"It is not a rare sight, when well treated, to see it reach from 3 to 4 feet in height, a blaze of colour. Ordinarily it sends up a spike about a foot in length, the upper part of which is densely studded with large, violet-purple flowers edged with the most delicate fringe; the divisions of the lip are fan-shaped, and very pretty. It flowers in June."—GARDEN. 3s. 6d. each.

RED-FLOWERED YUCCA

(Hesperaloe yuccaeifolia).

The white-flowered Yucca is well-known. It is obvious then what a pleasing sight it must be to view a Yucca 4 to 5 feet high, with long, magnificent spikes of orange-red flowers. 15s and 21s. each.

HELONIAS BULLATA.

This rare species is found in its native habitat in thick woods, so will make a most valuable addition to our comparatively few English flowers that will thrive and bloom underneath the shade of trees.

Flower-stem from 1 to 2 feet high; colour of bloom reddish-purple. We would strongly recommend all our patrons who have shady nooks or trees under which nothing seems to bloom, to give this lovely stranger a trial. 3s. 6d. and 5s. 6d. each.

PYXIDANTHERA BARBATULA

"First among our treasures is the delicate *Pyxie*, a little prostrate, trailing evergreen, forming dense tufts or masses, and among its small dark green and reddish leaves are thickly scattered the rose-pink buds and white blossoms."—GARDEN. 3s. 6d. each.

DIELYTRA CHRYSANTHA.

A yellow *Dielytra* sweet-scented! are two qualities which to our English gardeners might be put down as "unknown."

To imagine such a valuable addition has been discovered, growing 5 to 6 feet high and producing magnificent golden-yellow blooms, at the same time emitting a most delicious and enchanting odour. 4s. 6d. each.

TRITOMA SAUNDERSI.

This is a new and immense variety of the well-known "Poker Plant," altogether eclipsing, however, both in form and bloom, those varieties known to our gardeners.

To imagine magnificent spikes of orange-red blooms, each 18 to 24 inches long, conveyed but an inadequate idea until the flower is itself viewed. 3s. 6d. each.

FOR OTHER RARE and BEAUTIFUL PLANTS, BULBS, HARDY ORCHIDS, see our ILLUSTRATED AUCTUMN CATALOGUE OF FLORAL GEMS, gratis and post-free on application, wherein will be found offered many marvellously beautiful, rare, and curious species not to be found offered in any other English Catalogue.

Whilst as regards the Popular Dutch Bulbs, it will be seen that our Prices are as low as any of the Dutch Houses of respectability—the size and qualities being also exceptional.

To planters therefore who wish to "save" expense we would certainly solicit a perusal of our Catalogue ere ordering elsewhere.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 19, 1885.

THE ROSE IN 1885.

"COMPARISONS are odious," but nevertheless, when Rose enthusiasts meet together and talk over the results of the previous campaign, they are apt to have very different opinions as to the character of a Rose season, and such is poor human nature, that it is very frequently the case that that judgment is influenced by the character of the blooms in the garden of the speaker. If from day to day he has been in the habit of looking at luxuriant foliage and fine blooms, he eventually comes to the conclusion that the season is a good one; while, on the other hand, if he has had his plants smothered with aphid, or devoured by greenfly, the bud-worm, or dusted over with orange fungus, he, in giving his opinion, declares, "Never had a worse season." In looking at our prospects as Rose growers before the blooming season commenced, I ventured to say, that unless the unforeseen happened, we should have a first-rate season. Well, I do not think it came up quite to that high-water mark, but I should unhesitatingly pronounce it to be the best we have had for some years; the long-continued dry weather, combined with excessive heat, just prevented its being a model season, for seeing a good many Rose gardens as I do, and visiting as large a number of Rose shows as the brief Rose season will permit me to do, in the capacity of judge, I am not confined to the inspection of my own garden, but form my judgment, be it accurate or not, on a very wide and extensive area, beginning in our south-eastern district late in June, and ending with Darlington in the end of July. I have seen Roses in the most varied conditions of soil and climate, and am justified in calling it a brilliant, although from the intense heat a brief, season. I am now writing of course of exhibition Roses and exhibitions, although it is equally true of garden Roses, of which I hope to have something to say ere long.

It has been favourable for the following reasons:—The winter had been a mild one, following on a fine and warm autumn, consequently, rosaries were full of hard well ripened wood; this would have enabled them to resist frost, had it come, but it did not. And although we had, as usual, the inevitable late frosts, yet they were not so destructive as in many years. Then it was a season when aphides were certainly not in the ascendant; in my own garden and those of several friends whom I have visited, there was not a vestige of one to be seen: in a few localities indeed it was otherwise—at Aldminster, near Stratford-on-Avon, they were unusually abundant, and at Bishop Stratford I was told by a very successful Dahlia grower that you could not walk through the streets without being covered with them. These, however, were exceptions, as the rule was the other way. Then there was no disturbance of the blooms by heavy rains, or indeed by rains of any sort: for weeks, in many parts of the kingdom, not a drop fell, and where possible watering had to be

resorted to; but those who know how destructive to good blooms is heavy rain, must have felt its absence a great advantage. Against these advantages must be placed the long and severe drought, and the very hot weather at the latter part of July; this reduced the length of time in which Roses were really good very considerably, and after the middle of July most growers in the southern parts of the kingdom were *hors de combat*; very few made their appearance at Birkenhead, and only one at Darlington, and although many were anxious to do so they found it quite impossible.

With regard to the quality of the Roses exhibited it must be borne in mind that we are yearly becoming more exacting, and raising the standard both as to freshness of colouring and size. I sometimes think over the stands that Mr. Hedge, of Colchester, used to exhibit twenty years ago, and which used to astonish people then, and I am convinced that were they to be placed alongside of those exhibited now by Messrs. Slaughter, W. Haywood, Hall, Whitwell, Pemberton, and other amateurs, we should be surprised at the immense difference. It may be questionable whether too much stress may not be laid upon size, and whether in the endeavour to obtain that we may not be degenerating into coarseness. Looking at the Roses which have been exhibited during the past season, I feel pretty confident that the amateurs were better than the nurserymen, and that it would have been difficult for the latter at South Kensington to have beaten the former; at the same time I do not think there was exhibited this year any stand of which one could say "What a wonderful stand of Roses that is!" Nor did I, as a rule, see any Rose stand up prominently above its fellows, claiming attention and asserting its superiority; at the same time I think it must be conceded that there were fewer mediocre blooms exhibited than in previous years; the much neater arrangement of the boxes, the better manner in which the Roses were supported, and the staging quality of the blooms, endorsed the fact that the secrets of Rose growing are better understood, and that exhibitors have not attended shows in vain, and after all that has been said or done, we are apparently not able to devise anything better than the old regulation stand, with its green moss, bed for the Roses. There was at one time a great hubbub about using something else, and the advocates of black velvet were very strenuous in their exertions to get it allowed by the National Rose Society. They succeeded, but its warmest advocates have since given it up and fallen back on the old form of exhibiting.

We generally find that one Rose in a season comes exceptionally fine, and the palm this year must be given to Ulrich Brunner, a very large and well petalled Rose, which has been very bright and good. It has been, as might have been supposed, a grand season for light coloured Roses. Such flowers as Catherine Souper, Madame Lacharme, Monsieur Noman, Captain Christy, La France, and others of a similar character, have come out uncommonly well, for in wet weather they get soiled and stick together, while in bright sunny weather they freely display their beauty. A light coloured Rose that did not do well in 1885 is never likely to be worth much. It was not a year for A. K. Williams. Very seldom was it exhibited in good form.

As to the quantity of Roses exhibited I imagine it never was greater, if so great, as in the past year. Formerly it was no uncommon thing at the National Rose Society's exhibitions for many prizes to be unclaimed, as there were no exhibitors. It is not so now. Every class is well contested, and every prize claimed, and this I find to be nearly the same with provincial shows. These, too, have multiplied exceedingly, so that in all parts of the kingdom Rose societies are started. Some have an ephemeral existence, others have the elements of per-

manence, and at these shows the immense number of Roses exhibited is astonishing. There is one thing that the past season has done for such societies: it has given them, with hardly an exception, fine weather for their exhibitions; and if they have suffered loss this year they are never likely to be successful. The classes, too, at these provincial shows have greatly increased in numbers, so that a very large number of Roses must be exhibited. The two shows of the National Rose Society were a great success, that at South Kensington was probably the best the Society has ever held; but even there, owing to the hot weather immediately preceding it, a large number of exhibitors were unable to fulfil their engagements and dropped out. This was still more the case at Manchester so far as the Southern growers were concerned, but withal it was a fine show, and as far as my experience goes the same may be said of most of the shows throughout the kingdom.

NEW ROSES.

Another matter which is always of interest to Rose growers is the question of novelties, indeed one of the first questions one is asked is, Were there any good new Roses, and what are they? I think we must say that 1885 has been almost barren in this respect. Taking the Rose lists issued last autumn by the French and English raisers, it is somewhat remarkable to find that not one of them has as yet made its mark—all the high-sounding names and brilliant descriptions notwithstanding. I say "as yet," for it is very rarely that a decided opinion can be given on a new Rose the first year of its introduction, it is so forced and propagated that it has hardly a fair chance of developing its true character. This more especially refers to the foreign raised Roses. Our English raisers have not the same difficulty to contend with, and will not exhibit a Rose until it is in good form. Mr. H. Bennett has made a successful hit in his Mrs. John Laing, which obtained the National Society's Gold Medal; it is a fine deep rose-coloured flower, something between Mons. Noman and Francois Michelon, and, I think, a better Rose than Her Majesty, which I am disloyal enough to think will be too coarse, unless caught very young. Alphonse Souper promises well, but that is all that can be said of it. Merveille de Lyon was shown in large numbers, as might have been expected in a year that so well suited it, and when put right it is without doubt the finest white Rose we have, but it is, unhappily, too apt to show its eye, and there was not a stand of twelve shown but had some in it defective for this reason.

There are two Roses which must be unmasked—one, Lusidas, sent from Portugal, and let out at the modest sum of 50 francs, which, according to the *Journal des Roses*, is simply our old friend Celine Forestier; and Gloire Lyonnaise, which was described as a yellow hybrid perpetual. It was sent out by Guillot (fils), of Lyons, a raiser to whom we are indebted for many good Roses, amongst others, La France; and all one can say is, that if it be so, the climate of Lyons is more adapted for bringing out that tint in Roses than that of England. Here it has been simply a Captain Christy style of flower, with just the faintest suspicion of primrose at the base of the petals. Whether this is the commencement of a fresh break: one cannot say, but as a yellow hybrid perpetual it is simply a "take in."

It is amongst that lovely class—the Tea Roses—that the best novelties have been brought forward, not exactly and absolutely new, for Madame de Watteville, Madame Cusin, and the Hon. Edith Gifford, and Grace Darling are none of them new, but all are acquisitions. The first is a most distinct Rose—white, shaded with rose, and with the deeper colour-

edging the petals. It is a flower of great beauty, substance, and perfume. Madame Cusin is another Rose which has been especially good. Mr. Cranston, of Lamport, showed a stand of it at Canterbury which will not soon be forgotten by any who saw it. It is of a rosy-purplish tint, vigorous in habit, and in every way a desirable Rose. The Hon. Edith Gifford is of a pale flesh, with salmon-pink shading, full and free flowering. Grace Darling, another of Mr. Bennett's seedlings, is an acquisition. Base of the petals creamy-white, deeply tinted and shaded with pink, very vigorous, and likely to prove a useful Rose.

Such is my idea of the past season; if I am wrong about it, it is not because I have presumed to give an opinion on insufficient data, but must be set down to error of judgment. I have, however, the satisfaction of knowing that it is one shared in by many rosarians. *Wild Rose.*

New Garden Plants.

ONCIDIUM CROCODILICEPS, n. sp.*

A FINE little gem, imported from Mexico by Mr. F. Saader, who kindly sent it to me. Its bulbs are light green, ultimately much wrinkled, egg-shaped, a little acnicipitous on each side, and scarcely exceeding a strong hazel-nut in size. Leaves cuneate-oblong, acute, very strong. Flowers several in a one-sided raceme, as large as those of *Odontoglossum constrictum*. Bracts short. Mentum well developed. Sepals and petals light greenish-sulphur coloured beautifully striped and blotched with fine cinnamon, the stripes longitudinal. Lip subcordate, or rounded at the base, ligulate-obovate, blunt, bilobed, white, with a tuft of yellow hairs at the very base, an oblong bilobed velvet callus in front. There are five or three lilac stripes in front of the callus, and some lilac spots at the upper part. The column is leochiloid, there being two projecting cartilaginous arms on the sides of the stigmatic hollow, sometimes much developed, in other cases rather shorter. The inferior part is hairy on the sides, including a nectariferous hollow. The anther is very large, comparable to a broad crocodile's head. *H. G. Rehb. f.*

CALANTHE COLORANS, n. sp.†

Much in the way of *Calanthe odora*, Griff., and *C. vaginata*, Lindl. Raceme perianthial, elongate, not at all corymboid, as in *C. veratrifolia*, R. Br. It rises from the newly formed leaves, as I learn by the inexhaustible kindness of Mr. J. Day, my oldest English correspondent. In *Calanthe odora*, Griff., it rises surrounded by the vestiges of the withered leaves, bran-like masses of lid vascular bundles. Sepals and petals white, lip white, then ochre, with calli of gummi-gamboge yellow. Spur shorter than pallid ovary, generally bidentate at the apex. There can be no doubt it is the first *Calanthe* of that type flowering in Europe. It has long been kindly forwarded by Mr. B. S. Williams. *H. G. Rehb. f.*

DENDROBIUM INFUNDIBULUM (Lindl.) CARNEOPICTUM.

The *Dendrobium Jamesianum*, Rehb. f., is not distinguishable from *D. infundibulum*, Lindl., in its red paint on the lip, but in the side-lobes of the lip being full of asperities, and a distinct shape of lip.

* *Oncidium crocodiliceps*, n. sp.—Aff. *O.* (Leochiloid) *triglandatum*, Rehb. f.; parvum; pseudobulbis duphlysis ovoidetis denum valde rugosis, imo sulcatis; foliis geminis cuneato-oblongis acutis; racemo paucifloro, secundifloro, mento evoluto; sepalis ligulatis acutis; tepalis subsquaratis, nunc tepalibus dilatatis, labello basi sulcato seu rotundato, oblongo obovato bilobo, disco sericeo in basi, callo velutino oblongo antice emarginato anteposito; rostellato bidentato; brachiis columnae oblongo-ligulatis ad foveam, regione inferiori ad margines pulvulato velutinis; fovea nectarifera interposita; anthera oblonga maxima, basi supra pollinia tumida. E Mexico. *H. G. Rehb. f.*

† *Calanthe colorans*, n. sp.—Folius cum inflorescentia coactenatis; racemo densiusculo elongato; rhachi, bracteis, ovaris, sepalibus extus velutinis; bracteis ovato triangulari apiculatis ovaris pedicellatis; tepalibus; sepalis tepalibus oblongis acutis, labelli laciniis postice elliptico-acutis, basi suprema interna valgo implexis, lacinia antica divergente bifida, laciniis quadratis, sericibus collarum ternis in basi, callis ternis pediculis lateribus compressis, dorso emarginatis, callis anticis acutis 3-5; calcaribus filiformi apice bidentato ovario pedicellatum dimidium subulatis. Flores candidi. Labelium demum ochraceum callis semper xanthinis. *H. G. Rehb. f.*

Now, Mr. B. S. Williams sends me a *D. infundibulum* that has a nearly flesh colour hue on the lip, a thick central line, and a few similar streaks on the sides. I propose to give it the just mentioned name. It also came from Birmah. *H. G. Rehb. f.*

SCHISMATOGLOTTIS PULCHRA.

THIS new Bornean Aroid is prettier than its name. It is a low-growing species, which does not take up much room—an object with gardeners; and its glaucous green leaves are marked with silvery markings on the upper surface, the lower surface being green and unspotted. The leaves are 4–5 inches long, by 1½–2½ wide, cordate lanceolate acute. It is an introduction of the Compagnie Continentale of Ghent, to whom we are indebted for the illustration (fig. 76). It requires ordinary stove treatment, and would be very effective in front of taller-growing species.

ORCHIDS AT THE WOODLANDS, STREATHAM.

TWENTY-FIVE houses or divisions, each arranged to suit the habits of the plants contained in it, when man-

their good condition proves that the care bestowed on the planing and building of it has not been in vain, and that the many contrivances for good ventilation, for the ensuring of a proper temperature well in command, and other details involving much additional expense, have secured a good return. The first division is occupied by the cold *Odontoglossums*, and of them it may be said that there is not a sickly plant among them, although they are allowed to bloom rather heavily. When grown cool, moist, shady, and airy as they are here, the flowering is rarely followed by the ill effects which result where they are kept in more heat. The collection is rich in fine varieties of *O. crispum* (Alexandreæ) and *O. Pescatorei* and a batch of fine hybrids, such as Wilckeum, *O. Ruckerianum*, *O. Andersonianum*, and their rare varieties represent a sum of money which only their owner, who had the pleasure of paying it, could guess. Overhead in the *Odontoglossum*-house hang some scores of fine masses of *Cattleya citrina*, which do marvellously well here, and are a sight when in bloom.

The next division is rich in *Masdevallias*, some wonderful *Harryanas* being there, among them being four great masses of the rich coloured *M. H. versicolor*, some rare forms of the blood-red *strata*, and several plants of the new yellow *Harryana*, which is so effective when arranged with the other kinds. In a shady, moist corner *Odontoglossum*

several varieties of the Turneri section of *Lælia elegans*, the original form, with its large glowing carmine lip, being the best, although that named *L. e. Bluntii*, and the greener tinted *L. e. prasiata* are very fine. *Masdevallias* of the *chimæra* and *Bella* section are in flower overhead, and *Dendrobium Desei*, *D. Goldieum* and other *Dendrobies* and *Cypripediums* tell well in the general arrangement, our old friend *Amaryllis reticulata*, with its pretty rose-veined flowers and handsome leaves, being quite at home among them. In flower, too, is a strikingly beautiful form of *Miltonia candida grandiflora* with very large flowers, the broad sepals and petals being yellow, barred with brown, and the large labellum white shaded in the throat with rose; for showiness it may be called the very best *Miltonia*. Beyond the flowering plant house is the division for the lesser *Cattleyas* and *Lælias*, particularly rich in plants of *L. anceps Dawsoni*, *L. a. vestalis*, and all the other rare forms of white *Lælias* which are sending up flower-spikes profusely, and beyond that in the division specially planned for *Vandas*, *Acrides*, and *Saccolabiums*. This house, too, is a great success, for the plants thrive in it without giving trouble. The varied collection of named varieties of *Vanda suavis* and *tricolor* are particularly healthy, and the large specimens of the new *Acrides*, *A. Kobaneum*, *A. Lawrenceum*, *A. Sanderianum*, as well as the older and better known kinds of *Acrides*, *Saccolabium*, and *Vanda*, are in fine order, and with them some giant *Ocoidium sarcodeis* are sending up their flowers.

The last house of the new range is filled with specimen plants of *Lælias* of the *purpurata* and *elegans* sections, and *Cattleyas*, and if a best can be accorded where all are so good, here it must be, for the plants are very sound, clean, well-rooted, and well flower-sheathed. Some of the large named varieties of *C. Trianae* will be grand objects when flowering-time comes, and all will give good account of themselves in their seasons. Among a batch of fine forms of *Cattleya labiata* one stands out as an unrivalled specimen. It is a great sturdy plant of the true original *C. l. Pescatorei*, and has plump upright pseudobulbs of the bright green peculiar to it, bearing stout double flower-sheaths, each nearly as large as one's hand. Much interest has been created by this plant, as it is very rare, and many will be glad of an opportunity of seeing it in its best form when in flower. The numerous plants of *Cattleya Lawrenceana*, too, are sheathing up well. The varieties of *Lælia purpurata* are in the perfection of health, and a large specimen of *L. Williamsii*, *L. Russelliana* (with nine young growths), *L. Schroederiana*, &c., promise a good show for next summer, when the snowy blossoms of the large mass of *Coleogyne cristata alba* beside them, which awakened such lively competition when Messrs. Frothero & Morris passed it under their hammer, will come in very effectively no doubt.

The lesser lean-to range has divisions for *Dendrobies*, of which there is a well-grown household, and for *Cattleyas* and other fresh imported plants, and most of the other plant-houses are utilised for any special Orchid to which they may seem to offer a suitable place, such as cannot be found in the houses devoted to the collection. For example, the main lot of *Cattleya Lawrenceana* are doing to perfection standing in a row on inverted flower-pots, bringing them near the glass, in an intermediate stove-house, where other plants are arranged about them. This position they seem to enjoy much, and they are plump, and about to flower well.

The warm-house range has a fine house of *Phalaenopsis*, only *P. violacea* and *P. Schroederi* being in bloom among them, and also a very rich household of *Cypripediums*, among them some good specimens of *C. Dominianum*, *C. Pearcei*, *C. Stonei*, *C. Harrisianum*, *C. Ashburtoniæ*, *C. Sedeni*, *C. oceanthum*, being in bloom, and some very healthy plants of *C. Godfreyæ*.

In the intermediate-house there are some very fine masses of *Oncidium crispum*, *O. Marshallianum*, and others of that section, sending up very stout spikes, and the new and pretty *Agreum Leoni* is well furnished with its white fragrant flowers, and *Miltonia Regnelli purpurea* and the handsome *Pescatorea Klaboehorum* are also well in bloom. With respect to the *Pescatoreas* and *Polles*, the shady moist corner which Mr. J. Howe, the gardener, has selected for them seems to suit them admirably, although they are not easily pleased. In Mr. Measures' Orchid-houses much provision is made for having suitable places for all things, and certainly much skill and forethought are displayed in selecting the proper places for plants usually considered troublesome. *7. O.B.*

FIG. 76.—SCHISMATOGLOTTIS PULCHRA.

aged with that skilful care which is evidently exercised throughout the whole of the pretty establishment belonging to R. H. Measures, Esq., must necessarily give a good and varied show of flowers at all seasons, and the history of the rise and progress of such a garden speaks in no uncertain terms of the pleasures to be found in gardening when it is well carried out. Always noted for the good culture of whatever has been there attempted, step by step The Woodlands' garden has progressed as one class of plants after another has been taken in hand, and new houses built for their accommodation, until at present it forms one of the best examples of the kind in the neighbourhood of London, and even yet it is growing, for the fine ranges of neat glass structures which now occupy the two sides of a square, it is contemplated to continue until the quadrangle is completed.

Of late years Orchids have been added to the collection, and at the present time they are the principal feature. So greatly are they appreciated that they may be said to reign at The Woodlands, although they are not allowed to encroach too much on the fine specimens of *Eucharis*, *Anthurium*, and other beautiful flowering and foliage stove and greenhouse plants which formerly held sway, and which are so well worthy of the care bestowed on them. For the new extension of the Orchid branch new structures will be built in the same manner as the pretty span-roofed range which was formerly sufficient to meet the requirements of the case. Now that the plants have had time to settle down in this new range

brevifolium is growing well and sending up a fine spike; and *O. asperum* and several other rare things are producing flowers. The main feature in the next house is the capital arrangement for growing and showing *Cymbidium Lowianum* and *C. giganteum* to advantage. In place of a centre stage a row of terracotta pedestals is placed along the middle of the house, and on these stand huge specimens of the plants named, each many feet in circumference. When in bloom the long arching spikes arrange themselves all round, and each plant, standing out distinctly, offers more beauty and gracefulness to meet the eye than would a number of them staged together. Some day we shall see an Orchid show-house for large plants in bloom with such pedestals instead of stages: let us not then forget where the idea originated.

The middle division of the new range is an ornamental one, kept for plants in flower; it is very prettily arranged, the aid of *Caladiums* and other pretty foliage plants not liable to harbour insects being called in to assist in giving effect. In bloom are some fine specimens of *Cattleya Gaskelliana*, one almost all white, and others bright rose with crimson lip; *C. Eldorado*, several very handsome forms; several bright golden *Oncidium concolor*, one with three spikes, and one with thirty-four flowers on one spike; *Acineta densa aurea*, a rare golden-yellow form, producing a fine spike through the bottom of the basket; *Saccolabium Blumei majus*, fine in colour, and having spikes nearly 2 feet 6 inches in length;

GARDEN PALMS.

(Continued from p. 439, vol. xxiii.)

COPERNICIA, Mart.—This is a small genus, closely related to the *Coryphas* and *Thrinax*. Eight species are described, two of which are cultivated in gardens. They are slow growers when in a young state, whatever they may be when older, the plants at Kew being eight or ten years old though still very small. Their resemblance to the *Coryphas* led to their being by some authorities placed in that genus. From a garden point of view they are not ornamental enough to be recommended for general cultivation, their chief interest residing in the value of the wood in their trunks, which is excessively hard and durable, and in the wax produced by their leaves, each leaf, according to Seemann, yielding about 50 grains of a whitish, scaly powder, which is melted in pots over a fire. This vegetable fat is sometimes used by the Brazilians to adulterate bee's-wax. It is also imported into Great Britain for manufacturing candles, for which purpose it is largely used by Messrs. Price. This wax is produced only by *C. cerifera*; specimens of it may be seen in the Museum at Kew. The genus is confined to the tropics of South America and the West Indies. It is distinguished by its erect, ringed trunk, which is widened out at the base into a sort of hole and grows to a height of 30–40 feet. The leaves are palmate, the petioles rather short, and armed with small spines along the margins; seedling leaves simple and undivided. Seeds enclosed in a yellowish berry about as large as a Hamburgh Grape, the pericarp fleshy or fibrous, seed oblong or round, smooth or slightly channelled, brown when ripe.

C. cerifera, Mart., "Carabua Palm."—Brazil.
C. telorum, Mart.—Venezuela and West Indies.

CORYTHA, Linn.

In gardens this genus is represented by what is really a species of *Livistona*, viz., *L. australis*, whilst, except in botanical collections, the true species are unknown. They are not possessed of any useful garden qualities, but on the contrary are exceptionally difficult to cultivate satisfactorily, are stiff and ungraceful, and very sluggish growers. The plants at Kew are small, and, judging by their rate of growth during the past years, they are likely to remain small for a long time yet. Some years ago there existed at Kew a fine specimen of *C. umbrauculifera*, the Tallipot Palm, which held out signs of flowering, but was fatally injured, it was thought, by careless potting, so that the plant never came to maturity. There are six species included in the genus, all of them Asiatic. They have ringed or channelled trunks, not more than 30 feet high, but stout, and widened out at the base. They flower only once, and then die, the tall, terminal, branched inflorescence appearing when, according to Sir Joseph Hooker, the plant is about thirty years old. The leaves form an immense broad crown, the petioles are 7 feet long, the margins armed with small prickles, and the blade is palmate, much divided, each division being again split at the apex. On full-sized plants of *C. umbrauculifera* the blade is 6 feet long by about 13 feet broad, and the segments number as many as 100 in each leaf; the leaves of *C. elata* are about 10 feet in diameter. When the tree begins to blossom the leaves wither and fall off. There is a photograph of a flowering specimen of *C. umbrauculifera* in the Kew Museum which shows the noble character of the branching inflorescence. The berries are egg-shaped, about as large as pigeon's eggs; or, as in *C. Taliera*, Nutmeg-like, the pericarp hard and bony when dry, fleshy when fresh, and the seeds are hard, smooth, and pale brown. Leaves of seedling plants very stiff, simple for the first year or so, then gradually becoming palmate.

C. Gebanga, Blume, "Gebang Palm."—Java (cultivated in Birmah, &c.).

C. macrospoda, Kurz.—Andaman Islands.
C. umbrauculifera, Linn., "Tallipot Palm."—South India and Ceylon.

CYRTOSTACHYS, Blume,

Two species are described—one of them, *C. Renda*, being in cultivation in English gardens, the other hardly known even to botanists. The former is a pretty plant when small, the dark olive-green of its leaves and deep red of the stems and petioles gaining for it a place in many collections, generally, however, under the name of *Ptychosperma coccinea*. It is distinctly tropical in its requirements, thriving only when kept in a warm, moist stove, and when small

should be shaded from direct sunshine. Its seed germinates quickly, but unless the seedlings are kept in a very warm temperature they soon suffer. Full-sized plants are described as being unarmed, the stem tall, thin, and annulated, and the petioles with their sheathing bases dark red. Leaves pinnate, the segments linear and acuminate, the apex obliquely bidentate. The seeds are oblong, pointed at both ends, about the size of black Currants, dark brown, and covered with a thin coat of reticulating fibre. Seedling leaves bipartite.

C. Renda, Blume (*Areca erythropa*, Miq.; *Ptychosperma coccinea*, Hort.)—Malay Archipelago.

CYPHOSPERMA, H. Wendl.

One of the species of this genus has lately been introduced by M. Linden under the names of *Kentia robusta* and *K. Viellardi*. According to the *Genera Plantarum* there are only two species of *Cyphosperma* described, viz., *C. Viellardi* and *C. Balansea*. They are robust, pinnate-leaved Palms, with unarmed annulated stems when large, small plants having a broad spreading habit, rather stiff petioles, and graceful leaf-segments. The seeds are described as being small and acutely angled, and are enclosed in a thin shell-like husk. I have not seen seeds or seedlings of this genus.

C. Viellardi, Wendl. (*Kentia robusta*, Hort. Lind.; *K. Viellardi*, Brongn. and Gr.)—New Caledonia.
Demonorops—now included in *Calamus*.
Dickenia.—See *Acanthophoenix*.

DESMONCUS, Mart.

Like the *Batrices*, the plants of this genus are too straggling in growth and coarse in appearance to find much favour in gardens except when very young. Three or four species have been introduced, none of them, however, finding their way to the frost as garden Palms. In the American forests they occupy a position similar to that of the *Calamuses* in Asia, as they climb over trees and shrubs, often to a great distance, festooning from one tree to another. The trunks are no thicker than a walking-stick, and are clothed with large, sometimes hooked, spines; the leaves are scattered all along the stems, instead of being collected in a head as in most other Palms; they are pinnatisect, the segments rather broad and concave downwards, and each leaf is terminated by a long, tough, cord-like appendage, clothed with hooked spines, by means of which the plants are enabled to climb. There are some well-developed specimens of these Palms at Kew. The fruit is oval, about the size of a robin's egg, or in some species less, bright red when ripe; they each enclose an oval seed, which is pale brown, prettily reticulated with black lines, which converge at two or three punctures in the basal end. Seedling leaves split.

D. granatensis, Hort.—New Grenada.
D. major, Cruger.—Trinidad.
D. minor, Hort. (? *D. mitis*, Mart.)—West Indies?
D. polyacanthus, Hort.—Brazil and Guiana.

DICROSFERMA, Wendl. and Dr.

These plants are known in gardens as *Arecae*. They are ornamental when young, and grow into useful little pot plants in two or three years from seed. The leaves are pinnate, graceful, dark green, with the nerves and margins of the segments yellowish, or sometimes a purplish-brown colour. Being natives of the Mascarene Islands (Mauritius, &c.), they thrive with us only when treated as stove plants, and they require plenty of moisture always, both at the root and overhead. They grow to a large size, the trunk being rather thin, erect, and marked with the scars of the fallen leaves; but in our stoves, as the plants grow large, they become rather straggling in the disposition of their leaves. The seeds are about the size and shape of robin's eggs, and are enclosed in a dark brown fleshy pericarp beneath which is a thin coat of pale brown fibre. Seedling leaves bipartite. All the described species are in cultivation.

D. aureana, W. and D. (*Areca aurea*, Hort.)—Rodriguez Island.
D. alba, W. and D. (*Areca alba*, Dory; *A. borbonica*, Hort.)—Mauritius and Bourbon.
D. rubra, W. and D. (*Areca rubra*, Hort.)—Mauritius.
D. furfuracea, W. and D. (*Areca furfuracea*, Hort.; *A. pisifera*, Lodd.)—Mauritius.

DIDYMOSPERMA, Wendl. and Dr.

Under the name *Wallichia* the cultivated species of

this small genus of East Indian Palms have hitherto been known, and of the six species described four are represented at Kew. The most interesting is *D. distichum*, which is remarkable in having its foliage arranged in two straight series along the stem just as in *Ravenala* and *Strelitzia*. Another interesting one is *D. nanum*, one of the dwarfest of Palms—a plant of it at Kew flowering annually on stems less than a yard high. Seemann states that these plants "flower only once during their term of existence;" but this is true only in relation to the stems, which perish after flowering, but are succeeded by others, which spring up sucker-like from the base. They are all dwarf growers except *D. distichum*, their leaves are pinnatisect, very similar to the *Arengas*, except that they do not possess the curious lobe at the base of the segments, which is present in all the species of that genus. The segments are wedge-shaped, the upper ends jagged or truncate, under-side silvery, with brownish dots and lines. The fruit is a berry, containing a caustic juice, reddish-coloured, and with one, sometimes two seeds in each, which are like Coffee-nibs in size and shape, but hard and bony. Seedling leaf a solitary wedge-shaped blade, with the apex jagged.

D. distichum, Hook. f. (*Wallichia disticha*, T. Anders.)—Sikkim Himalaya.
D. nanum, W. and D. (*Wallichia nana*, Griff.)—Assam and Khasia Mountains.
D. porphyrocarpum, W. and D.—Java.
D. tricuspidatum, W. and D.—Philippine Islands.
W. W.

"HORTUS FLORIDUS."

A copy of this book in good condition is contained in the library of the New herbarium, where we recently had the opportunity—thanks to the courtesy of Professor Oliver—of inspecting it. We are therefore in a position to add some further details to those given at p. 345, September 12.

We may also add that we have received interesting communications on the same subject from Mr. J. H. Krelage, of Haarlem, and from Mr. Burbidge, who has had the opportunity of examining a copy of the English edition belonging to Canon Ellacombe. These further communications we may print on a subsequent occasion. The complete title of the work runs as follows:—

"PASSÆUS CRISPINUS.—*Hortus Floridus* in quo rariorum et minus vulgarium florum icones ad vivum versuque tota maturatissime delineate et secundum quatuor anni tempora divise exhibentur, incredibile labor ac diligentia Crispini Passæi junioris delineate ac summi in ordinem redactæ. Amstelred. apud Janssonium, 1644 (—17), 4. oblong. 184 foli. et tab."

The titlepage, moreover, has on one side Apollo, and on the other Diana, as supporters, and small medallion portraits of Dodonæus and Clusius, which look as if they ought to be good likenesses. Forty-one plates are devoted to spring flowers, nineteen to those of summer, twenty-five to those of autumn while twelve are allotted to winter flowers. The Latin text is printed opposite to the plates. These latter are excellent in their way, and some have been repeated in other works. In those days authors and publishers were not more particular about mentioning their obligations than are some of their descendants, who think that the purchase of electros absolves them from all necessity for acknowledgment of the source whence they were derived.

Bound up with it is another series of plates headed with this heading:—

"Cognoscite lilia agri quocumque crescent, non laborant neque nent amica diu vobis ne Salomonem quem in universa gloria sua sic anicium fuisse ut unum ex his Matth., 6 cap. Formulic Crispiani Passæi et Joannis Wellnelli."

The plan of the work is thus like the magnificent work attributed to Besler, and known as the *Hortus Eystettensis*. This latter was published in 1613, one year before Passæus and sixteen years before Parkinson.

Mr. Burbidge has mentioned the *Narcissi*, but there are also excellent figures of *Hepaticas*, *Anemones*, *Iris susiana*, *Orchidis*, then called *Satyrion basilicum* mas et femina; *Sunflowers*, then called *Chrysanthemum peruvianum*; and many others, including pictorial evidence that then, as now, field mice were fond of *Crocus bulbs*.

One plate represents a flower garden of the period in spring, with geometric beds filled with *Iris*s, *Tulips*, *Crown Imperials*, *Pæonies*, &c. Another plate represents the same garden in autumn, from the

opposite point of view. A lady leans over a flower-bed, with an excrescence from the centre of the dorsal surface of her dress, similar to that which finds favour at the present time, but rather more ugly. An arcade runs round the garden, at one end of which is a balcony, from which the master of the house surveys, doubtless admiringly, the lady in the parterre, as well as the flowers she is tending.

MESSRS. LOW'S NURSERIES.

ENFIELD.—If we were to tell the confiding reader that Messrs. Hugh Low & Co., of Orchard celebrity, had gone into the market-garden line of business, we should expect the announcement to be received with some hesitation. Nevertheless, the statement would not be wholly incorrect. Messrs. Low & Co., sighing for more worlds to conquer, have found themselves obliged to extend their borders, and have added to their far-famed Clapton Nurseries some 40 or more acres of market garden near Enfield. There, in a flat plain, surrounded by fields of Khabarb, of Cabbage, of Potatoes, of Strawberries, of Sea-kale—of whatever concerns the London market-gardener—have Messrs. Low established themselves. They, too, grow for market; but they differ materially from their neighbours, alike in what they grow, and in the market in which they dispose of their articles. They represent in a sense, a higher order of evolution than the market-gardener proper. Just as the farmer has been displaced to make room for the market-gardener, who can make the land return a profit under conditions which would be fatal to the farmer, so the market-gardener in his turn has to make way for the nurseryman, who by the superior value of his stock and his more advanced methods of growing it, can make the land yield profits beyond the reach of the market-gardener.

A bleak, wind-swept plain, as the neighbourhood of Bush Hill Park appears to be—a place not particularly of park-like aspect, and with no over-abundance of bushes—is not at first sight the place one would choose for a nursery garden. But Messrs. Low may very well be believed to know what they were about, and we doubt not there are many nurserymen who are being daily hemmed in more and more by bricks and mortar, and over whose establishments the smoky pall of London daily thickens, who would be glad if such a chance befell them as has fallen to the lot of Messrs. Low. Forty acres of fine rich loam and brick-earth, overlying gravel-beds so full of water that the daily use, even throughout this dry season, of steam-pumps to supply the requirements of Messrs. Low's *practises* has made no apparent difference in the supplies, are indeed a prize. It is just the soil for Roses and fruit trees; it suits Rhododendrons, and is excellently adapted for the ordinary hardy stuff of a nursery. It is rich, but not too tenacious, easily worked, and kept clean at no extravagant cost of labour.

It is less than four years since Messrs. Low became possessed of this valuable accession to their resources, but already it is stocked with fruit tree stocks and fruit trees of all descriptions, trained and untrained, pyramid or bush Pears, Cherries, Plums, Apricots, Apples; there they all are in a condition that under the circumstances leaves nothing to be desired. Stop I—that word “all” must come out. If there is one quality more than another that pervades the whole establishment it is its business-like aspect. There is no room here for sorts of doubtful or unknown value. Messrs. Low may have much admiration for science and botanical curiosities, they may have an abstract sense of the value of experiments, but they prefer that others should make them while they cultivate to as great perfection as possible those sorts—now we think we may say *all* those sorts—which experience has shown to be good, and for which there is a general demand. If by chance the British public demands something that is really not of first-class quality what is that to the business man? He grows what his customers want, and when they alter their minds he will be equal to the occasion.

Roses will clearly eventually add to Messrs. Low's repute. We dare not say how many dwarfs and maidens and standards, or how many Manetti stocks, we glanced at. To the ordinary visitor a few hundred or a few thousand, more or less, make little difference compared to the healthy condition and good growth of the plants, and from this point of view there is every reason for satisfaction. Variegated Maples and

Hollies, Aucubas and Euonymus, Privets and Pampas grass, are all grown here on a large scale. As is the case at Clapton with the Orchids and Heaths, so here at Enfield, the prodigious quantities of things grown excite astonishment. Here is half an acre of beautiful little plants of *Deutzia gracilis*, not varying more than the traditional *Peas* in pod. Something like 5000 of these were forced last year. Here are 20,000 similarly evenly grown plants of *Genista*, each in its traditional “48” pot.

To house all these there must be plenty of glass—that goes without saying—and here, sure enough, is a town of glasshouses, some forty in number, all (with two or three exceptions) 120 feet long by 25 in breadth, and about 9 feet to the ridge. All are span-roofed structures, the roofs resting on top brickwork and glazed with large panes, with top ventilation worked by gearing, and with side shutters at the bottom as well. Eight pipes ensure a circulation of hot-water—two being placed on either side of the central path, and others on either side under the eaves. A tank in each house ensures a moist atmosphere, and an abundant supply of water. Each of these houses contains 11,000 48-pots, and they are made the homes for thousands of Pelargoniums, Crassulas, Gardenias, Palms, Stephanotis, Adiantums, Azaleas grown on the Belgian plan, Solanums, Hydrangeas, Lapagerias, *Acacia armata*, and a good many et ceteras. Foremost among these we may place the pot-Vines and the pot-Roses—the Vines of all the most useful sorts, the *Roses* more select, *Marchal Niel* and *Niphotos* being chiefly honoured, and mildew conspicuous by its absence. We ought also to make special mention of *Madame Crousse* Pelargonium, a double Ivy-leaf variety of great freedom, which flowers continuously, and holds its petals well, and which is therefore in large demand for window-boxes. *Gloire d'Orleans* is a dwarfier, more compact kind, with rich rose-pink flowers. Camellias, nice little serviceable plants, are grown by the thousand, many of them set with “English” buds, which have the British quality of holding on while the buds on imported Belgian plants are said to drop off. Knowing how prone Camellias are to rid themselves of their buds in the hands of amateurs or unpractised hands we suggested faulty management, but Messrs. Low assure us that the Belgian buds drop off even under their management, which is, to say the least, not likely to be faulty.

Jasminum gracillimum is, we are happy to see, coming into large demand; its beauty and fragrance alike entitle it to favour. This is a comparatively new aspirant for favour, and although *Solanum jasminoides* is an old one, we do not remember to have ever seen it grown to better advantage than it is here in 32-pots, trained loosely to a height of 2 or 3 feet, and covered with elegant white or pale lilac flowers.

One or two houses are to be devoted to Orchids—Clapton cannot hold them all, and some have already welled over to Enfield. Besides the houses there are pits and frames, more than we cared to count. Messrs. Low, as we have seen, do not do things by halves; what they undertake they undertake on a vast scale, and the quality of their manufacture—for so we must call it—at Enfield, is on a par with the quantity.

CLAPTON.

At the Clapton nursery of the firm we found the houses—and there are a great number of them, as our readers well know—bare generally of the Orchid beauties, produced in such abundance in winter, spring, and early summer, but filled to repletion with plants in large and small pots, the latter, of course, taking the lead as to numbers. House after house was visited, and only here and there was anything seen to gladden the eye with colour; but of things “coming on,” we can only say, send for Messrs. Low & Co.'s list, and read it attentively. New and rare plants may be reckoned by groups of fifty to one hundred specimens, whilst the older favourites of the Orchid lover may be counted by thousands.

The only wonder seems to be, how can the sale of so many plants be attained? Either Orchid growing must be carried on in hundreds of places of which we wot not, or our gardeners must be destructives of the first order. We prefer to think the first reason must be the true one.

A few *Cattleya gigas* flowers, and these not good ones, were seen of a particularly dark variety, usually going under the appellation of C. g. Lowi. The variety flowers on pseudobulbs of 3 inches in height. *Oncidium Marshalli* does well here simply suspended on rafts in mid air, without any packing whatever, some fine bits were seen. *O. varicosum*, O. For-

lesii, and *O. praetextum* were being cultivated in the same house, but not in the same way.

Nowhere else can so many plants of *Cypripedium* in variety be found as here, and all are evenly grown and the very picture of robust health. There were *Parishii*, *Lowianum*, *Rochii*, *ciliosum*, *vestitulum*, the rarer *Chantini*, *Harrisianum*, *Leanum*, and hybridum. Only a few of these four are in stock. Others were *Dominyanum*, *Spirerianum*, and *Veitchii*. Our list is not then quite complete. Of *Odootoglossum Pescatorei* we were told there were not less than 10,000 plants, large and small, other species being in smaller numbers, but yet imposing enough.

Among Ferns *Lomaria gibba* was particularly fine; the plants, mostly in 48's, being full of fronds, dwarf, stocky, and insect free to a remarkable degree. *Adiantum mundanum*, dwarf, compact, and evidently as useful a Fern for the bouquet-maker as it is possible to have, was growing in its thousands. It bears a great similarity to *Pacottii*. *A. cuneatum* was found of course in numbers exceeding that of any others, proving its worth, and the extent of the demand for it. *Bouvardias* were very well grown, the one-year-old plants having stocky, bushy growth, with plenty of flower showing, the gem of them being *Flower of Beauty*, a light pink, that carried blooms on every shoot without exception. Other well-known kinds of the plants, such as *Leaves*, *Low & Co.* having taken up the growing of *Cyclamen* in good earnest, it was only to be expected we should find them grown in the best manner, and there are thousands of plants filling eight pits, which are models of what such stuff should be; and when we say that the stock is “Page's,” it will be understood that the strain is the best obtainable. Many thousands of Heaths, such as are now popular market kinds, were standing on beds of coal cinders. All were even in size, and regular in habit, as were also the *Ericas*. These plants will ere long, before autumn fogs descend on the town, be transported to the purer air of the Bush Hill Nursery, to remain there until the bloom appears. Tree *Ceratians* in 120 kinds filled another large cinder area, and were as robust and compact as their neighbours, the Heaths. Other things grown in quantity are the greenhouse hybrid *Rhododendrons*, such kinds as *Princess Royal*, *Alexandra*, *Taylori*, *Jasminiflorum*, *Princess Alice*, *Veitchii*, and *Duke of Edinburgh*, forming the bulk of them. The deliciously scented *fragrantissimum* was likewise there, and *Maddeni* and *Dalhoisianum*.

THE BRITISH ASSOCIATION.

HEREDITY.—The following extracts are taken from Mr. Francis Galton's presidential address to the anthropological section of the British Association, and, as will be seen, relate to the extremely important questions relating to the inheritance of parental and ancestral qualities and characteristics—questions as pertinent to plants as to animals.

Mr. Galton discussed the conditions of the stability and instability of types, urged the existence of a simple and far-reaching law that governed hereditary transmission, and proceeded as follows:—

“It is some years since I made an extensive series of experiments on the produce of seeds of different size but of the same species. They yielded results that seemed very noteworthy, and I used them as the basis of a lecture before the Royal Institution on February 9, 1877. It appeared from these experiments that the offspring did not tend to resemble their parent seeds in size, but to be always more mediocre than they—to be smaller than the parents if the parents were large, to be larger than the parents if the parents were very small. The subject of the inquiry on which I am about to speak was hereditary stature. My data consist of the heights of 930 children and of their respective parentages, 205 in number. In every case I transmuted the female statures to their corresponding male equivalents and used them in their transmuted form, so that no objection grounded on the sexual difference of stature need be raised when I speak of averages. The factor I used was 1.08, which is equivalent to adding a little less than one-twelfth to each female height. There can be no doubt that heredity proceeds to a considerable extent, perhaps principally, in a piecemeal or piebald fashion, causing the person of the child to be to that extent a mosaic of independent ancestral heritages, one part coming with more or less variation from this progenitor, and another from that. So far as the transmission of any feature may be regarded as an example of particulate inheritance, so far (it seems little more than a truism to assert) the element from which that feature was developed must have been particulate also. Therefore, wherever a

feature in a child was not personally possessed by either parent, but transmitted through one of them from a more distant progenitor, the element whence that feature was developed must have existed in a particulate, though impersonal and latent form, in the body of the parent. The total heritage of that parent will have included a greater variety of material than was utilised in the formation of his own personal structure. Only a portion of it became developed; the survival of at least a small part of the remainder is proved, and that of a large part may be inferred by his transmitting it to the person of his child. Therefore, the organised structure of each individual should be viewed as the fulfilment of only one out of an indefinite number of mutually exclusive possibilities. It is the development of a single sample drawn out of a group of elements. The conditions under which each element in the sample became selected are, of course, unknown, but it is reasonable to expect they would fall under one or other of the following agencies:—First, self-selection, where each element selects its most suitable neighbour, as in the theory of pangensis; secondly, general co-ordination, or the influence exerted on each element by many or all of the remaining ones, whether in its immediate neighbourhood or not; finally, a group of diverse agencies, alike only in the fact that they are not uniformly helpful or harmful, that they influence with no constant purpose—in philosophical language, that they are not teleological; in popular language, that they are accidents or chances. Their inclusion renders it impossible to predict the peculiarities of individual children, though it does not prevent the prediction of average results. We now see something of the general character of the conditions amid which the stable equilibrium that characterises each race must subsist. The appearance of a new and useful family peculiarity is a boon to breeders, who by selection in mating gradually reduce the preponderance of those ancestral elements that endanger reversion. The appearance of a new type is due to causes that lie beyond our reach, so we ought to welcome every useful one as a happy chance, and do our best to domicile and perpetuate it. When heredity shall have become much better and more generally understood than now, I can believe that we shall look upon a neglect to conserve any valuable form of family type as a wrongful waste of opportunity. The appearance of each new natural peculiarity is a faltering step in the upward journey of evolution, over which, in outward appearance, the whole living world is blindly blundering and stumbling, but whose general direction man has the intelligence dimly to discern, and whose progress he has power to facilitate."

FORESTRY.

General Walker, in introducing Major Bailey, who read a paper on "The Indian Forest School," said that the science of forestry was one which had not yet found a home in England. In France regular and systematic forest management had existed for centuries, and the result was seen in numerous well-stocked forests, which were managed with a view to the continuous production of whatever timber and fuel might be required to satisfy the wants of the people. But in England our extensive coalfields had hitherto furnished fuel in abundance which was better than firewood and less costly, and our ships had brought us from foreign countries much timber of good quality at a lower cost than that at which it could be produced at home. Thus having no need of the science of forestry, we had characteristically abstained from endeavouring to acquire it with a view at least to its practical introduction and development within the British Isles. But in India we had long since felt the need of systematic forestry and learned to appreciate its value. Already great benefits had been derived; the revenue from the forests has been increased, and the people of the country had been benefited. Lands which twenty years ago were bare, or only produced open scrub and a few isolated trees, were now stocked with dense forest, from 20 to 50 feet high, grown under the favouring influence of tropical heat and moisture, as well as under the fostering care of a scientific department; and it was anticipated that at no very distant date the forest lands which had necessarily been placed under the protection of the Government forest officers would not only yield a permanent supply of timber and fuel to the people without any expense to the State, but would contribute towards the healthy development of municipal institutions and of local self-government.

The success of Indian forestry had been so marked that some of the native states, which were generally keenly alive to their own interests, were now having men trained in the Government schools for the conservation and management of their own forests.

Major Bailey then remarked that it was only within the last twenty-five years that a special State Department had administered the Indian forests. The staff was at first composed of men who had received no professional education, but they were able to do all that was then needed, and they accomplished work of great value. But, as a result of their work, the State became possessed of large forest areas, from which a permanent supply of produce had to be secured, and which had, therefore, to be managed systematically. In 1878 Dr. Brandis proposed to establish a Central Forest School, and his proposals were accepted by Government. The chief object of the school was then to prepare natives of India for the executive charge of forest ranges, and to qualify them for promotion to the superior staff; but it was hoped that the school might ultimately be used to train candidates for the controlling branch. The chief forest officers of provinces were to select candidates and send them to be trained at the school. None but natives of India were to be admitted. A number of forests near Dehra Dun were grouped together as a training ground and placed under a separate conservator, who was also appointed director of the school. The first theoretical course was held in 1881, and they had been held every year since then. The present system was that the candidates, who must be in robust health, were selected by conservators of forests or by the director of the school. They must serve in the forests for at least twelve months before entering the school. Candidates for the rangers' certificate must have passed the entrance examination of an Indian University on the English side; candidates for the foresters' certificate pass a lower examination. The course of training for these two classes extended over eighteen and twelve months respectively. Men who gained the certificates returned to their provinces and were employed there. The course of instruction for the rangers' class embraced vegetable physiology, the elements of physics and chemistry, mathematics, and road-making and building, surveying, silviculture, working plans, forest utilisation, forest botany, the elements of mineralogy and geology, and forest law. The course for foresters was much more simple. The preparation of manuals was in progress, and a library, museum, chemical laboratory, observatory, and forest gardens had been established. No instruction fees are charged. It would not be possible to get candidates whose maintenance and education were entirely paid for by their friends. Nine men who had left the school had appointments of from £125 to £200 a year, and this ought to draw eligible candidates.

Dr. Brown said he had just returned from a six weeks' residence at a School of Forestry in Spain, and stated that the object aimed at by the leaders of that school was to prevent, one drop of water falling in the form of rain from passing into the sea until it had been utilised to the utmost in promoting the fertility of the country. A School of Forestry might be useful in Britain as well as India in supplying foresters for the colonies, and landed proprietors in this country would be all the better if they could get educated and trained foresters to undertake the management of their plantations.

CONSERVATION OF FORESTS.

Lieutenant-Colonel Playfair observed that his experience in Tunis proved in a most forcible manner the importance of preserving forests. In Roman times the province of Africa and the territory of Carthage formed the granary of Europe. In what was now practically a desert the remains of magnificent Roman farms were everywhere found. The small hillides were now nothing but sands. This was entirely due to the destruction of the forests with which they used to be covered, for the vegetable soil had been washed away into the valleys, and there it was now found, buried beneath some feet of sand and water-worn pebbles. No more striking instance of the importance of preserving forests could possibly be found.

CHARLES WRIGHT.—The American *Gardeners' Monthly* announces the death, in his seventy-fourth year, of this gentleman. He was better known to botanists, as a collector in Mexico and elsewhere, than to horticulturists.

TALIPOT PALM LABELS.

SINCE my arrival in England, in May last, from Ceylon, my friend, Mr. E. M. Holmes, kindly drew my attention to a paragraph in the *Gardeners' Chronicle* of March 28 last on "Palm Leaf Labels," and I have through your courtesy been able to read the paragraph, so as to be able to give such additional information about the labels referred to as may be of some interest to your readers.

The labels are made from the unexpanded frond or leaf of the Talipot Palm (*Corypha umbraculifera*). The leaf is fan-shaped, about 30 feet in circumference when full grown, and divided into 112 divisions, the tip of each division being emarginate and green. Each division is split into two, made into small rolls, and boiled in water for a few hours. After boiling the strips are dried in the shade, soaked in water for a few minutes, and both sides smoothed with an iron. The smoothing used to be performed in a primitive manner by rubbing the strips on a polished cylindrical piece of wood tied between two stools or trees. After smoothing it is necessary to roll up the strips of leaves quickly, to prevent curling, each roll containing fifty to 100 or more strips. When the surface is polished it is easy to write on it. The use of the smoothing-iron facilitates the process greatly, especially when the strips are spread on a table covered with a piece of blanket—the manner in which I have frequently performed the operation. The strips when thus prepared are called "Olas" by the natives, and used for writing upon with a style, as is well known in the East.

It is a fact that Palm-leaf books have been preserved for more than 500 years. It may be noticed that the durability of the leaf is owing to its being covered with a silicious cuticle, which is one of the most beautiful polarising objects of the vegetable kingdom, displaying the colours indigo, blue, violet, red, orange, yellow and green.

One of the Buddhist priests of Ceylon informed me that the Talipot leaf was used for writing Buddhist doctrines in the Buddhist era 432, or before A.D. 510. An Oriental scholar, also of Ceylon, is of opinion that the leaf was used in this way more than a thousand years ago. The exact time, however, cannot be ascertained. In India there is reason to believe that this leaf has been in use for the last two thousand years or more.

To return from this digression to the subject of making the labels, I may state that the "Olas," or strips of the leaf, are laid on a piece of smooth board. The labels are cut out by means of a stamp, which is hammered with a wooden mallet, and twelve or more labels can be cut at one stamping. The dimensions of the strips for making the labels may be briefly stated as follows:—

Length of longest strip	6 feet 7 inches.
Breadth of broadest part	2½ inches.
" narrowest part	1 inch.
Length of shortest strip	4 feet 9 inches.
Breadth, the same as longest strip.	

One strip makes on an average forty-nine labels of ordinary size. One hundred strips give 4900 labels.

As regards the question of the mode of writing upon these labels, I can only endorse your suggestion, viz., of scratching the leaf and applying the colouring matter. The common mode of writing as practised in the East is by means of a style, and Indian ink, charcoal, or other colouring matter, is rubbed upon the scratched writing. A specimen of a label written on with a style I send herewith for your inspection. The mode of writing with a style is no doubt foreign to Europeans, and may not be so easily accomplished as by the natives of the East; but some pointed instrument may be devised for writing on the Palm-leaf.

I have used these labels extensively attached to animal and vegetable specimens immersed in spirit, and found them in good preservation for a long time. The parchment labels attached to stone corals which I took with me to Ceylon turned into a pulpy mass in some months. Talipot labels attached to plants exposed to the tropical sun and rain were uninjured for a long time. According to Mr. Holmes' suggestion, I had some labels written on with strong sulphuric acid, and held to the fire in order to develop the writing. The acid was used with a quill pen.

The cost of 1000 labels, without brass eyes, is 2s. 6d. I shall be glad to supply any one with a few

labels for trial. *W. C. Ondaatje, F.L.S. (retired Colonial Surgeon, Ceylon), 85, Finborough Road, S.W., Sept. 3.*

Florists' Flowers.

THE HYACINTH.

The time has arrived when it is necessary to purchase the stock of Hyacinths, Tulips, Polyanthus, Narcissus, &c., for the season. To-day we have been preparing the compost for potting. I like to do this in August, but this year we have let it run into September. The potting material for Hyacinths ought to be light and rich, and if it is prepared two or three months before it is required, the manure becomes more thoroughly incorporated with the soil. I use two barrow-loads of loam to one of cow-manure, one of sand, and one of leaf-mould. River sand is generally preferred to any other. Some growers use a specially prepared kind of flower-pot, deeper than usual, but I do not like the appearance of them when so grown. I use 5-inch pots of the ordinary kind for the small bulbs, and 6-inch ones for the larger size. In potting the bulbs they should be pressed moderately firm into the compost, with the crown just projecting above the surface. It is an error also to press the bulbs into the soil with the fingers, as this causes the compost immediately beneath the bulbs to become too firm; the consequence of this is that when the mass of roots which rapidly form on the root-stock push into it the bulbs are sometimes thrown out of the soil. I know these small details may seem trifling to some people, but success or failure very often depends upon how or when the most minute details are carried into effect. We have no difficulty in obtaining cocoa-nut fibre refuse here; it is the cheapest material for plunging all kinds of Dutch bulbs in after they are potted, and if it is twelve months old it is better, as a mass of new cocoa-nut fibre will sometimes heat, which would be disastrous to hardy bulbs. The subsequent treatment after the bulbs have been removed from the plunging material, consists in developing the spikes which have been formed in the bulbs the previous year. If the bulbs are not the full age, and have not been well grown and ripened, they cannot be expected to produce spikes of the largest size. If it is necessary to force them in order to get the flower-spice fully developed by an early date, the forcing process must not be too severe at first. Start with a minimum temperature of 45°, it is better not to increase it to more than 55° as the highest minimum. Some few varieties have too many bells on the spikes, and were they allowed to remain they would not be perfectly developed. I thin the bells out when they are in the bud stage, and those that remain grow to their full size, forming a symmetrical spike. A Hyacinth spike is at its best about two weeks after the first flowers open. At present I need not say anything about the varieties it is best to grow; good selections were given about the end of March, or early in April. *J. Douglas.*

COMPARETTIA MACRO-PLECTRON.

Our Orchid growers would be doing good work, for which they would get well rewarded, if they were to arrange a house for and look specially after the *Comparettias*, *Inopis*, *Burlingtonias*, *Rodriguezias*, *Trichocentrus*, and other small growing Orchids of the same nature, which, by reason of the smallness of their pseudobulbs or entire want of them, are more easily damaged when grown mixed up with the general collection than those with large pseudobulbs containing stored vitality to enable them to tide over temporary difficulties. There is nothing to prevent those who wish to grasp the subject and do the best for their plants from setting apart a corner of a cool intermediate-house where all the frail plants named can be brought together, and there a special open woodwork stage could be arranged so that the plants might be brought to within 18 inches or 2 feet of the glass, for on this point the life or death of these things depends more than on anything else. Those which are in pots or pans should be placed on the stage, and those in baskets suspended above, so that the grower can have all under his eye all at once. He will

then be much better able to judge of and direct their progress than would be the case if he had to look about for the different specimens for comparison. All these small growers are safest in fibry peat alone if a good sample of it can be obtained, but if sphagnum is used it should be watched to see that it does not grow up too high among the small growths or it may cause them

these plants in a short time, 55° to 70° at all seasons being the best for them. Rather than in a close warm house they will do in a light part of the cool house if it does not get below 50° in winter.

Comparettia macroplectron (figs. 77, 78) is the largest and most delicate tinted of the genus, its flowers are white, prettily spotted, veined, and suffused with pink. It was introduced in 1878, and exhibited by F. A. Philbrick, Esq., at the Royal Horticultural Society in July, 1882, where it was awarded a First-class Certificate. The branched spike of Mr. Philbrick's plant was 1 foot 8 inches in length, and the length of the flower-spurs over 2 inches.

The figures A and B (fig. 79) represent seed vessels of *Comparettia macroplectron* when arrived at a state of maturity. One is somewhat longer than the other, but in other respects they are precisely similar. They are acutely triquetrous, or, more properly, three-winged. The transverse section at C illustrates this statement. The wings represent the midrib of the carpels, from which the valves split away or dehisce, as is most prevalent in the order, to allow of the dispersion of the myriads of minute seeds. The placentas, or points of attachment of the seeds, correspond to the notches on the middle of the slightly concave faces, and the same points also represent the margins of the infolded carpels. The whole vessel, when ripe, is dry, scarious, and of a papery texture.

C. falcata.—This is one of the freest growers of the *Comparettias*, with flowers smaller than those of *C. macroplectron*, and of a varying red colour. The best form of this plant was sent to the Royal Horticultural Society on the same day as Mr. Philbrick sent *C. macroplectron*, and it was awarded a First-class Certificate. Flowers bright orange-scarlet.

C. rosea.—This is often found in collections under the name *C. falcata*. It is similar in habit to that species, but has rose-coloured flowers.

C. coccinea grows about 6 inches in height, leaves often purplish on the under-side. Sepals and petals yellow and red, lip bright red.

C. speciosa is one of the rarest and showiest of the genus, its flowers are borne eight to twelve on a spike. Sepals and petals bright orange, base of the lip orange, the broadly expanded blade being bright cinnamon.

FROM A BUCKINGHAMSHIRE GARDEN.

AUGUST 18.—How full of charm is the return after absence to a beloved garden! One comes home rejoicing, to see with a fresh eye each dear tree and each familiar spot of lawn or border, and bringing back stores of pleasant memories with sweet suggestions for new delights to perfect and bring to pass and make one's own another day.

I note for special use these:—A *Mandevilla* growing in the open air. It covers half the front of an old house, climbing up to the roof, and when I saw it the pure white blossoms were clustered thickly all over it. The situation in which this *Mandevilla* grows and has flourished for many years is warm and sheltered, the house-walls of hummel-stone, being built in a niche under a limestone cliff. Possibly this may not be the only greenhouse creeper that might thrive in the open air, at least during the summer months. We have tried successfully the white and the salmon-coloured black-eyed *Thunbergia*; also *Convolvulus* from Indian seed, which has richer and more varied colouring than the common *Convolvulus major*.

The lightness and gaiety of such a flowery hedge is indescribable. That which I saw is nearly 10 feet high, the framework made of crossed stakes, the *Convolvulus* climbing and twining up to the top and flowering profusely on both sides.

This manner of growing Gooseberries I saw at an old place in Hampshire, bordering the walks round three sides of the kitchen-garden. Nothing can be more neat and useful than these espaliers, the Gooseberries being easily gathered without much pricking by thorns, while nets fall comfortably over, protecting them from the birds. It was a delightful garden! A long green walk lay between rows of Hollyhocks, pink, black, white, and pale primrose. These lovely Hollyhocks had the free, spiraling form, that is now so rarely seen when the blossoms seem to clump irregularly up the slender stem. Roses and most of the summer flowers had faded from the borders at the time of my visit. White Everlasting Pea and

FIG. 79.—SEED VESSELS OF COMPARETTIA MACROPLECTRON.

to damp off when not actively rooting and growing. None of the section of Orchids here under notice require drying off, and it is better to water them winter and summer alike than to attempt to do so, but strictly speaking it is by far the best plan to reduce the supply of water when the plants have fully made up and hardened their growths, and only to water them as they are becoming dry until they again start into growth. Free drainage is above all things essential. Anything like a hothouse is sure to be fatal to

red strongly scented *Fraxinella* were among the few that still bloomed in beauty. A favourite plant of red *Fraxinella* was lost from our garden a year or two ago, and I had not seen one since. The scent of the flower is said to be due to the emission of a vapour that can be set on fire with a lighted match. That, I have never tried. One has but to pass a glove lightly across the flower, however, and it is perfumed all over. In another part of this old garden grow white Strawberries of a peculiar kind. They flower and fruit at the same time, and the fruit, which is in flavour like a *Hautbois*, goes on ripening as late as October or November. Every little runner bears its flowers and Strawberries. A basketful of ripe berries was gathered the day that I was there—August 10. I believe in Shakespeare's time Strawberries were still called "Straeberies," from the Saxon "Stræe" or "Stray," indicating the habit of the Strawberry in putting forth runners to a distance from the parent plant, giving to both independent life. In some outland country places they still talk of the "Straeberry."

In a beautiful sea garden, high above the sea, half hid in groves of *Ilex*, a spot so sheltered that even in winter the lawns are scarcely ever swept by the wild sea winds, I found the little white sweet-scented *Orchis* in the middle of the month, growing on the brown parched-up turf. There had been no rain there, nor hardly any dew; the lawns, destitute of any poor vestiges of verdure, lay "gaspung as a thirsty land." Yet here and there, made bold by the idleness of scythe and mowers, suddenly arose these green and white points of *Orchis*. One of them, as it seemed in one night, shot up 4 inches, and this one I took home with me. It is set in water by my window, and now I can watch the untwisting of the plaited tress, as day by day its smoothness roughens with twin-pebbled moonlight-coloured flowers. It was a pretty notion to liken the little flower-spike to tresses of the *Virgins' hair*! though one may perhaps just fancifully trace in it a mingling of Pagan fairyism; for mermaids combed their sea-green locks, and I myself once knew the traditional fairy lady of a well, all in green, with long green hair. Her well-spring bubbled up by the side of a deep Somersetshire lane, and many children and old people have seen the green fairy rise at twilight from the water. The House, whose high windows and turrets look down over these brown lawns and flowers and *Ilex* woods, is romantic, like a poet's dream, rather than a house of the nineteenth century. Its stones, however, are the grey stones of an old house in Normandy. They were brought over many years ago, and rebuilt here on the edge of the sea in strange architecture, with the carved mouldings and gargoyles and oriel windows of the past, put in just as they were. The open parapet round the roof reads in its stone letters:—"Suae mari magno turbantibus æquora ventis Terra magnum alterius spectare laborem." The words seem to make music with the soft measure of the waves below, and the sound of the wandering winds. The thick-leaved *Ilexes* soon lose themselves in woods of Chestnut and Fir, and pass cut through them in lines of endless shade close in at last, each with an arch of sapphire sea. Beyond the edges of the woods wild Honey-suckle and low sea-blown Oaks, and Brambles, grow together in a sweet entanglement, and grassy paths between are set with purple Heather and Koopweed (Knops, or Hard-heads), and yellow Fleabane; and here a legion of butterflies perpetually dance and play, and make merry in the sunny weather. It should make amends for much sorrow in the world of Nature to see these thousands of beautiful creatures secure and happy in their innocent joy.

Along the green glade your feet are every moment ensnared by long-reaching Brambles, and every step disperses a fluttering crowd of butterflies. They are so tame that scarcely will they rise at your approach, often giving the observer time to stoop and examine with a lens their spangled wings and silver-topped antennæ and busy proboscis. The Fleabane is the butterflies' dear delight. (Did not the child who called them "futterbyses" hit upon a better name?) Two or three of diverse kinds will often prank their wings, and unrolling long black tongues, dig for honey settled together on the same flower, though Flowers may not be few; but when a Painted Lady (*Vanessa cardui*), and a silver-spotted Frillitary meet on one flower they are sure to fall out, and rising chase each other hotly. Besides the multitudes of common and uncommon white butterflies and

little cloudlets of the azure-winged *Alexis*, Peacocks, and Tortoiseshells and Painted Ladies in troops with now and then a rarer clouded yellow *Collas*, or rapid Frillitary, disport themselves up and down the glade till past mid-day. Long may their happy world be unknown to green gauze nets and murderous ammonia bottles! I am curious to know if any variation has ever been observed in the markings of the wings of these insects. I have for years closely examined Peacocks and Tortoiseshells and *Atalanta*s, and can never find the colours or patterns to vary in the least degree from those of the oldest specimens I can remember. In the glade dragon-flies dart fiercely to and fro, and wild "bees are busy on their threshold old." The honey gathered on that Hampshire coast is crystal pale this summer. It was made, as I was told, from fruit tree blossoms in the spring, the long-continued drought having dried up every drop of honey in the Heather-bells.

HOME AGAIN!

And now I have been tasting the pleasures of roaming through my own principality one more!—noting with the keenest zest the changes that eighteen days have wrought. I want to go all over it again. In a grand red glow, covering an area of 462 square feet of lawn, lighting up the old hall and the windows of other rooms that look that way, like the reflex of some fine sunrise, just beyond the south porch, lies the *Sumach* tree (*Rhus cotinus*). I cannot say that it stands upon the lawn, as would be said of any other tree, for the beautiful soft masses of it are like nothing else but those great white cumuli, or summer storm-clouds, steeped in a crimson after-glow, when we watch their changeless glory moving slowly on upon the low horizon. These *Sumach* snows, however, are reddened by hot weeks of July suns; they cover all the tree, till gently they shimmer down and lie still upon the turf. Not a branch or twig, scarcely even one green leaf, strays out amid the lightness of these plumes of marabout to break their dim monotony. This plumage of the tree is sunny red, cooled with grey or lilac shadows. Ever since June has it been ripening into this miracle of misty beauty. The lawns are burnt, but the parterre is formal and brilliant—just as it should be. So are the zig-zags of *Verbena* and *Pelargoniums* beyond the *Yew* hedges. The southern wall is fragrantly overhung with festooned *Clematis*. But all these are quickly passed. I long to know all's well with the *Fantaisie* and the *Bocage*. Ah! the Sweet Pea hedge round the tennis-lawn is gone and past. Turn-cap *Lilies*, proudly splendid, replace the *Roses* of the *Fantaisie*. The *Cryptomeria elegans*, intermingling here with verdure of wonderful freshness, seem to rejoice in the dry weather, and fair flowers of deep blue *Salvia* begin to bloom.

Three paces through the deep shadow of "the wood," and there is the broad border of the *Bocage* in all its glory. To know how this had fared in my absence, while yet the ground had not received comfort from any kindly rain, had been my secret trouble. I should like for the moment to be some one else, and as a stranger to describe this border quite impartially! Yet the only words I can devise as some one else's first impression seem cold and dry. Such as "A beautiful band of flowers, that reflects the highest credit on the care and skill which have made it what it is." That will not do. I must be myself, and try to give some faint outline of it. When I saw it last—last month—*Roses* and *Pinks* were over; and besides some budding *Corn-flags* and *Hyacinthus candicans*, there was little to give grace to the border, saving certain patches and rounds and clumps of green traced in and out between the *Roses*. I returned to find this young green grown out of all knowledge, and flowering with a strange luxuriance of bloom, the flowers all mixing in delicious confusion. There is *Ladies' Pincushion* (*Sauvades*), made in pale coral, passing through velvet shades of red to deep "murrey," stuck with silver pins as usual. *Lobelia fulgens* (the Cardinal's Flower) burn between the tufts of white and lilac Sultan's Flower (*Sweet Sultan*). *Gaillardia picta* *Lorenziana* mingles with *Gaillardia picta* flowering in gold and crimson petals, fantastically nicked, set round in little coronets; a bunch or two of *lilac* *Catananæ*, deep lengths of *Marvel* of *Peru* in three bright colours, many coloured *China Asters*, double *Stocks*, *Lupins*, dwarf *Phloxes*, one choice corner filled in with *Salpiglossis* of richly varied colours, brown, purple, and grey. *Sword Lilies* flash scarlet here and there amid all these, and grandest of

all are the fine plants of *Hyacinthus candicans*, each plant sending up three or four great stems, blue-green with the bloom of health, and each bearing a ring of bells in ivory-white. A white "Peach-leaf Bell flower," (*Campanula*) near at hand betrays the only failure in the perfect beauty of these fine *Hyacinthus* flowers—failure in the purity of their whiteness. Against a low Beech hedge at the back there is a stately line of auratum *Lilies*, counting seventy-three great heads of bloom with store of buds rich in promise for weeks far into the autumn. And around the *Lilies* are enlaced large African *Marigolds* of lemon and deep gold colour, with scattered posies of little striped French *Marigolds* and of *Zinnia Haageana*. At the farthest end a thicket of *Dianthus superbis* scents half the garden, and nearest to the *Fantaisie* a narrow grass walk intersecting the border and leading into *Glorietta* is fringed with *Lobelia senecioides* luxuriantly green and most delicately blue. *Chrysanthemum tricolor* fills up the corner, and on the other side deep purple and blue perennial-blooming *Pansies* set off the clean yellow rays and chocolate eyes of *Rudbeckia Newmanni*. Towering above the *Junipers* tall "Flowers of the Sun" keep watch, their green buds not opened yet. *Mignonette* and honied *Alyssum* and orange and red *Tigridias* seem to grow naturally in and out between the other plants, with now and then a sharp gleam of *Roses* in second bloom. How obscure and dull is the thought picture, the best I can make of the *Bocage* border. Old Parkinson would paint it in a dozen words! He would just say "the place is like a piece of tapestry of many glorious colours to increase every one's delight." Yet the colour is not all. A pervading perfume works like a charm about the place to bind in one sweet whole the outward brightness of the flowers and the unseen soul of them, which is their scent.

I wonder how many moles there may be in the garden. The gardener certainly would borrow Keats' phrase, and echo heartily "the demon mole!" For they burrow and throw up their earthworks and overturn stones, and uproot precious plants, caring nothing for right or wrong. For me, the mole is simply "the four-handed mole," the odd little persecuted wild beast (one of the last left in England), the little velvet-coated gentleman-navy, who excavates in darkness, carrying his subways across our nearest turf-walks without the least regard to propriety or order in the garden. At the entrance of the *Fantaisie*, indeed, for the last twelve years a mole-run has existed across the path. Our attempts to stop this right of way have signally failed. Scores of moles were caught year after year and gibbeted near the spot as a warning, till at last the order came for executions to cease. I could no longer endure the piteous sight of the beautiful mole-skin coat squeezed round the middle, and the two ungainly servicable hands that had worked so hard, helplessly spread on either side. So the underground "Taupies" got the upper hand of us that time, and the run remains to this day. Long ago, when the world was young, mole-hills were thought to be useful for lambs to sit upon, or to shelter under if the wind blew cold. ("Nootie-stumps," they call them in Gloucestershire.) Late, however, it has been discovered that "there is nothing more useful to the floriculturist, whether for pots or borders, than earth from a mole-hill; for, as the mole lives entirely on worms and insect larvae which are found in the best soil, that which he throws to the surface while in pursuit of his prey, finely pulverised, and free from the seeds of weeds as it will be found to be, is just in the state for producing the best flowers."

A long-desired white *Tigridia* has just now for me all the charm of a new possession. The cream-white flowers, with crimson-spotted centres, are to me an exquisite delight. It is one of those strange beings which look as if they had come from another world. Until now, the two *Tigridias*—the yellow and the red—with their threefold flowers, seemed always incomplete. Now, nothing more is needed. I do not want a blue or a pink *Tigridia*; this mysterious white 'third is enough.

September 1.—The soft triumph of the *Sumach* is over. According to the supreme beauty of her prime, is now her forlorn and wretched ruin. All in a day, so it seemed, the feathery fluff began to crisp and loosen. One night the west wind blew in his strength, and left our *Wig Tree* well-nigh bald. The marabout plumes, blown thither and thither, accumulated in angles of the house, and all the borders thereabout

were bedded deep in fluffy pink. But even this relic of grace is past, and the tree, nearly unleaved (for her feathers left no room for leaf), all dishevelled and hung with rags and tatters, is an almost ghastly sarcasm on her summer self. *E. V. B.*

The Apiary.

DOUBLING.

A FAR better method than killing the bees over the prophit pit is that called doubling. It has been proved that the safest way to get bees well through the winter, is to have them strong—*i. e.*, to have plenty of bees. In point of fact it is more important to have plenty of bees during the winter months than honey. A few bees with plenty of honey may die of cold, while plenty of bees will keep one another warm and sleep away the time, not eating anything at all during the coldest weather.

The best way to double is to go to a weak hive and a strong hive. Take your bellows and smoke the bees well, giving them a few minutes to gorge themselves. Then quietly open both hives, and uncover the bees in the strongest hive. Quickly move the frames apart, so that other frames can be put between. Then uncover the bees in the weak hive, and take the frames and bees out and put them in the other hive, not altogether, but alternately with the others. The bees will be so hopelessly mixed that they will generally settle down quietly, but if fighting commences smoke them again and again till thoroughly subdued. Cover up the bees, and leave the two queens to fight it out. "The fittest will survive." Many of our most noted bee masters say "Kill one of the queens before mixing," but my experience is against this plan; because if you destroy one queen, and the stranger bees kill the other, you would have no queen at all. After two or three days remove all honey not required, and only leave enough frames that can be well covered with bees. Any pair of hives can be treated in this way, and the empty hives can be taken indoors and repainted in the winter months, and brought out again in the spring. The hives left out this winter might have their turn for a coat of paint next winter, and so on.

To double two skeps, drive both of them into other hives after being well smoked. Then put the hive you mean to keep on its old stand. Put a sheet before the hive and throw the bees that came out of that hive on the sheet. They will quickly and joyfully scamper home, but while they are scampering, throw the other bees on the top, and they will be hopelessly mixed, and all go in together. The smoke will make them all smell alike, and the two queens can fight it out as before. This can be done with any pair of hives, and the empty hives can have the comb and honey removed. Wasps are very troublesome now. No better advice can be given than old Dr. Butler's, viz., put cider or beer in a bottle "covered with paper that bath a hoal in the middle, and see you shall catch manie." *Agnes.*

pyramidal or columnar growing plants as Irish Yews, Junipers, and such-like trees, to preserve their form. Roses promise an abundant second bloom. Remove from them all suckers, weak and flowerless shoots, and secure standards against the wind that may be expected in this month, and loosen the ties of those recently budded Roses which may have started into growth. Subtropicals have this season made enormous growth, and should be securely staked.

One flowering bed that retains its beauty and freshness throughout the drought and heat, and withstands capitial rain and storms, is that of tuberous Begonias. I grow mostly seedlings, and find red and pink flowered varieties the most effective for bedding.

Herbaceous Phloxes, Asters, Chrysanthemums, especially the small dwarf early flowering kinds, are now in full bloom, and can be removed to fill up vacancies in beds or borders; and also a collection of late autumn-flowering herbaceous plants and shrubs in pots, which can with the greatest facility be plunged in the beds as the summer plants are removed.

Titonia varvata and its varieties are magnificent plants, now full in bloom; many large plants have a hundred fine spikes of bloom on them. To have this plant in perfection it should never be removed, but allowed to grow into large masses, which should be protected in winter by strewing litter or leaf-mould over the crowns.

Calceolarias and *Violas* should now be propagated; the former do best in cold frames, but provision should be made to protect them from severe frost; pots or boxes should never be used for them, as they are most impatient of having their roots confined. *Violas* will strike and winter on any border where natural shelter is afforded.

The desired quantity of *Pelargoniums* should ere this have been propagated, and if not already done cuttings may yet be put in, but they will require the shelter of a frame or pit, and if it is heated they will strike quicker and better, and will not be so likely to damp off; but in fine weather full exposure to the sun and plenty of air will be most beneficial.

Alternantheras, *Coleuses*, *Iresines*, *Heliotropes*, and other like kinds of plants may still be propagated; a slight bottom-heat is requisite to ensure success. Damp must be guarded against by removing all decayed leaves, &c. The *Chrysanthemums* should have every attention, all side shoots should be taken off, and the plants staked and tied, and if extra large flowers are in request the buds should be thinned out, leaving only one or two buds to each shoot; they will be most useful for cut blooms, or for transplanting to the flower borders; but before removing the plants it is much safer to cut round them 6 or 7 inches with a spade, so as to sever all the roots at that distance from the stem. This should be done about fourteen days before they are removed. *W. Smythe, The Gardens, Basing Park, Alton.*

Plants and their Culture.

STOVE FLOWERING PLANTS.

A GOOD supply of these for autumn decoration will be found of excellent service from now onwards to the end of October, when the *Chrysanthemums* will come into bloom; in the flowering season, therefore, of *Allamandas*, *Clerodendrons*, *Bougainvillias*, *Dipladenias*, *Rondeletias*, *Vicocas*, and *Isoras* should be prolonged to meet these requirements; indeed, for some weeks to come they will prove of as great value as they have hitherto done during the summer season. To obtain the best results from the material at command the temperature of the stove must not be allowed to decline much during the remainder of the flowering season. A frequent mistake is made in suddenly lowering the temperature at this season. It is thought that the plants will start thereby into growth with renewed vigour in the spring; such, however, is not the case, for if the wood is not well ripened from now onwards by a dry and warm condition of the atmosphere this result cannot be obtained. The maintenance, therefore, of a slightly reduced temperature

from that hitherto in force will meet both wants, viz., the continued supply of cut bloom and the ripening of the wood. When the temperature is allowed to drop the results will soon be apparent in the injury caused to flowers and foliage by damp or excessive moisture, which cannot then be dispelled, from want of active circulation of the air. Rather more ventilation should be given when possible, and the atmospheric moisture reduced to a considerable extent.

STOVE FINE-FOLIAGE PLANTS.

SOME of the more luxuriant of these will in all probability have attained a large size, and become too large to be stowed away for the winter. Rather than keep such plants it will be far wiser to dispose of them at once, if possible, breaking them up for stock; reduce their dimensions, or if there are younger plants that can take their place throw them away. I need hardly say these latter remarks do not apply to *Tree Ferns* and *Palms*, which can usually be disposed of to advantage otherwise. Large *Pandanuses* are a nuisance rather than otherwise, therefore clear them out, younger ones will soon take their places. Huge spreading plants of *Marantas*, as *M. zebrina*, overgrown *Alocasias*, and any other specimens that impart a dense shade, and will not permit of another plant being grown partly underneath them, should be considerably reduced in size prior to rearranging the stove for the winter. The pyramidal form is not, we know, very popular with exhibitors; but is, nevertheless, the best shape of training to adopt, the plants taking less room, and when in their growing quarters looking far better than the flat or oval-topped plants; the shape we have advised also sets off all the long narrow leaved pendulous varieties to the utmost possible advantage. When tying these plants use tarred string in preference to any other material, because of its lasting properties. Tall plants of *Dracenas* will be an advantage rather than otherwise, when grown on a single stem. If denuded of their lower leaves by reason of age, so much the better through the winter months; such plants will form an ornamental feature in future arrangements. If it is desired to reduce the height of any, this can easily be done by partially severing the stem (close up to the lower leaves will be best), then bind some moss around it, and after having broken a flower-pot in two halves, bind the same together again around the stem and fill in with good sandy soil to encourage the young roots. This remark on reducing the height of *Dracenas* also applies to *Cordylines* that are generally grown in the conservatory, and more frequently than not mis-called *Dracenas*. *James Hudson, Gunnersbury House, Acton, W.*

The Kitchen Garden.

CAULIFLOWER.

SOME have given up the old custom of keeping autumn sown plants in frames or under hand-glasses through the winter, depending on spring-raised seedlings of early dwarf varieties for first cutting, such as Veitch's Early Dwarf Forcing and Sutton's First Crop. Both these varieties, when sown in February in heat, will produce beautiful small firm heads some days earlier than autumn-sown Early London; but they will not bear comparison with the last-named variety for size, colour, and flavour. It is, therefore, advisable to store a good batch of this old and valuable variety for spring planting. Likewise a good batch of Veitch's Autumn Giant planted out in the spring along with Early London will be sure to prove useful where an unbroken supply of Cauliflower is valued. The plants should be stored for the winter either under ordinary handlights, on the open quarters, or planted out in frames near the glass. For those placed under handlights the soil should be well manured prior to planting them out at the beginning of October, so that part of the contents of each handlight may remain undisturbed in the spring to come to maturity. Six or eight plants may be placed under each to winter, allowing four to remain in the spring, removing the remainder to the open ground after severe weather has passed. Any plants left in the seed-beds may be lifted and replanted several inches apart on the same bed; during mild winters they frequently pull through and prove useful. *G. H. Richards, Somerley, Ringwood, Hants.*

The Flower Garden.

WE have at last got the much desired change in the weather, and the late soaking rains have got down to the roots of most plants, and which was so much needed, after the three months of dry weather. The brightness of the summer garden is now fast passing away, and the heavy rains and stormy weather of the last week have completely despoiled the *Pelargoniums* and other bedding plants, so that they will require a considerable amount of labour bestowed on them to make them endurable in the garden till the frost arrives. A few sunny days may make them a little bright again, but the wealth of bloom is over for the season. Much neatness should be observed both in the keeping of the flower beds and walks, verges, edging, and everything else about the garden. Mowing must now again have attention, or the grass will soon get unsightly. Clip Yews and Privets and other hedges if not already done, and tie up any

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Sept. 21	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Clearance Sale of Nursery Stock, Ferns, &c., at the Sidcup Nursery, by Frotheroe & Morris.
WEDNESDAY, Sept. 23	Sale of Dutch Bulbs, at Stevens' Rooms. Clearance Sale of Greenhouse Plants, at Pounce's Nursery, Hendon, by Frotheroe & Morris. Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
THURSDAY, Sept. 24	Great Trade Sale of Ferns, &c., at Reeves' Nursery, Acton, by Frotheroe & Morris. Sale of Imported Orchids in variety, at Stevens' Rooms. Sale of Imported Orchids, at Frotheroe & Morris' Rooms.
FRIDAY, Sept. 25	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
SATURDAY, Sept. 26	Sale of Dutch Bulbs, at Stevens' Rooms.

THE cultivation of GRAPES in the OPEN AIR without further protection than that afforded by a wall with a southern aspect, has been considered of sufficient importance by various provincial horticultural societies to induce them to offer annual prizes for their production. It must be admitted, however, that such productions are usually unsatisfactory. But even last year some very fair crops of outdoor Grapes were ripened in various neighbourhoods, and should the weather of the present autumn continue favourable, a still more favourable result may be expected.

Indeed, it appears quite possible that if outdoor Grapes had even a tithe of the attention bestowed upon them which it is considered necessary to devote to the same kind of fruit when grown under glass, the result might be much more satisfactory than it usually is. The varieties of the Grape Vine which may with reasonable prospects of success be recommended for open-air culture in this country are few in number. The well-known Black Hamburgh variety has been known to ripen its fruit in the open air under exceptionally favourable circumstances, but the chances of its doing so are so uncertain, indeed so improbable, that it cannot be recommended for open-air culture. On the other hand, the Black Esperione, which is an excellent variety, may be recommended for the purpose, being an abundant bearer, while the fruit is of good quality, although the variety is less frequently grown than it deserves to be. Black Prince is also an excellent variety, and in favourable seasons will ripen its fruit satisfactorily on a south wall in the open air. The only other black variety is the Black Cluster; the fruit is sweet, without much flavour, and the bunches and the berries are small, but it will ripen its fruit in most seasons.

Of white sorts which can be recommended for open-air culture possibly the best is the well known Royal Muscadine, but Grove End Sweetwater, which is also an excellent variety, will succeed equally well. Buckland Sweetwater produces large bunches and large oval-shaped berries of good quality, but can hardly be recommended as an outdoor variety, unless in an exceptionally favourable situation; a few years since, however, a plant of this variety was inadvertently planted upon a south wall, and last year it ripened its fruit very satisfactorily, and it has every appearance of doing the same during the present season. To secure success with this variety in the open air it is necessary that the berries in each bunch should be well thinned out.

In all cases where Vines are planted outdoors it is necessary that properly prepared and ample root-room should be provided for them; but for Vines in the open air a rich border is not necessary, moderately rich and well-drained soil being all that is required. The Grape Vine being a remarkably accommodating plant, will make the best of unfavourable circumstances, as in cases where no particular care has been bestowed upon it, and even where the roots are necessarily under a paved or asphalted yard, a gravel path, or a hard roadway. But such Vines in general suffer more from the neglect and mismanagement of their branches and

foliage than from neglect as regards their roots, which, if left to themselves, will in most instances make successful efforts to take care of themselves. At the same time it should be borne in mind that they may be greatly benefited, and their crop of fruit augmented, and its quality improved, by the timely application of rich mulchings, liquid manure well diluted, or even copious watering with rain or river water during dry periods.

Where it is desired to cover a wall or portion of wall with Grape Vines there are two methods which may be successfully followed. As regards the first method, as soon as the border or bed of soil to contain the roots of the plants has been prepared, strong cuttings of the desired sorts may be inserted in the soil in front of the wall, at a distance of, say, 3 inches from it; these cuttings may be inserted at about a foot apart. This is in the expectation that each cutting will grow, which will generally be found to be the case; but to guard against anything like failure in this respect the cuttings may be put in closer together, and the superfluous ones may afterwards be weeded out. These cuttings will strike root freely enough in the ordinary

FIG. 80.—METHOD OF TRAINING OUTDOOR VINE.

soil of the border, but in order to facilitate this process a small portion of sifted leaf-mould and silver-sand in equal parts may be placed around the base of each cutting, which should be inserted as early in the autumn as they can be obtained. If this is duly attended to, each cutting will be found to have callused, and even to have emitted roots, before winter fairly sets in; and in the following spring each rooted cutting, which will be at a distance of 1 foot from each other, should be allowed to produce one shoot, which should be secured to the wall. This shoot, being the production of the first season of the plant's existence, will necessarily be weak, and should, in the autumn, be cut back to the base, and during the second season each plant ought to ripen a shoot, 3 or 4 feet in length, which will furnish fruit during the third year.

The second method of furnishing or covering the face of a south wall with the Grape Vine is to use for the purpose plants established in pots, and these may either be planted early in the autumn, or in the following spring; in either case the roots should be carefully spread out in planting, and the surface of the soil should be mulched with litter of some sort, to check evaporation, and to keep the roots in an equable

temperature. The Vines need not be planted nearer to each other than 6 feet, more or less, and the rod should be cut back to nearly the surface of the soil. Each plant should be allowed to produce two shoots, which should during the first season be trained vertically, and encouraged as much as possible. In the autumn these will probably have become strong rods, and should be pruned and brought down to the horizontal position, training one to the right and the other to the left at a distance of 1 foot from the surface of the soil. From these vertical shoots, at 1 foot apart, should be trained as shown in the illustration (fig. 80) during the second season, which will also bear a crop during the third. By either of these methods the surface of a wall of any reasonable height may soon be covered.

When the wall on which the Vines are to be trained is low, say some 5 or 6 feet high, the long-rod system of training is possibly the best. This consists in annually training a young rod, or shoot, from the bottom, to take the place of the rod which bore the fruit on the previous year, which should be cut out as soon as the fruit is gathered; but where the wall is high, or in the case of the gable-end of a building, &c., the spurring system will be found to be the most suitable for the purpose, being neater, and requiring less attention. The rods should be trained vertically, at a distance of not less than a foot apart, and should be cut back in the autumn to a healthy and well-developed bud; this should be done each year until the top, or the highest part of the wall it is desired to cover, has been reached. Each bud will generally break and produce a shoot which at the third or fourth joint will, if the Vine is in good condition, present an embryo bunch of Grapes, when the end of the shoot should be pinched off at the first or second joint beyond the bunch. In cases where a shoot may fail to show a bunch such shoot should not be rubbed off, but should be allowed to develop itself in all respects the same as the shoots which show bunches, as like them it is required to form a spur to produce shoots for future seasons. When spurs are fairly formed upon the rods each spur will generally produce several shoots, and the best placed and most promising should be selected, and the others rubbed off. When the flowers are about to expand each shoot with its bunch should be tied back to the rod which produced it. This is better than the practice of nailing them to the space of wall between the rods, having a neater appearance, leaving, as it does, the space of wall between the rods uncovered by foliage, and exposed to the influence of sunshine, and it consequently becomes warmed, and the temperature is thus increased more than would be the case were the surface of the wall entirely covered. The berries in each bunch should be carefully thinned-out as soon as they are large enough to allow of this being done, and not more than one bunch should be allowed upon each spur.

The operation of thinning-out the berries necessitates some little trouble, but it is amply repaid by the superior quality of the fruit. In the case of such varieties as the Muscadine, which generally produces small bunches, and the berries do not attain to a large size, this thinning out may sometimes be omitted; but it is absolutely necessary as regards such sorts as the Esperione and Buckland Sweetwater. As the season advances, all leading shoots should be stopped when they have attained to a length of some 5 feet, as this tends to strengthen the lower part of the shoot, and not more than 3 or 4 feet of young wood can be expected to thoroughly ripen in one season in the open air.

Care should be taken to preserve the foliage of the spurs in a healthy condition, particularly the leaf in immediate connection with the bunch, which if removed or injured, will

materially effect the development of the fruit. At the same time all laterals, as they are called, should be repeatedly stopped, for if allowed to grow unrestricted, they only tend to waste the energies of the Vine, unduly shade the fruit, and injure the leaves which it is so desirable to retain in a vigorous and healthy condition. In this respect, however, it too frequently happens that the Grape Vine in the open air is sadly neglected.

Taken altogether, it may possibly be concluded that, during most seasons, this crop might with very little more care and attention than is usually bestowed upon it, be rendered more satisfactory than is generally

at any rate, on the Continent the pods are produced much more freely than they are in this country. Once or twice we have seen pods of the white variety from the nursery either of Mr. PARKER or Mr. NOBLE.

— THE ABERDEEN SHOW.—At the recent flower show at Aberdeen held in connection with the British Association, the QUEEN'S prize for the best collection was carried off by Mr. P. W. FAIRGRIEVE, gardener to the Dowager-Duchess of ATHOLE. His collection consisted of Black Alicante and White Muscat of Alexandria Grapes; Nectarine—Fitzmaston Orange; Peaches—Royal George and Noblesse; Plums—Victoria and Guthrie's Gage; Pear—Louise Boone of Jersey; Apricot—Shipley's; Melon—Dunkeld Seedling. The collection from Haddo House, which was 2d, was also very fine. Mr. ALEXANDER

It will be hung in the herbarium, which owes so much to his liberality, and in which he accomplished so much of his life-work and where (in conjunction with Sir J. D. HOOKER) he elaborated the *Genera Plantarum*.

— SACCOLABIUM HEATHI.—We have received a white bloom of a *Saccolabium* under the above name, which appears to be a variety of *S. Blumei*. The colour is a pure white, and the spike, as seen in an accompanying photograph, of great length. It will be a welcome addition to the genus.

— THE CAISTER LIFE-BOAT RELIEF FUND.—The Covent Garden branch of this fund has remitted the sum of £363 10s. to the local committee. Covent Garden or the traders therein are not only

FIG. 81.—THE WISTARIA AT SHRUBB'S HILL, SUNNINGDALE.

found to be the case. In France the berries are used in puddings and as conserves, but on the whole the chief use of outdoor Grapes is for ornamental purposes, for few plants form a handsomer cover for walls. For economic purposes, other fruit trees fill the space better; but as there are many who have a sentimental regard for the Vine, the above remarks may be useful.

— WISTARIA.—The tree here figured (fig. 81) from the garden of J. B. TORRY, Esq., Shrubbs Hill, Sunningdale, covers a wall 9 feet high for a length of 340 feet. These figures will suffice to show what a wealth of beauty and delicate colour must be presented by this tree. Our summers are rarely hot enough to enable the pods to ripen; possibly our insects do not fulfil their duties as marriage priests;

BURNS, jun., Aberdeen, exhibited an attractive collection of fruits. The show of vegetables was good in every section, the Potatos, Onions, Leeks, Cabbages, &c., being all of fine size, shape, and quality.

— PACKING GRAPES.—In our description last week of the best mode of packing Grapes we omitted to say that the basket in which the Grapes were placed was lined with a layer of wadding covered with tissue paper.

— THE BENTHAM PORTRAIT.—The portrait of the late GEORGE BENTHAM, copied from that in the possession of the Linnean Society, at the expense of a number of friends of the deceased botanist, has been presented in the name of the subscribers to the Royal Gardens, Kew, by Sir JOHN LUBBOCK. The portrait is slightly modified from the original, and is superior to it in the opinion of some as a likeness.

munificent supporters of the Gardeners' Royal Eminent, but they recognise the claims of the Lifeboat Institution also. The sad disaster which the present subscription is intended to alleviate befel the crew of the boat established by the good feeling and liberality of "Covent Garden."

— THE "BOTANICAL MAGAZINE."—The September number of the *Botanical Magazine* contains coloured figures and authentic descriptions of the following plants:—

Anthurium Glazovii, tab. 6833.—A stove Aroid, of tufted habit, the leaf-stalks thickened at the top, blades oblong acute, with prominent and distant veins. Peduncle as long as the leaves, spathe laccolate, recurved, purplish on the inner surface. Spadix longer than the spathe, terete, conic, purplish-red. The plant is supposed to be a native of Rio, and flowered at Kew.

Pentstemon Menziesii var. *Scoleri*, tab. 6834.—A beautiful, slightly shrubby species, native of British Columbia and northern California, with narrow oblanceolate serrate leaves, and erect racemes of pale rosy-lilac, two-lipped flowers, each about 2 inches long.

Argemone aureola and *A. revoluta*, tab. 6835.—Very handsome Cape Composites, like Gazanias, suitable for greenhouse decoration, or for outdoor beds in summer.

Dicymosperma nanum, tab. 6836.—A dwarf Palm, not exceeding 2 feet in height, with pinnate green, glabrous leaves obliquely wedge-shaped, erect pinnæ and erect cylindrical flower-spikes. It is a native of Assam.

Pitula Auricula, tab. 6837.—This yellow-flowered alpine species, with obovate cuneate leaves with pale margins and mealy under-surface, is figured in view of the coming Flora Conference, as its relation to the garden Auricula is not wholly made out.

— FLOWER SHOWS.—Speaking recently at Paisley Major Coats remarked that few of the general public who attended these shows fully appreciated the kindness of those gentlemen who provided these displays. It was not only the trouble of sending the flowers, but the damage to which the plants were subjected in the removal, and the injury from gas and dust. At Montreal he was very much pleased to see a scheme conducted by the Horticultural Society. There it was arranged for the proprietors of greenhouses to allow the members of the Society access once or twice in the year, on certain days, to their conservatories. In this way the members of the Society had the pleasure of seeing the plants as they stood. They were not disturbed or injured by moving, and the pleasure was very much extended. In this way he believed the Society would obtain a very largely-increased membership, and they would only have to guarantee to proprietors that great care should be exercised, and that their flowers would not be damaged. He felt sure also that the gardeners would be pleased to see visitors, and it would give them a stimulus to keep their places in order. This proposal is already partially carried out in those cases where flower-shows are held in private gardens. We should be glad also to see garden establishments thrown open occasionally at a small fee, the proceeds to be given to the Gardeners' Royal Benevolent Institution.

— MANGNALL'S QUESTIONS.—It is deplorable that our secondary schools should still be made the means of conveying such information (?) as this:—"What improvements were made in MARY'S time?— Hemp and flax were first grown in England; and the Horse Guards instituted; starch was also invented." A new edition, 1859, p. 131.

— THE SEED HARVEST OF 1885.—Messrs. JAMES CARTER & CO. report that "The peculiar season we have experienced has had the result of retarding the development and ripening of all kinds of seeds, and the report we are enabled to offer at date of writing is consequently not quite so comprehensive as that we are accustomed to make, but the general estimates we have embodied may be relied upon.

"Red Clover.—In consequence of the dry and somewhat irregular season, the English crop is later than usual, and it is expected that the great scarcity of animal food from the same cause will induce many growers who had intended to take seed to convert the crop into cattle food. The low prices also realised last year has led to a smaller acreage than usual being left for seed, so that it is not expected the English crop will be a very large one.

"The reports from France, Italy, Hungary, Denmark, and other producing districts, speak of an indifferent output, the extreme drought having greatly prejudiced the prospects, and everything depends upon a good rainfall, which at the time of writing has not been generally experienced.

"From America the reports are not propitious; in fact, the estimates of the crop are so short that it is expected large purchases of European seed will have to be made to meet the deficiencies for home consumption.

"Cow Grass.—The limited crop of this article, the production of which (in reliable seed) is entirely confined to England, promises to be a fair average, with a quality equal to that of last year, and values will probably open at last season's closing prices. The importance of this crop is being more recognised every year, inasmuch that foreign Cow Grass is always of doubtful quality, and does not compare favourably with best English samples.

"White Clover.—There is a fair average crop of English

seed, which is expected to be harvested generally in good condition. Reports from Germany, France, Hungary, Netherlands, &c., and other Continental producing districts, point to the crops being less plentiful than last year. The quality all round is expected to be quite up to last year's average, and the ultimate output may yet exceed present expectations.

"Alfalfa.—Some very nice English samples are coming forward, and will be sure to command good values, as the crop of this article on the Continent is smaller than it has been for several years. Canadian and American reports are a little more satisfactory, but the small quantities these districts produce for export have no effect upon the general values or supplies.

"Trefoil.—An average crop both in English and foreign seed, and reasonable prices are at present asked for bright and bold seed.

"Lucerne.—This crop is likely to be a fair average one.

"Timothy.—Reports not yet perfect.

"Italian Rye-grass.—The English and Scotch crops have been secured in fine condition, and quality will be above the average. Values are at present ruled by reasonable prices.

"Perennial Rye-grass.—This is also an abundant crop, in excellent quality, and can be bought at present time upon favourable terms.

"Rape.—Is better in quality and lower in value than for many years.

"Suede and Turnips.—In quality exceedingly good, but the crops have come in very short in many districts. Values may increase as the season advances.

"Mustard.—A good average crop, but an exceptionally brisk demand for home sowing for spring food has caused values to harden considerably.

"Canary and Hemp.—Reports not yet perfect.

"Natural Grasses.—These may be considered satisfactory as to average crop, and samples generally possess higher standards of purity than they have shown in previous years. There is necessarily a great range of values in these articles, as the price entirely depends upon vitality and purity. As usual there is an abundance of low quality seed upon the market, at all sorts of prices."

— AGRI-HORTICULTURAL SOCIETY OF INDIA.

—Complaints are made that the subscriptions to this Society are too high for those living away from Calcutta, and now that European and American seedsmen are establishing agencies in that city gardeners can readily obtain from that source seeds which formerly they could only obtain conveniently through the Society.

— "FLORAL EVOLUTION."—In these go-ahead days one ceases to be surprised at discoveries, &c., which would have created a great sensation less than a generation ago. The following quotations, however, are calculated to startle or amuse matter-of-fact gardeners who do not deal in the miraculous. The writer evidently goes as far beyond Mr. GRANT ALLEN as that gentleman goes in advance of most of those who have accepted the doctrine of evolution.

"I take the liberty of sending you a specimen of floral evolution. They are two blooms of the Herb Paris (Paris quadrifolia). Perhaps you are aware of its existence. If you deem it of any importance I would send further particulars, together with a seedless of last year. The enclosed are two of thirty blossoms." It may be as well to state here that the specimens in question were flowers of perfectly typical *Lilium Martagon*, and an answer to that effect was sent to the gentleman from whose letter the above sentences are abstracted. What follows reached us in a few posts. "Whatever may be the similarity of *Lilium Martagon*, the specimen sent has its origin in Herb Paris. It is eighteen years since I dug the plant up in a wood in the neighbourhood; the plant was very abundant, so I secured a fine specimen, and it has remained to tell a strange tale. For some years it remained true to its nature, then it met with a succession of accidents, from children and the ravages of slugs. Three years ago was the first time in its new form, when it grew a little over 2 feet, and having ten blossoms. . . . You may rely upon its being a genuine case of floral evolution. I may say I have no other interest than to bring to your notice an interesting case in the botanical world."

— THE NEW ROCKWOOD.—In spite of the lateness of the season this looks particularly well. The clumps of stately *Acanthus*, *Tritomas*, *Pampas-grass*, hardy Bamboos, *Hyacinthus candicans*, produce a very bold effect. The *Eryngium* still remain in bloom, and lovely patches of *Cyclamen hederifolium* are very winsome. Colchicums and autumn Crocuses

are making their appearance. Some plants like the Bamboos have outgrown the accommodation provided for them, producing a feeling of incongruity, but considering the great number of subjects there is a remarkable absence of that muddled tangle which ill-kept rockeries present. The rockery must decidedly be considered one of the greatest attractions to Kew of late years. We are glad also to see improvements in the shrubbery beds. Too many of these consisted of mere thickets of common Laurel or other uninteresting shrubs, but now several of these have been replaced by beds of hardy shrubs selected for their variety, interest, and beauty of form and colour, thus carrying out the idea often urged in these columns, of affording to garden lovers an opportunity of seeing the most interesting and most suitable plants for the adornment of the garden and specially those which are not generally met with in market establishments or private gardens.

— DASYLIPIONS.—Some of the species of this genus will thrive with very little or no artificial heat. In the *Jardin d'Acclimatation* at Paris we saw a nice lot of plants which had not been hurt at all during the winter of 1883-84; these had withstood without injury 10° of cold (Centigrade). The only shelter accorded them was a sort of awning to keep off rain, &c. The *Dasyliptis* are graceful plants and are general favourites in French gardens, nicely grown examples cultivated in the open in Southern France are regularly sent to Paris where they are used largely for the decoration of apartments, &c.

— WASHINGTONIA ROBUSTA.—This is a new Palm described by HER WENLAND in the *Garten Zeitung*, and figured in a recent number of the *Revue Horticole*. It was introduced from the Sacramento River in California River in California, and may therefore be treated as a greenhouse Palm, well suited for the decoration of apartments. It differs from *W. Pritchardii* or *Brahea filifera* by its more robust and more compact habit, by its sparse leaves of a bright green, with leaf-stalks provided with strong short curved spines; by a deep blackish-violet tint on the back of the sheath, more or less prolonged on to the leaf-stalk; and by the smaller, round leaf-blade. *Washingtonia* thrives in the South of France, where long-continued drought seems to do it no harm, and where it has been subjected without injury to 6° or 7° of frost.

— JAPANESE PLANTS.—Under the title of *Nippon Shokubutsuzaï*; or, *Nomenclature of Japanese Plants, in Latin, Japanese, and Chinese*, a book of some 312 pages was published in Tokio last year. It has been compiled by Mr. J. MARUYA, Assistant Professor of Botany, and supervised by Mr. R. SATO, Professor of Botany in the University of Tokio. The book is not one of a nature that admits of criticism, and we can, therefore, only say that as a mere reference book it is calculated to be of much use. The arrangement is alphabetical, the Latin names being placed first, with the authorities and natural orders; then the Japanese names, both in Japanese and English characters, and the Chinese names in Chinese characters. In this way 2406 plants are enumerated, after which follows three indices, one in Japanese characters, another (which will be very useful to all who have anything to do with Japanese plants or their products) of Japanese names in English characters, and another in Chinese. The titlepage of the book, as will be seen, is in English, and it is published at Tokio, by Z. P. MARUYA & CO. The book is well bound in English style, with mottled covers and red edges.

— CARTER'S GRASSHOPPERS V. CROSS ARROWS.—The above match was played at "Lodge", on the ground of the latter club, on Saturday, in rather unfavourable weather, the wicket being heavy and treacherous and the light bad. After a closely contested game the Grasshoppers obtained the victory. Score: Cross Arrows, 58; Carter's Grasshoppers, 59. The umpires were—Grasshoppers: Mr. C. H. SHARMAN; Cross Arrows, Mr. J. GRUNDY.

— GARDENING APPOINTMENTS.—Mr. H. VICKERY, late Gardener at Testwood Park, Hants, has been appointed Head Gardener to R. S. TAYLOR, Esq., Huntsmore Park, Iwer, Bucks.—Mr. E. GREGG, late Foreman to Mr. GILMOR, of Ingestre Gardens, has been appointed Gardener to J. O. SHAW, Esq., Arrow Park, near Birkenhead.—Mr. G. W. LUCAS, lately Gardener to Colonel NOEL, Clonca Falls, Lydney, has been appointed Gardener to C. LIDDELL, Esq., Peasmarsh Place, Sussex.—Mr. PRESTLEY HOGGIN, Head Gardener at Porthgwillden Gardens, Truro, Cornwall, is about to give up the management of them on account of ill-health.—G. H. GOLDSMITH, for fifteen years Gardener at Hollands, Tonbridge, has been appointed Head Gardener to E. G. LODER, Esq., Floore, Weedon.

PROLIFERATION IN FERNS.

The interesting note and sketch in a recent number of the *Gardeners' Chronicle*, from Mr. Chas. Drury, on the various forms of proliferation in *Asplenium Filix-foemina*, Bernh., have recalled to my mind the numerous and varied instances I have observed among Ferns in a wild state, chiefly in the western tropics; for it is in these and other such warm regions, where the fronds of Ferns are perennial, that the feature is most common, and reaches its greatest development. Following as our guide in classification Hooker and Baker's *Synopsis Filicum*, we find that the large sub-order Polypodiaceae includes nearly all, though not quite all, the instances of proliferation. Taking the tribes of that sub-order, we find that it is rare or infrequent in Cyathes, Hymenophyloideae, Dicksoniae, Davalliaceae, Pteridaceae, Grammitidaceae, and Acrostichaceae, while Blechnaceae, Aspleniaceae, and Polypodiaceae, contain the bulk of the examples. In *Asplenium* it is probably more frequent than in all the other tribes together, but in no one it is absolutely absent. In the genera it is not so general, and there are several in which no instance has been observed. The part of the plant in which it manifests itself varies, but is constant in any single species. Taking a general review, however, of the proliferous species, the feature is exhibited in one or another on all parts of the vascular system, from the roots which spread like threads through the ground to the tips of the more slender ribs which ramify to the margins of the leaves; but I have never found it on all these parts of any one species in a wild state. As a supplement in reproduction to the normal generative function in Ferns, proliferation exhibits three very distinct, and, in each case, very definite forms, which are early recognised as distinct by the most casual observer. Two of these are limited to three of the smaller genera, while the third is common to many species of several genera.

These forms of proliferation are:—1st, the formation of fleshy bulbils or tubers; 2d, stolons; and 3d, ordinary vegetative buds. Examples of the first are found in *Cystopteris bulbifera*, and in two or three species of *Nephrolepis*. In the former they arise on the fronds, and in the latter on the subterranean roots. Both bulbils and tubers are of a firm fleshy substance, and can consequently remain dormant without injury several months, should the conditions affecting growth be unfavourable to their immediate vegetation, which state is generally the case with one of the examples mentioned, because of the severity of the winter over the greater part of its range and frequently, in the other instance, because of periods of drought acting with the dry and rather bare situations in which the plants are as a rule found. The bulbils are composed of two or more fleshy lobes, like cotyledons, from the base of which the germ starts, somewhat as the plumule does in a Pea. The tubers are solid, small, like some of the wild species of Potatoes, and they vegetate from the surface in a similar manner.

The second form—the production of stolons—occurs in *Blechnum* and *Nephrolepis*. Wiry shoots are thrown out above the surface of the ground, several inches to a foot or more long, which root and form a plant at the extremity. When established these effect other removes of the same character, and so the plants spread over the surrounding ground, cover banks or rocks, or ascend the trunks of trees, and in the West Indies are, not inaptly, called Walking Ferns. This form of proliferation differs materially from the rest, but the same free diffusion is attained by several species which are exclusively subjects of that.

The third form—the formation of vegetative buds—is, as I have said, the most common, and affects numerous species of several genera. Though plentifully illustrated in very diverse genera, it is, as before hinted, probably most frequent among the *Asplenium*. Due partly to a corresponding difference of habit, and partly to the position on the fronds in which the buds are produced, it falls into two distinct divisions. In the first of these the buds become established at a very early stage in their career while still connected with the parent plant; in the second they have to pass through a probationary period, and are at length separated from the parent before they attain, or even begin to attain, the fixture in *terra*

ferma necessary for their survival. To the former belong rootbuds, which, being already in the soil, no element ever disturbs the even and uneventful course of their development, and the majority of terminal buds, *i.e.*, those which arise at or near the extremity of the rachises or ribs of prostrate or arching fronds. Where the end of the spreading frond might not perhaps reach the surface of the ground the bud is often projected on a slender, much elongated, flagelliform tail in order more certainly to accomplish this. The connection remains, and aided, no doubt, as much by this, at least during the earlier days, as by what it gathers by its own incipient feeders, the development to the adolescent state is relatively; compared to that in the other subdivision, a rapid one. These are the instances in this division to which I have adverted as resembling in the facility they thus possess of spreading the truly stoloniferous species. In a few cases, in which the habit of frond is pinnatifid, the buds are produced at the ends of the pinnae generally, taking the place of a terminal leaflet, as well as at the end of the frond itself. In other cases, in which it is simply lobed or more or less entire, they spring from the margin, usually from a crenature or sinus. In the other subdivision the buds are produced on some part of the surface of the frond distant from the ground, or sufficiently clear to prevent connection. In some of the larger species they are elevated several feet above it. Here they are more copious, often most abundantly so, occupying the axis of the pinna, and frequently other parts of the vascular surface. During the embryonic stage they are sustained entirely as outgrowths from the parent frond, but gradually they emit rudimentary fronds and rootlets, which successively increase in size and efficiency, and thus they become strictly, for the time, aerial subjects, deriving as the parent fronds become enfeebled by age, or their connection with them is reduced by the slow process of disarticulation, which operates at least in more cases, and possibly, to some extent, in all, their sustenance from the atmosphere.

Thus existing, they are prepared to bear successfully the period while unconnected that must elapse, in the case of each, after they fall, or are dislodged, from the elevated home in which their infancy has been spent. How effectual this preparation is may be seen by the rapidity with which they become established, and, if the weather be favourable, without the least indication of suffering in the course of effecting this. A plant taken from the ground, laid side by side with one of them, would perish in the same time. In other instances, which, however, are comparatively rare, the same result is attained in a different way. Instead of throwing out roots and foliage, or at most doing so only very tardily, the bud slowly swells into a strong, scale-covered, fleshy rhizome, which, after it drops, will endure for a considerable time very adverse conditions, should such by any chance be encountered. I have seen these curious rhizomes an inch or two long, and as thick as one's finger or thumb. These derive all their nourishment from the frond to which for a considerable period they remain tenaciously attached. Root-buds occur in several species, but their true origin among wild plants is not always recognised, for, springing up, often plentifully, around the parent plants, they look like normal spore-produced ones. Species of several genera, which else resemble each other very little, have this characteristic in common. In none of the cases I can recall does foliage proliferation accompany root proliferation. In infrequent cases buds arise on the naked petioles of the fronds. The most remarkable instance I remember of this is in *Asplenium monanthemum*, L., which has slender polished, indurated stipes, quite devoid of any hollow or nidus, such as in other species the bud usually originates in. The stems of tree Ferns occasionally become bifurcated by budding at or near the crown. In a few arborescent species, too, buds normally spring from the base of the primary stem, and from other shorter stems around that. The most abundantly proliferous species have the most multiply divided fronds. Such are occasionally seen literally covered with the developed buds.

Among the more leafy species in which the feature is also freely developed the buds occasionally appear as if growing in the membranous surface; really, however, they are on the slender ribs which run through it. Other species, again, as I have said, exhibit the feature around the margins of the leaves. *Hemioites palmata*, Lino., and some varieties of *Cera-*

topteris are instances of this form, in both of which it occurs on the prostrate unisporiferous fronds. There are other instances, too, of dimorphic species, in which bud-production is mainly but not uniformly confined to the barren fronds. In all such cases these fronds are more or less prostrate, while the sporiferous ones, in which it is infrequent or quite absent, are erect. In *Polypodium reptans*, Sw., *Aspidium ilicifolium*, Fée, and *Fadyenia*, as instances among others, the former are radicate at the apex, while the latter are not. In these dimorphic cases the form of reproduction possessed by each kind of frond serves its own purpose best, and is most effectual. The sporiferous or fertile fronds being elevated, the spores when shed are more likely to reach new ground quite clear of the old plants, and thus afford a better chance of survival to the plants they produce, while the buds of the prostrate sterile ones being close to the ground can root immediately into it without having to pass through the precarious unattached period which is the lot of aerial buds, as already described, for undoubtedly there are risks of damage or complete destruction by drought or floods of rain (that may wash away or bury them), as well as the ravages of many herbivorous creatures which established plants, though quite as small, can bear with little loss. G. S. Jenman.

(To be continued.)

HARDY ORNAMENTAL SHRUBS.

FUCHSIA RICCIARTONI is a meet companion to *Hydrangeas*. I am not aware of any two shrubs that are more suitable for planting in close proximity. Mass planting is also most suitable for this *Fuchsia*, for when in large irregular clumps the flowers are shown to much better perfection than is the case with single specimens, be they ever so fine. Just now it is a grand sight to see the edges of park woods glistening with the red and purple flowers of this most profuse blooming plant, more especially if at irregular distances apart good-sized patches of the *Hydrangea* have been inserted. Although not hardy in Scotland generally, yet in England this pretty shrub is seldom killed outright, although frequently cut over by the ground during severe frost. This, however, injures it but little, as it throws up as strongly from the root the following spring, and blooms so profusely as to almost tempt one into the belief that such treatment is really necessary for its full development. Along the coast it is frequently met with over 10 feet in height (I have measured one specimen 16 feet), where, during the months of August and September, it is a floral treat of the most delicate appearance and the richest beauty.

THE BITTERSWEET, *SOLANUM DULCAMARA*,

although seldom grown for decorative purposes, has, we think, a claim for admission into the wild garden, if only in its clusters of purple flowers with conspicuous yellow anthers—colours that are certainly unusual amongst the flowers of our gardens. To see this plant in perfection it should be allowed free scope amongst other rather dense growing shrubs where the long flexuous stems will receive that support which their rather weak nature demands, and where the terminal cymes of flowers, peeping just above their support, will, during the summer months, prove a source of attraction. The reddish berries also are very ornamental.

ESCALLONIAS.

Amongst these will be found several distinct and interesting plants, most of which are well suited to the climate of this country where choice of situation is to be taken into account at time of planting. When in its best condition few of these are more lovely than *E. macrantha*, a plant that richly deserves extended cultivation in our gardens. It is most frequently seen as a wall plant, but it certainly looks best as a border shrub where the situation is suitable, and a slight protection afforded from the prevailing winds of the district. Planted as a single specimen it frequently attains a height of 6 feet, when it becomes a branching erect shrub, with shining oblong or elliptical leaves, and large crimson red flowers. It does especially well by the sea. The white flowered *E. philippiana*, introduced a few years ago from South America, is perhaps the most ornamental of the genus, the slender growth, spreading habit, and dense sprays of pretty white blooms and buds rendering the

plant one of the most effective for outdoor embellishment.

THE SYRIAN HIBISCUS (H. SYRIACUS)

is another shrub of far too rare occurrence in our gardens, more particularly when we consider its beauty as an autumn flowering plant, and that it was introduced in Parkinson's time, or early in the sixteenth century. Of medium height, seldom exceeding 6-8 feet, perfectly hard, and by no means particular as to choice of soil, so that it is not over-tweet this shrub is well adapted for planting as isolated specimens on the lawn, or intermixing with evergreens along the outskirts of plantations. The flowers are usually of a reddish-purple (this is, I believe, the typical colour), but the plant is so variable in this respect that there are many really distinct forms or varieties in cultivation, including white, yellow, rose, purple, violet, and striped. Then there are the double white and double purple kinds, as well as one with variegated foliage, which latter is a very distinct and ornamental shrubby plant. This plant is also known under the name of *Althæa frutes*.

RHUS COTINUS.

Than this or the Venetian Sumach there are few more striking objects in the autumn, but more especially when seen in the evening under the rays of a setting sun, being green in the shade, but of an intense crimson in the sunlight. The light, feathery inflorescence imparts a very peculiar appearance to the shrub, the simple rounded leaves on long petioles still further adding to its beauty.

This is a somewhat neglected shrub in our grounds, for although introduced more than 200 years ago, one seldom sees it, although its value for autumn decoration places it in the first rank amongst deciduous flowering plants.

The Stag's-horn Sumach, *R. typhina*, from North America, is another worthy member of this family, with dense clusters of variously coloured flowers, and deeply serrated leaflets. *R. glabra*, although not so showy as the latter, is yet well worthy of introduction, for the ornamental foliage and bright red berries render it at various times both decided and conspicuous. There is a variety of the latter with beautifully cut Fern-like foliage—known, indeed, as the Fern-leaved Sumach (*R. glabra laciniata*) with a good compact habit, and perfectly hardy. All the Sumachs do well in ordinary soil, require but little attention, and are readily propagated from cuttings. *A. D. Webster.*

DISEASE OF GENTIANA.

PUCCINIA GENTIANÆ, LINK.

A WEEK or two ago, examples of *Gentiana acaulis*, L., were forwarded by Dr. M. C. Cooke from Kew badly infested with a parasite new to Britain, named *Puccinia Gentianæ*, Link. As is common in such cases, the Uredo, or early condition of the Puccinia, was growing on the invaded plants in company with the mature or Puccinia state. The Uredo is the *U. Gentianæ* of Strass. It is a remarkable fact that whilst on the Continent the Puccinia attacks *Gentiana cruciata*, *G. asclepiadea*, *G. ciliata*, *G. Pneumonanthe*, and *G. utriculata*, no record is published of its attacks on *G. acaulis*, the plant upon which it has first shown itself in Britain. A large patch of *Gentiana acaulis* has been destroyed at Kew, and now that attention is directed to the fungus it is possible that accounts may be received of a similar destruction from other quarters.

Gardeners will be alive to the real danger of this new enemy when they are reminded that *Puccinia Gentianæ* is a close ally of *P. malvacarum*, the fungus of the Hollyhock disease.

The upper part of the accompanying illustration (fig. 82) shows, natural size, *Gentiana acaulis*—spotted with the Puccinia; the fungus grows on both sides of the leaves, but appears to prefer the upper surface. The spots or pustules are at first orange in colour, then black, a group of pustules enlarged to ten diameters is seen at A. When a few spores are taken from an orange spot and enlarged 400 diameters they are seen as at B, ochreous in colour, and furnished with from one to three lighter internal spots—these are the finely echinulate Uredo-spores.

When a few spores are taken from one of the black pustules, and enlarged to the same scale, they are seen as at C, bright dark brown in colour, and fur-

nished with a joint, or septum, across the middle. These are the Puccinia spores: the orange coloured Uredo-spores germinate at once, as soon as they are produced; the Puccinia spores, on the contrary, generally rest, sometimes for a long period, before germinating: they are potentially resting-spores.

It often happens in plants invaded by Puccinia that a fungus named *Æcidium* grows on the same host plants; this is the case in the plant before us, as Dr. Winter says the *Æcidium* was found in 1880. The belief, however, is by no means accepted by all botanists, that Puccinia and *Æcidium* must be genetically connected.

No *Æcidium* has been seen on the Kew plants, but all the evidence tends to show that the plants were imported into the garden with the disease in them in a latent state. Mr. D. Dewar, of the herbaraceous ground, Kew, says the plants were never really healthy in the garden during the two years they were there. They were planted in a large bed by themselves, and it was very difficult to make them grow at all. Some time after planting Mr. Dewar placed a healthy plant of *Gentiana acaulis*, received with others from Edinburgh, in the middle of the diseased clump, with the result that the Edinburgh example succumbed to the disease which it had contracted from the diseased specimens. Black and yellow flowers of sulphur were tried at Kew as a remedy without the slightest effect, and as a last resort all vestiges of the diseased plants were burnt.

The disease appears first in the basal leaves, as

FIG. 82.—PUCCINIA GENTIANÆ.

shown in the illustration; this may be because they are the first to appear above-ground. These first-produced leaves speedily change colour to yellow, and become dry, like tinder. The Kew plants made plenty of runners under-ground, but as soon as the young leaves appeared above-ground they were attacked and destroyed by this terrible scourge.

As with other Puccinia invaded plants, every scrap of diseased material should be destroyed with fire directly it is seen.

Since these notes were written the Editor of this paper has sent a large collection of diseased *Gentiana*, received from Russia. These Russian examples are in a far worse plight than the English ones, as a profuse growth of the Puccinia is to be seen on all parts of the Russian plants, from the lowest leaves to the floral organs. There can be no doubt that the disease is spread whilst in a latent condition in imported plants, as well as by the seeds; these seeds are either tainted with the fungus in a diffused or attenuated state, or they carry Uredo or Puccinia spores either outside or inside their membranes. *Worthington G. Smith, Darnstable.*

TEA.—The quantity of Tea exported from China and Japan to Great Britain, from the commencement of the season to July 2, was 49,170,477 lb., against 49,257,920 lb., exported in the corresponding period of last year. The exports to the United States and Canada during the same period were 6,790,605 lb., as against 7,654,678 lb.

Orchid Notes and Gleanings.

CLEISTOSTOMA GUIBERTI.

A GRAND Orchid, of which Mr. Linden received from Assam a solitary plant, which, unfortunately, is now lost. The habit is that of a *Vanda*; the leaves are strap-shaped, notched at the apex; the flowers are very numerous, disposed in branching panicles. Each flower is about 1½ inches across, with oblong-ovate segments of a creamy-white colour, thickly marked with irregular purplish spots. It is figured in *Lindenia*, tab. ix.

SELENIFEDIUM RETICULATUM.

A species discovered in Ecuador by Wallis, who sent home hundreds of specimens—all dead on arrival! The flowers are in racemes, each 7 inches across in the longest diameter, sepals white, with green netted venation; the posterior sepal lanceolate, the two lateral sepals deflexed and united into a solitary oblong obtuse segment, the two lateral petals spreading horizontally, linear-lanceolate, twisted, each about 3 inches long, lip leaf-shaped, greenish externally, white within, with a few purple spots. *Lindenia*, t. x.

ÆRIDES MACULOSUM.

A magnificent species, with a densely crowded raceme of flowers, each 2 inches across, with obovate oblong segments, whitish, spotted and tipped with reddish spots, anterior lobe of the lip tongue-shaped, reddish-violet. *Lindenia*, t. xi.

CATTLEYA MAXIMA VAR. HRUBYANA.

A lovely Cattleya, with flowers 6 inches across, the sepals and petals pale lilac-rose, sepals oblanccolate, petals obovate oblong, lip wrapped round the column at the base, expanding in front into an oblong disc, undulate at the margin, and marked with purplish diffuent veins on a white ground, and with a central yellow stripe. *Lindenia*, t. xii.

ODONTOGLOSSUM WILCKEANUM FALLENS.

A very beautiful variety, with numerous flowers in a two-ranked raceme, each 4 inches across in the longest diameter; sepals and petals white, with large chocolate blotches; the petals lanceolate, rather broader than the sepals, and boldly toothed in the middle; lip rather shorter than the petals, oblong obtuse acuminate, with a fringe of spine-like processes near the base, and two yellow keels running towards the apex. *Orchid Album*, t. 201.

LELIA CRISPA, CATTLEYA GIGAS AND OTHERS.

Referring to the remarks on this Orchid at p. 334, it is certainly not difficult to manage. I have grown it, for nearly twenty years, both the usual variety and *L. crispa superba*. It is grown along with *L. purpurata*, and annually produces strong flowering spathes. This is a very distinct and beautiful Cattleya, the flowers are not so large as those of *L. purpurata*, but the sepals and petals are pure white, as many as five and six flowers being produced on one spike: it flowers the end of July, or early in August. We had in flower with it this season the recently introduced Cattleya Gaskelliana, a species of great merit, flowering, as it does, after C. Mendelii and C. Mossiz, and thus prolonging the Cattleya bloom a month or six weeks longer. It can be depended upon to flower as freely as C. Mossiz or *L. crispa*, whereas the splendid C. gigas cannot. This I find very difficult to manage; it cannot be made to remain dormant in August or September after it has done flowering, and this restless habit prevents its flowering in most cases the following season. The autumn growth will not flower, and it weakens the plant so that it will not make a flowering growth the following season. C. imperialis and C. Sanderiana are too nearly allied to it in appearance and habit to be designated distinct species. As much may be said of the distinct and handsome C. aurea; it flowers at the same time as C. gigas, and has the same unfortunate habit of starting into flower as soon as the flowering period is over. *J. Douglas.*

RENANTHERA COCCINEA.

At Mr. E. Gotto's, The Lodge, Hampstead Heath, there is now in flower a plant of *Renanthera coc-*

cinea with a very fine spike bearing fifty-five flowers. It was imported about eighteen months ago, and has enjoyed full sun. I have had it in a vinery all the summer, having stood it on a shelf near the glass. *T. Banks.*

THE PROPAGATOR.

THE PROPAGATION OF BEDDING PLANTS.

It is not a good plan to entirely depend upon the old lifted plants for a supply of bedding plants; it is much better to propagate a large batch of cuttings in the autumn months. In the first place, one of the old lifted plants would take up as much room as a dozen cuttings; and in the second, the former would not stand the winter so well as the latter. Besides this, the cuttings grow more freely in the spring, and

As soon as the cuttings have rooted they should be moved into a warm house, and placed on a front platform or shelf near the glass. During the winter months they should be carefully watered, and the dead leaves and flower tufts should always be picked off. They will remain on the platform until they are wanted for spring propagation.

The best soil for the cuttings is that made up of equal quantities of loam, leaf-mould, peat, and river sand, and a small quantity of broken potsherds. The soil should be well mixed together, sifted, and rubbed through a quarter-inch sieve. Some large 48-pots should be used for the cuttings, and after the pots have been well drained the soil should be put in and pressed in firmly, leaving room enough for a quarter inch layer of sand upon the top.

VEREENAS.

The present is a good time for putting in cuttings of these plants, because, during the dry summer

follows:—Half loam, quarter leaf-mould, and quarter sand. It should be well mixed together, sifted and rubbed through a quarter-inch sieve. The cutting-pots can be prepared in the same way as those for the *Alternantheras*. *T. O'B.*

(To be continued.)

GENTIANA VERNA.

Few plants are more familiar to, or more highly appreciated by alpine tourists, than this lowly *Gentiana*. In the whole gamut of flower-colour there is nothing purer than the deep sky-blue of the corolla. It is common on most parts of the Swiss Alps above the forest line, and is, or was, found in Teesdale, Durham. In its native habitats it grows usually in deep rich mould with abundance of moisture and fully exposed to the sun. For the very characteristic figure (fig. 83) we are indebted to Mr. Scott Wilson, who has been passing some months in Switzerland, studying the flora of the country and the conditions under which alpine plants grow naturally. In this country its cultivation is easy, but it does not succeed well unless grown in masses, and lime appears to suit it better than granite. When found growing naturally in other than limestone soils, it is less robust.

There is a white-flowered variety of *G. verna* which usually remains constant and flowers freely under cultivation, but it sometimes, on being transplanted to other localities, turns to blue. This white variety sometimes occurs in the Jura mixed with the blue, forming a pretty combination of colour. After a particularly dry summer *G. verna* frequently flowers a second time.

AN OCTOGENARIAN HORTICULTURIST.

ON Monday, the 7th inst., the *employés* of Messrs. William Barron & Son, of the Elvastoo Nurseries, Borrowash, near Derby, to the number of sixty-five, were entertained at dinner by William Barron, the senior partner of the firm, to celebrate his eightieth birthday. The *employés* took advantage of the occasion to show the high esteem in which they hold their host by presenting the octogenarian with an arm-chair, accompanied by an appropriate address. During the evening Mr. Barron gave his guests a very interesting sketch of his past career.

Mr. Barron has been a most enthusiastic horticulturist all his life, having commenced his career of gardening as an apprentice at Blackadder, the seat of Thomas Boswell, Esq., where he made rapid progress in his profession. Having completed his term of apprenticeship he was appointed foreman in the houses under Mr. MacNab, at the Botanic Gardens, Edinburgh. From thence he went to Sion House. Having remained at Sion House for some considerable time he was selected to lay out the gardens at Elvaston Castle, the grounds of which are famed for the artistic manner in which they have been designed.

Ultimately he was permanently appointed head gardener and steward, in which position he remained for more than thirty years, during which time he enjoyed the entire confidence and respect of his noble employer, and was held in high esteem by all those with whom he came in contact.

During the time he had charge of the Elvaston gardens he brought together one of the then best collections of Conifere in this country, some of which have attained the proportions of large timber trees. Mr. Barron has made himself famous both as a landscape gardener and for his successful mode of removing large trees, some of them being of great dimensions, amongst which may be mentioned a few of the largest.

The first large trees that he attempted to remove were some Cedars of Lebanon, at Elvaston; the largest of these measures at the present time 80 feet in height, 9 feet 9 inches in circumference of stem, with a spread of branches 63 feet in diameter; this tree is in the most robust health. He also removed a Cedar of Lebanon from Hornsey to Acton, 60 feet high; in this required thirteen horses to convey it to its destination.

One of the largest trees removed was a Cedar of Lebanon, for Sir John Hanrot, Bart.; this tree measured 50 feet high, 50 feet diameter of branches, and was moved with a ball 18 feet long by 16 feet in width by 3 feet 7 inches deep, the whole weight being computed at 50 tons.

FIG. 83.—GENTIANA VERNA.

develop into more compact and better-shaped plants, and they are not so liable to canker or rot off as the old plants are.

ALTERNANTHERAS.

In taking the cuttings, those pieces should be selected that grow up from the base of the plant. Each piece should be about 2 inches long, and before dibbling them into a cutting-pot the leaves should be taken off for half an inch up the stem; all flower-tufts should be removed, and the base of the stem should be levelled. From twenty to twenty-six pieces can be dibbled into a 48-pot. The holes made by dibbling should be filled up with up with dry sand. After well watering them with a fine-rose pot they should be placed in a cold pit or frame as near the glass as possible. Here they must be shaded from the sun. In the morning they must be sprinkled with a fine-rose pot, and the frame must be ventilated for an hour; in the afternoon they must again be sprinkled, and then shut up close. A single mat should be thrown across the frame every night.

months, the plants are infested with thrips and red-spider, but now that the nights are colder and the dews heavier the plants are much clearer.

For the cuttings those pieces shooting up from the base of the plant should be taken. Each cutting should have four or more leaves attached to it, and it should be made at a leaf-joint if possible. Dibble in a dozen of the cuttings round the border of the pot, and six in the middle, and fill up the holes thus made with dry sand. They should be watered and placed in a shallow cold frame. Here they should be shaded from the sun, and sprinkled with a rose-pot every morning and afternoon. The frame should be ventilated for an hour in the morning. When the cuttings have rooted they can be placed either in a pit where the frost can be kept out, or on the front platform of a cold house, where they should be kept until they are required for spring propagation. They must be moderately watered. If mildew attacks the plants they should immediately be sprinkled with sulphur.

The soil for the cuttings should be made up as

The greatest feat of tree lifting was, however, accomplished at Dover, when an old Yew, considered to be over 1000 years old, was moved with the greatest success, and is now to be seen in a thriving condition.

Mr. Barron is still in the enjoyment of excellent health, thus showing the beneficial results of temperate habits and constant activity.

TREES OF THE UNITED STATES.

THERE has recently been placed on exhibition, at the New York Museum of Natural History, an almost complete representation of the trees of the United States,—between 400 and 500 trunk sections of the different species. These specimens are about 5 feet 8 inches long each, cut in such manner as to display their barks and the transverse and longitudinal sections of the wood. This is done by cutting away one side of each specimen at the top to the depth of one-half the diameter of the trunk and for one-third of its length. One half of each exposed portion is polished to illustrate the effect of this treatment of the wood, the remainder being left in the natural condition, with the top of the upper divided part finished by leveling. In the case of trees of commercial importance this form of representation is supplemented by carefully selected planks, or by "burls," showing better than the logs the true industrial value of the wood. Among specimens of this kind is a plank of Redwood (*Sequoia sempervirens*), measuring 8½ feet in width. A species remarkable for slow growth, and which is only 24 inches in diameter, shows an age of 410 years, being the oldest tree in the collection. This is *Picea Engelmanni*, named for its discoverer, Dr. Engelmann, and known also as Engelmann's Spruce, and as *Pinus commutata*. Another example of slow growth is seen in *Pinus edulis*, or edible Pine, from Arizona, called also Nut Pine. The seed of this Pine, which resembles a good-sized Bean, is used by the Indians for food. A tree of this species, which is 300 years old, measures only 15 inches in diameter. Another specimen, which is 34½ years old, shows a diameter of 37 inches. It is the Western Shell-bark Hickory (*Carya sulcata*), from Allenton, Mo. The same locality is represented by a specimen of *Tilia americana*, or Basswood, which is 40 inches in diameter, and 150 years old.

This valuable collection, numerically exceeding that made in connection with the census reports, includes examples of many curious and interesting species, of which probably the complete natural series could never have been viewed in their native soil by any single traveller, however diligent.

Among the extraordinary specimens is a representative of Texas. This is the *Cereus giganteus*, which resembles a fluted column. It is a plant which can be readily taken all to pieces. Its component parts are in the form of vertical sections of twisting curvatures in the line of their circumference, whereby one portion is fitted exactly to another. They can be separated without the slightest difficulty, in the absence of any heart at the centre for their attachment. The Washington Palm (*Washingtonia filifera*), from Southern California, is also curious. The specimen includes the top of the tree, which is severed from the body, and bears its dried and yellow wide-spreading leaves. Its peculiarity is in the ring-formations of the trunk, which are almost wholly detached from each other, standing one within another like a succession of forms of bark. They are easily detached from each other.

The Cocoa-nut tree from Key West, and the finely odorous Nutmeg tree from California, are among other specimens of importance. The Catalpa is represented as a species most remarkable for its durability. Some of this wood, known to have been buried in the earth for seventy-five years, has been brought out in perfectly sound condition. Specimens of beautiful woods are seen in the Arbutus, Sweet Bay (*Persea carolinensis*), Alaska Cedar (*Chamaecyparis nutkaensis*), and the beautifully figured Maple "burl" from Missouri.

With only seven unimportant exceptions, the specific gravity, ash, and fuel value of the wood of every indigenous arborescent species of the United States have been scientifically determined. The specific gravity was obtained by weighing carefully measured specimens 100 millimetres long and about 35 milli-

metres square, previously subjected to a temperature of 100° until their weight became constant. The ash is given in percentages of dry wood, which were determined by burning small blocks of the wood in a muffle furnace at a low temperature. The relative approximate full value of any wood is obtained by deducting its percentage of ash from its specific gravity. The correctness of the result thus found is based upon the hypothesis, first proposed by Count Rumford, that the value of equal weight of all woods for fuel is the same, which is considered to be approximately true. *Scientific American*.

HOME CORRESPONDENCE.

The Fruit Crops of the Present Season.—The fruit crops of the present season, in this neighbourhood, have been disappointing. In general a fair crop of fruit set, but the spring frosts killed much of it, and the continuance of more or less up to the present time of cold weather, caused much of the young fruit to shrivel and drop off. Most kinds of orchard fruit are below the average in size and quality. The hot fine summer of last year (1884) raised the expectation of good crops of superior quality this season; the young wood and the buds on fruit trees got well matured, the winter was a mild one, and the spring (owing to the dull cloudy weather) was a late one. The fruit trees showed an abundance of blossom and promised a heavy crop of fruit. Peaches, Nectarines, and Apricots coming into bloom whilst the weather was fine, and having the protection of walls, set good and abundant crops of fruit. In general these crops are fair, except that the fruits are not particularly large. Cherries, Pears, and Plums showed a great abundance of blossom; Cherries set pretty well and are good crops on walls; Plums and Pears promised good crops of fruit, but they got sadly injured by the frost and cold weather that prevailed the time they were in blossom, a great deal of the young fruit dropped off. Both Apples and Pears are below the average size, and the crops are very irregular, some trees heavily laden, whilst other trees have little or no fruit. Raspberries have in general been a heavy crop. Gooseberries have varied in crop very much. In one garden I called at, famous for its fruit crops, I found the crop a complete failure; in another garden, only a short distance from the other, I saw one of the finest crops of Gooseberries I ever beheld. There was a fair sized quarter of fine young healthy trees of large kinds, and a finer crop I never beheld. Currants were in general below an average crop. Strawberries were a good crop and very fine; and owing to the nice showers of rain we had they continued some time in bearing. *M. Sault, Holgate, York.*

Hybrid Abutilons.—How very useful these showy, free-growing, profuse-flowering, greenhouse shrubs are! Mr. Munro, the gardener at Cleveland, Lyme Regis, cultivates them on the back wall of ainery with excellent effect, and it is a very agreeable change, for back walls of "hip-roofed" and "lean-to" vineries are often naked and bare. The Abutilons are planted out in a compost of loam, peat, leaf-mould, and coarse sand, the border being thoroughly drained. During the blooming period the plants receive a copious supply of water, and liquid manure at times encourages them amazingly. *Boule de Neige*, with pure white flowers, is perhaps the most popular variety, but I believe that purple Emperor, crimson Banner, pink Admiration, rosy Delicatum, yellow Canary-bird, and many others, will become favourites as well when better known. Mr. Park-house, the gardener at Watermouth Castle, North Devon, also grows Abutilons in this way, and in his case, as also with Mr. Munro, the plants are neatly fastened and trained to the wall, producing a pretty green background, besides which they are so very handy where cut flowers are much in request, being prodigious bloomers. *W. Napier.*

Hoya Griffithii Fertilisation.—This plant is fertilised by large flies precisely as in *Hoya globulosa*, as described and illustrated by me in *Gardeners' Chronicle* for April 29, 1882, p. 570. When I received the blooms of *Hoya Griffithii* for engraving, a bluebottle had been caught and was held fast to one of the blossoms by a pair of pollen masses and their glutinous disc. In the box I found a second bluebottle dead from exhaustion, with two of its legs

locked together with a second pair of pollen masses. When flies alight on the flowers their feet touch the glutinous discs, and in the effort of the fly to get its feet free, the movement of the legs causes the pollen masses to fly out and embrace the foot; the fly on visiting a second flower draws the pollen masses over the stigmas. I at first engraved the bluebottle hanging from a flower, but as I considered it defaced the picture, I afterwards removed it. *W. G. S.*

Heavy Yield from Two Pounds of Potatoes.—I herewith send you the weight produced by 2 lb. of Potatoes, 1 lb. of each, from the spears—*i.e.*, Vanguard, 165 lb.; Sutton's New Regent, 140 lb.—and shall be pleased to know if as much or more has been got in any other way than that. *Geo. Lambert.*

Hooper's Illustrated Bulb Show Tickets.—These are a new introduction likely to be of service to country seedsmen. They are in the form of stiff oblong cards, with the upper portion rounded off like an arch; and on a suitable coloured ground there is painted in colours, near to Nature both in shape and size, clusters of different flowers—one on each, such as Anemones, Gladioli, Hyacinths, Iris, Ranunculus, &c. These picture tickets are intended for marking the prices of bulbs in seedsmen's windows; and seeing that they illustrate in colours the flower of the bulb offered, they are likely to prove very useful, and to a certain extent instructive. One thing is certain, they will tend to relieve something of the dulness that attaches to a seed shop when the bulbs are arranged for sale. Being both durable and cheap, these coloured cards are likely to be much in demand. *A. D.*

A Mushroom Field.—There is now to be witnessed a most remarkable and extraordinary crop of the common field Mushroom, *Agaricus campestris*, growing in some pasture fields in the occupation of Messrs. Duck & Sons, Moorland Farm, Petworth, Sussex. From particulars taken and observations made it appears that about four years ago the land in question was arable, its soil being for the most part of a fine yellow friable loam. A large herd of milch cows and farm horses having been depastured on it, together with its low-lying situation and other natural circumstances combined, having, as it were, produced this development. The area of land literally covered with Mushrooms of the best quality consists of about 80 acres; a considerable number of persons being constantly employed gathering, preparing, and packing them for the London and other markets. Messrs. Duck & Sons must be commended for the manner in which they carry on the dispatch of this useful esculent to the various markets. *W. Short, Mithurst.*

Picotée Favourite (Liddington).—This beautiful light rose-edged Picotée came well to the fore during the summer, and it has taken a high rank among the varieties grouped in this division. It is not a new flower, as it was raised some years since by old Mr. Liddington, now living with his son at the Eagle Hotel at Thame. But it appears to have remained (comparatively at least) unknown until Mr. Thomas Anstis, of Brill, sent it to Mr. Dodwell under the name of Mr. Payne, a well-known light rose edge. Mr. Dodwell soon discovered its difference in the character of the grass, and thus was able to make it known in order that it might be grown. Mr. T. Anstis freely presented it gratis to amateur cultivators of the Carnation and Picotée, and next year it will, no doubt, be generally cultivated for exhibition, as it is a good grower, the ground pure, the petals stout and of good form, and the edge of colour all that can well be desired. *R. D.*

Satyrinum carneum (see p. 331).—I saw this rare species in flower the other day in Major Hall's garden at Narrowwater, near Newry, bearing its fleshy hood-like blossoms on a stout spike a foot or so in height. Can Mr. Brown or our friends at the Cape tell us aught of *Disa macraetha*, of which fine rose-flowered species there is a drawing at Kew, copied from an original by Sanderson? Is it a rosy-white form of *D. grandiflora*, or is it distinct, as well as beautiful? *F. W. B.*

Japanese Peppermint.—Mr. Christy has lately sent me a specimen of his Japanese Peppermint plant, *Mentha arvensis* var. *pipercensens*, a green-stemmed form, in flower. It is a handsome plant, as large as the true Peppermint. With it Mr. Christy also sent some other specimens of Peppermint, and I was

interested in observing that one specimen which probably grew near a garden Mint (*M. viridis*) had approached to it in habit, the leaves being nearly sessile, and the spike tapering. Similarly, there is at the Botanical Gardens, Regent's Park, a Mint having the foliage of *M. viridis*, but the flowers are in whorls in the axils of the leaves. These plants show how important it is to exclude wild Mints from fields where Peppermint is cultivated. *E. M. Holmes*. [Mints are usually propagated by dividing the root, the possible crossing of the seed is therefore of the less consequence. Ed.]

Accidental Effects in Planting.—Some of the boldest and handsomest tree groups have been the result of fortuitous planting. The notification of such groups may be worth the telling. No. 1 keeps watch over a pond on the outskirts of a park. They had been dotting in Conifers in the policies; a few Pines were not required. A man was told off to put them on the verge of the pond to exclude still more its feathered denizens from the vulgar or covetous gaze of the wayfarers. By some inspiration, the man put together in a place apart, *Pinus Lambertiana*, *pyrenaica*, *ponderosa*, and *Cembra*. All are healthy and emulous to show, each its best guise. *Lambertiana*, pygmaea, taller and more aspiring than the others; *pyrenaica*, bright green, the branches all clustering together; *ponderosa*, with long and straggling arms, the parent stem always visible; *Cembra*, shaped like a Cedar of Lebanon cone, and quite spruce by the side of its carelessly attired neighbour. No. 2 takes the form of a triangle of foliage. The vertex is *Cryptomeria Lobbi*. When planted, no idea was held of the distinct habit of this variety of *C. japonica*. The laterals are very small when compared with the height, and the tree thus differs considerably from *japonica* of the spreading habit. This makes it admirably adapted for the place it fills, or for planting where the space is cramped. Modern prophecies are more often wrong than right. Notwithstanding, it is tolerably safe to say, that *Abies Albertiana* and *A. grandis* will eventually turn out to be very useful forest trees. Mons. A. Dupins, in the *Cultivator's Library*, writes of the latter, "Il croît dans les lieux bas et humides, et jamais sur les montagnes." Whatever may be the case in British Columbia, it will succeed in dry situations in England. In high latitudes I have no experience of this giant Fir. *C. A. M. C.*

A Large Horse-Chestnut Tree.—While on a visit to Abingdon, near Cambridge, I was much struck with a very fine specimen of the Horse-Chestnut (*Æsculus hippocastanum*) in the pleasure grounds at Abingdon Lodge, the residence of E. J. Mortlock, Esq. It has the appearance of having, when young, been cut down within 8 feet of the ground, from whence spring up fifteen branches. Between the branches at the base one can walk with perfect ease. Mr. Mortlock has had fastened at the point whence the branches spring zinc plates, so as to throw off the rain and prevent any lodging there and as hastening decay. The trunk is 19 feet in girth 3 feet from the ground, and 23 feet girth 5 feet from the ground. The tree in height is 75 feet, and in diameter of lower branches 104 feet. The longest and lowest branch measures from the trunk 65 feet in length; the tree appears to be in perfect health. *W. Dance, The Gardens, Gosfield Hall, Halstead, Essex.*

Pansies.—Notwithstanding the drought of the summer, old plants of the finer show varieties have in many instances stood better than could have been expected; and, indeed, some fine clumps did not cease to flower. They were strong plants, put out a year ago in beds with plenty of light rich sandy soil about the roots, in which they could work deeply. Perhaps growers of Pansies do not always realise the depth to which the fine spreading, thread-like roots of the Pansy will travel in search of nutriment, and it is of great benefit to the plants, when put out in the ground, to be in soil incorporated with which there is leaf-mould, sand, and the siftings of the potting-bench, to the depth of at least 15 inches. The roots get down into this, and they are to a great extent away out of the reach of drying influences, especially if a top-dressing of soil be added two or three times during the summer. I this season kept some large plants in good condition throughout the summer by giving them a good soaking with water, then a top-dressing of soil to the depth of an inch was added, and over this some short grass was placed.

The plants have never been without flower. Since the welcome rains fell a new and vigorous growth has been put forth, and up from the roots are springing young shoots in plenty. These make excellent stock. A bed should be prepared by digging the soil deeply, working in plenty of leaf soil—fresh leaves will do—a little dung, and abundance of refuse soil from the potting-bench. Let the leaves be deep down, and the finer soil above them. In this the plants will be placed. Two or three days should be allowed for the soil to settle, then the old plants lifted, carefully divided—all the rooted pieces being separated from those not so: the former can be planted out in lines 1 foot apart each way, the soil pressed firmly about them. If the weather is drying, an occasional sprinkling will be necessary. The plants soon make growth, and establish themselves, and in the spring charming beds are thus formed. The pieces of growths not rooted can be put round the sides of pots, they make capital cuttings: and should be placed in a cold frame, shaded if necessary from the sun. These give useful plants with which to make succession beds in spring. The finest self yellow Pansy is George Rudd, and to this may be added Gomar. The best white selfs are Fanny Anderson and Mrs. Goodall. The best dark selfs: Beacon, Garry, Leith Walk Beauty, and Sir Peter Coats. The best blue selfs: Blue Beard, Blue Stone, and W. J. Rawlings. The following are good yellow grounds: Alexander McLennan, Corsair, Inspector, James Orr, Master Ord, and Royalty. White grounds: Isa Craig, Miss Baird, Mrs. R. E. Matthews, Pladda, Sunny Park Beauty, and Village Maid. *R. D.*

The Scotch Boor Tree.—In reply to the editorial query (see p. 305), the Scotch Boor tree is *Sambucus nigra*. You will see in Loudon's *Encyclopædia*, p. 513, that the synonyms are "Bourtry," "Boor tree," "Am tree." How the common or black-fruited Elder should have been called Boor tree, or Boor tree, is unknown to me; but the Scotch name is immortalised by our great national poets—Burns and Tannahill. The latter makes the following use of it in that beautiful song, "Oh, are ye sleepin', Maggie?"—

"Fearfu' soughs the Boor tree bank,
The ritted wood roars wild and drear;
Loud the iron yett does clank,
And cry o' bowlets makes me eerie."

J. A.

Proteaceous Plants at Kew.—If the venerable ex-Curator of the Royal Gardens, Kew, could be so the few collections of Australian plants in cultivation in English gardens at the present time and compare them with what existed in 1862, he would be astonished at the fewness of the species in favour now. Australian plants, if we except the few soft-wooded things and such popular genera as *Eucalyptus*, *Blandfordias*, and *Acacias*, are at a discount in the horticulture of the present period, and no doubt this will in some measure account for the decrease generally in the number of these plants at Kew, for it is easy to believe that the Kew authorities are to some extent influenced by the interests and tastes of the gardeners of to-day, and, therefore, where space is limited plants of little interest are compelled to give place to those that are of more. With respect to the Proteads, of which Kew once possessed a very fine collection of large plants, but which, owing, as the ex-Curator states, to a change of quarters, rapidly decreased, I think that some of them at least are deserving of a place among greenhouse plants even now, indeed the *Grevilleas* and one or two *Lomatias* are here and there in favour. Still there are some beautiful plants among the *Banksias*, *Dryadras*, and *Hakeas* which were once well known in the gardens of this country, but are now met with only in botanical collections, chiefly at Kew and Glasgow. I believe that in the former establishment efforts are being made to increase the collection of Australian plants and hard-wooded subjects generally. Some genera are, of course, largely represented there now, as, for instance, the *Acacias*, of which there are between ninety and a hundred species and varieties; *Eucalyptus*, sixty species; *Melaleuca*, twenty-eight species; and *Boronia*, *Callistemon*, *Eriostemon*, also well represented. The following list of Proteads now in cultivation at Kew will show that whilst the large old specimens named by the ex-Curator have, some of them, disappeared, the order is still pretty strong in number. Comparing the genera with those he

enumerates it will be seen that there are now nineteen distinct genera represented out of a total of forty-nine, whilst in 1862 there were fifteen genera, *Anadenia* and *Hemididia* being now reduced, the former to *Grevillea*, the latter to *Banksia*. Altogether there are now living at Kew eighty-three species, most of them large healthy plants, so that taking into consideration what is said above with respect to these plants being now-a-days very little cared for generally, the Proteads cannot be said to be neglected at Kew. *Kewensis*.

Arum crinitum.—In what way is *Arum crinitum* fertilised? I have several plants in my garden, but it has quite puzzled me to find out how the pollen can get in the stigma, unless the insects which are enticed and entrapped lay eggs before dying, and the progeny in creeping out bring up the pollen and place it on the stigma. I have made some curious observations about the plant, but the fertilisation has quite baffled me, and I can find no allusion to it in any of my books. *A. D. W.*

Sulphide of Potassium.—Your correspondent, Mr. Badger, calls attention (p. 339) to the use of sulphide of potassium against midew, red-spider, and aphides. Gishurst Compound among other ingredients contains sulphide of sodium; a soluble sulphide has therefore been a long time in use. *The Inventor of Gishurst*.

Telegraph Cucumbers.—In looking through Mr. Cooling's nurseries, Bath, the other day, I saw a splendid house of Telegraph Cucumbers (Mr. Cooling's variety) hanging for seed. In the house—60 feet by 12 feet—huog 2000 beautiful fruit, a fine example of a perfect crop from the first growth up to the last, and quite filling the house. Mr. Cooling told me he had cut from the plants about 300 fruits for eating. The fruit measured generally from 18 inches to 2 feet in length, and was very evenly distributed through the house. *F. Bush, The Royal Nurseries, Ascot.*

Belladonna Lilies.—I have heard it said that Belladonna Lilies do not flower for some considerable time after replanting. I removed two large clumps last year immediately after flowering that had not been disturbed perhaps for fifty years. There were nearly 200 bulbs in each clump. These I transferred to a narrow border beneath a south wall, introducing a quantity of peat, leaf-mould, and well rotted cow manure. A double row was planted about 6 inches apart, making use of 300 of the best bulbs. At the present time there are 175 spikes of bloom, some of them with thirteen flowers on a spike. Immediately after flowering is evidently the season to shift or report Lilies of any kind, whether it is those deciduous after flowering or those that flower with their foliage, as the *Lilium lancifolium* and varieties. *D. C. P.*

Luculias.—These beautiful greenhouse evergreen flowering shrubs are sadly neglected in gardens at present, for rarely do I meet with any specimens. I am of course only able to record my experience of the gardens of the West of England, and the few instances where I have found them cultivated can be readily enumerated from memory. In the great Camellia-house, at the Exeter nursery, Messrs. Lacombe, Pince & Co. have the largest examples I am acquainted with of both species—*gratissima* and *Pinecana*, and these are neatly trained to the walls. In December they are literally covered with their fragrant, rosy, and white flowers, which are arranged in large terminal cymes, and form a sight worth a long journey to witness. They are planted out in a compost of fibrous loam, peat, and silver-sand, and they certainly enjoy this mixture, judging from their ample foliage and stout shoots. I am told that copious supplies of water are given during the summer; but after blooming the plants are pruned and allowed a season of rest until about Easter time. In the conservatory at Whiteaway, Devon, there is a fine flourishing plant of *L. Pinecana*, and it is doing first-rate under Mr. Nauscaven's care; and F. B. Short, Esq., Pichham, Devon, has an aged specimen of *L. gratissima* on the back wall of his conservatory, and there is one at Membland Hill, Ivybridge, on the back wall of a greenhouse, covering a space of some 18 feet by 14 feet. It was quite a small plant some five or six years ago, when Mr. Baker, the gardener, planted it there. There was

also a very old veteran growing in bush form in the gardens of that enthusiastic blind florist, Mr. Joel Roberts, Pennycomequick, Plymouth, the last time I passed that way. *W. Napper.*

Vitality of Seeds.—The table of the vitality of seeds in your last issue has called my attention to a case of the long-retained vitality of Melon seeds. I have some seeds of Read's Hybrid which was saved in the year 1873, consequently it is twelve years old. I have grown some of it each succeeding year, but what I consider most remarkable is that the older the seed the larger the fruit produced; some of them are from 1 lb. to 2 lb. (and some even more) heavier than the fruit were in the first years, although they are grown in the same houses, with the same treatment as those in the first years. I have several more seeds, and intend to sow each year, to see how long it will vegetate. It is not much longer in vegetating than seed one or two years old. The original seed is much smaller than those saved at the present time, indeed it is the smallest of any Melon seed that I have seen. *D. Walker, Dunortan, Trunbridge Wells.*

Reports of Societies.

THE ROYAL CALEDONIAN HORTICULTURAL SHOW, EDINBURGH: September 9 and 10.

INSTITUTED in 1809, and incorporated by Royal Charter in 1824, the Royal Caledonian Horticultural Society was never in a more flourishing condition than it is at present. For its long history it has endeavoured to foster in Edinburgh a love of flowers, and its efforts have been recognised in the highest quarters. The taste for flowers on the part of the municipal rulers of the capital of Scotland and of its citizens is shown in the great attention that is now paid to the floral adornment of the public grounds, and it has been the object of what such places should be, and by the generous patronage which is extended not only to the Royal Caledonian, but to another useful institution, in which many of the officials of the Caledonian take a lively interest—the working man's flower show. The autumn show of the Royal Caledonian, which took place on Wednesday and Thursday, September 9 and 10, is the third exhibition this year held under the same auspices. The spring show extended over two days in April, the summer show over two days in July, and before 1885 passed away there was never a winter show, which is down on the programme for November 25 and 26. Better guarantee than that could not be furnished that the management of the Society is in energetic hands. This year's autumn show was one of the most successful of the kind which the Society has ever held. The entries were never so numerous, and the quality of the exhibits, which were for the most part typical of the waning season of the year, was excellent, the general arrangement of flowers and fruit in the spacious Market Hall tasteful in the extreme, the weather all that could be desired, and the attendance of visitors most satisfactory. The Market Hall, adorned with a wealth of greenery, bright with the gay colours of our autumn flowers, and perfumed with the scent of luscious fruit, was never more attractive. There were in all about 1500 entries, and of Grapes alone there was a splendid display, over 400 bunches being staged.

FRUIT COLLECTIONS.

The position of honour at our autumn show is always given in the catalogue to the fruit, and this year especially it was well entitled to such consideration. Fruits grown indoors and out-of-doors were splendidly represented.

For the best collection of twelve sorts, the Culzean Castle exhibits carried off the blue ribbon. Two bunches of Muscats were the great feature of this collection, the berries being large in size, perfectly ripe, and beautifully finished. The two bunches were never so good. Seedlings which it contained were also excellent, and the same may be said of the plate of Nectaries, Figs, and Plums. The 2d prize lot from Archerfield included good bunches of Muscat of Alexandria, Gros Colmar, and Black Barossa, and capital plates of Figs and Apricots, while in the 3d prize collection there were very nice Peaches, Nectaries, Melons, and Pine-apples, but inferior Grapes. The Broxbrough Castle 1st prize lot of eight sorts included highly finished Muscats, and excellent Figs, Apricots and Peaches.

GRAPE.

Taken all over the Grapes were a splendid show, and formed the chief feature in the exhibition. The black varieties were rather better than the white. The two leading prizes went to Mr. Hammond, jr. to Sir Robert Lawson, Brynton Castle—a gentleman who evidently can appreciate good Grapes, though he has a personal and parliamentary antipathy to good wine. His collection of twelve bunches was, without exception, a splendid and beautifully finished lot—the Gros Maron, Muscat of Alexandria, and Black Alicante, being particularly fine. Mr. McKelvie's 2d prize lot were rather larger in the berry, but not quite so well finished, his Muscats, how-

ever, were shown in beautiful condition; the greatest defect of the 3d prize collection was their unripeness.

The 1st prize for eight bunches also went to Brynton Castle, this collection being strong in Golden Queen, whilst in the 2d prize lot from Aider Grange, Durban, the Black Hamburgs were conspicuous.

J. Boyd, gr. to Mr. Forbes, of Callander, had grand bunches of Black Hamburg, Muscat Hamburg, Black Alicante, and Lady Doreen, the first two being four bunches, distinct; and Mr. Hammond's 2d prize lot were also good, though not quite so well finished.

There was a large competition for the 1st prize for two bunches of Muscat of Alexandria, and the quality of the exhibits was high. The Galloway House Grapes, which 1st prize were beautifully finished, large in berry, and perfectly ripe; the 2d prize two bunches were rather deficient in the colour.

The competition was not nearly so strong in Black Hamburgs, but the quality was well kept up. Mr. Boyd, Callander House, being again successful. Neither in quantity nor in quality were the single bunches of Muscat of Alexandria up to the average, and even the 1st prize Grapes were shown in somewhat rough condition.

Out of a large competition Mr. James King secured the 1st ticket for bloom with a bunch of Black Alicante; the prize for flavour went to Hutton Hall, for a bunch of Madresfield Court (black), and to J. W. McEltach, Newbattle, for a bunch of the Duchess of Buccleuch (white).

On exhibition were two baskets of large-sized white Grapes (Duke of Buccleuch), from the Galloway Vineyards, which received a special award for general excellence, and for the manner in which they were packed for market.

MISCELLANEOUS.

Among other fruits grown indoors may be specially mentioned the Pine-apples, Melons (which were much above the average), the Peaches, Nectaries, and Apricots. Of all these the 1st prize lots especially were of high merit. The hardy fruits grown out-of-doors were also of much excellence. It may be questioned indeed whether the Society had ever a better display.

For the best collection of ten sorts Mr. Fairgrieve, Dundee, was usual in the van. His Peaches, Apricots, Plums, Pears, and Cherries, all beautifully coloured and perfectly ripe, could not have been well surpassed. The Hutton Hall collection included some wonderfully fine Plums and Apricots.

There was a great display of Apples and Pears, mostly of kitchen varieties, though those suitable for table were also fairly represented. The Apples, however, the season being yet early in Scotland, were for the most part shown in an unripe condition. Of Pears the collection from Lambton Castle was of very superior quality; it included such varieties as Gregoire Bordillon and Bellissime d'Hiver.

Some Castle Kennedy Figs, grown on a wall at Broxbrough Castle, were remarkable for their size, quality, and ripeness.

VEGETABLES.

It has often been hinted by thrifty housewives when they visited the show that the "Caledonian" rather neglected the encouragement of vegetable culture. China Asters and Dahlias, and even Grapes are all very fine in their way, but where are the Leeks, and Cabbages, and Potatos upon which the "lords of creation" must be fed? Critics of this sort, who, like Mr. Gilbert's hero in *Patience*, confess to

"An attachment à la Pluto to a bushful young Potato, Or a not too French French Bean."

had they been in the Market Hall last Wednesday or Thursday must have been greatly mollified and pleased. The vegetables made a very fair display indeed—Cauliflowers, Leeks, Peas, French Beans, Tomatoes, and Potatos, being shown in perfection.

A splendid collection of twelve sorts was staged by Mr. Low, Stirling, and in the market gardeners' class the exhibits of Mr. John Murie, Craigmiller, were also most creditable.

THE PLANTS IN POTS.

which go to form the backbone of all exhibitions, were as usual of high quality. In the autumn show, however, they are never so prominent a feature as in the spring time. The competition for the 1st prize went to Mr. R. Grassan, Oswald Road; and Mr. R. Paterson, Millbank, as usual, managed to secure a fair proportion of the honours for greenhouse plants. Of these, Cape Heaths and Statues were conspicuous on the tables. The exotic Ferns were an average lot, the *Davallia variety* being to the front. The same seems to have done well with the showy *Valloata purpurea* (Scarborough Lily), of which there were a number of well-bloomed plants.

CUT FLOWERS.

Of cut flowers there was a large display, and these formed the most agreeable and interesting feature of the exhibition. Gladioli, Dahlias (show, fancy, single, and Cactus), Hollyhocks, and Asters were particularly well represented, the nurserymen, however, being a long way ahead of their gardener friends in the quality of their exhibits. Alexander E. Campbell's thirty Gladioli were perhaps the best grown cut flowers in the exhibition. The spikes were large and of excellent colour. Messrs. Munro & Mein also exhibited some pretty spikes. The best of Mr. Campbell's were Diamond, De Mirbel, Horace Vernet, and Damon d'Urville; and in the 2d prize lot there were pretty spikes of Undine, Perleide, and African. Mr. E. Campbell, Edinburgh, showed eleven spikes Hollyhocks—2 flower which seems to be recovering from the disease which nearly annihilated it a few years ago—the Queen of

Yellows being particularly pleasing. A very pretty display was made by Messrs. John Lamont & Sons, of their crosses of single Dahlias. This flower has been made quite a specialty by the firm; the Glen Nurseries have ever been famed for Dahlias. In all fifty varieties were shown by them, several very attractive in colour. Of the newer kinds may be specially mentioned Mrs. R. J. Hamill, a yellow regularly striped with red; John Wallace, a strong lilac marked with magenta; Her Majesty, a yellow tipped with pure white; James Cocker, a crimson striped with maroon; Miss Gladstone, a silky mauve; and Jane Gilbert, a terra cotta with fancy markings. Messrs. R. B. Laird & Sons had also an attractive display of this now popular flower.

Double Dahlias suffered greatly in Scotland from the August frosts, and the blooms shown were not so large as usual. For the best twenty-four Mr. Montgomery, The Glen, Cardross, had a remarkably even lot; and the Messrs. Laird, who were not far behind him. This firm were placed 1st for their fancy Dahlias. One of the prettiest double Dahlias of the season is a white suffused with the faintest pink blush. It has been named Mrs. Gladstone. General Gordon is one of the best of the new fancy Dahlias, but the blooms shown of the "General" were not quite up to the mark.

ROSES.

It has been said that it is always the unexpected that happens. Who would have dreamt of Roses grown under the cold grey skies of "Aberdeen area" beating bloom from red; John Wallace, a strong lilac marked with magenta; James Cocker, a crimson striped with maroon; Miss Gladstone, a silky mauve; and Jane Gilbert, a terra cotta with fancy markings. Messrs. R. B. Laird & Sons had also an attractive display of this now popular flower.

It was last Wednesday, when Messrs. James Cocker & Sons, Aberdeen, carried off the 1st honours in the Rose competition both for the best thirty-six and also for the best eighteen. The Messrs. Cocker have been coming to the front for several years past as rosarians, and the blooms they exhibited were certainly of great excellence.

In the thirty-six bloom competition Hugh Dickson, Belmont, was placed 2d, but in the eighteen bloom contest the Belmont Roses were out of the running altogether. Mr. Dickson's old opponents, Messrs. Smith & Sons, Stranraer—excellent Rose growers also—being awarded the 2d ticket. The victory of the Messrs. Cocker was a very popular one. It had begun to be "pious opinion" if not an "article of faith" among our home nurserymen, that the Irish Roses could not be beaten. This upset to that belief will it may be hoped speedily amend. The fact that they are better than they have done to the cultivation of this beautiful and favourite flower. The Rose competition next July in Edinburgh should be of some interest. Hugh Dickson, if we mistake not, will give the Scotch nurserymen a tussle for the leading place, for which they should strenuously prepare.

TABLES OF PLANTS.

The nurserymen's large tables ranged down the centre of the hall, and well stocked with choice greenhouse and other plants, made as formerly an effective display. To Ireland & Thomson fell the 1st prize for the table of plants, 30 feet by 10 feet, arranged for effect. Their display was a most successful one, and included many of the Dracenas interspersed with beautiful Orchids. R. B. Laird & Sons were a good 2d. This firm also showed a very nice collection of new varieties of Crotons and Dracenas, the colour on their table being mainly supplied by Pelargoniums, such as the *Erica mammosa* and *Erica*. On their table was a large purple variety of *Sanderiana*, with fine dark green leathery leaves, strongly ribbed with white. On a very tastefully arranged table—which had not been entered for competition—J. Methven & Son exhibited groups of their decorative *Felagatos*, which were also very effective. The *Phlox* and *Cyperus*. A very large floral cross, consisting of white flowers, but having upon it crimson and yellow bosses or stars, was rather effective.

Dickson & Sons, Waterloo Place, have recently taken a new departure, which was manifested on their very admirable table of exhibits. Instead of sending the usual collection of nurserymen's plants, they went in this time chiefly for a seasonable display of cut flowers and of fruit chiefly grown at their new nurseries, Liberton. They showed no fewer than 110 varieties of Apples and Pears, with a number of sorts included in the table, which were many new ones. Of the newer varieties Stewart's Seedling, the new Northern Greening, Duchess of Oldenburg, King of Pippins, Robert Black (a very excellent Apple), and Mr. Gladstone, may be specially mentioned as good croppers, and otherwise satisfactory for cultivation. The new flowers included a very showy French Marigolds, single and pompon Dahlias, Carnations, Roses, and Pansies. An interesting exhibit was two plants of the new *Sycamore*—*Acer Hookerianum*, which has been recently introduced into this country by the Messrs. Munro & Mein. The tree, years old, stood about 4 feet in height, and were covered with a splendid crop of the large pinnated leaves, which showed a pretty reddish-brown colour on the underside. Mr. Robertson Munro, Abercorn Nurseries, had one of the brightest tables in the hall. It was entirely devoted to a display of cut herbaceous and fibrous hardy flowers, of which nearly 20 different kinds were on exhibition. Among other things shown of some interest were the scarlet *Lobelia Queen Victoria*, *Chrysanthemum maximum*, with very large flowers; *Lilium giganteum* of sprays; *Delphinium*, *Lythrum sperrum*, *Menziesia polifolia* alba, &c. Mr. Munro never did better at an autumn show.

Among other things in the Market Hall worthy of notice was the very desirable variety of carnation plants from the Etoile Garden. These included a remarkably fine collection of pitcher and insectivorous plants, several of the *Nepenthes* being hybrids raised by Mr. Lindsay, the Curator.

Mr. J. O. Mackenzie, of Portmore, sent for exhibition a number of small branches, with cones, of the newer Conifers, which had been grown at an elevation of upwards of 800 feet above sea-level. The list included the Albert Fir, young plants of which are at present growing at Portmore from seed ripened at Carstairs; the Nordmanniana, Douglas, and Menzies Firs, and Abies nobilis.

There was likewise an interesting exhibition of bees, and at the west end of the hall there was a display of manufactured goods more or less associated with horticulture. Wotherspoon's hot-water boiler for conservatories seemed a serviceable article; Robert Ure, Princes Street, had a good display of artistic ornamental stoneware; Mr. Andrew Wight, Hope Lane, had three prettily designed ferneries; and Messrs. Smith & Co., High Street; and Mr. P. Brown, Hamilton Place, ornamental wirework, stands, &c., for plants.

DERBY HORTICULTURAL SHOW:

September 9 and 10.

THE annual show of this Society was held, in connection with the Agricultural Show, in the Recreation Ground, the weather on the first day being very showery but on the second day everything that could be desired.

The show itself was, as a whole, a good one, the competition in the various classes, both by nurserymen, amateurs, and cottagers, being very close, the exhibits quite up to the average, the liberal prizes offered for stove and greenhouse foliage and flowering plants having brought many competitors amongst the nurserymen.

FOLIAGE AND FLOWERING PLANTS.

The leading prizes were awarded to Mr. Cypher, of Cheltenham, and Mr. Tudgey, Waltham Cross, who showed in their well-known style. The former beat his rival with a very good dozen of plants, comprising Phloxema proflera, Allamanda nobilis, and A. Hendersonii, Clerodendron biflorum, Isora Colei, Erica Irbiana, and retorta major, Kentia Fosteriana, Lantana borbonica, Cycas circinalis, and Crotons sunset and Prince of Wales. Mr. Tudgey was 2d, his plants lacking the freshness of the former; 3d, Mr. Haslam, Hartoft, whose plants were much smaller.

STOVE AND GREENHOUSE PLANTS.

Twelve stove and greenhouse, gentlemen's gardeners, brought five competitors, the 1st prize being awarded to Mr. Ward, Reddings; 2d, to Mr. Roberts, Highfield Hall, Leek. In my opinion this collection was a long way the 1st; the judges were strongly commented upon at the time—the flowering plants were much better than in the former collection, as were also the arrangement of them. 3d, Mr. Milford, Allestree Hall, who showed also a good collection; 4th, Mr. Gilbert, Duffield Hall; 5th, Mr. Robinson, Meynell Langley. Ferns and Selaginellas were well shown, the 1st for the former going to Mr. Ward, Reddings, for a good six; while the 1st for Selaginellas went to Mr. D. Robinson for six good pairs, well done.

CUT FLOWERS.

Cut Asters, Dahlias, Marigolds, Roses, were good, as were also cut double and single trusses of Pelargoniums and Gladioli.

Bouquets were shown in quantities, but the exhibitors should copy the example set them by those which were awarded 1st, which came from Mr. Cypher, who took both the 1st and 2d; others were, as is often the case, sadly overcrowded.

FRUIT.

Collection of ten distinct sorts brought four collections, 1st, Mr. Goodacre, Elvaston Castle, who showed well in everything; Mr. Ward, Reddings, 2d, with a good lot; closely followed by Mr. Evans, Chaddend, who was 3d.

Grapes proved a strong competition, 1st for black was awarded to Mr. Evans, but in the opinion of many competent judges the 2d prize lot, from Mr. Goodacre, should have held the prominent position; 3d, Mr. M. Vinel, who was 1st with white, showing good bunches of Chasselas Napoleon, well finished; 2d, Mr. H. W. Smith, Pivots, and Hobs, 3d, Mr. Horton Hall, both showing Muscat of Alexandria, good.

Apples and Pears were shown both in good quantity and quality.

Peaches and Nectarines were fair in both respects, as were likewise the Pines and Melons.

VEGETABLES.

These, considering the drought that has been experienced, were shown in first-rate quality.

In the collection of twelve sorts the 1st prize was awarded to Messrs. J. & H. Hickling, Loughborough, for a good lot.

Tomatoes and other vegetables were shown in great quantity, the quality being quite up to the average.

AMATEURS AND COTTAGERS.

These showed well in their respective classes. The plants, flowers, fruits, and vegetables shown by the various exhibitors were of good quality, and reflected great credit upon the various contributors.

Amongst the cut flower bouquet of wild flowers for children was full of interest to those exhibiting, the competition strong and deserving of great praise, the female sex taking the leading award.

NOT FOR COMPETITION.

Mr. John Campbell, Mickelover Manor Gardens, showed six splendid bunches of Grapes, two Muscat of

Alexandria, two Caion Hall, two Alnwick Seedling, all very fine bunches, weighing the former, nearly 6 lb. each—good berries, well finished.

Mr. Goodacre showed, from a very extensive collection of Apples grown at Elvaston, twenty-five varieties he considers, from long experience, best adapted for the climate of Derbyshire. These were shown upon the boughs, thus showing their prolific qualities in the most evident manner.

Messrs. Barron & Son, nurserymen, Borrowash, showed a choice collection of ornamental trees and Conifers; it was a pity they were not named, so as to have afforded a guide to the many interested onlookers. The same firm showed a splendid type of Lilium aratum, called rubrum vittatum, bright red taking the place of the yellow in the ordinary varieties. They also had some good summer-houses, rustic seats and chairs.

Mr. Cooling, nurseryman, Derby, showed collections of cut flowers, Roses, Dahlias, wreaths and crosses, plants, &c. A. O.

NORTHAMPTONSHIRE HORTICULTURAL: September 9 and 10.

THIS Society held its second exhibition this year on a large piece of ground temporarily fenced off from the race-course adjacent to the town. An untoward occurrence took place during the night preceding the show: the principal tent containing some of the best plants exhibited in the leading classes was blown down through being insufficiently secured, and this necessarily caused delay. Considering the lateness of the season the exhibition may be pronounced a success; flowering and fine-leafed plants were well shown, especially the former, which several of the competitors staged in better bloom than might have been looked for.

STOVE AND GREENHOUSE PLANTS.

In the open class for twelve stove and greenhouse plants, six flowering and six fine-foliage, Mr. Cypher, Cheltenham, scored an easy victory, staging a handsome group containing some very fine Crotons and Palms, Erica Eweriana, E. obtata purpurascens, Stephanotis floribunda, and Clerodendron biflorum. It is only in comparatively recent years that the two first-named plants have been seen much at autumn shows, now several exhibitors bring them out in almost as good condition at the latter end of the season as at the beginning, proving the accommodating character of the plants. Mr. J. Parker, Victoria Nursery, Rugby, who was 2d, had amongst others a well-flowered Dipladenia amabilis-Lagereria rosea, and Allamanda Hendersonii, also in nice condition. The best of the fine-leafed plants in this collection were Croton majesticus, C. Youngii, and C. Corypha australis.

Ten stove and greenhouse plants (amateurs), five in flower, and five fine-leafed.—With these Mr. Holland, gr. to W. Jeffrey, Esq., Billing Road, Northampton, took 1st, having nicely bloomed examples of Bougainvillea glabra and Dipladenia amabilis, bearing numerous trusses of unusually large flowers; amongst the ornamental-leaved subjects in this group was Cycas revoluta in flower.

Six stove and greenhouse plants (amateurs).—1st, Mr. Miller, gr. to R. Loder, Esq., Whittlebury.

FERNS, FUCHSIAS, &c.

In the class for six exotic varieties, Mr. Holland was the only exhibitor, taking 1st with a pretty half dozen, including Gymnogramma chrysophylla, and Adiantum farleyense.

Twelve dinner-table plants.—1st, Mr. Holland. With six Fuchsias, Mr. Garforth, gr. to P. Phipps, Esq., Collingtree, was 1st; 2d, Mr. F. Beard.

Six double varieties of zonal Pelargoniums.—1st, Mr. Garforth. Six singles.—1st, Mr. F. Beard; 2d, Mr. Garforth.

GROUPS OF PLANTS

were, as at most horticultural gatherings, made a leading feature. Liberal prizes were offered, and the large tent devoted to them. Evidently the success to be covered—240 feet, required more filling than most of the exhibitors competing had calculated upon, as most of the groups were too thin to admit of the pots being sufficiently hid. Some of the flowering plants used were too large. It is a mistake to introduce formally trained specimens, even if they are not large, into groups of this description, one of the main characteristics of which should be an absence of all that is stiff and formal. Mr. J. Parker was 1st, Mr. Miller 2d, and Mr. Holland 3d.

TABLE DECORATIONS.

Notwithstanding the general protest so long made against the use of anything in the shape of stands of flowers or of plants in this kind of decoration that are so high as to interfere with an uninterrupted sight across the table, exhibitors have persistently clung to arrangement in which the plants or stands employed are too high to be seen above. In this way they place themselves in the anomalous position of standing directly opposite to the principal aspect in the kind of decoration they undertake to illustrate. It does not require much reflection on the part of either exhibitors or those who act as judges in competitions of this kind to see that if they are to be successful in their aim it is necessary to get out of the old ruts. At the least it is inconsistent to hold on to a system that would not be tolerated in one household out of a score where table decoration is adopted. On this occasion most of the competitors kept clear of the antiquated stands, using only plants for

the centre-line, with a moderate addition of flowers and green foliage.

Mr. Cypher was 1st, with a table on which the low arrangement in question was adapted; a small Cocos Weddelliana, little more than a foot high, occupied the centre, with four smaller plants of the same elegant Palm as accessories, standing in a square about 15 inches from 1st, round the base of the central plant were suitable flowers, thinly placed in a setting of Ferns. A few small low glass stands, holding a few flowers and Ferns completed the arrangement, which for elegance combined with a due appreciation of form and colour in the materials employed was well adapted to the table. Mr. Parker and Mrs. J. Chettle, who were respectively 2d and 3d, both had beautiful tables, arranged similarly to the 1st, and little inferior, except that the plants used were somewhat too large to avoid the objection on the score of height.

With a hand-bouquet, Messrs. S. Perkins & Sons, Warwick Road Nursery, Coventry, and Mr. Cypher were equal 1st, both showing beautiful examples; Mr. F. Perkins, Leamington, 2d.

CUT FLOWERS.

There was not a large display of Roses, but some of those shown were unusually good for the advanced season; with twenty-four, Messrs. S. Perkins & Sons, took 1st, having a nice stand; Mr. House, Peterborough, a good 2d.

Dahlias were well shown. In the class for twenty-four show varieties, Messrs. J. & H. Hickling, nurserymen, Loughborough, took the lead with large, full-sized flowers, the best of which were General Roberts, salmon colour; Prince Bismarck, purple; James Cocker, purple; Mrs. J. Laing, white; Mrs. Harris, blush; and Aurora, salmon, 2d, Messrs. T. Perkins & son, Kingshorpe Nurseries.

Twelve varieties of single Dahlias.—1st, Messrs. T. Perkins & son; 2d, Mr. House.

Twelve fancy Dahlias.—These also were well shown—Messrs. Hickling taking 1st, here also with a beautiful set of blooms, conspicuous amongst which were Flora Wyatt, shaded salmon; Miss Browning, yellow, tipped with white; and the Rev. J. B. M. Camm, yellow, flaked with crimson; 2d, Messrs. T. Perkins & son. Twelve show Dahlias (amateurs).—1st, Mr. Miller; 2d, Mr. F. Beard.

Twelve single Dahlias (amateurs).—1st, Mr. J. D. Howes; 2d, Mr. S. Allen, gr. to H. S. Pritchard, Esq. Miscellaneous cut flowers were forthcoming in good condition, Mr. F. Perkins being 1st with a fine stand of twenty-four varieties, consisting of stove, greenhouse, and herbaceous varieties; 2d, Mr. Parker.

FRUIT.

With six dishes Mr. F. Day, gr. to Lord Wantage, Overstone, took 1st, having in a nice collection Black Hamburg Grapes, a good lot of Crimson Galande Peaches, a Melon, and Apricots; 2d, Mr. Garforth. Three bunches of Black Grapes.—1st, Mr. Miller, who staged a couple of bunches of Madresfield Court nicely finished, and one of Black Hamburg; 2d, Mr. F. Day with Black Hamburg.

Three bunches of White Grapes.—1st, Mr. Miller, who had Muscat of Alexandria, nice bunches, well finished.

Single Melon.—1st, Mr. E. Simons, Harlestone; 2d, Mr. Holland. Five of Peaches.—With these Mr. F. Day and Mr. Miller were equal 1st, both showing beautiful fruit, Mr. Day having grand examples of Crimson Galande.

Dish of Nectarines.—1st, Mr. Miller; 2d, Mr. J. Fairbrother.

Plums, Apples, and Pears were in excellent condition. In a close competition with three varieties of Pears, twelve of a sort, Mr. R. C. Westley, Kilsingbury, took 1st; 2d, Mr. H. Collings, Berry Wood.

Three varieties of Pears, six of each.—1st, Mr. Garforth; 2d, Mr. Starke, gr. to Sir T. Hesketh.

Three varieties of Apples, six of each.—1st, Mr. Harlock, gr. to Lord Lilford; 2d, Mr. R. C. Westley. Messrs. John Perkins & Son exhibited a fine collection of Gladioli; Messrs. T. Perkins & Son, Dahlias; and Mr. House, Peterborough, a collection of Roses—in each case not for competition.

FORESTRY.

DRAINING.

REMOVE accumulations of leaves, twigs, and branches from woodland ditches, as well as from the mouths of closed drains and culverts. With the late stormy wet weather these are apt to get choked up, and, unless immediately attended to, soon occasion much extra trouble and expense. The steady and cleaning of woodland ditches should be steadily prosecuted during the present warm weather, it being at that time more satisfactorily accomplished than during cold winter weather, as well as being less injurious to the men employed at the work. Cut new drains where stagnant moisture in the woods proclaims that such is necessary, and in doing so throw the soil well back from the verge so as to prevent its being accidentally thrown in again.

GAME COVERTS.

The layering and general extension of game coverts

may, where necessary and as time permits, be now engaged in. Laurels that have become overgrown should be bent over and pegged down (pruning, for appearance sake, had better be deferred till early spring). Privets pruned and layered, and the Rhododendron, where such is employed, divided, replanted, and laid for further stock. As layering is a simple and most inexpensive method of getting up covert, it should, on all estates where such is required, be extensively practised. A man and boy with hand-bill, mallet, and spade will go over a great number in a day by proceeding as follows—First cut a number of good strong hooked pegs—Oak, Ash, or any hardwood will do—and having bent the branch to be layered down until at about half its length it comes in contact with the ground, at which point it should be secured firmly by driving one of the pegs firmly into the ground, the hooked head of which will serve to keep the branch in position until rootlets are emitted. A spadeful of earth may be thrown over the layer at the point of junction with the ground, which will materially assist the process of rooting. All branches not layered may be removed from the stool.

PLANTING.

The enclosing, draining, and pitting or trenching of ground for new plantations, should be finished as quickly as possible. Ground of a stiff, retentive nature should be well broken up, either by trenching or steam-ploughing and drainage, previous to inserting the plants. Pitting is, in any case, a valuable preliminary to planting, more especially where done some time previous, the winter air having a most beneficial effect on newly exposed soil. Planting large evergreens may now be successfully performed, staking and tying where necessary, and giving the plants a liberal mulching to prevent excessive evaporation. Dead trees in last year's plantations should be removed, and holes for their successors prepared; at the same time it is well to ascertain, and remedy if possible, the cause of failures. Where slips have occurred along the banks of rivers and streams, the planting of Willows will be found an excellent remedy against further injury. Deciduous trees intended for planting out during the coming season should be lifted towards the end of the month, and "sheughed" in a dry, warm situation until required for use. In "sheughing" plants avoid overcrowding, and place so that the heads of one row shelter the stems and roots of the previous one.

ROADS AND WALKS.

Prepare and get forward stone and other material for road-making and repairing. Surface ruts and other inequalities should be levelled down at once, edg'es cut, weeds removed, gratings cleaned, and obstructing twigs or branches cut back and removed. Use the edging-iron along the sides of walks, and freshen the surface by a timely raking, or the application of gravel where such may be deemed necessary. *A. D. Webster, Penrhyn Castle, North Wales.*

PAULOWNIA IMPERIALIS.

In this country we usually plant this tree almost regardless of its being one that demands a warm position, and often find it in shady parts of the pleasure-ground, or carelessly stuck in amongst the usual heterogeneous collection of an English shrubbery. If it requires shelter it does not need to be crowded with other things with that end in view. What perhaps is required is the fullest southerly exposure, with dense trees at the rear, or else tall buildings. In such positions it will, in ordinary years, ripen its wood and flower well. The tree is not "spring tender," and can withstand any amount of cold such as we have [?]. In the bird market in Paris it is planted in intersecting lines, perhaps a dozen feet apart, and affords the frequenters of the market a grateful shade in hot weather, the leaves being large, and yet not numerous, nor the habit dense, so that under their shadere is a pleasant circulation of air. There some of the trees are allowed to flower, the handsome purple Gloxinia-like bloom being very striking; other trees have their shoots shortened back annually. In the case of these latter the heads are more compact and regular in outline. Possibly, having the continued good health of the trees in view, the flowering trees of one year become the pruned ones of the next.

JUNIPERUS VIRGINIANA.

This is not frequently planted in a group, and yet it is one of the best for the purpose, being a quick grower,

and relatively cheap to buy. In parks and pleasure-grounds of considerable extent, where deciduous and light green foliage abounds, this tree, carefully planted as regards quantity and position, forms an admirable contrast with the lighter greens, and associates well with glistening sheets of water, and adds shade, if wanted, to gloomy pools and secluded nooks. When thickly planted—that is, at 4 feet asunder, and even at a less distance—the plants grow straight and rapidly, forming fewer side-branches than when planted at a wide distance or when solitary. The outer trees of a group will extend their outside branches much as the Yew does, and will eventually sweep the ground, thus taking off the stiff appearance the group would otherwise acquire. The outsiders will also grow less in height than those in the interior, and in that way give the pleasing pyramidal form and irregularity to a group that is so desirable. In park land that is sometimes fed off the tree is preferable to the Yew, as nothing will browse on it excepting roe-deer, and these only in very severe weather. The wood has a certain value, when of fair size, for the lining of cabinet-makers' work, it being easily worked, agreeably perfumed, and insect-proof—at least to insects of temperate climes. *Sylvestris.*

SPANISH CHESTNUT GRAFTED ON OAK.

It will probably be news to most readers of the *Gardeners' Chronicle* to learn that *Castanea sativa* grafts readily on the common Oak. This tree only thrives where more or less sand is present in the soil, and in places where this constituent is almost or altogether absent the Spanish Chestnut often refuses to grow. Such is the case in the Botanic Garden at Dijon, where the only specimen is a grafted one, the stock below the graft being allowed to develop a shoot or two, just to prove to the sceptically inclined that it is nothing but the common Oak. Indeed, we were informed by Mons. Weber, the Curator, that it is only by using the Oak (which thrives at Dijon) that he is enabled to grow the Spanish Chestnut at all, as it will not succeed on its own roots. *G. M.*

- Sept. 10.—Fine bright morning, dull afternoon, heavy rain from 3.30 P.M.
- 11.—Slight rain in early morning, dull day, very fine clear night.
- 12.—Rain in early morning, dull day and night, strong wind.
- 13.—Fine dull day, clear sky at night.
- 14.—Dull day, fine and bright about 2 P.M.
- 15.—Very fine day and night.
- 16.—Dull day, heavy rain in evening.

LONDON: Atmospheric Pressure.—During the week ending September 12, the reading of the barometer at the level of the sea increased from 29.61 inches at the beginning of the week to 29.70 inches by 1 P.M. on the 6th, decreased to 29.58 inches by

5 P.M. on the 7th, increased to 29.82 inches by 9 A.M., decreased to 29.77 inches by 1 P.M. on the 8th, increased to 29.84 inches by 9 A.M., decreased to 29.75 inches by 1 P.M. on the 9th, increased to 29.89 inches by 9 A.M. on the 10th, decreased to 29.47 inches by 9 A.M. on the 11th, increased to 29.98 inches by 9 A.M. on the 12th, and was 29.86 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.78 inches, being 0.07 inch lower than last week, and 0.35 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 73°, on the 6th, on the 11th the highest was 59°. The mean of the seven high day temperatures was 64°.5.

The lowest temperature was 47°, on the 10th; on the 7th the lowest temperature was 56°. The mean of the seven low night temperatures was 49°.9.

The greatest range of temperature in one day was 24°.1, on the 6th; the smallest, on the 7th, was 5°.5.

The mean of the seven daily ranges was 14°.6.

The mean temperatures were—on September 6th, 59°.3; on the 7th, 58°; on the 8th, 57°.6; on the 9th, 57°; on the 10th, 53°.6; on the 11th, 53°.4; and on the 12th, 52°.2; and these were all below their averages (excepting the 6th, which was 0°.9 above) by 0°.4, 0°.7, 1°.1, 4°.4, 4°.4, and 5°.4 respectively.

The mean temperature of the week was 55°.9, being 1°.4 lower than last week, and 2°.2 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 126° on the 6th. The mean of the seven readings was 103°.5.

The lowest reading of a minimum thermometer placed on grass was 40°, on the 10th. The mean of the seven readings was 42°.

Rain.—Rain fell on five days, to the amount of 2.68 inches, of which 0.87 inch fell on the 10th.

ENGLAND: Temperature.—During the week ending September 12 the highest temperatures were 73° at Blackheath, 70°.9 at Cambridge, 70° at Sheffield; the highest at Bradford was 63°.8, at Preston 64°, at Liverpool 64°.8. The general mean was 67°.

The lowest temperatures were 40°.5 at Cambridge, 42° at Hull, 43° at Wolverhampton, the lowest at Liverpool 49°.3, at Plymouth and Brighton 48°.8. The general mean was 46°.2.

The greatest ranges were 30°.4 at Cambridge, 26° at Blackheath, 23° at Sheffield and Hull; the least ranges were 15°.5 at Liverpool, 16°.4 at Bradford, 17°.2 at Plymouth. The general mean was 20°.8.

The mean of the seven high day temperatures was highest at Cambridge, 66°.8, at Brighton 65°.2, at Turco 65°; and was lowest at Bolton, 60°.3, at Liverpool and Bradford 61°. The general mean was 63°.

The mean of the seven low night temperatures was highest at Turco, 52°, at Plymouth 51°.9, at Bristol 51°.6; and was lowest at Hull, 46°, at Wolverhampton 46°.2, at Bolton 46°.8. The general mean was 49°.4.

The mean daily range was greatest at Cambridge, 18°.8, at Hull 16°.6, at Wolverhampton 15°.9; and was least at Liverpool, 9°.6, at Plymouth and Bradford 11°.4. The general mean was 13°.7.

The mean temperature was highest at Turco, 57°.1, at Brighton 56°.8, at Plymouth 56°.2; and was lowest at Bolton, 52°.2, at Wolverhampton 52°.8, at Hull 52°.9. The general mean was 54°.9.

Rain.—The largest falls were 2.84 inches at Turco, 2.26 inches at Nottingham, 2.17 inches at Bristol; the smallest falls were 0.38 inch at Leeds, 0.6 inch at Bradford, 0.74 inch at Hull. The general mean fall was 1.57 inch. Rain fell on every day in the week at Plymouth, Brighton, Bristol, Cambridge, Wolverhampton, and Bolton, and from four to six days at other stations.

SCOTLAND: Temperature.—During the week ending September 12, the highest temperature was 68°.2, at Dundee; at Perth the highest temperature was 61°.5. The general mean was 64°.6.

The lowest temperature in the week was 35°, at Perth; at Greenock the lowest temperature was 44°.2. The general mean was 41°.7.

The mean temperature was highest at Edinburgh, 53°.8; and lowest at Perth, 52°.1. The general mean was 53°.3.

Rain.—The largest fall was 3.26 inches at Greenock,

SEEDS.

LONDON: Sept. 16.—The seed market to-day was thinly attended, and but little business was transacted. There is rather less inquiry for autumn-sowing seeds. Winter Tares are unchanged. Rye keeps firm. Very low rates still prevail for Rape seed. Considerable quantities of new English white Mustard have just been marketed. New French red Clover seed is obtainable between 4s. and 5s. per hundredweight. Canary and Hemp seed move off slowly on former terms. New French white Millet for birds is now arriving. Haricot Beans and blue boiling Peas are firmly held. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday there was very little English Wheat, and no change was made in quotations, the demand being very limited. For Australian, Indian, and some descriptions of Russian, about 3d. to 6d. advance was in some cases obtained, at which prices the parcels could not be replaced, owing to the larger advance required in forward positions. It remains to be seen what will be the course of prices now that they are virtually as low as in November of last year, whilst in the place of available supplies from heavy crops there is a considerable shrinkage to look for. Flour was firm. Grinding Barley shewed fully 3d. in some instances 6d. advance. No change occurred in the value of Beans or Peas. Maize tended to harden in value from scarcity. For Oats the trade was quiet, but very moderate arrivals gave some support to prices.—On Wednesday very little was done in most quotations of Wheat, which were nominal. The flour trade was quiet without quotable alteration. Maize was firmer. Beans and Peas moved off slowly, at late values. The trade for Oats remained quiet, without change in prices. Average prices of corn for the week ending Sept. 12.—Wheat, 31s. 10d.; Barley, 31s. 11d.; Oats, 19s. 1d. For the corresponding period last year:—Wheat, 34s.; Barley, 32s. 7d.; Oats, 19s. 9d.

CATTLE.

At Copenhagen Fields on Monday firmer prices in the dead meat trade, and the comparatively very moderate proportion of good or prime qualities of cattle in the supplies assisted the trade for these descriptions, and 10s. to 20s. per head more were in some cases obtained, but there was no improvement in the market for the plainer kinds. Sheep sold rather more readily, without change in value. The calf trade was quiet. Quotations:—Beasts, 3s. 10d. to 4s. 8d., and 4s. 8d. to 5s. 4d.; calves, 3s. to 4s. 8d.; sheep, 4s. to 4s. 6d., and 4s. 10d. to 5s. 6d.; pigs, 2s. 10d. to 4s. 6d.—Thursday's trade was very quiet. Beasts sold slowly, at drooping prices. Sheep were very quiet at about Monday's rates, calves were altogether neglected, and pigs firmer.

HAY.

Tuesday's Whitechapel Market report states that supplies were fair, with a fair trade. Quotations:—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; new Clover, 80s. to 94s.; hay, prime, 65s. to 97s.; inferior, 35s. to 60s.; and straw, 28s. to 39s. per load.—On Thursday there was a moderate supply on sale, and the trade was dull at Tuesday's rates. Cumberland Market quotations:—Clover, best, 90s. to 100s.; inferior, 60s. to 80s.; hay, best, 80s. to 92s.; inferior, 50s. to 70s.; and straw, 30s. to 36s. per load.

POTATOS.

The Borough Market report states that good samples meet a fair demand at steady rates; inferior sorts neglected. Quotations:—Regents, 80s. to 90s.; Margum Bonum, 80s. to 90s.; Early Roses, 70s. to 80s.; Shows, 70s. to 80s.; Kidneys, 10s. to 110s.; and Hebrons, 100s. to 200s. per ton.—The imports into London last week consisted of 10,556 bags from Hamburg, 707 Boulogne, and 50 bags from Rotterdam.

COALS.

The following are the prices current during the week:—Hebside West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 17s.; Hetton Lyons, 15s.; Lambton, 17s.; Wear, 15s.; East Hartlepool, 16s.; South Hartlepool, 15s.; Tees, 17s.; Downias Merthyr, 16s. 3d.

Government Stock.—Consols closed on Monday at 100 to 100½ for delivery, and 100½ to 100¾ for the account. Tuesday's figures were 100½ to 100¾ for both transactions. Wednesday's final quotations were 100 to 100½ for delivery, and 100½ to 100¾ for the account. Thursday's closing figures were 100 to 100½ for both transactions.

THE COLONIAL MANURE.

Unequalled for Excellence of Quality and Productive Powers.

Supplied in Tins,	s.	d.	each.
"	1	0	"

London: ERADURY, AGNEW, AND CO., Bouverie Street, E.C.

WANTED, a HEAD WORKING GARDENER, married, where five are kept.—Must be a good Grape Grower, and understand Ferns, Stone and Greenhouse Plants, as well as Kitchen Gardening. See—Apply, with full particulars, and stating wages required, to H. HARRIS, Stevenston Manor, Micheldever, Hants.

WANTED, an experienced GARDENER, and Wife as good PLAIN COOK, for a Lady's small family at Walton-on-Thames.—Write, stating ages, wages, capabilities, &c., to L. B. 65, Thornhill Road, Bartsbury, St.

WANTED, a WORKING GARDENER. Must understand all Flowers and Fruit for Market. Cows and Pigs.—A married man with wife as Plain Cook preferred, both to live in house; wages moderate, help given in house and garden. Answer by letter, Miss E. EYTON, 6, Fontis Terraces, Cuslow Gardens, London, S.W.

WANTED, a single young man, as thoroughly trained BARDOLMEY. Wages 40s per week, and 10s a week after one horse. Board and lodging in the house. Wages 40s.—Mrs. Y., Westfield, Little Chelford, Cambridgeshire.

Groom and Gardener.
WANTED, a middle-aged Man to look after a Garden and Horse, and make him generally useful. Live on the premises, meals in the house, and all found.—Apply by letter to Capt. E., Weynate Lodge, Tavistock Road, Crocyon.

WANTED, a SECOND GARDENER. One who has had good experience in all branches of Gardening, and has knowledge as to the care of Poultry should be required.—Apply by letter, A. Z., Quarry Hill House, Tonbridge, Kent.

Rose Grower and Propagator.
WANTED, an expert GRAFTER under Glass, with a good knowledge of Budding and of Forcing Blooms for Market, and be able to execute Orders expeditiously. Good references expected.—State full particulars, age, and wages required, to H. BENNETT, Pedigree Rose Nursery, Shepperton, Middlesex.

WANTED, a good PLANTSMAN and PROPAGATOR for the Glass Department. Single man, of character and ability. Wages 40s per week, and 10s a week after one horse.—N. Y. Z., Gardeners' Chronicle Office, 47, Wellington Street, Strand, W.C.

WANTED, to take the Supervision of a Nursery and the entire Charge of an Established Jobbing Trade, a MAN, thoroughly competent to give Estimates and Draw Plans. He must also be a good Farrier and expert at Wreaths, Crosses, Bouquets, &c. None need apply whose character will not bear the strictest inquiry as to ability and trustworthiness.—N. Y. Z., Gardeners' Chronicle Office, 47, Wellington Street, Strand, W.C.

WANTED, for a moderate-sized place, near Bagshot, a MAN and his WIFE, without children. The Man to understand the Management of a Flower and Kitchen Garden, Cows, and Pigs; the Wife to Manage the Dairy and Poultry. Unexceptional references for competence, steadiness, and trustworthiness are required, as the family are absent a great portion of the year.—Mrs. MARTIN, Collingwood Lodge, Bagshot, Surrey.

WANTED, for a large Provincial Nursery, a thoroughly qualified MANAGER, who can take a journey if required.—Apply by letter, enclosing copies of testimonials addressed, NURSERY MANAGER, Gardeners' Chronicle Office, 47, Wellington Street, Strand, W.C.

WANTED, a MAN, to execute Rose orders, and superintend their Packing and Despatch.—Apply stating experience, age, wages required, &c., to EWING AND CO., Sea View Nurseries, Havant, Hampshire.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be made payable to DRURY JAMES, 40, 11, RICHMOND, as unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH Gardeners, who will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, and they will be pleased to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON AND SONS, "Newton" Nurseries, Chester, are always in a position to recommend the highest respectability and thoroughly practical at their business.—Full particulars, with names of previous employers, &c., on application.

TO LANDED PROPRIETORS, &c.—A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Gardens and Parks Grounds, and to execute all kinds of Plans prepared. 115, Listria Park, Stamford Hill, N.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or GARDENER, and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

GARDENER (HEAD).—Wanted by an experienced young man a re-employment as above. Excellent references.—GEO. PARR, Fenagh House, Bagninstown, Ireland.

GARDENER (HEAD).—Where two or more are kept.—Age 17, married, no family; twenty years' experience in all branches. Five years' good character from last place.—A. S. J., Hurst Street, Herne Hill, S. E.

GARDENER (HEAD).—Age 38, married, no family; thoroughly practical in every branch. Excellent character.—G. MORRIS, The Gardens, Cossington, near Bridgwater, Somerset.

GARDENER (HEAD).—Age 33, married; thoroughly practical in his business in all departments of an extensive Estate. Three years' excellent character.—S. VILLE PENTON, Andover.

GARDENER (HEAD).—Could take the Management and Layout of a New Estate. A taste for and some years' experience in this branch of Horticulture. Good Plans and Estimates. Knowledge of Trees, Shrubs, &c.—A. B. J., Walford Road, Stoke Newington, N.

GARDENER (HEAD); age 35, married.—A. PERTIGREW, Gardener, Cardiff, Wales, wishes to recommend a thoroughly practical man in all branches of Gardening; understands the Management of Land and Stock.—For further particulars address as above.

GARDENER (HEAD).—Age 34, married, two children (youngest age 7); eighteen years' practical experience in Vines, Melons, Cucumbers, Stove and Greenhouse Plants, Fruit, Flower, and Kitchen Gardening in all its branches. Good character.—W. WILLIAMS, 12, Lansdown Terrace, Margate.

GARDENER (HEAD).—Age 40, no encumbrance; thoroughly practical in Early and Late Forcing of Fruit, Flowers, Vegetables, Orchid, Stove and Greenhouse Plants, Ferns, and Flower and Kitchen Gardening. Thirteen years in present situation. Satisfactory reasons for leaving. First instance, &c.—L. EIGH, Land Steward to Lady Oglander, Beaminster, Dorset.

GARDENER (HEAD WORKING).—Age 33, married, no family; twenty years' thorough practical experience. Three years' personal character from present employer.—J. McRAE, Cherry Tree Cottage, Southgate, N.

GARDENER (HEAD WORKING).—Age 37, married, three children; Scotch. Experienced in all departments of Gardening. Six years in present situation. Good testimonials.—O. L., Ardwell Gardens, Stranraer, Wigtownshire.

GARDENER (HEAD WORKING).—Age 36, married, two children (youngest aged ten years). Fourteen years' good practical experience as Head. Satisfactory reasons for leaving. Good testimonials.—GARDNER, Woodlands, Nightingale Lane, Clapham Common, S. W.

GARDENER (HEAD WORKING).—Age 28; married when suited; understands Gardening in all its branches. Three years in present situation, and can be highly recommended.—W. T., The Gardes, Wolfekeld Park, Mortimer, Reading.

GARDENER (HEAD WORKING), where three or more are kept.—Age 34, single; sixteen years' practical experience in all branches, in Nobleman's and Gentleman's Gardens.—J. HAINSWORTH, Aberford, Leeds.

GARDENER (HEAD WORKING).—Age 40, married, one in family (a boy, age 12); twenty years' thorough experience in Gardening in all branches. Also Meadow Land and Stock. Twelve years' good character.—J. S., Osmond, High Street, Esher, Surrey.

GARDENER (HEAD WORKING); age 40.—Mr. CLARK, Gardener to Lord Camoys, Stoor Park, Henley-on-Thames, can with confidence recommend a practical man, who has had twenty-six years' experience in good places, and can be thoroughly recommended by late employer.

CARPENTER, on a Gentleman's Estate.—Understands the Erection and Repairs of Greenhouses, Cottages, Farm Buildings, Painting and Glazing. First-class testimonials.—C. T., Ivy Cottage, Wraybury, Staices.

HOLLOWAY'S OINTMENT and PILLS.—Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the respiratory organs. In common colds and influenza the Pills, taken internally, and the Ointment rubbed over the chest and throat, are efficacious. When influenza is epidemic this treatment is the easiest, safest and surest. Holloway's Pills purify the blood, remove all obstructions to its free circulation through the lungs, relieve the over-castiged air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits. Such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints, by which the health of so many is seriously and permanently injured to most benefits.

SACCOLABIUM HEATHII.

To the Trade only.
E. H. KRELAGE and SON, NURSEYMEN, BREMEN, Germany, Haarlem, Holland. The Wholesale Catalogue (No. 3794) of Flower Roots and Miscellaneous Bulbous and Luberous-rooted Plants for 1885-86, in two columns, and is doubtless one of the most complete sent out of this specialty. The prices of plants in general are considerably lower than before. Prices of Tulips and other Bulbs, too, are in many instances inferior to former quotations. German and French editions as well as a separate English edition for America, are published.

"Irradiating the Present, Restoring the Past," A COMPLETE and ORIGINAL "LITTLE BOOK" of DAFFODILS, in its revised form, for 1885. Price 1s. *post-free.* There are namer us original illustrations; and the Daffodils are the best ripened Bulbs to be got, Ireland being *so general* to the cultivator. Over 300 varieties are given out. Early planting and early ripening of Bulbs should give grand results. Advantages offered by no other House in the Trade. W. M. TAYLOR, Horticulturist, 24, PATRICK STREET, COCK.

 At the International Exhibition, held at the Alexandra Palace, L. G. was awarded a Medal for Queen of Anemones. Testimonials from all parts are constantly coming in. The following, from Mr. ROBERTS, *Gardener to Lord Rothschild, only recently received:*—

"Dear Sir, I cannot speak too highly of your Anemones. They are such both in colour and size of flower. I potted a quantity, putting five bulbs in a pot, each under a glass. In due time they threw up as many as two dozen splendid blooms. They flowered two months sooner than the outdoor ones. I wish you had addressed me, who I wish them—Very truly yours, "J. ROBERTS."

Autumn Planting.
THE LAWSON NURSERY COMPANY (Limited), Edinburgh, have to intimate that their Nurseries are well stocked with FOREST and ORNAMENTAL TREES and SHRUBS, ROSES, FRUIT TREES, &c., of superior quality, and when personal inspection is not convenient they will be glad to make special offers upon application.

DESCRIPTIVE LIST FREE.
Selections from above may be made at dozen prices. The plants are remarkably fine and cheap.

RICHARD SMITH & CO.,
NURSEYMEN and SEED MERCHANTS,
WORCESTER.

"WILSON JUNR." BLACKBERRY.

TO OUR PATRONS. Leicester, Sept. 18, 1885.
In a CIRCULAR issued to the Trade on the 5th inst., I have now in America—has been informed by the raiser of this magnificent variety (from whom our stock has been secured), that it has come to his knowledge that some American houses have purchased a few hundreds of his stock, and sending out Wilson's Early (with a few "Wilson Junr." mixed as "Wilson Junr. (true)" representing their stock as coming from him, and offering same at a much cheaper rate than Wilson Junr. could possibly be sold. In case any of these should have found their way to this country we, in duty to our patrons as well as ourselves, to test this preliminary notice.

TO USE THESE. Collyer has purchased a few represented as such at a much cheaper rate than he has paid for the raiser's stock, so that if there should be any who are willing to run the risk (or would like to compare) they can have them at the reduced price as paid, and as q'd below. These we are calling stock No. 2.

IN EVERY CASE unless, of course, instructed to the contrary, we shall execute all orders from the raiser's own stock—viz., No. 1.

The stocks to all intending purchasers of the same therefore be offered as follows:— This constitutes what we know to be the true stock, and which was secured upon the very ground of the raiser. Our patrons may therefore purchase these without any risk whatever. Price, 2s. 3d. each, 22s. per dozen, 85s. per 100. Special price per gross, 100s.

STOCK NO. 2. a lower price and represented to be Wilson Junr. (true) but which, of course, after the raiser's warning, we certainly do not recommend. These are simply offered at the lower price, 10s. each—viz., 12s. each, 10s. per dozen, 75s. per 100.

PLANTS WILL BE READY about end of October, but we would solicit your order immediately if possible, and thereby ensure early delivery and first-class canes.

WE SHALL BE PLEASED to furnish, gratis and post-free, upon application, a large illustration (taken from a photograph) of this magnificent fruit.

Being to our central position and special tariff arrangements, we are enabled to forward all orders carriage paid to any part of the United Kingdom. Assuring you that all orders entrusted to us shall command our very best care and prompt attention.—We remain, Yours obediently,

VICCARS COLLYER & CO.,

SATURDAY, SEPTEMBER 26, 1885.

MONTSERRAT.

IF mortals were allowed to make their own heaven in their own way, Montserrat would be mine. Pardon, courteous reader, this egotistical sentence; it shall be the only one. The present Viceroy of Ireland, who visited this fairy dwelling when it was left to crumble into ruin by "Vathek" Beckford, says, in the record of his travels, that the view of forest scenery to be obtained from the library window transcends the power of the imagination. The ridge of Our Lady of Montserrat was also the vantage point from which Byron wrote his well-known description of Cintra, beginning, "Lo Cintra's glorious Eden intervenes." The property, before having the extreme good fortune to be purchased by Mr. Francis Cook, of St. Paul's Churchyard, belonged to the noble and chivalrous Portuguese family of De Castro. Romance is introduced into the history of their ownership from the three frustrated efforts which were made in the wane of last century by the Governor of Goa to reach his hereditary property. Governors of provinces have, ever since the days of ancient Rome, been too often under suspicion rather than above it. But this De Castro, like his celebrated ancestor, Don John, was sans reproche. He thought to return home to Montserrat, there to finish his course. But the Lord of sea and land willed otherwise. A lease of the property for twenty years was taken by a rich Brazilian diamond merchant, named De Visme. It was not the wish of the Lisbon Court that both the man and his money should leave their fair realm. He built a house on the site of the present one, taking down the chapel of Our Lady of Montserrat, and rebuilding it hard by, on the side of the serra. Beckford, travelling in Portugal, was so struck with admiration, when he saw the matchless position of the house and its grand scenic environment, that he took on the lease from the Brazilian merchant. He planned and altered in his usual infinite style, and left an undying monument of his sojourn in the waterfall which he constructed out of a mountain stream. Disgusted when he found the absent owner steadfast in his refusal to sell, he the offer never so tempting, he thrust from his mind all future interest in the place, and returned to England and built Fonthill. The date of Byron's visit was 1810, and the date of the purchase of the property by Mr. Cook 1855. Mr. Cook, who has travelled far and wide, unhesitatingly declares that his present home is the only place that ever tempted him to follow the pursuit of gardening out of England. He saw from the outset what the delight of it would be in such a temperature, how wide a scope for variety in vegetation he would have in his feet, and what the possibilities were, in such a position, to a landscape gardener who was a child of Nature, not of art. In De Visme's tenure, when the prospect, from whatever then took the place of the south portico, had for a foreground Orange quintas or gardens, such as may be seen occupying the land that trends downward from the

neighbouring villa of the Duke of Cadabal, there was no doubt much that was beautiful; but to see the same foreground now, one would say that it could only have been beautiful on the principle of *bene qui latet, bene vivit*. There can be few, if any, places that have had the same thought bestowed upon them as Montserrat. Its owner resides here in November (one of the best months to visit Portugal), the greater part of April and June, and the whole of May. During this period he gives his whole mind up to his estate. It seems perfect, but in his eyes there is often some little detail or arrangement that is faulty or which might be improved, however flawless and harmonious it may seem to others. Such and such a tree has outgrown the limits that can be given it, or something in its rear has developed unthought of beauties. Though that tree may have been very dear in the past, yet it must go. In fact, to the amateur, who is worthy of the name, there is no end to the improvements he may learn from the contemplation of his garden. Fresh sensations accompany each day, all momentary, may be; but not a week passes without Nature affording something to be written away in the mind's diary. Again, Mr. Cook is always adding to his stock of plants; at first he planted at a venture, now he knows pretty well what the winds and his other enemies will allow him to grow. Palms and Cycads are mingled with the singular vegetation of Mexico. Tree Ferns elbow Camellias, Ipomœas and Bougainvilleas cover entire walls, and Tacsonias overpower tall trees with their rank luxuriance. If the expression may be allowed for the nonce, the valley between the *palacio* and the dense wooded slopes of the serra may well be called by English tongues a vast open-air greenhouse.

Vegetation in Portugal seems to increase in dimensions almost with tropical celerity. Mr. Crawford, in his *Portugal, Old and New*, effectually disposes of the oft-repeated statement that this staunch little kingdom is behind the rest of Europe. He shows how the people are animated with as fine a sense of patriotism, and uprightness in their social relations, as other nations. And to-day the people are under as equable a government, both for the individual and the state, as any other European nation. It is as well, perhaps, that they do not see the need of hurry and break-neck competition. Their land will produce the same crops year after year without steam cultivators; and although their carts, ploughs, and *ciras* (threshing floors) are as simple in construction as those of Roman colonists, there is no agricultural depression. Doubtless with their advantages they ought to be a wealthier nation; but wealth is not happiness. That they are behind the age in botanical pursuits can admit of no question, and it is only recently, owing in great measure to what Mr. Cook, whom the King has made a *visconde*, has done at Montserrat, and men like Comte Fricalho, that thinking men have awoke from their supineness. Eucalypti planted twenty years ago have now matured into imposing trees. Incredible as it may seem, a Cupressus macrocarpa, eleven years planted, has developed at the Villa Pombal (near Montserrat) a girth of 9 feet.

Of these two examples will explain how Mr. Cook has been able to form in thirty years a garden which anybody ignorant of the rapidity of vegetable growth in this climate would put down as the work of two lifetimes. The climate of South Portugal, given irrigation, is as favourable (or even more so) for the growth of what rare John Parkinson would call "outlandish" flowers, shrubs, and trees as any in Europe. Considering their intercourse with Brazil and India, it is curious that the Portuguese have not made a better use of their opportunities. What can be expected from a people so heedless of sanitary arrangements?—some one will say,

The matter of irrigation is all-important. The lawn is the greatest feature of the English flower garden, and of the grounds surrounding the house. The lawn at Montserrat is said to be the only one in South Portugal, and goes far to form the unique grandeur of the place. It is only maintained by constant irrigation. An excellent system has been devised and carried out. Reservoirs are formed in two or three places on the side of the serra, so as to be fed by the mountain watercourses. The water is conducted thence into the gardens by artificial channels, the tops of the walls being invariably utilised for the purpose. A secondary system of tanks and reservoirs is then formed, from which the shallow courses, so constructed that the water may overflow and trickle over the lawn, are supplied. The stream, which is made to descend by a series of falls through the Valley of the Tree Ferns, and then to flow past the bases of the lawns, is also supplied from an *azeez grand reservoir* near the Collares high road. The necessity of irrigation both for the above purpose and for the Orange and Lemon quintas can well be seen by ascending the ramparts of the Moorish castle above quaint and picturesque Cintra. This frowning keep, which, if not so strong as the fortress at Santarem, would yet require a lion-hearted leader like Alfonso Henrique to capture, commands the country northward to Torres Vedras and the Escorial at Mafra (Portugal's Escorial). Even in the early days of May the land seems parched by the torrid glare of the sun.

The view that accompanies this notice (fig. 87, p. 401) is taken on the south side of the *palacio*, from near the brook which hurtles along at the foot of the steep lawn. The ground rises just as sharply on the other side—grass at first, then Cork woods, with a thick undergrowth, locally termed *mata*; afterwards Pine woods, which grow thinner towards the summit of the serra, some 1500 feet above the sea-level. An infinite number of paths and tracks are cut through the *mata*. Very pleasant it is to wander among the lavish profusion of Nature. The Cork trees are lichenized and covered with Ferns—each tree from its peculiar ramification a picturesque object. The undergrowth is composed of Arbutus, Laurustinus, the flowers of which here are without any pink flush; Broom—Golden Shower the natives call it; Butcher's Broom, Scrub Oak, Ivy, Periwinkle, Solomon's Seal, and Bracken. Magnificent views over the grounds, or down the vale of the river Varzea to the sea can be obtained at the openings. Its tangled, devious ways are the best offset possible to the orderly *paradise in sole* below.

"Our Mata much we love, with Nature here
Luxuriant reigneth empress, rules of art
Waving from her dominions dear
With smiling gesture."

The ridge on which the *palacio* is standing is formed by the serra thrusting out a huge above-ground root, trending westward on its northern flank, and separated from it by a deep ravine. The rich black mould washed down from the heights and accumulated at the foot, often to a depth of 10 feet, makes this sheltered *canyon* luxuriantly fertile. A path cut off from the grounds by an arch-enwove balustrade of exquisite design surrounds the *palacio*. By following this path an idea is obtained of the extent of the place. The time of my description is the spring, when the May sunshine fondles the May leaves.

From an anticipatory remark the reader will know that the immediate ground on the south is a stretch of greensward deepening to a sinuous brook, and that the opposing acclivity is prolonged to the saw-like peaks of the serra. As seen from our standpoint there are three peaks. Two are massive uprisings of ashen-grey rock, broken up by dark-shadow rifts and projecting points. The third is mound-like, and

covered with brown, sage-green and yellowing grasses, varied by bouldery groups of scattered rock. To the right Pine woods venture to the summit, and seem to touch the sky. This is a fair-weather picture, when every object is bathed in sunny radiance. On the morrow, maybe, the whole scene will be changed, and the swirling smoke of cloudland will be drifting rapidly, angry from opposition, along the brow. Turning half-face to the right, the spectator sees the azure glimmer of the restless sea beyond the sandy lowland of Collares, where soon the vineyards will rival the verdurous tints of the protecting Pine woods. Across the valley is a Sweet Chestnut wood protruding its tender leafage from ruddy buds. Such is the background. Slightly to the left, at close quarters, is an aspiring Thuia Lobbiæ, over 80 feet high—probably the best in Europe. Behind is the dark foliage of a wide-spreading Eugenia latifolia, 30 feet high, and an almost equally tall *Metrosideros robusta*. The Eugenia is 11 feet in girth at the height of a foot, and is furnished with six large arms and with roots protruding from the branches somewhat like a Banyan.

Immediately in front the lawn slopes down to a group of giant Araucarias (the dimensions of which will be given hereafter), each a model of symmetry—excelsa the antithesis of Bidwilli, in shade of green; above them is a peculiarly graceful *Deodar*, and beyond, a group of Eucalypti covered with white inflorescence. By the brookside is another *Araucaria brasiliensis*, with a *Muhlenbeckia complexa* hiding its straggly growth. Suitable plants, among them Callas, Bamboos, the Papyrus, and *Strelitzias*, garnish the waterside. To the right a large *Cupressus macrocarpa*, 17 feet 6 inches in girth at 2 feet up the trunk, spreads out like an ancient Oak—the lower tier of branches are cut away so as to show the willowy foliage of a tall Eucalyptus *viminifolia* and the ever varying tints of the valley, in April gay by reason of the light purple of the Judas trees, and the scarlet, mauve, and pink of the Rhododendrons.

On the west side of the terrace the limit of the grounds is circumscribed by tall *Pinus* in *signis* and Eucalypti, to which there is an easy fall of the lawn. North-eastward the eye is allowed an unrestricted prospect, and follows the meanderings of the river Varzea to Apple Bay, where it delivers Earth's tribute to Oceanus. Although 4 miles off the altitude is such that few of the ever-varying features of the sea are lost. When the Lusitanian sun is high in heaven the arrowy effulgence merges into a violet haze at the junction with the opalescent tints of the ether. The river's course lies through quintas, "teeming with their fruitage golden," and vineyards. The near reaches are lined with *Loquats* and *Oleanders*. A variegated *Pittosporum Tobira* comes close up to the balustrade with offerings of fair fragrant white flowers. A little farther off, placed so as not to obstruct the view, two graceful and pendulous Cedars of Goa relieve any monotony the lawn might have had on this side in a charming way.

Northward the declivity is abrupt, but still mantled with tree growth, in which everywhere the emerald leafage of the deciduous trees relieves the more sable plumage of the Pines, Corks, and Eucalypti. At the foot of the steep are some Orange and Olive groves, and then the campo rolls away to the famous lines of Torres Vedras, which form the horizon. Scattered over the plain at frequent intervals are the whitewashed houses of the peasantry. Still keeping his ground, but looking eastward, why is the onlooker so entranced? Simply because here he has some of the most perfect woodland and mountain scenery combined that can be seen in Europe. The side of the serra is broken up by deep fissures, and everywhere large masses and pinnacles of lichenized rock, with all their pearly-grey tones and silvery tints, peer from among the Corks, Pines, and Goas. This is

only one aspect. To describe the whole adequately, from the tree-embowered villas nesting at the foot, to the airily climbing peaks of the summit, would be impossible. Some idea of the beauty can be formed if the riven nature of the serra's flank, which a slight bend to the northward makes visible, and the great variety of the trees, be considered. Who has not wandered through a Cintra Cork wood has missed one of the fairest boons of Nature.

"And time-worn Cork trees everywhere
Wreathes his twisted branches there
High and hoary.
Ancient benefactor pure,
How he nurseth, pleased, secure,
That living feathery garniture
Of saucy Ferns that climb his head.
Fairy sprang, they deck him o'er
With such wealth of beauty's store,
That, quite forgot his lengthy reign,
He smiles in joyous youth again."

The Pena, whilom an old convent, now a regal residence, crowns with its cupolas one of the loftiest points of the serra, the terminal ridge of which is occupied by the ruined Moorish castle. Five or six villas, with their quintas, seem to form steps on the way to it; no wonder Cintra is a popular place wherein to spend the *villagiatúra*.

On the east side is the main entrance, which is approached by a broad carriage-drive over-arched with trees. From the south-east corner of the terrace there is the best view of Beckford's Falls; from the highest fall to the foot of the glen would be a distance of 500 feet. From the *palacio* only the upper series are to be seen. The stream comes out from below two Stone Pines placed among the Cork woods. The water with one bound leaps from a plane of rock into a little tarn, out of which it hurries down a steep rock-hindered course to make another venturesome plunge. The crystal rain is seen through the foliage of waving Tree Ferns; a bed of high shrubs and the trees planted to shield the Ferns from the sun, hide the lower fall. It is the fairest scene of this fairland: anything grander in landscape gardening, either in idea or execution, has not been accomplished. Although the original idea was Beckford's, it was the exquisite taste, loving care, and true sense of beauty of Mr. Cook that has brought about the present incomparable result. *C. A. M. Carmichael.*

(To be continued.)

New Garden Plants.

CYRANTHUS HYBRIDA, *N. E. Dr. n. hb.*

FROM Sir Trevor Lawrence I have just received an interesting hybrid raised from seed of *Cyranthus* (*Gastronema*) *sanguineus* var. *flammeus*, fertilised by the pollen of *Valloia purpurea*. In habit the plant very much resembles *Valloia purpurea*, the leaves, however, are rather narrower and slightly more acute. The umbels are several-flowered (6-flowered in the plant seen), the flowers are like those of *Valloia* except that the perianth-tube is bent forward and rather abruptly dilated in the throat, instead of being erect and funnel-shaped, and the segments are rather narrower, but are not revolute, as in the seed-producing parent. The stamens are short, not exerted beyond the tube, and the upper ones curved downwards, exactly as in *Cyranthus sanguineus*. There are two varieties of colour in the batch of seedlings, in one the flowers are bright rose-carmine, in the other bright light orange-scarlet, nearly the same as that of the seed-producing parent. The seeds were sown in November, 1853, so that the plant quickly arrives at flowering maturity. It is not a better plant from an ornamental point of view than *Valloia purpurea*, but the variation in colour will make it useful to mingle with that plant for an effective contrast. All the seedlings, I am informed, have not flowered

yet, so it is just possible that another colour variation may appear among them.

I think this plant can scarcely be claimed as an example of a hybrid between two distinct genera, but rather as proving a view that I have held for some time, viz., that *Cyranthus* and *Valloia* are not really distinct genera, but merely different types of form belonging to the same genus, just as one finds in many other genera, as, for example, in *Rhododendron*, *Lilium*, *Erica*, *Gentiana*, *Pelargonium*, &c. *N. E. Brown, Kew.*

LEPTACTINA TETRALOBA, *N. E. Dr., n. sp.*

Leptactina is a small genus of Rubiaceæ, the species being natives of Tropical Africa, the present plant being the first that has been introduced into European gardens. It was sent to Kew by Mr. Hanington from Kwa Chiropa, Usagara Mountains, East Tropical Africa.

As grown at Kew it forms a neat little bushy shrub, with leaves 2½ to 7 inches long, ¾ to 1¼ inch broad, oblanceolate, cuneately narrowed from above to the middle to the acutish base, apex somewhat acute, light shining green, minutely pellucid dotted, glabrous, with the margins and the edges of the ¼ to ¾ inch long petioles ciliate with short hairs directed forwards, the midrib and veins of the younger leaves also have similar hairs. Stipules erect, ovate acute, carinate, green, glabrous. Flower solitary, sessile, terminal. Calyx lobes erect, linear oblong acute, ¼ inch long, 1 line broad, green, gum-exuding towards the base, with very minute apiculate papillæ (scarcely hairs) on their stout midrib. Corolla white, hypocrateriform, covered outside with minute apiculate papillæ, inside hairy in the tube, glabrous on the lobes; tube 1¼ inch long, slender, slightly dilated above, and with four small protuberances near the top, corresponding to the places where the anthers are inserted; lobes four, oblong obtuse, ¾ inch long at their base, and alternating with them are four filiform processes, 1 line long (coronal appendages). Anthers included, linear, 5 lines long, peltately attached in the throat of the corolla by exceedingly short filaments, which support them at one-third below their apex. Style thickened and hairy in the upper part; stigma two-lobed.

This species is closely allied to *L. heinsioides*, Hiern, but seems to be clearly distinguished by its solitary flowers, and four-lobed corolla; the filiform coronal appendages also do not appear to be present in *L. heinsioides*, but the solitary specimen of that species at Kew is very fragmentary, and has but one flower, which I do not like to dissect, but no trace of them can be seen in this flower where the stamens are exposed to view. The plant appears likely to prove quite as ornamental as a *Garcinia*. *N. E. Brown.*

ZYGOPETALUM KLABOCHII, *n. sp., Rehb. f. MS. 1880.**

A fine *Kesfersteinia*, with larger whitish-ochre coloured sepals and petals. Lip pure white, neatly denticulate, fringed, blunt at the top, reflexed in the middle, full of purple spots, which are also scattered on base of the petals, on the side sepals, and on the base of the column, though not constantly. The callus is rather narrow, ligulate, bidentate, sometimes with two obscure angles on each side, one behind the other. Column wider at the top. The plant is of New Grenadan origin, or, if you like better, from the United States of Columbia, and most evidently first gathered, or, at least, sent by Mr. Edward Klaboch. I have known it since 1880, and now I have a fine specimen at hand from Mr. C. Dorman, The Firs, Lawrie Park, sent by Mr. F. Sander. It stands near *Zygopetalum forciopatum* and *laminatum*. *H. G. Rehb. f.*

CHAMEROPS HUMILIS IN THE JARDIN DES PLANTES.—In the Jardin des Plantes at Paris there exists in a large orangery a pair of remarkable specimens of the dwarf Fan Palm (*Chamerops humilis*). Both are male plants, and the stems of about 30 feet in height. The labels bear the legend, "Given to Louis XIV. by Charles III., Margrave of Baden-Dourlach." Neither seems to have suffered at all during the siege in the late Franco-German war, when a goodly number of rare and interesting plants were lost.

* *Zygopetalum Klabochii*, *n. sp.* Foliis lanceis angustis (ed. 5 poll. longis, 3 lin. latis); unifloro; sepalis tepalibusque ligulato-obtusis ellipticis, lobello cuneato, lobis ovato-oblongis marginibus auriformis denticulatis, callo in basi ligulato bidentato lateribus nunc unu bidentato; columna sursum amplata. Sepala, tepala, columna albo flavida. Tepala, sepalia parva nunc purpurea parva obtusa. Columnæ basis nunc etiam purpureo-petata. Labellum candidum, et supra callum, et præterea base purpureo punctatum. *H. G. Rehb. f.*

THE ORCHID HOUSE.

IN the culture of Orchids it is necessary to "take time by the forelock." Delay is in all cases to be avoided. Sometimes it is disastrous to the future well-being of the plants. We have now begun to clean the glass, and as the plants have to be removed from the stages to do this effectually, they are carefully looked over and cleaned at the same time. The best managed collections in the country cannot be kept free from thrips when these troublesome insects are in great numbers outside the house. The same remark applies to green-fly; during the month of July they were very numerous, and covered the clothes and tickled the faces of passengers in the highway.

In such circumstances it is the watchful nervous cultivator that succeeds. He watches the first appearance of insects on his plants, and immediately destroys them. In all cases fumigation is best; but some Orchids cannot stand so much tobacco-smoke as the apbis and thrips can. Cattleyas can be fumigated when *Odontoglossum vexillarium* and some other easily injured Orchids have been removed from the house. *Angraecums*, and the hot-house *Cypripediums*, may be fumigated, but the *O. odontoglossum Roezlii* will not stand it. On one occasion I spent for twelve months trying to kill red thrips on *Angraecum sesquipedale* by dipping the plants, and failed to clear them from the pest; but it has now been done by fumigating with tobacco-smoke.

These general observations apply to all the divisions. Referring particularly to the East India temperature. In that division the *Phalaenopsis* are now in full growth, and throwing up their flower-spikes. Some of them are in flower, such as *P. violacea*, a distinct and beautiful species. *P. esmeralda* is also beautiful now; the flowers are not large, but rich in colour. *P. sandieriana* is also in flower now, and is one of the best of the recently introduced species. The distinct rosy-tinted flowers are quite charming; some have quite a rosy-red or rosy-crimson tint. The most successful cultivators of *Phalaenopsis* and allied species of Orchids use thick shading, and are careful not to allow the plants to get too much sun.

If the plants of *Odontoglossum Roezlii* were not potted in July or August they should be done now. I have always grown these in the cool end of the warmest house, near the glass, and they require more sunshine than the *Moith* Orchids. Under those conditions we have grown plants from small bits in thumb-pots until they have attained the dimensions of large specimens, with a hundred or more flower open at one time.

No warm house should be without the singular looking *Angraecum*, especially *A. sesquipedale*. This fine species is very accommodating in its disposition, and will grow and flower well either in a light or shady part of the house. They are now pushing out their roots freely, and must be encouraged by the roots being kept moist, the surface sphagnum to be in a healthy growing state. The smaller-growing *Angraecums*, such as *A. citratum*, and that pretty little species *A. hyaloides* (the whole plant, with half-a-dozen spikes on it, of this last-named species may be enclosed in a snuff-box, and the flowers are of the purest white) should be suspended in baskets close to the roof-glass. The flower-spikes will soon be showing, and hanging the plants up near the glass keeps them out of the reach of slugs.

A word in passing about spot in Orchids, although it is a long time since I last saw it. It may be prevented altogether by judicious airing, and careful management of the saturation state of the atmosphere. It is usual during the summer months to keep the paths constantly wet, but now they are sprinkled twice a day only; in the morning, and the afternoon—about 4 o'clock is a good time.

The Cattleya-house requires much the same treatment as the warmest house in respect to atmospheric moisture. A large proportion of the pseudobulbs of the Cattleyas have completed their growth, but a large proportion have not done so; it is therefore necessary to keep the house rather warmer than it would be necessary to do if they had all completed their growths. These just pushing should be placed near the glass, and in the lightest and warmest part of the house. So ought also the *Lælia purpurata* and *L. elegans*; at this time they require a much warmer atmosphere than Cattleyas; 65° at night is more suit-

able to their requirements than 60°. Many species of *Acridies* which succeed best in this house are yet growing freely, and must receive no check to their growth. Keep the sphagnum in a healthy growing state, and all will be quite well with them. Of these are *A. Fieldingii*, *A. crispum*, and the allied species, *A. Lindleyana* and *A. Warneri*. Some of these, such as *A. Lindleyana*, are amongst the most magnificent species of this fine genus, and they succeed quite well in an airy part of the Cattle-house. If anything is likely to get them into bad health it is the system of keeping them in a close moist atmosphere and a high temperature. We have now removed the *Odontoglossums* that require a warmer atmosphere in winter from the cool-house into this one. They are *O. vexillarium*, *O. cirrhosum*, *O. Phalanopsis*, and a few *Oncidiums*, such as *O. incurvum* and *O. ornithorhynchum*, the *Masdevallias Chimera* and *M. Tovaensis*. Some of the above will succeed in a cool-house temperature, but they certainly do much better in the intermediate-house. It depends, of course, what the temperatures are; our house is kept about 55° in winter, but in cold weather the minimum is frequently 50°, sometimes lower. The cool-house is 45°, falling in cold weather to 40°. The *Vandas* in this house, such as *V. suavis* and *V. tricolor*, require the same treatment as the *Acridies*; and the lovely *V. cœrulea* is now pushing its flower-spikes very freely in a light airy place. *J. Douglas*.

THE EARLY HISTORY OF THE TURBAN RANUNCULUS.

The following account, furnished by Mr. G. Nicholson, Kew, is extracted from the English translation (published in 1718), of Tournefort's travels, entitled *A Voyage into the Levant, performed by command of the late French King*, will no doubt interest many readers. We have not attempted to alter in any way the quaint diction or spelling of the translator, John Ozell:—

"There are many other fine sorts of Orchis at Constantinople, but can't be propagated in Gardens, they delighting in nothing but air of the fields. 'Tis not so with the Ranunculuses, which are perpetually multiplying, and acquiring new beauties from the hands of the curious. For some years past, the Turks have been careful to cultivate these sorts of flowers. Cara Mustapha, who miscarry'd before Vienna, is said to have brought Ranunculuses first in fashion. This Visier, to amuse his master, Mahomet IV., who extremely loved hunting, privacy, and solitude, insensibly inspired him with a fancy for flowers; and understanding that the Ranunculuses were what he was most pleas'd with, he wrote to all the Bashaws throughout the empire, to send him roots and seeds of the finest sorts they could lay hand on. The Bashaws of Candia, Cyprus, Rhodes, Aleppo, Damascus, outdid all the others in making their court to him. From thence came those admirable species of Ranunculuses which are to be seen in the fine Gardens of Constantinople and Paris. The seeds which were sent to the Visier, and those propagated by private men, produced vast varieties. The ambassadors prided themselves in sending them to their respective masters; in Europe they were rectify'd by culture. M. Malaval contributed not a little thereto at Marseilles; he furnished France with 'em, and France all foreign countries. Except Pinks and July-flowers, we have no fine flowers, but what originally came from the Levant. A Virtuoso of Paris, one M. Bachelier, brought from thence in 1615, the first Indian Chestnut tree and double Anemonies. The Tuberoses, the Hyacinths, Narcissus, Flower-de-lis'es, came from the same country; but have been rectify'd in our gardens. There are cactus in France very proper for the multiplication of certain flowers. They raise in Normandy double Jonquils, and very beautiful Anemonies; the climate of Toulouse is extremely agreeable to these sorts of flowers. Now I am upon the topic of Anemonies, there goes a story of a certain lawyer, to whom M. Bachelier had refused to communicate the seed of these fine Anemonies; which when he could obtain neither for friendship nor money, nor by way of truck, a fancy took him to go and visit M. Bachelier, with three or four of his friends who were in the plot. He order'd his lacquey, who bore the train of his gown, to let it drop on some pots: that were in such an alley; in these pots were the Anemonies he wanted, and their seed was ready to fall. They walked a good while, and talked about the times: as soon as they were come to the very spot of ground a merry gentleman of the company began a story which engaged the whole attention of M. Bachelier; and at the same time the lacquey, who was no fool, let fall his master's train: the Anemony-seeds, having a downy coat, stuck to the gown, which the boy soon gathered up again, and the company went forward. The Virtuoso took leave of M. Bachelier, and went his way home,

where he carefully pick'd up the seeds which had stuck to his robes; he sow'd 'em the same day, and they produced very beautiful flowers.

"The garden of the French Palace at Constantinople is at present well kept; it has a terrace, from whence may be discover'd the plains of Asia, but there's no need to stretch the view so far: the ambassador causes to be cultivated within his own walls the finest Orange trees, Ranunculuses, Anemonies, and all such flowers as are beautiful and agreeable in their seasons."

TREES AND SHRUBS AT MESSRS. LEE & SONS' ARBORETUM, ISLEWORTH.

THE fine collections of hardy ornamental trees and shrubs from these nurseries that have been exhibited of late years at our horticultural displays must have suggested to admirers of such that the collections from which they were sent must be something out of the common way, and the idea is not an illusory one, as a recent inspection at their home quarters has amply verified.

We were prepared, of course, to see many fine things, but were totally unprepared to see so much that was remarkable. To stand at the entrance to the arboretum and gaze down the long avenue planted on either side with such rich, varied, and beautiful tree growth is a sight once seen not easily to be effaced from the memory; the glowing autumn tints, too, which many of the examples are now putting on add a new charm to an already bright picture.

It would appear to be a matter for regret that the subjects to be found in a place of this description are not more generally made use of by planners and planters of gardens and parks.

In a hasty look round notes were made of a few of the choicest subjects, but to give even a tithe of noteworthy plants would be more than the space permits, and might also weary the reader. We will therefore be content to single out the following from the many—beginning with:—

Ulmus Roseselii, a grand and noble tree for park or lawn, foliage of a bright golden hue, very effective; *U. campestris latifolia variegata*, a species of the English Elm, very conspicuous for its variegated foliage and fine habit; *U. viminalis variegata*, of a pretty pendulous habit of growth, silvery variegated foliage; *U. montana var.*, a species of the Wych Elm, deeply margined with white, very pretty and effective; *U. (Planera) Keki*, a very spiny dentated leaf, considered one of the best foliaged amongst the Elms—pendulous habit of growth; *U. plumosa*, leaves curling plume-like round the wood, giving it a very distinctive appearance—habit of growth erect.

Betula purpurea, purple-leaved Birch, very ornamental; *Tilia americana glabra*, a species of Lime, with very bold dentate foliage; *Cornus femina*, a very pretty bushy plant, centre of leaf olive-green margined with silver-white; in the early spring the plant is covered with small yellow blooms. *Populus canadensis aurea*, the golden Canadian Poplar; when planted out in an exposed situation this tree has a grand appearance. *P. Boileana*, Silver Poplar, somewhat new, leaves very deeply cut, of dark olive-green; an acquisition amongst this class of trees. *Crataegus filicifolia (new)*, Fern-leaved Thorn, leaves of a dark olive-green: very conspicuous. *Rhus glabra laciniata*, one of the most beautiful of hardy plants, with elegantly cut leaves; very free blooming. *Sambucus laciniata variegata*, cut-leaved Elder, throwing up long spikes of silvery variegated foliage; a very handsome and showy variety. *Corylus Avellana aurea*, a new golden-leaved Filbert; *C. Avellana purpurea*, purple-leaved Filbert, bearing large clusters of purple-coloured Filberts, which are sweet and edible, the bush is very prolific; a useful and ornamental subject. *Acer platanoides globosus*, a variety of the Norway Maple, and when "worked" as a standard it is very handsome; *A. colchicum rubrum*, young growths of a very deep red tint, rendering it effective; *A. Pseudo-Platanus Webbiana*, raised by Messrs. Lee; large leaves, very prettily variegated, having more white than is generally the case with the other varieties; footstalk of leaf yellowish tint, differing in this

respect from others, which are mostly of a reddish tint; a noble-looking Maple, of very vigorous growth. *A. striatum*, commonly called the Snake-barked Maple, in allusion to the peculiar striping of the bark; of very curious appearance, and a handsome tree of moderate height. *A. platanoides laciniata (the "Eagle's Claw")*, Norway Maple, very curious and interesting; *A. Pseudo-Platanus elegantissimus*, large, leaves, very prettily variegated with gold and green—most effective; a seedling raised by Messrs. Lee. *Euonymus europæus latifolius*, bearing fine broad leaves; the plant just now is covered with its numerous dull rose-coloured seed-vessels, giving it a very pretty and distinct appearance. *E. e. purpureus*, foliage of a dark purple, almost turning to a deep red in autumn; very pretty as a half-standard. *Cotoneaster affinis*, the deciduous Cotoneaster, now covered with clusters of coral-coloured berries, rendering it very effective; *Frunus economica*, very effective; centre of leaf green, margined with gold. *Morus papyrifera*, or Paper Mulberry; deeply cut heart-shaped leaves, ribs of which are tinted with pink; fruit round, rough, small, greenish. *M. bispanicus*, bears fine broad leaves, and is of free, robust growth.

A large collection of the different kinds of *Malus* is shown; we noted especially *M. Toringo pendula*, of very pendulous habit, and in the early spring is covered with pink and white flowers, and bearing a Crab much smaller than a *Pea*; it is, in fact, the smallest of Crabs. *Pyrus chinensis*, the Chinese Sand Pear, has fruit resembling in appearance a large, round, rough ball of worsted; it first fruited about twenty years ago (it has not done so since), and the fruit may now be seen at the Royal Gardens, Kew. *Juglans regia pendula (Weeping Walnut)*, magnificent when worked, as here, on a stem about 12 feet high; it has a noble appearance. This particular specimen is probably one of the finest in existence, and although this has been a very dry season the tree has made shoots 6 feet in length. *Castanea vesca heterophylla dissecta*, a Spanish Chestnut having variously shaped leaves; on the plant we noted five distinct forms of foliage, the young growths having long, drooping, narrow, tail-like leaves of about a foot in length, giving it a distinct and grotesque appearance; a showy plant in any position. *Catalpa sryngifolia aurea*, in exposed situations is a grand tree; the more intense the heat the deeper colour do the golden leaves assume. *Cornus mascula aurea elegantissima*, one of the prettiest of the Dogwoods; centre of leaf olive-green, variegated with gold, the points being tipped with magenta. *Acer pendula nova*, an acquisition amongst Maples—plant of beautifully spreading habit; *Caragana Chamlanga*, the Siberian *Pea* tree, bearing *Pea*-like flower tinted with pink and white, and retaining its glossy glaucous foliage until late in the autumn; *Cerasus Padus elegans*, Bird Cherry; pretty leaves, green margined with silver, very ornamental tree. *Pyrus sorbus vesita*: upper surface of leaves dark olive-green, under-surface being of a beautiful silvery-white; wood of glaucous appearance, makes a pretty plant as a standard. *Sambucus nigra var. aurea*, Golden Elder; a most effective plant; *Robinia Bessoniana*, a fine hardy tree—most effective for avenues and promenades.

Of the brave old Oak, a numerous and most interesting variety is grown. We can but give names of only a few of them. *Quercus cerris elegantissima*, a variety of the variegated Turkey Oak, much more deeply variegated than the old variety; *Q. filicifolia*, the true Fern-leaved Oak, foliage very dense and handsome; *Q. coccinea borealis*, foliage of a deep ruby tint—this is distinct; *Q. albo marmorata*, the young growth silvery variegated, the young shoots striped with red, which has a pretty effect; *Q. imbricaria*, very handsome, of robust growth—long lanceolate leaves; *Q. phellos*, very pretty, long narrow or Willow-like leaves, tinted in autumn deep red; *Q. robur purpurascens*, purple leaved, rapid and vigorous grower—a first-rate variety for the forester; *Q. panonica*, also a rapid grower, very erect habit, leaves fine olive-green; *Q. Ilex laurifolia*, an evergreen Oak of pretty appearance and pendulous habit; *Q. nobilis*, or Black Jack of America, the autumn tint being of a transparent red, and very beautiful; *Q. Diamio* is one of the largest leaved varieties of Oak we have. The plant, when in a vigorous state, produces leaves averaging from 16 to 18 inches in length, and 12 to 14 inches in diameter—rough habit; *Q. Tauzin splendens*, leaves of a very dark green, glaucous on the under-surface—very much

like a Turkey Oak in appearance, but of much more rapid growth: a very handsome variety of *Q. pyrenaica*, the foliage dying off in beautiful tints. *Q. Mirbecki*, of rather slow growth, has leaves broad, very dark green—a magnificent kind; *Q. austriaca sempervirens*, of dwarfish habit, very thick growth, semi-evergreen—very handsome; *Q. robur argenteus nana*, an English Oak of dwarf habit—very prettily variegated; *Q. diversifolia*, an evergreen variety,

PICEA MORINDA.*

This is a hardy, rapidly growing Spruce, growing in Bhotan and the Eastern Himalayas, at altitudes ranging from 7000—11,600 feet above the sea. Major Madden says it has many native names, all denominating a "prickly Fir," and he says the Babylonian confusion of the vernacular may reconcile mortals to the unity, however hard, or sometimes

but rapidly become pendulous (fig. 85). It is curious that Wallich and Forbes, *Pinctus Waburnense*, both figure the cone as growing erect when mature. This, however, is a mistake arising from the artist having seen only the detached cones. On the tree and in a mature state they are pendulous, as in all the true Spruces. The botanical history is now well known, and may be gleaned from any of the text-books. In gardens and plantations the growth is very rapid. The very beautiful tender green shoots, as well remarked by Major Madden, as they elongate, carry before them like an extinguisher the brown transparent scales of the leaf-buds. The twigs are used as litter, but the timber is soft and not durable. It forms excellent hedges, as few plants bear the shears better. On the other hand, when left to itself it forms a graceful pyramidal tree, with pendulous branches. The largest we have seen is in the garden of an old farmhouse in the neighbourhood of Witley Court, Worcestershire. The buds are elongate, light brown. The lateral buds at the end of the leader shoot expand before the terminal bud, and in growth the young shoots are strongly curved in a downward direction, apparently from more rapid growth on the upper as contrasted with the lower surface, from "epinasty," according to the modern terminology.

The tree in this country seems always ready to grow on the least provocation; hence the young shoots are apt to be nipped by frost, which does not seem to do permanent harm, and for hedge purposes is rather beneficial, as new growth is stimulated to take the place of the old. It was introduced into Scotland in 1818, the name *Smithiana* referring to Lord Hopetoun's gardener, who was the first to raise the plant from seed. Mr. Fowler reported in our columns in 1872 that one of the trees planted at Hopetoun was then 60 feet in height, and measured 7 feet round the bole at 4 feet from the ground. Mr. Fowler also notes that at Castle Keonedy this Himalayan Spruce grows much faster than the common one. The cone from which our figure was taken was sent to us from Penrbyn by Mr. A. D. Webster. M. T. M.

THE JEPHSON GARDENS, LEAMINGTON.

THESE gardens are nicely situated, adjoining the river Leam, which flows on the southern side for their entire length. Being in the town the inhabitants have easy access to them, and numbers of visitors find their way to this fashionable resort. The extent is some 14 or 15 acres. The most has been made of the ground available in the laying out, so as to secure as much room for promenading as possible—a matter of importance where large numbers of people congregate. A broad central walk runs the whole length, with others at intervals, where required, diverging from it, and leading to that which surrounds the whole garden near the boundary.

Trees of most kinds thrive well, both deciduous and evergreen; neither is this to be wondered at when the rich fertile nature of the soil in this part of the country is taken into account, the advantage of which was more than usually apparent during the present dry summer, when the lawns were green and pleasant to look upon at a time when the greater portion of the country was so burnt up that grass and stubble presented little difference in colour. From the entrance to a point some distance within the grounds evergreen Oaks stand right and left of the central walk, planted at sufficient distance apart to prevent their ever encroaching upon each other. They are beautiful trees, densely clothed with foliage, and feathered down to the green turf out of which they spring. These Oaks, with most of the other trees in the gardens, have been planted about forty years, and in common with the others have made good progress. Amongst the trees that are thriving well may be named the Lebanon *Deodora* and Mount Atlas Cedars, *Taxodium sempervirens*, *Pinus excelsa*, *P. Strobus*, *P. austriaca*, and others of the coniferous family. Deciduous trees do equally well; the clean healthy appearance they have is sufficiently indicative of their condition. Dispersed about the grounds is a good collection of Thorns. Evergreen and deciduous shrubs, of which there is a good selection, alike make good progress.

To the right of the main walk leading from the entrance is an ornamental piece of water, which is

FIG. 85.—CONE AND BUD OF PICEA MORINDA.

habit and growth of tree very thick; *Q. robur concordia*, beautiful golden leaves—handsome.

It would be unfair to close these rambling notes without a well-merited word of praise to Mr. John Webb, Messrs. Lee's able manager. The pleasure of our visit was appreciably enhanced by his company, and the communicative spirit which he showed.

Adjacent to the arboretum Messrs. Lee have a nursery devoted to the cultivation of Coniferae, Roses, Clematis, Camellias, Ivies, creepers, small evergreens, greenhouse plants, Vines, Heaths, &c., on which we may have something to say anon. J. B.

barbarous and pedantic, of the botanist. There is, unfortunately, a similar lack of unity in the botanical names, as any one may see who cares to look into the synonymy and literature of the species. The botanists, however, have this advantage, that there is order and method in their synonymy, which represents difference of opinion, not of fact; and for the unravelling of which there is a ready clue which is wanting in the vernacular appellations. The cones are at first erect,

* *Picea Morinda*, Link.; *Abies Morinda*, et A. *Smithiana*, Link.; *Pinus Smithiana*, Lambert ex Palatore, DC. *Prod.*, xvi, 35, p. 416 (1850); *Picea Smithiana*, Boissier, *Flor. Orient.*, v., p. 700 (1884).

well placed, and forms an interesting feature; a considerable portion of its surface is occupied by aquatic plants of various kinds.

On the opposite side of the main walk there is a flower garden made by the Curator, Mr. Longford, a few years ago. It consists of a moderate number of beds in the grass. As opposed to the intricate style so often met with, the design has the merit of simplicity, and is still further commendable for not being too large for the situation, whilst yet big enough to give the requisite amount of colour, which the frequenters of gardens of this description are likely to continue to hold in estimation. It was very well planted, partly in the carpet style, and the remainder with an assemblage of the usual continuous summer-flowering plants, in which soft colours were most prevalent. To the left of the entrance, just within the iron railing that separates the gardens from the main road, there are also two or three good-sized beds in the grass between the clumps of shrubs; these were planted as carpet beds, and as seen from the road, as well as from within, give agreeable bits of colour that brighten up the dark hues of the trees and shrubs around. These beds show at a glance the difference that exists between the use of enough colour to give life to the surroundings and the misuse of colour where introduced in wrong places or used in excess of what is required. The disavowal in which modern flower gardening is now held is due simply to the fact of those engaged in it not knowing the requisite amount of it that should be used; or, in other words, to the introduction of colour to positions where it was inadmissible, or to the use of too much. It is the misuse of summer bedding, rather than its use, that has brought it into disavowal.

The borders, which in some parts of the grounds are backed with shrubs, were gay with Violets, Pansies, and other flowers, which, combined with herbaceous plants and annuals, keep up a display.

There is a good collection of Roses, which soil and climate alike favour. The walks are dry, smooth, and pleasant to walk on, whilst the closely mown grass is of the dense character that is only met with where the land is of the best description; and the general aspect of the gardens is highly creditable to Mr. Longford. *T. B.*

GARDEN PALMS.

(Continued from p. 371.)

DIPLOTHEMIUM, Martius.—Only four species belong to this genus according to the *Genera Plantarum*, five according to Drude in Martius' *Flora of Brazil*. Three of them are cultivated at Kew, where one, viz., *D. glaucescens*, is represented by very handsome specimens, which in point of beauty are second to none of the cultivated Palms. The largest of these has arching leaves 15 feet in length by 4 feet in width, the segments being 2 feet long and 2 inches wide, olive-green above, silvery on the under side. When quite small this species is an attractive Palm, owing to the broad feather-like form of its foliage, which assumes a graceful habit at an early age. The petiole is very short, as the pinnae extend down the rachis of the leaf almost to its base; the lower part of the rachis is channelled, the upper part keeled; the midrib of the pinnae stout and prominent above. *D. glaucescens* forms a stem 12–15 feet high, whilst the other species are stemless. *D. maritimum* has leaves 7 feet long, the segments rather narrow and glaucous on the under-side. The fruit is as large as a Cherry, the covering fleshy when fresh, drying to a soft scale-like fibre, in which the smooth pale brown round seeds are enclosed; they are very hard and marked with three shallow furrows running from the base towards the apex. Seedling leaves simple, assuming a pinnate character when the plants are about a year old. The species thrive best when treated as tropical plants. *D. littorale* is figured in the *Bot. Mag.*, t. 4861, but it is not now known to be in cultivation.

D. campestre, Mart.—Brazil.

D. caudescens, Mart. (*Ceroxylon niveum*, Hort.)—Brazil.

D. maritimum, Mart.—Brazil.

DRYMOHLÆUS, Zippel.

This genus is made to include plants with cuneate or truncate leaf-segments, as well as those with linear, pointed ones, and is, therefore, exceptional among

Palm genera. In gardens the two types of foliage are represented by *D. Rumphii*, which has a thin erect stem, short leaves, with rather soft thick petioles, and leaf-segments broadened out like a fish's tail, with the apex jagged, a very broad one terminating the rachis, and the whole leaf is covered with a floury substance; and *D. singapensis*, which may be compared to a Cocos or Euterpe, as the leaves are graceful, arching, with segments not much wider than in Cocos Weddelliana. This species deserves to occupy a favoured position among garden Palms, as it is a quick grower, healthy in appearance, and particularly ornamental when young. There are twelve species described, all of them being unarmed, with erect, thin, annulated stems. The fruit varies in size, is ovoid or oblong, the pericarp thick and fibrous, enclosing the dark brown striated seeds, which are usually egg-shaped (*D. ceramensis*), and half an inch to an inch long (*D. singapensis*). Seedling plants not seen.

D. ceramensis, Miq.—Ceram.

D. oliveiformis, Mart. (*Ptychosperma Rumphii*, Bl.)—Moluccas.

D. Rumphii, Hort., Lind.—Moluccas.

D. singapensis, Hook. f. (*Ptychosperma singapensis*, Hort.)—Singapore.

DYPSIS, Noronha.

This genus is closely related to the Chamedoreas, and resembles in its leaf characters and habit some of the graceful leaved species of that genus. The cultivated kinds of *Dypsis* are very similar to each other, being erect, thin stemmed, the stem bright green, smooth and annulated, and the leaves are long, pinnate, the segments arranged in fascicles of six or eight, each 18 inches long, bright green. The clasping sheath-like base of the petiole is very prominently angled, and as the leaves appear to be arranged in three rows along the stem, that portion enclosed in the leaf-sheaths is distinctly triangular. The same character appears in *Hypoborbe Verschaffelii*. In the fasciculate arrangement of its leaf segments, and the curious triangular or tritichous character of its leaves, the genus *Dypsis* is distinguished from all other pinnate-leaved Palms. In addition to this form of leaf there is also in this genus a form the blade of which is entire with a sinus at the apex as in *Siveosonia* and *Verschaffelia*, but it is not represented in the species cultivated. There is a plant at Kew of *D. madagascariensis* 15 feet high, measuring to the top of the leaves which is over to feet long, very graceful, and not unlike the leaves of *Cocos plumosa*. The seeds are peg-top-shaped, half an inch long, and covered with a coat of brown fibre; internally they are milk-white. Seedling leaves split; the plants do not assume their graceful plumose characters till about five years old.

D. Hillebrandtii, Hort. Van Houtte.—Madagascar.

D. madagascariensis, Hort. (*Areca madagascariensis*, Lodd.)—Madagascar.

D. pinnatifrons, Mart. (*Areca gracilis*, Thou.)—Madagascar.

ELATIS.

The three or four species included in this genus have no particular attractiveness in their foliage, and the two species in gardens are so difficult to keep respectable, that if it were not for their interest as oil-yielding Palms, they would probably be discarded. There are two sections in the genus, viz., *Euelatis*, the species of which have erect or decumbent trunks, serrated petioles, and stiff leaf-segments, and *Barcella*, which has no stem and flaccid leaf-segments. *E. guineensis* when young forms a dense rosette of pinnate leaves, which are stout at the base, the lowermost pinnae reduced to long spines, which extend almost to the bottom of the petiole, the upper ones opposite, about a foot long, terminating in a long filament. When developed this species has a stem 20–30 feet high. Young plants of *E. melanococca* do not materially differ from the former. They are both moisture-loving plants, thriving best when kept uniformly wet at the roots, and in a hot, steamy atmosphere. *E. guineensis* may perhaps take rank second only to the Cocoa-nut Palm as a valuable economic plant, as from its yellowish fruits, about as large as Walnuts, is obtained the important product "Palm oil," of which upwards of 800,000 cwt. were imported into England in 1882. The oil is expressed from the fleshy covering of the seed. Good Palm oil is of a bright orange colour, about the consistency of butter, and when fresh has an agreeable smell. It is used

for making soap and candles, also for greasing the wheels of wagons, &c. This species is cultivated in various parts of South America, and of course very largely in Africa, about Liberia.

E. guineensis, Jacquin ("Oil Palm").—West Tropical Africa.

E. melanococca, Gaertner.—Central America.

ERYTHEA, Sereno Watson.

Two species of Californian Palms are included here, both very like the Copernicæ, having fan-shaped leaves borne in heads on stout annulated trunks, the leaf-stalks spiny or merely roughened along the edges. The blade is divided half way down into numerous segments, which droop and give the Palm a graceful Thrinax-like appearance. They have only recently been introduced into English gardens. Fruits Cherry-like, with a yellowish fleshy pericarp, which is sweet to the taste, and which encloses a dark brown somewhat compressed seed. Seedling leaves stiff, simple.

E. amata, S. Watson (*Brahea edulis*, Wendl.; and *E. Roezlii*, Hort.; *E. glauca*, Hort.)—Guadaloupe Islands (Coast of California).

PROLIFERATION IN FERNS.

(Continued from p. 371.)

FERNS fall roughly into two natural divisions, terrestrial and epiphytal. These divisions are marked by several characteristic features. They contrast, as a rule in habit of growth, texture, and circumscription of the fronds, and duration of the individual life. Broadly, the characters may be thus tabulated:—
Terrestrial: Rootstock generally upright, with the fronds clustered at the top; these more or less herbaceous in texture and perishable, and compound or decomposably cut; duration of life variable, but limited and relatively short. Epiphytal: Rootstock generally creeping, with the fronds placed along its axis; these more or less coriaceous, chartaceous or membranous in texture, and durable, and generally entire or pinnatifid; duration of life relatively long. There are very numerous absolute exceptions to the rule, and others in which these features are more or less modified in each division, but taken broadly they characterise the two sections very clearly.

In the New World the epiphytal is composed chiefly of the majority of the species of *Hymenophyllum*, *Polypodiæ*, *Vittariæ* (included in *Grammitida* in *Synopsis Filicum*), and *Acrostichæ*, with a few from one or two other tribes. The difference in the duration of life in the two divisions is due partly to the habit of growth in the respective rootstocks, and partly to constitutional character. The erect state, being generally unable to produce new roots after it clears the moist influence of the surface of the ground, exhausts itself in a period varying from a few months in the most hercaceous, to few, several or many years in the most arborescent; the creeping state, on the other hand, lying constantly prone along its whole length to the surface on which it is growing, roots as it elongates, new feeders keeping pace with the growth, and thus the life is renewed from day to day. In this form of growth, while the conditions of its environment remain favourable, duration seems to exert no adverse influence, and there is no evidence of a gradually diminishing energy, which age invariably manifests in the course of time in the other type. The constitution is tough, too, and slow to suffer under unfavourable influences, such, for instance, as disturbance of the plants, while in the erect form of growth it is tender, and suffers from disturbance immediately, and any adverse condition prolonged is irretrievably fatal. But this greater vitality of the creeping over the upright habit of growth is common to all the species in which it occurs, both terrestrial and epiphytal. The broad differences which I have enumerated that mark these primary divisions are due, I have no doubt, largely, if not altogether, to the conditions of their respective situations of growth. The epiphytal species, growing aloft on the exposed branches of trees, usually without soil of any kind, or with only what little *abris* from decay of bark, moss, or foliage may adhere to the roots, the repent form of rootstock affords the firmest and most secure hold; and as they are exposed without root protection in seasons of drought, under this influence have acquired a constitution that will resist successfully the ordeal. Some species of Vit-

tarize which have not acquired this toughness of fibre, and in which the rootstock is short and fleshy, have provided a substitute, which serves both for adhering to the surface and supplying moisture in the form of a sponge-like mass of hairs which clothe the roots. The matted mass clings tightly, and the moisture absorbed during rain is retained for a considerable time. Again, with regard to the durable texture of the fronds: were they herbaceous, as in the terrestrial species, they would either beyond recovery undergo prolonged drought; whereas now they are hardly affected—the leathery ones perhaps slightly shrivelling, and the elastic-membranous curling, both fully expanding again on the return of rain. Then as to their size and shape: were they large and freely divided, they would get much battered and damaged by wind, and constant risk would arise of the rootstock becoming dislodged by their sway and weight; hence they are usually small, and at most never exceed a moderate size, and are generally entire, or simply pinnatifid. The Hymenophyllæ are in part an exception to the rule, the majority being multifoldly divided, but these are protected by their generally diminutive size and common habit of growth. The Fern species in which the fronds are broad, and present a good leverage to wind, develops, like plants which are subject to immersion and the drag of river currents, a vast mass of tightly adhering roots, which completely clasp the branch on which they are growing. These facts, which favourably affect the duration of individual life among the epiphytal species, I have detailed, as they are probably a countervailing advantage to the general absence of proliferation which marks this division, and the perhaps generally less spore production than obtains in the terrestrial division. With regard to the duration of individual life, it appears to be a rule that, where it is brief by nature, or liable to be so from tender character, or precarious situation of growth, abundant fecundity accompanies it. *Ceratopteris* and the annual *Gymnogrammas* are instances among plants whose duration is by nature short; and *Cystopteris fragilis* and other plants which grow in the beds of rivers, and are liable to be washed away in floods, of those which by accident are so; the latter are, however, further protected by the faculty they have acquired of adhering tightly to a bare surface, so that, though the fronds are washed away, the rootstock frequently remains to sprout again when the water subsides.

Generally, I think it may be said that the fecundity of the epiphytal species is somewhat less than that of the terrestrial. The *Acrostichias* by their amorphous soil might appear an exception to such a rule, but even here the rule obtains; for in this tribe the fertile fronds are only produced in seasons, in many cases only once a year. More spores are probably lost, too, in the epiphytes through reaching unsuitable situations for their growth than among their terrestrial analogues. But, assuming the condition equally favourable in each case, I think it probable that in a wild state the spores of each are equally free in germinating. Gardeners, however, have not found this the case in cultivation; but may not their failure be very likely due to the greater difficulty of producing under an artificial state the conditions required by the epiphytal species, with perhaps at the same time an inherent want of adaptation to conditions defective in any of the normal qualities?—a feature which seems to be more rigidly characteristic of this division than of the other. That it is difficult to produce the conditions in cultivation of the wild state may be witnessed by an attempt to grow the epiphytal plants as they grow wild, so far as these conditions could be imitated by the cultivator. They are (1) a bare branch or trunk of a tree, and (2) alternating periods of moisture and drought. Any such attempt would fail absolutely from the first; yet it is on the bare branches of trees, subject at one season to weeks or months of cloud and rain, and at another to periods as long of sun and drought, that the spores of the majority of epiphytal species germinate and the plants spend their life. Of course there is something else—some ever-pervading impalpable atmospheric element, complex no doubt in character, which is imperfectly recognised by the observer, but which is among the chief essentials of success. With regard to wasted spores, Nature is ever bountiful of the elements of life, and her purpose is served if one in thousands succeeds. In both the divisions multitudes of spores perish after germination, through the conditions not being such as is required for the permanent and adult life.

In regard to the survival and permanence of specific types, the chief or only advantage which the epiphytal division possesses over the terrestrial is in the greater tenacity and duration of the individual life. The cases of proliferation which it presents are rare, especially of frond proliferation, and are chiefly confined to the species which may be described of intermediate character, that grow most on rocks or about the base of trees, and on prostrate decaying logs. The only form which I have witnessed in the strictly epiphytal species is root-proliferation, and this is rare. This, however, it is interesting to note is the only form that probably could be of any service in this division. The difference in the situations of growth would make all the forms of frond-proliferation, as a means of reproduction, nearly entirely futile. Their fronds generally spread out on being clear of the surface on which the rootstock is growing; so that birds, were they produced on them, would reach no surface in which to become established while connected with the plant; and were they to acquire roots and then drop, in the way I have described as accomplished by some of the terrestrial species, they would fall to the ground, where, in the majority of instances, they must necessarily perish—such a situation being the antithesis of what they require. Even among those stamend species which begin their life on the ground, but only attain perfection by ascending trees, in which it might succeed, I have met no instance. Many of the epiphytal species drop their fronds by disarticulation, which would also disadvantageously affect the success of most forms of frond-proliferation. Disarticulation is not confined to the epiphytal division, but in either division I have observed no case of frond-proliferation coexistent with it. Some Tree Ferns, in which the growth is periodic, curiously illustrate it by dropping all their fronds during the season of wet, the trunks standing as bare poles till the next tier of leaves is thrown out. This habit would be as fatal to any of the ordinary forms of bud-proliferation as the perishing of the fronds with the approach of winter, which is usual in the terrestrial division in a cold climate. With regard to this periodical growth, in some species of Tree Ferns I have on two or three or more occasions witnessed a remarkable instance of intelligence on the part of birds. It is known, of course, that in some of the tribe (*Cyathea*) the growth is continuous all through the year, while in others it is intermittent. The former throw up their fronds one after the other; the latter, at least when they first start into growth, several simultaneously, or nearly so. Prior to this growth the incipient fronds are tightly coiled, forming a rim to the top of the trunk, which, surrounded by the petioles of the preceding tier of fronds, is like the centre of a shuttlecock. Recognising the period of dormancy and its duration in this species, birds sometimes build their nests at the top of the trunk on the rudimentary fronds, supported by the leaves of the surrounding developed fronds. Here they hatch and rear their young before the growth starts. Were it to begin before the brood had fled the consequence would be more disastrous to the little family than an earthquake, for the nest is first lifted by the uncoiling fronds, and then as, rapidly, they more and more diverge, is turned over. The birds must also be able to distinguish the species of intermittent from those of unintermittent growth, for I have never observed an attempt to build on any of the latter. This seems to me a case of true discrimination and intelligent appreciation of facts in Nature in birds.

But to return to our subject. I have mentioned that the only form of proliferation found in Tree Ferns is a generally very casual budding of the stem, which results in furcation, or, where it is habitual, in fascicles of stems. The new divisions generally throw out aerial roots at the base, by which, if the part falls off, it may become established. If taken off with the roots developed, such young stems readily grow, like cuttings. Several species of Tree Fern throw out aerial roots on their stems under the influence of moisture, often several feet upwards from the ground. Perhaps all do to some extent, but under the same conditions it is manifested very unequally by different species. These root-fibres are very dense generally, and greatly increase the diameter of the stem in those cases in which it is most developed. I have come across examples so stout, tapering upwards from the ground, that I could not clasp the stem in my arms. When wounded on the stem some species also readily emit roots, and but rarely buds. This facility in rooting might be taken advantage

of by cultivators, who, instead of destroying Tree Ferns which become too tall for their houses, might, by erecting a box filled with soil on the stem at any desired point, shorten the stem to that extent. When the box becomes filled with the roots the stem could be cut just beneath it, and the plant lowered to the ground and planted again. I have done this with wild Ferns, leaving the matter entirely to Nature till the time for severance arrived, and thus obtained a large, wide-spreading plant in full fruit, with a stem so short as not to be clear of the surface of the ground.

Turning from Tree Ferns to those of the order which exhibit the other extreme of stature—the Hymenophyllæ—I know of but one instance in this tribe, and that a case of frond-proliferation—which occurs in a polymorphous terrestrial species, and which I shall have to refer to again. Possibly root-proliferation occurs in the tribe, but I have not observed it.

(To be continued.)

"HORTI FLORIDI." 1614—1617.

MR. F. W. BURBIDGE, in his interesting notes on the "Garden of Flowers" in the *Gardeners' Chronicle* of September 12, p. 346, has mentioned my name, soliciting me to give some information about the old garden books which were published from 1614 to 1617 as *Horti Floridi* at Arnhem and Utrecht in the North Netherlands. I am happy to be able to do so, as I am fortunate enough to possess in my library different copies of these very curious and rare works.

These books are interesting from a horticultural point of view, as they are examples of the oldest garden books we possess. The original engravings are good, and, as already mentioned by Mr. Burbidge, have been frequently reproduced in subsequent works, so, among others, in the different German "*Floriilegium*" for example, in Merian's *Forilegium renovatum et auctum*, published in 1641 at Frankfurt-on-the-Main.

The books are rarities, as a complete copy of one of the editions never seems to be met with, some plate or another being always missing, and the copies described are nearly all different in some way.

As Crispin de Pas and his family were well known engravers of the time, the books have their interest in the history of Art, especially as from the younger De Pas, the principal engraver of the work, but few engravings are known.

There are three different editions known of this *Hortus Floridus*—a Dutch one, which is, perhaps, the original one, a Latin one, which is that best known and mentioned in bibliographic literature; and an English one—that mentioned in the former number of the *Gardeners' Chronicle*. Other copies are mentioned, one with a French and others with a German title; these, however, contain no text, but only plates.

The bibliographical books are incomplete or incorrect in their details as to these *Horti*. In J. T. Seguire's *Bibliotheca Botanica* (Lugæ, 1740), the date of one of the editions is erroneously given as 1607 instead of 1617, and an Amsterdam edition of 1651 in folio, another of 1684 in quarto, and an Arnhem edition of 1615 in folio, are all mentioned, but all which I suppose to be very doubtful.

Albert von Haller (*Bibliotheca Botanica*, 1771), copies Seguire. The English edition is mentioned in both these works next to the Latin one.

In Pritzels's *Thesaurus Literature Botanice* (Lipsiæ, 1851) both editions are mentioned, sub. No. 7796, with reference to Seguire and Haller. In the second edition of Pritzel—edited by Dr. Carolus Jessen (Lipsiæ, 1872), finished in 1877—the Latin edition is mentioned, as in the first edition unaltered (sub. No. 6972), and the English edition is omitted; and sub. No. 6973 it gives, under a separate title, the last part of the former book, viz. 1—

"*Cognoscite illam agri quomodo crescent, non laborant neque neti vitæ dico vitæ in Salomonem quidem in universa gloria sua sic amicum fuisse de unum ex his Matth. 6 cap. Formicis Crispiani Passeri et Joannis Wellndellii.*"

These books have frequently given occasion to bibliographical theories, among others in the *Bibliographia Agricola*, published in Dutch by Martinus Nihil, at the Hague, where, in vol. ii., No. 6 (1875), Ph. T. J. Arnold gives a monograph of the book. Its study, however, is far from complete,

and several columns of the *Gardeners' Chronicle* would be necessary to describe all the variations in the copies found in various places.

The title of the Dutch edition begins as follows:—

"Den Blom-hof in houdende de rare oft ongemeene bloemdie op den tegenwoordigen tijdt bij De Liefhufers in estimate quehouden werde," &c.

This edition was printed at Utrecht for Crispin van de Pas, anno 1614. At the second page (back of title) a list is given of some florists from whose gardens the flowers published in the work have been drawn and engraved. This list contains fifteen names from Utrecht, five from Amsterdam, five from Haarlem, and two from Leiden. The title of my Latin edition is as follows:—

"PASSEUS CRISPINUS.—*Hortus Floridus* in quo rariorum a minus vulgariorum florum icones ad vivum verumque forma maceratissime delineatae et secundum quatuor anni tempora a diviso exhibentur, incredibile labore ac diligentia Crispini Passaei junioris delineatae ac summi in ordinem reductae." Arnhemii, apud Janssonium, 1614 (—17), 4, oblong, 184 foll. et tab."

The book was published in parts. There are some copies made to imitate this. Later, the plates were arranged in the bound copies in different ways. The book is divided into two equal parts of which the first contains the flowers of spring, summer, autumn, and winter. The spring division was published in 1814; the summer, only with a Latin text, at Arnhem in 1817; the autumn, with Latin text, at Arnhem in 1816; and winter, with Latin text, without indication of place or year of publication; in a second copy in my library Utrecht is given as the printing place of this part.

The second general part of the work is entitled "Altera pars floridus," &c., and has a second title, the verse of Matthew cited above.

All these editions are excessively rare, and are likely to become so more and more. As a proof how much they are valued it may be mentioned that in one of the last lists of the well-known bookseller, Mr. Bernard Quaritch, London (rough list, lxvii.), September, 1885, p. 655, another totally complete copy of the Latin edition is priced at £10.

The English edition seems to be the scarcest of all. I bought my copy in 1868 from the antiquarian stores of Mr. Frederick Muller at Amsterdam, at a high price. The copy was advertised as exceedingly rare. I have never met with another English copy since, till I found that of Mr. William Bayler Hartland, mentioned in his little *Book of Daffodils* (Cork, 1885), where, at the inside of the cover, a piece of poetry from Thomas Wood, out of this book, is printed.

My English copy has no separate titles for the four parts of the year, nor a principal title for the second part of the book. At Mr. Burbidge's request I give here the full title of the book, written in the same way as it is printed:—

A GARDEN OF FLOWERS,

Wherein Very

Lively is contained a true

and perfect description
of all the flowers contained
in these fower followinge bookes.

As also the perfect true Man-

ner of colovring the same
with their naturall colovres, beinge
all in their seasons the most rarest and
excellente flowers, that the world affordeth: misainter-
gued, both pleas-
sure and delight to the spectator, and most especially
to the well affected practitioner.

All which to the great changes,

and almost incredible labour and paine, the diligent Authare by
foure yeares experience, hath very Laboriously compiled, and
most excellently perfor-

med, both in their perfect Lineaments in representing them
in their copier-plates:
as also after a most exquisite manner and methode in
teachinge the practi-

sitioner the paine them even to the life.
Faithfully and truly translated out of the Netherlandish
original into English for the comon benefite of those that
understand no other langua-

ges, and also for the benefite of others newly printed both
in the Latine and
French tongues all at the charges of the Author.

Printed at Utrecht, By Salomon de Roy, for Crispian
de Passe, 1615.

On the other side of this title is printed an acrostic upon Crispian van de Passe, junior, from Thomas Wood, which is as follows:—

THE BOOKE TO HIS READERS.

COME hither that much desire,
R are flowers of dyvers Landes;
I represent the same to you,
S et et downe vnto your hands.
P resenting them vnto your view,
I n perfect shape, and faire;
A nd also teach to colour them,
N ot missinge of a haire.
V sing such coloures as requires,
A master workemans will
N ot of swarving thence in any case,
D eclaringe there his skill.
E ach flower his proper lineament,
F resentes from top to toe;
A nd shewes both Rooote, bud, blade and Stalke,
S o as each one doth growe.
S pring no paines, or charge I have,
E ach seasons flower to passe:
I n winter, Somer, Springe and fall,
V ntill this compleate was.
N ow vse this same for thy delight,
I njoy it as thou wilt:
O f blotts and blurs most carefully
R efraine, or else t's spilt. THOMAS WOOD.

FNIS.

Although neither of the four different copies I possess is quite complete, I can form out of them at least one complete copy; this ought to consist of the following plates:—Spring, 1—54; summer, 1—20; autumn, 1—25, with two supplementary plates; winter, 1—12. Second part, figures 1—120, on sixty-one plates. To give further particulars would necessitate too much time and space.

As before said, the family of De Pas were well-known engravers. Crispin de Pas, the father, was born in Zeelande, and was a very productive engraver. Eight hundred and sixty-one works are known from him, partly after Geldoopuis, Goltzius, F. R. Pourbus, Maubeuge, Martijn de Vos, Paul Morels, and others. He was assisted by his relatives, namely, by Crispin de Pas, jun.; Simon Guilhaume, Crispina, Barbara and Magdalene de Pas. The plates of the *Hortus Floridus* are principally from the hand of Crispin de Pas, jun.; however, he had collaborators among his family, at least plate 32 of the spring, L. Talipa, alba cum rubr. flam. et fanebut, is signed Willem Pas I. (Simon Guilhaume). By a closer examination of the work, which at present time does not permit me to make, some more particulars might be given; nevertheless this is said above I suppose will satisfy the esteemed inquirer. *H. H. Krelage, Haarlem, Sept. 14.*

CALANTHES.

It would be difficult to find a more useful class of plants than the three Calanthes I shall here mention, as they bloom during the most gloomy part of our winter, their colours are distinct and bright, and their flower-spikes are tall, arching very gracefully, and the plants have a charming effect when dotted about amongst other plants. They continue to bloom for three, and even four months, and no plants are so easy to cultivate where a little heat is at command. These qualities should place them in the front rank of winter-blooming plants, while any one may grow them without incurring the expense of building Orchid-houses; although those who have such structures may grow them to a higher state of perfection. Few Orchid growers would consider their collection complete if it did not include the Calanthes.

Those which I refer to are *C. Veitchii*, the red-flowering fine variety, from the eminent firm at Chelsea; the next is *C. nivalis*, a pure white variety, and a favourite with every one; the third is *C. vestita*, white with a ruby eye—in fact, there are two forms of this, one of which has a yellowish eye: both are pretty. The cultural details are very simple and easy of accomplishment if only heat is at command. But like all other plants they have their preferences. The plants like plenty of water when growing vigorously, good open compost in which to grow, a light position near the glass where the light may assist the foliage to expand and develop, a little bottom-heat in their earlier stages of growth, and a gradual ripening-off process which ends in a state of perfect rest.

By the time they have done flowering the roots

will have fulfilled their duty, the foliage will have died away, when water should be entirely withheld until the bulbs recommence growth, when they should be shaken out of the pots and started afresh, commencing with the earliest indication of growth at the base of the bulbs, in March or April. As these grow and become strong they will push out new roots; before this takes place the plants should be turned out of their pots and have the old soil quite removed. All the roots should be cut away (for these will be dead), the old bulbs should be removed from the new, for nothing will be gained by retaining these old bulbs, so, for the present, they may be laid aside. The potting process must be so well known that I need not enter fully into that. Sufficient to say that the pots should be clean and dry, well, but not heavily crocked. The compost should be half decayed fibry turf, broken into pieces, good peat, also broken up—about equal parts; some sphagnum cut up rather short; some crocks and charcoal broken up small, and then mixed altogether with the hand. Fill the pot nearly to the rim, take one or more bulbs and carefully place them on the compost, then pack them well round without injuring the young growths, shake some sharp sand over the surface, and the potting is done.

A little sand may be shaken in with the compost, while the pots are being filled, if the peat and loam should be of a heavy close nature. A few pieces of dry cow-dung may also be added if the other ingredients are poor; but soft unctuous manure must not be added on any account. The potting business being finished, the plants may be set in any warm and somewhat dark place for a fortnight—by that time young roots will be pushing their way into the dry sweet compost, which will now require to be well watered. This must be done through a rose in a careful manner, so that neither bulbs nor compost shall be displaced. Very little more water will be required for some time. A wet, sour soil is one of the things the plants dislike, and must, therefore, be avoided.

But the question will now arise, Where are the plants to be put for their season's growth? I must answer by giving my own practice. I used to put them in an ordinary hotbed where the temperature was kept up by means of dung linings; but this was a very troublesome affair, and risky as well, as makeshifts often are. Nevertheless I kept the plants there till the bulbs began to swell. I then removed them to a shelf in the stove, where they finished up their growth and flowered. But the best place I have found is in a small Cucumber house, one end of which we use for propagating purposes in early spring. The house is a lean-to, having a bed along one side, with pipes under it, a path through the centre, and shelves on the other side. The pots are set on the bed, and remain there till the bulbs are well formed and the bloom-spikes appear; then they are removed to the shelves for a few weeks, and when the flowers appear they are taken to the cool side of the stove, where they remain till flowers and foliage die away, unless any are required for the conservatory, which is sometimes the case; but this structure being for the most part filled with Chrysanthemums, is kept a little too cold for the Calanthes. The plants dislike strong sun, especially in their earlier stages of growth, and therefore must be thinly shaded. They dislike cold water, either at the roots or over the foliage; therefore all the water used for them should be about the same temperature as the atmosphere of the house. They dislike a dry atmosphere, sudden changes, cold draughts, dirt on the foliage, rough handling, and a low temperature all the while they are growing. A range of from 60° to 80° for day and night, sunshine or clouds, will answer at that season; 50° to 60° will do for the flowering season, and 50° to 55° for resting. Under these conditions, and with ordinary care, they will grow very freely, producing fine spikes of bloom. I have just measured a bulb of *C. Veitchii*, and find it 12 inches high and 8 inches in circumference. *C. nivalis* is as large, and most of them are pushing two spikes of bloom from each bulb. By the time they have finished up I dare say the strongest bulbs will be 15 inches high. I consider this very satisfactory, and expect to see fine blooms by-and-by.

Now a word about the old bulbs, which may be laid aside. If an increase of stock be required, and these are breaking, they may be potted up just like the others, only in smaller pots or more of them in a pot,

and some useful plants may be thus obtained, which will probably bloom the next autumn, and will certainly do so the following. But if a sufficient stock be already potted up and growing, or if these old bulbs are not breaking or likely to do so then throw them away. About the time the spikes are pushing well up and showing their flower-buds the foliage begins to fade, get spotted and die away, which is rather unfortunate, so far as the look is concerned.

But the skill of the cultivator must be brought to bear here, and while every care should be taken to retain the foliage in all its beauty as long as possible, yet we must not try to subvert Nature in this case, but rather assist and improve her, if we can. Shortly after the plants have been potted and are set in their growing quarters take some old ripe fronds of Maidenhair or other Ferns and lay them on the pots to remain there for a week or more, and by-and-by the result will appear, for by the time the foliage begins to die off, there will be some beautiful young Ferns peeping up amongst it.

But a word of caution must be given, for as the Calanthes are the things to be cultivated, they must have the first consideration; so too many Ferns must not be allowed to grow, neither must water be given

some of the new sorts of last year and the present; yet it is more for the improved shape of the flowers, substance in the petals, brilliancy and purity of the colours, that most growers will prize the new varieties.

Some of this year's seedlings at Swanley, of single varieties, whilst being perfect in shape and the flowers large enough to satisfy reasonable ideas, are a decided advance in the brilliancy of their colour, which in the case of several of the reds and crimsones vies with the intense shade present in a few of the highest coloured Roses. In yellows and whites, purity of colour combined with form alike stand out ahead of those that have hitherto been accepted as the best sorts. The sturdy, short-jointed habit of growth in the plants, with their flowers borne erect above the foliage, is such as to leave nothing to be desired in this direction. The Swanley seedlings occupy a number of the long span-roofed houses, which collectively present a sheet of bloom through the summer such as is equalled by few other plants. Amongst quantities of new kinds of the present and last season's raising, which I recently had an opportunity of seeing, the following are the most remarkable:—

Crimson Circle.—Bright crimson, veined with in-

Mrs. Nash.—Rosy-crimson; a fine and very distinct-looking sort.

Pink Perfection.—A finely formed flower; bright pink in colour.

Mrs. Lipharp.—Another finely formed flower; colour bright crimson, shaded with magenta.

Indian Chief.—The flowers of this variety are of remarkable substance, standing when cut, considerably longer than any sort I have met with. Colour indian-yellow, of a more decided shade than I have before seen.

Violet Gem.—A grand flower, all aglow with violet colour, such as is present in the centre of some of the large bloomed kinds of Cactus.

Countess of Besborough.—Flowers circular, of medium size; clear bright yellow in colour.

Crimson Perfection.—A beautiful circular flower, brilliant crimson in colour; the flowers are borne quite erect. One of the finest amongst the collection.

Queen of Yellows.—A pure yellow, deep in shade; excellent form and good habit.

Mr. H. G. Murray-Stuart.—A flower of immense size, with very broad petals; colour bright pink.

Glowworm.—A full-sized, beautifully formed flower; colour bright ruby-crimson. There is nothing amongst the brightest of the zonal Pelargoniums that surpasses this Begonia for brilliancy of colour.

King of Begonias.—Flowers of large size, unexceptionable in shape; colour reddish-crimson.

Wonderful.—A fine sort, alike for the size, substance, and form of the flowers, which are bright red in colour.

Rosa magnifica.—A fine flower every way; colour bright rose.

Perfection.—Another fine shaped flower, bright glossy red in colour.

King of the Crimsones.—A large bold flower; deep crimson, distinctly shaded with maroon.

Rosy Morn.—This is one of the brightest flowers of its colour, rosy-purple, and of good shape.

Pink Perfection.—One of the best habited sorts that has appeared, and a very free flowerer; colour soft pink.

Athalus.—An immense flower, with very broad petals; colour bright red.

Leviathan.—An enormous flower, over 6 inches in diameter; colour salmon-rose.

Charles Fellows.—A scarlet flowered variety, with stout, thick, broad petals, each of which often measure 2½ inches across.

Maecog.—Dark crimson in colour, flowers almost circular, petals of great size, more than 3 inches wide.

DOUBLE VARIETIES.

Double-flowered Begonias, like double flowers of other things, find many admirers, one of their chief merits being in their greater endurance. Yet with Begonias, except when the flowers are required for cutting, this is not of so much consequence as in the case of plants that do not give a succession of bloom, as every bit of growth they make produces flowers which keep on opening so as to take the place of those that drop in a way that keeps up an uninterrupted succession from the time the plants begin to bloom until there is not enough warmth and light in the greenhouse to enable them to continue flowering.

As those who have any acquaintance with Begonias do not require to be told, there are two distinct forms which the plants assume when they appear in double form. In one, which might be called the Pæony-formed division, the flowers have confused centres like those of a double Pæony; in the other, that may be termed the Rose-petalled section, the petals are even and imbricated, like those of a well-shaped Rose. By most people the latter—although not so large as the former—will be voted the most attractive. Double varieties do not so far seem to appear so frequently with the raisers in this country as on the Continent. Amongst the best doubles grown at Swanley may be named:—

Monr. de Venise.—A glossy crimson, large in size, and a free bloomer.

Louis de Goussaincourt.—A very large sort, with bright pink flowers.

Madame Castaignes.—A distinct and effective sort, with large flowers; bright pink in colour.

Ruhn von Erfurt.—A medium sized variety, with rich orange-scarlet flowers of beautiful form; a free-bloomer, and of good habit of growth.

Virginialis.—One of the best of the double white varieties.

FIG. 86.—REGULAR PELORIA OF FOXGLOVE. (SEE P. 400.)

merely to keep the Ferns growing when it is not required by the Orchids. The Ferns, however, will be very pretty for a time, and as the drying off process goes on, and water is withheld, they may be cut away to do duty with cut flowers. When the plants have done flowering they should be kept quite dry and stored away till potting time comes round again. *N. Blandford*.

TUBEROUS BEGONIAS AT SWANLEY.

A KNOWLEDGE of what has already been accomplished by hybridising would naturally induce caution in placing a limit to the possible in the raising of new varieties; still those who were most sanguine would scarcely have credited that the present race of tuberous Begonias, in their all but endless forms and shades of colour, could have sprung from the few, comparatively insignificant, species that the hybridisers had to work from; yet year by year the raisers have gone on bringing out new varieties that are so far in advance in the habit of the plants, the quantity of their flowers, and the brilliancy of their colours, that the produce of each succeeding season shows a marked improvement on those before existing. Those who are fond of varieties that bear gigantic flowers can scarcely fail to be satisfied with

tease scarlet. The flowers are as circular as a well-developed Christmas Rose, and about the same size.

Rosy Circle.—Another broad-petalled circular flower; colour intense rose.

Queen of Roses.—A bold, full-sized flower; colour deep rose, shaded with magenta; habit unusually robust and short-jointed.

Magenta.—Flowers full-sized, deep magenta in colour.

Floribunda.—Medium-sized flowers, vivid scarlet in colour, and produced in such quantities as to nearly hide the foliage.

Cannell's Favourite.—Flowers medium in size, colour bright crimson, the petals overlapping each other so as to scarcely show where they meet.

Earl of Besborough.—Medium-sized flowers, ground colour lemon, outer edge of petals red, centre pale violet; a very distinct and beautiful variety, and a profuse bloomer.

Salmonea.—A full-sized flower, beautiful in form; the colour is a peculiar shade of salmon. One of the freest bloomers.

Rose Perfection.—This sort bears an abundance of large finely-formed flowers, bright rose in colour.

Crimson King.—Flowers of unusual substance in the petals, which in most cases come in fives, one more than the usual number. The colour is deep crimson, with magenta centre.

Blanche Duval.—A beautiful flower; colour creamy-white tinted with blush.

Madame Alfred Werle.—A charming sort, buff, with purple shaded centre.

M. Legouve.—Buff, tinted with blush.

Grandville.—Outer petals silvery-white, centre salmon, edged with pink—A free erect flowering sort.

Madame E. Gallé.—One of the largest flowered varieties—a free bloomer; colour pale salmon, with orange centre.

Madame Comtesse.—A dwarf compact growing variety, with salmon-shaded rose flowers.

M. Truffaut.—A large variety, with flowers that are a combination of salmon, suffused with red and orange.

John Do..—A distinct looking variety that produces its well shaped flowers freely; the colour is not easy to describe, but may be set down as a bright shade of salmon, suffused with pale blush.

Madame Arnault.—One of the best sorts, with finely shaped flowers—habit dwarf, a free bloomer; colour blush pink, deepest at the outer edge of the petals.

Gabrielle Legros.—A large-sized variety, with imbricated flowers, which are produced freely; colour creamy-white, changing to pale yellow.

Quantities of tuberous-rooted Begonias are planted out in the open ground, some in beds consisting of a single variety, and others mixed; this is done with a view to prove the best kinds for bedding to meet the different requirements of those who want beds of a colour, and of those who prefer mixtures of such sorts as are best suited for outdoor cultivation, and which it may be well to state are those that bear comparatively small flowers. Amongst the sorts for a bed of one colour are:—

Alba floribunda.—The best white, very free, and a compact grower, doing well in the open air.

Worhiana.—Pale red, a dwarf compact grower, that flowers profusely from the beginning to the end of the season.

Louis Bouchet.—A small flowered, double red variety, about 10 inches high. A bed of this sort, from cuttings struck this year, was a complete mass of bloom.

Yellow Bedder.—A pure yellow, with a profuse flowering disposition. This plant has the peculiar habit of keeping or throwing up blooming growth from the bottom to an extent that all but covers the leaves with flowers.

Mr. Cannell is now trying what can be done in the way of crossing B. Martiana grandiflora with some others of the family. This is a comparatively little known plant, and is one of the most distinct and pretty of all the kinds known to cultivators. It has a branching, erect habit, and in the character of its growth is nearer that of B. fuchsoides than any other with which I am acquainted.

DAHLIAS.—Amongst other things well managed at Swanley are Dahlias, of which about 2 acres are grown. Soil and situation, combined with the treatment they get, appear to just suit them; the plants are unusually dwarf in growth, yet very strong, being kept well thinned out. When I saw them just after they had felt the effects of the recent rains they were bearing quantities of large finely-formed flowers. A large batch of seedlings of the Juarez type was just beginning to open their flowers. Of single varieties all the kinds worth cultivating are grown.

CHRYSANTHEMUMS are now receiving an extra amount of attention, several large span-roofed houses are being built to accommodate them when in bloom. Three thousand are grown in large pots, and a much greater number in small ones, so as to be in a condition to send away as required all on through the summer and autumn, during which season quantities are despatched to America, Australia, and New Zealand. When sent to places at long distances, the tops are reduced to about half their length, and the leaves removed, leaving a good length of bare stem, in which state they are found to bear the journey without suffering much. Tuberous Begonias and Chrysanthemums are the plants most in demand now in America and the distant colonies. T. B.

PROFESSOR ASA GRAY, of Cambridge, Mass., U.S., has lately been reminded by a congratulatory letter from the oldest natural history society of Germany—the Imperial Academia Leopoldino-Carolina Nature Curiosorum—that he was elected a member of it fifty years ago.

Orchid Notes and gleanings.

STENOGLOTTIS FIMBRIATA.

IN spite of the smallness of the flowers of some Orchids the whole aspect of the plant, together with the inflorescence, often carries an indisputable and convincing charm with it that captivates the beholder, whether an Orchid lover or otherwise. The plant under notice is the only known species of its kind, it is terrestrial in habit, and hails from South Africa, where so many species of like character abound. It is, moreover, a comparatively recent introduction, and whether it becomes popular and gets disseminated or not, its merits entitle it to such distinction. The leaves are lanceolate or oblong, collected in a radical rosette, spreading on the ground, deep glaucous green, and heavily spotted with black or purplish-black blotches. The delicately coloured rose-pink flowers are arranged in a somewhat secund manner on a leafless bracted stem. The labellum is spotted with purple, and deeply divided into three narrow segments, and is apparently the only thing suggesting the specific name. There is a figure of the plant in the *Botanical Magazine*, t. 5872, and a flowering specimen in the Orchid-house at Kew at the present time.

ZYGOPETALUM WENDLANDI.

The species of the section to which this belongs are generally seen in gardens under the name of Warszewiczella. The scape is short, ascending, and 1-flowered. The flower is of medium size, and like the most of its congeners of the same group, presents a rare and delicate beauty that readily captivates the fancy of the beholder. The sepals and petals are white, and so is the greater part of the labellum which is erect and turned up at the edges in a semi-tubular fashion. There is a violet blotch in the throat and three longitudinal darker lines along the middle, while a delicate reddish-purple band surrounds the margin, ultimately fading to pink. The plant is abundantly furnished with leathery, shining, deep green leaves, even in the flowering season, and the long lasting properties of the flowers are amply demonstrated by a plant in the cool division of the Orchid-house at Kew, where it has been flowering since the first week in August at least. J. F.

EPIDENDRUM PRISMATOCARPUM.

This species, when well grown, is distinct and beautiful. The plant alluded to by Mr. Crawshaw I saw exhibited at the flower show at Sevenoaks, where it was awarded a 1st prize. It was a very good variety, but not the best form. The best variety I have ever seen was the one exhibited by Mr. Philbrick, Q.C., at the Regent's Park exhibition in June, 1883. The common forms are not very striking, and do not produce more than eighteen or twenty flowers on a spike. Mr. Williams in the *Orchid Growers' Manual*, says it produces about fourteen flowers on a spike. The species is easily grown, and as it flowers in July, and remains in bloom a month, it should be grown in every collection. A small plant will grow into a good specimen in a few years. It should be grown in the Cattleya-house, in pots, and in the usual Cattleya compost. When making their growth, water freely, and when at rest give just enough water to keep the bulbs from shrivelling.

E. VITELLINUM MAJUS.

This has now become so cheap that anybody may obtain it, and it is also one of the plants that can easily be grown. It is presumably a cool-house species, but my experience with it does not suggest the cool house as the best for it, although it will grow there. I find the leaves become spotted after a time owing to the cool moist atmosphere in autumn when the growths are being matured. It has to be potted in peat and sphagnum the same as Cattleyas, but must by no means be over-potted. The best varieties produce large branched spikes and most brilliant coloured flowers. As usually seen at exhibitions, a dozen or more plants of small size and most humble spikes are crammed, or rather wedged closely together into a good sized pot, which gives one no idea of what the plant is when well grown.

E. VITELLINUM

successes it in our Cattleya-house. This is now in flower, and although they are similar in form and

colour, the character of the two plants is very different. The majus form, makes its growths and sheaths in the summer, while those of the previous year are developing their flower-spikes. This normal form is very different, it also makes its growth in the summer, and the flower-spikes are produced from these growths at once—indeed, the flower-spikes come with the growths. In E majus the growths remain dormant a year before the spikes are developed. We have it now very beautifully in bloom. The spikes are 20 inches long, and have twenty-two flowers on each.

E. NEMORALE MAJUS

is another species of great merit, producing its long handsome spikes of flowers in July. There is no more elegant species in the genus than this. The finest plant I ever saw of it was exhibited in a group of Orchids from the collection of Sir T. Lawrence, Bart., at the Botanic Gardens, Regent's Park, when the late Mr. Joseph Spyers had charge of it. It was furnished with just about a dozen spikes of its beautiful rose-lilac flowers. The spikes were about 4 feet in length. It is seldom in flower before July, but in that month it is one of the very best exhibition plants; it is so easily carried to the exhibition, and when there it is not easily matched. I grow it in the Cattleya-house, and it requires exactly the same treatment as the others I have named.

E. BICORNUTUM.

Were I to select another species of Epidendrum to add to the above it would be this delicately beautiful species. It produces a dozen flowers on a spike, pure white, with the exception of a slight spotting on the centre of the lip. This species is rather difficult to manage, although one would not think so from the sturdy appearance of the plant. It will flower once or twice, but after that begin to lose its vigour, Mr. Williams states in the *Orchid Manual* that it succeeds well on a block of wood without moss of any kind, and had so flowered six or seven years in succession. It ought to be grown in the warmest house, and will succeed for a few years potted in peat and sphagnum.

RENANTHERA COCCINEA.

Mr. T. Banks does not say how his plant of R. coccinea was potted. It seems to succeed best when the plant is encouraged to cling to a Birch tree with the bark on. The well-known specimen in the conservatory at Chatsworth, when I saw it some years ago, was trained to a Birch stem as thick as a man's leg, and about 15 feet high or more. There is now a handsome example in the Cattleya-house in Messrs. Veitch's nursery at Chelsea, with three flower-spikes. A stout Birch stem, about 6 feet long, has been inserted in a large pot filled with broken potsherds. The roots of the Renanthera are amongst the drainage, and the plant is clasping firmly the Birch tree, and enjoying its position. Those in the possession of newly-imported plants would do well to take a lesson from the Chatsworth plant, and the one I have alluded to in Messrs. Veitch's nursery. In the large Cattleya-house in this nursery, *Lelia elegans alba* is beautifully in flower, and a charming variety of the species it is. The shy-flowering *Cattleya speciosissima* is also in flower; so also is *C. Gaskelliana*, proving itself to be one of the most persistent of the genus, as different specimens have been in flower here for nearly three months. *C. Eldorado* is also very beautiful at this season, and so distinct, by its orange throat, and the perfume of the garden varieties of *Narcissus tazetta*, which it emits most powerfully in the morning. J. Douglas.

Florists' Flowers.

THE AURICULA.

I HAVE not alluded to any of the hardy florists flowers since the end of July, but the time has now come in which it will be necessary to prepare the whole of them for the winter. The Auriculas are now in the height of their autumn growth, and are almost as vigorous as they were in April. In a moderate sized collection not all of the plants will be growing vigorously; some few choice specimens, mostly old kinds, such as Complete, Colonel Taylor, Fremdon, Miss Arkley, &c., may have a languid inactive growth about them, which may make their owner uneasy. Probably the plants are suffering from decay of the main stem; the disease or decay

attacks the stem underground either at the side of the stem or at the end of it. In either case the only way to save the life of the plants is to shake them carefully out of the soil, and with a sharp knife cut away all decay from it. Such plants will not make vigorous flowering specimens next season, but they will in time give out offsets, which may grow with great vigour if the old plant does not. Plants potted now must be very carefully watered. Do not give any for a week at least. Remove all flower trusses as soon as they can be pinched out with the finger and thumb. It is quite necessary that the plants should be cleared from greenfly; the pest will now be found in the centre of the plant, or clustering round the offsets under the outer leaves. If there is any of the mealy or woolly aphid clustering round the neck of the plants it ought to be destroyed by brushing it out with a stiff brush. A lamp is necessary at night to look around the frames for caterpillars, maggots, and slugs. If all these troublesome pests are destroyed now, it may save many a tiresome search when the weather is rough. The small offsets that have till now been kept in a shady place, may be removed to an open one.

CARNATIONS AND PICOTEES.

The last week in September, or the first in October, is the best time to take off the layers from the parent plants and to re-pot them. I have tried potting soil with and without manure, but I fancy they do much better with a barrowload of good decayed stable-manure mixed with it, and as much leaf-mould and sand. Carefully remove the layers, and pot one in a small 6 pot or two in a large one. Pot the plants rather firmly, place them in a cold frame afterwards, and do not give any water for twenty-four hours after they are potted. Now is the best time to order plants, either to form a collection, or to add to one. They can be sent home at this season packed in paper with little damp moss about the roots: fifty pairs of plants can easily be packed in a box of moderate size. The plants should be potted as soon as they are received: they will not do better anywhere at this season than they will in a cold frame. As soon as the plants are fairly established, which will be in a week or ten days, air must be freely admitted—the lights to be removed altogether in fine weather. The plants will be well established before severe weather sets in; if they are not established early in the winter, they will not flower very strongly the following season. Those who neglect to purchase their plants at this time will require to have them sent home after November in the small pots in which they are established. This makes the carriage and packing more expensive. If there are insects on the plants they must be destroyed by dipping them in soft-soapy water.

Tree or perpetual flowering Carnations that may up to this time have been left out-of-doors should now be taken into the greenhouse in order to develop their flowers more perfectly than they would out-of-doors. The plants intended to flower after Christmas and onwards during the spring months must now be repotted. Our plants are in 5-inch pots; from these they may be potted into 7 or 8-inch. We have besides some large plants that have been in a corner of the greenhouse for more than twelve months, and almost any day flowers may be cut from them. The plants have not been potted since last year; but they may be seen to now with the others, and as they are forming fresh growths they will flower during the ensuing winter. Like the summer-flowering varieties they suffer from the attacks of greenfly, but in both cases a fumigating with tobacco-smoke will destroy them, or dipping as advised above. *J. Douglas.*

Plants and their Culture.

STOVE CLIMBERS.

SUCH of these as may have ceased to yield many flowers should be thinned out where their growth has been luxuriant (we are here alluding more particularly to those that are trained up rafters and wires), the wood will thereby have a better chance of becoming well ripened, and the plants that are grown beneath them will have the advantage of as great an amount of light as the season affords. Any Stephanotis, for instance, that has been flowering and growing freely

during the early spring and summer months, will have an amount of growth which can be advantageously removed; if done now it will tend to strengthen the early flower trusses which are obtained from the wood of the previous year's growth, but not from that of the current season. Where an early growth has been made these trusses will already be in a forward stage, and a plant in this stage ought to be kept drier at the root during the next three months, when by reversing the treatment and giving a slightly increased temperature an early crop of bloom may be obtained. The shoots of Allamandas that have not by this time set for bloom may also be thinned out. Dipladenia boliviensis will continue to flower for a considerable time yet, but it must have as much room as can be afforded it on the roof, and at the same time it will be overruled by other climbers; Ipomoea Horsfallii is well worthy of every attention, it should be trained rather more thinly than other climbers because of its dense habit of growth. Its brilliant flowers will tend to lighten up the stove during the dull season.

All the climbers should have a thorough overhauling and cleansing of any insect pests prior to the stove being rearranged for the winter. Insects are bad enough anywhere, but when allowed free course on the suspended climbers in such a way that their excreta is permitted to fall on the plants beneath them, this nuisance becomes even greater. Climbers in pots and on trellises, when they cease to produce bloom should also be brought into closer compass. If they can be accorded a warm, dry pit, in lieu of the stove proper, so much the better for the appearance of the latter, for when water is withheld and yellow leaves in quantity appear, the look of the house is not improved thereby. The first opportunity should be embraced of having the glass (both interior and exterior) well cleaned, and the painted woodwork washed, so that everything may be sweet and clean before the plants are stored in their winter quarters. *J. Hudson, Gunnersbury House, Acton, W.*

FRUITS UNDER GLASS.

VINES AND BORDERS.

THE making of Vine borders and the removal of existing ones are matters of importance in connection with the cultivation of Grapes under glass which at all times should receive particular attention when found necessary. In the formation of a border for Vines, in the first place, it is usually necessary to concrete the bottom of the border in order to prevent the roots going downwards. This material should be at the least 3 or 4 inches thick, and extend to a breadth of from 12 to 15 feet in front of the house; drains should be formed on its surface with ordinary 3-inch pipes, in order to carry off the excess of water that will at times accumulate. The concrete should then be covered as far as the border will be then made, with 15 inches of rubble, and on this a layer of closely fitted fresh turf sods with the grassy side placed downwards should be arranged. The composition of the soil for the border will vary according to the nature of the ingredients of which it is composed, in any case a good compost can be formed with about two-thirds of the top spit from a rich pasture with a fair proportion of bones or bone-dust, brick rubble, burnt earth, road scrapings, and animal manure added.

These things should be prepared beforehand and be well incorporated together by turning over the heap several times after which it should be put into a heap, and protected from the rain. Of late years, the making of a Vine-border is not considered to be such an undertaking as it was formerly, when we were instructed to consider the work we had completed, was to last fifteen or twenty years. Scarcely any one now-a-days contemplates such a thing; but, notwithstanding, there are Vines occasionally to be met with which have existed for that length of time, but the roots of these are not solely to be found within the limit of the border that was originally made for them; and the fact of their flourishing year after year, and producing full crops of fine Grapes, goes to prove that the roots have extended into the surrounding soil, and in which they find those elements of nourishment which are indispensable to their well-being.

Such Vines should be encouraged by good manure, manure being placed above where the roots are known to exist, and by any other means possible,

and in no case should the roots be interfered with so long as the Vine continues in vigorous health. In the case of our Vines, as soon as any indication of want of vigour, showing itself in lack of finish, is observable, I go to the roots as being the true source of the evil, and I find by partially lifting them a means of again increasing their activity, and restoring vitality, and therefore recommend the practice, and likewise that of restricting them to a limited and not over-large area of border, 12 or 15 feet being ample as to width. Now is the time to give attention in this way to ill-conditioned Vines, or those in an unsatisfactory state, by opening a trench at the front of the border and carefully taking away the old soil from the roots, and after rectifying any defects in the drainage, proceed, as in the case of a new border, with the sod at the bottom, and after examining and cutting back some of the roots, bring the rest up to within a foot of the surface of the new material, water them and press them in firmly by hand, fill up the border, and protect it by-and-by with a covering of manure about 9 inches thick. When this is done the future results can be looked forward to with confidence. *G. T. Miles, Wycombe Abbey.*

The Hardy Fruit Garden.

PREPARATIONS FOR PLANTING.

WALLS in kitchen gardens should be inspected, and every available space should be marked out and prepared for planting next month. Young trees can be bought cheaply, and may be trained in any form thought desirable, and they get acclimated to the position much better than when purchased from the nursery in a larger state. In planting trees, to be ready for removing to more permanent quarters when wanted, it is a good plan to plant on a prepared surface, which may be done as follows:—Take out the ground, say 18 inches deep, and fill up the bottom with 4 or 5 inches of any rubble at hand, such as small stones, bricks, or cinder ashes; have this beaten down firm, and on the top place four or five common slates; these will keep the roots from going down. Then add about 15 inches of soil, which should be prepared beforehand, and should consist of road-scrappings, turf loam, and burnt ashes. When planting, spread the roots evenly over the surface of the soil and cover them lightly, but firmly. When all is finished, place a good dressing of rotten manure on the surface. Trees planted in this manner early in the autumn seldom require any water during the following summer, and as a rule do well. The fresh soil and firm planting encourage fibrous roots, which can be easily lifted when the trees are required to fill up more permanent spaces on the walls. Last December we removed a large number of trees which had been thus prepared two and three years ago, and have not lost one, and many of them have borne a good crop of fruit this season; they consisted of Peaches, Apricots, Nectarines, Plums, and Cherries. Every means should be adopted to get the wood on wall trees thoroughly ripened; all useless growth should at once be removed, and any shoots required to fill up spaces should be nailed to the walls.

SMALL FRUITS.

Strawberry beds should have all runners cut off, and newly formed beds should now have a heavy dressing of rotten manure placed on the surface of the beds, to remain all the winter.

Raspberry canes should be thinned out, and all the old wood be removed, to allow of the thorough exposure of the future bearing canes to sun and air.

THE GATHERING AND STORING OF FRUIT

will still require much care and attention. The riper the fruit is before being gathered, the better the quality will be, and as a rule it will keep longer than when gathered in a half ripened state. I have often been asked the reason why Apples and Pears were keeping so badly, when the only reason was that they had been gathered in an unripe state. I know that many are tempted to gather Apples and Pears when unripe for fear of a high wind blowing them to the ground and rendering the best and finest fruits useless. Where there is any danger of this the trees might be gone over, so as to remove the very ripest and largest only. *J. Smith, Mentmore, Bucks.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Sept. 28	1	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
	2	Sale of Dutch Bulbs, at Stevens' Rooms.
	3	Clearance Sale of Plants, Live and Dead Stock, at the New Lodge, Nurseries, Whitstone, by Frotheroe & Morris.
TUESDAY, Sept. 29	1	Sale of Dutch Bulbs, at Stevens' Rooms.
	2	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
WEDNESDAY, Sept. 30	1	Sale of Imported Orchids, at Frotheroe & Morris' Rooms.
THURSDAY, Oct. 1	1	Sale of Dutch Bulbs, at Stevens' Rooms.
FRIDAY, Oct. 2	1	Sale of Dutch Bulbs, at Stevens' Rooms.
1	2	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
SATURDAY, Oct. 3	1	Sale of Dutch Bulbs, at Stevens' Rooms.

THE exact period of time that it would take to convert a Foxglove into a Campanula may be left to Mr. GRANT-ALLEN to determine. Far be it from us to deny the abstract possibility of the occurrence. Nature is so plastic, and so slight a shake of the kaleidoscope would be necessary, relatively speaking, that it would be very unscientific to deny the possibility. The very earliest, the first embryonic stages, are alike in the Campanula and in the Digitalis. Growth goes on on the same lines for a time, and then comes a change—one goes one way, another, the divergence becoming wider and wider as the time goes on, till at length in the fully formed flowers there are differences so great that no one who had not the imagination of a poet with a sublime disregard of facts, or of a very advanced revelationist more fond of speculation than of research, would dream of assuming a common origin, or point of departure for organisms so widely different.

But imagination, to be of any value, must have a rocky, substantial foundation of material fact, otherwise it degenerates into superstition or idle speculation, both of which are inimical to science and progress. For instance, if any one looking at the figure (fig. 86, p. 397), obligingly drawn for us by "E. V. B.," should imagine that a Foxglove had suddenly been converted into a Campanula, the imagination would be at fault, because, however close the superficial resemblance might be, the slightest examination of the details would suffice to show the fallacy. Even in the sketch, where detail was not studied, there is no indication of the inferior ovary which all Campanulas have, and we doubt not the interior arrangements of the flower (which we had no opportunity of seeing) were widely different from those of a Campanula.

But it may be said, this is a "sport," or more technically a reversion to the form of that ancestral progenitor from which both Campanulas and Foxgloves have descended. We respectfully submit that it is nothing of the kind. It has no more of the Campanula lineage in it than has Dig Ben of Westminster; it is hardly more closely related to a Campanula (except in the fact that both Foxglove and Campanula are plants) than the finger of a glove or a thumb is allied to a Digitalis. This is mere assertion, it may be said. Well, we cannot put the specimen itself into the hands of the reader; we cannot give him or her dissecting needle and magnifying glass, and so we cannot help being didactic and dogmatic, and asserting roundly, but without fear of contradiction, that this Foxglove has none but a purely superficial resemblance to a Campanula. Failing the means of proving our assertion, we are obliged to fall back on former experience. Many and many a similar flower we have seen, and cut up, but they all proved Foxgloves, and not Campanulas. In fact, the state of things represented in fig. 86 is, in all but one particular, not uncommon in Foxgloves—that one particular is the pendulous direction of the flowers. An ordinary Foxglove does hang down, the upper side of the flower-tube is shorter than the lower, giving the flowers the appearance of having been sliced away; and the disposition of the stamens and the arrangement of the spots

on the flower all have reference to the visits of insects and the mechanism they set in action to ensure the production of seed. The malformed cup-shaped flowers which are so common are usually erect and more or less reniform and regular in their construction. The present flower, regular in outline, or nearly so, hangs down, and thus increases the resemblance to the Campanula. Generally speaking, the erect, cup-shaped flower of the Foxglove results from the blending, at a very early stage of development, of several flowers into one. The presence apparently of seven lobes to the corolla in the figure may be an indication of a similar composite origin, but on the whole we believe the Foxglove in question to be really what it appears to be—a "regular" Foxglove, comparable to the regular Gloxinias, now so common, but which, unlike this Foxglove, have erect flowers.

An ordinary Foxglove is, of course, irregular, some of its component parts grow faster than others, or, what comes to the same thing, some stop growing while others pursue their course. The result is an oblique or irregular form of flower. Now let us suppose that the corolla lobes, instead of having grown thus irregularly, grew equally, none taking the precedence of another, but all growing uniformly: in such case we should have such a flower as that represented. This Campanula-like Foxglove, then, is merely a Foxglove in which, from what cause we know not, uniformity of growth has prevailed. It is, in the language of botany, a case of "peloria." Now peloria is of two main forms. In the one a habitually irregular flower like a Linaria becomes regular by the increase of its irregular portions. Instead of one spur it has five—that is irregular peloria. But suppose no spurs at all are formed, then, we should have an habitually irregular flower becoming regular by the non-development of its irregular elements. For us this constitutes regular peloria, and the Foxglove before us, so far as we can judge from the figures only, enters into this category. It is a Foxglove in which elements, habitually irregular, have developed uniformly and evenly. We submit that this is a much simpler and intrinsically probable explanation than that according to which this is a Foxglove on the way to becoming a Campanula, or a Foxglove suddenly manifesting the characteristics of a supposititious Campanula ancestor.

It is a very curious psychological fact, that persons with only a very slight or with no acquaintance with scientific facts and theories, frame the most astounding hypotheses, and seem deliberately to prefer and to adopt not what is the most probable and the simplest, but what is the least probable and the most complex explanation. The scientific imagination of a NEWTON, a GALILEO, a FARRADAY, a DARWIN, simplifies everything it deals with—crystallises the most obscure and complex phenomena into the clearest and most fecund of theories.

Of so opposite a character are the results of the mental processes of those who do not know how to use their imagination, that we could fain wish that nobody but a born poet or a born man of science might henceforth be permitted to indulge in speculation!

—DR. H. W. REICHARDT, Professor at the High School, Vienna, and Director of the Royal Herbarium, died recently quite suddenly, at Mödling, near Vienna.

—MR. CHAMBERLAIN IN SCOTLAND.—As is pretty generally known amongst his friends, MR. CHAMBERLAIN is an ardent lover of Orchids, and at Highbury, near Birmingham, possesses a fine collection of these flowers. During his recent visit to the North it was therefore but natural that he should be

the guest of another well-known Orchid amateur, DR. PATERSON, of Bridge of Allan, whose collection is of world-wide fame. The right hon. gentleman passed one night at Fernfield, the Doctor's residence.

—CYCLAMEN BLOOM DOUBLED.—From MR. THOMAS WARE has come a curious instance of doubling, there being two distinct ovaries, which were united at their base. The doubling in the petals was not quite complete.

—SCIRPUS HOLOSCHENUS VAR. ZEBRINUS.—We do not call to mind having seen this elsewhere than in the Jardin des Plantes at Paris. It is a compact tufted plant, with slender stems as thick as a crow-quill, alternately banded in a transverse direction with white and green, after the fashion of *Eulalia zebra* among grasses, and of *Scirpus Tabernaemontani* var. *zebrina* (*Juncus zebra* of gardeners) amongst Scirpi. For general gardening purposes it is far superior to the last named plant, as it will thrive in a dry border, where that would not exist. The green-leaved type only exists in a wild state in the British Islands on the sandy sea-coasts of North Devon and in the Channel Islands.

—"CAT" PLANTS.—Most of our readers—at any rate those who reside in villa gardens near large towns—know to their sorrow what an extraordinary attraction a fine bed of, say, *Nemophila insignis* is to the harmless (?) necessary cat. A considerable number of plants possess similar properties; among them are *Actinidia Kolumikita* (a Japanese climber, which frequently requires protection in many places until large enough to withstand the assaults of these creatures), and *Teucrium marum*, an interesting European herb, which we lately saw growing in the Brussels Botanic Garden beneath a stoutly-made iron cage-like trellis. On enquiry we found that, in order to keep this species alive, it was necessary to keep the cats at bay; when the plant is grown without some such protection it soon succumbs to their attacks.

—FOSTER'S SEEDLING AND TOKAY GRAPES AT SOUTH KENSINGTON FRUIT SHOW.—The statement made by our reporter in regard to these Grapes at p. 341 is perfectly correct. They were disqualified, not being Foster's Seedling. The judges at the Exhibition on the 8th inst. were subsequently permitted to award them an extra 1st prize on account of their very handsome appearance; but that did not remove the disqualification—so that a complaining correspondent's "facts" are not quite correct. No disinterested person who had the opportunity of examining them and tasting them in comparison with Foster's Seedling and the White Tokay could fail to trace the resemblance to the latter. Our correspondent when he states that the "white veins running longitudinally under the skin" are noticeable peculiarities of Foster's Seedling, "but never in White Tokay," simply makes a mistake, the reverse of it being actually the case, White Tokay being much veined, and Foster's not so. MR. ALLAN's examples were much veined, so were the White Tokays exhibited, and so likewise are the examples of White Tokay sent to us by MR. WALLIS, of Keele Hall, which are truly named, and identical with those exhibited last week. We have examined the leaves sent to us by our correspondent and by MR. WALLIS, and can trace but little distinction, excepting that MR. WALLIS' are much larger. The leaves of Foster's Seedling are similarly lobed and serrated.

—BULB CATALOGUE OF MESSRS. SUTTON & SONS, READING.—In this year's bulb list of the above-named firm are some deviations from the general practice of the trade introduced, in giving useful concise cultural directions for the cultivation of Hyacinths and other Dutch bulbs, and on Begonias, Lilies, Cyclamen, Gladioli, Anemones, Ranunculus. Illustrations of Hyacinths arranged in a bed, and of Narcissi are given, neither of which are particularly noticeable for grace of arrangement, and might have been better.

—AUTUMN FLOWERS.—MR. T. WARE sends us some handsome examples in *Lilium Kraitzii*, a pure white flower, with chocolate-coloured stamens, the flowering habit being semi-pendulous; *L. speciosum album vernum* is also white, the reverse of the petals being tinged with green at the base, and the stamens

FIG. 87.—PALACIO MONTSERRAT. (SEE P. 390.)

are yellow; *L. speciosum rubrum* Melpomene is a distinct variety, with bright purplish-rose coloured petals, narrowly margined with white. *Leucocjum autumnale*, with white bells hanging by pink peduncles, is a pretty thing for the rocky or for pots; *L. roseum longifolium* is still more delicate in habit, the total height from the bulb not exceeding 4 inches; the colour is pale rose. *Colchicum arenarium*, *C. parvulum*, and *C. montanum*, otherwise *Merendera hallowoodium*, are exceedingly pretty varieties of the Meadow Safran, of differing degrees of height and colour.

— **HOP SHOOTS.**—The following communication from E. BELKROEFT, which is worthy of special notice, has been kindly forwarded to us by Messrs. HOOPER & Co. of Covent Garden:—

"The Hop harvest does not seem to be a good one, and therefore the time seems to me appropriate to call the attention of English farmers to the extra profit which they can obtain from Hop shoots in the spring. This dainty vegetable fetches a long price in Belgium, and there is no reason why it should not here. If properly cooked, the English palate would not be long in appreciating its exquisite flavour, and the faculty would soon recommend it to patients of delicate digestion. It is more pleasant by far than Hop Tea, however tonic the latter may be. At present these Hop shoots are thrown away in Kent, &c. Next month and November is the time to earth-up the plant, and in March and April the blanched shoots are cut and sent to market. English Hop farmers might either import Belgian labourers, or pay a visit to the Hop districts of Belgium, and gather information on the spot. I hold myself at their disposal, and shall be glad if I can contribute to the cultivation of this new vegetable.

— **BELGIAN HORTICULTURAL SOCIETY.**—At the monthly meeting of the above, held at Ghent on September 14, the following awards were made:—Certificates of Merit: M. A. van Geert, for *Cyrtopodium sp. nova*; M. Ed. Pynaert van Geert, for *Tradescantia alita vittata*; MM. Desbois & Co., for *Drosera australis* fol. var.; M. Jules Heye-Leyssen, for *Cyrtopodium Petri*, *C. tonsans*, *C. ananthum superbum*, *C. alio purpureum*, *C. tessellatum purpureum*, *C. selligerum majus*; MM. Vervae & Co., for *Oloontoglossum fachtium*; MM. Dervae, Brothers, Wetteren, for *Rhms cotinus pendula*; MM. Desbois & Co., for *Pavonia intermedia* and for *Abutilon chrysostephannus*; M. A. van Geert, for *Gymnocheila Radiana crenata*, and for *Piper ornatum* and *Arenca Kisarinei*; M. L. van Houitte, for double-flowered tuberosus *Higonias*.

— **PALMS FOR INDOOR DECORATION.**—In the South of France a very large business is now done with Palms cultivated in the open air. Amongst those of which the greatest number is grown is *Phoenix tenuis*, which under such treatment forms beautiful sturdy stuff. The plants are lifted, the soil shaken from the roots, packed in bundles, and sent to Paris, where they are at once very firmly potted in comparatively small pots; these are then plunged in a hotbed inside a house which is kept shaded and moist, the plants being frequently syringed and carefully attended to for water. In a few weeks new roots are formed, air and light are more freely admitted, and the whole are gradually hardened off. Scarcely a leaf suffers, and by such treatment infinitely better plants are obtained at a much cheaper rate than if grown on in pots from the seed. *Raphis*, *Livistonia*, and many other greenhouse Palms are treated in the same way.

— **SWEET TEA OF SICHUAN.**—In a report of a journey through Central Ssu-chuan in June and July last Mr. ALEXANDER HOSIE mentions the discovery by Mr. BARBER of a peculiar kind of Tea, the following words:—"In my memory is not at fault he [Mr. BARBER] was regaled by a priest on Mount O mei with Tea possessing both the flavour of milk and sugar. It may have been in the very temple on the mountain-side in which I am now writing that Mr. BARBER was agreeably surprised. At any rate, I am sipping an infusion which is, without doubt, sweet, and which is declared by the priest to be brewed from a naturally prepared Tea leaf. It is a large dark brown leaf, and is very sweet when chewed. The people at the bottom of the mountain, whom I first questioned regarding this Tea, asserted that the leaves were sweet because they were first steeped in molasses; but the balance of

evidence, as I have since found from extensive inquiry, is against any such artificial preparation. The tree is said to grow in only one gorge in the mountain, whence the leaves are brought for sale." We are indebted to Mr. HOSIE for a sample of this Tea, which consists of the entire leaf rolled up loosely into little balls, and almost black in colour. Upon chewing a portion of a leaf it is found to be decidedly sweet, with a strong suspicion of liquorice rather than molasses, as stated by Mr. HOSIE. Upon soaking the leaves and flattening them out they were found to be those of *Viburnum dilatatum*, Thunberg. To prove that the leaves of this plant possessed no natural sweetness we obtained a few leaves from a growing plant and dried them, and found that neither in their fresh, and still less in their dried state, have they any marked flavour. Moreover, the leaves of the Mount O-mei Tea are transparent, as if they had been steeped in some solution, while those which I gathered and dried are opaque, and yet retain their green colour. It seems certain, then, that this singular Tea owes its sweetness to some foreign substance, as stated by "the people at the bottom of the mountain," and that substance may be molasses, but is, in all probability, liquorice.

— **SOLANUM TRILOBATUM.**—In the vast genus *Solanum* we should naturally expect to find a great amount of variation, and so we do—a fact that becomes more palpably evident every day as we note the various purposes to which the different species are put. This can be illustrated in a small way by comparing together such species as *S. tuberosum*, *S. jasminoides*, and *S. macrophyllum*. The species under notice was originally introduced as early as 1759, and has slender prickly stems, attaining a length of 10 to 14 feet. They lack the slender gracefulness of *S. jasminoides*, and, moreover, can hardly be said to climb in the proper sense, but in a state of Nature must scramble up amongst other vegetation by the aid of their strong hooked prickles. The leaves are three to five lobed, with prickly petioles, and the large flowers, produced in terminal racemes, are deep violet, fading with age, and furnished with prominent yellow anthers. A figure of the species was given in *DURMANN'S Flora Malabarica*, 57, l. 22, f. 2, and a recently introduced plant is flowering in the Water-Lily house at Kew.

— **MEDINILLA ERYTHROPHYLLA.**—While by no means new, the merits of this species deserve to obtain for it a more extended distribution than it at present enjoys in gardens. It is an East Indian species, with fair sized rose-purple flowers produced in closely arranged racemes on the old wood, and less seldom in the axils of the old leaves. This confirmed and constant habit allows the plant to be closely pruned each year without risk of sacrificing the bloom, a means by which also the plant can be kept bushy and within reasonable limits. For the decoration of the stove it is far superior to many others grown. The leaves medium-sized, oblong-elliptic, and three-nerved, the middle one of which is red. Like other species of *Medinilla*, and indeed most members of the same family, the petals are liable to drop early, an evil that is in some measure compensated by the successional development of fresh flowers. A compact and convenient sized specimen has been flowering for some time in the Palm-house at Kew. A figure of it may be referred to in *Faxton's Magazine*, ix., 79, ic.

— **THE ESSEX FIELD CLUB** will hold its sixth annual cryptogamic and botanical meeting in Epping Forest on Friday and Saturday, October 2 and 3. On the Saturday afternoon and evening there will be an exhibition of fungi and other plants, fresh and preserved, with micro-objects, &c., and papers will be read by Dr. Wharton and Mr. Worthington Smith. The following botanists, among many others, are expected to be present, and will act as "referees" in various departments of plant lore:—Professor Boulger, Dr. Braithwaite, Dr. M. C. Cooke, Rev. J. M. Crombie, Rev. Canon Du Port, Messrs. J. L. English, Henry Groves, F. J. Hanbury, E. M. Holmes, David Houston, A. V. Jennings, Arthur Lester, F. Coley, W. W. Reeves, Worthington G. Smith, C. A. Wright, Dr. Spurrell, Dr. H. T. Wharton, &c. Those wishing to attend should communicate with the Hon. Secretary, Mr. W. Cole, Buckhurst Hill, Essex, who will forward programmes giving full particulars.

— **GARDENING APPOINTMENT.**—H. HAWKES, for over three years Gardener to the Royal Bath Hotel, Bournemouth, as Head Gardener to R. LE DOUN, Esq., East Moulsey.

TERRESTRIAL ORCHIDS OF SOUTH AFRICA.

(Continued from p. 332.)

By an oversight the following fine species was omitted in its proper place under the genus *Dian.*

D. affinis, N. E. Brown (*Monalelia rufescens*, Lindl.).—Leaves broadly lanceolate to elliptic, passing into stem-sheaths. Flower-spike 3–6 inches long, many flowered, flowers $\frac{1}{2}$ inch in diameter, "sulphur-yellow." Dorsal sepal oblong obtuse, concave, with a slender spur 8–9 lines long, hanging down behind or beside the ovary; lateral sepals oblong obtuse; petals abruptly elbowed in the middle, the part above the elbow oblong emarginate; labellum elliptic-oblong. This plant was mistaken by Lindley for *D. rufescens*, Sw. It grows in stony places and clefts of rocks on Table Mountain and elsewhere at 1400–2500 feet elevation, and flowers in October and November.

NOTES ON CULTIVATION.

Having now given brief characters of the chief of those species which appear to me worth cultivating (although by no means all of them, as there are many others and several of them undescribed that are quite as handsome as some of those I have enumerated), I will proceed to give what information I possess that I think may in any way assist the cultivator in the management of them.

It may be said with perfect truth that South Africa is one of the most remarkable regions in the world, containing the largest of birds, several of the largest among animals, and a flora that is perhaps more varied, and more rich in species, area for area, than any other region, and yet without the vegetation making so prominent a feature in the scenery as it does in some countries with a far poorer flora! The climate, too, with which we are chiefly concerned, varies very much in different parts in temperature and rainfall, hence the necessity for the gardener to know something about the climate of the place from which the plant he fails to succeed with comes, and the conditions in which it grows naturally. This should always be his aim where he fails to cultivate a plant he is really anxious to succeed with, for there can be little doubt that the great cause of failure in most instances is the result of ignorance on the part of the cultivator of the natural conditions under which the plant grows. I have heard gardeners boast that they can grow plants better than they exist in Nature, and this is quite true with regard to a few plants, but they are very few indeed compared to the whole. Another expression not very rarely heard is, "If they won't grow we'll make them grow." Granting that the one who says this really has the requisite knowledge to "make them grow," he probably forgets that there was a time when that knowledge had not been obtained by any one, and that failure was the rule with the plants in question, the real knowledge having been gained by study of the natural surroundings of the plants. We have only to compare the success in the cultivation of epiphytical Orchids to-day with the success of fifty years ago to perceive the truth of this.

Now the climate of South Africa is so different in different parts that there can be little doubt it will be found that some of the terrestrial Orchids will require quite a different treatment to what others do, as the climate of one part is not suited to the requirements of some species from other parts. As an illustration of this I may mention that Sir Henry Barkly told me that of the large collection of Stapelias he had got together at Cape Town from various parts of South Africa, several would not thrive, and died, in spite of all he could do under outdoor cultivation. If such is the case with some species in what may be said to be their own country, what must we expect when they are subjected to the artificial conditions of cultivation, unless their natural surroundings are imitated as nearly as it is possible to do? Many South African plants readily withstand the vicissitudes of our English climate, some with (*Pelargonium*), others without (*Kniphofia*) protection during winter; but some will not do so, and among them appear to be the terrestrial Orchids, at any rate there has not been much success with them hitherto. When intro-

duced they often thrive and flower well the first year, and then die, but I do not see why they should not be as successfully cultivated as some other Orchids are now which fifty years ago cultivators were quite as unsuccessful with, and the key to success will be found in the study and judicious imitation of their natural conditions of growth.

I am not competent to give an account of the variations in climate, but will briefly point out that, roughly speaking, South Africa is divided by two gigantic steps, as it were, into three regions of different elevations; there is the lower coast region, which in the south-western part, where many of the species I have enumerated grow, enjoys a temperature of between 70° and 95° Fahr. during the summer season—say, from the middle of November to the middle of February (for it should always be remembered that the seasons there are exactly the opposite of ours here in England), and during winter the thermometer does not often fall below 50° Fahr., except on the mountain tops, where it sometimes freezes. The rainy season in the south and south-western part of this coast region takes place during winter, from about the middle of May to the middle of September; but in some years beginning in April, and in others lasting through October; at the end of the rainy season it gradually becomes dryer, and becomes very dry between November and April, when there are only occasional showers. In the south-eastern and eastern part of it summer is the rainy season. Next after traversing the mountain chain called in different parts Zwartbergen, Zuurbergen, &c., we come upon a region elevated 1800 to 2500 feet above the sea-level, which, taken as a whole, is perhaps warmer than the coast region, and part of it, called the Karoo, forms the hottest part of Cape Colony; the rainy season for the whole of this region is in summer. Lastly, ascending another great chain of mountains called the Nieuwveld, Stormbergen, Drakensberg, &c., the interior region has an elevation of 4000 to 5000 feet above the sea; and being nearer the equator the sun's rays are more nearly vertical, consequently in summer the days are very hot, but the great elevation considerably modifies the temperature in winter, especially on the higher elevations, such as on the Sneeuwberg, and the High Veld on the Drakensberg, where the nights in winter are cold and frosty, sometimes the thermometer falls 6° or 8° below freezing point, and snow occasionally falls to the depth of several inches, but does not last long except in a few places, as during the day it becomes hot, the thermometer often showing a very wide range in the course of twenty-four hours, since from freezing point, or even below, in the early morning, it will sometimes rise to 60° or 70°, or even more, by midday, descending again to freezing point at night. The rainy season of this region is in summer.

In the cultivation of these Orchids the first point to attend to is the soil. Under the description of each species I have given the character of the soil whenever known to me, and from an examination of the soil clinging to the roots and tubers of the dried specimens, and from collectors' notes, it appears in most cases they grow in a soil consisting of about three parts out of four of sharp white sand, and about one part of rich black vegetable loam; some of those which grow in swamps would perhaps require a little peat mixed with the above, whilst some few grow in a stiff clay soil, which after the rainy season is over becomes baked hard by the sun to an almost brick-like consistence.

Next as to watering the plants: this will probably be found to be the most important point in the treatment of them. First should be ascertained, if possible, the region and elevation of the plant's natural habitat, and the temperature and water regulated accordingly; and if the plant inhabits a region of summer rains, it should not be watered until that period comes; or if of winter rains, not until that season occurs, always remembering that the South African summer occurs during our winter, and the winter during our summer, it is quite true that many plants from the southern hemisphere will flower with us under cultivation at a different time of the year to what they do in Nature; but I suspect if this forcing is, in some cases at least, injurious to the plants, and causes the loss of some that would grow well enough, perhaps, if their natural requirements were attended to; and I think that the less attempt there is made to force these southern terrestrial Orchids the more likely will success attend the efforts of the cultivator, though some may perhaps

stand it with indifference. It will be noted that the time of flowering is from August to February or March, their routine of life being that after flowering they die down and remain dormant. In the south and south-western coast region their period of rest will be during the dry end of summer and autumn seasons, say January to May; in the inland regions it will be during the winter season, from about May to September, when the rainy season begins. During the rains they make their growth, and some of them flower, but others do not flower until after the rains are over, and their foliage at the time of flowering will often show signs of withering or dying off, so that this must not always be looked upon as a sign of unhealthiness.

Years ago many Cape Orchids were introduced, but according to accounts given by Lindley (who certainly knew as much or more about Orchids as any of those who have dealt with them since), they soon died out. In the *Botanical Register*, under t. 1653, Lindley writes of *Bartholina pectinata*:—"We presume that this, like all the Cape Orchidaceous plants, is incapable of being cultivated permanently by any means hitherto discovered; for the roots, although when first imported they flower, afterwards disappear. They should be planted in sandy loam, and kept in as light a greenhouse as possible, for it is probable that the reason of their disappearing is the want of light during their growing season in this country." I do not believe this is the reason, but it is more probable that the life of some terrestrial Orchids is of short duration, lasting only a few years (Sir Joseph Hooker holds the same opinion upon this point); this will in some measure account for the scarcity of certain species during some years, and abundance during others. If this surmise be correct, it stands to reason that we cannot expect the self-same plant to live under cultivation for a longer period than it does in Nature. But something might be done to keep them in cultivation by raising them from seed.

Under the description of *Satyrium pustulatum* (S. erectum, Sw.), in the *Botanical Register*, vol. xvi., t. 18, Lindley writes as follows, the paragraph included in brackets being a quotation from a communication from Sir John Herschel, published in the *Proceedings of the Horticultural Society*, vol. i., p. 56:—

"I have never found this in the sandy flats about the Cape, my roots were all taken from a clay, baked by the sun nearly to the consistence of a brick, at 'De Koch's,' a place about 40 miles east of Cape Town, in the district of Hottentots Holland. They were then in flower, rather past their maximum. Nevertheless they grew well enough in the peaty sand of which my garden consisted (this was at the Cape), and to admiration in a fine black sand enriched with vegetable matter, from the shrubby hills in the neighbourhood. Plenty of water and moderate temperature while leafing, diminished supply of wet and increased heat as the flower rises, and total dryness with heat when all is withered, seem to be the conditions."

"Practically the cultivation of Cape Orchidaceae has always been found extremely difficult in this country. The best method of cultivating the present species is to plant it out in a pit with a south aspect, fully exposed to the sun's rays at all seasons of the year. The pit must be well drained, and the soil should consist of peat well mixed with sand and leaf-mould. A great deal of harm may be done by injudicious watering. When it is not growing it should be kept perfectly dry. As soon as it begins to push through the soil a little water may be given, not amongst the leaves for this will probably injure them, but round the tubers; this may be gradually increased as the plant grows until the flowering stem makes its appearance, when the water must be discontinued. Heat and light are now the agents which will perfect the flower, and ripen the tubers for the following year. When propagation is attempted it must be done when the tubers are ripe, and the plant in a state of inaction. Those who have no pits to grow this plant in may be equally successful by cultivating it in pots, if the above suggestions are attended to."

Mr. Bolus, writing to me upon the cultivation of the Cape peninsula species, gives the following as his opinion as to their management:—"I believe they should be gradually dried off after flowering, and then kept in pots, laid on their sides, until about April (our time), when they should be repotted and the watering most carefully attended to, that is, the plants should never be allowed to become dry nor to be sodden for want of drainage, but the water increased from the middle of April until the end of July, when it should slacken off until October."

Taking the different character of the seasons in different parts of South Africa into consideration, I think it probable that the following mode of treatment will be found likely to give good results. Those species which come from the south and south-western coast region should be planted in suitable soil, with thorough drainage, and about May placed out in the open air in a sunny place, but protected at first from any very cold weather (for that season of the year), and especially from heavy rains. The watering must be very carefully attended to; at first, before the bulbs have fairly started into growth, the soil should only be kept just damp, not wet. As growth takes place and increases the water should be increased, and if the weather is not too sunny the plants may freely be exposed to rain, but if the season should be a hot, dry one, it would be better to shade the plants a little from the sun, and to take care not to water over the foliage, although in Nature some of them, for example *Disa maculata*, *D. rosea*, *D. longicornis* and *D. Richardiana*, grow in places that are constantly dripping with moisture during the winter and spring months—May to September. When the flower stem appears and has made a little growth, the water should be gradually decreased, and when in flower the plants should be exposed to the sun as much as possible. After flowering they should be dried off rapidly and placed in a hot dry greenhouse, the pots kept exposed to the sun and kept at a dry temperature of 70° to 90° Fahr. all the winter, during which time the soil may occasionally be damped just sufficient to prevent it remaining dust-dry for too long a time. About the end of February they may be transferred to a cooler house, and as the spring advances should be more and more exposed to the influences of the weather, since it must be remembered that our spring for temperature is nearly on a par with the late autumn and winter at the Cape, and our summer rather hotter than their spring; so that by graduating the temperature and water in the way indicated, the plants will be placed under conditions somewhat like those they have in Nature.

Those species which come from the interior regions should, I think, on the contrary, be placed in a dry, hot greenhouse about the beginning of September, and the watering carefully commenced, when the plants show signs of vegetative activity, increasing the supply as growth proceeds, as in the former case, and diminishing it when the flowers appear, and drying off rapidly as the plant begins to wither. As the winter passes away and the temperature outside gets warmer, the plants should be gradually placed in a cooler and cooler temperature, and in spring and summer the plants may be placed out in the open air in a sunny place, but should probably be protected a little from the fierce sunheat sometimes experienced in our summers, and should be kept dry until the time comes for placing them in a greenhouse again.

Concerning open-air treatment it may be worth while quoting what Lindley has published in the *Botanical Register*, 1838, Miscellaneous Notices, p. 83, under *Satyrium papillosum* (S. erectum, Sw.); he writes:—"It is particularly deserving of notice that the first of these species (*S. candidum*) was planted in the open ground in May last, and it was under such circumstances that the fine specimens I examined were produced. Upon this subject Sir John Herschel has favoured me with the following note:—"The specimen of *S. candidum* was flowered in a box of bog earth, openly exposed, except in heavy rains when it has been taken in, and in cold nights has been protected by mats. But there are also several specimens of the *S. candidum* now flowering in an open bed under a south wall with no protection whatever. Of these, however, the spikes are not yet so fully developed. Some specimens of that very fine *Satyrium*, the '*carneum*,' have also flowered (though very pale in colour) in garden pots of bog earth, exposed as in the case of *S. candidum*; some have come to very handsome heads, though far inferior to what they do with very little care in South Africa, where specimens have been obtained with 120 or more flowers on a spike. The *Satyrium papillosum* was brought over in a box of Cape soil in a growing state, and though generally exposed in London, has been occasionally brought indoors in cold nights, and, since the flower-stalks have become fully developed, has been entirely kept in the house and sometimes placed near a fire. *Satyrium chrysostachyum* [S. corifolium], a fine orange-flowered kind, similarly imported, has grown well, and gone through

its course, but without throwing up a single flower-stalk. It is now dormant, but the new tubers are satisfactorily formed, and promise well for next year."

These species which are natives of Natal will probably require a little moister atmosphere, and a more equable temperature.

As to repotting, I fancy it will be found that the less the bulbs are disturbed the better; they do not get rotted in Nature, and unless the soil is really unfit for them to grow in, I think they are best left alone. Gardeners as a rule dislike to see grass or weeds growing with their plants but in some cases there may be some benefit in the association when not overcrowded; tubers and bulbs under natural conditions usually grow amongst grass, moss, &c., and often thrive and grow to much greater perfection under those conditions than they do under cultivation. I think it probable that the roots of grasses, &c., growing round tubers and bulbs help to keep the latter in a proper state of moisture, preventing them from getting sodden by carrying off superabundant moisture, and when at first preventing the bulbs from becoming too dry, for however dry the earth may appear, a small amount of moisture is always rising by capillary attraction towards the surface, and in hot, dry climates becomes vaporised before reaching the surface. Some of this moisture is absorbed by the roots of plants, and although perhaps quite insufficient to keep the aerial part of the plant in activity, yet prevents its death by keeping alive the underground portion of the plant. Of course a certain amount of this moisture or vapour will be absorbed by bulbs or tubers, but I cannot help thinking that a network of root-fibres around them helps to keep them cooler and moister than they would be without them when exposed in a dry, sandy soil to the burning sun-heat. *N. E. Brown, Ken.*

OLD WARDEN PARK, BEDFORDSHIRE.

THIS, the handsome residence of Joseph Shuttleworth, Esq., is situated in a sheltered part of the country, $\frac{1}{2}$ mile from the station of Southill (Midland branch). It is surrounded by magnificent pleasure grounds, which are kept in fine order, as is also the village of Old Warden, and the churchyard, by a staff of men under the direction of Mr. G. Allis, the respected head gardener. A word or two about the village and church referred to would, perhaps, not be out of place, as both are objects of great interest. The village, which is one of the cleanest, neatest, and most picturesque I have seen, lies in a hollow, or rather on the side of one, and is sheltered by thick Pine woods planted on the rising ground, the beneficial effects of which may be seen in the cottagers' gardens, where fine fruit trees and vegetables were luxuriating; these gardens again are, in most cases, sheltered by some capital specimens of hedges, composed of different varieties of Hollies, Privet, and Aucuba. A length of prim variegated Holly hedges, with rough pyramids at intervals, is a sight in itself, and when covered with its crop of berries would be well worth a short journey to behold. The cottages are, for the most part, singular in outline; no particular form predominating; most of them are thatched, and the majority have climbers of Wistaria and Vine. Many fine young Comifers are planted about the grass plots and plantations. I noticed a fine group of *Pinus nobilis* making splendid growth; one of them, more stunted than the rest, had a fine cluster of thirteen well developed cones.

The mansion, which is approached through a well timbered park, is of recent construction, and is a fine massive building. The gardens, though small, are in very good order. The glass has been erected seven or eight years, and the vineries were in good condition. One viney, besides Black Hamburg, Muscat Hamburg, Muscat of Alexandria, and Gros Colmar, contained some exceedingly fine bunches of Buckland Sweetwater, perfect in every point. The late viney had excellent bunches of Lady Downe's, Black Alicante, Pearson's Golden Queen, Foster's Seedling, and Barbarossa.

In the Melon pits the plants looked well, and included fine fruits of A. F. Borro, Gilbert's Nettle, and Hero of Lockinge. The plant-bouses contained for the most part decorative stuff, specimen plants not being grown. The trees on walls were producing plentifully, although the fruit was small.

The kitchen garden is well arranged, and was skill-

fully cropped; and the standards and espalier fruit trees were carrying heavy loads. In a nice open space was the stock of *Chrysanthemums*, in grand order. The pleasure grounds contain many interesting views and scenes—one of the best of which is called the Swiss garden. Under the shade of a magnificent *Cedrus Libanus* on a mound, is a modern Swiss cottage, from the windows of which a variety of pleasing views can be obtained of the adjoining woodlands. Near the cottage are several famous trees, two *Araucarias imbricata* (male and female), the latter having ripened a cone this season; a grand group of *Abies canadensis*, over 30 feet high and laden with cones; two remarkably handsome *Arbor-vitae* symmetrical in shape and evenly matched. In other parts of the grounds were an Oak 16 feet 6 inches at 4 feet from the ground, and a very compact specimen of *Abies clausenensis*. In one part of the grounds several fine Spruce Fir trees have been taken possession of by the wild Clematis, which have clambered to the top of the trees and formed fine clusters of flowering shoots, their *Vicé-like* stems twisting about in most fantastic forms, and reminding one of the *banas* of Brazilian forests. A conservatory in the middle of the grounds, completely hidden by shrubs and entered by underground passages lined with rough terra cotta, is both uncommon and pleasing, the visitor being taken by surprise at finding a conservatory in such an unlikely situation. The gardens are under the able management of Mr. Allis, from whom I experienced great kindness, and to whom my thanks are due for a very pleasant afternoon. *C. F.*

The Rose.

DRY WEATHER ROSES.

HAPPENING to visit Messrs. Keynes, Williams & Co.'s Castle Street Nursery, at Salisbury, during the third week in August, when the effects of the drought were being, and had for a long time been severely felt, a good deal of interest attached to the behaviour of certain Roses during the season, for it was a matter of surprise to see some of the dwarf Roses vigorous in growth, clean and flowering freely and finely. It is true that the Rose grounds at Salisbury slope down towards the river Avon, but no water had been given them, for all the labour that could be spared for the task of watering found ample occupation in keeping alive the Dahlias in the quarters close by.

The following hybrid perpetuals can be grouped as Roses doing well in dry weather:—A. K. Williams, not large but lull, bright and good; Alfred Colomb, Alphonse Souper, Lacharme, new of 1883, bright pink, very large and bold; Avocat Duvier, bright purplish-red, a very effective Rose; Baron de Bonsetto, Black Prince, Camille Bernardin, Charles Darwin, a fine deep rich crimson variety; Charles Lefebvre, Comtesse de Sereny, Comtesse d'Oxford, Crown Prince, Docteur Andry, Duchesse de Morny, Duchesse de Vallombrosa, beautiful satiny pink, a fine Rose; Duke of Edinburgh, Duke of Teck, Elie Morel, Etienne Levet, Ferdinand de Lesseps, Fisher Holmes, François Levet, François Michelon, Horace Vernet, John Bright, John Stuart Mill, La France, La Rosière, a charming velvety crimson variety; Louis Dove, Louis van Houthe, Madame Charles Wood, Madame Eugénie Verdier, Madame Gabriel Luetz, Madame Hippolyte Jamaïn, Madame Lacharme, Madame Laurent, Madame Nachury, Madame Rothschild, Madame Victor Verdier, Mdlle. Emilie Fontaine, crimson fringed with fiery red; Mdlle. Eugénie Verdier, Mdlle. Marie Rady, Mdlle. Marie Verdier, Magna Charta, Marguerite de St. Amand, Marie Baumaon, Marquise de Castellane, Merveille de Lyon, charming despite the hot weather, and a lovely white Rose; Mons. E. Y. Teas, Mons. Nonan, Nardy Frères, Pierre Nottig, Queco of Queens, a very pretty pink Rose, edged

with blush; Reynolds Hole, Royal Standard, Senateur Vaise, Star of Waltham, Violet Bowyer, white, slightly tinged with soft flesh colour; and Xavier Olibo.

It will be observed that a considerable proportion of the foregoing are red or crimson Roses, and, indeed, flowers of crimson shades were very conspicuous throughout the whole. In the case of Rose shows held during the two last weeks of August and the first week of September, the preponderance of red varieties was very large; it usually is at this season of the year, but it was strikingly manifested this season.

A few Tea-scented varieties were also very fine, the season being considered—Catherine Mermet, Innocente Pirola, Madame Falcot, Madame Willermoz, Marie van Houthe, Niphotos, Souvenir d'Elise, and Souvenir d'au Ami. Bennett's Hybrid Tea, Lady Mary Fitzwilliam, was doing remarkably well, and so were Bourbons Baronne Gonella and Souvenir de la Malmaison.

It is not too much to claim for the varieties comprised in the foregoing list that they possess hardy and robust constitutions, and when planted in moderately rich soil, in which they can root deeply, they, despite a trying drought, will bloom continuously the whole summer. It may be that the soil at Salisbury—a good holding sandy loam—is favourable to the continuance of bloom; if this be so, let Rose cultivators endeavour to secure such a soil for themselves as nearly as they can. *R. D.*

MARKET GARDENING.

(Continued from p. 299.)

IT is satisfactory to me to find my imperfect remarks prove food for thought, and more, that an occasional reader resorts to the pen to discuss matters wherein there appears to be divergence of opinion. If I had one intention more than another when I commenced these papers on "Market Gardening" it consisted in the desire to place before professional gardeners throughout the country accurate data concerning the methods of field cultivators, so that notes might be compared for mutual benefit. Considering my past experience in private garden cultivation, the fact that I gained some nice prizes at a single International Exhibition at South Kensington, and the circumstance that for the last twelve or fourteen years I have been resident amongst market gardeners, and have had the best opportunities for studying field culture, I have not hesitated to speak out, and regret that any correspondent should consider my remarks as in any way hostile. I am bound, nevertheless, to meet "M. W.'s" strictures on common sense ground. And what do they amount to?

I have found no fault with gardeners or with the quality of their supplies, but only with an old rule-of-thumb practice, or system, which in many places still obtains, of growing too few hardy vegetables at too great an outlay for labour; such system being good enough for growing fine produce for display, either upon the ground or the exhibition tables, irrespective of quantity.

CABBAGES.—Now as to Cabbages, I have shown that market-garden growers produce beautiful white-hearts in succession, from the first week in September until the beginning of June following, and whether they are pulled or retained—as they often are for the exigencies of marketing—they exist long at such a period of the year, free from decay or particular injury. Your correspondent may do the same, and not resort to the old method of retaining the old stumps of late spring Cabbages for the winter uses.

Hence, I entirely dispute his assertion, that if the maturing crops are unused "a few weeks," "attendant loss and stench (!) would occur." Furthermore I assert, if aged Cabbages will not keep in a thick row such as I have described, they will become unfit also in any other state. It is a well known fact that on the old rule-of-thumb system, white-heart Cabbages are not in use until the month of May is wearing away. Now in lieu of this, I say, have white-hearts all the winter; plant even spring Cabbages earlier, larger and more thickly together; let them shelter and "nurse" each other, and before thinly planted plants are fit for use these will "come on," so that every other plant in each row, can be drawn for use six weeks or two months earlier, with quality and even "M. W.'s" superabundance, combined.

It stands to reason, however "absurd" it may seem

from my critic's point of view, that even if liability to decay, and a stench such as he describes existed, he could neutralise all by thinning out the plants for immediate use. He does not deny my quantities, but admits the bulk would be so great as to cause a stench! This, even were it possible, is a contingency also neutralised by planting half the accustomed space of ground—a plan I recommended in favour of growing larger supplies of other more valuable vegetables. "M. W." says there is no need to plant largely in private gardens because certain kinds are "in comparatively small demand," and this is his reason for planting Marrows upon rubbish-heaps. My desire was to show those who place timely fire to clear away rubbish-heaps, and very many of whom annually make up beds, piling upon their mounds of soil, covered with handlights, how simple the practice in connection with field culture is, and how unnecessary the outlay usually expended. As to making allowances for tastes, soils, elevations, &c., in private gardens, such matters are far removed from the scope or intentions of a writer on market gardening.

ONIONS.—Onion growing has become an important item in connection with market garden field crops, though the sorts grown vary greatly from what is customary in gardens, the more important crop being autumn sown Lisbons. The ground is well manured, an average quantity of moderately decomposed manure, costing from £10 to £12 per acre, being applied. Seeds are occasionally hand-sown broadcast, but more generally horse-drilled, and somewhat thickly. The ground is generally well rolled with large heavy iron rollers after planting. Hoeing is performed rapidly, so soon as the plants are an inch or two high, the price given varying according to the crop of weeds, from 3d. to 4d. a square rod being sometimes given; after which, if the weather is suitable, another horse-rolling is given. Occasionally during mild winters two, and sometimes three hoeings are requisite to keep the weeds down. In the spring months rapid growth is made, great aid at such a time being afforded by a good dressing with soot, or a very moderate one of nitrate of soda, both of which produce very rapidly, especially during showery weather, a deep green colour in the leaves, forcing growth, and materially assisting their sale. Such crops are generally drawn when the plants show first signs of hulbing, and subsequently, as they are bunched and marketed in the green state. The price given by "jobbers," who purchase the crops as they stand, and undertaking the whole subsequent work of digging, or drawing, bunching and marketing, is from £20 to £30 an acre, the latter price not being an excessive one for good crops. The White Spanish for summer crops, and at times Brown Globe, are treated in like manner, harvested, and generally stored for a month or two, when they are disposed of by the ton.

During winter and spring seasons the prices for such will vary very greatly, even within a month or two. The crop this season is a poor one—so small, that the markets have been already glutted with them bunched, and not within the last decade have such immense numbers of picklers been left upon the old beds for future collecting as are seen at this time.

RHUBARB, which a few years ago was but occasionally grown, and generally on the southern and western sides of the metropolis, has become a standing crop on market garden farms generally. Warm sites, and, as far as possible, deep arley lands are chosen, and are heavily manured, whereon stools, cut into suitable crowns, are planted, generally in rows. During the month of February the soil is moved between the lines, following which the crowns are covered over with the coarser stable sweepings brought from town. Some is forced by actual fermentation of such materials, some is only protected by the light covering under which it grows, and is pulled, bunched, and marketed, as soon as large enough, the practice being to draw plants and portions of plantations wholly, and not to select here and there the largest sticks, as is customary in gardens; and it would seem by this process that far heavier successional gatherings are secured, as, following each gathering, another seems to form very rapidly, and hardly second in quality to the first. Excepting in so far as the remains of the spring covering decays, and finds its way to the roots, direct manurings are an exceptional practice. *William Earley.*

(To be continued.)

LÆLIA ANCEPS AND L. HARPOPHYLLA.

THE short oblong pod of this species (fig. 88) may be compared with that of *L. harpophylla* (fig. 89).

FIG. 88.—LÆLIA ANCEPS.

which, though nearly, if not quite as broad in the centre, tapers more acutely to either end, and in which, moreover, the ribs are less prominent than in *L. anceps*. To what extent these characters are to be relied on we do not know, as it is only by the examination of

FIG. 89.—LÆLIA HARPOPHYLLA.

large numbers of specimens that a safe opinion can be formed.

RHAMNUS FRANGULA.—The berry-bearing Alder is not one of the least useful of our indigenous plants. Its unripe drupes are used to dye a green colour, and its wood is the Black Dogwood of gunpowder-makers. In addition to the uses mentioned (for making gunpowder it is largely cultivated in some countries), it is also grown in Belgium and elsewhere for shoemakers' pegs, and also for garden-sticks.

FERNS AT KEW.

THE value to horticulture of such a rich collection of Ferns as is now at Kew is seen in the number of visitors who go through the ferneries, note-book in hand, jotting down the names of those kinds which have most attraction for them, and probably also at the same time noting the conditions under which each kind is grown. Kew has been for many years famed for the richness of its Fern collection, a collection which had its origin in the zeal and perseverance of one of our most eminent peridologists, the late Sir Wm. Hooker and the venerated ex-Curator, Mr. J. Smith. Under the fostering care of these two men the Ferns at Kew rapidly increased in number, and the growth and interest of the collection have continued till the present, so that the ferneries at Kew contain perhaps the finest and most extensive Fern collection in existence. In the general characters of many of the kinds there represented much similarity is apparent, and for ordinary gardening purposes those species which are only to be distinguished from each other with the aid of a microscope are often confusing. Still the hosts of distinct and beautiful Ferns that are available for general cultivation, do not meet with as much attention outside botanical collections as their merits deserve. Pleasure is derived from a change in the plants we cultivate as much as in other sources of enjoyment, and it is so easy to make a selection of the kinds we would prefer to try next by utilising such an establishment as Kew that we are surprised to find so much conservatism among Fern fanciers. The Ferns at Kew may be pointed to as an instance of what we mean, for there are many handsome species quite distinct from what we ordinarily meet with, and which have been grown at Kew many years, but which are still strangers to most gardeners. Not only may this be said of the Ferns themselves, but also of the manner of their cultivation at Kew. The handsome, graceful drapery or curtains formed in the large fernery by tastefully training the different climbing Ferns from one pillar to another; the beauty of many of the Ferns when grown in baskets, the strange attractive pictures presented by large specimen Platyceriums placed on brackets, as we place old china; the mound clothed with masses of foliage formed by planting the rhizomatous or trailing kinds on conical mounds of peat; and last, but not least, the beauty and extraordinary variety of the Selaginellas. The latter genus is represented by over sixty kinds, amongst them being climbing, arboresc, rosette-shaped, and tiny crawling centipede-like varieties, all in vigorous growth and health, and not one of them unworthy a place among popular garden plants. Most cultivators know *S. denticulata* (of gardens), *S. Martensii*, and perhaps *S. Wildenowii*, but to many of them the collection of Selaginellas at Kew would be a great surprise, for, as was said by an eminent gardener the other day, "nobody seems to know much about these beautiful plants."

The Filmy Ferns are most of them beyond the capabilities of ordinary plant-houses, requiring for their healthy growth a special structure, and yet Mr. Cooper Foster in the little greenhouse adjoining his drawing-room has proved how even Filmy Ferns may be successfully cultivated by an amateur situated in the heart of London. At Kew there is a fine collection of these plants, most of them growing in a house where fire-heat is given only during winter-time, so that the cost of keeping such plants in health is comparatively light. We imagine that in an ordinary cool Orchid-house such Filmy Ferns as the *Todeas*, the Killarney and Tunbridge Ferns, and one or two other robust kinds, might be successfully grown.

Adiantums are at Kew rich in number of kinds, just about a hundred being represented, which are now at their best, so that for comparison and selection they may be turned to good account by visitors.

Reverting to the kinds grown in baskets we may here give a list of the most striking of the species used, though it is not difficult to cultivate any of the small Ferns in baskets, the question being their adaptability for such a purpose. Of Adiantums the most charming in baskets are *A. assimile* with thin stalks and graceful almost transparent pinne; *A. rhizophyllum*, the beautiful rosy tints of which are brought out by being placed near the glass; *A. venustum*, also a rose-tinted species, much more delicate than the last; *A. caudatum*, with long drooping narrow fronds bearing on their tips perfect young plants like the hen-and-chicken *Saxifrage*, but much more charming; *A. amabile* or *Moorei*, which is a

perfect ball of airy fronds, no basket being visible through them; *A. tinctum* and *A. Veitchii*, grown in baskets to heighten the red colour of the young fronds; *A. colpodis*, also thin and graceful; and the mist-like *A. gracillimum*, seen to advantage only when hung up in a basket between the eye and the light. After the *Adiantums* come the *Davallias* of the *dissecta* group, *D. dissecta* (elegans) itself looking exceptionally charming with its bright green triangular fronds, and brown creeping stems, which clasp the basket all round and look like so many squirrels' paws. *Polyopodium* or *Goniophlebium subauriculatum* and *Nephrolepis cordifolia* are both well known as basket plants, and at Kew they are plentifully grown as such, the long comb-like fronds of the one and the graceful feathery leaves of the other reaching down 4 or 6 feet from the baskets.

Polyopodium appendiculatum, like our native *Polyopody*, but with the leaves beautifully veined and tinted with vinous red; *Acrostichum venosum*, with long *Hart's*-tongue leaves, clothed with floury grey scales; these, and others besides, struck us as being specially serviceable for cultivation in baskets. *Selaginellas* of various kinds are used for covering the baskets and mould where the habit of the plant is not such as would hide them.

Among plants of special interest and rarity we noticed *Trichomanes Prieurii* in splendid health, as also *Tr. crispum* and *T. foribundum* (pinnatum). *Helminthostachys zeylanica*, a pretty little Ceylon Fern, with an appearance somewhat like an *Anemia*; *Selaginella canaliculata*, the stem of which is as thick as a man's thumb, and nearly 5 feet high; these were all in beautiful health, as, indeed, the collection in general is. *B.*

EIGHT DAYS' IN THE GARDEN OF ENGLAND.

TOTNES.—Attracted apparently by the scenic beauty of the estuary of the Dart, "the English Rhine" in miniature, it is related that "Brutus of Troy," the great grandson of *Virgil's* hero, *Aeneas*, landed on the spot where now stands the borough of Totnes; and as this was some time before he founded *Trois nevant* (New Troy), afterwards known as *Augusta Trinobantum*, and as London, Totnes may claim to be the most ancient borough in *Brutus'* land, or Britain. The legend must be true as a shapeless lump of granite by the side of the main street commemorates the fact. It bears no inscription!

The town, moreover, countenances the tradition of its antiquity; for, as the grass does not grow as rankly in its High Street as in that of the ancient Cinque port of Rye, it is only because of the extreme steepness of the gradients in the Devonian town which cause the Dartmoor showers to scour them clean "to the metal." There is only one level street in the place, that namely down by the wharves of the river Dart, which here ceases to be tidal, and makes a considerable bend in its course. This has so impressed the natives of this old hill-fort, that they style this short street "The Plains," and have chosen it as the site of their one monument, a grey granite obelisk, inscribed to the memory of poor William John Wills, a native of Totnes, who was, with Burke, the first to cross the continent of Australia from south to north, and who died of starvation in 1861, on the return journey. To the botanist, the memory of this ill-fated expedition is associated with the *Rhizocarpon Matssilii salavatris*, the "Nardoo," on the scanty starch in the microspores of which the party kept themselves alive for some time. Did the simple obelisk require embellishment, nothing could be more suitable than the pretty quarefoil frond of this aquatic, that is now familiar in many greenhouses.

From the river and the "plains," as at Exeter, a steep street denominated Fore Street ascends to the clock-surmounted arch of the West Gate of the old town, on either side of which steeply sloping gardens and houses, rising rapidly one above another, mark the line of the old walls, just within which stand the church and Guildhall. The former is a fine specimen of the Perpendicular architecture, so characteristic of South Devon. It is built of the warm-tinted red ochreous limestone of the district, and the only church of the little borough is, with its double north aisle, ample chancels, and lofty tower, a building Totnes may well be proud of. The painted stone screen, with most delicate tracery, is undoubtedly one of the finest in the kingdom, whilst the carved

Oak Corporation pews remind us that we are in a municipality.

The old priory on the north side of the church, now used as a prison, justice-room, and guildhall, all in one, is most quaintly interesting. We were carefully examining the castle betwixt two keys of the town arms, above the justice-seat, the commodious stocks to accommodate four culprits, the oil-paintings of departed magnates, and the "linen-pattern" scroll-work on the Oak benches, when we were frightened away by the solemn inquiry from the aged female custodian of an equally ancient maid, "Is there any one in the prison?" It was justices' day, and there being, it seemed, "a plentiful lack of" prisoners, we thought we had better leave, before some Dogberry or Verges should prove mistrustful of our botanical vasculum or geological hammer.

From the church the High Street still ascends, flanked on either side by quaint granite-columned "piazzas," faintly suggestive of the "rows" at Chester, to the Castle, whence Judhal de Totnes, the founder of the Priory of St. Mary, was able to overawe his feudatories in the town. The Castle is now enclosed and neatly laid out as a garden, the main lawn being devoted to the now ubiquitous tennis. The keep is the chief portion preserved, the building being, as the American tourist remarked, "in a very bad state of repair." A lofty mound, probably consisting merely of *debris*, covering a lower storey of the tower, is now draped with *Hart's*-tongue, which is perhaps the most abundant Fern of South Devon, and ascended by a somewhat painful flight of steps; whilst the upper storey is a circular grass plot, some 60 feet in diameter, surrounded by a 10-foot wall, on which is a path round the battlements, commanding a fine view of the gorge of the Dart. A young tree, springing from among the battlements, suggested to us the consideration that, pictures-que though they may be, the custodians of such places should beware of permitting the extensive growth of such parasitic vegetation, for the roots of one such tree may work more damage than one of "old Crumple's" cannon-shot. Almost all our ruins are attributed, somewhat unfairly, to the Lord Protector. On one side of the keep its slopes have been industriously terraced into a kitchen-garden, and in another part of the grounds a very perfect portion of the Castle ditch was overgrown with *Periwinkle*, *Mullein*, and that lover of made ground, the greater *Celandine*. *Chelidonium majus* may be a weedy thing, but after all so is *Maclureya cordata*, the foliage of which is no whit more unique in outline and colour than is that of our native *Papaver*ad.

The walls here, as elsewhere, throughout the district, bore many fine plants of *Cotyledon umbilicus*—a characteristically West-country plant; but the tall spikes of its creamy blossoms were over at the season of our visit. The pleasing combination of the Mountain Ash, with its slender gracefulness of stem, Fern-like foliage, and distinctively coloured fruit—then not as yet ripe—against the grey ruined walls, was also to be noted here.

(To be continued.)

FORESTRY.

A SELECT Committee of the House of Commons was appointed on Friday, May 15, "to consider whether, by the establishment of a Forest School, or otherwise, our woodlands could be rendered more remunerative."

The first witness examined was Mr. William G. Pedder, head of the Revenue Department of the India Office. The forest organisation in India, he said, originated in 1846; and in 1863 further steps were taken to secure the scientific training of Indian forest officials. Last year the gross revenue had risen to nearly £1,000,000, and the net revenue to nearly £400,000. Mr. Pedder expressed an opinion that in twenty or thirty years hence, when the result of what is now done has become apparent, the net returns of the revenue from Indian forests will become very much larger. The Indian Government established their school at Dehra Dun because it was desirable that officers, even of the lower grade, should have some special training. It had only been established for five years, so that they could not tell yet what the result of it might be.

But the improvement which has taken place in the forests was a much more important element than the

mere increase of net revenue. The forests were in course of being so completely destroyed in the various parts of India that the duty of the Forest Department had been to conserve them. He thought that, by the improvement of the education of our forest officials, we might produce somewhat similar improvements in England to those which have resulted in India. Believing there might be some improvements effected in training the forest officials, we requested the French Government to send over an experienced officer to examine and report upon the state of the English woodlands, and the authorities sent over Professor Boppe, who made a tour of inspection of some of our forests, accompanied by Colonel Pearson, then forest officer at Nancy, and some of the students. In his report the Inspector of French Forests says, were it only for the purpose of replanting the five or six millions of moor and waste land which cover one-third of the Highlands, he should consider there was a sufficient reason for the formation of a Forest School. He recommended that a National Forest School be founded in Great Britain, and that Professorships of Silviculture be instituted at Cooper's Hill and at Edinburgh. He believed the establishment in England of a similar school to that of Dehra Dun would be advantageous.

Dr. Hugh Cleghorn, who was for twelve years conservator of the Madras forests, said he concurred in Mr. Pedder's views. It was unquestionable that, if we had more trained officials, our woodlands would be rendered more remunerative; and it was marvellous that we should not at an earlier date have begun to adopt some means to preserve them. The establishment of a Forest School in each of the three Kingdoms would be a great advantage to this country. The supplies of timber coming from abroad were rapidly diminishing, and it was of great consequence that we should endeavour to increase our own production. There were many places in this country exceedingly suitable for planting, but it would be necessary to exclude sheep for perhaps thirty years.

Colonel Pearson, who represented the Indian Government for eleven years at the Forest School at Nancy, said he had the general charge of the forest students, and had been through most of the principal French forests. He had also been through the British forests with the French Professors. Several English colonists had applied to him for officials to take the management of forests, and, being unable to find any qualified Englishmen, he had been obliged to recommend French officials. The school at Nancy was an admirable one, and had done great service by instructing a very able body of men, who were now carrying on good work in India. He was in favour of supplementing the general education given in this country by giving a special forest education in some convenient place, where there should be a museum supplied with an instructor in forestry who might give lectures on the subject, and conduct the pupils from time to time into different forests with the view of enforcing the instruction of the lecture-room. He did not know one mature forest in England or Scotland at present, and, therefore, for an important part of the instruction relating to the removal of the crop, the students would have to go abroad. It would be desirable to interest in this subject persons concerned in the education of land agents. We should suffer in the future if this matter were not taken up now. He would give three courses—elementary, for the wood manager; more advanced for the land agent; and a higher course for those who wanted a thorough education; but for the complete course men ought to go to the Continent. There was one spot in the Forest of Dean especially suitable for instruction; but neither there nor in the New Forest could anything be shown regarding the management of Conifers.

Mr. W. T. Thistlethorn Dyer, Assistant Director of the Royal Gardens, Kew, said Kew performed, to a large extent, the part of a botanical authority to the Government, and when the Colonies applied for information, the Government sent to Kew for assistance. It had been found impossible to recommend to the Colonial Office properly qualified persons either to report upon or to manage colonial woods. Apart from the trained officials of the Indian Forest Department, it was practically impossible to meet the requirements of the Colonies; and that department had only spared men temporarily, which had caused great inconvenience. A good many of our Colonies had now come to that state of things that there will

probably be a demand for persons who understood the management of forests. He would make the demand for India a kind of nucleus of a school which should be utilised for the education of such gentlemen as wished to undertake colonial service, and for the instruction of land agents and persons competent to give advice as to our own woods.

THE SMALL-LEAVED LIME.

Where a neat, somewhat low-growing shrub tree is required *Tilia cordata* is preferable to either *T. platyphyllos* or *T. vulgaris*. At Metz, and elsewhere in western Germany, and also in eastern France, &c., where the three species were often growing in close proximity, the contrast between the bright, cheerful, fresh appearance of the first-named and the parched-up, almost leafless state of the two latter was very marked last month. In some towns the streets avenues, and the trees planted thickly in the squares for shade purposes, were almost all *T. cordata*, which seems rarely planted in Britain. It may be as well to remark that *T. cordata* is the correct name of the species generally mentioned in works on British botany as *T. parvifolia*. *T. platyphyllos* and *T. vulgaris* are both included under the old name, *T. europæa*; and the two species are, however, thoroughly distinct, and in most cases can be readily recognised by the leaves alone. The first has soft leaves, more or less hairy on both surfaces, and flowers earlier than *T. vulgaris*, which has the leaves glabrous except in the axils of the principal veins.

WOOD PAPER.

THE use of wood in paper-making is not as new as might be supposed. This means of supplying the want of rags in the manufacture of paper dates nearly a century back, and under certain processes of development wood now forms an important element in the paper industry. The extensive employment of wood-pulp in paper-making has in recent years given an impetus to the establishment of factories in all parts of Northern Europe, and in the Northern States of the American Union, so as to meet the increasing demand for this relief material, which is used chiefly for mixing or consumption with stock. It is said that in Germany alone wood-pulp constitutes 75 per cent. of the paper made in that country. The first industrial application of wood-fibre in the United Kingdom was made in 1847, when mechanical wood tissue obtained by grinding wood was used as an element in paper-making. Later on, about 1853, better wood-products under various names began to supersede the so-called mechanical wood. The later manufactures were chemically prepared, and therefore possessed superior advantages. They resolve themselves into two classes, viz., 1, those partially treated with bisulphite of lime, and called sulphite; and, 2, those effectually treated with caustic soda, and known as "chemical wood," or cellulose.

These two varieties of wood-pulp differ materially, both as regards utility and cost. The first occupies an intermediate position between absolute rawness and absolute purity of the wood fibre. The yield of pulp is larger and of stronger fibre, but it is wanting in purity, which limits the use of sulphite; and at the same time the price is only half that of cellulose, and is a vast improvement upon ordinary wood fibre, or ground wood. It is purer than mechanical wood pulp, and worth double its price. Sulphite is particularly adapted to the cheap papers of the present day. Notwithstanding its imperfections in respect to purity, the fibrous nature of sulphite renders it in itself, when properly used, a suitable material for paper-making without any other backing of fibre whatever. The price varies from £7 to £8 per ton, landed free in London. It is largely imported into India as an adulterant, and there is no reason why this country should not meet its own supply with the facilities which the large sources of cheap suitable timber available on the Himalayas afford. The Indian importation has received an impetus of late years, and shows a marked tendency to continue increasing, notwithstanding the numerous raw materials in the country for paper-making, and the fresh additions always being made to their number.

As regards chemical fibre, or cellulose, it is the purest variety of wood-fibre; but this purity is obtained at great cost, and at a sacrifice of strength. The severity of the treatment which it undergoes not only reduces the bulk of the out-turn, but depreciates

the texture, thus making it unsuitable for the ground-work of any good quality of paper. Moreover, the cost of manufacture is very great, and precludes its extensive use. But the purity of the fibre makes cellulose a blending material of the first order. Its market value at present is about £14 per ton. In England there are three establishments which produce "chemical wood," and, under various designations and patents, this wood-pulp system bids fair to show substantial dimensions at no distant period. *Indian Agriculturist*.

HOME CORRESPONDENCE.

Jasminum azoricum.—Leaving out of question the pure white sweetly scented flowers of this species, the foliage alone offers a plea for its cultivation. Excepting *J. heterophyllum*, we seldom see a species with so large, glossy, deep green leaves. They are compound, with three ovate or subcordate leaflets. The plant is figured in the *Botanical Register*, 89, and in the *Botanical Magazine*, t. 1889, and is recorded as being a native of Madeira, as well as the Azores, whence we have other useful greenhouse plants of various habit. It is a very old introduction, and, like other ucommon plants, gets lost sight of in a few gardens, or altogether lost to cultivation, till we renew our acquaintance with it, or reintroduce it. A pillar or rafter of the greenhouse is the most suitable place for it, where the slender stems will attain a length of 12—16 feet. The flowers are produced in axillary cymes along the upper side (or that towards the light) of the younger shoots, forming wreaths 1—2 or more feet long. *J. F.*

The Rowe Orphans.—Allow me to express my sincere thanks to those kind friends who have so generously responded to my appeal on behalf of the orphan children of the late Mr. and Mrs. Rowe of Northampton. Through the kindness of friends the two girls have been placed out, and in some measure provided for (that is to say, for the present). The boy is still an inmate of the Northampton Infirmary, and a long time must elapse before he can possibly be restored to health, even if he ever can be—a very doubtful matter. I, therefore, trust that those friends who have not yet subscribed to the fund will do so at their earliest convenience; and most thankfully received by the Rev. T. S. Thornton, Vicar of St. Sepulchre's, Northampton. *H. Beasley*

Selecting Apples for Planting: Culinary Varieties.—I am an advocate for planting in great variety, that is, if space will allow. I do not mean that the planter should confine himself to a single specimen of each, but from the experience one gets by planting largely one is enabled to increase the stock of such kinds that adapt themselves to the particular soil and climate. I own it is desirable to have quantities of good fruit of several standard varieties, and such varieties can only be rated as such after proving them in the above manner. The period of flowering, a critical time for all fruits of the different varieties, is not the same for all varieties, and we all know what a few frosty nights and tempestuous days and nights will do; therefore, by planting in variety we can make sure of some escaping the adverse elements. The variability of our climate, too, acts upon the fruit during summer and autumn, so that some keep much better than others, though classed for use at the same time. We have proved several varieties here, and readers of these pages have of late been advised to make their selections. The planting season being near at hand I will enumerate a few good and reliable kinds noted for their heavy cropping quality and good growth, suitable for pyramids, this mode being the most desirable

for gardens large or small, if properly attended to at the root and top. Early varieties:—Lord Suffield, well known, the best; Duchess of Oldenburg, heavy cropper, fine for orchard planting; Hawthornden (Old), liable to canker on light soils. It should have the soil prepared deeply, with the addition of plenty of good loam, and after commencing to fruit it should be occasionally supplied with good dressings of vegetable refuse (well decayed); Cellini requires the fruit to be well thinned in its early stages, being a very heavy cropper. It attains a beautiful colour; Ecklinville, fine; Keswick, useful either for dessert or kitchen use—a sure cropper; Jolly Beggar, foliage much like Hawthornden, but fruit quite distinct and handsome in shape; Stirling Castle, fruit much like Hawthornden in shape, colour and texture. Mid-season: New Hawthornden, more perfect in shape than the Old, and keeps longer; Peasgood's Nonsuch, the finest of all Apples—perfect in shape, and a free bearer; Loddington, very fine; Cox's Pomona, free bearer; Golden Noble would, if I were limited to one variety, be my choice. We have never failed to get a good crop of this variety, even when most of the others have failed. It is useful both for kitchen and dessert, and may be used from October to the end of February. It assumes a beautiful golden colour, such as no other Apple I know puts on. It makes a fine Orchard tree. We have two specimens planted thus with some thousands of fruit on. Our pyramids are also very prolific. Dredge's Fame, in some market gardens here is grown largely; it is a tremendous bearer, with fruit of a fine shape; Bedfordshire Foundling, good; Flower of Kent, very good; Late Blenheim Orange may be had to bear in a small and young state if kept lifted every few years; Alfriston is very good; Alloway Pippin is a distinct, handsome, and prolific variety; Lady Henniker is a free bearer; Damelov's Seedling is well known; Lane's Prince Albert will be grown as extensively as Blenheim Orange, being a first-class Apple; Beauty of Kent is good. We have many more varieties suitable only for exhibition or what come under the category of heavy croppers. I may mention that our soil is a sandy loam resting on the Red Sandstone rock, the aspect being southerly. *D. C. Powell*.

Economy and Seed of Potatoes.—Your correspondent, George Lambert, at p. 374, gives the result of a heavy yield from 2 lb. of Potatoes, and expresses a wish to know if "as much or more has been got in any other way?" Perhaps the following may have some interest for him, as well as some other of your readers. On April 13, 1883, 1 lb. of small tubers of Clarke's No. 1 Potato were weighed, and one of the tubers taken from this pound was cut into eight sets, each set having one eye. These eight sets were then placed separately in suitable soil in thumb-pots in a greenhouse. On April 25 the 1 lb. of tubers, minus the one tuber dealt with as just described, were cut into seventy-nine sets and planted in well fertilised, very light sandy soil. On May 9 nine cuttings were taken from the shoots of the eight sets in thumb-pots, and each potted separately into nine more thumb-pots. On June 1 the nine cuttings, which had by that time become well rooted, were with the eight sets all planted out into the open ground. On October 24 the crop was harvested, with the following results:—The eight sets produced 2½ lb. of tubers; the nine cuttings, 6 lb. ditto; and the seventy-nine sets, 10 stone 8 lb. Total from 1 lb., 1 cwt. 3 stone 2½ lb., or 156½ times the seed. The result of this trial, with others, appeared in your issue for April 5, 1884, p. 456. On March 28, 1884, from 1 lb. of Magnum Bonum Potatoes, fifty-three peel sets (very thin slices of peel, with one eye to each slice), weighing altogether 2½ oz., were cut. These were planted on April 2, in fairly good friable soil; the summer of 1884 was very hot and dry, and the soil and situation of the Potato bed as dry as fairly well-fertilised mould well could be, over a very dry and porous subsoil. The following was the result on taking up:—Of the fifty-three sets, weighing altogether 2½ oz., fifty grew, and produced, when dug on Oct. 4, 2 stone 10 lb. of good marketable tubers, some of them much above the average size, and 1 stone 3 lb. of small and inferior tubers—in all, 3 stone 13 lb. (55 lb.), or 880 oz. from 2½ oz., equal to over 16½ oz. per set, or 320 times the seed, equal to 2 cwt. 6 stone 12 lb. from 1 lb. The sets were placed in the ground at nearly or rather less than 2 feet by 1 foot, *i.e.*, at the rate of

about 20,000 sets per acre; and 55 lb. from fifty-three sets is equal to over 9½ tons for 20,000 sets—a very good weight per acre in a somewhat unfavourable soil and very hot, dry season. According to this trial, the weight of peel sets of Magnum Bonum Potatoes required per acre to produce a crop of over 5½ tons, in a soil and season not at all favourable, is less than 65 lb. *J. E. Ewing, Sept. 21.*

Injurious Insects.—Amongst the most recent additions to the Kew Museum is a set of mounts, illustrating the life-history of some of the most destructive of vegetable-feeding insects. This series has been got together and arranged by Mr. Moseley, of Huddersfield, under the superintendence of Miss E. A. Ormerod. The plan adopted in this new method of imparting a knowledge of the habits and destructiveness of certain insects has, it seems, been developed from a plan exhibited by Mr. Haley at Frome last year as the successful competitor for the prize offered by Miss Ormerod. The plan is to show the life history of each particular insect in a separate glazed mount, and a model or a specimen of the plant, showing the ravages it is subject to, and in some cases the parasites which attack the insects themselves, which are fully illustrated both by actual specimens and by magnified drawings showing the various stages of their development. A description of the insect written in plain terms so as to be understood by all, follows, and the plants are enumerated upon which the creature feeds, then follows a few words of instruction on the prevention of insect attacks and remedies. The set just deposited in the Kew Museum consists of ten of these mounts, ten of which have been arranged in their respective cases according to the botanical affinity of the plant attacked, such plants being the Turnip, Cabbage, Vine, Bean, Pea, Plum (attacked by Winter Moth), Apple (attacked by American Eelworm), Gooseberry, Celery, Lettuce, Beet or Mangel, Onion, Wheat (attacked by Daddy Long-legs), Potato and grass (attacked by Click-beetle and wireworms). This set of mounts, which has been specially prepared for the Kew Museum, are eminently suited for teaching in schools; and I understand that others are to be prepared on similar lines for use in Agricultural Colleges or schools. *R. Jackson.*

Zephyranthes candida.—If any one wishes to possess a pure white Crocus-like blossom at this or an earlier season of the year let him grow this plant. I have it now flowering sweetly, a clump of some dozen bulbs in a 32-pot, growing in a compost made up of loam, leaf mould, and sand, in which it appears to thrive. The blossoms are solitary, and without a taint of purple, in the centre being a circle of golden stamens. This plant possesses one advantage—the flowers remain fresh and clean for a good time. My plants have cool treatment all the year round. I think that if this subject could have a generous treatment in spring, by placing it in a little heat to induce vigour, and then to gradually harden it off so as to bear a cold frame, that it would flower much more freely than when grown altogether in a cool house. Two things appear to be essential to its success. One is that the roots be somewhat confined in the pots in which the specimen is growing; and secondly, that the roots be not too frequently disturbed. Valuable as it is, one does not often see it in gardens, where it certainly deserves a place. Has any one tested its hardihood by planting it out-of-doors? Will it succeed under favourable conditions? If so, does it flower more freely than when grown in pots under glass? *Ealing.*

Anemones.—In the short note appended to the reference to St. Bridget's Anemone from Mr. Burbidge there appears what seems to be a contradiction of terms or, rather, of advice, which needs explanation. First, it is said, "they are best not transplanted," and a couple of lines lower down, "they can also be transplanted quite safely, though in full flower." I presume it was intended to convey the advice that seedling plants should not be transplanted, but that older plants, even when in bloom, may be so, safely. I grow these Anemones from seed every year, and always transplant seedlings; indeed, I have but just now dibbled out hundreds of seedlings raised from the present year's seed. It is my invariable rule to sow seed in Melon boxes as soon as it is well ripened, and thus have an abundance of strong young plants, with good roots attached, to dibble out in the

autumn. I find the advantages are—first, that the plants may be got out into ground which has carried another crop of some kind, and having a fresh dressing of manure added, is just in the autumn in capital tilth for planting. The plants separate easily, and so planted make beds of uniform width and completeness, and by being planted in lines, the beds are also very easily cleaned. Thus I gain several months, as if the seed were held over till the following March, and then sown, I should have lost time, whilst that same spring the greater portion of my autumn bed of plants will produce beautiful blooms. Of course, being left in the ground all the summer, and lightly top-dressed with short manure, the plants break up again in the month of August, and soon begin to bloom, and do so freely all through the winter. In the autumn also more attention may be given to work of this kind than can well be bestowed in the spring. I do not know whether the St. Bridget strain differs materially from my own, but I shall be very pleased to exchange seed with Mr. Burbidge. Certainly Ireland has an advantage over Middlesex in a moister and therefore more growing climate. *A. Dean, Bedford.*

Late Prolific Raspberry.—I think Mr. Herriin, of Chalfont Park Gardens, has some little cause for complaint that whilst the Fruit Committee of the Royal Horticultural Society was apparently highly impressed with the appearance of the autumn fruiting Raspberry he exhibited the other day, that body should have asked, before making any award, to see it again, evidently forgetting that five weeks must elapse ere another meeting is held, and in five weeks goodness knows what may happen. Should Mr. Herriin be enabled to show his Raspberry again in good fruit so late as October 13 next, of course its persistent bearing, as well as its prolificacy, would be assured; but surely it can hardly be expected that any Raspberry could exhibit its true character and special flavour at so late a period of the year; hence the apparent hardship to the raiser as seen in the action of the committee. I have seen this Raspberry growing at Chalfont Park at this season of the year more than once, and can testify to its remarkable prolific character; indeed, it may be said if well grown in any garden, to add some four to six weeks to our Raspberry season—a matter of no small importance, for we have few more popular culinary fruits, and the extension of its production over a lengthened period would indeed be of great service, especially as the Raspberry is of all fruits one of the most certain to produce a crop, let their kinds be plentiful or otherwise. *A. D.*

Transplanting and Renovating Fruit Trees.—Hitherto the weather has been much too dry, and the atmosphere too arid, to think of disturbing fruit trees, but now that we have had rain and a favourable change for the work, no time should be lost in carrying it out, and operating on those that are unsatisfactory, or have to be moved from one place to another. Some hesitate to do this while the plants are in leaf, but after the middle of September they may be lifted with safety; and if there is no delay, and a dull, favourable day is chosen, the trees will do far better than they will if left till later in the season. These remarks, it need hardly be said, apply to those on the spot, as of course it would not do to get them from a distance till they have become defoliated, but when they can be got up and in again quick the transplanting may be done without the leaves flagging, and the leaves are of great use in inducing fresh roots. In renovating, the plants I like to start with first are Vines, as great liberties may be taken with these, for all we has to do to keep the foliage fresh is to close and shade the house, and syringe heavily, and if this is done the larger portion of the soil may be taken from the border, and new added, and the Vines brought round and invigorated at once. To insure the work being carried out expeditiously, several hands should be employed at it, and as the roots are laid bare it is necessary to damp them by sprinkling them over, and to keep them covered with wet mats, or the small ones may suffer and dry up, and the bark of the larger ones become contracted and injured by the air getting access to them. The way to get the soil out with as little trouble as possible is to skim the surface of the border and gradually work down from the front, tracing the roots back along their course, and clearing the earth out from among them with a suitable fork. Soil.—The

great mistake many make when seeing to or replanting Vines, is having a mixture of soils, as it often happens that good loam is spoiled by the additions put with it, and if anything at all is added, it should only be a few crushed bones, or a sprinkling of soot, as manure rous the fibre and alters the texture, rendering it close, after a short time, inert and sour. This being so, it is far better to keep to the top spit of some old pasture, the most suitable soil being that of a hazel colour, rather inclined to be stiff; and this may be used quite fresh, after the grass has been mown off, as all that is requisite is to chop it up roughly and wheel it in just as it comes. To have the roots in their proper positions they must be laid, or spread out, at the different levels they emanate from as the filling in proceeds, and carefully covered without being trampled on, or pulverised, when they will not be long in getting fresh hold. With the roots laid in and covered, the next proceeding is to mulch, and if this is done with long stable manure that has just a little warmth in it, a slight fermentation will set in in the border, that will be a great help to the Vines. To check the buds of these from being unduly excited plenty of air should be given as soon as the leaves will stand, and though it may be necessary to keep the house a little close by day they will bear it open by night if syringed or damped the last thing. Peaches and Nectarines under glass.—The same remarks that are made above apply equally to these, and if trees are carefully lifted at once and removed into the house and there attended to in a similar way to the Vines, they will finish and plump up their buds and bear fruit almost as large and fine in quality as they would had they been undisturbed. Before transplanting, however, or interfering with their roots, it is a good plan to thin out their shoots and leave no more than are wanted, as the pruning not only eases the trees but gives the wood more light and air, and this enables it to ripen before winter sets in. Plums and Apricots.—The leaves of these being thick and hard plants of both will bear disturbance better than Peaches and Nectarines; but when moved they must be kept up by frequent syringing, and if the sun breaks out it is advisable to shade by hanging a mat or cloth in front, or placing some branches of evergreen over them. Watering.—To make sure of the soil settling properly about the roots the water given should be thrown on with force before they are finally covered, as by applying it in that way the earth is carried into all the cavities, and the plants then have a good chance to get hold. *J. S.*

Maréchal Niel Rose.—This Rose is now in flower in Castle Hamilton conservatory, this being its third crop of flowers during the present year. *H. Haddock.*

Country Growers and Town Salesmen.—One of our most largely circulated daily newspapers bemoans, in a cleverly written article, with some truth, the poor development of native productions and the importations of much fruit and vegetables, which could, by home cultivation, prove a source of wealth to English growers, and check the divergence of the stream of British wealth into foreign channels, when it is sorely needed to render fruitful the poverty-stricken land at home. It may be that the article in question was merely written to interest and amuse the reader, to strike a political blow at free-trade, or to fill the paper—such things have been. I am merely taking it as a text for a letter to you to detail certain grievances which affect private growers, misled by glowing advertisements or generously priced market lists. Now I can tell the tale of a basket of Crown Artichokes, thirteen dozens, which were sent for disposal to a firm of salesmen who weekly advertise in your paper; on their agreeing to dispose of these surplus vegetables, and their offer to send account of sale of same, or at the end of the week or month, the hamper was, as I have said, despatched. And nothing further was heard of them. At the end of the month the sender wrote, but received no reply, at the end of six weeks another letter was sent, and the answer returned was that not a shilling had been offered for the Artichokes, so they could not be sold, and that a note to that effect had been sent, which the firm "supposes had miscarried." Now at this time for weeks before and since, Artichokes had been quoted as selling at 3s. per dozen; now the quotations are higher. It is possible the salesmen's business, not being so large as

their advertisements would lead gardeners to believe, may not have been able to effect a sale, but surely if unsuccessful one day they might have been fortunate the next; Crown Artichokes are not perishable, like Peaches or cut flowers. This case, which is but one of many, argues a lack of combination among the market people; surely some would be glad of those fruits or vegetables for disposal of which the consignee may have a superabundance. This case, or cases like this, explain why gardeners do not care to send their surplus fruit for disposal to the London markets, and leave the road clear to foreign, often inferior, and always staler, importations. Better to have fed the costermonger's donkey with 156 unproverbial Thistles (worth, according to the market list, 3d. apiece) than have had them and their hamper lauched into space, swept into the Thames, or left among the refuse of Covent Garden Market. Perhaps, sir, you or some of your readers would kindly advise gardeners of great and small holdings as to the best manner of disposing of the products of their skill, even to the establishment of a Gardeners' Co-operative Society; it would be a boon, not to cultivators only, but to the public, and it would help to foster into useful life the latent energy and capabilities of English cultivators and English soil. C.

National Pear Conference.—Now that the date is fixed, and forms are ready for those who intend to exhibit at the great Chiswick meeting—for such it will no doubt be—I think it may not be out of place to suggest that the committee, instead of issuing simply a catalogue, should put up in book form a suitable monograph of Pears; it would be of great value to those who, from many causes, cannot attend the conference to make notes themselves, and perhaps no such other chance will occur again to do so accurately. The book suggested could be issued in monthly parts, and should contain at least one coloured plate, representing, say, from two to six varieties, with sufficient woodcuts and letterpress matter to finish the work in a stated number of issues. I know many who would be pleased to obtain something of this kind, and I feel sure, besides the great boon, it would be a step forward, and a duty such as any committee of this sort ought to set about to execute; they would know then they had thoroughly done the work they had undertaken, and would leave the general public with such a book in their possession, the value of which can never be over-estimated. H. C.

Lye's New Fuchsias.—That such a successful exhibitor of Fuchsias as Mr. James Lye, of Clyffe Hill, Market Lavington, should also be a raiser of seedlings, is not surprising. No one so readily detects the failings of a particular variety as a grower and exhibitor of it, and Mr. Lye, finding that some of the leading varieties of Fuchsias were wanting in certain important respects, set himself the task of remedying these by raising new varieties of a comparatively faultless character. The fact that his new varieties are being largely grown for decorative exhibition purposes is ample testimony to their excellence; but yet, believing that the *ne plus ultra* stage of perfection in this popular flower has not yet been reached, he is still at work doing his best to improve, and that, too, with satisfactory results. So far his seedlings have been shown only in the West of England, and on the occasion of the Bath Floral *Fête* on September 2 a Special First-class Certificate of Merit was awarded to them for their obvious high-class quality; and the following have been selected for sending out early in the coming year:—Dark varieties: Emperor, bright red tube and sepals, the latter long and broad; maroon corolla, shaded with purple; a very fine bold and distinct variety, of the highest value for pillars, trellises, baskets, &c., being very fine indeed, and has a handsome drooping habit. It will also make a fine exhibition variety. Mr. T. Bright, deep rosy-pink tube and sepals, the corolla rose, with broad margins of rich blue-purple; of medium size, very pretty, distinct, and effective. Mr. F. Glass, bright deep crimson tube and sepals, purple-maroon corolla, the two colours contrasting finely; medium size; a very fine and distinct variety. And James Welch, bright rosy-red tube and sepals, the latter of fine form and handsomely reflexed; pale maroon corolla, much shaded with bright purple. Light varieties: Lye's Perfection, creamy tube and sepals, the latter delicately suffused with pink, and handsomely reflexed; bright carmine corolla, fine form, and very showy. Mrs.

F. Glass, creamy-white tube and sepals, deep pink corolla, tinted with violet; fine form, stout, and very good; in the way of, but a decided improvement upon, Beauty of Trowbridge. Diadem, delicate bluish tube and sepals; pale magenta corolla, broadly edged with brilliant crimson; a very fine, bold, stout, and showy variety. Beauty of Lavington, white tube and sepals, bright rosy-carmine corolla, with slight shading of violet; very pretty and effective. Emily Bright, creamy-white tube and sepals, bright carmine corolla, stout, fine form, and of the best quality; an improvement upon Mr. Bright. Excelsior, creamy tube and sepals, tinted with emerald; stout and well reflexed; rich deep rosy-magenta corolla, flushed with carmine; very fine and distinct, and a grand exhibition variety. And Nellie, creamy-white tube and sepals; corolla pink, suffused with pinkish-mauve, deepening to clear mauve; good form, stout; a very pleasing and distinct variety. R. D.

Foreign Correspondence.

CLIANTHUS DAMPIERI.—What a fine old plant this is! I have it planted here against an east wall, in a mixture of peat and loam and sand, where it grows luxuriantly and flowers profusely. Its large Pea flowers of bright scarlet colour, with a large black spot, always attract attention, on account of their colour and shape. Our plant is grafted on *Clianthus puniceus*, this species being harder and not damping off in the way peculiar to *Clianthus Dampieri*; I can, therefore, strongly recommend the grafting on *Clianthus puniceus*. My former employer, the superintendent of the Royal Gardens, Wilhelmshöhe, the year planted a *Clianthus Dampieri* on a warm southerly spot of the rockery, where it seems to be quite at home, but on account of its straggling habit it by no means looks so pretty as does my plant against a wall, where each shoot can be fastened and trained in a proper direction. C. Wissenbach, Cassel, Germany.

THE USES OF COTTON-SEED IN AMERICA.

It is well known that Cotton-seed is, as an article of commerce, a comparatively modern introduction. Not many years since the seed, which was produced in such abundance in the Cotton plantations of America was, not only a waste product, but one which the growers scarcely knew what to do with. Of late years the oil has been expressed in continually increasing quantities, and applied to a variety of useful purposes, not the least important of which is its substitution for Olive oil, for Cotton-seed is now purified so carefully that the result is a clear bright limpid oil, equal in appearance if not in taste to the best oil obtained from Olives. Mills for the expression of Cotton-seed oil have been erected in America in increasing numbers of late years. In 1870 there were only twenty-six mills, and in 1880 forty-seven, six of them in New Orleans. At the present time these mills are scattered throughout the South in all the important Cotton centres on the rivers and on the railways, and number 108 in all. The average yield of seed is about 3½ lb. to every pound of lint. The amount of seed annually crushed in the United States averages about 420,000 tons, a ton of Cotton-seed yields 3½ gals. of crude oil, 22 lb. of cotton, 750 lb. of cake of average value of 19 dols., making the total value of the Cotton-seed product of the South 8,000,000 dols., or 3 per cent. of that of the Cotton crop.

Cotton-seed cake—the residue of the seed after the expression of the oil—is used chiefly for stock feeding and for fertilising purposes for this purpose; it is generally ground into a meal known as Cotton-seed meal. Most of that used for feeding purposes is shipped to this country, where it is extensively used for fattening stock; it is also said to be a splendid food for cows, causing a rich and plentiful flow of milk. The cake is shipped from America in sacks containing 200 lb. each; it is of a rich golden colour when fresh, and has a sweet, nutty, oleaginous taste. It is a very valuable fertiliser for a large number of plants.

The oil from the Cotton seeds has been applied to

a variety of uses in America, such as the manufacture of the finer kinds of soap, also for mixing with paint, and for lubricating purposes; it, however, dries too slowly to be valuable for the first purpose, and is too gummy or sticky for the second. Another product is glycerine, but this manufacture has been but little attended to as yet. One gallon of crude oil will make 3½ lb. of glycerine. Its chief use, as before stated, is as a substitute for Olive oil, and the following extract will show the state of perfection in which the oil is now prepared:—"It is nearly impossible to detect good Cotton-seed oil from the best brands of Olive oil by taste, smell, or any other process; this the Olive growers of Italy have been unwillingly compelled to acknowledge. An instrument called the oleometer has been invented to distinguish between the two oils by means of their different specific gravity; but this is confessedly an uncertain and unreliable test."

The hulls or shells of the seed are used as fuel to drive the oil-expressing machinery, and containing some oil, they burn well and produce a good heat, and are used exclusively without any other fuel. It was recently stated in America that before long Cotton-seed would yield all the Grape sugar demanded by the commerce of the world. It is estimated that, "if all the seed produced was used and crushed this little article, once despised and deemed of no value, would be worth between 80,000,000 and 100,000,000 dols. annually."

WILD MANGOS.

The Jungli *am*, which is the original stock of all the fine Mangos, is not often met with in its native habitat, and less frequently in fruit. I have just received a few fine specimens of several varieties of Jungli Mangoes. From the fruits it appears they vary quite as much as our cultivated ones; and as to shape, they are the exact counterpart in miniature of many of our best varieties. My specimens came from the Kangra Valley, and were collected by a gentleman much interested in the fruit. I once saw the true Jungli Mango in the Dooras, and again afterwards growing at an elevation of about 2000 feet in Sikkim. It is very unlike the cultivated sort, having generally a straight trunk, whitish smooth bark, and thin leaves, forming a fine round-headed tree. The fruit rarely weighs 2 oz., often only 1 oz. The common country Mango, called "Deju," or "Desi," in Tirhoot, is really an inferior kind of cultivated Mango, and not the proper wild Mango of the forests.

Wild Mangos are found from India through Malay to Manila and some of the Pacific islands, and it is not really known if there is more than one species. The wild and cultivated sorts are so widely different in shape of fruit that they could almost be called distinct species, but every intermediate connecting stage may be found to bring them under one head. The flowers of the wild and cultivated Mango are exactly the same in structure, except that in the wild one there are often more stamens fertile.

It may not be known to most people that generally in a Mango flower there is only one stamen out of the lot fertile; this one is curved round just over the pistil in a peculiar way, to facilitate the fertilisation. The so-called "nak," or nose of the Mango, is the place the pistil adhered to in the flower. All this can be plainly seen with a moderately powerful reading-glass or lens when the Mangos are in flower.

PROTECTING MANGO FRUIT.

A very good way to protect Mangos from the attacks of birds and insects is to get a lot of very finely-woven, round, Bamboo baskets made, say 4 inches wide at top, 5 inches at the bottom, and as long as may be required for the fruit. See that there is no room for a fly to get in through the basket-work. Then put the Mango inside as it hangs on the tree, push a long thin peg through the top of the basket by the side of the stalk of the fruit on one side, and another similar peg on the other side, and the Mango will hold the basket up itself; then tie a little calico over the top of the basket, taking care not to tie the Mango stalk, and also to completely shut up the top of the basket. The Mango stalk must be quite free, because when the fruit is ripe, or nearly so, it will fall of its own accord, and will be found to be just fit to gather. If a net be suspended under the tree then all danger of bruising the fruit will be avoided. Then shake the tree, to gather only

the ripe ones. These should be kept on a "machan" for a few days till quite ripe, as all Mangos improve by keeping a little, and should never be eaten perfectly fresh from the tree. C. Maries, in "Indian Agriculturist."

CUDRANIA TRILOBA.

THIS name will be unfamiliar to most lovers of hardy trees and shrubs. It is, however, the true name of the shrub known in nurseries as *Maclura tricuspidata*, a comparatively recent introduction from China. From its resemblance to the Osage Orange, *Maclura aurantiaca*, Carrière concluded it was a *Maclura*, and named it *M. tricuspidata*. The Paris Jardin des Plantes was the first European garden which possessed the plant, and it was there it first flowered a few years ago. Probably the hot summer caused the species to flower at Kew the present year. It is a very interesting plant, a compact growing, somewhat spiny bush, with light green leaves, which vary very considerably in outline. In the young plant, and in strong shoots which develop after a plant is cut back, &c., they are very distinctly trilobate, but in adult flowering plants the tendency is to produce larger ovate entire leaves. According to an exhaustive and very interesting paper on the subject, published by Mr. F. B. Forbes, F.L.S., in the *Journal of Botany*, the plant now in question is the "ché," "ou-ché," or "shih" tree, the notices of which in standard Chinese works have long been a puzzle to botanists. The following particulars are abstracted from Mr. Forbes' paper. The leaves are used for feeding silkworms, but it is also said that its leaves are hard and not so good as those of the Mulberry. The etymological meaning of the character "ché" is "stone tree," and the species is said to prefer stony ground. The silk produced by silkworms fed on the leaves is employed in making lute-strings, which give a clearer sound than the ordinary ones. One author states that bownee use the wood to tip their bows with, and that the tree affords a reddish-yellow dye, called the "ché" yellow, which is used for the imperial garments. It is elsewhere stated that "ché" wood, to which has been applied a paste made of coal dust and vieogar, can be dyed black in a single night. For a very full account of the history and uses of *Cudrania triloba* the reader is referred to the *Journal of Botany*, vol. xxi, p. 145. A figure prepared from Kew specimens will appear shortly in the *Botanical Magazine*, G. N.

Captain W. H. Trant, of the steamer *Vendion*, sent five *Fuchsias*, which had travelled 15,000 miles.

The display of fruits was very extensive. W. H. Hunt exhibited a dish of very large Clapp's Favourite Pears; F. J. Ducher a dish of Ott's Seeding, which, though the smallest, were undoubtedly the finest flavoured Pears in the room.

- Sept. 17.—Rain from early morning till about 10 A.M., very dull day and night.
- 18.—Fine dull day, sun shining at times in the afternoon.
- 19.—Slight rain from 8 A.M. till about 11 A.M. Dull day. Fine clear night.
- 20.—Fine day and night.
- 21.—Slight rain about 8 A.M., very fine bright day from 11.30 A.M. Fine night.
- 22.—Dense fog in early morning, very fine day and night.
- 23.—Fine till about 2 P.M., drizzling rain from 3 P.M., and all the evening.

LONDON: Atmospheric Pressure.—During the week ending September 19, the reading of the barometer at the level of the sea increased from 29.86 inches at the beginning of the week to 30.07 inches by 5 P.M. on the 13th, decreased to 29.95 inches by 1 P.M. on the 14th, increased to 29.97 inches by 5 P.M. on the same day; decreased to 29.83 inches by 5 P.M. on the 15th, increased to 30.11 inches by 1 P.M. on the 16th, decreased to 29.96 inches by 9 A.M. on the 17th, increased to 30.09 inches by 5 P.M. on the 18th, and was 29.91 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30 inches, being 0.22 inch higher than last week, and 0.04 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 74.5°, on the 15th, on

the 19th the highest temperature was 57.2°. The mean of the seven high day temperatures was 65.2°.

The lowest temperature was 46°, on the 19th; and on the 15th the lowest temperature was 57.5°. The mean of the seven low night temperatures was 51.4°.

The greatest range of temperature in one day was 20°, on the 14th; the smallest, on the 17th, was 8.2°. The mean of the seven daily ranges was 13.7°.

The mean temperatures were—on September 13th, 58.2°; on the 14th, 58.7°; on the 15th, 64.3°; on the 16th, 58.4°; on the 17th, 54°; on the 18th, 53.7°; and on the 19th, 52.5°; of these 17 days there were above the averages by 0.8°, 1.5°, 7.2°, and 1.5°, respectively, and the last three were below by 2.6°, 2.7°, and 3.6° respectively.

The mean temperature of the week was 57.1°, being 1.2° higher than last week, and 0.3° above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 124.5°, on the 15th. The mean of the seven readings was 93.3°.

The lowest reading of a minimum thermometer placed on grass was 40°, on the 19th. The mean of the seven readings was 45.5°.

Rain.—Rain fell on five days, to the amount of 0.88 inch.

ENGLAND: Temperature.—During the week ending September 19 the highest temperatures were 78° at Cambridge, 74.5° at Blackheath, 73.9° at Nottingham; the highest temperatures were, at Plymouth 66°, at Truro, Newcastle, and Preston 68°. The general mean was 70.2°.

The lowest temperatures were 40° at Cambridge, 42.5° at Wolverhampton, 42.7° at Bolton; the lowest at Liverpool was 48.9°, at Brighton 48.8°, at Nottingham 47.6°. The general mean was 45.3°.

The greatest ranges were 38° at Cambridge, 28.5° at Blackheath, 27.7° at Wolverhampton; the least ranges were 19.4° at Liverpool, 19.5° at Plymouth, 19.7° at Brighton. The general mean was 24.9°.

The mean of the seven high day temperatures was highest at Cambridge, 67.6°, at Bristol 66.2°, and at Nottingham 65.9°; and was lowest at Bolton, 62.3°, at Sunderland 62.4°, at Liverpool 62.7°. The general mean was 64.3°.

The mean of the seven low night temperatures was highest at Brighton, 52°, at Bristol 51.5° at Blackheath 51.4°; and was lowest at Bolton, 45.4°, at Wolverhampton 45.7°, at Sheffield 47.3°. The general mean was 49.3°.

The mean daily range was greatest at Cambridge, 18.8°, at Wolverhampton 17.9°, at Bolton 16.9°; and was least at Brighton, 11.7°, at Liverpool 11.8°, at Newcastle 12.5°. The general mean was 15°.

The mean temperature was highest at Bristol, 57.5°, at Blackheath 57.1°, at Cambridge 56.9°; and was lowest at Bolton, 52.5°, at Wolverhampton 53.3°, at Sunderland 54°. The general mean was 55.5°.

Rain.—The largest falls were 1.49 inch at Preston, 1.41 inch at Bolton, 1.10 inch at Brighton; the smallest falls were 0.29 inch at Bristol, 0.32 inch at Newcastle, 0.35 inch at Truro. The general mean fall was 0.68 inch. Rain fell on every day in the week at Cambridge.

SCOTLAND: Temperature.—During the week ending September 19, the highest temperature was 68.6° at Leith; at Perth the highest temperature was 61.9°. The general mean was 63.9°.

The lowest temperature in the week was 34.5°, at Glasgow; at Aberdeen the lowest temperature was 42°. The general mean was 40°.

The mean temperature was highest at Edinburgh and Leith, 54.4°; and lowest at Glasgow and Greenock, 52.9°. The general mean was 53.6°.

Rain.—The largest fall was 1.96 inch, at Greenock; the smallest fall was 0.44 inch, at Aberdeen. The general mean fall was 1.11 inch.

JAMES GLAISHER, F.R.S.

Reports of Societies.

MASSACHUSETTS HORTICULTURAL.

BOSTON: August 20.—At the exhibition to-day V. H. Halleck, Son & Co., showed a new hybrid *Gladiolus*, *Argentuil*, which is, without doubt, the finest thing in this line. The stock originated with Herr Max Leitch. From the same firm came a new seedling variety of *Lilium lancifolium*, named *Opal*, white, with carmine dots, and quite distinct from any other variety. Mrs. F. B. Hayes exhibited a large collection of H. P. Roses and Asters. C. M. Hovey some good species of *Hydrangea paniculata grandiflora*. We also noticed large displays of cut flowers, *Gladioli*, *Gloxinias*, *Ploxy*, *Verbenas*, and *Marigolds*. E. Sheppard & Sons exhibited a collection of flowers, including some *Dahlias*—viz., *Winged Star*, *Acquition*, *Canary*, *Gracilis*, *Perfection*, *Lutea grandiflora*, *White Queen*, *Nora*, *Auber*, *Harlequin*, *Aurata*, *Defiance*, *Firefly*, and *Purple Prince*. They are not so good this year as usual, as they run to wood, and produce very few flowers, and these not of the best. On the fruit table were some fine specimens of the new Assumption Pear and Chenango Strawberry Apple, also some fine Moore's Early and Champion Grapes.

September 5.—This was the last of the free Saturdays for this season, and was the best. H. B. Watts showed a new white *Gladiolus* named *Fairy*. Joseph Taillit exhibited the new Rose, *William Francis Bennett*, which the committee deemed of good colour, but poor in the centre; a first-class Certificate was awarded for it. The same award was made for the new *Heliotrope*, *Roi des Noirs*, of very dark colour; also the new Rose, *Perle d'Or*, from C. M. Hovey. Dr. H. P. Walcott showed *Veronica longifolia submissilis*, but poor in the centre; a first-class Certificate was awarded for it. Strong exhibited seventeen vases of *Marigolds*, among which we noticed *Acer*, *Schubertii*, and *A. Reitenbachii*, the young growth of the former being of the richest soft pink, and the latter having a purplish tint in its early growth, changing to a rich dark purple as the season advances. C. H. Hovey exhibited a group of new *Gladioli*, hybridised with *G. purpureo-striatus*. Mrs. F. B. Hayes sent *Rhododendron Princess*,

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, Sept. 21, 1885, issued by the Meteorological Office, 116, Victoria-street, London, S.W. I.—The weather has been in a very changeable condition generally, some days being very dull and rainy and others fine and genial. In the south and south-east thunder and lightning were experienced.

The temperature has been 1° or 2° below the mean in

Ireland, the greater part of Scotland, in "England, N.W.," and the "Channel Islands," but about equal to, or 1" above, its normal value in most of the English districts and in the east of Scotland. The maxima were recorded in most places on the 15th, when the thermometer rose to between 59° and 65° in the northern and western parts of the kingdom and to 76°, 77°, or 78° over central, southern, and south-eastern England. The minima, which were generally registered either on the 17th or 18th, varied from 32° in "England, S.W." (at Llandowey), and 34° in "Ireland, N.," to 41° in the east, north-east, and south of England, and to 51° in the "Channel Islands."

The rainfall has varied considerably in different localities. Over Scotland, the south of England, and in the north of Ireland it has been more than the mean, in "England, E.," about equal to it, while elsewhere a deficit is shown. Over central and north-eastern England the fall has been very slight.

Bright sunshine shows an increase in most of the "Wheat-producing" districts, and also over the west of England, but a decrease elsewhere. The percentages of the possible amount of duration ranged from 20 in "Ireland, N.," to 45 in "England, N.E."

Depressions observed.—Very changeable, unsettled conditions have prevailed during this period. Several depressions have moved in a north-easterly direction outside our westerly and northerly coasts, the most important one being observed during the 19th. This depression brought moderate to strong southerly to westerly gales to all our western and northern stations, and fresh south-westerly winds to the south and east. During the 16th, 17th, and 18th, some small shallow disturbances passed eastwards, over the North of France, causing easterly breezes and thunderstorms over our southern and south-eastern countries.

Variorum.

WHERE STRAWBERRIES COME FROM.—In parts of Kent hundreds of acres are devoted to Strawberries, which are sometimes grown under fruit trees, but for the most part are planted in the open in rows, about 2½ feet apart and 1½ foot from plant to plant.

The plough is run between the rows in autumn to keep the plants on ridges, and assist in the drainage of the roots. In spring the ground is levelled, and a straw litter laid between the plants, in order to prevent the fruit from being splashed by the rains. When ripe, that required for dessert purposes is picked with stalks and gathered into small baskets, which are emptied into sieves holding about 12 lb., and for each of these the picker gets 3d. The packing is a task requiring considerable neatness and skill, and the practised hands sit in rough sheds built in the fruit gardens all the summer days arranging the ripe Strawberries with their leaves in the punnets; these again are packed in boxes containing sometimes thirty and sometimes sixty baskets, and are sent off in carts, or by train, to the market. The bruised or over-ripe fruit, termed "squashers," are packed in casks, and disposed of at some of the jam factories. An idea of the amount of fruit grown may be gained from the fact that from 6 to 8 tons of Strawberries have been sent in a day from one farm alone, and from 100 to 125 tons forwarded by one grower to market during a single season. The value of the crop varies from £20 to £60 per acre for best fruit, and for "squashers" and jam-fruit from £15 to £20 per ton. After gathering, the runners are cut away, and, with refuse, taken to the centre of the alleys, which are then dug and planted with Lettuces. A plantation lasts good five years, and is not in good bearing order until the second year. The cost of the runners is about 5s. per acre, and about 7000 plants per acre are required. *Castell's Family Magazine.*

PHORMIUM TENAX AND ITS THERAPEUTIC VALUE.—Among the botanical products of New Zealand there is one item for the *Materia Medica* that will prove a valuable auxiliary to the surgeon as soon as its therapeutical effects have become generally known. From 1869, when the properties of the plant were first made known, till the present, I have used it in hundreds of cases, including lacerations and amputations of every description, and I have no hesitation in saying that there is nothing known in the old country that can equal it in producing healthy granulations. I use a strong decoction—the stronger the better—made from the roots and the butts of the

leaves, boiled for twelve hours. At one time I had to make it fresh every second day, as it readily ferments and deteriorates, but since carbolic acid came into vogue I kept it for any length of time by adding about an ounce of equal parts of carbolic acid and glycerine to every quart. I require no other antiseptic precautions, but simply syringe the lesions occasionally with it, and maintain cotton wool or lint, soaked in it, constantly to the parts affected. If there are no foreign matters to be discharged there will be no discharge, in support of which will I instance the case of an Austrian, named Louis Lourich, whose forearm I lately amputated, after it had been shattered through dynamite. The ligatures were thirty-days in coming away, and the amount of pus from the operation up to that time would not altogether amount to a tablespoonful. The same patient had the soft parts of the other forearm torn and blown into such a mass of shreds that the members of the staff thought it was hopelessly beyond repair. I need only say that with the same treatment it became as sound and useful as before, and exhibits only scars showing where new skin had been formed. Some time ago a navy on the Winton Railway works had a loaded truck go over its foot, doubling it in the coil, bursting the integuments and leaving the os calcis nearly bare and the flexor tendons dipping loosely with bits of skin and fascia under the sole of the foot. The man lived in a tent near the works. I instructed one of his mates how to boil down a billy of Flax every day, and suspend it with a drip-rag over the injury, and the case recovered perfectly, with no appearance of pus, except on one occasion for twenty-four hours, through his mates leaving him for some sports or races with an insufficient supply of decoction, which compelled him to use water instead. In this case no carbolic acid, or anything, was used but the decoction of Flax by itself. I might adduce proofs by scores of its efficacy, but if, owing to these facts being made prominently known through the *Australian Medical Gazette*, medical men can be induced to test the remedy for themselves, it will require no assertions from me to cause the Phormium tenax to take the premier place as a granulating agent. *Francis A. Monkton, M.R.C.S.E., Surgeon-Superintendent, Kumara Hospital.*

A LARGE PIECE OF AMBER.—A piece of amber weighing 8 lb. (says the *Queen*) is at present being exhibited in the Mark Museum at Dantzig, for which the owner has refused £1500. It is probably the largest piece in the world without blemish. Frederick the Great, more than a century ago, paid the same sum for a piece weighing 13 lb., which is preserved in the Mineralogical Museum at Berlin, but it has gaps and cavities. Two beautiful pieces of fluke in amber are also to be seen in Berlin. One is a wurtz, which also was an acquisition of Frederick the Great; and the other is a complete tobacco-pipe, belonging to Frederick William III., the father of the present Emperor. It bears an admirably carved likeness of that monarch.

DENDROBIUM CHRYSANTHUM: *C. Herrin.* It is not rare for this to flower on growth of the current year.

ERRATA.—In the report of Royal Caledonian Horticultural Society's meeting, at p. 377, col. a, line 1, for "Mr. J. O. Mackenzie, of Portmore," read "Mr. J. Ord Mackenzie, of Dolphington." In article on Fertilisation in Ferns, p. 371, col. a, line 8, instead of "fronds are perennial," read "plants are evergreen."

GRAPES SHANKING AND SEEDLESS: *T. T.* Your Vines are in a bad state at the roots. Read our cultural directions on the Vine in this issue. You will then know how to proceed. Mrs. Prince is so unwise that it could scarcely be ripened before winter. You should have started this variety in April. The small seedless berries result from non-fertilisation of the flowers, and might have been avoided by impregnation with its own or other pollen applied with a camel-hair brush, or even by occasional syringing in the morning.

SEEDLING APPLES, &c.: *A. J. S.* Not equal to many others in cultivation. Pear, Bezi Quessou, or Nutmeg.

SIZE OF HALF-SIEVE: *W. J. L.* It is 3½ imperial gallons. The weight will vary with different things.

MUSHROOM DEFORMED: *W. Glen.* It is simply a case in which one Mushroom has grown on the cap of

another, the additional growth having the pileus turned upwards, and is destitute of a stalk. These malformations are not rare.

NAMES OF FRUITS: *J. H.* 1, Mulford Egg; 2, Passe Colmar; 3, perhaps St. Catherine (it was badly decayed); 4, Sandalls; 5, Golath (incorrectly called Nectarine Plum); 6, Lawson's Golden; 7, Kier's; 8, *Hypanoxis*; 1, Hawthorn; 2, *Calli*; 4, Gloria Mundi; 5, Franklin's Codlin Puff; 6, Dumelow's Seeding.—*J. R. Bury.* 1, Manck's Codlin; 2, Warner's King; 3, Cox's Pomona; 4, Beauty of Kent; 5, Lane's Prince Albert; 6, Cox's Orange Puff; 7, Reineette d'Hollande; 8, Wint's Pearmain. There is an Apple named Radford Beauty, a medium-sized round fruit of a bronzy-green colour.—*A. Holloway.* 1, Beurré Diel; 2, Giou Moreau; 3, Beurré de Caplaumont; 4, not recognised; 5, Fondante d'Autonne; 6, Sockle.—*W. W.* Williams' Bon Chrétien.

NAMES OF PLANTS: *Lattenbury.* Yellow Star Thistle (*Calceptria solstitialis*).—*D. M. Strachan.* *Vicia cracca*.—*H. C. & Sons.* 1, *Watsonia humilis*; 2, *W. iridifolia*; 3, *Trifolium aurea*.—*W. P. Hibern.* *Oncidium varicosum*.—*Ivy Shelvorton.* 1, *Perilla nan-kinensis*; 2, *Gazania uniflora*; 3, *Aster baccarabium*; 4, White Phlox var.—*C. J. K. B.* *Cymbidium giganteum*.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various cut flowers and their prices, including Abutilon, Asters, Bouvardias, Carnations, Boninas, Eucharis, Gardenias, Lapageria, and Lavender.

SEEDS.

LONDON, Sept. 23.—There were but few transactions on the seed market, the attendance being small to-day. The demand for Trifolium is now nearly over. Full prices are made for Rye, the trade continuing good. There is more inquiry for Winter Tares, at late rates. Moderate prices still rule for Mustard. Rape seed remains exceptionally cheap; this year's are the lowest ever known values. Blue Peas, on account of their scarcity, are exceedingly firm. The new Haricot Beans are cheap and good. The samples of new American Clover seed coming to hand show most unsatisfactory quality. Linseed is dearer. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday English Wheat, except just the best samples, was cheaper to sell, and foreign was much in the same way, except perhaps Indian and Australian, which showed fairly firm rates. Flour ruled dull, and the nominal top price of town was reduced 3s. per sack, making 34s. the quotation. Grinding Barley was firm, and the turn dearer. The new English varieties in quality, and the proportion of prime is small. Beans and Peas were unchanged. Maize, from scanty supply, upheld its value. Oats were dull, and rather in favour of buyers.—Wednesday's Wheat market opened with rather a firmer tone, but the want of demand prevented improvement, and the retail transactions that occurred left quotations nominally unchanged. Flour was quiet and unaltered. Maize was scarce and firm. Barley was steady, and Beans, Peas, and Oats, were quiet and unchanged.—Average price of corn for the week ending Sept. 19:—Wheat, 30s. 10d.; Barley, 34s. 1d.; Oats, 19s. 2d. For the corresponding period last year:—Wheat, 33s. 10d.; Barley, 32s. 3d.; Oats, 19s. 8d.

CATTLE.

At Copenhagen Fields on Monday the advance obtained in the best market on that day is night was not sustained, the sales being at fully 1s. per head lower, and in some cases a larger decline had to be conceded, the dull state of the dead meat trade and depressed rates at Smithfield militating against demand. Sheep were rather more numerous than on the previous Monday, but maintained that day's rates, although the sale was slow. The calf trade was very dull, and no pigs were on offer. Quotations.—Beasts, 10s. 10d. to 4s. 6d., and 4s. 8d. to 5s. 2d.; calves, 2s. 10d. to 10s. 4d.; sheep, 4s. to 4s. 6d., and 4s. 10d. to 5s. 6d.—On Thursday trade was quiet in tone. Both beasts and sheep sold slowly at about Monday's prices. Calves were steady, and best qualities made a shade more money. Pigs were dull.

HAY.

Tuesday's Whitechapel Market report states that trade was very dull, with considerable supplies. Quotations.—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; new Clover, 80s. to 94s.; hay, prime, 65s. to 95s.; inferior, 36s. to 60s.; and straw, 28s. to 35s. per load.—On Thursday there was a short supply on offer. The trade was very dull at late rates.—Cattle and Market quotations.—Clover, best, 90s. to 100s.; inferior, 60s. to 90s.; hay, best, 80s. to 90s.; inferior, 50s. to 70s.; and straw, 30s. to 35s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that the markets are largely supplied with middling and inferior qualities, but fine are not so plentiful. The latter realise fully steady prices, but the lower grades are a very difficult sale. Quotations.—Regents, 60s. to 80s.; Magnum Bonum, 50s. to 80s.; Early Roses, 70s. to 90s.; Hebrons, 90s. to 110s. per ton.—The imports into London last week consisted of 8573 bags from Hamburg, 400 Antwerp, 70 Rotterdam, 49 sacks St. Brieux, and 31 sacks from Boulogne.

COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 6d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 17s.; Hetton Lyons, 15s.; Lambton, 17s.; Wear, 15s.; Tees, 17s.; Dowils Merthyr, 16s. 3d.

Government Stock.—Consols closed on Monday at 99½ to 100 for both delivery and the account. The final figures of Tuesday and Wednesday were 99½ to 99½ for both transactions. Thursday's closing quotations were 99½ to 99½ for both delivery and account.

CARTERS' EARLY BULBS, FOR FORCING.

To produce Beautiful White and Coloured Flowers for Christmas and Easter Decoration.

- CARTERS' Earliest White Roman HYACINTHS. Per 100, 15s. 1/2; per dozen, 2s. 3/4.
CARTERS' Double Roman NARCISSUS. Per 100, 11s. 6d.; per dozen, 11s. 9d.
CARTERS' Paper-White NARCISSUS. Per 100, 11s. 6d.; per dozen, 11s. 9d.
CARTERS' Red and Yellow VAN THOL TULIPS. Per 100, 5s. 6d.; per dozen, 5s. 11d.
CARTERS' Extra Large SNOWDROPS. Per 100, 3s. 6d.
CARTERS' Double Sweet-scented TUBEROSES. Per 100, 3 s. 1/2; per dozen, 4s. 6d. All Parrels Carriage Free.

CARTERS' COLLECTIONS, SELECTED FROM THE ABOVE BULBS.—A, price 1s.; B, price 7s. 6d.; C, price 16s. All forwarded, packing free, per Parcel Post.

FOR Full Particulars see CARTERS' ILLUSTRATED CATALOGUE OF BULBS, ROSES, &c., gratis and post-free.

Carters Seedsman by Royal Warrant to His Royal Highness the PRINCE OF WALES. 237 High Holborn, London, W.C.

WHOLESALE BULB CATALOGUE

Contains List of 21 varieties of English, Dutch, and French-grown Bulbs, With Special Low Prices of the following:—

- 150,000 YELLOW CROCUS.
IRIS KEMPFER!—in about twenty different shades of colour. This grand Japanese Iris is hardly yet known in this country, but should be grown by every lover of flowers. It is by far the largest flower of this family, with most striking colours. We offer well established English-grown Roots.
IRIS GERMANICA, in great variety. This collection contains twenty-four different shades of colour. Also many other varieties of Iris.
20,000 NARCISSUS POETICUS PHENASIT (True).—True Early-flowering Ornament-eyed, blooming three weeks earlier than poeticus.
15,000 NARCISSUS, Orange Phoenix.—The King and Double White Dutch.

CARMAN, &c., in a Nursery.—Age 20; good reference.—K. E., 9, Devonshire Place, Chio's Hill, Heaton, N.W.

HOLLOWAY'S PILLS.—With the darkening of the days and changing temperatures the digestion becomes impaired, the liver disordered, and the mind despondent unless the cause of the ailment be traced to the natural state, and correct action on an operative like these Pills. They go directly to the source of the evil, thrust out all impurities from the circulation, reduce the temperature to the natural state, and correct all defective and contaminated secretions. Such easy means of instituting health, strength, and cheerfulness should be in the possession of all who see stomachs are weak, whose minds are much harassed, and whose brains are overworked. Holloway's is essentially a blood-purifying medicine, whereby its influence, reaching the remotest fibres of the frame, effects a universal good.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price, 5s. engraving, with Boiler, open feed syphon, 12 feet of 1-inch hot-water pipe, and patent joints complete, £4 4s. Delivered free to any station. Discount for cash.
 This is the simplest, cheapest, and most powerful apparatus made. It requires no back setting, no stopcocks, and no hot-water filter for fixing. The Boiler stands in the Green-house, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilized.
 It burns over 12 hours without attention at a nominal cost.
 Loughborough Boiler, to heat up to 62° Fahrenheit of 4-inch pipe, with hot-water pipe joints, &c., always in stock.
 Cost of Apparatus COMPLETE for Green-houses as below:—

GREENHOUSES & HEATING. B. W. WARRHURST. 314, BEAUFORT STREET, CHELSEA, S.W.

HILL and SMITH'S BLACK VARNISH, Oil Paint no Longer Necessary, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Inventors, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is not cold. It is used in the grounds at Windsor Castle, New Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.
 Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any station in the Kingdom.

UNSOLICITED TESTIMONIAL.
 "Pierrefield Park, June 21, 1876.—Sirs, I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox.
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been a article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which nothing is genuine. Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Brunley Hill Ironworks, Staffordshire; 111, Queen Victoria Street, London, E.C. 2; 7, Elmistack Street, Glasgow.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are especially suited for KITCHEN Gardens, as they have, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER and CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price LISTS Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Patterns Sheet of Plans of more elaborate Design, with Prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Sable Paving of great durability. Wall Copings, Drain Pipes, and Tiles of all kinds. Roofing Tiles of great variety. Slates, Cement, &c. F. ROSHER and CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND is fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples Sent free by post. FLINTS and JACK BURNERS, in great variety of patterns. KENT BEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER and CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount to the Trade.

GREENHOUSE GLASS, 1 1/2d. per foot, in boxes. Suitable for Frames, Conservatories, &c. PATENT NON-POISONOUS PAINT for Greenhouses, 6d. per lb., or 42s. per cwt.—B. LAMB and CO., Glass, Lead, Paint, and Varnish Merchants, Builders, and Decorators, Sundrymen, 8, Bucknall Street, London, W.C.

SUPERIOR VARNISH.

This Varnish is the cheapest and best covering which can be used for all outdoor purposes, and is fully two-thirds cheaper than oil paint. It is applied cold, and may be laid on by any farm labourer or other unskilled person. It dries quickly, giving a most brilliant finish, and looks equally as well as oil paint, yet at one-fourth the cost.
 PRICE in Casks, containing not less than 9 gallons, delivered free at most railway stations. Best prepared Jet or Black, 12 1/2d. per gallon.
 Catalogues of all kinds of Iron and Wire Fencing, Gates, Poultry Fencing, &c., free on application.

BAYLISS, JONES, & BAYLISS, WOLVERHAMPTON, and 139 and 141, Cannon Street, London, E.C.

DEANE & CO., Horticultural Builders and Hot-water Engineers,

45, King William Street, E.C. LONDON BRIDGE.

1st Assortment.—GRANDEUR A MERVILLE, Fir. 180; OTHELLO, D.Z. 125; KARL KROONPRINS VAN ZWEDEN, D.C. 200.

2d Assortment.—GIGANTEA, Fir. 250; NORMA, Fir. 85; BAKEN VAN HET L. E. 200; BLEU MOUANT, E.C. 100; LA TOUR D'AUVERGNE, Fir. 85.

Mixed Assortment.—ROBERT STEIGER, Fir. 120; AMV, Fir. 100; SULTANE, favourite, Fir. 60; GIGANTEA, Fir. 300; BLEU MOURANT, E.C. 600; BARON VAN HUYLL, E.C. 350; HEIRMEER, E.C. 120; LA TOUR D'AUVERGNE, Fir. 250.

Payment one month after delivery.

C. VREEBURG, Lisse, near Haarlem, Holland.

B. GILBERT, Anemone Nursery, Dyke, Bourne, Lincoln, begs to offer the following BULBS, PLANTS, &c.:

ANEMONE, King of Scarlets, B. G.'s own production, 4s. per dozen, 25s. per 100.

HEPATICAS, Double Red, 5s. per dozen, 30s. per 100. Single Blue, 4s. per dozen, 25s. per 100.

VIOLETS, Marie Louise, 4s. per dozen, 25s. per 100.

At the International Exhibition, held at the Alexandra Palace, B. G. was awarded a Medal for Garden Anemones. Testimonials from all parts are constantly coming in, the following from Mr. Roberts, *Gardener* to Lord Rothschild, only recently received:—

"Dear Sir,—I cannot speak too highly of your Anemones. They are superb both in colour and size of flower. I spotted a quantity, putting five bulbs in a pot, kept them under glass. In due time they threw up as many as two dozen splendid blooms. They flowered two months sooner than the outdoor ones, and were the admiration of all who saw them.—Yours very truly,"

"J. ROBERTS."

SURPLUS STOCK.
ISAAC DAVIES & SON

Have to offer the following Plants, in which they abound, at reduced prices. All the stuff is well grown and in fine condition for safe removal:—

RHODODENDRONS, Hybrid Seedlings, selected when in flower and the colour labelled on each plant, good bushy plants, mostly with buds, $\frac{2}{3}$ to $\frac{3}{4}$ feet high, 2s. to 3s. per dozen.

" Hybrid Seedlings, not selected, but of various colours, bushy plants, $\frac{1}{2}$ to 2 feet, 2s. per dozen, 4s. per 100; larger, very fine, 18s. to 24s. per dozen, 4s. to 6s. per 100; extra large bushes, 3 to 4 1/2 feet, 30s. to 42s. per dozen. Most of these are well set with buds.

" Seedlings from the best named sorts (including early-blooming seedlings), in great variety of colour, good bushy plants, 1 to 1 1/2 feet, 8s. per dozen, 50s. per 100, many with flower-buds.

" choice named kinds (including numerous beautiful varieties of our own raising), fine bushy plants, 1 1/2 to 3 feet high, mostly well-set with buds, 30s., 40s., 50s., to 60s. per dozen.

HOLLIES, &c.

The following carry fine balls of roots, and are in excellent condition for removal:—

HOLLY, Hodgins', fine bushy trees, 2, 3 to 4 1/2 feet high, 2s. 6d., 3s. 6d., to 5s. 6d. each.

" Variegated, of sorts, 1 1/2 to 5 feet, 1s. 6d., 2s. 6d., 3s. 6d., 5s., to 7s. each.

" Common Green, fine bushy trees, 1 1/2 to 2 1/2 and 3 feet, 6s., 10s., to 12s. per doz.

BOX, Handsomely, fine bushy trees, 2 to 2 1/2 feet, 5s. to 8s. per dozen; 1 1/2 to 4 1/2 feet, 9s. to 24s. per dozen.

ANDROMEDA FLORIBUNDA, thick bushes, 1 1/2 to 2 feet high, 4s. to 5s. 6d. per dozen; 2 to 2 1/2 feet, 18s. per dozen; densely covered with flower-buds, 2s. each, 21s. per dozen.

DAPHNE MEZERIUM, Red, 1 1/2 to 2 feet, 2s. 6d. to 4s. per dozen; 2 to 2 1/2 feet, very bushy, 9d. to 12s. 6d. each.

LILUM AURATUM (home-grown), from seed of our own sowing, good flowering Bulbs, 9s. to 12s. per dozen.

POPLAR, Golden, 6 to 8 feet in circumference, 1s. to 2s. each. The beautiful golden foliage makes this the most desirable tree for mixing with other ornamental trees.

THORNS, Flowering, Climbing ROSES, RETINOSPORAS, AUCUBAS, Hardy HEATHS of sorts, and other stock, which we hold in large quantities, and now offer at reduced prices to clear grounds.

CATALOGUE with sizes and prices on application.

THE Gardeners' Chronicle.

SATURDAY, OCTOBER 3, 1885.

BATTLE ABBEY.

THOSE who have read Mr. Freeman's account of the Battle of Senlac will feel a peculiar interest in Battle Abbey. It stands on high ground 7 miles from Hastings, which the Normans had occupied after landing at Pevensey. Harold's own vast estates included the greater part of Sussex, and, knowing the country well, he had marched straight from London and pitched his camp on the heights of Senlac. This neighbourhood is the most picturesque part of Sussex. The town and abbey of Battle cover the summit of one of the points of the Forest Ridge. At the time of the Conquest the great primeval forest, the Andrees Weald, whose remnants form the modern Weald, covered the whole country, which consists at present of pleasing little hills and dales. From the windows and terrace of the Duke of Cleveland's house, now called Battle Abbey, the extensive landscape includes Beachy Head and the distant South Downs, with glimpses of the wide green lawn called Pevensey Marsh, and Bex Hill, a rising watering-place on the coast. The sea is seen through the leafy openings between the hills, and immediately opposite the Abbey is the highest of the neighbouring hills, known as Telham Hill, and called by the Saxons Hetheland, or Heathfield, a name now given to another hill and parish of the district, having a similar soft and sandy soil, and producing in great profusion the same native plant, Heath or Heather.

Harold had been advised to baffle the enemy by retreating on London and harrying the country. He replied, "Never will I burn an English village or an English house; never will I harm the lands or goods of any Englishman." The Normans had landed at Pevensey September 28, the Battle of Hastings, as it is now called, was fought October 11, 1066. We are not concerned here with this great event in English history, except as it introduces the history of Battle Abbey. In accordance with his promise the night before the battle the Conqueror founded a monastery in honour of St. Martin on the spot where Harold and his brothers and chief followers fell in the last act of the tragedy as night was closing. The mitred abbot of this great monastery sat in Parliament, and by virtue of his immunities and privileges he was a thousand times more the master of the surrounding country than the present owner of Battle Abbey.

The entrance from the street of Battle to the grounds in which the house and ruins are situated is by a Gothic and embattled gateway, which admits the visitor into a wide space between the gate and the house. Beyond it are the ruins, including those of the great hall or refectory, and a beautiful Gothic hall of the time of King Stephen or of Henry II., where the monks feasted their tenants and the country round. Beneath it are crypts divided by graceful columns and springing arches, forming a somewhat gloomy vault used by the monks as a promenade.

SUTTON AND SONS, SEEDSMEN by Royal Warrant to H.M. the Queen and H.R.H. the Prince of Wales, READING.

The ruins of this great establishment have now become the ornamental rockwork of a shrubbery (see fig. 93, p. 433). The site of the great church forms a sober looking garden under the south-east windows of the house, and is entered from its side-door. The borders are edged with Box, and the garden itself is fenced with Yew trees. Brilliant gardening, for which the site and soils here are admirably adapted, can hardly be expected from an octogenarian proprietor. There are 8 or 10 acres of shrubbery around the house, and eight men are employed in this department and in the productive kitchen garden, which consists of about 2½ acres, within walls. Owing to the warm soil, shelter, and southern position, this is a land of outdoor Figs and Peaches. You will hardly see within a day's march such wall fruit as Mr. Burgoine can exhibit. His sorts of Figs are the Brunswick, which in Devonshire is grown as a standard, as it is in the Sussex village of Tarring, and the Brown Turkey. Mr. Burgoine very modestly attributes his success with Peaches partly to his numerous hives of bees, which he thinks assist the setting of the blossom.

Those who are interested in the growth of tender plants outdoors instead of under glass, where they are more often found, will not I hope complain of the following list of some of the plants covering the terrace wall, however prosaic it may be. It is a noble wall, 300 or 400 feet long, divided into compartments by enormous buttresses facing south, and more than 20 feet high. The Normans delivered their attack up this steep front, which the wall has rendered perpendicular, the house and terrace being above. A lower terrace, bounded by a fence of Laurostinus, passes along the foot of the wall, and at a lower level runs the valley, with its streamlet which is interposed between the heights of Senlac and Hetheland. Our palatial wall is built of the warm-looking yellow-grey sandstone of the neighbourhood, and the tender plants it shelters flourish in a dry and light loamy soil, which is both absorbent and retentive of warmth.

First on the list must be named *Stantonia latifolia* from China, an evergreen, 20 feet high, which finds here, I believe, the only site in England where it bears its fruit. This specimen was illustrated in the *Gardeners' Chronicle*, Feb. 19, 1876, p. 244; another one grows in the abbey. The *Choisya ternata*, 6 feet high, bears its white blossoms here, as well as *Escallonia montevicensis*, which is too tender for most sites, and far more so than *E. macrantha*, a common shrub of this neighbourhood. Its large trusses of white flowers are very handsome. The *Nerium Oleander* flourishes, but does not, I think, flower here, as it would do probably with a sufficient supply of water. Another noble and unusual wall shrub, growing 20 feet high, is the showy *Ceanothus* of the variety called *Gloire de Versailles*, with long spikes of pale blue flowers. *Trachelospermum jasminoides*, known as a stove climber, tops the wall here with blossoms like those of the *Jasmine*, and has safely resisted 20° of frost. *Mandevilla suaveolens* generally bears the character of a greenhouse climber, which may be cultivated in summer out-of-doors, but does not then produce flowers. Here, however, it is hardy, climbing high, and bearing sweet and snowy-white flowers.

The sweet scented *Verbenia* may not be uncommon outdoors; but it is a favourite in many cottage gardens in this county, as in Surrey also, but it rarely obtains a height of many feet, and does not blossom freely, if at all; whereas, here it covers the wall and its sheltering buttresses to a height of 20 feet, and I hardly recognised the familiar plant at first in consequence of its curious disguise of a white sheet of blossoms. *Tropaeolum pentaphyllum* and *T. speciosum* both grow here, the former with yellowish-red blossoms, being the greater novelty of the two and demonstrating a light

warm soil; the latter preferring a deep and moist, but still a light soil with a warm wall, and bearing the apt name of *Flame Nasturtium*, from the brilliant colour of its flowers. This creeper is, I suppose, when growing in perfection as I have seen it covering the pillars and roof of an ornate summer-house in Scotland, or sometimes of a cottage porch, one of the most exquisite, notwithstanding its small blossoms. The *Hadrothamnus fasciculatus* with its gay branches and its sheet of coral-like berries in spring, is described in Paxton's *Botanical Dictionary* as an elegant greenhouse plant bearing panicles of flowers in profusion. So it seems from what I saw, and so says Mr. Burgoine, but he adds that it ought to be more widely grown. But we do not all own a great sunk wall, shutting out north and east, with the flower-favouring, shrub-producing soil of the Hastings Sands.

As for other items in this catalogue, *Fuchsia*, *Fig*, and *Myrtle*, *Magnolias*, *Bottle-brush tree*, and *Pomegranate* are all here, ornamental though not rare. Quitting this interesting spot we looked into a conservatory and saw *Brugmansia Knightii*, with its gigantic white and tubular blossoms, and *Luculia gratissima*, which produces its cymes of fragrant, pink-coloured flowers at Christmas—trusses resembling those of the herbaceous *Phlox*. This is a tender plant, not very easy of cultivation, unless when the art is understood. Pot culture should be eschewed as the border of the greenhouse proves a more suitable position.

Finally, we ascended to the terrace, passed to a retired part of the shrubbery, where the foundations of "Harold's Chapel" mark the spot, near some Cedars of Lebanon, in the midst of a most peaceful garden scene, where the Saxon standard was planted, and where the last of the Saxon kings fell in its defence. We cannot quit the spot, unparalleled as it is among all the historic sites in England, for the importance of the event that occurred thereon, without recalling, in a few words, Mr. Freeman's account of the battle.

It began at nine o'clock in the morning and raged nearly six hours before the assailants gained any advantage. A series of single combats had been fought, the rival leaders had more than maintained their reputation for skill as generals, and for personal valour as fighting men. At length the ardour of the defenders and their confidence of having gained the day led to their discomfiture. A feigned retreat was executed by William's orders; they were fatally beguiled, and following the enemy, lost their defensive array. The slaughter at the close was immense. A deep ditch, called appropriately "Malfoyse," was filled up level with the bodies of the soldiers. Harold's brothers Gurth and Leofric were both killed. The king himself was killed by an arrow later in the day, as twilight approached, and the sun had set, before the battle closed, the last blows being struck in the gloom of the falling light.

The body of the Saxon king was wrapped in a purple robe, and buried, by the Conqueror's permission, by one of his knights, Wm. Malet, who had been one of Harold's companions during his visit to Normandy. This noble knight bore the body to the Norman camp at Hastings, and buried it beneath a cairn of stones on the rocks of the shore, probably at Fairlight. In December following it was removed to Waltham Abbey, which Harold himself had founded. His tomb was destroyed in 1540.

Eastward of the church at Battle are some fields, still called the Lake, and sometimes Sanguelac, the "Lake of Blood," and a few years ago the chalybeate springs, which form the sources of the little river Asten, were believed to owe their redness to the blood of the slaughtered English. H. E.

New Garden Plants.

PESCATOREA RUCKERIANA, n. sp.*

MUCH in the way of *Pescatorea Dayana*, but entirely distinct in the acute undulate sepals and petals, which appear to be fond of twisting, which produces an entirely novel appearance. They are white, with green apex, and a large light purple area near the apex. The lip has some yellow at the base of the side lacinia. The large callus is white, the anterior part purple. It appears triangular, being revolute on each side, and rolled underneath at the top. This is very peculiar. The column is marked by a purple and yellow hue at the base. This fine plant has been grown by Mr. Francis Kramer in the Flottbecker Park, the grand place of Mr. Rucker-Jenison, who combines two names, both highly regarded in Orchidic circles. It is dedicated with great pleasure to this new lover and possessor of Orchids, with the wish that this first novelty may be followed by others. I learn that the plant was imported by Messrs. Linden, of Ghent. H. G. Rehb. f.

CYPRIPEDIUM RADISSUM, n. *Hyb. artif. Veitch*.
(LAWRENCEANUM × SPICERIANUM.)

A cross between the natural species and the *Sedenian*-raised Orchid, kindly sent me by Mr. Harry Veitch. It is stated to have quite the habit of *Cypridium Spicerianum*. The flower, however, though adorned with purple-mauve, has lost the chief feature of the *Cypridium Patrianum* and *Spicerianum*—the curved undulate petals. The leaf at hand has neither the basilar purple blotches so conspicuous in *C. Spicerianum*, nor its undulations. It is light green, with scattered, transverse, dark green Hebrew-like markings. The brown peduncle bears a very short, keeled, greenish bract, and a dark brown and greenish ovary. The dorsal sepal is remarkable—*la pièce de resistance* of the whole, though neither so striking as in *C. Spicerianum*, nor as in *C. Lawrenceanum*.

It is rather broad and acuminate, white with mauve-purple lines over the chief nerves (a dozen): it has a dark purple, almost concealed midrib. All these nerves are green at the base, and have a green tint between them. Dorsal sepal nearly as long as the lip, with light brown lines. Petals nearly divaricate, though descending a little; a little undulate at the margin, and provided there with some cilia; green, with sepia-brown midline, a wash of sepia-brown around the anterior borders, and numerous sepia-brown spots on the upper margin. The form of the lip is that of *Cypridium Lawrenceanum*, green on the back, brown with green border in front. Staminate nearly as in *Cypridium Lawrenceanum*, though only with three teeth in front, but with a light mauve disc and a white border. The orange eye of *Cypridium Spicerianum* has vanished.

The most remarkable thing, the nature of the petals, has already been alluded to. The radiating lines of the vexillar dorsal sepal have been kept as they are in *Cypridium Lawrenceanum*, but coloured with the purple-mauve of *Cypridium Spicerianum*. The lip is like that of *C. Lawrenceanum* with the colours of that of *C. Spicerianum*; and so the staminate bears a compromise between the shape of the one and the colour of the other. All these phenomena are highly interesting. H. G. Rehb. f.

DENDROBIUM LOWII (Lindl.) FLEIOTRICHUM,
n. var.

Mr. Edward Low kindly sends me a flower of a new variety of this rather well-known plant. There are no red lines on the lip, and its basilar lacinia bear numerous short hairs. H. G. Rehb. f.

* *Pescatorea Ruckeriana*, n. sp.—Aff. *Pescatorea Dayana*, Rehb. f. Sepalis tepalisque cuneato-oblongis acutis undulatis, hinc tortis; labelli lacinias laterales angulatis, lacinia mediana triangulari antice levii, lateribus revolutis, apice acuto involuto callo majusculo cremato, dentibus obtusis quinque mediis productis. H. G. Rehb. f.

COMMON GARDEN INSECTS.

INSECT-LIFE abounds wherever there is plant-growth. Few studies repay the gardener the time spent in his pursuit better than that of the insect inhabitants of his garden; nothing is more soothing to the business man than to escape the smoke and turmoil of the city and spend an afternoon or an evening amongst the plants and their unbidden guests that every garden yields. But minds differ, and some are so constituted that such pursuits as gardening and entomology are unsuited to their nature. Let us hope, however, that such of our readers as may be of this class will still have sufficient interest in the wonders of outdoor insect-life as to follow us in our little entomological rambles.

It is a hot afternoon, and we saunter into our garden; the air is astir, the sound of ten thousand insect wings blend together into one continuous murmur; we take a quiet seat near the flowering Apple tree. In such a position, at the edge of a wood, let our readers imagine themselves, for the moment to be

ground or other suitable situation, to start the nest, and serve as a basis for its construction. Should the little architect not be successful in finding this, she excavates by the use of her feet and mouth an entirely new hole underground, in size varying according to the extent of the colony to be founded. The roof and sides of this subterranean chamber she makes smooth, and licks over with her long tongue, thereby covering them with her glutinous saliva. They then receive a coating of wax, and a series of waxen cells are constructed of irregular shape and dimensions, differing in this respect from the hive-bee's cells, which are of geometrical construction. The number of cells built in the nest varies, amounting sometimes to 200 or more, but in general not exceeding half that number, and frequently being only twenty or thirty. It seems, however, that at first only a few cells are constructed, and one or two eggs placed in each. The little white larvæ that proceed from these are fed by the mother bee with pollen and honey mixed, which she collects from far and near, and they remain in their cells during the pupal

the most voracious—devouring an astonishing number of flies of moderate size. Some brightly-coloured species when seen winging their rapid flight in the full blaze of summer's sunshine, look gorgeous. We well remember years ago watching for hours together amongst dense luxuriant foliage on the banks of the Seine on one of the hottest of days of the season, the lovely brilliant blue dragon-flies, chiefly of the genus *Agria*, in thousands, displaying their gaudy colours in their rapid flight above the water, when all Nature, save them and their prey, seemed lazy and overcome by the heat. The larvæ are aquatic. We have kept some of these insects in an aquarium for a long time, and were enabled to watch their transformation closely. They are not fastidious in their food, and almost any live insect of a small size that comes within reach is attacked and devoured by the larvæ. The manner in which the fly emerges from the pupa case is very curious. The pupa, when the proper time has arrived for it to undergo the last process of its transformation, seeks out a convenient water-plant stem, and slowly crawl

FIG. 90.—COMMON GARDEN INSECTS.

situated, and let us observe a few of the most conspicuous insects that pass before our eyes. A humble bee (*Bombus lucorum*) is the first to attract our attention; it is about to pay a visit to the Apple blossom, and is worthy a brief description here. This species is common, and makes itself conspicuous in nearly every garden, especially in the neighbourhood of trees; it is not so sharp a creature as butterflies or wasps, and if engaged in extracting honey, or gathering pollen, or in nest-building, it may readily be approached closely and examined. It is one of the sociable bees, living in a society composed of three castes or sexes—namely, males, females, and workers. The females, of which one is drawn in the woodcut (fig. 90), are of large size; the males are somewhat smaller, and the workers half the size of the females. The female bee is black, with a band of white across the abdomen, and the end of the body white, and of yellowish colour underneath. During the winter she exists in a torpid condition concealed in crevices, and presenting the appearance when discovered of being dead. In early spring she awakens, and takes to wing, and seeks out a convenient situation for her nest; a soft but dry mossy place is preferred, especially if there be already a hole in the

state. They then transform into workers in May and June, and commence at once to relieve the mother in her arduous duties. They build more waxen cells, until the full number is completed. The mother-bee supplies one egg for each cell as soon as it is formed. And so proceeds the construction of the nest, until in August or September the nest is full of bees—workers, males and females. Some of the latter sex lie dormant in a cell or crevice during the ensuing winter, when they form new colonies in the same manner as above described, and so commences again the cycle of bee-life. An interesting incident in the economy of these nests is the utilisation of the old empty cocoon or pupa cases as pots for storing honey and pollen, into which, as each bee returns from a foraging excursion, it empties its supply.

On the left of the humble bee, in the illustration, is seen a large insect, which will readily be recognised as being one of the

DRAGON-FLIES,

a numerous tribe of insects, most of which are possessed of handsome colouring and form. The species represented in our drawing is *Libellula depressa*, not one of the prettiest, but certainly one of

up, and when it has become somewhat dry the skin splits and the insect comes out, generally head downwards, the large wings gradually unfold, and after a great deal of preliminary cautious fluttering it takes to wing, and helps to free the air of thousands of smaller insects. In the top left-hand corner of the illustration is figured one of the prettiest of insects,

THE LACEWING FLY (*CHRYSOPE VULGARIS*),

which belongs to the same family as the dragon-flies, and whose beauty, as is the case also of the latter, lasts only during life, the dead insect possessing but little colour. The ample wings are beautifully transparent, of a brilliant green tint, but exhibiting according as the light falls on the insect nearly every colour of the rainbow, and covered with the most delicate and beautiful tracery of veins, finer than the finest lace ever produced, the antennæ being long and tapering, and in the head are set a pair of the most brilliant golden eyes, whilst the long thin body is light green. Pretty as this insect thus appears to the unaided eye, much greater beauty is brought to view by the use of the microscope, or even a pocket lens: the eyes and the wings are then seen to sparkle in the light, supposing the fly to be alive, and every turn

of the magnifying-glass exhibits to the view fresh beauties. Like the beauty of many of our brilliant modern anilindyes, the gorgeous hues of this insect are fugitive as bright. Only in the living insect are such hues to be seen, as with its life its beauty of colour departs. Moreover, though it delights the sight, this insect offends the sense of smell—its odour it emits when captured or annoyed, is exceeding disagreeable. The eggs of the lace-wing fly are deposited in a curious manner. Each egg is glued on the top of a pedestal, or foot-stalk; about half an inch high, formed of a thick glutinous secretion emitted by the insect (shown in fig. 90), which hardens almost instantaneously on coming in contact with the air. The larva of the lace-wing fly feeds chiefly upon aphides, or plant-lice, and has the extraordinary habit of covering itself with the skins of its victims. It is voracious, eats enormously, and grows rapidly, and in from two to four weeks after emerging from the egg, spins an unusually small cocoon, and transforms into the winged state.

SKIP JACK, BEETLES.

A large family of beetles known as skip-jacks, or click beetles, are to be observed on a great variety of plants. If the branches of a tree or bush be shaken over an outspread umbrella or sheet of paper some specimens may generally be secured. As an example we have given a common species in fig. 90 on the stem of the Apple tree. When alarmed and cannot escape they sham death, and if they fall on the back, as they are sure to do, suddenly spring into the air with a clicking noise, by which movement they generally contrive to get out of sight. This little manoeuvre is managed by a kind of spring on the underside of the insect, whereby it arches its body, thus resting on the head and tail end only, and then suddenly straightens itself, the spring causing the middle of its hard body to strike the ground with such force as to carry the insect into the air. They have large wings, and are frequently in flight, but do so in such a clumsy manner as to be readily caught by the hand.

The larvæ of some of these beetles, especially that of the common skip-jack, or *Elatér sanguineus*, are the well-known and well-hated wireworms—so named from being long and hard—which commit such extreme havoc with our crops, whilst many garden plants suffer more from these than all other insects together—in fact they may be said to be indiscriminate eaters and still more indiscriminate destroyers, as they generally devour the roots and lower portions only of the plants. There is no remedy for the mischief of these grubs so effectual as the natural one—frequent hoeing of the ground and “high” cultivation, whereby they are exposed to the attacks of birds and moles, which are their greatest enemies. C. Francis Young.

MONTSERRAT.

(Continued from p. 395.)

BELOW the path leading round to the falls may be noticed a high group of flowering shrubs on the confines of the lawn. This is known as the Doctor's border, in memory of Dr. Cargill, a personal friend of Mr. Cook, and a good botanist, who spent much energy and thought on the place. Among the plants in this border are *Dacrydium cupressinum*, 30 feet high; *Colletia horrida*, *Dryandra argentea*, *Dammara obtusa*, 50 feet high; *Ceanothus azureus* fore-also has to be cut back on account of its vigour; the *Guava*, which bears edible fruit in hot seasons; *Aralia pentalhalla*, *Jacaranda brasiliana*, *Leptospermum bullatum* and *scoparium*; *Lasiandra argentea*, *Catanospermum australe*, *Excochorda grandiflora*, *Laurus californica*, 5 feet 9 inches in girth; *Bombax pubescens*, and *Arcaucaria Ruloi*. In the surroundings of this mass of foliage and flower, i.e., on the lawn or on the high bank between it and the encircling walk, may be found the following (anything that is not a good specimen or perfectly healthy is omitted, so as to make the list reliable for those who wish to know what exotics can be grown out-of-doors in S.uth Europe)—*Habrothamnus cyanus*, *Grevillea robusta*, 70 feet high; *Magnolia Campbellii*, *Laurus foetens*, *Ficus Benjaminii*, *Arcaucaria Cunninghamii*, 70 feet; *Sirelitzia Augusta*, covering a large expanse of ground; *Sciadopitys verticillata*, *Cordylone indiva*, 30 feet high; *Diospyros ebenum*, *Eriobotrya japonica*, 33 yards to the circuit of the branches; *Eugenia*

australis, 3 feet 4 inches in girth; *Argania sideroxylo*, *Sida micrantha*, *Rhopala Pohlii*, *Ceratonia Siliqua*, and last, but not least, a magnificent specimen of *Macrozamia Mackenzii*, a fine Australian Cycad, described in *Gardener's Chronicle*, May 26, 1877, by itself on the lawn. A Cycad on a velvet lawn—and such a Cycad! Mackenzie, who saw the plant himself, said it was the finest in Europe.

As the visitor descends the steps to the walk which leads to the falls, and then proceeds along the top of the opposing stretch of lawn on the other side of the ravine, he notices everywhere the foliage of high Palms mingling with or waving above the trees and shrubs—unquestionably the finest combination possible in a garden. Beneath the wall on the left are *Clianthus pulegius* and *Fuchsia lilacina*, the latter, a very pretty free-flowering species, very little known in England. (As this climate is too hot for the Lilac, this plant forms an excellent substitute.) Further on, on the same side, are *Spormannia africana*, *Lagerströmia indica*, *Magnolia grandiflora*, quite a tree; *Ipomœa Learii*, and *Bignoniæ*; *Rondeletia (Rogiera) rosea*, *Erythrina* of sorts, *Stadmannia amabilis*, *Musa sapientum*, *Sirelizia regina*, *Canna*, 6 feet high; *Imanophyllum*, *Curculigo glabra*, *Hedychium coronarium*, *Libonia floribunda*, *Lasiandra macrantha*, 20 feet high; *Fuchsia microphylla*, prettily trained up a *Dracæna*; *Cantua dependens*, quite frutticose; *Trachelospermum jasminoides*, trained on a wall; likewise *Mandevilla suaveolens* and *Clerodendron Thomsonii*, *Franciscea (Brunfelsia) eximia*, and *Solanara grandiflora*, trained over the path and then up a tree on the outside. The most prominent of the Palms just here are *Sabal unbraucalifera*, 6 feet in girth, and altogether a magnificent specimen; *Trachycarpus Fortunei*, 30 feet high; and *Phoenix dactylifera*, 40 feet.

On the right-hand side is an *Arcaucaria excelsa*, with the following dimensions:—Height, 70 feet; girth at 1 foot up, 8 feet; circumference of branches, 52 yards. Adjoining, and on the lawn, a *Latania borbonica*, 4 feet 9 inches in girth at 3 feet from the ground, and 19 feet in height; *Chorisia speciosa*, 30 feet high; *Pittosporum Cargillii*, *Brugmansia (Datura) suaveolens* and *sanguinea*, the latter 3 feet 2 inches in girth; *Cycas revoluta*, of which the circuit of the branches is over 23 yards; and *Hibiscus rosa sinensis* are among the other notabilities. A pretty feature is formed by a Rose taking possession of an *Arcaucaria*, and forming an arch over the path.

At the bifurcation of this path is a reservoir for purposes of irrigation. Its walls are covered by choice creepers, and in any shadowed crevices are growing exultingly Maidenhair Ferns. Flowering plants, such as *Begonias*, purple *Lantanas*, and the *Cineraria* of the florists are planted in the border adjoining the path. In the angle, where a walk leading from under a Fern-covered tunnel joins, is another tall Date Palm, 6 feet 1 inch in girth as high up the trunk as to 10 feet. The ground around is hidden by a garniture of Ferns. Among them are *Nephrodium setosum*, *Asplenium bulbiferum*, *Lomaria gibba*, *Adiantum reniforme*, *Asplenium Veitchianum*, *Blechnum brasiliense*, and *Neprolepis exaltata*. The low rockwork bounding the path and all the way to the Valley of the Tree Ferns is *Sclagipœlla* clad. This spot is called Puck's Corner, because that mischievous fay is held to have fostered a curious vegetable growth. It was thought that a Cork tree would be in its right place among the Ferns. Accordingly it was planted, supported by a stake cut from a Plane tree. The stake rooted, and the two trees have grown up quite apart, as if from one base. The girth of this common trunk is 1 foot 1 inch, a matter of twenty years' growth.

“Two trees in one—puzzle to gardening men!
Plane tree and Cork in sworn hostility;
For with averted looks they climb on high,
And yet their bases intertwiningly
Mix in eternal union!”

The walk now is shaded by high trees, through which the sunshine glances fitfully on the delicately chiselled foliage of the Ferns. Ahead of the rock of the falls grows louder, and the splash of the stream against the rocks. The undergrowth of Ferns is here quite wonderful in its variety, *Davallias*, *Priritises*, *Lomarias*, and *Pelleas*, mingling as if their fronds had been arranged by fairy fingers. Above them tall *Cyatheas* and *Dicksonias*, their stems invested by inquisitive *Fernlets*, curious to know what the world is like from

so high a position. In the background on the left is a group of blossoming *Camellias*. A bridge, constructed so as to harmonise with the scene, crosses the stream about midway between the falls. Paths, with Ferns above, around, and everywhere, lead up to the chief falls. Everything is so marvelously strange and beautiful as to be beyond the powers of an ordinary scribbler. The Tree Ferns in the glen nearest the rushing stream are in the most perfect health, every frond glowing with silver-beaming spray flung from the water's chafed breast. Round the fount into which the stream first pours itself, *Dracænas*, *Bamboos*, and the *Papyrus* take the place of the Ferns. The stream so impinges that much of the surface of *Hippocrene*, as this rock-formed tarn is called, is calm, except for the ceaseless circling ripples swimming to the marge—

“Reflecting tranquilly those lines
Of tree and shrub, and rocky steep,
Towering around with careless grace.”

Enjoying the luxury of a spray bath on the craggy steep are “wilding Ferns and bright wild Ivy,” and Nile's white Lily wade far into the water. Looking down the rocky channel, so lovingly hid by the Ferns, glimpses of the glistening fountains of the *palacio* and the great lawn can be seen through the trees. Above the Ferns on the right are *Azaleas*, *Camellias*, and *Rhododendrons*, in full flower. The best view perhaps is from a little ledge, which is, as it were, an alcove by the side of the walk we have followed from the house. Here we are in the centre of the Ferns, and whether glancing upward or downward, it seems as if we were in another land. Below this standpoint the watercourse takes a turn, and so the Ferns cover a larger expanse of ground. The giant curves of the *Cyathea medullaris* fronds contrast vividly with the numerous fresh green plumes springing from the heads of the *Dicksonias*. The hill-side for some distance supports the same exquisite greenery. The background is the changeful foliage of Dr. Cargill's bed—his “*Thalamus*” he playfully called it.

“Sith it lies
A bed of odorous verdure on the rise.”

It is lovely, too, at the foot of the falls, where the brook, issuing from the Ferns, speeds from rock to rock in the hollow of the lawn. Its gushing sound attempers the roar of the great cascade which hangs whitening above, although only revealed in part by the jealous Ferns. The stream above the falls is prettily edged with rocks, and the path near it likewise—a Fern-girt archway, surmounted by *Yuccas* and *Aloes*, being very tastefully designed.

Just at hand is the main entrance, through an avenue of *Goa Cedars (Cupressus lusitanica)*. Planted twenty years ago, at a distance of 30 feet apart, all of the trees now touch. There is no *Conifer* with more graceful or more beautifully traced foliage than this. Behind them are standing tall *Arcaucarias*: *excelsa*, *Bidwillii*, and *Cunninghamii* suit the climate best. The most vigorous Tree Ferns in the valley are *Alsephila excelsa*, *Cyathea arborea*, *dealbata*, and *Smithii*, and *Dicksonia antarctica* and *squarrosa*. The most wonderful growth is made by *Cyathea medullaris*; one specimen, planted four years, and five from seed, is now 15 feet high. One of the fronds formed an ellipse, of which the diameter was 13 feet 2 inches.

We will again return to the walk from which we diverged to see the Valley of the Tree Ferns. After crossing the bridge the way lies through an avenue of *Dicksonias* to the ruined chapel of Our Lady. This ruined lane is embowered in trees, and its crumbling walls are clasped round by Ivy, while *Roses* supply its roof. Inside is a valuable Etruscan sarcophagus, and plants have been introduced wherever there would else have been mouldering heaps of masonry, chiefly Ferns and the large-leaved *Begonias*. In front the view takes in the ravine. Being exactly opposite the *palacio* this is a good place also to observe its arabesque architecture. Behind, the woods and *mata* are dense, and seemingly interminable. The trees around contain a fine *Podocarpus nerifolia*, and an *Acacia dealbata*, 3 feet 10 inches in girth at 5 feet up. The most extraordinary vision of all, however, is a Cloth of Gold Rose, which has taken possession of a tubular-shaped Cork tree. The Rose has clambered up its support so luxuriantly as to kill it, and still thirsting for further conquests, has thrown out branches to the neighbouring trees. The girth of the thickest stem is 1 foot 10 inches. In April hundreds of flowers were blow-

ing, and hundreds had shed their petals. The side of the path above the lawn is now unplanted, except where clumps incurve gracefully. By this means is shown the babbling stream at the foot of the lawn and a magnificent *Eucalyptus falcata*, 120 feet high. Before the walk takes a turn downwards to follow the course of the stream, the following shrubs and trees that are planted by its side may be noticed:—*Corynocarpus laevigatus*, a very fine example; *Dentzia scabra*, *Podocarpus ferruginea*, a tall *Dryandra*, two taller *Dammaras*, *Lagenaria Patersonii*, *Eurybia nitida*, *Brachychiton acerifolium* and *B. populneum*, *Jambosa anstralis*, *Knightsia excelsa*, in bloom; *Phyllocladus trichomanoides*, *Berberis nepalensis*, *Eugenia buxifolia*, and *Acacia melanoxylon*, 5 feet in girth. At the head of the steps, which begin the descent to the stream can be seen "Mexico":—

"Lo! Mexico,

Rock strewn, in front of thee, what colours glow

On his hot surface! All that Cactus gives
Of undescrivable painting, gorgeous lives
On his steep slope, and Aloe's flaming head
Shoots dashed upward from his rocky bed
And *Yucca*'s thousand chalice of snow."

Roses form a floral archway over the steps. Prominent among them is a *Maréchal Niel*, which exhibits no signs of canker, and yet grows in the most luxuriant manner. The girth of one of the branches was 1 foot 8 inches. A group of flowering *Camellias* also brightens the vicinage. Some little way down the steep path is a stone tank for water. The sides are covered with *Maidenhair Ferns*. Over the top are strewn some *Cork tree* branches, upon which is trained a *Boule de Neige Rose*. When the path reaches the brook there is a choice of two ways, one conducting to "Mexico," and the other down the right hand bank. Let us take the latter. For the first part it is an arcade of trees, with glimpses of bright *Rhododendrons* and the deep glaucous spears of the *Agaves*. Over the rocky bed of the stream the hillside rises abruptly. Soon an opening discloses a bank of *Yucca* under some old *Goa*, *Cypresses*, among which, for contrast sake, are planted *Cupressus fastigiata* and tree-like *New Zealand Dracenas*. Still further back are wickered grey *Cork woods*, and in a line down the valley *Pines*, terminating in the vividly coloured *Taxodium distichum*. Moisture cascades occur whenever the path takes a sudden dip. In another open space *Ilydranges* and *Ferns* have for company the merry prattle of a little rannel. Further on *Rhododendrons* hide the stream, and we leave the overarching foliage and seem to be at the bottom of a deep valley, with wooded steep on either side. The undergrowth of *Arbutus*, *Heather*, *Periwinkle*, and *Foxglove* is thick, but also bright and pleasant, and natural in every prospect. The scene soon changes; and we are beneath an arbour of *Laurels*, in which a cascade makes trilling melody. In the recess is a moss-green *sarcophagus*, brought from *Etruria*. On the top piece is a lady in a semi-recumbent position, as if prepared for resurrection, and holding, curiously enough, a *patena* in her hand. The relief on the side consists of two dolphins bestridden by boy figures, with a mask-like head between. Further down the stream variation is again introduced by *Palms*, *New Zealand Flax*, *Bamboos*, and *Fabians*. The brook also comes more into view, luxuriant *Ferns* thick by its side. In a sheltered dingle *Sikkim Rhododendrons* perfume the air, and above, waving *Eucalyptus* heads tell of breezes that here only gently fan. Every yard or so as we descend the valley there is something fresh. Here it is a wild *Vine*, the original support of which has died down, so that the root is connected as it were by a fibrous rope to the head in a tree some distance off. Here in a verdurous hollow, beneath the shadow of the *Limes*, just newly flegged, the Duke's brook comes hastening down from *Omunda Glen* to join our stream. Beyond this point the path is about 50 feet above the water, so that only glances of its flashing waters can be seen through the foliage. On the other side are orchards of golden-fruited *Oranges* and *Lemons*. Finally, *Peneus*, for so the brook whose course we have followed is called, glides through cultivated fields to the *Varze*; its banks the home of wild *Flags* and *Gladioli*.

The south sloping lawn at the threshold of the *palacio* is bounded to the west by "Mexico," which is situated on the side of a minor ridge, and sheltered on the west by a group of *Pine trees*. Mr. Cook

in the vicinity of "Mexico" proper has lately experimented with *Palms* he was chary of trying at first; a list of those that are healthy will, therefore, be valuable. They are *Phoenix reclinata*, *Pythosperma Alexandræ* (*Archontophoenix Alexandræ*), *Cocos plumosa* and *Weddelliana*, *Howea* (*Kentia*) *Belmoreana*, and *Rhopalostylis* (*Areca*) *Baueri*. A path runs along the head of this group, on the other side of which is a dense growth of *Yucca Parmentieri* and *Agave coccinea*. One of the latter, in flower, had a flower-spike 22 feet in height. Many of the *Yuccas* were 15 feet high, and were most striking and effective, while those in flower looked as if they were rearing a fountain from their midst. *Mesembryanthemums* and *Gazanias* fill up any bare spaces both by the border and in the crevices of the rocks that border the path. A noticeable plant in flower is *Dasylylion laevis*. A great beauty of this path is formed by a tree which, having been blown across the path so as to leave ample passage to pass below, has not been removed. An *Acetia* still continues to do so, but being thrown near a tall *Grevillea robusta*, 70 feet high, has also ascended it, and is flinging itself from branch to branch in wild luxuriance. The effect is indescribably beautiful, as also are other trees over-run in a similar manner by *Tacsonias*, *Tecomas*, and *Maurandias*.

In "Mexico" proper *Aloes* and *Yuccas* of every kind abound, and monotony is avoided by inserting *Palms*. As there are here some of the finest *Palms* in the garden, it will simplify matters to take them all at once, not as we come upon them. *Areca* (*Rhopalostylis*) *sapida*, one leaf of which measured 12 feet; two wide-spread *Date Palms*, the circumference of the branches of one was 39 paces; *Phoenix rupicola*, *Caryota urens*, *Livistonia Hoogendorpii*, *Howea Forsteriana*, and *Euterpe edulis* were among the most prominent or worthy of notice for being grown in the open. Among the other plants may be mentioned a group of five *Dracena Draco*s, large *Cacti*, *Dasylylion acrotichum*, some in flower; *Opuntias*, *Echium*, pride of *Teneriffe*; *Eucharis grandiflora*, *Dracena Shepperdi*, *Bonaparte juncea*, *Poinsettia pulcherrima*, *Vriesia glaucophylla*, and two *Cycads*, namely, *Encephalartos villosus* and *Macrocrambia cylindrica*. At the foot of this varied bank of plants is another little reservoir, which is covered by damp loving plants, and circled and shadowed by a *Monstera deliciosa*. The hillside above is covered with *Cedars*, *Eucalypti*, and *Cork trees*.

A short distance out on the lawn from "Mexico" are the *Araucarias* that were so prominent from the south portico. The best specimen of *A. Bidwilli* is 9 feet in girth at 1 foot, and 7 feet 11 inches at 4 feet. The circumference of the branches is 60 yards, and the height 65 feet. *A. Cunninghamii* is taller, but not so wide-spread, with a girth of 6 feet 5 inches at 3 feet. In the centre of the group are three *Araucarias*, each approaching 50 feet in height; the middle one girths 8 feet 3 inches at 3 feet, and the distance round the branches is 63 yards. Here also it must be remembered that it has only taken a period of twenty years for these fine *Araucarias* to reach the above dimensions. Behind them, on the ascending slope, is a group of tall *Palms*. *Pythosperma Cunninghamiana*, 25 feet high, and 2 feet 6 inches in girth; *Scarfthoria elegans*, *Livistonia borbonica*, *Corypha australis*, and *Chamærops excelsa* are, perhaps, the tallest. The *Corypha* is 45 feet high, and at 2 feet girths 5 feet 9 inches. The contrast afforded by the *Palms* to the *Eugenias* and *Cupressus funebris* above them, and to the *Araucarias* is most striking.

The west side of the house is chiefly remarkable from gay beds of *Rhododendrons* and *Roses* planted in a bowl-like hollow under the shade of a wooded knoll. The *Acacias*, many of them in flower, brighten up the surrounding foliage. Below the *Roses* is a sweet woodland path leading round to the north side through *Pines* and *Eucalypti*. A beautiful effect is given by covering spots on the lawn where trees have been taken down with crimson *Mesembryanthemums*, and by planting *Yucca* and *Aloes* on the turn of a steep bank.

The kitchen garden is at the base of the hill on the north side, and is protected by a high *Pitiosporum* hedge. Two noticeable plants are growing in the open there, to wit, *Annona glabra* and *Chrysophyllum imperialis* (*Theophrasta imperialis*). In the immediate neighbourhood of the house on this side may be found *Gardenias*, *Illicium floridanum*, *Caladiums*,

Abutilons, and numerous other greenhouse shrubs and plants—at least, so termed in England.

The above is but a meagre sketch of *Montserrat*, and but a very small proportion of the plants have been mentioned. The estate extends for some distance along the side of the *serra* towards *Cintra*, and includes in its confines a second ravine and series of cascades. Here the planting is nearly all natural, and few exotic trees are to be found. Nevertheless, the effect of the bright carpeting of the *Cistus* and the dark verdure of the *Cork woods* was bewitchingly pretty. *C. A. M. C.*

THE VERBENA.

THE enterprise shown by Mr. W. Stacey, nurseryman, of Great Dunmow, seems likely to ensure for the *Verbena* a further time of popularity, like that which it enjoyed many years ago, when Smith, Sankey, Edmonds, and others did so much to improve it, more than a quarter of a century ago, a work continued later by Perry, Eckford, &c. Mr. Stacey both raises good things and cultivates them well, and when he brings specimens to London they are always in the best form, and command general admiration. He has endeavoured to improve the habit and flowers alike, and we should like to see the *Verbena* more generously encouraged as an exhibition plant. In some of the West of England shows plants of large size, finely grown and bloomed, can be seen during the month of August; and though they may present to the eye a rather formal mass of flower when trained over the sloping wire trellises used in that part of the country, they, when well done, always command admiration. That they can be grown into fine decorative specimens does not admit of doubt, because it has been, and still is being done; the close, short-jointed, wiry growth found to be characteristic of some of Mr. Stacey's new varieties renders them well adapted for this purpose.

The production of new varieties by Mr. Stacey extends over the past three or four years; and the fact that several of them have received First-class Certificates of Merit attests to their size and excellent form. The following two dozen varieties represent the cream of the Dunmow collection, viz.:—*Lord Brooke*, rich shaded scarlet, with conspicuous white eye, pip large, stout and of fine form; *Striata*, a charming striped variety, the ground white, the stripes or quarterings pink, the pip of fine form and the trusses of bloom large and bold; *Hamlet* is a fine variety of an orange-crimson colour, pip and truss very fine; *Ophelia*, rich rose-puce, very pleasing and distinct in colour, pip large and fine; *Lilacina*, pale lilac with dark centre, very pretty and distinct; *Fairy Queen*, light ground with a conspicuous red centre, looking like a *Phlox*, very pretty and distinct; *Butterfly*, rosy-purple shaded with maroon, and large white centre; *Purpurea*, rich violet-purple, with white eye, pip of very fine form; *Othello*, crimson-maroon, suffused with purple, habit excellent, a fine variety for bedding purposes; *Purity*, white, a remarkably fine *Verbena*, and one of the best for exhibition purposes, large and stout in pip and handsome in truss; *Compacta*, also a good useful white variety, large in pip and stout in texture; *Mabel*, delicate mauve, very pretty and in good form; *Delicata*, clear pink, very pleasing and of good form; *Fantastic*, a fitting name for a very distinct variety, the ground colour salmon-pink, striped with scarlet, pip large and bold; *Lady Brooke*, bright pink, with a darker shade in the centre, white eye, pip large, and of fine form, the truss bold and striking; *Harlequin*, white, heavily flaked and spotted with rosy-purple, truss and pip very fine; *Maconate*, pale pink, with lemon centre, large and fine; *Orion*, bright carmine-scarlet, yellow eye, large pip, of fine form and bold truss; *Captivator*, shaded crimson, with large white eye, a good useful variety; *Miss Maynard*, violet-purple, with light centre, truss very fine; *Lord Wolseley*, claret, shaded with purple, large white eye, fine pip; *Kosy Morn*, bright rose, *Flambé*, fiery scarlet, with conspicuous lemon eye, a fine and striking variety; and *Ruby*, deep ruby-crimson, with white eye.

Here, then, we get a batch of new *Verbenas* of denoted excellence, and it must be said that the striped varieties, *Striata*, *Fantastic*, and *Harlequin* are remarkably good, and tell forcibly in a stand of cut blooms for exhibition.

The *Verbena*, when grown in pots, must have a liberal course of treatment. In the West of England

the plants are grown in what may be termed absurdly large pots, but perhaps they are necessary to bring to perfection the fifty or sixty fine trusses of bloom seen on some of the specimens. A good soil for these plants when grown in pots is a fibrous loam and well decayed manure, and when the plants are fully established they are greatly benefited by waterings of weak liquid manure. Treated thus, plants will yield a good display of bloom for three or four months, and will be found highly effective in the greenhouse and conservatory. *R. D.*

GROWTH AND REST.

FEW phenomena of plant-life are more distinctly marked out than the alternations of growth and of arrest of growth. Sometimes the arrest is absolute, at other times it is relative, while frequently there is no absolute arrest, but a change in the direction or mode of growth. When a leaf-shoot ceases to grow and encases its extremity in a winter-bud, the arrest is for the time absolute; but when the shoot ceases to grow in length, and its leaves become modified to form the several parts of the flower, the process is clearly not so much one of arrest as of change in the mode of growth. The illustration (fig. 91) affords examples of arrest, followed by renewed activity of growth. The inflorescence of a *Sempervivum*, in place of producing flowers, as usual, developed a series of rosettes or tufts of leaves, which occupied the position usually filled by the flowers. In this case the axis or branch supporting the leaves was arrested in growth, the consequence of which was that the leaves were all crowded together into a tuft. When we first received the plant the inflorescence was a mass of these tufts, but after a few days the centre of several of the rosettes elongated and produced leaf-bearing shoots, as shown in the figure.

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 406.)

BERRY POMEROY.—The chief sight of the Totnes district, which is the correct termination to the brief voyage up the navigable portion of the Dart, is the picturesquely situated castle of Berry Pomeroy. On the road from Totnes to the village of Berry Pomeroy, a distance of less than 2 miles, one of the plants we noticed was an *Arum*, which in the number of its ovaries and their spiral arrangement suggested *A. italicum* rather than *A. maculatum*. The church, though exhibiting to the main road an unappreciably severe tower, has a pretty Ivy-grown east end of red stone, and a fine Yew tree stands in the churchyard, whilst the wall of the adjoining parsonage is beautifully decked with Ferns, Polyody, Wall Rue, Hart's-tongue, English Maidehair, and *Asplenium Adiantum nigrum*, side by side. Not far off is a magnificent Sycamore, which we measured at 6 feet from the ground, as the ground level having altered, its roots began at almost 5 feet from the present roadway. Its girth was 16½ feet.

The castle is situated in a beautifully wooded glen, mainly composed of Beech, which "high overarch'd embower," and, though standing on a commanding knoll with a steep slope on three sides, is shut in by higher wooded hills on all sides. There are some fine Ash trees about the entrance, and also a rank growth of fine Teazles, Figwort, and other weeds, with magnificent clumps of Hart's-tongue—under the trees on one side the mound is literally draped with this Fern. An Elizabethan maeson built by one of the Seymours within the Norman castle, and gutted by fire, forms the most attractive part of the Ivy-grown ruin. At the foot of the northern slope of the castle hill runs a little, tributary of the Dart, which, after widening out into a wily bed bright by clumps of purple Loosestrife, flows over the wheel of an old mill that from the substantial granite work of its windows might well be coeval at least with the mansion in the castle. Of the *Lythrum* all three forms, long, short, and medium-styled, seemed equally abundant, and associated with it was the Great Skull-cap (*Scutellaria galericulata*). A limestone quarry hard by, streaked with every shade of red and grey, was copiously overgrown with Betony, Wood Germander, and the little white stars of *Sedum album*, which is distinctly one of the plants of the district. The babbling brook flowing from the wood-clad head of the glen, between the scarped rich coloured exposed

rock and the wooded hill whence rise the ruined walls of the castle, through a flowery meadow to the lonely old mill, formed together a rural landscape not easily forgotten, and we returned to Totnes well satisfied with our short excursion.

DARTINGTON AND STAVERTON.

Our next day's destination was Dartington Hall and Staverton, the first-named place being the residence of Arthur Champernowce, Esq., the representative of one of the oldest Devonshire families, who has himself, unaided, unravelled the very complex geological structure of this district. Looked at, by the way, broadly, the geology of Devonshire is not at all puzzling. The oldest rocks—

able stream. By its water, now a shallow silver ripple, here a dark black swift running pool, and there breaking in white and amber foam, we noticed *Sparganium oeglectum* in fruit, and an abundance of Alder, whilst in the neighbouring fields the Oaks were all apparently of the pedunculate variety. Dartington is mentioned in *Doomsday*, the greater part of the building, however, is the work of John Holland, Earl of Huntingdon and Duke of Exeter, half-brother of Richard II. It passed into the hands of the Champernowce family in the sixteenth century. Though there are traces of other buildings forming, perhaps, a second quadrangle, the existing remains almost enclose a rectangular space equal in area to "Tom quad" of Christ Church, Oxford—a space now divided

FIG. 91.—INFLORESCENCE OF *SEMPERVIVUM*, IN WHICH THE FLOWERS WERE REPLACED BY TUFTS OF LEAVES.

the Devonian—form two bands along the north and south coasts of the county, extending in each case for some 10 or 12 miles inland, and tilted subterraneously as two parts of a great trough or "synclinal" fold in which lie the carboniferous "culm-measures" of the centre of Devon; whilst through the southern portion has been thrust the great mass of granite rocks forming Dartmoor. When, however, we come to study the local effects of these foldings and intrusions, we find a well-nigh inextricable mass of faults, dykes and local minor folds; and these it is that Mr. Champernowce has unravelled in the Totnes area. Our two-mile walk to the Hall was mostly through the meadows on the gravel terraces of the Dart, which passes over a partly natural weir of limestone a little above the town of Totnes, and in the present exceptionally dry season appears above that point as a broad, winding, shallow, and, in fact, ford-

by a modern wall and containing some exceptionally large Cherry-Laurels and a very fine Deodar. On the west side is the great hall, nearly 70 feet by 40 feet, and about 50 feet in height, with the main entrance, and kitchens overgrown with Ivy and mainly roofless, the roof having been taken down, in the present century. It is in the Early Perpendicular style, and the simple slender mullions of the lofty windows have a magnificent effect. They are, however, probably a somewhat later insertion. The entrance exhibits some very fine ogee moulding, and the central boss of its groined roof bears the white bart couchant of Richard II. Another door is remarkable as having a "bolt-hole" 9 feet deep, to receive the beam that bars the door—a peculiarity paralleled in the west door of Exeter Cathedral. The great kitchen with its two huge fireplaces, either of them apparently capable of accommodating a whole ox, is strikingly similar to

that of the same date at Bodiam Castle, and we find in both places many examples of the arch for window or door consisting of two stones without a key-stone.

The present dwelling-house forms the north-west corner of the quadrangle, from which, along the north side, extends a long wing that consisted originally of five distinct though united "retainers" houses, each with its separate porch and external stair, these latter, of which several remain, affording the only access to the upper storey. Beneath one of these porches, with other Ferns, were huge clumps of *Asplenium Trichomanes*, one of them over a foot

fine *Araucaria* and a promising *Sequoia*, are in keeping with the surroundings, whilst a wood on the opposite summit protects both house and garden on the west. Of gardening proper, however, there was but little, and it was soon forced upon our minds that in Devonshire the natural scenic beauties are so great that the owners of estates generally have adopted a "rest and be thankful" policy, planting trees and shrubs rather than flowers, and trusting to the natural geniality of their climate and fertility of their soil to save them the trouble of much garden cultivation.

From Dartington we walked to Staverton, some-

Passing along an old boundary wall on which luxuriated some six or seven species of Ferns, the Ceterach occurring among them in addition to those we had seen at Berry Pomeroy, flanked by a row of fine Beech trees, we entered an upland meadow, gay with pink Centaury, Eyebright, Bartsia, and two species of Flax (*Linum catharticum* and *L. angustifolium*) over which sported the meadow-brown, blue and other butterflies. The weather being cold and the sky overcast comparatively few Lepidoptera were about; but besides the common blue (*Polyommatus alexis*), there were certainly the three meadow-browns (*Hipparchia janira*, *H. tihionus*, and *H. pamphilus*).

Turning out of our way through Staverton Ford Wood we were fully recompensed for so doing, by the sight of one of the most magnificent specimens of the small-leaved Lime (*Tilia parvifolia*) in this country. Standing a few yards from the pathway, on the edge of a steep wooded slope down to the river, this veteran has a girth of 15 feet at 5 feet from the ground, and sends out two monster ascending limbs that stretch 20 yards on either side from the main trunk, whilst a third rises erect, like the palmated antler of the reindeer, measuring 6 feet across below the point at which it divides into three branches. Such a tree must be considerably over 250 years old, in fact of an age that will take us back at least two generations before the time when Ray speaks of the planting of Lindens in his time. The species is common in this part of the county, and has often very much the appearance of being indigenous.

We then walked through the North Wood, where abundance of *Blechnum spicatum*, the beautiful little yellow *Fimbrinella*, *Saxifraga*, *Bracken*, and other woodland plants were noted, together with the fruit of the wild Hyacinth and of the Foxglove, of which last a few blossoms still lingered. On one plant, 7½ feet high, we counted 110 capsules. Each of these contains 200 or 300 seeds! Among the well grown young Beeches in the glades of this wood fluttered the Wood Ringlet (*Hipparchia hyperanthus*), and a considerable number of that magnificent butterfly the High-brown Fritillary, *Argynnis Adippe* that, from the chequered marking of its wings, shares a name with the lilaceous plants, whose flower is often similarly ornamented, the name signifying "chequered."

Staverton Bridge is one of the most beautiful on Dart, springing amongst glossy-leaved Alders, overgrown with *Ceterach*, and having several more arches than seemed necessary in the shrunken state of the stream beneath it. Much of the bed of the river was a bare heap of pebbles, including every variety of granite that occurs on Dartmoor, but one could well see that in winter the babbling brook might be as swift a current throughout its whole breadth as it was now in a narrow stream just below its thickly wooded and steeply sloping right bank. After a rapid survey of the church, which has the peculiarity of a small monumental brass let into the outside of the chancel-wall, and a hearty meal off the excellent bread and cheese and two-year-old cider at the "Church-house" Inn, whose ecclesiastically named walls were covered with a fine plant of *Escallonia rubra*, we retraced our steps to Totnes and took train for our second halting-place, Ashburton.

(To be continued.)

FIG. 92.—MASDEVALLIA LEONTOGLOSSA.

across, bearing many fronds 6 and 7 inches in length. The east and south sides of the quadrangle, formed by the barns of the home farm, were rendered picturesque by the plentiful growth of the orange lichen (*Parmelia parietina*) upon the small squares of greenish-grey Ashburton slate. This slate, the roofing material of the district, is not very durable when thus exposed to the weather, but it lasts longer on vertical surfaces, as in the upper storeys of many houses in Totnes and Ashburton, which are built of it, though its cold monotonous colour is by no means ornamental when thus applied.

To the west of the house and great hall is the garden, which rises in beautifully turf-ed terraces on either side of a deep hollow in which there was formerly a fish-pond. A row of fine Irish Yews, a

thing less than 2 miles further, but we did not take a goal leave of the Hall until we had inspected Mr. Chamberowoe's unrivalled collection of the *Stromatopora* and other fossils of this and other Devonian districts under the ciceronage of their learned owner. As we were leaving our attention was arrested by a gigantic cider pounding-stone, a solid mass of Dartmoor granite, more than 8 feet in diameter, and weighing certainly between 4 and 5 tons. These stones, of which we saw several smaller specimens in the district, are hollowed round their upper surface, other vertical grindstones working round this hollow as in the mortar-mixing machines familiar in connection with London building operations.

The walk to Staverton is through undulating meadow and woodland, which at the time of our visit were in the height of their summer beauty,

MASDEVALLIA LEONTOGLOSSA.

This curious plant, although discovered by Hermann Wagener more than a quarter of a century ago, was unknown in collections until the last few years, during which it has flowered in several collections, and in particular in that belonging to Sir Trevor Lawrence, where a dense leafy plant of it has produced many flowers. *M. leontoglossa* (fig. 92) is one of a distinct section of the *M. coriacea* group. It has thick fleshy leaves, often tinged with purple, and by these and the peculiar manner in which it produces its flowers, it is easily distinguished. It succeeds well in the cold house with the other *Masdevallias*, either in a pot or in a basket, but grows in baskets and suspended the waxlike flowers (which are pale yellow marked with purple), they more readily present themselves to view. *M. leontoglossa*, when closely examined, is wonderfully beautiful in its structure and marking. It is at present in flower in the collection belonging to Sydney Courtland, Esq., at Bocking Place, Brain'tree. *T. O.E.*

The Apiary.

I HAD intended that my paper this time should be on wax extracting, but as people have their honey all out of the hives now, and are thinking of storing or selling it, I must say something more about the most important part of the produce of our friends the bees—viz., the honey. It has hitherto been a difficult thing to store extracted honey in a nice and convenient way, but still more difficult to send it by post and rail. Numerous are the letters I have received to this effect—"Honey received, but useless, as bottle was smashed." Only a few weeks ago I had a telegram from the postmaster of M— saying that the box of comb honey I had so carefully packed was broken, and the honey running amongst other people's letters, and he requested that I should instruct him what to do with it, as he could not put it in the mail bag. I requested the postmaster to prevent further injury to the letters by eating it.

There is now, however, a box made which will cause a complete revolution in the honey as well as all other trades which require the aid of tin boxes. These boxes are invented by Mr. G. Featherstone Griffin, C.E., M.S.E., and are manufactured and sold by the Self-Opening Tin Box Co., at 19, Kirby Street, Hatton Garden, E.C. These boxes serve all purposes, and are made all sizes, so that any quantity of extracted honey can be sent with perfect safety, and without weighing. Do you wish to send 10 lb. of honey anywhere? Take this company's 10 lb. tin box, fill it with honey, lay the lid exactly level with the top of the box, and then press the lid down as far as it will go, taking care that it is even. The box will then be perfectly air and water tight, as there is no seam in the tin to interfere with a perfect fitting joint. If the porters at the railway stations say, "Now, Bill, you catch and I'll toss," as the author once heard them say, no harm will come to your honey, but it will arrive at its destination after passing through "Bill's" tender mercies just the same as when it started from your home. As air and water are entirely excluded these tins also do excellently well for storage. The honey will keep any length of time in them, and when you require to use any, you have only to lever the lid up, which can be done by your smallest child, and take out what you want. The lid must be put on evenly as before and pressed down. If the Self-Opening Tin Box Company would be kind enough to make tin boxes that would exactly hold our sections of comb honey, then would almost our only remaining difficulty vanish. These tins are also supplied to Messrs. Carter, and the Horticultural Societies of India and Australia, for preserving and transporting seeds. Tins were also sent out to the Government of India for packing the Cinchona bark in, and the Horticultural and Agricultural Societies of India directed Messrs. Sutton of Reading to send out all their seeds in these tins. *Agnes.*

ORCHIDS FOR AMATEURS.

(Continued from p. 394.)

EPIDENDRUM—MEMORALE SECTION (continued).

Epidendrum bracteatum.—A plant similar in habit to *E. ambiguum*, with ovoid crowded pseudobulbs and grass-like leaves. It is one of the prettiest of the small species of Epidendrum. The beautiful white labellum with crimson veins and rose-coloured shades, contrasted with its dull purple sepals, makes it a very desirable plant, although it does not seem to have been imported of late. It is a native of Mexico.

E. dichromum has elongate fusiform pseudobulbs, resembling those of *Laelia autumnalis*. Having regard to the form of the pseudobulbs alone, this plant should perhaps be placed in another section of the genus, but the structure of the flowers resembles that of the plants included in this section. In wild plants the scape is often 3 feet long; it bears a many-flowered panicle. The flowers vary much in size;

some are large and rose-coloured, others small and white. In the best form the sepals are an inch long, they are narrow and pointed, the petals are broader. The lip is deeply three-lobed, yellow and downy at its base, with veins and ribs of crimson radiating to its margin.

E. Hanburii.—A Mexican species with ovate pseudobulbs and narrow ensiform coriaceous leaves. The flowers are racemose; the raceme often 2 feet long. The sepals and petals are deep purple, the labellum is 3-lobed, the central lobe is of a pale rose colour with crimson radiating veins. The lateral lobes are white, and curve over the column. It flowers in spring.

E. macrochilum has ovate rugose pseudobulbs with two oblong coriaceous leaves. It is a native of Guatemala and Panama. The flowers are the largest in the genus. There are two varieties, one with brown sepals and petals, and a very large white labellum with a purple spot at its base, the other with deep purple sepals and petals, with a deep rose-coloured labellum. The plant is called the Dragon's Mouth (Boca del dragon) in Guatemala.

2. THE AURANTIACUM SECTION.

In this section the bulbs resemble those of a Cattleya with a thin stem below. Lindley speaks of the pseudobulbs as "evidently tending to the condition of an ordinary stem." The flower-spike grows out of a great spathe as in Cattleya.

E. aurantiacum.—A native of Guatemala and Mexico, where it grows upon bare rocks. The habit of this plant resembles that of Cattleya Skioneri. The bulbs are 7 or 8 inches high; they bear a pair of thick coriaceous leaves and a broad spathe. The flowers are of a uniform bright orange yellow, with crimson ray on the lip, which has three elevated lines in the throat. This species has numerous flowers, which are produced in spring. It should be grown in the coolest part of the Mexican-house, or it will do well in a warm greenhouse. Many plants do not open their flowers well, probably from some error of treatment. Several of the Epidendria without bulbs which I have referred to the radicans section have a spathe. They form the sub-genus "*Spathium*" of Lindley.

3. THE BICORNUTUM SECTION.

E. bicornutum.—A native of Trinidad and Demerara. The pseudobulbs are cylindrical, tapering at each end, and jointed like those of a Dendrobium. Each bulb bears two or three bright green leaves at its summit. The flowers are ten to twelve in number, forming a panicle. Each flower is nearly 2 inches in diameter, ivory-white, or tinged with rose, with a few crimson spots at the base of the labellum.

Culture.—This beautiful plant is difficult to import, and seldom arrives in a good state; the bulbs crack, or the buds perish; neither is it easy to grow, and it appears to dislike being moved. A specimen which is doing well, often falls after removal to a new locality. It requires the heat of the East India-house, and does best in a pot.

E. erubescens.—I have included *E. erubescens* in this section from the form of the pseudobulbs, but Lindley has placed it in a distinct group (Aulizeum). It is a native of Mexico, where it grows on Oaks at an elevation of 7500 to 8500 feet above the sea. The pseudobulbs are fusiform, with two oblong-acute leaves at their summits. The habit of this plant is very distinct, as it makes long woody rhizomes, which root from the under-side, and bear pseudobulbs at intervals of 5 or 6 inches. The flowers are borne in panicles. They are of a delicate rose colour, and as large as a shilling; the lip is darker than the rest of the flower, and has a yellow spot at its base.

The cultivation of this plant is said to be difficult; its habitat indicates the necessity for cool treatment, and experience shows that it is best grown with *Ondotoglossum*.

E. Stamfordianum.—Plant with fusiform pseudobulbs like those of a Cattleya, sheathed with coriaceous bracts. The flower-stem grows from the base of the bulb instead of from the summit—a character in which it differs from the rest of the genus, with the single exception of *E. purpurascens*, which has also a radical inflorescence. The inflorescence is a large branched raceme. The flowers are very fragrant and showy. The petals and sepals are green, shaded

with yellow, and spotted with rich chocolate-brown. The lip is broad and trilobed. The lateral lobes are toothed, and the median lobe is lacinate, and of a deep yellow colour. This plant is a native of the coast of Guatemala; it grows in shady damp places on the ground. There are two varieties, one much better than the other. The best form is said to have longer and thinner bulbs.

4. THE BARKERIA SECTION.

The genus *Barkeria* was separated from Epidendrum because the column has a broad wing, so that it is described as petaloid, and because the labellum is adherent to the column. Professor Reichenbach has reunited the genera, as the winged column of Epidendrum often becomes petaloid, and every degree of union exists between the column and the lip in the Epidendria. There seems no sufficient reason to separate the *Barkerias* from Epidendrum unless it be the habit of these beautiful Orchids. I have therefore ventured to include them in the genus.

The *Barkerias* are epiphytal Orchids with long fusiform pseudobulbs, which in their native country form dense tufts; each bears two to four leaves with a slender upright flowering stem arising from the apex of the pseudobulb. This bears a panicle of delicate and elegant flowers. The sepals are reflected, and the petals, which are broad, stand out like a pair of wings. The labellum is entire.

Culture.—These plants are natives of the west coast of Central America, where they are alternately exposed to torrential rains and extreme drought, hence they require a very copious supply of water during the period of growth, and a well marked period of rest during which no water should be applied to them. Some recommend that they should be simply affixed to blocks of wood, whilst others prefer to plant them in baskets, with little billets of charcoal and living sphagnum. The moss may be picked out with advantage at the approach of winter. During the growing period they are likely to suffer from want of water when they are placed on bare blocks, so that I prefer the latter method. They should be placed as near the glass as possible. I have found that they do best in the moist heat of the Cattleya house during the period of growth; but they should be removed to the Mexican-house as soon as this is completed, and the waterings gradually diminished. The leaves then fall. Some species flower before the fall of their leaves, and others after. No water should be given from the end of October until growth commences in spring. In winter the temperature should not exceed 55° or fall below 45°, and air should be given freely whenever the temperature renders this possible. *B. T. L.*

(To be continued.)

Orchid Notes and Cleanings.

A VERY interesting incident has just come under my notice, which may prove to be of some educational value to Orchid importers and growers. Dr. Ward, of Southampton, recently imported a batch of *Sophranitis grandiflora* and very generously gave me a few pieces of it. I laid them aside for a few days, then potted them and suspended them from the roof of the house. About a week after I examined them more closely, hoping to see roots moving, or breaks starting, when, on one piece of six bulbs I discovered a pod of seed about as large and of the same colour as the freshest leaf. Now I cannot for a moment suppose that this is the only case where seed-pods have been found on imported Orchids. But the questions suggested by this event are—Who have seen them? and; What results followed?

Can it be possible that there was sufficient vital power stored up in the foliage and bulbs of this small plant to sustain the life and supply the natural requirements of the seeds after it was taken away from its native home, and sent here in a half-dried condition, and in such condition to remain until new roots are

thrown out to gather fond, and restore the lost energies of the plant? Or is it probable that the enforced rest caused a suspension of organic life during the time of rest, and that when roots were formed and supplying sustenance to the plant, the organic forces again became active, and brought the seed to maturity? Or is it more likely that there is either no seed in the pod, or, if any, that it is void of germinating power?

I do not suppose that this seed-pod will awaken amongst Orchid growers such intense interest as did Mr. Pickwick's immortal discovery of the stone at Cobham amongst his friends. There is, however, some interest clustering around this event at present, but perhaps some one will as quickly solve the matter by saying, "Cut it off, and throw it away." *N. Blanford.*

VANDA CERULEA.

The difficulty attached to the growing of this species is doubtless the greatest obstacle that prevents its becoming common. In Warner's *Select Orchids*, p. 18, is a handsome figure of this species, and it has the honour of being figured in numerous other works. It is universally admitted to be a valuable and highly desirable Orchid; a fact to be accounted for, partly, because uncommon, but more by reason of its colour, which, although represented in a few different genera, is anything but of common occurrence. The sepals and petals are of a pale lavender, but subject to individual variation in the depth of its tint. The petals have the habit (and it is not a solitary instance in the genus) of turning downwards by twisting near the base, so that when level with, or below the eye, one can only see their backs. The comparatively small labellum is a deeper blue, with three longitudinal plates along its middle, which, with a yellow spot at the base, serve as guides for the fertilising insects, so necessary in the plant's economy in a wild state. A handsome flowering specimen may be seen in the Orchid-house at Kew, and we occasionally see it in other collections, though by no means common. *F.*

The Flower Garden.

THE recent access of frost, and the rain have destroyed all tender plants in the beds, therefore these should be cleared and replenished with such plants as are suitable for winter or spring decoration. It is advisable at once to take up all tender plants, and such as are not in sufficient number for next year's requirements.

These plants should be carefully taken up, potted, and placed in cold frames or pits, where heat can be given according to their wants, they will then become established early. No time should be lost in propagating when stock is deficient.

To facilitate cuttings striking at this late period, they should be plunged in a moderate heat for about twelve or fourteen days. This is a good time to propagate the Calceolaria, Viola and Pansy. The propagation of all the tenderest kinds of plants will now in most places be completed, and much care will be required to keep them from damping off. Of course all should now be safely housed, and fully exposed to light and air when the weather is suitable. Careful attention should be given to remove all decayed flowers and foliage so as to make the garden as gay and attractive as long as possible. Strict cleanliness should be maintained at this season. Alterations should at once be decided on, that the work may be set about; as it is not judicious to defer work of this kind that can be done in autumn and winter till the spring. Road and walk making, turf laying and levelling, tree and shrub planting, Box edging, draining and trenching, and all such heavy jobs may now be accomplished. Spring and winter bedding-out plants which have been in the reserve garden to refill all the vacant beds in the flower garden will now soon come into requisition. *W. Smythe, Basing Park, Alton.*

Plants and their Culture.

ROUVARDIAS.

THOSE that are still in the open border will soon need to be brought under cover; the few chilly nights of late have given us warning that the autumn frosts are not very far distant. We are just preparing a three-light pit for their reception, into which they will be planted straight away when lifted from their present position. They have been kept well pinched back, and are now a stocky lot of plants that will be invaluable for supplying cut bloom during the next three months.

SOLANUMS.

that have been grown beside them, have had all their leading shoots beyond the berries pinched off; this will aid in perfecting the crop and cause less drain upon the resources of the plants when lifted for potting in a week or ten days' time. We have an abundant crop of berries, but they are rather later than usual. As they will not be wanted, however, until the Chrysanthemums are over, there is plenty of time before us in their case. All other winter and spring blooming plants that are still in the open ground should be taken up for potting without any loss of time; fresh root-action will then be gained before the dormant period is upon us.

PLANTS FOR FORCING.

Any needful additions to the stock should be obtained and potted up as soon as possible. *Azalea mollis* in variety are always valuable both for cutting and decorative uses on the plant. *Rhododendrons*, *Kalmias*, and *Andromedas* require to be renewed every season, whereas the *Azalea* just named does not need this extra trouble; the latter three genera are not, however, to be passed over on any account; they are each and all of great service in their turn, and particularly so if a large conservatory has to be kept gay. The *Lilac*, Charles X., is still one of the best kind for pot culture. *Staphylea colchica* is very distinct, and one of the nearest approaches we have to the Orange blossom in its season. *Deutzia gracilis*, if exhausted or otherwise not reliable, ought to be recruited by the addition of some young plants to the stock already in pots. *Clematis* culture in pots has been so fully demonstrated during the past few seasons that they can be thoroughly relied upon. The following are six good and distinct kinds, viz., *Albert Victor*, *Lady Londesborough*, *Miss Bateman*, *The Queen*, *Vesta*, and *Stella*. The *Guelthers Rose* (*Viburnum Opulus*) is another capital pot plant for the spring, and one, too, that is of a thorough lasting character.

WINTER FLOWERING EPACRIS AND ERICAS.

These, if not already fully exposed to the sunshine, should for the next fortnight have the full advantage of it. By that time all arrangements for their winter storage should be completed, as a safeguard against heavy rains and frosty nights. Recent purchases of small Ericas will need the closest attention in regard to watering; in most cases their pots are crammed with roots, and if perchance an omission or two occur in the use of the water-pot no after-care will atone for the evil that has been wrought, and the consequent failure to develop their flowers. *James Hudson, Gunnersbury House Gardens, W.*

FRUITS UNDER GLASS.

PINE APPLES.

BEFORE cold and sunless weather comes upon us it will be well to proceed with and complete any re-arrangement of the plants or work in connection with these plants that may be necessary. Our usual practice at this season of the year is to bring all the fruiting plants together into one compartment, where they can be constantly supplied with heat suitable to their requirements, of 70° or 75° at night, 75° to 85° during the daytime, at about 85° at the roots. We also endeavour to have those plants which are intended to give a supply of fruit from the end of next May until the end of July together. We have recently for these plants prepared compartments, in the first place by

removing entirely the old plunging material; this is a most important matter in connection with good cultivation of these plants, because these beds, "although absolutely indispensable," are nevertheless, when permitted to become much decomposed, or otherwise to remain for a long period unchanged, become so full of worms as to render high-class cultivation almost impossible. Of all insects, or reptiles that infest Pine plants these are the most pernicious and destructive in their effects. Healthy, vigorous plants very soon become impaired, and the fruit as a natural consequence diminished in size and quality by their operations. By way of avoiding such consequences, we use as remedial means dry soil; this is scattered amongst the crocks at the time of potting the plants, and about the surface soil and rim of the pots, also beneath them in the bed, and occasionally use it in the water we give the plants. These means, in conjunction with using at the time of potting the toughest turfy loam obtainable, is the best way of dealing with this intolerable pest. In the case of plants which are loosened through their deprivations, these should be made firm again by well ramming down the soil when it is in a fit state for this purpose. After the compartments to which I referred have been thoroughly cleansed, lime-whitened, and painted, if required, new tan to the depth of 18 inches, and 2 feet in some cases, is put into the beds, the bottom-heat is applied, and when the bed has reached about 80° the plants are plunged in it at about 2 feet apart always for Queens, and 2 feet 6 inches in the case of stronger and more robust growers. Our plants for this purpose have up till now been grown in pits with fermenting beds, and were potted into the fruiting pots—11 and 12-inch ones—the first week in August last. They are now placed in the pits as described above, where they will remain until such time as they have fruited, which doubtless will be by the end of next July. Our present temperatures, and for some time onward, in these pits, will range from 65° to 70° at night, according to external conditions, and from 70° to 80° in like manner during the daytime; the air in the place will be kept moderately moist, and early in the afternoon occasionally on fine days a gentle syringing overhead will be applied. The ventilators will be opened at from 75° to 80°, and finally closed for the day at about the latter point.

Successional plants in 6 or 8-inch pots may safely be wintered in these pits, and suckers recently removed from the parent plant should be firmly potted in tough fibrous loam in 5 or 6-inch pots. I keep these plants in pits having fermenting beds, with a gentle heat in them, and as near to the glass as practicable, and allow a range of from 60° to 75° at the present time and onwards until the end of the present month (October). *G. T. Miles, Wycombe Abbey.*

The Kitchen Garden.

LETTUCE: ENDIVE.

FROM the sowing made about the middle of last month (of hardy Cabbage varieties) some should now be pricked out at the foot of favourable walls and on borders sloping south, and some may also be planted out in the open to grow on for placing under protection. Any spare frames which have lights free from much drip may be filled with seedling Cos and Cabbage Lettuce (hardy varieties) from sowings made the latter week in August. These will be of great value for spring use. The plants may be pricked out 6 inches apart, as in all probability it will be found necessary to draw before full grown, leaving the remainder more space to develop. Frames for this purpose should have a favourable aspect, and should be filled with light and moderately rich soil. Some plants should now be blanched, as Lettuces will soon be going back in quality.

PARSLEY.

In order to ensure a good winter's supply of the above a frame should now be filled with roots dug up from the open ground, derived from sowings made about May or June. Trim off most of the leaves when lifting and plant in nice soil. It is well to lay in the roots in trenches 6 inches apart and somewhat thickly. The frame should be kept a little close until the plants recommence growth, when the lights may be again removed until required. *G. H. Richards, Somerley Gardens, Ringwood.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Oct. 5	Sale of First-class Bulbs from Holland, at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Crystal Palace Autumn Fruit Show and International Potato Show (four days).
WEDNESDAY, Oct. 7	Sale of Stove and Greenhouse Plants, at Chicley Park, Hightgate, by Mr. J. C. Stevens. Sale of Orchids and Plants at the Castle Nursery, Lower Norwood, by Protheroe & Morris. Sale of Imported Orchids from Mr. Sander, at Stevens' Rooms.
THURSDAY, Oct. 8	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.
FRIDAY, Oct. 9	Sale of Bulbs from Holland, at Stevens' Rooms.
SATURDAY, Oct. 10	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

THE green coloration of the leaves of plants is more or less characteristic according to the kind of plant, and more or less intense according to their structure, healthy condition, and especially in proportion to the amount of diffused light to which they are subjected. As to the kind of plant it is astonishing what a variety there is in the shade and intensity of tint. We are apt to speak, for instance, of "grass green" as if all grasses were of the same colour, but let any one compare the colour of Rye, to take only one instance, with that of the wild Barley (*Hordeum murinum*), and how great the difference will appear. The depth of the tint, again, varies, not only according to the general health of the plant and the conditions of its exposure to light of varying intensity, but also according to the internal structure and arrangement of the palisade and other chlorophyll-containing cells. We have already called attention to this matter in connection with the leaves of Orchids and of Conifers, and have indicated the relations between the physiological activity and movements of the leaves and the disposition and thickness of the chlorophyll layers; and have indicated the cultural suggestions which may fairly be deduced from these facts.

The whole subject is of extreme importance, and little more than the fringe of it has yet been studied, whether from the side of chemistry, physics, or anatomy. PRINGSHEIM'S researches have been alluded to in these columns, but it can hardly be said of them at present that they are matured sufficiently to be available for cultural purposes. The effects of various manures containing iron, and especially those containing ammonia or nitrates, on the colour of plants, are more tangible so far as the gardener is concerned, and both he and the farmer have at their disposal the truly magnificent series of experimental researches carried out by Sir JOHN LAWES and Dr. GILBERT. It is quite easy on the experimental grounds at Rothamsted to pick out, by the varying colour of the foliage, those plots which are treated either with a moderate, or with an excessive amount of nitrogenous fertilisers; quite easy to see the different effects of nitrogenous manures on grasses and on leguminous plants respectively. It is easy to see, moreover, that a duly adjusted admixture of nitrogenous and of earthy and alkaline ingredients, especially potash, is more generally beneficial than either nitrogenous manures or mineral fertilisers separately. The nitrogenous manures as a rule favour succulent leaf development, but are not proportionately favourable to the woody tissues, the mineral manures, speaking broadly, favour the development of woody fibre at the expense of the more succulent tissue, and accelerate the ripening of the seed. Such generalities as these are now beyond dispute, but of course much, very much more requires to be elucidated before we can be said to have got beyond the alphabet of the subject. Any further communication will therefore be of value, and from this point of view, the following paper, read before the British

Association at Aberdeen by Dr. GILBERT, will be perused with interest* :—

"All who are accustomed to observe vegetation must have been struck with the great variety of shades of green which the foliage of different plants present. Without pretending to generalise further it may be stated that, at any rate so far as our common agricultural plants are concerned, they show somewhat characteristic shades of colour according to the natural order to which they belong—the Leguminosæ differing from the Gramineæ, the Cruciferae, the Chenopodiaceæ, and so on. But the same plant will exhibit very characteristic differences, not only at different stages of growth, but at the same stage in different conditions of luxuriance, as affected by the external conditions of soil, season, manuring, &c., but especially under the influence of different conditions as to manuring.

"The Rothamsted field experiments have afforded ample opportunity for observations of this kind, and it has been quite obvious that in a series of comparable experiments with the same crop depth of green colour by no means necessarily implied a finally greater amount of carbon assimilation; whilst we have long ago experimentally proved that the deeper colour was associated with a relatively high percentage of nitrogen in the dry or solid substance of the herbage; and this obviously means a lower relation of carbon to nitrogen.

"Mentioning these facts to Dr. W. J. RUSSELL, who has devoted so much attention to the subject of chlorophyll, he kindly undertook to make comparative determinations of the amounts of chlorophyll in parallel specimens, in which we were to determine the percentages of dry matter and of nitrogen. Accordingly, Dr. RUSSELL spent a day at Rothamsted during the period of active vegetation, for the purpose of collecting appropriate samples which were taken from several differently manured plots of meadow-grass, Wheat, Barley, and Potatos respectively.

"The following table gives the results of some of these experiments; namely, the percentages of nitrogen, and the relative amounts of chlorophyll, in the separated graminaceous and the separated leguminous plants in the mixed herbage of grass land; in specimens of Wheat grown by a purely nitrogenous manure, and by the same nitrogenous manure with a full mineral manure in addition; and in specimens of Barley grown by a purely nitrogenous manure, and by a mixture of the same nitrogenous manure and mineral manure in addition. It is to be borne in mind that the specimens were collected whilst the plants were still quite green and actively growing. I should further be explained that the amounts of chlorophyll recorded are, as stated in the table, relative and not actual; that is to say, the figures show the relative amounts for the individual members of each pair of experiments, and not the comparative amounts as between one set of experiments and another.

Relation Between Nitrogen Accumulation, Chlorophyll Formation, and Carbon Assimilation.

	Nitrogen per cent. in dry substance.	Relative Amount of Chlorophyll.	Carbon assimilated per acre per annum—lb.	Actual.	Difference.
<i>Hay.</i>					
Gramineæ	1.190	0.77
Leguminosæ	2.478	2.40
<i>Wheat.</i>					
Ammonium-salts only	(1.227)	2.00	1398	—824	..
„ salts and mineral manure	(0.566)	1.00	2222
<i>Barley.</i>					
Ammonium-salts only	(1.474)	3.20	1403	—685	..
„ salts and mineral manure	(0.792)	1.46	2688

"It will be seen in the first place that the separated leguminous herbage of hay contained a much higher percentage of nitrogen in its dry substance than the separated graminaceous herbage; and that, with the much higher percentage of nitrogen in the leguminous herbage, there was also a much higher proportion of chlorophyll. Under comparable conditions, however, the Leguminosæ eventually maintain a much higher relation of nitrogen to carbon than the Gramineæ; in other words, in their case carbon is not assimilated in so large a proportion to the nitrogen taken up.

"Next it is to be observed that the Wheat plants manured with ammonium-salts alone show a much

* Note on the Conditions of the Development, and of the Activity of Chlorophyll. By Professor J. H. Gilbert, LL.D., F.R.S. (Read in the Chemical Section, at the meeting of the British Association at Aberdeen.)

† The figures in parentheses represent determinations on not fully dried specimens.

higher percentage of nitrogen than those manured with the same amount of ammonium-salts, but with mineral manure in addition. The high proportion of chlorophyll again goes with the high nitrogen percentage; but the last column of the table shows that, with the ammonium-salts without mineral manure, with the high percentage of nitrogen, and high proportion of chlorophyll in the dry matter of the green produce, there is eventually a very much less assimilation of carbon. The result is exactly similar in the case of the Barley, the plants manured with ammonium-salts alone showing the higher percentage of nitrogen, the higher proportion of chlorophyll, but eventually a much lower assimilation of carbon.

"It is evident that the chlorophyll formation has a close connection with the amount of nitrogen assimilated, but that the carbon assimilation is not in proportion to the chlorophyll formed, if there be not a sufficiency of the necessary mineral constituents available. No doubt there had been as much or more, of both nitrogen assimilated, and chlorophyll formed, over a given area, where the mineral as well as the nitrogenous manure had been applied, the lower proportion of both in the dry matter being due to the greater assimilation of carbon, and consequent greater formation of non-nitrogenous substances."

— SATYRIUM CARNEUM.—We have to thank Mr. T. SMITH, of Newry, for a fine flower, albeit a little past its best, of *Satyrion carneum*, gathered in the garden of W. J. HALL, Esq., Narrawater, Co. Down. This species of *Orchis* is a native of the Cape of Good Hope. It forms a dense spike of a foot or more in length; the flowers, helmet-shaped, are less in length than the bracts, which partly enclose them; the colour is whitish-pink. It is somewhat tender, and requires some protection from frost.

— THE SUGGESTED NORTHERN DAHLIA SHOW.—This venture may now be regarded as safely floated, with a fair prospect of a successful result. The committee of the York Floral Fête are willing to take it up and work it through, their estimable secretary has already prepared a circular shortly to be issued. In this circular it is proposed that the show shall take place on a day hereafter to be named in the spacious exhibition building at York, that the sum of £250 be offered in prizes, to include fruit and other cut flowers, in addition to Dahlias; and that a guarantee of £400 is necessary in order to secure the committee against loss. An appeal will therefore be made to florists in general and cultivators of the Dahlia in particular, and there should be no difficulty in raising the sum required. The annual dinner in connection with the York Floral Fête takes place on October 8, and no doubt advantage will be taken of that gathering to push into prominence the suggested Dahlia Show at York. It is also to be regarded as the northern section of the National Dahlia Show, which is a happy decision, as it does away with any apprehensions of hostility to the show at the Crystal Palace. Like the National Auricula Society, it will now, it is hoped, be represented by exhibitions both in the North and South of England.

— INTERNATIONAL FRUIT SHOW, BUDA-PESTH.—An exhibition of fruits, both native and foreign, is to be held at Buda-Pesth, from October 15 to 30, at which money prizes, as also medals, will be awarded. Mr. WILHELM GILLEMOT, Gruppen Commissar, Landes Ausstellung, Buda-Pesth, will receive applications for space, and forward programmes of the arrangements.

— EXHIBITION OF CHRYSANTHEMUMS AT DEVIZES.—This annual exhibition takes place this year on November 17, as usual, in the Corn Exchange, and it is worthy of special notice, inasmuch as it is of a purely benevolent character, promoted by a body of ladies who act as district visitors among the poor, and any surplus obtained is devoted to purely benevolent objects. A bazaar of useful and fancy articles takes place in connection with it, and good prizes are offered to growers of this popular autumn flower. All the exhibition arrangements are in the hands of Mr. THOMAS KING, The Gardens, Devizes Castle.

— PLANTS FROM IRELAND IN FRUIT.—The warm summers of the last two years are remarkable for their effects in ripening the fruits of some rare plants in Ireland as well as in England. Miss C. M. OWEN, Knockmullen, sends us a shoot of *Myrtus pensylvanica*, bearing purplish-green fruits; and

FIG. 93.—ROCKERY AT BATTLE ABBEY. (SEE P. 424.)

Rubus occidentalis, cherry-red, sweet, Raspberry-like berries, of which the birds are, unfortunately, too fond. This should form a showy-looking Bramble in a warm corner of the garden.

— *PLANERA RICHARDI*.—SIR C. STRICKLAND writes about this tree:—"If it be as durable as it is said to be why is it not planted in England more than it is? It has been known a long time, it seems to be

perfectly hardy here (Yorkshire), and it is by no means very slow growing, and it ought to be worth more than Beech or Elm as a timber tree."

— **WOOLHOPE NATURALISTS' FIELD CLUB.**—The last field meeting of the year will be held at Hereford on Thursday, October 8, for a foray among the funguses, when the Club will be honoured by the company of many distinguished mycologists. An

evening meeting will be held in the Museum room, at the Free Library, on Wednesday evening, October 7, at 8.30, when the funguses brought there will be named and studied. Any collection of funguses for exhibition should be sent to Mr. CHAPMAN, at the Free Library, on Tuesday, or as early on Wednesday as may be convenient. The foray will be made on Risbury Camp and the park and lawns of Hampton Court. Members and visitors will leave the Barr's

Court station with the 9.25 A.M. train, to reach Leominster at 9.51, where carriages will be waiting to convey the visitors to Ribbury Camp. After the excursion, and the completion of the necessary official business, a paper, entitled "Flamen pomonalis," will be read by Dr. M. C. COOKE, M.A., &c.; and another on "Some Further Remarks on the Origin of Domestic Poultry," by E. C. PHILLIPS, Esq., F.L.S., &c. The following papers will also be read at one or other of the meetings:—1. "The Effect of Fungus Growth in Destroying Tree Life" will be introduced by Dr. BULL as a subject for discussion. 2. "Some Notes on British Puff-balls," by WILLIAM PHILLIPS, Esq., F.L.S., &c. 3. "On Polycistina, EHR.," by the Rev. JOHN E. VIZE, M.A. 4. "BEEFELD'S Researches on the Utlaginiæ," by CHARLES B. FLOWRIGHT, F.L.S. 5. "On Pestalozzia, De Not.," by the Rev. JOHN E. VIZE, M.A. 6. "The Solution of a New Zealand Botanical Mystery," by Dr. BULL.

—SALVIA GREGGII.—The habit, foliage, and general appearance of this new *Salvia* bear a strong resemblance to those of *S. Grahamii*. The leaves are small in both cases, but in the latter they are ovate and serrate, while in the former they are oblong, entire and narrowed at the base. The flowers are produced in simple or compound racemes, terminating not only the main axis, but all the numerous lateral branches by a continual succession is maintained for many weeks in a greenhouse or cool conservatory during autumn and early winter. The corolla is of a clear, attractive deep rose colour, with the upper lip hairy and small, while the three-lobed lower one has the middle segment broad and reniform. The plant is figured in a recent number of the *Botanical Magazine*. It is a native of the mountains of northern Mexico, at an elevation of 10,000 feet, and must consequently be nearly hardy. A group of it in the greenhouse at Kew is noticeable for its slender, branching, leafy habit, and comparatively large attractive flowers.

—PHYLLOXERA LAWS.—The kingdom of Greece is the last which has found it imperative in the interests of the vineyard culture—an important one indeed for the miniature monarchy—to forbid all trade with North and South America, Australia, Africa, the coast of Asia Minor, and the whole of Europe, with the exception of Holland, Belgium, Denmark, and the Scandinavian kingdom, in trees and plants of every kind, fresh fruits and their foliage, fruit juice, in natural or mixed state; flowering bulbs, and fresh fleshy roots of every description. Vine stakes which have been used in vineyards; and, lastly, hay in bundles. The regulation dates from July 5, 1885. As usual the restrictions are for the most part absurd and unnecessary.

—APONOCETON FENESTRALIS.—In popular estimation this has always been, and is likely to be, an interesting plant, judging from the number of visitors who make a point of seeing it when they visit Kew. This fact is further attested in several botanical works of note, such as the *Botanical Magazine*, t. 4894; *Flora des Serres*, xi., t. 1107—8; and *REGEL'S Gartenflora*, 1863, t. 387. Several plants have flowered at Kew this season, and one may still be seen in the fernery. This is evidence of its healthy condition, and speaks in favour of the cultural treatment it receives. The plants are plunged or immersed in a tub of water, the surface of which is always kept rippling by a gentle stream of water, conducted there by a syphon. Those who are acquainted with the Cape Pond-weed cannot fail to be struck with the similarity of the flowers of both, and notwithstanding the dissimilarity in the leaves of the two it is the only difference. The leaves of a Lattice-leaf plant have not formed the softer, parenchymatous tissue, so that the fibro-vascular tissue is developed like an open network. At one time it is said the natives used the farinaceous rootstock as an article of food, which is to be regretted, if still practised, as it would tend to exterminate a species, by no means plentiful.

—ENCEPHALARTOS HILDEBRANDTI.—Of the numerous species of *Encephalartos* cultivated under the proper name, or under that of *Zamia*, this is one of the more distinct. The leaves are pinnate, with lanceolate rather closely spiny serrate pinnae, that become gradually smaller and shorter towards the

base, till they are reduced to three spiny-toothed segments resembling little leaflets or pinnae. This character, and that of the comparatively numerous spines on the pinnae constitute the strongly distinctive features of this species when not in fruit. There is a handsome fruiting specimen amongst the unrivalled collection in the Palm-house at Kew bearing a number of cones of various sizes, but smaller than those of *E. villosus*, another allied species. *E. Hildebrandti* is figured in the *Revue Horticole*, 1880, 456; and again in *REGEL'S Gartenflora*, 1877, p. 245. In the latter a whole plant, stem, and leaves, but without fruit, however, is represented. Even in this condition their Palm-like character should gain a wider acquaintance in the gardens of this country than they do at present. Many species of the *Encephalartos* could be conveniently housed where a large specimen of the more universally grown *Cycas revoluta* would be inadmissible on account of its spreading habit.

—"THE ARTE OF GARDENING."—A correspondent writes:—

"At present I have in my possession a curious and interesting work of a still older date than the *Artes Floriarum*, viz., 1608. The titlepage announces it to be the 'Arte of Gardening, wherein is added much necessary matter, with a number of secrets; and the phisick helps belonging to each herb, which are easily prepared. Hearunto is annexed two proper Treatises, the first intituled the marvailous government, proprietie and benefite of bees, with the rare secrets of the honie and waxe; the other, the yearly conitures very necessary for husbandmen. To these is likewise ioyned a treatise of the arte of grafting and planting of trees. Gathered by THOMAS HILL, Citizen of London. Imprinted by EDWARD ALLDE, London.' Besides the type matter it contained thirty-two pages of closely written manuscript, and bound up with it is the *Scotts Gardener*, in two parts, 'published for the climate of Scotland, by JOHN REID, gard'ner.' The first, by THOMAS HILL, is dedicated to the Right Worshipfull Sir HENRY SAMES, Knight. In the preface we are told that, the ancient philosophers named the earth the mother of all plants and the manuring and dressing of it to be an exercise both virtuous and profitable, which the ancient Romans and diligent husbandmen did well observe, in that they from time to time did so painfully labour and diligently seek out the understanding and knowledge, not only of every kind of earth, but to dig, dung, orderly dress and cast into square and even beds every ground, and after the same they diligently learned the apt times which were most convenient to sow or plant in, according to the increase and decrease of the moone. When the seedes were thus orderly sowed and somewhat come up, then they thoroughly learned that the often weeding and watering of the young plantes did cause them the faster to come up. And in such places where the plantes grow thick together they, by their painfull industry learned to set them thinner, to the end they might the better increase and waxe bigger." Then follows a description of how they diligently sought the best means to expell and destroy venomous and harmful beastes, worms, flies, and such like. Amongst the helps against these enemies of the garden here is one against thick mists and frost:—"That if you bury the specked tuck inclosed in a new earthen pot in the middle of your garden that the same defendeth it from the hurtful weather and tempests. Some also hang the eagle's feathers or the skin of the seal in the middle of the garden or in the four corners of the same as a proved defence against tempests;" and mist and frost are to be banished by burning chaff, weeds or stubble in sundry places, so that the smoke may pass over the garden. It appears that the ladies of those days were more sensitive in regard to odour than those of the present day, for, at the conclusion of the cultural remarks on the Narcissus we read "these flowers are greatly esteemed by many people for their strong sweet scent, though there be few ladies that can bear the smell of them," &c."

—EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.—On the 23d ult. the exhibitors at the exhibitions of the above Society, together with a large number of supporters, dined together at the Lyric Hall, Ealing, in celebration of the twenty-first anniversary of the Society, the first exhibition having taken place in 1865. The chair was taken by Mr. RICHARD DEAN, who has filled the office of Hon. Secretary to the Society for the space of ten years; the Vice-Chairmen were Mr. GEORGE CANNON, of Messrs. C. LEE & SON; Mr. J. ROBERTS, Gunnersbury Park; and Mr. E. CHADWICK, Hanger Hill House. An incident of a very agreeable character took place in the course of the evening by the presentation to Mr. R. DEAN of a massive marble

clock. The presentation was made by Mr. E. FOUNTAIN, The Elms Gardens, Hanger Hill. In addition, an illuminated address was presented to Mr. DEAN, signed by sixty-seven subscribers.

—M. EDOUARD BOISSIER.—We regret to state that M. BOISSIER, author of the *Flora Orientalis*, and one of the founders of the Jardin d'Acclimatation of Geneva, died suddenly last Friday, Sept. 25.

—FROST IN DEVON.—Two degrees of frost on the morning of the 26th and 27th ult., and 6° on the 28th. This is the first time since 1874 that frost has occurred in the month of September. Marrows, Scarlet Runners, and French Beans, Dahlias, and Begonias, were blackened. The 29th was quite mild, with warm showers.

—GARDENING APPOINTMENTS.—Mr. JOHN THOMAS, late Foreman at Petworth Park, Sussex, has been appointed Gardener to Lieut.-Colonel HAREFIELD, Sunbury Court, Sunbury-on-Thames, Middlesex.—Mr. J. FORD, lately at Birdhurst, Croydon, as Head Gardener to Captain ELLIOT, Farnborough Park, Hants.—Mr. II. FORDE, late Foreman at Park Place, Henley-on-Thames, has been appointed Head Gardener to Colonel W. CORNWALLIS WEST, Ruthin Castle, North Wales.—Mr. WALTER EVANS, late Gardener to F. Pine, Esq., Maidstone, as Head Gardener to J. A. TAYLOR, Esq., Streatham Court, Tewkesbury.

CLEISTOGAMOUS FLOWERS OF HOYA.

WHILST on the subject of *Hoya* and *Asclepiad*, I must make a protest against a repetition of the statement that the genus *Hoya* is to be numbered among the genera known to produce cleistogamous flowers (flowers close fertilised in the bud before expansion); but I believe the statement to be based upon a misconception or imperfect observation. I have never seen a cleistogamous flower upon any *Asclepiadaceous* plant, and it is a group I have paid much attention to, although I have seen what I believe have been mistaken for cleistogamous flowers upon *Hoya* and upon some species of *Stapelia*, *Boncoseria*, &c., and it merely amounts to this:—When a flower (perhaps the only one out of several in an umbel or cyme) has been fertilised, the corolla falls away and the calyx segments close up around the ovary, which is quite small, and in this state it will remain upon the plant for several weeks, or even months apparently unchanged. The pedicels of all the unfertilised flowers having long before fallen away, a person first observing it in this state, and afterwards noting that it developed fruit, would be very likely to think that the flower thus producing fruit was cleistogamous, since no corolla was seen; but had the so imagined cleistogamous flowers been examined, I believe no corolla, filaments, anthers, or pollen, would have been found inside them, nothing but the two carpels of the ovary. But for all this the case is interesting and very remarkable in this—that no rule appears to be followed, as I have had plants belonging to the *Stapelia* group flower and produce their fruit in the same season, that is to say, that after the corolla has fallen the carpels grow and swell out rapidly; but at other times the fertilised carpels remain dormant for a long time before they commence to grow out; and I have observed both cases to occur upon the same individual, namely, in a plant of *Boncoseria europæa*; one year it flowered and ripened its seed during the same autumn, another year the carpels of the fertilised flower remained perfectly dormant from about the middle of October until April of the following year, when they commenced to grow out, and the seed ripened in July or August. Why this is the case I am quite unable to guess; whether they do it under natural conditions or whether it is due to the treatment they receive under cultivation I cannot say. I treat my plants all alike so far as I can tell, but still it by no means follows that the conditions are always nearly the same, I will not say absolutely the same, for that is an impossible thing to arrive at, and there may have been some slight difference in the arrangement of the soil, causing it to hold more water one year than another, and so cause the carpels to develop or become arrested as the case may be; there was no difference in the soil itself, as I don't report any *Stapelia*s for several years together. *N. E. Brown, Herbarium, Kew.*

FERTILISATION OF HOYAS AND OTHER ASCLEPIADS.

ON p. 374 Mr. W. G. Smith repeats the somewhat erroneous statement he gave in 1882 in these columns (see vol. xvii., p. 570) as to the manner in which these plants are fertilised. The "glutinous disc" to which he refers is not really glutinous, but is of a horny consistence, quite smooth, and very highly polished, but not in the least sticky. The manner in which the pollen masses are extracted is as follows:—The "glutinous disc," or "gland" of some authors, I prefer to term a corpuscle, since it is not a gland in any sense of the word, but it is itself a horny secretion from the upper part of the stigma; there are five of these corpuscles in each flower, one to each stigma, for the Asclepiads present the great, and, so far as I know, unique anomaly, of having five stigmas and but two carpels! The stigmas are situated at the five angles of the gynoestium between the anthers, but are only visible externally in the shape of a very narrow fissure, which is wider and open at the bottom, the true stigmatic surface being at the inner and upper part of a cavity behind this fissure; at the top of the fissure, and continuous with it, is seated the corpuscle, smooth, shiny, and dark brown or black in colour. This corpuscle is rather a curious piece of apparatus; if it is carefully examined under a microscope and transverse sections of it made, it will be found to be hollow, with the cavity open at the base, closed above perfectly, and in front imperfectly, by the closely applied acute edges; where the edges meet they form a distinct fissure down the front of the corpuscle, and at the base the fissure widens out like an inverted V; of course all this is very minute, and scarcely, if at all, visible with the naked eye. Under a high power of the microscope a transverse section of the corpuscle exhibits a stratified appearance, which is due to the secretion of successive layers of the substance of which the corpuscle is formed.

The manner in which the corpuscle acts in entrapping flies, &c., and in causing them to withdraw the pollen masses is in this way. The fissure of the corpuscle (when this is in its proper position in the flower) is directly continuous with the fissure that leads to the stigmatic cavity, which fissure, as I have above stated, is widened out at the base. Flies, bees, &c., when crawling about the flower in search of nectar frequently manage to get their legs, antennæ, or proboscis in the widened opening of the fissure leading to the stigmatic cavity, and when they endeavour to move, and the movement is in an upward direction, as would be generally the case, the leg or other organ would be drawn up the rapidly narrowing opening, and be caught by the closely contiguous elastic edges of the stigmatic cavity, and although clasped pretty tightly the edges are so smooth that the insect easily drags the imprisoned part up to the top of the fissure, and thence into the fissure of the corpuscle, but once caught by this organ it is not so easy, and usually impossible, for the insect to get free, for, besides being more rigidly elastic, it is altogether closed at the top, so that the part caught could not slip upwards, and so come out free; therefore the insect pulls the corpuscle away from its slight attachment to the stigmatic fissure, and with it the pair of pollen masses which are attached to its sides by shorter or longer caudicles. When pulled out from the anther-cells the pollen masses undergo slight movements, sometimes springing together, sometimes becoming slightly more divergent, and generally a slight amount of twisting also takes place; these movements are due to the rapid drying of the caudicles when exposed to the air. Sometimes, as stated by Mr. Smith, besides being held by the corpuscle, the leg or other part of the insect is embraced by the caudicles of the pollen masses, but this, according to my experience, happens but rarely. Should the corpuscle be more firmly attached than usual to the stigmatic fissure, and should the insect not be sufficiently strong to overcome the adhesion, it is either held there until it dies or only escapes by the loss of the whole or part of the captured limb.

I have witnessed both instances. On one occasion a small fly was caught by its foot and was not strong enough to pull the corpuscle from its place, and it kept twisting round and round until it escaped minus the whole of its tarsal joints which were left held in the cleft of the corpuscle. Although the pollen masses are most frequently extracted by means of the legs of insects I

have seen them withdrawn by the proboscis, antennæ, and by single hairs upon the insect.

Having withdrawn the pollen masses, in order to secure fertilisation they must be placed in contact with the stigmatic surface, which, as previously explained, lies at the upper and inner part of the stigmatic cavity; this is easily managed. An insect crawling about a flower with one or more pollen masses attached to him, is pretty certain to get in such a position whilst doing so that one, or even a pair of pollen masses is placed in or at the mouth of the stigmatic cavity (that is, where the fissure widens out at its lower end), and the least movement on the part of the insect in the right direction causes them to slip in the cavity, and so smooth are they that they do this with great rapidity and suddenness; when once in, the same process goes on as in the manner of their original extraction, only in this case it usually happens that it is the caudicle of the pollen mass that is caught in the fissure, and in pulling itself away the insect forces the pollen mass as far up the stigmatic cavity as it can go, and then the caudicle breaks off, sometimes, though rarely, at the end attached to the corpuscle, but generally it separates at its attachment with the pollen mass, and then, often, the caudicle is dragged up the stigmatic fissure until it reaches and enters the cleft in the corpuscle seated at the top of it, and then another pair of pollen masses are extracted in the same way as the original pair were by the leg or other part of the insect. Sometimes a series of several corpuscles and caudicles attached to one another are found fixed upon an insect's leg, the caudicle of one pollen mass (after fertilising the flower by dragging the pollen mass into the stigmatic cavity) serving to withdraw another pair of pollen masses, the caudicles of which in their turn may repeat the process.

For a full and complete account the structure, development, and fertilisation of an Asclepiad flower, I would refer those interested in the matter to the late Mr. Corry's paper upon the subject, published in a recent part of the *Transactions of the Linnean Society*. It was somewhat remarkable that Mr. Corry and myself should, unknown to each other, have been working at the same subject at the same time, and have arrived at almost exactly the same conclusions, the ground gone over by each of us being nearly the same, except that I worked chiefly with the genus *Stapelia* and its allies, although also with *Asclepias* and other genera, whilst Mr. Corry dealt almost entirely with *Asclepias*; he also paid attention to the results of self and cross-fertilisation, which I did not do. *N. E. Brown.*

THE ORCHID HOUSE.

COOL ORCHIDS.

THE weather has been cold for the last few days, and we have, in consequence, removed from this house to the Cattleya-house all the plants that have to be wintered there. I find the different form or position of the cool-house has much to do with its adaptability to preserve certain species of Orchids during the winter. For instance, when I had to grow the cool Orchids in a span-roofed house well exposed to the sun, many species did well there, which fail to pass the winter in good condition in our new house, which is a lean-to and faces north. *Odontoglossum cirrosium*, for instance, was always satisfactory in the span-roof, but it will not do at all in the lean-to with the same minimum temperature; half our plants were tried in the Cattleya-house last year, and the others in the cool-house. They did so much better with the Cattleyas, that we have this year removed them all there, where they occupy a position on the north side with *O. vexillarium*. *O. cirrosium* has more than doubled in price during the last year or two, it is doubtless not so plentiful as it was; I know that some growers have lost plants by keeping it in the cool-house through the winter. *Ada aurantiaca* has also been placed in the Cattleya-house. The white *Masdevallia*, *M. tovarensis*, has also had reserved for it a sunny position in the Cattleya-house; the plants are growing with great vigour. This pretty little species was rather over-rated, when it was scarce, and consequently expensive, but it is very useful to produce pure white blooms at mid-winter—a property that will prevent it being neglected. The space occupied by these plants has been filled up by giving the more hardy *Odonto-*

glossums, &c., more room, and this was a good chance to thoroughly clean the woodwork, and also the plants themselves. Red-spider has to be kept down by sponging, so also has greenfly. The latter is very troublesome indeed, in the cool-house. It clusters round the young growths as soon as they start from the base of the old bulbs, it also attacks the flower-spikes as they issue from the axils of the leaves. I do not know any better way to destroy them than by dipping the whole plant in tobacco, or soft-soapy water, or by using a brush dipped in the water to brush them off. I seldom go through the house without destroying several colonies of them with the fingers. Of course, after a thorough look over, as the plants are receiving now, they will not want any further attention for some time. If any plants require repotting, this should be done at once. I would rather pot cool Orchids, even at unseasonable times, than that they should get into bad condition by not being repotted. On this subject there is much difference of opinion. I have potted *Masdevallias* and *Odontoglossums* in every month in the year, and have been successful at all periods. Some good growers have stated that they ought not to be repotted during the summer months, but I have repotted hundreds of plants during the months of June and July, and they have succeeded equally well with those repotted in spring or in autumn. Some persons may fancy that the hot dry days of June and July are so exhausting to cool Orchids that to disturb their roots at that time may do grievous harm, but that it is not so.

Cultivators of cool Orchids will have observed that slugs are rather fastidious in their tastes, and that they prefer the succulent young spikes of *Oncidium macranthum* to anything else. The plan we have adopted now with these Orchids is to fill a saucer with water, invert a pot in the water, and place the pot containing this *Oncidium* on the inverted pot. It is necessary to watch the plants narrowly for a few weeks at first to see that no slugs have been imprisoned in the fortress, as they cannot pass the moat either way. I fancy slugs are more voracious at this season than they are at any other time. It is, therefore, a necessary part of the cultivator's work to look for them every night with a good lamp. At present the temperature of this house ought not to fall below 50°.

J. Douglas.

TREES AND SHRUBS.

RUIUS COTINUS.

IT is singular that this old plant should have so little attention paid to it at the present time, for certainly it is one of the most striking and beautiful shrubs in cultivation. It is perfectly hardy, and grows in almost any kind of soil. The flowers come out at the end of the branches, upon long hair-like footstalks, which divide and branch into large hair-like bunches of a purplish colour, whence the name of Wig Plant. These appear towards autumn, and are very striking when the sun is setting. I saw a fine specimen lately in the grounds of Benningborough Hall; since then I have seen several specimens in the beautiful and interesting grounds of Eskrick Park, the residence of Lord Wenlock. I think nurserymen might do something in the way of increasing the spread of this and many other beautiful old plants. They are easily increased by cuttings, also by layers. *M. Saul, Holgate, York.*

PICEA MORINDA.

In your description of this most ornamental of all the Spruces there is hardly sufficient prominence given to its pendulous character. It is not only curved in a downward direction, but droops, or weeps, as the enclosed shoots will show. Of course a good deal depends on soil and situation; but the long slender shoots, drooping back at right angles to the ground, without any curve, gives this tree such a drooping appearance that I have long designated it the Weeping Spruce. The cone illustrated on p. 393 is unusually even and regular for this Spruce. The majority of them are more or less irregular, as if a ligature of varying width were irregularly run round the cones. I enclose you several showing this tendency to uneven development. Can the resin so plentiful on most of them be the cause of this? No doubt its sticky character resists growth to some extent; and possibly this, with its unequal diffusion, may be the cause of the unequal growth of different portions of the cone. I am pleased to endorse

all you say about the usefulness for ornament and the rapid growth of this Spruce. The effects of the light green shoots in the early spring described by you are so striking that this Spruce has also been called *Candelabra Tree*.

UNUSUAL FREE GROWTH OF CONIFERS THIS SEASON.

The dry cool summer now drawing to a close seems to have been favourable to the growth of most Conifers. Most of our trees have made larger growth and look more robust and verdant than usual. This applies to Firs, Spruce, Cedars, Silver Firs, &c. Different species or varieties of these have all done remarkably well, and several of them have produced unusually good crops of cones. This is especially the case with *Abies Douglasii*, *Morinda*, *Abies Pinsapo* and *cephalonica*, and the Atlantic and Lebanon Cedars. The cones, however, are not only abnormally numerous, but late, so much so that it seems doubtful if they will ripen. The *Araucaria* has also coned, but, as usual in the absence of male bloom, the seeds are useless. The abnormally free growth of the Conifers can hardly be the result of the dry season, as we mostly think the rainfall of East Anglia all too little for them; it is more likely to have resulted from the coolness of the past summer; as the trees are more verdant than usual, part of this no doubt arises from the length and vigour of the shoots. Such fine Pines as *excelsa*, *Sabiniana*, and *macrocarpa* have more of a semi-glaucous hue than usual, while the Atlantic variety of the Cedar is almost blue. *D. T. Fish*.

RHAPHITHAMNUS CYANOCARPUS.

In most works this plant will be found under its old but incorrect name of *Citharexylon cyanocarpum*. It is an interesting and pretty Chilean evergreen shrub with small Myrtle-like leaves, spiny branches, and tubular blueish flowers, which are succeeded by blue fruits about the size of a Pea, which are very ornamental. It has long been grown in the winter garden at Kew, planted out in one of the beds. The following account, however, is of a plant in the open air in the beautiful garden of Mr. Kashleigh, at Menabilly, in Cornwall. Beautiful flowering specimens were sent us for naming, and an enquiry elicited the following information:—"The plant is growing outdoors, and flowering freely. It is 11 feet high, and 7 feet in diameter at 3 feet from the ground, one of the branches being 8 inches in circumference. It produces a nice effect; it is growing on a slope about 200 feet above sea-level, in a deep loamy soil, very much exposed to the north, east, and west winds. One of the greatest enemies we have here to vegetation is the wind, and this plant gets a fair share of it." A figure of this pretty shrub, drawn from Mr. Kashleigh's specimens, will appear in the *Botanical Magazine*. *G. N.*

THE PROPAGATOR.

THE PROPAGATION OF BEDDING PLANTS.

(Continued from p. 373.)

CALCEOLARIAS.—At this time of the year a general batch of *Calceolaria* cuttings of the kinds required for bedding next year should be made. When taking the cuttings the gross pieces should be passed over, and a selection made of the side-shoots of intermediate growth. The cuttings may be from 2 to 3 inches long, but each one must be made just below a leaf-joint. To keep the cutting firm in the pot it will only be necessary to cut off the two bottom leaves before dibbling in. About sixteen cuttings can be dibbled around the edge of a 24-pot, and eight in the middle. The holes made by dibbling should be filled up with dry sand.

After watering the cuttings they should be placed on a good ash bottom in a close cold frame. They must be sprinkled with a fine-rose pot morning and afternoon, and for ventilation the lights should be pushed down or raised from the back for an inch for an hour in the morning. They should also be shaded on sunny days, and every night a mat should be thrown across the frame. When the plants have well rooted the sprinkling overhead should be discontinued, it being then only necessary to water them as they become dry. All dead leaves should be removed, to prevent them damping other leaves near them.

As the nights become frosty the frames must be protected with mats or other material.

Some few years ago it was noticed that *Calceolarias* were not much used for bedding in our parks and gardens. It was because the plants had died off, and marred the general beauty of the beds. This can, however, be prevented. In the first place spring-rooted cuttings must never be used for bedding purposes; if they are used the majority of them will die off after they have thrown up their first bits of flower. The proper plants to use are autumn-struck cuttings which have had the tops twice pinched out while in the cutting-pots. And these should not be taken out of the store pots and potted into other pots until about six weeks before they are bedded out. The roots must not be allowed to become pot-bound, because if they are in that state when knocked out of the pots the fleshy points of the roots will stick to the sides of the pots, and consequently it frequently happens that such plants when bedded out perhaps flower a little, but soon, and suddenly, wither and die.

The *Calceolaria* beds should be watered twice or three times a week in dry weather. They should not merely be sprinkled with a rose-pot, but should be well watered with a spout-pot.

Greatly very frequently attack and spoil the plants in the frame if steps are not taken to prevent their ravages by lightly smoking them once a week.

The soil for the cuttings should be composed of loam, leaf-mould, and sand, well mixed together, and sifted through a $\frac{1}{4}$ -inch sieve. The cutting-pots, which should be of 24-size, should be filled with this soil to within a $\frac{1}{4}$ -inch of the top, and after the soil has been firmly pressed down the remaining space should be filled with a layer of sand. The soil should be well watered before the cuttings are dibbled in.

Some prefer to make up a cutting-bed for the *Calceolarias* in a cold frame, but when cuttings are rooted in pots they are perhaps more easily managed, particularly if only a small quantity be required. *T. O'E.*

BEAN WEEVIL.

HAVING received, in the early part of the present year, a packet of seed Beans, a large portion of which

FIG. 24.—BEAN WEEVIL.

were infested by *Bruchus rufimanus* (fig. 24), I determined to sow a quantity of the damaged seed in order to ascertain the true extent of the mischief wrought by the beetles. I therefore selected twenty Beans, three of which had each been perforated by three weevils, five by two, and twelve by one only, and sowed them under the most favourable conditions for their growth and general welfare. In about a fortnight the young plants appeared, seemingly in no way the worse for the injury received by the seed. The growth was strong and vigorous, and the condition of the plants all that could be desired. When the time for fruition came round, however, a great change took place. The blossoms were scanty and small, the foliage faded and withered, and in several cases the plants died off without producing a single pod.

The first three plants, or those raised from seed pierced by three weevils, were naturally the least productive. One of these was altogether barren, while the remaining two bore but three pods between them, none of which arrived at perfection. The next five, grown from seed tenanted by two beetles only, were slightly more fruitful, bearing in all six pods, of which five reached their full growth. Two of these five plants, however, were barren. Upon the remaining twelve, the seed of which had but one perforation, I counted twenty-three pods, not more than ten of which arrived at maturity. Only one plant of this latter group was entirely unfruitful. It will thus be seen that the twenty plants bore among them but thirty-two pods in all, of which less than one-half came to perfection. The Bean in question, I should mention, was not one of the most freely-bearing varieties, six pods being the average yield of each plant. The difference, however, between the produce of the infested seed and of that sown at the

same time, which was free from the weevil, proved beyond question that the presence of the beetle is highly prejudicial, not to the germinating qualities of the seed, which appear to be uninjured, but to the reproductive capabilities of the adult plant.

A striking feature in connection with the above experiment was that the plants raised from weevilled seed, with one single exception, altogether escaped the attacks of *Aphis rumicis*, from which scarcely another plant in the garden was free. From this I infer that the sap of the weakened plants was of too deteriorated a character to satisfy the fastidious tastes of the "colliers," *Theodore Wood, Freeman Lodge, St. Peter's, Kent, Aug. 21, in "Entomologist's Monthly Magazine."*

PRIMULA FARINOSA.

FOR our illustration of this little gem (fig. 95) we are indebted to Mr. Scott Wilson. It is found on our Scottish mountains, as well as in Switzerland, and generally in deep, rich, moist soil, fully exposed to the light. The flowers are of a pale lilac colour, with the mouth of the tube forming a yellow eye. It grows well in boggy soil.

FRUIT NOTES.

MUSCAT CHAMPION GRAPE.—This Grape is undeservedly neglected. The class for it at the recent Grape show at South Kensington was the only one that failed to attract exhibitors. The colour of the berries is to many an objection. Well finished bunches, however, often have the colour of tawny port; a colour not to be despised. The report is abroad that it is a difficult Grape to cultivate. It is extraordinary, considering how little the Grape is grown, how this calumny has been remembered. Muscat Champion will succeed with the same treatment as Hamburgs, and the two Grapes can be grown side by side. So far from being fastidious, I have seen fine bunches well coloured taken from the back wall of a viney. Exhibitors fight shy of it, but it is quite within the bounds of possibility to produce largeish bunches with as plump berries as those of good Gros Colmar and, as aforesaid, to deepen the colour of the epidermis. The flavour, however, is the reason why all should grow it. The raiser declared it to be a hybrid between Muscat of Alexandria and the Black Hamburg. The favouring, as well as the colour, bears out his statement, the large fleshy berries being richly charged with a delicate Muscat taste; in fact, the flavour is a mean between the flavours of the two parents. An old saying is, that God Almighty might have made a better fruit than the Strawberry, but it is certain that He has never done so; I humbly submit that man will find it difficult to get a better flavoured Grape than Muscat Champion. *C. A. M. C.*

PEAR BEURRÉ DE L'ASSOMPTION.

Herewith I send you fruits of this Pear, which in appearance and fine quality are of the first order, and could your readers see the splendid cordon tree it makes, and how freely it bears every year, they would, I am sure, also give it additional marks of excellence. I think it superior to Williams' Bon Chrétien, because it bears as well, keeps longer, and has not the musky or perfumed aroma of that variety, but is just as melting, with a flavour near akin to that of a good Marie Louise. In the new edition of his *Fruit Manual* Dr. Hogg quotes Mr. R. D. Blackmore as saying in reference to this Pear, "It is clumsy and ugly, has a bad habit of growth, and worse texture." My experience of it is of the very opposite description to this. *W. Wildsmith.*

GOLDEN NOBLE AND WALTHAM ABBEY SEEDLING APPLES.

I notice in the schedule of the Royal Horticultural Society, that at their exhibition to be held on the 13th and 14th inst., the above two Apples are classed as one and the same thing. Dr. Hogg, in his *Fruit Manual*, the greatest authority we have on Apples, describes them as distinct. I have Waltham Abbey Seedling, supplied to me by a leading nursery firm, corresponding entirely with the description in the *Fruit Manual*. Golden Noble I have many trees of. The two varieties are very distinct, and easily distinguished by any one with the least power of drawing comparisons. If Dr. Hogg in his *Fruit*

Manual is correct, why does the Horticultural Society class them as synonymous? And if the latter is right, then Dr. Hogg's researches are all wrong, and what is his Waltham Abbey Seedling? P.

PEACH KÖNIGIN OLGA.

This, one of the finest of the yellow-fleshed Peaches, is a seedling from P. Willermoz, obtained at the Pomological School at Reutlingen. Herr Rosenthal, of Vienna, says that it is an early variety, cannot be beaten for size and beauty, and must be considered a valuable addition to fruits. It possesses yellow flesh, somewhat reddish surrounding the stone, which is non-clinging. *Garten Zeitung.*

PROLIFERATION OF FERNS.

(Continued from p. 375.)

HAVING described the different forms which proliferation in Ferns manifests, and its methods of adaptation to the conditions under which in plants of varied or diverse habit it is produced, whereby it

have Asplenium, for instance, as we have seen, developed a largely preponderating share of this feature over other genera or tribes? Any identity of relation or alliance of any character, with generic or tribal distinctions is not obvious, and the variations of physiognomy and constitutional disposition or tendency are generally the same, in both prolific and non-prolific species. Though the nature of the agencies operating in some of their phases of the question is, it must be confessed, obscure; in others the conditions of the environment, which, when of a character favourable to the result, obviously exercise potent and stimulating influence, point to a probable and rational explanation of the phenomenon. Of these conditions of the environment which potentially affect the result, the chief is the degree and constancy of humidity. At the same time it must be remembered that we do not know enough of either the life history or the character, morphological and constitutional, of each species to determine clearly the questions affecting the operation of this influence; for it is life history and general character that the varying state of the presence and degree of prolifera-

their rank unsuspected and unquestioned by us. Therefore, in accepting the apparent proof that proliferation is indirectly due to atmospheric moisture, the difficulty encountered of two species alike in character and in their physical surroundings, in which the feature is manifest in one case and not in the other, may be with some probability explained by a possible difference in their age, which has allowed its development in the one and not in the other, because of the shorter period of time which has elapsed. But the period of origin is not the only question that might affect the issue. Change of physical surroundings would be equally potent, providing they were complete and durable as regards their influence on any particular species. Of this I shall describe a case presently where, probably from physical change over a large area, all the members of a single species occupying that area have become prolific, while those beyond it remain still normal.

Of the other conditions to which I have alluded that also in some important degree affect the issue, we have indeed indications, but their nature and mode of operating are, as I have before said very obscure. We recognise, for instance, from observation that plants which are remembered by certain features in habit of growth, structure, substance, physiognomy, &c., do not manifest proliferation, while plants with certain other features do, so; and we conclude that there is a potent though hidden connection between these respective features and the absence or presence of the proliferate tendency. We observe also, as I have before described, that there is apparently a similar intimate connection between the possession and its possible utility to a species, for when the conditions of life and circumstances are such that it could obviously serve no useful purpose as a reproductive agency, as in the epiphytall division, it is not present. Should any reader feel disposed to protest I will at once relieve him by saying that I have no desire to press unduly this debatable point of a case of perfect adaptation to end or object, which, though it looks so exceedingly plausible, is perhaps more apparent than real, and is possibly due to other circumstances, among which not the least may be the greatly reduced degree and influence of atmospheric moisture in positions more or less distant from the surface of the ground. There is the fact, however, that, whatever be the reason, it does not occur, and that if it did occur the circumstances of growth are such that it would be absolutely wasted energy. But what I have said now is nearly all we know of the more subtle and complex agencies which, pertaining to individuals or to communities, either associated by race or by conditions of life, affect the issue of this question. These remarks apply chiefly to the first origin of proliferation and the agencies under which it came into existence in any particular instance. When once established, of course it was transmitted from one generation to another, and maintained, as other possessions are, by hereditary transmission.

With regard now to the influence exercised by humidity as an agency in producing and maintaining proliferation. Unquestionably proliferation is greatly fostered by the presence, and is in evident relation to the degree, of moisture, for where this condition most prevails in the natural habitats of Ferns there, in the species possessing those characters which it alone accompanies, it is most frequent and presents its freest development. It is more common in wet than in dry situations, and as affecting the degree of humidity, under forest shade than in full exposure to sun, in close dells and ravines than on more airy and exposed ground, near streams and brooks than beyond their influence, on the ground, than aloft on rocks and trees, at high altitudes than low; and, lastly, more frequent on islands than on continents with equal range of elevation; though in all these cases the result is qualified by the other circumstances to which I have just now alluded.

Taking the different forms of proliferation, however, humidity is not necessary in the same degree, nor with the same constancy and uniformity of operation to all. That form of bud-proliferation which I have characterised as aerial is most dependent on its constancy and abundance. Nearly all the instances of this, and especially such as display the character most conspicuously, occur in deep forests or near streams, chiefly but not exclusively in cool mountain regions, where mists are constant and the vapours ascending from the warmer lower regions are condensed, saturating all vegetation with moisture. The radiant and also the few tuberous species often

FIG. 95.—PRIMULA FARINOSA. (SEE P. 436.)

effects success as a reproductive agency under each condition; and having also detailed some of the more prominent of the circumstances that clearly direct and define its distribution through the family, let us now see if any light can be thrown on the problems which occur to all observers as to its origin and utility. First in order is the question of its origin, and the nature of the cause, or causes, which first brought it about, and that maintain it. Possibly no direct and altogether conclusive reply can be given to this or any of the subsequent questions that will arise for whatever view the observer may take, he recognises at the same time certain other facts, varying in importance, which tend more or less to modify his conclusions.

It cannot be said that a feature which is so largely manifested in the order is abnormal, yet it is not a characteristic of the great majority of Ferns, and therefore not of the most truly normal state. Is it then a merely adventitious condition, the result of, say, constitution, situation of growth, surroundings, or other fortuitous circumstances of plant existence? If so, why does it appear in one species and not in another, which are growing side by side, and which often are closely allied, or more in one natural assemblage of species than in another? Why

in plants connected by conditions common to all or by family affinity, must be ascribed. It is now generally admitted that the species which inhabit the earth at present are not all of equal antiquity, that though the majority may perhaps be in varying degree very remote in birth, the origin of many is relatively recent, while some are comparatively modern. Of this modern origin we are, or may if we choose, be ourselves witnesses, for in field, forest, and by wayside there is the evidence, open to all who observe and compare, and in some cases it is so obvious as to be recognised by the least observant or enquiring. What we call forms, varieties, and subspecies, are arbitrarily determined points in the slow progress from one state to another. In other cases, instead of this very gradual process of change or modification of form and general character, extending over several or many generations, the same result is effected abruptly by generation at birth, and thus unobserved. Fortuitous circumstances throw distantly related species together, when occasionally a nuptial alliance occurs, and the relationship is proved by a new species resulting from the union. Such, when we are the authors of, or know their history, we designate hybrids, and refuse specific rank to, but doubtless they sometimes originate spontaneously in Nature, and take

inhabit more exposed places, where, of course, the agency is less potent and uniform under the greater power of evaporation there exercised by sun and air; but these classes, too, are mostly confined to the same generally moist regions. A further proof of the influence is afforded by the relatively meagre development of the feature in the same species when they happen to occupy a comparatively or unusually dry situation.

The feature in such situations does not disappear entirely; it would take probably many generations to return to a non-proliferous state again, but the tendency to proliferate is greatly diminished, and the development retarded under the less congenial conditions. Again, it might be expected, if this hypothesis be correct, that all other conditions being equal, an insular flora would be more freely and abundantly proliferous than a continental one; and this appears to be the case, but the evidence I can adduce on this aspect of the subject is, from the nature of the circumstances, very limited. Of the two floras which I am sufficiently acquainted with to express a reliable opinion one is insular and the other continental. In both latitude, topography, character of vegetation, &c., make them favourable cases for comparison. In the insular flora the number of proliferous species is quite two-thirds greater than that in the continental in relation to the total number of species in each. The preponderance is still greater in the much fuller development and increased number of the individuals affected in the insular case. Of course one instance of comparison such as this cannot be accepted as proof of it being a general rule, but the partial knowledge I possess of other floras leads me to believe it probable that were these as well known they would support the instance I have cited. One can only be a judge of the extent of proliferation in a flora by a thorough personal acquaintance in their native habitats with the whole of the species of that flora, for botanical specimens very imperfectly exhibit the extent of the feature in the wild plants, and cultivated collections are so partial as to be even less reliable for the purpose of forming a correct opinion of the entire flora. The prevalence of this feature or the relation to area, elevation, or physical conditions, can only be judged by observation on the ground.

So far I have dealt with general considerations alone. I will now describe a specific instance, to which I have before alluded as possibly the result of some physical or topographical change in the region where it occurs. This case is, perhaps, more clearly in the line of proof and convincing of the close relationship existing between proliferation in Ferns and abundant atmospheric humidity. It derives its great significance from the fact that it is a case of variation of feature in the same species, the variation accompanying clearly defined topographical limits, to which are due the essential atmospheric conditions in this instance which I have already described as an indispensable necessary in any case of proliferation. Though illustrated on a scale of great magnitude and extreme and unusual definiteness, the case is a rare one, but is not absolutely singular, for I remember another, though less prominent and important, yet, too, within its smaller limits as strictly and emphatically supporting this theory. This is an instance of a species with a wide vertical range that is proliferous at high elevations and non-proliferous at low, the atmosphere of the former being generally, as I have shown, more copiously and constantly humid than that of the latter, except under special limited conditions.

The chief instance, however, to which from this digression I return, is afforded by the Guianan, extending thence, if one may judge by a couple of specimens among the large set of this species in the Kew herbarium, to Panama and Mexico. There (in Guiana) the common large-leaved Shield Fern, *Aspidium macrophyllum*, Sw., presents two distinct states—a terrestrial and aquatic. The former is strictly confined to dry well drained ground in forests and half-open places, such indeed as it usually occupies over its very wide American range, while the latter is as strictly confined to the banks of rivers in the alluvial region of the country, where it grows on the banks and stumps of trees, and on branches that dip into the water. This latter is one of the most prolifically proliferous of all proliferous Ferns. Yet these plants are simply two forms of a very slightly varying widely diffused species, which are so generally identical, botanically, that if the young plants be

removed from the surface of the one where they present such a striking and comical feature in growth, there remains no difference in aspect or feature to distinguish one from the other.

I have discussed elsewhere* how possibly this aquatic form originated, and how its characteristic feature was in the course of time produced, and what purpose in the life-history and economy of the plant it may have served, all of which I will not repeat here. There can, however, be little, if any, doubt that the terrestrial Fern, which is nearly universal in eastern and central tropical and extra-tropical South America is the older form, and that the proliferous state is a branch from it which has originated under conditions which affected only the limited area to which this state is confined. As illustrating the agency and fostering influence of humidity on proliferation, I think this species, with its proliferous and non-proliferous states, must be regarded as an important confirmative instance. Here are two plants of an absolutely identical type, but growing under more or less opposite physical conditions. In that subject constantly to exceptionally abundant moisture proliferation has reached an extraordinary development; in the other, under reverse conditions, or conditions in which the influence is much less, no trace of it is found.

The inference that humidity is the chief agency of those we are conversant with in bringing about and maintaining this feature in the section of Ferns which from other circumstances are open or disposed to exhibit it, may from this case and the other evidence I have adduced be accepted as reasonable conclusions. It is only apparently in certain plants and under certain circumstances which pertain specially to these plants that proliferation is possible, but though the plants and these other circumstances be altogether most favourable for the result, without an abundant and more or less uniformly constant degree of atmospheric humidity it never appears.

G. S. Fenman.

(To be continued.)

SELECTING AND PLANTING FRUIT TREES.

FRUIT trees, or rather the sorts, sadly need weeding out, as there are many in the lists that are not worth growing; and instead of planting so many varieties, as some do, merely for the purpose of having a collection, it would be far better to increase the numbers of the most valuable kinds, as the fruit would be satisfactory, and disappointment and vexation avoided when the trees came into bearing. In making a selection the right thing is to pick out, not only those of superior quality, but such as by ripening one after the other afford a long and continuous succession; and as I have just had this to do for a gentleman who is furnishing a new garden, I repeat the list here, thinking it may be of use to others engaged in the same kind of work:—

SORTS.

Apples.—Taking these first, and in the order of their ripening, those I recommend for culinary purposes are, Lord Suffield, Keswick Codlin, Stirling Castle, Cellini, Cox's Pomona, Waltham Abbey Seedling, Lord Derby, Ecklinville Seedling, Mère de Dieu, Bedfordshire Foundling, Dlenheim Pippin, Alfriston, Warner's King, Dumelow's Seedling, Sturmer Pippin. Dessert kinds: Kerry Pippin, Welford Park, King of the Pippins, Ribston Pippin, Cox's Orange Pippin, Fearn's Pippin, Court Pendul-plat.

Apricots.—Hemskirk, Moor Park.

Cherries.—Culinary: May Duke, Morello. Dessert: Governor Wood, Frogmore Bigarreau, Black Eagle Bigarreau, Elton, Black Tartarian.

Currants.—Black: Naples, Lee's Prolific. Red: Red Dutch, Victoria, Wilmot's. White: Wilmot's Grape, Dutch.

Figs.—Brown Turkey.

Gooseberries.—Green: Ganton Green, Gretna Green, Pitmaston Green Gage, Walnut, Red: Champagne, Crown Bob, Forester, Ironmonger, Ritleman, Wonderful, Warrington. White: White-

smith, Antagonist, Bright Venus. Yellow: Champagne, Criterion.

Grapes.—For early vinery: Black Hamburgh Madresfield Court, Foster's Seedling, Muscat of Alex, andria, Buckland Sweetwater. Late vinery: Muscat of Alexandria, White Tokay, Gros Maroc, Lady Downe's, Alicante.

Nectarines.—Lord Napier, Elruge, Hardwicke Seedling, Humboldt Pine-apple, Rivers' Orange.

Peaches.—Alexander, Alexandria Noblesse, Dr. Hogg, Royal George, Bellegrave, Stirling Castle, Grosse Mignonne, Sea Eagle, Barrington, Walburton Admirable.

Pears.—Jargonelle, Beurré Giffard, Williams' Bon Chrétien, Beurré Superfin, Brown Beurré, Compté de Lamy, Louise Bonne of Jersey, Marie Louise, Doyenné du Comice, General Todtleben, Glou Morceau, Winter Nelis, Bergamot Espere, Josephine de Malines, Knight's Monarch, Beurré Rance, B. Clairegave.

Plums.—Culinary: Prince Englebert, Pond's Seedling, Victoria. Early and late: Washington, Fellemberg, Orleans. Dessert: Green Gage and Bryanstone Gage, Kirk's, Jefferson, Reine Claude de Bayay, Cox's Golden Drop.

Raspberries.—Fastoff, White Antwerp, Baumforth's Seedling, Merveille de Quatre Saison.

The above list comprises the cream, and though there may be others as good, there are few, if any, better among the whole lot.

Now as to planting. The sooner this operation is carried out the better; for the earlier the trees get planted after the shedding of the leaves the greater chance do they stand of becoming established and breaking strongly in the spring.

PREPARING FOR THE PLANTS.

As it is essential for their welfare that the plants should not be kept long out of the ground, preparation should be made for their planting, that all may be in readiness when they arrive, the first thing to be thought of being fresh soil; for, though fruit trees may do very well in the natural earth in some gardens, a little new loam is a great help in giving them a good start at the first. What suits most of them best is the top spit from some old pasture, as turf sods cut there, or from the roadside where there are waste spots, are full of fibre, and this, as it decomposes, is most agreeable food for the roots, which revel in it, and search the stuff through and through, assimilating all they can find.

PLANTING THE TREES.

Many planters, and especially young beginners, have a way of digging holes only just large enough to take the trees, instead of which they should have plenty of room for the roots to be spread well out, and the deeper and wider the ground is broken up the more freedom will they have to ramify, and the better will it be for the plants.

If fresh soil is provided, and there is a sufficient quantity of it, a sort of raised mound should be formed in each hole for standing the trees on, and as soon as these are placed in position, at the right height, and the roots regulated and laid in their proper position, they may at once be covered with the same kind of material, the next thing being to give a heavy watering to settle it about them, and prevent the bark shrinking.

As soon as the planting is complete the ground immediately round the trees ought to be mulched with some half-rotten littery dung, which is not only necessary to keep out frost during the winter, but to conserve the heat and moisture, and maintain the soil in a uniform condition till fresh roots are formed.

STAKING AND TYING.

The supporting of newly-planted trees is a very important matter, as wind-wavio, or any motion of their heads, is most injurious; for though they may oscillate only in a small degree the strain and movement below is great, the leverage causing a wrenching of the roots from one direction, and a pushing or doubling up in another, while the friction or chafing they undergo rubs off any young fibres emitted. This being so, the trees or bushes should be staked and tied securely directly they are planted, and those placed against a wall fastened in their position; but in doing this allowance must be made for any sinking, or the plants will be hung up by their branches.

CUTTING BACK THE HEADS.

Cutting back the heads of young fruit trees is one

* See *Timber* for 1885.

of the most injurious practices ever committed, and cannot be too strongly condemned, as it serves no useful purpose whatever, on the contrary, it greatly retards the progress of the plant; without the heading in, any healthy tree, newly transplanted, will fill its allotted space, on wall or trellis, or become large and established, in a quarter the time it will after the head is lopped off. Instead of the hard pruning, then, to which they are usually subjected, they should have their branches laid in, or left of their full length, except in cases where they are too crowded or misplaced for training, when they may be taken out to give proper room to the others. By adopting this course, and disbudding at the proper time, so as to leave the young shoots in the right place, it is astonishing what rapid strides a young tree will make in a couple of years; as, while making top growth and leaves, the roots are extending in a corresponding ratio to the heads, and the trees quickly become strong and fruitful. *J. S.*

HOME CORRESPONDENCE.

National Pear Conference.—I quite agree with your correspondent "H. C." in saying that something more should be expected from the forthcoming Conference on Pears than a printed catalogue, as was issued as the result of the Apple Congress in 1883. I was very disappointed over that matter, as the thousands of young gardeners who from a variety of causes could not attend at Chiswick, reaped no practical advantage from it whatever; and this I take it should be one of the chief objects of such meetings. My proposition accords with that of your correspondent. The book should be issued in say twenty parts at 1s. each, or bound complete at about one guinea, and it should have copious coloured plates. This would bring it within the reach of all, and the gathering would confer a lasting benefit upon all grades of the profession. If the Royal Horticultural Society cannot see its way clear to do this, surely there is some enterprising firm who would do so, and with advantage to itself. The fact that the committee desire exhibitors to procure any varieties of Pears from their districts, which may not necessarily be grown by themselves, should render the Conference all the more representative; and it would be a pity, may a disgrace, if results were not obtained commensurate with the extent of the exhibition. I may mention that I have already had several collections placed at my disposal in this district, and I hope to hear that the same kindly feeling and interest is being taken in other parts of the country. *W. G. Pragnell, The Gardens, Sherborne Castle, Dorset.*

Fertilisation of *Arum crinitum*.—With reference to my previous notes regarding the above, I may add that, having noticed during the past season the part in which this *Arum* entraps insects, I felt curious to find out if possible something regarding its secret history, but more particularly why insects are entrapped, for although the spathe remains open but for two days, it is truly surprising the number of flies that are lured into the cup-shaped prison at the base of the spathe, and from which they can never return. The position of the spathe when fully developed is oval-shaped, with the sides slightly incurved, the lower portion being involute, or formed into a sort of cup, the entrance to which is much contracted and almost filled up by the spadix. Outside the spathe is beautifully marbled, while the interior is of a flesh-colour, and thickly beset with fine silky hairs, which are incurved or bent towards the basal portion of the spathe, apparently as if to offer the least possible resistance to the ingress of insects. When open the plant emits a strong smell of carrion so powerful that it may be distinctly perceived at nearly two yards distance. This offensive odour is highly attractive to insects, especially flies, which alight on the broad distal portion of the spathe and creep along to the narrow entrance, and down into the cup-shaped base, and from which, owing to the incurved hairs, they can never escape. At mid-day, on June 29 last, I counted ten flies enter this *Arum* in five minutes, and seldom were there a less number than seven flies on the distal portion of the spathe at the same time.

On dissecting one of the flowers, after being open for two days, I counted no less than thirty-six large flies and several smaller ones, dead, within the cup-shaped base. What surprised me most, however, was, that the flies had produced their offspring there, for numbers of the grub were creeping about within the prison, but all that time they were of too small a size to effect an escape. The powerful odour of putrid meat given off by the plant has a purpose of its own by enticing and deceiving flies to enter the basal or convolute part, and where, after finding escape an impossibility, their ova are deposited amongst the hairs at and around the base of the spadix, where they soon hatch, and the young maggots in wriggling about bring the pollen in contact with the stigma, thus playing an important part in the economy of the flower. I at first wondered why the flies, instead of their progeny, did not fertilise the flower as I concluded they most naturally would do when buzzing about trying to effect an escape. But this is now quite plain, as I found that the pollen was then not in a fit state for applying to the stigma, and would not be until some time after the spathe had shivered up and the insects within were dead. By the time, however, that the offspring of the flies are able to move about both pollen and stigma are in a proper condition for fertilisation to take place. *A. D. Webster.*

Rose W. F. Bennett.—We send you two flowers of *W. F. Bennett* Rose, which, as we presume you are aware, was sent out through Messrs. W. Paul & Son, of Waltham Cross, as agent for Mr. Evans, of Philadelphia. *John Cowan.* [The blooms sent were pretty in bud, but were semi-double, but we should like to see many more flowers, grown under varied conditions of climate, soil and culture, before venturing to pronounce any decided opinion on it. *Ed.*]

Fruiting Pines in Small Pots, &c., at Dalkeith.—In looking through the extensive and well-kept gardens at Dalkeith Palace, near Edinburgh, early in September, I was as much surprised as pleased to see two or three houses full of fruiting Pines in 8-inch pots. The plants, which were within a few inches of the glass, were very dwarf and sturdy, and were each swelling and ripening fine well developed fruit, averaging about 6 lb., though many of them would probably turn the scale at 8 lb.—a fact which proves conclusively enough that the majority of Pines are grown in unnecessarily large pots, inasmuch as the fruits which Mr. M. Dunn, the courteous and much esteemed gardener-in-chief at Dalkeith, secures from his plants grown in the size pots indicated above are everything that could be desired. It goes without saying that plants grown in 8-inch pots must be well grown and liberally treated from start to finish, and that in order to swell such finely developed fruits as those mentioned liberal and frequent supplies of some powerful fertiliser must be given at the roots in a liquid state. Perhaps Mr. Dunn would kindly supply the readers of the *Gardeners' Chronicle* with information on this point, and also say if the plants are grown entirely in loam, as they appear to be, as by so doing I am sure he would confer a benefit on many Pine growers, including the writer. I need scarcely say that Grapes and other choice fruits, as well as plants, are also well grown at Dalkeith, and that in one and every department there is ample evidence of presiding skill and good management—good cultivation, cleanliness, and neatness being observed everywhere within the precincts of the gardens and grounds. In front of the principal range of vineries is a good batch of Strawberries in pots for forcing purposes, and which promise to give a good account of themselves in due time. The flower-beds on the beautiful lawn in front of Mr. Dunn's house were quite gay with a variety of flowering plants, which, the colours being judiciously arranged, were very effective. From this flower garden, which, I may say in passing, is as large as that in front of many a country mansion, steps descend to the principal broad walks, through kitchen gardens, &c., the borders on either side of which were enlivened with flowering plants, whilst Dahlias, &c., in a square of ground east of Mr. Dunn's house, made a grand display. The crops in the kitchen garden are in fine condition, a long border in front of a south wall being well stocked with sturdy young plants of Lettuce for lifting with the soil adhering to the roots and transplanting into cold pits on the approach of frost. In front of this

border, on a piece of ground sloping well to the south and east, I think, are growing a most promising lot of young pyramidally-trained Apple trees of the most approved varieties, which are, like the large trees in another quarter of the garden close by, bearing heavy crops of clean, kindly-looking fruits. Altogether there is quite a large but select collection of Apples grown at Dalkeith, and Mr. Dunn is quite familiar with the names and qualities of the individual varieties, as the remarks which he made in passing through this department afforded ample proof, if proof were necessary. *H. W. Ward, Longford Castle.*

"**Hortus Floridus.**"—The copy of *Hortus Floridus*, reviewed on September 12, does not belong to Mr. Hartland, and never did—it belongs to me, and it has been in my family for several generations, but I lent it to Mr. Hartland, as he was anxious to look over it. I am happy to find by Mr. Krelage's extremely interesting communication in the issue of September 26, that my *Hortus Floridus* has only a very few plates wanting, and that it is the rarest of the editions of this excessively rare book. Truly this old volume is an eloquent lecture on the wonders which the persevering care of plants can accomplish; for instance, the eyeless yellow and purple garden Pansy of 1614 is just three-quarters of an inch in diameter. *Cecil C. Woods, Cliplet, Blackrock, Cork, Sept. 28.* [Our valued correspondent, Mr. F. W. Burdidge, in reviewing the book, omitted to mention, quite unintentionally doubtless, that the book was not Mr. B. Hartland's property, but that of our correspondent. *Ed.*]

—My copy of the *Hortus Floridus*, mentioned on September 12, has bound up with it the work mentioned on September 19, and the number of plates of fruits and flowers in both is 167. I should be extremely glad to know how many plates of fruits and flowers the added work should have. *Cecil C. Woods.*

Early and Late Outdoor Chrysanthemums for Cutting.—I grow more than a thousand of these, planted as far as I can against south walls, more for the purpose of obliging my neighbours, for wreaths, bouquets, &c., than for any use I have for them myself. I have lately been through much of Ireland, and cannot help regretting how limited the outdoor culture of Chrysanthemums is; while every owner of a greenhouse feels bound to have them indoors, but they are very rarely used as cut bloom. Lovers of flowers, especially in towns, thus deprive themselves of a great floral treat, when they cannot be had elsewhere. Splendid blooms can be grown against a south wall. One of our largest and most successful growers was surprised at the promising wealth of bloom I showed him yesterday, much finer and earlier than those I have in pots. *W. J. Murphy, Clonmel.*

Country Growers and Town Salesmen.—Under the above heading appeared in your last issue a complaint from (I suppose) a country private grower of the treatment he received from a firm of Covent Garden salesmen after consigning to them a number of Artichokes. I consider this to be on a par with many similar complaints I have read in your paper. I can quite believe that the Artichokes were not sold, but left among the refuse of the market, seeing that the growers of that vegetable, who are comparatively few in number, and have, as may be supposed, a better chance of selling—for they have a regular supply right through the season—have this year wasted hundreds of dozens after taking them to market, and great quantities were wasted at home. Now as to prices. I can safely say that good Artichokes have not averaged 1s. per dozen through this season for those that were sold, and after the limited demand was supplied the remainder were unsaleable at any price. I cannot understand "C." when he says Artichokes are not sellable, as for the purpose of sale I do not know anything much more so. I am a market gardener, and have been attending Covent Garden selling my own goods for over twenty years. I have seen many of the consignments from private growers, and can conscientiously say that as a rule the vegetables are great rubbish. I often fancy that many country private growers imagine that London is very badly supplied with vegetables, and that the public are glad to take anything they are kind enough to send them, whereas I believe no town in England is so well supplied with good vegetables, both home-grown and foreign, which

latter are not always as stale as "C." imagines, as they usually arrive as fresh and in as good a condition as goods from the provinces, or better. Has "C." noticed that there is no wholesale vegetable price list in your paper? In conclusion, is it likely that salesmen who are dependent upon their senders for their living should act with such a suicidal policy as "C." and some others would have the public believe? *W. Poupert, Marsh Farm, Twickenham.*

Wood-paper Cuffs.—I saw about five years ago some very curious-looking cuffs for ladies' wear, which, I was told, were made from the bark of trees; they were a trifle thicker than the white cuffs made of paper, and of a very pretty light tan colour, perfectly smooth, like satin, and on the centre of each cuff there was a small bunch of very tiny blue Harebells nicely painted. I do not know whether they were foreign or English manufacture, but they looked to me as more like some preparation of wood shavings than bark. *Helen Watney.*

Crocus speciosus.—This is well named "the showy autumn Crocus." It has been termed the fines of the autumn-flowering types, and it is deservedly styled so. Just now it is throwing up its large and rich bluish-lilac flowers, lined with dark purple, in the open ground. A clump of this beauty is just now throwing up its blossoms through a covering of Mignonette growing on the surface, which is just the thing for it, as it serves to support the blossoms, keeping them upright, and so showing them off to the best advantage; when without such aid the stems appear too weak to bear the flowers steadfastly upright, and a gust of wind lays them low on the soil. It is best to plant it deeply in some rich soil in a spot where it can remain permanently, and so be undisturbed, and flower in the autumn. It is a leafless flower, which pushes suddenly, and is seen in all its beauty under the brightness of the autumn sun. And yet in how few gardens can it be met with. *A. D.*

The Nurserymen's Mutual Hailstorm Insurance Society.—Allow me, through the medium of your paper, to bring before your readers a matter which will greatly affect their interests. It is well known that during the last few years nurserymen and market gardeners have invested a large amount of capital in the erection of glasshouses, and owing to the heavy cost of insurance, much of this is uninsured against the danger of hailstorms. I am prepared with a scheme whereby every *bona fide* market grower may insure his glass at 5s. per cent. per annum. (The usual charge for 21 oz. glass is 20s. per cent. per annum.) Not only may the ordinary risk of breakage by hailstorms be met by the premium I have stated, but if taken up heartily by trade growers generally throughout the country, at the end of every five years a handsome bonus may be given to every policyholder, and thus almost, if not quite, affording the security of insurance free of cost. I base these statements on the average injury to glasshouses in this country by hailstorms during the past twenty years. I have the details for working the society, but to avoid trespassing on your space will mention only a few leading features in the management. Each district shall have a local committee, themselves growers, who shall receive applications, inspect the houses proposed, and report to a central committee of growers in London, who will occasionally sit to transact such business as may arise. There shall be no paid agents, or commissions on money received. All work done by committees shall be honorary, which will require only a few hours in each year. All money belonging to the Society to be invested in Consols, and when about £5000 or £6000 have accumulated the interest will cover all working expenses. I know a gentleman well connected, and having considerable commercial experience, who is ready to act as secretary. I may state that I have no personal interest in this matter, more than any other grower who may ensure his glasshouses. I have stated my views to several of the leading market growers around London, who highly approve of them, being convinced of their soundness, practicability, and advantage to the trade, and with me are most anxious to have the society started forthwith. But as I cannot converse with many who are trade growers, I ask, as an initial step, that all the readers of the *Gardeners' Chronicle* who are trade growers, and are favourable to this mutual insurance scheme, will write a letter to me personally, that I may be able to judge of the

amount of interest likely to be enlisted. *Geo. Beer, Chesswood Gardens, Worthing, Sussex.*

Tokay and Foster's Seedling Grapes.—I have read your remarks about the Foster's Seedling and Tokay Grapes at South Kensington, and, with all due deference to your opinion, I must beg to differ with you, for I do not think Mr. Allan's Grape the same as my Tokay. As I remember it, it was a longer, more even berry, not so round and lumpy as Tokay. I am sorry Mr. Allan could not send you berries of his to compare with mine. I remember when gardener at Astle Park, Cheshire, grafting Foster's Seedling on the Black Hamburg; and, so far as I can remember, it had very much the appearance of those shown by Mr. Allan. I hope, all being well, to compare berries with him next year. You also say mine were identical with those shown as White Tokay. They are the same as those awarded the 2d prize, shown by Mr. Hollingworth, but not the same, in my opinion, as those shown by Mr. Roberts, and to which the 1st prize was awarded. I told Mr. Roberts at the time that his were not Tokay. I never saw Tokay which approached the colour his were, and they were a different shaped berry. Had I been judging I should have disqualified them, and had I exhibited mine I should have protested against them. However, I shall ask Mr. Roberts to send berries and foliage of his variety to the next committee meeting at South Kensington, and I will do the same, as I think it much the best way of clearing these doubtful matters up. *J. Wallis.*

Disa crassicornis, Lindley.—The plant which Mr. Burbidge enquires about on p. 374 under the name of *Disa macrantha* is *D. crassicornis*, and was figured in the *Botanical Magazine* a few years since at t. 6529 under the name of *D. megaceras*, and in the *Garden* under the erroneous name of *D. macrantha*, the true *D. macrantha*, Thunberg, being, up to the present time, an unknown plant. The copy of Mr. Sanderson's drawing represents larger and more highly coloured flowers than do the plates above quoted. The flowers certainly grow larger than the *Botanical Magazine* shows them, but whether they become as highly coloured as in the copy of Mr. Sanderson's drawing, or whether this is due to the imagination of the artist, I have no means of knowing. Certainly it is a very beautiful species, and will well repay all the trouble a cultivator may bestow upon it. *N. E. Brown.*

Hardy Ferns, &c.—In looking through a number of collections of hardy Ferns at several exhibitions during the present season, I have occasionally wondered whether this class of plants is as sufficiently known as it deserves to be. I do not mean to infer that any departure of a novel or striking character has taken place during the shows that have been held this season, for the exhibits of each season and, in fact, of most exhibitions, are of a strikingly similar character. There are a large number of species and varieties that might be used for the purpose, so that it does seem somewhat tiresome and disappointing that when a group of twelve hardy Ferns is put up for competition there should be three, five, or even seven varieties of *Athyrium Filix-femina* found amongst them. If the class is for six plants, then often I have observed four of this species; and when prizes are offered for four hardy Ferns there are two or three specimens of this same form. Now, I take no exception whatever to this charming species; some of the forms are beautiful in the extreme, whether of the plain, tasselled, or much divided varieties, all are deserving of culture, and all are worthy of being placed upon the exhibition stage; but as the number of hardy Ferns is so large, I do think it would be well that in this class the number of specimens of this species were considerably reduced. In showing stave Ferns a class is almost always provided for *Adiantum*, and it is well that it is so, for a plant of *Adiantum cucuatum*, beautiful and well grown as it may be, does not stage very well with a *Dicksonia antarctica* having a stem 6 to 8 feet high. This is perhaps putting an extreme case. My view is that, among the *Adiantums* put up for competition, whether in a separate class or in a group of stave Ferns pure and simple, there is not seen so much variety and diversity as may be met with in the various forms of *A. Filix-femina*. This being so, I venture to suggest that it would be wise and desirable that a class be formed for this species only, say six *Athy-*

rium Filix-femina, to include such as are most distinct, and that the other class of hardy Ferns exclude this form, or only allow one or two. I do not think it would be wise to banish any forms from our exhibition stages, but I do think it would be well if some means could be adopted so that greater variety both of species and genera were not only well cultivated, but staged at our shows, both for the education of the general public, and for the extended knowledge of many who hope by-and-by to have charge of establishments where hardy plants of all sorts are grown. There are many hardy Ferns of most attractive appearance that are never seen in public competition, and I venture to remark that if some enthusiastic young grower would discard for a season or two the forms of *Athyrium Filix-femina* and grow other species of a very distinct character, and then stage them at one of our principal shows in a thoroughly well-grown and healthy condition, he would meet with an amount of success that would not only compensate him for all his labour, but would be far greater than he can hope to secure by showing them under conditions that rule at present. *W. Swann, Fallowfield.*

Zephyranthes candida.—"Ealing" asks whether "any one has tested the hardness of this plant out-of-doors?" I have grown it so for many years, and also *Zephyranthes atamasco*—both flower profusely. I have had as many as sixty flowers on a small patch, and I have no doubt that wherever *Sterbergia lutea* succeeds *Zephyranthes candida*, as well as the larger *atamasco*, may be grown. *T. H. Archer-Hind, Devonshire.*

Florists' Flowers.

THE PINK.

This is a busy time with the growers of florists' flowers, and the lowly Pink must be attended to now. We have just planted ours out in the open ground, and those who have not yet done so should see that this is done at once. The plants will succeed in any good garden soil, moderately rich, and in proper condition at the time of planting. The plants may be put out about 8 or 10 inches apart; very small plants may not be allowed more than 6 inches between them. Any long straggling specimens should have small sticks placed to them to keep them in their places. Indeed, if the position is much exposed to winds, all the plants should be supported in this way. It will not do to plant them out if wireworm exists in the soil—the leather-coated grub is sure to find them if it is in the vicinity; this nasty grub feeds at night, and may easily be destroyed by watching for it with a light. A pair of each kind of Pinks should be potted into small pots, and wintered in frames, to make good any losses that may occur in winter.

FORCING PINKS.

These plants must now be lifted from the open ground, and be potted into the pots in which they are to flower. I have always advised taking the cuttings of these in April, and if this has been done the plants will be of large size, and fit to be potted into 6-inch pots. When the plants are potted place them in a frame; the lights may be kept over them for a few days, but not too close. They will speedily root into the new compost, after which the lights ought to be removed entirely in fine weather.

THE PENTSTEMON.

This is a capital late autumn flowering plant, and will continue to hold up its head bravely when more tender things have succumbed to frost; but it will flower longer and better if the seed-pods are picked off as soon as the flowers fade. The present is a good time to take cuttings, which will strike freely under a hand-glass, or in a close frame with bedding *Calceolarias*. They will root quicker over a gentle hotbed, but I do not think they make any the better plants for the next season. If the old plants are left in the borders, they pass through ordinary winters unscathed, and flower strongly and early the following season.

THE PHLOX.

I have previously stated that the best way to cultivate this beautiful hardy plant successfully, is to take cuttings early in the year. March is a good month, each of these will produce one good spike the same season, either in pots or planted out. If they have been grown and flowered in pots, the present is a good time to plant them out in the open border, or if in beds, 20 inches apart; given a rich deep soil, they will produce splendid spikes the following season. Or if they are to be grown and flowered in pots the second season, they need not be potted until the spring, and 8 or 9-inch pots are the best sizes in which to flower them. The soil for potting ought to be light, to allow of free and rapid development of the roots.

THE POLYANTHUS.

With many persons the Polyanthus is a greater favourite than the Auricula. It is in all respects distinct, flowering several weeks earlier, and a bed or frame full of them rivets attention at once, owing to their distinct and brilliant colours. I was so pleased with the results of a frameful planted out in Mr. Brockbank's garden at Didsbury that I have planted a frame this season and potted up as many. I allude now to the laced type. The past season was very trying to them in this district; they were attacked by red-spider and green-fly simultaneously, and either of these is sufficient to cripple the plants. They were washed and cleaned, promising now to flower well. Our best plants last season were potted the last week in September; this year they were potted and planted out early in August; it was necessary to lift them to get at the red-spider. Plants of these, or the fancy kinds growing in beds or borders, may be left to themselves, except to dust some soft round the roots to keep slugs from them. Choice plants may even be watched at night with a lamp. I have seen plants quite cropped over with the leather-coated grub; this is very troublesome, as it is so fond of the leaves, and is not deterred by soot. *J. Douglas.*

Notices of Books.

Flore Complète de la Belgique, etc. Par André de Vos, Mons: Hector Mancaux. 12mo, pp. 739.

It is impossible to criticise a work of this character in detail until one has become practically familiar with its use, or otherwise, in the field. No such delay, however, is required to form an appreciation of the author's method of procedure, nor of the general value of his work. We need not, therefore, hesitate to commend this little volume to the attention of all those who are interested in the Belgian Flora, or, indeed, in that of north-west Europe generally. In some respects it follows the plan adopted by Lamarck, and of which English botanists have an excellent example in Bentham's *Handbook of British Plants*. It consists of analytical tables offering a series of alternative characters, by means of a succession of which the pupil is rapidly led to the identification of the natural order, genus and species of the plant before him. Such a plan necessitates a certain amount of previous knowledge of the organisation and characteristics of plants, and it demands rigid accuracy on the part of the compiler, and strict attention on the part of the reader, else the latter may very readily wander from the right track, and each successive alternative, instead of bringing him nearer and nearer to the desired goal, will necessarily take him further and further from it. The strict attention requisite on the part of the pupil is at first rather irksome, yet highly beneficial as a mental discipline, provided that the tables have been drawn up with sufficient care for the pupil's wants.

Such analytical tables, it seems to us, should, as a rule, include nothing that cannot readily be seen by the observer. To illustrate our meaning we may ask of what value in such tables are the details relating to the double generation of Conifers (*i.e.*, the production of corpuscula), and the division of the pollen-cells? And we may inquire how the pupil is to ascertain the presence or absence of a double set of vessels, or of an alternation of generation? These are points of first-rate importance, but they are not easily made out, and are quite useless for ordinary field use. But the objections that might be raised on this score are, partially at least, met by the fact that the work is intended for use by persons who have already some knowledge of botany, and, moreover, they apply merely to the larger groups, and not to the genera and species. In addition to the ordinary wild plants of Belgium, M. De Vos includes many of the more important hardy cultivated plants, which will render the work useful to gardeners and others desirous of gaining some information as to the plants they cultivate. Of course, it is impossible to enumerate a tithe of the hardy cultivated plants, so that selection was essential, and these, so far as we have seen, have been judiciously effected.

Reference is made in many cases to the most recent monographs of particular genera, and incidentally a great deal of information is given as to the geographical distribution of plants, the date of introduction, and the uses of those cultivated for economic purposes. Mention is even made of the principal insects and parasitic fungi injurious to particular crops, so that a very large amount of information on a great variety of subjects is condensed into a small space. Curiously enough we find but little reference to the structural adaptations to insect fertilisation, to which now-a-days so much attention is deservedly paid. Again, while the French and Flemish names are given, there is no attempt made to give the explanation of the classical names. We recognise, of course, that we have no right to expect this sort of information in an analytical flora, but M. De Vos has given us so much miscellaneous information that, we can scarcely help asking for more. We hope the author will deem this a compliment rather than otherwise, for if his book were less valuable than it is we should not ask for more. As it is, M. De Vos has produced what we cannot but consider a most useful publication. It consists not only of a series of analytical tables and condensed descriptions of plants, but is a veritable encyclopædia in miniature. How so much matter can have been compressed into little over 700 small pages is a mystery. A word of commendation is also due to the printer and publisher for the excellence of the typography and the quality of the paper.

SOMERLEY.

On the borderland lying not wide from that hunting-ground of royalty, the New Forest, and the heathery downs of Dorsetshire, stands Kingwood, a quiet old-world town—a little busier than was its normal state before the advent of the South-Western Railway, and the subsequent junction with the Bournemouth line. The Avon flows lazily past the town, stopping the while to broaden out into shallow and deep meers very suggestive of jack, whilst the swifter parts are admittedly the feeding-places of fine trout and salmon.

Somerley, the residence of the Earl of Northampton, occupies an elevated position, hidden amongst woods, about three miles from the little forest town. The house itself is a plain, commodious, modern building, of brick and stone, and is not visible from any point of vantage until the onlooker is close to it. The position is a remarkably good one, but standing amongst trees which press in on it on every side, the most would not appear to have been made of it by the present proprietor. He, like so many more, has a certain reverence for the old trees surrounding his residence, and views with disfavour any schemes of improvement which would cause the sacrifice of his favourites. New species of either deciduous or coniferous are not common about the grounds, which are of great extent, so that we find much of the beauty of scene due to the fine development of indigenous timber.

The common Beech, a never-failing tree in districts chalky, or bordering on that or the Greensand stone; Scotch Pine, Maple, and in the "the bottoms" common forms of Oak, make fine timber. Quite remarkable

were some Pines standing in a line alternating, mostly with Beech. The trees stood free on the edge of a declivity, where consequently the ground descended rapidly on one side, giving full exposure there, many of the specimens having a diameter of 3 feet at 4 feet from the ground, the massive rich red and almost smooth pillars associating and contrasting well with the yet larger Beeches. Some one, years ago, had made a walk perfectly straight for some 200 or 300 yards, running close up to the stems, so that their fine proportions should not be lost in the general wildness of the wood.

The grounds which stretch around the house, on the generally level ground there, are rather intricately planted with shrubberies and a few solitary trees; there is a considerable quantity of greensward, and fortunately but few walks—only just enough for getting healthy promenades, without taking the visitor to every big tree and show objects in the place. On the south side of the man-sion is a tangled declivity, which is overlooked from a terrace running on that side. This terrace is cold, severe, and quite unadorned, and appears with its natural surroundings of trees and shrubs just a bit incongruous, but we must not forget the dicum of the landscape gardener of a not distant date, that houses erected on ground near a declivity must seem to have their security made apparent, adding a terrace, walled, buttressed, and balustraded on the lower ground, the house being built first, and the sham platform made to account for the existence of the house at that point.

A stretch of velvety lawn, bounded by trees, with here and there a shrub or low tree, round-headed rather than "spiky," would be an improvement on the wild slope and its impeding terrace.

Some considerable distance north from the mansion are five vineries, lean-to houses of an old-fashioned stamp, as seen in the methods for ventilating, paving, and construction; fairly good Grapes are now grown in them, and when the young Vines, which Mr. Richards, the present able gardener, has planted, come into bearing, the crops will be greatly improved. Good well coloured bunches of all the popular late kinds were seen in the later houses. Behind this range of vineries the usual sheds, Mushroom-house, stockhouse, and offices are found, and still further to the rear, and shut in by trees on three sides, is a span-roofed vinery that was formerly a Peach-house intended to fruit early in the season; but which, owing entirely to the shade produced by the adjacent trees, turned out to be a failure for early work. It is now partly filled with some very strong canes of late keeping kinds that are certain to bring fine produce, and are likely to be heard of at our metropolitan shows at no distant date. One division of this house still remains planted with Peach trees, the wood, which has been cut back nearly as hard as would be done by gardeners at the winter pruning, the main idea being to plump up the bloom, *i.e.*, to cause their perfect development by cutting back in August when the chance of further growth being made had ceased. As seen in the second week in September, the experiment appeared likely to have the wished-for effect, and certainly there were no indications of the rear buds starting, which was of course to be apprehended.

Other houses in this area were a small stove filled with nice healthy young stock of useful furnishing plants. In this house we found some perfectly clean Gardenias, a large piece of *Catleya gigas* and one of *Dendrobium densiflorum*, which bloom always well, and get only stove treatment. Some pits useful for Cucumbers, Pines, Tomatoes, &c., fill up the space between the first-named range of vineries and the pleasure grounds; and so little was thought of the Vine roots extending beyond the border made for them, or of the need of sun-heat placing on the border, that the hinder walls of these pits were built on the sunny side of it. From the two instances mentioned, and there are others, the worst obstacle to good work in this portion of Somerley gardens would appear to be shade, either from buildings improperly placed, or from forest trees as improperly left standing. In another part of the Vine border a big Laurel has its position to the annihilation of the Vines for many feet on either side. It did not matter how much the Vines were given in the way of manure, the Laurel grew and prospered, but the Vines became smaller by degrees. In another there grew a mass of what is now Tree Ivy, as greedy a feeder on manurial good things. These masses of roots are

now enclosed within cement and brick walls, so that further wanderings are impossible.

On the lawn is an octagon-shaped house, planted in the middle with Camellias, which at the time of our visit were bristling with flower-buds, the sorts mostly being *C. imbricata*, *C. Lady Hume's Blush*; *C. sacoi-nova*, and *Marchioness of Exeter*. Flanking this house was a quadrilateral house, with tall upright sides filled with *Roses* on roof and sides, and another similar house on the opposite side of the octagon containing a great *Stephanotis* on the roof, and beneath it *Begonias* and other shade loving stove plants. *Magnolia conspicua*, the best variety, does splendidly at Somerley, and lives within winter protection; it is much used to cover buildings and unsightly walls, and occupies varied aspects with the advantage accruing of a long supply of flowers.

The flower garden, properly so-called, lies on the south side. It is small, but the beds are very numerous, causing the whole to represent a carpeted on a large scale, and requires about 20,000 plants to furnish it. Leaving the high ground on which the mansion is situated, a rather steep pathway leads down through the wood to the park. Here were found *Portugal Laurels*, that had grown into trees of 40 or more feet in height, and proportionately thick. Common *Laurel* grows less robustly, but both are picturesque additions to woodland scenery. *Rhododendron ponticum* grows wild everywhere, and was seen of all ages, from naturally layered bushes, 60 feet in circumference, to tiny yearlings.

A space of park land has to be traversed of about 400 yards, and the kitchen gardens are reached, lying warmly at the foot of the hill, and amongst a surrounding of solitary standing Oaks. This position has some advantages: it makes vegetable and fruit growing much easier than in exposed gardens, but late frosts are very common and destructive, and things are cut off earlier than on higher ground.

The area of the ground under fruit and vegetables is about 5 acres, and it is subdivided into several portions of singular form by intersecting walls, which latter give a great variety of aspects for fruits. The *Fig* grows well here, and *Peaches* ripen without glass protection, and it may be remarked that the wood gets quite matured without so much labour being necessary in laying it in close to the wall. By constant trenching and manuring, especially the first-named, the tilth has much improved, and is capable of supporting great crops of vegetables of the best quality, as witness *Mr. Richards'* triumphs in the classes for these at *Metropolitan* and other shows. Yet we found *fruit trees*, such as *espaliers*, bushes, and *pyramids*, growing strongly, but mostly barren. The roots were in the hungry grave of the substratum, and, for want of sufficient labour, could not be transplanted. This is to be regretted, for the climate of Hampshire is well suited for fruit growing. Of the few that were not influenced by the bad soil may be mentioned the *Ribston*, clean in wood and fruit; and *Cellini*, equally good.

A short range of *Peach-houses* is found in the kitchen garden, and good fruit was being gathered in them, as well as very fine *Tomatoes*, which latter were planted in short rows at right angles to the back wall, and 5 feet apart, the shade thrown on the *Peaches* being very trifling, and no way detrimental. Outside on the front wall *Laxton's out-of-door Tomato* was carrying a weight of 10 lb. of fruit per plant. A *Plum* wall planted with the usual kinds had produced a wonderful crop, but, except on a few, it was mainly over. *Morello Cherries* were equally fine, and these, like the *Plums*, had a large portion of the walls set apart for them.

We noticed some fine quarters of *Brussels Sprouts* and *Cauliflowers*, in the first *May's* variety took the lead for robust compact growth and firm *Sprouts*, followed by a selected variety from *Messrs. Sutton*; the kind of *Cauliflower* was *Veitch's Autumn Giant*.

Great care is evidently taken with the vegetable crops of all kinds, not alone for show purposes, which have special care, but for the ordinary supply. The light soil, when trenched, grows root crops of all kinds to great excellence, and clubbing and finger-and-toe (*Anbury*) disfigurements are unseen.

The surrounding demesne is of 4,000 acres in extent, the home park being more than a mile in length, but much less in breadth. A few exotic trees, coniferous and others, were noticed, but nothing which calls for special mention. *H.*

OCTOBER: PLANTING.

To be ready to take full advantage of autumn planting requires a little forethought and early preparation of the ground and materials, but where the instructions previously given in these columns have been acted upon everything should be in readiness by the middle of October, so as to allow the whole available staff under the forester's supervision to be employed in this important operation as soon as the nursery stock has arrived at a proper state of maturity to be safely removed. The advantages of early planting are so many, and now so well known, that one can only wonder why the practice is not more generally adopted. It is well known, however, that from one reason or another comparatively few planters adopt the early start, but defer this important work till the cold, drying winds of March arrive, and when the young plants are placed at the greatest disadvantage. In some cases it is certainly advisable to adopt spring planting—for instance, in dealing with cold, wet, retentive soils or peat bog; but these are few and peculiar, and should certainly form no excuse for the frequency with which the practice is adopted in various parts of the country.

Everything being in readiness, the next important but oft-neglected point is the selection of clean, healthy, well rooted and bushy plants, and such as are suitable for the situation and soil in which they are to be inserted. Dwarf, lanky, ill-grown, and badly rooted plants should at once be discarded, as they necessitate just the same expenditure in planting as others of good constitution and form, but never make profitable trees, and constitute a source of grievance to the owner and of annoyance to all who have been in any way connected with their removal.

The planting of upland or mountainous tracts also requires considerable forethought, and, above all, wise selection of the plants to be used. These should not only be small (small in proportion to such as are used in low-lying and sheltered situations) but chosen from such nursery ground as is well exposed and situated at a considerable elevation above the sea-level, for we can never expect plants that have been reared in a warm, sheltered, lowland nursery to succeed when planted on a bare, exposed mountain side, at least nearly so well as such as have been inured to it from their infancy. Lifting nursery stock is another matter of the highest importance, that should always be superintended by a careful, competent person, so that none of the barbarous treatment too often practised will be tolerated, and to which many of the failures in planting might be traced.

The plants should be lifted with a fork and raised clean out of the ground without racking and breaking the roots, for the preserving of these unimpaired is a matter of much importance for the plant's future welfare. As soon as lifted, and when not required for immediate use, the plants may be "laid in" and the roots carefully covered with a sufficient quantity of rather dry earth, but where it is at all practicable, as in a home nursery, it is well only to lift sufficient plants for one or two days' use—dispatch in lifting and planting being a golden rule. Of course where plants are procured in quantity from a distance, immediate planting is out of the question, but under these circumstances they should be unpacked immediately on arrival and "sheughed" thinly, and if at all dry well watered so as to preserve them in as healthy a state as possible until such time as they can be planted. When received from a distance young plants are often allowed to remain in bundles, but this is a very objectionable practice and should only be tolerated where planting is to take place in a day or two. In conveying young plants from the nursery to their place of destination the roots should never be allowed to become dry. The slightest protection, even a mat or damp refuse straw, or hay, will prevent this.

NURSERY WORK.

This is usually one of the busiest months in the nursery; for besides the autumn planting and transplanting, there will be the usual propagation by cuttings, layers, or suckers, the collecting, drying, and storing of tree seeds, formation of seed beds, and

general pruning of all nursery stock. In collecting seeds it should always be borne in mind that those from medium-sized, healthy trees are preferable, those from young trees often proving barren, and from old trees weakly in growth, and usually difficult to procure. Coniferous tree seeds are unusually abundant this season; indeed, we cannot remember so rich nor generally so good a crop. Many rare kinds are now coming for the first time, such as *Abies concolor*, *A. Pindrow*, *A. Pissapop*, *A. grandis*, *Picea orientalis*, &c., while hardwood trees and shrubs are in most cases well supplied with a heavy, healthy crop of fruits. As nursery borders become vacant they may, according as it is thought proper, be either deeply trenched and otherwise prepared for the reception of green crops during the following season, or where the soil has become too impoverished, receive a good top-dressing of leaf-mould or other necessary refuse, after which they may be planted with seedlings, varying the crop from *Firs* to hardwood or *vice versa*. Be sure that all seeds of weeds have been destroyed in the compost heap before its application to the borders, as a neglect of this precaution will cause endless work throughout the following season. By turning the compost heap occasionally, so that fermentation may go on equally all over the mass, and by adding a slight addition of lime, the germinative properties of most seeds will be destroyed. *A. D. Webster, Penrhyn Castle.*

(To be continued.)

The Weather.

- Sept. 24.—Fine day.
- 25.—Rain in morning, then between 1 P.M. and 3 P.M.; dull day.
- 26.—Fine and bright at times. Fine clear night.
- 27.—Dull cold day and night.
- 28.—Dense fog in early morning, fine bright day, fine night.
- 29.—Rain from early morning till about 9 A.M., fine but dull afterwards.
- 30.—Dull day, slight rain in afternoon.

LONDON: Atmospheric Pressure.—During the week ending September 26, the reading of the barometer at the level of the sea increased from 29.91 inches at the beginning of the week to 30.13 inches by 9 A.M., and decreased to 30.06 inches by 5 P.M. on the 20th, increased to 30.37 inches by 9 A.M. on the 22d, decreased to 30.05 inches by 1 P.M. on the 24th, increased to 30.09 inches by 5 P.M. on the 24th, decreased to 29.86 inches by 1 P.M. on the 25th, increased to 29.93 inches by 9 A.M. on the 26th, and was 29.87 inches by the end of the week.

The mean reading of the barometer for the week was 30.09 inches, being 0.09 inch higher than last week, and 0.13 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 67°.8, on the 23d, on the 26th the highest was 51°.2. The mean of the seven high day temperatures was 60°.3.

The lowest temperature was 35°.5, on the 26th; on the 21st and 23d the lowest temperature was 54°. The mean of the seven low night temperatures was 45°.3.

The greatest range of temperature in one day was 25°, on the 22d; the smallest, on the 21st, was 8°. The mean of the seven daily ranges was 15°.

The mean temperatures were—on the 20th, 54°; on the 21st, 56°; on the 22d, 55°; on the 23d, 60°; on the 24th, 50°; on the 25th, 44°; and on the 26th, 42°. In these the 21st and 23d were above their averages by 1°; and 4° and 9, and the rest were below by 1°; 8, 4°, 3°, 10°, 5, and 12° respectively—the 22d being the same as the average.

The mean temperature of the week was 51°; being 5° lower than last week, and 3° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 119°, on the 22d. The mean of the seven readings was 103°.

The lowest reading of a minimum thermometer placed on grass was 28°, on the 26th. The mean of the seven readings was 36°.

Rain.—Rain fell on three days, to the amount of 0.10 inch.

ENGLAND: Temperature.—During the week ending September 26 the highest temperatures were 69° at Cambridge, 68°, at Brighton, 68°, at Truro; the highest temperature at Bolton was 61°.9, at Preston 62°, at Bradford 62°.3. The general mean was 65°.

The lowest temperatures were 31°.9 at Bolton, 32° at Hull, 32°.1 at Nottingham; the lowest at Plymouth was 42°.9, at Liverpool 38°.6, at Newcastle 38°. The general mean was 35°.8.

The greatest ranges were 35° at Cambridge, 34°.9 at Nottingham, 33° at Hull; the least ranges were 21°.2 at Plymouth, 24°.7 at Liverpool, 26° at Newcastle and Preston. The general mean was 29°.7.

The mean of the seven high day temperatures was highest at Cambridge, 62°.7; at Truro 62°.3, at Nottingham 61°.4; and was lowest at Bolton, 55°.4, at Liverpool 56°.5, and at Newcastle 57°.6. The general mean was 59°.7.

The mean of the seven low night temperatures was highest at Brighton, 47°.2, at Truro 46°.4, at Plymouth 46°.3; and was lowest at Wolverhampton, 40°.9, at Hull 41°.1, at Bolton 41°.4. The general mean was 44°.4.

The mean daily range was greatest at Cambridge, 19°.5, at Nottingham 18°.9, at Wolverhampton 18°.5; and was least at Liverpool, 10°.6, at Preston 12°.4, at Bradford 13°.4. The general mean was 15°.

The mean temperature was highest at Truro and Brighton, 55°.1, at Plymouth 52°.9; and was lowest at Bolton, 47°.2, at Hull 48°.8, and at Wolverhampton 48°.9. The general mean was 50°.6.

Rain.—The largest falls were 0.80 inch at Truro, 0.78 inch at Bolton, 0.76 inch at Liverpool; the smallest falls were 0.01 inch at Brighton, and 0.03 inch at Nottingham and Leeds. No rain fell at Sheffield. The general mean was 0.30 inch.

SCOTLAND: Temperature.—During the week ending September 26, the highest temperature was 63°, at Perth; at Greenock the highest temperature was 58°.5. The general mean was 60°.1.

The lowest temperature in the week was 31°, at Perth; at Leith the lowest temperature was 38°.7. The general mean was 35°.3.

The mean temperature was highest at Leith, 51°.1; and lowest at Aberdeen, 48°.1. The general mean was 50°.3.

Rain.—The largest fall was 1.49 inch, at Aberdeen; the smallest fall was 0.08 inch, at Edinburgh. The general mean fall was 0.54 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, Sept. 28, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather has been in a changeable condition generally, and during the greater part of the period it was very cold for the season. Falls of rain or hail have been very prevalent, while in many places (including London) showers of snow have occurred.

The temperature has been unusually low for the time of year, the deficit over the greater part of England and in the south of Ireland amounting to 6°. The maxima, which were registered on the 22d, varied from 58° to 62° in Scotland and Ireland, and from 64° to 73° in England. During the latter part

of the week the maxima at many stations—even as far south as London—did not exceed 60°. The minima were generally recorded towards the end of the period, when the thermometer fell to 25° in "England, S.W." (at Liadovore), and to between 28° and 32° in all other districts except the "Channel Islands," where the lowest reading was 42°.

The rainfall has been less than the mean in the "Channel Islands," "Ireland, S.," "Scotland, W.," and over central, southern, and north-western England, but more elsewhere.

Bright sunshine has been more prevalent in most districts than it was last week, the percentages of the total duration varying from 29 in "Scotland, N.," and 37 in "Ireland, N.," to 50 in "England, E."

Depressions observed.—At the commencement of the period a large depression far to the northward of Scotland was moving away north-eastwards, while the barometer was highest over France and our southern coasts. As this disturbance passed away pressure decreased decidedly in the eastern and south-eastern parts of our area, where some shallow depressions were formed, while it increased steadily in the west. The wind, therefore, veered from the south-westward or westward to north or north-west on our coasts, and in many places blew strongly, with much colder weather. These conditions continued, with but slight alteration, until the end of the period, when depressions again appeared off our western coasts, and the wind backed to the southward, with rapidly rising temperature.

Answers to Correspondents.

* NOTICE.—We shall feel obliged by our correspondents who may require to have their Pears named sending them in a ripe condition, so as to insure accuracy, and not to send more than six varieties at one time.

CARNATIONS: E. B. C. There are many much better Carnations in the market. The colour of yours is not at all attractive, except as a curiosity. To make anything by them you had better apply to some leading florist.

CROCUS BULBS DISEASED: C. W. D. A reply shall be given when a careful examination has been made.

FERTILISATION: A. D. W. asks, Is it possible for a plant to be imperfectly fertilised by too small a quantity of pollen being applied to the stigma? To this we reply that nothing definite is known, but the probabilities are that it is so.

FLOWER GARDEN in a COLD SPOT: Pedro. You do not say precisely, but we think you require herbaceous plants of a dwarf habit, to flower from July onwards to February. Useful for the purpose are *Violas* of all shades, the dwarf forms of *Phlox* decussata, dwarf *Honeysuckle*, pegged down *Roses*, as *General Simpson*, *Sourire de la Malmaison*, *S. tartarica*, *Desprez*, and others which make long growth; *Fairy* *Roses*, *Phlox setacea*, *P. Nelsoni*, *Salvia patens*, *Campnula pulch.*, *C. p. alba*, *C. carpatica*, *Anemone Honoree Joubert*, *A. japonica*, *Colchicum autumnale* and *C. grandiflorum*, *Ajuga reptans*, *Androsace helvetica*, *S. lanugosa*, *Statice linumum*, *S. tartarica*, *Plumbago Lambertii*, *Gisoldium blandum*, *Lilium bulbiferum*, *L. Thurbergi*, *L. daburicum*, *Aster Amellus*, *A. amellodes*, *A. dumosus*, *Helioscopus niger*, *Erica Menziesii* in variety, *Fuchsia coccinea*, *Funkia ovata*, *F. subcordata*, *Gentiana crucifera*, *G. pneumonanthe*, *Myosotis* in variety, *Salvia argentea*, *Sedum fabarum*, *Stachys lanata*, for its leaves; *Stokesia carynea*, *Zaucheria californica*.

FUNGUS: R. R. W., Borden. The name of the fungus is *Boletus edulis*, a well-known edible species. A book on edible and poisonous fungi has been published by Mr. Worthington, 55, Smith St. We think Messrs. Chatto and Windus are the publishers.

INSECTS: T. S. The caterpillars, which are so numerous at the present time (in this peculiar season), and which are eating the roots of various vegetables just under the ground, are those of the Dart moth, *Noctua (Agrotis) segetum* and excimations. Carefully move the soil round the crown of the drooping plants, when the grubs will be easily found, and must be stamped out. I. O. W.—R. C. A. The brown oval bodies found in the dried cow manure are the chrysalids of two-winged flies, which have made their escape already. We found also a very small midge, the larvae of which feeds on decaying vegetable matter; and a number of small white mites. I. O. W.

NAMES OF PLANTS—C. R., Ham. *Cattleya Loddigesii*; *Oncidium varicosum* Rogersii.—J. R. O. 1, *Aristolochia Sipho*; 2, *Sanicifraga pelata*.—A. C. C. *Mitella Clowessii*.—*Cattleya Eden.* 1, *Viburnum cinnam.*; 2, *A. Heliosc.*, but as it is not in flower we cannot say which.

NAMES OF FRUITS.—F. B. 1, *Beurré d'Ananias*; 2, *Triomphe de Jodoigne*; 3, *Gansels Bergamot*; 4, *Duchesse d'Angoulême*; 5, *Van Mons Léon le Clerc*; 6, *Louise Bonne of Jersey*; 7, *Comte de Lamy*; 8, *Beurré Diel*; 9, *Flemish Beauty*; 10, *Passe Colmar*; 11, not recognised; 12, *Bergamotte d'Esperen*.—Z.

Irvine & Sons. 1 and 3, *Denyer's Victoria*; 2, *Jefferson*; 4, *Crosse's Dictator*.—T. E.—Apple, *Non-such*; Plum, *Ickworth Imperatrice*.—W. T. 1, *Fondante d'Autonne*; 2, *Beurré Diel*; 3, *Vicar of Winkfield*.—H. Bismarck. *Pear*. 1, *Beurré d'Ananias*; 2, *Duchesse d'Angoulême*; 3, *Verulam*; 4, *Beurré Bosc*; 5, *Catillac*; 6, *Clairgenu*. *Apples*: 1, *Adam's Pearmain*; 2, *New Hawthornden*; 3, not recognised; 4, *Warner's King*; 5, *Sirling Castle*; 6, *New Hawthornden*; 7, seedling—'not *Beurré's Pippin*, but unlike *Barclay's Seedling*.—R. *Ernestus & Sons*, 1, largest Apple, *Gravenstein*; 2, long conical, *Sugar-loaf*; 3, small bright colored *Hawthornden*.—G. W. C. The Crittenden Prolific Damson, raised by Mr. Crittenden of East Fairleigh. This is the best variety bearing Seedling.—R. *Ernestus & Sons*, 1, *Bergamotte*; 2, *Duchesse d'Angoulême*; 5, *Bergamotte Rouge*; 6, *Fondante d'Autonne*; unnamed *Pear*, *Beurré Clairgenu*.

PEAR LEAVES SKELETONISED: C. Warden. The leaves are eaten by the larvae of the Pear Saw-fly—*Tenthredo Cerasi*—which eats away the soft part of the leaf, so that the veins and skin of the lower side only remain. A skin of the surface soil under the trees, to the depth of 3 or 4 inches, the cocoons being found seldom deeper than that. Working in lime and soot would be beneficial. Dusting the grubs on the leaves with powdered caustic lime, two or three times, at short intervals; tobacco-water and soft-soap, are likewise good remedies applied with a syringe.

PEAR TREES NOT BEARING: S. A. S. Your trees must be lifted, and replanted in loamy soil; and you had better, so as to save further trouble, put a concrete or cement floor, 4 feet square, under each tree at 2 feet deep.

STEPHANOTIS FLOREBUNDUS: *Steph. notitis*. It bears fruit when grown in very warm houses, and the fruit is very poisonous. We do not know if the poisonous principle is made any use of.

TEN-WEEK STOCKS: F. Rinner, *Quedlinburg*. The Stocks, which were planted in a favourable position, gave rather more than 50 per cent. of double flowers, the plants being dwarf and the spikes of good quality. The colours were more pleasing.

WHITE LAFAGERIA: *Parkins & Son*. This is certainly better in most respects than the old variety, the petals having more substance, the tube is slightly more expanded, and the petals somewhat more rounded at their points. With regard to its being freer, and opening better than the old variety, we rather think these results are due more to management and soil than anything else.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

SEEDS.

LONDON: Sept. 30.—There is no change worthy of notice in the values of farm seeds: the trade is now getting quieter. Red Clover seed keeps firm: the supplies this season will not be abundant. Very moderate quotations prevail for Trefoil. Winter Tares are rather casual: the market continues fairly good. Sowing Rye is steady. More money is asked for Rape seed. White Mustard sells at last week's rates. There is no variation in the trade for blue boiling Peas. The new Haricot Beans are good, and sell at reasonable figures. The new French Millet proves of excellent quality. Linseed continues strong. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

From Monday's report of business done at Mark Lane we learn that the receipts of English Wheat are light, and of foreign good. The former sold slowly at rates on a par with those of the preceding Monday, and foreign realised a partial advance of 6d. Flour maintained steady value, Beans advanced 6d. on the week, and Maize was firmly held. Grinding Barley met a moderate demand at steady value; middling grades of English malting Barley were rather lower. Oats were not quotably altered as regards prices, but there was rather more tone in the trade. Peas and Lentils continued unaltered.—On Wednesday the tendency was against the sellers of both English and foreign Wheat. For flour the market was quiet and unchanged. Barley, Beans, and Peas sold in retail quantity at unaltered rates. Oats were steady in value, with moderate sales. Maize was held for late value.—Average prices of corn for the week ending Sept. 25:—Wheat, 30s. 10d.; Barley, 21s.; Oats, 19s. 4d. For the corresponding period last year:—Wheat, 33s.; Barley, 22s. 2d.; Oats, 19s. 10d.

CATTLE.

At Copenhagen Fields on Monday last an unusually large supply of cattle was on offer, the bulk of it of middling qualities, which were consequently a dull dragging sale, at rates in favour of buyers. Really prime qualities from their scarcity realised comparatively firm prices. Sheep were also a full supply, and fat coarse sorts sold slowly at easier rates. Calves were a dull sale. The pig trade was steady. Quotations:—Beasts, 3s. 10d. to 4s. 6d., and 4s. 8d. to 5s. 2d.; calves, English, 4s. 4d. to 4s. 10d.; Irish, 2s. 6d. to 3s.; sheep, 2s. 8d. to 4s. 4d., and 4s. 10d. to 5s. 6d.; pigs, 4s. to 4s. 8d.—On Thursday trade was quiet, and Monday's prices were not maintained without difficulty. Business in sheep was very quiet, and inferior sorts ruled in buyers' favour. Calves were dull, and pigs decidedly lower.

HAY.

Tuesday's Whitechapel Market report states that the weather checked the trade, which was dull. Quotations:—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 102s.; inferior, 60s. to 75s.; hay, prime, 65s. to 92s.; inferior, 35s. to 60s.; and straw, 28s. to 39s. per load.—On Thursday there was a moderate supply on sale. The trade was quiet, and prices were easier for straw (29s. to 31s.).—Cumberland Market quotations:—Clover, best, 95s. to 102s. 6d.; second, 60s. to 90s.; hay, best, 80s. to 90s.; second, 50s. to 70s.; new, 67s. to 80s.; and straw, 35s. to 36s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that best qualities maintained fairly steady value, inferior sorts being dull and irregular. Quotations:—Regents, 60s. to 80s.; Magnum Bonum, 50s. to 80s.; Early Roses, 70s. to 80s.; Hebrons, 100s. to 110s. per ton.—The imports into London last week consisted of 182 bags from Boulogne, 12,253 and 18,087, 79 barrels, 5 baskets from Rotterdam, and 1326 sacks from Stettin.

THE COLONIAL MANURE.

Unqualified for Excellence of Quality and Productive Powers.

Supplied in Tins, s. d.	1 0 each.
" " "	2 6 "

Further proof (his) that Consumption and Asthma ARE ALWAYS RELIEVED BY DR. LOCK'S PULMONIC WAFERS.
 Mr. PEACOCK, M.P.S., 217, Abhol Street, Liverpool, writes:—"A lady stated to me that Dr. Lock's Pulmonic Wafers were the only thing that gave ease to her daughter, suffering from Consumption." They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Hoarseness, Pains in the Chest, Accumulation—and taste pleasantly. Sold at 1s. 3d., 2s. 6d., 5s. 6d., and 11s. per Box, by all Druggists.

HOLLOWAY'S OINTMENT AND PILLS.
 H. Health's Defences.—None save the strongest can with impunity pass through the sudden transitions from wet to dry, from cold to muggy weather so prevalent during the autumnal and early winter months. Influenza, Bronchitis, Cough, Sore Throat, or Quinsy, will attack those most watchful of their health, but they may readily arrest any of these complaints by rubbing Holloway's Ointment twice a day upon the skin over the affected parts, and by assisting its curative action with appropriate doses of Pills. This well-known, safe and easy mode of treatment efficiently protects the invalid, both from present and future danger without weakening or even disturbing the system in the slightest degree.

The Official Report of the Committee of the Orchid Conference, held at the Royal Horticultural Society's Gardens, at South Kensington, on May 12 and 13, 1885.

THE ROYAL HORTICULTURAL SOCIETY will issue, about the end of the present month, a Full Report of the above. This Report is in book form of octavo size, and containing about 120 pages, will be distributed to all Fellows of the Society as a number of the Journal, and it will embrace:—

1. A Report of the proceedings at the Conference, including a Paper read by Mr. H. J. Veitch, F.L.S., on the Hybridization of Orchids, with illustrations and a Paper by Mr. James O'Brien, on the Cultivation of Orchids.
2. Botanical and Horticultural Reports by Henry N. Ridley, Esq. B.A., F.L.S., Natural History Museum, South Kensington, and F. W. Burbidge, Esq., F.L.S., Trinity College, Dublin.
3. An Alphabetical List of the Genera of Orchids.
4. A Catalogue of Exhibitors and Exhibits.

It is proposed to admit a limited number of first-class Advertisements, as well as a large sale of the edition to the number of copies to be distributed, it will be a specially valuable medium for Orchid Growers and Manufacturers of Orchid Pots and Boxes, as well as to Fruit and Seed Growers, Florists, Horticulturists, Garden Implement Cultivators, &c.

Advertisements will be inserted in all issues at one price. The Scale of Charges will be as follows:—

Back Page	£ 10 0
Covers and Special Positions	5 0
Inside ditto	10 0
Ordinary Pages	3 0
Half pages	1 5

All applications for Advertisement Space must be sent to **ADAMS AND FRANCIS** (Advertisement Agents to the Royal Horticultural Society), 59, Fleet Street, London, E.C.

PONTEY'S SUPERFINE LATE WHITE BROCCOLI.—This is one of the finest stocks of Late White Broccoli ever offered, producing large heads of a creamy white colour, and coming in for use as late as June. See following extract:—
From the *Gardener's Chronicle* and *Agricultural Gazette*, London:—"MONSTER BROCCOLI.—A few days since, Mr. C. Kessell, of The Coombe, Pezance, who has been a Broccoli grower for upwards of half a century, and was one of the first to get Earl Broccoli known into the London and Northern Markets, cut two monster Broccoli, which together weighed 30 lb. They were the sort known as Pontey's Late White Broccoli. To the husband and the single-grower had to be called into requisition to ascertain the weight of the plants."
Retail price, 2s. 6d. per ounce. Special quotations to the trade. Apply to
M. E. WILSON SERPELL, 21, Corwall Street, Plymouth.

RIPPINGILL'S PATENT PRIZE MEDAL
GREENHOUSE Warming STOVE.

The only perfect Oil Stove made.

Awarded the highest premium over all competitors wherever exhibited. The cheapest and most effective means known for warming small Greenhouses, and keeping out frost and damp. They burn absolutely without smoke or smell, require no pipes or fittings, give off no injurious vapour to either vegetable or animal life, will burn twice to twenty hours without attention, are so portable they can be moved from one place to another with ease, and are highly recommended. Prices from a few shillings. Sold by all Ironmongers and Lamp Dealers. See the name upon the stove before you purchase. Full Illustrated LIST and name and address of nearest agent for forwarded free on application to the sole manufacturers.

THE ALBION LAMP COMPANY,
ASTON ROAD, BIRMINGHAM.

TO BE SOLD, a very useful SPAN GREENHOUSE, about 40 feet by 19 feet, with Slate Fittings, Gearing, and Hot-water Pipes complete. Must be cleared at once. Price moderate. Also a smaller THREE-QUARTER SPAN GREENHOUSE, with Fittings.

KALMIA LATIFOLIA, healthy and well furnished plants, 18 to 24 inches, showing from twelve to thirty two-lobes of bloom.
AUCUBA JAPONICA, 2 1/2 to 3 feet, hundreds.
BAMBUA MELI, fine clumps, 5 to 8 feet high, transplanted spring, 1885, hundreds.
ROSE, Green and Variegated, 3, 4, 5, 6 to 7 feet, thousands.
HOLLER, Common, Green, 3, 4, 5 up to 10 feet, thousands.
" ALTA CLARENSE, " 3, 4, 5 up to 10 feet, many thousands.
" HODGINS, " 3, 4, 5 up to 10 feet, many thousands.
" LAURIFOLIA, " 3, 4, 5 up to 10 feet, many thousands.
" MYRTIFOLIA, " 3, 4, 5 up to 10 feet, many thousands.
" SCOTICA, " 3, 4, 5 up to 10 feet, many thousands.
" Yellow-berried and other sorts.
" Variegated, of all sizes, 3, 4, 5 to 10 feet, thousands.
" Golden Queen, 3, 4, 5, 7 to 10 feet, hundreds of beautiful specimens.
" Silver Queen, 4 to 10 feet, splendid specimens.
" Weeping, Ferris, 10 on straight stems, with heads of ten to fifteen years growth, hundreds.
" Weeping, New Golden, a large quantity of beautiful plants.

The following trees have stout, straight stems, fine beads, and splendid roots, and have all been transplanted within two years:—

- ACACIA BISSONIANA, 6 to 10 feet.
ACER DASYCARPUM, 12 to 15 feet.
" NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
" RETENACHII, 8 to 10 feet.
" SCHWEDLERI, 12 to 14, and 14 to 16 feet.
" WORLEYI, Standards, 12 to 14 feet.
BEECH, Common, 10 to 12 feet.
" Purple, Pyramids, 9 to 12, and 12 to 14 feet.
BIRCH, Silver, 12 to 14 feet.
" Purple, 14 feet.
CHESTNUT, Horse, 14 to 16 feet.
" Horse, Scallops, 12 to 14 feet.
" Double, 10 to 12 feet.
ELM, English, 10 to 12 feet.
" Guernsey, 10 to 12 feet.
LIMES, 10 to 12 feet, 12 to 14 feet, and 14 to 16 feet.
" Silver-leaved, 12 to 14 feet.
LYDIA AMAR, 8 to 10 feet.
ASH, Mountain, 10 to 12 feet.
MAPLE, Norway, 14 to 16 feet.
OAKS, American, 12 to 14 feet.
" English, 10 to 12 feet.
PLANES, 14 feet and upwards.
POPIAR CANADENSIS NOVA, 12 to 15 feet.
" BOLDIANA, 8 to 10 feet.
Sycamore, Common, 14 to 15 feet.
" Purple, 15 to 16 feet.
" Variegated, Standards, 10 to 12 feet.

Weeping Trees.

- BEECH, Weeping, Pyramids and Standards, 10 to 12 feet.
" Weeping, Purple (true), Standards, 8 to 10 feet.
FIRCH, Young's Weeping, Pyramids, 10 to 12 feet.
" Young's Weeping, Standards, 14 feet.
FERN, Weeping, Standards, 9 feet stems.
HAZEL, Weeping, Standards, 8 to 10 feet.
LARCH, Weeping, 6 to 10 feet.
POLAR, Weeping, Standards.
SOPHORA JAPONICA PENDULA, Standards, 8 to 9 feet.

Intending planters are invited to inspect the Plants growing; no one interested in such matters will regret the trouble. Catalogues convey but a very inadequate idea of such a Stock.

KNAP HILL NURSERY, WOKING, SURREY.

SUTTON'S FINE BULBS

108. Value Carriage Free.

SUTTON AND SONS pay frequent visits to all the principal Bulb Farms of Holland, and by careful trials of the finest varieties of bulbs in their own grounds they are enabled to select the sorts best suited to English Gardens. Having imported large quantities they can offer Collections of the Best Bulbs on the following advantageous terms:—

- SUTTON'S BULBS. — Collection "A," containing 2800 FINE BULBS for the Open Ground. Price, 105s. Carriage Free.
SUTTON'S BULBS. — Collection "B," containing 1350 FINE BULBS for the Open Ground. Price, 65s. Carriage Free.
SUTTON'S BULBS. — Collection "C," containing 1220 FINE BULBS for the Open Ground. Price, 42s. Carriage Free.
SUTTON'S BULBS. — Collection "D," containing 600 FINE BULBS for the Open Ground. Price, 21s. Carriage Free.
SUTTON'S BULBS. — Collection "E," containing 300 FINE BULBS for the Open Ground. Price, 10s. 6d.
SUTTON'S BULBS. — Collection "F," containing 1000 FINE BULBS for Pots and Glasses. Price, 105s. Carriage Free.
SUTTON'S BULBS. — Collection "G," containing 600 FINE BULBS for Pots and Glasses. Price, 65s. Carriage Free.
SUTTON'S BULBS. — Collection "H," containing 430 FINE BULBS for Pots and Glasses. Price, 42s. Carriage Free.
SUTTON'S BULBS. — Collection "I," containing 250 FINE BULBS for Pots and Glasses. Price, 21s. Carriage Free.
SUTTON'S BULBS. — Collection "K," containing 125 FINE BULBS for Pots and Glasses. Price, 10s. 6d.
SUTTON'S BULBS. — Collection "L," containing 250 FINE BULBS for Conservatory and Window Decoration. Price, 21s. Carriage Free.
SUTTON'S BULBS. — Collection "O," containing 125 FINE BULBS for Conservatory and Window Decoration. Price, 10s. 6d.
SUTTON'S BULB CATALOGUE, containing prices and full particulars of the Best Bulbs, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing detailed particulars of Collections of Bulbs for all purposes, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Hyacinth, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing a Toned Illustration of Sutton's Inimitable Bedding Hyacinths, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Tulip, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing Articles on the Culture of Crocuses, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing Articles on the Culture of Narcissus, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing a Toned Illustration of Narcissi and Jonquils, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Begonia, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Gloriosa, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Liliac, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Cyclamen, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing an Article on the Culture of the Gladiolus, gratis and post-free on application.
SUTTON'S BULB CATALOGUE, containing Articles on the Culture of Anemones, Ranunculus, &c., gratis and post-free on application.

THE Gardeners' Chronicle.

SATURDAY, OCTOBER 10, 1885.

EDMOND BOISSIER.

IN our last issue we had occasion to mention the death of this eminent botanist on September 25, at Valeyres, his country seat, near Orbe, Switzerland. The importance of his services to botany and horticulture is so great that some fuller account of his career will be called for by our readers, while some tribute of acknowledgment and gratitude, however inadequate, is due from those to whom he rendered such valuable service.

Edmond Boissier resembled George Bentham in his devotion to botanical science, especially systematic botany, and like Bentham, his means allowed him to pursue the science of his predilection, while his freedom from professional or other official duties enabled him to prepare works of great magnitude, such as require uninterrupted application and patient care and devotion. Boissier was born in Geneva in 1810, and in early youth showed indications of his attachment to botanical pursuits. This attachment was naturally fostered and developed by the tuition and encouragement of the elder De Candolle. In 1837 Boissier visited Spain for the purpose of collecting and studying plants. The first results of this expedition were manifested in the publication of descriptions of new species and subsequently in the issue of a splendid work, Voyage botanique dans le midi de l'Espagne pendant l'année 1837. This work was issued in two quarto volumes, with numerous plates and references to the geographical distribution of the species. It was in his Spanish travels that Boissier met with Abies Pinsapo; and by means of seed collected and transmitted by him, this superb tree was first introduced into this country, as is testified in a letter now before us in which he mentions the despatch of seeds to Lindley at the Horticultural Society in 1839. The tree was found in the mountains of Granada, forming forests at an elevation of 4000 to 6000 feet, and flourishing in places where the snow lies for four or five months in the year.

Boissier's appetite for botanical travel was not appeased by his Spanish expedition. In 1842 he visited Asia Minor, and in 1848 he travelled in Syria and Egypt. The outcome of these travels was first seen in the shape of detached publications devoted to the description of the new species found by him in his journeys. These "diagnoses" paved the way for the complete and elaborate Flora Orientalis, a work in five large octavo volumes, which occupied the author from 1867 to 1881. This is a work which students of the flora of the Levant, and horticulturists concerned in the plants derived from Eastern Europe and Western Asia, find indispensable. This may be understood when it is said that the limits of the Flora Orientalis include Greece, the Adriatic Islands, Dalmatia, European Turkey south of the Balkans, the Crimea, the Caucasus, Egypt, and Asia Minor, Persia, and Afghanistan up to the British frontier, and Southern Turkestan.

Of this immense area Boissier investigated the flora. As we have seen, his own travels were wide, and his own collections extensive, but neither would have sufficed for the region in question. By the collection of specimens from other travellers, from his own richly stocked library, and his relations with the principal botanists of Europe, Boissier was enabled to elaborate this vast *Flora*, not as a compiler, but as an original observer, examining and comparing for himself all the available material. The consequence is that we have in the *Flora Orientalis* a singularly clear, well-balanced series of botanical descriptions, in which the critical judgment, no less than the industry of the author, are conspicuously revealed.

Boissier was in no sense a Darwinian. To the last he expressed his belief in the existence and essential immutability of species. In spite of this many forms originally considered by him as distinct species, and published as such in the "diagnoses," were relegated by him to the rank of varieties in the more matured and elaborated *Flora*. In another point Boissier differed from most of the leading systematists. In one sense this is a mere technical detail, but it is important also as an indication of his mode of thought and of the views he entertained as to the nature of species. Every plant, we may explain, according to Linnean ordinance, has two names, one generic, the other specific. These names are assigned in the first instance by the discoverer or describer of the particular plant, and which henceforth bears in botanical books a third name—that of the author of the species, thus, *Nymphaea lutea*, Linneus. In course of time, from the examination of better material, or from more complete investigation, or other cause, it may be considered necessary by some botanists to alter the name of the plant by putting it into another genus and consequently giving it another generic name. Thus, in the instance above cited, Smith proposed the genus *Nuphar* as distinct from *Nymphaea*, and in consequence in most books the plant now stands as *Nuphar luteum* of Smith, *Nymphaea lutea* of Linneus being cited as a synonym. The rule generally followed is to adopt the name proposed by him who has placed the particular species under what is, or what is assumed to be, the right genus, and to attach to the designation of the plant the name of the botanist in question, not that of the original describer of the plant, whose name, however, finds a place in the synonymy. But Boissier and a few others, considering species to be unchanging, naturally attached more importance to the specific, or as they consider the invariable, than to the generic characters, and consequently to the specific rather than to the generic name. Such persons consider that more importance pertains to the man who describes a plant for the first time than to him who puts it into its right place in the system, and that, therefore, it is an act of justice to retain his name for the combination of words constituting the name of the plant, even though the combination in question is not the one framed by him. Thus in the case above cited Boissier writes "*Nuphar luteum*, Linneus *sub Nymphaea*," because he attaches more importance to the original discovery, or, in this case, to the delimitation of the species, than to its more correct allocation. One great objection to this practice is the fact that it attributes to Linneus an opinion he could not possibly have had, since the genus *Nuphar* was published subsequently. Again, it is most desirable that it should be known that the suffix of the name of any botanist to a specific name is merely for purposes of identification and for greater facility of reference, and that of itself it confers no credit nor discredit on any particular botanist. Hence the question of justice or injustice has really no place at all in the matter.

But to revert to Boissier's main work, we must not omit to mention his monograph of the

species of *Euphorbia* in De Candolle's *Prodromus*—an excellent sample of his powers, and which was accompanied by the publication (separately) of a series of excellent illustrations. In his botanical work Boissier received much assistance from George François Reuter, a friend for forty years—one who accompanied him in his travels, and who, up to the time of his death, in 1872, was his constant companion and assistant. Reuter was, in fact, to Boissier what Borneo was to Thuret.

But while his life's work was devoted strictly to scientific botany, Boissier sought recreation, and occupied his leisure in gardening. He took great interest in the culture of alpine plants, of which he had a fine collection at Valeys, and he was one of the founders of the Society for the Protection of Alpine Plants and of the Jardin d'Acclimatation at Geneva presided over by M. Correvon.

M. Boissier took much interest in the proposed *Primula* Conference, and had promised, in a letter to the present writer dated only a few weeks since, to communicate some observations on a weevil which attacked the primulaceous plants in his garden, and on the best means of destroying it. Orchids also were cultivated by M. Boissier, who possessed one of the few collections of these plants in Switzerland. M. Boissier's communications to this journal were only occasional, but we frequently had the privilege of consulting him, on behalf of our readers or ourselves, upon Eastern plants; and his last letter, received only a short time before his decease, lies before us unanswered.

His death removes from us almost the last of the great systematic botanists of that particular school, and such is the course of events that we do not at present see by whom the work is to be carried on in the future, but it is so essential that we do not doubt that eventually successors will be found to take up the work.

New Garden Plants.

CATTLEYA LUCIENIANA, n. *hyb.*, n. s. *

A LOVELY Cattleya, with the bulbs and leaves of *Cattleya Harrisoniana*, and a flower much like that of *Cattleya Isabelle*, Rehb., but much darker and richer in colour. The rather narrow sepals and petals are of a fine brown, most beautifully enlivened by a wash of purple. The lip is trifid. Its side-lacinia is blunt triangular, the mid-lacinia cuneate cordate emarginate, of the richest purple, the disc between the side-lacinia having red keels. The side-lacinia are pale yellow, with thick reddish veins. Column white, with purple lines on side, and numerous small points of purple. The front side of the column is whitish-yellow at the base, with numerous purple lines around the border of the fovea. One might take it for a dark *Cattleya Isabelle*, and so I did on first sight; the lip, however, has the anterior lacinia granulate, and the inner base of the column is broken up in keels. There can be no doubt its parents are *Cattleya Forbesii* and *guttata* or *granulosa*. It is dedicated with pleasure to M. Lucien Linden, who kindly sent it to me. *H. G. Rehb. f.*

ANGRECEM APICULATUM (Hook.) DORMANIANUM, n. *var.*

This is said to be very few-leaved, so that I highly appreciate the receipt of a leaf nearly a span long, and much in the way of those of *Angreem apiculatum* Kirkii, unequally bidentate at the top, much cuneate at the base. It has a one-sided raceme, with flowers like those of *A. apiculatum*, but smaller, with deep vermilion-flaked ovaries and vermilion spots to the sepals. Having observed the variability of *Angreem apiculatum* Kirkii I feel pretty sure that Mr. Dorman's plant belongs to this species. I feel great pleasure in dedicating this rare thing to my excellent correspondent, Mr. C. Dorman, of The

* *Cattleya Lucienniana*.—Caulis ac foliis *Cattleye Harrisonianae*, Bat.; sepalis lobatisque lobulatis obtuse acutis, labelli lacinia lateralibus triangularibus obtuse acutis, anteriori, venis superius incrassatis, lacinia mediana cuneato-oblonga emarginata, supra presertim disco papuloso linea mediana disci interlacinia; laterales pluricaemata; columna basi antice pluricaemata. *H. G. Rehb. f.*

Firs, Lawrie Park, Sydenham. As to this *Angreem*, I had it from Mr. F. Sander. *H. G. Rehb. f.*

SOLDANELLA ALPINA.

A DAINTY little plant, familiar in gardens forty or fifty years ago, but which had well-nigh disappeared, save from botanic gardens, till it shared in the *renaissance* of hardy plants which has happily set in. It is not uncommon in the higher pastures in Switzerland, where its dark green coin-shaped leaves and fringed slaty-blue flowers always attract attention. It is of easy cultivation in pots in rich but light loamy soil, or on the rock work beneath the shelter of stones, where the plant can secure the moisture it needs.

Our illustration (fig. 96) is one of a series by Mr. Scott Wilson, taken "on the spot," and will be appreciated for its faithfulness.

There are two or three other species all much alike. *S. minima* is a reduced copy of *S. montana*, and there are white varieties of the latter occasionally seen in cultivation.

GARDEN ROSES.

THERE has always existed a sort of quiet feud between botanists and florists, the former regarding the latter with some degree of horror as an awful intermeddler in his province, taking flower after flower into his hateful embraces, altering its character so that its own mother would not know it, and creating dire confusion in his nomenclature and arrangements—even the sacred ground of Orchids not being safe from his insidious attempts; and hence, in speaking of the florist's work he has various satirical phrases to express his dislike, and "damns with faint praise" his choicest work. [Darwin's researches and theories have altered this state of things. Ed.] On the other hand, the florist looks upon a large portion of the botanist's demesne as "Weeds, sir, weeds;" wonders how people can go into ecstasies over a thing it requires a microscope to see, or which may be picked up in any hedgerow. Let the two walk together through a Rose show; the former will be dragging almost the arm out of the socket of his brother, while he bids him look at the simple beauty of *Rosa rugosa* or *berberifolia* Hardii; the latter is pulling his friend in the opposite direction to admire the full bloom beauties of a *Marie Blumant* or *La France*, or the golden cup of a *Maréchal Niel*, and asks him if it is possible that he does not see far greater beauty there than in those poor simple weeds.

The former have received an accession of strength of late years from those who are neither botanists nor florists, but who imagine themselves to be æsthetes, although the greater portion of them have as much claim to the title as they have to being readers, who skim over the monthly and quarterly Reviews, and think they can then talk on any subject under the sun; they have introduced the worship of the Sun-flower, and the extravaganzas of "Patience" or "The Colonel" are not so much of exaggeration as some would imagine. These good people go into ecstasies over a single Dahlia, and condemn as barbarous the most finished show or fancy flowers; they condemn our *Marie Baumann*, *Charles LeFebvre*, &c., to hopeless perdition, and ask us to go into ecstasies over the wild Rose or some of the single Roses which are to be found in some gardens. When, then, we continually hear the cry for garden Roses, it is as well to look at the matter fairly, and see what it is that is wanted, or what persons mean when they cry out for garden Roses.

If there is one quality more than another for which a garden flower of any description is valuable, it is that of the length of its flowering period, and it is in this quality that so many of the exhibition Roses excel. And although the term hybrid perpetual is a misnomer, and the French one, *hybride remontante*, much more correct, yet it is amongst this class that we must look for Roses when they are so valuable, after the true Rose season is over, and we can in chill October, and even in November, gather for them a very respectable bouquet.

There are three divisions into which what are called garden Roses may be divided roughly: 1st, single-flowered Roses; 2d, the Moss, gallica, and hybrid China sections, which are in fact usually called summer Roses; and those exhibition Roses which by their vigorous growth and freedom of

flowering deserve the title. And with regard to the first of these, there are no doubt some very pretty and ornamental flowers. Such, for instance, is the yellow Persian Brier, a rich golden flower, blooms profusely when the plant is well established, but somewhat capricious; then there is the very pretty *berberifolia* Hardii (fig. 101), the Japanese *Rosa rugosa*, and *rugosa alba*. These, and others, will be discussed upon by my friend Mr. Girdlestone, in the *Rosarians' Year Book* for 1886. Suffice it to say now, with regard to them, that while very pretty they are very evanescent, and when cut very rapidly fall. I remember some years ago a very lovely stand exhibited at a local show, which was entirely composed of the wild Dog Rose; it was very graceful and elegant, but, alas! before the great body of visitors came the flowers had passed away, and the judges were much taken to task for having given the 1st prize to such a faded exhibition. So also do I well

full of Roses; they come in with a rush, dazzle and delight us by their beauty and perfume; but then they pass away, no second bloom of any kind is given forth by them, and in vain do we look for a flower after the rosy month of June is over. Moreover, I think we have amongst the hybrid perpetual Roses which equal them in form, colour, and perfume, while they also gratify us by producing blooms at various periods until frost sets in.

The National Rose Society has done good service with regard to the hybrid perpetual, and Tea Roses, by giving a list of those which, although not exactly to be regarded as exhibition Roses, are highly decorative for garden purposes, and it is amongst these that I believe the real garden Roses will be found. So many persons who grow Roses follow out the directions which are given on the subject of culture, and especially on pruning, that the Roses in their gardens are formed on the model of exhibition rosaries; the

many of these might have been placed in a stand of 48's, although at its best it is not what is strictly called an exhibition Rose; and there are such Roses as Madame Isaac Periere, and Madame Clemence Joigneaux, of which it may be safely said you can make any sized plant you like of them; so vigorous is the former that a friend of mine, Mr. Williams, of Alderminster, near Stratford-on-Avon, has distributed plants of it among his parishioners to train up their houses, where its fine blooms will add greatly to the charm of the village. On going round my small garden this morning (October 2) even after all the cold frosty nights and dreary rains with which we were visited last month, I find that I can gather fairly respectable blooms of such varieties as Baroness Rothschild, Jules Margottin, White Baroness, Edward Morren, Captain Christy, A. K. Williams, &c. I need not say that what we ordinarily speak of as "dread old-fashioned Roses," have nothing but leaves on them.

And what shall be said of the Tea Roses? My Tea bed is now full of flower, notwithstanding the boisterous and severe weather to which they have been exposed. I can gather a sheaf of them any day I like, and it should be remembered that some of the very best exhibition Roses amongst them are also the most vigorous growers; take, for example, Marie Van Houtte: this is quite vigorous enough to be made a pillar Rose, and yet what can be more exquisitely lovely than it is? Then Madame Lambard is one of the best growers and the freest autumnal bloomer that we have, while its varieties of colour make it something remarkable. I have cut from the same branch a flower of brilliant red and another pure yellow, and this I think is one of its great charms. Perle des Jardins, Bonquet d'Or, Rubens, Comtesse Riza du Parc, Jean Ducher, are all varieties that are now giving their third series of blooms, and they are as vigorous as Roses need be; and, in fact, where Teas can be grown in the open they are of all classes that which gives the most enjoyment for the longest time, blooming early and late.

If then these statements are deserving of consideration, the conclusion that might be drawn from them is this—that no garden ought to be without some few of the summer-flowering Roses, moss and others; and that where space is of no moment, a goodly number of them may be grown, and treated in any manner that one likes; but that those whose space is limited will do well to rely for garden decoration on the more vigorous growing of the hybrid perpetuals and the Teas, as giving them a longer period of blooming, and at the same time beautiful and lasting flowers. *Wild Rose.*

THE HOME OF *LÆLIA MONOPHYLLA* (HOOK.).*

DURING a recent collecting trip in the St. Andrew's mountains it was my good fortune to meet with this exquisite little plant in fine condition and in fair quantity. The elevation at which it grows is some 4500 feet above sea-level, in a temperature of 65°–66° Fabr. (mean annual). The stems and lower branches of trees, covering a ridge trending from east to west, were for the course of some half a mile bearing numerous specimens of the plant in full flower. It appeared to prefer the naked or slightly moss-covered stem to the knaurs or places containing decomposing vegetable matter, usually the favourite resting-place of many of the native Orchids. It would appear to be freely reproduced from seed, as young plants were present in various sizes from a quarter of an inch upwards. In its young state, and even when mature, unless in flower, it would often be mistaken for young plants of the common and more widely distributed *Tetramiera montana*, Grisebach. The sparingly sheathed scape varies from barely 2 inches to more than 6, and the leaves from 2 to 4 inches, while the whole plant sometimes measures 1 foot in length, bearing flowers of a size corresponding to its vigour. The plant was well figured and described by Sir Joseph Hooker at p. 6683, *Bat. Mag.*, but though the figure without doubt correctly represents the plant as seen under cultivation, it gives but partially its habitual characteristic of pendulous growth as seen under natural conditions in its native home, in the shady primeval forest.

* It was noticed that plants were seldom found at a

* *Synonymy.*—*Lælia monophylla*, N. E. Brown, *Gardeners' Chronicle*, vol. xviii., p. 782; *Trigonidium monophyllum*, Grisebach, *Fl. Brit. West Ind.*, p. 629; *Ocoteadisma monophylla*, Bentham, in *Gen. Plant.*, vol. iii., p. 526. (From *Bot. Mag.*)

FIG. 96.—*SOLDANELLA ALPINA*. (SEE P. 456.)

remember a sound rating I once received from a lady because I had awarded a 1st prize to a breast spray, because there was a single Rose in it. I bore the rating meekly. It was in vain I said we had to judge by what things were at the time, not by what they might have been or would be.

The second class of Roses which come under the term garden Roses are those which are sometimes called old-fashioned Roses, and are mostly of the sections I have already mentioned. It is difficult, I think, to call the Moss Roses decorative; very beautiful they are in the bud, but open they are then sprawling, ill-coloured flowers. We all love the Moss Rose, but it is only for its bud and its sweet perfume that we love it. Then there is, again, the pretty little *De Meaux*, and the mossy variety of it. These ought not to be absent from the garden, although they can hardly be regarded as decorative. There can be no doubt that some of the hybrid Chinas, &c., such Roses as *Chenédole*, Charles Lawton, the old *Cabbage*, *Blairii* No. 2, *Madame Plantier*, &c., are very decorative objects when you get good plants of them, but then they all come into flower when the garden is

plants are kept dwarf, cut back tolerably hard from year to year, and thus do not develop into those large proportions which those who call out for garden Roses consider necessary; but there is no reason why this should be so. Take any vigorous growing hybrid perpetual or Tea, and instead of pruning hard, endeavour to make a bush of it, and there is no reason whatever why you should not succeed in having a grand decorative plant, and with good and well developed flowers on it. I remember some years ago seeing at Major Dennistoo's, at Roslea, on the Clyde, a bush of *La France*: it was at least 6 feet through, and about the same in height; it was one mass of flower, and yet so good were they that a dozen blooms from it obtained the 1st prize for the best twelve of any one Rose at the Helensburgh Rose Show—a sufficient proof that a decorative plant need not be full of "rubbishy" blooms. I have a plant of *Souvenir de la Malmaison* in my own garden which is thirty-three years old, it has been cut tolerably hard, as may be imagined, from the fact that it is even now not more than 3 feet high; it had this autumn upwards of 150 blooms upon it, and with a little care

greater height from the ground than about 10 or 12 feet, a fact which would apparently indicate that it requires protection from the influences of sun and wind, to which it would be exposed if growing at a greater height. The plant at present has been found in but two localities, about 6 or 8 miles apart, at similar elevations, and though it would thus appear to be extremely local in its habitat, the possibility is that it will in course of time be also met with in other parts of Jamaica situated under the same conditions as to elevation and temperature. *J. H. Hart, Superintendent Government Cinchona Plantation, Jamaica, September, 1885.*

"THE MOTE."

THE Mote Park, near Maidstone, is the residence of the Dowager Lady Howard de Walden. In proceeding from Maidstone to the gardens the visitor passes an ornamental lake, well stocked with water-fowl, which forms a very attractive feature. Where a large establishment like this has to be regularly supplied with fruit and vegetables the means at the command of the gardener have to be very liberal, and they are so here. The ranges of fruit-houses are very extensive; but it is necessary to make additions to them, and the work has been entrusted to Messrs. Foster & Pearson, Beeston, Notts, who are carrying out the details of the work entrusted to their charge in a very able manner.

The most noticeable object in the hot-house department is a range of five vineries containing excellent crops of Grapes. The last house is planted with Lady Downe's, Alicante, and Gros Colmar. The next house is a Muscat, then a house for early Hamburg; next a house of well-coloured Muscats; and lastly, a house that has but recently been planted with Black Hamburg. The young Vines have made very even and vigorous growth, and are carrying their first crop of splendid bunches; but it is of the older Vines that a lesson might be learned most useful to the members of the ancient craft. When Mr. Davies took charge of the gardens, experienced Grape growers were of opinion that the best thing to do with the Vines (which had got into bad condition) was to grub them up, remake the borders—of course at considerable expense and loss of time—and replant with young Vines. This arrangement did not quite meet with the ready approval of the new gardener; he thought it would be better to try what could be done with the old Vines; and with no more expensive alteration than good surface-dressings judiciously applied, and careful management of the internal arrangements of houses—a good system of ventilation, watering, sprinkling the paths and surface of the borders, &c., the Vines are now bearing large crops of as good grapes as need be placed upon any table. Here, then, I think a lesson may be learned, that it is not always well for gardeners to make changes of a too radical kind, nor to put their employers to expenses which may be unnecessary; but Mr. Davies is evidently a master of Vine culture, as in another house we find a set of young Vines in pots grown from eyes during the present season, and their appearance suggests that next year they will be laden with a heavy crop of Grapes; and if further evidence be wanted, here is another house containing a lot of pot Vines in fruit that had been grown from eyes last year. The Vines are in 13-inch pots; and they have borne on an average 18 lb. of Grapes. Some of the bunches that have been cut weighed 3 lb., and others hanging on the Vines promise to make good the statement made to me by Mr. Davies to the effect that when such heavy crops are grown on pot-Vines the Grapes do not colour well, but the flavour is excellent.

Peaches and Nectarines are also well grown. There are several long houses, mostly lean-to, devoted to their culture; they are neither lofty nor wide. Most cultivators have found out by experience that large houses are not the best for fruit culture, and for Peaches wide and high houses mean a loss of capital. Mr. Davies considers Royal George the best Peach. Barrington is also grown for a late one, and of this I saw some superb specimens, which would have a very fine appearance on the dessert-table. The three Nectarines most esteemed are Pine-apple, Violette Hative, and Stanwick Elrage. The trees in pots were in excellent condition, and had a fine effect placed in a single row alongside the path. We have grown our Peaches and Nectarines on the same prin-

ciple as they are grown here; that is, some planted out, and a greater variety in pots. It is very interesting indeed to grow and prove new or scarce kinds in pots; in some cases the fruit from pot trees is not only more beautiful, but of better quality.

Large quantities of Melons are also grown; the houses for these have much steeper pitch than one usually sees. The Melons succeed quite as well in such houses during the summer months, and in winter they do well in these, when the fruit would be worthless from houses with roof-lights at an angle of 45°. Some young plants were being prepared to be planted as soon as the crop at present ripening is removed. These would bear fruit of good quality to ripen at Christmas. The varieties grown are hybrid Cashmere and Eastnor Castle.

Stove and greenhouse plants are grown in many houses, the plants mostly of small size, suitable to the requirements of such a large establishment. In one hothouse I found some very fine plants of *Eucharis amaranthica*; the largest and best was grown in a 12-inch pot; there were nine spikes of flowers on it, and from seven to eight flowers on each. This large plant had flowered three times in a year, the small ones twice in the same period. The healthy condition of the plants led to a conversation on the recent losses in some gardens from disease. We seem to agree on the point that the probable cause of some losses was in the management of the plants; and since I was at The Mote one good grower called here, and as our plants had the same healthy appearance I was asked if we had ever had any disease, and as I replied to the negative he remarked it was his opinion that disease was only a creation of the brain of some cultivators. [It is, however, only too real. Ed.] I may remark that the *Eucharis* dislikes to be disturbed at the roots. When the bulbs have been parted out separately and repotted, they very often decay at the roots, some die, others take a long time to recover, and it is only by great care in watering, and also in other details of the management, that they ultimately recover themselves and grow again into good flowering specimens. It is needless to say that the decaying bulbs soon become infested with fungoid growths, which may be considered a disease by some, but which is doubtless only the natural result of decay. [There is not the slightest doubt that the mites eat the healthy bulbs. Ed.]

An important feature is the collection of Orchids in course of formation; some of the choicest species, and varieties of species, have been purchased, and it is very interesting indeed to an Orchid fancier to notice the recently imported plants, and to make a comparison in the mind's eye of those in his own and others' collections. Here in the Mexican-house are a few plants of *Cattleya Lawrenceana*, one of them with a strong sheath. The white *Lelia* aneps, purchased from the immense importations landed in London in the spring, is doing as well here as I have seen it anywhere, but the growths have been rather disappointing. The bulbs were very plump when purchased, and I expected to see many flowering-sheaths, but we have none. I saw none here, nor have I seen them anywhere else as yet. I see they are again making a fresh start. *Utricularia Eadresi* was nicely in flower, and the pendulous spikes of pale bluish flowers are quite charming. A fine plant of *Zygopetalum crinitum* was expanding its distinct and beautiful flowers, three strong spikes on one plant. Fine masses of *Morodendron luxatum eburneum*, one of them flowering, all developing fine bulbs. This is a very beautiful Orchid, and should be grown in every select collection. *Schomburgkia Lyonsii* is represented by two plants, one showing two spikes, the other one. *Oncidium crispum grandiflorum* is forming good bulbs, which are certain to produce good spikes next year. This is a splendid Orchid. *Odontoglossum bictonense roseum* is a very beautiful form of the species. This, by the way, does best in a cool house, but it was doing well here. *Barkeria elegans* was also in flower; it is a charming little plant, with very beautiful flowers.

In the warmest house *Trichocentrum albo-purpureum* was diffusing its sweet perfume; it has curious but not pretty flowers, with brown sepals, petals of a purple tint, and lip white. The pretty little *Ionopsis paniculata* was well furnished with clusters of bluish-mauve flowers. A large mass of *Coryanthes macrantha* had flowered; it had been placed near the roof-glass just as it had been imported. The plant formed a large, irregular, roundish mass; probably inside was the ants' nest, on which this curious product of the vegetable kingdom subsists;

one large black ant crawled out from the interior while I was looking on it.

I found in another part of the garden a fine collection of show *Auriculas*, and also a very choice gathering of the best named *Amaryllis*. One seldom sees better grown bulbs than these were, and I found the whole of them in a cold frame from which the lights had been removed to expose the plants to sun and air. In such an extensive garden as this one might linger over the choicest treasures of many lands, and fill pages of descriptive matter.

I had just time to take a hurried run through the hardy fruit garden, and what I saw there made me envious. Apples and Pears were a good crop, and the quality of the fruit was such as cannot be excelled in any other county. The choicest Apples and Pears are grown on oblique cordons; these were loaded with fruit, where they had been protected in the spring by close netting. Not always does the protecting material save the crops, and knowing this, I inquired what material had been used? It is obtained from Cornwall, and is termed Eddy's No 3 shading. Where no protection had been given to the trees many had failed. On a wall facing east some upright cordons were loaded with splendid fruit. The varieties, such as Williams' Bon Chretien, Marie Louise, Emile d'Heyst, and Durandau were very remarkable, the last having the finest looking fruits. The garden has suffered much from drought, and the crops of vegetables and fruits have been kept up to a high standard by much and judicious labour expended on watering. *J. Douglas.*

LESCHENAUTIAS.

THE *Leschenaultias*—or more properly *Leschenaultia*, after the French botanist M. Leschenault—are most distinct and charming greenhouse plants, that are perhaps in danger of being lost to cultivation altogether. The genus seems to be peculiar to New Holland, from whence they have been introduced during the last sixty years, and they have been cultivated during that period to a high state of perfection. At no period during the last half century have they been so much neglected as they are now. One visits garden after garden and nursery after nursery, and in none of them are such plants as these placed in a prominent position. So much are they kept in the background, or not kept anywhere, that young gardeners are likely to grow up quite unaware of the fact that such plants are in existence. I believe Messrs. Low, of Clapton, Messrs. Veitch, of Chelsea, and perhaps other large firms, could produce most of the species now in cultivation, but perhaps they are seldom called on to do so, and gentlemen in the trade cannot afford to grow to any large extent plants that there is no demand for. The whole genus consists of easily cultivated plants; being natives of New Holland they are greenhouse plants, and their cultivation may be summed up in a few sentences. They will form either large or small specimens according to the amount of pot-room they receive. I have grown and flowered nice little specimens in 6-inch pots; but if these are intended to be grown on into large specimens, the plants must be repotted before they become anything like root-bound, or are checked in their free growth. Let us suppose a healthy young plant of any of the species is growing in a 5 or 6-inch pot, and that it is ready to be repotted. The potting soil ought to be two parts of turfy peat and one part of decayed turfy loam, a good sprinkling of coarse silver sand, some leaf-mould, and broken up charcoal. Drain the pots well, for in this consists the future well-being of the plants. Over the drainage put some fibre from which most of the peat particles has been beaten out with a stick. Pot the plants into 7 and 8-inch pot, without disturbing the ball of roots much, and ramming in the compound moderately firm. In shifting a plant from one pot to another, the roots ought to be more on the wet than the dry side; the potting soil must not be too dry, and when the plant has been potted place it in a light airy place in the greenhouse, but do not be in a hurry to give any water. In dull cold weather water might not be required for a week, in dry hot weather it might be necessary to water them in twenty-four hours. When I was a young gardener, I was often troubled to know how often a plant should be repotted. Hard-wooded plants, such as these, require considerable experience to deal with them in a satisfactory manner.

One plant may grow away freely, and another under the same conditions act quite contrary to that.

Suppose the plants do grow away freely, and that they are repotted in March; they would have to be shifted into larger pots in July or August, which would give them a chance to be well established before the winter, and they would require repotting again in March of the following year. By that time they will be large healthy specimens in 12 or 13 inch pots. The most troublesome of the insect pests which attack the leaves and shoots is greenfly. It is the same colour as the leaves, and clings to them so closely that it is sometimes not observed until mischief is done. The plants when small may be dipped in tobacco-water, or fumigated. The shoots must be tied out, and regulated with neat sticks, else they hang over each other, and form heaps or thick clusters. *L. formosa* was the first introduction. It was sent to this country in 1824, and immediately became popular. It forms immense masses of scarlet flowers, and when well grown is a very showy greenhouse plant. Since that date many fine species have been introduced from the Swan River colony—*L. biloba* in 1840. The variety major is one of the most beautiful and distinct of greenhouse plants, but it cannot be induced to grow into a nice bushy specimen; it shoots grow in an upright position, and in tying them out they will snap off at a joint. They do not form a bush unless the young shoots are constantly stopped. Some twenty years ago this plant was quite a pretty feature in collections of stove and greenhouse plants at the London exhibitions.

L. splendens and *L. arcuata* were discovered by Drummond in the Swan River colony, who sent seeds to Messrs. Pince, of Exeter, who raised plants, and first flowered them in England. *L. splendens* is a very handsome species, speedily growing into a well-formed bush; its brilliant scarlet flowers are very effective. Those who would be desirous of growing a collection might add *L. Baxterii*, *L. oblata*, *L. larinica*, and *L. glauca*—that is, if they are all in cultivation, and to be obtained in the usual way of trade. *J. Douglas*.

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 425)

ASHBURTON and BUCKLAND. — Before leaving Totnes we had an indication of the proximity of the mining industry, in a large wooden platform with a tramway adjoining it, near the "Plains" in that borough, upon which ore was spread out; but at Ashburton, a district stated to yield not only slate, but also amber and other metallic ores, but little seemed to be doing in this way. In a country of water-power, however, mining makes comparatively little show beyond a big wheel and the chimney of the pumping-engine by the side of more or less overgrown heaps of waste, that may be conspicuous on the horizon, as is the deserted "Druid" mine, on the road from Ashburton to Buckland; there is none of the smoke-blackened absence of vegetation that marks the reign of coal and steam. The little town of Ashburton, with its North, East, and West Streets, meeting at a point that has on a Wednesday to do duty as a cattle market, with its large, neatly restored church, and its "Latin school," is as quiet and as clean as Totnes; and one feels no difficulty in believing in the authenticity of the doorway and leaden pump of "Tudor Buildings" in North Street, said to date from A.D. 1490, though admittedly restored. On asking the vergier if there were "any brasses in the church" we got the reply, "Oh, yes; there's two chandeliers!" Round the church is a fine young plantation of Conifers, such as *Cupressus macrocarpa*, *Thuas*, &c., that seem obviously in air and soil that agrees with them. One of the peculiarities of South Devon that at once strikes a geologist, is the fertility of almost all the soils into which the various rocks disintegrate, whether slate, limestone, or granite.

Leaving the well-kept garden of the "Golden Lion," in which we heard that neither Pears nor any but bush fruits were abundant in the district, we started next morning for the special pride of the Upper Dart, the Buckland Drives, through the property of B. J. P. Bastard, Esq. Leaving the high road rather less than 2 miles north of the town, we found ourselves in a new country, a land of Heather and dwarf Furze, of Musk Mallow and Devil's-bit

Scabious, of Scotch Firs, limestone crags, and woodants' nests. Our road ran at a considerable height above the level of Ashburton or of the Dart; but above it, on our right, the ground sloped rapidly upwards for several hundred feet more. Clambering up one remarkable crag, known as Answell Rock, where it seemed as if some giant quarryman had been recklessly hurled down a heap of angular blocks of grey limestone, we gained a magnificent prospect from its summit. Around was a carpet of crimson Heather, broken here and there by ghostly patches of its dead stalks, that bleach so remarkably, or by a grey mass of stone overgrown with Reindeer moss (*Cladonia rangiferina*) and other lichens; to the north were the heights of Duckland Beacon, with its altar-like summit, Rippon Tor and Hey Tor, the latter in the mists of distance; and in front wound the silver streak of the Dart among the wooded slopes of Holne Chase and Buckland, some 800 or 900 feet below our feet, whilst beyond appeared those characteristic heaps of granite, the "tors," that crown the otherwise gently rounded hills of Dartmoor. Descending to a little stone bridge over an tributary streamlet, dashing down amid rocks and Ferns, beneath a grove of trees where—

"Hard by, a cottage chimney smokes,"

we reached Buckland Court, Mr. Bastard's residence, the gardens of which were our primary destination. The kitchen garden, facing south, has been established only two years, and the gardener, Mr. Leach, who received us with every courtesy, has many thieving enemies to contend with from the surrounding woods. He has good soil and plenty of peat and leaf-mould within reach, whilst a stream runs through the garden, with a straight course which, though planted with *Osunda* and other Ferns, is certainly an opportunity for beauty neglected. There had been a good crop of Raspberries, Strawberries, and Peas, though the latter were now suffering from drought, and here, as elsewhere in South Devon, Fears were a failure. The fine *Lilium auratum* that had been out for two years, and the large clumps of *Fuchsia*, were enough to cause envy in the heart of a Londoner; and, though his flower-garden is overshadowed by trees, and he has but little glass, Mr. Leach has *Pentstemons* and *Gloxinias* that would be a credit to a place where gardening was of more account than it is in "the garden of England."

Glancing at the carved wooden chancel-screen in the church we re-entered the woods, where Woodruff, Periwinkle, and many Ferns and lichens, luxuriated under the shade of some exceptionally fine, straight-stemmed young Yews, mixed with Birch and other timber. Large clumps of Blechnum, with fronds 15 inches in length; of Lady Fern, over 3 feet high; *Lactrea Oreopteris*, and a carpet of Whortleberry, the curious tufts of *Usnea barbata*, and many other lichens and mosses, the berries of the Rowan and the Guedres Rose, lent their charms to the path that led us down to the romantically beautiful banks of the Webber, or Webburn, which is undoubtedly the most beautiful of the tributaries of the Dart. Through a thick wood, and without actual cascade, this typical torrent scrambles over rounded ledges of moss-grown rock in silver foam, swirls round a black pool, where the sunlight through the leaves glances upon yellow shingle, to rush in an amber torrent through a space a few inches wide between two immense boulders, and then recommences its succession of foaming fall, still pool and rushing, bubbling torrent, again and again, for 2 or 3 miles of descent. It reminded me of no spot so much as of Stock Ghyll, behind the Force; but then the distance thence to Ambleside is trifling compared to this long woodland panorama of beauty.

Here we found ourselves now upon granite, pink pike and white felspar crystals glistening as the water distilled over them from the dripping mosses and Ferns of the slope above, and now upon black or dark grey Devonian slate or limestone, where the Golden Saxifrage (*Chrysosplenium oppositifolium*) flourished under a similar dripping well, and where the Lady Fern sent up fronds that we found by measurement to be 4½ feet in length. Holly, small-leaved Lime and Alder, were plentiful hereabouts, and upon the leaves of the Lime was a gall very similar to that well known universal on those of the Alder.

Following the Webburn down to its confluence with the Dart, we enjoyed the union of two classes of beauty to produce a third. The woodland stream came dashing from beneath a stone archway into a

far broader, shallower stream, coming from between slightly sloping banks of barren moorland, and flowing here over a low-lying shelf of slaty rock that jutted out into mid-channel. Here on a heathy patch, just at "the rivers' meet," we found our first specimens of the lovely little Ivy-leaved Bell-flower (*Wahlenbergia hederacea*).

From the bend which it makes on receiving the Webburn, the Dart enters upon a new stage in its beauty. For the next mile its course is virtually a winding gorge, with ground rising rapidly on either side to a height of several hundred feet. The now shallow stream, shrunken by drought, left bare patches of the granite sand that had coarsely ground off the rocks of the moor, and over some of these now empty pools we noticed the red leaf-stalks of the Coral Linden (*Tilia corallina*). Meanwhile, as we were gradually convincing ourselves that what appeared like mere shrubs on the opposite hills of Holne Chase were indeed full-sized Oaks and Birches, the latter flecked, here and there, with autumnal yellow, with slow and solemn flap of wings, two herons sailed overhead on their way up stream. At various places the rocks on either side of the river, though thickly grown with trees, overhang precipitously, as at the well-known "Lover's Leap;" but, after leaving the Buckland estate near the prettily-situated Holne Bridge, the remaining 2 miles of the return walk to Ashburton is comparatively uninteresting. Remembering, however, that Charles Kingsley was a native of the village of Holne, some 2 miles off among the moors, we cannot help feeling that it is not strange that he retained through life so strong a love for moorland beauty. *G. S. Boulger*.

(To be continued.)

INTERNATIONAL POTATO EXHIBITION.

TRIAL CULTURE OF SEEDLING POTATOS, 1885.

By permission of the Royal Horticultural Society the seedling Potatoes entered for the International Exhibition have, as in former years, been grown at Chiswick under the superintendence of a sub-committee. Mr. A. F. Barron has carried out the views of this sub-committee to their complete satisfaction, and they have made a report that will serve as the basis of action for the judges at the exhibition.

The seedlings sent for trial were forty-two in number; they were planted in good time on a well-prepared plot of ground, fully exposed as regards light and air, but having the advantage of shelter sufficient to ward off light spring frosts. They suffered no check from frost, and throughout the season there has not been seen upon the shaws the slightest sign of disease. But the long-continued droughts with frequent low night temperatures delayed growth, the early liftings being in many cases insufficiently matured for a sufficient comparison of merits. The later liftings were for the most part satisfactory; rain had improved the crop without causing injurious second growth, but a few sorts were noted as so far promising as to be worth special attention next year.

From the forty-two sorts in the trial, four were selected for the highest award in the garden, namely, three marks for heavy cropping, and three for high table quality. The names of these are:—

Faith (Penn).—Top growth neat, tubers white, round, neat, uniform, ripening early. One of the best in the trial.

New Flake (Ironsides).—A white kidney in the style of the Old Flake, but with a finer skin and a bolder form, the tubers being mostly of exhibition standard. Crop heavy, and quality fine.

General Gordon (Fidler).—A white round in the way of Schoolmaster; top growth strong, tubers handsome.

The Colonel (Johnson).—A capital white-skinned variety in the style of the Old Flake; rather late, but in every way first-rate.

The following were found to be productive and worthy of commendation for the present, but the awards made were not sufficiently high to bring them within the range of Certificates in the present season:—*Salisbury* (Ironsides), *General Gordon* (Fletcher), *Charity* (Penn), *Reading Giant* (Fidler), *agreat cropper*; *Bountiful* (Fidler), *Farmer's Pride* (Hill), *Emblem* (Ross), *Snow Queen* (Fidler), *White Beauty* (Ironsides), extraordinary heavy crop; *King of Russets*

(Lye), a heavy cropper, of good quality, in the way of Adirondack; Burton Hall Favourite (Johnson), May Queen (Dean), likely to be especially useful for early produce.

A COMMON EDIBLE MUSH-ROOM: AGARICUS RUBESCENS, P.

At the present time our pastures, grassy roadsides, and woodlands are everywhere ornamented with fungi. Some of these plants are no doubt poisonous, some are worthless or non-edible, whilst a large number are not only edible but delicious adjuncts for any table. It is not so difficult as many persons imagine to distinguish the edible from the non-edible species. A fungus eater must, however, have a correct knowledge of the characters of the fungi he eats and possess the capability of properly understanding the meaning of descriptive words. As fungi themselves are now easily procurable, it has been suggested that four or five of the most typical and most common species should be illustrated and described in this paper. The illustrations, engraved by the writer from Nature, are meant to assist readers of the *Gardeners' Chronicle* in clearly realising the descriptions. The essential points necessary to be correctly observed are printed in italics.

Agaricus rubescens, P. (figs. 97 and 98), grows in woods in the late summer and autumn; it does not, as a rule, grow in fields or open places. The top is foxy or rusty-brown, and covered with warts; the stem is brownish-buff, the gills are white, changing to pale buff when bruised; the stem has a ring or collar round its middle or near the top, the base of stem is bulbous, and warm brown in colour. The fungus is scentless, or nearly so, and almost tasteless, or slightly unpleasant when raw. On cutting or breaking a specimen the flesh changes to a pale red-buff or burnt sienna, or foxy colour, in patches. The plant is commonly much eaten by larvae. The shaded group (fig. 98) shows five individuals in various stages of growth from the "button" to the fully expanded condition. The average size of a full grown specimen is about 4 or 5 inches across the top.

To persons who have not had a large experience with fungi it is always necessary to make a section from top to bottom of any unfamiliar example. Sections of *Agaricus rubescens* thus made are shown in fig. 97. The warty top is shown at A A, the bulbous stem (not hollow), slightly attenuated upwards, is seen at B B, the collar round the stem at C C, and the mode of attachment of the gills to the stem at D D. In infancy the edge of the cap touches the rim of the bulb, as illustrated (just breaking away) at E. A section, through a very young example, is shown at F, and through a half-grown specimen at G. The way in which the edge of bulb, the collar, and the warts, are all conjoined in infancy is shown at point H, where these different parts are shown just separating. At J the collar is still adherent to the cap, and forms a covering over the gills. The dotted line at K shows the position of the collar, a short time before the drawing was made. At L, the white ovoid spores or seeds are shown enlarged, 500 diameters.

Agaricus rubescens is an easily recognised, noble and beautiful species. It is the *Gambelle* of the French, and has been termed in this country (in reference to the change of colour to burnt-sienna) the red-fleshed Mushroom—*rubescens*, means becoming red. In referring to this species in 1860, Mr. Berkeley wrote "quality doubtful," but we believe there is no doubt whatever at the present time that *Agaricus rubescens* is really a perfectly safe, delicious, and very abundant Mushroom. The following opinions have been expressed by various botanists. Vittadini writes:—"Non alimento del Cesareo delicato e sano." The illustrious Fries has written:—"Fungus suspectus vulgo adscriptus, esculentus a Vittadini." Dr. Badham, "A very delicate fungus." Mr. Frederick Currey, a former Secretary and Vice-President of the Linnean Society, "I can vouch for its being not only wholesome, but, as Dr. Badham says, 'a very delicate fungus.'" Corda writes:—"Oe of the most delicate Mushrooms of the Lorraine." Dr. M. C. Cooke in his most recent work on *Agarics*, "esculent." Many other commendations from eminent botanists and fungus eaters might be given.

The plant has been suspected on account of one or two dangerous species which are somewhat closely allied. The case of *Agaricus rubescens* is comparable with the Potato and Tomato; the two latter plants have dangerous allies in the Solanum family. Just

as the Tomato and Potato are exceptions to a kind of rough rule, so *Agaricus rubescens* is one of the exceptional plants of the subgenus (*Amanita*) to which it belongs.

In preparing fungi for the table it is necessary to remember that the examples should be fresh, clean, and undiseased, for a fungus of an "uncertain age" is quite as likely to disagree with the consumer as is a stale mackerel, a mouldy jelly, or a diseased grouse. It is very necessary to observe this point, for fungi are often exposed for sale in the market in a stale and semi-putrid state.

In cooking *Agaricus rubescens*, remove the warty skin, place in water for ten minutes, drain, and fry with butter and rump steak. It may be toasted, or stewed—*Agaricus rubescens* when treated with salt produces an excellent and delicate ketchup. *Agaricus rubescens* is essentially a delicate-flavoured fungus, it does not possess the very rich taste of the meadow Mushroom; it is in a high degree the kind of Mush-

arc quite good enough by themselves; also do not put too much grease of any kind in; melted grease is very indigestible, and a man with a weak stomach might eat a dish of fungi for the first time perhaps in his life which is too buttery, and if indigestion ensued, might unjustly condemn the Mushroom. Three-quarters of an hour covered with a plate in the oven is quite sufficient for *Agaricus rubescens*."

Personally I do not consider that *Agaricus rubescens* belongs to the first class of edible fungi; it is, however, in my opinion, a very good, safe, and delicate *Agaric*. A taste can easily be "acquired" for it. When compared with the pasture Mushroom it is like a sole to a turbot, or hock to sherry. The ketchup belongs to the first class.

Several British species allied to *Agaricus rubescens* are edible and good as *Agaricus strobiliformis*, Fr., a much paler *Agaric* than *A. rubescens*, 8 or 9 inches across the top, with large polygonal persistent warts; the warts are shaped like the scales of a Fir cone,

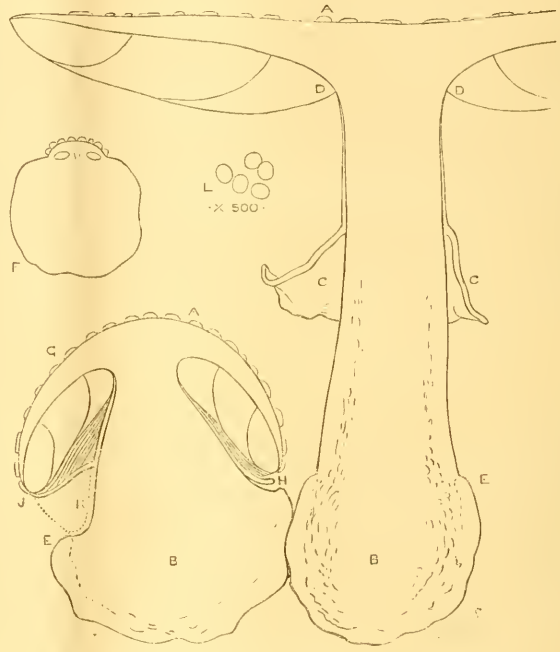

FIG. 97.—AGARICUS RUBESCENS. (FOR EXPLANATION, SEE TEXT.)

room to receive a flavour from some other and stronger tasting object with which it may be cooked, as steak, &c. It takes a flavour in the same way as does a cream or jelly.

A correspondent, Mr. J. A. Farrand, published the following account of *Agaricus rubescens* in the *Huddersfield Examiner* for May 2, 1885:—"I have had this several times during the season. It is a splendid eater, and perfectly safe. Rich beefy gravy, and kidney-like flesh; moreover, it is one of those Mushrooms of which you can enjoy a whole month without eating a whole specimen. It is good stewed in the oven, fried on the fire, or boiled in a saucepan, though I usually prefer any fungus I eat to be cooked in the oven. I recommend that they be first washed under the tap, and the scales (warts) removed with a soft brush, which is all the cleansing they require. If they are not going to be eaten at once, they should be placed in a dish and salted like a Cucumber till wanted. When about to cook them, I put just sufficient water to cover them, a little butter or dripping—butter is preferable—and quite optional, one or two cloves, but avoid over-seasoning them; they

hence the name *strobiliformis*. It is a rare plant, and grows on the borders of woods. Fries says, in reference to it, "Odeur et sapore gratus deliciosus." I have eaten this fungus, and agree with Fries estimate.

Another ally is *Agaricus vaginatus*, Fr. This plant grows in woods, the stem is naked, it has no collar, and the base of the stem is furnished with a somewhat large sheath wrapper or volva.

Four edible allies are commonly sold in the markets of Southern Europe—viz., *Agaricus Cæsareus*, Scop., and *A. coccola*, Scop., *A. ovoides*, Bull., and *A. leiocephalus*, Fr. Fries writes of the first, "sapidissimus;" of the second, "deliciosus;" of the third, "esculentus;" of the fourth, "suaevolens deliciosus."

Agaricus Cæsareus, Scopoli, or *Cæsar's Agaric*, was so named on the supposition that it was the "Boletus" used by Agrippina for poisoning Claudius. The fungus is recognised as an *Amanita* (subgenus to which all the fungi mentioned in these notes belong) by the description of Plioy, who accurately describes all the parts of the fungus, even to the volva entirely wrapping it in infancy.

There are several poisonous or suspicious species allied to *Agaricus rubescens*, as *A. virosus*, Fr., and *A. phalloides*, Fr., sulphur-yellow species, which grow in woods and have an offensive odour. *A. vernus*, Bull, white in colour, grows in woods, and has also an offensive odour. *A. muscarius*, L., grows in woods, especially of Beech and Fir. It has a vermilion or scarlet top, and is poisonous. A homœopathic preparation of the last fungus is sold as a cure for corns.

The qualities of some allies are unknown—they have not yet been tested. One species, *A. pantherinus*, DC., spotted like a panther, is sometimes

Florists' Flowers.

THE ANEMONE.

The middle of October is a good time to plant out the tubers of all the varieties of *A. hortensis*. In order to grow them well the ground must be well manured. It is best to have the beds where they are to be planted prepared by trenching a month or six weeks

usual to lift them when the leaves die down. If they are left alone they will sometimes flower again in the autumn.

THE RANUNCULUS.

In a letter to the *Times* Mr. F. W. Burbidge has been discoursing on the desirability of raising Anemones from seeds, and flowering them in the autumn. It may be a surprise to most people to know that the Ranunculus can be raised from seeds as easily as the Anemone. If the seeds are sown about the middle of October in boxes, and the boxes are placed in a cold frame, the seeds will vegetate in a month, and if carefully pricked out and grown on in boxes they will flower the following season. The little plants must be dried off in February. They must be started again about the 1st of March, if they are to flower the same season.

The old florists used to sow their seeds in January, but in that case the plants were not expected to bloom for eighteen months from the time of sowing the seeds. It is merely a matter of resting them. When the plants have made their growth, which they do in three months or less sometimes, they pass through the resting period almost immediately, and if the tubers are not taken out of the ground they will start to grow and flower at once. Mr. Barlow of Stakehill told me he had three successional blooms from the same set of Ranunculus in one season. The Anemone and Ranunculus are very tractable flowers to deal with, and can easily be grown and flowered from seeds and old tubers. Their culture was better understood fifty years ago, at least more generally understood, than it is now. *F. Douglas.*

COCAIN.

The *Sethia* india having been sent to me under the name of *Erythroxylon monogynum*, is found upon examination to contain a certain amount of alkaloid. The *Sethia acuminata*, which has also been sent to me as a variety of *Erythroxylon*, is a drug that has long been in use in Ceylon as a vermifuge, and I have for some time distributed it in the form of a fluid extract. At that time I was not aware that it had passed under the name of *Erythroxylon*. As soon as further supplies of these two drugs arrive a therapeutic examination will be carefully made with the alkaloids. I am glad to be able to record some further valuable information of general interest respecting *Erythroxylon Coca*. Dr. Manasseh, of St. Petersburg, gives an interesting account of the employment of the drug in sea-sickness:—

"He had read of its value in uncontrollable vomiting of pregnancy, and thought it might be useful in sea-sickness. He, therefore, went this summer on a sea voyage in order to test its efficacy. Among his fellow passengers were two—a man and woman—who were especially prone to the malady. He administered to each of them every two or three hours a teaspoonful of the following solution:—Muriate of Cocaine (0.15), rectified spirits of wine (in sufficient quantity), and distilled water (150.0), beginning the administration on starting. That it had a prophylactic effect seemed clear, for in spite of very rough weather for a period of forty-eight hours, both the individuals were, for the first time in their lives, free from sickness, and enjoyed a very good appetite the whole time. To a child six years old, who began to be attacked with sea-sickness on rising in the morning, the treatment was so effectual that it was able to play about during the day in spite of the storm. The child took one teaspoonful in two doses during the first half-hour, and then half a teaspoonful every three hours. Another case was that of a girl eighteen years of age who had been sick for twenty-four hours before the drug was given. The case being a severe one, she had a double dose every half-hour, with truly magical effect, for after the second dose the patient was able to assume a half-sitting posture, and after the sixth dose she rested and began to complain of hunger. During the rest of the voyage she remained well, although there was much rolling of the vessel. Similar good results attended the use of the drug in three milder cases, and had it not been that his supply ran short, Dr. Manasseh would have been able to make more extended observations. Still, from the experience of these few cases he thinks it justifiable to infer that in the drug we have a certain and harmless remedy against sea-sickness. In the same communication he mentions that he had found Cocainum muriaticum of great service in arresting the collapse of two severe cases of simple cholera, and thinks it desirable to try its action in cases of Asiatic cholera."

Dr. G. H. A. Dabbs reports this week in the *British Medical Journal* (p. 473) that he has used

FIG. 98.—*AGARICUS RUBESCENS*. (SEE P. 460.)

mistaken for *A. rubescens*, P., but the brown colour of *A. pantherinus*, approaches black, whilst that of *A. rubescens* is a rusty, foxy red. There is no change of colour in the flesh to sienna-red in *A. pantherinus*. I have seen intermediate forms between the two species, I take them to be hybrids, at any rate the characters are all intermediate. *W. G. Smith.*

ANTWERP EXHIBITION.—At the recent show held in Antwerp in connection with the International Exhibition Messrs. Rawlings Bros., Romford, were awarded the Gold Medal for fifty cut blooms of Dahlias, and the Silver Medal for twenty-five blooms. In another competition Mr. J. West, gardener to W. Keith, Esq., Brentwood, received a 1st prize for twenty-five cut blooms of Dahlias.

previously. In trenching place a good layer of manure in the bottom of the trench, over this a spit and shovelling of earth from the next trench, another layer of manure, and on the top 6 or 8 inches of soil. I place over the bed at planting time about 3 inches of potting soil. Plant in rows 6 inches apart and 6 inches between the tubers. They ought not to be planted very deep; about 2 inches of mould is enough over the tubers. A little white sand should be placed over each. The old florists used to protect their beds from heavy rains and severe frosts by coverings of straw mats placed over a wooden framework, but our modern experience has taught us that these coverings are unnecessary, and may even be hurtful. I leave the tubers in the ground all the year round, but it is

cocaine most successfully in four consecutive cases of childbirth, and that it is his intention to use it in future cases.

I can only add that in one American journal that reached me last week there were twelve notices of the employment of cocaine, and in no one instance have I as yet been able to trace any ill effects from its use.

The employment of the Erythroxylon Coca has now gone from the barbaric stage of depending for the effect by chewing the leaves (which might be fresh or stale: this means that they might contain hardly any percentage of cocaine, or, on the other hand, they might contain 0.55 per cent.), to the employment of the alkaloid where the doses can be most accurately apportioned. The solution of hydrochlorate of cocaine with water is always better when made fresh, and it is safe to apply it in any case of pain, even with children, by rubbing it in. It is most easily mixed with vaseline, and rapidly alloys pain in the joints. A small quantity of the alkaloid may be put with water and then placed on sugar, and it has a marked effect upon any one suffering with a sore throat. The price having fallen to about 4*l.* per grain, it is quite within the reach of any one. *T. Christy.*

Orchid Notes and Cleanings.

ORCHIDS IN FLOWER AT KEW.

THE following list of Orchids now in flower at Kew includes several of unusual interest and beauty, notably *Cypripedium Godfreyae*, recently imported among a batch of Orchids from Siam, and which has been figured for the *Botanical Magazine*. *C. Kaleturum*, lately described by Mr. N. E. Brown in these pages; *Dendrobium Phalaenopsis*, a beautiful large-flowered species from Timor Land; a new species of *Cypripodium*, the curious little black flowered *Bulbophyllum salutarium*, a very fine specimen of *Phalaenopsis Lowii*, *Phaius bicolor*, *Spathoglottis Fortunei*, an unusually large-flowered form of *Zygopetalum Gautieri*, and a handsome plant of *Cattleya Downiana*, which is growing upon a piece of Fern stem in company with *Adiantum cuneatum*, the fronds of which form a telling background for the rich colours of the *Cattleya* flowers.

EPIDENDRUM PRISMATOCARPUM.

Referring to Mr. Douglas's remarks on my specimen of this, exhibited at the Sevenoaks show (see p. 398), permit me to state that when he saw it the blooms were old and faded, they having commenced

to open on July 6, 1885, and the plant was exhibited on August 19, therefore the fineness of colour had almost gone. Mr. Douglas says it "remains in bloom a month." My variety always lasts two months, though, of course, the bloom looks a little autumnal at the end, but they are quite fit for making up into bouquets. If other growers are willing to enter a contest to see who has the best variety I shall be quite agreeable, and next year we could all send a spike to the Royal Horticultural Society, where we could all see them in a group and see their respective merits. I remember an incident in connection with this plant which may be of interest to younger Orchid growers than myself. It was the disinterested remark of the buyer whom I outbid, who opined that I had paid dearly for the "poor shy-blooming form." I bloomed it next season with twelve spikes, and it has since had twelve spikes each year. *De B. Crawshay.*

MESSRS. W. FROMOW & SONS' NURSERIES, HOUNSLOW.

AT this suburban nursery the principal subjects grown are Rhododendrons, American plants generally, coniferous and evergreen trees and shrubs, and hardy plants in common demand, the pure air of the district evidently suiting their requirements admirably, as was evidenced by their flourishing healthy appearance. If one were asked to state briefly the main features the answer would be Rhododendrons, Aucubas, and *Euonymus* grown for the London trade. Many more good things were there in abundance, but the aforesaid plants are grown in such quantities and prime condition that they stand out unmistakably from amongst the other stock. Of Rhododendrons (*ponicum*), hybrid seedling, and named varieties, about 150,000 are cultivated, plants from 1 to 3 feet in height and well set, bristling, in fact, with bloom-buds and remarkably healthy foliage. The soil is a good loamy one, and they luxuriate in it; thus very effectually disproving the once held notion that Rhododendrons would only thrive in peat soil; indeed, it has been found from experience that they will succeed in almost any soil that does not contain lime, and which has been rendered suitable for them by a good admixture of sand and leaf-mould.

The beds or "drifts," as they are called, of Rhododendrons are alone worth a journey to see, and have a charm (when in bloom) for every lover of this beautiful and showy class of plants. For the benefit of those whom it may concern we append notes on a few only (space forbidding a lengthy reference) of the best named sorts:—*Blandyanum*, deep rose-crimson—very good; *Hendersonii*, deep crimson; *Iago*, rose-purple, dark spots; *Lady Eleanor Cathcart*, pale rose, chocolate spots; *Limbatum*, white-edged crimson; *Lord Palmerston*, rose-crimson, fine tuss; *Mason's Perfection*, white, yellow spots, pretty; *Michael Waterer*, brightest crimson-scarlet; *Minnie*, bluish white, chocolate spots; *Mrs. John Clutton*, clear white, very good; *Mrs. John Waterer*, rose-crimson, excellent; *Warrior*, rose-crimson, fine flower.

Of *Aucuba japonica* some 200,000 are grown, and they are of all sizes, ranging from an inch high up to 5 feet, the plan generally adopted for increasing stock being from cuttings, these producing the bushy, well-shaped stuff so much in request by the trade for boxing—the plants got from layers, although obtained more quickly, not producing such shapely plants, having a "leggy" appearance, and therefore not so much in demand for the purpose named. As giving some idea of the trade done in this useful shrub, it may be mentioned that 49,800 cuttings were put in last year. While on the subject of box plants, it may be interesting to note that, in addition to *Aucubas*, the following, of sorts, are grown very largely for this purpose, viz.:—*Thuias*, *Cupressus*, *Retiosporas*, *Euonymus*, *Red Cedar* (*Juniperus virginiana*), *Box*, and *Berberis*.

Of those very effective and universally used box plants, the green and golden *Japan Euonymus*, some 30,000 are grown, and what a pretty effect they have when seen *en masse*. What may be described as one of the best shrub for hedge-making is *Ligustrum ovalifolium*; we saw it in 3 inches to 9 feet in height. An acquisition, too, in this way is *L. lucidum variegata* (the variegated Chinese Privet).

That beautiful white flowering shrub, *Andromeda japonica*, we also noted, *Azalea pontica* and *Ghent* varieties, an extensive collection is grown, and they are in capital condition. *Cratogeomys cocinea* fl.-pl., *Paul's double scarlet Thorn*, one of the finest hardy flowering trees of modern introduction, and the round-leaved *Laurel*—*rotundifolia*—is grown in quantity, the latter being a new and very desirable variety. Of the useful *Portugal Laurels*, about 1000 are cultivated. *Cupressus Lawsoniana argentea*, a beautiful and distinct kind, of very graceful habit, foliage of a silvery glaucous hue: of *C. Lawsoniana* alone some 30,000 plants are grown. Amongst *Yews*, of which there is a good collection, green and golden *Taxus baccata elegantissima* is very handsome in appearance, also *T. b. Dovastonii*, a fine weeping sort, leaves dark green. What a beautiful "feathery" tree is the well known *Thaiopsis borealis*.

Robinia Bessoniana, a fine tree for avenues and promenades—a very practical illustration of this is to be found in the pretty avenue of it at Sutton Court Road, Chiswick, the entrance to the Royal Horticultural Society's gardens, its round head of bright green leaves affording a delightful shade in summer, as well as giving quite a picturesque effect to the road in question, and giving one a notion of the Parisian boulevards. *Salisburia adiantifolia*, the Maidenhair tree, beautiful deciduous tree, leaves dying off yellow.

Amongst standard trees we noted a good collection of *Limes*, *Planes*, *Thorns* of sorts, *Laburnums*, &c. Of the ever popular *Virginian Creeper* (*Ampelopsis hederacea*) 30,000 are grown. What a hardy rapid climber it is, and what a striking appearance the intense scarlet foliage has at this particular season of the year. And then those best of all evergreen climbers, *Ivies*, *Hedera canariensis* (the Irish Ivy) some 40,000 plants are grown. How effective they are for covering walls, buildings, arbours, &c. The charming blue-flowered *Wittai's sinensis*, and the white variety, *alba*, are grown in quantity. *Poplars*, too, are somewhat largely and well grown, the principal varieties being the *Silver* or *Ahbe*, *Lombardy*, and *Black Italian*. Of *Golden* and *Silver Queen Hollies*, we noted some grand plants, quite lighting up their surroundings.

It now only remains to close these necessarily brief remarks by expressing our thanks for the courtesy shown by Messrs. Fromow's energetic foremen, Messrs. T. Kitchell and L. Godfrey, the nurseries under their charge redounding much to their credit. *Z.*

Plants and their Culture.

URCEOLINA AUREA (PENDULA).

I HAVE on previous occasions alluded to the utility of this bulbous plant for the decoration of the temperate-house as well as the stove. It is as well grown in the former, but still more so when grown in the latter. Although introduced from Peru as far back as 1837, it is still far from common, and, belonging to the *Amaryllidaceae*, its general outlines of culture can be seen at a glance. During its growing season it will succeed under the same course of culture as that given to *Eucharis* and *Pancreatum*. Some years ago, when first I grew it, the method adopted for its increase was by removing the offsets from the parent bulb. Last winter, when the bulbs were in flower, I contrived to fertilise flowers which gave seed-pods which ripened in due course, and a batch of seedlings resulted, which I am looking forward to see in a flowering condition another season. If they had been grown on more rapidly the strongest would in all probability flower this coming winter. It is of easy culture, and the knowledge that it can easily be raised from seed should cause its more extended cultivation, whilst its distinctive character is also a strong argument in its favour. Like all other bulbous plants that lie dormant during a portion of the year, it is sometimes liable to be overlooked, and when devoid of leaves to be pushed on one side. Avoid this oversight if possible, and when the flower-spikes begin to appear (as will be the case in a few weeks) see that the plant has all the light possible, so that the proper amount of strength is concentrated therein, to the future development of a fine umbel of flowers. The flower-spikes have a very bright and cheerful appearance when placed

along the margin of a group of plants in the stove, at the same time having good lasting properties.

EUCHARIS AMAZONICA.

If a batch of these that have made good growth can now be induced by an extra amount of warmth and a more liberal supply of water at the roots to push up some flower-spikes, they will come in very useful. Another lot ought to be held in reserve, if possible, to be brought on for use in December, and particularly for Christmas. Last year, towards the winter season, some of my stock, for want of room, were left in too low a temperature for a time, and a portion of them lost their roots, the effect of which was very noticeable in the spring, but which, by a more liberal course of treatment, have all recovered, and have thrown up some spikes, and promise many more ere long. This taught me the lesson, to exercise more care for the future. They will withstand a moderately low temperature, but if it is observed after a cold night that the foliage is limp and inclined to flag, then lose no time in removing them to more congenial quarters.

PANCRATIUM FRAGRANS.

This companion plant to the *Eucharis* will now in most cases have ceased to push up any flower-spikes. The young growth that is being made should be encouraged in its development, as on this will greatly depend the amount of flowers another season. *JAMES HUTTON, Gunnersbury House Gardens, Acton, W.*

FRUITS UNDER GLASS.

PEACHES.

As long as the trees continue in a healthy state and produce fair average crops of fruit, and finish it in a satisfactory manner there is really no reason to interfere with the main roots of such trees, or to disturb the rest more than is necessary for the purpose of giving the surface roots the benefit of the annual top-dressing of good fresh calcareous loam in a partially decomposed condition, with the customary mulching of manure on its surface, so much required not only to stimulate and nourish fresh feeding roots but also to protect them by-and-by, when they have permeated this stuff. Trees such as these referred to and in this condition of health are by no means common, but, on the other hand, it more frequently happens that much more attention is needful to keep them in a proper state, and even then in some places Peach trees are not at all long-lived, for after flourishing a few years premature decay sets in, and generally at the juncture where the stock and the tree are united, which checks the circulation of the sap, and soon arrests its progress to such a degree as to necessitate the removal of the tree entirely before its vitality ceases. The symptoms in trees affected in this way commence by an unhealthy appearance of the leaves, subsequently in diminished vigour, imperfectly developed wood, and badly finished fruit. In my opinion more trees were lost from this cause alone than from any other with which I am acquainted when they are cultivated under glass. If therefore Peaches are extensively grown in this way, by all means provide against such contingencies by planting every year some maiden trees in suitable places. These will in the course of two or three years, under proper care and attention, make trees far more suitable for transferring into houses than can possibly be procured in the ordinary way.

Any trees in the houses which have become at all unfruitful through exuberant growth or other causes, should be examined at the roots. This is best done by opening a trench down to the surface of the drainage at the outermost part of the roots. The soil should be carefully worked away from these to within 3 or 4 feet from the stem of the tree. They should then be shortened, and after fresh soil has been brought in and made up to within a foot of the surface, they should be spread out and be firmly pressed in and well watered. Subsequently the house which is to be started at about the end of next month should now be cleaned, painted, &c., in readiness for work. The trees should be pruned without further delay, afterwards carefully wash them with a soft brush and weak soft-soap water. This substance is very detrimental to the buds of Peach trees, therefore it should be sparingly used, and especially so on

trees at this early period. To show its effects I will give an instance which happened in my early days of practice, which I have never forgotten. A very large early house of fine Peach and Nectarine trees became infested with the brown scale; I with others were set to well wash these trees with prepared strong soft-soap water for the purpose of killing this pest, and this was done effectually, as no scale was left alive, and not more than a dozen or so of Peaches, for nearly all the buds dropped off the trees soon after forcing operations were commenced. After the trees are washed and tied on the trellises, remove about 3 inches off the surface of the border, and replace it with fresh calcareous loam, which should be covered with 2 inches of partly rotten manure. Unless very much frost prevails the lights may be kept off this house until the end of the present month. In later houses the trees may now be fully exposed to natural influences. *G. T. MILLS, Wycombe Abbey.*

The Hardy Fruit Garden.

THE principal crop of Apples and Pears will now be gathered, and will need care in the fruit-room. Air may be given when the outside temperature is dry and warm, but the ventilators are best shut on damp foggy days. All rotten or decaying fruit should at once be removed.

Filberts and Walnuts may now be gathered and stored away for winter use.

The season is now at hand when planting operations may be begun. To ensure a fair amount of success the ground should be thoroughly prepared before planting. When the ground is naturally of good quality little will be required, but to break up the ground, say about 2 feet deep, taking care to reserve some of the best soil for placing over the roots of the trees. When the ground is not suitable much may be done to improve it by mixing manure, wood-ashes, and, if of a heavy nature, sand, road scrapings, or leaf-soil may be added. Before planting permanent trees it is very important to have the ground thoroughly clear of weeds, for after the trees are planted it will be much more difficult to clear the ground.

From several years' experience I much prefer planting Apples on the Paradise stock. When planted on this stock they come into bearing at once, and if planted with care and well looked after in the way of mulching, &c., the first year, by the second year they will produce sufficient crops to pay for the trees. I have a great many varieties on this stock, and will select twelve of the best grown here, hoping that the selection may prove of some service to others who have not had an opportunity of growing so many kinds. I know many others of almost equal merit, but the following twelve are first-class as grown here:—

1. *Leon Pippin*.—A fine useful variety, in season from October to April, either for dessert or cooking; tree a free grower and may be planted closer together than many varieties owing to its compact upright growth.

2. *Cox's Pomona*.—Tree a good grower and free bearer and fruit above medium size, skin much streaked with red next the sun. One of the best autumn Apples grown.

3. *Cox's Orange Pippin*.—Fruit below medium size, in use from October to February; in its season the best dessert Apple grown. Tree a weak grower, hence it should have a good warm position; here on dwarf trees we get the largest and finest fruits.

4. *Lady Henker*.—This is a fine handsome Apple, very free grower and bearer; above medium size and colours well; useful for dessert or cooking.

5. *Blenheim Orange*, or *Blenheim Pippin*.—This is so well known and appreciated by every one that it needs no recommendation from me, but it may not be so generally known that this variety, when grafted on the Paradise stock, will fruit freely the second year after planting, and small trees planted here two years ago have this year produced finer crops of larger fruit than trees half a century old.

6. *Ribston Pippin* is still a king among dessert Apples, and should be planted largely by every fruit grower, on the Paradise stock, in light warm rich soil. Old trees are liable to canker. Young ones commence bearing immediately; they will produce much finer fruit than old trees if given good treatment.

7. *Fearn's Pippin*.—Below medium size, a fine,

crisp, and pleasant flavoured variety; a good grower, and a very free bearer.

8. *Court Pendule-plat*, or *Court Pendois*, also known under the name of "Wise Apple," owing to its habit of blooming late, and so escaping the late frosts. This is one of our best late Apples, a very free bearer, of excellent quality, and very handsome for dessert. I have kept them fresh and good till May.

9. *Collins*.—Medium size, very free bearer, and colours well; is useful for dessert or cooking, should be grown in rich warm soil. Here, when planted in a strong heavy soil the tree cankers, but in a dry and warm 10 ft. it is all that can be desired.

10. *Paragon's Nonesuch*.—Perhaps this is the handsomest of all Apples when well grown, very free bearer and good grower, but when grafted on the free stock a very shy bearer.

11. *Mr. Gladstone*.—This is a fine early Apple, very bright and handsome, but it can only be recommended for an early variety.

12. *Lane's Prince Albert*.—I am of opinion that this is the most profitable Apple to grow known at the present time. For ten years past we have never missed having a good crop of this variety, and this season I think the crop is better than ever. Good handsome fruit; will keep till April. *J. SMITH, Mountmore, Bucks.*

The Kitchen Garden.

CUCUMBERS.

THE plants in the earliest division will now be fruiting freely. Only moderate cropping should be allowed, so as not to weaken the plants by carrying a glut of fruit at one time. During the present month attend regularly twice weekly to stopping and tying, and maintain a regular top and bottom-heat.

MUSHROOM-HOUSE.

It is best not to apply tepid water to the beds until the young Mushrooms commence pushing through, but in some dry houses, even after keeping paths and walls damped, the soil on the surface of the beds will become too dry, especially if covering the beds has not been practised. Under these circumstances a moderate watering through a fine rose to moisten the soil once or twice before the crop appears, will be advantageous by bringing the beds into an earlier bearing state.

GENERAL WORK.

It will not be necessary until the beginning of next month to lift either late Cauliflower or early Broccoli approaching the cutting stage. The plots should be examined twice weekly, and the flowers protected by breaking the outside leaves over the hearts of the plants, and a little light dry bracken may likewise be laid over the top of the most advanced as an additional protection. Let the Dutch hoe be freely worked between the rows of late Spinach, Turnips, and other advancing crops for the double purpose of destroying young weeds and accelerating growth. Nearly all winter crops which were sown or planted at the usual time are backward this season.

A second sowing of China Rose Radish may now be made on a sunny border. The remainder of the Celery crop should now be finally earthed up, as sufficient frost may soon be expected to lay prostrate the leaves if this is not done. This season Brussels Sprouts are not so rank in growth as usual, but the plots should be looked over, and any decayed leaves removed, taking care not to break any healthy foliage—the more foliage to protect the Sprouts the better. Finish earthing-up late plantations of Leeks, drawing the soil as high as consistent with not burying the leaves too much, the object being to secure a long blanched part.

DEET ROOT.

The roots, being very susceptible to frost, the crop should be lifted and stored by the middle of the month. It is well to place the roots when storing in two different sizes; small roots are most valuable for salad purposes, and are invariably preferred to large ones in the kitchen. I do not advocate storing them out-of-doors if a suitable cellar is available. An airy shed is undoubtedly too dry for them, but if stored in sand on the floor of a somewhat damp and frost-proof cellar the roots will keep as firm as a rock until spring. A cellar not being available they may be stored similar to Potatoes out-of-doors, and the pit should be opened during mild weather, the roots examined, and any growth rubbed off. *G. H. RICHARDS, Somerley Gardens, Ringwood.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct 12	<p>Sale of Bulbs from Holland, at Stevens' Rooms.</p> <p>Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.</p> <p>Sale of Rhubarb, at Deppford, by Frotheroe & Morris.</p> <p>Royal Horticultural Society: Show of Apples and Pears (two days) Meeting of Fruit and Floral Committees, at 11 A.S. TUESDAY,	Oct 13	<p>Clearance Sale of Nursery Stock, at Upper Clapton, by Frotheroe & Morris.</p> <p>Sale of the First Portion of the Collection of Established Orchids formed by H. W. Lowe, Esq., at Frotheroe & Morris' Rooms.</p> <p>Sale of Dutch Bulbs, at Stevens' Rooms.</p> <p>Sale of Flowering and Established Orchids, at Stevens' Rooms.</p>
WEDNESDAY,	Oct 14	<p>Sale of Camellias, Azaleas, Roses, Lilies, &c., at Frotheroe & Morris' Rooms.</p> <p>Clearance Sale of Nursery Stock, at Dawson's Nursery, Sunbury, by Frotheroe & Morris (two days).</p> <p>Sale of Established Orchids, at Stevens' Rooms.</p>
THURSDAY,	Oct 15	<p>Sale of Dutch Bulbs, Roman Hyacinths, and Double Furberoses, at Frotheroe & Morris' Rooms.</p>
FRIDAY,	Oct 16	<p>Sale of Imported Orchids, at Frotheroe & Morris' Rooms.</p>
SATURDAY,	Oct 17	<p>Sale of Dutch Bulbs, at Stevens' Rooms.</p>

THE announcements in another column will show that the holiday season, if ever there is one in the horticultural world, is at an end. It will not surprise those who have taken part in recent Conferences and Congresses dealing with Apples, Narcissus, and Orchids, and it will not astonish those who are interested in the forthcoming exhibitions of Pears and Primroses, that the success which has attended these partial gatherings and which it is reasonably expected will ensue from those still to come—it will not, we repeat, be surprising that the idea of an INTERNATIONAL EXHIBITION AND CONGRESS on a large scale should once more be mooted. The Royal Horticultural Society, so often threatened and so much tried, has shown through all its troubles so much actual vitality and so much greater potential force, that we cannot doubt that the fullest sympathy will be accorded to it in its endeavour to act in accordance with the spirit of the age, and that the most careful consideration and the utmost support will be accorded to it in its endeavour to inaugurate an exhibition and a congress on a scale befitting the traditions of the Society and the needs of the day. We are well aware that many attempts in this direction have fallen flat. The gigantic success of 1866 has acted as an actual discouragement to further enterprise, and the altered conditions of the times have hitherto been adverse to the carrying out of such a scheme. But it would be idle to suppose that the horticultural world will be content to rest upon the memories of a period now twenty years old, rather it may be expected that it will be willing and with all confidence take into consideration the proposal once more to inaugurate an exhibition and a congress worthy of the nation. The matter is to be ventilated at the next meetings of the committees of the Society on Tuesday next, and we earnestly hope that the members and Fellows will come prepared to consider the matter in the most sympathetic manner. There are so many things to be considered, that it is hardly to be expected that any definite scheme can at once be adopted. First of all will come the question, whether or no such an exhibition on such a scale is desirable at this particular time. This is a point on which we ourselves are not prepared at the moment to offer an opinion. That must necessarily depend in large measure on the feeling of the exhibitors, and of those who may be expected to take an active part in the matter.

Assuming, however, that the desirability of such an exhibition be affirmed, the next point will be to determine who shall carry it out. We well remember that on the former occasion the Society, that should have placed itself at the head declined, doubtless for what then seemed good reason, to take part in the movement, which was entirely carried out by private zeal

and enterprise. The great success then attained was attributable mainly to the excellent feeling that prevailed among all those interested, and to the admirable chairmanship of the late Sir WENTWORTH DILKE. His zeal, and more especially his courtesy and tact, kept jarring elements within bounds, and so manipulated them that they were made to act together for the common good.

But even with the superlative administration of the chairman and treasurer it will be remembered that the matter was as nigh to have become as gigantic a failure as it afterwards developed into a success. A large guarantee fund was proposed, and very numerous promises of support were received, but that guarantee was never actually carried out, owing to legal difficulties, and it is hardly doubtful that had the promoters been obliged to seek the fulfilment of the implied promise of support in the case of a deficit, that considerable difficulties would have been experienced. But this is ancient history, and though we do well to profit by past experience, we shall do even better by endeavouring to work according to the lights and circumstances of the present. The questions for discussion on Tuesday next, then, seem to resolve themselves into these. Is it desirable at the present time to undertake such an exhibition and congress? If so, by whom shall the scheme be worked, and what shape shall the matter take? If it be considered desirable, there is hardly a doubt that the Royal Horticultural Society is the proper body to undertake it, always provided they can satisfy the public and the exhibitors and others, that they have the requisite zeal and administrative ability. The success of the recent partial congresses afford at least some guarantees on this point. In the next place, as to the scope of the proposed exhibition. There will, we anticipate, be little doubt that this must, to ensure success, be of the widest and most comprehensive character.

Horticulture at present is too much looked on as a mere luxury, and is thought to concern more especially the wealthier classes. But Horticulture, as we all know, has much wider aims. It concerns the peasant even more closely than the peer. The general welfare of the community is bound up with its success, and the special welfare of the landed interest, of the farmer, market gardener, manufacturer, and of our colonial brethren in every quarter of the globe, is very intimately concerned in it. All this, though well known to the horticulturist, is not sufficiently recognised by the general public, which eats, drinks, and is clothed, which builds houses, and manufactures what it requires, without much thought of the sources of supply and the means for augmenting that supply and of developing new resources. To illustrate our meaning we would point out that Horticulture should not content itself with exhibitions of flowers and fruit, however splendid, but it must develop its unrivalled resources by making known to the fullest the products of the vegetable world, their suitability for cultivation, and their adaptations to the requirements of mankind. Forestry in all its branches, the cultivation of food-plants in all climates, the development of the resources of our colonies in the production of materials for food, constructional purposes, medicinal and economic use. All these matters come legitimately into the scope of Horticulture when looked at in a comprehensive sense. It may be said that many of these matters are rather agricultural than horticultural, and in truth the interests of the two—Horticulture and Agriculture—are in so far identical, but Horticulture is the parent of Agriculture, and the manufacturers and farmers of this country and the colonists of the tropics are perfectly justified in looking to Horticulture for extended knowledge and judicious guidance.

In like manner Horticulture and Agriculture have claims upon a scientific congress. The art of Agriculture and the art of Horticulture have progressed as far as they can well do un-

aided, but Science, it cannot be doubted, has in its mines ore that only waits to be brought to the surface and utilised to extend the arts afforded in new directions, and to an extent as yet undreamt of.

Taken up in such a spirit, however much we may, in practice, fall short of the ideal, we cannot doubt that such an exhibition and congress thus conceived in the widest and broadest spirit, and carried out in a business-like manner—each helping each—will be attended with success. In any case, the matter is ripe for discussion, and such discussion penetrating, cautious, and exhaustive—we hope it may receive.

THE ROYAL BOTANIC INSTITUTION OF GLASGOW—more familiarly known as the Botanic Garden, Glasgow—is passing through a period of trial not very dissimilar to that which beset the Royal Horticultural Society. In order the better to develop its resources, the Institution, which is largely dependent on private subscription, borrowed money from the Corporation of Glasgow. With the money so obtained it reconstructed the garden, built new houses, and acquired a splendid winter garden. This attempt to meet at one time the requirements of fashion and the demands of science has failed, just as it failed at South Kensington. Science alone could not maintain the establishment, and the wealth and fashion of Glasgow, for whom these vast expenses were specially incurred, have left the Institution in the lurch, just as happened at South Kensington. As a consequence, the Corporation of Glasgow receiving, as we understand, no interest for the monies advanced, and seeing no prospects of doing so, have, as custodians of and dispensers of the public money, rather suddenly called up the money lent. There is, we believe, little doubt that the real value of the property is considerably greater than the amount lent, but the value cannot be realised without disastrous sacrifice, and the question is what is to be done? It is obvious that the proprietors of the garden are (as the Council of the Royal Horticultural Society was) paralysed by this state of things. The power is, we believe, in the hands of the Corporation of Glasgow to do as they list. What ought they to do under such circumstances? We can well understand that they are loath to expend monies from which all the citizens may not derive benefit. If it were a matter of pure science the difficulties would not be great, and the University and scientific bodies of so great a centre of learning might surely keep up a garden sufficient for their purposes. A botanic garden is more than ever necessary for the training and instruction of students of botany and science generally. At one time a herbarium, a few diagrams and models, supplemented by a relatively few specimens, such as would not tax the resources of a large garden, and by occasional excursions, would supply all that was considered necessary, but in the present state of botany a constant supply of fresh specimens of plants of all descriptions is a vital necessity for study and comparison. Even these requirements the University might be expected to supply, but when it comes to maintaining a costly and well furnished public garden, such as befits a large city like Glasgow, the case is different.

The scientific portion of the garden is limited in its requirements, but a pleasure ground and houses open to the public demand much larger funds. That the Corporation should hesitate about its duties in the matter, however, is rather surprising. We suppose no city in the universe, certainly none in Britain, stands more in need for purposes of health and recreation of such an establishment than Glasgow. If it did not exist the custodians of the public money might hesitate in incurring the expense, but there it is, and on the other hand there is a

city which, as any one who has visited it must acknowledge, stands wofully in need of the amenities, the life and health-giving requisites, which such a garden supplies. We trust, then, we may shortly hear that the garden has become

its management. Glasgow, which owes so much to botany, and which might owe so much more, should, even for personal, commercial, and manufacturing interests, apart even from wider sanitary considerations, look

known experts. The articles will be abundantly illustrated. In the following weeks we shall hope to give a complete account of the great exhibition of Pears to be held at Chiswick from October 21 to November 4.

FIG. 99.—ABIES PINSAPO. (SEE P. 468.)

public property, and that while it serves its beneficent purpose as a means of health and pleasure to the community, it may regain the ancient reputation it had when Dr. HOOKER, afterwards Sir WILLIAM, rendered the then little Glasgow Garden famous throughout the world by the zeal and energy he displayed in

to it that its Botanic Garden be suitably maintained and its influences enhanced.

— OUR NEXT NUMBERS.—In our next issue we shall lay before our readers various articles on the history, cultivation, and diseases of Pears, by well

— THE ROYAL HORTICULTURAL SOCIETY.— From a copy of the programme of the Primula Conference, to be held on April 24, 1886, under the auspices of this Society, it appears that an exhibition of these interesting plants will be held in the Conservatory at South Kensington on April 23 and 24, 1886, in conjunction with the exhibition of the Na-

tional Auricula Society. The President of the Conference, JOHN T. D. LANEVLYN, F.L.S., and the Chairman of the Committee, DR. MICHAEL FOSTER, F.R.S., are supported by a numerous committee of gentlemen interested in the subject in this country, both amateur and professional, as well as by the representatives of a large number of the chief botanical and horticultural gardens and museums abroad. It is proposed that the plants to be exhibited shall be ranged under eleven classes, namely—1. The Auricula. 2. The Primrose and Polyanthus. 3. Varieties of *Primula Sieboldii*. 4. Varieties of *Primula sinensis*. 5. European species, varieties and hybrids of the genus *Primula*. 6. Himalayan and other Asiatic species, varieties and hybrids of the genus *Primula*. 7. Chinese and Japanese species, varieties and hybrids of the genus *Primula*. 8. American species, varieties and hybrids of the genus *Primula*. 9. Plants allied to the genus *Primula*, such as *Cyclamen*, *D. decatanum*, *Androsace*, *Cortusa*, &c. (of the species only, not garden varieties, will be illustrated). 10. Primulaceous plants grown to admire special modes of culture, &c. 11. Specimens, models, and drawings, illustrative of the structure and mode of growth of Primulaceous plants. In order to assist in the arrangement of the European Primulas at the exhibition, MR. J. G. BAKER, F.R.S., has kindly drawn up for the committee a list of European Primulas, classified in three groups, published as an appendix to the programme, which may serve as a preliminary basis for the discussion at the Conference, and also as a guide, so far as possible, to the exhibitors in giving names to the plants they exhibit. The provisional programme of the Conference on April 24, 1886, includes:—1. The origin and history of the florists' Auricula, on which subject an introductory paper will be read by MR. SHURLEY HIBBERD. 2. The directions in which efforts should be made with the view of improving the florists' flowers belonging to the genus *Primula*; introductory paper by SAMUEL BARLOW, Esq., J.P. 3. The nomenclature of Alpine Primulas; introductory paper by MR. J. G. BAKER. 4. Culture of hardy Primulas; introductory paper by DR. MAXWELL T. MASTERS, on root-structure and mode of growth as affording indications of the probable best method of culture. This Conference, following closely as it does on the heels of the Apple Congress and the Orchid Conference, and with a Pear Congress in course of arrangement, together with the active part being taken by the Society in housing and caring for growing plants to be shown in the forthcoming Colonial and Indian Exhibition by the various colonies, gives evidence that the Royal Horticultural Society, under the energetic management of the present Council, not only still holds, but has taken a step in advance of, its well-known position as the horticultural authority in this country.

— THE BENTHAM PORTRAIT.—The following official reply has been received by SIR JOHN LUBBOCK in acknowledgment of the portrait presented by the subscribers to the Royal Gardens, Kew:—

“September 21, 1885.

“SIR JOSEPH HOOKER having informed the Board that a portrait of the late MR. GEORGE BENTHAM has been presented by you, on behalf of a body of subscribers, to the Royal Gardens, Kew, I am directed by the First Commissioner of Her Majesty's Works, &c., to express his thanks for the gift, and to acquaint you that the portrait will be hung in the Herbarium, in which he worked for so many years, and which was greatly enriched by his generosity.—I am, sir, your obedient servant.”

“A. B. MITFORD.

“SIR JOHN LUBBOCK, Bart., M.P.”

— NATIONAL CHRYSANTHEMUM SOCIETY.—Floral Committee:—MR. BERRY, Roehampton; MR. M. BUTCHER, Barnet; MR. BEVAN, Dartmouth Hill; MR. H. CANNELL, Swaleley; MR. R. DEAN, Ealing; MR. N. DAVIS, Camberwell; MR. GIBSON, Mitcham; MR. G. GORDON, Gunnersbury; MR. E. KEMP, Clapton; MR. J. J. LOWRY, Mill Hill; MR. MARDIN, Finsbury Park; MR. G. STEVENS, Putney; MR. J. SPRINGBELL, Cheshunt; MR. C. SAIT, Fulham; MR. J. TOWNSEND, Putney. The first meeting of the above committee will be held at the Royal Aquarium, Westminster, in the organ gallery, on Wednesday, October 14, at 2.30 p.m. precisely, when new or rare Chrysanthemums, or other subjects may be submitted. Certificates will be awarded according to merit. Exhibitors can obtain admission to these meetings by signing attendance book at staff-entrance of the Royal Aquarium

(next the theatre). Exhibits should be staged not later than 2.15 P.M. Parcels (carriage paid) may be directed to MR. WILLIAM HOLMES, Honorary Secretary, care of F. Cates, Esq., Royal Aquarium, Westminster, S.W. Exhibitors need not necessarily be members of the Society.

— GARDENERS AS VOTERS.—At a Registration Court in Midlothian lately the question of the right to vote of gardeners living in cottages came under discussion. It appears from the report in the *Edinburgh Courant* that objection was raised to one of the gardeners at Dalkeith. There were, said the objector, on the list for Dalkeith five gardeners who occupied cottages, and the objection was that they were not entitled to be registered. The Act of Parliament that gave the franchise to any householder allowed it to any man who occupied part of a house exclusively, but it did not give the right to any man who had a joint right with others to every part of the house. He would have been prepared to admit the case of this man if he had been satisfied that he had even a bedroom of his own. He understood, however, that two men used the same bedroom, and therefore had not any part of the house they could call exclusively their own.

“THE SHERIFF: Your objection is that it is not a separate dwelling-house, because they jointly occupy the house?”

“THE ASSESSOR: Duncan Brough occupies one room. He is the sole occupier, and can cook his food there.”

“THE SHERIFF: It is not exactly the case of a bothy; there is a common place for meals. They each have separate rooms, to which alone they have access?”

“THE ASSESSOR replied in the affirmative.”

“THE SHERIFF said it appeared to be the fact that this man had a separate sleeping apartment which he occupied exclusively, and he took his meals in the common room with other gardeners.”

“MR. CAMPBELL said MR. Nicholson's book said, ‘It would probably be held that where two or more servants together occupied a bothy none of them would be entitled to register;’ but if it was the case that they each had a separate sleeping room he would not press his objection further.”

“THE SHERIFF thought MR. CAMPBELL, the objector, was well advised in withdrawing it.”

— THE CRYPTOGAMIC SOCIETY OF SCOTLAND held its eleventh annual conference at Corrie, Island of Arran, on the 29th ult., and succeeding days. The weather was unfavourable throughout. Fungi were not abundant. This, however, was owing rather to a continuation of barren seasons than to soil or climate. Arran is rich in Feras. Trichomanes radicans has been gathered on the island. Hymenophyllum tunbridgeense, much less frequent in Scotland than in England, was found growing luxuriantly; *H. urticale*, more extended in its distribution, was also abundant. Some idea of the climate of the island may be formed from the fact that Palms, Camellias, Myrtles, Heaths, Fuchsias, &c., have been grown in the open air, uninjured through a long succession of winters. At the business meeting of the Society, DR. FLAXMAN SPURRELL in the chair, it was resolved to publish a volume of Transactions after the next annual conference, which will take place at Aberdeen in the autumn of next year, under the presidency of Professor J. W. II. TRAIL.

— HOME GROWN TIMBER.—We extract the following from a Scottish paper:—

“Two years ago a violent storm blew down an enormous number of trees in Scotland. On the Duke of Buccleuch's estate [at Drumlanrig] a hundred different woods were devastated. The trees have remained ever since as they fell. No one could be induced to undertake the huge contract of removing them. Just lately, however, an enterprising London merchant has purchased the entire lot from the Duke's stewards, who, indeed, had become so anxious to have them removed that they offered them at an extremely low price. The purchaser has begun to do a flourishing trade, for he can afford to undersell the Baltic merchants. The incident seems to show that forestry is indeed a neglected industry in this country. There seems no reason why the Baltic trade should not be permanently rivalled by the products of our own woodlands.”

— EXHIBITION OF AGRICULTURAL AND GARDEN PRODUCE AT NEWRY, OCTOBER 1, 1885.—The Newry public were on this occasion indebted to the enterprise and taste of Messrs. RODGER, McCLELLAND & Co., for what was one of the most

successful and attractive exhibitions of the above witnessed for a long time in this neighbourhood. The large premises were utilised for the purpose, and what with evergreens tastefully disposed, flowers, fruit, garden produce generally, and artistic designs on the walls, the place was transformed into a little Eden of Beauty. Above 300 exhibits were shown. The venture was unique, inasmuch as it was projected and carried out at the risk and expense of Messrs. RODGER, McCLELLAND & Co., but at the same time it will mark a new departure of a very gratifying kind to amateurs and farmers.

— SYMPHYTUM ASPERRIMUM.—MR. MITCHELL HENRY in the *Times* recommends the use of this plant as a forage crop:—

“Five years ago I obtained a small supply of the roots from a London agent, and planted them in a light sandy soil in which they did not do very well. The roots were then taken up, divided like Jerusalem Artichokes, and transplanted into reclaimed peat land, receiving a good supply of farmyard manure. Here the Prickly Comfrey has flourished amazingly, and by subdivision now covers several acres. It has been cut this year already five times, and will be cut again before Christmas, yielding by careful weighing after the present fifth cutting a total of 40 tons to the acre.

“The plant is uncommonly handsome, and when planted should have intervals for its growth of not less than 2 feet, and when gathered it should be cut down even with the ground and receive a dose of liquid or other manure. Cattle eat it greedily, and it is excellent for dairy cows, as it does not flavour the milk. I have seen it stated that the roughness of the leaves makes it distasteful to cattle, but this is an error. It is an invaluable food for pheasants, ducks, and all kinds of fowl, and if chopped up for them in that most useful instrument, STARRITT'S American circular cutter, and mixed with barley meal or crushed Indian corn, it fattens them rapidly and saves a third of the grain. I have had two of these mowing machines, one large and the other small, both purchased from GILBERTSON & PAGE, Herford.

“Like all broad-leaved plants, which derive much of their food from the air and the rain, Comfrey grows best wherever Swedes and Mangels flourish, and amply repays the expenditure of a fair supply of manure. It has been stated that no manure is wanted, but this, as regards all plants, is nonsense, for in some way or other you must restore to the soil what you have taken out of it, and root crops especially exhaust the soil. Preserved as ensilage Prickly Comfrey does not seem to have done very well, and the product is unusually disagreeable in smell.”

— PROPOSED INTERNATIONAL EXHIBITION.—A meeting of the Council and Committees of the Royal Horticultural Society is summoned for October 13, with a view of ascertaining the possibility of holding an International Show in 1887.

— ROYAL CALEDONIAN HORTICULTURAL SOCIETY'S APPLE AND PEAR CONGRESS, 1885.—At a meeting of the Council of the Royal Caledonian Horticultural Society, held on August 14, it was resolved to hold a special Exhibition and Conference on Apples and Pears, in connection with the Society's winter show, in the Waverley Market, Edinburgh, on November 25 and 26. While collections of Apples and Pears are solicited from all parts, for comparison and instruction, the chief object of the Conference is to utilise the favourable opportunity presented by the fine crop this year, for the purpose of gaining information about the Apples and Pears grown in Scotland, comparing their merits, and correcting their nomenclature. All fruit growers, especially in Scotland, are therefore invited to send as complete collections as possible of the Apples and Pears grown in their district; and as the object is solely educational, there will be no competition and no prizes. It is not necessary that the fruit should be grown by the sender. No limit will be put upon the number of kinds which any contributor may desire to send; but the number of each variety should be from two to four, according to circumstances. The Council are anxious to procure as complete representations as possible of the Apples and Pears grown in each district, and each variety should be distinctly labelled, with the name or names under which it is grown in the locality. It is also most desirable that each collection be accompanied by all the information possible about the climate, altitude, exposure, soil, stocks, method of cultivation, and other particulars, which will be of much value to the committee in drawing up their report. For this purpose forms will be sup-

plied on application to the Secretary. The specimens being strictly for examination and instruction, they must necessarily be at the disposal of the Council where required. Intending exhibitors must give notice to the Secretary or Assistant-Secretary, in writing, not later than Monday, November 16, stating the number of varieties to be exhibited, and the amount of space that will be required. Collections of fruit may be consigned to Mr. WILLIAM YOUNG, Assistant-Secretary, 18, Waverley Market, Edinburgh, and delivered there on or before Friday, November 20. The Council will pay the carriage of fruit, and take all possible care of it, and will also see that it is properly staged for the inspection of the committee; but they will not be held responsible for any error, damage, or loss of any fruit consigned to them. Exhibitors staging their own fruit can do so on Tuesday, November 24; and all must be staged and the hall cleared for the committee by 10 o'clock on the morning of Wednesday, November 25. Each exhibitor will receive free tickets of admission to the Exhibition for himself and such number of assistants as the Council may deem necessary. The entry form to be filled up and returned to the Secretary, 18, Waverley Market, Edinburgh, not later than Monday, November 16, runs as follows:—

Name of Exhibitor _____
 Address of Exhibitor _____
 Number of Varieties exhibited _____
 Amount of Space required _____ square feet
 Altitude above Sea-level _____ feet
 Aspect _____
 Sheltered or otherwise _____

The following table is to be filled up, as far as possible, by the exhibitor:—

Insert in column I. the number, and in column II. the name, of each variety exhibited; column III., its use; column IV., where grown; column V., form of tree; column VI., nature of soil and subsoil; column VII., age of tree, if known; and column IX., general remarks on any other point of interest.

I.—Nos.	II.—Names	III.—Dessert, Culinary, &c.	IV.—Wall, Gair, den, or Orchard	V.—Bush, Pyra. multi-stemmed, &c.	VI.—Soil, Subsoil, &c.	VII.—Soil and Subsoil.	VIII.—Age.	IX.—Remarks.
---------	-----------	-----------------------------	---------------------------------	-----------------------------------	------------------------	------------------------	------------	--------------

The following form must be filled in by each exhibitor:—

Pear: grown at _____

Name _____
 Use _____
 Season _____

Bearing qualities _____
 Stock _____
 Description of tree _____
 Exhibited by _____

— FRUIT CATALOGUE.—It is rare to find a catalogue of fruits, sent out by a nurseryman, so full of information likely to prove useful to the cultivator, as that of M. N. GAUCHER, of Stuttgart. The various methods and designs for planting regular fruit gardens with bush, pyramid, espalier, of all patterns of trees, are given, and sketches illustrating the manner in which the various trees, bushes, &c., are pruned and trained. The lists of the various kinds of fruits are very full, and are by no means confined to those of German origin.

— THE WHEAT CROP OF 1885.—We are indebted to the kindness of Sir J. B. LAWES, of the Laboratory, Rothamstead, for the following statement:—

"It is very rarely that the weather has been more favourable than that which we have had this year for the ripening and harvesting of the Wheat crop of the country. The months of July and August, although somewhat low in temperature, were almost without rain. The crop stood up well, and the land was unusually free from weeds. The sheaf binders therefore did their work under great advantages, and it is probable that the records of some of our farmers will show a more rapid

and cheaper ingathering of the harvest than they ever before experienced.

"The Wheat plant is a remarkable one, inasmuch as whatever the weather may be, it never fails to yield a crop, though it is only on very rare occasions that its choicest favours are bestowed upon us. One of the forty-two seasons over which our experiments at Rothamstead have extended, we have had only two which may be called first-class; and yet we have no reason to suppose that each crop of the forty-two might not have been equally good, had the season been equally favourable.

"In writing a few years ago on the influence of climate upon our Wheat crops, we pointed out that in those years in which the yield of Wheat was unusually large, one of the peculiar characteristics of the climate was the steady and progressive increase in the temperature during the whole period of the growth of the crop. We may, therefore, assume that any sudden and violent changes in temperature would be injurious to the crop, more especially if they occurred during the period of the year when the growth was most active. June is in this country the month in which the Wheat crop makes the larger portion of its growth; and it was in June of the present year that we experienced several violent fluctuations of temperature. Eight times we recorded a temperature ranging between 73° and 82° Fahr., followed in most cases by a very sharp fall, the difference in one instance being as much as 20°. As the weather in July and August was altogether favourable, it appears probable that the somewhat unfavourable report we are about to give must be due to injuries done to the crop previous to the month of July.

"The following table gives the yield of some of the plots of our experimental Wheat field, the crop being the forty-second in succession. The selected plots are the same as have been employed by us to determine the yield of the Wheat crop of the country for the last twenty-two years:—

	Harvests.						
	Unmanured, Plot 3.	Farmyard Manure, Plot 5.	Artificial Manures, Plot 6, 7, 8.			Mean of Plots 7, 8, 9.	Mean of Plots 3, 5, 6, 7, 8, 9.
<i>Bushels of Dry and Grain per Acre.</i>							
Present Year, 1885	41½	49½	31½	39½	34½	33½	49½*
Average 10 years, 1875-84	30½	29	28½	33½	34½	32½	24†
Average 23 years, 1852-74	14‡	25½	31½	37½	37	36½	28¼
Average 33 years, 1822-84	11	23½	27½	36½	36½	35½	27½§
<i>Weight per Bushel of Dressed Grain in Pounds.</i>							
Present Year, 1885	61	61½	61	61½	60½	61	61½
Average 10 years, 1875-84	58½	60½	60½	60½	59½	60	59½
Average 23 years, 1852-74	57½	60	59½	59	58½	59	58½
Average 33 years, 1822-84	53	60½	59½	59½	58½	59½	59
<i>Total Straw, Chaff, &c., per Acre, in Cwt.</i>							
Present Year, 1885	10½	33½	29½	43½	31½	34	25½
Average 10 years, 1875-84	8½	27½	31½	39½	42½	37½	24½
Average 23 years, 1852-74	19½	33½	34½	41½	42½	39½	28½
Average 33 years, 1822-84	11½	31½	32½	40½	42½	38½	27½

"The average produce of the selected plots shows a yield of not quite 29½ bushels per acre, but as the weight per bushel is slightly higher than the standard of 61 lb., we may take the average yield as being 29½ bushels.

"The peculiar feature of the crop of this season is the large yield obtained upon the plot manured with farmyard dung every year, as compared with the plots which receive artificial manures. This year there is a difference of 7 bushels per acre in favour of the dung, the mean of the artificial manures giving 33½ bushels, and the dung 40 bushels per acre. It is only under very special circumstances that the produce of the dung exceeds that of the artificial manures, and as the dunged plot is supplied every year with a large amount of vegetable matter, while the plots to which we apply artificial manures receive none, we might expect to find that the Wheat crop upon fen soils, and soils that contain much vegetable matter, would be considerably over an average. As the character of the climate has been specially unfavourable to the action of artificial manures, and the Wheat crop of the country generally

depends upon the manure of the farm, I should be disposed to think that my figures, as representing the yield of the country, are too low rather than too high. Taking them, however, as they stand, with an area under Wheat of 2,554,852 acres, the home-grown produce will amount to 9,421,017 quarters, and deducting 2½ bushels for seed, the amount available for consumption will be 8,702,465 quarters. The estimated average population for the harvest year, September 1, 1885, to August 31, 1886, is 36,617,201, and allowing for a consumption of 5.65 bushels per head, the total amount of Wheat required to feed the population will be 25,860,893 quarters. The imports, therefore, required to supplement our home produce will be a little over 17,000,000 quarters. Last year we imported and retained for home consumption 18,000,000 quarters, while our estimated requirements did not appear to amount to more than 10½ million quarters; and there appears, therefore, to be a large surplus stock of Wheat in our granaries—a sufficient reason to account for the want of any life in the trade."

— THE LINNEAN SOCIETY.—The meetings of this Society will be held at Burlington House, Piccadilly, W., on the following dates:—1885.—Thursday, November 5 and 19; December 3 and 17, 1886.—January 21; February 4 and 18; March 4 and 18; April 1 and 15; May 6 and (Anniversary) Monday 24; June, Thursdays 3 and 17. The chair will be taken at 8 o'clock in the evening precisely, at every meeting, excepting on May 24, the day appointed for the anniversary elections, when the chair will be taken at 3 o'clock in the afternoon precisely. The library is open daily from 10 o'clock till 5 o'clock in the afternoon (on meetings nights continuously), and the reading-room, adjoining, from 10 A.M. to 6 P.M., but on days of Council meetings and on Saturdays only till 4 P.M.

— TRAVELLING SIXTY YEARS AGO.—The subjoined letter from Mr. BICHENO, a well known British botanist, afterwards Colonial Secretary in Tasmania, addressed to the late Dr. (then Mr.) LINDLEY, will be read with interest in these days of cheap trains:—

"Newbury, April 25, 1879.
 "A letter from Mr. HOOKER this morning informs me that you propose in a few days to go down to Halesworth; and he has proposed that we should travel together, if it should be mutually agreeable. The scheme is one I shall be very happy to embrace if it should meet with your convenience, and the mode I propose to travel should be approved. It is my intention to reach London in my gig on Monday, the 3d May, and I should be ready, therefore, to set off the next day, in the afternoon, for some place about twenty miles on the road. On Wednesday we might reach Colchester, or Ipswich, and the morning of Halesworth. If, however, there was any spot in passing where any botanical rarities are to be found, I shall be happy to fall in with any arrangement that your knowledge of habitats may enable you to suggest.

"Should my proposition be acceptable to you, I shall feel much pleasure in giving you a seat in my gig. I have the honour to be, &c. 'J. E. BICHENO.'

— FORTHCOMING SHOWS.—On Tuesday next the Royal Horticultural Society will hold a meeting of the Fruit and Floral Committees, and a show of Apples and Pears on that and the following day. The National Pear Congress, inaugurated by the above Society, will last from October 21 till November 4.—At Exeter, on October 22, there will be held an exhibition of Apples and Pears, lasting two days.—Kingston and Surbiton Chrysanthemum Society's Show is fixed for November 10 and 11; and that of the National Society, at the Aquarium, on November 11—12.—The Richmond Chrysanthemum Show will be held on November 5 and 6, when I.L.R.H. Princess MARY will open the show. The Crystal Palace Chrysanthemum Show will be held on November 6 and 7.

— THE AYLESBURY CHRYSANTHEMUM SOCIETY.—This Society will hold an exhibition on November 19. There are forty classes constituted, and the chief prizes are of good amount, ranging from three guineas downwards.

— GARDENING APPOINTMENTS.—MR. ROBERT LEADBEITER, as Head Gardener to A. G. HUBBARD, Esq., Elmstead Lodge, Chislehurst.—MR. JAMES CHURCH, as Head Gardener to Sir WILLIAM PARKER, Bart., Melford Hall, Suffolk.

TRADE MEMORANDUM.

The whereabouts of Mr. Edwin Tellow, of Nottingham, is requested by several correspondents,

* Equal to 29½ bushels, at 61 lb. per bushel.
 † Equal to 25½ bushels, at 61 lb. per bushel.
 ‡ Equal to 27½ bushels, at 61 lb. per bushel.
 § Equal to 26½ bushels, at 61 lb. per bushel.

ABIES PINSAPO.*

THERE are few more handsome Firs than this, but though it has been in the country since 1838 it has in our experience produced its cones but rarely. The present occasion, when we are mourning the death of the botanist by whom it was introduced to this country, seems opportune for laying before our readers an illustration of the cone as produced in the grounds at Penrhyn Castle, North Wales (fig. 99).

The tree is now so common that detailed description is not necessary, and it is moreover to be found in all the books treating on garden Conifers. The most striking peculiarity consists in the close pyramidal habit, the densely set short bluntnish glaucous leaves spreading in every direction, not flattened out in two ranks, as is usual in Silver Firs. Both in cone and in foliage it resembles *A. cephalonica*, already figured, but the leaves are shorter, blunter, and much more glaucous. The Pinsapo, moreover, has the great merit of being more hardy and less subject to injury from spring frost than *A. cephalonica*. This immunity it owes to being later to move in spring. It is one of those Firs in which the side-buds at the ends of the shoot commence to grow before the central or terminal bud. As this occurs on the erect leader-shoot as well as on the side-shoots it is not easy to explain the peculiarity from more favourable exposure to sun. The buds are of a rounded form, and the scales adhering together are pushed off in the form of a little cap. The shoots when growing curve downwards, from superior force of growth on the upper as compared to that on the lower surface (epinasty). The fragrant resin exuded by this tree seems to be specially attractive to wasps.

YELLOW ROSES.

THE following are a few notes on probably all the yellow-flowered species of Roses at present in cultivation in this country. At any rate, if more do exist in British gardens they are by no means superior to those here mentioned. *R. xanthina*, of Lindley, which long remained a puzzle, and, indeed, was only known to Lindley, when he published his *Rosarum Monographia*, by a Chinese coloured drawing in Lambert's library, has been recently collected by the Abbé David, in Mongolia, but, so far, has not found its way into cultivation.

Rosa lutea, Miller, *Gardeners' Dictionary* (1759).

R. Eglanteria, Linnaeus, *Amoen. Acad.*, v., 220 (1760).

R. foetida, Allioni, *Fl. ped.*, ii., 138 (1785).

R. chlorophylla, Ehrhart, *Beitr. z. Naturk.*, ii., 138 (1788).

Rosa lutea is a very different plant from *R. hemisphaerica*, with which it has been at various times strangely confounded; the last-named belongs to the Pimpinellifolia group, whilst the subject of this note is one of the Rubiginosæ. It is undoubtedly the yellow Rose most generally cultivated in this country, and the one most easily grown. Comparatively few variations occur, *Harrisonii* and Persian Yellow being two double-flowered forms, and *punica* (*R. lutea* bicolor, *Bot. Mag.*, 1077), the Austrian Brier, a single-flowered one, with the petals red on the upper surface and yellow beneath. This species is a native of the East, but in various parts of South Europe it occurs in a semi-wild condition.

Rosa hemisphaerica, Herrmann, *Dissertatio Inauguralis Botanico-Médica de Rosa*, 18 (1762).

R. glaucophylla, Ehrhart, *Beitr. z. Naturk.*, ii., 69 (1788).

R. sulphurea, Aiton, *Hort. Kew.*, ii., 201 (1789).

R. Rapini, Boissier, *Diagnose Pl. Nov.*, ser. ii., No. 6, p. 172; *Flora Orientalis*, ii., p. 672.

For a very long time this beautiful but wayward Rose was only known in a double state. The wild type was first described by Boissier and Balansa under the name quoted amongst the synonymys. The double form, handsome as it is, does not find a place in many gardens, and this is owing to the fact of its being so hard to manage. In many localities it refuses to flower at all, and in others the blossoms rarely come to perfection. Parkinson wrote of it:—"The flower is so thick and double that very often

it breaketh out at one side or another, but few of them abiding whole and fair in our country." Where, however, the species does do well it is deservedly regarded as one of the most handsome of garden plants. The specific name, *glaucophylla*, was given by Ehrhart on account of the whitish under-surface of the leaflets. It is a native of Persia and Asia Minor, and is largely grown in the East.

Rosa Ece, Aitchison and Hemsley, "Notes on the Flora of the Kurum Valley, &c., Afghanistan," *Journal of the Linnean Society*, vol. xviii., p. 54, and xix., p. 161, plate viii.

This pretty species was introduced to Kew a few years ago by Dr. Aitchison. It is a distinct plant, remarkable for the small size of its yellow flowers, and for the very broad bases of its homomorphous prickles, resembling closely in this respect the Central Asian *R. platyacantha*, Schrenk. to which species indeed M. Crépin refers *R. Ece* as a variety. M. Crépin writes:—"Specimens of a yellow-flowered

FIG. 100.—ROSA LUTEA.

Rose from Mongolia, which I have referred to *R. platyacantha* resemble *R. Ece* extremely, only the leaves are not glandular. The existence of glands, however, on the under-surface of the leaflets does not to my mind constitute a specific character, for in the majority of types there are glandular and eglandular forms. If I am right in my determination, *R. Ece* bears the same relation to *R. platyacantha* as *R. myricantha* does to *R. pimpinellifolia*. Plants raised from seeds sent by Dr. Aitchison have grown freely at Kew, but so far have not produced flowers; there are generally seven small leaflets, and the bark of the young shoots is a deep red, the spines being lighter in colour. A native of Afghanistan.

Rosa simplicifolia, Salisbury, *Prodromus stirpium in hort. Chapel Allerton* (1796).

R. berberifolia, Pallas, *Nov. Act. Acad. Petrop.*, x., 379, t. 10 (1797).

Hultheimia berberifolia, Dumortier, *Dissert. Tournay* (1824).

Lowea berberifolia, Lindley in *Bot. Reg.*, t. 1261 (1829).

This species is doubtless one of the most interesting

of all the Roses. It forms a section by itself, being the only species with simple exstipulate leaves. Bunge maintained that the plant was aphyllous, and that the foliaceous organs were simply confluent modified stipules. It is unfortunate that so interesting and beautiful a species is so difficult to cultivate. The following extract is taken from a letter addressed to Mr. Smith, Curator, Royal Gardens, Kew, by Herr Max Leichtlin:—"I had it eight years ago in full flower and it was greatly admired by Boissier who had also seen it in its native haunts. It grows best in fissures of rocks exposed to all weathers but I think in your moist climate you will find it difficult to do well." The general aspect of the plant in a state of Nature may be imagined from the description, &c., extracted from a letter written from Camp Tir-Phul, Northern Afghanistan, by Surgeon-Major Aitchison to Sir J. D. Hooker, first published in *Nature*, July 9, 1885:—"It covers the whole country in localised patches, and being very dwarf in habit, not above 2 feet, the flowers are seen to perfection; they open out expanding almost flat, when the brilliant eye, formed by the claret colour of the bases of the petals, gives it quite a character. Amongst my Rose hips sent to you last year this was one of the species. I hope to be able to supply you with a lot more, it would make a lovely flower border." In the letterpress accompanying the beautiful coloured figure in Kew's *Les Roses*, Thory says that it thrives best when side grafted on *Rosa spinosissima*. If the plant is protected overhead by some means against the superabundant moisture of our British climate and placed in an open well drained sunny spot it might succeed; where it does thrive it sends up numerous suckers from its creeping underground stems.

The accompanying illustration (fig. 100) was made from a plant now growing at Kew. A native of Afghanistan, Persia, and Siberia.

Rosa Hardii, Cels frères, in *Annales de Flore et de Pomone pour les années 1835 6*; Paxton, *Magazine of Botany*, vol. x., 195 (1843).
R. Hardynna, *Bon Jardinier* (1842).

Rosa Hardii.—This beautiful Rose is supposed to be a hybrid between *R. berberifolia* and *R. involucreta*, Roxburgh (*R. cinclifolia*, Thory). In the Kew herbarium there is a specimen gathered in the Luxembourg garden on June 20, 1836, with the information in Gay's handwriting that the plant had originated from the seed of *R. cinclifolia* planted near a bush of *R. berberifolia*. That the cross was not artificially made is proved by the following note from the *Bon Jardinier* for 1842, also in Gay's handwriting:—"Mons. Hardy obtained in 1836 from a sowing of *R. cinclifolia*, the seeds of which are presumed to have been fertilised by *R. berberifolia*, a new Rose which bears his name." . . . According to Mr. W. Paul (the *Rose Garden*, 1848), "The most splendid collection in France is that in the Jardin de Luxembourg, in Paris, which is under the superintendence of M. Hardy. Most of the plants there are of some age, and flower most profusely in the season. It is true they look rather drawn, but when we consider their proximity to the heart of the city, it is surprising that they flourish so well. M. Hardy is so stranger in the Rose world: one of his varieties alone would have sufficed to render his name popular, but he has been fortunate enough to raise many others of first-rate properties, some bearing the after-appellation of 'Du Luxembourg.' And how could it be otherwise, when he has devoted so many years to the cultivation of this flower, and raised so many thousands of seedlings?" *R. Hardii* is a much freer grower and flowerer than *R. berberifolia*; it has from five to seven leaflets and handsome flowers, the petals being sulphur-yellow, with a crimson blotch at the base of each petal. The accompanying illustration (fig. 101) was made from a specimen which flowered in a pot under glass in April in the garden of Mr. Herbst, at Richmond. *Geo. Nicholson, Royal Gardens, Kew.*

GENTIANA PNEUMONANTHE.—In gardening, especially in experimental gardening, there must be, of course, many disappointing failures, there are, however, happily as many unexpected successes. I have lately had one. A plant of *Gentiana pneumonante*, our lovely native Gentian, planted near our pond, has sown its seed all about, and a number of young plants have come; some now in bloom. *George F. Wilson, Heatherbank, Weybridge Heath.*

* *Abies Pinsapo*, Boissier, in *Bibl. Univ. Geneva*, 1838.

HOME CORRESPONDENCE.

Vanda cœrulea.—I read at p. 431 that "the difficulty attached to the growing of this species is doubtless the greatest obstacle that prevents its becoming common." At one time *V. cœrulea* was considered a difficult species to cultivate, but the right system of culture has been found out, and frequently described in the *Gardeners' Chronicle*. It is as easily grown as any other *Vanda* if its requirements are attended to. A few years ago large quantities of it were introduced and sold at a cheap rate; it is not expensive now, so that neither expense nor difficulty of culture need deter any one from growing this distinct and beautiful species. In its native habitat, Silhet, Northern India—from whence it was first introduced in 1849—it grows on the tops of isolated trees, where

ten years since. I sowed these on February 14 with others, and gave them up for dead, as they were a week or ten days behind the others in coming up. Nothing kills seeds sooner than washing them; of course, I am speaking of fleshy seeds. My own practice in sowing Melon, Cucumber, or Tomato seeds is to spread the seed on a damp flannel, and gently rub the flesh off. All old seeds of the above are better for fruiting than new seeds. *Stephen Castle, West Lynn, October 1.*

"*Hortus Floridus*."—I am indeed very glad that Mr. Cecil C. Wood has declared himself the fortunate owner of this rare old book. I never by any possible means claimed it, and it was most kind of Mr. Woods to have lent it to me. When I took the book to Dublin last April, just to show it to my friend Mr. Burbidge, I told him I was not its fortunate owner, but merely brought it as a curiosity; Mr. Burbidge made notes, the *Gardeners' Chronicle*

lowing are in flower:—*C. zonatus*, from Cilicia, has bright lavender coloured flowers with a yellow centre. *C. tridifidus*, from Transylvania, has rich purple flowers, very distinct and beautiful. *C. uniflorus*, bluish-purple, a well known species. *C. etruscus*, purple, from Tuscany. *C. banaticus*, a pale blue species from Transylvania. *C. Tommasianus*, Dalmatia and Servia, very pretty pale mauve. *C. hymalis*, a purple species from Palestine; *C. acris*, one of the most distinct and pretty, the colour bright lavender, yellow centre (Asia Minor). *C. speciosus*, a well-known handsome species, bluish-purple; it is found wild from Transylvania to Persia; there is also a distinct form of it with larger flowers. *C. cancellatus* var. *cilicicus*, found in Syria and Asia Minor; this is also distinct, pale blue, marked with purple lines. *J. Douglas, Ilford, E.*

Reversion in Dahlias.—I set this year one of last year's Dahlias (double) which I saved during the winter. I have only a small garden, but it has grown very fine with small bloom in great quantity. I find there are several blooms coming from the one stem. Will you tell me if this is a usual thing, as I have grown many before, and the same thing has not come across my notice. *F. Feistel*. [A "double" Dahlia, so called, is an abnormality, which Nature, if left alone, often strives to correct. ED.]

Rainfall at Gordon Castle.—I herewith enclose an abstract of depth of rain registered here for the past nine months, and the amount for the same period of 1884, the difference on the aggregate for the first seven months in each year being little over half an inch in depth. It will be observed that the monthly fall in 1884 differed widely, varying from 0.61 to 3.33 inches; while in the present year, with the exception of May, 2.22 inches, also under average, variation was only about half an inch for each of the six months. These observations having been taken through a dry period, I have thought may interest some of your readers in the *Gardeners' Chronicle* to compare with their own. And it may perhaps induce others to do so likewise:—

To September 30, 1885.		For same period in 1884.

John Webster, Gordon Castle Gardens, Oct. 5.

FIG. 101.—ROSA HARDII X: FLOWERS YELLOW WITH A DEEP ORANGE "EYE." (SEE P. 468.)

it is well exposed to the sun and the free air around it. An Indian gentleman told me that he had seen this *Vanda* in its native habitat with frost on the leaves in the early morning. The natural conditions under which the plant grows and flowers freely can easily be imitated, although no one would allow them to be frozen as a necessary part of their culture. It grows and flowers with great vigour at Great Gearies in the Cattleya-house. The plants are growing in upright Teak cylinders full of broken potsheards, with just a little live sphagnum at the top. They are placed close to the glass at the sunniest end of the house, and freely supplied with water during summer and autumn. We are careful not to shade more than is absolutely necessary. The specimens at Kew are not to a very vigorous healthy state, consequently the spikes and flowers are not so large and well coloured as they ought to be. What does "F." consider a handsome flowering specimens? *J. D.*

Vitality of Seeds.—Let me add that some of my best Tomatos now growing are from seed that I saved

got them, and the horticultural world are the wiser. I fancy Mr. Woods is angry with me, or would not trouble you. I even told Mr. Woods of the notice in your paper, gave him your address, and got him to write you for copies. Indeed, when he says the volume has been in his family for generations he is perfectly right. The proprietor of Chiplee (Chip-lee) being the possessor of a very rare old place, full of all sorts of antiquated relics of a bygone age, you may well call him a "chip from the old block," indeed one of the oldest families in the city "on the Lee." Who has not heard of Father Prout's

"Bells of Shandon,
That sound so grand
The pleasant waters of the river Lee."

Wm. Baylor Hartland, Temple Hill, Cork.

Early Autumn Crocuses at Kew.—These form at present a very interesting study, a considerable number of distinct species being in flower. *C. Clusii* displays its pretty pale lilacy-purple flowers in the rock garden, and in a long narrow border the fol-

Primula farinosa.—In last week's issue of the *Gardeners' Chronicle* (p. 436) *Primula farinosa* is said to occur "on our Scottish mountains, as well as in Switzerland." So far as the Scottish habitat is concerned this statement is not strictly correct, for our British Floras concur in the statement that in Scotland it is only known to grow in one locality, namely, at Bridgehouse, near West Linton, on the south side of the Pentland Hills, about 18 miles from Edinburgh. In England it occurs in North Yorkshire, Lancashire, Westmoreland, Cumberland, Durham, and Northumberland, being generally local or rare, though common in a few localities. Outside Britain its range is rather extensive, as it is widely spread in Europe, and occurs also in Northern Asia, Tibet, Greenland, and the North United States, the stations, however, being generally northern or alpine, as the plant belongs to what is known as the "arctic-alpine" type. The closely allied *P. scotica* has a much more limited distribution. In Scotland it occurs in the counties of Caithness and Sutherland, and in the Orkney Islands; and on the Continent of Europe, in Lapland, Norway, and the mountains of Sweden. *R. A. Kofle, Herbarium, Kew.*

Lilium auratum.—Year by year we receive fresh convincing proofs of the variability and capriciousness of this handsome Japan Lily. Some bulbs will produce one or two enormous flowers on a stem, and the number will range from that to twenty on separate individuals. The stems will also vary from 1 or 2 to 7 feet in height, or perhaps more in rich soil in a sheltered situation, especially where the soil has recently been well dug or otherwise ameliorated. In

* Total for seven months, 11.62 inches.
† Total for seven months, 12.06 inches.

one of the Rhododendron beds at Kew, alongside the broad walk leading to the Palm-house, is a plant bearing the enormous number of 132 flowers. All these are the produce of one stem, which is about 3½ feet high, and fasciated. The flowers are of medium size and perfectly formed, all, or nearly all, fully expanded. Towards the top the stem divides into four strong branches, and these again subdivide more or less, and bear the flowers in a dense horizontal ridge, forcibly reminding one of the Cockscomb, *Celosia cristata*, or, on a smaller scale, the fasciated stems of *Sedum reflexum monstrosum*. The final sub-divisions of the stem, moreover, are racemose, as in the normal form or habit of the plant, but they are so shortened as to bring the flowers on a comparatively uniform level. Many varieties of this Lily are cultivated, and the type is figured in several botanical works, such as the *Botanical Magazine*, t. 5338; *Flore des Serres*, 1282-31; and the *Revue Horticole*, 1867, 371. 7. F.

Begonias.—We send you a small bit, cut from a Begonia growth made this year, as we thought you might like to see it. The variety is an old but very good one, called Vesuvius, and the plant was grown in a 10-inch pot and measured 7 feet high and 6 feet through, and it was the admiration of all who saw it, being covered with bloom all summer. The plant was grown in very ordinary soil, and a liberal dose of our Vine and plant manure. We sent a thicker bit than what we send you to Mr. Laing, of Forest Hill, knowing he is great in Begonias. *W. Thomson & Sons*, Clovenfurd. [The portion of stem sent measured 1 inch in diameter. Ed.]

Seed-pods on Imported Orchids.—In reference to the remarks at p. 430, it is perfectly well known that imported Orchids come over with seed-pods on them, ripe or otherwise; hundreds of seed-pods may be found clustering on the plants in the sale-rooms—scores of them on one plant. There is no process in Orchid culture at home more easy than furnishing the plants under one's care with seed-pods. A plant of *Olonotoglossum vexillarium* in our collection had a pod on it a day or two ago, self-fertilised. The difficulty consists first in getting the seeds to vegetate, and in the next place to rear the plants up to the flowering stage. It is no use sowing seeds from pods of which the pollen parent is unknown; we are frequently cutting off such pods, and disposing of them in the rubbish heap. 7. D.

Disa macrantha.—Mr. N. E. Brown is not quite correct in his assumption that I inquired of *Disa crassicornis* at p. 374. What I wanted to hear of was the true *D. macrantha*, of which I believe there is a specimen in the British Museum, found by Cooper in Kaffraria. As Mr. Brown did not see—so far as I am aware—Mr. Sanderson's original sketch, from which I made the copy now in the Kew herbarium, it would have been more generous, had he not gone out of his way to criticise that which he has not seen, especially as the "imagination" of a would-be critic is quite as powerful for evil as is that of an artist. I know *Disa crassicornis* (= *D. megaceras*) well as a cultivated species, and made the original sketch, from which the *Garden* plate was prepared, at Glasnevin, some five or six years ago. It first bloomed with Mr. Elwes, whose specimen was that figured in the *Botanical Magazine*. If Mr. Brown will now tell us somewhat of the true *D. macrantha* of Thunberg I shall be much obliged. F. W. B.

Satyrium carneum.—Would Mr. J. Smith, of Newry (p. 432), kindly inform me what soil is best suited for the cultivation of this interesting Orchid? Time after time have I procured tubers of the plant, but although I did my best have never been rewarded with a flower. Cultivation cannot, however, I fear, be the sole cause of failure, but the injured state in which the tubers are usually received. A. D. Webster.

Outdoor Tomatoes.—Through the large and admirably conducted trial of Tomatoes which has been conducted in the London Road nursery of Messrs. Sutton & Sons, at Reading, that firm has rendered considerable service to all who may wish to cultivate these fruits in the open for market or other purposes. The trial included some forty of well known kinds, and was throughout conducted most impartially. It

comprised eleven beds, each containing some 150 plants in pairs, three abreast, each plant being tied to a single stake, as throughout the simple plan of keeping every plant to a main stem alone was adopted. That style of training is easily insured by simply cutting away all side shoots. Generally, where the growth was good the resulting crop of fruit was remarkable. One entire bed was devoted to Chiswick Red, which seems to do marvellously well out in the open; the plants carried each from five to six clusters of fruits, large and very heavy, all the earlier fruits being quite ripe. Perhaps the most noticeable as a promising market kind is Earliest of All, because under this form of culture it showed without exception precocity in ripening fruit in advance of all other sorts. The crop, too, was a heavy one, and to secure fine samples in the open would be all the better for thinning. The fruits are of a rich colour, and somewhat punctured, though improving as the season advances. Powell's Early comes near to this in appearance, but is later, whilst a very fine and free cropping kind is Sutton's Main Crop, apparently here one of the very best for outdoor culture, rich in colour and fine in fruit. Several American kinds were tested, but seemed generally to lack robustness. Williams' Red King, Hackwood Park, Trophy, Hathaway's Excelsior, Ne Plus Ultra, and various other good red kinds under glass cropped moderately. Yellow kinds, of which there were several representatives, seemed to lack the needful robustness for this fully exposed form of cultivation, which naturally differs materially from wall training. The plants were all raised in heat, potted up singly, then turned out early under a fence in manure to make root, and from thence, later in the season, planted out into the open ground. Happily the sharp frosts of a fortnight since did the plants no harm, neither has disease. A. Dean.

Tropæolum canariense and Clematis Jackmanni.—*Tropæolum canariense* intertwined with *Clematis Jackmanni* and trained up to a wall has a very striking and pleasing effect. A few days since, in walking through a village in this immediate neighbourhood, my attention was attracted by some creepers growing up a wall. On getting nearer to them I found them to be *Tropæolum canariense* and *Clematis Jackmanni*. The deep, intense violet-purple of *Jackmanni* seemed to bring out the beauty of the *Tropæolum*. They are of the simplest culture. *Clematis Jackmanni*, being hardy, will last for a number of years. The *Tropæolums* are readily increased by seed, which should be sown early in order to get strong plants. *M. Saul*.

Abundance of Grapes and Strawberries for Every One.—I have ventured to beg your insertion of the following suggestion, which I believe will be of interest to your numerous readers, endeavouring to show the possibility and practicability of every householder being the possessor of a hothouse, enabling him to grow Grapes, Strawberries, &c., and to compete favourably with his more wealthy neighbours. The plan by which this boon could be secured is to utilise the roof of the house, which is not required for any particular purpose, by covering with glass instead of slate, &c., the hothouse is formed at once. The room would require an ordinary floor, and could be reached by the ordinary staircase. The Vase might be trained up the outside wall until it reached the hothouse, whilst Strawberries should stand on shelves, or hang from the roof. It would be necessary to have a stove in winter, the pipe of which could turn in the chimney which passed through the room. In districts where water is laid on a pipe might be carried up for watering Strawberries, flowers, &c. The Vines would not require any water. *Amateur*. [Experience has not justified the adoption of this plan except under special circumstances. Ed.]

Veitch's Sturdy Pea.—This excellent late Pea is the result of a cross between those two well known late varieties—Veitch's Perfection and Ne Plus Ultra. A few weeks since I had the pleasure of seeing several rows of it growing side by side with one of its parents—Ne Plus Ultra—in Tynninghame Gardens, near Prestonkirk. In the rich East Lothian soil the haulms, which are of a branching habit, robust in growth, perfectly free from mildew, and heavily cropped with long handsome pods containing from eight to ten large Peas, attain to a height of 4 or

5 feet. Sturdy is said to be the latest Pea in cultivation, but whether this is correct or not I am unable to say, though, judging by the examples seen at Tynninghame, it will continue to yield good gatherings until the haulms are cut down by frost. The same may be said of the several fine ranks of Ne Plus Ultra, which is in every soil and climate a grand late bearing Pea. Mr. Brotherton, the head gardener at Tynninghame, speaks very highly, as well he may, of Veitch's Sturdy as a late Pea. In conclusion, I may remark that I had never before seen such a fine healthy and heavily cropped lot of Peas—Peas as tender and sweet as could be desired in September, as those of which I write. The kitchen garden produce has not suffered so much from drought in Scotland—in the Lothians, at any rate—during the past intensely hot summer as in England. *H. W. Ward*.

Notices of Books.

Greenhouse and Stove Plants. By Thomas Baines. (John Murray.)

This is a valuable book, on account of its clear and extensive cultural information. The methods which have led to the author's well-known success are communicated by him to the fullest extent that is possible by means of pen and paper. The cultural details (herein revised, the author says, so far as necessary) here, for some of the plants, appeared in the *Gardener's Chronicle* and the *Garden*, and it is now a matter of great convenience to have these scattered communications brought together. The book opens with separate chapters upon the general management of greenhouse plants, stove plants, Ferns, and Palms; then follows, in one alphabetical arrangement, an enumeration of the plants of these classes, with details of special culture for genera and species. Short descriptions of the plants are given in popular language. The two first chapters are treated in sections, and bring readily to view the important heads of the subject, such as the position, form, and construction of the houses, light, air, shade, water, soil, potting, and propagating. In these chapters the principles of indoor gardening are clearly and concisely stated, and the information is well selected, touching upon all that is most important.

Under "Greenhouse Plants" the author justly remarks that "amongst the hard-wooded occupants of the greenhouse are many of the most beautiful, distinct, and profuse flowering plants in existence," and it is a good feature of the work that he has included a majority of the best. The description of a suitable house is not unnecessary, and the author rightly condemns the old system of sliding lights. He is well acquainted with the reasons of failure in plant cultivation, and he is emphatic upon several important points which are often little regarded. Some excellent remarks are given upon the necessity of full and abundant light, which is often better understood by market growers than it is by gardeners; and on the subject of ventilation it is usefully taught that plants will not suffer draught with impunity. The instructions for watering are given in general terms, for, as the author says, it is difficult to treat of the subject in any other way. It is only to be learnt by practice and close observation, supported, of course, by the proper considerations here given in detail. The weak part of this chapter is that which treats of propagation, to which only a few lines are devoted. The next, on stove plants, is treated in a similar way to the last, but with better instructions for propagating, and with equal success in affording the most essential information. The system of planting out is condemned with very slight reservation, and a number of objections are stated. It, however, has advantages, and is often the best system that can be adopted for climbers, and certain plants like *Musa coccoloba* and *M. roseacea* are never so fine as when planted out; indeed, few would fail to admit the great advantage it has for the proper subjects. We have to express approval of what is said with regard to excessively low night temperatures and exhausting periods of so-called rest for tropical plants in winter. Low night temperatures are sometimes adopted, perhaps on the score of economy, but whether this is so or not we often find in that mistake an explanation of the unsatisfactory condition of certain tropical plants. On ventilation the author wisely remarks that "the closest, glazed, and in

other ways the best constructed house we ever saw will admit sufficient air for the requirements of plants in the stove during the winter months without opening either the roof lights or side shutters." Air is sometimes given as if horticultural structures were air-tight. One mistake often leads to another, and air is sometimes given to clear off excessive moisture, the existence of which should be avoided. Ventilation is thought sometimes to be insufficient when the plants are really suffering from insufficiency of light. In relation to other matters ventilation is often but little understood, and we are glad to recommend attention to what our author says. The chapter on Ferns gives a general account of their cultivation, though but little is said in the body of the book of special culture, as needed by certain kinds. Had it been given we should have read with interest the author's treatment of Cheilanthes, which are often badly grown, though perfectly amenable to proper management. Ferns are not extensively dealt with, and it would be more satisfactory, perhaps, to have given them greater attention, or to have omitted them, as forming a sufficient subject for a separate treatise. The chapter on Palms is quite in accordance with our own experience, though more might be said. We have long observed that gardeners unaccustomed to Palms are apt to injure and even kill them by tearing out the brittle roots which coil near the bottom of the pot, and are the chief feeders of the plant. The broken roots are sure to perish, and it is unnecessary to disturb them much, because the older roots—especially in the case of young growing plants—are continually being superseded by new and stronger ones from the stem itself.

We now come to the body of the work, arranged in alphabetical order, according to the particular plant. Cultural instructions are freely given, even to the extent sometimes of trenching upon matters of general application. Seeds so easily raised as those of Francoea are the subject of minute detail; but the instructions that are given will generally be found reliable, and will prove of value to the skilled gardener as well as to the learner. In all that comes from the author's experience no better guide can be found; it is only sometimes that we must differ from him, as when he says that *Leucadendron argenteum* will thrive under treatment as advised for *Rhopalax*. In our experience such treatment would soon be fatal to it, and we find that it must have less moisture. *Sarmienta repens* is said to require the same treatment as *Columnas*. Now this plant, as the author says, belongs to the stove, while *Sarmienta* belongs to the greenhouse, and requires a very different and particular management. For the sake of so pretty a plant we wish the author had given details as to this. At Kew this difficult plant has lately been very successfully grown on pieces of Tree Fern stem. *Desmodium gyrans* is recommended to be grown from cuttings, but in our experience it can only be satisfactorily grown from seed—a method that is not mentioned by the author. *Nelumbium*, in comparison with *Nymphaeas*, is said to require a good depth of water, but, on the contrary, from the habit of the plant, even less is necessary.

A short selection of herbaceous plants for the greenhouse at p. 200 touches a sphere of great usefulness for many kinds, for which they are both legitimate and valuable, so that the list might well have been longer. Annuals should also have received attention.

The subject of insects, we think, is permitted to intrude superfluously: each introductory chapter, except that upon greenhouse plants, and the majority of those on the different genera, conclude with a paragraph relating to their extermination. We read the negative information forming a paragraph that "*Gloriosas* suffer but little from the depredations of insects, their juices not being relished by them." Cautions with regard to delicate plants and hints with regard to many, are useful enough, but to be told that leathery plants, like *Sansevieria zeylanica*, should be sponged when affected by scale, is unnecessary. The usual remedy of fumigation for greenfly is constantly mentioned, but, so far as we have noticed, no cases are pointed out for which it is unsuited.

Good selections of plants are given, but we notice important omissions, and, as in the case of *Grevilleas*, some of the best kinds are not among those included. We find no mention of the splendid *Cianthus Dampieri*, though full justice is done to *C. punicus*. Only one *Clematis* is mentioned under the genus, and nothing is said of the magnificent

hybrids which are so fine for the greenhouse, except that they are included in a list of hardy shrubs. It is not easy to understand why *Anectochilus* should be admitted, while other *Orchids* are not. In the preface it is said that the best new plants up to date are included, but three or four well deserving of this description we do not find.

We cannot always congratulate our author upon his use of terms. On the titlepage we are told that 500 families of plants are included in the work, which is a good many more than is allowed by botanists for the whole of the vegetable kingdom. Here, of course, genera are intended, though elsewhere the word is used in its correct application. Under *Macrezamia* we read that "These belong to the *Cycad* family and are a very distinct and handsome section of the genus." This confusion of common terms is to be regretted. Quite erroneous information is sometimes given, as in the case of *Desmodium gyrans*, the leaves of which are said to be constantly moving with the regularity of a clock—just the opposite of what is true. *Trichiniums* are said to be low-growing annuals with somewhat singular flowers not possessing much merit, and it is added that they can be raised from seed. Now *T. Mangleyi*, which comes under this description, is perennial, and though good seeds of course would grow, it must generally be propagated by means of the root. Moreover, it is a meritorious plant when well grown. The tuberous *Ipongia cinnabarina* is included under the fibrous-rooted kinds. The Chilean *Embothrium coccineum* is said to come from New Holland. *Ipongia Horsfallii* has been supposed to be a native of Africa or the East Indies, and as the mistake is repeated here we may mention that the true habit is Jamaica, as shown in the *Gardeners' Chronicle* of May 2, of this year.

An excellent alphabetical index adds to the value of this work. The whole book greatly requires further revision as partly indicated by our remarks, especially in matters relating to the physiology and natural history of the plants mentioned; but the value of the cultural information, especially as concerns the more popular plants, is so great, that we are bound on this head to give it our strongest recommendation.

NEW ZEALAND BOTANY.

SINCE the year 1867, when Dr. Haast explored and exhaustively described the geological and botanical features of the headwaters of the Rakaia and surrounding alpine country very little additional knowledge of its mineral and floral resources has been obtained. For nearly twenty years this glorious mountain region with its glaciers, rivers, forests, and lovely valleys, has remained in its primeval solitude, save for the occasional visits of shepherds from the outstations of Glenhorne and Mount Algidus, or of some adventurous horseman who has dared the perils of the numerous rivers to gaze upon the wonders of the high alps at the Stewart Glacier or at Browning's Pass. The discovery of gold-bearing quartz in the Rolleston range has at length roused public attention, the miner is at work, the plucky prospector is testing the ground in the very heart of the ranges, and the recent discovery of an extensive quartz reef on Mount Harman will probably cause the opening up of the country.

The valley of the Wilberforce, north-west of Mount Gargarus, to Mount Sebastopol, running through most romantic scenery, may be roughly estimated at 20 miles. On the right is the Birdwood range, with the Black range beyond; on the left is the Rolleston range, with Mount Williams at its western end, the spurs running into the valley. These spurs and the gullies between are covered with dense forests, which feed the small streams flowing into the Wilberforce. These tributaries are the Boulderstone, the Kakapo, the Kiwi, the Moa, and the Stewart or Unknown River, occurring in the order mentioned. Higher up is the Cascade range, with its numerous mountain torrents falling into the North Creek, which in turn empties itself into the Moa. One of the chief sources of the Wilberforce is the Stewart Glacier—an ice river from Mount Mystery in the central range, backed by Mount Collet, and Mount Park, with Browning's Pass to the north.

When the writer and his friends, Messrs. Brown and Arnold, met at the station on the morning of May 4, the weather for a botanical trip to the Wilberforce was not cheering, heavy masses of cloud were rolling up from the southward, and there was an

ominous bite in the air which betokened rough work in the ranges. Leaving the train at Springfield we arranged our swags and started on the long journey to the Moa River, a distance of 60 odd miles.

Mr. Landers welcomed us with the true hospitality which the dwellers in tents have always given to the stranger, and the cook put before us a substantial meal, which came to the famished botanists like manna in the wilderness. Slept like tops in comfortable camp beds, and next day we met with Mr. Slater, a prospector, who knew the country. He took us over the Moa River, and showed us the habitats of *Gleichenia Cunninghamii* and *Dracophyllum Traversii*. This *Eparid* grows 30 feet high, towering above the other parts of the bush, its long branches extending horizontally, bearing a tuft of leaves at the extremity, from which rises the bloom like a Pine-apple. It is certainly the most remarkable tree of the alpine flora. Many young specimens were collected; those about 2 feet high are very handsome, with filiform leaves drooping like a *Dracena*. There is another variety, *D. longifolia*, but its leaves are smaller and more imbricated. The tree was met with up to the snow, so that its hardy character cannot be doubted. The prevailing timber tree on the Moa is *Libocedrus Bidwillii*, the Incense Cedar, the *Kawaka* of the Maoris. The tree attains to 30 or 40 feet in height, its conical top and dark green foliage being visible above the surrounding bush. The bark, which peels off easily in spring, is utilised by the miners in various ways. Like all Cedars the wood is dark red, and splits readily into slabs, but as the centre of most of the trees is hollow, and the wood very soft, it is not of much value as timber. It is singular that the wood of the other variety, *Libocedrus Doniana*, which grows in the North Island, is hard and valuable. The Ribbon-wood, *Plagianthus betulinus*, is easily distinguished from the surrounding forest at this season by its golden leaves; the tree is deciduous, and its leaves had been touched by frost.

On our return to the North Creek we separated, my companions taking different routes; but I had definite objects in view, and in company with Mr. Slater went in search of *Ranunculus Godleyanus*. Mr. Landers told us that the yellow Buttercup grew at a considerable elevation up the North Creek, so we made a start in that direction. Following that creek, which flows into the Moa River a few chains above the camp, on either side were spurs of the Cascade range covered with forest up to the snow-line; at intervals were small waterfalls pouring over precipices among the large boulders which had been rolled down the creeks. *Ranunculus Lyallii* was plentiful on the banks, *Veronicas* lined the margins of the bush, while fine specimens of *Angelica giugidium* occurred some 2 feet across. The miners called it Aniseed, because the leaves and seed have a similar flavour. Horses are very fond of this aromatic herb, and eat it greedily. Crossed the North Creek on a temporary bridge which led to the reef, on the slopes of the mountain; it is situated 1600 feet above the creek, and can only be worked in fine weather; in winter the claim would be covered with snow.

Leaving the track we followed the bed of the North Creek, climbed over big boulders, and crossed the creek several times. When not in flood this creek is about the size of the Avon, but when there is a fresh it is a mountain torrent, tumbling over boulders and washing everything before it. *Dracophyllums* grew on the slopes in abundance, their peculiar heads standing up clear of the bush. Passing No. 2 creek we saw mountain Lilies growing under the side of boulders and burnt scrub, whilst others grew on the vertical faces of rocks, the roots wedging themselves into the crevices. *Ousia macrocarpa* grew in patches 2 or 3 feet across, its bold dark green foliage, purple underneath, and large trusses of white flowers, rendering it one of the finest of alpine herbaceous plants. We found the best patches growing in peaty soil with water trickling among their roots, on the sides of watercourses. The other variety, *O. macrophylla*, we found growing in similar situations, but the leaves and blooms are smaller. Some fine plants of *Aciphylla Monroi*, 8 inches high, were noted, evidently the male variety. The scenery up the creek baffles description; ahead there is Mount Mystery, to the left Mount Williams, with its ragged looking peaks sticking out of the snow, and on the right mountains covered with forest, the creek between. We had

some hard climbing to reach No. 5 creek, where the rare *Aciphylla*, with red midribs and spines, was met with. Half-a-dozen specimens were collected. A large *Aciphylla*, with dark green leaves, grew among the boulders. *Carmichaelia odorata* was apparently very local, as it was only met with once in No. 5 creek; it was out of bloom, but the miners said it scented the air in summer. Straggling plants of *Edelweiss*, *Helichrysum grandiceps*, now appeared, showing that we were not far off the yellow mountain Lily. Scrambling over some loose boulders we caught sight of what appeared to be *Ranunculus Godeleyanus*, about 300 feet above. Everything was frozen, and plants-collecting at 5000 feet is not very nice work, hands and feet being so numbened with cold as to be almost useless. *Celmisia coriacea*, the Cotton plant, grew in abundance at this elevation, its silvery foliage and graceful habit making it a very pretty plant. Of *C. petiolata* we saw a few plants growing in boggy ground. In shady places *Ranunculus Lyalli* was in full flower, and on one plant there must have been fifty expanded blooms. Several smaller varieties of *Ranunculus* grew among the stones. We at length reached R. Godeleyanus, named after Mr. Godley, the pioneer of Canterbury. It has dark green foliage with shining yellow flowers borne on flower-stalks like R. *Lyalli*. With a prospector's pick we dug the plants out of the shingle slide, composed of broken slate, water continually running at their roots from the melting of the snow above. As the plants were covered with snow and ice it was difficult to get them out even with the help of the pick. Some very fine specimens of this rare plant were collected, but as the sun was going down and it was freezing hard we decided to commence the descent. We had several miles of very rough country between us and the camp, which required daylight to travel over in safety. The prospect of spending the night in that alpine region without tent or food *à la Mr. Green* and his guides a Mount Cook, was not pleasant, so we came down at top speed. In No. 5 creek we saw the large white flowers of *Veronica macrantha*, also a new *Gentian* with white flowers and pale green leaves in the shape of a rosette. Both seed and plants were collected. On the way to camp a variegated sport on a plant of *Senecio Bidwillii* was secured for grafting. We arrived at camp at 7 P.M., heavily loaded with plants and about twenty varieties of seeds which were collected during the day.

Friday morning broke brightly, and we made sure of a good day's collecting in Happy Valley and Rebel Creek, which flows into the Moa River a short distance above the camp. *Senecio Lyalli*, with pure white flowers and dark green foliage, was growing near the water. It was evident that this valley had been filled with ice in winter, a mass remaining unmelted, with water running through a tunnel beneath. This valley bears due south, and the ice had but recently melted, so that vegetation was springing up. At one place in a bed of broken rock and shingle there was a grand alpine garden. Both the yellow and white mountain Lilies by the thousand were in full bloom, interspersed with the white *Marigold* (*Senecio Lyalli*); *Ligusticum proliferum*, with its highly ornamental foliage, was dotted about among the Lilies, and even the little *Montias* were represented in this natural garden. The most graphic description would fail to give an adequate idea of the purity and beauty of these alpine flowers, when seen in their natural habitat in broken ground among rocks and boulders, piled up in every conceivable position as the glaciers and floods have left them. Only one variety of *Aciphylla* grew in this cold valley which the sun never enters, everything was frozen, indeed, it was dangerous work, as we could get very little grip with our feet on the shingle slips, which had become transformed into ice slides. On a cliff we saw a fine patch of *Edelweiss*, far out of reach, also large plants of *Ranunculus Godeleyanus* just coming into bloom. *Polystichum cystogonium*, the alpine Fern, adds much to the beauty of the scenery, its green fronds contrasting with the rocks. On a bank of shingle and rocks were small patches of the pretty annual *Euphrasia antarctica*; *Rauolias* were represented by several varieties, australis and subsericea being the most prevalent. Mosses and lichens grew on every rock, but few were in fruit. Of *Acanes* there were several species, *ascendens* and *microphylla* occurred very often in the Moa river-bed. *Coriaria thymifolia*, the little Tutu, was plentiful, looking very much like the garden Thyme. *Veronica linifolia*, with its delicate pink

flowers, grew in the river-bed; also V. *Bidwillii*, which was in seed.

In the bush we saw nine distinct species of Ferns. The Filmy Ferns were represented by *Hymenophyllum Malinigi*, one of the rarest of the family, which grew on dead Cedars with a north aspect; H. multifidum carpeted the ground with its bright green fronds; H. polyanthos grew on the trees, but was rather scarce; H. villosum was found on bare rocks in very exposed situations; H. scabrum, with its long drooping fronds, in damp places. *Asplonia Colensoi* (the grove Fern) was prevalent, growing very large in the bush. *Polystichum vestitum* was very common; a forked variety of it was found by Mr. Brown. The Carrot Fern, *Asplenium Richardi* and *A. flabellifolium*, were scarce. *Cystopteris novae-zealandica*, which is one of the few deciduous Ferns, was very plentiful, its pale green fronds making it easily distinguished. Of *Lomarias* we saw *lancoolata*, *alpina*, and *discolor*. The little *Polypodium australe* grew on dead trees. *Goniopteris pennigerum* was very scarce. Of *Lycopodiums* *Billardieri* was growing in hollows of the Pitch Pine, and *L. selago* covered patches on the ground 2 or 3 yards across, looking like a bed of seedling Conifers.

Mr. Brown, who devoted himself to the collection of mosses, found several new species of *Andreaea*, *Weissia*, *Tortula*, *Orthotrichum*, *Eremodon*, and a *Polytichum*, with flat ovate capsules. *Dicranum elatratum*, a rather scarce variety, was abundant in this district. Of *Hepaticas* there were *Gottschia ciliata*, *Madotheca stangeria*, and *Tricholea tomentosa*.

Monday morning was fine, the sun shining on the distant peaks, so we said good-bye to our friends who had treated us so kindly at the camp. Mr. Lander gave us valuable information as to the habits of the plants, and Mr. Slater and Mr. McClure, of the Survey staff, were equally ready to be of service to the first party of botanists who had visited these remote ranges. The cook lent us his horse to carry our swags to the lower camp, and we were put across the main branch of the Wilberforce by one of Mr. Lander's men. It was 4 P.M. when we got over the river, but we managed to reach Fisher's whare, and remained there all night. Made a start at daybreak, and had some difficulty in crossing the Harper, as the ford had been washed away by the heavy flood; we had to go a long way up stream before we found a safe crossing place. Having crossed at a fork we made good progress to Lake Selve, where, during a short halt, we found a terrestrial Orchid which, with the Water Quillwort, we added to our collection. Reached the head of Lake Coleridge at dusk. One of the miners who had a horse came up with us near Lake Lyndon and carried our heavy swags to the hotel at the foot of Porter's Pass, where we arrived at 7 P.M. Next day we were fortunate in getting a lift in a drag going to Springfield, and were glad when we found ourselves in the train for Christchurch, where we arrived at 7.40, thoroughly knocked up, but satisfied with the result of our ten days' trip to the district of the quartz reef of Canterbury. F. N. Adams, in the "New Zealand Country Journal," of September, 1885.

SHIRECLIFFE HALL, SHEFFIELD.

SHIRECLIFFE HALL, as the name denotes, is situated on an eminence some 325 feet above the sea-level and about 2 miles from Sheffield Town Hall. The manufacturing portion of the town is principally situated in the valley, which forms a semicircle with a radius of 1 mile from Shirecliffe, and extends from north-east to south-west. Under these circumstances it will readily be understood that vegetation cannot be particularly luxuriant out-of-doors at Shirecliffe, and this fact is at once apparent in the stunted and dying condition of the Oaks that have stood "the battles of the breeze for between 400 and 500 years; nevertheless it is somewhat surprising to find what a pleasing and fresh appearance may be maintained by a careful selection of forest trees and shrubs most capable of withstanding the deleterious atmosphere, and by careful planting and judicious nursing," as practised by Mr. Udale, the head gardener, and who, by the way, could contribute a useful and valuable article on trees and shrubs for smoky towns if he would only do so [as we hope he will. E.D.] There are nice sweeps of lawn with natural undulations,

not marred by being cut up into flower beds. The grass is well kept, and the flower borders are gay in spring, summer, and autumn. One of the features of Shirecliffe out-of-doors in early spring consist in the masses of Crocuses which Mr. Udale has been forming for some years underneath and about the large Sycamores, Chestnuts, and Copper Beeches which stand on the lawn, and whose spreading boughs sweep the ground. It is well known that grass thrives very indifferently under such trees, but where advantage has been taken of such drawbacks to provide glorious masses of purple, blue, and gold, and where the masses are carried a foot or two beyond the sweep of the boughs, the green turf acts as a beautiful foil, enhances the beauty of the Crocuses, and produces such an effect as cannot be obtained when the bare and black earth shows between.

Adjoining the mansion is a rectangular conservatory and an octagonal tropical house and fernery combined. In the former the permanent plants are fine *Seafortias*, *Camellias*, *Ficus elastica*, *Araucaria excelsa glauca*, and a plant, 5 feet through, of *Peris umbrosa*; on the floor are stood a quantity of specimen Maidenhair Ferns, which form a lovely ground-work and "setting" for the choice flowering plants as they come in season. At the time of my visit these consisted of *Liliums*, *Campanulas*, and *Vallotas*, and in each of two large marble vases was a large specimen *Miltonia spectabilis*, 3 feet in diameter, and bearing eighty to ninety fine flowers each.

In the tropical-house are fine specimens of *Coccos plumosus*, *Seafortia elegans*, *Chamzoros Fortunei*, *Pandanus utilis*, *Cibotium princeps* and regale, and *Woodwardia radicans* is cased off in a corner and kept cool, the walls of the case being planted with *Selaginella jenticularia*. Passing to another part of the grounds we enter a porch, which is now turned into a hardy fernery, and where the Ferns are planted on tufa and cork-bark. This is a pleasant and beautiful retreat during the summer and autumn months.

We now enter the stove, which is a span-roofed structure; here the principal plants are large specimen plants of *Asparagus plumosus*, *Eucharis amazoena*, 5 feet through. In this house are also shown magnificent plants of *Dendrobium nobile*, *Phalenopsis Schilleriana*, and on the roof are *Allamanda Schottii*, *Cissus discolor*, &c. The next division in this range all have an east aspect, and consequently are lean-to's. The first we come to has a large *Stephanotis* on the roof, and in the front are grown Melons during the summer and autumn. The next division contains a miscellaneous collection of Orchids, such as *Miltonias*, *Dendrobis*, *Laelias*, &c., including a magnificent *Coleogyne cristata*. Another division contains a quantity of large specimen Maidenhair Ferns, *Gardenias*, &c., and suspended from the roof are several baskets of *Dendrobium Falconeri*.

In the next division are *Tomatos Cucumbers*, and *Heliotropes* on the back wall; in this house I also noticed two large plants of the rare *Platycodon Willinkii*. Leaving this range we enter two other lean-to's with a south aspect. The first is devoted to miscellaneous plants, amongst which are seen several gigantic *Aroids* which produced about 200 beautiful spathes during the last spring, *Azaleas*, and a large *Rhododendron fragrantissimum*; on the back wall are trained zonal *Pelargoniums*, which allow of "cut and come again" all the year round; on the roof are yellow *Banksian* Roses and *Vistaria sinensis*, the racemes of which, mingled with the yellow Roses, are most lovely. We now come to the *Camellia*-house, a span-roofed structure standing north and south; on the roof is a fine *Gloire de Dijon* Rose, which annually produces immense quantities of fine flowers. The varieties of *Camellias* are *alba plena*, *Lady Hume's Blush*, *Imbricata*, *Empress Eugénie*, &c. The *Azalea*-house is the next and last glass structure. This is span-roof, like the *Camellia* house; it is 50 feet long by 16 wide. The specimen *Azaleas* are very numerous and valuable, and comprise some of the best varieties in cultivation. *Chrysanthemums* are well grown also at Shirecliffe, some 200 plants in all, the best varieties of each section being grown. Mr. Udale has taken first honours several times at the metropolitan shows, and has held the premier position in Sheffield and neighbourhood for the past five years.

The fruit and vegetable crops are plentiful and of good quality. Strawberries in pots, for forcing, are also well done. The general keeping of the whole place reflects great credit on Mr. Udale, the gardener. *Edouard Gilman, Ingestre Gardens.*

Reports of Societies.

INTERNATIONAL POTATO EXHIBITION.

Crystal Palace: October 7, and following days.

THE tenth annual International Potato Exhibition, which opened under distinguished corporate auspices on Wednesday last, if somewhat smaller in dimensions as compared with some previous shows, at least suffered only from the effects of a difficult and exceptionally dry season. But for that and its adverse effects on some southern growers the display would without doubt have exceeded the finest yet held under the auspices of the promoters. In many cases grand tubers showed somewhat rough skins, the natural product of drought, whilst some kinds, and especially from cooler localities, showed beautiful skins. Those who hold that rough skins and table quality are inseparable must have been amply satisfied with the tubers as presented on the tables. In one respect, the absence of the long-established class for Reading have so long maintained, was noticeable, and the absence also of that eminent firm is to be regretted, eighteen kinds, which the Messrs. Sutton & Sons of probably the difficulty which kept them absent will be surmounted next year when it is just possible the Potato Show may be held at South Kensington, where we hope also the proposed Conference on Potatoes may be made a reality. The awards in the respective classes are given below, and in many cases the labour of judging was of an unusually difficult kind, owing to the fine average quality which prevailed.

In the class for twenty-four kinds, the premier class of the show, there were fourteen collections, the majority showing very fine form and ample size; indeed, some collections, in combining size with beauty of form and quality, have never been excelled. Mr. J. Hughes, gr. to Colonel Cartwright, Byfield, Notts, repeated his victory of last year in this class, by the presentation of samples of Chancellor, Snowdrop, Cosmopolitan, Edgote Seedling, Woodstock Kidney, and Fidler's Prolific, white kidneys; Sutton's Favourite, First and Best, M.P., Schoolmaster, and London Hero, white rounds; The Dean, Queen, &c. Valley, Reading Russet, Vicar of Laleham, Crimson Beauty, Blanchard, Edgote Purple, Rufus, and Pritzaker, coloured kinds. Mr. W. Ellington, Mildenhall, Suffolk, was 2d, having beautiful Clarke's Main Crop, International, Magnum Bonum, Cosmopolitan, and Chancellor, white kidneys; Enterprise, Pritzaker, Edgote Purple, and Defiance, coloured kidneys; The Doctor, Foster's Prolific, and Harvester, white rounds; and Life Guard, Empress of India, Peach Glove, Grampian, and Radstock Beauty, coloured rounds, exceptionally fine and good. Mr. E. S. Wills, gr. to R. A. Entwistle, gr. to Mr. F. Barrett, Barnsbury, Cambridge, having splendid, Edgote Seedling, Chancellor, Prime Minister, and Cosmopolitan, whites; and The Dean, Reading Russet, Vicar of Laleham, and Edgote Purple, coloured. Mr. E. Chopping, Sittingbourne, was 4th. Mr. W. Kerr, Darnvall, Dumfries, was 5th, with very clean samples; Mr. Allen, gr. to Mr. F. Barrett, Barnsbury Manor, 6th; and Mr. James Lye, Clough Hill, Devizes, 7th, with fine, though rather rough-skinned tubers.

In the class for twelve kinds there were thirteen collections, beautiful samples being again found. Here, as the competitors in the respective classes were excluded, a new lot of competitors came in—Mr. C. Howard, Canterbury, coming 1st with very fine samples of Duke of Albany, Chancellor, Ashtop Flake, Schoolmaster, Magnet, and Vermont Champion, whites; and Reading Russet, The Doctor, and Defiance, coloured. Mr. Tom Tooley, Newlands, Banbury, who, like Mr. Howard, is an amateur grower, came 2d, having Snowdrop, Schoolmaster, Cosmopolitan, and Magnum Bonum, whites; and Radstock Beauty, The Dean, Edgote Purple, Reading Russet, and Vicar of Laleham, coloured kinds; Mr. J. Gilmore, Hawkhurst, Kent, was 3d, with almost similar kinds; Mr. G. Akhurst, Faversham, was 4th; Mr. R. West, Northlands, Salisbury, 5th; and Mr. W. Woolford, Great Missenden, 6th.

The class for nine dishes brought a great competition, no less than twenty lots being staged. This was an open class, and here Mr. Hughes was again 1st with very beautiful samples of Vicar of Laleham, Edgote Purple, Pritzaker, and Reading Russet, coloured; and Snowdrop, Favourite, First and Best, Schoolmaster, and Cosmopolitan, whites. Mr. Ellington was again 2d with some wonderful Chancellor, G.P. Main Crop, and Inroquois, white; and Empress of India and Vicar of Laleham, coloured. Mr. Wills followed again 3d with capital samples. Mr. W. Kerr was 4th with smaller but clean, pretty samples, especially of Lord Rosebery, and M. Bresse, coloured kinds. Mr. Chopping was 5th, and Mr. West 6th.

The class of six dishes also brought twenty lots, many of remarkable quality. Mr. Hughes coming once more 1st with London Hero, First and Best, Chancellor, and Snowdrop, white; and Edgote Purple and Reading Russet, coloured. Mr. Rogers, Whittesea, came 2d

with a pretty even lot, including Pride of America and Wornleigh Seedling, and kinds not previously named; Mr. Ellington was 3d with oft-named sorts, all handsome. Mr. Chopping was 4th, and Mr. McKinlay, Penze, 5th—this gentleman having in his lot beautiful dishes of Rosebud, Cardinal, and Harvester.

There were eighteen lots in the class for three dishes of white kinds. Here Mr. J. Dean, Ealing, was 1st with good Schoolmaster, London Hero, and Harvester. Mr. Hughes 2d, with The Doctor, Schoolmaster, and First and Best. Mr. Chopping 3d, with Early Household, Favourite, and Schoolmaster. Mr. Ellington was 4th, and Mr. J. Hughes, Whittesea, 5th.

There were twenty-four lots in the class for three kinds of coloured rounds. Mr. Stanton, Towcester, coming 1st, with handsome Vicar of Laleham, Reading Russet, and Adirondack; Mr. Howard was 2d, with Vicar of Laleham, The Dean, and Adirondack; Mr. Wills 3d, with Reading Russet was 4th, and Mr. Ellington, 5th. There were twenty-four lots in these collections, Vicar of Laleham in four, and Adirondack in four.

There were seventeen lots in the class for white kidneys in three dishes. Mr. Wills coming 1st, with very handsome Snowdrop, Edgote Seedling, and Cosmopolitan; Mr. J. Hughes was 2d, with the Duke of Albany, and Chancellor; Mr. Ellington was 3d, with Snowdrop also, and Main Crop and International; Mr. Chopping was 4th, and Mr. John Hughes 5th.

Fifteen lots of three dishes competed in the coloured kidney class, Mr. Wills, having fine Edgote Purple, M. Bresse, and Pritzaker, was 1st; Mr. Chopping 2d, with the two latter and Vanguard; Mr. Ellington 3d, and Life Guard. Mr. Hughes would have been higher up but for an uneven dish of Beauty of Hebron. Mr. Kerr was 5th.

In the class for a single dish of any white kidney of Reading Russet, grand lots of Chancellor, shown by Mr. Howard, was 1st; Mr. Hughes coming 2d, with Snowdrop, a fine sample; Edgote Seedling came 3d, and Snowdrop, from Mr. Kerr, was 4th. There were twenty-eight dishes in this class.

Eighteen dishes were staged in a similar class for coloured kidneys, the best being a lot of Cardinal, from Mr. Hughes, Mr. Wills being next with Edgote Purple; Pritzaker, from Mr. Allen, was 3d; Mr. Kerr coming 4th with Defiance.

There were twenty-five dishes of white rounds in a similar class, the best, a fine dish of Schoolmaster, from Mr. Howard; Prime Minister, from Mr. West, was 2d; Chancellor 3d, from Mr. R. Dean; and Schoolmaster came 4th.

In the succeeding class, for coloured rounds, there were twenty-four dishes, Mr. Stanton coming 1st, with grand Vicar of Laleham; Mr. James Lye 2d, with very fine Reading Russet; Vicar of Laleham was again 3d, and Mr. J. Hughes 4th.

For the special class for six dishes, prizes offered by Messrs. James Carter & Co., to include three kinds named, only two lots competed, Mr. James Lye being 1st, and Mr. James Forder, King's Lynn, 2d, the latter having high samples.

In the class for five dishes, the prizes offered by Mr. Fidler, of Reading, and the class to include his Prolific and Success, Mr. Hughes, the raiser of those kinds, was 1st, having also M.P. and First and Best; Mr. Wills came 2d, with the same kinds, and Edgote Purple and Reading Russet; Mr. J. Russell, M.P., was 3d, Mr. C. Ross, Welford Park, 4th; and Mr. Woolford 5th.

The class for any white-skinned kind sent out during the past two years.—Mr. Chopping was 1st, with handsome Chancellor; Mr. Hughes coming 2d, with fine Fidler's Prolific; The Doctor, shown by Mr. Hughes, was 3d, and Chancellor was 4th.

The similar class for coloured kinds brought twenty dishes, the 1st prize going to Reading Ruby, a beautiful red kidney, raised by Mr. Fenn, and sent out by Messrs. Sutton & Sons, and shown by Mr. Wells, Fernhill, Windsor; Fidler's Enterprise, from Mr. Kerr, was 2d; Rufus, flat red round, from Mr. Dean, was 3d; and Crimson Beauty, from Mr. Hughes, 4th.

A number of seedling kinds were shown in the seedling classes, but certificates are granted for these only after growth and trial when cooked at Chiswick. This year the following certificates were alone granted—Mr. R. Lupton, M.P., Sunningwell, for a lot of seeds, some very white kidneys; To Mr. C. Fidler, for General Gordon, a very fine white main crop kidney; To Mr. Ironsides, for his New Flake, a very superior white kind; and to Mr. Hughes, for Colonel, a grand cropper, white kidney also.

Trade collections made a big show. Messrs. James Carter & Co., of High Holborn, having grand heaps of Importer, a huge flat white kind; Adirondack, Beauty of Hebron, White Elephant, Magnum Bonum, Vicar of Laleham, Reading Hero, and Supetra.

Messrs. Webb & Sons, of Wordsley, had a big collection of some eighty kinds, the Schoolmaster, Kinver Hero, and London Hero, being the coloured kidney, with the chief varieties in commerce, in fine form.

Messrs. Harrison & Son, of Leicester, also had a fine show including huge samples of Vicar of Laleham, Great Eastern, Schoolmaster, Magnum Bonum, &c.

Mr. Leonard Durdale showed an interesting collection of seedlings; and Mr. Fidler, of Reading, displayed a large collection of popular sorts. Shortly after the judging was concluded the Lord Mayor of London accompanied by the sheriffs, all in rich robes, visited the show and the awards declared it one of the best. The Lord Mayor afterwards presided at the usual judges' luncheon, at which a large number of persons sat down and did ample honour to an admirably served repast. At the close the Lord Mayor proposed the toast of the International Potato Show, to which Mr. Shirley Hibberd felicitously responded.

The Hardy Fruits.

These have, like the Potatoes, suffered somewhat in appearance generally, in consequence of the long period of drought felt in this country during the summer, and if there was an unexpected increase of the after-fall, there is still a great diversity in the size of the fruits, as if all had not benefited in an equal degree; and colour, so attractive always even in sorts of acknowledged inferiority, is not so marked as was the case last year. Prizes were fairly good, but scarcely any exhibitors hailed from distant counties, and the competition was mainly between the fruit growers of Bucks, Kent, Sussex, Berks, Herts, and Wilts. This may be owing to the well understood unwillingness of persons in other counties to enter the lists, not so much for fear of the vegetables as from acknowledged inferiority on such points as climate and soil. Climate seems to tell more than soil; as a rule the Apples from the heavy wealden clays of Sussex are finer than the same kinds are in the cold clays of Herts.

The fruit was considerably, as regarded numbers, in excess of last year, and many entries came late late to cause a slight embarrassment in the tabling of so many at the last moment.

The fruit tables, as well as those set apart for vegetables, were placed in the eastern half of the Palace, being arranged in three lines, with ample room around.

OPEN CLASSES.

Taking these as marked in the schedule, we have a competition for the best exhibition of Apples, culinary and dessert, six fruits of each. In this Messrs. G. & J. Lane, of St. Mary's Cray, Kent, nurserymen, were 1st, putting up 125 sorts, excellent as a whole, and showing most of the best known kinds in the South, and some that are less common, as Belle Griselinde, Wheeler's Russet, General Gordon, Martin Luther, Landsberger, Reineette, Late Red Nonsuch, Brown Kenting, White Quarenden, Pineau, Lord Kingston, Reineette d'Astrachan, Pear, Roscoff, Codlin, Reineette du Lou, and Reineette Seigeyne, 2d, Messrs. G. Bunyard & Co., The Old Nurseries, Maidstone, with 120 dishes, an almost equally good collection. Fine fruits were noticed of Potts' Seedling, Nancy, Winter Peach, Cox's Pomona, Emperor Alexander, New Hawthornden, the general excellence and great fruiting qualities of the last-named are getting well known. Some of the Apples in this collection had been grown under glass, notably the Melon, a handsome kind, with sufficed pinkish red, striped crimson, and which, when so grown, is very ornamental. The best fruits of most of the kinds are produced either on cordons or espaliers, 3d, Messrs. Rivers & Son, Sawbridgeworth, with 174 varieties; 4th, Messrs. Paul & Son, the Old Nurseries, Cheshunt.

PEARS.

For the best exhibition of these fruits, 1st, Messrs. Rivers & Son, with 100 varieties, noteworthy being Princess and many others, and some from the south of Jersey, and of handsome form and colour; other newer or uncommon kinds of goodly appearance being Lebrun, 20c, General Toddleben, Madame Fran aine's, Fertility, also a seedling, and Duches de Mouchy; 2d, Mr. James Butler, Orchard Lane, Sittingbourne. Besides the samples of well known sorts, the fruits of Dana's Hovey, King Edward, Doyenné Boussoch, and Nouveau Poiteau, 3d, Messrs. G. Bunyard & Co., with a nice collection arranged on plates with Plane leaves under them. In this lot we remarked Belle de Noel, Doyenné d'Été, Galmar d'Été, Marie Guisse, Nouvelle Pulvie, Marie Benoist, Princess, Royal or Mathew's Eliza, and an ornamental fruit in the Japanese wildling, Daimo. Mr. Waterman, gr. to Albert Brassey, Esq., Preston Hall, Maidstone, was 4th, showing fifty-six dishes of chiefly popular varieties.

AMATEURS.

For the best twenty-four dishes of Apples, kitchen and dessert, six fruits of each.—1st, Mr. Sidney Ford, Leonardslade, Horsham. This collection contained Melon, Hollandbury, Fat Ox, Warner's King, Stone's, Lady Henrick, Blenheim Orange, Dr. Harvey, Allriston, Cox's Orange, and France, Royal Prolific, and other fine examples of other kinds in dessert and culinary; 2d, Mr. A. Waterman, who had capital fruits of Mère de Ménage, Tower of Glamis, Broadeyed Pippin, Gloria Mundi, and Stone's; 3d, Mr. H. Davis, gr. to H. J. Lake, Esq., Fairlawne House, Bollo Lane, Chiswick. Very fine dishes of Pears were also shown.—1st, Mr. A. Waterman, good samples being observed of Beurré Superfin, Pitmaston Duches, Gansell's Bergamotte, and Calabrese Grosse; 2d, Mr. S. Ford, King Edward, Beurré D'Été, Durondeau, Beurré Dose, and Pitmaston Duke; 3d, Mr. J. Goldsmith, gr. to C. A. Hoare, Esq., Kelsey Manor, Beckenham, an excellent collection.

Twelve dishes of Apples, exhibitors in the class for twenty-four dishes being prohibited from showing in this class.—1st, Mr. J. Gilmore, gr. Hawkhurst, Kent; 2d, Dutch Mignon (rare seen in collections), New Hawthornden, Cackle Pippin, Adams' Pearmain, Herefordshire ditto, and Dumelow's the best; 2d, Mr. W. Dence, gr. to Colonel Lowe, Gosfield Hall, Halstead, Essex; the Warner's King, Hollandbury, Alexander, Worcester Pearmain, Favourite Pippin, Blenheim, a being of much merit; 3d, Mr. G. Collins, gr. to E. A. Rose, Esq., Wandsworth Common.

VEGETABLES (OPEN).

For the best exhibition of vegetables arranged for effect, and not more than four dishes of any sort.—1st, Mr. A. Waterman, who had sixty-four varieties, his table were nice example of Pragnal's Beet, Siltum Park

Celery, Snowball Turnip, Paris Red French Bean, Early Nantes Carrot, Student Parsnip, May's Northward Sprouts, and Ayleson's Lettuce; the collection was very abundant in quantity, and was tastefully set off with a groundwork of Parsley and other herbs, and blanched Endive, &c. 2d, Mr. J. Neighbour, Bickley, Kent; 3d, Mr. F. A. Beckett Cole, Hatch Farm, Penn, Bucks; 4th, Mr. C. J. Waite, gr. Glenside, Esch. For the best Gourd—1st, Mr. J. Sharpe, Grove Road, Lee, for a Squash of 108 lb.; 2d, Mr. Osman, Sutton, for Connecticut Yellow Squash of 67 lb.; 3d, Mr. Sturgess, Chestead.

Mr. Osman also took the 1st prize for a fine representative collection of edible Gourds; Mr. G. Sturgess, 2d; Mr. J. Sharpe, 3d.

For the best collection of ornamental Gourds—1st, Mr. Osman, with thirty, including the biggest and the smallest varieties; 2d, Mr. G. Sturgess; 3d, Mr. J. Sharpe.

AMATEURS.

Twelve dishes of vegetables, not more than two dishes of any variety—1st, Mr. C. Waite, gr. to Colonel Talbot, Glenhurst, Esch; 2d, Mr. F. A. Beckett; 3d, Mr. A. Waterman. These collections, and others which competed, held nothing of exceptional merit, although all were fine for the season. Peas were conspicuous by their frequent absence, and have been better. The Autumn Giant Cavilflower, Red Cabbage, and Coleworts were exceptionally good samples. Mr. L. Harris, Bradenham, took the 1st prize for six dishes; 2d, Mr. H. Tombs, Tyler's Green, Amersham.

First-class Certificates were granted to Messrs. J. Veitch & Sons for Apple Prince Bismarck, a large oblate conical fruit, with pale yellow rind, marked on the sunny side with faint rose; the eye is closed and set in a deep basin, pleated at the sides; stalk thick and short, and set in a deep concavity; and for Crab American.

Mr. T. Laxton received a First-class Certificate for Apple September Beauty, medium-sized, crimson coloured fruit, eye closed and set in a shallow cavity.

MISCELLANEOUS: NON-COMPETING.

From Mr. J. Butler, Sittingbourne, there came some extraordinarily fine samples of the following kinds of Peas, shown in large quantities—Bébé Die!, Beurre Châtré, and Pitmaster Duchs; also two boxes full of appetising looking fruit of Louise Bonne of Jersey. Photographs were likewise shown to give an idea of the abundance of fruits on trees in Mr. Butler's garden.

Mr. C. Cheeseman, gr. to Messrs. J. Veitch & Sons, showed a collection of 120 dishes of Apples and twenty-eight of Peas, many excellent examples of both being witnessed.

Messrs. W. Paul & Son had forty dishes of Apples grown in their Sussex branch nursery, and too dishes from Herts, besides eighty kinds of Peas, making altogether a very large and interesting show.

From the Fulham nurseries of Messrs. J. Veitch & Sons came 460 dishes of Apples, of mostly fine size and high in colour, the produce of bushes and pyramid trees. Of Peas too dishes in as many kinds were also shown by the same firm, proving the possibility of fruit growing within 4 miles of Charing Cross.

Mr. Laxton showed his open-air Tomato, new Apple Schoolmaster, and the Hyslop Crab, a small deep crimson fruit.

Mr. Everill, seedsman, Banbury, had a large collection of his several new varieties of Onions, at Rousley Park, Wrexton Hero, &c. Most of these were of a large size, and eminently suited for exhibition purposes, as may be gathered from the fact that six Onions had a weight of 8 lb. avoirdupois.

SCOTTISH HORTICULTURAL ASSOCIATION.

The seventh ordinary meeting of this session was held in the rooms, 5, St. Andrew Square, on Tuesday, the 6th inst. Mr. Robert Lindsay, Curator, Royal Botanic Garden, Vice-President, presided. Dr. J. M. Macfarlane, Royal Botanic Garden, Edinburgh, read a paper on "Nepenthes," in which he sketched the history and affinities of the order, entering more fully into the microscopic structure and physiological action. He described very minutely the structure of the stomach, which was first observed by Professor Dickson, and which are to be found on all parts of the plants, but more numerous on the under-surface of the lamina and round the rim of the pitchers. He gave some interesting details of various observations made by himself on the visits of insects, their capture and ultimate digestion by the plants. Synopsis of about forty species were given, twenty of which were introduced during the last few years. The paper was admirably illustrated by objects under the various microscopes, living plants, and a number of dried and preserved pitchers, some of which are not in cultivation. In the discussion which followed the reading of the paper, Mr. Lindsay stated that the first Nepenthes raised from seed in Britain was effected by Mr. Kelly in the nurseries of Messrs. Jas. Dickson & Son, Edinburgh, about 1830, from seeds given by the Curator, Trinity College Botanic Garden, Dublin, giving an interesting and instructive history of his wandering in Borneo, detailing the soil, situation, and altitude in which he found the various species which he collected. He also entering into details of the various experiments of Mr. Burbridge, who stated that he found in several instances the pitchers contained more or less of decomposed animal matter and from the small and slight hold of their roots, he had no doubt they derived great benefit from the insects which found their way into the pitchers. Mr. McKenzie, Warriston, was of opinion that this contention of plants being able to digest animal food, when applied to their leaves, required

more proof than botanists have hitherto been able to bring forward. The Chairman closed the discussion by giving some practical hints on the culture of Nepenthes; he also put the question to Mr. Burbridge, if there were not periods of the year in Borneo of draught, and if so, he pointed out the Nepenthes would be benefited by the moisture contained in their pitchers. Mr. Burbridge in reply, stated that on the plains he found Nepenthes generally growing in ditches, or in situations where leaves and decayed vegetable matter was blown by the wind round the plants, and thereby retaining moisture about them. With regard to the species found on the mountains he said they were in a constant state of dripping moisture. On the motion of the Chairman, a hearty vote of thanks was awarded to Dr. Macfarlane, and also to Mr. Burbridge for their communications.

EXHIBITS ON THE TABLE.

New seedling Apple, named Lady Sudeley, by Mr. George Bunyard, The Old Nurseries, Maidstone, Kent; it received a First-class Certificate from the Fruit Committee.

Aberia Caffra (the Kei fruit of the Cape), by Mr. Lindsay, Curator, Royal Botanic Gardens, who stated that this beautiful fruit was new to Europe; the specimens exhibited were sent to him by T. Hanbury, Esq., from the gardens of La Martole, Italy. It had a perfume somewhat between a Melon and a Pine-apple. It will, no doubt, prove an important addition to our half-hardy fruits. It is a native of Africa, and belongs to the Euxaceæ. The fruits are of the size and shape of Green Gage Plums, and of a soft yellow colour, each containing four or five seeds, and being of an agreeable sub-acid flavour.

Fruit of *Monstera deliciosa*, by Mr. Dunn, Dalkeith Palace Gardens. Mr. Dunn described the nature and qualities of the fruit, which was new to many of the members.

A collection of Apples, also *Fuchsia penduliflora*, F. Dominiana, F. alba coccinea, by Messrs. Dickson & Co., nurserymen, Edinburgh.

Crimson sp., from Demerara, by Mr. J. W. Machattie, Newbattle Abbey Gardens. The plant was in flower and well grown in the gardens of La Martole, Italy, and was recommended for Cultural Certificate. Fruit of *Beurré Hardy* Pear, by Messrs. James Dickson & Son, nurserymen, Edinburgh.

The meeting closed with a hearty vote of thanks to Mr. Lindsay for his conduct in the chair.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, OCTOBER 7, 1885.

MONTH AND DAY.	BAROMETER.	TEMPERATURE OF THE AIR.		HYGROMETRIC RELATIONS FROM GIBBS'S TABLES 7th Edition.	WIND.	RAINFALL.

- Oct. 1.—Rain falling in early morning; dull day, but fine.
- 2.—Fine, dull.
- 3.—Rain in early morning; fine day, bright mostly.
- 4.—Rain, but fine day.
- 5.—Rain in morning; dull day.
- 6.—Fine bright morning; rain falling from about 12.30 p.m.
- 7.—Rain in early morning; fine bright day; fine night.

LONDON: Atmospheric Pressure.—During the week ending October 3, the reading of the barometer at the level of the sea increased from 29.57 inches at the beginning of the week to 30.04 inches by 9 A.M. on the 28th, decreased to 29.73 inches by 9 A.M. on the 29th, increased to 29.81 inches by 5 P.M. on the same day, decreased to 29.49 inches by 5 P.M. on the 30th, increased to 30.03 inches by 9 A.M., decreased to 29.85 inches by 5 P.M. on October 2, and was 29.93 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.88 inches, being 0.21 inch lower than last week, and 0.06 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 60°.8, on September 30, on September 27 the highest was 47°.4. The mean of the seven high day temperatures was 56°.4.

The lowest temperature was 32° on September 27; on September 30 and October 3 the lowest temperature was 48°.5. The mean of the seven low night temperatures was 42°.6.

The greatest range of temperature in one day was 15°.5, on September 28 and October 2; the smallest, on the 3d, was 9°.3. The mean of the seven daily ranges was 13°.8.

The mean temperatures were—on September 27th, 49°.5; on the 28th, 43°.6; on the 29th, 52°.3; on September 30th, 54°.2; on October 1st, 50°.0; on the 2d, 51°.7; and on the 3d, 51°.7; and these were all below their averages by 14°.1, 10°.9, 2°.1, 0°.1, 4°.4, 2°.5, and 2°.2, respectively.

The mean temperature of the week was 49°.1, being 2°.8 lower than last week, and 5°.2 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 106°, on October 1. The mean of the seven readings was 87°.4.

The lowest reading of a minimum thermometer placed on grass was 23°, on September 27. The mean of the seven readings was 33°.

Rain.—Rain fell on four days, to the amount of 0.47 inch.

ENGLAND: Temperature.—During the week ending October 5 the highest temperatures were 64°.3 at Brighton, 63°.2 at Cambridge, 62°.2 at Plymouth; the highest at Bolton was 56°.6, at Wolverhampton 57°.8, at Sunderland, Preston, and Newcastle 58°. The general mean was 60°.2.

The lowest temperatures were 28°.6 at Wolverhampton; 30° at Turro, 31°.6 at Nottingham; the lowest at Liverpool was 40°.8, at Sunderland 39°, at Leeds and Preston, 37°. The general mean was 34°.5.

The greatest ranges were 33° at Cambridge, 32° at Turro, 30°.3 at Brighton; the least ranges were 18°.9 at Liverpool, 19° at Sunderland, 21° at Preston. The general mean was 25°.7.

The mean of the seven high day temperatures was at Turro, 59°.9, at Cambridge 59°.7, at Brighton and Bristol 57°.9; and was lowest at Bolton and Bradford, 53°.9, at Wolverhampton 54°. The general mean was 56°.2.

The mean of the seven low night temperatures was highest at Brighton, 45°.3, at Blackheath 43°.3, at Plymouth 43°.2; and was lowest at Wolverhampton, 37°.1, at Bolton 38°.6, and at Bristol 40°.6. The general mean was 42°.

The mean daily range was greatest at Cambridge, 18°.9, at Bristol 17°.1, at Turro 17°, and was least at Preston, 10°.5, at Liverpool 11°, at Sunderland 11°.7. The general mean was 14°.2.

The mean temperature was highest at Brighton, 50°.4, at Turro 50°.2, at Plymouth 49°.2; and was lowest at Wolverhampton, 44°.3, at Bolton 45°, at Bradford 46°.7. The general mean was 48°.

Rain.—The largest falls were 1.48 inch at Bolton, 1.21 inch at Preston, 1.00 inch at Bristol; the smallest falls were 0.40 inch at Sunderland, 0.4 inch at Cambridge, 0.46 inch at Wolverhampton. The general mean fall was 0.72 inch.

SCOTLAND: Temperature.—During the week ending October 3, the highest temperature was 58°.5, at Perth; at Greenock the highest temperature was 55°.2. The general mean was 50°.7.

The lowest temperature in the week was 26°, at Glasgow; at Aberdeen the lowest temperature was 36°. The general mean was 31°.7.

The mean temperature was highest at Paisley, 48°.6; and lowest at Perth, 47°.2. The general mean was 48°.

Rain.—The largest fall was 3.05 inches at Greenock, the smallest fall was 0.74 inch, at Aberdeen. The general mean fall was 1.32 inch.

JAMES GLAISHER, F.R.S.

Variorum.

LORD SHAFESBURY.—The Dean of Westminster sends to the *Times* a word in season, in the shape of an epigram by his predecessor on "the great Christian philanthropist" just lost to us. The following note from Lord Shaftesbury himself is appended to it:—

"I had written to Canon Conway to say that he had better find some new and younger chairman for the annual flower show in Dean's Yard, adding, that I was in the condition of a tree which, as Lucan says, 'casts a

shadow no longer by its leaves, but only by its stem.' He sent the note to the Dean, who returned it with the verses below. I knew that the Dean was very kindly disposed towards me, but I did not know how kindly."

These are the verses:—

"Tranco, non froedibus, efficit umbram."

Well said old Lucret: often have I seen
A stripping tree all foliage and all green;
But not a hope of grateful soothing shade,
Its empty strength in fluttering leaves displayed.
Give me the solid trunk, the aged stem
That rears its scant but glorious diadem;
That through long years of battle or of storm
Has striven while forests round it to reform;
That plants its roots too deep for man to shake,
That lifts its head too high for grief to break,
That still, through lightning flash and thunderstroke,
Retains its vital sap and heart of Oak.
Such gallant tree for me shall ever stand
A great rock's shadow in a weary land.

A. P. S., May, 1873.

Fall Mall Gazette, October 7.

Answers to Correspondents.

ARTICLES FOR COMPETITION IN SALADS: Enquiring Chef. If you were to put up for competition all the items named in your list you would certainly run the risk of getting disqualified, our judges, as a rule, recognising only such vegetables as enter into the generality of English salads, and these are few enough. Your list does not contain such herbs as Tarragon, Chervil, Chicory, Celery, Kampan, Blanched Dandelion; and those you name, amongst others that may be eaten raw—viz., Mushrooms, Beans, Potatoes, Globe Artichokes, red and white Cabbage, Cauliflower, Garlic or Marrow, Salsify, Scorzoneria, Parsnips, Turnips, and green Peas—stand in need of pickling or cooking before making use of them as salad ingredients.

BOOKS ON FRUIT-TREE PRUNING AND VINE CULTURE: E. W. Serpell. For the first-named Du Breuil on Fruits and Pruning, the English translation of which is sold by Lockwood & Co., 7, Stationers' Hall Court, Ludgate Hill, E.C.; and for the Vine, Mr. F. A. Barron's work, "The Vine," published at the Journal of Horticulture Office, 177, Fleet Street, E.C.

COLOUR OF WASH FOR GARDEN WALLS: T. T. Some warm colour, as dark red—anything rather grey or stone colour, will do for the purpose. It should be quite smooth, as rough-surfaced walls retain the sun's heat longer.

ERRATUM.—At p. 443, col. c, line 2, for "Crosse's Dictator," read "Corse's Dictator."

FERTILISER: A. D. W. Other things being equal the actual number of seeds produced by close or by cross-fertilised plants respectively would, no doubt, be the same, but in practice the circumstances ever would be precisely identical. You should read Darwin "On the Effects of Cross and Self Fertilisation in the Vegetable Kingdom."

FUNGI: A. B. W. 1, Polyporus versicolor; 2, the same; 3, Xylaria hypoxylon. The other two species are not in a fit condition for naming, as neither of them who send fungi for naming should always mention the habitat. W. G. S.

GRAPES SHANKING: E. S. T. There is nothing definite known to gardeners, or scientific men, as to the cause of shanking, as the berries will "shank" sometimes on Vines that are apparently in the highest state of vigour; but it is more often seen when the grapes are carrying too heavy crops, when the time in which they grow has got exhausted of some essential constituents, or has arrived at the mechanical condition as to its paricles that prevents the rapid egress of moisture, and has become water-logged, in which state of the soil the smaller roots and rootlets perish. This state of the soil is not at all the same in the best made artificial borders; and a large admixture of manures at the time of making will bring about this result sooner. Well-drained, high-standing borders of not more than 2 feet in depth, and composed mainly of turfy soil, not much broken up, and containing a liberal addition of bones (crushed), charcoal, and finely broken lime rubbish, will usually grow the Vine perfectly. In such borders the watering of the soil is quite under control; and if the borders are made with some means of throwing off heavy autumnal rains on those portions which are Vines carrying Grapes, there ought to be the minimum of loss from the maldry. Rain falling for lengthened periods on Vine borders, where the crop is gathered, and which it is not intended to force early, does good rather than harm—provided, of course, the soil is not adhesive, or the drainage defective.

HOP-DOG: G. Harris. This is the caterpillar of the moth known as Dasychira pudibunda, figured in Miss Ormerod's Manual of Injurious Insects. What the Hop-act and Land-measurer may be we do not know.

LAUREL BERRIES: J. P. If you mean the berries of the Cherry Laurel, they are no more poisonous than Cherries are. This so-called Laurel is indeed only an evergreen Cherry. The berries of the true Bay Laurel are also harmless.

NAMES OF FRUITS: Captain Tibbells, 1, Glou Morgan; 2, Emille d'Heyst—D. Walker, 1, not recognised; 2, Beurré Superfin; 3, Zephrin Grégoire; 4, Beurré d'Amanlis; 5, Fondante d'Anjoune; 6, Glou Morgan; 7, Oufgild, 1, not recognised; 8, Fondante d'Anjoune; 9, Fondante d'Anjoune; 10, Knight's Monarch; 6, Doyenné du Comice, —Old Subscriber, 1, Marchal de la Cour; 2, Duchesse d'Angoulême; 3, Bergamotte d'Espere; 4, Doyenné d'Alençon; 5, Beurré de Capiaumont; 6, Josephine de Malines. A. M., 1, Passe Colmar; 2, Beurré Superfin; 3, Duchesse d'Angoulême; 4, Emille d'Heyst; 5, Marchal de la Cour; 6, Grosse Calabrese.—W. A. B. Apple: Golden Reineette; Pears: 2, Vicar of Winkfield; 3, Althorp Crassane; 4, Beurré Clairgaut; 5, Marchal de la Cour; 6, Easter Beurré; 10, Winkfield; 11, Marie Louise; 12, Duchesse d'Angoulême; 13, Gansell's Bergamotte; 14, 17, Marie Louise; 15, Beurré Diel; 18, 20, Beurré Rance; 19, Beurré Diel; 21, Cattilae; 22, Beurré Bosc. This is far beyond our stipulated number of six sorts at a time.—Gustav R. Le Cour, Apple: 1, Winter Strawberry; 2, Margé; 6, Minshull Crab; 7, Bedfordshire Foundling; 8, Manks' Codlin; 9, Worcester Pearmain; 10, Wareham Russet; 11, Dumelow's Seedling; 12, Braddick's Nonpareil; 13, Gloria Mundi; 14, Scarlet Nonpareil. Pears: 6, Calabrese Bush; 7, 12, 14, Louis Bonnet; 15, Beurré Bosc; 16, Beurré d'Amanlis; 17, Beurré Clairgaut; 18, Beurré Defais. Far in excess of the stipulated number (six).—F. & A. D. & Sons, Your Apple is the Trumpington, or Delaware.—Jones, Craigs-Yvie. The numbers pinned on to the fruits were all torn off when they were received, so that we cannot identify any of the fruits sent. Why could you not wrap each sort separately in paper?—J. Rose, Apple sent as King of the Pippins is more like Emperor Alexander. The seedling Apple is inferior to hundreds of others in cultivation.—J. M. L., Apple: 2, 3, King of the Pippins; 4, Dumelow's Seedling; 5, Manks' Codlin; 10, Ringer; 14, Keswick Codlin; 16, Emperor Alexander. We are unable to give the names of the others, as the numbers being simply pinned on to the fruit, and carelessly packed without a morsel of paper, became detached, so that we could not tell to which they belonged. You should pack your fruit with more care, and send better examples.—A. Holloway, 7, 8, Beurré Diel; 11, Glou Morgan; 15, Thompson's. Others not recognised.—D. J., 3, Rymer; 4, Adams' Pearmain; 7, Drap d'Or. Others not recognised. We find the fruits grown in your district very difficult of recognition.—J. D., Not known.

NAMES OF PLANTS: J. P. Your branch looks like Picea orientalis, but we cannot be certain, as it may be only a form of P. excelsa, the common Spruce.—J. R. B., 1, Acer Pseudo-Platanus; 2, Acer platanoides; 3, Chionodoxa virginica.—Earr & Son, Specimen insufficient.—Stevens, Onocidium heteranthum; W. Earley, Phytolacca decandra (Poke-weed)—H. H. Chrysanthemum (Pyrethrum) uliginosum and Physoglossa virginiana.—W. H., 1, Eria Diluvium; 2, Vanda Roxburghii.—No Name (flower in a match-box), Odontoglossum tripudians.—D. P., In the absence of foliage we suppose it to be Gesnerifera.—H. G. Jones, Varieties of the Sweet Chestnut.—H. J. R., You can continue to send. We cannot, however, determine the Anagremum from the drawing of the leaf.

ORCHIDS: Peter Macey. The Lycaste Skinneri is not extraordinary for either form or colouring, but it is flowering unusually early. The Dendrobium is longicornia, a form of inaudibulum.

ORCHID: R. A. Your plant is what is supposed to be D. Erythraium, but it is possible to be sure about it. Clustering of which your specimen is an example, means, as you suppose, close-fertilisation in the bud, and consequently independently of insect agency.—J. W. It is quite impossible for us to name your Fancies shrivelled as they are beyond recognition. You should take fresh specimens to some dealer or to a nurseryman.

PANSIES: J. W. It is quite impossible for us to name your Fancies shrivelled as they are beyond recognition. You should take fresh specimens to some dealer or to a nurseryman.

PEPPERMINT GROWING: H. K. We do not know of any treatise on Peppermint cultivation for distilling purposes. The roots may be planted early in the spring-time, before growth has begun, in well-manured ploughed or dug land. It is as well to plant it in beds of 3 yards by 10 width, for convenience of digging. For several years the plants are usually inserted in lines 15 inches apart, the plants standing at 9 inches apart in the row. In the second year all will have run together. The crop is cut just before the bloom is fully open, and can be mowed or cut with a hedging-hoe. For several years winter dressings of rotten manure or nitrates may be given, but after the lapse of four or five years replanting on new ground will be found necessary. Damp localities, where no stagnant water is found, are best for its cultivation.

POTATO: W. S. Many thanks; such cases are common. There is, however, no real increase of substance, as the new growths are simply developed from the stores in the old tubers.

SEEDLING BEGONIAS: E. F. F. & Sons. The blooms were brilliant in colour, and of a large size, but in nurseries where the tuberous Begonia is made a special culture there are numbers equally good, and some superior as regards size of bloom.

SULPHATE OF AMMONIA: Quinton Read. Alone it is not good, but mixed with kainite, other mineral manures, or bone-dust, is useful for fruit trees. Mr. J. H. Harpenden would give you the proportions to use.

CATALOGUES RECEIVED.

BENJAMIN R. CANT, Colchester.—Roses. N. GAIGER, SUTTONFORD.—Illustrated and Descriptive Catalogue of Fruits. MARRIED.—In the Free Church Manse of Mayfield Newington, Edinburgh, on the 26th ult., by the Rev. Lewis Davidson, ALEXANDER TAIT, son of the late Alexander McQuhir Tait, foreman at Messrs. Dicksons' Nurseries, to MARY HORNSBY, daughter of James Hornsby, Builder, Gatehouse, parish of Girthorn, Stewartry of Kirkcubright, (Dumfries and Galloway, please copy).

Markets.

COVENT GARDEN, October 8. The following reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. [Eo.]

HEAVY supplies of Grapes continue to reach us, causing the prices to keep low. Cobs inclined to fall in price. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: Oct. 7.—But very little business was transacted on the seed market to-day, the attendance being poor. There is no change to be noted with regard to values. Red Clover seed has become quiet. Inquiries for Trifolium have now ceased. Less money is accepted for winter Tares. Sowing Rye sells at former figures. Canary and Hemp seed are both rather dearer. For blue Peas the demand is small. Haricot Beans are good and cheap. The tendency in feeding Linedseed is still in favour of holders. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday English Wheats were very irregular, from want of condition. Foreign was held for rather stiffer rates, which checked business. Flour was fully steady in value, with some enquiry. Fine milling Barley was scarce, but secondary and inferior kinds were plentiful, and 1s. to 2s. lower; grinding descriptions were steady. Beans and Oats continued without quotable change. American Oats were 3d. to 6d. lower, and the general demand dull.—On Wednesday business in Wheat, whilst limited, was at quite Monday's value. Flour was firm, with a moderate enquiry. Maling Barley of fine quality continued firm, but secondary grades drooped in value; grinding kinds were steady. Beans and Peas have sold without alteration in value. Oats met a quiet demand, but firm rates had to be paid. For Maize prices were against buyers.—Average prices of corn for the week ending Oct. 3.—Wheat, 30s. 6d.; Barley, 31s. 1d.; Oats, 19s. 1d. For the corresponding period last year:—Wheat, 32s. 4d.; Barley, 31s. 9d.; Oats, 19s.

CATTLE.

At Copenhagen Fields on Monday in the beast market our top quotations were reduced 2d. to 4d. per 8 lb., but in the general trade the reduction was 4d. Sheep were equally difficult to sell, and depressed 2d. to 4d. per 8 lb., many remaining unsold at a late hour. The calf trade was very dull, and quotations here also have to be reduced. Reports of the pig trade were not worse. Quotations:—Beasts, 3s. 6d. to 4s. 4d., and 4s. 6d. to 5s.; calves, English, 4s. to 4d.; Irish, 2s. to 2s. 4d.; sheep, 1s. 8s. to 4s. to 4s. 8d. to 5s.; 2d.; pigs, 4s. to 4s. 8d.—Thursday's trade was dull in tone, with a weak tendency. For beasts Monday's prices were only maintained with difficulty. For sheep the demand is inactive at weak currencies. Calves were quiet, and pigs were rather steadier.

HAY.

Tuesday's Whitechapel Market report states that there was a rather large supply on sale. Trade was quiet at the following prices:—Prime Clover, 92s. to 110s.; inferior, 60s. to 90s.; prime meadow hay, 60s. to 92s.; inferior, 40s. to 60s.; and straw, 20s. to 38s. per load.—On Thursday there was a fair supply on sale. The trade was very dull, especially for Clover, and prices were with difficulty maintained.

FRUIT, ROOTS, AND VEGETABLES.

COLUMBIA (East London).—Moderate supplies of fruit and vegetables; trade fair; prices moderate. Potato trade better; prices higher. Quotations:—Damsons, 6d. to 9s. per sieve; Apples, 2s. to 3s. 6d. per sieve; Peas, 3s. to 3s. 6d. per bush; Tomatoes, 1s. to 7s. 6d. per box; Cabbages, 4s. to 6s. per tally; Scarlet Beans, 3s. to 5s. per sieve; Cauliflowers, 2s. to 3s. 6d. per dozen; bunch greens, 2s. to 4s. per dozen; ditto Turnips, 2s. to 4s. per dozen; ditto Carrots, 1s. 6d. to 2s. per dozen; ditto Parsley, 1s. to 1s. 6d. per dozen; Beetroots, 2s. 6d. to 3s. per dozen; Celery, 10s. to 12s. 6d. per dozen bundles; English Onions, 3s. to 3s. 6d. per cwt.; pickling ditto, 3s. 6d. to 4s. per cwt.; foreign Onions, 7s. 6d. to 8s. per box. Potatoes: Magnums, 47s. 6d. to 80s.; Early Rose, 50s. to 60s.; Regents, 55s. to 70s.; Red, 50s. to 70s.; Victorias, 50s. to 60s.; Beauty of Hebron, 60s. to 80s.; Champions, 50s. to 65s. per ton; Carrots, 30s. to 50s. per ton.

STRATFORD.—There was a good supply of produce, and a fair trade was done at the following prices:—Cabbages, 3s. to 5s. per tally; red Cabbage, 4s. per dozen; greens, bunch, 3s. to 4s. per dozen; ditto, cut, 3s. to 4s. per tally; Scarlet Runners, 5s. per sieve. Potatoes:—Magnums, 45s. to 65s.; ditto, Champions, 60s.; ditto, Roses, 40s. to 50s.; ditto, Regents, 50s. to 60s. per ton. Hay, Clover, 75s. to 110s.; meadow, 60s. to 90s.; and straw, 20s. to 30s. per load. Onions, 10s. to 20s. per cwt.; chaff, 80s. to 100s. per ton; Turnips, 50s. to 80s. per ton; Apples, 2s. to 5s. per bushel; Onions, 70s. to 100s. per ton; Spanish Onions, 7s. 6d. per case; Carrots for cattle feeding, 30s. to 32s. per ton; Grapes, 6s. to 7s. per case; Carrots for household, 40s. to 50s. per ton; Tomatoes, 6s. to 8s. per case; Walnuts, 2s. per dozen pounds.

COALS.

The following are the prices current at market during the week:—Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 18s.; Heddon-Lynne, 16s.; Lambton, 17s. 6d.; Wear, 16s.; South Durham Tees, 16s. 3d.; Tees, 18s.

Government Stock.—Consols closed on Monday at 99s. to 100 for both delivery and the account. The figures of Tuesday and Wednesday were 100 to 100 for both transactions. Thursday's final quotations were the same as those of the two preceding days.

PUBLISHING OFFICE AND OFFICE FOR ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

BUY ONLY ENGLISH WATCHES.

BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH, has obtained the Highest Award of Gold Medal at the Inventions Exhibition, 1885

Advertisement for Benson's watches, featuring an image of a watch and text: SILVER, £5 5s. GOLD, £12 12s.

The "Ludgate" Watch is a SILVER ENGLISH LEVER, of my best London make, with "Special Strength" Three-quarter Plate Movement. Jewelled throughout in rubies—true Chrometone balance—adjusted for extremes with damp and dust-proof patent ring-band, and extended barrel—massive sterling silver case with crystal glass front, which combines the strength of the Hunter with the convenience of the Open Face Watch.

The Immense superiority in Value, Accuracy and Durability of the "Ludgate" Watch to Swiss and American made in imitation of and sold as English) and to the Old Full-plate English Lever (will sell for other makes), from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL—the only one adjudged to English Watches. The "Ludgate" is better quality and more than any £50 watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and roughest usage, and is therefore the best watch for Home, Indian and Colonial wear by Landowners (No. 1, large size), Workmen, and Artisans (No. 2, as sketch), Gentlemen, Officers and Men in A.M. services, Youths and Boys (No. 3, small) will be sent free under the my risk, to all parts of the world, for £5 5s. or in 18-carat gold, crystal glass cases, Twelve Guineas (No. 3 size).

SPECIAL NOTE that J. W. BENSON is the only Maker of a Three-quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold. The "Ludgate" Watch cannot be had through or by any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. An life of tested and Priced Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to—

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C.; and 25, Old Bond Street, W., London. Consistent upon the most liberal terms, the demand, always great, has so increased as to necessitate more extensive Machinery, which now enables us to execute all orders for the "Ludgate" Watch without delay. Illustrated Pamphlets of Watches from £2 to £50, Gold and Silver Jewellery, Clocks (Horn, Chime, and Turrit), Electroplate and Musical Boxes, free on application.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark).

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used cold on the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 2s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNREGISTERED TESTIMONIAL.—"Pierrefield Park, June 21, 1876.—SIR, I have this day forwarded from Chesham to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chesham.—I am, Sir, yours respectfully, Wm. Cox." HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE of Fencing Furdishes, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

105,000 Accidents. For which Two Millions are paid as Compensation by the RAILWAY PASSENGERS' ASSURANCE Company, 64, Cornhill. Accidents of all kinds. Paid-up and Invested Funds, £250,000. Premium Income, £235,000. Chairman, Harvie M. Farquhar, Esq. Apply to the Clerks at the Railway Stations, the Local Agents, or West-end Office, 8, Grand Hotel Buildings, Charing Cross; or at the Head Office, 64, Cornhill, London, E.C. WILLIAM J. VIAN, Secretary.

The Ladies' Gazette of Fashion for Sept., 1885, says:—"For neatness, durability, and appearance, we can not strongly recommend them." They combine every era of a good excellence. For the Autumn and Winter. Warm and Durable.

DEVONSHIRE SERGE SAILOR SUITS. viz., Blousy, Knee-bucklers, Singlet, Collar, Badge, Lany, rd, and Whistle, strong quality, from 7s. Currier, & Co. Fit and satisfaction guaranteed, or money returned. Girls' Naval Costumes—same price as Boys'. Also Galatea and Jersey Suits and Costumes, Ladies' Dress Serges, Cashmeres, Velveteens, and Underclothing, direct from our factories at astonishing low prices. Write for Illustrated List.

Patterns and Measurement Forms post free, from The Midland Manufacturing Company, Dudley, Please mention this paper.

JURY'S VERY OLD WHISKIES

(IRISH and SCOTCH). "Jury" Whiskey, 6 years old, 6s. 6d. bottle; 42s. dozen. "Special Jury" Whiskey, 7 years old, 4s. bottle; 46s. dozen. "Grand Jury" Whiskey, 13 years old, 5s. bottle; 60s. dozen. (20 years old, 6d. bottle; 72s. dozen.) So confident is Mr. Jury of the excellence of his Whiskies that he will pay the carriage upon a sam'l. bottle (Irish or Scotch), to any part of the United Kingdom upon receipt of remittance. W. J. JURY, Belfast.

By H.M.'s Royal Letters Patent. GIRDWOOD'S PATENT ASTHMA REMEDY. Newest and most wonderful DISCOVERY. Cures perfectly, without medicine, all such diseases as Bronchitis, Whooping Cough, Influenza, Hay-Fever, Diphtheria, &c. 2s. 3d. per box, with full directions for use. Sold by all Chemists and Patent Medicine Vendors, or sent direct (where it can not readily be obtained), upon receipt of remittance, to any part of the world, from the who'sale depot. Address: JOHN GIRDWOOD, Inventor, Patentee, and Sole Manufacturer, 9, Donegal St. West, Belfast.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price, as engraving, with Boiler, open jointed siphon, 12 feet of 4-inch hot-water pipe, and patent feeds complete, £4 4s. Delivered free to any station. Discount for cash. This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stokehole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilized. It burns over 12 hours without attention at a nominal cost. "Loughborough" Boilers to heat up to 650 feet of 4-inch pipe, with hot-water pipe, joints, &c., always in stock. Cost of Apparatus COMPLETE for Greenhouses as below:— 20 by 6 ft. £4 10 0 15 by 6 ft. £3 10 8 25 by 12 ft. £5 16 8 10 by 8 ft. £5 10 0 12 by 10 ft. £6 0 0 15 by 16 ft. 12 12 4 Proportionate prices for other sizes. Estimates on application. The measurement of Greenhouse being given, every apparatus is delivered with pipes cut and fitted ready for fixing. Illustrated List, with full particulars, post free.

Seed Trade WANTED, for a Scotch Provincial House, an experienced WAREHOUSEMAN.—Apply, stating age, wages expected, &c., to C. E. Marlborough & Co., 51, Old Bailey, London, E.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any individual into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER. Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS. JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN. Several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to recommend any Gentleman with particulars, &c.—St. John's Nursery, Worcester.

TO LANDED PROPRIETORS, &c.—A. McINTYRE (late of Victoria Park) is now at liberty to undertake the management of New Gardens and Parks, Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listeria Park, Stamford Hill, N.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON and SONS, "Newton" Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability and thoroughly practical at their business. Full particulars, with names of previous employers, &c., on application.

TO NURSERYMEN.—Situation wanted, by a young man (age 20), in a Nursery, under Glass. Four years' good character.—R. L. M. Albery, 3, Carfax, H. rsham, Sussex.

SHOPMAN (HEAD), or TRAVELLER.—Twelve years' experience in all departments, three years with last employer. Good references.—J. C., 2, Merton Street, Grimsbury, Banbury.

SHOPMAN.—Age 19; five years' experience. Good character.—K. K., Brookland House, Purton Road, West Kensington Park, London, W.

SHOPMAN, or OTHERWISE.—Age 30; good all-round knowledge of the Seed, Bulb and Florist Business. Fifteen years' experience. Good references.—A. B., 111, Stokes Road, Southwark Park, London, S. E.

SHOPMAN, or SECOND.—Age 27; eleven years' experience in all branches. First-class reference.—E. F., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN, or SECOND COUNTER-HAND.—Eight years' experience. Well up in the Retail Seed and Bulb Trade, and very highly recommended.—D. C., Fletcher, 19, Eglington Street, Glasgow.

SHOPMAN (ASSISTANT), under a good Head.—Age 21; good knowledge and experience in the Trade generally.—J. B., 29, Finkle Street, Keenal.

Shopman, or ASSISTANT.—Age 21; six years' experience. Good reference.—J. S., Thus, Irish & Sons, Ayr, N. B.

FLORISTS and SEEDSMEN.—Re-engagement wanted by young Lady (age 24), well up in Making Wreaths, Crosses, Bouquets, &c. Seven years' experience. First-class references from last situation.—K., 41, Kennel Street, Lewisham, S. E.

HOLLOWAY'S PILLS.—Nervousness and listlessness supports energy, the time has come to take some such alternative as Holloway's Pills to restrain a disorder from developing itself into a disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically on the functions of digestion and assimilation that the white body is revived, the blood rendered richer and purer, while the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all classes and all ages. They have a most beneficial effect on the condition of the blood; they soon rectify whatever is in fault, restore strength to the body and confidence to the mind.

APPEAL TO THE BENEVOLENT

On behalf of Two Sisters, aged respectively 70 and 72, who have lived together all their lives (the younger has been an invalid for many years), but the leases of their property having fallen into the hands of the Ecclesiastical Commissioners some six years ago, have vainly struggled to obtain a living by letting apartments, the little money they had saved being now quite exhausted, and owing over a year's rent, make this Appeal, hoping to save their home from being broken up, and parting with everything they possess. Will any kind Friends help them in their deepest distress? The following Persons have kindly allowed a reference to be made to them, and will give every information respecting the genuineness of this appeal:—

- Dr. MAXWELL T. MASTERS, F.R.S., 47, Wellington Street, Strand, W.C.
 - Mrs. DOWNING, 10, Lupus Street, Pinlco, S.W.
 - Mr. J. KEASLEY, 62, Salton Road, Brixton, S.W.
 - Mr. W. RICHARDS, 41, Wellington Street, Strand, W.C.
- Contributions gratefully received and thankfully acknowledged by Mr. W. RICHARDS, "Gardeners' Chronicle" Office, 41, Wellington Street, Strand, W.C.

GARDENERS' CHRONICLE OFFICE.

About 2 miles from Woking Station. SALE of exceptionally well-grown NURSERY STOCK. MESSRS. WATERER AND SONS have received instructions from Mr. Richard Collier, whose lease is expiring, to SELL BY AUCTION, on the premises, as above, on TUESDAY, October 27, and following days, commencing at 12 o'clock precisely on each day, the FIRST PORTION of the well-grown NURSERY STOCK on the above land, in excellent condition for removal, having all been moved within two years, comprising a great variety of very fine Ornamental Evergreen Trees and Shrubs, including many Specimen Trees, 20,000 Green and Variegated Standards and other Hollies, 2 to 9 feet; 20,000 Yews, from a feet 6 inches to 7 feet; several thousand Chamaecyparis, and Portugal Laurels, Retinospora, Ficus, Thuus, Cupressus Lawsoniana and erecta, Thuopsis, Pinus, 1,000 Rhododendrons, principally choice named sorts, 3,000 Spruce Firs, 2,000 Half-Standard and Standard Roses of the choicest varieties, 6,000 Marnett Stocks, 5,000 Crabs and Plum Stocks, 15,000 Birch, Elopah, Ash, and Chestnut Trees, 2 to 15 feet; and other Stock. The Auctioneers would draw the special attention of purchasers requiring plants for ornamental and effect purposes to this Sale, as the whole of the lots, including the Specimen Trees and Shrubs, are in perfect condition for removal. May be viewed several days prior to the Sale, and Catalogues obtained on the Premises, and of the Auctioneers, at their Offices, Chertsey, Weybridge Station, and High Street, Walton-on-Thames, Surrey.

Sale at Chester of Valuable Nursery Stock, to clear ground (partially sold). No series of plants from Messrs. Chivall & Co. (see advertisement) on account of expiration of lease. The Sale consists of EVERGREENS, FLOWERING SHRUBS, ORNAMENTAL and FRUIT TREES, TREES, and UNDERPLANTS. MESSRS. CHURTON, ELPHICK, and CO. will SELL the above by PUBLIC AUCTION (by instructions of Messrs. James Dickson & Sons, Chester), at the Station Road, and in the immediate vicinity of their Chester Railway Station, on THURSDAY, October 29, at 11 o'clock precisely. May be viewed several days prior to the Sale, and Catalogues obtained on the Premises; also from the Auctioneers and Vendors.

IMPORTANT SALE OF SHRUBS, FOREST TREES, ROSES, FRUIT TREES and HERBACEOUS PLANTS, AT John Stewart & Sons' Nurseries, Broughly Ferry, N.E. On WEDNESDAY, October 21. A. MONCUR, Auctioneer.

TO BE LET, or SOLD, with Immediate Possession, a MARKET NURSERY, 6 miles from Covent Garden, and in an Eight-roomed Dwelling-house, Coach-house and Stable, Twelve Greenhouses, well heated and in good condition. For particulars apply to PROTHEROE and MORRIS, 67, and 68, Chesham, E.C.

TO Nurserymen, Florists, and Others. TO BE LET or SOLD, on very advantageous terms, WILLS' NURSERY, situated in the Fulham Palace Road, Hammersmith, comprising an area of an acre and a half. There are several Hot-houses very efficiently heated with hot water on the premises. This Nursery would be invaluable to a Florist as a growing place for market, being so near Covent Garden; or the property, held for an unexpired term of sixty-six years, can be purchased.

Particulars on application to W. M. WHITEHOUSE, 25, Chancery Street, St. James's, S.W.

TO NURSERMEN AND OTHERS.—The Proprietor of a good Nursery, 3/4 acres in extent, situated on the high road, close to county town, is desirous, from age (74), to give up business. No reasonable offer will be refused, either in the form of an Annuity or Purchase. Further particulars apply to J. B. GARDINER'S Chronicle Office, 41, Wellington Street, Strand, W.C.

TO BE LET, on Lease, a MARKET NURSERY, situated in N.W. district, consisting of an Acre of Ground, Eleven Houses, Cottage, Stabling, Yard, and every convenience. No premium. Stock at valuation. Some of the best Vines and Peach-trees in the county. Particulars of NURSERY, 41, Wellington Street, Strand, W.C.

PROTHEROE and MORRIS, HORTICULTURAL MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 67 and 68, Chesham, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had an application.

JOHN KENNARD'S HORTICULTURAL NURSERIES, Pent, Loam, Sand, and Berkshire Pottery Dept., Catalogue and Nursery Catalogues, etc. Swan Place, Old Kent Road, S.E. Established 1854.

To Landed Proprietors, &c. A. MCINTYRE (late of Victoria Park) is now at liberty to undertake the FORMATION and PLANTING of NEW GARDENS and PARK GROUNDS and REMODELLING existing GARDENS. Plans prepared. 115, Latona Park, Stamford Hill, N.

WILLIAM CLAPHAM SHAW HEATH, STOCKPORT, LANDSCAPE GARDENER and ROCK ARTIST. Has carried out many extensive works recently for Noblemen and Gentlemen. Can refer to Messrs. Sander & Sons, St. Albans, where work can be seen. To be formed, Sandstone, Natural Rockwork to suit any locality.

Vines-Vines-Vines. THE LIVERPOOL HORTICULTURAL CO. (John Cowan), Limited, have this season a splendid stock of GRAPE VINES; they are unsurpassed by any in the country, either for fruiting in pots or planting vines. Black and Golden varieties, including the famous G. St. Albans, 75/6 each; Fruiting Canes, 5/6 and 5/6 each. The Vineyard and Nurseries, Garston, near Liverpool. Telegraphic Address—"COWAN, LIVERPOOL."

THE QUEEN'S SEEDSMEN.
WORDSLEY, STOURBRIDGE

APPEAL TO THE BENEVOLENT

On behalf of Two Sisters, aged respectively 70 and 72, who have lived together all their lives (the younger has been an invalid for many years), but the leases of their property having fallen into the hands of the Ecclesiastical Commissioners some six years ago, have vainly struggled to obtain a living by letting apartments, the little money they had saved being now quite exhausted, and owing over a year's rent, make this appeal, hoping to save their home from being broken up, and parting with everything they possess. Will any kind Friends help them in their dearest distress? The following persons have kindly allowed a reference to be made to them, and will give every information respecting the genuineness of this appeal:—

- Dr. MAXWELL T. MASTERS, F.R.S., 41, Wellington Street, Strand, W.C.
 Mr. DOWKING, 50, Lupin Street, Piccadilly, S.W.
 Mr. J. KEASLEY, 62, Saltoun Road, Brixton, S.W.
 Mr. W. RICHARDS, 41, Wellington Street, Strand, W.C.
- Contributions gratefully received and thankfully acknowledged by Mr. W. RICHARDS, "Gardeners' Chronicle" Office, 41, Wellington Street, Strand, W.C.

National Pear Conference,

Royal Horticultural Society's Garden, Chiswick, Oct. 20 to Nov. 4.

NOTICE.

THE GARDENERS' CHRONICLE

FOR OCTOBER 17 and FOLLOWING WEEKS,

WILL CONTAIN SPECIAL ARTICLES ON

PEARS AND PEAR CULTURE,

Contributed by the Leading Growers of the day, and illustrated with numerous ORIGINAL ILLUSTRATIONS.

The issue for October 24 will contain a full

REPORT of the EXHIBITION of PEARS AT CHISWICK.

Among the Contributors to these Numbers are the following eminent Pomologists:—

- Messrs. Backhouse, York
 A. F. Barron, Chiswick, Middlesex
 R. D. Blackmore, Teddington, Middlesex
 G. Bunyard, Maidstone, Kent
 T. Comber, Monmouth
 The Cranston Nursery Co., Hereford
 A. Dean, Bedford, Middlesex
 M. Dunn, Dalkeith, Midlothian
 J. S. Dickson, Chester
 F. & A. Dickson, Chester
 J. Douglas, Ilford, Essex
 W. Easley, Hord, Essex
 S. Ford, Leonardale, Sussex
 D. T. Fish, Bury St. Edmunds

R. Gilbert, Buntingford, Northamptonshire
 T. James, Royal Gardens, Frogmore
 H. Lane & Sons, Berkhamstead
 C. Lee & Son, Ealing, Middlesex
 W. Hart, Combe Abbey, Warwickshire
 Francis Rivers, Sawbridge, Hertford
 C. E. Sanders, Jersey
 R. Smith & Co., Worcester
 W. Wildsmith, Heckfield, Hants
 J. Veitch & Sons, Fulham, &c., &c.

Price 5d., post-free 5½d.
 May be ordered of all Booksellers and Newspapers, and at the Railway Bookstalls, or obtained direct from the Publisher W. RICHARDS, 41, Wellington Street, Strand, W.C.

FOR SALE, 7000 GENISTAS, in 5-inch pots, good plants, at 25s. and 28s. per 100. To the Trade only, for Cash. Post-office Orders payable at Leyton Green. Boxes for packing charged for.

T. BALDWIN and SON, Nurserymen and Florists, Edith Nursery, Burchall Road, Vicarage Road, Leyton.

HERMAN BUDDENBERG, BULB GROWER, Hillegom, near Haarlem, Holland (formerly BUDDENBERG BROS.), begs to inform his numerous Friends in Great Britain that he has established himself under his own name and on his own account, at BULB GROWERS' NURSERYMAN and SEEDSMAN; and kindly solicits the continuance of the same patronage and confidence as was entrusted to him for so many years. He will be pleased to receive the Wholesale Price LISTS of his Commercial Friends, and will mail his own free on demand.

B. MALLER and SONS beg to offer to the Trade a very extensive and unusually well grown stock of ERICAS (Hymenais and other varieties), EPACRIS, SOLIANUMS, GENISTAS, CYCLAMEN, BOUTARDIAS, ADIANUM CUNEATUM and other FERNS, GARDENIAS, STEPHANOTIS, FICUS ELASTICA, GREVILLEAS, VINES in Pots, &c. An inspection is invited. Trade CATALOGUES forwarded on application. Bunt Ash Lane Nurseries, Lee, S. E.

LOVEL'S STRAWBERRY RUNNERS
 Strong, healthy, and well-rooted.
 Sample of Plants, 5d. Price LIST free.
 W. LOWE and SON,
 Strawberry Growers, Driefield.

JAPANESE CHRYSANTHEMUM,
 G. WERMIG—One mass of large golden flowers from August to November, out-of-doors. First-class Certificates of the Royal Horticultural Society and National Chrysanthemum Society. Highest references in the gardening papers. Mr. DAVIES, the leading grower, says of it in the *Journal of Horticulture*:—"A most valuable acquisition. I congratulate Mr. Wermig upon raising such a specimen. It is one of the ground, 2s each, 18s. per dozen. Cash with order."
 G. WERMIG, Florist, Woking, and 154 and 155, Covent Garden Wholesale Flower Market, W.C.

THE
Gardeners' Chronicle.
 SATURDAY, OCTOBER 17, 1885.

PEARS FOR SMALL GARDENS.

THE approaching Pear Congress recalls some experiments in the cultivation of pyramids and bushes in my own garden in Essex. I had ten years' experience of the system which the late Mr. Rivers described in his *Miniature Fruit Garden*, and which he personally explained to me; and when last I saw my old favourites, all budded or double-grafted on Quince stocks to dwarf their growth, they were bearing large crops of fruit. I was an amateur, but in paying a recent visit to the famous nurseries at Sawbridgeworth one of the questions put to the existing firm was "Why should not the problem of Pear-growing for the million be solved by cottagers?" The Pear is peculiar. Other fruits can be grown by the acre almost anywhere, but I observed lately that Lord Sudeley, in his Worcestershire experiment, had planted thousands of other fruit trees, but a few hundreds only of Pears. It is the same in Kent, where Pears are grown in very small quantities compared with Apples, Cherries, Plums, and small fruits. The Pear of Old England, which gave the name of Pear Tree to scores of sites and spots in various counties, will flourish in all soils, drive its roots deep down in clays or gravels, still growing into the same sturdy, rigid, tree and bearing the same big crops of hard and indifferent fruit. But Pears that melt in the mouth, like Marie Louise, or buttery Pears like Beurré Bosc, are all fastidious subjects, requiring warm soils and plenty of sun. All the conditions of their production must be favourable—sort, stock, soil, and site must all be well chosen, and some will succeed where others may fail.

In a tent, on a village green in Sussex, the other day several prizes for Pears were awarded to cottagers, and each Pear would have sold at 6d. or 8d. in the fruiterers' shops at Eastbourne.

In another Sussex village I have more than once heard from a cottager the story of the Plum tree, price 1s., sort Victoria, which he planted against his house, and which soon brought him a crop of eight dozen, which he sold to a dealer at 12s. a dozen. Plums are not my subject, but near that profitable Plum tree, in another cottage garden, is a big bush of Williams' Bon Chrétien which produced nearly a bushel of Pears this year. I called several times in passing the cottage to admire the Pears and to witness certain smiling faces as the crop ripened, till one day I found the tree stripped. A dealer had called, and for each Pear he had left behind a penny. They were retailed in the nearest town at 2d. and 3d. each.

As in Essex, so in Sussex, or any other dry county not too far North. You may grow in dry climates the finest dessert fruit on the various kinds of dwarf trees. There are soils and sites here and there capable of producing the best Pears on large orchard trees, but it seems to me that the artificial system of Mr. Rivers might be carried out generally by cottagers, because the great obstacle to the plan,

the cost of labour, would be obviated. I cannot show a balance-sheet of my own Pear garden, inasmuch as the produce was consumed at home, but I can say that the labour cost nothing, for I planted, pruned, and pinched the trees myself and also picked the crop. In the case of cottagers, too, the labour of the garden is a labour of love. The cost of the best Pear trees, two and three years double grafted, is 30s. per dozen, or one year grafted 18s. per dozen, or less; and I believe that if two or three millions of these dwarfed fruit trees were planted in cottagers' gardens by the landowners, who might charge ten per cent. on the outlay, that a considerable income would devolve upon a class whose homes cannot be made too attractive. I asked at Sawbridgeworth, the other day, "What do you think of this scheme?" and I got a reply conveying real information, with examples, for the cottagers of that neighbourhood have borrowed the practice set before their eyes during the past forty years by Messrs. Rivers, and are growing Pears on small trees as they do.

Within the limits of this nursery of 140 acres, mainly devoted to fruit trees, with a few acres of Roses, a number of Pear trees have been planted, as examples for the production of fruit and to show the various methods of training. The espaliers, and five-branched cordons are kept in form by five wires held by sticks and supported by strong posts, 30 feet apart. Some of the cordons are diagonal, others upright, and some are trained to a single wire running parallel with the ground and 8 inches high. All the appliances are inexpensive. Those handsome and large fruited seedlings, Princess and Magnate, both raised from pips of the Louise Bonne of Jersey, and both prominent among the 100 varieties which gained Messrs. Rivers the 1st prize at the Crystal Palace, Oct. 7, were grown on cordons only three years old. It used to be said of a Pear planter, he "plants Pears for his heirs," but a cottager can now plant a pip at the birth of a baby, and the seedling will begin to bear almost as soon as his little one can run alone.

A great advantage of small trees consists in the opportunity offered for the testing of sorts. In many gardens sorts unsuited to the sites are planted, they stand ten years without bearing, and after encumbering the ground perhaps another ten years, they are cut down. They can be tested on the Quince stocks in a year or two by planting cordons, or dwarf maidens, which may be trained as you please. Some sorts, as Gansel's Bergamot, bear indifferently on the Pear and far better on the Quince, when double grafted. Others do well on either stock. Fondante d'Automne, a capital October Pear, with smooth tender skin, good eye, and a particularly well-bred appearance, is one of these. Beurré Hardy, another October Pear, with a good deal of colour when grown in full sunlight, is almost too vigorous in habit for the Pear stock, but it proves a free-growing, free-bearing pyramid on the Quince. A cynical remark is heard sometimes at markets that "a Pear is a Pear," and it must not be forgotten by growers for sale that good quality is not more indispensable than good crops, and therefore I would strongly recommend the principle of testing at home before planting doubtful sorts largely.

Another point to bear in mind is that Quince stocks require good soils. My own Pear plot was a stiff clay, which is as ungenial as a sharp gravel, and must be corrected. With this object I dug holes 2½ feet deep and 3 feet square, and placed broken bricks and tiles at the bottom. The holes were then filled up with a mixture of the clay, with friable soil, consisting of rotten turf and road-scrappings. The made earth was raised a foot above the surface, and the tree planted on the top to the depth of the bud or

graft. I believe this plan promotes the absorption of moisture and solar heat, and assists the ripening. We kept the ground clean by hoeing, but avoided digging. It has been said that raised borders dry rapidly, but they will not do so if they are mulched, and I have always thought that the comparatively shallow root-hold of the dwarfed trees which keeps them out of hurtful subsoils is not unfavourable to them even during droughts, owing to the large mass of fibrous roots which such trees produce. Growers must remember that large fruit crops can only be obtained by means of abundant dressings. A strong manure used by Messrs. Rivers, especially in pot culture in orchard-houses, consists of half road-scrappings and half kiln-dust mixed together and saturated with strong liquid manure. Cottagers residing away from the great Hertfordshire maltings may substitute the manure of their pigs. But although raw manure may be used at the surface it must not be mixed with the soil at the time of plant-

different shape, and some may be noticed spreading wide and not more than 3 feet from the ground, each bearing this year about a bushel.

In speaking of cottagers, I ought to have said, that in this parish of Sawbridgeworth, as elsewhere, they do not possess properly constructed fruit-rooms, and, therefore, they do not grow the keeping Pears, which require careful storage and thin distribution on shelves. Except a few hard baking Pears, which may be heaped without injury, almost like Potatoes—the Vicar of Winkfield, for example—they confine their attention to early sorts, which the dealers collect at the time of gathering. Doyenné d'Été, ripening in July, is one of their favourite sorts, and the earliest. As a bush on the Quince it is most prolific, but it must be double grafted. Other favourite sorts of the same class are Beacon, Williams' Bon Chrétien, and its esteemed seedling Souvenir du Congrès, which ripens two or three weeks later; and after them

FIG. 102.—PEAR-CORDON ARCH. (SEE P. 450.)

ing. The speedy restoration of exhausted fruit trees when the turf of the orchard proper is liberally dressed shows the propriety of surface dressings.

The best shapes are pyramids and bushes, according to the habit of the particular variety of Pear. Pruning is a very simple matter. The crops these trees produce will prevent rampant growth, and nothing is needed beyond stopping the shoots in July and a necessary thinning-out in winter. Learners with gardening instincts soon fall into this system of culture. Some of the trees at Sawbridgeworth have been kept hollow in the centre, around which is a circle of long leading branches, cordon-like, rising 8 feet high, and literally crowded with fruit. Instead of ropes of Onions there are ropes of Pears, richly coloured, of various shapes such as different kinds of Pears present, and offering to my thinking a novel and beautiful spectacle. These trees stand about 6 feet apart, and the crop in many cases is not less than a bushel to a bushel and a half on each tree. There are bushes on trees of other habit and

Marie Louise and Louise Bonne of Jersey, and Madame Treyve, ripening in October. Fertility is another promising Pear of the same month. These are followed in November and December, in the case of growers who can keep them properly, by a host of sorts—Beurré Bosc, Glou Morceau, Pitmaston Duchess, Doyenné du Comice, Durandeau, Duchesse d'Angoulême—a Pear that recalls some of the "idiosyncrasies" of fruit trees, for it proves insipid when grown on a wall, though rich and melting as a pyramid on the Quince. I will merely remind the grower that the sorts he selects should if possible be subjected to the test of trial at home. It would spoil his profits to plant Pears like Beurré de l'Assomption, for example—a good Pear, but producing tender blossoms, which readily rot, or are easily cut by frost, rendering the variety quite unsuitable for outdoor culture, though it is a noble Pear under glass. He would do wrong, too, to plant any sort bearing very large fruit except as dwarfs, for such fruit growing on tall trees would be easily shaken down by wind. This seems another good argument in favour of the dwarfing system. H. E.

New Garden Plants.

CATLEYA SCITA, n. hybr., nat. (?)

MR. B. S. WILLIAMS imported this very fine novelty amidst a mass of *Cattleya intermedia*. Finally it expanded its flowers, which are of quite the same shape as those of the larger variety of *Cattleya guttata*. The sepals and broad waxy petals are of the lightest ochre, with a few marginal, very light purple shades, and some small blotches of the same colour scattered in a most irregular way over those organs. The lip has its lateral laciniae half round, projecting in obtuse sharp angles. The general colour of them is

Rchb. f., give it two flowered inflorescences of flowers like those of *Dendrobium radians*, Rchb. f., and you have this lovely Borneo novelty, just introduced by Mr. W. Bull. The stem at hand exceeds 2 feet in length, and is as thick as a moderate goosequill, with 6-8 furrows and blunt angles. Leaves very strong, glistly, 1½ inch long by 0.6 inch wide at the base, tapering, blunt bilobed at the apex. Racemes very short, with two flowers. It appears most probable they will by-and-by become richer. Ovary green. Long pedicel white, with green base. Apex of mentum green. Flower purest white. There is a fine purple blotch at the base of the lip, and similar lines in front of the column under the fovea. There are three purple blotches at the base of the lip, and there are three purple petals oblong, blunt, far surpassing in extent the semilanceo-triangular sepals, which have obscure keels. Lips basilar, lobes very short, triangular, midlobe

biatæ" or Chimeroids, I hoped, indeed, to find a name for this, though its appearance was puzzling to me. I must, however, confess, I did not come to the point. A specimen of what may be the same I have from Wallis, left unnamed. Can it be a hybrid between *Masdevallia spectrum* and *M. Chimera*? I should guess so, were it not for the large flowers of the last named species and the comparatively small one of *Masdevallia senilis*, and for the rather equal length of the tails and bodies of the sepals. The flower is equal in size to one of *Masdevallia Benedicti* (prodolites). The reddish-brown colour of the sepals is as in *Masdevallia Rozeii*, *Winnianna spectrum*, &c. The inside is covered with numerous exceedingly short yellow hairs. Petals white, with two to three mauve-brown spots. Lip lightest purple and white. Column light green. The large leaves are remarkable when compared with the comparatively small flower *H. G. Rehb. f.*

PRUNING AND TRAINING PEARS.

By reference to my former remarks at p. 272, it will be noted that my second paper has to do with "Pruning, training, aspects and the forms that are best suited to certain varieties." Pruning and training I take together, for the simple reason that the mode of training must in some degree determine the extent, and frequency or otherwise of pruning. To illustrate my meaning, here is a tree with a single or may be double stem, trained to a wall some 10 feet in height, and which we call a "cordon," and on the same wall is another tree trained horizontally, and covering a space at least twenty times the size of the "cordon," and each have roots proportionate to spread of branches; as a matter of course therefore, the one form requires very different treatment, as regards pruning, to the other; and here I ought to explain, that I apply the term pruning to both root and branch, for the one always acts in sympathy with, or rather is influenced by the treatment the other receives.

Pruning.—With this explanation I pass on to note the fact that some good gardeners, men of deep thought and of first-rate practical ability, disapprove pruning, and do just as little of it as they are obliged to do, for appearance sake—I mean the appearance of the trees. Their favourite argument is that Nature ought to be allowed to prune by fruitfulness. Well, sometimes (very rarely though) Nature does oblige us, but she is far too feckly to be trusted at all times, and as regards Pears, never. Extension or freedom of growth combined with renewal of soil, will sometimes revive the waning vigour of an old tree, but once that vigour is assured there will be but little fruit unless the pruning-knife is judiciously applied. I grant that fruitfulness would be the best pruner, or, say the preventer of the necessity of it, but then how is this constant fruitfulness to be attained? Why, in no other way than by pruning. Call this dogmatism, or by whatever term you like, I have proved it by that best of all tests, namely, abundant crops of fruit from the same trees every year and for many years in succession.

Having decided that it is necessary to prune, next come the questions to what extent, and at what season it should be done—questions most difficult to answer in a way to suit varying climates and soils, hence general answers can only be given. In my former paper it will be seen that the Quince was most in favour as a stock for Pear growing, and it gains another mark in respect of this question of pruning. The fruitfulness of trees on the Quince over trees on the Pear stock is proverbial, and consequently less pruning is needed, and this pruning is best done in the summer by pinching out points of the young shoots as soon as they have grown to the desired length the form of training necessitates. And here I would observe that I am no believer in such constant repression of the summer's growth as to render winter-pruning unnecessary; so far from this being the fact I sometimes allow the growth of trees that are lacking or appear to be waning in vigour, to remain intact till the winter, and even then give pre-

ulis; tepalis apice bivalvibus pulvinari incano hispidis; labeo basi angulato calceolari antice assurgente valde angusto, habulo anteriori denticulato, carinis longitudoibus tenuis, lateralibus obliquis numerosis; columna apice apiculata sese denticulata. Perigonium rufulum, parte inferiori sepalorum lateralium ochroleucum. Linea obscure, 3-7, in basi sepalis impatis ochroleucis. Tepala alba medialibus violaceo brunneis. H. G. Rehb. f.

*

FIG. 103.—MARIE LOUISE, ON THE PEAR-STOCK; BRANCHES TRAINED DOWN. (SEE P. 490.)

lightest sulphur, anterior edges of the laciniae purple, disc white with some purple lines. Claw of the lip broad linear, entire, long anterior blade transverse, oblong, emarginate in front, toothleted on the sides. The whole of this part, excluding, however, the white base of the claw, is of the finest purple, and the asperities on the disc teach us clearly the affinity with *Cattleya guttata*. The column is of the lightest yellow, with some fine purple lines and spots. T.m.t., it is exceedingly elegant, for the noble simplicity of its fine colours. There can scarcely be a doubt about its origin. *H. G. Rehb. f.*

DENDROBIUM PARTHENIUM, n. sp.*

Take the stem of a very tall long-leaved *Dendrobium revolutum*, Lindl., or of *Dendrobium Dearei*,

* *Dendrobium Parthenium*, n. sp.—Aff. *Dendrobium Dearei*: caule elongato multicaulato; foliis densis cartilagineis a basi latiori oblongis apice obtuse bilobis; racemis inter folia bifidis (semper ?); mento extractioformi ovarii pedicellati dimidium squante; sepalis triangularibus acutis obscure medio uncinatis;

cuneate, obovate, emarginate, a little wavy, very stately. It is named *Parthenium* in allusion to its white virginal flowers, which might, no doubt, have pleased *Vesta* herself, provided the Romans had known *Dendrobium*. *H. G. Rehb. f.*

MASDEVALLIA SENILIS, n. sp.*

This was imported by Messrs. H. Low & Co., amidst specimens of *Masdevallia Chimera*. Having before me a set of more than twenty "Saccila-

tepals oblongis obtusissimis subacutis; labellulis basilaribus obtuse minutique angulatis, lobo medio producto magno cuneato oblongo bilobo undulato; columna apice constricta tridentata, infra ampliata, sub fovea stigmatidis fovea altera oblonga. Flos cardinalis. Labellum disco basilaris purpureum. Linea quaedam purpurea antica in columna. Ex Borneo insula introd. dom. W. Bull, Londinensis. *H. G. Rehb. f.*
* *Masdevallia senilis*, n. sp.—Aff. *Masdevallia specto* et *Chimera*: folio spatulato acuto exitis per nervum medium carinato, pergamento, pedunculo breviori unifloro (semper ?); sepalis a basi triangularibus sensim in caulis sequilongas attenuatis lateralibus subdivaricatis, omnibus parce ac brevissime flavo-pilosis;

ference to leaving the new shoots rather than rigid adherence to modes of training.

Trees on the natural or Pear stock, no matter in what description of soil they are growing, are so profuse in wood-growth that they require just as much summer pruning as do those on the Quince, and in addition winter thinning out of spurs is always necessary, except in seasons like the present, when abundant fruiting limits wood growth.

Root-pruning is a knotty point to deal with, but—Pharisee-like—I have settled it to my own satisfaction. It is necessary; and yet one can obtain fruitfulness of trees by all but dispensing with it. Trees on the Quince stock never root-prune (they fruit abundantly every year). When out trees are received from the nursery the thick woody roots are cut rather hard back, and any that have manifested a tendency to go straight down we cut clean off. This is the first step towards prevention of root-pruning, and the next is that in two years from the time of first planting the trees are again dug quite up, all thong-like and particularly straight down roots are again cut off, and the trees replanted, and those on Quince never require curtailment of root again. Those on the Pear stock occasionally do, and when such is necessary one side of the tree is rather hardly dealt with one year, and the other half the following year; but it is only large trees that are allowed unlimited growth that require such curtailment frequently.

Column Training.—Whilst on the subject of root-pruning I would like to refer to a line of about fifty conical trained trees that we have here, every one of which is on the Pearstock. They fruit most regularly, and yet are never root-pruned, at least not in the strict sense of that term. They are growing at the back of a border 3 feet wide, and which is filled with Roses. These—the Roses—are all lifted every alternate year, and the border is deeply trenched and heavily manured. During the process of trenching any Pear roots likely to interfere with the growth of the Roses are cut away, but only such, and yet this appears to be sufficient to keep the trees in a high state of fruitfulness, and no doubt the rich dressings that are intended for Roses only has much to do with the production of fine Pears. The Marie Louise, on the Pear stock, fig. 103, p. 489, is one of these trees. The cut does not very clearly show the mode of training, but as I think this ought to have somewhat of the credit of continuous fruiting I refer to it. The tree is furnished with branches from one main stem, each branch at a distance of from 24 to 30 inches from the main stem is bent downwards, and in some instances, for the sake of uniformity, the bend is rather a severe one, but my belief is that the change in direction thus given conduces to the formation of fruit-buds; hence I most strongly recommend this mode of training for gardens or positions that are restricted with regard to space. I ought to add that the mode of training is simplicity itself, the branches are merely bent to the desired angle, and are then with a piece of cord secured to the main stem, and the operation is complete; of course care is needed not to break the branches by bending them too far at once. They should be got down by degrees.

Bush Training.—Another form of training that is much in favour here is what may be described as an "upright bush form," of which fig. 106, gives a pretty correct representation. It is a tree of Beurré Clairgeau on the Quince stock, and which was planted in the autumn of 1876, and except the year after planting, the crop of fruit has been as heavy as it is this year. The mode of training is self-explanatory. Root-pruning has only been that of lifting and replanting in the autumn of 1878, and which did not affect the fruiting of the following year. Rich surface-dressings of manure have been regularly applied, and which might be thought to aid wood growth, but such has not been the case, either in respect of this tree or of many others that were planted at the same time, and which are trained in a similar fashion. The only pruning the trees receive is that of pinching back the lateral growths of the principal branches twice during the season, the first pinching being done about mid-summer, and the last at the end of July or beginning of August. Of course, when the trees are being pinched, and there is space for another principal branch, the most likely young shoot is left intact with that intent. The winter pruning required is almost nil, for there is really nothing to be done except it be the cutting out of any long spurs, or may be the removal of a main branch, with a view of making the trees more uniform.

We have some trees of the same form on the Pear stock, but they are much more difficult to keep in a fruitful condition. The reason will be obvious when it is stated that wood-growth is at least six times greater than that of trees on the Quince, consequently we have to check this redundant growth by root-pruning, in the manner indicated above.

Sticks.—The question will naturally be asked, why have trees on the Pear stock at all? To which I reply, because it is suitable for soils in which trees on the Quince would be very short-lived. Indeed, in shallow sandy or gravelly soils, trees on this stock would thrive and fruit; but a couple of years would be sufficient to kill trees on the Quince; moreover, some few varieties of Pears are finer, and fruit just as well on this stock as on the Quince. Amongst those that have come under my own observation are Duchesse d'Angoulême, Josephine de Malines, Winter Nelis, Swan's Egg, Dummore, and Beurré d'Espérance. It will be such information as this that the approaching Conference will elicit if each exhibitor will state in full the conditions, stocks, &c., under which each of his exhibits has been grown.

The Cordon System.—For some few years past the "cordon" system of training has been immensely popular, and I think justly so. Undoubtedly the great merit of the system is the power it places in

first-class for dessert in one district have to descend to the culinary class elsewhere, and it is the same more particularly with regard to position or aspect. Trained to a wall a bad kitchen Pear will oftentimes prove a good table Pear, all of which considerations have to be taken into account in discussing this branch of my subject, and readers must therefore pardon me asking that my remarks under this heading may be interpreted as having local significance only. What I mean by local in this connection is the south and south-western counties of England.

Aspects.—The aspect of all others for the growth of Pears on walls is a west one—a conclusion that I have arrived at after years of experience with trees on all aspects, and without exception all varieties grow and fruit more regularly, ripen, and especially colour better than on any other aspect, not even excepting a southern one. The reason, I think, is sufficiently clear, namely, the lengthened amount of sunshine that this aspect commands over all others; and what is of still greater moment is the lessened intensity of it, so that, if I may so put it, the fruit is gradually ripened, not roasted into ripeness; and to this alone I think is attributable the high colour of fruit grown on this aspect.

Training on Walls.—As to form of training for walls I unhesitatingly advise the cordon, or what I shall call treble cordons—that is, a tree with three stems—planted a yard apart, thus allowing a foot for each branch, and by way of increasing the length of stems they should be trained obliquely, say at about an angle of 45°. If a quantity of any one kind of Pear is in demand then there is no better mode of training than the old-fashioned horizontal style.

Sorts for Walls.—As regards varieties for growing on walls I have yet to learn the one that does not merit that distinction by fruiting regularly. But it would be a waste of valuable space to give second class kinds such a position. Our own rule in the matter is to entirely exclude early varieties, because they ripen perfectly in the open borders or as cordons. As per fig. 102, p. 488, only mid-season and late kinds are favoured with wall training, and only the very best of these, that is, the largest, handsomest, and highest in quality. Any exception to this rule is only made in respect of very late though small kinds, such as Bergamote d'Espérance, Knight's Monarch, Josephine de Malines, Glou Morceau, and Huyshe's Victoria. The following are a few of the kinds that best deserve wall (west) training:—Beurré d'Amanlis, Flemish Beauty, British Queen, Beurré Superfin, Fondante Van Mons, Beurré Hardy, Brown Beurré, Louise Bonne of Jersey, Urbaniste, Beurré Diel, Doyenné du Comice, Durandeau, Maréchal de la Cour, Marie Louise, Elmston Duchess, Beurré Clairgeau, Délices d'Hardenpont, Nouveau Poiteau, Van Mons, Léon le Clerc, Chaumont, Beurré Bachelier, Beurré d'Arenberg, General Todleben, and Zepherin Grégoire.

Standards.—In regard to fruit trees in the open borders the Pear, as requiring the longest season to mature its fruit, should always have the most favourable position, and varieties of a straggling habit of growth should either have plenty of room or else repressive training, as illustrated in fig. 103 and 105. Marie Louise, Josephine de Malines, Beurré Rose, and Knight's Monarch may be cited as examples of straggling growth. Compact, almost true pyramidal-shaped growing kinds are Beurré d'Espérance, Huyshe's Victoria, Comte de Lamy, Marie Louise, and Beurré Diel, and these, of course, are best suited for planting in borders of limited width, because, without much labour in the way of pinching or pruning, they are easily kept within restricted lines.

W. Wildsmith, Heckfield, Hants.

(To be continued.)

THE UNFRUITFULNESS OF THE PEAR.

It is a generally accepted fact that Pear tree blossoms must be properly fertilized to insure fine fruits that will properly mature in due season. My observation here has been now for some time in direct contradiction with this hypothesis. I have a very tall, large-headed specimen of the old variety Chaumontel, which is about 40 feet in height, and, owing to its height and isolated situation has to contend against all cold winds and spring frosts which occur. Notwithstanding this I have noted now for a few years past not only that this tree flowers, but that it invariably gives its full crops of fruit. This fact naturally led me to inquire whether this was owing to extreme hardness or to some other cause, and in the result I have found very many of the

FIG. 101.—DIAGRAM TO SHOW CONSTRUCTION OF THE PEAR. (SEE P. 491.)

the gardener's hands of having within the same space as previously a much longer succession of fruit. To take our own case: previously we had 9 yards of wall-space occupied by one large horizontally trained tree of Beurré d'Amanlis Pear; in the same space we have eighteen varieties of Pears, and though some few come in at near about the same season, we have a succession of fruit over from eight to ten weeks, in lieu of the three weeks that Beurré d'Amanlis continued in good condition. But this is not the only advantage. By high feeding we get finer, more beautifully coloured and highly flavoured fruit; and yet again, every cottager can now humour his fancy in his own little plot by the cultivation of Pears on this principle. The picture (from a photograph), fig. 102, p. 488, gives but a very faint idea of the beauty of an arch we have here trained on this principle, nearly every tree of which is annually clothed with fruit. About two-thirds of the trees are on the Quince, the remainder on the Pear stock, and these we sometimes have to cut round at the root, though very seldom, as close pinching of new growth, that cordon training entails, has necessarily its repressible effects on root extension.

SORTS, SOILS, AND ASPECTS.

With regard to the second part of my subject—viz., "Aspects and forms that are best suited to certain varieties"—it must ever be borne in mind, that perhaps there is no fruit that varies more greatly, in various soils, aspects, and districts, than does the Pear. Some kinds that are quite worthless in one district are in others excellent, and some that are

fruits really contain no seeds. Similarly, therefore, as Cucumbers occasionally are found to possess no seeds, though growing to a fair size, &c., precisely as large as seedling fruits do, and appearing as if they must possess them, the Pears upon this tree, somehow or other, show the same peculiarity. Given a show of flower, a crop of fruit is assured accordingly. I need not say this phase in fruit growing is a very acceptable one, and worthy the attention of propagators, did it appear possible to perpetuate it. The pipsless fruits are certainly not large, though as the tree is so very large, and necessarily of great age, this in a measure, no doubt, accounts for that fact. Certainly the whole of the crop continues upon the tree until the usual time, showing that in all but seeds the fruits derive all necessary sustenance to the last. When speaking of this matter to Dr. Masters lately, he informed me a permanent pipsless variety was grown upon the Continent. Should not British gardeners secure this boon? *William Earley.* [Many varieties occasionally are devoid of seed, but *Belle de Bruxelles*, or the *Boite sans pépins*, is always so. The true fruit of the Pear is the core; the fleshy edible portion is nothing but the end of the flower-stalk, which swells and becomes succulent. This may be seen in the specimen shown at fig. 104, and by numerous other specimens figured in these columns from time to time. ED.]

TREES AND SHRUBS.

PICEA MORINDA.

THE cone of the above figured recently in the *Gardeners' Chronicle* was quite characteristic of those

FIG. 105.—MODE OF RENOVATING OLD PEAR TREES.

produced in number on several trees at Penrhyn. This morning, although I examined several cones on three of the largest trees here (they are fully 50 feet in height), I quite failed even in one instance to notice what your correspondent (p. 435) directs attention to. All the cones were perfectly regular in formation, and with no appearance "as if a ligature of varying width were irregularly run round the cones." Very immature trees, or such as are unfavourably situated, often produce malformed cones. If there is anything more than another in the horticultural Press that requires remedying it is certainly the misleading fashion, too frequently adopted, of figuring abnormally large and fine specimens of flowers and fruit. In choosing specimens for drawing I have always been most particular not to take extraordinary, but such as are a fair average in every way, so that the inexperienced reader may not be deceived. The branches of this Spruce are never drooping, but horizontal, with up-curved points; the branchlets, however, droop in a remarkable degree, in fact project at right angles to the branch on the under-side. The cones are invariably produced on the three years old wood, or, in other words, at the joint of the third row of branchlets from the apex. I may here take the opportunity of pointing out that I do not at all agree with the statement made at p. 393, that the cones of this tree are at first erect, but soon become pendent, at least such I have never noticed in the trees here. *A. D. Webster.*

HIPPOPHAE RHAMNOIDES (SEA BUCKTHORN.)

This is a dwarf dioecious tree or shrub, with small linear leaves, and minute yellow flowers, succeeded by bright orange-coloured berries. It is a native of

the east coast of Britain, and is very suitable for planting near the sea as a shelter, as is conclusively shown by the manner in which the trees forming quite a plantation in the neighbourhood of the Bass Rock, and within a few yards of the sea, which forms the eastern bounds of Tynninghame Park, in East Lothian, luxuriate. The mass of silvery foliage as seen under the light of a bright blue sky is very effective in the distance, an effect which as the distance diminishes, is at the present time considerably heightened by the profusion of bright orange-coloured berries, with which the individual shoots or branches are studded. Therefore, it seems strange that a shrub like the one forming the subject of this notice, which not only flourishes at the seaside regardless of being frequently washed, as is the case with the trees at Tynninghame, by the briny spray, but is also a shrub of a highly ornamental character, is not more widely known, and consequently more extensively grown as a shelter in our many places of seaside resort; such, for instance, as the east and west cliffs at Bournemouth, where scarcely a tree or shrub, except the green *Eunymus*, of the many that have been planted in those bleak situations with a view to affording shelter as much as improving the appearance of the place can be induced to grow in the face of the salt breeze and cutting winds from the sea. It is therefore with a view to bringing under the notice of those of your readers who have to do with the planting and beautifying of certain situations in and about seaside towns the name and character of a shrub (*Hippophae rhamnoides*), which cannot fail to give

satisfaction in such situations, as it is pre-eminently a maritime shrub, that these notes are written in the hope that they may lead to a more liberal and judicious use of the tree in question being made in the places indicated above in the future, and that in consequence spots of vantage-ground which are now undesirable as places of resort to many of those visiting the seaside, by reason of their exposed situation, may be rendered comfortable, and favourite places of resort.

Having referred to Tynninghame, the beautiful residence of the Earl of Haddington, near Prestonkirk, in connection with the Sea Buckthorn, I may be allowed to say that the park, which extends far and wide, is beautifully wooded, and contains fine views of woodland and sea-coast scenery, as well as a series of pleasant walks, leading respectively to positions whence a variety of landscapes, composed of hill and dale, rich in sylvan beauty, and rugged though picturesque sea-coast, with the sea and distant rocks and hills in the background, present themselves in bold relief one to the other, the whole harmonising well with the character of the place.

In conclusion, I may remark that a short distance from Mr. Inglis' house, in the front and rear of which are well cared for flower and kitchen gardens, is a fine specimen Beech, having a clean straight stem for about 50 feet from the base, and a circumference of about 7 feet the entire height. *H. W. Ward.*

ARBUS UNEDO.

Messrs. Veitch send us under the name canariensis, from Combe Wood, flowering specimens of an *Arbutus*, which we take to be the red-flowered form of the common *Arbutus Unedo*,

with deep rose-pink flowers. It is a very handsome tree or shrub, the dark green of the foliage contrasting well with the reddish flowers. We cite the name under which the specimen was sent to us, but it is by no means the *Arbutus canariensis* of the *Bot. Mag.*, t. 1577.

ROOT-PRUNING OF THE PEAR:

ALMOST the first operations of the original cultivators were on the roots of Pears and other trees. With a keen eye for the best wildling Pears and other fruits, they would naturally exercise their talents in selecting the best strains and transplanting them, either by transplantation or grafting, near to their home; and every step in cultivation has been one also in root-pruning, and this of necessity rather than of choice. The concentration of seeds into beds and borders, cultivated patches, for safety and more rapid germination and moisture, necessitated their speedy transplantation and frequent removal; and any such disturbance of Pear roots proved a root-pruning of the most radical sort.

The nursery treatment of young Pears was and is rough and rude rather than genial and gentle. The roots having little commercial value, were too often treated as worthless; the tops were worth so much a foot or yard, and hence were almost religiously conserved. The Pear, being naturally a deep-rooting plant, suffered more from rough-and-ready and reckless modes of lifting than most other plants. Unless the spade were long and sharp, it missed or failed to cut the roots; nevertheless, the drawer, by a strong vertical pull, or side strait, or various wriggles, was supposed to have heaved the roots of the tree, or snapped them off more or less closely to the base of the bole—either method resulting in samples of root-pruning of the most trenchant sort.

Having destroyed and mutilated the major portion of the roots of Pears by rough-and-ready lifting, a second step was taken in root-pruning by the practice of inlaying the young plants by the heels. It originated at a time when roots were held in little esteem, and hence a temporary interregnum between seed-bed and lined-out rows was accounted of little or no moment; but as the value of roots is more correctly assessed, out of the seed-beds into the row has become the rule in regard to seedling Pear or other trees. Pear plants, whether mere seedlings or those of older growth, inlaid by the heels, rooted with abnormal rapidity, made roots as the proverbial farmer is said to make hay, when the sun shines. And it frequently happened that when the inlaid plants were wanted for lining out, the whole of the earth with which they were covered was filled with a veritable network of young, soft, brittle white fibrils. These not only filled the earth, but interlaced each other in all directions, or the trees were mostly laid in by the heels thickly. However, when the plants were separated the roots were snapped and smashed up and ruined, like delicate glass tubes roughly handled. Other plants were lined out in single file to do battle with the severities of our winter and spring climate either without roots or with the latter in very sorry condition. The survival of the Pears under such severe dual root-pruning, crowded, as a rule, within the limited period of one or at most three months, gave ample proof of wonderful tenacity of vital power. Neither do these two examples exhaust our catalogue of cases of root-hacking or pruning in the history of the Pear or other fruit-trees.

Annually, or biannually, the trees are lifted and lined-out: at greater distances, and between most of these liftings and replantings there were other interregnums of inlaying by the heels, and these three were the final liftings, packings, journeyings—inlaying before final planting in their permanent homes or growing quarters. It is hardly to be wondered at that trees subjected to such severe root-pruning not seldom grew so strongly afterwards as to give rise to the adage that "He that plants Pears plants for his heirs." These root hackings and lashings, in fact killed many trees, stunted and cankered many more into uselessness and disease. Nor did these severe methods or accidents of treatment exhaust the harsh treatment of Pears. Unsuitable selection of sorts, sites, and soils, unskillful planting and treatment, irrational top prunings and trainings tended to the misdirection or waste of power, and to check the healthy development of roots of a service-

able character. So numerous and severe were the rigorous measures applied to the Pear, that growth was well nigh stopped, or wholly misdirected. Well nigh denuded of roots, these, so soon as made, bored deeply below, and sent up fishing-rod-like shoots above. Like most extremes, the root hackings and slashings, air dryings, and general neglect, were succeeded by a period of semi-root-growth. Root-culture, careful husbanding, was proclaimed as the new gospel of Pear and general fruit culture; therefore roots, before held as little better than shoddy, became the be-all and end-all of fruit culture. "Roots, roots, more roots," was heard in all directions, and the Pear trees possessed of roots all things were possible, hence the rage for deep rich borders, the best loams were even further enriched with a third, more or less, of good farmyard manure.

The excessive stimulation and over-feeding of the roots resulted in Pear timber in plenty, and few or no fruit.

At this stage, with ages of previous experience in Pear treatment and its results to guide them, the principles and practice of modern root pruning were well and surely laid. The chief of these may be briefly stated thus. The modification of the character and function, rather than the mere reduction of the number of the roots, and the establishment of a sure and certain correlation between root condition and fertility of top. The fact that a cut Pear tree or other plant is a unity, as well as to some extent a congeries of independent individuals, in the matter of its buds, has been too much lost sight of. The action of root and top upon each other is reciprocal, hence the truism "Like top like bottom," is almost absolutely true. And had this been borne in mind during the period of the root culture of the Pear, such success in fertility might have been reached as would have rendered most of our modern root-prunings needless; but instead of that, when roots were long fostered by every available means, the tops of Pears were pruned with greater severity, and hence of necessity became more and yet more sterile. For the richer the root-runs, and the more severe the top-pruning, the less the benefit, or, rather, the greater the evil that comes to them as fruit trees through their liberal equipment of vigorous roots. But let these roots below find their equivalents in superior shoots above, and reciprocity being thus established the long shoots would yield back their acknowledgment in having boughs of mellow fruit.

The second principle of root-pruning should aim at improving the character and functions of roots rather than reducing their number. The majority of the old root-pruners, and not a few modern practitioners, seem to think that the curtailing of an excess of root-force is the be-all and end-all of root-pruning. It is hardly the beginning of it. True, the removal of some roots is mostly the first step in the practice; but this step is as often as otherwise taken, not because there are already too many roots, but too few. We prune for more root-force, not less, and by increasing the number we not only vastly augment the root-force of Pear and other trees, but improve the quality of them, and probably considerably modify and improve the supplies of food they either directly or indirectly formed. This is really the main point. As far as the health and durability of the Pear tree goes, and its capacity to make timber goes, prune its roots not at all. It will also be shown presently that there are certain natural and artificial substitutes for root-pruning that may render it superfluous or even injurious; but, as a rule, and especially with young trees that are to be limited severely as to area, root-pruning is the shortest, safest, and an absolutely sure cut to fertility. There is no doubt whatever that Pear and other trees can be pruned into fertility.

Fortunately, too, for Pear growers, the reciprocity or correlation between root and top is not only a one-sided one. The root takes the initiative in inducing fertility, but once established the top also exerts a fertilising influence on the roots. Fruitful tops strengthen and sustain fibrosity of roots, and as nothing succeeds like success, so there is no aid so potent for fertility as a heavy crop of fruit. In fertility, as in other conditions of plant life and growth, like produces like. Hence, once Pears are root-pruned into fertility, they mostly continue so; and just as the physician ceases his prescriptions when his patients are cured, so the root-pruner should cease his operations on the roots of his Pears, and may, therefore, be accepted as absolute truth.

To insure this fertility, however, the root-pruner

must prune for small fibrous roots. The more of these the better, and these are the products of culture as well as cutting. Dressings of maiden loam, new sweet soil, and fostering composts exact and foster the rapid multiplication of fibrous roots. Frequent and successive cutting may occasionally be needful to break up the one fork-like root into two, four, eight, sixteen, thirty, sixty, or a hundred; and it is only or chiefly in this extreme fibrosity of root that the basis of present and permanent fertility is laid. The fibrous roots result in fruitful tops, the trees are linked together in vital bonds that last as long as the verisimilitude exists between the two; so soon as their fertility is thoroughly established, and has become habitual, then the root-pruner should stop. Strange, however, as it may seem, not a few have failed to do so, and th:

and it is no mystery to practical men that though semi-drowned roots might grow wood, they would fail to contribute to the production of fruit. Alien stocks, such as the Quince, Whitethorn, or Medlar, especially the first, have been found to favour fertility, Free-rooting weak-growing Pear stocks raised from the seeds of such Pears as Louise Bonne of Jersey, Winter Nels, Beurré de Capiaumont, the old Swan's Egg, &c., foster fertility, though not to the same extent as root-pruning.

DOUBLE, OR MULTIPLE GRAFTING,

is another equivalent or substitute for root-pruning. It is found that the introduction of one or more foreign cylinders between the root stock and the fruit-bearing top of a Pear tree exerts a powerful effect on its fertility. The supply of food is doubtless

FIG. 106.—BEURRE CLAIRGEAU ON THE QUINCE, BUSH-TRAINED. (SEE P. 490.)

disastrous results of root-pruning too severely or too long have in not a few instances counterbalanced its obvious and substantial advantages. Pears may speedily be root-pruned into unhealth by continuing the practice after fertility has been established. At times slight prunings may be needful to maintain the trees in bearing condition, but more frequently fertility will reproduce itself; and there are other aids to, or equivalents for, root-pruning in the maintenance of a fruitful state.

Among these substitutes the most potent, as we have already seen, is fertility; poor, dry root-runs are others of considerable potency. How a lean larder can result in full crops of fruit may seem a mystery, but it is, nevertheless, a fact. Pear trees, may be, are often starved as well as pruned into fertility. The lifting of the roots of Pear and other fruit trees nearer the surface has similar results, the additional warmth and more free access of air inducing a fibrous—that is, fertile—condition or state of root. Dry borders are also warmer than wet,

less, and probably considerably altered, in its passage from the roots to the branches. This seems but an improved mode of ringing and ligatures so generally practised in older times. The check may be less severe and less injurious, but fertility in both cases alike was or is heightened and hastened by the check. Ascending from operations on the stems to those on the extremity of the tops of trees, there is little doubt that severe and incessant summer pinching may prove somewhat of an equivalent or substitute for root-pruning. The breaking up and reducing the strength of wood in the making is a very different matter, and has diametrically opposite effects on fertility than severe pruning of shoots or branches after they are formed. The former—that is, shoot-pinching—judiciously practised, promotes fertility, severe pruning sterility.

Paradoxical as it may seem, it is as consistent and philosophical as true to add that top extension may exert as potent an influence in promoting fertility as top-pinching. All depends on inclining the balance of

reciprocity between root and top towards fertility. True and copious extension of top also involves great ramification and subdivision of branch. These will have their counterparts in the roots beneath; in fact, by the mechanical obstructions offered to the latter through bad, impervious soils and subsoils, stones, &c., the roots will of necessity be more minutely divided than the tops; and in this extra subdivision will be found the key to the fertility of the grand old Pear trees in gardens and orchards; their fertility is the result of the same principles and laws here set forth as the basis of successful root-pruning. It took them longer to reach it, that is all; and it is to be hoped they will no longer be trotted out as conclusive

the power of hastening as well as heightening and broadening the area of fertility?

It is difficult to say which of these merits is the greatest. In this age of red-hot haste and hurryscurry who can estimate the advantage of gathering ripe Pears from late trees two or three years from the graft? Talk of planting Pears for heirs now—plant your Pears on baby's birthday, and the fruit will be ready for him before he has cut all his first teeth.

Root-pruning heightens fertility to the uttermost. Carried to excess the tree dies from exhaustion, virtually droops, and dies beneath its heavy burden. But it ought not to be carried to

one, two, six, a dozen, a score can be packed into a few yards, and preserved in health and fertility without greatly enlarging their size for a dozen or even a score of years. In smaller areas still it would be easy to sell or exchange the tiny trees as they out-grow their space. But no one who has not tried the *petite culture* of the Pear which root-pruning and its equivalents have rendered possible and easy, can have the faintest idea of its immense capacity for continuous fertility within the compass of the most limited area. But for root-pruning the pot-culture of the Pear, now so popular among amateurs with small or without gardens, would have continued impossible. *D. T. Fish.*

(To be continued.)

CULTURE OF PEAR TREES IN POTS.

I AM well aware that this system of cultivating the Pear does not meet with universal acceptance; indeed, considerable diversity of opinion exists as to the advantages to be derived from cultivating any class of fruit trees in pots. Most advocates of the system will freely admit that it is not adapted to supply the toiling millions with cheap fruit; but by cultivating three or four dozens of Pear trees in pots, under the shelter of a very cheaply constructed orchard-house a sufficient supply for a family may be produced of superior fruit to any that can be obtained from walls in the majority of British gardens. This statement is not made without a considerable experience, extending over nearly a quarter of a century. When I had charge of the gardens at Loxford Hall we cultivated Pear trees in pots during nearly the whole of the period, and I never saw or tasted better fruit of the choice varieties grown under any other condition. Whenever the fruit was exhibited it always gained a high position, either for flavour or appearance. I have frequently recommended the system, and still adhere to all I have stated of its advantages. A well-known amateur cultivator, G. F. Wilson, Esq., of Heatherbank, Weybridge Heath, can bear even a better testimony than I can. On one occasion he was awarded the 1st prize for a dish of Louise Bonne of Jersey at the Crystal Palace for flavour against thirty-six competing single dishes of any kind. How was the fruit produced? may be a reasonable question to ask. The trees were grown in pots. One Louise Bonne was $5\frac{1}{2}$ feet high and 2 feet in diameter (fig. 107). It was growing in a 13-inch pot, and bore 118 fruits, all of full average size, the largest specimen $5\frac{1}{2}$ inches in length and 9 $\frac{1}{2}$ inches in circumference.

Another tree bore forty-two fruits, and a third, growing in a 16-inch pot, bore eighty-two fruits.

Specimens of Williams' Bon Chrétien were $5\frac{1}{2}$ inches in length and 10 inches in circumference.

A dwarf standard of Marie Louise, in a 16-inch pot, 4 feet 10 inches high and 2 feet in diameter, was laden with forty-five Pears, some of which were $5\frac{1}{2}$ inches long by $8\frac{1}{2}$ inches in circumference.

Winter Nelis, a bush 3 feet 6 inches high and 3 feet through, in a 14-inch pot, ripened seventy-three fruits, many specimens being 4 inches long and 7 $\frac{1}{2}$ inches in circumference.

An Easter Beurcé, 4 feet high by 3 feet in diameter, in a 15-inch pot, bore twenty-seven fruits, some of which were 5 inches long and 10 inches in circumference.

A loose bush of a Glou Morceau, $3\frac{1}{2}$ feet by $3\frac{1}{2}$ feet, in a 14-inch pot, ripened forty Pears, which measured on an average 5 inches long by $8\frac{1}{2}$ inches in circumference.

Maréchal de la Cour, a bush 4 feet high by $3\frac{1}{2}$ feet through, in a 15-inch pot, ripened seventy-seven fruits, $5\frac{1}{2}$ inches long by 9 inches in circumference.

Triomphe de Jodoigne, 3 feet high and 4 feet through, growing in a 15-inch pot, ripened sixty-eight fruits, some of the specimens were 6 inches long by 9 $\frac{1}{2}$ inches circumference. These were a few specimens selected from a collection of Pear trees grown in pots in Mr. Wilson's garden, cultivated by himself. I allude to them here as an example of what can be done when an earnest amateur takes the management into his own hands. I have also alluded to my own experience as that of a gardener having to study the best method of supplying a private family with first-class fruit. Such examples effectually silence the carping critics, who dismiss the subject with the remark that pot trees are mere toys. A house for Pear trees in pots may contain twice as many as

FIG. 107.—POT CULTURE OF PEARS.

proofs of the uselessness or folly of root-pruning. Rightly read and interpreted, their fertility but establishes the soundness of the practice they were brought forth to destroy. The annual harvest of lusciousness is the product of reciprocal action and reaction between their far-running roots and wide-spreading branches, and the root-pruned cordoon, bush, or pyramid is made and kept fruitful on exactly the same principle.

But while these monarchs of the field or orchard are gradually growing and root-pruning themselves into fertility, it is a great cultural triumph of root-pruning to be reaping a long series of good harvests from small trees. It has been said, with much truth, that all things are possible for him who can afford to wait, and assuredly Pears in plenty are among them; but how few can afford to wait?—and why should any one do so when root-pruning puts into our hands

excess. The skilful root-pruner will prune sufficiently to support a good crop, and will then thin the fruit in proportion to the vigour of the tree. Neither will he root-prune ahead of any of its substitutes or equivalents. He will also cease to prune, lift, replant, pinch, double-graft, or check growth in any way after fertility is well established. "Let well alone" is his motto—a motto that would have saved thousands of Pear trees, slain by fussy prunings, pinchings, &c., persisted in for years after all need for them had ceased.

By lessening the area of fertility what a boon root-pruning has conferred on amateurs, tradesmen, mechanics, working men in towns and suburbs, as well as in the country. A huge Pear tree is as impossible to millions, and would prove almost as great an incumbrance, as the proverbial white elephant. But these baby Pear trees, root-pruned into fertility,

could be brought to perfection in it. Half of them may be removed out-of-doors about the first or second week in June; where the fruit will ripen later and be quite as good in flavour as that in the house. One of the principal advantages of the system is the certainty of getting a crop. East winds and dull, cold weather at blooming time are completely set at defiance.

The cultural directions are very simple and may be summed up in a few words. I prefer the pyramid form to any other, and purchase two-year-old trees of that form, which have generally a few flower-buds upon them, although no fruit can be expected from such trees the first season. The trees are mostly grafted on the Quince, and are planted into pots from 9 to 11 inches diameter according to the size of the trees. They do not require much pruning. The young wood may be cut back a little, that is all. Pot them firmly in good turfy loam three parts, one part decayed stable manure, rammng the compost in firmly with a wooden rammer.

The trees require an abundant supply of water at the roots as soon as they are growing freely. They will form plenty of blossom-buds during the season, and the year following invariably produce a good crop of fruit. They will not require to be repotted at the end of their first season, but as soon as the fruit is formed, place some rich surface-dressing on the surface of the soil in the pots. I mix up a few barrowfuls of the following three weeks before it is required:—One barrowful of loam, one of fresh horse-droppings, and one of malt or kiln dust. This heats violently, and must be turned over daily to prevent its being overheated. Next season the trees may be repotted into larger pots, using the same compost as before. When the trees are in 14-inch and 16-inch pots they do not require repotting for five or six years; all that is required is to dig out some of the top soil with a piece of pointed iron, and replace it with some loam and decayed manure in equal parts. The trees do not require much syringing, as they are not so liable to be attacked by aphids and red-spider as Peach and Nectarine trees. They should be syringed once a day only in hot, dry weather. They also require to be watered at least twice a day in hot weather. Success or failure will greatly depend upon the care with which the water supply is administered. *J. Douglas.*

PEARS AND STOCKS.

THE undermentioned are found to succeed and do well upon a wall, especially when protected in spring with canvas, viz.:—Bergamotte d'Espereur, Beurré Rance, and Beurré Sterckmanns (are much improved when protected), Baronne de Mello, Beurré Duval, Beurré Bachelier, Beurré d'Arenberg, Beurré Capiaumont, Beurré Hardy, Beurré Six, Colmar d'E'c, Conseiller de la Cour, Doyenné du Comice, Duchesse d'Angoulême, Fondante d'Automne, Huyshe's Prince Consort, Jersey Gratioli, Marie Louise d'Ucèle, Napoleon, Olivier des Serres, and Prince Napoleon.

The undermentioned succeed upon the Pear stock as pyramids, viz.:—Althorpe Crassane, Autumn Josephine de Malines, Basiner, Beurré Clairgeau, Beurré d'Amanlis, Beurré de Jonghe, Beurré Diel, Beurré Langelier, Beurré Rance, British Queen, Clapp's Favorite, Comte de Lamy, Doyenné Boussoch, Eyewood, Easter Beurré, Forelle, Fondante d'Automne, General Todleben, Glou Morceau, Grasiin, Huyshe's Prince of Wales, Huyshe's Victoria, Jargonelle, Knight's Monarch, Louise Bonne de Jersey, Marie Guise, Marie Louise, Passe Crassane, Passe Colmar, Pitmaston, Duchesse, St. Germain, Seckle, Urbaniste, Van Mons' Léon le Clerc, Vicar of Winkfield, Victoria, and Williams Bon Chrétien.

The list I have given of Pears on both Quince and Pear stocks includes sorts which have proved suitable, have succeeded admirably, and been laden with fine fruits. Nothing could exceed the beauty of some of the trees while in bloom—the trees were perfect pictures. Our situation is low and damp, and we have heavy fogs, much rain, and prevailing east winds; for instance, last spring, during March and April, when most of the trees were in flower, the wind was from the east, or north-east, for forty-two days, often accompanied by sleet or rain, the average rainfall here, during the two months named being 3.1 inches, consequently we suffer much from spring frosts, the blossom being often destroyed, but I find, when protected by canvas, the fruit does not become

spotted and deteriorated in appearance, and, as a matter of course, keeps much better.

Root-pruning is regularly attended to, a certain number of trees being done each year. The trees are of all ages. The soil is a strong retentive loam resting on clay. *Thomas Jones, Royal Gardens, Windsor, Oct. 10.*

A DEVONSHIRE GARDEN.

OWNERS of gardens in Devon may be envied for two very good reasons—firstly, on account of the copious yield of large, well-flavoured Apples they annually garner; secondly, for the luxuriant growth and wider selection of trees and shrubs allowed by their genial presiding climate. In both these respects there are few better typical examples than Killerton, Sir T. D. Acland's homestead in the basin of the Exe. The soil is an exceeding rich loam, resting upon hard rock or the Red Sandstone.

The orchards contain trees in all stages of growth. From the teeming nature of the soil Apples grafted on Rivers' Paradise stocks have attained the proportions of standard trees on the Crab. The three most useful varieties to name to your readers are, perhaps, Royal Somerset, Ross Nonpareil, and Mère de Ménage. The two first are unfading bearers, and profitable and desirable sorts. The third, although not so prolific, grows up into a robust tree; its large, brilliantly coloured fruit, which will keep far into the new year, always command a ready sale.

Some of the Pears sent to South Kensington by Mr. Garland have been sensational. He has shown Doyenné du Comice 14 lb. in weight, and dishes of Knight's Monarch and Winter Nelis so large as to be hardly recognisable. The current year has favoured him well. If he shows at the Congress, his collection is sure to be valuable, so unusually good is the soil. Information about late Pears is frequently requested. Here the three best are L'Incomice, Bergamotte d'Espereur, and Winter Nelis; Beurré Rance and Ne Plus Meuris are very unprofitable servants, albeit prolific ones. The best of the former I have ever seen were packed away in bracken in air-tight drawers and not opened till Easter. Beurré Clairgeau, on the other hand, comes fairly good, and the Chaumontels are excellent when grown upon a south wall. It is not generally known that by gathering early ripe Winter Nelis can be had in the first half of October. The fruit must be put in a warm kitchen or room and kept unexposed to the air. In this way by successive gatherings this most luscious of all Pears (barring, perchance, Doyenné du Comice) can be had from October to January.

Peach trees on a wall facing north to the east than south were loaded with fine fruit; Dymond and Hale's Early being found second to none for outdoor culture. Gooseberries on a north wall produced edible fruit until the second week in September. Most things are so well done at Killerton that it will not be amiss to mention other *notanda* besides the two strong points enumerated above. Outside, along the front of the vinerias, above the sashes, is placed a disused gaspipe, into which have been inserted at short intervals brass jets. This pipe is connected to the main water supply by leaden tubing, so that by the mere turn of a tap the Vine border can be rained upon for as long a period as desired. Simple and effective, was a verdict unhesitatingly arrived at. In the fate vinerias are two uncommonly fine plants—to wit, Eocephalatos Altensteiner, and Platycerium alcinorum. Both are growing in late vinerias; the latter is 5 feet through and 6 feet 6 inches high. The compost for it is made up of two-thirds park-loam and one of peat. A Lagaperia is planted out in a prepared walled-in border 4½ feet square. It is growing in 20 inches of soil resting upon a rubble drainage. The growth was most luxuriant, and the number of flowers produced from St. Switbin's Day to Vule-tide very large. This was the finest plant I have ever seen. By putting brickwork round the border, planks or iron grating can be spread across for pot plants to rest on; thus no space is lost. That a Lagaperia does best when planted few will question, only it must be planted where the conditions are favourable. A house built out to a north wall will be found very much to its taste.

The trees in the park and grounds are simply magnificent, and the grouping at the foot of the Beech woods above the house richly deserves the visit of your special artist or photographer. At this point compact-growing Conifers, such as Cupressus torulosa

and Thuia gigantea, stand out against the forest background. The specimens of the Cypress are giants of their kind. The beds of shrubs on the sloping lawn contain Bamboos, Aralias, Colletias, Desfontainea spinosa, and suchlike tender shrubs, which not only live but flourish in Devonshire. Tasmania aromatica is perfectly hardy on the lawn, in which position Buddleia globosa will also be found useful.

The extent of ground planted with Conifers is large. The collection of species is not large, but the trees are healthier and more robust than those at Bicton. Deodars are fine, and have been numerous planted. The most imposing tree was a pendulous Scotch Fir growing on the lawn near the mansion. Some of the branches hang down as much as 33 feet, and give the old fellow a most original and handsome garb. A better lawn tree, *ex mea sententia*, than a good Pinus sylvestris is well nigh impossible. Yet what pains have been taken to supersede it with fresh faces. If further proof is needed go to Meikleour, on the Tay side. A thickly branched Araucaria imbricata is 60 feet high. The tallest Thuia dolabrata is 25 feet. Rare as this is it is not so surprising as a Mount Atlas Cedar, which is more than 80 feet in height. This tree, planted in 1809, has a girth of 15 feet 6 inches at more than a yard from the ground. A Lebanon Cedar in the park is as much as 16 feet, but that is not so out of the common. A Tulip tree near the Scotch Fir is also 16 feet in girth, and forms a good companion to it.

Near the kitchen garden is probably as fine a Lucombe Oak, all points taken into consideration, as any in the country. The trunk rises, bare of branches, for about 50 feet; at 3 feet up it girths 13 feet 4 inches. A defeated rival of the same age exists at Carlew, in Cornwall, planted by that good arborist, Sir Charles Lemon. I have, in some measure, spoilt my advocacy by using too many laudatory epithets already, but I must be assertive once again, and say that the planting on the rising ground behind the house is a most brilliant effort of landscape work. Owing to the Press a certain name and fame are easily acquired now-a-days. It would be strange if Killerton House had not obtained a fair meed of both. *C. A. M. C.*

PETWORTH PARK.

THE Pears are grown here as pyramids on the Quince stock, and are admirable examples of such culture, not being quite so formal as they frequently appear. The following were carrying heavy crops:—Emile d'Heyst, one of the finest autumn Pears, heavily laden with very large fruit; Durandau, very large and evenly cropped; Beurré Diel, heavily cropped with clean fruit (this sort is bearing heavily this hot season, and the fruit is free from cracks or spots, even on standards); Pitmaston Duchess, a regular crop of very large fruit; Souvenir du Congrès, heavily laden trees of this grand September fruit; standards of Beurré Capiaumont and Catillac, heavily cropped.

But the pride of the gardens is found in the cordons walls, the trees all being trained upright (not oblique), and in most cases they were regularly fruited from base to summit; the fruit was good and clean as I saw it, and now that copious rains have fallen it will doubtless gain size and colour. Easter Beurré did not appear at home in any position, and Napoleon was not happy—but most of the Pears in general cultivation were represented by admirably managed trees, carrying a regular crop. The palm (on cordons) must be given to Pitmaston Duchess, but Duchesse d'Angoulême, Marie Louise, Beurré d'Anjou were grand; Bergamotte d'Espereur, Glou Morceau, Marie Benoist were excellent; as also Louise d'Ucèle, Nouvelle Fulbie, Winter Nelis, and Emile d'Heyst, Madame Millet, a Pear that generally is not good, was cropping heavily, clean well formed fruit, Beurré Bosc, Conseiller de la Cour, Soldat Labourer, Doyenné du Comice, were among the cream of the cordons—and better examples I never yet saw—as candlabra-trained trees. A grand tree was Beurré Rance was remarkable, and this is a Pear that seldom does well; and in the same forms were Fondante d'Automne, Napoleon, doing well on an east wall with Josephine de Malines. One standard-trained Catillac was a marvel of fertility.

Apples do not do so well as Pears, the great drought has affected them, and red-spider has been prevalent, but we noted remarkable specimens of Peasgood's Nonsuch, Waltham Abbey, and Mère de

Ménage on pyramids, and extraordinary fruits of Melon, and Calville Blanc on the walls. Plums were mostly gone, and a few trees of Coe's Golden Drop did the honours for the family; a standard tree of Scarlet Nonpareil was remarkable for an enormous crop of richly coloured fruit. Grows on sandy soil should note this, as generally this is a shy bearer. On the lawn was a fine example of the Sussex Nanny Apple, a rich dessert fruit, that has been neglected, but which for September use is first-rate, and very handsome in appearance. Sturmer Pippin also does well, being eminently happy in a light warm soil.

The Peaches under glass were specimens of successful culture, and it was a treat to see them with the Nectarines on the south wall outside, with rich dark green foliage covering the bricks entirely, and carrying large crops, which struck me would have been much larger in a less dry season. The Grapes were, and had been, fine—a full crop of well finished bunches. But the wonder of the houses is an immense white Ischia Fig, which entirely fills a house 30 x 15 feet, a picture of health and vigour, and crowded with its second crop of fruit in all stages, from the green figlets to the luscious splitting morsels of sweetness and flavour. The main stem was of enormous dimensions, and one could almost credit that it was planted in the reign of the great pioneer of fruit growing, Henry VIII., whose grand portrait in the carved room (rich with the priceless work of Gibbon) seems to give colour to the report.

It is scarcely necessary to say that the glass houses contained everything that was needed for such a vast establishment, and each department was conspicuous for good management and care, and a credit to Mr. Breese, the gardener. In the greenhouse I noted a fine mass of Nerine Fothergilli that had apparently not been potted for a dozen years—treatment which seemed to suit this somewhat fickle subject, as shown by several fine heads of its coral-coloured flowers.

In the pits were a splendid set of Pines in all stages of development, beautiful to look on—so clean and vigorous. A young Dougainvillea in the stove was covered with its gay sprays of coloured bracts, of a larger size than is usually seen; and in a pond-like depression was a mass of the American Cranberry, full of fast-ripening fruit—a novel sight. Provision is made to flood this pond at the proper seasons.

I cannot close this notice without reverting to the noble timber trees in the park, the principal kinds, being Spanish Chestnut, Beech, Lime, and Oaks, some remarkable examples of which exist. In evergreens there are finely-coloured Golden Queen and Water's Hollies, with some fine specimens of the best green forms, such as *Scottica*, *recurva*, *opaca*, and *Hodginsii*. There is a noble group of Scotch Firs; of Silver Firs there are several examples of massive erect growth, like a man-of-war's masts, and some Cedars of Lebanon, vying with those on the historical mount, carrying immense boles without a knot or branch.

There is a very large Tulip tree near the mansion, the trunk of which near the turf must be about 24 feet round, and in the woodland walk I noted a very fine Liquidambar, a pleasing contrast to the surrounding timber trees.

Rhododendrons and Azaleas were quite at home, and on the mansion walk were magnificent trees of *Magnolia exoniensis*, and *Photinia glabra*. *Vitor*.

PEARS FOR MARKET.

OUR orchards in the Maidstone district contain many old kinds which cannot be named, and which may probably have been planted for perry in times gone by, or they may be merely chance seedlings, but for market work the kinds required are few. Starting with the July sorts the old Green Chisel is the earliest. The Chalk, a yellowish-green sort, is next, and is a local kind, called also the Sweetwater. It is a valuable market Pear, as it is a regular heavy bearer, owing, no doubt, to the fact that the tree recovers itself after the fruit is picked. Doyenné d'Été, the first really good Pear, succeeds well as a standard tree. The old London Pear, the Lammas, is the next, and from its red cheek and bright yellow colour it is a good "coaster's" sort. There is, then, a little break, and September sees the "City" Pear *par excellence* in the markets. The well known Williams' Bon Chrétien is largely planted, as it never fails to command

a good price, but the tree is very tender when in flower, and it is not a regular bearer. Such favour does this sort gain in the markets that other sorts of the same season do not sell while it is "in." After September the Beurré de Capiaumont, a pretty russet Pear, comes, and the fertile Aston Town or Sammer Crassane are ready. Fertility, which may be called an improved Capiaumont, also claims notice, as it is a most valuable fruit and a constant cropper. In September also the Hessele or Hazell Pear is most lucrative, as it is a very fertile tree; and as it does not readily bruise it can be kept till its almost ripe stage. This is perhaps one of the most beautiful sorts in growth, and when heavily laden, its pendent branches and conspicuous bunches of fruit make a striking picture. The old "Bergamy," or Autumn Bergamot, is still found on very old trees, and is a favourite London Pear, being one of the three-penny sort, which is the *acme* of a coarser warts.

In East Kent, Barré Bœc, Marie Louise, and Louise Bonne, are well grown, but such Pears require a warm situation, and the rich deep loams of the brick-making country. There are but few winter sorts. Broom Park and Bishop's Thumb are fine croppers, but for profit, Pears are best fit to market from the trees. Kent cannot be considered a Pear country as far as marketing goes, but it is conspicuous in garden fruit. The county lacks the deep rich loams of Hereford and Middlesex; and Plums, Damsons, and Cherries, which succeed on lighter and shallower soils, are preferred. It is astonishing the effect of winter manuring and sheep-folding on the old Pears in orchards, and it is not too much to say that most of our pears are starved for want of proper attention. *George Bunyard, Maidstone.*

The Flower Garden.

No time should now be lost in clearing, dressing, and replanting the beds with winter shrubs, and spring plants and bulbs. In performing this work now, not only will the garden present a changed and bright appearance, but by being planted early the spring plants become well established, and, therefore, better able to endure the severity of the winter. In removing the summer plants it is always advisable to preserve a few plants of each of the different varieties of Pelargoniums and other useful plants, to be potted singly or planted thickly in shallow boxes, which should then be placed in pit or house, where they can have heat for two or three weeks, till they have made fresh roots and re-established themselves; they then will only require to be preserved from frost and damp. If these plants are not cut back too hard they will be found most useful for planting vases and for filling the centres of large beds, and places where large specimens are required. In preparing the beds for transplanting, it is not desirable at this season, when the soil is light and free, to dig them, but simply to clear off the plants and rubbish, and level the surface. By this means much labour and time are saved, and the condition of the soil is more conducive to the health of the plants during winter than when the soil is rendered light and loose by digging. In heavy soils, however, not only will digging be found necessary and advantageous, but where Violets, Polyantuses, double Primulas, or any such plants are intended to be grown a liberal dressing of well decayed manure or leaf-mould mixed with sharp sand. Then if not wet the soil should be trodden before planting, and when bulbs are planted much mischief afterwards arises from the holes in which they are planted being filled in with rich light soil or sand, and without the precaution being taken to make the soil surrounding them equally firm with the other parts of the bed. These holes, made by the dibble, form in wet weather easy receptacles for the water to drain into, and frequently are the cause of great destruction to bulbs and other plants.

PLANTS AND BULBS FOR BEDS.

For small beds for early flowering the Winter Aconite is very pretty, especially when associated with Snowdrops and early flowering Scillas; Crown Imperials are most effective for centres of large beds and for mixed borders. The Crocus, when planted

in masses, is one of the most hardy and also the most brilliant of spring bulbs. Narcissus, Jonquil, and Daffodil are good for early spring gardens, their golden hues being very gorgeous. To succeed they should be planted deep, and be allowed to remain in the ground undisturbed. The more suitable varieties are N. Bulbocodium, poeticus, biflorus. The Tulip, both single and double, must also claim a first place in the spring garden, which cannot be complete without them; if those already mentioned give chiefly the orange tints, the Tulip gives the scarlet, rose, crimson hues. It also extends the period of bloom far beyond those already mentioned. The Hyacinth, with its lovely and varied shades of purple, red, pink, must ever command a prominent position. The Hyacinth when massed in borders produces a charming effect, but for baskets and vases they are particularly suitable. It is more liable to injury from frost than those already mentioned, and requires slight protection during severe weather by placing leaf-mould or similar material over the bulbs. To prolong the season of blooming a few bulbs should be potted at different times, to replenish with as the others are removed. There are many more most beautiful bulbs that can be used for the spring garden, such as the Anemones, the early Dwarf Iris, Ranunculus, Dog's-tooth Violets, the Giarf Hyacinth; but to be effective the different kinds of bulbs should be planted with great care and due regard to their habits and nature.

STORE HOUSES.

Recently propagated plants should now be safely housed. Pelargoniums winter best on shelves in a cool dry house, damp is their great enemy, and should be guarded against; and Verbenas, Petunias, and Ageratums will require the same treatment for the present—*Alternanthera*, *Coleus*, and *Iresines* a moist heat, a minimum temperature of 60°, if they are to winter well. Any succulent plant of which it is desired to increase the stock should be placed in heat, to induce them to throw out offsets or cuttings. *Wm. Smythe, The Gardens, Basing Park, Alton.*

FRUITS UNDER GLASS.

STRAWBERRIES IN POTS.

THESE plants, after developing their growth, will naturally need a resting period. For this object they should now be placed in a cold pit or frame, and be kept much drier at the roots than they have been hitherto; in fact, only sufficient water should be given to prevent them from becoming dusty, and the lights should be kept off them whenever it is not excessively wet or frosty. No place in my opinion is so well adapted for wintering Strawberry plants in as cold pits or frames with a floor of coals, on which to stand the plants at no great distance from the lights, which should only be placed on them whenever rain or frost is severe. If the pots are not plunged in some sort of light material, they should be covered up during very severe weather.

Towards the end of the current month all the plants should be brought together in their winter quarters. Those which are to be forced at an early and intermediate date should have the protection as recommended, but the later ones, in my opinion, do not require it at all. These plants do exceedingly well with considerably less trouble when they are placed entirely out-of-doors, in beds, and even plunged up to the rim of the pots in coals, and the same also beneath them to prevent the ingress of worms. With regard to the best variety for early forcing opinions vary considerably. Black Prince is early, but too small; La Grosse Sucrée is much extolled by some growers, but we have abandoned it for early work because of its acidity when ripened early. Keens' Seedling is still a favourite, and can be depended on when subjected to good management, but taking all points into account, *Viscontesse Hericet* de Thury stands pre-eminent in my estimation as being the best of all the old varieties for very early forcing. Our customary practice is to start a batch of this kind early in December; the plants are usually placed on a shelf which commands every ray of sunshine and light, and when these elements abound they get the advantage of a place having the fullest amount of air consistent with keeping up the house to a moderate temperature, and syringing is freely done whenever circumstances admit once or twice a day. *G. T. Miles, Wycombe Abbey.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct. 19	Sale of Bulbs from Holland, at Stevens' Rooms.
		Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
TUESDAY,	Oct. 20	Quince Sale at the Vauxhall Nursery, Canterbury, by Frotheroe & Morris (four days).
		Pear Conference at the Royal Horticultural Society's Gardens, Chiswick (fourteen days).
WEDNESDAY,	Oct. 21	Sale of Linums, Tuberoses, Roman Hyacinths &c., at Stevens' Rooms.
		Sale of Plants, Roses, &c., at Frotheroe & Morris' Rooms.
THURSDAY,	Oct. 22	Sale of Nursery Stock at Joining's Nursery, Waltham Cross, by Frotheroe & Morris' Rooms.
		Sale of Dutch Bulbs, at Stevens' Rooms.
FRIDAY,	Oct. 23	Sale of Nursery Stock at the Manor Lane Nursery, Lee, by Frotheroe & Morris.
		Apple and Pear Show at Exeter (two days).
SATURDAY,	Oct. 24	Sale of Established and Imported Orchids from Mr. F. Sander, at Stevens' Rooms.
		Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
		Sale of Dutch Bulbs, at Stevens' Rooms.
		Sale of Dutch Bulbs, at Stevens' Rooms.

OUR present number is largely occupied with matters relating to PEARS and PEAR CULTURE, and the subject will be continued in subsequent issues, as it will necessarily be incumbent upon us to report upon the large collections to be brought together at Chiswick next week. The Pear Conference—a misnomer in some respects—is well timed. Rarely has there been so general a crop of Pears throughout the country—rarely therefore, so favourable an opportunity of bringing together and of studying all that pertains to Pears.

It can hardly be expected that the same unlooked-for success which attended the Apple Congress will be experienced on this occasion; nevertheless, the entries are very numerous and the "Conference" is well-timed. Those who look to fruit culture to supplement the deficiencies of agriculture may profit much; they may learn from the exhibition and from the articles we now publish that Pear culture now-a-days is not so risky a matter as it once was—that although the obstacles offered by our climate are not lessened gardeners have found a way round the obstacle. The introduction of the Quince stock on suitable soils has rendered Pear culture vastly more certain and more productive, and has caused the old adage to become obsolete. But while strongly advising the farmer to take a leaf out of the gardener's book we as strongly advise him to let it be a leaf and not the whole volume. To drop metaphor, fruit-culture, and more especially Pear culture, must not be depended on as the main source of revenue. As an accessory it may be very useful, but it would, in most cases, be disastrous for a farmer or market gardener to attempt to make it his mainstay. After all, however, fruit-culture is not more risky and uncertain than that of Hops. The beautiful little pyramids which we lately saw in Mr. BUNYARD'S nursery at Maidstone furnish an astonishing spectacle to those who remember the old disheartening proverb, and call to mind the *status quo ante* the introduction of the Quince stock. They would excite the envy of the distressed agriculturist and speculator. But it must be remembered that Pears have, this season at any rate, been a drug in the market, and that it is not every agriculturist who is in a position to give the unremitting personal attention and skill which a RIVERS, a BUNYARD, or a LEE give, in planting and training their trees. A visit to Mr. BUNYARD'S nursery—and the same may be said of many others—is in itself an instructive lesson in watchful care, symmetry, method, and appropriateness. This is only attained by years of personal supervision, and a complete knowledge of the business. Is it likely that a farmer occupied with other matters, or a speculator going into fruit-culture without any previous training, can expect to succeed at once? He must do as the gardener and nurserymen have done—begin at the beginning and go on by degrees. If this cautious method of procedure were adopted fruit cul-

ture might be made a very valuable addition to the resources of the farmer, and the disastrous consequences of plunging into an ill-considered venture would be obviated.

As to fruit growing on a small scale in private

on the one hand, and to obviate the disappointment just alluded to on the other, we have thought it well to utilise the exhibition of Pears at Chiswick, by the publication of a series of articles from the pens of our best cultivators

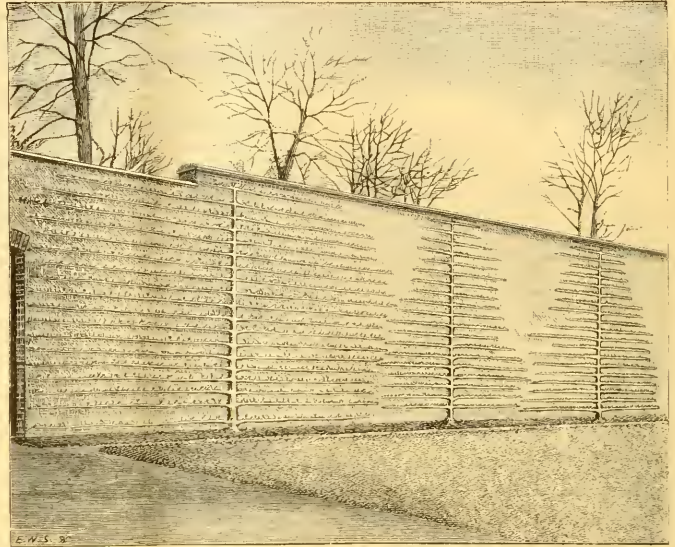

FIG. 108.—PEARS HORIZONTALLY TRAINED. (SEE P. 499.)

FIG. 109.—MARIE LOUISE PEAR ON BOTHY. (SEE P. 499.)

gardens, the case is somewhat different: the risk is here infinitely less, indeed the art and resources of the gardener, the introduction of the Quince stock, and the selection of suitable sorts have rendered a crop of some sort almost a certainty. In order to help on fruit-cul-

and largest growers. To the courtesy of these gentlemen we are indebted for the opportunity of laying before our readers an amount of information as to modes of culture and the sorts suitable for different localities, such as we believe has not previously been gathered together.

— THE PROPOSED INTERNATIONAL EXHIBITION.—The tone of the conference of the members of the several committees, with the Council of the Royal Horticultural Society, and which was held at South Kensington on

but a cautious spirit evidently pervaded the meeting, and there was no such eagerness displayed to take the matter up as there was in 1866. Nor is this either to be wondered at or regretted. An exhibition so vast and

the several committees, but of the horticultural world in general, and of ascertaining their views. It seemed to be the general feeling that not mere exhibitions of plants, but of horticultural produce and appliances, home, foreign,

FIG. 110.—PALMETTE TRAINED TREE.

Tuesday last, for the purpose of considering the feasibility of establishing an International Horticultural Exhibition on a large and comprehensive scale, in 1887, was, to say the least, not enthusiastic. The matter was carefully laid before the meeting by Sir TREVOR LAWRENCE, the President, and by Mr. W. T. THISELTON DYER, on behalf of the Council;

varied as the one contemplated must needs be, one partly continuous for many months, partly intermittent, cannot be undertaken without much consideration; and hence, after some discussion, it was resolved that the meeting be adjourned for one month, to give the Council the opportunity of inviting the presence at another meeting not merely of the members of

and colonial, and of all descriptions—forestry products, illustrations of insect injuries, and diseases caused by fungi—models, artificial flowers—indeed, speaking generally, of anything and everything pertaining to the vegetable kingdom and its products, should be got together; and that as even such a programme would probably not suffice, the exhibition should be tacked

on as an adjunct to some other subject, such as music now is to machinery in the Inventions Exhibition.

If such a programme, even in considerably reduced proportions, is to be carried out, a site must be found, and, above all, money must be obtained. It appears that there is little likelihood of any difficulty at all as to site, while if the Commissioners be really desirous, as it is alleged they are, of helping forward the scheme, there need not be great apprehension as to the needful funds being forthcoming. As to exhibitions of living plants the exhibitors present were very shy of committing themselves, for which caution they are not to blame; but there can be little doubt, we think, that if the scheme is more definitely elaborated, the exhibitors, as a body, will not be found wanting. In the meantime a month is now given for consideration, and during that time we trust the Council of the Society will take every means, by circular or otherwise, of gaining the opinion of the provincial exhibitors and nurserymen, of the members of the several horticultural societies throughout the kingdom, and of all those who may be concerned, directly or collaterally, in the proposed exhibition. When the Council has gained such evidence, and is in a position to state more decidedly what support the Commissioners will give, it will be time to decide what—if anything—shall be done. Probably some of our readers may, in the meantime, be disposed to give their fellows the benefit of their opinions through the medium of the Press.

— THE ROYAL HORTICULTURAL SOCIETY. — While we rejoice at the spirit manifested by the Council in even suggesting such an Exhibition as that above alluded to, we can but think that there are other matters which in the present state of things are more pressing and of greater importance. First and foremost is the urgent necessity for proper accommodation and meeting places for the Fellows, proper offices for the officials, a proper home for the library. It is probable, however, that all these might naturally be evolved out of the Exhibition scheme, indeed it is certain that the preliminary business of such an Exhibition could not be carried out with such accommodation as the Society now has.

— THE PROVINCIAL EXHIBITIONS. — While doubts may fairly be felt by some people as to the propriety of embarking in so vast an undertaking as an International Horticultural Exhibition must needs be, there will, we imagine, be no doubt whatever that the time has come, and more than that, to return to those annual provincial exhibitions which were, on the whole, so successful in former years. The experience gained in the past should lead to the avoidance of the blunders that led to the disaster at Preston. Bury St. Edmund's has been mentioned in this connection, and it certainly has claims by reason of the cordial welcome it gave the Society before, if not from mere priority. Still, we can but think that it would be well to hold the provincial show in some larger city, and one more distinctively associated with horticulture. Why not Liverpool? Such a show has never been held in that city, and it seems not unlikely that the Liverpool authorities would, if proper representations were made to them, invite the Society, and perhaps make the Provincial Horticultural Show an adjunct for the time to the great Exhibition of Navigation, Travelling, Commerce, and Manufacture, proposed to be held in that city in 1886.

— INTERNATIONAL EXHIBITION OF NAVIGATION, TRAVELLING, COMMERCE, AND MANUFACTURE. — This Exhibition, which it is intended to hold in Liverpool next year, has the support of the citizens—so much so that a guarantee fund of over £50,000 has been formed. The exhibition will be opened in the middle of May, and kept open for six months, on the Edge Lane Park estate, about 35 acres in extent. This land, which has lately been acquired by the Liverpool Corporation as a public park, is within two miles of the Exchange, and adjoins Edge Hill Station on the London and North-Western Railway Company's main line. It was thought proper that Liverpool should give to its first exhibition the stamp of its own individuality, and that the second seaport of the world should

show a collection illustrating navigation in ancient and modern times. Travelling by land was naturally added, and so the chief feature of the scheme is a "Travellers' Exhibition." As closely allied to this there is also a division for the "Commerce and Manufacturers of the World." In this latter section the raw materials of the animal, vegetable, and mineral kingdoms, the processes through which they pass, and the resulting products will be shown. Special prominence will be given to food, drink, and clothing. As no English exhibit will be admitted to the Indian and Colonial Exhibition to be held at South Kensington next year, Liverpool will be the only place where home exhibitors can display their goods. It is calculated that in Liverpool and fifty miles round there is a larger population than in London and fifty miles round it, so there should be plenty of visitors to the Exhibition; moreover, there is a great number of American and other foreign travellers who pass through Liverpool to whom the Exhibition will recommend itself.

— HORTICULTURAL EXHIBITION IN 1887. — The following note has been sent us for publication:—A meeting of the Council and Committees of the Royal Horticultural Society was held at South Kensington, on Tuesday, the 13th inst., Sir TREVOR LAWRENCE, Bart., M.P., in the chair. The object of the meeting was to consider the advisability of holding an International Horticultural Exhibition at South Kensington in 1887, and it was resolved that, with the view of obtaining a larger representation of horticulturists than was then present, another meeting be held on November 13. The Council invite the co-operation of all who are interested in this matter, and invite them to take part in the proceedings of the forthcoming meeting.

— THE FRUIT SHOW OF THE ROYAL HORTICULTURAL SOCIETY, OCTOBER 13. — So well did fruit growers respond to the invitation of the Royal Horticultural Society on Tuesday last that the large number of 1709 dishes of Apples and Pears were exhibited, inclusive of no competing fruit.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION. — The annual dinner of the above is fixed to take place in 1886 on the evening of July 2.

— HORTICULTURE AND THE DEPRESSION OF TRADE. — Messrs. SMITH & LARKE send us the following:—

"The Secretary of the 'Royal Commission on the Depression of Trade and Industry' has intimated to Messrs. SMITH & LARKE, of Ashford Nursery, that he will be happy to lay before the Royal Commission any information relating to the nursery trade which they think may be useful. That firm will, therefore, be pleased to receive any suggestions for improving the present state of the trade. All communications on the subject should be addressed to Messrs. SMITH & LARKE, at their London house, 14, High Street, Kensington, W."

— WHO, WHERE, WHAT? — One of our Continental colleagues, speaking of an Orchid, says that it flourishes "Chez Eoil et Derby à Knowsley." Can it be the Earl of DERBY, of Knowsley, who is intended?

— NATIONAL CHRYSANTHEMUM SOCIETY. — The autumn general meeting of this Society will be held on Monday evening, October 19, at the "Old Four Swans," 83, Bishopsgate Street Within, City. The President, E. SANDERSON, Esq., will take the chair at half-past 7 o'clock precisely.

— TILADIANTHA DURIA. — Mr. LYNCH sends us from Le Cambridge Botanic Garden a fruit of this curious yellow-flowered Cucurbit. The fruit is very ornamental, 2½ inches long by 1½ inch broad, elliptical, pointed at both ends, thinly covered with short rough hairs, and deep crimson in colour. At the top of the fruit are the remains of the perianth.

— AGRICULTURAL SOCIETY OF INDIA. — At the ordinary general meeting, held on Wednesday, August 28, Captain J. F. POGSON forwarded, as a curiosity, a hood made from the leaves of the Maua Dhun creeper (Baubinia Vahlia). It forms an excellent protection from rain for coolies, and lasts out a rainy season; its price was four annas, and the hood is much worn. Mr. A. C. ELECYNNDON, of Doorna Factory, Sitamarhi, sent an exceptionally large specimen of the Jack fruit, one of a pair

brought to him on account of their unusual size. The larger of the two was 3 feet in length, 3 feet 5 inches in girth at the thickest part, and 2 feet to inches at the thinnest, and weighed over 60 lb. The seed has been sown in the Society's garden, and the plants will be preserved.

— LORD SUDELEY ON SMALL HOLDINGS. — At a meeting lately held at Tregynon, on Lord SUDELEY'S Montgomeryshire estate, it was resolved to forward a petition to his lordship, asking him "that all industrious and thrifty persons on the Tregynnog estate may have sufficient land allotted to them to enable them to keep a cow, and that the number of small farms should be increased." The following reply from Lord SUDELEY has been received by Mr. BOWEN, chairman of the meeting:—

"Toddington, Winchcombe, Cheltenham, Oct. 2.
"Dear Sir,—I have to acknowledge the receipt of a petition drawn up at a meeting at which you were the chairman, praying that all industrious and thrifty persons on the Tregynnog estate may have sufficient land allotted to them to enable them to keep a cow, and that the number of small farms should be increased. You are probably not aware that on the Tregynnog estate the proportion of small farms is fully maintained, that there are at present no less than seventy-six small holdings under 45 acres, and that of these fifty five range from 2 to 11 acres, so that ample scope is given to the smaller tenantry to gradually rise to larger-sized farms. It is, however, perfectly true that there are still several cottages which have little or no land attached. At Toddington, on my Gloucestershire property, all the cottages (numbering about 150) have gardens of a quarter of an acre attached, and an extra quarter of an acre can always be obtained if desired. This principle of granting in arable districts a quarter or half an acre, or instead, where there is pasture available, land under proper conditions sufficient to enable cottagers to keep a cow, is one which I have always been much in favour of, and I am extremely glad to see that there is a wish to have this system more fully carried out. It is not of course possible in every case to give sufficient pasture to keep a cow, as the due regard must be paid to the conditions and requirements of neighbouring farms; but so far as I am concerned I can only say that I should be extremely pleased to see no exception to the rule, and in all cases where it is wished, industrious and thrifty persons in cottages on the Tregynnog estate possessed either of half an acre of garden land, or, where possible in pasture districts and where the tenant has sufficient capital, land enough to keep a cow. It will be clearly quite impossible to extend this system hurriedly, but every consideration will be given to carry it out fully as soon as practicable.—Yours faithfully,
"LORD SUDELEY.
"MR. BOWEN."

— IS A TENANT'S GREENHOUSE A BUILDING? — The following letter has been sent us for publication, and in view of its great importance we solicit the opinions of our readers:—

"On Wednesday, September 30, I Mr. A. DENT, horticultural builder) was summoned by Mr. ELKINGTON, district surveyor of Penge, to appear at Lambeth Police Court, on a charge of erecting a greenhouse, 12 feet by 8 feet, in the district of Penge, without having given the notice required under the Buildings Act.

"I contended that this greenhouse was a tenant's fixture, and did not come under the Act, being made standing in every respect boarded up to sill of sashes; portable, and not fixed to another sill or frame at bottom, formed of 7 by 2½ inch deal.

"I was advised to have wheels put on this greenhouse, to save being compelled to comply with the Act, which states that all buildings shall have 6-inch brick walls, with proper footings and concrete foundations, which, of course, I could not carry out, being only a tenant's fixture. Accordingly I had four wheels put on the bottom frame, so that the whole could be moved in one if necessary, or taken apart, and stowed away in a shed if required.

"The result was that Mr. CHANCE (magistrate) decided that this greenhouse, although not connected with the ground either by posts driven in, or by brick-work under, but only laid on top of the earth, was a building within the Act, and gave it as his opinion that even cucumber frames were not exempt.

"Now, sir, I report this case to you, feeling that it is a matter not to be trifled with, but should be dealt with promptly and decisively, and in the interests of flower growers generally I take the liberty of asking you to give this matter all the publicity possible.

"Having seen the uncertainty which existed among tenants and the gardening papers generally, I took the precaution of employing a first-class solicitor to defend the case, thus incurring considerable expense, the case being adjourned and having to reappear on Saturday;

but it was all no use. I was fined a nominal fine of 5s. and the cost of the summons, with, of course, the privilege of appeal.

"Now this appeal will be of no use to me, but if your readers feel sufficient interest in the cause of tenants' rights, as to having a greenhouse of their own, and will offer some assistance towards the cost of an appeal against this decision, I am quite willing to join in the expense and allow my case to be used as a test case, in the interests of tenants and flower growers generally.

"Should you deem this worthy of insertion, those of your readers who wish to help in this important matter may forward their names, addresses, and amount they promise to contribute, to **BASIL E. GREENFIELD, ESQ.**, solicitor, 17, Katharine Street, Croydon, and they will receive an acknowledgment in the paper they choose to name.

"In writing please write the word 'appeal' on outside of envelope."

— **CHRYSANTHEMUM SHOWS.** — The Royal Horticultural Society of Southampton will hold a show on November 3 and 4, when liberal prizes will be awarded in leading classes.—**Higgate, Finchley, and Hornsey** will hold a show for the same flower, and for fruits and vegetables on November 5 and 6, when nearly £70, with Medals and Certificates from the National Chrysanthemum Society, will be awarded.—The second exhibition of the flower will be held in Huddersfield on November 13 and 14; and Stoke Newington will have its Chrysanthemum annual show on November 9 and 10.

— **HACKNEY MICROSCOPICAL AND NATURAL HISTORY SOCIETY.**—The Council have arranged for a Fungus foray to take place in Epping Forest, on October 24. The trains will leave Liverpool Street Station at 10.9 A.M. for Chingford, and 2.10 P.M. for Loughton. The route will be through the Green Ride and High Beach to the "Robin Hood" by the early train, where the afternoon party from Loughton can join at from 3.15 to 3.45 P.M. The President (Dr. M. C. COOKE, F.L.S.), **WORTHINGTON G. SMITH, F.L.S.**, Mr. J. ENGLISH, Dr. H. L. WHARTON, F.L.S., E. M. HOLMES, Rev. J. McCROMBIE, and **Geo. MASSEE**, are expected to give their valuable assistance on this occasion. Mr. COLLIS WILMOTT, F.R.M.S., of The Triangle, Hackney, is the Hon. Secretary.

— **LE JARDIN ALPIN D'ACCLIMATATION DE GENÈVE.** — The following is from M. CORREYON:—

"Permettez moi de remercier par l'organe de votre estimable journal les personnes qui ont répondu à vos articles du 11 Juillet, passé relatifs à la question de la protection des plantes Alpines et de notre Jardin Alpin. Bien des personnes m'ont écrit à ce sujet, et je leur ai généralement répondu par l'envoi de notre bulletin et de nos comptes-rendus. Je pense toute-fois qu'il est nécessaire que je fasse connaître ce fait—c'est que le jardin d'acclimatation que nous avons fondé, et qui est encore de création fort récente, a déjà rendu d'utiles services à la cause que nous défendons. Un grand nombre d'amateurs de plantes, qui les eussent autrefois arrachées dans les montagnes, se sont adressés au jardin pour avoir des plantes élevées de semis chez nous. C'est là que nous estimons qui doivent se porter nos efforts, et c'est à aider, à secourir le Jardin Alpin de Genève, en devenant actionnaires ou en souscrivant à la liste des donateurs, que sont invités tous les amis de cette belle cause. La flore alpine, acclimatée dans les jardins, offre beaucoup d'attraits, et le peuple Anglais, mieux que tout autre, sait l'apprécier. Notre jardin s'efforcera aussi de développer cette science d'acclimatation et de répandre la connaissance de ces cultures. Notre établissement, bien qu'encore dans l'enfance, a reçu cette année la visite d'un grand nombre d'étrangers, qui nous ont témoigné leur satisfaction pour ce que nous avons déjà obtenu. Nous espérons ainsi faire connaître et apprécier la flore de nos montagnes tout en empêchant sa destruction. Jusqu'à présent nous avons acclimaté le plus grand nombre d'entre ces plantes par le moyen du semis.

"Réservez, Monsieur le Rédacteur, l'assurance de notre entier dévouement.

"Le Secrétaire, H. CORREYON, Directeur du Jardin.

"N.B.—Les dons et les demandes d'actions doivent être adressées au Jardin Alpin d'Acclimatation de Genève."

— **GARDENING APPOINTMENT.** — Mr. GEO. MARTIN, late Foreman at The Gardens, Danesbury, Welwyn, Herts, has been appointed Head Gardener to J. S. CRAWLEY, Esq., Hockwood Park, Laton, Beds,

PEARS.

The photographs from which the engravings on p. 496 were taken were prepared some years ago. The large tree on the left of fig. 103 is a *Passé Colmar*, the next *Glout Morzau*, and the next *Berré Diel*. The *Passé Colmar* has never been very fruitful, the fruit always following the young wood at the extreme ends of the horizontal branches. No matter how the spurs were managed the greater portion of the surface of the tree ran to breastwood. The tree is now undergoing a process of grafting with selected sorts; the experiment so far bids fair to be a successful one. *Glout Morzau* and *Berré Diel* crop very satisfactorily. The latter is not particularly deserving of a wall, but one does not like removing a tree, as vacant spaces on walls look so bad. With these trees the wall space is now well filled up.

The Pear on fig. 109 is a *Marie Louise*. It has been a prolific bearer of handsome fruit for many years, but I think I must admit the crop this year to be the best I have ever known upon it. It fruits generally all over the tree. The greater portion of one side of the tree derives a considerable amount of beneficial warmth from the bothy chimney, against which, as may be observed, it is trained. The loosely trained tree in the corner is a *Castle Kennedy* Fig, now replaced by a *Cherry*. The old man close by, whose height is 5 feet 8 inches, will give some idea of the height of those buildings.

We have another long Pear wall similarly trained, having a south-east aspect, some of the varieties on which are *Berré Rance*, *Williams' Bou Chârien*, *Marie Louise*, *Thompson's*, *Forelle* or *Trouf Pear*, *Easter Berré*, *Glout Morzau*, *Wentz Nels*, *Van Mons' Lion* le Clerc, *Victoria*, *Berré Langelier*, *Brown Berré*, *Berré d'Amanlis*, *Louise Banne* of *Jersey*, *Jargonelle*, &c. These are this year a more or less excellent crop. Some of these were also more or less addicted to fruiting at the extreme ends, and with a view to obviate this, seeing that the yearly cutting away of the breastwood did not produce on the spurs fruit-bearing buds, but only another formation of wood-buds again to be cut away, I cut away every alternate horizontal branch, and laid in lateral shoots close to the wall, precisely like that known as the Seymour system of Peach training. My object in doing this was in the hope that at the base of these shoots fruitful buds would form and give fruits such as we generally have it always, at the extreme ends of the horizontal branches. The result of my experiment has this year turned out a very happy and beneficial one, for on several of the trees these lateral shoots have been well loaded with fruit—producing a pleasing appearance as compared to having fruit only at the extreme ends of the branches. Of course it may be argued that these lateral shoots may also become barren, like the others, when they become old and the knife has to be applied. The remedy for this will be simply to cut out these old laterals and train in young ones. It is, however, satisfactory to know that our effort in producing fruitfulness has been so far successful. My experiment has been closely watched and freely criticised by practical neighbours, and their coming this year and seeing a fair crop of fruit on these laterals was rather convincing proof of the success of the experiment.

I have no particular faith in root-pruning trees on walls with a view to produce fruitfulness. Fruitfulness is produced by this method at the expense of the health of the trees. Rather, I should advise encouraging a vigorous growth until the wall is covered, and then if fruitfulness does not follow some gentle means of producing it might be tried. *W. Miller, Coombe Abbey Gardens, Warwickshire.*

GATHERING AND STORING FRUIT.

It is of the utmost importance to store fruit in a clean and perfectly sweet place; a fruit-room should be as sweet as a dairy. The principles to be kept in view in the construction of a fruit-room are darkness and dryness to a certain extent, and a low and steady temperature of 40° to 45°. Light is not essential. Fruit, while growing on the tree, is perpetually supplied by the stem with water sufficient to replace what is given off by its surface. As soon as the fruit is gathered the source of supply is removed, then with the action of light upon it the fruit loses weight, without being able to replace its loss. It is thus that fruit becomes shrivelled and withered prematurely. Light, therefore, is not essential to a good fruit-room. It is, however, advisable to have some windows, which should be kept darkened, except when storing

the fruit or for the necessary inspections of the fruit, which should be frequent, and for the greater facility for selecting the ripest and best specimens. The air should be kept moderately dry, but ventilation should not be used except for the purpose of getting rid of offensive smells arising from decayed fruit.

Great care should be taken in gathering, handling, and storing the fruit, placing each kind by itself and keeping wall fruit apart from standard fruit. Gather the fruit in baskets lined with hay, and place them on the shelves side by side, with the eyes downwards. No fruit ought to be beaten down from or shaken off the trees, all should be carefully plucked and put into the basket, not thrown or tumbled in; they should be then taken carefully to the fruit-room and placed carefully on the shelves. Those kinds that are plentiful may be placed three or four deep on the shelves.

Early Apples are, as a rule, softer in texture than the late keeping sorts, and on that account special care should be taken in handling them. If roughly thrown into baskets or emptied therefrom they are seriously damaged by being bruised; the contusions may not show immediately, but in the course of a few days the fruit will be unsightly and the reverse of acceptable, and it will speedily decay.

Some persons do not know when fruit is sufficiently ripe to gather. The first symptom of ripening is a slight change in colour, followed immediately by the falling of several of the specimens. When this occurs the crops should be examined, by gently lifting a few fruit. If matured they will separate from the trees, and fall into the hand without any twisting of the stalk whatever; if they cannot be taken without breaking the stalk, they are not ready for gathering. When early Apples and Pears are allowed to hang on the trees after becoming quite ripe, the fruits are apt to turn mealy in texture. It is seldom that the whole of the fruit on a tree ripens exactly at the same time. This is often an advantage, as by gathering a few two or three times a week, the produce of one tree—it may be a favourite Pear—is usable over a longer period than would be possible if all were secured at once. Those who have small trees containing choice fruits in the garden can, and should, gather the crops periodically. They will find the period of their use, of particular kinds, that are often, if not invariably, over too soon, materially prolonged. Late fruit of all kinds should be put in place in the fruit-room, from whence they need not be removed until wanted. Early fruit should be placed where they can be taken from when wanted. When the fruit is all gathered the house should be cleaned, the atmosphere should be kept as uniform as possible, the temperature not lower than 40° nor higher than 45° if possible. A few nice dessert Pears and Apples should during the autumn be put periodically into a warm house to ripen. Avoid handling fruit much, the less they are moved about the nicer they look when ripe. *M. Saul, Holgate, York.*

GARDEN PEARS.

THEIR name is legion, and a source of perplexity to the grower of trees, but to ensure a regular supply to a much larger number of kinds is necessary than would be the case if we had sorts which could be depended on for a certain supply; the spring frosts are the great bane of Pears, and, curious to say, those having pendent flowers seem no better protected by the corolla than the upright bloomers.

The introduction of the *Quince* stock has in the last thirty years revolutionised the growth of Pears, and except in soils where they do not succeed (which are few garden trees on free stocks are seldom planted. "Plant Pears for your heirs" is no longer a safe proverb, being ousted by "Fruit the first year" under the modern system. It is the opinion of many that the praise of cordons has been over-blazoned, and in many cases this is so. They are to be recommended where a variety is wanted in a small space or to cover vacant walls quickly, and perhaps for villa gardens; but the most serviceable tree for general wall or espalier planting are trained trees on *Quince*, and for choice the *candelabra* style of training; such can be seen in perfection at *Barham Court*, and Mr. HAYCOCK, the champion grower, considers the fruit from open trees as large and of better flavour than from a wall. The culture of Pears on the free stock as pyramids or other garden trees generally results in a luxuriant growth of foliage and shoots, with the

minimum of fruit, because the demands on the garden staff will not admit of root-pruning, which must be regularly carried out. A successful example of this operation was mentioned in the *Gardeners' Chronicle* as performed by Mr. Smith, of Keoward Gardens, Yalding, and whose trees I had the pleasure of seeing in full regular bearing. On the Quince stock this work is much facilitated, as the roots are mostly those called fruit fibres, in opposition to growth producers. After two or three vigorous root-prunings, such trees (as an amateur whose trees are the best in England, and who has had them under his care from infancy, says) are conquered, and when once they get into a fertile state they bear so freely that exuberant growth is checked, in fact, the tree is a scientific success, the proper balance having been found between root power and fruit produce. When fruit is set the fruits should be thinned out, leaving only those exposed to the sun and in the best positions, and if the crop is a heavy one, mulching may be carried out, but never without a crop, as infertility will only be encouraged.

It is lamentable to see in many old walled gardens perfect forests of breastwood with only a few fruit on the ends of branches. Here judicious root-pruning would be well repaid, but if the sort is obsolete the trees can

HOME CORRESPONDENCE.

Satyrium carneum.—Mr. Webster asks (p. 470) concerning the soil that is best suited for the cultivation of this plant. In its native country it grows in moist sandy soil a few miles inland from Cape Town, and apparently not ascending above 1000 feet on the mountains, so that it is perhaps a little more tender than some of the species. The soil seems to consist of about three parts silver sand and one part black vegetable loam. For further information Mr. Webster may refer to what I have quoted from a note of Sir John Herschell's on p. 403 of this volume. *N. E. Brown.*

Covent Garden Prices.—Under the heading of "Country Growers and Town Salesmen," which appeared in your columns Sept. 26, p. 408, "C.," in a lengthy article, aired a fancied grievance before the public. The article in question, though giving no name, points so directly to us, that we feel compelled to take up the matter on behalf of ourselves and other salesmen whose lot it is to be brought into contact with small and unsatisfactory growers. On

bear out his views. Should the supposed market prices quoted in many papers by any fortunate and unforeseen circumstances prove to be correct these prices, as a rule, apply to the best produce in the market, grown and packed by practical growers. The private grower may imagine, no doubt, that his goods are quite equal to any grown by professionals, and markets them with the expectation that he will get the same value for them; failing to do so he makes no allowance for his own want of knowledge as regards growing and packing, and casts the blame upon the head of the salesman. *Squelch & Barnham.*

Chrysanthemum G. Wermig.—The small flowers set out of the fine sport from Mad. Desgrange grown out-of-doors. It grows to 6 inches in diameter, and has been blooming with me since the middle of August, going through the frosts well. I find it do very well as a late one, too, if you take the cuttings in June, in fact I had some as late as January last year, which it is of importance to know, as there is scarcely one, even amongst the late ones, which can beat it in colour and elegant form, and certainly not in its abundant flowering. All the plants, and I have nearly 10,000 of them, are literally one mass of

FIG. 111.—BEURRE CLAIR-GEAU: PYRAMID ON QUINCE FOUR YEARS OLD: FROM A PHOTOGRAPH.

readily be grafted with better sorts, and in two years will commence to bear. Much of this excess of wood growth is owing to the constant manuring necessary for the crops grown on the fruit borders, and the frequent disturbance of the roots. It should be as a law of the Medes that no fruit-tree border should ever be dug within 3 feet of the wall or 6 feet of espalier tree stems. These few remarks would scarcely be complete without a list of the best twenty-five kinds for general garden culture (see pp. 502, 503), and as a rule, where the later and slowly ripening sorts succeed, it is preferable to plant duplicate trees, than to increase the number of varieties. *G. E.*

St. Ambrose Apricot.—This is a large unevenly-shaped variety, well worthy of being more planted. It seems to form a hardy tree, and can generally be depended upon in most seasons to produce a goodly number of high-coloured fruit. Mr. Webster, of the Gordon Castle gardens, manages his Apricot wall extremely well. He is an advocate of constant root-lifting, and prefers seedling trees. One of his trees, a seedling from Moor Park, and identical with the parent, extends along the wall for 24 feet, with never a sign of decay. It would be valuable information if some of your correspondents were to give their experiences of not only seedling Apricots, but also Peaches. *C. A. M. C.*

FIG. 112.—BEURRE CLAIR-GEAU: HORIZONTAL ESPALIER ON QUINCE FOUR YEARS OLD: FROM A PHOTOGRAPH. (SEE P. 499)

July 23 a consignment of 13 dozen Artichokes was received from "C.," whom we assume to be the same as your correspondent. These were a small bluish Artichoke, about the size of the proverbial Thistle, and as valuable. At that time the finest green Artichokes were selling at 9s. to 1s. per dozen (wholesale), and only limited quantities could be sold at those prices. To our knowledge plenty were uncut by large growers, as they would not repay the trouble of marketing. Other salesmen whom we could mention were also throwing away quantities, not being able to sell them; consequently, we could not dispose of such an extremely indifferent sample as we received, and after offering them for sale for a few days, they were at last thrown away. Our sender was informed of the fact as soon as we saw there was no possibility of effecting a sale, and though "C." states that he received no information respecting them for six weeks after their dispatch, we distinctly affirm that a return note marked "worthless" was sent after a lapse of a few days. "C.'s" insinuation respecting the extent of our business is illimed, seeking, as it does, to cast aspersion upon the abilities of salesmen whose fault consists in not being able to realise paper prices for goods that might justly be termed rubbish. "C." no doubt will resent having his goods indicted in such terms, for too often does the private grower think his geese swans, and is only too ready to bespatter the salesman when the prices realised do not

flowers, and the sale in Covent Garden Market has been better than any other variety. *G. Wermig.* [Landsome yellow flowers of an early kind, very free in blooming—an acquisition. Ed.]

Annual Chrysanthemums.—I enclose a few flowers of the annual Chrysanthemum for your inspection. I find them free bloomers, very useful to cut from, and keep a remarkable time in water after cut. In addition to the above they have just stood three consecutive nights of frost—7° each night—almost unurt. At dawn this morning it was 25° warmer than yesterday at the same time. *J. Shrimpton, Aston Clinton.* [Showy useful border flowers, some of which had discs of yellow, whilst the rays were either some other shade of yellow or white. Some others were quite double and full. Ed.]

Larkspurs.—I presume that it would be difficult to say that our cultivated Delphiniums have sprung from any one species. One of the oldest is, no doubt, the Siberian *D. elatum*, which was introduced nearly 300 years ago. This is the well-known Bee Larkspur. But is it a native of Siberia, or did it find its way there from the mountains of Virginia and Carolina, and then to Britain? By some *D. exaltatum* is considered to be identical with *D. elatum*, but a catalogue published in 1817, and considered to be a very reliable one, makes them to be distinct. Next to *D.*

elatum in point of earliness of introduction came *D. intermedium*. These, with *D. grandiflorum*, *D. puniceum*, and *D. urceolatum*, appear to be the only species in cultivation in this country seventy years ago. *D. Barlowi* and *D. Hendersoni*, which were in all probability seedling varieties of *D. elatum* or *D. grandiflorum*, have, no doubt, been the remote progenitors of some of the finest varieties in cultivation. Later in point of time came the large blue *D. formosum*, the origin of which is, perhaps, not accurately known; and this fine form appears to have been the forerunner of many of our present striking varieties. They are now very numerous, varied, and wonderfully fine; English and foreign raisers have vied with each other in the production of new forms, and every year brings additions to them. Now the varieties give flowers of many shades, and especially of blue, from clear azure to deep indigo, with pure white, pale lavender, and orange centres; then there are other shades, and combinations of shades—pink, rose, red, bronze, and blue. There are fully double, semi-double, and single varieties, and they vary in the height of growth from 2 to 5 feet. A good selection of fully double flowers

Maude, brilliant blue, suffused with rosy-crimson, extra fine; *Magnificum*, blue and red; *Madame Chate*, porcelain-blue and bronzy-red, very fine; *Madame Henri Jacotot*, azure-blue, tinted with rosy-pink, distinct and very fine; *Nahamah*, dark blue, suffused with bronzy-crimson, very fine; *Schamyl*, dark blue, very handsome; and *Wheeleri*, dark blue, with bronzy-red centre. The foregoing are intended to be suggestive rather than exhaustive lists. The best way to enjoy the peculiar beauty of the varieties of the Delphinium is to plant a bed of say two dozen plants of distinct varieties; having three lines to the bed, the tallest plants down the centre, the dwarfest at the sides. To do them justice, they want to be in a good loam, enriched with decomposed manure and leaves. The plants root freely and somewhat deeply, and therefore the soil should be trenched to a good depth, and the dung mixed in with it. Clumps can also be placed along the back of the mixed border, according to the height of the variety, and they can be used in many other suitable spots. It is always pleasant to find a mixed border in a kitchen garden, and the Delphinium is always a conspicuous ornament in these, as well as very useful

seedlings. It is well to sow the seed as soon as gathered, as it is found by experience that if kept long it does not germinate so freely. Some shallow wooden boxes, drained with broken crocks, and some moss laid over them, are well adapted for sowing the seed. After being filled with a good and rather light gritty soil the seeds should be scattered thinly over the surface, then covered to the depth of an eighth of an inch, and the whole gently pressed down. Then the boxes can be placed in a cold frame, raised on inverted flower-pots, or stood on pieces of slate, to prevent the worms working up into them, and disturbing the seeds. Some patience is necessary, as it is found the seeds of some of the sorts will not germinate until nearly a year afterwards. The boxes should be kept free of weeds, and the surface gently stirred occasionally. The annual Larkspurs are not so well appreciated, or so much grown, as they deserve to be. The branching Larkspurs are doubtless improved varieties of the British field Larkspur, *D. consolida*. They grow somewhat tall and branch freely, producing many flowers, and there are now several pretty varieties. The progenitor of the fine German Larkspur is, it is believed, the Swiss *D. Ajacis*. By means of careful selection there are now something like five different types with their varieties, viz., the Dwarf Rocket, Stock-flowered; Emperor, Candelabrum, and the tall Hyacinth-flowered. All these are very fine, and show the results of many years' careful selection both in this country and abroad. Seeds of these can be sown in the open ground in spring in a good free soil, and the plants thinned out, so as to allow ample space for the development of each. There is a curious legend referring to the origin of *D. Ajacis* (Ajax), which is given by Mr. Folkard in his book on *Plant Lore*, &c. "Ajax, the son of Telamon and Hecione, was, next to Achilles, worthily reputed the most valiant of all the Greeks of the Trojan War, and engaged in single combat with Hector, the intrepid captain of the Trojan hosts, who was subsequently slain by Achilles. After the death of Achilles, Ajax and Ulysses both claimed the arms of the deceased hero. The latter was awarded them by the Greeks, who preferred the wisdom and policy of Ulysses to the courage of Ajax. This threw Ajax into such a fury, that he slaughtered a flock of sheep, mistaking them for the sons of Atreus; and then upon perceiving his error, stabbed himself with the sword presented to him by Hector—the blood spurting from his self-inflicted death-wound giving birth as it fell to the earth to the purple Delphinium, which bears upon its petals the letters at once the initials of his name and an exclamation of grief at the loss of such a hero." Those who have eyes to see it can read upon the petals the letters A. I. A., and which the botanists term Delphinium Ajacis—truly a flower upon which the name of a king is written. In conclusion it seems superfluous to allude to the value of the Delphinium for cut purposes; but now that collections of cut blooms of hardy flowers figure in most schedules of prizes, the Delphinium is one of the most valuable and effective subjects that can be grown for this purpose. But few other hardy flowers supply such rich hues of blue and violet. *R. D.*

FIG. 113.—MESSRS. BUNYARD'S FRUIT-ROOM: WALLS OF REED, ROOF THATCHED.

will be found in the following:—*Alopecuroides*, rich blue and bronzy-red; *Amédée Hians*, bright shining blue, with light centre, flowers very double and well formed; *Globe*, pale lavender, light centre; *Herman Stenger*, outer petals blue, centre petals rosy-pink, extra double; *Hybridum*, rich blue, very fine; *La Lyrraine*, bright metallic blue, fine and distinct; *Madame E. Geoy*, reddish-purple, tipped with blue, centre blue and white, flowers large and fully double; *Mons. Rile*, rich indigo-blue, with purple centre, extra fine; *Mons. Le Bihan*, double bluish-lilac, white centre; *Prince of Wales*, azure-blue, white centre; *Rannunculeflorum*, rosy-lilac, the edges of the petals broadly margined with cobalt-blue, very double and distinct, and a beautiful variety; and *Victor Lemoine*, blue with lighter centre, a beautiful variety. The semi-double varieties include *Barlowi*, dark blue shaded with bronzy-red; *Barlowi versicolor*, dark blue, suffused with rosy-crimson; *Etoile*, blue, white centre, very fine; *Exquisite*, brilliant cobalt-blue, tinted with rosy-lilac, extra fine; *Mrs. James Helme*, azure-blue and rose; and *Phoenix*, rich purplish-red and bright violet-blue, large and fine. A selection of thoroughly good single varieties will be found in the following:—*Amabilis*, azure-blue, changing to rosy-lilac; *Beauty of Charone*, rich blue; *Conspicua*, light blue, white and orange eye; *Grandis*, light blue; *Gloire de St.*

for cutting from. The scarlet Delphinium—*D. nudicaule*—has a marked individuality of its own, and it deserves a place in every collection. Unlike the other Delphiniums, while doing well in the same soil, it forms corm-like roots, which lie near the surface, and during winter these are apt to become exposed, and so in danger of being washed away by heavy rains; therefore, it is a good plan to top-dress the surface over the roots with some soil during the summer, and again in the autumn, so that the plant may be preserved during the winter. Years ago Delphiniums were much more grown in pots than they are now. Good strong plants were selected, and potted in 12-inch pots in a soil made up of equal parts of turfy loam, coarse sand, well-decomposed manure, and leaf-mould. This was done in early spring, and the first shoots were cut back to three or four eyes, which broke strongly again, and any shoots thrown up directly from the roots were also stopped, and in this way good bushy specimens were formed. The plants were started into growth in a gentle heat, and then gradually hardened off, and brought on into flower in the open air. It is scarcely necessary to mention that the Delphinium can be propagated by division of the roots, and also by means of cuttings made of the young growths thrown up at the end of the summer. The Delphinium seeds freely, and it is very interesting to raise

Disa macrantha (*D. crassicornis*).—I am sorry Mr. Burbridge should be so offended with me for trying to answer his original question as I thought he wished it answered. I understood that he wished to know the name of the plant represented in a sketch of Mr. Sanderson's under the name *D. macrantha*, a copy of which, made by Mr. Burbridge, is in the Kew herbarium. I replied that I believed this drawing to represent *D. crassicornis*, but that the flowers were larger and more highly coloured than represented in that species as grown here, but whether the large size and heightened colour of the drawing is real, or due to the imagination of the artist, I could not tell. I can now, after another careful examination, only repeat that my firm conviction is that the drawing in question is an inexact and possibly exaggerated representation of *Disa crassicornis*. Neither can I do more than repeat what I said concerning the true *D. macrantha*, Swartz—namely, that up to the present time it is unknown what plant is intended by this name; certainly it is not the plant represented by Mr. Sanderson's sketch; and the plant Mr. Burbridge alludes to as being in the British Museum, collected by Cooper, in Caffaria (if I am right in supposing he means Cooper, No. 1291, which was erroneously distributed as *D. macrantha*), is *Disa crassicornis*, Lindl. *N. E. Brown*.

NOTES FROM THE PEAR-GROWING DISTRICTS.

BRENS.—The following varieties of Pears in good condition, and bearing fine crops on splendid young trees, were observed at Benham Park, Newbury, the seat of Sir Richard Sutton, Bart., viz.:—Glu Morceau, Beurré Rance, Beurré diel, Marie Louise, General Todtleben, Pitmansot Duches, Duchesse d'Angoulême, Winter Nelis, Passe Colmar, Beurré d'Arenberg, and others, some being horizontally trained, others fan-trained.—Mr. Howe, the gardener, preferring the latter style of training, especially for those Pears having a slender habit of growth. A.

CHEESHIRE.—We now send you a list of the Pears which seem to suit our climate best. We may remark that this is not a very good Pear country (we mean for standard or orchard), and for some years past the crops have been very poor—nearly a failure, in fact:—

Autumn Berginot, excellent; tree hardy. Pear or Quince, Beurré d'Amans, excellent; forms a grand pyramid on Quince or Pear.
Beurré de l'Assomption, a very good early Pear.
Bonne de Mello, an excellent late autumn Pear. Grows well on Quince.
Beurré de Capimont, very free and hardy, a most useful Pear here.
Beurré diel, very fine, but requires a wall to do well.
Beurré Superfin: this is one of our best Pears.
Cron des Carmes: with us this is an excellent early Pear.
Comte de Lamy, of first-class quality; tree hardy, good bearer.
Jargonelle, ripens well on standards.
Louise Bonne de Jersey, perhaps the best Pear grown here, hardy, free, and in every way first-rate.
Marie Louise, tree hardy, blossom tender; seldom produces crop except on wall.
Marie Louise d'Ucle, hardy, free bearing; and excellent: a most desirable Pear.
Pitmansot Duches, large and fine, but requires a wall here.
Suckle, first-rate, hardy and free bearing.
Suffolk Thorn: this is a hardy, free growing and bearing sort, and well deserving a place.
Summer Doyné: this is a delicious early Pear, very fine; does well on Quince.
Swan's Egg, tree very vigorous, bears well: a useful Pear.
Thompson's, a hardy free growing sort, and of first-rate quality.
Williams Bon Chrétien: this is one of our most useful and reliable sorts.

The above we consider the best twenty Pears grown in this neighbourhood. There are of course many excellent Pears besides these, but some are tender as trees, others tender in blossom, and many requiring walls, which are not worth extensive cultivation. The following have done reasonably well here:—Durandau, Beurré Hardy, Easter Beurré, blooms early, generally killed by frost; Flemish Beauty, General Todtleben, Glou Morceau, bears well, but does not ripen thoroughly; Jersey Gratioli, Bergamotte d'Espere, bears well, but requires a wall and a good climate. James Dickson & Sons, *Newton Nurseries, Chester.*

The following Pears succeed well on Quince, bear well, and ripen their fruit on the open quarter in this nursery:—

Louise Bonne de Jersey	Soldat Labourant
Beurré d'Amans	White Doyné
Williams Bon Chrétien	Cron des Carmes
Jargonelle	Doyné d'Été
Marie Louise d'Ucle	Feritilly
Comte de Lamy	Beurré diel
Beurré d'Arenberg	Beurré de Capimont
Beurré Superfin	Beurré Clairgou
Alexandre Lambre	

The following bear well on the Quince, but rarely ripen their fruit satisfactorily unless on a wall:—

Doyné du Comice	Glou Morceau
General Todtleben	Chaumontel
Bergamotte d'Espere	Beurré Bachelier
Duchesse d'Angoulême	Maréchal de la Cour
Pitmansot Duches	Easter Beurré

Few Pears bear well in our cold soil on the Pear stock (in open ground), the fruit generally being small, unless in hot dry seasons. The remarks apply only to our cold damp soil. The following do fairly well on standards for orchard:—

Hesle	Marie Louise d'Ucle
Louise Bonne de Jersey	Feritilly
Beurré d'Amans	Alexandre Lambre
Doyné d'Été	Secilg's Pégimot (Rivers)
Cron des Carmes	

F. & A. Dickson & Sons, *Chester.*

DEVON: Ailinton.—I send you a list of the Pears we grow, with a description of their fruit-bearing characters, and the stocks on which they are grown:—

PEARS ON PEAR STOCK.	
Beurré Rose—good bearer	Bon Chrétien (Williams)—good bearer
" d'Amans—very good bearer	British Queen—very shy bearer
" diel—good bearer	Easter Beurré—good bearer
" Superfin—fair bearer	

PEARS ON QUINCE STOCK.	
Forelle—good bearer	Passe Colmar—good bearer
Glou Morceau—good bearer	Pitmansot Duches—good bearer
Marie Louise—shy bearer	Thompson's—shy bearer
Monarch (Knights)—great bearer	Van Mons' Lion le Clerc—shy bearer
Ne Plus Meuris—great bearer	

PEARS ON QUINCE STOCK.	
Bergamotte d'Espere—good bearer	Gansel's Bergamotte—good bearer
Beurré Bachelier—fair bearer	General Todtleben—shy bearer
" Clairgou—great bearer	Gilgöl—good bearer
" d'Arenberg—fair bearer	Hesle—Victoria—good bearer
" Rance—good bearer	Jargonelle—good bearer
Gilgöl—shy bearer	Josephine de Malines—good bearer
Chaumontel—good bearer	L'Incompte—good bearer
Comte de Lamy—great bearer	Louise Bonne de Jersey—good bearer
Conseiller de la Cour—fair bearer	Madame Treuve—good bearer
Crasanne—good bearer	Verulam—good bearer
Doyné du Comice—good bearer	Vicar of Winkfield—good bearer
Duchesse d'Angoulême—shy bearer	Winter Nelis—good bearer
Eyewood—great bearer	Zepherin Grégoire—good bearer

John Garland, *Kilerton, Exeter.*

ESSEX.—The most suitable Pears in this district are the following:—

PEARS, STANDARDS OR PYRAMIDS, ON THE PEAR STOCK.	
July.—Doyné d'Été, Citron des Carmes.	
August.—Jargonelle, Beurré Giffard, Clapp's Favourite, Beaco.	
September.—Bon Chrétien (Williams), Summer Beurré d'Arenberg, Beurré d'Amans, Madame Treuve, Colmar d'Été, Louise de Fontenay Vendé.	
October.—Fondante d'Autonne, Fertility, Beurré Hardy, Hesle.	
November and December.—Marie Louise d'Ucle, Emile d'Heyst, Winter Nelis, Beurré d'Arenberg, Josephine de Malines.	

Pears on the Pear stock are so long in bearing when planted as pyramids or standards that the result is often disheartening. The following are selected because they are comparatively early producers:—

PEARS ON PEAR STOCK FOR WALL.	
July.—Doyné d'Été, fruit small, but very productive.	
August.—Jargonelle, Beurré Giffard, Clapp's Favourite.	
September.—Bon Chrétien (Williams), Beurré d'Amans, Madame Treuve, Beurré Superfin, Souvenir du Congrès, Louise de Fontenay Vendé, Dr. Hogg.	
October.—Louise Bonne de Jersey, Fondante d'Autonne, Beurré Hardy, Gansel's Bergamot, Broua Beurré, Marie Louise, Beurré Baco.	
November and December.—Glou Morceau, Pitmansot Duches, Doyné du Comice, Durandau, Marie Louise d'Ucle, Emile d'Heyst, Beau diel, Beurré d'Arenberg, Marie Louise, Monarch (Knights).	
December to March.—Passe Crasanne, Bergamotte d'Espere, Easter Beurré, Ne Plus Meuris, Beurré Rance, Olivier des Serres.	

PEARS ON QUINCE STOCK.	
July.—St. Swithin's, Doyné d'Été, Citron des Carmes.	
August.—Jargonelle, *Beurré Giffard, *Clapp's Favourite, Beacon.	
September.—*Bon Chrétien (Williams), *Summer Beurré d'Arenberg, *Beurré d'Amans, Madame Treuve, *Beurré Superfin, Colmar d'Été, *Souvenir du Congrès, *Louise de Fontenay Vendé, *Dr. Hogg.	
October.—*Louise Bonne de Jersey, *Fondante d'Autonne, *Gratioli, *Fertility, *Beurré Hardy.	
November.—*Thompson's, *Conseiller de la Cour, *Bonne de Mello, *Glou Morceau, *Pitmansot Duches, *Marie Louise, *Doyné du Comice, *Durandau, *Emile d'Heyst, *Duchesse d'Angoulême, *Gansel's Bergamot.	
December.—*Beurré diel, *Beurré d'Anjou, *Beurré d'Arenberg, *Passe Colmar, *Princess.	

January.—*Winter Nelis, *Josephine de Malines, *Ir. Grégoire, *Marie Benoist, *Passe Crasanne, *Monarch, *Bergamotte d'Espere, *Nouvelle Tulvie, *Prince Napoleon.	
March.—*Easter Beurré, *Olivier des Serres, *Ne Plus Meuris, *Broua Rance.	

The above sorts will grow equally well as cordons, espaliers, bushes, and pyramids. Those marked * are large, and suited also for espaliers and walls. Francis Rivers, *Sawbridgegworth.*

HEREFORDSHIRE.—We beg to hand you a list of desirable Pears for Herefordshire; our soil does not suit all Pears, and in planting a good quantity of finely pulverised bones should be added, as we find bones in this form suit all crops, either trees or agricultural produce:—

Ambrosia—on Pear	Durandau, ditto
Aston Tow, ditto	Fertility—Quince and Pear
Bellissime d'Hiver—Quince	Flemish Beauty, ditto
Bere—Quince and Pear	Castille, ditto
Beurré d'Amans, ditto	Gratioli of Jersey—Pear
Beurré d'Arenberg, ditto	Hesle—Pear and Quince
" Bachelier, ditto	Josephine de Malines—Pear
" Clairgou—Pear	and Quince
" Bon—Pear and Quince	Madame Treuve, ditto
" Babet Fère, ditto	Marie Benoist, ditto
" Capimont, ditto	Maréchal de la Cour, ditto
" diel, ditto	Marie Louise d'Ucle, ditto
" Grubault—Quince	Castille, ditto
" Rance—Pear and Quince	Nouveau Poiteau Quince and Pear
" Doyné du Comice, ditto	Ne Plus Meuris—Pear
Comte de Lamy, ditto	Pitmansot Duches—Quince and Pear
Doyné d'Été, ditto	and Pear
Duchesse d'Angoulême, ditto	Summer Doyné—Pear
	Uvedale's St. Germain, ditto
	Williams' Bon Chrétien, ditto
	Quince and Pear.

Louise Bonne de Jersey and Glou Morceau canker badly; of little use. *The Cranston Company, Hereford.*

MESSRS. LANE & SONS' NURSERY.—The celebrated nurseries of Messrs. Lane & Sons, at Berkhamstead, have long been famous, not alone for one class of plants or productions, but for several. It will be within the recollection of the older men in the profession, when the firm was well known as possessing the best collections of herbaceous plants, and Pansies especially, to be found in the home counties. But that was long before the public had become tired of the monotony of bedding out. Pears are not largely grown here, the district being cold and the soil unsuited to most kinds. Few standard trees are found in the sixteen orchards belonging to the nursery, of which there are three, and what varieties are grown for the purpose of obtaining fruit are worked and grown as oblique cordons, the edges of the orchard quarters being planted with them. Early varieties are mostly made use of for this purpose, the late-maturing, long-keeping kinds seldom attaining perfection. The sorts are—Citron des Carmes, Doyenné d'Été, Gratioli, Louise Bonne de Jersey, Marie Louise d'Ucle, Souvenir du Congrès and Seckle. The list published by the firm contains less than four dozen kinds, but these are the recognised good ones, which are to be found in most gardens, and which are found to bear well, either as bushes, standards, espaliers, or wall-trained. The following is the list of varieties (exclusive of those mentioned previously) that are grown for sale, and which may prove of some value to persons residing in hilly districts and on cold soils:—

Bon Chrétien (Williams)	Passe Colmar
Brookwood Park	Pitmansot Duches, or Williams' d'Amans
Broua Beurré	" d'Angoulême
Castille	Secilg
Chaumontel	Souvenir du Congrès
Citron des Carmes	Uvedale's St. Germain
Doyenné d'Été	Vicar of Winkfield
Doyné du Comice	Victoria (Williams)
Duchesse d'Angoulême	Winter Nelis
Durandau	Alexandre Lambre
Easter Beurré	Althorpe Glessane
Gansel's Bergamot	Autumn Bergamot
Glou Morceau	Bergamotte d'Espere
Gratioli	Beurré Bachelier
Haston's Incomparable	" Clairgou
Jargonelle	" d'Amans
Josephine de Malines	" de Capimont
Knights of the Cross	" de l'Assomption
Louise Bonne de Jersey	" diel
Madame Treuve	" Holly
Marie Louise	" Rance
Marie Louise d'Ucle	" Superfin
Ne Plus Meuris	

JERSEY.—There are many varieties of Pears comparatively worthless for general cultivation. Nurserymen keep them in stock, as they are occasionally inquired for. I send you a catalogue on which I mark the varieties generally grown here in quantity, all of which are acceptable varieties and succeed one another in their periods of maturity. The question of quality is the result of soil, whilst size is attainable by careful pruning, thinning, and manuring. The Chaumontel Pear, which is most grown here, surpasses all others as to quality in the months of November and December. I think no fruit equal to a good specimen of it. It requires a rich, moist soil, to bring it to perfection, and fine fruits often weigh from 12 to 20 oz. Sometimes extraordinary specimens weigh as much as 24 to 30 oz. each. The Pound (Castille) Pear, and the large Belle de Jersey, Belle Angevine or Uvedale's St. Germain, are the culinary Pears best worth growing—the former being best for flavour, whilst the latter is the largest and finest looking Pear grown, ranging from 16 to 50 oz. in weight. I have seen larger specimens, but they are unusual. The trees of both these varieties are of vigorous habit of growth, and will answer to any amount of manuring and thinning, if large fruits are desired. They require sheltering situations, as from the great weight of the fruits they are liable to be blown down by the wind. The flesh of a well matured Pound Pear becomes red in cooking, and was described to me by an epicure as being "both meat and drink," and of excellent quality. The Madeleine, or Citron des Carmes, is our first dessert Pear, and ripens in July followed by Moutille Bouche, Jargonelle, Williams' Bon Chrétien, Beurré d'Amans, Louise Bonne, Marie Louise, Beurré de l'Assomption, Conseiller de la Cour, Beurré diel, Doyné du Comice, Crasanne, Chaumontel, Glou Morceau, and Easter Beurré; and in this collection of fifteen varieties we have the *crème de la crème* of Pears generally cultivated. Many other varieties are cultivated, but not so worthy of general cultivation. Charles B. Saunders, *St. Helier's.*

KENT.—The following Pears are most suitable for gardens in the warmer districts of Kent:—

Reports of Societies.

ROYAL HORTICULTURAL:
October 13 and 14.

This was again one of those successful meetings of which the Society has had several during the year now waning, and must have promoted as great satis-

July to August.—Beurré Giffard, medium size—best of the earlies; Jargonelle, medium size—best on Quince or wall.
September.—Stour du Congrès, very large—excellent bearer; Williams' Non Chrétien, very large—best on Quince stock pyramid of Ville de Vienne, very large—exquisite flower, fertile; Madame Trefroy, medium—luscious sweetness, fertile; Fondante d'Automne, medium—most fertile, exquisite flavour.

October.—Louise Bonne de Jersey, medium—prolific on Quince; Marie Louise, medium—best flavour from open trees; Pimisson Duchesse, enormous—fertile and handsome; Emile d'Heys, medium—very fine, delicious.
November.—Beurré Superfin, large—exquisite flavour; Beurré Hardy, medium—fertile, rich flavour.

December.—Winter Nelis, small—best on wall; Thompson's, medium—among the best, shy bearer; Yancey, large—good bearer, very rich; Doyenné du Comice, large—grand and fertile; Moarich (Knights), medium—very rich, best from open trees.

January to March.—Duchesse de Bordeaux, medium—keeps well, rich flavour; Nouvelle Fulvie, large—best on wall, fine; Josephine de Maline, small—best on pyramids on Quince; Marie Benoist, very large—most delicious; Olivier des Serres—small—a Bergamot, of delicious flavour; Loconne, small—very delicious; Bergamotte d'Espèren, medium—worth a wall, very fertile, and good for a late sort.

It is often said that pyramidal trees are over-pruned, the examples figured are natural pyramids, partly pruned—such are objects of beauty and utility. Geo. Bunyard, Maldstone.

MIDDLETON, TH.—The following list of Pears has been kindly furnished by Mr. Dunn, of Dalkeith Gardens, and should be found useful for those planters of the fruit residing in the colder parts of the country, where some of the finest varieties of Continental origin do not usually succeed in position in the open air:—

TWELVE BEST DESSERT PEARS IN THE ORDER OF RIPENING.

1. Jargonelle, wall or standard—free stock; no good on Quince; good from standards; neat early pear; 2. Williams' Bon Chrétien, wall, bush, or standard—free and Quince stocks always fine; very good from standards. 3. Beurré d'Amants, wall, bush, or standard—free and Quince stocks; best on free stocks. 4. Louise Bonne de Jersey, wall, bush, or standard—free and Quince stocks; best on free stock. 5. Thompson's wall and bush—free and Quince stocks; very fine, but not always a sure bearer. 6. Marie Louise (best all-round Pear), wall, bush, or standard—free stock only; very good as a standard, not good as a dwarf tree. 7. Winter Nelis, wall and bush—free and Quince stocks; best on wall; rather small, but delicious. 8. Napoleon, wall, bush, or standard—either stock; equally fine from wall and standard. 9. Hacin's Loup-à-pied, wall, bush, or standard—free and Quince; best from free stock; very good from standards. 10. Beurré Diel, wall, bush, or standard—free and Quince; best from free stock; best on a wall. 11. Glou Morceau, wall, bush, or standard—free and Quince; best on a wall, but very good on standard. 12. Easter Beurré, wall, bush—free and Quince; keeps later and equally good from bush.

CULINARY PEARS.

1. Catillac, wall, bush, or standard—either stock; best on free stock; does well on standard, need not get a wall. 2. Bellissime de Hiver, wall, bush, or standard—either stock; best on free stock; very fine. 3. Black Worcester, wall, bush, or standard—free stock; good.

Mr. Dunn remarks that in ordinary seasons "all the Pears mentioned, except Thomson's, Winter Nelis, and Easter Beurré, do well here as standards; and the fruit they produce is generally better flavoured than from wall trees, although in most instances slightly smaller. Many other sorts are grown, some of them very good and useful—such as Brown Beurré, Beurré Bose, Doyenné du Comice, Josephine de Maline, Comice de Lamay, Beurré Giffard, Beurré Rance, Matthew's Eliza, Passe Colmar, Doyenné d'Été (very early); Muirfowl Egg, Ne Plus Meuris, Hesse (very free-bearing as a standard); Duchesse d'Angoulême, Beurré Superfin, and others too numerous to mention; but the twelve dessert Pears named in the list are the best here for a continuous supply of first-rate Pears from August to March, or during the season of good Pears."

SUSSEX.—In the Horsham district Pears grow well, as do likewise Apples, such examples of which are frequently witnessed at metropolitan shows. We are indebted for this list to the kindness of Mr. Sidney Ford, the experienced gardener to W. E. Hubbard, E. q., Leonard's Lee:—

TWENTY FIRST-CLASS PEARS ON THE QUINCE.

Duchesse d'Angoulême	White Doyenné
Chausmelet	General Doldheim
Madame Millet	Summer Beurré d'Arnhem
Winter Nelis	Doyenné du Comice
" d'Amants	(Thompson's)
" Strickmans	Napoleon
" d'Anjou	Glou Morceau
" Eichelier	Bon Godden (William's)
L'Étoile de Jersey	Fondante de Cuème
Madame Trefroy	Maria Louise d'Ucole
Pimisson Duchesse	Durandine

PEARS WHICH SUCCEED ON FREE STOCKS.

Gaue's Bergamot	Graffiot of Jersey
Beurré Bose	Longue Marie of Jersey
" Clargève	Marie Louise
" Diel	Madame Millet
" Rance	Knights' Monarch
Easter Beurré	Wier
Bon Chrétien	Olivier des Serres
Windsor Park	Pimisson Duchesse
Chausmelet	Thompson's
Duchesse d'Angoulême	Vicar of Winkfield
Buradocue	Souvenir du Congrès

(To be continued.)

FIG. 144.—WEEPING PEAR TREE.

faction in the minds of the executive as it appeared to give to the numerous visitors. Rarely has fruit been shown in better condition, or of finer quality, equally noticeable in Pears and Apples, and certainly the number of dishes—1700—must have exceeded the expectations of the most sanguine.

As was most proper flowers, were not present in any great quantities, so that there was nothing that could much distract the sole attention due to the fruit.

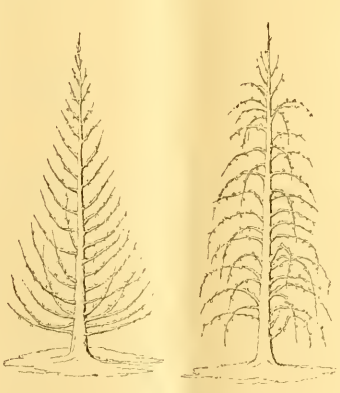

FIG. 145.—PYRAMID PEARS WITH UPRIGHT OR DEFLEXED BRANCHES.

An exception must be made, in so far as regards Mr. A. E. Campbell's Gladiti, which, fine as they were, failed to obtain the same amount of general criticism as fell to their lot on an earlier occasion.

Vegetables shown for Messrs. Sutton & Sons' special awards were not very numerous, nor were there many things included in them of supreme merit; and some exhibitors failed to see that to show vegetables that attain to excellence only during the summer months disqualifies when shown in late autumn.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and

Messrs. J. Douglas, J. Lane, W. Bealby, H. Bennett, H. Herbst, W. Wilks, J. Fraser, G. Duffield, H. Ballantine, J. Dornay, H. Williams, H. M. Pollett, J. O'Brien, E. Hill, H. Turner, J. Smith, J. James, J. Walker, J. Child, W. B. Kellock, T. Baines.

Messrs. J. Veitch & Sons showed a number of varieties of greenhouse Rhododendrons, some of which are of recent raising. An intense scarlet was seen in R. cardinalis, K. Minerva is pale yellow, with a tress which is close yet large; R. Apollo, an orange-scarlet, with a very large tress. These two last-named were awarded a First-class Certificate. Other varieties were shown, in which salmon or yellow tints prevailed, and sometimes both in the same bloom. A novel free-blooming Begonia, John Heale x B. socotrana, and a tuberous variety of their raising came also from the Chelsea firm. The colour is bright like the flowers, being pendent in slender racemes, and the habit altogether distinct. Female blooms were absent, so that long-continued flowering is likely to be a property of the plant. A First-class Certificate was given. A pretty painful of Anzania punicea, Habingtonia Camphorosma, a myrtaceous plant from the Swan River, Western Australia, having pinkish-white silver-like blooms in racemes, and Heath-like foliage. A good plant of Callicarpa purpurea, standing 4 feet, and as much in breadth; it had a number of drooping bunches of its singular purple berries, making it exceedingly attractive. The plant is by no means a novelty, but it is rarely seen in plant collections. A Cultural Commendation was awarded. Vanda Hookeriana received the same award, being shown by Mr. E. Hill, gr. to Lord Rothschild, Tring Park. There were four flowers open on the small specimen, on which the lip-spottings were very fine. The growth was hard and wiry; evidently the culture of this beautiful Orchid is well understood at Tring Park. De B. Crawshaw, Esq., Rosen-Id, Sevenoaks (gr., Mr. Cook), had a plant of Odontoglossum odoratum leucoblossum; and from the garden of A. H. Smee, Esq., Wallington (Mr. Cummings, gr.), a plant of Cattleya speciosissima and Lycaste Smeana, the first-named of but small pretensions to beauty, and the last a pale form of Skinneri. D. Duke, Esq., The Glen, Lauriston (gr., Mr. A. Nokes), brought Eriaria Lindleyana Centaria with purple sepals and petals, and a lip of a much darker tint. It was nicely flowered, and obtained a Cultural Commendation. Some pretty early flowering Chrysanthemums from Mr. Boyce, 87, Noursey Road, Holloway, were seen in Mandarini, Madame C. Desgranges, G. Vermig, and some new Anemone and poppy-flowers varieties. Mr. W. Bull, The Nurseries, King's Road, Chelsea, had *Gastroneura hybrida* under the name of *Vallota intermedia*, a beautifully flowered *Eucharis Mastersii*, showing admirably the character of the plant, which some think is no advance on *E. candida*; *Oncidium Buckii* (gr. in fruit), the sepals and petals of rich brown barred with yellow, the lip of the purest yellow, 2 inches across, a beautiful showy species. From the same establishment were *Aloesia Regina*, a dark metallic-green foliage plant; *Lælia autumnalis atrombrans*, bearing a pretty spike of blooms; several new varieties of *Chrysanthemum* in *Roi des Princes*, a chocolate-brown Japanese; *Fleur d'Éclat*, rose-nauve, partially incurved Japanese; and *La Bien aimée*, a rose pompon. Mr. Herrin, gr., Chalfont Park, showed some showy *Celosia pyramidalis coccinea*, receiving a Vote of Thanks. Mr. Thomas Ware, Tottenham, had a quantity of cut blooms of hardy plants, mostly varieties of *Michaelmas Daisies*; some varieties of *Colchicum*, inclusive of two double-flowered varieties. From the Grousecock Gardens Mr. Campbell showed a very choice collection of *Gladiti*, about which it may have something to say at another time. Some varieties of *Ixora* were sent by Mr. J. Hudson, as *Morsell*, a fine truss, sent out some years since by Mr. B. S. Williams; Prince of Orange, *Williamsii*, a distinct rose-scarlet; and *coccinea*. Mr. Forbes, gr., Dover House, Rochester, sent cut blooms of Japanese *Chrysanthemum*, viz., *Margot*, a pale pink, with a lower coloured centre; *M. Mousilac*, a rich red-brown; *l'île des Plaisirs*, also rich brown, the reverse of the petals dead gold colour—a handsome kind, and which was awarded a First-class Certificate. Messrs. H. Cannell & Sons showed several showy kinds of scarlet, white, and pink *Pelargoniums*, and likewise *Begonia* blooms, both single and double flowered. Some *Carnations* from Swanley, Pride of Penshurst, a good smooth flower, pale yellow, were much admired. Early flowering *Chrysanthemum Faberti*, a bright canary-yellow, was a good kind and obtained a Vote of Thanks. The single flowered tuberous *Begonia Earl of Bessborough*, with deep orange coloured blooms, obtained a First-class Certificate. From Leonard's Lee Mr. S. Ford sent cones of *Omnia eximia* and *Albus Woburnia*. Messrs. H. M. C. Co., Covent Garden, sent some flowering Tree *Carnations* of some merit.

FIRST-CLASS CERTIFICATES.

- To Mr. J. Forbes, for *Chrysanthemum l'île des Plaisirs*.
- To Messrs. J. Veitch & Sons, for *Begonia John Heale*.
- To Messrs. J. Veitch & Sons, for *Rhododendron Apollo*.
- To Messrs. J. Veitch & Sons, for *Rhododendron Minerva*.
- To Mr. W. Ball, for *Eucharis Mastersii*.
- To Mr. W. Bealby, for *Ivy-leaf Pelargonium Alice Crouse*.
- To Messrs. H. Cannell & Sons, for *Begonia Earl o' Bessborough*.
- To Mr. Laxton, for *Apple September Beauty*.
- To Mr. Gilbert, for *Chou de Burghley*.

FRUIT, &c.

Present: H. Veitch, Esq., in the chair; and Messrs. J. Lee, J. Woodbridge, G. T. Miles, T. F. Rivers, G. Bunyard, J. E. Lane, J. Ellam, J. Burnett, C. Ross, S. Ford, F. Rutland, W. Paul, A. Sutton, J. B. Haywood, G. Page, G. Paul, J. Roberts, and J. Sheppard.

APPLES.

For the best collection of Apples (nurserymen), not exceeding 100 varieties, six fruits to constitute a dish.—1st, Messrs. G. Bunyard, The Old Nurseries, Maidstone, whose exhibits were, if anything, superior to that shown by them at the Crystal Palace in the previous week, and comprised mainly the same varieties; 2d, Messrs. J. & G. Lane, St. Mary's Gray, Kent;—thus reversing the order of their names at this competition. The 3d prize was taken by Messrs. Paul & Son, Old Nurseries, Chesham. The Sawbridgeford collection, which failed to win, numbered eighty dishes.

For the best collection of fifty varieties (amateurs).—Mr. Ford, Leonardislee, was 1st. Some of his fruit being remarkably fine, as Broadhurst Pippin, Emperor Alexander, Minshul Crab, Bedfordshire Foundling, Hawthorned, Lady Henniker, Pitmans Nonpareil, and Stone's Apple; 2d, Mr. D. C. Powell, The Gardens, Powderham Castle, Devon;—a small collection, but one in which the fruit was smaller than in the first lot; 3d, Mr. A. Waterman, of Preston Hall, Aylesford. In this competition five collections were tabled.

For the best twelve culinary Apples, distinct.—1st, Mr. C. Ross, gr., Welford Park, who had fine examples of Peasgood's Nonsuch, Prince Albert, Brahan's Nonsuch, Annie Elzabeth, Mère de Ménage, and Stirling Castle; 2d, Mr. D. C. Powell, his Blenheim Orange, Reimette du Canada, and Galloway Pippin were excellent dishes; 3d, Mr. J. Grey, Normanton Gardens, Stamford.

For six dishes of culinary Apples, Mr. F. Miller, gr., 1st, Friend, Esq., Northdown, Margate, was 1st—in this lot were fine Alexander and Blenheim Orange; 2d, Mr. F. Rutland, gr., Goodwood, Sussex, the Frogmore Prolific, Roul Suffield, Peasgood's Nonsuch, and Blenheim Orange being capital samples; 3d, Mr. Ross. In this class there were ten lots staged.

For the best twelve varieties of dessert fruits.—In this class Mr. F. Rutland was placed 1st—good samples were observed of Brownlee's Russet, Nanny, Kerry Pippin, Mannington's Pearmain, Cox's Orange Ribston, and Melon; 2d, Mr. F. J. P. F. Fincham, Nacton House, Ipswich; Silk, Whiteness, Margate; & G. Richards, J. Gilmore, J. Bolton, Combe Cam, Sevenoaks; & G. Thompson, T. F. Halsey, J. Burnett, Goldsmith, and A. Smith.

COLLECTIONS OF APPLES AND PEARS.

Messrs. J. Veitch & Sons showed 160 dishes of Apples and 100 of Pears, for which a Silver Medal was awarded. Messrs. Cheal & Sons showed a collection of Apples consisting of 140 dishes, and of Pears thirty-three dishes; a Silver Medal was awarded also in this class. Messrs. W. Paul & Son, Waltham Cross, showed 152 dishes of Apples, and did Messrs. C. Lee & Son; in each case the Silver Medal was given.

PEARS.

In this division of the show there was not only considerable competition but in many instances the samples were remarkably fine as, for instance, the wonderful Pitmans Duchesse d'Angoulême, shown by Mr. Thomas, of Sittingbourne, who had in addition a huge heap of these fruits, and some wonderful "colours." Louise Bonne, that did not make one's mouth water. In the nurserymen's class not to exceed fifty varieties, there were four lots, all of good average merit. Mr. Thomas was 1st, having in his collection some noble samples, besides those named above, of Beurré Clairgeau, King Edward, Concillier d'été, Doyenné d'Etampes, Beckon's P. Rivers, Sawbridgeford, was 2d, having in his collection very fine fruit of Beurré Benoist, Pitmans Duchesse, Rivers' Princess, very handsome; Beurré Diel, Glou Morceau, Doyenné du Comice, and Lebrun; Mr. G. Bunyard, Maidstone, came 3d, with a very interesting collection, including, with many above-named, Marie Louise d'Uccle, Belisime d'Hiver, &c.

A duplicate class of fifty kinds for amateur growers brought fine lots, or a total of some 250 dishes. Here Mr. Roberts, Ginnerbury, was 1st, his exhibits being neatly set up with foliage; the collection included kinds previously mentioned, of good colour and fair size, though all the amateur lots in this class were wanting in that feature as compared with the nurserymen's lots. Mr. C. Major, Kelso, Beckon's Pears, was 2d, and Mr. A. H. Smees, The Grange, Walsington, was 3d.

In the class for twelve kinds, Mr. Allan, gr. to Lord Suffolk, Gunton Park, was a strong 1st, having splendid

Marie Louise de la Cour, Pitmans Duchesse, Beurré Diel, Glou Morceau, Beurré Clairgeau, Doyenné du Comice, Glou Morceau, Marie Louise d'Uccle, Beurré Hardy, Louise Bonne, Winter Nels, and Fondante d'Automne. Mr. Thomas came 2d here, with fine kinds, showing good colour, as previously named. Mr. A. Waterman, gr. to H. A. Brassy, Esq., Preston Hall, Maidstone, was 3d. There were seven lots in this class, and in the one for six kinds there were not less than sixteen, and a grand class it was. Here Mr. Allan was again 1st, with capital samples of Pitmans Duchesse, Marie Louise de la Cour, Marie Louise d'Uccle, Doyenné du Comice, Jersey Gratiola, and Fondante d'Automne. Mr. C. Major, Kelso, was 2d, H. V. Sewell, Esq., Warren Hill, Longton, was 3d, having fine Brookworth Park, Van Mons' Léon le Clerc, and previously named kinds. Mr. Hoare came 3d.

Of stewing Pears, in three dishes, there were nine lots. Mr. Rutland, gr. to the Duke of Richmond, Goodwood, being placed 1st, with large samples of Uvedale's St. Germain, Grosse Calebasse, and King Edward, Mr. W. Johnston, gr. to the Marchioness Camden, Lambeth, Esq., was 2d; and Mr. Sharpe, gr. to F. Halchett, Esq., Lee, Kent, was 3d.

For the best lot of single dishes, in some of the classes of which there was considerable competition, there were seven lots of that capital Pear Doyenné du Comice, Mr. Allan having the best, Mr. C. Ross, Welford Park, and Mr. Johnston coming 2d and 3d.

For the best lot of three dishes, Mr. Bunyard having the best, and very handsome samples too; Mr. Burnett, The Deepdene, Dorking, coming 2d; and Mr. R. Smith, gr. to Lady Fletcher, Yalding, 3d.

There were but four dishes of Marie Louise de la Cour, Mr. Allan having grand samples; the next coming from the Duke of Devonshire's Gardens, Maidstone; and Mr. Silk, gr. to J. Abernethy, Esq., Margate.

No less than thirteen dishes of that beautiful Pear, Marie Louise, were staged, Mr. R. Smith having beautiful clean samples; and Mr. Powell, Powderham Castle, coming 2d, with large, if less handsome fruits. Mr. Smees had the best lot.

Of that grand late Pear, Glou Morceau, there were thirteen dishes, Mr. Ross, Mr. C. Howe, Benham Park, Newbury, and Mr. Powell taking prizes in the above order.

Of Beurré Rance there were twelve dishes, Mr. R. Smith, gr. to W. Tate, being the best; Messrs. Howe and Sewell following.

Beurré Benoist brought but one dish, a fine sample, from Mr. Rutland, and there was but one lot of Urbaniste—a good sample—from Mr. Thomas.

The popularity of Beurré Rance, on the other hand, was shown by its eighteen dishes, generally very fine samples, the best coming from Messrs. Thomas, Sewell, and Bunyard.

The less showy Pear, Winter Nels, found eight dishes to represent it, Messrs. Silk, R. Smith, and Allan being the prize-winner, but Pitmans Duchesse brought only three dishes, all grand samples, from Messrs. Thomas, Howe, and Rutland.

There were but three dishes of Beurré Bachelier, Mr. W. Johnston having very fine samples; Mr. Neighbour, of Eickley Park Gardens, and Mr. R. Smith, coming 2d and 3d.

Of Fondante d'Automne there were but five dishes, Messrs. Allan, Silk, and R. Smith having the awards; and but four lots of Passe Colmar, whilst of Louise Bonne there were six dishes, some beautifully sized samples, from Mr. Thomas, coming 1st, Mr. W. Tate, Streatham, was 2d; and Mr. Allan 3d.

The trade collections of Pears from Messrs. Veitch & Sons, Cheal & Sons, Sussex; W. Paul & Sons, Waltham Cross; Paul & Sons, Chesham; were of exceeding interest, and highly commended. The Pear market will have more than usual examination, and secure more interest.

VEGETABLES.

The valuable special prizes offered for a collection of forty kinds of vegetables at this meeting brought eight lots, and very high prizes throughout—better has seldom been seen at this time of the year. Mr. Haines, gr. to Earl Radnor, Colehill, Berks, was 1st, with high-class samples of Autumn Giant Cauliflowers, Sutton's New Intermediate Carrot (very beautiful), Roushank Park Onions, Perfection Tomatoes, Scholmaster's Sprouts, Cambridge Wonder Bean, Exhibition Brussels Sprouts, and Clarke's Red Celery; Mr. W. Meads, Beckett Park Gardens, Shrivensham, was 2d, also having beautiful Carrots of the same kind, and fine Trophy Tomatoes; Mr. Pope, Highclere Castle, was 3d, with fine samples of the same Carrots, Cauliflowers, and White Gem Celery; Mr. Waite, Esher, was 4th, having in his collection pretty Snowdrift Potatoes and Stamfordian Tomatoes; and Mr. Richards, Somerley Park Gardens, was 5th; Mr. Richards' stems of Brussels Sprouts sold his chances, as other samples were excellent.

Mr. G. Jacobs, Petworth, showed a fine French Pumpkin of 213 lb. weight, prettily tattooed with Fern foliage.

THE WOOLHOPE CLUB.

For three successive years has the writer found himself in the city of Hereford during that week in autumn which the Woolhope Club devotes to the study of mycology. In these sixteen years many old faces have passed away, many new ones have appeared, but still, the tradition of kind and hearty co-operation, to be looked forward to by all those fungologists who have once been initiated into a personal participation of the fungus foray as one of the red-letter days or weeks of the year. The *habitués* began to muster from north, south, east, and west, on the evening of Monday, October 5; mutual felicitations were

indulged in, and amongst genial hand-shaking, the prospects of the morrow were discussed.

The morning of Tuesday, October 6, broke bright and sunny, so the party of eighteen gentlemen who assembled at the Hereford station were in high spirits. New ground was to be hunted in the woods of Westwood. The list included the President of the Woolhope Club, Mr. C. G. Martin, Dr. Bull, Dr. Carlyle, Rev. Canon Du Port, Messrs. Cunningham, Vize, C. E. Broome, W. Phillips, G. Masse, C. Bucknall, J. Griffith, Morris, Edwin Lees, C. B. Plowright, and others.

As the day advanced no objection was made, under the guidance of Dr. Bull, a few drops of rain fell, but too few to disturb the equanimity of the fungus-hunters. One by one, however, the umbrellas went up as the rain came down slowly and surely, increasing in frequency and volume. A belt of trees yielded several interesting specimens, amongst which was a *Tricholoma*, very much like *A. terreus*, but turning red when injured, for which character it was first assigned to *A. inodorus*, Fr., but subsequently to *A. atro-squamosus*, Chev. Having the habit and odour of *A. terreus*, it more resembles the figure of *A. gattusius*, Schaeff., in Cooke's *Illustrations*. Mr. Bucknall produced some fine specimens of the new *Boletus tenuipes*, a plant with the habit of *B. piperaus*, but abundantly distinct. The rain now settled into a steady downpour—

"The land was water, and the sky was lead."

Such a soaking the mycologists had not had since the memorable days, in years gone by, at Whitfield and at Cabala. The party were entertained to luncheon by Mr. Atwood-Mathews, of Pontrias.

It is not too much to say the tables were loaded with fungi. The would-be mycologists had a two-way at first sight, and, by observing amongst these *A. muscarius* and several other beautiful but poisonous species. Confidence was, however, soon restored when word was passed round that these were not intended for consumption, but were models skilfully constructed for artistic effect in honour of the occasion. At the end of the luncheon came in due course, and was peculiarly grateful to the sodden fungologists. The party returned in the afternoon to Hereford, when a general rush for dry clothes took place. In the evening a reception was held at the residence of the President, Mr. C. G. Martin, on a paper on "Polycestina," and exhibited specimens. Dr. Bull read a paper, not too long, "On the Solution of a New Zealand Botanical Mystery," and showed specimens of *Torubia Robertsi* in fine fruit. On Wednesday (October 7) the mycologists set out for a day's work at Dinmore Hill, and were accompanied by Mr. Dinmore Hill. Special instructions had been given to search for and to find two species which had not previously been met with in these Herefordshire forays, viz., *Boletus purpurascens* and *Corinarium dibaphis*. The former was soon found, and two specimens only, and they were small, but still characteristic, and the latter in abundance in all stages and in excellent condition. This remarkable *Cortinarius* has certainly during the past sixteen years never previously put in an appearance at Hereford. So large and so well marked a plant could not be overlooked, and it was with great joy, in yellow, vivid purple surrounded by a purple margin, its lemon-yellow gills and stem, with its marginate bulb, all of which characters render it a fungus once seen, never to be forgotten. One point about it, however, is not quite clear. Fries placed it in the third group of *Boletus*, but it is not a *Boletus*, and with this gills, but in his description he speaks of the gills as being "purpurascens-ferugineus," yet he quotes Saunders and Smith, t. 10, but which figure, like our Hereford specimens, is devoid of any purple tint about the gills. The inference is, that it is not a *Boletus*, but a *Cortinarius*. Dinmore yielded its usual crop of good things, which have so often before been enumerated, including *Telephora clavularis*, *Gyrophorus arbutinus*, and a Peziza that puzzled Mr. Phillips. In the evening the mycologists were entertained at dinner by Mr. C. G. Martin, the President of the Woolhope Club, after which Mr. Phillips read in the Woolhope Room his very interesting paper on "Puffballs," illustrated with drawings of many species. He expressed his opinion that *Lycoperdon perlatum* was undoubtedly British, and that under L. *serotinum* he included a new species, which he named the spores of L. *saccatum* being larger, and having a peculiar outline. They are often spoken of as echinate, but this is hardly the case, as these are not so much covered by spines as surrounded by a paler irregularly pointed outline. It is to be hoped Mr. Phillips will publish his paper in *Botanist*, with figures of the spores of the different species.

A strong muster of members, including four ladies, on club-day (Thursday, October 8) assembled at the station and took train for Leominster, in spite of the threatening weather, which developed into a sharp rain on arrival at the last-named place. Nothing dented our spirits were taken, and a start made for Ribby Camp. During the ride the clouds broke, the blue sky became visible, and the sun shone out. Unversed as the present writer is in the mysteries of archæology, his impressions of the camp are worth recording, though it produce few fungi, and to be full of Apples? The party now gracefully slid down the grassy slopes of the camp, and made for Hell's Hole Dingle, through which we were to walk to Hampton Court. But as the Duke of Argyll's park, over which the party had to cross, was to be effected this comfortably the order was given for the young and able-bodied each to carry a stone. This was, of course, done for something under a mile, but—oh, cruel fate!—only to find after the portage had been made that the stone brought down was not less than a few hundred yards above the weir. Lamentations over wasted labour were, however, soon dispelled when the

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, OCTOBER 14, 1885.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometrical Deductions from Glaisher's Tables 7th Edition, WIND, RAINFALL. Rows for Oct 8-14 and a Mean row.

- Oct. 8.—Rain falling nearly all morning; dull afternoon. Fine night.
9.—Fine day, bright at times.
10.—Rain from early morning till about noon; fine but dull afterwards.
11.—Dull day.
12.—Cold day and night.
13.—Dull day and night.
14.—Slight rain all morning; fine and bright from noon to 1 P.M.; rain in afternoon and evening.

LONDON: Atmospheric Pressure.—During the week ending October 10, the reading of the barometer at the level of the sea increased from 29.93 inches at the beginning of the week to 29.95 inches by 9 A.M. on the 4th, decreased to 29.65 inches by 5 P.M. on the 5th, increased to 29.82 inches by 9 A.M. on the 6th, decreased to 29.53 inches by 5 P.M. on the same day, increased to 29.89 inches by 5 P.M. on the 7th, decreased to 29.36 inches by 9 A.M., increased to 29.46 inches by 5 P.M. on the 9th, decreased to 29.25 inches by 9 A.M. on the 10th, and was 29.16 inches by the end of the week.

Temperature.—The highest temperature in the shade in the week was 57°, on the 4th, on the 10th the highest temperature was 49.7°. The mean of the seven high day temperatures was 53.5°. The lowest temperature was 37.5°, on the 8th, on the 5th the lowest temperature was 47°. The mean of the seven low night temperatures was 41.5°.

The greatest range of temperature in one day was 17°, on the 8th; the smallest, on the 5th, was 5.9°. The mean of the seven daily ranges was 12°. The mean temperatures were—on the 4th, 48.8°; on the 5th, 48.5°; on the 6th, 46.8°; on the 7th, 47°; on the 8th, 46.9°; on the 9th, 46.2°; and on the 10th, 45.5°; and these were all below their averages by 4.7°, 4.7°, 6.1°, 5.6°, 5.3°, 5.7°, and 6.1°, respectively.

The mean temperature of the week was 47.1°, being 2° lower than last week, and 5.5° below the average of the week. The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 98°, on October 6. The mean of the seven readings was 82°.1.

The lowest reading of a minimum thermometer placed on grass was 30°, on the 4th. The mean of the seven readings was 35°.

Rain.—Rain fell on five days, to the amount of 1.02 inch.

ENGLAND: Temperature.—During the week ending October 10 the highest temperatures were 60° at Truro, 59.1° at Cambridge, 59° at Plymouth; the highest at Bolton was 53.1°, at Bradford, Sunderland, and Newcastle, 54°. The general mean was 56.4°.

The lowest temperatures were 32° at Hull, 33.5° at Wolverhampton, 36° at Newcastle; the lowest

at Brighton was 40.8°, at Plymouth, 40.5°, at Liverpool 40.3°. The general mean was 37.9°. The greatest ranges were 24° at Hull, 22.6° at Cambridge, 21.6° at Wolverhampton; the least ranges were 14° at Sunderland, 14.6° at Liverpool, 16.3° at Bolton. The general mean was 18.5°.

The mean of the seven high day temperatures was highest at Truro, 57.4°, at Plymouth 57°, at Cambridge 55.9°; and was lowest at Bolton 50.8°, at Sunderland 51.2°, at Liverpool 51.8°. The general mean was 53.8°. The mean of the seven low night temperatures was highest at Truro, 45.9°, at Plymouth 44.3°; at Liverpool 43°; and was lowest at Wolverhampton, 35.2°, at Hull 37.4°, at Bolton 39.1°. The general mean was 41°.

The mean daily range was greatest at Wolverhampton, 18.2°, at Cambridge 16.1°, at Hull 16°; and was least at Liverpool, 8.8°, at Sunderland 9.5°, at Bradford 10.5°. The general mean was 12.8°. The mean temperature was highest at Truro, 50.5°, at Plymouth 49.5°, at Brighton 47.6°; and was lowest at Wolverhampton, 43.2°, at Bolton 43.8°, at Hull 44.3°. The general mean was 46.2°.

Rain.—The largest falls were 2.41 inches at Truro, 2.09 inches at Bolton, 2.01 inches at Liverpool; the smallest falls were .45 inch at Newcastle, .76 inch at Hull, .84 inch at Leeds. The general mean fall was 1.35 inch.

SCOTLAND: Temperature.—During the week ending October 10, the highest temperature was 57.2°, at Paisley and Perth; at Greenock the highest temperature was 52.7°. The general mean was 54.5°. The lowest temperature in the week was 31.4°, at Edinburgh; at Leith the lowest temperature was 38.9°. The general mean was 36.5°. The mean temperature was highest at Paisley, 46.8°; and lowest at Aberdeen, 44.2°. The general mean was 45.6°.

Rain.—The largest fall was 1.85 inch, at Greenock; the smallest fall was .025 inch, at Dundee. The general mean fall was .75 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questioneth much shall learn much."—BACON. PINUS ARISTATA.—A correspondent, who has tried the nursery trade in vain, wishes to know where this species may be obtained.

Answers to Correspondents.

* * OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraph regulations our Registered Telegraphic Address is "GARDCHRON, LONDON." GARDCHRON being written in one word. Telegrams thus addressed will reach the Editor or the Publisher without other address being needed than "GARDCHRON, LONDON."

BOOK ON VINES: W. R. Mr. Barton, of Chiswick, has written the best modern work. It is published at the office of the Journal of Horticulture, 171, Fleet Street, E.C.

CALCEOLARIAS: A. R. The colours are in some cases rich and uncommon, but there seems to be no difference in form.

CHISWICK TRIALS OF VEGETABLES: F. H. Frézier. You should apply to the Secretary, Royal Horticultural Society.

ERRATUM.—In "Montserrat," p. 399, col. c., line 18, of your issue of September 26, Thunia Lobbia ought to be Cryptomeria Lobbia, an erect variety of C. japonica.

EUCHARIS BULB: C. B. M. should address the Editor, and not the Publisher. The bulbs are swarming with mites and the algocentrum in it, but neither does it affect the bulbs and start afresh.

FERN: J. B. Burn. Neither Adiantum assimile nor A. formosum, and not much like either. What is the history of the plant? We do not recognise it in its present condition. It looks very much like a hybrid, or variation from spores, with a good deal of cuneatum and something like algocentrum in it, but neither does it accord with either of these. Send a spore of it pressed flat before getting withered.

GRAPE DUKE OF BUCKLEUCH: Subscriber. A temperature rather higher than that in which the Black Hamburg flourishes suits it best. A mid-season Muscat-house treatment is suitable.

NAMES OF FRUITS: W. Comfort. Doyenné du Commerce.—J. J. Bishop's Thumb: 4. Verulam: 4. Louise Bonne of Jersey: 8. Chassanottelle: 6. Beurre

rare Agaricus Badhami was found in fine condition under some Fir trees. The walk through the Dingle—the length of which was variously estimated from a half to four miles—was productive of many interesting fungi, and in due course Hampton Court came into view, with its Gipsy Oak, ancient Cedars, and Spanish Ivy. Mr. Arkwright regarded as many as were disposed with refreshment while the others hunted over the lawn. Under one of the Cedars Mr. W. B. Grove, of Birmingham, soon discovered a Genster, probably G. Bryantii.

As the time was getting away, the order "Forward!" was given, and Dinmore Hill ascended. The general who led his 10,000 men up a hill and down again has long been held up to ridicule in rhyme, but to lead an army of mycologists, not only up a hill, but through a wood, is by no means so easy a feat. Somebody blundered in the wrong turn, and took of a railway train at the junction while the others came out somewhere—on the wrong side of the hill. Train time was drawing near, rain began to fall, legs began to ache, baskets to feel heavy; nobody seemed to know exactly where we were, nor which way we should go till the order "Forward!" was again given. Now, in point of fact, this was really "backward," but Woolphonsians, unlike ropemakers, do not as a rule progress backwards; so on we went, not without trepidation, however, lest we should find ourselves the next time we emerged from the wood with the man before us. The rumble of a railway train at the junction sounded ominously in our ears. Under such circumstances how eagerly every one is on the look-out for a landmark, a sign-post, a windmill, or well-known church steeple, for instance, but no such landmark checked our progress. The trouble of a party sighted a particular cluster of trees. All right now, here is where A. atro-punctatus grows. Take the path to the left, and we shall be all right. Still some were a little dubious about plunging once more into brushwood in which they could not see to yards in front of you, but several of the landmarks mentioned themselves—first in places where Boletus purpurascens was found, then the habitat of Cortinarius ditaphus, which, of course, settled the whole affair; and within 10 minutes we were safely landed at the station, and in due course arrived at Hereford.

There is a great similarity amongst all dinners, even if they be Woolphoe dinners; but they are for all that necessary, and by no means unpleasant events. After dinner Dr. Cooke read a humorous poem, entitled "Flamen Pomonialis," in which the Editor of the Pomona reads largely. The trouble of a party sighted a particular cluster of trees. All right now, here is where A. atro-punctatus grows. Take the path to the left, and we shall be all right. Still some were a little dubious about plunging once more into brushwood in which they could not see to yards in front of you, but several of the landmarks mentioned themselves—first in places where Boletus purpurascens was found, then the habitat of Cortinarius ditaphus, which, of course, settled the whole affair; and within 10 minutes we were safely landed at the station, and in due course arrived at Hereford.

There is a great similarity amongst all dinners, even if they be Woolphoe dinners; but they are for all that necessary, and by no means unpleasant events. After dinner Dr. Cooke read a humorous poem, entitled "Flamen Pomonialis," in which the Editor of the Pomona reads largely. The trouble of a party sighted a particular cluster of trees. All right now, here is where A. atro-punctatus grows. Take the path to the left, and we shall be all right. Still some were a little dubious about plunging once more into brushwood in which they could not see to yards in front of you, but several of the landmarks mentioned themselves—first in places where Boletus purpurascens was found, then the habitat of Cortinarius ditaphus, which, of course, settled the whole affair; and within 10 minutes we were safely landed at the station, and in due course arrived at Hereford.

In the evening the company assembled in the Woolphoe Room. The writer gave an account of Brefeld's researches on the Ustilagineæ, in which he pointed out Brefeld's method of cultivating these spores in "Kammern," so that they are exposed to the air, and yet the culture is not spoiled by Bacteria, although the nourishing fluid employed is a highly putrescible one, namely, a decoction of the excreta of herbivorous animals. He also pointed out the soundness of the statement which has been made about Brefeld, namely, that he has attempted to show that yeast (Saccharomyces) originates from the Ustilagineæ, whereas his investigations show that the conidia of the Ustilagineæ reproduce themselves by budding (just as yeast-cells do), not in saccharine solutions, but in the excreta of various vegetable feeding animals.

A discussion followed, opened by Dr. Bull, on "The Effect of Fungus Growth in Destroying Tree Life," in which several members took part.

Dr. Cooke exhibited a specimen of Agaricus melles, determined from the spores of Rhizomorpha from Epping Forest, as a case in point, showing that A. melles was a true tree-destroying fungus. The researches of Hartig were referred to by one of the members, and the general wish expressed that the subject should be taken up more fully next year. The last day was spent in Haywood Forest, where, as usual, Cortinarius setaceus and C. triumphans were found, together with several other species of more or less interest. In the evening Mr. Vize read his paper on "Festulago," alluding, among other species, to the P. Guenepii, which plays such havoc on Camelina leaves.

During the week the following were amongst the more important and interesting species met with:—Agaricus Badhami, pantherinus, metulesporus, carcharius, mucidus, sejunctus, albo-brunneus, atro-squamosus, sulphureus, carneus, clavipes, odorus, phyllophilus, finnosus, versutus, rancioides, prurus, hibernus, rusticus, phlebopus, lividus, indoratus, orchelites, piscioidorus, variabilis, radicosus, pudicus, pyridiorus, glutinosus, sinapiensis, carbonarius, alnicola, cruenens, squamosus, pyrochrous, semivestitus, Coprinus comatus, fuscescens, Cortinarius triumphans, halitatus, sebaceous, varicos, varicolor, infractus, glaucopus, purpurascens, ditaphus, fulgens, papulosus, colimitus, mucidulus, elator, vibratilis, albo-violaceus, anomalous, torvus, everitus, hinnuleus, incusis, priginus, saturninus, decipiens, Pleurotus goniatus, variabilis, pseudo-albus, Lactarius torminosus, turpis, hysginus, flexuosus, pyrogalus, glycosimus, mitissimus, Russula furcata, rosacea, fellea, vesca, Nectylas parasitica, Mearnsius foetidus, Hudsoni, Eleutherus tenuipes, ladius, piperatus, purpureus, edulis, versipellis, scaber, felleus, laticus, Polyporus repescens, giganteus, Tremella foliaceus, mesenterica, Himenella auriculae-jude, Genista imbricatus, Bryantii, Tuber aestivum.

And so the happy week ended. One more Woolphoe week is over; may we all meet again next year. Charles B. Plowright.

de Capiamont.—*f. Day*, 3, is not Duchess of Oldenburg—more closely resembles Beauty of Kent; 4, London Peach; 5, Roundway's Magnum Bonum; others not recognised. Second lot: 1, Franc Real; 2, Calkot Rossi; 3, Autumn Bergamot; 4, Apple Knivick Codlin; 5, *Traughton*. 1 is a seedling, 2 is a fine looking fruit, seemingly well worthy of note; 2, is New Hawthornden; 3, Jolly Beggar.—*f. H. Brown*. 1, Cox's Pomona; 2, New Hawthornden; 3, Hornmade Pearmain; 4, Beauty of Kent; 5, Duke of Devonshire.—*f. Dutch*. Mignonette.—*Cattley & Apple*. 1, Eclivine Seedling; 2, Lord Suffield; 3 and 5, Golden Noble.—*A. B.* 1 and 2, Northern Greening; 3, Yorkshire Beauty; 5, Yorkshire Greening; 8, Wyken Pippin; 10, Grange's Pearmain; 11, Old Nonpareil; 12, Autumn Bergamot.—*G. G.* 1, *Green*; 2, Dumfold's Seedling; 4, Downton Nonpareil; 5, Wyken Pippin; 6, Beauty of Kent; 7, Coe's Golden Drop; 8, Court of Wick; 10, Beauty of Kent; 11, Grange's Pearmain; 12, Rymer.—*H. Noble*, 1, Fearn's Pippin; 2, Pear Van Mans' Lion le Clerc; 4, Alfriston; 5, Hambleton Deux-ans; 6, not recognised.—*G. S. C.* 1, Winter Nels; 2, Vicar of Winkfield; 3 and 4, Glou Moreau; 5, Beurré Diel; 6, Duchesse d'Angouleme; 7, Bellissime d'Hiver; 8, Beurré de Capiamont.—*W. Cutbush & Son*. Apple: Keswick Codlin. Plum: White Bullace.

NAMES OF PLANTS: *f. W.* 1, Dendrobium octatum; 2, Gonolophium appendiculatum; 3, Hydrolepis tenuifolia; 4, Diplazium decussatum; 5, Pteris tremula; 6, Cyrtium falcatum; 7, Pteris flabellata. *f. M.* 1, Polychymon Lonicites; 2, Polyopodium dictyopteris.—*E. Thomas* should address the Editor not the Publisher. The plant is *Tricentria hirta*—*W. R. E.* One of the Junipers. We cannot tell which without going to a nursery to compare.—*W. Barnes*. 1, *Pernettya mucronata*; 2, *Cistus ladanifer*; 3 and 4, *Taxodium distichum*.—*A. A.* 1, Lilium floridanum; 2, *Hyacinthus orientalis*; 3, *C. tinatifolia*; 4, *C. nigra*; 5, *C. crussigalli*; 6, *C. crussigalli* var. *pyracanthifolia*.—*C. E.* 1, *Rex*; 2, *Metallica*; 3, *Pirio*; 4, *Brunati*.—*W. Miller*. *Uderby*. *Cynochos* chorchelion.—*R. E.* 1, *Zygopodium Kieniceri*; 2, *Lycium bartholomae*; 3, *Cataleya holcroftii*—*Red Berry*, 1, *Pinus Finaster*; 2 and 3, *Lycium Barbarum*; 4, *Campanula pyramidalis*.—*Carler Page & Co.* *Trichium Mangiesii*.

PARADISE STOCK: *Amateur*. This is a species of Apple that is used as a stock for dwarf trees in pots, &c. It is less enduring than the Doucin, and is propagated by layering and cuttings.

PEARs: *P. T.* One of the two is more russety and a little smaller than the other, but there is no other difference.

PERALGONIUM: *Parishdell*. We cannot give you the information. Send a specimen to one of the trade growers.

PENSION LIST: *W. E.* Sometimes needy deserving persons are put on the Charity list, if they have been connected with horticulture.

TREES AND SHRUBS IN LEASEHOLD LAND: *E. A.* These are usually found and planted according to arrangements between lessor and lessee. The law book which would give you some information is that of *Fixtures*. As a book on fruit growing get *Profitable Fruit Farming*, by Charles Whitehead, published by Longman, Green & Co.

VEGETABLE MARROW: *Enquirer*. As this is a Gourd, of which Vegetable Marrow is the popular denomination several edible varieties, we should think that showing them in a collection of edible kinds would not be disqualify.

* All communications intended for publication should be addressed to the Editor, and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

* FOREIGN SUBSCRIBERS sending Post-Office Orders should be requested to send to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

DIED.—We regret to announce the decease, on October 6, of Mrs. JANE MURRAY, widow of Mr. Adam Murray, late Assistant-Secretary of the Royal Horticultural Society.

—We also regret to hear of the death of Madame VAN HULLE, on October 10, after a short but painful illness. Madame Van Hulle was the wife of Prof. Van Hulle, of the Ghent School of Horticulture.

Markets.

COVENT GARDEN, October 15.

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week.]

TRADE still quiet, and supplies heavy. James Webber, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and fruit items including Apples, Damsons, Pigs, Grapes, Keft Cobs, Kent Filberts, Lemons, Melons, Peaches, Pine-apples, St. Michael, Pears, Kent Filberts, Plums.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with 2 columns: s. d. s. d. and vegetable items including Artichokes, Aubergines, Beans, French, Beet, Brussels, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Garlic, Herbs, Hero Radish, Lettuces, Parsnips, Mushrooms, Onions, Potatoes, Parsley, Radishes, Small salads, Spinach, Tomatoes, Turnips, Veget. Marrow.

POTATOES.—Magnum Bonum, bad trade, 50s. to 80s. Regents, 60s. to 80s. per ton.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and plant items including Amlia Sieboldii, Arbor-vita, Begonias, Asters, Arum Lilies, Begonias, Buavardia, Chrysanth., Cyperus, Dracena terminalis, Erica, Euonymus, Evergreens, Ferns, Foliage Plants, Geranium, Fuchsia, Marguerite Daisy, Myrtle, Palms, Pelargonium, Scarlet.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. and flower items including Amlia, Arum Lilies, Asters, Azalea, Carnations, Chrysanth., Cyperus, Eucharis, Gardenias, Lilac, Lilium, Lily, Longifol., Marguerites, Mignonette, Pelargonium, Roses, Rhodantea, Stephanotis, Tropaeolum, Tuberoses, Woodstock, Zar, Farnet, Farnet.

SEEDS.

LONDON: Oct. 14.—Not much business was done on to-day's market. Good new French Red Clover seed is now offering at very moderate rates. There is no change in either Alsike, white, or Trefoil. Hemp seed, being in abundant supply, is cheaper. For Canary seed the demand keeps slow. Winter Tares are in small request, at the late reduction in price. The colder weather has somewhat hardened the value of boiling Peas. Feeding Linseed is firm. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday prices of both English and imported Wheats ruled quite 6d. higher, whilst on some descriptions a larger advance was obtained. Grinding Duty held its value steady, and fine milling, being

scarce, was firm; but inferior grades of the latter continued dull and drooping in value. Beans advanced 1d. to 14. 6d. per quarter, and Peas 6d. Oats realised full rates to 3s. advance. Round Maize was dearer, and flat corn steady.—On Wednesday trade in general had a firm tone, but without activity. English and foreign Wheats were firmly held, but the demand was not sufficient to establish any quotable advance. Flour tended against buyers. All spring corn was equally as firm as Wheat, but also very quiet. Barley was firm, and Maize dull.—Average prices of corn for the week ending Oct. 10.—Wheat, 30s. 7d.; Barley, 30s. 11d.; Oats, 18d. 8d. For the corresponding period last year:—Wheat, 33s. 2d.; Barley, 32s. 7 Oats, 19s. 1d.

FRUIT, ROOTS, AND VEGETABLES.

COLUMBIA (East London): Oct. 14.—Good supplies of fruit and vegetables; prices firm. (Quotations:—Apples, 2s. to 4s. per bushel; Peas, 3s. to 4s. 6d. per bushel; Cauliflowers, 1s. to 2s. per dozen; bunch Grapes, 4s. to 5s. per dozen; ditto Turnips, 3s. to 4s. per doz.; ditto Carrots, 1s. 6d. to 2s. per dozen; ditto Parsley; 1s. to 1s. 6d. per dozen; Cabbages, 4s. to 6s. per bushel; English Onions, 3s. to 4s. per cwt.; pickling, ditto, 3s. to 4s. 6d. per cwt.; foreign Onions, 3s. to 3s. 6d. per bushel; ditto Radishes, 7s. to 6s. per box; Savoy, 5s. to 8s. per tally; greens, bunch, 2s. 6d. to 4s. per dozen; Cauliflowers, 1s. to 2s. per dozen; Mangels, 15s. to 20s. per ton; Turnips, 40s. to 80s. per ton; ditto, bunch, 2s. to 4s. per dozen; Apples, English, 1s. 6d. to 4s. 6d. per bushel; Peas, 2s. 6d. to 3s. per bushel; Onions, English, 7s. to 9s. per ton; ditto, pickling, 10s. to 100s. per ton; ditto, foreign, 2s. 6d. to 3s. per bag; Spanish Onions, 8s. 6d. per case; Carrots for cattle, 26s. to 30s. per ton; ditto, household, 40s. to 45s. per ton; ditto, bunch, 1s. 4d. to 1s. per bushel; Cucumbers, flat bed, 7s. to 8s. per dozen; ditto, 2s. to 2s. 6d. per quarter; Peas, 2s. to 3s. per quarter.

STRATFORD: Oct. 13.—Again the supplies to this market have been good during the past week, as also the attendance of buyers, consequently a fair trade was done at the following quotations:—Cabbages, 2s. to 3s. per tally; red Cabbages, 7s. to 4s. 6d. per box; Savoy, 5s. to 8s. per tally; greens, bunch, 2s. 6d. to 4s. per dozen; Cauliflowers, 1s. to 2s. per dozen; Mangels, 15s. to 20s. per ton; Turnips, 40s. to 80s. per ton; ditto, bunch, 2s. to 4s. per dozen; Apples, English, 1s. 6d. to 4s. 6d. per bushel; Peas, 2s. 6d. to 3s. per bushel; Onions, English, 7s. to 9s. per ton; ditto, pickling, 10s. to 100s. per ton; ditto, foreign, 2s. 6d. to 3s. per bag; Spanish Onions, 8s. 6d. per case; Carrots for cattle, 26s. to 30s. per ton; ditto, household, 40s. to 45s. per ton; ditto, bunch, 1s. 4d. to 1s. per bushel; Cucumbers, flat bed, 7s. to 8s. per dozen; ditto, 2s. to 2s. 6d. per quarter; Peas, 2s. to 3s. per quarter.

CATTLE.

At Copenhamen Fields on Monday the general trade varied but slightly from Monday se'night. Quite an inconsiderable number of best cattle and sheep was picked out at rather more money, but apart from that prices remained where they were before. Quotations:—Beasts, 3s. 6d. to 4s. 4d.; and 4s. 8d. to 5s. 2d.; calves, English, 4s. 4d. to 4s. 8d.; Irish, 2s. to 2s. 4d.; sheep, 3s. 8d. to 4s. 2d., and 4s. 8d. to 5s. 4d.; pigs, 4s. to 4s. 8d. Oct. 15.—Trade is dull in tone. Supplies of best and sheep were about the average for Thursday, and with a slow demand prices were weak. Fine calves were steady; other kinds dull, and pigs quiet, but firm for small beasts.

HAY.

WHITECHAPEL: Oct. 13.—Trade very dull, with short supplies. Clover, prime, 80s. to 107s.; inferior, 60s. to 75s. Hay, prime, 65s. to 92s.; inferior, 36s. to 60s.; Straw, 28s. to 38s. per ton. The trade was quiet, at late rates.

CUMBERLAND (Regent's Park): Oct. 13.—A fair supply. The favourable weather caused a slightly increased demand at the following prices:—Clover, best, 95s. to 102s. 6d.; second, 60s. to 90s. Hay, best, 75s. to 87s. 6d.; second, 50s. to 70s. Straw, 30s. to 36s. per ton.

STRATFORD: Oct. 13.—Clover, 75s. to 100s.; and meadow hay, 80s. to 90s. per load.

POTATOS.

BOROUGH AND SPITALFIELDS: Oct. 13.—Markets still slack. Best samples move off in small quantities at steady value, but all other grades are a dull and difficult sale at irregular prices. Regents, 60s. to 80s.; Magnum Bonum, 50s. to 60s.; Early Roses, 70s. to 80s.; Hebrons, 100s. to 110s. per ton.

COLUMBIA (East London): Oct. 14.—Demand for Potatoes better. Beauty Beane, 70s. to 80s.; Reading Hero, 60s. to 80s.; Early Roses, 60s. to 65s.; Champions, 45s. to 50s.; Victorias, 50s. to 65s.; Regents, 55s. to 70s.; and Magnums, 50s. to 80s. per ton.

STRATFORD: Oct. 13.—Magnums, 45s. to 60s.; Regents, 50s. to 60s.; and Champions, 45s. to 55s. per ton.

Imports.—The imports into London last week consisted of 1283 bags from Hamburg, 50 from Boulogne, and 2 bags from Rotterdam.

COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 6d.; Walls End—Tyne (unscreened), 11s. 3d.; Lambton, 18s.; Wear, 16s. 6d.; Binchester, 16s. 6d.; South Durham Tees, 16s. 6d.; Hetton, 18s. 6d.; Hetton Lyons, 16s. 6d.

Government Stock.—Consols closed on Monday and Tuesday at 104 3/4 to 104 1/2 for both delivery and account. Wednesday's prices were 104 to 103 1/2 for both transactions. The final quotation for Thursday were similar to those of Monday and Tuesday.

WANTED, TO Seed Merchants.
OFFERS FOR
 150 Bushels of **WILLIAM I. PEAS.**
 75 " **RINGLEADER.**
 25 " **DAY'S EARLY SURISE.**
 Samples on application to
WILLIAM JONES, Balford, Newton Court, Pembroke,
Hertfordshire.

PONTEY'S SUPERFINE LATE WHITE BROCCOLI.—This is one of the finest stocks of Late White Broccoli ever offered, producing large heads of a creamy white colour, and coming in for use as late as June. See following extract:—
 From the *Gardener's Chronicle* and *Agricultural Gazette*, London:—"MONSTER BROCCOLI.—A few days since, Mr. C. Kessel, of the Cocobe, Penzance, who has been a Broccoli grower for upwards of half a century, and was one of the first to get the Early Broccoli of Cornwall into the London and Northern Markets, cut two monster Broccoli, which together weighed 50 lb. They were the sort known as Pontey's Late White Wulcove. The huge scales at the smelting-house had to be called into requisition to ascertain the weight of the plants." Retail price, 2s. 6d. per ounce. Special quotations to the trade. Apply to
E. WILSON SERPELL, 21, Cornwall Street, Plymouth.

100 Herbaceous and Alpine Plants for 25s.
RICHARD SMITH AND CO.'S selection as above contains a most interesting and valuable assortment of beautiful and Hardy Plants for the Border or Rock-work, which produce flowers and render the garden attractive all through the year. New List of sixty-four pages free.
RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

MILLTRACK MUSHROOM SPAWN.—The best and cheapest ever offered. Quality guaranteed. 4s. 6d. per bushel (16 lbs.), 6s. per bushel package; 2 cakes as samples, free parcel post, 1s. 3d. Trade supplied very low.
MORIE AND CO., Manufacturers, Child's Hill Farm, N.W.; and 1 and 4, Finchurch Street, London, E.C.

GARDEN REQUISITES.
COCOA-NUT FIBRE REFUSE.
 4d per bushel; 100 for 55s.; truck (loose, about a ton), 26s. 1/4 bushel bags, 4d. each.

OIL PAINT no Longer Necessary.
HILL and SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on
all outdoor work, while it is fully two-thirds cheaper. It was
introduced upwards of thirty years ago by the Advertisers, and
its genuine good quality, notwithstanding a host of unprincipled
imitators, is fully attested by its constantly increasing sale. It
may be applied by an ordinary labourer, requiring no mixing
or thinning, and is used cold. It is used in the grounds at
Windsor Castle, Kew Gardens, and at the seats of many
hundreds of the Nobility and Gentry, from whom the most
flattering testimonials have been received.
Sold in Casks of about 20 gallons each, at 2s. 6d. per gallon,
at the Manufactory, or 1s. 8d. per gallon carriage paid to any
Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Pierrefield Park, June 21, 1876.—Sir, I have this day
forwarded from Chesham to your address a black varnish cask,
to be filled and returned with as good Varnish as the last we
had, which I candidly admit was the best we ever had. Address
Varnish to Pierrefield Park, Chesham.—I am, Sir, yours
respectfully, Wm. Cox"

CAUTION.—HILL & SMITH would particularly warn their
Consumers against the various cheap Varnishes now so much
advertised.
H. & S.'s Varnish has been an article of common use on most
of the large estates in the Kingdom for upwards of thirty years;
and its constantly increasing trade in it, and the numerous
Testimonials they receive stamp it as a truly genuine article.
Every cask is legibly marked with their name and Registered
Trade Mark as above, without which none is genuine.
Large Illustrated CATALOGUE of Fencing Hurdles, Field
and Entrance Gates, sent on application.
HILL AND SMITH, Birley Hill Ironworks, Staffordshire;
118, Queen Victoria Street, London, E.C.; and 73, Elmbank
Street, Glasgow.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable to a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or fictitious names are not forwarded, but are at once returned to the writers.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, PAULIF, FOREMAN, or JOURNEYMAN. More Cures of Consumption, Coughs, Asthma, and DISEASES of the CHEST and LUNGS.

DR. LOCKOCK'S PULMONIC WAFFERS.—Mr. C. WARD, Stationer, &c., Market Place, Hitchin, Herts., writes:—"Cures of Consumption, Asthma, and other Diseases of the Chest and Lungs are regularly occurring abundantly in this time of year. Whooping Coughs, Colds, Rheumatism, and all Hysterical and Nervous Complaints, instant relief and a rapid cure is given by the Wafters, which are pleasant to take."

Sold by all Druggists at 1s. 1/2d. and 2s. 0d. per Box.

HOLLOWAY'S OINTMENT and PILLS.—Influenza, Sore Throat, Quinsy, Mumps, and similar complaints always abound in a disturbed weather, and are most safely and effectually subdued by rubbing Holloway's Ointment at least twice a day upon the chest and glands of the throat. The Ointment penetrates the skin, reduces inflammation, and heals ulcerations. This treatment is sufficient for curing the most serious and complicated throat affections, providing Holloway's Ointment is used in the time of the attack. Following gives pain, the Ointment may be relied on till improving symptoms admit of painless deglutition. In Asthma, Bronchitis, Pleurisy, Whooping Cough, Incurable Consumption, Scarcely ever fails. Holloway's Medicines are not less valuable in mitigating the most troublesome features than they are certain in ultimately curing.

APPEAL TO THE BENEVOLENT

On behalf of Two Sisters, aged respectively 70 and 72, who have lived together all their lives (the younger has been an invalid for many years), but the leases of their property having fallen into the hands of the Ecclesiastical Commissioners some six years ago, have vainly struggled to obtain a living by letting apartments, the little money they had saved being now quite exhausted, and owing over a year's rent, make this Appeal, hoping to save their home from being broken up, and parting with everything they possess. Will any kind Friends help them in their deepest distress? The following persons have kindly allowed a reference to be made to them, and will give every information respecting the genuineness of this Appeal:—

- Dr. MAXWELL T. MASTERS, F.R.S., 41, Wellington Street, Strand, W.C.
- Mrs. DOWNING, 10 Lupus Street, Finslow, S.W.
- Mr. J. KEASLEY, 62, Salford Road, Brixton S.W.
- Mr. THOS. VERNON, *Weekly Dispatch* Office.
- Mr. J. P. FULLE, *Weekly Dispatch* Office.
- Mr. H. W. PERCY, *Weekly Dispatch* Office.
- Mr. W. RICHARDS, 41, Wellington Street, Strand, W.C.

Contributions will be gratefully received and thankfully acknowledged by Mr. W. RICHARDS, "Gardeners' Chronicle" Office, 41, Wellington Street, Strand, W.C.

Oncidium Jonesianum (Rehb. f.)

OVER ONE THOUSAND SPLENDID PLANTS. MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, October 30, at half-past 12 o'clock precisely, a grand importation of ONCIDIUM JONESIANUM (Rehb. f.), perfectly. There are rare masses among them, but every plant is fine, the greatest care and trouble having been exercised in collecting choice specimens. O. JONESIANUM is a very beautiful plant, doubt one of the finest introductions; it has extremely beautiful large white flower, the lip having a reddish brown taint, and the calyx and petals a rich rose color. It is a very early flowering, as many as fifteen flowers on a spike being produced, and the numerous spikes on the plants offered demonstrate how floriferous it is. On view morning of Sale, and Catalogues had.

Sunbury, Middlesex.

C. ALLEN, Stone Hills Nursery, Heigham, Norwich.

PONTEY'S SUPERFINE LATE WHITE BROCCOLI. - This is one of the finest stocks of Late White Broccoli ever offered, producing large heads of a creamy white colour, and coming in for use as late as June. See following extract:

From the Gardeners' Chronicle and Agricultural Gazette, London: - "Messrs. Broccoli. - A few days since, Mr. C. Kessell, of The Cobden, Fenwick, who has been a Broccoli grower for upwards of half a century, and was one of the first to get the Early Broccoli of Cornwall into the London and Western Markets, sent two monster Broccoli, which together weighed 50 lb. They were the sort known as Pontey's Late White Wiclow. The huge scales at the smoking-house had to be called in roundly, as in the weight of the plants."

Retail price, 2s. 6d. per ounce. Special quotations to the Trade. Apply to E. WILSON SERPELL, 31, Cornwall Street, Plymouth.

ONCIDIUM JONESIANUM (Rchb. f.) OVER ONE THOUSAND SPLENDID PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Chapside, E.C., on FRIDAY NEXT, October 30, at half-past 12 o'Clock precisely, a grand importation of ONCIDIUM JONESIANUM, in simply superb order, every bulb and eye being perfect. There are rare masses among them, but every plant is fine, the greatest care and trouble having been exercised in collecting them. ONCIDIUM JONESIANUM is without doubt one of the finest introductions; it has extremely beautiful large white flowers, the lip having a reddish-brown crest, and the sepals and petals spotted with chocolate. It is very free flowering, as many as fifteen flowers on a spike being produced, and the numerous spikes on the plants offered demonstrate how floriferous it is.

On view morning of Sale, and Catalogues had.

BERLIN LILY of the VALLEY CROWNS,

very strong blooming, at low prices. Also CYCLAMEN SEEDS,

Victor is the perfection of Potatos for fruit cultivation, New Potatos fit for use having been produced by it in six weeks from date of planting.

CHARLES SHARPE & CO., SEED MERCHANTS, SLEAFORD.

OUR CHRYSANTHEMUMS.

WE are determined (under this heading in particular, when so many are supposed to have the best) to keep our announcements accurate. Last year our show of four 100 feet houses was described by the Press, and admitted to be an extraordinary exhibition and the best trade display ever seen. This year we have erected five houses, specially constructed, which present a continuous bank of the whole family from the original species to 500 named varieties, 200 feet by 4 to 5 feet wide, of nearly 5000 plants, with vigorous dark green foliage, and as near perfection as can well be imagined, and the treat which awaits all lovers can readily be anticipated. Beyond this collection is enriched with best varieties direct from Japan; also Messrs. Collingford, Teesdale, A. W. Tait, and our own seedlings. Consequently, we feel quite justified in saying that nothing hitherto so interesting in the history of the Chrysanthemum ever approached those now on view at Swanley. Send for our Catalogue - the most complete and descriptive of the best-kept collection in England.

H. CANNELL & SONS, THE HOME OF FLOWERS, SWANLEY, KENT.

BULBS, AFRICAN and NATIVE

PLANTS of NATAL - A large variety, comprising Crinum, Imantophyllum, Hemerocallis, Native Orchids, Montvelia, Hypoxis, Begonia Granatensis, Dietes Huttoni, Gerbera, Agapanthus, &c. Zantedeschia and Pezomachus.

Mr. R. W. BEACHEY, Flinder, Kingskerswell, Devonshire.

ECKFORD'S NEW CULINARY PEAS FOR 1886.

NOW OFFERED FOR THE FIRST TIME.

MR. WILLIAM BULL has much pleasure in offering the two following magnificent Culinary Peas, which have been raised by the celebrated hybridist, Mr. HENRY ECKFORD, Gardener to Dr. SANKEY. These two varieties have been selected and grown with much care, and constitute, both in flavour and bearing, great advances on existing kinds:—

DUKE OF CONNAUGHT (Eckford's). FIRST-CLASS CERTIFICATE.

A most excellent, distinct main-crop Pea, attaining a height of 4 to 5 feet, producing in the most abundant manner, long, square-ended, bright green pods, well filled with seven or eight large Peas of very superior flavour. It is a magnificent variety for Exhibition. As a proof of its great superiority, this Pea was, after trial at Chiswick, awarded a First-class Certificate by the Fruit and Vegetable Committee of the Royal Horticultural Society.

In Sealed Quarter-pint Packets, 2s. 6d. each.

Respecting the above Peas, Mr. CHARLES PENNY, Gardener to H.R.H. the PRINCE OF WALES, Sandringham, writes:—"Your Pea **Duke of Connaught** is of excellent flavour, and **Progress** first-class in every particular. I can confidently recommend them, and am sure they must give general satisfaction."

PROGRESS.

A splendid late variety, growing to a height of 5 feet, very vigorous and productive, bearing a profusion of dark green pods of medium size, well filled with seven or eight bright green Peas of excellent flavour.

This extremely prolific variety can be strongly recommended as a marked advance on those already in cultivation, and forms a very handsome variety for exhibition purposes.

In Sealed Quarter-pint Packets, 2s. 6d. each.

ECKFORD'S NEW SWEET PEAS FOR 1886.

NOW OFFERED FOR THE FIRST TIME.

In offering the following three New Sweet Peas, raised by Mr. HENRY ECKFORD, Gardener to Dr. SANKEY, Mr. WILLIAM BULL is pleased to say that they will be found distinct and desirable acquisitions:—

CARDINAL.

A splendid robust growing variety, producing a great profusion of bright shining crimson-scarlet flowers, very distinct and handsome.

In Packets, 1s. 6d. each.

PRINCESS OF WALES.

A lovely variety, shaded and striped with mauve on a white ground, in a most pleasing manner; flowers of great substance and perfect shape. It has been awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society.

In Packets, 1s. 6d. each.

INDIGO KING.

The standard of this charming variety is of a dark maroon-purple, with clear indigo-blue wings.

In Packets, 1s. 6d. each.

ECKFORD'S NEW MIXED SWEET PEAS.

This special strain of mixed Sweet Peas is saved from choice named and unnamed varieties of Mr. Eckford's raising. These are of various colours and the mixture includes many of great merit.

In Packets, 1s. each.

PHACELIA CAMPANULARIA.

This is not only a lovely annual, but one of the most beautiful blue flowers known. It has been introduced from Southern California, is of dwarf bushy habit, and bears a profusion of erect, bell-like flowers in terminal racemes, of the brightest ultramarine-blue. *In Packets, 1s. each.*

WILLIAM BULL, F.L.S., Establishment for New and Rare Plants and Seeds, 536, KING'S ROAD, CHELSEA, LONDON, S.W.

THE BOILER OF THE AGE.

WEEKS'S PATENT DUPLEX UPRIGHT TUBULAR BOILER

PRESENTS A CAREER OF UNPARALLELED ACHIEVEMENTS.

Upwards of 3500 in Operation.

A guarantee for ten years (subject to the usual printed conditions) given with every Duplex Boiler, when fixed by J. Weeks & Co.

Full particulars and Illustrated Catalogue, 13th edition, post-free.

Address—J. WEEKS & CO., Horticultural Engineers, KING'S ROAD, CHELSEA, S.W.

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

National Pear Conference,

Royal Horticultural Society's Garden, Chiswick, Oct. 20 to Nov. 4.

NOTICE.

THE GARDENERS' CHRONICLE

FOR

OCTOBER 17 and FOLLOWING WEEKS

WILL CONTAIN SPECIAL ARTICLES ON

PEARS AND PEAR CULTURE,

Contributed by the Leading Growers of the day, and illustrated with numerous

ORIGINAL ILLUSTRATIONS.

The issue for October 24 will contain a full

REPORT OF THE EXHIBITION OF PEARS AT CHISWICK.

Among the Contributors to these Numbers are the following eminent Pomologists:—

- Messrs. Backhouse, York
A. F. Barron, Chiswick, Middlesex
R. D. Blackmore, Teddington, Middlesex
G. Bunyard, Maidstone, Kent
T. Cromber, Monmouth
The Cranston Nursery Co., Hereford
A. Deau, Belfont, Middlesex
M. Dunn, Dalkeith, Midlothian
Jas. Dickson, Cherter
P. & A. Dickson, Chester
J. Douglas, Ilford, Essex
W. Earley, Ilford, Essex
S. Ford, Leonardlee, Sussex
D. T. Fish, Bury St. Edmund's

Price 5d., post-free 5 1/2d.

May be ordered of all Booksellers and Newsagents, and at the Railway Bookstalls, or obtained direct from the Publisher

W. RICHARDS, 41, Wellington Street, Strand, W.C.

VEITCH'S DAFFODILS

for Pot-Culture or Planting.

JAMES VEITCH & SONS, Royal Exotic Nursery, Chelsea, S.W.

Our Collection of these hardy and attractive early spring-flowering bulbs embraces all the finest and most distinct well-known varieties, as also the most beautiful and desirable new hybrids.

BICOLOR HORSFIELDII (King of Daffodils) A splendid large fine-flowering early variety.

Per dozen, 20s.

BICOLOR EMPRESS. One of the largest and noblest of all Daffodils, grand form.

Each, 1s. 6d.; per dozen, 15s.

BICOLOR LORIPOLUS RUGULOSUS. Showy variety, very free blooming and early, fine for cutting.

Per dozen, 2s. 3d.; per 100, 15s.

BICOLOR LORIPOLUS EMPEROR. The most noble and striking Daffodil in cultivation, a most beautiful and desirable variety.

Each, 2s.; per dozen, 21s.

MAJOR MAXIMUS. Immense size, one of the finest and largest of all Daffodils.

Per dozen, 5s. 6d.

MAJOR OBEVALLARI (Tonby Daffodil). Bright yellow, dwarf, and floriferous; one of the earliest.

Per dozen, 2s.; per 100, 12s. 6d.

MOSCHATUS CERNEUS PLENUS. An extremely beautiful and very scarce creamy-white variety.

Each, 2s. 6d.

MOSCHATUS FALLIDUS PÆCOX. Very early flowering, pale sulphur coloured flowers.

Per dozen, 3s.

ODORUS MINOR PLENUS (Queen Anne's Double Jonquil). One of the prettiest and most exquisite varieties.

Per dozen, 6s.

POETICUS PLENUS. Very early, broad pure white perianth, with red crown.

Per dozen, 12s. 9d.; per 100, 12s. 6d.

SINGLE DAFFODIL (Lent Lily). Per 100, 3s.

DOUBLE DAFFODIL. Per 100, 3s.

PHEASANT'S EYE NARCISSUS. Per 100, 3s.

DOUBLE WHITE SWEET-SCENTED NARCISSUS. Per 100, 4s. 6d.

For other varieties, see CATALOGUE, Gratis and Post-free on application.

ROYAL EXOTIC NURSERY, CHELSEA, S.W.

SUTTON'S SUPERB HYACINTHS.

Carefully Selected from the Principal Bulb Farms in Holland.

SUTTON'S COLLECTIONS OF HYACINTHS FOR POTS AND GLASSES.

Table listing various hyacinth collections and their prices, such as '100 in 100 very choice sorts, carriage free .. £4 4 0'.

SUTTON'S "SPECIAL" EXHIBITORS' COLLECTIONS

Table listing exhibitor collections and prices, such as '25 Splendid Hyacinths for Exhibition .. £2 2 0'.

"The 100 Hyacinths I had from your firm are now in bloom, and they are splendid. They win the admiration of all who see them." — Mr. J. B. BUSSELL, Gardener to Mrs. P. T. Feham, Abermarlin Park.

"At the Bristol Spring Show, in March last, the Hyacinths we had from you were awarded a Silver Medal from the Royal Horticultural Society for the best twelve Hyacinths in the show." — Mr. G. MARSH, Gardener to Mr. Dunlop, Esq., St. Michael's Hill House.

"The Hyacinths supplied by Messrs. Sutton for forcing both in glasses and pots, have been magnificent this year, each a perfect specimen." — Mrs. HATHERRILL, Leamington.

For further particulars see Sutton's Bulb Catalogue, for 1885, containing Complete Cultural Instructions, Gratis and post-free on application.

Seedsmen by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales, READING.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 24, 1885.

PARALLELS OF PEARDOM.

WHAT is a Pear in the world of philology? In the Saxon vocabularies (Wright, i., 285) it is pere, pera, and pirige. These are obvious deductions from the Latin pyrus, which again is a possible, though not obvious, deduction from the Greek aptos. Daubeny (Trees of Antients, p. 147) assigns to Greece ten species of Pyrus, and to Italy six. Of Malus, the Apple, and Cydonia or Cydonium, the Quince, there is nothing now to be said, for the Pear is a sufficient handfl. It is impossible to avoid the suspicion that pyrus, pyre, and pyramid are related, if not in a strictly objective way, yet by analogy of thought. The pyre, indeed, was a pyramid in construction, and a flame ever tends to a pyramidal form. But the wood of the Pear was not in request for burning of the dead; that of the Pine was preferred before all other, and for the best reasons, although when the "pyral combustion" proceeded slowly, it might at one time have been customary to add a woman as being "unctuously constituted" and more inflammable than eight or ten bodies of men (Brown, Urne Burial, iv., 22). But necessity has no choice. The burning of the dead was a fine custom, instituted in defence of the living (Warburton on sixth Æneid), and the deed was done with the best means at command. Therefore, as regards the materials, there was never any pious prescription. In another direction, perhaps, we may see a flame in the woods when Pyrus communis mixes golden leaves with ruddy fruits; and if we could associate Pyrus aucuparia, which is common to all Europe (Watson, Cybele), we should obtain a pictorial harmonisation of the elements before us. Pyrus and pyrum passed into pirige, and thence to pere and pera, as in Chaucer's Merchant's Tale, 1025:—

"Now sire, quod she, for ought that may betide, I muste have of the peres that I see, Or I muste die, so sore longth me To eten of the smal peres green."

And again in the same tale—

"So long about the alleys is he gon, Til that he was come again to the pery."

In "Piers Ploughman," 5, 16, it is pirie which carries us direct to the Latin, as in Pliny, Virgil, and Columella. Skeat (Æt. Dic.) says, "root unknown." The modern Welsh peran, a Pear, and perain, Pears, take us more directly, because not through any corruption, to the Latin. But that is just what we expect a Celtic tongue to do, for it is a far off branch of the same tree, and reminds one of the Italian pera, for Pear, as well as of the English perry, the liquor that is made from it. We will make an end of the difficulty by calling it the fire tree, the tree that makes a pyramid of flame to light up the autumnal woods, giving real warmth ultimately by its eatable fruits, which are pyramidal in form, and therefore flame-like, a resemblance often augmented by a fiery colour.

"The fabric seem'd a wood of rising green,
With sulphur and bitumen cast between,
To feed the flames: The trees were unctuous Fir,
And Mountain Ash, the mother of the spear;
The mourner Yew, and builder Oak were there;
The Beech, the swimming Alder, and the Plane,
Hard Box, and Linden of a softer grain;
And Laurel, which the gods for conquering chiefs
ordain."
Dryden, Arcite.

Bergamot is a collective name for a distinct class of Pears. In the popular regard the name connects the fruit with the essential oil derived from the yellow rind of Citrus limetta, the fragrant Lime. The Bergamot of the garden is the Monarda, an American genus, and therefore out of the category. A Bergamot Pear need not have any fragrance. It takes its name from Bergamo, a town in Lombardy, where certain kinds of smallish Pears were grown and became famous for their sweetness. In Cotgrave thus:—"A yellow Pear, with a hard rind, good for perry; also the delicate Italian small Pear, called the Bergamotte." For a general definition of a Bergamot Pear, perhaps small and sweet should suffice.

A *Besi* Pear is a foundling, a wilding, a thing without a history. The Dictionary of the *Académie* gives the vague and worthless definition, "Nom générique de plusieurs sortes de Poires." Leroy, i, 265, gives a proper clue. He says, "Le mot (ou bezy) appartient à la langue Bretonne et signifie, d'après les Dictionnaires de Trevous et de Richelet, *Poire sauvage*," and he adds that most of the Pears that bear the name have been found "à l'état de sauvageon." Thus, Besi d'Héry was discovered in the forest of Héry, in Brittany. Besi de Quesnoy was found in the forest of Quesnoy.

A *Burré* Pear is a buttery Pear, therefore has, or should have, a melting flesh. The editor of the new *Ogville* has missed it, for it should be, where it is not, in his vol. i, p. 359. Humour creeps in where it is least looked for. Here is a transcript from Mitaud's Boyer—"Beurrier, a butterman. 'Des auteurs à beurrières,' Grub Street writers." Does it mean that those writers provided paper for the butter-shops? The Laureate could only think of curl-papers when writing *In Memoriam* (lxxvi, 7).

Fondante is the equivalent of *Beurré*, and should indicate a melting Pear.

Bon, or *Bonne*, might pass for good; but it may mean large, unusual, extra fine in any way whatever. For the most part it may be taken to indicate a thing about the goodness of which there can be no dispute.

A *Catillac* is a reminder of an engine of punishment, "parce que sa chain s'attaché à la gorge de celui qui la mange crue!"

Colmar is the capital of the department of the Haut-Rhin, France, sweetly situated at the foot of the Vosges Mountains. It is a great place for manufactures, and also for Pears; the variety known as Colmar having been grown there for hundreds of years; and it probably is one of the thirty or forty the Romans were choice about. Several of the modern Colmars are seedlings of Van Mons, and have their first or generic name from their general characters, and not from any geographical relationships.

Délice, m., and *Délices*, f., imply delightful; and it happens that all the Pears having this prefix are good.

Doyenné refers to the deanery, and seems to imply that the Pear having such a prefix originated in the curé's garden. In Boyer we have "Doyenné (sorte de Poire), Carlisle Pear, the Dean's Pear." Leroy knocks the dean on the head by saying the name was given to the Pear known as Doyenné to indicate its excellence: "d'une chose de qualité supérieure: c'est la doynné." As a generic term it is the equivalent of *Bon*, and should speak of a good Pear.

Muscat, as applied to a Pear, suggests that it

has a musky flavour. It has, in respect of the fruit, nothing to do with Muskovy.

Passé, apart from a suffix, means almost anything, but in this particular connection it indicates high quality. Thus "passe-fin," excellent fine cloth, as in Cotgrave. So *Passé Colmar* must be a superb Colmar Pear. Whether raised or found at Colmar is of no consequence, for Ostend rabbits are grown at Ghent and Bruges.

A *Rousselet* is a red Pear. A *rousseau* is a red-haired man. The verb *roussit* means to redden, or, as our country folks would say "ruddle." The Summer Pear known as *Rousselet d'Août* was anciently known as the *Ronselet*. Cotgrave gives "Rousselet, the name of a delicate small Pear." Freely translated it is the Little Russet. The type is Gros Rousselet, described in Martyn's Miller as of a dark red colour.

Crasane is a troublesome word as a prefix to a Pear. It suggests the choke Pear, which was anciently so-called, and is thus defined in the latest *Ogville*—"A kind of Pear that has a rough astringent taste and is swallowed with difficulty, or which contracts the parts of the mouth." Leroy gives a list of thirteen "Crasanes," all of which are described under other names. A rough thick coat is doubtless all that is needed to constitute a *Crasane*, for the coat being removed there remains more to gratify than to pain one. Dodoens describes the wild Pears as rough, binding, and chokely. Parkinson says the perry made of choke Pears becomes as mild and pleasant as wine, "and will hardly be known by the sight or taste from it" (*Parad.*, 594). In Martyn's Miller the chokey Pear, Poire d'Étrangillon, No. 27 of list, is described as having red flesh. Dodoens says the chokey Pears, "eaten rawe or backte before meale . . . do fortifie and strengthen the stomacke" (*Lyte*, 713).

Calabese means like a calabash, a Gourd, or a bottle.

Wardens are long keeping cooking Pears. Hogg associates them with the Cistercian Abbey of Warden, in Bedfordshire, "where a particular Pear was cultivated and used in pies;" and he quotes from the Clown in *Winter's Tale*, "I must have saffron to colour the Warden pies," which is prose, though quoted in *Fruit Manual* as verse. Turner, in *Herbal* (1568) says of Warden Pears, they are called walo, "that is, the hollow place or loofe of a mannis hand, because they be as big as a man can grype in the palm or loofe of his hand. These are commonly called in English Wardens, if they have a bynding, and be rede, when as they are rosted and indure unto Marche or February. It appeareth that they have their name of long keeping, for 'warden' in Duche, from whence our English came, is to kepe. Serotina pira are they that hang upon their mother until winter, and were ripe with the frost. These are partlely our wardenes, and partlely other long during Peares, which are called in Duche winter biren, and they may well be called in English winter Pears" (*Herbal*, ii, 108). The Cistercian and Benedictine monks were amongst the foremost founders of gardening in these isles, but the association of the Warden Pear with a particular establishment is scarcely justified by coincidence of name. The Dutch "weeren" and "waerden" is the source of our English word "warden," and carries with it the twofold idea of a keeper and something to be kept.

"For rightfulliche reson, sholde rude gow alle,
And kynde wil be wardeny your weith to kepe,
And tynde of gowre treasure."

"Piers Ploughman," 15.

Wardens were of many kinds. Tusser speaks of "Wardens white and red" in *January's Abstract*. Parkinson speaks of the "Red Warden and the Spanish Warden most excellent

Peares, either to bake or to roast, for the sick or for the sound." Turner speaks of dried Pears in a way to imply that Wardens were the best for the purpose, but as a matter of course, any dry textured Pear would answer. He says "The broth of dried Peares stop the belly," a direct reference to their astringent properties. Falstaff, contemplating the laugh turned upon him at court, after the buck-basket business, anticipates becoming "as crestfallen as a dried Pear," a sufficient suggestion that dried Pears were common comestibles in Shakespeare's time. *Shirley Hibberd*.

FRUIT TREES AT MESSRS.

LEE & SON'S, EALING.

OF Ealing, it has been well said its history has yet to be written—but it bids fair to supply the materials at an early date. The place has a fascinating charm for every true horticulturist, for from there came those ever-to-be-remembered stove and greenhouse plants, unsurpassed specimens of cultural skill, that created such a sensation at the old Chiswick shows of the Horticultural Society. We allude of course to Ealing Park, the home of the late Mrs. Lawrence, mother of the President of the Royal Horticultural Society, and himself an ardent horticulturist. Here is a strong argument for the "hereditarians." But it is not our purpose to dwell any further on Ealing Park—indeed it would be difficult to do so. It has been shorn of its glory by the speculative builder!

There can be nothing more interesting to those connected with the cultivation of fruit trees than to look over the collections of Apples and Pears in a first-rate nursery, where these are grown extensively, to see the number of varieties, and to note the different characters of the fruit in colour, form, and size, and to compare notes as to the correctness of names, &c.; also the great diversity in the growth of the trees, especially to those who have a fancy for any particular kind of fruit or form of tree, as they are to be found in all forms and shapes suited to the varied tastes of the planters.

One of the oldest (perhaps the oldest, for they were established in 1720) nurseries is that of Messrs. Charles Lee & Son, Hammersmith, who have one of their branch establishments at Ealing, containing about 25 acres, devoted to the cultivation of fruit trees; the soil is of a deep loamy nature, in every way suitable to the growth of fruit trees. Very great attention is given to the selection of the various stocks as most suitable on which to work the different kinds. Here are to be seen whole quarters of standard Apples growing upon the free stock, suitable for orchard planting; also pyramidal and trained trees. Perhaps the most interesting Apple feature here is to see a quarter of pyramid Apples worked on the Paradise stock, literally laden with fruits of fine size.

Mr. George Cannon, Messrs. Lee's manager, himself an enthusiastic fruitist, recommends this kind of tree to be more extensively planted, especially in small gardens, as they are of a compact moderate growth, very prolific, while the fruit comes to such fine size that too much cannot be said in their favour. It is worthy of note that he recommends that all the free-bearing varieties, such as Lord Suffield, Stirling Castle, Keswick Codlin, Maax Codlin, Potts' Seedling, Frogmore Prolific, Ecklinville Seedling, Hawthornden, and Worcester Pearmain should be worked on the free stock, he having found that these sorts when on Paradise bear so freely as to become stunted in growth and the fruit small; but such sorts as the following are benefited to a very marked degree, being made prolific and producing fine large fruit, viz.—Ribston Pippin, Cox's Orange Pippin, Margil, Sturmer Pippin, Claygate Pearmain, Adam's Pearmain, Cockle Pippin, King of the Pippins, and Pine-apple Russet; these comprise some of the finest dessert kinds. The following kitchen sorts should be worked on the Paradise stock also, viz.—Alexander, Blenheim Orange, Peasegood's Nonsuch (it may be remembered what magnificent examples of this variety were exhibited by Messrs. Lee at the great Apple Congress at Chiswick in 1883), Beauty of Kent, Golden Noble, Warner's King, Lady Heniker, Galway Pippin, Alfriston, Anne Elizabeth, and Gloria Mundi; the above mentioned, grown as single and

double cordons, produce some of the finest and largest fruit frequently to be seen on the exhibition tables.

Pears do well at this nursery, some of the pyramids and the espaliers are carrying nice crops of fruit. A collection of fruit from these trees is now being exhibited at the National Pear Congress at Chiswick. Most of the fruit on these trees is growing on the Pear stock. There is, however, a nice collection worked upon the Quince, and these should be largely planted—such as Beurré Diel, Marie Louise d'Uccle, Louise Bonne of Jersey, Beurré Superfin, Doyenné du Comice, Beurré Hardy, Doyenné Bessaie, Beurré d'Areberg, Beurré Bachelier, Bergamote d'Esperen, Duchesse d'Angoulême, Fondante d'Automne, White Doyenné, and Soldat d'Esperen. All these make fine pyramids on the Quince, and produce fine fruit on most soils. The following do not succeed well on the Quince, but they are so indispensable that they should not be left out of any collection, and these have to be grown on the Pear stock, viz.—Jargonelle, Williams' Souvenir du Congrès, Pitmaston Duchesse, Marie Louise, Glou Morgeau, Winter Nelis, Josephine de Malines, Easter Beurré, and Beurré Cane; they are all good bearers when properly cultivated, that being more vigorous growers on the Pear stock they require attention paid to root pruning.

The next special feature at this nursery is the stock of standard, half-standard, and dwarf-trained kinds of Nectarines, and of themselves as the three finest Nectarines grown. Peaches in pots are also grown successfully at this nursery.

The collection comprises all the latest and newest kinds, but the good old favourite sorts, such as Royal George, Grosse Migonne, Bellegrape, Early York, Noblesse, Elruge, and Pitmaston Orange, are still to the front, and in greatest demand, but a few sorts may be mentioned which are most useful additions, viz.—Alexander, the best and earliest variety; Condon, fine and early; Early Silver and Dr. Hogg, good second earlies; Dymond, showy, mid-season; and Sea Eagle and Princess of Wales, good late kinds. Lord Napier, Humboldt, and Fine-apple Nectarines have established themselves as the three finest Nectarines grown. Peaches in pots are also grown successfully at this nursery.

There is a great stock of Plums. Thousands are grown in dwarf trained standards and pyramids, and also the same with Cherries.

Roses are here successfully (as the leading horticultural exhibitions testify) and extensively cultivated. There are 20,000 standards and half standards, and the same number of dwarfs, all showing a condition of growth that only such soil as is to be found at this nursery can produce.

There is a centre walk nearly half a mile in length planted on each side with specimen shrubs, and a fine collection of herbaceous plants is here to be seen in good order. Thus Messrs. Lee are marching with the times, for herbaceous plants, long left in the "cold shade of opposition," are deservedly making known their many claims to recognition by emerging from such shade into the full light of universal approbation.

To those who are more particularly interested in Rose and fruit tree cultivation we should recommend a visit to this excellently managed nursery. They will find a guide, philosopher, and true friend in Mr. Cannon. The stock will be found in excellent condition, the climate of Ealing being good and sufficiently far from the metropolis to escape, in a great degree, the London smog.

Such stock as is here to be found used to be grown at the nursery of the firm at Hammersmith (of happy memory as regards this firm), but with the inevitable increase of railways and bricks and mortar, all nurseries of this description have had to seek fresh fields and pastures new, where the gentle art might be carried on unmolested, if not amidst such venerable and honoured associations.

The soil of Ealing, generally, is of a loamy, holding nature, well suited to fruit trees, and especially Roses, which do wonderfully well; and the villa gardens make a good show of these flowers, and are, as a rule, well kept—the allotment gardens at Ealing, cultivated by the cottagers (for extent), holding their own with any in the country, and an earnest appeal was made at the recent twenty-first anniversary dinner of the Ealing Horticultural Society, by the Hon. Secretary, Mr. R. Dean, to the "powers that be," that such allotments should be extended. May the appeal be not made in vain. It was made in a good cause. There are very few suburban places where gardening is carried out better than at Ealing, and the presence in its midst of the excellent society before mentioned has, doubtless, much to do with this very desirable and encouraging state of affairs.

BENEDICT ROEZL.

ALL those interested in the introduction of interesting plants, indeed all those who sympathise with courage, energy and intelligence, will learn with great regret of the death of this renowned collector, at Prague, in the sixty-second year of his age.

He was born in Bohemia and began his horticultural career when he was twelve years old. To write an account of his wanderings and adventures (he was robbed seventeen times), to detail all that we owe to his zeal, would demand far more space than we can give. We have therefore judged it best simply to repeat the summary biographical notice, for which we were indebted to him some ten years ago.

Since that time Roetzl has chiefly resided at Prague, but was not an infrequent visitor to this country. It was as late as the summer of this year that we were privileged to see him and avail ourselves of his experience.

"I started in my horticultural career," writes M. Roetzl, "in my thirteenth year—in 1836. I was apprenticed in the gardens of the Count of Thun at Tötschen, in Bohemia, from which, after three years, I went to the gardens of the Count Paulkowsky, at Medica, Galicia. At that time these gardens contained the largest collection of plants in Europe, and I was there enabled to gain

BENEDICT ROEZL.

most of my botanical knowledge of plants. After staying three years I went to the far-famed gardens of Baron Von Hugel; from there I went to Telsch, in Moravia, to Count Lichtenstein, and from there to Ghent, to M. Van Houtte, where I stayed five years. I was *chef de culture* in the School of Horticulture of the Belgian Government. After this I served for two years as foreman to M. Wagner in Riga (Russia). From Riga I went again to M. Van Houtte for two years, but I could no longer restrain my ardent wish to see the tropics, and I proceeded *vid* New Orleans to Mexico—this was in 1854. In Mexico I started a nursery for European fruit trees; there also I collected a large number of Mexican Pines. From thence I sent to Europe *Dahlia imperialis*, *Bouvardia Humboldtii*, *Zinnia Haageana*, *Cosmos atropurpureus*, *Agave schildigeri*, and many other plants. I introduced into Mexico the culture of the Ramie (*Bolmeria tenacissima*), and planted many acres of land with it. I invented also a machine for extracting and cleaning the fibre of Ramie and Hemp, and took out a patent for my machine from the Government of the United States on September 17, 1867. The Agricultural Exhibition awarded a diploma for it in February, 1868. This discovery was the cause in 1868 of the loss of one of my arms. Many people in Havana solicited me to exhibit my machine there, and I was asked by some gentlemen to try if the machine would extract the fibre from *Agave americana*. The result of the trial proved my assertion, that the fibre would come out green, was correct; but in endeavouring to show that they were right in their assertions they managed in some way or the other to fasten some screws tighter, so as to get the cylinders closer together, and I, not knowing this, in putting a leaf between the cylinders (making 360 revolutions per minute) lost my left arm. Afterwards I again

travelled in Mexico, and discovered *Dalechampia Rozeiana* rosea, *Apheandra aurantiaca* Roetzl, *Campyobotrys Ortgiesii*, C. Roetzl, *Negelia fulgida* and *digitalifera*. From Mexico I went again to Havana and Cuba, and discovered *Microcybus* species.

"Afterwards I proceeded to New York, to start on my Californian travels over the Rocky Mountains and Sierra Nevada. I discovered here the new *Lilies Washingtonianum*, *puberulum*, *parvum*, and *Humboldtii*; the latter I found on the hundredth memorial day of Alexander Von Humboldt, and hence named one of the species after him. The Lily in question does not come from the Humboldt country, as some catalogues assert. I also found here *Saxifraga pedata*, *Calochortus Leichlinii*, *Abies magnifica*, and many others that have been published from time to time. From there I went to Panama and Oceania, in New Grenada, where I found *Utricularia montana*, *Anacetochilus Ortgiesii*, and forwarded about 10,000 Orchids to Europe, and something like 500 species of plants. From there I went to the Sierra Nevada from Santa Martha; I found there *Teleogon Roetzlii* (Reich.), and of which I collected 800 plants. These died in one night, owing to the great heat in Rio de Hacha. I also found many new varieties of *Odontoglossum*, and forwarded upwards of 3000 to Europe.

"Then at the beginning of the Franco-German war I went to Panama and San Francisco, and owing to the war many of my assignments arrived dead at their destination. Wishing to await the end of the war, I went to the Washington Territory and found *Lilium columbianum*, and a great variety of Conifer seeds. From there I proceeded to Sierra Nevada, California, to gather Conifer seeds, but the harvest was lost on account of the severe frost. From there I went to South California, then to Panama and Bonaventura, in Choco; here I found *Gaura Roetzlii*, and *Lindeni*, and *Cyrtopodium palmifolium* and *Roetzlii*. Here I also gathered *Cattleya choconensis*, and brought them to Bonaventura to ship them, and returned through the valley of Cauca. Now a very difficult journey commenced through the State of Cauca to Antioquia, where I discovered large quantities of many varieties of *Masdevallias*, described by Professor Reichenbach, and *Odontoglossum vexillarium*, *Curmeria picturata*, *Cattleya gigas*, *Phyllotheum Lindeni*, and many *Diefenbachias* and other Aroids. After a journey of six months, I travelled down the Magdalena River, and to Colon and Panama, thence to North Peru, crossed the Andes, where I found a scarlet Violet, a new specimen of *Heliotropium*, *Tillandsia asperata*, *Epidendrum Frederici Guilielmi*, *Masdevallia amabilis*, &c. I returned to Payta to ship my plants and myself too, and went to Bonaventura, found *Odontoglossum Roetzlii*, and when almost exhausted I found on the way *Masdevallia chimera*, and several new Aroids, which I brought myself to Europe. After staying about four months and visiting the principal towns and nurseries, and seeing my parents again, I started once more for a new series of travels.

"On August 3, 1872, I went from Liverpool *vid* New York into the Colorado Territory, and in Denyer City I was robbed of 2000 dollars, the whole of my possessions. There I collected *Yucca angustifolia*, *Calochortus Kraglii*, *Ipomoea leptophylla*, and proceeding to New Mexico I found the beautiful *Abies concolor* (Engelmann), *Yucca baccata*, many hardy Cacti, and many animals and peripherals. From there I went again to the Sierra Nevada, where I found *Pinus edulis*, P. Bolanderi, and collected Californian Lilies, and went to San Francisco and thence *vid* Acapulco into the Sierra Madra, where I found *Odontoglossum maxillare pulchellum*, *citrosimum*, *roseum*, and many others—altogether 3500 Orchids, which arrived in London in fine condition. From there I went to Panama over the Isthmus, and went to La Guayra to get to Caracas in Venezuela, where I found *Cattleya labiata* Roetzlii. I forwarded in all not less than 8 tons of Orchids to London. From thence to St. Thomas and to Havana and Vera Cruz, then to the Isthmus of Tehuantepec and into the State of Oajaca, in Mexico, where I found a real 'new wonder,' the double *Poinsettia pulcherrima*, which has already flowered in New York, and many Cacti and Agaves, *Bign.* and Orchids—in all 10 tons of plants. From the City of Mexico I returned from Vera Cruz, to go to New York, from New York to Panama, from there to Lima and Peru, over the Oroza Railroad, crossed the Andes at a height of 17,000 feet to Tarma and Chanchamaga, brought back with me 10,000 bulbs of various sorts, *Pilococcus mollis*, many new *Bromelias*, *Loasas*, *Calceolarias*, *Fuchsias*, *Mutisias*, and many other new plants. From thence I returned to Lima and Callao to South Peru, to Morienda and Arripa, to Puno on the Lake of Titicaca. From there I went to La Paz, in Bolivia, and from thence I went over the Snowy Mountains of Illimani to the province of Yungas, there I found *Odontoglossum selligerum*, *Teleogon Benedicti*, *Masdevallia aspera*, many new bulbous *Begonias*, *Loasas*, *Troscodias*, *Tropaeolums*, and others. From thence I returned to Tacna, crossed the Andes to Lima; from there again I went to Payta, crossed the Andes to Huaca-Camba, from whence I sent home many *Masdevallias* and *Odontoglossums*, *Pilococcus Peacockii*, and *Teleogon Hercules*, and

went to Guayaquil (Ecuador). From there down the Chimbaro, found the *Zamia Pescatorea* Roezlii (Rehb.), Batemanni, Wallisii (Rehb.), and others. I returned to Guayaquil, and went to Bonaventura to visit once more the Valley of Cauca, where I found *Masdevallia chimera*, *Odontoglossum Roezlii*, *Pescatorea Dayana*, and many others. With these I started once more for London."

Such, in mere outline, is the account of M. Roezli's wanderings, and of the results of his travels.

Orchid Notes and Cleanings.

ODONTOGLOSSUM CIRROSUM.

THERE is one point referred to in a recent letter on Orchid culture, by Mr. Douglas, which it always appears to me is not sufficiently considered by most growers, and that is the great effect that locality and the size and position of the Orchid-house has upon the treatment required by the plants within it. As an example of this, Mr. Douglas says that he finds his *Odontoglossum cirrosum* thrive best in the Cattleya, or intermediate-house; but my experience differs entirely from his. I grew my *cirrosus* for some years in the intermediate house, with the unvarying result that the plants were sickly and weak and frequently did not flower at all. For the past three years I have grown them in a cold *Odontoglossum*-house, and they are vigorous and healthy and flower with strong spikes.

Again, a large and well known grower assured me lately that *Coccolyne cristata* would not flourish with him in a cooler temperature than that of the Cattleya-house; but all my plants are kept in a cool house with *Lycaste* and *Laelia anceps* and *autumnalis*, and they can vie with those of any other grower in vigorous health and in the quantity and quality of the flowers. About two years ago I nearly killed all my *Odontoglossum Rossi majus* and *O. Cervantesii* by removing them, on experienced advice, into the *Odontoglossum*-house; but now they are replaced in the intermediate-house they are again in strong health. I believe, therefore, that it is impossible to give any general rule, excepting within very wide limits, as to the correct treatment and temperature for any class of Orchids, as these points differ much according to the conditions under which they are grown, and can only be determined for each locality by experience and trial. *S. Courtault, Boeking Place, Braintree.*

VANDA CERULEA.

In a recent number a correspondent mentions *Vanda cerulea* as not often seen. I lately had a plant of it, imported from Mandalay, Burmah, some five years ago, in flower for the first time. The flowers were large, flat, of a beautiful pale turquoise colour, and finely reticulated with darker lines, like the wing of a dragon fly. It was greatly admired by those who saw it. I have not seen this reticulation mentioned, nor is it shown in the portrait given in the *Garden*, vol. xxi., 1882, p. 254, in which the colour is also very inferior. *H. J. Ross.*

— One frequently hears remarks passed upon the difficulty experienced in flowering this beautiful Orchid in a satisfactory manner; but our experience here with a small piece, about 1 foot 4 inches in height, is of a nature calculated to make us hesitate before entirely concurring in that opinion. The plant in question was bought about twelve months ago with one flower-spike showing. This season it has produced two strong spikes, each with nineteen flowers upon it, and besides these two more spikes have pushed through, and are evidently prepared to grow away should the present spikes be removed at once before the plant is exhausted. Rather more than the usual amount of shade has been given on account of other Orchids occupying the same house, and rather less than the usual quantity of water has been supplied to the roots, or, more correctly speaking, to the moss, for the majority of the roots—as is usual with these epiphytes—are in the air. *F. The Note.* [Tell us how you manage it. ED.]

— At p. 466 it seems I am called upon to define the use or meaning of terms. This I consider the purport of "J. D.'s" question when he asks me what

I consider a handsome flowering specimen. Seeing that I applied the expression to a certain plant which he has evidently inspected, it behoves me to stand by and explain it without shifting ground to obtain a definition. The word handsome simply means beautiful or good-looking. Of course we must always make a comparison in order to be understood when we say a plant is handsome; but I fail to see that the application in the present instance implied that the plant in question was in any way superior in merit to average specimens of the same species. On the other hand, if we compare it with the darker coloured but smaller flowers of *V. conculescens*, there can be little difficulty in deciding which has the more handsome flowers. Furthermore, the plant in question is small, with a stem of about 7 inches, closely furnished with healthy unspotted leaves, and the raceme bears eleven flowers, each averaging about 3½ inches across. The specimen will not compare with the magnificent one figured in Warner's *Select Orchids*, p. 18, but it will compare very favourably with dried plants I have seen that were collected on their native *Khassia* hills; and the flowers are in themselves, or whether compared with those of other species, undeniably handsome. Since writing the previous article another and fewer flowered specimen has opened its buds, with which the said article has nothing to do. *F. F.*

— Here there are two nice plants of this lovely species in flower, which are, I think, extra good for the size of the plants; they are growing in Teak baskets, and are only 8 inches high, with seven pairs of leaves; each has spikes 1½ foot long, and twelve flowers upon each. The variety is very fine, with flowers nearly 4 inches across. *F. Bedford, Straßan.*

DISA MACRANTHA, Thunberg.

In a recent number of the *Gardeners' Chronicle*, p. 479, Mr. Burridge refers to a plant, collected by Coper in Kaffaria, in the British Museum herbarium as belonging to this species. I am responsible for this statement, having mentioned it in a letter to Mr. Burridge. I am afraid I must correct it. The plant alluded to, which I had not then properly examined, is a young *D. crassicornis*. *D. macrantha*, Thunb., I have not met with. It seems to be very similar to *D. corouta*, and I should not imagine it to be superior to that species as a cultural plant. Any way, I fear it must be added to the already considerable list of lost Cape plants. *H. N. Ridley.*

ONCIDIUM OCHTHODES AND O. CHRYSORNIS.

The above-named plants may both be seen in flower at the present time at Kew, and as on comparison they prove to be one and the same species, it may be interesting to record the fact, especially as they are likely to be flowering in other collections. Both were described in these columns by Dr. Reichenbach—*O. ochthodes* in 1871 (p. 1433), and *O. chrysornis* in 1880 (vol. xiv., n.s., p. 620), and both were found in Ecuador. The former was imported by Mr. Bull, through one of his collectors, Dr. Reichenbach, when describing it, pointed out its affinity with *O. pyramidale*, Lindl., and remarked:—"It would be that species if its petals, columnar wings, and lip were not very distinct." Besides these differences, however, may be noted its stouter habit, larger and denser panicle, with more zigzag branches. It is a native of Peru. *O. chrysornis* was discovered by Klaboch, and afterwards by Honda. The difference between the two is very slight—less, indeed, than often occurs between individuals of the same species. The older name of *ochthodes* will have to be retained for the species, which is well marked by the long leaf-like rostellum and hatchet-shaped column-wings. *O. chrysornis* represents a state with the markings somewhat less distinct than the type. *R. A. Rolfe, Herbarium, Kew.*

ODONTOGLOSSUM BREVIFOLIUM.

This rare and extremely handsome *Odontoglossum*, native of the Peruvian Cordilleras, where it was discovered by Hartweg, is now in perfection at the Woodlands, Streatham Hill; and although Mr. Measures has in his collection the very cream of the genus, there are a few only that can equal in beauty this grand species. The flower-spike is erect, with about a dozen large flowers, which are of a rich shining chestnut-brown colour, bordered with yellow, the major portion of the labellum being yellow in just sufficient quantity to form a pleasing and beautiful contrast. Of the numbers of handsome Orchids in flower mention must be made of the extra

fine varieties of *Cypripedium insigne*, including all the newest and very best. Of the true autumn-flowering *Cattleya labiata* there is a good healthy specimen with two large spikes of bloom; and the charmingly bright and beautiful *Cattleya aurea*, the best variety, is also blooming freely. In fact, this collection is noted for the many superb varieties contained in it, and at any time of the year something exceptional is sure to be found at the Woodlands. *J. G.*

ORCHIDS AT KEW.

The last week in September is about the worst time in the whole year to expect a display of flowers in the Orchid-houses, but there was a goodly display here at the time of my visit. Cattleyas were represented by the gorgeous *C. aurea* var. *Downiana*, a species that does not succeed well in every garden. The only chance to flower it is to grow it in baskets suspended near the glass where it can get plenty of light and air, with a warm Cattleya-house temperature. The last blooms of *C. Gaskelliana* were open on the plants. I have referred to this new species before as being most useful to carry the *Cattleya* bloom into July and August; it is an additional argument in its favour to find its delicately tinted blooms about the end of September. *Zygotopetalum Gautieri* was represented by a very fine healthy specimen. The greenish coloured sepals and petals are blotched and spotted with brown. The lip is deeply tinged with a blue suffusion. *Oncidium varicosum* represents the yellow-flowered species of this genus; the plants were furnished with long elegant spikes of its handsome blooms. The small-flowered type had a representative in *O. ochthodes*, interesting as a botanical specimen, perhaps. The best of the small-flowered type is *O. cheiroporum*, graceful and pretty, with a delicious perfume. *Spathoglottis Fortunei* is a pretty terrestrial Orchid; several plants of it were furnished with upright spikes of bright yellow flowers. Another pretty terrestrial Orchid, also in flower, was *Stenoglossis fimbriata*; the leaves are marked with blackish spots; from the centre issues a small spike of rose-lilac flowers.

Amongst *Odontoglossums* the following are, or were at that time, in flower:—*O. Ehrenbergii*, the plant and flowers resembling a small form of *C. Rossi*; *O. constrictum* is not very handsome, but the white lip, edged with yellow, forms a much more pretty flower than *O. Lindleyanum*; *O. vulcanicum* (*Mesopidinium*) is very pretty, producing neat and elegant spikes of rose-coloured flowers. The above were all cultivated in the Cattleya-house. In the warmest house various species and varieties of *Cypripedium* grow with great vigour, especially those of the *C. longifolium* type; *C. conchiferum* is very elegant, it has pale rose lateral petals, the dorsal sepal greenish-yellow, marked with pale green lines, the slipper greenish-yellow. The hybrid forms of this group are represented by *C. calurum* and *C. porphyreum*. The modest-looking *C. concolor* was flowering well under the shade of the taller ones; there was a small plant with a well-developed flower of the new and very pretty *C. Godefroyæ*. This species seems to grow well in the warmest house; here it was not near the glass. Overhead *Phalænopsis* were growing and flowering freely suspended from the roof. *P. Esmeralda* was represented by the poorest variety, but *P. violacea* and *P. amabilis* were very handsome; and attached to a raft were three or four flowering examples of *P. Lowii*, very pretty and distinct. The flowers are not large, but the colour is charming—a delicate bluish blush with a violet-coloured lip. Amid plants of *Dendrobium Phalænopsis* oae has produced four handsome flowers, proving it to be the finest of the *D. bigibbum* group. It is figured in the *Bot. Mag.*, tab. 6817; but the figure does not represent such well developed flowers. *Saccolabium Blumei majus* is finely in flower. This good old species ranks amongst the most handsome of the genus, and *Dendrobium formosum giganteum* is also flowering remarkably well: as many as eight large fully developed flowers could be counted in one cluster. This plant does not succeed well year after year in collections; the growths decline in vigour after the second year. Probably the system of culture has something to do with it. The plants should be kept in the warmest house, and quite close to the glass while they are making their growth, and be freely supplied with water. The flowers are produced in autumn. After the flowering period is over they go to rest, and during winter keep the roots comparatively dry, though not so dry as *D. Wardianum* and *D. nobile* are allowed to become. They do best during winter in the Cattleya-house, and should be cultivated in Teak baskets. *J. D.*

SEEDLING POTATOS IN IRELAND.

At the Dairy Show of the Royal Dublin Society, held last week in Dublin, a remarkable exhibition of seedling Potatos took place which is deserving of notice. The prizes were offered by the Commissioners of National Education of Ireland, for the best new varieties of Potatos raised from seed of the Potatos supplied by the Commissioners in the years 1882 and 1883 to teachers of National Agricultural Schools and schools having gardens attached—the object in view by the Commissioners being the mitigation of the disease by the raising and introduction of new varieties.

Four sets of prizes were offered. 1. For the best variety of round Potato for table use, £10, £5, £3. 2. For the best variety of kidney or long Potato for table use, £10, £5, £3. 3. For a variety of early Potato, round or kidney, which being tested at the farms of the Board of National Education in the year 1884, shall prove to be the earliest and the best in produce and quality, £10, £5, £3. 4. For the largest and best variety of Potato for cattle feeding, £10, £5, £3. A further prize of £10 was offered for the best report upon the system of raising Potatos from seed.

In response to these liberal prizes no fewer than 254 dishes of Potatos were exhibited in competition. Collectively, it cannot be said that they presented a very attractive appearance, many extremely poor examples being submitted, and several badly diseased. A great many seemed to partake of the character of the Scotch Champion, others of Victoria, Snowflake, and other well known varieties, indicative of their parentage no doubt. The judges had a very difficult task to perform in deciding on their respective merits. After much discussion it was decided to award the prizes in regard to appearance alone—no information being available as to their cropping qualities, &c., and the test of cooking being considered unfair in regard to the late varieties. Some eight or ten varieties in each set being selected, were recommended to be further tested by being grown next year under similar conditions, and again examined before being sent out. Of the prize winners, in the first set, Mr. W. McClean, Carmee, Monaghan, obtain the first prize, with a very fine round white; for the second set, Mr. McClean was again successful, thus securing no less than £20. The first prize in the third set went to Mr. M. Hall, Kilgreaney, Bagnalstown, Carlow; and in the fourth, Mr. M. Bell, Gortagilly, Moneymore, Londonderry, was the successful exhibitor.

It will be interesting to note as to whether any of these Potatos will prove of superior vigour or quality to those now in cultivation. Our present impression is that they will not. The Commissioners are, however, to be congratulated on having given so much encouragement and support to the subject of Potato growing, which is of so much importance to Ireland.

ROOT-PRUNING OF THE PEAR.

(Concluded from p. 495.)

DWARFING STOCKS.—The use of the Quince and other dwarfing stocks has also greatly assisted this and other modes of *petite culture*. But pot-culture itself is a mode of root-pruning. The cramming of the roots within the pot, their pressure against the sides, are powerful aids to fertility. And Pears in pots are growing for ornament, in addition to their usefulness. In front areas or small gardens, on terrace-door steps, in balconies, they are fit companions and formidable rivals to such plants as Box, Sweet Bays, Laurels, Laurustinus, Hollies &c. And few plants can equal well-formed Pear trees in pots or tubs, covered with white bloom in the early spring, clothed with the soft verdure of the young leaves, or with leaves of every colour in the autumn, and laden with their fruit of such varied size, colour, and form throughout the growing season?

WHEN TO PRUNE.

About the middle of October is, as a rule, the best season to root-prune Pear trees; much, however, depends on season and local climate. The best condition is a fortnight or three weeks before the fall of the leaf. The leaves, however, should not be so

immature, nor the root-pruning so severe, as to cause the leaf to fall too much, else will the advantage of early root-pruning be lost. The object of choosing this early period is to obtain the help of the leaf in stimulating the almost spontaneous production of new roots. The whole of the month of November is also suitable for root-pruning, but the earlier in the month the better, for the reason just stated, and likewise for the additional one of obtaining the remainder of the summer's warmth to forward the same purpose—the prompt emission and growth of fresh roots. In the case of very vigorous trees, that need a severe check, they may be root-pruned in June or July; this needs special care and skill, and should not be practised by novices.

METHOD OF PRUNING.

As to the mode of root-pruning, it should be performed tenderly. Careful uncovering and examination should precede cutting. The barbarous method of going haphazard at the roots underground with a sharp spade somewhere in the direction of the vigorous shoots hardly deserves the name of root-pruning. Frequently the mere examination and uplifting of a few of the deeper boring roots will be all that is needed—root detachment or disturbance being equivalent in many cases to a considerable amount of root-pruning. Again, the uplifting of roots, placing them nearer the surface, and surrounding them with fresh soil, may prove equivalent to root-pruning. In cases where actual removal or shortening of roots is determined on, the cuts cannot be too short, clean, and prompt. Beware also of cutting too many roots, as the temptation is great after the labour of uncovering to prune too severely. Cover up as soon as practicable,

FIG. 117.—REVERSED TRAINING OF PEAR.

able, bearing in mind that root-drying and root-fingerling secure almost as severe a check as the actual removal of such roots.

Unless in extreme cases, it is also wise and sound practice only to prune one-half of the roots at a time. By this means there will be little risk of losing a crop, and the tree will be preserved in good health while being root-pruned into higher fertility. Transplantation is also a complete substitute for root-pruning, though the two are mostly practised abreast. This, to some extent, is unavoidable, and hence the less need for adding intentional pruning, unless of wounded or bruised roots, at the same time.

AFTER-TREATMENT.

This consists in adding maiden earth when practicable over the wounded roots, and mulching the surface with frost-proof litter of some sort—the first to stimulate the production and multiplication of new roots, and the second to preserve them in security against the severities of the first winter and spring, and also to secure them against the heat and drought of the succeeding summer. Roots lately pruned are in an abnormal condition, alike in regard to condition and place. They are more active, numerous, tender, and closer to the surface than roots in a normal state, and hence the necessity of special protection against cold, drought, heat, or other climatic changes. Where the first-formed roots are destroyed by those or other causes, the trees are virtually root-pruned twice, or even oftener, within the compass of a few months, and not seldom fail to re-establish them, become the prey of disease, or actually perish in consequence.

So soon as the roots get a fresh grip of the soil the trees are safe, provided the young and active fibres are protected by a surface mulching. Unless the root-pruning is performed too late, carried too far, or un-

skillfully performed, the trees will set and finish their next year's crop as usual, and probably prove sufficiently fertile ever afterwards, in consequence of the one skillful pruning of their roots; and should it prove otherwise, all successive root-prunings are rendered more simple and safe in consequence of the first, as all things are possible with fibrous roots, while there is often considerable risk in operating on lany ones; but, as already stated, the greatest art in root-pruning, as in writing, is to know where to stop. D. T. Fish.

FRUIT NOTES.

FRUIT GROWING AT EALING.—The soil of this neighbourhood generally is of a good loam of a holding nature, resting on gravel at various depths, and is well suited to the cultivation of fruit trees, especially of Apples and Pears. There are a number of villa gardens, most of which have more or less a collection of fruit trees, and many amateurs take a great interest in fruit growing. It is very interesting to note the result of the different treatment carried out; some go in for very close pruning, and stump their trees to appear more like a lurch broom half worn out; others go to the other extreme, and allow their trees to grow at will; while others, more practical, and who know something about the cultivation of these trees, take the wiser course, and merely prune them into shape, well thinning the branches to admit of light and air, and root prune if over-vigorous, and thereby obtain good results. This is the best season for Pears I have known for many years, the trees are carrying good crops throughout the district, with scarcely any exceptions to varieties.

The north part, known as Castlebr Hill, is very heavy, and the subsoil is deep, heavy, brick earth, bordering on to clay; the other parts of Ealing vary, some part of the soil is of a rich deep loam, while in others it is lighter, stony, and more shallow, and nearer the gravel, therefore great care is required in making selections of fruit trees to suit these conditions. In ordinary seasons a great difference can be seen with regard to the fruiting of some varieties; where the soil is heavy, with a cold subsoil, many of our fine late Pears do not succeed, the fruit does not develop to their proper size, but becomes cracked, woody, and worthless.

PEARS FOR CLAY SOILS.

For such situations the following may be grown as standards, pyramids, and espaliers on the Pear stock, viz.:—Autumn Bergamot, Beurré Bosc, Beurré d'Amanlis, Beurré d'Arenberg, Jargonelle, Beurré de Capiaumont, Fondante d'Automne, Marie Louise, Jersey Gratifol, Marie Louise d'Ucle, Pitmans Duches, Thompson's, Souvenir du Congrès, Williams, Caillac, Belle Julie, White Doyenné, and Doyenné d'Été. But pruning should be carried out with care, the system of close pruning, often practised should be avoided, the trees merely require pruning into shape, well thinning out the branches to admit of light and air, and allowing the trees plenty of scope, as it were, to let off the exuberant or over-strong growth, which otherwise when cut back too closely only produce stronger wood. In the case of over-vigorous growth judicious root-pruning, carried out at the end of October, should be resorted to, to induce them to bear. A selection from the earliest to the latest of the finest kinds grown as pyramids and espaliers can be brought together when judiciously planted in sheltered spots, especially where there are walls for the more tender kinds. Taking the neighbourhood as a whole, I have found the following sorts as pyramids (mostly worked on the Quince stock) fruiting well in most seasons, viz.:—Beurré d'Élé, Beurré Bichelier, Marie Louise d'Ucle, Doyenné du Commerce, Beurré Superfin, Beurré Hardy, Thompson's, White Doyenné, Beurré d'Arenberg, Bergamotte d'Espéran, Maréchal de la Cour, Baronne de Mello, and Louise Bonne; they also succeed well grown as espaliers and cordons on this stock. I should recommend them to be largely planted, as they are easier to manage, making handsome compact trees of moderate growth, and with the assistance of mulching in the growing season the fruit comes to a large size. The following also do well as pyramids and espaliers, but must be worked upon the Pear stock, viz.: Beurré Bosc, Beurré Clairgeau, Beurré d'Amanlis, Jargonelle, Marie Louise, Knight's Monarch, Passe Colmar, Pitmans Duches, Souvenir du Congrès, and Caillac, but more attention must be paid to these with regard to the pruning, also root-

pruning, as they grow much more vigorous on this stock.

A few sorts may be mentioned as best grown on walls, on a south-east or west aspect, viz., Chantouille, Brown Beurré, Beurré Rance, Duchesse d'Angoulême, Gansel's Bergamot, Ginn Morçear, Pitmaston Duchess, Marie Louise, and Winter Nelis; these rarely succeed here, unless planted on walls. They should be worked on the Pear stock.

Where the soil is light and gravelly Pears do best worked on the Pear stock, but if worked on the Quince in such soils it would necessitate the addition

sults, whilst those which are sown the year after come up more slowly and with more difficulty. Last year I sowed seeds of *Anemone alpina* which had been collected in 1853. At the end of six months they had commenced to germinate, but with difficulty, and only gave very few plants, whilst the fresh seeds which were sown under the same conditions gave me cent. per cent. Not a single seed failed, and the plants are vigorous and strong; the same happened with *Anemone sulfurea* and *A. vernalis*. On September 15 last I sowed *Anemone sulfurea*, *A. montana*, and *A. Halleri*,

destined to facilitate dispersion of the seed by the wind. Some seeds, however, such as those of *Anemone narcissiflora*, *Violas*, and *Primulas*, seem to succeed better when a little time is allowed to pass between the time of the gathering and the sowing of the seed. I have sown in the open ground in a bed facing south seeds of different rather delicate alpine plants; they seem to get on marvellously well. I think that this method should be more often practised than it is. *Eryngium alpinum*, *Campansula thyrsoidea* and *barbata*, *Primula Auricula*, *Aster alpinus*, *Androsace lactea*, and various *Anemones* accommodate them-

FIG. 118.—A, PYRAMID; B, C, UPRIGHT PEAR CORDONS, FROM SPECIMENS AT CHISWICK.

of loam, heavy mulching, and frequent watering during the summer, otherwise the fruits come very small. *George Cannon, Ealing.*

ALPINE PLANTS.

SEED-SOWING.—The present is the best time for sowing seeds of alpine plants, it may therefore be appropriate to furnish some hints on this subject. The various *Anemones* should be sown as soon as possible. I have noticed that those seeds which are sown soon after being gathered germinate immediately, and give very good re-

sults which at this moment are growing as vigorously as the Lettuces and Cabbages of our kitchen gardens. The soil I find best is a simple mixture of peat, leaf-mould and sand, to which I add a little fine sphagnum.

I have also two magnificent beds of *Arnica montana*, sown at the same time, and which came up in the proportion of 90 per cent. But the difficulties of acclimatising this plant when taken and transplanted from the mountain are well known.

Edelweiss, *Aster alpinus*, *Hypochoeris helvetica*, and in general all the Composites, germinate better when sown immediately after the collection of the seeds. I have noticed also that it is so for the most part with seeds furnished with a pappus or tuft of hairs

selves very well to this mode of sowing, which offers the great advantage of not needing so much care as is requisite when seeds are raised in pots or pans. For this system it is necessary to thoroughly drain the soil of the bed, so that the moisture may not kill the young plants. I mix with the soil one-fifth of cake-dust to render it more porous.

I have remarked that alpine plants raised from seed are much more robust and more easy to grow than those directly transplanted from the mountains, and, strange to say, they are less likely to vary. Perhaps this last observation may only apply to a limited number of species, but, at all events, I can affirm that it is so with many. *H. Correvon, Geneva.*

PEARS AGAINST WALLS.

Two methods of growing Pears against walls do not always obtain the consideration which in certain sites they are deserving of. These I will refer to separately.

REFLEXED TRAINING.

Frequently old wall-trained Pear trees are seen on

The fact is, these young growths direct the energies of such trees into a wrong channel, which persistent pruning has little beneficial result in controlling. What the doctor would call a radical surgical remedy has to be undertaken, which is especially applicable to such trees as have lost some of the lower branches. Early in the season cut all the horizontal parts off but the two upper ones. Encourage these four branches to

that not only will these young growths, downward trained, fruit freely and quickly, but the fruit will be generally of the finest size and quality. Whatever may be thought to the contrary this system may be described as one of natural tree culture. Observe, it is the upper branches of trees bending over with weight of fruit which give wildling or orchard tree crops. Here also, however abruptly, apparently distorted, the

FIG. 119.—PYRAMID PEAR TREE: FROM A SPECIMEN AT CHISWICK.

which the lowermost branches, which were once the strongest and best upon the tree, have become weak, or have died off, and the tree finds vent for the superabundant growth on the tiers of branches higher up the wall, and the result of persistent hard pruning at that part only reproduces a succession of strong young growths, with the resulting long spurs. Practically, when trees arrive at this state, they cease to give perfect fruit, and the crops are usually meagre.

orm young shoots upon their whole length, and so soon as these young shoots are sufficiently matured train them downward from the top of the wall to the base, as far as possible parallel with the upright holes. By saving two horizontal main branches on each side of the tree a greater choice of young shoots can be found for thus training downwards, so as to leave no unsightly gaps (see fig. 117, p. 523.) The greater recommendation for this style of training consists in the fact

top branches of these trained trees, in all their vigour, are doing under peculiarly favourable circumstances the very same thing. Some growers may point to the bareness or loss of wall space. Whilst, however, Tomatos are so desirable it is needless to say that for the first summer or two admirable use can be made of such spaces. Again, where unappreciated sorts of Pears exist, wall trained, by simply grafting improved sorts on to these upper branches, in due time, and

that incredibly limited in extent, vacant spaces on walls can be covered with bearing wood.

TREES NORTH PLANTED, SOUTH TRAINED.

Many vacant or partly vacant wall niches or spaces exist on the sunny sides of walls where opportunity may not exist to plant trained Pear trees, hence such spaces are often left bare. By procuring a standard tree or two at a small cost these may often be planted on the north or other side of such walls, and the growing heads trained over the walls to occupy such spaces by the same system of training as that described above. During dry seasons the roots will be able to furnish better support from the moister sources, and aided by sun and warm good crops will result. *William Earley, Norfolk.*

Florists' Flowers.

CHRYSANTHEMUMS IN OCTOBER.

THOSE who are growing for cut blooms for exhibition will now have their plants housed, and as near the glass as possible. Some fire-heat is absolutely necessary to have flowers of the highest quality, but it should not be applied unless really needed—either in frosty or very wet weather, when damp hangs about the house and is likely to injure the flowers. Calling upon Mr. E. Sanderson, the veteran President of the National Chrysanthemum Society, at Harlesden Park, Willesden, a few days ago, it was found that he had housed his plants a week previously, and was giving them an abundance of air on all favourable occasions. It is scarcely possible to imagine plants in better health than the 150 or so Mr. Sanderson has in his house. They are literally laden with leaves, and such leaves too—large, stout, and of a rich deep olive-green colour. But it is possible to have an extra strong growth at the expense of flowers, as some growers have found to their cost. But Mr. Sanderson is much too wary and experienced a grower to commit this mistake, and his plants may be seen throwing up large fat buds that cannot fail to produce fine flowers. One can quite understand the regret with which so keen a lover of the Chrysanthemum as the President of the National Society regards the process of disbudding; but then he is an exhibitor, and it is necessary he should cultivate accordingly. Were it not for this, and did he not grow for competition, he would allow his plants to carry more shoots and flowers, and he would be certain to have fine plants and blooms still.

As soon as his plants have gone out of flower, he secures cuttings which are thrown up from the roots close round the main stem: these are struck in his greenhouse, rooting in about six weeks. They are then potted off singly into 60-sized pots, placed in a close frame, or in the warmest parts of his greenhouse, and when well established are stopped. When they break again, if the two leading shoots, one at each side of the stem, are of equal strength, they are permitted to grow, and when these form a terminal bud it is either picked out or allowed to perish: two shoots are then allowed to go up from each stem, each of which carries a flower. This is the old system of Chrysanthemum culture observed for years past with the addition of the first stop.

If one of the shoots put forth at the first stop proves to be stronger than the other then the strong one is allowed to go away, and eventually allowed to carry three, or, if it is very strong, four shoots. The stems of the plants are tree-like; they are marvelously strong and healthy, and they will carry grand blooms.

Mr. Sanderson is in no sense of the word what is known as a "bullock grower," that is, one who cultivates by inordinate feeding. His plants are in 24-sized pots, or one a little larger, and they were placed in their blooming pots about the third week in June. The dry summer, and marked absence of rain, rendered the closest attention necessary while the plants were in the open air, and no labour or attention was spared. Now that the plants are thoroughly established in their pots, and indeed, for some time past, guano is occasionally administered by sprinkling some on the surface of the soil when quite moist, and then watering it in. Beyond this, no other stimulant is applied, and the greatest care is exercised that the soil in the

pots is not allowed to become too dry, while a free current of air is admitted on all favourable occasions.

Thrips is in this way kept under. When the plants were housed they were thoroughly well fumigated; this is a good practice, because it cannot be done while the plants are in flower without danger of injury from the smoke. Earwigs require to be closely looked after. They appear to be singularly mischievous in that they reach the surface of the bud when the embryo flower is becoming perceptible, and pierce its centre, eating it away, and doing considerable injury. They take up their quarters within the curled portions of the leaves, and from this post of advantage sally forth after dark. When the plants were being housed each one was subjected to a rapping process against the ground, with the result that the vermin were dislodged and came tumbling to the ground. As many as six or seven were found on one plant. At night the plants are carefully gone over after dark by means of a light, and any marauder captured in the act has but a short shrift.

Mr. Sanderson's potting compost is made up of decomposed surface soil from pasture land and some well rotted cow-manure. How the plants enjoy this is abundantly seen at Harlesden Park. *R. D.*

MESSRS. LANE & SONS' NURSERY, BERKHAMSTEAD.

EVERY one visiting these nurseries ought to make a point of inspecting the celebrated Vines. At the time of our visit a great deal of the fruit was already cut, but that which remained hanging on the Vines was of no mean order, the bunches averaging 2 lb. in weight, and the size of berry and general appearance very fair—Gros Colmar, Black Hamburg, and Muscat of Alexandria being the bulk of these. Many of the Vine stems would measure 9 inches in circumference at 3 feet from the ground.

There is some evidence of failing vigour in these Vines in somewhat less heavy crops and poorer foliage, both of which must be attributed to the natural exhaustion of the soil; but there was no appearance of the fatal shanking. The stream of spring water still runs past the border, to which, by some, much of the success that has attended the Vine culture here is attributed.

Behind the town a large orchard exists, planted with large bush and dwarf standard Apples and Plums, the latter chiefly as standards. Filberts and Cob-nuts in variety are planted in alternate rows, and sometimes alternately in the rows as well. The production of Apples this year was very great, and the fruit fairly well grown, notwithstanding the dry weather. It was quite a fortnight later in being fit to gather; and in regard to some late Plums like the Wyedale, they will barely ripen ere the frosts strip the foliage from the trees. Nuts that grow here to a great size for bushes, and which are not cut into the border so common in Kent and Sussex, have borne prodigiously, and the Nuts are in consequence smaller than usual.

Apples are found to do well, and are cultivated in large numbers both for sale as trees and for fruit. We saw large quantities of Lane's Prince Albert in store, the fruit smooth, firm, large, and hard—one. This is one of the finest culinary kinds to grow, lasting as it does from October to May in good condition, and its cropping properties are prodigious. This is an excellent nursery for the tyro orchardist to visit in the early autumn before finally deciding on a selection of hardy fruits.

Roses are much grown as standards and bushes as well as in pots. We saw great breadths taken up with the hardier Teas, hybrid perpetuals, and Bourbon varieties, and with Maerlet worked and unworked stocks. The nursery in which the fine Rhododendrons, Hollies, Conifers, &c., are grown is on the elevated common of Berkhamstead, some distance from the town. Here, arranged on undulating land, are fine breaths of Golden and Silver Hollies of all sizes, the Caucasian and round-leaved, and Portugal Laurels, strong healthy bushes of a dark green tint denoting perfect health. *Azalea mollis* is much grown from home-saved seed, and is found to grow just as freely as the Ghent varieties—no mean saving

on imported ware. *Abies concolor*, *A. amabilis* and *A. nobilis* do well on this high land.

Amongst variegated plants, or those with silver and yellow tinted foliage, must be mentioned the several varieties of Irish Yew. These are generally identical in habit with the original tree, and undoubtedly of great use as contrasts with sombre-leaved plants in the pleasure ground. In masses the effects, in well-chosen positions, are extremely satisfactory. The growth is free yet dense, and some deviations from the type give spreading low growths useful for massing or clothing low banks.

Thuia Vervaeiana is another plant with golden-tinted foliage, free in growth, but less bright.

A fine break of *Araucaria imbricata*, raised from home-grown seed, was observed, and many of the choicest kinds of *Rhododendrons*.

A big border is reserved by the side of a road for these latter, which, being stocked with big plants in groups of three, permit the visitor to make a selection of the finest without the fatigue of searching the many quarters.

Much good planting material was observed in this division, which comprised both the ornamental and the useful; of the latter must be named the Damson *Crittenden Prolific*, a kind which will, before long, be largely planted. The Plum and its congeners grow very vigorously in the stiff soil, making handsome stems and heads in a short space of time.

Messrs. Lane have planted an orchard of Damsons, consisting of these, and the Pershore and the Wyedale, a tart, late hanging clingstone Plum.

A SELECT LIST OF THIRTY PEARS, SUITABLE FOR GENERAL CULTIVATION.

1. *Doyenné d'Été* (Summer Doyenné).—This is the first Pear of the year, ripening frequently in the second week of July. It is valuable on this account. By gathering a few at a time, which should be kept a day or two to become mellow, its season may last a week or ten days. The fruits are small, but rather pretty, skin green, and bronzey-purple on the exposed side. Flavour sweet and pleasant. Tree of stubby compact growth, succeeding well on the Quince. An extraordinary and almost certain cropper. Raised by Van Mons.

2. *Beurré Giffard*.—This is a very pretty Pear, not so well known or cultivated as it should be. It generally ripens in the beginning of August. The fruits are of medium size, of a regular pyriform shape, skin pale green, mottled with bright crimson on the exposed side. Flesh melting, sweet, and pleasant. Tree of somewhat straggling growth, and only moderately fruitful. Raised by M. Giffard, of Angers, France.

3. *Jargonelle* (Grosse Cuisse-Madame).—This is a well known Pear, in all parts of the country. In Scotland it is the Pear by which all others are judged, and it succeeds; there admirably grown against a wall. In the south of England it should be grown against a wall with a northern aspect, otherwise it is very inferior. Fruit long, pyriform, with a long stalk; skin mottle, greenish-yellow; quality excellent. A very old French Pear. There is a record of one planted at Rouen in 1588.

4. *Williams' Bon Chrétien* (syns. Williams', Bartlett).—This is an extremely well known Pear, and very largely cultivated for the London markets. It is the Pear of the season in and around London, no other variety being half so much appreciated. The fruits are large, and generally of good appearance, and of uniform good quality. To some the musky flavour is rather strong and objectionable. The tree is of free growth succeeding well as standards in the southern districts, and on walls in the northern. It is only a moderate cropper. It was raised at Aldermaston and sent out by Williams, a nurseryman of Chiswick, where the original tree is still growing.

5. *Madame Treveux*.—This is one of the finest of the new Pears, deserving of extensive cultivation. It generally ripens in the end of August or beginning of September, and lasts about a week or ten days. The fruit is large, of broad pyriform shape, generally pale green in colour, with slight patches of russet, and some streaks of red on the exposed side. Flesh very tender, melting, very juicy, rich, and pleasant. Tree of free growth, and generally cropping freely. Raised by M. Treveux, nurseryman, at Treveux, France.

6. *Beurré d'Amanlis*.—This is a well-known and extremely valuable Pear, very largely cultivated for the London markets. Its season lasts through the latter part of September. The fruit is large, roundish ovate; skin bright green, smooth, dull brown on the exposed side. Flesh, melting, somewhat watery at times. Tree of strong free growth, succeeding well on the Quince. A great and constant cropper. Raised at Amanlis, France. The *Beurré d'Amanlis Panaché* is an extremely pretty striped variety of this.

7. *Sauvent du Congrès*.—This is a grand new Pear, having somewhat the appearance of Williams' Bon Châcien, from which it has probably originated. It comes into use in the end of September. The fruit is large, of somewhat irregular form. Skin yellow, flaked with light russet. Flesh melting, partaking somewhat of the musky nature of Williams' Bon Châcien, but not so rich as that variety. Tree of free growth, and pretty free cropper.

8. *Louise Bonne of Jersey*.—This is a well known and much esteemed variety, very largely cultivated for market purposes. It is the Pear of the season in France. Its season lasts during the greater portion of October. Fruit of medium size, regular pyriform, shape. Skin bright green, dark brown or purple on the exposed side. Flesh melting and juicy of the first quality. Tree of free growth, succeeding well on the Quince, and a pretty constant cropper. Raised in France, near Poiteau. A striped variety of this exists, which is exceedingly beautiful.

9. *Fondante d'Autonne*.—A pretty distinct and well known variety, remarkable for its great sweetness and richness. In season the early part of October. Fruit of medium size, roundish obovate, with a large open eye. Skin dull green-russet, seldom coloured. Flesh melting, exceedingly rich, and full of flavour. Decays somewhat rapidly at the core. Tree of free growth and an excellent cropper.

10. *Beurré Hardy*.—A very fine and handsome Pear, and one peculiarly liked by birds and wasps, who find it sweeter than most other sorts. In season the early part of October. Fruit large, of a pretty regular turbinate shape. Skin of a uniform brown-russet, very pretty. Flesh melting, juicy, very sweet and pleasant. Tree of very fine pyramidal habit of growth, succeeding well as a pyramid on the Quince. Raised in France, and named in compliment to M. Hardy.

11. *Thompson's*.—A Pear of very fine quality, but by no means handsome. In season during October. Fruit of medium size, of irregular shape. Skin pale green, covered with patches of light russet. Surface of fruit very uneven under the skin. Flesh melting, very rich and juicy. Tree of free growth, and a great cropper. Raised by Van Mons, and named in compliment to Robert Thompson, of Chiswick.

12. *Jersey Gratioli*.—An old, distinct, and pretty well known Pear, much cultivated for the London markets. In season during October. Fruit large, roundish obovate, skin rough, of a uniform dull brown-russet colour. Flesh melting, juicy, with a fine brisk acid flavour, which is extremely pleasant. Tree of free stubby growth, succeeding well as an orchard standard.

13. *Suffolk Thorn*.—A very fine Pear, not half so well known as it deserves to be; comes into use shortly after being gathered during October. Fruit of medium size, turbinate in shape, skin mostly covered with warm russet. Flesh melting, sweet, with a somewhat musky flavour and very pleasant. Tree of somewhat thorny growth, like a wild Pear, very fruitful; succeeds well as an orchard standard. An English seedling, raised at Clavering Hall, Suffolk.

14. *Marie Louise*.—One of the standard Pears, unequalled by any in its season; much cultivated. Fruit long, pyriform, pale greenish-yellow, sometimes covered with russet. Flesh very soft and buttery, juicy, rich and excellent. In season through the month of November. If gathered successively, they may be made to last a long time. The finest in appearance are those grown on walls, but those from standards or pyramids are generally much superior in flavour. If grown on the Quince they require to be double grafted.

15. *Beurré Superfin*.—This is one of the finest of Pears in cultivation. In season end of October and November. Fruit roundish, turbinate. Skin smooth, greenish-yellow flaked with russet. Flesh melting, very juicy, having a very pleasant rich acid flavour. Tree a good grower, succeeding well on the Quince. Raised by M. Goubault. A. F. B.

(To be continued.)

The Hardy Fruit Garden.

WHERE there is a large number of hardy fruit trees grown, pruning should be commenced early in the autumn, but not before the leaves have fallen. Small bush and pyramidal trees, if they have been well looked after during the summer as to pinching and thinning of the young growth, will now need little attention as to pruning, merely looking over them, and cutting out any useless shoots that may have been overlooked during the summer. When this is done advantage should be taken of dry weather to wheel manure on the ground, and have it spread on the surface among the trees, taking care that the ground is clean, and free from weeds. Should the ground be too wet for hoeing small annual weeds might be lightly pointed in before spreading the manure on the surface, but by no means dig in weeds that are seeding; these should all be pulled up and burnt. Now is a favourable time to commence root-pruning any trees that may be growing to wood instead of producing fruit-buds. At the same time it should always be taken into consideration how large it is desirable for any kind of fruit tree to grow, either on the walls or in the open garden. In my opinion it is a great mistake to begin root-pruning until the trees have filled their allotted space. A small stunted tree can never be made to produce satisfactory crops of fruit, therefore it should be our aim to produce a fine healthy growth, by building up a good healthy fabric; we can then make it fruitful by root-pruning if required, but to root-prune a sickly or unhealthy tree, with the object of making it fruitful, is a mistake. Unhealthy trees may always be improved by careful digging under the roots and placing fresh loam round the roots. Old soil from the potting bench mixed with fresh loam and road grit or burnt ashes is a good and always comestable material for placing round trees. Cuttings of Gooseberries and Currants may now be put in, they will strike root freely in any ordinary garden soil. When sparrows are numerous it will be advisable to go over the Gooseberry and Currant bushes, and dust them all over with soot and lime when they are damp in the morning. This will be found an effectual remedy, and if repeated say once a month during the winter will protect the buds and prove beneficial to the bushes. As soon as the leaves of Peach, Nectarine, and Apricot trees have fallen, the old wood should be gone over, and when required fresh nailed up, but all the wood of the current year should be unfastened from the walls and left in this state till spring, for if pruned now and nailed up it only encourages the buds to grow, where it should be our aim to retard them as much as possible. This only applies to trees on south walls. Fig trees may be tied up ready for protecting either with Fern or mats. *J. Smith, Mentmore, Bucks, Oct. 19.*

THE PROPAGATOR.

THE PROPAGATION OF CONIFERS.

THE *Retinosporas*, in their sphere, are excellent plants for decorative purposes; the symmetry of their shape and the variety, as well as the beauty of the delicate tints of colour in their foliage, always add a pleasing effect to their environments. Most of them are of small growth, and are suited for pot culture. In the cool conservatory or winter garden they can be kept in the perfect health for years in small pots; they are also very effective in rock gardens, and are among the best subjects for furnishing beds in the flower garden in winter, as they move well when the beds are wanted for other purposes.

RETINOSPORAS.

Select for cuttings pieces 2 inches long from the tops of the side growths, taking care that the pieces are fully developed and the wood ripe. It would be waste of time to put in cuttings in an unripe state. When a few of the bottom leaf-branches have been trimmed off, and the bottom of the stem levelled with a sharp knife, the cuttings can be dibbled into 48-pots—a dozen round the edge and six in the middle of each pot. The cuttings must be watered with a fine-rose pot, and placed in a shallow case or frame

in a cold house, or, rather, a house where the frost is kept out.

While in the frame the cuttings must not be watered overhead, but must be carefully watered with a fine-spot pot. They must not be allowed to become dry. The glasses of the frame must be taken off for an hour both night and morning. Any sunshine should be intercepted by appropriate shading. As soon as the cuttings are rooted the ventilation of the frame should be gradually increased, until at length the plants are hardy enough to be stood out in the open house. After a few days they can be potted separately into thumb-pots, watered, and placed on a front platform or shelf as near the glass as possible. Here the plants must be regularly watered, never allowing them to become dry. When the plants are strong enough they can be potted into larger pots and potted again if necessary.

The soil to be used for potting the cuttings should be composed of one half loam and the remaining half of equal quantities of peat and sand. A small quantity of finely broken potsherds should be added, and the whole well mixed together, and sifted through a fine sieve. For cutting pots some large 4's should be drained to a quarter of their depth, and then filled up with the above-named soil, which should be firmly pressed in.

The soil in which to pot the plants should be made up of three-quarters good turfy loam, and the remaining fourth of equal quantities of peat and sand, and to this should be added small quantities of charcoal and finely broken potsherds or ballast.

The treatment given above can be applied to the following varieties:—*R. pisifera*, *R. pisifera aurea*, *R. squarrosa*, *R. obtusa*, *R. obtusa alba*, *R. obtusa aurea*, *R. obtusa nana*, *R. plumosa*, *R. filifera*, *R. leptoclada*, and *R. ericoides*. The variegated varieties can also be grafted into young plants of more robust green forms. *T. O'E.*

(To be continued.)

The Kitchen Garden.

ASPARAGUS BEDS AND FRENCH BEANS.

THE now ripe growths, together with all weeds, should be removed from the beds, followed by the removal of a couple of inches of the old surface soil. This should be replaced with 3 inches of rich, short manure; if a little fresh soil is at hand to mix with the manure before placing it on the beds, it would be beneficial.

A second batch of French Beans should now be sown in pots to form a succession to those now commencing to flower.

FORSING.

If required early some *Seakale*, *Rhubarb*, and *Asparagus* must soon be lifted and placed into pits or houses to force. Providing a sufficient number of roots have been grown in the kitchen garden to meet these demands it is best to ascertain roughly the number, especially in the case of *Asparagus*, so that the stock can be divided into so many batches of a given number to extend over the season.

In order to start the roots quickly into growth, the first batches will have to be given a little stronger heat than will be found necessary later; simultaneously a batch of *Seakale* may be placed in the Mushroom-house for succession.

Asparagus is most conveniently and best forced in a frame or low forcing pit heated by hot-water pipes, wherein a bed of fermenting material can be raised up to within a foot of the glass on which to place the roots, in some fine light soil; failing this, the old-fashioned wooden two-light box is best, which can be placed on the top of a good lasting hotbed, and linings constructed outside, which should be added to as they subside, to assist in maintaining a steady heat. Once the rank heat has passed off, and the roots are placed on the bed, no air will be required until the grass is peeping through, after which time it must be admitted in accordance with the weather. The glass should be covered nightly with mats and other protection in the shape of dry bracken or straw.

The protection in the shape of dry leaves or straw should now be placed round the roots of *Globe Artichokes*, previously removing any old decayed leaves or old remaining stems. Some soil should be thrown on the leaves, or straw (whichever is used), to keep out wet, and also to prevent the protection being removed by the wind. *G. H. Richards, Somerley, Ringwood.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Oct 26	Sale of first-class Bulbs, at Stevens' Rooms, Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Royal Horticultural Society: Meeting of the Fruit and Floral Committees, at 11 A.M., at South Kensington.
TUESDAY,	Oct 27	Clearance Sale of Flowering Orchids, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock at Putney, by Protheroe & Morris (two days).
WEDNESDAY,	Oct 28	Sale of first-class Bulbs, at Stevens' Rooms. Sale of Plants, Roses, &c., at Protheroe & Morris' Rooms. Sale of Established and Imported Orchids, at Stevens' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	Oct 29	Clearance Sale of Nursery Stock at Hendon, by Protheroe & Morris. Sale of Nursery Stock, at West Wickham, by Protheroe & Morris (two days).
FRIDAY,	Oct 30	Sale of Imported Orchids, at Protheroe & Morris' Rooms. Sale of first-class Bulbs, at Stevens' Rooms.
SATURDAY,	Oct 31	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

THE NATIONAL PEAR CONFERENCE, which opened at the Royal Horticultural Society's Gardens at Chiswick on Wednesday last, and which will be continued until November 4, may be already chronicled as, in one respect, a great success. At the time of writing it is impossible to say much more than that the exhibition itself is successful beyond the most sanguine expectation. From the far North to the utmost South, from East to West, from sunny France and wet Wales, Pears have poured in in such numbers that more than six thousand two hundred plates loads the board; and if we count an average of five Pears to each plate, it brings the number of Pears exhibited up to the respectable number of thirty-one thousand Pears. Chiswick itself shows 200 sorts. Nearly 200 exhibitors show their produce and this "all for love," as no prizes of any kind are offered. But, of course, the mere record of so many thousand Pears and so many tons weight of crockery, however impressive it may be to the popular mind, is not a matter of first-rate importance to our readers. When we say that the noble vinery is full from end to end, and that two large tents do not suffice to hold the fruits, we have said enough on the subject of quantity. The sight in the great vinery, with the Grapes still clustering overhead, is impressive enough for a statistician, and beautiful enough for an artist—but these are, after all, secondary matters. The main object of the Exhibition is to collect information, and formulate it for future use. For this purpose the Exhibition offers greater facilities than any previously held. First, there is an unrivalled opportunity for establishing and correcting nomenclature; next, there are equally unrivalled means of testing the suitability of particular kinds to particular localities, and of observing the changes brought about by variations in stocks, methods of culture, aspect, soil, and the like. It is, indeed, most interesting to see the summer Pears of the South, like the Jargonelle, just in in the North of Scotland; most instructive to see the differences in colour of the same variety grown against a wall or on a standard. Jersey, we venture to think, carries the palm for quality, the Pears from the Channel Islands being superior to those even from the banks of the Loire. Of our own specially British Pears those from the noble county of Kent stand foremost, and once more assert the right of that county to the title of the Garden of England—an epithet which some eight-day wanderer in Devonshire has unthinkingly assigned in our columns to the latter county, to the wrathful, and we must say righteous, indignation of both men of Kent and Kentish men. Certainly the wanderer aforesaid, who has his eyes about him, will, we are sure, after seeing what Kent can do, admit with CÆSAR that it is "the civilised place in all the isle;" and if Exeter, whose fruit show is coincident with that now on view at Chiswick, can produce better samples than those shown from Kent, then we shall feel grateful that happy England should have two such centres of

luscious fruit production. At any rate, at Chiswick the several counties have fair play, as their products lie side by side, and no favour is given to either. In point of numbers, we believe, Middlesex heads the list, as might have been expected; but the metropolitan county has no such advantages of soil and climate as Mid-Kent has. An enormous show of this kind necessarily entails some monotony and repetition, but in the report in another column we have endeavoured to bring into view the salient points of an exhibition of Pears, the like of which we never saw before, and which the present generation is hardly likely to see again.

It will be within the cognisance of many of our readers that efforts have lately been made, mainly at the instigation and through the exertions of Lord CATHCART, to introduce various wild species of POTATO for the purposes of cultivation and also for the purposes of cross-breeding and hybridisation. The introduction of new blood, it was thought, might give us new and more robust varieties, and possibly some that would withstand the attacks of the Potato fungus better than existing varieties. Mr. BAKER made known to us through the medium of a paper in the *Journal of the Linnean Society*, the species most likely to be of service from their tuber-producing habit, and rendered great service by his careful definitions and indications of habit and locality. To some of the conclusions and inferences at which he arrived we must respectfully demur; we accept our friend's facts with gratitude, and he will be the first to excuse us if we do not altogether see our way to endorse his views as to the nature of the tuber and other matters of speculation. Be this as it may, however, one of the species prominently brought under notice is the Solanum Maglia, discovered by DARWIN in islands off the south part of Chile in low-lying marshy places. It is quite clear from Mr. BAKER'S own figures, as well as from a comparison of specimens, that this is in some respects more nearly allied to the bulk of cultivated Potatos than is the Solanum tuberosum itself, from which they have hitherto been supposed to be derived, and which latter is a native of high mountain regions in Peru, subject to intermittent and scanty rainfall. Solanum Maglia has been grown for some time at Kew, but without producing much result so far as tubers are concerned. No sooner, however, do the magicians of Reading, we mean Messrs. SUTTON & SONS, get hold of it, than they manage to make the small tubers of Solanum Maglia produce a very respectable crop of large or medium-sized pinkish tubers, of irregular form and sunken eye, it is true, but still so far from unpromising as to suggest the probability of ultimately securing a new and distinct variety which for shape and appearance may eventually merit a place on the exhibition table. Moreover, the flavour when cooked is by no means bad, but is so good as in this case also to suggest the probability of great improvement in the future. This of itself is not a very great achievement, but it is not all; we expect a plant to "improve" under the hands of the cultivators, especially of those so skilled and experienced as Messrs. SUTTON and their assistants. But Messrs. SUTTON have not been content with this comparatively easy experiment, they have entered the field as hybridists, and have broken ground which we, like all those interested in the matter, have so long and so repeatedly urged cultivators to do. It is not every one—even granted the requisite skill and knowledge—who has the facilities, can afford the time, or exercise the patience requisite for such experiments, but Messrs. SUTTON have not recoiled from the difficulties and tedium of the task. Commercial men can hardly be blamed if they do not enter into matters which are the more fitting task of an experimental garden; but

when they do take them up we ought to be specially grateful, for they are sure to do so on a large scale, and with an amount of care and oversight which others less favourably placed cannot give. At any rate, Messrs. SUTTON, exercising all due precautions to prevent fallacy and error, crossed the blooms of Solanum Maglia with pollen from one of Mr. FENN'S varieties, as narrated by them in the *Times* of November 29, 1884. If Mr. FENN'S production be truly a descendant of *S. tuberosum*, the process is one of hybridisation between two so-called species; if the two parents are merely varieties of one and the same species, the process is one of simple crossing, and not of hybridisation. But, in any case, the two processes, crossing and hybridisation, clearly only differ in degree. From the cross three berries were obtained in 1884, the seeds from which were sown in March of the present year, and treated under identically the same conditions in every respect, so far as could be, have now produced a crop of tubers, in which, as is usual in first crosses, may be seen an immense degree of variation in the amount and nature of the produce, in habit of growth, colour, size, duration, and the like. In some cases the seedlings produced four or five small tubers, not bigger than Peas; in other cases seedlings from the same cross yielded as many as ninety-nine tubers, ranging in size from that of a Pea to that of a large Walnut, but weighing in all only eleven ounces; while in another case forty-four tubers weighed two pounds twelve and a half ounces.

In some the skin is brown and rough, in others smooth and yellow, in some red, in others half red, half yellow. The height and character of the haulm varied like those of the tuber.

In some instances cuttings were taken from the plants, and these cuttings produced, *pro rata*, as much variety in tuber as those produced in the ordinary way, and one of the tubers so produced was the largest of the whole.

A tuber of Solanum tuberosum from Arizona yielded sixty-eight tubers of small size. Solanum Comersoni also produced tubers and flowers, which latter resisted all the efforts of the experimenter to effect a cross.

Seedlings from old and well-known varieties were also grown in the same way as seedlings of Solanum Maglia, and these proved, on the whole, less productive than the crossed seedlings of *S. Maglia*, but also showed a good deal of variation in the tubers.

In addition Messrs. SUTTON have succeeded in crossing the Victoria Potato with the pollen of Chiswick Red Tomato, and other Potatos with pollen from *S. Dulcamara* and *S. nigrum*, reversing the cross in some instances. From these crosses seed has been obtained, but we must await another season to ascertain the result. Such, in bare outline, are the results hitherto obtained by Messrs. SUTTON. So far they agree with what happens generally in first crosses. A great deal of variation has ensued, and some of the tubers are, to say the least, promising. Whether any of them will prove able to resist the attacks of parasitic fungi better than the varieties we have, remains to be seen. This year, happily, the fungus has hardly put in an appearance at all, and if growers would now destroy the few diseased tubers they find instead of throwing them on the dunghap, they might do much to mitigate the disease in future years. In any case, however, the thanks of all horticulturists, practical and scientific, are due to Messrs. SUTTON, and the results attained will, we trust, induce them to continue their researches another year. Those gentlemen gave us the privilege of inspecting the results of their experiments, and have furnished us with the following statistical details. We would further suggest that they should ascertain, not only the weight of the tubers in air, but also in water (specific gravity), as they

FIG. 120.—CLEMATIS DAVIDIANA: HARDY ERECT HERBACEOUS PLANT: FLOWERS BLUE. (SEE P. 530.)

would do in the case of Swedes or Mangels, and thus obtain a truer insight into quality than mere weight in air can afford. They may not win success in the particular direction in which it is sought, but they are certain to gain some useful result by this process of questioning Mother Nature.

— SOLANUM MAGLIA HYBRID POTATOS.—

No.	When sown.	When planted.	Height of haulm.	When lifted.	Weight of produce.	Number of Tubers.	Colour of Tubers.
1	1875, March	1885, June 11	Inches, 12	1885, June 29	Grains, 6	6	Brown

25	"	"	70	"	1 2½	14	White
26	"	"	30	August	0 3½	17	"

The last four (Nos. 24 to 28) were sown like the others, but when about 9 inches in height the tops were taken off to increase the number of plants, as was hoped; but though the cuttings grew and yielded well, all four of the parent-plants died.

— CLEMATIS DAVIDIANA.—This is one of the annual species introduced from Northern China by the Abbé DAVID, and appropriately named after him by the late M. DECAISNE. For the specimen whence our illustration was taken, we are indebted to Mr. LYNCH, of the Cambridge Botanic Garden, and a comparison of the figure now given (fig. 120) with that in M. DECAISNE'S memoir on the tubular-flowered Clematis, will show how greatly the plant has advanced in the matter of attractiveness. The flowers are of a rich blue colour, with a powerful perfume, as in *C. flammula*, and so far seems to have produced stems only. M. DECAISNE mentions that the dried specimens in herbaria are likewise male. The plant dies down in winter, but the stock is quite hardy, so that we have in it a notable addition to our collection of herbaceous plants. A full description is given in M. DECAISNE'S Monograph in the *Annales des Sciences et des Arts*, and in the *Flore des Serres*, vol. xxii., p. 163. For the rest our illustration tells its own tale.

— WISLEY.—We understand that some illustrations of Mr. G. F. WILSON'S garden at Oakwood, Wisley, will be published in the *Grafic* of October 24.

— THE DE CANDOLLE PRIZE.—The Physical and Natural History Society of Geneva offers a prize of 500 francs for the best monograph of a genus or family of plants. The manuscript may be written in Latin, French, German, English, or Italian, and should be sent to M. le Président de la Société de Physique et d'Histoire Naturelle de Genève, à l'Athénée, Genève, Switzerland. The Society would probably publish the selected monograph in its *Memoirs*.

— NARCISSEUS MONOPHYLLUS.—Mr. WARE skips from autumn to spring at a bound, and nullifies winter in a manner as agreeable as surprising, by sending us flowers of the lovely white Hoop-petticoat Narcissus,

— THE PHYSIOGRAPHE.—M. DELAPIERRE, 33, Rue du Faubourg Saint Antoine, has forwarded us one of these useful implements, destined to be used instead of the camera-lucida. The prism is replaced by small mirrors and a neutral tint reflector borne on a horizontal arm, and capable of being easily adjusted and focussed. It is applicable for portraiture, landscape, reproduction of plans, drawings, &c. From the trials that we have made with it we have found it easier and quicker to manage

recreation as shall conduce to render a visit to the American Exhibition entertaining as well as instructive, and these will include not only excellent music and cheerful surroundings, but many novelties not hitherto enjoyed by Europeans. The site selected will furnish 10 or 12 acres of grounds for these purposes, and afford ample space also, for the display, in climatic sequence, of exclusively American Conifers, and other plants, shrubs, and flowers, including an avenue commencing with those found in the Northern and Eastern States, and ending with those of the Southern and Western States. The chief of the horticultural department is Mr. WILLIAM GOLDRING.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Committee will meet early in November next to consider the additions to the Pension List which are to be made in January, 1886. The Committee will be greatly obliged by the collecting cards being sent in on, or before November 1, as upon the result of the collection the number to be placed on the Pension List will mainly depend. At the last meeting of the Committee Baron SCHROEDER, The Dell, Egham, was elected Vice-President, in room of EDMUND WILDER, Esq., deceased. He has, we understand, written to the Secretary, that he will accept the office with pleasure, and will continue to give the Institution his best support and aid.

— NATIONAL ROSE SOCIETY.—The meetings of this Society have been arranged to be held in 1886: the Metropolitan Show at South Kensington on July 6; the Provincial Show at the Botanic Gardens, Birmingham, on Thursday, July 15. The following Rose Show fixtures have also been announced:—Farnham, June 30; Reigate, July 1; Tunbridge Wells, July 2; Eltham, July 3; Sutton, July 7; Helston, July 8; and Wirral, July 10. These Societies are all affiliated with the National Society.

— THE "BOTANICAL MAGAZINE."—The October number contains figures of the following plants:—*Chamedorea Arembergiana*, t. 6838. — An elegant dwarf Palm, not exceeding 5½ feet in height, with a crown of pinnate leaves, each 6–7 feet long, and with ten to fifteen pairs of drooping oblong lanceolate leaves. The whitish flowers are borne on long, pendulous catkins, which emerge from the trunk beneath the crown of leaves. It is a native of Guatemala, and requires stout treatment.

Euchlia ampliata, Benthm, t. 6839.—A species native of the Ecuadorian Andes, with leaves margined with red, and with long, slender, trumpet-shaped scarlet flowers. It was introduced to Kew from Quito, through the late ISAAC ANDERSON-HENRY.

Anemone polyanthes, t. 6840.—A hardy herbaceous plant, 12–18 inches high, with rounded palmately lobed hairy leaves and star-like white flowers in an umbelliform inflorescence. Each flower measures about 1½ inch across. It is a common Himalayan plant, extending from Kashmir to Sikkim.

Callipsyche awantiana, t. 6841.—This plant, a native of the Andes of Ecuador, combines the leaf and habit of *Eucharis* with flowers of the shape of those of a *Hippeastrum*, but yellow, and with very long declinate stamens. The leaves are produced after the flowers. It is a very striking plant.

Phacelia Parryi, t. 6842.—A native of Southern California, like its near ally, *P. campanularia*, but with narrower leaves and shorter corolla tube. *P. campanularia* is among the most splendid annuals introduced of late years (by Mr. THOMPSON of Ipswich) but is as yet scarcely known. The present is hardly inferior.

— THE NATIONAL CHRYSANTHEMUM SOCIETY.—The autumn general meeting of the members of this Society (one of the quarterly gatherings provided by the rules) took place at the "Old Four Swans Inn," Bishopsgate Street, on the 19th inst., when there was a large attendance of members. The Hon. Secretary, Mr. WILLIAM HOLMES, reported that sixteen societies had become affiliated under the National Society, and nominated for election twenty-two new members, making the total number 295. A sub-committee was appointed to draw up rules for the guidance of the Floral Committee. Some correspondence was read in reference to suggestions that prizes should be offered for late Grapes on the occasion of the exhibition of late

than the camera, while the image is equally well defined, and the point of the pencil not so subject to those disappearances which render camera drawing so vexatious a proceeding. Moreover, the apparatus is less expensive than the ordinary camera.

— MR. BUNYARD'S FRUIT-ROOM.—Of this illustration given in our last issue, Mr. BUNYARD, of Maidstone, writes:—"It was made of matchboard and quartering, a cheap affair, and yet keeps fruit as long as possible. It is topped with reeds from the Medway marshes. The boards and slabs at the sides are painted green, and the base of the reeds was creosoted, and we expect it to stand for twenty years. The old man who thatched it told me that the 'reed' was practically indestructible if laid properly, and that he had used over again materials from an old barn that had stood for eighty years."

— GHENT HORTICULTURAL SOCIETY.—At a meeting of this Society, held on October 12, the following awards were made:—First-class Certificates to M. Jules Heye-Leyden, for *Cypripedium Fairieanum*; to M. Vervaeck & Co., for *Dendrobium* species from Birma; to M. Desmet-Duvivier, for *Eucharis Sanderiana*. Commendations for novelty to MM. Vervaeck & Co., for *Comperetia macroplectron*; to M. Ed. Pynaert, for *Cypripedium Arthurianum*; to M. Desmet-Duvivier, for *Cattleya superba splendens*. Cultural Commendations to M. L. Spaë-Van der Meulen, for *Cocos Blumenavi*; to M. Bernard Spaë, for *Tillandsia muscica*.

— LORD MAYOR'S DAY.—Mr. E. S. WILLIAMS has, we learn, been entrusted with the floral decorations at the Guildhall on November 9, 1885.

— AMUSEMENTS AT THE AMERICAN EXHIBITION, 1886.—"America in Miniature" would not be complete without an effort to combine recreation with instruction. It is best in these matters to have as little hypocrisy as possible. Where one person cares for the exhibits, probably half-a-dozen prefer the agreeable accompaniments; nor can they be blamed for a taste so natural. The Council have, therefore, from the inception of their work, while bestowing every attention upon the technical and educational purposes of the Exhibition, been mindful of the necessity of providing such forms of legitimate

flowering Chrysanthemums in January next. The Hon. Secretary advised that the matter should be left in his hands. The Society had no funds from which to offer prizes, but should any subscriptions be sent in specially for that purpose he would ask the committee to arrange certain classes for Grapes according to the amount received. It was believed that special prizes would be offered for late Grapes at the January meeting, and the particulars would be announced at the earliest possible moment.

— **CARYOPTERIS MASTACANTHUS.**—After the late severe frosts, when the thermometer fell to 26° and 23° Fahr., it is pleasing to see the attractive bright blue flowers of this Verbenaceous plant as showy as ever, and without evidence of having suffered in any material way. Truly at Kew it enjoys the protection of a wall on a southern aspect. The contrast becomes more conspicuous when we compare it with the blackened condition of *Tropaeolum*, *Dahlia*, and *Boehmeria nivea*, the later of which exists in the open air all winter, and renews itself annually from the rootstock. Not only is the plant in question notable in the order to which it belongs, but it supplies a desirable colour in the waning days of autumn. The individual flowers are small, but produced in axillary clusters in great profusion, they exhibit a striking contrast to the deep green colour of the ovate-oblong serrated leaves. Even although so nearly hardy it would repay cultivation in a greenhouse where it would introduce its own characteristic distinctness amongst the other appropriate occupants of the house at that season. It produces numerous branching stems about 2 feet in height, and a group of it grown in pots would have an excellent effect. It has recently been figured in the *Botanical Magazine*, t. 6799, and a full page illustration has been given in our columns.

— **HORTICULTURAL CLUB.**—The first monthly dinner and conversation for the winter season took place on Tuesday last, at the rooms, 1, Henrietta Street, Covent Garden. There was a large attendance, including Mr. G. Lee, Chairman; Professor Foster, Revs. F. H. Galland T. Flintoff, Messrs. Deal, George Paul, Drury, Cousins, Stoltenhoff, Collins, Stamfels, &c. The following new members were elected:—Rev. W. Wilks, Shirley, Croydon; Messrs. E. B. Lindsell, Helston; Arthur Turner, Slough; W. H. Williams, Salisbury; Herbert Cutbush, Highgate; and George Bunyard, Maidstone. Professor Foster opened an interesting discussion on the germination of seeds, which was continued by Mr. George Paul, Messrs. Drury, Cousins, &c. The thanks of the members present were given to Professor Foster for his kindness in introducing the subject, and for the interesting facts brought forward.

— **ADHATODA CYDONIIFOLIA.**—Unlike most members of the *Acanthaceae*, this has a slender somewhat twining habit, and is most suitable as a basket plant or for training up the rafters of a stove. It is one of the five Brazilian species, and seems rather variable in the amount of hairiness of the leaves. There is a form of it in the Palm-house at Kew, figured in the *Botanical Magazine*, t. 4962. It is a much smoother plant than that figured at t. 25, and described at p. 148 of *MARTIUS' Flora Brasiliensis*, vol. ix., but in other respects the figures agree. The flowers are very showy, and freely produced in axillary and terminal clusters on the growing shoots. The tube and upper lip are white, with the exception of the tip and upper margins, which are purple. The lower lip is broad, three lobed, and a deep rich purple verging on violet, with a longitudinal median white stripe. It would constitute an excellent companion to and contrast beautifully with *Asystasia scandens*, belonging to the same natural order, and producing large white flowers, widening upwards or funnel shaped. Its showy congener, however, under notice, has ringent flowers and is closely allied to *Jussiaea*.

— **LANDSCAPE GARDENING.**—We learn from the *Sussex Daily News* that the new cemetery of the Brighton and Preston Cemetery Company is to be made very pretty. The difference a good landscape gardener can effect in the appearance of a bare expanse of land, if given *carte blanche* in the utilisation of the land, is very considerable. The cemetery company have sought the services of a landscape gardener, and have accepted the plans of a

gentleman well known in Brighton, and who acquired a considerable reputation for the skill with which, under his direction, 21 acres of land at Stoke-upon-Trent, devoid of natural beauty, were converted, according to Mr. MILNER'S plans, into one of the prettiest cemeteries in the country. Mr. SYDNEY MARSHALL, son of Mr. E. J. MARSHALL, of the Brighton Grammar School, is entrusted with the duty of laying out the new cemetery at Brighton. His plans, while not disregarding the importance of leaving as much land as possible for grave spaces, point to the addition to Brighton of a cemetery which will tempt many to resort to it as an agreeable resort, and which will afford another proof of the surprising results of landscape gardening, of which Brighton has had several instances. Trees, shrubs, and flowers are to be freely used, and curved drives and walks are to be constructed with such freedom as will completely alter the aspect of the treeless and roadless acreage of arable land which the company have secured on the southern and eastern sides of the existing parochial cemetery.

— **YEOVIL CHRYSANTHEMUM AND FRUIT SHOW.**—This show will be held on Tuesday, November 17, when a Silver Cup of £5 value will be awarded for twenty-four blooms, twelve Japanese and twelve incurved, distinct varieties. Moderate money prizes and the National Chrysanthemum Society's Medals will be awarded in other classes.

— **BEEES AND BEE-KEEPING.**—Mr. FRANK CHESHIRE has commenced the publication destined to be *A Complete Treatise on the Anatomy, Physiology, and Profitable Management of the Hive Bee* (L. UFGOTT GILL, 170, Strand). In addition to a summary of general knowledge on these matters, Mr. CHESHIRE promises us much that will be in all respects new; and as the author is known to have been long engaged in research, we look forward with interest to future issues. The first part opens with some very clear descriptive details relating to the natural history of the bee and the economy of the hive-bee. Mr. CHESHIRE rightly remarks that it is only a half truth to say practice makes perfect, practice without intelligent insight is mere mechanical repetition, or stereotype, but "practice hand in hand with accurate knowledge and observation works out perfection."

— **MANCHESTER HORTICULTURAL IMPROVEMENT SOCIETY.**—The first meeting of the session will be held in the Memorial Hall, Albert Square, Manchester, at half past 7 o'clock on Thursday evening, October 29, when the election of officers, &c., will take place, after which a *reunion* of the past session will be given by Mr. E. FINDLAY (President).

— **THE LAMBETH AMATEUR CHRYSANTHEMUM SOCIETY.**—This most deserving Society, which has now for several years taught the inhabitants of this murky portion of the metropolis how well the best of autumn flowers, which helps to brighten up many a court garden and window-sill, can be cultivated even under such conditions, will hold its show on November 3 and 4.

— **PRESENTATION.**—On the evening of Friday, the 16th inst., Mr. GEORGE SMITH, who is about to leave the employment of Messrs. DICKSON & CO., seed merchants, Edinburgh, was met by a number of his friends connected with the trade, and presented with a handsome writing desk, bearing a suitable inscription, as a tangible proof of the esteem in which they hold him. A most enjoyable evening was spent.

— **THE ADIRONDACK FORESTS.**—A report has been presented to the State of New York, dealing with the present condition of the forests of the Adirondack plateau, a region ill-adapted for agricultural operations. The forests have been, as elsewhere, recklessly destroyed, but what remain are considered as essential to the continued prosperity of the State, and their destruction must be followed by wide-spread commercial disasters. The Commissioners have obtained proof that the flow of the rivers has decreased within the memory of living men from 30 to 50 per cent., while the damage from spring floods and summer droughts is increasing. The report ends with a series of practical suggestions applicable to the particular case drawn up by the Commissioners, among whom is Professor SARGENT, of Harvard University.

— **GARDENING APPOINTMENT.**—GEORGE HARRIS, late Foreman at Arle Court, Cheltenham, has been appointed Head Gardener to J. T. CUDDALE, Esq., Seizecote House, Moulton-in-Marsh, Gloucestershire.

FORESTRY.

OCTOBER: PLANTING.

(Continued from p. 492.)

TOWARDS the end of the month commerce the general thinning of plantations, reserving, of course, such timber as it may be intended to bark in spring. As soon as the thinning is completed all timber, firewood, and branches should be at once cleared out, the former being lotted for sale, and the latter converted into faggots for home consumption. In lotting wood always place the various kinds and sizes together, and as near clearance roads as possible, few things enhancing the value of timber more than ease of transit and delivery. The branches for faggot-making may be collected in heaps alongside the woodland drives, where they may be worked up as time and circumstances permit. Firewood had better be conveyed outside the wood, and formed into heaps containing a load each, thus not only preventing trespass, but allowing of their clearance by purchasers when convenient. General forest pruning had best be carried out at the same time as thinning, branches cut back from woodland drives, and ditches cleared of all debris.

Ornamental Conifers should also receive attention in the way of removing rival shoots and any branches that bear too great a proportion to the stem, taking care to cut clean, and deface the marks where amputation takes place. This latter may not be at all necessary in the case of small twigs and branches, but where the cut exceeds a couple of inches in diameter it is better not only for the tree's sake but for appearance also, to obliterate the marks of pruning.

The luxuriant growth of trees and shrubs during the early summer months received a slight check later on by the unusually dry weather, but the showery nature of the past month has caused several, notably the Oak and Elm, to push a second growth, which is both striking and effective, the light green tints of the young growths offering a rich contrast to the now dark green of the older foliage. (Will such trees as are making a second growth exhibit two distinct rings or layers of wood for this season?)

Woodland vegetation suffered very severely during the months of July and August, many of the more robust growing Ferns, the perennial Mercury and other like plants being quite killed down by the protracted drought. Insect pests have also been unusually abundant and destructive. The Limes have suffered very severely from that ever increasing fungus—*Capnodium Footii*, which has in many cases turned the upper surface of the leaves completely black, after which they become sickly and fall off prematurely. Hardly any shrub seems exempt from its attacks—Laurels, Laurustinus, Holly, Aucuba, Box, Privet, Barbary, and the Arbutus falling alike. Continue the cutting and pruning or switching of hedges as convenient, but it is well to forward the work as much as possible during the present and following months. The preparation of ground by trenching for the reception of Quicks should be pushed forward so that an early start at hedge planting may be got, as it is well known that autumn formed fences succeed better than where the work is delayed until the spring. In preparing the ground along the line of fence the soil should be slightly raised in the centre so that the plants will stand rather above than below the general ground level. Too little attention is usually given to the formation of hedges, but when it is remembered how well-bestowed a little labour and care is on this important operation one can only wonder at the slovenly manner in which the work is usually performed. Fill up gaps in existing fences towards the end of the month, using extra strong and well-rooted plants for the work. Prepare the ground previously by a careful picking and addition of good loam from an adjoining field. Finish ditch scouring during the month, and spread the clearings either over the adjoining ground or convey it to the compost heap.

Look well to the gratings of closed drains, so that everything may be in good working order before the usual rains set in. This is a very important duty, for if long neglected it causes much labour and expense. Drainage of wet, cold woodlands should also be well forwarded before inclement weather comes upon us. Repair roads and walks, which should now be kept in a dry, passable condition, and free from all ruts and surface inequalities. Freshen the sides of walks by a slight verging

or clipping, and the centres by a coating of gravel, at the same time taking care that no overhanging vegetation interferes with traffic, which, especially during damp weather, is most objectionable. Leaves will now be giving a little extra work to the roadmen, but these should be promptly removed, more particularly within the policy grounds, and conveyed to the *depoit* for such. Mow and keep tidy lawns and pleasure grounds, fork over shrubby borders, and trim-in all straggling branches from evergreens. Turi laying and groundwork improvements may also be engaged in during dry weather, and when the state of the soil will permit.

An occasional look to woodland fences, tree guards, and rabbit-proof wire nettings will often prevent serious damage. Where young and unfenced plantations are exposed to the depredations of hares and rabbits it may be found necessary to wash the stems of the more valuable, during dry weather, with any of the prepared solutions sold for this purpose. A good mixture, that generally proves efficacious is Stockholm tar, nightsoil and lime, but this, like other specifics, requires constant renewal, thereby occasioning no small expense in labour as well as the cost of the tar. Wire netting is in the long run perhaps the most effective as well as cheapest preventive against the depredations of game with which I am acquainted. *A. D. Webster, Penryhn Castle, North Wales.*

PEARS.

(Continued from p. 495.)

VARIETIES:—In continuation of my notes on Pears, I consider this part of my subject, namely, "Varieties, their merits and peculiarities," as the most difficult one to deal with, for the reason, that necessarily my remarks can only have a limited signification. What I mean is, that the same variety of Pear often varies so greatly—even if grown at but a short distance—as to be scarcely recognisable as the same kind. I purpose shirking the difficulty by asking for licence to "speak only that I do know," as regards the merits, &c., of the various kinds grown here; and probably beginners in Pear culture, with a similar soil (sandy loam resting on gravel) and climate, may gain some little assistance from my experience. The Pear Conference that is now being held fully recognised, and to some extent met the difficulty here mentioned, by issuing to every exhibitor forms ruled for the insertion of various particulars, such as soils, situations, and the names of kinds best suited to particular districts; and when these particulars are published—as presumably they will be—there will be little excuse for holding aloof from Pear culture, on the ground of not knowing what sort to plant. As regards myself I have long since arrived at the opposite condition; namely, as to what sorts I ought not to plant. As to which is the greatest difficulty of the two, it would be hard to say, and if the Pear Conference should insist on reducing the twelve hundred varieties that are said to be in cultivation to fifty, this result will not be the least of the benefits it is likely to confer on gardeners.

We have here upwards of 100 varieties, and so far as continuous supplies of ripe fruit is concerned, we could well afford to dispense with sixty of them, and in making out the following list I have had special regard to this idea, many good October and November Pears being expunged, for the simple reason that it is in those months that most of our best Pears ripen here. I place them in the order they usually ripen here:—Beurré Giffard, Jargonelle, Souvenir du Congrès, Williams' Bon Chrétien, Beurré de l'Assomption, Beurré d'Amaalis, Flemish Beauty, Madame Treyve, St. Michel Archange, British Queen, Beurré Superfin, Fondante d'Automne, Fondante Vao Mons, Autumn Bergamot, Beurré Capiaumont, Beurré Hardy, Brown Beurré, Comte de Lamy, Emile d'Heyst, Duchesse d'Angoulême, Louise Bonne de Jersey, Seckle, Suffolk Thorn, Urbaniste, Beurré Bosc, Beurré Diel, Doyenné du Comice, Durandeanu, Gansel's Bergamot, Maréchal de la Cour, Marie Louise, Pitmaston Duchess, Délices d'Hardepoint, Nouveau Poiteau, Thompson's, Huyshe's Prince Consort, Passe Colmar, Winter Nelis, Chaumontel, Beurré Bachelier, Dr. Trouseau, Beurré d'Aremberg, Glou Moreau, Huyshe's Victoria, Knight's Monarch, Beurré de Joeghe, General Todtleben, Josephine de Malines, Bergamote d'Espere, Easter Beurré, and Olivier des Serres. It will be noted how few very early Pears are in the list, and my reasons for all but excluding them are, first, that they all lack keeping properties, they must be used the moment they are ripe;

or else wasted; next, there are few of them of good quality, most are mealy and iospid; and lastly, they are not wanted, for in July and August there is

plod, does not fruit satisfactorily in many places, but here it never fails to produce a full crop of magnificent fruit. Our trees are all worked on the Quince stock and trained as orchard cordons. In regard to the "merits and peculiarities" of varieties generally the subject would be interesting enough, but my leisure for such work is a restricted quantity, and will not admit of my treating the subject at full length. Hence I shall content myself by allusion to the best kinds only, and by best I wish to be understood as meaning those kinds that possess the greatest number of good qualities, not necessarily such as are the largest and best looking. These are desirable points, but quality, keeping properties, and fertility are infinitely preferable.

In the above list the kinds that possess all the points of merit here mentioned are:—Beurré d'Amaalis, British Queen, Beurré Superfin, Beurré Hardy, Comte de Lamy, Duchesse d'Angoulême, Urbaniste, Beurré Diel, Doyenné du Comice, Durandeanu, Marie Louise, Pitmaston Duchess, Délices d'Hardepoint, Thompson's, Winter Nelis, Chaumontel, Glou Moreau, General Todtleben, Josephine de Malines, and Easter Beurré. It therefore follows that these are the varieties that should have attention in preference to all others; but I would not be understood as meaning to the exclusion of all others, except for gardens of limited area; and in the largest gardens they should be grown in greater numbers than varieties that may be handsomer but are less meritorious in other respects.

EFFECT OF STOCK.

Then with regard to the different effects produced from the same variety of Pear growing on the Quince, and of the same variety on the natural stock, one would naturally suppose that the greater vigour of a tree on its own stock would produce the largest and best fruit, but it is quite the exception for it to do so, and the only instance within my recollection are the varieties Josephine de Malines, Marie Louise, Winter Nelis, and Comte de Lamy—all small Pears, and yet extra fine in both size and quality, though lacking colour. Such an occurrence would warrant the belief that the larger varieties of Pears would be proportionately increased in size, but what is the fact? Duchesse d'Angoulême comes small and deformed; Doyenné du Comice, too, is small, and never colours; General Todtleben gets a fair size, but is covered with spot, and there is not the faintest bit of red on the side next the sun; Easter Beurré does a little better, and Beurré Diel the best of all the large kinds; but in all there is wanting that matured appearance of colour which is never wanting in the same varieties of fruit grown on the Quince stock, in addition to the larger size of the fruit, though, in some measure, is no doubt due to the high feeding that we apply to trees on the Quince, and which the strong growth of trees on the natural stock would resist by growing stronger still, so as to necessitate further root-pruning. It was the working out the idea, or, perhaps, I should say, the determination to obtain fine fruit, that some years ago now opened my eyes to the superiority of the Quince over the Pear stock in attaining that result; and dearly had I to pay for my lessons by the peculiarities, not to say freaks, of many trees. Well do I remember a certain Beurré Diel, full of fruit, full of wood—everything, in fact, to encourage me to feed *ad libitum*, and I did so, but the fruit was obstinate, and did not turn out a bit better than others that had no special attention. But I was rewarded, for, contemporaneously, the same full feeding had been applied to a set of cordon, that had then been planted three years, and oh, such fruit!—as you may guess, Mr. Editor, for with them I took my first prize for Pears at South Kensington, and this too in spite of "Cabby" having allowed my hamper to have a "downer" when turning the corner out of Sloane Street into the Fulham Road. But there are "merits and peculiarities" connected with certain varieties apart from those caused by the stock, such, for instance, as habit of growth, liability to canker, preference for certain positions or aspects, and fertility or free fruiting. As regards habit, I strongly favour those kinds that grow compactly, that need no artificial supports, even in a young state: Marie Louise, Huyshe's Victoria, Comte de Lamy, Winter Nelis, Délices d'Hardepoint, and Glou Moreau, may be cited as belonging to this class, and it is this class of tree that should, when possible, be planted in narrow borders, or on low walls, either as cordons or horizontally trained. I have not specially noted any

FIG. 121.—BEURRÉ HARDY, ON QUINCE, RECENTLY LIFTED.

FIG. 122.—SINGLE CORDON TRAINING.

FIG. 123.—EMILE D'HEYST ON QUINCE, NATURAL HABIT; FOUR YEARS OLD.

generally abundance of small fruits that can be used for dessert. For most gardens a couple of early kinds would be found to be ample, and the two to which I give preference are Williams' Bon Chrétien and Beurré de l'Assomption; the latter variety, I am

varieties that are more liable to canker than others, consequently cannot name them, but I have proved that the evil, if not to be quite cured, can be sufficiently checked, that there need be no apprehension of evil. Our mode of procedure is to cut away the split bark of the cankered spot as soon as perceived, and at planting time to lift the tree, cut the strongest roots, and in a barrow-load or two of fresh loam replant the tree. The varieties that are most benefited by position are very late kinds; the best of them we honour with wall training and protection, and the next best are relegated to the best places, or borders, open to the south and west. As to fertility, I have a notion that when we have attained to the full knowledge and stature of Pear culture, all kinds will be alike fruitful. The Quince stock, double grafting, &c., is all tending in that

branches reach. The trees are about 25 to 30 feet high, and have been planted some fifteen years, and we are afraid injury may be done by this parasite amongst the roots, although they now appear numerous and healthy. 1. What is the cause? 2. Can anything be done to destroy, without injury to the tree? 3. Would a heavy top-dressing of fresh lime destroy without injury to tree? 4. The name thereof and if edible? *W. Crump, Madresfield Court, Malvern.* [The name of the fungus sent from Madresfield Court is *Agaricus elatus* of Fries. It is common in Fir plantations, where (like its allies, as *A. fastidiosus*, Fr.) it grows in "fairy-rings." We were the first to publish this species as British, for though extremely common, it had been overlooked. It is not a parasite, as suggested by Mr. Crump, it and all its allies being thoroughly terrestrial. Neither is it edible, it belongs

wonderful degree of perfection. The deepest coloured variety was one named *cardinalis*; a tiny plant, only 4 inches in height, had produced a large truss of deep red flowers. [Was it not a flowering "top" struck? Ed.] Duke of Connaught is of a deeper hue of red, but lacks the lustre seen in *cardinalis*; it is a very desirable variety. What a great beauty is *Apollo*, which gained a First-class Certificate of Merit; it is a pale bright orange colour, with a dash of buff in it, and thirteen flowers formed a truss—and such flowers!—large, with finely rounded segments. Crown Princess of Germany is buff and bright cerise, the latter in the form of a marginal colour, very distinct and pretty. Queen Victoria is in the same way, but paler, and very pretty also. Memnon, like *Apollo*, has large flowers and finely formed segments, bright yellow, faintly tinted with the most delicate red; very fine. Princess Frederica is a pale canary-buff, the segments very narrowly edged with pink; very pretty. Duchess of Connaught is of a clear pink colour, a little deeper on the edges, quite distinct, and very pretty. Princess Alexandra is also of a very delicate blush. Maiden's Blush is a charming variety; it is of a delicate blush tint with the slightest edging of pink to the segments. It is no wonder the foregoing gathered such a crowd of admirers about them. *R. D.*

Symphytum asperillum.—I have been much interested in reading the letter of Mr. Mitchell-Henry reproduced in your columns from the *Times* of October 5, on the growth of Caucasian Prickly Comfrey (*Symphytum asperillum*). I have been a grower of it for many years, and can endorse all he says as to its value. Since the introduction of the real Caucasian Comfrey, imported by my friend Thomas Christy, of London, and called by him Russian Comfrey, I have mainly grown this variety, and find it superior in value. The last two seasons, during the summer drought, it has been invaluable, my cows keeping in full milk, while others in the pastures failed to give milk. With regard to ensilage, George Fry's, of Chobham, system of sweet ensilage must, I think, be adopted. I have a small silo now filled with it on that principle not yet opened, but it appears to be sweet and promising. All kinds of fowls, partridges, and other game are very fond of roaming over my plantations. They sometimes honeycomb the large lower leaves, but I do not think they damage the crop; indeed, I have a notion they have golden feet, as sheep are said to have. With regard to the last paragraph on the healing properties of this plant I consider the real Caucasian superior to the common English Comfrey, and I have been recently informed that a poultice made of the root is a perfect cure [Palliative. Ed.] for erysipelas. If this is found to be a fact it adds greatly to its value. *Henry Daubleday, Coggeshall.*

Self-Sown Dahlias.—Last autumn being very warm and dry our single Dahlias in the berbaecous borders ripened and shed a quantity of seed, and this spring a number of young plants appeared as soon as the mild weather came; some of these were allowed to remain, and have since flowered well. I measured one plant a few days ago, and found it was 2 feet high and 3 feet in diameter; this bore upwards of a hundred flowers and buds at the time. All of the plants were of a more compact and dwarf habit than those raised in the usual way. Considering this is a very cold situation here it seems most probable they might be raised from seed sown outside, in more favourable localities, with advantage. *W. H. Divers, Kettleton Hall.*

International Horticultural Exhibition for 1887.—It is gratifying to find that after a period of nineteen years the Council of the Royal Horticultural Society has at last taken the initiative in laying before the horticultural public a scheme for holding a large International Show in 1877. It was the Commissioners of the Exhibition of 1851 who laid the scheme before them, according to one of the speakers at the meeting held at South Kensington last Tuesday, and they transmitted their views to their three committees. Now, considering the success of the last International Horticultural Exhibition held in 1866, and the good it did, for horticulture generally, it is the almost universal opinion of those interested in horticulture that another should be held. This being so, the questions arise—when and where, and who is to find the money to carry out the scheme. Now, considering the present state of the Horticultural Society, and the way its affairs have been

FIG. 124.—BEURRÉ SUPERFIN, TWELVE YEARS OLD, ON QUINCE, FORMING A NATURAL PYRAMID WITH SCARCELY ANY PRUNING.

direction; but meanwhile we must favour those kinds that we know to be good bearers, and the following are a few of them:—Williams' Bon Chrétien, Beurré d'Amanlis, Beurré Superfin, Beurré Hardy, Duchesse d'Angoulême, Doyenné du Comice, Marie Louise, Délices d'Hardenpont, Winter Nelis, Glou Morceau, Josephine de Malines, and Bergamote d'Espéren. *W. Wildsmith, Heckfield, Hants.*

HOME CORRESPONDENCE.

Fungus in Turf.—We should be glad of any information—through the columns of the *Gardeners' Chronicle*—you may be able to offer respecting the accompanying fungus. It infests the turf around the bole of each tree of *Abies nobilis* in a very fine avenue growing there and forming perfect "fairy-rings" of about 2 feet width and distant some 10 feet from the bole, just about to where the extremity of the lower

to a dangerous group of Agarics. We think Mr. Crump is entirely wrong in supposing this fungus to be capable of causing injury to coniferous trees. It is far more probable that some other fungus is working the injury (if there is any injury). One of the numerous lot may be present which are known to be able to attack and destroy the Coniferae; he will possibly find these (if present) on or close to the boles, or on the roots. We do not know what the effect of a top-dressing of lime would be, but as this fungus is not a parasite and does not cause disease, and the Coniferae do not appear to be at present diseased, it is probable that no good would come from liming. *W. G. S.]*

Greenhouse Rhododendrons at South Kensington.—Could any better illustration be afforded of the rapid improvement effected in a group of plants than that seen in the collection of Rhododendrons, of which *R. javanicum* is the type, shown by Messrs. Veitch & Sons at South Kensington on Tuesday? It was admitted on all hands they had attained to a

managed since its commencement, I think it most undesirable, if this proposed exhibition is to be a success, that the Horticultural Society should take the matter into its hands. There is another way of bringing about the desired result, and, judging from past experience, one that will meet with general approval—*i.e.*, to call a meeting of the surviving members of the Committee of the International Horticultural Exhibition of 1866, together with their Secretary, Mr. Thomas Moore, and hear what suggestions they may have to make; then, if the Commissioners like to come to terms as to funding the necessary space and funds, all well and good; if not, let us have an exhibition as before, standing on its own merits, which has been second to none either before or since. Surely in this great horticultural country there is abundance of material and money to make a great and successful show without the want of assistance from any Society or Commissioners. *Exhibitor*. ["Exhibitor" was not favoured us with his name, but we insert his letter as it is very desirable that full discussion should take place, so that the Council of the Society and we, think we may say, the Commissioners, should be able to glean a fair idea of the feeling of the horticultural world before the general meeting is called. ED.]

Eucharis Mite.—In reading Mr. Douglas's notes on Note Park, p. 458, October 10, and of the fine plants of Eucharis, noting Mr. Douglas's conversation with Mr. Davies on the recent losses in some gardens, he says we seemed to agree on the point that these losses were probably due to the management of the plants, and adding the opinion, "as if he concurred," of another successful grower, that the disease was only a creation of the brain of some cultivators. I would remind Mr. Douglas this is rather an uncharitable opinion to assert, and sounds uncomplimentary to those whose plants are unfortunately attacked by the mite, and it is a well-known fact that there are many such, and in some of our largest and noblest gardens, under the care of well-known and formerly successful growers, whose brains are as free—not their plants—from the creation of disease as Mr. Douglas's, or the successful grower whose opinion he quotes—who still grow well other more difficult plants, but fail to keep their Eucharis good under the ravages of the mite. At the present moment I have here just such a plant as Mr. Douglas names, flowering for the third time this year, but I have many others in bad condition through being attacked by the mite eating its way to the very heart of the finest and best bulbs, and the strongest and most robust roots, causing the foliage firstly to have a yellow tinge all round the edge, which gradually extends over the whole leaf, as the roots are eaten away by the mite. It is the mite that causes the disease, not the disease the mite, for it is on the finest and best bulbs and roots they feast, not the decayed ones, with me. I have the same or a similar mite on the Scilla sibirica, which has destroyed the bulbs by thousands, clearing off in some cases whole borders, in others long patches: a finer or better lot of this Scilla until this last season was not readily to be found, and was the admiration of all who saw them. *Thor. Kestley, Darley Abbey*. [It may now be regarded as settled that the mite is the culprit, not the mere scavenger. ED.]

Thunia Lobbia (gigantea 2).—There is a Thunia Lobbia at Penricken, a lovely wild garden near Falmouth, quite the height mentioned in connection with the specimen of Cryptomeria Lobbia. The climate of Portugal would be unsuited for the Thunia. The best specimen in England of the Cryptomeria is at Dropmore, where the distinct habit of the tree can be well studied. The Cacti at Montserrat are not so fine, perhaps, as in some other gardens in Portugal, particularly those on the seaward slope of the mountains near Amaranthe. Mr. Crawford tells of a C. peruvianus there that reaches above the eaves of a rather lofty two-storied house, and girls near the ground 19 inches. *C. A. M. C.*

Tritomas.—Amongst these will certainly be found several of the most conspicuous ornaments of our autumn garden. T. Saundersii, with its dwarf habit, early blooming, and distinct flower-tubes, deep red, tipped with yellow, is well worthy of attention. Another dwarf form is T. Macowani, the flower-scapes of which grow little more than 2 feet in height, and the flower-tubes are different in colour to any other, being of a pale saffron tint and very lasting. The giant T. nobilis is also well deserving of cultiva-

tion, the noble flower-stems, fully 7 feet in height, standing well out from the shrubs with which they are associated. It is a very vigorous form, having been known to grow as much as 4 inches in twenty four hours. All the Tritomas do best in warm sunny borders, but where they are amply supplied with moisture during the growing season. *A. D. W.*

NOTES FROM THE PEAR-GROWING DISTRICTS.

(Continued from p. 503.)

IRELAND (SOUTH).—This has been a bad year for wall Pears here in the south of Ireland. I send you names of sorts mostly in the gardens. Some may have done better than others, they vary so very much in the different aspects and soils:—

Duchesse d'Angoulême (Williams')	Louise Bonne de Jersey, in every garden
Beurré d'Amansis	Doyenné du Comice
Bon Chrétien	Van Mons
Joséphine de Malines	Pitmasdon Duchess
Marie Louise, in many gardens	Bishop's Thumb, in many gardens
Beurré Capiaumont	Oldfury Sugar Pear
Hardy	

W. B. Hatland.

LONDON (SOUTH-WEST DISTRICT.)—The following list, furnished by Messrs. J. Veitch & Sons, of Pears includes those which do best on the Pear stock as pyramids or standards:—

Beurré Bosc	Monarch (Knight's)
Citron des Carmes	Passe Colmar
Comte de Lamy	Seckle
Doyenné d'Été	Souvenir du Congrès
Gansell's Bergamot	Thompson's
Gratioli de Jersey	Uvedale's St. Germain
Hacox's Incomparable	Van Mons' Léon le Clerc
Huysh's Prince of Wales	Verulam
Madame Treve	Zéphirine Grégoire
Marie Louise	

Those kinds that do equally well on Pear or Quince stock as pyramids are:—

Bergamote d'Espereur	Duchesse d'Angoulême
Beurré d'Amansis	Durandais
d'Anjou	Fondante d'Automne
d'Arenberg	d'Euverne
d'Assomption	General Tottleben
Bachelier	Glou Moreau
Diel	Jargonelle
Giffard	Louise Bonne de Jersey
Hardy	Nouvelle Fulvie
Superfin	Olivier des Serres
Capille	Pitmasdon Duchess
Clapp's Favourite	Nicot of Winkfield
Conseiller de la Cour	Williams' Bon Chrétien
Doyenné d'Alençon	Winter Nelis
du Comice	

The varieties here named are most successful when grown against a wall:—Beurré Rance, Brown Beurré, Easter Beurré, Josephine de Malines, Marie Benoist, Passe Ciasanne; and on the Quince stock, Beurré Sterckmanns.

NORTHAMPTONSHIRE.—Our garden here may be described as a sandy loam, from 3 to 3½ feet deep, resting on shale, so-called in this locality, which is simply a limestone. The garden is enclosed by a ditch from 10 to 12 feet deep, so that in that important matter of draining it is all to be wished for. The year 1885 will be remembered here as the year for Pears, but the heavy crop and the dry season combined have left their mark in the matter of size, but for quality it has doubtless improved. We grow numbers of varieties here. The following for walls, both south and west aspect, we find suit this locality best:—

Thompson's	Beurré Clairgenu
Louise Bonne de Jersey	d'Amansis
Souvenir du Congrès	d'Arenberg
Passe Colmar	Easter
Marie Louise	Hardy
Glou Moreau	Sterckmanns
Fondante d'Automne	Diel
Beckworth 2nd	d'Espereur
British Queen	Bergamote d'Espereur
Bon Chrétien (Williams')	Pitmasdon Duchess
Beurré d'Angoulême	Nagana
Rance	Gansell's Bergamot

Our best dessert Pears are grown here on south walls, on the Quince stock, as single cordons; they bear profusely, and give good results almost yearly. We simply tie to each stem a quantity of the common Bracken lightly, and the protection is complete from spring frosts. On another south wall, where the same varieties are grown on the Pear stock, the present trees have been planted six years, and have this year also done well. These trees I got from the nursery as feathered pyramids. Planted at 5½ feet apart we train the young shoots downwards, and they do well with us; the turning of the Pear shoots downwards checks the sap at the base, and they make fruit-spurs instead of

gross shoots; to fill walls quickly doubtless this is the system. For our earliest Pears we like Williams' Bon Chrétien, Beurré d'Amansis; second, Thompson's, and Fondante d'Automne—two of the highest and best flavoured Pears of my knowledge; third, Marie Louise and Napoleon; and for late use B rance, Marie Louise and Glou Moreau. The eight varieties are the cream of our collection. I may here add that grand late Pear Beurré Rance in the sunny south does not become melting only in very fine seasons. *R. Gilbert, Burghley.*

SUSSEX.—The undermentioned list of varieties of the Pear cultivated in Sussex and other south-coast districts enjoying a similar climate and soil, has been supplied us by Messrs. Cheal & Sons, nurserymen of Crawley in that county. The suitability of the climate for the successful growth of the Pear is made evident by the extended list, which appears to contain almost every variety of acknowledged worth, as well as some kinds that are cultivated in great quantities for the market and which have no other qualifications beyond those of undoubted abundant cropping. The first list of those suitable for this district on the Pear stock:—

Bergamot, Autumn	Fertility
Beurré Bosc	Hessle
Chairgenu	Joseph Gratioli
de Capiaumont	Louise Bonne de Jersey
Diel	Marie Louise
Hardy	Souvenir du Congrès
Superfin	Suzanne's Egg
Bon Chrétien (Williams')	Windsor
Comte de Lamy	

PYRAMID PEARS.

Bergamote d'Espereur—Quince	Conseiller de la Cour—Quince
Beurré d'Anjou ditto	Doyenné d'Automne—Quince
Bachelier ditto	Duchesse d'Angoulême—Quince
Chairgenu—Pear and Quince	Fondante—Quince
de Capiaumont ditto	Fondante d'Automne ditto
Hardy—Quince	General Tottleben ditto
Superfin ditto	Louise Bonne de Jersey ditto
Bon Chrétien (Williams'), ditto	Marie Louise d'Ucle ditto
Brookwork Park—Pear	Olivier des Serres—Pear
Clapp's Favourite—Quince	Souvenir de Congrès ditto
Comte de Lamy ditto	Thompson's—Quince.

ESPALEER PEARS ON PEAR STOCK.

Beurré Bachelier	Duchesse d'Angoulême
Bosc	Glou Moreau
d'Amansis	Jargonelle
Diel	Joséphine de Malines
Hardy	Marie Louise
Rance	Olivier des Serres
Superfin	Pitmasdon Duchess
Bon Chrétien (Williams')	Souvenir du Congrès
Clapp's Favourite	Winter Nelis
Conseiller de la Cour	

The following is a list of cordon Pears suitable for this district, all on Quince stock, some of them being double worked:—

Bergamote d'Espereur	Doyenné Baussoch
d'Anjou	Fertility
Bachelier	Fondante d'Automne
d'Amansis	Joséphine de Malines
Diel	Louise Bonne de Jersey
Hardy	Marie Louise d'Ucle
Superfin	Pitmasdon Duchess
Bon Chrétien (Williams')	Thompson's
Clapp's Favourite	General Tottleben
Conseiller de la Cour	Duchesse d'Angoulême

Reports of Societies.

NATIONAL CHRYSANTHEMUM.

FLORAL COMMITTEE.—The first meeting of this body took place at the Royal Aquarium, on Wednesday, the 4th inst., Mr. E. Sanderson, President, in the chair; and also Messrs. R. E. Buxton, J. W. Holmes, Hon. Secretary; H. Cannell, R. Dean, G. Gordon, G. Stevens, N. Davis, C. Gibson, T. Bevan, J. Mardlin, J. W. Springbetu, J. Townsend, E. Berry, M. Butcher, E. T. Kemp, and W. Swift.

The committee having discussed and adopted certain rules governing its mode of action, proceeded to make the following orders:—To Mr. W. E. Boyce, River Road, Upper Holloway, for pompon Chrysanthemum Pomponium, a charming variety, having medium size well formed flowers of a yellow ground shaded with orange-brown; and to Japanese Chrysanthemum Mandarin having cream and pink thread-like petals, large and full flowers, a very useful variety because flowering in September. Ten very fine blooms of this were also shown by Mr. N. Davis, Lilford Road Nurseries, Cambridge, who was also awarded a First Prize Cert. of Merit. The same award was made to Mr. Davis, Japanese Chrysanthemum Lachme, a fine reflexed variety, the colour cinnamon-crimson, the reverse orange, and so forming a unique centre. Hybrid pompon Mrs. Callington, a very pretty and free flowering white variety was highly commended. Mr. Davis also had Simon Delaux, crise-crimson, with buff reverse to the petals. Fleur d'Étè, bright pinkish-lilac, a small but, very pretty reflexed Japanese variety; Rose Celeste,

pale pink; *Erd Fleur*, an early flowering variety, colour magenta, with white centre; *Isidore Peral*, gold and purplish-magenta, reflexed, very pretty; and *Margot*, a lovely pink flower, certificated last year. A First-class Certificate of Merit was awarded to Mr. Forbes, The Gardens, Dover House, Roehampton, for Japanese Buds and Latin, deep pink, with broad reflexed petals, extra fine. *L. Isle des Plaisirs*, orange and reddish-cinnamon; the reverse golden-buff, was Commended as a good October variety. This was also finely shown by Messrs. J. Laing & Co., Stansted Park, Forest Hill. Mr. Forbes also had *Mons. Moussillac*, maroon-crimson, the reverse of petals buff; a full and fine flower, and a good early variety.

First-class Certificates of Merit were awarded to Mr. H. Cannell, nurseryman, Swanley, for pompon *Chrysanthemum Fibritz*, a very pretty yellow variety, early, and very free; for double *Begonia Léon de St. Jean*, with very large and full rich bright rosy-crimson flowers; and to the following new double Ivy-leaved *Pergolans*:—*Hoffgartner Eichler*, bright scarlet, very deep pink, flowers of fine form; *Madame Thibaut*, rich deep pink, very double, and extra fine; and *Furcin Josephine* von Hohenzollern, rich crimson, large, and double. *Primula sinensis fimbriata King of Purples*, a Fern-leaved variety, was Commended for its deep blue or purple.

A First-class Certificate of Merit was awarded to Mr. Wright, Temple Gardens, for *Belle Navarraise*, a large, full, and handsome, fimbriated hybrid pompon, extra fine. Mr. R. Ballantine had *Mons. Delaux*, a fine Japanese variety, crimson, flushed with orange and purple, large and full; Commended. Mr. T. S. Ware had *Roi de Princes*, a deep chestnut-crimson flowering variety, and a very useful double white also distinctive also *Bonnet d'Étoile*, lilac-purple, a useful early-flowering variety. Mr. H. Cannell had a basket of *Begonia Earl of Blessborough*, a fine apricot-coloured single variety; of blooms of *Begonias*, and cut blooms of *Pergolans*. Mr. Owen, Borist, Maidenhead, had a collection of cut blooms of *Chrysanthemums*; and Mr. Bayes the same. Altogether it was a very successful first meeting.

THE PEAR CONGRESS, CHISWICK.

The Apple Congress, which was held at Chiswick in 1883, was an undoubted success when viewed in some of its aspects. Its effects as regards the limitation of sorts to soils and localities will be felt in years to come when the lessons it taught are assimilated by the horticultural mind in general, so that we can but rejoice at the immense numbers of Pears shown on this occasion. That it will lead to the same degree of elimination of kinds, as happened in the case of Apples, we feel assured, if we may judge from the conspicuous merits of some Pears in all varieties of soil, locality, and freedom of bearing. Much useful information is conveyed by the tickets placed on each dish of fruit when it is stated what kind of stock was employed, how grown—as pyramid, cordon, espalier, bush or wall trained—if free bearing or otherwise, and the habit of growth. All exhibitors did not avail themselves of the cards issued by the Royal Horticultural Society, so that the information is not equally attainable as to all parts of the country, but still enough will be found that will render the future report of the Society of great value to planters, whether in private or market gardens. Taking the fruit generally as to appearance the finest coloured and the largest came from Jersey and France, followed next by those from Mr. Haycock, gr., Barham Court, Maidstone; Mr. Breeze, Petworth; Messrs. Veitch & Sons, Chelsea; Messrs. W. Paul & Son, Waltham Cross; Paul & Son, Cheshunt; Messrs. G. Bunyard & Co., Maidstone; T. Bunyard, Ashford; and many private and other growers. Some excellent samples of fruit came from Scotland, but our northern counties were conspicuous by their absence, at least in any quantity. Ireland sent only one lot, and Wales but five. Taking the fruit according to the Society's method of grouping, we have

GROUP L.—SOUTHERN COUNTIES.

Surrey.—In this county Mr. Sydney Ford heads the list with seventy-two kinds, including beautiful specimens of *Beurré Diel*, *Beurré Clairgeau*, *Calebasse Grosse*, *B. Illissime d'Hiver*, *Pitaston Duchesse*, *Durandean*, *Ester Beurré*, *Thompson's*, *Beurré Superfin*, *General Todleben*, *Glou Morceau*, &c. Messrs. Cheal & Sons, Crawley, came next, with sixty kinds. We noticed in this good collection *Duc de Morny*, similar in form and flavour to *Marie Louise*, but late; *Beurré d'Anjou*, a fine Pear; *Doyenné Boussoch*, *Chaumontel*, fine samples, from a cordon; *Ester Beurré*, *Beurré Diel*, *Beurré Hardy*, *Bonnet d'Étoile*, *Grosse Calebasse*, fine in colour and quality. This large collection was gathered mainly from cordons, free standing, or on walls, and from bushes and pyramids. Fine development was conspicuous in the generality of the sorts. Mr. Breeze, Petworth, with fifty varieties, and Mr. Rust, Eridge Castle, with thirty-six, sent the next largest lots. Three fine

samples of cullinary Pears were seen in the former, viz. *Belle d'Anjou*, *Castille*, *Belle d'Angéline* and *Verulam*, *Marie Denost*, *Durandean*, *President Mass*, *Beurré Diel*, the hardy *Marie Louise d'Ucle*, *Ester Beurré* very fine, *Passe Crassane* and *Monarch*. The fruit here was the produce of upright cordons on walls, of espaliers and pyramids.

The lesser collection of Mr. Rust had the shy cropping *Gansel's Bergamot*, *Triomphe de Jodoigne*, *Marie Louise*, *Beurré Hardy*, *Beurré Clairgeau*, the pretty *Follele*, *Beurré Bose*, *Beurré Diel*, *Doyenné d'Alençon*, *Dunmore*, *Thompson's*, and *Prince Consort*. The fruit was excellent in most points, and but few small varieties were shown.

The county of *Surrey* contributed heavily, Mr. Burnett, The Deepdene, Dorking, sending fifty-five dishes, of which the following were conspicuous:—*Princess (Rivers)*, a showy fruit; *Winter Crassane*, *Pitaston Duchesse*, *Van Mons*, *Joséphine de Malines*, *Prince of Wales (Huyshe's)*, and the piquant, seldom seen *Eyewood*. The fruit in all cases were clear in the rind, and large for the sort.

Mr. Forbes, gr., Dover House, Roehampton, had thirty-three dishes, all evidently the pick of his kinds. Particularly good were *Beurré Nancy*, *Beurré Bose*, *Beurré Bachelier*, *Beurré Clairgeau*, *Glou Morceau*, a variety which does well on the light soils round London on either Pear or Quince stock; *Marie Louise*, *Winter Nelis*, one of the best of late sorts; *Pitaston Duchesse*, and *Duchesse d'Angoulême*.

Some fine fruit came from Mr. Evans, gr., Lythe Hill, Haslemere, all of which was clean and generally well done, although some kinds were undersized, the soil or elevation not suiting them. *General Todleben*, *Beurré Hardy*, *Maréchal de la Cour*, *Van Mons*, *Madame Treve*, *Beurré Clairgeau*, were some of the best.

Mr. W. Roupell, Roupell Park, had twenty-one dishes, and considering the ungenial nature of his soil, they were very fair samples; *Marie Louise*, from tree on the Pear stock, and *General Todleben*, from the same stock, were very nicely grown fruits.

Mr. Cummings, gr. to H. A. Smea, Esq., The Grange, Carsballon, had the largest collection of any one showing from *Surrey*, staging 113 dishes. His finest were *General Todleben*, capital late kind; *Duchesse d'Orléans*, good quality, but rare; and several beautiful examples, *Beurré Clairgeau*, one dish being ripe from a tree in a sunny spot, the other from a shaded tree a fortnight or more later, not being yet ripe; *Doyenné du Commerce*, *Plus 1N*, a very bright *Follele*, *Bezi Mai*. This collection was grown chiefly on bushes and pyramids, and the examples seen were highly coloured, and of a fair size—useful dessert fruit.

Middlesex had a brave show, the large nurseries contributing largely, and the Royal Horticultural Society topping the list with 200 kinds; next Messrs. J. Veitch & Sons, Chelsea, with 120 kinds; Messrs. C. Lee & Son, Hammersmith, eighty varieties; and private growers, as Mr. J. Roberts, Gunnersbury Park, fifty; Mr. J. Hudson, Gunnersbury House, thirty; Mr. J. Woodbridge, St. John House, thirty-six; Mr. G. Thompson, twenty-four; Mr. E. Chadwick, twenty-four; and several others with smaller collections. The fruits from Messrs. J. Veitch & Sons were chiefly produced on bushes and young pyramids in their Fulham nursery, being generally well finished and clear of rivalry, *Hacón's Incomparable*, *Monarch*, *Eyewood*, *Marie Louise*, *Beurré Louise*, *Monsieur le Curé*, *Chancellor* (an October Pear, of good quality, and large), *Beurré Ballet frères*, *Chaumontel*, *Passe Colmar*, *Beurré Bachelier*, *Anna Nelis*, were some of the finest specimens.

The collection from the Royal Horticultural Society's gardens consisted of most of the kinds worth growing, and many that are discarded in private gardens, but which are cultivated there for comparison, or other purposes. The finer samples were *General Todleben*, *Huyshe's Bergamot*, *Lieutenant Poitevin*, *Beurré de Jonghe*, *Grosse Calebasse*, *Forme de Bergamot*, *Duchesse d'Angoulême*, *Gansel's Bergamotte*, *Musette de Nancy*, *Bezi du Louvaine*, *Souverain dit Congrès*, and *Beurré Diel*; *Maréchal Dillen*, from the Quince, a good October Pear, bearing well; *Beurré Gris d'Hiver*, late, from Quince; *Suffolk Thorn*, from Pear stock, a pyramid, cropping well; *capital Beurré Bose* grown on the Pear, also bearing well. Many varieties were small, but were clear in the skin.

Messrs. C. Lee & Sons' consisted of well grown sorts, and much information was afforded by the tickets. *Pitaston Duchesse* from the Pear stock was first-class; *Bassiner*, also from the Pear, small but a very late keeper; and other fine Pears from Pear stocks were *Beurré Nancy*, *Napoleon*, very free bearing; *Grosse Calebasse*, *Beurré Bachelier* and *Beurré Diel*. *Gansel's* is a moderate bearer on that stock; *Ester Beurré*, *Winter Nelis*. The collection contained under its 200 kinds the cream of the Pears, and was of much value in showing those which do the best in certain soils on the Pear, the bulk being chiefly the produce of kinds on that stock.

Mr. J. Roberts' fifty kinds were of the finest quality and finish, and showed high cultivation, as did also those of Mr. Woodbridge—*Brougham* and *Belle Julie* and the

Winter Windsor being most noticeable sorts in the latter collection.

Mr. J. Hindson's fruits, coming as they do from the same locality, generally resembled the two last-named collections, both in variety and appearance. His stinging Pears *Belleime d'Hiver* and *Catlag*, and the dessert kinds *Beurré Rance*, *Glou Morceau*, and *General Todleben* were good examples.

Kent was represented by Messrs. G. Bunyard & Co. with 100 varieties; Mr. T. Bunyard with seventy; Mr. Thomas, Sittingbourne, seventy; Mr. C. Haycock, Barham Court, seventy-six.

In the first-named collection were *Duchesse de Bordeaux*, very prolific, on Quince stocks; *Colmar d'Automne*, also a good bearer on the same; *Eyewood*, the same; *Chaumontel*, shy on the Quince as on the Pear. Heavy croppers on the Quince are *Marie Louise d'Ucle* *Glou Morceau*, *Beurré Clairgeau*, *General Todleben*, *Fondante Couronne*, *Doyenné du Commerce*; and equally good on the Pear are *Pitaston Duchesse*, *Jargonelle*, *Durandean*—all of these kinds were observed in perfection, so grown, in this collection. Much more information of a similar kind was likewise given. The pretty marbled *Japan Pear*, *Daimo*, was shown by them.

Mr. Haycock's fruit were the finest English produce shown, and gained the highest encomiums from the many judges of good fruit present. Most of it was larger than seen in other lots, and was without blemish of any kind. It would serve little purpose to enumerate the names, and we will, therefore, say that it composed the best sorts grown in the southern parts of the country.

Closely following on the above-named was that of Mr. Thomas, of Sittingbourne, consisting of popular, good, and presentable kinds, especially fine in colour being *Louise Bonne* of Jersey, *Cuisse Madame*, and *Beurré Sterckmans*.

Mr. T. Bunyard had fifty-two varieties of considerable excellence, as had likewise Mr. R. Smith, Yalding, Maidstone (eighteen varieties), *Marie Louise*, *Chaumontel*, and winter *Nelis* were of especial quality.

Hampshire.—This county did not put in a great lot of fruit, considering its size and suitability, and the warlike of its sheltered valleys, but Mr. Waldsmith worthily upheld its capabilities with his collection of ninety varieties. Heckfield has been long famous for its fruits, and where they are grown in almost all methods, but bush and pyramids, and wall cordons seemed to be most productive of fine samples. Some of the finest were *Huyshe's Victoria*, from Quince stock—a pyramid; *Maréchal de la Cour*, the same stock—a bush; *Urbaniste*, a cordon on the Quince; *Louise Bonne*, the same; *Durandean*, a bush on the Quince; *Calebasse*, *Duchesse d'Angoulême*, *Poir d'Ananas*, *Bergamot Heimberg*, all from either bush or pyramid on Quince stocks; *Director Alphonse*, *Gros Treve*, *Fondante Van Mons* were from cordons on Quince growing on a wall; *Chaumontel*, *Maréchal Dillen*, *Seckle*, and *Pitaston Duchesse* were from wall trained trees on Pear stocks.

Bucks.—Mr. Ross, of Wellock Park Gardens, showed twenty-seven excellent fine varieties, as well as good flavoured small kinds.

Wilt.—Mr. Ward, Longford Castle Gardens, brought forty dishes, consisting of the most appreciated dessert kinds, amongst them being excellent *Glou Morceau*, *Van Mons*, *Pitaston Duchesse*, *Doyenné du Commerce*, and *Monsieur le Curé*. Mr. Miller, gr., Rood Ashton, had sixty dishes—*Gilgill*, *Emile d'Heyst*, and *Monarch* being very fine fruits.

GROUP III.

Hertfordshire.—The next largest contributors of Pears are found in this group, in which Messrs. W. Paul & Sons, Waltham Cross, figure with 150 kinds; Messrs. Paul & Sons, Cheshunt, with eighty; Messrs. T. F. Rivers & Sons with an equal number, and several private gardens send considerable numbers. In the first named lot are good fruits of *Triomphe de Jodoigne* from both Pear and Quince stocks, *Ester Beurré*, fine, from Pear stock, as are *Beurré Hardy*, *Conseiller de la Cour*, and *Beurré Diel*, the last named being still better from the Quince. *Gilgill* bears best on the Quince, the sample shown being very fine. On Quince *General Todleben* is a great bearer, and almost as good on the Pear. If all the fruits in this collection were not first-class, yet the information was of a useful kind, and well worth preserving as being the result of many years' experience with a large number of varieties. In the Cheshunt collection of Messrs. Paul & Son were many good examples. Some of the Pears from this district showed signs of fungus in the rind that gives such a crippled look to the fruit. Mr. Mundell, gr., Moor Park, had sixty, several fine dishes being noticed, as *Doyenné Boussoch*, *Beurré Bose*, *Beurré Easter*, *Beurré Clairgeau*, *Swan's Egg*, *Marie Louise d'Ucle*, *Hacón's*, and *Uvedale's St. Germain's*. Messrs. F. T. Rivers & Sons, Sawbridgeworth, had, as usual, an interesting collection of the best varieties, and of rarer ones were *Zoe*, *Beurré Dumont*, *Beurré Langelier*, *Magnate*, and the not particularly good kind, *Jean de Witte*.

Bucks.—Mr. Smith, gr., Mentmore, had fifty dishes, remarkable as being mainly from bushes on the Quince not more than three years planted, large examples being

observed of General Todtleben, Marie Louise, America, Colmar d'Arenberg, Jules Apoles, and others. Mr. Charles Turner, Slough, contributed a hundred dishes in as many choice varieties, noticeable among which, as some rarely seen, were Frogmore Russet, Groom's Princess Royal, Beurré Gouabaut, Beurré Van Geert, Beurré Ballet frères, and a small late kind, *Enfant Prodigue*.

In addition to the conservatory, two large tents were also occupied, and in these the more remote country contributions were displayed. Even here, however, owing to the large number of collections sent for staging by the committee, the work of placing was far from being complete at the time of our visit, hence the present report is necessarily incomplete.

Dorsetshire, as might be expected from a county so well placed, gave capital samples, although represented by but one collection only, that staged by Mr. W. J. Pragnall, gr. to J. D. W. Digby, Esq., Sherborne Castle, who had 100 sorts, and all thoroughly representative of various forms of garden culture. Not a few of the samples were from free-growing standard trees. Pitminster Duchess was very fine from that source, and from a wall was smaller, but cleaner and handsomer. Beurré Clairgeau, Louise Bonne, and Forelle gave very rich colour, as also did handsome medium-sized kind, Du Congrès Poniologique, from a free pyramid; Beurré de Capiaumont, and Comte de Lamy were also richly coloured, whilst of fine samples were *Belleissime d'Hiver*, Beurré Bachelier, Bishop's Thumb, Duchesse d'Angoulême Huyshe's Bergamot, and Doyenné du Comice.

Devonshire was favoured by a capital representative collection of 120 kinds from R. Veitch & Sons, of Exeter, who had Louise Bonne, Beurré Superfin, Doyenné Boussoch, Jersey Gratioli, in fine colour; Catilau, Glou Morceau, Beurré Clairgeau, and *Belleissime d'Hiver*, very fine. Mr. Garland, of Killerton Gardens, had about forty kinds, but many of the samples were poor and much spotted.

Gloucester was represented by some fifty kinds, rather medium-sized samples, including the black Worcester stewing Pear, Beurré Amanlis, and *Conselleur de la Cour*. This lot was not named fully, but appeared to belong to Mr. Shingles, of Tortworth Court Gardens.

Lincolnshire was well represented by a fine collection of some fifty-six kinds, sent from Belvoir Castle by Mr. Ingram. Most of the samples were excellent, and included good Doyenné Boussoch, Beurré Superfin, Beurré Rance, General Todtleben, Glou Morceau, Madame Millet, Urnaiste, and Beurré d'Anjou, all from walls trees.

From **Cheshire** came a very fine and interesting collection, sent by Messrs. F. & A. Dickson & Son, of Chester, gathered chiefly from nursery pyramid trees. *Conseur du Congrès*, Marie Louise d'Uccle, Beurré Diel, Easter Beurré, Louise Bonne, Beurré Hardy, &c., were capital. Also came a collection from James Dickson & Sons, also of Chester, the samples fair but calling for no special comment.

Worcester was represented by a very fine collection, indeed from R. Smith & Son's well-known fruit nursery, the samples fine, clean, and the collection included many first-class kinds; very handsome Josephine de Malines, Beurré Hardy, Duchesse d'Angoulême, Pitminster Duchess, huge samples of Van Mons' Léon le Clerc, Beurré Bachelier, Gansel's Bergamot, Beurré Superfin, and Doyenné d'Alençon. This collection comprised some eighty varieties.

From **Nottingham** came a good representative collection of 170 kinds, sent by Messrs. J. & R. Pearson, of Chilwell. Some of the samples were probably grown under glass, as such kinds as Doyenné Boussoch, Beurré Superfin, *Conselleur de la Cour*, and others were exceptionally clean and bright. Separately from the Gloucester collection was a large one from Messrs. J. Jeffries & Co., Cirencester, which included some superb Marie Louise, though somewhat more russet than usual.

Essex found its reputation well supported by Messrs. Saltmarsh, of Chelmsford, who put up some 150 kinds. Here Beurré Défais, Marie Louise d'Uccle, Doyenné Boussoch, and Durandau showed fine colour, whilst Grosse Calabasse, Beurré Hardy, Beurré Diel, Beurré Clairgeau, Glou Morceau, and Beurré Langelier had the call for size.

From **Norfolk** came a collection of forty kinds only, from G. C. Browne, Meopham; a variety named Beurré Montgeron was very noticeable for its great beauty and rich colour.

Bedford found a useful aid in Mr. Laxton, of Gifford, who collected from various gardens a good representative collection of sixty dishes, but the samples were not of the highest quality.

From **Huntingdon** came a collection sent by Mr. Hardy, Orton Hall Gardens, Peterborough, but many of the fruits were not in good condition. In the second tent were other Worcester collections, not all of which were ready when this report was prepared, but a good one of some eighty or ninety kinds from Mr. W. Coleman, Eastour Castle Gardens, merits more extended notice, as it included many fine samples. He

also sent a number of small perry Pears of the district. Mr. Crump, Madresfield Court Gardens, had about forty kinds, mostly very fine samples of sorts previously named, and there were other collections from the same district. A very fine and interesting collection of about sixty-six kinds from Mr. Denning, gr. to the Earl of Chesterfield, Holme Lacey, Herefordshire, whose kinds were chiefly grown on Quince cordons. Here were grand samples of Doyenné Boussoch, Haco's Incomparable, Princess, very rich colour; Beurré Hardy, Madame Treyve, Louise Bonne, and Pitminster Duchess.

Going northwards to **Lancashire** were some two or three collections; one of them, unnamed, included the handsome stewing Pear *Verulam*. There was also a fair collection from Mr. Brocklebank, Liverpool, of thirty kinds.

South Wales was fairly represented by collections from Mr. W. Powell, Taiבח, Glamorgan, and Mr. Muir, Margam Park. The former grower was a farmer. Mr. Muir's were fairly good samples, and very clean. Also a collection of thirty kinds from Baron de Rutzeu, Haverrfordwest.

The **North Wales** group included a large collection of some sixty kinds from Wynnstay Castle Gardens, Ruabon; six kinds also from Mr. Coomber, Hendre Park Gardens, Moamouth; and a small collection from Oswestry.

From **Ireland** came at least one collection, sent by Mr. Uthank, Camperville, Limerick, who had twenty kinds, some admirable samples of ordinary sorts.

Scotland made a better figure, although the moderate size of the samples showed that 50 far north is not favourable to the production of good samples. There appeared to be some six or eight collections from North of the Tweed, including an excellent one from Alliston Gardens, St. Boswells, sent by Mr. Dalrymple, of forty-eight kinds; also one of about fifty kinds, from Mr. Dunn, of Dalkeith Palace Gardens; and sixteen kinds from Newbattle Abbey. Messrs. Ormiston & Co., Renwick, Melrose, had a large collection; and an interesting one was sent by Dr. Robertson, of Errol.

Mr. J. Austin, gr., Witley Court, showed an Apple, *Peasgood's Nonsuch*, of the weight of 23 oz. It had lost an ounce since being gathered.

No doubt, when the whole of the collections are fully arranged and placed according to geographical position, the show will be not only singularly complete and representative, but full of interest to all lovers of Pears.

CHANNEL ISLANDS.

A very fine collection of fruits came from Jersey, the productions of the nursery of Mr. Le Cornu, St. Helier's. Most of them were grown on the Quince stock, and for size and general appearance exceeded any shown by English growers—a fact which is to be ascribed to the finer climate of the islands.

FRANCE.

M. F. Jamin, Bourg-la-Reine, exhibited a collection of large fruits, consisting mostly of varieties previously noted in English collections. Sorts not met with in those were *Léon le Clerc d'Hiver*, a showy, long Pear, with much bright colour on the sunny side—it was from a tree on the Quince; *Oliver des Serres* was double the size of the same kind in our collections; *Fondante de Pansele* also from the Quince, of great fertility and moderate growth; *Doyenné du Comice d'Angers*, a handsome fruit, but shy; *Louis Cappe*, from the Quince, a good bearer and moderate grower; *Beurré Luizet*, a splendid long fruit, good bearer on the Quince; and *Beurré Bretonneau*, also good on the same stock.

M. André Leroy, Angers, had 120 dishes, but few of them approached the size of the first-named collection, yet there were many kinds new to English gardeners.

The following are the groups and the number of dishes sent by the exhibitors:—

GROUP I.

Berks.—Mr. Howe, 24; Mr. C. Ross, 27; Mr. Allen, 18; Mr. Laurence, 4.
Hants.—Rev. J. L. Carriek, 12; Mr. Wildsmith, 50.
Kent.—Mr. Saunders, 36; Mr. C. Davies, 59; Mr. R. T. Bunyard, 70; Messrs. Bunyard & Co., 100; Mr. R. T. Smith, 18; Mr. W. Rogers, 26; Mr. W. H. Divers, 24; Mr. W. Harrington, 20; Mr. W. Selwyn, 32; Mr. A. Thomas, 10; and Mr. C. Haycock, 76.
Middlesex.—Mr. A. Wright, 24; Mr. J. Coombes, 30; Mr. J. Hudson, 50; Mr. W. H. Tilly, 6; Mr. R. L. Cosh, 6; Mr. W. Wood, 13; Messrs. C. Lee & Son, 80; Royal Horticultural Society, 200; Mr. Woodbridge, 36; Mr. Denk, 14; Mr. G. Thompson, 24; Rev. H. Taylor, 6; Mr. E. Chadwick, 40; Messrs. J. Veitch & Sons, 120; Mr. J. Roberts, 50; Mr. J. Graham, 1; Mr. H. J. Draper, 4; Mr. H. W. Ward, 6.
Survey.—Mr. B. Greaves, 20; Mr. Taylor, 40; Mr. G. W. Cummins, 110; Mr. Sheppard, 65; Mr. Leech, 30; Mr. R. Lloyd, 40; Mr. Burnett, 55; Mr. J. Burrell, 24; Mr. H. Matthews, 30; Mr. W. Ruppell, 20; Mr. W. Stuart, 20; Mr. D. East, 11; Mr. A. Evans, 24;

Mr. J. Boland, 47; Messrs. Arnafield & Son, 4; Mr. Forbes, 33.

Sussex.—Mr. J. Anderson, 4; Mr. W. J. Gibbons, 12; Mr. S. Ford, 72; Mr. J. Rust, 36; Mr. J. Burberry, 30; Messrs. Cheal & Sons, 60; Mr. J. Breeze, 50.
Wilts.—Mr. Miller, 60; Mr. C. Warden, 25; Mr. B. Cochrane, 8; Mr. H. W. Ward, 40.

GROUP II.

Essex.—Mr. F. C. Barker, 80; Mr. W. Dance, 90; Mr. R. Warner, 25; Mr. W. Connell, 10; Messrs. Saltmarsh & Son, 80; Mr. Spivey, 54.
Lincolnshire.—Mr. J. McKelvie, 30.
Norfolk.—Mr. J. Plowright, 12; Mr. W. Vrieland, 20; Mr. Sheppard, 10; Mr. Brown, 30.
Suffolk.—Mr. G. Palmer, 25.

GROUP III.

Bedford.—Mr. T. Laxton, 20.
Herefordshire.—Messrs. T. F. Rivers & Son, 80; Messrs. W. Paul & Son, 150; Messrs. Paul & Son, 80; Mr. Mundell, 60; Mr. W. Norman, 25.
Buckinghamshire.—Mr. C. Turner, 100; Mr. J. Smith, 50; Mr. G. T. Miles, 40; Mr. T. Fletcher, 10.
Huntingdonshire.—Mr. A. Harding, 40; Miss Cheere, 12.
Oxfordshire.—Mr. C. Hewett, 40.

GROUP IV.

Cheshire.—Messrs. F. & A. Dickson & Son, 50; Messrs. J. Dickson & Son, 32.
Derbyshire.—Mr. J. Gaiger, 12; Mr. Froggatt, 12.
Warwickshire.—Mr. George Clements, 12.
Nottinghamshire.—Mr. J. Gleeson, 40; Mr. Pownell, 24; Mr. Pearson, 45; Mr. Newton, 50.
Rutlandshire.—Mr. W. N. Divers, 20; Mr. J. Grey, 30.
Staffordshire.—Mr. R. Machellan, 30; Mr. J. Gillman, 25.
Leicestershire.—Mr. W. Ingram, 50; Messrs. Harrison & Sons, 54.
Northamptonshire.—Mr. E. Cole, 80; Mr. C. R. Clarke, 6.

GROUP V.

Devonshire.—R. Veitch & Son, 120; Mr. J. Willis, 32; Mr. J. Garland, 37; Mr. G. P. Home, 12.
Dorsetshire.—Mr. W. Pragnall, 110.
Gloucestershire.—Mr. T. Shingles, 54; Mr. Jefferson, 90; Mr. H. Bannister, 24; Mr. Davis, 40.
Herefordshire.—Mr. W. Denning, 67; Mr. J. Henderson, 25; Mr. A. Ward, 36; Mr. W. Coleman, 90; Mr. J. W. Watkins, 38, and also perry in bottle.
Worcestershire.—Mr. W. Crump, 30; Mr. A. Ritchie, 30; Messrs. Smith & Co., 60.
Monmouthshire.—Mr. T. Coomber, 30.

GROUP VI.

Cumberland.—Mr. Turner, 1; Mr. Johnson, 1.
Lancashire.—Mr. J. Hathaway, 35; Mr. Winkworth, 35.
Yorkshire.—Messrs. Slater & Son, 30; Mr. H. J. Clayton, 30; Mr. E. L. Hall, 45.

SCOTLAND.

Messrs. Ormiston & Henwick, 50; Mr. W. Smith, 45; Mr. J. Day, 36; Mr. McHattie, 15; Mr. Melville, 40.

IRELAND.

Mr. G. F. Uthank, 26.

WALES.

Mr. Middleton, 60; Mr. Muir, 42; Mr. J. Griffin, 20; Mr. G. Hawkins, 6; Mr. Jenkins, 15.

CHANNEL ISLANDS.

Mr. J. L. Mansell, 12; Mr. Thurton, 20; Mr. Le Cornu, 8.

FRANCE.

M. Leroy, 196; M. Jamin, 50.

Obituary.

BARON STERNBERG.—At Turin, on August 12, died, Baron Franz Ungern Sternberg, a pupil of the veteran Bunge, and monographer of the Salicorniades. He was well known to botanical tourists in the Alps Maritimes, as he resided for some time at Tenda.

— Carnation and Picotee growers will learn with much regret that an old and much respected member of their fraternity, Mr. Samuel Brown, Crompton Road, Handsworth, Birmingham, passed to his rest on the 16th inst. Mr. Brown had passed the allotted span of man, having attained the age of seventy-one years, for more than forty of which he had been known as a zealous and successful cultivator of Carnations and Picotees, a faithful friend, and a warm-hearted man.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, OCTOBER 21, 1885.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygro-metrical Deductions from Glaisher's Tables 7th Edition, WIND, RAINFALL. Rows for Oct. 15-21 and a Mean row.

- Oct. 15.—Very fine day.
16.—Heavy rain in early morning, fine bright day.
17.—Dense fog from early morning till noon, dull day.
18.—Very dull day.
19.—Fine dull day.
20.—Dull in early morning, fine bright day.
21.—Fine morning, drizzling rain in afternoon, very fine night.

LONDON: Atmospheric Pressure.—During the week ending October 17, the reading of the barometer at the level of the sea increased from 29.16 inches at the beginning of the week to 29.86 inches by 9 A.M. on the 13th, decreased to 29.79 inches by 9 A.M. on the 14th, increased to 29.81 inches by 1 P.M., and decreased to 29.71 inches by 5 P.M. on the same day, increased to 30.15 inches by 1 P.M. on the 15th, decreased to 30.03 inches by 9 A.M. on the 16th, increased to 30.13 inches by 1 P.M. on the 17th, and was 30.12 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.80 inches, being 0.29 inch higher than last week, and 0.01 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 55°.8, on the 16th, on the 13th the highest was 46°.5. The mean of the seven high day temperatures was 50°.5.

The lowest temperature was 32°. on the 12th, on the 16th the lowest temperature was 46°.5. The mean of the seven low night temperatures was 39°.7. The greatest range of temperature in one day was 17°. on the 12th; the smallest, on the 11th, was 5°.3. The mean of the seven daily ranges was 10°.8.

The mean temperatures were—on the 11th, 44°.5; on the 12th, 40°.7; on the 13th, 41°.8; on the 14th, 43°.1; on the 15th, 46°.8; on the 16th, 50°.9; on the 17th, 46°. and these were all below their averages (excepting the 16th, which was 0°.9 above) by 6°.8, 10°.3, 8°.9, 7°.3, 3°.4, and 3°.8, respectively. The mean temperature of the week was 44°.8, being 2°.3 lower than last week, and 5°.7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 95°.5, on the 16th. The mean of the seven readings was 71°.0.

The lowest reading of a minimum thermometer placed on grass was 22°.2, on the 12th. The mean of the seven readings was 32°.

Rain.—Rain fell on four days, to the amount of 0.39 inch.

ENGLAND: Temperature.—During the week ending October 17 the highest temperatures were 61°.5 at Cambridge, 60° at Truro, 57°.4 at Nottingham; the highest at Bradford was 52°.1, at Sunderland and Newcastle, 53°. The general mean was 55°.5. The lowest temperatures were 29°.8 at Wolverhampton, 32° at Blackheath and Hull; the lowest at Truro was 38°, at Sheffield and Newcastle, 37°. The general mean was 34°.6.

The greatest ranges were 29°.2 at Cambridge, 26°.3 at Wolverhampton, 23°.8 at Blackheath; the

least ranges were 15°.5 at Bradford, 16° at New-castle, 18° at Sheffield and Sunderland. The general mean was 20°.9.

The mean of the seven high day temperatures was highest at Truro, 54°.9, at Plymouth 53°. at Bristol 52°.9; and was lowest at Wolverhampton, 49°.4, at Bolton 49°.7, at Bradford 49°.9. The general mean was 51°.4.

The mean of the seven low night temperatures was highest at Truro, 43°.4, at Leeds 43°.1; at Sheffield and Sunderland 42°.7; and was lowest at Wolverhampton, 36°.4, at Bolton 38°.5, at Bristol 39°. The general mean was 40°.8.

The mean daily range was greatest at Bristol, 13°.9, at Cambridge 13°.2, at Wolverhampton 13°; and was least at Sunderland, 7°.5, at Bradford 8°.3, at Leeds 9°.1. The general mean was 10°.6.

The mean temperature was highest at Truro, 48°.1, at Sheffield and Leeds 46°.7; and was lowest at Wolverhampton, 41°.9, at Bolton 43°.1, at Hull 44°.6. The general mean was 45°.2.

Rain.—The largest falls were 1.66 inch at Truro, 1.48 inch at Sunderland, 1.15 inch at Newcastle; the smallest falls were 0.20 inch at Brighton, 0.34 inch at Liverpool, 0.39 inch at Blackheath. The general mean fall was 0.65 inch.

SCOTLAND: Temperature.—During the week ending October 17, the highest temperature was 55°.2, at Paisley; at Leith the highest temperature was 50°.3. The general mean was 53°.1.

The lowest temperature in the week was 25°.2, at Perth; at Greenock the lowest temperature was 34°. The general mean was 30°.2.

The mean temperature was highest at Paisley, 45°.9; and lowest at Perth, 43°.7. The general mean was 45°.

Rain.—The largest fall was 0.71 inch, at Aberdeen; the smallest fall was 0.03 inch, at Leith. The general mean fall was 0.18 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questioneth much shall learn much."—BACON.

ORCHIDS.—Can any of your readers inform me whether the following Orchids are worth cultivating, viz., Angraecum odoratissimum and Polypodium cardyanum? These plants, I imagine, are amongst the early introductions, as they came from the San Donato collection of Prince Demidoff. H. J. R.

Answers to Correspondents.

* OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraph regulations our Registered Telegraphic Address is "GARDCHRON, LONDON." GARDCHRON being written as one word. Telegrams thus addressed will reach the Editor or the Publishers without other address being needed than "GARDCHRON, LONDON."

ACACIA AT MASONIC FUNERAL: A. N. We do not know which species is used.

CYCLAMENS DECAYING IN CENTRE: Constant Reader. The plants damping off as they are doing can only be accounted for by their being damped over daily. Cyclamens ought not to be syringed or damped over in any way at this season of the year. Even when applying water to the roots it must be done without any water getting in to the centre of the plants. They ought to be placed in a heated house now, and be kept as close as possible to the glass, so that damp may be dried up and frost kept out. Let the atmosphere of the house be moderately dry, and by paying attention to the watering they will recover.

DOUBLE EUCHARIS: R. Brothers. The flower is a composite one, resulting from the union of two. When this happens some of the portions are suppressed, so that the number of parts is less than would be the case in two separate flowers.

DOUBLE LAFAGERIA: G. T. Interesting, but we have seen much finer samples.

EARWIGS IN THE HOUSE: Subscriber. They can be readily caught by using Bean-stalks, Bamboo, small tubes, garden pots, &c., so placed that the insects can readily enter on being disturbed. When once in these simple traps you can turn them out into hot water, or kill them as tenderly as you like.

EDGING A COMPETING GROUP OF CHRYSANTHEMUMS: T. W. We should think it ought not to be disputed, as it would not influence the judges, who would not give attention to the setting, but to the Chrysanthemums.

ERRATA.—In our report of the miscellaneous exhibits

at the Fruit Show at South Kensington on the 13th and 14th inst., we omitted to state that Mr. H. B. May obtained a Silver Banksian Medal for a group of Ferris, Crotons, Draecenas, &c.—Mr. S. Jacobs, of Covent Garden, was the exhibitor of the fine Goutd shown at the late show at South Kensington, not Mr. Jacobs of Petworth, as was stated.

EUCHARIS: D. C. H. Your bulbs are attacked by the Eucharis mite, so often mentioned of late, and fully described at p. 440, vol. xxiii., 1885.

FUNGUS: E. V. B. Scleroderma vulgare, an ally of the Puff-balls, sometimes mistaken for the Truffie, an entirely different fungus.

INSECTS: A. M. M. The large many-celled gall found at the roots of an Oak is that of the gall-fly (Cynidros), Aphilothia radialis, &c. The perfect flies are still in their cells, which they will remain till next spring, when they escape, mount the Oak, deposit their eggs in the young shoots, which produce gall-flies, named Andricus Noddi. These descend the trees and deposit their eggs in the roots, which reproduce the A. radialis. G. W.

IS CHARCOAL BURNING INJURIOUS TO FRUIT TREES: E. T. In reply to the query as to whether fumes from a charcoal kiln are injurious to fruit trees, I should say not; at least, on examining an Elm, Oak, Elder, Alder, and Thorn growing within six yards of where charcoal has been manufactured for the past twenty years, they do not seem to have suffered in the least. A. D. W.

NAMES OF FRUITS: W. D. 1, Warner's King; 2, not known; 3, Bees Apple; 4, not recognised; 5, Easter Bouré; 2, Hacon's Incomparable (where there were two numbers 2); 5, Winter Nels; 6, Glou Morceau.—C. T. 1, Doyenné du Comice; 2, Marie Louise; 3, Beauté d'Amans; 4, B. Sterckmans; 5, Adams' Delmaris; 6, 5, not recognised; 7, not recognised; A. Vasey. Probably Hanwell Sounding.—J. A. Gaddes. Pears: 1, Gansel's Bergamot; 2, Marie Louise; 3, Louise Bonne of Jersey. Apples: 1, Lord Suffield; 2, not recognised; 3, Margi; 4, Fearn's Pippin; 5, Horned's Pearmain; 6, Bedfordshire Foundling.—S. H. 2, Rye; 3, Lamb's Apple; 4, not recognised; 5, Goff; 6, Wyken Pippin; others not recognised. Berwick Stanmouth. 50 and 62, Hambleton Deuxans; 52, Golden Hall of Devon; 53, Sturmer Pippin; 54, Caroline; 59, Requette du Canada; 60, Old Nonpareil; 61, not recognised; one other, number lost, Mannington Pearmain; others not recognised.—S. L. 1, Scarlet Nonpareil; 2, King of the Pippins; 3, not known; 4, Ashmead's Kernel; 5, New Hawthornden; 6, 7, Sturmer Pippin; 8, Blenheim Orange; 9, Brabat Bellefleur; 10, Sturmer Pippin, probably.—The Garden, Apple: 1, M. Mojein. Pear: Flemish Beauty.—H. Woods. Apple: Summer Thor.—J. K. & Co. Small specimen, Waltham Abbey Seedling.—W. Cook. 1, 4, 5, Marie Louise; 2, Beauté d'Amans; 3, Louise Bonne of Jersey; 6, Vicar of Winkfield; 7, Glou Morceau. These are all dessert Pears of the first quality.

NAMES OF PLANTS: G. W. 1, Forsythia viridissima; 2, one of the varieties of Ceanothus azureus.—W. K. We cannot undertake to name the numerous varieties of Crotons and Draecenas. 9, is Phytolacton Lindeni; 10, Justicia speciosa.—Darlington. 1, Adiantum concinnum; 2, Adiantum pubescens; 3, Selaginella involvens; 4, Selaginella; 5, Selaginella; 6, Selaginella & Sons, 1, Lonitza xylostemum; 2, Spiraea callosa; 3, one of the numerous forms of, or hybrids from, Spiraea salicifolia.

PASSION-FLOWER OVER LUXURIANT TO FLOWER: J. A. Ewing. Uncover the extremities of the roots, and trace them inwards to the wall for a foot or more; then prune the tips of the bigger ones by so much, retaining the smaller and more fibrous roots. If the plant requires manure, apply bone-meal, charcoal, or Standen's Patent Manure in small quantities. With this treatment, unless your plot is very young, or shaded by other things, you ought to bring it into a flowering state.

SEEDING DAHLIA: W. P. Your flowers are not improvements on existing kinds, but it is late for good flowers; send, therefore, next season earlier.

SEA BUCKTHORN AND CATTLE: T. D. We never heard that the foliage is injurious to cattle.

TOMATO: Waite, Nash & Co. From sample sent it does not seem to be any improvement on Hathaway's Excelisior, which is one of the best flavoured sorts.

WALNUTS AND FIGS: H. H. You can keep your Walnut in charcoal dust, or silver sand in a rather dark room. Figs: Brown Turkey. Lee's Perpetual or Negro Largo will do for (about) six weeks; the latter is not very free unless the roots are much restricted as to space.

COMMUNICATIONS RECEIVED.—Sutton & Sons—Brownlow Knox.—W. S.—G. T. W.—F. C. Hememander, Erfurt—Delapierre—Marshall P. Wilder, Boston—E. Andrie, Paris.—D. H.—Thos. Ware.—W. C. Camera lucida—W. SEEDS.

LONDON: Oct. 21.—The seed market was to-day scantily attended, and the transactions passing were few and unimportant. At present no speculative inquiry shows itself for Clover seeds. For winter Tares the sale is still small. Seed Rye also moves off slowly. Some new Turkish Canary seed has now arrived, and is obtainable at very moderate rates: the impression prevails that higher values will shortly be seen. Hemp seed is 11. cheaper. There is no change in Haricot Beans and blue Peas. Linseed is steady with but little offering. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

FRUIT, ROOTS, AND VEGETABLES.

COLUMBIA (East London): Oct. 21.—Fair demand for fruit and vegetables, with good supplies. Prices:—Cabbages, 2s. 6d. to 4s. 6d. per tally; greens, 2s. 6d. to 4s.; Turnips, 2s. to 2s. 6d.; Carrots, 2s. to 2s. 3d.; and Parsley, 1s. to 1s. 6d. per dozen bunches; Celery, 7s. to 12s.; and Beetroot, 3s. to 3s. 6d. per dozen; Horse Radish, 1s. to 1s. 3d. per bundle; Mangels, 22s. 6d. to 25s. per ton; Carrots, 50s. to 55s. per ton; Onions, 4s. to 4s. 6d. per cwt.; Apples, 2s. to 4s. 6d.; and Pears, 2s. 6d. to 4s. 6d. per bushel.

STRATFORD: Oct. 20.—The supplies have been good during the past week, as also the attendance of buyers, consequently a fair trade has been done at the following quotations:—Cabbages, 2s. to 2s. per tally; red Cabbage, 5d. to 1s. 6d. per dozen; greens, bunch, 2s. 6d. to 3s. 6d. per dozen; Cauliflowers, 1s. to 2s. per dozen; Mangels, 17s. to 20s. per ton; Turnips, 50s. to 85s. per ton; ditto, bunch, 1s. 6d. to 3s. 6d. per dozen; Apples, 2s. to 2s. per bushel; Carrots for cattle, 26s. to 30s. per ton; ditto, household, 42s. to 50s. per ton; ditto, bunch, 2s. per dozen; Tomatos, 8s. per case; Celery, 1s. to 1s. 2d. per bundle; Horse Radish, 10s. to 1s. per bundle.

COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 0d.; East Weylin, 15s. 6d.; Walls End—Tyne (unscreened), 14s. 3d.; Lambton, 18s.; Wear, 16s. 6d.; Hulam, 18s. 5d.; East Hartlepool, 17s. 6d.; South Hartlepool, 16s. 6d.; Tees, 18s. 6d.; Harton, 16s. 6d.; Hutton, 18s. 6d.; Heaton Lyons, 15s. 6d.; Wear, 16s. 6d.; South Durham 16s. 6d.

BECK & CO., LTD.,

130, GREAT SUFFOLK STREET, LONDON, S.E.

(Telegraphic Address—"Hydrant, London").

HOT-WATER VALVE MANUFACTURERS, &c.

GOLD MEDAL, HEALTH EXHIBITION.

The above is an illustration of our NEW PATENT THROTTLE VALVE, the advantages of which are shown in sections below. **BEST AND MOST COMPACT THROTTLE VALVE in the MARKET.**

Prices:—8s. 3d. 10s. 12s. 6d.

Should this Valve be left unused for a lengthened period and be found tightly wedged, by simply unscrewing the LOWER Nut, or Spindle, the wing will be released and can then be readily turned at pleasure and the Nut retightened. **No violence is therefore needed, and the Valve should never be broken.**

For renewal or cleaning the Wing and Cover can be removed, as shown above.

Beck's Patent Horizontal Screw-down Hot-water Valves Are Manufactured at the above Address only, and the Name of the Firm is Cast on each.

GARDEN HYDRANTS, STANDPIPES, HOSE, BRANCHPIPES, SPREADERS, ROSES, &c. FIRE APPLIANCES.

Sectional or Complete Catalogues on application.

GREENHOUSE GLASS, 1 1/2 ft. per foot, in boxes. Suitable for Frames, Conservatories, &c.
PATENT NON-POISONOUS PAINT for Greenhouses, 6d. per lb., or 4s. per cwt.—**LAMB and CO.,** Glass, Lead, Paint, and Varnish Merchants, Builders, and Decorators, Sundrymen, 8, Buckland Street, London, W.C.

SUPERIOR VARNISH.

This Varnish is the cheapest and best covering which can be used for all outdoor purposes, and has many advantages over oil paint. It is applied cold, and may be laid on by any farm labourer or other unskilled person. It dries quickly, giving a hard, brilliant polish, and looks equally as well as oil paint, yet at one-fourth the cost.

PRICE in Casks, containing not less than 9 gallons, delivered free at most railway stations:—Best prepared Jet or Black, 12.6d. per gallon.

Catalogues of all kinds of Iron and Wire Fencing, Gates, Poultry Fencing, &c., free on application
BAYLISS, JONES, & BAYLISS,
 WOLVERHAMPTON,
 and 139 and 141, Cannon Street, London, E.C.

Cucumber Frames.

R. HALLIDAY AND CO. desire to draw special attention to their Cucumber Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one.

Prices, delivered to any station in England:—
 2 light frame, 8 feet by 6 feet } Packing 1 3 0 0
 3-light frame, 12 feet by 6 feet } Cases free 3 5 0
 6-light frame, 24 feet by 6 feet } Cases free 10 0 0
 The glass is nailed and putted in. Lights and framing for brick pits at proportionately low prices.

BUY ONLY ENGLISH WATCHES.

BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH, has obtained the Highest Award of Gold Medal at the Inventions Exhibition, 1885

SILVER, £5 5s. GOLD, £12 12s.

The "Ludgate Watch" is a Silver ENGLISH Lever, of my best London make, with "Special Strength" Three-quarter Plate Movement. Specified throughout in rubies—true Chronometer balance—adjusted for extension with clamp and dust proof patent ring band, and a extended barrel—massive sterling silver dome case with crystal glass front, which combines the strength of the Hunter with the convenience of the Open Face Watch—Winds, set hands and opens at back. The immense superiority in Value, Accuracy, and Durability of the "Ludgate" Watch to Swiss and American made in imitation of and sold as English and to the Old Full-plate English Lever (all sold by other makers), from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL—the only one judged to English Watches. The "Ludgate" is of better quality and value than any two watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and roughest usage, and is therefore the best watch for Home, Indian and Colonial wear by Gardeners (No. 1, large size), Workmen, and Strangers (No. 2, as sketch), Gentlemen, Officers and Men in H.M. Services, Youths and Boys (No. 3, small), will be sent, free and safe, at my risk, to all parts of the world, for £5 5s. or in 18-carat gold, crystal glass cases, Twelve Guineas (No. 3 size). A remittance by P.O. Draft, or Cash, must accompany orders. SPECIALLY NOTE that J. W. BENSON is the only Maker of a Three Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. An Illustrated and Priced Book explaining the advantages of this Watch over the Full-plate English Watches, sold by all other makers, will be sent post-free on application.

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C. And 25, Old Broad Street, W., London.

Consequent upon the award of the GOLD MEDAL, the demand, always great, has so increased as to necessitate more extensive Machinery, which now enables us to execute all orders for the "Ludgate" Watch without delay.

Illustrated Pamphlets of Watches from £2 to 100s. Gold and Silver Jewellery, Clocks (House, Chamber, and Tower), Electro-plate and Musical Boxes, free on application.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price, as engraving, with Boiler, open feed syphon, 15 feet of 4-inch hot-water pipe, and patent joints complete, £4 4s. Delivered free to any station. Discount for cash.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stokehole, and no hot-water fitter for fixing. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilized.

It burns over 12 hours without attention at a nominal cost. "Loughborough" Boilers to heat up to 550 feet of 4-inch pipe, with hot-water pipes, &c., always in stock.

Cost of Apparatus COMPLETE for Greenhouses as below:— up to 6 ft. £4 14 | 15 by 9 ft. £5 10 | 25 by 12 ft. £6 16 | 12 by 8 ft. £3 10 | 20 by 10 ft. £6 10 | 45 by 16 ft. £12 4

Proportional prices for larger sizes. Boiler itself is utilised. The measurement of Greenhouse being given, every apparatus is delivered with pipes cut and fitted ready for fixing.

Illustrated List, with full particulars, sent free.

DEANE & CO., Horticultural Builders and Hot-water Engineers, 46, King William; LONDON BRIDGE, Street, E.C.

RIPPINGHILL'S PATENT PRIZE MEDAL GREENHOUSE WARMING STOVE.

THOMAS ROBERTS, 112, Victoria Street, Westminster, S.W.

IRON GARDEN WHEELBARROWS With TUBULAR FRAME and HANDLES.

Every Gardener should use the "Easy Tip." No. 14, Japanned, 22s.; with Galvanised Body, 22s.; Galvanised all over, 25s.

Barrows forwarded, Carriage Paid, to any part of England on receipt of Cheque or Postal Order, payable to BRIERLEY & SON, BIRMINGHAM.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully twenty times cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested, by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Pierrefield Park, June 21, 1876.—Sirs, I have this day forwarded from Clepton to your address a black varnish cask, to be filled and returned with the best Varnish as the last we had, which I candidly admit was the good we ever had. Address Varnish to Pierrefield Park, Clepton.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing Hurdles, Field and Potance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 73, Elanbank Street, Glasgow.

WANTED, a young MAN, married preferred, with some knowledge of Tea Roses, and to make himself useful in a Market Nursery.

WANTED IMMEDIATELY, a good experienced ROSE GRAFIER, under glass, for a month or six weeks. Wages 20s. per week.

WANT PLACES.

POSTAL ORDERS.-To Advertisers, Subscribers, and Others.-It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to place any Gentleman with employers, &c.-St. John's Nursery, Worcester.

TO LANDED PROPRIETORS, &c.-A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Lastria Park, Stamford Hill, N.

SEED TRADE.-Age 35; married; Shop or Warehouse.-C., 96, Albert Street, Queen's Park, Kilmarn, N.W.

HOLLOWAY'S PILLS.-Any Dyspeptic who suffers from the purifying, regulating, and gently aperient powers of these Pills, should permit no one to cloud his judgment or to warp his course. With a box of Holloway's Pills, and attention to accompanying "Directions," he may feel thoroughly satisfied that he can safely and effectually release himself from his miseries without impairing his appetite or weakening his digestion. This most excellent medicine acts as a purgative and is highly beneficial in all cases of a thousand annoying forms of nervous complaints. An occasional resort to Holloway's remedy will prove highly salutary to all persons, whether young or ill, whose digestion is slow or imperfect-a condition usually evidenced by weariness, lagour and despondency.

Excellence combined with Economy.

APPEAL TO THE BENEVOLENT

On behalf of Two Sisters, aged respectively 70 and 72 (the younger has been an invalid for many years), who have lived together all their lives. The leases of their property having fallen into the hands of the Ecclesiastical Commissioners some six years ago, they have vainly struggled since then to obtain a living by letting apartments, but the little money they had saved being now quite exhausted, and owing over a year's rent, make this Appeal, hoping to save their home from being broken up, and parting with everything they possess. Will any kind friends help them in their deepest distress? The following Gentlemen have kindly allowed a reference to be made to them, and will give every information respecting the genuineness of this Appeal:—

- Dr. MAXWELL T. MASTERS, F.R.S., 41, Wellington Street, Strand, W.C.
- Mr. J. KEALEY, 62, Salton Road, Eriston, S.W.
- Mr. W. RICHARDS, 41, Wellington Street, Strand, W.C.

Billing Road Nurseries, Northampton.

MR. LAXTON'S
SEED, VEGETABLE, and FRUIT
NOVELTIES and SPECIALTIES
FOR 1886.

Full particulars with Prices of the following, with other first-rate New and Distinct VEGETABLES, FRUITS, &c., will shortly be Published, and sent to the Trade for quotation in their Catalogues:—

VEGETABLES.

LAXTON'S "CHARMER," a GRAND NEW PEA, fixed in character, and not all paid. A large and very handsome podded, wrinkled seedling, from William I. of the highest quality and fertility. A most distinct Pea, suitable for Exhibition, Market, or Table.

LAXTON'S "EVOLUTION," the everlasting bearer PEA, and the finest Exhibition variety (see *Gardener's Chronicle*). Aa improved stock.

LAXTON'S NEW "OPEN-AIR" TOMATO, the best and only reliable Tomato suitable for out-of-door growth in this country (see *Garden*, and *Gardener's Chronicle*).

LAXTON'S "THE CZAR," NEW WHITE RUNNER BEAN, by far the large and best Runner Bean. First-class Certificate, Shrewsbury, 1885.

LAXTON'S "GIRTFORD GIANT" SCARLET RUNNER BEAN, the finest and most prolific Scarlet Runner. First-class Certificate, Shrewsbury, 1884.

LAXTON'S "UTILITY" POTATO.—A new large, handsome, highly productive, and vigorous seedling from 1000 seedlings of market sorts as a disease-resisting winter Potato, to supersede Champion and Magnum Bonum. Good for Market, Table, and Exhibition.

LAXTON'S "WHITE HEBRON" FIRST EARLY POTATO.—A white-skinned selection from the well-known White Hebron, very floury, and good from July to April, and unusually productive. First-class Certificate, Shrewsbury, 1885.

LAXTON'S "JOHN HARRISON" LONG-POD BEAN, the finest and best filed of all the Longpods. First-class Certificate from the Royal Horticultural Society.

LAXTON'S "SANDY PRIZE" ONION.—The best White Spanish, grown only from selected very large and sound bulbs.

FRUITS.

LAXTON'S "SEPTEMBER BEAUTY," NEW APPLE, a very handsome fruit of the richest flavour, and the best mid-season dessert Apple, an excellent bearer. First-class Certificates from the Royal Horticultural Society, and at the Crystal Palace, October, 1885.

"DARTMOUTH CRAB" the largest, hand-somest, and best of all the Crabs, and one of the most beautiful fruits in cultivation, and it eaten fresh gathered is equal to a good early dessert Apple. It is coated with a rich bloom, and has the appearance of so enlarged Victoria Plum. An American introduction much admired, as shown by me at the Crystal Palace, at South Kensington, and at the Pear Conference, October, 1885.

"THE KIEFFER" PEAR.—The finest and most distinct of recently introduced American Pears. Said to have originated from a cross of Williams' with the Chinese Sand Pear.

PERPETUAL CLOVE PINK, (Mrs. SIN- KINGS.)—Although a true hybrid between a Pink and a Clove Carnation, this is the most useful and remarkable flower of the past decade, is fairly fertile, and I am enabled to offer good seed which will produce both true Cloves and Pinks, and fine intermediates, mostly perpetual in character.

Eight First-class Certificates have been awarded to T. Laxton during the past season for New Fruits and Vegetables, including four from the Royal Horticultural Society, and one from the Crystal Palace.

Liberal Trade Terms.

This Trade will oblige by inserting the above in their Catalogues.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 31, 1885.

ASHRIDGE PARK.

THE history of this noble and delightful residence may commence here with the Princess Elizabeth, who received a present of Ashridge from her brother, Edward VI., and waited here the doubtful course of events during the reign of Mary. On her accession Elizabeth bestowed Ashridge on one of her deserving followers, and in the next reign it was granted to Sir Thomas Egerton, Lord Ellesmere, whose descendant, the Duke of Bridgewater, executed those famous works in the cutting of canals, which have been commemorated in a monument on the hill. By the will of the seventh Earl of Bridgewater, Lord Alford succeeded to Ashridge, on condition of his obtaining a higher grade in the peerage than that of Earl within five years. Fate deprived him of the opportunity, for he died within a year, and then followed litigation, with a decision ultimately against Lord Alford's son, and in favour of his brother, the Hon. Charles Henry Cautley.

I found it a very pleasant walk of 4 miles from the railway station of Tring to the house. At the little village of Aldbury, which looks odd, like its name, you begin to climb the chalk hill which will presently bring you to the high level of Ashridge Park, at an altitude where the noble park which surrounds the house could hardly be expected to produce any timber but Beech if the chalk rock were not pretty well capped with good soil. Beech is the prevailing tree, and early in July, when the sun glints among the graceful branches that overspread your steep path, what a lovely tree it is. I steered for the monument at the top of the hill, which passengers by the North-Western Railway must have seen high up among the trees opposite Tring Station. At the base of this commemorative and characteristic tower is the inscription, "In honour of Francis, 3d Duke of Bridgewater, Father of Inland Navigation." Hard by is a cottage with its number on the door (25), and when I asked for 24 and 26 these neighbouring cottages were reported each a mile distant in opposite directions. This is a delightful site in summer, but solitary in winter, when the squirrels are asleep and the birds silent or gone elsewhere. The wind howls here sometimes, but the masses of Beech around break its fury, and the cottage is always snug, though sometimes it must be solitary. There were other visitors at the time of my call, for around the tower is a large level piece of turf shaded with great trees, where several parties were encamped under the spreading branches, and some festive vans lately laden with people and provisions were drawn up under the thickets.

The monument seems to link the outer world with the great house. You see it from everywhere, and the house, secluded as it is amidst its thousand acres of wooded park, from nowhere, till you reach the top of the hill, where I was told, "You will see the house from the monument at the end of the avenue;" and

there it lay, just $1\frac{1}{4}$ mile distant, a very extensive pile with a flag flying from the tower.

An avenue always forms a grand approach, and this is a very first-rate avenue, composed of Beech trees of great size, and planted wide apart. It passes first through common land, covered with Beech, and then through the park proper, which is fenced for deer, but in such a way that the continuity of the open glade is unbroken from tower to house, or from house to tower. I walked slowly through the park and avenue, marking on either hand much interesting life to examine and admire—hinds with their calves, and does with their young, making off among the bracken, or standing with head uplifted facing and watching the intruder, with squirrels running and hopping over the turf, trailing their inconsequential tails, or bearing them aloft curling over their backs, and running up the trees on taking the alarm. A great herd of deer and cattle was gathered about the north front of the house, where, notwithstanding the absence at the moment of the head gardener, Mr. Lowe, I found a polite guide through even the most private grounds and conservatories.

The original conventual buildings consisted of a grand old pile, comprising church, cloisters, and residence, including Queen Elizabeth's bed and two pairs of her shoes, which are still preserved with other relics on the spot. But the old house was damaged by the Roundheads in the Civil War, and was in consequence replaced by another, built by the seventh Earl of Bridgewater, the author of the unfortunate will which has been referred to. His house stands partly in Bucks, partly in Herts, and is remarkable for the extent of the ground it covers in two counties—the chapel, great conservatory, and principal apartments being in Bucks, the stable and offices in Herts. There is an old riddle, "Why is Buckinghamshire like an ox-goat?" the answer being because it runs into Oxon (oxen) and Herts (hurts). Earl Brownlow's splendid house stands at the very point of penetration. It is a very extensive building including a massive turreted tower and a tall and beautiful spire surmounting the chapel, and a varied line, if I may quote Sir Bernard Burke, of "towers and battlements, arched doorways, mullioned windows, corbels, and machicolations," with a fine Gothic porch and a frontage from the eastern angle to the western point, more than 1000 feet in length.

The ornamental gardens are on the south and east, so that the various parts of the dwelling communicate directly with the flower-gardens and lawns, and with fifty-six acres of ornamental shrubberies. In fact, the grounds are delightful, and I do not believe that even the landscape gardening of Olympus—that seat and residence of the gods—could boast of such exquisite turf and such charming clumps of native and imported shrubs.

A greenhouse and orangery are associated with some of the departments in the eastern wing, and the dining-room opens into a great conservatory, beautifully constructed and planted, leading by its opposite door into the south side of the ante-chapel. The chapel itself, with Gothic ceiling and rich painted windows, is very fine. But we are here concerned with the outside rather than the inside of this delightful residence, and that being so, we must ascend the central tower for the sake of the wide view of the Home Counties; over the Surrey hills to a distance of forty miles; over Windsor Forest, and great part of Bucks north of the Chilterns; and over the counties of Beds and Herts in the east; as far as the distant hills of Warwickshire in the north-west.

My description of the grounds and gardens must be brief. There are twenty-eight gardens devoted entirely to the ornamental de-

partment, to the care of the houses, the extensive flower gardens and shrubberies. These gardens are admirably sheltered by a grand bank of lofty Limes on the north side near the house, which is itself, from its extent, a capital break-wind. The site is high, but the shelter so perfect that all kinds of shrubs flourish on the lawn, where clumps, mainly composed of Rhododendrons and of good old sorts of shrubs, such as Bay, Box and Yew, with many others, were planted some time since with such artful arrangement that the general effect of the shrubbery is as natural as possible, though it is, of course, entirely the result of superior landscape gardening. The quality of the soil is excellent, as you may see by the large size and luxuriance of the Oaks, Sweet Chestnuts, and Cedars of Lebanon, as well as by the healthy and rapid growth of two long rows of Deodar Cedars, which have been planted, in recent years, in an added portion of the extensive grounds furthest from the house. Two old Ash trees on the lawn are the sole survivors of a number of trees of the same kind from which the place took its name of Ashridge.

The principal flower garden covers the space between some of the best rooms of the house and the Lime trees that have been noticed, and in such a position with the dense mass of green foliage in the background, the beds, which are numerous, can hardly be too gorgeous. This is called the Italian garden. The lesser and more retired space known as the French garden is a very charming enclosure, fenced on all sides with banks of evergreen Oaks, or walls covered with creepers or trained shrubs, including Camellias and Pomegranates, with pale green narrow leaves. Trellised arcades, festooned with Roses and Honeysuckles, run round two sides of this garden, and another side is bounded by the stable, which was formerly a nursery, it is said, and which might now be a palace, having ornamental dormer windows in the roof and a covered walk or cloister, formed by the projection of the upper part of the building, and running the whole length of the garden. Some of the beds are edged with Box and filled with the accustomed bedding plants, others are filled with Clematis trained level with the ground, and next the cloister is a long border fitted with all sorts of things, more pleasing than rare, Maize and Marigold—to name two out of twenty—and hives of bees in the middle. Passing through this garden, a gravel walk, having a most substantial flint wall on the right covered thick with Ivy, Virginian Creeper, and Roses, leads to a tropical fernery, having the "old garden," which is sequestered and enclosed, in front of it. *Ficus repens* is a good plant for covering walls, but in the fernery here it not only covers the walls with close fitting vegetable tapestry, but it hangs down gracefully in thick festoons from rods and pillars. The most remarkable of the specimen plants in this house, passing by the Tree Ferns, is *Calocasia odora*, which grows by the tank in the centre with leaves 4 feet long borne on footstalks 8 feet in length. Another ornament in this warm quarter belongs to the animated world, being a trumpet bird brought by Lord Brownlow from Jamaica, and I think if it were generally known what a gentle, affectionate, pretty creature the trumpet bird is it would be more often seen in tropical houses. It greeted me very kindly, walking close up in a most elegant manner, and allowing me to stroke its head and back without wincing, and its disposition is so good that it seems to have quite forgiven the macaw in the cage hanging above, though that cruel bird with the terrible bill caught it near the bars one day and tore off its upper mandible.

Among things notable at Ashridge are the creepers, and on the outside walls of the fernery, which is not glass to the ground, I noticed the great leaves of an *Aristolochia*, and the dainty foliage of the variegated Vine, besides small-

leaved Ivies and other things. I should have said that the conservatory into which the dining-room opens is nobly furnished with suitable plants, Palms, three or four varieties of Passion-flower, *Bignonia speciosa*, *Cobea scandens* dependent from above; and, among other things, the *Stantonia latifolia*, which was figured in the *Gardeners' Chronicle* when in blossom. Both the stove and the Orchard-house contain much that should be reported if space would permit, and perhaps it may "show vilely" in me, like Prince Henry's taste for small beef, that I could not prevent the eye from wandering sometimes, in walking through these houses, away from the most rare and beautiful plants to the draped walls, covered as they are with the *Ficus* just named and with *Adiantum cuneatum* and *A. pubescens*. In spite of our admiration of things that are rare and novel, it is pleasing to reflect that many of the most beautiful decorative plants are easily obtained and common to all. *H. E.*

New Garden Plants.

MORMODES DAYANUM, n. sp.*

ONCE more a new *Mormodes*. Flowers equal to those of *Mormodes Wendlandi*, ochre-coloured, with long longitudinal lines inside on the sepals and petals. Lip revolute, so that the outside of both halves touch one another. Its shape is triangular, with an inflexed short apiculus in the middle. There is a round excavation in front of the apiculus, and a linear one at the base. The whole of the lip is white, and of ivory texture. It is distinct in the angle it makes from its neighbours. The upper and lateral borders of the lip stand nearly under a right angle. The small apiculate column is white also. It is named in honour of the excellent Mr. Day, who, when seeing the plant at Mr. Bull's, immediately recognised its remarkable features. *H. G. Rehb. f.*

CATASETUM (MONACHANTHUS) GLAUCOGLOSSUM, n. typ.†

A new Mexican Cattleya (sex ?). Who would have expected it? What may be the characters of other sex? It was kindly sent me by Mr. W. Bull. One might have thought of a certain affinity with *Cattleya Russelianum*, but that is a *Monachanthus* itself. I have a very strong deflexed peduncle before me bearing nine ascending flowers, surpassing those of *Catasetum Russelianum*, Lindl., by a very strong texture. Sepals ligulate, acute, brown. Petals much larger, oblong, acute, glaucous with rows of brown spots. Lip with a depressed rounded sac and a triangular mouth, quite glaucous, with some brown spots inside. There are two glaucous transverse trisetate calli in the interior and two broad callous lines running parallel to the point of the lip. Column whitish, with purple longitudinal lines under the fovea. *H. G. Rehb. f.*

CATLEYA PORPHYROPHLEBIA, n. hrb., Veitch.

A new English Orchid, a hybrid between *Cattleya intermedia* and *superba*. "The habit of the plant is dwarf, resembling *superba*. It has four bulbs with one leaf, and one, the last, is two-leaved. Bulbs 1 to 4 inches long. Leaves $2\frac{1}{2}$ to 6 inches long, and 1 to 2 inches wide. The plant is only four years old." So much was written by Mr. Harry Veitch, who kindly sent a flower. It might be compared to a very large flower of *Cattleya intermedia*, but has a lip of exquisite beauty. This has the anterior lobe

* *Mormodes Dayanum*, n. sp.—Racemo paucifloro; floribus magnitudine illorum *Mormodes Wendlandi*; Rehb. f.; sepalis tepalisque linearilanceis; labello explanato triangulo cum apiculis in medio marginis superioris, lateribus reflexis angulum rectum efficientibus, apiculis deflexis, fovea impressa subrotunda juxta apiculum, linea impressa ad basin angulis.—Sepala et tepala flava lineis rubris. Labello album. *H. G. Rehb. f.*

† *Catasetum (Monachanthus) glaucoglossum*, nov. typ.—Racemo parvifloro (deflexo), floribus ascendebus sepalis ligulatis acutis; tepalis late oblongis acutis, labello calciformi retrocurvo late depresso oblongo rotundato costato, antro, antrotriangulo acuto concavo, callis geminis abruptis trisetatis, lineis antepositis geminis crassis elevatis apicem versus; columna retrocurva androclino membranacea marginata. E. Mexico, mp. col. mercator Londinensis. *W. Bull. H. G. Rehb. f.*

nearly orbiculate, undulate, toothletted, purple, with much darker purple stripes and markings which is very charming. The remainder of the lip, disc, and side lobes are paler in colour. Disc whitish verging to the lightest pallid sulphur. Borders light purple. Mid-line with four purple lines and short purple lines proceeding towards the angles on each side. Column white, with some purple dashes. The rather broad sepals and petals are rose coloured. There would appear not to be *embarras de richesse*, but de *paucité*. It may be frequently demanded, but will be seldom obtained. *H. G. Rehb. f.*

ONCIDIUM OCHRODES AND O. CHRYSORNIS.

It is ascertained on p. 522, that these two species are the same. My opinion is at variance with this. My eleven wild grown specimens of *Oncidium chrysornis* all show lips of nearly the same breadth both at the base and at the top, as the width at the base is not much greater, and is now and then equal to that of the top. The callus has the anterior and some side lobes bidentate. The column is exceedingly slender, and has its wings cuneate at the base. The zig-zag twigs of the inflorescence are very short and strong, quite resembling those of *Oncidium pyramidale* and *O. chrysornis*.

What I have seen of *Oncidium ochrodes* is much thinner in its branches, and the whole inflorescence is always much shorter. It is far more decidedly a "Basilata" *Oncidium*, the anterior part of the lip being considerably narrower. The callus has simply filiform or conical warts. The column is far thicker, and its wings are sessile, not cuneate at the base.

The "pyramidale" group is very difficult, as in the majority of the *Oncidia*. If some of the English lovers of Orchids had time and space to sow some species, it would be a great boon for scientific knowledge, to learn something about the constancy of features by the observation of large numbers. *H. G. Rehb. f.*

SOIL FERTILISERS.

THE following is the summing up of the main points in a lecture upon this subject delivered by Professor G. C. Caldwell, Ithaca, New York, before the Massachusetts Horticultural Society:—

1. That if the elements needed for the food of the gardener's or horticulturist's crops cannot be obtained in sufficient quantity from stable manure, or other animal waste, they can be procured in the trade in unlimited quantity, and in every degree of availability depending on different grades of solubility, and in the greatest variety of mixtures, so as to suit any whim or fancy of crop or crop grower.

2. That profitable crop-growing can be carried on, for many years at least, with these commercial fertilisers alone.

3. That the most evident distinction between stable manure and commercial fertilisers, and the distinction upon which we should, therefore, naturally base an explanation of the greater reliability of the former, is its large proportion of vegetable matter, or humus-forming material, of which commercial fertilisers contain practically none.

4. That soils contain, in a difficultly soluble condition, and therefore not easily fed upon by the crops, large supplies of all the needed elements of plant food.

5. That humus, through its decay in the soil, furnishes carbonic acid, among other solvent agents; and this carbonic acid appears to play an important part in the nourishment of crops by bringing the native, insoluble stock of plant food within their easy reach.

6. That even if we add water-soluble plant food to the soil it becomes largely insoluble before the crop can feed upon it, or needs it; therefore soluble plant food added to the soil in commercial fertilisers needs also the help of the humus, finally, for its solution.

7. That plant food in most animal and vegetable residues used as manures costs much less than in commercial manures.

8. That, in spite of the disadvantages which, under some conditions, attend the use of commercial fertilisers, they are, nevertheless, a very important and necessary help in crop growing.

9. That in using these fertilisers the wisest course appears to be to make one's own mixtures of the raw materials, as well for securing a better manure as for economy in first cost.

TORREYA CALIFORNICA,

THE STINKING CEDAR, OR CALIFORNIAN NUTMEG.

THIS is described as a tree 60 to 80 feet high, with a trunk attaining 3 feet in diameter, and inhabiting the western slopes of the Sierra Nevada of California, from the Mendocino County to Zulare County. During my visit to California I had not the good fortune to see a good specimen of this most interesting tree. The only place in which I remember to have met with it was in the gorge of the Yosemite Valley by the rocky stream, some miles below the hotels, where it formed a scrappy tree 20 feet high, or thereabouts, growing interspersed with *Picea contorta* and various deciduous shrubs. The accompanying is a copy of a sketch which I made of the best specimen I could find, and which represents anything but an attractive appearance (fig. 125). The colour of the foliage was bright green, and the large green Plum-like fruits, produced in abundance, had a very singular appearance. The wood is described as light, soft, not very

VARIETIES OF PEARS.

As the present is the time to compare notes, perhaps a *resumé* of results, noticed from trees growing in a heavy brick earth resting on chalk in the northern division of Suffolk, will not be an unnecessary harping on a familiar theme. People are too apt to consider a subject threadbare when they observe a good deal of information in newspapers about any one topic. The case may be, however, that the humble-minded will be intensely interested with each week's quota of information, that a few unsuspected facts will pierce the mail of the stiff-necked dogmatist, and that the canny will have unquestionable evidence from the pens of more than one witness on which to base chops, charges, and additions. Ardent cultivators have been so often bitten in trying new varieties that it is small wonder their enthusiasm dwindled. A very good pomologist, whose name you give as one of the contributors to your "Pear numbers," once told me that he had been made a *corpus vile* by a nurseryman, whereon to experiment with imported Pears, which he, the nurseryman, had not even seen fruited. Such experience, attained *à force de peine et de sueurs*, cannot but interest even those whom experience has made conceited. Therefore, it is to be hoped that your columns will still for some time longer contain more or less of Pear lore; in order that your issues for this month and the next may be a permanent *thesaurus* of information, worth any number of scattered notes and articles.
