfordshire, 7544.
 Grove, a seat in Middlesex, 7520.
 Grove Cottage, Oxfordshire, 7558.
 Grove Hill, Surrey, 7527.
 Grub (*groben*, Teut. to delve or dig), to root up trees which are not to be planted again: to clear the ground of ligneous vegetables by digging round and cutting their roots.
 Guaiacum, lignum vitæ, decan. monog. and rutaceæ, a S. tr. W. Ind. which grows in loam and peat, and ripened cuttings taken off at a joint, root readily when thinly planted in a pot of sand, and plunged under a hand-glass in heat.
 Guarea, octan. monog. and meliaceæ, a S. tr. S. Amer. which grows freely in loam and peat, and ripened cuttings root in sand under a hand-glass.
 Guatteria, polyan. polyg. and anonaceæ, a S. tr. Jamaica, which requires a loamy soil, and ripe cuttings root in sand under a hand-glass.
 Guelder-rose, — see *Viburnum*.
 Guérin, M——, a French author on gardening, page 1117. A. D. 1732.
 Guérin and Schwartz, their work on gardening, page 1122. A. D. 1813.
 Guettarda, monœc. hexan. and rubiaceæ, S. tr. which may be treated like gardenia.
 Guildandina, nicker-tree, decan. monog. and leguminosæ, a S. tr. India, which thrives in loam and peat, and cuttings root in sand under a hand-glass.
 Guillemeau, J. L. M., his work on gardening, page 1120. A. D. 1800.
 Guimpel, F——, his works on gardening, page 1127. A. D. 1810.

Guiting Park, Gloucestershire, 1565.
 Gum-succory, chondrilla juncea.
 Gundelia, syngen. polyg. segr. and cynarocephalæ, a H. peren. Levant, of common culture.
 Gunnera, gynan. dian. and urticæ, a G. peren. C. B. S. which may be treated as an aquatic.
 Gunnersbury, a seat in Middlesex, 7520.
 Günther, J. Jac., his work on gardening, page 1127. A. D. 1806.
 Gunton Hall, Norfolk, 7554.
 Gurnth, Amelia, her works on gardening, page 1125. A. D. 1790.
 Gustavia, monad. polyan. and myrteaceæ, a S. tr. which thrives well in sandy loam, and cuttings root freely in sand under a hand-glass.
 Guys Cliff, a seat in Warwickshire, 7571.
 Gymnadenia, gynan. monan. and orchideæ, a H. peren. Brit. which grows best in sandy loam, peat, and chalk, and may be increased by seeds; if planted in pots they must be well drained.
 Gymnema, pentan. dig. and asclepiadeæ, a S. tr. Ceylon, which grows in loam and peat, and cuttings root freely under a hand-glass.
 Gymnocladus canadensis, diœc. decan. and leguminosæ, a H. tr. Canada, which grows in common soil, and is increased by cuttings of the roots.
 Gynnostyles, syngen. polyg. necess. and corymbifereæ, a G. an. S. Amer. of common culture.
 Gypsophila, decan. dig. and caryophyllæ, H. peren. and an. Eur. well adapted for rock-work, and propagated by cuttings or seeds.
 Gypsum, 1179.
 Gyrotheca, trian. monog. and hæmodoraceæ, a G. peren. N. Amer. which grows well in light soil, and may be increased by dividing at the root.

H.

Habenaria, gynan. monan. and orchideæ, H. peren. Eur. and Amer. requiring the same treatment as gymnadenia.
 Hack, a north country term for a pick-axe, — see Pick-axe.
 To hack (*hacken*, Teut. to hew), to cut over or clear away, by cutting ligneous vegetables.
 Hackfall, scenery of, in Yorkshire, 7582.
 Hackness, scenery of, in Yorkshire, 7582.
 Hackney botanic nursery garden, 7356.
 Hackwood Park, Hampshire, 7594.
 Haddon Hall, Derbyshire, 7575.
 Haddow Hall, Lancashire, 7588.
 Hæmanthus, hexan. monog. and amaryllideæ, G. peren. C. B. S. which thrive best in sandy loam and peat, and like other bulbs require no water when in a dormant state.
 Hæmatoxylon, logwood, decan. monog. and leguminosæ, a S. tr. S. Amer. which grows in loam and peat, and cuttings root readily in sand under a hand-glass.
 Hæmodorum, trian. monog. and hæmodoraceæ, a G. peren. N. S. W. a bulb which may be treated as hæmanthus.
 Hafod, a seat in Cardiganshire, 7607.
 Haga, gardens of, near Stockholm, 246.
 Hagley Hall, Staffordshire, 7570.
 Hagley, Worcestershire, 7566.
 Haigh Hall, Lancashire, 7588.
 Hair-grass, — see *Aira*.
 Hakea, tetran. monog. and proteaceæ, G. tr. Austral. which thrive well in a third loam, a third peat, and a third sand, the pots well drained, and too much watering avoided; ripened cuttings root readily under a hand-glass in sand.
 Haldon House, Devonshire, 7600.
 Halesia, snowdrop-tree, dodec. monog. and ebenaceæ, H. tr. N. Amer. which grow freely in common soil, and are increased by cuttings of the roots.
 Halingbury Place, Essex, 7541.
 Hall, Joseph, his work on gardening, page 1100. A. D. 1645.
 Halleria, didyn. angios. and scrophularinæ, a G. tr. C. B. S. which grows freely in loam and peat, and ripened cuttings root readily in sand under a hand-glass.
 Hallia, diadel. decan. and leguminosæ, a G. tr. and bien. and peren. C. B. S. which grow freely in loam and peat, and young cuttings root under a hand-glass in sand.
 Haloragis, octand. tetrag. and onagrariæ, a G. tr. N. Zeal. which may be treated as hallia.
 Halsewood, a seat in Sligo, 7675.
 Ham Court, Worcestershire, 7566.

- Ham House, Middlesex, 327.
 Hamamelis, tetran. dig. and berberidæ, a H. tr. N. Amer. which thrives in common soil, and is generally increased by layers.
Hamel du Monceau, or *Duhamel*, Henry Lewis du, a French author on gardening, page 1117. A.D. 1730.
 Hamels, a seat in Hertfordshire, 7544.
Hamilton, the Hon. Charles, of Painsill, a man of great taste in gardening, 341.
 Hamilton Palace, Lanarkshire, 7629.
 Hamiltonia, oil-nut, polyan. dicæ. and terebintacæ, a G. tr. N. Amer. which grows in loam and peat, and cuttings root under a hand-glass in sand.
 Hammer, 1345.
Hamner, F——, L——, and Dietrich, their work on gardening, page 1121. A.D. 1802.
 Hampshire, gardens and residences of, 7594.

 Hart's tongue, *scolopendrium officinarum*.
 Hartwort, — see *Tordylium*.
 Hassagay-tree, *curtisia faginea*.
 Hasselquistia, pentan. dig. and umbellifereæ, H. an. Egypt, of common culture.
 Hassendean nursery, Roxburghshire, 7621.
 Hatchet-vetch, — see *Biserrula*.
 Hatfield House, Hertfordshire, 7545.
 Hatton House, Midlothian, 7618.
 Hawick nursery, Roxburghshire, 7621.
 Hawkstone Park, Shropshire, 7569.
 Hawkweed, — see *Hieracium*.
 Hawm, or haulm (*healm*, Sax.), the lower part of the straw after the ears are cut off; in gardening, the term is generally applied to leguminous vegetables, after their produce has been gathered.
Haworth, Adrian Hardy, Esq., his writings on gardening, page 1110. A.D. 1794.
 Hawthorn, *mespilus oxyacantha*, — see *Cratægus*.
 Hay, Mr. John, planner of gardens, Edinburgh; an excellent horticulturist, and a good man, 2870.
 Hayes Place, Kent Road, 7537.
Haynes, Thomas, his works on gardening, page 1113. A.D. 1811.
Haywood, Joseph, gent., his writings on gardening, page 1114. A.D. 1818.
 Head, or upper gardener, 7383; who ought to recommend him, 7489.
 Headfort, a seat in Eastmeath, 7661.
 Heading, the growing of the leaves of a plant into a roundish head or loaf, as in the common cabbage; called also cabbaging, or loaving.
 Heart's ease, *viola tricolor*.
 Heartseed, — see *Cardiospermum*.
 Heartsheath Hall, Flintshire, 7606.
 Heat, 1196.
 Heath, — see *Erica*.
 Heathfield, a seat in Kent, 7537.
 Heathfield Park, Sussex, 7531.
 Heaton Hall, Northumberland, 7586.
 Heaton Lodge, Lancashire, 7583.
 Hebeustræta, didyn. angios. and verbenacæ, G. tr. and peren. C. B. S. which thrive in loam and peat, and young cuttings root readily in the same soil under a hand-glass.
 Hedeoma, dian. monog. and labiateæ, H. an. of common culture.
 Hedera, ivy, pentan. monog. and caprifoliæ, a H. tr. Brit. a well-known creeper of easy culture.
 Hedge-hyssop, — see *Gratiola*.
 Hedge-mustard, *sisymbrium officinale*.
 Hedge-nettle, — see *Stachys*.
 Hedges, their formation and management, 6820, 6899.
 Hedsor Lodge, Buckinghamshire, 7547.
 Hedychium, garland-flower, monan. monog. and scitamineæ, S. peren. E. Ind. reedy marsh plants of easy culture.
 Hedyotis, tetran. monog. and rubiaceæ, a S. an. E. Ind. of easy culture.
 Hedyopsis, syngen. polyg. æqual. and cichoracæ, H. an. Eur. and Candia, of common culture.
 Hedyosarum, diadel. decan. and leguminosæ, S. and G. tr. India and Amer. which thrive well in loam and peat, and young cuttings root in sand under a bell-glass.
Heely, Joseph, his works on gardening, page 1108. A.D. 1777.
 Heiligense, a royal seat at Potsdam in Prussia, 210.
 Helenium, syngen. polyg. super. and corymbifereæ, a F. peren. and H. peren. N. Amer. of easy culture.
 Helianthemum, sun-rose, polyan. monog. and cistineæ, F. and H. tr. and H. an. Eur. and Amer. which grow in sandy loam and peat, and root readily by cuttings, or are raised by seeds.
 Helianthus, sun-flower, syngen. polyg. frustan. and corymbifereæ, G. and H. peren. and an. Amer. of easy culture.
 Helianthus tuberosus, the Jerusalem artichoke, 3638.
 Heliconia, pentan. monog. and musacæ, S. peren. Ind. which grow in rich loam kept moist, and are increased by dividing at the root.
 Helicteres, screw-tree, monadelph. dodec. and malvacæ, S. tr. C. B. S. which thrive in loam and peat, and are readily increased by cuttings taken off at a joint, and plunged under a hand-glass in a pot of sand.
 Helicarpus, dodec. dig. and tiliacæ, a G. tr. Vera Cruz, which thrives in loam and peat, and cuttings root in sand under a hand-glass.
 Heliphila, tetradyn. siliq. and crucifereæ, G. tr. which grow in sandy loam, and may be increased by seeds or cuttings under a hand-glass; and H. an. of common culture.
 Heliospis, syngen. polyg. super. and corymbifereæ, a H. peren. N. Amer. of common culture.
 Heliotropium, turnsole, pentan. monog. and boragineæ, S. tr. and bien. and G. tr. Ind. and Amer. which thrive in any rich, light soil, and cuttings will root freely under a hand-glass.
 Helix, the snail, and limax, the slug, to destroy, 2275.
Helbach, J. Ch., his works on gardening, page 1127. A.D. 1809.
 Helleborus, polyan. polyg. and ranunculacæ, H. peren. Eur. of common culture.
 Hellenia, monan. monogyn. and scitamineæ, a S. peren. E. Ind. a marsh plant.
Hellenius, Charles Nicolas, his works on gardening, page 1130. A.D. 1789.
 Helmingham Hall, Suffolk, 7552.
 Helminthia, syngen. polyg. super. and cichoracæ, a H. an. Brit. of easy culture.
 Helonias, hexan. trig. and melanthaceæ, H. peren. N. Amer. which delight in peat soil and a moist situation, and are increased by dividing at the root or by seeds.
 Hemerocallis, day-lily, hexan. monog. and hémérocalleidæ, H. peren. Eur. and China, of easy culture in any soil.
 Hemidesmus, pentan. dig. and asclepiadæ, a S. tr. Ceylon, which delights in light, rich soil, and cuttings root readily under a hand-glass in a pot of sand plunged in a little heat.
 Hemionitis, cryptog. filices and filicæ, S. peren. W. Ind. ferns of common culture.
 Hemlock, — see *Conium*.
 Hemp, — see *Cannabis*.
 Hemp-nettle, — see *Galeopsis*.
Hempel, G. E. L., his work on gardening, page 1127. A.D. 1816.
 Hemstedbury, a seat in Hertfordshire, 7544.

- Henbane, — see Hyoscyamus.
 Henbit, lamium amplexicaule.
 Hendon Place, Middlesex, 7520.
 Henham, a seat in Suffolk, 7552.
 Henlys, a seat in Caermarthenshire, 7614.
 Henne, Sm. D. L., his work on gardening, page 1124.
 A. D. 1771.
 Henriquez, Jean, his work on gardening, page 1119.
 A. D. 1781.
 Hentzner, Peter, a travelling tutor to a German nobleman, who came to England during the reign of Elizabeth, and afterwards published his travels, 323.
 Hepatica, polyan. polyg. and ranunculaceæ, H. peren. Eur. which prefer loam and peat, and are increased by dividing at the root. The roots are very liable to be eaten by snails.
 Heppe, John Christopher, his work on gardening, page 1125. A. D. 178-.
 Heracleum, cow-parsnep, pentan. dig. and umbellifereæ, H. peren. Eur. of common culture.
 Herb-gardens, or physic-gardens, and their management, 7360.
 Herb-gardens in Midlothian, 7618.
 Herb-robert, geranium robertianum.
 Herbage, first used by man as food, 27.
 Herbalists, — see Physic gardeners.
 Herder, a German divine and philosopher who died in the beginning of the present century, page 1. (See *Supp. Encyc. Brit.*)
 Herefordshire, gardens and residences of, 7563.
 Heresbachius, Conradus, his work on gardening, page 1122. A. D. 1578.
 Herissant, Louis Antoine Prosper, his work on gardening, page 1118. A. D. 1771.
 Heritiera, looking-glass plant, monœc. monad. and malpighiaceæ, a S. tr. E. Ind. which grows in loam and peat, and ripened cuttings root readily in a pot of sand plunged under a hand-glass in a moist heat.
 Hermannia, monadel. pentan. and tiliaceæ, G. tr. C. B. S. which grow in rich, light soil, and are increased by cuttings in the same soil under a hand-glass.
 Hernas, polygam. monœc. and umbellifereæ, G. peren. C. B. S. which thrive in any light soil, and are increased by cuttings or dividing at the root.
 Hermes, J. Gf., his works on gardening, page 1126. A. D. 1801.
 Herminium, gynan. monan. and orchideæ, a H. peren. Eng. which thrives best in loam, peat, and chalk in pots, and is increased by seeds.
 Hernandia, Jack in a box, monœc. trian. and laurineæ, a S. tr. W. Ind. which grows freely in sandy loam and peat, and ripened cuttings not deprived of their leaves root readily under a hand-glass in sand.
 Herniaria, rupture-wort. pentan. dig. and amaranthaceæ, a G. and H. tr. Eur. which grow in rich, light soil, and are increased by cuttings under a hand-glass; and H. peren. which grow best in loam and peat, and are increased by cuttings or dividing at the root.
 Heron's bill, — see *Erodium*.
 Herpestis, didyn. angios. and scrophularineæ, a S. peren. and H. peren. India and Amer. which thrive well in rich, light soil, and root freely from cuttings.
 Herrera, Gabriello Alphonso, his work on gardening, page 1131. A. D. 1557.
 Hertfordshire, gardens and residences of, 7543.
 Hervé, Mons. Villé, his works on gardening, page 1120. A. D. 1790.
 Hesperantha, evening flower, trian. monog. and irideæ, G. peren. C. B. S. bulbs which may be treated as *ixiæ*.
 Hesperis, rocket, tetrad. siliq. and crucifereæ, H. peren. bien. and an. Eur. of easy culture.
 Hesperis matronalis, 6456.
 Hesse, Henry, his work on gardening, page 1123. A. D. 1713.
 Heterospermum, syngen. polyg. super. and corymbifereæ, a H. an. New Spain, of common culture.
 Heuchera, pentan. dig. and saxifrageæ, H. peren. N. Amer. which thrive in rich, light soil, and are increased by dividing at the root.
 Heveringham Hall, Suffolk, 7552.
 Hewel Grange, a seat in Worcestershire, 7566.
 Heynea, decan. monog. and meliaceæ, a S. tr. N. Amer. which thrives in loam and peat.
 Heythorpe, a seat in Oxfordshire, 7559.
 Hibbertia, polyan. trig. and magnoliaceæ, G. tr. Austral. which grow in sandy loam and peat, and cuttings root readily in the same soil under a hand-glass.
 Hibiscus, monadel. polyan. and malvaceæ, S. tr. and G. peren. India, C. B. S. which thrive in rich, light soil, and ripen seeds, or root readily by cuttings in sand under a hand-glass.
 Hibiscus esculentus, 6035.
 Hibern, John Christian, his work on gardening, page 1123. A. D. 1671.
 Hieracium, hawkweed, syngen. polyg. æqual. and cichoraceæ, H. peren. and an. Eur. and Amer. of the easiest culture.
 High Clere, a seat in Hampshire, 7594.
 High Meadow, Gloucestershire, 7565.
 Highnam Court, Gloucestershire, 7565.
 Hill, Daniel, M. D., his work on vegetable physiology, page 1112. A. D. 1800.

 Hill, Sir John, M. D., his work on gardening, page 1104. A. D. 1755.
 Hill, Hyll, or Hyle, Thomas, his work on gardening, page 1099. A. D. 1574.
 Hill Hall, Essex, 7542.
 Hill Park, Kent, 7537.
 Hilla, hexan. monog. and rubiaceæ, S. tr. W. Ind. which grow in sandy loam and peat, and cuttings root in sand under a hand-glass.
 Hillington Park, Norfolk, 7554.
 Hillsborough Castle, a seat in Down, 7683.
 Hiltbrandt, Ant., his work on gardening, page 1124. A. D. 1777.
 Hinuber, gardens of, in Hanover, 204.
 Hip, the common name of the fruit of the rose tribe.
 Hippiæ, syngen. polyg. necess. and corymbifereæ, S. an. and G. tr. C. B. S. and E. Ind. which grow freely in any light soil, and cuttings planted under a hand-glass will root readily.
 Hippocrateæ, trian. monog. and acereæ, a S. tr. S. Amer. which grows well in loam and peat, and cuttings root under a hand glass in sand.
 Hippocrepis, horseshoe-vetch, diadel. decan. and leguminosæ, a G. tr. Minorca, which thrives in loam and peat, and cuttings root readily under a hand-glass; and a H. peren. and an. Europe, of common culture.
 Hippomane, manchineel, monœc. monadel. and euphorbiaceæ, a S. tr. W. Ind. a powerful poison which grows in sandy loam, and cuttings root in sand under a hand-glass.
 Hippophaë, sea buckthorn, dicec. tetran. and elæagneæ, H. tr. Eur. and Amer. which grow in any common soil, and are increased by layers or cuttings of the roots.
 Hippuris, mare's tail, dian. monog. and naiadeæ, a H. peren. Brit. an aquatic.
 Hirschfeldt, or Hirschfield, Ch. Caius L., his works on gardening, page 1124. A. D. 1773.
 Hirtella, pentan. monog. and rosaceæ, a S. tr. W. Ind. which grows in loam and peat, and cuttings root in sand under a hand-glass.
 Hitt, Thomas, his works on gardening, page 1105. A. D. 1755.
 Hoe, different sorts of, 1310.
 Hoëing, 1873.
 Hoffmannseggia, decan. monog. and leguminosæ, a S. tr. Chili; which grows in loam and peat, and cuttings, not too ripe, will root under a hand-glass in sand.
 Hofland, Mrs., her writings on gardening, page 1114. A. D. 1820.
 Hofwyl, an agricultural establishment near Berné in Switzerland, 1034.
 Hog-plum, — see *Spondias*.
 Hog-weed, — see *Boerhaavia*.
 Holcus, soft grass, polyg. monœc. and gramineæ, H. peren. and an. Eur. and Amer. grasses of easy culture.
 Holinshead, Ralph, an English historian, who died about 1580, 420.
 Holkham Hall, Norfolk, 7555.
 Holland House, Middlesex, 7522.
 Holly, — see *Ilex*.
 Hollyhock, — see *Althæa*.
 Holm Lacey, a seat in Herefordshire, 7568.
 Holme, a seat in Yorkshire, 7582.
 Holosteum, tetran. trig. and caryophylleæ, a H. an. Eng. of common culture.
 Holwood House, Kent, 7537.

- Hurstbourne Park, Hampshire, 7594.
- Hutchinsia, tetrad. silic. and crucifereæ, H. peren. and a bien. Eur. rock-work plants which grow in loam and peat, and root freely.
- Huthem, —, his works on gardening, page 1129. A. D. 1817.
- Huts, as garden buildings, 1781.
- Hyacinth, — see *Hyacinthus*.

- Hyacinthus*, hyacinth, hexan. monog. and asphodeleæ, H. peren. Eur. bulbs of easy culture.
- Hyacinthus orientalis*, 6222.
- Hyæna* poison, hyænanche globosa.
- Hyænanche*, diœc. deced. and hydrocharideæ, a G. tr. C.B.S. which grows in loam and peat, and may be increased by cuttings in sand under a bell-glass.
- Hyde Hall, Cheshire, 7590.
- Hyde Park, London, 7517.
- Hydrangea*, decan. dig. and saxifrageæ, F. and H. tr. Amer. and China, which grow in common soil, and ripened cuttings root readily.
- Hydrangea hortensis*, 6176.
- Hydrastis*, polyan. polyg. and ranunculaceæ, a H. peren. Canada, which grows best in light soil in rather a moist situation, and is increased by tubers of the roots.
- Hydrocharis*, frog-bit, diœc. enneandr. and hydrocharideæ, a H. peren. Brit. an aquatic.
- Hydrocotyle*, pennywort, pentan. dig. and umbellifereæ, G. and H. peren. Eur. Amer. and C. B. S. which grow best in peat soil kept moist, and are increased by division at the root.
- Hydrolea*, pentand. digyn. and convolvulaceæ, a S. tr. S. Amer. which thrives best in loam and peat, and cuttings root in sand under a hand-glass.
- Hydropeltis*, polyan. polyg. and ranunculaceæ, N. Amer. a peren. will grow in loamy soil, or may be treated as an aquatic.
- Hydrophyllum*, water-leaf, pentan. monog. and boraginææ, H. peren. Amer. which grow freely in any light, rich soil, and are increased by suckers from the roots.
- Hydrophyllum virginicum*, or Shawanese salad, 4381.
- Hydrostatic press, its use in gardening, 1470.
- Hygrometer, its use in gardening, 1285.
- Hymenæa*, decan. monog. and leguminosæ, S. tr. E. Ind. which grow freely in loam and peat, and cuttings root in sand under a hand-glass in heat.
- Hymenopappus*, syngen. polyg. æqual. and corymbifereæ, a F. bien. Louisiana, of common culture.
- Hymenophyllum*, filmy leaf, cryptog. filices and filiceæ, a H. peren. Eng. a fern, which grows best in small pots in loam and peat.
- Hycosamus*, henbane, pentan. monog. and solanææ, G. tr. peren. and bien. Eur. which grow in loam and peat, and cuttings root without being covered by a glass; the H. peren. and an. are of common culture.
- Hyoseris*, swine's succory, syngen. polyg. æqual. and cichoraceæ, H. peren. and an. Eur. of common culture.
- Hypecoum*, tetran. dig. and papaveraceæ, a H. bien. and an. Eur. of easy culture.
- Hyperanthera*, horseradish-tree, decan. monog. and leguminosæ, a S. tr. E. Ind. which thrives in light loam, and cuttings root under a hand-glass in sand.
- Hypericum*, St. John's wort, polyad. polyan. and hypericineæ, G. tr. Eur. and Amer. which grow in loam and peat, and young cuttings root freely under a bell-glass in sand; the H. tr. and peren. are of easy culture; some are increased by cuttings under a hand-glass, and others by division at the root.
- Hypochæris*, cat's ear, syngen. polyg. æqual. and cichoraceæ, H. peren. and an. Eur. of easy culture.
- Hypochæris maculata*, 4295.
- Hypoxis*, hexan. monog. and asphodeleæ, G. and H. peren. Amer. and C. B. S. which grow in loam and peat, and are increased by offsets from the roots.
- Hyptis*, didyn. gymnos. and labiateæ, S. and G. tr. bien. and peren. Ind. and America, which grow freely in rich, light soil, and the hot-house sorts are increased by cuttings under a hand-glass in heat.
- Hyssop*, — see *Hyssopus*.
- Hyssopus*, didyn. gymnos. and labiateæ, H. tr. and peren. Eur. and N. Amer. of easy culture.
- Hyssopus officinalis*, the common hyssop, 4321.
- I.
- Iberis*, candy-tuft, tetrad. silic. and crucifereæ, G. and F. tr. Eur. which grow in common soil, and are readily propagated by cuttings; and H. peren. and an. of easy culture.
- Ice-house*, its construction, 1728; management, 1730.
- Ice-plant*, mesembryanthemum crystallinum.
- Ichneumon* manifestator, 2261. and 3593.
- Ichnocarpus*, pentan. monog. and apocynææ, a S. tr. E. Ind. which thrives well in loam and peat, and cuttings root freely in sand under a hand-glass.
- ICKWORTH Park, Suffolk, 7552.
- Icolmkill*, in the Hebrides, early improvements there, 352.
- Idæphonso*, near Madrid, gardens of, 294.
- Ilex*, holly, tetran. tetrag. and rhamnææ, G. and F. tr. Eur. and Amer. which thrive well in loam and peat, and ripened cuttings root freely under a hand-glass in sand; the commoner H. tr. are increased by seed, and the finer sorts by grafting and budding.
- Ilex aquifolium*, the common holly, 7115.
- Illecebrum*, knot-grass, pentan. monog. and amarantaceæ, a H. peren. Eng. a rock plant which grows best in pots in light soil, and seeds ripen abundantly.
- Illicium*, aniseed-tree, polyan. polyg. and magnoliaceæ, a F. tr. Florida, which grows best in light loam, and is increased by layers, or ripened cuttings in sand under a hand-glass.
- Impatiens*, balsam, pentan. monog. and geraniaceæ, H. bien. S. an. Ind. Amer. Eng. of easy culture in rich soil.
- Impatiens balsamina*, the garden balsam, 6479.
- Imperatoria*, masterwort, pentan. dig. and umbellifereæ, a H. peren. Scot. of easy culture.
- Implements*, origin of, 31.
- Implements of gardening*, 1294; tools, 1295; the pick, lever, spade, fork, shovel, dibber, forester's dibber, planter's back, planter's trowel, planter's pick-axe, garden trowel, transplanter, draw-hoe, prong-hoe, thrust-hoe, rake, drill-rake, hoe-rake, turfing-iron, turf-raser, turf-beetle, turf-scraper, wire-broom, dock-weeder, besom, wire-besom, implement cleaner, 1296. to 1323.
- Implements used in gardening*, their further improvement, 1847.
- Improvement*, forming a plan of, 7364.
- Improvement*, rural, — see *Landscape-gardening*.
- Improver*, rural, — see *Landscape-gardener*.
- Inarching*, 2007.
- Indian corn*, — see *Zea*.
- Indian cress*, — see *Tropeolum*.
- Indian cucumber*, medeola virginica.
- Indian fig*, cactus opuntia.
- Indian millet*, sorghum vulgare.
- Indian shot*, canna indica.
- Indigo*, — see *Indigofera*.
- Indigofera*, indigo, diadel. decan. and leguminosæ, S. tr. bien. and an. Ind. and C. B. S. which grow in loam and peat, and cuttings root readily in young wood under a bell-glass in sand; the H. an. are of easy culture.
- Inga*, polyg. monœc. and leguminosæ, S. tr. E. and W. Ind. which grow in loam and peat, and cuttings root in sand in bottom heat under a bell-glass.
- Ingatstone Hall*, Essex, 7542.
- Ingestree Hall*, Staffordshire, 7570.
- Inocarpus*, Otaheite chestnut, decan. monog. and sapoteæ, a S. tr. South Sea Islands, which thrives well in loam and peat, and ripened cuttings will root in sand under a hand-glass.
- Inoculating*, 2050.
- Inscriptions*, their use and abuse in gardening, 1845.
- Insects*, the common injurious sorts described, 2220; subduing them, 2276. The insects which infest particular plants, and the mode of extirpation, &c. are treated of in giving the culture and management of the plant, or the department in the garden to which it belongs.
- Instruments of action*, 1361; garden-line, ground-measurer, timber-measurer, ground-compasses, boring-piece, levels, adjusting horizontal level, spirit-level, staff, straight-edge, stake, 1362. to 1374. — see *Machines and Utensils*.
- Instruments of designation*, 1375; designators or naming instruments, common tally (*tallier*, Fr. to cut) or number-stick, botanic tally, written name-stick, permanent label, temporary label, 1376. to 1388.
- Instruments of operation*, 1325; common garden-knife, common pruning-knife, folding pruning-knife, grafting-knife, budding-knife, asparagus-knife, grafting-chisel, forest-chisel, pruning-bill, forest-axe, pruning-saw, averruncator (*averrunco*,

- to cut or prune), French pruning-shears, hedge-shears, verge-shears, turf-shears, scythe, garden-scarifiers or bark-scalers, moss-scraper, blunt knife, forest barking-irons, garden-hammer, garden-pincers, weeding-pincers, grape-gatherer, peach-gatherer, pear-gatherer, berry-gatherer, apple-gatherer, seed and cherry gatherer, climbing-spur, 1326, to 1359.
- Inula*, syngen. polyg. super. and corymbifereæ, S. an. and H. peren. Eur. and Asia, of the easiest culture.
- Inula crithmifolia*, samphire, 4281.
- Inula helenium*, elecampane, 4240.
- Inverary Castle, Argyleshire, 7649.
- Invercauld House, Aberdeenshire, 7639.
- Invergordon Castle, Ross-shire, 7647.
- Inverness nursery, 7648.
- Inverness-shire, gardens of, 7648.
- Ionidium*, pentan. monog. and violacæ, a G. peren. S. Amer. which grows freely in loam and peat, and young cuttings root readily under a hand-glass.
- Ipomœa*, pentan. monog. and convolvulacæ, S. peren. bien. and an. Ind. Amer. Eur. twiners which grow in rich light soil, and young cuttings root freely in sand under a hand glass; the H. peren. and an. are of the easiest culture.
- Ipomopsis*, pentan. monog. and polemoniaceæ, a G. bien. and H. an. N. Amer. of common culture.
- Ireland, gardens and residences of, 7651.
- Iresine*, diœc. pentan. and amaranthacæ, a F. peren. Amer. which grows in loam and peat, and is increased by dividing at the root.
- Iris*, trian. monog. and irideæ, G. and H. peren. Eur. As. and Amer. of easy culture in loam and peat, and increased by dividing at the root; some of them may be treated as marsh plants.
- Iris persica*, tuberosa, susiana, xiphium, &c. 6304.
- Iron-tree, siderodendrum triflorum.
- Iron-wort, — see *Sideritis*.
- Irrigation, 1098.
- Isatis*, woad, tetrad. silic. and cruciferæ, a H. peren. bien. and an. Eur. of easy culture.
- Ischæmum*, polyg. monœc. and gramineæ, a S. peren. and an. E. Ind. grasses of common culture.
- Isle of Anglesea, gardens and residences of, 7603.
- Isle of Man, as to gardening, 7588.
- Isles of Jersey and Guernsey, as to gardening, 7598.
- Isnardia*, tetran. monog. and onagrææ, a H. an. Eur. of common culture.
- Isophilus*, gynan. monan. and orchideæ, S. peren. W. Ind. parasites which may be treated as acridæ, epidendrum, &c.
- oetis*, quillwort, cryptog. hydrop. and marsiliacæ, a H. peren. Brit. a marsh plant.
- Isola bella*, gardens of, 82.
- Isolepis*, trian. monog. and cyperacæ, a H. peren. and an. Brit. grasses of common culture.
- Isopogon*, tetran. monog. and proteacæ, G. tr. N. Holl. which grow in loam, peat, and sand well drained, and ripened cuttings root under a hand-glass, care being had to take off the glass occasionally to avoid damps.
- Isopyrum*, polyan. polyg. and ranunculacæ, a H. peren. and an. Eur. of easy culture.
- Italian books on gardening, 7694.
- Itea*, pentan. monog. and saxifragæ, a H. tr. N. Amer. which thrives well in sandy loam, and is increased by layers.
- Iva*, syngen. polyg. necess. and corymbifereæ, a S. an. and H. tr. Amer. both of common culture.
- Ivy, — see *Hedera*.
- Ixia*, trian. monog. and irideæ, G. peren. C. B. S. bulbs which grow best in sandy loam and decayed leaves or peat, and require no water after they have done flowering: they will do well in beds in the open garden treated in the same manner as ranunculus, guarding against frost and heavy rains, — see 6319.
- Ixodia*, syngen. polyg. æqual. and corymbifereæ, a G. tr. N. Holl. which thrives best in sandy loam and peat, and young cuttings root freely in the same kind of soil under a hand-glass.
- Ixora*, tetran. monog. and rubiacæ, S. tr. E. Ind. and China, of great beauty, which thrive well in loam and peat, and cuttings root freely in sand under a hand-glass.
- J. or Jus., A. L. de Jussieu's Genera Plantarum.

 Leith walk nursery, 7618.
 Leitrim, county of, as to gardening, 7674.
 Leland, John, an English antiquary, who died
 about 1552.
 Lemaître, M. —, curate of Joinville, a French
 author on gardening, page 1117. A.D. 1719.
 Lemaire, Fr. —, a French author on gardening,
 page 1116. A.D. 17 —.
 Lemna, duck-weed, monœc. dian. and naiadeæ, H.
 an. Brit. aquatics which may be treated as calli-
 triche.
 Lemoine, Leonor, his work on gardening, page 1120.
 A.D. 1801.
 Lemon, — see Citrus.
 Lemon-grass, and odopogon schœnanthus.
 Lentil, ervum lens.
 Leonharde, F. G. and J. H. Seidel, their work on
 gardening, page 1126. A.D. 1803.
 Leonotis, lion's tail, didyn. gymnos. and labiateæ,
 G. tr. and a S. an. E. Ind. and C. B. S. which
 thrive in light rich soil, and young cuttings root
 readily under a hand-glass.
 Leontice, hexan. monog. and berberideæ, a G. and
 H. peren. Levant; which grow freely in loam
 and peat, and may be increased by dividing at the
 root or by seeds.
 Leontodon, dandelion, syngen. polyg. æqual. and
 cichoraceæ, H. peren. Eur. of easy culture.
 Leontodon taraxacum, the common dandelion,
 3994.
 Leonurus, motherwort, didyn. gymnos. and labia-
 teæ, H. peren. bien. and an. Eur. of common
 culture.
 Leopard's bane, — see Doronicum.
 Lepchinia, didyn. gymnos. and labiateæ, a H.
 peren. Mexico; of common culture.
 Lepidium, pepperwort, tetrad. silic. and crucifereæ,
 G. and E. tr. and H. an. Eur. and Amer. of com-
 mon culture.
 Leptanthus, trian. monog. and a H.
 peren. N. Amer. which thrives in peat soil, and
 is increased by offsets from the roots.
 Leptospermum, icosan. monog. and myrteaceæ, G.
 tr. Austral. which grow well in an equal mixture
 of sandy loam and peat, and young cuttings root
 readily in sand under a bell-glass.
 Leschevin, C. —, his works on gardening, page
 1121. A.D. 1805.
 Lessertia, diadel. decan. and leguminosæ, a G.
 peren. and an. C. B. S. which grow in sandy loam
 and peat, and are readily increased by cuttings or
 seeds.
 Lestibudesia, pentan. monog. and amaranthaceæ, a
 S. tr. and bien. W. Ind. which grows freely in
 light, rich soil, and is readily increased by cuttings
 or seeds.
 Lettson, John Coakley, M.D. F.R.S. his work on
 gardening, page 1109. A.D. 1781.
 Lettuce, 3964. — see Lactuca.
 Leucadendron, diœc. tetran. and proteaceæ, G. tr.
 C. B. S. which grow best in light loam mixed
 with more than one third sand, the pots well
 drained, and over watering avoided. Ripened
 cuttings, taken off early in spring at a joint, root
 in sand under a hand-glass.
 Leucas, didyn. gymnos. and labiateæ, S. an. Ind. of
 common culture.
 Leucojum, snow-flake, hexan. monog. and amaryl-
 lideæ, H. peren. Eur. bulbs of easy culture.
 Leucopogon, pentan. monog. and epacrideæ, G. tr.
 N. S. W. which thrive in sandy loam and peat,
 and the tops of the very young shoots taken off
 for cuttings, will root in sand under a bell-glass.
 Leucospermum, tetran. monog. and proteaceæ, G.
 tr. which may be treated as leucadendron.
 Level, different kinds of, 1368.
 Levelling, 1931.
 Lever, its form and uses in gardening, 1297.
 Lewisham nursery, 7536.
 Leysera, syngen. polyg. super. and corymbifereæ,
 G. tr. C. B. S. which grow freely in peat soil with
 a little loam, and cuttings planted under a hand-
 glass in the same kind of soil will root freely.
 Lèzay de Marnesia, his works on gardening, page
 1119. A.D. 1787.
 Liancourt, Count de, his palace and gardens, 161.
 Liatrias, syngen. polyg. æqual. and corymbifereæ, a
 G. and H. peren. N. Amer. which grow freely in
 rich, light soil, and may be increased by seed or
 dividing at the root.
 Licorice, — see Glycyrrhiza.
 Licuala, hexan. monog. and palmeæ, a S. tr. E. Ind.
 a palm which may be treated like latonia.
 Lidbeckia, syngen. polyg. super. and corymbifereæ,
 a G. tr. C. B. S. which grows freely in loam and
 peat, and cuttings root readily in the same soil
 under a hand-glass.
 Liebauld, Stephen, his works on gardening, page
 1115. A.D. 1570.
 Liger, Louis, a French author on gardening, page
 1116. A.D. 1703.
 Light, the importance of, to vegetables, 1594.
 Lightfootia, bell-flower, pentan. monog. and cam-
 panulaceæ, a G. tr. and peren. Eur. and C. B. S.
 which grow freely in loam and peat, and cuttings
 root readily in the same soil under a hand-glass.
 Lightoler, J. —, his works on gardening, page 1107.
 A.D. 1766.
 Ligne, Prince de, a German soldier and statesman
 of great personal acquirements, and a favorite at
 most of the courts of Europe. He published
 fourteen volumes on miscellaneous subjects,
 among which are various remarks on gardens,
 and especially on those of England. He flourished
 during the reigns of Frederick the Great of
 Prussia and Catharine II. of Russia, and died at
 an advanced age at Vienna, in 1814.
 Lignum vitæ tree, guaiacum officinale.
 Ligusticum, lovage, pentan. dig. and umbellifereæ,
 H. peren. Eur. and a bien. of common culture.
 Ligustrum, privet, dian. monog. and oleineæ, H. tr.
 Brit. and China, of the easiest culture, and in-
 creased by cuttings or seeds.
 Lilac, — see Syringa.
 Lilium, lily, hexan. monog. and liliaceæ, H. peren.
 Eur. Amer. and India, bulbs, highly esteemed as
 border-flowers, 6311.
 Lily, — see Lilium.
 Lily of the valley, — see Convallaria.
 Lily-pink, aphyllanthes monspeliensis.
 Lily-thorn, — see Catesbæa.
 Limax, the slug, and helix, the snail, to destroy,
 2275.
 Lime-tree, — see Tilia.
 Limerick, gardens of, 7663.
 Limeum, heptan. dig. and portulacæ, a G. peren.
 which grows in sandy loam and peat, and cuttings
 under a hand-glass root readily.
 Linnetis, trian. monog. and gramineæ, H. peren.
 Eur. and Amer. grasses of easy culture.
 Limodorum, gynan. monan. and orchideæ, a G.
 peren. Japan, which thrives best in loam and
 peat and some bits of sticks and stones mixed with
 it, and is increased by dividing at the root.
 Limonia, decan. monog. and auranteæ, S. tr. India
 and China, which grow in loam and peat with
 some rotten dung; ripened cuttings root in sand
 under a hand-glass in a moist heat.
 Limosella, mudwort, didyn. angios. and scrophu-
 larineæ, a H. an. Brit. a marsh plant of easy
 culture.
 Linaria, toad-flax, didyn. angios. and scrophu-
 larineæ, F. and H. peren. and an. Eur. and Amer.
 which grow freely in common soil, and the
 more delicate kinds root readily by cutting
 under a hand-glass.

- Mansion-residences*, 7271; their management, 7443.
- Manulea*, didyn. angios. and scrophularinææ, G. tr. bien. and an. C.B.S. which grow in light, rich soil, and are readily increased by young cuttings planted under a hand-glass.
- Manures*, 1111; of animal and vegetable origin, 1112; theory of their operations, from land plants, sea weeds, dry straw, inert peaty matter, wood-ashes, animal substances, bones, blood, urine, night-soil, dung of fowls, of cattle, preservation of manures of animal and vegetable origin, 1113, to 1162.
- Manures of mineral origin*, 1163; theory of their operation, different species, lime, chalk, marl, magnesla, gypsum, application of mineral manures, 1164, to 1194.
- Maple-tree*, — see *Acer*.
- Maranta*, arrow-root, monan. monog. and cannaæ, S. peren. S. Amer. which thrive in light, rich soil, and are increased by dividing at the root.
- Marattia*, cryptog. poropterides and filiceæ, a S. peren. Jamaica, a fern of common culture.
- Marble Hill*, a seat in Middlesex, 7520.
- Marble Hill Cottage*, Middlesex, 7520.
- Maregravia*, polyan. monog. and caparideæ, a S. tr. W. Ind. which grows in loam and peat, and roots by cuttings.
- Marchant*, —, a French author on gardening, page 1116. A. D. 1701.
- Marechal*, Pierre Sylvain, his works on gardening, page 1119. A. D. 1780.
- Mare's tail*, — see *Hippuris*.

- Marginal banks of water, how to improve, 722.
 Margram, a seat in Glamorganshire, 7608.
 Marica, trian. monog. and iridæ, S. tr. and peren. S. Amer. which grow in loam and peat, and are increased by offsets from the roots or seeds.
 Marigold, — see Calendula.
 Marino, a seat near Dublin, 7653.
 Mariscus, trian. monog. and cyperaceæ, S. peren. E. Ind. mosses of easy culture.
 Marjoram, — see Origanum.
 Market for seeds in Mark Lane, 7515.
 Market for vegetables and fruits in Covent-garden, &c. 7514.
 Market-gardeners, 7396.
 Market-gardens, their formation, 7358; management, 7457; market-gardens of Middlesex, 7517.
 Markham, Gervase, his work on gardening, page 1099. A. D. 1623.
 Marrubium, horehound, didyn. gymnos. and labiateæ, G. tr. and H. peren. Eur. and C. B. S. of easy culture.
 Marsden Park, Essex, 7541.
 Marsden Park, Surrey, 7528.
 Marsdenia, pentan. dig. and asclepiadææ, a S. and G. tr. Syria and N. S. W. which thrive in loam and peat, and cuttings root freely in sand under a hand-glass.
 Marsh-mallow, — see Althæa.
 Marsh-marigold, — see Caltha.
 Marsh plants, table of, 6522.
 Marshal, Humphrey, his work on gardening, page 1131. A. D. 1785.
 Marshal, the Rev. Charles, his work on gardening, page 1112. A. D. 1796.
 Marshal, William, Esq., his works on gardening, page 1109. A. D. 1785.
 Marshallia, syngen. polyg. æqual. and corymbifereæ, F. peren. Carol. which grow in loam and peat, and are increased by cuttings or dividing at the root.
 Marsham, Robert, Esq. F.R.S., his writings on gardening, page 1105. A. D. 1758.
 Martagon, — see Fritillaria.
 Marton, — see Lilium.
 Martyn, Thomas, B.D. F.R.S. his works on gardening, page 1110. A. D. 1792.
 Martynia, didyn. angios. and bignoniaceæ, S. and G. an. Amer. of easy culture.
 Marvel of Peru, — see Mirabilis.
 Mary-le-bonne nursery, 7518.
 Mason, George, Esq., his work on gardening, page 1107. A. D. 1763.
 Mason, the Rev. William, the poet, his works on gardening, page 1108. A. D. 1772.
 Masse, Jean, his works on gardening, page 1118. A. D. 1766.
 Masson de Blamont, C. F. P., his work on gardening, page 1119. A. D. 1790.
 Massonia, hexan. monog. and asphodeleæ, G. peren. C. B. S. bulbs which grow in loam and peat with little water, and are increased by offsets or by seeds.
 Masterwort, — see Imperatoria.
 Mastick-tree, pistacia lentiscus.
 Mat-grass, — see Nardus.
 Materials of landscape-gardening, their union in forming the constituent scenes of a country-residence, 7248.
 Mathiola, stock, tetrand. siliq. and crucifereæ, G. tr. and bien. and H. an. Eur. of easy culture, and increased by cuttings and seeds.
 Matricaria, syngen. polyg. super. and corymbifereæ, a G. bien. and H. an. Eur. and C. B. S. of easy culture.
 Mattisfont House, Hampshire, 7594.
 Maupin, —, his works on gardening, page 1118. A. D. 1763.
 Maurandia, didyn. angios. and scrophularineæ, G. tr. Mex. climbers which thrive in any light, rich soil, and are increased by seeds or young cuttings under a hand-glass.
 Maurice, the Rev. Thomas, M.A. his works on gardening, page 1108. A. D. 1777.
 Mawe, Thomas, as an author on gardening, page 1107. A. D. 1767.
 May apple, — see Podophyllum.

 Mayer, J. F., his works on gardening, page 1124. A. D. 1778.
 Mayer, J. Jac., his works on gardening, page 1125. A. D. 1793.
 Mayer, or Meyer, John, his work on gardening, page 1124. A. D. 1776.
 Mayo, county of, as to gardening, 7673.
 Maze, — see Labyrinth.
 Mazus, didyn. angios. and scrophularineæ, F. an. China, of common culture, 1664.
 Meader, James, his works on gardening, page 1108. A. D. 1771.
 Meadow-grass, — see Poa.
 Meadow Promenade, Edinburgh, 7313.
 Meadow-rue — see Thalictrum.
 Meadow-saxifrage, — see Seseli.
 Meager, Leonard, his works on gardening, page 1101. A. D. 1682.
 Medeola, hexan. trig. and smilacææ, a H. peren. Virginia, which succeeds best in light soil, and is increased by dividing the root.
 Medhurst, his weighing-machine, preferable for the gardener's seed and fruit room, 1702.
 Medicago, medick, diadel. decan. and leguminosææ, F. and H. tr. and H. peren. Eur. all of easy culture, in light soil.
 Medick, — see Medicago.
 Medikus, Frederick Casimir, his work on gardening, page 1124. A. D. 1782.
 Medlar, — see Mespilus.
 Meend Park, Herefordshire, 7568.
 Melaleuca, polyad. icos. and myrtaceæ, S. and G. tr. Austral. which grow in sandy loam and peat, and ripened cuttings not too old will root in sandy loam under a bell-glass.
 Melampodium, syngen. polyg. nesses. and corymbifereæ, H. an. W. Ind. of common culture.
 Melampyrum, cow-wheat, didyn. angios. and scrophularineæ, H. an. Eng. of common culture.
 Melanthera, syngen. polyg. æqual. and corymbifereæ, a S. bien. and G. peren. Amer. which thrive well in loam and peat, and cuttings root freely under a hand-glass.
 Melanthium, hexan. trig. and melanthaceæ, G. peren. C. B. S. bulbs which may be treated like ixia.
 Melasphæula, triand. monogyn. and iridææ, a G. peren. C.B.S. a bulb which may be treated as ixia.
 Melastoma, decan. monog. and melastomeæ, S. tr. which thrive in loam and peat, require little water in winter, and young cuttings root readily under a hand-glass in moist heat.
 Melburn, a seat in Yorkshire, 7582.
 Melchett Park, Wiltshire, 7596.
 Melhania, monadel. pentand. and malvaceæ, S. tr. St. Helena, which grow freely in sandy loam and cuttings root in sand under a bell-glass.
 Melia, bead-tree, decan. monog. and meliaceæ, a S. tr. and G. tr. E. and W. Ind. and Syria, which grow in loam and peat, and cuttings root under a hand-glass in sand.
 Melianthus, honey-flower, didyn. angios. and rutaceæ, G. tr. which thrive in rich, light soil, and cuttings planted under a hand-glass will root freely.
 Melic-grass, — see Melica.
 Melica, melic grass, trian. dig. and graminææ, H. peren. Eur. and Amer. grasses of easy culture.
 Melicocca, honey-berry, octan. monog. and sapindææ, a S. tr. Jam. which thrives best in light loam, and cuttings root in sand under a hand-glass in heat.
 Melilot, trifolium melilot.
 Melilotus, melilot, diadel. decan. and leguminosææ, H. bien. and an. Eur. of easy culture, and increased by seed.
 Melimala (from *mel*, honey, and *malum*, an apple), sweet apples, 52.
 Melissa, balm, didyn. gymnos. and labiateæ, a H. peren. S. Eur. 4253.
 Melittis, bastard-balm, didyn. gymnos. and labiateæ, a H. peren. Eur. of easy culture, 4449.
 Melochia, monad. pentan. and malvaceæ, S. tr. and an. W. and E. Ind. which grow in light loam, and cuttings root under a hand-glass in heat.
 Melodinus, pentan. dig. and apocynææ, a S. tr. N. Caledonia, a climber which grows freely in loam and peat, and cuttings root readily in sand under a bell-glass.
 Melon, — see Cucumis.
 Melon-pit, at Edmonstone, 2685.
 Melon-pit, Knight's, 2684.
 Melonry, 2479.
 Melothria, trian. monog. and cucurbitaceæ, a H. an. Amer. of common culture.
 Melton on the Hill, Yorkshire, 7582.
 Melville Castle, Midlothian, 7618.
 Mem. Caled. Hort. Soc., Memoirs of the Caledonian Horticultural Society, page 1113. A. D. 1810.

- Memecylon*, octan. monog. and santalaceæ, a S. tr. E. Ind. which grows in sandy loam and peat, and young cuttings in sand under a hand-glass root freely.
- Menabilly*, a seat in Cornwall, 7601.
- Menageries of the Paris garden*, 7333.
- Meniscium*, cryptog. filices, a S. peren. Martinico, a fern of common culture.
- Menispermum*, moon-seed, monœc. dodec. and menispermæ, a H. tr. N. Amer. which thrives in loam and peat, and cuttings root readily under a hand-glass.
- Mentha*, mint, didyn. gymnos. and labiateæ, a S. peren. and H. peren. Eur. and Asia, of the easiest culture.
- Mentha piperita*, the peppermint, *M. viridis*, the spearmint, and *M. pulegium*, the penny-royal, 4149.
- Mentzelia*, polyan. monog. and looseæ, a S. an. and G. peren. Amer. which grow readily in loam and peat, and cuttings root in sand under a hand-glass.
- Menyanthes*, buckbean, pentan. monog. and gentianeæ, a H. peren. Brit. a marsh plant.
- Menziesia*, octand. digyn. and rhodorceæ, H. tr. Eur. and Amer. which thrive in peat soil, and are propagated by layers.
- Mercurialis*, diœc. ennean. and euphorbiaceæ, H. peren. and an. Eur. of the easiest culture.
- Mercury*, — see *Mercurialis*.
- Merevale*, a seat in Warwickshire, 7571.
- Merionethshire*, gardens and residences of, 7612.
- Merlet*, Jean, a French author on gardening, page 1116. A. D. 1675.
- Merulius destruens*, a fungus commonly called the dry rot, — to guard against in timber, 6956.
- Merville*, a seat near Dublin, 7653.
- Mesembryanthemum*, fig-marigold, icos. di-pentag. and ficoideæ, G. tr. peren. and an. C. B. S. and Austral. succulents of easy culture in loam and lime-rubbish, and the annual species in rather richer soil, 6657.
- Mespilus*, icos. di-pentag. and rosaceæ, G. and H. tr. Amer. and Eur. which grow in any common soil, and are increased by seeds or by budding on the common thorn, *M. oxyacantha*.
- Mespilus oxyacantha*, the hawthorn, 7120.
- Mespilus germanica*, the medlar, 4465.
- Mespilus japonica*, the loquat-apple, 5994.
- Metrosideros*, icos. monog. and myrteaceæ, G. tr. which grow in loam and peat, and ripened cuttings may be rooted, but not without difficulty, in sand under a bell-glass.
- Meum*, bawd-money, pentan. dig. and umbellifereæ, H. peren. and bien. Eur. of common culture.
- Meursius*, John, his work on gardening, page 1129. A. D. 1613.

- Milleria*, syngen. polyg. necess. and corymbifereæ, S. an. S. Amer. of common culture.
- Millet-grass*, — see *Milium*.
- Milton Abbey*, Dorsetshire, 7598.
- Mimetes*, tetran. monog. and proteaceæ, G. tr. C. B. S. which thrive in two thirds loam and one third sand, with the pots well drained; ripened cuttings root in sand under a hand-glass, care being taken to prevent damping off.
- Mimosa*, polyg. monœc. and leguminosæ, S. tr. bien. and an. E. and W. Ind. which thrive well in loam and peat, and cuttings of such sorts as do not ripen seed will root, if planted young, in sand under a bell-glass.
- Mimulus*, monkey-flower, didyn. angios. and scrophularineæ, a G. tr. G. and F. and H. peren. Amer. which thrive in common soil; the woody species is increased by cuttings, and the others by dividing at the root, or by seeds.
- Mimusops*, octan. monog. and sapoteæ, S. tr. F. Ind. which grow in loam and peat, and ripened cuttings root readily in sand under a hand-glass.
- Mint*, — see *Mentha*.
- Minto House*, Roxburghshire, 7621.
- Minuartia*, trian. trig. and caryophyllææ, H. an. Spain, of common culture.
- Mirabilis*, marvel of Peru, pentan. monog. and nyc-tagineæ, G. peren. India, which grow in light rich soil, and will flower well in the open air in summer; but their roots, which are fusiform, must be taken up and replanted next year: they are readily increased by seeds, and are generally treated as half-hardy annuals.
- Mirbel*, C. F. Briseau, a celebrated French author on vegetable physiology, 549.
- Mirbella*, decan. monog. and leguminosæ, G. tr. Austral. which grow in loam and peat, and young cuttings root without difficulty in sand under a bell-glass.
- Miscellaneous articles*, flower-stand, basket flower-border, parterre-edgings, earthenware border, bass-mats, prepared coverings, straw-coverings, reed-coverings, protecting bags, feet or shoe-scraper, props for plants, spray or branches, wall-tree nails, lists, mat-ties, osier-twigs, boards and planks, tressels, — see *Instruments*, *Implements*, and *Utensils*, and *Structures of gardening*.
- Miscellaneous articles* used in gardening, 1491.
- Mistletoe*, — see *Viscum*.
- Mistey Hall*, Essex, 7542.
- Mitchella*, polyan. polyg. and magnoliaceæ, a H. tr. E. Ind. a diminutive creeper which grows in peat soil, and is readily increased by layers.
- Mitella*, decan. dig. and saxifrageæ, H. peren. N. Amer. rockwort plants, which prefer light rich soil, and are increased by dividing at the root.
- Mizauld*, —, a French writer on gardening, page 1115. A. D. 1564.
- Moat*, a seat in the county of Mayo, 7673.
- Moccas Court*, Herefordshire, 7568.
- Mœhringia*, octan. dig. and caryophyllææ, a H. peren. S. Eur. a rockwort plant, or one well adapted for small pots; it grows in loam and peat, and is increased by dividing at the root.
- Mœnchia*, tetran. tetrag. and caryophyllææ, a H. an. Brit. of easy culture.
- Moer*, M —, his works on gardening, page 1118. A. D. 1754.

- Mustard, — see Sinapis.
- Mustel, —, his work on gardening, page 1119. A. D. 1784.
- Myagrum, tetrad silic. and crucifereæ, H. an. Eur. of the easiest culture.
- Myginda, tetran. tetrag. and rhamneæ, S. tr. which grow in loamy soil, and cuttings will root in sand under a hand-glass.
- Mylœcaryum, buckwheat-tree, decan. monog. and eriaceæ, a H. tr. which thrives well in loam and peat, requires protection in winter, and ripened cuttings root freely under a hand-glass in sand.
- Mynadoc Castle, Stirlingshire, 7631.
- Myoporum, didyn. angios. and myoporineæ, G. tr. which grow in loam and peat, and are readily increased by cuttings in sand under a hand-glass.
- Myosotis, scorpion-grass, pentan. monog. and boragineæ, H. peren. and an. of the easiest culture.
- Mysurus, mouse-tail, pentan. polyg. and ranunculacææ, a H. an. Brit. of common culture.

- Myrica*, candleberry-myrtle, diœc. tetran. and amentaceæ, G. tr. C. B. S. which grow in loam and peat, and cuttings root freely under a bell-glass; the H. tr. Brit. and Amer. prefer a moist peat soil, and are annually increased by seeds or layers.
- Myriophyllum*, water-milfoil, monœc. polyandr. and onagrariæ, H. peren. Brit. aquatics increased by seeds.
- Myristica*, the nutmeg, diœc. monad. and myristicæ, S. tr. Ind. which grow in light loam, and have as yet been little propagated.
- Myrodia*, monadel. polyan. and malvacæ, a S. tr. W. Ind. which grows readily in light, rich soil, and cuttings root readily in sand under a bell-glass.
- Myrrh*, — see *Myrrhis*.
- Myrrhis*, myrrh, pentan. dig. and umbellifereæ, a H. peren. Brit. of easy culture.
- Myrsine*, polyg. diœc. and myrsinacæ, G. tr. C. B. S. evergreens which grow in loam and peat, and cuttings root readily in sand under a hand-glass.
- Myrsiphyllum*, hexan. trig. and smilacæ, G. peren. C. B. S. climbers which thrive in loam and peat, and are increased by division at the root.
- Myrtus*, myrtle, icos. monog. and myrtacæ, G. tr. Eur. and W. Ind. which grow freely in rich loam, and are increased by cuttings; *M. tomentosa* requires the heat of a dry stove, and the cuttings, which must not be too old, will root under bell-glasses.

 Obs. Mod. Gard., Wheatley's Observations on Modern Gardening.
 Ochna, polyan. monog. and ochraceæ, a S. and G. tr. E. Ind. and C. B. S. which grow freely in loam and peat, and cuttings root in sand under a hand-glass.
 Ochroma, mœiad. pentan. and malvaceæ, S. tr. Amer. which grow freely in loam and peat, and cuttings root in sand under a hand-glass.
 Ochrus, diadel. decan. and leguminosæ, a H. an. Eur. of common culture.
 Ochertyre, a seat in Perthshire, 7636.
 Ockenden, —, Esq., his work on gardening, page 1103. A. D. 1770.
 Octomeria, gynan. monan. and orchideæ, a S. peren. W. Ind. a parasite, which requires the same treatment as aërides.
 Ocymum, didyn. gymnos. and labiateæ, S. tr. bien. and an. and H. an. Ind. and China, of easy culture in light, rich soil, as tender annuals.
 Ocymum basilicum and minimum, the sweet basil, 4174.
 Oedera, syngen. polyg. segr. and corymbifereæ, a G. tr. C. B. S. which grows in any light soil, and cuttings root readily under a hand-glass.
 Oenanthe, water-dropwort, pentan. dig. and umbellifereæ, a G. peren. and H. peren. Eur. and C. B. S. of easy culture, and increased by seeds.
 Enothera, octan. monog. and onagariæ, H. peren. bien. and an. Amer. of common culture.
 Offsets, to propagate by, 1988.
 Oil-nut, hamiltonia oleifera.
 Oily grain, — see Sesamum.
 Oily palm, elais guineensis.
 Okeham Park, Surrey, 7528.
 Olafsyn, Olaf, his works on gardening, page 1130. A. D. 1770.
 Old man's beard, — see Geropogon.
 Oldenlandia, tetran. monog. and rubiaceæ, a S. peren. and an. E. and W. Ind. of common culture.
 Olea, olive and phillyræa, dian. monog. and oleinæ, G. and H. tr. Eur. and C. B. S. which grow in loam and peat, and ripened cuttings root freely in sand under a hand-glass.
 Olea europea, the common olive, 5958.
 Oleander, — see Nerium.
 Oleaster, — see Elæagnus.
 Olive, — see Olea.
 Olive bark-tree, bucidia buceras.
 Olive-wood, — see Elæodendrum.
 Oliveria, pentan. dig. and umbellifereæ, a H. an. Bagdad, of common culture.
 Olyra, monœc. trian. and gramineæ, a S. peren. W. Ind. a grass of easy culture.
 Ombersley Court, Worcestershire, 7566.
 Omphalea, monœc. monadel. and euphorbiaceæ, a S. tr. Jamaica, which grows in light loam, and cuttings root in sand under a hand-glass in heat, care being taken not to injure the leaves.
 Oncidium, gynan. monan. and orchideæ, S. peren. Ind. which require the same treatment as aërides.
 Onion, — see Allium.
 Oniscus asellus, the wood-louse, 2273.
 Onoclea, cryptog. filices and filiceæ, H. peren. Eur. and Amer. ferns of common culture.
 Ononis, rest-harrow, diadel. decan. and leguminosæ, G. tr. and peren. Eur. and C. B. S. which thrive in loam and peat, and are increased by seeds or young cuttings under a bell-glass in sand.
 Onopordum, cotton-thistle, syngen. polyg. æqual. cynarocephalæ, H. peren. bien. and an. Eur. of common culture.
 Onopordum acanthium, 3960.
 Onosma, pentan. monog. and boragineæ, a G. peren. and H. peren. Br. and S. Eur. which succeed best in rich, light soil, and are increased by cuttings under hand-glasses in sand.
 Onosmodium, pentan. monogyn. and boragineæ, a H. peren. N. Amer. which may be treated as onosma.
 Operations of gardening, 1853; mechanical, lifting, carrying, drawing, pushing, &c. 1856. to 1861.
 Operations, laborious, on the soil, 1862; picking, digging, shovelling, excavating, levelling, marking with the line, trenching, ridging, forking, hoeing, raking, scraping, sweeping, wheeling, beating, rolling, sifting, &c. 1863. to 1881.
 Operations, laborious, with plants, 1882; sawing, cutting, clipping, splitting, mowing, weeding, watering, &c. 1883. to 1893.
 Operations in which skill is more required than strength, 1894; transferring designs from ground to paper or memory, dimensions of simple objects, forms of surface, irregular figures, raised and depressed surfaces, delineating by ground-lines only, elevations, profiles, circular profiles, bird's-eye views, general views, &c. 1895. to 1912.
 Operations, transferring figures or designs from paper or memory to plain surfaces, 1914; perpendiculars, angles, ovals, gardener's oval, a spiral line, centre of three points, polygons, polygonal gardens, fanciful figures, 1915. to 1924.
 Operations of gardening; transferring figures and designs to irregular surfaces, 1925; straight lines, continuous lines, curved lines, level lines, &c. 1926. to 1933.
 Operations for the arrangement of quantities, by trial and correction, by measure superficial, by solid measure, 1935. to 1939.
 Operations for carrying designs into execution, 1940; removing surface encumbrances, smoothing surfaces, drawing off water by under-drains, by surface-drains; forming excavations for retaining water, removal of earth, forming the bed or bottom, head, sluice; surfaces to imitate nature, artificial surfaces; walks, form of their surface, weeds, resistance of walks to animals, to weather, 1941. to 1968.
 Operations, scientific processes, 1969; preparations for fermenting substances, stable-dung, tanner's bark, leaves, preparation, formation of beds, ashes, composts, liquid manures, mould-composts, composts for particular plants, compost-ground, 1970. to 1984.
 Operations of propagation, 1985; by seed, by bulbs, offsets, slips, division of the plant, runners, suckers, layers, twisting, ringing, piercing, and wire-layers, layering trees in the open garden, stools, Chinese layering, inarching, grafting,

- theories of whip-grafting, cleft-grafting, crown-grafting, side-grafting, saddle-grafting, shoulder-grafting, root-grafting, terebration (*terebratio*, Lat. a boring with a wimble), stocks, free-growing stocks, dwarfing-stocks, scions, grafting-clay, budding, shield-budding, shield-budding reversed, scollop-budding, budding with double ligatures, stocks for budding, instruments and materials for, 1866. to 2062.
- Operating for propagating by cuttings, 2063; choice, preparation, insertion, and management, 2064. to 2069.
- Operations of rearing and culture, 2070.
- Operations in sowing and planting, sowing, patches, broad-cast, planting, and watering, 2071. to 2078.
- Operations in transplanting, 2079; preparation of the soil, removal of the plant, inserting, spade-planting, hole-planting, trench-planting, trenching-in planting, slit-planting, holeing-in planting, drill-planting, bedding-in planting, furrow-planting, dibble-planting, trowel-planting, planting with balls, planting by mudding-in, panning, mulching, edgings, verges, turfing, transplanting in pots, shifting, 2080. to 2109.
- Operations in pruning, 2110; for promoting the growth and bulk of a tree, for lessening the bulk of a tree, for modifying the form of a tree, to form dwarf standards, concave dwarfs, convex or conical dwarfs, horizontal dwarfs, spiral dwarfs, fan dwarfs, distaffs, natural dwarfs, pruning half and entire standards, pruning trees on walls or espaliers, pruning for blossom-buds, pruning for the enlargement of the fruit, for adjusting the stem and branches to the roots, for renewal of the head, for curing diseases, pruning roots, pruning herbaceous plants, seasons for pruning, summer pruning, 2111. to 2139.
- Operations in training, 2140; object of training, modes of training trees with flexible stems, fan-training, horizontal training, horizontal training with screw stem, oblique training, perpendicular training, stellate training, open fan, wavy or curvilinear training, performing the operation on walls, shreds and nails, herbaceous training, 2141. to 2155.
- Operations in blanching, 2156; by earthing, by tying together the leaves, by overlaying, by covering with utensils, 2157. to 2160.
- Operations for inducing a state of fruitfulness, 2161; laying bare the roots, cutting the roots, notching the stem, partial decortication, stripping off pieces of the bark, ringing, renewal of the soil, bending down the branches, application to herbaceous plants, 2162. to 2175.
- Operations for retarding vegetation, 2177; by the form of surface, by shade, by the ice-cold room, 2178. to 2180.
- Operations for accelerating vegetation, 2181; by the form of surface, by shelter, by soil, by previous preparation of the plant, by inducing a state of rest, by housing, by artificial heat, by flued walls, by glass cases, by hot-beds, by walled pits, by hot-houses, temporary emplacement in hot-houses, permanent, 2182. to 2200.
- Operations to imitate warm climates, 2201; general management, green-house, dry-stove, bark-stove, watering, insects, 2202. to 2205.
- Operations of protection from atmospherical injuries, protecting by fronds and frond-like branches, by straw-ropes, nets, canvass or bunting screens, mats, straw, and litter, oiled paper-frames, protecting ropes, transparent covers, transparent screens, &c. 2206. to 2218.
- Operations relative to vermin diseases, and other casualties of plants, 2219; kinds of vermin, human enemies, brute vermin, quadrupeds, feathered enemies, insects, coleoptera, hemiptera, lepidoptera, neuroptera, hymenoptera, diptera, aptera, worms, slugs, 2220. to 2275.
- Operations relative to subduing vermin, 2276; insect vermin, preventive operations, palliative operations, destructive operations, 2277. to 2285.
- Operations relative to diseases and other casualties, 2286. to 2288.
- Operations of gathering, packing, preserving, and keeping, 2289; gathering fruits and seeds, preserving heads or leaves, roots, fruits, ripe fruit, pears, and apples, sweating fruit, preserving seeds, roots, cuttings, grafts, roots, &c. 2290. to 2321.
- Operations relating to the final products derived of gardens and garden-scenery, vegetable products, fruits, seeds, roots, stems and stalks, leaves, flowers, barks, woods, entire plants, 2323. to 2333.
- Operations of superintendence and management, 2334; head gardener's duties, keeping accounts, time-book, cash-book, forest-book, produce-book, weather-book, register of temperature of hot-houses, of the open air, record of the growth of plants, reading-library, 2335. to 2354.
- Operations for the beauty and order of garden-scenery, 2355; order, propriety, decorum, neatness, importance of the profession of a gardener, &c. 2356. to 2373.
- Opercularia, tetran. monog. and nyctagineæ, a G. tr. N. S. W. which thrives in loam and peat, and cuttings root freely in sand under a hand-glass.
- Ophioglossum, adder's tongue, cryptog. stachyopterides and filices, a S. and H. peren. Brit. W. Ind. ferns of common culture.
- Ophiopogon, snake's beard, hexandria monogyn. and smilacæ, a F. peren. Japan, which grows in sandy loam and peat, and is increased by dividing at the root.
- Ophioxylon, polyg. monoc. and apocynæ, a S. tr. E. Ind. which grows in loam and peat, and cuttings root in sand under a hand-glass.
- Ophrys, gynan. monan. and orchideæ, a G. peren. and H. peren. Eur. and Barbary, which succeed best in a mixture of loam, peat, and chalk broken small; the best time to transplant them, as well as most other orchideous plants, is when they are growing: they are increased by seeds, which should be sown as soon as they are ripe.
- Oramore Castle, a seat in Galway, 7672.
- Orange, — see Citrus.
- Orangery, ornamental, its construction, 2171; for producing fruit, 5928.
- Orchard, formation and planting of one subsidiary to the kitchen-garden, 2527; site, manure, screens, selections of kinds, age of plants from the nursery, temporary and final distances, culture of the soil, of standard fruit-trees, only situation and soil, sorts, age of the plants, design for one to surround a kitchen-garden, 2563. to 2544.
- Orchard, general culture and management of, 2613; manuring, cropping, watering, staking and protecting, mulching and clothing the stems, pruning aged trees, season of pruning, insects and diseases, gathering and storing orchard fruits, pears, packing orchard and other fruits for carriage, general culture and management, 2614. to 2643.
- Orchardists, 7395.
- Orchards, commercial, their formation, 7455. and 7463; management, 7463.
- Orchis, gynan. monan. and orchideæ, G. and H. peren. Eur. and Amer. which may be treated like ophrys, only they do not require chalk mixed with the loam and peat.
- Order, its importance in gardening, 2356.
- Orford Hall, a seat in Lancashire, 7588.
- Origanum, marjoram, didyn. gymnos. and labiatæ, G. and F. tr. and H. peren. Eur. which grow in loam and peat, and cuttings root readily under a hand-glass.
- Origanum onites, marjorana, &c., the garden marjorams, 4162.
- Orkney and Shetland Islands, as to gardening, 7645.
- Ornmiston, a seat in East Lothian, 7619.
- Ormosia, decan. monog. and leguminosæ, a S. tr. W. Ind. which thrives well in loam and peat, and is increased by cuttings in sand under a hand-glass; or seeds from the West Indies will vegetate freely.
- Ornithidium, gynan. monan. and orchideæ, a S. peren. W. Ind. a parasite which may be treated as ærides.
- Ornithogalum, star of Bethlehem, hexan. monog. and asphodeleæ, G. T. and H. peren. Eur. C. B. S. bulbs of easy culture.
- Ornithopus, bird's foot, diadel. decan. and leguminosæ, a H. peren. and an. Eur. of common culture.
- Ornitrophe, octan. monog. and sapindæ, S. tr. E. and W. Ind. which prefer a light loam, and cuttings root in sand under a hand-glass.
- Ornus, flowering-ash, dian. monog. and oleinæ, H. tr. Italy, which grow in common soil, and are increased by seeds or budding, or grafting on the common ash, fraxinus excelsior.
- Orobanche, didyn. angios. and orobancheæ, H. peren. Brit. parasites which root in the soil, and afterwards attach themselves to, and root into

other plants. The common broom-rape, an. major, may be sown or planted at the root of the common broom, spartium, and the others at the roots of such plants as they are seen to affect in their wild state.

Orobis, bitter vetch, diadel. decan. and leguminosæ, H. peren. Eur. of easy culture.

Orobis tuberosus, the tuberous-rooted bitter vetch, 4302.

Orontium, hexan. monog. and aroideæ, H. peren. Amer. and Japan, which grow in light sandy soil, and are increased by division at the root.

Orpine, — see *Telephium*.

Ortega, trian. monog. and caryophyllæ, H. peren. Eur. which thrive in light rich soil, and cuttings root freely under a hand-glass.

Orthopogon, trian. dig. and gramineæ, a S. tr. W. Ind. of common culture.

Oryza, rice, hexan. dig. and gramineæ, a S. an. Ethiopia, of easy culture as a marsh plant.

Osbaston, a seat in Derbyshire, 7574.

Osbeck, P. A. Toreen, and Captain Ekeberg, their voyage to China, page 1130. A. D. 1771.

Osbeckia, octan. monog. and melastomæ, a S. bien. Ceylon, of common culture.

Osier, — see *Salix*.

Osmites, syngen. polyg. frustran. and corymbifereæ, a G. tr. C. B. S. which grows well in light rich soil, and cuttings root freely under a hand-glass.

Osmunda, cryptog. schismatopterides and filices, H. peren. Amer. Brit. and C. B. S. ferns of common culture, 1678.

Ossenfelder, H. A., his works on gardening, page 1124. A. D. 1771.

Ossington Hall, Nottinghamshire, 7576.

Osten, Van, his works on gardening, page 1129. A. D. 1703.

Osteospermum, syngen. polyg. necess. and corymbifereæ, G. tr. C. B. S. which may be treated as osmides.

Osterton House, Nottinghamshire, 7576.

Ostrya, hop-hornbeam, monæc. polyan. and amen-tacæ, H. tr. Italy and N. Amer. which grow in any soil, and are increased by seeds or layers.

Oswego tea, — see *Monarda*.

Osyris, poet's cassia, diæc. trian. and santalacæ, a G. tr. S. Eur. which thrives in loam and peat, and ripened cuttings will root in sand under a hand-glass.

Otaheite chestnut, *inocarpus edulis*.

Otaheite myrtle, *securinaga nitida*.

Othonna, ragwort, syngen. polyg. necess. and corymbifereæ, G. and F. tr. and peren. C. B. S. which grow in any light, rich soil, and cuttings root freely under a hand-glass.

Otto, Frederick, C. M. H. S., inspector of the botanic garden, Berlin, 219.

Owston, a seat in Yorkshire, 7582.

Ox-eye, — see *Bupthalamum*.

Ox-eye daisy, *chrysanthemum leucanthemum*.

Ox-lip, — see *Primula*.

Ox-tongue, — see *Picris*.

Oxalis, wood-sorrel, decandr. pentagyn. and geraniacæ, G. and H. peren. C. B. S. bulbs of easy culture.

Oxalis acetosella, the common wood-sorrel, 4075.

Oxford botanic garden, 7557.

Oxfordshire, gardens and residences of, 7558.

Oxyanthus, pentan. monog. and rubiacæ, a S. tr. Sierra Leone, which thrives well in sandy loam and peat, and cuttings root in sand under a hand-glass.

Oxybaphus, umbrella-wort, triand. monogyn. and nyctaginæ, S. peren. and an. S. Amer. which grow in loam and peat, and are increased by young cuttings under a bell-glass in sand.

Oxyccoccus, cranberry, octan. monog. and ericæ, a S. tr. and H. tr. Eur. and Amer. which require a peat soil, and moist situation.

Oxyccoccus macrocarpus and *palustris*, 4708.

Oxylobium, decan. monog. and leguminosæ, G. tr. Austral. which grow in sandy loam and peat, and young cuttings root in sand under a hand-glass.

Oxystelma, pentandria digynia and asclepiadæ, a S. peren. E. Ind. which thrives well in loam and peat, and cuttings root freely in sand under a hand-glass.

Oxytropis, diadel. decan. and leguminosæ, H. peren. and an. Eur. which prefer a light sandy soil, and are readily increased by seeds.

P.

Pachysandra, monæc. tetran. and euphorbiacæ, a H. peren. N. Amer. which succeeds well in any common light soil, and increases freely by suckers from the roots.

Packbush, S. T., his works on gardening, page 1123, A. D. 1695.

Packenham Hall, a seat in Westmeath, 7662.

Paddock, puddock, or purrock, a country term, originally applied to a small space enclosed by pales from a park, for hounds to run matches in, now generally applied to the small grass enclosures commonly attached to a park, or kept in the hands of the resident on the demesne.

Paderia, pentan. monog. and rubiacæ, a D. S. tr. China, a climber which thrives in loam and peat, and cuttings root readily.

Pæonia, pæony, polyan. dig. and ranunculacæ, the Chinese tree-pæony, a F. tr. China, with numerous varieties, thrives in any rich, light soil; and ripened cuttings slipped off, and planted in the ground in a shady place, without cover, will root freely. The H. peren. Eur. requires a deep, rich, loamy soil, — see 1639.

Pæony, — see *Pæonia*.

Pain's Hill, a seat in Surrey, 7527.

Paisley manufacturers, their gardens and florists' meetings, &c., 7623.

Palavia, monad. polyan. and malvacæ, a H. an. Peru, of common culture.

Palisade (*palissade*, Fr.), any fence of pales, a paling; the term is generally used when an ornamental paling is intended.

Palissy, Bernard de, a French author on gardening, page 1115. A. D. 1563.

Pallasia, syngen. poly. frustran. and corymbifereæ, a G. tr. Peru, which thrives in any rich, light soil, and cuttings root freely under a hand-glass.

Palma Christi, — see *Ricinus*.

Panax, polyg. diæc. and araliæ S. tr. Amer. and China, which thrive well in light loam, and cuttings root readily in sand under a hand-glass; the H. peren. grow in similar soil, and are increased by seeds, or dividing at the root.

Pancratium, hexan. monog. and amaryllidæ, S. and G. peren. and H. peren. Eur. Amer. and India, which grow in light loam and vegetable mould, with little water when not in a growing state. They are increased by seeds and suckers.

Pandanus, screw-pine, diæc. monan. and pandanacæ, S. tr. Ind. and N. S. W. which thrive in loamy soil; but rarely produce growths which admit of removal for propagation.

Panic-grass, — see *Panicum*.

Panicum, panic-grass, trian. dig. and gramineæ, S. tr. and bien. and H. peren. and an. Ind. Amer. and Eur. grasses of common culture.

Pannage, a law term signifying the feed which swine or cattle may derive from the mast, acorns, or herbage of woods.

Panning, forming a pan or saucer-like hollow round newly planted trees, to receive and retain water, 2098.

Panshanger, a seat in Hertfordshire, 7544.

Panton House, Lincolnshire, 7577.

Papaver, poppy, polyan. monog. and papaveracæ, H. peren. Eur. of easy culture.

Papaw-tree, — see *Carica*.

Paper mulberry, *morus papyrifera*.

Papilio, the butterfly, a lepidopterous insect, 2251.

Papilio machaon, 6194.

Parasitic hardy shrubs, 6588.

Parasitic exotics, their culture and management, 6736.

Parasitic plants, such as root into other living plants, and derive their nourishment from them; some root into the stem or branches, as viscus, the mistletoe; others attach themselves to the root, as hypocistus; some of the epiphytæ and aëridæ will grow either on living or dead trees.

Pardanthus, trian. monog. and irideæ, a G. peren. China, a bulb which may be treated as ixia.

Parham, a seat in Sussex, 7531.

Pariana, monæc. polyan. and gramineæ, a S. tr. Cayenne, which grows in loam and peat, and cuttings root in sand under a bell-glass.

Parietaria, pellitory, poly. monæc. and urticæ, a S. peren. and an. and H. peren. Eur. and India, of easy culture in light soil.

Paris, octan. tetrag. and smilacæ, a H. peren. Brit.

- which prefers a shady situation in a light sandy loam, and is increased by seed.
- Park, in gardening, a portion of forest-like scenery attached to a country-house, and devoted to the growth of timber, the harbor of game, deer, or the pasturage of cattle, &c.
- Park, par., J. Parkinson Paradisi in Sole, Paradisus terrestris.
- Park Place, Berkshire, 7561.
- Parkinson, John, his works on gardening, page 1099. A. D. 1629.
- Parkinsonia, decan. monog. and leguminosæ, a S. tr. W. Ind. which thrives in loam and peat, and cuttings root in sand under a bell-glass.
- Parkyns, G. J., his works on gardening, page 1113. A. D. 1805.
- Parnassia, grass of Parnassus, pentan. tetrag. and cappariæ, H. peren. Brit. and Amer. marsh plants which thrive best in moist peat soil.
- Paronychia, pentan. monog. and amarantaceæ, G. peren. Eur. which thrive well in loam and peat, and cuttings root freely under a hand-glass; the H. peren. and an. prefer the same soil, and are increased by cuttings or seeds.
- Parsley, 4082,—see Apium.
- Parsley piert, alchemilla aphanes.
- Parsnep,—see Pastinaca.
- Parterre (Fr.), an even or level piece of ground; a flower garden,—see Flower-garden.
- Parterre edgings, 1500.
- Parthenium, syngen. polyg. nesses. and corymbifereæ, a H. peren. and an. W. Ind. and Amer. of common culture.
- Pascalina, syngen. polyg. frustan. and corymbifereæ, Chili, which grows best in loam and peat, and cuttings root under a hand-glass.
- Paspalum, trian. dig. and gramineæ, S. and H. W. Ind. and S. Amer. grasses of easy culture.
- Pasque flower,—see Pulsatilla.
- Passerina, sparrow-wort, octan. monog. and thymelææ, G. tr. C. B. S. which thrive best in sandy peat, and cuttings root freely under a bell-glass in sand.
- Passiflora, passion-flower, monadelph. pentand. and passifloreæ, S. and G. tr. climbers, free growers, and easily managed; they thrive best in loam and peat, and young cuttings root readily in heat under a bell-glass.
- Passiflora quadrangularis, and other fruit-bearing species, 6003.
- Passion-flower,—see Passiflora.
- Pastinaca, parsnep, pentan. dig. and umbellifereæ, H. bien. and a peren. of common culture.
- Pastinaca sativa, the garden parsnep, 3723.
- Patée d'oye, or cross patée d'oye, (heraldry,) a cross with the crosslets spreading like duck feet, as in the Maltese cross,—a form of planting avenues, &c., 6813.
- Patersonia, monadel. trian. and irideæ, G. peren. N. S. W. which grow in loam and peat, and are increased by dividing at the root.
- Paulet, —, his works on gardening, page 1150. A. D. 1793.
- Paullinia, octan. trig. and sapindeæ, S. tr. W. Ind. which succeed in light loam, and cuttings root best in sand in bottom-heat under a hand-glass.
- Paultons, seat in Hampshire, 7594.
- Pavetta, tetrandria monogynia and rubiaceæ, a S. tr. E. Ind. which thrives best in loam and peat, and cuttings root readily in sand under a hand-glass.
- Pavilion, a regal residence in Brighton, 7533.
- Pavonia, monadel. polyan. and malvaceæ, S. and G. tr. and S. an. E. and W. Ind. which grow in loam and peat, and root readily in sand under a hand-glass: most of the species produce abundance of seeds.
- Pawlosky, an imperial seat near Petersburg, 258.
- Pea,—see Pisum.
- Peach-house, its construction, 2664; general culture and management of, 3063.
- Peach-gatherer, 1354.
- Peach-tree,—see Amygdalus.
- Pear-gatherer, 1355.
- Pear-tree,—see Pyrus.
- Pea-plant,—see Sagina.
- Peat-earth shrubs, their culture, final situation, 6569.
- Pectis, syngen. polygam. super. and corymbifereæ, S. an. W. Ind. of common culture.
- Pedaliun, didynan. angios. and pedalineæ, S. an. E. Ind. of common culture.
- Pedicularis, lousewort, didyn. angios. and scrophularineæ, F. and H. peren. and an. Eur. and Amer. which succeed best in peat soil and a moist situation, and are increased by seeds.
- Peel Hall, Cheshire, 1590.
- Peganum, dodec. monog. and rutaceæ, H. peren. Eur. which thrive in rich, light soil, and cuttings root freely under hand-glasses.
- Pekra, a seat near Moskwa, 262.
- Pelargonium, stork's bill, monadelph. heptan. and geraniaceæ, G. tr. peren. and an. C. B. S. and some S. tr. and peren. all of easy culture in any rich, light soil, the succulent sorts well drained and not overwatered, 6601.
- Pelle, M. de St. Maurice, a French author on gardening, page 1116. A. D. 17—.
- Peliosanthes, hexan. monog. and S. peren. E. Ind. which grow best in rich loam, and are increased by dividing at the root.
- Pelleport-Saune, M.—, his work on gardening, page 1122. A. D. 1813.
- Pellitory,—see Peltaria.
- Peltaria, tetrad. silic. and crucifereæ, a H. peren. Austral. of common culture.
- Pembrokeshire, gardens and residences of, 7609.
- Penæa, tetran. monog. and penæaceæ, G. tr. C. B. S. which thrive in loam and peat, with the pots well drained, and young cuttings root without difficulty under bell-glasses in sand.
- Pendarves, a seat in Cornwall, 7601.
- Penguin, a seat in Flintshire, 7606.
- Penicillaria, poly. monæc. and gramineæ, a S. and H. an. E. and W. Ind. of common culture.
- Pennistemon, trian. dig. and gramineæ, H. an. Eur. and Ind. grasses of the easiest culture.
- Pennycook House, Midlothian, 7618.
- Pennyroyal, mentha pulegium.
- Pennywort,—see Hydrocotyle.
- Penpont, a seat in Breconshire, 7613.
- Penrhyn Castle, Caernarvonshire, 7604.
- Penrice Castle, Glamorganshire, 7608.
- Penshurst, a seat in Kent, 7538.
- Pentapetes, monadel. dodec. and malvaceæ, a S. tr. and a bien. Ind. and N. Spain, which grow freely in light, rich soil, and cuttings root in sand under a bell-glass.
- Penthorum, decan. pentag. and sempervivæ, a H. peren. Virginia, which grows freely in light, sandy soil, and is readily increased by dividing at the root, or by young cuttings under a hand-glass.
- Pentre, a seat in Pembrokeshire, 7609.
- Pentstemon, didyn. angios. and bignoniaceæ, a F. tr. and H. peren. N. Amer. which grow in light, rich soil, and succeed well in pots. Cuttings root freely under hand-glasses.
- Pentzia, syngen. polyg. equal. and corymbifereæ, a G. tr. C. B. S. which thrives well in any rich, light soil, and cuttings root freely under a hand-glass.
- Peplis, water-purslane, hexan. monog. and salicaceæ, a H. an. Brit. a marsh plant of easy culture.
- Pepper,—see Piper.
- Pepper Harrow, a seat in Surrey, 7528.
- Pepper-vine, cissus stans.
- Pepperwort,—see Lepidium.
- Perdicium, syngen. poly. super. and corymbifereæ, a H. peren. Siberia, which grows in rich, light soil, and is increased by dividing at the root.
- Perfect, Thomas, his works on gardening, page 1105. A. D. 1759.
- Perforated piers, piers for fruit-tree walls, the projecting parts of which are perforated to admit of training the shoots through the pier, instead of stopping them there, or bending them over it. It is an ingenious mode, but the rounded pier (1572. fig. 246. a), where practicable, is to be preferred, as more readily admitting the taking down and replacing of the branches at the pruning season.
- Pergularia, pentan. dig. and asclepiadæ, S. tr. E. Ind. fragrant climbers which succeed well in loam and peat, and cuttings root readily in sand under a hand-glass.
- Perilla, didyn. gymnos. and labiateæ, a H. an. India, of common culture.
- Periploea, pentan. dig. and asclepiadæ, a G. and H. tr. Syria and the Canaries, which grow freely in common soil, and are increased by layers or cuttings.
- Periwinkle,—see Vinca.
- Perotis, trian. dig. and gramineæ, a S. an. E. Ind. of common culture.
- Pers., Christian Henry Persoon's Synopsis Plantarum.

- Persian gardening, 459.
 Persicaria, polygonum persicaria.
 Persoonia, tetran. monog. and proteaceæ, G. tr. N. S. W. which thrive in loam and peat, and ripened cuttings root in sand under a hand-glass.
 Perth nursery, 7635.
 Perthshire, gardens and residences of, 7635.
 Peschelus, —, his works on gardening, page 1123. A. D. 1597.
 Petalostemum, diadel. pentan. and leguminosæ, H. peren. N. Amer. which thrive in light, rich soil, and are increased by seeds or dividing at the root.
 Peterhoff, an imperial residence near Petersburg, 254.
 Peterkin, Joshua, his works on planting, page 1131. A. D. 1790.
 Peters, Richard, his work on gardening, page 1131. A. D. 1810.
 Petersham Lodge, Surrey, 7527.
 Petiveria, heptan. monog. and chenopodæ, S. tr. W. Ind. which grow well in light, rich soil, and cuttings root freely under a hand-glass.
 Petrea, didyn. angios. and verbenacæ, a S. tr. Vera Cruz, a climber, which thrives well in loam and peat, and cuttings root in sand under a hand-glass in heat.
 Petre, Robert, Lord, an accomplished nobleman and great encourager of gardening in the time of Miller, — see Ingatestone.
 Petrocallis, tetrad. silic. and cruciferae, a H. peren. Pyreneas, a rockwork plant, which grows well in peat, and cuttings root readily under a hand-glass.
 Petrophila, tetran. monog. and proteaceæ, G. tr. N. W. S. which may be treated as proteæ.
 Petrowka, a seat near Moskwa, 281.
 Petworth House, Sussex, 7532.
 Peucedanum, sulphur-wort, pentan. dig. and umbelliferae, a G. bien. and H. peren. Eur. of common culture.
 Phaca, bastard vetch, diadelph. decan. and leguminosæ, H. peren. Eur. which succeed in common garden soil, and are increased by seeds. Some of the dwarfier kinds are well adapted for rockwork or growing in pots.
 Phalena quercus, the egger-moth, 7075.
 Phalangium, hexan. monog. and asphodeleæ, H. peren. S. Eur. which thrive in rich, light soil, and are readily increased by dividing the root.
 Phalaris, canary-grass, trian. dig. and graminæ, a H. peren. and an. Eur. Egypt, and C. B. S. grasses of easy culture.
 Phallus esculentus, the morel, 4543.
 Pharnaceum, pentan. trig. and caryophyllæ, a S. and G. tr. and H. an. Eur. and C. B. S. which thrive in sandy loam and peat, and cuttings root in the same soil under a hand-glass.
 Pharus, monœc. hexan. and graminæ, a S. peren. Jam. a grass of easy culture.
 Phaseolus, kidneybean, diadel. decan. and leguminosæ, S. peren. and an. and H. an. Asia, Amer. and Africa, which thrive in light, rich soil, and may be propagated from cuttings or seeds.
 Phaseolus vulgaris, the common kidneybean, 3629; to force kidneybeans, 3367; soil, sorts, sowing, culture, time of beginning to force, temperature, successional supplies, forcing in a hot-house, insects, forcing in a peach or cherry house, in a common hot-bed, crop raised under glass to fruit in the open garden, crop raised on slight heat, 3368, to 3380.
 Pheasantry, 7247.
 Phellandrium, water-hemlock, pentan. digyn. and umbelliferae, a H. bien. Brit. an aquatic which may be sown in pots and placed in the aquarium, or the seeds scattered in any pond.
 Philadelphus, syringa, icos. monog. and myrteacæ, H. tr. Eur. and Carolina, shrubs of easy culture.
 Phillips, Henry, his works on gardening, page 1114. A. D. 1820.
 Phillips, Leonard, jun., nurseryman, his works on gardening, page 1114. A. D. 1814.
 Philoxerus, pentan. monog. and amaranthacæ, a S. tr. and peren. Amer. which thrive well in rich soil, and are readily increased by cuttings.
 Philydium, dian. monog. and juncæ, a S. tr. China, of common culture.
 Phillyrea, olea alaternus.
 Phleum, catstail-grass, trian. dig. and graminæ, H. peren. and an. Eur. of common culture.
 Phlomis, didyn. gymnos. and labiateæ, H. tr. and peren. Eur. which prefer a light, dry soil, and are increased by cuttings under a hand-glass or seeds.
 Phlox, lychnidea, pent. monog. and polemoniaceæ, H. peren. Amer. mostly border-flowers, which prefer a rich loam, and are increased by cuttings or dividing at the roots.
 Phoenix, date-palm, diœc. trian. and palmæ, a S. tr. and G. tr. Levant, C. B. S. and E. Ind. which require a light soil, and are increased by seeds.
 Phoenix Park, Dublin, 7653.
 Phormium, flax-lily, hexan. monog. and asphodeleæ, a G. peren. N. Zeal. which thrives in any light, rich soil, and is increased by offsets from the roots.
 Phryma, didyn. gymnos. and labiateæ, a H. peren. N. Amer. which thrives well in rich, light soil, and cuttings root freely in sand under hand-glasses.
 Phrynium, monan. monog. and canneæ, S. peren. E. Ind. which thrive in rich, light soil, and are increased by dividing at the root.
 Phylla, pentandria monogynia and rhamnæ, G. tr. C. B. S. which grow best in sandy peat, and young cuttings root readily under a bell-glass in sand.
 Phyllanthus, monœc. monad. and euphorbiacæ, S. tr. and an. chiefly W. Ind. which succeed well in loam and peat, and cuttings root freely in soil under a hand-glass.
 Phyllis, pentan. dig. and rubiacæ, a G. tr. Canar. which grows in loam and peat, and cuttings root in sand under a hand-glass.
 Phylloma, hexan. monog. and asphodeleæ, a S. tr. Bourb. which thrives well in sandy loam, requires very little water, and is increased by suckers.
 Phys. des Arb., Duhamel sur le Physique des Arbres.
 Physalis, winter cherry, pentan. monog. and solanæ, S. and G. tr. and H. peren. and an. chiefly N. Amer. which thrive well in rich, light soil, and are increased by young cuttings under a hand-glass or by seeds.
 Physic-gardeners, herbalists, or simplicists, 7464.
 Physic-nut, — see Jatropha.
 Physic or herb gardens, their formation, 7360.
 Phyteuma, rampion, pentan. monog. and campanulacæ, a G. peren. and H. peren. and a bien. chiefly Europe, which thrive in rich, light soil, do well in pots, and are increased by dividing at the root: the garden rampion is a campanula.
 Phytolacca, dodec. decag. and chenopodæ, S. tr. As. Afr. and Amer. which thrive well in loam and peat, and are increased by cuttings or seeds.
 Piaranthus, pentan. monog. and asclepiadæ, a D. S. tr. C. B. S. a succulent which grows in loamy soil with old lime rubbish, and sand well drained, and readily increased by cuttings.
 Piccioli, Giuseppe, his work on gardening, page 1128. A. D. 1783.
 Pick and pick-axe, 1296.
 Picking, 1863.
 Picramnia, diœc. pentan. and urticæ, a S. tr. Jam. which thrives in loamy soil, and large cuttings root freely in sand under a hand-glass.
 Picridium, syngen. polyg. æqual. and cichoracæ, a H. peren. and an. France and Barb. of common culture.
 Picris, syngen. polyg. æqual. and cichoracæ, H. peren. and an. chiefly Europ. of common culture.
 Picris hieracioides, hawkweed-like, ox-tongue, 4291.
 Picton, a seat in Pembrokeshire, 7609.
 Pierard, Charles Francis, his work on gardening, page 1122. A. D. 1820.
 Piercefield, a seat in Monmouthshire, 7567.
 Pierre, Louis de, his works on gardening, page 1108. A. D. 1772.
 Pigeon-house, — see Columbarium.
 Pigeon-houses of Persia, 466.
 Pigott, Richard, his work on gardening, page 1114. A. D. 1820.
 Pilewell House, Hampshire, 7594.
 Pilewort, ficaria verna.
 Pillwort, pilularia globulifera.
 Pilularia, pillwort, cryptog. hydropter. and marsilacæ, a H. peren. Brit. an aquatic of common culture.
 Pimelea, dian. monog. and thymelæ, G. tr. Austral. which thrive best in sandy peat, and young cuttings root in sand under a bell-glass.
 Pimpernell, — see Anagallis.
 Pimpinella, burnet-saxifrage, pentan. dig. and um-

- belliferae, *H. peren.* and an an. chiefly Europ. which grow in rich, light soil, and are increased by seeds.
- Pimpinella anisum*, the anise, 4219.
- Pinckneya*, pentan. monog. and rubiaceae, a *F. tr.* Georgia, which grows in sandy loam and peat, and cuttings root in sand under a hand-glass.
- Pindemonte*, Ippolito, his works on gardening, page 1129. A. D. 1817.
- Pine-apple, 514. — see *Bromelia*.
- Pine-tree, — see *Pinus*.
- Pinery, its construction, 2645; general culture and management, 2697.
- Pinguicula*, butterwort, dian. monogyn. and lenticulariae, a *G. an.* Carolin. and *H. peren.* Europ. which grow naturally in swamps, and succeed in pots of any species of sphagnum, with a little peat at the bottom, like *drosera*; they are increased by offsets from the heart of the plant, and from seed.
- Pinguicula vulgaris*, the common butterwort, 4320.
- Pink, — see *Dianthus*.
- Pinkie House, East Lothian, 7619.
- Pinus*, the pine-fir and larch, monœc. monad. and confereae, a *S. tr.* Amboyna, *G. tr.* E. Ind. and *H. tr.* Eur. and Amer.; the *S.* species succeed in light, loamy soil, and ripened cuttings taken off at a joint will root, though not readily, in sand under a hand-glass; the *G.* species require the same soil, and roots more freely; the *H.* species grow in light soil, and are commonly increased by seeds.
- Pinus abies*, the spruce-fir, and other firs in common cultivation, 7058, to 7067.
- Pinus cedrus*, and *P. larix*, the cedar-larch, and common larch, 7051, and 7053.
- Pinus sylvestris*, the Scotch or wild pine, and the other pines in common cultivation, 7040.
- Piper, pepper, dian. trig. and urticæ, *S. tr.* chiefly climbers, *peren.* and an. *W. Ind.* mostly succulents which grow in sandy loam and peat, and are readily increased by cuttings and suckers.
- Pipewort, *ericaulon septangulare*.
- Piqueria*, syngen. polyg. æqual. and corymbiferae, a *G. peren.* Mex. which grows freely in any light, rich soil, and cuttings root readily under a hand-glass.
- Piscidia*, Jamaica dogwood, diadel. decan. and leguminosæ, a *S. tr.* *W. Ind.* a strong fast-growing plant in sandy loam, and cuttings root in sand under a hand-glass.
- Piscinary, 1767.
- Pisé, or *en pisé*, (*en pîre* or *en pis*, in the worst manner, that is, as a last resource,) a mode of building mud walls, 1564.
- Pisonia*, heptan. monog. and nyctagineae, *S. tr.* *W. Ind.* and a *G. tr.* Austral. which grow in loam and peat, and cuttings root in sand under a hand-glass.
- Pistachia*-tree, — see *Pistacia*.
- Pistacia*, diœc. pentag. and terebintaceae, *G. tr.* Barb. and *H. tr.* *S. Eur.* the *G.* species grow in loam and peat, and ripened cuttings root in sand under a hand-glass; the *H. tr.* are rather tender, but grow in common soil, and are increased by layers or cuttings under a hand-glass in sandy soil.
- Pisum*, pea, diadelph. decan. and leguminosæ, a *H. peren.* Eng. and *H. an.* *S. Eur.* of common culture.
- Pisum maritimum*, the sea-pea, 4309.
- Pisum sativum*, the garden-pea, 3597; to force the pea, 3393.
- Pit, a structure with a glass cover or roof, used as a habitation for plants. Earth-pit, bark-pit, flued pit, M'Phail's pit, Alderstone pit, pit with rising frame, West's pit, &c. 1540, to 1544.
- Pit, in the conservatory, the bed of earth in which the trees are planted, occupying the principal part of the area of the house.
- Pit of a stove or hot-house, an excavation in the moist or bark-stove for containing fermentable materials in order to supply bottom heat.
- Pitcairnia*, hexan. monog. and bromelæe, *S. tr.* *W. Ind.* and *S. Amer.* which flower freely in light, rich soil, and are increased by suckers from the root.
- Pitcher-plant, *nepenthes distillatoria*, 593.
- Pitmaston, a seat near Worcester, 3329.
- Pittosporum*, pentan. monog. and pittosporæ, a *S. tr.* Guinea, and *G. tr.* Austral. *C. B. S.* and *E. Ind.* which grow in loam and peat, and cuttings root freely in sand under a hand-glass.
- Plane-tree, — see *Platanus*.
- Plank-plant, *bossiaea scolopendrium*.
- Planner (*Scotch*), a maker of plans, — see Horticultural Architect.
- Plans for improving country-residences, 7364; how to form, 7364; important uses of, 7369; how to carry into execution, 7370.
- Plans of gardens and garden objects, how to form, 1895; to transfer them to ground, 1913; to execute them, 1940.
- Plant, grass., *Histoire des Plantes Grasses*. Par A. P. Decandolle.
- Plant packing-case, different sorts of, 1404.
- Platago, plantain, tetran. monog. and plantagineae, a *G. tr.* and bien. *C. B. S.* and *H. peren.* and an. chiefly Eur. all of very easy culture in common soil.
- Plantago coronopus*, star of the earth, 4315.
- Plantain, — see *Platago*.
- Plantain-tree, — see *Musa*.
- Plantations, neglected, to improve, neglected hedge-rows, hedge-row timber, neglected ornamental plantations, 6914, to 6924.
- Plantations, ornamental, their formation, 6852; form, extent, disposition, general form, situation, arrangement of species, size of plants, 6853, to 6876.
- Plantations of trees, their uses, as to shelter and climate, improving soils, shade, separation, seclusion, distinction, appropriation, concealment, to heighten agreeable objects, direct the eye to objects, render indifferent objects agreeable, enhance the value of landed property, afford profit, 6762, to 6775.
- Plantations, their different kinds, group, clump, woods, copsewoods, 6810, to 6814.
- Plantations, their disposition in the ancient style, 7205; in the modern style, 7214.
- Plantations, useful, their formation, 6815; preparing the soil, form, enclosing, fences, species of tree, mixture, whether to be sown or planted, disposition of the plants, number of plants and distance, size of the plants, seasons for planting, operations of, 6816, to 6851.
- Plantations, useful and ornamental, their culture and management, 6877; culture of the soil, filling up blanks, pruning, for utility, for ornament, seasons for, implements for, resinous trees, non-resinous trees, heading-down trees, pruning for bends, coppices, osier holts, strips and screens, trees for shade, trees in parks, in pleasure-grounds and lawns, thinning, 6878, to 6913.
- Plantations, valuation of, 6966.
- Planting, — see Arboriculture.
- Planting, different modes of performing the operation, 2077, to 2109.
- Planting in arboriculture, operation of, by pitting, by the diamond dibber, by the planter's mattock, by the planter, by siltling, 6841, to 6851.
- Plants, — see Vegetables.
- Plants, as indicative of soils, list of, 1036.
- Plants used as preserves and pickles, 4258.
- Plants used in tarts, confectionary, and domestic medicine, 4195.
- Plas Newydd, a seat in Anglesea, 7603.
- Plat (*plat*, Fr. flat), a piece of ground of determinate form, small compared with a field, but larger than a border, bed, or stripe, — see Plot.
- Plat-band (*plat bande*, Fr.), a border round a flat.
- Platanus*, plane-tree, monœc. polyan. and amentaceae, *H. tr.* Levant, and *N. Amer.* handsome timber trees which grow in common soil, and are propagated by layers and cuttings.
- Platt*, Sir Hugh, his works on gardening, page 1099. A. D. 1594.
- Plattes*, Gabriel, his works on gardening, page 1100. A. D. 1633.
- Platylodium*, flat pea, diadel. decan. and leguminosæ, *G. tr.* Austral. which grow in sandy loam and peat, and cuttings root in sand under a hand-glass.
- Plaz*, Anthony William, his works on gardening, page 1123. A. D. 1764.
- Pleacher (from *plecto*, to plait or weave), an arbor-maker, — see *Topiarius*.
- Pleasure-ground, garden-scenery devoted to show and recreation, generally placed near the house, and consisting of lawn, shrubbery, flower-gardens, walks, water, seats, &c.
- Plectranthus*, didyn. gymnos. and labiateae, a *S. tr.* and an. and *G. tr.* and a bien. Africa and *E. Ind.* of easy culture in light soil.

- Plectronia**, pentan. monog. and rhamnææ, a G. tr. C. B. S. which thrives in loam and peat, and ripened cuttings root under a hand-glass in sand.
- Pilea**, ennean. trig. and juncææ, a G. peren. Carol. of common culture.
- Plenck**, J. J., his work on gardening, page 1125. A. D. 1784.
- Plenck ic.**, *Icones Plantarum*, &c., or figures of plants, &c. by Dr. J. J. Plenck.
- Pleurothallis**, gynan. monan. and orchideæ, a S. peren. W. Ind. a parasite which requires to be treated as aërides, &c.
- Plocama**, pentan. monog. and rubiaceæ, a G. tr. Canar. which grows in loam and peat, and ripened cuttings root in sand under a hand-glass.
- Plot** (from *comploter*, to contrive or design), a plot laid out in figures or contrivances, as a parterre.
- Ploughed gardens and their management**, 7453. to 7456.
- Ploughman's spikenard**, — see *Baccharis*.
- Pluk. alm.**, Leon. Plukennet *Almagestum Botanicum*.
- Pluk. phyt.**, L. Plukennet *Phytographia*.
- Plukenetia**, monœc. monad. and euphorbiææ, a S. tr. W. Ind. a climber which grows best in loamy soil, and cuttings root in sand under a hand-glass.
- Plum-tree**, — see *Prunus*.
- Plumbago**, leadwort, pentan. monog. and plumbaginææ, S. tr. E. and W. Ind. a G. tr. C. B. S. and a H. peren. S. Eur. The S. and G. species flower freely in loam and peat, and cuttings root in sand under a hand-glass: the H. species is of easy culture.
- Plumeria**, pentan. dig. and apocynææ, S. tr. E. and W. Ind. which flower freely in light, loamy soil, and require but little water, especially when not in a growing state. Large cuttings laid to dry for a considerable time, and stuck in the tan, will root freely.
- Plumpton**, scenery of, in Yorkshire, 7582.
- Pluviometer**, or rain-gauge, 1286.
- Poa**, meadow-grass, trian. dig. and graminææ, S. peren. and an. E. Ind. and H. peren. and an. Eur. and N. Amer. all of the easiest culture.
- Podalyria**, decan. monog. and leguminosææ, G. tr. C. B. S. pretty plants which grow in loam and peat, and are increased by ripened cuttings in sand, under a hand-glass, or by seeds.
- Podocarpus**, monœc. monadel. and confifereæ, G. tr. China and C. B. S. which grow in loam and peat, and ripened cuttings root readily under a hand-glass in sand.
- Podolepis**, syngen. polyg. super. and corymbifereæ, G. peren. Austral. which thrive well in loam and peat, and are increased by dividing at the root.
- Podolobium**, decan. monog. and leguminosææ, a G. tr. N. S. W. a handsome plant which grows in loam and peat, and young cuttings may be rooted in sand under a bell-glass.
- Podophyllum**, duck's foot, polyan. monog. and papaveraceæ, a H. peren. N. Amer. which thrives in rich, light soil, and is increased by dividing at the root.
- Poederle**, — l'aine, his works on gardening, page 1129. A. D. 1772.
- Poet's cassia**, *osyris alba*.
- Pogonia**, gynan. monan. and orchideæ, a G. peren. and H. peren. N. Amer. which grows best in peat, and is increased by offsets from the bulbs.
- Poincinia**, Barbadoes flower-fence, decan. monog. and leguminosææ, S. tr. E. Ind. which require a strong heat to make them flower well; they grow in loam and peat, and are increased by cuttings in sand, under a hand-glass, or by seeds.
- Poinsot**, —, his work on gardening, page 1121. A. D. 1804.
- Poison-nut**, *strychnos nux vomica*.
- Poison-oak**, *rhus toxicodendron*.
- Poisonous plants**, of common occurrence, in Britain, 4234.
- Polemonium**, Greek valerian, pentan. monog. and polemoniææ, H. peren. N. Amer. and Brit. of the easiest culture.
- Polesdon**, a seat in Surrey, 7527.
- Pollanthes**, tuberose, hexan. monog. and hemerocalidææ, a G. peren. E. Ind., 6332.
- Policie**, the Scotch term for pleasure-ground.
- Polish and Russian works on gardening**, 7697.
- Polish millet**, *digitaria sanguinalis*, 4335.
- Pollichia**, monan. monog. and chenopodææ, a G. bien. C. B. S. of easy culture.
- Polycarpon**, all-seed, tetran. trig. and caryophyllææ, a H. an. Engl. of common treatment.
- Polycnemum**, trian. monog. and chenopodææ, a H. an. S. Eur. of common culture.
- Polygala**, milkwort, diadelph. octan. and pedicularææ, G. tr. C. B. S. and H. tr. peren. and an. Eur. and N. Amer.; the G. sp. grow in peat soil, and young cuttings root freely in sand, under a bell-glass; the hardy sorts prefer a similar soil, and are increased by dividing at the root, or by seeds.
- Polygonatum**, Solomon's seal, hexan. monog. and smilacææ, H. peren. Brit. and Amer. of easy culture.
- Polygonatum vulgare**, 4308.
- Polygonum persicaria**, octan. trig. and polygonææ, a S. peren. and G. bien. E. Ind. and H. tr. peren. and an. Eur. and N. Amer. of easy culture.
- Polymnia**, syngen. polyg. necess. and corymbifereæ, a S. bien. Afr. and H. peren. Amer. of common culture.
- Polypodium**, polypody, cryptog. filices and filicææ, S. peren. W. Ind. and H. peren. Brit. of easy culture.
- Polypody**, — see *Polypodium*.
- Polygogon**, trian. dig. and graminææ, a H. peren. Brit. a grass of the usual culture.
- Pom. Brit.**, *Pomona Britannica*, by Henry Phillips.
- Pomaderris**, pentan. monog. and rhamnææ, G. tr. N. Holl. which thrive in loam and peat, and cuttings root freely in sand under a hand-glass.
- Pomegranate**, — see *Punica*.
- Pon-quá-quá**, his villa, near Canton, 480.
- Ponds**, their formation, 1719, larger excavations, 1945.
- Pondweed**, — see *Potamogeton*.
- Pongamia**, diadel. decan. and leguminosææ, a S. tr. E. Ind. which thrives in loam and peat, and cuttings root in sand under a hand-glass.
- Poniemenia**, a seat at Grodno, 283.
- Ponsonby Hall**, Cumberland, 7593.
- Pontederia**, hexan. monog. and asphodeleæ, a S. peren. E. Ind. and H. peren. N. Amer. aquatics of common culture.
- Ponley**, Mr. William, his works on gardening, page 1112. A. D. 1800.
- Ponthlewa**, gynan. monan. and orchideæ, a S. peren. W. Ind. which grows in sandy loam and peat well drained, and little water given when it is not in a growing state.
- Pontilly Castle**, Cornwall, 7601.
- Ponty Pool**, a seat in Monmouthshire, 7567.
- Poplar**, — see *Populus*.
- Poppy**, — see *Papaver*.
- Populus**, poplar, diœc. octan. and amentaceæ, H. tr. N. Amer. and Eur. of easy culture in moist deep soil, and increased readily, some by cuttings, others by layers, and all by cuttings of the root.
- Populus alba**, and other species grown as timber-trees, 7154, to 7142.
- Porcelia**, polyan. polyg. and annoneææ, H. tr. N. Amer. which grow in loam and peat, and are increased by layers.
- Porchæ**, 1809.
- Port Elliot**, a seat in Cornwall, 7601.
- Portable threshing machine**, in use in gardening, 1705.
- Porticeæ**, 1809.
- Portlandia**, pentan. monog. and rubiaceæ, S. tr. W. Ind. beautiful plants which thrive in sandy loam and peat, and cuttings, with their leaves not shortened, root readily under a hand-glass.
- Portwood House**, Hampshire, 7594.
- Portulaca**, purslane, dodec. monog. and portulacææ, a S. bien. and an. E. and W. Ind. and H. an. S. Amer. and Eur. of common culture.
- Portulaca oleracea**, the garden purslane, 4068.
- Portulacaria**, purslane-tree, pentan. pentag. and portulacææ, a G. tr. Afr. a succulent which thrives in sandy loam and brick rubbish, and is easily increased by cuttings.
- Poscharskey**, Ch. F., his works on gardening, page 1127. A. D. 1808.
- Pot-herbs and garnishings**, 4081; to force pot-herbs, 3399.
- Potamogeton**, pond-weed, tetrandr. tetragyn. and alismacææ, H. peren. Brit. aquatics of easy culture.
- Potatœ**, — see *Solanum*.
- Potentilla**, cinquefoil (five leaves), icos. polyg. and rosacææ, H. tr. peren. and a bien. chiefly Eur. of easy culture.

- Potentilla anserina*, the wild tansy or goose-grass, 4307.
- Poterium*, burnet, monœc. polyan. and rosaceæ, G. tr. S. Eur. and H. peren. Eur. of common culture.
- Poterium sanguisorba*, the common burnet, 4072.
- Pothos*, tetran. monog. and aroidæ, S. peren. W. Ind. and a H. peren. N. Amer. all of which thrive well in loamy soil, and are increased by dividing the roots, or by seed.
- Potsdam, gardens of, 208.
- Powdersham Castle, Devonshire, 7600.
- Powel, Anthony, Esq. his work on gardening, page 1107. A. D. 1769.
- Powerscourt, a seat in Wicklow, 7654.
- Powys Castle, a seat in Montgomeryshire, 7567.
- Poynton, a seat in Cheshire, 7590.
- Pozzi, George, his works on the vine, page 1128. A. D. 1810.
- Prasium*, didyn. gymnos. and labiateæ, F. tr. S. Eur. which thrives in light rich soil, and young cuttings root under a hand-glass.
- Praslin*, formerly Vaux le Vicompte and V. le Villars, now Vause Praslin, a seat near Paris, the first attempt of Le Notre's to lay out grounds.
- Preaudeau-Chemilly*, E., his works on gardening, page 1120. A. D. 1794.
- Prenanthes*, syngen. polyg. æqual. and cichoraceæ, a F. tr. Barb. and H. peren. and a bien. N. Amer. and Eur. of common culture.
- Preserving vegetables, 2289.
- Preserving vegetables, operation for, 2289.
- Preston Hall, in East Lothian, 7619.
- Prestwood, a seat in Staffordshire, 7570.
- Prestwood Hall, Leicestershire, 7573.

- Prick, or pricker, a small dibber, — see Dibber.
- Pricking, or pricking out, transplanting very young plants or seedlings, with a prick or small dibber.
- Primrose, *primula vulgaris*, — see *Primula*.
- Primula*, primrose, pentan. monog. and primulaceæ, H. peren. Eur. beautiful little plants: the hardier sorts grow in loamy soils in shaded situations, and the alpinæ thrive best in peat and loam in pots; all require to be frequently parted and replanted.
- Primula auricula*, the auricula, 6339.
- Primula elatior*, the oxlip, 6403.
- Primula veris*, the cowslip, 6401.
- Primula vulgaris*, the primrose, 6399.
- Primula vulgaris*, var. *polyanthus*, the polyanthus, 6389.
- Prince's feather, *amaranthus hypochondriacus*.
- Prinos, winter berry, hexan. monog. and rhamnææ, F. and H. tr. N. Amer. which grow well in light soil, but prefer peat, and are increased by layers or seeds.
- Priory, a seat in Hampshire, 7594.
- Priory, a seat in Surrey, 7527.
- Priva, didyn. angios. and verbenaceæ, S. peren. Mex. and E. Ind. which grow in loam and peat, and cuttings root readily under a hand-glass.
- Privet, — see *Ligustrum*.
- Professional police of gardening, 7700.
- Promenades, public, equestrian, pedestrian, and mountain, 7313, to 7322.

- Propagation, different operations for, 1985.
- Propriety, as a requisite beauty in gardening, 2357.
- Props for plants, different kinds of, used in gardening, 1517.
- Prosopis*, decan. monog. and leguminosæ, a S. tr. E. Ind. a prickly plant of which the pods are eaten as a spice in India; it grows in loam and peat, and cuttings root in sand under a hand-glass.
- Prospect towers, their use in gardening, 1806.
- Prostanthera*, didyn. gymnos. and labiateæ, a G. tr. N. S. W. a beautiful plant which thrives in loam and peat, and cuttings root in the same soil under a hand-glass.
- Protea*, tetran. monog. and proteaceæ, G. tr. C. B. S. magnificent plants which grow best in light turfy loam, with one third fine sand; the pots well drained, and furnished with a stratum of sherds or gravel; care must be taken not to let the plants droop for want of water, as they will seldom recover. Ripened cuttings taken off at a joint, and pared quite smooth, and thinly planted in pots of sand, will root under a hand-glass, but not plunged; damp must be avoided by wiping the glasses frequently.
- Protecting vegetables, 2206.
- Prunella*, self-heal, didyn. gymnos. and labiateæ, H. peren. and an. N. Amer. and Eur. which thrive in light rich soil, and are increased by dividing at the root.
- Pruning, origin of, 32.
- Pruning, science of, 2110.
- Prunus*, the plum and cherry, icos. di-pentag. and rosaceæ, S. G. and F. tr. W. and E. Ind. and H. tr. Eur. and N. Amer. The G. and F. sp. grow in loam and peat, and cuttings root in sand under a hand-glass: the H. sorts grow in any loamy soil, and are increased by all the modes of propagating trees.
- Prunus avium*, the gean, 4577.
- Prunus cerasus*, the cherry, 4574; cherry-house, 2674; and to force the cherry, 3117.
- Prunus domestica*, the common plum, 4550; to force the plum, 4570.
- Prunus spinosa*, the sloe, 4765; *P. padus*, the bird-cherry, 4766.
- Psiadia*, syngen. polyg. necess. and corymbiferææ, a S. tr. Maurit. which grows freely in rich light soil, and cuttings will root readily under a hand-glass.
- Psidium*, guava, icos. monog. and myrteaceæ, S. tr. W. Ind. grown there for their fruit: here they thrive in loam and peat, and ripen fruit readily; they are increased by cuttings in sand under a hand-glass, or by layers.
- Psidium*, *pyriferum*, *poniferum*, &c. 5982.
- Psilotum*, cryptog. stachyopt. and lycopodineæ, a S. peren. W. Ind. a fern which grows in loam and peat, and cuttings will root under a hand-glass in sand.
- Psoralea diadelph.* decan. and leguminosæ, a S. bien. and G. tr. and peren. chiefly C. B. S. which grow freely in loam and peat, and are increased by cuttings in sand under a bell-glass, or by seeds, which they ripen abundantly.
- Psoralea esculenta*, the bread-root, 4333. 6031.
- Psychotria*, pentan. monog. and rubiaceæ, S. tr. W. Ind. which grow in loam and peat, and cuttings root in sand under a hand-glass.
- Pteris*, brake, cryptog. filices and filiceæ, a S. tr. and peren. W. Ind. G. peren. Mad. N. S. W. and H. peren. Brit. and N. Amer. all of easy culture.
- Pterocarpus*, diadelph. decan. and leguminosæ, S. tr. E. and W. Ind. which thrive in light loamy soil, and cuttings not deprived of their leaves, root in sand under a hand-glass.
- Pteronia*, syngen. polyg. æqual. and cynarocephalææ, G. tr. C. B. S. which thrive in loam and peat, and cuttings root freely under a hand-glass.
- Pterospermum*, monad. dodec. and malvaceæ, G. tr. E. Ind. which thrive well in light loam, and cuttings, not deprived of their leaves, root freely in sand under a hand-glass.
- Pterostylis*, gynan. monan. and orchideæ, a G. peren. N. S. W. which thrives in sandy loam and peat, without much water after it has done flowering.
- Pterygodium*, gynan. monan. and orchideæ, a G. peren. C. B. S. which may be treated as *pterostylis*.
- Puanke-quæ, villa of, near Canton, 676.

- Puddling to hold water, 1719.
- Pulhawa, a seat near Lublin, in Poland, 283.
- Pultein, Samuel, M. A., his work on gardening, page 1105. A. D. 1760.
- Pulmonaria*, lungwort, pentan. monog. and boraginææ, H. peren. Eur. and N. Amer. of easy culture in light soil.
- Pulsatilla*, pasque flower, polyan. polyg. and ranunculaceæ, H. peren. Eur. which grow best in light sandy soil, and may be increased by division at the root.
- Pultenæa*, decan. monog. and leguminosæ, S. tr. Austral. which grow in sandy loam and peat, and cuttings root readily under a bell-glass in sand.

Pulteney, Richard, F. R. S., author of various botanical works, and of *Sketches of the Progress of Botany in England*, 2 vols. 8vo. 1790. He died in 1801.

Pumpkin, cucurbita pepo, 4208.

Pumps used in gardening, 1716.

Punica, pomegranate, icos. monog. and myrteaceæ, a G. peren. W. Ind. H. tr. S. Europ. of easy culture in light soil, and increased by cuttings.

Punica granatum, the common pomegranate, 5952.

Punnet, a small flat basket of from four to twelve inches in diameter, and one to three inches deep, formed of split wood or shavings of timber, — see Basket.

Pupalia, pentan. monog. and amaranthaceæ, a S. tr. and peren. E. Ind. which grows readily in light rich soil, and cuttings root freely under a hand-glass in heat.

Pursh, Fl. Amer., *Flora America Septentrionalis*; or, a Systematic Description and Arrangement of the Plants of North America, by Frederick Pursh.

Purslane, — see Portulaca.

Purslane-tree, portulacaria afra.

Puttenham Priory, Surrey, 1527. to 1217.

Pycnanthemum, didyn. gymnos. and labiateæ, H. peren. S. Amer. which thrive in light rich soil, and are increased by dividing at the root.

Pye, H., Esq., his ideas on laying out public squares, 7321.

Pye, Mrs. Hampden, her works on gardening, page 1108. A. D. 1775.

Pyrethrum, feverfew, syngen. polyg. super. and corymbifereæ, G. tr. Teneriffe and Canaries, and H. peren. Europe, of easy culture.

Pyrola, winter green, decan. monog. and ericeæ, H. peren. Brit. rather difficult to cultivate; they do best in sand or gravel, in a shady situation, and are increased by seeds or young cuttings under a hand-glass.

Pyrus, the apple, pear, service, &c. icos. di-pentag. and rosaceæ, H. peren. chiefly Eur. of easy culture, and increased by seeds, layers, cuttings, &c.

Pyrus aria, the whitebeam-tree, 4768.

Pyrus aucuparia, the mountain ash, 4767.

Pyrus communis, the pear, 4433.

Pyrus domestica, the true service, 4473.

Pyrus malus, the apple-tree, 4339.

Pyrus terminalis, the wild service, 4768.

Pyxidanthera, pentan. monog. and ericeæ, a H. peren. Carolin. which thrives in peat soil, and may be increased by cuttings under a hand-glass.

Pyt House, Wiltshire, 7396.

Q.

Quaking grass, — see Briza.

Quassia, decan. monog. and simarubæ, S. tr. W. Ind. which flower freely in loam and peat, and ripened cuttings, taken off at a joint, not defoliated, root readily in sand under a hand-glass.

Queenby Hall, Leicestershire, 7573.

Queensborough, a seat in Galway, 7672.

Querber, J.—, his works on gardening, page 1120. A. D. 1800.

Quercitron, the dyer's oak, 7072.

Quercus, oak, monœc. polyan. and amentaceæ, H. tr. N. Amer. and Eur. which grow in loamy soil, and are increased by seeds, and some sorts by layers and grafting.

Quercus cerris, the luccombe oak a variety of the Turkey oak, 7071.

Quercus robur and pedunculata, the common oak, 7070.

Queria, trian. monog. and caryophyllæ, a H. an. Spain, of common culture.

Quillwort, isoetes lacustris.

Quince-tree, — see Cydonia.

Quincunx, a mode of planting or disposing of objects, 2076.

Quintinie, Jean de la, his writings on gardening, page 1116. A. D. 1696.

Quisqualis, decan. monog. and combretaceæ, S. tr. E. Ind. climbers, which grow in loam and peat, and root freely in sand under a hand-glass.

R.

Raby Castle, Durham, 7585.

Radiola, all-seed, tetran. tetrag. and sempervivæ, a H. an. Brit. of easy culture.

Radish, — see Raphanus.

Radnorshire, gardens of, 7610.

Rafflesia Arnoldii, and R. horsfieldii, 6737.

Rafnia, diadel. decan. and leguminosæ, a G. bien.

C. B. S. of common culture.

Ragged Robin, lychnis flosculi.

Ragwort, — see Othonna.

Rails, or railings, used in gardening, 1803. and 6092.

Rain-gauge, or pluviometer, 1286.

Rainham, a seat in Norfolk, 7554.

Raith, a seat in Fifeshire, described, 7635.

Rajania, diœc. hexan. and dioscoreæ, a S. peren. W. Ind. which thrives well in rich loam, and is increased by dividing at the roots.

Rake (rateau, Fr.), different kinds of, 1314.

Raking, 1874.

Ramonda, pentan. monog. and solanaceæ, a H. peren. Pyrenees, which thrives in dry rockwork or in pots, in loam and peat, and is increased by dividing at the root, or by seeds.

Ramoon-tree, — see Trophis.

Rampion, — see Campanula and Phyteuma.

Ramsay, James, a Scotch landscape-gardener, 363.

Ramson, allium ursinum.

Rana arborea, or tree-frog, 6086.

Randia, pentan. monog. and rubiaceæ, S. tr. Afr.

and W. Ind. which grow best in sandy loam and peat, and cuttings root in sand under a hand-glass, in moist heat.

Ranft, I. F., his works on gardening, page 1125. A. D. 1789.

Ransleben, his essay on gardening, page 1127. A. D. 1817.

Ranunculus, crowfoot, polyan. polyg. and ranunculaceæ, H. peren. bien. and an. of easy culture in common garden-soil, some requiring a moist situation, and others, as R. aquatilis, to be planted in shallow water.

Ranunculus asiaticus, the garden ranunculus, 6256.

Rape, brassica napus.

Raphanus, radish, tetrad. siliq. and crucifereæ, a H. peren. bien. and an. Eur. of easy culture.

Raphanus sativus, the garden radish, 3754; to force the radish, 3403.

Rapin, René, a French writer on gardening, page 1116. A. D. 1665.

Rapistrum, tetrad. silic. and crucifereæ, H. an. Egypt and Eur. of common culture.

Rarities, as garden decorations, 1841.

Raspberry, rubus idæus, 4696. — see Rubus.

Rastillon, a seat in the county of Cork, 7666.

Rathfarnham Castle, a seat in the county of Dublin, 7653.

Rauch, B. A., his works on gardening, page 1120. A. D. 1801.

Rauwolfia, pentan. monog. and apocynæ, St. tr. S. Amer. and Jamaica, which grow in loam and peat, and cuttings may be rooted in sand under a hand-glass.

Ravensworth Castle, Durham, 7584.

Re, Filippo, his works on gardening, page 1128. A. D. 1809.

Rea, John, gent., his works on gardening, page 1101. A. D. 1665.

Read's garden syringe, 1419.

Reaumuria, polyan. pentag. and ficoideæ, a F. tr.

Syria, a handsome flowering plant in sandy loam and peat, and young cuttings root under a hand-glass.

Red Castle, a seat in Ross-shire, 7647.

Red cedar, juniperus virginiana.

Red Rise, a seat in Hampshire, 7594.

Red spider, — see Acarus.

Redgrave Hall, Suffolk, 7552.

Redouté, J. P. and C. A. Thory, their works on gardening, page 1122. A. D. 1819.

Reeds, — see Arundo.

Reeds, coverings of, used in gardening, 1520.

Regent's Park, London, 7313.

Regina Claudia (*Reine Claude*, Fr.), Queen Claudine, a plum, the green gage of this country, — see Plums, 4553.

Reid, John, his works on gardening, page 1101. A. D. 1683.

Relbania, syngen. polyg. super. and corymbifereæ, a G. tr. C. B. S. which grows in rich, light soil, and cuttings root under a hand-glass.

Religion, its influence on gardening, 512.

Rem. on Hot., Remarks on Hot-houses, page 1112. A. D. 1803.

Rendcome, a seat in Gloucestershire, 7565.

- Rendella*, Prospera, his work on gardening, page 1128. A. D. 1629.
- Rendlesham Hall, Suffolk, 7552.
- Renfrewshire, gardening of, 7628.

- Reseda, dodéc. trig. and resedaceæ, G. tr. Spain, C. B. S. and H. peren. bien. and Eur. all of easy culture.
- Reseda odorata, the mignonette, 6484; tree-mignonette, 6487.
- Residences, the formation and laying out of, 7270; mansion and demesne, villa, villa farm, ferme ornée, temporary residences, cottage ornée, citizen's villa, suburban house, house with carriage-entrance, house with covered entrance, house and conservatory, house and flower-garden-entrance, house and French parterre, common front or street garden, farmer's garden, laborer's cottage and garden, 7271. to 7311.
- Resinous timber-trees, the most useful sorts described, 7039.
- Resson, Jean Baptiste Deschines de, a French author on gardening, page 1117. A. D. 1716.
- Rest-harrow, — see *Ononis*.
- Restio, rope-grass, diœc. trian. and restiaceæ, a G. peren. C. B. S. which thrives in peat soil, and is increased by dividing at the root.
- Retarding vegetation, operations for, 2177.
- Retreat, Devonshire, 7600.
- Retzia, pentan. monog. and convolvulaceæ, a G. tr. C. B. S. which thrives in any rich soil, and cuttings root freely in sand under a hand-glass.
- Rhagadiolus, syngen. polyg. æqual. and cichoraceæ, H. an. Eur. of common culture.
- Rhagodia, polyg. monœc. and chenopodeæ, a G. tr. N. S. W. which thrives in loam and peat, and cuttings root freely under a hand-glass.
- Rhamnus, buckthorn, pentan. monog. and rhamneæ, G. tr. China, C. B. S. and H. tr. Eur. and N. Amer.; the G. sorts thrive in loam and peat, and cuttings root freely in sand under a hand-glass; the H. species grow in the common soil, and are increased by layers or seeds; some of these are evergreens, others decumbent.
- Rhapis, polyg. monœc. and palmææ, a S. tr. and G. bien. China and Carolina, which thrive in sandy loam, and are increased by suckers.
- Rheed, mal., Hortus Indicus Malabaricus. Adornatus per Henr. van Rhee de van Drakenstein.
- Rheum, rhubarb, ennean. trig. and polygoneæ, H. peren. Eur. and Asia, of easy culture.
- Rheum raphanticum, common culinary or tart-rhubarb, 4196; to force rhubarb, 4203.
- Rhexia, octan. monog. and melastomeæ, a S. tr. S. Amer. and F. and H. peren. N. Amer. beautiful plants which grow best in peat soil, and are readily increased.
- Rhinanthus, yellow rattle, didyn. angios. and scrophularineæ, a H. an. which prefers a peat soil, and a moist situation.
- Rhipsalis, iosan. monog. and cactææ, D. S. tr. W. Ind. and S. Amer. succulents of easy culture.
- Rhodiola, rose-root, diœc. octan. and sempervivææ, a H. peren. Brit. of easy culture in dry soil.
- Rhododendron, decan. monog. and rhodoraceæ, G. F. and H. tr. chiefly N. Amer. which prefer peat soil, and are increased by layers or seeds, 6562.
- Rhodora, decan. monog. and rhodoraceæ, a H. tr. N. Amer. which may be treated like rhododendron.
- Rhopala, tetrandr. monogyn. and proteaceæ, S. tr. which grow in sandy loam, with a little peat, and cuttings root in sand under a hand-glass.
- Rhubarb, — see *Rheum*.
- Rhus, sumach, pentan. trig. and terebintaceæ, S. and G. tr. chiefly C. B. S. and H. tr. N. Amer. The G. sorts thrive well in loam and peat, and cuttings root freely under a hand-glass in sand; the H. kinds grow in common soil, and are increased by cuttings of the roots, or layers.
- Rhynchospora, trian. monog. and cyperaceæ, H. peren. Brit. grasses of easy culture.
- Rib-grass, plantago lanceolata.
- Ribes, the currant and gooseberry, pentan. monog. and cactææ, H. tr. Eur. and N. Amer. of easy culture.
- Ribes grossularia, the gooseberry, 4634.
- Ribes nigrum, the black currant, 4578.
- Ribes rubrum, the red currant, 4680.
- Ribes spicatum, the acid or tree currant, 4769.
- Ribstone Hall, Yorkshire, 7582.
- Rice, — see *Oryza*.
- Richard, —, his works on gardening, page 1121. A. D. 1802.
- Richardia, hexan. monog. and rubiaceæ, a S. tr. Vera Cruz, which grows in loam and peat, and cuttings root in sand under a hand-glass.
- Richmond Hill, Surrey, 7527.
- Richmond Park, Surrey, 7529.
- Ricinus, palma Christi, monœc. monad. and euphorbiaceæ, S. bien. and an. and G. tr. E. Ind. and Africa, of easy culture: the tr. species root from cuttings taken off at a joint, and planted under a hand-glass.
- Ricotia, tetrad. silic. and crucifereæ, a H. an. Egypt, of common culture.
- Ridging, 1871. — see *Operations*.
- Riding, a carriage-road or indicated path fit for horses and carriages, made for the display of the scenery of a residence, 7265.

 Roots of wild plants, edible, 4300.
 Rope-grass, — see Restio.
 Rosa, rose, icos. polyg. and rosaceæ, G. Fr. and H. tr. China and Europe; the tender species grow in light rich soil, and cuttings root readily under a hand-glass; the H. sorts grow best in good rich soil, and are increased by layers or by budding or grafting.
 Rose, — see Rosa.
 Rose, table of the species whence have been originated most of the ornamental sorts, 6546; propagation, final situation, general culture, forcing, insects, 6547. to 6561.
 Rose-acacia, robinia hispida.
 Rose-campion, — see Agrostemma.
 Rose of Jericho, anastatica hierochuntica.
 Rose-root, — see Rhodiola.
 Rosemary, — see Rosmarinus.
 Rose, John, his works on gardening, page 1101. A. D. 1666.
 Rosenburg, O — F —, his works on gardening, page 1127. A. D. 1808.
 Rosmarinus, rosemary, dian. monog. and labiateæ, a G. tr. Chili and H. tr. Eur. of easy culture in dry light soil, and increased by cuttings.
 Rosmarinus officinalis, the common rosemary, 4179.
 Rössig, K. Glo., his works on gardening, page 1127. A. D. 1807.
 Rossignol, l'Abbé de, his works on gardening, page 1120. A. D. 1797.
 Rosslyn House, Middlesex, 7520.
 Ross-shire, gardens of, 7647.
 Rotation of crops, rationale of, 1107; new opinions on, 1110; in kitchen-gardens, 2556. and 2557.
 Rotboellia, hard-grass, trian. digyn. and gramineæ, H. an. Eur. of the easiest culture.
 Rotheras, a seat in Herefordshire, 7568.
 Rothia, syngen. polyg. equal. and cichoraceæ, a H. bien. and an. S. Eur. of common culture.
 Rotterdam, gardens of, 128.
 Rotting-ground in nurseries, 6979.
 Rottlera, diœc. icos. and, a G. tr. E. Ind. which grow in loam and peat, and cuttings root in sand under a hand-glass.
 Rough chervil, — see Anthriscus.
 Roulet, Jean Antoine, his work on gardening, page 1127. A. D. 1817.
 Rour, Augustin, his works on gardening, page 1117. A. D. 1750.
 Roxb. cor., Plants of the coast of Coromandel. By Will. Roxburgh.
 Roxburgh House, a seat in Ross-shire, 7647.
 Roxburghia, octand. monogyn. and salicaceæ, a S. peren. E. Ind. a climber which grows in loam and peat, and may be increased, but not readily, by dividing at the root.
 Roxburghshire, gardens of, 7621.
 Royal gardener, 7387.
 Royal gardens, and their management, 7451.
 Royal gardens of Britain; at Carlton House, Hampton Court, Kensington, and Pimlico, 7523; at Kew and Richmond, 7529; at Windsor and Frogmore, 7562; at Brighton, 7533.
 Royena, decan. dig. and ebenaceæ, G. tr. C. B. S. which thrive in loam and peat, and ripened cuttings root readily in sand under a hand-glass.
 Royer, Johann, his work on gardening, page 1123. A. D. 164..
 Rubia, madder, tetran. monog. and rubiaceæ, G. tr. and H. per. Eur. of easy culture in light rich soil.
 Rubus, bramble, icos. polyg. and rosaceæ, a S. tr. and G. tr. E. Ind. and H. tr. Eur. and N. Amer.; the tender kinds thrive in rich light soil, and cuttings root under a hand-glass; the H. sp. are chiefly prickly trailers, which grow in any soil, and are increased by suckers or seeds, and some sorts by cuttings.
 Rubus idæus, the raspberry, 4696; R. fruticosus, the common bramble; R. chamæmorus, the cloud-berry; R. arcticus, the crimson bramble; and R. cæsius, the dewberry, 4770. to 4773.
 Rudbeck, Olaus, his work on gardening, page 1129. A. D. 1664.
 Rudbeck, Olaus, filius, his works on gardening, page 1130. A. D. 1686.
 Rudbeckia, syngen. polyg. frustran. and corymbifereæ, F. and H. peren. and an. N. Amer. of easy culture.
 Rudolphi, J. C —, his works on gardening, page 1126. A. D. 1802.
 Rue, — see Ruta.
 Ruellia, didyn. angios. and acanthaceæ, S. tr. and G. peren. Ind. and Amer. pretty plants of easy culture in light rich soil.
 Ruins as objects in garden-scenery, 1839. and 7237.
 Ruizia, monad. polyan. and malvaceæ, a S. tr. Bourb. which grows in loam and peat, and cuttings root in sand under a hand-glass.
 Rum. Amb., Ge. Everh. Rumphii Herbarium Amboinense.
 Rumex, dock, hexan. trig. and polygoneæ, S. and G. tr. and peren. Afr. and H. peren. and an. Eur. of easy culture.
 Rumex patientia, patience-dock, or spinach-dock, 3807.
 Rumex scutatus and acetosa, the garden-sorrels, 3799.
 Runners, to propagate by, 1991.
 Ruppia, tetran. tetrag. and naiades, a H. peren. Brit. a submarine aquatic, which should be grown in sand, kept moist, and occasionally strewed with salt.
 Rupture-wort, — see Herniaria.
 Rusborough, a seat in Wicklow, 7654.
 Ruscus, butcher's broom, diœc. monad. and smilacææ, a G. and H. tr. Eur. under-shrubs, evergreens, which will grow in shady situations, and are increased by dividing at the root.
 Rush, — see Juncus.
 Rush-broom, viminaria denudata.
 Rush-nut, cyperus esculentus, — see Cyperus.
 Rushbrook Hall, Suffolk, 7552.
 Rushton Hall, Northamptonshire, 7580.
 Russel Square, London, 7320.
 Russelia, didyn. angios. and scrophularineæ, a S. tr. S. Amer. a pretty plant which thrives in light rich soil, and cuttings root readily under a hand-glass in heat.
 Ruta, rue, decan. monog. and rutaceæ, G. and H. tr. and peren. Eur. and Afr. under-shrubs, evergreens which prefer light soil, and are readily increased by cuttings or seeds.
 Rutlandshire, gardens and residences of, 7579.
 Rutter, James, and Daniel Carter, their works on gardening, page 1107. A. D. 1767.
 Rye, — see Secale.
 Rye-grass, lolium perenne.

S.

- Sabal, hexan. trig. and palmææ, a S. peren. Florida, which grows in light sandy loam, and may be occasionally increased by suckers.
 Sabb. hort., Sabbati (liberatus) Hortus romanus.
 Sabbatia, pentan. monog. and gentianeæ, H. bien. N. Amer. of easy culture.
 Saccharum, sugar-cane, trian. digy. and gramineæ, a S. peren. Ind. which grows in rich loam, and is increased by suckers or cuttings of the stem.
 Sacconi, Agostino, his work on gardening, page 1128. A. D. 1697.
 Sacred bean, — see Nelumbium.
 Sage, — see Salvia.
 Sagina, pearlwort, tetran. tetrag. and caryophylleæ, H. an. Brit. of easy culture.
 Sagittaria, arrow-head, monœc. polyan. and alismaceæ, S. and G. peren. China and Amer. and H. peren. Brit. and Amer. aquatics of easy culture.
 Sagittaria sagittifolia, common arrow-head, 4300.
 Sago-palm, sagus rumphii.
 Sagus, sago-palm, monœc. hexan. and palmææ, a S. tr. which requires a sandy loam and a strong moist heat.
 St. Andrew's cross, ascyrum crux Andree.
 St. Anne's Hill, a seat in Surrey, 7527.
 Saint Etienne, Claude de, a French author on gardening, page 1116. A. D. 1660.
 St. John's wort, — see Hypericum.
 St. Laurence's Cottage, Hampshire, 7594.
 St. Mary's Isle, a seat in Kircudbrightshire, 7625.
 St. Peter's wort, symphoria glomerata.
 Saint Peravi, Guerneau de, his works on gardening, page 1118. A. D. 1765.
 Saint Simon, Marquis de, his works on gardening, page 1118. A. D. 1768.
 Saintfoin, — see Hedysarum.
 Salad, to grow in cellars, 3992.
 Salad-plants, — see Acetarius Plants.
 Salads from wild plants, 4311.
 Salicornia, glasswort, monan. monog. and chenopodeæ, a G. tr. Arabia, and a H. tr. peren. and an. Brit. succulent salt-marsh plants, which grow in rich light soil not overwatered.

- Salicornia herbacea*, samphire, 4282.
Salisbury, monœc. polyan. and podocarpeæ, a H. tr. Japan, which grows in sheltered situations, in common garden soil, and is increased by layers.
Salisbury Craig, a hill at Edinburgh, how to improve, 7317.
Salisbury, Richard Anthony, Esq. F. R. S., &c. his writings on gardening, page 1110. A. D. 1791.
Salisbury, William, his writings on gardening, page 1112. A. D. 1797.
Salix, willow, diœc. monan. and amentaceæ, a S. tr. E. Ind. and H. tr. Eur. and N. Amer. which grow mostly in moist soil, and are readily increased by cuttings.
Salix alba, the Huntington and other tree willows grown for timber, 7144.
Salix viminalis, the common osier, and other basket and hoop willows, 7149.
Sallows, — see *Salix*.
Salsify, — see *Tragopogon*.
Salsola, saltwort, pentan. dig. and chenopodeæ, a G. tr. S. Eur. and a H. peren. and an. Eur. and Afr. which may be treated like *salicornia*.
Salt, as a manure, 1189.
Salt-tree, *robinia halodendron*.
Salt-wort, — see *Salsola*.
Salter, J—, his work on gardening, page 1114. A. D. 1816.
Salton Hall, a seat in East Lothian, 7619.
Sa. ram, a seat in Devonshire, 7600.
Salvia, sage, dian. monog. and labiateæ, S. and G. tr. and peren. and H. tr. peren. and an. all of easy culture in light sandy soil.
Salvia officinalis, the common sage, 4140.
Salvia sclarea, clary, 4145.
Satzmann, F. Z., gardener to the King of Prussia, 208; his works on gardening, page 1124. A. D. 1781.
Sam., *Samouelle's Entomologist's Useful Companion*.
Samboursky, —, his poem on gardens, page 1131. A. D. 1788.
Sambucus, elder, pentan. trig. and caprifoleæ, H. tr. and a peren. Eur. and Amer. of easy culture, and increased by cuttings or seeds.
Sambucus nigra, the common elder, as a fruit-tree, 4627; as a forest tree, 7119.
Samphire, — see *Crithmum* and *Inula*.
Samraff, Cp. L., his works on gardening, page 1125. A. D. 1788.
Samyda, decan. monog. and samydeæ, S. tr. W. Ind. which grow, though shyly, in loam and peat, and cuttings root in sand under a hand-glass.
Sandal-wood, *santalum album*.
Sandbeck (sand-brook), a seat in Yorkshire, 7582.
Sandbox-tree, — see *Hura*.
Sandon, a seat in Staffordshire, 7570.
Sandwell Park, Staffordshire, 7570.
Sandwort, — see *Arenaria*.
Sang, Edward, his edition of Nicol's Planter's Kalendar, page 1112. A. D. 1798.
Sanguinaria, pucedon, polyan. monog. and papaveraceæ, a H. peren. which grows best in light sandy soil, and increases by seeds, or offsets from the root.
Sanguisorba, great burnet, tetran. monog. and rosaceæ, H. peren. Brit. and Amer. of common culture.
Sanicle, — see *Sanicula*.
Sanicula, sanicle, pentan. dig. and umbellifereæ, H. peren. Brit. and Amer. of easy culture.
Sans Souci, a royal palace at Potsdam, 208.
Sansevera, hexan. monog. and hemerocallideæ, S. peren. and a H. peren. E. Ind. and China, succulents increased by suckers.
Santalum, sandal-wood, tetran. monog. and santalaceæ, a S. tr. E. Ind. which grows in light loam, and cuttings root in sand under a hand-glass.
Santolina, lavender-cotton, syngen. polyg. æqual. and corymbifereæ, H. tr. and per. Eur. which grow in common garden soil, and are readily increased by cuttings.
Sanvitalia, syngen. polyg. super. and corymbifereæ, a H. an. Mexico, of easy culture.
Sapindus, soapberry, octan. trig. and sapindiaceæ, a S. tr. and G. tr. Amer. which thrive well in loam and peat, and large cuttings root in sand under a hand-glass.
Sapium, monœc. monad. and euphorbiaceæ, a S. tr. W. Ind. which grows in loam and peat, and cuttings root in sand under a hand-glass.
Saponaria, soapwort, decan. dig. and caryophylleæ, H. peren. and an. Eur. of easy culture.
Sarcophyllum, diadel. decan. and leguminosæ, a G. tr. C. B. S. a succulent which grows in loam and peat, not overwatered, and cuttings root readily in sand under a bell-glass.
Sarcostemma, pentan. dig. and asclepiadeæ, a S. tr. E. Ind. a climber which grows in loam and peat, and cuttings root in sand under a hand-glass.
Sarracenia, side-saddle flower, polyan. monog. and F. peren. N. Amer. which grow in pots, with turfy peat at the bottom, and the upper part filled with sphagnum, in which the plants must be set, and then placed in pans of water in a shady situation.
Sartorelli, G. B., his works on gardening, page 1129. A. D. 1816.
Sassafras-tree, *laurus sassafras*.
Satureja, savory, didyn. gymnos. and labiateæ, a S. tr. G. tr. and H. peren. and an. Eur. and N. Amer. of easy culture.
Satureja montana and *hortensis*, winter and summer garden savory, 4170.
Satyrion, gynan. monan. and orchideæ, G. peren. S. Eur. which grow in sandy loam and peat, with little water, when not in a growing state, and are increased by seeds.
Saururus, lizard's tail, heptan. tetrag. and naiades, a H. peren. an aquatic increased by parting at the root.
Saussai, le Sieur de, a French writer on gardening, page 1117. A. D. 1792.
Saussure, Nicolas de, his works on gardening, page 1124. A. D. 1775.
Savanna-flower, *echites suberecta*.
Savi, Gaetano, his work on gardening, page 1123. A. D. 1811.
Savin, *juniperus sabina*.
Savory, — see *Satureja*.
Saw, 1331.
Saw-wort, — see *Serratula*.
Sawing, 1883.
Saxifraga, saxifrage, decan. dig. and saxifrageæ, F. and H. peren. and an. Eur. and N. Amer. chiefly alpine, and well adapted for rockwork; but some, as *S. nivalis*, *hirculus*, &c. are marsh plants; all are of easy culture.
Saxifraga crassifolia, as a tea-plant, 4319.
Saxifrage, — see *Saxifraga*.
Scabiosa, scabious, tetran. monog. and dipsaceæ, G. tr. C. B. S. and H. peren. and an. Eur. all of easy culture in common light soil.
Scabious, — see *Scabiosa*.
Scævola, pentan. monog. and goodenovieæ, a S. tr. and G. tr. and peren. W. Ind. and Austral. which grow freely in loam and peat, and cuttings root readily under a hand-glass.
Scammony, — see *Convolvulus scammonia*.
Scandix, cicely, pentan. dig. and umbellifereæ, H. an. Eur. and Persia, of easy culture.
Scandix cerefolium, chervil, 4107.
Scandix odorata, sweet cicely, 4314.
Scares, for birds and vermin, used in gardening, 1483.
Schabol, Jean-Roger, his works on gardening, page 1118. A. D. 1767.
Schefferia, diœc. tetran. and a S. tr. W. Ind. which grows in loam and peat, and may be increased by layers or cuttings in sand under a bell-glass.
Scheuchzeria, hexan. trig. and juncagineæ, a H. peren. Engl. a marsh plant increased by seeds.
Schiller, I. K., his works on gardening, page 1125. A. D. 1795.
Schinus, diœc. decan. and terebintaceæ, G. tr. and H. tr. S. Amer. which grow in loam and peat, and ripened cuttings, with their leaves not shortened, will root freely in sand under a hand-glass.
Schisandra, monœc. pentan. and menispermœæ, a G. tr. N. Amer. a climber which grows in sandy peat and loam, and ripened cuttings root in sand under a bell-glass.
Schk. Hand., *Botanisches Handbuch*. Von Christ. Schkuhr.
Schkuhria, syngen. polyg. super. and corymbifereæ, a H. an. Mex. of common culture.
Schmahling, L. C., his works on gardening, page 1125. A. D. 1786.
Schmersall, I. F., his works on gardening, page 1123. A. D. 1790.

A. D. 1802.
- Schweitzingen*, Duke of Baden's gardens at, 214.
- Schwenkia*, dian. monog. and scrofularineæ, a S. bien. Guinea, of easy culture.
- Schwobber*, gardens of, in Hanover, 204.
- Scilla*, squill, hexan. monog. and asphodeleæ, a G. peren. and H. peren. Eur. and C. B. S. bulbs of easy culture.
- Scilla esculenta*, the quamash, 4334.
- Scions for grafting* (*scion*, Fr.), 2043.
- Scirpus*, club-rush, triand. monogynia and cyperaceæ, a S. peren. E. Ind. and H. peren. Brit. marsh grasses of easy culture.
- Scirpus tuberosus*, the water-chestnut, 6032.
- Scleranthus*, knawel, decan. dig. and portulacææ, a H. peren. and an. Brit. which grow best in light, sandy soil, and are easily propagated.
- Sclerocarpus*, syngen. polygam. frust. and corymbifereæ, a G. an. Guinea, of common culture.
- Sclerothamnus*, decan. monog. and leguminosæ, a G. tr. of N. Holl. which grows in sandy loam and peat, and young cuttings root in sand under a bell-glass.
- Scleroxylon*, pentandria monogynia and sapoteæ, a G. tr. C. B. S. which grows in loam and peat, and ripened cuttings root in sand under a hand-glass.
- Scolopendrium*, hart's tongue, cryptog. filices and filicæ, H. peren. Brit. of easy culture in peat earth in the shade, or in pots.
- Scolymus*, golden thistle, sygen. polyg. æqual. and cichoraceæ, a F. bien. and H. peren. and an. Eur. As. and Afr. of easy culture.
- Scone Palace*, Perthshire, 7636.
- Scoparia*, tetran. monog. and scrofularineæ, a S. an. Jamaica, of common culture.
- Scopolia*, pentan. monog. and thymeleæ, a S. tr. E. Ind. which grows in loam and peat, and cuttings root in sand under a hand-glass.
- Scorpion-grass*, — see *Myosotis*.
- Scorpion-senna*, coronilla emerus.
- Scorpiurus*, caterpillar, diadelph. decan. and leguminosæ, H. an. S. Eur. of common culture.
- Scorzonera*, viper's grass, syngen. polyg. æqual. and cichoraceæ, H. peren. and bien. Eur. of common culture.
- Scorzonera hispanica*, the garden viper's grass, 3746.
- Scotland*, gardens and residences of, 7615.
- Scottia*, diadelph. decand. and leguminosæ, a G. tr. N. Holl. which thrives in loam and peat, and young cuttings, taken off at a joint, root in sand under a bell-glass.
- Screen-plantations*, 6794. and 6819.
- Screens for sheltering wall-trees*, 1425.
- Screens for sifting earth*, 1392.
- Screw-pine* — see *Pandanus*.
- Screw-tree*, — see *Helicteres*.
- Scrophularia*, fig-wort, didyn. angios. and scrophularineæ, G. bien. and an. and F. and H. peren. Eur. and Amer. of easy culture.
- Sculptures*, 1843.
- Sculptures, vegetable*, 1344.
- Scunk-weed*, *pothos foetida*.
- Scurvy-grass*, — see *Cochlearia*.
- Scutellaria*, skull-cap, didyn. gymnos. and labiateæ, a S. peren. and G. tr. W. Ind. and Crete, and H. peren. Eur. of common culture.
- Scythe*, different sorts used in gardening, 1435. and 1473.
- Sea-buckthorn*, — see *Hippophae*.
- Sea-heath*, — see *Frankenia*.
- Sea-holly*, *eryngium maritimum*.
- Sea-kale*, *crambe maritima*, — see *Crambe*.
- Sea-lavender*, — see *Statice*.

- Selago*, didynam. gymnos. and verbenaceæ, G. tr. C. B. S. which grow in loam and peat, and cuttings root freely in the same soil under a hand-glass.
- Self-heal*, — see *Prunella*.
- Seligmann*, J. M., his works on gardening, page 1123. A. D. 1750.
- Selinum*, milk-parsley, pentan. dig. and umbellifereæ, H. peren. and an. Eur. of easy culture, and increased by dividing at the root or seeds.
- Selkirkshire*, as to gardening, 7622.
- Selwood Park*, Berkshire, 7561.
- Sempervivum*, houseleek, dodec. dodecag. and semperviveæ, G. tr. H. peren. and an. Asia, C. B. S. and Eur. succulents, which answer well treated as sedum.
- Senacia*, pentandria monogynia and rhamneæ, a S. tr. Bomb. which requires the same treatment as *celesturus*.
- Senecio*, groundsel, syngen. polyg. super. and corymbifereæ, a S. peren. G. tr. and bien. C. B. S. and H. peren. bien. and an. Eur. which grow in light soil, and are easily increased by the ordinary means.
- Sensitive plant*, *mimosa sensitiva*.
- Septas*, heptandria heptagynia and semperviveæ, G. peren. C. B. S. succulents which grow in loam and peat, require little water when not in a growing state, and are increased by dividing at the roots.
- Septfoil*, — see *Tormentilla*.
- Sepulchral structures*, as garden buildings, 1792.
- Serapias*, gynandria monandria and orchideæ, G. peren. S. Eur. which thrive in loam and peat, and are increased by dividing at the root or by seeds.
- Seriana*, octan. trig. and sapindeæ, S. tr. S. Amer. which thrive in sandy loam, and cuttings root in sand under a hand-glass.
- Seriola*, syngen. polyg. æqual. and cichoraceæ, H. peren. S. Eur. of easy culture.
- Scrissa*, pentan. monogynia and rubiaceæ, a G. tr. Japan, which grows in loam and peat, and cuttings root freely under a hand-glass in sand.
- Serpicula*, monœc. tetrandria and onagraceæ, a G. peren. C. B. S. a creeper which grows in loam and peat, and cuttings root freely under a hand-glass in sand.
- Serratula*, saw-wort, syngen. polygam. æqualis and

- cynarocephalæ, *H. peren.* Eur. of common culture.
- Serruria, tetran. monog. and proteacæ, *G. tr.* and *A. H. tr. C. B. S.* free flowerers which require the same treatment as protea.
- Sersalisia, pentan. monog. and sapotæ, *A. G. tr. N. Holl.* which grows in sandy loam and peat, and cuttings root readily in sand under a hand-glass.
- Service-tree, — see *Pyrus*.
- Sesamum, oily grain, didyn. angios. and bignoniaceæ, *S. an.* of easy culture.
- Sesbana, diadel. decan. and leguminosæ, *A. S. tr. bien.* and *an. E. Ind.* of common culture. The *S. species* is a beautiful plant.
- Seseli, meadow-saxifrage, pentan. dig. and umbellifereæ, *H. peren. bien.* and *an. Eur.* and *N. Amer.* of easy culture.
- Sesleria, trian. monog. and gramineæ, *H. peren. Eur.* of easy culture.
- Sesuvium, icos. di-pentag. and ficoideæ, *S. peren.* and *an. W. Ind.* and *S. Amer.* succulents which grow in loam and peat, and are easily propagated.
- Shade, in arboriculture, 6765.

 Soft-grass, — see *Holcus*.
 Soft-wooded timber-trees, 7125.
 Soil, 927; mixed soils, 928; aquatic soils, 929; earthy soils, 930; vegetable soils, 938.
 Soils, as indicated by spontaneous vegetables growing on them, 1036; list of plants indicating the more common soils, 1037.
 Soils, improvement of, 1068; by pulverisation, aeration, alteration, removal of superabundant ingredients, incineration, changing the condition of lands as to water, draining, embanking, subterranean irrigation, surface irrigation, changing the condition of lands in respect to atmospheric influence, solar influence, shelter, rotation of crops, Sir H. Davy's opinion on rotations, Grisenthwaite's opinion, 1069 to 1110.
 Soils, table of, their nomenclature and classification, 1034; discovering their qualities, 1035; uses of soil to vegetables, 1051.
 Solandra, pentan. monog. and solanæææ, S. tr. Jamaica, free-growing plants, which, when it is intended they should flower, must be put in a state of rest by withholding water till their leaves drop. Cuttings root easily.
 Solanum, nightshade, pentan. monog. and solanæææ, S. and G. tr. peren. and an. and H. peren. and an. all of easy culture in light rich soil.
 Solanum lycopersicum, the love-apple, 4259.
 Solanum melongena, the egg-plant, 4266.
 Solanum tuberosum, the potatoe, 3644; to force the potatoe, 3381.
 Soldanella, pentan. monog. and primulacææ, H. peren. Germ. alpine, pretty little plants, which grow well in rockwork or in pots, in two thirds peat and one third sandy loam; they are increased by parting the root.
 Soldier-wood, inga purpurea.
 Solidago, golden rod, syngenesia polygamia superflua and corymbiferaæ, H. peren. N. Amer. and Eur. large cumbersome plants of the easiest culture.
 Solomon's seal, — see *Polygonatum*.
 Somerfeldt, Christian, his work on gardening, page 1130. A.D. 178-.
- Somersetshire, gardens and residences of, 7599.
 Samolus, brook-weed, pentan. monog. and primulacææ, a G. peren. N. S. W. and H. peren. Brit. The first grows in loam and peat, and cuttings root under a hand-glass; the other prefers a moist situation, and is increased by dividing at the root.
 Sonchus, sow-thistle, syngen. polyg. æqual. and cichoracææ, G. tr. and H. peren. Madeira, N. Amer. and Eur. of easy culture.
 Sonchus oleraceus, the common sow-thistle, 4299.
 Sonnini, C. S., his works on gardening, page 1121. A.D. 1804.
 Sophiowski, a fine seat in Podolia, now much neglected, 264.
 Sophora, decan. monog. and leguminosææ, a S. tr. India, H. tr. Japan, and H. peren. Eur.; the tender species thrive well in light loam, and cuttings root in sand under a hand-glass; the hardy herbs require a rich loam, and are increased by seeds or dividing at the root.
 Sorghum, polyg. monoc. and graminææ, a S. bien. and H. peren. and an. As. and Eur. of easy culture.
 Sorocephalus, tetran. monog. and proteacææ, G. tr. C. B. S. which require to be treated as protea.
 Sorrel, — see *Rumex*.
 Sour gourd, adansonia digitata.
 South American fruits deserving cultivation, 6020.
 South Lodge, Middlesex, 7520.
 South Sea sea, ilex vomitoria.
 Southam House, Gloucestershire, 7565.
 Southern-wood, artemisia abrotanum.
 Southgate Grove, Middlesex, 7520.
 Sow-thistle, — see *Sonchus*.
 Sowerbaæ, hexan. monog. and asphodeleææ, a G. peren. N. S. W. which thrives in peat soil with plenty of water, and is increased by dividing at the root.
 Sowerby, James, F.L.S., his works on gardening, page 1110. A.D. 1789.
 Sowing, different modes of performing the operation, 2071.
 Spade, Roman (*tigo*), Italian (*zappa*), French (*beche*), and Chinese, 31.
 Spade, spit or spitter (*spada*, Lat. and Sax. *spade*, Dan.), an implement for penetrating and breaking up the soil, different kinds of, 1300.
 Spananthe, pentan. dig. and umbelliferææ, a S. bien. Caraccas, of easy culture.
 Spanish elm, cordia geraschanthus.
 Spanish nut, moræa sisyrinchium.
 Sparaxis, triand. monog. and irideææ, G. peren. C. B. S. bulbs which require the same treatment as *ixia*.
 Spardoni, Paulo, his work on gardening, page 1123. A.D. 1810.
 Sparganium, bur-reed, monoc. trian. and aroidææ, H. peren. Brit. marsh plants, of easy culture.
 Sparrmannia, polyan. monog. and tiliacææ, a G. tr. C. B. S. which grows in loam and peat, and cuttings root readily under a hand-glass.
 Sparrow-wort, — see *Passerina*.
 Spartium, broom, diadel. decan. and leguminosææ, G. and H. tr. Europe and Africa, which thrive in loam and peat, and are readily increased by seeds, or by young cuttings in sand under a bell-glass.
 Spatalia, tetran. monog. and proteacææ, G. tr. C. B. S. which require the same treatment as protea.
 Spathelia, pentan. trig. and terebintacææ, a S. tr. Jamaica, which thrives in light loam, and cuttings root readily under a hand-glass.
 Speechly, William, his works on gardening, page 1108. A.D. 1779.
 Speedwell, — see *Veronica*.
 Spergula, spurrey, decan. pentag. and caryophyllææ, H. peren. and an. of easy culture in soft moist soil.
 Spermaceoæ, button-weed, tetran. monog. and rubiacææ, a S. tr. peren. and bien. As. and Afr. which grow freely in loam and peat, and are increased by cuttings under a hand-glass, or by seeds.
 Sphæranthus, syngen. polyg. segreg. and cynarocéphalææ, a S. peren. E. Ind. and G. an. C. B. S. of easy culture.
 Sphærolobium, decan. monog. and leguminosææ, G. tr. N. Holl. pretty plants, which grow in sandy loam and peat, and young cuttings root readily in sand under a bell-glass.

- Sphenogyne, syngen. polyg. frustran. and corymbiferae, G. tr. and a H. an. C. B. S. which thrives well in light rich soil, and cuttings, in the shade, under a hand-glass, root freely.
- Sphinx elpenor, the elephant hawk-moth, 6193.
- Spiderwort, — see Tradescantia.
- Spilermannia, didyn. angios. and verbenaceae, a G. tr. C. B. S. which may be treated as sphenogyne.
- Spigelia, worm-grass, pentan. monog. and gentianae, a S. an. W. Ind. and H. peren. Amer. which are best grown in loam and peat, and are readily increased by cuttings.
- Spignell, — see Athamanta.
- Spike-rush, — see Eleocharis.
- Spikenard, valeriana jatamansi. V. celtica and officinalis may be used as substitutes by those who prefer this sort of perfume.
- Spilanthus, syngen. polyg. aequal. and corymbiferae, a S. peren. bien. and an. E. Ind. and S. Amer. which grow in rich light soil, and are readily increased either by seeds or cuttings.
- Spinaceous plants, 3766.
- Spinacia oleracea, the common spinage, 3767.
- Spinage, spinacia oleracea, 3766.
- Spindle-tree, — see Euonymus.
- Spiraea, icos. di-pentag. and rosaceae, H. tr. and peren. Eur. and N. Amer. all of easy culture.
- Spiraea filipendula, dropwort, 4304.
- Spitz, A. C., his work on gardening, page 1126. A. D. 1798.
- Spleenwort, — see Asplenium.
- Spofforth, a residence near Wetherby, Yorkshire, 7582.
- Spondias, hog-plum, decan. pentag. and terebin-taceae, S. tr. W. Ind. which grow freely in loam and peat, and large cuttings root in sand under a hand-glass.
- Sponge-tree, mimosa farnesiana.
- Sporobolus, trian. dig. and gramineae, a H. an. India, of the easiest culture.
- Spratsborough Hall, Yorkshire, 7582.
- Sprengel, Kurt, his Gazette of Gardening, page 1126. A. D. 1804.
- Sprengelia, pentan. monog. and epacrideae, a G. tr. N. S. W. which thrives in sandy peat, with the pots well drained, and kept rather in a shady aspect; young cuttings root in sand under a bell-glass.
- Spring Garden, a seat in Galway, 7672.
- Spring-grass, — see Anthoxanthum.
- Spring Grove, Middlesex, 7520.
- Spurge, — see Euphorbia.
- Spurrey, — see Spergula.
- Squares, public, laid out as gardens, 7319; Russel Square, Sloane Square, Edward's Square. &c. 7320. to 7322.
- Squash, cucurbita melopepo.
- Squill, — see Scilla.
- Staavia, pentan. monog. and rhamneae, G. tr. C. B. S. which thrive in sandy peat, and young cuttings root in sand under a bell-glass.
- Stable-dung, 1971.
- Stachys, hedge-nettle, didyn. gymnos. and labiateae, a G. tr. and peren. S. Amer. and C. B. S. and H. peren. and an. Eur. of the easiest culture.
- Stachytarpheta, bastard vervain, dian. monog. and verbenaceae, S. tr. bien. and a G. bien. W. Ind. and S. Amer. pretty plants, which thrive in rich light soil, and cuttings root readily under a hand-glass in heat.
- Stackpool Court, a seat in Pembrokeshire, 7609.
- Stahelina, syngen. polyg. aequal. and cynarocephaleae, G. tr. and a H. tr. S. Eur. which grow in rich light soil, and cuttings root freely under a hand-glass.
- Staff-tree, — see Celastrus.
- Staffordshire, gardens and residences of, 7570.
- Stamford Court, Worcestershire, 7566.
- Standish, Arthur, a writer on gardening, page 1099. A. D. 1613.
- Stanmore House, Middlesex, 7521.
- Stanstead House, Sussex, 7531.
- Stanton Harold, Leicestershire, 7573.
- Stapelia, pentan. dig. and asclepiadeae, D. S. tr. C. B. S. succulents which grow in sandy loam and old lime, with brick rubbish, with little water. In light rich soil they grow more luxuriantly, but are very apt to damp off if they happen to get too much water; they are readily increased by cuttings, and some by suckers.
- Staphylea, bladder-nut, pentan. trig. and rhamneae, H. tr. which grow in any soil, and are readily increased by seeds or layers.
- Star-apple, — see Chrysophyllum.
- Star of Bethlehem, — see Ornithogalum.
- Star of the earth, plantago coronopus.
- Star-thistle, centaurea calcitrapa.
- Star-wort, — see Aster.
- Starkea, syngen. polyg. super. and corymbiferae, a S. peren. Jamaica, which thrives in rich light soil, and cuttings root readily under a hand-glass.
- Statice, sea-lavender, pentan. pentag. and plum-bagineae, G. tr. and peren. C. B. S. and S. Eur. F. and H. peren. Afr. and Eur. The tender kinds grow in sandy loam and peat, the others in light soil, and all are increased by dividing the root, or by seeds.
- Statistics of British gardening, 7375; different conditions of men engaged in the practice and pursuit of gardening, 7377; operators or serving gardeners, 7378; tradesmen-gardeners, 7388; garden-counsellors or artists, 7400; patrons of gardening, 7378. to 7411.
- Statistics of British gardening, different kinds of gardens, 7412; private British gardens, 7413; commercial gardens, 7453; public gardens, 7490; leading gardens of the different counties particularised, 7510.
- Stanton, Nottinghamshire, 7580.
- Staurocanthus, diadel. decan. and leguminosae, a F. tr. Portugal, which grows in loam and peat, and is increased by seeds or young cuttings in sand under a bell-glass.
- Steele, Richard, his work on gardening, page 1110. A. D. 1793.
- Stelis, gynan. monan. and orchideae, S. peren. W. Ind. a parasite which may be treated as atrides, and increased by dividing at the root.
- Stellaria, stitchwort, decan. trig. and caryophyl-leae, H. peren. and an. Eur. of easy culture in sandy soil.
- Stellera, octan. dig. and thymeleae, a H. tr. S. Eur. which grows in light soil, and may be increased by cuttings under a hand-glass or by layers.
- Stemodia, didyn. angios. and scrophularineae, a S. peren. S. Amer. which thrives in light, rich soil, and cuttings root freely under a hand-glass in heat.
- Stenanthera, pentan. monog. and epacrideae, a G. tr. N. S. W. a beautiful plant which grows in loam and peat well drained, and young cuttings root in sand under a bell-glass.
- Stenochilus, didyn. angios. and myoporineae, a G. tr. N. Holl. which grows in loam and peat, and cuttings root freely in sand under a bell-glass.
- Stephanus, Morinus, a French author on garden-ing, page 1116. A. D. 1658.
- Stephenson, David, M. A., his work on gardening, page 1104. A. D. 1746.
- Sterculia, monoe. monad. and sterculiaceae, S. tr. and a G. tr. E. and W. Ind. which thrive in loam and peat, and ripened cuttings, not deprived of their leaves, root readily in sand under a hand-glass in moist heat.
- Sternberg, Baron Von, his works on gardening, page 1127. A. D. 181-.
- Stevia, syngen. polygam. aequal. and corymbiferae, a F. peren. H. peren. and an. Mexico. which answer best in loam and peat, in pots, and cuttings root readily under a hand-glass.
- Stewart Hall, a seat in Tyrone, 7679.
- Stilago, dioc. trian. and terebin-taceae, S. tr. E. Ind. which grow in loamy soil, and cuttings may be rooted in sand under a hand-glass.
- Stillingfleet, Benjamin, his writings on gardening, page 1105. A. D. 1759.
- Stillinga, monoe. monad. and euphorbiaceae, a G. tr. G. peren. and H. tr. China and N. Amer. which grow in loam and peat and cuttings root under a hand-glass; the tender kinds in sand.
- Stinking horehound, — see Ballota.
- Stipa, feather-grass, trian. dig. and gramineae, a H. an. S. Amer. and H. peren. Eur. of easy culture.
- Stirlingshire, gardens of, 7631.

 Stornberg, his plan of a Chinese garden, 478.
 Stourhead, a seat in Wiltshire, 7597.
 Stout Hall, Glamorganshire, 7608.
 Stout's Hill, Gloucestershire, 7565.
 Stove, dry, — see *Dry-stove*.
 Stove, moist, or bark-stove, — see *Bark-stove*.
 Stove-plants, — see *Bark-stove* and *Dry-stove*.
 Stowe, a seat in Buckinghamshire, 7548.
 Stowels, a seat in Gloucestershire, 7565.
 Stradbury Hall, in Queen's County, 7659.
 Stradmore Vale, a seat in Cardiganshire, 7607.
 Stramonium, *datura stramonium*.
 Strapwort, *corrigiola littoralis*.
 Stratiotes, water-soldier, diœc. dodec. and ' alismaceæ, a. H. peren. Eng. an aquatic which only requires to be thrown into a pond or aquarium.
 Stratton Park, Hampshire, 7594.
 Straw coverings used in gardening, 1508.
 Strawberry, — see *Fragaria*. . . . 4712
 Strawberry-blite, — see *Blitum*.
 Strawberry Hill, Middlesex, 7520.
 Strawberry-tree, — see *Arbutus*.
 Streams of water, how to improve in garden-scenery, 7223.
 Streatham, Surrey, 7527.
 Street-gardens, 7292; their management, 7426.
 Strelitzia, pentand. monogyn. and musaceæ, S. tr. C. B. S. which grow in sandy loam, and are increased slowly by suckers. By rubbing the pollen on the stigmas, when the plants are in bloom, perfect seeds are readily obtained. (*Sweet*.)
 Streptopus, hexan. monog. and smilacæ, H. peren. Hung. and N. Amer. which succeed best in light sandy soil, and are increased by dividing at the root.
 Structures, in gardening, 1523; portable or moveable structures, canvass screen, canvass curtain, ideal paper frame netting screen, common glass case, glass tent, common hot-bed frame, separating frame, moveable bottomed frame, Mallet's frame, &c. 1524. to 1538.
 Structures, partly moveable, 1539; earth-pit, bark-pit, flued pit, M'Phail's pit, Alderstone pit; pit with rising frame, West's pit, &c., 1540. to 1544.
 Structures, fixed, 1555; garden walls, brick, stone, or mud walls, solid brick wall, flued wall, cellular wall, mud or earth wall, boarded wall, wavy wall, angular wall, zigzag wall, square pier wall, nurseryman's wall, pined wall, sheltering piers, arched or roofed walls, espalier rails, wooden espaliers, framed wooden espalier rail, cast-iron espalier rail, horizontal espalier rail, oblique espalier rail, 1556. to 1582.
 Structures, permanent, 1583; hot-house, acuminated semi-globe, acuminated semi-dome, semi-ellipse, parallelogram with curved roof and ends, with ridge and furrow roof, polyprosopic hot-house, mushroom-houses, flued mushroom-houses, German mushroom-house, cold-houses, 1584. to 1627.
 Structures, their further improvement, 1850.
 Strumaria, hexan. monog. and amaryllidæ, G. peren. C. B. S. bulbs which thrive in sandy loam and decayed leaves, require little water when not in a growing state, and are increased by offsets or seeds.
 Struthiola, tetrandria monogynia and thymelææ, G. tr. C. B. S. which grow in sandy peat, and young cuttings root freely in sand under a bell-glass.
 Strychnos, pentan. monog. and apocynææ, S. tr. E. Ind. which grow in sand and peat, and cuttings root in sand under a bell-glass.
 Stuartia, monad. polyan. and tillacææ, H. tr. N. Amer. handsome plants which thrive in peat soil or very sandy loam; they flower after attaining a good size, and are increased by layers in peat.
 Stub House, Durham, 7584.
 Studley Royal, Yorkshire, 7582.
 Stutthorpe, Yorkshire, 7582.
 Stylidium, gynan. dian. and stylidææ, a G. tr. and peren. Austral. which grow in sandy loam and peat, and are increased by seeds or parting at the root: the shrubby species by cuttings under a hand-glass.
 Sympheia, pentand. monogyn. and epacridææ, G. tr. N. S. W. beautiful plants which grow in sandy loam and peat, and young cuttings root in sand under a bell-glass.
 Styrax, storax, decan. monogyn. and ebenacææ, H. tr. Italy and N. Amer. which thrive and flower freely in light sandy loam, and are increased by layers or seeds.
 Subularia, awlwort, tetrad. silic. and cruciferae, a H. an. Brit. an aquatic of easy culture.
 Suburban villa, 7285; suburban house, 7286; their management, 7430.
 Succisæ repullulant (from *succido*, Lat. to cut down, and *repululo*, Lat. to bud or sprout), trees which stole, or which being cut over spring again.
 Succory, — see *Cichorium*.
 Succowia, tetrad. silic. and cruciferae, a H. an. Minorca, of common culture.
 Suckers to propagate by, 1992.
 Sudborne Hall, Suffolk, 7552.
 Suffocation, a disease of plants, 893.
 Suffolk, gardens and residences of, 7552.

 Sun-fern, polypodium phegopteris.
 Sun-flower, — see *Helianthus*.
 Sun-rose, — see *Helianthemum*.
 Supple-jack, *paullinia polyphylla*.
 Surrey, gardens and residences of, 7524.
 Surveyor of trees and timber, 7401.
 Sussex, gardens and residences of, 7530.
 Sutherlandia, diadel. decan. and leguminosæ, C. B. S. which thrives in loam and peat, and is readily increased by seeds.
 Sutherlandshire, gardens of, 7646.
 Swallow-wort, — see *Asclepias*.
 Sweet, Robert, F. L. S., his writings on gardening, page 1114. A. D. 1818.
 Sweet flag, *acorus calamus*.
 Sweet gale, *myrica gale*.
 Sweet gum tree, *liquidambar styraciflua*.
 Sweet herbs, 4131.
 Sweet pea, *lathyrus odoratus*.
 Sweeping, 1877.
 Swertia, felwort, pentan. dig. and gentianææ, a H. peren. Eng. a marsh plant which prefers a peat soil.
 Swietenia, mahogany-tree, decan. monog. and meliacææ, S. tr. W. and E. Ind. which grow in loam and peat, and ripe cuttings, with their leaves not shortened, root freely in sand under a hand-glass in moist heat.
 Swinden, N., his work on gardening, page 1108. A. D. 1778.
 Swine's succory, — see *Hyoseris*.
 Swings as garden decorations, 1821.
 Switzer, Stephen, his works on gardening, page 1102. A. D. 1715.
 Symphoria, St. Peter's wort, pentan. monog. and caprifolia, a H. tr. N. Amer. a dwarf shrub which grows in the shade of other trees in any soil, and is increased by cuttings in the open ground.
 Symphytum, comfrey, pentan. monog. and boragi-nææ, H. peren. Eur. of easy culture.

Synedrella, syngenesia polygamia superflua and *corymbifera*, a S. an. W. Ind. of common culture, 1749.
Syrian rue, peganum harmala.
Syringa, lilac, dian. monog. and oleineæ, H. tr.
 Persia and China, of easy culture.
Syringa, common, — see *Philadelphus*.
Syringe, garden, different sorts of, 1418.

T.

Tabern. ic., *Icones plantarum* (eadem acin *Tabernæmontani Krauterbuch*).
Tabernæmontana, pentan. dig. and apocynæ, S. tr. W. and E. Ind. which thrive well in loam and peat, and cuttings root in sand under a hand-glass.
Tacca, hexan. monog. and aroidæ, S. peren. E. Ind. which grow in loam and peat with little water, and are increased by suckers.
Tacamahac, *populus balsamifera*.
Tagetes, syngen. polyg. super. and *corymbifera*, a G. peren. and H. an. S. Amer. of common culture.
Taille d'éte, summer pruning, 2138.
 Taking vegetables or crops, — see *Gathering*.
Taliaris, a seat in Caermarthenshire, 7614.
Tallium, dodec. monogyn. and *portulacæ*, S. tr. and bien. W. Ind. and S. Amer. of a succulent nature, which grow in light sandy loam, and cuttings root freely.
Tallies, or numbering instruments, different kinds of, 1377.
 Tallow-tree, *stilingia sebifera*.
Tamarind, — see *Tamarindus*.
Tamarindus, *tamarind-tree*, monadelph. trian. and leguminosæ, a S. tr. W. Ind. which grows in loam and peat, and cuttings root under a bell-glass in sand.
Tamarisk, — see *Tamarix*.
Tamarix, *tamarisk*, pentan. trig. and *portulacæ*, a S. tr. E. Ind. and H. tr. Eur. of easy culture, and increased by cuttings.
Tamus, black briony, diœc. hexan. and *smilacæ*, a G. tr. C. B. S. and H. peren. Eur. The G. species *T. elephantipes*, or elephant's foot, is a curious plant which thrives in light, rich soil, not overwatered when the plant is in a dormant state. Sweet recommends "young cuttings to be taken off at a joint, and planted in pots of sand in bottom heat under a hand-glass." (*Bot. Cult.* 262.) The H. sorts are of easy culture.
Tamus communis, the common black briony, 4285.
Tan, — see *Bark* for the use of tanners.
Tan-y-Bwlch Hall, a seat in Merionethshire, 7612.
Tanacetum, tansy, syngen. polyg. super. and *corymbifera*, G. tr. C. B. S. and H. peren. and an. Eur. of easy culture in common soil.
Tanacetum vulgare, the common tansy, 4187.
Tansy, — see *Tanacetum*.
Tarchonanthus, African seabane, syngen. polygam. æqual. and *corymbifera*, a G. tr. C. B. S. of easy culture.
Tare, — see *Ervum*.
Tatin, A., his works on gardening, page 1120. A. D. 18—.
Tatton Park, Cheshire, 7591.
Taurida, gardens of, 259.
Tavistock, a seat in Devonshire, 7600.
Taxus, yew-tree, diœc. monad. and *conifera*, a G. tr. China, and H. tr. Brit. the exotic species grow in loam and peat, and roots, not without difficulty, by cuttings, in sand, under a bell-glass; the common yew is increased only by seeds, 7122.
Taylor, Adam, his works on gardening, page 1107. A. D. 1769.
Taymouth, a seat in Perthshire, 7636.
Tea-tree, *camellia bohea* and *C. viridis*.
Teak-wood, — see *Tectona*.
Teasel, — see *Dipsacus*.
Tectona, *teak-wood*, pentan. monogyn. and *verbenacæ*, a S. tr. E. Ind. which grows in loam and peat; ripened cuttings root freely in sand under a hand-glass.
Teedia, didyn. angios. and *scrophularinæ*, G. bien. C. B. S. of easy culture.
Teesdalia, tetrad. silic. and *crucifera*, a H. an. Brit. of common culture.
Telephium, *orpine*, pentan. trigyn. and *portulacæ*, a H. peren. S. Eur. well adapted for rockwork, and easily increased.
Telopea, *waratah*, tetran. monog. and *proteacæ*,

a G. tr. N. S. W. one of the most beautiful of green-house plants, which grows in equal parts of loam, peat, and sand, well drained, not overwatered, and placed in an airy situation; ripened cuttings, taken off at a joint, just before growth commences, root in sand under a hand-glass, but not plunged in heat.
Temple, Sir William, his works on gardening, page 1101. A. D. 1685.
Temple Grove, formerly Sheen Grove, near East Sheen, Surrey, the seat of Sir William Temple's horticultural operations referred to by Evelyn and himself. The house is now a boarding-school, 1666.
Templemore, a seat in Tipperary, 7667.
Temples, 1808.
Templetonia, diadel. decan. and leguminosæ, a G. tr. N. Holl. which grows in sandy loam and peat, and young cuttings root freely under a bell-glass in sand.
Temporary country-residence, 7281.
Tenthredinidæ, a natural order of insects, comprehending chiefly the Linnaean genus *tenthredo*, or saw-fly.
Tephrosia, diadel. decan. and leguminosæ, S. and G. tr. peren. and bien. C. B. S. Ind. and Amer. which thrive in loam and peat, and are increased by cuttings in sand under a bell-glass.
Terebinthinate trees, such as have a resinous, or turpentine odor.
Terebration, a mode of grafting, 2038.
Teredo pinorum, the *noctua pinastri*, L. a moth whose caterpillar feeds on the leading shoot of the common pine, and often leaves that tree without a leader, 7044, and 900.
Terminalia, polyg. monœc. and *combretacæ*, S. tr. E. Ind. which grow in sandy loam, and ripened cuttings, not defoliated, root in sand under a bell-glass.
Terraces, 7256.
Tessier, A. H., his works on gardening, page 1120. A. D. 1791.
Tetragonia, icos. di-pentag. and *ficoideæ*, G. tr. peren. bien. and an. C. B. S. and Austral. somewhat succulent, which prefer sandy soil, and root readily by cuttings.
Tetragonia expansa, New Zealand spinach, 3794.
Tetragonotheca, syngen. polyg. super. and *corymbifera*, a H. peren. Virgin. which grows in light, rich soil, and is increased by dividing at the root, or by seed.
Tetratheca, octan. monogyn. and *tremandrea*, a G. tr. N. S. W. a pretty plant, which thrives in loam and peat, and cuttings root in sand under a bell-glass.
Tetseady Park, Cornwall, 7601.
Teucrium germander, didyn. gymnos. and *labiateæ*, G. F. and H. tr. and H. peren. and an. Eur. and Amer. of easy culture in almost any soil.
Thalia, monan. monog. and *cannææ*, a G. peren. S. Carolin. an aquatic, rather hardy, and increased by dividing at the root.
Thalictrum, meadow-rue, polyan. polyg. and *ranunculacæ*, H. peren. Eur. and N. Amer. some of which are adapted for rockwork, or growing in pots, and all are of easy culture.
Thame Park, Oxfordshire, 7558.
Thapsia, deadly carrot, pentan. dig. and *umbellifera*, H. peren. Eur. of easy culture.
Thelygonum, monœc. polyan. and *urticææ*, a H. an. S. Eur. of easy culture.
Thelymitra, gynand. monandr. and *orchidææ*, a G. peren. N. S. W. which grows in sandy loam and peat, and requires little water when not in a growing state.
Theobalds, a seat in Hertfordshire, 7544.
Theobroma, chocolate-nut, polyad. decan. and *malvacææ*, S. tr. S. Amer. which grows in light, rich soil, and cuttings root in sand under a hand-glass.
Thermometer, different sorts of, for gardens, 1483, 1489, and 1490.
Thermopsis, decan. monog. and leguminosæ, a H. peren. Siberia, a pretty plant, rather difficult of culture; it grows best in light loam, and is increased by seed.
Thesium, bastard toad-flax, pentan. monog. and *santalacææ*, a G. tr. and H. peren. Eur. Amer. and C. B. S. of which the H. species grow best in chalky soil, and are increased by seeds, and the G. tr. is of common culture in light loam.

- Trees, classification of, according to their uses, 6763; for timber, bark, charcoal, ashes, pales and fencing, hoops, &c. shelter, shade, improving bad soil, separation and defence, seclusion, 6780. to 6794.
- Trees, their uses in ornamental scenery, 6795; magnitude, form, mode of growth, duration, and expression, 6796. to 6801.
- Trees, their wounds, bruises, casualties, and defects, 6925.
- Trees, insects and vermin by which they are infested, 6934.
- Trees, their products, 6935; prunings, thinnings,

- seeds, osier-grounds, coppice-woods, 6936. to 6940.
- Trees, season for cutting, 6941; mode of cutting, barking, pollards, period of felling, operation of felling, season of felling, 6942. to 6957.
- Trees, uses of their roots, 6961; method of charring, 6962.
- Trees, valuation of, 6963; as plantations, as timber, measurement of, 6967. to 6972.
- Trees, nursery for, — see Nursery.
- Trees, their nursery culture, 6982; coniferous, nut-bearing, berried stoves, berries and capsule bearing trees, with small seeds, with leguminous seeds, small soft-seeds, general culture of, 6983. to 7026.
- Trefoil, — see Trifolium.
- Trelawney House, Cornwall, 7601.
- Tremadoc House, a seat in Merionethshire, 7612.
- Trenching, 1870.
- Trent Place, Middlesex, 7521.
- Trentham, a seat in Staffordshire, 7570.
- Trevirana, didynam. angios. and scrophularineæ, a S. peren. Jamaica, which flowers freely in sandy loam and peat, the pots being kept dry as soon as the flowering season is over till the roots begin to vegetate.
- Trew ehret., *Plantæ selectæ, quarum Imagines, pinxit Ge. Dion. Ehret. Collegit et illustravit Christ. Jac. Trew.*
- Trewia, diœc. polyan. and , a S. tr. E. Ind. which grows in loam and peat, and cuttings root in sand under a hand-glass.
- Trianon grand, a royal garden near Paris, 172.
- Trianon petit, a royal garden near Paris, 169.
- Trianthema, decan. dig. and portulacæ, S. an. E. and W. Ind. of common culture.
- Tribulus, caltrop, decan. monog. and rutacæ, a S. peren. and an. and H. an. Eur. and Amer. which grow in light soil, and cuttings root freely in sand under a hand-glass.
- Trichilia, decan. monog. and meliacæ, S. tr. W. Ind. which thrive in loam and peat, and cuttings root in sand under a hand-glass in heat.
- Trichodesma, pentan. monog. and boragineæ, a S. an. and H. an. E. Ind. and C. B. S. of common culture.
- Trichodium, trian. dig. and gramineæ, H. peren. N. Amer. and Brit. of easy culture.
- Trichomanes, cryptog. filices and filicæ, a H. peren. Brit. of easy culture in loam and peat in the shade.
- Trichonema, trian. monog. and iridæ, G. peren. and a H. peren. bulbs which may be treated as ixia.
- Trichophorum, trian. monog. and cyperacæ, H. peren. Brit. and N. Amer. grasses of easy culture in moist soil.
- Trichosanthes, snake-gourd, monœc. monad. and cucurbitacæ, a S. peren. and F. an.; the S. species thrive best in rich sandy loam, and cuttings root freely under a hand-glass in a moist heat; the others may be treated as cucumis.
- Trichostema, didyn. gymnos. and labiateæ, a H. bien. and an. N. Amer. of common culture.
- Trientalis, winter green, heptan. monog. and primulacæ, a H. peren. Brit. and N. Amer. which grow best in light soil, and are increased by dividing at the root or by seeds.
- Triewald, Martin, his writings on gardening, page 1103. A. D. 1729., and page 1130. A. D. 1740.
- Trifolium, trefoil, diadelph. decan. and leguminosæ, H. peren. bien. and an. Eur. Afr. and N. Amer. of easy culture, and increased by dividing the roots or by seeds.
- Triglochin, arrowgrass, hexan. trig. and juncagineæ, a G. peren. and H. peren. C. B. S. and Brit. marsh plants of easy treatment.
- Trigonella, fenugreek, diadelph. and leguminosæ, S. an. and H. peren. bien. and an. E. Ind. and Eur. of easy culture.
- Trillium, hexandria trigynia and smilacæ, a G. peren. and H. peren. N. Amer. which do best in a bed of peat in a moist shady situation, and are increased, though slowly, by dividing at the root.
- Tring Park, Hertfordshire, 7544.
- Triodia, trian. dig. and gramineæ, a H. peren. Brit. of easy culture.
- Triosteum, feverwort, pentan. monog. and caprifolia, H. peren. N. Amer. which grow freely in rich, light soil, and are increased by cuttings under a hand-glass, or by dividing the root.
- Tripsacum, monœc. trian. and gramineæ, a H. peren. N. Amer. of easy culture.
- Trisetum, trian. dig. and gramineæ, a H. peren. and an. Eur. of common culture.
- Tristania, polyad. icos. and myrtaceæ, G. tr. N. S. W. which grow in sandy loam and peat, and cuttings, not too much ripened, root readily in sand under hand or bell glasses.
- Triticum, wheat-grass, trian. dig. and gramineæ, H. peren. and an. Eur. and Asia, of common culture.
- Tritoma, hexan. monog. and hemerocallidæ, a F. peren. C. B. S. which thrive best in peat soil, and are increased by dividing at the root.
- Tritonia, trian. monog. and iridæ, Br. G. peren. C. B. S. bulbs which may be treated as ixia.
- Triumfetta, dodec. monog. and tiliacæ, S. tr. and an. E. and W. Ind. which grow in loam and peat, and cuttings root in sand under a hand-glass.
- Trolius, globe-flower, polyan. polyg. and ranunculacæ, Eur. and N. Amer. of easy treatment.
- Tropæolum, Indian cress, octan. monog. and geraniacæ, G. tr. bien. and an. Peru, which grow in light, rich soil, and are of easy increase by cuttings or seeds.
- Tropæolum majus, common Indian cress, 4116.
- Trophis, ramoon-tree, diœc. tetran. and , S. tr. E. and W. Ind. which grow freely in loam and peat, and cuttings root under a hand-glass in sand.
- Trowel, Samuel, his work on gardening, page 1104. A. D. 1739.
- Trowel, the garden, 1308.
- Troximon syngen. polyg. æqual. and cichoracæ, H. peren. N. Amer. which grow freely in rich, light soil, and are increased by seeds.
- Troy House, Monmouthshire, 7567.

- Tuberosæ, polyanthes tuberosa — see Polyanthes.
- Tuilleries (tile-grounds, or tile-kilns), gardens of the, at Paris, 161.
- Tulbagia, hexan. monog. and hemerocallidæ, H. peren. C. B. S. which grow in sandy loam, and are increased by offsets from the bulbs.
- Tulip, — see Tulipa.
- Tulip-tree, — see Liriodendron.
- Tulipa, tulip, hexan. monog. and liliacæ, H. peren. bulbs, Eur. which grow best in sandy soil, and are increased by offsets.
- Tulipa gesneriana, the common tulip, 6242.
- Tupelo, — see Nyssa.
- Tupistra, hexan. monog. and aroidæ, a peren. Amboyna, which may be grown in loam and peat.
- Turf, the superiority of British, 5399.
- Turf-raser, &c., 1317. to 1319.
- Turfing, the transplanting or laying down turf, 2101.
- Turneric, — see Curcuma.
- Turnip, — see Brassica.
- Turnera, pentan. trig. and portulacæ, S. tr. an. and H. an. which grow in rich, light soil, and are increased by cuttings under a hand-glass or by seeds.
- Turnsole, — see Heliotropium.
- Turritis, tower-mustard, tetrad. siliq. and crucifereæ, H. peren. and an. Eur. of easy culture.
- Tussilago, colt's foot, syngen. polyg. super. and corymbifereæ, a S. bien. and H. peren. W. Ind. and Eur. of easy culture. T. fragrans is a desirable plant for a green-house during winter, on account of the odor its flowers diffuse at that season.
- Tway-bla e, listera ovata.
- Tweedale, county of, s. to gardening, 7623.
- Twickenham, village of, in Middlesex, 7520.
- Twickenham Park, Middlesex, 7520.
- Twinstead Hall, Essex, 7541.
- Tyford House, Middlesex, 7520.
- Tynningham, a seat in Haddingtonshire, 7619.
- Typha, cat's tail, monœc. trian. and aroidæ, H. peren. Brit. marsh plants of easy treatment.
- Tzaritzina, or Zaritzina, an Imperial residence near Moscow, 262.

U.

- Udum salictum* (*udas*, *a*, *um*, wet or moist, and *salictum*, *i*, a willow-ground), a proper situation for growing willows.
- Ulex*, furze, diadel. decan. and leguminosæ, H. tr. Brit. which grow best in dry soil, and are increased by seeds.
- Ulmus*, elm-tree, pentan. dig. and amentaceæ, H. tr. Brit. and N. Amer. and a G. tr. China, all of which thrive in loamy soil, and the G. species is increased by cuttings under a hand-glass.
- Ulmus campestris*, and other species grown as timber-trees, 7081.
- Ulua lactuca*, 4358.
- Umbrella-wort, — see *Oxybaphus*.
- Underley Park, near Kirby Lonsdale, 6182.
- Ungehauser*, J. A., his works on gardening, page 1123. A. D. 1741.
- Utiola*, sea-side oat, trian. dig. and gramineæ, H. peren. N. Amer. of easy culture.
- Unona*, polyan. polyg. and anoniaceæ, a S. tr. Java, which grows best in light loam, and ripened cuttings root in sand under a hand-glass.
- Up Park, Sussex, 7531.
- Upsal, botanic garden of, 248.
- Urania*, hexan. monog. and musaceæ, a S. tr. E. Ind. which thrives in loamy soil with plenty of water and a strong heat, and is increased by imported seeds.
- Urena*, monad. polyan. and malvaceæ, S. tr. and a G. tr. E. Ind. and Surinam, which grow in loam and peat, and are increased by seeds or cuttings.
- Uropetalon*, hexan. monog. and asphodelæ, G. and F. peren. C. B. S. bulbs which may be treated as *ixia*, &c.
- Urtica*, nettle, monœc. tetran. and urticæ, S. tr. and peren. W. Ind. and F. and H. peren. and an. Eur. all of which grow well in rich, light soil, and are readily increased by the usual means.
- Urtica dioica*, the common stinging nettle as a pot-herb, and to force, 4296.
- Ustilago*, a small fungus, which is thought to occasion the blight and smut, 878.
- Utensils, 1390; mould-screen, mould-sieve, mould-scuttle, mould-basket, flower-pot, store-pot, pot for bulbous roots, classic pot, stone-ware pot, glazed pot, flowerpot-gauge, square pot, saucer, carnation-saucer, propagation-pot, blanching-pot, plant-box, plant-basket, planter's basket, watering-pot, watering-tube, garden-syringe, hand-forcing-pump, portable canvass or gauze case, oiled paper shade, straw-net, garden-net, horizontal shelter, plant-umbrella, earthenware shelter, leaden hand-glass, copper hand-glass, cast-iron hand-glass, wrought-iron hand-glass, green bell-glass, crystal bell or receiver, utensils for entrapping vermin, 1391. to 1438.
- Utility, as expressive of design in landscape-gardening, 7169.
- Utricularia*, hooded milfoil, dian. monog. and lentibularia, H. peren. Brit. marsh plants, which prefer peat soil, or they will grow in pots of sphagnum with a little peat earth at bottom, set in pans of water.
- Uvaria*, polyan. polyg. and annonaceæ, S. E. and W. Ind. which thrive best in sandy loam, and ripened cuttings root in sand under a hand-glass in heat.
- Uvularia*, hexan. monog. and melanthaceæ, H. peren. N. Amer. which grow in light sandy soil, and are increased by dividing at the root.
- V.
- Vaccinium*, whortleberry, decan. monog. and ericæ, G. and H. tr. Brit. and N. Amer. which thrive best in peat soil, or sand and peat, and are increased by layers, young cuttings under a bell-glass, or by seeds.
- Vaccinium hispidulum*, and other fruit-bearing species, 4774.
- Valantia*, polyg. monœc. and rubiaceæ, a H. peren. and an. Brit. of easy culture.
- Valmont*, l'Abbé de, a French writer on gardening, page 1116. A. D. 1705.
- Valentines, a seat in Essex, 7542.
- Valerian*, — see *Valeriana*.
- Valeriana*, valerian, trian. monog. and dipsacæ, H. peren. and an. Eur. of easy culture; the smaller sorts grow best in light soil, and answer well for pots or rockwork.
- Valeriana locusta*, or lamb-lettuce, — see *Fedia*.
- Valleyfield, a seat in Fifeshire, 7635.
- Van Dieman's Land, gardening of, 504.
- Van Kampen*, et fils, their works on gardening, page 1129. A. D. 1760.
- Van Sterbeck*, Francis, his works on gardening, page 1129. A. D. 1682.
- Vander Groen*, J., his work on gardening, page 1129. A. D. 1699.
- Vases as decorations, 1835.
- Vanguiera*, pent. monog. and rubiaceæ, a S. tr. Ind. which grows in sandy loam and peat, and cuttings root freely in sand in heat under a hand-glass.
- Vanilla*, gynan. monan. and orchideæ, S. tr. trailers and parasites, which root at every joint into the bark of the trees, on which they grow. They may be treated as aërides, and are readily increased by cuttings.
- Various British authors, who have touched incidentally on gardening, page 1105. A. D. 1760.
- Vegetable kingdom, origin and progress of the study of, 547; among the ancients, in modern times, in the present day, 548. to 554.
- Vegetable glossology, or the names of the parts of plants, 555.
- Vegetable phytagraphy, or the nomenclature and description of plants, 557; vulgar mode of naming plants, scientific rules for names, names of classes and orders, names of genera, of species, of varieties and subvarieties, description of plants, herbariums, methods of study, &c. 558. to 582.
- Vegetable taxonomy, or the classification of plants, 583; methods in use, table of the Linnean method, of the method of Jussieu, detail of the Linnean system, and arrangement of the genera under the different classes and orders, arrangement of the genera under the classes and orders of Jussieu, 584. to 589.
- Vegetable organology, or the external structure of plants, 590. Perfect plants: their conservative organs — root, trunk, branches, leaf, frond; conservative appendages — germs, glands, tendrils, stipulæ, ramenta, armature, pubescence, anomalies; reproductive organs — flower, flower-stalk, receptacle, inflorescence, fruit; reproductive appendages; appendages proper to the flower of the fruit. Imperfect plants: filices, equisetaceæ, and lycopodiaceæ — conservative organs, reproductive organs; musci — conservative organs, reproductive organs; hepaticæ — conservative organs, reproductive organs; algæ and lichens — conservative organs, reproductive organs, utility of the algæ; fungi — conservative organs, reproductive organs, uses of the fungi, 591. to 604.
- Vegetable anatomy, or the internal structure of plants, 605. Decomposite organs — seed, nucleus, pericarp, flower-stalk, leaf-stalk, gems, buds, bulbs, propago, gongylus, caudex, appendages; composite organs — epidermis, pulp, pith, cortical layers, ligneous layers, concentric layers, divergent layers; elementary or vascular organs — utricles, tubes, large tubes, small tubes, apertures, pores, gaps, appendages, 606. to 634.
- Vegetable chemistry, or primary principles of plants, 635. Mechanical processes; chemical processes; compound products — gum, sugar, starch, gluten, albumen, fibrina, extract of catechu, of senna, of quinquina, of saffron, coloring matter, tannin, bitter principle, narcotic principle, oxalic acid, citric acid, malic acid, gallic acid, tartaric acid, benzoic acid, prussic acid, fixed oils, volatile oils, wax, butter of cacao, of coco, of nutmeg, tallow of croton, wax of myrtle, resins, rosin, mastich, bloom, gum-resins, balsams, camphor, caoutchouc, cork, woody fibre, charcoal, sap, proper juice, ashes, alkalies, earths, silica, magnesia, metallic oxides; simple products, 636. to 714.
- Vegetable physiology, or the functions of plants, 715. Germination of the seed, physical phenomena, chemical phenomena; food of the vegetating plant — water, gasses, carbonic acid gas, oxygen, nitrogen, hydrogen, extracts, salts, earths, manures; process of nutrition — introssuption, ascent of the sap, causes of the sap's ascent, elaboration of the sap, of carbonic acid, of oxygen, decomposition of water, descent of the proper juice, causes of descent: process of vegetable development; elementary organs — compo-

- site organs, annuals and annual shoots, perennials and their annual layers, circulation of vegetable juices; decomposite organs, the root, the stem, the branches, the bud, the leaf, the flower, and fruit: anomalies of vegetable development—the root, the stem, the branch, the bud, the leaves, the flower, the fruit, the habit, physical virtues, duration: sexuality of vegetables, discoveries of the moderns, impregnation of the seed, access of the pollen, theory of the animalculist, hybrids; changes consequent upon impregnation, external changes, internal changes; propagation of the species; equivocal generation, seeds, gems, runners, slips, layers, suckers, grafting; causes limiting the propagation of the species: evidence and character of vegetable vitality—excitability, heat, frondescence, efflorescence, maturation of the fruit; calendarium flora; irritability, stimuli, instinct, definition of the plant, 716. to 858.
- Vegetable pathology, or the diseases and casualties of the lives of plants, 859; wounds and bruises, incisions, boring, girdling, fracture, pruning, grafting, felling, buds destroyed, leaves destroyed, decortication; diseases—blight, smut, mildew, honey-dew, dropsy, flux of juices, gangrene, etiolation, suffocation, contortion, consumption; natural decay, of the temporary organs, flower, fruit, of the permanent organs, 860, to 907.
- Vegetable geography, or the territorial distribution of plants, 908. Geographical distribution; physical distribution—temperature, elevation, moisture, soil, mixed soils, aquatic soils, earthy soils, vegetable soils, light; civil causes affecting distribution; characteristic, or picturesque distribution, systematic distribution, arithmetical distribution, economical distribution, distribution of the British flora, application of the native flora of Britain, artificial flora, native countries of the exotics of British gardens, periods of their introduction, obvious character of the plants cultivated in British gardens, their botanical and horticultural distribution, according to the Linnæan system, according to that of Jussieu, British flora procurable at the nurseries, hardy plants, greenhouse and dry-stove plants, hot-house plants, annuals, native and exotic, artificial application of the British flora, fruit-trees and plants, herbaceous plants used for culinary purposes, florists' flowers, hardy barren trees and shrubs, herbaceous plants used in agriculture for food, and in the arts, miscellaneous application of hardy herbaceous plants, application of various ornamental exotics which require the protection of glass, native habitations of plants, 909. to 1032.
- Vegetable culture as derived from the study of plants, 1004: to increase the number and retain the native qualities of plants; to increase the number and improve the qualities of plants; increasing the magnitude; to increase the number, improve the quality, and increase the magnitude; to form new varieties; to preserve plants for future use, 1004. to 1016.
- Vegetable sculptures, their formation, 1844.
- Vegetables, to form new varieties of, 1013.
- Vegetables, to preserve for future use, 2289.
- Vegetables composing the Hortus Britannicus, arranged according to the Linnæan system, 588; the Jussieuian system, 589; to the departments of horticulture, 986.
- Vegetables which first attracted man's attention as food, 26.
- Vegetation to accelerate or force, operations for, 2181.
- Vegetation to retard, operations for, 2177.
- Velezia, pentan. dig. and caryophyllæ, a H. an. Spain, of common culture.
- Veltheimia, hexan. monog. and hemerocallideæ, G. peren. C. B. S. bulbs, which grow in light loam, and are readily increased by offsets; or the leaves pulled off close to the bulb, and planted, will deposit bulbs at their base, as will many other scaly and coated bulbs.
- Venerie, a royal residence at Turin, 77.
- Vent. mal., Jardin de la Malmaison. Par E. P. Ventenat.
- Venus's comb, scandix pecten.
- Venus's flytrap, dionæa muscipula.
- Veratrum, polygam. monœc. and melanthaceæ, H. peren. Eur. and N. Amer. which grow best in rich sandy soil, and are increased by dividing at the root, or by seeds, which should be sown as soon as ripe.
- Verbascum, mullein, pentan. monog. and solanæ, G. peren. and bien. and H. peren. bien. and an. all of easy culture on light soil.
- Verbena, vervain, didyn. angios. and verbenaceæ, H. peren. bien. and an. Eur. and N. Amer. which thrive in any common soil, and are increased by dividing at the root.
- Verbesina, syngen. polyg. super. and corymbifereæ, S. an. and a tr. E. Ind. and W. Ind. and G. peren. and H. peren. Amer. which grow in common soil, and are readily increased by cuttings, seeds, or dividing at the root.
- Vermin, traps and snares used for, in gardening, 1435. and 1473.
- Vernonia, syngen. polyg. æqual. and corymbifereæ, a S. bien. E. Ind. and H. peren. N. Amer. which grow well in rich loam, and make a fine show in autumn.
- Veronica, speedwell, dian. monog. and scrophulariæ, G. tr. and peren. N. Hol. and H. peren. and an. Eur. all of easy culture in any soil: the G. species are propagated by cuttings under a hand-glass, and all the rest by seeds, or dividing the root.
- Veronica beccabunga, brooklime, 600.
- Veronica spicata, British tea, 4317.
- Vervain,—see Verbena.
- Vesicaria, tetrad. silic. and crucifereæ, H. peren. and a bien. S. Eur. of common culture.
- Vespa vulgaris, the common wasp, 4837.
- Vestia, pentan. monog. and solanæ, a G. tr. Chili, which thrives in loam and peat, and cuttings root freely under a hand-glass.
- Vetch,—see Vicia.
- Viat, —, his works on gardening, page 1122. A. D. 1819.
- Vibert, J. P., his work on gardening, page 1122. A. D. 1820.
- Viburnum, pentan. trig. and caprifolia, a G. tr. Canaries, and H. tr. Eur. and N. Amer. which thrives well in common soil, and are increased by layers or cuttings under a hand-glass in a shady situation; both the G. and H. kinds are early flowerers, which render them very desirable.
- Vicia, vetch, diadel. decan. and leguminosæ, a S. an. E. Ind. G. peren. C. B. S. and H. peren. Eur. of easy culture in light soil.
- Vicia faba, the common bean, 3612.
- Vigne de la Reine, a seat near Turin, 77.
- Vilain, Madame, her villa near Ghent, 125.
- Villa-farm, 7279; management of, 7430. and 7435.
- Villa-residence, 7278; management of, 7435.
- Villaneuve, a seat near Warsaw, 282.
- Villarsia, pentan. monog. and gentianæ, a G. peren. and H. peren. aquatics which flower freely.
- Viminaria, rush-broom, decan. monog. and leguminosæ, a G. tr. which grows in sandy loam and peat, and is readily increased by seeds or cuttings under a bell-glass in sand.
- Vinca, periwinkle, pentan. monog. and apocynæ, a S. tr. and an. E. Ind. and H. peren. and an. shrub, Eur. The S. species grows in light, rich earth, and flowers the greater part of the year, and cuttings root in sand under a hand-glass. The H. sorts are trailers, and are increased by cuttings, layers, or dividing at the root.
- Vine,—see Vitis.
- Vine, a seat in Hampshire, 7594.
- Vinery, its construction, 2656.
- Vineyard-nursery, at Hammersmith, 7518.
- Viola, violet, pentan. monog. and violacæ, a G. tr. and H. peren. and an. N. Amer. and Eur. which grow in light soil, are well adapted for rockwork or pots, and are readily increased by seeds or parting the root.
- Violet,—see Viola.
- Viper's bugloss,—see Echium.
- Viper's grass,—see Scorzonera.
- Virgilia, decan. monog. and leguminosæ, G. tr. Afr. and a H. tr. N. Amer. which thrive in loam and peat, and young cuttings root in sand under a bell-glass.
- Virginian poke, phytolacca decandra.
- Virgin's bower,—see Clematis.
- Viscum, mistletoe, diœc. tetran. and caprifolia, a H. tr. Eng. parasite, 6588.
- Visnaga, toothpick, pentan. dig. and umbellifereæ, a H. an. S. Eur. of common culture.
- Visnea, dodec. trig. and ebenacæ, a G. tr. Canaries, which grows in loam and peat, and ripened cuttings root in sand under a hand-glass.
- Vispère, Francis Xavier, his dissertation on the growth of wine in England, page 1109. A. D. 1786.

- Vitex*, chaste tree, didyn. anglos. and verbenacæ, S. and G. tr. E. Ind. which grow in loam and peat, and cuttings root freely in sand under a hand-glass.
- Vitis*, vine, pentan. monog. and vites, a S. tr. Ind. and H. tr. N. Amer. of easy culture, and readily increased by cuttings or layers.
- Vitis vinifera*, the common grape-vine, 4790; culture in the open air in various ways, 4816; in the vinery and other hot-houses, 2940.
- Vittaria*, cryptog. filices and filicæ, a S. peren. Amer. of easy culture in loam and peat, and increased by dividing the root or by seeds.
- Voerhelm*, George, his work on gardening, page 1129. A. D. 1752.
- Volkamer*, Johann Christoph, his works on gardening, page 1123. A. D. 1700.
- Volkameria*, didyn. anglos. and verbenacæ, S. tr. W. Ind. which thrive well in loam and peat, and cuttings root freely under a hand-glass.
- Von Brocke*, H. C., his works on gardening, page 1124. A. D. 1763.

 Worm, the common, *lumbricus terrestris*. Worms may either be destroyed by picking them up by hand very early in the morning, or late in the evening during moist weather, or by watering with lime or salt water.
 Worm-grass, — see *Spigelia*.
 Wormleybury, a seat in Hertfordshire, 7544.
 Wormsley, a seat in Oxfordshire, 7558.
 Wormwood, — see *Artemisia*.
 Wrightia, *pentan. monog.* and *apocynææ*, S. tr. E. Ind. which thrive in loam and peat, and cuttings root readily in sand under a hand-glass.
 Wrotham Place, Middlesex, 7521.
 Wroxton, a seat in Oxfordshire, 7558.
 Wulfenia, *dian. monog.* and *scrophularinææ*, a H. an. *Carinthia*, of common culture.
 Wynnestay, a seat in Denbighshire, 7605.
 Wycombe Abbey, Buckinghamshire, 7547.
 Wycombe Park, Buckinghamshire, 7547.
 Wyke House, Middlesex, 7520.

X.

- Xanthium, *monœc. pentan.* and *corymbifereæ*, H. an. Eur. and China, of common culture.
 Xanthochymus, *polyad. polyan.* and *guttifereæ*, a S. tr. E. Ind. a fine-looking plant, which thrives in light loam, and cuttings root in sand under a hand-glass in heat.
 Xanthorrhæa, *hexan. monog.* and *asphodelææ*, G. peren. N. S. W. which thrive well in loam and peat, and are increased by offsets.
 Xeranthemum, *syngen. polyg. super.* and *corymbifereæ*, H. an. S. Eur. of common culture.
 Ximenesia, *syngen. poly. super.* and *corymbifereæ*, a G. bien. Mexico, of easy culture, and increased by cuttings.
 Xiphidium, *trian. monogyn.* and *hemodoracææ*, S. tr. peren. W. Ind. which thrive in sandy loam and peat, and are increased by dividing the roots.
 Xylomelum, *tetran. monog.* and *proteacææ*, a G. tr. N. S. W. which may be treated as *banksia*.
 Xylophylla, *pentan. trig.* and *euphorbiacææ*, H. tr. Eur. which grow in common soil, and are increased by layers, or ripened cuttings under a hand-glass.
 Xylopiæ, *polyan. polyg.* and *anoniacææ*, S. tr. W. Ind. which grow in sandy loam, and cuttings root in sand under a hand-glass.
 Xyris, *trian. monogyn.* and *restiæcææ*, a G. peren. and H. peren. N. S. W. and Carol. pretty plants, which thrive in peat soil, and are readily increased by dividing at the root.
 Xysmalobium, *pentan. dig.* and *asclepiadææ*, a G. tr. C. B. S. which grows in loam and peat, and cuttings root in sand under a hand-glass.
 Xystus, or terrace, 41.

Y.

- Yam, *dioscorea sativa*.
 Yarrow, *achillea millefolium*.
 Yellow bird's nest, *monotropa hypopithys*.
 Yellow rattle, *rhinanthus crista-galli*.
 Yellow root, *zanthorhiza apiifolia*.
 Yellow wort, *chlora perfoliata*.
 Yeo Vale, a seat in Devonshire, 7600.
 Yester House, a seat in East Lothian, 7619.
 Yew-tree, — see *Taxus*.
 Yorkshire, gardens and residences of, 7581.
 Yucca, Adam's needle, *hexan. monog.* and *liliacææ*, S. G. and H. tr. As. and S. Amer. which grow in rich loam, and are increased by suckers from the roots.

Z.

- Zacintha, syngen. polyg. æqual. and cichoraceæ, a H. an. S. Eur. of common culture.
- Zaluzania, syngen. polyg. super. and corymbifereæ, a F. peren. Mex. which grows in rich, light soil, and cuttings root readily under a hand-glass.
- Zamia, diœc. polyan. and cycadææ, S. and G. tr. C. B. S. W. Ind. and Austral. which grow in light sandy soil, and some species may be increased by suckers.
- Zamoyst, a seat in Poland, 283.
- Zannichellia, pond-weed, monœc. monandria and naideæ, a H. an. an aquatic.
- Zanthorhiza, yellow root, pentan. polyg. and ranunculaceæ, a H. tr. which grows in common soil, and is increased by suckers.
- Zanthoxylum, toothach-tree, diœcia pentand. and terebintaceæ, a S. and G. tr. and a H. tr. The tender species grow in sandy loam, and cuttings will root in sand under a hand-glass; the hardy sorts in any soil, and cuttings of the roots will shoot into plants in bottom heat.
- Zapania, didyn. angios. and verbenaceæ, a S. and G. peren. W. Ind. and Amer. which grow in light, rich soil, and cuttings root freely under a hand-glass.
- Zaritzina, or Tzaritzina, a palace and gardens near Moscow, 262.
- Zarskoje-selo, or Tzarskoje-selo, an imperial residence near Petersburg, 257.
- Zea, Indian corn, monœc. *rian. and gramineæ, a H. an. Amer. of easy culture, 4335.
- Zedoary, curcuma zerumbet.
- Zeyher and G. Romer, their works on gardening, page 1127. A. D. 1815.
- Zieria, tetran. monog. and rutaceæ, a G. tr. N. S. W. a pretty plant, which grows in sandy loam and peat, and young cuttings root in sand under a bell-glass.
- Zingiber, ginger, monan. monog. and scitamineæ, S. peren. which grow in light, rich soil, and are increased by dividing at the root.
- Zinnia, syngen. polyg. super. and corymbifereæ, H. an. S. and N. Amer. of common culture.
- Zizania, monœc. hexan. and gramineæ, a H. an. N. Amer. an aquatic which only requires to be sown in shallow water or on the margin of a pond.
- Ziziphora, dian. monog. and labiateæ, H. tr. peren. and an. Eur. which grow freely in rich, light soil, and are increased by seeds or cuttings.
- Zizyphus, pentan. monogynia and rhamneæ, S. G. and H. tr. As. Af. and Eur. of which the tender kinds grow well in loam and peat, and cuttings root in sand under a hand-glass; the H. species are increased by seeds or ripened cuttings under a hand-glass.
- Zizyphus lotus, the true lotus, and Z. jujuba, the jujube-tree, 6016.
- Zœgea, syngen. polyg. frustr. and cynarocephaleæ, a H. an. Levant, of the usual culture.
- Zorn. ic, Icones plantarum medicinalium, Von Joh. Zorn.
- Zornia, diadel. decan. and leguminosæ, a S. tr. and an. E. Ind. which grow freely in rich, light soil, and cuttings root easily under a hand-glass.
- Zoph, K., his work on gardening, page 1126. A. D. 1798.
- Zygophyllum, bean-caper, decan. monog. and rutaceæ, G. tr. and a H. peren. C. B. S. which thrive in loam and peat, and cuttings root readily under a hand-glass.

THE END.

pieces with the greatest perfection. Sir Henry and Lady Bunbury, with Mr. Bunbury and Mr. Edward Bunbury, welcomed the visitors on the lawn, to which an approach was made from the marquee by an arch of evergreens; and after the Horticultural Show had been inspected the company spread themselves over the velvet turf, or wandered through the inviting shades of the shrubberies, and admired the noble specimens of the arboretum, amongst which towers a standard *Magnolia acuminata*, a magnificent tree, 50 feet in height, the Douglas fir, sixty feet high, one of the largest in England, the Cephalonian fir, thirty feet, which was first introduced, we believe, by her ladyship's brother; a beautiful *araucaria imbricata*; *cryptomeria japonica*, 8 feet high; *abies Frazerii*, 20 feet; *abies Khutneri*, 16 feet; a very fine *pinus cembra*; several very fine *liriodendron tulipiferum*, or tulip trees, just coming into flower; a fine weeping ash, over whose drooping branches the Dundee rambler rose was spread in profuse flower—an excellent idea; and last, though far from least, we must notice a gigantic silver fir, 106 feet high, 12 feet in circumference at 2 feet from the ground, and straight as an arrow—its equal is, perhaps, not to be found in the country.
